\*1 : When "LU-0000" is displayed, the LU #0 data or the configuration information on the subsystem is lost.

Check the LU #0 status in the Hitachi Storage Navigator Modular 2, and if LU #0 has errors, follow the recovery methods ①. If it is normal, the recovery operation is not needed.

| W3E000       | Uncorrectable forced parity correction LU is detected | An LU, the forced restoration for which by means of parity could not be continued, was detected.                                                                              |                   | ① Check the LU information using the Hitachi Storage Navigator Modular 2.<br>② Have the LU, the forced restoration for which by means of parity cannot be continued, skip the restoration by issuing an instruction to skip the restoration using the Hitachi Storage Navigator Modular 2. <sup>(*)</sup><br>The warning is removed after all the LUs, the forced restoration for which by means of parity cannot be continued, receive an instruction to skip the restoration. | —                                                                                                                                    |

\*1 : When there is an LU which is not executing the forced parity correction, the dynamic sparing is suppressed and the data recovery is always executed by the correction copy. Also, the copy back from the Spare Disk Drive does not operate. In this case, perform the "Skip" instruction for all the LUs that the LU status is "Uncorrected 2" after the data recovery to the Spare Disk Drive. The dynamic sparing and the copy back can be executed now by this operation.

| -                                | Abnormal End<br>Down grade install NG<br>[Modular Volume Migration<br>has already taken place] | The update installation cannot be performed for the firmware of the revision which is not supporting the Modular Volume Migration function because the LU that the Modular Volume Migration is executed exists in the subsystem with the Modular Volume Migration function. | <p>① 1. Return the subsystem to the normal mode by clicking the [Go to Normal Mode] button in the menu frame of the maintenance mode window on WEB.</p> <p>2. Check that the "110000 Subsystem is ready" is displayed in the Information Message of the normal mode window on WEB.</p> <p>3. When the Modular Volume Migration function of the priced option is locked, unlock the Modular Volume Migration function referring to <a href="#">Modular Volume Migration User's Guide "3.1.1 Installing Volume Migration"</a>. However, when the Modular Volume Migration function of the priced option is expired, unlock it with the Emergency Key, etc.</p> <p>4. When the Modular Volume Migration function is disabled, enable the Modular Volume Migration function referring to <a href="#">Modular Volume Migration User's Guide "3.1.3 Enabling or Disabling Volume Migration"</a>.</p> <p>5. Check if the LU whose intermediate LU number and the internal LU number do not match exists by the maintenance mode of the Hitachi Storage Navigator Modular 2.</p> <p>6. When there is the LU whose intermediate LU number and the internal LU number do not match, perform the Modular Volume Migration so that the intermediate LU number and the internal LU number match referring to the <a href="#">"Modular Volume Migration User's Guide"</a>. In that case, the data of the LUs may have to be backed up as needed.</p> <p>7. Lock the priced option of the Modular Volume Migration function referring to <a href="#">Modular Volume Migration User's Guide "3.1.2 Uninstalling Volume Migration"</a>.</p> | <p><a href="#">WEB "3.7 Return Method to the Normal Mode" (WEB 03-0540)</a></p> <p>—</p> <p><a href="#">Modular Volume Migration User's Guide "3.1.1 Installing Volume Migration"</a></p> <p><a href="#">Modular Volume Migration User's Guide "3.1.3 Enabling or Disabling Volume Migration"</a></p> <p>—</p> <p><a href="#">"Modular Volume Migration User's Guide"</a></p> <p><a href="#">Modular Volume Migration User's Guide "3.1.2 Uninstalling Volume Migration"</a></p> |

## Chapter 8. Hitachi Storage Navigator Modular 2 Error Messages

**Table 8.1 Hitachi Storage Navigator Modular 2 Error Messages**

| Message code | Error code | Message text/Recovery methods                                                                                                                |
|--------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| DMEA000001   | 0x00010000 | Busy status was reported from the subsystem. Please retry after waiting for a while.                                                         |
| DMEA000002   | 0x00020000 | The Queue Full status was reported from the subsystem. Please retry after waiting for a while.                                               |
| DMEA000003   | 0x00030000 | LU0 is reserved by another host. Please retry after the reservation is canceled.                                                             |
| DMEA000004   | 0x00040000 | An error was detected in the data received from the subsystem. Confirm the subsystem status and the LAN environment, and then try again.     |
| DMEA000005   | 0x00050000 | An error occurred while communicating with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.          |
| DMEA000006   | 0x00060000 | Failed to connect with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.                              |
| DMEA000007   | 0x00070000 | An invalid response was received from the subsystem. Confirm the subsystem status and the LAN environment, and then try again.               |
| DMEA000008   | 0x00080000 | An unexpected error was reported from the subsystem. Please retry after waiting for a while.                                                 |
| DMEA00000A   | 0x00090000 | The CHECK CONDITION status was reported from the subsystem, but the details could not be acquired. Please retry after waiting for a while.   |
| DMEA00000B   | 0x00001002 | Failed to transfer data. Confirm the subsystem status and the LAN environment, and then try again.                                           |
| DMEA00000C   | 0x00001003 | Failed to issue the SCSI command. Confirm the subsystem status and the LAN environment, and then try again.                                  |
| DMEA00000D   | 0x0000FFFF | Insufficient memory. Terminate other programs and then try again.                                                                            |
| DMEA00000E   | 0x0000FFFE | An internal program error occurred. Wait for a while and then try again. If the problem cannot be solved, contact the maintenance personnel. |
| DMEA000010   | 0x00000010 | An error occurred while communicating with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.          |
| DMEA000011   | 0x00000011 | An error occurred while communicating with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.          |
| DMEA000012   | 0x00000012 | An error occurred while secure communicating with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.   |
| DMEA000201   | 0x00000201 | The specified user ID or password is incorrect.                                                                                              |
| DMEA001000   | 0x00000001 | The information file for the subsystem cannot be opened. Confirm the execution environment.                                                  |
| DMEA001001   | 0x00000002 | The information file for the subsystem is invalid. Confirm the execution environment.                                                        |
| DMEA001002   | 0x00000003 | The specified subsystem name is already registered. Specify another name.                                                                    |
| DMEA001003   | 0x00000004 | The specified subsystem name is not registered.                                                                                              |
| DMEA001004   | 0x00000005 | The registered information does not match the status of the subsystem. Correct the information and then try again.                           |
| DMEA001005   | 0x00000006 | The number of registered subsystems has reached the maximum. Delete unnecessary information and then try again.                              |
| DMEA001006   | 0x00000102 | Invalid parameter.                                                                                                                           |

|--------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMEA001169   | 0x00001030 | The process cannot be performed because the term of the temporary key or emergency key is expired.                                                                  |
| DMEA001170   | 0x0000101B | The character length of the serial number is incorrect.                                                                                                             |
| DMEA001171   | 0x00001040 | The contents of the license key file are invalid. Please confirm the file and then try again.                                                                       |
| DMEA001172   | 0x00001041 | The contents of the license key file are invalid. Please confirm the file and then try again.                                                                       |
| DMEA001173   | 0x00001042 | The process cannot be performed because the number of license key is over 50. Please confirm the file and then try again.                                           |
| DMEA001175   | 0x00001043 | Could not finish replacing the firmware. Please see if there are any alarms or warnings in the subsystem.                                                           |
| DMEA001176   | 0x00001044 | The process cannot be performed because NNC is physically unequipped. Confirm the NNC status and try again.                                                         |
| DMEA001177   | 0x00001045 | The specified NNC cannot be performed because it is physically unequipped or unconnectable. Please confirm the NNC status and try again.                            |
| DMEA001178   | 0x00001060 | The specified application program does not exist. Please confirm whether the specified application program is stored.                                               |
| DMEA001179   | 0x00001061 | Failed to start the specified application program. Confirm the path to the specified application and the operational environment.                                   |
| DMEA00117A   | 0x0000105A | The contents of the NNC BIOS firmware are invalid. Please confirm the file and then try again.                                                                      |
| DMEA00117B   | 0x00001059 | The NNC BIOS firmware is not read.                                                                                                                                  |
| DMEA00117C   | 0x00001058 | The directory for storing the NNC BIOS firmware cannot be created. Please check the permission of the install directory.                                            |
| DMEA00117D   | 0x00001057 | The NNC BIOS firmware in the specified path does not exist. Please confirm whether the NNC BIOS firmware is stored in the path or the specified path is right.      |
| DMEA00117E   | 0x00001056 | The NNC BIOS firmware cannot be read. Please check the permission and available capacity of the install directory.                                                  |
| DMEA00117F   | 0x00001046 | The process cannot be performed because Fibre Channel Port is physically unequipped. Confirm the subsystem status and try again.                                    |
| DMEA001180   | 0x00001047 | The process cannot be performed because the same address is specified as the NTP server 1 and the NTP server 2. Specify the different address and try again.        |
| DMEA001181   | 0x0000105B | The process cannot be performed because the controller of the NNC is not registered. Register the controller of the NNC and then try again.                         |
| DMEA001182   | 0x0000105C | The process cannot be performed because the connection with controller of the NNC failed. Confirm the subsystem status and the LAN environment, and then try again. |
| DMEA001183   | 0x00001065 | The function cannot be executed because some port is invalid or unequipped. Please confirm the subsystem.                                                           |
| DMEA001184   | 0x00001070 | The process cannot be performed because the port is not connected to the maintenance port. Please confirm the port of connection and try again.                     |
| DMEA001185   | 0x00001071 | The process cannot be performed because the port is not connected to the management LAN. Please confirm the port of connection and try again.                       |
| DMEA001186   | 0x00001075 | The process cannot be performed because iSCSI port is physically unequipped. Please confirm the subsystem status and try again.                                     |
| DMEA001187   | 0x00001076 | The specified target is already defined. Please confirm the name or number and specify a new target.                                                                |
| DMEA001188   | 0x00001077 | The specified target is not defined. Please confirm the name or number and specify a defined target.                                                                |
| DMEA001189   | 0x00001078 | The function cannot be executed because Target 0 is specified. Please specify other than target 0 and try again.                                                    |
| DMEA001190   | 0x00001079 | The specified alias is invalid. Please confirm alias and try again.                                                                                                 |
| DMEA001191   | 0x00001080 | The specified initiator name is invalid. Please confirm initiator name and try again.                                                                               |
| DMEA001192   | 0x00001081 | The specified iSCSI name is invalid. Please confirm iSCSI name and try again.                                                                                       |
| DMEA001193   | 0x00001082 | The specified user name is invalid. Please confirm user name and try again.                                                                                         |
| DMEA001194   | 0x00001083 | The specified secret is invalid. Please confirm secret and try again.                                                                                               |
| DMEA001195   | 0x00000515 | The parameter for Port or the item name is invalid.                                                                                                                 |
| DMEA001196   | 0x00000517 | The specified KeepAliveTimer value is invalid. Confirm the value and try again.                                                                                     |

| DMED260020   | 0x03260020 | The process cannot be performed because the DP pool consumed capacity is not normal state. Please confirm the DP pool consumed capacity and then try again.                                                                                                                                                            |
| DMED260021   | 0x03260021 | The process cannot be performed because the combination of RAID level and number of drives does not match. Please confirm the number of drives and then try again.                                                                                                                                                     |
| DMED260022   | 0x03260022 | The process cannot be performed because different drives are specified. Please confirm the drive type and then try again.                                                                                                                                                                                              |
| DMED260023   | 0x03260023 | The process cannot be performed because there are some logical units that are not normal or skip state of the parity correction. Please retry after changing to normal state.                                                                                                                                          |
| DMED260024   | 0x03260024 | The process cannot be performed because the drive type of the DP pool is different. Please confirm the drive type and then try again.                                                                                                                                                                                  |
| DMED260025   | 0x03260025 | The process cannot be performed because the combination of stripe size and segment size does not match. Please confirm the stripe size or the cache partition and then try again.                                                                                                                                      |
| DMED260026   | 0x03260026 | The process cannot be performed because the combination of the number of drives and the combination does not match. Please confirm the number of drives and the combination and then try again.",                                                                                                                      |
| DMED260027   | 0x03260027 | The process cannot be performed because the capacity of DP pool will exceed the maximum. Please delete unnecessary DP pools and then try again.                                                                                                                                                                        |
| DMED260028   | 0x03260028 | The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.                                                                                         |
| DMED260029   | 0x03260029 | The process cannot be performed because the DP optimization state of the specified logical unit in DP pool or the logical units in DP pool that has specified logical unit is neither in Normal state nor in Failed state. Please wait for completion of DP optimization or cancel DP optimization and then try again. |
| DMED26002A   | 0x0326002A | The process cannot be performed because the DP optimization state of logical unit in DP pool is not Normal. Please try again, after DP optimization is completed. When the state of DP optimization is failed, cancel DP optimization and then try again.                                                              |
| DMED26002B   | 0x0326002B | The process cannot be performed because the capacity of DP pool for performing DP optimization is insufficient. Please add capacity of DP pool for performing DP optimization and then try again.                                                                                                                      |
| DMED26002C   | 0x0326002C | The process cannot be performed because specified logical unit in DP pool or the logical units in DP pool that has specified logical unit contains the write uncompleted logical unit. Please recover and then try again.                                                                                              |
| DMED26002D   | 0x0326002D | It is not necessary to cancel because DP optimization state of the logical unit in specified DP pool or the logical unit in DP pool containing specified logical unit is already optimizing or canceling.                                                                                                              |
| DMED26002E   | 0x0326002E | The process cannot be performed because DP optimization state of the logical unit in DP pool is not normal. Please confirm DP optimization state of the logical unit in DP pool and then try again.                                                                                                                    |
| DMED26002F   | 0x0326002F | The process cannot be performed because specified logical unit in DP pool contains the write uncompleted logical unit. Please recover and then try again.                                                                                                                                                              |
| DMED260030   | 0x03260030 | The process cannot be performed because status of the logical unit in specified DP pool or the logical unit in DP pool containing specified logical unit is neither in Normal state nor in Regression state. Please recover the logical unit and then try again.                                                       |
| DMED260031   | 0x03260031 | The process cannot be performed because ShadowImage pair of Simplex state exists in specified DP pool. Please release the pair and then try again.                                                                                                                                                                     |
| DMED260032   | 0x03260032 | The process cannot be performed because specified logical unit in DP pool or the logical units in DP pool that has specified logical unit is in the PIN exceeded state. Please recover and then try again.                                                                                                             |
| DMED260033   | 0x03260033 | The process cannot be performed because state of the DP pool which contains the specified logical unit is Detached. Please recover and then try again.                                                                                                                                                                 |
| DMED260034   | 0x03260034 | The process cannot be performed because status the logical unit in the specified DP pool is in Normal state nor in Regression state. Please recover the logical unit and then try again.                                                                                                                               |
| DMED260035   | 0x03260035 | The process cannot be performed because specified logical unit in DP pool is in the PIN exceeded state. Please recover and then try again.                                                                                                                                                                             |
| DMED260036   | 0x03260036 | The process cannot be performed because the updating of DP management information is in progress. Please wait a moment and then try again.                                                                                                                                                                             |
| DMED260037   | 0x03260037 | The capacity of DP pool to which the specified P-VOL belongs is insufficient. | Message code | Error code | Message text/Recovery methods                                                                                                                                                                                                       |
|--------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMED3C1219   | 0x033C1219 | The firmware cannot be downgraded because the user whose user authentication is RADIUS exists. Please delete the user whose user authentication is RADIUS and try again.                                                            |
| DMED3C121A   | 0x033C121A | The firmware cannot be downgraded because the number of registered account exceeded the maximum value that can be supported on the downgraded version. Please confirm the number of registered account and try again.               |
| DMED3C121B   | 0x033C121B | The firmware cannot be downgraded because the command device that uses the logical unit in the DP pool exists. Please release the command device that uses the logical unit in the DP pool and try again.                           |
| DMED3C121C   | 0x033C121C | The firmware cannot be downgraded because the DM-LU that uses the logical unit in the DP pool exists. Please release the DM-LU that uses the logical unit in the DP pool and try again.                                             |
| DMED3C121F   | 0x033C121F | The firmware cannot be downgraded because the number of connected subsystem exceeded the maximum value that can be supported on the downgraded version. Please remove drives or use another firmware and then try again.            |
| DMED3C1220   | 0x033C1220 | The firmware cannot be downgraded because the volume migration pair that uses the logical unit in the DP pool exists. Please release the pair and try again.                                                                        |
| DMED3C1221   | 0x033C1221 | The firmware cannot be downgraded because the state of DP optimization is optimizing. Please try again, after DP optimization is completed. When the state of DP optimization is failed, cancel DP optimization and then try again. |
| DMED3C1222   | 0x033C1222 | The firmware cannot be downgraded because SSD is mounted. Please remove SSD or use another firmware and then try again.                                                                                                             |
| DMED3C1223   | 0x033C1223 | The firmware cannot be downgraded because the number of connected Dense units exceeded the maximum value that can be supported on the downgraded version. Please remove the Dense units or use another firmware and then try again. |
| DMED3C1224   | 0x033C1224 | The firmware cannot be downgraded because the updating of DP management information is in progress. Please wait a moment and then try again.                                                                                        |
| DMED3C1225   | 0x033C1225 | The firmware cannot be downgraded because Advanced Security Mode is enabled. Please change Advanced Security Mode to disabled and try again.                                                                                        |
| DMED3C1227   | 0x033C1227 | The firmware cannot be downgraded because the SAS drives are mounted in the Dense Units. Please remove the SAS drives or use another firmware and then try again.                                                                   |
| DMED3C1228   | 0x033C1228 | The firmware cannot be downgraded because remote paths are set to an array whose H/W revision is 0200. Please delete remote paths and try again.                                                                                    |
| DMED3C12FF   | 0x033C12FF | The firmware cannot be downgraded because tape group targeted differential backup or backed up differential exists. Please delete tape groups, and try again.                                                                       |
| DMED3D0001   | 0x033D0001 | The process cannot be performed because the drive firmware is being replaced. Please retry after replacement completes.                                                                                                             |
| DMED400001   | 0x03400001 | The process cannot be performed because the specified logical units contain an unformatted LU. Confirm the logical unit status and try again.                                                                                       |
| DMED400002   | 0x03400002 | The process cannot be performed because the specified logical units contain V-VOL of Snapshot. Confirm the logical unit status and try again.                                                                                       |
| DMED400003   | 0x03400003 | The process cannot be performed because some logical units are under quick formatting. Confirm the logical unit status and try again.                                                                                               |
| DMED400004   | 0x03400004 | The process cannot be performed because the specified logical units contain a Sub LU of the unifying Lus. Confirm the logical unit status and try again.                                                                            |
| DMED400005   | 0x03400005 | The process cannot be performed because the specified logical units contain an invalid LU. Confirm the logical unit status and try again.                                                                                           |
| DMED400006   | 0x03400006 | The specified LUs contain regressed LU. Confirm the LU status and try again.                                                                                                                                                        |
| DMED400007   | 0x03400007 | The process cannot be performed because ShadowImage, Remote Replication, or SnapShot is in progress. Please wait a moment and then try again.                                                                                       |
| DMED400008   | 0x03400008 | The operation of 'start' or 'skip', and 'cancel' is specified at the same time. Confirm the operation and try again.                                                                                                                |
| DMED400009   | 0x03400009 | The process cannot be performed because the specified logical units contain an undefined LU. Confirm the logical unit status and try again.                                                                                         |

| Message code | Error code | Message text/Recovery methods                                                                                                                              |
|--------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMED400011   | 0x03400011 | The process cannot be performed because parity correction is not completed. Please try again, after it is completed.                                       |
| DMED400012   | 0x03400012 | The process cannot be performed because parity correction is not executed or is aborted. Please try again, after it is completed.                          |
| DMED400013   | 0x03400013 | The process cannot be performed because parity correction is not completed. Please try again, after it is completed.                                       |
| DMED400014   | 0x03400014 | The process cannot be performed because parity correction is not completed. Please try again, after it is completed.                                       |
| DMED400015   | 0x03400015 | The process cannot be performed because parity correction is not executed or is aborted. Please try again, after it is completed.                          |
| DMED400021   | 0x03400021 | The 'cancel' operation cannot be specified to the uncorrected logical units. Confirm the parity correction status and try again.                           |
| DMED400022   | 0x03400022 | The 'start' operation cannot be specified to the aborted logical units. Confirm the parity correction status and try again.                                |
| DMED400023   | 0x03400023 | The 'cancel' operation cannot be specified to the aborted logical units. Confirm the parity correction status and try again.                               |
| DMED400024   | 0x03400024 | The 'start' operation cannot be specified to the correcting logical units. Confirm the parity correction status and try again.                             |
| DMED400025   | 0x03400025 | The 'skip' operation cannot be specified to the correcting logical units. Confirm the parity correction status and try again.                              |
| DMED400026   | 0x03400026 | The 'start' operation cannot be specified to the waiting logical units. Confirm the parity correction status and try again.                                |
| DMED400027   | 0x03400027 | The 'skip' operation cannot be specified to the waiting logical units. Confirm the parity correction status and try again.                                 |
| DMED400028   | 0x03400028 | The 'cancel' operation cannot be specified to the skipped logical units. Confirm the parity correction status and try again.                               |
| DMED400029   | 0x03400029 | The 'cancel' operation cannot be specified to the corrected logical units. Confirm the parity correction status and try again.                             |
| DMED40002A   | 0x0340002A | The logical units are under quick formatting. Please the parity correction status and try again.                                                           |
| DMED500001   | 0x03500001 | The command device is not registered. Please register the command device and try again.                                                                    |
| DMED600001   | 0x03600001 | The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.                    |
| DMED700001   | 0x03700001 | The specified logical unit is not defined. Specify a defined logical unit.                                                                                 |
| DMED700002   | 0x03700002 | The process cannot be performed because the status of pair is Simplex(SMPL). Confirm the LU status and try again.                                          |
| DMED800002   | 0x03800002 | A parameter error occurred. Please confirm the specified parameter.                                                                                        |
| DMED800004   | 0x03800004 | The specified NNC number is not NAS port. Please confirm the port type.                                                                                    |
| DMED800005   | 0x03800005 | The process cannot be performed because BIOS is being updated. The updating is completed, then try again.                                                  |
| DMED800006   | 0x03800006 | The process cannot be performed because NAS OS is not ready or booting, or it is not in shutdown process. Please confirm NAS OS status and then try again. |
| DMED800007   | 0x03800007 | The process cannot be performed because BIOS is being updated. The updating is completed, then try again.                                                  |
| DMED800008   | 0x03800008 | The process cannot be performed because the install of the NAS OS is not completed. Please try again after install is completed.                           |
| DMED800009   | 0x03800009 | The process cannot be performed because the alternative NNC is not active. Please confirm NNC status and try again.                                        |
| DMED800011   | 0x03800011 | The process cannot be performed because NAS OS is loading. Please stop NAS OS, then try again.                                                             |
| DMED800013   | 0x03800013 | The process cannot be performed because NAS OS is in shutdown process. Shutdown process is completed, then try again.                                      |
| DMED800014   | 0x03800014 | The process cannot be performed because NAS dump is being collected. The collection is completed, then try again.                                          |

| Message code | Error code | Message text/Recovery methods                                                                                                                                             |
|--------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMED800015   | 0x03800015 | The process cannot be performed because System LU is not defined. Please define System LU and then try again.                                                             |
| DMED800016   | 0x03800016 | The time out occurred during install. Please turn off NNC breaker and turn on it, then try again.                                                                         |
| DMED800017   | 0x03800017 | The time out occurred during install. Please turn off NNC breaker and turn on it, then try again.                                                                         |
| DMED800019   | 0x03800019 | The process cannot be performed because NAS OS is not in stopped state. Please stop NAS OS, then try again.                                                               |
| DMED80001A   | 0x0380001A | The process cannot be performed because BIOS is being updated. The updating is completed, then try again.                                                                 |
| DMED80001B   | 0x0380001B | The process cannot be performed because NAS OS is detached. Please recover NAS OS status and then try again.                                                              |
| DMED800020   | 0x03800020 | The specified IP address is incorrect. Please specify a correct IP address.                                                                                               |
| DMED800021   | 0x03800021 | The specified number is incorrect. Please specify a correct number.                                                                                                       |
| DMED800022   | 0x03800022 | The specified MTU is incorrect. Please specify a correct MTU.                                                                                                             |
| DMED800023   | 0x03800023 | The specified negotiation is incorrect. Please specify a correct negotiation.                                                                                             |
| DMED800024   | 0x03800024 | The process cannot be performed because NAS OS is not ready. Please confirm NAS OS status and then try again.                                                             |
| DMED800025   | 0x03800025 | The process cannot be performed during NNC LAN setting. Please confirm NAS OS status and then try again.                                                                  |
| DMED800026   | 0x03800026 | The same IP address as the management LAN of the subsystem cannot be set up. Please specify a correct IP address.                                                         |
| DMED800027   | 0x03800027 | The specified time zone does not have daylight saving time. Please confirm the time zone.                                                                                 |
| DMED800029   | 0x03800029 | The process cannot be performed because the MTU value of NNC does not match. Please set up the same MTU value.                                                            |
| DMED800030   | 0x03800030 | The process cannot be performed because specified IP address is same as the current IP address of alternative NNC. Please specify another IP address and try again.       |
| DMED800099   | 0x03800099 | The error occurred during install. Please reboot NAS Setup, then try again.                                                                                               |

## Chapter 9. Failure Analysis by Sense Data

In case of Fibre Channel, when an error occurs Sense Data is stored in Payload of FCP\_RSP and transferred to Host Computer.

### 9.1 Details of Sense Code

The details of Sense Code are shown below.

| Sense key | Sense code | Description                                                                                         | Recovery methods                                                                                                                                  | Reference page                                                               |
|-----------|------------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 0/5       | 00 00      | There is no valid additional sense information.                                                     | Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.                                          | <a href="#">Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040)</a> |
| 4         | 01 00      | The INDEX signal cannot be detected.<br>The SECTOR signal cannot be detected.                       |                                                                                                                                                   |                                                                              |
| 1/4       | 02 00      | Seek operation in the Disk Drive cannot be executed correctly.                                      |                                                                                                                                                   |                                                                              |
| 4         | 03 00      | A Write Fault was detected in the Disk Drive.                                                       |                                                                                                                                                   |                                                                              |
| 2         | 04 00      | The LU connected cannot execute a command because LUs are being formatted.                          | This is not failure. If this error code frequently appears, collect Simple trace and request the Technical Support Center to analyze the failure. |                                                                              |
| 2         | 04 01      | The Disk Drive will soon become ready although it is currently not ready.                           |                                                                                                                                                   |                                                                              |
| 2         | 04 02      | The Disk Drive is currently not ready; it has not been spun-up.                                     |                                                                                                                                                   |                                                                              |
| 2         | 04 03      | The host I/O cannot be executed because the Disk Drive is spin-down with the Power Saving function. | Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.                                          |                                                                              |
| 2         | 04 04      | The logical unit is currently not ready.<br>(It is executing the formatting command.)               | This is not failure. If this error code frequently appears, collect Simple trace and request the Technical Support Center to analyze the failure. |                                                                              |
| 2         | 04 84      | A sequential shutdown is in progress.                                                               |                                                                                                                                                   |                                                                              |

## 9.2 List of Detail Codes of Sense Code (5/9FFE)

| Detail code | Hitachi Storage Navigator Modular 2 indication                                                                                                                                | Recovery methods                 | Reference page |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|----------------|
| 010001      | DMER010001: The target LU is undergoing the change of an ownership of LU. Retry after waiting for a while.                                                                    | Retry after waiting for a while. | —              |
| 010002      | DMER010002: The change of a controller that controls the LU cannot be checked because the directory was blocked in the other controller. Retry after waiting for a while.     | Retry after waiting for a while. | —              |
| 010003      | DMER010003: An instruction to change the controller that controls the LU was issued. Retry after waiting for a while.                                                         | Retry after waiting for a while. | —              |
| 010004      | DMER010004: The owner controller of the LUs to be paired is detached. Retry.                                                                                                  | Retry.                           | —              |
| 010005      | DMER010005: The owner controller of the LUs to be paired is detached. Retry.                                                                                                  | Retry.                           | —              |
| 010006      | DMER010006: The owner controller of the LUs to be paired is detached. Retry.                                                                                                  | Retry.                           | —              |
| 010007      | DMER010007: The owner controller of the LUs to be paired is detached. Retry.                                                                                                  | Retry.                           | —              |
| 010009      | DMER010009: The owner controller of the LUs to be paired is detached. Retry after waiting for a while.                                                                        | Retry after waiting for a while. | —              |
| 01000A      | DMER01000A: The owner controller of the LUs to be paired is detached. Retry after waiting for a while.                                                                        | Retry after waiting for a while. | —              |
| 01000B      | DMER01000B: The owner controller of the LUs to be paired is detached. Retry after waiting for a while.                                                                        | Retry after waiting for a while. | —              |
| 010019      | DMER010019: The pair operation command is a time-out. Retry after waiting for a while.                                                                                        | Retry after waiting for a while. | —              |
| 010065      | DMER010065: Since the specified P-VOL requires a change of an ownership of LU, it is undergoing the execution of the ownership of LU change. Retry after waiting for a while. | Retry after waiting for a while. | —              |
| 010066      | DMER010066: Though the specified P-VOL requires a change of an ownership of LU, the controller to be changed is blocked. Retry after waiting for a while.                     | Retry after waiting for a while. | —              |
| 010067      | DMER010067: Since the specified P-VOL requires a change of an ownership of LU, the execution of the ownership of LU change has been started. Retry after waiting for a while. | Retry after waiting for a while. | —              |
| 011001      | DMER011001: The target LU is undergoing the change of an ownership of LU. Retry after waiting for a while.                                                                    | Retry after waiting for a while. | —              |
| 011002      | DMER011002: The change of a controller that controls the LU cannot be checked because the directory was blocked in the other controller. Retry after waiting for a while.     | Retry after waiting for a while. | —              |
| 011003      | DMER011003: An instruction to change the controller that controls the LU was issued. Retry after waiting for a while.                                                         | Retry after waiting for a while. | —              |
| 012001      | DMER012001: The target LU is undergoing the change of an ownership of LU. Retry after waiting for a while.                                                                    | Retry after waiting for a while. | —              |
| 012002      | DMER012002: The change of a controller that controls the LU cannot be checked because the directory was blocked in the other controller. Retry after waiting for a while.     | Retry after waiting for a while. | —              |
| 012003      | DMER012003: An instruction to change the controller that controls the LU was issued. Retry after waiting for a while.                                                         | Retry after waiting for a while. | —              |

| Detail code | Hitachi Storage Navigator Modular 2 indication                                                                                                                   | Recovery methods                        | Reference page |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|----------------|
| 020000      | DMER020000: The pair status of the P-VOL is other than Simplex. Check the pair status of the LU.                                                                 | Check the pair status of the LU.        | —              |
| 020001      | DMER020001: The status of the P-VOL is other than normal and regressive. Check the status of the LU.                                                             | Check the status of the LU.             | —              |
| 020002      | DMER020002: The P-VOL is a Cache Residency LU. Check the status of the LU.                                                                                       | Check the status of the LU.             | —              |
| 020003      | DMER020003: The P-VOL is reserved as a Cache Residency LU. Check the status of the LU.                                                                           | Check the status of the LU.             | —              |
| 020004      | DMER020004: The P-VOL is a command device. Check the status of the LU.                                                                                           | Check the status of the LU.             | —              |
| 020005      | DMER020005: The primary sequence number is different from the own Array ID. Check the Array ID.                                                                  | Check the Array ID.                     | —              |
| 020006      | DMER020006: Both of the two paths are abnormal. Check the status of the path.                                                                                    | Check the status of the path.           | —              |
| 020007      | DMER020007: The P-VOL has been defined as a SubLU of a unified LU. Check the status of the LU.                                                                   | Check the status of the LU.             | —              |
| 020009      | DMER020009: There exist maximum number of pairs already. Delete the unnecessary pairs.                                                                           | Delete the unnecessary pairs.           | —              |

| 2049                 | The internal processing to switch the owner right of the LU between the Control Unit operated during the execution of the Modular Volume Migration, but the internal processing timed out because the load of I/O to the LU was heavy.   | ① 1. The cause that the executing Modular Volume Migration terminated abnormally is because the internal processing timed out the heavy load of I/O to the LU of the pair. There is no failed part.<br>2. If the Modular Volume Migration repeatedly terminates abnormally due to this factor, execute the Modular Volume Migration to the LU before releasing the pair when the load of I/O to the LU of the pair becomes light.                                                            | —<br><br>—                                                                                                                                                                                                                                                      |
