- The [port-channel load-balance](#) command configures the hash seed for the algorithm.
- The [port-channel load-balance fm6000 fields mac](#) command controls the hash algorithm for non-IP packets.

Example

These commands configure the switch's port channel load balance for IP packets by source and destination IP address and port fields.

```
switch(config)# port-channel load-balance fm6000 fields ip ip-tcp-udp-header
switch(config)#
```

11.2.5.23 port-channel load-balance fm6000 fields mac

The **port-channel load-balance fm6000 fields mac** command specifies data fields that configure the port channel load balance hash algorithm for non-IP packets on FM6000 platform switches. The hashing algorithm fields used for balancing non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance fm6000 fields mac** and **default port-channel load-balance fm6000 fields mac** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **port-channel load-balance fm6000 fields mac** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
port-channel load-balance fm6000 fields mac MAC_FIELD_NAME
```

```
no port-channel load-balance fm6000 fields mac
```

```
default port-channel load-balance fm6000 fields mac
```

Parameters

MAC_FIELD_NAME Fields the hashing algorithm uses for Layer 2 routing. Options include:

- **dst-mac** MAC destination field.
- **eth-type** EtherType field.
- **src-mac** MAC source field.
- **vlan-id** VLAN ID field.
- **vlan-priority** VLAN priority field.

Command may include from one to five fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

- The [port-channel load-balance](#) command configures the hash seed for the algorithm.
- The [port-channel load-balance fm6000 fields ip](#) command controls the hash algorithm for IP packets.

Example

These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)# port-channel load-balance fm6000 fields mac dst-mac eth-type
switch(config)#
```

11.2.5.24 port-channel load-balance module

The **port-channel load-balance module** command assigns a named load-balancing profile to a linecard.

Note: Available on the 7500E platform.

The **no port-channel load-balance module** and **default port-channel load-balance module** commands unassigns the load balancing module, or restores the default data fields for the load balancing module.

Command Mode

Global Configuration

Command Syntax

port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

no port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

default port-channel load-balance module **LINECARD_RANGE** sand profile **PROFILE_NAME**

Parameters

- **LINECARD_RANGE** Linecard number range includes:
 - **3-10** Linecard number range.
- **PROFILE_NAME** Load-balance profile name.

Examples

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)# port-channel load-balance module 3-7 sand profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)# no port-channel load-balance module 3-7 sand profile Linecard5
switch(config)#
```

11.2.5.25 port-channel load-balance petraA fields ip

The **port-channel load-balance petraA fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Petra platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance petraA fields ip** and **default port-channel load-balance petraA fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance petraA fields ip** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
port-channel load-balance petraA fields ip IP_FIELD_NAME
```

```
no port-channel load-balance petraA fields ip
```

```
default port-channel load-balance petraA fields ip
```

Parameters

IP_FIELD_NAME Fields the hashing algorithm uses for Layer 3 routing. Options include:

- **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
- **mac-header** Algorithm uses entire MAC header.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

Related Command

The [port-channel load-balance](#) command configures the hash seed for the algorithm.

Example

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)# port-channel load-balance fm6000 fields ip ip-tcp-udp-header
switch(config)#
```

11.2.5.26 port-channel load-balance sand profile (7500E/7500R)

The **port-channel load-balance sand profile** command configures a global LAG hashing profile on the port channel interface. A default profile is set as a global profile when no other profile is set as global.

The **no port-channel load-balance sand profile** command removes the active profile from the **port-channel load-balance** command from *running-config*, restoring the default profile.

Command Mode

Global Configuration

Command Syntax

```
port-channel load-balance sand profile profile_name
```

```
no port-channel load-balance sand profile profile_name
```

Parameter

profile_name Name of the profile assigned to the selected module.

Example

This command configures a global LAG hashing profile on 7500 series platform switch.

```
switch(config)# port-channel load-balance sand profile myGlobalProfile  
switch(config)#
```

11.2.5.27 port-channel load-balance trident fields ip

The **port-channel load-balance trident fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Trident platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance trident fields ip** and **default port-channel load-balance trident fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance trident fields ip** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
port-channel load-balance trident fields ip IP_FIELD_NAME
no port-channel load-balance trident fields ip
default port-channel load-balance trident fields ip
default port-channel load-balance trident fields ip ingress-interface disabled
```

Parameters

- **IP_FIELD_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Command may include from one to four of the following four options, in any combination and listed in any order.
 - **destination-ip** Algorithm uses destination IP address field.
 - **source-ip** Algorithm uses source IP address field.
 - **destination-port** Algorithm uses destination TCP/UDP port field.
 - **source-port** Algorithm uses source TCP/UDP port field.
 - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

Note: This option cannot be used in combination with any other option.

- **mac-header** Algorithm uses fields specified by [port-channel load-balance trident fields mac](#).

Note: This option cannot be used in combination with any other option.

- **ingress-interface** Disable from LAG hashing.

Default setting is **ip-tcp-udp-header**.

Related Commands

- The [port-channel load-balance](#) command configures the hash seed for the algorithm.
- The [port-channel load-balance trident fields ipv6](#) command controls the hash algorithm for IPv6 packets.

-
- The `port-channel load-balance trident fields mac` command controls the hash algorithm for non-IP/IPv6 packets.

Examples

- These commands configure the switch's port channel load balance for IP packets by using the IPv6 destination field in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields ip destination-ip  
switch(config)#
```

- This command disables the ingress interface for IPv4 traffic.

```
switch(config)# port-channel load-balance trident fields ip ingress-interface  
disabled  
switch(config)#
```

11.2.5.28 port-channel load-balance trident fields ipv6

The **port-channel load-balance trident fields ipv6** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IPv6 packets on Trident platform switches. The hashing algorithm fields used for IPv6 packets differ from the fields used for non-IPv6 packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance trident fields ipv6** and **default port-channel load-balance trident fields ipv6** commands restore the default data fields for the IPv6 packet load balancing algorithm by removing the **port-channel load-balance trident fields ipv6** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
port-channel load-balance trident fields ipv6 IP_FIELD_NAME
no port-channel load-balance trident fields ipv6
default port-channel load-balance trident fields ipv6
```

Parameters

- **IP_FIELD_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Command may include from one to four of the following four options, in any combination and listed in any order.
 - **destination-ip** Algorithm uses destination IPv6 address field.
 - **source-ip** Algorithm uses source IPv6 address field.
 - **destination-port** Algorithm uses destination TCP/UDP port field.
 - **source-port** Algorithm uses source TCP/UDP port field.
 - **ip-tcp-udp-header** Algorithm uses source and destination IPv6 address fields. Source and destination port fields are included for TCP and UDP packets.
 Note: This option can't be used in combination with any other option.
 - **mac-header** Algorithm uses fields specified by [port-channel load-balance trident fields mac](#).
 Note: This option can't be used in combination with any other option.
 - **ingress-interface** Disable from LAG hashing.

Default setting is **ip-tcp-udp-header**

Related Commands

- The [port-channel load-balance](#) command configures the hash seed for the algorithm.
- The [port-channel load-balance trident fields ipv6](#) commands controls the hash algorithm for non-IP packets.

-
- The `port-channel load-balance trident fields mac` command controls the hash algorithm for non-IP packets.

Examples

- These commands configure the switch's port channel load balance for IP packets by using the IPv6 source field in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields ipv6 source-ip  
switch(config)#
```

- This command disables the ingress interface for IPv6 traffic.

```
switch(config)# port-channel load-balance trident fields ipv6 ingress-interface  
disabled  
switch(config)#
```

11.2.5.29 port-channel load-balance trident fields mac

The **port-channel load-balance trident fields mac** command specifies data fields that the port channel load balance hash algorithm uses for distributing non-IP packets on Trident platform switches. The hashing algorithm fields used for non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance trident fields mac** and **default port-channel load-balance trident fields mac** commands restore the default data fields for the non-IP packet load balancing algorithm by removing the **port-channel load-balance trident fields mac** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
port-channel load-balance trident fields mac MAC_FIELD_NAME
no port-channel load-balance trident fields mac
default port-channel load-balance trident fields mac
default port-channel load-balance trident fields mac ingress-interface disabled
```

Parameters

- **MAC_FIELD_NAME** Fields the hashing algorithm uses for Layer 2 routing. Options include:
 - **dst-mac** MAC destination field.
 - **eth-type** EtherType field.
 - **src-mac** MAC source field.
 - **ingress-interface** Disable from LAG hashing.

Command may include from one to three fields, in any combination and listed in any order. The default setting is the selection of all fields.

Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.
- [port-channel load-balance trident fields ip](#) controls the hash algorithm for IP packets.
- [port-channel load-balance trident fields ipv6](#) controls the hash algorithm for IP packets.

Examples

- These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)# port-channel load-balance trident fields mac dst-mac eth-type
switch(config)#
```

-
- This command disables the ingress interface for IPv4 traffic.

```
switch(config)# port-channel load-balance trident fields mac ingress-interface disabled  
switch(config)#
```

11.2.5.30 port-channel min-links

The **port-channel min-links** command specifies the minimum number of interfaces that the configuration mode LAG requires to become active. If there are fewer ports than specified by this command, the port channel interface does not become active. The default min-links value is **0**.

The **no port-channel min-links** and **default port-channel min-links** commands restore the default min-links setting for the configuration mode LAG by removing the corresponding **port-channel min-links** command from the configuration.

Note: In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs **LAG-4-MINLINK_INTF_INSUFFICIENT** message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. **LAG-4-MINLINK_INTF_NORMAL** is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise **LAG-4-MINLINK_INTF_INSUFFICIENT** is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is **360s** seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

```
port-channel min-links quantity
no port-channel min-links
default port-channel min-links
```

Parameters

quantity Minimum number of interfaces. Value range varies by platform. Default value is **0**.

Example

These commands set **4** as the minimum number of ports required for **port channel 13** to become active.

```
switch(config)# interface port-channel 13
switch(config-if-Po13)# port-channel min-links 4
switch(config-if-Po13)# show active
interface Port-Channel13
  port-channel min-links 4
```

```
switch(config-if-Po13) #
```

11.2.5.31 port-channel min-links review interval

The **port-channel min-links review interval** command enables or disables timer based min-links review feature for all port-channels.

The **no port-channel min-links review interval** and **default port-channel min-links review interval** commands restore the default min-links-timeout-base to 180 seconds by removing the corresponding **port-channel min-links review interval** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
port-channel min-links review interval timeout (seconds)  
no port-channel min-links review interval  
default port-channel min-links review interval
```

Guidelines

The min-links-timeout-base interval for port-channels can be set within the range of **0** to **600** seconds. When setting the review interval to zero, the command has the following effect:

- Disables the timer-based min-links review feature for all port-channels.
 - For LACP port-channels, it prevents the port-channel from bringing link up (even after one or more member ports were negotiated to collect or distribute (rx or tx)) until there are sufficient member interfaces ready to join the port-channel. Meanwhile, the partner can enable the port-channel link with fewer than required member interfaces. This configuration does not impact port-channels without min-links configuration.

Related Command

[port-channel min-links](#)

Example

This command sets the port-channel min-links interval to **200** seconds.

```
switch(config)# port-channel min-links review interval 200
```

11.2.5.32 port-channel speed mixed

The **port-channel speed mixed** command configures a port channel with the ability to have active members of multiple speeds.

Note: Available on the 7020, 7280, 7500, and 7800 platforms. Minimum links is not available on mixed-speed port channels.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

```
port-channel speed mixed
```

Related Commands

The [interface port-channel](#) command places the switch in the ***interface-port-channel*** configuration mode.

Example

These commands place the switch in the ***interface port-channel*** mode and configure the mixed speed port-channel.

```
switch(config)# interface port-channel 1
switch(config-if-Po1)# port-channel speed mixed
```

11.2.5.33 port-channel speed minimum

The **port-channel speed minimum** command specifies the cumulative minimum speed of all active members in order for a port channel to become active. If there is less than the specified by this command, the port channel interface does not become active.

Note: If both minimum speed and minimum links are configured, minimum speed will take precedence.

Command Mode

Interface-Port-Channel Configuration

Command Syntax

port-channel speed minimum *speed-value*

Parameter

speed-value Minimum speed value. The value ranges from **1** to **65535**.

Related Command

The [interface port-channel](#) command places the switch in interface-port-channel configuration mode.

Example

These command sets **100** Gbps as the minimum speed needed for port channel **1** to become active.

```
switch(config)# interface port-channel 1
switch(config-if-Po1)# port-channel speed minimum 100 gbps
```

11.2.5.34 show lacp aggregates

The **show lacp aggregates** command displays aggregate IDs and the list of bundled ports for all specified port channels.

Command Mode

EXEC

Command Syntax

```
show lacp [PORT_LIST] aggregates [PORT_LEVEL] [INFO_LEVEL]
```

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Port channels for which aggregate information is displayed. Options include:
 - **<no parameter>** All configured port channels.
 - **c_range** Channel list (number, range, or comma-delimited list of numbers and ranges).
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
 - **no parameter** Ports bundled by LACP into the port channel.
 - **all-ports** All channel group ports, including channel group members not bundled into the port channel interface.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
 - **no parameter** Aggregate ID and bundled ports for each channel.
 - **brief** Aggregate ID and bundled ports for each channel.
 - **detailed** Aggregate ID and bundled ports for each channel.

Example

This command lists aggregate information for all configured port channels.

```
switch> show lacp aggregates

Port Channel Port-Channel1:
  Aggregate ID:
  [(8000,00-1c-73-04-36-d7,0001,0000,0000),(8000,00-1c-73-09-a0-f3,0001,0000,0000)]
  Bundled Ports: Ethernet43 Ethernet44 Ethernet45 Ethernet46
Port Channel Port-Channel2:

  Bundled Ports: Ethernet41 switch>
```

11.2.5.35 show lacp counters

The **show lacp counters** command displays LACP traffic statistics.

Command Mode

EXEC

Command Syntax

```
show lacp [PORT_LIST] counters [PORT_LEVEL] [INFO_LEVEL]
```

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be interchanged while running the command.

Parameters

- **PORT_LIST** Ports for which port information is displayed. Options include:
 - **no parameter** All configured port channels.
 - **c_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
 - **interface** Ports on all interfaces.
 - **interface ethernet e_num** Port on Ethernet interface specified by **e_num**.
 - **interface port-channel p_num** Port on port channel interface specified by **p_num**.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
 - **no parameter** Only ports bundled by LACP into an aggregate.
 - **all-ports** All ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
 - **no parameter** Displays packet transmission (TX and RX) statistics.
 - **brief** Displays packet transmission (TX and RX) statistics.
 - **detailed** Displays packet transmission (TX and RX) statistics and actor-partner statistics.

Example

This command displays transmission statistics for all configured port channels.

```
switch> show lacp counters brief
```

Port	Status	LACPDUs		Markers		Marker Response		Illegal
		RX	TX	RX	TX	RX	TX	
Port Channel Port-Channel1:

```
switch>
```

11.2.5.36 show lacp interface

The **show lacp interface** command displays port status for all port channels that include the specified interfaces. Within the displays for each listed port channel, the output displays sys-id, partner port, state, actor port, and port priority for each interface in the channel.

Command Mode

EXEC

Command Syntax

show lacp interface [**INTERFACE_PORT**] [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: **INTERFACE_PORT** is listed first when present. Other parameters can be listed in any order.

Parameters

- **INTERFACE_PORT** Interfaces for which information is displayed. Options include:
 - **no parameter** All interfaces in channel groups.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **port-channel p_num** Port channel interface specified by **p_num**.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
 - **no parameter** Command lists data for ports bundled by LACP into the aggregate.
 - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
 - **no parameter** Displays same information as **brief** option.
 - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
 - **detailed** Includes **brief** option information plus state machine data.

Example

This command displays LACP configuration information for all ethernet interfaces.

```
switch> show lacp interface
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state
```

11.2.5.37 show lacp internal

The **show lacp internal** command displays the local LACP state for all specified channels. Local state data includes the state machines and LACP protocol information.

Command Mode

EXEC

Command Syntax

```
show lacp [PORT_LIST] internal [PORT_LEVEL] [INFO_LEVEL]
```

Parameters

- **PORT_LIST** Interface for which port information is displayed. Options include:
 - **no parameter** All configured port channels.
 - **c_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
 - **interface** Ports on all interfaces.
 - **interface ethernet e_num** Ethernet interface specified by **e_num**.
 - **interface port-channel p_num** Port channel interface specified by **p_num**.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
 - **no parameter** Command lists data for ports bundled by LACP into an aggregate.
 - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
 - **no parameter** Displays same information as **brief** option.
 - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
 - **detailed** Includes **brief** option information plus state machine data.

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Example

This command displays internal data for all configured port channels.

```
switch> show lacp internal

LACP System-identifier: 8000,00-1c-73-04-36-d7
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
      G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
      C = Collecting, X = state machine expired,
      D = Distributing, d = default neighbor state
      |Partner
Port Status | Sys-id                Port#  State   Actor
OperKey    PortPriority
-----
Port Channel Port-Channell1:
Et43 Bundled | 8000,00-1c-73-09-a0-f3  43    ALGs+CD 0x0001  32768
Et44 Bundled | 8000,00-1c-73-09-a0-f3  44    ALGs+CD 0x0001  32768
Et45 Bundled | 8000,00-1c-73-09-a0-f3  45    ALGs+CD 0x0001  32768
Et46 Bundled | 8000,00-1c-73-09-a0-f3  46    ALGs+CD 0x0001  32768
```

11.2.5.38 show lacp peer

The **show lacp peer** command displays the LACP protocol state of the remote neighbor for all specified port channels.

Command Mode

EXEC

Command Syntax

show lacp [**PORT_LIST**] peer [**PORT_LEVEL**] [**INFO_LEVEL**]

Note: **PORT_LEVEL** and **INFO_LEVEL** parameters can be placed in any order.

Parameters

- **PORT_LIST** Interface for which port information is displayed. Options include:
 - **no parameter** Displays information for all configured port channels.
 - **c_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
 - **interface** Ports on all interfaces.
 - **interface ethernet e_num** Ethernet interface specified by **e_num**.
 - **interface port-channel p_num** Port channel interface specified by **p_num**.
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
 - **no parameter** Command lists data for ports bundled by LACP into an aggregate.
 - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
 - **no parameter** Displays same information as **brief** option.
 - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
 - **detailed** Includes **brief** option information plus state machine data.

Example

This command displays the LACP protocol state of the remote neighbor for all port channels.

```
switch> show lacp peer

State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
C = Collecting, X = state machine expired,
D = Distributing, d = default neighbor state
```

```

```
* - Only local interfaces for MLAGs are displayed. Connect to the peer to
    see the state for peer interfaces.
switch>
```

11.2.5.39 show lacp sys-id

The **show lacp sys-id** command displays the System Identifier the switch uses when negotiating remote LACP implementations.

Command Mode

EXEC

Command Syntax

show lacp sys-id [INFO_LEVEL]

Parameters

INFO_LEVEL Amount of information that is displayed. Options include:

- **no parameter** Displays system identifier.
- **brief** Displays system identifier.
- **detailed** Displays system identifier and system priority, including the MAC address.

Examples

- This command displays the system identifier.

```
switch> show lacp sys-id brief
8000,00-1c-73-04-36-d7
```

- This command displays the system identifier and system priority.

```
switch> show lacp sys-id detailed
System Identifier used by LACP:
System priority: 32768 Switch MAC Address: 00:1c:73:04:36:d7
802.11.43 representation: 8000,00-1c-73-04-36-d7
```

11.2.5.40 show load-balance profile

The **show load-balance profile** command displays the contents of the specified load balance profiles. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes.

Command Mode

EXEC

Command Syntax

```
show load-balance profile [PROFILES]
```

Parameters

PROFILES Load balance profiles for which command displays contents. Options include:

- **no parameter** Displays all load balance profiles.
- **profile_name** Displays specified profile.

Related Commands

- [load-balance policies](#) places the switch in **load-balance-policies** configuration mode.
- [ingress load-balance profile](#) applies a load-balance profile to an Ethernet or port channel interface.

Example

This command displays the contents of the **LB-1** load balance profile.

```
switch> show load-balance profile LB-1

----- LB-1 -----

Source MAC address hashing          ON
Destination MAC address hashing     ON
Ethernet type hashing              ON
VLAN ID hashing                    ON
IP protocol field hashing           ON
DSCP field hashing is               ON
Symmetric hashing for non-IP packets OFF
Symmetric hashing for IP packets    OFF
Random distribution for port-channel ON
Random distribution for ecmp         ON

Profile LB-1 is applied on the following
Port-Channel100

----- myGlobalProfile (global) -----
L3 hashing is ON
Symmetric hashing is OFF
Hashing mode is flow-based
Hash polynomial is 3
Hash seed is 0
Profile myGlobalProfile (global) is applied on the following
Linecard3
Linecard4
Linecard5
Linecard6 switch>
```

11.2.5.41 show port-channel

The **show port-channel** command displays information about members the specified port channels.

Command Mode

EXEC

Command Syntax

```
show port-channel [MEMBERS] [PORT_LIST] [INFO_LEVEL]
```

Parameters

- **MEMBERS** List of port channels for which information is displayed. Options include:
 - **no parameter** All configured port channels.
 - **p_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
- **PORT_LEVEL** Ports displayed, in terms of aggregation status. Options include:
 - **no parameter** Displays information on ports that are active members of the LAG.
 - **active-ports** Displays information on ports that are active members of the LAG.
 - **all-ports** Displays information on all ports (active or inactive) configured for LAG.
- **INFO_LEVEL** Amount of information that is displayed. Options include:
 - **no parameter** Displays information at the brief level.
 - **brief** Displays information at the brief level.
 - **detailed** Displays information at the detail level.

Display Values

- **Port Channel** Type and name of the port channel.
- **Time became active** Time when the port channel came up.
- **Protocol** Protocol operating on the port channel.
- **Mode** Status of the Ethernet interface on the port. The status value is Active or Inactive.
- **No active ports** Number of active ports on the port channel.
- **Configured but inactive ports** Ports configured but that are not actively up.
- **Reason unconfigured** Reason why the port is not part of the LAG.

Guidelines

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform specific. For example, compatibility may require identical operating parameters such as speed and Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

Examples

- This command displays output from the **show port-channel** command.

```
switch> show port-channel 3
Port Channel Port-Channel3:
  Active Ports:
    Port                Time became active    Protocol    Mode
    -----
    Ethernet3           15:33:41              LACP        Active
    PeerEthernet3       15:33:41              LACP        Active
```

- This command displays output from the **show port-channel active-ports** command.

```
switch> show port-channel active-ports
Port Channel Port-Channel3:
  No Active Ports
Port Channel Port-Channel11:
  No Active Ports
switch>
```

- This command displays output from the **show port-channel all-ports** command.

```
switch> show port-channel all-ports
Port Channel Port-Channel3:
  No Active Ports
  Configured, but inactive ports:
    Port          Time became inactive    Reason unconfigured
    -----
    Ethernet3      Always                          not compatible with aggregate

Port Channel Port-Channel11:
  No Active Ports
  Configured, but inactive ports:
    Port          Time became inactive    Reason unconfigured
    -----
    Ethernet25     Always                          not compatible with aggregate
    Ethernet26     Always                          not compatible with aggregate
```

- This command displays details about the port-channel configuration:

```
switch#show port-channel 50 detailed
Port Channel Port-Channel50 (Fallback State: Unconfigured):
Minimum links: unconfigured Minimum speed: unconfigured
Current weight/Max weight: 1/16

Active Ports:
Port          Time Became Active    Protocol    Mode    Weight    State
-----
Ethernet51    Wed 15:19:30          LACP        Active   1          Rx,Tx
PeerEthernet52 Wed 15:19:28          LACP        Active   0          Unknown
```

This output displays the following information:

- **Port** - the Active ports on an interface.
- **Time Became Active** - The time when a port came up on the network.
- **Protocol** - the network protocol associated with the port.
- **Mode** - the current mode of the port as *Active* or *Inactive*.
- **Weight** - The member port weight is directly proportional to other members speeds and determines the number of packets sent over the member port when it becomes active. For same speed port-channels, all members have a weight of one (1).
- **State** - the state of the port as receiving (Rx) traffic, transmitting (Tx) traffic, or Unknown.

11.2.5.42 show port-channel dense

The **show port-channel dense** command displays the port-channels on the switch and lists their component interfaces, LACP status, and set flags.

Command Mode

EXEC

Command Syntax

show port-channel dense

Example

This command displays **show port-channel dense** output:

```
switch> show port-channel dense

      Flags
-----
a - LACP Active          p - LACP Passive
U - In Use              D - Down
+ - In-Sync             - - Out-of-Sync      i - incompatible with agg
P - bundled in Po       s - suspended        G - Aggregable
I - Individual          S - ShortTimeout     w - wait for agg

Number of channels in use: 2
Number of aggregators:2

      Port-Channel      Protocol      Ports
-----
Po1 (U)                LACP (a)      Et47 (PG+) Et48 (PG+)
Po2 (U)                LACP (a)      Et39 (PG+) Et40 (PG+)
```

11.2.5.43 show port-channel limits

The **show port-channel limits** command displays groups of ports that are compatible and may be joined into port channels. Each group of compatible ports is called a LAG group. For each LAG group, the command also displays **Max interfaces** and **Max ports per interface**.

- **Max interfaces** defines the maximum number of active port channels that may be formed out of these ports.
- **Max ports per interface** defines the maximum number of active ports allowed in a port channel from the compatibility group.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or Maximum Transmission Unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

Command Mode

EXEC

Command Syntax

```
show port-channel limits
```

Example

This command displays **show port-channel list** output:

```
switch> show port-channel limits

LAG Group: focalpoint
-----
Max port-channels per group: 24, Max ports per port-channel: 16
24 compatible ports: Ethernet1  Ethernet2  Ethernet3  Ethernet4
                    Ethernet5  Ethernet6  Ethernet7  Ethernet8
                    Ethernet9  Ethernet10 Ethernet11  Ethernet12
                    Ethernet13 Ethernet14 Ethernet15  Ethernet16
                    Ethernet17 Ethernet18 Ethernet19  Ethernet20
                    Ethernet21 Ethernet22 Ethernet23  Ethernet24
-----
```

11.2.5.44 show port-channel load-balance fields

The **show port-channel load-balance fields** command displays the fields that the hashing algorithm uses to distribute traffic across the interfaces that comprise the port channels.

Command Mode

EXEC

Command Syntax

`show port-channel load-balance HARDWARE fields`

Parameters

HARDWARE ASIC switching device. Selection options depend on the switch model and include:

- **arad**
- **fm6000**
- **petraA**
- **trident**

Example

This command displays the hashing fields used for balancing port channel traffic.

```
switch> show port-channel load-balance fm6000 fields

Source MAC address hashing for non-IP packets is ON
Destination MAC address hashing for non-IP packets is ON
Ethernet type hashing for non-IP packets is ON
VLAN ID hashing for non-IP packets is ON
VLAN priority hashing for non-IP packets is ON
Source MAC address hashing for IP packets is ON
Destination MAC address hashing for IP packets is ON
Ethernet type hashing for IP packets is ON
VLAN ID hashing for IP packets is ON
VLAN priority hashing for IP packets is ON
IP source address hashing is ON
IP destination address hashing is ON
IP protocol field hashing is ON
TCP/UDP source port hashing is ON
TCP/UDP destination port hashing is ON switch>
```

11.2.5.45 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from **0** at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the [clear counters](#) command.

Command Mode

EXEC

Command Syntax

show port-channel load-balance [MEMBERS]

Parameters

MEMBERS list of port channels for which information is displayed. Options include:

- **no parameter** all configured port channels.
- **c_range** ports in specified channel list (number, number range, or list of numbers and ranges).

Example

This command displays traffic distribution for all configured port channels.

```
switch> show port-channel load-balance
ChanId  Port  Rx-Ucst  Tx-Ucst  Rx-Mcst  Tx-Mcst  Rx-Bcst  Tx-Bcst
-----
      8   Et10  100.00%  100.00%  100.00%  100.00%    0.00%  100.00%
-----
      1   Et1   13.97%   42.37%   47.71%   30.94%    0.43%   99.84%
      1   Et2   86.03%   57.63%   52.29%   69.06%   99.57%    0.16%
-----
      2   Et23  48.27%   50.71%   26.79%   73.22%    0.00%  100.00%
      2   Et24  51.73%   49.29%   73.21%   26.78%    0.00%    0.00%
-----

switch>
```

11.3 Multi-Chassis Link Aggregation

Arista switches support Multi-Chassis Link Aggregation (MLAG) to logically aggregate ports across two switches. For example, two 10-gigabit Ethernet ports, one each from two MLAG configured switches, can connect to two 10-gigabit ports on a host, switch, or network device to create a link that appears as a single 20-gigabit port. MLAG-configured ports provide Layer 2 multipathing, increased bandwidth, higher availability, and other improvements on traditional active-passive or Spanning Tree governed infrastructures.

The Multi-Chassis Link Aggregation section contains these topics:

- [MLAG Introduction](#)
- [MLAG Conceptual Overview](#)
- [MLAG Maintenance](#)
- [Configuring MLAG](#)
- [EVPN - MLAG Single-homed Hosts](#)
- [Configuring MLAG Layer 2 Subinterfaces](#)
- [Configuring Forced Periodic ARP and NDP Refresh](#)
- [MLAG Implementation Example](#)
- [MLAG Commands](#)

11.3.1 MLAG Introduction

High availability data center topologies typically provide redundancy protection at the expense of over-subscription by connecting Top-Of-Rack (TOR) switches and servers to dual aggregation switches. In these topologies, Spanning Tree Protocol prevents network loops by blocking half of the links to the aggregation switches. This reduces the available bandwidth by 50%.

Deploying MLAG removes over-subscription by configuring an MLAG link between two aggregation switches to create a single logical switching instance that utilizes all connections to the switches. Interfaces on both devices participate in a distributed port channel, enabling all active paths to carry data traffic while maintaining the integrity of the Spanning Tree topology.

MLAG provides these benefits:

- Aggregates multiple Ethernet ports across two switches.
- Provides higher bandwidth links as network traffic increases.
- Utilizes bandwidth more efficiently with fewer links blocked by STP.
- Connects to other switches and servers by static LAG or LACP without other proprietary protocols.
- Supports normal STP operation to prevent loops.
- Supports active-active Layer-2 redundancy.

Note: For information on enabling Precision Timing Protocol (PTP) on an MLAG interface, see the [Timing Protocols](#) chapter.

Note: The global STP configuration is derived from the primary peer device while the secondary device parameters are ignored. When STP is disabled on the primary device, the secondary device will not contain any STP configuration information from the primary device. As a result, the secondary device will not be able to decide on the port roles or states, and will remain in the default state which is the discarding state. This is an expected behavior.

Note: It is highly recommended that both MLAG peer switches are identical platforms and run identical EOS images. Running different images/platform may result in a failure to form an association with the MLAG peer or see discrepancy in behavior.

11.3.2 MLAG Conceptual Overview

11.3.2.1 MLAG Operation Process

A Multi-chassis Link Aggregation Group (MLAG) is a pair of links that terminate on two cooperating switches and appear as an ordinary Link Aggregation Group (LAG). The cooperating switches are MLAG peer switches and communicate through an interface called a peer link. While the peer link's primary purpose is exchanging MLAG control information between peer switches, it also carries data traffic from devices that are attached to only one MLAG peer and have no alternative path. An MLAG domain consists of the peer switches and the control links that connect the switches.

In the figure below, Switch A and Switch B are peer switches in the MLAG domain and connect to each other through the peer link. Each peer switch uses the peer address to form and maintain the peer link.

The MLAG domain ID is a text string configured in each peer switch. MLAG switches use this string to identify their peers. The MLAG System ID (MSI) is the MLAG domain's MAC address. The MSI is automatically derived when the MLAG forms and does not match the bridge MAC address of either peer. Each peer uses the MSI in STP and LACP PDUs.

The topology shown below contains four MLAGs: one MLAG connects each device to the MLAG domain. Each peer switch connects to the four servers through MLAG link interfaces.

In a conventional topology, with dually-attaching devices to multiple switches for redundancy, Spanning Tree Protocol (STP) blocks half of the switch-device links. In the MLAG topology, STP does not block any portion because it views the MLAG Domain as a single switch and each MLAG as a single port. The MLAG protocol facilitates the balancing of device traffic between the peer switches.

Figure 11-1: MLAG Domain Topology

When MLAG is disabled, peer switches revert to their independent state. MLAG is disabled by any of the following:

- MLAG configuration changes.
- The TCP connection breaks.
- The peer-link or local-interface goes down.
- A switch does not receive a response to a keep alive message from its peer within a specified period.

11.3.2.2 MLAG Interoperability with Other Features

The following sections describe MLAG interaction with other switch features.

11.3.2.2.1 VLANs

VLAN parameters must be configured identically on each peer for the LAGs comprising the peer link and MLAGs. These parameters include the switchport access VLAN, switchport mode, trunk-allowed VLANs, the trunk native VLAN, and switchport trunk groups.

Configuration discrepancies may result in traffic loss in certain failure scenarios. Port-specific bridging configuration originates on the switch where the port is physically located.

11.3.2.2.2 LACP

Link Aggregation Control Protocol (LACP) should be used on all MLAG interfaces, including the peer-link. LACP control packets reference the MLAG system ID.

11.3.2.2.3 Static MAC Addresses

A static MAC address configured on an MLAG interface is automatically configured on the peer's corresponding interface. Configuring static MAC addresses on both peers prevents undesired flooding if an MLAG peer relationship fails.

If the MLAG peering relationship is disabled, the static MAC previously learned from peer is removed.

11.3.2.2.4 Spanning Tree Protocol (STP)

When implementing MLAG in a spanning tree network, spanning tree must be configured globally and on port-channels configured with an MLAG ID. Port specific spanning tree configuration comes from the switch where the port physically resides. This includes spanning-tree PortFast BPDU Guard and BPDU filter.

11.3.2.2.5 Port Mirroring

A port channel which is a member of an MLAG *must not* be used as the destination port for a port mirroring (port monitoring) session.

11.3.2.3 IPv6 Flow Label Hashing

Arista switches use the hashing algorithm to load-balance traffic among LAG members and Layer 3 ECMP (equal cost multipath) paths. For IP and IPv6 traffic, the hashing algorithm includes (if so configured for LAG) the IP packet fields such as source and destination IP addresses as well as source and destination ports for UDP and TCP traffic.

To improve traffic distribution for IPv6 traffic, IPv6 Flow Label field has been added to the hashing algorithm for both LAG and ECMP.

Note: IPv6 Flow Label is included in the LAG hashing algorithm only when the MAC header hashing is not enabled for IPv6 traffic.

11.3.3 MLAG Maintenance

These sections describe tasks required for MLAG to operate on the switch:

-
- [Ensuring Control Plane ACL Compatibility](#)
 - [MLAG Availability through a Single Functional Peer](#)
 - [Upgrading MLAG Peers](#)
 - [Forced Periodic ARP and NDP Refresh on IPv4 and IPv6 Networks](#)

11.3.3.1 Ensuring Control Plane ACL Compatibility

The control plane Access Control List (ACL) on any interface participating in the MLAG must be configured to allow only the peer link neighbor to generate MLAG control traffic. The required rules are included in the default control plane ACL for Ethernet ports.

Any custom control plane ACL applied to a participating port must include these three rules:

```
permit tcp any any eq mlag ttl eq 255
permit udp any any eq mlag ttl eq 255
permit tcp any eq mlag any ttl eq 255
```

MLAG peers that function as routers must each have routing enabled.

11.3.3.2 MLAG Availability through a Single Functional Peer

MLAG high availability advantages are fully realized when all devices that connect to one MLAG switch also connect to the peer switch. A switch can continue supporting MLAG when its peer is offline if the STP agent is restartable. When one peer is offline, data traffic flows from the devices through the MLAG component link that connects to the functioning switch. When a switch is offline, its interfaces and ports do not appear in [show mlag](#) and [show spanning tree protocol](#) commands of the functioning peer.

To view the restartability status of the STP agent, use the **detail** option of the [show spanning-tree instance](#) command:

```
switch-1# show spanning-tree instance detail | grep agent
Stp agent restartable           :                True
```

STP agent restartability requires consistent configuration between the peers of STP, LACP, MLAG, and switchport parameters. Events triggering an STP state machine change may also briefly prevent the STP agent from being restartable.

11.3.3.2.1 Reload Delay

If an MLAG peer reboots, all ports except those in the peer-link port-channel remain in **errdisabled** state for a specified time, called the reload-delay period. This period allows all topology states to stabilize before the switch begins forwarding traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches:** 300 seconds
- **Trident II modular switches:** 1200 seconds
 - 7304
 - 7308
 - 7316
 - 7300X series
- **Sand platform fixed configuration switches:** 600 seconds
 - 7280 series (except 7280CR2 and 7280SR2)
 - 7020 series
- **Sand platform modular switches:** 1800 seconds

- 7504
- 7508
- 7500E series
- 7548S
- **Sand Jericho+ fixed configuration switches:** 900 seconds
 - 7280CR2 series
 - 7280SR2 series

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the [reload-delay mlag](#) command.

Severing the physical connection (cable) that establishes the peer-link between MLAG peers may result in a **split brain** state where each peer independently enters spanning tree state to prevent topology loops. Sessions established through one interface of a dual attached device may fail if its path is disrupted by the STP reconvergence, possibly resulting in temporarily lost connectivity. Sessions can be reestablished if permitted by the resulting topology.

11.3.3.3 Upgrading MLAG Peers

MLAG ISSU (In-Service Software Upgrade) upgrades EOS software on one MLAG peer with minimal traffic disruptions on active MLAG interfaces and without changing the network topology.

11.3.3.3.1 Verifying Configuration Compatibility

A seamless EOS upgrade on an MLAG peer requires that the following features are configured consistently on each switch:

- VLANs.
- Switchport configuration on port channel interfaces that are configured with an MLAG ID.
- STP configuration (global).

11.3.3.3.2 Version Compatibility

A switch running MLAG can be upgraded without disrupting MLAG traffic when the upgraded EOS version is compatible with the version on the peer switch. Refer to the Release Notes for a list of compatible EOS versions.

11.3.3.3.3 Reload Warning Conditions

Entering an EOS reload command while MLAG is active generates warning messages if conditions that can result in packet loss during the upgrade are present. All warnings should be resolved before confirming the reload request. The following table displays the reload conditions and a common resolution method for each condition.

Table 70: Reload Warning Resolutions

Reload Condition	Resolution Method
Compatibility check	Refer to the Release Notes to verify that the new version is compatible with the currently installed version.
Active-partial MLAG warning	Bring up the remote port-channel. If the MLAG is not actively used, then this warning can be ignored.
STP is not restartable	Wait for STP to be restartable: typically 30 seconds, up to 120 seconds for a newly started STP agent. Refer to MLAG Availability through a Single Functional Peer for information on checking restartability.
Reload delay too low	Configure a reload delay value greater than or equal to the default. Recommend delay is 300 seconds for TOR switches, 900 seconds for modular switches, and 600 seconds for Sand platform fixed configuration switches (7020 and 7280 series (except 7280CR2 and 7280SR2)).
Peer has error-disabled interfaces	Wait for reload-delay to expire on the peer.

Example

The following **reload** command generates MLAG warning conditions that should be addressed before confirming the ***proceed with reload*** prompt.

```
switch(config)# reload
If you are performing an upgrade, and the Release Notes for the
new version of EOS indicate that MLAG is not backwards-compatible
with the currently installed version (4.9.2), the upgrade will
result in packet loss.

The following MLAGs are not in Active mode. Traffic to or from these ports will
be lost during the upgrade process.
```

mlag	desc	state	local	remote	local/remote status
14		active-partial	Po14	Po14	up/down
15		active-partial	Po15	Po15	up/down

```

Stp is not restartable. Topology changes will occur during the upgrade process.

The configured reload delay of 100 seconds is below the default
value of 300 seconds. A longer reload delay allows more time to
rollback an unsuccessful upgrade due to incompatibility.

The other MLAG peer has errdisabled interfaces. Traffic loss will occur during
the upgrade process.

Proceed with reload? [confirm]
```

11.3.3.3.4 Performing an MLAG ISSU Upgrade

The following procedure performs an MLAG ISSU upgrade:

1. Verify configuration consistency on each peer ([Verifying Configuration Compatibility](#)).
2. Verify version compatibility between the new and existing images ([Version Compatibility](#)).
3. Configure [reload-delay mlag](#) ([MLAG Availability through a Single Functional Peer](#)) if needed. Recommended delay period varies by switch type, and each switch defaults to its recommended delay period.
4. Install the new image onto one of the peers:
 - a. Upload the new image to the switch.
 - b. Set the boot path to the new image.

- c. Enter the `reload` command.
5. Resolve all reload warnings.
6. Confirm the reload.
7. Wait for MLAG peers to renegotiate to the active state and reload-delay expiry on rebooted peer; until reload-delay period has expired, ports on the rebooted peer (except the peer-link) will be in ***errdisabled*** state with err-disabled reason being ***mlag-issu***.
Avoid configuration changes on both peers until after this step.
8. Repeat the upgrade process for the other peer.
When upgrading modular switches with dual supervisors, upgrade the standby supervisors first, then upgrade the active supervisors.

11.3.3.4 Forced Periodic ARP and NDP Refresh on IPv4 and IPv6 Networks

Overview

In MLAG configurations where, each leaf connects to both spines (bowtie setups) and relies on Address Resolution Protocol (ARP) and Neighbor Discovery Protocol (NDP) refresh requests to keep VMACs in downstream MLAG switches up to date. Configure forced periodic ARP and NDP refresh requests to send ARP and NDR in periodic intervals independently of the confirmed time of ARP and NDR entries in the kernel. By default, when various processes confirm a neighbor entry using ARP synchronization between MLAG peers, the switch may not send an ARP refresh request for another duration of ARP aging timeout for IPv4 networks or NDP cache expiration time for IPv6 networks.

In topologies where the two upstream MLAG switches with VXLAN virtual MAC addresses, the VMAC can age out from the MAC tables of the downstream MLAG switches. Aging out can happen when the upstream switch sending APR or NDP requests through the downstream switch that owns the VMAC does not send an ARP or NDP request in that period because of ARP synchronization between the upstream MLAG peers. Adding this feature ensures that the upstream switches send ARP and NDP requests at the configured cache interval to prevent aging out of the VMAC on downstream switches.

11.3.4 Configuring MLAG

These sections describe the basic MLAG configuration steps:

- [Configuring the MLAG Peers](#)
- [Configuring MLAG Services](#)

11.3.4.1 Configuring the MLAG Peers

Connecting two switches as MLAG peers requires the establishment of the peer link and an SVI that defines local and peer IP addresses on each switch.

The peer link is composed of a LAG between the switches. When all devices that connect to the MLAG domain are dually connected to the switches through an MLAG, a peer link of two Ethernet interfaces is sufficient to handle MLAG control data and provide N+1 redundancy. When the domain connects to devices through only one MLAG peer, the peer link may require additional Ethernet interfaces to manage data traffic.

Disruptions to peer link connectivity due to forwarding agent restarts may cause an extended MLAG outage. Forwarding agent restart event include some configuration changes, such as port speed change or UFT mode change). The following precautions can reduce the risk of losing peer-link connectivity:

- all switches: constructing peer-links from port-channels in preference to a single Ethernet interface.
- modular systems: peer-link port-channel members should span multiple line cards.

- multi-chip systems: peer-link port-channel member should span multiple chips.

[Managing Switch Configuration Settings](#) describes modular systems.

The steps that configure two switches as MLAG peers include:

- [Configuring the Port Channels, VLAN Interfaces, and IP addresses](#)
- [Configuring Peer Parameters](#)
- [Configuring MLAG Peer Gateway](#)

11.3.4.1.1 Configuring the Port Channels, VLAN Interfaces, and IP addresses

The peer link is a normal port channel. The local address is the SVI that maps to the peer link port channel. The port channel and SVI must be configured on each peer switch. The port channel should be an active LACP port. The local and peer addresses must be located on the same IP address subnet. Autostate should be disabled on the SVI configured as the local interface.

Examples

- These commands create an active mode LACP port channel interface from two Ethernet interfaces and configure it as part of a trunk group on each switch.

The **switchport mode trunk** command permits all VLANs on the interface by default, so all VLANs are permitted on port channel 10 in the following example. The configuration of a trunk group for a VLAN restricts only that specific VLAN to the associated ports: VLAN 4094 is only permitted on port channel 10, and not on any other ports on the switch. It is important to remember that all VLANs must be permitted between the peers on the peer link for correct operation.

Switch 1

```
switch1# config
switch1(config)# vlan 4094
switch1(config-vlan-4094)# trunk group mlpeer
switch1# config
switch1(config)# interface ethernet 1-2
switch1(config-if-et1-2)# channel-group 10 mode active
switch1(config-if-et1-2)# interface port-channel 10
switch1(config-if-po10)# switchport mode trunk
switch1(config-if-po10)# switchport trunk group mlpeer
switch1(config-if-po10)# exit
switch1(config)#
```

Switch 2

```
switch2# config
switch2(config)# vlan 4094
switch2(config-vlan-4094)# trunk group mlpeer
switch2(config-vlan-4094)# exit
switch2(config)# interface ethernet 1-2
switch2(config-if-et1-2)# channel-group 10 mode active
switch2(config-if-et1-2)# interface port-channel 10
switch2(config-if-po10)# switchport mode trunk
switch2(config-if-po10)# switchport trunk group mlpeer
switch2(config-if-po10)# exit
switch2(config)#
```

- These commands create an SVI for the local interface and associate it to the trunk group assigned to the peer link port channel.

The SVI creates a Layer 3 endpoint in the switch and enables MLAG processes to communicate via TCP. The IP address can be any unicast address that does not conflict with other SVIs. STP is disabled for

the peer link **vlan 4094** to prevent any potential STP disruption of inter peer communications. Recall that the VLAN has been restricted to port-channel 10 by the earlier trunk group configuration thus preventing potential Layer 2 loop conditions within **vlan 4094**.

Switch 1

```
switch1# config
switch1(config)# interface vlan 4094
switch1(config-if-vl4094)# ip address 10.0.0.1/30
switch1(config-if-vl4094)# no autostate
switch1(config-if-vl4094)# exit
switch1(config)# no spanning-tree vlan-id 4094
switch1(config)#
```

Switch 2

```
switch2# config
switch2(config)# interface vlan 4094
switch2(config-if-vl4094)# ip address 10.0.0.2/30
switch2(config-if-vl4094)# no autostate
switch2(config-if-vl4094)# exit
switch2(config)# no spanning-tree vlan-id 4094
switch2(config)#
```

11.3.4.1.2 Configuring Peer Parameters

Peer connection parameters configure the connection between the MLAG peer switches. This section describes the following peer configuration parameters.

- [MLAG Configuration Mode](#)
- [Local VLAN Interface](#)
- [Peer Address](#)
- [Peer Link](#)
- [Domain ID](#)
- [Heartbeat Interval and Timeout](#)
- [Reload Delay Period](#)
- [Shutdown](#)

11.3.4.1.2.1 MLAG Configuration Mode

Peer connection parameters are configured in MLAG-configuration mode. The [mlag configuration \(global configuration\)](#) command places the switch in MLAG configuration mode.

Example

This command places the switch in MLAG configuration mode.

```
switch(config)# mlag configuration
switch(config-mlag)#
```

11.3.4.1.2.2 Local VLAN Interface

The local interface specifies the SVI upon which the switch sends MLAG control traffic. The local IP address is specified within the definition of the VLAN associated with the local interface. The Peer Address configures the control traffic destination on the peer switch.

The **local-interface** command specifies a VLAN interface as the peer link SVI.

Example

This command configures **vlan 4094** as the local interface.

```
switch(config-mlag)# local-interface vlan 4094
switch(config-mlag)#
```

11.3.4.1.2.3Peer Address

The peer address is the destination address on the peer switch for MLAG control traffic. If the peer IP address is unreachable, MLAG peering fails and both peer switches revert to their independent state.

The **peer-address** command specifies the peer address.

Example

This command configures a peer address of **10.0.0.2**.

```
switch(config-mlag)# peer-address 10.0.0.2
switch(config-mlag)#
```

11.3.4.1.2.4Peer Link

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries MLAG advertisements, keepalive messages, and data traffic between the switches. This information keeps the two switches working together as one. While interfaces comprising the peer links on each switch must be compatible, they need not use the same interface number. Ethernet and port-channel interfaces can be configured as peer links.

The **peer-link** command specifies the interface the switch uses to communicate MLAG control traffic.

Example

This command configures **port-channel 10** as the peer link.

```
switch(config-mlag)# peer-link port-channel 10
switch(config-mlag)#
```

11.3.4.1.2.5Domain ID

The MLAG domain ID is a unique identifier for an MLAG domain. The MLAG domain ID must be the identical on each switch to facilitate MLAG communication.

The **domain-id** command configures the MLAG domain ID.

Example

This command configures **mlagDomain** as the domain ID:

```
switch(config-mlag)# domain-id mlagDomain
switch(config-mlag)#
```

11.3.4.1.2.6Heartbeat Interval and Timeout

The heartbeat interval specifies the period between the transmission of successive keepalive messages. Each MLAG switch transmits keepalive messages and monitors message reception from its peer. The heartbeat timeout is reset when the switch receives a keepalive message. If the heartbeat timeout expires, the switch disables MLAG under the premise that the peer switch is not functioning.

The [heartbeat-interval \(MLAG\)](#) command configures the heartbeat interval between **1** and **30** seconds, with a default value of **4** seconds. The heartbeat timeout expiry is 30 seconds.

Note: On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to **10** seconds.

Example

This command configures the heartbeat interval as **2500** milliseconds (2.5 seconds).

```
switch(config-mlag)# heartbeat-interval 2500
switch(config-mlag)#
```

11.3.4.1.2.7 Reload Delay Period

The reload delay period specifies the interval that non-peer links are disabled after an MLAG peer reboots. This interval allows non-peer links to learn multicast and OSPF states and synchronize ARP caches before the ports start handling traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform.

- Fixed configuration switches: **300** seconds (five minutes).
- Trident II platform modular switches: **1200** seconds (twenty minutes).
- Sand platform fixed configuration switches (7020 and 7280 series (except 7280CR2 and 7280SR2)): **600** seconds (ten minutes).
- Sand platform modular switches: **1800** seconds (thirty minutes).

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the [reload-delay mlag](#) command.

Example

This command configures the reload delay interval as **2.5** minutes (**150** seconds).

```
switch(config-mlag)# reload-delay 150
switch(config-mlag)#
```

11.3.4.1.2.8 Shutdown

The [shutdown \(MLAG\)](#) command disables MLAG operations without disrupting the MLAG configuration. The **no mlag configuration** command (global configuration mode) disables MLAG and removes the MLAG configuration. The **no shutdown** command resumes MLAG activity.

Examples

- This command disables MLAG activity on the switch.

```
switch(config-mlag)# shutdown
switch(config-mlag)#
```

- This command resumes MLAG activity on the switch.

```
switch(config-mlag)# no shutdown
switch(config-mlag)#
```

11.3.4.1.3 Configuring MLAG Peer Gateway

In an MLAG setup, routing on a MLAG peer switch is possible using its own bridge system MAC, VARP MAC, or VRRP MAC. On a peer receiving an IP packet with destination MAC set to one of these MACs, a packet gets routed if its hardware has enough information to route the packet. Configuring sending traffic to a cached MAC involves routing the session table and MLAG peer traffic if packets are received with the MAC peer.

Examples

- This command enables the MLAG peer gateway.

```
switch(config)# ip virtual-router mac-address mlag-peer
switch1(config)#
```

- This command disables the MLAG peer gateway.

```
switch(config)# no ip virtual-router mac-address mlag-peer
switch1(config)#
```

11.3.4.1.4 Configuring Ingress Replication to LAGs

Hardware support for ingress replication to LAGs is enabled by default when the user configures ingress replication. When multicast traffic is sent over the LAG, the hardware uses its built-in algorithm, based on the L2/L3/L4 headers, to load balance traffic over ports in the LAG. When a port goes down in a LAG, the hardware quickly hashes the multicast traffic over the remaining ports in the LAG, resulting in fewer drops than software based LAG support.

Examples

- This command enables ingress replication.

```
switch(config)# platform sand multicast replication default ingress
switch1(config)#
```

- This command configures the maximum members (within a range of **1** through **64**) for ingress only replication in a multicast group.

```
switch(config)# platform sand multicast replication ingress maximum 32
switch1(config)#
```

11.3.4.2 Configuring MLAG Services

An MLAG is a pair of links that originate on a network attached device and terminate on the two MLAG peer switches. The MLAG switches coordinate traffic to the device through a common [mlag \(port-channel interface configuration\)](#) command on the interfaces that connect to the device.

The MLAG ID differs from the MLAG domain ID. The MLAG domain ID is assigned globally per switch in MLAG configuration mode, and the same MLAG domain ID must be on both switches.

Port channels configured as an MLAG must have identical port channel numbers. Although the MLAG ID is a distinct parameter from the port channel number, best practices recommend assigning the MLAG ID to match the port channel number.

Note: Arista recommends configuring the downstream switch or router connected to the MLAG peers to negotiate a LAG using LACP rather than configuring static LAGs. (On Arista switches, LACP is enabled using the command **channel-group mode active**. See [Port Channels and LACP](#).) Using LAGs negotiated by LACP can help avoid problems caused by miscabling because LACP PDUs

include the system ID and LACP key, which identify the switch and the LAG it belongs to. If MLAG misconfig happens using a LACP LAG, some ports become inactive in the LAG which prevents it from bridging traffic erroneously. More importantly, when the MLAG state is primary on one switch and inactive on another, the peer switches are acting as two independent L2 switches rather than as one logical L2 switch. In this scenario, the downstream switch will have its LAG (logical L2 port) connected to two distinct L2 switches, which can result in spanning tree problems on the downstream switch because it will receive BPDUs with different system IDs on the same LAG. If spanning tree is not running, an L2 loop will be created between MLAG peer switches and the downstream device. Allowing LACP to negotiate the downstream LAG avoids this problem because only ports connected to a given peer become active in the LAG, and the other set of ports cannot bridge traffic.

The example below does not follow this convention to emphasize the distinct parameters. The example in [MLAG Implementation Example](#) follows the best practices convention.

Examples

- These **switch1** commands bundle Ethernet interfaces **3** and **4** in **port channel 20**, then associate that port channel with **mlag 12**.

```
switch1(config)# interface ethernet 3-4
switch1(config-if-et3-4)# channel-group 20 mode active
switch1(config-if-et3-4)# interface port-channel 20
switch1(config-if-po20)# mlag 12
switch1(config-if-po20)# exit
switch1(config)#
```

- These **switch2** commands bundle Ethernet interfaces **9** and **10** in **port channel 20**, then associate that port channel with **mlag 12**.

```
switch2(config)# interface ethernet 9-10
switch2(config-if-et9-10)# channel-group 20 mode active
switch2(config-if-et9-10)# interface port-channel 20
switch2(config-if-po20)# mlag 12
switch2(config-if-po20)# exit
switch2(config)#
```

- These commands configure the port channels that attach to the MLAG on network attached device:

```
NAD(config)# interface ethernet 1-4
NAD(config-if-Et1-4)# channel-group 1 mode active
NAD(config-if-Et1-4)# exit
NAD(config)#
```

The following figure displays the result of the interface MLAG configuration.

Figure 11-2: MLAG Interface Configuration

11.3.5 EVPN - MLAG Single-homed Hosts

Add a local VTEP to each MLAG peer for the control plane to advertise singly connected hosts directly behind a specific local VTEP-MLAG peer. Outgoing EVPN route advertisements contain nexthop and router MAC extended community when multi-VTEP MLAG mode is enabled. The following table summarizes the information. For symmetric IRB support, MLAG shared router MAC must be enabled.

Table 71: Route Advertisement

Routes	Single-homed Host	Multi-homed Host
MAC/IP routes (Type-2)	Local VTEP IP / Bridge MAC	MLAG VTEP IP / Shared MLAG Router MAC
IMET routes (Type-3)	MLAG VTEP IP	
IP Prefix routes (Type-5)	Local VTEP IP / Bridge MAC	

In multi-VTEP MLAG mode, IP prefix routes are advertised independently by each MLAG peer with its own local VTEP IP as nexthop, even when both peers are connected to that route. Additionally, egress VXLAN packets use the appropriate source IP address to match what is advertised by the EVPN control plane.

Displaying EVPN with MLAG Single-home Hosts

The following displays the nexthop address of locally generated EVPN Type-2 and Type-3 routes. The real IP address helps identify the VTEP in use. The nexthop of locally generated EVPN Type-5 routes are displayed

as "-". The shared MLAG VTEP IP is **1.1.1.1** and the local VTEP IPs of the two MLAG peers are **1.0.1.1** and **1.0.2.2**.

```

* RD: 31000:300 ip-prefix 10.1.0.0/16
    1.0.2.2 - 100 0 i
```

Configuration Considerations

- The MLAG VTEP IP advertises BUM traffic. VXLAN flooded packets may be seen on the peer-link.
- The singly connected interfaces or non-MLAG interfaces must be placed in an exclusive VLAN with an MLAG interface as a member.
- Enable the MLAG shared router MAC to support symmetric IRB.
- For an EVPN Type-5 setup, the VRF to VNI mapping must be configured on both VTEPs of the MLAG pair.
- For an EVPN Type-5 setup as well as EVPN symmetric IRB setup, the VRF to VNI mapping must be configured identically across all the VTEPs in the network. The same VRF must be mapped to the same value of VNI on all the VTEPs that participate in the EVPN network.

11.3.6 Configuring MLAG Layer 2 Subinterfaces

To configure an MLAG L2 subinterface, first configure an MLAG interface, and then add an L2 subinterface to the interface on both peers. Once configured, an MLAG subinterface automatically inherits the MLAG ID of the parent interface to generate a unique MLAG ID.

For example, if configuring Port-Channel10 as MLAG 11, then the subinterface has the MLAG ID 11.1 as an implicit configuration.

When configuring an L2 subinterface, the parent interface must be a routed port. This does not comply with MLAG protocols as the MLAG interface must not be a routed port. An interface with the parameters, **mlag 10** and **no switchport**, becomes ignored as an MLAG interface until you create L2 subinterfaces on that interface.

Example Configuration

The following commands add an MLAG L2 subinterface to **switch1** and **switch2**:

```
switch1# conf
switch1(config)# interface ethernet 3-4
switch1(config-if-et3-4)# channel-group 10 mode active
switch1(config-if-et3-4)# interface port-channel 10
switch1(config-if-po10)# mlag 10
switch1(config-if-po10)# no switchport
switch1(config-if-po10)# interface port-channel 10.1
switch1(config-if-po10.1)# encapsulation dot1q vlan 10
switch1(config-if-po10.1)# vlan id 100
switch1(config-if-po10.1)# exit
switch1(config)#
```

```
switch2# conf
switch2(config)# interface ethernet 9-10
switch2(config-if-et9-10)# channel-group 10 mode active
switch2(config-if-et9-10)# interface port-channel 10
switch2(config-if-po10)# mlag 10
switch2(config-if-po10)# no switchport
switch2(config-if-po10)# interface port-channel 10.1
switch2(config-if-po10.1)# encapsulation dot1q vlan 10
switch2(config-if-po10.1)# vlan id 100
switch2(config-if-po10.1)# exit
switch2(config)#
```

To display information about MLAG L2 subinterfaces configured on a switch, use the `show mlag subinterfaces` command:

```
switch# show mlag subinterfaces
```

MLAG	Desc	Local Sub-Interface	Local Status
10.1		Po10.1	up
10.2		Po10.2	up
10.3		Po10.3	up
10.4		Po10.4	up

If you have an MLAG interface with a routed port, but no subinterfaces configured, you may see output similar to the following:

```
switch(config)# show mlag interfaces
```

mlag	desc	state	local	remote	status
10		active-full	Po10	Po10	up/up
11		disabled-ignored	Po11	-	-
12		active-full	Po12	Po12	up/up

MLAG interface 11 has a routed port but no subinterfaces configured and returns the state **disabled-ignored**.

11.3.7 Configuring Forced Periodic ARP and NDP Refresh

To enable Forced Periodic ARP Refresh on an IPv4 network, use the following command:

```
switch(config-if-Et1)# arp aging refresh always
```

To enable Forced Periodic NDP Refresh on an IPv6 network, use the following command:

```
switch(config-if-Et1)# ipv6 nd cache refresh always
```

To disable the feature, use the following command with **no** or **default** prefix:

```
switch(config-if-Et1)# no arp aging refresh always
```

```
switch(config-if-Et1)# no ipv6 nd cache refresh always
```

11.3.8 MLAG Implementation Example

This example creates an MLAG Domain, then configures MLAG connections between the peer switches and four Network Attached Devices (NADs). The MLAG switches connect through a LAG and communicate with the NADs through MLAGs. Although the NADs can be any device that supports LACP LAGs, the devices in this example are Arista switches.

Figure 11-3: MLAG Implementation Example

11.3.8.1 Topology

Figure 25: MLAG Implementation Example displays the MLAG topology. Switch 1 and Switch 2 are MLAG peers that logically represent a single Layer 2 switch. The peer link between the switches contains the following interfaces:

- **Switch 1: ethernet 47, ethernet 48**
- **Switch 2: ethernet 23, ethernet 24**

The example configures MLAGs from the MLAG Domain to four network attached devices (NAD-1, NAD-2, NAD-3, NAD-4).

11.3.8.2 Configuring the Peer Switch Connections

To configure the switches in the described topology, perform the tasks in these sections:

- [Configuring the Peer Switch Port Channels](#)
- [Configuring the Peer Switch SVIs](#)

- [Configuring the Peer Links](#)

11.3.8.2.1 Configuring the Peer Switch Port Channels

These commands create the port channels the switches use to establish the peer link.

These commands create port channels on Switch1

```
switch1(config)# interface ethernet 47-48
switch1(config-if-et47-48)# channel-group 101 mode active
switch1(config-if-et47-48)# interface port-channel 101
switch1(config-if-po101)# switchport mode trunk
switch1(config-if-po101)# switchport trunk group peertrunk
switch1(config-if-po101)# exit
switch1(config)#
```

These commands create port channels on Switch2

```
switch2(config)# interface ethernet 23-24
switch2(config-if-et23-24)# channel-group 201 mode active
switch2(config-if-et23-24)# interface port-channel 201
switch2(config-if-po201)# switchport mode trunk
switch2(config-if-po201)# switchport trunk group peertrunk
switch2(config-if-po201)# exit
switch2(config)#
```

11.3.8.2.2 Configuring the Peer Switch SVIs

For each peer switch, these commands create an SVI and associate it to the trunk group assigned to the peer link port channel. STP is disabled on the VLAN.

These commands configure the SVI on Switch1

```
switch1(config)# vlan 4094
switch1(config-vlan-4094)# trunk group peertrunk
switch1(config-vlan-4094)# interface vlan 4094
switch1(config-if-vl4094)# ip address 172.17.0.1/30
switch1(config-if-vl4094)# no autostate
switch1(config-if-vl4094)# exit
switch1(config)# no spanning-tree vlan-id 4094
switch1(config)#
```

These commands configure the SVI on Switch2

```
switch2(config)# vlan 4094
switch2(config-vlan-4094)# trunk group trunkpeer
switch2(config-vlan-4094)# interface vlan 4094
switch2(config-if-vl4094)# ip address 172.17.0.2/30
switch2(config-if-vl4094)# no autostate
switch2(config-if-vl4094)# exit
switch2(config)# no spanning-tree vlan-id 4094
switch2(config)#
```

11.3.8.2.3 Configuring the Peer Links

These commands create the peer links on each MLAG switch.

These commands create peer links on Switch1

```
switch1(config)# mlag configuration
switch1(config-mlag)# local-interface vlan 4094
switch1(config-mlag)# peer-address 172.17.0.2
switch1(config-mlag)# peer-link port-channel 101
switch1(config-mlag)# domain-id mlag_01
switch1(config-mlag)# heartbeat-interval 2500
switch1(config-mlag)# reload-delay 150
switch1(config-mlag)# exit
switch2(config)#
```

These commands create peer links on Switch2

```
switch2(config)# mlag configuration
switch2(config-mlag)# local-interface vlan 4094
switch2(config-mlag)# peer-address 172.17.0.1
switch2(config-mlag)# peer-link port-channel 201
switch2(config-mlag)# domain-id mlag_01
switch2(config-mlag)# heartbeat-interval 2500
switch2(config-mlag)# reload-delay 150
switch2(config-mlag)# exit
switch2(config)#
```

11.3.8.3 Configuring Peer Switch MLAGs

These commands create the MLAGs that connect the MLAG domain to the network attached devices.

These commands configure MLAG 1 on Switch1

```
switch1(config)# interface ethernet 17-18
switch1(config-if-et17-18)# channel-group 1 mode active
switch1(config-if-et17-18)# interface port-channel 1
switch1(config-if-po1)# mlag 1
switch1(config-if-po1)# exit
switch1(config)#
```

These commands configure MLAG 1 on Switch2

```
switch2(config)# interface ethernet 1-2
switch2(config-if-et1-2)# channel-group 1 mode active
switch2(config-if-et1-2)# interface port-channel 1
switch2(config-if-po1)# mlag 1
switch2(config-if-po1)# exit
switch2(config)#
```

These commands configure MLAG 2 on Switch1

```
switch1(config)# interface ethernet 19-20
switch1(config-if-et19-20)# channel-group 2 mode active
switch1(config-if-et19-20)# interface port-channel 2
switch1(config-if-po2)# mlag 2
switch1(config-if-po2)# exit
switch1(config)#
```

These commands configure MLAG 2 on Switch2

```
switch2(config)# interface ethernet 3-4
switch2(config-if-et3-4)# channel-group 2 mode active
switch2(config-if-et3-4)# interface port-channel 2
switch2(config-if-po2)# mlag 2
```

```
switch2(config-if-po2) # exit
switch2(config) #
```

These commands configure MLAG 3 on Switch1

```
switch1(config) # interface ethernet 23
switch1(config-if-et23) # channel-group 3 mode active
switch1(config-if-et23) # interface port-channel 3
switch1(config-if-po3) # mlag 3
switch1(config-if-po3) # exit
switch1(config) #
```

These commands configure MLAG 3 on Switch2

```
switch2(config) # interface ethernet 7
switch2(config-if-et7) # channel-group 3 mode active
switch2(config-if-et7) # interface port-channel 3
switch2(config-if-po3) # mlag 3
switch2(config-if-po3) # exit
switch2(config) #
```

These commands configure MLAG 4 on Switch1

```
switch1(config) # interface ethernet 25
switch1(config-if-et25) # channel-group 4 mode active
switch1(config-if-et25) # interface port-channel 4
switch1(config-if-po4) # mlag 4
switch1(config-if-po4) # exit
switch1(config) #
```

These commands configure MLAG 4 on Switch2

```
switch2(config) # interface ethernet 9
switch2(config-if-et9) # channel-group 4 mode active
switch2(config-if-et9) # interface port-channel 4
switch2(config-if-po4) # mlag 4
switch2(config-if-po4) # exit
switch2(config) #
```

11.3.8.4 Configuring the Network Attached Devices

These commands create the LAGs on the Network Attached Devices that connect to the MLAG domain.

These commands configure the port channels on NAD-1

```
NAD-1(config) # interface ethernet 7-10
NAD-1(config-if-Et7-10) # channel-group 1 mode active
NAD-1(config-if-Et7-10) # exit
NAD-1(config) #
```

These commands configure the port channels on NAD-2

```
NAD-2(config) # interface ethernet 25-28
NAD-2(config-if-Et25-28) # channel-group 7 mode active
NAD-2(config-if-Et25-28) # exit
NAD-2(config) #
```

These commands configure the port channels on NAD-3

```
NAD-3(config)# interface ethernet 3-4
NAD-3(config-if-Et3-4)# channel-group 5 mode active
NAD-3(config-if-Et3-4)# exit
NAD-3(config)#
```

These commands configure the port channels on NAD-4

```
NAD-4(config)# interface ethernet 1-2
NAD-4(config-if-Et1-2)# channel-group 2 mode active
NAD-4(config-if-Et1-2)# exit
NAD-4(config)#
```

11.3.8.5 Verification

The following tasks verify the MLAG peer and connection configuration:

- [Verify the Peer Switch Connection](#)
- [Verify the MLAGs](#)
- [Verify Spanning Tree Protocol \(STP\)](#)
- [Verify the MLAG Port Channel](#)
- [Verify the VLAN Membership](#)

11.3.8.5.1 Verify the Peer Switch Connection

To display the MLAG configuration and the MLAG status on **switch 1**, use the [show mlag](#) command:

```
switch1# show mlag
MLAG Configuration:
domain-id          :          mlag_01
local-interface    :          Vlan4094
peer-address       :          172.17.0.2
peer-link          :          Port-Channel101

MLAG Status:
state              :          Active
peer-link status   :          Up
local-int status   :          Up
system-id          :          02:1c:FF:00:15:38

MLAG Ports:
Disabled           :          0
Configured         :          0
Inactive           :          0
Active-partial     :          0
Active-full        :          4
```

To display the MLAG configuration and the MLAG status on **switch 2**, use the [show mlag](#) command:

```
switch2# show mlag
MLAG Configuration:
domain-id          :          mlag_01
local-interface    :          Vlan4094
peer-address       :          172.17.0.1
peer-link          :          Port-Channel102

MLAG Status:
state              :          Active
peer-link status   :          Up
local-int status   :          Up
system-id          :          02:1c:FF:00:15:41

MLAG Ports:
Disabled           :          0
```

```
Configured      : 0
Inactive       : 0
Active-partial  : 0
Active-full    : 4
```

11.3.8.5.2 Verify the MLAGs

The `show mlag interfaces` command displays MLAG connections between the MLAG switches and the Network Attached Devices.

- This `show mlag interfaces` command displays MLAG connections between the MLAG peer **switch 1** and the network attached devices:

```
switch1# show mlag interfaces
```

mlag	desc	state	local	remote	local/remote status
1	sw1.po1	active-full	Po1	Po1	up/up
2	sw1.po2	active-full	Po2	Po2	up/up
3	sw1.po3	active-full	Po3	Po3	up/up
4	sw1.po4	active-full	Po4	Po4	up/up

- The following `show mlag interfaces` command, with the **detail** option, displays MLAG connections between the MLAG peer **switch 1** and the network attached devices.

```
switch2#show mlag interfaces detail
```

mlag	state	local	remote	local/remote oper	config	last change	changes
1	active-full	Po1	Po1	up/up	ena/ena	6 days, 2:08:28 ago	5
2	active-full	Po2	Po2	up/up	ena/ena	6 days, 2:08:30 ago	5
3	active-full	Po3	Po3	up/up	ena/ena	6 days, 2:08:33 ago	5
4	active-full	Po4	Po4	up/up	ena/ena	6 days, 2:08:41 ago	5 switch2#

11.3.8.5.3 Verify Spanning Tree Protocol (STP)

STP functions can be displayed from each peer switch. MLAG interfaces are displayed as a single entry. Configured interfaces on each switch that are not included in an MLAG are displayed. Local interfaces have the normal notation; remote interfaces are preceded by **P** or **Peer**.

VLAN Output 1: Assume VLAN 3903 includes MLAG 1

```
switch1# show spanning-tree vlan-id 3903
Spanning tree instance for vlan 3903
VL3903
  Spanning tree enabled protocol rapid-pvst
    Root ID    Priority    36671
              Address    001c.730c.3009
              Cost      1999 (Ext) 0 (Int)
              Port      105 (Port-Channel5)
              Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

    Bridge ID   Priority    36671 (priority 32768 sys-id-ext 3903)
              Address    021c.7300.1319
              Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec
```

Interface	Role	State	Cost	Prio.Nbr	Type
Po1	root	forwarding	1999	128.105	P2p switch1#

The output displays **mlag 1** under its local interface name (**Po1**). A peer interface is not displayed because spanning tree considers the local and remote Port Channels as a single MLAG interface.

VLAN Output 2: Assume VLAN 3908 does not include any MLAGs

```
switch1# show spanning-tree vlan-id 3908
Spanning tree instance for vlan 3908
VL3908
  Spanning tree enabled protocol rapid-pvst
  Root ID      Priority      36676
                Address      021c.7300.1319
                This bridge is the root

  Bridge ID    Priority      36676 (priority 32768 sys-id-ext 3908)
                Address      021c.7300.1319
                Hello Time 2.000 sec  Max Age 20 sec  Forward Delay 15 sec

Interface      Role          State          Cost          Prio.Nbr Type
-----
Et17           designated forwarding 2000          128.217 P2p
Et18           designated forwarding 2000          128.218 P2p
PEt17          designated forwarding 2000          128.17  P2p
PEt18          designated forwarding 2000          128.18  P2p
```

The output displays all interfaces from both switches. Each interface is explicitly displayed because they are individual units that STP must consider when selecting ports to block.

- **Et17** and **Et18** are located on the switch where the **show spanning-tree** command is issued.
- **PEt17** and **PEt18** are located on the remote switch from where the command was issued

An identical command issued on the peer switch displays similar information.

Verify the MLAG does not create topology loops (show spanning-tree blocked)

```
switch1# show spanning-tree blocked
Name          Blocked Interfaces List
-----
Number of blocked ports (segments) in the system : 0 switch1#
```

11.3.8.5.4 Verify the MLAG Port Channel

Issue the command **show port-channel** for channels **1-4** from **switch 1**:

```
switch# show port-channel 1-4
Port Channel Port-Channel1:
  Active Ports: Ethernet17      Ethernet18      PeerEthernet1 PeerEthernet2
Port Channel Port-Channel2:
  Active Ports: Ethernet19      Ethernet20      Ethernet21      Ethernet22
                  PeerEthernet3 PeerEthernet4 PeerEthernet5 PeerEthernet6
Port Channel Port-Channel3:
  Active Ports: Ethernet23      Ethernet24      PeerEthernet7 PeerEthernet8
Port Channel Port-Channel4:
  Active Ports: Ethernet25      Ethernet26      PeerEthernet9 PeerEthernet10
```

Issue the command **show port-channel load-balance fields detailed** command for **channel 1** from **switch 2**:

```
switch2# show port-channel 1 detailed
Port Channel Port-Channel1:
  Active Ports:
    Port          Time became active      Protocol      Mode
    -----
    Ethernet17    7/7/11 15:27:36         LACP         Active
    Ethernet18    7/7/11 15:27:36         LACP         Active
    PeerEthernet1 7/7/11 15:27:36         LACP         Active
    PeerEthernet2 7/7/11 15:27:36         LACP         Active
```

11.3.8.5.5 Verify the VLAN Membership

The **show vlan** command displays VLAN member ports, including MLAG ports and ports on each peer not bundled in an MLAG.

```
Switch1# show vlan 3903, 3908
VLAN  Name                               Status  Ports
-----
3903  ar.mg.rn.172.17.254.16/29             active  Cpu, Po1
3908  po.ra.ar.mg.172.17.254.64/29          active  Cpu, Et17, Et18, PEt17, PEt18
```

11.3.9 MLAG Commands

Global MLAG Commands

- [mlag configuration \(global configuration\)](#)

MLAG Interface Configuration Commands

- [mlag \(port-channel interface configuration\)](#)

MLAG Configuration Commands

- [arp aging refresh always](#)
- [domain-id](#)
- [dual-primary detection delay](#)
- [dual-primary recovery delay](#)
- [heartbeat-interval \(MLAG\)](#)
- [local-interface](#)
- [ipv6 nd cache refresh always](#)
- [peer-address](#)
- [peer-address heartbeat](#)
- [peer-link](#)
- [reload-delay mlag](#)
- [reload-delay mode](#)
- [reload-delay non-mlag](#)
- [shutdown \(MLAG\)](#)

Display Commands

- [show mlag](#)
- [show mlag interfaces](#)
- [show mlag interfaces members](#)
- [show mlag subinterfaces](#)
- [show mlag interfaces states](#)
- [show mlag issu warnings](#)

11.3.9.1 arp aging refresh always

The **arp aging refresh always** command enables the switch to send forced periodic ARP requests for an MLAG configuration in an IPv4 network. This may be necessary to prevent the VMAC from aging out on downstream switches. Using the **no** or **default** disables the feature.

Command Mode

Interface Configuration Mode

Command Syntax

```
arp aging refresh always
```

```
no arp aging refresh always
```

```
default arp aging refresh always
```

Example

Use the following command to enable Forced Periodic ARP requests on the switch:

```
switch(config-if-Et1)#arp aging refresh always
```

11.3.9.2 domain-id

The **domain-id** command specifies a name for the Multi-chassis Link AGgregation (MLAG) domain.

The **no domain-id** and **default domain-id** commands remove the MLAG domain name by deleting the **domain-id** statement from *running-config*.

Command Mode

MLAG Configuration

Command Syntax

domain-id *identifier*

no domain-id

default domain-id

Parameter

identifier alphanumeric string that names the MLAG domain.

Example

This command names the MLAG domain *mlag1*.

```
switch(config)# mlag
switch(config-mlag)# domain-id mlag1
switch(config-mlag)#
```

11.3.9.3 dual-primary detection delay

Use the **dual-primary detection delay** command to configure a dual primary detection delay with an optional action to errdisable all interfaces on secondary MLAG peer after a dual primary condition is detected.

Command Mode

MLAG configuration mode

Command Syntax

```
dual-primary detection delay seconds [action errdisable all-interfaces]
no dual-primary detection delay seconds [action errdisable all-interfaces]
default dual-primary detection delay seconds [action errdisable all-interfaces]
```

Parameters

- **seconds** Dual primary detection delay in seconds.
- **action** Specifies the action when dual-primary is detected.
- **errdisable** Errdisable interfaces.
- **all-interfaces** Disables all Ethernet interfaces except the peer-link.

Examples

- In this example, the command errdisables all physical interfaces on secondary MLAG peer when dual primary condition is detected.

```
switch(config-mlag)# dual-primary detection delay 5 action errdisable all-interfaces
```

Both MLAG peers must have equivalent configurations.

- The following command removes the Dual Primary Detection feature. You must unconfigure both MLAG peers.

```
switch(config-mlag)# no dual-primary detection
```

11.3.9.4 dual-primary recovery delay

Use the **dual-primary recovery delay** command to configure dual-primary detection recovery-delay for MLAG interfaces and non-MLAG interfaces. Negating the configurations or configuring default values makes both recovery delay values reset back to **0**. The non-MLAG delay must always be less than the MLAG delay so you have more time for L3 convergence before enabling MLAG interfaces.

Command Mode

MLAG configuration mode

Command Syntax

```
dual-primary recovery delay mlag seconds non-mlag seconds
```

```
no dual-primary recovery delay mlag seconds non-mlag seconds
```

```
default dual-primary recovery delay mlag seconds non-mlag seconds
```

Parameters

- **mlag *seconds*** Delay in seconds after dual-primary detection resolves until non peer-link ports that are part of an MLAG are enabled. Range **0 - 1000** seconds. A suggested value for MLAG is **60** seconds. These values can be adjusted depending on the network scale.
- **non-mlag *seconds*** Delay in seconds after dual-primary detection resolves until ports that are not part of an MLAG are enabled. Range **0 - 1000** seconds. A suggested value for non-MLAG is **0** seconds. These values can be adjusted depending on the network scale.

Example

```
switch(config)# mlag
switch(config-mlag)# dual-primary recovery delay mlag 60 non-mlag 0
```

11.3.9.5 heartbeat-interval (MLAG)

The **heartbeat-interval** command configures the interval at which heartbeat messages are issued in a Multi-chassis Link AGgregation (MLAG) configuration.

The **no heartbeat-interval** and **default heartbeat-interval** commands revert the heartbeat interval to the default setting by removing the **heartbeat-interval** command from *running-config*.

Command Mode

MLAG Configuration

Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

Parameters

period Interval duration in milliseconds. Value ranges from **1000** through **30000** milliseconds. Default interval is **4000** milliseconds.

Guidelines

Heartbeat messages flow independently in both directions between the MLAG peers. If a peer stops receiving heartbeat messages within the expected time frame (**30** seconds), the other peer can assume it no longer functions and without intervention or repair, the MLAG becomes disabled. Both switches revert to their independent state.

Note: On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to **10** seconds.

Example

This command configures the heartbeat interval to **15000** milliseconds:

```
switch(config)# mlag
switch(config-mlag)# heartbeat-interval 15000
switch(config-mlag)#
```

11.3.9.6 ipv6 nd cache refresh always

The **ipv6 nd cache refresh always** command enables the switch to send forced periodic ARP requests for an MLAG configuration in an IPv6 network. This may be necessary to prevent the VMAC from aging out on downstream switches. Using the **no** or **default** disables the feature.

Command Mode

Interface Configuration Mode

Command Syntax

```
ipv6 nd cache refresh always
no ipv6 nd cache refresh always
default ipv6 nd cache refresh always
```

Example

Use the following command to enable Forced Periodic ARP requests on the switch:

```
switch(config-if-Et1)# ipv6 nd cache refresh always
```

11.3.9.7 local-interface

The **local-interface** command assigns a VLAN interface for use in Multi-chassis Link AGgregation (MLAG) configurations. The VLAN interface is used for both directions of communication between the MLAG peers.

The **no local-interface** and **default local-interface** commands delete the VLAN interface assignment by removing the **local-interface** command from **running-config**.

Command Mode

MLAG Configuration

Command Syntax

```
local-interface vlan vlan_number
no local-interface
default local-interface
```

Parameter

vlan_number VLAN number, in the range from **1** through **4094**.

Guidelines

When configuring the local interface, the VLAN interface must exist already. To configure a VLAN interface, issue the command **interface vlan**.

Example

This command assigns **VLAN 4094** as the local interface.

```
switch(config)# mlag
switch(config-mlag)# local-interface vlan 4094
switch(config-mlag)#
```

11.3.9.8 mlag (port-channel interface configuration)

The **mlag** command assigns an MLAG ID to a port-channel. MLAG peer switches form an MLAG when each switch configures the same MLAG ID to a port-channel interface. Only one MLAG ID can be assigned to an interface. An individual MLAG number cannot be assigned to more than one interface.

The **no mlag** and **default mlag** commands remove the MLAG ID assignment from the configuration mode interface by deleting the corresponding **mlag** command from *running-config*.

Command Mode

Interface-Port Channel Configuration

Command Syntax

```
mlag number  
no mlag  
default mlag
```

Parameter

number Number used as MLAG ID. Value ranges from **1** to **2000**.

Example

These commands configures a port channel and assigns it **mlag 4**.

```
switch(config)# interface ethernet 5-10  
switch(config-if-Et5-10)# channel-group 1 mode active  
switch(config-if-Et5-10)# interface port-channel 4  
switch(config-if-Po4)# switchport trunk group group4  
switch(config-if-Po4)# mlag 4  
switch(config-if-Po4)# exit  
switch(config)#
```

11.3.9.9 peer-address

The **peer-address** command specifies the peer IPv4 address for a Multi-chassis Link AGgregation (MLAG) domain. MLAG control traffic, including keepalive messages, is sent to the peer IPv4 address. If the peer IPv4 address is unreachable, then MLAG peering fails and both peer switches revert to their independent state.

The **no peer-address** and **default peer-address** commands remove the MLAG peer's IPv4 address assignment by deleting the peer-address command from *running-config*.

Command Mode

MLAG Configuration

Command Syntax

```
peer-address ipv4_addr
```

```
no peer-address
```

```
default peer-address
```

Parameter

ipv4_addr MLAG peer IPv4 address.

Example

These commands configure the MLAG peer address.

```
switch(config)# mlag
switch(config-mlag)# peer-address 10.0.0.2
switch(config-mlag)#
```

11.3.9.10 peer-address heartbeat

The **peer-address heartbeat** command causes the MLAG agent to start using **Peer-IP** address in the given VRF for UDP-based heartbeat control messages.

To enable MLAG dual primary detection feature, the command must be configured on both MLAG peers in the MLAG configuration mode.

Note: The command supports both IPv4 and IPv6 addresses.

Command Mode

MLAG configuration mode

Command Syntax

```
peer-address heartbeat [Peer-IPv4 | Peer-IPv6] [vrf vrf_name]
```

```
no peer-address heartbeat [Peer-IPv4 | Peer-IPv6] [vrf vrf_name]
```

```
default peer-address heartbeat [Peer-IPv4 | Peer-IPv6] [vrf vrf_name]
```

Parameters

- **Peer-IP** The Management IP address of the MLAG peer reachable in the VRF **VRF-NAME** (or default VRF if there is no VRF configured).
- **vrf vrf_name** Named VRF.

Examples

- ```
switch(config)# mlag
switch(config-mlag)# peer-address heartbeat 172.30.118.190
```

- This example removes the feature.

```
switch(config-mlag)# no peer-address heartbeat
```

### 11.3.9.11 peer-link

The **peer-link** command specifies the interface that connects Multi-chassis Link AGgregation (MLAG) peers. To form an MLAG, two switches are connected through an interface called a peer link. The peer link carries control and data traffic between the two switches. Control traffic includes MLAG-related advertisements and keepalive messages. This information keeps the two switches working as one.

The **no peer-link** and **default peer-link** command remove the peer link by deleting the **peer-link** command from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
peer-link INT_NAME
no peer-link
default peer-link
```

#### Parameters

**INT\_NAME** denotes the interface type and number of the interface. Values include:

- **ethernet e\_num** Ethernet interface range specified by **e\_num**.
- **port-channel p\_num** Channel group interface range specified by **p\_num**.

#### Example

These commands creates a peer link.

```
switch(config)# mlag configuration
switch(config-mlag)# peer-link port-channel 10
switch(config-mlag)
```

---

### 11.3.9.12 mlag configuration (global configuration)

The **mlag configuration** command enters MLAG configuration mode to configure Multi-chassis Link Aggregation (MLAG) features. MLAG configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no mlag configuration** and **default mlag configuration** commands remove all MLAG configuration commands from **running-config**.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
mlag configuration
```

```
no mlag configuration
```

```
default mlag configuration
```

**mlag** and **mlag configuration** are identical commands.

#### Guidelines

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries control and data traffic between the switches, including advertisements and keepalive messages. This information coordinates the switches. Functioning peers are in the **active** state.

Each peer switch uses IP-level connectivity between their local addresses and the MLAG peer IP address to form and maintain the peer link.

#### Commands Available in MLAG Configuration Mode

- [domain-id](#)
- [heartbeat-interval \(MLAG\)](#)
- [local-interface](#)
- [peer-address](#)
- [peer-link](#)
- [reload-delay mlag](#)
- [shutdown \(MLAG\)](#)

#### Example

These commands enter MLAG configuration mode and configure MLAG parameters:

```
switch(config)# mlag
switch(config-mlag)# local-interface vlan 4094
switch(config-mlag)# peer-address 10.0.0.2
switch(config-mlag)# peer-link port-channel 10
switch(config-mlag)# domain-id mlagDomain
switch(config-mlag)# heartbeat-interval 2500
switch(config-mlag)# reload-delay 2000
switch(config-mlag)# exit
switch(config)#
```

### 11.3.9.13 reload-delay mlag

The **reload-delay mlag** command configures the reload delay period for MLAG links. The command also specifies the reload delay period for non-MLAG links when the **reload-delay non-mlag** command is not configured.

Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches: 300** seconds
- **Trident II modular switches: 1200** seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches: 600** seconds
  - 7280 series (except 7280CR2 and 7280SR2)
  - 7020 series
- **Sand platform modular switches: 1800** seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S
- **Sand Jericho+ fixed configuration switches: 900** seconds
  - 7280CR2 series
  - 7280SR2 series

The **no reload-delay mlag** and **default reload-delay mlag** commands restore the default value by deleting the **reload-delay mlag** statement from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
reload-delay [mlag] PERIOD
```

```
no reload-delay [mlag]
```

```
default reload-delay [mlag]
```

#### Parameters

- **PERIOD** Period that non-peer links are disabled after an MLAG peer reboots. Options include:
  - **infinity** link is not enabled after reboot.
  - **0 to 86400** disabled link interval (seconds). Default varies by switch platform as described above.

#### Guidelines

The **reload-delay** and **reload-delay mlag** commands are equivalent.

#### Example

---

These commands configure the reload-delay interval to **15** minutes.

```
switch(config)# mlag configuration
switch(config-mlag)# reload-delay mlag 900
switch(config-mlag)#
```

### 11.3.9.14 reload-delay mode

The **reload-delay mode** command specifies the state of LACP LAG ports during the MLAG reload delay period. By default, MLAG ports remain in the errdisabled state during reload delay. This command configures MLAG ports to come up to standby mode before the expiration of the reload delay period.

The **no reload-delay mode** and **default reload-delay mode** commands restore the default behavior of MLAG ports by deleting the **reload-delay mode** statement from *running-config*. The default behavior is for the MLAG ports to remain in the errdisabled state until the expiration of the reload delay period.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
reload-delay mode lacp standby
no reload-delay mode
default reload-delay mode
```

#### Related Commands

**reload-delay mlag** configures the MLAG reload delay period.

#### Example

These commands configure the MLAG port to come up to standby state before the end of the reload delay period.

```
switch(config)# mlag configuration
switch(config-mlag)# reload-delay mode lacp standby
switch(config-mlag)#
```

---

### 11.3.9.15 reload-delay non-mlag

The **reload-delay non-mlag** command specifies the period that non-MLAG links are disabled after an MLAG peer reboots. This interval allows non peer links to learn multicast and OSPF states before the ports start handling traffic. The recommended minimum value required to ensure the forwarding hardware is initialized with the topology state depends on the switch platform:

- Fixed configuration switches: **300** seconds (five minutes.)
- Sand platform fixed configuration switches (7020 and 7280 series (except 7280CR2 and 7280SR2)): **600** seconds (ten minutes.)
- Modular switches: **1200** seconds (twenty minutes.)

When the **reload-delay non-mlag** command is not configured, the **reload-delay mlag** command specifies the reload delay time for non-MLAG and MLAG links.

The **no reload-delay non-mlag** and **default reload-delay non-mlag** command restores the default behavior by deleting the **reload-delay non-mlag** statement from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
reload-delay non-mlag PERIOD
no reload-delay non-mlag
default reload-delay non-mlag
```

#### Parameters

**PERIOD** Period that non-MLAG links are disabled after an MLAG peer reboots. Options include:

- **infinity** links are not enabled after reboot.
- **0 to 86400** disabled link interval (seconds). Values range from **0** to **86400** (24 hours).

#### Example

These commands configure the reload-delay interval of non-MLAG links to **20** minutes.

```
switch(config)# mlag configuration
switch(config-mlag)# reload-delay non-mlag 1200
switch(config-mlag)#
```

### 11.3.9.16 show mlag interfaces members

The **show mlag interfaces members** command displays information about the Multi-chassis Link Aggregation (MLAG) members on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

**show mlag interfaces members**

#### Example

This command displays the MLAG interface members.

```
switch# show mlag interface members
Mlag4 is Port-Channel4
 Active Ports: Ethernet3 PeerEthernet3
Mlag5 is Port-Channel5
 Active Ports: Ethernet14
Mlag7 is Port-Channel7
 Active Ports: Ethernet5 PeerEthernet5
Mlag8 is Port-Channel8
 Active Ports: Ethernet10 PeerEthernet10
Mlag9 is Port-Channel9
 Active Ports: Ethernet15 Ethernet21 PeerEthernet19 PeerEthernet20
Mlag10 is Port-Channel10
 Active Ports: Ethernet19 Ethernet20 PeerEthernet21 PeerEthernet22 switch#
```

### 11.3.9.17 show mlag interfaces states

The **show mlag interfaces states** command displays information about the Multi-chassis Link AGgregation (MLAG) states on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag interfaces [MLAGS] states [STATE_NAMES][INFO_LEVEL]
```

#### Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - **no parameter** command displays data for all MLAGs.
  - **mlag\_id** specifies MLAG for which command displays data. Value ranges from **1** to **2000**.
- **STATE\_NAMES** MLAG channels for which command displays data. Parameter may specify more than one name, which can be listed in any order. Valid state names include:
  - **active-full** includes active-full interfaces.
  - **active-partial** includes active-partial interfaces.
  - **configured** includes configured interfaces.
  - **disabled** includes disabled interfaces.
  - **inactive** includes inactive interfaces.
- **INFO\_LEVEL** specifies information displayed by command. Options include:
  - **no parameter** command displays basic MLAG interface parameters.
  - **detail** command displays detailed MLAG interface state parameters.

#### Example

This command displays the MLAG interface states that are active-full.

```
switch# show mlag interfaces states active-full
```

| mlag | desc             | state       | local | remote | local/remote<br>status |
|------|------------------|-------------|-------|--------|------------------------|
| 4    | b.po1            | active-full | Po4   | Po4    | up/up                  |
| 7    | ar.mg.au.po1     | active-full | Po7   | Po7    | up/up                  |
| 8    | co.po1           | active-full | Po8   | Po8    | up/up                  |
| 9    | k.po5            | active-full | Po9   | Po9    | up/up                  |
| 10   | ar.mg.pt.ir.po10 | active-full | Po10  | Po10   | up/up switch#          |

### 11.3.9.18 show mlag interfaces

The **show mlag interfaces** command displays information about the Multi-chassis Link AGgregation (MLAG) configuration on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag interfaces [MLAGS][INFO_LEVEL]
```

#### Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - **no parameter** command displays data for all MLAGs.
  - **mlag\_id** specifies MLAG for which command displays data. Value ranges from **1** to **2000**.
- **INFO\_LEVEL** specifies information displayed by command. Options include:
  - **no parameter** command displays basic MLAG interface parameters.
  - **detail** command displays detailed MLAG interface parameters.

#### Example

This command displays output from the **show mlag interfaces detail** command:

```
switch> show mlag interfaces detail
```

| mlag | state       | local | remote | local/remote |         | last change |             | changes |
|------|-------------|-------|--------|--------------|---------|-------------|-------------|---------|
|      |             |       |        | oper         | config  |             |             |         |
| 4    | active-full | Po4   | Po4    | up/up        | ena/ena | 6 days,     | 1:19:26 ago | 5       |
| 5    | active-full | Po5   | Po5    | up/up        | ena/ena | 6 days,     | 1:19:24 ago | 5       |
| 6    | active-full | Po6   | Po6    | up/up        | ena/ena | 6 days,     | 1:19:23 ago | 5       |
| 7    | active-full | Po7   | Po7    | up/up        | ena/ena | 6 days,     | 1:19:23 ago | 5       |

---

### 11.3.9.19 show mlag issu warnings

The **show mlag issu warnings** command displays a warning message regarding the backward-compatibility of this feature before you upgrade.

#### Command Mode

EXEC

#### Command Syntax

**show mlag issu warnings**

#### Example

This command displays the MLAG backward-compatibility warning message. Refer to the [MLAG ISSU Compatibility Matrix](#) for details about upgrading the configuration.

```
switch# show mlag issu warnings
Please use the MLAG ISSU Compatibility Check tool at https://www.arista.com/en/support/mlag-portal
to verify ISSU compatibility.
If you are performing an upgrade, and the Release Notes for the new version of EOS indicate that
 MLAG is not backwards-compatible
with the currently installed version (4.28.8.1M), the upgrade will result in packet loss.

Stp is not restartable. Topology changes will occur during the upgrade
process.

switch#
```

### 11.3.9.20 show mlag subinterfaces

The **show mlag subinterfaces** command displays information about MLAG Layer 2 subinterfaces configured on a switch.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag subinterfaces
```

#### Parameters

**1\_2048** - Specify the MLAG interface ID.

#### Example

To display information about MLAG L2 subinterfaces configured on a switch, use the **show mlag subinterfaces** command:

```
switch# show mlag subinterfaces
```

| MLAG | Desc | Local Sub-Interface | Local Status |
|------|------|---------------------|--------------|
| 10.1 |      | Po20.1              | up           |
| 10.2 |      | Po20.2              | up           |
| 10.3 |      | Po20.3              | up           |
| 11.1 |      | Po11.1              | up           |

---

### 11.3.9.21 show mlag

The **show mlag** command displays information about the Multi-chassis Link AGgregation (MLAG) configuration on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

**show mlag** [INFO\_LEVEL]

#### Parameters

**INFO\_LEVEL** specifies information displayed by command. Options include:

- **no parameter** command displays MLAG configuration, status, and ports.
- **detail** command displays MLAG configuration, status, ports, and detailed status.

#### Example

This command displays output from the **show mlag** command:

```
switch> show mlag
MLAG Configuration:
domain-id : ar.mg.mlag
local-interface : Vlan3901
peer-address : 172.17.254.2
peer-link : Port-Channell

MLAG Status:
state : Active
peer-link status : Up
local-int status : Up
system-id : 02:1c:73:00:13:19

MLAG Ports:
Disabled : 0
Configured : 0
Inactive : 0
Active-partial : 0
Active-full : 5 switch>
```

### 11.3.9.22 shutdown (MLAG)

The **shutdown** command disables MLAG on the switch without modifying the MLAG configuration.

The **no shutdown** and **default shutdown** commands re-enable MLAG by removing the **shutdown** command from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Example

These commands disable MLAG on the switch.

```
switch(config)# mlag configuration
switch(config-mlag)# shutdown
switch(config-mlag)#
```

---

## 11.4 Data Transfer

Arista switches support the transfer of packets (network layer) and frames (data link layer). This chapter describes concepts and processes that are referenced by routing and switching protocols that Arista switches support.

Sections in this chapter include:

- [Data Transfer Introduction](#)
- [Data Transfer Methods](#)
- [MAC Address Table](#)
- [Configuring Ports](#)
- [Monitoring Links](#)
- [PHY test pattern CLI](#)
- [Data Transfer Commands](#)

### 11.4.1 Data Transfer Introduction

Arista switches transfer data through switching, routing, and Layer 3 switching. This chapter provides an introduction to these transfer methods.

Data structures and processes that support data transfer methods and referenced in specific protocol chapters are also described, including:

- routed ports
- switched ports
- MAC address table
- port mirroring
- storm control
- loopback interfaces
- route redistribution
- null0 interfaces
- MTUs

### 11.4.2 Data Transfer Methods

This section describes these data transfer methods:

- [Switching and Bridging](#)
- [Routing](#)
- [Layer 3 Switching](#)

#### 11.4.2.1 Switching and Bridging

Switching and bridging operations transmit data link layer frames between devices within a single subnet. Each port is assigned a 48 bit Media Access Control (MAC) address. Frames arriving at a hub are bridged, or sent to all other ports on the subnet. Switches can associate ports with their MAC addresses, obviating the need to flood the subnet when sending a frame.

Subnets in the switch are defined by VLANs. A Virtual Local Area Network (VLAN) is a group of devices that are configured to communicate as if they are attached to the same network regardless of their physical location. **VLANs** describes VLANs.

Four MAC address types identify the scope of LAN interfaces that an address represents:

- **unicast:** represents a single interface.
- **broadcast:** represents all interfaces.
- **multicast:** represents a subset of all interfaces.
- **reserved:** assigned to nodes that have no configured MAC address.

The Individual/Group (I/G) bit distinguishes unicast MAC addresses from multicast addresses. As shown in [Figure 26: MAC Address Format](#), the I/G bit is the least significant bit of the most significant byte in a MAC address.

#### 11.4.2.1.1 MAC Address Format

Figure 11-4: MAC Address Format

- Unicast address: the I/G bit is **0**: **1234.1111.1111** is a unicast MAC address (the most significant byte is an even number).
  - Reserved address: all bits set to **0 (0000.0000.0000)**.
- Multicast address: the I/G bit is **1**: **1134.1111.1111** is a multicast MAC address (the most significant byte is an odd number).
- Broadcast address: all bits set to **1 (FFFF.FFFF.FFFF)**.

#### Examples

- The following are unicast MAC addresses:

```
0200.0000.0000
1400.0000.0000
```

- The following are multicast MAC addresses:

```
0300.0000.0000
2500.0000.0000
```

The following sections describe MAC address functions and data structures:

- [Assigning a MAC Address to an Interface](#)
- [MAC Address Table](#)

---

#### 11.4.2.2 Routing

Routing transmits network layer packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. Connected subnets have IP address ranges that do not overlap. A router connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are internet layer protocols that facilitate packet-switched networking, including transmissions across multiple networks.

These chapters describe available IP features:

- [IPv4](#)
- [IPv6](#)

##### 11.4.2.2.1 Static Routing

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate.

Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as **connected** routes that are available for redistribution into routing domains defined by dynamic routing protocols.

These sections describe static route configuration commands:

- [IPv4 Address Configuration](#)
- [Configuring Default and Static IPv6 Routes](#)

##### 11.4.2.2.2 Dynamic Routing

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic routing protocols:

- [Open Shortest Path First – Version 2](#)
- [Open Shortest Path First – Version 3](#)
- [Border Gateway Protocol \(BGP\)](#)
- [Routing Information Protocol](#)
- [IS-IS](#)

##### 11.4.2.3 Layer 3 Switching

Layer 3 switches establish data paths through routing processes (Layer 3) and transfer data as a switch (Layer 2) through speed-optimized hardware. Layer 3 switches use a control plane (routing) and data plane (switching) to manage these processes.

###### 11.4.2.3.1 Control plane

The control plane builds and maintains the IP routing table, which identifies IP packet routes in terms of destination addresses. The routing table defines a route by its next hop address and the egress interface that accesses the next hop.

The control plane derives routing information from three sources:

- Status of physical and virtual interfaces on the switch.

- Static routes entered through the CLI.
- Routes established through dynamic routing protocols.

### Applying an ACL to the Control Plane

The control plane supports routing and management functions, handling packets that are addressed to the switch without regard to any switch interface.

To apply an IP ACL to the control plane, enter `ip access-group (Control Plane mode)` in control-plane mode. The `system control-plane` command places the switch in control-plane mode.

ACLs and Route Maps describes access control lists.

### Example

These commands place the switch in control-plane mode and assigns **CP-Test1** to the control plane.

```
switch(config)# system control-plane
switch(config-system-cp)# ip access-group CP-Test1 in
switch(config-system-cp)#
```

#### 11.4.2.3.2 Data plane

The data plane routes IP packets based on information derived by the control plane. Each packet's path includes Layer 2 addresses that reach its next hop destination. The data plane also performs other operations required by IP routing, such as recalculating IP header checksums and decrementing the Time-To-Live (TTL) field.

Arista data planes support these packet forwarding modes:

- **Store and forward:** the switch accumulates entire packets before forwarding them.
- **Cut through:** the switch begins forwarding frames before their reception is complete.

Cut through mode reduces switch latency at the risk of decreased reliability. Packet transmissions can begin immediately after the destination address is processed. Corrupted frames may be forwarded because packet transmissions begin before CRC bytes are received.

Packet forwarding mode availability varies by switch platform:

- **Arad:** store and forward mode only.
- **FM6000:** both modes are available.
- **Petra:** store and forward mode only.
- **Trident:** both modes are available.
- **Trident II:** both modes are available.

The data plane is also referred to as the forwarding plane.

### Data Plane Forwarding Mode Configuration

The `switch forwarding-mode` command specifies the forwarding mode of the switch's data plane. This command is available on Trident, Trident II, and FM6000 platform switches. The forwarding mode is **store-and-forward** on Arad and Petra platform switches.

### Examples

- This command changes the forwarding mode to **store-and-forward**.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)#
```

- The [show switch forwarding-mode](#) command displays the switch's forwarding mode.

```
switch(config)# show switch forwarding-mode
Current switching mode: store and forward
Available switching modes: cut through, store and forward
```

### 11.4.3 MAC Address Table

The switch maintains a MAC address table for switching frames efficiently between ports. The MAC address table contains static and dynamic MAC addresses.

- Static MAC addresses are entered into the table through a CLI command.
- Dynamic MAC addresses are entered into the table when the switch receives a frame whose source address is not listed in the MAC address table. The switch builds the table dynamically by referencing the source address of frames it receives.

#### 11.4.3.1 MAC Address Table Configuration

These sections describe MAC address table configuration tasks.

- [Static MAC Address Table Entries](#)
- [Dynamic MAC Address Table Entries](#)

##### 11.4.3.1.1 Static MAC Address Table Entries

The MAC address table accepts static MAC addresses, including multicast entries. Each table entry references a MAC address, a VLAN, and a list of Layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The [mac address-table static](#) command adds a static entry to the MAC address table.

#### Examples

- This command adds a static entry for unicast MAC address **0012.3694.03ec** to the MAC address table.

```
switch(config)# mac address-table static 0012.3694.03ec vlan 3 interface
Ethernet
7
switch(config)# show mac address-table static
Mac Address Table

Vlan Mac Address Type Ports Moves Last Move

switch(config)#

```

- This command adds the static entry for the multicast MAC address **0112.3057.8423** to the MAC address table.

```

switch(config)# mac address-table static 0112.3057.8423 vlan 4 interface
port-channel 10 port-channel 12
switch(config)# show mac address-table
 Mac Address Table

Total Mac Addresses for this criterion: 1
switch(config)#

```

#### 11.4.3.1.2 Dynamic MAC Address Table Entries

##### Learning Mode

The switch maintains a MAC address table for switching frames efficiently between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The [switchport mac address learning](#) command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

##### Example

These commands disables MAC address learning for **interface ethernet 8**, then displays the active configuration for the interface.

```

switch(config)# interface ethernet 8
switch(config-if-Et8)# no switchport mac address learning
switch(config-if-Et8)# show active
interface Ethernet8
no switchport mac address learning
switch(config-if-Et8)#

```

##### Aging Time

Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from **10** to **1000000** seconds with a default of **300** seconds (five minutes).

---

## Example

This command sets the MAC address table aging time to two minutes (**120** seconds).

```
switch(config)# mac address-table aging-time 120
switch(config)#
```

The [mac address-table aging-time](#) command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

## Mac Moves

Secure MAC addresses is allowed to move when they appear on another interface, when configured. By default, secure MAC addresses does not move.

```
switch(config)# default switchport port-security mac address moveable
switch(config)#
```

## Persistent Port Security

When the persistent PortSec-Protect is enabled, secure MAC addresses persist across device reboots and interface flaps. These MAC addresses can still be aged or moved when configured using the commands **mac address-table aging-time** and **default switchport port-security mac address moveable**. Persistent port security is enabled by default, and can be disabled.

```
switch(config)# default switchport port-security persistence disabled
```

## Example

**show port-security** command displays the settings for the new global port security configurations, including MAC aging, MAC moves, and persistent port security.

```
switch(config)# show port-security
Secure address moves: disabled
Secure address aging: disabled
Secure address reboot persistence: enabled
Secure address link down persistence: enabled
Secure Port MaxSecureAddr CurrentAddr SecurityViolation Security Action
 (Count) (Count) (Count)

Total Addresses in System: 0
```

## Clearing Dynamic Addresses

The [clear mac address-table dynamic](#) command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and Layer 2 (Ethernet or port channel) interface.

## Example

This command clears all dynamic mac address table entries for **port channel 5** on **VLAN 34**.

```
switch(config)# clear mac address-table dynamic vlan 34 interface port-channel 5
switch(config)
```

### 11.4.3.2 Displaying the MAC Address Table

The `show mac address-table` command displays the specified MAC address table entries.

#### Example

This command displays the MAC address table.

```
switch# show mac address-table
 Mac Address Table

```

### 11.4.3.3 MAC Address Learning Per-VLAN

MAC address learning per-VLAN enables or disables MAC address learning per-VLAN instead of per-port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is disabled, the entry is not added to the table.

#### 11.4.3.3.1 MAC Address Learning Configuration

The `mac address learning` command enables MAC address learning on a VLAN interface. By default, MAC address learning on a VLAN is enabled.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

---

To disable MAC learning on a particular VLAN, use `no mac address learning` command on a VLAN configuration.

### Examples

- These commands enable MAC address learning on **vlan 10** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# mac address learning
```

- These commands disable MAC address learning on **vlan 10** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# no mac address learning
```

## 11.4.4 Configuring Ports

This section describes these port properties:

- [Port Mirroring](#)
- [Storm Control](#)
- [Switched and Routed Ports](#)
- [Loopback Interfaces](#)
- [MAC Security](#)
- [Null0 Interface](#)
- [Maximum Transmission Units \(MTU\)](#)

### 11.4.4.1 Port Mirroring

Port mirroring, also known as port monitoring, is the duplication of traffic from a collection of source ports to a destination port. A mirror session correlates a set of source ports to a destination port.

Valid mirror sources are Ethernet or port channel interfaces, including port channels which are part of an MLAG. Mirror destination ports are usually Ethernet interfaces; port channel destination ports are also supported on some platforms.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

Layer 2 control protocols do not run on destination ports. An interface cannot be in more than one mirror session and cannot simultaneously be a source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

- **Ingress Mirroring:** Packets received by a source port are duplicated, including all valid data frames and L2 control PDUs. Ports mirror data before forwarding logic is applied. Packets subsequently dropped because of forwarding decisions are mirrored.
- **Egress Mirroring:** Packets transmitted by a source port are duplicated, with these exceptions:
  - **Flooded/Multicast Packets:** Packets sent to multiple mirror ports generate one copy, except in multi-chip devices when the mirror source and destination ports are on different chips; in this case, an extra copy is generated.
  - **Dropped Packets:** Packets dropped by forwarding decisions (such as output STP state checks) on egress sources are not duplicated. Packets dropped because of congestion may be duplicated.
- **Filtered Mirroring:** Specific packets are selected for mirroring based on PERMIT and DENY configurations.

- **Mirroring to GRE Tunnel:** Mirrored packets are encapsulated with GRE protocols for transiting Layer 3 network.

VLAN tags on duplicate packets from an egress source are identical to tags on inbound source packets.

When a packet's path through the switch includes multiple mirror source ports in different mirror sessions, the traffic is duplicated once and sent to the destination of the highest numbered session.

#### 11.4.4.1.1 Port Mirroring Capacity

Port mirroring capacity varies by platform. This section describes session limits for each platform.

##### FM6000 Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (any number), Port channel interfaces (any number), CPU.
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting the number of available sessions.

Enabling each of the following features reduces the number of available sessions by one: ACL Logging, MLAG Peer Link, sFlow, VTEP Learning (VXLAN), LANZ Sampling

##### Arad Platform Switches

- **Maximum Number of Sessions:** 14.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Although the number of configured source interfaces is unlimited, the number of interfaces that can be effectively mirrored is restricted by the destination port speed.

##### Petra Platform Switches

- **Maximum Number of Sessions:** 16.
- **Session Sources:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Session Destinations:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- Egress IP ACL on destination port is not supported.

Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

##### Trident Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on destination port is supported.

---

Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

### Trident II Platform Switches

- **Maximum Number of Sessions:** 4.
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number).
- **Session Destinations:** Ethernet interfaces (one).
- Egress IP ACL on Destination Port is supported.

Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

#### 11.4.4.1.2 Configuring Mirror Ports

Mirror sessions associate a set of source ports to a destination port using the [monitor session source](#) and [monitor session destination](#) commands. An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction. On Trident and Trident II platform switches (DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series), all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device cannot process VLAN tags properly, mirroring should be configured exclusively for ingress traffic by specifying **rx** in the [monitor session source](#) command.

Filtering on TX traffic in a mirror session is not supported.

#### Example

These commands configure **interface ethernet 7** as the source port and **Ethernet interface 8** as the destination port for the **redirect\_1** mirroring session. The session mirrors ingress and egress traffic.

```
switch(config)# monitor session redirect_1 source ethernet 7
switch(config)# monitor session redirect_1 destination ethernet 8
```

The [show monitor session](#) command displays the configuration of the specified port mirroring session.

#### Example

This command shows the configuration of the **redirect\_1** mirroring session.

```
switch(config)# show monitor session
Session redirect_1

Source Ports
 Both: Et7
Destination Port: Et8
switch(config)#
```

The [monitor session ip access-group](#) command configures an ACL to filter the traffic being mirrored to the destination port.

## Example

These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session **redirect\_1**.

```
switch(config)# ip access-list allow-host
switch(config-acl-allow-host)# 10 permit ip host 192.168.11.24 host 10.0.215.23
switch(config-acl-allow-host)# 20 deny ip any any
switch(config-acl-allow-host)# exit
switch(config)# monitor session redirect_1 ip access-group allow-host
switch(config)#
```

### 11.4.4.1.3 Configuring Filtered Mirroring

Filtered mirroring allows for configuring IPv4, IPv6, and MAC access lists and then updating a monitor session with corresponding configuration changes. EOS mirrors the packets that match permit statements. EOS does not select those packets for mirroring that match deny statements.

**Note:** EOS supports all standard IPv4, IPv6, and MAC qualifiers.

On Strata series platforms, packets from a single monitor source can be mirrored in multiple sessions that use the same access-list. You can attach multiple monitor sources with various access-lists to a monitor session. Each monitor session should contain one access-list type only. Hence, IPv4, IPv6, and MAC access-lists from the same monitor source must appear in different monitor sessions.

When multiple IPv6 monitor sessions share the same monitor source, only one of the monitor sessions remains active and others are automatically inactivated. When the active monitor session is removed from the monitor source, the system automatically activates the inactive monitor sessions.

Packets matching both IP and MAC access lists behave differently on various platforms.

**Table 72: Behavior of Filtered Mirroring in Different Platforms**

| Platform Series                          | Behavior of Filtered Mirroring                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DCS-7050/7050X, DCS-7250X, and DCS-7300X | When entry packets match both IPv4 and MAC access-lists, mirrored copies are created for both IPv4 and MAC access-lists; and forwarded to configured destinations.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DCS-7280SE and DCS-7500E                 | When entry packets match both IPv4 and MAC access-lists, a mirrored copy is created only for IPv4 access-list. The behavior of filtered mirroring varies in the following ways when a packet matches an entry in both access-list types: <ul style="list-style-type: none"> <li>• Mirroring is permitted when a packet contradicts with permit and deny configurations.</li> <li>• Mirroring is denied when an entry packet matches deny configurations in both.</li> <li>• IP access-list is prioritized over MAC access-list when an entry packet matches permit configurations in both.</li> </ul> |

**Note:** User-Defined Field (UDF) qualifiers in filtered mirroring access-lists allow matching packets using arbitrary user-defined patterns.

Use the **system profile** command to enable the Mirroring ACL profile that supports matching on IPv6, MAC and UDFs.

The following table provides the matching types supported in default and Mirroring ACL profiles.

**Table 73: Supported Matching Types**

| Profiles      | IPv4 | IPv6 | MAC | UDF |
|---------------|------|------|-----|-----|
| Default       | Yes  | No   | No  | No  |
| Mirroring ACL | Yes  | Yes  | Yes | Yes |

**Note:** MAC mirroring-ACLs do not accept routed IPv4/IPv6 packets and bridged IPv6 packets.

### Examples

- These commands create an IPv4 access-list and then attach the access-list to monitor sessions.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# 10 permit tcp any any rst
switch(config-acl-acl1)# 20 permit tcp any any syn
switch(config-acl-acl1)# 30 permit tcp any any ack

switch(config)# monitor session 1 source Ethernet1 rx ip access-group acl1
switch(config)# monitor session 1 source Ethernet2 rx ip access-group acl1
switch(config)# monitor session 1 destination <destination>
```

- These commands create an IPv6 access-list and then attach the access-list to monitor sessions.

```
Arista(config)# ipv6 access-list acl2
Arista(config-ipv6-acl-acl2)# 10 permit ipv6 any any

Arista(config)# monitor session 2 source Ethernet4 rx ipv6 access-group acl2
Arista(config)# monitor session 2 destination Ethernet5
```

- These commands configure the same monitor source in multiple monitor sessions.

```
switch(config)# monitor session 1 source Ethernet1 rx ip access-group acl1
switch(config)# monitor session 1 destination <destination 1>

switch(config)# monitor session 2 source Ethernet1 rx ip access-group acl2
switch(config)# monitor session 2 destination <destination 2>
```

- This command configures access-list priorities for dictating the matching order across multiple access-lists that are attached to the same monitor source.

```
switch(config)# monitor session 1 source Ethernet1 rx ip access-group acl1 priority 1
switch(config)# monitor session 1 destination <destination 1>

switch(config)# monitor session 2 source Ethernet1 rx ip access-group acl2 priority 2
switch(config)# monitor session 2 destination <destination 2>
```

- This command enables the Mirroring ACL profile.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# system profile mirroring-acl
switch(config-hw-tcam)# show hardware tcam profile
 Configuration Status
FixedSystem mirroring-acl mirroring-acl
switch(config-hw-tcam)#
```

#### 11.4.4.1.4 Filtered Mirroring to CPU

Filtered mirroring to CPU adds a special destination to port mirroring that allows mirrored traffic to be sent to the switch supervisor. The traffic can then be monitored and analyzed locally without the need of a remote port analyzer. Filtered mirroring to CPU can also be used for debugging and troubleshooting configured to

mirror RX traffic, TX traffic or both, with up to 14 mirroring profiles used simultaneously. In addition, mirroring to CPU uses control plane protection to limit the rate of the traffic sent to the CPU.

### Examples

- These commands configure the source for normal mirroring and the destination to CPU.

```
switch(config)# monitor session mySession source ethernet 3/1 both
switch(config)# monitor session mySession destination cpu
switch(config)#
```

- These commands configure reserved bandwidth and shape rate of mirrored traffic.

```
switch(config)# policy-map type copp copp-system-policy
switch(config-pmap-control-plane-copp-system-policy)# class copp-system-mirroring
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)# bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)# shape kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#
```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```
switch(config)# show monitor session

 Session mySession

 Source Ports:

 Both : Et3/1

 Destination Ports:

 Cpu : active (mirror0)

switch(config)#
```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```
switch(config)# show policy-map type copp copp-system-policy class copp-system-mirroring

 Class-map: copp-system-mirroring (match-any)

 shape : None

 bandwidth : None

switch(config)#
```

#### 11.4.4.1.5 Configuring Filtered Mirroring to GRE Tunnel

The [monitor session source](#) and [monitor session destination](#) commands configure source and destination ports to the specified port mirroring session in a GRE tunnel.

On DCS-7010T, DCS-7050/7050X, DCS-7060X, DCS-7250X, DCS-7260X, DCS-7300X, a special GRE tunnel destination is supported to mirror ingress packets that are dropped during ASIC forwarding. This GRE destination is referred as the “forwarding-drop” destination, and the corresponding session is called as the “forwarding-drop” session.

**Note:** Forwarding-drop sessions are the sessions corresponding to forwarding-drop destinations.

**Note:** From Release **EOS 4.25.2F** onwards platforms DCS-7050X, DCS-7060X, DCS-7250X, DCS-7260X, CCS-720X started supporting the **tx** keyword, which specifies that outgoing packets should be mirrored.

## Examples

- These commands configure ingress filtered mirroring to a GRE tunnel.

```
switch(config)# monitor session abc source Ethernet1 rx ip access-group acl1
switch(config)# monitor session abc destination tunnel mode gre source 1.1.1.1
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
```

- These commands configure egress filtered mirroring to a GRE tunnel.

```
switch(config)# monitor session abc source Ethernet1 tx ip access-group acl1
switch(config)# monitor session abc destination tunnel mode gre source 2.2.2.2
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be
```

- This command configures forwarding-drop sessions.

```
switch(config)# monitor session 1 forwarding-drop destination tunnel mode gre source 1.1.1.1
destination 2.2.2.2
```

- A forwarding-drop session is configured by using the **forwarding-drop** keyword when configuring the GRE destination:

```
switch(config)# monitor session 1 source <source>
switch(config)# monitor session 1 forwarding-drop destination tunnel mode gre
source <sourceIp>
destination <destIp>
[ttl <value>]
[dscp <value>]
[protocol <value>]
[vrf <value>]
```

- A mirroring to GRE destination can be configured as follows:

```
switch(config)# monitor session 1 source <source> rx | tx
switch(config)# monitor session 1 destination tunnel mode gre
source <sourceIp>
destination <destIp>
[ttl <value>]
[dscp <value>]
[protocol <value>]
[vrf <value>]
```

The **rx** keyword specifies that incoming packets should be mirrored.

### 11.4.4.1.6 Security ACL Filtered Mirroring

Security ACL Filtered Mirroring is configured using port security ACLs.

#### Configuring Security ACL Filtered Mirroring

The following configures **interface ethernet 8** as the destination port for the **redirect\_1** mirroring session, and **interface ethernet 9** as the destination port for the **redirect\_2** mirroring session. A source port is not needed to create a mirror session. Other destination options for monitor sessions such as GRE or CPU are also configurable.

```
switch (config)# monitor session redirect_1 destination ethernet 8
switch (config)# monitor session redirect_2 destination ethernet 9
```

## Examples

### Egress IPv4 ACL

The following commands create an IPv4 access-list, and then attach the access-list to **interface ethernet 7** in the out direction with the following rules.

- matching Rule 10 will be mirrored to **interface ethernet 8**.
- matching Rule 20 will not be mirrored.
- matching Rule 30 will be mirrored to **interface ethernet 9**.
- matching Rule 40 will be dropped and not mirrored.

Specifying a mirror session in a deny rule for egress ACL has no effect.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# 10 permit ip host 10.0.0.4 any mirror session redirect_1
switch(config-acl-acl1)# 20 permit ip host 10.0.0.5 any
switch(config-acl-acl1)# 30 permit ip host 10.0.0.6 any mirror session redirect_2
switch(config-acl-acl1)# 40 deny ip any any

switch(config)# interface ethernet 7
switch(config-if-Et7)# ip access-group acl1 out
```

**Note:** Security ACL Filtered Mirroring has higher priority over standard Port Mirroring.

Using the same configuration as above with **interface ethernet 7** as the source port of **redirect\_1**, the following configuration displays the impact on packets egressing from **interface ethernet 7**.

```
switch(config)# monitor session redirect_1 source ethernet 7
```

- matching Rule 10 and Rule 20 will be mirrored to **interface ethernet 8**.
- matching Rule 30 will be mirrored to **interface ethernet 9**.
- matching Rule 40 will be dropped and not mirrored.

### Egress IPv6 ACL

The following commands create an IPv6 access-list, and then attach the access-list to **interface ethernet 7** in the egress direction.

```
switch(config)# ipv6 access-list acl1
switch(config-ipv6-acl-acl1)# 10 permit ipv6 host 10:10:10:10:10:10:10:1 any mirror session redirect1
switch(config-ipv6-acl-acl1)# 20 permit ipv6 host 10:10:10:10:10:10:10:5 any
switch(config-ipv6-acl-acl1)# 30 permit ipv6 host 10:10:10:10:10:10:10:6 any mirror session redirect2
switch(config-ipv6-acl-acl1)# 40 deny ipv6 any any

switch(config)# interface ethernet 7
switch(config-if-Et7)# ipv6 access-group acl1 out
```

**Note:** The mirroring behavior of egress IPv6 ACL is identical to egress IPv4 ACL. The egress IPv6 ACL is supported only on R3 Series and forward.

### Egress MAC ACL

The following commands create a MAC access-list, and then attach the access-list to **interface ethernet 7** in the out direction. The mirroring behavior of egress MAC ACL is identical to egress IPv4 ACL.

```
switch(config)# mac access-list acl1
switch(config-mac-acl-acl1)# 10 permit 0000.1111.4444 0000.0000.0000 any mirror session redirect_1
switch(config-mac-acl-acl1)# 20 permit 0000.1111.5555 0000.0000.0000 any
switch(config-mac-acl-acl1)# 30 permit 0000.1111.6666 0000.0000.0000 any mirror session redirect_2
switch(config-mac-acl-acl1)# 40 deny any any
```

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# mac access-group acl1 out
```

## Ingress IPv4 ACL

The following commands create an IPv4 access-list, and then attach the access-list to **interface ethernet 7** in the in direction with the following rules.

- matching Rule 10 and Rule 20 will be mirrored to **interface ethernet 8**.
- matching Rule 30 will be mirrored to **interface ethernet 9** since Security ACL Filtered Mirroring has higher priority.
- matching Rule 40 will be dropped and mirrored to **interface ethernet 8**.

```
switch(config)# ip access-list acl2
switch(config-acl-acl2)# 10 permit ip host 10.0.0.4 any mirror session redirect_1
switch(config-acl-acl2)# 20 permit ip host 10.0.0.5 any
switch(config-acl-acl2)# 30 permit ip host 10.0.0.6 any mirror session redirect_2
switch(config-acl-acl2)# 40 deny ip host 10.0.0.7 any mirror session redirect_1

switch(config)# interface ethernet 7
switch(config-if-Et7)# ip access-group acl2 in

switch(config)# monitor session redirect_1 source ethernet 7
```

**Note:** Unlike egress ACL, mirror session specified in a deny rule for ingress ACL will take effect.

The mirroring behavior of ingress IPv6 and MAC ACLs are identical to ingress IPv4 ACL.

## Limitations

- The feature is not supported in AlgoMatch mode.
- Egress Security ACL Filtered Mirroring works on IPv4 - permit rules, and MAC - permit rules.
- By default, egress MAC ACL is disabled. Egress MAC ACL is required to be enabled.
- By default, bridged traffic is not subject to Egress IP ACLs, therefore, the bridged packets will not be mirrored.
- RACL and subinterface ACL are not supported for filtering mirroring.
- If a packet is dropped by an ingress ACL and the destination is GRE, the metadata of the GRE packet cannot be computed as expected.

### 11.4.4.2 Storm Control

A traffic storm is a flood of packets entering a network, resulting in excessive traffic and degraded performance. Storm control prevents network disruptions by limiting traffic beyond specified thresholds on individual physical LAN interfaces.

Storm control monitors inbound traffic levels over one-second intervals and compares the traffic level with a specified benchmark.

Storm control has three modes:

- **Storm control broadcast:** When inbound broadcast traffic exceeds the specified threshold within a one-second control interval, broadcast traffic is dropped until the end of the interval.
- **Storm control multicast:** When inbound multicast traffic exceeds the specified threshold within a one-second control interval, multicast traffic is dropped until the end of the interval.
- **Storm control unknown-unicast:** When inbound unknown unicast traffic exceeds the specified threshold within a one-second control interval, unknown unicast traffic is dropped until the end of the interval.

Broadcast, multicast, and unknown-unicast storm control are independent features and can be enabled simultaneously.

### Storm Control Configuration

The `storm-control` command configures and enables broadcast or multicast storm control on the configuration mode interface. The command provides three mode options:

- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.
- **storm-control unknown-unicast** unknown unicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting.

When storm control is enabled, the switch monitors inbound traffic levels over one second intervals and compares the traffic level with a specified threshold. The threshold is either a percentage of the total available port bandwidth or the number of packets per second (pps) and is configurable on each interface for each transmission mode.

### Examples

- These commands enable multicast storm control on Ethernet interfaces **2** through **4** and set a threshold of **65%**. During each one second interval, the interface drops inbound multicast traffic in excess of **65%** of capacity.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et4/4/4)# storm-control multicast level 65
switch(config-if-Et4/4/4)#
```

- These commands clear multicast storm control on Ethernet interfaces **2** through **4**.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# no storm-control multicast
switch(config-if-Et2/3/4)#
```

- These commands enable broadcast storm control on Ethernet interfaces **2** through **4** and set broadcast traffic to **50%**. During each one second interval, the interface drops inbound multicast traffic in excess of **50%** of capacity.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# storm-control broadcast level 50
switch(config-if-Et2/3/4)#
```

- These commands enable unknown-unicast storm control on Ethernet interfaces **2** through **4** and set a threshold of **5000000** packets per second (PPS).

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# storm-control unknown-unicast level pps 5000000
switch(config-if-Et2/3/4)#
```

**Note:** User cannot configure a PPS setting and a percentage setting on the same interface for the same mode at the same time. They are mutually exclusive.

- These commands clear broadcast storm control on Ethernet interfaces **2** through **4**.

```
switch(config)# interface ethernet 2/3/4
switch(config-if-Et2/3/4)# no storm-control broadcast
switch(config-if-Et2/3/4)#
```

---

The [show storm-control](#) command displays the storm-control level and interface inbound packet capacity for the specified interface.

### Examples

- This command displays the storm control configuration for Ethernet ports **2** through **4**.

```
switch(config-if-Et2/3/4)# show storm-control
Port Type Level Units Rate(Mbps) Status Reason

Et2/3/4 unknown-unicast 5000000 pps 0 active
 multicast 65.0 % 5500 active
 broadcast 50.0 % 5000 active
switch(config-if-Et2/3/4)#
```

#### 11.4.4.3 Switched and Routed Ports

A switched port is an Ethernet or port channel interface that is configured as a Layer 2 interface. Switched ports bridge frames and are assigned to at least one VLAN. Switched ports are not associated with any IP addresses. By default, Ethernet and port channel interfaces are in switched port mode.

A routed port is an Ethernet or port channel interface that is configured as a Layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

Configuring an interface as a routed port is similar to creating a VLAN with spanning-tree disabled, making the port the only member of that VLAN and configuring the IP address on the switch virtual interface (SVI) associated with the VLAN.

All IP-level interface configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. If the interface is reverted to switched port mode, **running-config** maintains IP level interface configuration statements. These changes become active again if the interface is configured back to routed port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration is not propagated to the LAG from its component members.

The broadcast queue towards the CPU is shared among all interfaces of the forwarding chip. Broadcast storm on a single port adversely impacts other interfaces of the same chip by potentially dropping even low rate broadcast frames. Routed port storm control attempts to mitigate this effect by performing storm control on the broadcast frames for routed ports.

### Routed Port Configuration

The switching-routing configuration of Ethernet and port channel interfaces is specified by the [switchport](#) and **no switchport** commands. These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

The no switchport command places the configuration mode interface in **routed port** mode. Routed ports behave as Layer 3 interfaces. They do not bridge packets and are not VLAN members. An IP address can be assigned to a routed port for the direct routing of packets to and from the interface.

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from **1006** to **4094**. VLANs that are allocated internally for a routed interface cannot be directly created or configured. [Allocating Internal VLANs](#) describes VLAN allocation configuration procedures.

## Example

This command places **interface ethernet 5** in routed port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
```

## Switched Port Configuration

The switchport command places the configuration mode interface in **switched port (Layer 2)** mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments. By default, Ethernet and port channel interfaces are switched ports.

## Example

This command places **interface ethernet 5** in switched port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport
```

The switchport default mode routed command places the configuration mode interface for a switch with all ports in **switched port (Layer 3) routed** mode, changing the switch with all ports from **switchport default mode access**.

## Examples

- This command places a switch with all ports in routed mode.

```
switch(config)# switchport default mode routed
```

- This command places a switch with all ports in access mode.

```
switch(config)# switchport default mode access
```

### 11.4.4.4 Loopback Interfaces

A loopback interface is a virtual network interface implemented in software that is not tied to a specific hardware interface. Loopback interface configuration mode is used for creating loopback interfaces and modifying their operating parameters.

Internet protocols reserve specific addresses for loopback network segments:

- IPv4 designates **127/8** as loopback subnet, which includes **127.0.0.0** through **127.255.255.255**.
- IPv6 designates **::1/128** as the loopback address, which includes **0:0:0:0:0:0:0:1** (also written as **::1**).

Arista switches support the configuration of 1001 loopback interfaces, numbered from 0 to 1000.

## Loopback Interface Configuration

Loopback ports are instantiated by entering loopback interface configuration mode for the desired loopback interface number. Loopback interface configuration mode also provides access to loopback configuration commands. Previously instantiated ports are edited by entering loopback interface configuration mode for the specified interface.

The [interface loopback](#) command places the switch in loopback interface configuration mode for the specified interface, creating the specified loopback interface if it does not exist. Configuration mode can also be entered for a range of loopback interfaces, but they must all have been previously created

### Example

These commands instantiate *interface loopback 2* and assign it IP address *10.1.1.42/24*.

```
switch(config)# interface loopback 2
switch(config-if-Lo2)# ip address 10.1.1.42
switch(config-if-Lo2)# show active
interface Loopback2
 ip address 10.1.1.42/24
switch(config-if-Lo2)#
```

## 11.4.4.5 MAC Security

MAC security restricts input to a switched port by limiting the number of MAC addresses that can access the port. Ports with MAC security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. When the limit is exceeded, the port becomes errdisabled.

### Port Security Configuration

MAC address security is enabled by [switchport port-security](#). The default MAC address limit on an interface where port security is enabled is one; to change that default limit, use the [switchport port-security mac-address maximum](#) command.

### Example

These commands enable MAC security on *interface ethernet 7*, set the maximum number of assigned MAC addresses to 2, assign two static MAC addresses to the interface, and clear the dynamic MAC addresses for the interface.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# switchport port-security
switch(config-if-Et7)# switchport port-security mac-address maximum 2
switch(config-if-Et7)# exit
switch(config)# mac address-table static 0034.24c2.8f11 vlan 10 interface ethernet 7
switch(config)# mac address-table static 4464.842d.17ce vlan 10 interface ethernet 7
switch(config)# clear mac address-table dynamic interface ethernet 7
switch(config)# show port-security
```

| Secure Port | MaxSecureAddr<br>(Count) | CurrentAddr<br>(Count) | SecurityViolation<br>(Count) | Security Action |
|-------------|--------------------------|------------------------|------------------------------|-----------------|
| Et7         | 2                        | 2                      | 0                            | Shutdown        |

```
Total Addresses in System: 1
switch(config)# show port-security mac-address
Secure Mac Address Table
```

| Vlan | Mac Address    | Type             | Ports | Remaining Age<br>(mins) |
|------|----------------|------------------|-------|-------------------------|
| 10   | 0034.24c2.8f11 | SecureConfigured | Et7   | N/A                     |
| 10   | 4464.842d.17ce | SecureConfigured | Et7   | N/A                     |

```
Total Mac Addresses for this criterion: 2
switch(config)#
```

## MAC Security LLDP Bypass

When MAC address security configuration is applied on the interface, it encrypts and decrypts all the other protocols PDU and other data packets. **LLDP bypass** allows LLDP packets to be sent or received from the port even when the port is not authorized.

The following configuration allows LLDP packets to be received or sent from an interface where the MAC security profile is applied.

```
switch(config)# mac security
switch(config-mac-security)# profile test
switch(config-mac-security-profile-test)# l2-protocol lldp bypass unauthorized
```

**unauthorized** allows the LLDP packet to be received and sent out when MKA session between the MACsec peers is yet to come up.

## Show Command

The following command shows LLDP packets is bypassed for encryption or decryption.

```
switch(config)# show mac security interface ethernet 4/4/1 detail
Interface: Ethernet4/4/1
Profile: profile1
SCI: d4:af:f7:2e:67:b0::786
SSCI: 00000002
Controlled port: True
Key server priority: 1
Session rekey period: 30
Traffic: Protected
Bypassed protocols: LLDP
Key in use: c0645d4332ba2e1d4d5fb17f:129
Latest key: None
Old key: c0645d4332ba2e1d4d5fb17f:129(RT)
```

### 11.4.4.6 Null0 Interface

The **null0 interface** is a virtual interface that drops all inbound packets. A null0 route is a network route whose destination is **null0 interface**. Inbound packets to a null0 interface are not forwarded to any valid address. Many interface configuration commands provide **null0** as an interface option.

### 11.4.4.7 Maximum Transmission Units (MTU)

The MTU of a communications protocol refers to the size in bytes of the largest frame (Ethernet) or packet (IP) that can be sent on the network.

Different protocols support a variety of MTU sizes. Most IP over Ethernet implementations use the Ethernet V2 frame format, which specifies an MTU of **1500** bytes. Jumbo frames are Ethernet frames containing more than **1500** bytes.

#### 11.4.4.7.1 Switching interface MTU size

On Arista devices, layer two interfaces (either trunk or access ports) are set with a default ethernet MTU of 9236 bytes. This value cannot be changed and is derived as follows: 9214 + 6 (source MAC ) + 6 (dst MAC) + 4 (VLAN tag) + 2 (ether type) + 4 (crc) totals 9236 bytes.

The output of [show interfaces](#) command for a layer two interface displays the following:

## Trunk

```
Ethernet1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5073 (bia 001c.731c.5073)
Ethernet MTU 9214 bytes , BW 1000000 kbit
```

---

## Access

```
Ethernet3 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5075 (bia 001c.731c.5075)
Ethernet MTU 9214 bytes , BW 1000000 kbit
```

### 11.4.4.7.2 Routing Interface MTU Size

The MTU size on Layer 3 interfaces varies between a minimum of **68** to the maximum **9214** bytes. The default size is **1500** bytes. The **show interface** output for a Layer 3 interface displays the following:

#### VLAN Routed Interface

```
Vlan100 is up, line protocol is up (connected)
Hardware is Vlan, address is 001c.731c.5072 (bia 001c.731c.5072)
Internet address is 10.1.1.2/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 9214 bytes
```

#### Physical Routed Interface

```
Ethernet4 is down, line protocol is down (connect)
Hardware is Ethernet, address is 001c.731c.5072
Internet address is 10.10.10.10/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 9214 bytes
```

A routed interface fragments packets that exceed the configured IP MTU on the interface. For example, if a **2000** byte packet is received on routed interface 1 and is forwarded from routed interface 2 then routed interface 2 fragments the packet into a **1500** byte packet plus an additional packet containing the remaining data. This fragmentation should be avoided by configuring a consistent IP MTU across all systems within the operational domain.

The IP MTU set on a routed interface is valid for both IPv4 and IPv6 packets.

#### MTU Configuration

The **mtu** command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. An interface's MTU value is displayed with the **show interface** command. The command is valid for all routable interfaces.

#### Examples

- This command sets the MTU size of **1492** bytes on **VLAN interface 20**

```
switch(config-if-Vl20)# mtu 1492
switch(config-if-Vl20)#
```

- This command displays status for a routed interface.

```
switch(config-if-Et3)# show interface e3
Ethernet3 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5072
Internet address is 10.1.1.2/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 1500 bytes , BW 1000000 kbit
Full-duplex, 1Gb/s, auto negotiation: on, uni-link: unknown
Up 22 days, 7 hours, 47 minutes, 58 seconds
```

```
switch(config)#
```

- Using ping on a Linux host, you can test the maximum transmission through the interface.

```
[user@linux ~]$ ping -M do -s 1472 10.1.1.2
PING 10.1.1.2 (10.1.1.2) 1472(1500) bytes of data.
1480 bytes from 10.1.1.2: icmp_seq=1 ttl=64 time=0.206 ms
1480 bytes from 10.1.1.2: icmp_seq=2 ttl=64 time=0.191 ms
--- 10.1.1.2 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 999ms
rtt min/avg/max/mdev = 0.191/0.198/0.206/0.015 ms
```

The size **1472** has **8** bytes of ICMP information added and **20** bytes of IP headers added, generating a total packet size of **1500** bytes.

- The option **-M do** specifies that fragmentation is prohibited for this test.
- The option **-s** specifies the size of the packet being generated.
- A capture of the frame displays total length of **1514** bytes on the wire which includes the Ethernet headers and type field.

## 11.4.5 Monitoring Links

This section describes link monitoring and object tracking processes:

- [Object Tracking](#)
- [Errdisabled Ports](#)
- [Error Disable Detect Cause for ACL](#)
- [Configuring Error Disable Recovery Interval for each Cause](#)
- [Link Flap Monitoring](#)
- [Fabric Link Monitoring](#)
- [Rapid Automated Indication of Link-Loss](#)

### 11.4.5.1 Object Tracking

Object tracking makes it possible for the switch to take action in response to changes in specific switch properties by creating an object to track those properties. When the tracked property changes, the object then changes state, allowing configured agents to react accordingly.

#### Object Tracking Configuration

The [track](#) command creates an object that changes state to reflect changes in a specific switch property. Agents configured to track that object are then able to react to the change.

#### Example

These commands create an object that tracks the line protocol state on **interface ethernet 8**, then configures **interface ethernet 5** to disable VRRP when that tracked object changes state to **down**.

```
switch(config)# track ETH8 interface ethernet 8 line-protocol
switch(config)# interface ethernet 5
switch(config-if-Et5)# vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

These commands use object tracking:

- link tracking group
- vrrp tracked-object

---

### 11.4.5.2 Errdisabled Ports

The switch places an Ethernet or management interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. Conditions that error-disable an interface include:

- **bpduguard**
- **link-flap**
- **no-internal-vlan**
- **portchannelguard**
- **portsec**
- **tapagg**
- **uplink-failure-detection**
- **xcvr\_unsupported**

Most conditions are programmed by the configuration of other features, such as Spanning Tree protocol (bpduguard). Link flap error-disabling is configured through errdisable commands or link flap monitor commands ([Link Flap Monitoring](#)).

Error-disabled interfaces are recovered either through manual or automated methods.

To manually recover an interface, enter its configuration mode and execute **shutdown** and **no shutdown** commands.

#### Example

These commands manually recover *interface ethernet 30* from the errdisable state.

```
switch(config)# interface ethernet 30
switch(config-if-Et30)# shutdown
switch(config-if-Et30)# no shutdown
switch(config-if-Et30)#
```

Automated recovery of Ethernet interfaces that are error-disabled by a specified condition is enabled by [errdisable recovery cause](#) . The [errdisable recovery interval](#) specifies the period that an interface remains disabled until it is enabled and begins operating normally. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

#### Example

These commands configure automated recovery for all interfaces that are error-disabled from link flap and **bpduguard** conditions. Automated recovery begins five minutes after the port is disabled.

```
switch(config)# errdisable recovery cause link-flap
switch(config)# errdisable recovery cause bpduguard
switch(config)# errdisable recovery interval 300
switch(config)#
```

### 11.4.5.3 Error Disable Detect Cause for ACL

The **no errdisable detect cause acl** command configures routed ports, subinterfaces, and physical ports to not get into the **errdisabled** state on ACL failure, the default behavior. To reestablish the default behavior, use the **errdisable detect cause acl** command.

The following displays the output when **errdisabling** is enabled for ACLs.

```
switch(config)# show errdisable detect
Errdisable Reason Detection Status

```

|     |         |
|-----|---------|
| acl | Enabled |
|-----|---------|

The following displays the output when **errdisabling** is disabled for ACLs.

```
switch(config)# show errdisable detect
Errdisable Reason Detection Status

acl Disabled
```

#### 11.4.5.4 Configuring Error Disable Recovery Interval for each Cause

The duration after which an interface tries to recover from being error disabled is programmable for each trigger which causes the interface to be error disabled using the **errdisable recovery cause NAME\_OF\_CAUSE interval DURATION** command. The command applies only to interfaces that are enabled for error recovery after being error disabled.

##### Examples

- This command configures interfaces to recover in **30** seconds when the cause is **bpduguard**.

```
switch(config)# errdisable recovery cause bpduguard interval 30
```

- Either of these commands revert the interval to the global value when the cause is **bpduguard**.

```
switch(config)# no errdisable recovery cause bpduguard interval
```

```
switch(config)# default errdisable recovery cause bpduguard interval
```

- This command displays the status of the interfaces.

```
switch# show errdisable recovery
Errdisable Reason Timer Status Timer Interval

bpduguard Disabled 30
hitless-reload-down Disabled 300
lACP-no-portid Disabled N/A
lACP-rate-limit Disabled 300
license-enforce Disabled N/A
link-flap Disabled 300
no-internal-vlan Disabled 300
uplink-failure-detection Disabled 300
```

#### 11.4.5.5 Link Flap Monitoring

Link flap frequency is the quantity of link flaps (connection state changes) over a specified period. Excessive link flaps result in network stability issues, including spanning tree and routing recalculations. Link flaps are often caused by Layer 1 issues, such as a bad cable or duplex mismatch. Link flap monitoring specifies link flap thresholds and disables a port when a threshold is exceeded.

Link flap monitoring can be enabled on all interfaces through **errdisable link flap** commands or on individual interfaces with the **link flap monitor**.

##### 11.4.5.5.1 Global Link Flap Monitor

Global link flap detection is configured through two global configuration mode commands:

- [errdisable flap-setting cause link-flap](#) configures the link-flap frequency that defines link-flap errors on an Ethernet interface.
- [errdisable detect cause link-change](#) enables the error-disabling of Ethernet interfaces that exceed the threshold link flap frequency.

Link-flap detection is enabled by default.

### Example

These commands sets the link flap error criteria of **15** connection state changes over a **30** second period, then enables error detection on all interfaces.

```
switch(config)# errdisable flap-setting cause link-flap max-flaps 15 time 30
switch(config)# errdisable detect cause link-change
switch(config)#
```

#### 11.4.5.5.2 Interface Link Flap Monitor

An interface is monitored for link flap errors with link flap profiles. A link flap profile specifies conditions that define a link-flap error. Profiles are assigned to Ethernet interfaces. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

The global link flap monitor is used by interfaces that are not individually monitored for link flap errors.

### Configuring Link Flap Profiles

Link flap profiles are configuration statements that define a link flap error in terms of these criteria:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

The [monitor link-flap policy](#) command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. The [profile max-flaps \(Link Flap Configuration\)](#) command configures link flap profiles.

The default-profile set is a list of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled but link-flap profiles are not assigned. The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, [errdisable flap-setting cause link-flap](#) specifies default error-disable criteria. When the default-profile set contains multiple profiles, the criteria is satisfied when conditions match any profile.

### Example

These commands enter link flap configuration mode and create four link flap profiles.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile LF01 max-flaps 15 time 60
switch(config-link-flap)# profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)# profile LF03 max-flaps 20 time 75 violations 2 intervals 6
switch(config-link-flap)# profile LF04 max-flaps 30 time 100 violations 4 intervals 7
switch(config-link-flap)# show active
monitor link-flap policy
 profile LF01 max-flaps 15 time 60 violations 1 intervals 1
 profile LF02 max-flaps 10 time 30 violations 5 intervals 10
 profile LF02 max-flaps 20 time 75 violations 2 intervals 6
 profile LF02 max-flaps 30 time 100 violations 4 intervals 7
```

```
switch(config-link-flap)#
```

The [default-profiles](#) command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a [default-profile](#) command replaces the current default-profile statement in **running-config**.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, [errdisable flap-setting cause link-flap](#) specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single [default-profiles](#) command.

## Example

This command assigns configures **LF01** and **LF02** as the default-profile set.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# default-profiles LF01 LF02
switch(config-link-flap)# show active
monitor link-flap policy
 profile LF01 max-flaps 15 time 60 violations 1 intervals 1
 profile LF02 max-flaps 10 time 30 violations 5 intervals 10
 profile LF02 max-flaps 20 time 75 violations 2 intervals 6
 profile LF02 max-flaps 30 time 100 violations 4 intervals 7
 default-profiles LF01 LF02
switch(config-link-flap)#
```

## Interface Link Flap Profile Assignments

Link flap monitoring is enabled on individual Ethernet interfaces and can optionally specify one or more profiles to define link-flap error-disabling criteria. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions; a port is disabled when conditions match any of the profiles assigned to an interface.

The [monitor link-flap profiles](#) command controls link-flap monitoring on a configuration mode interface. The command provides these link flap detection options:

- **monitor link-flap (no profiles listed):** Interface detects link flaps using default-profile set criteria.
- **monitor link-flap (at least one profile listed):** Interface detects link flaps using listed profile criteria.
- **default monitor link-flap:** The interface uses global link flap monitor commands ([Global Link Flap Monitor](#)).
- **no monitor link-flap:** The interface does not detect link flaps.

## Examples

- This command assigns **LF03** and **LF04** link flap profiles to **interface ethernet 33**.

```
switch(config)# interface ethernet 33
switch(config-if-Et33)# monitor link-flap profiles LF03 LF04
switch(config-if-Et33)# show active
interface Ethernet33
 monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on **interface ethernet 34**.

```
switch(config)# interface ethernet 34
switch(config-if-Et34)# no monitor link-flap
switch(config-if-Et34)# show active
```

```
interface Ethernet34
 no monitor link-flap
switch(config-if-Et34)#
```

- This command assigns the default-profile set to **interface ethernet 35**.

```
switch(config)# interface ethernet 35
switch(config-if-Et35)# monitor link-flap
switch(config-if-Et35)# show active
interface Ethernet35
 monitor link-flap
switch(config-if-Et35)#
```

- This command configures **interface ethernet 36** to use the global link flap monitoring commands.

```
switch(config)# interface ethernet 36
switch(config-if-Et36)# default monitor link-flap
switch(config-if-Et36)# show active
interface Ethernet36
switch(config-if-Et36)#
```

#### 11.4.5.6 Fabric Link Monitoring

Fabric link monitoring enables EOS to monitor low error rate errors on all fabric links for long durations, and automatically isolates fabric links on consistent error detection over an extended time interval. Isolated fabric links are restored when the error rate drops below a configured threshold.

The error rate over each configurable polling interval is derived by comparing the number of cells with CRC errors against the total number of received cells. Links are automatically isolated when the error rate is above the configured threshold for the configured consecutive number of polling intervals.

On an isolated fabric link, control cells (but not data cells) are sent. Once the error rate drops below a set threshold for the configured consecutive number of polling intervals, EOS revives the fabric link to continue sending data traffic.

##### 11.4.5.6.1 Configuring Fabric Link Monitoring

Configuration mode commands globally enable and disable fabric link monitoring and syslog messages for the settings described below.

The **no platform sand monitor** command disables fabric link monitoring.

#### Generate Serdes Error Syslog

The **platform sand monitor serdes error log** command generates syslog fabric link monitoring for serdes error logging.

#### Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)# platform sand monitor serdes error log
switch(config)#
```

The following syslog messages are not enabled by default. Fabric link monitoring syslog is enabled by configuring the **platform sand monitor serdes error log** command.

## Examples

- The following Syslog message is generated when a fabric link for serdes is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes withdrawn from the switch fabric.
```

- Here is another instance where a Syslog message is generated when a fabric link is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes Arad10/5-FabricSerdes-11 withdrawn from the switch fabric.
```

- The following Syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes restored to the switch fabric.
```

- Here is another instance where a Syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes Arad10/5-FabricSerdes-11 restored to the switch fabric.
```

## Generate Serdes Error Threshold

The [platform sand monitor serdes error threshold](#) command generates a fabric link monitoring serdes error threshold.

### Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between **200** and **30000** received cells.

```
switch(config)# platform sand monitor serdes error threshold 200 30000
switch(config)#
```

## Enable Serdes Poll Period

The [platform sand monitor serdes poll period](#) command sets the serdes poll period.

### Example

This command changes the serdes polling period for fabric link monitoring to **6** seconds.

```
switch(config)# platform sand monitor serdes poll period 6
switch(config)#
```

## Monitor Serdes Poll Threshold Isolation

The [platform sand monitor serdes poll threshold isolation](#) command sets and enables fabric link monitoring for serdes poll threshold isolation.

### Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is **5** consecutive polls.

```
switch(config)# platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

---

## Monitor Serdes Poll Threshold Recovery

The `platform sand monitor serdes poll threshold recovery` command sets and enables fabric link monitoring for serdes poll threshold recovery.

### Example

This command changes the number of consecutive serdes polls used for threshold recovery to **6** seconds.

```
switch(config)# platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

## Show Fabric Monitoring Health

The `show fabric monitoring health` command displays the fabric monitoring connected state status with isolated links.

### Example

When fabric links are isolated, their connected state status is shown with isolated links.

```
switch(config)# show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

### 11.4.5.7 Rapid Automated Indication of Link-Loss

Rapid Automated Indication of Link-Loss (RAIL) is a software feature that reduces the wait time of applications on hosts that are blocked due to a failed link. When a link goes down because of link-flapping or the unavailability of a directly connected server, the switch drops all traffic to servers whose next-hop destination was learned on the port connected to the link. Applications that drive the traffic (clients on source hosts) are blocked because of the dropped edge-switch traffic. Connection timeout varies by application and is usually measured in seconds or minutes.

RAIL is functional on a switch if it is routing-enabled and available for servers that set the switch as the default router.

#### 11.4.5.7.1 RAIL Method

When a link monitored by RAIL goes down, the switch performs these steps for servers that the switch proxies:

1. IP addresses of servers on the failed link are extracted from ARP cache. The interface that accesses the server is determined by searching for the MAC address in the hardware MAC address tables.

2. Upon link shutdown, a dynamic MAC entry is added in the MAC address table for each server that was learned on the failed interface. Each new entry lists its interface as **CPU**.

The figure below titled **RAIL Scenarios** depicts three switch-server scenarios: link is up, link is down with RAIL disabled, and link is down with RAIL enabled. A failed link with RAIL enabled results in these behaviors:

1. All ingress packets whose destination MAC address matches an address added to the MAC address table are sent to the CPU.
2. For packets scheduled to be forwarded to the source address, the switch sends one of the following, based on the type of received segment:
  - **TCP**: TCP RST segment to the source IP address and port.
  - **UDP**: ICMP unreachable segment to the source IP address and port.
3. The client closes the socket associated with the transmitted segment and notifies the application. The application reacts immediately instead of maintaining the block until connection timeout expiry.

**Figure 11-5: RAIL Scenarios**

#### 11.4.5.7.2 RAIL Implementation

RAIL defines a state machine that manages the RAIL activity level relative to a specified server. The state machine consists of four states:

- **Up**: Transitions to this state from **Inactive** when ARP and MAC entries are added for the server.
- **Proxying**: Transitions to this state from **Up** when Link Down is detected and RAIL proxying is enabled. The switch is a proxy for messages to the server.
- **Down**: Transitions to this state from **Up** when Link Down is detected and RAIL proxying is not enabled. Messages from the client remain unanswered and the application recovers only after timeout expiry.
- **Inactive**: Transitions to this state upon any of the following conditions:
  - Server's MAC address or ARP entry is deleted (from any state).
  - Proxy timeout expiry (from **Proxying** state).
  - Link down timeout expiry (from **Down** state).

#### 11.4.5.7.3 RAIL Configuration

Server-failure configuration mode commands globally enable RAIL and configure RAIL parameters. RAIL is functional on individual interfaces only when it is globally enabled and enabled on the interface. RAIL monitors an interface for link errors when RAIL is globally enabled and enabled on the interface.

---

## Entering Server-failure Configuration Mode

The `monitor server-failure` command places the switch in server-failure configuration mode. The `exit` command returns the switch to global configuration mode. Server-failure mode is not a group change mode; *running-config* is changed when commands are entered and not affected by exiting the mode.

The `no monitor server-failure` deletes all server-failure mode commands from *running-config*.

### Examples

- These commands place the switch in the *server-failure* configuration mode.

```
switch(config)# monitor server-failure
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from *running-config*.

```
switch(config)# no monitor server-failure
switch(config)#
```

## Enabling RAIL on the Switch

RAIL is disabled by default and is enabled by `no shutdown` (server-failure configuration mode). The `shutdown` command disables RAIL without removing RAIL commands from *running-config*.

### Examples

- These commands enable RAIL globally.

```
switch(config)# monitor server
switch(config-server-failure)# no shutdown
switch(config-server-failure)# show active
monitor server-failure
no shutdown
switch(config-server-failure)#
```

- This command disables RAIL globally.

```
switch(config-server-failure)# shutdown
switch(config-server-failure)#
```

## Enabling Proxy Mode

The `proxy` (server-failure configuration mode) command sets the RAIL proxy setting to *enabled* and specifies the interval that RAIL responds to messages sent to servers on failed links. The proxy timeout is measured individually for each server whose link has failed. The switch enters RAIL proxy state only when the proxy setting is enabled.

When RAIL is enabled but the proxy setting is disabled, the switch maintains a list of unavailable servers without responding to messages sent to the servers. The RAIL proxy setting is *disabled* by default. When RAIL proxy is enabled, the default period is three minutes.

The `no proxy` and `default proxy` commands return the RAIL proxy setting to *disabled*. The `no proxy lifetime` and `default proxy lifetime` commands set the proxy timeout to its default of three minutes if the RAIL proxy setting is *enabled*. The lifetime commands have no effect if RAIL proxy is *disabled*.

## Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of **10** minutes.

```
switch(config)# monitor server
switch(config-server-failure)# proxy lifetime 10
switch(config-server-failure)# show active
monitor server-failure
 proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of **3** minutes.

```
switch(config-server-failure)# no proxy lifetime
switch(config-server-failure)# show active
monitor server-failure
 proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)# no proxy
switch(config-server-failure)# show active
switch(config-server-failure)#
```

## Selecting Networks to Monitor

The [network \(server-failure configuration mode\)](#) command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. **Running-config** can contain multiple **network** statements, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

## Example

These commands specify two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)# monitor server
switch(config-server-failure)# network 10.1.1.0/24
switch(config-server-failure)# network 10.2.1.96/28
switch(config-server-failure)# show active
monitor server-failure
 network 10.2.1.96/28
 network 10.1.1.0/24
switch(config-server-failure)#
```

## Enabling RAIL on an Interface

RAIL monitors an interface for link errors only when RAIL is globally enabled and enabled for the interface. The [monitor server-failure link](#) command enables RAIL on the configuration mode interface. Configuration settings are effective for all Ethernet and port channel interfaces that enable RAIL.

## Example

These commands enable RAIL on **port channel interface 100**.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# monitor server-failure link
switch(config-if-Po100)# show active
interface Port-Channel100
 monitor server-failure link
```

```
switch(config-if-Po100)#
```

#### 11.4.5.7.4 Displaying RAIL Status

The switch provides commands to display RAIL configuration and status information:

##### Displaying RAIL Configuration settings

The `show monitor server-failure` command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

##### Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch> show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
 10.2.1.96/28 : 0 servers
 10.1.1.0/24 : 0 servers
 10.3.0.0/16 : 3 servers switch>
```

##### Displaying RAIL History for All Connected Servers

The `show monitor server-failure history` command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

##### Example

This command displays the link failure history from the time RAIL is instantiated on the switch.

```
switch> show monitor server-failure history
Total server failures: 4

Server IP Server MAC Interface Last Failed

10.1.67.92 01:22:ab:cd:ee:ff Ethernet17 2013-02-02 11:26:22
44.11.11.7 ad:3e:5f:dd:64:cf Ethernet23 2013-02-10 00:07:56
10.1.1.1 01:22:df:42:78:cd Port-Channel6 2013-02-09 19:36:09
10.1.8.13 01:33:df:ee:39:91 Port-Channel5 2013-02-10 00:03:39 switch>
```

##### Displaying Server Configuration and Status

The `show monitor server-failure servers` command displays status and configuration data about each server that RAIL monitors. The display format depends on the parameter specified by the command:

##### Examples

- This command displays RAIL information for the server at IP address **10.11.11.7**.

```
switch> show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address : 10.11.11.7
MAC Address : ad:3e:5f:dd:64:cf
Current state : down
Interface : Ethernet23
Last Discovered : 2013-01-06 06:47:39
Last Failed : 2013-02-10 00:07:56
Last Proxied : 2013-02-10 00:08:33
```

```
Last Inactive : 2013-02-09 23:52:21
Number of times failed : 3
Number of times proxied : 1
Number of times inactive : 18 switch>
```

- This command displays RAIL information for the all servers on configured interfaces.

```
switch> show monitor server-failure servers all
Total servers monitored: 5
```

| Server IP   | Server MAC        | Interface     | State    | Last Failed          |
|-------------|-------------------|---------------|----------|----------------------|
| 10.1.67.92  | 01:22:ab:cd:ee:ff | Ethernet17    | inactive | 7 days, 12:47:48 ago |
| 44.11.11.7  | ad:3e:5f:dd:64:cf | Ethernet23    | down     | 0:06:14 ago          |
| 10.1.1.1    | 01:22:df:42:78:cd | Port-Channel6 | up       | 4:38:01 ago          |
| 10.1.8.13   | 01:33:df:ee:39:91 | Port-Channel5 | proxying | 0:10:31 ago          |
| 132.23.23.1 | 00:11:aa:bb:32:ad | Ethernet1     | up       | never switch>        |

## 11.4.6 PHY test pattern CLI

Use the Ethernet Physical Layer (PHY) test pattern CLI to check the quality of the physical layer for an Ethernet interface. You can do this by generating a specific test pattern to a peer, and having the peer check the test pattern that is received, and vice versa. Because the test pattern is a well-known sequence of bits, the peer can check that the pattern received matches this well-known sequence; any difference is a bit error introduced by the peculiarities of the physical layer. The quality of the link is determined based on the acceptable bit errors, as published by the hardware vendors.

To enable the test pattern generator, configure a specific test pattern on the transmitter side of an interface. The test pattern checker is enabled by configuring the test pattern to be checked on the receiver side of the interface. PRBS is the test pattern supported by EOS.

**Note:** Physical links are bidirectional; to test both directions, the generator and checker both need to be enabled on both sides of the link. Both directions can be tested simultaneously or separately. The order of testing does not matter.

### 11.4.6.1 Configuration

You can configure a test pattern is configured using the **phy diag** interface configuration mode command.

1. Enter interface configuration mode, entering the targeted interface name.

```
switch(config)# interface <interfaceName>
```

2. Enable a test pattern on an interface using the **phy diag** command. You can select the transmitter or the receiver. To display the available interfaces, select **test pattern ?**.

```
switch(config-if)# phy diag [transmitter | receiver] test pattern ?
PRBS11 Configure the PRBS11 test pattern
PRBS15 Configure the PRBS15 test pattern
PRBS23 Configure the PRBS23 test pattern
PRBS31 Configure the PRBS31 test pattern
PRBS49 Configure the PRBS49 test pattern
PRBS58 Configure the PRBS58 test pattern
PRBS7 Configure the PRBS7 test pattern
PRBS9 Configure the PRBS9 test pattern
```

3. To disable a test pattern on an interface, enter the following command. You can select the transmitter or the receiver, as well as the selected named test pattern.

```
switch(config-if)# no phy diag [transmitter|receiver] test pattern TestPattern
```

4. By default, a test pattern is disabled.

```
switch(config-if)# default phy diag [transmitter|receiver] test pattern
```

5. The following command clears the recorded test pattern status data for all the interfaces. Upon running the command, all the counter values are set to **0** and link states are marked as **not locked**.

```
switch# clear phy diag test pattern
```

#### 11.4.6.2 Show Commands

To display the configured and operational test pattern, as well as the test patterns available for an interface, use the **show interfaces** command.

In the following example, interfaces **ethernet 36/1** and **ethernet 31/1** are selected for display. The user-configured test pattern is displayed under the **Configured** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **Operational** column. The **Available** column lists the test patterns available for the interface.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern
```

| Interface    | Configured |         | Operational |         | Available               |
|--------------|------------|---------|-------------|---------|-------------------------|
|              | Transmit   | Receive | Transmit    | Receive |                         |
| Ethernet26/1 | PRBS15     | PRBS15  | PRBS15      | PRBS15  | PRBS 7,9,11,15,23,31,58 |
| Ethernet31/1 | PRBS7      | PRBS31  | PRBS7       | PRBS31  | PRBS 7,9,11,15,23,31,58 |

Use the **show interfaces [<interface range>] phy detail** command to display the operational test pattern for an interface. In the example below, the **Test pattern** field will not be available, on disabling the test pattern.

**Note:** This command is not available on DCS-7060PX4 and DCS-7060DX4.

```
switch# show interfaces ethernet 26/1 phy detail | i Test pattern
Test pattern enabled
switch# show interfaces ethernet 31/1 phy detail | i Test pattern
Test pattern enabled
```

Use the **show interfaces [<interface range>] phy diag test pattern counters** to display test pattern link state and error information.

Available error information:

- **Link state:** whether or not the checker locked on to the configured test pattern.
- **Bit Errors:** the accumulated number of bit errors.
- **Largest Burst:** the largest burst of errors that occurred.
- **Burst Count:** the number of occurrences of errors.
- **Last Error Time:** the last time an error has occurred, 'never' if no errors have occurred.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern counters
Current System Time: Wed May 30 22:24:32 2018
```

| Interface    | Lane | Link State | Bit Errors | Largest Burst | Burst Count | Last Error Time |
|--------------|------|------------|------------|---------------|-------------|-----------------|
| Ethernet26/1 | 0    | locked     | 409266     | 409266        | 1           | 0:21:27 ago     |
| Ethernet26/1 | 1    | locked     | 347084     | 347084        | 1           | 0:21:27 ago     |
| Ethernet26/1 | 2    | locked     | 420681     | 420681        | 1           | 0:21:27 ago     |
| Ethernet26/1 | 3    | locked     | 392969     | 392969        | 1           | 0:21:27 ago     |
| Ethernet31/1 | 0    | not locked | 1417655    | 651822        | 3           | 0:03:20 ago     |
| Ethernet31/1 | 1    | not locked | 1782238    | 736819        | 3           | 0:03:20 ago     |
| Ethernet31/1 | 2    | not locked | 1760538    | 866185        | 3           | 0:03:20 ago     |
| Ethernet31/1 | 3    | not locked | 1817413    | 923941        | 3           | 0:03:20 ago     |

Use the **show interfaces [<interface range>] phy diag test pattern counters** to display the lock state of an interface along with a detailed information on the recorded bit errors.

Available detailed information:

- **Last clear:** the time when the test pattern results were last cleared.
- **Operational test pattern:** the test pattern operational at the receiver side.
- **Bit rate:** the transmission bit rate.
- **Lock state:** the current lock status, number of times it changed and the last time the lock status got changed.
  - **locked:** receiver is able to lock on to the incoming test pattern.
  - **not locked:** receiver is not able to lock on to the incoming test pattern.
- **Largest burst:** the largest burst of errors that occurred.
- **Bit errors\*:** the accumulated number of errors, number of occurrences of errors, and last time errors were captured. The \* suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- **Total Bits:** the total bits received.
- **Bit error rate (BER)\*:** the ratio of captured bit errors to the total bit received. The \* suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- **Bit errors since last lock:** the accumulated number of errors since last time lock was gained.
- **Total bits since last lock:** the total bits received since last lock.
- **BER since last lock:** the ratio of captured bit errors to the total bit received since last lock.

Bit error rate > 1.26E-08*
Bit errors since last lock 893472*
Total bits since last lock 144,471.793 Gb
BER since last lock > 6.18E-09*

```

### 11.4.6.3 Bit Error Rate (BER)

Bit error rate is the ratio of the recorded bit errors to the total bits received for the duration of the test run. To achieve a reliable transmission, BER should be relatively small. As per IEEE 802.3 standard, the minimum BER requirement for Ethernet links is 1E-12. Therefore, links with BER lower than 1E-12 are to be considered reliable.

The BER reported by the **test pattern** CLI is the pre-FEC (Forward Error Correction) BER. For links that have FEC enabled, it is expected to see a higher BER, in the range of **1E-4** to **1E-8**, because they are calculated before FEC is applied on the link. Based on the type of FEC applied on the link, these errors could get corrected to achieve the minimum BER requirement of 1E-12 or less.

### 11.4.6.4 Limitations

The configuration of test patterns is supported only on a few types of ports. The available test patterns that may be configured on an interface are found in the **Available** field of the **show interfaces phy diag test pattern** CLI command.

The test pattern CLI calculates only pre-FEC BER.

If one end of the system is from another vendor, consult the vendor's documentation for the equivalent command(s) to achieve the appropriate behavior.

## 11.4.7 Data Transfer Commands

### Control Plane and Data Plane Commands

- [ip access-group \(Control Plane mode\)](#)
- [show switch forwarding-mode](#)
- [switch forwarding-mode](#)
- [system control-plane](#)

### Errdisable Commands

- [errdisable detect cause link-change](#)
- [errdisable flap-setting cause link-flap](#)
- [errdisable recovery cause](#)
- [errdisable recovery interval](#)
- [show errdisable recovery](#)

### Fabric Link Monitoring Commands

- [platform sand monitor serdes error log](#)
- [platform sand monitor serdes error threshold](#)
- [platform sand monitor serdes poll period](#)
- [platform sand monitor serdes poll threshold isolation](#)
- [platform sand monitor serdes poll threshold recovery](#)
- [show fabric monitoring health](#)

- 
- [show platform trident mirroring](#)

### **RAIL Commands**

- [clear server-failure servers inactive](#)
- [monitor server-failure](#)
- [monitor server-failure link](#)
- [network \(server-failure configuration mode\)](#)
- [proxy \(server-failure configuration mode\)](#)
- [show monitor server-failure](#)
- [show monitor server-failure history](#)
- [show monitor server-failure servers](#)
- [shutdown \(server-failure configuration mode\)](#)

### **Link Flap Monitor Commands**

- [default-profiles](#)
- [monitor link-flap policy](#)
- [monitor link-flap profiles](#)
- [profile max-flaps \(Link Flap Configuration\)](#)

### **MAC Address Table Commands**

- [clear mac address-table dynamic](#)
- [mac address-table aging-time](#)
- [mac address-table static](#)
- [show bridge mac-address-table aging timeout](#)
- [show mac address-table](#)
- [show mac address-table count](#)
- [show mac address-table mlag-peer](#)
- [show mac address-table multicast](#)
- [show mac address-table multicast brief](#)
- [switchport mac address learning](#)

### **Port Configuration Commands**

- [clear counters](#)
- [description](#)
- [interface loopback](#)
- [load interval](#)
- [mac address learning](#)
- [mtu](#)
- [phy diag](#)
- [show interfaces](#)
- [show interfaces description](#)
- [show interfaces phy diag](#)
- [show port-channel load-balance](#)
- [switchport](#)
- [switchport default mode access](#)
- [switchport default mode routed](#)

**Port Mirroring Commands**

- [monitor session destination](#)
- [monitor session destination cpu](#)
- [monitor session forwarding-drop](#)
- [monitor session ip access-group](#)
- [monitor session source](#)
- [monitor session source ip access-group](#)
- [monitor session truncate](#)
- [no monitor session](#)
- [show monitor session](#)

**Port Security Commands**

- [show port-security](#)
- [show port-security interface](#)
- [show port-security mac-address](#)
- [switchport port-security](#)
- [switchport port-security mac-address maximum](#)
- [switchport port-security violation](#)

**Storm Control Commands**

- [show storm-control](#)
- [storm-control](#)

**Tracking Commands**

- [links minimum](#)
- [link tracking group](#)
- [link tracking group \(interface\)](#)
- [show link tracking group](#)
- [show track](#)
- [track](#)
- [traffic-loopback](#)

### 11.4.7.1 clear counters

The **clear counters** command resets the counters to zero for the specified interfaces. The command provides the following options:

- **No parameter:** When no option is selected, the counters are reset on the switch.
- **Session parameter:** The command resets the counters in software for the current CLI session, establishing a baseline upon which subsequent **show interfaces** or **show interfaces counters** commands are relative. Counters are not affected for other CLI sessions.

**Note:** The **clear counters** command (and other commands that reset counters to zero) do not reset SNMP counters (such as IF-MIB::ifInOctets). As specified in **RFC 2578, sections 7.1.6** and **7.1.10**, a single value of a counter in SNMP has no information content. Instead, meaningful information is given by the difference between two separate fetches of a particular counter. SNMP counters automatically reset to **0** when they reach their maximum values.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear counters [INTERFACE][SCOPE]
```

#### Parameters

- **INTERFACE** Interface type and number. Options include:
  - **no parameter** Display information for all interfaces.
  - **ethernet e\_range** Ethernet interface range specified by **e\_range**.
  - **loopback l\_range** Loopback interface specified by **l\_range**.
  - **management m\_range** Management interface range specified by **m\_range**.
  - **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
  - **vlan v\_range** VLAN interface range specified by **v\_range**.
  - **VXLAN vx\_range** VXLAN interface range specified by **vx\_range**.
- Valid **e\_range**, **l\_range**, **m\_range**, **p\_range**, **v\_range**, and **vx\_range** formats include number, number range, or comma-delimited list of numbers and ranges.
- **SCOPE** Duration of the reset results. Options include:
  - **no parameter** counters are cleared on the switch.
  - **session** counters are reset only for the current session.

#### Example

These commands display interface counters, clear the counters, then display the counters again.

```
switch# show interfaces ethernet 1
Ethernet1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.7302.2fff (bia 001c.7302.2fff)
MTU 9212 bytes, BW 10000000 Kbit

---

### 11.4.7.2 clear mac address-table dynamic

The **clear mac address-table dynamic** command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and Layer 2 (Ethernet or port channel) interface.

- To remove a specific entry, include its VLAN and interface in the command.
- To remove all dynamic entries for a VLAN, do not specify an interface.
- To remove all dynamic entries for an interface, do not specify a VLAN.
- To remove all dynamic entries, do not specify a VLAN or an interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear mac address-table dynamic [VLANs][INTERFACE]
```

#### Parameters

- **VLANs** Table entries are cleared for specified VLANs. Options include:
  - **no parameter** all VLANs.
  - **vlan v\_num** VLAN specified by **v\_num**.
- **INTERFACE** Table entries are cleared for specified interfaces. Options include:
  - **no parameter** all Ethernet and port channel interfaces.
  - **interface ethernet e\_range** Ethernet interfaces specified by **e\_range**.
  - **interface port-channel p\_range** port channel interfaces specified by **p\_range**.
  - **VXLAN vx\_range** VXLAN interfaces specified by **vx\_range**.

Valid **range** formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

This command clears all dynamic mac address table entries for **port channel 5** on **vlan 34**.

```
switch# clear mac address-table dynamic vlan 34 interface port-channel 5
switch#
```

### 11.4.7.3 clear server-failure servers inactive

The **clear server-failure servers inactive** command removes all inactive server entries from the server failed history list. The switch maintains this list, even after a server's ARP entry is removed, to maintain a list of servers that are connected to the switch and log the most recent time of the failure of the link that connects the switch to the server.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear server-failure servers inactive
```

#### Related Command

[show monitor server-failure history](#)

#### Example

This command clears the inactive servers from the server failed history list.

```
switch# clear server-failure servers inactive
switch#
```

---

#### 11.4.7.4 default-profiles

The **default-profiles** command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a **default-profile** command replaces the current default-profile statement in *running-config*.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, [errdisable flap-setting cause link-flap](#) specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single **default-profiles** command.

The **no default-profiles** and **default default-profiles** commands restore the empty default-profile set by deleting the **default-profiles** command from *running-config*.

##### Command Mode

Link-flap Configuration

##### Command Syntax

```
default-profiles [LF_PROFILES]
```

```
no default-profiles
```

```
default default-profiles
```

##### Parameters

**LF\_PROFILES** Name of link-flap profiles assigned to default profile set. Parameter may contain zero, one, or multiple link-flap profile names:

- **no parameter** default-profile set is empty.
- **profile** name of single link-flap profile.
- **profile\_1 profile\_2 ... profile\_N** list of link-flap profile names.

##### Related Commands

- [monitor link-flap policy](#) places the switch in *link-flap-profiles* configuration mode.
- [profile max-flaps \(Link Flap Configuration\)](#) configures link flap profiles.

##### Guidelines

The [errdisable flap-setting cause link-flap](#) statement is also configurable through the [profile max-flaps \(Link Flap Configuration\)](#) command.

##### Example

This command assigns configures **LF01** and **LF02** as the default-profile set.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# default-profiles LF01 LF02
switch(config-link-flap)# show active
monitor link-flap policy
 profile LF01 max-flaps 15 time 60 violations 1 intervals 1
 profile LF02 max-flaps 10 time 30 violations 5 intervals 10
 profile LF03 max-flaps 25 time 100 violations 2 intervals 12
 profile LF04 max-flaps 5 time 15 violations 1 intervals 3
 default-profiles LF01 LF02
switch(config-link-flap)#
```

### 11.4.7.5 description

The **description** command adds comment text for the configuration mode interface. The text provides information about the interface and has no effect on interface functions. The [show interfaces description](#) command displays interface description text.

The **no description** command removes the description text for the configuration mode interface from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

#### Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

#### Parameter

***label\_text*** character string assigned to description attribute.

#### Example

These commands add description text to **interface ethernet 23**, then displays the text through the [show interfaces description](#) command.

```
switch(config)# interface ethernet 23
switch(config-if-Et23)# description external line
switch(config-if-Et23)# show interfaces ethernet 23 description
Interface Status Protocol Description
Et23 up up external line
```

---

### 11.4.7.6 errdisable detect cause link-change

The **errdisable detect cause link-change** command enables the error-disabling of Ethernet interfaces when the switch detects a link flap error on the interface. The [errdisable flap-setting cause link-flap](#) command defines a link flap error in terms of the frequency of connection state changes.

The switch places an interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. To re-enable an error-disabled interface, enter **shutdown** and **no shutdown** command in the configuration mode for the interface.

By default, link flap detection is enabled. The **no errdisable detect cause link-change** command disables the triggering of error-disable actions. The **errdisable detect cause link-change** and **default errdisable detect cause link-change** commands enable the triggering of error-disable actions by removing the **no errdisable detect cause link-change** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
errdisable detect cause link-change
no errdisable detect cause link-change
default errdisable detect cause link-change
```

#### Examples

- This command disables error detection on the switch.

```
switch(config)# no errdisable detect cause link-change
switch(config)#
```

- These commands sets the link flap error criteria of **15** connection state changes over a **30** second period, then enables error detection on the switch.

```
switch(config)# errdisable flap-setting cause link-flap max-flaps 15 time 30
switch(config)# errdisable detect cause link-change
switch(config)#
```

### 11.4.7.7 errdisable flap-setting cause link-flap

The **errdisable flap-setting cause link-flap** command configures the link-flap frequency that defines an link-flap error on an Ethernet interface. The **errdisable detect cause link-change** command uses this criteria to trigger an error-disable action.

The link-flap frequency is defined by the quantity of link flaps (connection state changes) over a specified period. The default settings are five link flaps and ten seconds.

The **no errdisable flap-setting cause link-flap** and **default errdisable flap-setting cause link-flap** commands restore the default link flap cause settings by removing the **errdisable flap-setting cause link-flap** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
errdisable flap-setting cause link-flap max-flaps quantity time period
no errdisable flap-setting cause link-flap
default errdisable flap-setting cause link-flap
```

#### Parameters

- ***quantity*** Number of link flaps. Value ranges from **1** to **100**. Default value is **5**.
- ***period*** Interval over which link flaps accumulate to trigger an error condition (seconds). Value ranges from **1** to **1800**. Default value is **10**.

#### Example

This command sets the link flap error criteria of **15** connection state changes over **30** second periods.

```
switch(config)# errdisable flap-setting cause link-flap max-flaps 15 time 30
switch(config)#
```

---

#### 11.4.7.8 errdisable recovery cause

The **errdisable recovery cause** command enables the automated recovery of error-disabled Ethernet interfaces. An interface that is disabled as a result of a specified condition attempts normal operation after a specified interval. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

**Running-config** can simultaneously store **errdisable recovery cause** statements for each error-disable condition. By default, error-disable recovery is disabled for all conditions.

The **no errdisable recovery cause** and **default errdisable recovery cause** commands disable automated recovery for interfaces disabled by the specified condition by removing the corresponding **errdisable recovery cause** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

```
errdisable recovery cause CONDITION
no errdisable recovery cause CONDITION
default errdisable recovery cause CONDITION
```

##### Parameters

**CONDITION** Disabling condition for which command automates recovery. Options include:

- **arp-inspection**
- **bpduguard**
- **link-flap**
- **no-internal-vlan**
- **portchannelguard**
- **portsec**
- **tapagg**
- **uplink-failure-detection**
- **xcvr\_unsupported**

##### Related Command

[errdisable recovery interval](#) configures the period that an ethernet interface remains disabled before automated recovery begins.

##### Example

This command enables error-disable recovery for interfaces that are disabled by link-flap and bpduguard conditions and sets the errdisable recovery period at **10** minutes.

```
switch(config)# errdisable recovery cause bpduguard
switch(config)# errdisable recovery cause link-flap
switch(config)# errdisable recovery interval 600
switch(config)# show running-config
! Command: show running-config

errdisable recovery cause bpduguard
errdisable recovery cause link-flap
errdisable recovery interval 600
!
```

```
switch(config)#
```

---

#### 11.4.7.9 errdisable recovery interval

The **errdisable recovery interval** command specifies the period that an error-disabled Ethernet interface remains disabled before automated errdisable recovery begins. This command affects only interfaces whose automated recovery is enabled for the disabling condition ([errdisable recovery cause](#)). When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

The **no errdisable recovery interval** and **default errdisable recovery interval** commands restore the default error recovery period of **300** seconds by removing the **errdisable recovery interval** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
errdisable recovery interval period
no errdisable recovery interval
default errdisable recovery interval
```

##### Parameters

***period*** Error disable recovery period (seconds). Value ranges from **30** to **86400**. Default value is **300**.

##### Related Command

[errdisable recovery cause](#) enables the automated recovery of error-disabled Ethernet interfaces.

##### Example

This command enables error-disable recovery for interfaces that are disabled by link-flap conditions and sets the errdisable recovery period at **10** minutes.

```
switch(config)# errdisable recovery cause link-flap
switch(config)# errdisable recovery interval 600
switch(config)# show running-config
! Command: show running-config

!
errdisable recovery cause link-flap
errdisable recovery interval 600
!

!
i
switch(config)#
```

### 11.4.7.10 interface loopback

The **interface loopback** command places the switch in loopback interface configuration mode for the specified interface and creates a loopback interface if one does not exist. It can also be used to configure multiple loopback interfaces if they have all been previously created.

The command can specify a single interface or multiple interfaces:

- **Single interface:** Command creates an interface if it specifies one that was not previously created.
- **Multiple interfaces:** Command is valid only if all specified interfaces were previously created.

The **no interface loopback** command removes the specified interfaces from *running-config*, including all interface configuration statements. The **default interface loopback** command removes all configuration statements for the specified loopback interface without deleting the loopback interface from *running-config*.

The following commands are available in loopback interface configuration mode:

- **description**
- **exit**
- **ip address**
- **ip proxy-arp**
- **ipv6 address**
- **ipv6 enable**
- **load interval**
- **logging event**
- **mtu**
- **shutdown (Interfaces)**
- **snmp trap**

#### Command Mode

Global Configuration

#### Command Syntax

```
interface loopback l_range
no interface loopback l_range
default interface loopback l_range
```

#### Parameters

***l\_range*** Loopback interfaces (number, range, or comma-delimited list of numbers and ranges). Loopback number ranges from **0** to **1000**.

#### Examples

- This command enters loopback interface configuration mode for loopback interfaces **1** through **5**.

```
switch(config)# interface loopback 1-5
switch(config-if-Lo1-5)#
```

- This command creates interface **23** and enters loopback interface configuration mode.

```
switch(config)# interface loopback 23
switch(config-if-Lo23)#
```

- 
- This command removes loopback interfaces **5** through **7** from *running-config*.

```
switch(config)# no interface loopback 5-7
switch(config)#
```

#### 11.4.7.11 ip access-group (Control Plane mode)

The **ip access-group** command applies an IPv4 or standard IPv4 Access Control List (ACL) to the control plane.

The **no ip access-group** and **default ip access-group** commands remove the corresponding **ip access-group** command from *running-config*.

##### Command Mode

Control-plane Configuration

##### Command Syntax

```
ip access-group list_name [VRF_INSTANCE] DIRECTION
no ip access-group [list_name][VRF_INSTANCE] DIRECTION
default ip access-group [list_name][VRF_INSTANCE] DIRECTION
```

##### Parameters

- ***list\_name*** name of ACL assigned to interface.
- **VRF\_INSTANCE** specifies the VRF instance being modified.
  - ***no parameter*** changes are made to the default VRF.
  - ***vrf vrf\_name*** changes are made to the specified user-defined VRF.
- **DIRECTION** transmission direction of packets, relative to interface. Valid options include:
  - **in** inbound packets.

##### Example

These commands apply the IPv4 ACL named **test2** to the control plane.

```
switch(config)# system control-plane
switch(config-system-cp)# ip access-group test2 in
switch(config-system-cp)#
```

---

#### 11.4.7.12 link tracking group (interface)

The **link tracking group** command adds the configuration mode interface to a link-state group and specifies whether it is upstream or downstream.

The **no link tracking group** and **default link tracking group** commands remove the specified link-state group assignment for the configuration mode interface.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

##### Command Syntax

```
link tracking group group_name DIRECTION
```

```
no link tracking group [group_name]
```

```
default link tracking group [group_name]
```

##### Parameters

- **group\_name** link tracking group name.
- **DIRECTION** position of the interface in the link-state group. Valid options include:
  - **upstream**
  - **downstream**

##### Example

These commands create link-state group “xyz” and add **VLAN interface 100** to the group as an upstream interface.

```
switch(config)# link tracking group xyz
switch(config-link-state-xyz)# show active
link tracking group xyz
switch(config-link-state-xyz)# exit
switch(config)# interface vlan 100
switch(config-if-Vl100)# link tracking group xyz upstream
switch(config-if-Vl100)# show active
interface Vlan100
 link state group xyz upstream
switch(config-if-Vl100)#
```

### 11.4.7.13 link tracking group

The **link tracking group** command creates and enables a link-state group and places the switch in link-state-group configuration mode. A link-state group consists of “upstream” interfaces (connections to servers) and “downstream” interfaces (connections to switches and clients). In the event of a failure of all upstream interfaces in the link-state group, the downstream interfaces are shut down.

The **no link tracking group** and **default link tracking group** commands delete the link tracking group from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
link tracking group group_name
no link tracking group group_name
default link tracking group group_name
```

#### Parameter

***group\_name*** link-state group name.

#### Commands available in link-state Configuration Mode

[links minimum](#) configures the minimum number of links that the link-state group requires.

#### Example

This command creates and enables *link-state group 1*.

```
switch(config)# link tracking group 1
switch(config-link-state-1)#
```

---

#### 11.4.7.14 links minimum

The **links minimum** command specifies the minimum number of links the configuration mode link-state group requires.

The **no links minimum** and **default links minimum** commands restore the default minimum value of 1 by deleting the corresponding **links minimum** statement from *running-config*.

##### Command Mode

Link-State Configuration

##### Command Syntax

```
links minimum quantity
no links minimum
default links minimum
```

##### Parameter

**quantity** Minimum number of links. Value ranges from **1** to **100000**. Default value is **1**.

##### Related Commands

- [link tracking group](#) creates and enables a link-state group and places the switch in *link-state* configuration mode.
- [link tracking group \(interface\)](#) adds the configuration mode interface to the specified link-state group.

##### Example

These commands configure link-state tracking group *link-a* to have at least **60** links.

```
switch(config)# link tracking group link-a
switch(config-link-state-link-a)# links minimum 60
switch(config-link-state-link-a)#
```

### 11.4.7.15 load interval

The **load-interval** command changes the load interval for the configuration mode interface. Load interval is the time period over which data is used to compute interface rate counters. Interface rates are exponentially weighted moving averages; recent data samples have greater influence than older samples. Statistics calculated with shorter load intervals are usually more sensitive to short traffic bursts.

The **no load-interval** and **default load-interval** commands restore the default value of **300** seconds by removing the corresponding **load-interval** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

#### Command Syntax

```
load-interval delay
```

```
no load-interval
```

```
default load-interval
```

#### Parameter

**delay** Load interval delay. Values range from **5** to **600** (seconds). Default value is **300** (five minutes).

#### Example

These commands set the load interval for **interface ethernet 7** at **60** seconds.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# load-interval 60
switch(config-if-Et7)#
```

---

#### 11.4.7.16 mac address learning

The **mac address learning** command enables MAC address learning on a VLAN configuration mode. By default, MAC address learning is enabled by on a VLAN.

The **no mac address learning** command disables MAC address learning for the VLAN configuration mode. The **mac address learning** and **default mac address learning** commands enable MAC address learning for the VLAN configuration mode by deleting the corresponding **no mac address learning** command from the *running-config*.

##### Command Mode

Interface-VLAN Configuration

##### Command Syntax

```
mac address learning local limit
```

```
no mac address learning local limit
```

```
default mac address learning local limit
```

##### Parameter

**local limit** Maximum number of locally learned dynamic hosts. Range **0-10000**. To reset the learning limit threshold to have no limit, use the **mac address learning** command.

##### Examples

- These commands enable MAC address learning on **vlan 10** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# mac address learning
```

- These commands disable MAC address learning on **vlan 10** configuration.

```
switch(config)# vlan 10
switch(config-vlan-10)# no mac address learning
```

- An example for **5,000** MACs:

```
switch(config-vla-10)# mac address learning local limit 5000 hosts
```

Mac address learning local limit **5000** host.

No mac address learning local limit **5000** host.

Default mac address learning local limit **5000** host.

### 11.4.7.17 mac address-table aging-time

The **mac address-table aging-time** command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

The **no mac address-table aging-time** and **default mac address-table aging-time** commands reset the aging time to its default by removing the **mac address-table aging-time** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
mac-address-table aging-time period
no mac-address-table aging-time
default mac-address-table aging-time
```

#### Parameters

- ***period*** MAC address table aging time. Default is **300** seconds. Options include:
  - **0** disables deletion of table entries on the basis of aging time.
  - **10** through **1000000** (one million) aging period (seconds).

#### Example

This command sets the MAC address table aging time to two minutes (**120** seconds).

```
switch(config)# mac address-table aging-time 120
switch(config)#
```

### 11.4.7.18 mac address-table static

The **mac address-table static** command adds a static entry to the MAC address table. Each table entry references a MAC address, a VLAN, and a list of Layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The command replaces existing dynamic or static table entries with the same VLAN-MAC address. Static entries are not removed by aging ([mac address-table aging-time](#)). Static MAC entries for mirror destinations or LAG members are typically avoided.

The most important byte of a MAC address distinguishes it as a unicast or multicast address:

- **Unicast:** most significant byte is an even number. Examples: **0200.0000.0000**    **1400.0000.0000**.
- **Multicast:** most significant byte is an odd number. Examples: **0300.0000.0000**    **2500.0000.0000**.

The **no mac address-table static** and **default mac address-table static** commands remove corresponding **mac address-table static** commands from **running-config** and MAC address table entries.

#### Command Mode

Global Configuration

#### Command Syntax

```
mac address-table static mac_address vlan v_num [DESTINATION]
no mac address-table static mac_address vlan v_num [DESTINATION]
default mac address-table static mac_address vlan v_num [DESTINATION]
```

#### Parameters

- **mac\_address** Table entry's MAC address (dotted hex notation – H.H.H).
- **v\_num** Table entry's VLAN.
- **DESTINATION** Table entry's port list.

For multicast MAC address entries, the command may contain multiple ports, listed in any order. The CLI accepts only one interface for unicast entries.

- **drop** creates drop entry in table. Valid only for unicast addresses.
    - **interface ethernet e\_range** Ethernet interfaces specified by **e\_range**.
    - **interface port-channel p\_range** Port channel interfaces specified by **p\_range**.
    - **no parameter** Valid for **no** and **default** commands that remove multiple table entries.
- e\_range** and **p\_range** formats include number, range, comma-delimited list of numbers and ranges.

#### Examples

- This command adds a static entry for unicast MAC address **0012.3694.03ec** to the MAC address table.

```
switch(config)# mac address-table static 0012.3694.03ec vlan 3 interface ethernet 7
switch(config)# show mac address-table static
 Mac Address Table

Vlan Mac Address Type Ports Moves Last Move
```

```

3 0012.3694.03ec STATIC Et7
Total Mac Addresses for this criterion: 1

 Multicast Mac Address Table

Vlan Mac Address Type Ports

Total Mac Addresses for this criterion: 0

switch(config)#

```

- These commands add a static drop entry for MAC address **0012.3694.03ec** to the MAC address table, then displays the entry in the MAC address table.

```

switch(config)# mac address-table static 0012.3694.03ec vlan 3 drop
switch(config)# show mac address-table static
 Mac Address Table

Vlan Mac Address Type Ports Moves Last Move

1 0012.3694.03ec STATIC
Total Mac Addresses for this criterion: 1

 Multicast Mac Address Table

Vlan Mac Address Type Ports

Total Mac Addresses for this criterion: 0

switch(config)#

```

- This command adds a static entry for the multicast MAC address **0112.3057.8423** to the MAC address table.

```

switch(config)# mac address-table static 0112.3057.8423 vlan 4 interface
port-channel 10 port-channel 12
switch(config)# show mac address-table
 Mac Address Table

Vlan Mac Address Type Ports Moves Last Move

Total Mac Addresses for this criterion: 0

 Multicast Mac Address Table

Vlan Mac Address Type Ports

4 0112.3057.8423 STATIC Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#

```

---

#### 11.4.7.19 monitor link-flap policy

The **monitor link-flap policy** command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. Link-flap configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Link flap profiles are assigned to Ethernet interfaces and specify conditions that define a link-flap error. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

##### Command Mode

Global Configuration

##### Command Syntax

```
monitor link-flap policy
```

##### Commands Available in Link-flap Configuration Mode

- [default-profiles](#) configures the set of profiles that define the default-profile set.
- [profile max-flaps \(Link Flap Configuration\)](#) configures a link-flap profile.

##### Examples

- These commands place the switch in **link-flap** configuration mode.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)#
```

- This command returns the switch to **global** configuration mode.

```
switch(config-link-flap)# exit
switch(config)#
```

### 11.4.7.20 monitor link-flap profiles

The **monitor link-flap profiles** command enables link-flap monitoring on the configuration mode interface and specifies the error-disable criteria for the interface. Entering a **monitor link-flap profiles** command replaces the corresponding statement in *running-config*.

The command enables the following link flap detection options:

- **monitor link-flap (no profiles listed)**: The interface detects link flaps using the criteria defined by the default-profile set ( [default-profiles](#)).
- **monitor link-flap profiles (at least one profile listed)**: The interface detects link flaps using the criteria of the listed profiles. Error-disable criteria require conditions that match at least one profile.
- **default monitor link-flap**: The interface detects link flaps using the **errdisable flap-setting cause link-flap** and **errdisable recovery cause** commands.
- **no monitor link-flap**: The interface does not detect link flaps.
- **Default monitor link flap** is the default setting.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
monitor link-flap [LF_PROFILES]
```

```
no monitor link-flap
```

```
default monitor link-flap
```

#### Parameters

**LF\_PROFILES** Name of link-flap profiles assigned to interface. Parameter may contain zero, one, or multiple link-flap profile names:

- **no parameter** Link flap criteria determined by default-profile set.
- **profiles profile\_name** Name of single link-flap profile.
- **profiles profile\_name\_1 profile\_name\_2 ... profile\_name\_N** List of link-flap profile names.

#### Examples

- This command applies the **LF03** and **LF04** link flap profiles to *interface ethernet 33*.

```
switch(config)# interface ethernet 33
switch(config-if-Et33)# monitor link-flap profiles LF03 LF04
switch(config-if-Et33)# show active
interface Ethernet33
 monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on *interface ethernet 34*.

```
switch(config)# interface ethernet 34
switch(config-if-Et34)# no monitor link-flap
switch(config-if-Et34)# show active
interface Ethernet34
 no monitor link-flap
switch(config-if-Et34)#
```

---

#### 11.4.7.21 monitor server-failure link

The **monitor server-failure link** command enables Rapid Automated Indication of Link-loss (RAIL) on the configuration mode interface. RAIL must be properly configured globally or this command has no effect on switch operation.

When an interface monitored by RAIL goes down, the switch performs these steps for servers that the switch accesses from the interface:

1. IP addresses of the servers are removed from ARP cache.
2. A dynamic MAC entry is added to the MAC address table for each server. The port for each entry is listed as CPU.

The **no monitor server-failure link** and **default monitor server-failure link** commands disable RAIL on the configuration mode interface by deleting the corresponding **monitor server-failure link** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
monitor server-failure link
no monitor server-failure link
default monitor server-failure link
```

##### Related Commands

[monitor server-failure](#) places the switch in server-failure configuration mode for configuring RAIL.

##### Example

These commands enable RAIL on *interface port-channel 100*.

```
switch(config)# interface port-channel 100
switch(config-if-Po100)# monitor server-failure link
switch(config-if-Po100)# show active
interface Port-Channel100
 monitor server-failure link
switch(config-if-Po100)#
```

### 11.4.7.22 monitor server-failure

The **monitor server-failure** command places the switch in server-failure configuration mode. Rapid Automated Indication of Link-loss (RAIL) settings are configured in server-failure configuration mode. RAIL is disabled by default and is enabled by the **no shutdown** command in server-failure configuration mode.

The **no monitor server-failure** and **default monitor server-failure** commands disable RAIL and restore all settings to their default state by removing all server-failure configuration mode statements from **running-config**.

Server-failure configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting server-failure configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor server-failure
no monitor server-failure
default monitor server-failure
```

#### Commands Available in server-failure Configuration Mode

- [network \(server-failure configuration mode\)](#)
- [proxy \(server-failure configuration mode\)](#)
- [shutdown \(server-failure configuration mode\)](#)

#### Examples

- These commands place the switch in server-failure configuration mode and enables RAIL.

```
switch(config)# monitor server-failure
switch(config-server-failure)# show active
switch(config-server-failure)# no shutdown
switch(config-server-failure)# show active
monitor server-failure
no shutdown
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from **running-config**.

```
switch(config)# no monitor server-failure
switch(config)#
```

### 11.4.7.23 monitor session destination cpu

The **monitor session destination cpu** command configures the CPU as the destination port of a specified port mirroring session. The **monitor session source** command configures the source port of the mirroring session. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction.

The CPU can only be configured as a destination for a mirroring session, not as a source. However, the CPU can serve as the destination for multiple mirroring sessions. Traffic mirrored to the CPU can be viewed using tcpdump.

The **no monitor session destination cpu** and **default monitor session destination cpu** commands remove the mirror session destination assignment by deleting the corresponding **monitor session destination cpu** command from *running-config*. The **no monitor session** command removes the entire mirror session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name destination cpu
no monitor session session_name destination cpu
default monitor session session_name destination cpu
```

#### Parameter

**session\_name** Label assigned to port mirroring session.

#### Guidelines

To view the traffic mirrored to the CPU from a source port, use tcpdump from the Bash shell, with the source interface as an argument. This causes tcpdump to capture packets from the kernel interface of the source port.

#### Examples

- These commands configure **interface ethernet 35** as the source and the CPU as the destination port for the **redirect\_1** mirroring session, then display the mirror interface.

```
switch(config)# monitor session redirect_1 destination cpu
switch(config)# monitor session redirect_1 source ethernet 35
switch(config)# show monitor session

Session redirect_1

Source Ports:

 Both: Et35

Destination Ports:

 Cpu : active (mirror0)

switch(config)#
```

- This command uses tcpdump to view the traffic mirrored by the **redirect\_1** mirroring session. The CPU mirror interface specified in the previous output must be used in the tcpdump expression (in this case, **mirror0**).

```
switch# bash tcpdump -i mirror0
tcpdump: WARNING: mirror0: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
```

```
listening on mirror0, link-type EN10MB (Ethernet), capture size 65535 bytes
09:51:12.478363 00:1c:73:27:a6:d3 (oui Arista Networks) > 01:80:c2:00:00:00 (oui

```

#### 11.4.7.24 monitor session destination

The **monitor session destination** command configures an interface as the destination port of a specified port mirroring session. The destination is usually an Ethernet interface, but other options are available on certain platforms (see **Guidelines**). The **monitor session source** command configures the source port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously used as both source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic only from one direction.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

The **no monitor session destination** and **default monitor session destination** commands remove the mirroring session destination assignment by deleting the corresponding **monitor session destination** command from *running-config*. The **no monitor session** removes the entire mirroring session.

##### Command Mode

Global Configuration

##### Command Syntax

```
monitor session session_name destination{cpu | ethernet e_range | port-channel p_range | tunnel mode}
```

```
no monitor session session_name destination
```

```
default monitor session session_name destination
```

##### Parameters

- **session\_name** label assigned to the port mirroring session.
- **cpu** configures a CPU as the destination interface.
- **ethernet e\_range** configures Ethernet interfaces specified by **e\_range** as the destination interface. The ethernet interface value ranges from **1** to **50**.
- **port-channel p\_range** configures port channel interfaces specified by **p\_range** as the destination interface. The port-channel value ranges from **1** to **2000**.
- **tunnel mode** configures a tunnel as the destination interface. Option includes:
  - **gre** configures GRE-tunnel as the destination interface.

##### Guidelines

Tunnel mode is supported on select platforms only.

Port mirroring capacity varies by platforms. The session destination capacity of switches on each platform is listed below:

- **Arad Platform:** Ethernet interfaces (one).
- **FM6000 Platform:** Ethernet interfaces (any count), Port channel interfaces (any count), CPU.
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Trident Platform:** Ethernet interfaces (one).
- **Trident II Platform:** Ethernet interfaces (one).

When there are multiple transmit (Tx) sources in a monitor session, mirrored frames use Tx properties of the lowest numbered Tx mirror source configured. Packets are modified based on properties.

Allowed VLANs on the **ethernet8** source interface are **10, 20** and **30**. Allowed VLANs on **ethernet9** source interface are **30, 40**, and **50**. The frames going out of **ethernet9** tagged with **10, 20**, and **30** appears at the mirrored destination as tagged frames. The tagged frames with **40** or **50** on **ethernet9** appears at the mirrored destination as untagged frames. Since **ethernet8** is the lowest numbered source interface, all Tx frames on ethernet8 are tagged in the mirrored destination.

### Examples

- This command configures **interface ethernet 8** as the destination port for the **redirect\_1** mirroring session.

```
switch(config)# monitor session redirect_1 destination ethernet 2
switch(config)# show monitor session

Session redirect_1

Source Ports:

Destination Ports:

 Et2 : active

switch(config)#
```

- This command configures a GRE tunnel with source and destination addresses as **1.1.1.1** and **2.2.2.2** respectively as the destination interface for the **redirect\_2** mirroring.

```
switch(config)# monitor session redirect_2 destination tunnel mode gre source
1.1.1.1 destination 2.2.2.2
switch(config)# show monitor session

Session redirect_2

Source Ports:

Destination Ports:

 status source dest TTL DSCP proto VRF fwd-drop
Grel : active 1.1.1.1 2.2.2.2 128 0 0x88be default no

switch(config)#
```

---

### 11.4.7.25 monitor session forwarding-drop

The **monitor session forwarding-drop** command configures a forwarding-drop session for mirroring ingress packets that are dropped during ASIC forwarding.

The **no monitor session forwarding-drop** and **default monitor session forwarding-drop** commands delete the current forwarding-drop configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name forwarding-drop destination tunnel mode
no monitor session session_name forwarding-drop destination tunnel mode
default monitor session session_name forwarding-drop destination tunnel mode
```

#### Parameters

- **destination** specifies to mirror packets at destination.
- **tunnel mode** specifies to mirror packets that pass through a tunnel. Options include:
  - **gre** configures GRE-tunnel as the destination interface.

#### Related Commands

- [monitor session destination](#)
- [monitor session destination cpu](#)
- [show monitor session](#)

#### Guidelines

The forwarding-drop configuration is supported on select platforms only.

#### Example

This command configures a forwarding-drop session to **1.1.1.1** as the destination.

```
switch(config)# monitor session 1 forwarding-drop destination tunnel mode gre source 1.1.1.1
destination
2.2.2.2
switch(config)# show monitor session

Session 1

Programmed in HW: No
Source Ports:
Destination Ports:
 status source dest TTL DSCP proto VRF fwd-drop
Grel : active 1.1.1.1 2.2.2.2 128 0 0x88be default yes

switch(config)#
```

### 11.4.7.26 monitor session ip access-group

The **monitor session ip access-group** command configures an ACL to filter the traffic being mirrored to the destination port. ACLs applied to a source port affect the RX side of the interface, and do not impact the TX side of the interface. TX mirrored packets cannot be filtered, and will continue to be sent to the mirror destination.

The **no monitor session ip access-group** and **default monitor session ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session ip access-group** command from *running-config*. The **no monitor session** command removes the entire mirror session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name ip access-group acl_name
```

```
no monitor session session_name ip access-group
```

```
default monitor session session_name ip access-group
```

#### Parameters

- **session\_name** Label assigned to port mirroring session.
- **acl\_name** The ACL to be applied to filter traffic for the specified session.

#### Examples

- These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session **redirect\_1**.

```
switch(config)# ip access-list allow-host
switch(config-acl-allow-host)# 10 permit ip host 192.168.11.24 host 10.0.215.23
switch(config-acl-allow-host)# 20 deny ip any any
switch(config-acl-allow-host)# exit
switch(config)#
switch(config)# monitor session redirect_1 ip access-group allow-host
switch(config)#
```

- Use the **show monitor session** command to verify the configuration.

```
switch# show monitor session
Session redirect_1

Source Ports:
Both: Et35(Acl:allow-host)
Destination Ports:
Cpu : active (mirror0)
ip access-group: allow-host switch#
```

---

#### 11.4.7.27 monitor session source

The **monitor session source** command configures the source port of a specified port mirroring session. The **monitor session destination** or **monitor session destination cpu** command configures the destination port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. An interface which is part of a port channel cannot be used as a source, but a port channel which is a member of an MLAG can be used. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

The **no monitor session source** and **default monitor session source** commands remove the mirroring session source assignment by deleting the corresponding **monitor session source** command from *running-config*. The **no monitor session** removes entire the mirroring session.

##### Command Mode

Global Configuration

##### Command Syntax

```
monitor session session_name source INT_NAME DIRECTION
no monitor session session_name source INT_NAME DIRECTION
default monitor session session_name source INT_NAME DIRECTION
```

##### Parameters

- **session\_name** Label assigned to port mirroring session.
- **INT\_NAME** Source interface for the mirroring session.
  - **ethernet e\_range** Ethernet interfaces specified by *e\_range*.
  - **port-channel p\_range** Port channel interfaces specified by *p\_range*.
- **DIRECTION** transmission direction of traffic to be mirrored.
  - **no parameter** mirrors transmitted and received traffic.
  - **both** mirrors transmitted and received traffic.
  - **rx** mirrors received traffic only.
  - **tx** mirrors transmitted traffic only.

##### Guidelines

On DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series, due to limitations of the switch ASIC, all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device is unable to process VLAN tags in a desirable manner mirroring should be configured exclusively for ingress traffic by specifying **rx**.

##### Restrictions

Port mirroring capacity varies by platform. Session source capacity for each platform is listed below:

- **FM6000 Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Arad Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways).
- **Trident Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Trident II Platform:** Ethernet interfaces (any number), port channel interfaces (any number).

The number of interfaces that can be effectively mirrored is restricted by the destination port speed.

##### Example

This command configures ***interface ethernet 7*** as the source port for ***redirect\_1*** mirroring session.

```
switch(config)# monitor session redirect_1 source ethernet 7
switch(config)#
```

---

#### 11.4.7.28 monitor session source ip access-group

The **monitor session source ip access-group** command configures an ACL to filter the traffic being mirrored from a specific source port. This enables the ability to filter traffic using a different ACL on each source port and have the combined matched traffic sent to the destination port.

The **no monitor session source ip access-group** and **default monitor session source ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session source ip access-group** command from *running-config*. The **no monitor session** command removes the entire mirror session.

##### Command Mode

Global Configuration

##### Command Syntax

```
monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
no monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
default monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
```

##### Parameters

- **s\_name** Label assigned to port mirroring session.
- **INT\_NAME** Source interface for the mirroring session.
  - **ethernet e\_range** Ethernet interfaces specified by *e\_range*.
  - **port-channel p\_range** Port channel interfaces specified by *p\_range*.
- **DIRECT** transmission direction of traffic to be mirrored. Options include:
  - **no parameter** mirrors received traffic only.
  - **rx** mirrors received traffic only.
- **acl\_name** The ACL to be applied to filter traffic for the specified session.

##### Example

These commands create ACLs and apply them to filter the traffic mirrored from two source ports by session *redir\_1*.

```
switch(config)# ip access-list allow-host-x
switch(config-acl-allow-host-x)# 10 permit ip host 192.168.11.24 host 10.0.215.23
switch(config-acl-allow-host-x)# 20 deny ip any any
switch(config-acl-allow-host-x)# exit
switch(config)# ip access-list allow-host-y
switch(config-acl-allow-host-y)# 10 permit ip host 172.16.233.80 host 10.0.215.23
switch(config-acl-allow-host-y)# 20 deny ip any any
switch(config-acl-allow-host-y)# exit
switch(config)# monitor session redir_1 source ethernet 5,9 rx
switch(config)# monitor session redir_1 source ethernet 5 ip access-group allow-host-x
switch(config)# monitor session redir_1 source ethernet 9 ip access-group allow-host-y
switch(config)#
```

### 11.4.7.29 monitor session truncate

The **monitor session truncate** command configures a port mirroring session to truncate mirrored packets, retaining only the first **160** bytes. Packet truncation can be used to prevent oversubscription of the session's destination port.

Packet truncation applies to the mirroring session as a whole, and cannot be applied to individual source ports.

The **no monitor session truncate** and **default monitor session truncate** commands restores mirroring of full packets by deleting the corresponding **monitor session truncate** command from *running-config*. The **no monitor session** removes the entire mirroring session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name truncate
no monitor session session_name truncate
default monitor session session_name truncate
```

#### Parameters

**session\_name**    Label assigned to port mirroring session.

#### Example

This command configures mirroring session **redirect\_1** to truncate mirrored packets.

```
switch(config)# monitor session redirect_1 truncate
switch(config)#
```

---

### 11.4.7.30 mtu

The **mtu** command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. The switch fragments IP packets that are larger than the MTU value for the outbound interface. An interface's MTU value is displayed with the [show interfaces](#) command.

MTU is independently configurable on all routable interfaces.

The **no mtu** and **default mtu** commands restore the interface's MTU to the default value by removing the corresponding mtu command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

**mtu** *bytes*

**no mtu**

**default mtu**

#### Parameter

**bytes** MTU size (bytes). Values range from **68** to **9214**. The default MTU size is **1500** bytes.

#### Example

This command sets the MTU size of **1492** bytes on *interface vlan 20*.

```
switch(config)# interface vlan 20
switch(config-if-Vl20)# mtu 1492
switch(config-if-Vl20)#
```

### 11.4.7.31 network (server-failure configuration mode)

The **network** command specifies the IPv4 network space that Rapid Automated Indication of Link-loss (RAIL) monitors for failed links to connected servers. RAIL reduces the wait time for applications on directly connected servers that are blocked due to a failed link. **Running-config** supports simultaneous network command, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

The **no network** and **default network** commands terminate the RAIL monitoring of the specified IPv4 address space by deleting the corresponding **network** command from **running-config**.

#### Command Mode

Server-failure Configuration

#### Command Syntax

```
network netv4_address
no network netv4_address
default network netv4_address
```

#### Parameter

**netv4\_addr** IPv4 subnet address to be monitored (CIDR or address-mask notation).

#### Related Command

[monitor server-failure](#) places the switch in server-failure configuration mode.

#### Example

This command specifies two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)# monitor server
switch(config-server-failure)# network 10.1.1.0/24
switch(config-server-failure)# network 10.2.1.96/28
switch(config-server-failure)# show active
monitor server-failure
 network 10.2.1.96/28
 network 10.1.1.0/24
switch(config-server-failure)#
```

---

#### 11.4.7.32 no monitor session

The **no monitor session** and default monitor session commands remove the specified monitor session from the switch by deleting all corresponding monitor commands from **running-config**. Commands that remove or alter individual commands within a session configuration are described in the [monitor session destination](#) and [monitor session source](#) commands.

##### Command Mode

Global Configuration

##### Command Syntax

```
no monitor session session_name
default monitor session session_name
```

##### Parameter

**session\_name** Label assigned to port mirroring session.

##### Example

This command displays the configuration of the **redirect\_1** mirroring session, deletes the session, then confirms that the session was removed.

```
switch(config)# show monitor session redirect_1
Session redirect_1

Source Ports
 Both: Et7
Destination Port: Et8
switch(config)# no monitor session redirect_1
switch(config)# show monitor session redirect_1
Session not created

switch(config)#
```

### 11.4.7.33 phy diag

Use the **phy diag** command to configure a test pattern in the interface configuration mode. The **no** and **default** forms of the command disables the test pattern.

#### Command Mode

Interface configuration mode

#### Command Syntax

```
phy diag [transmitter | receiver] test pattern TestPattern
```

```
no phy diag [transmitter | receiver] test pattern TestPattern
```

```
default phy diag [transmitter | receiver] test pattern TestPattern
```

#### Parameters

- **transmitter** Configures the physical transmitter.
- **receiver** Configures the physical receiver.
- **test pattern *TestPattern*** Configures the named test pattern.

#### Examples

- Enable a test pattern on an interface using the **phy diag** command. You can select the transmitter or the receiver. To display the available interfaces, select **test pattern ?**.

```
switch(config-if)# phy diag [transmitter | receiver] test pattern ?
PRBS11 Configure the PRBS11 test pattern
PRBS15 Configure the PRBS15 test pattern
PRBS23 Configure the PRBS23 test pattern
PRBS31 Configure the PRBS31 test pattern
PRBS49 Configure the PRBS49 test pattern
PRBS58 Configure the PRBS58 test pattern
PRBS7 Configure the PRBS7 test pattern
PRBS9 Configure the PRBS9 test pattern
```

- To disable a test pattern on an interface, enter the following command. You can select the transmitter or the receiver, as well as the selected named test pattern.

```
switch(config-if)# no phy diag [transmitter | receiver] test pattern TestPattern
```

- By default, a test pattern is disabled.

```
switch(config-if)# default phy diag [transmitter | receiver] test pattern
```

- The following command clears the recorded test pattern status data for all the interfaces. Upon running the command, all the counter values are set to **0** and link states are marked as **not locked**.

```
switch# clear phy diag test pattern
```

---

#### 11.4.7.34 platform sand monitor serdes error log

The **platform sand monitor serdes error log** command is used for enabling the serdes error log for fabric link monitoring.

##### Command Mode

Global Configuration

##### Command Syntax

```
platform sand monitor serdes error log
```

##### Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)# platform sand monitor serdes error log
switch(config)#
```

#### 11.4.7.35 platform sand monitor serdes error threshold

The **platform sand monitor serdes error threshold** command is used for generating a fabric link monitoring serdes error threshold.

##### Command Mode

Global Configuration

##### Command Syntax

```
platform sand monitor serdes error threshold
```

##### Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between **200** and **30000** received cells.

```
switch(config)# platform sand monitor serdes error threshold 200 30000
switch(config)#
```

---

#### 11.4.7.36 platform sand monitor serdes poll period

The `platform sand monitor serdes poll period` command is used to enable the serdes poll period.

##### Command Mode

Global Configuration

##### Command Syntax

```
platform sand monitor serdes poll period
```

##### Example

This command changes the serdes polling period for fabric link monitoring to **6** seconds.

```
switch(config)# platform sand monitor serdes poll period 6
switch(config)#
```

### 11.4.7.37 platform sand monitor serdes poll threshold isolation

The **platform sand monitor serdes poll threshold isolation** command is used to set and enables fabric link monitoring for serdes poll threshold isolation.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand monitor serdes poll threshold isolation
```

#### Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is **5** consecutive polls.

```
switch(config)# platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

---

#### 11.4.7.38 platform sand monitor serdes poll threshold recovery

The **platform sand monitor serdes poll threshold recovery** command is used to set and enable fabric link monitoring for serdes poll threshold recovery.

##### Command Mode

Global Configuration

##### Command Syntax

```
platform sand monitor serdes poll threshold recovery
```

##### Example

This command changes the number of consecutive serdes polls used for threshold recovery to **6** seconds.

```
switch(config)# platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

### 11.4.7.39 profile max-flaps (Link Flap Configuration)

The **profile max-flaps** command creates a link flap profile that, when assigned to an Ethernet interface, specifies the conditions that result in an error-disable action. Link flap profile parameters include:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

By default, **violations** and **intervals** are each set to one, resulting in a profile that triggers a link-flap error when the specified frequency is exceeded once. By configuring violations and intervals, link-flap errors are defined when the frequency is exceeded multiple times over a specified set of intervals.

**Default** is a reserved profile name that modifies the [errdisable flap-setting cause link-flap](#) statement in *running-config*. When configuring the **default** profile, **violations** and **intervals** are disregarded.

The **no profile max-flaps** command removes the specified profile by deleting the corresponding **profile max-flaps** command from *running-config*. The **no profile max-flaps default** command restores default [errdisable flap-setting cause link-flap](#) values by removing that command from *running-config*.

#### Command Mode

Link-flap Configuration

#### Command Syntax

```
profile PROFILE_NAME max-flaps flap_max time period [EXTENSIONS]
no profile LF_PROFILE
```

#### Parameters

- **PROFILE\_NAME** Name of link flap profile. Options include:
  - **default** command modifies default values ([errdisable flap-setting cause link-flap](#)).
  - **profile\_name** command modifies specified link-flap profile.
- **flap\_max** Threshold number of interface state changes. Value ranges from **1** to **100**.
- **period** Interval when flaps accumulate toward threshold (seconds). Value ranges from **1** to **1800**.
- **EXTENSIONS** Configures multi-flap triggers. Options include:
  - **no parameter** Sets errors and episodes to default values (one).
  - **violations errors intervals episodes** Link flap errors (**errors**) and number of periods (**episodes**).
    - **Errors** range is **1** to **1000**. Default value is **1**.
    - **Episodes** range is **1** to **1000**. Default value is **1**.

#### Related Command

[monitor link-flap policy](#) places the switch in **link-flap** configuration mode.

#### Example

These commands create two link flap profiles with various trigger settings.

```
switch(config)# monitor link-flap policy
switch(config-link-flap)# profile LF01 max-flaps 15 time 60
switch(config-link-flap)# profile LF02 max-flaps 10 time 30 violations 5 intervals 10
```

---

```
switch(config-link-flap)# show active
monitor link-flap policy
 profile LF01 max-flaps 15 time 60 violations 1 intervals 1
 profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#
```

#### 11.4.7.40 proxy (server-failure configuration mode)

The **proxy** command enables the Rapid Automated Indication of Link-loss (RAIL) proxy setting and specifies the interval that RAIL responds to messages sent to servers on failed links, starting from when the switch detects the failed link. The RAIL state machine is in the proxying state during the timeout interval this command specifies. When RAIL proxy is not enabled, the switch maintains a list of unavailable servers without responding to messages sent the servers. The switch can enter RAIL proxy state only when this command is enabled.

The RAIL proxy setting is **disabled** by default. When RAIL proxy is enabled, the default period is three minutes.

The **no proxy** and **default proxy** commands return the RAIL proxy setting to disabled by removing the proxy statement from *running-config*.

The **no proxy lifetime** and **default proxy lifetime** command sets the proxy time setting to its default value of three minutes if the RAIL proxy setting is **enabled**. These commands have no effect if the RAIL proxy setting is **disabled**.

##### Command Mode

Server-failure Configuration

##### Command Syntax

```
proxy [lifetime time_span]
no proxy [lifetime]
default proxy [lifetime]
```

##### Parameter

**timespan** proxy timeout period (minutes). Value ranges from 1 to **10080**. Default value is **3**.

##### Related Command

[monitor server-failure](#) places the switch in server-failure configuration mode.

##### Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of 10 minutes.

```
switch(config)# monitor server
switch(config-server-failure)# proxy lifetime 10
switch(config-server-failure)# show active
monitor server-failure
 proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of 3 minutes.

```
switch(config-server-failure)# no proxy lifetime
switch(config-server-failure)# show active
monitor server-failure
 proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)# no proxy
switch(config-server-failure)# show active
monitor server-failure
switch(config-server-failure)#
```

---

#### 11.4.7.41 show bridge mac-address-table aging timeout

The **show bridge mac-address-table aging timeout** command displays the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries that exceed the aging time.

Aging time ranges from **10** seconds to **1000000** seconds with a default of **300** seconds (five minutes).

##### Command Mode

EXEC

##### Command Syntax

```
show bridge mac-address-table aging timeout
```

##### Example

This command shows the MAC address table aging time.

```
switch> show bridge mac-address-table aging timeout
Global Aging Time: 120 switch>
```

#### 11.4.7.42 show errdisable recovery

The **show errdisable recovery** command displays information about the recovery intervals and error disable causes.

##### Command Mode

EXEC

##### Command Syntax

```
show errdisable recovery
```

##### Parameter

*no parameter* state of the system.

##### Example

The following output is for a system where the causes are listed and interval timer for each cause is identified along with the timer status.

```
switch# show errdisable recovery
Errdisable Reason Timer Status Timer Interval

bpduguard Disabled 30
hitless-reload-down Disabled 300
lacp-no-portid Disabled N/A
lacp-rate-limit Disabled 300
license-enforce Disabled N/A
link-flap Disabled 300
no-internal-vlan Disabled 300
uplink-failure-detection Disabled 300
```

---

#### 11.4.7.43 show fabric monitoring health

The **platform sand monitor health** command is used to display the fabric monitoring connected state status with isolated links.

##### Command Mode

Global Configuration

##### Command Syntax

**platform sand monitor health**

##### Example

This command displays the connected state status with isolated links.

```
switch(config)# show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

#### 11.4.7.44 show interfaces

The **show interfaces** command displays operational status and configuration information of specified interfaces. The output includes speed, duplex, flow control information and basic interface statistics.

The input and output bit rates, as displayed, do not include framing bits that are part of the Ethernet standard, the inter-frame gap and preamble that total 20 bytes per packet. The percentage number includes those framing bits to provide a better link utilization estimate.

##### Command Mode

EXEC

##### Command Syntax

**show interfaces** [INT\_NAME]

##### Parameters

**INT\_NAME** Interface type and numbers. Options include:

- **no parameter** all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **loopback l\_range** Loopback interface specified by **l\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
- **vlan v\_range** VLAN interface range specified by **v\_range**.
- **VXLAN vx\_range** VXLAN interface range specified by **vx\_range**.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

##### Example

This command display configuration and status information for Ethernet interface **1** and **2**.

```
switch> show interfaces ethernet 1-2
Ethernet1 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.2481.7647 (bia 001c.2481.7647)
 Description: mkt.1
 MTU 9212 bytes, BW 10000000 Kbit
 Full-duplex, 10Gb/s, auto negotiation: off
 Last clearing of "show interface" counters never
 5 seconds input rate 33.5 Mbps (0.3% with framing), 846 packets/sec
 5 seconds output rate 180 kbps (0.0% with framing), 55 packets/sec
 76437268 packets input, 94280286608 bytes
 Received 2208 broadcasts, 73358 multicast
 0 runts, 0 giants
 0 input errors, 0 CRC, 0 alignment, 0 symbol
 0 PAUSE input
 6184281 packets output, 4071319140 bytes
 Sent 2209 broadcasts, 345754 multicast
 0 output errors, 0 collisions
 0 late collision, 0 deferred
 0 PAUSE output
Ethernet2 is up, line protocol is up (connected)
 Hardware is Ethernet, address is 001c.2481.7648 (bia 001c.2481.7648)
 Description: mkt.2
 MTU 9212 bytes, BW 10000000 Kbit
 Full-duplex, 10Gb/s, auto negotiation: off
 Last clearing of "show interface" counters never
 5 seconds input rate 711 kbps (0.0% with framing), 271 packets/sec
 5 seconds output rate 239 kbps (0.0% with framing), 65 packets/sec
 73746370 packets input, 78455101010 bytes
 Received 11 broadcasts, 83914 multicast
 0 runts, 0 giants
 0 input errors, 0 CRC, 0 alignment, 0 symbol
 0 PAUSE input
 5687714 packets output, 4325064454 bytes
 Sent 15 broadcasts, 107279 multicast
```

---

```
0 output errors, 0 collisions
0 late collision, 0 deferred
0 PAUSE output switch>
```

#### 11.4.7.45 show interfaces description

The **show interfaces description** command displays the status and description text of the specified interfaces. The [description](#) command configures an interface's description parameter.

##### Command Mode

EXEC

##### Command Syntax

```
show interfaces [INT_NAME] description
```

##### Parameters

**INT\_NAME** Interface type and labels. Options include:

- **no parameter** all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **loopback l\_range** Loopback interface specified by **l\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
- **vlan v\_range** VLAN interface range specified by **vx\_range**.
- **VXLAN vx\_range** VXLAN interface range specified by **vx\_range**.

Range formats include number, number range, or comma-delimited list of numbers and ranges.

##### Example

This command displays description text and status of **interfaces ethernet 1-10**.

```
switch> show interfaces ethernet 1-10 description
Interface Status Protocol Description
Et1 up up ctar_01
Et2 up up ctar_02
Et3 up up ctar_03
Et4 up up fobd_01
Et5 up up fobd_02
Et6 up up yzrq_01
Et7 up up yzrq_02
Et8 down down yzrq_03
Et9 up up yzrq_04
Et10 up up yzrq_05 switch>
```

#### 11.4.7.46 show interfaces phy diag

##### Command Mode

EXEC

##### Command Syntax

```
show interfaces [interface type interface range] phy diag [error-correction | test pattern]
```

##### Parameters

- **interface type *interface range*** Type of interface and range.
- **error-correction** Forwards error correction.
- **test pattern** Displays test patterns.

##### Guidelines

The user-configured test pattern is displayed under the **Configured** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **Operational** column. The **Available** column lists the test patterns available for the interface.

##### Example

- In this example, interfaces ethernet **26/1** and **31/1** in the **show interfaces ethernet 26/1,31/1 phy diag test pattern** command are selected to display the configured and operational test pattern, and the available test patterns.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern
 Configured Operational
Interface Transmit Receive Transmit Receive Available

Ethernet26/1 PRBS15 PRBS15 PRBS15 PRBS15 PRBS 7,9,11,15,23,31,58
Ethernet31/1 PRBS7 PRBS31 PRBS7 PRBS31 PRBS 7,9,11,15,23,31,58
```

The user-configured test pattern is displayed under the **Configured** column, which is divided based on transmitter and receiver configuration. The currently operational test pattern is displayed under the **Operational** column. The **Available** column lists the test patterns available for the interface.

- In this example, the **show interfaces ethernet 26/1 phys detail | i Test pattern** command displays the operational test pattern for an interface. Here the **Test pattern** field will not be available, on disabling the test pattern.

```
switch# show interfaces ethernet 26/1 phy detail | i Test pattern
Test pattern enabled
switch# show interfaces ethernet 31/1 phy detail | i Test pattern
Test pattern enabled
```

- In this example, the **show interfaces ethernet 26/1,31/1 phy diag test pattern counters** command displays test pattern link state and error information.

The following information is listed in the display output:

- **Link state:** whether or not the checker locked on to the configured test pattern.
- **Bit Errors:** the accumulated number of bit errors.
- **Largest Burst:** the largest burst of errors that occurred.
- **Burst Count:** the number of occurrences of errors.
- **Last Error Time:** the last time an error has occurred, 'never' if no errors have occurred.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern counters
Current System Time: Wed May 30 22:24:32 2018
 Largest Burst
```

| Interface    | Lane | Link State | Bit Errors | Burst  | Count | Last Error Time |
|--------------|------|------------|------------|--------|-------|-----------------|
| Ethernet26/1 | 0    | locked     | 409266     | 409266 | 1     | 0:21:27 ago     |
| Ethernet26/1 | 1    | locked     | 347084     | 347084 | 1     | 0:21:27 ago     |
| Ethernet26/1 | 2    | locked     | 420681     | 420681 | 1     | 0:21:27 ago     |
| Ethernet26/1 | 3    | locked     | 392969     | 392969 | 1     | 0:21:27 ago     |
| Ethernet31/1 | 0    | not locked | 1417655    | 651822 | 3     | 0:03:20 ago     |
| Ethernet31/1 | 1    | not locked | 1782238    | 736819 | 3     | 0:03:20 ago     |
| Ethernet31/1 | 2    | not locked | 1760538    | 866185 | 3     | 0:03:20 ago     |
| Ethernet31/1 | 3    | not locked | 1817413    | 923941 | 3     | 0:03:20 ago     |

- In this example, the **show interfaces ethernet 26/1,31/1 phy diag test pattern counters** command displays the lock state of an interface along with a detailed information on the recorded bit errors.

The following information is listed in the display output:

- Last clear:** the time when the test pattern results were last cleared.
- Operational test pattern:** the test pattern operational at the receiver side.
- Bit rate:** the transmission bit rate.
- Lock state:** the current lock status, number of times it changed and the last time the lock status got changed.
  - locked:** receiver is able to lock on to the incoming test pattern.
  - not locked:** receiver is not able to lock on to the incoming test pattern.
- Largest burst:** the largest burst of errors that occurred.
- Bit errors\*:** the accumulated number of errors, number of occurrences of errors, and last time errors were captured. The \* suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- Total Bits:** the total bits received.
- Bit error rate (BER)\*:** the ratio of captured bit errors to the total bit received. The \* suffix, indicating that data may not be accurate due to loss of lock, is applied if the current lock status is not locked or if the lock status has changed more than once. This suffix is cleared when the test pattern status data is cleared via the CLI listed above.
- Bit errors since last lock:** the accumulated number of errors since last time lock was gained.
- Total bits since last lock:** the total bits received since last lock.
- BER since last lock:** the ratio of captured bit errors to the total bit received since last lock.

```
switch# show interfaces ethernet 26/1,31/1 phy diag test pattern counters detail

#### 11.4.7.47 show link tracking group

The **show link tracking group** command displays information about a specified link-state group or about all groups.

##### Command Mode

EXEC

##### Command Syntax

```
show link tracking group [DATA_LEVEL][GROUPS]
```

##### Parameters

- **DATA\_LEVEL** device for which the command provides data. Options include:
  - **no parameter** information about all groups in group list.
  - **detail** detailed information about all groups in group list.
- **GROUPS**
  - **no parameter** all link-state groups.
  - **group\_name** link-state group name.

##### Example

This command displays all the link-state group information.

```
switch# show link tracking group detail
Link State Group: 1 Status: up
Upstream Interfaces : Vlan100
Downstream Interfaces : Vlan200
Number of times disabled : 2
Last disabled 0:10:29 ago

Link State Group: group3 Status: down
Upstream Interfaces : Ethernet24
Downstream Interfaces : Ethernet8
Number of times disabled : 2
Last disabled 0:30:35 ago

Link State Group: 2 Status: up
Upstream Interfaces : Ethernet2 Ethernet5
Downstream Interfaces : Ethernet12
Number of times disabled : 0
Last disabled never switch#
```

#### 11.4.7.48 show mac address-table

The **show mac-address-table** command displays the specified MAC address table entries.

##### Command Mode

EXEC

##### Command Syntax

**show mac address-table** [ENTRY\_TYPE][MAC\_ADDR][INTF\_1 ... INTF\_N][VLAN]

##### Parameters

- **ENTRY\_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - **no parameter** all table entries.
  - **configured** static entries; includes unconfigured VLAN entries.
  - **dynamic** entries learned by the switch.
  - **static** entries entered by CLI commands and include a configured VLAN.
  - **unicast** entries with unicast MAC address.
- **MAC\_ADDR** command uses MAC address to filter displayed entries.
  - **no parameter** all MAC addresses table entries.
  - **address mac\_address** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF\_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - **no parameter** all Ethernet and port channel interfaces.
  - **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
  - **port-channel p\_range** Port channel interfaces specified by **p\_range**.
- **VLAN** command filters display by VLAN.
  - **no parameter** all VLANs.
  - **vlan v\_num** VLANs specified by **v\_num**.

#### 11.4.7.49 show mac address-table count

The **show mac-address-table count** command displays the number of entries in the MAC address table for the specified VLAN or for all VLANs.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table count [VLANs]
```

##### Parameters

**VLANs** The VLANs for which the command displays the entry count.

- **no parameter** all configured VLANs.
- **vlan v\_num** VLAN interface specified by **v\_num**.

##### Example

This command displays the number of entries on **VLAN 39**.

```
switch> show mac address-table count vlan 39

Mac Entries for Vlan 39:

Dynamic Address Count : 1
Unicast Static Address Count : 1
Multicast Static Address Count : 0
Total Mac Addresses : 2 switch>
```

### 11.4.7.50 show mac address-table mlag-peer

The **show mac-address-table mlag-peer** command displays the specified MAC address table entries learned from the MLAG peer switch.

#### Command Mode

EXEC

#### Command Syntax

```
show mac address-table mlag-peer [ENTRY_TYPE][MAC_ADDR][INTF_1 ... INTF_N][VLAN]
```

#### Parameters

- **ENTRY\_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - **no parameter** all MLAG peer entries.
  - **configured** static entries on MLAG peer; includes unconfigured VLAN entries.
  - **dynamic** entries learned on MLAG peer.
  - **static** MLAG entries entered by CLI commands and include a configured VLAN.
  - **unicast** MLAG entries with unicast MAC address.
- **MAC\_ADDR** command uses MAC address to filter displayed entries.
  - **no parameter** all MAC addresses table entries.
  - **address mac\_address** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF\_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - **no parameter** all Ethernet and port channel interfaces.
  - **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
  - **port-channel p\_range** Port channel interfaces specified by **p\_range**.
- **VLAN** command filters display by VLAN.
  - **no parameter** all VLANs.
  - **vlan v\_num** VLANs specified by **v\_num**.

#### Related Commands

- [show mac address-table](#)
- [show mac address-table multicast](#)

---

#### 11.4.7.51 show mac address-table multicast

The **show mac-address-table** command displays the specified multicast MAC address table entries.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table multicast [MAC_ADDR][INTF][VLANS]
```

##### Parameters

- **MAC\_ADDR** command uses MAC address to filter displayed entries.
  - **no parameter** all MAC addresses table entries.
  - **address mac\_address** displays entries with specified address (dotted hex notation – H.H.H).
- **INTF** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - **no parameter** all Ethernet and port channel interfaces.
  - **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
  - **port-channel p\_range** Port channel interfaces specified by **p\_range**.
- **VLANS** command filters display by VLAN.
  - **no parameter** all VLANs.
  - **vlan v\_num** VLANs specified by **v\_num**.

##### Related Commands

- [show mac address-table](#)
- [show mac address-table multicast brief](#)

#### 11.4.7.52 show mac address-table multicast brief

The **show mac-address-table** command displays a summary of multicast MAC address table entries.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table multicast [VLANs] brief
```

##### Parameters

**VLANs** command filters display by VLAN.

- **no parameter** all VLANs.
- **vlan v\_num** VLANs specified by **v\_num**.

##### Related Command

[show mac address-table multicast](#).

---

#### 11.4.7.53 show monitor server-failure

The **show monitor server-failure** command displays Rapid Automated Indication of Link-loss (RAIL) configuration settings and the number of servers on each monitored network.

##### Command Mode

EXEC

##### Command Syntax

```
show monitor server-failure
```

##### Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch> show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
 10.2.1.96/28 : 0 servers
 10.1.1.0/24 : 0 servers
 10.3.0.0/16 : 3 servers switch>
```

#### 11.4.7.54 show monitor server-failure history

The **show monitor server-failure history** command displays the time of all link failures detected by Rapid Automated Indication of Link-loss (RAIL) and includes the interface name for each failure.

The history is cleared by removing RAIL from the switch (**no monitor server-failure**).

##### Command Mode

EXEC

##### Command Syntax

```
show monitor server-failure history
```

##### Related Command

[clear server-failure servers inactive](#)

##### Example

This command displays the Fast Server Failure link failure history from the time RAIL is instantiated on the switch.

```
switch> show monitor server-failure history
Total server failures: 4
```

| Server IP  | Server MAC        | Interface     | Last Failed         |
|------------|-------------------|---------------|---------------------|
| 10.1.67.92 | 01:22:ab:cd:ee:ff | Ethernet17    | 2013-02-02 11:26:22 |
| 44.11.11.7 | ad:3e:5f:dd:64:cf | Ethernet23    | 2013-02-10 00:07:56 |
| 10.1.1.1   | 01:22:df:42:78:cd | Port-Channel6 | 2013-02-09 19:36:09 |
| 10.1.8.13  | 01:33:df:ee:39:91 | Port-Channel5 | 2013-02-10 00:03:39 |

```
switch>
```

#### 11.4.7.55 show monitor server-failure servers

The **show monitor server-failure servers** command displays status and configuration information about each server that RAIL is monitoring. The display format depends on the parameter specified by the command:

- **single IP address:** command displays information about the server at the specified address, including IP address, MAC address, RAIL state, the time of most recent entry of all RAIL states, and the number of failed, proxied, and inactive state entries.
- **no parameter, key specifying a server list:** command displays a table. Each row corresponds to a monitored server. Information that the command displays includes IP address, MAC address, RAIL state, the time of most recent link failure.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor server-failure servers [SERVER_LIST]
```

#### Parameters

**SERVER\_LIST** Servers for which command displays information. Valid options include:

- **no parameter** all servers in up, down, and proxying states.
- **ipv4\_addr** individual server; command displays detailed information.
- **all** all servers on monitored networks.
- **inactive** all servers in inactive state.
- **proxying** all servers in proxying state.

#### Examples

- This command displays RAIL information for the server at IP address **10.11.11.7**.

```
switch> show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address : 10.11.11.7
MAC Address : ad:3e:5f:dd:64:cf
Current state : down
Interface : Ethernet23
Last Discovered : 2013-01-06 06:47:39
Last Failed : 2013-02-10 00:07:56
Last Proxied : 2013-02-10 00:08:33
Last Inactive : 2013-02-09 23:52:21
Number of times failed : 3
Number of times proxied : 1
Number of times inactive : 18 switch>
```

- This command displays RAIL data for all servers in monitored networks that are in inactive state.

```
switch> show monitor server-failure servers inactive
Inactive servers: 1

Server IP Server MAC Interface State Last Failed

10.1.67.92 01:22:ab:cd:ee:ff Ethernet17 inactive 7 days, 12:48:06 ago switch>
```

- This command displays RAIL information for all servers in monitored networks that are in up, down, and proxying states.

```
switch> show monitor server-failure servers
Active servers: 4

Server IP Server MAC Interface State Last Failed
```

```

44.11.11.7 ad:3e:5f:dd:64:cf Ethernet23 down 0:03:21 ago
10.1.1.1 01:22:df:42:78:cd Port-Channel6 up 4:35:08 ago

---

#### 11.4.7.56 show monitor session

The **show monitor session** command displays the configuration of the specified port mirroring session. The command displays the configuration of all mirroring sessions on the switch when the session name parameter is omitted.

##### Command Mode

EXEC

##### Command Syntax

```
show monitor session SESSION_NAME
```

##### Parameters

**SESSION\_NAME** Port mirroring session identifier. Options include:

- **no parameter** displays configuration for all sessions.
- **label** command displays configuration of the specified session.

##### Example

This command displays the mirroring configuration of the specified monitor session.

```
switch> show monitor session redirect_1

Session redirect_1

Source Ports

 Both: Et7

Destination Port: Et8
switch(config)>
```

### 11.4.7.57 show platform trident mirroring

The **show platform trident mirroring** command displays current parameters of all configured mirroring sessions in Trident series platforms.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform trident mirroring [detail | session]
```

#### Parameters

- **detail** displays the detailed information of all configured mirroring sessions.
- **session session\_name** displays the information of specified mirroring session.

#### Guidelines

This command is supported on DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

#### Examples

- This command displays the detailed information of all configured mirroring sessions.

```
switch(config)# show platform trident mirroring detail

Session : 123
=====

srcIntf(rx): Ethernet12/3
Hw Mirror Id: 0x1

count: 1
Dest: Et24/4

EGR_IM_MTP_INDEX

DestPort[0]: Et24/4
Encap Enable: 0
```

---

```
switch(config)#
```

- This command displays the information of session **123**.

```
switch(config)# show platform trident mirroring session 123
```

| Session<br>===== | SrcIntf<br>===== | Acl<br>=== | DestIntf | NextHopMac<br>===== | OutIntf<br>===== |
|------------------|------------------|------------|----------|---------------------|------------------|
| 123              | Et12/3(rx)       |            | Et15/1   |                     |                  |
|                  | Et12/3(tx)       |            | Et15/1   |                     |                  |

```
switch(config)#
```

### 11.4.7.58 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from zero at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the [clear counters](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel load-balance [MEMBERS]
```

#### Parameters

**MEMBERS** List of port channels for which information is displayed. Options include:

- **no parameter** All configured port channels.
- **c\_range** Ports in specified channel list (number, number range, or list of numbers and ranges).

#### Example

This command displays traffic distribution for all configured port channels.

```
switch> show port-channel load-balance
ChanId Port Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst

8 Et10 100.00% 100.00% 100.00% 100.00% 0.00% 100.00%

switch>
```

### 11.4.7.59 show port-security

The **show port-security** command displays a summary of MAC address port security configuration and status on each interface where switchport port security is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show port-security
```

#### Display Values

Each column corresponds to one physical interface. The table displays interfaces with port security enabled.

- **Secure Port:** Interface with switchport port-security enabled.
- **MaxSecureAddr:** Maximum quantity of MAC addresses that the specified port can process.
- **CurrentAddr:** Static MAC addresses assigned to the interface.
- **SecurityViolation:** Number of frames with unsecured addresses received by port.
- **Security Action:** Action triggered by a security violation.

These are the value displayed by the command.

- **Aging Time:** Age of Mac address.
- **MAC Moveable:** Mac address movement.
- **Port Security:** Enabled or disabled status

#### Examples

- This command displays switchport port security configuration and status data.

```
switch> show port-security
Secure Port MaxSecureAddr CurrentAddr SecurityViolation Security Action
 (Count) (Count) (Count)

Et7 5 3 0 Shutdown
Et10 1 0 0 Shutdown

Total Addresses in System: 3 switch>
```

- From *EOS Release 4.26.0F*, **show port-security** command displays the settings for the new global port security configurations, including MAC aging, MAC moves, and persistent port security.

```
switch(config)# show port-security
Secure address moves: disabled
Secure address aging: disabled
Secure address reboot persistence: enabled
Secure address link down persistence: enabled
Secure Port MaxSecureAddr CurrentAddr SecurityViolation Security Action
 (Count) (Count) (Count)

Total Addresses in System: 0
```

### 11.4.7.60 show port-security interface

The **show port-security interface** command displays the switchport port-security status of all specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show port-security interface [INT_NAME]
```

#### Parameters

**INT\_NAME** Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **loopback l\_range** Loopback interface specified by **l\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
- **vlan v\_range** VLAN interface range specified by **v\_range**.
- **VXLAN vx\_range** VXLAN interface range specified by **vx\_range**.

Valid **range** formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command display port-security configuration and status for the specified interfaces.

```
switch> show port-security interface ethernet 7-8
Interface : Ethernet7
Port Security : Enabled
Port Status : Secure-down
Violation Mode : Shutdown
Maximum MAC Addresses : 5
Aging Time : 5 mins
Aging Type : Inactivity
SecureStatic Address Aging : Disabled
Total MAC Addresses : 3
Configured MAC Addresses : 3
Learn/Move/Age Events : 5
Last Source Address:Vlan : 164f.29ae.4e14:10
Last Address Change Time : 0:39:47 ago
Security Violation Count : 0
Interface : Ethernet8
Port Security : Disabled
Port Status : Secure-down
Violation Mode : Shutdown
Maximum MAC Addresses : 1
Aging Time : 5 mins
Aging Type : Inactivity
SecureStatic Address Aging : Disabled switch>
```

---

#### 11.4.7.61 show port-security mac-address

The **show port-security mac-address** command display static unicast MAC addresses assigned to interfaces where switchport port security is enabled.

##### Command Mode

EXEC

##### Command Syntax

```
show port-security mac-address
```

##### Example

This command displays MAC addresses assigned to port-security protected interfaces.

```
switch> show port-security mac-address
Secure Mac Address Table

Vlan Mac Address Type Ports Remaining Age
 (mins)

 10 164f.29ae.4e14 SecureConfigured Et7 N/A
 10 164f.29ae.4f11 SecureConfigured Et7 N/A
 10 164f.320a.3a11 SecureConfigured Et7 N/A

Total Mac Addresses for this criterion: 3 switch>
```

### 11.4.7.62 show storm-control

The **show storm-control** command displays the storm-control level and interface inbound packet capacity for the specified interface.

The configured value ([storm-control](#)) differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. This command displays the broadcast or multicast rate after this adjustment.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show storm-control [INT_NAME]
```

#### Parameters

- **no parameter** Command returns data for all interfaces configured for storm control.
- **INT\_NAME** interface type and port range. Settings include:
  - **ethernet e\_range** Ethernet interfaces that **e\_range** denotes.
  - **port-channel p\_range** Port channel interfaces that **p\_range** denotes.

When storm control commands exist for a port-channel and an Ethernet port that is a member of the port channel, the command for the port-channel takes precedence.

Valid **range** formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the storm control configuration for **ethernet port 2** through **ethernet port 4**.

```
switch# show storm-control
Port Type Level Rate (Mbps) Status Drops Reason
Et10/2 all 75 7500 active 0
Et10/3 multicast 55 5500 active 0
Et10/4 broadcast 50 5000 active 0 switch#
```

---

#### 11.4.7.63 show switch forwarding-mode

The **show switch forwarding-mode** command displays the switch's current and available forwarding plane hardware modes.

##### Command Mode

EXEC

##### Command Syntax

```
show switch forwarding-mode
```

##### Related Command

[switch forwarding-mode](#) configures the switch's forwarding mode setting.

##### Example

This command changes the switch's forward mode to **store-and-forward**, then displays the forwarding mode.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)# show switch forwarding-mode
Current switching mode: store and forward
Available switching modes: cut through, store and forward
```

### 11.4.7.64 show track

The **show track** command displays information about tracked objects configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show track [OBJECT][INFO_LEVEL]
```

#### Parameters

- **OBJECT** tracked object for which information is displayed. Options include:
  - **no parameter** displays information for all tracked objects configured on the switch.
  - **object\_name** displays information for the specified object.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - **no parameter** displays complete information including object status, number of status changes, time since last change, and client process tracking the object (if any).
  - **brief** displays brief list of all tracked objects and their current status.

#### Examples

- This command displays all information for tracked object **ETH8**.

```
switch# show track ETH8
Tracked object ETH8 is up
 Interface Ethernet8 line-protocol
 4 change, last change time was 0:36:12 ago
 Tracked by:
 Ethernet5/1 vrrp instance 50 switch#
```

- This command displays summary information for all tracked objects.

```
switch# show track brief
Tracked object ETH2 is up
Tracked object ETH4 is down
Tracked object ETH6 is up
Tracked object ETH8 is up switch#
```

---

#### 11.4.7.65 shutdown (server-failure configuration mode)

The **shutdown** command disables Rapid Automated Indication of Link-Loss (RAIL). By default, RAIL is disabled.

After entering server-failure configuration mode, a **no shutdown** command is required to enable RAIL.

The **no shutdown** command enables RAIL on the switch. The **shutdown** and **default shutdown** commands disable RAIL by removing the shutdown command from *running-config*.

##### Command Mode

Server-failure Configuration

##### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

##### Examples

- This command enables RAIL on the switch.

```
switch(config)# monitor server
switch(config-server-failure)# no shutdown
switch(config-server-failure)# show active
monitor server-failure
no shutdown
switch(config-server-failure)#
```

- This command disables RAIL on the switch.

```
switch(config-server-failure)# shutdown
switch(config-server-failure)# show active
monitor server-failure
switch(config-server-failure)#
```

### 11.4.7.66 storm-control

The **storm-control** command configures and enables storm control on the configuration mode physical interface. The command provides three mode options:

- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.
- **storm-control unknown-unicast** unknown unicast inbound packet control.

An interface configuration can contain three storm control statements, one with each mode setting.

The threshold is either a percentage of the available port bandwidth or the number of packets per second (PPS) and is configurable on each interface for each transmission mode.

The **no storm-control** and **default storm-control** commands remove the corresponding **storm-control** statement from *running-config*, disabling storm control for the specified transmission type on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
storm-control MODE level { threshold_percent | pps threshold }
```

```
no storm-control MODE
```

```
default storm-control MODE
```

#### Parameters

- **MODE** packet transmission type. Options include:
  - **broadcast**
  - **multicast**
  - **unknown-unicast**
- **threshold\_percent** Inbound packet level that triggers storm control, as a percentage of port capacity. Value ranges from **0.01** to **100**. Storm control is suppressed by a level of **100**.

The configured value differs from the programmed threshold in that the hardware accounts for InterFrame Gaps (IFG) based on the minimum packet size. The [show storm-control](#) command displays the broadcast, multicast, or unknown unicast rate after this adjustment.

- **pps threshold** Inbound packet level that triggers storm control, in packets per second. The value ranges from 0 to 1073741823.

#### Example

These commands enable multicast, broadcast, and unknown unicast storm control on **Ethernet port 20** and sets thresholds of **65%** (multicast), **50%** (broadcast), and **350000 PPS** (unknown-unicast). During each one second interval, the interface drops inbound multicast traffic, broadcast traffic, and unknown unicast traffic in excess of the specified thresholds.

```
switch(config)# interface ethernet 20
switch(config-if-Et20)# storm-control multicast level 65
switch(config-if-Et20)# storm-control broadcast level 50
switch(config-if-Et20)# storm-control unknown-unicast level pps 350000
switch(config-if-Et20)# show active
interface Ethernet20
 storm-control broadcast level 50
 storm-control multicast level 65
```

---

```
storm-control unknown-unicast level pps 350000
switch(config-if-Et20)#
```

### 11.4.7.67 switch forwarding-mode

The **switch forwarding-mode** command specifies the mode of the switch's forwarding plane hardware. The default forwarding mode is **cut through**.

The **no switch forwarding-mode** and **default switch forwarding-mode** commands restore the default forwarding mode by removing the **switch forwarding-mode** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
switch forwarding-mode MODE_SETTING
```

```
no switch forwarding-mode
```

```
default switch forwarding-mode
```

#### Parameters

**MODE\_SETTING** Specifies the switch's forwarding plane hardware mode. Options include:

- **cut-through** the switch begins forwarding frames before their reception is complete.
- **store-and-forward** the switch accumulates entire packets before forwarding them.

#### Guidelines

The forwarding plane mode is **store-and-forward** on Petra and Arad platform switches.

#### Related Command

[show switch forwarding-mode](#) displays the current forwarding mode.

#### Example

This command changes the forwarding mode to **store-and-forward**.

```
switch(config)# switch forwarding-mode store-and-forward
switch(config)#
```

---

### 11.4.7.68 switchport

The **switchport** command places the configuration mode interface in **switched port** (Layer 2) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

The **no switchport** command places the configuration mode interface in **routed port** (Layer 3) mode. Routed ports are not members of any VLANs and do not switch or bridge packets. All IP level configuration commands, including IP address assignments, apply directly to the routed port interface.

By default, Ethernet and Port Channel interfaces are in switched port mode. The **default switchport** command also places the configuration mode interface in switched port mode by removing the corresponding **no switchport** command from **running-config**.

These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport
```

```
no switchport
```

```
default switchport
```

#### Guidelines

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from **1006** to **4094**. VLANs that are allocated internally for a routed interface cannot be directly created or configured. The **vlan internal order** command specifies the method that VLANs are allocated.

All IP-level configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. Any IP-level configuration changes made to a routed interface are maintained when the interface is toggled to switched port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration statements are not propagated to the LAG from its component members.

#### Examples

- These commands put **interface ethernet 5** in routed port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)#
```

- These commands returns **interface ethernet 5** to switched port mode.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport
switch(config-if-Et5)#
```

#### 11.4.7.69 switchport default mode access

The **switchport default mode access** command places the configuration mode interface in **switched port default access** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

##### Command Mode

Global Configuration

##### Command Syntax

```
switchport default mode access
```

##### Related Command

[switchport default mode routed](#) puts a switch with all ports in routed port mode.

##### Example

This command puts a switch with all ports in access port mode.

```
switch(config)# switchport default mode access
```

---

#### 11.4.7.70 switchport default mode routed

The **switchport default mode routed** command places the configuration mode interface in **switched port default routed** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

By default, on a switch with default startup config or no config, all ports come up in access mode. By adding the CLI command **switchport default mode routed** to kickstart config, all ports will come up in routed mode after boot up. On boot up, Zero Touch Provisioning (ZTP) is enabled by default if the startup config (**/mnt/flash/startupconfig**) is deleted. ZTP can be disabled by setting **DISABLE=True** in ZTP config (**/mnt/flash/zerotouchconfig**). Kickstart config (**/mnt/flash/kickstart-config**) is used when startup config is missing and ZTP is disabled.

##### Command Mode

Global Configuration

##### Command Syntax

```
switchport default mode routed
```

##### Related Command

[switchport default mode access](#) puts a switch with all ports in access port mode.

##### Example

This command puts a switch with all ports in routed port mode.

```
switch(config)# switchport default mode routed
```

### 11.4.7.71 switchport mac address learning

The **switchport mac address learning** command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The **no switchport mac address learning** command disables MAC address learning for the configuration mode interface. The **switchport mac address learning** and **default switchport mac address learning** commands enable MAC address learning for the configuration mode interface by deleting the corresponding **no switchport mac address learning** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport mac address learning
no switchport mac address learning
default switchport mac address learning
```

#### Example

These commands disables MAC address learning for *interface ethernet 8*, then displays the active configuration for the interface.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# no switchport mac address learning
switch(config-if-Et8)# show active
interface Ethernet8
 no switchport mac address learning
switch(config-if-Et8)#
```

---

#### 11.4.7.72 switchport port-security

The **switchport port-security** command enables MAC address port security on the configuration mode interface. Ports with port security enables restrict traffic to a limited number of hosts, as determined by their MAC addresses. On enabling the **switchport port-security** command, the port-security mode would be 'shutdown', by default.

The [switchport port-security mac-address maximum](#) command specifies the maximum number of MAC addresses. The [switchport port-security violation](#) command enables port security in protect mode.

The **no switchport port-security** and **default switchport port-security** commands disable port security on the configuration mode interface by removing the corresponding **switchport port-security** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

##### Command Syntax

```
switchport port-security
no switchport port-security
default switchport port-security
```

##### Example

These commands enable port security on *interface ethernet 7*.

```
switch(config)# interface ethernet 7
switch(config-if-Et7)# switchport port-security
switch(config-if-Et7)#
```

### 11.4.7.73 switchport port-security mac-address maximum

The **switchport port-security mac-address maximum** command specifies the maximum MAC address limit for the configuration mode interface when configured as a secure port. When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. Once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port becomes errdisabled. The [switchport port-security](#) command configures an interface as a secure port.

The **no switchport port-security mac-address maximum** and **default switchport port-security mac-address maximum** commands restore the maximum MAC address limit of one on the configuration mode interface by removing the corresponding **switchport port-security mac-address maximum** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport port-security mac-address maximum max_addr
no switchport port-security mac-address maximum
default switchport port-security mac-address maximum
```

#### Parameters

*max\_addr* maximum number of MAC addresses. Value ranges from 1 to 1000. Default value is 1.

#### Example

These commands configure a maximum of five incoming addresses for secure *interface port-channel 14*.

```
switch(config)# interface port-channel 14
switch(config-if-Po14)# switchport port-security mac-address maximum 5
switch(config-if-Po14)#
```

---

#### 11.4.7.74 switchport port-security violation

The **switchport port-security violation** command configures port security in protect mode (with the option of enabling logging) or the shutdown mode.

The **no switchport port-security** and **no switchport port-security violation protect log** commands disable port security protect mode and port security protect mode logging on the configuration mode interface.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

##### Command Syntax

**switchport port-security violation {protect [log]} shutdown}**

**no switchport port-security violation protect log**

**default switchport port-security violation protect log**

##### Parameters

- **protect** - Configures the port security in the protect mode.
- **shutdown** - Configures the port security in the shutdown mode.
- **log** - the log of new addresses seen after reaching the limit in the protect mode.

##### Guidelines

When enabling port security, the port accepts traffic and adds source addresses to the MAC table until reaching the maximum. The **switchport port-security** command configures an interface as a secure port.

In the protect mode, the ACLs dynamically create to block incoming MAC addresses when reaching the configured maximum MAC value.

In the shutdown mode, once reaching the maximum, if any traffic arrives from a source not in the MAC table for the secure port, the port sets to errdisabled.

##### Examples

- These commands configure port security violation protect mode for **secure port channel interface 14**.

```
switch(config)# interface port-channel 14
switch(config-if-Po14)# switchport port-security violation protect
switch(config-if-Po14)#
```

- These commands configure port security violation protect logging mode for **secure port channel interface 14**.

```
switch(config)# interface port-channel 14
switch(config-if-Po14)# switchport port-security violation protect log
switch(config-if-Po14)#
```

- These commands configure port security violation shutdown mode for **secure port channel interface 15**.

```
switch(config)# interface port-channel 15
switch(config-if-Po15)# switchport port-security violation shutdown
switch(config-if-Po15)#
```

**Note:** After reaching the interface limit, a brief window occurs when learned MAC addresses can exceed the limit. After PortSec-Protect disables MAC learning on the interface, EOS removes the excess MAC addresses.

---

#### 11.4.7.75 system control-plane

The **system control-plane** command places the switch in **control-plane** configuration mode. Control-plane mode is used for assigning an ACL (access control list) to the control plane.

The **control-plane** configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. Exiting **control-plane** configuration mode does not affect the configuration.

The **exit** command returns the switch to **global** configuration mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
system control-plane
```

##### Command Available in control-plane Configuration Mode

[ip access-group \(Control Plane mode\)](#)

##### Examples

- This command places the switch in the **control plane** mode.

```
switch(config)# system control-plane
switch(config-system-cp)#
```

- This command assigns the **control-plane-2** ACL to the control plane.

```
switch(config-system-cp)# ip access-group control-plane-2
switch(config-system-cp)#
```

- This command exits the **control plane** mode.

```
switch(config-system-cp)# exit
switch(config)#
```

### 11.4.7.76 track

The **track** command creates an object whose state changes to provide information to a client process. The client process must be separately configured for object tracking to have an effect on the switch.

The **no track** and **default track** commands remove the specified tracked object by removing the corresponding **track** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
track object_name interface INTERFACE_NAME PROPERTY
```

```
no track object_name
```

```
default track object_name
```

#### Parameters

- **object\_name** User-created name for the tracked object.
- **INTERFACE\_NAME** Interface associated with the tracked object. Options include:
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
  - **VXLAN vx\_num** VXLAN interface specified by **vx\_num**.
- **PROPERTY** Tracked property. Options include:
  - **line-protocol** Object changes when the state of the associated interface changes.

#### Example

This command creates a tracked object which tracks the state of the line protocol on *interface ethernet 8*.

```
switch(config)# track ETH8 interface ethernet 8 line-protocol
switch(config)#
```

---

#### 11.4.7.77 traffic-loopback

The **traffic-loopback** command is used to create loopbacks to verify the functionality of interfaces and partner links. The **source** determines whether outgoing traffic is being looped back to the interface (**system**) to test the interface itself, or incoming traffic is being looped back to the link partner (**network**) to test the link between the systems. The **device** determines whether **system** traffic is looped on the physical level (**phy**) or Layer-2 level (**mac**). Only the **phy** level is available for **network** traffic.

The **no traffic-loopback** command deletes the loopback configuration.

##### Command Mode

Interface Configuration

##### Command Syntax

```
traffic-loopback source [system|network] device [phy|mac]
no traffic-loopback
```

##### Parameters

- **system** loops outgoing traffic back to the interface.
- **network** loops incoming traffic back to the link partner.
- **phy** implements loopback in the physical layer.
- **mac** implements loopback in the MAC layer (available only for **system** traffic).

##### Examples

- These commands cause outgoing traffic on **interface ethernet 1** to be looped back to the interface at the MAC level.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# traffic-loopback source system device mac
switch(config-if-Et1)#
```

- These commands cause incoming traffic on **interface ethernet 1** to be looped back to the link partner at the physical level.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# traffic-loopback source network device phy
switch(config-if-Et1)#
```

- These commands delete the loopback configuration from **interface ethernet 1**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no traffic-loopback
switch(config-if-Et1)#
```

## 11.5 Octal Port Renumber to Four Interfaces

For an octal port such as a QSFPDD or OSFP, this feature rennumbers the ports on a system to have 4 configurable interfaces instead of eight. The original octal would have had eight interfaces named **x/1** to **x/8** where x is the front panel port number.

The four interfaces created by this feature are named **x/1** to **x/4** instead and each interface has two transceiver lanes attached to it. Thus each interface can be configured to two-lane, four-lane or eight-lanes speeds as appropriate. However, the interfaces are restricted from any single-lane speeds and are not capable of a full breakout.

The entire chassis must be renumbered. This feature is not supported on a per-line card or per-port basis. Any cards in the same chassis that do not support this feature are unaffected. For affected line cards, both the configurable speeds and the default speeds of all interfaces are affected.

### Supported Speeds

**Table 74: Supported Speeds on Octal Ports**

| Interface Name With Feature | Interface Name Without Feature | Supported Speeds with Feature  | Default Speed |
|-----------------------------|--------------------------------|--------------------------------|---------------|
| Ethernetx/1                 | Ethernetx/1                    | 400G-8, 200G-4, 100G-2, 100G-4 | 400G-8        |
| Nonexistent                 | Ethernetx/2                    | N/A                            | N/A           |
| Ethernetx/2                 | Ethernetx/3                    | 100G-2                         | 100G-2        |
| Nonexistent                 | Ethernetx/5                    | N/A                            | N/A           |
| Ethernetx/3                 | Ethernetx/5                    | 200G-4, 100G-2, 100G-4         | 100G-2        |
| Nonexistent                 | Ethernetx/6                    | N/A                            | N/A           |
| Ethernetx/4                 | Ethernetx/7                    | 100G-2                         | 100G-2        |
| Nonexistent                 | Ethernetx/8                    | N/A                            | N/A           |

### 11.5.1 Configuring Octal Port Renumber to 4 Interfaces

In order to configure a chassis to octal port renumbering with four interfaces, a boot command is used.

The boot command is different from a standard CLI command since it takes effect very early in the boot process but can be configured in the same way. Therefore it requires a reboot after the CLI command in order to take effect.

Since the ports will be renumbered for all cards that support the feature, the current configuration of the switch may no longer make sense after the reboot. Please ensure all interface configurations reflect the new naming scheme. The following items should be addressed prior to enabling or disabling the feature and performing a reboot:

1. Change interface naming appropriately.
2. Review interface speeds to ensure they are supported with the feature.
3. Review change in interface defaults to ensure the feature's defaults are desired.
4. Review changes to SNMP OIDs for affected interfaces.

From the CLI configuration mode, use the following command to enable the feature:

```
switch(config)# boot port numbering octal interfaces 4
```

---

The command warns that the switch needs to be rebooted for the command to take effect. Reboot the box afterward.

From the CLI configuration mode, use the following command to disable the feature:

```
switch(config)# no boot port numbering octal interfaces 4
```

The command warns that the switch needs to be rebooted for the command to take effect. Reboot the box afterward.

## 11.5.2 Show Commands

To confirm the command has taken effect, expose inactive interfaces with the **service interface inactive expose** CLI command and confirm the affected linecards only have four interfaces for each front panel port.

```
switch#(config-if-Et16/1,16/3)# show interfaces et15/1-16/1 status
Port Name Status Vlan Duplex Speed Type Flags Encapsulation
Et15/1 Name connected 1 full 400G 400GBase-CR8
Et15/2 Name inactive 1 full 100G Not Present
Et15/3 Name inactive 1 full 100G Not Present
Et15/4 Name inactive 1 full 100G Not Present
Et16/1 Name connected 1 full 400G 400GBase-CR8
```

## 11.5.3 Limitations

- A config replace of the startup config does not affect the configuration of this feature.
- Since the feature is stored in **flash:boot-config**, removing or overwriting the boot-config can affect the presence of the feature on the next reboot.

## 11.5.4 Commands

- [boot port numbering octal interfaces 4](#)

### 11.5.4.1 boot port numbering octal interfaces 4

The **boot port numbering octal interfaces 4** command configures a chassis to octal port renumbering with four interfaces.

The **no boot port numbering octal interfaces 4** command disables the **boot port numbering octal interfaces 4** configuration from the *running-config*.

#### Command Mode

Global Configuration Mode

#### Command Syntax

```
boot port numbering octal interfaces 4
```

```
no boot port numbering octal interfaces 4
```

#### Example

To enable **boot port numbering octal interfaces 4**, use the following command:

```
switch(config)#boot port numbering octal interfaces 4
```

# Layer 2 Configuration

---

This chapter contains the following sections:

- [Spanning Tree Protocol](#)
- [Link Layer Discovery Protocol](#)
- [Virtual LANs \(VLANs\)](#)
- [DCBX and Flow Control](#)
- [IP Address Locking](#)
- [Layer 2 Protocol Forwarding](#)
- [Layer 2 Subinterfaces](#)

## 12.1 Spanning Tree Protocol

Spanning Tree Protocols prevent bridging loops in Layer 2 Ethernet networks. Arista switches support Rapid Spanning Tree, Multiple Spanning Tree, and Rapid-Per VLAN Spanning Tree protocols.

These sections describe the Arista Spanning Tree Protocol implementation.

- [Introduction to Spanning Tree Protocols](#)
- [Spanning Tree Overview](#)
- [Configuring a Spanning Tree](#)
- [STP Commands](#)

### 12.1.1 Introduction to Spanning Tree Protocols

Arista Switches support the leading spanning tree protocols: RSTP, MST and Rapid-PVST. This variety of options simplifies integration into existing networks without compromising network reliability, scalability or performance.

### 12.1.2 Spanning Tree Overview

An Ethernet network functions properly when only one active path exists between any two stations. A spanning tree is a loop-free subset of a network topology. STP is a L2 network protocol that ensures a loop-free topology for any bridged Ethernet LAN. STP allows a network to include spare links as automatic backup paths that are available when an active link fails without creating loops or requiring manual intervention. The original STP is standardized as IEEE 802.1D.

Several variations to the original STP improve performance and add capacity. Arista switches support these STP versions:

- Rapid Spanning Tree (RSTP)
- Multiple Spanning Tree (MSTP)
- Rapid Per-VLAN Spanning Tree (Rapid-PVST)

The Overview contains the following sections:

- [Spanning Tree Protocol Versions](#)
- [Structure of a Spanning Tree Instance](#)
- [Bridge Protocol Data Units \(BPDUs\)](#)

### 12.1.2.1 Spanning Tree Protocol Versions

STP versions supported by Arista switches address two limitations of the original Spanning Tree protocol that was standardized as *IEEE 802.1D*:

- Slow convergence to the new spanning tree topology after a network change.
- The entire network is covered by one spanning tree instance.

The following sections describe the supported STP versions, compatibility issues in networks containing switches running different STP versions, and supported alternatives to spanning tree.

#### 12.1.2.1.1 Rapid Spanning Tree Protocol (RSTP)

RSTP is specified in *802.1w* and supersedes STP. RSTP provides rapid convergence after network topology changes. Similar to STP, RSTP provides a single instance of spanning tree for the entire network. Standard *802.1D-2004* incorporates RSTP and obsoletes STP.

The RSTP instance is the base unit of MST and Rapid-PVST spanning trees.

#### 12.1.2.1.2 Rapid Per-VLAN Spanning Tree Protocol (Rapid-PVST)

Rapid Per-VLAN Spanning Tree (PVST) extends the original STP to support a spanning tree instance on each VLAN in the network. The maximum number of PVST instances that can be created on a switch depends on the hardware platform. In most of the cases, it is 510. PVST can load balance Layer-2 traffic without creating a loop because it handles each VLAN as a separate network. However, PVST does not address slow network convergence after a network topology change.

Arista switches support Rapid-PVST, which is a variation of PVST based on RSTP instances. Rapid-PVST provides rapid connectivity recovery after the failure of a bridge, port, or LAN. Rapid-PVST can be enabled or disabled on individual VLANs.

#### 12.1.2.1.3 Multiple Spanning Tree Protocol (MSTP)

MST extends Rapid Spanning Tree Protocol (RSTP) to support multiple spanning tree instances on a network, but is still compatible with RSTP. By default, Arista switches use MSTP.

MST supports multiple spanning tree instances, similar to Rapid PVST. However, MST associates an instance with multiple VLANs. This architecture supports load balancing by providing numerous forwarding paths to data traffic. Network fault tolerance is improved because failures in one instance do not affect other instances.

#### MST Regions

An *MST region* is a group of connected switches with identical MST configuration. Each region can support a maximum of 65 spanning-tree instances. MST regions are identified by a version number, name, and VLAN-to-instance map. You must configure identical parameters on all switches in the regions. Changes to any MST instance can affect other MST instances and may cause traffic disruption in other VLANs, unless the same changes are applied to all switches. Only MST region members participate with the MST instances defined in the region. A VLAN can be simultaneously assigned to only one spanning-tree instance. MST does not specify the maximum number of regions that a network can contain.

#### MST Instances

Each MST instance is identified by an instance number that ranges from 0 to 4094 and is associated with a set of VLANs. An MST region contains two types of spanning tree instances: an Internal Spanning Tree Instance (IST) and Multiple Spanning Tree Instances (MSTI).

- IST is the default spanning tree instance in MST regions; and is always zero. It gives a root switch to the region that contains all VLANs configured across all switches in the region but not assigned to a MST instance. IST considers all interfaces regardless of the VLAN membership.
- **Multiple Spanning Tree instances (MSTIs)** consist of VLANs that are assigned through MST configuration statements. VLANs assigned to an MSTI are removed from the IST instance. VLANs in an MSTI operate as a part of a single Spanning Tree topology. Because each VLAN can belong to only one instance, MST instances (and the IST) are topologically independent.

### MSTP-Rapid PVST+ Interoperation

MSTP-Rapid PVST+ interoperation allows protocol-level interaction between MSTP and Rapid PVST+ by consuming and transmitting PVST BPDUs through MSTP at the border ports. While transmitting from Rapid PVST+ to MSTP or vice-versa, you can deploy MSTP in certain regions and Rapid PVST+ in other regions based on their merits or other factors. MSTP-Rapid PVST+ interoperation allows MSTP to work with any Rapid PVST+ implementation.

MSTP inter-operation can be viewed as bi-directional BDP conversion occurring at MSTP PVST+ border ports as following:

- The outgoing Common Internal Spanning Tree (CIST) BPD is projected as Rapid PVST+ BPDUs across various VLANs.
- Incoming PVST+ topology BPD is mapped to corresponding MSTI based on incoming VLAN.

The following restrictions are enforced based on port role. These are relevant only for border ports with roles designated or root (for CIST) that can potentially forward.

- Case (A): If the MSTP-Rapid PVST+ border port role is designated for CIST, it should not receive any superior PVST BPD (with respect to CIST). Root of all VLANs in the PVST region should be towards the MSTP region.
- Case (B): If the MSTP-Rapid PVST+ border port role is root for CIST, it should not receive any inferior Rapid PVST+ BPD (with respect to CIST). Root of all VLANs in the Rapid PVST+ region should be within the PVST+ region.

**Note:** If the restrictions are violated, the port enters blocking state. The BPD translation occurs only on MSTP-Rapid PVST+ border ports with the forwarding state for CIST.

It is desirable to configure multiple MSTP-Rapid PVST+ border ports conforming to Case(A) for a specified Rapid PVST+ region as it allows VLAN load balancing across the ports. This can be achieved by adjusting the per-VLAN port cost towards the Rapid PVST+ region such that the per-VLAN root port is evenly distributed across the border ports.

#### 12.1.2.1.4 Version Interoperability

A network can contain switches running different spanning tree versions. The Common Spanning Tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.

In multi-instance topologies, the following instances correspond to the CST:

- **Rapid-PVST:** VLAN 1
- **MST:** IST (instance 0)

RSTP and MSTP are compatible with other spanning tree versions:

- An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.
- RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.

- An MST bridge detects a port is at a region boundary when it receives an STP BPDU or an MST BPDU from a different region.
- MST ports assume they are boundary ports when the bridges to which they connect join the same region.

The `clear spanning-tree detected-protocols` command forces MST ports to renegotiate with their neighbors.

#### 12.1.2.1.5 Switchport Interface Pairs

Switchport interface pairs associate two interfaces in a primary-backup configuration. When the primary interface is functioning, the backup interface remains dormant in standby mode. When the primary interface stops functioning, the backup interface handles the traffic.

An alternative implementation balances traffic between the primary and backup interfaces. If either interface shuts down, the other handles traffic addressed to the pair.

The following guidelines apply to switchport interface pairs.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLAN interfaces can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- STP is disabled on ports configured as primary or backup interfaces.
- Static MAC addresses should be configured after primary-backup pairs are established.

#### 12.1.2.2 Structure of a Spanning Tree Instance

A Layer 2 network consists of bridges and network segments. A loop exists when multiple active paths connect two components. Spanning tree protocols allow only one active path between any two network components. Loops are removed by blocking selected ports that connect bridges to network segments.

Ports are assigned cost values that reflect their transmission speed and any other criteria selected by the administrator. Ports with faster transmission speeds and other desirable characteristics are assigned lower costs. High cost ports are blocked in deference to lower cost ports.

A network topology defines multiple possible spanning trees. Network bridges collectively compute and implement one spanning tree to maintain connectivity between all network components while blocking ports that could result in loops. Administrators improve network performance by adjusting parameter settings to select the most efficient spanning tree.

Spanning tree bridges continuously transmit topology information to notify all other bridges on the network when topology changes are required, such as when a link fails. Bridge Protocol Data Units (BPDUs) are STP information packets that bridges exchange.

The following sections describe spanning tree configuration parameters.

##### 12.1.2.2.1 Root and Designated Bridges

The **root bridge** is the center of the STP topology. A spanning tree instance has one root bridge. Spanning tree bases path calculations on each network components distance from the root bridge.

All other network bridges calculate paths to the root bridge when selecting spanning tree links. STP calculates the distance to the root bridge to build a loop-free topology that features the shortest distance between devices among all possible paths.

Each switch is assigned a unique bridge ID number for each instance. All network switches collectively elect the root bridge by comparing bridge IDs. The root bridge is the switch with the lowest bridge ID.

The bridge ID contains the following eight bytes, in order of decreasing significance:

- Port priority (four bits)
- Instance number (12 bits): VLAN number (Rapid-PVST); instance number (MST); 0 (RST)
- MAC address of switch (six bytes)

A **designated bridge** is defined for each network segment as the switch that provides the segments shortest path to the root bridge. A designated bridge is selected for each segment after a root bridge is selected; a switch can be a designated bridge for multiple segments.

The following network calculations in [Spanning Tree Network Example](#) assume that each path has the same cost:

- **Switch B** is the root bridge its bridge ID is lowest because it has the smallest port priority.
- **Switch A** is the designated bridge for **VLAN 11**.
- **Switch B** is the designated bridge for **VLAN 10**, **VLAN 13**, **VLAN 16**, **VLAN 18**, **VLAN 19**.
- **Switch C** is the designated bridge for **VLAN 25**.
- **Switch D** is the designated bridge for **VLAN 21**, **VLAN 23**.

**Figure 12-1: Spanning Tree Network Example**

#### 12.1.2.2.2 Port Roles

Messages from connected devices to the root bridge traverse a least-cost path, which has the smallest cost among all possible paths to the root bridge. The cost of a path is the sum of the costs of all path segments, as defined through port cost settings.

Active ports in a least cost-path fulfill one of two possible roles: root port and designated port. STP blocks all other network ports. STP also defines alternate and backup ports to handle traffic when an active port is inaccessible.

- **Root Port (RP)** accesses the bridges least-cost path to the root bridge. Each bridge selects its root port after calculating the cost of each possible path to the root bridge.

The following ports in [Spanning Tree Network Example](#) are root ports:

- **Switch A: port 2**
- **Switch C: port 1**
- **Switch D: port 3**

- **Designated Port (DP)** accesses a network segments designated bridge. Each segment defines one DP. Switches can provide DPs for multiple segments. All ports on the root bridge are DPs.

The following ports in [Spanning Tree Network Example](#) are designated ports:

- **Switch A: port 4 (VLAN 11)**
- **Switch B: port 2 (VLAN 13), port 4 (VLAN 18), port 5 (VLAN 10), port 6 (VLAN 19), port 8 (VLAN 16)**
- **Switch C: port 2 (VLAN 25)**
- **Switch D: port 2 (VLAN 23), port 6 (VLAN 21)**

- **Alternate ports** provide backup paths from their bridges to the root bridge. An alternate port is blocked until a network change transforms it into a root port.
- **Backup ports** provide alternative paths from VLANs to their designated bridges. A backup port is blocked until a network change transforms it into a designated port.

#### 12.1.2.2.3 Port Activity States

A ports activity state defines its current STP activity level. STP monitors BPDUs for network changes that require an activity state transition.

STP defines three port activity states:

- **Forwarding:** The port receives and sends data. Root ports and designated ports are either in, or transitioning to, this state.
- **Discarding:** The port does not receive or send data. Blocked ports receive BPDU packets. All ports except RPs and DPs are blocked, including alternate and backup ports.
- **Learning:** The transitional post-discarding state where the port prepares to forward frames by adding source addresses from inbound data packets to the switching database.

#### 12.1.2.2.4 Port Types

Port type is a configurable parameter that reflects the type of network segment that is connected to the port. Proper port type configuration results in rapid convergence after network topology changes. RSTP port types include normal, network, and edge ports. **Normal** is the default port type.

- **Normal** ports have an unspecified topology.
- **Network** ports connect only to switches or bridges.

RSTP immediately transitions network ports to the discarding state.

- **Edge** ports connect directly to end stations.

Edge ports transition directly to forwarding state because they do not create loops. An edge port becomes a normal port when it receives a BPDU.

---

#### 12.1.2.2.5 Link Types

Link type is a configurable parameter that determines candidates for RSTP fast state transition.

- The default link type for full-duplex ports is **point-to-point**.
- The default link type for half-duplex ports is **shared**.

Fast state transitions are allowed on point-to-point links that connect bridges. Fast state transitions are not allowed on shared ports regardless of the duplex setting.

#### 12.1.2.3 Bridge Protocol Data Units (BPDUs)

Spanning tree rules specify a root bridge, select designated bridges, and assign roles to ports. STP rule implementation requires that network topology information is available to each switch.

Switches exchange topology information through Bridge Protocol Data Units (BPDUs). Information provided by BPDU packets include bridge IDs and root path costs.

##### 12.1.2.3.1 BPDU Types

STP defines three BPDU types:

- Configuration BPDU (CBPDU), used for computing the spanning tree.
- Topology Change Notification (TCN) BPDU, announces network topology changes.
- Topology Change Notification Acknowledgment (TCA), acknowledges topology changes.

Bridges enter the following addresses in outbound BPDU frames:

- Source address: outbound port's MAC address.
- Destination address: STP multicast address **01:80:C2:00:00:00**.

Bridges regularly exchange BPDUs to track network changes that trigger STP recomputations and port activity state transitions. The **hello timer** specifies the period between consecutive BPDU messages; the default is two seconds.

##### 12.1.2.3.2 Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The switch recomputes the spanning tree topology if it does not receive another BPDU before the max-age timer expires. When **edge** ports and **point-to-point** links are properly configured, RSTP network convergence does not require forward-delay and max-age timers.

##### 12.1.2.3.3 MSTP BPDUs

MSTP BPDUs are targeted at a single instance and provide STP information for the entire region. MSTP encodes a standard BPDU for the IST, then adds region information and MST instance messages for all configured instances, where each message conveys spanning tree data for an instance. Frames assigned to VLANs operate in the instance to which the VLAN is assigned. Bridges enter an MD5 digest of the VLAN-to-instance map table in BPDUs to avoid including the entire table in each BPDU. Recipients use this digest and other administratively configured values to identify bridges in the same MST region.

MSTP BPDUs are compatible with RSTP. RSTP bridges view an MST region as a single-hop RSTP bridge regardless of the number of bridges inside the region because:

- RSTP bridges interpret MSTP BPDUs as RSTP BPDUs.
- RSTP bridges increment the **message age timer** only once while data flows through an MST region; MSTP measures **time to live** with a **remaining hops** variable, instead of the message age timer.

Ports at the edge of an MST region connecting to a bridge (RSTP or STP) or to an endpoint are *boundary ports*.

### 12.1.3 Configuring a Spanning Tree

These sections describe the following configuration processes:

- [Version Configuration and Instance Creation](#)
- [Spanning Tree Instance Configuration](#)
- [Port Roles and Rapid Convergence](#)
- [Configuring BPDU Transmissions](#)

#### 12.1.3.1 Version Configuration and Instance Creation

The switch supports three STP versions and switchport backup interface pairs. Disabling spanning tree is also supported but not recommended.

The `spanning-tree mode` global configuration command specifies the spanning tree version the switch runs. This section describes command options that enable and configure STP versions.

##### 12.1.3.1.1 Multiple Spanning Tree (MST)

Multiple Spanning Tree is enabled by the `spanning-tree mode` command with the **mstp** option. MSTP is the default STP version.

#### Example

This command enables Multiple Spanning Tree.

```
switch(config)# spanning-tree mode mstp
switch(config)#
```

#### Configuring MST Regions

All switches in an MST region must have the same name, revision, and VLAN-to-instance map. Changes to one MST instance will cause the spanning tree to be recalculated, affecting other MST instances and causing traffic disruption in other VLANs, unless the same changes are applied to all switches. MST configuration mode commands sets the region parameters. The **MST** configuration mode is a group-change mode where changes are saved by exiting the mode.

#### Example

The `spanning-tree mst configuration` command places the switch in the **MST** configuration mode.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)#
```

The `instance` command assigns VLANs to MST instances. The `name (mst-configuration mode)` and `revision (mst-configuration mode)` commands configure the MST region name and revision.

**Note:** Changing MST configurations, particularly VLAN-to-instance mapping changes, can cause traffic disruption.

## Examples

- These commands assign **vlan 4-7** and **9** to instance **8** and remove **vlan 6** from instance **10**.

```
switch(config-mst)# instance 8 vlans 4-7,9
switch(config-mst)#no instance 10 vlans 6
switch(config-mst)#
```

- These commands assign the **name (corporate\_1)** and **revision (3)** to the switch.

```
switch(config-mst)# name corporate_1
switch(config-mst)# revision 3
switch(config-mst)#
```

The `exit (mst-configuration mode)` command transitions the switch out of the **MST** configuration mode and saves all pending changes. The `abort (mst-configuration mode)` command exits the **MST** configuration mode without saving the pending changes.

## Example

This command exits the **MST** configuration mode and saves all pending changes.

```
switch(config-mst)# exit
switch(config)#
```

## Configuring MST Instances

These STP commands provide an optional MST instance parameter. These commands apply to instance **0** when the optional parameter is not included.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

## Examples

- This command configures priority for MST instance **4**.

```
switch(config)# spanning-tree mst 4 priority 4096
switch(config)#
```

- Each of these commands configure priority for MST instance **0**.

```
switch(config)# spanning-tree mst 0 priority 4096
```

or

- `switch(config)# spanning-tree priority 4096`

### 12.1.3.1.2 Rapid Spanning Tree (RST)

Rapid spanning tree is enabled through the `spanning-tree mode` command with the **rstp** option.

## Example

- This command enables Rapid Spanning Tree.

```
switch(config)#spanning-tree mode rstp
switch(config)#
```

These STP commands, when they do not include an optional MST or VLAN parameter, apply to RSTP. Commands that configure MSTP instance **0** also apply to the RSTP instance.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

### Examples

- These commands apply to the RST instance.

```
switch(config)# spanning-tree priority 4096
```

and

```
switch(config)# spanning-tree mst 0 priority 4096
```

- These commands do not apply to the RST instance.

```
switch(config)# spanning-tree mst 4 priority 4096
```

and

```
switch(config)# spanning-tree vlan-id 3 priority 4096
```

**Show** commands (such as `show spanning-tree`) displays the RSTP instance as MST0 (MST instance **0**).

### Example

- This command, while the switch is in RST mode, displays RST instance information.

```
switch(config)# show spanning-tree
MST0
Spanning tree enabled protocol rstp<---RSTP mode indicator
Root ID Priority 32768
 Address 001c.730c.1867
 This bridge is the root

Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 001c.730c.1867
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

Interface Role State Cost Prio.Nbr Type

Et51 designated forwarding 2000 128.51 P2p

switch(config)#
```

#### 12.1.3.1.3 Rapid Per-VLAN Spanning Tree (Rapid-PVST)

Rapid-PVST mode is enabled by the `spanning-tree mode` command with the **rapid-pvst** option.

### Example

- This command enables Rapid Per-VLAN Spanning Tree.

```
switch(config)# spanning-tree mode rapid-pvst
switch(config)#
```

These commands provide an optional VLAN parameter for configuring Rapid-PVST instances.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`
- `spanning-tree mst pvst border`

### Examples

- This command configures bridge priority for **vlan 4**.

```
switch(config)# spanning-tree vlan-id 4 priority 4096
switch(config)#
```

- This command enables MSTP PVST+ border ports. The command is effective only if spanning-tree mode is MSTP.

```
switch(config)# spanning-tree mst pvst border
```

#### 12.1.3.1.4 Switchport Backup Mode

Switchport backup interface pairs are enabled through the `spanning-tree mode` command with the **backup** option. Enabling switchport backup disables all spanning-tree modes. For loop avoidance under switchport backup mode, use the [Loop Protection](#) feature.

### Example

This command enables switchport backup.

```
switch(config)# spanning-tree mode backup
switch(config)#
```

The `switchport backup-link` command establishes an interface pair between the command mode interface (primary) and the interface specified by the command (backup).

### Example

These commands establish **interface ethernet 7** as the backup port for **interface ethernet 1**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport backup-link ethernet 7
switch(config-if-Et1)#
```

The **prefer** option of the `switchport backup-link` command establishes a peer relationship between the primary and backup interfaces and specifies VLAN traffic that the backup interface normally carries. If either interface goes down, the other interface carries traffic normally handled by both interfaces.

### Examples

These steps perform the following:

- configures **interface ethernet 1** as a trunk port that handles VLANs **4** through **9** traffic.
- configures **interface ethernet 2** as the backup interface.
- assigns **ethernet 2** as the preferred interface for VLANs **7** through **9**.

1. Enter configuration mode for the primary interface.

```
switch(config)# interface ethernet 1
```

2. Configure the primary interface as a trunk port that services VLANs **4-9**

```
switch(config-if-Et1)# switchport mode trunk
```

```
switch(config-if-Et1)# switchport trunk allowed vlan 4-9
```

3. Configure the backup interface and specify the VLANs that it normally services.

```
switch(config-if-Et1)# switchport backup-link Ethernet 2 prefer vlan 7-9
switch(config-if-Et1)#
```

#### 12.1.3.1.5 Loop Protection

Loop protection is a loop detection and prevention method which is independent of STP and is not disabled when the switch is in switchport backup mode. When loop protection is active on an interface, that interface periodically sends out loop-detection frames; if one is received that originated on the switch, the receiving port is errdisabled until a timeout period has passed or it is manually reset.

Loop protection is configured and enabled per VLAN, but individual ports in a VLAN can be configured to disable loop protection.

**Note:** Loop protection cannot be enabled on an MLAG peer link.

This feature is disabled by default. To enable it, use the `monitor loop-protection` command to enter loop-protection configuration mode, then use the `no shutdown (Loop-protection)` command to enable the feature. To enable loop protection on a VLAN, use the `protect vlan` command. To exclude a port from loop protection, use the `no loop-protection` command.

The feature is configured with the following additional commands:

- `transmit-interval`
- `disabled-time`
- `rate-limit`

#### Examples

- This command enters loop protection configuration mode.

```
switch(config)# monitor loop-protection
switch(config-monitor-loop-protect)#
```

- These commands enable loop protection on VLANs **1025-2000**.

```
switch(config)# monitor loop-protection
switch(config-monitor-loop-protect)# no shutdown
switch(config-monitor-loop-protect)# protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

- These commands exclude **interface ethernet 38** from loop protection.

```
switch(config)# interface ethernet 38
switch(config-if-Et38)# no loop-protection
switch(config-if-Et38)#
```

- These commands configure loop protection with a transmission interval of **10** seconds, a disabled time of two days, and a maximum rate of **500** loop detection frames per second.

```
switch(config-monitor-loop-protect)# transmit-interval 10
switch(config-monitor-loop-protect)# disabled-time 172800
switch(config-monitor-loop-protect)# rate-limit 500
switch(config-monitor-loop-protect)#
```

### 12.1.3.1.6 Disabling Spanning Tree

Spanning tree is disabled by the `spanning-tree mode none` command with the **none** option. The switch does not generate STP packets. Switchport interfaces forward packets when connected to other ports. The switch forwards inbound STP packets as multicast data packets on the VLAN where they are received.

#### Example

This command disables all STP functions.

```
switch(config)# spanning-tree mode none
switch(config)#
```

### 12.1.3.2 Spanning Tree Instance Configuration

A network performs these steps to set up an STP instance:

1. The bridge with the lowest ID is elected root bridge.
2. Root Ports (RP) are selected on all other bridges.
3. Designated bridges are selected for each network segment.
4. Designated Ports (DP) are selected on each designated bridge.
5. Networks begin forwarding data through RPs and DPs. All other ports are blocked.

#### 12.1.3.2.1 Root Bridge Parameters

STPs use bridge IDs for electing the root bridge. Switches denote a bridge ID for each configured Spanning Tree instance. The bridge ID composition is:

- Priority (four bits)  
Priority is expressed as a multiple of 4096 because it is stored as the four most significant bits of a two-byte number.
- Protocol Dependent (twelve bits)
  - **Rapid-PVST:** VLAN number
  - **MST:** Instance number
  - **RST:** 0
- MAC address of switch (six bytes)

#### Example

The switch defines bridge IDs for three MST instances:

- **MST 0: 32768** (Priority (**32768**)+Instance number(**0**)) and **001c.7301.23de** (MAC address)
- **MST101: 32869** (Priority (**32768**)+Instance number(**101**)) and **001c.7301.23de** (MAC address)
- **MST102: 32870** (Priority (**32768**)+Instance number(**102**)) and **001c.7301.23de** (MAC address)

This command displays a table of root bridge information.

```
switch> show spanning-tree root
```

| Instance | Priority | Root ID<br>MAC addr | Root<br>Cost | Time | Hello<br>Age | Max<br>Dly | Fwd<br>Root Port |
|----------|----------|---------------------|--------------|------|--------------|------------|------------------|
| MST0     | 32768    | 001c.7301.23de      | 0            | 2    | 20           | 15         | Po937            |
| MST101   | 32869    | 001c.7301.23de      | 3998         | 0    | 0            | 0          | Po909            |
| MST102   | 32870    | 001c.7301.23de      | 3998         | 0    | 0            | 0          | Po911            |

The switch provides two commands that configure the switch priority: `spanning-tree priority` and `spanning-tree root`. The commands differ in the available parameter options:

- `spanning-tree priority` options are integer multiples of **4096** between **0** and **61440**.
- `spanning-tree root` options are **primary** and **secondary**.
- **primary** assigns a priority of **8192**.
- **secondary** assigns a priority of **16384**.

The default priority value is **32768**.

The following examples configure bridge IDs with both commands.

### Examples

- These commands configure MST instance bridge priorities with the `root` command:

```
switch(config)# spanning-tree mst 0 root primary
switch(config)# spanning-tree mst 1 root secondary
switch> show spanning-tree root
```

| Instance | Priority | Root ID<br>MAC addr | Root<br>Cost | Hello<br>Time | Max<br>Age | Fwd<br>Dly | Root Port |
|----------|----------|---------------------|--------------|---------------|------------|------------|-----------|
| MST0     | 8192     | 001c.7301.6017      | 0            | 2             | 20         | 15         | None      |
| MST1     | 16385    | 001c.7301.6017      | 0            | 0             | 0          | 0          | None      |
| MST2     | 32770    | 001c.7301.6017      | 0            | 0             | 0          | 0          | None      |

- Instance **0** root priority is **8192**: primary priority plus the instance number of **0**.
- Instance **1** root priority is **16385**: secondary priority plus the instance number of **1**.
- Instance **2** root priority is **32770**: default priority plus the instance number of **2**.

These priority settings normally program the switch to be the primary root bridge for instance 0, the secondary root bridge for instance 1, and a normal bridge for instance 2. Primary and secondary root bridge elections also depend on the configuration of other network bridges.

- These priority commands configure Rapid-PVST VLAN bridge priorities:

```
switch(config)# spanning-tree vlan-id 1 priority 8192
switch(config)# spanning-tree vlan-id 2 priority 16384
switch(config)# spanning-tree vlan-id 3 priority 8192
switch(config)# no spanning-tree vlan-id 4 priority
switch(config)# show spanning-tree root
```

| Instance | Priority       | Root ID<br>MAC addr | Root<br>Cost | Hello<br>Time | Max<br>Age | Fwd<br>Dly | Root Port |
|----------|----------------|---------------------|--------------|---------------|------------|------------|-----------|
| VL18193  | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |
| VL216386 | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |
| VL38195  | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |
| VL432788 | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |

- VLAN **1** root priority is **8193**: configured priority plus the VLAN number of **1**.
- VLAN **2** root priority is **16386**: configured priority plus the VLAN number of **2**.
- VLAN **3** root priority is **8195**: configured priority plus the VLAN number of **3**.

These priority settings normally program the switch to be the primary root bridge for VLANs **1** and **3**, the secondary root bridge for **vlan 2**, and a normal bridge for **vlan 4**. Primary and secondary root bridge elections also depend on the configuration of other network bridges. **vlan 4** root priority is **32788**: default priority plus the VLAN number of **4**.

---

### 12.1.3.2.2 Path Cost

Spanning tree calculates the costs of all possible paths from each component to the root bridge. The path cost is equal to the sum of the cost assigned to each port in the path. Ports are assigned a cost by default or through CLI commands. Cost values range from 1 to **200000000** (200 million).

The default cost is a function of the interface speed:

- 1 gigabit interfaces have a default cost of **20000**.
- 10 gigabit interfaces have a default cost of **2000**.

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Costs can be specified for Ethernet and port channel interfaces. The command provides a mode parameter for assigning multiple costs to a port for MST instances or Rapid-PVST VLANs.

#### Examples

- These commands configure a port cost of **25000** to *interface ethernet 5*. This cost is valid for RSTP or MSTP instance **0**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree cost 25000
switch(config-if-Et5)#
```

- This command configures a path cost of **300000** to *interface ethernet 5* in MST instance **200**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree mst 200 cost 300000
switch(config-if-Et5)#
```

- This command configures a path cost of **10000** to *interface ethernet 5* in Rapid-PVST VLAN **200-220**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree vlan-id 200-220 cost 10000
switch(config-if-Et5)#
```

### 12.1.3.2.3 Port Priority

STP uses the port priority interface parameter to select ports when resolving loops. The port with the lower port priority numerical value is placed in forwarding mode. When multiple ports are assigned equal port priority numbers, the port with the lower interface number is placed in forwarding mode. Valid port-priority numbers are multiples of 16 between **0** and **240**; the default is **128**.

The `spanning-tree port-priority` command configures the port-priority number for the configuration mode interface. The command provides a mode option for assigning different priority numbers to a port for multiple MST instances or Rapid-PVST VLANs. Port-priority can be specified for Ethernet and port channel interfaces.

#### Examples

- This command sets the access port priority of **144** for Ethernet **5** interface.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree port-priority 144
switch(config-if-Et5)#
```

- This command sets the access port priority of **144** for Ethernet **5** interface in MST instance **10**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree mst 10 port-priority 144
switch(config-if-Et5)#
```

### 12.1.3.3 Port Roles and Rapid Convergence

Spanning Tree provides the following options for controlling port configuration and operation:

- **portfast**: Allows ports to skip learning state before entering the forwarding state.
- **port type** and **link type**: Designates ports for rapid transitions to the forwarding state.
- **root guard**: Ensures that a port will not become the root port.
- **loop guard**: Prevents loops resulting from unidirectional failure of links.
- **bridge assurance**: Prevents loops caused by unidirectional links or a malfunctioning switch.

#### 12.1.3.3.1 PortFast

PortFast allows devices to gain immediate network access before convergence of the spanning tree. Enabling PortFast on ports connected to another switch can create loops.

A **portfast** port that receives a BPDU sets its operating state to **non-portfast** while remaining in **portfast** configured state. In this state, the port is subject to topology changes and can enter the discarding state.

The [spanning-tree portfast](#) command programs access ports to immediately enter the forwarding state. PortFast connects devices attached to an access port, such as a single workstation, to the network immediately without waiting for STP convergence. PortFast can also be enabled on trunk ports.

#### Example

This command unconditionally enables portfast on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast
switch(config-if-Et5)#
```

#### 12.1.3.3.2 Port Type and Link Type Configuration

RSTP only achieves rapid transition to forwarding state on edge ports and point-to-point links.

#### Port Type

Edge ports are directly connected to end stations. Because edge ports do not create loops, they transition directly to forwarding state when a link is established.

The [spanning-tree portfast <port type>](#) command sets the configuration mode interfaces port type. Spanning tree ports can be configured as **edge** ports, **network** ports, or **normal** ports. The default port type is **normal**.

- **edge ports** connect to a host (end station). Configuring a port that connects to a bridge as an edge port may create a loop. Edge ports that receive a BPDU become a normal spanning tree port.
- **network ports** connect only to a Layer 2 switch or bridge. Configuring a port connected to a host as a network port transitions the port to the discarding state.
- **normal ports** have an unspecified topology.

#### Examples

- This command configures **interface ethernet 5** as a network port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast network
switch(config-if-Et5)#
```

- Auto-edge detection converts ports into edge ports when they do not receive a new BPDU before the current BPDU expires, as measured by the max-age timer. The [spanning-tree portfast auto](#) command

---

enables auto-edge detection on the configuration mode interface, superseding the `spanning-tree portfast` command. Auto-edge detection is enabled by default.

This command enables auto-edge detection on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast auto
switch(config-if-Et5)#
```

### Link Type

The switch derives a ports default link type from its duplex mode:

- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared link**.

The `spanning-tree link-type` command specifies the configuration mode interfaces link-type. RSTP fast transition is not allowed on **shared link** ports, regardless of their duplex setting. Because the ports are full-duplex by default, the default link-type setting is **point-to-point**.

### Example

This command configures *interface ethernet 5* as a shared port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree link-type shared
switch(config-if-Et5)#
```

#### 12.1.3.3.3 Root Guard and Loop Guard

**Root guard** stops a port from becoming a root port, which stops connected switches from becoming root bridges. When a switch detects a new root bridge, its root-guard-enabled ports enter blocked (root-inconsistent) state. When the switch no longer detects a new root, these ports enter learning state.

Root guard is enabled on a per-port basis. The setting applies to all STP instances. Disabling root guard places the port in learning state.

The `spanning-tree guard` command, with the root option, enables root guard on the configuration mode interface.

### Example

This command enables root guard on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree guard root
switch(config-if-Et5)#
```

**Loop guard** prevents loops resulting from unidirectional failure of point-to-point links by verifying that non-designated ports (root, blocked, and alternate) are receiving BPDUs from their designated ports. A loop-guard-enabled root or blocked port that stops receiving BPDUs transitions to the discarding (loop-inconsistent) state. The port recovers from this state when it receives a BPDU.

Loop guard, when enabled globally, applies to all point-to-point ports. Loop guard is configurable on individual ports and applies to all STP instances of an enabled port. Loop-inconsistent ports transition to learning state when loop guard is disabled.

If loop guard is enabled on a root switch, it takes effect only if the switch becomes a nonroot switch.

When using loop guard:

- Do not enable loop guard on portfast-enabled ports.

- Loop guard is not functional on ports not connected to point-to-point links.
- Loop guard has no effect on disabled spanning tree instances.

Loop guard aspects on port channels include:

- BPDUs are sent over the channels first operational port. Loop guard blocks the channel if that link becomes unidirectional even when other channel links function properly.
- Creating a new channel destroys state information for its component ports; new channels with loop-guard-enabled ports can enter forwarding state as a DP.
- Disassembling a channel destroys its state information; component ports from a blocked channel can enter the forwarding state as DPs, even if the channel contained unidirectional links.
- If a link on any port of the channel becomes unidirectional, the channel is blocked. Transmission resumes if the port is removed from the channel or the bidirectional communication is restored.

Loop guard configuration commands include:

- `spanning-tree guard loop default` command enables loop guard as a default on all switch ports.
- `spanning-tree guard` control the loop guard setting on the configuration mode interface. This command overrides the default command for the specified interface.

### Examples

- This command enables loop guard as the default on all switch ports.

```
switch(config)# spanning-tree guard loop default
switch(config)#
```

- This command enables loop guard on **interface ethernet 6**.

```
switch(config)# interface ethernet 6
switch(config-if-Et6)# spanning-tree guard loop
switch(config-if-Et6)#
```

#### 12.1.3.3.4 Bridge Assurance

Bridge assurance protects against unidirectional link failures, other software failures, and devices that continue forwarding data traffic after they quit running spanning tree.

Bridge assurance programs the switch to send BPDUs at each hello time period through all bridge assurance-enabled ports (i.e., network ports). Bridge assurance operates only on **network** ports with **point-to-point** links, ideally with bridge assurance enabled on each side of the link. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled.

Ports not receiving a BPDU packet within a hello time period enter inconsistent (blocking) state. In this case, the `show spanning-tree transmit active` command will show a bridge assurance status of inconsistent for the port. If the other side of the link has bridge assurance enabled, or if the other switch is the root bridge, it will send periodic BPDUs, preventing an inconsistent blocking state.

Bridge assurance is globally enabled by default, but must also be enabled on a per-port basis by designating the port as a network port with the `spanning-tree portfast <port type>` command. The `no spanning-tree transmit active` command disables bridge assurance globally.

### Example

These commands enable bridge assurance on the switch, then enable bridge assurance on **interface ethernet 5** by designating it a network port.

```
switch(config)# spanning-tree transmit active
```

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast network
switch(config-if-Et5)#
```

#### 12.1.3.4 Configuring BPDU Transmissions

The following sections describe instructions that configure BPDU packet contents and transmissions.

##### 12.1.3.4.1 Configuring Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

In standard STP, ports passively wait for **forward\_delay** and **max\_age** periods before entering the forwarding state. RSTP achieves faster convergence by relying on edge port and link type definitions to start forwarding traffic. When edge ports and link types are properly configured, bridge timers are used in RSTP as backup or when interacting with networks running standard STP.

The `spanning-tree hello-time` command configures the hello time.

#### Examples

- This command configures a hello-time of **1** second (**1000** ms).

```
switch(config)# spanning-tree hello-time 1000
switch(config)#
```

The `spanning-tree max-hops` command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the max hop value to **40**.

```
switch(config)# spanning-tree max-hops 40
switch(config)#
```

The `spanning-tree forward-time` command configures the forward delay setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the forward delay timer value to **25** seconds.

```
switch(config)# spanning-tree forward-time 25
switch(config)#
```

The `spanning-tree max-age` command configures the max age setting that the switch inserts into BPDUs that it sends out as the root bridge.

- This command sets the max age timer value to **25** seconds.

```
switch(config)# spanning-tree max-age 25
switch(config)#
```

#### 12.1.3.4.2 BPDU Transmit Hold-Count

The `spanning-tree bpd tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from **1** to **10** BPDUs with a default of **6** BPDUs.

Higher hold-count settings can significantly impact CPU utilization, especially in Rapid-PVST mode. Smaller values can slow convergence in some configurations.

##### Example

This command configures a transmit hold-count of **8** BPDUs.

```
switch(config)# spanning-tree bpd tx hold-count 8
switch(config)#
```

#### 12.1.3.4.3 BPDU Guard

PortFast interfaces do not receive BPDUs in a valid configuration. BPDU Guard provides a secure response to invalid configurations by disabling ports when they receive a BPDU. Disabled ports differ from blocked ports in that they are re-enabled only through manual intervention.

- When configured globally, BPDU Guard is enabled on ports in the operational portfast state.
- When configured on an individual interface, BPDU Guard disables the port when it receives a BPDU, regardless of the portfast state of the port.

The `spanning-tree edge-port bpduguard default` global configuration command enables BPDU Guard by default on all portfast ports. BPDU Guard is disabled on all ports by default.

The `spanning-tree bpduguard` interface configuration command controls BPDU Guard on the configuration mode interface. This command takes precedence over the default setting configured by `spanning-tree edge-port bpduguard default`.

- `spanning-tree bpduguard` enables BPDU Guard on the configuration mode interface.
- `spanning-tree bpduguard disable` disables BPDU Guard on the configuration mode interface.
- `no spanning-tree bpduguard` reverts the configuration mode interface to the default BPDU Guard setting.

##### Example

These commands enable BPDU Guard by default on all portfast ports, then disable BPDU Guard on **interface ethernet 5**.

```
switch(config)# spanning-tree edge-port bpduguard default
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree bpduguard disable
switch(config-if-Et5)
```

#### 12.1.3.4.4 BPDU Filter

BPDU filtering prevents the switch from sending or receiving BPDUs on specified ports. BPDU filtering is configurable on Ethernet and port channel interfaces.

Ports with BPDU filtering enabled do not send BPDUs and drops inbound BPDUs. Enabling BPDU filtering on a port not connected to a host can result in loops as the port continues forwarding data while ignoring inbound BPDU packets.

The `spanning-tree bpdupfilter` command controls BPDU filtering on the configuration mode interface. BPDU filtering is disabled by default.

---

## Example

These commands enable BPDU filtering on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree bpduguard enable
switch(config-if-Et5)#
```

### 12.1.3.4.5 BPDU Rate Limit

BPDU input rate limiting restricts the number of BPDUs that a port on which BPDU Guard and BPDU Filter are both disabled accepts during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as `bpduguard`.

Configuring the rate limiter requires two steps:

- Establishing the rate limit threshold
- Enabling rate limiting

#### Establishing the Rate Limit Threshold

The `spanning-tree bpduguard rate-limit count (interface)` command specifies the BPDU reception rate (quantity per interval) that triggers the discarding of BPDUs. The command is available in global and interface configuration modes.

- The `spanning-tree bpduguard rate-limit count` global command specifies the maximum reception rate for ports that are not covered by interface rate limit count commands. The global command specifies the default limit.

**Note:** Arista Networks recommends retaining the default rate-limit values. In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limiting on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

- The `spanning-tree bpduguard rate-limit count` interface command defines the maximum BPDU reception rate for ports in the configuration mode interface.

#### Examples

- This command configures the global limit of **5000** BPDUs over a **4** second interval.

```
switch(config)# spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

- These commands configure a limit of **7500** BPDUs over an **8** second interval on the *interface ethernet 2*.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# spanning-tree bpduguard rate-limit count 7500 interval 8
switch(config-if-Et2)#
```

#### Enabling Rate Limiting

BPDU rate limiting is enabled globally or on individual ports:

- `spanning-tree bpduguard rate-limit default` enables rate limiting on all ports that are not covered by the interface rate limiting command. The default setting is **enabled**.

- `spanning-tree bpduguard rate-limit enable / disable` interface command enables or disables BPDU rate limiting on the configuration mode interface. This command has precedence over the global command.

### Examples

- This command enables rate limiting on ports that are not covered by interface rate limit commands:

```
switch(config)# spanning-tree bpduguard rate-limit default
switch(config)#
```

- These commands enable rate limiting on the *interface ethernet 15*:

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

## 12.1.4 STP Commands

### Spanning Tree Commands: Global Configuration

- `spanning-tree bpdu tx hold-count`
- `spanning-tree bpduguard rate-limit count (global)`
- `spanning-tree bpduguard rate-limit default`
- `spanning-tree edge-port bpdufilter default`
- `spanning-tree edge-port bpduguard default`
- `spanning-tree forward-time`
- `spanning-tree guard loop default`
- `spanning-tree hello-time`
- `spanning-tree max-age`
- `spanning-tree max-hops`
- `spanning-tree mode`
- `spanning-tree mst configuration`
- `spanning-tree mst pvst border`
- `spanning-tree portchannel guard misconfig`
- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree transmit active`
- `spanning-tree vlan-id`

### Loop Protection Commands

- `disabled-time`
- `loop-protection`
- `monitor loop-protection`
- `protect vlan`
- `rate-limit`
- `show loop-protection`
- `shutdown (Loop-protection)`
- `transmit-interval`

---

## Spanning Tree Commands: Interface Configuration Mode

- `spanning-tree bpdupfilter`
- `spanning-tree bpduguard`
- `spanning-tree bpduguard rate-limit count (interface)`
- `spanning-tree bpduguard rate-limit enable / disable`
- `spanning-tree cost`
- `spanning-tree guard`
- `spanning-tree link-type`
- `spanning-tree port-priority`
- `spanning-tree portfast`
- `spanning-tree portfast auto`
- `spanning-tree portfast <port type>`
- `switchport backup-link`

## MST Configuration Commands

- `abort (mst-configuration mode)`
- `exit (mst-configuration mode)`
- `instance`
- `name (mst-configuration mode)`
- `revision (mst-configuration mode)`
- `show (mst-configuration mode)`

## Display Commands

- `show spanning-tree`
- `show spanning-tree blockedports`
- `show spanning-tree counters`
- `show spanning-tree instance`
- `show spanning-tree instance detail`
- `show spanning-tree interface`
- `show spanning-tree mst`
- `show spanning-tree mst configuration`
- `show spanning-tree mst interface`
- `show spanning-tree mst test information`
- `show spanning-tree root`
- `show spanning-tree topology status`
- `show spanning-tree transmit active`

## Clear Commands

- `clear spanning-tree counters`
- `clear spanning-tree counters session`
- `clear spanning-tree detected-protocols`

#### 12.1.4.1 **abort (mst-configuration mode)**

The **abort** command, in MST-configuration mode, discards pending changes to the MST region configuration, then returns the switch to global configuration mode.

The `exit (mst-configuration mode)` command saves MST region changes to **running-config** before returning the switch to global configuration mode.

##### **Command Mode**

MST-configuration

##### **Command Syntax**

**abort**

##### **Example**

This command discards changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst) # abort
switch(config) #
```

#### 12.1.4.2 clear spanning-tree counters

The **clear spanning-tree counters** command resets the BPDU counters for the specified interfaces to zero in all CLI sessions.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear spanning-tree counters [INT_NAME]
```

##### Parameters

**INT\_NAME** Interface type and number. Options include:

- **no parameter** resets counters for all interfaces.
- **interface ethernet *e\_num*** Ethernet interface specified by *e\_num*.
- **interface loopback *l\_num*** Loopback interface specified by *l\_num*.
- **interface management *m\_num*** Management interface specified by *m\_num*.
- **interface port-channel *p\_num*** Port-Channel Interface specified by *p\_num*.
- **interface vlan *v\_num*** VLAN interface specified by *v\_num*.

##### Example

This command resets the BPDU counters on **interface ethernet 15**.

```
switch# show spanning-tree counters
 Port Sent Received Tagged Error Other Error

 Ethernet15 32721 0 0 0
 Port-Channel10 8487 0 0 0

switch# clear spanning-tree counters interface ethernet 15<---Clear command
switch# show spanning-tree counters
 Port Sent Received Tagged Error Other Error

 Ethernet15 11 0 0 0
 Port-Channel10 84942 6 0 switch#
```

### 12.1.4.3 clear spanning-tree counters session

The **clear spanning-tree counter session** command resets the BPDU counters to zero on all interfaces in the current CLI session. Counters in other CLI sessions are not affected.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear spanning-tree counters session
```

#### Example

This command resets the BPDU counters in the current CLI session.

```
switch# show spanning-tree counters
 Port Sent Received Tagged Error Other Error

 Ethernet15 32721 0 0 0
 Port-Channel10 8487 0 0 0

switch# clear spanning-tree counters session
switch# show spanning-tree counters
 Port Sent Received Tagged Error Other Error

 Ethernet15 11 0 0 0
 Port-Channel10 7 2 6 0 switch#
```

---

#### 12.1.4.4 clear spanning-tree detected-protocols

The **clear spanning-tree detected-protocols** command restarts the Spanning Tree Protocol (STP) migration state machine on the specified interfaces. The switch is reset to running rapid spanning tree protocol on an interface where it previously detected a bridge running an old version of the protocol.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear spanning-tree detected-protocols [INT_NAME]
```

##### Parameters

**INT\_NAME** Interface type and number. Values include:

- **no parameter** all interfaces.
- **ethernet *e\_num*** Ethernet interface specified by *e\_num*.
- **loopback *l\_num*** Loopback interface specified by *l\_num*.
- **management *m\_num*** Management interface specified by *m\_num*.
- **port-channel *p\_num*** Port-Channel Interface specified by *p\_num*.
- **vlan *v\_num*** VLAN interface specified by *v\_num*.

##### Example

This command restarts the STP migration machine on all switch interfaces.

```
switch# clear spanning-tree detected-protocols
switch#
```

### 12.1.4.5 disabled-time

The **disabled-time** command sets the time for which the port remains disabled after a loop is detected by loop protection. The **no disabled-time** and **default disabled-time** commands reset the disabled time to the default of **604800** seconds (seven days).

**Note:** If this value is changed, interfaces that are already disabled by loop protection will remain disabled for the previously configured period.

#### Command Mode

Loop-protection Configuration

#### Command Syntax

```
disabled-time [period]
```

```
no disabled-time [period]
```

```
default disabled-time [period]
```

#### Parameter

**period** Time in seconds for which the port remains disabled. Values range from **0** to **604800** (seven days). Default is **604800**. A value of **0** disables the interface until it is manually reset, even if the disabled time is later set to a non-zero value. To restore the port manually, shut it down and then re-enable it.

#### Example

This command configures loop protection to disable a port on which a loop is detected for a period of two days (**172800** seconds).

```
switch(config-monitor-loop-protect)# disabled-time 172800
switch(config-monitor-loop-protect)#
```

---

#### 12.1.4.6 **exit (mst-configuration mode)**

The **exit** command, in MST-configuration mode, saves changes to the MST region configuration, then returns the switch to global configuration mode. MST region configuration changes are also saved by entering a different configuration mode.

##### **Command Mode**

MST-configuration

##### **Command Syntax**

`exit`

##### **Examples**

- This command saves changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)# exit
switch(config)#
```

- This command saves changes to the MST region, then places the switch in Interface-Ethernet mode.

```
switch(config-mst)# interface ethernet 3
switch(config-if-Et3)#
```

### 12.1.4.7 instance

The **instance** command inserts an entry into the VLAN-to-instance map that associates a set of VLANs to an MST instance. In addition to defining the MST topology, the VLAN-to-instance map is one of three parameters, along with the MST name and revision number, that identifies the switch's MST region.

The **no instance** command removes specified entries from the VLAN-to-instance map. If the command does not provide a VLAN list, all entries are removed for the specified instance. The **no instance** and **default instance** commands function identically.

#### Command Mode

MST-Configuration

#### Command Syntax

```
instance mst_inst vlans v_range
no instance mst_inst [vlans v_range]
no default instance mst_inst [vlans v_range]
```

#### Parameters

- ***mst\_inst*** MST instance number. Value of ***mst\_inst*** ranges from **0** to **4094**.
- ***v\_range*** VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges.

#### Examples

- This command maps VLANs **20-39** to MST instance **2**.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# instance 2 vlans 20-39
switch(config-mst)#
```

- This command removes all VLAN mappings to MST instance **10**.

```
switch(config-mst)# no instance 10
switch(config-mst)#
```

---

### 12.1.4.8 loop-protection

The **loop-protection** command enables loop protection on the configuration mode interface. All interfaces in a VLAN under loop protection have loop protection enabled by default. The **no loop-protection** and **default loop-protection** commands disable loop protection on the interface.

When loop protection is disabled (at the VLAN or interface level), the computed state of the interface is forgotten and packets queued to be sent are dropped. If an interface is err-disabled by loop protection, disabling loop protection removes the err-disable.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
loop-protection
no loop-protection
default loop-protection
```

#### Example

These commands disable loop protection on **interface ethernet 2/4**. If the interface is currently errdisabled by loop protection, the errdisable is removed.

```
switch(config)# interface ethernet 2/4
switch(config-if-Et2/4)# no loop-protection
switch(config-if-Et2/4)#
```

### 12.1.4.9 monitor loop-protection

The **monitor loop-protection** command places the switch in loop-protection configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor loop-protection
```

#### Commands available in loop-protection configuration mode:

- [shutdown \(Loop-protection\)](#)
- [protect vlan](#)
- [transmit-interval](#)
- [disabled-time](#)
- [rate-limit](#)

#### Example

This command places the switch in ***loop-protection*** configuration mode.

```
switch(config)# monitor loop-protection
switch(config-monitor-loop-protect)#
```

---

#### 12.1.4.10 name (mst-configuration mode)

The **name** command configures the MST region name. The name is one of three parameters, along with the MST revision number and VLAN-to-instance map, that identifies the switch's MST region.

The name has up to 32 characters. The default name is an empty string. The name string accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from *running-config*.

##### Command Mode

MST-Configuration

##### Command Syntax

name *label\_text*

no name

default name

##### Parameter

**label\_text** character string assigned to name attribute. Maximum 32 characters. The space character is not permitted in the name string.

##### Example

This command assigns **corporate\_100** as the MST region name.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# name corporate_100
switch(config-mst)# show pending
Active MST configuration
Name [corporate_100]
Revision 0 Instances configured 1

Instance Vlans mapped

0 1-4094

```

#### 12.1.4.11 protect vlan

The **protect vlan** command specifies which VLANs participate in loop protection. The **no protect vlan** and **default protect vlan** commands remove loop protection from the specified VLANs.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

```
protect vlan vlan-range
```

##### Parameter

**vlan-range** List of VLANs (number, range, comma-delimited list of numbers and ranges). Numbers range from **1** to **4094**.

##### Example

This command enables loop protection on VLANs **1025-2000**.

```
switch(config-monitor-loop-protect)# protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

---

#### 12.1.4.12 rate-limit

The **rate-limit** command sets the maximum number of loop detection frames which can be sent by the switch per second. The **no rate-limit** and **default rate-limit** commands return the rate limit to the default value of **1000**.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

```
rate-limit [frames]
no rate-limit [frames]
default rate-limit [frames]
```

##### Parameters

**frames** Maximum number of frames sent per second. Values range from **0-1000**, default is **1000**. A value of **0** disables throttling.

##### Example

This command sets the maximum number of loop detection frames to **500** per second.

```
switch(config-monitor-loop-protect)# rate-limit 500
switch(config-monitor-loop-protect)#
```

### 12.1.4.13 revision (mst-configuration mode)

The **revision** command configures the MST revision number. The revision number is one of three parameters, along with the MST name and VLAN-to-instance map, that identifies the switch's MST region. Revision numbers range from **0** to **65535**. The default revision number is **0**.

The **no revision** and **default revision** commands restore the revision number to its default value by removing the revision command from **running-config**.

#### Command Mode

MST-Configuration

#### Command Syntax

```
revision rev_number
```

```
no revision
```

```
default revision
```

#### Parameter

**rev\_number** revision number. Possible ranges from **0** to **65535** with a default of **0**.

#### Example

This command sets the revision number to **15**.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# revision 15
switch(config-mst)# show pending
Active MST configuration
Name []
Revision 15Instances configured 1

Instance Vlans mapped

0 1-4094

```

#### 12.1.4.14 show (mst-configuration mode)

The **show** command displays the current and pending MST configuration:

Exiting MST configuration mode stores all pending configuration changes to **running-config**.

##### Command Mode

MST-Configuration

##### Command Syntax

show [EDIT\_VERSION]

##### Parameters

**EDIT\_VERSION** specifies configuration version that the command displays. Options include:

- **no parameter** command displays pending MST configuration.
- **active** command displays MST configuration stored in **running-config**.
- **current** command displays MST configuration stored in **running-config**.
- **pending** command displays pending MST configuration.

##### Example

These commands contrast the difference between the active and pending configuration by adding MST configuration commands, then showing the configurations.

```
switch(config-mst)# show pending
Active MST configuration
Name []
Revision 0 Instances configured 1

Instance Vlans mapped

0 1-4094

switch(config-mst)# instance 2 vlan 20-29,102
switch(config-mst)# revision 2
switch(config-mst)# name baseline
switch(config-mst)# show pending
Pending MST configuration
Name [baseline]
Revision 2 Instances configured 2

Instance Vlans mapped

0 1-19,30-101,103-4094
2 20-29,102

switch(config-mst)# show active
Active MST configuration
Name []
Revision 0 Instances configured 1

Instance Vlans mapped

0 1-4094

```

### 12.1.4.15 show loop-protection

The **show loop-protection** command displays loop protection status.

#### Command Syntax

**show loop-protection** [**detail**]

#### Examples

- This command displays basic loop protection information.

```
switch# show loop-protection
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800(or Permanent)
Packets Transmitted rate: 12/second(or Unthrottled)
Total: 3 Vlans enabled.
switch>
```

- This command displays detailed information about loop protection.

```
switch# show loop-protection detail
Loop protection is enabled

Transmit interval: 5
Disable Time: 604800
Packets Transmitted rate: 12/second
Total: 3 Vlans enabled.
Destination address: ffff.ffff.ffff
Ethernet type: 0x88b7
Receive action: Interface Disable
```

| Vlan Detected | Loop | Disabled Intfs | Total Intfs Disabled | Latest Time |
|---------------|------|----------------|----------------------|-------------|
| 1             | Yes  | Et1-2          | 20                   | 18:01       |
| 2             | No   | -              | 20                   | -           |
| 3             | No   | -              | 20                   | -           |

```
switch#
```

- This command displays loop protection information for the interfaces in VLANS 3-4.

```
switch# show loop-protection vlan 3-4
```

| Vlan | Intf | LP Enabled | State    | LP Disabled at | Bring up at |
|------|------|------------|----------|----------------|-------------|
| 3    | Et1  | Yes        | shutdown | Yes 17:21      | 18:21       |
| 3    | Et2  | Yes        | shutdown | No -           | -           |
| 3    | Et3  | Yes        | enabled  | No -           | -           |
| 3    | Et4  | No         | -        | -              | -           |
| 4    | -    | No         | -        | -              | -           |

```
switch#
```

- This command displays the number of loop detection packets sent and received.

```
switch# show loop-protection counters
```

| VLAN | Tx  | Rx | Rx-Other |
|------|-----|----|----------|
| 2    | 200 | 0  | 100      |
| 3    | 200 | 1  | 0        |

| Intfs | Tx  | Rx | Rx-Other |
|-------|-----|----|----------|
| Et1   | 200 | 0  | 100      |
| Et2   | 200 | 1  | 0        |

```
switch#
```

---

#### 12.1.4.16 show spanning-tree

The **show spanning-tree command** displays spanning tree protocol (STP) data, organized by instance.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree [VLAN_ID][INFO_LEVEL]
```

##### Parameters

- **VLAN\_ID** specifies the VLANs for which the command displays information. Formats include:
  - **no parameter** displays information for all VLANs.
  - **vlan** displays data for instances containing the first VLAN listed in running-config.
  - **vlan v\_range** displays data for instances containing a VLAN in the specified range.
- **INFO\_LEVEL** specifies level of information detail provided by the command.
  - **no parameter** displays table for each instance listing status, configuration, and history.
  - **detail** displays data blocks for each instance and all ports on each instance.

##### Display Values

- **Root ID** Displays information on the ROOT ID (elected spanning tree root bridge ID):
  - **Priority** Priority of the bridge. Default value is **32768**.
  - **Address** MAC address of the bridge.
- **Bridge ID** bridge status and configuration information for the locally configured bridge:
  - **Priority** Priority of the bridge. The default priority is **32768**.
  - **Address** MAC address of the bridge.
  - **Hello Time** Interval (seconds) between bridge protocol data units (BPDUs) transmissions.
  - **Max Age** Maximum time that a BPDU is saved.
  - **Forward Delay** Time (in seconds) that is spent in the learning state.
- **Interface** STP configuration participants. Link-down interfaces are not shown.
- **Role** Role of the port as one of the following:
  - **Root** The best port for a bridge to a root bridge used for forwarding.
  - **Designated** A forwarding port for a LAN segment.
  - **Alternate** A port acting as an alternate path to the root bridge.
  - **Backup** A port acting as a redundant path to another bridge port.
- **State** Displays the interface STP state as one of the following:
  - **Learning**
  - **Discarding**
  - **Forwarding**
- **Cost** STP port path cost value.
- **Prio. Nbr.** STP port priority. Values range from 0 to 240. Default is 128.
- **Type** The link type of the interface (automatically derived from the duplex mode of an interface):
  - **P2p Peer (STP)** Point to point full duplex port running standard STP.
  - **shr Peer (STP)** Shared half duplex port running standard STP.

## Examples

- This command displays STP data, including a table of port parameters.

```
switch# show spanning-tree vlan 1000
MST0
Spanning tree enabled protocol rstp
 Root ID Priority 32768
 Address 001c.7301.07b9
 Cost 1999 (Ext) 0 (Int)
 Port 101 (Port-Channel2)
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

 Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 001c.7304.195b
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

Interface Role State Cost Prio.Nbr Type

Et4 designated forwarding 20000 128.4 P2p
Et5 designated forwarding 20000 128.5 P2p
Et6 designated forwarding 20000 128.6 P2p
Et23 designated forwarding 20000 128.23 P2p
Et26 designated forwarding 20000 128.26 P2p
Et32 designated forwarding 2000 128.32 P2p switch>
```

- This command displays output from the show spanning-tree command:

```
Switch# show spanning-tree
MST0
Spanning tree enabled protocol mstp
 Root ID Priority 32768
 Address 0011.2201.0301
 This bridge is the root

 Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 0011.2201.0301
 Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec

Interface Role State Cost Prio.Nbr Type

Et4 designated forwarding 2000 128.4 P2p
Et5 designated forwarding 2000 128.5 P2p
...
PEt4 designated forwarding 2000 128.31 P2p
PEt5 designated forwarding 2000 128.44 P2p
...
Po3 designated forwarding 1999 128.1003 P2p
```

- This command displays STP data, including an information block for each interface running STP.

```
switch# show spanning-tree vlan 1000 detail
MST0 is executing the rstp Spanning Tree protocol
 Bridge Identifier has priority 32768, sysid 0, address 001c.7304.195b
 Configured hello time 2.000, max age 20, forward delay 15, transmit hold-count 6
 Current root has priority 32768, address 001c.7301.07b9
 Root port is 101 (Port-Channel2), cost of root path is 1999 (Ext) 0 (Int)
 Number of topology changes 4109 last change occurred 1292651 seconds ago
 from Ethernet13

Port 4 (Ethernet4) of MST0 is designated forwarding
 Port path cost 20000, Port priority 128, Port Identifier 128.4.
 Designated root has priority 32768, address 001c.7301.07b9
 Designated bridge has priority 32768, address 001c.7304.195b
 Designated port id is 128.4, designated path cost 1999 (Ext) 0 (Int)
 Timers: message age 1, forward delay 15, hold 20
 Number of transitions to forwarding state: 1
 Link type is point-to-point by default, Internal
 BPDU: sent 452252, received 0, taggedErr 0, otherErr 0, rateLimiterCount 0
 Rate-Limiter: enabled, Window: 10 sec, Max-BPDU: 400

Port 5 (Ethernet5) of MST0 is designated forwarding
 Port path cost 20000, Port priority 128, Port Identifier 128.5.

```

#### 12.1.4.17 show spanning-tree blockedports

The **show spanning-tree blockedports** command displays the list of blocked (discarding) ports.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree blockedports
```

##### Example

This command shows the ports that are in discarding state.

```
switch# show spanning-tree blockedports
Name Blocked Interfaces List

MST0 Po903, Po905, Po907, Po909, Po911, Po913, Po915, Po917, Po919, Po921, Po923
 Po925, Po927, Po929, Po931, Po933, Po935, Po939, Po941, Po943, Po945, Po947

Number of blocked ports (segments) in the system : 22 switch#
```

#### 12.1.4.18 show spanning-tree counters

The **show spanning-tree counters** command displays the number of BPDU transactions on each interface running spanning tree.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree counters
```

##### Example

This command displays the BPDU counter status on each interface running spanning tree.

| switch# | show spanning-tree counters |         |          |              |             |            |
|---------|-----------------------------|---------|----------|--------------|-------------|------------|
|         | Port                        | Sent    | Received | Tagged Error | Other Error | sinceTimer |
|         | Ethernet2                   | 1008399 | 0        | 0            | 0           | 0          |
|         | Ethernet3                   | 1008554 | 0        | 0            | 0           | 0          |
|         | Ethernet4                   | 454542  | 0        | 0            | 0           | 0          |
|         | Ethernet5                   | 1008556 | 0        | 0            | 0           | 0          |
|         | Ethernet6                   | 827133  | 0        | 0            | 0           | 0          |
|         | Ethernet8                   | 1008566 | 0        | 0            | 0           | 0          |
|         | Ethernet10                  | 390732  | 0        | 0            | 0           | 0          |
|         | Ethernet11                  | 1008559 | 0        | 0            | 0           | 0          |
|         | Ethernet15                  | 391379  | 0        | 0            | 0           | 0          |
|         | Ethernet17                  | 621253  | 0        | 0            | 0           | 0          |
|         | Ethernet19                  | 330855  | 0        | 0            | 0           | 0          |
|         | Ethernet23                  | 245243  | 0        | 0            | 0           | 0          |
|         | Ethernet25                  | 591695  | 0        | 0            | 0           | 0          |
|         | Ethernet26                  | 1007903 | 0        | 0            | 0           | 0          |
|         | Ethernet32                  | 1010429 | 8        | 0            | 0           | 0          |
|         | Ethernet33                  | 510227  | 0        | 0            | 0           | 0          |
|         | Ethernet34                  | 827136  | 0        | 0            | 0           | 0          |
|         | Ethernet38                  | 1008397 | 0        | 0            | 0           | 0          |

### 12.1.4.19 show spanning-tree instance

The **show spanning-tree instance** command displays spanning tree protocol bridge configuration settings for each instance on the switch. The display includes **Bridge ID**, **Hello Time**, **Max Age**, and **Forward Delay** times.

The command also displays the restartability of the STP agent when the **detail** option is selected. A switch can continue support of MLAG operation when its peer is offline and the STP agent is unavailable.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree instance [INFO_LEVEL]
```

#### Parameters

**INFO\_LEVEL** specifies level of information detail provided by the command.

- **no parameter** command displays information in a data table.
- **detail** command displays bridge information in data blocks for each instance.

#### Examples

- This command displays a bridge data table.

```
switch# show spanning-tree instance
 Bridge ID
Instance Priority MAC addr Hello Time Max Age Fwd Dly

MST0 32768(32768, sys-id 0) 001c.7302.2f98 2000 20 15
MST101 32869(32768, sys-id 101) 001c.7302.2f98 2000 20 15
MST102 32870(32768, sys-id 102) 001c.7302.2f98 2000 20 15 switch#
```

- This command displays bridge data blocks.

```
switch# show spanning-tree instance detail
Stp Detailed Status:
 Stp agent restartable : True
 MST-PVST interoperoperation : Disabled
 Stp heartbeat timeout : 2.0
 Last local heartbeat timeout : 0:04:07 ago
 Local heartbeat timeout since reboot : 1

MST0
 Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 001c.7302.2f98
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

MST101
 Bridge ID Priority 32869 (priority 32768 sys-id-ext 101)
 Address 001c.7302.2f98
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

MST102
 Bridge ID Priority 32870 (priority 32768 sys-id-ext 102)
 Address 001c.7302.2f98
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec switch#
```

---

#### 12.1.4.20 show spanning-tree instance detail

The **show spanning-tree instance detail** command displays detailed MST information including MSTP-Rapid PVST+ interoperation status.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree instance detail
```

##### Example

This command displays detailed MST information.

```
switch# show spanning-tree instance detail
Stp Detailed Status:
 Stp agent restartable : True
 MST-PVST interoperation : Enabled
 Stp heartbeat timeout : 2.0
 Last local heartbeat timeout : 36 days, 19:10:46 ago
 Local heartbeat timeout since reboot : 1
MST0
 Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
 Address 001c.7374.8572
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec switch#
```

### 12.1.4.21 show spanning-tree interface

The **show spanning-tree interface** command displays spanning tree protocol information for the specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree interface INT_NAME [INFO_LEVEL]
```

#### Parameters

- **INT\_NAME** Interface type and number. Values include:
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **peer ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **port-channel p\_num** Port-Channel Interface specified by **p\_num**.
  - **peerport-channel p\_num** Port-Channel Interface specified by **p\_num**.
- **INFO\_LEVEL** specifies level of detail provided by the output. Options include:
  - **no parameter** command displays a table of STP data for the specified interface.
  - **detail** command displays a data block for the specified interface.

#### Examples

- This command displays an STP table for Ethernet interface 5.

```
switch# show spanning-tree interface ethernet 5
Instance Role State Cost Prio.Nbr Type

MST0 designated forwarding 20000 128.5 P2p switch#
```

- This command displays a data block for Ethernet interface 5.

```
switch# show spanning-tree interface ethernet 5 detail
Port 5 (Ethernet5) of MST0 is designated forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.5.
Designated root has priority 32768, address 001c.7301.07b9
Designated bridge has priority 32768, address 001c.7304.195b
Designated port id is 128.5, designated path cost 1999 (Ext) 0 (Int)
Timers: message age 1, forward delay 15, hold 20
Number of transitions to forwarding state: 1
Link type is point-to-point by default, Internal
BPDU: sent 1008766, received 0, taggedErr 0, otherErr 0, rateLimiterCount 0
Rate-Limiter: enabled, Window: 10 sec, Max-BPDU: 400 switch#
```

### 12.1.4.22 show spanning-tree mst

The **show spanning-tree mst** command displays configuration and state information for Multiple Spanning Tree protocol (MST) instances.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree mst [INSTANCE] [INFO_LEVEL]
```

#### Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - **no parameter** all MST instances.
  - **mst\_inst** MST instance number. Value of **mst\_inst** ranges from **0** to **4094**.
- **INFO\_LEVEL** type and amount of information in the output. Options include:
  - **no parameter** output is interface data in tabular format.
  - **detail** output is a data block for each interface.

#### Examples

- This command displays interface data blocks for MST instance **3**.

```
switch# show spanning-tree mst 3 detail
MST3vlans mapped:3
Bridgeaddress 0011.2233.4402priority32771(32768 sysid 3)

---

### 12.1.4.23 show spanning-tree mst configuration

The **show spanning-tree mst configuration** command displays information about the MST regions VLAN-to-instance mapping. The command provides two display options:

- **default** displays a table that lists the instance to VLAN map.
- **digest** displays the configuration digest.

The configuration digest is a 16-byte hex string calculated from the md5 encoding of the VLAN-to-instance mapping table. Switches with identical mappings have identical digests.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree mst configuration [INFO_LEVEL]
```

#### Parameters

**INFO\_LEVEL** specifies data provided by the output. Options include:

- **no parameter** command displays VLAN-to-instance map.
- **digest** command displays the MST configuration digest.

#### Examples

- This command displays the MST regions VLAN-to-instance map.

```
switch# show spanning-tree mst configuration
Name []
Revision 0 Instances configured 3

Instance Vlans mapped

01,4-4094
22
33

switch#
```

- This command displays the MST regions configuration digest.

```
switch# show spanning-tree mst configuration digest
Name []
Revision 0 Instances configured 1
Digest 0xAC36177F50283CD4B83821D8AB26DE62 switch#
```

#### 12.1.4.24 show spanning-tree mst interface

The **show spanning-tree mst interface** command displays Multiple Spanning Tree Protocol (MSTP) information for a specified interface on the specified MST instances.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree mst [INSTANCE] interface INT_NAME [INFO_LEVEL]
```

##### Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - **no parameter** all MST instances.
  - **mst\_inst** denotes a single MST instance. Value of *mst\_inst* ranges from **0** to **4094**.
- **INT\_NAME** Interface type and number. Values include:
  - **ethernet e\_num** Ethernet interface specified by *e\_num*.
  - **peerethernet e\_num** Ethernet interface specified by *e\_num*.
  - **port-channel p\_num** Port-channel interface specified by *p\_num*.
  - **peerport-channel p\_num** Port-channel interface specified by *p\_num*.
- **INFO\_LEVEL** specifies level of detail provided by the output. Options include:
  - **no parameter** command displays a table of STP instance data for the specified interface.
  - **detail** command displays a data block for all specified instance-interface combinations.

##### Examples

- This command displays an table of STP instance data for **interface ethernet 1**:

```
switch# show spanning-tree mst interface ethernet 1
Ethernet1 of MST0 is root forwarding
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2120, received 2164, taggedErr 0, otherErr 0

Instance Role Sts CostPrio.Nbr Vlans mapped

0RootFWD2000128.11,4-4094
2DesgFWD2000128.12
3RootFWD2000128.13
```

- This command displays blocks of STP instance information for **interface ethernet 1**.

```
switch# show spanning-tree mst 3 interface ethernet 1 detail
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2321, received 2365, taggedErr 0, otherErr 0

Ethernet1 of MST3 is root forwarding
Vlans mapped to MST3 3
Port infoport id128.1priority128 cost2000
Designated rootaddress 0011.2233.4401priority32768 cost0
Designated bridgeaddress 0011.2233.4401priority32768 port id128.1
```

---

#### 12.1.4.25 show spanning-tree mst test information

The **show spanning-tree mst test information** displays diagnostic spanning tree protocol information.

##### Command Mode

EXEC

##### Command Syntax

**show spanning-tree mst test information**

##### Example

This command displays diagnostic STP information.

```
switch# show spanning-tree mst test information
bi = MstInfo.BridgeInfo("dut")
bi.stpVersion = "rstp"
bi.mstpRegionId = ""
bi.bridgeAddr = "00:1c:73:01:60:17"
si = MstInfo.BridgeStpiInfo("Mst")
bi.stpiInfoIs("Mst", si)
si.cistRoot = Tac.Value("Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17')
si.cistPathCost = 0
bmi = MstInfo.BridgeMstiInfo("Mst0")
bmi.bridgeId = Tac.Value("Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17')
bmi.designatedRoot = Tac.Value("Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17')
si.mstiInfoIs("Mst0", bmi)
bmii = MstInfo.BridgeMstiIntfInfo("Mst0", "Ethernet15")
bmii.portId = Tac.Value("Stp::PortId",
portPriority=128, portNumber=15)
bmii.role = "designated"
bmii.operIntPathCost = 2000
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs("Ethernet15", bmii)
bii = MstInfo.BridgeIntfInfo("Ethernet15")
bii.operExtPathCost = 2000
si.intfInfoIs("Ethernet15", bii)
bmii = MstInfo.BridgeMstiIntfInfo("Mst0", "Port-Channel10")
bmii.portId = Tac.Value("Stp::PortId",
portPriority=128, portNumber=101)
bmii.role = "designated"
bmii.operIntPathCost = 1999
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs("Port-Channel10", bmii)
bii = MstInfo.BridgeIntfInfo("Port-Channel10")
bii.operExtPathCost = 1999
si.intfInfoIs("Port-Channel10", bii)
switch>
```

### 12.1.4.26 show spanning-tree root

The **show spanning-tree root** command displays the Bridge-ID, cost to the root bridge, root port, and the root bridge timer settings for all instances.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree root [INFO_LEVEL]
```

#### Parameters

**INFO\_LEVEL** specifies output format. Options include:

- **no parameter** output displays data in tabular format.
- **detail** output displays a data block for each instance.

#### Examples

- This command displays a table of root bridge information.

```
switch# show spanning-tree root
```

| Instance | Root ID<br>Priority | MAC addr<br>MAC addr | Root<br>Cost | Hello<br>Time | Max<br>Age | Fwd<br>Dly | Root Port |
|----------|---------------------|----------------------|--------------|---------------|------------|------------|-----------|
| MST0     | 32768               | 001c.7301.23de       | 0            | 2             | 20         | 15         | Po937     |
| MST101   | 32869               | 001c.7301.23de       | 3998         | 0             | 0          | 0          | Po909     |
| MST102   | 32870               | 001c.7301.23de       | 3998         | 0             | 0          | 0          | Po911     |

switch>

- This command displays root bridge data blocks for each MSTP instance.

```
switch# show spanning-tree root detail
MST0
MST0
 Root ID Priority 32768
 Address 001c.7301.23de
 Cost 0 (Ext) 3998 (Int)
 Port 100 (Port-Channel937)
 Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec
MST101
 Root ID Priority 32869
 Address 001c.7301.23de
 Cost 3998
 Port 107 (Port-Channel909)
 Hello Time 0.000 sec Max Age 0 sec Forward Delay 0 sec
MST102
 Root ID Priority 32870
 Address 001c.7301.23de
 Cost 3998
 Port 104 (Port-Channel911)
 Hello Time 0.000 sec Max Age 0 sec Forward Delay 0 sec switch>
```

---

#### 12.1.4.27 show spanning-tree topology status

The **show spanning-tree topology status** command displays the forwarding state of ports on the specified VLANs.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree topology [VLAN_NAME] status [INFO_LEVEL]
```

##### Parameters

- **VLAN\_NAME** specifies the VLANs that the output displays. Options include:
  - **no parameter** output includes all VLANs.
  - **vlan** output includes all VLANs.
  - **vlan v\_num** command includes specified VLAN; **v\_num** ranges from **1** to **4094**.
- **INFO\_LEVEL** specifies information provided by output. Options include:
  - **no parameter** output lists forwarding state of interfaces.
  - **detail** output lists forwarding state and change history of interfaces.

##### Examples

- This command displays forwarding state for ports mapped to all VLANs.

```
switch# show spanning-tree topology status
Topology: Cist
Mapped Vlans: 1-4,666,1000-1001,1004-1005
Cpu: forwarding
Ethernet2: forwarding
Ethernet3: forwarding
Ethernet4: forwarding
Ethernet5: forwarding
Ethernet6: forwarding
Ethernet8: forwarding
Ethernet10: forwarding
Port-Channel1: forwarding
Port-Channel2: forwarding
Port-Channel3: forwarding switch>
```

- This command displays forwarding state and history for ports mapped to **vlan 1000**.

```
switch# show spanning-tree topology vlan 1000 status detail
Topology: Cist
Mapped Vlans: 1000
Cpu: forwarding (1 changes, last 23 days, 22:54:43 ago)
Ethernet2: forwarding (3 changes, last 23 days, 22:48:59 ago)
Ethernet4: forwarding (3 changes, last 10 days, 19:54:17 ago)
Ethernet5: forwarding (3 changes, last 23 days, 22:54:38 ago)
Ethernet6: forwarding (3 changes, last 19 days, 15:49:10 ago)
Ethernet10: forwarding (3 changes, last 9 days, 7:37:05 ago)
Port-Channel1: forwarding (3 changes, last 23 days, 22:54:34 ago)
Port-Channel3: forwarding (5 changes, last 21 days, 4:56:41 ago)

switch>
```

#### 12.1.4.28 show spanning-tree transmit active

The **show spanning-tree transmit active** command displays spanning tree protocol bridge assurance information for network ports or for all ports. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree transmit active INFO_LEVEL
```

##### Parameters

**INFO\_LEVEL** specifies level of information detail provided by the command.

- **no parameter** command displays bridge assurance information for network ports.
- **detail** command displays bridge assurance information for all ports.

##### Example

This command displays the bridge assurance status of network ports.

```
switch# show spanning-tree transmit active
Name Bridge Assurance Status

VL1 Et5/1 consistent

Number of bridge assurance inconsistent ports in the system : 0 switch>
```

---

#### 12.1.4.29 shutdown (Loop-protection)

The **shutdown** command disables loop protection globally. The feature is disabled by default, and is enabled by using the **no shutdown** command.

**Note:** To function, loop protection must also be enabled on a per-VLAN basis using the **protect vlan** command.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

`shutdown`

`no shutdown`

##### Example

This command enables loop protection globally on the switch.

```
switch(config-monitor-loop-protect)# no shutdown
switch(config-monitor-loop-protect)#
```

### 12.1.4.30 spanning-tree bpdu tx hold-count

The **spanning-tree bpdu tx hold-count** command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from **1** to **10** BPDUs with a default of **6** BPDUs.

The **no spanning-tree bpdu tx hold-count** and **default spanning-tree bpdu tx hold-count** commands restore the transmit hold count default of **6** BPDUs by removing the **spanning-tree bpdu tx hold-count** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree bpdu tx hold-count max_bpdu
```

```
no spanning-tree bpdu tx hold-count
```

```
default spanning-tree bpdu tx hold-count
```

#### Parameter

**max\_bpdu** BPDU packets. Value ranges from **1** to **10**. Default is **6**.

#### Example

This command configures a transmit hold-count of **8** BPDUs.

```
switch(config)# spanning-tree bpdu tx hold-count 8
switch(config)#
```

---

### 12.1.4.31 spanning-tree bpdudfilter

The **spanning-tree bpdudfilter** command controls bridge protocol data unit (BPDU) filtering on the configuration mode interface. BPDU filtering is disabled by default.

- **spanning-tree bpdudfilter enabled** enables BPDU filtering.
- **spanning-tree bpdudfilter disabled** disables BPDU filtering by removing the **spanning-tree bpdudfilter** command from *running-config*.

The BPDU filter default setting for portfast ports is configured by the **spanning-tree edge-port bpdudfilter default** command; BPDU filter is disabled by default on all non-portfast ports.

The **no spanning-tree bpdudfilter** and **default spanning-tree bpdudfilter** commands restore the global BPDU filter setting on the configuration mode interface by removing the corresponding **spanning-tree bpdudfilter** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpdudfilter FILTER_STATUS
```

```
no spanning-tree bpdudfilter
```

```
default spanning-tree bpdudfilter
```

#### Parameters

**FILTER\_STATUS** BPDU filtering status. Options include:

- **enabled** BPDU filter is enabled on the interface.
- **disabled** BPDU filter is disabled on the interface.

#### Example

This command enables BPDU filtering on *interface ethernet 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdudfilter enabled
switch(config-if-Et5)#
```

### 12.1.4.32 spanning-tree bpduguard

The **spanning-tree bpduguard** command controls BPDU Guard on the configuration mode interface. A BPDU Guard-enabled port is error disabled if it receives a BPDU packet.

The BPDU Guard default setting for portfast ports is configured by the [spanning-tree edge-port bpduguard default](#) command; BPDU Guard is disabled by default on all non-portfast ports.

The **no spanning-tree bpduguard** and **default spanning-tree bpduguard** commands restore the global BPDU Guard setting on the configuration mode interface by removing the corresponding **spanning-tree bpduguard** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpduguard GUARD_ACTION
```

```
no spanning-tree bpduguard
```

```
default spanning-tree bpduguard
```

#### Parameters

**GUARD\_ACTION** BPDU Guard setting. Options include:

- **disable** Disable BPDU Guard.
- **enable** Enable BPDU Guard.
- **rate-limit** BPDU input rate limiter options.

#### Example

These commands enable BPDU Guard on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree bpduguard enabled
switch(config-if-Et5)
```

---

### 12.1.4.33 spanning-tree bpduguard rate-limit count (global)

The **spanning-tree bpduguard rate-limit count** command sets the maximum BPDU reception rate (quantity per interval) for ports that are not covered by a [spanning-tree bpduguard rate-limit count \(interface\)](#) command.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as **bpduguard**.

To enable or disable BPDU rate limiting, use the [spanning-tree bpduguard rate-limit enable / disable](#) command.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the global setting to its default value by removing the **spanning-tree bpduguard rate-limit count** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree bpduguard rate-limit count max_bpdu [interval period]
no spanning-tree bpduguard rate-limit count
default spanning-tree bpduguard rate-limit count
```

#### Parameters

- **max\_bpdu** configures the maximum number of BPDUs per timer interval. Values range from **1** to **20000**.
- **interval period** configures the timer interval in seconds. The value of **period** ranges from **1** to **15**.

#### Guidelines

Arista Networks recommends retaining the default rate-limit values.

In PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limiting on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add **300** more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

#### Example

This command configures the global rate limit as **5000** BPDUs per **4** second period.

```
switch(config)# spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

### 12.1.4.34 spanning-tree bpduguard rate-limit count (interface)

The **spanning-tree bpduguard rate-limit count** command configures the maximum BPDU reception rate for the configuration mode interface. The default rate limit is specified by the [spanning-tree bpduguard rate-limit count \(global\)](#) command.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as **bpduguard**.

To enable or disable BPDU rate limiting, use the [spanning-tree bpduguard rate-limit enable / disable](#) command.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the interface value to the global setting by removing the corresponding **spanning-tree bpduguard rate-limit count** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpduguard rate-limit count max_bpdu [TIMER]
```

```
no spanning-tree bpduguard rate-limit count
```

```
default spanning-tree bpduguard rate-limit count
```

#### Parameters

- **max\_bpdu** BPDU quantity. Value ranges from **1** to **20000**.
- **TIMER** BPDU reception interval (seconds). Options include:
  - **period** reception interval defaults to **hello-time**.
  - **interval period** Value of **period** ranges from **1** to **15**.

#### Example

These commands configure a rate limit of **7500** BPDUs per **8** second period on **interface Ethernet 2**.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# spanning-tree bpduguard rate-limit count 7500 interval 8
switch(config-if-Et2)#
```

---

#### 12.1.4.35 spanning-tree bpduguard rate-limit default

The **spanning-tree bpduguard rate-limit default** command configures the global default BPDU rate limit setting. This setting provides the default for individual ports whose configuration does not include a [spanning-tree bpduguard rate-limit enable / disable](#) command. The default global setting is enabled.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. s

BPDU rate limits are established by [spanning-tree bpduguard rate-limit count \(global\)](#) commands.

The **no spanning-tree bpduguard rate-limit default** sets the global BPDU rate limit setting to disabled. The **spanning-tree bpduguard rate-limit default** and **default spanning-tree bpduguard rate-limit default** commands restore the default global rate limit setting to enabled by removing the **no spanning-tree bpduguard rate-limit default** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree bpduguard rate-limit default
no spanning-tree bpduguard rate-limit default
default spanning-tree bpduguard rate-limit default
```

##### Example

This command enables rate limiting on all ports not covered by an interface rate limit command.

```
switch(config)# spanning-tree bpduguard rate-limit default
switch(config)#
```

### 12.1.4.36 spanning-tree bpduguard rate-limit enable / disable

These commands enable and disable BPDU rate limiting on the configuration mode interface:

- **spanning-tree bpduguard rate-limit enable** enables BPDU rate limiting.
- **spanning-tree bpduguard rate-limit disable** disables BPDU rate limiting.

The **spanning-tree bpduguard rate-limit default** command enables BPDU rate limiting on all ports not configured with a **spanning-tree bpduguard rate-limit** command.

BPDU rate limiting restricts the number of BPDUs that ports on which both BPDU Guard and BPDU Filter are disabled can accept during a specified interval. If the number of BPDUs received on the port during the configured interval exceeds the limit, the port will be error disabled with the cause listed as **bpduguard**.

To specify the BPDU rate limit for an interface, use the **spanning-tree bpduguard rate-limit count (interface)** command.

The **no spanning-tree bpduguard rate-limit** and **default spanning-tree bpduguard rate-limit** commands restore the global rate limit setting on the configuration mode interface by removing the corresponding **spanning-tree bpduguard rate-limit** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpduguard rate-limit enable
spanning-tree bpduguard rate-limit disable
no spanning-tree bpduguard rate-limit
default spanning-tree bpduguard rate-limit
```

#### Example

These commands enable rate limiting on **interface ethernet 15**.

```
switch(config)# interface ethernet 15
switch(config-if-Et15)# spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

---

### 12.1.4.37 spanning-tree cost

The **spanning-tree cost** command configures the path cost of the configuration mode interface. Cost values range from **1** to **200000000** (**200** million). The default cost depends on the interface speed:

- **1** gigabit interface: cost = **20000**
- **10** gigabit interface: cost = **2000**

The **spanning-tree cost** command provides a mode option:

- RST instance cost is configured by not including a mode.
- MST instance 0 cost is configured by not including a mode or with the **mst** mode option.
- MST instance cost is configured with the **mst** mode option.
- Rapid-PVST VLAN cost is configured with the **vlan** mode option.

The **no spanning-tree cost** and **default spanning-tree cost** commands restore the default cost on the configuration mode interface by removing the corresponding **spanning-tree cost** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree MODE cost value
```

```
no spanning-tree MODE cost
```

```
default spanning-tree MODE cost
```

#### Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - **no parameter** RST instance, MST instance **0**, or all Rapid-PVST instances permitted on the interface.
  - **mst m\_range** specified MST instances. **m\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from **0** to **4094**.
  - **vlan v\_range** specified Rapid-PVST instances. **v\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from **1** to **4094**. **value** path cost assigned to interface. Values range from **1** to **200000000** (**200** million). Default values are **20000** (1 G interfaces) or **2000** (10 G interfaces).

#### Examples

- These commands configure a port cost of **25000** for **interface Ethernet 5** when configured as an RST port, as a port in MST instance **0**, or all unconfigured Rapid-PVST instances that are not explicitly configured.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning tree cost 25000
```

- This command configures a port cost of **30000** for **interface Ethernet 5** when configured as a port in MST instance **200**.

```
switch(config-if-Et5)# spanning tree mst 200 cost 30000
```

- This command configures a port cost of **100000** for **interface Ethernet 5** when configured as a port in VLANs **200-220**.

```
switch(config-if-Et5)# spanning tree vlan 200-220 cost 100000
switch(config-if-Et5)#
```

---

#### 12.1.4.38 spanning-tree edge-port bpdufilter default

The **spanning-tree edge-port bpdufilter default** command configures the global BPDU filter setting as **enabled**. Ports not covered by a [spanning-tree bpdufilter](#) command use the global BPDU filter setting.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree edge-port bpdufilter default
no spanning-tree edge-port bpdufilter default
default spanning-tree edge-port bpdufilter default
```

##### Example

This command configures the BPDU filter global setting to **enabled**.

```
switch(config)# spanning-tree edge-port bpdufilter default
switch(config)#
```

#### 12.1.4.39 spanning-tree edge-port bpduguard default

The **spanning-tree edge-port bpduguard default** command sets the global BPDU guard setting as **enabled**. Ports not covered by a [spanning-tree bpduguard](#) command use the global BPDU guard setting.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree edge-port bpduguard default
no spanning-tree edge-port bpduguard default
default spanning-tree edge-port bpduguard default
```

##### Example

This command configures the global BPDU guard setting to enabled.

```
switch(config)# spanning-tree edge-port bpduguard default
switch(config)#
```

---

#### 12.1.4.40 spanning-tree forward-time

The **spanning-tree forward-time** command configures the forward delay timer. Forward delay is the time that a port is in learning state before it begins forwarding data packets.

The switch inserts the forward delay timer value in BPDU packets it sends as the root bridge. The forward delay value ranges from **4** to **30** seconds with a default of **15** seconds.

The **no spanning-tree forward-time** and **default spanning-tree forward-time** commands restore the forward delay timer default of **15** seconds by removing the **spanning-tree forward-time** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree forward-time period
no spanning-tree forward-time
default spanning-tree forward-time
```

##### Parameter

***period*** forward delay timer (seconds). Value ranges from **4** to **30**. Default is **15**.

##### Example

This command sets the forward delay timer value to **25** seconds.

```
switch(config)# spanning-tree forward-time 25
switch(config)#
```

#### 12.1.4.41 spanning-tree guard

The **spanning-tree guard** command enables root guard or loop guard on the configuration mode interface. The **spanning-tree guard loop default** command configures the global loop guard setting.

- Root guard prevents a port from becoming a root or blocked port. A root guard port that receives a superior BPDU transitions to the root-inconsistent (blocked) state.
- Loop guard protects against loops resulting from unidirectional link failures on point-to-point links by preventing non-designated ports from becoming designated ports. When loop guard is enabled, a root or blocked port transitions to loop-inconsistent (blocked) state if it stops receiving BPDUs from its designated port. The port returns to its prior state when it receives a BPDU.

The **no spanning-tree guard** and **default spanning-tree guard** commands sets the configuration mode interface to the global loop guard mode by removing the **spanning-tree guard** statement from **running-config**. The **spanning-tree guard none** command disables loop guard and root guard on the interface, overriding the global setting.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
spanning-tree guard PORT_MODE
```

```
no spanning-tree guard
```

```
default spanning-tree guard
```

##### Parameters

**PORT\_MODE** the port mode. Options include:

- **loop** enables loop guard on the interface.
- **root** enables root guard on the interface.
- **none** disables root guard and loop guard.

##### Example

This command enables root guard on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree guard root
switch(config-if-Et5)#
```

---

#### 12.1.4.42 spanning-tree guard loop default

The **spanning-tree guard loop default** command configures the global loop guard setting as **enabled**. Ports not covered by a **spanning-tree guard** command use the global loop guard setting. Loop guard prevents blocked or root ports from becoming a designated port due to failures resulting in a unidirectional link. The **spanning-tree guard** interface configuration statement overrides the global setting for a specified interface. The default global loop guard setting is disabled.

The **no spanning-tree guard loop default** and **default spanning-tree guard loop default** commands restore the global loop guard setting of disabled by removing the **spanning-tree guard loop default** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree guard loop default
no spanning-tree guard loop default
default spanning-tree guard loop default
```

##### Example

This command enables loop guard as the default on all switch ports.

```
switch(config)# spanning-tree guard loop default
switch(config)#
```

#### 12.1.4.43 spanning-tree hello-time

The **spanning-tree hello-time** command configures the hello time, which specifies the transmission interval between consecutive bridge protocol data units (BPDU) that the switch sends as a root bridge. The hello time is also inserted in outbound BPDUs.

This hello time ranges from **0.2** seconds to **10** seconds with a default of **2** seconds.

The **no spanning-tree hello-time** and **default spanning-tree hello-time** commands restore the hello time default of 2 seconds by removing the **spanning-tree hello-time** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree hello-time period
no spanning-tree hello-time
default spanning-tree hello-time
```

##### Parameter

***period*** hello-time (milliseconds). Value ranges from **200** to **10000**. Default is **2000**.

##### Example

This command configures a hello-time of **1** second.

```
switch(config)# spanning-tree hello-time 1000
switch(config)#
```

---

#### 12.1.4.44 spanning-tree link-type

The **spanning-tree link-type** command specifies the configuration mode interfaces link type, which is normally derived from the ports duplex setting. The default setting depends on a ports duplex mode:

- full-duplex ports are **point-to-point**.
- half-duplex ports are **shared**.

The **no spanning-tree link-type** and **default spanning-tree link-type** commands restore the default link type on the configuration mode interface by removing the corresponding **spanning-tree link-type** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
spanning-tree link-type TYPE
```

```
no spanning-tree link-type
```

```
default spanning-tree link-type
```

##### Parameters

**TYPE** link type of the configuration mode interface. Options include:

- **point-to-point**
- **shared**

##### Example

This command configures *interface ethernet 5* as a shared port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree link-type shared
switch(config-if-Et5)#
```

#### 12.1.4.45 spanning-tree max-age

The **spanning-tree max-age** command configures the switch's max age timer, which specifies the max age value that the switch inserts in outbound BPDU packets it sends as a root bridge. The max-age time value ranges from **6** to **40** seconds with a default of **20** seconds.

Max age is the interval, specified in the BPDU, that BPDU data remains valid after its reception. The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max age expiry.

The **no spanning-tree max-age** and **default spanning-tree max-age** commands restore the max-age default of **20** seconds by removing the **spanning-tree max-age** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree max-age period
no spanning-tree max-age
default spanning-tree max-age
```

##### Parameter

***period*** max age period (seconds). Value ranges from **6** to **40**. Default is **20**.

##### Example

This command sets the max age timer value to **25** seconds.

```
switch(config)# spanning-tree max-age 25
switch(config)#
```

---

#### 12.1.4.46 spanning-tree max-hops

The **spanning-tree max-hops** command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPDU can traverse before it is discarded. The max-hop value ranges from **1** to **40** with a default of **20**.

The **no spanning-tree max-hops** and **default spanning-tree max-hops** commands restore the max-hops setting to its default value of **20** by removing the **spanning-tree max-hops** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree max-hops ports
no spanning-tree max-hops
default spanning-tree max-hops
```

##### Parameter

***ports*** max hops (bridges). Value ranges from **1** to **40**. Default is **20**.

##### Example

This command sets the max hop value to **40**.

```
switch(config)# spanning-tree max-hop 40
switch(config)#
```

#### 12.1.4.47 spanning-tree mode

The **spanning-tree mode** command specifies the spanning tree protocol version that the switch runs. The default mode is Multiple Spanning Tree Protocol (MSTP).

The **no spanning-tree mode** and **default spanning-tree mode** commands restore the default spanning tree protocol version.

**Note:** The **spanning-tree mode** command may disrupt user traffic. When the switch starts a different STP version, all spanning-tree instances are stopped, then restarted in the new mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree mode VERSION
```

```
no spanning-tree mode
```

```
default spanning-tree mode
```

##### Parameters

**VERSION** spanning tree version that the switch runs. Options include:

- **mstp** multiple spanning tree protocol described in the *IEEE 802.1Q-2005* specification and originally specified in the *IEEE 802.1s* specification.
- **rstp** rapid spanning tree protocol described in the *IEEE 802.1D-2004* specification and originally specified in the *IEEE 802.1w* specification.
- **rapid-pvst** rapid per-VLAN spanning tree protocol described in the *IEEE 802.1D-2004* specification and originally specified in the *IEEE 802.1w* specification.
- **backup** disables STP and enables switchport interface pairs configured with the **switchport backup-link** command.
- **none** disables STP. The switch does not generate STP packets. Each switchport interface forwards data packets to all connected ports and forwards STP packets as multicast data packets on the VLAN where they are received.

##### Guidelines

Backup mode is not available on Trident platform switches.

##### Example

This command configures the switch to run multiple spanning tree protocol.

```
switch(config)# spanning-tree mode mstp
switch(config)#
```

---

#### 12.1.4.48 spanning-tree mst configuration

The **spanning-tree mst configuration** command places the switch in MST-configuration mode, which is the group change mode where MST region parameters are configured.

Changes made in a group change mode are saved by leaving the mode through the **exit** command or by entering another configuration mode. To discard changes from the current edit session, leave the mode with the **abort** command.

These commands are available in MST-configuration mode:

- [abort \(mst-configuration mode\)](#)
- [exit \(mst-configuration mode\)](#)
- [instance](#)
- [name \(mst-configuration mode\)](#)
- [revision \(mst-configuration mode\)](#)
- [show \(mst-configuration mode\)](#)

The **no spanning-tree mst configuration** and **default spanning-tree mst configuration** commands restore the MST default configuration.

**Note:** Changing MST configurations, particularly VLAN-to-instance mapping changes, can cause traffic disruption.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree mst configuration
```

```
no spanning-tree mst configuration
```

```
default spanning-tree mst configuration
```

#### Examples

- This command enters MST configuration mode.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)#
```

- This command exits MST configuration mode, saving MST region configuration changes to **running-config**.

```
switch(config-mst)# exit
switch(config)#
```

- This command exits MST configuration mode without saving MST region configuration changes to **running-config**.

```
switch(config-mst)# abort
switch(config)#
```

#### 12.1.4.49 spanning-tree mst pvst border

The **spanning-tree mst pvst border** command configures MSTP PVST border feature to automatically detect border ports facing PVST+ regions. By default, spanning-tree mst pvst border is disabled.

The **no spanning-tree mst pvst border** and **default spanning-tree mst pvst border** commands restore the default MST configuration.

##### Command Mode

MST Configuration

##### Command Syntax

```
spanning-tree mst pvst border
no spanning-tree mst pvst border
default spanning-tree mst pvst border
```

##### Example

This command enters the MST configuration mode.

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# spanning-tree mst pvst border
```

---

#### 12.1.4.50 spanning-tree portchannel guard misconfig

The **spanning-tree portchannel guard misconfig** command enables the switch to detect misconfigured port channels that may cause network loops by monitoring inbound BPDUs. When a port channel receives **75** inconsistent BPDUs within **30** seconds, the switch error disables the port. When a port channel receives **5** BPDUs with the same source BPDU during the **30** second measurement interval, the error counter is reset and the port continues normal port channel operation. Misconfigured port channel detection is disabled by default.

The **no spanning-tree portchannel guard misconfig** and **default spanning-tree portchannel guard misconfig** commands disables the detection of misconfigured port channels by removing the **spanning-tree portchannel guard misconfig** statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree portchannel guard misconfig
no spanning-tree portchannel guard misconfig
default spanning-tree portchannel guard misconfig

spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
default spanning-tree etherchannel guard misconfig
```

#### Guidelines

The **spanning-tree portchannel guard misconfig** and **spanning-tree etherchannel guard misconfig** commands are equivalent.

#### Examples

- This command enables port channel misconfiguration detection on the switch.

```
switch(config)# spanning-tree portchannel guard misconfig
switch(config)# show running-config
!
spanning-tree mode mstp
spanning-tree portchannel guard misconfig
!
!
end
switch(config)#
```

- This command disables port channel misconfiguration detection on the switch.

```
switch(config)# no spanning-tree portchannel guard misconfig
switch(config)# show running-config
!
spanning-tree mode mstp
!
!
end
switch(config)#
```

#### 12.1.4.51 spanning-tree portfast

The **spanning-tree portfast** command programs configuration mode ports to immediately enter forwarding state when they establish a link. PortFast ports are included in spanning tree topology calculations and can enter discarding state. This command overrides the **spanning-tree portfast auto** command.

The **no spanning-tree portfast** and **default spanning-tree portfast** commands remove the corresponding **spanning-tree portfast** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
spanning-tree portfast
```

```
no spanning-tree portfast
```

```
default spanning-tree portfast
```

##### Example

This command unconditionally enables portfast on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast
switch(config-if-Et5)#
```

---

#### 12.1.4.52 spanning-tree portfast auto

The **spanning-tree portfast auto** command enables auto-edge detection on the configuration mode interface. When auto-edge detection is enabled, the port is configured as an edge port if it does not receive a new BPDU before the current BPDU expires. Auto-edge detection is enabled by default. The **spanning-tree portfast** command, when configured, has priority over this command.

The **no spanning-tree portfast auto** command disables auto-edge port detection. This command is removed from **running-config** with the **spanning-tree portfast auto** and **default spanning-tree portfast auto** commands.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
spanning-tree portfast auto
```

```
no spanning-tree portfast auto
```

```
default spanning-tree portfast auto
```

##### Example

This command enables auto-edge detection on **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast auto
switch(config-if-Et5)#
```

### 12.1.4.53 spanning-tree portfast <port type>

The **spanning-tree portfast** command specifies the STP port mode for the configuration mode interface. Default port mode is **normal**.

Port modes include:

- **Edge:** Edge ports connect to hosts and transition to the forwarding state when the link is established. An edge port that receives a BPDU becomes a normal port.
- **Network:** Network ports connect only to switches or bridges and support bridge assurance. Network ports that connect to hosts or other edge devices transition to the discarding state.
- **Normal:** Normal ports function as normal STP ports and can connect to any type of device.

The **no spanning-tree portfast <port-type>** and **default spanning-tree portfast <port-type>** commands restore the default port mode of normal by removing the corresponding **spanning-tree portfast <port-type>** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

**spanning-tree portfast PORT\_MODE**

**no spanning-tree portfast PORT\_MODE**

**default spanning-tree portfast PORT\_MODE**

#### Parameters

**PORT\_MODE** STP port mode. Options include:

- **edge**
- **network**
- **normal**

The **normal** option is not available for the **no** and **default** commands.

#### Related Commands

The **spanning-tree portfast** command also affects the **spanning-tree portfast auto** and **spanning-tree portfast** configuration for the configuration mode interface:

- **spanning-tree portfast normal:** **spanning-tree portfast auto** is enabled.
- **spanning-tree portfast edge:** **spanning-tree portfast** is enabled.
- **spanning-tree portfast network:** **spanning-tree portfast auto** is disabled.

#### Example

This command configures *interface ethernet 5* as a network port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree portfast network
switch(config-if-Et5)#
```

---

#### 12.1.4.54 spanning-tree port-priority

The **spanning-tree port-priority** command specifies the configuration mode interfaces port-priority number. The switch uses this number to determine which interface it places into forwarding mode when resolving a loop. Valid settings are all multiples of **16** between **0** and **240**. Default value is **128**. Ports with lower numerical priority values are selected over other ports.

The **no spanning-tree port-priority** and default spanning-tree port-priority commands restore the default of **128** for the configuration mode interface by removing the **spanning-tree port-priority** command from **running-config**.

The **spanning-tree port-priority** command provides a mode option:

- RST instance port-priority is configured by not including a mode.
- MST instance **0** port-priority is configured by not including a mode or with the **mst** mode option.
- MST instance port-priority is configured with the **mst** mode option.
- Rapid-PVST VLAN port-priority is configured with the **vlan** mode option.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
spanning-tree [MODE] port-priority value
```

```
no spanning-tree [MODE] port-priority
```

```
default spanning-tree [MODE] port-priority
```

##### Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - **no parameter** RST instance or MST instance 0.
  - **mst m\_range** specified MST instances. **m\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from **0** to **4094**.
  - **vlan v\_range** specified Rapid-PVST instances. **v\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from **1** to **4094**.
- **value** bridge priority number. Values range from **0** to **240** and must be a multiple of **16**.

##### Example

This command sets the port priority of **interface ethernet 5** to **144**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# spanning-tree port-priority 144
switch(config-if-Et5)#
```

### 12.1.4.55 spanning-tree priority

The **spanning-tree priority** command configures the bridge priority number. The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from **0** to **65535** (**16** bits); bridges with smaller bridge IDs are elected over other bridges.

Because bridge priority sets the four most significant bits of the bridge ID, valid settings include all multiples of **4096** between **0** and **61440**. Default value is **32768**.

The **spanning-tree priority** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance **0** priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree priority** and **default spanning-tree priority** commands restore the bridge priority default of **32768** for the specified mode by removing the corresponding **spanning-tree priority** command from **running-config**.

Another method of adding **spanning-tree priority** commands to the configuration is through the **spanning-tree root** command. Similarly, the **no spanning-tree root** command removes the corresponding **spanning-tree priority** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree [MODE] priority level
no spanning-tree [MODE] priority
default spanning-tree [MODE] priority
```

#### Parameters

- **MODE** spanning tree instances for which the command configures priority. Options include:
  - **no parameter** RST instance or MST instance **0**.
  - **mst m\_range** specified MST instances. **m\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from **0** to **4094**.
  - **vlan v\_range** specified Rapid-PVST instances. **v\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from **1** to **4094**.
- **level** priority number. Values include multiples of **4096** between **0** and **61440**. Default is **32768**.

#### Examples

- This command configures a bridge priority value of **20480** for Rapid-PVST VLANs **20**, **24**, **28**, and **32**.

```
switch(config)# spanning-tree vlan-id 20,24,28,32 priority 20480
switch(config)#
```

- This command configures a bridge priority value of **36864** for the RST instance. When MST is enabled, this command configures a priority of **36864** for MST instance **0**.

```
switch(config)# spanning-tree priority 36864
switch(config)#
```

---

#### 12.1.4.56 spanning-tree root

The **spanning-tree root** command configures the bridge priority number by adding a **spanning-tree priority** command to the configuration. Parameter settings set the following priority values:

- **primary** sets the bridge priority to **8192**.
- **secondary** sets the bridge priority to **16384**.

The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from **0** to **65535** (**16** bits); bridges with smaller bridge IDs are elected over other bridges.

When no other switch in the network is similarly configured, assigning the primary value to the switch facilitates its selection as the root switch. Assigning the secondary value to the switch facilitates its selection as the backup root in a network that contains one switch with a smaller priority number.

The **spanning-tree root** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance **0** priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree root** and **default spanning-tree root** commands restore the bridge priority default of **32768** by removing the corresponding **spanning-tree priority** command from **running-config**. The **no spanning-tree root**, **no spanning-tree priority**, **default spanning-tree root** and **default spanning-tree priority** commands perform the same function.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree [MODE] root TYPE
no spanning-tree [MODE] root
default spanning-tree [MODE] root
```

#### Parameters

- **MODE** specifies the spanning tree instances for which priority is configured. Values include:
  - **no parameter** RST instance or MST instance **0**.
  - **mst m\_range** specified MST instances. **m\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from **0** to **4094**.
  - **vlan v\_range** specified Rapid-PVST instances. **v\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from **1** to **4094**.
- **TYPE** sets the bridge priority number. Values include:
  - **primary** sets the bridge priority to **8192**.
  - **secondary** sets the bridge priority to **16384**.

#### Examples

- This command configures a bridge priority value of **8192** for Rapid-PVST VLANs **20** to **36**.

```
switch(config)# spanning-tree vlan-id 20-36 root primary
```

- This command configures a bridge priority value of **16384** for the RSTP instance and MST instance **0**.

```
switch(config)# spanning-tree root secondary
```

---

#### 12.1.4.57 spanning-tree transmit active

The **spanning-tree transmit active** command enables bridge assurance globally, which enables bridge assurance on all ports with a port type of **network**. Bridge assurance protects against unidirectional link failure, other software failure, and devices that quit running a spanning tree algorithm.

Bridge assurance is available only on point-to-point links on spanning tree **network** ports. Both ends of the link should ideally have bridge assurance enabled. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the `show spanning-tree transmit active` command will show a bridge assurance status of inconsistent (blocking) for that port.

The **no spanning-tree transmit active** command disables bridge assurance.

The **spanning-tree transmit active** and **default spanning-tree transmit active** commands restore the default behavior by removing the **no spanning-tree transmit active** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree transmit active
no spanning-tree transmit active
default spanning-tree transmit active
```

##### Example

This command enables bridge assurance on the switch.

```
switch(config)# spanning-tree transmit active
switch(config)#
```

### 12.1.4.58 spanning-tree vlan-id

The **spanning-tree vlan-id** command enables Spanning Tree Protocol (STP) on specified VLANs by removing any corresponding **no spanning-tree vlan-id** statements from **running-config**. Spanning-tree is enabled on all VLANs by default.

The **no spanning-tree vlan-id** command disables STP on the specified interfaces. The **default spanning-tree vlan-id** enables STP on the specified interfaces.

**Note:** Disabling STP is not recommended, even in topologies free of physical loops; STP guards against configuration mistakes and cabling errors. When disabling STP, ensure that there are no physical loops in the VLAN.

When disabling STP on a VLAN, ensure that all switches and bridges in the network disable STP for the same VLAN. Disabling STP on a subset of switches and bridges in a VLAN may have unexpected results because switches and bridges running STP will have incomplete information regarding the network's physical topology.

The following STP global configuration commands provide a **vlan** option for configuring Rapid-PVST VLAN instances:

- [spanning-tree priority](#)
- [spanning-tree root](#)

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree vlan-id v_range
no spanning-tree vlan-id v_range
default spanning-tree vlan-id v_range
```

#### Parameter

**v\_range** VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from **1** to **4094**.

#### Examples

- This command disables STP on **VLANs 200-205**.

```
switch(config)# no spanning-tree vlan-id 200-205
switch(config)#
```

- This command enables STP on **vlan 203**.

```
switch(config)# spanning-tree vlan-id 203
switch(config)#
```

---

### 12.1.4.59 switchport backup-link

The **switchport backup-link** command establishes a primary-backup configuration for forwarding VLAN traffic between the command mode interface and a specified interface. The **show interfaces switchport backup-link** command displays the state of backup interface pairs on the switch:

- the primary interface is the command mode interface.
- the backup interface is the interface specified in the command.

The following guidelines apply to primary and backup interfaces:

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLANs can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- The STP mode is backup.
- Static MAC addresses should be configured after primary-backup pairs are established.

When load balancing is not enabled, the primary and backup interfaces cannot simultaneously forward VLAN traffic. When the primary interface is forwarding VLAN traffic, the backup interface drops all traffic. If the primary interface fails, the backup interface forwards VLAN traffic until the primary interface is functional.

The **prefer vlan** option balances the load across the primary and backup interfaces. When the command includes the **prefer vlan** option, each interface is the primary for a subset of the vlans carried by the pair. When both interfaces are up, prefer option vlans are forwarded on the backup interface and all other configured vlans are carried by the primary interface.

The **no switchport backup-link** and **default switchport backup-link** commands remove the primary-backup configuration for the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport backup-link INT_NAME [BALANCE]
```

```
no switchport backup-link
```

```
default switchport backup-link
```

#### Parameters

- **INT\_NAME** the backup interface. Options include:
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Channel group interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
  - **VXLAN vx\_num** VXLAN interface specified by **vx\_num**.
- **BALANCE** VLANs whose traffic is normally handled on the backup interfaces. Values include:
  - **no parameter** backup interface handles no traffic if the primary interface is operating.

- **prefer vlan v\_range** list of VLANs whose traffic is handled by backup interface.

### Examples

- These commands establish **interface ethernet 7** as the backup port for **interface ethernet 1**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport backup-link ethernet 7
switch(config-if-Et1)#
```

- These commands configure the following:
  - **interface ethernet 1** as a trunk port that handles VLAN 4 through 9 traffic.
  - **interface ethernet 2** as its backup interface.
  - **interface ethernet 2** as the preferred interface for VLANs 7 through 9.

```
switch(config-if-Et1)# switchport mode trunk
switch(config-if-Et1)# switchport trunk allowed vlan 4-9
switch(config-if-Et1)# switchport backup-link Ethernet 2 prefer vlan 7-9
switch(config-if-Et1)#
```

---

#### 12.1.4.60 transmit-interval

The **transmit-interval** command sets the interval at which loop detection packets are transmitted. The **no transmit-interval** and **default transmit-interval** commands restore the transmission interval to the default of **5** seconds.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

`transmit-interval interval`

##### Parameter

***interval*** Interval in seconds at which loop-detection packets are transmitted. Values range from **1** to **10**; default is **5**.

##### Example

This command sets the loop detection packet transmission interval to **10** seconds.

```
switch(config-monitor-loop-protect)# transmit-interval 10
switch(config-monitor-loop-protect)#
```

## 12.2 Link Layer Discovery Protocol

This section describes Link Layer Discovery Protocol (LLDP) configuration tasks. Refer to the command descriptions for information about commands used in this chapter.

Topics in this section include:

- [LLDP Introduction](#)
- [LLDP Overview](#)
- [LLDP Configuration Procedures](#)
- [LLDP Configuration Commands](#)

### 12.2.1 LLDP Introduction

Link Layer Discovery Protocol (LLDP) lets Ethernet network devices to advertise details about themselves, such as capabilities, identification, and device configurations to directly connected devices on the network that are also using LLDP.

### 12.2.2 LLDP Overview

LLDP is a discovery protocol that allows devices to advertise information about themselves to peer devices that are on the same physical LAN and store information about the network. LLDP allows a device to learn higher layer management reachability and connection endpoint information from adjacent devices.

Each switch with an active LLDP agent sends and receives messages on all physical interfaces enabled for LLDP transmission. These messages are sent periodically and are typically configured for short intervals to ensure that accurate information is always available. These messages are then stored for a configurable period of time, and contained within the received packet. The system discards the message information when it reaches the configured value. The system sends an advertisement only when a relevant change occurs in the switch. If information changes for any reason, the LLDP agent is notified and sends out and updates the new values.

#### 12.2.2.1 LLDP Data Units

A single LLDP Data Unit (LLDPDU) is transmitted in a single 802.3 Ethernet frame. The basic LLDPDU includes a header and a series of Type-Length-Value elements (TLVs). Each TLV advertises different types of information, such as its device ID, type, or management addresses.

LLDP advertises the following TLVs by default:

- port-description
- system-capabilities
- system-description
- system-name
- management-address
- port-vlan

#### 12.2.2.2 Transmission and Reception

Every device that uses LLDP has its own LLDP agent. The LLDP agent is responsible for the reception, transmission, and management of LLDP. When you enable LLDP on a port, the system enables the transmission and reception of LLDPDUs by default. However, the agent can be configured only to transmit or receive.

---

## Transmission

When LLDP transmission is enabled, the LLDP agent advertises information about the switch to neighbors at regular intervals. Each transmitted LLDPDU contains the mandatory TLVs and any enabled optional TLVs.

## Reception

When LLDP reception is enabled, the LLDP agent receives and stores advertised information from neighboring devices.

### 12.2.2.3 Storing LLDP Information

Whenever the switch receives a valid and current LLDP advertisement from a neighbor, it stores the information in a Simple Network Management Protocol (SNMP) Management Information Base (MIB).

### 12.2.2.4 Guidelines and Limitations

LLDP has the following configuration limitations:

- LLDP must be enabled globally before enabling it on an interface.
- LLDP is not supported on virtual interfaces.
- LLDP can discover only one device per port.

## 12.2.3 LLDP Configuration Procedures

These sections describe the following configuration processes:

- [Enabling LLDP Globally](#)
- [Enabling LLDP on an Interface](#)
- [Optional LLDP Parameters](#)
- [Clearing LLDP Statistics](#)
- [Displaying LLDP Information](#)

### 12.2.3.1 Enabling LLDP Globally

The `lldp run` command globally enables LLDP on the Arista switch. Once LLDP is enabled, the switch will transmit advertisements from the ports that are configured to send TLVs. The neighbor information table is populated as advertisements from the neighbors arrive on the ports.

#### Example

This command enables LLDP globally on the Arista switch.

```
switch(config)# lldp run
switch(config)#
```

### 12.2.3.2 Enabling LLDP on an Interface

When enabling LLDP, it is enabled on all interfaces by default. By using the `lldp transmit` and `lldp receive` commands, LLDP can be enabled or disabled on individual interfaces or configured to only send or only receive LLDP packets.

#### Examples

- These commands enable **interface ethernet port 3/1** to transmit LLDP packets.

```
switch(config)# interface ethernet 3/1
```

```
switch(config-if-Et3/1) # lldp transmit
switch(config-if-Et3/1) #
```

- These commands enable **interface ethernet port 3/1** to receive LLDP packets.

```
switch(config) # interface ethernet 3/1
switch(config-if-Et3/1) # lldp receive
switch(config-if-Et3/1) #
```

### 12.2.3.3 Optional LLDP Parameters

The following sections describe these tasks:

- [Setting the LLDP Timer](#)
- [Setting the LLDP Hold Time](#)
- [Setting the LLDP Re-initialization Timer](#)
- [Setting the IP Management Address to be used in the TLV](#)
- [Selecting the LLDP TLVs](#)
- [Configuring LLDP for Power over Ethernet](#)

#### 12.2.3.3.1 Setting the LLDP Timer

The [lldp timer](#) command specifies the time in seconds between LLDP updates sent by the switch.

##### Examples

- This command specifies that the LLDP updates should be sent every **120** seconds.

```
switch(config) # lldp timer 120
switch(config) #
```

- This command reverts the LLDP timer to its default value of **30** seconds.

```
switch(config) # no lldp timer 120
switch(config) #
```

#### 12.2.3.3.2 Setting the LLDP Hold Time

The [lldp hold-time](#) command sets the amount of time a receiving device should retain the information sent by the device.

##### Examples

- This command specifies that the receiving device should retain the information for **180** seconds before discarding it.

```
switch(config) # lldp hold-time 180
switch(config) #
```

- This command reverts the LLDP hold time and to the default value of **120** seconds.

```
switch(config) # no lldp hold-time 180
switch(config) #
```

#### 12.2.3.3.3 Setting the LLDP Re-initialization Timer

The [lldp run](#) command specifies the amount of time in seconds to delay the re-initialization attempt by the switch.

### Example

This command specifies that the switch waits **10** seconds before attempting to re-initialize.

```
switch(config)# lldp timer reinitialization 10
switch(config)#
```

#### 12.2.3.3.4 Setting the IP Management Address to be used in the TLV

The [lldp management-address](#) command specifies the IP management address or the IP address of the VRF interface in LLDP Type-Length-Value (TLV) triplets.

### Example

This command specifies the IP management address to be used in the TLV.

```
switch(config)# lldp management-address ethernet 3/1
switch(config)#
```

#### 12.2.3.3.5 Selecting the LLDP TLVs

The [lldp tlv transmit](#) command specifies which Type, Length, and Value (TLVs) elements include in LLDP packets. The `no lldp tlv transmit` command removes the TLV configuration.

### Example

This command enables the system descriptions to be included in the TLVs.

```
switch(config)# lldp tlv transmit system-description
switch(config)#
```

#### 12.2.3.3.6 Configuring LLDP for Power over Ethernet

Initial Power over Ethernet (PoE) power-level negotiation with a Powered Device (PD) takes place in hardware (see [Configuring Power over Ethernet \(PoE\)](#)). Once hardware negotiation has taken place, IEEE 802.3at Power Via MDI Type-Length-Value elements (TLVs) are included by default in LLDP packets sent to connected PDs to allow LLDP to negotiate power needs further. LLDP allows the switch to deal with more granular power requests from PDs, and also allows dynamic power-level setting. TLVs received from connected Power-Sourcing Equipment (PSE) are ignored.

**Note:** Power Via MDI TLVs are not sent (even when enabled) under the following circumstances:

1. there is a user-configured power limit on the port, or
2. hardware negotiation sets the power to higher than class **4** because **IEEE 802.3bt**, which increases the maximum power output for PoE, is not yet supported by LLDP.

To disable Power Via MDI TLVs globally, use the [no lldp tlv transmit](#) command and specify the Power Via MDI TLV. Hardware negotiation and manual power limits will remain in effect.

### Example

This command disables the sending of Power Via MDI TLVs globally.

```
switch(config)# no lldp tlv transmit power-via-mdi
switch(config)#
```

To disable Power Via MDI TLVs on an individual interface, use the [poe negotiation lldp disabled](#) command. Hardware negotiation and manual power limits will remain in effect.

### Example

These commands disable the sending of Power Via MDI TLVs on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe negotiation lldp disabled
switch(config-if-Et5)#
```

### New LLDP Fields Defined by IEEE 802.3at-2009

Arista switches *do not* support the following new LLDP/SNMP fields defined in *IEEE standard 802.3at-2009*:

- **Power type** a LldpXdot3RemPowerType
- **Power source** a LldpXdot3RemPowerSource
- **Power priority** a LldpXdot3RemPowerPriority
- **PD requested power value** a LldpXdot3RemPDRequestedPowerValue
- **PSE allocated power value** a LldpXdot3RemPSEAllocatedPowerValue

#### 12.2.3.4 Clearing LLDP Statistics

- [clear lldp counters](#)
- [clear lldp table](#)

#### 12.2.3.5 Displaying LLDP Information

- [Viewing LLDP Global Information](#)
- [Viewing LLDP Local Information](#)
- [Viewing LLDP Neighbors](#)
- [Viewing LLDP Traffic](#)

##### 12.2.3.5.1 Viewing LLDP Global Information

The [show lldp](#) command displays LLDP information.

### Examples

- This command displays global information about LLDP.

```
switch# show lldp
LLDP transmit interval : 60 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
 Port Description
 System Name
 System Description
 System Capabilities
 Management Address (Management0)
 IEEE802.1 Port VLAN ID
 IEEE802.3 Link Aggregation
 IEEE802.3 Maximum Frame Size
Port Tx Enabled Rx Enabled
Et3/1 Yes Yes switch#
```

- This command displays LLDP information.

```
switch# show lldp ethernet interface 3/1
LLDP transmit interval : 30 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
 Port Description
 System Name
 System Description
 System Capabilities switch#
```

### 12.2.3.5.2 Viewing LLDP Local Information

The `show lldp local-info` command displays the information contained in the LLDP TLVs to be sent about the local system.

#### Example

This command displays information contained in the TLVs about the local systems.

```
switch# show lldp local-info management 1
Local System:
- Chassis ID type: MAC address (4)
 Chassis ID : 001c.730f.11a8
- System Name: "switch.aristanetworks.com"
- System Description: "Arista Networks EOS version 4.13.2F running on an Arista
Networks DCS-7150S-64-CL"
- System Capabilities : Bridge, Router
 Enabled Capabilities: Bridge

Interface Management1:
- Port ID type: Interface name (5)
 Port ID : "Management1"
- Port Description: ""
- Management Address Subtype: IPv4 (1)
 Management Address : 172.22.30.154
 Interface Number Subtype : ifIndex (2)
 Interface Number : 999001
 OID String :
- IEEE802.1 Port VLAN ID: 0
- IEEE802.1/IEEE802.3 Link Aggregation
 Link Aggregation Status: Not Capable (0x00)
 Port ID : 0
- IEEE802.3 Maximum Frame Size: 1518 bytes
switch(config)#
```

### 12.2.3.5.3 Viewing LLDP Neighbors

The `show lldp neighbors` command displays information about LLDP neighbors.

#### Examples

- This command shows information about LLDP neighbors.

```
switch# show lldp neighbor
Last table change time : 0:12:33 ago
Number of table inserts : 33
Number of table deletes : 0
Number of table drops : 0
Number of table age-outs : 0

Port Neighbor Device ID Neighbor Port ID TTL
Et3/1 tgl04.sjc.aristanetworks.com Ethernet3/2 120
Ma1/1 dc1-rack11-tor1.sjc 1/1 120 switch#
```

- This command displays detailed information about the neighbor **ethernet 3/1**.

```
switch# show lldp neighbor ethernet 3/1
Last table change time : 0:16:24 ago
Number of table inserts : 33
Number of table deletes : 0
Number of table drops : 0
Number of table age-outs : 0

Port Neighbor Device ID Neighbor Port ID TTL
Et3/1 tgl04.sjc.aristanetworks.com Ethernet3/2 120 switch#
```

#### 12.2.3.5.4 Viewing LLDP Traffic

The `show lldp counters` command displays the LLDP traffic information for the switch.

##### Example

This command displays the LLDP counters on the switch.

```
switch# show lldp counters
Port Tx Frames Tx Length Exceeded
Et20 69485 0
Et21 69394 0
Et22 69203 0
Et23 57546 0
Et24 0 0
Mal 69665 0

Port Rx Frames Rx Errors Rx Discard TLVs Discard TLVs Unknown
Et20 69470 0 0 0 0
Et21 69383 0 0 0 0
Et22 69143 0 0 0 0
Et23 55370 0 0 0 0
Et24 0 0 0 0 0
Mal 69078 69078 0 69078 0 switch#
```

## 12.2.4 LLDP Configuration Commands

### Global Configuration Commands

- `lldp hold-time`
- `lldp management-address`
- `lldp management-address vrf`
- `lldp receive packet tagged drop`
- `lldp run`
- `lldp timer`
- `lldp timer reinitialization`
- `lldp tlv transmit`

### Interface Configuration Commands – Ethernet Interface

- `lldp receive`
- `lldp transmit`
- `poe negotiation lldp disabled`

### Privileged EXEC Commands

- `clear lldp counters`

- 
- [clear lldp table](#)

#### **EXEC Commands**

- [show lldp](#)
- [show lldp counters](#)
- [show lldp local-info](#)
- [show lldp neighbors](#)

### 12.2.4.1 clear lldp counters

The **clear lldp counters** command resets the LLDP counters to zero.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear lldp counters [SCOPE]
```

#### Parameters

**SCOPE** Session affected by command. Options include:

- **no parameter** command affects counters on all CLI sessions.
- **session** clears LLDP counters for the current CLI session only.

#### Examples

- This command resets all the LLDP counters to zero.

```
switch(config)# clear lldp counters
switch(config)#
```

- This command resets only the LLDP counters for the current CLI session.

```
switch(config)# clear lldp counters session
switch(config)#
```

---

#### 12.2.4.2 clear lldp table

The **clear lldp table** command clears neighbor information from the LLDP table.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear lldp table
```

##### Example

This command clears neighbor information from the LLDP table.

```
switch(config)# clear lldp table
switch(config)#
```

### 12.2.4.3 lldp hold-time

The **lldp hold-time** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp hold-time period
no lldp hold-time
default lldp hold-time
```

#### Parameters

***period*** The amount of time a receiving device should hold LLDPDU information before discarding it. Value ranges from **10** to **65535** second; default value is **120** seconds.

#### Examples

- This command sets the amount of time before the receiving device discards LLDPDU information to **180** seconds.

```
switch(config)# lldp hold-time 180
switch(config)#
```

- This command restores the hold-time to its default value of **120** seconds.

```
switch(config)# no lldp hold-time 180
switch(config)#
```

---

#### 12.2.4.4 lldp management-address

The **lldp management-address** command enables the user to add the IP management address used for LLDP Type-Length-Value (TLV).

##### Command Mode

Global Configuration

##### Command Syntax

```
lldp management-address [INTERFACE]
no lldp management-address [INTERFACE]
default lldp management-address [INTERFACE]
```

##### Parameters

**INTERFACE** Interface type and number. Options include:

- **all** all interfaces.
- **ethernet e\_num** Ethernet interface specified by **e\_num**.
- **loopback l\_num** Loopback interface specified by **l\_num**.
- **management m\_num** Management interface specified by **m\_num**.
- **port-channel p\_num** Port-Channel Interface specified by **p\_num**.
- **vlan v\_num** VLAN interface specified by **v\_num**.

##### Examples

- This command specifies the IP management address to be used in the TLV.

```
switch(config)# lldp management-address ethernet 3/1
switch(config)#
```

- This command removes the IP management address used in the TLV.

```
switch(config)# no lldp management-address ethernet 3/1
switch(config)#
```

- This command specifies that **vlan200** is used in the TLV.

```
switch(config)# lldp management-address vlan 200
switch(config)#
```

- This command removes the VLAN ID used in the TLV.

```
switch(config)# no lldp management-address vlan 200
switch(config)#
```

### 12.2.4.5 lldp management-address vrf

The **lldp management-address vrf** command enables the user to add the IP address of the VRF interface used in LLDP Type-Length-Value (TLV).

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp management-address vrf VRF_INSTANCE
no lldp management-address vrf VRF_INSTANCE
default lldp management-address vrf VRF_INSTANCE
```

#### Parameter

**VRF\_INSTANCE** specifies the VRF instance.

#### Examples

- This command specifies the management address VRF to be used in the TLV.

```
switch(config)# lldp management-address vrf test 1
switch(config)#
```

- This command removes the management VRF used in the TLV.

```
switch(config)# no lldp management-address vrf test 1
switch(config)#
```

---

### 12.2.4.6 lldp receive

The **lldp receive** command enables LLDP packets on an interface. The **no lldp receive** command disables the acceptance of LLDP packets.

#### Command Mode

Interface-Ethernet configuration

Interface-Management configuration

#### Command Syntax

lldp receive

no lldp receive

default lldp receive

#### Examples

- These commands enable the reception of LLDP packets on *interface ethernet 4/1*.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# lldp receive
switch(config-if-Et4/1)#
```

- These commands disable the reception of LLDP packets on *interface ethernet 4/1*.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# no lldp receive
switch(config-if-Et4/1)#
```

### 12.2.4.7 lldp receive packet tagged drop

The **lldp receive packet tagged drop** command is a global configuration command and when configured, the LLDP ignores all the packets with **VLAN-tag**. By default, this command is disabled.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp receive packet tagged drop
```

#### Example

This command when configured, the LLDP ignores all the packets with **VLAN-tag**.

```
switch(config)# lldp receive packet tagged drop
```

---

### 12.2.4.8 lldp run

The **lldp run** command enables LLDP on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp run
no lldp run
default lldp run
```

#### Examples

- This command enables LLDP globally on the switch.

```
switch(config)# lldp run
switch(config)#
```

- This command disables LLDP globally on the switch.

```
switch(config)# no lldp run
switch(config)#
```

### 12.2.4.9 lldp timer reinitialization

The **lldp timer reinitialization** command sets the time delay in seconds for LLDP to initialize.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp timer reinitialization delay
no lldp timer reinitialization
default lldp timer reinitialization
```

#### Parameter

**delay** the amount of time the device should wait before re-initialization is attempted. Value ranges from **1** to **20** seconds; default value is **2** seconds.

#### Examples

- This command specifies that the switch should wait **10** seconds before attempting to re-initialize.

```
switch(config)# lldp timer reinitialization 10
switch(config)#
```

- This command restores the default initialization delay of **2** seconds.

```
switch(config)# no lldp timer reinitialization 10
switch(config)#
```

---

#### 12.2.4.10 lldp timer

The **lldp timer** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it. The **no lldp timer** command removes the configured LLDP timer.

##### Command Mode

Global Configuration

##### Command Syntax

```
lldp timer transmission_time
```

```
no lldp timer
```

```
default lldp timer
```

##### Parameter

***transmission\_time*** the period of time at which LLDPDUs are transmitted. Values range from **5** to **32768** seconds; the default is **30** seconds.

##### Examples

- This command configures a period of **180** seconds at which the LLDPDUs are transmitted.

```
switch(config)# lldp timer 180
switch(config)#
```

- This command removes the configured period of time at which the LLDPDUs are transmitted.

```
switch(config)# no lldp timer 180
switch(config)#
```

### 12.2.4.11 lldp tlv transmit

The **lldp tlv transmit** command allows the user to specify the Type-Length-Values (TLVs) to include in LLDP packets.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp tlv transmit TLV_NAME
no lldp tlv transmit TLV_NAME
default lldp tlv transmit TLV_NAME
```

#### Parameters

**TLV\_NAME** Options include:

- **link-aggregation** specifies the link aggregation TLV.
- **management-address** specifies the management address TLV.
- **max-frame-size** specifies the Frame size TLV.
- **port-description** specifies the port description TLV.
- **port-vlan** specifies the port VLAN ID TLV.
- **power-via-mdi** specifies the power over Ethernet TLV.
- **system-capabilities** specifies the system capabilities TLV.
- **system-description** specifies the system description TLV.
- **system-name** specifies the system name TLV.

#### Examples

- This command enables the system description TLV:

```
switch(config)# lldp tlv transmit system-description
switch(config)#
```

- This command disables the system description TLV:

```
switch(config)# no lldp tlv transmit system-description
switch(config)#
```

- This command enables the max-frame-size TLV:

```
switch(config)# lldp tlv transmit max-frame-size
switch(config)#
```

- This command disables the max-frame-size TLV:

```
switch(config)# no lldp tlv transmit max-frame-size
switch(config)#
```

---

#### 12.2.4.12 lldp transmit

The **lldp transmit** command enables the transit of LLDP packets on an interface.

##### Command Mode

Interface-Ethernet configuration

Interface-Management configuration

##### Command Syntax

```
lldp transmit
```

```
no lldp transmit
```

```
default lldp transmit
```

##### Examples

- These commands enable the transmission of LLDP packets.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# lldp transmit
switch(config-if-Et4/1)#
```

- These commands disable the transmission of LLDP packets.

```
switch(config)# interface ethernet 4/1
switch(config-if-Et4/1)# no lldp transmit
switch(config-if-Et4/1)#
```

### 12.2.4.13 poe negotiation lldp disabled

Power Via MDI TLVs are included by default in LLDP packets sent to Power over Ethernet (PoE) Powered Devices (PDs) to allow dynamic negotiation of power levels. The **poe negotiation lldp disabled** command disables the sending of Power Via MDI TLVs from the configuration-mode interface.

The **no poe negotiation lldp disabled** and **default poe negotiation lldp disabled** commands restore the default behavior (sending Power Via MDI TLVs) by removing the corresponding **poe negotiation lldp disabled** command from *running-config*.

To disable Power Via MDI TLVs globally, use the **no lldp tlv transmit** command and specify the Power Via MDI TLV.

#### Command Mode

Interface-Ethernet configuration

#### Command Syntax

```
poe negotiation lldp disabled
no poe negotiation lldp disabled
default poe negotiation lldp disabled
```

#### Example

These commands disable the sending of power via MDI TLVs on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# poe negotiation lldp disabled
switch(config-if-Et5)#
```

---

#### 12.2.4.14 show lldp counters

The **show lldp counters** command displays LLDP traffic information for the switch.

##### Command Mode

EXEC

##### Command Syntax

```
show lldp counters [INTERFACE]
```

##### Parameters

**INTERFACE** Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.

Valid **e\_range** and **m\_range** formats include number, number range, or comma-delimited list of numbers and ranges.

##### Example

This command displays the LLDP counters on the switch.

```
switch# show lldp counters
```

| Port | Tx Frames | Tx Length Exceeded |
|------|-----------|--------------------|
| Et20 | 69485     | 0                  |
| Et21 | 69394     | 0                  |
| Et22 | 69203     | 0                  |
| Et23 | 57546     | 0                  |
| Et24 | 0         | 0                  |
| Ma1  | 69665     | 0                  |

| Port | Rx Frames | Rx Errors | Rx Discard | TLVs Discard | TLVs Unknown |
|------|-----------|-----------|------------|--------------|--------------|
| Et20 | 69470     | 0         | 0          | 0            | 0            |
| Et21 | 69383     | 0         | 0          | 0            | 0            |
| Et22 | 69143     | 0         | 0          | 0            | 0            |
| Et23 | 55370     | 0         | 0          | 0            | 0            |
| Et24 | 0         | 0         | 0          | 0            | 0            |
| Ma1  | 69078     | 69078     | 0          | 69078        | 0            |

### 12.2.4.15 show lldp local-info

The **show lldp local-info** command displays LLDP errors and overflows.

#### Command Mode

EXEC

#### Command Syntax

```
show lldp local-info [INTERFACE]
```

#### Parameters

**INTERFACE** Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.

Valid **e\_range** and **m\_range** formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the specific LLDP errors and overflows on **management interface 1**.

```
switch# show lldp local-info management 1
Local System:
- Chassis ID type: MAC address (4)
 Chassis ID : 001c.730f.11a8qqq
- System Name: "switch.aristanetworks.com"
- System Description: "Arista Networks EOS version 4.13.2F running on an Arista
Networks DCS-7150S-64-CL"
- System Capabilities : Bridge, Router
 Enabled Capabilities: Bridge

Interface Management1:
- Port ID type: Interface name (5)
 Port ID : "Management1"
- Port Description: ""
- Management Address Subtype: IPv4 (1)

- IEEE802.1/IEEE802.3 Link Aggregation
 Link Aggregation Status: Not Capable (0x00)
 Port ID : 0
- IEEE802.3 Maximum Frame Size: 1518 bytes
se505.16:01:44#
switch#
```

---

### 12.2.4.16 show lldp neighbors

The **show lldp neighbors** command displays information about the switch's LLDP neighbors.

#### Command Mode

EXEC

#### Command Syntax

```
show lldp neighbors [INTERFACE][INFO_LEVEL]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - **no parameter** displays information for all interfaces.
  - **ethernet e\_range** Ethernet interface range specified by **e\_range**.
  - **management m\_range** Management interface range specified by **m\_range**.
  - Valid **e\_range** and **m\_range** formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - **no parameter** Displays information for all interfaces.
  - **detailed** LLDP information for all the adjacent LLDP devices.

#### Examples

- This command displays the neighbor's information about LLDP.

```
switch(config)# show lldp neighbors
Last table change time : 0:12:33 ago
Number of table inserts : 33
Number of table deletes : 0
Number of table drops : 0
Number of table age-outs : 0

Port Neighbor Device ID Neighbor Port ID TTL
Et3/1 tg104.sjc.aristanetworks.com Ethernet3/2 120
Ma1/1 dc1-rack11-tor1.sjc 1/1 120 switch#
```

- This command displays LLDP neighbor information for *interface ethernet 3/1*.

```
switch# show lldp neighbors ethernet 3/1
Last table change time : 0:16:24 ago
Number of table inserts : 33
Number of table deletes : 0
Number of table drops : 0
Number of table age-outs : 0

Port Neighbor Device ID Neighbor Port ID TTL
Et3/1 tg104.sjc.aristanetworks.com Ethernet3/2 120 switch#
```

- This command displays detailed LLDP neighbor information for *interface ethernet 3/1*.

```
switch# show lldp neighbors 3/1 detail

Interface Ethernet 3/1 detected 1 LLDP neighbors:

Neighbor 001c.7300.1506/Ethernet6/25, age 8 seconds
Discovered 5 days, 3:58:58 ago; Last changed 5 days, 3:56:57 ago
- Chassis ID type: MAC address (4)
 Chassis ID : 001c.7300.1506
- Port ID type: Interface name (5)
 Port ID : "Ethernet6/25"
- Time To Live: 120 seconds
- Port Description: "Ethernet6/25"
```

```
- IEEE802.3 Power Via MDI
 Port Class : PD
 PSE MDI Power Support : Not Supported
 PSE MDI Power State : Disabled
 - System Name: "Leaf-Switch1.aristanetworks.com"
 - System Description: "Arista Networks EOS version 4.10.1-SSO running on an Arista Networks
DCS-7504"
 - System Capabilities : Bridge, Router
 Enabled Capabilities: Bridge
 - Management Address Subtype: IPv4 (1)
 Management Address : 172.22.30.116
 Interface Number Subtype : ifIndex (2)
 Interface Number : 999999
 OID String :
 - IEEE802.1 Port VLAN ID: 1
 - IEEE802.1/IEEE802.3 Link Aggregation
 Link Aggregation Status: Capable, Disabled (0x01)
 Port ID : 0
 - IEEE802.3 Maximum Frame Size: 9236 bytes
switch#
```

---

### 12.2.4.17 show lldp

The **show lldp** command displays LLDP information.

#### Command Mode

EXEC

#### Command Syntax

```
show lldp [INTERFACE]
```

#### Parameters

**INTERFACE** Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.

Valid **e\_range** and **m\_range** formats include number, number range, or comma-delimited list of numbers and ranges.

#### Examples

- This command displays all LLDP information.

```
switch# show lldp
LLDP transmit interval : 60 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : test

Enabled optional TLVs:
 Port Description
 System Name
 System Description
 System Capabilities
 Management Address (Management0)
 IEEE802.1 Port VLAN ID
 IEEE802.3 Link Aggregation
 IEEE802.3 Maximum Frame Size

Port Tx Enabled Rx Enabled
Et3/1 Yes Yes

switch#
```

- This command displays specific information about LLDP for **interface ethernet 3/1**.

```
switch# show lldp ethernet 3/1
LLDP transmit interval : 30 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default

Enabled optional TLVs:
 Port Description
 System Name
 System Description
 System Capabilities switch#
```

- This command displays specific information about LLDP for **management interface 1/1**.

```
switch# show lldp management 1/1
LLDP transmit interval : 60 seconds
LLDP transmit holdtime : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
```

Enabled optional TLVs:  
Port Description  
System Name  
System Description  
System Capabilities  
Management Address (Management0)  
IEEE802.1 Port VLAN ID  
IEEE802.3 Link Aggregation  
IEEE802.3 Maximum Frame Size

| Port  | Tx Enabled | Rx Enabled  |
|-------|------------|-------------|
| Mal/1 | Yes        | Yes switch# |

---

## 12.3 Virtual LANs (VLANs)

This chapter describes Arista's Virtual LANs (VLANs) implementation and MAC address tables.

Sections in this chapter include:

- [VLAN Introduction](#)
- [VLAN Conceptual Overview](#)
- [VLAN Configuration Procedures](#)
- [VLAN Configuration Commands](#)

### 12.3.1 VLAN Introduction

Arista switches support industry standard 802.1q VLANs. Arista EOS provides tools to manage and extend VLANs throughout the data center network.

### 12.3.2 VLAN Conceptual Overview

#### 12.3.2.1 VLAN Definition

A Virtual Local Area Network (VLAN) allows a group of devices to communicate as if they were in the same network regardless of their physical location. VLANs are Layer 2 structures based on the 802.1Q standard.

These parameters are associated with a VLAN:

- VLAN number (**1-4094**): VLAN numbers uniquely identify the VLAN within a network. `VLAN 1` exists by default; all other VLANs only exist after configuring.
- VLAN name (optional): The VLAN name is a text string that describes the VLAN.
- VLAN state (**active** or **suspended**): The state specifies the VLAN transmission status within the switch. In the **suspended** state, VLAN traffic is blocked on all switch ports. The default state is **active**.

VLANs define Layer 2 broadcast domains in a Layer 2 network, in which each device can receive broadcast frames sent by any other within the domain. Switches accommodating multiple broadcast domains serve as multi-port bridges where each broadcast domain is a distinct virtual bridge. Traffic does not pass directly between different VLANs within a switch or between two switches.

#### 12.3.2.2 VLAN Switching

Ethernet and port channel interfaces are configured as switched ports by default. Switched ports are configurable as members of one or more VLANs. Switched ports ignore all IP-level configuration commands, including IP address assignments.

##### 12.3.2.2.1 VLAN Trunking and Trunk Groups

Trunking extends multiple VLANs beyond the switch through a common interface or port channel.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs, i.e., VLANs configured in a trunk group are pruned of all ports that are not associated with the trunk group. See the Trunk Ports example section for further details.

**Note:** Be cautious when using allowed VLAN lists or trunk groups to ensure that the VLAN topology is consistent with any Layer-2 control protocol topology, or unpredictable results can occur.

VLAN traffic is carried through Ethernet or LAG ports. A port's switchport mode defines the number of VLANs for which the port can carry traffic.

- Access ports carry traffic for one VLAN – the access VLAN. Access ports associate untagged frames with the access VLAN. Access ports drop tagged frames that are not tagged with the access VLAN.
- Trunk ports carry traffic for multiple VLANs. Tag frames specify the VLAN for which trunk ports process packets.

#### 12.3.2.2.2 Q-in-Q Trunking

A Q-in-Q network is a multi-tier layer 2 VLAN network. A typical Q-in-Q network is composed of a service provider network (tier 1) where each node connects to a customer network (tier 2).

802.1ad is a networking standard that supports Q-in-Q networks by allowing multiple 802.1Q tags in an Ethernet frame.

Each interface in a customer network is assigned to a customer-VLAN (c-VLAN). Packets in c-VLANs contain 802.1q tags that switch traffic within the network. c-VLANs access the service provider VLAN (s-VLAN) through a provider switch. Customer switch ports connect to an s-VLAN through provider switch edge ports, which are configured as dot1q ports and operate as follows:

- **Inbound traffic (from customer switches):** adds an s-VLAN tag, then forwards packets to the provider network.
- **Outbound traffic (to customer switches):** removes the s-VLAN tag, then forwards packets to the customer network.

#### 12.3.2.2.3 TPID (Configurable Ethertypes)

By default, VLAN-tagged packets carry a Tag Protocol Identifier (TPID) of 0x8100. On some Arista platforms, however, the TPID of a switchport can be modified in accordance with IEEE 802.1ad to allow for the use of 802.1q TPIDs other than 0x8100. Well known and standard tags include:

**0x8100** customer VLAN.

- **0x88a8** service VLAN tag used in provider bridging.
- **0x9100** service VLAN tag used in provider bridging (common, but not standardized).

Other non-standard TPID values may also be configured for interoperability with legacy equipment or non-standard systems. Values range from 0x600 (1536) through 0xFFFF (65535).

Non-default TPID values are most commonly used for provider bridging on a network-to-network interface.

#### 12.3.2.3 VLAN Routing

Each VLAN can be associated with a Switch Virtual Interface (SVI), also called a VLAN interface. The VLAN interface functions in a routed network (Layer 3) with an assigned IP subnet address. Connecting different VLANs requires Layer 3 networking.

##### 12.3.2.3.1 VLAN Interfaces

A Switched Virtual Interface (SVI) connects to the VLAN segment on the switch to provide Layer 3 processing for packets from the VLAN. An SVI can be activated only after it is connected to a VLAN. SVIs are typically configured for a VLAN to a default gateway for a subnet to facilitate traffic routing with other subnets.

In a Layer 3 network, each VLAN SVI is associated with an IP subnet, with all stations in the subnet members of the VLAN. Traffic between different VLANs is routed when IP routing is enabled.

---

### 12.3.2.3.2 Internal VLANs

A routed port is an Ethernet or port channel interface that functions as a Layer 3 interface. Routed ports do not bridge frames nor switch VLAN traffic. Routed ports have IP addresses assigned to them and packets are routed directly to and from the port.

The switch allocates an internal VLAN for an interface when it is configured as a routed port. The internal VLAN is assigned a previously unused VLAN ID. The switch prohibits the subsequent configuration of VLANs and VLAN interfaces with IDs corresponding to allocated internal VLANs.

### 12.3.2.3.3 Support for Private VLAN

Private VLAN is a feature that segregates a regular VLAN broadcast domain while maintaining all ports in the same IP subnet. There are three types of VLAN within a private VLAN:

1. **Primary VLAN:** Ports in the primary VLAN can send and or receive traffic from ports in all the corresponding PVLANS. There is only one primary VLAN in a private VLAN.
2. **Community VLAN:** This is a secondary VLAN. Hosts in a community VLAN forward traffic to each other as well as ports in the primary VLAN. There are multiple community VLANs in a private VLAN.
3. **Isolated VLAN:** This is a secondary VLAN. Hosts in an isolated VLAN only forward traffic to ports in the primary VLAN. Hosts within an isolated VLAN can not communicate with each other using bridging. There are multiple isolated VLANs in a private VLAN.

#### 12.3.2.3.3.1 Limitations

##### On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

- Private VLAN and Algomatch features are mutually exclusive. Disable algomatch with the **hardware access-list mechanism tcam** command . Note that this requires a reload of the system to take effect.
- L2 and L3 multicast traffic is not supported.

##### On All Platforms except 7300X3, CCS-720XP, DCS-7050X3

Private VLAN and IPv4/IPv6 uRPF features are mutually exclusive.

##### On All Platforms

- Tunnel termination on PVLAN ports is not supported.
- Ingress IPv4/IPv6 RACLs on the primary VLAN are not honored for packets ingressing through ports in secondary VLANs.
- Only isolated private VLAN trunks and normal trunk ports are supported. It allows trunk ports to forward and receive traffic for all primary and or secondary VLANs. An isolated trunk translates traffic coming in on a primary VLAN to the lowest valued secondary VLAN on the trunk port.
- Private VLAN is not supported on L2 subinterfaces.
- Hardware accelerated Sflow is not supported on Private VLAN ports.
- VLAN Mapping and or Translation is not supported with Private VLAN.

#### 12.3.2.3.3.2 Show Commands

- Use the **show vlan private-vlan** command to display the primary and secondary defined VLANs:

```
switch# show vlan private-vlan
Primary Secondary Type Ports

```

|     |     |           |               |
|-----|-----|-----------|---------------|
| 100 | 101 | community | Et1, Et6      |
| 100 | 102 | isolated  | Et1, Et7, Et8 |
| 200 | 201 | community | Et10, Et9     |

- Use the **show vlan 100,101,102,200,201** command to display which interfaces are member of which VLANs:

```
show vlan 100,101,102,200,201
VLAN Name Status Ports

100 VLAN0100 active Et1, Et6+, Et7+, Et8+
101 VLAN0101 active Et1+, Et6
102 VLAN0102 active Et1+, Et7, Et8
200 VLAN0200 active Et10
201 VLAN0201 active Et10+, Et9

+ indicates a private VLAN promoted port
```

Promoted ports are displayed to indicate they are part of the same broadcast domain as the indicated VLAN. Interfaces in a primary VLAN are included in the display of all its associated secondary VLANs. Interfaces in secondary VLANs are included in the display of both its primary VLAN and its own domain.

### On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

Use the **show platform sand pvlan interfaces** command to display the status of the interfaces to configure a private VLAN.

```
switch# show platform sand pvlan interfaces
Interface Secondary Primary State
 VLAN VLAN

Ethernet6 101 100 enabled
Ethernet7 102 100 enabled
Ethernet8 102 100 enabled
Po1 102 100 enabled
Ethernet9 201 200 failed
Po2 202 200 failed
```

In this output, the **Secondary VLAN** column indicates the VLAN which is configured on the interface. The **Primary VLAN** column indicates the primary VLAN to which the secondary VLAN belongs to. The **State** field has three possible values - enabled, failed, configured. The **enabled** state indicates that the private VLAN is configured and enabled on that interface. The **failed** state indicates that the private VLAN configuration has failed for that interface. The **configured** state indicates that private VLAN is configured on that interface but has not taken effect. When port channels are configured in a private VLAN, it is enabled only if entries for all the member interfaces are successfully programmed in the hardware. If the hardware entries for any one of the member interfaces fails, the entries for other member interfaces are also removed from the hardware and the state is marked as failed.

#### 12.3.2.3.4 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the Vlan ID field (VID) in dot1q headers on packets passing through a switched port without changing any other fields.

VLAN translation also supports the ability to translate packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

When configuring the VLAN translation mode, consider the following:

- VLAN translation is only supported for tagged packets.

- BPDUs from STP, LLDP and other protocols are not affected by this mapping.
- VLAN translation is not applicable for access ports.
- Untagged packets entering the switch on the trunk native VLAN are not mapped.
- TPID and VLAN priority does not get re-written during the translation.

### 12.3.3 VLAN Configuration Procedures

These sections describe basic VLAN configuration tasks.

- [Creating and Configuring VLANs](#)
- [Configuring VLAN Switching](#)
- [Creating and Configuring VLAN Interfaces](#)
- [Allocating Internal VLANs](#)
- [Private VLAN Configuration](#)
- [Configuring VLAN Translation](#)
- [Configuring VLAN Counters](#)

#### 12.3.3.1 Creating and Configuring VLANs

The CLI provides two methods of creating VLANs.

- Explicitly through the [vlan](#) command.
- Implicitly through the [switchport access vlan](#) command.

The [switchport access vlan](#) command generates a warning message when it creates a VLAN.

To create a VLAN, use the **vlan** command in global configuration mode. Valid VLAN numbers range between **1** and **4094**. To create multiple VLANs, specify a range of VLAN numbers.

To edit an existing VLAN, enter the **vlan** command with the number of the existing VLAN.

#### Examples

- This command creates **VLAN 45** and enters VLAN configuration mode for the new VLAN.

```
switch(config)# vlan 45
switch(config-vlan-45)#
```

- Use the [name \(VLAN configuration mode\)](#) command to assign a name to a VLAN.

These commands assign the name Marketing to **VLAN 45**.

```
switch(config)# vlan 45
switch(config-vlan-45)# name Marketing
switch(config-vlan-45)# show vlan 45
```

| VLAN | Name      | Status | Ports |
|------|-----------|--------|-------|
| 45   | Marketing | active | Et1   |

```
switch(config-vlan-45)#
```

- To change the state of a VLAN, use the [state](#) command in VLAN configuration mode.

These commands suspend **VLAN 45**. VLAN traffic is blocked on all switch ports.

```
switch(config)# vlan 45
switch(config-vlan-45)# state suspend
switch(config-vlan-45)# show vlan 45
```

| VLAN | Name      | Status    | Ports |
|------|-----------|-----------|-------|
| 45   | Marketing | suspended | Et1   |

```
45 Marketing suspended
switch(config-vlan-45) #
```

- These commands activate **VLAN 45**.

```
switch(config) # vlan 45
switch(config-vlan-45) # state active
switch(config-vlan-45) # show vlan 45
```

| VLAN | Name      | Status | Ports |
|------|-----------|--------|-------|
| 45   | Marketing | active | Et1   |

```
switch(config-vlan-45) #
```

### 12.3.3.1.1 VLAN Policy

The VLAN policy configuration command enables a switch to configure a VLAN policy when it receives a packet with unknown destination MAC address on a VLAN. The [mac address forwarding](#) command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default behavior is to flood the L2 miss packets on all ports of the VLAN.

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

### Examples

- These commands create a **vlan 333** and then set the unicast policy to 'drop' and the multicast policy to 'log' for the specific **vlan 333**.

```
switch(config) # vlan 333
switch(config-vlan-333) # mac address forwarding unicast miss action drop
switch(config-vlan-333) # mac address forwarding multicast miss action log
```

- These commands display the VLAN policy that was defined when **vlan 333** is created.

```
switch(config) # show vlan 333 mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| 333  | flood        | flood        |

- These commands display the VLAN policy type that was defined when **vlan 333** is configured with the 'drop' unicast policy and the 'log' multicast policy.

```
switch(config) # show vlan 333 mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| 333  | drop         | log          |

```
switch(config)# show vlan mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| 1    | flood        | flood        |
| 333  | drop         | log          |

### 12.3.3.2 Configuring VLAN Switching

The following describe the configuration of VLAN ports.

#### 12.3.3.2.1 Access Ports

Access ports carry traffic for one VLAN, as designated by a `switchport access vlan` command. Access ports associate untagged frames with the access VLAN. Tagged frames received by the interface are dropped unless they are tagged with the access VLAN.

To configure an interface group as an access port, use the `switchport mode` command.

#### Examples

- These commands configure **interface ethernet 1** as an access port.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport mode access
switch(config-if-Et1)#
```

- To specify the port's access VLAN, use the `switchport access vlan` command.

These commands configure **vlan 15** as the access VLAN for **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport access vlan 15
switch(config-if-Et5)#
```

- These commands configure interface Ethernet **1** through **3** as access ports that process untagged frames as **vlan 5** traffic.

```
switch(config)# interface Ethernet 1-3
switch(config-if-Et1-3)# switchport mode access
switch(config-if-Et1-3)# switchport access vlan 5
switch(config-if-Et1-3)# show interfaces ethernet 1-3 vlans
Port Untagged Tagged
Et1 None 23,25
Et2 18 -
Et3 None 14
switch(config-if-Et1-3)#
```

#### 12.3.3.2.2 Trunk Ports

Trunk ports carry traffic for multiple VLANs. Messages use tagged frames to specify the VLAN for which trunk ports process traffic.

- The `vlan trunk list` specifies the VLANs for which the port handles tagged frames. The port drops any packets tagged for VLANs not in the VLAN list.
- The `native vlan` is the VLAN where the port switches untagged frames.

To configure an interface group as a trunk port, use the `switchport mode` command.

#### Example

These commands configure *interface ethernet 8* as a trunk port.

```
switch(config)# interface ethernet 8
switch(config-if-Et8)# switchport mode trunk
switch(config-if-Et8)#
```

By default all VLANs are permitted on a port configured with 'switchport mode trunk'. To limit the port's VLAN trunk list, use the **switchport trunk allowed vlan** command. Only VLANs in the allowed list will be permitted.

### Examples

- These commands configure VLAN **15, 20, 21, 22, 40**, and **75** as the explicitly permitted VLAN trunk list for ethernet interface **12-16**.

```
switch(config)# interface ethernet 12-16
switch(config-if-Et12-16)# switchport trunk allowed vlan 15,20-22,40,75
switch(config-if-Et12-16)#
```

- These commands explicitly permit VLAN **100** through **120** to the VLAN trunk list for *interface ethernet 14*.

```
switch(config)# interface ethernet 14
switch(config-if-Et14)# switchport trunk allowed vlan add 100-120
switch(config-if-Et14)#
```

- To specify the port's native VLAN, use the **switchport trunk native vlan** command.

These commands configure **vlan 12** as the native VLAN trunk for *interface ethernet 10*.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# switchport trunk native vlan 12
switch(config-if-Et10)#
```

- By default, ports send native VLAN traffic with untagged frames. The **switchport trunk native vlan** command can also configure the port to send native VLAN traffic with tag frames.

These commands configure *interface ethernet 10* to send native VLAN traffic as tagged.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# switchport trunk native vlan tag
switch(config-if-Et10)#
```

- These commands configure *interface ethernet 12* as a trunk with **vlan 15** as the native VLAN. The port's trunk list includes all VLANs except **201-300**.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport mode trunk
switch(config-if-Et12)# switchport trunk native vlan 15
switch(config-if-Et12)# switchport trunk allowed vlan except 201-300
switch(config-if-Et12)#
```

- Assume that all ports on the switch are configured with switchport mode trunk similar to Ethernet **1** and **2** shown below:

```
!
interface ethernet 1
 switchport mode trunk
!
interface ethernet 2
 switchport mode trunk
!
```

- Further assume that **vlan 30** is not configured as part of a trunk group.

```
switch# show vlan
VLAN Name Status Ports
```

| VLAN | Name    | Status | Ports    |
|------|---------|--------|----------|
| 1    | default | active | Et1, Et2 |
| 30   | vlan30  | active | Et1, Et2 |

- Now configure **vlan 30** as part of **trunk group 30**:

```
switch(config)# vlan 30
switch(config-vlan-30)# trunk group 30
```

- This updates the VLAN membership for **vlan 30**.

| VLAN | Name    | Status | Ports    |
|------|---------|--------|----------|
| 1    | default | active | Et1, Et2 |
| 30   | vlan30  | active |          |

**Note:** **Vlan 30** is no longer on Et1, Et2 i.e. it has been 'pruned' due to the trunk group command in the vlan configuration.

- To permit **vlan 30** on **Et1**, you need to associate the interface with the trunk group as follows:

```
switch(config-if-Et1)# switchport trunk group 30
```

Now we see Et1 included in the vlan 30 list

| VLAN | Name    | Status | Ports    |
|------|---------|--------|----------|
| 1    | default | active | Et1, Et2 |
| 30   | vlan30  | active | Et1      |

- The trunk group command is not additive to the allowed VLAN command.

```
interface ethernet 1
 switchport mode trunk
 switchport trunk allowed vlan 10
 switchport trunk group trunk30

Vlan 30 will not be permitted on the interface as it is not listed in the allowed
vlan list.
```

### 12.3.3.2.3 Dot1q Tunnel Ports

**Dot1q (802.1Q)** is a tunneling protocol that encapsulates traffic from multiple customer (c-tag) VLANs in an additional single outer service provider (s-tag) VLAN for transit across a larger network structure that includes traffic from all customers. Tunneling eliminates the service provider requirement that every VLAN be configured from multiple customers, avoiding overlapping address space issues.

Tunneling preserves the inner VLANs through the tunneled network; these inner VLANs are ignored by intermediate devices that make forwarding decisions based only on the outermost VLAN tag (S-Tag)

A dot1q-tunnel port sits at the edge of the tunneled network. Unlike regular access ports, a dot1q-tunnel port does not drop traffic that arrives with **802.1Q** tags in place; it ignores existing **802.1Q** information and associates arriving traffic (with or without **802.1Q** headers) with a new tunnel VLAN ID.

Packets arriving at a tunnel port are encapsulated with an additional **802.1Q** tag that can be trunked between multiple devices like any traditional VLAN. When exiting a dot1-tunnel port, the S-Tag is removed to revert the customer traffic to its original tagged or untagged state.

To configure an interface group as a dot1q tunnel port, use the **switchport mode** command.

#### Example

These commands configure **interface ethernet 12** as a dot1q tunnel port.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport mode dot1q-tunnel
switch(config-if-Et12)#
```

To specify the dot1q-tunnel port's access VLAN, use the **switchport access vlan** command. The port then handles all inbound traffic as untagged VLAN traffic.

### Example

These commands configure **vlan 60** as the access VLAN for **interface ethernet 12**.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport access vlan 60
switch(config-if-Et12)#
```

#### 12.3.3.2.4 TPID Configuration

The default Tag Protocol Identifier (TPID, also called dot1q ethertype) on all switch ports is 0x8100. To configure a different TPID on a port, use the **switchport dot1q ethertype** command. This feature is available only on 7280E and 7500E platforms.

**Note:** If dot1q tunneling is enabled on the interface, a TPID configured on the interface becomes irrelevant.

### Example

In this provider bridging example, **interface ethernet 1** is the user network interface and **interface ethernet 2** is the network-to-network interface. These commands configure dot1q tunneling on **interface ethernet 1** and set the TPID of **interface ethernet 2** to **0x9100**.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# switchport mode dot1q-tunnel
switch(config-if-Et1)# interface ethernet 2
switch(config-if-Et2)# switchport mode trunk
switch(config-if-Et2)# switchport dot1q ethertype 0x9100
switch(config-if-Et2)#
```

In the above configuration, packets from **Et1** to **Et2** will undergo dot1q-tunneling (stacking of an additional dot1q tag), with an outer TPID of 0x9100 at egress, while packets with outer TPID 0x9100 going from **Et2** to **Et1** will have the outer tag removed at egress.

#### 12.3.3.2.5 Layer 2 802.1Q Encapsulation

Layer 2 traffic encapsulation is enabled on the configuration mode interface for a specified VLAN through **l2-protocol encapsulation dot1q vlan**.

### Example

These commands enable traffic encapsulation for **vlan 200** traffic passing through **interface ethernet 5/2**.

```
switch(config)# interface ethernet 5/2
switch(config-if-Et5/2)# l2-protocol encapsulation dot1q vlan 200
```

#### 12.3.3.2.6 Port VLAN Scaling on DCS-7160

Port VLAN scaling allows the user to configure a subset of ports in the scale mode. The **switchport vlan forwarding** command forwards packets between the ports belonging to VLAN in the interface configuration

mode. Port-VLAN table is used for storing the configuration on a per port/VLAN combination. The scaling configuration is applicable on a per-port basis and supports a maximum of **128** ports.

**Note:** The configuration is applicable to trunk ports only.

### Example

- This command enables VLAN scaling on a port with an **interface ethernet 2**.

```
switch# config terminal
switch(config)# interface ethernet 2
switch(config-if-Et2)# switchport vlan forwarding accept all
```

- This command disables VLAN scaling on a port.

```
switch# config
switch(config)# interface ethernet 2
switch(config-if-Et2)# no switchport vlan forwarding accept all
```

### 12.3.3.3 Creating and Configuring VLAN Interfaces

The **interface vlan** command places the switch in **VLAN-interface** configuration mode for modifying an SVI. An SVI provides a management address point and Layer 3 processing for packets from all VLAN ports.

### Example

This command enters **VLAN-interface** configuration mode for **vlan 12**. The command also creates **vlan 12** interface if it was not previously created.

```
switch# config t
switch(config)# interface vlan 12
switch(config-if-Vl12)#
```

### 12.3.3.4 Allocating Internal VLANs

The **vlan internal order** command specifies the VLANs that the switch allocates as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order. The default allocation range is between VLAN **1006** and VLAN **4094**.

The **no switchport** command converts an Ethernet or port channel interface into a routed port, disabling Layer 2 switching for the interface.

### Examples

- This command configures the switch to allocate internal VLANs in ascending order starting with **1006**.

```
switch(config)# vlan internal order ascending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order starting with **4094**.

```
switch(config)# vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order from **4094** through **4000**.

```
switch(config)# vlan internal order descending range 4000 4094
switch(config)#
```

### 12.3.3.5 Private VLAN Configuration

#### On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

- On systems with algomatch hardware, the access-list mechanism must explicitly be set to TCAM using the following command. Ignore this step when on non-algomatch hardware based systems.

```
switch(config)# hardware access-list mechanism tcam
```

- To enable the private VLAN feature, you must also enable the forwarding-ID feature.

```
switch(config)# platform sand l2 forwarding-id sharing
```

#### On All Platforms

- Any regular VLAN can act as a primary without any extra configuration. The only requirement is that the VLAN must be active. Use the following command to configure a VLAN as active or inactive:

```
switch(config)# vlan 100
```

```
switch(config)# no vlan 100
```

```
switch(config)# default vlan 100
```

- Configure VLANs as secondary inside the **VLAN** configuration mode. Use the configuration to specify the primary VLAN as isolated and the type of secondary VLAN:

```
switch(config)# vlan 20
switch(config-vlan-20)# private-vlan isolated primary vlan 10
switch(config)# vlan 30
switch(config-vlan-30)# private-vlan community primary vlan 10
```

Figure 12-2: Support for Private VLAN

- Interfaces are assigned to primary or secondary VLANs in the same way as regular VLANs. It works with both access and trunk ports. The following shows the standard switchport command configuring an access interface to the secondary VLAN configured before:

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# switchport access vlan 20
```

- Trunk ports forward any traffic within the allowed VLANs configured on the interface, whether they are primary or secondary VLANs. To configure trunk ports to translate traffic from primary VLAN to secondary (this maps to the lowest secondary VLAN if multiple are allowed) configure the following on the trunk port:

```
switch(config)# interface ethernet 1/1
switch(config-if-Et1/1)# switchport trunk private-vlan secondary
```

## Steps to Unconfigure

### On all Platforms

- To unconfigure a private VLAN, use the following command. This reverts the VLAN back to a regular VLAN. At this point, the broadcast domain for this VLAN adjusts and all hosts start to be learned in the regular VLAN, as opposed to the primary VLAN. The MAC table entries previously learned on the primary VLAN are not used anymore for forwarding.

```
switch(config-vlan-20)# no private-vlan
```

- To restore trunk port behavior to allow traffic on all primary and secondary VLANs:

```
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# no switchport trunk private-vlan secondary
```

### On DCS-7280R, DCS-7280R2, DCS-7500R, DCS-7500R2, DCS-7020R

To unconfigure forwarding-id sharing:

```
switch(config)# no platform sand 12 forwarding-id sharing
Note: This configuration needs the device to be rebooted to take effect.
```

## 12.3.3.6 Configuring VLAN Translation

VLAN translation changes the VLAN ID of specified packets entering or leaving a port. The following sections describe the configuration of VLAN translation.

### 12.3.3.6.1 Per-port VLAN Translation on Switched Ports

The [switchport vlan translation](#) command allows translation of the VLAN tag of traffic entering or exiting a switched port.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the [switchport mode](#) command.

#### Examples

- This command configures **interface ethernet 5** as a trunk port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport mode trunk
switch(config-if-Et5)#
```

- By default, the translation is bidirectional: packets ingressing an interface through **vlan A** are internally mapped to **vlan B**; **vlan B** packets egressing the same interface are mapped to **vlan A**.
- These commands map **interface ethernet 5** traffic with dot1q tag **50** to bridging **vlan 60**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation 50 60
switch(config-if-Et5)#
```

- These commands provides multiple 1:1 VLAN mappings under an interface.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation 50 60
switch(config-if-Et5)# switchport vlan translation 61 71
switch(config-if-Et5)# switchport vlan translation 62 72
switch(config-if-Et5)#
```

- These commands translate only incoming packets.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation in 50 60
switch(config-if-Et5)#
```

- These commands translate only egress packets.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation out 60 50
switch(config-if-Et5)#
```

### 12.3.3.6.2 Dropping VLAN Translations

#### Dropping Mismatched VLAN Translations on a Routed Port

On routed ports, the [encapsulation dot1q vlan](#) command, permitted only on routed ports, configures the VLAN on the interface to act as the native VLAN. This command maps packets ingressing with the specified VLAN ID to the internal VLAN ID of the routed port. All traffic egressing out of the routed port tagged with the VLAN ID specified in the command.

#### Example

These commands translate between **vlan 50** and the internal VLAN for **interface ethernet 5** (a routed port).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

#### Dropping Unmatched VLAN Translations on an Interface

Configure an Ethernet interface to drop unmatched VLAN translation packets from ingress and egress ports.

#### Example

Use the following commands to drop invalid VLAN translations from Ethernet1:

```
switch(config)# interface Ethernet1
switch(config-if-Et2)# switchport vlan translation out required
switch(config-if-Et2)# switchport vlan translation in required
```

### 12.3.3.6.3 Double VLAN Translation

Double VLAN translation creates mappings between an inner and outer VLAN ID pair of a double-tagged packet and a single bridging VLAN. On ingress, specified double-tagged packets are mapped to the bridging VLAN, and on egress packets with the ID of the bridging VLAN are double tagged as specified. By default, the translation is bidirectional, but it can be applied only on ingress or egress.

#### Example

These commands causes packets entering *interface ethernet 3/1* with an outer VLAN ID of **1000** and an inner VLAN ID of **100** to be processed in bridging *vlan 200*.

```
switch(config)# interface ethernet 3/1
switch(config-if-Et3/1)# switchport vlan translation in 1000 inner 100 200
switch(config-if-Et3/1)#
```

### 12.3.3.7 Configuring VLAN Counters

Add VLAN ingress and egress counters that provide the ability to count packets and bytes ingressing or egressing a bridge domain for a VLAN.

**Note:** Only R Series platforms support this configuration.

Use the following commands to add VLAN ingress and egress counters to the switch:

```
switch(config)# hardware counter feature vlan in
switch(config)# hardware counter feature vlan out
```

To display the configuration, use the [show hardware counter](#).

```
switch(config)# show hardware counter feature
```

| Feature | Direction | Counter Resource (Engine) | Status | Detail                 |
|---------|-----------|---------------------------|--------|------------------------|
| Queue   | out       | Jericho2C+: 16            | up     | Not user-configurable. |
| VLAN    | out       | Jericho2C+: 2             | up     |                        |
| VLAN    | in        | Jericho2C+: 1             | up     |                        |
| VOQ     | in        | Jericho2C+: 0, 8          | up     | Not user-configurable. |

Verify the counter status using the [show vlan counters](#) command.

```
switch# show vlan counters
```

| Vlan    | InOctets | InPkts |
|---------|----------|--------|
| Vlan1   | 0        | 0      |
| Vlan100 | 186      | 2      |
| Vlan200 | 0        | 0      |
| Vlan300 | 64       | 1      |

| Vlan    | OutOctets | OutPkts |
|---------|-----------|---------|
| Vlan1   | 0         | 0       |
| Vlan100 | 0         | 0       |
| Vlan200 | 114       | 1       |
| Vlan300 | 70        | 1       |

To clear the counter status, use the following command:

```
switch(config)# clear vlan counters
switch(config)# show vlan counters
```

| Vlan    | InOctets | InPkts |
|---------|----------|--------|
| Vlan1   | 0        | 0      |
| Vlan100 | 0        | 0      |
| Vlan200 | 0        | 0      |
| Vlan300 | 0        | 0      |

| Vlan    | OutOctets | OutPkts |
|---------|-----------|---------|
| Vlan1   | 0         | 0       |
| Vlan100 | 0         | 0       |
| Vlan200 | 0         | 0       |
| Vlan300 | 0         | 0       |

## 12.3.4 VLAN Configuration Commands

### Global VLAN Configuration Commands

- [interface vlan](#)
- [vlan](#)
- [vlan internal order](#)

### VLAN Configuration Mode Commands

- [mac address forwarding](#)
- [name \(VLAN configuration mode\)](#)
- [state](#)
- [trunk group](#)

### Layer 2 Interface (Ethernet and Port Channel) Configuration Commands

- [switchport access vlan](#)
- [switchport dot1q ethertype](#)
- [switchport mode](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk group](#)
- [switchport trunk native vlan](#)
- [switchport vlan forwarding](#)
- [switchport vlan translation](#)
- [switchport vlan translation required](#)

### VLAN Interface Configuration Mode Commands

- [autostate](#)
- [encapsulation dot1q vlan](#)
- [l2-protocol encapsulation dot1q vlan](#)
- [pvlan mapping](#)

### Show Commands

- [show dot1q-tunnel](#)
- [show interfaces switchport](#)

- 
- `show interfaces switchport backup-link`
  - `show interfaces switchport vlan mapping`
  - `show interfaces trunk`
  - `show interfaces vlans`
  - `show pvlan mapping interfaces`
  - `show vlan`
  - `show vlan brief count`
  - `show vlan counters`
  - `show vlan dynamic`
  - `show vlan internal allocation policy`
  - `show vlan internal usage`
  - `show vlan trunk group`

### 12.3.4.1 autostate

When **autostate** is **enabled**, the VLAN interface will be up when:

- the corresponding VLAN exists and is in the active state.
- one or more Layer 2 ports in the VLAN are up and in spanning-tree forwarding state.
- the VLAN interface exists and is not in a shutdown state.

Autostate is **enabled** by default. When autostate is **disabled**, the VLAN interface is forced to be active.

- The **no autostate** command disables autostate on the configuration mode interface. The **no autostate** command is stored to **running-config**.
- The **autostate** command enables the autostate function on the configuration mode VLAN SVI by removing the corresponding **no autostate** statement from **running-config**.
- The **default autostate** command restores the autostate default state of **enabled** by removing the corresponding **no autostate** statement from **running-config**.

#### Command Mode

Interface-VLAN Configuration

#### Command Syntax

```
autostate
no autostate
default autostate
```

#### Guidelines

Autostate should be disabled on SVIs configured as an MLAG local interface.

#### Examples

- These commands disable autostate on **vlan 100**.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# no autostate
switch(config-if-Vl100)#
```

- These commands enable autostate on **vlan 100**.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# autostate
switch(config-if-Vl100)#
```

---

### 12.3.4.2 encapsulation dot1q vlan

#### Routed Port VLAN Translation

In the configuration mode for an Ethernet or port channel interface, the **encapsulation dot1q vlan** translates packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port, and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

#### Subinterface VLAN Assignment

When used in the configuration mode for an Ethernet or port channel subinterface, however, the **encapsulation dot1q vlan** command assigns a dot1q tag to the subinterface. Traffic ingressing on the parent interface with that dot1q tag will then be sent to the configured subinterface. See **Subinterfaces** and **Subinterface Configuration** for details.

The **no encapsulation dot1q vlan** and **default encapsulation dot1q vlan** commands restore the default VLAN to the configuration mode interface by removing the corresponding **encapsulation dot1q vlan** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-port-channel Configuration

Subinterface-Ethernet Configuration

Subinterface-port-channel Configuration

#### Command Syntax

```
encapsulation dot1q vlan vlan_id
no encapsulation dot1q vlan
default encapsulation dot1q vlan
```

#### Parameter

**vlan\_id** For VLAN translation, the ID of the external VLAN to be translated; for subinterface configuration, the VLAN of the subinterface. Values range from **1** to **4094**.

#### Examples

- These commands translate between **vlan 50** and the internal VLAN for **interface ethernet 5** (a routed port).

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

- These commands assign packets ingressing on **interface ethernet 1/1** with **vlan ID 100** to subinterface **ethernet 1/1.1**.

```
switch(config)# interface ethernet1/1.1
switch(config-if-Et1/1.1)# no switchport
switch(config-if-Et1/1.1)# encapsulation dot1q vlan 100
switch(config-if-Et1/1.1)#
```

### 12.3.4.3 interface vlan

The **interface vlan** command places the switch in VLAN-interface configuration mode for modifying parameters of the Switch Virtual Interface (SVI). An SVI provides Layer 3 processing for packets from all ports associated with the VLAN. There is no physical interface for the VLAN.

When entering configuration mode to modify existing SVIs, the command can specify multiple interfaces. The command creates an SVI if the specified interface does not exist prior to issuing the command. When creating an SVI, the command can only specify a single interface.

The **no interface vlan** command deletes the specified SVI interfaces from **running-config**. The **default interface vlan** commands remove all configuration statements for the specified SVI interfaces from **running-config** without deleting the interfaces.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface vlan v_range
no interface vlan v_range
default interface vlan v_range
```

#### Parameter

**v\_range** VLAN interfaces (number, range, or comma-delimited list of numbers and ranges). VLAN number ranges from **1** to **4094**.

#### Restrictions

**Internal VLANs:** A VLAN interface cannot be created or configured for internal VLAN IDs. The switch rejects any interface vlan command that specifies an internal VLAN ID.

#### Example

This example creates an SVI for **vlan 12**:

```
switch# config
switch(config)# interface vlan 12
switch(config-if-Vl12)#
```

---

#### 12.3.4.4 l2-protocol encapsulation dot1q vlan

The **l2-protocol encapsulation dot1q vlan** command enables Layer 2 802.1Q traffic encapsulation on the configuration mode interface for a specified VLAN. The default VLAN for all interfaces is VLAN 1.

The **no l2-protocol encapsulation dot1q vlan** and **default l2-protocol encapsulation dot1q vlan** commands disable the specified encapsulation on the configuration mode interface by removing the corresponding **l2-protocol encapsulation dot1q vlan** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

##### Command Syntax

```
l2-protocol encapsulation dot1q vlan vlan_id
no l2-protocol encapsulation dot1q vlan
default l2-protocol encapsulation dot1q vlan
```

##### Parameter

**vlan\_id** the ID of the native VLAN. Values range from **1** to **4094**.

##### Example

These commands enable 802.1Q encapsulation of traffic on **vlan 200**.

```
switch(config)# interface ethernet 5/2
switch(config-if-Et5/2)# l2-protocol encapsulation dot1q vlan 200
switch(config-if-Et5/2)# show active
interface Ethernet5/2
 l2-protocol encapsulation dot1q vlan 200
switch(config-if-Et5/2)#
```

### 12.3.4.5 mac address forwarding

The **mac address forwarding** command enables a switch to configure a VLAN policy when it receives a packet with an unknown destination MAC address on a VLAN. The command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default state is to flood the L2 miss packets on all ports of the VLAN.

The **show vlan** command displays information about the VLAN policy that is being configured.

The **no** form and the **default** form of the command removes the previously configured VLAN policy on the VLAN.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
mac address forwarding [unicast | multicast] miss action [drop | flood | log]
no mac address forwarding [unicast | multicast] miss action [drop | flood | log]
default mac address forwarding [unicast | multicast] miss action [drop | flood | log]
```

#### Parameters

- **unicast** the unicast type of transmission.
- **multicast** the multicast type of transmission.
- **drop** the selected packets are dropped.
- **flood** the selected packets are flooded in the specific VLAN.
- **log** the selected packets are sent to the CPU for logging purpose.

#### Guidelines

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

#### Examples

- These commands create a **vlan 333** and then set the unicast policy to **drop** and the multicast policy to **log** for the specific **vlan 333**.

```
switch(config)# vlan 333
switch(config-vlan-333)# mac address forwarding unicast miss action drop
switch(config-vlan-333)# mac address forwarding multicast miss action log
```

- These commands display the VLAN policy that was defined when **vlan 333** is created.

```
switch(config)# show vlan 333 mac address forwarding
```

---

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| ---- | -----        | -----        |
| 333  | flood        | flood        |

- These commands display the VLAN policy type that was defined when **vlan 333** is configured with the **drop** unicast policy and the **log** multicast policy.

```
switch(config)# show vlan 333 mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| ---- | -----        | -----        |
| 333  | drop         | log          |

```
switch(config)#show vlan mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| ---- | -----        | -----        |
| 1    | flood        | flood        |
| 333  | drop         | log          |

### 12.3.4.6 name (VLAN configuration mode)

The **name** command configures the VLAN name. The name can have up to 32 characters. The default name for VLAN 1 is **default**. The default name for all other VLANs is VLANxxxx, where xxxx is the VLAN number. The default name for **vlan 55** is **VLAN0055**. The **show vlan** command displays the VLAN name.

The **name** command accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from **running-config**.

#### Command Mode

VLAN Configuration

#### Command Syntax

name *label\_text*

no name

default name

#### Parameter

**label\_text** character string assigned to name attribute. Maximum length is **32** characters. The space character is not permitted in the name string.

#### Example

These commands assign **corporate\_100** as the name for **vlan 25**, then displays the VLAN name.

```
switch(config)# vlan 25
switch(config-vlan-25)# name corporate_100
switch(config-vlan-25)# show vlan 25
VLAN Name Status Ports
----- -----
25 corporate_100 active
switch(config-vlan-25)#
```

---

### 12.3.4.7 pvlan mapping

The pvlan mapping command maps a Switch Virtual Interface (SVI) available in the primary VLAN to the secondary VLAN or VLANs in the VLAN configuration mode. The [show pvlan mapping interfaces](#) command displays the list of mapped VLANs.

The **no pvlan mapping** and **default pvlan mapping** commands restore the default state of the private VLAN mapping.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
pvlan mapping {add | remove | vlan ID}
no pvlan mapping {add | remove | vlan ID}
default pvlan mapping {add | remove | vlan ID}
```

#### Parameters

- **add** adding VLANs to the PVLAN mapping of the current VLAN interface.
- **remove** removing VLANs from the PVLAN mapping of the current VLAN interface.
- **vlan ID** The secondary VLAN IDs of the private VLAN mapping. The IDs range from **1** to **4094**.

#### Related Commands

[show pvlan mapping interfaces](#)

#### Example

These commands assign a secondary VLAN ID of **50** to the primary VLAN.

```
switch(config)# vlan 25
switch(config-vlan-25)# pvlan mapping 50
switch(config-vlan-25)#
```

### 12.3.4.8 show dot1q-tunnel

The **show dot1q-tunnel** command displays the ports that are configured in dot1q-tunnel switching mode. The **switchport mode** command configures the switching mode for the configuration mode interface.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1q-tunnel [INTERFACE]
```

#### Parameters

**INTERFACE** Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **loopback l\_range** Loopback interface specified by **l\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
- **vlan v\_range** VLAN interface range specified by **v\_range**.
- **VXLAN vx\_range** VXLAN interface range specified by **vx\_range**.

Valid **range** formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the ports that are configured in dot1q-tunnel switching mode.

```
switch> show dot1q-tunnel
dot1q-tunnel mode LAN Port (s)

Po4
Po21
Po22 switch>
```

---

### 12.3.4.9 show interfaces switchport backup-link

The **show interfaces switchport backup-link** command displays interfaces that are configured as switchport backup pairs and the operational status of each interface. For each pair, the command displays the names, roles, status, and VLAN traffic of each interface.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] switchport backup-link
```

```
show interfaces switchport backup-link [module {Fabric f_num | Linecard lc_num | Supervisor
svr_num | Switchcard | 1-2 | 3-6 }]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - **no parameter** Display information for all interfaces.
  - **ethernet *e\_range*** Ethernet interface range specified by ***e\_range***.
  - **loopback *l\_range*** Loopback interface specified by ***l\_range***.
  - **management *m\_range*** Management interface range specified by ***m\_range***.
  - **port-channel *p\_range*** Port-Channel Interface range specified by ***p\_range***.
  - **vlan *v\_range*** VLAN interface range specified by ***v\_range***.

Valid ***e\_range***, ***l\_range***, ***m\_range***, ***p\_range***, and ***v\_range*** formats include number, number range, or comma-delimited list of numbers and ranges.
- **module** Displays interfaces of the specified module. Options include:
  - **Fabric *f\_num*** Displays interfaces of the specified fabric module. Value ranges from **1** to **6**.
  - **Linecard *lc\_num*** Displays interfaces of the specified linecard module. Value ranges from **3** to **6**.
  - **Supervisor *svr\_num*** Displays interfaces of the specified supervisor module. Accepted values are **1** and **2**.
  - **Switchcard** Displays interfaces of switchcard modules.
  - **1-2** Displays interfaces of the specified supervisor module.
  - **3-6** Displays interfaces of the specified linecard module.

#### Display Values

- **State** Operational status of the interface. Values include:
  - **Up** Spanning tree mode is *backup*, interface status is **up**.
  - **Down** Spanning tree mode is *backup*, interface status is **down**.
  - **Inactive Configuration** The spanning tree mode is not **backup**.
- **Forwarding vlans** VLANs forwarded by the interface. Depends on interface operation status and prefer option specified by the **switchport backup** command.

#### Examples

- This command displays the configured switchport primary-backup pairs.

```
switch> show interfaces switchport backup-link
Switch backup interface pair: Ethernet3/17, Ethernet3/8
Primary Interface: Ethernet3/17 State: Inactive Configuration
Backup Interface: Ethernet3/8 State: Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
```

```
Mac move destination: ff:ff:ff:ff:ff:ff
```

- This command displays interfaces of the module for *linecard 4*.

```
switch(config)# show int switchport backup-link module Linecard 4
Switch backup interface pair: Ethernet4/19/1, Ethernet4/19/2
Primary Interface: Ethernet4/19/1 State: Inactive Configuration
Backup Interface: Ethernet4/19/2 State: Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
Mac move destination: ff:ff:ff:ff:ff:ff
```

### 12.3.4.10 show interfaces switchport vlan mapping

The **show interfaces switchport vlan mapping** command displays mapping information of the configured VLANs in an interface mode.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces switchport vlan mapping
```

#### Examples

- This command displays mapping information of the configured VLAN IDs.

```
switch# show interfaces switchport vlan mapping

Ethernet3

```

| Original Vlan | New Vlan | Status | Direction<br>Configured | Direction<br>Active |
|---------------|----------|--------|-------------------------|---------------------|
| 10            | 100      | Active | In/Out                  | In/Out              |
| 11            | 200      | Active | In                      | In                  |
| 300           | 12       | Active | Out                     | Out                 |

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)# show interfaces switchport vlan mapping

Ethernet3/1

```

| Direction<br>Outer Tag | Direction<br>Inner Tag | VLAN ID | Status | Configured | Active Dot1 | qTunnel |
|------------------------|------------------------|---------|--------|------------|-------------|---------|
| 1000                   | 100                    | 200     | active | In/Out     | In/Out      | -       |
| 1001                   | 101                    | 201     | active | In         | In          | -       |
| 1002                   | 102                    | 202     | active | Out        | Out         | -       |

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)# show interfaces switchport vlan mapping

Ethernet1/1

```

| Outer Tag | Inner Tag | VLAN ID | Status | Direction<br>Configured | Direction<br>Active |
|-----------|-----------|---------|--------|-------------------------|---------------------|
| 70        | -         | 300     | Active | In/Out                  | In/Out              |
| 10        | 50        | 100     | Active | In/Out                  | In/Out              |
| 20        | 60        | 100     | Active | In                      | In                  |
| 30        | 40        | 200     | Active | Out                     | Out                 |

### 12.3.4.11 show interfaces switchport

The **show interfaces switchport** command displays the switching configuration and operational status of the specified ports.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] switchport
```

#### Parameters

**INTERFACE** Interface type and numbers. Options include:

- **no parameter** Display the switching status for all interfaces.
- **ethernet *e\_range*** Ethernet interface range specified by *e\_range*.
- **loopback *l\_range*** Loopback interface specified by *l\_range*.
- **management *m\_range*** Management interface range specified by *m\_range*.
- **port-channel *p\_range*** Port-Channel Interface range specified by *p\_range*.
- **vlan *v\_range*** VLAN interface range specified by *v\_range*.

Valid *e\_range*, *l\_range*, *m\_range*, *p\_range*, and *v\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Examples

- This command displays the switching status for all interfaces.

```
switch(config)# show interface switchport
Default switchport mode: access

Name: Et5/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

Name: Et5/2
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

[...]

switch(config)#
```

- This command displays the switching status of port channel interfaces **21** and **22**.

```
switch> show interface port-channel 21-22 switchport
Name: Po21
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
```

```
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 100 (VLAN0100)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups: foo

Name: Po22
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups:

switch>
```

- This command displays the configured status of VLAN scaling for the **interface ethernet 2/1** port.

```
switch# show interface Ethernet 2/1 switchport
Name: Ethernet 2/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
MAC Address Learning: enabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allConfiguredVlans switch>
```

### 12.3.4.12 show interfaces trunk

The **show interfaces trunk** command displays configuration and status information for interfaces configured in switchport trunk mode.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] trunk
```

#### Parameters

**INTERFACE** Interface type and numbers. Options include:

- **no parameter** Display information for all interfaces.
- **ethernet e\_range** Ethernet interface range specified by **e\_range**.
- **management m\_range** Management interface range specified by **m\_range**.
- **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.

Valid **e\_range**, **m\_range**, and **p\_range** formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the trunk status for all interfaces configured in switchport trunk mode.

```
switch> show interfaces trunk
Port Mode Status Native vlan
Po1 trunk trunking 1
Po2 trunk trunking 1

Port Vlans allowed
Po1 1-15
Po2 16-30

Port Vlans allowed and active in management domain
Po1 1-10
Po2 21-30

Port Vlans in spanning tree forwarding state
Po1 1-10
Po2 21-30 switch>
```

---

### 12.3.4.13 show interfaces vlans

The **show interfaces vlans** command displays a table that lists the VLANs that are carried by the specified interfaces. Interfaces that do not carry VLANs are not listed in the table. The table lists the untagged (native or access) and tagged VLANs for each interface.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INT_NAME] vlans
```

#### Parameters

**INT\_NAME** Interface type and number. Values include:

- **ethernet *e\_num*** Ethernet interface specified by *e\_num*.
- **management *m\_num*** Management interface specified by *m\_num*.
- **port-channel *p\_num*** Port-Channel Interface specified by *p\_num*.

#### Example

This command displays the VLANs carried by all L2 ports.

```
switch> show interfaces vlans
Port Untagged Tagged
Et9 3910 -
Et11 3912 -
Et16 500 -
Et17 3908 -
Et18 3908 -
Po1 1 101-102,500,721,3000,
Po2 101 -
Po4 3902 -
Po5 3903 -
Po6 3992 -
Po7 661 -
Po8 3911 -
```

#### 12.3.4.14 show pvlan mapping interfaces

The **show pvlan mapping interfaces** command displays information about the private VLAN mapping interfaces.

##### Command Mode

EXEC

##### Command Syntax

```
show pvlan mapping interfaces
```

##### Example

This command displays information about the private VLAN mapping interfaces.

```
switch(config)# int vlan 50
switch(config-if-Vl50)# pvlan mapping 70
switch(config-if-Vl50)# show pvlan mapping interfaces
Interface Secondary Vlan

Vlan50 70
```

### 12.3.4.15 show vlan

The **show vlan** command displays the VLAN ID, name, status, and member ports of all configured VLANs. The command only displays active ports by default; by specifying **configured-ports**, the command displays all ports that are members of a configured VLAN regardless of their activity status, including Ethernet ports that are members of a port channel.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan [VLAN_LIST] [PORT_ACTIVITY]
```

#### Parameters

- **VLAN\_LIST** List of VLANs displayed by command. Options include:
  - **no parameter** all VLANs.
  - **v\_range** VLANs specified by **v\_range**.
  - **id v\_range** VLANs specified by **v\_range**.
  - **name v\_name** VLANs specified by the VLAN name **v\_name**.**v\_range** formats include number, number range, or comma-delimited list of numbers and ranges.
- **PORT\_ACTIVITY** Ports listed in table. Options include:
  - **no parameter** table displays only active ports (same as **active-configuration** option).
  - **active-configuration** table displays only active ports.
  - **configured-ports** table displays all configured ports.

#### Display Values

- **VLAN** The VLAN ID.
- **Name** The name of the VLAN.
- **Status** The status of the VLAN.
- **Ports** The ports that are members of the VLAN.

#### Examples

- This command displays status and ports of VLANs **1-1000**.

```
switch> show vlan 1-1000
VLAN Name Status Ports

1 default active Po1
184 fet.arka active Cpu, Po1, Po2
262 mgq.net active PPo2, Po1
512 sant.test active Cpu, Et16, Po1
821 ipv6.net active Cpu, Po1, Po7 switch>
```

- This command displays the list of all the member interfaces under each SVI.

```
switch# show vlan
VLAN Name Status Ports

1 default active Cpu, Et1, Et26
2148 VLAN2148 active Cpu, Et18
2700 VLAN2700 active Cpu, Et18
```

### 12.3.4.16 show vlan brief count

The **show vlan brief count** command displays the number of VLANs that are configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan brief count
```

#### Example

This command displays the number of VLANs on the switch.

```
switch> show vlan brief count
Number of existing VLANs : 18 switch>
```

### 12.3.4.17 show vlan counters

Displays information about configured ingress and egress VLAN counters on the switch.

#### Configuration Mode

EXEC

#### Command Syntax

```
show vlan counters
```

#### Example

Use the following command to display VLAN counters configured on the switch:

```
switch# show vlan counters
Vlan InOctets InPkts
Vlan1 0 0
Vlan100 186 2
Vlan200 0 0
Vlan300 64 1

Vlan OutOctets OutPkts
Vlan1 0 0
Vlan100 0 0
Vlan200 114 1
Vlan300 70 1
```

---

#### 12.3.4.18 show vlan dynamic

The **show vlan dynamic** command displays the source and quantity of dynamic VLANs on the switch. Dynamic VLANs support VM Tracer monitoring sessions.

##### Command Mode

EXEC

##### Command Syntax

```
show vlan dynamic
```

##### Example

This command displays the source and quantity of dynamic VLANs on the switch.

```
switch> show vlan dynamic
Dynamic VLAN source VLANS
vmtracer-poc 88 switch>
```

### 12.3.4.19 show vlan internal allocation policy

The **show vlan internal allocation policy** command displays the method the switch uses to allocate VLANs to routed ports. The **vlan internal order** command configures the allocation method.

The allocation method consists of two configurable components:

- **range:** the list of VLANs that are allocated to routed ports.
- **direction:** the direction by which VLANs are allocated (ascending or descending).

#### Command Mode

EXEC

#### Command Syntax

```
show vlan internal allocation policy
```

#### Example

This command displays the internal allocation policy.

```
switch> show vlan internal allocation policy
Internal VLAN Allocation Policy: ascending
Internal VLAN Allocation Range: 1006-4094 switch>
```

---

### 12.3.4.20 show vlan internal usage

The **show vlan internal usage** command shows the VLANs that are allocated as internal VLANs for routed ports.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

When an interface is configured as a routed port, the switch allocates an SVI with a previously unused VLAN ID. The switch prohibits the configuration of VLANs with numbers corresponding to internal VLAN interfaces allocated to a routed port. VLAN interfaces corresponding to SVIs allocated to a routed port cannot be configured by VLAN interface configuration mode commands.

#### Command Mode

EXEC

#### Command Syntax

**show vlan internal usage**

#### Example

This command displays the VLANs that are allocated to routed ports.

```
switch> show vlan internal usage
1006 Ethernet3
1007 Ethernet4 switch>
```

### 12.3.4.21 show vlan trunk group

The **show vlan trunk group** command displays the trunk group membership of the specified VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan [VLAN_LIST] trunk group
```

#### Parameters

**VLAN\_LIST** VLAN list. Options include:

- **no parameter** all VLANs.
- **v\_range** VLANs specified by **v\_range**.
- **id v\_range** VLANs specified by **v\_range**.
- **name v\_name** VLANs specified by the VLAN name **v\_name**.

#### Display Values

- **VLAN** VLAN ID.
- **Trunk Groups** Trunk groups associated with the listed VLANs.

#### Example

This command displays the trunk group membership of all configured VLANs.

```
switch> show vlan trunk group
VLAN Trunk Groups

5
10 first_group
12
40 second_group
100 third_group
101 middle_group
102
200 switch>
```

---

### 12.3.4.22 state

The **state** command configures the VLAN transmission state of the configuration mode VLAN.

- **Active state:** Ports forward VLAN traffic.
- **Suspend state:** Ports block VLAN traffic.

The default transmission status is **active**.

The **no state** command restores the default VLAN transmission state to the configuration mode VLAN by removing the corresponding **state** command from **running-config**.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
state OPERATION_STATE
```

```
no state
```

```
default state
```

#### Parameters

**OPERATION\_STATE** VLAN transmission state. Options include:

- **active** VLAN traffic is forwarded.
- **suspend** VLAN traffic is blocked.

#### Example

These commands suspend VLAN traffic on VLANs **100-102**.

```
switch(config)# vlan 100-102
switch(config-vlan-100-102)# state suspend
switch(config-vlan-100-102)#
```

### 12.3.4.23 switchport access vlan

The **switchport access vlan** command specifies the access VLAN of the configuration mode interface. Ethernet or port channel interfaces that are in access mode are members of only the access VLAN. Untagged frames that the interface receives are associated with the access VLAN. Frames tagged with the access VLAN are also associated with the access VLAN. The interface drops all other tagged frames that it receives. By default, VLAN 1 is the access VLAN of all Ethernet and port channel interfaces.

An interface's access mode is effective only when the interface is in access mode or dot1q-tunnel mode, as specified by the **switchport mode** command. Interfaces in dot1q-tunnel mode handle inbound traffic as untagged traffic and associate all traffic with the access VLAN. Interfaces configured to switchport trunk mode maintain and ignore existing switchport access commands.

The **no switchport access vlan** and **default switchport access vlan** commands restore **VLAN 1** as the access VLAN of the configuration mode interface by removing the corresponding **switchport access vlan** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport access vlan v_num
no switchport access vlan
default switchport access vlan
```

#### Parameter

**v\_num**    number of access VLAN. Value ranges from **1** to **4094**. Default is **1**.

#### Example

These commands assign **VLAN 100** as the access VLAN to *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport access vlan 100
switch(config-if-Et5)#
```

---

#### 12.3.4.24 switchport dot1q ethertype

The **switchport dot1q ethertype** command configures the tag protocol identifier (TPID, also known as a dot1q ethertype), of the configuration mode interface. By default, all switch ports use the standard TPID of **0x8100**.

The **no switchport dot1q ethertype** and **default switchport dot1q ethertype** commands restore the TPID to **0x8100** by removing the corresponding **switchport dot1q ethertype** statement from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
switchport dot1q ethertype ethertype
no switchport dot1q ethertype
default switchport dot1q ethertype
```

##### Parameter

**ethertype** ethertype number (TPID). Value ranges from **0x600 (1536)** through **0xFFFF (65535)**, and can be entered in decimal or hexadecimal notation. Value is stored and displayed in hexadecimal form; the default value is **0x8100**.

##### Example

These commands configure **0x9100** as the TPID of *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport dot1q ethertype 0x9100
switch(config-if-Et5)#
```

### 12.3.4.25 switchport mode

The **switchport mode** command specifies the switching mode of the configuration mode interface. The switch supports five switching modes: access, trunk, dot1q-tunnel, tap, and tool.

- **Access switching mode:** The interface is a member of one VLAN, called the access VLAN, as specified by the **switchport access vlan** command. Tagged frames received on the interface are dropped unless they are tagged with the access VLAN. Frames transmitted from the interface are always untagged.
- **Trunk switching mode:** The interface may be a member of multiple VLANs, as configured by the **switchport trunk allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport trunk native vlan** command.
- **Dot1q-tunnel switching mode:** The interface treats all inbound packets as untagged traffic and handles them as traffic of its access VLAN, as specified by the **switchport access vlan** command.
- **Tap mode:** The interface operates as a tap port. Tap ports receive traffic for replication on one or more tool ports. The interface may be a member of multiple VLANs, as configured by the **switchport tap allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport tap native vlan** command.

Tap ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

**Tool mode:** The interface operates as a tool port. Tool ports replicate traffic received by tap ports. The interface may be a member of multiple VLANs, as configured by the **switchport tool allowed vlan** command. MAC learning, control plane interaction and traps for inbound traffic are disabled.

Tool ports are in STP forwarding state and prohibit ingress traffic that uses port settings.

The status of switchport configured ports depends on the switch's tap aggregation mode (which can be viewed by using the **mode** command):

- tap aggregation mode enabled: tap and tool ports are enabled. Switching ports are disabled.
- tap aggregation mode disabled: tap and tool ports are disabled. Switching ports are enabled.

The **no switchport mode** and **default switchport mode** commands return the configuration mode interface to its default setting as an access port by deleting the corresponding **switchport mode** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport mode MODE_TYPE
```

```
no switchport mode
```

```
default switchport mode
```

#### Parameters

**MODE\_TYPE** switching mode of the configuration mode interfaces. Options include:

- **access** access switching mode.
- **dot1q-tunnel** dot1q-tunnel switching mode.
- **tap** tap switching mode.
- **tool** tool switching mode.

- 
- **trunk** trunk switching mode.

### Restrictions

**Dot1q-tunnel** switching mode is not available on Petra platform switches.

**Tap** aggregation (tap and tool modes) is available on FM6000 and Arad platform switches.

### Example

These commands configure *interface ethernet 4* as a trunk port.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# switchport mode trunk
switch(config-if-Et4)#
```

### 12.3.4.26 switchport trunk allowed vlan

The **switchport trunk allowed vlan** command creates or modifies the list of VLANs for which the configuration mode interface, in trunk mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in **running-config** without taking effect when the switch is in tap aggregation mode or the interface is not in trunk mode.

The **no switchport trunk allowed vlan** and **default switchport trunk allowed vlan** commands restore the trunk mode default allowed VLAN setting of **all** by removing the corresponding **switchport trunk allowed vlan** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport trunk allowed vlan EDIT_ACTION
```

```
no switchport trunk allowed vlan
```

```
default switchport trunk allowed vlan
```

#### Parameters

**EDIT\_ACTION**    modifications to the VLAN list.

- **v\_range**    Creates VLAN list from *v\_range*.
- **add v\_range**    Adds specified VLANs to current list.
- **all**    VLAN list contains all VLANs.
- **except v\_range**    VLAN list contains all VLANs except those specified.
- **none**    VLAN list is empty (no VLANs).
- **remove v\_range**    Removes specified VLANs from current list.

Valid **v\_range** formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

These commands create the trunk mode allowed VLAN list of **6-10** for **interface ethernet 14**, then verifies the VLAN list.

```
switch(config)# interface ethernet 14
switch(config-if-Et14)# switchport trunk allowed vlan 6-10
switch(config-if-Et14)# show interfaces ethernet 14 switchport
Name: Et14
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: 6-10
Trunk Groups:

switch(config-if-Et14)#
```

---

### 12.3.4.27 switchport trunk group

The **switchport trunk group** command assigns the configuration mode interface to the specified trunk group. Trunk group ports handle traffic of the VLANs assigned to the group.

The **no switchport trunk group** and **default switchport trunk group** commands remove the configuration mode interface from the specified trunk group by deleting the corresponding statement from running-config. If the command does not specify a trunk group, the interface is removed from all trunk groups to which it is assigned.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel which is being used as a mirror destination *must not* be assigned to an MLAG.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport trunk group [group_name]
no switchport trunk group [group_name]
default switchport trunk group [group_name]
```

#### Parameter

**group\_name** trunk group name.

#### Example

These commands assign **port channel 4** to trunk group **fe-1**.

```
switch(config)# interface port-channel 4
switch(config-if-Po4)# switchport trunk group fe-1
switch(config-if-Po4)#
```

### 12.3.4.28 switchport trunk native vlan

The **switchport trunk native vlan** command specifies the trunk mode native VLAN for the configuration mode interface. Interfaces in trunk mode associate untagged frames with the native VLAN. Trunk mode interfaces can also be configured to drop untagged frames. The default native VLAN for all interfaces is VLAN 1.

The **no switchport trunk native vlan** and **default switchport trunk native vlan** commands restore **vlan 1** as the trunk mode native VLAN to the configuration mode interface by removing the corresponding **switchport trunk native vlan** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport trunk native vlan VLAN_ID
no switchport trunk native vlan
default switchport trunk native vlan
```

#### Parameters

- **VLAN\_ID** the ID of the native VLAN. Options include:
  - **v\_num** VLAN number. Value ranges from **1** to **4094**.
  - **tag** interface drops all untagged frames.

#### Example

These commands configure **vlan 100** as the native VLAN for **port channel 21**.

```
switch(config)# interface port-channel 21
switch(config-if-Po21)# switchport trunk native vlan 100
switch(config-if-Po21)#
```

---

#### 12.3.4.29 switchport vlan forwarding

The **switchport vlan forwarding** command forwards packets between the ports belonging to VLAN in the interface configuration mode. The scaling configuration is applicable on a per-port basis. In the 7160 platform, the hardware uses a Port-VLAN table for storing the configuration on a per port/VLAN combination and supports a maximum of **128** ports.

**Note:** The configuration is applicable to trunk ports only.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
switchport vlan forwarding [accept | all]
```

##### Parameters

- **accept** accepts packets for VLAN.
- **all** all VLANs.

##### Example

This command forwards and accepts all the packets of VLAN of *interface ethernet 2*.

```
switch(config)# interface ethernet 2
switch(config-if-Et2) # switchport vlan forwarding accept all
switch(config-if-Et2) #
```

### 12.3.4.30 switchport vlan translation

The **switchport vlan translation** command allows you to map packets from one VLAN to another using VLAN translation. This is carried out on packets having a dot1q header (tagged frames) only. The translation rewrites the VLAN ID (VID) field in dot1q headers on packets passing through a switched port without changing any other fields.

By default, the translation is bidirectional. The packets ingressing an interface through **vlan A** are internally mapped to **vlan B**; **vlan B** packets egressing the same interface are mapped to **vlan A**.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the [switchport mode](#) command.

VLAN translation on routed ports is accomplished through the [encapsulation dot1q vlan](#) command.

The **no switchport vlan translation** and **default switchport vlan translation** commands remove VLAN mapping by removing the switchport vlan translation command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport vlan translation [DIRECTION] incoming_vlanid new_vlanid
no switchport vlan translation incoming_vlanid new_vlanid
no switchport vlan translation DIRECTION incoming_vlanid
default switchport vlan translation incoming_vlanid new_vlanid
default switchport vlan translation DIRECTION incoming_vlanid
```

#### Parameters

- **DIRECTION** direction of traffic to be translated.
  - **no parameter** translates the specified VLAN IDs for transmitted and received traffic.
  - **in** translates the specified VLAN IDs for received traffic only.
  - **out** translates the specified VLAN IDs for transmitted traffic only.
  - **incoming\_vlanid** Enter the VLAN ID to be translated. Value ranges from **1** to **4094**.
- **new\_vlanid** The new VLAN ID or bridging VLAN ID that will be used internally. Value ranges from **1** to **4094**.

#### Example

- These commands translate only incoming packets, changing the VLAN ID to **2008** in the dot1q header of packets ingressing on **vlan 201**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation in 201 2008
switch(config-if-Et5)#
```

- These commands translate multiple VLAN mappings on an **interface ethernet 5**.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# switchport vlan translation 50 60
switch(config-if-Et5)# switchport vlan translation 61 71
switch(config-if-Et5)# switchport vlan translation 62 72
switch(config-if-Et5)#
```

---

### 12.3.4.31 switchport vlan translation required

On routed ports, the **switchport vlan translation required** command (permitted only on routed ports) configures the VLAN on the interface to act as the native VLAN.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
switchport vlan translation in|out required
```

#### Parameters

- **in** - Ingress packets without a matching VLAN drop from the port.
- **out** - Egress packets without a matching VLAN drop from the port.

#### Examples

- The following command places the switch in **switchport** configuration mode and sets the requirement that egress VLAN translations must match or drop from the port.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport vlan translation out required
```

- The following command places the switch in **switchport** configuration mode and sets the requirement that ingress VLAN translations must match or drop from the port.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# switchport vlan translation in required
```

### 12.3.4.32 trunk group

The **trunk group** command assigns the configuration mode VLAN to a specified trunk group.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs. Switchport commands specify the physical interfaces that carry trunk group traffic.

The **no trunk group** and **default trunk group** commands remove the configuration mode VLAN from the specified trunk group by removing the corresponding **trunk group** statement from **running-config**. If a trunk group is not specified, the commands remove the configuration mode VLAN from all trunk groups.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
trunk group [name]
```

```
no trunk group [name]
```

```
default trunk group [name]
```

#### Parameter

**name** a name representing the trunk group.

#### Example

These commands assigns **vlan 49** to the trunk group **mlagpeer**:

```
switch(config)# vlan 49
switch(config-vlan-49)# trunk group mlagpeer
switch(config-vlan-49)#
```

---

### 12.3.4.33 **vlan**

The **vlan** command places the switch in VLAN configuration mode to configure a set of virtual LANs. The command creates the specified VLANs if they do not exist prior to issuing the command. A VLAN in use as an internal VLAN may not be created or configured. The switch rejects any **vlan** command that specifies an internal VLAN ID.

The **default vlan** and **no vlan** commands removes the VLAN statements from **running-config** for the specified VLANs.

The **exit** command returns the switch to global configuration mode.

#### **Command Mode**

Global Configuration

#### **Command Syntax**

```
vlan vlan_range
```

```
no vlan vlan_range
```

```
default vlan vlan_range
```

#### **Parameter**

***vlan\_range***    VLAN list.

Formats include a name, number, number range, or comma-delimited list of numbers and ranges.

#### **Commands Available in VLAN Configuration Mode**

- [name \(VLAN configuration mode\)](#)
- [state](#)
- [trunk group](#)

#### **Guidelines**

In MLAG configurations, VLANs operate as follows:

- The VLAN must be configured identically on both MLAG peer switches.
- The port-specific bridging configuration originates on the switch where the port is physically located. This configuration includes the switchport access VLAN, switchport mode (trunk or access), trunk-allowed VLANs, the trunk native VLAN, and the switchport trunk groups.

#### **Example**

This command creates **vlan 49** and enters **VLAN** configuration mode for the new VLAN:

```
switch(config)# vlan 49
switch(config-vlan-49)#
```

### 12.3.4.34 vlan internal order

The **vlan internal order** command specifies the range that the switch can allocate as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order from VLAN **1006** to VLAN **4094**.

The **no vlan internal order** and **default vlan internal order** commands revert the policy to its default.

#### Command Mode

Global Configuration

#### Command Syntax

```
vlan internal order DIRECTION [RANGE_VLAN]
```

```
no vlan internal order
```

```
default vlan internal order
```

#### Parameters

- **DIRECTION** VLAN allocation number direction. Options include:
  - **ascending** allocates internal VLANs from lower VLAN bound to upper VLAN bound.
  - **descending** allocates internal VLAN from upper VLAN bound to lower VLAN bound.
- **RANGE\_VLAN** allocation range. Options include:
  - **no parameter** **1006** (lower bound) to **4094** (upper bound).
  - **range, lower, upper** specifies lower bound (**lower**) and upper bound (**upper**).

#### Examples

- This command configures the switch to allocate internal VLANs from **3000** through **3999**.

```
switch(config)# vlan internal order ascending range 3000 3999
switch(config)#
```

- This command configures the switch to allocate internal VLANs from **4094** through **1006**.

```
switch(config)# vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANs from **4094** down through **4000**.

```
switch(config)# vlan internal order descending range 4000 4094
switch(config)#
```

- This command reverts the allocation policy to its default (ascending, between **1006** and **4094**).

```
switch(config)# no vlan internal order
switch(config)#
```

---

## 12.4 DCBX and Flow Control

This section describes Data Center Bridging Capability Exchange (DCBX) configuration tasks. Topics in this section include:

- [Introduction](#)
- [Overview](#)
- [DCBX Configuration and Verification](#)
- [Configuring Priority-Flow-Control \(PFC\)](#)
- [Configuring PFC Watchdog](#)
- [DCBX and Flow Control Commands](#)

### 12.4.1 Introduction

EOS implements Link Layer Discovery Protocol (LLDP) and the Data Center Bridging Capability Exchange (DCBX) protocol to help automate the configuration of Data Center Bridging (DCB) parameters, including the Priority-Based Flow Control (PFC) standard, which allows an end-to-end flow-control feature.

This feature enables a switch to recognize when it is connected to an iSCSI device and automatically configure the switch link parameters (such as priority flow control) to provide optimal support for that device. DCBX can be used to prioritize the handling of iSCSI traffic to help ensure that packets are not dropped or delayed. DCBX is off by default.

### 12.4.2 Overview

#### 12.4.2.1 Data Center Bridging Capability Exchange (DCBX)

DCBX works with LLDP to allow switches to exchange information about their Data Center Bridging (DCB) capabilities and configuration and automatically negotiate common Priority-Based Flow Control (PFC) parameters.

Data is exchanged in Type-Length-Value (TLV) format. For DCBX to function on an interface LLDP must be enabled on that interface as well.

#### 12.4.2.2 Priority-Based Flow Control (PFC)

Priority-Based Flow Control (PFC) uses a new control packet defined in IEEE 802.1Qbb and is not compatible with 802.3x Flow Control (FC). An interface that is configured for PFC will be disabled for FC. When PFC is disabled on an interface, the FC configuration for the interface becomes active. Any FC frames received on a PFC configured interface are ignored.

Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

When PFC is disabled, the interface defaults to the IEEE 802.3x flow control setting for the interface. PFC is disabled by default.

#### 12.4.2.3 PFC Watchdog

The PFC watchdog identifies the egress queues that are unable to transmit packets for a long time due to receiving continuous PFC pause frames. On identifying such stuck tx-queue PFC watchdog error-disables the respective port with a error-disable reason of stuck-queue. When there is an error reported on a port the traffic is re-routed through a different port to the destination.

The PFC watchdog supports the following PFC watchdog configurations:

- PFC watchdog forced recovery of queues

- PFC watchdog polling interval configuration
- PFC Watchdog non-disruptive priorities configuration
- Displaying stuck queue and recovery counters

## 12.4.3 DCBX Configuration and Verification

### 12.4.3.1 Set the Priority Rank to the Traffic Class

The [dcbx application priority](#) command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

#### Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports **860** and **3260**) should be assigned the given priority of **5**.

```
switch(config)# dcbx application tcp-sctp 860 priority 5
switch(config)# dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned are the given the priority **5**.

```
switch(config)# dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)# no dcbx application tcp-sctp 860 priority 5
switch(config)# no dcbx application tcp-sctp 3260 priority 5
```

### 12.4.3.2 Configuring CEE DCBX Priority Group

The [priority-flow-control priority](#) command configures the Enhanced Transmission Selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

#### Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as **7** and sets traffic class priority to **5**.

```
switch(config)# dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority as **7** and bandwidth value to **70** percent.

```
switch(config)# dcbx ets traffic-class 7 bandwidth 70
```

### 12.4.3.3 DCBX Verification

To display the DCBX status and the interfaces on which DCBX is enabled, use the [show dcbx](#) command.

## Example

This command displays the DCBX status for *Ethernet 50*.

```
switch# show dcbx Ethernet 50
Ethernet50:
 IEEE DCBX is enabled and active
 Last LLDPDU received on Thu Feb 14 12:06:01 2013
 No priority flow control configuration TLV received
 No application priority configuration TLV received switch#
```

## 12.4.4 Configuring Priority-Flow-Control (PFC)

### 12.4.4.1 Enable Priority-Flow-Control (PFC)

The [priority-flow-control](#) command enables Priority-Flow-Control (PFC) on an individual port.

#### Example

The **priority-flow-control** command in DCBX mode enables PFC on an interface.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
```

### 12.4.4.2 Set the Priority Flow Control Priority

The [priority-flow-control priority](#) command in DCBX mode creates a priority group that pauses priority. Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

#### Examples

- The **priority-flow-control priority** command in DCBX mode creates a priority group that pauses priority **5** on *interface ethernet 2*.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# priority-flow-control priority 5 no-drop
```

- To enable lossy behavior, use the drop option of the **priority-flow-control priority** command.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# priority-flow-control priority 5 drop
```

### 12.4.4.3 Disable Priority-Flow-Control (PFC)

To disable Priority Flow Control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, use the [priority-flow-control priority](#) command.

#### Example

To disable PFC, use the **no priority-flow-control** command.

```
switch (config)# interface ethernet 2
switch(config-if-Et2)# no priority-flow-control
```

## 12.4.5 Configuring PFC Watchdog

### 12.4.5.1 Enabling PFC Watchdog

The `priority-flow-control pause watchdog default timeout` command starts monitoring all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled.

**Note:** To enable PFC watchdog, user is required to configure guaranteed bandwidth on the tx-queue to be monitored. Also, PFC must be enabled on the port for the traffic flowing into the queue that is being monitored.

#### Example

These commands enable the PFC watchdog monitoring on **tx-queue 3** of **Ethernet 1/1**, and configures a PFC congestion timeout of **10** seconds which error-disables the port if the queue is stuck.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

### 12.4.5.2 Enabling PFC Watchdog Queue Recovery

The `priority-flow-control pause watchdog default recovery-time forced` command recovers a stuck queue after the PFC storm ceases. PFC watchdog supports the following two recovery methods.

- Auto Recovery – recover queue(s) after the PFC storm ceases.
- Forced Recovery – recover queue(s) after a fixed duration, irrespective of PFC storm being received.

**Note:** The default recovery mode is “auto”.

#### Example

This command recovers a stuck queue after a fixed duration of **10** seconds.

```
switch(config)# priority-flow-control pause watchdog default recovery-time 10 forced
```

### 12.4.5.3 Configuring PFC Watchdog Polling Interval

The `priority-flow-control pause watchdog default polling-interval` command configures the frequency at which queues should be checked for stuck or recovery detection. By default, polling interval is calculated internally or it considers the value configured through the CLI.

**Note:** Configuring a very low polling interval may increase load on the CPU.

#### Example

This command configures a polling interval of **10** seconds on the switch.

```
switch(config)# priority-flow-control pause watchdog default polling-interval 10
```

#### 12.4.5.4 Displaying Stuck Queue and Recovery Counters

The `show priority-flow-control counters watchdog` command displays the value of number of times a queue is identified as stuck and recovered. These counters are maintained only for those queues that have PFC watchdog functionality enabled. These counters are cleared when either PFC or PFC watchdog configuration is disabled. Alternatively, `show interfaces priority-flow-control counters watchdog` command can be used to display the counters.

##### Examples

- This command displays the value of number of times the queue was stuck and recovered for all the interfaces.

```
switch# show priority-flow-control counters watchdog
Port TxQ Total times Total times
 ----- stuck recovered

Et1/1 UC2 2 2
Et1/1 UC3 3 3
Et2/1 UC2 12 12
Et2/1 UC3 31 30
```

- This command displays the value of number of times the queue was stuck and recovered for a specific interface. In this case it is **Et1/1**.

```
switch# show priority-flow-control interfaces Ethernet 1/1 counters watchdog
Port TxQ Total times Total times
 ----- stuck recovered

Et1/1 UC2 2 2
Et1/1 UC3 3 3
```

#### 12.4.5.5 PFC Watchdog Non-disruptive Priorities

The PFC Watchdog acts to drop the traffic entering or leaving the port at the stuck PFC priority. Later when the queue recovers, this action is reversed. While applying these actions, some traffic (for all priorities) is dropped on that port. In such case, the `priority-flow-control pause watchdog hardware non-disruptive priority` command can be used to avoid the traffic drop on ports at stuck queues.

This traffic drop can be avoided by configuring specific PFC priorities as non-disruptive. When queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

##### Examples

- This command configures the specific PFC priorities as non-disruptive, and the priority is set to **3**.

```
switch(config)# priority-flow-control pause watchdog hardware non-disruptive priority 3
```

- This command configures all the ports, having a subset of non-disruptive priorities as a part of their no-drop priorities, start in non-disruptive mode.

```
switch(config)# priority-flow-control pause watchdog hardware port non-disruptive-only
```

#### 12.4.5.6 Displaying PFC Watchdog Information

The `show priority-flow-control` command displays the PFC watchdog status information. Note, if the PFC watchdog default timeout value is non-zero then PFC watchdog is active on the switch.

##### Example

This command displays the PFC watchdog default timeout value, in this show example the timeout value is **3.0** which means the PFC watchdog is active.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port Enabled Priorities Active Note
Et1/1 Yes 34 Yes DCBX disabled
Et1/2 Yes 34 Yes DCBX disabled
Et1/3 Yes 34 Yes DCBX disabled
Et1/4 Yes 34 Yes DCBX disabled
```

The **show interface status errdisabled** command displays the port which is error-disabled due to stuck-queue condition.

### Example

This command displays the interface Ethernet **Eth1/1** status as errdisabled and the reason.

```
switch# show interface Eth1/1 status errdisabled

Port Name Status Reason

Et1/1 Eth1/1 errdisabled stuck-queue
```

The **show priority-flow-control status** command displays the current PFC watchdog details.

### Example

This command displays the PFC watchdog configuration details at global and interface level.

```
switch# show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port Status Priorities Note
Et1/1 E A W 1 7 DCBX disabled
Et1/2 E A - DCBX disabled
Et1/3 D - -
Et1/4 D - -
Et2/1 D - -
..
..
```

## 12.4.6 DCBX and Flow Control Commands

### Configuration Commands

- [dcbx application priority](#)
- [dcbx ets](#)
- [dcbx mode](#)
- [no priority-flow-control](#)
- [platform fm6000 pfc-wm](#)
- [priority-flow-control](#)
- [priority-flow-control pause watchdog action](#)
- [priority-flow-control pause watchdog default](#)
- [priority-flow-control pause watchdog hardware](#)

- 
- [priority-flow-control priority](#)

#### **Show Commands**

- [show dcbx](#)
- [show dcbx application-priority-configuration](#)
- [show dcbx priority-flow-control-configuration](#)
- [show dcbx status](#)
- [show interfaces priority-flow-control](#)
- [show platform fm6000 pfc-wm](#)
- [show priority-flow-control](#)

### 12.4.6.1 dcbx application priority

The **dcbx application priority** command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

The **no dcbx application priority** and **default dcbx application priority** commands remove the specified DCBX traffic class priority assignment by deleting the corresponding **dcbx application priority** command from **running-config**. When the command does not specify a traffic class, all DCBX traffic class priority assignments are removed.

#### Command Mode

Global Configuration

#### Command Syntax

```
dcbx application [APPLICATION_TYPE priority] rank
no dcbx application [APPLICATION_TYPE priority]
default dcbx application [APPLICATION_TYPE priority]
```

#### Parameters

- **APPLICATION\_TYPE** traffic class receiving the priority assignment. Options include:
  - **ether *ethertype\_number*** Ethernet traffic. ***ethertype\_number*** varies from **1536** to **65535**.
  - **iscsi** iSCSI traffic. Maps to TCP/SCTP ports **860** and **3260**.
  - **tcp-sctp *port\_number*** TCP/SCTP traffic. Port number varies from **1** to **65535**.
  - **tcp-sctp-udp *port\_number*** TCP/SCTP/UDP traffic. Port number varies from **1** to **65535**.
  - **udp *port\_number*** UDP traffic. Port number varies from **1** to **65535**.
- **rank** priority assigned to traffic class. Values range from **0** to **7**.

#### Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports **860** and **3260**) should be assigned the given priority of **5**.

```
switch(config)# dcbx application tcp-sctp 860 priority 5
switch(config)# dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned to is given priority **5**.

```
switch(config)# dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)# no dcbx application tcp-sctp 860 priority
switch(config)# no dcbx application tcp-sctp 3260 priority
```

---

### 12.4.6.2 dcbx ets

The **dcbx ets** command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

The **no dcbx ets** and **default dcbx ets** commands remove the specified DCBX traffic classes priority assignment by deleting the corresponding **dcbx ets** command from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
dcbx ets [qos map cos value traffic-class value | traffic-class value bandwidth value]
```

```
no dcbx ets [qos map cos value traffic-class value | traffic-class value bandwidth value]
```

```
default dcbx ets [qos map cos value traffic-class value | traffic-class value bandwidth value]
```

#### Parameters

- **qos** QoS to configure.(The sub options include):
  - **map** QoS map to configure.
  - **cos** CoS value assigned to port. Value ranges from **0** to **7**. Default value is **0**.
  - **traffic-class** Assigns the traffic-class priority to the QoS map. The value ranges from **0** to **7**.
- **traffic-class** Assigns the traffic class priority. The value ranges from **0** to **7**. (The sub options include):
  - **bandwidth** The percentage of bandwidth assigned to the packets received from traffic class. The value ranges from **0** to **100** in percentage. The default value is **0**.

#### Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as **7** and sets the traffic class priority to **5**.

```
switch(config)# dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority value to **7** and sets the bandwidth value to **70** percent.

```
switch(config)# dcbx ets traffic-class 7 bandwidth 70
```

### 12.4.6.3 dcbx mode

The **dcbx mode** command enables DCBX mode on the configuration mode interface. The switch supports **IEEE P802.1Qaz**. When DCBX is enabled, two TLVs are added to outgoing LLDPDUs, which instruct the peer on the interface to configure PFC (priority flow control) and the application priority table in the same way as the switch.

The **no dcbx mode**, **default dcbx mode**, and **dcbx mode none** commands disable DCBX on the configuration mode interface by removing the corresponding **dcbx mode** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
dcbx mode MODE_NAME
```

```
no dcbx mode
```

```
default dcbx mode
```

#### Parameters

**MODE\_NAME** Specifies the DCBX version. Options include:

- **ieee** IEEE version.
- **cee** Converged Enhanced Ethernet version.
- **none** DCBX is disabled.

#### Examples

- These commands enable **interface ethernet 2** to use IEEE DCBX.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# dcbx mode ieee
switch(config-if-Et2)#
```

- These commands disable DCBX on **interface ethernet 2**.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# dcbx mode none
switch(config-if-Et2)
```

---

#### 12.4.6.4 no priority-flow-control

The **no priority-flow-control** and **default priority-flow-control** commands disable the priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, which takes effect when PFC is re-enabled. The commands delete all corresponding **priority-flow-control** commands from **running-config**.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
no priority-flow-control
default priority-flow-control
```

##### Example

These commands disable Priority Flow Control (PFC) on **interface ethernet 3**.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# no priority-flow-control
switch(config-if-Et3)#
```

### 12.4.6.5 priority-flow-control

The **priority-flow-control** command enables Priority Flow Control (PFC) on the configuration mode interface to pause selected traffic classes.

The **no priority-flow-control** and **default priority-flow-control** commands disable PFC on the configuration mode interface by deleting the corresponding **priority-flow-control** command from **running-config**. The **priority-flow-control priority** command also disables PFC on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
priority-flow-control on
no priority-flow-control on
default priority-flow-control on
```

#### Examples

- These commands enable PFC on **interface ethernet 3**.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# priority-flow-control on
switch(config-if-Et3)#
```

- These commands disable PFC on **interface ethernet 3**.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# no priority-flow-control
switch(config-if-Et3)#
```

---

#### 12.4.6.6 platform fm6000 pfc-wm

The **platform fm6000 pfc-wm** command configures the hardware buffer space allocated to the Priority Flow Control (PFC) RX-Private buffer. The command provides options to configure the buffer size and specify when PFC frames are sent to request that a neighbor stop sending traffic. The default values are as follows:

- **RX-Private: 18400** bytes
- **on (watermark): 9280** bytes
- **off (watermark): 1600** bytes

Values that are entered in the command are rounded up to the closest multiple of **160**. The **RX-Private** value must be greater than the **off** value, which must be larger than the **on** value.

The **no platform fm6000 pfc-wm** and **default platform fm6000 pfc-wm** commands restore the default settings by removing the **platform fm6000 pfc-wm** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 pfc-wm [RX-PRIVATE_SIZE][PFC-ON_WM][PFC-OFF_WM]
no platform fm6000 pfc-wm
default platform fm6000 pfc-wm
```

The **platform fm6000 pfc-wm** command must explicitly configure at least one parameter.

#### Parameters

- **RX-PRIVATE\_SIZE** Specifies size of rx-private buffer. Options include:
  - **no parameter** rx-private buffer retains previously configured size.
  - **rx-private 18268 to 102400** Size of rx-private buffer (bytes).
- **PFC-ON\_WM** Buffer capacity that triggers the switch to send PFC frames. Options include:
  - **no parameter** Parameter retains previously configured value.
  - **on 9134 to 102400** Buffer capacity that triggers PFC frames (bytes).
- **PFC-OFF\_WM** Buffer capacity that triggers the switch to stop PFC frame transmissions. Options include:
  - **no parameter** Parameter retains previously configured value.
  - **off 1536 to 102400** Buffer capacity that turns off PFC frames.

#### Related Command

[show platform fm6000 pfc-wm](#) displays the PFC RX-Private buffer memory allocations.

#### Example

This command configures the rx-private hardware buffer.

```
switch(config)# platform fm6000 pfc-wm rx-private 24800 on 16000 off 3200
switch(config)#
```

### 12.4.6.7 priority-flow-control pause watchdog action

The **priority-flow-control pause watchdog** action command either drops the traffic on a stuck queue, or error disables the port which has a stuck queue, or notifies if there is no action on the stuck queue. The following actions are performed based on the queue status.

The **no priority-flow-control pause watchdog** action command removes the specified **priority-flow-control pause watchdog action configuration** by deleting the corresponding **priority-flow-control pause watchdog action** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
priority-flow-control pause watchdog action
no priority-flow-control pause watchdog action
```

#### Parameters

**action** PFC watchdog action for stuck transmit queues. Options include.

- **drop** Drop traffic on the stuck queue.
- **errdisable** Error disable port which has the stuck transmit queue.
- **notify-only** No action on the stuck queue.

#### Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

#### Example

These commands enables the pfc-watchdog monitoring on **tx-queue 3** of **Ethernet 1/1**, and configures a PFC watchdog action drop and drops the traffic if the queue is a stuck queue.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog action drop
```

#### 12.4.6.8 priority-flow-control pause watchdog default

The **priority-flow-control pause watchdog default** command monitors all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled. Guaranteed bandwidth is needed to ensure starvation due to higher priority traffic is not wrongly flagged as a stuck-queue due to congestion. The stuck duration after which the port needs to be error disabled is also configurable.

The **no priority-flow-control pause watchdog default** command removes the specified priority-flow-control pause watchdog configuration by deleting the corresponding **priority-flow-control pause watchdog** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
priority-flow-control pause watchdog default
no priority-flow-control pause watchdog default
```

##### Parameters

**default** Specifies the default value. Options include.

- **polling-interval** Configures the interval at which the watchdog should poll the queues. The polling interval value ranges from **0.005** to **30** seconds.
- **recovery-time** Configures recovery-time after which stuck queue should recover and start forwarding. The recovery-time value ranges from **0.01** to **60** seconds.
  - **forced** Force recover any stuck queue(s) after the recovery-time interval, irrespective of whether PFC frames are being received or not.
- **timeout** Configures timeout after which port should be errdisabled or should start dropping on congested priorities. The timeout value ranges from **0.01** to **60** seconds.

##### Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

- Polling Interval Discrepancy

For user configured polling-interval to be valid, it must satisfy the following conditions

When the recovery-mode is auto and timeout, recovery-time, and polling-interval are non-default,  $\text{polling-interval} \leq \min(\text{timeout}, \text{recovery-time}) / 2$ ,

When recovery-mode is forced or recovery-time is not configured,  $\text{polling-interval} \leq (\text{timeout} / 2)$

For better functioning of PFC Watchdog, when user configured polling interval is too large compared to either timeout or recovery time values, Watchdog will use auto calculated value instead of user configured value until the discrepancy is resolved. Also, CLI warning and syslog messages are generated to inform user of the discrepancy.

- CLI Warnings

When there is discrepancy between timeout and polling-interval, the format of the message is as shown below:

```
! User configured polling interval <user-cfgd polling-interval> second(s) is
greater than half of timeout <user-cfgd timeout> second(s). Setting
polling-interval to <to-be-used polling-interval> second(s)
```

When there is discrepancy between recovery-time and polling-interval, the format of the message is as shown below

```
! User configured polling interval <user-cfgd polling-interval> second(s) is
greater than half of recovery-time <user-cfgd recovery-time> second(s). Setting
polling-interval to <to-be-used polling-interval> second(s)
```

### Examples

- These commands enable the pfc-watchdog monitoring on tx-queue **3** of **interface ethernet1/1**, and configures a PFC congestion timeout of **10** seconds which error-disables the port if the queue is stuck.

```
switch# config
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

- These commands enable the pfc-watchdog monitoring on tx-queue **3** of **interface ethernet1/1**, and configures a PFC forced recovery-time interval of **30** seconds after which the stuck queue(s) are recovered, irrespective of whether PFC frames are being received or not.

```
switch# config
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default recovery-time 30 forced
```

- These commands enable the pfc-watchdog monitoring on tx-queue **3** of **Ethernet 1/1**, and configures a PFC polling-interval of **20** seconds after which queue is polled.

```
switch# config
switch(config)# interface Ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default polling-interval 20
```

---

### 12.4.6.9 priority-flow-control pause watchdog hardware

The **priority-flow-control pause watchdog hardware** command configures specific PFC priorities as non-disruptive. This will avoid traffic drop on queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

The **no priority-flow-control pause watchdog hardware** command removes the specified **priority-flow-control pause watchdog non-disruptive** configuration by deleting the corresponding **priority-flow-control pause watchdog hardware** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
priority-flow-control pause watchdog hardware
no priority-flow-control pause watchdog hardware
```

#### Parameters

**hardware** Configure PFC priority through hardware. Options include:

- **non-disruptive** PFC watchdog non-disruptive configuration. The priority value ranges from **0** to **7**.

#### Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

#### Example

These commands enable the pfc-watchdog monitoring on tx-queue **3** of **interface ethernet 1/1**, and configures PFC priorities as non-disruptive on PFC priorities **3** and **4**.

```
switch# config
switch(config)# interface ethernet1/1
switch(config-if-Et1/1)# priority-flow-control on
switch(config-if-Et1/1)# priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog hardware non-disruptive priority 3 4
```

### 12.4.6.10 priority-flow-control priority

The **priority-flow-control priority** command configures the packet resolution setting on the configuration mode interface. This setting determines if packets are dropped when priority flow control (PFC) is enabled on the interface. Packets are dropped by default.

The **no priority-flow-control priority** and **default priority-flow-control priority** commands restore the default packet drop setting on the configuration mode interface by deleting the corresponding **priority-flow-control priority** command from **running-config**. The **priority-flow-control priority** command also restores the default setting on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
priority-flow-control priority pack-drop
no priority-flow-control priority
default priority-flow-control priority
```

#### Parameters

**pack-drop** denotes the interfaces. Options include:

- **drop** Packets are dropped. Default setting.
- **no drop** Packets are not dropped.

#### Examples

- These commands in DCBX mode create a priority group that pauses dot1p priority **5** on **interface ethernet 2**.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# priority-flow-control priority 5 no-drop
```

- These commands enable lossy behavior.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# priority-flow-control priority 5 drop
```

- These commands remove the priority group that pauses dot1p priority **5** on **interface ethernet 2**.

```
switch(config)# interface ethernet 2
switch(config-if-Et2)# priority-flow-control on
switch(config-if-Et2)# no priority-flow-control priority
```

---

### 12.4.6.11 show dcbx

The **show dcbx** command list DCBX status and the interfaces on which DCBX is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE]
```

#### Parameters

**INTERFACE** Interface type and number. Options include:

- **no parameter** all configured DCBX interfaces.
- **ethernet e-num** Ethernet interface specified by **e-num**.

#### Examples

- This command displays the DCBX status for **ethernet 50**.

```
switch# show dcbx ethernet 50
Ethernet50:
 IEEE DCBX is enabled and active
 Last LLDPDU received on Thu Feb 14 12:06:01 2013
 No priority flow control configuration TLV received
 No application priority configuration TLV received switch#
```

- This command displays the DCBX status for **ethernet 50** when Priority Flow Control (PFC) is not enabled.

```
switch# show dcbx ethernet 50
Ethernet50:
 IEEE DCBX is enabled and active
 Last LLDPDU received on Thu Feb 14 12:08:29 2013
 - PFC configuration: willing
 not capable of bypassing MACsec
 supports PFC on up to 4 traffic classes
 PFC enabled on priorities: 5 7
 WARNING: peer PFC configuration does not match the local PFC configuration
 - Application priority configuration:
 2 application priorities configured:
 tcp-sctp 860 priority 5
 tcp-sctp 3260 priority 5 switch#
```

### 12.4.6.12 show dcbx application-priority-configuration

The **show dcbx application-priority-configuration** command displays the DCBX peer application priority configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE] application-priority-configuration
```

#### Parameters

**INTERFACE** Interface type and number. Options include:

- **no parameter** All configured DCBX interfaces.
- **ethernet e-num** Ethernet interface specified by **e-num**.

#### Guidelines

This command and the [show priority-flow-control](#) command function identically.

#### Example

This command displays the DCBX peer application priority configuration for all DCBX-enabled interfaces.

```
switch# show dcbx application-priority-configuration
Ethernet1:
 Last LLDPDU received on Thu Feb 14 10:52:20 2013
 No application priority configuration TLV received
Ethernet2:
 Last LLDPDU received on Thu Feb 14 10:52:20 2013
 No application priority configuration TLV received
...
Ethernet50:
 Last LLDPDU received on Thu Feb 14 12:08:29 2013
 - Application priority configuration:
 2 application priorities configured:
 tcp-sctp 860 priority 5
 tcp-sctp 3260 priority 5 switch#
```

---

### 12.4.6.13 show dcbx priority-flow-control-configuration

The **show dcbx priority-flow-control-configuration** command displays the IEEE DCBX peer priority flow control configurations.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE] priority-flow-control-configuration
```

#### Parameters

**INTERFACE** Interface type and number. Options include:

- **no parameter** all configured DCBX interfaces.
- **ethernet e-num** Ethernet interface specified by **e-num**.

#### Example

This command displays the DCBX peer priority flow control configuration for the DCBX-enabled interfaces on the device.

```
switch# show dcbx priority-flow-control-configuration
Ethernet1:
 Last LLDPDU received on Thu Feb 14 10:52:20 2013
 No priority flow control configuration TLV received
Ethernet2:
 Last LLDPDU received on Thu Feb 14 10:52:20 2013
 No priority flow control configuration TLV received
...
Ethernet50:
 Last LLDPDU received on Thu Feb 14 12:11:29 2013
 - PFC configuration: willing
 not capable of bypassing MACsec
 supports PFC on up to 4 traffic classes
 PFC enabled on priorities: 5 7
 WARNING: peer PFC configuration does not match the local PFC configuration
switch#
```

#### 12.4.6.14 show dcbx status

The **show dcbx status** command displays the DCBX status on the interfaces on which DCBX is enabled.

##### Command Mode

EXEC

##### Command Syntax

```
show dcbx [INTERFACE] status
```

##### Parameters

**INTERFACE** Interface type and number. Options include:

- **no parameter** all configured DCBX interfaces.
- **ethernet e-num** Ethernet interface specified by **e-num**.

##### Example

This command displays the DCBX status for the DCBX-enabled interfaces.

```
switch# show dcbx status
Ethernet1:
 Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet2:
 Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet50:
 IEEE DCBX is enabled and active
 Last LLDPDU received on Thu Feb 14 12:11:54 2013 switch#
```

#### 12.4.6.15 show interfaces priority-flow-control

The **show interfaces priority-flow-control** command displays the status of PFC on all interfaces.

##### Command Mode

EXEC

##### Command Syntax

```
show interfaces [INTERFACE] priority-flow-control [INFO_LEVEL]
```

##### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - **no parameter** Display information for all interfaces.
  - **ethernet e\_range** Ethernet interface range specified by **e\_range**.
  - **loopback l\_range** Loopback interface specified by **l\_range**.
  - **management m\_range** Management interface range specified by **m\_range**.
  - **port-channel p\_range** Port-Channel Interface range specified by **p\_range**.
  - **vlan v\_range** VLAN interface range specified by **v\_range**.
  - **VXLAN vx\_range** VXLAN interface range specified by **vx\_range**.Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO\_LEVEL** specifies the type of information displayed. Options include:
  - **no parameter** Displays information about all DCBX neighbor interfaces.
  - **status** Displays the DCBX status.
  - **counters** Displays the DCBX counters.

##### Guidelines

This command and the [show priority-flow-control](#) command function identically.

##### Example

This command displays the PFC for all interfaces.

```
switch# show interfaces priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7

Port Enabled Priorities Active Note
Et1 No No
Et2 No No
...
Et50 Yes 5 Yes
...
Port RxPfc TxPfc
Et1 0 0
Et2 0 0
...
Et50 0 0
...
switch#
```

#### 12.4.6.16 show platform fm6000 pfc-wm

The **show platform fm6000 pfc-wm** command displays the buffer space allocated to the RX-Private buffer and buffer levels that trigger PFC frame transmission activities.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
show platform fm6000 pfc-wm
```

##### Related Command

[priority-flow-control priority](#) specifies the PFC RX-Private buffer memory allocation.

##### Example

This command displays the rx-private hardware buffer memory allocation.

```
switch# show platform fm6000 pfc-wm
Pfc_Rx_Private_WM: 24800 Bytes
Pfc_On_WM: 16000 Bytes
Pfc_Off_WM: 3200 Bytes switch#
```

### 12.4.6.17 show priority-flow-control

The **show priority-flow-control** command displays the status and other PFC and PFC watchdog information on all interfaces if no specific interface is specified.

#### Command Mode

EXEC

#### Command Syntax

```
show priority-flow-control [status | counters | interfaces]
```

#### Parameters

- ***interfaces*** specifies the interface for which the information is displayed. Options include:
  - **Ethernet** Hardware Ethernet interface.
  - **Loopback** Loopback interface.
  - **Management** Management interface.
  - **Port-Channel** Lag interface.
  - **Recirc-Channel** Recirculation interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** VLAN interface.
  - **VXLAN** VXLAN Tunnel Interface.
- ***status*** displays the interface PFC status.
- ***counters*** displays the interface PFC counters. Options include:
  - ***detail*** displays the DCBX counters for each priority class. This option is available only on Trident switches.
  - ***watchdog*** displays the PFC watchdog counters.

#### Examples

- This command displays the PFC status on all interfaces.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
Port Enabled Priorities Active Note
Et1 No No
Et2 No No
...
Et50 Yes 5 Yes
...
Port RxPfc TxPfc
Et1 0 0
Et2 0 0
...
Et50 0 0
...
```

- This command displays the PFC watchdog status. If PFC watchdog default timeout is non-zero (in this case it is 3.0) then PFC watchdog is actively running on the switch.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port Enabled Priorities Active Note
Et1/1 Yes 34 Yes DCBX disabled
Et1/2 Yes 34 Yes DCBX disabled
Et1/3 Yes 34 Yes DCBX disabled
Et1/4 Yes 34 Yes DCBX disabled
...
```

- This command displays the current value of these counters for all the interfaces being monitored by PFC watchdog. Alternatively, `show interfaces priority-flow-control counters watchdog` command can be used for the same.

```
switch# show priority-flow-control counters watchdog
Port TxQ Total times Total times
 stuck recovered

Et1/1 UC2 2 2
Et1/1 UC3 3 3
Et2/1 UC2 12 12
Et2/1 UC3 31 30
```

- This command displays the current value of these counters for a specific subset of interfaces. Alternatively, `show interfaces priority-flow-control counters watchdog` command can be used for the same.

```
switch# show priority-flow-control interfaces ethernet 1/1 counters watchdog
Port TxQ Total times Total times
 stuck recovered

Et1/1 UC2 2 2
Et1/1 UC3 3 3
```

- This command displays the configuration details of PFC watchdog at global and interface level.

```
switch# show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port Status Priorities Note
Et1/1 E A W 1 7 DCBX disabled
Et1/2 E A - DCBX disabled
Et1/3 D - -
Et1/4 D - -
Et2/1 D - -
..
```

## 12.5 IP Address Locking

EOS provides IP Address Locking capabilities when configured on an Ethernet Layer 2 port.

After enabling IP Address Locking on a Layer 2 (L2) port, the port only permits IP and ARP packets with authorized IP source addresses. Configure IP Address Locking in one of two modes:

- IPv4
- IPv6

IP Address Locking prevents a host on a different interface from claiming ownership of an IP address through ARP spoofing. IPv6 Locking extends this behavior to IPv6 packets, including ICMPv6 Neighbor Discovery Router Advertisement and Redirect and DHCP server-to-client packets.

On an IPv4 Locked Port, the ARP protocol performs the following actions on the network:

- Probing with the IPv4 address **0.0.0.0** as the Sender Protocol Address (SPA).
- Permit Duplicate Address Detection (DAD).
- Drop incoming DHCP server response packets to avoid any rogue devices acting as DHCP servers.
- Permit incoming DHCP client request packets on devices to complete the DHCP handshake and obtain a DHCP lease.

On an IPv6 Locked Port, the ARP protocol performs the following actions on the network:

- Drop incoming DHCPv6 server response packets.
- Permit incoming DHCPv6 client request packets.
- On an incoming ICMPv6 network device, perform the following actions:
  - Drop Router Advertisement packets since only routers should send these packets.
  - Permit Router Solicitation packets.
  - Drop redirect packets as only routers should send these packets.

**Figure 12-3: IP Address Locking**

IP Address Locking relies on DHCP LeaseQuery and MAC address learning to determine if an IP address is authorized on a particular port. Ensure that DHCP servers used in the network allow **LeaseQuery** messages.

This chapter describes IP Address Locking configuration tasks and associated commands.

- [IP Address Locking Configuration](#)
- [IP Address Locking Commands](#)

## 12.5.1 IP Address Locking Configuration

This section describes IP Locking configuration tasks. Topics in this section include:

- [Preparing a Switch for IP Address Locking](#)
- [Enabling IP Address Locking](#)
- [Disabling IP Address Locking](#)
- [Enabling IP Address Locking on Ports](#)
- [Enabling IP Address Locking on All Ports of a VLAN](#)
- [Blocking IPv4 and ARP Packets](#)
- [Configuring IP Locking Static Leases](#)
- [Configuring IP Address Locking Lease Query Timeout](#)
- [Configuring Locked Address Expiration](#)
- [Enforcing Locked IP Addresses](#)
- [Displaying IP Address Locking Counters](#)
- [Displaying IP Address Locking](#)

### 12.5.1.1 Preparing a Switch for IP Address Locking

Before enabling IPv4 Address Locking, you must configure a DHCP Server and a Local Layer 3 interface.

#### Enabling a DHCP Server for IPv4 Address Locking

Add the DHCP servers used by hosts to acquire leases. IPv4 Address Locking communicates with the DHCP servers to learn the authorized IP addresses on the switch.

##### Example

The following commands enable DHCP servers with an IPv4 address of *10.1.1.1*, and another DHCP server with the IP address, *10.30.1.3*:

```
switch(config-address-locking)# dhcp server ipv4 10.1.1.1
switch(config-address-locking)# dhcp server ipv4 10.30.1.3
```

#### Adding a Local Layer 3 Interface

Add a local L3 interface to communicate with the DHCP server. This could be the management interface, a routed interface, or a Switch Virtual Interface (SVI). This interface requires an assigned valid IP address, routable to the configured DHCP server, and can reside in a non-default VRF. The switch packets sent to the DHCP Server use the interface IP address as the source IP address.

##### Example

The following commands configure an interface with a valid IP address, *10.10.1.2/16*, on VLAN2160:

```
switch# configure
switch(config)# interface Vlan2160
switch(config-if-Vl2160)# ip address 10.10.1.2/16
```

---

The following commands add the interface to the IP Address Locking configuration:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# local-interface Vlan2160
```

### 12.5.1.2 Enabling IP Address Locking

Configure IP Address Locking for either IPv4 or IPv6 addresses, and both types of IP addresses can be enabled for IP Address Locking. IPv6 Address Locking requires a different approach outlined in this section.

#### Enabling IP Address Locking

Configure IPv4 Address Locking commands in the configuration mode.

##### Example

Use the following commands to enter IP Address Locking configuration mode and add IPv4 Address Locking:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv4
```

### Enabling IPv6 Address Locking

To enable IPv6 locking, disable the enforcement of IPv6 Address Locking.

##### Example

Use the following commands to disable IPv6 Address Locking enforcement, and then enable IPv6 for IP Address Locking:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv6 enforcement disabled
switch(config-address-locking)# locked-address ipv6
```

### 12.5.1.3 Disabling IP Address Locking

Disable IP Address Locking using the `disabled` command in address-locking mode. This turns off the feature and allows a host to use any IP address, authorized or unauthorized, on any port.

##### Example

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# disabled
```

#### 12.5.1.4 Enabling IP Address Locking on Ports

To enable IPv4 Address Locking on ports connected to clients, IP Address Locking must be enabled in the interface configuration mode. Running this command only enables IPv4 Locking and overrides the previous configuration for the interface.

##### Example

Use the following commands to enable IP Address Locking for the interface, **Ethernet27/1**:

```
switch(config)# interface Ethernet27/1
switch(config-if-Et27/1)# address locking
switch(config-if-Et27/1-address-locking)# address-family ipv4
```

Use the following commands to enable IPv6 Address Locking on ports connected to clients, use the **address-family ipv6** parameter.

##### Example

To activate IPv6 Address Locking on interface **Ethernet53** and port **4**, use the following syntax:

```
switch(config)# interface Ethernet53/4
switch(config-if-Et53/4)# address locking
switch(config-if-Et53/4-address-locking)# address-family ipv6
```

#### 12.5.1.5 Enabling IP Address Locking on All Ports of a VLAN

To activate IP Address Locking on all VLAN port members, use the VLAN address locking configuration submenu.

##### Examples

The following commands activate IPv4 Address Locking on VLAN 20:

```
switch(config)# vlan 20
switch(config-vlan-20)# address locking
switch(config-vlan-20-addr-lock)# address-family ipv4
```

To exclude a VLAN port member, disable IP Address Locking on that port using the interface configuration submenu.

The following commands exclude port **25** on **Ethernet2**:

```
switch(config)# interface Ethernet2/25
switch(config-if-Et2/25)# address locking
switch(config-if-Et2/25)# address-family ipv4 disabled
```

To configure IPv6 Address Locking on all ports, use the same commands, but designate the **address-family** as **ipv6**.

The following commands enable IPv6 Address Locking and override the previous configuration for the interface.

```
switch(config)# interface Ethernet 27/1
switch(config-if-Et27/1)# address locking
switch(config-if-Et27/1-address-locking)# address-family ipv6
```

To enable IPv6 Address Locking on all members of a port for VLAN 20, use the IPv6 Locking commands in the VLAN address locking configuration sub-mode.

```
switch(config)# vlan 20
switch(config-vlan-20)# address locking
switch(config-vlan-20-addr-lock)# address-family ipv6
```

Use the following command to enable both IPv4 and IPv6 Address Locking on a port:

```
switch(config)# interface Ethernet 27/1
switch(config-if-Et27/1)# address locking
switch(config-if-Et27/1-address-locking)# address-family ipv4
switch(config-if-Et27/1-address-locking)# address-family ipv6
```

#### 12.5.1.6 Blocking IPv4 and ARP Packets

Use the [deny ip\\_address](#) on IPv4 Address Locking ports to block all IPv4 and ARP packets with a specific source IPv4 address. The port denies the packet and affects only IPv4 enforcement modes. This action deauthorizes the addresses on the port and can be configured with multiple IPv4 addresses. You must configure this on an interface already configured with IPv4 Address Locking.

**Note:** Use only IPv4 addresses with this configuration.

##### Example

```
switch(config)# interface Ethernet27/1
switch(config-if-Et27/1)# address locking
switch(config-if-Et27/1-addr-lock)# deny 172.21.16.25
```

#### 12.5.1.7 Configuring IP Locking Static Leases

The [lease mac](#) command within address locking configuration mode installs a lease into hardware for the configured IP address on the interface with the configured associated MAC address. If the MAC address does not appear in the MAC table or the MAC address on an interface without a configured IP Locking feature, the lease does not install until the interface adds the MAC address to an interface configured with IP Locking.

**Note:** IP Locking removes from the switch any lease from the DHCP server that matches either the same IP or MAC as a statically configured lease.

##### Example

Use the following commands to configure an IP address, *172.21.13.11*, and MAC Address, *a0:ce:c8:b1:78:d3*, with a static lease:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# lease 172.21.13.11 mac a0:ce:c8:b1:78:d3
```

#### 12.5.1.7.1 Clearing Leases

The `clear address locking lease` command removes the lease from hardware. The command removes lease bindings at different granularities.

- The `clear address locking lease ipv4 V4ADDR` command removes a single lease associated with an IPv4 address.
- The `clear address locking lease ipv6 V6ADDR` command removes a single lease associated with an IPv6 address.
- The `clear address locking lease intf ethernet slot` command removes all leases associated with the specified interface.
- The `clear address locking lease all` removes all leases on the switch.

#### 12.5.1.8 Configuring IP Address Locking Lease Query Timeout

The command, `lease query retry interval interval timeout minutes` configures sending lease queries at specific retry intervals. The `no lease query retry` command removes the retry interval and timeout configuration.

##### Example

Use the following commands to configure an interval, 5, and timeout of 100 minutes :

```
switch(config)# address locking
switch(config-address-locking)# lease query retry interval 5 timeout 100
```

IP Address Locking sends out DHCP LeaseQuery requests to all configured DHCP servers in the following cases:

- When an IP Address Locking enabled port learns a MAC address, IP Address Locking sends out a LeaseQuery request for the learned MAC address. After learning the MAC address, IP Address Locking waits one (1) second for the DHCP.
- When an IP Address Locking enabled port removes a MAC address after enabling the locked-address expiration mac disabled feature, IP Address Locking sends a LeaseQuery request for the removed MAC address.
- When the IP Address Locking agent restarts, EOS sends LeaseQuery requests for all MAC addresses on all IP Address Locking interfaces and for all MAC addresses in the IP Address Locking table.
- When you add a new DHCP configuration, EOS sends new LeaseQuery requests to the new DHCP for all MAC addresses learned on all IP Address Locking interfaces and for all MAC addresses in the IP Address Locking leases table.

- When you configure an interface with IP Address Locking, IP Address Locking sends LeaseQuery requests for all MAC addresses learned on that interface.
- When an IP or ARP packet with a source IP address that does not exist in the IP Address Locking table arrives at an interface, EOS sends LeaseQuery requests for all MAC addresses on that interface. If the host already has a valid DHCP lease and the DHCP server sends a LeaseActive reply, IP Address Locking sends at least one (1) request every 50 seconds for that host as a result of dropped ARP or IP packets.
- When the DHCP Lease reaches the last known expiration time, IP Address Locking sends out a LeaseQuery request for the MAC address associated with the lease. Note that this may be different from the actual expiration time. For example, if the host renewed the lease before the actual lease expires and received no LeaseQuery requests sent for the MAC address, IP Address Locking sends out a query at the original expiration time.
- After a LeaseActive reply receives a matching MAC address of a previously received lease, IP Address Locking sends out a LeaseQuery request for the previous IP address associated with the updated MAC address.
- After a LeaseActive reply receives a matching MAC address of a previously received lease, IP Address Locking sends out a LeaseQuery request for the previous MAC address associated with the updated IP address.

When IP Address Locking sends out a LeaseQuery request, and does not receive a LeaseActive reply, IP Address Locking sends six (6) additional retries over 64 seconds using an exponential backoff algorithm. A 0-25% delay sending requests which may take up to 80 seconds to send out all seven (7) requests.

Every LeaseQuery request includes a transaction ID. After sending the last request, and for an additional 10 seconds, IP Address Locking accepts any LeaseActive reply matching the transaction ID and then queries for the MAC address of a sent LeaseQuery request.

If a LeaseActive reply contains multiple IP addresses, IP Address Locking begins a query process for the additional IP addresses using the same retry mechanisms. However, if you configure the LeaseQuery retry interval and timeout but do not receive LeaseActive replies, IP Address Locking sends continuous lease query requests at the configured retry interval until reaching the specified timeout period.

#### 12.5.1.9 Configuring Locked Address Expiration

The IP addresses remain authorized and installed after the corresponding MAC addresses age out. IP Address Locking, by default, removes authorized leases after the corresponding MAC addresses age out. The `locked-address expiration mac disabled` command configures IP Address Locking to keep leases installed, after the corresponding MAC addresses age out.

##### Example

The following commands keep leases installed on the IP address:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address expiration mac disabled
```

#### 12.5.1.10 Enforcing Locked IP Addresses

The `locked-address ipv4 enforcement disabled` command disables address filtering for all ports with IPv4 Address Locking enabled. This permits IPv4 packets while still keeping all other drop rules. When configured, IP Address Locking does not drop IP or ARP packets, and does not send out lease queries to configured DHCP servers.

## Examples

The following commands disable IPv4 Address Locking globally:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv4 enforcement disabled
```

The following commands configure locked address enforcement for an interface:

```
switch(config)# interface Ethernet27/1
switch(config-if-Et27/1)# address locking
switch(config-if-Et27/1-address-locking)# locked-address ipv4 enforcement disabled
```

The following commands configure locked address enforcement for a VLAN:

```
switch(config)# vlan 20
switch(config-vlan-20)# address locking
switch(config-vlan-20-addr-lock)# locked-address ipv4 enforcement disabled
```

The `locked-address ipv6 enforcement disabled` command disables address filtering for all ports with IPv6 Locking enabled. This permits IPv6 packets while still keeping all other drop rules.

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv6 enforcement disabled
```

To configure locked address enforcement for an interface, use the following commands:

```
switch(config)# interface Ethernet27/1
switch(config-if-Et27/1)# address locking
switch(config-if-Et27/1-address-locking)# locked-address ipv6 enforcement disabled
```

To configure locked address enforcement for VLAN 20, use the following commands:

```
switch(config)# vlan 20
switch(config-vlan-20)# address locking
switch(config-vlan-20-addr-lock)# locked-address ipv6 enforcement disabled
```

### 12.5.1.11 Displaying IP Address Locking Counters

The `show address locking counters` command displays DHCP lease query messages sent, received, and dropped. The output provides two sets of counters:

- The number of packets sent and received from each DHCP server.
- The number of packets sent and received for each locked interface.

The output displays separate counters for the different types of messages communicated between the switch and the DHCP server.

#### Example

```
switch# show address locking counters
Lease Active Lease Unknown Lease Unassigned
DHCP Server Query Rcvd Drop Rcvd Drop Rcvd Drop Unknown

```

```
80.80.80.80 32860 8002 34 8001 32 13423 134 3234
```

| Interface | Query | Lease | Active | Lease | Unknown | Lease | Unassigned |
|-----------|-------|-------|--------|-------|---------|-------|------------|
| -----     |       |       |        |       |         |       |            |
| Ethernet2 | 1747  | 1234  |        | 189   |         | 324   |            |

The `clear address locking counters` command resets all the counters associated with IP Locking to zero.

### 12.5.1.12 Displaying IP Address Locking

Use the `show address locking` command to display the status of IPv4 and IPv6 locking.

#### Example

```
switch# show address locking
IP Locking is active
Interface IPv4 IPv6

Ethernet27/1 yes no (not configured)
Ethernet31/1 no (not configured) no (not a layer 2 interface)
```

The `show address locking` command also displays interfaces with the reason IP Address Locking may not be enabled. For an interface without IP Address Locking enabled, the following priority (highest at top) imposes on the output:

- Unconfigured.
- Not a Layer 2 interface.
- No local interface configured.
- No DHCP server configured.

The `show address locking table ipv4` command displays all the DHCP leases that IP Address Locking knows about, current status of installed leases, and the authorized interfaces for these IP addresses.

#### Example

```
switch# show address locking table ipv4
IP Address MAC Address Interface Installed Expiration Time

10.30.4.4 ba76.a467.7ff8 Et27/1 installed in 0:01:57
```

## 12.5.2 IP Address Locking Commands

### IP Address Locking Configuration Commands

- [address locking deny](#)
- [address locking dhcp](#)
- [address-locking disable](#)
- [address locking lease query](#)
- [address locking local-interface](#)

### IP Address Locking Clear Commands

- [clear address locking lease](#)

### IPv4 Static Lease Commands

- [address locking lease](#)

### IP Address Locking Address Expiration Commands

- [locked-address expiration mac disabled](#)

### IP Address Locking Address Enforcement Commands

- [locked-address ipv4 enforcement disabled](#)
- [locked-address ipv6 enforcement disabled](#)

### IP Address Locking Show Commands

- [show address locking](#)
- [show address locking counters](#)
- [show address locking table ipv4](#)

---

### 12.5.2.1 address locking deny

Use the **address locking** command to block IPv4 and ARP packets with specific IPv4 addresses on the switch. You must perform this command from an interface configured for IP Address Locking on the switch.

#### Command Mode

Interface Configuration

Address Locking Configuration

#### Command Syntax

`address locking deny ip_address`

#### Parameter

***ip\_address*** - Specify the IPv4 address to block packets.

#### Example

Use the following command to deny IPv4 and ARP packets from IPv4 address, *172.16.21.131*, from Ethernet interface, *Ethernet53/4*:

```
switch(config)# interface Ethernet53/4
switch(config-if-Et53/4)# address locking
switch(config-address-locking)# deny 172.16.21.131
```

### 12.5.2.2 address locking dhcp

Use the **address locking** command to enter address locking mode and then **dhcp** to configure the DHCP server.

#### Command Mode

Address Locking Configuration

#### Command Syntax

```
address locking dhcp server ipv4 ip_address
```

#### Parameters

- **dhcp server** - configure a DHCP server to assign IP addresses and assign static addresses using a MAC address.
  - **ipv4 *ip\_address*** - Specify the IP address for the DHCP server.
  - **mac *mac\_address*** - Specify the MAC address of the DHCP server.

#### Example

To configure a DHCP server with an IPv4 address. 172.13.21.3, use the following command:

```
switch(config)# address locking
switch(config-address-locking)# dhcp server ipv4 172.13.21.3
```

### 12.5.2.3 address-locking disable

The **address-locking disable** command disables IP Address Locking on a switch.

#### Command Mode

Address Locking Configuration

#### Command Syntax

```
address-locking disable
```

#### Example

Use the **address-locking** command to enter address locking mode and then **disable** to disable the configuration.

```
switch(config)# address-locking
switch(config-address-locking)# disable
```

---

#### 12.5.2.4 address locking lease

Use the **address locking** command to enter the IPv4 and IPv6 locking mode and then on the switch, use the **lease** to configure DHCP leases.

The **lease mac** command within the address locking configuration mode installs a lease onto hardware for the configured IP address on the interface with the associated configured MAC address. If the MAC address does not exist in the MAC table or the MAC address appears on an interface with an IP Locking configuration feature, the lease does not install until you add the MAC address to an interface configured with IP Locking.

##### Command Mode

Address Locking Configuration

##### Command Syntax

```
lease ip_address mac ip_address
```

##### Parameters

- **lease**
  - **V4ADDR** - Specify the IPv4 address to assign the lease.
  - **mac MACADDR** - Configure the MAC address for a static lease.
- **no lease V4ADDR mac MACADDR** - Removes the retry and timeout configuration.
- **default lease V4ADDR mac MACADDR** - Configures the lease with the default IPv4 address and MAC address.

##### Example

To configure a lease with the IPv4 address, *1.1.1.1*, and the MAC address, *a.b.c*, use the following command:

```
switch(config)# address locking
switch(config-address-locking)# lease 1.1.1.1 mac a.b.c
```

### 12.5.2.5 address locking lease query

Use the **address locking** command to enter the IPv4 and IPv6 locking mode and then use the **lease query retry interval** to configure DHCP leases.

The **no lease query retry** command removes the retry interval and timeout configuration.

#### Command Mode

Address Locking Configuration

#### Command Syntax

`lease query retry interval interval-time`

#### Parameters

**interval *interval-time*** - Configure the query retry interval and timeout. The interval can be from 1 - 4294967295 seconds.

#### Example

To configure a lease with the retry interval, 5 seconds, and a timeout, 100, use the following command:

```
switch(config)# address locking
switch(config-address-locking)# lease query retry interval 5 timeout
100
```

---

### 12.5.2.6 address locking local-interface

Use the **address locking local-interface** command to configure a local interface for IPv4 and IPv6 locking IP addresses on the switch.

#### Command Mode

Address Locking Configuration

#### Command Syntax

**address locking local-interface** [Ethernet | Loopback | Management | Port Channel | Tunnel | Vlan]

#### Parameters

- **local-interface**
  - **Ethernet slot\_number** - Configure an Ethernet subinterface for IPv4 and IPv6 locking IP addresses on the switch.
  - **Loopback loopback\_interface\_number** - Configure a Loopback interface for IPv4 and IPv6 locking IP addresses on the switch.
  - **Management management\_interface slot\_number** - for IPv4 and IPv6 locking IP addresses on the switch.
  - **Port-Channel lag\_group port\_channel\_subinterface** - Configure a Port-Channel interface for IPv4 and IPv6 locking IP addresses on the switch.
  - **Tunnel tunnel\_interface** - Configure a Tunnel interface for IPv4 and IPv6 locking IP addresses on the switch.
  - **Vlan vlan\_interface\_number** - Configure a VLAN interface for IPv4 and IPv6 locking IP addresses on the switch.

#### Example

To configure an Ethernet interface, Ethernet53/4, use the following command:

```
switch(config)# address locking
switch(config-address-locking)# local-interface Ethernet53/4
```

### 12.5.2.7 clear address locking lease

Use the **clear address locking lease** command to remove lease bindings at different granularities.

- The **clear address locking lease ipv4 V4ADDR** command removes a single lease associated with an IPv4 address.
- The **clear address locking lease ipv6 V6ADDR** command removes a single lease associated with an IPv6 address.
- The **clear address locking lease intf ethernet slot** command removes all leases associated with the specified interface.
- The **clear address locking lease all** command remove all leases on the switch.

#### Command Mode

Address Locking mode

#### Command Syntax

**clear address locking lease** [ all | interface [ ethernet slot ] | ipv4 V4ADDR | ipv6 V6ADDR ]

#### Parameters

- **all** - View the entire lease table.
- **interface** - interface to clear the lease.
  - **ethernet *slot*** - Ethernet interface slot number.
- **ipv4 *V4ADDR*** - IPv4 address of the lease
- **ipv6 *V6ADDR*** - IPv6 address of the lease

### Example

Use the following command to clear all IP Address Locking leases from the switch:

```
switch(config-address-locking)# clear address locking lease all
```

---

### 12.5.2.8 locked-address expiration mac disabled

IP Address Locking, by default, removes authorization from leases after the corresponding MAC addresses age out. Use the **locked-address expiration mac disabled** command to configure IP Address Locking to keep the leases installed, even after the corresponding MAC addresses age out.

#### Command Mode

Address Locking Configuration

#### Command Syntax

```
locked-address expiration mac disabled
```

```
no locked-address expiration mac disabled
```

```
default locked-address expiration mac disabled
```

#### Parameters

- **expiration** - Configures expiration mode for locked addresses.
- **mac** - Configures deauthorizing locked addresses when MAC addresses age out.
- **disabled** - Disables deauthorizing locked address when MAC addresses age out.

#### Example

Use this command to disable locked address expiration:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address expiration mac disabled
```

### 12.5.2.9 locked-address ipv4 enforcement disabled

The **locked-address ipv4 enforcement disabled** command disables address filtering for all ports with IPv4 Locking enabled. This permits IPv4 packets while still keeping all other drop rules.

#### Command Mode

Address Locking Configuration

#### Command Syntax

```
locked-address ipv4 enforcement disabled
no locked-address ipv4 enforcement disabled
default locked-address ipv4 enforcement disabled
```

#### Parameters

- **ipv4** - Configure the IP address family.
- **enforcement** - Configure enforcement for locked addresses.
- **disabled** - Disable enforcement for locked addresses.

#### Example

Use the following command to disable locking address enforcement for IPv4 addresses:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv4 enforcement disabled
```

---

### 12.5.2.10 locked-address ipv6 enforcement disabled

The **locked-address ipv6 enforcement disabled** command disables address filtering for all ports with IPv6 Locking enabled. This permits IPv6 packets while retaining all other drop rules.

#### Command Mode

Address Locking Configuration

#### Command Syntax

```
locked-address IPv6 enforcement disabled
no locked-address IPv6 enforcement disabled
default locked-address IPv6 enforcement disabled
```

#### Parameters

- **ipv6** - IPv6 address configuration.
- **enforcement** - Configure enforcement for locked addresses.
- **disabled** - Disable enforcement for locked addresses.

#### Example

Use the following command to disable locking address enforcement for IPv6 addresses:

```
switch# configure
switch(config)# address locking
switch(config-address-locking)# locked-address ipv6 enforcement disabled
```

### 12.5.2.11 show address locking

Use the **show address locking** command to display the status of IP and IPv6 locking.

The **show address locking** command also displays the reason as to why IP Locking is not enabled for an interface. For an interface without IP Locking enabled, the following priority (highest at top) apply to the output:

- Interface not configured.
- Interface is not a Layer 2 interface.
- No local interface configured.
- No DHCP server configured.

#### Command Mode

EXEC

#### Command Syntax

```
show address locking
```

#### Example

To display information about IP locking, use the **show address locking** command:

```
switch# show address locking
```

```
IP Locking is active
```

| Interface | IPv4 | IPv6 |
|-----------|------|------|
|-----------|------|------|

|              |                     |                              |
|--------------|---------------------|------------------------------|
| Ethernet27/1 | yes                 | no (not configured)          |
| Ethernet31/1 | no (not configured) | no (not a layer 2 interface) |

---

### 12.5.2.12 show address locking counters

The **show address locking counters** command displays DHCP lease query messages sent, received, and dropped. Two sets of counters display in the output:

- Number of packets sent and received from each DHCP server.
- Number of packets sent and received for each locked interface.

IP Locking uses separate counters for different kinds of messages communicated between the switch and the DHCP server.

#### Command Mode

EXEC

#### Command Syntax

```
show address locking counters
```

#### Related Commands

The **clear address locking counters** command resets all the counters associated with IP Locking to zero.

#### Example

The following command displays IP Address Locking Counters:

```
switch# show address locking counters
Lease Active Lease Unknown Lease Unassigned
DHCP Server Query Rcvd Drop Rcvd Drop Rcvd Drop Unknown

80.80.80.80 32860 8002 34 8001 32 13423 134 3234

Interface Query Lease Active Lease Unknown Lease Unassigned

Ethernet2 1747 1234 189 324
```

### 12.5.2.13 show address locking table ipv4

Use the **show address locking table ipv4** command to display all DHCP leases with IP Locking, and the interfaces with authorized the IP addresses.

#### Command Mode

EXEC

#### Command Syntax

```
show address locking table ipv4 [dynamic [installed | [interface Ethernet slot] | installed |
interface [Ethernet [slot] | static [installed | interface [Ethernet slot]]]
```

#### Parameters

- **dynamic** - Display the dynamic leases.
  - **installed**- Display the leases installed on the hardware.
  - **interface** - Display the leases on a specified interface.
- **installed** - Display installed leases.
- **interface** - Display the leases on a specified interface.
  - **Ethernet *slot*** Specified Ethernet sub-interface.
- **static** - Display static leases.
  - **installed** - Display the leases on the hardware.
  - **interface** - Display the leases on a specified interface.
    - **Ethernets/*lot*** Specified Ethernet sub-interface.

#### Example

```
switch# show address locking table ipv4
IP Address MAC Address Interface Installed Expiration Time

AC 10.30.4.4 ba76.a467.7ff8 Et27/1 installed in 0:01:57

 IP Address Action

 10.30.4.4 permit
```

---

## 12.6 Layer 2 Protocol Forwarding

EOS supports Layer2 (L2) Protocol Forwarding on Ethernet interfaces in addition to Type-5 PW. Also, EOS allows selective forwarding of certain L2 Protocol packets, such as tagged, untagged, and all, instead of forwarding all LACP frames, both tagged and untagged. The protocol list for L2 Protocol Forwarding also supports PAUSE, LACP, LLDP, MACsec, and STP. Additionally, L2PF supports the Per-VLAN Spanning Tree (PVST) protocol to forward, drop, or trap PVST packets on Type-2 platforms. EOS enables drop support for all supported protocols.

### 12.6.1 Configuring L2 Protocol Forwarding

Use the following commands to create a profile that allows forwarding tagged/untagged/all types of PAUSE/LACP/LLDP/MACSEC/STP/E-LMI/ ISIS/micro-BFD frames.

```
switch(config-l2-protocol)# forwarding profile abc
switch(config-l2-protocol-abc)# isis forward
switch(config-l2-protocol-abc)# macsec tagged forward
switch(config-l2-protocol-abc)# pause untagged forward
switch(config-l2-protocol-abc)# exit
```

The following commands apply the profile to an interface or subinterface:

```
switch(config)# int ethernet1/1
switch(config-if-Et1/1)# l2-protocol forwarding profile abc
switch(config-if-Et1/1)# exit
switch(config)# int ethernet2/1.1
switch(config-if-Et2/1.1)# l2-protocol forwarding profile def
switch(config-if-Et2/1.1)# exit
```

#### 12.6.1.1 TCAM Profile

A specific TCAM profile is required to configure L2 Protocol Forwarding profiles except if the L2 Protocol Forwarding profile has only 'l2p forward' and is configured on Type-5 PW ports on Type-1 platforms. One such TCAM profile is as follows:

```
switch(config)# hardware tcam
switch(config-tcam)# profile l2protocolfwd
switch(config-tcam-profile-l2protocolfwd)# feature acl port ip
switch(config-tcam-feature-acl-port-ip)# sequence 45
switch(config-tcam-feature-acl-port-ip)# key size limit 160
switch(config-tcam-feature-acl-port-ip)# key field dscp dst-ip ip-frag ip-protocol l4-dst-port l4-ops l4-src-port src-ip tcp-control ttl
switch(config-tcam-feature-acl-port-ip)# action count drop
switch(config-tcam-feature-acl-port-ip)# packet ipv4 forwarding bridged
switch(config-tcam-feature-acl-port-ip)# packet ipv4 forwarding routed
switch(config-tcam-feature-acl-port-ip)# packet ipv4 forwarding routed multicast
switch(config-tcam-feature-acl-port-ip)# packet ipv4 mpls ipv4 forwarding mpls decap
switch(config-tcam-feature-acl-port-ip)# packet ipv4 mpls ipv6 forwarding mpls decap
switch(config-tcam-feature-acl-port-ip)# packet ipv4 non-VXLAN forwarding routed decap
switch(config-tcam-feature-acl-port-ip)# packet ipv4 VXLAN eth ipv4 forwarding routed decap
switch(config-tcam-feature-acl-port-ip)# packet ipv4 VXLAN forwarding bridged decap
switch(config-tcam-feature-acl-port-ip)# feature acl port ipv6
switch(config-tcam-feature-acl-port-ipv6)# sequence 25
switch(config-tcam-feature-acl-port-ipv6)# key field dst-ipv6 ipv6-next-header ipv6-traffic-class l4-dst-port l4-ops 3b l4-src-port src-ipv6-high src-ipv6-low tcp-control
switch(config-tcam-feature-acl-port-ipv6)# action count drop
switch(config-tcam-feature-acl-port-ipv6)# packet ipv6 forwarding bridged
switch(config-tcam-feature-acl-port-ipv6)# packet ipv6 forwarding routed
switch(config-tcam-feature-acl-port-ipv6)# packet ipv6 forwarding routed multicast
switch(config-tcam-feature-acl-port-ipv6)# packet ipv6 ipv6 forwarding routed decap
switch(config-tcam-feature-acl-port-ipv6)# feature acl port mac
switch(config-tcam-feature-acl-port-mac)# sequence 55
switch(config-tcam-feature-acl-port-mac)# key size limit 160
switch(config-tcam-feature-acl-port-mac)# key field dst-mac ether-type src-mac
switch(config-tcam-feature-acl-port-mac)# action count drop
```

```

switch(config-tcam-feature-acl-port-mac) # packet ipv4 forwarding bridged
switch(config-tcam-feature-acl-port-mac) # packet ipv4 forwarding routed
switch(config-tcam-feature-acl-port-mac) # packet ipv4 forwarding routed multicast
switch(config-tcam-feature-acl-port-mac) # packet ipv4 mpls ipv4 forwarding mpls decap
switch(config-tcam-feature-acl-port-mac) # packet ipv4 mpls ipv6 forwarding mpls decap
switch(config-tcam-feature-acl-port-mac) # packet ipv4 non-VXLAN forwarding routed decap
switch(config-tcam-feature-acl-port-mac) # packet ipv4 VXLAN forwarding bridged decap
switch(config-tcam-feature-acl-port-mac) # packet ipv6 forwarding bridged
switch(config-tcam-feature-acl-port-mac) # packet ipv6 forwarding routed

switch(config-tcam-feature-qos-ip)# sequence 75
switch(config-tcam-feature-qos-ip)# key size limit 160
switch(config-tcam-feature-qos-ip)# key field dscp dst-ip ip-frag ip-protocol 14-dst-port 14-ops 14-src-port src-ip tcp-control
switch(config-tcam-feature-qos-ip)# action set-dscp set-policer set-tc
switch(config-tcam-feature-qos-ip)# packet ipv4 forwarding routed
switch(config-tcam-feature-qos-ip)# packet ipv4 forwarding routed multicast
switch(config-tcam-feature-qos-ip)# packet ipv4 mpls ipv4 forwarding mpls decap
switch(config-tcam-feature-qos-ip)# packet ipv4 mpls ipv6 forwarding mpls decap
switch(config-tcam-feature-qos-ip)# packet ipv4 non-VXLAN forwarding routed decap
switch(config-tcam-feature-qos-ip)# feature qos ipv6
switch(config-tcam-feature-qos-ipv6)# sequence 70
switch(config-tcam-feature-qos-ipv6)# key field dst-ipv6 ipv6-next-header ipv6-traffic-class 14-dst-port 14-src-port src-ipv6-high src-ipv6-low
switch(config-tcam-feature-qos-ipv6)# action set-dscp set-policer set-tc
switch(config-tcam-feature-qos-ipv6)# packet ipv6 forwarding routed
switch(config-tcam-feature-qos-ipv6)# feature tunnel VXLAN
switch(config-tcam-feature-tunnel-VXLAN)# sequence 50
switch(config-tcam-feature-tunnel-VXLAN)# key size limit 160
switch(config-tcam-feature-tunnel-VXLAN)# packet ipv4 VXLAN eth ipv4 forwarding routed decap
switch(config-tcam-feature-tunnel-VXLAN)# packet ipv4 VXLAN forwarding bridged decap

```

For ISIS protocol forwarding, “snoop” action has to be present in the TCAM profile for I2-protocol forwarding feature as follows:

```

switch(config-tcam)# feature l2-protocol forwarding
switch(config-tcam-l2-protocol forwarding)# sequence 95
switch(config-tcam-l2-protocol forwarding)# key size limit 160
switch(config-tcam-l2-protocol forwarding)# key field dst-mac vlan-tag-format
switch(config-tcam-l2-protocol forwarding)# action mirror redirect-to-cpu set-tc snoop
switch(config-tcam-l2-protocol forwarding)# packet non-ip forwarding bridged
switch(config-tcam-l2-protocol forwarding)# packet non-ip forwarding bridged sub-interface

```

For the special case of micro-BFD protocol forwarding, the following TCAM profile needs to be applied:

```

switch(config)# hardware tcam
switch(config-tcam)# profile l2protocolfwd-bfd-rfc-7130
switch(config-tcam-profile l2protocolfwd-bfd-rfc-7130)# feature acl port ip egress mpls-tunnelled-match
switch(config-tcam-feature-acl-port-ip-egress-mpls-tunnelled-match)# sequence 95

```

```

switch(config-tcam-feature-acl-port-ip-egress-mpls-tunnelled-match)# feature acl port ipv6 egress
switch(config-tcam-feature-acl-port-ipv6-egress)# sequence 105
switch(config-tcam-feature-acl-port-ipv6-egress)# key field dst-ipv6 ipv6-next-header ipv6-
traffic-class 14-dst-port 14-src-port src-ipv6-high src-ipv6-low tcp-control
switch(config-tcam-feature-acl-port-ipv6-egress)# action count drop mirror
switch(config-tcam-feature-acl-port-ipv6-egress)# packet ipv6 forwarding bridged
switch(config-tcam-feature-acl-port-ipv6-egress)# packet ipv6 forwarding routed
switch(config-tcam-feature-acl-port-ipv6-egress)# feature acl port mac
switch(config-tcam-feature-acl-port-mac)# sequence 55
switch(config-tcam-feature-acl-port-mac)# key size limit 160
switch(config-tcam-feature-acl-port-mac)# key field dst-mac ether-type src-mac
switch(config-tcam-feature-acl-port-mac)# action count drop mirror
switch(config-tcam-feature-acl-port-mac)# packet ipv4 forwarding bridged
switch(config-tcam-feature-acl-port-mac)# packet ipv4 forwarding routed
switch(config-tcam-feature-acl-port-mac)# packet ipv4 forwarding routed multicast
switch(config-tcam-feature-acl-port-mac)# packet ipv4 mpls ipv4 forwarding mpls decap
switch(config-tcam-feature-acl-port-mac)# packet ipv4 mpls ipv6 forwarding mpls decap
switch(config-tcam-feature-acl-port-mac)# packet ipv4 non-VXLAN forwarding routed decap
switch(config-tcam-feature-acl-port-mac)# packet ipv4 VXLAN forwarding bridged decap
switch(config-tcam-feature-acl-port-mac)# packet ipv6 forwarding bridged
switch(config-tcam-feature-acl-port-mac)# packet ipv6 forwarding routed
switch(config-tcam-feature-acl-port-mac)# packet ipv6 forwarding routed decap
switch(config-tcam-feature-acl-port-mac)# packet ipv6 forwarding routed multicast
switch(config-tcam-feature-acl-port-mac)# packet ipv6 ipv6 forwarding routed decap
switch(config-tcam-feature-acl-port-mac)# packet mpls forwarding bridged decap
switch(config-tcam-feature-acl-port-mac)# packet mpls ipv4 forwarding mpls

switch(config-tcam-feature-tunnel-VXLAN)# packet ipv4 VXLAN forwarding bridged decap

```

Once **l2protocolfwd** or **l2protocolfwd-bfd-rfc-7130** tcam profile is created, the profile needs to be applied to the switch using the following command under config mode:

```
switch(config)# hardware tcam
switch(config-tcam)# system profile l2protocolfwd
```

### Consumption of TCAM

The following table describes how TCAM is consumed when the **same** L2 Protocol Forwarding profile is applied:

| Level of application | Type-1 platforms                                           | Type-2 platforms                                                           |
|----------------------|------------------------------------------------------------|----------------------------------------------------------------------------|
| Front panel ports    | Separate TCAM entries for each port                        | Same set of TCAM entries for ports on the same fap <b>and</b> core         |
| Subinterfaces        | Same set of TCAM entries for subinterfaces on the same fap | Same set of TCAM entries for subinterfaces on the same fap <b>and</b> core |

## 12.6.2 L2 Protocol Forwarding Limitations

1. A maximum of **31** distinct L2 Protocol Forwarding profiles are applied across multiple subinterfaces on the same FAP.
2. A maximum of **31** distinct L2 Protocol Forwarding profiles are applied across multiple subinterfaces, and front panel ports on the same FAP on Type-2 platforms.
3. The feature is not supported for subinterfaces on Type-1 platforms if any of the following features are present in the TCAM Profile:
  - feature pbr subintf ip
  - feature pbr subintf ipv6
  - feature pbr subintf mpls

## 12.6.3 L2 Protocol Forwarding Show commands

The show l2-protocol forwarding interface displays the L2 protocol forwarding profile configuration corresponding to the interfaces or subinterfaces.

```
switch(config)# show l2-protocol forwarding interface

Interface Profile

Ethernet1/1 abc
Ethernet2/1.1 def

switch> show l2-protocol forwarding interface Ethernet1/1

Interface Profile

Ethernet1/1 abc
```

The following show commands display all packet forwarding behavior on an interface or a subinterface:

```
switch(config)# show l2-protocol forwarding interface detail

Tagging Types: T: tagged U: untagged
Actions: F: forward
 BFD RFC-7130 E-LMI ISIS LACP LLDP MACSEC PAUSE STP
Interface Profile T U T U T U T U T U T U

```

```

Ethernet1/1 abc - - - - F F - - - - F - - F - -
Ethernet2/2.1 def - - - - - - - - - - - - - - - -

```

```

switch> show l2-protocol forwarding interface Ethernet1/1 detail
Tagging Types: T: tagged U: untagged

```

Actions: F: forward

| Interface   | Profile | BFD | RFC-7130 | E-LMI | ISIS | LACP | LLDP | MACSEC | PAUSE | STP |
|-------------|---------|-----|----------|-------|------|------|------|--------|-------|-----|
|             |         | T   | U        | T     | U    | T    | U    | T      | U     | T   |
| Ethernet1/1 | abc     | -   | -        | -     | -    | F    | F    | -      | -     | -   |

```

switch> show l2-protocol forwarding interface Ethernet2/2.1 detail
Tagging Types: T: tagged U: untagged

```

Actions: F: forward

| Interface     | Profile | BFD | RFC-7130 | E-LMI | ISIS | LACP | LLDP | MACSEC | PAUSE | STP |
|---------------|---------|-----|----------|-------|------|------|------|--------|-------|-----|
|               |         | T   | U        | T     | U    | T    | U    | T      | U     | T   |
| Ethernet2/2.1 | def     | -   | -        | -     | -    | -    | -    | -      | -     | -   |

## 12.7 Layer 2 Subinterfaces

A Layer 2 subinterface is a logical bridging endpoint associated with traffic on an interface distinguished by 802.1Q tags, where each **interface, 802.1q tag** tuple is treated as a first-class bridging interface.

Like other types of interfaces, an L2 subinterface is a normal bridging endpoint in the bridging domain.

### 12.7.1 Configurations

#### 12.7.1.1 Creating a Layer 2 Subinterface

Complete the following steps to configure a Layer 2 (L2) subinterface on an Arista switch:

1. Configure the parent interface to be a routed port.

```
switch(config)# interface et1
switch(config-if-Et1)# no switchport
```

2. Create a subinterface on the parent interface (**et1.1**), assign 802.1q encapsulation (**vlan 100**), and assign the forwarding VLAN ID (**vlan 200**).

```
switch(config-if-Et1)# interface et1.1
switch(config-if-Et1.1)# encapsulation dot1q vlan 100
switch(config-if-Et1.1)# vlan id 200
! VLAN does not exist. Creating vlan 200
```

3. An alternative to configuring a forwarding VLAN id is to use VLAN name (**office**).

```
switch(config)# vlan 200
switch(config-vlan-200)# name office
switch(config-vlan-200)# int et1.2
switch(config-if-Et1.2)# encapsulation dot1q vlan 101
switch(config-if-Et1.2)# vlan name office
```

4. Now subinterfaces **et1.1** and **et1.2** have been created and added to **vlanVLAN 200**.

```
switch# show interface et1.1-2 status
Port Name Status Vlan Duplex Speed Type Flags Encapsulation
Et1.1 Name connected 200 full 10G dot1q-encapsulation 100
Et1.2 Name connected 200 full 10G dot1q-encapsulation 101
```

### 12.7.1.2 MAC Address on Layer 2 Subinterface

MAC addresses can either be statically configured or dynamically assigned behind Layer 2 (L2) subinterfaces.

```
switch(config)# mac address-table static 0000.000a.000a vlan 200 interface et1.1
```

```
switch# show mac address-table interface et1.1-2
 Mac Address Table

Vlan Mac Address Type Ports Moves Last Move
---- -
200 0000.000a.000a STATIC Et1.1
200 0000.000b.000b DYNAMIC Et1.2 1 0:00:06 ago
Total Mac Addresses for this criterion: 2
```

MAC address learning can be enabled or disabled on an L2 subinterface using the following commands:

In the following example, the **show interface ethernet1.1 switchport** command has this *running-config*:

```
switch(config-if-Et1.1)# show interface ethernet1.1 switchport
Name: Et1.1
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
MAC Address Learning: disabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allowedVlansOnly
```

To enable MAC address learning, use the **no mac address learning disabled** command:

```
switch(config-if-Et1.1)# no mac address learning disabled
```

### 12.7.1.3 QoS Feature

Supported QoS features include the following:

## Shaping

After creating an L2 subinterface, you can configure a shape rate (in Kbps) on the sub-interface. For example, configure the shape rate to **50000000** Kbps.

```
switch(config-if-Et1.1) # shape rate 50000000
```

The configuration of non-default shape rate results in the allocation of dedicated virtual output queues (VOQ) for the subinterface. Each subinterface allocates four (4) VOQs. Different TC traffic goes to the VOQ according to the following mapping:

|         |      |
|---------|------|
| TC6-7 : | VOQ3 |
| TC4-5 : | VOQ2 |
| TC2-3 : | VOQ1 |
| TC0-1 : | VOQ0 |

VOQ3 is in strict-priority mode to the other VOQs.

VOQ2, VOQ1, and VOQ0 are in WRR with a static credit ratio 2:3:6 (higher ratio implies more credits).

The subinterface inherits the trust mode of the parent interface.

Before *EOS Release 4.24.2F*, EOS supported shaping only on L2 subinterfaces of parent Ethernet interfaces, for example, **Et1.1**. Beginning with *EOS Release 4.24.2F*, EOS supports shaping on L2 subinterface over a port-channel parent interface for example, **Po1.1**.

**Note:** A single parent interface supports up to 2000 shaped subinterfaces.

## Guaranteed Bandwidth

After configuring shaping on an L2 sub-interface, configure a guaranteed bandwidth (in Kbps or percent) on the subinterface using the **bandwidth guaranteed** command.

```
switch(config-if-Et1.1) # bandwidth guaranteed 10000000
switch(config-if-Et1.1) # bandwidth guaranteed percent 10
```

## Policing

For policing to work on the L2 subinterface, you must switch to the QoS profile.

## Example

```
switch(config) # hardware tcam
switch(config-hw-tcam) # system profile qos

Sample Policy-map Configuration:

switch(config) # ip access-list a1
switch(config-acl-a1) # statistics per-entry
switch(config-acl-a1) # 10 permit ip any any

switch(config) # class-map type qos match-any c1
switch(config-cmap-qos-c1) # match ip access-group a1

switch(config) # class-map type qos match-any c2
switch(config-cmap-qos-c2) # match vlan 100 0xfff

switch(config) # ipv6 access-list a1
switch(config-ipv6-acl-a1) # statistics per-entry
switch(config-ipv6-acl-a1) # 10 permit ipv6 any any
```

```
switch(config)# class-map type qos match-any c3
switch(config-cmap-qos-c3)# match ipv6 access-group a1

switch(config)# policy-map type quality-of-service p1
switch(config-pmap-quality-of-service-p1)# class c1
switch(config-pmap-quality-of-service-p1-c1)# police cir 10 Mbps bc 100000 bytes
exit
exit
```

After you create an L2 subinterface, you can configure a policy-map on the sub-interface, similar to the following example.

```
switch(config-if-Et1.1)# service-policy type qos input p1
```

## Interface Counters

To enable the hardware features for counting packets on L2 subinterfaces ingress and/or egress, use the **hardware counter feature** command, similar to the following example. In the example, enable subinterface **layer2** for ingress, and then enable for egress.

### Example

```
switch(config)# hardware counter feature subinterface in layer2
switch(config)# hardware counter feature subinterface out layer2
```

To display the L2 subinterface counters, use the **show interface counters** command similar to the following example. In the example, subinterface **et1.1** displays.

```
switch# show interfaces et1.1 counters

Port InOctets InPkts
Et1.1 0 0

Port OutOctets OutPkts
Et1.1 0 0
```

To clear all of the interface counters, use the **clear counters** command:

```
switch# clear counters
```

To learn counters for a specific L2 interface, use the **clear counters** command, and clear the L2 subinterface. In the example, clear the L2 subinterface **et1.1**.

```
switch# clear counters et1.1
```

### 12.7.1.4 Limitations

The following limitations apply to the Layer 2 subinterface feature:

- A total of **256** Layer 2 subinterfaces with shaping are supported across the entire switch and they can be distributed across any number of Ethernet ports.
- When configuring a shape rate on an L2 subinterface over a parent port-channel interface, such as, **Po1.1**, traffic load-balancing is disabled and is directed to a selected port-channel member. Also, the bandwidth of the port-channel subinterface will be equal to the selected member. However, the **show interface** command continues to show the bandwidth of the port-channel which is incorrect.
- After configuring a shape rate on an L2 subinterface, the L2 subinterface must be flapped by using the **shut** and **no shut** commands.

- Shaping of BUM traffic on L2 subinterfaces is supported only with “*ingress replication*”.
- EOS does not support Layer 3 forwarding through SVIs .
- EOS does not support control plane processing, such as IGMP snooping and STP BPDU.
- When IGMP protocol packets are expected to be forwarded on L2 subinterfaces, then IGMP snooping must be disabled globally on the entire switch using the `no ip igmp snooping` command. When IGMP snooping is configured on any VLAN, then IGMP protocol packets are discarded by L2 subinterfaces.
- Double tagged packets arriving on L2 subinterfaces with a single `encapsulation dot1q vlan <outer_vid>` command configured will match on the outer VLAN tag, and have only the outer VLAN tags terminated.
- Configuration of double tagged L2 subinterfaces through the `encapsulation dot1q vlan <outer_vid> inner <inner_vid>` command is not supported.
- EOS does not support the mixing of shaped and non-shaped subinterfaces under the same parent interface.
- Traffic classification on ingress traffic to l2 subinterface is disabled by default. To enable this feature, configure using the `qos trust cos` command on the parent interface.
- L2 subinterfaces are not supported in an MLAG environment.

## 12.7.2 QoS Show Commands

Use the `show interfaces status` command to display the subinterface status.

### Example

```
switch# show interfaces status sub-interfaces
Port Name Status Vlan Duplex Speed Type Flags

Et1.1 Encapsulation connected 200 full 10G dot1q-encapsulation 100
Et1.2 connected connected 200 full 10G dot1q-encapsulation 101
```

Use the `show vlan` command to display the VLAN membership. In the following example, **vlan 200** is configured to be displayed.

### Example

```
switch# show vlan 200
VLAN Name Status Ports
---- -
200 office active Et1.1, Et1.2, Et5
```

Use the `show qos interface` command to display the QoS configuration on an L2 subinterface. In the following example, QoS subinterface **Ethernet 1.1** is configured to be displayed.

### Example

```
switch# show qos interface Ethernet 1.1
Ethernet1.1:

Trust Mode: DSCP
Default COS: 0
```

```
Default DSCP: 0
```

```
Port shaping rate: 50625 / 50000 kbps
```

Use the **show interface counters** with the queue keyword to display the L2 subinterface counters. For example subinterface **Ethernet 1.1** is configured to display the L2 subinterface counters.

#### Example

```
switch# show interface Ethernet 1.1 counters queue
Aggregate VoQ Counters
Egress Traffic Pkts Octets DropPkts DropOctets
Port Class

Et1.1 TC0-1 0 0 0 0
Et1.1 TC2-3 0 0 0 0
Et1.1 TC4-5 0 0 0 0
Et1.1 TC6-7 460266 276159600 109316 65589600
```

Use the **show mac address-table** command to display the MAC address on L2 subinterfaces. For example, subinterfaces **Et1.1** and **Et1.2** are configured to be displayed.

#### Example

```
switch# show mac address-table interface et1.1-2
Mac Address Table

Vlan Mac Address Type Ports Moves Last Move

200 0000.000a.000a STATIC Et1.1
200 0000.000b.000b DYNAMIC Et1.2 1 0:00:16 ago
Total Mac Addresses for this criterion: 2
```

## Layer 3 Configuration

---

This chapter covers the following Layer 3 sections:

- [IPv4](#)
- [IPv6](#)
- [Ingress and Egress Per-Port for IPv4 and IPv6 Counters](#)
- [ACLs and Route Maps](#)
- [VRRP and VARP](#)
- [DirectFlow](#)
- [Decap Groups](#)
- [Nexthop Groups](#)
- [Global Knob to Set MTU for all Layer 3 Interfaces](#)
- [Support for Layer 3 MTU on 7280R3/7500R3/7800R3](#)
- [Segment Security](#)

### 13.1 IPv4

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv4 and includes these topics:

- [IPv4 Addressing](#)
- [IPv4 Routing](#)
- [IPv4 Multicast Counters](#)
- [Route Management](#)
- [IPv4 Route Scale](#)
- [IP Source Guard](#)
- [DHCP Server](#)
- [DHCP Relay Global Configuration Mode](#)
- [DHCP Relay Across VRF](#)
- [DHCP Relay in VXLAN EVPN](#)
- [DHCP Snooping with Bridging](#)
- [TCP MSS Clamping](#)
- [IPv4 GRE Tunneling](#)
- [GRE Tunneling Support](#)
- [BfRuntime to Use Non-default VRFs](#)
- [IPv4 Commands](#)

#### 13.1.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- [IPv4 Address Formats](#)
- [IPv4 Address Configuration](#)

- [Address Resolution Protocol \(ARP\)](#)
- [Displaying ARP Entries](#)

### 13.1.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from 0 to 255. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask:** The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.
- **IP address and wildcard mask:** The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.
- **CIDR notation:** CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

#### Examples

- These subnets (subnet mask and CIDR notation) are calculated identically:

```
10.24.154.13 255.255.255.0
10.24.154.13/24
```

- The defined space includes all addresses between **10.24.154.0** and **10.24.154.255**. These subnets (wildcard mask and CIDR notation) are calculated identically:

```
124.17.3.142 0.0.0.15
124.17.3.142/28
```

The defined space includes all addresses between **124.17.3.128** and **124.17.3.143**.

### 13.1.1.2 IPv4 Address Configuration

#### Assigning an IPv4 Address to an Interface

The `ip address` command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

#### Example

These commands configure an IPv4 address with subnet mask for **VLAN 200**:

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip address 10.0.0.1/24
switch(config-if-Vl200)#
```

#### Assigning an IPv4 Class E Address to an Interface

The `ipvr routable 240.0.0.0/4` command assigns a class E addresses to an interface. When configured, the class E address traffic are routed through BGP, OSPF, ISIS, RIP, static routes and programmed to the FIB and kernel. By default, this command is disabled.

## Example

- These commands configure an IPv4 Class E (**240/4**) address to an interface.

```
switch(config)# router general
switch(config-router-general)# ipv4 routable 240.0.0.0/4
```

## Detecting duplicate IP Addresses on an Interface

The **ip address duplicate detection disabled** command detects any duplicate IP address on the interface. When the duplicate IP address is detected, a syslog message is generated. It helps the network operator to identify IP addresses misconfiguration. By default, this feature is enabled.

## Examples

- This command disables the feature on the switch.

```
switch(config)# ip address duplicate detection disabled
```

- This command enables the feature.

```
switch(config)# ip address duplicate detection logging
```

**Note:** Commands are in global configuration mode, and are not per VRF.

This is an example of a Syslog message, when a duplicate IP address is detected.

```
Mar 24 16:41:57 cd290 Arp: %INTF-4-DUPLICATE_ADDRESS_WITH_HOST: IP address 100.1.1.2
configured on interface Ethernet1/1 is in use by a host with
MAC address 00:00:01:01:00:00 on interface Ethernet1/1 in VRF default
```

### 13.1.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) maps IP addresses to MAC addresses recognized by the local network devices. The ARP cache consists of a table that stores the correlated addresses of the devices that the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the device MAC address assigned to the packet destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Add static ARP entries to the cache using the CLI.

## Proxy ARP

Proxy ARP enables a network device (proxy) to respond to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination directs to the proxy device which then routes the traffic toward the ultimate destination.

## Configuring ARP

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the Layer 3 interface. The default duration is **14400** seconds (four hours).

---

Entries refresh and expire at a random time within the range of **80%-100%** of the cache expiry time. The refresh attempts three times at an interval of **2%** of the configured timeout.

Static ARP entries never time out and must be removed from the table manually.

### Example

This command specifies an ARP cache duration of **7200** seconds (two hours) for dynamic addresses added to the ARP cache learned through **VLAN 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# arp aging timeout 7200
switch(config-if-Vl200)# show active
interface Vlan200
 arp aging timeout 7200
switch(config-if-Vl200)#
```

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache.

### Example

This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)# arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

The **arp proxy max-delay** command enables delaying proxy ARP requests on the configuration mode interface. EOS disables Proxy ARP by default. When enabled, the switch responds to all ARP requests, including gratuitous ARP requests, with target IP addresses that match a route in the routing table. When a switch receives a proxy ARP request, EOS performs a check to send the response immediately or delay the response based on the configured maximum delay in milliseconds (ms).

### Example

Use the following command to set a delay of **500ms** before returning a response to a proxy ARP request.

```
switch(config)#arp proxy max-delay 500ms
```

#### 13.1.1.3.1 Gratuitous ARP

EOS broadcasts gratuitous ARP packets using a device in response to an internal change rather than as a response to an ARP request. The gratuitous ARP packet consists of a request packet (no reply expected) that supplies an unrequested update of ARP information. In a gratuitous ARP packet, both the source and

destination IP addresses use the IP of the sender, and the destination MAC address uses the broadcast address (**ff:ff:ff:ff:ff:ff**).

Gratuitous ARP packets generate to update ARP tables after an IPv4 address or a MAC address change occurs.

### Configuring Gratuitous ARP

By default, Arista switch interfaces reject gratuitous ARP request packets. The `arp gratuitous accept` command configures an L3 interface to accept the gratuitous ARP request packets sent from a different device in the network and add the mappings to the ARP table. Gratuitous ARP can be configured on Ethernet interfaces, VLANs/SVI, or L3 port channels, but has no effect on L2 interfaces.

#### Example

These commands enable gratuitous ARP packet acceptance on *interface ethernet 2/1*.

```
switch (config)# interface ethernet 2/1
switch (config-if-Et2/1)# arp gratuitous accept
```

#### 13.1.1.4 Displaying ARP Entries

The `show ip arp` command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the **resolve** argument.

#### Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch> show ip arp

Address Age (min) Hardware Addr Interface
172.25.0.2 0 004c.6211.021e Vlan101, Port-Channel2
172.22.0.1 0 004c.6214.3699 Vlan1000, Port-Channel1
172.22.0.2 0 004c.6219.a0f3 Vlan1000, Port-Channel1
172.22.0.3 0 0045.4942.a32c Vlan1000, Ethernet33
172.22.0.5 0 f012.3118.c09d Vlan1000, Port-Channel1
172.22.0.6 0 00e1.d11a.a1eb Vlan1000, Ethernet5
172.22.0.7 0 004f.e320.cd23 Vlan1000, Ethernet6
172.22.0.8 0 0032.48da.f9d9 Vlan1000, Ethernet37
172.22.0.9 0 0018.910a.1fc5 Vlan1000, Ethernet29
172.22.0.11 0 0056.cbe9.8510 Vlan1000, Ethernet26 switch>
```

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses. The output displays host names assigned to IP addresses in place of the address.

```
switch> show ip arp resolve

Address Age (min) Hardware Addr Interface
green-vl101.new 0 004c.6211.021e Vlan101, Port-Channel2
172.22.0.1 0 004c.6214.3699 Vlan1000, Port-Channel1
orange-vl1000.n 0 004c.6219.a0f3 Vlan1000, Port-Channel1
172.22.0.3 0 0045.4942.a32c Vlan1000, Ethernet33

royalblue.newco 0 0018.910a.1fc5 Vlan1000, Ethernet29
172.22.0.11 0 0056.cbe9.8510 Vlan1000, Ethernet26 switch>
```

#### 13.1.1.4.1 ARP Inspection

The Address Resolution Protocol (ARP) inspection command `ip arp inspection vlan` activates a security feature that protects the network from ARP spoofing. EOS intercepts ARP requests and responses on untrusted interfaces on specified VLANs and verifies intercepted packets to ensure valid IP-MAC address bindings. On trusted interfaces, all incoming ARP packets process and forward without verification, and all invalid ARP packets are dropped.

##### Enabling and Disabling ARP Inspection

By default, EOS disables ARP inspection on all VLANs.

##### Examples

- This command enables ARP inspection on VLANs **1** through **150**.

```
switch(config)# ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs **1** through **150**.

```
switch(config)# no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs **1** through **150**.

```
switch(config)# default ip arp inspection vlan 1 - 150
switch(config)#
```

- This command enable ARP inspection on multiple VLANs **1** through **150** and **200** through **250**.

```
switch(config)# ip arp inspection vlan 1-150,200-250
switch(config)#
```

##### Syslog for Invalid ARP Packets Dropped

After dropping an invalid ARP packet, EOS displays the following syslog message appears. The log severity level can be set higher if required.

```
%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface Ethernet28/1 Vlan
2121 because invalid mac and ip binding. Received: 00:0a:00:bc:00:de/1.1.1.1.
```

##### Displaying ARP Inspection States

The command `show ip arp inspection vlan` displays the configuration and operation state of ARP inspection. For a VLAN range specified by `show ip arp inspection vlan` displays only VLANs with ARP inspection enabled. If you do not specify a VLAN, the output displays all VLANs with ARP inspection enabled. The operation state turns to **Active** when the hardware traps ARP packets for inspection.

##### Example

This command displays the configuration and operation state of ARP inspection for VLANs **1** through **150**.

```
switch(config)# show ip arp inspection vlan 1 - 150

VLAN 1

Configuration
: Enabled
Operation State : Active
VLAN 2

Configuration
: Enabled
Operation State : Active
{...}
VLAN 150

Configuration
: Enabled
Operation State : Active

switch(config)#
```

### Displaying ARP Inspection Statistics

The command `show ip arp inspection statistics` displays the statistics of inspected ARP packets. For a VLAN specified by `show ip arp inspection vlan`, the output displays only VLANs with ARP inspection. If you do not specify a VLAN, the output displays all VLANs with ARP inspection enabled.

The command `clear arp inspection statistics` clears ARP inspection.

### Examples

- This command displays ARP inspection statistics for **VLAN 1**.

```
switch(config)# show ip arp inspection statistics vlan 2

Vlan : 2

ARP Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 (5 minutes ago)
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
 Source MAC: 00:01:00:01:00:01
 Dest MAC: 00:02:00:02:00:02
 ARP Type: Request
 ARP Sender MAC: 00:01:00:01:00:01
 ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for **ethernet interface 3/1**.

```
switch(config)# show ip arp inspection statistics ethernet interface 3/1

Interface : 3/1

ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1
```

```
Last invalid ARP:
Time: 10:20:30 (5 minutes ago)
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
 Source MAC: 00:01:00:01:00:01
 Dest MAC: 00:02:00:02:00:02
 ARP Type: Request
 ARP Sender MAC: 00:01:00:01:00:01
 ARP Sender IP: 1.1.1
```

```
switch(config)#
```

- This command clears ARP inspection statistics.

```
switch(config)# clear arp inspection statistics
switch(config)#
```

## Configuring Trust Interface

By default, all interfaces are untrusted. The command [ip arp inspection trust](#) configures the trust state of an interface.

### Examples

- This command configures the trust state of an interface.

```
switch(config)# ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)# no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to the default.

```
switch(config)# default ip arp inspection trust
switch(config)#
```

## Configuring Rate Limit

After enabling ARP inspection, EOS traps ARP packets to the CPU. When the incoming ARP rate exceeds expectations, two actions can be taken. For notification purposes, the command [ip arp inspection logging](#) enables logging of incoming ARP packets. The command [ip arp inspection limit](#) disables the interfaces and prevents a denial-of-service attack..

### Examples

- This command enables logging of incoming ARP packets when the rate exceeds the configured value and sets the rate to **2048**, the upper limit for the number of invalid ARP packets allowed per second. Then, it sets the burst consecutive interval to monitor interface for a high ARP rate to **15** seconds.

```
switch(config)# ip arp inspection logging rate 2048 burst interval 15
switch(config)#
```

- This command configures the rate limit of incoming ARP packets to disable the interface when the incoming ARP rate exceeds the configured value, and sets the rate to **512**, the upper limit for the number of invalid ARP packets allowed per second. Then sets the burst consecutive interval to monitor the interface for a high ARP rate to **11** seconds.

```
switch(config)# ip arp inspection limit rate 512 burst interval 11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)# interface ethernet 3/1
switch(config)# ip arp inspection limit rate 20 burst interval 5
switch(config)# interface Ethernet 3/3
switch(config)# ip arp inspection trust
switch(config)# show ip arp inspection interfaces
```

| Interface | Trust State | Rate (pps) | Burst Interval |
|-----------|-------------|------------|----------------|
| Et3/1     | Untrusted   | 20         | 5              |
| Et3/3     | Trusted     | None       | N/A            |

```
switch(config)#
```

### Disabling Errors Caused by ARP Inspection

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, EOS disables the interface by default. If **errdisabled**, the interface remains in this state until you intervene with the command **errdisable detect cause arp-inspection**. For example, after you perform a **shutdown** or **no shutdown** of the interface or it automatically recovers after a certain time period. The command **errdisable recovery cause arp-inspection** enables auto recovery. The command **errdisable recovery interval** enables sharing the auto recovery interval among all disabled interfaces. See the chapter [Data Transfer Introduction](#) for information on all **errdisable** commands.

#### Examples

- This command enables errdisable caused by an ARP inspection violation.

```
switch(config)# errdisable detect cause arp-inspection
switch(config)#
```

- This command disables errdisable caused by an ARP inspection violation.

```
switch(config)# no errdisable detect cause arp-inspection
switch(config)#
```

- This command enables auto recovery.

```
switch(config)# errdisable recovery cause arp-inspection
switch(config)#
```

- This command disables auto recovery.

```
switch(config)# no errdisable recovery cause arp-inspection
switch(config)#
```

- This command enables sharing the auto recovery interval of **10** seconds among all errdisable interfaces.

```
switch(config)# errdisable recovery interval 10
switch(config)#
```

- This command disables sharing the auto recovery interval of **10** seconds among all errdisable interfaces.

```
switch(config)# no errdisable recovery interval 10
switch(config)#
```

- This command displays the reason for a port entering the errdisable state.

```
switch(config)# show interfaces status errdisabled

Port Name Status Reason

Et3/2 -----
errdisabled arp-inspection

switch(config)#
```

## Configuring Static IP MAC Binding

The ARP inspection command **ip source binding** allows you to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry can only be configured on Layer 2 ports. By default, there is no binding entry on the system.

### Examples

- This command configures static IP-MAC binding for IP address **127.0.0.1**, MAC address **0001.0001.0001**, **vlan 1**, and Ethernet interface **slot 4** and **port 1**.

```
switch(config)# ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface
ethernet 4/1
switch(config)#
```

- This command configures static IP-MAC binding for IP address **127.0.0.1**, MAC address **0001.0001.0001**, **vlan 1**, and **port-channel interface 20**.

```
switch(config)# ip source binding 127.0.0.1 0001.0001.0001 vlan 1 interface
port-channel 20
switch(config)#
```

- This command displays the configured IP-MAC binding entries. Note that the Lease column displays dynamic DHCP snooping binding entries. For static binding entries, lease time displays as infinite.

```
switch(config)# show ip source binding 127.0.0.1 0001.0001.0001 static vlan 1
interface port-channel 20

MacAddress IpAddress Lease(sec) Type VLAN Interface

0001.0001.0001 127.0.0.1 infinite static 1 Port-Channel20

switch(config)#
```

## 13.1.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range, and each device on the

subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address. IPv4 and IPv6 are internet layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- [Enabling IPv4 Routing](#)
- [Static and Default IPv4 Routes](#)
- [Dynamic IPv4 Routes](#)
- [Viewing IPv4 Routes and Network Components](#)

### 13.1.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next-hop addresses specified by the forwarding table.

The [ip routing](#) command enables IPv4 routing.

#### Example

This command enables IP routing:

```
switch(config)# ip routing
switch(config)#
```

### 13.1.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols cannot establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes available for redistribution into routing domains defined by dynamic routing protocols.

The [ip route](#) command creates a static route. The destination is a network segment; the next-hop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is **1**. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of **200** is overridden by OSPF intra-area routes, which have a default distance of **110**.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of **0**.

#### Example

This command creates a static route:

```
switch(config)# ip route 172.17.252.0/24 vlan 500
switch(config)#
```

---

## Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is **0.0.0.0/0**, and the next-hop is the default gateway.

### Example

This command creates a default route and establishes **192.14.0.4** as the default gateway address:

```
switch(config)#ip route 0.0.0.0/0 192.14.0.4
switch(config)#
```

## Resolution RIB Profiles for Static Routes

Specify a Resolution RIB Profile as a system-connected per next-hop for a static route. System-connected describes a static route that only resolves if the next hop can be reached over a connected route. If you do not specify a system-connected route, the static route resolves if the next hop can be reached over any type of route in the FIB, including a connected route or a tunnel RIB. route.

### Configuring Resolution RIB Profile for Static Routes

Use the following command to configure a Resolution RIB Profile for static route, 10.0.0.0/24, and 10.1.0.0:

```
switch(config)#ip route vrf myVRF 10.0.0.0/24 10.1.0.0 resolution ribs system-connected
```

## Displaying Resolution Profiles for Static Routes

Use the **show ip route** command:

```
switch(config)#show ip route
interface Ethernet1
 mtu 1500
 no switchport
 ip address 10.1.1.1/24
!
interface Ethernet2
 no switchport
 ip address 10.10.10.1/24

ip route 10.100.100.0/24 10.10.10.2 resolution ribs system-connected
!
arp 10.1.1.2 00:22:33:44:55:66 arpa
arp 10.10.10.2 00:22:33:44:55:67 arpa
!
mpls tunnel static st1 10.10.10.2/32 10.1.1.2 Ethernet1 label-stack 9000
```

### 13.1.2.3 Dynamic IPv4 Routes

Dynamic routing protocols establish dynamic routes. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- [OSPFv2 Introduction](#)
- [Border Gateway Protocol \(BGP\)](#)
- [Routing Information Protocol \(RIP\)](#)
- [IS-IS](#)

### 13.1.2.4 Viewing IPv4 Routes and Network Components

#### Displaying the FIB and Routing Table

The `show ip route` command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays configured commands not in the FIB. The `show ip route summary` command displays the number of routes, categorized by source, in the routing table.

#### Examples

- This command displays IP routes learned through BGP.

```
switch> show ip route bgp

Codes: C - connected, S - static, K - kernel,
 O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
 E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
 N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
 R - RIP, A - Aggregate

B E 170.44.48.0/23 [20/0] via 170.44.254.78
B E 170.44.50.0/23 [20/0] via 170.44.254.78
B E 170.44.52.0/23 [20/0] via 170.44.254.78
B E 170.44.54.0/23 [20/0] via 170.44.254.78
B E 170.44.254.112/30 [20/0] via 170.44.254.78
B E 170.53.0.34/32 [1/0] via 170.44.254.78
B I 170.53.0.35/32 [1/0] via 170.44.254.2
 via 170.44.254.13
 via 170.44.254.20
 via 170.44.254.67
 via 170.44.254.35
 via 170.44.254.98 switch>
```

- This command displays a summary of routing table contents.

```
switch> show ip route summary

Route Source Number Of Routes

connected 15
static 0
ospf 74
 Intra-area: 32 Inter-area:33 External-1:0 External-2:9
 NSSA External-1:0 NSSA External-2:0
bgp 7
 External: 6 Internal: 1
internal 45
attached 18
aggregate 0 switch>
```

#### Displaying the IP Route Age

The `show ip route age` command displays the time when the route for the specified network was present in the routing table. It does not account for changes in parameters like metrics, next hop etc.

#### Example:

This command displays the time since the last update to ip route **172.17.0.0/20**.

```
switch> show ip route 172.17.0.0/20 age

Codes: C - connected, S - static, K - kernel,
 O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
 E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
 N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
 R - RIP, I - ISIS, A - Aggregate

B E 172.17.0.0/20 via 172.25.0.1, age 3d01h

switch>
```

## Displaying Gateways

A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route in is **0.0.0.0/0**.

The [show ip route gateway](#) command displays IP addresses of all gateways (next hops) used by active routes.

### Example

This command displays next hops used by active routes.

```
switch> show ip route gateway

The following gateways are in use:
172.25.0.1 Vlan101
172.17.253.2 Vlan2000
172.17.254.2 Vlan2201
172.17.254.11 Vlan2302
172.17.254.13 Vlan2302
172.17.254.17 Vlan2303
172.17.254.20 Vlan2303
172.17.254.66 Vlan2418
172.17.254.67 Vlan2418
172.17.254.68 Vlan2768
172.17.254.29 Vlan3020 switch>
```

## Displaying Host Routes

The [show ip route host](#) command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = **255.255.255.255** or prefix = **/32**). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

### Example

This command displays all host routes in the host forwarding table.

```
switch# show ip route host

R - receive B - broadcast F - FIB, A - attached
```

```

F 127.0.0.1 to cpu
B 172.17.252.0 to cpu
A 172.17.253.2 on Vlan2000
R 172.17.253.3 to cpu
A 172.17.253.10 on Vlan2000
R 172.17.254.1 to cpu
A 172.17.254.2 on Vlan2901
B 172.17.254.3 to cpu
B 172.17.254.8 to cpu
A 172.17.254.11 on Vlan2902
R 172.17.254.12 to cpu

F 172.26.0.28 via 172.17.254.20 on Vlan3003
 via 172.17.254.67 on Vlan3008
 via 172.17.254.98 on Vlan3492
via 172.17.254.86 on Vlan3884
 via 172.17.253.2 on Vlan3000
F 172.26.0.29 via 172.25.0.1 on Vlan101
F 172.26.0.30 via 172.17.254.29 on Vlan3910
F 172.26.0.31 via 172.17.254.33 on Vlan3911
F 172.26.0.32 via 172.17.254.105 on Vlan3912 switch#

```

### 13.1.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- [Multicast Counters Hardware Overview](#)
- [Multicast Counters iBGP and eBGP Configuration](#)
- [Configuring IPv4 Multicast Counters](#)

#### 13.1.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- [Platform Independent Requirements for Counters](#)
- [Policer Counter Overview](#)
- [BGP Functions Supported for Arista Switches](#)
- [Additional Requirements](#)

##### 13.1.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters.
- Clear counters.
- Show counters.
- Configure counter mode for byte (default) or frame mode.

##### 13.1.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries, and each entry has one 32-bit entry1 and one 32-bit entry2, which can be used as either a packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

---

Each FFU/BST entry points to a corresponding RAM in switch hardware routing. A policer index is saved in the action ram, so when installing a multicast route into hardware, the platform code will get a policer index and save it in the action field. A counter is not added to the action field if a policer index is unavailable.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated to a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

```
[no] platform fm6000 [nat|acl|qos|multicast] policer banks <1|2>
```

Available bank(s) are reserved for the feature. Otherwise the command will take effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.

### 13.1.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations

### 13.1.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:

- Reservation of policer banks.
- Notification of policer bank availability when a policer entry is freed by other features.

### 13.1.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.

- [Policer Usage](#)

#### 13.1.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required, and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

Suppose the user configures a specific counter, and the Starter Group (SG) already has a wildcard-created counter. In that case, this counter is upgraded to a specific one, with no change in the hardware policer index. If the user configures both a wildcard counter and a specific counter for this SG and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in the hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, do not allocate a policer entry until a real route (G, S) is programmed into the Frame Filtering and Forwarding Unit (FFU).

### 13.1.3.3 Configuring IPv4 Multicast Counters

Perform the following CLI steps to configure IPv4 multicast counters on the FM6000 platform:

1. Execute the global configuration command:

- **no|default ip multicast count bytes| packets**

Enables wildcard counters. Also used to change bytes/packets mode. When hardware runs out of resources, specific creation has priority to preempt counters from wildcard creation. The **bytes | packets** optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. All counter values will be reset to zero when the counter mode changes.

- **no|default ip multicast count <G> <S>**

This only takes effect when **ip multicast count** is enabled. Either **<G> <S>** or **bytes|packets** optional keyword is used. They can not be used concurrently.

No | default Commands: (default is same as no)

- **no ip multicast count** Deletes all multicast counters, including explicit **<G> <S>** routes
  - **no ip multicast count <G> <S>** Removes the config. Do not delete the counter because the wildcard is still active.
  - If no **<G, S>** is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”
  - If **<G, S>** is specified, only **<G, S>** will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This **<G, S>** configuration is applicable when the hardware runs out of resources. Specific **<G, S>** creation has priority to preempt counters from wildcard creation.

The **byte | frame** optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

Either **<G, S>**, or **byte | frame** optional keywords are used but cannot be used together. All counters are **byte|frame**. The **byte|frame** mode is global and not applicable on a **<G, S>** basis.

2. Execute clear command:

```
clear ip multicast count <G> <S>
```

3. Execute show command:

```
show multicast fib ipv4 <G> count
```

This command currently exists but does not show anything.

This show command is intended to display the following (example):

```
switch> show multicast fib ipv4 count
Activity poll time: 60 seconds
225.1.1.1 100.0.0.2
Byte: 123
Vlan100 (iif)
Vlan200
Activity 0:00:47 ago
```

Total counts are the sum of counts from all sources in that group.

The count value can be **N/A** if a mroute does not have an associated counter.

If the count value for any source in a **G** is **N/A**, then the total counts for **G** will be shown as **N/A**. However, the count values for other sources are still shown.

---

## 13.1.4 Route Management

When enabling routing, the switch discovers the best route to a packet destination address by exchanging routing information with other devices. EOS disables IP routing by default.

The following sections describes routing features that EOS supports:

- [Route Redistribution](#)
- [Equal Cost Multipath Routing \(ECMP\) and Load Sharing](#)
- [Unicast Reverse Path Forwarding \(uRPF\)](#)
- [Routing Tables / Virtual Routing and Forwarding \(VRF\)](#)
- [RIB Route Control](#)

### 13.1.4.1 Route Redistribution

Route redistribution advertises connected (static) routes or routes established by other routing protocols into a dynamic routing protocol's routing domain. By default, the switch advertises only routes in a routing domain established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol, or all static routes, advertise into the routing domain. Commands can filter routes by applying a route map and defining the subset of routes to advertise.

### 13.1.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing

Equal Cost Multi-Path (ECMP) provides a routing strategy to forward traffic over multiple paths with equal routing metric values.

#### Configuring ECMP (IPv4)

EOS assigns all ECMP paths with the same tag value, and commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Switches select different hash seeds to perform hash calculations and avoid hash polarization.

The [ip load-sharing](#) command provides the hash seed with an algorithm for distributing data streams among multiple equal-cost routes to a specified subnet.

#### Example

This command sets the IPv4 load sharing hash seed to **20**:

```
switch(config)# ip load-sharing fm6000 20
switch(config)#
```

#### Multicast Traffic Over ECMP

The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the [multipath none](#) command or the no version of the [multipath deterministic](#) command.

#### Resilient ECMP

Resilient ECMP uses prefixes where routes are not desired for rehashing due to link flap, typically where ECMP participates in load balancing. Resilient ECMP configures a fixed number of next-hop entries in the

hardware ECMP table for all the routes within a specified IP address prefix. Implementing fixed table entries for a specified next-hop address allows the data flow hash to a valid next-hop number to remain intact even when some next-hops go down or come back online.

Enable resilient ECMP for all routes within a specified prefix using the [ip hardware fib ecmp resilience](#)

command. The command specifies the maximum number of next-hop addresses that the hardware ECMP table contains for the specified IP prefix and configures a redundancy factor that facilitates the duplication of next-hop addresses in the table. The fixed table space for the address uses the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of next-hop addresses, the redundancy factor specifies the number of times to list each address. When the table contains fewer than the maximum number of next-hop addresses, the table space entries fill with additional duplication of the next-hop addresses.

EOS supports resilient ECMP for IPv6 IP addresses.

### Example

This command configures a hardware ECMP table space of 24 entries for the IP address **10.14.2.2/24**. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each address duplicates until filling all of the 24 table entries.

```
switch(config)# ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
switch(config)#
```

## Unequal Cost Multipath (UCMP) for Static Routes

Unequal Cost Multipath (UCMP) for Static Routes provides a mechanism to forward traffic from a device on an ECMP route with the ratio of the weights used for next-hops and program them into the Forwarding Information Database (FIB).

### Configuring UCMP for Static Routes

Use the following commands to configure UCMP on the VRF, **myVRF**, with an FEC maximum size of 100:

```
switch(config)# router general
switch(config-router-general)# vrf myVRF
switch(config-router-general-vrf-myVRF)# route static ucmp forwarding fec maximum-size 100
```

## Aggregate Group Monitoring (AGM) for ECMP

This feature allows the monitoring of packets and bytes traversing the members of the configured ECMP groups on the switch with a high time resolution. Once enabled, AGM collects data for the specified duration, writes it to the specified file on the switch storage, and then stops.

### Supported Platforms

- DCS-7260CX3

### Configuring AGM for ECMP Groups

**Note:** You must have at least one ECMP Group configured on the switch.

To begin collecting data on the switch at 100 millisecond intervals for 1800 seconds, use the following command:

```
switch(config)# start snapshot counters ecmp poll interval 100 milliseconds duration 1800 seconds
```

Specify an optional URL to store the data. If not specified, the files store in the non-persistent storage at **/var/tmp/ecmpMonitor**.

If providing a URL, it must point to a valid file system. EOS allows the following file systems:

- **file** - The path must start with **/tmp** or **/tmp**. The files store in the non-persistent storage.
- **flash** - Files store in persistent storage.

Use the following command to interrupt the snapshot before the end of the configured duration:

```
switch# stop snapshot counters ecmp
```

To delete previous snapshots, use the following command:

```
switch# clear snapshot counters ecmp id_range
```

If you do not specify a range of IDs, then all previous snapshots delete from the system.

**Displaying AGM for ECMP Information**

Use the **show snapshot counters ecmp history** to display information about the configuration.

```
switch# show snapshot counters ecmp history
Request ID: 17
Output directory URL: file:/var/tmp/ecmpMonitor
Output file name(s): ecmpMonitor-17-adj1284.ctr, ecmpMonitor-17-adj1268.ctr

Complete: True
Poll interval: 1000 microseconds
Total poll count: 59216
Start time: 2024-06-17 17:58:36
Stop time: 2024-06-17 17:59:36

L2 Adjacency ID Interfaces

1268 Ethernet54/1, Ethernet41/1, Ethernet1/1,
Ethernet57/1
1284 Ethernet20/1, Ethernet35/1, Ethernet41/1,
Ethernet8/1, Ethernet1/1
```

The output displays the list of previous snapshots including any current ones as well as the following information:

- **Request ID** - Identifies the snapshot Request ID to use for the **clear** command.
- **Output directory URL** - Identifies the snapshot storage location.
- **Complete** - Identifies the snapshot completion status.
- **Poll Interval** - Identifies the configured polling interval for the snapshot.
- **Total poll count** - Identifies the total number of hardware counters collected.
- **Start time** and **Stopped time** - Identifies the system time when the snapshot started and stopped.
- **L2 Adjacency ID** and **Interfaces** - The summary of the ECMP groups monitored by AGM.

**13.1.4.2.1 Resilient Equal-Cost Multi-Path (RECM) Deduping**

Routes covered by a Resilient Equal-Cost Multi-Path (RECM) prefix consists of routes that use hardware tables dedicated for Equal-Cost Multi-Path (ECMP) routing. Resilient ECMP (RECM) deduping reduces

the number of ECMP hardware table entries allocated by the switch to force the routes with the same set of next hops but point to different hardware table entries and point to the same hardware table entry when encountering high hardware resource utilization. Forcing RECMF routes to change the hardware table entry that they point to may potentially cause a traffic flow disruption for any existing flows going over that route. The deduping process attempts to minimize the amount of potential traffic loss.

Each route needs to allocate hardware table entries in the ASIC that contain forwarding information for the route, such as the next-hops and egress links used by each next-hop uses. The network device uses these hardware table entries when making forwarding decisions for a packet meant for a certain route. These ECMP hardware tables have limited size and can fill up quickly if allocating a large number of these hardware table entries. One option to ease the usage of these hardware tables can force RECMF routes to share hardware table entries.

RECMF routes can point to the same hardware table entry if they share the same set of next hops and the order of the next-hops. However, RECMF routes may end up sharing the same set of next-hops, but the next-hop ordering may be different between them, and the routes end up occupying different hardware table entries in the ASIC. RECMF routing has a property where the current ordering of next-hops for a given route can be influenced by the previous order. The ordering between the routes can differ because these routes had a different set of next hops at some previous time before they finally converged onto the same set of next-hops.

When the ECMP hardware resource usage crosses the high threshold, the deduping process begins, and it lasts until the ECMP hardware resource usage falls below the low threshold. Use the `ip hardware fib next-hop resource optimization thresholds` command to modify the thresholds.

#### 13.1.4.2.1.1 Configuring Resilient ECMP Deduping

EOS disabled Resilient ECMP Deduping by default.

- Use the following command to disable all the hardware resource optimization features:

```
switch(config)# ip hardware fib next-hop resource optimization disabled
```

- Use the following command to re-enable the all hardware resource optimization features after disabling them:

```
switch(config)# no ip hardware fib next-hop resource optimization disabled
```

- Use the following command to configure the thresholds for starting and stopping the optimization:

```
switch(config)# ip hardware fib next-hop resource optimization thresholds low <20> high <80>
```

#### Note:

- The value specified for the threshold represents the percentage of resource utilization, and uses an integer between **0** and **100**.
- Setting the high threshold to **80** indicates that optimization starts when the resource utilization is above **80%**. The default value of this threshold is **90**.
- Setting the low threshold to **20** indicates that optimization stops when the resource utilization is below **20%**. The default value of this threshold is **85**.

#### 13.1.4.2.1.2 Show Commands

- The `show ip hardware fib summary` command displays the statistics of this RECMF deduping:

#### Example

```
switch# show ip hardware fib summary
Fib summary

```

```

Adjacency sharing: disabled
BFD peer event: enabled
Deletion Delay: 0
Protect default route: disabled
PBR: supported
URPF: supported
ICMP unreachable: enabled
Max Ale ECMP: 600
UCMP weight deviation: 0.0
Maximum number of routes: 0
Fib compression: disabled
Resource optimization for adjacency programming: enabled
Adjacency resource optimization thresholds: low 20, high 80

```

The last two lines of the output shows if RECMC deduping is enabled, and the corresponding threshold values for starting and stopping the optimization process.

- The **show hardware capacity** command displays the utilization of the hardware resources. The example below shows the multi-level hierarchy ECMP resources:

```

switch# show hardware capacity
Forwarding Resources Usage

```

| Table | Feature      | Chip | Used Entries | Used (%) | Free Entries | Committed Entries | Best | Case Max | High | Watermark Entries |
|-------|--------------|------|--------------|----------|--------------|-------------------|------|----------|------|-------------------|
| ECMP  |              |      | 0            | 0%       | 4095         | 0                 | 4095 |          | 0    |                   |
| ECMP  | Mpls         |      | 0            | 0%       | 4095         | 0                 | 4095 |          | 0    |                   |
| ECMP  | Routing      |      | 0            | 0%       | 4095         | 0                 | 4095 |          | 0    |                   |
| ECMP  | VXLANOverlay |      | 0            | 0%       | 4095         | 0                 | 4095 |          | 0    |                   |
| ECMP  | VXLANTunnel  |      | 0            | 0%       | 3891         | 0                 | 3891 |          | 0    |                   |

#### 13.1.4.2.1.3 Limitations

- With RECMC deduping, optimization of a sub-optimal ECMP route requires releasing and reallocating hardware resources for the route. Therefore the process may increase overall convergence time for route programming. It may not be desirable to always start the optimization when the sufficient hardware resource existt. The threshold value for starting the optimization should be adjusted based on the route scale of the network.
- The deduping of ECMP hardware resources may cause potential traffic flow disruption for traffic flows going over RECMC routes with changing hardware table entries. While the deduping process tries to minimize the amount of traffic flow disruption, it is still sometimes inevitable.
- RECMC hardware table entries can only be deduped to other RECMC hardware table entries that share the same set of nexthops. This puts a limit to the amount of RECMC hardware table entries that can be reduced to the number of RECMC hardware table entries with unique nexthop sets.

#### 13.1.4.3 Unicast Reverse Path Forwarding (uRPF)

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in forwarded packets from a switch. When uRPF determines that the routing table does not contain an entry with a valid path to the packet source IP address, the switch drops the packet.

IPv4 and IPv6 uRPF operate independently. Configure uRPF on a VRF. Commands that do not specify a VRF utilize the default instance. uRPF does not affect multicast routing.

uRPF defines two operational modes:

- **Strict mode** - In strict mode, uRPF also verifies that a received packet on the interface with the routing table entry uses that entry for the return packet.
- **Loose mode** - uRPF validation does not verify the inbound packet ingress interface.

### 13.1.4.3.1 uRPF Operation

Configure uRPF on interfaces. For packets arriving on a uRPF-enabled interface, the source IP address examines the source and destination addresses of unicast routing table entries and verifies it.

uRPF requires a reconfigured routing table to support IP address verification. When enabling uRPF for the first time, unicast routing becomes briefly disabled to facilitate the routing table reconfiguration. The initial enabling of uRPF does not affect multicast routing.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address that matches the packet's source IP address. In strict mode, the uRPF also fails when the matching entry's outbound interface does not match the packet's ingress interface.

uRPF does not verify the following packets:

- DHCP with a source that uses **0.0.0.0** and a destination uses **255.255.255.255**.
- IPv6 link local in the following format **-FE80::/10**.
- Multicast packets

#### ECMP uRPF

When verifying ECMP routes, strict mode checks all possible paths to determine the correct interface receives the packet. ECMP groups with a maximum of eight routing table entries support strict mode. The switch reverts to loose mode for ECMP groups that exceed eight entries.

#### Default Routes

uRPF strict mode provides an **allow-default** option that accepts default routes. On interfaces that enable allow-default and define a default route, uRPF strict mode validates a packet even when the routing table does not contain an entry that matches the packet's source IP address. If not enabling allow-default, uRPF does not consider the default route when verifying an inbound packet.

#### Null Routes

**NULL0** routes drop traffic destined to a specified prefix. When enabling uRPF, traffic originating from null route prefixes drops in strict and loose modes.

### 13.1.4.3.2 uRPF Configuration

Enable Unicast Reverse Path Forwarding (uRPF) for IPv4 packets ingressing the configuration mode interface using the **ip verify** command.

**Note:** uRPF cannot be enabled on interfaces with ECMP member FECs.

#### Examples

- This command enables uRPF loose mode on **interface vlan 17**.

```
switch(config)# interface vlan 17
switch(config-if-Vl17)# ip verify unicast source reachable-via any
switch(config-if-Vl17)# show active
 interface Vlan17
 ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on **interface vlan 18**.

```
switch(config)# interface vlan 18
switch(config-if-Vl18)# ip verify unicast source reachable-via rx
```

```
switch(config-if-Vl18)# show active
interface Vlan18
 ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

#### 13.1.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)

An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a Routing Information Base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances:

- A default global VRF
- Multiple user-defined VRFs

The number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.

- Management VRFs have routing disabled and typically used for management-related traffic.
- Dataplane VRFs have routing enabled and support routing protocols and packet forwarding, including both hardware and software.

Trident, FM6000, and Arad platform switches support dataplane VRFs.

VRFs support unicast IPv4 and IPv6 traffic and multicast traffic. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a Route Distinguisher (RD) may be prepended to each address. *RFC4364* defines RDs.

##### 13.1.4.4.1 Default VRF

EOS creates the default VRF automatically and you cannot rename or configure it. Some configuration options accept **default** as a VRF input.

##### 13.1.4.4.2 User-Defined VRFs

Create a user-defined VRF with the [vrf instance](#) command. After creating it, a VRF may be assigned a Route Distinguisher (RD) with the [rd \(VRF configuration mode\)](#) command in the VRF submode of Router-BGP Configuration Mode.

#### Examples

- These commands create a VRF named **purple**, place the switch in BGP VRF configuration mode for that VRF, and specify a route distinguisher for the VRF, identifying the administrator as **AS 530**, and assigning **12** as its local number.

```
switch(config)# vrf instance purple
switch(config-vrf-purple)# router bgp 50
switch(config-router-bgp)# vrf purple
switch(config-router-bgp-vrf-purple)# rd 530:12
switch(config-router-bgp-vrf-purple)#
```

- To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the [vrf \(Interface mode\)](#) command. Loopback, SVI, and routed ports can be added to a VRF.

These commands add **vlan 20** to the VRF named **purple**.

```
switch(config)# interface vlan 20
```

```
switch(config-if-Vl20)# vrf purple
switch(config-if-Vl20)#
```

- The **show vrf** command shows information about user-defined VRFs on the switch.

This command displays information for the VRF named **purple**.

```
switch# show vrf purple
Vrf RD Protocols State Interfaces

purple 64496:237 ipv4 no routing Vlan42, Vlan43 switch>
```

---

#### 13.1.4.4.2.1rd (VRF configuration mode)

The **rd** command issued in VRF Configuration Mode is a legacy command supported for backward compatibility. To configure a Route Distinguisher (RD) for a VRF, use the **rd** (VRF configuration mode) command.

**Note:** Legacy RDs that were assigned to a VRF in VRF Configuration Mode will still appear in **show vrf** outputs if an RD has not been configured in Router-BGP VRF Configuration Mode, but they no longer have an effect on the system.

#### 13.1.4.4.3 Context-Active VRF

The context-active VRF specifies the default VRF commands to use when displaying or refreshing routing table data.

VRF-context aware commands include:

- **clear arp-cache**
- **show ip**
- **show ip arp**
- **show ip route**
- **show ip route gateway**
- **show ip route host**

The **cli vrf** command specifies the context-active VRF.

##### Example

This command specifies **magenta** as the context-active VRF.

```
switch# cli vrf magenta
switch# show routing-context vrf
Current VRF routing-context is magenta
```

The **show routing-context vrf** command displays the context-active VRF.

##### Example

This command displays the context-active VRF.

```
switch# show routing-context vrf
Current VRF routing-context is magenta switch#
```

#### 13.1.4.5 RIB Route Control

The Routing Information Base (RIB) consists of the routing information learned by the routing protocols, including static routes. The Forwarding Information Base (FIB) consists of the routes actually used to forward traffic through a router.

Forwarding Information Base (FIB) performs IP destination prefix-based switching decisions. Similar to a routing table, the FIB maintains the forwarding information for the winning routes from the RIB. When routing or topology changes occur in the network, the IP routing table information updates, and reflects the changes in the FIB.

### 13.1.4.5.1 Configuring FIB policy

The RIB calculates the best or winning routes to each destination and place these routes in the forwarding table. Then advertises the best routes based on the configured FIB policy.

For example, a FIB policy can be configured to deny the routes for FIB programming, however, it does not prevent these routes from advertising a routing protocol, or redistributed into another routing domain, or used for recursive resolution in the IP RIB. FIB policies control the size and content of the routing tables, and the best route to take to reach a destination.

Use the **rib ipv4 | ipv6 fib policy** command to enable an FIB policy for a specific VRF in the Router General Configuration Mode.

EOS supports the following match statements:

- **match interface**
- **match [ ip | ipv6 ] address *prefix-list***
- **match [ ip | ipv6 ] resolved-next-hop *prefix-list***
- **match isis level**
- **match metric**
- **match source-protocol**

#### Example

The following example enables FIB policy for IPv4 in the default VRF, using the route map, **map1**.

```
switch(config)# router general
switch(config-router-general)# vrf default
switch(config-router-general-vrf-default)# rib ipv4 fib policy map1
```

### 13.1.4.5.2 Displaying FIB Information

Use the **show rib route <ipv4|ipv6> fib policy exclude** command to display the RIB information. The **fib policy excluded** option displays the RIB routes excluded from programming into the FIB by the FIB policy.

#### Example

The following example displays the routes filtered by FIB policy using the **fib policy excluded** option of the **show rib route ip|ipv6** command.

```
switch# show rib route ipv6 fib policy excluded
switch# show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
 B - BGP, O - Ospf, O3 - Ospf3, I - Isis
 > - Best Route, * - Unresolved Nexthop
 L - Part of a recursive route resolution loop
>B 10.1.0.0/24 [200/0]
 via 10.2.2.1 [115/20] type tunnel
 via 10.3.5.1, Ethernet1
 via 10.2.0.1 [115/20] type tunnel
 via 10.3.4.1, Ethernet2
 via 10.3.6.1, Ethernet3
>B 10.1.0.0/24 [200/0]
 via 10.2.2.1 [115/20] type tunnel
 via 10.3.5.1, Ethernet1
 via 10.2.0.1 [115/20] type tunnel
 via 10.3.4.1, Ethernet2
 via 10.3.6.1, Ethernet3
```

### 13.1.4.5.3 Displaying RIB Route Information

Use the [show rib route ip](#) command to view the IPv4 RIB information.

#### Example:

This command displays IPv4 RIB static routes.

```
switch# show rib route ip static

VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
 B - BGP, O - Ospf, O3 - Ospf3, I - Isis
 > - Best Route, * - Unresolved Nexthop
 L - Part of a recursive route resolution loop
>S 10.80.0.0/12 [1/0]
 via 172.30.149.129 [0/1]
 via Management1, directly connected
>S 172.16.0.0/12 [1/0]
 via 172.30.149.129 [0/1]
 via Management1, directly connected switch#
```

## 13.1.5 IPv4 Route Scale

Optimize IPv4 routes to achieve route scale when route distribution has many routes with one or two parameters, and each parameter consisting of prefix lengths **12**, **16**, **20**, **24**, **28**, and **32**. If configuring two separate prefix lengths, in any order, one must have the prefix length of **32**.

**Note:** IPv4 Route Scale cannot be used with AlgoMatch.

The following sections describe IPv4 route scale configuration, show commands, and system log messages:

- [Configuring IPv4 Route Scale](#)
- [IPv4 Routescale with 2-to-1 Compression](#)
- [Show Commands](#)

### 13.1.5.1 Configuring IPv4 Route Scale

Enable IPv4 route scale using the [ip hardware fib optimize](#) command in the Global Configuration Mode. The platform Layer 3 agent restarts to ensure IPv4 routes optimization with the [agent SandL3Unicast terminate](#) command in the Global Configuration Mode.

#### Example

This configuration command allows configuring prefix lengths **12** and **32**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes uses a prefix-length of **32** required in the instance when using two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

**Example**

This configuration command restarts the platform Layer 3 agent to ensure IPv4 route optimization.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes and then re-adds them to the hardware.

**Example**

This configuration command allows configuring prefix lengths **32** and **16**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes uses a prefix-length of **32** required in the instance when using two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

**Examples**

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 route optimization.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes and then re-adds them to the hardware.

- This configuration command allows configuring prefix length **24**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 24
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

In this instance, when configuring a single prefix-length, the configuration does not require a prefix-length of **32**. For this command to take effect, you must restart the platform Layer 3 agent.

**Examples**

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 route optimization.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes and then re-adds them to the hardware.

- This configuration command allows configuring the prefix length **32**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

For this command to take effect, you must restart the platform Layer 3 agent.

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 route optimization.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes and then re-adds them to the hardware.

- This configuration command disables the prefix lengths **12** and **32** configuration.

```
switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized
```

One of the two prefixes uses a prefix-length of **32** required in the instance when using two prefixes. For this command to take effect, you must restart the platform Layer 3 agent.

### Examples

- This configuration command restarts the platform Layer 3 agent to ensure no IPv4 route optimization.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes and then re-adds them to the hardware.

- This configuration command attempts to configure the prefix lengths **20** and **28** which triggers an error exception. One of the two prefixes in this command must be a prefix-length of **32** required when adding two prefixes.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 20 28
% One of the prefix lengths must be 32
```

IPv4 routes of certain prefix lengths can be optimized for enhanced route scale. The following command disables prefix optimization on the specified VRF(s) to provide more flexibility.

### Examples

- This configuration command disables prefix optimization on the default VRF.

```
switch(config)# ip hardware fib optimize disable-vrf default
! Please restart layer 3 forwarding agent to ensure that the disable-vrf option
change takes effect
```

- This configuration command disables prefix optimization on VRFs named **vrf1** and **vrf2**.

```
switch(config)# ip hardware fib optimize disable-vrf vrf1 vrf2
! Please restart layer 3 forwarding agent to ensure that the disable-vrf option
change takes effect
```

- This configuration command restarts the platform Layer 3 agent to ensure that the disable-vrf configuration takes effect.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

### Examples

- This configuration command enables prefix optimization on the default VRF.

```
switch(config)# ip hardware fib optimize vrf default prefix-length 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- This configuration command enables prefix optimization on VRFs named **vrf1** and **vrf2**.

```
switch(config)# ip hardware fib optimize vrf vrf1 vrf2 prefix-length 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- This configuration command disables optimization on **vrf1** and **vrf2** optimization configured in above example.

```
switch(config)# no ip hardware fib optimize vrf vrf1
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

The **platform trident forwarding-table partition flexible** command enables ALPM Mode in Flexible UFT mode using a subset of resources, so ALPM and Exact Match can coexist.

### Examples

- This configuration command sets up the flexible partition.

```
switch(config)# platform trident forwarding-table partition flexible ?
 alpm Shared UFT bank entries for the ALPM table
 exact-match Shared UFT bank entries for the exact-match table
 l2-shared Shared UFT bank entries for the MAC table
 l3-shared Shared UFT bank entries for the host table
```

- ALPM gives the route prefix in DEFIM (TCAM table for longest prefix matched (LPM) lookup) and ALPM tables.

```
switch(config)# platform trident forwarding-table partition flexible alpm ?
 184320 Upto 180K LPM routes
 368640 Upto 360K LPM routes
```

**Note:** The size parameter has following values:

- DCS-7300X3: 180k and 360k are accepted.
- CCS-720XP: 144k and 96k are accepted.
- Other sizes are invalid.

### 13.1.5.2 IPv4 Routescale with 2-to-1 Compression

The IPv4 routescale with 2-to-1 compression optimizes certain prefix lengths and enhances the route scale capabilities on 7500R, 7280R, 7500R2, and 7280R2 platforms. The compression is best suited to achieve route scale when route distribution has a large number of routes of one or two prefix lengths.

#### 13.1.5.2.1 Configuring IPv4 Routescale 2-to-1 Compression

Use the **compress** command to increase the hardware resources available for the specified prefix length. This command allows configuring up to one compressed prefix length, and this command is supported only on 7500R, 7280R, 7500R2, and 7280R2 platforms.

**Note:** The **compress** command takes effect only when you restart the platform Layer3 agent on 7500R, 7280R, 7500R2, and 7280R2 platforms. Use command **agent SandI3Unicast terminate** to restart the platform Layer3 agent.

#### Examples

- In the following example we are configuring prefix length **20** and **24**, expanding prefix length **19** and **23**, and compressing prefix length **25**.

```
switch(config)# ip hardware fib optimize prefix-length 20 24 expand 19 23 compress 25
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- In the following example we are configuring prefix length **20** and **23**, expanding prefix length **19**, compressing prefix length **24**.

```
switch(config)# ip hardware fib optimize prefix-length 20 23 expand 19 compress 24
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- Optionally, you can also use the **internet** profile to configure the IPv4 route scale compression.

```
switch(config)# ip hardware fib optimize prefixes profile internet
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

Configure a new TCAM profile for the **compress** configuration to work, and disable a few features in the new TCAM profile to make space for the flex-route feature in the hardware. Features like **acl vlan ip** and the **mirror ip** have to be disabled, if you need any of these features or any other features to be enabled with flex-route feature, contact the Arista team.

The **internet** profile works differently based on whether the flex-route feature is enabled in the TCAM profile or not. If the flex-route feature is enabled, the **internet** profile behaves like **ip hardware fib optimize prefix-length 20 23 expand 19 22 compress 24**. If the flex-route feature is disabled, the **internet** profile behaves as **ip hardware fib optimize prefix-length 20 24 expand 19 23**.

#### Example

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile flex-route copy default
switch(config-hw-tcam-profile-flex-route)# feature flex-route copy system-feature-source-profile
switch(config-hw-tcam-profile-flex-route-feature-flex-route)# exit
switch(config-hw-tcam-profile-flex-route)# no feature acl vlan ip
switch(config-hw-tcam-profile-flex-route)# no feature mirror ip
switch(config-hw-tcam-profile-flex-route)# exit
Saving new profile 'flex-route'
switch(config-hw-tcam)# system profile flex-route
```

### 13.1.5.2.2 Limitations

- A maximum of two prefix lengths can be optimized directly at any point of time, of which only one can be a non-nibble aligned prefix length. Additional prefix lengths can be optimized using the **expand** or the **compress** options.
- A maximum of 1-to-4 way expansion and 2-to-1 way compression into any optimized prefix length is supported. Multiple expansion prefix lengths can be programmed at any time, however, there can be just one compression prefix length programmed at any given point in time.
- A maximum of **4096** next-hops can be reliably pointed to by the compressed prefixes using 2-to-1 way compression.
- The 2-to-1 compression cannot be enabled along with unicast RPF. When both features are enabled together, unicast RPF functionality may not be correct.
- The flex-route feature in TCAM profiles based only on the default profile, while disabling the **acl vlan ip** and the **mirror ip** features. Contact the Arista team if any other feature, that is not available in the default TCAM profile, is required to be supported along with the flex-route feature, including support for Mirror to GRE tunnel or ACLs on SVI.
- VXLAN is not supported with the compress option of this feature. There is no Syslog or a warning message when VXLAN is configured along with the 2-to-1 way compression feature.

### 13.1.5.3 Show Commands

Display the IPv4 route scale summary using the `show platform arad ip route summary` command in the Global Configuration Mode. Resources for all IPv4 route scale routes are displayed by the `show platform arad ip route` command for the Global Configuration Mode.

#### Examples

- This command displays hardware resource usage for IPv4 routes.

```
switch(config)# show platform arad ip route summary

Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

- This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources appear with an asterisk (\*).

```
switch(config)# show platform arad ip route

Tunnel Type: M(mpls), G(gre)
* - Routes in LEM

| Routing Table |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|VRF| Destination | | | |Acl | |ECMP | FEC | Tunnel|
|ID | Subnet | Cmd | Destination |VID |Label| MAC / CPU Code |Index|Index|T Value|
|-----|-----|-----|-----|-----|-----|-----|-----|-----|

|0 | 10.20.30.0/24* | ROUTE |Et9 |1006 | - |00:01:00:02:00:03 | - |1027 | - |
```

### 13.1.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks.

IP Source Guard (IPSG) filters inbound IP packets based on the source MAC and IP addresses. Hardware supports IPSG. IPSG enabled on a Layer 2 port verifies IP packets received on this port. EOS permits packets if each packet source MAC and IP addresses match user-configured IP-MAC binding entries on the receiving VLAN and port. EOS drops packets with no match immediately.

### 13.1.6.1 Configuring IPSG

IPSG applies only to Layer 2 ports, and you enable it using the `ip verify source` command for the Global Configuration Mode. When configured on Layer 3 ports, IPSG does not take effect until this interface converts to Layer 2.

Layer 2 Port-Channels, not member ports, support IPSG. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therefore, source IP MAC binding entries should be configured on port channels using the `ip source binding` command. When configured on a port channel member port, IPSG does not take effect until deleting this port from the port channel configuration.

#### Examples

- These configuration commands exclude VLAN IDs **1** through **3** from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs **4** through **10** on **ethernet 36** filter using IPSG, while those received on VLANs **1** through **3** are permitted.

```
switch(config)# no ip verify source vlan 1-3
switch(config)# interface ethernet 36
switch(config-if-Et36)# switchport mode trunk
switch(config-if-Et36)# switchport trunk allowed vlan 1-10
switch(config-if-Et36)# ip verify source
switch(config-if-Et36)#
```

- This configuration command configures source IP-MAC binding entries to IP address **10.1.1.1**, MAC address **0000.aaaa.1111**, **VLAN ID 4094**, and **interface ethernet 36**.

```
switch(config)# ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface
ethernet 36
switch(config)#
```

### 13.1.6.2 DHCP Server Show Commands

Use the `show dhcp server` command to display DHCP server information.

- DHCPv4 display example:

```
switch# show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
 Interface Status

Ethernet1 Inactive (Could not determine VRF)
Ethernet2 Inactive (Not in default VRF)
Ethernet3 Inactive (Kernel interface not created yet)
Ethernet4 Inactive (Not up)
Ethernet5 Inactive (No IP address)
Ethernet6 Active
```

```

Vendor information:
Vendor ID: default
 Sub-options Data

 1 192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
 Sub-options Data

 2 192.0.2.2
 3 "Foo"

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.1

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2

```

- For DHCPv6, there are two additional fields in subnet information output, **Direct** field and the **Relay** field. These two fields specify if the DHCP Server is accepting broadcast or relayed messages.

The **Direct** field displays **Active** when the subnet matches the interface with DHCPv6 configured. This indicates the server is accepting broadcast messages.

The **Direct** field displays **Inactive** when there is another existing subnet already matching the interface, or when the subnet matches more than one DHCP configured interface.

Examples of outputs for the DHCPv6 **show dhcp server** command:

In this example, DHCPv6 is configured with subnet **fe80::/10** while being enabled on **Ethernet1** with address **fe80::1/64** and on **Ethernet3** with address **fe80::2/64**.

```

switch# show dhcp server ipv6
IPv6 DHCP server is active
Debug log is enabled

DNS server(s): fe80::6

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

 Interface Status

 Ethernet1 Active
 Ethernet3 Active

```

```

Subnet: fe80::/10

Subnet name: foo

Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5

Direct: Inactive (Multiple interfaces match this subnet: Ethernet1 Ethernet3)
Relay: Active

Active leases: 0

```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets **fc00::/7** and **fe80::/10** while being enabled on **Ethernet1** with address **fe80::1/10** and **fc00::1/7**.

```

switch# show dhcp server ipv6
IPv6 DHCP server is active

DNS server(s): fc00::2

DNS domain name: testaristanetworks.com

Lease duration: 1 days 3 hours 30 minutes

Active leases: 0

IPv6 DHCP interface status:

 Interface Status

 Ethernet1 Active

Subnet: fc00::/7

Subnet name: foo

Range: fc00::1 to fc00::5

DNS server(s): fc00::6 fc00::8

```

```
Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active
```

```
Active leases: 0
```

```
Subnet: fe80::/10
```

```
Subnet name: bar
```

```
Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active
```

```
Active leases: 0
```

- When a subnet is disabled, the **show dhcp server** command displays the disable message with a reason. The number of active leases of the disabled subnets will be **0**. In this example, there are overlapping subnets.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
 Interface Status

 Ethernet1 Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet 10.0.0.0/24)
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
 Interface Status

 Ethernet1 Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12 overlaps with an existing
pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example shows duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
```

```
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11
```

```
MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server (including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address).

```
switch# show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.ffac
```

### 13.1.7 DHCP Server

The router with DHCP Server enabled acts as a server that allocates and delivers network addresses with desired configuration parameters to its hosts.

The DHCP server is based on ISC Kea.

The router with an DHCP Server enabled acts as a server that allocates and delivers network addresses with desired configuration parameters to its hosts.

DHCP Server support includes:

DHCPv4 support includes:

- Configurable on different interfaces: Routed, VLAN, LAG, Sub-interface, and LAG Sub-interface.
- Configurable lease time for allocated network addresses.
- Configurable DNS domain.
- Configurable DNS servers.
- Configurable subnets with parameters:
  - Default gateway
  - DNS servers
  - Ranges
  - Lease time

Additional features for DHCPv4 include:

- Configurable TFTP server
- Configurable TFTP bootfile

Additional features for DHCPv4 includes:

- Configurable Vendor options with sub options
- Configurable sub option types include: IPv4 address, array of IPv4 addresses, and string
- TFTP bootfile now supports an URI

Additional features for DHCPv4 include a configurable static IP address for exclusive use by a given client, based on the client's MAC address.

Example deployment:

DHCP Server on an aggregation switch, via VXLAN tunnels.

### 13.1.8 DHCP Server Overview

The **dhcp server** command configures an Ethernet interface on a switch with DHCP server enabled. Configure the following features on all platforms:

- Interfaces including Routed, VLANs, LAG, Sub-interface, and LAG Sub-interface
- Lease time for allocated network addresses
- DNS domains
- DNS servers
- Subnets with parameters:
  - Default gateway
  - DNS servers
  - Ranges
  - Lease time
- TFTP Server-Name (DHCP option 66 )
- TFTP server Bootfile-Name (DHCP option 67)
- List of TFTP servers (DHCP option 150)
- Vendor options with suboptions (DHCP option 43)
- Suboptions including IPv4 address, array of IPv4 addresses, and string.
- TFTP server Bootfile-Name (DHCP option 67) with support for an URI.
- Configurable static IP address for exclusive use by a given client, based on the client MAC address.

**Note:** Only supported on a default VRF.

---

## Minimal DHCP Server Configuration

The following displays a DHCP server enabled for IPv4 on Ethernet1 and IPv6 on Ethernet 2.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# dhcp server ipv4
switch(config)# interface ethernet 2
switch(config-if-Et2)# dhcp server ipv6
```

The following file extract displays a minimal working configuration for DHCP IPv4.

```
interface Ethernet1
no switchport
dhcp server ipv4
ip address 192.0.2.1/24
dhcp server
subnet 192.0.2.0/24
range 192.0.2.100 192.0.2.199
```

The following file extract displays a minimal working configuration for DHCP IPv6.

```
interface Vlan1409
dhcp server ipv6
ipv6 address 2001:db8:0:10::1/64/10
dhcp server
subnet 2001:db8:0:10::/64
range 2001:db8:0:10::1000 2001:db8:0:10::1fff
```

### 13.1.8.1 Configuring DHCP Servers

The DHCP server options configured globally per address family apply to all subnets. Access the following commands under the **config-dhcp-server** level.

The following command enters the DHCP server global configuration mode.

```
switch# configure
switch(config)# dhcp server
switch(config-dhcp-server)#
```

Use the following command to disable the DHCP server.

```
switch(config-dhcp-server)# disabled
```

Use the following commands to configure the DNS servers. Only two servers can be configured globally per address family.

```
switch(config-dhcp-server)# dns server ipv4 192.0.2.4 192.0.2.5
switch(config-dhcp-server)# dns server ipv6 2001:db8:0:10::53 2001:db8:0:10::5353
```

The following commands configure the domain names for allocated IP addresses. For example, add a domain with the name **podV4.example.com** for DHCPv4 and a domain with the name **podV6.example.com** for DHCPv6.

```
switch(config-dhcp-server)# dns domain name ipv4 podV4.example.com
switch(config-dhcp-server)# dns domain name ipv6 podV6.example.com
```

The following commands configure lease time for the allocated IP addresses. For example, configure the lease time as one (1) day.

```
switch(config-dhcp-server)# lease time ipv4 1 days 0 hours 0 minutes
```

```
switch(config-dhcp-server)# lease time ipv6 1 days 0 hours 0 minutes
```

The following command configures the TFTP Server-Name. The server can be in the form of either an IPv4 address or a fully qualified domain name and only available in DHCPv4. For example, configure the TFTP server with the IPv4 address, 192.0.2.6.

```
switch(config-dhcp-server)# tftp server option 66 ipv4 192.0.2.6
```

The following command configures the TFTP Servers.

```
switch(config-dhcp-server)# tftp server option 150 ipv4 192.0.2.6 192.0.2.7
```

The following command configures the TFTP Server Bootfile-Name, only available in DHCPv4.

```
switch(config-dhcp-server)# tftp server file ipv4 bootfile.conf
```

The following command configures Vendor specific option. To enter the Vendor option submenu **config-dhcp-vendor-ipv4** from **config-dhcp-server** config mode, specify a vendor class identifier, only available in DHCPv4. For example, Vendor option for clients with vendor class identifier vendorClassIDA.

```
switch(config-dhcp-server)# vendor-option ipv4 vendorClassIDA
```

The following command configures **default**. If you do not configure the **default**, the DHCP Server sends the configured Vendor option to clients requesting a Vendor option with a vendor class identifier that does not match any configured Vendor option.

```
switch(config-dhcp-server)# vendor-option ipv4 default
```

The following command configures suboptions for the Vendor. The configuration sends the resulting Vendor option in a hexadecimal format to the desired client. The output displays a Vendor option with a suboption with IPv4 address 192.0.2.8, for clients with the vendor class identifier vendorClassIDA, resulting in Vendor option 1:4:c0:0:2:8.

```
Sub option number is 1
Length of the Data is 4
Data is c0:0:2:8
dhcp server
vendor-option ipv4 vendorClassIDA
sub-option 1 type ipv4-address data 192.0.2.8
```

The following command configures the Vendor option with IPv4 addresses 192.0.2.8 and 192.0.2.9, for clients with the vendor class identifier vendorClassIDA, resulting in the Vendor option fe:8:c0:0:2:8:c0:0:2:9.

```
switch(config-dhcp-server)# vendor-option ipv4 vendorClassIDA sub-option 254 type array ipv4-
address data 192.0.2.8 192.0.2.9
```

The following command configures Vendor option with a string "vendor", for all clients whose vendor class identifier does not match any configured Vendor option, resulting in Vendor option 1e:3:46:4f:4f:.

```
switch(config-dhcp-server)# vendor-option ipv4 default sub-option 30 type string data "vendor"
```

---

The following command sets up Vendor option holding two suboptions, suboption 1 holds the IPv4 address 192.0.2.8, and suboption 2 holds a string “vendor”, for all clients whose vendor class identifier does not match any configured Vendor option, resulting in Vendor option 1:4:c0:0:2:8:2:3:46:4f:4f.

```
switch(config-dhcp-server)# vendor-option ipv4 default sub-option 1 type ipv4-address data 192.0.2.8 sub-option 2 type string data "vendor"
```

## Configuring DHCP Server Subnets

DHCP Server settings can also be configured per subnet and overrides the DHCP Server global mode configurations. There can be multiple subnets configured, but they must not overlap. EOS disables overlapping subnets.

The following command enters DHCP Server subnet mode under the IPv4 address family.

```
switch(config-dhcp-server)# subnet 192.0.2.0/32
```

The following command enters DHCP Server subnet mode under IPv6 address family.

```
switch(config-dhcp-server)# subnet 2001:db8:0:10::/64
```

The following command configures the name of the subnet. For example, name subnetV4 for DHCPv4 and subnetV6 for DHCPv6.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 name subnetV4
switch(config-dhcp-server)# subnet 2001:db8:0:10::/64 name subnetV6
```

The following command configures range of IP addresses of the subnet. The range must be within the subnet mask, otherwise the subnet becomes disabled.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 range 192.0.2.100 192.0.2.199
switch(config-dhcp-server)# subnet 2001:db8:0:10::/64 range 2001:db8:0:10::1000 2001:db8:0:10::1fff
```

The following command configures the DNS servers for a subnet. Configure up to 2 servers per subnet.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 dns server 192.0.2.1 192.0.2.10
switch(config-dhcp-server)# subnet 2001:db8:0:10::/64 dns server 2001:db8:0:10::10 2001:db8:0:10::11
```

The following command configures the lease time for allocated IP addresses of the subnet.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 lease time ipv4 3 days 0 hours 0 minutes
switch(config-dhcp-server)# subnet fe80::/10 lease time ipv4 3 days 0 hours 0 minutes
```

The following command configures the default-gateway for a subnet.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 default-gateway 192.0.2.3
```

The following command configures the TFTP Server-Name for a subnet. The server can be in the form of either an IPv4 address or a fully qualified domain name, but can only be configured for DHCPv4.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 tftp server option 66 subnet-tftp.example.com
```

The following command configures a list of TFTP servers. The server can only be in the form of an IP address, but can only be configured for DHCPv4.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 tftp server option 150 192.0.2.6 192.0.2.7
```

The following command configures the TFTP server Bootfile-Name for a subnet, but can only be configured for DHCPv4.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24 tftp server file subnet-bootfile.conf
```

The following command configures a static IP address for exclusive use by a client. Enter the **dhcp-server-subnet** configuration submode, (**config-dhcp-mac-address-ipv4**) from and specify the client MAC Address. The IP address must not be used by another client. Only DHCPv4 addresses allowed for this configuration.

```
switch(config-dhcp-server)# subnet 192.0.2.0/24
switch(config-dhcp-server-subnet-ipv4)# reservations mac-address 1a1b.1c1d.1e1f ipv4-address
192.0.2.201
```

### 13.1.8.2 Displaying DHCP Information

#### Show DHCP Server Information

The following command displays the DHCP Server information.

```
switch# show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 192.0.2.4 192.0.2.5
DNS domain name: podV4.example.com
Lease duration: 1 days 0 hours 0 minutes
TFTP server: 192.0.2.6 (Option 66)
192.0.2.6 192.0.2.7 (Option 150)
TFTP file: https://john.doe@www.example.com:123/example/one
Active Leases: 1
IPv4 DHCP interface status:
Interface Status

Ethernet1 Inactive (Could not determine VRF)
Ethernet2 Inactive (Not in default VRF)
Ethernet3 Inactive (Kernel interface not created yet)
Ethernet4 Inactive (Not up)
Ethernet5 Inactive (No IP address)
Ethernet6 Inactive (No Link Local address)
Ethernet7 Inactive (DHCP relay is configured for this interface)
Ethernet8 Inactive (DHCP relay is always on)
Ethernet9 Active

Vendor information:
Vendor ID: default
Sub-options Data

1 192.0.2.0
2 "vendor"

Vendor ID: vendorClassIDA
Sub-options Data

254 192.0.2.8, 192.0.2.9

Subnet: 192.0.2.0/24
Subnet name: subnetFooV4
Range: 192.0.2.100 to 192.0.2.199
DNS server(s): 192.0.2.1 192.0.2.10
Lease duration: 3 days 0 hours 0 minutes
Default gateway address: 192.0.2.3
TFTP server:
 subnet-tftp.example.com (Option 66)
 192.0.2.6 192.0.2.7 (Option 150)
TFTP boot file: subnet-bootfile.conf
```

```
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 192.0.2.201
MAC address: 2a2b.2c2d.2e2f
IPv4 address: 192.0.2.150
```

## Displaying Disabled Subnets

When a subnet becomes disabled, the **show dhcp server [ipv4|ipv6]** output displays the disabled message under Disabled reason(s). None of the disabled subnets have active leases. Currently, the output displays only 2 disabled reasons.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
Interface Status

Ethernet1 Active

Subnet: 10.0.0.0/24 (Subnet is disabled)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
Disabled reason(s):
Overlapping subnets: 10.0.0.0/8

Subnet: 10.0.0.0/8 (Subnet is disabled)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.5.5.5
Default gateway address: 10.0.0.3
Active leases: 0
Disabled reason(s):
Overlapping subnets: 10.0.0.0/24

For Overlapping ranges:
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
Interface Status

Ethernet1 Active

Subnet: 10.0.0.0/8 (Subnet is disabled)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
Disabled reason(s):
Overlapping range: 10.0.0.9 to 10.0.0.12

E.g. Duplicate static IP address reservation:
Subnet: 10.0.0.0/8 (Subnet is disabled)
Subnet name:
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.5.5.5
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11

MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11

Disabled reason(s):
Duplicate IPv4 address reservation: 10.0.0.11
```

For DHCPv6, **Direct** and **Relay** indicates that the DHCP Server accepts broadcast and relayed messages.

```
switch# show dhcp server ipv6
IPv6 DHCP server is active
Debug log is enabled
DNS server(s): fe80::6
DNS domain name: aristanetworks.example.com
Lease duration: 1 days 3 hours 30 minutes
Active leases: 0
IPv6 DHCP interface status:
Interface Status

Ethernet1 Active
Ethernet3 Active

Subnet: fe80::/10
Subnet name: foo
Range: fe80::1 to fe80::3
DNS server(s): fe80::4 fe80::5
Direct: Inactive (Multiple interfaces match this subnet: Ethernet1 Ethernet3)
Relay: Active
Active leases: 0
```

For DHCPv6, a subnet may match only one interface and vice versa. Otherwise the subnet is disabled and no lease assigned for that subnet.

```
interface Ethernet1
no switchport
ipv6 address 2001:db8:0:10::1/64
dhcp server ipv6
interface Ethernet3
no switchport
ipv6 address 2001:db8:0:11::1/64
dhcp server ipv6
dhcp server
subnet 2001:db8::/56
```

The following enables DHCPv6 on Ethernet1 (with address fc00::1/7 and fe80::1/10), and then configures subnets fc00::/7 and fe80::/64 for DHCPv6.

```
interface Ethernet1
no switchport
ipv6 address fc00::1/7
ipv6 address fe80::1/64 link-local
dhcp server ipv6
dhcp server
subnet fc00::/7
subnet fe80::/64

#show dhcp server ipv6
IPv6 DHCP server is active
DNS server(s): fc00::2
DNS domain name: aristanetworks.example.com
Lease duration: 1 days 3 hours 30 minutes
Active leases: 0
IPv6 DHCP interface status:
Interface Status

Ethernet1 Active

Subnet: fc00::/7
Subnet name: foo
Range: fc00::1 to fc00::5
DNS server(s): fc00::6 fc00::8
Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0

Subnet: fe80::/64
Subnet name: subnetBarV6
Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active
```

---

```
Active leases: 0
```

## Leases

The following output displays the IP addresses allocated by the DHCP Server with the **show dhcp server [ipv4|ipv6] leases** command. It also displays the expected end time for the address, the time when the address is assigned, and the equivalent MAC address.

```
switch# show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b
End: 2019/06/20 18:06:33 UTC
Last transaction: 2019/06/20 14:36:33 UTC
MAC address: 165a.a86d.ffa6
```

### 13.1.9 DHCP Relay Global Configuration Mode

Configure DHCP Relay using the **dhcp relay** command in the global configuration mode. The command places the switch in DHCP Relay mode and allows the configuration of DHCP Relay on several interfaces with a single command. The configuration entered in the DHCP Relay global configuration mode can be overridden by equivalent interface specific commands.

#### Examples

The **dhcp relay** command places the switch in the DHCP Relay configuration mode.

```
switch(config)# dhcp relay
switch(config-dhcp-relay)#
```

Specify the IP address of the default DHCP or DHCPv6 Server. Multiple IP addresses can be specified and DHCP requests forward to all specified helper addresses. Configure an **ip helper-address IP\_Address** under each desired routing interface.

Use the following commands to forward DHCP broadcast packets received on interface **Ethernet1** and **Vlan2** to DHCP servers at **10.0.0.1**, **10.0.0.2**, and to hostname **DefaultDHCPHostname**:

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 192.168.1.1/16

switch(config)# interface vlan2
switch(config-if-Et1)# ip address 172.16.1.1/16

switch(config)# dhcp relay
switch(config-dhcp-relay)# server 10.0.0.1
switch(config-dhcp-relay)# server 10.0.0.2
switch(config-dhcp-relay)# server DefaultDHCPHostname
```

Use the following commands to forward DHCPv6 broadcast packets received on interface **ethernet1** to a DHCPv6 Server at **fc00::3**.

```
switch(config)# interface ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ipv6 address fc00::1/10

switch(config)# dhcp relay
switch(config-dhcp-relay)# server fc00::3
```

The configuration points a routed interface to the specified DHCP and DHCPv6 server, if the configuration meets following criteria:

- The default VRF contains the routed interface.
- The interface has an IP address configured.
- The configuration does not occur on a Management or a Loopback interface.

Use the following commands to remove the default DHCP or DHCPv6 Server.

```
switch(config)# dhcp relay
switch(config-dhcp-relay)# no server 10.0.0.1
switch(config-dhcp-relay)# no server 10.0.0.2
switch(config-dhcp-relay)# no server DefaultDHCPHostname
switch(config-dhcp-relay)# no server fc00::3
```

To override the default DHCP Server on an interface, the parameter, **ip helper-address IP\_Address**, must be used.

Use the following commands to forward a DHCP broadcast packet received on interface Ethernet1 to DHCP Servers at **10.0.0.1**, **10.0.0.2** and hostname **DefaultDHCPHostname**, but VLAN2 broadcasts packets to the DHCP Server at **10.0.0.3** only.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 192.168.1.1/16

switch(config)# interface vlan2
switch(config-if-Et1)# ip address 172.16.1.1/16
switch(config-if-Et1)# ip helper-address 10.0.0.3

switch(config)# dhcp relay
switch(config-dhcp-relay)# server 10.0.0.1
switch(config-dhcp-relay)# server 10.0.0.2
switch(config-dhcp-relay)# server DefaultDHCPHostname
```

To override the default DHCPv6 Server on an interface, the parameter, **ipv6 helper-address IPv6\_Address>** must be used.

Use the following commands to forward a DHCPv6 broadcast packet received on interface Ethernet1 to DHCPv6 Server at **fc00::3**, and VLAN2 broadcasts packets to DHCPv6 Server at **fc00::4** only.

```
switch(config)# interface ethernet 1
```

```

switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ipv6 address fc00::1/10

switch(config)# interface vlan2
switch(config-if-Et1)# ipv6 address fc00::2/10
switch(config-if-Et1)# ipv6 helper-address fc00::4

switch(config)# dhcp relay
switch(config-dhcp-relay)# server fc00::3

```

You can disable DHCP or DHCPv6 Relay functionality from a specific interface. This disables both DHCP Relay global and interface mode configurations.

Use the following command to disable DHCP Relay functionality only.

```

switch(config)# interface vlan3
switch(config-if-Et1)# dhcp relay ipv4 disabled

```

Use the following to disable DHCPv6 Relay functionality only.

```

switch(config)# interface Vvlan3
switch(config-if-Et1)# dhcp relay ipv6 disabled

```

### 13.1.9.1 Displaying DHCP Relay

The **show ip dhcp relay** command displays all the interfaces enabled with DHCP Relay and the server configured on these interfaces.

#### Example

```

switch# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCPv6 Relay Remote ID (Option 37) encoding format: MAC address:interface ID
DHCP Smart Relay is disabled
Default L3 interface DHCP servers:
 DHCPv4 servers: 10.0.0.1
 10.0.0.2
 DefaultDHCPHostname
 DHCPv6 servers: fc00::3
Interface: Ethernet1
 DHCP Smart Relay is disabled
 DHCPv6 all subnet relaying is disabled
 Using default DHCPv4 servers
 Using default DHCPv6 servers
Interface: Ethernet2
 DHCP Smart Relay is disabled
 DHCPv6 all subnet relaying is disabled
 Using default DHCPv4 servers
 DHCPv6 servers: fc00::4
Interface: Vlan2
 DHCP Smart Relay is disabled
 DHCPv6 all subnet relaying is disabled
 DHCPv4 servers: 11.0.0.3
 DHCPv6 servers: fc00::4
Interface: Vlan3
 DHCP Smart Relay is disabled
 DHCPv6 all subnet relaying is disabled
 DHCPv4 Relay is disabled

```

DHCPv6 Relay is disabled

### 13.1.9.2 DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- [Configuring DHCP Relay](#)
- [DHCP Relay Global Configuration Mode Show Command](#)

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- **VPN identifier** - The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

**Table 75: VPN Identifier**

| SubOpt | Len | ASCII VRF Identifier |   |   |   |   |   |   |
|--------|-----|----------------------|---|---|---|---|---|---|
| 151    | 7   | V                    | R | F | N | A | M | E |

- **Link selection** - The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. After enabling the DHCP smart relay, the link selection fills with the subnet of the active address. The relay agent sets the Gateway IP address (glPaddr) to its IP address so that DHCP messages can be routed over the network to the DHCP server.

**Table 76: Link Selection**

| SubOpt | Len | Subnet IP Address |    |    |    |
|--------|-----|-------------------|----|----|----|
| 5      | 4   | A1                | A2 | A3 | A4 |

- **Server identifier override** - The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. After enabling the DHCP smart relay, the server identifier fills with the active address, one of the primary or secondary addresses chosen by smart relay mechanism.

**Table 77: Link Selection**

| SubOpt | Len | Overriding Server Identifier Address |    |    |    |
|--------|-----|--------------------------------------|----|----|----|
| 11     | 4   | B1                                   | B2 | B3 | B4 |

- **VSS control suboption as suboption 152** - The DHCP server strips out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.
- **Circuit ID** - Identifies the circuit, interface or VLAN, on the switch that received the request.
- **Remote ID** - Identifies the remote host.

**Note:** The DHCP server must be capable of handling VPN identifier information in Option 82.

Direct communication between DHCP client and server may not be possible if they reside in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

The relay agent adds all the appropriate sub-options, and forwards all request packets, including renew and release, to the DHCP server. When the relay receives the DHCP server response messages, EOS removes Option 82 information and forwards the response to the DHCP client in the client VRF.

### 13.1.9.2.1 Configuring DHCP Relay

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The [ip helper-address](#) command enables DHCP relay on an interface and relays DHCP messages to the specified IPv4 address.

#### Example

This command enables DHCP relay on the *interface ethernet 1/2*; and relays DHCP messages to the server at **1.1.1.1**.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# ip helper-address 1.1.1.1
switch(config-if-Et1/2)#
```

The commands provided in the following examples enable the attachment of VRF-related tags in the relay agent information option. If both the DHCP client interface and server interface exist on the same VRF, default or non-default, then EOS does not insert the VRF-related DHCP relay agent information option.

#### Examples

- This command configures the DHCP relay to add option 82 information.

```
switch(config)# ip dhcp relay information option
```

- These commands configure two new VRF instances and assign them Route Distinguishers (RDs).

```
switch(config)# vrf instance mtxxg-vrf
switch(config-vrf-mtxxg-vrf)# router bgp 50
switch(config-router-bgp)# vrf mtxxg-vrf
switch(config-router-bgp-vrf-mtxxg-vrf)# rd 5546:5546
switch(config)# vrf instance qchyh-vrf
switch(config-vrf-qchyh-vrf)# router bgp 50
switch(config-router-bgp)# vrf qchyh-vrf
switch(config-router-bgp-vrf-qchyh-vrf)# rd 218:218
```

- This command configures an interface connected to DHCP client in vrf *mtxxg-vrf* and assigns an IP address.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# no switchport
```

- This command configures the DHCP client interface in VRF *mtxxg-vrf*.

```
switch(config-if-Et9)# vrf mtxxg-vrf
switch(config-if-Et9)# ip address 10.10.0.1/16
```

- This command configures the server interface in VRF *qchyh-vrf*.

```
switch(config-if-Et11)# vrf qchyh-vrf
switch(config-if-Et11)# ip address 10.40.0.1/16
```

- This command configures a helper address for a DHCP server in VRF *qchyh-vrf*.

```
switch(config-if-Et11)# ip helper-address 10.40.2.3 vrf qchyh-vrf
```

### Configuring Option 82

Use the following commands to enter Information Option (Option 82) insertion and configure the format of information options:

```
switch(config)#dhcp relay
switch(config-dhcp-relay)#information option
switch(config-information-option)#
```

To specify the format for the **circuit-id encoding**, use the following command:

```
switch(config-information-option)#circuit-id encoding (%x | %p)
```

The default format uses *string* denoted by **%p**. Setting the encoding to **%x** enables hex encoding for the circuit ID. The configured value must be a valid hex number. If not configured, DHCP Relay uses the default format.

To specify the format for the **remote-id encoding**, use the following command:

```
switch(config-information-option)#remote-id encoding (%x | %p)
```

The default format uses *string* denoted by **%p**. Setting the encoding to **%x** enables hex encoding for the remote ID. The configured value must be a valid hex number. If not configured, DHCP Relay uses the default format.

#### 13.1.9.2.2 DHCP Relay Global Configuration Mode Show Command

##### Example

This command displays the VRF specifier for the server:

```
switch# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Ethernet9
Option 82 Circuit ID: Ethernet9
DHCP Smart Relay is disabled
DHCP servers: 10.40.2.3
10.40.2.3:vrf=qchyh-vrf
```

#### 13.1.9.3 DHCP Relay in VXLAN EVPN

The [ip dhcp relay information option \(Global\)](#) command enables the configuration of the DHCP server to uniquely identify the origin of the request using a source-interface and the helper address. Configure the source interface with a routable address used by the DHCP server to uniquely identify the DHCP relay agent that forwarded the client request.

---

## Configuring DHCP Relay in VXLAN EVPN (IPv4)

Use the following command to enable the DHCP relay information option (**Option 82**) required to specify a source interface.

```
switch(config)# ip dhcp relay information option
```

The following configures a Loopback interface as the source interface.

```
switch(config)# interface Loopback1
switch(config-if-Lo1)# ip address 1.1.1.1/24
```

Use the following commands to configure the Loopback interface as the specified source interface for the helper address.

```
switch(config)# interface vlan100
switch(config-if-Vl100)# ip helper-address 10.1.1.4 source-interface Loopback1
```

Use the following commands to configure the Loopback interface when the DHCP server resides in a different VRF (**red**). The source interface must be configured in the DHCP server VRF for the command to take effect.

```
switch(config)# interface Loopback3
switch(config-if-Lo3)# vrf red
switch(config-if-Lo3)# ip address 1.1.1.1/24

switch(config)# interface vlan100
switch(config-if-Vl100)# ip helper-address 10.1.1.4 vrf red source-interface Loopback3
```

The following command disables the use of source interface along with the helper address.

```
switch(config)# interface vlan100
switch(config-if-Vl100)# no ip helper-address 10.1.1.4 source-interface Loopback1
```

## Configuring DHCP Relay in VXLAN EVPN (IPv6)

Use the following commands to configure a local interface.

```
switch(config)# interface Loopback2
switch(config-if-Vl100)# ipv6 address 2001::10:20:30:1/128
```

Use the following commands to configure the Loopback interface as the local interface for the helper address.

```
switch(config)# interface vlan200
switch(config-if-Vl200)# ipv6 dhcp relay destination 2002::10:20:30:2 local-interface Loopback2
```

Use the following commands to configure the Loopback interface when the DHCP server is in a different VRF (**red**). The local interface must be configured in the DHCP server's VRF for the command to take effect.

```
switch(config)# interface Loopback4
switch(config-if-Lo4)# vrf red
switch(config-if-Lo4)# ipv6 address 2001::10:20:30:1/128

switch(config)# interface vlan200
switch(config-if-Vl200)# ipv6 dhcp relay destination 2002::10:20:30:2 vrf red local-interface Loopback4
```

Use the following command to disable the use of local interface along with the helper address.

```
switch(config-if-Vl200)# no ipv6 dhcp relay destination 2002::10:20:30:2 local-interface Loopback4
```

The following command displays the status of DHCP relay option (**Option 82**) and lists the configured DHCP servers.

```
switch# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is enabled
DHCP Smart Relay is disabled
Interface: Vlan100
 Option 82 Circuit ID: Vlan100
 DHCP Smart Relay is disabled
 DHCP servers: 10.1.1.4
Interface: Vlan200
 Option 82 Circuit ID: Vlan100
 DHCP Smart Relay is disabled
 DHCP servers: 2002::10:20:30:2
```

### 13.1.10 DHCP Snooping with Bridging

In this configuration, in addition to sending DHCP packets to relay after adding information option, the packets also be bridge within the VLAN. In the bridging mode, the switch intercepts DHCP packets, inserts option-82 if not already present, and bridges the packet within the VLAN. This mode of DHCP snooping can be configured without DHCP relay configuration.

#### 13.1.10.1 Configuring DHCP Snooping with Bridging

Following are the steps to configure DHCP snooping with bridging:

1. Enable DHCP snooping feature using the [ip dhcp snooping](#) command.

```
switch# ip dhcp snooping
```

2. Enable the insertion of option-82 in DHCP request packets using the [ip dhcp snooping information option](#) command. By default, option-82 is disabled and must be enabled for DHCP Snooping to be functional.

```
switch# ip dhcp snooping information option
```

3. Enable DHCP snooping on the corresponding VLANs using the [ip dhcp snooping vlan](#) command. By default, EOS disables DHCP snooping on any VLAN.

```
switch# ip dhcp snooping vlan
```

4. Set the circuit-id information sent in option-82. By default, EOS sends the Interface name and VLAN ID. Remote circuit-id contains the MAC address of the relay agent.

```
switch# ip dhcp snooping information option circuit-id type 2 format
%h:%p Hostname and interface name
%p:%v Interface name and VLAN ID
```

5. Enable bridging capabilities of DHCP snooping using the [ip dhcp snooping bridging](#) command. This command enables DHCP snooping with or without DHCP relay configuration.

```
switch# ip dhcp snooping bridging
```

#### 13.1.10.2 DHCP Snooping with Bridging Show Commands

The [show ip dhcp snooping](#) displays the DHCP snooping with bridging information.

```
switch# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
```

```

650
DHCP Snooping bridging is operational on following VLANs:
650
Insertion of Option-82 is enabled
Circuit-id sub-option Type: 0
Circuit-id format: Interface name:Vlan ID
Remote-id: 00:1c:73:8d:eb:67 (Switch MAC)

```

### 13.1.10.3 Troubleshooting

- Configure all the needed commands so that DHCP snooping is enabled and operational on all the VLANs.
- **show ip dhcp snooping** displays whether the DHCP snooping is operational or not.
- **show ip dhcp snooping counters** displays if snooped packets are getting dropped or not.
- **show ip dhcp snooping counters debug** displays the reason for packets getting dropped.

```

switch# show ip dhcp snooping counters debug
Counter Requests Responses

Received 3 2
Forwarded 3 2
Dropped - Invalid VlanId 0 0
Dropped - Parse error 0 0
Dropped - Invalid Dhcp Otype 0 0
Dropped - Invalid Info Option 0 0
Dropped - Snooping disabled 0 0

```

- Check if the packets are hitting the TCAM rule.

```

switch# show platform trident tcam detail | grep -i dhcp
DHCP Snooping uses 3 entries.
...
655402 45 hits - DHCP client to relay trap-to-cpu

```

### 13.1.11 TCP MSS Clamping

TCP MSS clamping limits the value of the Maximum Segment Size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

#### 13.1.11.1 Cautions

*This feature should be used with caution.* When the TCP MSS clamping feature is enabled by issuing the [tcp mss ceiling](#) command on any routed interface, *all* routed IPv4 TCP SYN packets (TCP packets with the “SYN” flag set) are sent by default to the CPU and switched through software, even on interfaces where no TCP MSS ceiling has been configured, as long as TCP MSS clamping is enabled. This limits the number of TCP sessions that can be established through the switch per second, and, because throughput for software forwarding is limited, this feature can also cause packet loss if the rate at which TCP SYN packets are sent to the CPU exceeds the limits configured in the control-plane policy map.

Packet loss and TCP session reductions can be minimized by enabling TCP MSS clamping in hardware, but only SYN packets in which MSS is the first TCP option are clamped in the hardware data path; other TCP SYN packets are still switched through software.

To disable MSS clamping, the MSS ceiling must be removed from every interface on which it has been configured by issuing the `no tcp mss ceiling` command on each configured interface.

#### 13.1.11.2 Enabling TCP MSS Clamping

There is no global configuration to enable TCP MSS clamping. It is enabled as soon as an MSS ceiling is configured on at least one interface.

#### 13.1.11.3 Disabling TCP MSS Clamping

To disable TCP MSS clamping, the MSS ceiling configuration must be removed from every interface by using the `no` or `default` form of the `tcp mss ceiling` command on every interface where a ceiling has been configured.

#### 13.1.11.4 Configuring the TCP MSS Ceiling on an Interface

The TCP MSS ceiling limit is set on an interface using the `tcp mss ceiling` command. This also enables TCP MSS clamping on the switch as a whole.

**Note:** Configuring a TCP MSS ceiling on any interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on IPv4 unicast packets entering the switch; the configuration has no effect on GRE transit packets.
- The feature is supported only on IPv4 routed interfaces. It is not supported on L2 (switchport) interfaces or IPv6 routed interfaces.
- The feature is not supported for IPv6 packets even if they are going to be tunneled over an IPv4 GRE tunnel.
- The feature is not supported on VXLAN, loopback or management interfaces.
- The feature is only supported on IPv4 unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.

#### Example

- These commands configure **interface ethernet 5** as a routed port, then specify a maximum MSS ceiling value of **1458** bytes for TCP SYN packets exiting that port.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv4 1458 egress
switch(config-if-Et5)#
```

- These commands apply TCP MSS clamping at **1436** bytes in the egress direction for IPv6 packets:

```
switch(config)# interface ethernet 26
switch(config)# tcp mss ceiling ipv6 1436 egress
```

- These commands apply TCP MSS clamping at **1476** bytes for IPv4 packets and **1436** bytes for IPv6 packets in egress direction:

```
switch(config)# interface ethernet 27
switch(config)# tcp mss ceiling ipv4 1476 ipv6 1436 egress
```

#### 13.1.11.5 Verifying the TCP MSS Clamping

If TCP MSS ceiling is configured on an interface and if the command **show cpu counters queue | nz** is incrementing in **CoppSystemL3Ttl1IpOptUcast** field for Tcp packet with Syn flag, then TCP MSS clamping is being performed in Software.

```
switch# show cpu counters queue | nz
Fap0.1:
CoPP Class Queue Pkts Octets DropPkts DropOctets
Aggregate

CoppSystemL3Ttl1IpOptUcast TC0 1 82 0 0
```

#### 13.1.11.6 Configuring TCP MSS Clamping

##### Interface Configuration

You can specify the TCP MSS value under the **interface configuration mode**. The command syntax is shown below:

```
tcp mss ceiling [ipv4 | ipv6] 64-65515 egress
```

The keyword **egress** specifies that the MSS clamping is applied on packets transmitted out on the interface in egress direction.

The following example applies TCP MSS clamping at **1436** bytes in the egress direction for IPv4 packets:

```
switch(config)# interface ethernet 25
switch(config)# tcp mss ceiling ipv4 1436 egress
```

the following example applies TCP MSS clamping at **1436** bytes in the egress direction for IPv6 packets:

```
switch(config)# interface ethernet 26
switch(config)# tcp mss ceiling ipv6 1436 egress
```

The following example applies TCP MSS clamping at **1476** bytes for IPv4 packets and **1436** bytes for IPv6 packets in egress direction:

```
switch(config)# interface ethernet 27
switch(config)# tcp mss ceiling ipv4 1476 ipv6 1436 egress
```

##### Hardware TCP MSS Clamping Configuration

Hardware MSS clamping requires the system TCAM profile to have TCP MSS clamping enabled. You can achieve this by creating a user defined TCAM profile as described below. The [User Defined PMF Profiles - TOI](#) provides general guidelines on how to create and configure TCAM profiles.

The system TCAM profile must have the feature **tcp-mss-ceiling ip** in it in order to use hardware MSS clamping. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

##### Step 1: Create the user defined TCAM profile

The following example demonstrates copying any source profile and adding the feature **tcp-mss-ceiling ip**. In this example, the profile name is **Pro1** and the source profile name is **Source1**.

```
(config)# hardware tcam
(config-hw-tcam)# profile Pro1 copy Source1
(config-hw-tcam-profile-Pro1)# feature tcp-mss-ceiling ip copy system-feature-source-profile
```

TCP MSS clamping is supported only for IPv4 routed packets. Set the packet type for the feature as follows. This is optional when using **copy system-feature-source-profile**. In this example, the system profile name is **Pro1** and the feature name is **Source1**.

```
(config-hw-tcam-profile-Pro1-feature-Source1)# packet ipv4 forwarding routed
```

Set the key size limit to **160**. This is also optional when the feature is copied from **system-feature-source-profile**. In this example, the system profile name is **Pro1** and the feature name is **Source1**.

```
(config-hw-tcam-profile-Pro1-feature-Source1)# key size limit 160
```

Removing unused features to ensure that the TCP MSS TCAM DB is allocated. In this example, the system profile name is **Pro1** and the feature name is **Source1**.

```
(config-hw-tcam-profile-Pro1-feature-Source1)# exit
(config-hw-tcam-profile-Pro1)# no feature mirror ip
(config-hw-tcam-profile-Pro1)# no feature acl port mac
```

## Step 2: Apply the user defined TCAM profile to the system.

The following example sets the profile as the system profile under the *hardware tcam* mode. In this example, the system profile name is **red**.

```
(config-hw-tcam)# system profile red
```

When the system TCAM profile is changed, it is expected that some agents will restart. Also it might be necessary to remove some unused features from the TCAM profile to ensure that the TCP MSS feature gets allocated a TCAM DB. For more information about configuring TCAM profiles, refer to [User Defined PMF Profiles](#).

**Note:** The hardware clamping only works for TCP packets with MSS as the first TCP option. Packets where MSS is not the first TCP option are still trapped to CPU for clamping in software even if the **feature tcp-mss-ceiling** is configured in the system TCAM profile.

## Backward Compatibility

The **tunnel mss ceiling** command which provides the same functionality is deprecated with the introduction of **tcp mss ceiling** command. The configuration option **tunnel mss ceiling** was available only on GRE tunnel interfaces, while **tcp mss ceiling** is supported on other routed IPv4 interfaces as well.

### 13.1.11.7 TCP MSS Clamping Limitations

- The TCP-MSS Clamping is not supported on L2 (switchport ) interfaces.
- The TCP-MSS Clamping is NOT supported on VXLAN, Loopback and Management interfaces.
- The TCP-MSS Clamping is supported only in the Egress direction.
- The TCP-MSS Clamping is only supported on unicast routed packets entering the switch. The configuration has no effect on GRE transit packets and GRE decap case, even if the Egress interface has TCP MSS ceiling configured.

---

## Software TCP MSS Clamping Limitations

- Once the TCP-MSS Clamping is enabled, all routed TCP-SYN packets will be software switched, even on interfaces where there is no TCP-MSS ceiling configuration.
- TCP SYN packets could get dropped under high CPU usage conditions or due to DOS attack protection mechanisms such as PDP/CoPP. These factors could limit the TCP connection establishment rate, i.e new TCP sessions established per second through the switch.

## Hardware MSS Clamping Limitations

- Hardware TCP-MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- TCP SYN packets where TCP-MSS is not the first TCP option are trapped to CPU for MSS adjustment even in hardware MSS clamping mode.
- Hardware TCP-MSS clamping is not supported for IPv6 packets.

### 13.1.11.8 Configuring Hardware Support for TCP MSS Clamping

TCP MSS clamping can be supported in hardware, but some packets are still routed through the software data path, and an MSS ceiling value must be configured on each interface where clamping is to be applied.

Hardware support for clamping is accomplished through the use of a user-defined TCAM profile. The TCAM profile can be created from scratch or copied from an existing profile, but in either case it must include the `tcp-mss-ceiling ip` feature.

#### Guidelines

- When the system TCAM profile is changed, some agents will restart.
- To ensure that the TCP MSS feature is allocated a TCAM DB, it may be necessary to remove some unused features from the TCAM profile.
- Hardware TCP MSS clamping only works for TCP packets with MSS as the first TCP option. Other TCP SYN packets are still trapped to the CPU for clamping in software.
- Hardware TCP MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- The maximum MSS ceiling limit with hardware MSS clamping is 32727 even though the CLI allows configuration of much larger values.
- For more information on the creation of user-defined TCAM profiles, see <https://www.arista.com/en/support/toi/eos-4-20-5f/13977-user-defined-pmf-profile>.

To configure hardware support for TCP MSS clamping, create a TCAM profile that includes the `tcp mss ceiling` feature, then apply it to the system.

#### 13.1.11.8.1 Creating the TCAM Profile

A TCAM profile that supports TCP MSS clamping can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

#### Modifying a Copy of the Default TCAM Profile

The following commands create a copy of the default TCAM profile, name it `tcp-mss-clamping`, and configure it to enable MSS clamping in hardware, then remove some unused features included in the default profile to ensure that there are sufficient TCAM resources for the clamping feature.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile tcp-mss-clamping copy default
```

```

switch(config-hw-tcam-profile-tcp-mss-clamping1)# feature tcp-mss-ceiling ip copy system-feature-
source-profile
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-ceiling)# key size limit 160
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-ceiling)# packet ipv4 forwarding
 routed
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-ceiling)# exit

switch(config-hw-tcam-profile-tcp-mss-clamping)# no feature mirror ip
switch(config-hw-tcam-profile-tcp-mss-clamping)# no feature acl port mac
switch(config-hw-tcam-profile-tcp-mss-clamping1)# exit

switch(config-hw-tcam)# exit

switch(config)#

```

### 13.1.11.8.2 Applying the TCAM Profile to the System

The following commands enter Hardware TCAM Configuration Mode and set the **tcp-mss-clamping** profile as the system profile.

```

switch(config)# hardware tcam
switch(config-hw-tcam)# system profile tcp-mss-clamping
switch(config-hw-tcam)#

```

### 13.1.11.8.3 Verifying the TCAM Profile Configuration

The following command displays hardware TCAM profile information to verify that the user-defined TCAM profile has been applied correctly.

```

switch(config)# show hardware tcam profile

Configuration Status
FixedSystem tcp-mss-clamping tcp-mss-clamping

switch(config)#

```

## 13.1.12 IPv4 GRE Tunneling

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation.

**Note:** The forwarding over GRE tunnel interface on DCS-7500R is supported only if all the line cards on the system have Jericho family chip-set.

### 13.1.12.1 Configuring GRE Tunneling Interface

#### On a Local Arista Switch

```

switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.1/24
switch(config-if-Tu10)# tunnel source 10.1.1.1
switch(config-if-Tu10)# tunnel destination 10.1.1.2
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10

```

---

## On a Remote Arista Switch

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.2/24
switch(config-if-Tu10)# tunnel source 10.1.1.2
switch(config-if-Tu10)# tunnel destination 10.1.1.1
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

## Alternative Configuration for Tunnel Source IPv4 Address

```
switch(config)# interface Loopback 10
switch(config-if-Lo10)# ip add 10.1.1.1/32
switch(config-if-Lo10)# exit

switch(config)# conf terminal
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel source interface Loopback 10
```

## Configuration for Adding an IPv4 Route over the GRE Tunnel Interface

```
switch(config)# ip route 192.168.100.0/24 Tunnel 10
```

### Tunnel Mode

Tunnel Mode needs to be configured as gre, for GRE tunnel interface. Default value is **tunnel mode gre**.

### IP Address

Configures the IP address for the GRE tunnel interface. The IP address can be used for routing over the GRE tunnel interface. The configured subnet is reachable over the GRE tunnel interface and the packets to the subnet are encapsulated in the GRE header.

### Tunnel Source

Specifies the source IP address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel source IPv4 address should be a valid local IPv4 address configured on the Arista Switch. The tunnel source can also be specified as any routed interface on the Arista Switch. The routed interface's IPv4 address is assigned as the tunnel source IPv4 address.

### Tunnel Destination

Specifies the destination IPv4 address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel destination IPv4 should be reachable from the Arista Switch.

### Tunnel Path Mtu Discovery

Specifies if the “Do not Fragment” flag needs to set in the outer IPv4 encapsulation header for packets going over the GRE tunnel interface.

### Tunnel TOS

Specifies the Tunnel Type of Service (ToS) value to be assigned to the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. Default TOS value of **0** will be assigned if tunnel TOS is not configured.

## Tunnel TTL

Specifies the TTL value to be assigned to the outer IPv4 encapsulation header for packet going over the GRE tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel Path MTU Discovery to be configured.

### 13.1.12.2 Displaying GRE tunnel Information

- The following commands display the tunnel configuration.

```
switch# show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
Hardware is Tunnel, address is 0a01.0101.0800
Internet address is 192.168.1.1/24
Broadcast address is 255.255.255.255
Tunnel source 10.1.1.1, destination 10.1.1.2
Tunnel protocol/transport GRE/IP
 Key disabled, sequencing disabled
 Checksumming of packets disabled
Tunnel TTL 10, Hardware forwarding enabled
Tunnel TOS 10
Path MTU Discovery
Tunnel transport MTU 1476 bytes
Up 3 seconds
```

- ```
switch# show gre tunnel static
```

Name	Index	Source	Destination	Nexthop	Interface
Tunnel10	10	10.1.1.1	10.1.1.2	10.6.1.2	Ethernet6/1

```
switch# show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
  via 10.6.1.2, 'Ethernet6/1'
  GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

- Use the **show platform fap tcam summary** command to verify if the TCAM bank is allocated for GRE packet termination lookup.

```
switch# show platform fap tcam summary
```

Bank	Tcam Allocation (Jericho0)	
	Used By	Reserved By
0	dbGreTunnel	-

- Use the **show ip route** command to verify if the routes over tunnel is setup properly.

```
switch# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort is not set

C      192.168.1.0/24 is directly connected, Tunnel10, Static Interface GRE tunnel
index 10, dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS 10
S      192.168.100.0/24 is directly connected, Tunnel10, Static Interface GRE
tunnel index 10, dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS 10
```

- The following commands are used to verify the tunnel encapsulation programming.

```
switch# show platform fap eedb ip-tunnel gre interface Tunnel 10
```

Jericho0									
GRE Tunnel Egress Encapsulation DB									
Bank/	OutLIF	Next	VSI	Encap	TOS	TTL	Source	Destination	
OamLIF	OutLIF	Drop							
Offset		OutLIF	LSB	Mode			IP	IP	Set
Profile									
3/0	0x6000	0x4010	0	2	10	10	10.1.1.1	10.1.1.2	No
0	No								

```
switch# show platform fap eedb ip-tunnel
```

Jericho0									
IP Tunnel Egress Encapsulation DB									
Bank/	OutLIF	Next	VSI	Encap	TOS	TTL	Src	Destination	OamLIF
OutLIF	Drop								
Offset		OutLIF	LSB	Mode	Idx	Idx	Idx	IP	Set
Profile									
3/0	0x6000	0x4010	0	2	9	0	0	10.1.1.2	No
0	No								

13.1.13 GRE Tunneling Support

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation. A maximum of 256 GRE-tunnel interfaces are supported.

Note: GRE keepalives are not supported.

To configure a local Arista switch on a GRE-tunnel interface, consider the following an example.

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.1/24
switch(config-if-Tu10)# tunnel source 10.1.1.1
switch(config-if-Tu10)# tunnel destination 10.1.1.2
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

To configure a remote Arista switch on a GRE-tunnel interface, consider the following an example.

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.2/24
switch(config-if-Tu10)# tunnel source 10.1.1.2
switch(config-if-Tu10)# tunnel destination 10.1.1.1underlayVrf
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

To add a IPv4 route over the GRE-tunnel interface, configure simulare to the following.

```
switch(config)# ip route 192.168.100.0/24 Tunnel 10
```

Note: IPv6 GRE-Tunnels are not supported. This is only a data-plane limitation whereas IS-IS IPv6 (such as control-plane) can still work.

Use the **show interfaces Tunnel** command to display the interface tunnel.

```
switch(config)# show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
    Key disabled, sequencing disabled
    Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
  Tunnel underlay VRF "underlayVrf"
  Up 3 seconds
```

Use the **show gre tunnel static** command to display a static interface tunnel.

```
switch(config)#show gre tunnel static
```

Name	Index	Source	Destination	Nexthop	Interface
Tunnel10	10	10.1.1.1	10.1.1.2	10.6.1.2	Ethernet6/1

Use the **show tunnel fib static interface** command to display a fib static interface tunnel.

```
switch(config)# show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
  via 10.6.1.2, 'Ethernet6/1'
  GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

Tunnel Mode

Tunnel mode is **GRE** for a GRE-tunnel interface which is also the default tunnel mode.

IP address

Use this IP address for routing over the GRE-tunnel interface. The configuration subnet is reachable over the GRE-tunnel interface, and the packets to the subnet is encapsulated with the GRE header.

Tunnel Source

Specifies the source IP address for the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The tunnel source IPv4 address is a valid local IPv4 address configured on the Arista switch. It uses any route interface on the Arista switch. The routed interfaces IPv4 address assigns the tunnel source IPv4 address. Maximum of 16 unique tunnel source IPv4 addresses are supported across all GRE-tunnel interfaces.

The following is an example of an interface as a Tunnel source.

```
switch(config)# interface Loopback 10
switch(config-if-Lo10)# ip add 10.1.1.1/32
switch(config-if-Lo10)# exit
switch(config)# interface Tunnel 10
```

```
switch(config-if-Tu10)# tunnel source interface Loopback 10
```

Note: Coexistence of GRE-tunnel interfaces and Decap-Groups is not supported.

Note: Coexistence of GRE-tunnel interfaces and VXLAN is not supported.

Note: GRE-tunnel is not supported with MLAG configuration.

Tunnel Destination

Specifies the destination IPv4 address for the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The tunnel destination IPv4 is reachable from the Arista switch.

Note: Multicast traffic over GRE-Tunnels is not supported.

Tunnel Path MTU Discovery

The tunnel path Maximum Transmission Unit (MTU) Discovery specifies if the Don't Fragment (DF) flag needs to be set in the encapsulating IPv4 header of a packet going over the GRE-Tunnel interface. MTU configuration on the GRE-tunnel interface is used by control plane protocols and not enforced in hardware for packets forwarded in data-plane. The MTU change on the tunnel interface does not take effect until the tunnel interface is flapped.

Tunnel TOS

The Tunnel TOS specifies the TOS value to be set in the encapsulating IPv4 header of a packet going over the GRE-Tunnel interface. The default value of **0** is assigned if tunnel TOS is not configured. Maximum of seven unique tunnel TOS values are supported across all GRE-tunnel interfaces.

Tunnel TTL

The Tunnel TTL specifies the TTL value to be set in the encapsulating IPv4 header of a packet going over the GRE-tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel path MTU discovery to be configured. Maximum of four unique tunnel TTL values are supported across all GRE-tunnel interfaces.

VRF Forwarding (Overlay VRF)

The following configuration is an example of overlay VRF, for a GRE tunnel interface.

```
switch(config)# vrf instance overlayVrf
switch(config)# ip routing vrf overlayVrf
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# vrf overlayVrf
```

Note: Both the tunnels source and destination address must be in the underlay VRF. GRE key forwarding is not supported.

The following is an example of a static route configuration, with an overlay VRF.

```
switch(config)# ip route vrf overlayVrf 7.7.7.0/24 192.168.1.2
```

VRF Forwarding (Underlay VRF)

The following is an configuration example of a underlay VRF for a GRE tunnel interface.

```
switch(config)# vrf instance underlayVrf
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel underlay vrf underlayVrf
```

13.1.13.1 TCAM Bank Allocation

Note: Command to check if Ternary Content-Addressable Memory (TCAM) bank is allocated for GRE packet termination lookup.

```
switch(config)# show platform fap tcam summary
```

Tcam Allocation (Jericho0)		
Bank	Used By	Reserved By
0	dbGreTunnel	-

PBR is not supported on GRE terminated packets.

Verifying Tunnel Routes

Use the **show ip route** command to check if the routes over tunnel is setup correctly.

```
switch(config)# show ip route
VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort is not set

C      192.168.1.0/24 is directly connected, Tunnel10, Static Interface GRE-Tunnel index 10, dst
10.1.1.2, src 10.1.1.1, TTL 10, TOS 10
S      192.168.100.0/24 is directly connected, Tunnel10, Static Interface GRE-Tunnel index 10,
dst 10.1.1.2, src 10.1.1.1, TTL 10, TOS 10
```

Verifying Tunnel Encap

Use the **show platform fap eedb ip-tunnel gre interface Tunnel** command to check the tunnel encap programming on the GRE interface.

```
switch(config)# show platform fap eedb ip-tunnel gre interface Tunnel 10
```

Jericho0 GRE Tunnel Egress Encapsulation DB											
Bank/ Offset	OutLIF	Next OutLIF	VSI LSB	Encap Mode	TOS	TTL	Source IP	Destination IP	OamLIF Set	OutLIF Profile	Drop
3/0	0x6000	0x4010	0	2	10	10	10.1.1.1	10.1.1.2	No	0	No

Use the **show platform fap eedb ip-tunnel** command to check the tunnel encap programming on the IP-tunnel interface.

```
switch(config)# show platform fap eedb ip-tunnel
```

Jericho0 IP Tunnel Egress Encapsulation DB											
Bank/ Offset	OutLIF	Next	VSI	Encap	TOS	TTL	Src	Destination	OamLIF	OutLIF	Drop

Offset		OutLIF	LSB	Mode	Idx	Idx	Idx	IP	Set	Profile	
3/0	0x6000	0x4010	0	2	9	0	0	10.1.1.2	No	0	No

Verifying Tunnel VRF

Use the **show ip interface tunnel** command to check the overlay VRF.

```
switch(config)# show ip interface tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1476 bytes
  VPN Routing/Forwarding "overlayVrf"
switch(config)# show ip route vrf overlayVrf

VRF: overlayVrf
Codes: C - connected, S - static, K - kernel,
        O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
        E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
        N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
        R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
        O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
        NG - Nexthop Group Static Route, V - VXLAN Control Service,
        DH - DHCP client installed default route, M - Martian,
        DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

C       1.1.1.0/24 is directly connected, Ethernet1
S       7.7.7.0/24 [1/0] via 192.168.1.2, Tunnel10, Static Interface GRE-Tunnel index 10, dst
10.1.1.2, src 10.1.1.1
C       192.168.1.0/24 is directly connected, Tunnel10, Static Interface GRE-Tunnel index 10,
dst 10.1.1.2, src 10.1.1.1
```

Tunnel underlay VRF Configuration

Use the **show interfaces Tunnel** command to check the underlay VRF.

```
switch(config)# show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
  Hardware is Tunnel, address is 0a01.0101.0800
  Internet address is 192.168.1.1/24
  Broadcast address is 255.255.255.255
  Tunnel source 10.1.1.1, destination 10.1.1.2
  Tunnel protocol/transport GRE/IP
  Key disabled, sequencing disabled
  Checksumming of packets disabled
  Tunnel TTL 10, Hardware forwarding enabled
  Tunnel TOS 10
  Path MTU Discovery
  Tunnel transport MTU 1476 bytes
  Tunnel underlay VRF "underlayVrf"
  Up 3 seconds
```

Use the **show ip route vrf underlayVrf** command to check the IP route VFR underlayVRF.

```
switch(config)# show ip route vrf underlayVrf
VRF: underlayVrf
Codes: C - connected, S - static, K - kernel,
        O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
        E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
        N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,
        R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
        O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
        NG - Nexthop Group Static Route, V - VXLAN Control Service,
        DH - DHCP client installed default route, M - Martian,
        DP - Dynamic Policy Route, L - VRF Leaked,
```

```
Gateway of last resort is not set

C      10.1.1.0/24 is directly connected, Ethernet1
```

13.1.14 BfRuntime to Use Non-default VRFs

Use the following commands to configure the VRF for the BfRuntime connection for the management interface on the switches that support it. The management interface may be configured on a different VRF from the default one.

Configuring BfRuntime to Use Non-default VRFs

The **platform barefoot bfrt vrf** command configures the forwarding plane agent to restart and listen on the configured VRFs for connections.

```
switch(config)# platform barefoot bfrt vrf <VRF name>
```

If no VRF specified, the configuration uses the default VRF for the IP and port for the the BfRuntime server. The following displays a typical configuration.

```
switch(config)# vrf instance management
switch(config-vrf-management)# exit
switch(config)# platform barefoot bfrt 0.0.0.0 50052
switch(config)# platform barefoot bfrt vrf <VRF name>
switch(config)# int management1
switch(config-if-Ma1)# vrf management
```

Displaying BfRuntime Configuration

The **show platform barefoot bfrt** command displays the existing configuration for the BfRuntime server.

```
switch# show platform barefoot bfrt
Namespace: management
FixedSystem:0.0.0.0:50052
```

13.1.15.1 agent SandL3Unicast terminate

The **agent SandL3Unicast terminate** command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

Command Mode

Global Configuration

Command Syntax

```
agent SandL3Unicast terminate
```

Related Commands

- [ip hardware fib optimize](#) enables IPv4 route scale.
- [show platform arad ip route](#) shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- [show platform arad ip route summary](#) shows hardware resource usage of IPv4 routes.

Example

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)# agent SandL3Unicast terminate  
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

13.1.15.2 arp

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The **no arp** and **default arp** commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

Command Mode

Global Configuration

Command Syntax

```
arp [VRF_INSTANCE] ipv4_addr mac_addr arpa
```

```
no arp [VRF_INSTANCE] ipv4_addr
```

```
default arp [VRF_INSTANCE] ipv4_addr
```

Parameters

- **VRF_INSTANCE** Specifies the VRF instance being modified.
 - **no parameter** Changes are made to the default VRF.
 - **vrf vrf_name** Changes are made to the specified user-defined VRF.
- **ipv4_addr** IPv4 address of ARP entry.
- **mac_addr** Local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

Examples

- This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)# arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

- This command adds the same static entry to the ARP cache in the VRF named **purple**.

```
switch(config)# arp vrf purple 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

13.1.15.3 arp aging timeout

The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is **14400** seconds (four hours).

The **arp aging timeout** and **default arp aging timeout** commands restores the default ARP aging timeout for addresses learned on the configuration mode interface by deleting the corresponding **arp aging timeout** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
arp aging timeout arp_time
```

```
no arp aging timeout
```

```
default arp aging timeout
```

Parameter

arp_time ARP aging timeout period (seconds). Values range from **60** to **65535**. Default value is **14400**.

Example

This command specifies an ARP cache duration of **7200** seconds (two hours) for dynamic addresses added to the ARP cache that were learned through **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# arp aging timeout 7200
switch(config-if-Vl200)# show active
interface Vlan200
  arp aging timeout 7200
switch(config-if-Vl200)#
```

13.1.15.4 arp cache persistent

The **arp cache persistent** command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The **no arp cache persistent** and **default arp cache persistent** commands remove the ARP cache persistent configuration from the running-config.

Command Mode

Global Configuration

Command Syntax

```
arp cache persistent
```

```
no arp cache persistent
```

```
default arp cache persistent
```

Example

This command restores the ARP cache after reboot.

```
switch(config)# arp cache persistent  
switch(config)#
```

13.1.15.5 arp gratuitous accept

The **arp gratuitous accept** command configures the configuration mode interface to accept gratuitous ARP request packets received on that interface. Accepted gratuitous ARP requests are then learned by the ARP table.

The **no** and **default** forms of the command prevent the interface from accepting gratuitous ARP requests. Configuring gratuitous ARP acceptance on an L2 interface has no effect.

Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

Interface Port-channel Configuration

Command Syntax

```
arp gratuitous accept
```

```
no arp gratuitous accept
```

```
default arp gratuitous accept
```

Example

These commands configure **interface ethernet 2/1** to accept gratuitous ARP request packets.

```
switch(config)# interface ethernet 2/1
switch(config-if-Et2/1)# arp gratuitous accept
switch(config-if-Et2/1)#
```

13.1.15.6 arp proxy max-delay

The **arp proxy max-delay** command enables delaying proxy ARP requests on the configuration mode interface. Proxy ARP is disabled by default. When proxy ARP is enabled, the switch responds to all ARP requests, including gratuitous ARP requests, with target IP addresses that match a route in the routing table. When a switch receives a proxy ARP request, EOS performs a check to send the response immediately or delay the response based on the configured maximum delay in milliseconds (ms).

Command Mode

Configuration mode

Command Syntax

```
arp proxy max-delay milliseconds
```

Parameters

milliseconds - Configure the maximum delay before returning a proxy ARP response in milliseconds. Use a range between 0 and 1000ms with a default value of 800ms.

Example

This command sets a delay of 500ms before returning a response to a proxy ARP request.

```
switch(config)# arp proxy max-delay 500ms
```

13.1.15.7 clear arp inspection statistics

The `clear arp inspection statistics` command clears ARP inspection statistics.

Command Mode

EXEC

Command Syntax

`clear arp inspection statistics`

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection logging](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)
- [show ip arp inspection statistics](#)

Example

This command clears ARP inspection statistics.

```
switch(config)# clear arp inspection statistics  
switch(config)#
```

13.1.15.8 clear arp

The **clear arp** command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

Command Mode

Privileged EXEC

Command Syntax

```
clear arp [VRF_INSTANCE] ipv4_addr
```

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which arp data is removed.
 - **no parameter** Specifies the context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ipv4_addr** IPv4 address of dynamic ARP entry.

Example

These commands display the ARP table before and after the removal of dynamic ARP entry for IP address **172.22.30.52**.

```
switch# show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0         001c.730b.1d15 Management1
172.22.30.52     0         0025.900e.c468 Management1
172.22.30.53     0         0025.900e.c63c Management1
172.22.30.133    0         001c.7304.3906 Management1

switch# clear arp 172.22.30.52
switch# show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0         001c.730b.1d15 Management1
172.22.30.53     0         0025.900e.c63c Management1
172.22.30.133    0         001c.7304.3906 Management1 switch#
```

13.1.15.9 clear arp-cache

The **clear arp-cache** command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing **clear arp-cache** for all interfaces can result in extremely high CPU usage while the tables are resolving.

Command Mode

Privileged EXEC

Command Syntax

```
clear arp-cache [VRF_INSTANCE][INTERFACE_NAME]
```

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which arp data is refreshed.
 - **no parameter** Specifies the context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **INTERFACE_NAME** Interface upon which ARP cache entries are refreshed. Options include:
 - **no parameter** All ARP cache entries.
 - **interface ethernet e_num** ARP cache entries of specified Ethernet interface.
 - **interface loopback l_num** ARP cache entries of specified loopback interface.
 - **interface management m_num** ARP cache entries of specified management interface.
 - **interface port-channel p_num** ARP cache entries of specified port-channel Interface.
 - **interface vlan v_num** ARP cache entries of specified VLAN interface.
 - **interface VXLAN vx_num** VXLAN interface specified by **vx_num**.

Related Commands

The [cli vrf](#) command specifies the context-active VRF.

Example

These commands display the ARP cache before and after ARP cache entries are refreshed.

```
switch# show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0         001c.730b.1d15  Management1
172.22.30.118    0         001c.7301.6015  Management1

switch# clear arp-cache
switch# show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0         001c.730b.1d15  Management1 switch#
```

13.1.15.10 clear ip dhcp relay counters

The **clear ip dhcp relay counters** command resets the DHCP relay counters. The configuration mode determines which counters are reset:

The **Interface configuration** command clears the counter for the configuration mode interface.

Command Mode

Privileged EXEC

Command Syntax

clear ip dhcp relay counters [INTERFACE_NAME]

Parameters

INTERFACE_NAME Entity for which counters are cleared. Options include:

- **no parameter** Clears counters for the switch and for all interfaces.
- **interface ethernet e_num** Clears counters for the specified Ethernet interface.
- **interface loopback l_num** Clears counters for the specified loopback interface.
- **interface port-channel p_num** Clears counters for the specified port-channel Interface.
- **interface vlan v_num** Clears counters for the specified VLAN interface.

Examples

- These commands clear the DHCP relay counters for **vlan 1045** and shows the counters before and after the **clear** command.

```
switch# show ip dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Vlan1001	207	148	0	4 days, 19:54:24 ago
Vlan1045	376	277	0	4 days, 19:54:24 ago

```
switch# clear ip dhcp relay counters interface vlan 1045
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	380	380	0	4 days, 21:19:17 ago
All Resp	281	281	0	
Vlan1000	207	148	0	4 days, 21:18:30 ago
Vlan1045	0	0	0	0:00:07 ago

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Vl1045)# exit
switch(config)# clear ip dhcp relay counters
switch(config)# show ip dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	0	0	0	0:00:03 ago
All Resp	0	0	0	
Vlan1000	0	0	0	0:00:03 ago

```
Vlan1045 | 0 0 0 | 0:00:03 ago
```

13.1.15.11 clear ip dhcp snooping counters

The `clear ip dhcp snooping counters` command resets the DHCP snooping packet counters.

Command Mode

Privileged EXEC

Command Syntax

`clear ip dhcp snooping counters [COUNTER_TYPE]`

Parameters

COUNTER_TYPE - Specify the type of counter to reset. Options include the following:

- **no parameter** Counters for each VLAN.
- **debug** Aggregate counters and drop cause counters.

Examples

- This command clears the DHCP snooping counters for each VLAN.

```
switch# clear ip dhcp snooping counters
switch# show ip dhcp snooping counters

      | Dhcp Request Pkts | Dhcp Reply Pkts |
Vlan |  Rcvd  Fwdd  Drop |  Rcvd Fwdd  Drop | Last Cleared
-----|-----|-----|-----|-----
 100 |    0    0    0 |    0    0    0 | 0:00:10 ago switch#
```

- This command clears the aggregate DHCP snooping counters.

```
switch# clear ip dhcp snooping counters debug
switch# show ip dhcp snooping counters debug

Counter                               Snooping to Relay Relay to Snooping
-----|-----|-----|-----|-----
Received                               0                0
Forwarded                             0                0
Dropped - Invalid VlanId               0                0
Dropped - Parse error                  0                0
Dropped - Invalid Dhcp Otype           0                0
Dropped - Invalid Info Option          0                0
Dropped - Snooping disabled            0                0

Last Cleared:  0:00:08 ago switch#
```

13.1.15.12 clear ip multicast count

The `clear ip multicast count` command clears all counters associated with the multicast traffic.

Command Mode

Global Configuration

Command Syntax

```
clear ip multicast count [group_address [source_address]]
```

Parameters

- **no parameters** Clears all counts of the multicast route traffic.
- **group_address** Clears the multicast traffic count of the specified group address.
 - **source_address** Clears the multicast traffic count of the specified group and source addresses.

Guidelines

This command functions only when the `ip multicast count` command is enabled.

Examples

- This command clears all counters associated with the multicast traffic.

```
switch(config)# clear ip multicast count
```

- This command clears the multicast traffic count of the specified group address.

```
switch(config)# clear ip multicast count 16.39.24.233
```

13.1.15.13 clear snapshot counters ecmp

The `clear shapshot counters ecmp` deletes previous snapshots.

Command Mode

EXEC

Command Syntax

```
clear snapshot counters ecmp req_id_range
```

Parameters

- **req_id_range** - Specify the Request ID of the snapshot to delete. If none specified, all previous snapshots delete from the switch.

Example

To delete previous snapshots, use the following command:

```
switch#clear snapshot counters ecmp id_range
```

13.1.15.14 cli vrf

The **cli vrf** command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

Command Mode

Privileged EXEC

Command Syntax

```
cli vrf [VRF_ID]
```

Parameters

VRF_ID Name of VRF assigned as the current VRF scope. Options include:

- **vrf_name** Name of user-defined VRF.
- **default** System-default VRF.

Guidelines

VRF-context aware commands include:

[clear arp-cache](#)

[show ip](#)

[show ip arp](#)

[show ip route](#)

[show ip route gateway](#)

[show ip route host](#)

Related Commands

The [show routing-context vrf](#) command displays the context-active VRF.

Example

These commands specify **magenta** as the context-active VRF, then display the context-active VRF.

```
switch# cli vrf magenta
switch# show routing-context vrf
Current VRF routing-context is magenta switch#
```

13.1.15.15 compress

The **compress** command increases the hardware resources available for the specified prefix lengths.

The **no compress** command removes the 2-to-1 compression configuration from the **running-config**.

Note: The **compress** command is supported only on 7500R, 7280R, 7500R2 and 7280R2 platforms.

Command Mode

Global Configuration

Command Syntax

```
ip hardware fib optimize prefix-length prefix-length expand prefix-length compress
```

```
no ip hardware fib optimize prefix-length prefix-length expand prefix-length compress
```

Parameters

compress Allows configuring up to one compressed prefix length.

Example

In the following example we are configuring prefix length **20** and **24**, expanding prefix length **19** and **23**, and compressing prefix length **25**.

```
switch(config)# ip hardware fib optimize prefix-length 20 24 expand 19 23 compress 25
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

13.1.15.16 description (VRF)

The **description** command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The **no description** and **default description** commands remove the text string from the configuration mode VRF by deleting the corresponding **description** command from *running-config*.

Command Mode

VRF Configuration

Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

Parameters

label_text Character string assigned to the VRF configuration.

Related Commands

The [vrf instance](#) command places the switch in VRF configuration mode.

Example

These commands add description text to the *magenta* VRF.

```
switch(config)# vrf instance magenta
switch(config-vrf-magenta)# description This is the first vrf
switch(config-vrf-magenta)# show active
  vrf instance magenta
    description This is the first vrf

switch(config-vrf-magenta)#
```

13.1.15.17 dhcp relay

The **dhcp relay** command places the switch in the DHCP relay mode. This command is executed under **global configuration mode**.

The **no dhcp relay** command removes DHCP relay configuration from the **running-config**.

Command Mode

Global Configuration Mode

Command Syntax

```
dhcp relay
```

```
no dhcp relay
```

Example

The **dhcp relay** command places the switch in the DHCP relay configuration mode.

```
switch(config)# dhcp relay  
switch(config-dhcp-relay)#
```

13.1.15.18 dhcp server

The **dhcp server** command places the switch in the DHCP relay mode. Execute this command in the DHCP Server Configuration Mode.

The **no dhcp server** command removes DHCP relay configuration from the *running-config*.

Command Mode

Global Configuration Mode

Command Syntax

dhcp server

no dhcp server

Example

The **dhcp server** command places the switch in the DHCP relay configuration mode.

```
switch(config)# dhcp server  
switch(config-dhcp-server) #
```

13.1.15.19 dhcp server client

The **dhcp server client** command configures client options for the DHCP server. Execute this command under the **dhcp server configuration mode**.

Command Mode

DHCP Server Configuration Mode

Command Syntax

```
dhcp server client class [ipv4|ipv6] definition client_class assignments [default-gateway|dns|lease|option|private-option|tftp]
```

Parameters

- **[ipv4|ipv6]** - Select the IP address family.
- **definition *client_class*** - Add a class for the client definition.
- **default-gateway** - Configure the client class default gateway sent to DHCP clients.
- **dns** - Configure the client class DNS.
- **lease** - Configure the client class lease.
- **option** - Configure the client class DHCP options.
- **private-option** - Configure the client class's private options.
- **tftp** - Configure the client class's TFTP options.

Example

Use the **dhcp server client class default-gateway** command to add a client definition for the IPv4 DHCP client class default gateway of 10.0.0.1. options.

```
switch(config-dhcp-server)# client class ipv4 definition test1 default-gateway 10.0.0.1
```

13.1.15.20 dhcp server debug

The **dhcp server debug log** command configures DHCP server debugging configuration. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server debug log *file*

Parameters

log *file* - Specify the file location to store debugging logs.

Example

Use the **dhcp server log** command to add a file location for debugging logs.

```
switch(config-dhcp-server)#debug log
```

13.1.15.21 dhcp server dns

The **dhcp server dns** command configures DHCP server DNS options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server dns [domain name *domain_name*] [server [ipv4|ipv6] *ip_address*

Parameters

- **domain name *domain_name*** - Specify the domain name of the DNS server.
- **server [ipv4|ipv6] *ip_address*** - Specify the DNS server as IPv4 or IPv6 and the IP address of the server.

Example

Use the **dhcp server dns** command to add an IPv4 DNS server, 192.168.10.5, to the DHCP configuration options.

```
switch(config-dhcp-server)# dns server ipv4 192.168.10.5
```

13.1.15.22 dhcp server lease

The **dhcp server lease** command configures DHCP server lease options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server lease time [ipv4|ipv6] *days days hourshours minutesminutes*

Parameters

- **[ipv4|ipv6]** - Configure the lease for IPv4 or IPv6.
- ***days days*** - Specify the number of days for the lease to be in effect from 0 to 2000 days.
- ***hourshours*** - Specify the number of hours for the lease to be in effect from 0 to 23 hours.
- ***minutesminutes*** - Specify the number of minutes for the lease to be in effect from 0 to 59 minutes.

Example

Use the **dhcp server lease** command to add an IPv4 lease to be in effect for 10 days, to the DHCP configuration.

```
switch(config-dhcp-server)# dns lease time ipv4 10 days
```

13.1.15.23 dhcp server option

The **dhcp server option** command configures DHCP server options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

```
dhcp server option [ipv4|ipv6] code [always-send data type [hex |string] data]]  
>quoted_string >hex [client-id disable] hourhours minutesminutes
```

Parameters

- **[ipv4|ipv6]** - Configure the option for IPv4 or IPv6.
- **code** - Specify the option number from the DHCP options.
- **[always-send data type [hex |string] data]] >quoted_string >hex** - Specify to send the option whether or not the client requested it.
- **client-id disable** - Prevent the DHCPv4 server from sending back the client ID.

Example

Use the **dhcp server option** command to add an IPv4 DHCP code, 67, to the DHCP configuration.

```
switch(config-dhcp-server)# option ipv4 option 67
```

13.1.15.24 dhcp server private-option

The **dhcp server private-option** command configures DHCP server private options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server private-option [ipv4|ipv6] *code* [always-send data type [hex |string] data]] *>quoted_string >hex*

Parameters

- [ipv4|ipv6] - Configure the option for IPv4 or IPv6.
- *code* - Specify the option number from 224 to 254.
- [always-send data type [hex |string] data]] *quoted_string >hex* - Specify to send the option whether or not the client requested it.

Example

Use the **dhcp server option** command to add an IPv4 private option code, 225, and to always send the option to the DHCP configuration.

```
switch(config-dhcp-server)# option ipv4 private-option 225 always-send private-option ipv4 225  
always-send type string data "Code Sent"
```

13.1.15.25 dhcp server subnet

The **dhcp server subnet** command configures DHCP server subnet options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server subnet *ipv4_address* *ipv6_address*

Parameters

- *ipv4_address* - Configure the IPv4 subnet.
- *ipv6_address* - Configure the IPv6 subnet.

Example

Use the **dhcp server subnet** command to add an IPv4 subnet, *198.168.0.0/24*, to the DHCP configuration.

```
switch(config-dhcp-server)# subnet 198.168.0.0/24
```

13.1.15.26 dhcp server subnet client

The `dhcp server subnet [ipv4 | ipv6] client` command configures client options for the DHCP server. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

`dhcp server subnet [ipv4|ipv6] client class defintion client_class [default-gateway|dns|lease|name|range|reservations|tftp]`

Parameters

- `[ipv4|ipv6]` - Select the IP address family.
- `definition client_class` - Add a class for the client definition.
- `default-gateway ip_address` - Configure the client class default gateway sent to DHCP clients.
- `dns server` - Configure the client class DNS.
- `lease days hourhours minutesminutes` - Configure the client class lease in days, hours, and minutes.
- `name name` - Configure the subnet name.
- `range ip_address_start ip_address_end` - Configure the range of IP addresses for the subnet.
- `reservations mac-address mac_address [hostname | ipv4-address]` - Configure the MAC address to use for reservations.
- `tftp` - Configure the client class's TFTP options.

Example

Use the `dhcp server subnet ipv4 client class default-gateway` command to add a client definition for the IPv4 DHCP client class default gateway of 10.0.0.1. options.

```
switch(config-dhcp-server)#subnet ipv4 client class ipv4 definition test1 default-gateway 10.0.0.1
```

13.1.15.27 dhcp server tftp

The **dhcp server tftp** command configures DHCP server TFTP options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

```
dhcp server tftp server [file [ipv4|ipv6] file_name] [option [150|66]] ipv4
```

Parameters

- **file [ipv4|ipv6] *file_name*** - Configure the IPv4 or IPv6 boot file name.
- **option [150|66]] ipv4 *ip_address*** - Configure the TFTP DHCP option as 150 or 66 with an IPv4 address.

Example

Use the **dhcp server tftp** command to add option 150 with an IPv4 address *198.168.0.11*, to the DHCP configuration.

```
switch(config-dhcp-server)# tftp option 150 ipv4 198.168.0.11
```

13.1.15.28 dhcp server vendor-option

The **dhcp server vendor-option** command configures the DHCP server vendor identifier options. Execute this command under the **dhcp server configuration mode**.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server vendor-option ipv4 *vendor_id* default *vendor_id* sub-option *sub-option_code*

Parameters

- ***vendor_id*** - Configure the vendor identifier.
- **default *vendor_id*** - Set as the default vendor specific option.
- **sub-option *sub-option_code*** - Set the sub-option code from 1-254.

Example

Use the **dhcp server vendor-option** command to add vendor option, **1:4:c0:0:2:8**, to the DHCP configuration.

```
switch(config-dhcp-server) # vendor-option 1:4:c0:0:2:8
```

13.1.15.29 dhcp server vendor-option ipv4 sub-option

The **dhcp server vendor-option** command configures the DHCP server vendor identifier options. Execute this command in the DHCP Server Configuration Mode.

Command Mode

DHCP Server Configuration Mode

Command Syntax

dhcp server vendor-option ipv4 *vendor_id* default *vendor_id* sub-option *sub-option_code* type [array | ipv4-address | *string*] array [ipv4-address data *ip_address* [string data *quoted_string*

Parameters

- ***vendor_id*** - Configure the vendor identifier.
- **default *vendor_id*** - Set as the default vendor specific option.
- **sub-option *sub-option_code*** - Set the sub-option code from 1-254.

Example

Use the **dhcp server vendor-option** command to add the vendor option, *1:4:c0:0:2:8*, to the DHCP Server configuration.

```
switch(config-dhcp-server) # vendor-option 1:4:c0:0:2:8
```

13.1.15.30 interface tunnel

The **interface tunnel** command places the switch in interface-tunnel configuration mode.

Interface-tunnel configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed.

The **no interface tunnel** command deletes the specified interface tunnel configuration.

The **exit** command returns the switch to the global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
interface tunnel number
```

```
no interface tunnel number
```

Parameter

number Tunnel interface number. Values range from 0 to 255.

Example

This command places the switch in interface-tunnel configuration mode for tunnel interface **10**.

```
switch(config)# interface tunnel 10  
switch(config-if-Tu10)#
```

13.1.15.31 ip arp inspection limit

The **ip arp inspection limit** command disables the interface if the incoming ARP rate exceeds the configured value rate limit of the incoming ARP packets on an interface.

Command Mode

EXEC

Command Syntax

```
ip arp inspection limit [ RATE pps] [BURST_INTERVAL sec | none]
no ip arp inspection limit [ RATE pps] [BURST_INTERVAL sec | none]
default ip arp inspection limit [ RATE pps] [BURST_INTERVAL sec | none]
```

Parameters

- **RATE** - Specifies the ARP inspection limit rate in packets per second.
 - **pps** - Specify the number of ARP inspection limit rate packets per second.
- **BURST_INTERVAL** - Specifies the ARP inspection limit burst interval.
 - **sec** - Specify the burst interval in seconds.

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)

Examples

- This command configures the rate limit of incoming ARP packets to disable the interface when the incoming ARP rate exceeds the configured value, sets the rate to **512**, the upper limit for the number of invalid ARP packets allowed per second, and sets the burst consecutive interval to monitor the interface for a high ARP rate to **11** seconds.

```
switch(config)# ip arp inspection limit rate 512 burst interval 11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)# interface ethernet 3/1
switch(config)# ip arp inspection limit rate 20 burst interval 5
switch(config)# interface Ethernet 3/3
switch(config)# ip arp inspection trust
switch(config)# show ip arp inspection interfaces
```

Interface	Trust State	Rate (pps)	Burst Interval
Et3/1	Untrusted	20	5
Et3/3	Trusted	None	N/A

```
switch(config)#
```

13.1.15.32 ip arp inspection logging

The **ip arp inspection logging** command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

Command Mode

EXEC

Command Syntax

ip arp inspection logging [**RATE** *pps*][**BURST_INTERVAL** *sec* | none]

no ip arp inspection logging [**RATE** *pps*][**BURST_INTERVAL** *sec* | none]

default ip arp inspection logging [**RATE** *pps*][**BURST_INTERVAL** *sec* | none]

Parameters

- **RATE** - Specifies the ARP inspection limit rate in packets per second.
 - **<pps>** - Specifies the number of ARP inspection limit rate packets per second.
- **BURST_INTERVAL** - Specifies the ARP inspection limit burst interval.
 - **sec** - Specify the number of burst interval seconds.

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)

Example

This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to monitor the interface for a high ARP rate to **15** seconds.

```
switch(config)# ip arp inspection logging rate 2048 burst interval 15
switch(config)#
```

13.1.15.33 ip arp inspection trust

The **ip arp inspection trust** command configures the trust state of an interface. By default, all interfaces are untrusted.

Command Mode

EXEC

Command Syntax

ip arp inspection trust

no ip arp inspection trust

default ip arp inspection trust

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection logging](#)
- [show ip arp inspection vlan](#)
- [ip arp inspection vlan](#)

Examples

- This command configures the trust state of an interface.

```
switch(config)# ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)# no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to the default.

```
switch(config)# default ip arp inspection trust
switch(config)#
```

13.1.15.34 ip arp inspection vlan

The **ip arp inspection vlan** command enables ARP inspection. EOS intercepts ARP requests and responses on untrusted interfaces on specified VLANs, and verifies intercepted packets with valid IP-MAC address bindings. EOS drops all invalid ARP packets. On trusted interfaces, EOS processes all incoming ARP packets and forwards without verification. By default, EOS disables ARP inspection on all VLANs.

Command Mode

EXEC

Command Syntax

ip arp inspection vlan [LIST]

Parameters

LIST Specifies the VLAN interface number.

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)

Example

- This command enables ARP inspection on VLANs **1** through **150**.

```
switch(config)# ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs **1** through **150**.

```
switch(config)# no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs **1** through **150**.

```
switch(config)# default ip arp inspection vlan 1 - 150
switch(config)#
```

- These commands enable ARP inspection on multiple VLANs **1** through **150** and **200** through **250**.

```
switch(config)# ip arp inspection vlan 1-150,200-250
switch(config)#
```

13.1.15.35 ip dhcp relay all-subnets

The **ip dhcp relay all-subnets** command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that you enable DHCP relay on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the **ip dhcp relay all-subnets default** command. The **ip dhcp relay all-subnets** command, when configured, takes precedence over the global smart relay setting.

The **no ip dhcp relay all-subnets** command disables DHCP smart relay on the configuration mode interface. The **default ip dhcp relay all-subnets** command restores the interface's to the default DHCP smart relay setting, as configured by the **ip dhcp relay all-subnets default** command, by removing the corresponding **ip dhcp relay all-subnets** or **no ip dhcp relay all-subnets** statement from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip dhcp relay all-subnets

no ip dhcp relay all-subnets

default ip dhcp relay all-subnets

Examples

- This command enables DHCP smart relay on VLAN interface **100**.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip helper-address 10.4.4.4
switch(config-if-Vl100)# ip dhcp relay all-subnets
switch(config-if-Vl100)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command disables DHCP smart relay on VLAN interface **100**.

```
switch(config-if-Vl100)# no ip dhcp relay all-subnets
switch(config-if-Vl100)# show active
interface Vlan100
  no ip dhcp relay all-subnets
  ip helper-address 10.4.4.4
switch(config-if-Vl100)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command enables DHCP smart relay globally, configures VLAN interface **100** to use the global setting, then displays the DHCP relay status.

```
switch(config)# ip dhcp relay all-subnets default
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip helper-address 10.4.4.4
switch(config-if-Vl100)# default ip dhcp relay
switch(config-if-Vl100)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

13.1.15.36 ip dhcp relay all-subnets default

The **ip dhcp relay all-subnets default** command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting applies to all interfaces for which an [ip dhcp relay all-subnets](#) statement does not exist. Enabling DHCP smart relay on an interface requires that you also enable DHCP relay on that interface.

The **no ip dhcp relay all-subnets default** and **default ip dhcp relay all-subnets default** commands restore the global DHCP smart relay default setting of disabled by removing the **ip dhcp relay all-subnets default** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip dhcp relay all-subnets default
no ip dhcp relay all-subnets default
default ip dhcp relay all-subnets default
```

Example

This command configures the global DHCP smart relay setting to **enabled**.

```
switch(config)# ip dhcp relay all-subnets default
switch(config)#
```

13.1.15.37 ip dhcp relay always-on

The **ip dhcp relay always-on** command enables the DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an [ip helper-address](#) statement.

The **no ip dhcp relay always-on** and **default ip dhcp relay always-on** commands remove the **ip dhcp relay always-on** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

ip dhcp relay always-on

no ip dhcp relay always-on

default ip dhcp relay always-on

Example

This command enables the DHCP relay agent.

```
switch(config)# ip dhcp relay always-on  
switch(config)#
```

13.1.15.38 ip dhcp relay information option (Global)

The **ip dhcp relay information option** command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by the [ip helper-address](#) commands. The command specifies the tag contents for packets forwarded by the configured interface. The default value for each interface configured with an **ip helper-address** is the name and number of the interface.

The **no ip dhcp relay information option** and **default ip dhcp relay information option** commands restore the switch default setting of not attaching tags to DHCP requests by removing the **ip dhcp relay information option** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip dhcp relay information option
no ip dhcp relay information option
default ip dhcp relay information option
```

Example

This command enables the attachment of tags to DHCP requests forwarded to DHCP server addresses.

```
switch(config)# ip dhcp relay information option
switch(config)#
```

13.1.15.39 ip dhcp relay information option circuit-id

The **ip dhcp relay information option circuit-id** command specifies the content of tags that the switch attaches to DHCP requests before forwarding them from the configuration mode interface to DHCP server addresses specified by **ip helper-address** commands. Tags attach to outbound DHCP requests only if you enable the information option on the switch (**ip dhcp relay information option circuit-id**).

The **no ip dhcp relay information option circuit-id** and **default ip dhcp relay information option circuit-id** commands restore the default content setting for the configuration mode interface by removing the corresponding command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

ip dhcp relay information option circuit-id *id_label*

no ip dhcp relay information option circuit-id

default ip dhcp relay information option circuit-id

Parameters

id_label- Specify the tag content. Use a format in alphanumeric characters (maximum 15 characters).

Example

This command configures **x-1234** as the tag content for packets send from VLAN **200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip dhcp relay information option circuit-id x-1234
switch(config-if-Vl200)#
```

13.1.15.40 ip dhcp snooping

The **ip dhcp snooping** command enables DHCP snooping globally on the switch. Configure DHCP snooping as a set of Layer 2 processes and use it with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address as the router-ID along with the physical interface name and VLAN number as the circuit-ID in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- Enable DHCP snooping globally.
- Enabled insertion of option-82 information in DHCP packets.
- Enable DHCP snooping on the specified VLAN.
- Enable DHCP relay on the corresponding VLAN interface.

The **no ip dhcp snooping** and **default ip dhcp snooping** commands disables global DHCP snooping by removing the **ip dhcp snooping** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping

no ip dhcp snooping

default ip dhcp snooping

Related Commands

- [ip dhcp snooping information option](#) enables insertion of option-82 snooping data.
- [ip helper-address](#) enables the DHCP relay agent on a configuration mode interface.

Example

This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```
switch(config)# show ip dhcp snooping
DHCP Snooping is disabled
switch(config)# ip dhcp snooping
switch(config)# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is not operational
DHCP Snooping is configured on following VLANs:
  None
DHCP Snooping is operational on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```

13.1.15.41 ip dhcp snooping bridging

The **ip dhcp snooping bridging** command enables the DHCP snooping bridging configuration.

The **no ip dhcp snooping bridging** command removes the DHCP snooping bridging configuration from the *running-config*.

Command Mode

Global Configuration Mode

Command Syntax

```
ip dhcp snooping bridging
```

```
no ip dhcp snooping bridging
```

Example

This command configures the DHCP snooping bridging.

```
switch# configure  
switch(config)# ip dhcp snooping bridging
```

13.1.15.42 ip dhcp snooping information option

The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a Layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- Enable DHCP snooping globally.
- Enabled insertion of option-82 information in DHCP packets.
- Enable DHCP snooping on the specified VLAN.
- Enable DHCP relay on the corresponding VLAN interface.

If not enabling DHCP snooping globally, the **ip dhcp snooping information option** command persists in **running-config** without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from **running-config**.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping information option

no ip dhcp snooping information option

default ip dhcp snooping information option

Example

These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

```
switch(config)# ip dhcp snooping information option
switch(config)# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 100
DHCP Snooping is operational on following VLANs:
 100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch(config)#
```

13.1.15.43 ip dhcp snooping vlan

The **ip dhcp snooping vlan** command enables DHCP snooping on specified VLANs. DHCP snooping provides a Layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. Configure DHCP snooping on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- Enable DHCP snooping globally.
- Enabled insertion of option-82 information in DHCP packets.
- Enable DHCP snooping on the specified VLAN.
- Enable DHCP relay on the corresponding VLAN interface.

If not enabling global DHCP snooping, the **ip dhcp snooping vlan** command persists in *running-config* without any operational affect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable DHCP snooping operability by removing the **ip dhcp snooping information option** statement from *running-config*.

Command Mode

Global Configuration

Command Syntax

ip dhcp snooping vlan *v_range*

no ip dhcp snooping vlan *v_range*

default ip dhcp snooping vlan *v_range*

Parameters

- ***v_range*** - Specify the range of VLANs to enable DHCP snooping. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

Example

These commands enable DHCP snooping globally, DHCP snooping on VLAN interface **100**, and DHCP snooping on **vlan100**.

```
switch(config)# ip dhcp snooping
switch(config)# ip dhcp snooping information option
switch(config)# ip dhcp snooping vlan 100
switch(config)# interface vlan 100
switch(config-if-Vl100)# ip helper-address 10.4.4.4
switch(config-if-Vl100)# show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 100
DHCP Snooping is operational on following VLANs:
 100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch(config)#
```

13.1.15.44 ip hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command enables resilient ECMP for the specified IP address prefix and configures a fixed number of next hop entries in the hardware ECMP table for that prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

Resilient ECMP is useful when it is not desirable for routes to be rehashed due to link flap, as when ECMP is being used for load balancing.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip hardware fib ecmp resilience net_addr capacity nhop_max redundancy duplicates
no ip hardware fib ecmp resilience net_addr
default ip hardware fib ecmp resilience net_addr
```

Parameters

- **net_addr** IP address prefix managed by command. (CIDR or address-mask).
- **nhop_max** Maximum number of nexthop addresses for specified IP address prefix.

Value range varies by platform:

- Helix: <2 to 64>
- Trident: <2 to 32>
- Trident II: <2 to 64>
- **duplicates** Specifies the redundancy factor. Value ranges from **1** to **128**.

Example

This command configures a hardware ECMP table space of 24 entries for the IP address **10.14.2.2/24**. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)# ip hardware fib ecmp resilience 10.14.2.2/24 capacity 6 redundancy 4
switch(config)#
```

13.1.15.45 ip hardware fib next-hop resource optimization

The **ip hardware fib next-hop resource optimization** command is used to enable or disable the resource optimization features on the switch. By default, RECOMP is enabled on the switch.

The **no hardware fib next-hop resource optimization** command removes all the resource optimization features running on the switch.

Command Mode

Global Configuration Mode

Command Syntax

```
ip hardware fib next-hop resource optimization OPTIONS
```

```
no ip hardware fib next-hop resource optimization OPTIONS
```

Parameters

- The following two options are allowed to configure with this command:
 - **disabled** Disable hardware resource optimization for adjacency programming.
 - **thresholds** Utilization percentage for starting or stopping optimization. The resource utilization percentage value ranges from 0 to 100. It can be set to low and high.

Examples

- The following command is used to disable all hardware resource optimization features on the switch:

```
switch# configure terminal
switch(config)# ip hardware fib next-hop resource optimization disabled
```

- The following command is used to configure the thresholds for starting and stopping the optimization:

```
switch(config)# ip hardware fib next-hop resource optimization thresholds low 20 high 80
```

13.1.15.46 ip hardware fib optimize

The **ip hardware fib optimize** command enables IPv4 route scale. Restart the platform Layer 3 agent to ensure optimization of IPv4 routes with the [agent SandL3Unicast terminate](#) command for the configuration mode interface.

Command Mode

Global Configuration

Command Syntax

```
ip hardware fib optimize exact-match prefix-length prefix-length prefix-length
```

Parameters

prefix-length The length of the prefix equal to **12**, **16**, **20**, **24**, **28**, or **32**. Optionally, add one additional prefix-length limited to the prefix-length of **32**.

Related Commands

- The [agent SandL3Unicast terminate](#) command restarts the Layer 3 agent to ensure optimization of IPv4 routes.
- The [show platform arad ip route](#) command shows resources for all IPv4 routes in hardware. Routes with additional hardware resources appear with an asterisk (*).
- The [show platform arad ip route summary](#) command displays hardware resource usage of IPv4 routes.

Examples

- This configuration command allows configuring prefix lengths **12** and **32**

```
switch(config)# ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes in this command has a prefix-length of **32**, required in the instance when adding two prefixes. For this command to take effect, restart the platform Layer 3 agent.

- This configuration command restarts the platform Layer 3 agent to ensure optimization of IPv4 routes.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, and then re-added to the hardware.

- This configuration command allows configuring prefix lengths **32** and **16**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

One of the two prefixes in this command is a prefix-length of **32**, required when adding two prefixes. For this command to take effect, restart the platform Layer 3 agent.

- This configuration command restarts the platform Layer 3 agent to ensure optimization of IPv4 routes.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, and then re-added to the hardware.

- This configuration command allows configuring prefix length **24**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 24
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

In this instance, add one prefix-length, and does not require a prefix-length of **32**. For this command to take effect, restart the platform Layer 3 agent.

- This configuration command restarts the platform Layer 3 agent to ensure optimization of IPv4 routes.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, and then re-added to the hardware.

- This configuration command allows configuring the prefix length of **32**.

```
switch(config)# ip hardware fib optimize exact-match prefix-length 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

For this command to take effect, restart the platform Layer 3 agent.

- This configuration command restarts the platform Layer 3 agent to ensure optimization of IPv4 routes.

```
switch(config)# agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, and then re-added to the hardware.

- This configuration command disables configuring prefix lengths **12** and **32**.

```
switch(config)# no ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized
```

One of the two prefixes in this command has a prefix-length of **32**, required when configuring two prefixes. For this command to take effect, restart the platform Layer 3 agent.

13.1.15.47 ip helper-address

The **ip helper-address** command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The **no ip helper-address** and **default ip helper-address** commands remove the corresponding **ip helper-address** command from **running-config**. Commands that do not specify an IP helper-address remove all helper-addresses from the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip helper-address ipv4_addr [vrf vrf_name][source-address ipv4_addr | source-interface INTERFACES]
no ip helper-address [ipv4_addr]
default ip helper-address [ipv4_addr]
```

Parameters

- **vrf vrf_name** Specifies the user-defined VRF for DHCP server.
- **ipv4_addr** Specifies the DHCP server address accessed by interface.
- **source-address ipv4_addr** Specifies the source IPv4 address to communicate with DHCP server.
- **source-interface INTERFACES** Specifies the source interface to communicate with DHCP server. Options include:
 - **Ethernet eth_num** Specifies the Ethernet interface number.
 - **Loopback lpbck_num** Specifies the loopback interface number. Value ranges from 0 to 1000.
 - **Management mgmt_num** Specifies the management interface number. Accepted values are **1** and **2**.
 - **Port-Channel {int_num | sub_int_num}** Specifies the port-channel interface or subinterface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
 - **Tunnel tnl_num** Specifies the tunnel interface number. Value ranges from 0 to 255.
 - **VLAN vlan_num** Specifies the Ethernet interface number. Value ranges from 1 to 4094.

Related Commands

- [ip dhcp relay always-on](#)
- [ip dhcp relay information option \(Global\)](#)
- [ip dhcp relay information option circuit-id](#)

Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv4 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

Examples

- This command enables DHCP relay on the VLAN interface **200**; and configure the switch to forward DHCP requests received on this interface to the server at **10.10.41.15**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ip helper-address 10.10.41.15
```

```
switch(config-if-Vl200)# show active  
interface Vlan200  
    ip helper-address 10.10.41.15  
switch(config-if-Vl200)#
```

- This command enables DHCP relay on the **interface ethernet 1/2**; and configures the switch to use **2.2.2.2** as the source IP address when relaying IPv4 DHCP messages to the server at **1.1.1.1**.

```
switch(config)# interface ethernet 1/2  
switch(config-if-Et1/2)# ip helper-address 1.1.1.1 source-address 2.2.2.2  
switch(config-if-Et1/2)#
```

13.1.15.48 ip icmp redirect

The **ip icmp redirect** command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The **no ip icmp redirect** disables the switch from sending ICMP redirect messages.

Command Mode

Global Configuration

Command Syntax

```
ip icmp redirect
```

```
no ip icmp redirect
```

```
default ip icmp redirect
```

Example

This command disables the redirect messages.

```
switch(config)# no ip icmp redirect
switch(config)# show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
no ip icmp redirect
ip routing
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#
```

13.1.15.49 ip load-sharing

The **ip load-sharing** command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The **no ip load-sharing** and **default ip load-sharing** commands return the hash seed to the default value of zero by removing the **ip load-sharing** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

ip load-sharing HARDWARE seed

no ip load-sharing HARDWARE

default ip load-sharing HARDWARE

Parameters

- **HARDWARE** The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI ? command.
 - **arad**
 - **fm6000**
 - **petraA**
 - **trident**
- **seed** The hash seed. Value range varies by switch platform. The default value on all platforms is 0.
 - when **HARDWARE=arad** **seed** ranges from 0 to 2.
 - when **HARDWARE=fm6000** **seed** ranges from 0 to 39.
 - when **HARDWARE=petraA** **seed** ranges from 0 to 2.
 - when **HARDWARE=trident** **seed** ranges from 0 to 5.

Example

This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.

```
switch(config)# ip load-sharing fm6000 1
switch(config)#
```

13.1.15.50 ip local-proxy-arp

The **ip local-proxy-arp** command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The **no ip local-proxy-arp** and **default ip local-proxy-arp** commands disable local proxy ARP on the configuration mode interface by removing the corresponding **ip local-proxy-arp** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip local-proxy-arp
```

```
no ip local-proxy-arp
```

```
default ip local-proxy-arp
```

Example

These commands enable local proxy ARP on VLAN interface **140**.

```
switch(config)# interface vlan 140
switch(config-if-Vl140)# ip local-proxy-arp
switch(config-if-Vl140)# show active
interface Vlan140
  ip local-proxy-arp
switch(config-if-Vl140)#
```

13.1.15.51 ip multicast count

The **ip multicast count** command enables the IPv4 multicast route traffic counter of group and source addresses in either bytes or packets.

The **no ip multicast count** command deletes all multicast counters including the routes of group and source addresses.

The **no ip multicast count *group_address source_address*** command removes the current configuration of the specified group and source addresses. It does not delete the counter because the wildcard is still active.

The **default ip multicast count** command reverts the current counter configuration of multicast route to the default state.

Command Mode

Global Configuration

Command Syntax

```
ip multicast count [group_address [source_address] | bytes | packets]
no ip multicast count [group_address [source_address] | bytes | packets]
default ip multicast count [group_address [source_address] | bytes | packets]
```

Parameters

- ***group_address*** Configures the multicast route traffic count of the specified group address.
 - ***source_address*** Configures the multicast route traffic count of the specified group and source addresses.
- **bytes** Configures the multicast route traffic count to bytes.
- **packets** Configures the multicast route traffic count to packets.

Guidelines

This command is supported on the FM6000 platform only.

Examples

- This command configures the multicast route traffic count to bytes.

```
switch(config)# ip multicast count bytes
```

- This command configures the multicast route traffic count of the specified group and source addresses.

```
switch(config)# ip multicast count 10.50.30.23 45.67.89.100
```

- This command deletes all multicast counters including the routes of group and source addresses.

```
switch(config)# no ip multicast count
```

- This command reverts the current multicast route configuration to the default state.

```
switch(config)# default ip multicast count
```

13.1.15.52 ip proxy-arp

The **ip proxy-arp** command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default. When proxy ARP is enabled, the switch responds to all ARP requests, including gratuitous ARP requests, with target IP addresses that match a route in the routing table.

The **no ip proxy-arp** and **default ip proxy-arp** commands disable proxy ARP on the configuration mode interface by removing the corresponding **ip proxy-arp** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip proxy-arp
```

```
no ip proxy-arp
```

```
default ip proxy-arp
```

Example

This command enables proxy ARP on *interface ethernet 4*.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ip proxy-arp
switch(config-if-Et4)#
```

13.1.15.53 ip route

The **ip route** command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The **no ip route** and **default ip route** commands delete the specified static route by removing the corresponding **ip route** command from *running-config*. Commands that do not list a nexthop address remove all **ip route** statements with the specified destination from *running-config*. If an **ip route** statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

Command Mode

Global Configuration

Command Syntax

```
ip route [VRF_INSTANCE] dest_net NEXTHOP [DISTANCE][TAG_OPTION][RT_NAME]
no ip route [VRF_INSTANCE] dest_net [NEXTHOP][DISTANCE]
default ip route [VRF_INSTANCE] dest_net [NEXTHOP][DISTANCE]
```

Parameters

- **VRF_INSTANCE** Specifies the VRF instance being modified.
 - **no parameter** Changes are made to the default VRF.
 - **vrf vrf_name** Changes are made to the specified VRF.
- **dest_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **NEXTHOP** Location or access method of next hop device. Options include:
 - **ipv4_addr** An IPv4 address.
 - **null0** Null0 interface.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-channel interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
- **DISTANCE** Administrative distance assigned to route. Options include:
 - **no parameter** Route assigned default administrative distance of one.
 - **1-255** The administrative distance assigned to route.
- **TAG_OPTION** Static route tag. Options include:
 - **no parameter** Assigns default static route tag of 0.

- **tag *t_value*** Static route tag value. *t_value* ranges from 0 to 4294967295.
- **RT_NAME** Associates descriptive text to the route. Options include:
 - ***no parameter*** No text is associated with the route.
 - **name *descriptive_text*** The specified text is assigned to the route.

Related Command

The [ip route nexthop-group](#) command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

Example

This command creates a static route in the default VRF.

```
switch(config)# ip route 172.17.252.0/24 vlan 2000
switch(config)#
```

13.1.15.54 ip routing

The **ip routing** command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **no ip routing** and **default ip routing** commands disable IPv4 routing by removing the **ip routing** command from **running-config**. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch's MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch's address are typically discarded. The **delete-static-routes** option removes static entries from the routing table.

IPv4 routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

```
ip routing [VRF_INSTANCE]
no ip routing [DELETE_ROUTES][VRF_INSTANCE]
default ip routing [DELETE_ROUTES][VRF_INSTANCE]
```

Parameters

- **DELETE_ROUTES** Resolves routing table static entries when routing is disabled.
 - **no parameter** Routing table retains static entries.
 - **delete-static-routes** Static entries are removed from the routing table.
- **VRF_INSTANCE** Specifies the VRF instance being modified.
 - **no parameter** Changes are made to the default VRF.
 - **vrf vrf_name** Changes are made to the specified user-defined VRF.

Example

This command enables IPv4 routing.

```
switch(config)# ip routing
switch(config)#
```

13.1.15.55 ip source binding

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

Note: IP source bindings are also used by static ARP inspection.

The `no ip source binding` and `default ip source binding` commands exclude parameters from IPSG filtering, and set the default for `ip source binding`.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ip source binding [IP_ADDRESS][MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
no ip source binding [IP_ADDRESS][MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
default ip source binding [IP_ADDRESS][MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
```

Parameters

- **IP_ADDRESS** Specifies the IP ADDRESS.
- **MAC_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

Related Commands

- [ip verify source](#)
- [show ip verify source](#)

Example

This command configures source IP-MAC binding entries to IP address **10.1.1.1**, MAC address **0000.aaaa.1111**, VLAN ID **4094**, and **interface ethernet 36**.

```
switch(config)# ip source binding 10.1.1.1 0000.aaaa.1111 vlan 4094 interface
ethernet 36
switch(config)#
```

13.1.15.56 ip verify source

The **ip verify source** command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therefore, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The **no ip verify source** and **default ip verify source** commands exclude VLAN IDs from IPSG filtering, and set the default for **ip verify source**.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ip verify source vlan [VLAN_RANGE]
no ip verify source [VLAN_RANGE]
default ip verify source
```

Parameters

VLAN_RANGE Specifies the VLAN ID range.

Related Commands

- [ip source binding](#)
- [show ip verify source](#)

Example

This command excludes VLAN IDs **1** through **3** from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs **4** through **10** on **Ethernet 36** will be filtered by IPSG, while those received on VLANs **1** through **3** are permitted.

```
switch(config)# no ip verify source vlan 1-3
switch(config)# interface ethernet 36
switch(config-if-Et36)# switchport mode trunk
switch(config-if-Et36)# switchport trunk allowed vlan 1-10
switch(config-if-Et36)# ip verify source
switch(config-if-Et36)#
```

13.1.15.57 ip verify

The **ip verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

The **no ip verify** and **default ip verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ip verify** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip verify unicast source reachable-via RPF_MODE
```

```
no ip verify unicast
```

```
default ip verify unicast
```

Parameters

RPF_MODE Specifies the uRPF mode. Options include:

- **any** Loose mode.
- **rx** Strict mode.
- **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

Guidelines

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent **ip verify** commands on any interface do not disrupt IPv4 routing.

Examples

- This command enables uRPF loose mode on **VLAN interface 17**.

```
switch(config)# interface vlan 17
switch(config-if-Vl17)# ip verify unicast source reachable-via any
switch(config-if-Vl17)# show active
  interface Vlan17
    ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on **VLAN interface 18**.

```
switch(config)# interface vlan 18
switch(config-if-Vl18)# ip verify unicast source reachable-via rx
```

```
switch(config-if-Vl18)# show active
interface Vlan18
  ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

13.1.15.58 ipv4 routable 240.0.0.0/4

The **ipv4 routable 240.0.0.0/4** command assigns an class E addresses to an interface. When configured, the class E address traffic are routed through BGP, OSPF, ISIS, RIP, static routes and programmed to the FIB and kernel. By default, this command is disabled.

The **no ipv4 routable 240.0.0.0/4** and **default ipv4 routable 240.0.0.0/4** commands disable IPv4 Class E routing by removing the **ipv4 routable 240.0.0.0/4** command from **running-config**.

IPv4 routable **240.0.0.0/4** routing is disabled by default.

Command Mode

Router General Configuration

Command Syntax

```
ipv4 routable 240.0.0.0/4
no ipv4 routable 240.0.0.0/4
default ipv4 routable 240.0.0.0/4
```

Example

These commands configure an IPv4 Class E (**240/4**) address to an interface.

```
switch(config)# router general
switch(config-router-general)# ipv4 routable 240.0.0.0/4
```

13.1.15.59 platform barefoot bfrt vrf

The **platform barefoot bfrt vrf** command configures the forwarding plane agent on supported platforms to restart and listen on the configured VRF for connections. If left unconfigured, the default VRF is used for the IP and port for the BfRuntime server.

Command Mode

Global Configuration

Command Syntax

```
platform barefoot bfrt vrf VRF name
```

Parameters

VRF name configured VRF for connections.

Example

These commands configure the forwarding plane agent to restart and listen on the configured VRF for connections.

```
switch(config)# vrf instance management
switch(config-vrf-management)# exit
switch(config)# platform barefoot bfrt 0.0.0.0 50052
switch(config)# platform barefoot bfrt vrf <VRF name>
switch(config)# int management1
switch(config-if-Mal)# vrf management
```

13.1.15.60 platform trident forwarding-table partition

The **platform trident forwarding-table partition** command provides a shared table memory for L2, L3 and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

Note: Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident forwarding-table partition** and **default platform trident forwarding-table partition** commands remove the **platform trident forwarding-table partition** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
platform trident forwarding-table partition SIZE
no platform trident forwarding-table partition
default platform trident forwarding-table partition
```

Parameters

SIZE Size of partition. Options include:

- **0** 288k I2 entries, 16k host entries, 16k lpm entries.
- **1** 224k I2 entries, 80k host entries, 16k lpm entries.
- **2** 160k I2 entries, 144k host entries, 16k lpm entries.
- **3** 96k I2 entries, 208k host entries, 16k lpm entries.

The default value is **2** (160k I2 entries, 144k host entries, 16k lpm entries).

Examples

- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

```
switch(config)# platform trident forwarding-table partition 2
switch(config)
```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

```
switch(config)# platform trident forwarding-table partition 3
Warning: StrataAgent will restart immediately
```

13.1.15.61 platform trident routing-table partition

The **platform trident routing-table partition** command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

Note: Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident routing-table partition** and **default platform trident routing-table partition** commands restore the default partitions sizes by removing the **platform trident routing-table partition** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
platform trident routing-table partition SIZE
no platform trident routing-table partition
default platform trident routing-table partition
```

Parameters

SIZE Size of partition. Options include:

- **1** 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length).
- **2** 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length).
- **3** 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length).

The default value is **2** (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length)).

Restrictions

Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

Example

This command sets the shareable routing table to option **1** that supports **6K** prefixes equal to or shorter than **/64** and **1K** prefixes longer than **/64**.

```
switch(config)# platform trident routing-table partition 1
switch(config)
```

13.1.15.62 rib fib policy

The **rib fib policy** command enables FIB policy for a particular VRF under router general configuration mode. The FIB policy can be configured to advertise only specific RIB routes and exclude all other routes.

For example, a FIB policy can be configured that will not place routes associated with a specific origin in the routing table. These routes will not be used to forward data packets and these routes are not advertised by the routing protocol to neighbors.

The **no rib fib policy** and **default rib fib policy** commands restore the switch to its default state by removing the corresponding rib fib policy command from **running-config**.

Command Mode

Router General Configuration

Command Syntax

```
rib [ipv4 | ipv6] fib policy name
```

```
no rib [ipv4 | ipv6] fib policy name
```

```
default rib [ipv4 | ipv6] fib policy name
```

Parameters

- **ipv4** IPv4 configuration commands.
- **ipv6** IPv6 configuration commands.
- **name** Route map name.

Example

The following example enables FIB policy for IPv4 in the default VRF, using the route map, **map1**.

```
Switch(config)# router general
Switch(config-router-general)# vrf default
Switch(config-router-general-vrf-default)# rib ipv4 fib policy map1
```

13.1.15.63 show arp

The **show arp** command displays all ARP tables. This command differs from the [show ip arp](#) command in that it shows MAC bindings for all protocols, whereas [show ip arp](#) only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the **resolve** argument.

Command Mode

EXEC

Command Syntax

```
show arp [VRF_INST][FORMAT][HOST_ADD][HOST_NAME][INTF][MAC_ADDR][DATA]
```

Parameters

The **VRF_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF_INST** Specifies the VRF instance for which data is displayed.
 - **no parameter** Context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **FORMAT** Displays format of host address. Options include:
 - **no parameter** Entries associate hardware address with an IPv4 address.
 - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST_ADD** IPv4 address by which routing table entries are filtered. Options include:
 - **no parameter** Routing table entries are not filtered by host address.
 - **ipv4_addr** Table entries matching specified IPv4 address.
- **HOST_NAME** Host name by which routing table entries are filtered. Options include:
 - **no parameter** Routing table entries are not filtered by host name.
 - **host hostname** Entries matching **hostname** (text).
- **INTF** Interfaces for which command displays status.
 - **no parameter** Routing table entries are not filtered by interface.
 - **interface ethernet e_num** Routed Ethernet interface specified by **e_num**.
 - **interface loopback l_num** Routed loopback interface specified by **l_num**.
 - **interface management m_num** Routed management interface specified by **m_num**.
 - **interface port-channel p_num** Routed port channel Interface specified by **p_num**.
 - **interface vlan v_num** VLAN interface specified by **v_num**.
 - **interface VXLAN vx_num** VXLAN interface specified by **vx_num**.
- **MAC_ADDR** MAC address by which routing table entries are filtered. Options include:
 - **no parameter** Routing table entries are not filtered by interface MAC address.
 - **mac_address mac_address** Entries matching **mac_address** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
 - **no parameter** Routing table entries.
 - **summary** Summary of ARP table entries.
 - **summary total** Number of ARP table entries.

Related Commands

The [cli vrf](#) command specifies the context-active VRF.

Example

This command displays the ARP table.

```
switch> show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0         001c.730b.1d15  Management1
172.22.30.133    0         001c.7304.3906  Management1 switch>
```

13.1.15.64 show dhcp server

Use the **show dhcp server** command to display DHCP server information.

Command Mode

EXEC

Command Syntax

```
show dhcp server [ ipv4|ipv6 |leases|vrf]
```

Parameters

- **ipv4** - Displays details related to IPv4.
- **ipv6** - Displays details related to IPv6.
- **leases-** - Displays active leases.
 - **A.B.C.D/E** - Displays IPv4 lease details.
 - **A:B:C:D:E:F:G:H/I** Displays IPv6 lease details.
 - **NAME** Displays the lease name.

Examples

- Display DHCPv4 information.

```
switch# show dhcp server ipv4
IPv4 DHCP Server is active
Debug log is enabled
DNS server(s): 10.2.2.2
DNS domain name: domainFoo
Lease duration: 1 days 0 hours 0 minutes
TFTP server:
serverFoo (Option 66)
10.0.0.3 (Option 150)
TFTP file: fileFoo
Active Leases: 1
IPv4 DHCP interface status:
  Interface      Status
-----
  Ethernet1      Inactive (Could not determine VRF)
  Ethernet2      Inactive (Not in default VRF)
  Ethernet3      Inactive (Kernel interface not created yet)
  Ethernet4      Inactive (Not up)
  Ethernet5      Inactive (No IP address)
  Ethernet6      Active

Vendor information:
Vendor ID: default
  Sub-options      Data
-----
  1                 192.0.2.0, 192.0.2.1

Vendor ID: vendorFoo
  Sub-options      Data
-----
  2                 192.0.2.2
  3                 "Foo"

Subnet: 10.0.0.0/8
Subnet name: subnetFoo
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.1.1.1 10.2.2.2
Lease duration: 3 days 3 hours 3 minutes
Default gateway address: 10.0.0.3
TFTP server:
subnetServerFoo (Option 66)
10.0.0.4 (Option 150)
TFTP boot file: subnetFileFoo
Active leases: 1
Reservations:
MAC address: 1a1b.1c1d.1e1f
```

```
IPv4 address: 10.0.0.1
MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.2
```

- In this example, DHCPv6 is configured with subnet **fe80::/10** while enabled on **Ethernet1** with address **fe80::1/64** and on **Ethernet3** with address **fe80::2/64**.

```
switch# show dhcp server ipv6
IPv6 DHCP server is active
Debug log is enabled
DNS server(s): fe80::6
DNS domain name: testaristanetworks.com
Lease duration: 1 days 3 hours 30 minutes
Active leases: 0
IPv6 DHCP interface status:
Interface      Status
-----
Ethernet1      Active
Ethernet3      Active
Subnet: fe80::/10
Subnet name: foo
Direct: Inactive (Multiple interfaces match this subnet: Ethernet1 Ethernet3)
Relay: Active
Active leases: 0
```

- This example illustrates when multiple subnets match an interface. In this example, DHCPv6 is configured with subnets **fc00::/7** and **fe80::/10** while enabled on **Ethernet1** with address **fe80::1/10** and **fc00::1/7**.

```
switch# show dhcp server ipv6
IPv6 DHCP server is active
DNS server(s): fc00::2
DNS domain name: testaristanetworks.com
Lease duration: 1 days 3 hours 30 minutes
Active leases: 0
IPv6 DHCP interface status:
Interface      Status
-----
Ethernet1      Active
Subnet: fc00::/7
Subnet name: foo
Range: fc00::1 to fc00::5
DNS server(s): fc00::6 fc00::8
Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active

Active leases: 0
Subnet name: bar
Direct: Inactive (This and other subnets match interface Ethernet1)
Relay: Active
Active leases: 0
```

- When a subnet is disabled, the **show dhcp server** command displays the disable message with a reason. The number of active leases of the disabled subnets are **0**. In this example, there are overlapping subnets.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
Interface      Status
-----
Ethernet1      Active

Subnet: 10.0.0.0/24 (Subnet is disabled - overlapping subnet 10.0.0.0/8)
Range: 10.0.0.1 to 10.0.0.10
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0

Subnet: 10.0.0.0/8 (Subnet is disabled - overlapping subnet 10.0.0.0/24)
DNS server(s):
```

```
Default gateway address: 10.0.0.3
Active leases: 0
```

- In this example, the display output shows overlapping ranges.

```
switch# show dhcp server
IPv4 DHCP Server is active
DNS server(s): 10.2.2.2
Lease duration: 1 days 0 hours 0 minutes
Active Leases: 0
IPv4 DHCP interface status:
  Interface      Status
-----
  Ethernet1      Active

Subnet: 10.0.0.0/8 (Subnet is disabled - range 10.0.0.9-10.0.0.12 overlaps with an existing
pool)
Range: 10.0.0.1 to 10.0.0.10
Range: 10.0.0.9 to 10.0.0.12
DNS server(s): 10.3.3.3 10.4.4.4
Default gateway address: 10.0.0.4
Active leases: 0
```

- This example displays duplicate static IP address reservation.

```
Subnet: 10.0.0.0/8 (Subnet is disabled - ipv4-address 10.0.0.11 is reserved more than once)
Subnet name:
DNS server(s):
Default gateway address: 10.0.0.3
Active leases: 0
Reservations:
MAC address: 1a1b.1c1d.1e1f
IPv4 address: 10.0.0.11
MAC address: 2a2b.2c2d.2e2f
IPv4 address: 10.0.0.11
```

- Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server including the IP address, the expected end time for that address, the time when the address is handed out, and the equivalent MAC address.

```
switch# show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a
2000:0:0:40::b
End: 2019/06/20 18:06:33 UTC
Last transaction: 2019/06/20 14:36:33 UTC
MAC address: 165a.a86d.ffac
```

13.1.15.65 show dhcp server leases

Use the **show dhcp server leases** command to display DHCP server lease information.

Command Mode

EXEC

Command Syntax

```
show dhcp server leases [ ipv4 | ipv6
```

Parameters

- **ipv4** Displays details related to IPv4.
- **ipv6** Displays details related to IPv6.
- **leases** Displays active leases.

Example

Use the **show dhcp server leases** command to display detailed information about the IP addresses allocated by the DHCP Server including the IP address, the expected end time for that address, the time when assigning the address, and the equivalent MAC address.

```
switch# show dhcp server leases
10.0.0.10
End: 2019/06/20 17:44:34 UTC
Last transaction: 2019/06/19 17:44:34 UTC
MAC address: 5692.4c67.460a

2000:0:0:40::b

End: 2019/06/20 18:06:33 UTC

Last transaction: 2019/06/20 14:36:33 UTC

MAC address: 165a.a86d.fffac
```

13.1.15.66 show hardware capacity

The `show hardware capacity` command displays the utilization of the hardware resources:

Command Mode

Privileged EXEC

Command Syntax

`show hardware capacity`

Example

The following command is used to show the utilization of the hardware resources:

switch# **show hardware capacity**
Forwarding Resources Usage

Table	Feature	Chip	Used Entries	Used (%)	Free Entries	Committed Entries	Best Case Max	High	Watermark
Entries									

ECMP			0	0%	4095	0	4095	0	
ECMP	Mpls		0	0%	4095	0	4095	0	
ECMP	Routing		0	0%	4095	0	4095	0	
ECMP	VXLANOverlay		0	0%	4095	0	4095	0	
ECMP	VXLANTunnel		0	0%	3891	0	3891	0	

13.1.15.67 show interface tunnel

The **show interface tunnel** command displays the interface tunnel information.

Command Mode

EXEC

Command Syntax

show interface tunnel *number*

Parameter

number Specifies the tunnel interface number.

Example

This command displays tunnel interface configuration information for tunnel interface **10**.

```
switch# show interface tunnel 10

Tunnel10 is up, line protocol is up (connected)
Hardware is Tunnel, address is 0a01.0101.0800
Internet address is 192.168.1.1/24
Broadcast address is 255.255.255.255
Tunnel source 10.1.1.1, destination 10.1.1.2
Tunnel protocol/transport GRE/IP
  Key disabled, sequencing disabled
  Checksumming of packets disabled
Tunnel TTL 10, Hardware forwarding enabled
Tunnel TOS 10
Path MTU Discovery
Tunnel transport MTU 1476 bytes
Up 3 seconds
```

13.1.15.68 show ip

The **show ip** command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

Command Mode

EXEC

Command Syntax

show ip

Example

This command displays IPv4 routing status.

```
switch> show ip

IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10 switch>
```

13.1.15.69 show ip arp

The **show ip arp** command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by the host names when the command includes the **resolve** argument.

Command Mode

EXEC

Command Syntax

```
show ip arp [VRF_INST][FORMAT][HOST_ADDR][HOST_NAME][INTF][MAC_ADDR][DATA]
```

Parameters

The **VRF_INST** and **FORMAT** parameters list first and second. The **DATA** parameter lists last. All other parameters can be placed in any order.

- **VRF_INST** - Specifies the VRF instance to display data.
 - **no parameter** - Specifies the Context-active VRF.
 - **vrf vrf_name** - Specifies name of VRF instance. Specifies the system default VRF **default**.
- **FORMAT** - Displays format of host address. The options include the following:
 - **no parameter** - Displays entries associated hardware address with an IPv4 address.
 - **resolve** - Displays the specific associated hardware address with a host name (if it exists).
- **HOST_ADDR** - Specifies the IPv4 address to filter routing table entries. The options include the following:
 - **no parameter** - Routing table entries not filtered by host address.
 - **ipv4_addr** - Table entries matching specified IPv4 address.
- **HOST_NAME** - Host name by to filter routing table entries. The options include the following:
 - **no parameter** - Routing table entries not filtered by host name.
 - **host hostname** - Entries with matching **hostname** (text).
- **INTERFACE_NAME** - Interfaces to display status.
 - **no parameter** - Routing table entries not filtered by interface.
 - **interface ethernet e_num** - Routed Ethernet interface specified by **e_num**.
 - **interface loopback l_num** - Routed loopback interface specified by **l_num**.
 - **interface management m_num** - Routed management interface specified by **m_num**.
 - **interface port-channel p_num** - Routed port channel Interface specified by **p_num**.
 - **interface vlan v_num** - VLAN interface specified by **v_num**.
 - **interface VXLAN vx_num** - VXLAN interface specified by **vx_num**.
- **MAC_ADDR** - MAC address to filter routing table entries. The options include the following:
 - **no parameter** - Routing table entries not filtered by interface MAC address.
 - **mac_address mac_address** - Entries with matching **mac_address** (dotted hex notation – H.H.H).
- **DATA** - Details of information provided by command. The options include the following:
 - **no parameter** - Routing table entries.
 - **summary** - Summary of ARP table entries.
 - **summary total** - Number of ARP table entries.

Examples

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch> show ip arp
```

Address	Age (min)	Hardware Addr	Interface
172.25.0.2	0	004c.6211.021e	Vlan101, Port-Channel2
172.22.0.1	0	004c.6214.3699	Vlan1000, Port-Channel1
172.22.0.2	0	004c.6219.a0f3	Vlan1000, Port-Channel1
172.22.0.3	0	0045.4942.a32c	Vlan1000, Ethernet33
172.22.0.5	0	f012.3118.c09d	Vlan1000, Port-Channel1
172.22.0.6	0	00e1.d11a.a1eb	Vlan1000, Ethernet5
172.22.0.7	0	004f.e320.cd23	Vlan1000, Ethernet6
172.22.0.8	0	0032.48da.f9d9	Vlan1000, Ethernet37
172.22.0.9	0	0018.910a.1fc5	Vlan1000, Ethernet29
172.22.0.11	0	0056.cbe9.8510	Vlan1000, Ethernet26 switch>

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses. The output displays host names assigned to IP addresses in place of the address.

```
switch> show ip arp resolve
```

Address	Age (min)	Hardware Addr	Interface
green-vl101.new	0	004c.6211.021e	Vlan101, Port-Channel2
172.22.0.1	0	004c.6214.3699	Vlan1000, Port-Channel1

royalblue.newco	0	0018.910a.1fc5	Vlan1000, Ethernet29
172.22.0.11	0	0056.cbe9.8510	Vlan1000, Ethernet26 switch>

13.1.15.70 show ip arp inspection statistics

The **show ip arp inspection statistics** command displays the statistics of inspected ARP packets. For a specified VLAN specified, the output displays only VLANs with ARP inspection enabled. If no VLAN specified, the output displays all VLANs with ARP inspection enabled.

Command Mode

EXEC

Command Syntax

```
show ip arp inspection statistics [vlan [VID]][INTERFACE] interface intf_slot | intf_port
```

Parameters

- **VID** - Specifies the VLAN interface ID.
- **INTERFACE** - Specifies the interface (e.g., Ethernet).
 - ***intf_slot*** - Specifies the Interface slot.
 - ***intf_port*** - Specifies the Interface port.
- **INTF** - Specifies the VLAN interface slot and port.

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)

Examples

- This command display statistics of inspected ARP packets for VLAN **10**.

```
switch(config)# show ip arp inspection statistics vlan 10

Vlan : 10
-----
ARP
Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1
Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for Ethernet interface **3/1**.

```
switch(config)# show ip arp inspection statistics ethernet interface 3/1
Interface : 3/1
-----
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
```

```
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

13.1.15.71 show ip arp inspection vlan

The **show ip arp inspection vlan** command displays the configuration and operation state of ARP inspection. For a VLAN range specified, the output displays only VLANs with ARP inspection enabled. If no VLAN specified, the output displays all VLANs with ARP inspection enabled. The operation state turns to **Active** when hardware becomes ready to trap ARP packets for inspection.

Command Mode

EXEC

Command Syntax

show ip arp inspection vlan [LIST]

Parameters

LIST - Specifies the VLAN interface number.

Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [show ip arp inspection statistics](#)

Example

This command displays the configuration and operation state of ARP inspection for VLANs **1** through **150**.

```
switch(config)# show ip arp inspection vlan 1 - 150

VLAN 1
-----
Configuration
: Enabled
Operation State : Active
VLAN 2
-----
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
-----
Configuration
: Enabled
Operation State : Active

switch(config)#
```

13.1.15.72 show ip dhcp relay counters

The **show ip dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Command Mode

EXEC

Command Syntax

```
show ip dhcp relay counters
```

Example

This command displays the IP DHCP relay counter table.

```
switch> show ip dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Vlan1000	0	0	0	4 days, 19:54:24 ago
Vlan1036	376	277	0	4 days, 19:54:24 ago switch>

13.1.15.73 show ip dhcp relay

The **show ip dhcp relay** command displays the DHCP relay agent configuration status on the switch.

Command Mode

EXEC

Command Syntax

```
show ip dhcp relay
```

Example

This command displays the DHCP relay agent configuration status.

```
switch> show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  DHCP Smart Relay is disabled
  DHCP servers: 10.4.4.4 switch>
```

13.1.15.74 show ip dhcp snooping counters

The **show ip dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets received by the switch. The output displays data for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping counters [COUNTER_TYPE]

Parameters

COUNTER_TYPE - Displays the type of counter.

- **no parameter** Command displays counters for each VLAN.
- **debug** Command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch> show ip dhcp snooping counters

Vlan | Dhcp Request Pkts | Dhcp Reply Pkts |
      | Rcvd  Fwdd  Drop | Rcvd Fwdd  Drop | Last Cleared
-----|-----|-----|-----|-----
 100 |      0      0      0 |      0      0      0 | 0:35:39 ago switch>
```

- This command displays the number of DHCP packets sent on the switch.

```
switch> show ip dhcp snooping counters debug
Counter                               Snooping to Relay Relay to Snooping
-----|-----|-----
Received                               0                0
Forwarded                              0                0
Dropped - Invalid VlanId                0                0
Dropped - Parse error                    0                0
Dropped - Invalid Dhcp Otype             0                0
Dropped - Invalid Info Option            0                0
Dropped - Snooping disabled              0                0

Last Cleared:  3:37:18 ago switch>
```

13.1.15.75 show ip dhcp snooping hardware

The **show ip dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping hardware

Example

This command DHCP snooping hardware status.

```
switch> show ip dhcp snooping hardware
DHCP Snooping is enabled
DHCP Snooping is enabled on following VLANs:
  None
  Vlans enabled per Slice
    Slice: FixedSystem
  None switch>
```

13.1.15.76 show ip dhcp snooping

The **show ip dhcp snooping** command displays the DHCP snooping configuration.

Command Mode

EXEC

Command Syntax

show ip dhcp snooping

Example

This command displays the switch's DHCP snooping configuration.

```
switch> show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 100
DHCP Snooping is operational on following VLANs:
 100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch>
```

13.1.15.77 show ip hardware fib summary

The **show ip hardware fib summary** command displays the statistics of the RECOMP.

Command Mode

Privileged EXEC

Command Syntax

```
show ip hardware fib summary
```

Example

- The following command is used to show the statistics of RECOMP:

```
switch# show ip hardware fib summary
Fib summary
-----
Adjacency sharing: disabled
BFD peer event: enabled
Deletion Delay: 0
Protect default route: disabled
PBR: supported
URPF: supported
ICMP unreachable: enabled
Max Ale ECMP: 600
UCMP weight deviation: 0.0
Maximum number of routes: 0
Fib compression: disabled
Resource optimization for adjacency programming: enabled
Adjacency resource optimization thresholds: low 20, high 80
```

About the Output

The last two lines of the output shows whether the feature is enabled and what are the corresponding threshold values for starting and stopping the optimization process.

13.1.15.78 show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

Command Mode

EXEC

Command Syntax

```
show ip interface [INTERFACE_NAME][VRF_INST]
```

Parameters

- **INTERFACE_NAME** Interfaces for which command displays status.
 - **no parameter** All routed interfaces.
 - **ipv4_addr** Neighbor IPv4 address.
 - **ethernet e_range** Routed Ethernet interfaces specified by **e_range**.
 - **loopback l_range** Routed loopback interfaces specified by **l_range**.
 - **management m_range** Routed management interfaces specified by **m_range**.
 - **port-channel p_range** Routed port channel Interfaces specified by **p_range**.
 - **vlan v_range** VLAN interfaces specified by **v_range**.
 - **VXLAN vx_range** VXLAN interfaces specified by **vx_range**.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
 - **no parameter** Context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.

Examples

- This command displays IP status of configured VLAN interfaces numbered between **900** and **910**.

```
switch> show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```

- This command displays the configured TCP Maximum Segment Size (MSS) ceiling value of **1436** bytes for an Ethernet interface **25**.

```
switch> show ip interface ethernet 25
Ethernet25 is up, line protocol is up (connected)
  Internet address is 10.1.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1500 bytes
  IPv4 TCP MSS egress ceiling is 1436 bytes
```

13.1.15.79 show ip interface brief

Use the **show ip interface brief** command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

Command Mode

EXEC

Command Syntax

```
show ip interface [INTERFACE_NAME][VRF_INST] brief
```

Parameters

- **INTERFACE_NAME** Interfaces for which command displays status.
 - **no parameter** All routed interfaces.
 - **ipv4_addr** Neighbor IPv4 address.
 - **ethernet e_range** Routed Ethernet interfaces specified by **e_range**.
 - **loopback l_range** Routed loopback interfaces specified by **l_range**.
 - **management m_range** Routed management interfaces specified by **m_range**.
 - **port-channel p_range** Routed port channel Interfaces specified by **p_range**.
 - **vlan v_range** VLAN interfaces specified by **v_range**.
 - **VXLAN vx_range** VXLAN interface range specified by **vx_range**.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
 - **no parameter** Context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.

Example

This command displays the summary status of VLAN interfaces **900-910**.

```
switch> show ip interface vlan 900-910 brief

! Some interfaces do not exist
Interface      IP Address      Status    Protocol    MTU
Vlan901        170.33.254.1/30 up         up          9212
Vlan902        170.33.254.14/29 up         up          9212
Vlan905        170.33.254.17/29 up         up          1500
Vlan907        170.33.254.67/29 up         up          9212
Vlan910        170.33.254.30/30 up         up          9212
```

13.1.15.80 show ip route

The **show ip route** command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays configured commands not in the FIB.

Command Mode

EXEC

Command Syntax

```
show ip route [VRF_INSTANCE][ADDRESS][ROUTE_TYPE][INFO_LEVEL][PREFIX]
```

Parameters

The **VRF_INSTANCE** and **ADDRESS** parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF_INSTANCE** Specifies the VRF instance for which data is displayed.
 - **no parameter** Context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Filters routes by IPv4 address or subnet.
 - **no parameter** All routing table entries.
 - **ipv4_addr** Routing table entries matching specified address.
 - **ipv4_subnet** Routing table entries matching specified subnet (CIDR or address-mask).
- **ROUTE_TYPE** Filters routes by specified protocol or origin. Options include:
 - **no parameter** All routing table entries.
 - **aggregate** Entries for BGP aggregate routes.
 - **bgp** Entries added through BGP protocol.
 - **connected** Entries for routes to networks directly connected to the switch.
 - **isis** Entries added through ISIS protocol.
 - **kernel** Entries appearing in Linux kernel but not added by EOS software.
 - **ospf** Entries added through OSPF protocol.
 - **rip** Entries added through RIP protocol.
 - **static** Entries added through CLI commands.
 - **vrf** Displays routes in a VRF.
- **INFO_LEVEL** Filters entries by next hop connection. Options include:
 - **no parameter** Filters routes whose next hops are directly connected.
 - **detail** Displays all routes.
- **PREFIX** Filters routes by prefix.
 - **no parameter** Specific route entry that matches the ADDRESS parameter.
 - **longer-prefixes** All subnet route entries in range specified by ADDRESS parameter.

Related Command

The [cli vrf](#) command specifies the context-active VRF.

Examples

- This command displays IPv4 routes learned through BGP.

```
switch> show ip route bgp

13.1.15.81 show ip route age

The **show ip route age** command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

Command Mode

EXEC

Command Syntax

show ip route **ADDRESS** age

Parameters

ADDRESS Filters routes by IPv4 address or subnet.

- **ipv4_addr** Routing table entries matching specified address.
- **ipv4_subnet** Routing table entries matching specified subnet (CIDR or address-mask).

Example

This command shows the amount of time since the last update to ip route **172.17.0.0/20**.

```
switch> show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
switch>
```

13.1.15.82 show ip route gateway

The **show ip route gateway** command displays IP addresses of all gateways (next hops) used by active routes.

Command Mode

EXEC

Command Syntax

```
show ip route [VRF_INSTANCE] gateway
```

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- **no parameter** Context-active VRF.
- **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.

Related Commands

The [cli vrf](#) command specifies the context-active VRF.

Example

This command displays next hops used by active routes.

```
switch> show ip route gateway
The following gateways are in use:
 172.25.0.1 Vlan101
 172.17.253.2 Vlan3000
 172.17.254.2 Vlan3901
 172.17.254.11 Vlan3902
 172.17.254.13 Vlan3902
 172.17.254.17 Vlan3903
 172.17.254.20 Vlan3903
 172.17.254.66 Vlan3908
 172.17.254.67 Vlan3908
 172.17.254.68 Vlan3908
 172.17.254.29 Vlan3910
 172.17.254.33 Vlan3911
 172.17.254.35 Vlan3911
 172.17.254.105 Vlan3912
 172.17.254.86 Vlan3984
 172.17.254.98 Vlan3992
 172.17.254.99 Vlan3992 switch>
```

13.1.15.83 show ip route host

The **show ip route host** command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = **255.255.255.255** or prefix = **/32**). Each entry includes a code of the route's purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

Command Mode

EXEC

Command Syntax

```
show ip route [VRF_INSTANCE] host
```

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- **no parameter** Context-active VRF.
- **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.

Related Commands

The [cli vrf](#) command specifies the context-active VRF.

Example

This command displays all host routes in the host forwarding table.

```
switch> show ip route host
R - receive B - broadcast F - FIB, A - attached

F 127.0.0.1 to cpu
B 172.17.252.0 to cpu
A 172.17.253.2 on Vlan2000
R 172.17.253.3 to cpu
A 172.17.253.10 on Vlan2000
B 172.17.253.255 to cpu
B 172.17.254.0 to cpu
R 172.17.254.1 to cpu
B 172.17.254.3 to cpu
B 172.17.254.8 to cpu
A 172.17.254.11 on Vlan2902
R 172.17.254.12 to cpu

F 172.26.0.28 via 172.17.254.20 on Vlan3003
               via 172.17.254.67 on Vlan3008
               via 172.17.254.98 on Vlan3492
               via 172.17.254.2 on Vlan3601
               via 172.17.254.13 on Vlan3602
via 172.17.253.2 on Vlan3000
F 172.26.0.29 via 172.25.0.1 on Vlan101
F 172.26.0.30 via 172.17.254.29 on Vlan3910
F 172.26.0.32 via 172.17.254.105 on Vlan3912 switch>
```

13.1.15.84 show ip route match tag

The **show ip route match tag** command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

Command Mode

EXEC

Command Syntax

```
show ip route [VRF_INSTANCE] ADDRESS match tag
```

Parameters

- **VRF_INSTANCE** Specifies the VRF instance for which data is displayed.
 - *no parameter* Context-active VRF.
 - **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Displays routes of specified IPv4 address or subnet.
 - *ipv4_addr* Routing table entries matching specified IPv4 address.
 - *ipv4_subnet* Routing table entries matching specified IPv4 subnet (CIDR or address-mask).

Example

This command displays the route tag for the specified subnet.

```
switch> show ip route 172.17.50.0/23 match tag
Codes: C - connected, S - static, K - kernel,
        O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
        E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
        N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
        R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
        O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
        NG - Nexthop Group Static Route, V - VXLAN Control Service,
        DH - DHCP client installed default route, M - Martian

O E2    172.17.50.0/23 tag 0 switch>
```

13.1.15.85 show ip route summary

The **show ip route summary** command displays the number of routes, categorized by destination prefix, in the routing table.

Command Mode

EXEC

Command Syntax

```
show ip route [VRF_INSTANCE] summary
```

Parameters

VRF_INSTANCE Specifies the VRF instance for which data is displayed.

- **no parameter** Context-active VRF.
- **vrf vrf_name** Specifies name of VRF instance. System default VRF is specified by **default**.

Example

This command displays a summary of the routing table contents.

```
switch> show ip route summary
Route Source          Number Of Routes
-----
connected              15
static                  0
ospf                   74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
  NSSA External-1:0 NSSA External-2:0
bgp                      7
  External: 6 Internal: 1
internal               45
attached               18
aggregate              0 switch>
```

13.1.15.86 show ip verify source

The **show ip verify source** command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

Command Mode

EXEC

Command Syntax

```
show ip verify source [VLAN | DETAIL]
```

Parameters

- **VLAN** Displays all VLANs configured in **no ip verify source vlan**.
- **DETAIL** Displays all source IP-MAC binding entries configured for IPSG.

Related Commands

- [ip source binding](#)
- [ip verify source](#)

Examples

- This command verifies the IPSG configuration and operational states.

```
switch(config)# show ip verify source
Interface      Operational State
-----
Ethernet1      IP source guard enabled
Ethernet2      IP source guard disabled
```

- This command displays all VLANs configured in **no ip verify source vlan**. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)# show ip verify source vlan
IPSG disabled on VLANs: 1-2
VLAN      Operational State
-----
1          IP source guard disabled
2          Error: vlan classification failed
```

- This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an "IP source guard disabled" state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a "Port-Channel down" state will be shown.

```
switch(config)# show ip verify source detail
Interface      IP Address  MAC Address  VLAN  State
-----
Ethernet1      10.1.1.1    0000.aaaa.1111  5    active
Ethernet1      10.1.1.5    0000.aaaa.5555  1    IP source guard disabled
Port-Channel1  20.1.1.1    0000.bbbb.1111  4    Port-Channel down
```

13.1.15.87 show platform arad ip route summary

The **show platform arad ip route summary** command shows hardware resource usage of IPv4 routes.

Command Mode

EXEC

Command Syntax

```
show platform arad ip route summary
```

Related Commands

- The [agent SandL3Unicast terminate](#) command enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- The [ip hardware fib optimize](#) command enables IPv4 route scale.
- The [show platform arad ip route](#) command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Example

This command shows hardware resource usage of IPv4 routes.

```
switch(config)# show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4

switch(config)#
```

13.1.15.88 show platform arad ip route

The **show platform arad ip route** command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

Command Mode

EXEC

Command Syntax

```
show platform arad ip route
```

Related Commands

- The [agent SandL3Unicast terminate](#) command enables restarting the Layer 3 agent to ensure IPv4 routes are optimized.
- The [ip hardware fib optimize](#) command enables IPv4 route scale.
- The [show platform arad ip route summary](#) command shows hardware resource usage of IPv4 routes.

Examples

- This command displays the platform unicast forwarding routes. In this example, the ACL label field in the following table is **4094** by default for all routes. If an IPv4 egress RACL is applied to an SVI, all routes corresponding to that VLAN will have an ACL label value. In this case, the ACL Label field value is 2.

```
switch# show platform arad ip route
Tunnel Type: M(mpls), G(gre)

switch(config)#

```

13.1.15.89 show platform barefoot bfrt

The **show platform barefoot bfrt** command displays information about the current BfRuntime server configuration.

Command Mode

EXEC

Command Syntax

```
show platform barefoot bfrt
```

Parameters

no parameter state of the system.

Example

The following output is for a system where the BfRuntime server has been configured.

```
(switch)# show platform barefoot bfrt
Namespace: management
FixedSystem:0.0.0.0:50052
```

13.1.15.90 show platform fap eedb ip-tunnel gre interface tunnel

The `show platform fap eedb ip-tunnel gre interface tunnel` command verifies the tunnel encapsulation programming for the tunnel interface.

Command Mode

EXEC

Command Syntax

`show platform fap eedb ip-tunnel gre interface tunnel` *number*

Parameter

number Specifies the tunnel interface number.

Example

These commands verify the tunnel encapsulation programming for the *tunnel interface 10*.

```
switch# show platform fap eedb ip-tunnel gre interface tunnel 10
-----
|                                     Jericho0                                     |
|                                     GRE Tunnel Egress Encapsulation DB           |

```

13.1.15.91 show platform fap tcam summary

The **show platform fap tcam summary** command displays information about the TCAM bank that is allocated for GRE packet termination lookup.

Command Mode

EXEC

Command Syntax

```
show platform fap tcam summary
```

Example

This command verifies if the TCAM bank is allocated for GRE packet termination lookup.

```
switch# show platform fap tcam summary

Tcam Allocation (Jericho0)
Bank      Used By      Reserved By
-----
0         dbGreTunnel    -
```

13.1.15.92 show platform trident forwarding-table partition

The **show platform trident forwarding-table partition** command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

Command Mode

Privileged EXEC

Command Syntax

```
show platform trident forwarding-table partition
```

```
show platform trident forwarding-table partition flexible
```

Examples

- The **show platform trident forwarding-table partition** command shows the Trident forwarding table information.

```
switch(config)# show platform trident forwarding-table partition
L2 Table Size: 96k
L3 Host Table Size: 208k
LPM Table Size: 16k
switch(config)#
```

- The **show platform trident forwarding-table partition flexible** shows the banks allocated for ALPM as well.

```
switch(config)# show platform trident forwarding-table partition flexible
-----
Minimum L2 entries           = 32768
Minimum L3 entries           = 16384

13.1.15.93 show rib route ip

The **show rib route ip** command displays a list of IPv4 Routing Information Base (RIB) routes.

Command Mode

EXEC

Command Syntax

```
show rib route ip [vrf vrf_name][PREFIX][ROUTE TYPE]
```

Parameters

- **vrf vrf_name** Displays RIB routes from the specified VRF.
- **PREFIX** dDisplays routes filtered by the specified IPv4 information. Options include:
 - **ip_address** Displays RIB routes filtered by the specified IPv4 address.
 - **ip_subnet_mask** Displays RIB routes filtered by the specified IPv4 address and subnet mask.
 - **ip_prefix** Displays RIB routes filtered by the specified IPv4 prefix.
- **ROUTE TYPE** Displays routes filtered by the specified route type. Options include:
 - **bgp** Displays RIB routes filtered by BGP.
 - **connected** Displays RIB routes filtered by connected routes.
 - **dynamicPolicy** Displays RIB routes filtered by dynamic policy routes.
 - **host** Displays RIB routes filtered by host routes.
 - **isis** Displays RIB routes filtered by ISIS routes.
 - **ospf** Displays RIB routes filtered by OSPF routes.
 - **ospf3** Displays RIB routes filtered by OSPF3 routes.
 - **reserved** Displays RIB routes filtered by reserved routes.
 - **route-input** Displays RIB routes filtered by route-input routes.
 - **static** Displays RIB routes filtered by static routes.
 - **vrf** Displays routes in a VRF.
 - **vrf-leak** Displays leaked routes in a VRF.

Examples

- This command displays IPv4 RIB static routes.

```
switch# show rib route ip static
VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S 10.80.0.0/12 [1/0]
    via 172.30.149.129 [0/1]
    via Management1, directly connected
>S 172.16.0.0/12 [1/0]
    via 172.30.149.129 [0/1]
    via Management1, directly connected switch#
```

- This command displays IPv4 RIB connected routes.

```
switch# show rib route ip connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>C 10.1.0.0/24 [0/1]
    via 10.1.0.102, Ethernet1
```

```
>C 10.2.0.0/24 [0/1]
    via 10.2.0.102, Ethernet2
>C 10.3.0.0/24 [0/1]
    via 10.3.0.102, Ethernet3 switch#
```

- This command displays routes leaked through VRF leak agent.

```
switch# show rib route ip vrf VRF2 vrf-leak
VRF: VRF2, Protocol: vrf-leak
...
>VL 20.0.0.0/8 [1/0] source VRF: VRF1
    via 10.1.2.10 [0/0] type ipv4
    via 10.1.2.10, Ethernet1
```

13.1.15.94 show rib route fib policy excluded

The **show rib route fib policy excluded** command displays the RIB routes filtered by FIB policy. The **fib policy excluded** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

Command Mode

EXEC

Command Syntax

```
show rib route [ipv4 | ipv6] fib policy excluded
```

Example

The following example displays the RIB routes excluded by the FIB policy using the **fib policy excluded** option of the **show rib route** command.

```
switch# show rib route ipv6 fib policy excluded
switch# show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
    via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
    via 10.3.4.1, Ethernet2
    via 10.3.6.1, Ethernet3
>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
    via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
    via 10.3.4.1, Ethernet2
    via 10.3.6.1, Ethernet3
```

13.1.15.95 show rib route summary

The **show rib route summary** command displays information about the routes present in the Routing Information Base.

Command Mode

EXEC

Command Syntax

```
show rib route summary [INFO_LEVEL]
```

Parameters

- **no parameter** variable displays data in one table with the summary of all routes in the RIB for default VRF.
- **brief** keyword displays one table with the summary of all routes across all configured VRFs.
- **ip** keyword displays one table with the summary of all IPv4 in the RIB for default VRF.
- **ipv6** keyword displays one table with the summary of all IPv4 in the RIB for default VRF.
- **vrf vrf_Name** keyword displays one table with the summary of all routes in the Routing Information Base for the specified VRF.
- **vrf all** keyword displays one table with the summary of all routes in the Routing Information Base for each configured VRF.
- **INFO_LEVEL** amount of information that is displayed. Options include:
 - **Display Values**
 - **VRF** VRF RIB displayed.
 - **Route Source** Source for the route.
 - **Number of Routes** Number of routes for each source.

Examples

- The following displays data in one table with the summary of all routes in the RIB for default VRF.

```
switch> show rib route summary
VRF: default
Route Source          Number Of Routes
-----
BGP                    1
Connected              4
Dynamic policy         0
IS-IS                  0
OSPF                   0
OSPFv3                 0
RIP                    0
Route input            2
Static                 0
VRF leak               0
```

- The following displays data in one table with the summary of all routes across all configured VRFs.

```
switch> show rib route summary brief
Route Source          Number Of Routes
-----
BGP                    2
Connected              8
Dynamic policy         0
IS-IS                  0
OSPF                   0
OSPFv3                 0
```

```

RIP                                0
Route input                        4
Static                            0
VRF leak                          0

```

- The following displays data in one table with the summary of all IPv4 routes in the RIB for default VRF.

```

switch> show rib route summary ip
VRF: default
Route Source      Number Of Routes
-----
BGP                1
Connected          4
Dynamic policy     0
IS-IS             0
OSPF               0
OSPFv3             0
RIP                0
Route input        2
Static             0
VRF leak           0

```

- The following displays data in one table with the summary of all IPv6 routes in the RIB for default VRF.

```

switch> show rib route summary ipv6
VRF: default
Route Source      Number Of Routes
-----
BGP                0
Connected          0
Dynamic policy     0
IS-IS             0
OSPF               0
OSPFv3             0
RIP                0
Route input        0
Static             0
VRF leak           0

```

- The following displays data in one table with the summary of all routes in the RIB for the VRF named **red**.

```

switch> show rib route summary vrf red
VRF: red
Route Source      Number Of Routes
-----
BGP                1
Connected          4
Dynamic policy     0
IS-IS             0
OSPF               0
OSPFv3             0
RIP                0
Route input        2
Static             0
VRF leak           0

```

- The following displays data in one table with the summary of all routes in the RIB for each configured VRF.

```

switch> show rib route summary vrf all
VRF: red
Route Source      Number Of Routes
-----
BGP                1
Connected          4
Dynamic policy     0
IS-IS             0
OSPF               0
OSPFv3             0

```

```
RIP                                0
Route input                        2
Static                            0
VRF leak                          0
```

```
VRF: default
```

```
Route Source      Number Of Routes
```

```
-----
```

BGP	1
Connected	4
Dynamic policy	0
IS-IS	0
OSPF	0
OSPFv3	0
RIP	0
Route input	2
Static	0
VRF leak	0

13.1.15.96 show routing-context vrf

The **show routing-context vrf** command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

Command Mode

EXEC

Command Syntax

```
show routing-context vrf
```

Related Commands

The [cli vrf](#) command specifies the context-active VRF.

Example

This command displays the context-active VRF.

```
switch> show routing-context vrf  
Current VRF routing-context is PURPLE switch>
```

13.1.15.97 show snapshot counters ecmp history

The **show snapshot counters ecmp history** displays information about the AGM configuration.

Command Mode

EXEC

Command Syntax

```
show snapshot counters ecmp history
```

Parameters

- **Request ID** - Identifies the snapshot Request ID to use for the **clear** command.
- **Output directory URL** - Identifies the snapshot storage location.
- **Complete** - Identifies the snapshot completion status.
- **Poll Interval** - Identifies the configured polling interval for the snapshot.
- **Total poll count** - Identifies the total number of hardware counters collected.
- **Start time** and **Stopped time** - Identifies the system time when the snapshot started and stopped.
- **L2 Adjacency ID** and **Interfaces** - The summary of the ECMP groups monitored by AGM.

Example

Use the **show snapshot counters ecmp history** to display information about the configuration.

```
switch#show snapshot counters ecmp history  
Request ID: 17  
Output directory URL: file:/var/tmp/ecmpMonitor  
Output file name(s): ecmpMonitor-17-adj1284.ctr, ecmpMonitor-17-adj1268.ctr  
Complete: True  
Poll interval: 1000 microseconds
```

```
Total poll count: 59216
Start time: 2024-06-17 17:58:36
Stop time: 2024-06-17 17:59:36
```

```
L2 Adjacency ID      Interfaces
-----
1268                  Ethernet54/1, Ethernet41/1, Ethernet1/1,
Ethernet57/1
1284                  Ethernet20/1, Ethernet35/1, Ethernet41/1,
Ethernet8/1, Ethernet1/1
```

13.1.15.98 show tunnel fib static interface gre

The **show tunnel fib static interface gre** command displays the Forwarding Information Base (FIB) information for a static interface GRE tunnel.

Command Mode

EXEC

Command Syntax

show tunnel fib static interface gre *number*

Parameter

number Specifies the tunnel index number.

Example

This command display the interface tunnel configuration with GRE configured.

```
switch# show tunnel fib static interface gre 10  
  
Type 'Static Interface', index 10, forwarding Primary  
  via 10.6.1.2, 'Ethernet6/1'  
    GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

13.1.15.99 show vrf

The **show vrf** command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

Command Mode

EXEC

Command Syntax

```
show vrf [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE Specifies the VRF instance to display.

- **no parameter** Information is displayed for all VRFs.
- **vrf vrf_name** Information is displayed for the specified user-defined VRF.

Example

This command displays information for the VRF named *purple*.

```
switch> show vrf purple
Vrf      RD          Protocols  State      Interfaces
-----
purple   64496:237      ipv4       no routing  Vlan42, Vlan43 switch>
```

13.1.15.100start snapshot counters

The **start snapshot counters ecmp** allows the monitoring of packets and bytes traversing the members of the configured ECMP groups on the switch with a high time resolution.

Command Mode

Global Configuration Mode

Command Syntax

```
start snapshot counters ecmp poll interval interval [milliseconds | microseconds]
duration duration seconds destination_url
```

Parameters

- **interval *interval*** - Specify at least 100 microseconds. EOS does not guarantee the interval, and the actual poll interval may depend on the system load as well as the number and size of configured ECMP groups. Valid values include milliseconds and microseconds.
- **duration *duration* seconds** - Specify the duration for collecting data. A maximum of 3600 seconds can be configured.
- ***destination_url*** - Optionally, provide a destination URL for data storage.
 - **file** - The path must start with */tmp* or */tmp*. The files store in the non-persistent storage.
 - **flash** - Files store in persistent storage.

Example

To begin collecting data on the switch at 100 millisecond intervals for 1800 seconds, use the following command:

```
switch(config)#start snapshot counters ecmp poll interval 100  
milliseconds duration 1800 seconds
```

13.1.15.101tcp mss ceiling

The **tcp mss ceiling** command configures the Maximum Segment Size (MSS) limit in the TCP header on the configuration mode interface and enables TCP MSS clamping.

The **no tcp mss ceiling** and the **default tcp mss ceiling** commands remove any MSS ceiling limit previously configured on the interface.

Note: Configuring a TCP MSS ceiling on any Ethernet or tunnel interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

Command Mode

Interface-Ethernet Configuration

Subinterface-Ethernet Configuration

Interface-Port-channel Configuration

Subinterface-Port-channel Configuration

Interface-Tunnel Configuration

Interface-VLAN Configuration

Command Syntax

```
tcp mss ceiling {ipv4 segment size | ipv6 segment size}{egress | ingress}
```

```
no tcp mss ceiling
```

```
default tcp mss ceiling
```

Parameters

- **ipv4 segment size** The IPv4 segment size value in bytes. Values range from **64** to **65515**.
- **ipv6 segment size** The IPv6 segment size value in bytes. Values range from **64** to **65495**. This option is not supported on Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+).
- **egress** The TCP SYN packets that are forwarded from the interface to the network.
- **ingress** The TCP SYN packets that are received from the network to the interface. Not supported on Sand platform switches.

Guidelines

- On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), this command works only for egress, and is supported only on IPv4 unicast packets entering the switch.
- Clamping can only be configured in one direction per interface and works only on egress on Sand platform switches.
- To configure ceilings for both IPv4 and IPv6 packets, both configurations must be included in a single command; re-issuing the command overwrites any previous settings.
- Clamping configuration has no effect on GRE transit packets.

Example

These commands configure **interface ethernet 5** as a routed port, then specify a maximum MSS ceiling value of **1458** bytes in TCP SYN packets exiting that port. This enables TCP MSS clamping on the switch.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv4 1458 egress
switch(config-if-Et5)#
```

13.1.15.102tunnel

The **tunnel** command configures options for protocol-over-protocol tunneling. Because interface-tunnel configuration mode is not a group change mode, **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no tunnel** command deletes the specified tunnel configuration.

Command Mode

Interface-tunnel Configuration

Command Syntax

tunnel *options*

no tunnel *options*

Parameters

- **options** Specifies the various tunneling options as listed below.
 - **destination** Destination address of the tunnel.
 - **ipsec** Secures the tunnel with the IPsec address.
 - **key** Sets the tunnel key.
 - **mode** Tunnel encapsulation method.
 - **path-mtu-discovery** Enables the Path MTU discovery on tunnel.
 - **source** Source of the tunnel packets.
 - **tos** Sets the IP type of service value.
 - **ttl** Sets time to live value.
 - **underlay** Tunnel underlay.

Example

These commands place the switch in interface-tunnel configuration mode for **interface Tunnel 10** and with GRE tunnel configured on the interfaces specified.

```
switch(config)# ip routing
switch(config)# interface Tunnel 10
switch(config-if-Tu10)# tunnel mode gre
switch(config-if-Tu10)# ip address 192.168.1.1/24
switch(config-if-Tu10)# tunnel source 10.1.1.1
switch(config-if-Tu10)# tunnel destination 10.1.1.2
switch(config-if-Tu10)# tunnel path-mtu-discovery
switch(config-if-Tu10)# tunnel tos 10
switch(config-if-Tu10)# tunnel ttl 10
```

13.1.15.103vrf (Interface mode)

The **vrf** command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the [vrf instance](#) command.

The **no vrf** and **default vrf** commands remove the configuration mode interface from the specified VRF by deleting the corresponding **vrf** command from *running-config*.

All forms of the **vrf** command remove all IP addresses associated with the configuration mode interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrf [vrf_name]
```

```
no vrf [vrf_name]
```

```
default vrf [vrf_name]
```

Parameters

vrf_name Name of configured VRF.

Examples

- These commands add the configuration mode interface (**vlan 20**) to the VRF named **purple**.

```
switch(config)# interface vlan 20
switch(config-if-Vl20)# vrf purple
switch(config-if-Vl20)#
```

- These commands remove the configuration mode interface from VRF **purple**.

```
switch(config)# interface vlan 20
switch(config-if-Vl20)# no vrf purple
switch(config-if-Vl20)#
```

13.1.15.104vrf instance

The **vrf instance** command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the [vrf \(Interface mode\)](#) command.

The **no vrf instance** and **default vrf instance** commands delete the specified VRF instance by removing the corresponding **vrf instance** command from **running-config**. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
vrf instance [vrf_name]
```

```
no vrf instance [vrf_name]
```

```
default vrf instance [vrf_name]
```

Parameters

vrf_name Name of VRF being created, deleted or configured. The names **main** and **default** are reserved.

Example

This command creates a VRF named **purple** and places the switch in VRF configuration mode for that VRF.

```
switch(config)# vrf instance purple
switch(config-vrf-purple)#
```

13.2 IPv6

EOS supports Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv6 and includes these topics:

- [Introduction](#)
- [IPv6 Description](#)
- [Configuring IPv6](#)
- [IPv6 Commands](#)

13.2.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are Internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP version 4 (IPv4) and IP version 6 (IPv6).

IPv6 is described by *RFC 2460: Internet Protocol, Version 6 (IPv6) Specification*. *RFC 2463* describes ICMPv6 for IPv6. ICMPv6 is a core protocol of the Internet Protocol suite.

13.2.2 IPv6 Description

Internet Protocol version 6 (IPv6) consists of a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. EOS assigns a 128 bit IP address that identifies its network location to each network device.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols cannot interoperate. Many transport and application-layer protocols require little or no change to operate over IPv6.

- [IPv6 Address Format](#)
- [IPv6 DHCP Snooping](#)
- [Neighbor Discovery Protocol](#)
- [IPv6 Duplicate Address Detection Proxy](#)

13.2.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses abbreviate as follows:

- Leading zeros in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

Example

The following three IPv6 hexadecimal number representations refer to the same address:

```
d28e:0000:0000:0000:0234:812f:61ed:4419
d28e:0:0:0:234:812f:61ed:4419
d28e::234:812f:61ed:4419
```

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

Unicast and Anycast Addressing

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association, for example, packets to a single member of a group of potential receivers identified by the same destination address.

Compose unicast and anycast addresses as follows:

- A 64-bit network prefix that identifies the network segment.
- A 64-bit interface identifier based on interface MAC address.

The format of a network address identifies the scope of the address:

- Global address - Valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- Link-local address - Scope extends only to the link to which the interface is directly connected. Link-local addresses do not route from the link.

The switch creates the link-local addresses and you cannot configure it. The following figure depicts the switch's link local address derivation method.

Figure 13-1: Link Local Address Derivation

Multicast Addressing

Multicast addressing defines a one-to-many association. Packets simultaneously route from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. EOS assigns one multicast address to an interface for each multicast group of an interface.

A solicited-node multicast address consists of an IPv6 multicast address whose scope extends only to the link to the directly connected interface. All IPv6 hosts have at least one address per interface. Neighbor Discovery Protocol uses solicited-node multicast addresses to obtain Layer 2 link-layer addresses of other nodes.

13.2.2.2 IPv6 DHCP Snooping

Dynamic Host Configuration Protocol (DHCP) snooping is a Layer 2 feature that is configured on LAN switches. The Arista EOS switch supports Option-37 insertion that allows relay agents to provide remote-id information in DHCP request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-37) to include the switch MAC address (router-id) along with the physical interface name and VLAN number (remote-id) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

13.2.2.3 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (**RFC 4861**) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:

- Auto-configuring a node IPv6 address.
- Sensing other nodes on the link.
- Discovering the link-local addresses of other nodes on the link.
- Detecting duplicate IPv6 addresses.
- Discovering available routers.
- Discovering DNS servers
- Discovering the link address prefix.
- Maintaining path reachability data to other active neighbor nodes.

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

13.2.2.4 IPv6 Duplicate Address Detection Proxy

Overview

IPv6 Duplicate Address Detection Proxy ensures that all IPv6 addresses assigned on a network segment are unique. After a host verifies the uniqueness of the IPv6 address, it enables DAD on the network.

However, if two network segments cannot communicate with each other, IPv6 DAD cannot perform and duplicate addresses may be assigned to the same interface. To prevent this, a proxy for IPv6 hosts must be assigned on the network and it responds on behalf of the address owner when the address already exists.

13.2.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- [Configuring IPv6 on the Switch](#)
- [Configuring IPv6 on an Interface](#)
- [Configuring IPv6 Duplicate Address Detection Proxy on an Interface](#)
- [Configuring IPv6 DHCP Snooping](#)
- [Viewing IPv6 Network Components](#)
- [DHCP Relay Agent for IPv6](#)

- [TCP MSS Clamping for IPv6](#)

13.2.3.1 Configuring IPv6 on the Switch

Configure IPv6 to route unicast packets, perform static routing, and Equal Cost Multi-path routing on a switch. This section covers the following topics:

- [Enabling IPv6 Unicast Routing on the Switch](#)
- [Configuring Default and Static IPv6 Routes](#)
- [IPv6 ECMP](#)

13.2.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The [ipv6 unicast-routing](#) command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

Example

This command enables IPv6 unicast-routing.

```
switch(config)# ipv6 unicast-routing
switch(config)#
```

13.2.3.1.2 Configuring Default and Static IPv6 Routes

The [ipv6 route](#) command creates an IPv6 static route to a destination with an IPv6 prefix, and the source uses an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, EOS assigns an administrative distance of **1** to static routes.

Assigning a higher administrative distance to a static route allows dynamic routing data to override the static route. For example, an OSPF intra-area route, with a default distance of **110**, overrides a static route with a distance value of **200**.

Example

Use the following command to create an IPv6 static route.

```
switch(config)# ipv6 route 10:23:31:00:01:32:93/24 vlan 300
switch(config)#
```

The default route denotes the packet forwarding rule that takes effect if no other route exists for a specified IPv6 address. EOS sends all packets without destinations in the routing table to the destination specified by the default route.

The IPv6 default route source uses **::/0** as an IP address. EOS refers to the default route destination as the default gateway.

Example

Use the following command to create a default route and establish **fd7a:629f:52a4:fe61::2** as the default gateway address.

```
switch(config)# ipv6 route ::/0 fd7a:629f:52a4:fe61::2
switch(config)#
```

13.2.3.1.3 IPv6 ECMP

Multiple routes configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch spreads outbound traffic across all ECMP route paths equally and assigns the same tag value to each path. Commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. [Equal Cost Multipath Routing \(ECMP\) and Load Sharing](#) describes resilient ECMP. The [ipv6 hardware fib ecmp resilience](#) command implements IPv6 resilient ECMP.

Example

This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address **2001:db8:0::/64**. A maximum of five next-hop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, ECMP duplicates each address until 15 table entries exist.

```
switch(config)# ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5 redundancy 3
switch(config)#
```

13.2.3.2 Configuring IPv6 on an Interface

This section covers the following topics:

- [Enabling IPv6 on an Interface](#)
- [Assigning an IPv6 Address to an Interface](#)
- [IPv6 Neighbor Discovery](#)
- [IPv6 Router Preference](#)
- [Configuring uRPF](#)

13.2.3.2.1 Enabling IPv6 on an Interface

The [ipv6 enable](#) command enables IPv6 in the Configuration Mode if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The **no** [ipv6 enable](#) command disables IPv6 on an interface not configured with an IPv6 address. This command does not disable interfaces configured with an IPv6 address.

Example

This command enables IPv6 on *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 enable
switch(config-vl200)#
```

13.2.3.2.2 Assigning an IPv6 Address to an Interface

The [ipv6 address](#) command enables IPv6 in the Interface Configuration Mode, assigns a global IPv6 address to the interface, and defines the prefix length. Routable interfaces support this command. Multiple global IPv6 addresses can be assigned to an interface. EOS supports Stateless Address Auto Configuration (SLAAC).

Examples

- Use the following commands to configure an IPv6 address with subnet mask for *vlan 200*:

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 address 10:23:31::1:32:93/64
```

```
switch(config-if-Vl200)#
```

- Use the following commands to configure an IPv6 address using SLAAC:

```
switch(config)#interface vlan 200
switch(config-if-vl200)#ipv6 address auto-config
switch(config-if-vl200)#
```

13.2.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:

- Determine Layer 2 addresses for neighbors known to reside on attached links.
- Detect changed Layer 2 addresses.
- Purge invalid values from the neighbor cache table.
- Find neighboring routers to forward packets.
- Track neighbor reachability status.

The [RFC 2461](#) defines IPv6 Neighbor Discovery. IPv6 Stateless Address Autoconfiguration is described by [RFC 2462](#).

The following sections describe Neighbor Discovery configuration tasks.

13.2.3.2.3.1 Reachable Time

The `ipv6 nd reachable-time` command specifies the time period that EOS includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node becomes reachable after a reachability confirmation event.

Example

Use these commands to configure the entry of **25000** (25 seconds) in the reachable time field of RAs sent from **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd reachable-time 25000
switch(config-if-Vl200)# show active
  interface Vlan200
    ipv6 address fd7a:4321::1/64
    ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

13.2.3.2.3.2 Router Advertisement Interval

The `ipv6 nd ra interval` command configures the interval between IPv6 RA transmissions from the configuration mode interface.

Example

These commands configure a RA transmission interval of **60** seconds on **interface vlan 200**, then displays the interface status.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra interval 60
switch(config-if-Vl200)# show active
  interface Vlan200
    ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

13.2.3.2.3.3 Router Lifetime

The `ipv6 nd ra lifetime` command specifies the value EOS places in the **router lifetime** field of IPv6 RAs sent from the IPv6 interface.

If you configure the value as **0**, IPv6 peers connected to the specified interface remove the switch from the lists of default routers. Values greater than **0** indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless set to **0**, the router lifetime value should be equal to or exceed the interval between unsolicited RAs sent on the interface.

Example

Use the following command to configure the switch to set **2700** as the router lifetime field of RAs transmitted from **interface vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra lifetime 2700
switch(config-if-Vl200)# show active
interface Vlan200
  ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

13.2.3.2.3.4 Router Advertisement Prefix

The `ipv6 nd prefix` command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as IPv6 addresses are advertised in the interface's RAs. The `ipv6 nd prefix` command with the **no-advertise** option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are **2,592,000** (valid) and **604,800** (preferred) seconds.

Example

These commands enable neighbor discovery advertising for IPv6 address **3012:D678::/64**, specifying a valid lifetime of **1,296,000** seconds and the default preferred lifetime.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd prefix 3012:D678::/64 1296000
switch(config-if-Vl200)#
```

13.2.3.2.3.5 Router Advertisement Suppression

The `ipv6 nd ra disabled` command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

Example

This command suppresses all RAs on **interface vlan 200**.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra disabled all
switch(config-vl200)#
```

13.2.3.2.3.6 Router Advertisement MTU Suppression

The `ipv6 nd ra mtu suppress` command suppresses the router advertisement MTU option on the IPv6 interface. The MTU option causes an identical MTU value to advertise from all nodes on a link. By default, EOS does not suppress the router advertisement MTU option.

Example

Use the following command to suppress the MTU option on *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra mtu suppress
switch(config-vl200)#
```

13.2.3.2.3.7 Router Advertisement Flag Configuration

The following commands set the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The `ipv6 nd managed-config-flag` command sets the `managed address configuration` flag. This bit instructs hosts to use stateful address autoconfiguration.
- The `ipv6 nd other-config-flag` command sets the `other stateful configuration` flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the `managed address configuration` flag is set.
- These commands configure the switch to set the `managed address configuration` flag in advertisements sent from *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```

- These commands configure the switch to set the `other stateful configuration` flag in advertisements sent from *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

13.2.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. [RFC 4191](#) describes the IPv6 Router Preference Protocol.

The `ipv6 nd router-preference` command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs sent from the IPv6 interface. The default field entry value is `medium`.

Example

Use the following command to configure the switch as a medium preference router on RAs sent from *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

13.2.3.2.5 Configuring uRPF

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in forwarded packets from the switch. [Unicast Reverse Path Forwarding \(uRPF\)](#) describes uRPF. Enable uRPF for IPv6 packets entering the IPv6 interface using the [ipv6 verify](#) command.

uRPF defines two operational modes:

- **Strict Mode** - uRPF verifies that a packet received on the interface has a routing table entry specified for a return packet.
- **Loose Mode** - uRPF validation does not consider the inbound packet ingress interface only that a valid return path exists.

Example

This command enables uRPF Strict Mode on the **interface vlan 100**. If the interface has a default route configured, all inbound packets pass the uRPF check as valid.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)# show active
interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

13.2.3.3 Configuring IPv6 Duplicate Address Detection Proxy on an Interface

Configure IPv6 DAD on an interface, and add an IPv6 address on the interface. Then enable IPv6 on the interface. You can configure this in conjunction with IPv6 ND Proxy.

Example Configuration

Use the following commands on interface **Ethernet 1**:

```
switch(config-if-Et1/1)#ipv6 nd dad proxy
switch(config-if-Et1/1)#ipv6 address 2001:db8:1::/64
switch(config-if-Et1/1)#ipv6 enable
```

To set the expiration time for the Neighbor Cache Table, use the following command:

```
switch(config-if-Et1/1)#ipv6 nd cache expire 1800
```

The expiration time has a default value of 14400 seconds (4 hours).

Displaying IPv6 DAD Proxy Information

To display the configuration output, use the [show ipv6 nd dad interface Ethernet1](#) command:

```
switch#show ipv6 nd dad interface
Ethernet1
  ipv6 nd proxy prefix connected
  ipv6 nd dad proxy
  ipv6 address 2001:db8:3::/64
```

13.2.3.4 Configuring IPv6 DHCP Snooping

13.2.3.4.1 Enabling IPv6 DHCP Snooping

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping provides a Layer 2 feature that can be configured on LAN switches. Arista switches support Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets.

Note: DHCPv6 VLAN classification and DHCPv4 VLAN classification share same hardware resource.

Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)# ipv6 dhcp snooping
switch(config)# ipv6 dhcp snooping remote-id option
switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)# ipv6 dhcp snooping
switch(config)# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
 2789-2790
DHCPv6 Snooping is operational on following VLANs:
 2789
Insertion of Option-37 is enabled
```

13.2.3.5 Displaying IPv6 Network Components

13.2.3.5.1 Displaying RIB Route Information

Use the **show rib route ipv6** command to view the IPv6 Routing Information Base (RIB) information.

Example

This command displays IPv6 RIB BGP routes.

```
switch# show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
B      2001:10:1::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100::/64 [200/200]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:1::/64 [200/0]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:2::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected switch#
```

13.2.3.5.2 Displaying the FIB and Routing Table

The **show ipv6 route** command displays routing table entries in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal

cost paths to the same prefix display contiguously as a block, with the destination prefix displayed only on the first line.

Example

This command displays a route table entry for a specific IPv6 route.

```
switch> show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
    via f180::21c:73ff:fe00:1319, Vlan3601
    via f180::21c:73ff:fe00:1319, Vlan3602
    via f180::21c:73ff:fe00:1319, Vlan3608
    via f180::21c:73ff:fe0f:6a80, Vlan3610
    via f180::21c:73ff:fe00:1319, Vlan3611 switch>
```

13.2.3.5.3 Displaying the Route Age

The **show ipv6 route age** command displays the IPv6 route age to the specified IPv6 address or prefix.

Example

This command displays the route age for the specified prefix.

```
switch> show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate

C 2001::3:0/11 age 00:02:34 switch>
```

13.2.3.5.4 Displaying Host Routes

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = **/128**). Each displayed host route displays the purpose of the route:

- **F** - Displays static routes from the FIB.
- **R** - Displays routes defined because the IP address is an interface address.
- **A** - Displays routes to any neighboring host with the switch that has an ARP entry.

Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch# show ipv6 route host
R - receive F - FIB, A - attached

F   ::1 to cpu
A   fee7:48a2:0c11:1900:400::1 on Vlan102
R   fee7:48a2:0c11:1900:400::2 to cpu
F   fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R   fee7:48a2:0c11:1a00::17 to cpu

```

13.2.3.5.5 Displaying Route Summaries

The **show ipv6 route summary** command displays the current number of routes of the IPv6 routing table in summary format.

Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source      Number Of Routes
-----
connected         2
static            0
ospf              5
bgp               7
isis              0
internal          1
attached          0
aggregate         2
Total Routes      17 switch>
```

13.2.3.6 DHCP Relay Agent for IPv6

13.2.3.6.1 Configuring IPv6 DHCP Relay

13.2.3.6.1.1 Configuring the IPv6 DHCP Relay Agent (Global)

The `ipv6 dhcp relay always-on` command enables the switch DHCP IPv6 Relay Agent globally regardless of the DHCP IPv6 Relay Agent status on any interface. EOS enables DHCP IPv6 Relay Agent by default if at least one routable interface has an `ipv6 dhcp relay destination` statement.

Example

This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

13.2.3.6.1.2 Configuring DHCP for IPv6 Relay Agent

The `ipv6 dhcp relay destination` command enables the DHCP IPv6 Relay Agent function and specifies the client message destination address on an interface.

Example

This command enables the DHCP IPv6 Relay Agent function and sets the client message destination address to **2001:0db8:0:1::1** on **interface ethernet 4**.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)
```

13.2.3.6.1.3 Configuring the Client Link Layer Address for the IPv6 DHCP Relay Agent

The `ipv6 dhcp relay option link-layer address` command enables the DHCPv6 relay agent to configure the Client Link Layer Address option to solicit and request messages. In other words, the command enables the Client Link Layer Address option (79) in the Global Configuration Mode. The `no ipv6 dhcp relay option link-layer address` command disables the link layer address option (79) in the Global Configuration Mode.

Example

This command enables the insertion of Client Link Layer Address option (79) in the Global Configuration Mode.

```
switch(config)# ipv6 dhcp relay option link-layer address
```

13.2.3.6.1.4 Clearing IPv6 DHCP Relay Counters

The `clear ipv6 dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters to reset:

- **Global configuration:** - Clears the counters for the switch and for all interfaces.
- **Interface configuration** - Clears the counter for the configuration mode interface.

Examples

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)# exit
switch(config)# clear ipv6 dhcp relay counters
switch(config)#
```

- These commands clear the DHCP relay counters for *interface ethernet 4*.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# clear ipv6 dhcp relay counters
switch(config)#
```

13.2.3.6.2 Displaying IPv6 DHCP Relay Information

13.2.3.6.2.1 IPv6 DHCP Relay Status

The `show ip dhcp relay` command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

Example

This command displays the DHCP Agent Relay parameter status.

```
switch(config)# interface ethernet 1/2
switch(config-if-Et1/2)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet1/2
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et1/2)#
```

13.2.3.6.2.2 IPv6 DHCP Relay Counters

The `show ipv6 dhcp relay counters` command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Example

This command displays the IP DHCP relay counter table.

```
switch> show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Ethernet4	207	148	0	4 days, 19:54:24 ago switch>

13.2.3.7 TCP MSS Clamping for IPv6

TCP MSS Clamping limits the value of the Maximum Segment Size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. Use TCP MSS Clamping when connecting through a GRE tunnel to cloud providers that require asymmetric routing.

When configuring MSS clamping on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit, the configured limit overwrites the TCP MSS value, and the TCP checksum recomputes and updates.

By default, the software datapath handles TCP MSS Clamping. However, the hardware configuration can support the process to minimize possible packet loss and reduce the number of TCP sessions that the switch can establish per second.

13.2.3.7.1 Configuring the TCP MSS Ceiling on an IPv6 Interface

Set the TCP MSS Ceiling limit on an interface using command `tcp mss ceiling ipv6`. This also enables TCP MSS Clamping on the switch.

Note: TCP MSS Clamping routes all TCP SYN packets through software, even on interfaces with no TCP MSS Ceiling configured no hardware support. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On platform switches *DCS-7280R3*, *DCS-7500R3 Line Cards* and *DCS-7800R3 Line Cards*, the following limitations apply:

- This command works only on egress packets.
- Unicast packets entering the switch support TCP MSS Ceiling and the configuration has no effect on GRE transit packets
- or GRE decap, even if the egress interface has TCP MSS Ceiling configured.
- EOS does not support TCP MSS Ceiling on L2 (switchport) interfaces.
- VXLAN, Loopback or management interfaces do not support TCP MSS Ceiling.
- Only hardware TCP MSS clamping is supported on release *EOS-4.26.1F* and later.

Example

These commands configure **interface ethernet 26** as a routed port, then specify a maximum TCP MSS Ceiling value of **1436** bytes for TCP SYN packets exiting that port.

```
switch(config)# interface ethernet 26
switch(config-if-Et5)# no switchport
switch(config-if-Et5)# tcp mss ceiling ipv6 1436 egress
switch(config-if-Et5)#
```

13.2.4.1 clear ipv6 dhcp relay counters

The **clear ipv6 dhcp relay counters** command resets the DHCP relay counters. If you do not specify a port, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6 dhcp relay counters [port]
```

Parameters

port - Specify the interface to access the neighbor. Options include the following:

- **no parameter** - Removes all dynamic entries.
- **interface ethernet *e_num*** - Specify the Ethernet interface by *e_num*.
- **interface loopback *l_num*** - Specify the Loopback interface by *l_num*.
- **interface port-channel *p_num*** - Specify the Port-channel interface by *p_num* *p_num*.
- **interface vlan *v_num*** - Specify the VLAN interface by *v_num*.

Example

These commands clear the DHCP relay counters for **interface ethernet 4** and shows the counters before and after the **clear** command.

```
switch(config)# show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Ethernet4	207	148	0	4 days, 19:54:24 ago

```
switch(config)# interface ethernet 4  
switch(config-if-Et4)# clear ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop

All Resp	281	281	0	
Ethernet4	0	0	0	4 days, 21:18:30 ago

These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)# exit  
  
switch(config)# clear ipv6 dhcp relay counters  
  
switch(config)# show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	0	0	0	0:00:03 ago
All Resp	0	0	0	
Ethernet4	0	0	0	0:00:03 ago

```
switch(config)#
```

13.2.4.2 clear ipv6 dhcp snooping counters

The `clear ipv6 dhcp snooping counters` command resets the DHCP snooping packet counters.

Command Mode

Privileged EXEC

Command Syntax

`clear ipv6 dhcp snooping counters [counter_type]`

Parameters

- **counter_type** - Specifies the type of counter to reset.
- **no parameter** - Clears the counters for each VLAN.
- **debug** - Clears aggregate counters and drop cause counters.

Examples

- This command clears the number of DHCP packets sent and received on each VLAN.

```
switch# clear ipv6 dhcp snooping counters
switch# show ipv6 dhcp snooping counters
```

Vlan	Dhcpv6 Request Pkts Rcvd	Fwdd	Drop	Dhcpv6 Reply Pkts Rcvd	Fwdd	Drop	Last Cleared
2789	1	1	0	1	1	0	0:03:09 ago

- This command clears the number of DHCP packets sent on the switch.

```
switch# clear ipv6 dhcp snooping counters debug
switch# show ipv6 dhcp snooping counters debug
```

Counter	Snooping to Relay	Relay to Snooping
Received	1	1
Forwarded	1	1
Dropped - Invalid VlanId	0	0
Dropped - Parse error	0	0
Dropped - Invalid Dhcp Otype	0	0
Dropped - Invalid Remote-ID Option	0	0
Dropped - Snooping disabled	0	0

Last Cleared: 0:04:29 ago

13.2.4.3 clear ipv6 neighbors

The **clear ipv6 neighbors** command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6 neighbors [port][dynamic_ipv6]
```

Parameters

- **port** Interface through which neighbor is accessed. Options include the following:
 - **no parameter** - Removes all dynamic entries.
 - **interface ethernet e_num** - Specify the Ethernet interface by **e_num**.
 - **interface loopback l_num** - Specify the Loopback interface by **l_num**.
 - **interface port-channel p_num** - Specify the Port-channel interface by **p_num p_num**.
 - **interface vlan v_num** - Specify the VLAN interface by **v_num**.
- **dynamic_ipv6** - Specifies the address of entry to remove. Options include the following:
 - **no parameter** - Removes all dynamic entries for specified interface.
 - **ipv6_addr** - Removes the IPv6 address of the entry.

Example

This command removes all dynamic neighbor entries for **vlan 200**.

```
switch# clear ipv6 neighbors vlan 200  
switch#
```

13.2.4.4 ipv6 address

The **ipv6 address** command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. Routable interfaces support this command. Multiple global IPv6 addresses can be assigned to an interface. The IPv6 address or prefix can be supplied manually, or configured using Stateless Address Auto Configuration.

The **no ipv6 address** and **default ipv6 address** commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding **ipv6 address** command from **running-config**. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if **ipv6 enable** command is configured on the interface.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 address [ ipv6_address | ipv6_prefix | auto-config ]
```

```
no ipv6 address { ipv6_address | ipv6_prefix | auto-config }
```

```
default ipv6 address { ipv6_address | ipv6_prefix | auto-config }
```

Parameter

ipv6_address - Specify the IPv6 address to assign to the interface.

ipv6_prefix - Specify the IPv6 prefix assigned to the interface (CIDR notation).

auto-config - Use SLAAC auto-configuration.

Example

These commands configure an IPv6 address and prefix length for **interface vlan 200**:

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 address 10:23:31:00:01:32:93/64
switch(config-if-Vl200)#
```

13.2.4.5 ipv6 dhcp relay always-on

The **ipv6 dhcp relay always-on** command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an **ipv6 dhcp relay destination** statement.

The **no ipv6 dhcp relay always-on** and **default ipv6 dhcp relay always-on** commands remove the **ipv6 dhcp relay always-on** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ipv6 dhcp relay always-on
no ipv6 dhcp relay always-on
default ipv6 dhcp relay always-on
```

Example

This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

13.2.4.6 ipv6 dhcp relay destination

The **ipv6 dhcp relay destination** command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The **no ipv6 dhcp relay destination** and **default ipv6 dhcp relay destination** commands remove the corresponding **ipv6 dhcp relay destination** command from *running-config*. When the commands do not list an IPv6 address, all **ipv6 dhcp relay destination** commands are removed from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 dhcp relay destination [ipv6_addr][source-address ipv6_addr]
```

```
no ipv6 dhcp relay destination [ipv6_addr]
```

```
default ipv6 dhcp relay destination [ipv6_addr]
```

Parameters

- **ipv6_addr** DHCP Server's IPv6 address.
- **source-address ipv6_addr** specify the source IPv6 address to communicate with DHCP server.

Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv6 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

Example

This command enables the DHCPv6 relay agent and sets the destination address to **2001:0db8:0:1::1** on *interface ethernet 4*.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)# show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet4
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et4)#
```

13.2.4.7 **ipv6 dhcp relay option link-layer address**

The **ipv6 dhcp relay option link-layer address** command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode.

The **no ipv6 dhcp relay option link-layer address** command disables the link layer address option (79) in the global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
ipv6 dhcp relay option link-layer address
no ipv6 dhcp relay option link-layer address
default ipv6 dhcp relay option link-layer address
```

Example

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)# ipv6 dhcp relay option link-layer address
```

13.2.4.8 ipv6 enable

The **ipv6 enable** command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The **no ipv6 enable** and **default ipv6 enable** command remove the corresponding **ipv6 enable** command from **running-config**. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 enable
```

```
no ipv6 enable
```

```
default ipv6 enable
```

Example

This command enables IPv6 on **interface vlan 200**.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 enable
switch(config-vl200)#
```

13.2.4.9 ipv6 hardware fib aggregate-address

The **ipv6 hardware fib aggregate-address** command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The **no ipv6 hardware fib aggregate-address** and **default ipv6 hardware fib aggregate-address** commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding **ipv6 hardware fib aggregate-address** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ipv6 hardware fib aggregate-address ipv6_prefix summary-only software-forward  
no ipv6 hardware fib aggregate-address ipv6_prefix  
default ipv6 hardware fib aggregate-address ipv6_prefix
```

Parameters

ipv6_prefix IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

Example

These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.

```
switch(config)# ipv6 hardware fib aggregate-address fd77:4890:5313:ffed::/64  
summary-only software-forward  
switch(config)# show ipv6 hardware fib aggregate-address  
Codes: S - Software Forwarded  
S   fd77:4890:5313:ffed::/64  
  
switch(config)#
```

13.2.4.10 ipv6 hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ipv6 hardware fib ecmp resilience net_prfx capacity nhop_max redundancy duplicates
```

```
no ipv6 hardware fib ecmp resilience net_addr
```

```
default ipv6 hardware fib ecmp resilience net_addr
```

Parameters

- ***net_prfx*** IPv6 address prefix managed by command.
- ***nhop_max*** Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
 - Helix: <2 to 64>
 - Trident: <2 to 32>
 - Trident II: <2 to 64>
- ***duplicates*** Specifies the redundancy factor. Value ranges from 1 to 128.

Example

This command configures a hardware ECMP table space of 15 entries for the IPv6 address **2001:db8:0::/64**. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)# ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity 5 redundancy 3
```

13.2.4.11 ipv6 hardware fib nexthop-index

The **ipv6 hardware fib nexthop-index** command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route's ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- **Next hop index:** specified in the command.
- **Prefix offset:** the least significant bits of the route's prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies an prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The **no ipv6 hardware fib nexthop-index** and **default ipv6 hardware fib nexthop-index** commands remove the specified nexthop used for ECMP routes by removing the **ipv6 hardware fib nexthop-index** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ipv6 hardware fib nexthop nxthop_index [PREFIX]
no ipv6 hardware fib nexthop
default ipv6 hardware fib nexthop
```

Parameters

- **nxthop_index** specifies the next hop index. Value ranges from **0** to **32**.
- **PREFIX** Number of bits of the route's prefix to use as the prefix-offset. Value ranges from **0** to **64**.
 - **no parameter** The prefix offset is set to zero.
 - **prefix-bits 0 to 64** Specifies the number bits to use as the prefix-offset.

Example

This command specifies the next hop from the list of ECMP next hops for the route.

```
switch(config)# ipv6 hardware fib nexthop-index 5 prefix-bits 10

switch> show ip
IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10 switch>
```

13.2.4.12 ipv6 nd dad proxy

IPv6 DAD Proxy can be configured on an interface, and you must configure an IPv6 address on the interface and then enable IPv6 on the interface. You can configure this in conjunction with IPv6 ND Proxy.

Command Mode

Interface-Ethernet Configuration

Command Syntax**ipv6 nd dad proxy****Example**

The following example enables IPV6 DAD Proxy on Ethernet1:

```
switch(config-if-Et1/1)#ipv6 nd dad proxy  
switch(config-if-Et1/1)#ipv6 address 2001:db8:1::/64  
switch(config-if-Et1/1)#ipv6 enable
```

13.2.4.13 ipv6 nd managed-config-flag

The **ipv6 nd managed-config-flag** command causes the **managed address configuration** flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The **no ipv6 nd managed-config-flag** and **default ipv6 nd managed-config-flag** commands restore the default setting where the **managed address configuration** flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding **ipv6 nd managed-config-flag** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd managed-config-flag
```

```
no ipv6 nd managed-config-flag
```

```
default ipv6 nd managed-config-flag
```

Example

These commands cause the managed address configuration flag to be set in IPv6 RA packets sent from *interface vlan 200*.

```
switch(config)# interface vlan 200  
switch(config-if-Vl200)# ipv6 nd managed-config-flag  
switch(config-if-Vl200)#
```

13.2.4.14 ipv6 nd ns-interval

The **ipv6 nd ns-interval** command configures the interval between IPv6 Neighbor Solicitation (NS) transmissions from the configuration mode interface.

The **no ipv6 nd ns-interval** and **default ipv6 nd ns-interval** commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of **1000** milliseconds by removing the corresponding **ipv6 nd ns-interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ns-interval period no ipv6 nd ns-interval  
default ipv6 nd ns-interval
```

Parameter

period interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from **1000** to **4294967295**. The default period is **1000** milliseconds.

Example

This command configures a neighbor solicitation transmission interval of **30** seconds on **interface vlan 200**.

```
switch(config)# interface vlan 200  
switch(config-if-Vl200)# ipv6 nd ns-interval 30000  
switch(config-if-Vl200)#
```

13.2.4.15 ipv6 nd other-config-flag

The **ipv6 nd other-config-flag** command configures the configuration mode interface to send IPv6 RAs with the **other stateful configuration** flag set.

The **no ipv6 nd other-config-flag** and **default ipv6 nd other-config-flag** commands restore the default setting by removing the corresponding **ipv6 nd other-config-flag** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
default ipv6 nd other-config-flag
```

Example

These commands configure the switch to set the other stateful configuration flag in advertisements sent from *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

13.2.4.16 ipv6 nd prefix

The **ipv6 nd prefix** command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as **IPv6 addresses** are advertised in the interface's RAs. The **ipv6 nd prefix** command with the **no-advertise** option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one **ipv6 nd prefix** command that enables prefix advertising, RAs advertise only prefixes specified through **ipv6 nd prefix** commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are **2,592,000** (valid) and **604,800** (preferred) seconds.

The **no ipv6 nd prefix** and **default ipv6 nd prefix** commands remove the corresponding **ipv6 nd prefix** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd prefix ipv6_prefix LIFETIME [FLAGS]
```

```
ipv6 nd prefix ipv6_prefix no-advertise
```

```
no ipv6 nd prefix ipv6_prefix
```

```
default ipv6 nd prefix ipv6_prefix
```

Parameters

- **ipv6_prefix** IPv6 prefix (CIDR notation).
- **no-advertise** Prevents advertising of the specified prefix.
- **LIFETIME** Period that the specified IPv6 prefix is advertised (seconds). Options include:
 - **valid preferred** Two values that set the *valid* and *preferred* lifetime periods.
 - **valid** One value that sets the *valid* lifetime. The *preferred* lifetime is set to the default value.
 - **no parameter** The *valid* and *preferred* lifetime periods are set to their default values.

Options for **valid**: **0** to **4294967295** and **infinite**. Default value is **2592000** Options for **preferred**: **0** to **4294967295** and **infinite**. The default value is **604800**. The maximum value (**4294967295**) and **infinite** are equivalent settings.

- **FLAGS** **on-link** and **autonomous address-configuration** flag values in RAs.
 - **no parameter** both flags are set.
 - **no-autoconfig** **autonomous address-configuration** flag is reset.
 - **no-onlink** **on-link** flag is reset.
 - **no-autoconfig no-onlink** both flags are reset.
 - **no-onlink no-autoconfig** both flags are reset.

Example

These commands enable neighbor discovery advertising for IPv6 address **3012:D678::/64**, on *interface vlan 200*, specifying a valid lifetime of **1,296,000** seconds and the default preferred lifetime.

```
switch(config)# interface vlan 200  
switch(config-if-Vl200)# ipv6 nd prefix 3012:D678::/64 1296000
```

13.2.4.17 ipv6 nd ra disabled

The **ipv6 nd ra disabled** command suppress IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

The **no ipv6 nd ra disabled** and **default ipv6 nd ra disabled** commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding **ipv6 nd ra disabled** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra disabled [SCOPE]
no ipv6 nd ra disabled
default ipv6 nd ra disabled
```

Parameters

SCOPE specifies the RAs that are suppressed.

- **no parameter** Periodic unsolicited RAs are suppressed.
- **all** All RAs are suppressed.

Example

This command suppresses all RAs on *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra disabled all
switch(config-vl200)#
```

13.2.4.18 ipv6 nd ra dns-server

The **ipv6 nd ra dns-server** command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the **ipv6 nd ra dns-servers lifetime** command.

The **no ipv6 nd ra dns-server** and **default ipv6 nd ra dns-server** commands remove the corresponding **ipv6 nd ra dns-server** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra dns-server ipv6_addr SERVER_LIFE
```

```
no ipv6 nd ra dns-server ipv6_addr
```

```
default ipv6 nd ra dns-server ipv6_addr
```

Parameters

- **ipv6_addr** RDNSS address to be included in RAs from the command mode interface.
- **SERVER_LIFE** maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
 - **no parameter** lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the **ipv6 nd ra interval** command.
 - **lifetime 0** the configured RDNSS is not to be used.
 - **lifetime 1 to 4294967295** specifies the lifetime period for this RDNSS in seconds.

Example

This command configures the RDNSS at **2001:0db8:0:1::1** as a preferred RDNSS for *interface vlan 200* to include in its neighbor-discovery route advertisements, and sets its lifetime value to **300** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime 300
switch(config-if-Vl200)#
```

13.2.4.19 ipv6 nd ra dns-servers lifetime

The **ipv6 nd ra dns-servers lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The **no ipv6 nd ra dns-servers lifetime** and **default ipv6 nd ra dns-servers lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-servers lifetime** command from *running-config*. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra dns-servers lifetime period
no ipv6 nd ra dns-servers lifetime
default ipv6 nd ra dns-servers lifetime
```

Parameters

period the RDNSS lifetime value for the configuration mode interface. Options include:

- **0** any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
- **1 to 4294967295** maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-server** command. Should be between the router advertisement interval configured on the interface and two times that interval.

Example

This command sets the default RDNSS maximum lifetime value for **interface vlan 200** to **350** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-servers lifetime 350
switch(config-if-Vl200)#
```

13.2.4.20 ipv6 nd ra dns-suffix

The **ipv6 nd ra dns-suffix** command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106 . The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the [ipv6 nd ra dns-suffixes lifetime](#) command.

The **no ipv6 nd ra dns-suffix** and **default ipv6 nd ra dns-suffix** commands remove the corresponding **ipv6 nd ra dns-suffix** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra dns-suffix domain SUFFIX_LIFE
```

```
no ipv6 nd ra dns-suffix ipv6_addr
```

```
default ipv6 nd ra dns-suffix ipv6_addr
```

Parameters

- **domain** domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, "." and "-" and must begin and end with an alphanumeric character.
- **SUFFIX_LIFE** maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
 - **no parameter** lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the **ipv6 nd ra interval** command.
 - **lifetime 0** the configured domain suffix is not to be used.
 - **lifetime 1 to 4294967295** specifies the lifetime period for this domain suffix in seconds.

Example

These commands create a DNSSL for **interface vlan 200** to include in its neighbor-discovery route advertisements, and set its lifetime value to **300** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-suffix test.com lifetime 300
switch(config-if-Vl200)#
```

13.2.4.21 ipv6 nd ra dns-suffixes lifetime

The **ipv6 nd ra dns-suffixes lifetime** command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The **no ipv6 nd ra dns-suffixes lifetime** and **default ipv6 nd ra dns-suffixes lifetime** commands remove the default lifetime value from the interface by removing the corresponding **ipv6 nd ra dns-suffixes lifetime** command from *running-config*. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra dns-suffixes lifetime period
no ipv6 nd ra dns-suffixes lifetime
default ipv6 nd ra dns-suffixes lifetime
```

Parameters

period the DNSSL lifetime value for the configuration mode interface. Options include:

- **0** any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
- **1 to 4294967295** maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the **ipv6 nd ra dns-suffix** command. Should be between the RA interval configured on the interface and two times that interval.

Example

This command sets the default DNSSL maximum lifetime value for **interface vlan 200** to **350** seconds.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra dns-suffixes lifetime 350
switch(config-if-Vl200)#
```

13.2.4.22 ipv6 nd ra hop-limit

The **ipv6 nd ra hop-limit** command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The **no ipv6 nd ra hop-limit** and **default ipv6 nd ra hop-limit** commands remove the corresponding **ipv6 nd ra hop-limit** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra hop-limit quantity
no ipv6 nd ra hop-limit lifetime
default ipv6 nd ra hop-limit lifetime
```

Parameters

quantity the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:

- **0** indicates that outgoing packets from attached hosts are to be immediately discarded.
- **1 to 255** number of hops. The default value is **64**.

Example

These commands include a hop-limit value of **100** in RA packets sent by *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra hop-limit
switch(config-if-Vl200)#
```

13.2.4.23 ipv6 nd ra interval

The **ipv6 nd ra interval** command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The **no ipv6 nd ra interval** and **default ipv6 nd ra interval** commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of **200** seconds by removing the corresponding **ipv6 nd ra interval** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra interval [SCALE] ra_period [minimum_period]
```

```
no ipv6 nd ra interval
```

```
default ipv6 nd ra interval
```

Parameters

- **SCALE** timescale in which command parameter values are expressed.
 - **no parameter** seconds.
 - **msec** milliseconds.
- **ra_period** maximum interval between successive IPv6 RA transmissions. The default period is **200** seconds.
 - **4 - 1800** valid range when **SCALE** is set to default value (seconds).
 - **500 - 1800000** valid range when **SCALE** is set to **msec**.
- **minimum_period** minimum interval between successive IPv6 RA transmissions. Must be smaller than **ra_period**. By default, a minimum period is not defined.
 - **no parameter** Command does not specify a minimum period.
 - **3 - 1799** valid range when **scale** is set to default value (seconds).
 - **375 - 1799999** valid range when **scale** is set to **msec**.

Example

These commands configure a RA transmission interval of **60** seconds on VLAN interface **interface vlan 200**, then displays the interface status.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra interval 60
switch(config-if-Vl200)# show active
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

13.2.4.24 ipv6 nd ra lifetime

The **ipv6 nd ra lifetime** command specifies the value that the switch places in the **router lifetime** field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to **0**, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than **0** indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is **0**, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The **no ipv6 nd ra lifetime** and **default ipv6 nd ra lifetime** commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of **1800** seconds by removing the corresponding **ipv6 nd ra lifetime** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra lifetime ra_lifetime
```

```
no ipv6 nd ra lifetime
```

```
default ipv6 nd ra lifetime
```

Parameters

ra_lifetime router lifetime period (seconds). Default value is 1800. Options include:

- **0** Router should not be considered as a default router.
- **1 - 65535** Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the **ipv6 nd ra interval** command.

Example

This command configures the switch to enter **2700** in the router lifetime field of RAs transmitted from **interface vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 nd ra lifetime 2700
switch(config-if-Vl200)# show active
interface Vlan20
  ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

13.2.4.25 ipv6 nd ra mtu suppress

The **ipv6 nd ra mtu suppress** command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The **no ipv6 nd ra mtu suppress** and **default ipv6 nd ra mtu suppress** commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding **ipv6 nd ra mtu suppress** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd ra mtu suppress
```

```
no ipv6 nd ra mtu suppress
```

```
default ipv6 nd ra mtu suppress
```

Example

This command suppresses the MTU option on *interface vlan 200*.

```
switch(config)# interface vlan 200
switch(config-vl200)# ipv6 nd ra mtu suppress
switch(config-vl200)#
```

13.2.4.26 ipv6 nd reachable-time

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The **no ipv6 nd reachable-time** and **default ipv6 nd reachable-time** commands restore the entry of the default value (**0**) in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd reachable-time** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd reachable-time period  
no ipv6 nd reachable-time  
default ipv6 nd reachable-time
```

Parameter

period Reachable time value (milliseconds). Value ranges from **0 to 4294967295**. Default is **0**.

Example

These commands configure the entry of **25000** (25 seconds) in the reachable time field of RAs sent from **interface vlan 200**.

```
switch(config)# interface vlan 200  
switch(config-if-Vl200)# ipv6 nd reachable-time 25000  
interface Vlan200  
    ipv6 address fd7a:4321::1/64  
    ipv6 nd reachable-time 25000  
switch(config-if-Vl200)#
```

13.2.4.27 ipv6 nd router-preference

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is **medium**.

The **no ipv6 nd router-preference** and **default ipv6 nd router-preference** commands restore the switch to enter the default DRP field value of **medium** in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd router-preference** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 nd router-preference RANK  
no ipv6 nd router-preference  
default ipv6 nd router-preference
```

Parameters

RANK Router preference value. Options include:

- **high**
- **low**
- **medium**

Example

This command configures the switch as a medium preference router on RAs sent from **interface vlan 200**.

```
switch(config)# interface vlan 200  
switch(config-if-Vl200)# ipv6 nd router-preference medium  
switch(config-if-Vl200)#
```

13.2.4.28 ipv6 neighbor cache persistent

The **ipv6 neighbor cache persistent** command restores the IPv6 neighbor cache after reboot.

The **no ipv6 neighbor cache persistent** and **default ipv6 neighbor cache persistent** commands remove the ARP cache persistent configuration from the *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ipv6 neighbor cache persistent
no ipv6 neighbor cache persistent
default ipv6 neighbor cache persistent
```

Example

This command restores the ipv6 neighbor cache after reboot.

```
switch(config)# ipv6 neighbor cache persistent
switch(config)#
```

13.2.4.29 ipv6 neighbor

The **ipv6 neighbor** command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The **no ipv6 neighbor** and **default ipv6 neighbor** commands remove the specified static entry from the IPV6 neighbor discovery cache and delete the corresponding **ipv6 neighbor** command from **running-config**. These commands do not affect any dynamic entries in the cache.

Command Mode

Global Configuration

Command Syntax

```
ipv6 neighbor ipv6_addr PORT mac_addr
no ipv6 neighbor ipv6_address PORT
default ipv6 neighbor ipv6_addr PORT
```

Parameters

- **ipv6_addr** Neighbor's IPv6 address.
- **PORT** Interface through which the neighbor is accessed. Options include:
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-channel interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
 - **mac_addr** Neighbor's data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

Example

This command will add a static entry to the neighbor discovery cache for the neighbor located at **3100:4219::3EF2** with hardware address **0100.4EA1.B100** and accessible through **vlan 200**.

```
switch(config)# ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
switch(config)#
```

13.2.4.30 ipv6 route

The **ipv6 route** command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is **1**. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of **200** is overridden by OSPF intra-area routes, which have a default distance of **110**.

The command provides these methods of designating the nexthop location:

- **null0**: Traffic to the specified destination is dropped.
- **IPv6 gateway**: Switch identifies egress interface by recursively resolving the next-hop.
- **Egress interface**: Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- **Combination Egress interface and IPv6 gateway**: Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The **no ipv6 route** and **default ipv6 route** commands delete static routes by removing the corresponding **ipv6 route** statements from **running-config**. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

Command Mode

Global Configuration

Command Syntax

```
ipv6 route dest_prefix NEXTHOP [DISTANCE][TAG_OPT][RT_NAME]
```

```
no ipv6 route dest_prefix [nexthop_addr][DISTANCE]
```

```
default ipv6 route dest_prefix [nexthop_addr][DISTANCE]
```

Parameters

- **dest_prefix** Destination IPv6 prefix (CIDR notation).
- **NEXTHOP** Access method of next hop device. Options include:
 - **null0** Null0 interface – route is dropped.
 - **nexthop_addr** IPv6 address of nexthop device.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-channel interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
 - **ethernet e_num nexthop_addr** Combination route (Ethernet interface and gateway).
 - **loopback l_num nexthop_addr** Combination route (loopback interface and gateway).
 - **management m_num nexthop_addr** Combination route (management interface and gateway).
 - **port-channel p_num nexthop_addr** Combination route (port channel interface and gateway).

- **vlan v_num nexthop_addr** Combination route (VLAN interface and gateway).
- **VXLAN vx_num nexthop_addr** Combination route (VXLAN interface and gateway).
- **DISTANCE** administrative distance assigned to route. Options include:
 - **no parameter** route assigned default administrative distance of one.
 - **1 to 255** The administrative distance assigned to route.
- **TAG_OPT** static route tag. Options include:
 - **no parameter** assigns default static route tag of **0**.
 - **tag 0 to 4294967295** Static route tag value.
- **RT_NAME** Associates descriptive text to the route. Options include:
 - **no parameter** No text is associated with the route.
 - **name descriptive_text** The specified text is assigned to the route.

Example

This command creates an IPv6 static route.

```
switch(config)# ipv6 route 10:23:31:00:01:32:93/24 vlan 300
```

13.2.4.31 ipv6 unicast-routing

The **ipv6 unicast-routing** command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The **no ipv6 unicast-routing** and default **ip ipv6 unicast-routing** commands disable IPv6 unicast routing by removing the **ipv6 unicast-routing** command from *running-config*. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the **delete-static-routes** option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

Command Mode

Global Configuration

Command Syntax

```
ipv6 unicast-routing  
no ipv6 unicast-routing [DELETE_ROUTES]  
default ipv6 unicast-routing [DELETE_ROUTES]
```

Parameters

DELETE_ROUTES Resolves routing table static entries when routing is disabled.

- **no parameter** Routing table retains static entries.
- **delete-static-routes** Static entries are removed from the routing table.

Example

This command enables IPv6 unicast-routing.

```
switch(config)# ipv6 unicast-routing  
switch(config)#
```

13.2.4.32 ipv6 verify

The **ipv6 verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface.

The **no ipv6 verify** and **default ipv6 verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ipv6 verify** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 verify unicast source reachable-via RPF_MODE
```

```
no ipv6 verify unicast
```

```
default ipv6 verify unicast
```

Parameters

RPF_MODE Specifies the uRPF mode. Options include:

- **any** Loose mode.
- **rx** Strict mode.
- **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

Guidelines

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent **ip verify** commands on any interface do not disable IPv6 routing.

Example

This command enables uRPF strict mode on *interface vlan 100*. When a default route is configured on the interface, all inbound packets are checked as valid.

```
switch(config)# interface vlan 100
switch(config-if-Vl100)# ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)# show active
interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

13.2.4.33 ipv6 dhcp snooping

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch.

The **no ipv6 dhcp snooping** and **default ipv6 dhcp snooping** commands disable global DHCP snooping by removing the ipv6 dhcp snooping command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

```
no ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

```
default ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

Parameters

- **remote-id option** configures the remote ID option.
- **vlan** enables IPv6 DHCP snooping for a specific VLAN. Numbers range from 1 to 4094.
- **\$** end of range.
- **vlan-range** VLANs based on the snooping enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from **1** to **4094**.

Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)# ipv6 dhcp snooping  
switch(config)# ipv6 dhcp snooping remote-id option  
switch(config)# ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)# ipv6 dhcp snooping  
switch(config)# show ipv6 dhcp snooping  
DHCPv6 Snooping is enabled  
DHCPv6 Snooping is operational  
DHCPv6 Snooping is configured on following VLANs:  
  2789-2790  
DHCPv6 Snooping is operational on following VLANs:  
  2789  
Insertion of Option-37 is enabled
```

13.2.4.34 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Note: PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode** and **default pim ipv6 sparse-mode** commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel

Configuration Interface-VLAN Configuration

Command Syntax

```
pim ipv6 sparse-mode
no pim ipv6
no pim ipv6 sparse-mode
default pim ipv6
default pim ipv6 sparse-mode
```

Example

This command enables **pim ipv6 sparse-mode** on **interface vlan 4** interface.

```
switch(config)# interface vlan 4
switch(config-if-Vl4)# pim ipv6 sparse-mode
switch(config-if-Vl4)#
```

13.2.4.35 show ipv6 dhcp relay counters

The **show ipv6 dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

Command Mode

EXEC

Command Syntax

```
show ipv6 dhcp relay counters
```

Example

This command displays the IP DHCP relay counter table.

```
switch> show ipv6 dhcp relay counters
Interface | Dhcp Packets |
-----|-----|
          | Rcvd Fwdd Drop | Last Cleared
-----|-----|
  All Req | 376 376 0 | 4 days, 19:55:12 ago
  All Resp | 277 277 0 |
Ethernet4 | 207 148 0 | 4 days, 19:54:24 ago
switch>
```

13.2.4.36 show ipv6 dhcp snooping

The **show ipv6 dhcp snooping** command displays information about the DHCP snooping configuration.

Command Mode

EXEC

Command Syntax

```
show ipv6 dhcp snooping
```

Related Commands

- [ipv6 dhcp snooping](#)
- [show ipv6 dhcp snooping counters](#)
- [show ipv6 dhcp snooping hardware](#)
- [clear ipv6 dhcp snooping counters](#)

Example

This command displays the switch's DHCP snooping configuration.

```
switch# show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
  2789-2790
DHCPv6 Snooping is operational on following VLANs:
  2789
Insertion of Option-37 is enabled
```

13.2.4.37 show ipv6 dhcp snooping counters

The **show ipv6 dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

Command Mode

EXEC

Command Syntax

```
show ipv6 dhcp snooping counters [COUNTER_TYPE]
```

Parameters

- **COUNTER_TYPE** The type of counter that the command displays.
- **no parameter** command displays counters for each VLAN.
- **debug** command displays aggregate counters and drop cause counters.

Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch# show ipv6 dhcp snooping counters
```

Vlan	Dhcpv6 Request Pkts	Dhcpv6 Reply Pkts	Last Cleared				
Rcvd	Fwdd	Drop	Rcvd	Fwdd	Drop		
2789	1	1	0	1	1	0	0:03:09 ago

- This command displays the number of DHCP packets sent on the switch.

```
switch# show ipv6 dhcp snooping counters debug
```

Counter	Snooping to Relay	Relay to Snooping
Received	1	1
Forwarded	1	1
Dropped - Invalid VlanId	0	0
Dropped - Parse error	0	0
Dropped - Invalid Dhcp Optype	0	0
Dropped - Invalid Remote-ID Option	0	0
Dropped - Snooping disabled	0	0

Last Cleared: 0:04:29 ago

13.2.4.38 show ipv6 dhcp snooping hardware

The **show ipv6 dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

Command Mode

EXEC

Command Syntax

```
show ipv6 dhcp snooping hardware
```

Example

This command displays DHCP snooping hardware status.

```
switch# show ipv6 dhcp snooping hardware
DHCPv6 Snooping is enabled
DHCPv6 Snooping is enabled on following VLANs:
2789
  Vlans enabled per Slice
    Slice: Linecard0-0
2789
    Slice: Linecard0-1
2789
    Slice: Linecard0-2
2789
    Slice: Linecard0-3
2789
```

13.2.4.39 show ipv6 hardware fib aggregate-address

The **show ipv6 hardware fib aggregate-address** command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The **ipv6 hardware fib aggregate-address** command configures IPv6 prefix restrictions.

Command Mode

EXEC

Command Syntax

```
show ipv6 address fib aggregate-address [ADDRESS][RESTRICTION]
```

Parameters

- **ROUTE_FILTER** filters by IPv6 address. Options include:
 - **no parameter** Displays all routes.
 - **ipv6_addr** Command displays only specified address.
 - **ipv6_prefix** Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
 - **no parameter** displays routes restricted from the hardware routing table.
 - **software-forward** displays routes restricted from the hardware routing table.

Example

This command displays the routes that are restricted from the hardware routing table.

```
switch> show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S   fd77:4890:5313:aaed::/64
S   fd77:4890:5313:ffed::/64 switch>
```

13.2.4.40 show ipv6 interface

The **ipv6 interface** command displays the status of specified routed interfaces that are configured for IPv6.

Command Mode

EXEC

Command Syntax

```
show ipv6 interface [INTERFACE_NAME][INFO_LEVEL]
```

Parameters

- **INTERFACE_NAME** interfaces for which command displays status.
 - **no parameter** all routed interfaces.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-Channel Interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
- **INFO_LEVEL** amount of information that is displayed. Options include:
 - **no parameter** command displays data block for each specified interface.
 - **brief** command displays table that summarizes IPv6 interface data.

Example

This command displays the status of **interface vlan 903**.

```
switch> show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
Global unicast address(es):
  fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
Joined group address(es):
  ff02::1
  ff02::1:ff01:21e
  ff02::1:ff00:3
  ff01::2 switch>
```

13.2.4.41 show ipv6 nd dad proxy

Display information about the IPv6 Duplicate Address Detection (DAD) feature configured on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
show ipv6 nd dad proxy
```

Example

The following example displays information about IPV6 DAD Proxy on Ethernet1:

```
switch# show ipv6 nd dad interface ethernet1/1
Ethernet1/1
ipv6 nd proxy prefix connected
ipv6 nd dad proxy
```

```
ipv6 address 2001:db8:3::/64
```

13.2.4.42 show ipv6 nd ra internal state

The **ipv6 nd ra internal state** command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

Command Mode

EXEC

Command Syntax

show ipv6 nd ra internal state [INTERFACE_NAME]

Parameters

INTERFACE_NAME interfaces for which command displays status.

- **no parameter** all routed interfaces.
- **ethernet e_num** Ethernet interface specified by **e_num**.
- **loopback l_num** Loopback interface specified by **l_num**.
- **management m_num** Management interface specified by **m_num**.
- **port-channel p_num** Port-Channel Interface specified by **p_num**.
- **vlan v_num** VLAN interface specified by **v_num**.
- **VXLAN vx_num** VXLAN interface specified by **vx_num**.

Example

This command displays the IPv6 RA daemon for **vlan 1243**.

```
switch> show ipv6 nd ra internal state vlan 1243
INTERFACE: Vlan3908
               ifindex : 0x00000021
               mtu : 9212
               numIpv6Addr : 2

numRsDroppedInvalidHopLimit : 0
numPktDroppedUnexpectedType : 0
initialized : 1 switch>
```

13.2.4.43 show ipv6 neighbors

The **show ipv6 neighbors** command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

Command Mode

EXEC

Command Syntax

```
show ipv6 neighbors [PORT][SOURCE][INFO_LEVEL]
```

Parameters

- **PORT** Filters by interface through which neighbor is accessed. Options include:
 - **no parameter** all routed interfaces.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-channel interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
- **SOURCE** Filters by neighbor IPv6 address. Options include:
 - **no parameter** all IPv6 neighbors.
 - **ipv6_addr** IPv6 address of individual neighbor.
- **INFO_LEVEL** amount of information that is displayed. Options include:
 - **no parameter** command displays the discovery cache for the specified interfaces.
 - **summary** command displays summary information only.

Example

This command displays the IPv6 neighbor discovery cache for IPv6 address **fe80::21c:73ff:fe01:5fe1**.

```
switch> show ipv6 neighbors fe80::21c:73ff:fe01:5fe1
IPv6 Address      Age Hardware Addr  State Interface
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH Et12
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH Po999
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V1102
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V1103
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V1205
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V1207
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V13901
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V13902
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V13903
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V13904
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V13905
fe80::21c:73ff:fe01:5fe1  0 001c.d147.8214 REACH V13996
```

13.2.4.44 show ipv6 route

The **show ipv6 route** command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays all configured routes.

Command Mode

EXEC

Command Syntax

```
show ipv6 route [ADDRESS][ROUTE_TYPE][INFO_LEVEL]
```

Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
 - **no parameter** all routing table entries.
 - **ipv6_address** routing table entries matching specified IPv6 address.
 - **ipv6_prefix** routing table entries matching specified IPv6 prefix (CIDR notation).
- **ROUTE_TYPE** filters routes by specified protocol or origin.
 - **no parameter** all routing table entries.
 - **aggregate** entries for BGP aggregate routes.
 - **bgp** entries added through BGP protocol.
 - **connected** entries for routes to networks directly connected to the switch.
 - **kernel** entries appearing in Linux kernel but not added by EOS software.
 - **isis** entries added through IS-IS protocol.
 - **ospf** entries added through OSPF protocol.
 - **static** entries added through CLI commands.
- **INFO_LEVEL** Filters entries by next hop connection.
 - **no parameter** filters routes whose next hops are directly connected.
 - **detail** displays all routes.

Examples

- This command displays a route table entry for a specific IPv6 route.

```
switch> show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
    via fe80::21c:73ff:fe00:1319, Vlan3601
    via fe80::21c:73ff:fe00:1319, Vlan3602
    via fe80::21c:73ff:fe00:1319, Vlan3608
    via fe80::21c:73ff:fe0f:6a80, Vlan3610
    via fe80::21c:73ff:fe00:1319, Vlan3611 switch>
```

- This example displays an IPv6 route with Forwarding Equivalency Class (FEC) with an IPv6 next hop and an IPv4 next hop route.

```
#show ipv6 route 2001:1::/64
VRF: default
```

Routing entry for 2001:1::/64

Source Codes:

C - connected, S - static, K - kernel, O3 - OSPFv3,

13.2.4.45 show ipv6 route age

The **show ipv6 route age** command displays the IPv6 route age to the specified IPv6 address or prefix.

Command Mode

EXEC

Command Syntax

```
show ipv6 route ADDRESS age
```

Parameters

ADDRESS filters routes by IPv6 address or prefix.

- **ipv6_address** routing table entries matching specified address (A:B:C:D:E:F:G:H).
- **ipv6_prefix** routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

Example

This command displays the route age for the specified prefix.

```
switch> show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate
C 2001::3:0/11 age 00:02:34 switch>
```

13.2.4.46 show ipv6 route host

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix =/128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **A** routes to any neighboring host for which the switch has an ARP entry.
- **R** routes defined because the IP address is an interface address.

Command Mode

EXEC

Command Syntax

```
show ipv6 route host
```

Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch> show ipv6 route host
R - receive F - FIB, A - attached

F  ::1 to cpu
A  fee7:48a2:0c11:1900:400::1 on Vlan102
R  fee7:48a2:0c11:1900:400::2 to cpu
F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R  fee7:48a2:0c11:1a00::17 to cpu
F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                           via fe80::21c:73ff:fe01:5fe1 on Vlan3902 switch>
```

13.2.4.47 show ipv6 route interface

The **show ipv6 route interface** command displays routing table entries on a specified routed port.

Command Mode

EXEC

Command Syntax

```
show ipv6 route [ADDRESS] interface PORT_NAME [INFO_LEVEL]
```

Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- **ADDRESS** filters routes by IPv6 address or prefix.
 - **no parameter** all routing table entries.
 - **ipv6_address** routing table entries matching specified IPv6 address.
 - **ipv6_prefix** routing table entries matching specified IPv6 prefix (CIDR notation).
- **PORT_NAME** interfaces for which command displays status.
 - **ethernet e_num** Ethernet interface specified by **e_num**.
 - **loopback l_num** Loopback interface specified by **l_num**.
 - **management m_num** Management interface specified by **m_num**.
 - **port-channel p_num** Port-Channel Interface specified by **p_num**.
 - **vlan v_num** VLAN interface specified by **v_num**.
 - **VXLAN vx_num** VXLAN interface specified by **vx_num**.
- **INFO_LEVEL** Filters entries by next hop connection.
 - **no parameter** filters routes whose next hops are directly connected.
 - **detail** displays all routes.

Example

This command displays the IPv6 routes in *interface ethernet 8*.

```
switch> show ipv6 route interface ethernet 8
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate

O   fd7a:629f:63af:1232::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:4118::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:4119::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:411a::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:fe78::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
C   fd7a:629f:63af:fe88::/64 [0/1]
    via ::, Ethernet12
O   fd7a:629f:63af:fe8c::/64 [10/20]
    via fe80::21c:73ff:fe00:3640, Ethernet8
C   fe80:0:40::/64 [0/1]
    via ::, Ethernet8
```

13.2.4.48 show ipv6 route match tag

The **show ipv6 route match tag** command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

Command Mode

EXEC

Command Syntax

```
show ipv6 route ADDRESS match tag
```

Parameters

ADDRESS filters routes by IPv6 address or prefix.

- **ipv6_address** routing table entries matching specified address (A:B:C:D:E:F:G:H).
- **ipv6_prefix** routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

Example

This command displays the route tag for the specified prefix.

```
switch> show ipv6 route 2001:0DB8::/64 match tag
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R - RIP, A B
- BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG -
Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked

C    2001:0DB8::/64 tag 0 switch>
```

13.2.4.49 show ipv6 route summary

The **show ipv6 route summary** command displays the information about the IPv6 routing table.

Command Mode

EXEC

Command Syntax

```
show ipv6 route summary
```

Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch> show ipv6 route summary
Route Source      Number Of Routes
-----
connected         2
static            0
ospf              5
bgp               7
isis              0

13.2.4.50 show platform fap mroute ipv6

The `show platform fap mroute ipv6` command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

Command Mode

EXEC

Command Syntax

`show platform`

Example

This command enables PIM sparse mode on **VLAN 4** interface.

```
switch# show platform fap mroute ipv6
Jericho0 Multicast Routes:
-----
Location  GroupId Group      Source      IIF      McId      OIF
FLP/TT    FLP/TT  TT          FLP         FLP       FLP       FLP
-----
4096/2048 1/1      ff33::1:0:0:23/128 101:1::2/128  Vlan1357 21504      Vlan1044(Et7/1) Vlan1123(Et9/1)
                                           Vlan1200(Et8/1) Vlan1223(Et2/1)
                                           Vlan1226(Et5/1) Vlan1232(Et3/1)
                                           Vlan1307(Et6/1) Vlan1337(Et4/1)
```

13.2.4.51 show rib route ipv6

The **show rib route ipv6** command displays a list of IPv6 Routing Information Base (RIB) routes.

Command Mode

EXEC

Command Syntax

```
show rib route ipv6 [vrf vrf_name] [PREFIX][ROUTE TYPE]
```

Parameters

- **vrf vrf_name** displays RIB routes from the specified VRF.
- **PREFIX** displays routes filtered by the specified IPv6 information. Options include:
 - **ipv6_address** displays RIB routes filtered by the specified IPv6 address.
 - **ipv6_subnet_mask** displays RIB routes filtered by the specified IPv6 address and subnet mask.
 - **ipv6_prefix** displays RIB routes filtered by the specified IPv6 prefix.
- **ROUTE TYPE** displays routes filtered by the specified route type. Options include:
 - **bgp** displays RIB routes filtered by BGP.
 - **connected** displays RIB routes filtered by connected routes.
 - **dynamicPolicy** displays RIB routes filtered by dynamic policy routes.
 - **host** displays RIB routes filtered by host routes.
 - **isis** displays RIB routes filtered by ISIS routes.
 - **ospf** displays RIB routes filtered by OSPF routes.
 - **ospf3** displays RIB routes filtered by OSPF3 routes.
 - **reserved** displays RIB routes filtered by reserved routes.
 - **route-input** displays RIB routes filtered by route-input routes.
 - **static** displays RIB routes filtered by static routes.

Examples

- This command displays IPv6 RIB BGP routes.

```
switch# show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
B      2001:10:1::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100::/64 [200/200]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:1::/64 [200/0]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:2::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected switch#
```

- This command displays IPv6 RIB connected routes.

```
switch# show rib route ipv6 connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>C     2001:10:1::/64 [0/1]
```

```
    via 2001:10:1::102, Ethernet1
>C  2001:10:2::/64 [0/1]
    via 2001:10:2::102, Ethernet2
>C  2001:10:3::/64 [0/1]
    via 2001:10:3::102, Ethernet3 switch#
```

13.3 Ingress and Egress Per-Port for IPv4 and IPv6 Counters

This feature provides support for per-interface ingress and egress packet and byte counters for both IPv4 and IPv6.

This section describes Ingress and Egress per-port for IPv4 and IPv6 counters, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [Configuration](#)
- [Show Commands](#)
- [Dedicated ARP Entry for TX IPv4 and IPv6 Counters](#)
- [Limitations](#)

13.3.1 Configuration

IPv4 and IPv6 ingress counters (count **bridged and routed** traffic, supported only on front-panel ports) can be enabled and disabled using the **hardware counter feature ip in** command:

```
[no] hardware counter feature ip in
```

For IPv4 and IPv6 ingress and egress counters that include only **routed** traffic (supported on Layer3 interfaces such as routed ports, L3 subinterfaces only):

On the DCS-7300X, DCS-7250X, DCS-7050X, and DCS-7060X platforms, IPv4 and IPv6 **packet** counters for only **routed** traffic do not require any configuration. They are collected by default. Other platforms (DCS-7280SR, DCS-7280CR and DCS-7500-R) need the feature enabled.

```
[no]hardware counter feature ip in layer3
```

```
[no]hardware counter feature ip out layer3
```

13.3.2 Show Commands

Use the **show interfaces counters ip** command to display IPv4, IPv6 packets, and octets.

```
switch# show interfaces counters ip
Interface  IPv4InOctets  IPv4InPkts  IPv6InOctets  IPv6InPkts
Et1/1      0             0           0             0
Et1/2      0             0           0             0
Et1/3      0             0           0             0
Et1/4      0             0           0             0
...
Interface  IPv4OutOctets  IPv4OutPkts  IPv6OutOctets  IPv6OutPkts
Et1/1      0             0           0             0
Et1/2      0             0           0             0
Et1/3      0             0           0             0
Et1/4      0             0           0             0
...
```

The output from the **show interfaces counters ip** can also be queried through SNMP via the ARISTA-IP-MIB.

To clear the the IPv4 or IPv6 counters, use the **clear counters** command

```
switch# clear counters
```

13.3.3 Dedicated ARP Entry for TX IPv4 and IPv6 Counters

IPv4/IPv6 egress Layer 3 (**hardware counter feature ip out layer3**) counting on DCS-7280SR, DCS-7280CR and DCS-7500-R platforms work, based on ARP entry of the nexthop. By default, IPv4 next hop and IPv6 next hop both resolve to the same MAC address and interface that have shared ARP entry. To differentiate the counters between IPv4 and IPv6, disable arp entry sharing with following command:

```
ip hardware fib next-hop arp dedicated
```

On the DCS-7280SR, DCS-7280CR and DCS-7500-R platforms, this command is required for IPv4 and IPv6 egress counters to operate.

13.3.4 Limitations

- Packet sizes greater than 9236 bytes are not counted by per-port IPv4 and IPv6 counters.
- Only the DCS-7260X3, DCS-7368, DCS-7300, DCS-7050SX3, DCS-7050CX3, DCS-7280SR, DCS-7280CR and DCS-7500-R platforms support the **hardware counter feature ip in** command.
- Only the DCS-7280SR, DCS-7280CR and DCS-7500-R platforms support the **hardware counter feature ip [in|out] layer3** command.

13.4 ACLs and Route Maps

The switch uses rule-based lists to control packet access to ports and to select routes for redistribution to routing domains defined by dynamic routing protocols. This section describes the construction of Access Control Lists (ACLs), prefix lists, and route maps.

This section includes the following topics:

- [ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction](#)
- [Access Control Lists](#)
- [Service ACLs](#)
- [Sub-interface ACLs](#)
- [Egress ACL Counters](#)
- [RACL Sharing on SVIs](#)
- [Route Maps](#)
- [Prefix Lists](#)
- [Port ACLs with User-Defined Fields](#)
- [ACL, Route Map, and Prefix List Commands](#)

13.4.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction

Access Control Lists (ACLs), Service ACLs, route maps, and prefix lists are all processed in order, beginning with the first rule and proceeding until a match is encountered.

An Access Control List (ACL) is a list of rules that control the inbound flow of packets into Ethernet interfaces, subinterfaces, and port channel interfaces or the switch control plane. The switch supports the implementation of a wide variety of filtering criteria including IP and MAC addresses, TCP/UDP ports with include/exclude options without compromising its performance or feature set. Filtering syntax is industry standard.

A Service ACL applies a control-plane process to control connections to, or packets processed by, the agent process.

A route map is a list of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

A prefix list is a list of rules that defines route redistribution access for a specified IP address space. Route maps often use prefix lists to filter routes.

The RACL divergence optimizes the usage of hardware resources occupied on each forwarding ASIC by installing ACLs only on the hardware components corresponding to the member interfaces belonging to the SVIs on which ACL is applied. Hence, saving the hardware resources used and enables RACLs to scale-up to a larger configuration. Use **show** commands to display the interface mapping, TCAM entries, and TCAM utilization information.

13.4.2 Access Control Lists

These sections describe access control lists:

- [ACL Types](#)
- [ACL Configuration](#)
- [Applying ACLs](#)

13.4.2.1 ACL Types

The switch supports the following ACL types:

-
- **IPv4** can match on IPv4 source or destination addresses, with L4 modifiers including protocol, port number, IPsec tunnel interfaces, and DSCP value.
 - **IPv6** can match on IPv6 source or destination addresses, with L4 modifiers including protocol, port number, or GRE tunnel interface.
 - **Standard IPv4** can match only on source IPv4 address.
 - **Standard IPv6** can match only on source IPv6 address.
 - **MAC** can match on L2 source and destination addresses.

ACLs can also be made dynamic and the **payload** keyword can be used to turn an ACL into a User-Defined Field (UDF) alias for use in other ACLs.

13.4.2.1.1 ACL Structure

An ACL is an ordered list of rules that defines access restrictions for the entities (the control plane, or an interface) to which it is applied. ACLs are also used by route maps to select routes for redistribution into specified routing domains.

ACL rules specify the data to which packet contents are compared when filtering data.

- The interface forwards packets that match all commands in a permit rule.
- The interface drops packets that match all commands in a deny rule.
- The interface drops packets that do not match at least one rule.

Upon its arrival at an interface, a packet's fields are compared to the first rule of the ACL applied to the interface. Packets that match the rule are forwarded (permit rule) or dropped (deny rule). Packets that do not match the rule are compared to the next rule in the list. This process continues until the packet either matches a rule or the rule list is exhausted. The interface drops packets not matching a rule.

The sequence number designates the rule's placement in the ACL.

13.4.2.1.2 ACL Rules

ACL rules consist of a command list that is compared to inbound packet fields. When all of a rule's criteria match a packet's contents, the interface performs the action specified by the rule.

The set of available commands depend on the ACL type and the specified protocol within the rule. The following is a list of commands available for supported ACL types

IPv4 ACL Rule Parameters

All rules in IPv4 ACLs include the following criteria:

- **Protocol:** The packet's IP protocol. Valid rule inputs include:
 - Protocol name for a limited set of common protocols.
 - Assigned protocol number for all IP protocols.
- **Source Address:** The packet's source IPv4 address. Valid rule inputs include:
 - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
 - A host IP address (dotted decimal notation.)
 - *any* to denote that the rule matches all source addresses.
- **Destination Address:** The packet's destination IP address. Valid rule inputs include:
 - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
 - A host IP address (dotted decimal notation.)
 - *any* to denote that the rule matches all destination addresses.

All rules in IPv4 ACLs **may** include the following criteria:

- **Fragment:** Rules filter on the fragment bit.
- **Time-to-live:** Compares the TTL (time-to-live) value in the packet to a specified value. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform. Comparison options include:
 - **Equal:** Packets match if packet value equals statement value.
 - **Greater than:** Packets match if packet value is greater than statement value.
 - **Less than:** Packets match if packet value is less than statement value.
 - **Not equal:** Packets match if packet value does not equal statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports / Destination Ports:** A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
 - **any** denotes that the rule matches all ports.
 - A list of ports that matches the packet port. Maximum list size is 10 ports.
 - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
 - Integer (lower bound): The rule matches any port with a number larger than the integer.
 - Integer (upper bound): The rule matches any port with a number smaller than the integer.
 - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits:** Rules filter TCP packets on flag bits.
- **Message type:** Rules filter ICMP type or code.
- **Tracked:** Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

IPv6 ACL Rule Parameters

Note: When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

All rules in IPv6 ACLs include the following criteria:

- **Protocol:** All rules filter on the packet's IP protocol field. Rule input options include:
 - Protocol name for a limited set of common protocols.
 - Assigned protocol number for all IP protocols.
- **Source Address:** The packet's source IPv6 address. Valid rule inputs include:
 - An IPv6 prefix (CIDR). Discontiguous masks are supported.
 - A host IP address (dotted decimal notation).
 - **any** to denote that the rule matches all addresses.
- **Destination Address:** The packet's destination IP address. Valid rule inputs include:
 - A subnet address (CIDR or address-mask). Discontiguous masks are supported.
 - A host IP address (dotted decimal notation).
 - **any** to denote that the rule matches all addresses.

All rules in IPv6 ACLs **may** include the following criteria:

- **Fragment:** Rules filter on the fragment bit.
- **HOP** Compares the packet's hop-limit value to a specified value. Comparison options include:
 - **eq:** Packets match if hop-limit value equals statement value.
 - **gt:** Packets match if hop-limit value is greater than statement value.
 - **lt:** Packets match if hop-limit value is less than statement value.

- **neq:** Packets match if hop-limit value is not equal to statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports / Destination Ports:** A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
 - **any** denotes that the rule matches all ports.
 - A list of ports that matches the packet port. Maximum list size is 10 ports.
 - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
 - Integer (lower bound): The rule matches any port with a number larger than the integer.
 - Integer (upper bound): The rule matches any port with a number smaller than the integer.
 - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits:** Rules filter TCP packets on flag bits.
- **Message type:** Rules filter ICMP type or code.
- **Tracked:** Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

Standard IPv4 and IPv6 ACL Rule Parameters

Note: When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

Standard ACLs filter only on the source address.

MAC ACL Rule Parameters

MAC ACLs filter traffic on a packet's layer 2 header. Criteria that MAC ACLs use to filter packets include:

- **Source Address and Mask:** The packet's source MAC address. Valid rule inputs include:
 - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
 - **any** to denote that the rule matches all source addresses.
- **Destination Address and Mask:** The packet's destination MAC address. Valid rule inputs include:
 - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
 - **any** to denote that the rule matches all destination addresses.
- **Protocol:** The packet's protocol as specified by its EtherType field contents. Valid inputs include:
 - Protocol name for a limited set of common protocols.
 - Assigned protocol number for all protocols.

13.4.2.1.3 Creating and Modifying Lists

The switch provides configuration modes for creating and modifying ACLs. The command that enters an ACL configuration mode specifies the name of the list that the mode modifies. The switch saves the list to the running configuration when the configuration mode is exited.

- ACLs are created and modified in ACL configuration mode.
- Standard ACLs are created and modified in Standard-ACL-configuration mode.
- MAC ACLs are created and modified in MAC-ACL-configuration mode.

Lists that are created in one mode cannot be modified in any other mode.

A sequence number designates the rule's placement in a list. New rules are inserted into a list according to their sequence numbers. A rule's sequence number can be referenced when deleting it from a list.

[ACL Configuration](#) describes procedures for configuring ACLs.

13.4.2.1.4 Implementing Access Control Lists

An Access Control List (ACL) is implemented by assigning the list to an Ethernet interface or subinterface, to a port channel interface, or to the control plane. The switch assigns a default ACL to the control plane unless the configuration contains a valid control-plane ACL assignment statement. Ethernet and port channel interfaces are not assigned an ACL by default. Standard ACLs are applied to interfaces in the same manner as other ACLs.

IPv4 and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. The control-plane does not support egress ACLs.

[Applying ACLs](#) describes procedures for applying ACLs to interfaces or the control plane.

13.4.2.1.5 ACL Rule Tracking

ACL rule tracking determines the impact of ACL rules on the traffic accessing interfaces upon which they are applied. ACLs provide two tracking mechanisms:

- **ACL logging:** A syslog entry is logged when a packet matches specified ACL rules.
- **ACL counters:** ACL counters increment when a packet matches a rule in specified ACLs.

ACL Logging

ACL rules provide a **log** option that produces a log message when a packet matches the rule. ACL logging creates a syslog entry when a packet matches an ACL rule where logging is enabled. Packets that match a logging-enabled ACL rule are copied to the CPU by the hardware. These packets trigger the creation of a syslog entry. The information provided in the entry depends on the ACL type or the protocol specified by the ACL. Hardware rate limiting is applied to packets written to the CPU, avoiding potential DoS attacks. The rate of logging is also software limited to avoid the creation of syslog lists that are too large for practical use by human operators.

[ACL Rule Tracking Configuration](#) describes procedures for configuring and enabling ACL logging.

ACL Counters

An ACL counter is assigned to each ACL rule. The activity of the ACL counters for rules within a list depend on the list's counter state. When the list is in counting state, the ACL counter of a rule increments when the rule matches a packet. When the list is in a non-counting state, the counter does not increment. A list's counter state applies to all rules in the ACL. The default state for new ACLs is non-counting.

When an ACL changes from counting state to non-counting state, or when the ACL is no longer applied to any interfaces that increment counters, counters for all rules in the list maintain their values and do not reset. When the ACL returns to counting mode or is applied to an interface that increments counters, the counter operation resumes from its most recent value.

Counters never decrement and are reset only through CLI commands.

[ACL Rule Tracking Configuration](#) describes procedures for configuring and enabling ACL counters.

13.4.2.1.6 Egress ACL Counters

Egress ACL counters count the number of packets matching rules associated with egress ACLs applied to various interfaces in a switch. For 7050 and 7060 series switches, these counters are maintained for every TCAM rule; on these platforms, packet counters greater than zero are always shown by commands such as `show platform trident tcam`, `show platform trident counters`, and `show ip access-`

list. For other switches, counters are not enabled by default and must be configured for each ACL, and the counters can be shown with the **show hardware counter** and **show ip access-list** commands.

13.4.2.1.6.1 Configuring Egress ACL Counters

For 7050 and 7060 series switches, egress ACL counters are always enabled, and no configuration is required.

For other platforms, to enable egress ACL counters for a specific ACL, use the **counter per-entry** command in the configuration mode for the ACL.

Example

In the following example, configure the **counters per-entry** command in the ACL configuration mode.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# counters per-entry
```

Enabling Egress Counters Globally

For 7050 and 7060 series switches, egress counters are always enabled.

For other switches, both IPv4 and IPv6 egress ACL counters are enabled in the global configuration mode by using the **hardware counter feature acl out** command.

Example

The following example shows how to enable IPv4 egress ACL counters.

```
switch(config)# hardware counter feature acl out ipv4
switch(config)#
```

The following example shows how to enable IPv6 egress ACL counters.

```
switch(config)# hardware counter feature acl out ipv6
switch(config)#
```

Disabling Egress Counters Globally

For 7050 and 7060 series switches, egress counters cannot be disabled.

For other switches, both IPv4 and IPv6 egress ACL counters are also disabled in the global configuration mode by using the **hardware counter feature acl out** command.

The following example shows how to disable IPv4 egress ACL counters.

```
switch(config)# no hardware counter feature acl out ipv4
switch(config)#
```

The following example shows how to disable IPv6 egress ACL counters.

```
switch(config)# no hardware counter feature acl out ipv6
switch(config)#
```

Egress Counter Roll Over in the Global Mode

The counters roll over when the counter value for an ACL rule exceeds **2⁶⁴**.

Example

In the following example, the **hardware counter feature acl ipv6 out** command is configured using units and packets.

```
switch(config)# hardware counter feature acl ipv6 out units packets
switch(config)#
```

The **clear ip access-lists counters** command clears the counters for all of the IPv4 ACLs or a specific IPv4 ACL, either globally or per-CLI session.

Example

In the following example the ACL list named **red** is selected.

```
switch(config)# clear ip access-list counters red session
switch(config)#
```

The IPv6 egress ACL counters do not work in unshared mode.

Example

Use the **hardware access-lists resource sharing vlan ipv6 out** command to enable egress IPv6 ACL sharing.

```
switch(config)# hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

The **clear ipv6 access-list counters** command clears the counters for all of the IPv6 ACLs or a specific IPv6 ACL, either globally or per-CLI session.

Example

In the following example the ACL list named **green** is selected.

```
switch(config)# clear ipv6 access-list counters green session
switch(config)#
```

13.4.2.1.6.2 Displaying Egress ACL Counters

Use the following show commands to display Egress ACL Counters information.

Use the **show ip access-lists** command to display all the IPv4 ACLs, or a specific IPv4 ACL configured in a switch. The output contains details such as rules in an ACL and respective counter values with each rule.

```
switch(config)# show ip access-list acl1
IP Access List acl1
  counter per-entry
  10 deny ip 11.1.1.0/24 any dscp af11
  20 deny ip any any [match 39080716, 0:00:00 ago]
```

Use the **show ipv6 access-lists** command to display all the IPv6 ACLs or a specific IPv6 ACL configured in a switch. The output contains details such as rules in an ACL and respective counter values with each rule.

```
switch(config)# show ipv6 access-list acl1
IPv6 Access List acl1
  counter per-entry
  10 permit ipv6 any any [match 3450000, 0:00:10 ago]
  20 deny ipv6 any any
```

The counter name **EgressAclDropCounter** in the output of this show command signifies the aggregate counter value for the remaining egress IPv4 ACL. In this example the deny rules, whose per rule counters, are not allocated. The per rule counters is not allocated when the user does not configure the **counter per-entry** parameter for the respective ACL.

```
switch(config)# show hardware counter drop
Summary:
Total Adverse (A) Drops: 0
Total Congestion (C) Drops: 0
Total Packet Processor (P) Drops: 250
Type Chip CounterName : Count : First Occurrence : Last Occurrence
-----
P  Fap0  EgressAclDropCounter : 250 : 2015-11-11 22:39:02 : 2015-11-11 22:51:44
```

13.4.2.2 ACL Configuration

Access Control Lists (ACLs) are created and modified in an ACL-configuration mode. A list can be edited only in the mode where it was created. The switch provides five configuration modes for creating and modifying access control lists:

- **ACL configuration mode** for IPv4 access control lists.
- **IPv6-ACL configuration mode** for IPv6 access control lists.
- **Std-ACL configuration mode** for Standard IPv4 access control lists.
- **Std-IPv6-ACL configuration mode** for Standard IPv6 access control lists.
- **MAC-ACL configuration mode** for MAC access control lists.

These sections describe the creation and modification of ACLs:

- [Managing ACLs](#)
- [Modifying an ACL](#)
- [ACL Rule Tracking Configuration](#)
- [Displaying ACLs](#)
- [Configuring Per-Port Per-VLAN QoS](#)
- [Displaying Per-Port Per-VLAN QoS](#)
- [Configuring Mirror Access Control Lists](#)

13.4.2.2.1 Managing ACLs

Creating and Opening a List

To create an ACL, enter one of the following commands, followed by the name of the list:

- [ip access-list](#) for IPv4 ACLs.
- [ipv6 access-list](#) for IPv6 ACLs.
- [ip access-list standard](#) for standard IPv4 ACLs.
- [ipv6 access-list standard](#) for standard IPv6 ACLs.
- [mac access-list](#) for MAC ACLs.

The switch enters the appropriate ACL configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list (see [Modifying an ACL](#) for additional information).

Examples

- This command places the switch in **ACL** configuration mode to create an ACL named **test1**.

```
switch(config)# ip access-list test1
```

```
switch(config-acl-test1)#
```

- This command places the switch in Standard-ACL-configuration mode to create a Standard ACL named **stest1**.

```
switch(config)# ip access-list standard stest1
switch(config-std-acl-stest1)#
```

- This command places the switch in **MAC-ACL** configuration mode to create an MAC ACL named **mtest1**.

```
switch(config)# mac access-list mtest1
switch(config-mac-acl-mtest1)#
```

Saving List Modifications

ACL configuration modes are group-change modes. Changes made in a group-change mode are saved by exiting the mode. To exit the group-change mode, changes can also be discarded using the `abort` command instead of `exit`.

Examples

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)# permit ip 10.10.10.0/24 any
switch(config-acl-test1)# permit ip any host 10.20.10.1
switch(config-acl-test1)# deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)# show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Because the changes were not yet saved, the ACL remains empty, as shown by [show ip access-lists](#).

```
switch(config-acl-test1)# show ip access-lists test1
switch(config-acl-test1)#
```

To save all current changes to the ACL and exit ACL configuration mode, type **exit**.

```
switch(config-acl-test1)# exit
switch(config)# show ip access-lists test1
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any

Total rules configured: 4
  Configured on Ingress: Et1/1
  Active on      Ingress: Et1/1
```

To apply the ACL test1 on an interface (say Ethernet1/1) and on ingress direction, use the following command:

```
switch(config)# int et1/1
switch(config-if-Et1/1)# ip access-group test1 in
```

To save all current changes to the Ethernet interface and exit interface configuration mode, type `exit`.

```
switch(config-if-Et1/1)# exit
switch(config)#
```

Discarding List Changes

The **abort** command exits ACL configuration mode without saving pending changes.

Examples

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)# permit ip 10.10.10.0/24 any
switch(config-acl-test1)# permit ip any host 10.20.10.1
switch(config-acl-test1)# deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)# show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip 10.30.10.0/24 host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
```

To discard the changes, enter **abort**. If the ACL existed before entering ACL-configuration mode, **abort** restores the version that existed before entering ACL-configuration mode. Otherwise, [show ip access-lists](#) shows the ACL was not created.

```
switch(config-acl-test1)# abort
switch(config)#
```

13.4.2.2.2 Modifying an ACL

An existing ACL, including those currently applied to interfaces, can be modified by entering the appropriate configuration mode for the ACL as described in [Creating and Opening a List](#). By default, while an ACL is being modified all traffic is blocked on any interface to which the ACL has been applied.

Permit All Traffic During ACL Update

Because blocking ports during ACL modifications can result in packet loss and can interfere with features such as routing and dynamic NAT, 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches can be configured instead to permit all traffic on Ethernet and VLAN interfaces while ACLs applied to those interfaces are being modified. This is done with the [hardware access-list update default-result permit](#) command.

These commands add deny rules to the appropriate ACL:

- [deny \(IPv4 ACL\)](#) adds a deny rule to an IPv4 ACL.
- [deny \(IPv6 ACL\)](#) adds a deny rule to an IPv6 ACL.
- [deny \(Standard IPv4 ACL\)](#) adds a deny rule to an IPv4 standard ACL.
- [deny \(Standard IPv6 ACL\)](#) adds a deny rule to an IPv6 standard ACL.
- [deny \(MAC ACL\)](#) adds a deny rule to a MAC ACL.

These commands add permit rules to the appropriate ACL:

- [permit \(IPv4 ACL\)](#) adds a permit rule to an IPv4 ACL.

- **permit (IPv6 ACL)** adds a permit rule to an IPv6 ACL.
- **permit (Standard IPv4 ACL)** adds a permit rule to an IPv4 standard ACL.
- **permit (Standard IPv6 ACL)** adds a permit rule to an IPv6 standard ACL.
- **permit (MAC ACL)** adds a permit rule to a MAC ACL.

Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ACL configuration mode for the list. The new rule's sequence number is derived by adding **10** to the last rule's sequence number.

Examples

- This command configures the switch to permit all traffic during ACL modifications on interfaces to which the ACL has been applied. The rules in modified ACLs are applied after exiting ACL configuration mode, and after the ACL rules have been populated in hardware.

```
switch(config)# hardware access-list update default-result permit
```

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)# permit ip 10.10.10.0/24 any
switch(config-acl-test1)# permit ip any host 10.20.10.1
switch(config-acl-test1)# deny ip host 10.10.10.1 host 10.20.10.1
```

- To view the edited list, type **show**.

```
switch(config-acl-test1)# show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
```

- This command appends a rule to the ACL. The new rule's sequence number is **40**.

```
switch(config-acl-test1)# permit ip any any
switch(config-acl-test1)# show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Inserting a Rule

To insert a rule into a ACL, enter the rule with a sequence number between the existing rules' numbers.

Example

This command inserts a rule between the first two rules by assigning it the sequence number **15**.

```
Switch(config-acl-test1)# 15 permit ip 10.30.10.0/24 host 10.20.10.1
Switch(config-acl-test1)# show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  15 permit ip 10.30.10.0/24 host 10.20.10.1
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Deleting a Rule

To remove a rule from the current ACL, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.
- Enter **no**, followed by the rule to be deleted.
- Enter **default**, followed by the rule to be deleted.

Examples

- These equivalent commands remove rule **20** from the list.

```
switch(config-acl-test1)# no 20
switch(config-acl-test1)# no permit ip any host 10.20.10.1
switch(config-acl-test1)# default permit ip any host 10.20.10.1
```

- This ACL results from entering one of the preceding commands.

```
switch(config-acl-test1)# show
ip access list test1
 10 permit ip 10.10.10.0/24 any
 15 permit ip 10.30.10.0/24 host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
```

Resequencing Rule Numbers

Sequence numbers determine the order of the rules in an access control list. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Resequencing rule numbers changes the sequence number of rules to provide a constant difference between adjacent rules. The [resequence \(ACLs\)](#) command adjusts the sequence numbers of ACL rules.

Example

The [resequence \(ACLs\)](#) command renumbers rules in the test1 ACL. The sequence number of the first rule is **100**; subsequent rules numbers are incremented by **20**.

```
switch(config-acl-test1)# show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 25 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 50 permit ip any any
 90 remark end of list
switch(config-acl-test1)# resequence 100 20
switch(config-acl-test1)# show
IP Access List test1
 100 permit ip 10.10.10.0/24 any
 120 permit ip any host 10.20.10.1
 140 deny ip host 10.10.10.1 host 10.20.10.1
 160 permit ip any any
 180 remark end of list
```

13.4.2.2.3 ACL Rule Tracking Configuration

ACL rules provide a **log** option that produces a syslog message about the packets matching packet. ACL logging creates a syslog entry when a packet matches an ACL rule with logging enabled.

This feature is currently available on Arad switches and 7100 series switches. On 7100 series switches, matches are logged only on ingress, not egress.

Example

This command creates an ACL rule with logging enabled.

```
switch(config-acl-test1)# 15 permit ip 10.30.10.0/24 host 10.20.10.1 log
switch(config-acl-test1)#
```

The format of the generated Syslog message depends on the ACL type and the specified protocol:

- Messages generated by a TCP or UDP packet matching an IP ACL use this format:
IPACCESS: list acl intf filter protocol src-ip(src_port) -> dst-ip(dst_port)
- Messages generated by ICMP packets matching an IP ACL use this format:
IPACCESS: list acl intf filter icmp src-ip(src-port) -> dst-ip(dst-port) type= n code= m
- Messages generated by all other IP packets matching an IP ACL use this format:
IPACCESS: list acl intf filter protocol src-ip -> dst-ip
- Messages generated by packets matching a MAC ACL use this format:
MACACCESS: list acl intf filter vlan ether src_mac -> dst_mac
- Messages generated by a TCP or UDP packet matching a MAC ACL use this format:
MACACCESS: list acl intf filter vlan ether ip-prt src-mac src-ip : src-prt -> dst-mac dst-ip : dst-prt
- Messages generated by any other IP packet matching a MAC ACL use this format:
MACACCESS: list acl intf filter vlan ether src_mac src_ip -> dst_mac dst_ip

Variables in the Syslog messages display the following values:

- **acl** Name of ACL.
- **intf** Name of interface that received the packet.
- **filter** Action triggered by ACL (**denied** or **permitted**).
- **protocol** IP protocol specified by packet.
- **vlan** Number of VLAN receiving packet.
- **ether** EtherType protocol specified by packet.
- **src-ip** and **dst-ip** source and destination IP addresses.
- **src-prt** and **dst-prt** source and destination ports.
- **src-mac** and **dst-mac** source and destination MAC addresses.

ACLs provide a command that configures its counter state (counting or non-counting). The counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

The [counters per-entry \(ACL configuration modes\)](#) command places the ACL in counting mode.

This command places the configuration mode ACL in counting mode.

```
switch(config-acl-test1)# counters per-entry
switch(config-acl-test1)#exit
switch(config-acl-test1)#show ip access-list test1
IP Access List test1
    counters per-entry
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any
    50 remark end of list
Total rules configured: 5
    Configured on Ingress: Et1
    Active on      Ingress: Et1
```

The [clear ip access-lists counters](#) and [clear ipv6 access-lists counters](#) commands set the IP access list counters to zero for the specified IP access list.

This command clears the ACL counter for the test1 ACL.

```
switch(config)# clear ip access-lists counters test1
switch(config)#
```

13.4.2.2.4 Displaying ACLs

ACLs can be displayed by a **show running-config** command. The [show ip access-lists](#) also displays ACL rosters and contents, as specified by command parameters.

When editing an ACL, the [show \(ACL configuration modes\)](#) command displays the current or pending list, as specified by command parameters.

Displaying a List of ACLs

To display the roster of ACLs on the switch, enter **show [ip | ipv6 | mac] access-lists** with the **summary** option.

Example

This command lists the available IPv4 access control lists.

```
switch(config)# show ip access-lists summary
IPV4 ACL default-control-plane-acl
    Total rules configured: 12
    Configured on: control-plane
    Active on      : control-plane

IPV4 ACL list2
    Total rules configured: 3

IPV4 ACL test1
    Total rules configured: 6

IPV4 ACL test_1
    Total rules configured: 1

IPV4 ACL test_3
    Total rules configured: 0
switch(config)#
```

Displaying Contents of an ACL

These commands display ACL contents.

- [show access-lists](#)
- [show ip access-lists](#)
- [show ipv6 access-lists](#)
- [show mac access-lists](#)

Each command can display the contents of one ACL or of all ACLs of the type specified by the command:

- To display the contents of one ACL, enter **show [ACL_TYPE] access-lists** followed by the name of the ACL. Here ACL_TYPE can be ip, ipv6, mac or simply empty.
- To display the contents of all ACLs (ip, ipv6 and mac) on the switch, enter the command without any options.

ACLs in counting mode display the number of inbound packets each rule in the list matched and the elapsed time since the last match.

Examples

- This command displays the rules in the **default-control-plane-acl IP ACL**, configuration, and status.

```
switch# show ip access-lists default-control-plane-acl
IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 1725, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https
  50 permit udp any any eq bootps bootpc snmp [match 993, 0:00:29 ago]
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 1316, 0:00:23 ago]
  120 permit tcp any any range 5900 5910
Total rules configured: 12
      Configured on Ingress: control-plane(default VRF)
      Active on      Ingress: control-plane(default VRF)
```

- This command displays the rules, configuration, and status of all the IP ACLs on the switch. .

```
switch# show ip access-lists
IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 1371, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https
  50 permit udp any any eq bootps bootpc snmp
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 1316, 0:00:23 ago]
  120 permit tcp any any range 5900 5910

Total rules configured: 12
Configured on Ingress: control-plane(default VRF)
Active on      Ingress: control-plane(default VRF)

IP Access List list2
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 permit ip any host 10.20.10.1
  40 deny ip host 10.10.10.1 host 10.20.10.1
  50 permit ip any any

Total rules configured: 5
Configured on Ingress: Et1/1
Active on      Ingress: Et1/1

IP Access List test1
switch(config)#
```

Displaying ACL Modifications

While editing an ACL in ACL-configuration mode, the [show \(ACL configuration modes\)](#) command provides options for displaying ACL contents.

- To display the list, as modified in ACL configuration mode, enter **show** or **show pending**.
- To display the list, as stored in **running-config**, enter **show active**.
- To display differences between the pending list and the stored list, enter **show diff**.

Examples

The examples in this section assume these ACL commands were previously entered.

These commands are stored in the configuration:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to **running-config**:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to **running-config**:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

This command displays the pending ACL, as modified in **ACL** configuration mode.

```
switch(config-acl-test_1)# show pending
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip 10.10.0.0/16 any
 25 permit tcp 10.10.20.0/24 any
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 45 deny pim 239.24.124.0/24 10.5.8.4/30
 50 remark end of list
```

This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)# show active
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.21.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

This command displays the difference between the saved and modified ACLs.

- Rules added to the pending list are denoted with a plus sign (+).
- Rules removed from the saved list are denoted with a minus sign (-).

```
switch(config-acl-test_1)# show diff
---
+++
@@ -1,7 +1,9 @@
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
- 20 permit ip any host 10.21.10.1
+ 20 permit ip 10.10.0.0/16 any
+ 25 permit tcp 10.10.20.0/24 any
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
+ 45 deny pim 239.24.124.0/24 10.5.8.4/30
```

Displaying Egress ACL Counters

Use the following show commands to display Egress ACL Counters information.

Use the **show ip access-lists** command to display all the IPv4 ACLs, or a specific IPv4 ACL configured in a switch. The output contains details such as rules in an ACL, respective counter values with each rule, configuration, and status.

```
switch(config)# show ip access-list acl1
IP Access List acl1
counter per-entry
10 deny ip 11.1.1.0/24 any dscp af11
20 deny ip any any [match 39080716, 0:00:00 ago]

Total rules configured: 2
Configured on Ingress: Et2/1
Active on      Ingress: Et2/1
```

Use the **show ipv6 access-lists** command to display all the IPv6 ACLs or a specific IPv6 ACL configured in a switch. The output contains details such as rules in an ACL, respective counter values with each rule along with the configuration and status.

```
switch(config)# show ipv6 access-list acl1
IPv6 Access List acl1
counter per-entry
10 permit ipv6 any any [match 3450000, 0:00:10 ago]
20 deny ipv6 any any

Total rules configured: 2
Configured on Ingress: Et1/1
Active on      Ingress: Et1/1
```

The counter name **EgressAclDropCounter** in the output of this show command signifies the aggregate counter value for the remaining egress IPv4 ACL. In this example, the deny rules, whose per rule counters, are not allocated. The per-rule counters are not allocated when the user does not configure the counter per-entry parameter for the respective ACL.

```
switch(config)# show hardware counter drop
Summary:
Total Adverse (A) Drops: 0
Total Congestion (C) Drops: 0
Total Packet Processor (P) Drops: 250
Type Chip CounterName : Count : First Occurrence : Last Occurrence
-----
P Fap0 EgressAclDropCounter : 250 : 2015-11-11 22:39:02 : 2015-11-11 22:51:44
```

13.4.2.2.5 Configuring Per-Port Per-VLAN QoS

To configure per-port per-VLAN QoS, first, configure the ACL policing for QoS, and then apply the policy-map on a single Ethernet or port-channel interfaces on a per-port per-VLAN basis. The per port per VLAN QoS allows a class-map to match traffic for a single VLAN or for a range of VLANs separated by commas. Per-port per-VLAN works with QoS-based class-maps only.

To configure per-port per-VLAN QoS on DCS-7280(R) and DCS-7500(R), change the TCAM profile to QoS as shown below.

1. Change the TCAM profile to QoS.

```
switch# config
switch(config)# hardware tcam profile qos
```

2. Create an ACL and then match the traffic packets based on the VLAN value and the VLAN mask configured in the ACL.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit vlan 100 0xffff ip any any
switch(config-acl-acl1)# exit
```

3. Similarly, create a class-map and then match the traffic packets based on the range of VLAN values configured in the class-map.

```
switch(config)# class-map match-any class1
switch(config-cmap-qos-class1)# match vlan 20-40, 1000-1250, 2000
switch(config-cmap-qos-class1)# exit
```

13.4.2.2.6 Displaying Per-Port Per-VLAN QoS

The following show commands display the status, traffic hit counts, tcam profile information, and policy-maps configured on an interface.

Examples

- The **show policy-map** command displays the policy-map information of the configured policy-map.

```
switch# show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

- The **show policy-map interface** command displays the policy-map configured on an interface.

```
switch# show policy-map interface ethernet 1
Service-policy input: p1
Hardware programming status: Successful
Class-map: c2001 (match-any)
Match: vlan 2001 0xffff
set dscp 4
Class-map: c2002 (match-any)
Match: vlan 2002 0xffff
set dscp 8
Class-map: c2003 (match-any)
Match: vlan 2003 0xffff
set dscp 12
```

13.4.2.2.7 Configuring Mirror Access Control Lists

Access Control Lists (ACLs) are configured to permit or deny traffic between source and destination ports on Strata-based platforms. Mirror ACLs are used in mirroring traffic by matching VLAN ID of the configured ACLs. Mirror ACLs are applied for IPv4, IPv6, and MAC ACLs.

Note: Mirror ACLs work in receiving direction only.

Examples

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit vlan 1234 0x0 ip any any
```

- These commands configure monitor session **sess1** with **Ethernet 1** as source port and **Ethernet 2** as destination port for an ingress ip **acl_1**.

```
switch(config)# monitor session sess1 source ethernet 1 rx ip access-group acl1
switch(config)# monitor session sess1 destination ethernet 2
```

13.4.2.3 Applying ACLs

Access Control Lists become active when they are assigned to an interface or subinterface or to the control plane. This section describes the process of adding and removing ACL interface assignments.

Applying an ACL to an Interface

The switch must be in interface configuration mode to assign an ACL to an interface or subinterface.

- The `ip access-group` command applies the specified IP or standard IP ACL to the configuration mode interface or subinterface.
- The `ip access-group` command applies the specified IP or standard IP ACL to the control-plane traffic.
- The `mac access-group` command applies the specified MAC ACL to the configuration mode interface.

IPv4, IPv6, and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned with multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. IPv6 egress ACLs have limited availability, and IPv6 egress ACLs applied to routed interfaces or subinterfaces across the same chip on the DCS-7500E and the DCS-7280E series can be shared. In addition to that, the DSCP value can match on IPv6 egress ACLs. This results in a more efficient utilization of system resources, and is particularly useful for environments with few, potentially large, IPv6 egress ACLs applied across multiple routed interfaces.

Examples

- These commands assign **test1** ACL to **interface ethernet 3**, then verify the assignment.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# ip access-group test1 in
switch(config-if-Et3)# show running-config interfaces ethernet 3
interface Ethernet3
  ip access-group test1 in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and applies the ACL assignment to the control-plane traffic.

```
switch(config)# control-plane
switch(config-cp)# ip access-group test_cp in
```

- This command enables shared ACLs.

```
switch(config)# hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- This command disables shared ACLs.

```
switch(config)# no hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- These commands apply an IPv4 ACL named **test_ACL** to ingress traffic on **interface ethernet 5.1**.

```
switch(config)# interface ethernet 5.1
switch(config-if-Et5.1)# ipv4 access-group test_ACL in
switch(config-if-Et5.1)#
```

Removing an ACL from an Interface

The `no ip access-group` command removes an IP ACL assignment statement from **running-config** for the configuration mode interface. After an ACL is removed, the interface is not associated with an IP ACL.

The **no mac ip access-group** command removes a MAC ACL assignment statement from *running-config* for the configuration mode interface. After a MAC ACL is removed, the interface is not associated with an MAC ACL.

To remove an ACL from the control plane, enter the **no ip access-group** command in control plane configuration mode. Removing the control plane ACL command from *running-config* reinstates **default-control-plane-acl** as the control plane ACL.

Examples

- These commands remove the assigned IPv4 ACL from *interface ethernet 3*.

```
switch(config)# interface ethernet 3
switch(config-if-Et3)# no ip access-group test in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and remove the ACL assignment from *running-config*, restoring **default-control-plane-acl** as the control plane ACL.

```
switch(config)# control-plane
switch(config-cp)# no ip access-group test_cp in
switch(config-cp)#
```

13.4.3 Service ACLs

These sections describe Service ACLs:

- [Service Access Control List Description](#)
- [Configuring Service ACLs and Displaying Status and Counters](#)

13.4.3.1 Service Access Control List Description

Service ACL enforcement is a feature added to a control plane service (the SSH server, the SNMP server, routing protocols, etc) that allows the switch administrator to restrict the processing of packets and connections by the control plane processes that implement that service. The control plane program run by the control plane process checks already received packets and connections against a user configurable Access Control List (ACL), a Service ACL. The Service ACL contains permit and deny rules matching any of the source address, destination address, and TCP or UDP ports of received packets or connections. After receiving a packet or connection, the control plane process evaluates the packet or connection against the rules of the Service ACL configured for the control plane process, and if the received packet or connection matches a deny rule the control plane process drops or closes it without further processing.

Control Plane Process Enforced Access Control enables the system administrator to restrict which systems on the network can access the services provided by the switch. Each service has its own access control list, giving the system administrator fine grained control over access to the switch's control plane services. The CLI for this uses the familiar pattern of access control lists assigned for a specific purpose, in this case for each control plane service.

13.4.3.2 Configuring Service ACLs and Displaying Status and Counters

13.4.3.2.1 SSH Server

To apply the SSH server Service ACLs for IPv4 and IPv6 traffic, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands in *mgt-ssh* configuration mode as shown below.

```
switch(config)# management ssh
```

```
switch(config-mgmt-ssh)# ip access-group <acl_name> [vrf <vrf_name>] in
switch(config-mgmt-ssh)# ipv6 access-group <acl_name> [vrf <vrf_name>] in
```

In *Release EOS-4.19.0*, all VRFs are required to use the same SSH server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the SSH server is enabled.

To display the status and counters of the SSH server Service ACLs, use the following commands.

```
switch> show management ssh ip access-list
switch> show management ssh ipv6 access-list
```

13.4.3.2.2 SNMP Server

To apply the SNMP server Service ACLs to restrict which hosts can access SNMP services on the switch, use the **snmp-server community** command as shown below.

```
snmp-server community community-name [view viewname] [ro | rw] acl_name
snmp-server community community-name [view viewname] [ro | rw] ipv6 ipv6_acl_name
```

13.4.3.2.3 EAPI

To apply Service ACLs to the EOS application programming interface (EAPI) server, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)# management api http-commands
switch(config-mgmt-api-http-cmds)# vrf <vrf_name>
switch(config-mgmt-api-http-cmds-vrf-<vrf>)# ip access-group <acl_name>
switch(config-mgmt-api-http-cmds-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the EAPI server Service ACLs, use the following commands.

```
switch> show management api http-commands ip access-list
switch> show management api http-commands ipv6 access-list
```

13.4.3.2.4 BGP

To apply Service ACLs for controlling connections to the BGP routing protocol agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
switch(config)# router bgp <asn>
switch(config-router-bgp)# ip access-group <acl_name>
switch(config-router-bgp)# ipv6 access-group <ipv6_acl_name>
switch(config-router-bgp)# vrf <vrf_name>
switch(config-router-bgp-vrf-<vrf>)# ip access-group <acl_name>
switch(config-router-bgp-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the BGP routing protocol Service ACLs, use the following commands.

```
switch> show bgp ipv4 access-list
switch> show bgp ipv6 access-list
```

13.4.3.2.5 UCMP auto adjust for BGP

UnequalCost Multi-Path (UCMP) for BGP forwards traffic based on weight assignments for next hops of routes of ECMP traffic. The weights are programmed in the FIB. By disseminating BGP link-bandwidth extended community attribute information with BGP routes, the receiver device of all routes, programs

the next hops in the FIB using the received link-bandwidth values. The percentage of interface speed is appended to the received link bandwidth extended community value of the route. The weight ratio of the traffic sent over egress ports is adjusted to forward more traffic towards the peer with higher interface speed.

Configuring UCMP auto adjust for BGP

The following command enables the weight adjustment.

This command configures the adjust auto to **62.3** percent.

```
switch(config-router-bgp)# neighbor group1 link-bandwidth adjust auto percent 62.3
```

PERCENT is a float value between **0.0** to **100.0** and is optional.

13.4.3.2.6 OSPF

To apply Service ACLs for controlling packets processed by the OSPF routing protocol agent, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands as shown below.

```
switch(config)# router ospf <id>
switch(config-router-ospf)# ip access-group <acl_name>
switch(config-router-ospf)# ipv6 access-group <ipv6_acl_name>
```

When using VRFs, each per-VRF OSPF instance must be assigned its Service ACL explicitly.

To display the status and counters of the OSPF routing protocol Service ACLs, use the following commands.

```
switch> show ospf ipv4 access-list
switch> show ospf ipv6 access-list
```

13.4.3.2.7 PIM

To apply Service ACLs for controlling packets processed by the PIM routing protocol agent, use the **access-group** command as shown below.

```
switch(config)# router pim
switch(config-router-pim)# ipv4
switch(config-router-pim-ipv4)# access-group <acl_name>
switch(config-router-pim-ipv4)# vrf <vrf_name>
switch(config-router-pim-vrf-<vrf>)# ipv4
switch(config-router-pim-vrf-<vrf>-ipv4)# access-group <acl_name>
```

To display the status and counters of the PIM routing protocol Service ACLs, use the following commands.

```
switch> show ip pim access-list
```

13.4.3.2.8 IGMP

To apply Service ACLs for controlling packets processed by the IGMP management protocol agent, use the **ip igmp access-group** command as shown below.

```
switch(config)# router igmp
switch(config-router-igmp)# ip igmp access-group <acl_name>
switch(config-router-igmp)# vrf <vrf_name>
switch(config-router-igmp-vrf-<vrf>)# ip igmp access-group <acl_name>
```

To display the status and counters of the IGMP management protocol Service ACLs, use the following commands.

```
switch> show ip igmp access-list
```

13.4.3.2.9 DHCP Relay

To apply Service ACLs for controlling packets processed by the DHCP relay agent, use the **ip dhcp relay access-group** and **ipv6 dhcp relay access-group** commands as shown below.

```
switch(config)# ip dhcp relay access-group <acl_name> [vrf <vrf_name>]
switch(config)# ipv6 dhcp relay access-group <acl_name> [vrf <vrf_name>]
```

To display the status and counters of the DHCP relay agent Service ACLs, use the following commands.

```
switch> show ip dhcp relay access-list
switch> show ipv6 dhcp relay access-list
```

13.4.3.2.10 LDP

To apply Service ACLs for controlling packets and connections processed by the LDP MPLS label distribution protocol, use the command as shown below.

[ip access-group \(Service ACLs\)](#)

```
switch(config)# mpls ldp
switch(config-mpls-ldp)# ip access-group <acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
switch> show mpls ldp access-list
```

13.4.3.2.11 LANZ

To apply Service ACLs for controlling connections accepted by the LANZ agent, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands as shown below.

```
switch(config)# queue-monitor streaming
switch(config-qm-streaming)# ip access-group <acl_name>
switch(config-qm-streaming)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
switch> show queue-monitor streaming access-lists
```

13.4.3.2.12 MPLS Ping and Traceroute

To apply Service ACLs for controlling connections accepted by the MPLS Ping agent, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands as shown below.

```
switch(config)# mpls ping
switch(config-mpls-ping)# ip access-group <acl_name> [vrf <vrf_name>]
switch(config-mpls-ping)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>]
```

13.4.3.2.13 Telnet Server

To apply Service ACLs to the Telnet server, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
switch(config)# management telnet
switch(config-mgmt-telnet)# ip access-group <acl_name> [vrf <vrf_name>] in
switch(config-mgmt-telnet)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>] in
```

In EOS 4.19.0, all VRFs are required to use the same Telnet server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the Telnet server is enabled.

To display the status and counters of the LDP Service ACLs, use the following commands.

```
switch> show management telnet ip access-list
switch> show management telnet ipv6 access-list
```

13.4.4 Sub-interface ACLs

This Sub-interface ACLs feature enables ACL functionality on subinterfaces.

13.4.4.1 Configuring Sub-interface ACLs

Configure the ACLs on subinterfaces, use the following command:

```
ip|ipv6 access-group acl-name in | out
```

To unconfigure the ACLs on subinterfaces, use the following command:

```
no ip|ipv6 access-group in | out
```

13.4.4.2 Sub-interface ACLs Limitations

The sub-interface ACLs feature contains the following limitations:

- Egress IPv4 ACLs on subinterfaces are not supported when sharing mode is disabled for Egress IPv4 RACLs.
- Egress IPv6 ACL deny logging is not supported on subinterfaces.
- Blocking traffic while modifying ACLs is not supported on Egress IPv4 ACLs on subinterfaces.

13.4.4.3 Sub-interface ACLs Show Commands

The `show ip|ipv6 access-lists` displays the summary of a configured ACL including the subinterface on which the ACL is configured and active.

```
show ip|ipv6 access-lists acl-name summary
```

Examples

```
switch(config)# show ip access-lists acl1 summary
IPV4 ACL acl1
  Total rules configured: 1
  Configured on Ingress: Et5.1
  Active on Ingress: Et5.1
```

```
switch(config)# show ipv6 access-lists acl1 summary
IPV6 ACL acl1
  Total rules configured: 1
```

```
Configured on Egress: Et5.1  
Active on Egress: Et5.1
```

13.4.5 RACL Sharing on SVIs

13.4.5.1 IPv4 Ingress Sharing

The IPv4 ingress sharing optimizes the utilization of hardware resources by sharing the hardware resources between different VLAN interfaces when they have same ACL attached.

Larger deployments are benefited with this function, where IPv4 ingress sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs and an ingress sharing is applied on all VLANs, it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 ingress sharing is disabled on the switches.

To enable IPv4 Ingress Sharing use **no hardware access-list resource sharing vlan in** command. Note, enabling or disabling the IPv4 ingress sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding. The **no** form of the command disables the IPv4 ingress sharing on the switch. To display the IPv4 ingress sharing information use **show platform trident** command on the switch.

13.4.5.2 IPv4 Egress Sharing

The IPv4 Egress Sharing optimizes the utilization of hardware resources by sharing TCAM entries for a group of SVIs on which IPv4 ACLs shared. The TCAM entries are shared for all the SVIs per chip, hence, saving a lot of hardware resources and enabling ACLs to scale to a larger configurations.

Larger deployments are benefited, where IPv4 Egress Sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs, and when Egress Sharing is applied on all VLANs it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 Egress Sharing is enabled on the switches. However, both IPv4 Egress Sharing and uRPF cannot be enabled at the same time. Disabling IPv4 RACL sharing will allow uRPF configuration and make sure RACL configuration, non-shared mode, is configured at the same time.

To enable unicast Reverse Path Forwarding (uRPF) on the switch, the IPv4 Egress Sharing must be disabled using the **no hardware access-list resource sharing vlan ipv4 out** command.

To enable IPv4 Egress Sharing if previously disabled from the default configuration, use [hardware access-list resource sharing vlan ipv4 out](#) command. Note, enabling or disabling the IPv4 Egress Sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding.

The following **show** commands can be used to verify the IPv4 Egress Sharing information on the switch.

- [show ip access-lists](#)
- [show vlan](#)
- [show platform arad acl tcam](#)
- [show ip route](#)
- [show platform arad ip route](#)

13.4.5.3 Configuring IPv4 Egress Sharing

Use **hardware access-list resource sharing vlan ipv4 out** command to enable the IPv4 Egress Sharing on the switch. By default, IPv4 Egress Sharing is enabled on the switch. The **no** form of the command disables the IPv4 Egress Sharing on the switch and user is allowed to configure the uRPF on the switch.

13.4.5.4 Displaying IPv4 Egress Sharing Information

Examples

- The `show ip access-lists` command displays the list of all the configured IPv4 ACLs.

```
switch# show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
Total rules configured: 17
Configured on Ingress: control-plane(default VRF)
Active on Ingress: control-plane(default VRF)

IPV4 ACL ipAclLimitTest
Total rules configured: 0
Configured on Egress: V12148,2700
Active on Egress: V12148,2700
```

- The `show vlan` command displays the list of all the member interfaces under each SVI.

```
switch# show vlan
VLAN  Name          Status  Ports
-----
1     default         active
2148  VLAN2148        active  Cpu, Et1, Et26
2700  VLAN2700        active  Cpu, Et18
```

- The `show platform arad acl tcam` command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC and the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries, direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: V12148, V12700
Bank Offset Entries
0           0           1
Fap: Arad1, Shared: true, Interfaces: V12148
Bank Offset Entries
0           0           1
```

```
switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
=====
Arad0:
=====
Bank  Used          Used %          Used By
0     1              0           IP Egress PACLS/RACLs
Total Number of TCAM lines used is: 1
=====
Arad1:
=====
Bank  Used          Used %          Used By
0     1              0           IP Egress PACLS/RACLs
Total Number of TCAM lines used is: 1
```

- The `show ip route` command displays the unicast ip routes installed in the system.

```
switch# show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,
NG - Nexthop Group Static Route

Gateway of last resort is not set
C 10.1.0.0/16 is directly connected, Vlan2659
C 10.2.0.0/16 is directly connected, Vlan2148
C 10.3.0.0/16 is directly connected, Vlan2700
S 172.17.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.18.0.0/16 [1/0] via 172.24.0.1, Management1

```

13.4.6 Route Maps

A route map is an ordered set of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

13.4.6.1 Route Map Description

Route maps are composed of route map statements, each of which consists of a list of match and set commands.

Route Map Statements

Route map statements are categorized by the resolution of routes that the statement filters.

- Permit statements facilitate the redistribution of matched routes.
- Deny statements prevent the redistribution of matched routes.

Route map statement elements include name, sequence number, filter type, match commands, set commands, and continue commands.

- **name** identifies the route map to which the statement belongs.
- **sequence number** designates the statement's placement within the route map.
- **filter type** specifies the route resolution. Valid types are **permit** and **deny**.
- **match commands** specify criteria that select routes that the statement is evaluating for redistribution.
- **set commands** modify route parameters for redistributed routes.
- **continue commands** prolong the route map evaluation of routes that match a statement.

Statements filter routes for redistribution. Routes that statements pass are redistributed (permit statements) or rejected (deny statements). Routes that statements fail are filtered by the next statement in the route map.

- When a statement does not contain a **match** command, the statement passes all routes.
- When a statement contains a single **match** command that lists a single object, the statement passes routes whose parameters match the object.
- When a statement contains a single **match** command that lists multiple objects, the statements passes routes whose parameters match at least one object.
- When a statement contains multiple **match** commands, the statement passes routes whose parameters match all match commands.

Set commands modify parameters for redistributed routes. **Set** commands are valid in permit statements.

Example

The following route map statement is named **MAP_1** with sequence number **10**. The statement matches all routes from BGP Autonomous System 10 and redistributes them with a local preference set to **100**. Routes that do not match the statement are evaluated against the next statement in the route map.

```
switch# route-map MAP_1 permit 10
      match as 10
      set local-preference 100
```

Route Maps with Multiple Statements

A route map consists of statements with the same name and different sequence numbers. Statements filter routes in ascending order of their sequence numbers. When a statements passes a route, the redistribution action is performed as specified by the filter type and all subsequent statements are ignored. When the

statement fails the route, the statement with the smallest sequence number that is larger than the current one filters the route.

All route maps have an implied final statement that contains a single deny statement with no match command. This denies redistribution to routes that are not passed by any statement.

Example

The following route map is named **MAP_1** with two permit statements. Routes that do not match either statement are denied redistribution into the target protocol domain.

```
switch# route-map MAP_1 permit 10
  match as 10
  set local-preference 100
!
switch# route-map MAP_1 permit 20
  match metric-type type-1
  match as 100
```

[Route Map Configuration](#) describes route map configuration procedures.

Route Maps with Multiple Statements and Continue Commands

Route map statements that contain a [continue \(route map\)](#) command support additional route map evaluation of routes whose parameters meet the statement's match commands. Routes that match a statement containing a **continue** command are evaluated against the statement specified by the **continue** command.

When a route matches multiple route map statements, the filter action (deny or permit) is determined by the last statement that the route matches. The **set** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statements containing them.

Example

The following route map is named **MAP_1** with a permit statement and a deny statement. The permit statement contains a continue command. Routes that match statement 10 are evaluated against statement 20.

```
route-map MAP_2 permit 10
  match as 10
  continue 20
  set local-preference 100
!
route-map MAP_2 deny 20
  match metric-type type-1
  match as 100
```

The route is redistributed if it passes statement 10 and is rejected by statement 20. The route is denied redistribution in all other instances. The **continue** command guarantees the evaluation of all routes against both statements.

13.4.6.2 Route Map Configuration

Route maps are created and modified in route map configuration mode. These sections describe the configuration mode and its commands.

- [Route Map Creation and Editing](#)
- [Modifying Route Map Components](#)

13.4.6.2.1 Route Map Creation and Editing

Creating a Route Map Statement

To create a route map, enter `route-map` followed by the map name and filter type (**deny** or **permit**). The default sequence number is assigned to the statement if the command does not include a number.

Example

This command places the switch in *route map* configuration mode to create a route map statement named **map1** with a sequence number of **50**.

```
switch(config)# route-map map1 permit 50
switch(config-route-map-map1)#
```

Editing a Route Map Statement

To edit an existing route map statement, enter `route-map` with the map's name and statement's number. The switch enters route map configuration mode for the statement. Subsequent `match (route-map)` and `set (route-map)` commands add the corresponding commands to the statement.

The **show** command displays contents of the existing route map.

Example

This command places the switch in route map configuration mode to edit an existing route map statement. The **show** command displays contents of all statements in the route map.

```
switch(config)# route-map MAP2
switch(config-route-map-MAP2)#show
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
switch(config-route-map-MAP2)#
```

Saving Route Map Modifications

Route map configuration mode is a group-change mode. Changes are saved by exiting the mode, either with an explicit **exit** command or by switching directly to another configuration mode. This includes switching to the configuration mode for a different route map.

Example

The first command creates the **map1** statement with sequence number of 10. The second command is not yet saved to the route map, as displayed by the **show** command.

```
switch(config)# route-map map1 permit
switch(config-route-map-map1)# match as 100
switch(config-route-map-map1)# show

switch(config-route-map-map1)#
```

The **exit** command saves the **match** command.

```
switch(config-route-map-map1)# exit
switch(config)# show route-map map1
route-map map1 permit 10
```

```

Match clauses:
  match as 100
Set clauses:
switch(config)#

```

Discarding Route Map Modifications

The **abort** command discards all pending changes and exits route map configuration mode.

Example

The **abort** command discards the pending **match** command and restores the original route map.

```

switch(config)# route-map map1 permit
switch(config-route-map-map1)# match as 100
switch(config-route-map-map1)# abort
switch(config)# show route-map map1
switch(config)#

```

13.4.6.2.2 Modifying Route Map Components

These commands add rules to the configuration mode route map:

- **match (route-map)** adds a match rule to a route map.
- **set (route-map)** adds a set rule to a route map.

Inserting a Statement

To insert a new statement into an existing route map, create a new statement with a sequence number that differs from any existing statement in the map.

Example

This command adds statement 50 to the **Map1** route map, then displays the new route map.

```

switch(config)# route-map Map1 permit 50
switch(config-route-map-Map1)# match as 150
switch(config-route-map-Map1)#exit
switch(config)#show route-map Map1
route-map Map1 deny 10
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
route-map Map1 permit 50
  Match clauses:
    match as 150
  Set clauses:
switch(config)#

```

Deleting Route Map Components

To remove a component from a route map, perform one of the following:

- To remove a command from a statement, enter **no**, followed by the command to be removed.
- To remove a statement, enter **no**, followed by the route map with the filter type and the sequence number of the statement to be removed.
- To remove a route map, enter **no** followed by the route map without a sequence number.

13.4.6.3 Using Route Maps

Protocol redistribution commands include a route map parameter that determines the routes to be redistributed into the specified protocol domain.

Example

This command uses **Map1** route map to select OSPFv2 routes for redistribution into BGP AS1.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute ospf route-map Map1
switch(config-router-bgp)# exit
switch(config)#
```

13.4.7 Prefix Lists

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), an address space identifier (IPv4 subnet address or IPv6 prefix), and a sequence number.

Prefix lists are referenced by route map match commands when filtering routes for redistribution.

- [Prefix List Configuration](#) describes the prefix list configuration process.
- [Using Prefix Lists](#) describes the use of prefix lists.
- [Static Routes Redistribution into IGPs](#) describes redistribution of routes whose configured next-hops satisfy the route-map policy.

13.4.7.1 Prefix List Configuration

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), a network address (IPv4 subnet or IPv6 prefix), and a sequence number. A rule may also include an alternate mask size.

The switch supports IPv4 and IPv6 prefix lists. The switch is placed in a Prefix-list configuration mode to create and edit IPv4 or IPv6 prefix lists.

13.4.7.1.1 IPv4 Prefix Lists

IPv4 prefix lists are created or modified by adding an IPv4 prefix list rule in the Prefix-list configuration mode. Each rule includes the name of a prefix list, in addition to the sequence number, network address, and filter action. A list consists of all rules that have the same prefix list name.

The `ip prefix-list` command creates a prefix list or adds a rule to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

Creating an IPv4 Prefix List

To create an IPv4 prefix list, enter the `ip prefix-list` command, followed by the name of the list. The switch enters **IPv4 prefix-list** configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Examples

- This command places the switch in **IPv4 prefix list** configuration mode to create an IPv4 prefix list named `route-one`.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named **route-one**.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)# seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)# seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)# seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)# seq 40 deny 1.1.1.0/24
```

To view the list, save the rules by exiting the **Prefix-list** command mode, then re-enter the configuration mode and type `show active`.

```
switch(config-ip-pfx)# exit
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)# show active
ip prefix-list route-one
  seq 10 deny 10.1.1.0/24
```

```
seq 20 deny 10.1.0.0/16
seq 30 permit 12.15.4.9/32
seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)# ip prefix-list route-one
```

IPv4 prefix lists are referenced in [match \(route-map\)](#) command.

13.4.7.1.2 IPv6 Prefix Lists

Creating an IPv6 Prefix List

The switch provides **IPv6 prefix-list** configuration mode for creating and modifying IPv6 prefix lists. A list can be edited only in the mode where it was created.

To create an IP ACL, enter the [ipv6 prefix-list](#) command, followed by the name of the list. The switch enters **IPv6 prefix-list** configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

Example

This command places the switch in **IPv6 prefix list** configuration mode to create an IPv6 prefix list named **map1**.

```
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)#
```

Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in **Prefix-List** configuration mode for the list. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

Example

These commands enter the first two rules into a new prefix list.

```
switch(config-ipv6-pfx)# permit 3:4e96:8ca1:33cf::/64
switch(config-ipv6-pfx)# permit 3:11b1:8fe4:1aac::/64
```

To view the list, save the rules by exiting the **prefix-list** command mode, then re-enter the configuration mode and type **show active**.

```
switch(config-ipv6-pfx)# exit
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)# show active
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
switch(config-ipv6-pfx)#
```

This command appends a rule to the end of the prefix list. The new rule's sequence number is **30**.

```
switch(config-ipv6-pfx)# permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)# exit
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)# show active
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:1141:ab34::/64
```

```
switch(config-ipv6-pfx)#
```

Inserting a Rule

To insert a rule into a prefix list, use the [seq \(IPv6 Prefix Lists\)](#) command to enter a rule with a sequence number that is between numbers of two existing rules.

Example

This command inserts a rule between the first two rules by assigning it the sequence number **15**.

```
switch(config-ipv6-pfx)# seq 15 deny 3:4400::/64
switch(config-ipv6-pfx)# exit
switch(config)# show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

Deleting a Rule

To remove a rule from the configuration mode prefix list, enter **no seq** (see [seq \(IPv6 Prefix Lists\)](#)), followed by the sequence number of the rule to be removed.

Example

These commands remove rule 20 from the prefix list, then displays the resultant prefix list.

```
switch(config-ipv6-pfx)# no seq 20
switch(config-ipv6-pfx)# exit
switch(config)# show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

13.4.7.2 Using Prefix Lists

Route map match commands include an option that matches a specified prefix list.

Example

The **MAP_1** route map uses a match command that references the **PL_1** prefix list.

```
switch(config)# route-map MAP_1 permit
switch(config-route-map-MAP_1)# match ip address prefix-list PL_1
switch(config-route-map-MAP_1)# set community 500
switch(config-route-map-MAP_1)# exit
```

13.4.7.3 Static Routes Redistribution into IGP

Use **match ip next-hop** route-map, while redistributing static routes into IGP to redistribute the static routes whose **configured** next-hops satisfies the route-map policy.

The following example applies **match ip next-hop** clause for static routes redistributed into IGP for multi-agent mode as well. The following configures a static route.

```
switch(config)# ip route 10.20.30.0/24 1.2.3.4
```

The following configures a prefix-list.

```
switch (config)# ip prefix-list prefixListName  
switch(config-ip-pfx)# permit 1.2.3.4/32
```

1.2.3.4 is a **configured** next-hop for static route **10.20.30.0/24**.

The following configures a route map.

```
switch(config)# route-map routeMapName  
switch(config-route-map-routeMapName)# match ip next-hop prefix-list prefixListName
```

To redistribute static routes with 'match ip next-hop' route-map clause in IS-IS.

```
switch(config-router-isis)# redistribute static route-map routeMapName
```

Redistributed routes can be seen using the following show commands. If routes are redistributed into IS-IS then **show isis database detail** If routes are redistributed into OSPFv2 then **show ip ospf database detail**.

```
switch# show ip route  
  
VRF: default  
Codes: C - connected, S - static, K - kernel,  
        O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,  
        E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,  
        N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E - eBGP,  
        R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,  
        O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,  
        NG - Nexthop Group Static Route, V - VXLAN Control Service,  
        DH - DHCP client installed default route, M - Martian,  
        DP - Dynamic Policy Route, L - VRF Leaked  
  
Gateway of last resort is not set  
  
...  
I L2      10.20.30.0/24 [115/10] via 1.2.3.4, Ethernet1  
  
switch# show isis database detail  
  
IS-IS Instance: B VRF: default  
IS-IS Level 1 Link State Database

```

13.4.8 Port ACLs with User-Defined Fields

Describes the support for specifying User-Defined Fields (UDF) in Port ACLs including IPv4, IPv6, and MAC ACLs. The purpose of the User-Defined Fields feature is to permit or deny packets based on custom offset pattern matching.

User-Defined Fields, or UDFs, are defined as part of an access-list filter and are comprised of an offset, length, pattern match and mask. This describes a single portion of any incoming packet to match the provided value upon.

UDFs may also be defined via aliases. Aliases are a way to save a UDF configuration for reuse in multiple access-lists and or access-list rules. An alias may substitute for a fully defined UDF including the offset, pattern and mask. The pattern or mask may be overridden when the alias is used in an access-list rule.

The behavior, CLI syntax and configuration of UDFs are identical to Traffic Steering UDF and Mirroring ACL UDF.

This section describes port ACLs with user-defined fields, including configuration instructions. Topics covered by this section include:

- [Configuring Port ACLs with User-Defined Fields](#)
- [Port ACLs with User-Defined Fields Limitations](#)

13.4.8.1 Configuring Port ACLs with User-Defined Fields

User-Defined Fields are specified as part of an access-list. The type of access-list however, dictates the base position of the UDF and the options available. In addition, a TCAM profile must be configured to include UDFs as part of the Port ACL feature's key.

13.4.8.1.1 TCAM Profile

User-Defined Fields are defined as additional fields in the Port ACL feature's key. By default, UDFs are not included in the keys for the Port ACL features. Adding a UDF to the key requires removal of different key fields to fit within the TCAM width restrictions.

Note: Each UDF is either 16 bits wide or 32 bits wide.

Below are example configurations of the TCAM profile.

13.4.8.1.1.1 IPv4 Port ACL

The following configurations create a new profile based on the default profile. This new profile replaces the Layer 4 port key fields with one 16-bit UDF and one 32-bit UDF.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile ipv4Udf copy default
switch(config-hw-tcam-profile-ipv4Udf)# feature acl port ip
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# no key field 14-ops
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# no key field 14-src-port
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# no key field 14-dst-port
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# key field udf-16b-1
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# key field udf-32b-1
switch(config-hw-tcam-profile-ipv4Udf-feature-acl-port-ip)# exit
switch(config-hw-tcam-profile-ipv4Udf)# exit
switch(config-hw-tcam)# system profile ipv4Udf
```

Example-16-bit IPv4 Header Match

The following configurations match IPv4 packets based on the Identification(ID) field. Packets ingressing into **interface ethernet 7** with an ID equal to **1000** is forwarded. Packets with an ID different than **1000** is dropped.

```
(config)# ip access-list udfAcl
(config-acl-udfAcl)# permit ip any any payload header start offset 1 pattern 0x03E80000 mask
0x0000FFFF
(config-acl-udfAcl)# deny ip any any
(config-acl-udfAcl)# exit
```

```
(config)# interface ethernet 7
(config-if-Et7)#
```

13.4.8.1.1.2IPv6 Port ACL

The following configurations create a new profile based on the default profile. This new profile replaces the destination IPv6 address key field with two 32-bit UDFs.

```
switch(config)# hardware tcam
switch(config-hw-tcam)# profile ipv6Udf copy default
switch(config-hw-tcam-profile-ipv6Udf)# feature acl port ipv6
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# no key field dst-ipv6
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# key field udf-32b-1
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# key field udf-32b-2
switch(config-hw-tcam-profile-ipv6Udf-feature-acl-port-ipv6)# exit
switch(config-hw-tcam-profile-ipv6Udf)# exit
switch(config-hw-tcam)# system profile ipv6Udf
```

Example-32-bit IPv6 Payload Match

The following configurations match IPv6 UDP packets based on the first 32 bits of the packet payload. UDP packets ingressing into **interface ethernet 7** that starts with **0x1234567X** (where X can be any valid hexadecimal) in the payload are forwarded. Any other packets are dropped. The offset is set to 2 (2 x 4-byte words) to skip the UDP header.

```
(config)# ipv6 access-list udfAcl
(config-ipv6-acl-udfAcl)# permit udp any any payload offset 2 pattern 0x12345670 mask 0x0000000f
(config-ipv6-acl-udfAcl)# deny ipv6 any any
(config-ipv6-acl-udfAcl)# exit
(config)# interface ethernet 7
(config-if-Et7)# ipv6 access-group udfAcl in
```

13.4.8.2 Port ACLs with User-Defined Fields Limitations

User-defined fields consume a limited set of copy resources. For each unique offset, if a pattern is specified that is masked to be > 16 bits wide, then a 32-bit resource is used. If no 32-bit resource is available, then two 16-bit resources are used, if available. Copy resources are dependent upon the number of UDF key fields added to the feature key. Each UDF key field maps to one copy resource. Using the above TCAM profile configurations:

- IPv4: 1 x 16-bit pattern + 1 x 32-bit pattern.
- IPv6: 2 x 32-bit pattern.
- MAC: 1 x 16-bit pattern + 1 x 32-bit pattern.

Other limitations include:

- Maximum offset value is **31**, which is 31 4-byte words, or 124 bytes.
- UDFs only work on ingress Port ACLs.

13.4.9 ACL, Route Map, and Prefix List Commands

This section describes CLI commands that this chapter references.

ACL Creation and Access Commands

- [hardware access-list resource sharing vlan in](#)
- [hardware access-list resource sharing vlan ipv4 out](#)
- [ip access-list](#)
- [ip access-list standard](#)
- [ipv6 access-list](#)
- [ipv6 access-list standard](#)
- [mac access-list](#)
- [system profile](#)

ACL Implementation Commands

- [ip access-group](#)
- [ipv6 access-group](#)
- [mac access-group](#)

Service ACL Implementation Commands

- [ip access-group \(Service ACLs\)](#)
- [ipv6 access-group \(Service ACLs\)](#)

ACL Edit Commands

- [counters per-entry \(ACL configuration modes\)](#)
- [hardware access-list update default-result permit](#)
- [no <sequence number> \(ACLs\)](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

ACL Rule Commands

- [deny \(IPv4 ACL\)](#)
- [deny \(IPv6 ACL\)](#)
- [deny \(MAC ACL\)](#)
- [deny \(Standard IPv4 ACL\)](#)
- [deny \(Standard IPv6 ACL\)](#)
- [permit \(IPv4 ACL\)](#)
- [permit \(IPv6 ACL\)](#)
- [permit \(MAC ACL\)](#)
- [permit \(Standard IPv4 ACL\)](#)
- [permit \(Standard IPv6 ACL\)](#)
- [remark](#)

ACL List Counter Commands

- [clear ip access-lists counters](#)
- [clear ipv6 access-lists counters](#)

-
- [hardware counter feature acl out](#)

ACL Display Commands

- [show access-lists](#)
- [show ip access-lists](#)
- [show ipv6 access-lists](#)
- [show mac access-lists](#)

Prefix List Creation and Access Commands

- [ip prefix-list](#)
- [ipv6 prefix-list](#)

Prefix List Edit Commands

- [deny \(IPv6 Prefix List\)](#)
- [permit \(IPv6 Prefix List\)](#)
- [seq \(IPv6 Prefix Lists\)](#)

Prefix List Display Commands

- [show hardware tcam profile](#)
- [show ip prefix-list](#)
- [show ipv6 prefix-list](#)
- [show platform arad acl tcam](#)
- [show platform arad acl tcam summary](#)
- [show platform arad mapping](#)
- [show platform fap acl](#)
- [show platform fap acl tcam](#)
- [show platform fap acl tcam hw](#)
- [show platform fap acl tcam summary](#)
- [show platform trident tcam](#)

Route Map Creation and Access Command

- [route-map](#)

Route Map Edit Commands

- [continue \(route map\)](#)
- [description \(route map\)](#)
- [match \(route-map\)](#)
- [set \(route-map\)](#)
- [set as-path prepend](#)
- [set as-path match](#)
- [set community \(route-map\)](#)
- [set extcommunity \(route-map\)](#)

Route Map Display Commands

- [show route-map](#)

13.4.9.1 clear ip access-lists counters

The **clear ip access-lists counters** command sets ACL counters to zero for the specified IPv4 Access Control List (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip access-lists counters [ACL_NAME][SCOPE]
```

Parameters

- **ACL_NAME** Name of ACL. Options include:
 - **no parameter** all ACLs.
 - **access_list** name of ACL.
- **SCOPE** Session affected by command. Options include:
 - **no parameter** command affects counters on all CLI sessions.
 - **session** affects only current CLI session.

Example

This command resets all IPv4 ACL counters.

```
switch(config)# clear ip access-lists counters  
switch(config)#
```

13.4.9.2 clear ipv6 access-lists counters

The **clear ipv6 access-lists counters** command sets ACL counters to zero for the specified IPv6 Access Control List (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

Command Mode

Privileged EXEC

Command Syntax

```
clear ipv6 access-lists counters [ACL_NAME][SCOPE]
```

Parameters

- **ACL_NAME** name of ACL. Options include:
 - **no parameter** all IPv6 ACLs.
 - **access_list** name of IPv6 ACL.
- **SCOPE** Session affected by command. Options include:
 - **no parameter** command affects counters on all CLI sessions.
 - **session** affects only current CLI session.

Example

This command resets all IPv6 ACL counters.

```
switch(config)# clear ipv6 access-lists counters  
switch(config)#
```

13.4.9.3 continue (route map)

The **continue** command creates a route map statement entry that enables additional route map evaluation of routes whose parameters meet the statement's matching criteria.

A statement typically contains a **match (route-map)** and a **set (route-map)** command. The evaluation of routes whose settings are the same as **match** command parameters normally ends and the statement's **set** commands are applied to the route. Routes that match a statement containing a **continue** command are evaluated against the statement specified by the continue command.

When a route matches multiple route map commands, the filter action (**deny** or **permit**) is determined by the last statement that the route matches. The **set** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statement containing them.

The **no continue** and **default continue** commands remove the corresponding **continue** command from the configuration mode *route map* statement by deleting the corresponding command from **running-config**.

Command Mode

Route-Map Configuration

Command Syntax

```
continue NEXT_SEQ
no continue NEXT_SEQ
default continue NEXT_SEQ
```

Parameters

NEXT_SEQ Specifies next statement for evaluating matching routes. Options include:

- **no parameter** Next statement in the route map, as determined by sequence number.
- **seq_number** Specifies the number of the next statement. Values range from **1** to **16777215**.

Restrictions

A **continue** command cannot specify a sequence number smaller than the sequence number of its route map statement.

Related Command

route-map command enters **route map** configuration mode.

Example

This command creates route map **map1**, statement **40** with a match command, a set command, and a continue command. Routes that match the statement are subsequently evaluated against statement **100**. The **set local-preference** command is applied to matching routes regardless of subsequent matching operations.

```
switch(config)# route-map map1 deny 40
switch(config-route-map-map1)# match as 15
switch(config-route-map-map1)# continue 100
switch(config-route-map-map1)# set local-preference 50
switch(config-route-map-map1)#
```

13.4.9.4 counters per-entry (ACL configuration modes)

The **counters per-entry** command places the ACL in counting mode. In counting mode, the feature generally displays the number of instances in which each rule in the list matches an inbound packet and the elapsed time since the last match. However, for certain select platforms, in addition to the packet counter, ACL counters can also be enabled for byte counts when applied to data plane ACLs. A complete list of platforms that support byte count for data plane ACLs are listed below:

Note: Byte counting is supported only for data plane ACLs.

Only the below platforms support ACL byte counting

- CCS-710/720/722/755/758 series
- DCS-7010TX
- DCS-7050SX3/CX3/TX3/CX4/DX4/PX4
- DCS-7060 Series
- DCS-7300X3/7304X3/7308X3/7316/7320X/7324/7328/7358X4/7368/7388

On the FM6000 platform, this command has no effect when used in an ACL that is part of a PBR class map.

The **no counters per-entry** and **default counters per-entry** commands place the ACL in non-counting mode.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

`counters per-entry`

`no counters per-entry`

`default counters per-entry`

Examples

- This command places the **test1** ACL in counting mode.

```
switch(config)# ip access-list test1
switch(config-acl-test1)# counters per-entry
switch(config-acl-test1)#
```

- This command displays the ACL, with counter information, for an ACL in counting mode.

```
switch# show ip access-lists
IP Access List default-control-plane-acl [readonly]
counters per-entry
10 permit icmp any any
20 permit ip any any tracked [match 12041 packets, 0:00:00 ago]
30 permit ospf any any
40 permit tcp any any eq ssh telnet www snmp bgp https [match 11 packets, 1:41:07 ago]
50 permit udp any any eq bootps bootpc snmp rip [match 78 packets, 0:00:27 ago]
60 permit tcp any any eq mlag ttl eq 255
70 permit udp any any eq mlag ttl eq 255
80 permit vrrp any any
90 permit ahp any any
100 permit pim any any
```

```

110 permit igmp any any [match 14 packets, 0:23:27 ago]
120 permit tcp any any range 5900 5910
130 permit tcp any any range 50000 50100
140 permit udp any any range 51000 51100
Total rules configured: 14
    Configured on Ingress: control-plane(default VRF)
    Active on      Ingress: control-plane(default VRF)

```

- On platforms that support byte counting, Counter information will be displayed as shown below:

```

switch# show ip access-lists
IP Access List default-control-plane-acl [readonly]
    counters per-entry
    10 permit icmp any any [match 30 packets, 0:02:08 ago]
    20 permit ip any any tracked [match 97777 packets, 0:00:00 ago]
    30 permit udp any any eq bfd ttl eq 255
    40 permit udp any any eq bfd-echo ttl eq 254
    50 permit udp any any eq multihop-bfd micro-bfd sbfd
    60 permit udp any eq sbfd any eq sbfd-initiator
    70 permit ospf any any
    80 permit tcp any any eq ssh telnet www snmp bgp https msdp ldp netconf-ssh gnmi [match
72 packets, 0:00:00 ago]
    90 permit udp any any eq bootps bootpc snmp rip ntp ldp ptp-event ptp-general
    100 permit tcp any any eq mlag ttl eq 255
    110 permit udp any any eq mlag ttl eq 255
    120 permit vrrp any any
    130 permit ahp any any
    140 permit pim any any
Total rules configured: 14
    Configured on Ingress: control-plane(default VRF)
    Active on      Ingress: control-plane(default VRF)

IP Access List ipCountersTest:The ipCountersTest ACL is applied to the data plane. Hence, it
displays the byte count information as shown below:
    counters per-entry
    10 permit tcp host 10.1.1.1 range 2000 4000 host 10.2.1.1 [match 486 bytes in 3
packets, 0:00:26 ago]
    20 permit tcp host 10.1.1.1 range 14000 16000 host 10.2.1.1 [match 486 bytes in 3
packets, 0:00:18 ago]
    30 permit udp host 10.1.1.1 range 62000 64000 host 10.2.1.1 [match 450 bytes in 3
packets, 0:00:00 ago]
    40 permit tcp host 10.1.1.1 range 50000 52000 host 10.2.1.1 [match 486 bytes in 3
packets, 0:00:02 ago]
    50 permit tcp host 10.1.1.1 range 38000 40000 host 10.2.1.1 [match 486 bytes in 3
packets, 0:00:10 ago]
    60 permit tcp host 10.1.1.1 range 26000 28000 host 10.2.1.1 [match 486 bytes in 3
packets, 0:00:18 ago]
Total rules configured: 6

```

ipCountersTest ACL above is applied to the data plane. Hence, it displays the byte count information.

Note:

- ByteCounting is supported only for data plane ACLs
- Only below platforms support ACL byte counting
 - CCS-710/720/722/755/758 series
 - DCS-7010TX
 - DCS-7050SX3/CX3/TX3/CX4/DX4/PX4
 - DCS-7060 Series
 - DCS-7300X3/7304X3/7308X3/7316/7320X/7324/7328/7358X4/7368/7388

13.4.9.5 deny (IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode IPv4 Access Control List (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding **10** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

```
[SEQ_NUM] deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS]
[MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
no deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS]
[MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
default deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS]
[MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding 10 to the number of the ACL's last rule.
 - **14294967295** Number assigned to entry.
- **PROTOCOL** protocol field filter. Values include:
 - **ahp** Authentication Header Protocol (51).
 - **icmp** Internet Control Message Protocol (1).
 - **igmp** Internet Group Management Protocol (2).
 - **ip** Internet Protocol v4 (4).
 - **ospf** Open Shortest Path First (89).
 - **pim** Protocol Independent Multicast (103).
 - **tcp** Transmission Control Protocol (6).
 - **udp** User datagram protocol (17).
 - **vrrp** Virtual Router Redundancy Protocol (112).
 - **protocol_num** Integer corresponding to an IP protocol. Values range from **0** to **255**.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
 - **network_addr** Subnet address (CIDR or address-mask).
 - **any** Packets from all addresses are filtered.
 - **host ip_addr** IP address (dotted decimal notation).

Subnet addresses support discontinuous masks.
- **SOURCE_PORT** and **DEST_PORT** Source and destination port filters. Options include:
 - **any** All ports.
 - **eq port-1 port-2 ... port-n** A list of ports. Maximum list size is 10 ports.
 - **neq port-1 port-2 ... port-n** The set of all ports not listed. Maximum list size is 10 ports.

- **gt port** The set of ports with larger numbers than the listed port.
- **lt port** The set of ports with smaller numbers than the listed port.
- **range port_1 port_2** The set of ports whose numbers are between the range.
- **fragments** Filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
 - **no parameter** Rule does not use DSCP to filter packets.
 - **dscp dscp_value** Packets match if DSCP field in packet is equal to **dscp_value**.
- **TTL_FILTER** Rule filters packet by its TTL (time-to-live) value. Values include:
 - **ttl eq ttl_value** Packets match if **ttl** in packet is equal to **ttl_value**.
 - **ttl gt ttl_value** Packets match if **ttl** in packet is greater than **ttl_value**.
 - **ttl lt ttl_value** Packets match if **ttl** in packet is less than **ttl_value**.
 - **ttl neq ttl_value** Packets match if **ttl** in packet is not equal to **ttl_value**.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.
- **log** Triggers an informational log message to the console about the matching packet.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops OSPF packets from **10.10.1.1/24** to any host.

```
switch(config)# ip access-list text1
switch(config-acl-text1)# deny ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **deny** statement with the sequence number 65. The **deny** statement drops all PIM packets.

```
switch(config-acl-text1)# 65 deny pim any any
switch(config-acl-text1)#
```

13.4.9.6 deny (IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode IPv6 Access Control List (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding **10** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

IPv6-ACL Configuration

Command Syntax

```
[SEQ_NUM] deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT][FLAG] [MSG][hop][tracked]
[DSCP_FILTER] [log]
```

```
no deny PROT SRC_ADDR [SOURCE_PT] DEST_ADDR [DEST_PT][FLAG][MSG][hop][tracked]
[DSCP_FILTER][log]
```

```
default deny PROT SRC_ADDR [SOURCE_PT] DEST_ADDR [DEST_PT][FLAG][MSG] [hop][tracked]
[DSCP_FILTER][log]
```

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **PROT** Protocol field filter. Values include:
 - **icmpv6** Internet Control Message Protocol for version 6 (58).
 - **ipv6** Internet Protocol IPv6 (41).
 - **ospf** Open Shortest Path First (89).
 - **tcp** Transmission Control Protocol (6).
 - **udp** User Datagram Protocol (17).
 - **protocol_num** Integer corresponding to an IP protocol. Values range from **0** to **255**.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
 - **ipv6_prefix** IPv6 address with prefix length (CIDR notation).
 - **any** Packets from all addresses are filtered.
 - **host ipv6_addr** IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
 - **any** All ports.
 - **eq port-1 port-2 ... port-n** A list of ports. Maximum list size is 10 ports.
 - **neq port-1 port-2 ... port-n** The set of all ports not listed. Maximum list size is 10 ports.
 - **gt port** The set of ports with larger numbers than the listed port.
 - **lt port** The set of ports with smaller numbers than the listed port.
 - **range port_1 port_2** The set of ports whose numbers are between the range.
- **HOP** Filters by packet's hop-limit value. Options include:
 - **no parameter** Rule does not use hop limit to filter packets.

-
- **hop-limit eq *hop_value*** Packets match if **hop-limit** value in packet equals *hop_value*.
 - **hop-limit gt *hop_value*** Packets match if **hop-limit** in packet is greater than *hop_value*.
 - **hop-limit lt *hop_value*** Packets match if **hop-limit** in packet is less than *hop_value*.
 - **hop-limit neq *hop_value*** Packets match if **hop-limit** in packet is not equal to *hop_value*.
 - **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
 - **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
 - **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.
 - **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
 - **no parameter** Rule does not use DSCP to filter packets.
 - **dscp *dscp_value*** Packets match if DSCP field in packet is equal to *dscp_value*.
 - **log** Triggers an informational log message to the console about the matching packet.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops IPv6 packets from **3710:249a:c643:ef11::/64** to any host.

```
switch(config)# ipv6 access-list text1
switch(config-acl-text1)# deny ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```

13.4.9.7 deny (IPv6 Prefix List)

The **deny** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are denied access when they match the prefix that a **deny** statement specifies.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode prefix list. The **no seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

Command Mode

IPv6-pfx Configuration

Command Syntax

[SEQUENCE] deny *ipv6_prefix* **[MASK]**

Parameters

- **SEQUENCE** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the list's last rule.
 - **seq seq_num** Number is specified by **seq_num**. Value ranges from **0 to 65535**.
- **ipv6_prefix** IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
 - **no parameter** Exact match with the subnet mask is required.
 - **eq mask_e** Prefix length is equal to **mask_e**.
 - **ge mask_g** Range is from **mask_g** to **128**.
 - **le mask_l** Range is from **subnet** mask length to **mask_l**.
 - **ge mask_l le mask_g** Range is from **mask_g** to **mask_l**.
 - **mask_e, mask_land, and mask_g** range from **1 to 128**.
 - When **le** and **ge** are specified, **subnet** mask **mask_g mask_l**.

Example

This command appends a **deny** statement at the end of the **text1** prefix list. The **deny** statement denies redistribution of routes with the specified prefix.

```
switch(config)# ipv6 prefix-list route-five
switch(config-ipv6-pfx)# deny 3100::/64
switch(config-ipv6-pfx)#
```

13.4.9.8 deny (MAC ACL)

The **deny** command adds a deny rule to the configuration mode MAC Access Control List (ACL). Packets filtered by a deny rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

MAC-ACL Configuration

Command Syntax

```
[SEQ_NUM] deny SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
no deny SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
default deny SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
 - **mac_address mac_mask** MAC address and mask.
 - **any** Packets from all addresses are filtered.
 - **mac_address** specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
 - **mac_mask** specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
 - **0** bits require an exact match to filter.
 - **1** bits filter on any value.
- **PROTOCOL** Protocol field filter. Values include:
 - **aarp** Appletalk Address Resolution Protocol (0x80f3).
 - **appletalk** Appletalk (0x809b).
 - **arp** Address Resolution Protocol (0x806).
 - **ip** Internet Protocol Version 4 (0x800).
 - **ipx** Internet Packet Exchange (0x8137).
 - **lldp** LLDP (0x88cc).
 - **novell** Novell (0x8138).
 - **rarp** Reverse Address Resolution Protocol (0x8035).
 - **protocol_num** Integer corresponding to a MAC protocol. Values range from **0** to **65535**.
- **log** Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a permit statement at the end of the ACL. The deny statement drops all aarp packets from **10.1000.0000** through **10.1000.FFFF** to any host.

```
switch(config)# mac access-list text1
switch(config-mac-acl-text1)# deny 10.1000.0000 0.0.FFFF any aarp
```

- This command inserts a permit statement with the sequence number **25**. The deny statement drops all packets through the interface.

```
switch(config-mac-acl-text1)# 25 deny any any
```

13.4.9.9 deny (Standard IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv4 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding **10** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-ACL Configuration

Command Syntax

```
[SEQ_NUM] deny SOURCE_ADDR [log]
```

```
no deny SOURCE_ADDR [log]
```

```
default deny SOURCE_ADDR [log]
```

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
 - **network_addr** Subnet address (CIDR or address-mask).
 - **any** Packets from all addresses are filtered.
 - **host ip_addr** IP address (dotted decimal notation).
Subnet addresses support discontinuous masks.
- **log** Triggers an informational log message to the console about the matching packet.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from **10.10.1.1/24**.

```
switch(config)# ip access-list standard text1
switch(config-std-acl-text1)# deny 10.1.1.1/24
switch(config-std-acl-text1)#
```

13.4.9.10 deny (Standard IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv6 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding **10** to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-IPv6-ACL Configuration

Command Syntax

[SEQ_NUM] deny SOURCE_ADDR

no deny SOURCE_ADDR

default deny SOURCE_ADDR

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
 - **ipv6_prefix** IPv6 address with prefix length (CIDR notation).
 - **any** Packets from all addresses are filtered.
 - **host ipv6_addr** IPv6 host address.

Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from **2103::/64**.

```
switch(config)# ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)# deny 2103::/64
switch(config-std-acl-ipv6-text1)#
```

13.4.9.11 description (route map)

The **description** command adds a text string to the configuration mode route map. The string has no functional impact on the route map.

The **no description** and **default description** commands remove the text string from the configuration mode route map by deleting the corresponding **description** command from *running-config*.

Command Mode

Route-Map Configuration

Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

Parameter

label_text Character string assigned to the route map configuration.

Related Command

[route-map](#)

Example

These commands add description text to the **XYZ-1** route map.

```
switch(config)# route-map XYZ-1
switch(config-route-map-XYZ-1)# description This is the first map.
switch(config-route-map-XYZ-1)# exit
switch(config)# show route-map XYZ-1
route-map XYZ-1 permit 10
  Description:
    description This is the first map.
  Match clauses:
  Set clauses:
switch(config)#
```

13.4.9.12 hardware access-list resource sharing vlan in

The **hardware access-list resource sharing vlan in** command enables the IPv4 Ingress Sharing of hardware resources on the switch same ACL is applied on different VLANs.

The **no hardware access-list resource sharing vlan in** command disables the IPv4 Ingress Sharing of hardware resources on the switch.

Command Mode

Global Configuration

Command Syntax

```
hardware access-list resource sharing vlan in
```

```
no hardware access-list resource sharing vlan in
```

Guidelines

- This command is compatible only with the DCS-7010 and DCS-7050x series switches.
- Enabling IPv4 Ingress Sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.

Use the **show platform trident** command to verify the Ingress IPv4 Sharing information.

13.4.9.13 hardware access-list resource sharing vlan ipv4 out

The **hardware access-list resource sharing vlan ipv4 out** command enables the IPv4 Egress RACL TCAM sharing on the switch.

The **no hardware access-list resource sharing vlan ipv4 out** command disables the IPv4 Egress RACL TCAM sharing on the switch. By default, the IPv4 Egress RACL sharing is enabled on the switch.

Command Mode

Global Configuration

Command Syntax

```
hardware access-list resource sharing vlan ipv4 out
no hardware access-list resource sharing vlan ipv4 out
```

Guidelines

- This command is compatible only with the DCS-7280E and DCS-7500E series switches.
- Disabling IPv4 RACL sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.
- Enabling IPv4 RACL sharing, if previously disabled from the default configuration, requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding. Enabling IPv4 RACL sharing if uRPF is configured will disable uRPF.
- Use the **show running-config all | include sharing** command to verify whether or not sharing for egress IPv4 RACLs is enabled.

Example

This command verifies whether IPv4 RACL sharing is enabled or disabled.

```
switch# show running-config all | include sharing
hardware access-list resource sharing vlan ipv4 out
----->It returns the following output if IPv4 RACL sharing is enabled.
```

13.4.9.14 hardware access-list update default-result permit

The **hardware access-list update default-result permit** command configures the switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified. Traffic is permitted when the ACL is available for modification using one of the **ip access-list** commands, and ends when the ACL configuration mode is exited and rules are populated in hardware. This command is disabled by default.

The **no hardware access-list update default-result permit** and **default hardware access-list update default-result permit** commands restore the switch to its default state (blocking traffic during ACL modifications) by removing the corresponding **hardware access-list update default-result permit** command from the *running-config*.

Command Mode

Global Configuration

Command Syntax

```
hardware access-list update default-result permit
no hardware access-list update default-result permit
default hardware access-list update default-result permit
```

Restrictions

This command is available on the Arista 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches.

When enabled, static NAT, and ACL-based mirroring are affected during ACL updates.

Example

This command configures a 7150 series switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified.

```
switch(config)# hardware access-list update default-result permit
switch(config)#
```

13.4.9.15 hardware counter feature acl out

The **hardware counter feature acl out** command enables egress ACL hardware counters for IPv4 or IPv6, which count the number of packets hitting rules associated with egress ACLs applied to various interfaces on a switch.

The **no hardware counter feature acl out** and **default hardware counter feature acl out** commands disable or return the egress ACL hardware counters to the default state.

Command Mode

Global Configuration

Command Syntax

```
hardware counter feature acl out [OPTIONS]
```

```
no hardware counter feature acl out [OPTIONS]
```

```
default hardware counter feature acl out [OPTIONS]
```

Parameters

- **OPTIONS** ACL hardware counter options include:
 - **ipv4** Address family IPv4.
 - **ipv6** Address family IPv6.

Examples

- This command enables IPv4 egress ACL hardware counters.

```
switch(config)# hardware counter feature acl out ipv4  
switch(config)#
```

- This command disables IPv4 egress ACL hardware counters.

```
switch(config)# no hardware counter feature acl out ipv4  
switch(config)#
```

13.4.9.16 ip access-group (Service ACLs)

The **ip access-group** (Service ACLs) command configures a Service ACL to be applied by a control-plane service. The service is specified by the command mod (Service ACLs)e in which the Service ACL is applied.

The **no ip access-group** (Service ACLs) and **default ip access-group** (Service ACLs) commands remove the corresponding **ip access-group** (Service ACLs) command from *running-config*.

Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

Router-IGMP Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

Command Syntax

```
ip access-group acl_name [vrfvrf_name][in]  
no ip access-group acl_name [vrfvrf_name][in]  
default ip access-group acl_name [vrfvrf_name][in]
```

Parameters

Parameters vary by process.

- ***acl_name*** Name of the Service ACL assigned to control-plane service.
- ***vrf vrf_name*** Specifies the VRF in which the Service ACL is to be applied.
- ***in*** Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

These commands apply the Service ACL ***bgpac1*** to the BGP routing protocol in VRF ***purple***.

```
(config)# router bgp 5  
(config-router-bgp)# vrf purple  
(config-router-bgp-vrf-purple)# ip access-group bgpac1
```

For additional configuration examples, see [Configuring Service ACLs and Displaying Status and Counters](#).

13.4.9.17 ip access-group

The **ip access-group** command applies an IPv4 or standard IPv4 Access Control List (ACL) to the configuration mode interface or subinterface.

The **no ip access-group** and **default ip access-group** commands remove the corresponding **ip access-group** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip access-group list_name DIRECTION  
no ip access-group list_name DIRECTION  
default ip access-group list_name DIRECTION
```

Parameters

- ***list_name*** Name of ACL assigned to interface.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
 - **in** Inbound packets.
 - **out** Outbound packets.

Restrictions

Filtering of outbound packets by ACLs is not supported on Petra platform switches.

Filtering of outbound packets by ACLs on FM6000 switches is supported on physical interfaces only (Ethernet and port channels).

ACLs on sub-interfaces are supported on DCS-7280E, DCS-7500E, DCS-7280R, and DCS-7500R.

Example

These commands apply the IPv4 ACL named **test2** to *interface ethernet 3*.

```
switch(config)# interface ethernet 3  
switch(config-if-Et3)# ip access-group test2 in  
switch(config-if-Et3)#
```

13.4.9.18 ip access-list

The **ip access-list** command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list** and **default ip access-list** commands delete the specified IPv4 ACL.

Command Mode

Global Configuration

Command Syntax

```
ip access-list list_name
no ip access-list list_name
default ip access-list list_name
```

Parameter

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in ACL configuration mode:

- [deny](#) (IPv4 ACL)
- [no <sequence number>](#) (ACLs)
- [permit](#) (IPv4 ACL)
- [remark](#)
- [resequence](#) (ACLs)
- [show](#) (ACL configuration modes)

Related Commands:

- [ip access-list standard](#) Enters **std-acl** configuration mode for editing standard IP ACLs.
- [show ip access-lists](#) Displays IP and standard ACLs.

Examples

- This command places the switch in ACL configuration mode to modify the **filter1** IPv4 ACL.

```
switch(config)# ip access-list filter1
switch(config-acl-filter1)#
```

- This command saves changes to **filter1** ACL, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)# exit
switch(config)#
```

- This command discards changes to **filter1**, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)# abort
switch(config)#
```

13.4.9.19 ip access-list standard

The **ip access-list standard** command places the switch in std-ACL configuration mode, which is a group change mode that modifies a standard IPv4 access control list. The command specifies the name of the standard IPv4 ACL that subsequent commands modify, and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list standard** and **default ip access-list standard** commands delete the specified ACL.

Command Mode

Global Configuration

Command Syntax

```
ip access-list standard list_name
no ip access-list standard list_name
default ip access-list standard list_name
```

Parameter

list_name Name of standard ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-ACL configuration mode:

- [deny](#) (Standard IPv4 ACL)
- [no <sequence number>](#) (ACLs)
- [permit](#) (Standard IPv4 ACL)
- [remark](#)
- [resequence](#) (ACLs)
- [show](#) (ACL configuration modes)

Related Commands

- [ip access-list](#) Enters ACL configuration mode for editing IPv4 ACLs.
- [show ip access-lists](#) Displays IPv4 and standard IPv4 ACLs.

Examples

- This command places the switch in std-ACL configuration mode to modify the **filter2** IPv4 ACL.

```
switch(config)# ip access-list standard filter2
switch(config-std-acl-filter2)#
```

- This command saves changes to **filter2** ACL, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)# exit
switch(config)#
```

- This command discards changes to **filter2**, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)# abort
switch(config)#
```

13.4.9.20 ip prefix-list

The **ip prefix-list** command creates a prefix list or adds an entry to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

A prefix list comprises all prefix list entries with the same label. The sequence numbers of the rules in a prefix list specify the order that the rules are applied to a route that the match command is evaluating.

The **no ip prefix-list** and **default ip prefix-list** commands delete the specified prefix list entry by removing the corresponding **ip prefix-list** statement from *running-config*. If the **no** or **default ip prefix-list** command does not list a sequence number, the command deletes all entries of the prefix list.

Command Mode

Global Configuration

Command Syntax

```
ip prefix-list list_name [SEQUENCE] FILTER_TYPE network_addr [MASK]
```

```
no ip prefix-list list_name [SEQUENCE]
```

```
default ip prefix-list list_name [SEQUENCE]
```

Parameters

- **list_name** The label that identifies the prefix list.
- **SEQUENCE** Sequence number of the prefix list entry. Options include:
 - **no parameter** Entry's number is ten plus highest sequence number in current list.
 - **seq seq_num** Number assigned to entry. Value ranges from **0** to **65535**.
- **FILTER_TYPE** Specifies route access when it matches IP prefix list. Options include:
 - **permit** Routes are permitted access when they match the specified subnet.
 - **deny** Routes are denied access when they match the specified subnet.
- **network_addr** Subnet upon which command filters routes. Format is CIDR or address-mask.
- **MASK** Range of the prefix to be matched.
 - **no parameter** Exact match with the subnet mask is required.
 - **eq mask_e** Prefix length is equal to **mask_e**.
 - **ge mask_g** Range is from **1** to **32**.
 - **le mask_l** Range is from **subnet** mask length to **mask_l**.
 - **ge mask_l le mask_g** Range is from **mask_g** to **mask_l**.
 - **mask_e, mask_l, and mask_g** range from **1** to **32**. When **le** and **ge** are specified, **subnet mask mask_g > mask_l**.

Example

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named **route-one**.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named **route-one**.

```
switch(config)# ip prefix-list route-one
switch(config-ip-pfx)# seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)# seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)# seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)# seq 40 deny 1.1.1.0/24
```

13.4.9.21 ipv6 access-group

The **ipv6 access-group** command applies an IPv6 or standard IPv6 Access Control List (ACL) to the configuration mode interface.

The **no ipv6 access-group** and **default ipv6 access-group** commands remove the corresponding **ipv6 access-group** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 access-group list_name DIRECTION  
no ipv6 access-group list_name DIRECTION  
default ipv6 access-group list_name DIRECTION
```

Parameters

- ***list_name*** Name of ACL assigned to interface.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
 - **in** Inbound packets.
 - **out** Outbound packets.

Examples

These commands assign the IPv6 ACL named *test2* to the *interface ethernet 3*.

```
switch(config)# interface ethernet 3  
switch(config-if-Et3)# ipv6 access-group test2 in  
switch(config-if-Et3)#
```

13.4.9.22 ipv6 access-group (Service ACLs)

The **ipv6 access-group** (Service ACLs) command configures an IPv6 or standard IPv6 Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The **no ipv6 access-group** (Service ACLs) and **default ipv6 access-group** (Service ACLs) commands remove the corresponding **ipv6 access-group** (Service ACLs) command from **running-config**.

Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

Command Syntax

```
ipv6 access-group ipv6_acl_name [vrfvrf_name][in]
no ipv6 access-group [ipv6_acl_name][vrfvrf_name][in]
default ipv6 access-group ipv6_acl_name [vrf vrf_name][in]
```

Parameters

Parameters vary by process.

- **ipv6_acl_name** Name of the IPv6 Service ACL assigned to control-plane service.
- **vrf vrf_name** Specifies the VRF in which the Service ACL is to be applied.
- **in** Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

Example

These commands apply the IPv6 Service ACL **bgpac1** to the BGP routing protocol in VRF **purple**.

```
(config)# router bgp 5
(config-router-bgp)# vrf purple
(config-router-bgp-vrf-purple)# ipv6 access-group bgpac1
```

For additional configuration examples, see [Configuring Service ACLs and Displaying Status and Counters](#).

13.4.9.23 ipv6 access-list

The **ipv6 access-list** command places the switch in **IPv6-ACL** configuration mode, which is a group change mode that modifies an IPv6 access control list. The command specifies the name of the IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list** and **default ipv6 access-list** commands delete the specified IPv6 ACL.

Command Mode

Global Configuration

Command Syntax

```
ipv6 access-list list_name
no ipv6 access-list list_name
default ipv6 access-list list_name
```

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-ACL configuration mode:

- [deny \(IPv6 ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(IPv6 ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

Related Commands

- [ipv6 access-list standard](#) Enters **std-ipv6-acl** configuration mode for editing standard IPv6 ACLs.
- [show ipv6 access-lists](#) Displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in IPv6-ACL configuration mode to modify the **filter1** IPv6 ACL.

```
switch(config)# ipv6 access-list filter1
switch(config-ipv6-acl-filter1)#
```

- This command saves changes to **filter1** ACL, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)# exit
switch(config)#
```

- This command discards changes to **filter1**, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)# abort
switch(config)#
```

13.4.9.24 ipv6 access-list standard

The **ipv6 access-list standard** command places the switch in std-IPv6-ACL-configuration mode, which is a group change mode that modifies a standard IPv6 access control list. The command specifies the name of the standard IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list standard** and **default ipv6 access-list standard** commands delete the specified ACL.

Command Mode

Global Configuration

Command Syntax

```
ipv6 access-list standard list_name
no ipv6 access-list standard list_name
default ipv6 access-list standard list_name
```

Parameters

list_name Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in std-IPv6-ACL configuration mode:

- [deny](#) (Standard IPv6 ACL)
- [no <sequence number>](#) (ACLs)
- [permit](#) (Standard IPv6 ACL)
- [remark](#)
- [resequence](#) (ACLs)
- [show](#) (ACL configuration modes)

Related Commands

- [ipv6 access-list](#) Enters IPv6-ACL configuration mode for editing IPv6 ACLs.
- [show ipv6 access-lists](#) Displays IPv6 and standard IPv6 ACLs.

Examples

- This command places the switch in Std-IPv6 ACL configuration mode to modify the **filter2** ACL.

```
switch(config)# ipv6 access-list standard filter2
switch(config-std-ipv6-acl-filter2)#
```

- This command saves changes to **filter2** ACL, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)# exit
switch(config)#
```

- This command discards changes to **filter2**, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)# abort
switch(config)#
```

13.4.9.25 ipv6 prefix-list

The **ip prefix-list** command places the switch in **IPv6 prefix-list** configuration mode, which is a group change mode that modifies an IPv6 prefix list. The command specifies the name of the IPv6 prefix list that subsequent commands modify and creates a prefix list if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending prefix list changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no ipv6 prefix-list** and **default ipv6 prefix-list** commands delete the specified IPv6 prefix list.

Command Mode

Global Configuration

Command Syntax

```
ipv6 prefix-list list_name
no ipv6 prefix-list list_name
default ipv6 prefix-list list_name
```

Parameter

list_name Name of prefix list. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

Commands Available in IPv6-pfx configuration mode:

- [deny \(IPv6 Prefix List\)](#)
- [permit \(IPv6 Prefix List\)](#)
- [seq \(IPv6 Prefix Lists\)](#)

Examples

- This command places the switch in **IPv6 prefix-list** configuration mode to modify the **route-five** prefix list.

```
switch(config)# ipv6 prefix-list route-five
switch(config-ipv6-pfx)#
```

- This command saves changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)# exit
switch(config)#
```

- This command saves changes to the prefix list, then places the switch in **interface-ethernet** mode.

```
switch(config-ipv6-pfx)# interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)# abort
switch(config)#
```

13.4.9.26 mac access-group

The **mac access-group** command applies a MAC Access Control List (MAC ACL) to the configuration mode interface.

The **no mac access-group** and **default mac access-group** commands remove the specified **mac access-group** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Command Syntax

```
mac access-group list_name DIRECTION
```

```
no mac access-group list_name DIRECTION
```

```
default mac access-group list_name DIRECTION
```

Parameters

- ***list_name*** Name of MAC ACL.
- **DIRECTION** Transmission direction of packets, relative to interface. Valid options include:
 - **in** Inbound packets.
 - **out** Outbound packets.

Restrictions

Filtering of outbound packets by MAC ACLs is supported only on Helix, Trident, and Trident II platform switches.

Example

These commands assign the MAC ACL named *mtest2* to *interface ethernet 3* to filter inbound packets.

```
switch(config)# interface ethernet 3  
switch(config-if-Et3)# mac access-group mtest2 in  
switch(config-if-Et3)#
```

13.4.9.27 mac access-list

The **mac access-list** command places the switch in **MAC-ACL** configuration mode, which is a group change mode that modifies a MAC access control list. The command specifies the name of the MAC ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no mac access-list** and **default mac access-list** commands delete the specified list.

Command Mode

Global Configuration

Command Syntax

```
mac access-list list_name
no mac access-list list_name
default mac access-list list_name
```

Parameter

list_name Name of MAC ACL. Names must begin with an alphabetic character and cannot contain a space or quotation mark.

Commands Available in MAC-ACL configuration mode:

- [deny \(MAC ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(MAC ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

Examples

- This command places the switch in **MAC-ACL** configuration mode to modify the **mfilter1** MAC ACL.

```
switch(config)# mac access-list mfilter1
switch(config-mac-acl-mfilter1)#
```

- This command saves changes to **mfilter1** ACL, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)# exit
switch(config)#
```

- This command saves changes to **mfilter1** ACL, then places the switch in **interface-ethernet** mode.

```
switch(config-mac-acl-mfilter1)# interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to **mfilter1**, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)# abort
switch(config)#
```

13.4.9.28 match (route-map)

The **match** command creates a route map statement entry that specifies one route filtering command. When a statement contains multiple match commands, the permit or deny filter applies to a route only if its properties are equal to corresponding parameters in each **match** command. When a route properties do not equal the command parameters, the route is evaluated against the next statement in the route map, as determined by sequence number. If all statements fail to permit or deny the route, the route is denied.

The **no match** and **default match** commands remove the **match** command from the configuration mode route map statement by deleting the corresponding command from **running-config**.

Note: The route map configuration supports only standard ACL.

Command Mode

Route-Map Configuration

Command Syntax

match **CONDITION**

no match **CONDITION**

default match **CONDITION**

Parameters

- **CONDITION** Specifies criteria for evaluating a route. Options include:
 - **aggregate-role** Role in BGP contributor-aggregate relation. Options include:
 - **contributor** BGP aggregate's contributor.
 - **aggregate-attributes** Route map to apply against the aggregate route.
 - **as 1 to 4294967295** BGP Autonomous System number.
 - **as-path path_name** BGP Autonomous System path access list.
 - **as-path length { <= | = | => } length**
 - **<=** Length of AS path must be less than or equal to specified value.
 - **=** Length of AS path must be equal to specified value.
 - **=>** Length of AS path must be equal to or greater than specified value.
 - **length** Value for AS path length comparison (0-4000).
 - **community NAME** BGP community. Options for **NAME** include:
 - **listname** BGP community.
 - **listname exact-match** BGP community; list must match set that is present.
 - **extcommunity listname** BGP extended community. Options for **listname** include:
 - **listname** BGP community.
 - **listname exact-match** BGP community; list must match set that is present.
 - **interface INTF_NAME** Specifies an interface. Options for **INTF_NAME** include:
 - **ethernet e_num** Ethernet interface.
 - **loopback l_num** Loopback interface.
 - **port-channel p_num** Port channel interface.
 - **vlan v_num** VLAN interface.
- **invert-result** Invert sub route map result.
- **ip address LIST** IPv4 address filtered by an ACL or prefix list. **LIST** options include:

- **access-list *acl_name*** IPv4 address filtered by access control list (ACL).
- **prefix-list *plv4_name*** IPv4 address filtered by IP prefix list.
- **ip next-hop prefix-list *plv4_name*** IPv4 next-hop filtered by IP prefix list.
- **ip resolved-next-hop prefix-list *plv4_name*** IPv4 resolved nexthop filtered by IP prefix list.
- **ipv6 address prefix-list *plv6_name*** IPv6 address filtered by IPv6 prefix list.
- **ipv6 next-hop prefix-list *plv6_name*** IPv6 next-hop filtered by IPv6 prefix list.
- **ipv6 resolved-next-hop prefix-list *plv6_name*** IPv6 resolved nexthop filtered by IPv6 prefix list.
- **local-preference *1* to *4294967295*** BGP local preference metric.
- **metric *1* to *4294967295*** Route metric.
- **metric-type *OSPF_TYPE*** OSPF metric type. Options include:
 - **type-1** OSPF type 1 metric.
 - **type-2** OSPF type 2 metric.
- **source-protocol *protocol_type*** Routing protocol of route's source. Options include:
 - **bgp**
 - **connected**
 - **ospf**
 - **rip**
 - **static**
- **tag *1* to *4294967295*** Route tag.

Related Command

[route-map](#)

Examples

This command creates a **route map** match rule that filters routes from BGP **as 15**.

```
switch(config)# route-map map1
switch(config-route-map-map1)# match as 15
switch(config-route-map-map1)#
```

This command adds a **route-map** match rule that the AS path be less than or equal to 300.

```
switch(config-route-map-map1)#match as-path length <= 300
switch(config-route-map-map1)#
```

13.4.9.29 no <sequence number> (ACLs)

The **no <sequence number>** command removes the rule with the specified sequence number from the ACL. The **default <sequence number>** command also removes the specified rule.

no *line_num*

default *line_num*

Parameter

line_num Sequence number of rule to be deleted. Values range from **1 - 4294967295**.

Example

This command removes statement **30** from the list.

```
switch(config-acl-test1)# show IP Access Lists test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
Total rules configured: 5
Configured on Ingress: Et1/1
Active on      Ingress: Et1/1

switch(config-acl-test1)# no 30
switch(config-acl-test1)# show IP Access Lists
 20 permit ip any host 10.20.10.1
 40 permit ip any any
 50 remark end of list
Total rules configured: 4
Configured on Ingress: Et1/1
Active on      Ingress: Et1/1
```

13.4.9.30 permit (IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode IPv4 Access Control List (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

Command Mode

ACL Configuration

Command Syntax

```
[SEQ_NUM] permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]  
[FLAGS][MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
no permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS  
[MESSAGE] [fragments] [tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
default permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS  
[MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **PROTOCOL** Protocol field filter. Values include:
 - **ahp** Authentication Header Protocol (51).
 - **gre** Generic Routing Encapsulation.
 - **gtp** GPRS Tunneling Protocol.
 - **icmp** Internet Control Message Protocol (1).
 - **igmp** Internet Group Management Protocol (2).
 - **ip** Any Internet Protocol v4 (4).
 - **ospf** Open Shortest Path First (89).
 - **pim** Protocol Independent Multicast (103).
 - **tcp** Transmission Control Protocol (6).
 - **udp** User datagram protocol (17).
 - **vlan** Enter VLAN number and mask. VLAN value ranges from 1 to 4094; mask value ranges from 0x000-0xFFFF .
 - **vrrp** Virtual Router Redundancy Protocol (112).
 - **protocol_num** Integer corresponding to an IP protocol. Values range from **0 to 255**.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
 - **network_addr** subnet address (CIDR or address-mask).
 - **any** Packets from all addresses are filtered.
 - **host ip_addr** IP address (dotted decimal notation).

Source and destination subnet addresses support discontinuous masks.
- **SOURCE_PORT** and **DEST_PORT** Source and destination port filters. Options include:

- **any** All ports.
- **eq port-1 port-2 ... port-n** A list of ports. Maximum list size is 10 ports.
- **neq port-1 port-2 ... port-n** The set of all ports not listed. Maximum list size is 10 ports.
- **gt port** The set of ports with larger numbers than the listed port.
- **lt port** The set of ports with smaller numbers than the listed port.
- **range port_1 port_2** The set of ports whose numbers are between the range.
- **fragments** Filters packets with FO bit set (indicates a non-initial fragment packet).
- **FLAGS** Flags bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MESSAGE** Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** Rule filters packet by its DSCP value. Values include:
 - **no parameter** Rule does not use DSCP to filter packets.
 - **dscp dscp_value** Packets match if DSCP field in packet is equal to **dscp_value**.
- **TTL_FILTER** Rule filters packet by its TTL (time-to-live) value. Values include:
 - **ttl eq ttl_value** Packets match if **ttl** in packet is equal to **ttl_value**.
 - **ttl gt ttl_value** Packets match if **ttl** in packet is greater than **ttl_value**.
 - **ttl lt ttl_value** Packets match if **ttl** in packet is less than **ttl_value**.
 - **ttl neq ttl_value** Packets match if **ttl** in packet is not equal to **ttl_value**.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.
- **log** Triggers an informational log message to the console about the matching packet.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all OSPF packets from **10.10.1.1/24** to any host.

```
switch(config)# ip access-list text1
switch(config-acl-text1)# permit ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **permit** statement with the sequence number **25**. The **permit** statement passes all PIM packets through the interface.

```
switch(config-acl-text1)# 25 permit pim any any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)# ip access-list acl1
switch(config-acl-acl1)# permit vlan 1234 0x0 ip any any
```

13.4.9.31 permit (IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode IPv6 Access Control List (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

Command Mode

IPv6-ACL Configuration

Command Syntax

```
[SEQ_NUM] permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP]  
[tracked] [DSCP_FILTER] [FLOW_LABEL] [log]
```

```
no permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked]  
[DSCP_FILTER] [FLOW_LABEL] [ log]
```

```
default permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT] [FLAG] [MSG] [HOP] [tracked]  
[DSCP_FILTER] [FLOW_LABEL] [log]
```

Note: Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding 10 to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **PROT** Protocol field filter. Values include:
 - **icmpv6** Internet Control Message Protocol for v6 (58).
 - **ipv6** Internet Protocol IPv6 (41).
 - **ospf** Open Shortest Path First (89).
 - **tcp** Transmission Control Protocol (6).
 - **udp** User Datagram Protocol (17).
 - **vlan** Enter VLAN number. Value ranges from 1 to 4094.
 - **protocol_num** Integer corresponding to an IP protocol. Values range from 0 to 255.
- **SRC_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
 - **ipv6_prefix** IPv6 address with prefix length (CIDR notation).
 - **any** Packets from all addresses are filtered.
 - **host ipv6_addr** IPv6 host address.
- **SRC_PT** and **DEST_PT** Source and destination port filters. Options include:
 - **any** All ports.
 - **eq port-1 port-2 ... port-n** A list of ports. Maximum list size is 10 ports.
 - **neq port-1 port-2 ... port-n** The set of all ports not listed. Maximum list size is 10 ports.
 - **gt port** The set of ports with larger numbers than the listed port.
 - **lt port** The set of ports with smaller numbers than the listed port.
 - **range port_1 port_2** The set of ports whose numbers are in the range.
- **HOP** The rule filters by packet's hop-limit value. Options include:

- **no parameter** The rule does not use hop limit to filter packets.
- **hop-limit eq hop_value** Packets match if **hop-limit** value in packet equals **hop_value**.
- **hop-limit gt hop_value** Packets match if **hop-limit** in packet is greater than **hop_value**.
- **hop-limit lt hop_value** Packets match if **hop-limit** in packet is less than **hop_value**.
- **hop-limit neq hop_value** Packets match if **hop-limit** in packet is not equal to **hop_value**.
- **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
- **tracked** The rule filters packets in existing ICMP, UDP, or TCP connections.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP_FILTER** The rule filters packet by its DSCP value. Values include:
 - **no parameter** The rule does not use DSCP to filter packets.
 - **dscp dscp_value** Packets match if DSCP field in packet is equal to **dscp_value**.
- **FLOW_LABEL** The rule permits packets with IPv6 flow labels matching an exact value or a pattern based on a mask. Options include:
 - **no parameter** The rule does not use IPv6 flow labels to filter packets.
 - **flow-label eq ipv6_flow_label** The IPv6 flow label must exactly match **ipv6_flow_label**. Flow labels can range from 0 to 1048575.
 - **flow-label ipv6_flow_label flow_label_mask** The IPv6 flow label must match a pattern defined by **ipv6_flow_label** and **flow_label_mask**. The mask is an inverse mask. Where the mask has a 0 bit, the flow label must match the **ipv6_flow_label** value, and where the mask has a 1 bit, the corresponding bit in the flow label is ignored. For example, if **ipv6_flow_label** is 10 (0b01010 in binary) and **flow_label_mask** is 0x14 (0b10100 in binary), the rule will match flow labels described by 0b.1.10 (where "." is a wildcard and can be either 0 or 1); the flow labels that will match are 10 (0b01010), 14 (0b0110), 26 (0b11010), and 30 (0b1110). Flow labels can range from 0 to 1048575 and flow label masks can range from 0x00000 to 0xfffff.
- **log** Pass an informational log message to the console when a packet matches.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all IPv6 packets with the source address 3710:249a:c643:ef11::/64 and with any destination address.

```
switch(config)# ipv6 access-list acl1
switch(config-acl-acl1)# permit ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-acl1)# exit
switch(config)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)# ip access-list acl2
switch(config-acl-acl2)# permit ipv6 vlan 1234 0x0 ip any any
switch(config-acl-acl2)# exit
switch(config)#
```

- These commands add a rule to permit all IPv6 packets with flow label 23.

```
switch(config)# ipv6 access-list acl3
switch(config-acl-acl3)# permit ipv6 any any flow-label eq 23
switch(config-acl-acl3)# exit
switch(config)#
```

-
- These commands create a rule to permit all IPv6 packets matched by the flow label 23 and the mask 0x5678.

```
switch(config)# ipv6 access-list acl4  
switch(config-acl-acl4)# permit ipv6 any any flow-label 23 0x5678  
switch(config-acl-acl4)# exit  
switch(config)#
```

13.4.9.32 permit (IPv6 Prefix List)

The **permit** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are redistributed into the specified domain when they match the prefix that a **permit** statement specifies.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode prefix list. The **no seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

Command Mode

IPv6-pfx Configuration

Command Syntax

[SEQUENCE] **permit** *ipv6_prefix* [MASK]

Parameters

- **SEQUENCE** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding 10 to the number of the list's last rule.
 - **seq seq_num** Number is specified by **seq_num**. Value ranges from **0 to 65535**.
- **ipv6_prefix** IPv6 prefix upon which command filters routes (CIDR notation).
- **MASK** Range of the prefix to be matched.
 - **no parameter** Exact match with the subnet mask is required.
 - **eq mask_e** Prefix length is equal to **mask_e**.
 - **ge mask_g** Range is from **mask_g** to **128**.
 - **le mask_l** Range is from **subnet** mask length to **mask_l**.
 - **ge mask_l le mask_g** Range is from **mask_g** to **mask_l**.
 - **mask_e, mask_l** and **mask_g** range from **1 to 128**.
 - When **le** and **ge** are specified, the prefix list size **mask_g mask_l**.

Example

This command appends a **permit** statement at the end of the text1 prefix list. The **permit** statement allows redistribution of routes with the specified prefix.

```
switch(config)# ipv6 prefix-list route-five
switch(config-ipv6-pfx)# permit 3100::/64
switch(config-ipv6-pfx)#
```

13.4.9.33 permit (MAC ACL)

The **permit** command adds a permit rule to the configuration mode MAC access control list packets through the interface to which the list is applied. Rule filters include protocol, source, and destination.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

MAC-ACL Configuration

Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
no permit SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
default permit SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **SOURCE_ADDR** and **DEST_ADDR** Source and destination address filters. Options include:
 - **mac_address mac_mask** MAC address and mask.
 - **any** Packets from all addresses are filtered.
 - **mac_address** Specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
 - **mac_mask** Specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
 - **0** bits require an exact match to filter.
 - **1** bits filter on any value.
- **PROTOCOL** Protocol field filter. Values include:
 - **aarp** Appletalk Address Resolution Protocol (0x80f3).
 - **appletalk** Appletalk (0x809b).
 - **arp** Address Resolution Protocol (0x806).
 - **ip** Internet Protocol Version 4 (0x800).
 - **ipx** Internet Packet Exchange (0x8137).
 - **lldp** LLDP (0x88cc).
 - **novell** Novell (0x8138).
 - **rarp** Reverse Address Resolution Protocol (0x8035).
 - **protocol_num** Integer corresponding to a MAC protocol. Values range from **0** to **65535**.
- **log** Triggers an informational log message to the console about the matching packet.

Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all aarp packets from **10.1000.0000** through **10.1000.FFFF** to any host.

```
switch(config)# mac access-list text1
switch(config-mac-acl-text1)# permit 10.1000.0000 0.0.FFFF any aarp
switch(config-mac-acl-text1)#
```

- This command inserts a **permit** statement with the sequence number **25**. The **permit** statement passes all packets through the interface.

```
switch(config-mac-acl-text1)# 25 permit any any  
switch(config-mac-acl-text1)#
```

13.4.9.34 permit (Standard IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv4 Access Control List (ACL). Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding **10** to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-ACL Configuration

Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR [log]
```

```
no permit SOURCE_ADDR [log]
```

```
default permit SOURCE_ADDR [log]
```

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
 - **network_addr** Subnet address (CIDR or address-mask).
 - **any** Packets from all addresses are filtered.
 - **host ip_addr** IP address (dotted decimal notation).
Subnet addresses support discontinuous masks.
- **log** Triggers an informational log message to the console about the matching packet.
 - Valid in ACLs applied to the control plane.
 - Validity in ACLs applied to data plane varies by switch platform.

Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all packets with a source address of **10.10.1.1/24**.

```
switch(config)# ip access-list standard text1
switch(config-std-acl-text1)# permit 10.1.1.1/24
switch(config-std-acl-text1)#
```

13.4.9.35 permit (Standard IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv6 access control list. Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

Command Mode

Std-IPv6-ACL Configuration

Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR
```

```
no permit SOURCE_ADDR
```

```
default permit SOURCE_ADDR
```

Parameters

- **SEQ_NUM** Sequence number assigned to the rule. Options include:
 - **no parameter** Number is derived by adding **10** to the number of the ACL's last rule.
 - **1 - 4294967295** Number assigned to entry.
- **SOURCE_ADDR** Source address filter. Options include:
 - **ipv6_prefix** IPv6 address with prefix length (CIDR notation).
 - **any** Packets from all addresses are filtered.
 - **host ipv6_addr** IPv6 host address.

Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement drops packets with a source address of **2103::/64**.

```
switch(config)# ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)# permit 2103::/64
switch(config-std-acl-ipv6-text1)#
```

13.4.9.36 remark

The **remark** command adds a non-executable comment statement into the pending ACL. Remarks entered without a sequence number are appended to the end of the list. Remarks entered with a sequence number are inserted into the list as specified by the sequence number.

The **default remark** command removes the comment statement from the ACL.

The **no remark** command removes the comment statement from the ACL. The command can specify the remark by content or by sequence number.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

`remark text`

`line_num remark [text]`

`no remark text`

`default remark text`

Parameters

- **text** The comment text.
- **line_num** Sequence number assigned to the remark statement. Value ranges from **1 - 4294967295**.

Example

This command appends a comment to the list.

```
switch(config-acl-test1)# remark end of list
switch(config-acl-test1)# show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

13.4.9.37 resequence (ACLs)

The **resequence** command assigns sequence numbers to rules in the configuration mode ACL. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

Maximum rule sequence number is **4294967295**.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

```
resequence [start_num [inc_num]]
```

Parameters

- **start_num** Sequence number assigned to the first rule. Default is **10**.
- **inc_num** Numeric interval between consecutive rules. Default is **10**.

Example

The **resequence** command re-numbers the list, starting the first command at number **100** and incrementing subsequent lines by **20**.

```
switch(config-acl-test1)# show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
switch(config-acl-test1)# resequence 100 20
switch(config-acl-test1)# show
IP Access List test1
 100 permit ip 10.10.10.0/24 any
 120 permit ip any host 10.20.10.1
 140 deny ip host 10.10.10.1 host 10.20.10.1
 160 permit ip any any
 180 remark end of list
```

13.4.9.38 route-map

The **route-map** command places the switch in **route map** configuration mode, which is a group change mode that modifies a route map statement. The command specifies the name and number of the route map statement that subsequent commands modify and creates a route map statement if it references a nonexistent statement. All changes in a group change mode edit session are pending until the end of the session.

Route maps define commands for redistributing routes between routing protocols. A route map statement is identified by a name, filter type (**permit** or **deny**), and sequence number. Statements with the same name are components of a single route map; the sequence number determines the order in which the statements are compared to a route.

The **exit** command saves pending route map statement changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no route-map** and **default route-map** commands delete the specified route map statement from **running-config**.

Note: The route map configuration supports only standard ACL.

Command Mode

Global Configuration

Command Syntax

```
route-map map_name [FILTER_TYPE] [sequence_number]
no route-map map_name [FILTER_TYPE] [sequence_number]
default route-map map_name [FILTER_TYPE][sequence_number]
```

Parameters

- **map_name** Label assigned to route map. Protocols reference this label to access the route map.
- **FILTER_TYPE** Disposition of routes matching commands specified by route map statement.
 - **permit** Routes are redistributed when they match route map statement.
 - **deny** Routes are not redistributed when they match route map statement.
 - **no parameter** Assigns **permit** as the **FILTER_TYPE**.

When a route does not match the route map criteria, the next statement within the route map is evaluated to determine the redistribution action for the route.

- **sequence_number** The route map position relative to other statements with the same name.
 - **no parameter** Sequence number of 10 (default) is assigned to the route map.
 - **1-16777215** Specifies sequence number assigned to route map.

Commands Available in route map configuration mode:

- [continue \(route map\)](#)
- [match \(route-map\)](#)
- [set \(route-map\)](#)

Examples

- This command creates the route map named **map1** and places the switch in route map configuration mode. The route map is configured as a permit map.

```
switch(config)# route-map map1 permit 20  
switch(config-route-map-map1)#
```

- This command saves changes to **map1** route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1)# exit  
switch(config)#
```

- This command saves changes to **map1** route map, then places the switch in interface-Ethernet mode.

```
switch(config-route-map-map1)# interface ethernet 3  
switch(config-if-Et3)#
```

- This command discards changes to **map1** route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1)# abort  
switch(config)#
```

13.4.9.39 seq (IPv6 Prefix Lists)

The **no seq** command removes the rule with the specified sequence number from the ACL. The **default seq** command also removes the specified rule.

The **seq** keyword is a command option used at the beginning of [deny \(IPv6 Prefix List\)](#) and [permit \(IPv6 Prefix List\)](#) commands that places a new rule between two existing rules.

Command Mode

IPv6-pfx Configuration

Command Syntax

```
no seq line_num
```

```
default seq line_num
```

Parameter

line_num Sequence number of rule to be deleted. Valid rule numbers range from **0** to **65535**.

Example

These commands remove rule **20** from the **map1** prefix list, then displays the resultant list.

```
switch(config)# ipv6 prefix-list map1
switch(config-ipv6-pfx)# no seq 20
switch(config-ipv6-pfx)# exit
switch(config)# show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch(config)#
```

13.4.9.40 set (route-map)

The **set** command specifies modifications to routes that are selected for redistribution by the configuration mode route map.

The **no set** and **default set** commands remove the specified **set** command from the configuration mode route map statement by deleting the corresponding **set** command from *running-config*.

Command Mode

Route-Map Configuration

Command Syntax

set **CONDITION**

no set **CONDITION**

default set **CONDITION**

Parameters

- **CONDITION** Specifies the route modification parameter and value. Options include:
 - **as-path prepend** BGP AS number that is prepended to as-path. For details, see the [set as-path prepend](#) command.
 - **1 - 4294967295** BGP AS number to prepend.
 - **auto** Use peer AS number for inbound and local AS for outbound to prepend.
 - **distance 1 - 255** Protocol independent administrative distance.
 - **ip next-hop ipv4_address** Next hop IPv4 address.
 - **ip next-hop peer-address** Use BGP peering address as next hop IPv4 address.
 - **ipv6 next-hop ipv6_address** Next hop IPv6 address.
 - **ipv6 next-hop peer-address** Use BGP peering address as next hop IPv6 address.
 - **local-preference 1 - 4294967295** BGP local preference metric.
 - **metric 1 - 4294967295** Route metric.
 - **metric + 1 - 4294967295** Add specified value to current route metric.
 - **metric - 1 - 4294967295** Subtract specified value to current route metric.
 - **metric-type OSPF_TYPE** OSPF metric type. Options include:
 - **type-1** OSPF type 1 metric.
 - **type-2** OSPF type 2 metric.
 - **origin O_TYPE** BGP origin attribute. Options for **O_TYPE** include:
 - **egp** Exterior BGP route.
 - **igp** Interior BGP route.
 - **incomplete** BGP route of unknown origin.
 - **tag 1 - 4294967295** Route tag.
 - **weight 1 - 65535** BGP weight parameter.

Related Commands

- [route-map](#) enters *route-map* configuration mode.
- [set \(route-map\)](#) specifies community modifications for the redistributed routes.
- [set community \(route-map\)](#) specifies extended community modifications for the redistributed routes.

Example

This command creates a route map entry that sets the local preference metric to **100** on redistributed routes.

```
switch(config)# route-map map1  
switch(config-route-map-map1)# set local-preference 100  
switch(config-route-map-map1)#
```

13.4.9.41 set as-path match

The **set as-path match** command configures the **AS_PATH** attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor in the route map configuration mode.

The **no set as-path match** command removes the AS path specified for the BGP prefix.

Command Mode

Route-Map Configuration

Command Syntax

```
set as-path match all replacement [[none | auto] as_path]
```

```
no set as-path match all replacement [[none | auto] as_path]
```

Parameters

- **none** Replaces the **AS-Path** of the matching routes with a null or an empty **AS-Path**.
- **auto** If the specific route map is applied as an inbound policy to a corresponding BGP neighbor statement, then replace the **AS_PATH** of the prefixes received from this neighbor with the neighbor's AS number. If this route map is applied as an outbound policy to a corresponding neighbor statement, then replace the **AS_PATH** of the prefixes advertised to this neighbor with the locally configured AS number.
- **as_path** Replaces the AS-Path of the matching routes with an arbitrary **AS-Path**.

Examples

- This command replaces the AS-Path with the **none** option.

```
switch# show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200

* > 202.202.1.0/24 80.80.1.1 - - - 200 200 500 600 i
```

The AS-Path of matching prefixes are replaced with the locally configured AS **200** and **500 600**.

13.4.9.42 set as-path prepend

The **set as-path prepend** command adds a **set** statement to a route map to prepend one or more Autonomous System (AS) numbers to the **AS_PATH** attribute of a BGP route.

The **no set as-path prepend** and **default set as-path prepend** commands remove the specified set statements from the route map and update all corresponding routes.

Command Mode

Route-Map Configuration

Command Syntax

```
set as-path prepend {{auto | as_number... [auto | as_number]}} | last-as count}
no set as-path prepend {{auto | as_number... [auto | as_number]}} | last-as count}
default set as-path prepend {{auto | as_number... [auto | as_number]}} | last-as count}
```

Parameters

- **auto** Prepends the peer AS number for peer inbound route maps and the local AS number for peer outbound route maps.
- **as_number** Prepends the specified AS number. Can be entered in plain notation (values range from **1-4294967295**) or in asdot notation as described in RFC 5396. In asdot notation, AS numbers from **1-65535** are entered in plain notation, and AS numbers from **65536 to 4294967295** are entered as two values separated by a dot. The first value is high-order and represents a multiple of **65536**; the second value is low-order and represents a decimal integer. For example, AS number **65552** can be entered as either **65552** or 1.16 (i.e., 1*65536+16). However they are entered, AS numbers are stored internally in plain decimal notation and will appear that way in **show** outputs.
- **last-as count** Prepends the last AS number in the AS path *count* times. Values range from **1 to 15**. This is mutually exclusive with the use of the **auto** keyword or the entry of one or more specified AS numbers, and is not supported in multi-agent mode.

Examples

- These commands create a route-map entry that prepends AS number **64496** and prepends either the peer or local AS number twice.

```
switch(config)# route-map map1
switch(config-route-map-map1)# set as-path prepend 64496 auto auto
switch(config-route-map-map1)# exit

switch(config)# show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 auto auto
switch(config)#
```

- The commands create a route-map entry that prepends AS numbers **64496**, **64498**, and **65552**.

```
switch(config)# route-map map2
switch(config-route-map-map2)# set as-path prepend 64496 64498 1.16
switch(config-route-map-map2)# exit

switch(config)# show route-map map2
route-map map2 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 64498 65552
```

```
switch(config)#
```

- These commands create a route map entry that prepends the last AS number **12** times.

```
switch(config)# route-map map3
switch(config-route-map-map3)# set as-path prepend last-as 12
switch(config-route-map-map3)# exit

switch(config)# show route-map map3
route-map map3 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
switch(config)#
```

13.4.9.43 set community (route-map)

The **set community** command specifies community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **set community none** command removes community attributes from the route.

The **no set community** and **default set community** commands remove the specified community from the configuration mode route map statement by deleting the corresponding statement from the **running config**.

Command Mode

Route-Map Configuration

Command Syntax

```
set community [GSHUT | aa:nn | community-list | internet | local-as | no-advertise | no-export | none | number]
```

```
no set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]
```

```
default set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]
```

Parameters

- **GSHUT** Configures a graceful shutdown in BGP.
- **aa:nn** Configures the community AS and network number, separated by colon. Value ranges from **0:0** to **65535:65535**.
- **community-list** A label for community list.
- **internet** Advertises route to the Internet community.
- **local-as** Advertises route only to local peers.
- **no-advertise** Does not advertise route to any peer.
- **no-export** Advertises route only within BGP AS boundary.
- **none** Does not provide any community attributes.
- **number** Configures the community number. Value ranges from **1** to **4294967040**.
- **additive** Adds specified attributes to the current community.
- **delete** Removes specified attributes from the current community.

Related Commands

- [ip community-list](#)
- [route-map](#)
- [set \(route-map\)](#)
- [set community \(route-map\)](#)

Guideline

EOS does not support disabling the process of graceful shutdown community.

Example

This command advertises routes only to local peers.

```
switch(config-route-map-map1)# show active
route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345
switch(config-route-map-map1)# set community local-as
switch(config-route-map-map1)# ip community-list 345 permit 23
```

```
switch(config)# route-map map1  
switch(config-route-map-map1)# show active  
route-map map1 permit 10  
    match community instances <= 50  
    set community 0:456 0:2345 local-as  
switch(config-route-map-map1)#
```

13.4.9.44 set extcommunity (route-map)

The **set extcommunity** command specifies extended community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **set extcommunity none** command removes extended community attributes from the route.

The **no set extcommunity** and **default set extcommunity** commands remove the specified **set extcommunity** command from the configuration mode route map statement by deleting the corresponding statement from *running-config*.

Command Mode

Route-Map Configuration

Command Syntax

```
set extcommunity COND_X [COND_2][COND_N][MOD_TYPE]
set extcommunity none
no set extcommunity COND_X[COND_2][COND_N][MOD_TYPE]
no set extcommunity none
default set extcommunity COND_X [COND_2][COND_N][MOD_TYPE]
default set extcommunity none
```

Parameters

- **COND_X** Specifies extended community route map modification. Command may contain multiple attributes. Options include:
 - **rt ASN:nn** Route target attribute (AS:network number).
 - **rt IP-address:nn** Route target attribute (IP address: network number).
 - **soo ASN:nn** Site of origin attribute (AS:network number).
 - **soo IP-address:nn** Site of origin attribute (IP address: network number).
- **MOD_TYPE** Specifies route map modification method. Options include:
 - **no parameter** Command replaces existing route map with specified parameters.
 - **additive** Command adds specified parameters to existing route map.
 - **delete** Command removes specified parameters from existing route map.

Related Commands

- [route-map](#) enters route map configuration mode.
- [set \(route-map\)](#) specifies attribute modifications for the redistributed routes.

Example

This command creates a route map entry in *map1* that sets the route target extended community attribute.

```
switch(config)# route-map map1
switch(config-route-map-map1)# set extcommunity rt 10.13.2.4:100
switch(config-route-map-map1)#
```

13.4.9.45 show (ACL configuration modes)

The **show** command displays the contents of an Access Control List (ACL).

- **show** or **show pending** displays the list as modified in ACL configuration mode.
- **show active** displays the list as stored in running-config.
- **show comment** displays the comment stored with the list.
- **show diff** displays the modified and stored lists, with flags denoting the modified rules.

Exiting the ACL configuration mode stores all pending ACL changes to **running-config**.

Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

Command Syntax

`show`

`show active`

`show comment`

`show diff`

`show pending`

Examples

The examples in this section assume these ACL commands are entered as specified.

- These commands are stored in **none**:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

- The current edit session removed this command. This change is not yet stored to **none**:

```
20 permit ip any host 10.21.10.1
```

- The current edit session added these commands ACL. They are not yet stored to **none**:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)# show active
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.21.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

- This command displays the pending ACL, as modified in ACL configuration mode.

```
switch(config-acl-test_1)# show pending  
IP Access List test_1  
10 permit ip 10.10.10.0/24 any  
20 permit ip 10.10.0.0/16 any  
25 permit tcp 10.10.20.0/24 any  
30 deny ip host 10.10.10.1 host 10.20.10.1  
40 permit ip any any  
45 deny pim 239.24.124.0/24 10.5.8.4/30  
50 remark end of list
```

- This command displays the difference between the saved and modified ACLs.
 - Rules added to the pending list are denoted with a plus sign (+).
 - Rules removed from the saved list are denoted with a minus sign (-)

```
switch(config-acl-test_1)# show diff  
---  
+++

13.4.9.46 show hardware tcam profile

The **show hardware tcam profile** command displays the hardware specific information for the current operational TCAM profile in the running configuration.

This command is applicable to DCS-7280(E/R) and DCS-7500(E/R) series switches only.

Command Mode

EXEC

Command Syntax

show hardware tcam profile

Parameters

- **tcam** Specifies the TCAM information.
- **profile** Specifies the TCAM profile information.

Example

This command displays the current operational TCAM profile details.

```
switch# show hardware tcam profile
Configuration      Status
FixedSystem        default      default
```

13.4.9.47 show access-lists

The `show access-lists` command displays the contents of all the IPv4, IPv6, and MAC Access Control Lists (ACLs) on the switch in one shot, along with the configuration and status. Use the summary option to display only the configuration and status, which contains details like the name of the ACL, total rules configured, configured/active on status containing interface information, and supplicant information (in case of dynamic ACLs from dot1x sessions).

Command Mode

Privileged EXEC

Command Syntax

```
show access-lists [INTERFACE][ACL_NAME][SCOPE]
```

Parameters

- **INTERFACE** Filtering is based on interfaces like Ethernet, VLANs, and Port Channels. Selection options include:
 - no parameter All ACLs are displayed.
 - **INTERFACE ACL** is displayed attached to the given interface (if present).
- **ACL_NAME** Name of lists to be displayed. Selection options include:
 - no parameter All ACLs are displayed.
 - **ACL_NAME** Specified ACL is displayed.
- **SCOPE** Detailed or summarized information displayed. Selection options include:
 - no parameter All rules in the specified lists are displayed along with the configuration and status.
 - **summary** Only the configuration and status are displayed.

Examples

- This command displays all rules in all the ACLs (IPv4, IPv6, and MAC), along with the configuration and status.

```
switch# show access-lists

Active on      Ingress: Et11/1
Active on      Egress: Et11/1

```

- This command displays only the configuration and status of each ACL on the switch.

```
switch# show access-lists summary
Phone ACL bypass: disabled
IPv4 ACL default-control-plane-acl [readonly]
    Total rules configured: 27
    Configured on Ingress: control-plane(default VRF)
    Active on      Ingress: control-plane(default VRF)

IPv4 ACL v4Acl
    Total rules configured: 1
    Configured on Ingress: Et1/1
    Active on      Ingress: Et1/1

Standard IPv4 ACL stAcl
    Total rules configured: 1

IPv4 ACL noRulesAcl
    Total rules configured: 0
    Configured on Ingress: Et2/1
    Active on      Ingress: Et2/1

IPv6 ACL default-control-plane-acl [readonly]
    Total rules configured: 27
    Configured on Ingress: control-plane(default VRF)
    Active on      Ingress: control-plane(default VRF)

IPv6 ACL v6Acl
    Total rules configured: 3
    Configured on Ingress: Et1/1
    Active on      Ingress: Et1/1

MAC ACL mlist
    Total rules configured: 1
    Configured on Ingress: Et11/1
    Configured on Egress: Et11/1
    Active on      Ingress: Et11/1
    Active on      Egress: Et11/1
```

- This command displays all rules in list2 ACL along with the configuration and status.

```
switch# show access-list list2
IP Access List list2
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1

    Total rules configured: 3
    Configured on Ingress: Et1/1
    Active on      Ingress: Et1/1

IPv6 Access List list2
    10 permit ipv6 3891:3c58:6300::/64 any
    20 permit ipv6 any host 2fe1:b468:24a::
    30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de::

    Total rules configured: 3
    Configured on Ingress: Et2/1
    Active on      Ingress: Et2/1 switch#
```

The above output displayed two ACLs as the switch had IPv4 and IPv6 ACLs with the same name (list2).

- This command displays all rules in list2 ACL on the interface Ethernet 1/1 along with the configuration and status.

```
switch# show access-list list2 interface Ethernet 1/1
IP Access List list2
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1

    Total rules configured: 3
    Configured on Ingress: Et1/1
    Active on      Ingress: Et1/1 switch#
```

Use the above command with summary to just display the configuration and status.

13.4.9.48 show ip access-lists

The **show ip access-lists** command displays the contents of IPv4 and standard IPv4 Access Control List (ACLs) on the switch, along with the configuration and status. Use the summary option to display only the configuration and status, which contains details like the name of the ACL, total rules configured, configured/active on status containing interface information, and supplicant information (in case of dynamic ACLs from dot1x sessions).

Command Mode

Privileged EXEC

Command Syntax

```
show ip access-lists [INTERFACE][ACL_NAME][SCOPE]
```

Parameters

- **INTERFACE** Filtering is based on interfaces like Ethernet, VLANs, and Port Channels. Selection options include:
 - **no parameter** All IPv4 ACLs are displayed.
 - **INTERFACE** IPv4 ACL is displayed on the given interface (if present).
- **ACL_NAME** Name of lists to be displayed. Selection options include:
 - **no parameter** All IPv4 ACLs are displayed.
 - **ACL_NAME** Specified IPv4 ACL is displayed.
- **SCOPE** Detailed or summarized information displayed. Selection options include:
 - **no parameter** All rules in the specified lists are displayed along with the configuration and status.
 - **summary** Only the configuration and status are displayed.

Examples

- This command displays all rules in list2 IPv4 ACL, configuration, and status.

```
switch# show ip access-lists list2
IP Access List list2
  10 permit ip 10.10.10.0/24 any
  20 permit ip any host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
Total rules configured: 3
  Configured on Ingress: Et1/1
  Active on      Ingress: Et1/1 switch#
```

The above output can also be displayed with the help of the **show ip access-lists interface Ethernet 1/1** command since the ACL list2 is applied to the Ethernet 1/1 interface.

- This command displays the name of, and number of rules in, each list on the switch.

```
switch# show ip access-lists summary
IPV4 ACL default-control-plane-acl
  Total rules configured: 12
  Configured on: control-plane
  Active on      : control-plane

IPV4 ACL list2
  Total rules configured: 3
IPV4 ACL test1
  Total rules configured: 6
Standard IPV4 ACL test_1
  Total rules configured: 1
IPV4 ACL test_3
```

```
Total rules configured: 0 switch#
```

- This command displays the summary and lists all the configured IPv4 ACLs.

```
switch # show ip access-lists summary  
IPv4 ACL default-control-plane-acl [readonly]  
Total rules configured: 17  
Configured on Ingress: control-plane(default VRF)  
Active on Ingress: control-plane(default VRF)  
  
IPv4 ACL ipAclLimitTest  
Total rules configured: 0  
Configured on Egress: V12148,2700  
Active on Egress: V12148,2700
```

13.4.9.49 show ip prefix-list

The **show ip prefix-list** command displays all rules for the specified IPv4 prefix list. The command displays all IPv4 prefix list rules if a prefix list name is not specified.

Command Mode

EXEC

Command Syntax

```
show ip prefix-list [DISPLAY_ITEMS]
```

Parameters

DISPLAY_ITEMS Specifies the name of prefix lists for which rules are displayed. Options include:

- **no parameter** All IPv4 prefix list rules are displayed.
- **list_name** Specifies the IPv4 prefix list for which rules are displayed.

Example

This command displays all rules in the route-one IPv4 prefix list.

```
switch(config-ip-pfx)# show ip prefix-list
ip prefix-list route-one
  seq 10 deny 10.1.1.0/24
  seq 20 deny 10.1.0.0/16
  seq 30 permit 12.15.4.9/32
  seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)#
```

13.4.9.50 show ipv6 access-lists

The **show ipv6 access-lists** command displays the contents of all IPv6 Access Control Lists (ACLs) on the switch, along with the configuration and status. Use the summary option to display only the configuration and status, which contains details like the name of the ACL, total rules configured, configured/active on status containing interface information, and supplicant information (in case of dynamic ACLs from dot1x sessions).

Command Mode

Privileged EXEC

Command Syntax

```
show ipv6 access-lists [INTERFACE][ACL_NAME][SCOPE]
```

Parameters

- **INTERFACE** Filtering is based on interfaces like Ethernet, VLANs, and Port Channels. Selection options include:
 - no parameter All IPv6 ACLs are displayed.
 - **INTERFACE IPv6 ACL** attached to the given interface (if present) is displayed.
- **ACL_NAME** Name of lists to be displayed. Selection options include:
 - no parameter All IPv6 ACLs are displayed.
 - **ACL_NAME** Specified IPv6 ACL is displayed.
- **SCOPE** Detailed or summarized information displayed. Selection options include:
 - no parameter All rules in the specified lists are displayed along with the configuration and status.
 - **summary** Only the configuration and status are displayed.

Examples

- This command displays all rules in test1 IPv6 ACL.

```
switch# show ipv6 access-lists list2
IP Access List list2
  10 permit ipv6 3891:3c58:6300::/64 any
  20 permit ipv6 any host 2fe1:b468:024a::
  30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de::
Total rules configured: 3
  Configured on Ingress: Et1/1
  Active on      Ingress: Et1/1 switch#
```

The above output can also be displayed using the **show ipv6 access-lists interface Ethernet 1/1** command since the ACL list2 is applied to the Ethernet 1/1 interface.

- This command displays the name and number of rules in each list on the switch.

```
switch# show ipv6 access-lists summary
IPv6 ACL list2
  Total rules configured: 3
  Configured on Ingress: Et1/1
  Active on      Ingress: Et1/1

IPv6 ACL test1
  Total rules configured: 6

IPv6 ACL test_1
  Total rules configured: 1

Standard IPv6 ACL test_3
  Total rules configured: 0 switch#
```

13.4.9.51 show ipv6 prefix-list

The **show ipv6 prefix-list** command displays all rules for the specified IPv6 prefix list. The command displays all IPv6 prefix lists if a prefix list name is not specified.

Command Mode

EXEC

Command Syntax

```
show ipv6 prefix-list [DISPLAY_ITEMS]
```

Parameters

DISPLAY_ITEMS Specifies the name of prefix lists for which rules are displayed. Options include:

- **no parameter** All IPv6 prefix lists are displayed.
- **list_name** Specifies the IPv6 prefix list for which rules are displayed.

Examples

- This command displays all rules in the map1 IPv6 prefix list:

```
switch> show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64 switch>
```

- This command displays all prefix lists:

```
switch> show ipv6 prefix-list
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
ipv6 prefix-list FREDD
ipv6 prefix-list route-five
ipv6 prefix-list map2
seq 10 deny 10:1:1:1::/64 ge 72 le 80
seq 20 deny 10:1::/32 switch>
```

13.4.9.52 show mac access-lists

The `show mac access-lists` command displays the contents of all MAC Access Control Lists (ACLs) on the switch, along with their configuration and status. Use the **summary** option to display only the configuration and status, which contain details such as the name of the ACL, the total rules configured, and where the ACL is configured/active with a status containing specific interface information.

Command Mode

Privileged EXEC

Command Syntax

```
show mac access-lists [INTERFACE][ACL_NAME] [SCOPE]
```

Parameters

- **INTERFACE** Filtering is based on interfaces like Ethernet and Port Channels. Selection options include:
 - **no parameter** All MAC ACLs are displayed.
 - INTERFACE MAC ACL attached to given interface (if present) is displayed.
- **ACL_NAME** Name of lists to be displayed. Selection options include:
 - **no parameter** All MAC ACLs are displayed.
 - ACL_NAME Specified MAC ACL is displayed.
- **SCOPE** Detailed or summarized information displayed. Selection options include:
 - **no parameter** All rules in the specified lists are displayed along with the configuration and status.
 - **summary** Only the configuration and status is displayed.

Examples

- This command displays all rules in **mtest2** MAC ACL.

```
switch# show mac access-list mlist2
MAC Access List mlist2
  10 permit 1024.4510.F125 0.0.0 any aarp
  20 permit any 4100.4500.0000 0xFF.FFFF novell
  30 deny any any

Total rules configured: 3
Configured on Ingress: Et1/1
Active on      Ingress: Et1/1 switch#
```

The above output can also be displayed with the help of `show mac access-lists interface Ethernet 1/1` command since the ACL mlist2 is applied on Ethernet 1/1 interface.

- This command displays the number of rules in each MAC ACL on the switch.

```
switch# show mac access-list summary
MAC ACL mlist1
  Total rules configured: 6

MAC ACL mlist2
  Total rules configured: 3
  Configured on Ingress: Et1/1
  Active on      Ingress: Et1/1

MAC ACL mlist3
  Total rules configured: 1

MAC ACL mlist4
  Total rules configured: 0 switch#
```

13.4.9.53 show platform arad acl tcam summary

The **show platform arad tcam summary** command displays the percentage of TCAM utilization per forwarding ASIC.

Command Mode

EXEC

Command Syntax

show platform arad acl tcam *summary*

Parameter

summary Displays the ACL TCAM summary.

Example

This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.

=====
Arad3/0:
=====
  Bank      Used      Used %      Used By
    1         4         0      IP RACLs
Total Number of TCAM lines used is: 4

=====
Arad3/4:
=====
  Bank      Used      Used %      Used By
    1         2         0      IP RACLs
Total Number of TCAM lines used is: 2
```

13.4.9.54 show platform arad acl tcam

The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.

This command is applicable only on DCS-7500E, DCS-7280E series switches.

Command Mode

EXEC

Command Syntax

```
show platform arad acl tcam [scope]
```

Parameters

scope Specifies the information displayed. Options include:

- **detail** Displays the ACL TCAM details.
- **diff** Displays the difference between hardware and shadow.
- **hw** Displays the ACL entries from hardware.
- **shadow** Displays the ACL entries from shadow.
- **summary** Displays the ACL TCAM summary.

Examples

- This command displays the number of TCAM entries used by Arad0 ASIC. In this example, ACL is applied on two VLANs (**V12148** and **V12700**) but number of TCAM entries occupied is only one.

```
switch# show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries, direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: V12148, V12700
Bank Offset Entries
0          0          1
Fap: Arad1, Shared: true, Interfaces: V12148
Bank Offset Entries
0          0          1
```

- This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
=====
Arad0:
=====
Bank   Used           Used %           Used By
0       1               0      IP Egress PACLS/RACLs
Total Number of TCAM lines used is: 1
=====
Arad1:
=====
Bank   Used           Used %           Used By
0       1               0      IP Egress PACLS/RACLs
Total Number of TCAM lines used is: 1
```

13.4.9.55 show platform arad mapping

The `show platform arad mapping` command displays the mapping between the interfaces and the forwarding ASICs.

Command Mode

EXEC

Command Syntax

`show platform arad chip_name mapping`

Parameter

chip_name Specifies the Arad chip name.

Example

This command displays the mapping between the interfaces and the forwarding ASICs on the Arad3/0 chip.

```
switch# show platform arad arad3/0 mapping
```

Arad3/0	Port	SysPhyPort	Voq	(Fap,FapPort)	Xlge	Serdes
	Ethernet3/1/1	34	288	(0 , 2)	n/a	(20)
.....						

13.4.9.56 show platform fap acl

The **show platform fap acl** command displays the ACL information of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

```
show platform fap acl [ipkgv | l4ops | mirroring | opkgv | pmf | tcam | udf | vsicfg]
```

Parameters

- **ipkgv** Displays the ACL Ingress Interface Specification (IPKGV) information.
- **l4ops** Displays the ACL Layer 4 Options (L4OPS) information.
- **mirroring** Displays the mirroring ACL information.
- **opkgv** Displays the ACL Egress Interface Specification (OPKGV) information.
- **pmf** Displays the Pmf.
- **tcam** Displays the ACL TCAM information.
- **udf** Displays the ACL UDF information.
- **vsicfg** Displays the ACL Virtual Switch Instance (VSI) CONFIG information.

Guidelines

This command is supported on DCS-7280SE and DCS-7500E series platforms only.

Example

This command displays the brief information of all installed mirroring ACLs.

```
switch(config)# show platform fap acl mirroring

=====
Aggregate ACLs
=====

(list2:0->2) type=2; version=0
- list2 [ prio 0 ] => session 2

(list1:10->1,list3:20->3) type=0; version=13
- list3 [ prio 20 ] => session 3
- list1 [ prio 10 ] => session 1

=====
Interface-ACL Mapping
=====

Ethernet1 => (list1:10->1,list3:20->3) [ ipv4 ]
Ethernet33 => (list2:0->2) [ mac ]
```

13.4.9.57 show platform fap acl tcam

The **show platform fap tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC of Sand platform devices.

Command Mode

Privileged EXEC

Command Syntax

```
show platform fap acl tcam [detail | diff | hw | shadow | summary]
```

Parameter

- **detail** Displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.
- **diff** Displays the difference between hardware and shadow.
- **hw** Displays ACL entries from hardware.
- **shadow** Displays ACL entries from shadow.
- **summary** Displays the percentage of TCAM utilization per forwarding ASIC.

Example

This command displays the number of TCAM entries and other ACL TCAM detail.

```
switch# show platform fap acl tcam detail
ip access-list ipAcl0000 (RACL, 1 rules, 2 entries, direction in, state success)
  Shared: false
  Interface: Vlan0002
  -----
  Fap: Arad3/0
  Bank Offset Entries
  1         0         2
  Interface: Vlan0003
  -----
  Fap: Arad3/0
  Bank Offset Entries
  1         2         2
  Fap: Arad3/4
  Bank Offset Entries
  1         0         2
```

13.4.9.58 show platform fap acl tcam hw

The **show platform fap acl tcam hw** command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

Command Mode

EXEC

Command Syntax

```
show platform fap fap_name acl tcam hw
```

Parameters

- **fap_name** Specifies the switch chip-set name.
- **acl** Specifies the Arad ACL information.
- **tcam** Specifies the Arad TCAM information.
- **hw** Specifies the ACL entries for hardware.

Example

This command displays the TCAM entries configured for each TCAM bank including policy maps and corresponding traffic matches.

```
switch# show platform fap Arad1 acl tcam hw

<-----OUTPUT OMITTED FROM EXAMPLE----->
```

13.4.9.59 show platform fap acl tcam summary

The **show platform fap acl tcam summary** command displays for each forwarding ASIC, the number of TCAM entries consumed per ACL type, and in which TCAM bank the entries are installed. A mirroring ACL does not consume TCAM resources unless attached to a mirroring source interface, and a mirroring destination is configured. If the mirroring destination is a GRE tunnel, at least one nexthop entry for the tunnel destination must be resolved before a TCAM entry is installed.

Command Mode

EXEC

Command Syntax

```
show platform fap acl tcam summary
```

Example

This command displays the number of TCAM entries consumed per ACL type, the bank installed, and ASIC. Three TCAM entries are consumed across two forwarding ASICs, two for IP ACLs, and one for MAC ACLs.

```
switch# show platform fap acl tcam summary
=====
Arad0:
=====
      Bank   Used Used %    Used By
      0, 1     2     0    IP Mirroring
Total Number of TCAM lines used is: 4
=====
Arad1:
=====
      Bank   Used      Used %      Used By
      2     1         0      Mac Mirroring
```

13.4.9.60 show platform trident tcam

The **show platform trident tcam** command displays the TCAM entries configured for each TCAM group including policy maps and corresponding hits.

Command Mode

EXEC

Command Syntax

```
show platform trident tcam [acl | cpu-bound | detail | directed-broadcast | entry | mirror | pbr | pipe | qos | shared | summary]
```

Parameters

- **no parameters** Displays TCAM entries for each TCAM group.
- **acl** Displays the trident ACL information.
- **cpu-bound** Displays the trident cpu-bound information.
- **detail** Lists all TCAM entries.
- **directed-broadcast** Allows inbound broadcast IP packets with Source IP address as one of the permitted broadcast host.
- **entry** Displays the TCAM entry information.
- **mirror** Displays the trident Mirroring ACL information.
- **pbr** Displays the trident PBR ACL information.
- **pipe** Allows to specify a pipe for filtering.
- **qos** Displays the trident QOS information.
- **shared** Displays the ACL Sharing information.
- **summary** Displays the TCAM allocation information.

Guidelines

This command is applicable only on DCS-7010, DCS-7050/DCS-7050X, DCS7250X, DCS-7300X series switches.

Examples

- This command displays the Trident mirroring ACL information.

```
switch(config)# show platform trident tcam mirror
=== Mirroring ACLs on switch Linecard0/0 ===

Session: mir-sess2

ck338.22:14:38(config-pmap-qos-policy1)#
```

13.4.9.61 show route-map

The **show route-map** command displays the contents of configured route maps.

Command Mode

EXEC

Command Syntax

show route-map [*map_name*]

Parameters

- **no parameter** Displays the content of all configured route maps.
- **map_name** Displays the content of the specified route map.

Examples

- This command displays the **map1** route map.

```
switch(config)# show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
    set as-path prepend auto auto
```

- This command displays the **map** route map.

```
switch> show route-map map
route-map map permit 5
  Match clauses:
    match as 456
  Set clauses:
route-map map permit 10
  Match clauses:
match ip next-hop 2.3.4.5
  match as-path path_2
  Set clauses:
    set local-preference 100
```

13.4.9.62 system profile

The **system profile** command creates a new Ternary Content-Addressable Memory (TCAM) profile in the running configuration.

The **default system profile** and **no system profile** commands delete non-default TCAM profiles from the running configuration.

Command Mode

Hardware TCAM

Command Syntax

```
system profile [profile_name] default | mirroring-acl | pbr-match-nexthop-group | qos | tap-aggregation-  
default | tap-aggregation-extended | tc-counters]
```

```
default system profile
```

```
no system profile
```

Parameters

- **profile_name** Creates a profile with the specified name.
- **default** Creates a default profile.
- **mirroring-acl** Creates a mirroring-ACL profile.
- **pbr-match-nexthop-group** Creates a pbr-match-nexthop-group profile.
- **qos** Creates a Quality of Service (QoS) profile.
- **tap-aggregation-default** Creates a tap-aggregation-default profile.
- **tap-aggregation-extended** Creates a tap-aggregation-extended profile.
- **tc-counters** Creates a tc-counters profile.

Guideline

These commands are compatible with the DCS-7280SE and DCS-7500E series switches only.

Examples

- These commands create a mirroring-ACL profile.

```
switch(config)# hardware tcam  
switch(config-hw-tcam)# system profile mirroring-acl  
switch(config-hw-tcam)# show hardware tcam profile  
Configuration      Status  
FixedSystem        mirroring-acl    mirroring-acl  
switch(config-hw-tcam)#
```

- These commands delete non-default TCAM profiles.

```
switch(config)# hardware tcam  
switch(config-hw-tcam)# show hardware tcam profile  
Configuration      Status  
Linecard9          mirroring-acl    mirroring-acl  
Linecard8          mirroring-acl    mirroring-acl  
Linecard3          mirroring-acl    mirroring-acl  
Linecard4          mirroring-acl    mirroring-acl  
Linecard6          mirroring-acl    mirroring-acl  
switch(config-hw-tcam)# default system profile  
switch(config-hw-tcam)# show hardware tcam profile  
Configuration      Status  
Linecard9          default          default  
Linecard8          default          default  
Linecard3          default          default  
Linecard4          default          default  
Linecard6          default          default  
switch(config-hw-tcam)#
```

- These commands delete TCAM profiles.

```
switch(config-hw-tcam) # show hardware tcam profile
Configuration      Status
Linecard9          tc-counters      tc-counters
Linecard8          tc-counters      tc-counters
Linecard3          tc-counters      tc-counters
Linecard4          tc-counters      tc-counters
Linecard6          tc-counters      tc-counters
switch(config-hw-tcam) # no system profile
switch(config-hw-tcam) # show hardware tcam profile
Configuration      Status
Linecard9          default          default
Linecard8          default          default
Linecard3          default          default
Linecard4          default          default
Linecard6          default          default
switch(config-hw-tcam) #
```

13.5 VRRP and VARP

A virtual IP (VIP) address is an IP address that does not directly connect to a specific interface. Inbound packets sent to a Virtual IP address are redirected to a physical network interface. VIPs support connection redundancy by assigning the address to multiple switches. If one device becomes unavailable, packets sent to the address are still serviced by the functioning device.

Arista switches support virtual IP addresses through Virtual Router Redundancy Protocol, version 2 (VRRPv2), Virtual Router Redundancy Protocol, version 3 (VRRPv3), and Virtual-ARP (VARP). This chapter describes the Arista switch support of virtual IP addresses and contains these sections:

- [VRRP and VARP Conceptual Overview](#)
- [VRRP and VARP Implementation Procedures](#)
- [VRRP and VARP Implementation Examples](#)
- [VRRP and VARP Configuration Commands](#)

13.5.1 VRRP and VARP Conceptual Overview

This section review the following topics:

- [VRRPv2](#)
- [VRRPv3](#)
- [VARP](#)

13.5.1.1 VRRPv2

A virtual router, also known as a virtual router group, is defined by a Virtual Router Identifier (VRID) and a virtual IP address. A virtual routers mapping of VRID and IP address must be consistent among all switches implementing the virtual router group. A virtual routers scope is restricted to a single LAN.

A LAN may contain multiple virtual routers for distributing traffic. Each virtual router on a LAN is assigned a unique VRID. A switch may be configured with virtual routers among multiple LANs.

VRRP uses priority ratings to assign Master or Backup roles for each VRRP router configured for a virtual router group. The Master router sends periodic VRRP Advertisement messages along the LAN and forwards packets received by the virtual router to their destination. Backup routers are inactive but are available to assume Master router duties when the current Master fails.

A VRRP can be configured to allow VRRP routers with higher priority to take over Master router duties. Alternatively, the group can be configured to prevent a router from preemptively assuming the Master role.

A VRRP router is always assigned the Master of any virtual router configured with the address owned by the VRRP router, regardless of the preemption prevention setting.

On 7280R3, 7500R3 and 7800R3 series, maximally 14 unique VRRP groups can be configured along with VARP and MLAG Peer gateway virtual MAC capabilities.

13.5.1.2 VRRPv3

RFC 5798 defines version 3 of the Virtual Router Redundancy Protocol (VRRP) for both IPv4 and IPv6. It is based on version 2 of VRRP, as defined in *RFC 3768*.

13.5.1.3 VARP

Virtual VRRP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When ip routing is enabled, packets to the virtual MAC address are routed to the next hop destination.

Figure 13-2: VARP Configuration

The following sections are included in this chapter:

- [VRRP and VARP Conceptual Overview](#)
- [VRRP and VARP Implementation Procedures](#)
- [VRRP and VARP Implementation Examples](#)
- [VRRP and VARP Configuration Commands](#)

13.5.2 VRRP and VARP Implementation Procedures

This section contains the following configuration instructions:

- [VRRP Configuration for IPv4](#)
- [VRRP Configuration for IPv6](#)
- [VARP Configuration](#)

13.5.2.1 VRRP Configuration for IPv4

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The `no vrrp` command removes all VRRP commands for the specified virtual router from *running-config*.

13.5.2.1.1 Virtual Router Configuration

Most configuration tasks are optional because all mandatory parameters have a default value. The following virtual router parameters are configurable:

- VRRP version (default = version 2)
- Router priority (default = 100)
- Preemption option (default is enabled)
- Advertisement timer (default = one second)
- Description (optional parameter)
- Peer authentication (optional parameter)
- Secondary IP addresses (optional parameter)

VRRP Version

The `vrrp ipv4 version` command sets the version of VRRP for the corresponding IPv4 virtual router. IPv6 version is not configurable as it only supports version 3. The version selected in a VRRP group can either be same for all group members or independent of each other. By default, Arista switches use VRRP version 2, which supports only IPv4 environments. VRRP version 3 supports both IPv4 and IPv6 environments.

Example

This command causes **vlan 20** to use VRRP version 3.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

Master and Backup Router

The VRRP routers within a virtual router group determine the Master router through priority settings. Priority values range from **254** (highest priority) to **1** (lowest priority). Priority is either set by a CLI command or is assigned the default value of **100**. A switch specifies priority settings for each of its virtual routers. Once set, VRRP priority level can also be changed by a tracked object. The `vrrp tracked-object` command configures the VRRP client process to track an object created by the `track` command and react if its status changes to **down**.

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The `vrrp priority-level` command configures the switchs priority setting for the specified virtual router.

Example

This command sets the priority value of **250** for the virtual router with **VRID 15** on **VLAN 20**.

```
switch(config-if-vl20)# vrrp 15 priority-level 250
switch(config-if-vl20)#
```

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Examples

- This command disables preempt mode for the virtual router **15** on **vlan 20**.

```
switch(config-if-vl20)# no vrrp 15 preempt
switch(config-if-vl20)#
```

- This command enables preempt mode for the virtual router **30** on **vlan 20**.

```
switch(config-if-vl20)#vrrp 30 preempt
switch(config-if-vl20)#
```

The `vrrp preempt delay` command configures a period between an event that elevates a switch to master VRRP router status and the switch's assumption of master VRRP router role. Command options configure delays during normal operation and after a switch reboot.

Advertisement Interval

The Master router sends periodic VRRP Advertisement messages to other VRRP routers. The `vrrp advertisement interval` command specifies the interval between successive advertisement message transmissions.

The advertisement interval also defines the timeout that determines when the switch assumes the Master router role. This timeout interval is three times the advertisement interval.

Example

This command sets the advertisement interval of **10** seconds for virtual router **35** on **vlan 100**.

```
switch(config-if-vl100)# vrrp 35 advertisement interval 10
switch(config-if-vl100)#
```

Description

The `vrrp session description` command associates a text string to the specified virtual router. The maximum string length is **80** characters. The string has no functional impact on the virtual router.

Example

This command associates the text string **Laboratory Router** to virtual router **15** on **vlan 20**.

```
switch(config-if-vl20)# vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```

Peer Authentication

VRRP peer authentication validates VRRP advertisement packets that the switch receives from other VRRP routers in a specified virtual router group. When a virtual router uses authentication, all VRRP routers in the group must use the same authentication parameters.

The `vrrp peer authentication` command configures virtual router authentication parameters for the specified virtual router.

Example

This command implements plain-text authentication, using **12345** as the key, for virtual router **40** on **vlan 100**.

```
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

Secondary Addresses

The `vrrp ipv4 secondary` command assigns a secondary IP address to a virtual router. Secondary addresses are optional; a virtual routers configuration may include more than one secondary address command. The primary and secondary address list must be identical for all switches in a virtual router group.

A primary IP address is assigned to a virtual router with the `vrrp ipv4` command ([Virtual Router Enabling and the Primary IP address](#)).

Example

This command assigns the IP address of **10.2.4.5** as the secondary IP address for the virtual router **15** on **vlan 20**.

```
switch(config-if-vl20)# vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

13.5.2.1.2 Virtual Router Enabling and the Primary IP address

The `vrrp ipv4` command configures the primary IP address of the specified virtual router and enables the virtual router if the primary address is contained within the configuration mode interfaces IP address subnet. A virtual routers configuration may contain only one primary IP address assignment command; subsequent `vrrp ipv4` commands reassign the virtual routers primary IP address.

Example

This command enables virtual router group **15** (VRID) on **vlan 20** and assigns **10.1.1.5** as the virtual routers primary address.

```
switch(config-if-vl20)# vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.2.1.3 Disabling VRRP

The `vrrp disabled` command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group. The `no vrrp disabled` command changes the switchs virtual router state to **backup** or **master** if the virtual router is properly configured.

VRRP can also be shut down when the status of a tracked object configured by the `vrrp tracked-object` command changes to **down**.

Examples

- This command places the switch in stopped mode for virtual router **24** on **vlan 20**.

```
switch(config-if-vl20)# vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router **24** on **vlan 20**.

```
switch(config-if-vl20)# no vrrp 24 disabled
switch(config-if-vl20)#
```

- This command configures the switch to enter stopped mode for virtual router **24** on **vlan 20** if the status of **tracked-object interfaceE6/48** changes to **down**.

```
switch(config-if-vl20)# vrrp 24 tracked-object interfaceE6/48 shutdown
switch(config-if-vl20)#
```

The `no vrrp` and `no vrrp ipv4` commands delete the specified virtual IP address from the interface. Additionally, the `no vrrp` command removes all residual VRRP commands for the virtual router.

Examples

- This command removes all VRRP configuration commands for virtual router **10** on **vlan 15**.

```
switch(config-if-vl15)# no vrrp 10
switch(config-if-vl15)#
```

- This command disables virtual router **25** on **vlan20** and removes the primary IP address from its configuration.

```
switch(config-if-vl20)# no vrrp 25 ipv4 10.1.1.5
switch(config-if-vl20)#
```

13.5.2.2 VRRP Configuration for IPv6

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The `no vrrp` command removes all VRRP commands for the specified virtual router from *running-config*.

13.5.2.2.1 Configuring VRRP for IPv6

Specify the VRRP Version

The `vrrp ipv4 version` command sets the version of VRRP used on an interface. The version selected in a VRRP group must be the same for all group members. By default, Arista switches use VRRP version 2, which is not compatible with IPv6.

Example

This command causes **vlan 20** to use VRRP version 3.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

Create a VRRP Group and Configure a Virtual IPv6 Address

The `vrrp ipv6` command assigns an IPv6 address to the interface being configured and creates a VRRP group.

Example

These commands create VRRP group 3 and configure a virtual IPv6 address for the VRRP group on the **vlan 20** interface.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

Configure Tracking

The `vrrp tracked-object` command configures the VRRP client process to track an object created by the `track` command and react if its status changes to **down**.

Example

This command causes interface **vlan 20** to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-vl20)# vrrp 1 tracked-object ETH8 shutdown
switch(config-if-vl20)#
```

Configure the Priority Level

The `vrrp priority-level` command configures the switchs priority setting for the specified virtual router.

Example

This command sets the priority value of **250** for the virtual router with **VRID 15** on **vlan 20**.

```
switch(config-if-vl20)# vrrp 15 priority-level 250
switch(config-if-vl20)#
```

Configure the Preemption Mode

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

Example

This command enables preempt mode for the virtual router **30** on **vlan 20**.

```
switch(config-if-vl20)# vrrp 30 preempt
```

Configure the VRRP Advertisement Interval

The `ip virtual-router mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

Example

This command configures a MAC address advertisement interval of one minute (**60** seconds).

```
switch(config)# interface vlan 20
switch(config-if-vl20)# ip virtual-router mac-address advertisement-interval 60
switch(config-if-vl20)#
```

13.5.2.2.2 Verify VRRP IPv6 Configurations

Use the following commands to display the VRRP configurations and status.

Show VRRP Group

The `show vrrp` command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface.

Example

This command displays a table of information for VRRP groups on the switch.

```
switch# show vrrp interface vlan 3060 brief
Interface Id Ver Pri Time State VrIps
Vlan3060 1 3 100 3609 Master 2001::2
2001::3
Vlan3060 2 3 100 3609 Master 2002::2
2002::3 switch#
```

13.5.2.3 VARP Configuration

Implementing VARP consists of assigning virtual IP addresses to VLAN interfaces and configuring a virtual MAC address.

Virtual IP Addresses

The `ip virtual-router address` command assigns a virtual IP address to the VLAN interface being configured. Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IPv4 address may optionally be configured with a subnet, but doing so modifies the behavior of ARP requests sent from the router. When the router sends an ARP request for an IPv4 address in a virtual subnet, the ARP request uses the virtual IPv4 address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for **VLAN 10**.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 10.0.0.6
switch(config-if-Vl10)# ipv6 address 2001::1/64
switch(config-if-Vl10)# ipv6 virtual-router address 2001::2
switch(config-if-Vl10)# exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv4 address with a subnet for **vlan 10**. A static route is added to indicate that the virtual subnet is reachable through **vlan 10**.

```
switch(config)# ip route 192.0.0.0/24 vlan 10
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)# exit
switch(config)#
```

Virtual MAC Address

The `ip virtual-router mac-address` command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source.

When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

Example

This command configures a virtual MAC address.

```
switch(config)# ip virtual-router mac-address 001c.7300.0099
switch(config)#
```

Show Virtual MAC Address

To display the virtual router MAC and IP addresses, enter the `show ip virtual-router` command.

Example

This command displays the virtual router addresses assigned on the switch.

```
switch# show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address      Virtual IP Address  Status      Protocol
Vlan15     10.1.1.3/24      10.1.1.15          up          up
Vlan15     10.1.1.3/24      10.1.1.16          up          up
Vlan15     10.1.1.3/24      10.1.1.17          up          up
Vlan20     10.12.1.6/24     10.1.1.51          up          up
Vlan20     10.12.1.6/24     10.1.1.53          up          up
Vlan20     10.12.1.6/24     10.1.1.55          up          up
switch#
```

Show IPv6 Virtual-Router

The `show ipv6 virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Example

This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch# show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

13.5.3 VRRP and VARP Implementation Examples

This section contains the following example set:

- [VRRP Examples](#)
- [VARP Example](#)

13.5.3.1 VRRP Examples

This section provides code that implements three VRRP configurations:

- Example 1 configures two switches in a single virtual router group. This implementation protects the LAN against the failure of one router.
- Example 2 configures two switches into two virtual routers within a single LAN. This implementation protects the LAN against the failure of one router and balances traffic between the routers.
- Example 3 configures three switches to implement virtual routers on two LANs. Each LAN contains two virtual routers. One switch is configured into four virtual routers – two on each LAN.

13.5.3.1.1 VRRP Example 1: One Virtual Router on One LAN

The network diagram displays the Example 1 network. Two switches are configured as VRRP routers to form one virtual router.

Figure 13-3: VRRP Example 1 Network Diagram

The following code configures the first switch (**Router A**) as the master router and the second switch (**Router B**) as a backup router for virtual router **10** on **vlan 50**. **Router A** becomes the Master virtual router by setting its priority at **200**; **Router B** maintains the default priority of **100**. The advertisement interval is three seconds on both switches. Priority preemption is enabled by default.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)# interface vlan 50
switch-A(config-if-vl50)# ip address 10.10.4.1/24
switch-A(config-if-vl50)# no vrrp 10
switch-A(config-if-vl50)# vrrp 10 priority 200
switch-A(config-if-vl50)# vrrp 10 advertisement interval 3
switch-A(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)# exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# no vrrp 10
switch-B(config-if-vl50)# vrrp 10 advertisement interval 3
switch-B(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)# exit
```

13.5.3.1.2 VRRP Example 2: Two Virtual Routers on One LAN

The network diagram displays Example 2. Two switches are configured as VRRP routers to form two virtual routers on one LAN. Using two virtual routers distributes the LAN traffic between the switches.

Figure 13-4: VRRP Example 2 Network Diagram

The following code configures two switches as a master and a backup router for two virtual routers on **vlan 50**.

- **Router A** is the master for virtual router **10** and backup for virtual router **20**.
- **Router B** is the master for virtual router **20** and backup for virtual router **10**.
- VRRP advertisement interval is **3** seconds on virtual router **10** and **5** seconds on virtual router **20**.
- Priority preemption is enabled by default for both virtual routers.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)# interface vlan 50
switch-A(config-if-vl50)# ip address 10.10.4.1/24
switch-A(config-if-vl50)# no vrrp 10
switch-A(config-if-vl50)# vrrp 10 priority 200
switch-A(config-if-vl50)# vrrp 10 advertisement interval 3
switch-A(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)# no vrrp 20
switch-A(config-if-vl50)# vrrp 20 advertisement interval 5
switch-A(config-if-vl50)# vrrp 20 ip 10.10.4.20
switch-A(config-if-vl50)# exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# no vrrp 10
switch-B(config-if-vl50)# vrrp 10 advertisement interval 3
switch-B(config-if-vl50)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)# no vrrp 20
switch-B(config-if-vl50)# vrrp 20 priority 200
switch-B(config-if-vl50)# vrrp 20 advertisement interval 5
switch-B(config-if-vl50)# vrrp 20 ip 10.10.4.20
switch-B(config-if-vl50)# exit
```

13.5.3.1.3 VRRP Example 3: Two Virtual Routers on Two LANs

The network diagram displays Example 3. Three switches are configured as VRRP routers to form four virtual router groups two groups on each of two LANs.

Figure 13-5: VRRP Example 3 Network Diagram

The following code configures the three switches as follows:

- **Router A** is the master for virtual router **10** and backup for virtual router **20** on **vlan 100**.
- **Router A** is the master for virtual router **30** and backup for virtual router **40** on **vlan 150**.
- **Router B** is the master for virtual router **20** and backup for virtual router **10** on **vlan 100**.
- **Router C** is the master for virtual router **40** and backup for virtual router **30** on **vlan 150**.
- VRRP advertisement interval is set to one second on all virtual routers.
- Priority preemption is disabled on all virtual routers.

Switch Code that Implements Router A on the First Switch

```
switch-A(config)# interface vlan 100
switch-A(config-if-vl100)# ip address 10.10.4.1/24
switch-A(config-if-vl100)# no vrrp 10
switch-A(config-if-vl100)# vrrp 10 priority 200
switch-A(config-if-vl100)# no vrrp 10 preempt
switch-A(config-if-vl100)# vrrp 10 ip 10.10.4.10
switch-A(config-if-vl100)# vrrp 10 advertisement interval 1
switch-A(config-if-vl100)# no vrrp 20
switch-A(config-if-vl100)# no vrrp 20 preempt
switch-A(config-if-vl100)# vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)# interface vlan 150
switch-A(config-if-vl150)# ip address 40.10.5.7/24
switch-A(config-if-vl150)# no vrrp 30
switch-A(config-if-vl150)# vrrp 30 priority 200
switch-A(config-if-vl150)# no vrrp 30 preempt
switch-A(config-if-vl150)# vrrp 30 ip 40.10.5.31
switch-A(config-if-vl150)# vrrp 30 advertisement interval 1
switch-A(config-if-vl150)# no vrrp 40
switch-A(config-if-vl150)# no vrrp 40 preempt
switch-A(config-if-vl150)# vrrp 40 ip 40.10.5.32
switch-A(config-if-vl150)# exit
```

Switch Code that Implements Router B on the Second Switch

```
switch-B(config)# interface vlan 100
switch-B(config-if-vl100)# ip address 10.10.4.2/24
switch-B(config-if-vl100)# no vrrp 10
switch-B(config-if-vl100)# no vrrp 10 preempt
switch-B(config-if-vl100)# vrrp 10 ip 10.10.4.10
switch-B(config-if-vl100)# no vrrp 20
switch-B(config-if-vl100)# vrrp 20 priority 200
switch-B(config-if-vl100)# no vrrp 20 preempt
switch-B(config-if-vl100)# vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)# vrrp 20 advertisement interval 1
switch-B(config-if-vl100)# exit
```

Switch Code that Implements Router C on the Third Switch

```
switch-C(config)# interface vlan 150
switch-C(config-if-vl150)# ip address 40.10.5.8/24
switch-C(config-if-vl150)# no vrrp 30
switch-C(config-if-vl150)# no vrrp 30 preempt
switch-C(config-if-vl150)# vrrp 30 ip 40.10.5.31
switch-C(config-if-vl150)# no vrrp 40
switch-C(config-if-vl150)# vrrp 40 priority 200
switch-C(config-if-vl150)# no vrrp 40 preempt
switch-C(config-if-vl150)# vrrp 40 ip 40.10.5.32
switch-A(config-if-vl100)# vrrp 40 advertisement interval 1
switch-C(config-if-vl150)# exit
```

13.5.3.2 VARP Example

This section provides code that implements a VARP configuration. The network diagram displays the Example 1 network. Two switches in an MLAG domain are configured as VARP routers.

The following code configures **10.10.4.10** as the virtual IP address for **VLAN 50**, **10.24.4.1** as the virtual IP address for **VLAN 70**, and **001c.7300.0999** as the virtual MAC address on both switches.

Figure 13-6: VARP Example Network Diagram

Switch Code that Implements VARP on the First Switch

```
switch-A(config)# ip virtual-router mac-address 001c.7300.0999
switch-A(config)# interface vlan 50
switch-A(config-if-vl50)# ip address 10.10.4.1/24
switch-A(config-if-vl50)# ip virtual-router address 10.10.4.10
switch-A(config-if-vl50)# interface vlan 70
switch-A(config-if-vl70)# ip address 10.24.4.17/24
switch-A(config-if-vl70)# ip virtual-router address 10.24.4.1
switch-A(config-if-vl70)# exit
```

Switch Code that Implements VARP on the Second Switch

```
switch-B(config)# ip virtual-router mac-address 001c.7300.0999
switch-B(config)# interface vlan 50
switch-B(config-if-vl50)# ip address 10.10.4.2/24
switch-B(config-if-vl50)# ip virtual-router address 10.10.4.10
switch-B(config-if-vl50)# interface vlan 70
switch-B(config-if-vl70)# ip address 10.24.4.18/24
switch-B(config-if-vl70)# ip virtual-router address 10.24.4.1
switch-B(config-if-vl70)# exit
```

13.5.4 VRRP and VARP Configuration Commands

This section contains descriptions of CLI commands that support VRRP and VARP.

Global Configuration Commands

- [ip fhrp accept-mode](#)
- [ip virtual-router mac-address](#)
- [ip virtual-router mac-address advertisement-interval](#)

Interface Configuration Commands Ethernet, Port Channel, and VLAN Interfaces

- [ip virtual-router address](#)
- [ipv6 virtual-router address](#)
- [no vrrp](#)
- [vrrp advertisement interval](#)
- [vrrp disabled](#)
- [vrrp ipv4](#)
- [vrrp ipv4 checksum pseudo-header exclude](#)
- [vrrp ipv4 secondary](#)
- [vrrp ipv4 version](#)
- [vrrp ipv6](#)
- [vrrp mac-address advertisement-interval](#)
- [vrrp peer authentication](#)
- [vrrp preempt](#)
- [vrrp preempt delay](#)
- [vrrp priority-level](#)
- [vrrp session description](#)
- [vrrp timers delay reload](#)
- [vrrp tracked-object](#)

Privileged EXEC Commands

- [show ip virtual-router](#)
- [show ipv6 virtual-router](#)
- [show vrrp](#)

13.5.4.1 ip fhrp accept-mode

The **ip fhrp accept-mode** command configures the switch to permit SSH access to the VRRP Master and VARP Master router. All routers within a VRRP or VARP group should be configured consistently. By default, SSH access to the VRRP and VARP Master routers is not permitted.

The **no ip fhrp accept-mode** and **default ip fhrp accept-mode** commands restores the default SSH access availability by removing the **ip fhrp accept-mode** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip fhrp accept-mode
no ip fhrp accept-mode
default ip fhrp accept-mode
```

Example

This command configures the switch to permit SSH access to the VRRP and VARP Master routers.

```
switch(config)# ip fhrp accept-mode
switch(config)# show running-config

!
ip fhrp accept-mode
!

switch(config)#
```

13.5.4.2 ip virtual-router address

The **ip virtual-router address** command assigns a virtual IPv4 address to the VLAN interface being configured. (To assign a virtual IPv6 address to a VLAN interface, use the **ipv6 virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IP address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IP address in a virtual subnet, the ARP request will use the virtual IP address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

A maximum of **500** virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ip virtual-router address** and **default ip virtual-router address** commands remove the specified virtual IP address from the configuration mode interface by deleting the corresponding **ip virtual-router address** command from **running-config**. If the command does not specify an address, all virtual IPv4 addresses are removed from the interface.

Command Mode

Interface-VLAN Configuration

Command Syntax

```
ip virtual-router address ipv4_addr
no ip virtual-router address [ipv4_addr]
default ip virtual-router address [ipv4_addr]
```

Parameter

ipv4_addr IP address of router. Dotted decimal notation.

Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for **vlan 10**.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 10.0.0.6
switch(config-if-Vl10)# exit
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address with a subnet for **vlan 10**. A static route is added to indicate that the virtual subnet is reachable through **vlan 10**.

```
switch(config)# ip route 192.0.0.0/24 vlan 10
switch(config)# interface vlan 10
switch(config-if-Vl10)# ip address 10.0.0.2/24
switch(config-if-Vl10)# ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)# exit
```

13.5.4.3 ip virtual-router mac-address

The **ip virtual-router mac-address** command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source. The virtual router is not configured on the switch until this virtual mac-address is assigned.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG. When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

The **no ip virtual-router mac-address** command removes a virtual MAC address from the interface by deleting the corresponding **ip virtual-router mac-address** command from **running-config**.

Command Mode

Global Configuration

Command Syntax

```
ip virtual-router mac-address mac_addr  
no ip virtual-router mac address [mac_addr]
```

Parameter

mac_addr MAC IP address (dotted hex notation). Select an address does not appear on the switch.

Example

This command configures a virtual MAC address.

```
switch(config)# ip virtual-router mac-address 001c.7300.0099  
switch(config)#
```

13.5.4.4 ip virtual-router mac-address advertisement-interval

The **ip virtual-router mac-address advertisement interval** command specifies the period between the transmission of consecutive gratuitous ARP requests that contain the virtual router mac address for each virtual-router IP address configured on the switch. The default period is **30** seconds.

The **no ip virtual-router mac-address advertisement-interval** command restores the default period of **30** seconds by removing the **ip virtual-router mac-address advertisement-interval** command from *running-config*.

Command Mode

Global Configuration

Command Syntax

```
ip virtual-router mac-address advertisement-interval period
no ip virtual-router mac-address advertisement-interval
default ip virtual-router mac-address advertisement-interval
```

Parameter

period advertisement interval (seconds). Values range from **0 to 86400**. Default is **30**.

Example

This command configures a MAC address advertisement interval of one minute (**60** seconds).

```
switch(config)# ip virtual-router mac-address advertisement-interval 60
switch(config)#
```

13.5.4.5 ipv6 virtual-router address

The **ipv6 virtual-router address** command assigns a virtual IPv6 address to the VLAN interface being configured. (To assign a virtual IPv4 address to a VLAN interface, use the **ip virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A maximum of **500** virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ipv6 virtual-router address** and **default ipv6 virtual-router address** commands remove the specified virtual IPv6 address from the configuration mode interface by deleting the corresponding **ipv6 virtual-router address** command from **running-config**. If the command does not specify an address, all virtual IPv6 addresses are removed from the interface.

Command Mode

Interface-VLAN Configuration

Command Syntax

```
ipv6 virtual-router address net_addr
no ipv6 virtual-router address [net_addr]
default ipv6 virtual-router address [net_addr]
```

Parameter

net_addr network IPv6 address.

Example

These commands configure a Switch Virtual Interface (SVI) and a virtual IPv6 address for **vlan 10**.

```
switch(config)# interface vlan 10
switch(config-if-Vl10)# ipv6 address 2001:0DB8:0:1::1/64
switch(config-if-Vl10)# ipv6 virtual-router address 2001:0DB8:0:1::2
switch(config-if-Vl10)# exit
```

13.5.4.6 no vrrp

The **no vrrp** command removes all VRRP configuration commands for the specified virtual router on the configuration mode interface. The **default vrrp** command also reverts VRRP configuration parameters to default settings by removing the corresponding **vrrp** commands.

Commands removed by the **no vrrp** command include:

- [vrrp advertisement interval](#)
- [vrrp disabled](#)
- [vrrp ipv4](#)
- [vrrp ipv4 secondary](#)
- [vrrp peer authentication](#)
- [vrrp preempt](#)
- [vrrp preempt delay](#)
- [vrrp priority-level](#)
- [vrrp session description](#)

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
no vrrp group
```

```
default vrrp group
```

Parameter

group Virtual Router Identifier (VRID). Values range from **1 to 255**.

Example

This command removes all VRRP configuration commands for virtual router **group 10** on **vlan 15**.

```
switch(config)# interface vlan 15
switch(config-if-vl15)# no vrrp 10
switch(config-if-vl15)#
```

13.5.4.7 show ip virtual-router

The **show ip virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IP addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

```
show ip virtual-router
```

Messages

- **IP virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IP address** no virtual IP addresses are assigned to any VLAN interfaces.

Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch# show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address      Virtual IP Address  Status      Protocol
Vlan15     10.1.1.3/24      10.1.1.15          up          up
Vlan15     10.1.1.3/24      10.1.1.16          up          up
Vlan15     10.1.1.3/24      10.1.1.17          up          up
Vlan20     10.12.1.6/24     10.1.1.51          up          up
Vlan20     10.12.1.6/24     10.1.1.53          up          up
Vlan20     10.12.1.6/24     10.1.1.55          up          up switch#
```

- This command generates a response that indicates a virtual MAC address is not assigned to the switch.

```
switch# show ip virtual-router
IP virtual router is not configured switch#
```

13.5.4.8 show ipv6 virtual-router

The **show ipv6 virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

Command Mode

EXEC

Command Syntax

```
show ipv6 virtual-router
```

Messages

- **IPv6 virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IPv6 address** no virtual IPv6 addresses are assigned to any VLAN interfaces.

Example

This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch# show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

13.5.4.9 show vrrp

The **show vrrp** command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface. Parameter options control the amount and formatting of the displayed information.

Command Mode

Privileged EXEC

Command Syntax

```
show vrrp [INFO_LEVEL] [STATES]
show vrrp INTF GROUP_NUM [INFO_LEVEL] [STATES]
show vrrp GROUP_NUM INTF_GROUP [INFO_LEVEL] [STATES]
```

Parameters

- **INTF** specifies the VRRP groups for which the command displays status. When the parameter is omitted or specifies only an interface, the group list is filtered by the STATES parameter.
 - **no parameter** specified groups on all interfaces.
 - **interface ethernet e_num** specified groups on Ethernet interface.
 - **interface loopback l_num** specified groups on loopback interface.
 - **interface management m_num** specified groups on management interface.
 - **interface port-channel p_num** specified groups on port channel interface.
 - **interface vlan v_num** specified groups on VLAN interface.
 - **interface VXLAN vx_num** specified groups on VXLAN interface.
- **GROUP_NUM** the VRRP ID number of the group for which the command displays status.
 - **no parameter** all groups on specified interface.
 - **vrid_num** Virtual Router Identifier (VRID). Value ranges from **1** to **255**.
- **INFO_LEVEL** Specifies format and amount of displayed information. Options include:
 - **no parameter** displays a block of data for each VRRP group.
 - **brief** displays a single table that lists information for all VRRP groups.
- **STATES** Specifies the groups, by VRRP router state, that are displayed. Options include:
 - **no parameter** displays data for groups in the **master** or **backup** states.
 - **all** displays all groups, including groups in the **stopped** and **interface down** states.

Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch# show vrrp brief
Interface Id  Ver Pri Time  State  VrIps
Vlan1006 3    2   100 3609 Master 127.38.10.2
Vlan1006 4    3   100 3609 Master 127.38.10.10

  State is Stopped
  Virtual IPv4 address is 128.44.5.3
  Virtual MAC address is 0000.5e00.0101
```

```
Mac Address Advertisement interval is 30s
VRRP Advertisement interval is 1s
Preemption is enabled
Preemption delay is 0s
Preemption reload delay is 0s
Priority is 100
Master Router is 0.0.0.0
Master Advertisement interval is 1s
Skew time is 0.609s
Master Down interval is 3.609s switch#
```

- This command displays data for all VRRP group 2 on *vlan 1014*.

```
switch# show vrrp interface vlan 1014 group 2
Vlan1006 - Group 2
  VRRP Version 2
  State is Master
  Virtual IPv4 address is 127.38.10.2
  Virtual MAC address is 0000.5e00.0103
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 127.38.10.1 (local), priority is 100
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s switch#
```

13.5.4.10 vrrp advertisement interval

The **vrrp advertisement interval** command configures the interval between successive advertisement messages that the switch sends to VRRP routers in the specified virtual router group. The switch must be the groups Master virtual router to send advertisement messages. The advertisement interval must be configured identically on all physical routers in the virtual router group.

The advertisement interval also influences the timeout interval that defines when the virtual router becomes the master virtual router. When preemption is enabled, the virtual router becomes the master when three times the advertisement interval elapses after the switch detects master router priority conditions.

The **no vrrp advertisement interval** and **default vrrp advertisement interval** commands restore the default advertisement interval of one second for the specified virtual router by removing the corresponding **vrrp advertisement interval** command from *running-config*. The **no vrrp** command also removes the **vrrp advertisement interval** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group advertisement interval adv_time  
no vrrp group advertisement interval  
default vrrp group advertisement interval
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1 to 255**.
- **adv_time** advertisement interval (seconds). Values range from **1 to 255**. Default value is **1**.

Example

This command sets the advertisement interval of five seconds for the virtual router **35** on **vlan 100**.

```
switch(config)# interface vlan 100  
switch(config-if-vl100)# vrrp 35 advertisement interval 5  
switch(config-if-vl100)#
```

13.5.4.11 vrrp disabled

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a **master** or **backup** router for the virtual router group.

The **no vrrp disabled** and **default vrrp disabled** commands remove the corresponding **vrrp disabled** command from **running-config**. This changes the switch's virtual router state to **backup** or **master** if the virtual router is properly configured.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group disabled
```

```
no vrrp group disabled
```

```
default vrrp group disabled
```

Parameter

group Virtual Router Identifier (VRID). Values range from **1 to 255**.

Examples

- These commands place the switch in stopped mode for virtual router **24** on **vlan 20**.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router **24** on **vlan 20**.

```
switch(config-if-vl20)# no vrrp 24 disabled
switch(config-if-vl20)#
```

13.5.4.12 vrrp ipv4

The **vrrp ipv4** command configures the primary IP address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet. A VRRP virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands replace the existing primary address assignment.

The **vrrp ipv4 secondary** command assigns a secondary IP address to the VRRP virtual router.

The **no vrrp ipv4** and **default vrrp ipv4** commands disable the VRRP virtual router and deletes the primary IP address by removing the corresponding **vrrp ipv4** statement from *running-config*. The **no vrrp** command also removes the **vrrp ipv4** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group ipv4 ipv4_address  
no vrrp group ipv4 ipv4_address  
default vrrp group ipv4 ipv4_address
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1 to 255**.
- **ipv4_address** IPv4 address of the virtual router.

Related Command

[vrrp ipv4 secondary](#)

Example

This command enables virtual router **15** on **vlan 20** and designates **10.1.1.5** as the virtual routers primary address.

```
switch(config)# interface vlan 20  
switch(config-if-vl20)# vrrp 15 ipv4 10.1.1.5  
switch(config-if-vl20)#
```

13.5.4.13 vrrp ipv4 checksum pseudo-header exclude

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group on the configuration mode interface of the switch and supports IPv4 VRRPv3 interoperability.

The **no** form of the command deletes the **vrrp ipv4 checksum pseudo-header exclude** configuration from the Ethernet interface on the switch.

The **exit** command returns the switch to global configuration mode.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group ipv4 checksum pseudo-header exclude  
no vrrp group ipv4 checksum pseudo-header exclude
```

Parameter

group Virtual Router Identifier (VRID). Values range from **1 to 255**.

Example

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on VRRP **group 1** on **interface ethernet 1**.

```
switch(config-if-Et1)# vrrp 1 ipv4 checksum pseudo-header exclude
```

13.5.4.14 vrrp ipv4 secondary

The **vrrp ipv4 secondary** command assigns a secondary IP address to the specified virtual router. Secondary IP addresses are an optional virtual router parameter. A virtual router may contain multiple secondary address commands. The IP address list must be identical for all VRRP routers in a virtual router group.

The virtual router is assigned a primary IP address with the **vrrp ipv4** command.

The **no vrrp ipv4 secondary** and **default vrrp ipv4 secondary** commands remove the secondary IP address for the specified VRRP virtual router by deleting the corresponding **vrrp ipv4 secondary** statement from running-config. The **no vrrp** command also removes all **vrrp ipv4 secondary** commands for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group ipv4ipv4_addr secondary  
no vrrp group ipv4ipv4_addr secondary  
default vrrp group ipv4ipv4_addr secondary
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1 to 255**.
- **ipv4_addr** secondary IPv4 address of the virtual router.

Related Command

[vrrp ipv4](#)

Example

This command assigns the IP address of **10.2.4.5** as the secondary IP address for the virtual router with VRID of **15** on **vlan 20**.

```
switch(config)# interface vlan 20  
switch(config-if-vl20)# vrrp 15 ipv4 10.2.4.5 secondary  
switch(config-if-vl20)#
```

13.5.4.15 vrrp ipv4 version

The **vrrp ipv4 version** command enables VRRP on the configuration mode interface and configures the VRRP version for the specified VRRP virtual router.

The **no vrrp ipv4 version** and **default vrrp ipv4 version** commands restore the default VRRP version to VRRPv2 by removing the corresponding **vrrp ipv4 version** statement from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group ipv4 version VERSION_NUMBER
```

```
no vrrp group ipv4 version
```

```
default vrrp group ipv4 version
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1 to 255**.
- **VERSION_NUMBER** Specifies VRRP version that the switch uses. Default value is 2 (VRRPv2). Options include:
 - **2** VRRP v2 supports IPv4 environment.
 - **3** VRRP v3 supports IPv4 and IPv6 environment.

Examples

- This command enables VRRPv3 for IPv6 on *interface ethernet 3*.

```
switch(config)# interface ethernet 3  
switch#(config-if-Et3)# vrrp 1 ipv4 version 3
```

- This command removes VRRPv3 from *interface ethernet 3* and reverts to the default VRRPv2.

```
switch(config)# interface ethernet 3  
switch(config-if-Et3)# no vrrp 1 ipv4 version
```

13.5.4.16 vrrp ipv6

The **vrrp ipv6** command configures the IPv6 address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet.

The **no vrrp ipv6** and **default vrrp ipv6** commands disable the VRRP virtual router and deletes the IPv6 address by removing the corresponding **vrrp ipv6** statement from *running-config*. The **no vrrp** command also removes the **vrrp ipv6** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group ip ipv6_address
```

```
no vrrp group ip ipv6_address
```

```
default vrrp group ip ipv6_address
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1** to **255**.
- **ipv6_address** IPv6 address of the virtual router.

Examples

- This command enables address **2001:db8:0:1::1** for IPv6 VRRP on **vlan 20**.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

- This command disables VRRPv3 on **vlan 20** from virtual router **3**.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# no vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

13.5.4.17 vrrp mac-address advertisement-interval

The **vrrp mac-address advertisement-interval** command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

The **vrrp mac-address advertisement-interval 0**, **no vrrp mac-address advertisement-interval** and **default vrrp mac-address advertisement-interval** commands disable the feature by removing the **vrrp mac-address advertisement-interval** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group mac-address advertisement-interval period
```

```
no vrrp group mac-address
```

```
default vrrp group mac-address
```

Parameters

- **group** Virtual Router IDentifier (VRID). Values range from **1 to 255**.
- **period** interval in which the master router sends advertisement packets (seconds). Value ranges from **0 to 3600**. Selecting **0** as the interval disables this feature.

Examples

- This command specifies the interval between advertisement packets sent to the members of VRRP group **3** on **vlan 20**.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# vrrp 3 mac-address advertisement-interval 60
switch(config-if-vl20)#
```

- This command disables the feature on **vlan 20**.

```
switch(config)# interface vlan 20
switch(config-if-vl20)# no vrrp 3 mac-address advertisement-interval
switch(config-if-vl20)#
```

13.5.4.18 vrrp peer authentication

The **vrrp peer authentication** command configures parameters the switch uses to authenticate virtual router packets it receives from other VRRP routers in the group.

The **no vrrp peer authentication** and **default vrrp peer authentication** commands disable VRRP peer authentication of packets from the specified virtual router by removing the corresponding **vrrp peer authentication** command from *running-config*. The **no vrrp** command also removes the **vrrp peer authentication** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group peer authentication AUTH_PARAMETER
```

```
no vrrp group peer authentication
```

```
default vrrp group peer authentication
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1 to 255**.
- **AUTH_PARAMETER** encryption level and authentication key used by router. Options include:
 - **text text_key** plain-text authentication, **text_key** is text.
 - **text key** plain-text authentication, **key** is text.
 - **ietf-md5 key-string 0 text_key** IP authentication of MD5 key hash, **text_key** is text.
 - **ietf-md5 key-string text_key** IP authentication of MD5 key hash, **text_key** is text.
 - **ietf-md5 key-string 7 coded_key** IP authentication of MD5 key hash, **coded_key** is MD5 hash.

Guidelines

This command is applicable to VRRPv2 which supports IPv4 addresses only.

Examples

- This command implements plain-text authentication, using **12345** as the key, for virtual router **40** on **vlan 100**.

```
switch(config)# interface vlan 100
switch(config-if-vl100)# vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using **12345** as the key.

```
switch(config-if-vl100)# vrrp 40 peer authentication ietf-md5 key-string 0 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using **12345** as the key. The key is entered as the MD5 hash equivalent of the text string.

```
switch(config-if-vl100)# vrrp 40 peer authentication ietf-md5 key-string 7
EA3TUPxdddFCLYT8mb+kxw==
switch(config-if-vl100)#
```

13.5.4.19 vrrp preempt

The **vrrp preempt** command controls a virtual routers preempt mode setting. When preempt mode is enabled, if the switch has a higher priority it will preempt the current master virtual router. When preempt mode is disabled, the switch can become the master virtual router only when a master virtual router is not present on the subnet, regardless of VRRP priority level settings. By default, preempt mode is enabled.

The **no vrrp preempt** and **default vrrp preempt** commands disable preempt mode for the specified virtual router; the **default vrrp preempt** command stores a corresponding **no vrrp preempt** statement in **running-config**. The **vrrp preempt** command enables preempt mode by removing the corresponding **no vrrp preempt** statement from running-config.

The **no vrrp** command also enables preempt mode by removing the **no vrrp preempt** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group preempt  
no vrrp group preempt  
default vrrp group preempt
```

Parameter

group Virtual Router Identifier (VRID). Values range from **1 to 255**.

Related Command

[vrrp preempt delay](#)

Examples

- This command disables preempt mode for virtual router **20** on **vlan 40**.

```
switch(config)# interface vlan 40  
switch(config-if-vl40)# no vrrp 20 preempt  
switch(config-if-vl40)#
```

- This command enables preempt mode for virtual router **20** on **vlan 40**.

```
switch(config-if-vl40)# vrrp 20 preempt  
switch(config-if-vl40)#
```

13.5.4.20 vrrp preempt delay

The **vrrp preempt delay** command specifies the interval between a VRRP preemption event and the point when the switch becomes the master VRRP router. A preemption event is any event that results in the switch having the highest virtual router priority setting while preemption is enabled. The **vrrp preempt** command enables preemption for a specified virtual router.

The command configures two delay periods:

- **minimum** time delays master VRRP takeover when VRRP is fully implemented.
- **reload** time delays master VRRP takeover after VRRP is initialized following a switch reload (boot).

Note: If the switch senses that there are no other active switches in the virtual router group, it will bypass any configured preempt time delay and become the VRRP master after the standard master downtime interval (3*advertisement interval + skew time).

Running-config maintains separate delay statements for **minimum** and **reload** parameters. Commands may list both parameters. Commands that list one parameter do not affect the omitted parameter. Values range from **0 to 3600** seconds (one hour). The default delay is zero seconds for both parameters.

The **no vrrp preempt delay** and **default vrrp preempt delay** commands reset the specified delay to the default of zero seconds. Commands that do not list either parameter resets both periods to zero. The **no vrrp** command also removes all **vrrp preempt delay** commands for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group preempt delay [MINIMUM_INTERVAL] [RELOAD_INTERVAL]
```

```
no vrrp group preempt delay [DELAY_TYPE]
```

```
default vrrp group preempt delay [DELAY_TYPE]
```

Parameters

- **group** Virtual Router IDentifier (VRID). Values range from **1 to 255**.
- **MINIMUM_INTERVAL** period between preempt event and takeover of master VRRP router role.
 - **no parameter** minimum delay is not altered by command.
 - **minimum min_time** delay during normal operation (seconds). Values range from **0 to 3600**.
- **RELOAD_INTERVAL** period after reboot-VRRP initialization and takeover of master VRRP router role.
 - **no parameter** reload delay is not altered by command.
 - **reload reload_time** delay after reboot (seconds). Values range from **0 to 3600**.
- **DELAY_TYPE** delay type that is reset to default value.
 - **no parameter** reload and minimum delays are reset to default.
 - **minimum** minimum delay is reset to default.
 - **reload** reload delay is reset to default.

(**DELAY_TYPE** parameter is only used in **no vrrp preempt delay** and **default vrrp preempt delay** commands).

Related Command

[vrrp preempt](#)

Examples

- This command sets the minimum preempt time of **90** seconds for virtual router **20** on **vlan 40**.

```
switch(config)# interface vlan 40
switch(config-if-vl40)# vrrp 20 preempt delay minimum 90
switch(config-if-vl40)#
```

- This command sets the minimum and reload preempt time to **0** for virtual router **20** on **vlan 40**.

```
switch(config-if-vl40)# no vrrp 20 preempt delay
switch(config-if-vl40)#
```

13.5.4.21 vrrp priority-level

The **vrrp priority-level** command configures the switch's priority setting for a VRRP virtual router. Priority values range from **1** to **254**. The default value is **100**.

The router with the highest VRRP priority level setting for a group becomes the master virtual router for that group. The master virtual router controls the IP address and is responsible for forwarding traffic sent. The **vrrp preempt** command controls the time when a switch can become the master virtual router.

The **no vrrp priority-level** and **default vrrp priority-level** commands restore the default priority of 100 to the virtual router on the configuration mode interface by removing the corresponding **vrrp priority-level** command from **running-config**. The **no vrrp** command also removes the **vrrp priority-level** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group priority-level level  
no vrrp group priority-level level  
default vrrp group priority-level level
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1** to **255**.
- **level** priority setting for the specified virtual router. Values range from **1** to **254**.

Example

This command sets the virtual router priority value of **250** for virtual router **group 45** on **vlan 20**.

```
switch(config)# interface vlan 20  
switch(config-if-vl20)# vrrp 45 priority-level 250  
switch(config-if-vl20)#
```

13.5.4.22 vrrp session description

The **vrrp session description** command associates a text string to a VRRP virtual router on the configuration mode interface. The string has no functional impact on the virtual router. The maximum length of the string is **80** characters.

The **no vrrp session description** and **default vrrp session description** commands remove the text string association from the VRRP virtual router by deleting the corresponding **vrrp session description** command from *running-config*. The **no vrrp** command also removes the **vrrp session description** command for the specified virtual router.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group session description label_text  
no vrrp group session description  
default vrrp group session description
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1 to 255**.
- **label_text** text that describes the virtual router. Maximum string length is **80** characters.

Example

This command associates the text string **Laboratory Router** to virtual router **15** on **vlan 20**.

```
switch(config)# interface vlan 20  
switch(config-if-vl20)# vrrp 15 session description Laboratory Router  
switch(config-if-vl20)#
```

13.5.4.23 vrrp timers delay reload

The **vrrp timers delay reload** command delays the time for VRRP initialization after a system reboot.

The **no vrrp timers delay reload** and **default vrrp timers delay reload** commands restore the default value of **0** by deleting the **vrrp timers delay reload** statement from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group timers delay reload [INTERVAL]
```

```
no vrrp group timers delay reload
```

```
default vrrp group timers delay reload
```

Parameters

INTERVAL The number of seconds for the delay (seconds). Options include:

- **no parameter** Default value of **0** seconds.
- **0 to 3600** seconds. Ranges between **0 to 60** minutes.

Examples

- These commands configure the VRRP reload delay interval to **15** minutes.

```
switch(config)# interface vlan 100  
switch(config-if-Vl100)# vrrp 2 timers delay reload 900  
switch(config-if-Vl100)#
```

- These commands removes the VRRP reload delay interval.

```
switch(config)# interface vlan 100  
switch(config-if-Vl100)# no vrrp 2 timers delay reload  
switch(config-if-Vl100)#
```

13.5.4.24 vrrp tracked-object

The **vrrp tracked-object** command configures the VRRP client process on the configuration mode interface to track the specified tracked object and react when its status changes to **down**. The tracked object is created by the **track** command.

The **no vrrp tracked-object** and **default vrrp tracked-object** commands cause the VRRP client process to stop tracking the specified tracked object by removing the corresponding **vrrp tracked-object** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
vrrp group tracked-object object_name ACTION amount
```

```
no vrrp group tracked-object object_name ACTION
```

```
default vrrp group tracked-object object_name ACTION
```

Parameters

- **group** Virtual Router Identifier (VRID). Values range from **1** to **255**.
- **object_name** name of tracked object.
- **amount** amount to decrement VRRP priority level. Values range from **1** to **254**.
- **ACTION** The action that VRRP is to take when the tracked objects status changes to **down**. Options include:
 - **decrement** decrease VRRP priority level by *amount*.
 - **shutdown** shut down VRRP on the configuration mode interface.
 - If both **decrement** and **shutdown** are configured on the same interface for the same VRRP group, then VRRP will be shut down on the interface if the tracked object is down.

Related Commands

[track](#)

Example

This command causes *interface ethernet 5* to disable VRRP when tracked object **eth8** changes state.

```
switch(config-if-Et5)# vrrp 1 tracked-object eth8 shutdown
switch(config-if-Et5)#
```

13.6 DirectFlow

This section describes Arista's DirectFlow implementation. Topics in this section include:

- [Introduction](#)
- [DirectFlow Configuration](#)
- [DirectFlow Feature Interactions](#)
- [DirectFlow Commands](#)

13.6.1 Introduction

DirectFlow allows you to define flows consisting of conditions to match, and actions to perform, that are a superset of the OpenFlow 1.0 specification. DirectFlow runs alongside the existing L2/L3 forwarding plane, enabling a network architecture that incorporates new capabilities such as TAP aggregation and custom traffic engineering, alongside traditional forwarding models. DirectFlow does not require a controller or any third party integration, as flows can be installed via the CLI.

DirectFlow exposes the underlying forwarding ASIC's capabilities through a programmable interface like EAPI or the standard CLI.

DirectFlow works in conjunction with all other aspects of standard Layer 2 or Layer 3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

DirectFlow enables you to configure flows that consist of matching criteria and actions, and to modify how traffic is processed, by overriding the L2 lookup decision or rewriting a MAC address or VLAN for example.

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS, and others are all respected by DirectFlow. Traffic that does not match any programmed flow is processed normally, while traffic that matches programmed flows is now subject to the actions specified in the flows.

13.6.1.1 DirectFlow Flows

You can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:

- [DirectFlow Non-persistent Flows](#)
- [Supported Matches](#)
- [Supported Actions](#)

13.6.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations and do not persist over a reboot. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for **5** minutes, the agent can program a non-persistent flow that expires after a hard timeout of **300** seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) do not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

Note: By default, all DirectFlow flows are persistent. You must use the **no persistent** command to configure a non-persistent flow.

13.6.1.1.2 Supported Matches

DirectFlow supports all matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type, and code.

In addition, DirectFlow also allows matching on:

- TCP flags
- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

13.6.1.1.3 Supported Actions

DirectFlow supports the following actions:

- Setting the source or destination MAC address
- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror)
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent.

13.6.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect **ONLY** after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators. Therefore they must **all** match for the condition to be true and action to be taken.
- CLI is automatically set to match the ethertype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv4 or IPv6 source and destination addresses:
 - VLAN priority
 - VLAN ID
 - EtherType
 - Source interface
 - Class of Service (CoS)

13.6.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

Note: ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

Enter the DirectFlow Configuration Mode

The `directflow` command places the switch in DirectFlow configuration mode.

```
switch(config)# directflow
switch(config-directflow)#
```

Enable DirectFlow

The `shutdown (DirectFlow)` command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow)# no shutdown
```

Create the Flow

The `flow (DirectFlow)` command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow)# flow Test-1
switch(config-directflow-Test-1)#
```

Create the DirectFlow Match Criteria

The `match (DirectFlow-flow mode)` command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow-Test-1)# match ethertype ip
switch(config-directflow-Test-1)# match source ip 10.10.10.10
```

Action Set

The `action set (DirectFlow-flow mode)` command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow-Test-1)# action egress mirror ethernet 7
switch(config-directflow-Test-1)# action set destination mac 0000.aaaa.bbbb
```

Finalize the Flow

DirectFlow flows do not take effect until you exit the configuration sub-mode for the specified flow. Use the `exit` command to finalize the flow and put it into effect.

```
switch(config-directflow-Test-1)# exit
switch(config-directflow)#
```

Redirect to CPU

The `action output interface cpu (DirectFlow-flow mode)` command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch(config)# directflow
switch(config-directflow)# flow redirect-http-cpu
switch(config-directflow-redirect-http-cpu)# match ip protocol tcp
switch(config-directflow-redirect-http-cpu)# match destination port 80
switch(config-directflow-redirect-http-cpu)# action output interface cpu
```

Configuring a Non-persistent Flow

DirectFlow flows are persistent by default. Use the `no persistent` command to configure non-persistent flows.

```
switch config)# directflow
switch(config-directflow)# flow example-non-persistent
switch(config-directflow-example-non-persistent)# match input interface ethernet 25
switch(config-directflow-example-non-persistent)# action drop
switch(config-directflow-example-non-persistent)# no persistent
switch(config-directflow-example-non-persistent)# timeout hard 300
```

Display Details for Configured Flows

The `detail` option of the `show directflow flows` command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.

The initial use of the command displays the flow configuration (before the timeout expires).

```
switch(config-directflow)# show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow programmed)
  persistent: False
  priority: 0
  hard timeout: 300
  idle timeout: 0
  match:
    ingress interface:
      Et25
  actions:
    drop
  matched: 0 packets, 0 bytes
```

The second use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```
switch(config-directflow)# show directflow flows example-non-persistent detail
Flow example-non-persistent: (Flow not programmed)
  persistent: False
  priority: 0
  hard timeout: 300
  idle timeout: 0
  match:
    ingress interface:
      Et25
  actions:
    drop
  matched: 0 packets, 0 bytes
```

13.6.3 DirectFlow Feature Interactions

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet
- Copy to CPU
- Redirect to CPU
- Drop
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

Bridging Features

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- **Q-in-Q:** Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- **Counters:** All packets that match DirectFlow entries cause interface counters to increment as usual.

Spanning Tree

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

LLDP, LAGs, and LACP

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

sFlow

sFlow is unaffected by DirectFlow.

IGMP Snooping

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.

Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

ACLs

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a **permit** action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

13.6.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

Unicast Routing

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

Multicast Routing

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry. The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.

13.6.3.2 Displaying DirectFlow Configurations

The [show directflow flows](#) command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.

```
switch(config-directflow)# show directflow flows
Flow Test1:
priority: 0
match:
  ingress interface: Ethernet1
    ethertype ip
  source ip address: 10.10.10.10
actions:
  output mirror: Ethernet2
matched: 0 packets, 0 bytes
switch(config-directflow)#
```

- This example shows the status of a non-persistent flow. The flow will be deleted once **5** minutes have elapsed.

```
switch(config-directflow)# show directflow flows example-non-persistent
Flow example-non-persistent:
persistent: False
priority: 0
hard timeout: 300
idle timeout: 0
match:
  ingress interface:
    Et25
actions:
  drop
```

```
matched: 0 packets, 0 bytes
```

13.6.4 DirectFlow Commands

DirectFlow Global Configuration Mode

- [directflow](#)

DirectFlow Configuration Commands

- [action drop \(DirectFlow-flow mode\)](#)
- [action mirror \(DirectFlow-flow mode\)](#)
- [action output \(DirectFlow-flow mode\)](#)
- [action output interface cpu \(DirectFlow-flow mode\)](#)
- [action set \(DirectFlow-flow mode\)](#)
- [flow \(DirectFlow\)](#)
- [match \(DirectFlow-flow mode\)](#)
- [persistent](#)
- [priority \(DirectFlow-flow mode\)](#)
- [shutdown \(DirectFlow\)](#)
- [timeout \(DirectFlow-flow mode\)](#)

DirectFlow and Clear Commands

- [show directflow](#)
- [show directflow flows](#)

13.6.4.1 action drop (DirectFlow-flow mode)

The **action drop** command configures packets that match an entry to be dropped.

The **no action drop** and **default action drop** commands remove the statement from the DirectFlow *configuration mode*.

Command Mode

Directflow-flow Configuration

Command Syntax

```
action drop
```

```
no action drop
```

```
default action drop
```

Example

This command sets the action for packets from **Test-1** to be dropped.

```
switch(config-directflow-Test-1)# action drop  
switch#
```

13.6.4.2 action mirror (DirectFlow-flow mode)

The **action mirror** command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The **no action mirror** and **default action mirror** commands remove the statement from DirectFlow **configuration mode**.

Command Mode

Directflow-flow Configuration

Command Syntax

```
action DIRECTION mirror INT_NAME
no action DIRECTION mirror INT_NAME
default action DIRECTION mirror INT_NAME
```

Parameters

- **DIRECTION** transmission direction of traffic to be mirrored.
 - **ingress** mirrors before any rewrites.
 - **egress** mirrors after rewrites.
- **INT_NAME** Source interface for the mirroring session.
 - **ethernet e_range** Ethernet interfaces specified by **e_range**.
 - **port-channel p_range** Port channel interfaces specified by **p_range**.

Example

This command configures mirror traffic to **ethernet 2**.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)# match ethertype ip
switch(config-directflow-Test1)# match source ip 10.10.10.10
switch(config-directflow-Test1)# action egress mirror ethernet 2
switch(config-directflow-Test1)#
```

13.6.4.3 action output (DirectFlow-flow mode)

The **action output** command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The **no action output** and **default action output** commands remove the statement from **DirectFlow** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

action output **DESTINATION**

no action output **DESTINATION**

default action output **DESTINATION**

Parameters

DESTINATION transmission direction of traffic to be mirrored.

- **all** mirrors transmitted and received traffic.
- **flood** mirrors received traffic only.
- **interface ethernet e_range** Ethernet interfaces specified by **e_range**.
- **interface port-channel p_range** Port channel interfaces specified by **p_range**.
- **nexthop vrf vrf_name ip_addr**. If the next hop is reachable in the default VRF, the default VRF does not need to be specified.

Examples

- This command configures **interface ethernet 7** as the output for the mirroring session.

```
switch(config-directflow-Test1)# action output interface ethernet 7
switch(config-directflow-Test1)#
```

- The following commands configure a flow redirecting all traffic from **10.10.1.2** to **e_range** next hop assuming an appropriately configured TCAM profile.

```
switch(config-directflow)# flow flow-sip-10_10_1_2-redirect-to-10_30_1_2
switch(config-directflow-Test1)# match ethertype ip
switch(config-directflow-Test1)# match source ip 10.10.1.2
switch(config-directflow-Test1)# action output nexthop 10.30.1.2
switch(config-directflow-Test1)#
```

13.6.4.4 action output interface cpu (DirectFlow-flow mode)

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from **DirectFlow** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

action output DESTINATION

no action output DESTINATION

default action output DESTINATION

Parameters

DESTINATION transmission direction of traffic to be mirrored.

- **all** mirrors transmitted and received traffic.
- **flood** mirrors received traffic only.
- **interface cpu** Ethernet interfaces specified by **e_range**.

Examples

- This command configures **interface ethernet 7** as the output for the mirroring session.

```
switch(config-directflow-Test1)# action output interface ethernet 7
switch(config-directflow-Test1)#
```

- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.

```
switch (config)# directflow
switch(config-directflow)# flow redirect-http-cpu
switch(config-directflow-redirect-http-cpu)# match ip protocol tcp
switch(config-directflow-redirect-http-cpu)# match destination p cpuport 80
switch(config-directflow-redirect-http-cpu)# action output interface
```

13.6.4.5 action set (DirectFlow-flow mode)

The **action set** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The **no action set** and **default action set** commands remove **action set** statement from **DirectFlow** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

```
action set CONDITION
```

```
no action set CONDITION
```

```
default action set CONDITION
```

Parameters

CONDITION specifies parameter and value. Options include:

- **cos 0 to 7** Cost of service.
- **destination mac *mac_addr*** Dotted hex notation.
- **ip tos 0 to 255** Type of service.
- **source mac *mac_addr*** Dotted hex notation.
- **traffic-class 0 to 7** Dotted hex notation.
- **vlan 0 to 4094** Number of VLAN.

The **no action set** and **default action set** commands require only the **CONDITION** type without a specific condition value.

Example

These commands change the destination MAC of the frame.

```
switch(config-directflow)# flow Test1  
switch(config-directflow-Test1)# action egress mirror ethernet 7  
switch(config-directflow-Test1)# action set destination mac 0000.aaaa.bbbb
```

13.6.4.6 directflow

The **directflow** command places the switch in DirectFlow configuration mode.

The **no directflow** and **default directflow** commands delete the DirectFlow configuration mode statements from **running-config**.

DirectFlow configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. The **exit** command returns the switch to **global configuration mode**.

Command Mode

Global Configuration

Command Syntax

```
directflow
```

```
no directflow
```

```
default directflow
```

Commands Available in DirectFlow-Flow configuration mode:

- [flow \(DirectFlow\)](#)
- [shutdown \(DirectFlow\)](#)

Examples

- This command places the switch in **DirectFlow** configuration mode.

```
switch(config)# directflow  
switch(config-directflow)#
```

- This command returns the switch to **global management** mode.

```
switch(config-directflow)# exit  
switch(config)#
```

13.6.4.7 flow (DirectFlow)

The **flow** command places the switch in **flow** configuration mode.

The **flow** command specifies the name of the flow that subsequent commands modify and creates a newflow definition if it references a nonexistent flow. All changes in a **flow** configuration mode edit session are pending until the session ends:

- The **exit** command saves pending changes to **running-config** and returns the switch to **DirectFlow** configuration mode. Changes are also saved by entering a different configuration mode.
- The **abort** command discards pending changes, returning the switch to **DirectFlow** configuration mode.

The **no flow** and **default flow** commands delete the specified role by removing the role and its statements from **running-config**.

Command Mode

DirectFlow Configuration

Command Syntax

```
flow flow_name
```

```
no flow flow_name
```

```
default flow flow_name
```

Parameter

flow_name Name of flow.

Commands Available in DirectFlow-Flow configuration mode:

- [action drop \(DirectFlow-flow mode\)](#)
- [action mirror \(DirectFlow-flow mode\)](#)
- [action output \(DirectFlow-flow mode\)](#)
- [action set \(DirectFlow-flow mode\)](#)
- [match \(DirectFlow-flow mode\)](#)

13.6.4.8 match (DirectFlow-flow mode)

The **match** command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The **no match** and **default match** commands remove the **match** statement from the configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

match **CONDITION**

no match **CONDITION**

default match **CONDITION**

Parameters

CONDITION specifies criteria for evaluating a route. Options include:

- **cos 0 to 7** cost of service.
- **destination ip *ipv4_sub*** destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
- **destination mac *mac_addr*** Add to the existing community. Dotted hex notation.
- **destination mac *mac_addr* mask *mac_mask*** Add to the sting community. Dotted hex notation.
- **destination port 0 to 65535** Fields accepted only if protocol is TCP|UDP.
- **ethertype 0 to 65535** Layer 4 destination port.
- **ethertype ARP** Layer 4 destination port.
- **ethertype IP** Layer 4 destination port.
- **icmp code 0 to 255** Fields accepted only if protocol is ICMP.
- **icmp type 0 to 255** Fields accepted only if protocol is ICMP.
- **input interface ethernet *e_num*** Ethernet interface specified by ***e_num***.
- **input interface port-channel *p_num*** Port channel interface specified by ***p_num***.
- **ip protocol 0 to 255** Type of service.
- **ip protocol icmp** L3 fields valid only if ethertype is IP (0x0800).
- **ip protocol tcp** L3 fields valid only if ethertype is IP (0x0800).
- **ip protocol udp** L3 fields valid only if ethertype is IP (0x0800).
- **ip tos 0 to 255** L3 fields valid only if ethertype is IP (0x0800).
- **source ip *ipv4_subnet*** L3 fields valid only if ethertype is IP (0x0800).
- **source mac *mac_addr*** Add to the existing community. Dotted hex notation.
- **source mac *mac_addr* mask *mac_mask*** Add to the sting community. Dotted hex notation.
- **source port 0 to 65535** Fields accepted only if protocol is TCP|UDP.
- **tcp flag ack** Layer 4 destination port.
- **tcp flag fin** Layer 4 destination port.
- **tcp flag psh** Layer 4 destination port.
- **tcp flag rst** Layer 4 destination port.
- **tcp flag syn** Layer 4 destination port.
- **tcp flag urg** Layer 4 destination port.
- **tcp flag urg** Layer 4 destination port.
- **vlan 1 to 4094 mask 1 to 4095** Number of VLAN.

The **no match** and **default match** commands require only the **CONDITION** type without a specific condition value.

Example

This command creates the rules to match on Ethertype IP and Source IP **10.10.10.10**.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)# persistent
switch(config-directflow-Test1)# match ethertype ip
switch(config-directflow-Test1)# match source ip 10.10.10.10
```

13.6.4.9 persistent

DirectFlow flows are persistent by default. Once finalized, they appear in the running configuration, and if saved to **startup config** they will persist over a reboot. The **no** form of the **persistent** command prevents the flow from showing up in **running config**, ensuring that it will not persist over a reboot.

Command Mode

Directflow-flow Configuration

Command Syntax

`persistent`

`no persistent`

Example

These commands create and enable a non-persistent DirectFlow flow.

```
switch(config)# directflow
switch(config-directflow)# flow example-non-persistent
switch(config-directflow-example-non-persistent)# match input interface ethernet 25
switch(config-directflow-example-non-persistent)# action drop
switch(config-directflow-example-non-persistent)# no persistent
switch(config-directflow-example-non-persistent)# timeout hard 300
switch(config-directflow-example-non-persistent)# exit
switch(config-directflow)#
```

13.6.4.10 **priority (DirectFlow-flow mode)**

The **priority** command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from **0 to 65535**. The default is **0**. The higher priority rules match first.

The **no priority** and **default priority** commands remove **priority** statement from the **DirectFlow** configuration mode.

Command Mode

Directflow-flow Configuration

Command Syntax

```
priority priority_value
```

```
no priority
```

```
default priority
```

Parameter

priority_value priority *xxx*. Value ranges from **0 to 65535**. Default is **0**.

Example

These commands assign the priority of **150** to flow **Test-1**.

```
switch(config-directflow-Test-1)# priority 150  
switch(config-directflow-Test-1)#
```

13.6.4.11 show directflow

The **show directflow** command displays summary information for DirectFlow. With the **counters** or **details** options, it displays counters or details for all flows configured on the switch.

Command Mode

EXEC

Command Syntax

```
show directflow [counters | details]
```

Examples

- This command displays summary information for DirectFlow.

```
switch# show directflow
DirectFlow configuration: Enabled
Total matched: 0 packets
Total programmed flows: 3 flows switch#
```

- This command displays counters for all DirectFlow flows configured on the switch.

```
switch# show directflow counters
```

Flow Name	Source	Matched packets	Matched bytes
test3	config	0	0
test2	config	0	0
test1	config	0	0

```
Total matched packets: 0 switch>
```

- This command displays details for all DirectFlow flows configured on the switch.

```
switch# show directflow detail
Flow test3: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
    source IPv6 address: fcaa::ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff
  actions:
    output interfaces:
      Et32
    source: config
  matched: 0 packets, 0 bytes
Flow test2: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
      Et3/1
    source: config
  matched: 0 packets, 0 bytes
Flow test1: (Flow programmed)
  persistent: True
  priority: 0
```

```
priorityGroupType: default
tableType: ifp
hard timeout: 0
idle timeout: 0
match:
  ingress interface:
    Et1/1
actions:
  output interfaces:
    Et2/1
source: config
matched: 0 packets, 0 bytes
Flows: 3 programmed, 0 rejected switch#
```

13.6.4.12 show directflow flows

The **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters. Including the name of a specific flow limits the output to information about the specified flow.

Command Mode

EXEC

Command Syntax

```
show directflow flows [flow_name [counters | detail]]
```

Parameters

- **flow_name** name of flow for which to display information. If no flow name is entered, command displays information for all flows.
- **counters** displays DirectFlow counters for the specified flow.
- **detail** displays detailed information for the specified flow.

Examples

- This command displays the contents of the flow table.

```
switch# show directflow flows
Flow test3:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd

Total matched packets: 1 switch#

```

13.6.4.13 shutdown (DirectFlow)

The **shutdown** command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The **no shutdown** command re-enables DirectFlow.

Command Mode

Directflow Configuration

Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

Examples

- These commands enable DirectFlow on the switch.

```
switch(config)# directflow  
switch(config-directflow)# no shutdown  
switch(config-directflow)#
```

- This command disables DirectFlow Flow.

```
switch(config-directflow-Test1)# shutdown
```

13.6.4.14 timeout (DirectFlow-flow mode)

The **timeout** command, in **DirectFlow** mode, command configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a users most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

Command Mode

Directflow-flow Configuration

Command Syntax

```
no timeout hard
```

```
no timeout idle
```

Parameters

- **idle** session idle timeout length.
 - **0** Automatic connection timeout is disabled.
 - **1-4294967295** Automatic timeout period (seconds).
- **hard** session hard timeout length.
 - **0** Automatic connection timeout is disabled.
 - **1-4294967295**

Example

- These commands enable a hard timeout period of **5** seconds on the switch.

```
switch(config)# directflow  
switch(config-directflow-Test1)# timeout hard 5  
switch(config-directflow-Test1)#
```

- These commands enable DirectFlow on the switch.

```
switch(config)# directflow  
switch(config-directflow-Test1)# no timeout hard  
switch(config-directflow-Test1)#
```

13.7 Decap Groups

These sections describe the Decap Groups features:

- [Decap Groups Overview](#)
- [Configuring Decap Groups](#)
- [Configuring Generic UDP Encapsulation \(GUE\) Decap Groups](#)
- [Decap Groups Commands](#)

13.7.1 Decap Groups Overview

The Decap Group feature provides a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot transmit through Decap Groups, use Nexthop Groups to create a reverse path for a packet. Decap Groups support payload extraction of packets received from Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

The Decap capabilities also support the Generic UDP Encapsulation (GUE). GUE provides a general method for encapsulating packets of random IP protocols within a UDP tunnel and contains an extensible header format with optional data.

The switch identifies a GUE packet based on the outer UDP destination port, terminates the tunnel based on the outer destination IP address, and removes the outer IP/UDP encapsulation. The outer UDP destination port also determines if the inner payload source as IP or MPLS. For IP payloads, the first instance of the inner payload distinguishes between IPv4 addresses and IPv6 addresses. The decapsulated packet then forwards to IP or MPLS forwarded based on the inner payload.

Decap Groups have the following constraints:

- Destination IP addresses terminate tunnels and the source IP address has no impact.
- Packets matching a decap group do not process through the ingress interface and VLAN.
- During a tunnel termination, an ingress ACL filters the inner header of each decap group packet.
- Decap Groups do not support VRF.

The decap support over GUE has the following constraints:

- Does not support outer UDP checksum validation.
- Does not support outer IP options handling.
- Does not perform outer IP TTL check.
- Does not provide exception handling on inner IP packets. Specifically, packets with inner IP TTL=1 or IP options attempt to forward in HW.
- The DCS-7020, DCS-7280R, DCS-7280R2, DCS-7500R, and DCS-7500R2 switch series do not support VXLAN with GUE decap option on.
- If enabling GUE with outer IP hashing, inner IP fields are not included in the load balance key of MPLS over GRE packets in tc-counters TCAM profile on DCS-7020, DCS-7280R, DCS-7280R2, DCS-7500R, and DCS-7500R2 switch series.

The tunnel type and decap IP address define the Decap Groups:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap Groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

13.7.2 Configuring Decap Groups

Configure Decap Groups using the **decap-group** configuration mode. The **decap-group** configuration mode changes the **running-config** immediately after entering commands. However, when exiting, the **decap-group** configuration mode does not affect running-config. The **exit** command returns the switch to **global** configuration mode.

- Specify the static CLI entry for the incoming label with the **mpls static** command.
- Specify the tunnel type with the **tunnel type (Decap Group)** command.
- Specify the Decap IP address with the **tunnel decap-ip (Decap Group)** command.
- Add the locally configured IP addresses to the Layer 3 interfaces using the **tunnel decap-interface (Decap Group)** command for a specified decap group.

Decap groups do not define a default destination address or tunnel type. You must configure both parameters. A decap group can contain multiple **tunnel decap-ip** statements.

Examples

- Use this command to define a static CLI entry for the incoming-label.

```
switch(config)# mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type  
ipv4
```

- Use this command to create a decap group named **DC-1** and configure the group to terminate packets from GRE tunnel packets with the destination IP address of **10.14.3.2**.

```
switch(config)# ip decap-group DC-1  
switch(config-dg-DC-1)# tunnel type gre  
switch(config-dg-DC-1)# tunnel decap-ip 10.14.3.2  
switch(config-dg-DC-1)# show active  
ip decap-group DC-1  
tunnel type gre  
tunnel decap-ip 10.14.3.2  
switch(config-dg-DC-1)# end  
switch(config)#
```

13.7.3 Configuring Generic UDP Encapsulation (GUE) Decap Groups

The **ip decap-group** configuration specifies the GUE tunnel termination as follows:

```
switch(config)# ip decap-group test  
switch(config-dg-test)# tunnel type UDP  
switch(config-dg-test)# tunnel decap-ip 2.2.2.2  
switch(config-dg-test)# tunnel decap-interface et1
```

Configure the global UDP destination port to payload type mapping:

```
switch(config)# ip decap-group type udp destination port 6080 payload ip  
switch(config)# ip decap-group type udp destination port 5555 payload mpls
```

Note: Each payload type can be mapped to only one UDP port. Otherwise, the following error occurs:

```
switch(config)# ip decap-group type udp destination port 6080 payload ip  
% There can be only one UDP destination port per payload type
```

MPLS over GUE Decap Group Configuration

The MPLS over GUE Decap Group requires the following platform configurations. First, the **mpls-over-gre** must be enabled since this supports the MPLS-over-GRE support in hardware:

```
switch(config)# platform fap mpls-over-gre
```

Then enable outer IP hashing:

```
(config)# load-balance policies  
switch(config-load-balance-policies)# load-balance sand profile default  
! profile default is a reserved profile  
! profile default is the current global profile  
switch(config-sand-load-balance-profile-default)# packet-type gue outer-ip
```

13.7.4 Decap Groups Commands

Decap Groups Configuration Commands

- [ip decap-group](#)
- [tunnel decap-interface](#)
- [tunnel decap-ip](#)
- [tunnel type](#)

Decap Groups Show Command

- [show ip decap-group](#)

13.7.4.1 ip decap-group

The **ip decap-group** command places the switch in **decap-group** configuration mode which permits the creation or modification of Decap Groups. A Decap Group provides a data structure that defines a method of extracting the payload from an encapsulated packet received on the switch receives at a specified IP address.

Decap Groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a Decap Group can function.

Commands entered in the **decap-group** configuration mode immediately change the **running-config**. Exiting the **decap-group** configuration mode does not affect **running-config**. The **exit** command returns the switch to **global** configuration mode.

The **no ip decap-group** and **default ip decap-group** commands delete previously configured commands in the specified **decap-group** mode.

Command Mode

Global Configuration

Command Syntax

```
ip decap-group group_name
no ip decap-group group_name
default ip decap-group group_name
```

Parameters

group_name Decap group name.

Examples

- This command creates a decap group named **DC-1**.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)#
```

- This command exits the **decap-group** mode for the **DC-1** decap group.

```
switch(config-dg-DC-1)# exit
switch(config)#
```

- This command delete the decap group named **DC-1**.

```
switch(config)# no ip decap-group DC-1
switch(config)#
```

13.7.4.2 show ip decap-group

The **show ip decap-group** command displays the IP decap groups available on the switch.

Command Mode

Global Configuration

Command Syntax

```
show ip decap-group [decap-group name | dynamic]
```

Parameters

- **decap-group name** The decap group name.
- **dynamic** Displays the dynamic entries only.

Related Commands

- [show ip decap-group](#)
- [tunnel decap-ip](#)
- [tunnel type](#)

Examples

- This command displays the IP decap groups that are available in a switch.

```
switch(config)# show ip decap-group
NOTE: "D" column indicates dynamic entries
D | Name | Type | Info | Version | Addr Type
--|-----|-----|-----|-----|-----
* | d1 | GRE | 1.2.3.4 | | |
* | d2 | IP-in-IP | Ethernet12/3 | IPv4 | primary
| gre-with-intf | GRE | | | |
| ipip-with-decapall | IP-in-IP | all | IPv4 | all
| ipip-with-decapall | IP-in-IP | all | IPv6 | all
| ipip-with-intf | IP-in-IP | Ethernet11/3 | IPv6 | all
| ipip-with-intf | IP-in-IP | Ethernet11/3 | IPv4 | primary
* | ipip-with-ip | IP-in-IP | 1001::1 | IPv6 |
* | ipip-with-ip | IP-in-IP | 1.1.1.1 | IPv4 |
| p1 | GRE | 100.100.100.100 | | |
| p2 | UNKNOWN | | | |
```

- This command displays the UDP decap groups that are available in a switch.

```
switch(config)# show ip decap-group
NOTE: "D" column indicates dynamic entries
D | Name | Type | Info | Version | Address | UDP Dest | Payload
| | | | | | Type | Port | Type
--|-----|-----|-----|-----|-----|-----|-----
| foo | UDP | Ethernet1 | IPv4 | primary | 6080 | ip
| | | | | | | 5555 | mpls
| bar | UDP | 2.2.2.2 | IPv4 | | 6080 | ip
| | | | | | | 5555 | mpls
```

- The following command displays the decap-groups configured in HW:

```
switch(config)# show platform fap decap-group
DecapIp | LIF
-----|-----
2.2.2.2 | 0
3.3.3.3 | 1
```

13.7.4.3 tunnel decap-interface

The **tunnel decap-interface** command adds all locally configured IP addresses to the specific Layer 3 interface per Decap Group.

The **no tunnel decap-interface** command and the **default tunnel decap-interface** command restores the default state by removing the locally added IP addresses from the Decap Group.

Command Mode

Decap-Group Configuration

Command Syntax

```
tunnel decap-interface { Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | VXLAN | all }
```

```
no tunnel decap-interface { Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | VXLAN | all }
```

```
default tunnel decap-interface { Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | VXLAN | all }
```

Parameters

- **Ethernet *e_num*** - Ethernet interface specified by *e_num*. The Ethernet port number ranges from **1** to **36**.
- **Loopback *l_num*** - Loopback interface specified by *l_num*. The loopback interface number ranges from **0** to **1000**.
- **Management *m_num*** - Management interface specified by *m_num*. The management port number ranges from **1** to **1**.
- **Port-channel *p_num*** - Port-channel interface specified by *p_num*. Options include the following:
 - **Port-channel** interface number. The port-channel interface number ranges from **1** to **2000**.
 - **Port-channel** sub interface number. The port-channel sub interface number **1-2000,1-4094**.
- **tunnel *t_num*** - Tunnel interface specified by *t_num*. The tunnel interface number ranges from **0** to **255**.
- **vlan *v_num*** - VLAN interface specified by *v_num*. The VLAN interface number ranges from **1** to **4094**.
- **VXLAN *vx_num*** - VXLAN interface specified by *vx_num*. The VXLAN tunnel interface number ranges from **1** to **1**.
- **all address-family** - This parameter configures all L3 interfaces as a decap interface.

Example

These commands add locally configured IP addresses to the **interface ethernet 1/1** for the **dg1** Decap Group.

```
switch(config)# ip decap-group dg1
switch(config-dg-dg1)# tunnel decap-interface Ethernet1/1

switch(config-dg-dg1)# show active
ip decap-group dg1
  tunnel type ipip
  tunnel decap-interface Ethernet1/1
  tunnel decap-interface all address-family ipv6 address all
```

13.7.4.4 tunnel decap-ip

The **tunnel decap-ip** command specifies the IP address of packets handled by the configuration mode for the Decap Group. A Decap Group provides a data structure that defines a method of extracting the payload from an encapsulated packet received on the switch from a specified IP address.

Decap Groups do not define a default decap-ip address. A Decap Group does not become functional until an IP address is specified. Decap Groups can contain only one tunnel decap-ip statement. Subsequent commands replace any previously configured statements.

Command Mode

Decap-Group Configuration

Command Syntax

```
tunnel decap-ip ipv4_address
```

Parameter

ipv4_addr An IPv4 address.

Related Commands

- The [ip decap-group](#) command places the switch in **decap-group** configuration mode.
- The [tunnel type](#) command specifies the tunnel protocol for extracting payload.
- The [show ip decap-group](#) command.

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

These commands configure **10.14.3.2** as the decap-IP address for the **DC-1** decap group.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)# tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)# show active
ip decap-group DC-1
    tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#
```

13.7.4.5 tunnel type

The **tunnel type** command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include General Routing Encapsulation (GRE) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group does not become functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement. Subsequent commands replace previously configured statements.

Command Mode

Decap-group Configuration

Command Syntax

```
tunnel type gre
```

Related Commands

- The [ip decap-group](#) command places the switch in **decap-group** configuration mode.
- The [tunnel decap-ip](#) command specifies the IP address of packets handled by the decap group.
- The [show ip decap-group](#) command.

Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Example

This command configures decap group **DC-1** to terminate packets from GRE tunnel packets.

```
switch(config)# ip decap-group DC-1
switch(config-dg-DC-1)# tunnel type gre
switch(config-dg-DC-1)# show active
ip decap-group DC-1
tunnel type gre
switch(config-dg-DC-1)#
```

13.8 Nexthop Groups

These sections describe the Nexthop groups:

- [Nexthop Group Description](#)
- [Nexthop Group Configuration](#)
- [Support for IPv6 Link-Local Addresses in Nexthop Groups Entries](#)
- [Nexthop Group Commands](#)

13.8.1 Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry's specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group's tunnel type.

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet's hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.

13.8.2 Nexthop Group Configuration

Nexthop groups are configured and modified in nexthop-group configuration mode. After a group is created, it is associated to a static route through an [ip route nexthop-group](#) statement.

These tasks are required to configure a nexthop group and apply it to a static route.

- [Creating and Editing Nexthop Groups](#)
- [Configuring a Group's Encapsulation Parameters](#)
- [Configuring the Group's Size](#)
- [Creating Nexthop Group Entries](#)
- [Displaying Nexthop Groups](#)
- [Applying a Nexthop Group to a Static Route](#)

Creating and Editing Nexthop Groups

Nexthop groups are created by a [nexthop-group](#) command that specifies a group that isn't already configured. The switch enters ***nexthop-group*** configuration mode for the new group. ***Nexthop-group*** mode is also accessible for modifying existing groups. When in ***nexthop-group*** configuration mode, the ***show active*** command displays the group's configuration.

- This command creates a nexthop group named **NH-1**.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)#
```

- These commands enter **nexthop-group** configuration mode for the group named **NH3**, then displays the previously configured group parameters.

```
switch(config)# nexthop-group NH3
switch(config-nexthop-group-NH3)#show active
nexthop-group NH3
  size 4
  ttl 10
  entry 0 tunnel-destination 10.14.21.3
  entry 1 tunnel-destination 10.14.21.5
  entry 2 tunnel-destination 10.14.22.5
  entry 3 tunnel-destination 10.14.22.6
switch(config-nexthop-group-NH3)#
```

Configuring a Group's Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group's tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

- This command configures the TTL setting to **32** for nexthop group **NH-1** encapsulation packets.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# ttl 32
switch(config-nexthop-group-NH-1)# show active
nexthop-group NH-1
  size 128
  ttl 32
switch(config-nexthop-group-NH-1)#
```

The address is inserted in the encapsulation source IP fields is specified by [tunnel-source \(Nexthop Group\)](#).

- These commands create **interface loopback 100**, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group **NH-1**.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.1.1.1/32
switch(config-if-Lo100)# exit
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)# show active
nexthop-group NH-1
  size 256
  ttl 32
  tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)#
```

Configuring IP-in-IP Encapsulation

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```
switch(config)# ip route 124.0.0.1/32 nexthop-group abc
switch(config)# nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)# size 512
switch(config-nexthop-group-abc)# tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)# entry 0 tunnel-destination 1.1.1.2
switch(config-nexthop-group-abc)# entry 1 tunnel-destination 10.1.1.1
switch(config-nexthop-group-abc)# ttl 64
switch(config-nexthop-group-abc)#
```

Configuring the Group's Size

The group's size specifies the number of entries in the group. A group can contain up to **256** entries, which is the default size. The group's size is specified by [size \(Nexthop Group\)](#).

This command configures the nexthop group **NH-1** to contain **128** entries.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 128
switch(config-nexthop-group-NH-1)# show active
  nexthop-group NH-1
    size 128
    ttl 64
switch(config-nexthop-group-NH-1)#
```

Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group's size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by [entry \(Nexthop Group\)](#).

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 4
switch(config-nexthop-group-NH-1)# entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)# entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)# entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)# show active
  nexthop-group NH-1
    size 4
    ttl 64
    entry 0 tunnel-destination 10.13.4.4
    entry 1 tunnel-destination 10.15.4.22
    entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config)# nexthop-group nhg-v6-mpis type ip
switch(config-nhg-v6-mpis)# size 3
switch(config-nhg-v6-mpis)# entry 0 nexthop 2002::6401:1
```

```
switch(config-nhg-v6-mpls)# entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls)# entry 2 nexthop 2002::6404:2
switch(config-nhg-v6-mpls)#
```

- These commands configure an IPv4 route to point to the nexthop group **nhg-v6-mpls**. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch# ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mpls
switch#
```

Displaying Nexthop Groups

The `show nexthop-group` command displays a group's configured parameters.

This command displays the properties of the nexthop group named **NH-1**.

```
switch> show nexthop-group NH-1
Name      Id      type      size  ttl    sourceIp
NH-1      4       ipInIp    256   64     0.0.0.0 switch>
```

Applying a Nexthop Group to a Static Route

The `ip route nexthop-group` associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.

This command creates a static route in the default VRF, using the nexthop group of **NH-1** to determine the next hop address.

```
switch(config)# ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

The `show ip route` command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of **NG**.

This command displays a routing table that contains a static route with its nexthop specified by a nexthop group.

```
switch> show ip route
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route

Gateway of last resort is not set

C      10.3.3.1/32 is directly connected, Loopback0
C      10.9.1.0/24 is directly connected, Ethernet51/3
C      10.10.10.0/24 is directly connected, Ethernet51/1
S      10.20.0.0/16 [20/0] via 10.10.10.13, Ethernet51/1
C      10.10.11.0/24 is directly connected, Ethernet3

S    10.22.0.0/16 [1/0] via 10.17.0.1, Management1 switch>
```

13.8.3 Support for IPv6 Link-Local Addresses in Nexthop Groups Entries

IPv6 Link-local addresses in Nexthop Groups entries support IPv6 link-local nexthops belonging to a Nexthop Group. Only the MPLS Nexthop Group supports IPv6 and because of this, IPv6 is limited to getting support only by the Nexthop Group of MPLS. An advantage is that you can use these devices even when they are not configured with globally routable IPv4 or IPv6 addresses.

13.8.3.1 Configuration

An MPLS next-hop group with IPv6 address now accepts an interface if the IPv6 address is a link-local. Note the use of percentages between the IPv6 address and the interface.

```
switch(config)# nexthop-group nhg1 type mpls
switch(config-nexthop-group-nhg1)# entry 0 push label-stack 606789 nexthop fe80::fe80:2%Ethernet2
switch(config-nexthop-group-nhg1)# entry 1 push label-stack 204164 nexthop fe80::fe80:2%Ethernet3
```

13.8.3.2 Show Commands

Use the **show nexthop-group** command to display the current status of the nexthop-groups.

```
switch# show nexthop-group
nhg1
  Id          1
  Type        mpls
  Size        12
  Entries (left most label is the top of the stack)
    0  push label-stack 606789  nexthop fe80::fe80:2
      Tunnel destination directly connected, Ethernet2
      00:d4:27:77:e9:77, Ethernet2
    1  push label-stack 204164  nexthop fe80::fe80:2
      Tunnel destination directly connected, Ethernet3
      00:79:21:32:0f:32, Ethernet3
```

13.8.3.3 Limitations

Review the following limitations for the support of IPv6 link-local address in nexthop group entries:

- Only the nexthop-group of MPLS supports an IPv6 address. Therefore, link-local IPv6 addresses are only supported for this type of nexthop-group.
- Nexthop-groups are configured and exist in the default VRF. The link-local IPv6 addresses for nexthop-group entries can only be resolved for interfaces in the default VRF.

13.8.4 Nexthop Group Commands

Nexthop Commands

- `entry` (Nexthop Group)
- `ip route nexthop-group`
- `nexthop-group`
- `size` (Nexthop Group)
- `ttl` (Nexthop Group)
- `tunnel-source` (Nexthop Group)

Nexthop Show Command

- `show nexthop-group`

13.8.4.1 entry (Nexthop Group)

The **entry** command defines a nexthop entry in the **nexthop group** configuration mode . Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size ([size \(Nexthop Group\)](#)) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The **no entry** and **default entry** commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding **entry** statement from **running-config**.

Command Mode

Nexthop-group Configuration

Command Syntax

```
entry index tunnel-destination ipv4_address
```

```
no entry index
```

```
default entry index
```

Parameters

- **index** Entry index. Values range from **0** to **group-size – 1**.
- **ipv4_address** Nexthop IPv4 address.
- **group-size** is the group's entry capacity, as specified by the [size \(Nexthop Group\)](#) command.

Example

These commands sets the nexthop group size at four entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 4
switch(config-nexthop-group-NH-1)# entry 0 tunnel-destination 10.13.4.4
switch(config-nexthop-group-NH-1)# entry 1 tunnel-destination 10.15.4.22
switch(config-nexthop-group-NH-1)# entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)# show active
nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

13.8.4.2 ip route nexthop-group

The **ip route nexthop-group** command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; **running-config** stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is **1**. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of **200** is overridden by OSPF intra-area routes, which have a default distance of **110**.

The **no ip route nexthop-group** and **default ip route nexthop-group** commands delete the specified route by removing the corresponding **ip route nexthop-group** command from **running-config**. **Ip route nexthop-group** statements for an IP address in multiple VRFs must be removed separately.

A **no ip route** or **default ip route** command without a nexthop parameter deletes all corresponding **ip route nexthop-group** statements. Deleting a user-defined VRF also deletes its static routes.

Command Mode

Global Configuration

Command Syntax

```
ip route [VRF_INST dest_net nexthop-group nhgp_name [dist][TAG_OPTION][RT_NAME]
no ip route [VRF_INST] dest_net [nexthop-group nhgroup_name][distance]
default ip route [VRF_INST] dest_net [nexthop-group nhgroup_name][distance]
```

Parameters

- **VRF_INST** Specifies the VRF instance being modified.
 - **no parameter** Changes are made to the default VRF.
 - **vrf vrf_name** Changes are made to the specified VRF.
- **dest_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **nhgp_name** Name of nexthop group.
- **dist** Administrative distance assigned to route. Options include:
 - **no parameter** Route assigned default administrative distance of one.
 - **1–255** The administrative distance assigned to route.
- **TAG_OPTION** Static route tag. Options include:
 - **no parameter** Assigns default static route tag of **0**.
 - **tag t_value** Static route tag value. **t_value** ranges from 0 to **4294967295**.
- **RT_NAME** Associates descriptive text to the route. Options include:
 - **no parameter** No text is associated with the route.
 - **name descriptive_text** The specified text is assigned to the route.

Related Commands

The **ip route** command creates a static route that specifies the nexthop address without using nexthop groups.

Example

This command creates a static route in the default VRF, using the nexthop group of **NH-1** to determine the next hop address.

```
switch(config)# ip route 10.17.252.0/24 nexthop-group NH-1  
switch(config)#
```

13.8.4.3 nexthop-group

The **nexthop-group** command places the switch in **nexthop-group** configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing **nexthop group** configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

The **nexthop-group** configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting the **nexthop-group** configuration mode does not affect **running-config**. The **exit** command returns the switch to **global** configuration mode.

The **no nexthop-group** and **default nexthop-group** commands delete previously configured commands in the specified **nexthop-group** mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

Command Mode

Global Configuration

Command Syntax

```
nexthop-group group_name type TUNNEL_TYPE
no nexthop-group [group_name][type TUNNEL_TYPE]
default nexthop-group [group_name][type TUNNEL_TYPE]
```

Parameters

- **group_name** Nexthop group name.
- **TUNNEL_TYPE** Tunnel protocol of the nexthop-group. Options include:
 - **ip** ECMP nexthop.
 - **ip-in-ip** IP in IP tunnel.
 - **gre** Encapsulates the Layer 3 protocols over IP networks.
 - **mpls-over-gre** Tunnels MPLS over a non-MPLS network.
 - **entry** Nexthop Group Entry Configuration.
 - **size** Nexthop Group Entry Size.
 - **tos** Tunnel encapsulation IP type of service.
 - **ttl** Tunnel encapsulation TTL value.
 - **tunnel-source** Source Interface or Address.

Commands Available in Nexthop-group Configuration Mode

- [entry \(Nexthop Group\)](#)
- [size \(Nexthop Group\)](#)
- [ttl \(Nexthop Group\)](#)
- [tunnel-source \(Nexthop Group\)](#)

Restrictions

Tunnel type availability varies by switch platform.

Examples

-
- This command creates a nexthop group named **NH-1** that specifies ECMP nexthops.

```
switch(config)# nexthop-group NH-1 type ip
switch(config-nexthop-group-NH-1)#
```

- This command exits nexthop-group mode for the **NH-1** nexthop group.

```
switch(config-nexthop-group-NH-1)# exit
switch(config)#
```

- These commands creates a nexthop group **NH-2** of type MPLS over GRE.

```
switch(config)# nexthop-group NH-2 type mpls-over-gre
switch(config-nexthop-group-NH-2)# tunnel-source 11.1.1.1
switch(config-nexthop-group-NH-2)# ttl 32
switch(config-nexthop-group-NH-2)# tos 20
switch(config-nexthop-group-NH-2)# entry 0 push label-stack 16000 tunnel-destination 11.1.1.2
switch(config)# ip route 100.1.1.1/32 Nexthop-Group NH-2
```

Counters for nexthop group may be enabled using the following command

```
switch(config)# hardware counter feature nexthop
```

13.8.4.4 show nexthop-group

The **show nexthop-group** command displays properties of the specified nexthop group.

Command Mode

EXEC

Command Syntax

```
show nexthop-group nhgroup_name [VRF_INST]
```

Parameters

- **nhgroup_name** Name of the group displayed by command.
- **VRF_INST** Specifies the VRF instance for which data is displayed.
 - **no parameter** Context-active VRF.
 - **vrf vrf_name** Specifies the name of VRF instance. System default VRF is specified by **default**.

Related Commands

The [show nexthop-group](#) command places the switch in the **nexthop-group** configuration mode to create a new group or modify an existing group.

Example

This command displays the nexthop group information.

```
switch(config)# show nexthop-group
Id          107
Type        mplsOverGre
Size        1 (auto size enabled, programmed size 1)
TTL         32
Source IP   11.1.1.1
Entries (left most label is the top of the stack)
  0 push label-stack 16000 tunnel-destination 11.1.1.2
    Tunnel destination directly connected, Ethernet1
    00:00:aa:aa:aa:aa, Ethernet1
```

With nexthop group counter enabled

```
switch(config)# show nexthop-group
Id          1
Type        mplsOverGre
Size        1 (auto size enabled, programmed size 1)
TTL         64
Source IP   0.0.0.0
Entries (left most label is the top of the stack)
  0 push label-stack 16000 tunnel-destination 1.1.1.2
    Tunnel destination directly connected, Ethernet1
    00:00:aa:aa:aa:aa, Ethernet1
  0 packets, 0 bytes
```

```
switch(config)# show nexthop-group summary
Number of Nexthop Groups configured: 1
Number of unprogrammed Nexthop Groups: 0
```

Nexthop Group Type	Configured
MPLS over GRE	1

Nexthop Group Size	Configured
1	1

13.8.4.5 size (Nexthop Group)

The **size** command configures the quantity of nexthop entries in the **nexthop group** configuration mode . Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the [entry \(Nexthop Group\)](#) command. The default size is **256** entries.

The **no size** and **default size** commands restore the size of the configuration mode nexthop group to its default of **256** by removing the corresponding **size** command from **running-config**.

Command Mode

Nexthop-group Configuration

Command Syntax

size *entry_size*

no size *entry_size*

default size *entry_size*

Parameter

entry_size Group size (entries). Value ranges from 1 to 255. Default value is 256.

Example

This command configures the nexthop group **NH-1** to contain **128** entries.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# size 128
switch(config-nexthop-group-NH-1)# show active
  nexthop-group NH-1
    size 128
    ttl 64
switch(config-nexthop-group-NH-1)#
```

13.8.4.6 ttl (Nexthop Group)

The **ttl** command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode nexthop group. The default TTL value is **64**.

The **no ttl** and **default ttl** commands restore the default TTL value written into TTL fields for the **nexthop group** configuration mode by deleting the corresponding **ttl** command from **running-config**.

Command Mode

Nexthop-group Configuration

Command Syntax

```
ttl hop_expiry
```

```
no ttl hop_expiry
```

```
default ttl hop_expiry
```

Parameters

hop_expiry Period that the packet remains valid (seconds or hops) Value ranges from **1** to **64**.

Restrictions

This command is available only to Nexthop groups for tunnels of type **IP-in-IP**, **GRE**, **MPLS**, and **MPLS over GRE**.

Related Commands

The [nexthop-group](#) command places the switch in the **nexthop-group** configuration mode.

Examples

- This command configures the **ttl** setting to **32** for nexthop group **NH-1** packets.

```
switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# ttl 32
switch(config-nexthop-group-NH-1)# show active
nexthop-group NH-1
  size 128
  ttl 32
switch(config-nexthop-group-NH-1)#
```

- This command restores the **no ttl** setting for nexthop group **NH-1** packets.

```
switch(config-nexthop-group-NH-1)# no ttl
switch(config-nexthop-group-NH-1)# show active nexthop-group NH-1
  size 128
  ttl 64
switch(config-nexthop-group-NH-1)#
```

13.8.4.7 tunnel-source (Nexthop Group)

The **tunnel-source** command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the **nexthop group** configuration mode. The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is **0.0.0.0**.

The **no tunnel-source** and **default tunnel-source** commands remove the source IP address setting from the configuration mode nexthop group by deleting the **tunnel-source** command from **running-config**.

Command Mode

Nexthop-group Configuration

Command Syntax

```
tunnel-source SOURCE
no tunnel-source SOURCE
default tunnel-source SOURCE
```

Parameters

SOURCE IP address or derivation interface. Options include:

- **ipv4_addr** An IPv4 address.
- **intf ethernet e_num** Ethernet interface specified by **e_num**.
- **intf loopback l_num** Loopback interface specified by **l_num**.
- **intf management m_num** Management interface specified by **m_num**.
- **intf port-channel p_num** Port-channel interface specified by **p_num**.
- **intf vlan v_num** VLAN interface specified by **v_num**.

Restrictions

This command is available only to Nexthop groups for tunnels of type **ip-in-ip**.

Related Commands

The **nexthop-group** command places the switch in the **nexthop-group** configuration mode.

Example

These commands create **interface loopback 100**, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group **NH-1**.

```
switch(config)# interface loopback 100
switch(config-if-Lo100)# ip address 10.1.1.1/32
switch(config-if-Lo100)# exit

switch(config)# nexthop-group NH-1
switch(config-nexthop-group-NH-1)# tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)# show active nexthop-group NH-1
    size 256
    ttl 64
    tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)# show nexthop-group NH-1
Name      Id      type    size  ttl  sourceIp
NH-1      2      ipInIp  256   64   10.1.1.1

switch(config-nexthop-group-NH-1)#
```

13.9 Global Knob to Set MTU for all Layer 3 Interfaces

- Global Layer 3 Maximum Transfer Unit (MTU) feature provides a CLI command to set the MTU value for all Layer 3 interfaces.
- The default value for global Layer 3 MTU and for each interface Layer 3 MTU is **1500**.
- Any interface which has an MTU configured is not affected by the global L3 MTU.
- When the global L3 MTU is changed, any existing interfaces which are using the default are updated to use the new MTU. Any additional interfaces which are configured in the future will also use the new default MTU.

The related sections are:

- [Global Knob to Set MTU for all Layer 3 Interfaces Configuration](#)
- [Show Commands](#)
- [Limitations](#)

13.9.1 Global Knob to Set MTU for all Layer 3 Interfaces Configuration

The global L3 **mtu** command is under **interface-defaults** sub-mode. In this example, the MTU value is set to **1600**.

```
(config)# interface defaults
(config-interface-defaults)# mtu 1600
```

13.9.2 Limitations

The following are limitations for the Global knob to set MTU for all Layer 3 interfaces feature:

- Only Ethernet, Port-Channel, and VLAN interfaces are supported.
- Other interface types, such as Management, Loopback, VXLAN, and Tunnel, are not supported.

13.9.3 Show Commands

Use the **show interface** command to display the current MTU value applied on the selected interface. In the following example, **interface ethernet1**, **interface ethernet2**, and **interface ethernet3** are selected for display.

```
(config)# interface ethernet3
(config-if-Et3)# no switchport
(config-if-Et3)# mtu 1600
(config-if-Et3)# interface defaults
(config-interface-defaults)# mtu 1700
(config-interface-defaults)# show interfaces ethernet1
...
IP MTU 1700 bytes (default) , BW 10000000 kbit
...
(config-interface-defaults)# show interfaces ethernet2
...
IP MTU 1700 bytes (default) , BW 10000000 kbit
...
(config-interface-defaults)# show interfaces ethernet3
...
IP MTU 1600 bytes , BW 10000000 kbit
...
```

In this example,

- Switch **interface ethernet3** from Layer 2 to Layer 3 and explicitly set its MTU to **1600**.
- Enter the **interface-defaults sub-mode**, set global L3 MTU to **1700**.
- The **show interface** command states **interface ethernet1** and **interface ethernet2** are using global L3 MTU value, while **interface ethernet3** are using its local MTU value.
- The **default** in the output indicates whether or not the interface is using global L3 MTU.

13.10 Support for Layer 3 MTU on 7280R3/7500R3/7800R3

Support for Layer 3 Maximum Transmission Unit (MTU) on 7280R3/7500R3/7800R3 switches includes the following:

- Enforces the MTU for Layer 3 packets on 7280R3/7500R3/7800R3 switches. The MTU can be set on any SVI and the MTU of that specific SVI is enforced when the packets egress out of a trunk port. This behavior is not supported on 7280E/R/R2 and 7500E/R/R2 line cards.
- MTU enforcement is done after adding all of the encapsulation headers in the Egress packet. For example, if an interface is configured with an MTU value of **1500** and the packet size is larger than **1500** with all encapsulation headers added, the packet is considered MTU violated. In 7280E/R/R2 and 7500E/R/R2 line cards, MTU is enforced before adding encapsulation headers.
- Actual MTU configured in hardware is MTU configured in the CLI + **18** bytes. **18** bytes is added to accommodate the L2 header. If the outgoing packet is untagged, the actual MTU configured in hardware is the MTU configured in the CLI + four (**4**) bytes.

13.10.1 Layer 3 MTU Configuration

You can configure Layer 3 MTU on Layer 3 interfaces and SVI's using the **mtu** command within interface configuration mode.

This command sets the MTU size of **1492** bytes on **interface ethernet 1/1**.

```
(config)# interface ethernet 1/1
(config-if-Et1/1)# mtu 1492
```

MTU is independently configurable on all routable interfaces. The switch supports MTU sizes ranging from **68** to **9214** bytes. The default MTU size is **1500** bytes.

The **no mtu** and **default mtu** commands restore the interface's MTU to the default value by removing the corresponding **mtu** command from **running-config**.

13.10.2 Layer 3 MTU Show Commands

The **show interfaces** command displays the MTU configured on the L3 interface. In this example, **ethernet 1/1** interface is selected to display. **IP MTU** represents the Layer 3 MTU of the interface.

```
switch(config-if-Et9/1)# show interfaces ethernet 1/1
...
IP MTU 1600 bytes , BW 1000000000 kbit
Full-duplex, 100Gb/s over 4 lanes, auto negotiation: off, uni-link: n/a
...
```

13.10.3 L3 MTU Limitations

The following limitations apply to support of Layer 3 MTU:

- Only three (3) unique MTU values can be configured on a switch. If the number of unique MTU values exceeds three (3), additional unique MTU definitions will not be enforced on an interface.

-
- When the number of unique MTU values becomes less than three (3) (after unconfiguring MTU on some interfaces), MTU on interfaces that are previously unprogrammed, are not reprogrammed automatically. CLI commands `no mtu` followed by `mtu` must be called to program MTU on an interface.
 - When the startup configuration has more than three (3) unique MTU values defined on different interfaces of the switch, there is no guarantee which unique MTU values will be active when the switch is rebooted.
 - L3 MTU is not enforced on Multicast packets for Jericho2 based platforms.

13.11 Segment Security

- [Overview of MSS-Group](#)
- [Configuring MSS-Group](#)
- [Limitations](#)
- [Show Commands](#)
- [Segment Security Commands](#)

13.11.1 Overview of MSS-Group

Hosts and networks can be grouped into segments based on their prefixes; the MSS-Group feature (also called Segment Security) allows policies to be applied to segments rather than to interfaces or subnets. Policies define inter-segment and intra-segment rules; for example, segment A is allowed to communicate with segment B, or hosts in segment B are not allowed to communicate with each other.

By default, traffic directed to a segment is dropped; an explicit allow policy is required to allow communication. The two directions of traffic are handled independently; to allow traffic between two segments, forward policy must be configured in both segments.

13.11.2 Configuring MSS-Group

To configure MSS-Group (segment security) to control groups of IPv4 and/or IPv6 addresses (called “segments”), define one or more match lists, create segments based on those match lists, create policies governing traffic to individual segments, define default policy for all segments, and enable the MSS-Group feature. Up to 60 segments can be defined across all VRFs. Traffic to and from VLANs with no SVI configured are considered part of the default VRF, and are subject to the policies defined in the default VRF. This feature does not require routing to be enabled on the switch, even though the mode name starts with the word “router.”

Define Match Lists

Use the `match-list input` command to define an IPv4 or IPv6 subnet list. Each match list must contain only one type of prefix, either IPv4 or IPv6. It cannot contain a mixture. Each match list name of a given type must be unique, but an IPv4 match list and an IPv6 match list can have the same name.

Example

- The following commands define two IPv4 match lists named camera-prefixes and admin-prefixes and two IPv6 match lists also named camera-prefixes and admin-prefixes, and add a total of seven prefixes.

```
switch(config)# match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-ipv4 69.89.31.200/32
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-ipv4 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-ipv4 70.89.31.0/24
switch(config-match-list-prefix-ipv4-camera-prefixes)# exit
switch(config)# match-list input prefix-ipv6 camera-prefixes
switch(config-match-list-prefix-ipv6-camera-prefixes)# match prefix-ipv6 2001:0:9d38:6ab8::/64
switch(config-match-list-prefix-ipv6-camera-prefixes)# match prefix-ipv6 2002:0:9d38:6
ab8::3/128
switch(config-match-list-prefix-ipv6-camera-prefixes)# exit
switch(config)# match-list input prefix-ipv4 admin-prefixes
switch(config-match-list-prefix-ipv4-admin-prefixes)# match prefix-ipv4 80.80.0.0/16
switch(config-match-list-prefix-ipv4-admin-prefixes)# exit
switch(config)# match-list input prefix-ipv6 admin-prefixes
switch(config-match-list-prefix-ipv6-admin-prefixes)# match prefix-ipv6 2003:0:9d38:6ab8::/64
switch(config-match-list-prefix-ipv6-admin-prefixes)# exit
switch(config)#
```

Define Segments using Match Lists

Use the `segment` command to define a segment. A segment contains one or two match lists, one of type IPv4 and the other of type IPv6.

Example

- The following commands define segments using the match lists configured above.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment camera
switch(config-router-seg-sec-vrf-segment-camera)# definition
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv4 camera-prefixes
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv6 camera-prefixes
switch(config-router-seg-sec-vrf-segment-def)# exit
switch(config-router-seg-sec-vrf-segment-camera)# exit
switch(config-router-seg-sec-vrf-default)# segment secure-admin
switch(config-router-seg-sec-vrf-segment-secure-admin)# definition
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv4 admin-prefixes
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv6 admin-prefixes
switch(config-router-seg-sec-vrf-segment-def)# exit
switch(config-router-seg-sec-vrf-segment-secure-admin) exit
switch(config-router-seg-sec-vrf-default)# exit
switch(config-router-seg-sec)# exit
switch(config)#
```

Define Policies Between Segments

Use the `policies` command to drop or forward traffic to a segment from specific other segments. Two built-in policies are available: `policy-forward-all` to forward traffic between segments, and `policy-drop-all` to drop traffic between segments. By default, the drop-all policy is enabled.

Example

- The following commands allow bidirectional traffic between the two segments defined above.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment camera
switch(config-router-seg-sec-vrf-segment-camera)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from secure-admin policy policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)# exit
switch(config-router-seg-sec-vrf-segment-camera)# exit
switch(config-router-seg-sec-vrf-default)# segment secure-admin
switch(config-router-seg-sec-vrf-segment-secure-admin)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from secure-admin policy policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)# exit
switch(config-router-seg-sec-vrf-segment-secure-admin)# exit
switch(config-router-seg-sec-vrf-default)# exit
switch(config-router-seg-sec)# exit
switch(config)#
```

Enable MSS-Group

By default, MSS-Group is not enabled. Use the `no shutdown` command to enable it. Use the `shutdown` command to disable it.

Examples

- The following commands enable MSS-Group.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no shutdown
switch(config-router-seg-sec)# exit
switch(config)#
```

- The following commands disable MSS-Group.

```
switch(config)# router segment-security
```

```
switch(config-router-seg-sec)# shutdown
switch(config-router-seg-sec)# exit
switch(config)#
```

Configuring Default Forward/Drop Behavior

By default, when MSS-Group is first enabled, all traffic to nodes in a segment is dropped unless explicitly allowed by a "forward-all" policy as shown above. This includes traffic within the segment. Use the **no segment policy** command to change this behavior to allow intra-segment traffic.

Example

- The following commands allow all traffic within each segment as well as between segments.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no segment policy policy-drop-all default
switch(config-router-seg-sec)# exit
switch(config)#
```

You can modify the policy for each segment and in greater detail with the **policies** command.

Example

- The following commands prevent nodes in the **camera** segment from communicating with each other.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment camera
switch(config-router-seg-sec-vrf-segment-camera)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from camera policy policy-drop-all
switch(config-router-seg-sec-vrf-segment-policies)# exit
switch(config-router-seg-sec-vrf-segment-camera)# exit
switch(config-router-seg-sec-vrf-default)# exit
switch(config-router-seg-sec)# exit
switch(config)# exit
```

13.11.3 Limitations

- Multicast and Link Local prefixes are not supported.
- Traffic disruption during prefix and policy configuration is expected. We do not support atomicity during segment and prefix configuration.
- MSS-Group and URPF feature interaction is not supported. If both features are configured (misconfiguration), the platform gives URPF higher priority and removes any existing segment configurations from hardware.
- Prefixes entries failed to get installed in hardware (because of insufficient hardware resources) are retried periodically till resources become available and prefixes are successfully installed. However, the same is not true for policy entries. There is no retry mechanism implemented for failed policy entries. The user needs to free up hardware resources and re-enable the MSS-Group feature after removing it once.
- Custom policies can not be configured. Clients can choose from two built-in policies 'policy-drop-all' and 'policy-forward-all'.
- A given prefix can only be part of a single segment in VRF. Attempting to configure the same prefix in more than one segment leads to undefined traffic forwarding behavior.
- The same prefix can not be configured in both MSS-Group and MSS-L3 configurations.
- SSU can be performed with MSS-Group configured but the traffic flows for MSS-Group configuration will not be hitless.

- DHCP discovery packets with broadcast destination IP of **255.255.255.255** will only match **0.0.0.0/0** prefix.
- All traffic sourced from and/or destined to switch owned IPs are allowed regardless of MSS-Group configuration.
- Due to source and destination IP lookup being required, the capacity of the LPM table is halved when MSS-G is enabled. The host table capacity is unchanged as the source and destination lookup is always enabled by default.

13.11.4 Show Commands

The **show** commands available to examine the configuration and status of MSS-Group include:

- **show segment-security [vrf <vrf-name>] [segment <seg-name>]**

```
switch# show segment-security
VRF : default
Segment      Interfaces Prefix IPv4      Prefix IPv6      From Segment Policy
-----
camera        camera-prefixes camera-prefixes secure-admin policy-forward-all
secure-admin  admin-prefixes  admin-prefixes  camera        policy-forward-all
```

- **show match-list {prefix-ipv4 | prefix-ipv6} [<list-name>]**

```
switch# show match-list prefix-ipv4
Name      Prefix
-----
admin-prefixes 80.80.0.0/16
camera-prefixes 69.89.31.200/32
               69.89.31.201/32
               70.89.31.0/24

switch# show match-list prefix-ipv6
Name      Prefix
-----
admin-prefixes 2003:0:9d38:6ab8::/64
camera-prefixes 2001:0:9d38:6ab8::/64
               2002:0:9d38:6ab8::3/128
```

- **show segment-security hardware summary [vrf <vrf-name>] [segment<seg-name>]**

This command shows the hardware ID, number of prefixes, and number of successfully programmed prefixes for each VRF and segment specified. By default, all VRFs and segments are shown.

```
switch# show segment-security hardware summary
VRF: default
Segment      Hardware ID  Prefixes  Programmed
-----
camera        63          5         5
secure-admin  62          2         2
```

- **show segment-security hardware detail [vrf <vrf-name>] [segment<seg-name>]**

This command shows the hardware ID assigned to each segment, the prefixes in each segment, and the adjacency index for each prefix (as determined from L3 hardware tables).

```
switch# show segment-security hardware detail
VRF: default
Segment      Hardware ID  Prefixes      Adj Index
-----
camera        63          69.89.31.200/32 1
               69.89.31.201/32 1
               70.89.31.0/24   1
               2001:0:9d38:6ab8::/64 2
               2002:0:9d38:6ab8::3/128 2
secure-admin  62          80.80.0.0/16   1
               2003:0:9d38:6ab8::/64 2
```

- **show segment-security hardware routes [vrf<vrf-name>] [segment<seg-name>]**

Since MSS Group prefixes use L3 hardware tables, the prefixes can overlap with FIB routes. So each prefix is assigned a route type. There are three possible classifications for a prefix:

1. The prefix does not overlap with an FIB route. This prefix has route type 'S'.
2. The prefix is also configured in the FIB. If a segment prefix is identical to an FIB prefix, it is given the route type 'S,F'.
3. The prefix overlaps with an FIB entry but there is no exact match in the FIB. This prefix has the route type 'F'.

The following command shows the route types for prefixes in hardware.

```
switch# show segment-security hardware routes
Codes: S - Segment prefix
       F - FIB route
       S,F - Segment prefix which is also present in FIB
VRF: default
Segment      Hardware ID  Routes                                     Route Type
-----
camera        63          69.89.31.200/32                           S
              69.89.31.201/32                S
              70.89.31.0/24                  S,F
              2001:0:9d38:6ab8::/64          S
              2002:0:9d38:6ab8::3/128        S
secure-admin  62          80.80.0.0/16                             S
              2003:0:9d38:6ab8::/64          S
```

- **show segment-security hardware counters[vrf<vrf-name>]**

This command displays the counters for policies in each segment, including the default policies. For each policy configured between two segments, the Hit counter shows all hits, whether the packets were dropped or forwarded. The Drop counter shows which of those hits were dropped. There are also lines for the default policy of each segment, and the Drop counter includes packets which do not match a configured policy but are dropped by these default policies.

```
switch# show segment-security hardware counters
VRF: default
Policy      Hit      Drop
-----
policy-drop-all      6          6
policy-forward-all  13          0
Dest Segment  Source Segment  Policy      Hit      Drop
-----
camera        *              n/a         0        3
camera        camera          n/a         6        6
camera        secure-admin    n/a         4        0
secure-admin  *              n/a         0       12
secure-admin  camera          n/a         9        0
```

- **clear segment-security hardware counters**

This command clears the Hit and Drop counters for each policy, setting them to 0.

- [show segment-security hardware detail](#)
- [show segment-security hardware routes](#)
- [show segment-security hardware summary](#)

13.11.5.1 clear segment-security hardware counters

The **clear segment-security hardware** command clears the MSS-Group (segment security) Hit and Drop counters for all hits, and the hits and drops for each separate segment's policy. All MSS-Group counters are set to 0.

Command Mode

Privileged EXEC

Command Syntax

```
clear segment-security hardware counters
```

Examples

- This command clears all counters for MSS-Group.

```
switch# clear segment-security hardware counters  
switch#
```

13.11.5.2 definition (segment)

The **definition** command enters Router Segment-Security VRF Segment Definition Configuration mode. This is not a group change mode. Changes are applied to **running-config** immediately. The **exit** command does not affect the configuration.

The **no definition** and **default definition** commands clear the segment definitions from **running-config**.

Command Mode

Router Segment-Security VRF Segment Configuration

Command Syntax

`definition`

`no definition`

`default definition`

Commands Available in Router Segment-Security VRF Segment Definition Configuration Mode

`match (segment definition)`

Example

- These commands enter Router Segment-Security VRF Segment Definition mode for the segment "admin".

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# definition
switch(config-router-seg-sec-vrf-segment-def)#
```

13.11.5.3 from (segment policies)

The **from** command adds a policy to a segment in order to filter traffic from a specified segment (the same segment or a different segment). The policy can be either policy-drop-all or policy-forward-all. The default is policy-drop-all. Therefore, for a segment to allow traffic among its own members, it requires a policy-forward-all policy for itself. You can add any number of policies.

The **no from** and **default from** commands clear the segment policy from the *running-config*.

Command Mode

Router Segment-Security VRF Segment Policies Configuration

Command Syntax

```
from segment_name policy policy_type
no from segment_name [policy policy_type]
default from segment_name [policy policy_type]
```

Parameters

policy_type The type of policy. The possible values are "policy-drop-all" and "policy-forward-all". The default is "policy-drop-all".

segment_name The name of the segment to filter. This can be the segment currently being configured, to give you control over traffic within the segment.

Related Command

```
segment policy policy-drop-all default
```

Example

These commands add three policies to the segment **admin**. One policy allows traffic within the **admin** segment itself. The second policy drops all traffic from segment **seg1**. The third policy forwards all traffic from **seg2**.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# policies
switch(config-router-seg-sec-vrf-segment-policies)# from admin policy policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)# from seg1 policy policy-drop-all
switch(config-router-seg-sec-vrf-segment-policies)# from seg2 policy policy-forward-all
switch(config-router-seg-sec-vrf-segment-policies)#
```

13.11.5.4 match-list input

The **match-list input** command enters Match List Configuration mode for the specified match list, creating one if it does not exist. The commands in this mode apply changes to **running-config** immediately. The **exit** command is not needed to save the changes to the configuration.

The **no match-list input** and **default match-list input** commands remove the specified match list from **running-config**.

Command Mode

Global Configuration Mode

Command Syntax

```
match-list input {prefix-ipv4|prefix-ipv6} match_list_name
no match-list input {prefix-ipv4|prefix-ipv6} match_list_name
no match-list input {prefix-ipv4|prefix-ipv6} match_list_name
```

Parameters

- **prefix-ipv4** This match list has IPv4 prefixes only.
- **prefix-ipv6** This match list has IPv6 prefixes only.
- **match_list_name** The name of the match-list to add to. If it does not exist it will be created.

Examples

- The following command creates an IPv4 match list called **camera-prefixes** and enters Match List Configuration mode.

```
switch(config)# match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-admin-prefixes)#
```

- The following command removes the IPv4 match list **camera-prefixes** from **running-config**.

```
switch(config)# no match-list input prefix-ipv4 camera-prefixes
switch(config)#
```

13.11.5.5 match (match-list input)

The **match** command adds an entry to a match list. Each entry in a given match list must be of the same type, either IPv4 or IPv6. This command updates **running-config** immediately. It is not necessary to use the **exit** command to save changes.

The **no match** and **default match** commands remove the specified match list entry from the match list in **running-config**.

Command Mode

Match List input Configuration Mode

Command Syntax

```
match {prefix-ipv4|prefix-ipv6} ip_address_prefix
no match {prefix-ipv4|prefix-ipv6} ip_address_prefix
default match {prefix-ipv4|prefix-ipv6} ip_address_prefix
```

Parameters

- **prefix-ipv4** This prefix is IPv4. You cannot mix prefix types in a single match list.
- **prefix-ipv6** This prefix is IPv6. You cannot mix prefix types in a single match list.
- **ip_address_prefix** The prefix to add. For IPv4, it is of the form **A.B.C.D/E**. For IPv6, it is of the form **A:B:C:D:E:F:G:H/I**.

Examples

- The following commands add two IPv4 entries to the match list **camera-prefixes**.

```
switch(config)# match-list input prefix-ipv5 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-ipv4 69.89.31.200/32
switch(config-match-list-prefix-ipv4-camera-prefixes)# match prefix-ipv4 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#
```

- The following command removes one entry from the **camera-prefixes** match list.

```
switch(config)# match-list input prefix-ipv4 camera-prefixes
switch(config-match-list-prefix-ipv4-camera-prefixes)# no match prefix-ipv4 69.89.31.201/32
switch(config-match-list-prefix-ipv4-camera-prefixes)#
```

13.11.5.6 match (segment definition)

The **match** command adds a match list to a segment definition. The match list cannot contain both IPv4 and IPv6 prefixes. One match list of each type can be added. The segment definition is updated in *running-config* immediately.

The **no match** command removes the specified match list from the segment definition in *running-config*.

The **default match** command removes the specified match list from the segment definition in *running-config*.

Command Mode

Router Segment-Security VRF Segment Definition Configuration

Command Syntax

```
match {prefix-ipv4|prefix-ipv6} match_list_name
no match {prefix-ipv4|prefix-ipv6} match_list_name
default match {prefix-ipv4|prefix-ipv6} match_list_name
```

Parameters

prefix-ipv4 The match list contains IPv4 prefixes.

prefix-ipv6 The match list contains IPv6 prefixes.

match_list_name The name of the match list.

Examples

These commands add two match lists to the segment **admin**, an IPv4 match list named **admin-prefixes** and an IPv6 match list also named **admin-prefixes**.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# definition
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv4 admin-prefixes
switch(config-router-seg-sec-vrf-segment-def)# match prefix-ipv6 admin-prefixes
switch(config-router-seg-sec-vrf-segment-def)#
```

13.11.5.7 policies (segment)

The **policies** command places the switch in Router Segment Security VRF Segment Policies Configuration mode. In this mode, the command **from** creates a policy for the segment. A segment can contain multiple policies.

The **no policies** command clears the segment policies from *running-config*.

The **default policies** command clears the segment policies from *running-config*.

Command Mode

Router Segment-Security VRF Segment Configuration

Command Syntax

`policies`

`no policies`

`default policies`

Examples

This command places the switch in Router Segment-Security VRF Segment Policies configuration mode for the segment *admin*.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)# policies
switch(config-router-seg-sec-vrf-segment-policies)#
```

13.11.5.8 router segment-security

The **router segment-security** command enters Router Segment-Security Configuration Mode. This mode is required to enable or disable MSS-Group (segment security), and to enter the Router Segment-Security VRF configuration mode to create segments from match lists and to configure MSS-Group.

The **no router segment-security** command removes the MSS-Group configuration from *running-config*.

The **default router segment-security** command removes the MSS-Group configuration from *running-config*.

Command Mode

Global Configuration Mode

Command Syntax

```
router segment-security
no router segment-security
default router segment-security
```

Commands Available In Router Segment-Security Configuration Mode

segment

shutdown

vrf

Examples

- The following command enters Router Segment-Security configuration Mode.

```
switch(config)# router segment-security
switch(config-router-seg-sec)#
```

- The following command disables MSS-Group and removes the MSS-Group configuration from the *running-config*.

```
switch(config)# no router segment-security
switch(config)#
```

13.11.5.9 segment

The **segment** command enters Router Segment-Security VRF Segment Configuration mode, creating a segment if one does not exist. The commands in this mode apply changes to **running-config** immediately. The **exit** command does not affect the configuration.

The **no segment** command and the **default segment** command clear the segment from **running-config**.

Command Mode

Router Segment-Security VRF Configuration

Command Syntax

```
segment segment_name
```

```
no segment segment_name
```

```
default segment segment_name
```

Parameters

segment_name the name of the segment.

Commands Available in Router Segment-Security VRF Segment Configuration Mode

- [definition](#)
- [policies](#)

Example

The following command creates a new segment called **admin** and enters Segment Configuration mode.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)# segment admin
switch(config-router-seg-sec-vrf-segment-admin)#
```

13.11.5.10 segment policy policy-drop-all default

The **segment policy policy-drop-all default** command configures the switch to drop all traffic to all segments. This is the default.

The **no segment policy policy-drop-all default** command allows segments to receive traffic. This is necessary to allow traffic within a segment.

The **default segment policy policy-drop-all default** command restores the default, so that all traffic to all segments is dropped.

Command Mode

Router Segment-Security Configuration

Command Syntax

```
segment policy policy-drop-all default
```

```
no segment policy policy-drop-all default
```

```
default segment policy policy-drop-all default
```

Example

This command removes the policy-drop-all policy from the general segment security configuration.

```
switch(config)# router segment-security  
switch(config-router-seg-sec)# no segment policy policy-drop-all default  
switch(config-router-seg-sec)#
```

13.11.5.11 show match-list

The **show match-list** command displays match lists of type IPv4 or IPv6.

Command Mode

Privileged EXEC

Command Syntax

```
show match-list {prefix-ipv4 | prefix-ipv6} [list-name]
```

Parameters

- **prefix-ipv4** IPv4 prefix list.
- **prefix-ipv6** IPv6 prefix list.
- ***list-name*** match list name.

Examples

- The following command displays all the IPv4 match lists and their contents.

```
switch# show match-list prefix-ipv4
Name          Prefix
-----
admin-prefixes 80.80.0.0/16
camera-prefixes 69.89.31.200/32
                69.89.31.201/32
                70.89.31.0/24 switch#
```

- The following command displays the contents of the IPv6 match list camera-prefixes.

```
switch# show match-list prefix-ipv6 camera-prefixes
Name          Prefix
-----
camera-prefixes 2001:0:9d38:6ab8::/64
                2002:0:9d38:6ab8::3/128 switch#
```

13.11.5.12 show segment-security

The **show segment-security** command shows the status and configuration of MSS-Group (segment security).

Command Mode

Privileged EXEC

Command Syntax

```
show segment-security [{vrf vrf_name} [segment seg_name] | application [application_name]
| policy [policy_name] | segment segment_name | sessions [vrf vrf_name] | status [vrf vrf_name]
[segment seg_name]]
```

Parameters

- **vrf** Show information for a particular VRF. By default, all VRFs are shown.
 - **vrf_name** VRF name to show. The default VRF instance is named "default".
- **segment** Show information for a particular segment. By default, all segments are shown.
 - **segment_name** The name of the segment to show.
- **application** Show status and configuration for applications. By default, no application information is shown.
 - **application_name** The name of the application to show. If this is omitted, all applications are shown.
- **policy** Show information about policies.
 - **policy_name** The name of the policy to show. If this is omitted, all policies are shown.
- **sessions** Show information about sessions.
 - **vrf** Show session information about a particular VRF.
 - **vrf_name** The VRF for which to show session information. The default VRF is named "default".
- **status** Show status information.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must precede the **segment** parameter. Command syntax such as **show segment-security hardware detail segment segment_name vrf vrf_name** is not valid.

Examples

- This command displays the MSS-Group configuration for all VRF instances and all segments.

```
switch# show segment-security
VRF : default
Segment      Interfaces Prefix IPv4      Prefix IPv6      From Segment Policy
-----
camera                camera-prefixes camera-prefixes secure-admin policy-forward-all
secure-admin          admin-prefixes  admin-prefixes  camera          policy-forward-all
switch#
```

- This command shows the MSS-Group configuration for the default VRF instance only.

```
switch# show segment-security vrf default
VRF : default
Segment      Interfaces Prefix IPv4      Prefix IPv6      From Segment Policy
-----
camera                camera-prefixes camera-prefixes secure-admin policy-forward-all
```

```
secure-admin      admin-prefixes  admin-prefixes  camera      policy-forward-all
switch#
```

- This command shows the MSS-Group configuration for the **camera** segment.

```
switch# show segment-security segment camera
VRF : default
Segment      Interfaces Prefix IPv4      Prefix IPv6      From Segment Policy
-----
camera              camera-prefixes camera-prefixes  secure-admin policy-forward-all
switch#
```

- This command shows information for all applications.

```
switch# show segment-security applications
application: app-match-all
protocol: all switch#
```

- This command shows information for the policy **policy-drop-all**.

```
switch# show segment-security policy policy-drop-all
policy: policy-drop-all [readonly]
10 application app-match-all action drop stateless switch#
```

13.11.5.13 show segment-security hardware counters

The **show segment-security hardware counters** command displays the counters for policies in each segment, including the default policies. For each policy configured between two segments, the Hit counter shows all hits, whether the packets were dropped or forwarded. The Drop counter shows which of those hits were dropped. There are also lines for the default policy of each segment, and the Drop counter includes packets which do not match a configured policy but are dropped by these default policies. To clear the Hit and Drop counters for each policy, setting them to 0, use the **clear segment-security hardware counters** command.

Command Mode

Privileged EXEC

Command Syntax

```
show segment-security hardware counters [vrf vrf_name]
```

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- **vrf_name** The VRF to show. To show the default VRF, specify "default".

Example

This command displays the policy and counters for policies configured for all segments in VRF **site_b**.

```
switch# show segment-security hardware counters vrf site_b
VRF: site_b
Policy              Hit      Drop
-----
policy-drop-all    6        6
policy-forward-all 13        0

Dest Segment      Source Segment      Policy      Hit      Drop
-----
camera            *                   n/a         0        3
camera            camera              6          6
camera            secure-admin        4          0
secure-admin      *                   n/a         0       12
secure-admin      camera              9          0 switch#
```

13.11.5.14 show segment-security hardware detail

The **show segment-security hardware detail** command displays the hardware ID allocated to each segment, the prefixes programmed in hardware for each segment, and the adjacency index used by each prefix (as determined from L3 hardware tables).

Command Mode

Privileged EXEC

Command Syntax

```
show segment-security hardware detail [vrf vrf_name][segment seg_name]
```

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- **vrf_name** The name of the VRF to show details for. To show details for the default VRF, you must specify "default".
- **segment** Show details for a specific segment. If this parameter is omitted, details for all segments are shown.
- **seg_name** The name of the segment to show details for.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must come first. The command syntax **show segment-security hardware detail segment *segment_name* vrf *vrf_name*** is not valid.

Example

This command displays the hardware IDs allocated to each segment in vrf **site_a**, the prefixes in each segment, and the adjacency index for each prefix (as determined from L3 hardware tables).

```
switch# show segment-security hardware detail vrf site_a
VRF: site_a
Segment      Hardware ID    Prefixes                      Adj Index
-----
camera        63             69.89.31.200/32              1
               69.89.31.201/32              1
               70.89.31.0/24                1
               2001:0:9d38:6ab8::/64        2
               2002:0:9d38:6ab8::3/128      2
secure-admin  62             80.80.0.0/16                 1
               2003:0:9d38:6ab8::/64        2 switch#
```

13.11.5.15 show segment-security hardware routes

The **show segment-security hardware routes** command displays the route and type for each programmed prefix in hardware. Since MSS-Group prefixes use L3 hardware tables, the prefixes can overlap with FIB routes, so each prefix is assigned a route type. There are three possible classifications for a prefix:

1. The prefix does not overlap with an FIB route. This prefix has route type S.
2. The prefix is also configured in the FIB. If a segment prefix is identical to an FIB prefix, it is given the route type S,F.
3. The prefix overlaps with an FIB entry but there is no exact match in the FIB. This prefix has the route type F.

Command Mode

Privileged EXEC

Command Syntax

```
show segment-security hardware routes [vrf vrf-name][segment seg-name]
```

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- **vrf_name** The name of the VRF to show details for. To show details for the default VRF, you must specify "default".
- **segment** Show details for a specific segment. If this parameter is omitted, details for all segments are shown.
- **seg_name** The name of the segment to show details for.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must come first. The command syntax **show segment-security hardware detail segment segment_name vrf vrf_name** is not valid.

Example

This command displays the route and type for programmed prefixes in hardware for the VRF named **site_a** and the segment **camera**.

```
switch# show segment-security hardware routes vrf site_a segment camera
Codes: S - Segment prefix
       F - FIB route
       S,F - Segment prefix which is also present in FIB

VRF: site_a
Segment      Hardware ID  Routes                                     Route Type
-----
camera       63          69.89.31.200/32                           S
              69.89.31.201/32                  S
              70.89.31.0/24                    S,F
              2001:0:9d38:6ab8::/64             S
              2002:0:9d38:6ab8::3/128           S switch#
```

13.11.5.16 show segment-security hardware summary

The **show segment-security hardware summary** command displays the hardware ID, number of prefixes, and number of successfully programmed prefixes for each VRF and segment specified. By default, all VRFs and segments are shown.

Command Mode

Privileged EXEC

Command Syntax

```
show segment-security hardware summary [vrf vrf-name][segment seg-name]
```

Parameters

- **vrf** Show details for a specific VRF. If this parameter is omitted, details for all VRFs are shown.
- **vrf_name** The name of the VRF to show details for. To show details for the default VRF, you must specify "default".
- **segment** Show details for a specific segment. If this parameter is omitted, details for all segments are shown.
- **seg_name** The name of the segment to show details for.

Guidelines

If both **vrf** and **segment** parameters are specified, the **vrf** parameter must come first. The command syntax **show segment-security hardware detail segment *segment_name* vrf *vrf_name*** is not valid.

Example

This command displays the hardware ID allocated to each configured segment, the number of prefixes configured, and the number of prefixes successfully programmed in hardware for all VRFs and all segments.

```
switch# show segment-security hardware summary

VRF: default
Segment      Hardware ID  Prefixes  Programmed
-----
camera       63          5         5
secure-admin 62          2         2 switch#
```

13.11.5.17 shutdown (router segment-security)

The **shutdown** command disables MSS-Group (segment security) in the switch. This is the default. The **no shutdown** and **default shutdown** commands enable MSS-Group.

Command Mode

Router Segment-Security Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Example

This command enables MSS-Group in the switch.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# no shutdown
switch(config-router-seg-sec)#
```

13.11.5.18 vrf (router segment-security)

The **vrf** command enters Router Segment-Security VRF Configuration mode, creating a VRF instance if necessary, to create and configure MSS-Group segments.

Command Mode

Router Segment-Security Configuration

Command Syntax

vrf *vrf_instance*

Parameter

vrf_instance The name of the VRF instance. To configure MSS-Group for the default VRF instance, specify "default".

Commands Available in Router Segment-Security VRF Configuration Mode

[segment](#)

Example

The following command enters Router Segment-Security VRF Configuration mode for the default VRF instance.

```
switch(config)# router segment-security
switch(config-router-seg-sec)# vrf default
switch(config-router-seg-sec-vrf-default)#
```

IP Services

The Internet Protocol Services (IP Services) chapter contains the following section(s):

- [CloudVision eXchange \(CVX\)](#)

14.1 CloudVision eXchange (CVX)

CloudVision eXchange (CVX) provides a single access point for real-time provisioning, orchestration and integration with third-party controllers. CVX aggregates and distributes operational state information across a set of EOS switches to support applications that provide network services. See the *CloudVision User Guide*, <https://www.arista.com/en/support/product-documentation>, for additional information.

Topics in this section include:

- [Upgrading CVX](#)
- [CVX Overview](#)
- [CVX Services](#)
- [Deploying CVX](#)
- [CVX Configuration](#)
- [CVX Secure out-of-band Connection](#)
- [CVX High Availability](#)
- [CVX VIP](#)
- [CVX Commands](#)

14.1.1 Upgrading CVX

You can upgrade CVX from a previous version to the current version by performing a few simple tasks. You can use the following procedure to upgrade any previous version of CVX to the current version.

Requirements

Make sure you follow these requirements during the upgrade process.

- If you have CVP, CVX and client switches in your environment, make sure you upgrade each component in the following order:
 - Upgrade CVP first.
 - Upgrade the CVX cluster.
 - Upgrade the client switches. The reason for this is to ensure backward compatibility.
 - You must upgrade the CVX cluster before you upgrade the client switches.
 - If the CVX cluster is a three node cluster, make sure that only one node of the cluster is down at any one time during the upgrade process. (The order in which you upgrade the nodes does not matter.)

Pre-requisites

Before you begin the upgrade, make sure that:

- You perform a backup to ensure that you can restore data if needed.

- You download the latest version of CVX from Arista's Software Download page (<https://www.arista.com/en/support/software-download>).

Complete the following steps to upgrade CVX.

1. Login to the cluster to be upgraded. (You can login to any node.)
2. Upgrade the node. You must deploy a new image to perform the upgrade.
3. Wait for the node you are upgrading to rejoin the cluster. Once the node has rejoined, go to the next step. (The node automatically rejoins the cluster as a follower node.)
4. Repeat steps 1 through 3 to upgrade the two remaining nodes one node at a time. It does not matter the order in which you upgrade the remaining nodes.

14.1.2 CVX Overview

A CVX deployment includes CVX and a set of CVX clients to which CVX provides services. CVX is not part of the data plane, nor does it receive data-path traffic. All CVX components exist as agents that run on EOS instances.

For more information, see:

- [System Requirements](#)
- [CVX Infrastructure](#)
- [CVX Features](#)
- [CVX Clients](#)

14.1.2.1 System Requirements

Certain hardware and software is required to be able to use CloudVision eXchange in your CloudVision virtual appliance implementation.

The CloudVision eXchange should be installed on a single system along with CloudVision Portal.

The following table lists the minimum hardware and software required to use CloudVision eXchange.

Required Hardware

The hardware required to use the CloudVision eXchange are:

- CPU: 4 cores (base), 8 cores (recommended)
- RAM: 4G (base), 8G (recommended)
- Disk: 4G

Required Software

The software required to use the CloudVision eXchange are:

- EOS switches: Recommend 4.16.8M or later

Note: It is a best practice and highly recommended that the version of CVX should match the version running on the switches.

- CloudVision Portal: version 2016.1

(CloudVision Portal software is required if you want to use it in conjunction with CloudVision eXchange. If you plan to use only CloudVision eXchange, CloudVision Portal software is not required.)

Note: CVX supports live vMotion.

14.1.2.2 CVX Infrastructure

CVX provides a single integration point into network-wide services running across CVX clients. CVX is typically deployed as an EOS instance running on a VM (vEOS). The CVX infrastructure consists of a CVX instance functioning as a server and a set of CVX clients. The CVX server uses a heartbeat keepalive (KA) mechanism to maintain contact with its clients.

When de-configuring or shutting down CVX, client services should be shut down first.

14.1.2.3 CVX Features

CVX manages communications among the network CVX clients, and provides an integration point for services to those clients. CVX also discovers the physical network topology by aggregating topology information it receives from its client devices.

14.1.2.4 CVX Clients

CVX client is the agent that allows a switch to interact with a CVX server to access CVX services. Enabling the CVX client includes providing the IP address or host name of the device running CVX. The CVX client can then access services that are enabled on the CVX server.

The CVX client must be enabled to access the CVX server and the services it offers. Individual services may require additional configuration statements.

Services should be shut down or de-configured on clients before shutting down or de-configuring CVX. CVX-controlled switch features may continue to run after shutting down CVX if they are not explicitly shut down or de-configured prior to shutting down CVX.

14.1.3 CVX Services

CVX services are applications that run on top of the CVX infrastructure, and are accessed by CVX clients through the CVX server. All CVX services are maintained by version level; client switches negotiate the version they use when connecting to the server. This allows multiple switches that run different EOS versions to connect to the same CVX server.

The following sections briefly describe some of the services available to CVX clients through CVX:

- [OpenStack Service](#)
- [VXLAN Control Service](#)
- [Hardware Switch Controller \(HSC\) Service](#)
- [Network Topology Service](#)
- [Static Topology Service](#)

14.1.3.1 OpenStack Service

The OpenStack service on CVX allows the networking component of an OpenStack deployment (also known as Neutron) to share state with CVX.

When deployed, this integration allows CVX to send state about the logical networks created in the OpenStack cloud to the CVX clients that configure the network.

More information on OpenStack software can be found in its online documentation at <http://docs.openstack.org/>.

14.1.3.2 VXLAN Control Service

The VXLAN control service allows hardware VXLAN Tunnel End Points (VTEPs) to share state with each other in order to establish VXLAN tunnels without the need for a multicast control plane. Configuration is required both on the client switches and in CVX.

14.1.3.3 Hardware Switch Controller (HSC) Service

Traffic between virtual machines which share a physical host (or between virtual machines and the rest of the network) is forwarded by virtual switches. The management and configuration of virtual switches uses the Open VSwitch DataBase (OVSDB) management protocol, as described in *RFC 7047*.

The Hardware Switch Controller (HSC) service provides an integration point between OVSDB controllers and the VXLAN control service, allowing exchange of state information among virtual and hardware switches.

14.1.3.4 Network Topology Service

The network topology service gathers information from CVX clients to provide a view of the physical topology of the network. Aggregated information gathered by the network topology service is used by other CVX services, and can be viewed on the CVX server.

14.1.3.5 Static Topology Service

Static Topology addresses cases where the deployment infrastructure in an OpenStack setup that manages Virtual Machines and Bare Metal servers does not enable LLDP on interfaces connecting hosts to switches. As a result, the topology information does not appear on CVX.

An example of this case is some deployments of OpenStack that do not enable LLDP for DPDK interfaces. Even with the manual configuration of LLDP on hypervisors, the configuration does not persist after OpenStack redeployment.

Static Topology enables the topology configuration statically using the **service topology** command on CVX without running LLDP on the servers connected to switches.

To view the aggregated topology information, use the **show network physical-topology** command on the switch running the CVX server instance.

14.1.4 Deploying CVX

CloudVision Exchange (CVX) can be deployed on KVM and ESXi. The required EOS version and Aboot version vary depending on whether you are deploying CVX on KVM or ESXi.

For the detailed steps to use to deploy CVX, see:

- [Deploying CVX on Kernel-based Virtual Machine \(KVM\)](#).
- [Deploying CVX on VMware ESXi](#).

14.1.4.1 Deploying CVX on Kernel-based Virtual Machine (KVM)

Complete the following steps to install CVX on Ubuntu/KVM. Once the installation is complete, you can begin the CVX configuration process.

Note: Make sure you select versions of EOS and Aboot that meet the minimum requirements for CVX. The supported versions are:

- EOS (version **4.16.8M** or later).
- **Aboot-veos-serial-8.0.0.iso** (located in the vEOS section of the download).

Pre-requisites

Before you begin the procedure, make sure that:

- Install **qemu-kvm**, **libvirt***, and all related dependencies using yum (RHEL7/CentOS7) and apt-get (Ubuntu).
- Two bridges are configured for use by the KVM VM, and that you have the names of the bridges. (Steps are included in the procedure to add bridges, if they are not already configured.)

Note: The bridges must be configured to persist (**brctl** commands do not persist across reboots). You can use Network Manager (or another application available to you) to complete this configuration.

- You have both **generateXmlForKvm.py** and **cvpTemplate.xml**. They are required to complete the procedure. You can find them in the CVP tarball for Ubuntu.

Complete the following steps to install CVX.

1. Download the Aboot and EOS files from: <https://www.arista.com/en/support/software-download/>.
2. Use **sudo su** to acquire superuser privileges, which are required to complete some of the installation steps.
3. Confirm that KVM is running on the server by entering the following command:

```
virsh -c qemu:///system listAb
```

The command output should match this example:

```
Id      Name      State
-----
$
```

4. If the output does not look correct (previous step) go to for additional assistance: <https://help.ubuntu.com/community/KVM/Installation>.
5. Use the following command to convert the **vmdk** file to **qcow2**: **qemu-img convert EOS_4_16_8M.vmdk -O qcow2 EOS.qcow2**.

Note: Step 6 and 7 are required if you do not already have 2 bridges defined in different subnets. If the bridges exist, go directly to step 8.

6. Use **brctl** to add bridges for the KVM VM to use (br1 and br2 can be any names you choose).

```
brctl addbr br1
brctl addbr br2
```

ifconfig can be used to identify Ethernet ports to be bridged. Once you identify the ports, add them to the bridges.

Example

```
brctl addif br1 enx803f5d086eae
```

7. Confirm that the bridges are up using **brctl show**.

- Enter: **ifconfig br1 up**
- And: **ifconfig br2 up**

Note: The following step uses a number of input parameters (the number required vary depending on your server setup). To ensure the command executes successfully, we recommend that you type it into a scratch pad and edit as needed before typing it into the Linux Terminal.

- Use the following command to generate **cvx.xml**, which will be used to setup the CVX VM.

```
generateXmlForKvm.py
```

Example

```
python generateXmlForKvm.py -n cvx --device-bridge br1 --cluster-bridge br2 -e /usr/bin/kvm
-i cvpTemplate.xml -c /home/myname/Downloads/Aboot-veos-serial-8.0.0.iso -x /home/myname/
Downloads/EOS.qcow2 -b 8192 -p 2 -t
-n cvx: VM name.
```

```
--device-bridge br1: This is the name you gave the bridge - br1 or anything else.
--cluster-bridge br2: Cluster bridge if clustering servers.
-i cvpTemplate.xml: Path to XML file input template.
-k: VM ID number used by virsh. If not entered, a random number is assigned.
-b 8192: 8G of RAM.
-p 2: # of CPU cores.
-c: Path to Aboot file.
-x: Path to qcow2 file created in step 3.
-t: This parameter indicates the file defined by -x is for CVX.
-e â€˜/usr/bin/kvm: Ubuntu path to KVM.
(for RHEL KVM this is: -e â€˜usr/libexec/qemu-kvm)
-o: XML file used by virsh to define the KVM VM.
```

8. Run the following commands:

```
virsh define cvx.xml
virsh start cvx
virsh console cvx
```

9. (Optional) To configure CVX to start automatically, enter:

```
virsh autostart cvx
```

You are now ready to begin the CVX configuration (see [CVX Configuration](#)).

14.1.4.2 Deploying CVX on VMware ESXi

Complete the following steps to install CVX on ESXi. Once the installation is complete, you can begin the CVX configuration process.

Note: Make sure you select versions of EOS that meet the minimum requirements for CVX. The supported version is EOS (version **4.21.0** or later).

Complete the following steps to install CVX.

1. Go to: <https://www.arista.com>.
2. Select **Support > Software Download**.
3. From the software download page, expand **Active Releases > 4.21 > EOS-4.21.0F** to download **EOS-4.21.0F.vmdk**.

4. Load the files you downloaded into a datastore location within the VMware vSphere environment.

Figure 14-1: Loading the Files into the VMware vSphere Environment

5. Right-click the **filestore location** you selected, and choose **New Virtual Machine**.

Figure 14-2: Selecting New Virtual Machine

The New Virtual Machine dialog appears.

Figure 14-3: New Virtual Machine Dialog

6. In the New Virtual Machine dialog, select **Create a new virtual machine**, then click **Next**.

The dialog refreshes, showing options for the new Virtual Machine.

New Virtual Machine dialog (naming and selecting the location).

Figure 14-4: New Virtual Machine Dialog (Naming and Selecting the Location)

7. The dialog refreshes, showing options for selecting the datastore.
8. Enter a **name** for the new Virtual Machine.

9. Select a **location** for the new Virtual Machine, then click **Next**.

Figure 14-5: New Virtual Machine Dialog (Selecting the Datastore)

10. Select the **datastore** for the new Virtual Machine configuration files and all of the virtual disks. Click **Next**. The dialog refreshes, showing operating system selection options.
11. Click **Next**. The dialog refreshes, showing compatibility options.

Figure 14-6: New Virtual Machine Dialog (Compatibility Options)

12. Using the Compatible with menu, select the **ESXi compatibility** for the new Virtual Machine.

Note: When adding the VMDK to ESX6, it treats this as sparse by default, whereas in ESX 5 it is thick. Converting the vEOS VMDK file from thin to thick would allow it to boot properly in ESX6: `vmkfstools -i vEOS-lab-4.18.5M.vmdk -d eagerzeroedthick vEOS-lab-4.18.5M-thick.vmdk`.

Go to <https://arista.my.site.com/AristaCommunity/s/> and refer to the following topics for the issue and solution:

- Tip for Arista vEOS on VMware ESX 6..
- Common Issues When Deploying CVX.
- 4.18.2F on vCenter 6 or 6.5.

Note: If the VM keeps rebooting and showing "This is not a bootable disk. Insert a bootable floppy and press any key to try again", then go to <https://arista.my.site.com/AristaCommunity/s/> and refer to the **Common Issues When Deploying CVX 4.18.2F on vCenter 6 or 6.5** topic.

13. Click **Next**. The dialog refreshes, showing operating system selection options.

Figure 14-7: New Virtual Machine Dialog (Operating System Options)

14. Using the Guest OS Family menu, choose **Linux**.
15. Using the Guest OS Version menu, choose **Other Linux (64-Bit)**.
16. Click **Next**.

The dialog refreshes, showing options for customizing hardware.

Figure 14-8: New Virtual Machine Dialog (Hardware Configuration Options)

17. Change the default settings for the following options:

CPU	Set to 4 (number of CPUs)
Memory	Set to 8 GB
New Hard Disk	Delete the current setting (leave this option empty).
New Network	Specify connection to Network LAN segment with connectivity to CVX client devices (the Management LAN). Choose VMXNET3 network adapter type. This connection is used for CVX client / server communications.
Existing Hard Disk	Specify the EOS-4.21.0F.vmdk you downloaded in step 3.

18. (Optional) Delete the floppy drive and SCSI controller.

19. Click **Next**. You are now ready to begin the CVX configuration (see [CVX Configuration](#)).

14.1.5 CVX Configuration

CVX, its clients, and its services, are independently configured. These sections describe configuration processes for each:

- [Ports Used by CVX](#).
- [CVX Server Configuration](#).
- [CVX Client Configuration](#).
- [CVX Client Services Configuration](#).

14.1.5.1 Ports Used by CVX

CVX uses the following ports:

- Controller database (Controllerdb): **Port 9979**.

- Client-server out-of-band connection: **Port 50003**.
- CVX cluster peer out-of-band connection: **Port 50004**.

Note: All of these connections are TCP.

14.1.5.2 CVX Server Configuration

Enabling CVX on the CVX Server

CVX parameters for the server infrastructure are configured in **CVX** configuration mode. CVX configuration mode is not a group-change mode; **running-config** is changed when commands are entered, and exiting the mode does not modify **running-config**. The **cvx** command places the switch in **CVX** configuration mode.

CVX is disabled by default. The **no shutdown (CVX)** command enables CVX on the switch.

Example

These commands enter CVX-configuration mode and enable CVX.

```
switch(config)# cvx
switch(config-cvx)# no shutdown
switch(config-cvx)#
```

CVX Heartbeat Configuration

CVX synchronizes with its client devices by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period determine when a client's access to the server is disrupted.

The interval between heartbeat messages that the server transmits is specified by the **heartbeat-interval (CVX)** command. The CVX timeout period is specified by the **heartbeat-timeout (CVX)** command. When CVX does not receive a subsequent heartbeat message from a CVX client before the timeout expiry, the server discontinues CVX services to that client.

Best practices dictate that CVX and its client applications configure identical heartbeat interval and heartbeat timeout values.

Example

These commands configure a CVX heartbeat interval of 30 seconds and a server heartbeat timeout period of 90 seconds.

```
switch(config-cvx)# heartbeat-interval 30
switch(config-cvx)# heartbeat-timeout 90
switch(config-cvx)#
```

Disabling CVX on the CVX Server

Note: Before disabling or de-configuring CVX on the CVX server, CVX client services should be explicitly disabled or shut down. Failure to disable or de-configure services prior to disabling or de-configuring CVS may result in CVX features continuing to run after CVX shutdown.

When disabling the CVX service, service VXLAN configuration may be retained or erased. Be sure to disable or shut down client services prior to disabling the CVX service.

Examples

- These commands shut down the CVX service while retaining the CLI configuration for service VXLAN.

```
localhost(config)# cvx
```

```
localhost(config-cvx)# service VXLAN
localhost(config-cvx-VXLAN)# shutdown
```

- These commands shut down the CVX service and also erase service VXLAN CLI configuration.

```
localhost(config-cvx-VXLAN)#
localhost(config)# cvx
localhost(config-cvx)# no service VXLAN
```

14.1.5.3 CVX Client Configuration

This section describes the CVX client configuration and commands that enable CVX services. Most commands for the configuration of the CVX client infrastructure are accessed in Management-CVX configuration mode.

- **Enabling CVX on the CVX Client**

CVX client parameters are configured in **Management-CVX** configuration mode. Management-CVX configuration mode is not a group-change mode; running-config is changed when commands are entered, and exiting the mode does not modify running-config. The **management cvx** command places the switch in **Management-CVX** configuration mode.

CVX client is disabled by default. The **no shutdown (Management-CVX)** command enables CVX client on the switch.

For the CVX network topology service to create an inventory of all CVX clients, ensure that LLDP is enabled on each client switch using the **lldp run** command.

Example

These commands enter **Management-CVX-configuration** mode and enable the CVX client.

```
switch(config)# lldp run
switch(config)# management cvx
switch(config-mgmt-cvx)# no shutdown
switch(config-mgmt-cvx)#
```

- **CVX Client Heartbeat Configuration**

A CVX client synchronizes and maintains contact with CVX by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period define when communication with CVX will be considered down.

The interval between heartbeat messages that the CVX client transmits is configured by the **heartbeat-interval (Management-CVX)** command.

The CVX client timeout period is specified by the **heartbeat-timeout (Management-CVX)** command. When a CVX client does not receive a subsequent heartbeat message from CVX within this timeout period, the client assumes that services provided by CVX are no longer available.

Best practices dictate that a CVX client's heartbeat interval and heartbeat timeout values are identical to those of the CVX server to which it connects.

Example

This command configures a CVX client heartbeat interval of **30** seconds and client timeout period of **90** seconds.

```
switch(config-mgmt-cvx)# heartbeat-interval 30
switch(config-mgmt-cvx)# heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

- **Connecting the CVX Client to a Server**

The **server host (Management-CVX)** command identifies the location of the CVX server that the client accesses. The **source-interface (Management-CVX)** command specifies the interface from which the client derives the IP address it uses as the source in CVX packets that it transmits. And the **no shutdown (Management-CVX)** command enables CVX on the client switch.

Example

These commands configure the switch as a CVX client, connecting to a CVX server at IP address **10.1.1.14** and using IP address **10.24.24.1** as the source address for its outbound packets.

```
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.24.24.1/24
switch(config-if-Lo5)# management cvx
switch(config-mgmt-cvx)# server host 10.1.1.14
switch(config-mgmt-cvx)# source-interface loopback 5
switch(config-mgmt-cvx)# no shutdown
switch(config-mgmt-cvx)#
```

14.1.5.4 CVX Client Services Configuration

Switches running EOS must be configured as CVX clients to access the network services running on CVX. Individual services may require additional configuration.

Refer to the following for information regarding the services available to a CVX client.

- [Configuring OpenStack Service.](#)
- [Configuring VXLAN Control Service.](#)
- [Configuring Hardware Switch Controller Service \(HSC\).](#)
- [Configuring Network Topology Service.](#)
- [Configuring Static Topology Service.](#)

14.1.5.4.1 Configuring OpenStack Service

The OpenStack service is enabled from CVX-OpenStack configuration mode, which is accessed by the **service openstack** command. The **no shutdown (CVX-OpenStack)** command enables CVX OpenStack services on the CVX server. Additional configuration is necessary to deploy OpenStack (<http://docs.openstack.org/>).

Example

These commands enable the CVX-OpenStack service.

```
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# no shutdown
switch(config-cvx-openstack)#
```

14.1.5.4.2 Configuring VXLAN Control Service

The VXLAN control service is enabled on CVX by the **no shutdown (CVX-VXLAN)** command and on the client switches by enabling CVX and configuring the VXLAN as a controller client. When VXLAN control service is enabled, CVX functions as a VXLAN controller for its clients.

For information about configuring VXLAN on the client switch, see the VXLAN chapter of the *User Manual* .

Examples

- These commands enable VXLAN control service on the CVX server.

```
switch(config-cvx)# service VXLAN
switch(config-cvx-VXLAN)# no shutdown
```

```
switch(config-cvx-VXLAN) #
```

- These commands enable VXLAN Control Service on the CVX client. (This example assumes that the VXLAN has already been configured on the client switch. For information about configuring VXLAN, see the VXLAN chapter of the *User Manual*).

```
switch(config) # interface VXLAN 1  
switch(config-if-Vx1) # VXLAN controller-client
```

14.1.5.4.3 Configuring Hardware Switch Controller Service (HSC)

Certificate Requirements for CVX Interoperability with VMware NSX 6.2.2 and Higher

The HSC service is enabled on the CVX server by the **no shutdown (CVX-HSC)** command.

The certificate type needs to be changed from MD5 to SHA512 for use with VMware NSX **6.2.2**. Complete the following steps to make the change.

1. At the EOS prompt of CVX, use the following commands.

```
switch(config) # cvx  
switch(config-cvx) # service hsc  
switch(config-cvx-hsc) # shut
```

2. Acquire superuser privileges and edit the default.

```
switch(config) # bash  
switch(config) # sudo su  
switch(config) # vi /usr/bin/ovs-pki
```

3. Find and replace **default_md** with **sha512** (from **md5**).

```
default_md =md5  
default_md =sha512
```

4. Delete all files and folders from **/persist/secure/openvswitch/**.

```
cd /persist/secure/openvswitch/bash-4.1#sudo rm -r *
```

5. Generate the new certificate.

```
[admin@CVX ~]$ exit  
logout  
CVX(config-cvx-hsc) # no shutdown  
CVX(config-cvx-hsc) # end
```

6. Verify the change using the command.

```
CVX# show nsx status
```

Example

These commands enable the CVX-HSC service.

```
switch(config) # cvx  
switch(config-cvx) # no shutdown  
switch(config-cvx) # service hsc  
switch(config-cvx-hsc) # no shutdown
```

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the

flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the VTEP (CVX-HSC) command.

Example

This command configures the CVX-HSC service to connect to an OVSDB controller at IP address **192.168.2.5**, using the default port **6632**.

```
switch(config-cvx-hsc)# manager 192.163.2.5
switch(config-cvx-hsc)#
```

Example

This command configures the CVX-HSC service to use send-to-any replication.

```
switch(config-cvx-hsc)# vtep flood list type all
switch(config-cvx-hsc)#
```

Having established a connection to the OVSDB controller, the HSC service will publish the inventory of switches managed by CVX to OVSDB. For the inventory to succeed, LLDP must be enabled on each CVX client switch with the **lldp run** command.

Note: HSC also makes use of the VXLAN control service; ensure that VXLAN control service is enabled and properly configured (see [VXLAN Control Service](#) for details).

Note: LLDP is enabled by default on Arista switches.

Example

This command enables LLDP.

```
switch(config)# lldp run
switch(config)#
```

14.1.5.4.4 Configuring Network Topology Service

A network topology agent runs on each Arista switch whether or not the switch is connected to a CVX server. It requires no configuration. The network topology service on the CVX server is also enabled by default and requires no configuration.

To view the aggregated topology information, use the **show network physical-topology** command on the switch running the CVX server instance.

Examples

- This command displays all visible hosts.

```
switch# show network physical-topology hosts
Unique Id                Hostname
-----
001c.7385.be69           cvx287.sjc.aristanetworks.com
0000.6401.0000           cvc1
0000.6402.0000           cvc2
0000.6403.0000           cvc3
0000.6404.0000           cvc4
bcf6.85bd.8050           dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch# show network physical-topology neighbors
cvx287.sjc.aristanetworks.com
Interface      Neighbor Intf      Neighbor Host
-----
Ethernet1      Ethernet7          cvc4
Ethernet2      Ethernet7          cvc2
Ethernet9      Ethernet7          cvc1
Ethernet10     Ethernet7          cvc3
Management1    27                 dsj14-rack14-tor1

OUTPUT OMITTED FROM EXAMPLE
dsj14-rack14-tor1

Interface      Neighbor Intf      Neighbor Host
-----
27             Management1        cvx287.sjc.aristanetwork
```

14.1.5.4.5 Configuring Static Topology Service

Use the **service topology** command to configure the topology statically on CVX without running LLDP on the servers connected to switches. It is configured under CVX configuration mode.

Example

- The following command configures topology statically on the switch.

```
switch# config
switch(config)# cvx
switch(config-cvx)# service topology
```

- The topology information can be specified using the following command:

```
switch(config-cvx-topology)# network physical-topology switch SWITCH interface INTERFACE
neighbor NEIGHBOR-HOST neighbor-interface NEIGHBOR-INTERFACE
```

The format of the hostname in this command could depend on services running on the host. As an example, in OpenStack use cases, it should match the hostname used by openstack services (For example, neutron server and agents) which is an FQDN format. The hostname in the command is case sensitive.

Optional Parameter

The neighbor interface is an optional parameter in the above configuration however setting it helps to understand the physical network connectivity between switches and hosts. It also helps in troubleshooting any issue that may arise in the network.

Limitations

To avoid misconfiguration in a topology consisting of a switch with a connected host, where LLDP is enabled and static topology is used to configure the physical topology it is recommended to use only one source of configuration, not both. As a mismatch in the configuration can cause wrong configuration on the switch by a feature consuming the topology information.

14.1.6 CVX Secure out-of-band Connection

This feature adds support for securing out-of-band connection between CVX server and CVX clients by SSL/TLS transport protocol. SSL/TLS is an application-layer protocol that provides secure transport between client and server through a combination of authentication, encryption and data integrity. SSL/TLS uses certificates and private-public key pairs to provide this security. We will use the term SSL to mean SSL/TLS.

By default, CVX server and CVX clients communicate over insecure transport (there is no authentication and encryption between CVX server and CVX clients). This poses the possibility of security risks, such

as communicating with untrusted CVX server and CVX clients, or eavesdropping CVX server/client communications. This feature can be used to secure the out-of-band connection between CVX server and CVX clients.

Note: The CVX client-server out-of-band connection uses port 50003. The CVX cluster peer out-of-band connection uses port 50004. These are TCP ports.

For more information, see [Show Commands](#)

S

14.1.6.1 Configuring the CVX Secure out-of-band Connection

This feature uses SSL certificate and key management infrastructure for managing certificates, keys and SSL profiles. For more information regarding this infrastructure see *SSL Certificate and Key Management* in the *Arista User's Guide*.

1. On CVX server, copy the server certificate and key and also the CA certificate to verify CVX clients.

```
switch(config)# !Copy the PEM encoded certificate and RSA key files for CVX server
switch(config)# !Lets call them server.crt and server.key
switch(config)# copy <url> certificate:server.crt
switch(config)# copy <url> sslkey:server.key
switch(config)# !Copy the PEM encoded CA certificate to verify the certificate of CVX
clients.Lets call it ca.crt
switch(config)# copy <url> certificate:ca.crt
```

2. On CVX server, configure SSL profile with the certificates and key as below. Lets call the SSL profile as **serverssl**.

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile serverssl
switch(config-mgmt-sec-ssl-profile-serverssl)# certificate server.crt key server.key
switch(config-mgmt-sec-ssl-profile-serverssl)# !You can trust multiple CA certificates
switch(config-mgmt-sec-ssl-profile-serverssl)# trust certificate ca.crt
```

Note: If you are using intermediate certificates to build a 'Chain of Trust' (such as **server.crt** -> **intermediate1.crt** -> **intermediate2.crt** -> **ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-serverssl)# chain certificate intermediate1.crt
switch(config-mgmt-sec-ssl-profile-serverssl)# chain certificate intermediate2.crt
```

3. On CVX server, configure to use the serverssl SSL profile. With this configuration, the CVX server starts listening on a secure port. The CVX server will continue to listen on the default port. i.e., the CVX server will accept connections from CVX clients over both SSL and default non-SSL transports. During a SSL negotiation, the CVX server will authenticate itself to the CVX clients by presenting server.crt and it verifies the authenticity of the CVX client by checking if the CVX client certificate is signed by the trusted certificate ca.crt.

```
switch(config)# cvx
switch(config-cvx)# ssl profile serverssl
```

4. On CVX client, copy the client certificate and key and also the CA certificate to verify CVX server.

```
switch(config)# !Copy PEM encoded certificate and RSA key files for CVX client
switch(config)# !Lets call them client.crt and client.key
switch(config)# copy <url> certificate:client.crt
switch(config)# copy <url> sslkey:client.key
switch(config)# !Copy PEM encoded CA certificate used to verify the
switch(config)# !certificate of CVX server. Lets call it ca.crt
switch(config)# copy <url> certificate:ca.crt
```

Note: If you are using intermediate certificates to build a 'Chain of Trust' (such as **client.crt** -> **intermediate1.crt** -> **intermediate2.crt** -> **ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-clientssl)# chain certificate intermediate1.crt
switch(config-mgmt-sec-ssl-profile-clientssl)# chain certificate intermediate2.crt
```

5. On CVX client, configure SSL profile with the certificates and key as below. Lets call the SSL profile as clientssl.

```
switch(config)# management security
switch(config-mgmt-security)# ssl profile clientssl
switch(config-mgmt-sec-ssl-profile-clientssl)# certificate client.crt key client.key
switch(config-mgmt-sec-ssl-profile-clientssl)# !You can trust multiple CA certificates
switch(config-mgmt-sec-ssl-profile-clientssl)# trust certificate ca.crt
```

6. On CVX client, configure to use the SSL profile clientssl. With this configuration, the CVX client will connect to the secure port of the CVX server over SSL transport. During SSL negotiation, the CVX client will authenticate itself to the CVX server by presenting client.crt and it verifies the authenticity of the CVX server by checking if the CVX server certificate is signed by the trusted certificate ca.crt.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# ssl profile clientssl
```

14.1.6.2 Show Commands

For information regarding show commands of SSL certificate, key and profile, please refer to *SSL Certificate and Key Management*.

To show the SSL profile status on CVX server, use the **show cvx** command.

```
switch# show cvx

CVX Server
Status: Enabled
UUID: beb19142-dfaa-11e4-b996-001c73105347
Heartbeat interval: 20.0
Heartbeat timeout: 60.0
SSL profile: serverssl
Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled for CVX server and the CVX clients can connect to CVX server over SSL transport. If there are any errors, then the status will show Disabled and the reason will be listed. In Disabled state, the CVX clients wont be able to connect to CVX server over SSL transport.

To show the SSL connection status of CVX clients on CVX server, use the show cvx connections command.

```
switch# show cvx connections

Switch 00:1c:73:10:53:48
Hostname: sq302
Status: up
Last heartbeat sent: 0:00:04 ago
Last heartbeat received: 0:00:10 ago
Clock offset: -0.00201620385865
Out-of-band connection: SSL secured
In-band connection: Not secured (SSL not supported)
```

The out-of-band connection shows as SSL secured, which means that the CVX client has connected to CVX server over SSL transport. The in-band connection is another connection between CVX server and CVX client. The SSL is not yet supported for this connection and hence it shows as SSL not supported. There

is already some level of protection for the in-band connection. The CVX server and CVX client opens up the access to in-band connection only if the out-of-band connection is successful. Since the out-of-band connection is configured to use SSL, the in-band connection access is granted only for authentic CVX client and CVX server.

To show SSL profile status and connection status on CVX client, use the `show management cvx` command.

```
switch# show management cvx

CVX Client
Status: Enabled
Last connected time: 2015-04-14 11:16:19
Connection status: Connected
Out-of-band connection: SSL secured
In-band connection: Not secured (SSL not supported)
Negotiated version: 2
Controller UUID: 0e7dee2e-e2cf-11e4-880f-001c73105347
Controller: 127.0.0.1
Last heartbeat sent: 0:00:00 ago
Last heartbeat received: never
Clock offset: 0.0
SSL profile: clientssl
Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled and the CVX client can connect to CVX server over SSL transport. If there are any errors, then the status will show as Disabled and the reason will be listed. In Disabled state, the CVX client won't be able to connect to the CVX server.

Similar to the CVX server, the out-of-band connection shows as SSL secured and the SSL is not yet supported for in-band connection.

The possible reasons for Disabled SSL status on CVX server and CVX client are:

- **SSL profile does not exist:** If the SSL profile configured under CVX server/client is not configured under management security, you will see this message. Configure the SSL profile with required certificates and key under management security.
- **Invalid SSL profile:** If the SSL profile configured under CVX server/client is in invalid state, you will see this message. Check `show management security ssl profile <name>` command to see the errors on the SSL profile and fix them.
- **Trusted certificates not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have trusted certificates configured, you will see this message. Configure trusted CA certificates in the SSL profile.
- **Certificate not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have certificate key pair configured, you will see this message. Please configure certificate and key pair in the SSL profile.
- **Diffie-Hellman parameters not yet ready:** When EOS is booted, a Diffie-Hellman parameters file is auto generated by the system if one does not exist. This Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. Only the CVX server uses this file and hence this message can be seen only on `show cvx` command output. If the file is not yet generated, you will see this message. When the file is ready, this message automatically goes away and the SSL profile will become enabled.

14.1.7 CVX High Availability

CVX provides high availability by enabling you to use multiple (redundant) CVX Controllers in the same cluster. Each Controller in the cluster has its own dedicated machine so that if a Controller fails, the failure is isolated to a single machine.

Within a cluster, one of the Controllers is a primary (leader), and the other Controllers are backup (follower) Controllers. If the primary Controller fails, one of the backup Controllers automatically assumes the role of the primary Controller.

CVX high availability does not prevent or compromise the detection of software failures or link failures that may cause Controllers to be unreachable on the network.

The configuration that is required to ensure CVX is set up for high availability involves:

- Configuring the CVX cluster.
- Configuring the CVX clients.

For more information, see:

- [CVX Clusters](#).
- [Handling of CVX Controller Failures](#).
- [CVX Support for EOS Failure Modes](#).
- [Client Interaction](#).
- [Service Agents Interaction](#).
- [Leader Election](#).
- [Configuring CVX Clusters for High Availability](#).
- [Configuring CVX Clients for High Availability](#).

14.1.7.1 CVX Clusters

CVX clusters are sets of CVX Controllers (usually 3 Controllers). Within a cluster, each Controller runs on its own dedicated machine, and all of the Controllers run the same version of CVX. Each Controller in the cluster functions as either the primary (leader) Controller, or a backup (follower) Controller.

One of the CVX Controllers is elected by the group of Controllers to be the primary Controller. Once a Controller is elected to be the primary, the other Controllers in the cluster are automatically assigned the role of backup Controllers. Cluster members maintain an out-of-band connection amongst themselves, which is used for the leader election protocol.

CVX Controllers in a cluster that are not the primary Controller always function as backup Controllers. Within the same cluster, only one CVX Controller can assume the role of a primary at any time.

For more information, see:

- [Required Number of Controllers to Support High Availability](#)
- [Cluster Configuration Options](#)

14.1.7.1.1 Required Number of Controllers to Support High Availability

A cluster must have enough Controllers so that in the case of a failure of the primary Controller, there are enough remaining Controllers for the election process to be completed. The election process is used by clusters to select a new primary Controller in the case of failure.

Note: The number of Controllers for a cluster is **3** (one primary and two backup Controllers).

Examples

In a cluster with only **two** Controllers (one primary and one backup), a simple majority of backup Controllers does not exist after a failure of the primary Controller. A simple majority of two backup Controllers is required for the leader election process.

14.1.7.1.2 Cluster Configuration Options

You can configure the cluster for high availability using either of the following modes:

- Cold followers mode - Only the Controllerdb of the primary (leader) CVX Controller mounts from the client switches.

- Warm followers mode - The Controllerdb of every (all) CVX Controllers in the cluster mount from the client switches.

Advantages and Disadvantages of the Modes

The advantage of the warm follower mode is that if the primary CVX Controller fails, the switchover to the new primary is faster than a switchover in cold follower mode. The reason for this is that the state of the new primary does not have to be rebuilt from scratch. The disadvantage of the warm follower mode is that serialization from the switch is slower compared to cold follower mode.

14.1.7.2 Handling of CVX Controller Failures

CVX Controllers can fail because of hardware or software faults. Because EOS agents are designed to be software fault-tolerant, an agent that fails is automatically restarted and resumes operation statefully. The most recent saved state in Sysdb for the agent is used to restore the state of the agent.

Unlike software failures, hardware failures are not handled by EOS. CVX handles hardware failures through the use of redundant backup (follower) CVX Controllers that run on their own dedicated machine. Within a cluster, any backup Controller can assume the role of the primary (leader) Controller.

Note: In the event of a network partition, the partition with a majority of the Controllers elects a leader from its Controllers, and the minority partition relinquishes any leadership it might have had.

14.1.7.3 CVX Support for EOS Failure Modes

CVX supports both EOS failure modes that apply when a CVX Controller fails. The EOS failure modes are:

- Fail-stop
- Fail-recover

Because CVX supports both EOS failure modes, a failed CVX Controller can rejoin the cluster if the following failures occur:

- A crash of the agent or machine running CVX.
- The CVX controller or dedicated machine it runs on is removed (partitioned) from the cluster.

14.1.7.4 Client Interaction

Client switches maintain an out-of-band connection to all members of the cluster. The connection is used to determine liveness and for communications. The connection is also used to signal a change in leadership (switchover) to the client switches. Switchovers that are changes in leadership within a cluster are executed similarly to CVX Graceful Reboot switchovers.

The ControllerClient agent on the switch is responsible for maintaining liveness with the Controllers and for exchanging metadata. The ControllerClient agent registers with all cluster members. Each Controller's ControllerStatus has an additional flag to record whether the Controller is a leader within the cluster.

If there is more than one leader, the switch automatically waits until only one Controller is designated as the leader in the cluster. Once a single Controller is designated as the leader, the switch executes a graceful switchover to the new leader Controller.

14.1.7.5 Service Agents Interaction

One change to Service Agents is required to support CVX high availability. Service Agents must be modified to include the leader flag (this flag identifies the leader CVX Controller in the cluster). On a leader switchover, Service Agents are deactivated on the old leader Controller and activated on the new leader Controller. The client switches will perform a graceful switchover to the new leader Controller.

14.1.7.6 Leader Election

Leader election is an internal, system-run process that is essential to CVX high availability. The leader election process is used to safely elect a new leader Controller within a cluster following the failure of the current leader Controller, or a network configuration change that results in the loss of the current leader Controller in the cluster.

The leader election process is designed to ensure stability of leader Controllers within clusters. The process is based on an algorithm that provides the mechanism for the backup (follower) Controllers to elect (by consensus), the new leader Controller in the cluster.

14.1.7.7 Configuring CVX Clusters for High Availability

Configuring CVX clusters for high availability is a simple process that involves pointing each cluster member to the other cluster members using the peer host command. The objective of this task is to successfully register each cluster member with the other cluster members. Successful registration of the cluster members with each other ensures that the members can communicate with each other to elect a new leader member if the original leader member fails.

Once you complete the process, the cluster members will be successfully registered with each other. In addition, the cluster members will automatically elect a leader member and assign the leader to that member. The non-leader members are automatically assigned the role of follower.

Requirements

The requirements for setting up clusters for high availability are:

- The number of CVX Controllers in a cluster is **3**.
- An **odd number** of CVX instances (CVX Controllers) are required to form a cluster.

Note: If an even number of CVX Controllers are configured in a cluster, a CVX instance will automatically refuse to participate in the cluster.

- All cluster members must point to each other. This is essential for clusters to operate normally. (The steps required to complete this task are included in the following procedure.)

Procedure

Note: This procedure provides configuration examples for each step. The example cluster used throughout the procedure contains 3 cluster members (named **cvs1**, **cvs2**, and **cvs3**). The IP addresses of the cluster members are:

- **cvs1 (10.0.0.1)**
- **cvs2 (10.0.0.2)**
- **cvs3 (10.0.0.3)**.

Complete the following steps to configure clusters for high availability.

1. Using the peer host command, configure one of the cluster members to point to every other cluster member. This example shows the configuration of cluster member **cvs1** to point to the other cluster members (**cvs2** and **cvs3**).

```
cvsl(config-cvx)# peer host 10.0.0.2 (connects cvs1 to cvs2)
cvsl(config-cvx)# peer host 10.0.0.3 (connects cvs1 to cvs3)
```

2. Use the **show cvx** command to check the **Mode** and **Peer registration state** status values for cluster member **cvs1**. The status values should be:
 - **Mode** = *Cluster*
 - **Peer registration state** = *Connecting*

Note: Mode automatically changes from Standalone to Cluster when configuring a CVX cluster. This is because the presence of multiple CVX peers causes the Mode to change to Cluster. **Peer registration state** remains in Connecting status after you configure the first cluster member. This is because the two peers must register with each other for the registration of the two members to be successful.

- Using the peer host command, configure peer cluster member **cvs2** to point to every other cluster member. This example shows the configuration of cluster member **cvs2** to point to the other cluster members (**cvs1** and **cvs3**).

```
cv2(config-cvx)# peer host 10.0.0.1 (connects cvs2 to cvs1)
cv2(config-cvx)# peer host 10.0.0.3 (connects cvs2 to cvs3)
```

- Use the **show cvx** command to check the **Peer registration state** settings for **cvs1**. This is done to verify that peers **cvs1** and **cvs2** are successfully registered with each other.

```
cv1(config-cvx)# show cvx
```

Example

This example shows the output of the **show cvx** command for **cvs1**. The **Peer registration state** setting of Registration Complete for peer **cvs2** indicates a successful registration between **cvs1** and **cvs2**.

```
cv1(config-cvx)# show cvx

CVX Server
Status: Enabled
UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
Mode: Cluster
Heartbeat interval: 20.0
Heartbeat timeout: 60.0
Cluster Status
Name: default
Role: Standby
Leader: 10.0.0.2
Peer timeout: 10.0
Last leader switchover timestamp: 0:00:03 ago
Peer Status for 10.0.0.3
Peer registration state: Connecting
Peer service version compatibility : Version mismatch
Peer Status for 10.0.0.2
Peer Id : 02-01-63-02-00-00
Peer registration state: Registration complete
Peer service version compatibility : Version ok
```

- Using the peer host command, configure peer cluster member **cvs3** to point to every other cluster member. This example shows the configuration of cluster member **cvs3** to point to the other cluster members (**cvs1** and **cvs2**).

```
cv3(config-cvx)# peer host 10.0.0.1 (connects cvs3 to cvs1)
cv3(config-cvx)# peer host 10.0.0.2 (connects cvs3 to cvs2)
```

- Use the **show cvx** command to check the **Peer registration state** settings for **cvs1**. This is done to verify that peers **cvs1** and **cvs3** are successfully registered with each other.

```
cv1(config-cvx)# show cvx
```

Example

This example shows the output of the **show cvx** command for **cvx1**. The **Peer registration state** setting of Registration Complete for peer **cvx3** indicates a successful registration between **cvx1** and **cvx3**.

```
cvx1(config-cvx)# show cvx

CVX Server
Status: Enabled
UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
Mode: Cluster
Heartbeat interval: 20.0
Heartbeat timeout: 60.0
Cluster Status
Name: default
Role: Standby
Leader: 10.0.0.2
Peer timeout: 10.0
Last leader switchover timestamp: 0:05:37 ago
Peer Status for 10.0.0.3
Peer Id : 02-01-63-03-00-00
Peer registration state: Registration complete
Peer service version compatibility : Version ok
Peer Status for 10.0.0.2
Peer Id : 02-01-63-02-00-00
Peer registration state: Registration complete
Peer service version compatibility : Version ok
```

Next Step

You are now ready to configure the CVX clients for high availability (see [Configuring CVX Clients for High Availability](#)).

14.1.7.8 Configuring CVX Clients for High Availability

Configuring CVX clients for high availability is a simple process that involves pointing each CVX client to every CVX cluster member using the server host command. The objective of this task is to successfully establish connections between each CVX client and every CVX cluster member. The connections are essential to ensure that the CVX clients are aware of the current status of each cluster member.

Note: If a CVX client is not pointing to every cluster member, or if it is pointing to a CVX instance (Controller) that is not part of the cluster, the client may not be aware of leadership changes in the cluster, or may become confused about which cluster member is currently the leader. Either of these scenarios can result in unexpected errors.

Once you complete the process, the CVX clients will have established connections with each cluster member (the Connection status for each Controller should be Established). In addition, the clients will be aware of which CVX instance (Controller) is currently the leader in the cluster.

Procedure

Note: This procedure provides configuration examples for each step. The example CVX client used throughout the procedure is named **cvc1**. The IP addresses of the cluster members are: **10.0.0.1** (**cvx1**), **10.0.0.2** (**cvx2**), and **10.0.0.3** (**cvx3**).

Complete the following steps to configure CVX clients for high availability.

1. Using the server host command, configure each of the CVX clients to point to every cluster member. This example shows the configuration of client **cvc1** to point to all of the cluster members (the addresses of the cluster members are **10.0.0.1**, **10.0.0.2**, and **10.0.0.3**).

```
cvc1(config-mgmt-cvx)# server host 10.0.0.1 (connects cvc1 to cluster member 10.0.0.1)
cvc1(config-mgmt-cvx)# server host 10.0.0.2 (connects cvc1 to cluster member 10.0.0.2)
cvc1(config-mgmt-cvx)# server host 10.0.0.3 (connects cvc1 to cluster member 10.0.0.3)
```

2. Use the **show man cvx** command to check the status of client **cvc1**. The Connection status for each cluster member should be Established. In addition, the client is also aware that cluster member **10.0.0.3** is the current Master.

```
cvcl(config-mgmt-cvx)# show man cvx

CVX Client
Status: Enabled
Source interface: Inactive (Not configured)
Controller cluster name: default
Controller status for 10.0.0.1
  Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
  Negotiated version: 2
  Controller UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
  Last heartbeat sent: 0:00:07 ago
  Last heartbeat received: 0:00:07 ago
Controller status for 10.0.0.3
  Master since 0:03:34 ago
  Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
  Negotiated version: 2
  Controller UUID: c64954b8-7324-11e5-9f33-51f8b016cae8
  Last heartbeat sent: 0:00:14 ago
  Last heartbeat received: 0:00:14 ago
Controller status for 10.0.0.2
  Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
  Negotiated version: 2
  Controller UUID: 6a0dbf2c-7324-11e5-94f3-ff17a8a1cdc8
  Last heartbeat sent: 0:00:05 ago
  Last heartbeat received: 0:00:05 ago
```

14.1.8 CVX VIP

CVX VIP provides the virtual IP address that actively follows the master controller of the CVX cluster.

The virtual IP address of the CVX HA Cluster is configured on a macvlan interface setup on top of a physical management interface of the master controller. The virtual IP and virtual MAC needs to be provided by the customer as part of the controller configuration. This information is available to all controllers as each cluster member has to be configured manually by the user on all controllers.

The macvlan interface created should be designated as **Management0**. **Management0** is currently used for the ManagementActive interface on modular switches. Without explicit configuration of VIP and VMAC, CVX VIP functionality will not work in the CVX HA cluster.

Customers can pick the VMAC from a pool of MAC addresses reserved for use with CVX clusters. The OUI pool, 00:1C:73:00:00:AA “ 00:1C:73:00:00:FF has been reserved for this purpose.

The macvlan interface is setup if all of the following conditions are met:

- VMAC is configured by the user
- The controller instance is a leader
- There are more than one controller instances
- The controller is not being run on a modular system
- [CVX VIP](#)
- [Data Replication](#)
- [SSH Host Key Tagging](#)

14.1.8.1 Configuring VIP

All CLI commands applicable to the management interface of the controller will be allowed on **Management0**, with the exception of Layer 1 / phy level commands. So auto-negotiation or flow control cannot be configured

on the **Management0** interface. Instead these commands can only be run on the physical management interfaces. This makes sense as the phy-level configuration really depends on what the interface is physically wire.

To configure VMAC/VIP :

```
CVX(config)# interface management 0
CVX(config-if-Ma0)# mac-address 00:1C:72:00:00:FF
CVX(config-if-Ma0)# ip address 10.0.0.2
```

14.1.8.2 Data Replication

At EOS boot time, SSH host keys and Diffie-Hellman parameters are automatically generated and persistently stored on each controller. Multiple SSL profiles / keys / certificates might also be created and used by various agents on the controllers. Since these information contribute to the identity of the master, they will need to follow the master controller for all time.

In case of a controller switchover, the newly elected master controller will need to use the same SSH host keys & SSL profiles / keys / certificates to retain its identity and prevent any kind of network security alarms from being tripped. For example, if an SSH client notices that the host key has changed, it will normally flag an error warning the user of a possible man-in-the-middle type attack. Hence, this data will be replicated from the master to slaves.

14.1.8.3 SSH Host Key Tagging

SSH host keys are tagged with the chassis MAC address to deal with key regeneration issues when a supervisor module is moved from one chassis to another. This behavior will cause regeneration issues if we replicate the SSH host keys across the cluster resulting in the key fingerprint seen by management tools to be different.

To mitigate this, in addition to the chassis MAC address, the host keys would now be tagged with VMAC of the CVX HA cluster. If CVX VIP and VMAC are configured, SshHostKeysAgent will not regenerate keys if tagged VMAC and configured VMAC are the same, even if there is a mismatch between the chassis MAC and tagged MAC.

14.1.9 CVX Commands

CVX Server Commands

- [cvx](#)
- [heartbeat-interval \(CVX\)](#)
- [heartbeat-timeout \(CVX\)](#)
- [port \(CVX\)](#)
- [show cvx](#)
- [shutdown \(CVX\)](#)

CVX Client Commands

- [management cvx](#)
- [heartbeat-interval \(Management-CVX\)](#)
- [heartbeat-timeout \(Management-CVX\)](#)
- [server host \(Management-CVX\)](#)
- [source-interface \(Management-CVX\)](#)
- [shutdown \(Management-CVX\)](#)

CVX OpenStack Commands

- [name-resolution force \(CVX-OpenStack\)](#)

- [name-resolution interval \(CVX-OpenStack\)](#)
- [service openstack](#)
- [shutdown \(CVX-OpenStack\)](#)

CVX VXLAN Control Service Commands

- [resync-period](#)
- [service vxlan](#)
- [shutdown \(CVX-VXLAN\)](#)
- [vtep \(CVX-VXLAN\)](#)

CVX Hardware Switch Controller (HSC) Commands

- [manager](#)
- [ovsdb-shutdown](#)
- [service hsc](#)
- [shutdown \(CVX-HSC\)](#)
- [vtep \(CVX-HSC\)](#)

CVX Network Topology Service Commands

- [lldp run](#)

CVX Static Topology Service Commands

- [service topology](#)
- [show network physical-topology](#)

14.1.9.1 cvx

CVX (CloudVision eXtension) aggregates and shares status across a network of physical switches running EOS. CVX services provide visibility and coordinate activities across a network of switches that are configured as CVX clients.

The **cvx** command enters CVX configuration mode. CVX configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting CVX configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

The **no cvx** and **default cvx** commands restore all CVX server defaults by deleting all CVX configuration mode statements from the **running-config**.

Command Mode

Global Configuration

Command Syntax

```
cvx
no cvx
default cvx
```

Commands Available in CVX Configuration Mode

- **port (CVX)**
- **service openstack**
- **service VXLAN**
- **shutdown (CVX)**
- **heartbeat-interval (CVX)**
- **heartbeat-timeout (CVX)**

Example

These commands enter the CVX-configuration mode and displays the CVX configuration.

```
switch(config)# cvx
switch(config-cvx)# show active all

cvx
  shutdown
  port 9979
  heartbeat-interval 20
  heartbeat-timeout 60
  no service VXLAN
  service openstack
  shutdown
  name-resolution interval 21600
switch(config-cvx)#
```

14.1.9.2 heartbeat-interval (CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX server. Heartbeat messages are part of the keepalive mechanism between CVX and the CVX clients to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands restore the heartbeat interval to the default setting by removing the **heartbeat-interval** command from *running-config*.

Command Mode

CVX Configuration

Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

Parameters

period Interval duration (seconds). Value ranges from **5** through **60**. Default value is **20**.

Related Commands

- **cvx.**
- **heartbeat-timeout (CVX)**

Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When a client stops receiving heartbeat messages from the server within a specified period, the client assumes that the CVX server is no longer functioning.

Best practices dictate that CVX and its client applications configure identical heartbeat interval values.

Example

This command configures a CVX server heartbeat interval of **30** seconds:

```
switch(config)# cvx
switch(config-cvx)# heartbeat-interval 30
switch(config-cvx)#
```

14.1.9.3 heartbeat-interval (Management-CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX client. Heartbeat messages are part of the keepalive mechanism between the CVX client and the CVX server to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands revert the heartbeat interval to the default setting by removing the **heartbeat-interval** command from *running-config*.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

Parameters

period: Interval duration (seconds). Value ranges from **5** through **60**. Default value is **20**.

Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When the server stops receiving heartbeat messages from a client within a specified period, the server assumes that the device it is no longer functioning as a CVX client.

Best practices dictate that the CVX client's heartbeat interval value is identical to that of its CVX server.

Related Commands

[heartbeat-timeout \(Management-CVX\)](#) specifies the CVX client timeout interval.

Example

These commands configure a CVX client heartbeat interval of **30** seconds:

```
switch(config)# management cvx
switch(config-mgmt-cvx)# heartbeat-interval 30
switch(config-mgmt-cvx)#
```

14.1.9.4 heartbeat-timeout (CVX)

The **heartbeat-timeout** command specifies the CVX timeout period. When a CVX server does not receive consecutive heartbeat messages from a CVX client within the heartbeat timeout period, the server discontinues providing CVX services to the client device. The default timeout period is **60** seconds.

The **no heartbeat-timeout** and **default heartbeat-timeout-timeout** commands restore the heartbeat timeout to the default setting by removing the heartbeat-timeout command from **running-config**.

Command Mode

CVX Configuration

Command Syntax

```
heartbeat-timeout period
no heartbeat-timeout
default heartbeat-timeout
```

Related Commands

- **cvx** places the switch in CVX configuration mode.
- **heartbeat-interval (CVX)** specifies the CVX heartbeat interval.

Parameters

period heartbeat timeout interval (seconds). Value ranges from **15** to **10800**. Default value is **60**.

Guidelines

Best practices dictate that CVX and its client applications configure identical heartbeat timeout values.

Examples

These commands set the CVX timeout period to **90** seconds.

```
switch(config)# cvx
switch(config-cvx)# heartbeat-timeout 90
switch(config-cvx)#
```

14.1.9.5 heartbeat-timeout (Management-CVX)

The **heartbeat-timeout** command specifies the CVX client timeout period. When a CVX client does not receive consecutive heartbeat messages from a CVX server within the period specified by this command, the client assumes that its connection to CVX is disrupted. The default timeout period is **60** seconds.

The **no heartbeat-timeout** and **default heartbeat-timeout** commands restore the CVX client heartbeat timeout to the default setting by removing the **heartbeat-timeout** command from **running-config**.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
heartbeat-timeout period
no heartbeat-timeout
default heartbeat-timeout
```

Parameter

period heartbeat timeout interval (seconds). Value ranges from **15** to **10800**. Default value is **60**.

Guidelines

Best practices dictate that the CVX client's heartbeat timeout value is identical to that of its CVX server.

Related Command

[heartbeat-interval \(Management-CVX\)](#) specifies the CVX client heartbeat interval.

Example

These commands set the CVX client timeout period to **90** seconds.

```
switch(config)# management cvx
switch(config-mgmt-cvx)# heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

14.1.9.6 lldp run

The **lldp run** command enables LLDP on the Arista switch.

Command Mode

Global Configuration

Command Syntax

```
lldp run
```

```
no lldp run
```

```
default lldp run
```

Examples

- This command enables LLDP globally on the Arista switch.

```
switch(config)# lldp run  
switch(config)#
```

- This command disables LLDP globally on the Arista switch.

```
switch(config)# no lldp run  
switch(config)#
```

14.1.9.7 management cvx

The **management cvx** command places the switch in **mgmt-CVX** configuration mode to configure CVX client parameters.

Mgmt-CVX configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting **mgmt-CVX** configuration mode does not affect the **running-config**. The **exit** command returns the switch to global configuration mode.

The **no management cvx** and **default management cvx** commands delete all mgmt-CVX configuration mode statements from the **running-config**.

Command Mode

Global Configuration

Command Syntax

```
management cvx
```

```
no management cvx
```

```
default management cvx
```

Commands Available in Mgmt-CVX Configuration Mode

- **heartbeat-interval** (Management-CVX)
- **heartbeat-timeout** (Management-CVX)
- **server host** (Management-CVX)
- **source-interface** (Management-CVX)
- **shutdown** (Management-CVX)

Examples

- This command places the switch in mgmt-CVX configuration mode.

```
switch(config)# management cvx  
switch(sl)(config-mgmt-cvx)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-cvx)# exit  
switch(config)#
```

14.1.9.8 manager

The **manager** command configures the IP address of the OVSDB controller for the HSC service, allowing CVX to connect to the controller.

The **no manager** and **default manager** commands remove the HSC manager configuration from *running-config*.

Command Mode

CVX-HSC Configuration

Command Syntax

```
manager ip_address [port]
```

Parameters

- **ip_address** IP address of the HSC manager.
- **port connection port**. Values range from **1** to **65535**; default value is **6632**.

Related Commands

service hsc places the switch in CVX-HSC configuration mode.

Example

These commands point the HSC service to a controller at IP address **192.168.2.5** using the default port **6632**.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# manager 192.163.2.5
switch(config-cvx-hsc)#
```

14.1.9.9 name-resolution force (CVX-OpenStack)

The **name-resolution force** command initiates an OpenStack controller function that communicates with the OpenStack Keystone and Nova services to update names of VMs and tenants mapped by the local OpenStack instance.

The OpenStack controller accesses the Keystone and Nova services in response to various triggering events (such as the creation of a new tenant, network or VM), and also at a regular interval configured by the **name-resolution interval (CVX-OpenStack)** command (default interval 6 hours). The **name-resolution force** command is used to force an immediate update without waiting for a triggering event.

Command Mode

CVX-OpenStack Configuration

Command Syntax

name-resolution force

Related Commands

- **service openstack** places the switch in CVX-OpenStack configuration mode.
- **name-resolution interval (CVX-OpenStack)** sets the interval for automatic Keystone updates.

Example

These commands update the OpenStack instance immediately with data from the Keystone service.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# name-resolution force
switch(config-cvx-openstack)#
```

14.1.9.10 name-resolution interval (CVX-OpenStack)

The **name-resolution interval** command specifies the period between consecutive requests that the OpenStack controller sends to the Keystone service for VM and tenant name updates. Keystone is OpenStack's authentication and authorization service.

The default period is **21600** seconds (six hours).

The **name-resolution force (CVX-OpenStack)** command performs an immediate update, as opposed to waiting for the periodic update.

Command Mode

CVX-OpenStack Configuration

Command Syntax

```
name-resolution interval period
```

Parameters

period Keystone identity service polling interval (seconds).

Related Command

service openstack places the switch in **CVX-OpenStack** configuration mode.

Example

These commands set the name resolution interval period at **18000** (five hours).

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# name-resolution interval 18000
switch(config-cvx-openstack)#
```

14.1.9.11 ovssdb-shutdown

The **ovssdb-shutdown** command shuts down the OVSSDB server.

The **no ovssdb-shutdown** and **default ovssdb-shutdown** commands enable the OVSSDB server by removing the **ovssdb-shutdown** command from the *running-config*.

Command Mode

CVX-HSC Configuration

Command Syntax

ovssdb-shutdown

no ovssdb-shutdown

default ovssdb-shutdown

Related Command

The **service hsc** command places the switch in the **CVX-HSC** configuration mode.

Example

These commands shut down the OVSSDB server used by the HSC service.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# ovssdb-shutdown
switch(config-cvx-hsc)#
```

14.1.9.12 port (CVX)

The **port** command specifies the TCP port number the CVX server listens on. The default port number is **9979**.

The **no port** and **default port** commands restore the default port number by removing the port statement from **running-config**.

Command Mode

CVX Configuration

Command Syntax

```
port port_number
```

```
no port
```

```
default port
```

Parameter

port_number TCP port number. Value ranges from **1** to **65535**.

Related Command

cvx places the switch in the **CVX** configuration mode.

Examples

- These commands configure **9500** as the CVX server port.

```
switch# config
switch(config)# cvx
switch(config-cvx)# port 9500
switch(config-cvx)#
```

- These commands restore the default port (**9979**) as the CVX server port.

```
switch(config-cvx)# no port
switch(config-cvx)#
```

14.1.9.13 resync-period

The **resync-period** command configures the grace period for completion of synchronization between the VXLAN control service and clients after a CVX restart. Arista recommends leaving the grace period set to its default of **300** seconds.

The **no resync-period** command disables VXLAN control service graceful restart. The **default resync-period** command resets the grace period to its default of **300** seconds.

Command Mode

CVX-VXLAN Configuration

Command Syntax

```
resync-period seconds  
no resync-period  
default resync-period
```

Parameter

seconds synchronization grace period in seconds. Values range from **30** to **4800**; default is **300**.

Example

These commands reset the VXLAN control service synchronization grace period to **300** seconds.

```
switch(config)# cvx  
switch(config-cvx)# service VXLAN  
switch(config-cvx-VXLAN)# default resync-period  
switch(config-cvx-VXLAN)#
```

14.1.9.14 server host (Management-CVX)

The **server host** command configures the IP address or host name of the CVX server to which the CVX client device connects. The configuration of this address is required for the switch to function as a CVX client. By default, no CVX host address is specified.

The **no server host** and **default server host** commands remove the CVX host address assignment by removing the server host statement from the *running-config*.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
server host host  
no server host  
default server host
```

Parameter

host IPv4 address (in dotted decimal notation) or FQDN host name of the CVX server.

Example

This command specifies **10.1.1.14** as the address of the server to which the CVX client connects.

```
switch(config)# management cvx  
switch(config-mgmt-cvx)# server host 10.1.1.14  
switch(config-mgmt-cvx)#
```

14.1.9.15 service hsc

The **service hsc** command enters the **CVX-HSC** configuration mode where the HSC service is enabled and configured.

CVX-HSC configuration mode is not a group change mode; the **running-config** is changed immediately upon entering commands. Exiting the **CVX-HSC** configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

```
service hsc
```

Commands Available in CVX-HSC Configuration Mode

- **manager**
- **ovsdb-shutdown**
- **shutdown (CVX-HSC)**

Related Command

cvx places the switch into the CVX configuration mode.

Example

These commands enter the **CVX-HSC** configuration mode.

```
switch(config)# cvx  
switch(config-cvx)# service hsc  
switch(config-cvx-hsc)#
```

14.1.9.16 service openstack

The service openstack command places the switch in CVX-OpenStack configuration mode.

In order to integrate Arista switches into an OpenStack managed cloud network, OpenStack needs to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to hosts where the VMs reside.

CVX-OpenStack configuration mode is not a group change mode; the **running-config** is changed immediately upon entering commands. Exiting the **CVX-OpenStack** configuration mode does not affect the **running-config**. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

```
service openstack
```

Commands Available in CVX-OpenStack Configuration Mode

- **name-resolution force (CVX-OpenStack)**
- **name-resolution interval (CVX-OpenStack)**
- **shutdown (CVX-OpenStack)**

Related Command

cvx places the switch into the CVX configuration mode.

Example

These commands places the switch into the **CVX-OpenStack** configuration mode.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)#
```

14.1.9.17 service topology

The **service topology** command configures the topology statically on CVX without running LLDP on the servers connected to switches.

The **no service topology** command removes the static topology configuration from the *running-config*.

Command Mode

CVX Configuration Mode

Command Syntax

```
service topology
```

```
no service topology
```

Example

The following command configures topology statically on the switch.

```
switch# config
switch(config)# cvx
switch(config-cvx)# service topology
switch(config-cvx-topology)#
```

14.1.9.18 service VXLAN

The **service VXLAN** command enters the **CVX-VXLAN** configuration mode where the VXLAN control service is enabled and configured.

The CVX-VXLAN configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting the **CVX-VXLAN** configuration mode does not affect the **running-config**. The **exit** command returns the switch to global configuration mode.

Command Mode

CVX Configuration

Command Syntax

```
service VXLAN
```

Commands Available in CVX-VXLAN Configuration Mode

- **resync-period**
- **shutdown (CVX-VXLAN)**
- **vtep (CVX-VXLAN)**

Related Command

The **cvx** command places the switch into the CVX configuration mode.

Example

These commands enter the **CVX-VXLAN** configuration mode.

```
switch(config)# cvx  
switch(config-cvx)# service VXLAN  
switch(config-cvx-VXLAN)#
```

14.1.9.19 show cvx

The **show cvx** command displays the enable status and current configuration of CVX.

Command Mode

EXEC

Command Syntax

```
show cvx
```

Example

This command displays the status and configuration of CVX.

```
switch(config)# cvx
cvx
no shutdown
heartbeat-interval 30
heartbeat-timeout 90
switch(config-cvx)# dis
switch> show cvx
CVX Server
Status: Enabled
UUID: 75ce27ce-cc04-11e4-a404-233646319a2c
Heartbeat interval: 30.0
Heartbeat timeout: 90.0 switch>
```

14.1.9.20 show network physical-topology

The **show network physical-topology** command displays the network topology discovered through CVX.

Command Mode

EXEC

Command Syntax

show network physical-topology *hosts|neighbors*

Parameters

- **hosts** Displays all hosts visible in the topology.
- **neighbors** Displays all connections in the network topology. Table is sorted by host name, and can be optionally filtered by host.

Examples

- This command displays all visible hosts.

```
switch# show network physical-topology hosts
```

Unique Id	Hostname
001c.7385.be69	cvx287.sjc.aristanetworks.com
0000.6401.0000	cvc1
0000.6402.0000	cvc2
0000.6403.0000	cvc3
0000.6404.0000	cvc4
bcf6.85bd.8050	dsj14-rack14-tor1

- This command displays all connections in the topology.

```
switch# show network physical-topology neighbors
```

cvx287.sjc.aristanetworks.com

Interface	Neighbor Intf	Neighbor Host
Ethernet1	Ethernet7	cvc4
Ethernet2	Ethernet7	cvc2
Ethernet9	Ethernet7	cvc1
Ethernet10	Ethernet7	cvc3
Management1	27	dsj14-rack14-tor1

OUTPUT OMITTED FROM EXAMPLE

dsj14-rack14-tor1

Interface	Neighbor Intf	Neighbor Host
27	Management1	cvx287.sjc.aristanetwork

14.1.9.21 shutdown (CVX)

The **shutdown** command, in cvx mode, disables or enables the switch as a CVX server. By default, CVX is disabled on the switch.

The **no shutdown** command enables the switch as a CVX server. The **shutdown** and **default shutdown** commands disable the switch as a CVX server by removing the **no shutdown** command from *running-config*.

Note: Be sure to de-configure or shut down all CVX client services before disabling CVX; failure to do so may result in CVX client services continuing to run after CVX has been disabled.

Command Mode

CVX Configuration

Command Syntax

shutdown

no shutdown

default shutdown

Related Command

The **cvx** command places the switch in CVX configuration mode.

Examples

- These commands enable the switch as a CVX server.

```
switch# config
switch(config)# cvx
switch(config-cvx)# no shutdown
switch(config-cvx)#
```

- This command disables CVX on the switch.

```
switch(config-cvx)# shutdown
switch(config-cvx)#
```

14.1.9.22 shutdown (CVX-HSC)

The **shutdown** command, in **CVX-HSC** configuration mode, disables or enables the CVX service on the switch. HSC is disabled by default.

When a CVX server enables HSC, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the HSC service; the **shutdown** and **default shutdown** commands disable the HSC service.

Command Mode

CVX-VXLAN Configuration

Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

Related Command

The **service hsc** command places the switch into the CVX-HSC configuration mode.

Examples

- These commands enable the HSC service.

```
switch(config)# cvx  
switch(config-cvx)# service hsc  
switch(config-cvx-hsc)# no shutdown  
switch(config-cvx-hsc)#
```

- These commands disable the HSC service.

```
switch(config)# cvx  
switch(config-cvx)# service hsc  
switch(config-cvx-hsc)# shutdown  
switch(config-cvx-hsc)#
```

14.1.9.23 shutdown (Management-CVX)

The **shutdown** command, in the **mgmt-cvx** mode, disables or enables CVX client services on the switch. CVX services are disabled by default.

The **no shutdown** command enables CVX client services. The **shutdown** and **default shutdown** commands disable CVX client services by removing the corresponding no shutdown command from the **running-config**.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

Examples

- These commands enable CVX client services.

```
switch(config)# management cvx  
switch(config-mgmt-cvx)# no shutdown  
switch(config-mgmt-cvx)#
```

- This command disables CVX client services.

```
switch(config-mgmt-cvx)# shutdown  
switch(config-mgmt-cvx)#
```

14.1.9.24 shutdown (CVX-OpenStack)

The **shutdown** command, in the **cvx-openstack** configuration mode, disables or enables CVX-OpenStack on the switch. CVX-OpenStack is disabled by default.

When a CVX server enables OpenStack services, its clients are accessible to the OpenStack network controller (Neutron). Integrating Arista switches into an OpenStack-managed cloud network requires OpenStack to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to the hosts where the VMs reside.

The **no shutdown** command enables CVX-OpenStack. The **shutdown** and **default shutdown** commands disable CVX-OpenStack by removing the corresponding no shutdown command from the **running-config**.

Command Mode

CVX-OpenStack Configuration

Command Syntax

```
shutdown
no shutdown
default shutdown
```

Related Command

service openstack places the switch in *CVX-OpenStack* configuration mode.

Examples

- These commands enable CVX-OpenStack.

```
switch(config)# cvx
switch(config-cvx)# service openstack
switch(config-cvx-openstack)# no shutdown
switch(config-cvx-openstack)#
```

- These commands disable CVX-OpenStack.

```
switch(config-cvx-openstack)#
switch(config-cvx-openstack)# shutdown
switch(config-cvx-openstack)#
```

14.1.9.25 shutdown (CVX-VXLAN)

The **shutdown** command, in **CVX-VXLAN** configuration mode, disables or enables the CVX VXLAN control service on the switch. VXLAN control service is disabled by default.

When a CVX server enables VXLAN control service, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the VXLAN control service. The **shutdown** and **default shutdown** commands disable the VXLAN control service.

Command Mode

CVX-VXLAN Configuration

Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

Related Command

The **service VXLAN** command places the switch in CVX-VXLAN configuration mode.

Examples

- These commands enable VXLAN control service.

```
switch(config)# cvx
switch(config-cvx)# service VXLAN
switch(config-cvx-VXLAN)# no shutdown
switch(config-cvx-VXLAN)#
```

- These commands disable VXLAN control service.

```
switch(config)# cvx
switch(config-cvx)# service VXLAN
switch(config-cvx-VXLAN)# shutdown
switch(config-cvx-VXLAN)#
```

14.1.9.26 source-interface (Management-CVX)

The **source-interface** command specifies the interface from where the IPv4 address is derived for use as the source for outbound CVX packets that the switch sends as a CVX client. There is no default source interface assignment.

The **no source-interface** and **default source-interface** commands remove the source interface assignment for the CVX client by deleting the source-interface statement from the **running-config**.

Command Mode

Mgmt-CVX Configuration

Command Syntax

```
source-interface INT_NAME
no source-interface
default source-interface
```

Parameters

INT_NAME: Interface type and number. Options include:

- **ethernet e_num**: Ethernet interface specified by **e_num**.
- **loopback l_num**: Loopback interface specified by **l_num**.
- **management m_num**: Management interface specified by **m_num**.
- **port-channel p_num**: Port-Channel Interface specified by **p_num**.
- **vlan v_num**: VLAN interface specified by **v_num**.

Example

These commands configure the CVX client to use the IP address **10.24.24.1** as the source address for its outbound packets.

```
switch# config
switch(config)# interface loopback 5
switch(config-if-Lo5)# ip address 10.24.24.1/24
switch(config-if-Lo5)# exit
switch(config)# management cvx
switch(config-mgmt-cvx)# source-interface loopback 5
switch(config-mgmt-cvx)#
```

14.1.9.27 vtep (CVX-HSC)

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the **vtep** command in the **CVX-HSC** configuration mode.

Command Mode

CVX-HSC Configuration

Command Syntax

```
vtep flood list type all | any
no vtep flood list type
default vtep flood list type
```

Parameters

- **all**: send-to-all replication; flood list is the list of VTEPs.
- **any**: send-to-any replication; flood list is a list of replication nodes. This is the default setting.

Example

These commands configure the HSC to use send-to-all replication.

```
switch(config)# cvx
switch(config-cvx)# service hsc
switch(config-cvx-hsc)# vtep flood list type all
switch(config-cvx-hsc)#
```

14.1.9.28 vtep (CVX-VXLAN)

The OVSDB management protocol includes provisions for control-plane MAC learning, which allows MAC addresses to be distributed among VTEPs without using the data plane. Some controllers (such as VMware NSX) take advantage of this facility; others (such as Nuage VSP) do not. By default, CVX uses control-plane MAC learning.

To switch to data plane MAC learning, use the **vtep** command in the CVX-VXLAN configuration mode, as shown below.

Command Mode

CVX-VXLAN Configuration

Command Syntax

```
vtep mac-learning [control-plane|data-plane ]
```

Related Command

The **service VXLAN** command places the switch into the **CVX-VXLAN** configuration mode.

Example

These commands configure CVX to use data-plane MAC address learning.

```
switch(config)# cvx
switch(config-cvx)# service VXLAN
switch(config-cvx-VXLAN)# vtep mac-learning data-plane
switch(config-cvx)#
```

Routing Protocols

The Routing Protocols chapter contains the following sections:

- [Routing Information Protocol \(RIP\)](#)
- [Open Shortest Path First – Version 2](#)
- [Open Shortest Path First – Version 3](#)
- [IS-IS](#)
- [Border Gateway Protocol \(BGP\)](#)
- [Maintenance Mode](#)
- [Bidirectional Forwarding Detection](#)

15.1 Routing Information Protocol (RIP)

This chapter contains the following sections.

- [RIP Conceptual Overview](#)
- [Running RIP on the Switch](#)
- [Configuring RIP on Multiple VRFs](#)
- [RIP Commands](#)

15.1.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an Interior Gateway Protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of **15** hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicast at address **224.0.0.9** to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every **30** seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of **1**, and the router adds **1** to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.

15.1.2 Running RIP on the Switch

15.1.2.1 Accessing RIP Configuration Mode and Enabling RIP

15.1.2.1.1 RIP Configuration Mode

The `router rip` command places the switch in router-RIP configuration mode to configure Routing Information Protocol (RIP) routing.

Example

This command places the switch in router-RIP configuration mode.

```
switch(config)# router rip
switch(config-router-rip)#
```

Using the `router rip` command puts the switch in router-RIP configuration mode but does not enable RIP on the switch.

15.1.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled by default on the switch. The `no shutdown (RIP)` command in router-RIP configuration mode will enable RIP.

Example

This command enables RIP on the switch.

```
switch(config-router-rip)# no shutdown
switch(config-router-rip)#
```

Issuing this command enables RIP, but to send and receive RIP route updates and route packets via RIP, you must also use the `network (RIP)` command to specify interfaces on which RIP will run.

15.1.2.1.3 Disabling RIP

You can disable RIP in two ways. The `shutdown (RIP)` command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the *running-config*. The `no router rip` command disables RIP and removes all user-entered router-RIP configuration statements from the *running-config*.

Examples

- This command disables RIP on the switch and removes all user-entered router-RIP configurations.

```
switch(config)# no router rip
switch(config)#
```

- This command disables RIP on the switch but preserves all user-entered router-RIP configurations.

```
switch(config-router-rip)# shutdown
switch(config-router-rip)#
```

15.1.2.2 Configuring RIP

Issuing the `no shutdown (RIP)` command in router-RIP configuration mode enables RIP. However, to run RIP on an interface, you must specify a RIP network using the `network (RIP)` command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.

15.1.2.2.1 Specifying RIP Networks

The [network \(RIP\)](#) command identifies networks on which RIP will run and specifies which routes RIP will accept into its routing table. You can issue the [network \(RIP\)](#) command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates, you must specify one or more RIP networks.

Use the **no network (RIP)** command to disable RIP on a specific network.

Examples

- This command enables RIP on **10.168.1.1/24**.

```
switch(config-router-rip) # network 10.168.1.1/24
switch(config-router-rip) #
```

- This command disables RIP on **10.168.1.1/24**.

```
switch(config-router-rip) # no network 10.168.1.1/24
switch(config-router-rip) #
```

15.1.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

Use the [redistribute \(RIP\)](#) command to enable route import from a specified protocol into RIP. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

Example

This command redistributes all routes learned from OSPF into RIP.

```
switch(config-router-rip) # redistribute OSPF
switch(config-router-rip) #
```

15.1.2.2.3 Configuring RIP Timers

When RIP runs on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the [timers \(RIP\)](#) command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

Example

This command sets the update interval to **60** seconds, the expiration time to **90** seconds, and the deletion time to **150** seconds.

```
switch(config-router-rip) # timers 60 90 150
switch(config-router-rip) #
```

15.1.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the [rip v2 multicast disable](#) command in the configuration mode for the interface.

Example

The following commands configure RIP version 2 broadcasting on *interface ethernet5*.

```
switch(config)# interface ethernet5
switch(config-if-Et5)# rip v2 multicast disable
switch(config-if-Et5)# exit
switch(config)#
```

15.1.2.3 Displaying RIP Information

15.1.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch's routing table, use the [show ip rip database](#) command. (You can also display similar information using the RIP option in the [show ip route](#) command.)

Examples

- This command displays all active rip routes.

```
switch> show ip rip database
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

- This command submits a query for RIP route information for a network.

```
switch> show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

15.1.2.3.2 Displaying RIP Route Gateways

To see information about the switch's RIP route gateways, use the [show ip rip neighbors](#) command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Example

This command displays information about all the gateways of RIP routes.

```
switch> show ip rip neighbors
Gateway      Last-Heard    Bad-Packets    Bad-Routes    Flags
10.2.12.33   00:00:15
                                     SRC, TRSTED,
                                     ACCPTED, RJCTED,
                                     Q_RJCTED, AUTHFAIL
```

15.1.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The **vrf instance** and **vrf (Interface mode)** commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The **router rip vrf** command places the switch in router-RIP configuration mode to configure a RIP routing instance in a non-default VRF.

Examples

- These commands configure a non-default VRF and enable unicast routing in it.

```
switch(config)# vrf instance test
switch(config-vrf-test)# exit
switch(config)# ip routing vrf test
switch(config)#
```

- This command configures a RIP instance in a non-default VRF.

```
switch(config)# router rip vrf test
switch(config-router-rip-router-rip-vrf-test)# no shutdown
switch(config-router-rip)# exit
switch(config)#
```

- This command configures an interface as part of a non-default VRF by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

```
switch(config)# interface Ethernet 3 / 1
switch(config-if-Et3/1)# no switchport
switch(config-if-Et3/1)# ip address 1.0.0.1/24
switch(config-if-Et3/1)# vrf test
switch(config-if-Et3/1)# network 1.0.0.1
switch(config-if-Et3/1)# exit
switch(config)#
```

15.1.4 RIP Commands

Global Configuration Commands

- `router rip`
- `router rip vrf`

Interface Configuration Commands

- `rip v2 multicast disable`

Router-RIP Configuration Mode

- `distance (RIP)`
- `distribute-list (RIP)`
- `metric default`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers (RIP)`

Display Commands – EXEC Mode

- `show ip rip database`
- `show ip rip neighbors`

15.1.4.1 distance (RIP)

The **distance** command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from **1 to 255**; lower distance values correspond to higher reliability. The default RIP distance value is **120**.

The **no distance** and **default distance** commands restore the administrative distance default value of **120** by removing the **distance** command from **running-config**.

Command Mode

Router-RIP Configuration

Command Syntax

```
distance distance_value
```

```
no distance
```

```
default distance
```

Parameter

distance_value distance assigned to RIP routes. Values range from **1** to **255**.

Example

These commands assign an administrative distance of **75** to RIP routes.

```
switch(config)# router rip
switch(config-router-rip)# distance 75
switch(config-router-rip)#
```

15.1.4.2 distribute-list (RIP)

The **distribute-list** command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

Configuration Notes:

- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
 - **match ip address access-list**
 - **match ip address prefix-list**
- The **distribute-list** command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
 - Routes permitted by the prefix/access lists are treated as matched.
 - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
 - Unmatched routes are further evaluated by the next route-map clause.
 - If a route does not match any clause in a route-map, it is denied.
 - If the route-map given in the **distribute-list** command is not configured, then all routes are permitted.
 - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The **no distribute-list** and **default distribute-list** commands remove the corresponding **distribute-list** command from *running-config*.

Command Mode

Router-RIP Configuration

Command Syntax

```
distribute-list DIRECTION MAP [INTF]
```

```
no distribute-list DIRECTION MAP [INTF]
```

```
default distribute-list DIRECTION MAP [INTF]
```

Parameters

- **DIRECTION** direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
 - **in** specifies inbound as the direction the distribute-list is applied.
 - **out** specifies outbound as the direction the distribute-list is applied.
- **MAP** specifies route map that assigns attribute values to the network. Options include:
 - **no parameter** attributes are not assigned through a route map.
 - **route-map map_name** attributes listed by specified route map are assigned to the network.
- **INTF** interface to be configured. Options include:

-
- **ethernet *e_num*** Ethernet interface.
 - **loopback *l_num*** Loopback interface.
 - **port-channel *p_num*** Port channel interface.
 - **vlan *v_num*** VLAN interface.

Examples

- The following commands demonstrate that an **access-list** or **prefix-list** can be used within a **route-map** for use in a **distribute-list**.

```
switch(config)# ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
switch(config)# route-map myRouteMap permit 10
switch(config-route-map-myRouteMap)# match ip address prefix-list 8to24
switch(config-route-map-myRouteMap)# exit
switch(config)#
switch(config)# router rip
switch(config-router-rip)# distribute-list in route-map myRouteMap
switch(config-router-rip)#
```

- These commands suppress routes advertised on a particular interface.

```
switch(config)# ip prefix-list 2 seq 10 deny 30.1.1.0/24
switch(config)# route-map myRmOut permit 10
switch(config-route-map-myRmOut)# match ip address prefix-list 2
switch(config-route-map-myRouteMap)# exit
switch(config)# router rip
switch(config-router-rip)# distribute-list out route-map myRmOut
```

15.1.4.3 metric default

The **metric default** command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of **0** is assigned to redistributed connected and static routes. The default metric values range from **0** to **16** with a default value of **1**.

The **no metric default** and **default metric default** commands remove the **metric default** command from **running-config** and returns the metric value to its default value of **1**.

Command Mode

Router-RIP Configuration

Command Syntax

```
metric default metric_value  
no metric default  
default metric default
```

Parameter

metric_value default metric value assigned. Values range from **0 to 16**; default is **1**.

Example

This command sets the default metric value to **5**.

```
switch(config)# router rip  
switch(config-router-rip)# metric default 5  
switch(config-router-rip)#
```

15.1.4.4 network (RIP)

The **network** command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The **no network** and **default network** commands disable RIP on the specified network by removing the corresponding **network** command from *running-config*.

Command Mode

Router-RIP Configuration

Command Syntax

```
network NETWORK_ADDRESS
no network NETWORK_ADDRESS
default network NETWORK_ADDRESS
```

Parameters

NETWORK_ADDRESS network IP address. Entry formats include the following:

- **ipv4_subnet** IPv4 subnet (CIDR notation).
- **ipv4_addr mask wildcard_mask** IP address and wildcard-mask.

Examples

- This command enables RIP on **10.168.1.1/24**.

```
switch(config)# router rip
switch(config-router-rip)# network 10.168.1.1/24
switch(config-router-rip)#
```

- This command also enables RIP on **10.168.1.1/24**.

```
switch(config-router-rip)# network 10.168.1.1 mask 0.0.0.255
switch(config-router-rip)#
```

15.1.4.5 redistribute (RIP)

The **redistribute** command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.
- **BGP, OSPF, and IP static routes** by default, routes are not redistributed. The **redistribute** command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The **no redistribute** and **default redistribute** commands reset the default route redistribution setting by removing the **redistribute** statement from *running-config*.

Command Mode

Router-RIP Configuration

Command Syntax

```
redistribute connected ROUTE_MAP
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute connected ROUTE_MAP
no redistribute ROUTE_TYPE
default redistribute connected ROUTE_MAP
default redistribute ROUTE_TYPE
```

Parameters

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
 - **BGP** routes from a BGP domain.
 - **OSPF** routes from an OSPF domain.
 - **OSPF match external** routes external to RIP, but imported from OSPF.
 - **OSPF match internal** OSPF routes that are internal to the AS.
 - **static** IP static routes.
- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
 - **no parameter** all routes are redistributed.
 - **route-map map_name** only routes in the specified route map are redistributed.

Example

These commands redistribute OSPF routes into RIP.

```
switch(config)# router rip
switch(config-router-rip)# redistribute OSPF
switch(config-router-rip)#
```

15.1.4.6 **rip v2 multicast disable**

The **rip v2 multicast disable** command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to **255.255.255.255**.

The **no rip v2 multicast disable** and **default rip v2 multicast disable** commands specify the transmission of update packets as multicast to **224.0.0.9** if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
rip v2 multicast disable
```

```
no rip v2 multicast disable
```

```
default rip v2 multicast disable
```

Example

The following example configures version 2 broadcasting on *interface ethernet 5*.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# rip v2 multicast disable
switch(config-if-Et5)# exit
switch(config)#
```

15.1.4.7 router rip vrf

The **router rip** command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The **no router rip vrf** and **default router rip vrf** commands disable an RIP routing instance in the non-default VRF, and remove all user-entered **router-rip** configuration statements from **running-config**. To disable RIP without removing configuration statements, use the [shutdown \(RIP\)](#) command.

The **exit** command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router rip vrf [RIP_INSTANCE]
no router rip vrf [RIP_INSTANCE]
default router rip vrf [RIP_INSTANCE]
```

Parameter

RIP_INSTANCE configure a RIP VRF instance in the non-default VRF.

Examples

- This command configures a RIP instance in the non-default VRF.

```
switch(config)# router rip vrf test
switch(config-router-rip-router-rip-vrf-test)# no shutdown
switch(config-router-rip)# exit
switch(config)#
```

- This command disables a RIP instance in the non-default VRF.

```
switch(config)# no router rip vrf test
switch(config)#
```

15.1.4.8 router rip

The **router rip** command places the switch in **router-rip** configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; **running-config** is changed immediately upon command entry. The **exit** command does not affect **running-config**.

The **no router rip** and **default router rip** commands disable RIP and remove all user-entered **router-rip** configuration statements from **running-config**. To disable RIP without removing configuration statements, use the **shutdown (RIP)** command.

The **exit** command returns the switch to the **global** configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router rip
```

```
no router rip
```

```
default router rip
```

Commands Available in router-rip Configuration Mode

- [distance \(RIP\)](#)
- [network \(RIP\)](#)
- [redistribute \(RIP\)](#)
- [shutdown \(RIP\)](#)
- [timers \(RIP\)](#)

Example

This command places the switch in the **router-rip** configuration mode.

```
switch(config)# router rip  
switch(config-router-rip)#
```

15.1.4.9 show ip rip database

The **show ip rip database** command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- **default (no arguments):** information about all RIP routes.
- **IPv4 address and mask:** information about the referenced addresses.
- **active:** information about routes not superseded by routes from other protocols.

Command Mode

EXEC

Command Syntax

```
show ip rip database [FILTER]
```

Parameters

FILTER routing table entries that the command displays. Values include .:

- **no parameter** displays all routing table entries.
- **active** displays all active routing table entries.
- **net_addr** subnet address (CIDR or address-mask). Command displays entries in this subnet.

Examples

- This command displays all active rip routes.

```
switch> show ip rip database active
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

- This command submits a query for RIP route information for a network.

```
switch> show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

- This command returns information for all RIP routes.

```
switch> show ip rip database
10.1.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.2.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.3.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, inactive
10.212.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, active
10.214.0.0/255.255.255.0
[1] via 10.8.12.17, 00:00:30, Et4, active
```

15.1.4.10 show ip rip neighbors

The **show ip rip neighbors** command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

Command Mode

EXEC

Command Syntax

```
show ip rip neighbors
```

Example

The **show ip rip neighbors** command displays information about all gateways of RIP routes.

```
switch> show ip rip neighbors
Gateway      Last-Heard      Bad-Packets      Bad-Routes      Flags
10.2.12.33   00:00:15
                                SRC, TRSTED,
                                ACCPTED, RJCTED,
                                Q_RJCTED, AUTHFAIL
```

15.1.4.11 shutdown (RIP)

The **shutdown** command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The **no shutdown** command enables RIP. The **default shutdown** command disables RIP.

Command Mode

Router-RIP Configuration

Command Syntax

`shutdown`

`no shutdown`

`default shutdown`

Examples

- This command disables RIP on the switch.

```
switch(config)# router rip
switch(config-router-rip)# shutdown
switch(config-router-rip)#
```

- This command enables RIP on the switch.

```
switch(config-router-rip)# no shutdown
switch(config-router-rip)#
```

15.1.4.12 timers (RIP)

The **timers** command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The **no timers** and **default timers** commands return the timer values to their default values by removing the **timers** command from *running-config*.

Command Mode

Router-RIP Configuration

Command Syntax

```
timers update_time expire_time deletion_time
```

```
no timers
```

```
default timers
```

Parameters

- ***update_time*** Default is **30** seconds.
- ***expire_time*** Default is **180** seconds.
- ***deletion_time*** Default is **120** seconds.

Parameter values are in seconds and range from **5 to 2147483647**.

Example

This command sets the update (**60** seconds), expiration (**90** seconds), and deletion (**150** seconds) times.

```
switch(config)# router rip
switch(config-router-rip)# timers 60 90 150
switch(config-router-rip)#
```

15.2 Open Shortest Path First – Version 2

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by *RFC 2328*.

This section contains the following topics:

- [OSPFv2 Introduction](#)
- [OSPFv2 Conceptual Overview](#)
- [Configuring OSPFv2](#)
- [OSPFv2 Configuration Examples](#)
- [OSPFv2 Commands](#)

15.2.1 OSPFv2 Introduction

This section contains the following topics:

- [Supported Features](#)
- [Features Not Supported](#)

15.2.1.1 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance.
- Intra- and inter-area routing.
- Type 1 and 2 external routing.
- Broadcast and P2P interfaces.
- Stub areas.
- Not so stubby areas (NSSA) (*RFC 3101*).
- MD5 Authentication.
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering.
- Opaque LSAs (*RFC 2370*).
- Graceful restart (*RFC 3623*).
- OSPF Routes over GRE Tunnels.

15.2.1.2 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces.
- OSPFv2 MIB support.

15.2.2 OSPFv2 Conceptual Overview

This section contains the following topics:

- [Storing Link States](#)
- [Topology](#)
- [Link Updates](#)
- [OSPFv2 Route Redistribution Instance](#)
- [OSPFv2 and BFD Sessions for Adjacencies in any State](#)
- [OSPFv2 Multiple Instances Support](#)

- [OSPF Routes over GRE Tunnels](#)

15.2.2.1 Storing Link States

OSPFv2 is a dynamic, link-state routing protocol where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A Link State Advertisement (LSA) is an OSPFv2 packet that communicates a router's topology to other routers. The Link State Database (LSDB) stores an area's topology database and comprises LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

15.2.2.2 Topology

An Autonomous System (AS) is the IP domain where a dynamic protocol controls traffic routing. In OSPFv2, an AS comprises areas that define the LSDB computation boundaries—all routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carrying data to the IP space on the route.

OSPFv2 defines these routers:

- An Internal Router (IR) is a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- An Area Border Router (ABR) is a router that has interfaces in multiple areas and maintains one LSDB for each connected area.
- An Autonomous System Boundary Router (ASBR) is a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.
- [OSPFv2 Router Types](#) displays the OSPFv2 router types.

Figure 15-1: OSPFv2 Router Types

OSPFv2 areas are assigned a number between **0** and **4,294,967,295** (2321). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.

- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.
- Not-So-Stubby-Area (NSSA) may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

15.2.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router's hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

OSPFv2 Neighbors illustrates OSPFv2 neighbors.

Figure 15-2: OSPFv2 Neighbors

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router generates an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When an LSA changes a router's LSDBA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use the Dijkstra algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

15.2.2.4 OSPFv2 Route Redistribution Instance

OSPFv2 Route Redistribution is used for redistributing OSPFv2 leaked and non-leaked routes from one instance to another when multiple OSPFv2 instances are configured. The OSPFv2 Route Redistribution is supported on all platforms in the multi-agent routing mode.

15.2.2.5 OSPFv2 and BFD Sessions for Adjacencies in any State

BFD sessions are only established for OSPFv2 adjacencies that are in the FULL state. In a LAN environment this results in BFD sessions not being established for OSPFv2 adjacencies with DR Other neighbors.

This feature provides a configuration that enables the establishment of BFD sessions for OSPFv2 adjacencies that are in any state. This results in the BFD sessions being established for OSPFv2 adjacencies with DR Other neighbors.

15.2.2.6 OSPFv2 Multiple Instances Support

EOS Release 4.22.1F adds support for multiple OSPFv2 instances to be configured in the default VRF. OSPFv2 Multiple Instances Support provides isolation and allows segregating and dividing the link state database based on the interface.

Basic OSPFv2 functionality, along with the redistribution of OSPFv2 routes (all instances) into BGP and **default information originate always** is available forward from the **EOS Release 4.22.1F**.

Support for graceful restart and BFD with multiple OSPFv2 instances was added in the **EOS Release 4.23.1**.

15.2.2.6.1 OSPFv2 Multiple Instances Support Platform Compatibility

OSPFv2 Multiple Instances Support is supported on all platforms.

15.2.2.7 OSPF Routes over GRE Tunnels

This feature introduces support for OSPF routes over GRE tunnels under default and non-default VRFs. It is disabled by default.

15.2.2.7.1 Limitations

The platform does not support arbitrarily created TCAM profiles. When the TCAM profile cannot be programmed, the show command prints **ERROR** in the status column.

15.2.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- [Configuring the OSPFv2 Instance](#)
- [Configuring OSPFv2 Areas](#)
- [Support for OSPFv2 dn-bit-ignore](#)
- [OSPFv2 Area Filter by Prefix-List](#)
- [IPv4 Unnumbered Interfaces](#)
- [Configuring Interfaces for OSPFv2](#)
- [Enabling OSPFv2](#)
- [OSPFv2 Multiple Instances Support Configuration](#)
- [OSPF Routes over GRE Tunnels Configuration](#)
- [Displaying OSPFv2 Status](#)

15.2.3.1 Configuring the OSPFv2 Instance

15.2.3.1.1 Entering OSPFv2 Configuration Mode

The `router ospf` command places the switch in **router-ospf** configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process IDs.

Example

This command places the switch in **router-ospf** configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of **100**.

```
switch(config)# router ospf 100
switch(config-router-ospf)#
```

15.2.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id (OSPFv2)` command configures the router ID for an OSPFv2 instance.

Example

This command assigns **10.1.1.1** as the OSPFv2 router ID.

```
switch(config-router-ospf)# router-id 10.1.1.1
switch(config-router-ospf)#
```

15.2.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.

LSA Overload

The `max-lsa (OSPFv2)` command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- **Warning:** the switch logs OSPF MAXLSA WARNING if the LSDB contains a specified percentage of the LSA maximum.

- **Temporary shutdown:** when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch restarts OSPFv2 after a specified period (the default is **5** minutes).
- **Permanent shutdown:** the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is **5**). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a `router ospf` command.

The LSDB size restriction is removed by setting the LSA limit to zero.

Note: If OSPFv2 has entered a permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2 and will disable overload protection.

Example

- This command configures the OSPFv2 maximum LSA count to **20000** and triggers these actions:
 - The switch logs an **OSPF MAXLSA WARNING** if the LSDB has **8000** LSAs (**40%** of **20000**).
 - The switch temporarily disables OSPFv2 for **10** minutes if the LSDB contains **20000** LSAs.
 - The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
 - The shutdown counter resets if the LSDB contains less than 20,000 LSAs for **20** minutes.

```
switch(config-router-ospf) # max-lsa 20000 40 ignore-time 10 ignore-count 4 reset-time 20
switch(config-router-ospf) #
```

Logging Adjacency Changes

The `log-adjacency-changes` (OSPFv2) command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.

```
switch(config-router-ospf) # log-adjacency-changes
switch(config-router-ospf) #
```

- This command configures the switch to log all OSPFv2 link-state changes.

```
switch(config-router-ospf) # log-adjacency-changes detail
switch(config-router-ospf) #
```

OSPF RFC Compatibility

RFC 2328 and *RFC 1583* specify different methods for calculating summary route metrics. The `compatible` (OSPFv2) command allows the selective disabling of compatibility with *RFC 2328*.

Example

This command sets the OSPF compatibility list with *RFC 1583*.

```
switch(config) # router ospf 6
switch(config-router-ospf) # compatible rfc1583
switch(config-router-ospf) #
```

Administrative Distance

The `distance ospf (OSPFv2)` command configures the administrative distance for intra-area, inter-area, or external OSPF routes. The command must be entered multiple times to configure the administrative distance for multiple route types. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for all routes is **110**.

Note: OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether by entering the `distance ospf` command directly through the CLI or by applying a configuration file containing the command.

Example

This command configures an administrative distance of **95** for OSPFv2 intra-area routes and will cause links to flap if issued while OSPF is running.

```
switch(config-router-ospf) # distance ospf intra-area 95
switch(config-router-ospf) #
```

Passive Interfaces

The `passive-interface (OSPFv2)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive-interface in the router LSA.

The `no passive-interface` command re-enables OSPFv2 processing on the specified interface.

Examples

- This command configures **vlan 2** as a passive interface.

```
switch(config-router-ospf) # passive-interface vlan 2
switch(config-router-ospf) #
```

- This command configures **vlan 2** as an active interface.

```
switch(config-router-ospf) # no passive-interface vlan 2
switch(config-router-ospf) #
```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Example

The `redistribute (OSPFv2) connected` command converts connected routes to OSPFv2 external routes.

```
switch(config-router-ospf) # redistribute connected
switch(config-router-ospf) #
```

Redistributing Static Routes

Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

Examples

- The `redistribute (OSPFv2)` static command converts the static routes to OSPFv2 external routes.

```
switch(config-router-ospf) # redistribute static
switch(config-router-ospf) #
```

- The `no redistribute (OSPFv2)` command stops the advertising of the static routes as OSPFv2 external routes.

```
switch(config-router-ospf) # no redistribute static
switch(config-router-ospf) #
```

Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The `distribute-list in` command specifies the filter to be used and applies it to the OSPF instance.

Example

These commands configure a prefix-list named *dist_list1* in OSPF instance **5** to filter certain routes from incoming OSPF LSAs.

```
switch(config) # router ospf 5
switch(config-router-ospf) # distribute-list prefix-list dist_list1 in
switch(config-router-ospf) #
```

15.2.3.1.4 Configuring OSPFv2 Route Redistribution

Use the `redistribute ospf instance` command to redistribute either the non-leaked routes or both leaked and non-leaked routes. This command is configured under the *router-ospf* mode.

Examples

- The **leaked** clause includes both internal and external routes.

```
switch(config-router-ospf) # redistribute ospf instance include leaked
<cr>
Options:
  include      Include leaked routes
  match        Routes learned by the OSPF protocol
  route-map    Specify which route map to use
```

- The **match** clause allows matching on the different OSPFv2 route types.

```
switch(config-router-ospf) # redistribute ospf instance match external
<cr>
Options:
  external      OSPF routes learned from external sources
  internal      OSPF routes learned from internal sources
  nssa-external OSPF routes learned from external NSSA sources
```

- The following command redistributes the OSPFv2 external routes from all other OSPFv2 instances in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external
```

- The following command redistributes the OSPFv2 internal leaked and non-leaked routes from all other instances in all VRFs into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance include leaked match internal
```

- Matching based on the OSPFv2 instance ID is supported in the route-map.

```
switch(config)# route-map rml permit 10
switch(config-route-map-rml)# match ospf instance 3
```

- The following command redistributes the OSPFv2 external routes from the OSPFv2 instance with **ID 3** in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external route-map rml
```

Show Commands

- The **show ip ospf database external** command is used to verify if the AS-External LSAs are created in the instance for the redistributed route and advertised into the OSPFv2 domain.
- The **show route-map** command displays the details of a configured route-map.

15.2.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in **router-ospf** configuration mode, as described in [Entering OSPFv2 Configuration Mode](#), to run area commands.

Areas are assigned a 32-bit number expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

15.2.3.2.1 Configuring the Area Type

The **area (OSPFv2)** commands specifies the area type, refer [OSPFv2 Commands](#) section for the **area** commands. The switch supports three area types:

- **Normal area:** Area that accepts intra-area, inter-area, and external routes. The backbone area (area **0**) is a normal area.
- **Stub area:** Area that does not advertise external routes. External routes are reached through a default summary route (**0.0.0.0**). Networks with no external routes do not require stub areas.
- **Not So Stubby Area (NSSA):** ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

Examples

- This command configures area **45** as a stub area.

```
switch(config-router-ospf)# area 45 stub
switch(config-router-ospf)#
```

- This command configures area **10.92.148.17** as an NSSA.

```
switch(config-router-ospf)# area 10.92.148.17 NSSA
switch(config-router-ospf)#
```

15.2.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The `area nssa no-summary (OSPFv2)` command configures the router to not import type-3 summary LSAs into the Not-So-Stubby Area (NSSA). It injects a default summary route (**0.0.0.0/0**) into the NSSA to reach the inter-area prefixes.

Example

This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (**0.0.0.0/0**) into the NSSA area.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#
```

15.2.3.2.3 Assigning Network Segments to the Area

Assigning Routes to an Area

The `network area (OSPFv2)` command assigns the specified network segment to an OSPFv2 area. The network can be entered using CIDR notation or an address and wildcard mask.

The switch zeroes the host portion of the specified network address. For example, **1.2.3.4/24** converts to **1.2.3.0/24**, and **1.2.3.4/16** converts to **1.2.0.0/16**.

Example

Each of these equivalent commands assigns the network segment **10.1.10.0/24** to area 0.

```
switch(config-router-ospf)# network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf)# network 10.1.10.0/24 area 0
```

In each case, *running-config* stores the command in CIDR (prefix) notation.

Summarizing Routes

By default, Area Border Routers (ABRs) create a summary LSA for each route in an area and advertise them to adjacent routers. The `area range (OSPFv2)` command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The `area range (OSPFv2)` command can be used to suppress route advertisements.

Examples

- Two `network area` commands assign subnets to an area. The `area range (OSPFv2)` command summarizes the addresses the ABR advertises in a single LSA.

```
switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf)#
```

- The `network area` command assigns a subnet to an area, followed by an `area range (OSPFv2)` command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)# network 10.12.31.0 0.0.0.255 area 5
switch(config-router-ospf)# area 5 range 10.12.31.0 0.0.0.255 not-advertise
switch(config-router-ospf)#
```

15.2.3.2.4 Configuring Area Parameters

These **router-ospf** configuration mode commands define OSPFv2 behavior in a specified area.

Default Summary Route Cost

The **area default-cost (OSPFv2)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

Example

This command configures a cost of **15** for the default summary route in area **23**.

```
switch(config-router-ospf) # area 23 default-cost 15
switch(config-router-ospf) #
```

Filtering Type 3 LSAs

The **area filter (OSPFv2)** command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. ABRs send type 3 LSAs and contain information about one of its connected areas.

Example

This command prevents the switch from entering Type 3 LSAs originating from the **10.1.1.2/24** subnet into its **area 2** LSDB.

```
switch(config-router-ospf) # area 2 filter 10.1.1.2/24
switch(config-router-ospf) #
```

15.2.3.3 Support for OSPFv2 dn-bit-ignore

The OSPFv2 **dn-bit-ignore** command enables or disables the inclusion of LSAs having a “Down” (DN) bit set in SPF calculations. The DN Bit is a loop prevention mechanism implemented when using OSPF as a CE - PE IGP protocol.

OSPFv2 only honors the DN-bit in **type-3** LSAs in non-default VRFs. Starting with *Release EOS-4.25.0F*, OSPFv2 honors the DN-bit in **type-5** and **type-7** LSAs in non-default VRFs. This means that the type-3/5/7 LSAs with DN-bit set are not in SPF calculation, and any routes that carry LSAs are not installed in the routing table. This behavior changes when using the **dn-bit-ignore lsa type-5 type-7** command.

15.2.3.3.1 Configuration

OSPFv2

Use the command **dn-bit-ignore** to ignore the DN-bit in type-3/5/7 LSAs.

Use the command **dn-bit-ignore lsa type-5 type-7** to include only type-5 and type-7 LSAs having their DN-bit set in the SPF calculation. The commands **no dn-bit-ignore lsa type-5 type-7** or **default dn-bit-ignore lsa type-5 type-7** are configured to revert the behavior to default. This command is available in **router ospf PROCESS_ID vrf VRF_NAME** configuration mode.

Note: This command is not available in the default VRF.

This command is for backward compatibility to revert the behavior seen before Release *EOS-4.25.0*, where the type-5 and type-7 LSAs with DN-bit set would get included in the SPF calculations.

```
(config) # router ospf 1 vrf red
```

```
(config-router-ospf-vrf-red)#?
...
dn-bit-ignore          Disable DN-bit check for Type-3, Type-5 and Type-7 LSAs in non-default
VRFs
...
(config-router-ospf-vrf-red)#dn-bit-ignore ?
lsa    Disable DN-bit check only for Type-5 and Type-7 LSAs in non-default VRFs
<cr>
(config-router-ospf-vrf-red)#dn-bit-ignore lsa type-5 type-7
```

OSPFv3

Use the command **dn-bit-ignore** to include type-3/5/7 LSAs having their DN-bit set in the SPF calculation.

Use the commands **dn-bit-ignore** or **default dn-bit-ignore** to revert the behavior to default. This command is available in **ipv6 router ospf PROCESS_ID vrf VRF_NAME** configuration mode and **router ospfv3 vrf VRF_NAME** configuration mode.

Note: This command is not available in the default VRF, and both configuration styles are described in the following section.

router ospfv3 Configuration Style

The **dn-bit-ignore** command is available under the **router ospfv3 vrf VRF_NAME** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
(config)# router ospfv3 vrf red
(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

ipv6 router ospf Configuration Style

The **dn-bit-ignore** command is also available under the **ipv6 router ospf PROCESS_ID vrf VRF_NAME** configuration mode. This disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
(config)# ipv6 router ospf 1 vrf red
(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

15.2.3.3.2 Show Commands

Use the **show running-config** command to verify whether the **dn-bit-ignore** command is configured.

15.2.3.4 OSPFv2 Area Filter by Prefix-List

The **ospf area area_id filter** command configures the set of prefixes to be filtered for multi-agent routing and the ribd routing protocols. Area filters are used to prevent specific prefixes from being announced by an area as Type 3 summary LSAs or as Type 4 ABR summary LSAs in an OSPFv2 Area Border Router (ABR).

Examples

- The following configures a prefix-list filter to permit two prefixes and deny all others.

```
switch(config)# ip prefix-list type3Permit
switch(config-ip-pfx)# ip seq 10 permit 10.0.1.0/24
switch(config-ip-pfx)# ip seq 20 permit 10.0.2.0/24
switch(config-ip-pfx)# ip seq 30 deny 10.0.0.0/0
switch(config-ip-pfx)# exit
```

- The following applies the filter to the backbone area.

```
switch(config)# router ospf 1
switch(config-router-ospf)# area 0 filter prefix-list type3Permit
```

- The following configures a prefix-list to deny a list of prefixes and permit all others.

```
switch(config)# ip prefix-list type3Deny
switch(config-ip-pfx)# ip seq 10 deny 10.0.1.0/24
switch(config-ip-pfx)# ip seq 20 deny 10.0.2.0/24
switch(config-ip-pfx)# exit
```

- The following applies the filter.

```
switch(config)# router ospf 1
switch(config-router-ospf)# area 1.1.1.1 filter prefix-list type3Deny
```

Show Commands

The following displays the output of **show ip ospf** with the area filter listed.

```
switch# show ip ospf
Area 3.3.3.3
  Number of interface in this area is 2
  It is a normal area
  Traffic engineering is disabled
  Area has None authentication
  SPF algorithm executed 1 times
  Number of LSA 1. Checksum Sum 53568
  Number of opaque link LSA 0. Checksum Sum 0
  Number of opaque area LSA 0. Checksum Sum 0
  Area ranges are
    3.3.0.0/16 Cost 0 Advertise
    3.30.0.0/16 Cost 0 Advertise
  Area filter prefix-list type3Permit
```

15.2.3.5 IPv4 Unnumbered Interfaces

The **ip address unnumbered** command specifies a lending interface from which many interfaces may borrow the same address, reducing the number of unique IPv4 addresses needed. A lending interface is a loopback interface. Only one borrowing interface is referenced to one lender at a time, even though multiple loopbacks may be used as lending interfaces. Unnumbered interfaces may reference the same or different lending interfaces. Any IPv4 routed interface is configurable as an unnumbered interface and is referenced to one lending interface.

The following configures an unnumbered borrowing interface.

```
switch(config)# interface Ethernet1
switch(config-if-Et1)# ip address unnumbered Loopback1
```

OSPF configuration

To enable OSPF on an unnumbered interface, configure the area and set the network type to point-to-point under the **interface** config mode.

```
switch(config-if-Et1)# ip ospf area 1
switch(config-if-Et1)# ip ospf network point-to-point
```

Note: The **network** command under **router ospf configuration mode** is not supported for configuring unnumbered interfaces. You must specify the area and **network point-to-point** command in the configuration context of the unnumbered interface.

Enabling OSPF on the lending interface in the same area as the borrowing interfaces is recommended. For different unnumbered interfaces in different areas, configure them to use different loopbacks.

```
switch(config)# interface loopback 1
switch(config-if-Lo1)# ip address 1.1.1.1/32
switch(config-if-Lo1)# ip ospf area 1
```

ISIS configuration

To enable ISIS on an unnumbered interface, configure the area and set the network type to point-to-point under the **interface** config mode.

```
switch(config-if-Et1)# isis enable inst1
switch(config-if-Et1)# isis network point-to-point
```

Enabling ISIS on the lending interface in the same area as the borrowing interfaces is recommended.

```
switch(config)# interface loopback 1
switch(config-if-Lo1)# ip address 1.1.1.1/32
switch(config-if-Et1)# isis enable inst1
switch(config-if-Et1)# isis network point-to-point
```

Show commands

The same IP address may be in use on multiple interfaces at the same time, as displayed in the following output of the **show ip interface brief** command. In this example, Ethernet **2-5** are unnumbered and borrowing from **loopback1**.

```
switch(config-if-Et2)# show ip interface brief
Address
Interface  IP Address  Status  Protocol  MTU  Owner
-----
Ethernet1  1.1.2.1/24  up      up        1500
Ethernet2  1.1.1.1/32  up      up        1500  Lo1
Ethernet3  1.1.1.1/32  up      up        1500  Lo1
Ethernet4  1.1.1.1/32  up      up        1500  Lo1
Ethernet5  1.1.1.1/32  up      up        1500  Lo1
Loopback1  1.1.1.1/32  up      up        65535
```

The following displays OSPF with two adjacencies with the same peer via **Ethernet 2** and **Ethernet 3**. The same **Neighbor ID** is listed for both interfaces. Intermediate System to Intermediate System (IS-IS) behaves similarly.

```
switch(config-if-Et2)# show ip ospf neighbor
Neighbor ID  Instance  VRF    Pri  State  Dead Time  Address  Interface
2.2.1.1      1         default 0    FULL   00:00:36  2.2.1.1  Ethernet3
2.2.1.1      1         default 0    FULL   00:00:34  2.2.1.1  Ethernet2
```

Limitations

- Configuring the addresses on the lending loopbacks as **/32** is recommended. To resolve routes via an unnumbered peer, the **/32** address is required. Configuring a lending loopback as **/32** and enabling OSPF/ISIS on it propagates that prefix.
- Only use loopback interfaces as lending interfaces.

- Enable only one IGP on a lending loopback interface. For multiple IGPs, enable each on a different loopback.
- Configure only one BFD multi-hop session per loopback.
- SSO is not supported for BFD multi-hop sessions over unnumbered interfaces.
- OSPFv3 does not support unnumbered interface addressing.

15.2.3.6 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

15.2.3.6.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- Simple password authentication - A password is assigned to an area. Interfaces connected to the area can authenticate packets by enabling authentication and specifying the area password.
- Message digest authentication - Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string using the MD5 algorithm based on the OSPFv2 packet, key, and key ID and appends that string to the packet.

Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. After configuring a new key on an interface; the router transmits OSPFv2 packets for both keys. After the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. Enabling authentication.
2. Configuring a key (password).

To configure simple authentication on a VLAN interface:

1. Enable simple authentication with the `ip ospf authentication` command.

```
switch(config-if-vl12) # ip ospf authentication
```

2. Configure the password with the `ip ospf authentication-key` command.

```
switch(config-if-vl12) # ip ospf authentication-key 0 code123
```

The **running-config** stores the password as an encrypted string using a proprietary algorithm. To configure Message-Digest authentication on a VLAN interface:

1. Enable Message-Digest authentication with the `ip ospf authentication message-digest` command.

```
switch(config-if-vl12) # ip ospf authentication message-digest
```

2. Configure the key ID and password with the `ip ospf message-digest-key` command.

```
switch(config-if-vl12) # ip ospf message-digest-key 23 md5 0 code123
```

The **running-config** uses a proprietary algorithm to store the password as an encrypted string. The key ID (23) is between keywords **message-digest-key** and **md5**.

15.2.3.6.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in **interface-vlan** configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbor's dead interval.

The `ip ospf hello-interval` command configures the hello interval for the configuration mode interface. The default is **10** seconds.

Example

This command configures a hello interval of **30** seconds for **VLAN 2**.

```
switch(config-if-V12)# ip ospf hello-interval 30
switch(config-if-V12)#
```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface. The default is **40** seconds.

Example

This command configures a dead interval of **120** seconds for **vlan 4**.

```
switch(config-if-V14)# ip ospf dead-interval 120
switch(config-if-V14)#
```

Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The `ip ospf retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is **5** seconds.

Example

This command configures a retransmit interval of **15** seconds for **vlan 3**.

```
switch(config-if-V13)# ip ospf retransmit-interval 15
switch(config-if-V13)#
```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The `ip ospf transmit-delay` command configures the transmission delay for the configuration mode interface.

Example

This command configures a transmission delay of **5** seconds for **vlan 6**.

```
switch(config-if-Vl6)# ip ospf transmit-delay 5
switch(config-if-Vl6)#
```

15.2.3.6.3 Configuring Interface Parameters

Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is **10**.

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface.

Example

This command configures a cost of **15** for **vlan 2**.

```
switch(config-if-Vl2)# ip ospf cost 15
switch(config-if-Vl2)#
```

Router Priority

Router priority determines preference during Designated Router (DR) and Backup Designated Router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ip ospf priority` command configures router priority for the configuration mode interface. The default priority is 1.

Examples

- This command configures a router priority of **15** for **vlan 8**.

```
switch(config-if-Vl8)# ip ospf priority 15
switch(config-if-Vl8)#
```

- This command restores the router priority of **1** for **vlan 7**.

```
switch(config-if-Vl7)# no ip ospf priority
switch(config-if-Vl7)#
```

15.2.3.7 Enabling OSPFv2

15.2.3.7.1 Disabling OSPFv2

The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

- `shutdown (OSPFv2)` disables all OSPFv2 activity.
- `ip ospf disabled` disables OSPFv2 activity on a VLAN interface.

The `no shutdown` and `no ip ospf disabled` commands resume OSPFv2 activity.

Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config-router-ospf)# shutdown
switch(config-router-ospf)#
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)# no shutdown
switch(config-router-ospf)#
```

- This command disables OSPFv2 activity on VLAN 5.

```
switch(config-if-Vl5)# ip ospf disabled
switch(config-if-Vl5)#
```

15.2.3.7.2 IPv4 Routing

OSPFv2 requires enabling IPv4 routing on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

Examples

- This message is displayed if, when entering the **router-ospf** configuration mode, IP routing is not enabled.

```
switch(config)# router ospf 100
! IP routing not enabled
switch(config-router-ospf)#
```

- This command enables IP routing on the switch.

```
switch(config)# ip routing
switch(config)#
```

15.2.3.8 OSPFv2 Multiple Instances Support Configuration

The existing OSPFv2 configuration commands remain unchanged and are used for configuring multiple OSPFv2 instances. Each OSPFv2 instance in the default VRF is identified by a unique instance ID.

```
router ospf id [vrf | general]
```

15.2.3.8.1 Redistribute Configuration

Configuring the **redistribute ospf** command under the **config-router-bgp** mode with multiple OSPFv2 instances configured redistributes routes from all OSPFv2 instances into BGP.

These commands redistribute OSPFv2 routes into the BGP domain.

```
switch(config)# router bgp 1
switch(config-router-bgp)# redistribute OSPF
switch(config-router-bgp)#
```

15.2.3.8.2 Special Cases

Route Selection in case of Ties between Instances

When learning of the same prefix in multiple instances with the same metric, EOS uses route-type as the first criteria to tie break:

O > O IA > N1 > N2 > E1 > E2

Codes: O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type2

When routes have an identical route-type, the route with the lowest next-hop IP address is selected.

Note: An ECMP route is not created in this case.

Overlapping Network Statements Configured

The CLI does not guard against overlapping network statements configured in different instances. This state is a misconfiguration.

15.2.3.8.3 OSPFv2 Multiple Instances Limitations

- OSPFv2 Multiple Instances is available only with the multi-agent routing protocol model.
- Only one interface can only have one instance of OSPFv2 running at any time.
- All the OSPFv2 instances must be in the default VRF.
- Multiple OSPFv2 instances cannot be connected to the same network or configured with interfaces in the same area. In particular, multiple OSPFv2 instances may not be connected to the same instance on another router in the same area.
- The following features are not supported with multiple OSPFv2 instances:
 - Redistributing routes from a specific OSPFv2 instance into BGP.
 - Redistribution of routes into an OSPFv2 instance.
 - A per-interface area configuration.
 - Passive interface configuration.
 - SNMP
 - Summary address.
 - Service ACL.
 - Max Metric with **on-startup** configuration.

15.2.3.9 OSPF Routes over GRE Tunnels Configuration

You may employ the following commands in the router OSPF mode:

- **tunnel routes**
- **no tunnel routes**
- **default tunnel routes**

To enable OSPFv2 over GRE tunnels, use the following commands:

```
switch(config)# router ospf 6
switch(config-router-ospf)# tunnel routes
switch(config-router-ospf)#
```

To disable OSPFv2 routes over GRE tunnels, use the following commands:

```
switch(config)# router ospf 6
switch(config-router-ospf) # no tunnel routes
switch(config-router-ospf) #
```

To enable the default OSPFv2 routes over GRE tunnels, use the following commands:

```
switch(config)# router ospf 6
switch(config-router-ospf) # default tunnel routes
switch(config-router-ospf) #
```

15.2.3.9.1 TCAM Profile Configuration

On DCS-7020, DCS-7280R/R2, or DCS-7500R/R2 platforms, enabling OSPF routes over GRE tunnels requires the system TCAM profile to have the “Tunnel IPv4” feature enabled so that control packets such as OSPF hellos received over GRE tunnel interfaces are appropriately classified. To achieve this, create a user-defined TCAM profile, as described in the following section.

Create the user-defined TCAM profile manually from scratch or copy it from an existing TCAM profile. The system TCAM profile must contain the feature **tunnel ipv4** for the OSPFv2 over GRE tunnel interfaces. This requirement applies regardless of whether it is copied from an existing profile or created from scratch.

15.2.3.9.2 User Defined PMF (or TCAM) Profiles

This section describes a set of CLI commands to create a user-defined Programmable Mapping and Filtering (PMF) (or TCAM) profile. The profile comprises a set of TCAM features, each with a customized lookup key, actions, and packet types to hit.

All TCAM profile CLIs are under **hardware tcam** mode.

```
(config)# hardware tcam
(config-hw-tcam) #
```

There are two ways to create a TCAM profile. The recommended way is to create a profile based on an existing one. In this example, the command creates a copy of the profile **newprofile1**.

```
(config)# hardware tcam
(config-hw-tcam) # profile newprofile1 copy default
(config-hw-tcam-profile-newprofile1) #
```

The other way is to create one profile from scratch. In this example, the command creates the profile **newprofile2**.

```
(config)# hardware tcam
(config-hw-tcam) # profile newprofile2
(config-hw-tcam-profile-newprofile2) #
```

To remove a profile, use the **no profile** command. In this example, the command removes the **newprofile2** profile.

```
(config)# hardware tcam
(config-hw-tcam) # no profile newprofile2
```

Features can be turned on and off in the new profile. In this example, the command turns on the **acl port ipv6** feature.

```
(config-hw-tcam-profile-<profile>) # feature acl port ipv6
```

Features can be turned on and off in the new profile. In this example, the command turns off the **acl port ipv6** feature.

```
(config-hw-tcam-profile-<profile>)# no feature acl port ipv6
```

Hierarchical CLI tokens describe the features. For example, **feature acl port ip** represents the IPv4 port ACL, and **feature acl port ipv6** represents the IPv6 port ACL. Under each feature mode, various fields can be modified.

- **packet**

This section describes the packet types to which the feature will be applied.

```
packet packet header tokens forwarding [bridged | routed | mpls][multicast][decap]
```

```
no packet packet header tokens forwarding [bridged | routed | mpls][multicast][decap]
```

The packet header is described in a series of CLI packet header tokens after the **packet** token. It starts from the outermost header after Ethernet. For example, a regular IPv4 packet is **packet ipv4**, and a VXLAN packet is **packet ipv4 VXLAN eth ipv4**. The **forwarding** token indicates the forwarding type of the packet. **multicast** indicates if the packet is a multicast packet. Lastly, **decap** indicates if the packet is decapsulated after a tunnel.

- **key field**

The key field describes the TCAM key format for the feature. The CLI can add or delete fields used to build the key.

```
(config-hw-tcam-profile-<profile>-feature-<feature>)# [no]keyfield field
```

Locate all supported key fields with **key field ?**

- **key size**

The key size describes the TCAM key size limit. If too many key fields are added to the feature, the key size will exceed the limit, and a Syslog will be issued. The default key size limit is **320**.

```
(config-hw-tcam-profile-<profile>-feature-<feature>)# [no]key size limit size
```

- **action**

The action to take when hitting a TCAM entry.

```
(config-hw-tcam-profile-<profile>-feature-<feature>)# [no]action action
```

Find the supported actions using **action ?**.

- **sequence**

Sequence describes the programming order of each feature. Changing the order may affect a profile's programming status. The default sequence is **0**.

```
(config-hw-tcam-profile-<profile>-feature-<feature>)# [no]sequence sequence
```

The system saves the profile after exiting the feature mode. To use the newly defined profile, a CLI is available to apply the profile to the system globally.

```
(config)# hardware tcam
(config-hw-tcam)# system profile newprofile1
```

15.2.3.10 Displaying OSPFv2 Status

This section describes OSPFv2 **show** commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

15.2.3.10.1 OSPFv2 Summary

The **show ip ospf** command displays general OSPFv2 configuration information and operational statistics.

Example

This command displays general OSPFv2 information.

```
switch# show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPFs 5000 msec
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msec
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters, operational statistics, and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

15.2.3.10.2 Viewing OSPFv2 on the Interfaces

The **show ip ospf interface** command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

Examples

- This command displays complete OSPFv2 information for **vlan 1**.

```
switch# show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
```

```
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500 switch#
```

The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router (DR), and Backup Designated Router (BDR).

- This command displays a summary of interface information for the switch.

```
switch# show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0
Vlan110.0.0.010.168.0.1/2410BDR1
Vlan210.0.0.210.168.2.1/2410BDR1
Vlan310.0.0.310.168.3.1/2410DR0 switch#
```

Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.

15.2.3.10.3 Viewing the OSPFv2 Database

The `show ip ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the database contents for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

Examples

- This command displays LSDB contents for **area 2**.

```
switch# show ip ospf 1 2 database

OSPF Router with ID(10.168.103.1) (Process ID 1)

```

15.2.3.10.4 Viewing OSPFv2 Neighbors

The `show ip ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors for all areas and interfaces on the switch. The command also allows the display of neighbors for individual interfaces or areas. The **adjacency-changes** option displays the interface's adjacency changes.

Examples

- This command displays the switch's neighbors.

```

switch# show ip ospf neighbor
Neighbor IDPriStateDead TimeAddressInterface

```

```
10.168.104.21FULL/DR00:00:3510.168.0.2Vlan1
10.168.104.28FULL/BDR00:00:3110.168.2.2Vlan2 switch#
```

- This command displays details about the neighbors to **vlan 2**.

```
switch# show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes
Adjacency was established 000:01:25:48 ago
DR is 10.168.2.1 BDR is 10.168.2.2
Options is E
Dead timer due in 00:00:34 switch#
```

- This command displays the adjacency changes to **vlan 2**.

```
switch# show ip ospf neighbor vlan 2 adjacency-changes
[08-04 08:55:32] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:58:51] 10.168.104.2, interface Vlan2 adjacency dropped: interface went
down
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went
down
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not
list our router ID
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established switch#
```

The `show ip ospf neighbor state` command displays the state information for OSPF neighbors on a per-interface basis.

Example

This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch# show ip ospf neighbor state full
Neighbor ID      VRF      Pri   State          Dead Time   Address        Interface
Test1            default  1     FULL/BDR       00:00:35    10.17.254.105  Vlan3912
Test2            default  1     FULL/BDR       00:00:36    10.17.254.29   Vlan3910
Test3 default      1     FULL/DR 00:00:35 10.25.0.1      Vlan101
Test4            default  1     FULL/DROTHER   00:00:36    10.17.254.67   Vlan3908
Test5            default  1     FULL/DROTHER   00:00:36    10.17.254.68   Vlan3908
Test6            default  1     FULL/BDR       00:00:32    10.17.254.66   Vlan3908
Test7            default  1     FULL/DROTHER   00:00:34    10.17.36.4     Vlan3036
Test8            default  1     FULL/BDR       00:00:35    10.17.36.3     Vlan3036
Test9            default  1     FULL/DROTHER   00:00:31    10.17.254.13   Vlan3902
Test10           default  1     FULL/BDR       00:00:37    10.17.254.11   Vlan3902
Test11           default  1     FULL/DROTHER   00:00:33    10.17.254.163  Vlan3925
Test12           default  1     FULL/DR        00:00:37    10.17.254.161  Vlan3925
Test13           default  1     FULL/DROTHER   00:00:31    10.17.254.154  Vlan3923
Test14           default  1     FULL/BDR       00:00:39    10.17.254.156  Vlan3923
Test15           default  1     FULL/DROTHER   00:00:33    10.17.254.35   Vlan3911
Test16           default  1     FULL/DR        00:00:34    10.17.254.33   Vlan3911
Test17 default      1     FULL/DR 00:00:36    10.17.254.138  Ethernet12
Test18           default  1     FULL/DR       00:00:37    10.17.254.2     Vlan3901 switch>
```

The `show ip ospf neighbor summary` command displays a single line of summary information for each OSPFv2 neighbor.

Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch# show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
```

```
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START switch>
```

15.2.3.10.5 Viewing OSPFv2 Routes

The **show ip route** command displays OSPFv2 details.

Examples

- This command displays all of a switch's routes.

```
switch# show ip route
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

Gateway of last resort:
S0.0.0.0/0 [1/0] via 10.255.255.1
C10.255.255.0/24 is directly connected, Management1
C10.168.0.0/24 is directly connected, Vlan1
C10.168.2.0/24 is directly connected, Vlan2
O10.168.3.0/24 [110/20] via 10.168.0.1
O10.168.103.0/24 [110/20] via 10.168.0.1
C10.168.104.0/24 is directly connected, Loopback0 switch#
```

- This command displays the switch's OSPFv2 routes.

```
switch# show ip route ospf
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

O10.168.3.0/24 [110/20] via 10.168.0.1
O10.168.103.0/24 [110/20] via 10.168.0.1 switch#
```

Use the **ping** command to determine the accessibility of a route.

Example

This command pings an OSPFv2 route.

```
switch# ping 10.168.0.1
PING 10.168.0.1 (10.168.0.1) 72(100) bytes of data.
80 bytes from 10.168.0.1: icmp_seq=1 ttl=64 time=0.148 ms
80 bytes from 10.168.0.1: icmp_seq=2 ttl=64 time=0.132 ms
80 bytes from 10.168.0.1: icmp_seq=3 ttl=64 time=0.136 ms
80 bytes from 10.168.0.1: icmp_seq=4 ttl=64 time=0.137 ms
80 bytes from 10.168.0.1: icmp_seq=5 ttl=64 time=0.136 ms

--- 10.168.0.1 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 7999ms
rtt min/avg/max/mdev = 0.132/0.137/0.148/0.015 ms switch#
```

15.2.3.10.6 Viewing OSPFv2 SPF Logs

The **show ip ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPF.

Example

This command displays the SPF information for OSPF.

```
switch# show ip ospf spf-log
OSPF Process 172.26.0.22

15.2.3.10.7 Viewing OSPFv2 Multiple Instances Support

The **show ip ospf** commands will take an instance ID filter to get the information for a particular OSPFv2 instance. If no instance ID is specified in the show query, EOS displays information for all the active OSPFv2 instances.

The **show ip ospf** commands will also display instance ID and router ID either in the output headers or as a separate column.

The following is a sample output for the **show ip ospf** command with two OSPFv2 instances with **ID 1** and **ID 2**.

```

switch# show ip ospf
OSPF instance 1 with ID 1.1.1.1 VRF default
  Supports opaque LSA
  Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
  It is not an autonomous system boundary router and is not an area border router
  ...
OSPF instance 2 with ID 2.2.2.2 VRF default
  Supports opaque LSA
  Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  Ignore-count allowed 5, current 0
  It is not an autonomous system boundary router and is not an area border router
  ...

```

The following is a sample output for the **show ip ospf** command with Graceful Restart enabled for two OSPFv2 instances with ID **10** and **11**.

```

switch# show ip ospf
OSPF instance 10 with ID 2.2.2.2 VRF default
  Supports opaque LSA
  Maximum number of LSA allowed 12000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 5 minutes
  ...
Graceful-restart is configured, grace-period 120 seconds
  State: In progress, expires in 113 seconds
  Graceful-restart-helper mode is enabled
  ...
OSPF instance 11 with ID 3.3.3.3 VRF default
  Supports opaque LSA
  Maximum number of LSA allowed 12000

```

```

Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
...
Graceful-restart is configured, grace-period 120 seconds
State: In progress, expires in 113 seconds
Graceful-restart-helper mode is enabled
...

```

The following is a sample output for the **show ip ospf neighbor detail** command.

```

switch# show ip ospf neighbor
Neighbor ID   Instance  VRF      Pri  State      Dead Time  Address    Interface
2.2.2.2       1         default  1    FULL/DR    00:00:38   10.1.1.2   Ethernet1
4.4.4.4       2         default  1    FULL/DR    00:00:36   40.1.1.2   Ethernet4

switch# show ip ospf neighbor 2.2.2.2 detail
Neighbor 2.2.2.2, instance 1, VRF default, interface address 10.1.1.1

  In area 0.0.0.0 interface Ethernet1

  Neighbor priority is 1, State is FULL, 7 state changes

  Adjacency was established 00:38:48 ago

  Current state was established 00:38:48 ago

  DR IP Address 10.1.1.2 BDR IP Address 10.1.1.1

  Options is E

  Dead timer is due in 00:00:35

  Inactivity timer deferred 0 times

  LSAs retransmitted 1 time to this neighbor

  Graceful-restart-helper mode is Inactive

  Graceful-restart attempts: 0

```

The following is a sample output for **show ip ospf neighbor detail** with BFD enabled.

```

switch# show ip ospf neighbor 2.2.2.2 detail
Neighbor 3.3.3.3, instance 10, VRF default, interface address 1.0.0.1
  In area 1.2.3.4 interface Ethernet1
  Neighbor priority is 1, State is FULL, 7 state changes
  Adjacency was established 22:03:05 ago
  Current state was established 22:03:05 ago
  DR IP Address 1.0.0.1 BDR IP Address 1.0.0.2
  Options is E
  Dead timer is due in 00:00:34
  Inactivity timer deferred 0 times
  LSAs retransmitted 1 time to this neighbor
  Bfd request is sent and the state is Down
  Graceful-restart-helper mode is Inactive
  Graceful-restart attempts: 0
Neighbor 6.6.6.6, instance 10, VRF default, interface address 1.0.1.1
  In area 1.2.3.4 interface Ethernet5
  Neighbor priority is 1, State is FULL, 7 state changes
  Adjacency was established 22:03:10 ago
  Current state was established 22:03:10 ago
  DR IP Address 1.0.1.1 BDR IP Address 1.0.1.2
  Options is E
  Dead timer is due in 00:00:30
  Inactivity timer deferred 0 times
  LSAs retransmitted 2 times to this neighbor
  Bfd request is sent and the state is Down

```

```

Graceful-restart-helper mode is Inactive
Graceful-restart attempts: 0
Neighbor 4.4.4.4, instance 12, VRF default, interface address 1.0.3.1
In area 1.2.3.4 interface Ethernet2
Neighbor priority is 1, State is FULL, 7 state changes
Adjacency was established 22:03:10 ago
Current state was established 22:03:10 ago
DR IP Address 1.0.3.1 BDR IP Address 1.0.3.2
Options is E
Dead timer is due in 00:00:32
Inactivity timer deferred 0 times
LSAs retransmitted 1 time to this neighbor
Graceful-restart-helper mode is Inactive
Graceful-restart attempts: 0

```

The CAPI outputs for OSPFv2 show commands are already indexed by instance ID and remain unchanged.

The **show ip route** and **show ip route ospf** commands show routes from all OSPFv2 instances with no mention of instance ID. For example, **11.1.1.0/24** is learned from instance **100** and **12.1.1.0/24** from instance **200**.

```

switch# show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,

/8: 2 /24: 3 /32: 9

```

15.2.3.10.8 Displaying OSPF Routes over GRE Tunnel Status

A show command is available to list the TCAM profile status on each line card.

```

(config)# show hardware tcam profile
Configuration Status FixedSystem newprofile1 newprofile1

```

If the profile cannot be programmed, the Status column will print **ERROR**. See [Limitations](#) for additional information. Display the contents of a PMF using the following command:

```

(config)# show hardware tcam profile detail

```

Example

```

(config-hw-tcam)# show hardware tcam profile newprofile1 detail
Profile newprofile1 [ FixedSystem ]
Feature mpls
-----
Key size 160
Actions drop, redirect, set-ecn
Packet type ipv4 mpls ipv4 forwarding mpls decap
            ipv4 mpls ipv6 forwarding mpls decap
            mpls ipv4 forwarding mpls
            mpls ipv6 forwarding mpls
            mpls non-ip forwarding mpls

Feature acl vlan ipv6
-----
Key size 320
Key fields dst-ipv6, ipv6-next-header, l4-dst-port, l4-src-port,
           src-ipv6-high, src-ipv6-low, tcp-control
Actions count, drop, mirror, redirect
Packet type ipv6 forwarding routed
...

```

Note: After copying from the base profile, the profile contains all the untouched features.

Example

This example demonstrates how to create a new profile to match on **vlan** field in MAC ACL.

```
(config-hw-tcam)# profile macvlan copy default
(config-hw-tcam-profile-macvlan)# feature acl port mac
(config-hw-tcam-profile-macvlan-feature-acl-port-mac)# key field vlan
(config-hw-tcam-profile-macvlan-feature-acl-port-mac)# exit
(config-hw-tcam-profile-macvlan)# exit
Saving new profile 'macvlan'
(config-hw-tcam)# system profile macvlan
```

15.2.4 OSPFv2 Configuration Examples

This section describes the commands required to configure three OSPFv2 topologies.

- [OSPFv2 Configuration Example 1](#)
- [OSPFv2 Configuration Example 2](#)
- [OSPFv2 Configuration Example 3](#)

15.2.4.1 OSPFv2 Configuration Example 1

The OSPF Autonomous System in Example 1 contains two areas connected through two routers. The backbone area also contains an internal router that connects two subnets.

15.2.4.1.1 Example 1 Topology

[OSPFv2 Example 1](#) displays the Example 1 topology. Two ABRs, **Router A** and **Router B**, connect Area 0 and Area 1. **Router C** is an internal router connecting two subnets in Area 0.

Figure 15-3: OSPFv2 Example 1

Area 1 Configuration

Area 1 contains one subnet accessed by **Router A** and **Router B**.

- **Router A**: The subnet **10.10.1.0/24** is accessed through **VLAN 1**.
- **Router B**: The subnet **10.10.1.0/24** is accessed through **VLAN 1**.
- Each router uses simple authentication with the password **abcdefgh**.

- Designated Router (DR): **Router A**.
- Backup Designated Router (BDR): **Router B**.
- Each router defines an interface cost of **10**.
- Router priority is not specified for either router on Area **1**.

Area 0 ABR Configuration

Area 0 contains one subnet accessed by ABRs **Router A** and **Router B**.

- **Router A**: The subnet **10.10.2.0/24** is accessed through **VLAN 2**.
- **Router B**: The subnet **10.10.2.0/24** is accessed through **VLAN 2**.
- Designated Router (DR): **Router B**.
- Backup Designated Router (BDR): **Router A**.
- Each router uses simple authentication with the password **ijklmnop**.
- Each router defines an interface cost of **20**.
- Each router defines a retransmit-interval of **10**.
- Each router defines a transmit-delay of **2**.
- Router priority is specified so that **Router B** will be elected as the Designated Router.

Area 0 IR Configuration

Area **0** contains one internal router that connects two subnets.

- **Router C**: The subnet **10.10.2.0/24** is accessed through **VLAN 2**.
- **Router C**: The subnet **10.10.3.0/24** is accessed through **VLAN 3**.
- The subnet **10.10.2.0/24** link is configured as follows:
 - Interface cost of **20**.
 - Retransmit-interval of **10**.
 - Transmit-delay of **2**.
- The subnet **10.10.3.0/24** link is configured as follows:
 - Interface cost of **20**.
 - Dead interval of **80** seconds.

15.2.4.1.2 Example 1 Code

The following code examples configure the OSPFv2 instances on the three switches.

1. Configure the interface addresses.

a. Router A interfaces:

```
switch-A(config)# interface vlan 1
switch-A(config-if-vl1)# ip address 10.10.1.1/24
switch-A(config-if-vl1)# interface vlan 2
switch-A(config-if-vl2)# ip address 10.10.2.1/24
```

b. Router B interfaces:

```
switch-B(config)# interface vlan 1
switch-B(config-if-vl1)# ip address 10.10.1.2/24
switch-B(config-if-vl1)# interface vlan 2
switch-B(config-if-vl2)# ip address 10.10.2.2/24
```

c. Router C interfaces:

```
switch-C(config)# interface vlan 2
```

```
switch-C(config-if-vl2)# ip address 10.10.2.3/24
switch-C(config-if-vl2)# interface vlan 3
switch-C(config-if-vl3)# ip address 10.10.3.3/24
```

2. Configure the interface OSPFv2 parameters.

a. Router A interfaces:

```
switch-A(config-if-vl2)# interface vlan 1
switch-A(config-if-vl1)# ip ospf authentication-key abcdefgh
switch-A(config-if-vl1)# ip ospf cost 10
switch-A(config-if-vl1)# ip ospf priority 6
switch-A(config-if-vl1)# interface vlan 2
switch-A(config-if-vl2)# ip ospf authentication-key ijklmnop
switch-A(config-if-vl2)# ip ospf cost 20
switch-A(config-if-vl2)# ip ospf retransmit-interval 10
switch-A(config-if-vl2)# ip ospf transmit-delay 2
switch-A(config-if-vl2)# ip ospf priority 4
```

b. Router B interfaces:

```
switch-B(config-if-vl2)# interface vlan 1
switch-B(config-if-vl1)# ip ospf authentication-key abcdefgh
switch-B(config-if-vl1)# ip ospf cost 10
switch-B(config-if-vl1)# ip ospf priority 4
switch-B(config-if-vl1)# interface vlan 2
switch-B(config-if-vl2)# ip ospf authentication-key ijklmnop
switch-B(config-if-vl2)# ip ospf cost 20
switch-B(config-if-vl2)# ip ospf retransmit-interval 10
switch-B(config-if-vl2)# ip ospf transmit-delay 2
switch-B(config-if-vl2)# ip ospf priority 6
```

c. Router C interfaces:

```
switch-C(config-if-vl3)# interface vlan 2
switch-C(config-if-vl2)# ip ospf cost 20
switch-C(config-if-vl2)# ip ospf retransmit-interval 10
switch-C(config-if-vl2)# ip ospf transmit-delay 2
switch-C(config-if-vl2)# interface vlan 3
switch-C(config-if-vl3)# ip ospf cost 20
switch-C(config-if-vl3)# ip ospf dead-interval 80
```

3. Attach the network segments to the areas.

a. Router A interfaces:

```
switch-A(config-if-vl2)# router ospf 1
switch-A(config-router-ospf)# router-id 169.10.0.1
switch-A(config-router-ospf)# network 10.10.1.0/24 area 1
switch-A(config-router-ospf)# network 10.10.2.0/24 area 0
```

b. Router B interfaces:

```
switch-B(config-if-vl2)# router ospf 1
switch-B(config-router-ospf)# router-id 169.10.0.2
switch-B(config-router-ospf)# network 10.10.1.0/24 area 1
switch-B(config-router-ospf)# network 10.10.2.0/24 area 0
```

c. Router C interfaces:

```
switch-C(config-if-vl3)# router ospf 1
switch-C(config-router-ospf)# router-id 169.10.0.3
switch-C(config-router-ospf)# network 10.10.2.0/24 area 0
switch-C(config-router-ospf)# network 10.10.3.0/24 area 0
```

15.2.4.2 OSPFv2 Configuration Example 2

The AS in Example 2 contains three areas. Area **0** connects to the other areas through different routers. The backbone area contains an internal router that connects two subnets. Area **0** is normal; the other areas are stub areas.

15.2.4.2.1 Example 2 Topology

[OSPFv2 Example 2](#) displays the Example 2 topology. One ABR (**Router B**) connects Area **0** and Area **10.42.110.0**; another ABR (**Router C**) connects Area **0** and Area **36.56.0.0**. **Router A** is an internal router connecting two subnets in Area **0**.

Figure 15-4: OSPFv2 Example 2

Area 10.42.110.0 Configuration

Area **10.42.110.0** contains one subnet that is accessed by **Router B**.

- **Router B**: The subnet **10.42.110.0** is accessed through **VLAN 15**.
- **Router B** uses simple authentication with the password **abcdefgh**.
- Each router defines a interface cost of **10**.

Area 10.56.0.0 Configuration

Area **10.56.0.0** contains one subnet that is accessed by **Router C**.

- **Router C**: The subnet **10.56.0.0** is accessed through **VLAN 21**.
- **Router C** uses simple authentication with the password **ijklmnop**.
- Each router defines a interface cost of **20**.

Area 0 ABR Configuration

Area **0** contains two subnets. ABR **Router B** connects one subnet to area **10.42.110.0**. ABR **Router C** connects the other subnet to area **10.56.0.0**.

- **Router B**: The subnet **10.119.254.0/24** is accessed through **VLAN 16**.
- **Router C**: The subnet **10.119.251.0/24** is accessed through **VLAN 20**.
- Designated Router (DR): **Router B**.
- Backup Designated Router (BDR): **Router C**.
- Each ABR uses simple authentication with the password *ijklmnop*.
- Each router defines an interface cost of **20**.
- Each router defines a retransmit-interval of **10**.
- Each router defines a transmit-delay of **2**.

Area 0 IR Configuration

Area **0** contains two subnets connected by an internal router.

- **Router A**: The subnet **10.119.254.0/24** is accessed through **VLAN 16**.
- **Router A**: The subnet **10.119.251.0/24** is accessed through **VLAN 20**.
- The subnet **10.42.110.0** is configured as follows:
 - Interface cost of **10**.
- The subnet **10.56.0.0/24** is configured as follows:
 - Interface cost of **20**.
 - Retransmit-interval of **10**.
 - Transmit-delay of **2**.

15.2.4.2.2 Example 2 Code

1. Configure the interface addresses.

a. Router A interfaces:

```
switch-A(config)# interface vlan 16
switch-A(config-if-vl16)# ip address 10.119.254.2/24
switch-A(config-if-vl16)# interface vlan 20
switch-A(config-if-vl20)# ip address 10.119.251.1/24
```

b. Router B interfaces:

```
switch-B(config)# interface vlan 15
switch-B(config-if-vl15)# ip address 10.42.110.1/24
switch-B(config-if-vl15)# interface vlan 16
switch-B(config-if-vl16)# ip address 10.119.254.1/24
```

c. Router C interfaces:

```
switch-C(config)# interface vlan 20
switch-C(config-if-vl20)# ip address 10.119.251.2/24
switch-C(config-if-vl20)# interface vlan 21
switch-C(config-if-vl21)# ip address 10.56.0.1/24
```

2. Configure the interface OSPFv2 parameters.

a. Router A interfaces:

```
switch-A(config-if-vl20)# interface vlan 16
switch-A(config-if-vl16)# ip ospf cost 10
switch-A(config-if-vl16)# interface vlan 20
```

```

switch-A(config-if-vl20)# ip ospf cost 20
switch-A(config-if-vl20)# ip ospf retransmit-interval 10
switch-A(config-if-vl20)# ip ospf transmit-delay 2

```

b. Router B interfaces:

```

switch-B(config-if-vl16)# interface vlan 15
switch-B(config-if-vl15)# ip ospf authentication-key abcdefgh
switch-B(config-if-vl15)# ip ospf cost 10
switch-B(config-if-vl15)# interface vlan 16
switch-B(config-if-vl16)# ip ospf authentication-key ijklmnop
switch-B(config-if-vl16)# ip ospf cost 20
switch-B(config-if-vl16)# ip ospf retransmit-interval 10
switch-B(config-if-vl16)# ip ospf transmit-delay 2
switch-B(config-if-vl16)# ip ospf priority 6

```

c. Router C interfaces:

```

switch-C(config-if-vl21)# interface vlan 20
switch-C(config-if-vl20)# ip ospf authentication-key ijklmnop
switch-C(config-if-vl20)# ip ospf cost 20
switch-C(config-if-vl20)# ip ospf retransmit-interval 10
switch-C(config-if-vl20)# ip ospf transmit-delay 2
switch-C(config-if-vl20)# ip ospf priority 4
switch-C(config-if-vl20)# interface vlan 21
switch-C(config-if-vl21)# ip ospf authentication-key ijklmnop
switch-C(config-if-vl21)# ip ospf cost 20
switch-C(config-if-vl21)# ip ospf dead-interval 80

```

3. Attach the network segments to the areas.

a. Router A interfaces:

```

switch-A(config-if-vl20)# router ospf 1
switch-A(config-router-ospf)# router-id 10.24.1.1
switch-A(config-router-ospf)# network 10.119.254.0/24 area 0
switch-A(config-router-ospf)# network 10.119.251.0/24 area 0
switch-A(config-router-ospf)# area 0 range 10.119.251.0 0.0.7.255

```

b. Router B interfaces:

```

switch-B(config-if-vl16)# router ospf 1
switch-B(config-router-ospf)# router-id 10.24.1.2
switch-B(config-router-ospf)# area 10.42.110.0 stub
switch-B(config-router-ospf)# network 10.42.110.0/24 area 10.42.110.0
switch-B(config-router-ospf)# network 10.119.254.0/24 area 0

```

c. Router C interfaces:

```

switch-C(config-if-vl21)# router ospf 1
switch-C(config-router-ospf)# router-id 10.24.1.3
switch-C(config-router-ospf)# area 10.56.0.0 stub 0
switch-C(config-router-ospf)# network 10.119.251.0/24 area 0
switch-C(config-router-ospf)# network 10.56.0.0/24 area 36.56.0.0

```

15.2.4.3 OSPFv2 Configuration Example 3

The AS in Example 3 contains two areas that connect through one ABR.

- **Area 0:** Backbone area contains two internal routers connecting three subnets, one ASBR, and one ABR that connects to **Area 1**.
- **Area 1:** NSSA contains one internal router, one ASBR, and one ABR that connects to the backbone.

15.2.4.3.1 Example 3 Topology

OSPFv2 [Example 3](#) displays the Example 3 topology. One ABR connects Area **0** and Area **1**. **Router C** is an ABR that connects the areas. **Router A** is an internal router connecting two subnets in Area **1**. **Router D** and **Router E** are internal routers connecting subnets in Area **0**. **Router B** and **Router F** are ASBRs connecting static routes outside the AS to Area **1** and Area **0**, respectively.

Figure 15-5: OSPFv2 Example 3

Area 0 ABR Configuration

ABR **Router C** connects one area **0** subnet to an area **1** subnet.

- **Router C:** The subnet **10.10.2.0/24** is accessed through **VLAN 11**.
- Authentication is not configured on the interfaces.
- All interface OSPFv2 parameters are set to their default values.

Area 0 IR Configuration

Area **0** contains two internal routers, each of which connects two of the three subnets in the area.

- **Router D:** The subnet **10.10.2.0/24** is accessed through **VLAN 11**.
- **Router D:** The subnet **10.10.3.0/24** is accessed through **VLAN 12**.
- **Router E:** The subnet **10.10.3.0/24** is accessed through **VLAN 12**.
- **Router E:** The subnet **10.10.4.0/24** is accessed through **VLAN 13**.
- All interface OSPFv2 parameters are set to their default values.

Area 0 ASBR Configuration

ASBR **Router F** connects one area **0** subnet to an external subnet.

- **Router F:** The subnet **10.10.4.0/24** is accessed through **Router F**.
- **Router F:** The subnet **12.15.1.0/24** is accessed through **VLAN 14**.
- All interface OSPFv2 parameters are set to their default values.

Area 1 ABR Configuration

ABR **Router C** connects one area **0** subnet to area **1**.

- **Router C:** The subnet **10.10.1.0/24** is accessed through **VLAN 10**.
- Authentication is not configured on the interface.
- All interface OSPFv2 parameters are set to their default values.

Area 1 IR Configuration

Area **1** contains one internal router that connects two subnets in the area.

- **Router A:** The subnet **10.10.1.0/24** is accessed through **VLAN 10**.
- **Router A:** The subnet **10.10.5.0/24** is accessed through **Router A**.
- All interface OSPFv2 parameters are set to their default values.

Area 1 ASBR Configuration

ASBR **Router B** connects one area **1** subnet to an external subnet.

- **Router B:** The subnet **10.10.1.0/24** is accessed through **VLAN 10**.
- **Router B:** The subnet **16.29.1.0/24** is accessed through **VLAN 15**.
- All interface OSPFv2 parameters are set to their default values.

15.2.4.3.2 Example 3 Code

1. Configure the interfaces.

a. Router A interfaces:

```
switch-A(config)# interface vlan 10
switch-A(config-if-vl10)# ip address 10.10.1.1/24
switch-A(config-if-vl10)# interface vlan 9
switch-A(config-if-vl11)# ip address 10.10.5.1/24
```

b. Router B interfaces:

```
switch-B(config)# interface vlan 10
switch-B(config-if-vl10)# ip address 10.10.1.2/24
switch-B(config-if-vl10)# interface vlan 15
switch-B(config-if-vl18)# ip address 16.29.1.1/24
```

c. Router C interfaces:

```
switch-C(config)# interface vlan 10
switch-C(config-if-vl10)# ip address 10.10.1.3/24
switch-C(config-if-vl10)# interface vlan 11
switch-C(config-if-vl11)# ip address 10.10.2.2/24
```

d. Router D interfaces:

```
switch-D(config)# interface vlan 11
switch-D(config-if-vl11)# ip address 10.10.2.1/24
switch-D(config)# interface vlan 12
switch-D(config-if-vl12)# ip address 10.10.3.1/24
```

e. Router E interfaces:

```
switch-E(config)# interface vlan 12
switch-E(config-if-vl12)# ip address 10.10.3.2/24
switch-E(config)# interface vlan 13
switch-E(config-if-vl13) #ip address 10.10.4.1/24
```

f. Router F interfaces:

```
switch-F(config)# interface vlan 13
switch-F(config-if-vl13)# ip address 10.10.4.2/24
switch-F(config)# interface vlan 14
switch-F(config-if-vl14)# ip address 12.15.1.1/24
```

2. Attach the network segments to the areas.

a. Router A interfaces:

```
switch-A(config-if-vl10)# router ospf 1
switch-A(config-router-ospf)# router-id 170.21.0.1
switch-A(config-router-ospf)# area 1 NSSA
switch-A(config-router-ospf)# network 10.10.1.0/24 area 1
```

b. Router B interfaces:

```
switch-B(config-if-vl10)# router ospf 1
switch-B(config-router-ospf)# router-id 170.21.0.2
switch-B(config-router-ospf)# area 1 NSSA
switch-B(config-router-ospf)# network 10.10.1.0/24 area 1
```

c. Router C interfaces:

```
switch-C(config-if-vl11)# router ospf 1
switch-C(config-router-ospf)# router-id 170.21.0.3
switch-C(config-router-ospf)# area 1 NSSA
switch-C(config-router-ospf)# network 10.10.1.0/24 area 1
switch-C(config-router-ospf)# network 10.10.2.0/24 area 0
```

d. Router D interfaces:

```
switch-D(config-if-vl12)# router ospf 1
switch-D(config-router-ospf)# router-id 170.21.0.4
switch-D(config-router-ospf)# network 10.10.2.0/24 area 0
switch-D(config-router-ospf)# network 10.10.3.0/24 area 0
```

e. Router E interfaces:

```
switch-E(config-if-vl13)# router ospf 1
switch-E(config-router-ospf)# router-id 170.21.0.5
switch-E(config-router-ospf)# network 10.10.3.0/24 area 0
switch-E(config-router-ospf)# network 10.10.4.0/24 area 0
```

f. Router F interfaces:

```
switch-F(config-if-vl14)# router ospf 1
switch-F(config-router-ospf)# router-id 170.21.0.6
switch-F(config-router-ospf)# network 10.10.4.0/24 area 0
switch-F(config-router-ospf)# redistribute static
```

15.2.5 OSPFv2 Commands

Global Configuration Mode

- `ip ospf router-id output-format hostnames`
- `line system`
- `router ospf`

Interface Configuration Mode

- `interface Tunnel`
- `ip ospf area`
- `ip ospf authentication`
- `ip ospf authentication-key`
- `ip ospf cost`
- `ip ospf dead-interval`
- `ip ospf disabled`
- `ip ospf hello-interval`
- `ip ospf message-digest-key`
- `ip ospf network point-to-point`
- `ip ospf priority`
- `ip ospf retransmit-interval`
- `ip ospf transmit-delay`
- `tunnel routes`

Router-OSPFv2 Configuration Mode

- `adjacency exchange-start threshold (OSPFv2)`
- `area default-cost (OSPFv2)`
- `area filter (OSPFv2)`
- `area nssa (OSPFv2)`
- `area nssa default-information-originate (OSPFv2)`
- `area nssa no-summary (OSPFv2)`
- `area not-so-stubby lsa type-7 convert type-5 (OSPFv2)`
- `area range (OSPFv2)`
- `area stub (OSPFv2)`
- `auto-cost reference-bandwidth (OSPFv2)`
- `compatible (OSPFv2)`
- `default-information originate (OSPFv2)`
- `distance ospf (OSPFv2)`
- `dn-bit-ignore (OSPFv2)`
- `log-adjacency-changes (OSPFv2)`
- `max-lsa (OSPFv2)`
- `max-metric router-lsa (OSPFv2)`
- `maximum-paths (OSPFv2)`
- `network area (OSPFv2)`
- `no area (OSPFv2)`
- `passive-interface default (OSPFv2)`
- `passive-interface (OSPFv2)`
- `point-to-point routes (OSPFv2)`
- `redistribute (OSPFv2)`

- redistribute ospf instance
- router-id (OSPFv2)
- shutdown (OSPFv2)
- summary-address
- timers lsa rx min interval (OSPFv2)
- timers lsa tx delay initial (OSPFv2)
- timers spf delay initial (OSPFv2)

TCAM Profile Configuration Mode

- packet
- system profile

Display and Clear Commands

- clear ip ospf neighbor
- show hardware tcam profile
- show ip ospf
- show ip ospf border-routers
- show ip ospf database database-summary
- show ip ospf database <link state list>
- show ip ospf database <link-state details>
- show ip ospf interface
- show ip ospf interface brief
- show ip ospf lsa-log
- show ip ospf neighbor
- show ip ospf neighbor adjacency-changes
- show ip ospf neighbor state
- show ip ospf neighbor summary
- show ip ospf request queue
- show ip ospf retransmission queue
- show ip ospf spf-log
- show line system dom thresholds
- show line system status

15.2.5.1 auto-cost reference-bandwidth (OSPFv2)

The **auto-cost reference-bandwidth** command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

$\text{OSPFv2-cost} = (\text{auto-cost value} * 1 \text{ Mbps}) / \text{interface bandwidth}$.

The switch uses a minimum OSPFv2-cost of **1**. The switch rounds down all non-integer results.

On a 10G Ethernet interface:

- if auto-cost = **100**, then OSPFv2-cost = **100** Mbps / 10 Gbps = **0.01**, and the default cost is set to **1**.
- if auto-cost = **59000**, then OSPFv2-cost = **59000** Mbps / 10 Gbps = **5.9**, and the default cost is set to **5**.

The **no auto-cost reference-bandwidth** and **default auto-cost reference-bandwidth** command removes the **auto-cost reference-bandwidth** command from **running-config**. When this parameter is not set, the default cost for Ethernet interfaces is the default **ip ospf cost** value of 10.

Command Mode

Router-OSPF Configuration

Command Syntax

```
auto-cost reference-bandwidth rate
no auto-cost reference-bandwidth rate
default auto-cost reference-bandwidth rate
```

Parameter

rate Values range from **1 to 4294967**. Default is **100**.

Example

To configure a default cost of **20** on 10G Ethernet interfaces:

1. Calculate the required auto-cost value:
 $\text{auto-cost} = (\text{OSPFv2-cost} * \text{interface bandwidth}) / 1 \text{ Mbps} = (20 * 10000 \text{ Mbps}) / 1 \text{ Mbps} = 200000$
2. Configure this value as the auto-cost reference-bandwidth.

```
switch(config)# router ospf 6
switch(config-router-ospf)# auto-cost reference-bandwidth 200000
switch(config-router-ospf)#
```

15.2.5.2 adjacency exchange-start threshold (OSPFv2)

The **adjacency exchange-start threshold** command sets the exchange-start options for an OSPF instance.

The **no adjacency exchange-start threshold** and **default adjacency exchange-start threshold** command resets the default by removing the corresponding a **adjacency exchange-start threshold** command from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
adjacency exchange-start threshold peers  
no adjacency exchange-start threshold  
default adjacency exchange-start threshold
```

Parameter

peers Value ranges from **1- 4294967295**. Default value is **10**.

Example

This command sets the adjacency exchange start threshold to **20045623**.

```
switch(config)# router ospf 6  
switch(config-router-ospf) # adjacency exchange-start threshold 20045623  
switch(config-router-ospf) #
```

15.2.5.3 area default-cost (OSPFv2)

The **area default-cost** command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to **10**.

The **no area default-cost** and **default area default-cost** command resets the default-cost value of the specified area to **10** by removing the corresponding **area default-cost** command from **running-config**. The **no area (OSPFv2)** command removes all area commands for the specified area from **running-config**, including the **area default-cost** command.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost def_cost
default area area_id default-cost def_cost
```

Parameters

- **area_id** Area number: **0 to 4294967295** or **0.0.0.0 to 255.255.255.255** **running-config** stores value in dotted decimal notation.
- **def_cost** Value ranges from **1 to 65535**. Default value is **10**.

Example

This command configures a cost of **15** for default summary routes that an ABR sends into area **23**.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 23 default-cost 15
switch(config-router-ospf)#
```

15.2.5.4 area filter (OSPFv2)

The **area filter** command prevents an area from receiving Type 3 Summary LSAs and Type 4 APSR Summary LSAs from a specified subnet.

The **no area filter** and **default area filter** commands remove the specified **area filter** command from **running-config**. The **no area** command (see [no area \(OSPFv2\)](#)) removes all area commands for the specified area from **running-config**, including **area filter** commands.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id filter net_addr
no area area_id filter net_addr
default area area_id filter net_addr
```

Parameters

- **area_id** Area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**. **running-config** stores value in dotted decimal notation.
- **net_addr** Network IP address. Entry formats include address-prefix (CIDR) and address-mask. **running-config** stores value in CIDR notation.

Example

This command prevents the switch from entering Type 3 LSAs and Type 4 LSAs originating from the **10.1.1.0/24** subnet into its area **2** LSDB.

```
switch(config)# router ospf 6
switch(config-router-ospf)# area 2 filter 10.1.1.0/24
switch(config-router-ospf)#
```

15.2.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv2)

The **area not-so-stubby lsa type-7 convert type-5** command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

The **no area not-so-stubby lsa type-7 convert type-5** and **no area not-so-stubby lsa type-7 convert type-5** commands allow LSAs to be translated dynamically by removing the **no area not-so-stubby lsa type-7 convert type-5** command from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id not-so-stubby lsa type-7 convert type-5
no area area_id not-so-stubby lsa type-7 convert type-5
default area area_id not-so-stubby lsa type-7 convert type-5
```

Parameters

area_id Area number.

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
- *running-config* stores value in dotted decimal notation.

Example

This command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

```
switch(config-router-ospf) # area 3 not-so-stubby lsa type-7 convert type-5
switch(config-router-ospf) #
```

15.2.5.6 area nssa (OSPFv2)

The **area nssa** command configures an OSPFv2 area as a Not-So-Stubby Area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id nssa [TYPE]
```

```
no area area_id nssa [TYPE]
```

```
default area area_id nssa [TYPE]
```

Parameters

- **area_id** All parameters except **area_id** can be placed in any order.
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
 - *running-config* stores value in dotted decimal notation.
- **TYPE** Area type. Values include:
 - *no parameter*
 - **nssa-only**

Example

This command configures area **3** as a NSSA area.

```
switch(config-router-ospf) # area 3 nssa nssa-only
switch(config-router-ospf) #
```

15.2.5.7 area nssa default-information-originate (OSPFv2)

The **default area nssa default-information-originate** command sets default route origination for the Not-So-Stubby Area (NSSA), allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the [redistribute \(OSPFv2\)](#) command). The **no area nssa default-information-originate** command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See [Advertisement of Default Route](#) for details.

Areas are **normal** by default; area type configuration is required only for stub and NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the [default-information originate \(OSPFv2\)](#) command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the [area nssa default-information-originate \(OSPFv2\)](#) or [area nssa no-summary \(OSPFv2\)](#) command.

Table 78: Advertisement of Default Route

Static Default Route Installed	Redistribute Static	Command Form	Advertise in ABR	Advertise in ASBR
no	no	default or no	no	no
no	no	standard	yes	no
no	yes	default	yes	yes
no	yes	no	no	no
no	yes	standard	yes	no
yes	no	default or no	no	no
yes	no	standard	yes	yes
yes	yes	default	yes	yes
yes	yes	no	no	no
yes	yes	standard	yes	yes

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
```

```
no area area_id nssa default-information-originate
```

```
default area area_id nssa default-information-originate
```

Parameters

- **area_id** All parameters except **area_id** can be placed in any order.
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
 - **running-config** stores value in dotted decimal notation.
- **VALUE** Values include:

- ***no parameter*** Default value of **1**.
- **metric 1-65535**.
- **TYPE** Values include:
 - ***no parameter***.
 - **metric-type 1-2**.
- **EXCL** Values include:
 - ***no parameter***.
 - **nssa-only**.

Example

This command configures area **3** as an NSSA and generates a type 7 default LSA within the NSSA.

```
switch(config-router-ospf) # area 3 nssa default-information-originate nssa-only  
switch(config-router-ospf) #
```

15.2.5.8 area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the Not-So-Stubby Area (NSSA) in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id nssa no-summary  
no area area_id nssa no-summary  
default area area_id nssa no-summary
```

Parameters

area_id Area number.

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
- **running-config** stores value in dotted decimal notation.

Examples

- This command directs the device not to import type-3 summary LSAs into the NSSA area

```
switch(config)# router ospf 6  
switch(config-router-ospf)# area 1.1.1.1 nssa no-summary  
switch(config-router-ospf)#
```

- This command directs the device to import type-3 summary LSAs into the NSSA area.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# no area 1.1.1.1 nssa no-summary  
switch(config-router-ospf)#
```

15.2.5.9 area range (OSPFv2)

The **area range** command configures OSPF Area Border Routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The **no area (OSPFv2)** command removes all area commands for the specified area from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
no area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
default area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

Parameters

- **area_id** Area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255** *running-config* stores value in dotted decimal notation.
- **net_addr.**
- **ADVERTISE_SETTING** Values include:
 - **no parameter**
 - **advertise**
 - **not-advertise**
- Values include:
 - **no parameter**
 - **cost range_cost** Value ranges from **1** to **65535**.

Examples

- The **network area** command assigns two subnets to an area. The **area range** command summarizes the addresses, which the ABR advertises in a single LSA.

```
switch(config)# router ospf 6
switch(config-router-ospf)# network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)# network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)# area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf)#
```

- The **network area** command assigns a subnet to an area, followed by an **area range** command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)# network 10.12.31.0/24 area 5
switch(config-router-ospf)# area 5 range 10.12.31.0/24 not-advertise
switch(config-router-ospf)#
```

15.2.5.10 area stub (OSPFv2)

The **area stub** command sets the area type of an OSPF area to **stub**. All devices in an Area Stub (AS) must specify the same area type for identically numbered areas.

The **no area stub** command remove the specified stub area from the OSPFv2 instance by deleting all **area stub** commands from **running-config** for the specified area.

The **no area stub** command configures the specified area as a normal area.

Command Mode

Router-OSPF Configuration

Command Syntax

```
area area_id stub [summarize]
no area area_id stub [summarize]
default area area_id stub [summarize]
```

Parameters

- **area_id** Area number.
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0 (or 0.0.0.0)** is not configurable; it is always normal.
 - **running-config** stores value in dotted decimal notation.
- **summarize** Area type. Values include:
 - **no parameter**
 - **no-summary**

Examples

- These commands configure area **45** as a stub area.

```
switch(config)# router ospf 3
switch(config-router-ospf)# area 45 stub
switch(config-router-ospf)#
```

- This command configures area **10.92.148.17** as a stub area.

```
switch(config-router-ospf)# area 10.92.148.17 stub
switch(config-router-ospf)#
```

15.2.5.11 clear ip ospf neighbor

The **clear ip ospf** command clears the neighbors statistics per interface.

Command Mode

Privileged EXEC

Command Syntax

```
clear ip ospf [PROCESS_ID] neighbor [LOCATION][VRF_INSTANCE]
```

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
 - *no parameter*
 - *1 to 65535*.
- **LOCATION** IP Address or interface peer group name. Values include:
 - ** clears all OSPF IPv4 neighbors.*
 - *ipv4_addr*
 - *ethernet e_num*
 - *loopback l_num*
 - *port-channel p_num*
 - *vlan v_num*
- **VRF_INSTANCE** Specifies the VRF instance.
 - *vrf vrf_name* configures the *vrf_name* instance.

Examples

- This command resets all OSPF neighbor statistics.

```
switch# clear ip ospf neighbor *  
switch#
```

- This command resets the OSPF neighbor statistics for the specified **ethernet 3** interface.

```
switch# clear ip ospf neighbor ethernet 3  
switch#
```

15.2.5.12 compatible (OSPFv2)

The **compatible** command allows the selective disabling of compatibility with *RFC 2328*.

The **no compatible** and **default compatible** commands reverts OSPF to *RFC 2328* compatible and removes the compatible statement from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
compatible rfc1583
```

```
no compatible rfc1583
```

```
default compatible rfc1583
```

Examples

- This command sets the OSPF compatibility list with *RFC 1583*.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# compatible rfc1583  
switch(config-router-ospf)#
```

- This command disables *RFC 1583* compatibility.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# no compatible rfc1583  
switch(config-router-ospf)#
```

15.2.5.13 default-information originate (OSPFv2)

The **default-information originate** command enables default route origination for normal areas. The user may configure the metric value and metric type used in LSAs. The **always** option will cause the ASBR to create and advertise a default route whether or not one is configured.

The **no default-information originate** command prevents the advertisement of the default route. The **default default-information originate** command enables default route origination with default values (metric type 2, metric=1).

Command Mode

Router-OSPF Configuration

Command Syntax

```
default-information originate [FORCE][VALUE][TYPE][MAP]
no default-information originate
default default-information originate
```

Parameters

All parameters can be placed in any order.

- **FORCE** Advertisement forcing option. Values include:
 - **no parameter**
 - **always**
- **VALUE** Values include:
 - **no parameter**
 - **metric 1-65535**
- **TYPE** Values include:
 - **no parameter**
 - **metric-type 1-2**
- **MAP** Sets attributes in the LSA based on a route map. Values include:
 - **no parameter**
 - **route-map map_name.**

Examples

- These commands always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.

```
switch(config)# router ospf 1
switch((config-router-ospf)# default-information originate always
switch(config-router-ospf)# show active
router ospf 1
  default-information originate always
```

- These commands advertise a default route with a metric of **100** and an external metric type of **1** if a default route is configured.

```
switch(config)# router ospf 1
switch((config-router-ospf)# default-information originate metric 100 metric-type 1
```

15.2.5.14 distance ospf (OSPFv2)

The **distance ospf** command specifies the administrative distance for intra-area, inter-area, or external OSPF routes. The command must be issued separately for each route type being configured. The default administrative distance for all routes is **110**.

The **no distance ospf** and **default distance ospf** commands remove the corresponding **distance ospf** command from **running-config**, returning the OSPFv2 administrative distance setting for the specified route type to the default value of **110**.

Note: OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the **distance ospf** command directly through the CLI or by applying a configuration file that contains the command.

Command Mode

Router-OSPF Configuration

Command Syntax

```
distance ospf [external | inter-area | intra-area]
no distance ospf [external | inter-area | intra-area]
default distance ospf [external | inter-area | intra-area]
```

Parameters

- **external** Sets administrative distance for external routes.
- **inter-area** Sets administrative distance for inter-area routes.
- **intra-area** sSets administrative distance for intra-area routes.
- **distance** Values range from **1 to 255**. Default value is **110** for all types.

Example

This command configures an administrative distance of **85** for all OSPFv2 intra-area routes on the switch. If issued while OSPF is running, this command will cause OSPF links to flap.

```
switch(config)# router ospf 6
switch(config-router-ospf)# distance ospf intra-area 85
switch(config-router-ospf)#
```

15.2.5.15 distribute-list in

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The **distribute-list in** command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **no distribute-list in** and **default distribute-list in** commands remove the **distribute-list in** command from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
distribute-list {prefix-list | route-map} list_name in
no distribute-list {prefix-list | route-map}
default distribute-list {prefix-list | route-map}
```

Parameters

- **prefix-list** Specifies a prefix-list as the filter.
- **route-map** Specifies a route-map as the filter.
- **list_name** The name of the prefix-list or route-map used to filter routes from incoming LSAs.

Related Commands

- [area filter \(OSPFv2\)](#)
- [redistribute \(OSPFv2\)](#)

Example

These commands configure a prefix list named **dist_list1** in OSPF instance **5** to filter certain routes from incoming OSPF LSAs.

```
switch(config)# router ospf 5
switch(config-router-ospf)# distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```

15.2.5.16 dn-bit-ignore (OSPFv2)

The **dn-bit-ignore** command results in the DN bit in Type 3 Summary LSAs to be ignored during the Shortest Path First (SPF) calculations.

The **no dn-bit-ignore** and **default dn-bit-ignore** commands result in the DN bit in Type 3 Summary LSAs to not be ignored during SPF calculations.

Command Mode

Router-OSPF Configuration

Command Syntax

```
dn-bit-ignore
```

```
no dn-bit-ignore
```

```
default dn-bit-ignore
```

Examples

- This command ignores the DN bit.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# dn-bit-ignore  
switch(config-router-ospf)#
```

- This command causes the DN bit not to be ignored.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# no dn-bit-ignore  
switch(config-router-ospf)#
```

15.2.5.17 interface Tunnel

OSPF packets by default are sent with Time to Live (TTL) value **1**. This may not work in tunnel scenarios where the peer tunnel end point could be more than one hop away. It is recommended to explicitly configure TTL on the tunnel interface. TTL configuration is allowed only if **path-mtu-discovery** is configured.

Command Mode

Configuration mode

Command Syntax

```
interface Tunnel Tunnel No
```

Parameter

Tunnel No Tunnel number.

Example

```
(config)# interface Tunnel 5
(config-if-Tu0)# tunnel path-mtu-discovery
(config-if-Tu0)# tunnel ttl 5
```

15.2.5.18 ip ospf area

The **ip ospf area** command enables OSPFv2 on an interface and associates the area to the interface.

The **no ip ospf area** and **default ip ospf area** commands disable OSPFv2 on the configuration mode interface and remove the configured area from the system.

Note: The per interface configuration has precedence over the OSPF Configuration mode. In other words, the area configured by the **ip ospf area** command has precedence over the area configured by the network area command.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf area area_id
```

```
no ip ospf area area_id
```

```
default ip ospf area area_id
```

Parameters

area_id The area ID. The valid values are **0** to **4294967295** or a decimal range between **0.0.0.0** and **255.255.255.255**.

Example

These commands enable OSPFv2 on the **et2** interface and associates area identifier **1.1.1.1** to the interface.

```
switch(config)# Interface ethernet 2  
switch(config-if-Et2)# ip address 1.0.0.1/24  
switch(config-if-Et2)# ip ospf area 1.1.1.1  
router ospf 1
```

15.2.5.19 ip ospf authentication

The **ip ospf authentication** command enables OSPFv2 authentication for the configuration mode interface..

The **no ip ospf authentication** and **default ip ospf authentication** commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding **ip ospf authentication** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf authentication [METHOD]
no ip ospf authentication
default ip ospf authentication
```

Parameters

METHOD OSPFv2 authentication method. Options include:

- *no parameter*
- **message-digest**

Examples

- This command enables simple authentication on **vlan 12**.

```
switch(config)# interface vlan 12
switch(config-if-vl12)# ip ospf authentication
switch(config-if-vl12)#
```

- This command enables message-digest authentication on **vlan 12**.

```
switch(config-if-vl12)# ip ospf authentication message-digest
switch(config-if-vl12)#
```

15.2.5.20 ip ospf authentication-key

The **ip ospf authentication-key** command configures the OSPFv2 authentication password for the configuration mode interface.

The **no ip ospf authentication-key** and **default ip ospf authentication-key** commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding **ip ospf authentication-key** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf authentication-key [ENCRYPT_TYPE] key_text
```

```
no ip ospf authentication-key
```

```
default ip ospf authentication-key
```

Parameters

- **ENCRYPT_TYPE** Encryption level of the *key_text* parameter. Values include:
 - **no parameter** the *key_text* is in clear text.
 - **0 key_text** is in clear text. Equivalent to **no parameter**.
 - **7 key_text** is MD5 encrypted.
- **key_text** the authentication-key password.

Example

This command specifies a password in clear text.

```
switch(config)# interface vlan 12
switch(config-if-Vl12)# ip ospf authentication-key 0 code123
switch(config-if-Vl12)# show active
interface Vlan12
  ip ospf authentication-key 7 baY1lFzVbcx4yHq1IhmMdw==
switch(config-if-Vl12)#
```

The *running-config* stores the password as an encrypted string.

15.2.5.21 ip ospf cost

The **ip ospf cost** command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the **auto-cost reference-bandwidth (OSPFv2)** command.
- Port channel: **10**.
- VLAN: **10**.

The **no ip ospf cost** and **default ip ospf cost** commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding **ip ospf cost** command from **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf cost interface_cost
```

```
no ip ospf cost
```

```
default ip ospf cost
```

Parameter

interface_cost Value ranges from **1 to 65535**; default is **10**.

Example

This command configures a cost of **15** for **vlan 2**.

```
switch(config)# interface vlan 2
switch(config-if-Vl2)# ip ospf cost 15
switch(config-if-Vl2)#
```

15.2.5.22 ip ospf dead-interval

The **ip ospf dead-interval** command configures the dead interval for the configuration mode interface.

The **no ip ospf dead-interval** and **default ip ospf dead-interval** commands restore the default dead interval of **40** seconds on the configuration mode interface by removing the corresponding **ip ospf dead-interval** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf dead-interval time  
no ip ospf dead-interval  
default ip ospf dead-interval
```

Parameter

time Value ranges from **1 to 8192**; default is **40**.

Example

This command configures a dead interval of **120** seconds for **vlan 4**.

```
switch(config)# interface vlan 4  
switch(config-if-Vl4)# ip ospf dead-interval 120  
switch(config-if-Vl4)#
```

15.2.5.23 ip ospf disabled

The **ip ospf disabled** command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, the it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the `shutdown (OSPFv2)` command.

The **no ip ospf disabled** and **default ip ospf disabled** commands enable OSPFv2 on the configuration mode interface by removing the corresponding **ip ospf disabled** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf disabled
no ip ospf disabled
default ip ospf disabled
```

Examples

- This command shuts down OSPFv2 activity on *vlan 5*.

```
switch(config)# interface vlan 5
switch(config-if-Vl5)# ip ospf disabled
switch(config-if-Vl5)#
```

- This command resumes OSPFv2 activity on *vlan 5*.

```
switch(config-if-Vl5)# no ip ospf disabled
switch(config-if-Vl5)#
```

15.2.5.24 ip ospf hello-interval

The **ip ospf hello-interval** command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for Each OSPFv2 neighbor, and should not be longer than any neighbors dead interval.

The **no ip ospf hello-interval** and **default ip ospf hello-interval** commands restore the default hello interval of **10** seconds on the configuration mode interface by removing the **ip ospf hello-interval** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf hello-interval time
no ip ospf hello-interval
default ip ospf hello-interval
```

Parameter

time Hello interval (seconds). Values range from **1 to 8192**; default is **10**.

Example

This command configures a hello interval of **30** seconds for **vlan 2**.

```
switch(config)# interface vlan 2
switch(config-if-Vl2)# ip ospf hello-interval 30
switch(config-if-Vl2)#
```

15.2.5.25 ip ospf message-digest-key

The **ip ospf message-digest-key** command configures a message digest authentication key for the configuration mode interface.

The **no ip ospf message-digest-key** and **default ip ospf message-digest-key** commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding **ip ospf message-digest-key** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

ip ospf message-digest-key *key_id* md5 **ENCRYPT_TYPE** *key_text*

no ip ospf message-digest-key *key_id*

default ip ospf message-digest-key *key_id*

Parameters

- **key_id** Key ID number. Value ranges from **1 to 255**.
- **ENCRYPT_TYPE** Encryption level of the **key_text** parameters. Values include:
 - **no parameter**
 - **0 key_text**
 - **7 key_text**
- **key_text** message key (password).

Example

This command configures **code123** as the MD5 key with a corresponding key ID of **23**.

```
switch(config)# interface vlan 12
switch(config-if-vl12)# ip ospf message-digest-key 23 md5 0 code123
switch(config-if-vl12)#
```

The *running-config* stores the password as an encrypted string.

15.2.5.26 ip ospf network point-to-point

The **ip ospf network point-to-point** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **no ip ospf network** and **default ip ospf network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ip ospf network** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf network point-to-point
```

```
no ip ospf network
```

```
default ip ospf network
```

Examples

- These commands configure ethernet interface **10** as a point-to-point link.

```
switch(config)# interface ethernet 10
switch(config-if-Et10)# ip ospf network point-to-point
switch(config-if-Et10)#
```

- This command restores ethernet interface **10** as a broadcast link.

```
switch(config-if-Et10)# no ip ospf network
switch(config-if-Et10)#
```

15.2.5.27 ip ospf retransmit-interval

The **ip ospf retransmit-interval** command configures the link state advertisement retransmission interval for the interface.

The **no ip ospf retransmit-interval** and **default ip ospf retransmit-interval** commands restore the default retransmission interval of **5** seconds on the configuration mode interface by removing the corresponding **ip ospf retransmit-interval** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf retransmit-interval period
no ip ospf retransmit-interval
default ip ospf retransmit-interval
```

Parameter

period Retransmission interval (seconds). Value ranges from **1 to 8192**; default is **5**.

Example

This command configures a retransmission interval of **15** seconds for **vlan 3**.

```
switch(config)# interface vlan 3
switch(config-if-Vl3)# ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```

15.2.5.28 ip ospf router-id output-format hostnames

The **ip ospf router-id output-format hostnames** command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- `show ip ospf`
- `show ip ospf border-routers`
- `show ip ospf database <link state list>`
- `show ip ospf database database-summary`
- `show ip ospf database <link-state details>`
- `show ip ospf interface`
- `show ip ospf neighbor`
- `show ip ospf request queue`
- `show ip ospf retransmission queue`

The **no ip ospf router-id output-format hostnames** and **default ip ospf router-id output-format hostnames** commands remove the **ip ospf router-id output-format hostnames** command from *running-config*, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

Command Mode

Global Configuration

Command Syntax

```
ip ospf router-id output-format hostnames
no ip ospf router-id output-format hostnames
default ip ospf router-id output-format hostnames
```

Example

This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

```
switch(config)# ip ospf router-id output-format hostnames
switch(config)#
```

15.2.5.29 ip ospf transmit-delay

The **ip ospf transmit-delay** command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The **no ip ospf transmit-delay** and **default ip ospf transmit-delay** commands restore the default transmission delay (**1** second) on the configuration mode interface by removing the corresponding **ip ospf transmit-delay** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ip ospf transmit-delay trans  
no ip ospf transmit-delay  
default ip ospf transmit-delay
```

Parameter

trans LSA transmission delay (seconds). Value ranges from **1 to 8192**; default is **1**.

Example

This command configures a transmission delay of **5** seconds for **vlan 6**.

```
switch(config)# interface vlan 6  
switch(config-if-Vl6)# ip ospf transmit-delay 5  
switch(config-if-Vl6)#
```

15.2.5.30 ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface..

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (**1**) on the configuration mode interface by removing the corresponding **ip ospf priority** command from *running-config*.

Command Mode

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

Command Syntax

```
ip ospf priority priority_level
no ip ospf priority
default ip ospf priority
```

Parameter

priority_level priority level. Value ranges from **0 to 255**. Default value is **1**.

Examples

- This command configures a router priority of **15** for **vlan 8**.

```
switch(config)# interface vlan 8
switch(config-if-Vl8)# ip ospf priority 15
switch(config-if-Vl8)#
```

- This command restores the router priority of **1** for **vlan 7**.

```
switch(config)# interface vlan 7
switch(config-if-Vl7)# no ip ospf priority
switch(config-if-Vl7)#
```

15.2.5.31 line system

The **line system** command places the switch in the OSPF - Line System configuration mode.

The **no line system** command removes the Line System configurations from the *running-config*.

Command Mode

Global Configuration Mode

Command Syntax

```
line system
no line system
```

Parameters

The following parameters are allowed to be configured under LS mode.

- **port number** Transceiver slot number. Value ranges from **1 - 66**.
 - The following parameters are allowed under **LS port mode**:
 - booster Booster settings
 - pre-amp Pre-amp settings

Example

This command places the switch in the OSPF Line System configuration mode.

```
switch# config
switch(config)# line system
switch(config-ls)#
```

15.2.5.32 log-adjacency-changes (OSPFv2)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from *running-config*.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in *running-config*.

The **no log-adjacency-changes** disables link state change syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
log-adjacency-changes detail
no log-adjacency-changes
default log-adjacency-changes
```

Examples

- This command configures the switch to send a syslog message when a neighbor goes up or down.

```
switch(config)# router ospf 6
switch(config-router-ospf)# log-adjacency-changes
switch(config-router-ospf)#
```

- After entering the command, **show active** does not display a **log-adjacency-changes** statement.

```
switch(config-router-ospf)# show active router ospf 1
switch(config-router-ospf)#
```

- This command configures the switch to send a Syslog message when it detects any link state change.

```
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#
```

- After entering the command, **show active** displays a **log-adjacency-changes detail** command.

```
switch(config-router-ospf)# show active router ospf 1
switch(config-router-ospf)# log-adjacency-changes detail
switch(config-router-ospf)#
```

15.2.5.33 maximum-paths (OSPFv2)

The **maximum-paths** command controls the number of parallel routes that OSPFv2 supports. The default maximum is **16** paths.

The **no maximum-paths** and **default maximum-paths** commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the **maximum-paths 16** statement in *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
maximum-paths paths  
no maximum-paths  
default maximum-paths
```

Parameters

paths Maximum number of parallel routes.

Value ranges from **1** to the number of interfaces available per ECMP group, which is platform dependent.

- **Arad:** Value ranges from **1 to 128**. Default value is **128**.
 - **FM6000:** Value ranges from **1 to 32**. Default value is **32**.
 - **PetraA:** Value ranges from **1 to 16**. Default value is **16**.
 - **Trident:** Value ranges from **1 to 32**. Default value is **32**.
 - **Trident II:** Value ranges from **1 to 128**. Default value is **128**.

Example

This command configures the maximum number of OSPFv2 parallel paths to **12**.

```
switch(config)# router ospf 6  
switch(config-router-ospf) # maximum-paths 12  
switch(config-router-ospf) #
```

15.2.5.34 max-lsa (OSPFv2)

The **max-lsa** command specifies the maximum number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- **Warning:** the switch logs OSPF MAXLSA WARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown:** when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is five minutes).
- **Permanent shutdown:** the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is 5). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

The **no max-lsa** and **default max-lsa** commands restore all LSA overload parameters to their default settings.

Note: if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

Command Mode

Router-OSPF Configuration

Command Syntax

```
max-lsa lsa_num [WARNING] [IGNORE_TIME][IGNORE_COUNT][RESET]
```

```
no max-lsa
```

```
default max-lsa
```

Parameters

- **lsa_num** Maximum number of LSAs. Value ranges from **0 to 100,000**.
 - **0** Disables overload protection.
 - **1 to 100000** Specifies maximum value; default value is **12,000**.
- **WARNING** Warning threshold, as a percentage of the maximum number of LSAs (% of **lsa_num**).
 - **no parameter** Default of **75%**.
 - **percent** Ranges from **25 to 99**.
- **IGNORE_TIME** Temporary shutdown period (minutes). Options include:
 - **no parameter** Default value of **5** minutes.
 - **ignore-time period** Value ranges from **1 to 60**.
- **IGNORE_COUNT** Number of temporary shutdowns required to trigger a permanent shutdown.
 - **no parameter** Default value of **5**.
 - **ignore-count episodes** Ranges from **1 to 20**.
- **RESET** Period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
 - **no parameter** Default value of **5** minutes.
 - **reset-time r_period** Ranges from **1 to 60**.

Example

This command defines an LSA limit of **8000** and other parameters.

```
switch(config-router-ospf) # max-lsa 8000 40 ignore-time 6 ignore-count 3 reset-time 20  
switch(config-router-ospf) #
```

15.2.5.35 max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

Command Mode

Router-OSPF Configuration

Command Syntax

```
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

Parameters

All parameters can be placed in any order.

- **EXTERNAL** Advertised metric value. Values include:
 - **no parameter** Default value of **1**.
 - **external-lsa** Range: **1 to 16777215**. Default value is **0xFF0000**.
- **STUB** Advertised metric type. Values include:
 - **no parameter** Default value of **2**.
 - **include-stub**
- **STARTUP** Limit scope of LSAs. Values include:
 - **no parameter**
 - **on-startup**
 - **on-startup wait-for-bgp**
 - **on-startup** Range: **5 to 86400**.
- **wait-for-bgp** or an **on-start** time value is not included in **no** and **default** commands.
- **SUMMARY** Advertised metric value. Values include:
 - **no parameter**
 - **summary-lsa**
 - **summary-lsa** Range: **1 to 16777215**.

Example

This command configures OSPF to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf) # max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf) #
```

15.2.5.36 network area (OSPFv2)

The **network area** command assigns the specified IPv4 subnet to an OSPFv2 area.

The **no network area** and **default network area** commands delete the specified network area assignment by removing the corresponding **network area** command from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
network ipv4_subnet area area_id
```

```
no network ipv4_subnet area area_id
```

```
default network ipv4_subnet area area_id
```

Parameters

- **ipv4_subnet** IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask. The *running-config* stores value in CIDR notation.
- **area_id** Area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**. The *running-config* stores value in dotted decimal notation.

Example

These equivalent commands each assign the subnet **10.1.10.0/24** to area **0**.

```
switch(config-router-ospf) # network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf) # network 10.1.10.0/24 area 0
switch(config-router-ospf) #
```

15.2.5.37 no area (OSPFv2)

The **no area** command removes the corresponding **area** command from the *running-config*:

- **no/default area not-so-stubby lsa type-7 convert type-5** commands remove the **translate type7 always** parameter without changing the area type.
- **no/default area nssa**, **no/default area stub**, and **no/default area stub no-summary** commands restore the areas type to **normal**.
- The **no/default area default-information-originate** command removes all area commands for the specified area from *running-config*.
- The **no/default area** command removes all area commands for the specified area from the *running-config*.
- The **no/default area** command removes all area commands for the specified area from the *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

no area *area_id* [TYPE]

default area *area_id* [TYPE]

Parameters

- **area_id** area number.
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
 - The *running-config* stores value in dotted decimal notation.
- **TYPE** Area type. Values include:
 - **nssa**
 - **nssa translate type7 always**
 - **stub**
 - **stub no-summary**

Examples

- These commands remove area **1** from the running configuration.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no area 1
switch(config-router-ospf)#
```

- These commands remove area **10.92.148.17** as an NSSA.

```
switch(config-router-ospf)# no area 10.92.148.17 nssa
switch(config-router-ospf)#
```

15.2.5.38 packet

This describes packet types that the feature is applied on.

Command Mode

system-feature-source-profile (**config-hw-tcam-profile-profile-feature-feature**)

Command Syntax

packet *packet header tokens* forwarding [bridged | routed | mpls][multicast][decap]

Parameters

- **packet header tokens** The packet header is described as a series of CLI packet header tokens after the **packet** token. It starts from the outer most header after Ethernet. For example, a regular IPv4 packet is **packet ipv4** and a VXLAN packet is **packet ipv4 VXLAN eth ipv4**.
- **forwarding** The **forwarding** token indicates the forwarding type of the packet.
 - **bridged**
 - **routed**
 - **mpls**
 - **multicast** Indicates if the packet is a multicast packet.
 - **decap** Indicates if the packet is decapsulated after a tunnel.

Guidelines

On DCS-7020, DCS-7280R/R2 or DCS-7500R/R2, enabling OSPF routes over GRE tunnels requires the system TCAM profile to have “Tunnel IPv4” feature enabled so that control packets such as OSPF hellos received over GRE tunnel interfaces are appropriately classified. This can be achieved by creating a user defined TCAM profile.

The user defined TCAM profile may be created either manually from scratch or by copying from an existing TCAM profile. The system TCAM profile must have the feature **tunnel ipv4** for OSPFv2 over GRE tunnel interfaces to work. This is applicable regardless of whether the TCAM profile is copied from an existing profile or created from scratch.

To create a user defined TCAM profile.

```
(config)# hardware tcam
(config-hw-tcam)# profile profilename copy default
(config-hw-tcam-profile-profile)# feature tunnel ipv4 copy system-feature-source-profile
```

The following steps are optional if the feature is added by copying from system-feature-source-profile.

- Set the packet types for the feature as follows to match GRE tunnelled ipv4 routed unicast and multicast packets.

```
(config-hw-tcam-profile-profile-feature-feature)# packet ipv4 non-VXLAN forwarding routed decap
(config-hw-tcam-profile-profile-feature-feature)# packet ipv4 non-VXLAN forwarding routed
multicast decap
```

- Specify the qualifiers to match on.

```
(config-hw-tcam-profile-profile-feature-feature)# key field inner-dst-ip inner-ip-protocol
inner-l4-dst-port inner-l4-src-port inner-ttl
```

- Set the key size limit to **160**.

```
(config-hw-tcam-profile-profile-feature-feature)# key size limit 160
(config-hw-tcam-profile-profile-feature-feature)# exit
```

It maybe necessary to disassociate some features which are not applicable to GRE encapsulated packets from the GRE TCAM program to make room for the **tunnel ipv4** feature.

Related Commands

- [system profile](#)
- [interface Tunnel](#)
- [show hardware tcam profile](#)

15.2.5.39 passive-interface default (OSPFv2)

The **passive-interface default** command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The **passive-interface (OSPFv2)** configures the OSPFv2 active-passive status for a specific interface:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface** statements in *running-config*.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface** statements in *running-config*.

The **no passive-interface** and **default passive-interface** commands configures all interfaces as OSPFv2 active by default by removing the **passive-interface default** statement from *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
passive-interface default
no passive-interface default
default passive-interface default
```

Examples

- This command configures the default interface setting as OSPFv2 passive. This command also removes all **passive-interface** statements from the *running-config*.

```
switch(config)# router ospf 6
switch(config-router-ospf)# passive-interface default
switch(config-router-ospf)#
```

- This command configures the default interface setting as OSPFv2 active. This command also removes all **no passive-interface** statements from the *running-config*.

```
switch(config-router-ospf)# no passive-interface default
switch(config-router-ospf)#
```

15.2.5.40 passive-interface (OSPFv2)

The **passive-interface** command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the **passive-interface default (OSPFv2)** command:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface** statements in the *running-config*.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface** statements in the *running-config*.

The **no passive-interface** command enables OSPFv2 on the specified interface range. The **default passive-interface** command sets the interface to the default interface activity setting by removing the corresponding **passive-interface** or **no passive-interface** statement from the *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

Parameters

- **INTERFACE_NAME** Interface to be configured. Options include:
 - **ethernet e_range**
 - **port-channel p_range**
 - **vlan v_range**
 - **VXLAN vx_range**

Examples

- These commands configure Ethernet interfaces **2** through **5** as passive interfaces.

```
switch(config)# router ospf 6
switch(config-router-ospf)# passive-interface ethernet 2-5
switch(config-router-ospf)#
```

- This command configures VLAN interfaces **50-54**, **61**, **68**, and **102-120** as passive interfaces.

```
switch(config-router-ospf)# passive-interface vlan 50-54,61,68,102-120
switch(config-router-ospf)#
```

- This command configures **vlan 2** as an active interface.

```
switch(config-router-ospf)# no passive-interface vlan 2
switch(config-router-ospf)#
```

15.2.5.41 point-to-point routes (OSPFv2)

The **point-to-point routes** command enables the switch to maintain a local Routing Information Base (RIB) to store information it learns from its neighbors.

The **no point-to-point routes** and **default point-to-point routes** commands program the switch to include point-to-point links in its RIB by removing the **point-to-point routes** command from the *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
point-to-point routes
```

```
no point-to-point routes
```

```
default point-to-point routes
```

Examples

- This command configures the switch to optimize the local RIB by not including point-to-point routes.

```
switch(config)# router ospf 6
switch(config-router-ospf)# no point-to-point routes
switch(config-router-ospf)#
```

- This command configures the switch to include point-to-point routes.

```
switch(config-router-ospf)# point-to-point routes
switch(config-router-ospf)#
```

15.2.5.42 redistribute (OSPFv2)

The **redistribute** command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from the *running-config*, disabling route redistribution for the specified route type.

Command Mode

Router-OSPF Configuration

Command Syntax

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE [ROUTE_MAP]
default redistribute ROUTE_TYPE [ROUTE_MAP]
```

Parameters

- **ROUTE_TYPE** Source from which routes are redistributed. Options include:
 - **connected** routes that are established when IPv4 is enabled on an interface.
 - **BGP** routes from a BGP domain.
 - **RIP** routes from a RIP domain.
 - **static** IP static routes.
- **ROUTE_MAP** Route map that determines the routes that are redistributed. Options include:
 - *no parameter*
 - *route-map map_name*

Examples

- The **redistribute static** command starts the advertising of static routes as OSPFv2 external routes.

```
switch(config)# router ospf 6
switch(config-router-ospf)# redistribute static
switch(config-router-ospf)#
```

- The **no redistribute bgp** command stops the advertising of BGP routes as OSPFv2 external routes.

```
switch(config-router-ospf)# no redistribute bgp
switch(config-router-ospf)#
```

15.2.5.43 redistribute ospf

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

Command Mode

Config-router-bgp

Command Syntax

```
redistribute ospf [include [leaked] | match [external | internal | nssa-external] | route-map word]  
no redistribute ospf [match [external | internal | nssa-external]]  
default redistribute ospf [match [external | internal | nssa-external]]
```

Parameters

- **include** Include following routes while redistributing.
 - **leaked** Include leaked routes of this protocol while redistributing.
- **match** Routes learned by the OSPF protocol.
 - **external** OSPF routes learned from external sources.
 - **internal** OSPF routes learned from internal sources.
 - **nssa-external** OSPF routes learned from external NSSA sources.
- **route-map** Name a router map.
 - ***word*** Route map name.

Example

Use the following commands to redistribute OSPFv2 routes into the BGP domain.

```
switch(config)# router bgp 1  
switch(config-router-bgp)# redistribute OSPF  
switch(config-router-bgp)#
```

15.2.5.44 redistribute ospf instance

The **redistribute ospf instance** command redistributes either the non-leaked routes, or both leaked and non-leaked routes. The **exit** command returns the switch to the **global** configuration mode.

Command Mode

Router-OSPF Configuration

Command Syntax

```
redistribute ospf instance [OPTIONS]
```

Parameters

- **include** Include leaked routes.
 - **leaked** OSPF leaked routes.
- **match** Routes learned by the OSPF protocol.
 - **external** OSPF routes learned from external sources.
 - **internal** OSPF routes learned from internal sources.
 - **nssa-external** OSPF routes learned from external NSSA sources.

Examples

- This command redistributes the OSPFv2 external routes from all other OSPFv2 instances in the same VRF into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance match external
```

- This command redistributes the OSPFv2 internal leaked and non-leaked routes from all other instances in all VRFs into the given instance.

```
switch(config-router-ospf)# redistribute ospf instance include leaked match internal
```

15.2.5.45 router ospf

The **router ospf** command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The **exit** command returns the switch to the **global** configuration mode.

The **show ip ospf** command displays the process ID of the OSPFv2 instances configured on the switch.

The **no router ospf** and **default router ospf** commands delete the specified OSPFv2 instance.

The **router-ospf** configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **router-ospf** configuration mode does not affect **running-config**. The **exit** command returns the switch to the **global** configuration mode.

Refer to the Router-OSPFv2 Configuration Mode for a list of commands available in **router-ospf** configuration mode.

Command Mode

Global Configuration

Command Syntax

```
router ospf process_id [VRF_INSTANCE]
no router ospf process_id [VRF_INSTANCE]
default router ospf process_id [VRF_INSTANCE]
```

Parameters

- **process_id** OSPFv2 process ID. Values range from **1** to **65535**.
- **VRF_INSTANCE**
 - **no parameter** Configures the default VRF instance.
 - **vrf vrf_name** Configures the vrf_name instance.

Examples

- This command creates an OSPFv2 instance with process ID **145** in the main VRF.

```
switch(config)# router ospf 145
switch(config-router-ospf)#
```

- This command deletes the specified OSPFv2 instance.

```
switch(config)# no router ospf 145
switch(config)#
```

15.2.5.46 router-id (OSPFv2)

The **router-id** command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from the **running-config**; the switch uses the loopback or highest address as the router ID.

Command Mode

Router-OSPF Configuration

Command Syntax

```
router-id [identifier]
```

```
no router-id [identifier]
```

```
default router-id [identifier]
```

Parameters

identifier Value ranges from **0.0.0.0** to **255.255.255.255**.

Example

This command assigns **10.5.4.2** as the router ID for the OSPFv2 instance.

```
switch(config)# router ospf 6
switch(config-router-ospf) # router-id 10.5.4.2
switch(config-router-ospf) #
```

15.2.5.47 show hardware tcam profile

Use the **show hardware tcam profile** command to verify that the user-defined-tcam profile is applied correctly without errors on the DCS-7020, DCS-7280R/R2, or DCS-7500R/R2 platforms.

This command is applicable the following platforms:

- DCS-7280E
- DCS-7280R
- DCS-7280R2
- DCS-7020R
- DCS-7500E
- DCS-7500R
- DCS-7500R2

Command Mode

EXEC

Command Syntax

```
show hardware tcam profile [profile] detail
```

Parameters

- **tcam** Specifies the TCAM information.
- **profile profile** Specifies the TCAM profile information.
- **detail** Displays detailed tcam profile information.

Example

This example displays the detailed tcam profile information for profile named **newprofile1**.

```
(config-hw-tcam)# show hardware tcam profile newprofile1 detail
Profile newprofile1 [ FixedSystem ]
Feature          mpls
-----
Key size         160
Actions          drop, redirect, set-ecn
Packet type      ipv4 mpls ipv4 forwarding mpls decap
                  ipv4 mpls ipv6 forwarding mpls decap
                  mpls ipv4 forwarding mpls
                  mpls ipv6 forwarding mpls
                  mpls non-ip forwarding mpls

Feature          acl vlan ipv6
-----
Key size         320
Key fields        dst-ipv6, ipv6-next-header, l4-dst-port, l4-src-port,
                  src-ipv6-high, src-ipv6-low, tcp-control
Actions          count, drop, mirror, redirect
Packet type      ipv6 forwarding routed
...
```

15.2.5.48 show ip ospf border-routers

The **show ip ospf border-routers** command displays the internal OSPFv2 routing table entries to Area Border Routers (ABRs) and Autonomous System Boundary Routers (ASBRs) for each of the OSPFv2 areas.

Command Mode

EXEC

Command Syntax

```
show ip ospf border-routers [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE Specifies the VRF instance.

- **no parameter** displays information from all VRFs, or from context-active VRF if set.
- **vrf vrf_name** displays information from the specified VRF.

Example

This command displays the ABRs and ASBRs.

```
switch# show ip ospf border-routers
OSPF Process 10.17.0.42, VRF default

Router ID      Area          Type
10.17.0.1      0.0.0.0      ASBR switch>
```

15.2.5.49 show ip ospf database database-summary

The **show ip ospf database database-summary** command displays the number of link state advertisements in the OSPFv2 database.

Command Mode

EXEC

Command Syntax

```
show ip ospf [AREA] database database-summary [VRF_INSTANCE]
```

Parameters

- **VRF_INSTANCE** Specifies the VRF instance.
 - **no parameter** displays information from all VRFs, or from context-active VRF if set.
 - **vrf vrf_name** displays information from the specified VRF.
- **AREA** areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
 - **no parameter**
 - **process_id**
 - **process_id area_id**
 - **process_id** input range: **1 to 65535**.
 - **area_id** input range: **0 to 4294967295** or **0.0.0.0 to 255.255.255.255**.

Example

This command displays the LSDB content summary for area **0**.

```
switch# show ip ospf 1 0 database database-summary

LSA Type      Count
Router        18
Network       21
Summary Net    59
Summary ASBR   4
Type-7 Ext     0
Opaque Area    0
Type-5 Ext    4238
Opaque AS      0
Total         4340 switch>
```

15.2.5.50 show ip ospf database <link state list>

The **show ip ospf database <link state list>** command displays the OSPFv2 link state advertisements that originate on a specified switch.

Command Mode

EXEC

Command Syntax

```
show ip ospf [AREA] database[ROUTER] [VRF_INSTANCE]
```

Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
 - *no parameter*
 - *process_id*
 - *process_id area_id*
 - *process_id* value ranges from **1 to 65535**.
 - *area_id* is entered in decimal or dotted decimal notation.
- **ROUTER** Router or switch for which the command provides data. Options include:
 - *no parameter*
 - *adv-router [a.b.c.d]*
 - *self-originate*
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - *vrf vrf_name* displays information from the specified VRF.

Example

This command displays OSPFv2 LSAs that originate at the router with a router ID of **10.26.0.31**.

```
switch# show ip ospf database adv-router 10.26.0.31
OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)
10.26.0.3110.26.0.319180x80002b4a0x13153
Type-5 AS External Link States

10.24.238.24410.26.0.316780x800003d20x4e060
10.24.238.22410.26.0.316780x800003d20x17510
<-----OUTPUT OMITTED FROM EXAMPLE----->
Type 11 Opaque LSDB
TypeLink IDADV RouterAgeSeq# Checksum switch>
```

15.2.5.51 show ip ospf database <link-state details>

The **show ip ospf database** command displays details of the specified link state advertisements.

Command Mode

EXEC

Command Syntax

```
show ip ospf [AREA] database LINKSTATE_TYPE linkstate_id [ROUTER] [VRF_INSTANCE]
```

Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
 - *no parameter*
 - *process_id*
 - *process_id area_id*
 - *process_id* input range: **1 to 65535**.
 - *area_id* input range: **0 to 4294967295** or **0.0.0.0 to 255.255.255.255**.
- **LINKSTATE_TYPE** Link state types. Parameter options include:
 - **detail** Displays all link states.
 - **router**
 - **network**
 - **summary**
 - **asbr-summary**
 - **external**
 - **nssa-external**
 - **opaque-link**
 - **opaque-area**
 - **opaque-as**
- **linkstate_id** Network segment described by the LSA (dotted decimal notation).
Value depends on the LSA type.
- **ROUTER** Router or switch for which the command provides data. Options include:
 - *no parameter*
 - **adv-router [a.b.c.d]**
 - **self-originate**
- **VRF_INSTANCE** Parameter has no effect; this command displays information about the specified process and area regardless of VRF.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - **vrf vrf_name** displays information from the specified VRF.

Examples

- This command displays the router link states contained in the area 2 LSDB.

```
switch# show ip ospf 1 2 database router

OSPF Router with ID(10.168.103.1) (Process ID 1) (VRF default)

Router Link States (Area 0.0.0.2)
```

```

15.2.5.52 show ip ospf interface brief

The **show ip ospf interface brief** command displays a summary of OSPFv2 information.

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID] interface brief [VRF_INSTANCE]
```

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
 - *no parameter*
 - **1 to 65535**
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - **vrf vrf_name** displays information from the specified VRF.

Related Command

[show ip ospf interface](#)

Example

This command displays a summary of interface information for the switch.

```
switch# show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0
Vlan110.0.0.010.168.0.1/2410BDR1

Vlan310.0.0.310.168.3.1/2410DR0 switch>
```

15.2.5.53 show ip ospf interface

The **show ip ospf interface** command displays interface information that is related to OSPFv2.

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID] interface [INTERFACE_NAME][VRF_INSTANCE]
```

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
 - *no parameter*
 - **1 to 65535**
- **INTERFACE_NAME** Interface type and number. Values include:
 - *no parameter*
 - **ethernet e_num**
 - **loopback l_num**
 - **port-channel p_num**
 - **vlan v_num**
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - **vrf vrf_name** displays information from the specified VRF.

Related Command

[show ip ospf interface brief](#)

Example

This command displays complete OSPFv2 information for **vlan 1**.

```
switch# show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500 switch>
```

15.2.5.54 show ip ospf lsa-log

The **show ip ospf lsa-log** command displays log entries when LSA update messages are sent or received for OSPF.

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID] ospf-log
```

Parameters

PROCESS_ID OSPFv2 process ID. Values include:

- *no parameter*
- **1 to 65535**

Example

This command displays log entries when LSA update messages are sent or received for OSPF.

```
switch# show ip ospf lsa-log
OSPF Process 3.3.3.3, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed, new hold value 3000 msecs
/* Here the maxwait value was changed to 3000 from earlier 32000, this is not part of the log */
[04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 32000 msecs
[04:19:54] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 16000 msecs
[04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 8000 msecs
[04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 4000 msecs
[04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold value 2000 msecs
[04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new hold value 900 msecs
[04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by 995 msecs
[04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new hold value 1000 msecs
switch#
```

15.2.5.55 show ip ospf neighbor adjacency-changes

The **show ip ospf neighbor adjacency-changes** command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

Command Mode

EXEC

Command Syntax

```
show ip ospf neighbor [INTERFACE_NAME][NEIGHBOR] adjacency-changes [VRF_INSTANCE]
```

Parameters

- **INTERFACE_NAME** Interface type and number. Values include:
 - *no parameter*
 - **ethernet e_num**
 - **loopback l_num**
 - **port-channel p_num**
 - **vlan v_num**
- **NEIGHBOR** OSPFv2 neighbor. Options include:
 - *no parameter*
 - **ipv4_addr**
 - **host_name**
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - **vrf vrf_name** displays information from the specified VRF.

Example

This command displays the adjacency changes to **vlan 2**.

```
switch# show ip ospf neighbor vlan 2 adjacency-changes
[08-04 08:55:32] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:58:51] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped: interface went down
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did not
list our router ID
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established switch>
```

15.2.5.56 show ip ospf neighbor state

The **show ip ospf neighbor state** command displays the state information on OSPF neighbors on a per-interface basis.

Command Mode

EXEC

Command Syntax

```
show ip ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

Parameters

- **STATE_NAME** Output filtered by the devices OSPF state. Options include valid OSPF states:
 - **2-ways**
 - **attempt**
 - **down**
 - **exch-start**
 - **exchange**
 - **full**
 - **graceful-restart**
 - **init**
 - **loading**
- **VRF_INSTANCE** Specifies the VRF instance.
 - **no parameter** displays information from all VRFs, or from context-active VRF if set.
 - **vrf vrf_name** displays information from the specified VRF.

Example

This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch# show ip ospf neighbor state full
Neighbor ID      VRF      Pri  State          Dead Time   Address      Interface

Test17           default  1    FULL/DR        00:00:36   10.17.254.138   Ethernet12
Test18           default  1    FULL/DR        00:00:37   10.17.254.2     Vlan3901 switch>
```

15.2.5.57 show ip ospf neighbor summary

The **show ip ospf neighbor summary** command displays a single line of summary information for each OSPFv2 neighbor.

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID] neighbor summary [VRF_INSTANCE]
```

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
 - *no parameter*
 - *1 to 65535*
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - *vrf vrf_name* displays information from the specified VRF.

Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch# show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START switch>
```

15.2.5.58 show ip ospf neighbor

The **show ip ospf neighbor** command displays OSPFv2 neighbor information for specified interfaces.

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID] neighbor [INTERFACE_NAME] [NEIGHBOR] [DATA] [VRF_INSTANCE]
```

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
 - *no parameter*
 - *1 to 65535*
- **INTERFACE_NAME** Interface type and number. Values include:
 - *no parameter*
 - *ethernet e_num*
 - *loopback l_num*
 - *port-channel p_num*
 - *vlan v_num*
- **NEIGHBOR** OSPFv2 neighbor. Options include:
 - *no parameter*
 - *ipv4_addr*
- **DATA** Type of information the command displays. Values include:
 - *no parameter*
 - *detail*
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* displays information from all VRFs, or from context-active VRF if set.
 - *vrf vrf_name* displays information from the specified VRF.

Examples

- This command displays the switch's neighbors.

```
switch# show ip ospf neighbor
Neighbor IDVRFPriStateDead TimeAddressInterface
10.168.104.2default1FULL/DR00:00:3510.168.0.2Vlan1
10.168.104.2default8FULL/BDR00:00:3110.168.2.2Vlan2 switch>
```

- This command displays details about the neighbors to **vlan 2**.

```
switch# show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes
Adjacency was established 00:01:25:48 ago
DR is 10.168.2.1 BDR is 10.168.2.2
Options is E
Dead timer due in 00:00:34 switch>
```

15.2.5.59 show ip ospf request queue

The **show ip ospf request queue** command displays a list of all OSPFv2 Link State Advertisements (LSAs) requested by a router.

Command Mode

EXEC

Command Syntax

```
show ip ospf request queue [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE Specifies the VRF instance.

- **no parameter** displays information from all VRFs, or from context-active VRF if set.
- **vrf vrf_name** displays information from the specified VRF.

Example

This command displays an LSA request list.

```
switch# show ip ospf request queue
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
Type LS ID ADV RTR Seq No Age Checksum switch>
```

15.2.5.60 show ip ospf retransmission queue

The **show ip ospf retransmission queue** command displays a list of all OSPFv2 Link State Advertisements (LSAs) waiting to be re-sent.

Command Mode

EXEC

Command Syntax

```
show ip ospf retransmission queue [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE Specifies the VRF instance.

- **no parameter** displays information from all VRFs, or from context-active VRF if set.
- **vrf vrf_name** displays information from the specified VRF.

Example

This command displays an empty retransmission list.

```
switch# show ip ospf retransmission queue
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum switch>
```

15.2.5.61 show ip ospf spf-log

The **show ip ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPF.

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID] ospf-log
```

Parameters

PROCESS_ID OSPFv2 process ID. Values include:

- *no parameter*
- **1 to 65535**

Example

This command displays the SPF information for OSPF.

```
switch# show ip ospf spf-log
OSPF Process 172.26.0.22
When      Duration(msec)
13:01:34  1.482
13:01:29  1.547

15:00:47  1.603 switch>
```

15.2.5.62 show ip ospf

The **show ip ospf** command displays OSPFv2 routing information

Command Mode

EXEC

Command Syntax

```
show ip ospf [PROCESS_ID][VRF_INSTANCE]
```

Parameters

- **PROCESS_ID** OSPFv2 process ID. Values include:
 - *no parameter*
 - **1 to 65535**
- **VRF_INSTANCE** Specifies the VRF instance.
 - *no parameter* configures the default VRF instance.
 - **vrf vrf_name** configures the *vrf_name* instance.

Example

This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch# show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPF 5000 msecs
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

15.2.5.63 show line system dom thresholds

The **show line system dom thresholds** command reports DOM information reported by the OSFP-LS module. This includes standard fields such as temperature and voltage. In addition to standard DOM fields, the OSFP-LS also monitors the laser temperature for each of its amplifiers. The reported RX power reflects the total RX power seen on that path. TX bias current monitoring is not supported on these modules and should be ignored.

Command Mode

EXEC

Command Syntax

```
show line system [[port RANGE] dom thresholds]
```

Example

This command displays the DOM information reported by the OSFP-LS module.

```
switch# show line system port 10 dom thresholds
Ch: Channel, mA: milliamperes, dBm: decibels (milliwatts),
C: Celsius, V: Volts, NA or N/A: not applicable.

Port 10
Last update: 0:00:04 ago
```

	Value	High Alarm Threshold	High Warn Threshold	Low Warn Threshold	Low Alarm Threshold	Unit	Indicator
Temperature	32.83	70.00	65.00	0.00	-5.00	C	
Voltage	3.29	3.47	3.37	3.23	3.14	V	
Booster							
TX bias current	N/A	N/A	N/A	N/A	N/A	mA	
Optical TX power (line)	-3.58	7.96	7.50	-9.03	-15.06	dBm	
Optical RX power (local)	-28.24	-16.23	-17.26	-30.00	-33.01	dBm	
Laser Temperature	43.55	80.00	75.00	-5.00	-10.00	C	
Pre-amp							
TX bias current	N/A	N/A	N/A	N/A	N/A	mA	
Optical TX power (local)	-3.38	7.96	7.50	-9.03	-15.06	dBm	
Optical RX power (line)	-15.42	5.77	4.77	-28.24	-30.97	dBm	
Laser Temperature	43.54	80.00	75.00	-5.00	-10.00	C	

15.2.5.64 show line system status

The **show line system status** command displays module status. The OSFP-LS is compliant to the Common Management Interface Specification (CMIS), and implements various CMIS-defined status flags. Data path 1 reflects the outgoing booster path and data path 2 reflects the incoming pre-amp path.

Command Mode

EXEC

Command Syntax

show line system [port **RANGE**] status

Example

This command displays the displays module status.

```
switch(config-ls-port10,19)# show line system status
```

Some lines of output do not apply to the OSFP-LS modules (For example, **Operational speed**, **RX CDR LOL**). These lines of output should be ignored. The fields of interest are **Module state**, **Data path 1 state**, and **Data path 2 state**. Under normal operating conditions, **Module state** will read **ready** and the **Data path state** fields will read either **initialized** or **activated**. Initialized means that the module is ready to operate but is receiving no signal to amplify. Activated means that the amplifier is active.

15.2.5.65 shutdown (OSPFv2)

The **shutdown** command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the **shutdown (OSPFv2)** command.

The **no shutdown** and **default shutdown** commands enable the OSPFv2 instance by removing the **shutdown** statement from the OSPF block in *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# shutdown  
switch(config-router-ospf)#
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)# no shutdown  
switch(config-router-ospf)#
```

15.2.5.66 summary-address

The **summary-address** command allows aggregation of external routes advertised by an OSPF ASBR. It is used to aggregate AS External and NSSA External LSAs.

The **default summary-address** and **no summary-address** commands delete the current **summary-address** configurations.

Command Mode

Router Configuration Mode

Command Syntax

```
summary-address {ip_address subnet_mask | ip_prefix} [attribute_map WORD | not_advertise | tag]
```

```
default summary-address {ip_address summary_mask | ip_prefix}
```

```
no summary-address {ip_address summary_mask | ip_prefix}
```

Parameters

- **ip_address subnet_mask** IPv4 subnet in dotted decimal notation.
- **ip_prefix** IPv4 subnet in CIDR notation.
- **attribute_map WORD** allows using a route-map to set the attributes to be advertised in the LSA. Options include:
 - set metric
 - set metric-type
 - set tag
- **not_advertise** suppresses the advertisement of contributing external prefixes by the router.
- **tag** allows setting the tag in the advertised external LSA. The tag value ranges from **0 to 4294967295**. The default value is **0**.

Guidelines

This feature reduces the size of External LSDB in OSPF, does not impact inter area and intra area LSAs. This command installs a Null0 route in FIB when at least one contributor is present.

Restriction

Only OSPF redistributed routes are aggregated.

Example

This command advertises an external LSA for **50.0.0.0/16** prefix if at least one BGP contributing route is present which falls in the subnet **50.0.0.0/16**.

Note: The **show** commands display aggregation of BGP prefixes **50.0.0.0/24** and **50.0.1.0/24** into one OSPF AS External LSA for **50.0.0.0/16** prefix. A route-map is to set metric and tag for the advertised LSA.

```
switch(config)# router ospf 5
switch(config-router-ospf)# redistribute bgp
switch(config-router-ospf)# summary-address 50.0.0.0/16 attribute-map BGP_AGGR
switch(config-router-ospf)# exit
switch(config)# show ip route bgp
```

15.2.5.67 system profile

Use the **system profile** command to apply the user defined TCAM profile to the system.

Command Mode

hardware tcam mode

Command Syntax

```
system profile profilename
```

Parameter

profilename Name of the selected system profile.

Example

```
(config-hw-tcam)# system profile profilename
```

15.2.5.68 timers lsa rx min interval (OSPFv2)

The **timers lsa rx min interval** command sets the minimum interval for acceptance of identical Link State Advertisements (LSAs) from OSPFv2 neighbors.

The **no timers lsa rx min interval** and **default timers lsa rx min interval** commands restore the minimum interval to the default of **1** second by removing the **timers lsa rx min interval** command from the *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
timers lsa rx min interval lsa_time  
no timers lsa rx min interval  
default timers lsa rx min interval
```

Parameter

lsa_time Minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is **1000** (1 second).

Example

This command sets the minimum LSA arrival interval to **10** milliseconds.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# timers lsa rx min interval 10  
switch(config-router-ospf)#
```

15.2.5.69 timers lsa tx delay initial (OSPFv2)

The **timers lsa tx delay initial** command sets the rate-limiting values for OSPF link-state advertisement generation.

The **no timers lsa tx delay initial** and **default timers throttle lsa all** commands restore the defaults by removing the **timers lsa tx delay initial** command from the **running-config**.

Command Mode

Router-OSPF Configuration

Command Syntax

```
timers lsa tx delay initial [initial_delay | min_hold | max_wait]  
no timers lsa tx delay initial  
default timers lsa tx delay initial
```

Parameters

- ***initial_delay*** Value ranges from **0 to 600000** (ms). Default is **1000**.
- ***min_hold*** Value ranges from **0 to 600000** (ms). Default is **5000**.
- ***max_wait*** Value ranges from **0 to 600000** (ms). Default is **5000**.

Example

This command sets the rate-limiting values for OSPF link-state advertisement to **10** milliseconds.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# timers lsa tx delay initial 10  
switch(config-router-ospf)#
```

15.2.5.70 timers spf delay initial (OSPFv2)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The **timers spf delay initial** command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- **Initial delay:** how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.
- **Hold interval:** this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- **Maximum interval:** the maximum time the switch will wait after a topology change before performing an SPF calculation.

The **no timers spf delay initial** and **default timers spf delay initial** commands restore the default OSPFv2 SPF calculation intervals by removing the **timers spf delay initial** command from the *running-config*.

Command Mode

Router-OSPF Configuration

Command Syntax

```
timers spf delay initial [initial_delay | hold_interval | max_interval]
no timers spf
default timers spf
```

Parameters

- **initial_delay** Initial delay between a topology change and SPF calculation. Value ranges from **0 to 65535000** (ms). Default is **0** (ms).
- **hold_interval** Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from **0 to 65535000** (ms). Default is **5000** (ms).
- **max_interval** Maximum hold interval before the switch will perform an SPF calculation. Value ranges from **0 to 65535000** (ms). Default is **5000** (ms).

Example

These commands set the SPF timers on the switch.

```
switch(config)# router ospf 6
switch(config-router-ospf)# timers spf 5 100 20000
switch(config-router-ospf)#
```

15.2.5.71 tunnel routes

Use the **tunnel routes** command or the **default** form of the command to enable OSPFv2 routes over GRE tunnels. The tunnel routes are enabled, by default. Use the **no** form of the command to disable the tunnel routes.

Command Mode

Router OSPF configuration (config-router-ospf)

Command Syntax

```
tunnel routes
```

```
no tunnel routes
```

```
default tunnel routes
```

Examples

- To enable OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# tunnel routes  
switch(config-router-ospf)#
```

- To disable OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# no tunnel routes  
switch(config-router-ospf)#
```

- To enable the default OSPFv2 routes over GRE tunnels.

```
switch(config)# router ospf 6  
switch(config-router-ospf)# default tunnel routes  
switch(config-router-ospf)#
```

15.3 Open Shortest Path First – Version 3

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by *RFC 5340*.

This chapter contains the following sections.

- [OSPFv3 Introduction](#)
- [OSPFv3 Conceptual Overview](#)
- [Configuring OSPFv3](#)
- [OSPFv3 Configuration Examples](#)
- [OSPFv3 Commands](#)

15.3.1 OSPFv3 Introduction

OSPFv3 is based on OSPFv2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)

The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets
- Support flood pacing

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

15.3.2 OSPFv3 Conceptual Overview

This section contains the following topics:

- [Storing Link States](#)
- [Topology](#)
- [Link Updates](#)
- [OSPFv3 Security](#)
- [Flood Pacing](#)
- [OSPFv3 BFD Sessions for Adjacencies in any State](#)
- [Support for OSPFv3 dn-bit-ignore](#)

15.3.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol in which links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A Link State Advertisement (LSA) is an OSPFv3 packet communicating a router's topology to other routers. The Link State Database (LSDB) stores an area's topology database and comprises LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

15.3.2.2 Topology

An Autonomous System (AS) is the IP domain within which a dynamic protocol controls traffic routing. In OSPFv3, an AS comprises areas that define the LSDB computation boundaries—all routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other autonomous systems commit to carrying data to the IP space on the route.

OSPFv3 defines these routers:

- **Internal Router (IR):** a router with interfaces in a single area. All IRs in an area maintain identical LSDBs.
- **Area Border Router (ABR):** a router with interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- **Autonomous System Boundary Router (ASBR):** a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.

OSPFv3 Router Types displays the OSPFv3 router types.

Figure 15-6: OSPFv3 Router Types

OSPFv3 areas are assigned a number between **0** and **4,294,967,295**. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated area **0**, that connects to all other areas. The backbone receives routing information from all areas and distributes it to the other areas as required.

OSPFv3 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.

15.3.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A routers hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- Share a common network segment.
- Are in the same area.
- Have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

[OSPFv3 Neighbors](#) illustrates OSPFv3 neighbors.

Figure 15-7: OSPFv3 Neighbors

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces, preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When an LSA changes a router's LSDB, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routing devices use Dijkstra's algorithm to calculate the shortest path to all known destinations based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

15.3.2.4 OSPFv3 Security

The OSPFv3 protocol relies on the IPsec Authentication Header (AH) and Encapsulating Security Payload (ESP) header to provide data integrity, authentication, and confidentiality. Transport mode provides IPsec to OSPFv3 packets.

The IPsec SA has a Security Policy Index (SPI), HMAC algorithm, and a secret key as parameters. These parameters are used to compute Integrity Check Value (ICV), that is used to authenticate peers. When authentication is enabled, all corresponding peers must use same SA parameters to clear OSPFv3 ICV verification. SA can be configured at both area and interface levels.

Note: On the same area or interface, EOS allows security configuration with either AH or ESP but not both. We can have one area or interface configured with AH and another with ESP.

15.3.2.4.1 OSPFv3 Authentication

While sending OSPFv3 packets, the system inserts the HMAC-MD5 or SHA algorithm hash in the IPsec header and sends the packet over the wire for peer authentication.

While receiving OSPFv3 packets, the system verifies the computed hash with the one in the IPsec header and discards OSPFv3 packets if it fails.

15.3.2.4.2 OSPFv3 Encryption

ESP provides confidentiality to OSPFv3 packets. When confidentiality is enabled, ESP encrypts the sent data and decrypts the received data. OSPFv3 packets that are not encapsulated with a security payload are discarded.

OSPFv3 encryption uses the Triple Data Encryption Standard (3DES) and Advanced Encryption Standard (AES) algorithms. 3DES uses a **192** bit key, whereas the AES key length varies by **128**, **192**, and **256** bits.

15.3.2.5 Flood Pacing

OSPFv3 flood pacing allows configuring the minimum interval between the transmission of consecutive Link State (LS) update packets in a network. Flood pacing provides the following benefits:

- Prevents the rapid drain of flood queue by sending consecutive LSU packets with a delay.
- It helps mitigate high CPU or socket buffer utilization issues that occur when a switch instantly floods a large number of LSAs.
- When LSDB is updated frequently, an incremented flood pacing interval scales down LSA flooding.

Note: A high flood pacing interval may lead to convergence delays in large OSPF LSDBs.

15.3.2.6 OSPFv3 BFD Sessions for Adjacencies in any State

BFD sessions are only established for OSPFv3 adjacencies that are in the FULL state. In a LAN environment, this results in BFD sessions not being established for OSPFv3 adjacencies with DR Other neighbors.

This feature provides configuration that enables the establishment of BFD sessions for OSPFv3 adjacencies that are in any state. This results in the BFD sessions being established for OSPFv3 adjacencies with DR Other neighbors.

15.3.2.7 Support for OSPFv3 dn-bit-ignore

The OSPFv3 **dn-bit-ignore** command enables or disables the inclusion of LSAs with a Down (DN) bit set in SPF calculations. The DN Bit provides a loop prevention mechanism when configuring OSPF as a CE - PE IGP protocol.

The IEEE RFC *RFC6565* explains the DN-bit usage in OSPFv3. OSPFv3 honors the DN-bit in **type-3**, **type-5**, or **type-7** LSAs in non-default VRFs. SPF calculations do not include the LSAs and subsequently do not install them in the routing table. Using the **dn-bit-ignore** command changes this behavior. Arista Networks recommends understanding the entire topology before configuring the **dn-bit-ignore** command, as it can lead to forwarding loops on the network.

15.3.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- [Configuring an OSPFv3 Instance](#)
- [Configuring OSPFv3 Areas](#)
- [Configuring Interfaces for OSPFv3](#)
- [Enabling OSPFv3](#)
- [Configuring OSPFv3 Security](#)
- [Configuring OSPFv3 Flood Pacing](#)
- [Configuring OSPFv3 dn-bit-ignore](#)
- [Displaying OSPFv3 Status](#)

15.3.3.1 Configuring an OSPFv3 Instance

15.3.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. The switch must be in router-OSPFv3 configuration mode to execute OSPFv3 configuration commands. The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the `ipv6 router ospf` command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the `ipv6 router ospf` command must specify its process ID (and VRF, if not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The `show ipv6 ospf` command displays information about OSPFv3 instances, including their process IDs.

Example

This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance with a process ID of 9.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

15.3.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID. When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

Note: A router ID is required to run OSPF, and Arista recommends setting the router ID manually for the following reasons:

1. If there are no IPv4 addresses configured on the switch, a manually configured router ID is required.
2. The router ID also does not change if the interface status or IP address changes, which can cause confusion if the ID is selected automatically.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.

Note: When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **router-id (OSPFv3)** command configures the router ID for an OSPFv3 instance.

Example

This command assigns **15.1.1.1** as the OSPFv3 router ID.

```
switch(config-router-ospf3) # router-id 15.1.1.1
switch(config-router-ospf3) # show active
ipv6 router ospf 9
  router-id 15.1.1.1
switch(config-router-ospf3) #
```

15.3.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands control the OSPFv3 instance's behavior.

Logging Adjacency Changes

The **log-adjacency-changes (OSPFv3)** command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

Examples

- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.

```
switch(config-router-ospf3) # log-adjacency-changes
switch(config-router-ospf3) #
```

- This command configures the switch to log all OSPFv3 link-state changes.

```
switch(config-router-ospf3) # log-adjacency-changes detail
switch(config-router-ospf3) #
```

Intra-Area Distance

The **distance ospf intra-area (OSPFv3)** command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is **10**.

Example

This command configures an administrative distance of **90** for OSPFv3 intra-area routes.

```
switch(config-router-ospf3) # distance ospf intra-area 90
switch(config-router-ospf3) # show active
ipv6 router ospf 9
  distance ospf intra-area 90
switch(config-router-ospf3) #
```

Passive Interfaces

The **passive-interface (OSPFv3)** command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, others may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.

The **no passive-interface** command re-enables OSPFv3 processing on the specified interface.

Examples

- This command configures **vlan 200** as a passive interface.

```
switch(config-router-ospf3) # passive-interface vlan 200
switch(config-router-ospf3) # show active
ipv6 router ospf 9
    passive-interface Vlan200
switch(config-router-ospf3) #
```

- This command configures **vlan 200** as an active interface.

```
switch(config-router-ospf3) # no passive-interface vlan 200
switch(config-router-ospf3) # show active
ipv6 router ospf 9
switch(config-router-ospf3) #
```

Redistributing Connected Routes

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes established when enabling IPv6 on an interface.

Example

The **redistribute (OSPFv3) connected** command converts connected routes to OSPFv3 external routes.

```
switch(config-router-ospf3) # redistribute connected
switch(config-router-ospf3) # show active
ipv6 router ospf 9
    redistribute connected
switch(config-router-ospf3) #
```

Redistributing Static Routes

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

Example

The **redistribute (OSPFv3) static** command converts static routes to OSPFv3 external routes.

```
switch(config-router-ospf3) # redistribute static
switch(config-router-ospf3) # show active
ipv6 router ospf 9
    redistribute static
switch(config-router-ospf3) #
```

15.3.3.2 Configuring OSPFv3 Areas

Area commands configure OSPFv3 areas. The switch must be in router-OSPFv3 configuration mode to run area commands, as described in [Entering OSPFv3 Configuration Mode](#).

Areas are assigned a 32-bit number expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

15.3.3.2.1 Configuring the Area Type

The **no area (OSPFv3)** command specifies the area type. The switch supports three area types:

- **Normal area:** Area that accepts intra-area, inter-area, and external routes. The backbone area (area **0**) is a normal area.
- **Stub area:** Area where external routes are not advertised. External routes are reached through a default summary route (**0.0.0.0**) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

Example

These commands configure area **200** as an NSSA area and **300** as a stub area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 200 nssa
switch(config-router-ospf3)# area 300 stub
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.200
  area 0.0.1.44 stub
switch(config-router-ospf3)#
```

15.3.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

Default Summary Route Cost

The **area default-cost (OSPFv3)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to **10**.

Example

This command configures a cost of **25** for the default summary route in area **0.0.1.194 (450)**.

```
switch(config-router-ospf3)# area 450 default-cost 25
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.1.194 default-cost 25
```

Area Stub

The **area stub (OSPFv3)** command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.

Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (**0.0.0.0**). Networks without external routes do not require stub areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

Examples

- This command configures area **45** as a stub area.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 45 stub
switch(config-router-ospf3)#
```

- This command configures area **10.92.148.17** as a stub area.

```
switch(config-router-ospf3)# area 10.92.148.17 stub
switch(config-router-ospf3)#
```

Area Range

The **area range (OSPFv3)** command is used by OSPFv3 Area Border Routers (ABRs) to consolidate or summarize routes, configure a cost setting for those routes, and suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The **area range (OSPFv3)** command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

Examples

- These commands consolidate and summarize routes at an area boundary **1**.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands change the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64 not-advertise
switch(config-router-ospf3)#
```

15.3.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

15.3.3.3.1 Assigning an Interface to an Area

The **ipv6 ospf area** command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent **ipv6 ospf area** commands that designate a different area on an interface replace any existing command for the interface.

Example

These commands enable OSPFv3 instance **9** on **interface vlan 200** and associate area **0** to the interface.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ipv6 ospf 9 area 0
switch(config-if-Vl200)# show active
interface Vlan200
  ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```

15.3.3.3.2 Configuring Intervals

Interval configuration commands determine the OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in `vlan-interface` configuration mode.

Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbor's dead interval.

The `ospfv3 hello-interval` command configures the hello interval for the configuration mode interface. The default is **10** seconds.

Example

These commands configure a hello interval of **45** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 hello-interval 45
switch(config-if-Vl200)# show active
interface Vlan200
  ospfv3 hello-interval 45
switch(config-if-Vl200)#
```

Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. Configure identical dead intervals on all OSPFv3 neighbors. They must be longer than the hello interval of any neighbor.

The `ospfv3 dead-interval` command configures the dead interval for the configuration mode interface. The default is **40** seconds.

Example

This command configures a dead interval of **75** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 dead-interval 75
switch(config-if-Vl200)# show active
interface Vlan200
  ospfv3 dead-interval 75
switch(config-if-Vl200)#
```

Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. If they do not receive an acknowledgment, they will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The `ospfv3 ipv6 retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is **5** seconds.

Example

This command configures a retransmission interval of **25** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)# show active
interface Vlan200
  ospfv3 ipv6 retransmit-interval 25
```

```
switch(config-if-Vl200) #
```

Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The **ospfv3 transmit-delay** command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

Example

This command configures a transmission delay of **10** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200) # ospfv3 transmit-delay 10
switch(config-if-Vl200) # show active
interface Vlan200
    ospfv3 transmit-delay 10
switch(config-if-Vl200) #
```

15.3.3.3.3 Configuring Interface Parameters

Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the interface's bandwidth. The **ospfv3 cost** command configures the OSPFv3 cost for the configuration mode interface. The default cost is **10**.

Example

This command configures a cost of **50** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200) # ospfv3 cost 50
switch(config-if-Vl200) # show active
interface Vlan200
    ospfv3 cost 50
switch(config-if-Vl200) #
```

Router Priority

Router priority determines preference during Designated Router (DR) and Backup Designated Router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of **0** cannot be elected as a DR or BDR.

The **ospfv3 priority** command configures router priority for the configuration mode interface. The default priority is **1**.

Example

This command configures a router priority of **128** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200) # ospfv3 priority 128
switch(config-if-Vl200) # show active
interface Vlan200
    ospfv3 priority 128
switch(config-if-Vl200) #
```

15.3.3.4 Enabling OSPFv3

15.3.3.4.1 IP Routing

OSPFv3 requires enabling IPv6 unicast routing on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.

```
switch(config)# ipv6 router ospf 9
! IPv6 routing not enabled
switch(config-router-ospf3) #
```

- This command enables IP routing on the switch.

```
switch(config)# ipv6 unicast-routing
```

15.3.3.4.2 Disabling OSPFv3

The **shutdown (OSPFv3)** disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the **ipv6 ospf area** statement for the corresponding interface.

The **no shutdown** command resumes OSPFv3 activity.

Examples

- This command disables OSPFv3 activity on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3) # shutdown
switch(config-router-ospf3) # show active
ipv6 router ospf 9
  shutdown
switch(config-router-ospf3) #
```

- This command resumes OSPFv3 activity on the switch.

```
switch(config-router-ospf3) # no shutdown
switch(config-router-ospf3) # show active
ipv6 router ospf 9
switch(config-router-ospf3) #
```

15.3.3.5 Configuring OSPFv3 Security

You can configure OSPFv3 security for either an area, an interface, or both, using either an Authentication Header (AH) or an Encapsulating Security Payload (ESP).

When configuring OSPFv3 security on an area, the configured settings apply to all interfaces in that area. Interface-specific configuration overrides configuration on the area to which the interface belongs.

15.3.3.5.1 Configuring OSPFv3 Authentication

Configuring OSPFv3 Authentication for Areas

The **area authentication ipsec spi** command configures OSPFv3 authentication on an area.

Example

This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BFE81A
DD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQ1lczqdvKAZKLtYVr6I7+R3niuWouDKKYCFNs4/
XOWG/Iap5Q==
switch(config-router-ospf3)#
```

Configuring OSPFv3 Authentication for Interfaces

The **ospfv3 authentication ipsec spi** command configures OSPFv3 authentication on an interface.

Example

This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config-if-Et9)# ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)# show active
interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx1O+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#
```

15.3.3.5.2 Configuring OSPFv3 Encryption

Configuring OSPFv3 Encryption for Areas

The **area encryption ipsec spi** command configures OSPFv3 security on an area.

Example

This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
$1$cNpcrQ1lczqdvKAZKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#
```

Configuring OSPFv3 Encryption for Interfaces

The **ospfv3 encryption ipsec spi** command configures OSPFv3 security on an interface.

Example

This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0
2fd4e1c67a2d28fced849ee1bb76e7391b93eb12
switch(config-if-Et9)# show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
$1$VmUkWK6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

15.3.3.6 Configuring OSPFv3 Flood Pacing

You can configure flood pacing for global OSPFv3 instances and address families. The **timers pacing flood** command configures OSPFv3 flood pacing.

Examples

- This command configures OSPFv3 flood pacing timer to **50** ms in the global OSPFv3 instance.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# timers pacing flood 50
switch(config-router-ospf3)# show ipv6 ospf
Routing Process "ospfv3 9" with ID 13.13.13 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPF 5000 msec
  Current hold time between two consecutive SPF 5000 msec
  Maximum wait time between two consecutive SPF 5000 msec
  SPF algorithm last executed 21d19h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

- This command configures OSPFv3 flood pacing timer to **50** ms for ipv4 address family.

```
switch(config)# router ospfv3
switch(config-router-ospfv3)# address-family ipv4
switch(config-router-ospfv3-af)# timers pacing flood 50
switch(config-router-ospfv3-af)# show ospfv3
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPF 5000 msec
  Current hold time between two consecutive SPF 5000 msec
  Maximum wait time between two consecutive SPF 5000 msec
  SPF algorithm last executed 00:01:05 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

15.3.3.7 Configuring OSPFv3 dn-bit-ignore

OSPFv3

Use the command **dn-bit-ignore** to include type-3/5/7 LSAs to set the DN-bit in the SPF calculation.

The commands **dn-bit-ignore** or **default dn-bit-ignore** revert the behavior back to default. Use this command in the **ipv6 router ospf vrf** configuration mode and the **router ospfv3 vrf** configuration mode. The default VRF does not support this command.

router ospfv3

The **dn-bit-ignore** command in the **router ospfv3 vrf** configuration mode disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
switch(config)# router ospfv3 vrf red
switch(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

ipv6 router ospf

The **dn-bit-ignore** command in the **ipv6 router ospf vrf** configuration mode disables the dn-bit check for Type-3/5/7 LSAs in non-default VRFs.

```
switch(config)# ipv6 router ospf 1 vrf red
switch(config-router-ospfv3-vrf-red)# dn-bit-ignore
```

15.3.3.8 Displaying OSPFv3 Status

This section describes OSPFv3 **show** commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

15.3.3.8.1 OSPFv3 Summary

The **show ipv6 ospf** command displays general OSPFv3 configuration information, operational statistics, and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.

Example

This command displays OSPFv3 routing process information.

```
switch(config-router-ospf3)# show ipv6 ospf
Routing Process "ospfv3 1" with ID 1.1.1.1 and Instance 0 VRF default
  It is not an autonomous system boundary router and is not an area border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  ...
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
```

15.3.3.8.2 Viewing OSPFv3 on the Interfaces

The **show ipv6 ospf interface** command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of all interfaces or a specified interface. You can configure the command to display complete information or a summary.

Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch# show ipv6 ospf interface
Ethernet17 is up
  Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan31 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.22
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan32 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
  Designated Router is 10.37.0.11
  Backup Designated Router is 10.37.0.22
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 2 switch#
```

15.3.3.8.3 Viewing the OSPFv3 Database

The **show ipv6 ospf database <link state list>** command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the database's contents for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

Example

This command displays the OSPFv3 database of Link State Advertisements (LSAs).

```
switch# show ipv6 ospf database
Routing Process "ospf 9":

  AS Scope LSDB

Type      Link ID      ADV Router  Age      Seq#      Checksum
AEX       0.0.0.5      10.37.0.37  15       0x80000005 0x00be82
AEX       0.0.0.9      10.37.0.22  1747     0x8000002b 0x00df56
AEX       0.0.0.3      10.37.0.46  599      0x8000002d 0x00651d

Area 0.0.0.0 LSDB

Type      Link ID      ADV Router  Age      Seq#      Checksum
RTR       0.0.0.0      10.37.0.32  234      0x80000031 0x00585a
NTW       0.0.0.26     10.37.0.32  271      0x80000005 0x005609
NAP       0.0.0.26     10.37.0.32  274      0x80000005 0x00964c

Interface vlan3911 LSDB

Type      Link ID      ADV Router  Age      Seq#      Checksum
LNK       0.0.0.38     10.37.0.22  267      0x80000005 0x00a45a
LNK       0.0.0.23     10.37.0.23  270      0x8000002c 0x005b7e

Interface vlan3902 LSDB

Type      Link ID      ADV Router  Age      Seq#      Checksum

LNK       0.0.0.22     10.37.0.23  250      0x8000002d 0x00c350 switch#
```

15.3.3.8.4 Viewing OSPFv3 Neighbors

The **show ipv6 ospf neighbor** command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The **adjacency-changes** option displays the interface's adjacency changes.

Example

This command displays the switch's neighbors.

```
switch# show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
  In area 0.0.0.0 interface et12
  DR is 10.37.0.37 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3911
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3908
  DR is 10.37.0.22 BDR is 10.37.0.21
  Options is 0
  Dead timer is due in 39 seconds switch#
```

15.3.3.8.5 Viewing OSPFv3 Routes

The **show ipv6 routes** command provides an OSPFv3 option.

Example

This command displays the switch's OSPFv3 routes.

```
switch# show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP, A -
Aggregate

O   fd7a:3279:81a4:1112::/64 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1114::/64 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1124::/64 [10/20]
    via fe80::21c:41ff:fe01:5fe1, Vlan3901
    via fe80::21c:41ff:fe01:5fe1, Vlan3902
    via fe80::21c:41ff:fe01:5fe1, Vlan3908
O   fd7a:3279:81a4:1a00::25/128 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1a00::28/128 [150/11]
    via fd7a:3279:81a4:fe40::5, Vlan3908
```

15.3.3.8.6 Viewing OSPFv3 dn-bit-ignore

The **show running-config** command verifies whether the **dn-bit-ignore** command is configured.

15.3.4 OSPFv3 Configuration Examples

This section describes the commands required to configure three OSPFv3 topologies.

15.3.4.1 OSPFv3 Configuration Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

15.3.4.1.1 Example 1 Topology

OSPFv3 Example 1 displays the Example 1 topology. Two ABRs, **Router A** and **Router B**, connect Area 0 and Area 1. **Router C** is an internal router connecting two links in Area 0. Area 0 is normal; area 1 is stub.

Figure 15-8: OSPFv3 Example 1

Area 1 Configuration

Area 1 contains links to ABRs **Router A** and **Router B**.

- **Router A** is accessed through **VLAN 301**.
- **Router B** is accessed through **VLAN 401**.
- Designated Router (DR): **Router A**.
- Backup Designated Router (BDR): **Router B**.
- Each router defines an interface cost of **10**.
- Router priority is not specified for either router on area 1.

Area 0 ABR Configuration

Area 0 contains links to ABRs **Router A** and **Router B**.

- **Router A** is accessed through **VLAN 302**.
- **Router B** is accessed through **VLAN 402**.
- Designated Router (DR): **Router B**.
- Backup Designated Router (BDR): **Router A**.
- Each router defines an interface cost of **20**.
- Each router defines a retransmit-interval of **10**.
- Each router defines a transmit-delay of **2**.
- Router priority is specified such that **Router B** will be elected as the Designated Router.

Area 0 IR Configuration

Area **0** contains two links to an internal router.

- **Router C** is accessed through **VLAN 501** and **VLAN 502**.
- **VLAN 501** is configured as follows:
 - Interface cost of **20**.
 - Retransmit-interval of **10**.
 - Transmit-delay of **2**.
- **VLAN 502** is configured as follows:
 - Interface cost of **20**.
 - Dead interval of **80** seconds.

15.3.4.1.2 Example 1 Code

This code configures the OSPFv3 instances on the three switches.

1. Configure the areas and router IDs.

a. Router A OSPFv3 instance configuration:

```
switch-A(config)# ipv6 router ospf 100
switch-A(config-router-ospfv3)# area 1 stub
switch-A(config-router-ospfv3)# router-id 10.17.0.1
```

b. Router B OSPFv3 instance configuration:

```
switch-B(config)# ipv6 router ospf 100
switch-B(config-router-ospfv3)# area 1 stub
switch-B(config-router-ospfv3)# router-id 10.17.0.2
```

c. Router C OSPFv3 instance configuration: interfaces:

```
switch-C(config)# ipv6 router ospf 100
switch-C(config-router-ospfv3)# router-id 10.17.0.3
```

2. Configure the interface OSPFv3 area and transmission parameters.

a. **Router A** interfaces:

```
switch-A(config)# interface vlan 301
switch-A(config-if-Vl301)# ipv6 ospf 100 area 1
switch-A(config-if-Vl301)# ospfv3 cost 10
switch-A(config-if-Vl301)# ospfv3 priority 6
switch-A(config-if-Vl301)# exit
switch-A(config)# interface vlan 302
switch-A(config-if-Vl302)# ipv6 ospf 100 area 0
switch-A(config-if-Vl302)# ospfv3 cost 20
switch-A(config-if-Vl302)# ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl302)# ospfv3 transmit-delay 2
switch-A(config-if-Vl302)# ospfv3 priority 4
```

b. **Router B** interfaces:

```
switch-B(config)# interface vlan 401
switch-B(config-if-Vl401)# ipv6 ospf 100 area 1
switch-B(config-if-Vl401)# ospfv3 cost 10
switch-B(config-if-Vl401)# ospfv3 priority 4
switch-B(config-if-Vl401)# exit
switch-B(config)# interface vlan 402
switch-B(config-if-Vl402)# ipv6 ospf 100 area 0
switch-B(config-if-Vl402)# ospfv3 cost 20
switch-B(config-if-Vl402)# ospfv3 ipv6 retransmit-interval 10
```

```
switch-B(config-if-Vl402)# ospfv3 transmit-delay 2
switch-B(config-if-Vl402)# ospfv3 priority 6
```

c. Router C interfaces:

```
switch-C(config)# interface vlan 501
switch-C(config-if-Vl501)# ipv6 ospf 100 area 0
switch-C(config-if-Vl501)# ospfv3 cost 20
switch-C(config-if-Vl501)# ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl501)# ospfv3 transmit-delay 2
switch-C(config-if-Vl501)# exit
switch-C(config)# interface vlan 502
switch-C(config-if-Vl502)# ipv6 ospf 100 area 0
switch-C(config-if-Vl502)# ospfv3 cost 20
switch-C(config-if-Vl502)# ospfv3 dead-interval 80
```

15.3.4.2 OSPFv3 Configuration Example 2

The AS in Example 2 contains three areas. Area **0** connects to the other areas through different routers and contains an internal router connecting two links. Area **0** is normal; the other areas are stub areas.

15.3.4.2.1 Example 2 Topology

[OSPFv3 Example 2](#) displays the Example 2 topology. One ABR (**Router B**) connects area **0** and area **1**; another ABR (**Router C**) connects area **0** and area **2**. **Router A** is an internal router connecting two links in area **0**.

Figure 15-9: OSPFv3 Example 2

Area 1 Configuration

Area **1** contains one link that is accessed by **Router B**.

- **Router B** is accessed through **VLAN 601**.

- The router defines a interface cost of **10**.

Area 2 Configuration

Area **2** contains one link that is accessed by **Router C**.

- **Router C** is accessed through **VLAN 802**.
- The router defines a interface cost of **20**.

Area 0 ABR Configuration

One ABR **Router B** link connects area **1** to area **0**. One ABR **Router C** link connects area **0** to area **2**.

- **Router B** is accessed through **VLAN 602**
- **Router C** is accessed through **VLAN 801**.
- Designated Router (DR): **Router B**.
- Backup Designated Router (BDR): **Router C**.
- Each router defines an interface cost of **20**.
- Each router defines a retransmit-interval of **10**.
- Each router defines a transmit-delay of **2**.

Area 0 IR Configuration

Area **0** contains links connected by an internal router.

- Router A is accessed through **vlan 701** and **vlan 702**.
- The **vlan 701** link is configured as follows:
 - Interface cost of **10**.
- The **vlan 702** link is configured as follows:
 - Interface cost of **20**.
 - Retransmit-interval of **10**.
 - Transmit-delay of **2**.

15.3.4.2.2 Example 2 Code

1. Configure the areas and router IDs.

a. Router A OSPFv3 instance configuration:

```
switch-A(config)# ipv6 router ospf 200
switch-A(config-router-ospfv3)# router-id 10.24.1.10
```

b. Router B OSPFv3 instance configuration:

```
switch-B(config)# ipv6 router ospf 200
switch-B(config-router-ospfv3)# area 1 stub
switch-B(config-router-ospfv3)# router-id 10.24.2.10
```

c. Router C OSPFv3 instance configuration:

```
switch-C(config)# ipv6 router ospf 200
switch-C(config-router-ospfv3)# area 1 stub
switch-C(config-router-ospfv3)# router-id 10.25.2.12
```

2. Configure the interface OSPFv3 area and transmission parameters.

a. Router A interfaces:

```

switch-A(config)# interface vlan 701
switch-A(config-if-Vl701)# ipv6 ospf 200 area 0
switch-A(config-if-Vl701)# ospfv3 cost 10
switch-A(config-if-Vl701)# exit
switch-A(config)# interface vlan 702
switch-A(config-if-Vl702)# ipv6 ospf 200 area 0
switch-A(config-if-Vl702)# ospfv3 cost 20
switch-A(config-if-Vl702)# ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl702)# ospfv3 transmit-delay 2

```

b. Router B interfaces:

```

switch-B(config)# interface vlan 601
switch-B(config-if-Vl601)# ospfv3 200 area 1
switch-B(config-if-Vl601)# ospfv3 cost 10
switch-B(config-if-Vl601)# exit
switch-B(config)# interface vlan 602
switch-B(config-if-Vl602)# ospfv3 200 area 0
switch-B(config-if-Vl602)# ospfv3 cost 20
switch-B(config-if-Vl602)# ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl602)# ospfv3 transmit-delay 2
switch-B(config-if-Vl602)# ospfv3 priority 6

```

c. Router C interfaces:

```

switch-C(config)# interface vlan 801
switch-C(config-if-Vl801)# ospfv3 200 area 0
switch-C(config-if-Vl801)# ospfv3 cost 20
switch-C(config-if-Vl801)# ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl801)# ospfv3 transmit-delay 2
switch-C(config-if-Vl801)# exit
switch-C(config)# interface vlan 802
switch-C(config-if-Vl802)# ospfv3 200 area 2
switch-C(config-if-Vl802)# ospfv3 cost 20
switch-C(config-if-Vl802)# ospfv3 dead-interval 80

```

15.3.4.3 OSPFv3 Configuration Example 3

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.

15.3.4.3.1 Example 3 Topology

[OSPFv3 Example 3](#) displays the Example 3 topology. One ABR connects area **0** and area **1**. **Router C** is an ABR connecting the areas. **Router A** is an internal router connecting two links in area **1**. **Router D** and

Router E are internal routers connecting links in area **0**. **Router B** and **Router F** are ASBRs that connect static routes outside the AS to area **1** and area **0**, respectively.

Figure 15-10: OSPFv3 Example 3

Area 0 ABR Configuration

ABR **Router C** connects one area **0** link to an area **1** link.

- **Router C** is accessed through **VLAN 1302**.
- All interface OSPFv3 parameters are set to their default values.

Area 0 IR Configuration

Area **0** contains two internal routers, each of which connects two of the three links in the area.

- **Router D** is accessed through **VLAN 1401** and **VLAN 1402**.
- **Router E** is accessed through **VLAN 1501** and **VLAN 1502**.
- All interface OSPFv3 parameters are set to their default values.

Area 0 ASBR Configuration

ASBR **Router F** connects one area **0** link to an external link.

- **Router F** is accessed through **VLAN 1601**.
- **Router F** connects to the external AS through **VLAN 1602**.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ABR Configuration

ABR **Router C** connects one area **0** link to an area **1** link.

- **Router C** is accessed by area **1** through **VLAN 1301**.
- **Router C** is accessed by area **0** through **VLAN 1302**.

- All interface OSPFv3 parameters are set to their default values.

Area 1 IR Configuration

Area **1** contains one internal router that connects two links in the area.

- **Router A** is accessed through **VLAN 1101** and **VLAN 1102**.
- All interface OSPFv3 parameters are set to their default values.

Area 1 ASBR Configuration

ASBR **Router B** connects one area **1** link to an external link.

- **Router B** is access through **VLAN 1201**.
- **Router B** connects to the external AS through **VLAN 1202**.
- All interface OSPFv3 parameters are set to their default values.

15.3.4.3.2 Example 3 Code

1. Configure the areas and router IDs.

a. **Router A** OSPFv3 instance configuration:

```
switch-A(config)# ipv6 router ospf 300
switch-A(config-router-ospfv3)# router-id 10.12.15.10
switch-A(config-router-ospfv3)# area 1 stub
```

b. **Router B** OSPFv3 instance configuration:

```
switch-B(config)# ipv6 router ospf 300
switch-B(config-router-ospfv3)# router-id 10.12.15.12
switch-B(config-router-ospfv3)# area 1 stub
```

c. **Router C** OSPFv3 instance configuration:

```
switch-C(config)# ipv6 router ospf 300
switch-C(config-router-ospfv3)# router-id 10.12.15.13
switch-C(config-router-ospfv3)# area 1 stub
```

d. **Router D** OSPFv3 instance configuration:

```
switch-D(config)# ipv6 router ospf 300
switch-D(config-router-ospfv3)# router-id 10.12.15.14
```

e. **Router E** OSPFv3 instance configuration:

```
switch-E(config)# ipv6 router ospf 300
switch-E(config-router-ospfv3)# router-id 10.12.15.15
```

f. **Router F** OSPFv3 instance configuration:

```
switch-F(config)# ipv6 router ospf 300
switch-F(config-router-ospfv3)# router-id 10.12.15.31
```

2. Configure the interfaces.

a. **Router A** interfaces:

```
switch-A(config)# interface vlan 1101
switch-A(config-if-Vl1101)# ospfv3 300 area 1
switch-A(config-if-Vl1101)# exit
switch-A(config)# interface vlan 1102
```

```
switch-A(config-if-Vl1102)# ospfv3 300 area 1
```

b. Router B interfaces:

```
switch-B(config)# interface vlan 1201
switch-B(config-if-Vl1201)# ospfv3 300 area 1
switch-B(config-if-Vl1201)# exit
```

c. Router C interfaces:

```
switch-C(config)# interface vlan 1301
switch-C(config-if-Vl1301)# ospfv3 300 area 1
switch-C(config-if-Vl1301)# exit
switch-C(config)# interface vlan 1302
switch-C(config-if-Vl1302)# ospfv3 300 area 0
```

d. Router D interfaces:

```
switch-D(config)# interface vlan 1401
switch-D(config-if-Vl1401)# ospfv3 300 area 0
switch-D(config-if-Vl1401)# exit
switch-D(config)# interface vlan 1402
switch-D(config-if-Vl1402)# ospfv3 300 area 0
```

e. Router E interfaces:

```
switch-E(config)# interface vlan 1501
switch-E(config-if-Vl1501)# ospfv3 300 area 0
switch-E(config-if-Vl1501)# exit
switch-E(config)# interface vlan 1502
switch-E(config-if-Vl1502)# ospfv3 300 area 0
```

f. Router F interfaces:

```
switch-F(config)# interface vlan 1601
switch-F(config-if-Vl1601)# ospfv3 300 area 0
switch-F(config-if-Vl1601)# exit
```

15.3.5 OSPFv3 Commands

Global Configuration Mode

- `clear ospfv3 ipv6 force-spf`
- `ipv6 router ospf`

Interface Configuration Mode

- `ipv6 ospf area`
- `ospfv3 authentication ipsec spi`
- `ospfv3 cost`
- `ospfv3 dead-interval`
- `ospfv3 encryption ipsec spi`
- `ospfv3 hello-interval`
- `ospfv3 ipv6 retransmit-interval`
- `ospfv3 network`
- `ospfv3 priority`
- `ospfv3 transmit-delay`

Router-OSPFv3 Configuration Mode

- `adjacency exchange-start threshold (OSPFv3)`
- `area authentication ipsec spi`
- `area default-cost (OSPFv3)`
- `area encryption ipsec spi`
- `area nssa (OSPFv3)`
- `area nssa default-information-originate (OSPFv3)`
- `area not-so-stubby lsa type-7 convert type-5 (OSPFv3)`
- `area range (OSPFv3)`
- `area stub (OSPFv3)`
- `default-information originate (OSPFv3)`
- `default-metric (OSPFv3)`
- `distance ospf intra-area (OSPFv3)`
- `log-adjacency-changes (OSPFv3)`
- `max-metric router-lsa (OSPFv3)`
- `maximum-paths (OSPFv3)`
- `no area (OSPFv3)`
- `passive-interface (OSPFv3)`
- `redistribute (OSPFv3)`
- `router-id (OSPFv3)`
- `shutdown (OSPFv3)`
- `timers`
- `timers lsa rx min interval (OSPFv3)`
- `timers lsa tx delay initial (OSPFv3)`
- `timers spf delay initial (OSPFv3)`

Display Commands

- `show ipv6 ospf`
- `show ipv6 ospf border-routers`

-
- `show ipv6 ospf database`
 - `show ipv6 ospf database<link-state details>`
 - `show ipv6 ospf database <link state list>`
 - `show ipv6 ospf database link`
 - `show ipv6 ospf database link if-name`
 - `show ipv6 ospf database link if-type`
 - `show ipv6 ospf interface`
 - `show ipv6 ospf lsa-log`
 - `show ipv6 ospf neighbor`
 - `show ipv6 ospf neighbor state`
 - `show ipv6 ospf neighbor summary`
 - `show ipv6 ospf spf-log`
 - `show ospfv3`

15.3.5.1 adjacency exchange-start threshold (OSPFv3)

The **adjacency exchange-start threshold** command sets the exchange-start options for an OSPF instance.

The **no adjacency exchange-start threshold** and **default adjacency exchange-start threshold** command resets the default by removing the corresponding **adjacency exchange-start threshold** command from the *running-config*.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
adjacency exchange-start threshold peers  
no adjacency exchange-start threshold  
default adjacency exchange-start threshold
```

Parameter

peers Value ranges from **1 - 4294967295**. Default value is **10**.

Example

This command sets the adjacency exchange start threshold to **156923**.

```
switch(config)# ipv6 router ospf 3  
switch(config-router-ospf3)# adjacency exchange-start threshold 156923  
switch(config-router-ospf3)#
```

15.3.5.2 area authentication ipsec spi

The **area authentication ipsec spi** command configures OSPFv3 authentication on an area.

The **default area authentication** and **no area authentication** commands delete the OSPFv3 authentication on an area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id authentication ipsec spi spi_value {md5|sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

```
no area area_id authentication ipsec spi spi_value {md5| sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

```
default area area_id authentication ipsec spi spi_value {md5| sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

Parameters

- **area *area_id*** configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from **0 to 4294967295**.
- **spi *spi_value*** configures the IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **0 unencrypted_key** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an unencrypted format.
- **7 encrypted_key** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an encrypted format.
- **KEY** configures either a **128** bit MD5 key or a **140** bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
 - **0 unencrypted_passphrase** configures an unencrypted key.
 - **7 encrypted_passphrase** configures an encrypted key.
 - **LINE** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- [ospfv3 authentication ipsec spi](#)
- [area encryption ipsec spi](#)

Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

Examples

- This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 34 md5 0 8FD6158BFE81A
DD961241D8E4169D411
switch(config-router-ospf3)# show active
```

```

ipv6 router ospf 9
  area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQ11czqdvKAzKLtYVr6I7+R3niuWouDK
KYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#

```

- This command configures OSPFv3 authentication on an area with SHA1 algorithm.

```

switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
$1$Ab754G00HbG11IKq1C17lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G00HbG11IKq1C17lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)#

```

- This command deletes the OSPFv3 authentication on an area.

```

switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQ11czqdvKAzKLtYVr6I7+R3niuWouDKKYC
FNs4/XOWG/Iap5Q==
  area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G00HbG11IKq1C17lyUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)#no area 0.0.0.0 authentication
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQ11czqdvKAzKLtYVr6I7+R3niuWouDKKYC
FNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#

```

15.3.5.3 area default-cost (OSPFv3)

The **area default-cost** command sets the cost for the default summary routes sent into an area. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to **10**.

The **no area default-cost** and **default area default-cost** command resets the default-cost value of the specified area to **10** by removing the corresponding **area default-cost** command from **running-config**. The **no area (OSPFv3)** command removes all area commands for the specified area from **running-config**, including the **area default-cost** command.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

Parameters

- **area_id** area number. **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**. **Running-config** stores value in dotted decimal notation.
- **def_cost** Values range from **1** to **65535**.

Example

These commands configure a cost of **15** for default summary routes that an ABR sends into area **100**.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 100 default 15
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.100 default-cost 15
switch(config-router-ospf3)#
```

15.3.5.4 area encryption ipsec spi

The **area encryption ipsec spi** command configures OSPFv3 security on an area.

The **default area encryption** and **no area encryption** commands delete the OSPFv3 security on an area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id encryption ipsec spi spi_value esp{3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc}{  
0 unencrypted_key | 7 encrypted_key}{ md5 | sha1} { 0 unencrypted_key | 7 encrypted_key | KEY}
```

```
area area_id encryption ipsec spi spi_value esp null{md5 | sha1} { 0 unencrypted_key | 7  
encrypted_key | KEY}
```

```
area area_id encryption ipsec spi spi_value esp{3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc |  
null} {md5 | sha1} { 0 unencrypted_key | 7 encrypted_key | LINE}
```

```
no area area_id encryption
```

```
default area area_id encryption
```

Parameters

- **area *area_id*** configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from **0 to 4294967295**.
- **spi *spi_value*** configures the value for IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- **0 *unencrypted_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an unencrypted format.
- **7 *encrypted_key*** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an encrypted format.
- **KEY** configures either a **128** bit MD5 key or a **140** bit SHA1 key.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **passphrase** configures passphrase for authentication and encryption. Options include:
 - **0 *unencrypted_passphrase*** configures an unencrypted key.
 - **7 *encrypted_passphrase*** configures an encrypted key.
 - **LINE** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- [area authentication ipsec spi](#)
- [ospfv3 encryption ipsec spi](#)

Guidelines

Passphrase and **key** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase.

Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

Examples

- This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase
0
8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
  $1$cNpcrQ1lczqdvKazKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#
```

- This command deletes the OSPFv3 security on an area.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
  $1$cNpcrQ1lczqdvKazKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)# no area 0.0.0.0 encryption
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

15.3.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv3)

The **area not-so-stubby lsa type-7 convert type-5** command configures the switch to always translate Type-7 Link-State Advertisement (LSAs) to Type-5 LSAs.

The **no area not-so-stubby lsa type-7 convert type-5** and **no area not-so-stubby lsa type-7 convert type-5** commands allow LSAs to be translated dynamically by removing the **no area not-so-stubby lsa type-7 convert type-5** command from the *running-config*.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id not-so-stubby lsa type-7 convert type-5
no area area_id not-so-stubby lsa type-7 convert type-5
default area area_id not-so-stubby lsa type-7 convert type-5
```

Parameters

area_id

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
- The *running-config* stores value in dotted decimal notation.

Example

These commands configure the switch to always translate **Type-7** Link-State Advertisement (LSAs) to **Type-5** LSAs.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 3 not-so-stubby lsa type-7 convert type-5
switch(config-router-ospf3)#
```

15.3.5.6 area nssa (OSPFv3)

The **area nssa** command configures an OSPFv3 area as a Not-So-Stubby Area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

The **no area nssa** command configures the specified area as a normal area by removing the specified **area nssa** command from *running-config*.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id nssa [TYPE]
```

```
no area area_id nssa [TYPE]
```

```
default area area_id nssa [TYPE]
```

Parameters

- **area_id**
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
 - The *running-config* stores value in dotted decimal notation.
- **TYPE**

Values include:

 - **no parameter**.
 - **nssa-only**

Example

This command configures area **3** as a NSSA area.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 3 nssa nssa-only
switch(config-router-ospf3)#
```

15.3.5.7 area nssa default-information-originate (OSPFv3)

The **area nssa default-information-originate** command sets an area as an NSSA and the generation of a type 7 default LSA is created if a default route exists in the routing table.

The switch supports three area types:

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area **0** is always a normal area and cannot be configured through this command.

The **no area** and **default area** commands remove the specified area from the OSPFv3 instance by deleting all **area** commands from the **running-config** for the specified area, including the **area default-cost (OSPFv3)** command.

The **no area stub** and **default area stub** commands configure the specified area as a normal area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
no area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
default area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
```

Parameters

All parameters except **area_id** can be placed in any order.

- **area_id.**
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0** (or **0.0.0.0**) is not configurable; it is always normal.
 - **Running-config** stores value in dotted decimal notation.
- **VALUE** Values include:
 - **no parameter.**
 - **metric 1-65535.**
- **TYPE** Values include:
 - **no parameter.**
 - **metric-type 1-2.**
- **EXCL** Values include:
 - **no parameter.**
 - **nssa-only.**

Examples

- These commands sets area **1** as NSSA only and generates a **type 7** default LSA if a default route exists in the routing table.

```
switch(config-router-ospf3) # area 3 nssa default-information-originate nssa-only
switch(config-router-ospf3) #
```

- These commands generates a **type 7** default route.

```
switch(config-router-ospf3) # area 3 nssa default-information-originate
switch(config-router-ospf3) #
```

15.3.5.8 area range (OSPFv3)

The **area range** command is used by OSPFv3 area border routers to summarize routes.

The **no area range** and **default area range** commands remove the area-range by deleting the corresponding **area range** command from the *running-config*.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

```
no area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

```
default area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

Parameters

- **area_id** **0** to **4294967295** or **0.0.0.0** to **255.255.255.255**.
- **net_addr**
- **ADVERTISE_SETTING** specifies the LSA advertising activity. Values include:
 - **no parameter**
 - **advertise**
 - **not-advertise**
- **COST_SETTING** Values include:
 - **no parameter**
 - **cost range_cost** Value ranges from **1** to **65535**.

Examples

- These commands summarize routes at an area boundary **1**.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands modify the address range status to DoNotAdvertise.

```
switch(config)# ipv6 router ospf 1
switch(config-ospf6-router)# area 1 range 2001:0DB8:0:1::/64 not-advertise
switch(config-ospf6-router)#
```

15.3.5.9 area stub (OSPFv3)

The **area stub** command configures the area type of an OSPFv3 area.

Areas are **normal** by default.

The **no area stub** command configures the specified area as a normal area.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
area area_id stub
```

```
no area area_id stub
```

```
default area area_id stub
```

Parameters

area_id

- Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
- Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
- The **running-config** stores value in dotted decimal notation.

Examples

- This command configures area **45** as a stub area.

```
switch(config)# ipv6 router ospf 3
switch(config-router-ospf3)# area 45 stub
switch(config-router-ospf3)#
```

- This command configures area **10.92.148.17** as a stub area.

```
switch(config-router-ospf3)# area 10.92.148.17 stub
switch(config-router-ospf3)#
```

15.3.5.10 clear ospfv3 ipv6 force-spf

The **clear ospfv3 ipv6 force-spf** command starts the SPF algorithm without clearing the OSPF database.

Command Mode

Privileged EXEC

Command Syntax

```
clear ospfv3 ipv6 force-spf [VRF_INSTANCE]
```

Parameters

VRF_INSTANCE Values include:

- **no parameter** Action is performed in the default VRF.
- **vrf vrf_name** Action is performed in the specified VRF.

Example

This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

```
switch(config)# clear ospfv3 ipv6 force-spf  
switch(config)#
```

15.3.5.11 default-information originate (OSPFv3)

The **default-information originate** command generates a default external route into an OSPF domain.

The **no default-information originate** and **default default-information originate** command removes the configuration from the the *running-config*.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
default-information originate [DURATION][VALUE][TYPE][MAP]
no default-information originate
default default-information originate
```

Parameters

All parameters can be placed in any order.

- **DURATION** Values include:
 - *no parameter.*
 - *always.*
- **VALUE** Values include:
 - *no parameter.*
 - *metric 1-65535.*
- **TYPE** Values include:
 - *no parameter.*
 - *metric-type 1-2.*
- **MAP** Values include:
 - *no parameter.*
 - *route-map map_name.*

Examples

- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# default-information originate always
switch(config-router-ospf3)# show active
ipv6 router ospf 1
  default-information originate always
```

- These commands configures OSPF area **1** as metric of **100** for the default route with an external metric type of **Type 1**.

```
switch(config)# ipv6 router ospf 1
switch(config-router-ospf3)# default-information originate metric 100 metric-type 1
switch(config-router-ospf3)# show active
ipv6 router ospf 1
  default-information originate metric 100 metric-type 1
switch(config-router-ospf3)#
```

15.3.5.12 default-metric (OSPFv3)

The **default-metric** command sets default metric value for routes redistributed into the OSPFv3 domain.

The **no default-metric** and **default default-metric** commands restores the default metric to its default value of **10** by removing the **default-metric** command from the **running-config**.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
default-metric def_metric
```

```
no default-metric
```

```
default default-metric
```

Parameter

def_metric Values range from **1 to 65535**. Default value is **10**.

Example

These commands configure a default metric of **30** for routes redistributed into OSPFv3.

```
switch(config)# ipv6 router ospf 9  
switch(config-router-ospf3)# default-metric 30  
switch(config-router-ospf3)# show active  
ipv6 router ospf 9  
    default-metric 30  
switch(config-router-ospf3)#
```

15.3.5.13 distance ospf intra-area (OSPFv3)

The **distance ospf intra-area** command sets the administrative distance for routes in a single OSPFv3 area. The default is **110**.

The **no distance ospf intra-area** and **default distance ospf intra-area** commands remove the **distance ospf intra-area** command from the *running-config*, returning the OSPFv3 intra-area distance setting to the default value of **110**.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
distance ospf intra-area distance
no distance ospf intra-area
default distance ospf intra-area
```

Parameter

distance Values range from 1 to 255. Default is 110.

Example

This command configures a distance of **90** for all OSPFv3 intra-area routes on the switch.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# distance ospf intra-area 90
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  distance ospf intra-area 90
switch(config-router-ospf3)#
```

15.3.5.14 ipv6 ospf area

The **ipv6 ospf area** command enables OSPFv3 on the interface and associates the area to the interface. OSPFv3 areas are configured in by **no area (OSPFv3)** commands in **router-OSPFv3** configuration mode.

The **no ipv6 ospf area** and **default ipv6 ospf area** commands disable OSPFv3 on the configuration mode interface by removing the corresponding **ipv6 ospf area** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ipv6 ospf process_id [area area_id]  
no ipv6 ospf process_id [area area_id]  
default ipv6 ospf process_id [area area_id]
```

Parameters

- **process_id** Values range from **1 to 65535**.
- **area_id**.
 - Valid formats: integer **0** to **4294967295** or dotted decimal **0.0.0.0** to **255.255.255.255**.
 - **Running-config** stores value in dotted decimal notation.

Example

These commands enable OSPFv3 on VLAN interface **200** and associates area **0** to the interface.

```
switch(config)# interface vlan 200  
switch(config-if-Vl200)# ipv6 ospf 9 area 0  
switch(config-if-Vl200)# show active  
interface Vlan200  
    ipv6 ospf 9 area 0.0.0.0  
switch(config-if-Vl200)#
```

15.3.5.15 ipv6 router ospf

The **ipv6 router ospf** command places the switch in router-OSPFv3 configuration mode and creates and OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The **show ipv6 ospf** command displays the router ID of each OSPFv3 instance configured on the switch.

The **no ipv6 router ospf** and **default ipv6 router ospf** commands delete the OSPFv3 instance.

Refer to the [Router-OSPFv3 Configuration Mode](#) command for a list of commands available in router-OSPFv3 configuration mode.

Command Mode

Global Configuration

Command Syntax

```
ipv6 router ospf process_id [VRF_INSTANCE]
no ipv6 router ospf process_id [VRF_INSTANCE]
default ipv6 router ospf process_id [VRF_INSTANCE]
```

Parameters

- ***process_id*** Values range from **1 to 65535**.
- ***VRF_INSTANCE*** Values include:
 - ***no parameter*** OSPF instance is in the default VRF.
 - ***vrf vrf_name*** OSPF instance is the specified VRF.

Examples

- This command creates an OSPFv3 instance in the default VRF with process ID **9**.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

- This command deletes the OSPFv3 instance.

```
switch(config)# no ipv6 router ospf 9
switch(config)#
```

15.3.5.16 log-adjacency-changes (OSPFv3)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from the *running-config*.

The default option (sending a message only when a neighbor goes up or down) is active when the *running-config* does not contain any form of the command. Entering the command in any form replaces the previous command state in the *running-config*.

The **no log-adjacency-changes** disables link state change Syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from the *running-config*.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
log-adjacency-changes [INFO_LEVEL]
no log-adjacency-changes
default log-adjacency-changes
```

Parameters

INFO_LEVEL Options include:

- **no parameter** Sends messages when a neighbor goes up or down.
- **detail** Sends messages for all neighbor state changes.

Example

This command configures the switch to send a Syslog message when a neighbor state changes.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# log-adjacency-changes
switch(config-router-ospf3)# show active
ipv6 router ospf 9
  log-adjacency-changes
switch(config-router-ospf3)#
```

15.3.5.17 maximum-paths (OSPFv3)

The **maximum-paths** command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The **no maximum-paths** command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of **16** by removing the **maximum-paths** command from **running-config**.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
maximum-paths paths  
no maximum-paths  
default maximum-paths
```

Parameters

paths Value range is platform dependent:

- **Arad:** Value ranges from **1 to 128**. Default value is **128**.
- **FM6000:** Value ranges from **1 to 32**. Default value is **32**.
- **PetraA:** Value ranges from **1 to 16**. Default value is **16**.
- **Trident:** Value ranges from **1 to 32**. Default value is **32**.
- **Trident II:** Value ranges from **1 to 128**. Default value is **128**.

Example

This command configures the maximum number of OSPFv3 parallel paths to **12**.

```
switch(config)# ipv6 router ospf 9  
switch(config-router-ospf3)# maximum-paths 12  
switch(config-router-ospf3)#
```

15.3.5.18 max-metric router-lsa (OSPFv3)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

```
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

Parameters

All parameters can be placed in any order.

- **EXTERNAL** Values include:
 - **no parameter** Default value of **1**.
 - **external-lsa** Range: **1 to 16777215**. The default value is **0xFF0000**.
- **STUB** Values include:
 - **no parameter** Default value of **2**.
 - **include-stub**.
- **STARTUP** Values include:
 - **no parameter**
 - **on-startup**
 - **on-startup wait-for-bgp**
 - **on-startup** Range: **5 to 86400**.
wait-for-bgp or an **on-start** time value is not included in **no** and **default** commands.
- **SUMMARY** Values include:
 - **no parameter** Metric is set to the default value of **1**.
 - **summary-lsa**.
 - **summary-lsa** Range: **1 to 16777215**.

Example

This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf3) # max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf3) #
```

15.3.5.19 no area (OSPFv3)

The **no area** command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the **no area** command include:

- **area**
- **nssa**
- **range**
- **stub**

Area settings can be removed individually; refer to the command description page of the desired command for details.

Command Mode

Router-OSPFv3 Configuration

Command Syntax

no area *area_id* [*TYPE*]

default area *area_id* [*TYPE*]

Parameters

- **area_id** area number.
 - Valid formats: integer **1** to **4294967295** or dotted decimal **0.0.0.1** to **255.255.255.255**.
 - Area **0** (or **0.0.0.0**) is not configurable; it is always **normal**.
 - The **running-config** stores value in dotted decimal notation.
- **TYPE** area type. Values include:
 - **nssa**.
 - **nssa translate type7** always.
 - **stub**.
 - **stub no-summary**.

Example

This command remove the area **1** stub configuration.

```
switch(config)# ipv6 router ospf 9
switch(config-router-ospf3)# no area 1 stub
switch(config-router-ospf3)#
```

15.3.5.20 ospfv3 transmit-delay

The **ospfv3 transmit-delay** command configures the transmission delay for OSPFv3 packets.

The **no ospfv3 transmit-delay** and **default ospfv3 transmit-delay** commands restore the default transmission delay of **1** second on the configuration mode interface by removing the corresponding **ospfv3 transmit-delay** command from *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ospfv3 transmit-delay trans
no ospfv3 transmit-delay
default ospfv3 transmit-delay
```

Parameter

trans Value ranges from **1 to 65535**; default is **1**.

Guideline

Arista devices also support the legacy **ipv6 ospf transmit-delay** command in certain software releases of the EOS.

Example

This command configures a transmission delay of **10** seconds for **VLAN 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 transmit-delay 10
switch(config-if-Vl200)# show active
interface Vlan200
  ospfv3 transmit-delay 10
switch(config-if-Vl200)#
```

15.3.5.21 ospfv3 authentication ipsec spi

The **ospfv3 authentication ipsec spi** command configures OSPFv3 authentication on an interface.

The **default ospfv3 authentication** and **no ospfv3 authentication** commands delete the OSPFv3 authentication on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ospfv3 authentication ipsec spi spi_value {md5 | sha1}{0 unencrypted_key | 7 hidden_key | KEY}
ospfv3 authentication ipsec spi spi_value {md5 | sha1} passphrase{0 unencrypted_passphrase | 7 hidden_passphrase | LINE}
no ospfv3 authentication
default ospfv3 authentication
```

Parameters

- **spi spi_value** configures IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **0 unencrypted_key** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an unencrypted format.
- **7 encrypted_key** configures either a **192** bit 3DES key or **128/192/256** bit AES key in an encrypted format.
- **KEY** configures either a **128** bit MD5 key or a **140** bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
 - **0 unencrypted_passphrase** configures an unencrypted passphrase.
 - **7 encrypted_passphrase** configures an encrypted passphrase.
 - **LINE** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- [area authentication ipsec spi](#)
- [ospfv3 encryption ipsec spi](#)

Guidelines

Passphrase and **key** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase. Arista devices also support the legacy **ipv6 ospf authentication ipsec spi** command in certain software releases of the EOS.

Restriction

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

Examples

- This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 authentication ipsec spi 3456 md5 0 8FD6158BFE81ADD961241D8E41
69D411
switch(config-if-Et9)# show active
interface Ethernet9
```

```
no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx1O+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#
```

- This command configures OSPFv3 authentication on an interface with SHA1 algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 authentication ipsec spi 987 sha1 7 $1$VmUkWk6IL2S343bR3BbH0Rh
gvxHhwBpfvB4VXKN00QF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)# show active
interface Ethernet9
  no switchport
ospfv3 authentication ipsec spi 987 sha1 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKN00QF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

- This command deletes the OSPFv3 authentication on an interface.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# show active
interface Ethernet9
  no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVVOjKcjsrYuv6dx1O+nSwKQdaiRt
2RPTQ==
switch(config-if-Et9)#no ospfv3 authentication
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
switch(config-if-Et9)#
```

15.3.5.22 ospfv3 cost

The **ospfv3 cost** command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is **10**.

The **no ospfv3 cost** and **default ospfv3 cost** commands restore the default cost of **10** for the configuration mode interface by removing the corresponding **ospfv3 cost** command from the **running-config**.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ospfv3 cost interface_cost
```

```
no ospfv3 cost
```

```
default ospfv3 cost
```

Parameters

interface_cost Value ranges from **1 to 65535**; default is **10**.

Guideline

Arista devices also support the legacy **ipv6 ospf cost** command in certain software releases of the EOS.

Example

This command configures a cost of **50** for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 cost 50
switch(config-if-Vl200)# show active
interface Vlan200
  ospfv3 cost 50
switch(config-if-Vl200)#
```

15.3.5.23 ospfv3 dead-interval

The **ospfv3 dead-interval** command sets the OSPFv3 dead interval.

The **no ospfv3 dead-interval** and **default ospfv3 dead-interval** commands restore the default dead interval of **40** seconds on the configuration mode interface by removing the corresponding **ospfv3 dead-interval** command from the *running-config*.

Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

```
ospfv3 dead-interval time
```

```
no ospfv3 dead-interval
```

```
default ospfv3 dead-interval
```

Parameter

time Value ranges from **1 to 65535**; default is **40**.

Guideline

Arista devices also support the legacy **ipv6 ospf dead-interval** command in certain software releases of the EOS.

Example

This command configures a dead interval of **75** seconds for **vlan 200**.

```
switch(config)# interface vlan 200
switch(config-if-Vl200)# ospfv3 dead-interval 75
switch(config-if-Vl200)# show active
interface Vlan200
  ospfv3 dead-interval 75
switch(config-if-Vl200)#
```

15.3.5.24 ospfv3 encryption ipsec spi

The **ospfv3 encryption ipsec spi** command configures OSPFv3 security on an interface.

The **default ospfv3 encryption** and **no ospfv3 encryption** commands delete the OSPFv3 security on an interface.

Command Mode

Interface-Ethernet Configuration

Command Syntax

```
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{0 unencrypted_key | 7 encrypted_key} {md5 | sha1}{0 unencrypted_key | 7 encrypted_key | KEY}
```

```
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{0 unencrypted_key | 7 encrypted_key} {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}
```

```
ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1}{0 unencrypted_key | 7 encrypted_key | KEY}
```

```
ospfv3 encryption ipsec spi spi_value esp {md5 | sha1} passphrase {0 unencrypted_passphrase | 7 encrypted_passphrase | LINE}
```

```
default ospfv3 encryption
```

```
no ospfv3 encryption
```

Parameters

- **spi spi_value** configures the value for IPsec Security Parameter Index. The value ranges from **0 to 4294967295**.
- **3des-cbc** configures ESP with 3DES-CBC encryption.
- **aes-128-cbc** configures ESP with AES-128-CBC encryption.
- **aes-192-cbc** configures ESP with AES-192-CBC encryption.
- **aes-256-cbc** configures ESP with AES-256-CBC encryption.
- **null** configures ESP with null encryption.
- **0 unencrypted_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- **7 encrypted_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **KEY** configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
 - **0 unencrypted_passphrase** configures an unencrypted passphrase.
 - **7 encrypted_passphrase** configures an encrypted passphrase.
 - **LINE** uses passphrase string to derive keys for authentication and encryption.

Related Commands

- [area encryption ipsec spi](#)
- [ospfv3 authentication ipsec spi](#)

Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase. Arista devices also support the legacy `ipv6 ospf encryption ipsec spi` command in certain software releases of the EOS.

Restrictions

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

Examples

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and **SHA1** algorithm.

```
switch(config)# interface ethernet 9
switch(config-if-Et9)# ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 0
2fd4e1c67a2d28fced849eelbb76e7391b93eb12
switch(config-if-Et9)# show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
  $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```
