## Chapter 1. Before Starting Trouble Analysis

A message reports the contents of the failures detected during the operation.

The failures detected during operation after the main switch of this unit is turned on and the state of the unit are reported.

The composition and description contents of each message are as follows.

① The following messages are indicated.

- CUDG detected message ··· : 018xxxxx (“Chapter 2. CUDG Detected Messages” (MSG 02-0000))
- Failure messages ········· : Hxxxxx · (“Chapter 3. Failure Messages” (MSG 03-0000))
- Progress messages ········· : Ixxxxx · (“Chapter 4. Progress Messages” (MSG 04-0000))
- Flash detected messages··· : Rxxxxx · (“Chapter 5. Flash Detected Messages” (MSG 05-0000))
- Warning messages·········· : Wxxxxx · (“Chapter 6. Warning Messages” (MSG 06-0000))
- WEB messages ··········· : “Chapter 7. Web Error Messages” (MSG 07-0000)
- Hitachi Storage Navigator Modular 2 messages :  
“Chapter 8. Hitachi Storage Navigator Modular 2 Error Messages” (MSG 08-0000)
- Sense Data·············· : “Chapter 9. Failure Analysis by Sense Data” (MSG 09-0000)

② Message text : Message text is indicated.

③ Description : Contents of failure are described concretely.

④ Collection of errors

|  |                   |  |
|--|-------------------|--|
|  | Collect the error |  |
|  | Simple Trace      |  |

Simple trace · : Collect Simple Trace (Troubleshooting “7.3 Collecting Simple Trace” (TRBL 07-0040))

CTL Trace ···· : Collect CTL Alarm Trace (Troubleshooting “7.4 Collecting CTL Alarm Trace” (TRBL 07-0090))

Full Dump····· : Collect Full Dump (Troubleshooting “7.5 Collecting Full Dump” (TRBL 07-0140))

Space········ : Does not need to be collected.

⑤ Recovery methods .. : How to recover from failure is indicated.

①, ②... : Recovery method number.

When “.” is written here, no recovery operation is required.

When another message other than this message is displayed, execute that trouble analysis also.

Because the status where the array subsystem is being started is in the middle of the transition to the status of the subsystem power turned on (Ready status) from the status of the subsystem power turned off, do not perform the recovery work which affects the operation of the array subsystem while the array subsystem is being started.

Also, the setting function or the reference function using the Hitachi Storage Navigator Modular 2 cannot be executed to the array subsystem which is being started.

⑥ Reference page.. : No. of page in which the recovery methods are described.

## Chapter 2. CUDG Detected Messages

\*1 : If this message is issued frequently, it is suspected that one of the following cases have occurred.

- Symptom : Spin-up operation repeats interruption and restart because of contention with the RAID Manager command in the case where the ShadowImage in-system replication function is used.

Corrective action : Contact the system manager. If RAID Manager command is issued by polling in a short period, check the manual and change the value to be appropriate.

- Symptom : A spin up operation repeats an interruption and restart because LU switchings occur frequently.

Corrective action : Check the setting of the owner right to the LU and change it so that the LU switching does not occur owing to an I/O command issued by a host.

The ENC firmware displayed in the message is not updated. Replace the ENC Unit displayed in the message to update the ENC firmware. However, the back-end redundancy is lost while replacing the ENC Unit. Check that the customer has no problem on the operation, and then perform it. If this failure occurs while operating the automatic download of the ENC firmware, do not replace the ENC Unit and execute the online firmware replacement. | <a href="#">Replacement “2.2.9 Replacing ENC Unit” (REP 02-1020)</a>                         |

|              |              |             |                   | ④ 1. When "Expanding (x)" or "Waiting expansion (n) (x)" is displayed in [Status] of the RAID Group in one or more RAID Groups, wait until "Normal" is displayed in [Status] of all the RAID Groups. In this case, it takes time to complete the RAID Group expansion processing. When [Status] of all the RAID Groups changes to "Normal", go to Step ⑤.                              | <a href="#">"ShadowImage in-system replication User's Guide"</a>                        |
|              |              |             |                   | 2. When "Normal" is displayed in [Status] of all the RAID Groups, you cannot execute the version downgrade to the firmware which does not support the RAID Group expansion function because the specific operation of the RAID Group expansion function is performed. Execute the update installation of the firmware of the version which supports the RAID Group expansion function. | —                                                                                       |
|              |              |             |                   | ⑤ Change it to the maintenance mode after completing all the RAID Group expansion processing.                                                                                                                                                                                                                                                                                          | <a href="#">WEB "Chapter 3. | R54300       | Down grade install NG [The remote path is connected to the unsupported frontend port] | In the setting of the TrueCopy remote replication function or the TrueCopy Extended Distance function, the version downgrade cannot be performed because the remote path connection port of the remote-side array subsystem is set as the unsupported front-end port in the firmware to be installed. | Simple Trace      | ① 1. Click [Go to Normal Mode] of the menu frame in the WEB window, and start the subsystem.<br>2. Check that the subsystem becomes Ready.<br>3. Connect Hitachi Storage Navigator Modular 2 to the subsystem.<br>4. Examine the unlocked licenses referring to [Settings] – [Licenses] of the unit window of Hitachi Storage Navigator Modular 2.<br>5. Among the unlocked licenses, refer to the “User’s Guide” (*1) of the relevant license, and delete the remote path whose remote path connection port is set as the unsupported front-end port.<br>6. Change it to the maintenance mode.<br>7. Perform the update installation of the firmware again to downgrade the version of the firmware. | <a href="#">Installation “1.5.1 Subsystem Power On” (INST 01-0140)</a><br>—<br>—<br><a href="#">System Parameter “Chapter 6.
