| <b>Description</b> | This command administratively sets the IS-IS router to operate in the overload state for a specific time period, in seconds, or indefinitely.<br><br>During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by the router and will not be used for other transit traffic.<br><br>If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.<br><br>The <b>overload</b> command can be useful in circumstances where the router is overloaded or used prior to executing a <b>shutdown</b> command to divert traffic around the router.<br><br>The <b>no</b> form of the command causes the router to exit the overload state. |
| <b>Default</b>     | no overload                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                   |                                                                                        |
|-------------------|----------------------------------------------------------------------------------------|
| <b>Parameters</b> | <i>seconds</i> — the time, in seconds, that this router must operate in overload state |
| <b>Values</b>     | 60 to 1800                                                                             |
| <b>Default</b>    | infinity (overload state maintained indefinitely)                                      |
| <b>max-metric</b> | — set the maximum metric in addition to overload                                       |

## overload-on-boot

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b> | <p>When the router is in an overload state, the router is used only if there is no other router to reach the destination. This command configures the IGP upon bootup in the overload state until one of the following events occur:</p> <p><b>Step 1.</b> The timeout timer expires.</p> <p><b>Step 2.</b> A manual override of the current overload state is entered with the <b>config&gt;router&gt;isis&gt;no overload</b> command.</p> <p>The <b>no overload</b> command does not affect the <b>overload-on-boot</b> function.</p> <p>If no timeout is specified, IS-IS will go into overload indefinitely after a reboot. After the reboot, the IS-IS status will display a permanent overload state:</p> <ul style="list-style-type: none"><li>• L1 LSDB Overload : Manual on boot (Indefinitely in overload)</li><li>• L2 LSDB Overload : Manual on boot (Indefinitely in overload)</li></ul> <p>This state can be cleared with the <b>config&gt;router&gt;isis&gt;no overload</b> command.</p> <p>When specifying a timeout value, IS-IS will go into overload for the configured timeout after a reboot. After the reboot, the IS-IS status will display the remaining time the system stays in overload:</p> <ul style="list-style-type: none"><li>• L1 LSDB Overload : Manual on boot (Overload Time Left : 17)</li><li>• L2 LSDB Overload : Manual on boot (Overload Time Left : 17)</li></ul> <p>The overload state can be cleared before the timeout expires with the <b>config&gt;router&gt;isis&gt;no overload</b> command.</p> <p>The <b>no</b> form of the command removes the overload-on-boot functionality from the configuration.</p> |
| <b>Default</b>     | no overload-on-boot                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                    | Use the <b>show router isis status</b> command to display the administrative and operational state as well as all timers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Context</b>     | config>service>vprn>isis                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b> | This command configures the maximum number of prefixes that IS-IS can learn, and use to protect the system from a router that has accidentally advertised a large number of prefixes. If the number of prefixes reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, IS-IS will go into overload. |

The **overload-timeout** option controls the length of time that IS-IS is in the overload state when the prefix-limit is reached. The system automatically attempts to restart IS-IS at the end of this duration. If the **overload-timeout forever** option is used, IS-IS is not restarted automatically and stays in overload until the condition is manually cleared by the administrator. This is also the default behavior when the **overload-timeout** option is not configured.

The **no** form of the command removes the **prefix-limit**.

| <b>Parameters</b> | <p><b>log-only</b> — Enables a warning message to be sent at the specified threshold percentage and also when the limit is exceeded. However, overload is not set when this parameter is configured.</p> <p><i>limit</i> — the number of prefixes that can be learned, expressed as a decimal integer</p> <p><b>Values</b> 1 to 4294967296</p> <p><i>percent</i> — The threshold value (as a percentage) that triggers a warning message to be sent.</p> <p><b>Values</b> 0 to 100</p> <p><i>seconds</i> — the time in minutes before IS-IS is restarted</p> <p><b>Values</b> 1 to 1800</p> <p><b>forever</b> — specifies that IS-IS should be restarted only after the execution of the <b>clear router isis overload prefix-limit</b> command</p> |

## reference-bandwidth

**Syntax** **reference-bandwidth** *bandwidth-in-kbps*  
**reference-bandwidth** [**tbps** *Tera-bps*] [**gbps** *Giga-bps*] [**mbps** *Mega-bps*] [**kbps** *Kilo-bps*]  
**no reference-bandwidth**

**Context** config>service>vpn>isis

**Description** This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

In order to calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

cost = reference – bandwidth ÷ bandwidth

If the reference bandwidth is configured as 10 Gigabits (10,000,000,000), a 100 M/bps interface has a default metric of 100. In order for metrics in excess of 63 to be configured, wide metrics must be deployed. (See wide-metrics-only in the **config>router>isis** context.)

If the reference bandwidth is not configured, then all interfaces have a default metric of 10.

The **no** form of the command reverts to the default value.

| <b>Description</b> | <p>This command enables the use of an RSVP-TE shortcut for resolving IGP routes by IS-IS or OSPF routing protocols.</p> <p>This command instructs IS-IS or OSPF to include RSVP LSPs originating on this node and terminating on the router-id of a remote node as direct links with a metric equal to the operational metric provided by MPLS. If the user enabled the <b>relative-metric</b> option for this LSP, IGP will apply the shortest IGP cost between the endpoints of the LSP plus the value of the offset, instead of the LSP operational metric, when computing the cost of a prefix which is resolved to the LSP.</p> <p>When a prefix is resolved to a tunnel next-hop, the packet is sent labeled with the label stack corresponding to the NHLFE of the RSVP LSP. Any network event causing an RSVP LSP to go down will trigger a full SPF computation which may result in installing a new route over another RSVP LSP shortcut as tunnel next-hop or over a regular IP next-hop.</p> <p>When rsvp-shortcut is enabled at the IGP instance level, all RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in <b>configure&gt;router&gt;mpls&gt;lsp&gt;to</b>, corresponds to a router-id of a remote node. RSVP LSPs with a destination corresponding to an interface address or any other loopback interface address of a remote node are automatically not considered by IS-IS or OSPF. The user can, however, exclude a specific RSVP LSP from being used as a shortcut for resolving IGP routes by entering the <b>config&gt;router&gt;mpls&gt;lsp&gt;no igp-shortcut</b> command.</p> |

The SPF in OSPF or IS-IS will only use RSVP LSPs as forwarding adjacencies, IGP shortcuts, or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If the user enabled two or more options in the same IGP instance, then forwarding adjacency takes precedence over the shortcut application, which takes precedence over the LDP-over-RSVP application.

When ECMP is enabled on the system and multiple equal-cost paths exist for a prefix, the following selection criteria are used to pick up the set of next-hops to program in the data path:

- for a destination = tunnel-endpoint (including external prefixes with tunnel-endpoint as the next-hop):
  - select tunnel with lowest tunnel-index (ip next-hop is never used in this case)
- for a destination != tunnel-endpoint:
  - exclude LSPs with metric higher than underlying IGP cost between the endpoint of the LSP
  - prefer tunnel next-hop over ip next-hop
  - within tunnel next-hops:
    - i.select lowest endpoint to destination cost
    - ii.if same endpoint to destination cost, select lowest endpoint node router-id
    - iii. if same router-id, select lowest tunnel-index
  - within ip next-hops:
    - i.select lowest downstream router-id
    - ii.if same downstream router-id, select lowest interface-index
- Although no ECMP is performed across both the IP and tunnel next-hops, the tunnel endpoint lies in one of the shortest IGP paths for that prefix. In that case, the tunnel next-hop is always selected as long as the prefix cost using the tunnel is equal or lower than the IGP cost.

The ingress IOM will spray the packets for this prefix over the set of tunnel next-hops and IP next-hops based on the hashing routine currently supported for IPv4 packets.

This feature provides IGP with the capability to populate the multicast RTM with the prefix IP next-hop when both the **rsvp-shortcut** and the **multicast-import** options are enabled in IGP. The unicast RTM can still make use of the tunnel next-hop for the same prefix. This change is made possible with the enhancement by which SPF keeps track of both the direct first hop and the tunneled first hop of a node which is added to the Dijkstra tree.

The resolution and forwarding of IPv6 prefixes to IPv4 IGP shortcuts is not supported.

The **no** form of this command disables the resolution of IGP routes using RSVP shortcuts.

**Default**    no rsvp-shortcut

---

| <b>Context</b>     | config>service>vprn>isis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b> | <p>This command enables IS-IS multi-instance (MI) as described in draft-ginsberg-isis-mi-bis-01. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs. A single topology is supported in each instance, so the instance-specific topology identifier (ITID) is set to 0 and cannot be changed.</p> <p>The <b>standard-multi-instance</b> (based on draft-ginsberg-isis-mi-bis-01) and <b>iid-tlv-enable</b> (based on draft-ietf-isis-mi-02) commands cannot be configured in the same instance, because the MAC addresses and PDUs from the two standards are incompatible.</p> <p>The <b>no</b> form of the command removes the <b>standard-multi-instance</b> configuration.</p> |
| <b>Default</b>     | no standard-multi-instance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## timers

|                    |                                                 |
|--------------------|-------------------------------------------------|
| <b>Syntax</b>      | <b>[no] timers</b>                              |
| <b>Context</b>     | config>service>vprn>isis                        |
| <b>Description</b> | This command configures the IS-IS timer values. |
| <b>Default</b>     | disabled                                        |

## lsp-wait

|                    |                                                                                                                                                                                                                                                                                                             |               |              |                |       |

| <b>Syntax</b>      | <b>lsp-wait</b> <i>lsp-wait</i> [ <b>lsp-initial-wait</b> <i>initial-wait</i> ] [ <b>lsp-second-wait</b> <i>second-wait</i> ]                                                                                                                                                                               |               |              |                |       |
| <b>Context</b>     | config>service>vprn>isis>timers                                                                                                                                                                                                                                                                             |               |              |                |       |
| <b>Description</b> | This command is used to customize LSP generation throttling. Timers that determine when to generate the first, second, and subsequent LSPs can be controlled with this command. Subsequent LSPs are generated at increasing intervals of the second <b>lsp-wait</b> timer until a maximum value is reached. |               |              |                |       |
| <b>Parameters</b>  | <p><i>lsp-wait</i> — specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSP being generated</p> <table><tr><td><b>Values</b></td><td>10 to 120000</td></tr><tr><td><b>Default</b></td><td>50000</td></tr></table>                                                   | <b>Values</b> | 10 to 120000 | <b>Default</b> | 50000 |
| <b>Values</b>      | 10 to 120000                                                                                                                                                                                                                                                                                                |               |              |                |       |
| <b>Default</b>     | 50000                                                                                                                                                                                                                                                                                                       |               |              |                |       |

*initial-wait* — specifies the initial LSP generation delay, in milliseconds

**Values** 10 to 100000

**Default** 10

*second-wait* — specifies the hold time, in milliseconds, between the first and second LSP generation

**Values** 10 to 100000

**Default** 1000

## spf-wait

**Syntax** `[no] spf-wait spf-wait [spf-initial-wait initial-wait] [spf-second-wait second-wait]`

**Context** config>service>vprn>isis>timers

**Description** This command defines the maximum interval, in milliseconds, between two consecutive SPF calculations. Timers that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command. Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the **spf-second-wait** interval. For example, if the **spf-second-wait** interval is 1000, then the next SPF will run after 2000 milliseconds, and the next SPF after that will run after 4000 milliseconds, and so on, until it reaches the *spf-wait* value. The SPF interval will stay at the *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to the SPF *initial-wait* value.

**Default** no spf-wait

**Parameters** *spf-wait* — specifies the maximum interval in milliseconds between two consecutive SPF calculations

**Values** 10 to 120000

**Default** 10000

*initial-wait* — specifies the initial SPF calculation delay, in milliseconds, after a topology change

**Values** 10 to 100000

**Default** 1000

*second-wait* — specifies the hold time, in milliseconds, between the first and second SPF calculation

**Values** 10 to 100000

**Default** 1000

## strict-adjacency-check

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b> | <p>This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies will not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it will be torn down. This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (no strict-adjacency-check) a BFD session failure for either IPv4 or Ipv6 will cause the routes for the other address family to be removed as well.</p> <p>When disabled (<b>no strict-adjacency-check</b>), both routers only need to have one common address family to establish the adjacency.</p> |
| <b>Default</b>     | no strict-adjacency-check                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b> | <p>This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference:</p> <ol style="list-style-type: none"><li>1. <b>configure&gt;service&gt;vprn&gt;isis&gt;system-id</b></li><li>2. <b>configure&gt;service&gt;vprn&gt;isis&gt;router-id</b></li><li>3. <b>configure&gt;service&gt;vprn&gt;router-id</b></li><li>4. <b>configure&gt;service&gt;vprn&gt;if&gt;"system"&gt;-address</b></li><li>5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0</li></ol> <p>The system ID is integral to IS-IS; therefore, for the <b>system-id</b> command to take effect, a <b>shutdown</b> and then <b>no shutdown</b> must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.</p> <p>The <b>no</b> form of the command removes the system ID from the configuration. The router ID is used when no system ID is specified.</p> |
| <b>Default</b>     | no system-id                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b> | <p>This command applies one or more (up to 5) route policies as IS-IS import policies.</p> <p>When a prefix received in an IS-IS LSP is accepted by an entry in an IS-IS import policy, it is installed in the routing table, if it is the most preferred route to the destination.</p> <p>When a prefix received in an IS-IS LSP is rejected by an entry in an IS-IS import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination.</p> <p>The flooding of LSPs is unaffected by IS-IS import policy actions.</p> <p>The <b>no</b> form of the command removes all policies from the configuration.</p> |
| <b>Default</b>     | no import                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>policy-name</i> — Identify the export route policy name. Allowed values are any string up to 32 characters long, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes. The specified name(s) must already be defined.                                                                                                                                                                                                                                                                                                                                            |

| <b>Context</b>     | config>service>vprn>isis                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b> | This command allows one IGP to import its routes into RPF RTM while another IGP imports routes only into the unicast RTM. Import policies can redistribute routes from an IGP protocol into the RPF RTM (the multicast routing table). By default, the IGP routes will not be imported into RPF RTM as such an import policy must be explicitly configured. |
| <b>Default</b>     | disabled                                                                                                                                                                                                                                                                                                                                                    |

### 3.9.2.29 OSPF Commands

| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b> | <p>This command creates the context to configure an OSPF area. An area is a collection of network segments within an AS that have been administratively grouped together. The area ID can be specified in dotted decimal notation or as a 32-bit decimal integer.</p> <p>The <b>no</b> form of the command deletes the specified area from the configuration. Deleting the area also removes the OSPF configuration of all the interfaces, virtual-links, sham-links, and address-ranges etc., that are currently assigned to this area.</p> |
| <b>Default</b>     | no area — No OSPF areas are defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>   | <p>This command creates ranges of addresses on an Area Border Router (ABR) for the purpose of route summarization or suppression. When a range is created, the range is configured to be advertised or not advertised into other areas. Multiple range commands may be used to summarize or hide different ranges. In the case of overlapping ranges, the most specific range command applies.</p> <p>ABRs send summary link advertisements to describe routes to other areas. To minimize the number of advertisements that are flooded, you can summarize a range of IP addresses and send reachability information about these addresses in an LSA.</p> <p>The <b>no</b> form of the command deletes the range (non) advertisement.</p> |  |
| <b>Default</b>       | <b>no area-range</b> — No range of addresses are defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| <b>Special Cases</b> | <p><b>NSSA Context</b> — In the NSSA context, the option specifies that the range applies to external routes (via type-7 LSAs) learned within the NSSA when the routes are advertised to other areas as type-5 LSAs.</p> <p><b>Area Context</b> — If this command is not entered under the NSSA context, the range applies to summary LSAs even if the area is an NSSA.</p>                                                                                                                                                                                                                                                                                                                                                                |  |
| <b>Parameters</b>    | <i>ipv6-prefix/prefix-length</i> — the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| <b>Values</b>        | <div> <div>ipv6-prefix</div> <div> x::x::x::x::x::x (eight 16-bit pieces)<br/> x::x::x::x::d.d.d.d<br/> x: [0 to FFFF]H<br/> d: [0 to 255]D </div> </div> <div> <div>ipv6-prefix-length</div> <div>0 to 128</div> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |

*mask* — the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation

**Values** 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

**advertise | not-advertise** — Specifies whether or not to advertise the summarized range of addresses into other areas. The **advertise** keyword indicates the range will be advertised, and the keyword **not-advertise** indicates the range will not be advertised.

The default is **advertise**.

## blackhole-aggregate

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Syntax</b>      | <b>[no] blackhole-aggregate</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Context</b>     | config>service>vprn>ospf>area<br>config>service>vprn>ospf3>area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>This command installs a low priority blackhole route for the entire aggregate. Existing routes that make up the aggregate will have a higher priority and only the components of the range for which no route exists are blackholed.</p> <p>It is possible that when performing area aggregation, addresses may be included in the range for which no actual route exists. This can cause routing loops. To avoid this problem configure the blackhole aggregate option.</p> <p>The <b>no</b> form of this command removes this option.</p> |
| <b>Default</b>     | blackhole-aggregate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b> | <p>This command creates a context to configure an OSPF interface.</p> <p>By default interfaces are not activated in any interior gateway protocol such as OSPF unless explicitly configured.</p> <p>The <b>no</b> form of the command deletes the OSPF interface configuration for this interface. The <b>shutdown</b> command in the <b>config&gt;router&gt;ospf&gt;interface</b> context can be used to disable an interface without removing the configuration for the interface.</p> |
| <b>Default</b>     | no interface — No OSPF interfaces are defined.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

---

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><i>ip-int-name</i> — The IP interface name. Interface names must be unique within the group of defined IP interfaces for <b>config router interface</b> and <b>config service vprn interface</b> commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes.</p> <p>If the IP interface name does not exist or does not have an IP address configured an error message will be returned.</p> <p>If the IP interface exists in a different area it will be moved to this area.</p> <p><i>secondary</i> — allows multiple secondary adjacencies to be established over a single IP interface</p> |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## sham-link

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Context</b>     | config>service>vprn>ospf>area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b> | This command is similar to a virtual link with the exception that metric must be included in order to distinguish the cost between the MPLS-VP RN link and the backdoor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <p><i>ip-int-name</i> — The local interface name used for the sham-link. This is a mandatory parameter and interface names must be unique within the group of defined IP interfaces for <b>config&gt;router&gt;interface</b>, <b>config&gt;service&gt;ies&gt;interface</b> and <b>config&gt;service&gt;vprn&gt;interface</b> commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters, the entire string must be enclosed between double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.</p> <p><i>ip-address</i> — The IP address of the SHAM-link neighbor in IP address dotted decimal notation. This parameter is the remote peer of the sham link's IP address used to set up the SHAM link. This is a mandatory parameter and must be a valid IP address.</p> |

## advertise-subnet

|                    |                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] advertise-subnet</b>                                                                                                                                                                                                                     |
| <b>Context</b>     | config>service>vprn>ospf>area>if                                                                                                                                                                                                                 |
| <b>Description</b> | <p>This command enables advertising point-to-point interfaces as subnet routes (network number and mask). When disabled, point-to-point interfaces are advertised as host routes.</p> <p>This command is not supported in the OSPF3 context.</p> |

The **no** form of the command disables advertising point-to-point interfaces as subnet routes meaning they are advertised as host routes.

**Default** advertise-subnet — Advertises point-to-point interfaces as subnet routes.

## authentication

**Syntax** **authentication bidirectional** *sa-name*  
**authentication inbound** *sa-name* **outbound** *sa-name*  
**no authentication**

**Context** config>service>vprn>ospf3>area>if

**Description** This command configures OPSFv3 confidentiality authentication.

The no form of the command removes the SA name from the configuration.

**Parameters** **bidirectional** *sa-name* — specifies the IPsec security association name in case the OSPFv3 traffic on the interface has to be authenticated

**inbound** *sa-name* — specifies the IPsec security association name in case the OSPFv3 traffic on the interface has to be authenticated

**outbound** *sa-name* — specifies the IPsec security association name in case the OSPFv3 traffic on the interface has to be authenticated

## authentication-key

**Syntax** **authentication-key** [*authentication-key* | *hash-key*] [**hash** | **hash2**]  
**no authentication-key**

**Context** config>service>vprn>ospf>area>if  
config>service>vprn>ospf>area>virtual-link  
config>service>vprn>ospf>area>sham-link

**Description** This command configures the password used by the OSPF interface or virtual-link to send and receive OSPF protocol packets on the interface when simple password authentication is configured.

This command is not valid in the OSPF3 context.

All neighboring routers must use the same type of authentication and password for proper protocol communication. If the **authentication-type** is configured as password, then this key must be configured.

By default, no authentication key is configured.

This command is not supported in the OSPF context.

The **no** form of the command removes the authentication key.

---

|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | no authentication-key — No authentication key is defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters</b> | <p><i>authentication-key</i> — The authentication key. The key can be any combination of ASCII characters up to 8 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").</p> <p><i>hash-key</i> — The hash key. The key can be any combination of ASCII characters up to 22 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").</p> <p>This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.</p> <p><b>hash</b> — Specifies the key is entered in an encrypted form. If the <b>hash</b> or <b>hash2</b> parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> or <b>hash2</b> parameter specified</p> <p><b>hash2</b> — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the <b>hash2</b> encrypted variable cannot be copied and pasted. If the <b>hash</b> or <b>hash2</b> parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> or <b>hash2</b> parameter specified.</p> |

## authentication-type

| <b>Description</b> | <p>This command enables authentication and specifies the type of authentication to be used on the OSPF interface, virtual-link, and sham-link.</p> <p>This command is not valid in the OSPF3 context.</p> <p>Both simple <b>password</b> and <b>message-digest</b> authentication are supported.</p> <p>By default, authentication is not enabled on an interface.</p> <p>The <b>no</b> form of the command disables authentication on the interface.</p> <p>This command is not supported in the OSPF context.</p> |
| <b>Default</b>     | no authentication — no authentication is enabled on an interface                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b>  | <b>password</b> — This keyword enables simple password (plain text) authentication. If authentication is enabled and no authentication type is specified in the command, simple <b>password</b> authentication is enabled.                                                                                                                                                                                                                                                                                          |

**message-digest** — This keyword enables message digest MD5 authentication in accordance with RFC1321. If this option is configured, then at least one message-digest-key must be configured.

## bfd-enable

| <b>Description</b> | This command enables the use of bi-directional forwarding (BFD) to control the state of the associated protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command under the IP interface.<br><br>The <b>no</b> form of this command removes BFD from the associated IGP protocol adjacency. |
| <b>Default</b>     | no bfd-enable                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <b>remain-down-on-failure</b> — forces adjacency down on BFD failure                                                                                                                                                                                                                                                                                                                                                                                                                    |

## dead-interval

|                      |                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <b>dead-interval</b> <i>seconds</i><br><b>no dead-interval</b>                                                                                                                                                                                                                                                                                                     |
| <b>Context</b>       | config>service>vprn>ospf>area>if<br>config>service>vprn>ospf>area>virtual-link<br>config>service>vprn>ospf3>area>if<br>config>service>vprn>ospf3>area>virtual-link<br>config>service>vprn>ospf>area>sham-link                                                                                                                                                      |
| <b>Description</b>   | This command configures the time, in seconds, that OSPF waits before declaring a neighbor router down. If no hello packets are received from a neighbor for the duration of the dead interval, the router is assumed to be down. The minimum interval must be two times the hello interval.<br><br>The <b>no</b> form of the command reverts to the default value. |
| <b>Default</b>       | 40                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Special Cases</b> | <b>OSPF Interface</b> — If the <b>dead-interval</b> configured applies to an interface, then all nodes on the subnet must have the same dead interval.<br><br><b>Virtual Link</b> — If the <b>dead-interval</b> configured applies to a virtual link, then the interval on both termination points of the virtual link must have the same dead interval.           |

**Sham-link** — If the **dead-interval** configured applies to a sham-link, then the interval on both endpoints of the sham-link must have the same dead interval.

**Parameters**    *seconds* — the dead interval expressed as a decimal integer

**Values**        2 to 2147483647 seconds

## graceful-restart

**Syntax**        **[no] graceful-restart**

**Context**        config>service>vprn>ospf  
                  config>service>vprn>ospf3

**Description**    This command enables OSPF graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, then the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.

The **no** form of the command disables graceful restart and removes the graceful restart configuration from the OSPF instance.

**Default**        no graceful-restart

## helper-disable

**Syntax**        **[no] helper-disable**

**Context**        config>service>vprn>ospf>graceful-restart  
                  config>service>vprn>ospf3>graceful-restart

**Description**    This command disables helper support for OSPF graceful restart (GR).

When **graceful-restart** is enabled, the router can be a helper (meaning that the router is helping a neighbor to restart), a restarting router, or both. The router only supports helper mode. It will not act as a restarting router, because the high availability feature set already preserves OSPF forwarding information such that this functionality is not needed. This command is a historical command and should not be disabled. Configuring **helper-disable** has the effect of disabling graceful restart, because the router only supports helper mode.

The **no helper-disable** command enables helper support and is the default when graceful restart is enabled.

**Default**        no helper-disable

## strict-lsa-checking

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | <p>This command applies one or more (up to 5) route policies as OSPF import policies. When a prefix received in an OSPF LSA is accepted by an entry in an OSPF import policy it is installed in the routing table if it is the most preferred route to the destination. When a prefix received in an OSPF LSA is rejected by an entry in an OSPF import policy it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination. The flooding of LSAs is unaffected by OSPF import policy actions. This command only applies to the 7750 SR.</p> |

|                   |                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | If an OSPF route has the lowest preference value among all routes to a destination it is installed in the routing table.                                                                                                                                                                                                              |
| <b>Parameters</b> | <i>policy-name</i> — The import route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes.<br>The specified name(s) must already be defined. |

## hello-interval

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>   | <p>This command configures the interface type to be either broadcast or point-to-point.</p> <p>Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided the link is used as a point-to-point.</p> <p>If the interface type is not known at the time the interface is added to OSPF and subsequently the IP interface is bound (or moved) to a different interface type, this command must be entered manually.</p> <p>The <b>no</b> form of the command reverts to the default value.</p> |
| <b>Default</b>       | point-to-point — if the physical interface is SONET<br><br>broadcast — if the physical interface is Ethernet or unknown                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Special Cases</b> | <b>Virtual-Link</b> — a virtual link is always regarded as a point-to-point interface and not configurable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>    | <p><b>broadcast</b> — Configures the interface to maintain this link as a broadcast network. To significantly improve adjacency forming and network convergence, a network should be configured as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.</p> <p><b>point-to-point</b> — configures the interface to maintain this link as a point-to-point link</p>                                                                                                                                                                                            |

## loopfree-alternate-exclude

|                    |                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] loopfree-alternate-exclude</b>                                                                                                                                                                                                            |
| <b>Context</b>     | config>service>vprn>ospf>area<br>config>service>vprn>ospf3>area<br>config>service>vprn>ospf>area>interface<br>config>service>vprn>ospf3>area>interface                                                                                            |
| <b>Description</b> | This command instructs IGP to not include a specific interface or all interfaces participating in a specific IS-IS level or OSPF area in the SPF LFA computation. This provides a way of reducing the LFA SPF calculation where it is not needed. |

When an interface is excluded from the LFA SPF in IS-IS, it is excluded in both level 1 and level 2. When it is excluded from the LFA SPF in OSPF, it is excluded in all areas. However, the above OSPF command can only be executed under the area in which the specified interface is primary and once enabled, the interface is excluded in that area and in all other areas where the interface is secondary. If the user attempts to apply it to an area where the interface is secondary, the command will fail.

The **no** form of this command re-instates the default value for this command.

**Default** no loopfree-alternate-exclude

config>service>vprn>ospf>area>interface  
config>service>vprn>ospf3>area>interface

**Description** This command enables filtering of outgoing OSPF LSAs on the selected OSPFv2 or OSPFv3 interface. Three filtering options are provided:

- Do not flood any LSAs out the interface. This option is suitable if the neighbor is simply-connected and has a statically configured default route with the address of this interface as next-hop.
- Flood the router's own router-LSA out the interface and suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and has a statically configured default route with a loopback or system interface address (contained in the router-LSA) as next-hop.
- Flood the router's own router-LSA and all self-generated type-3, type-5 and type-7 LSAs advertising a default route (0/0) out the interface; suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and does not have a statically configured default route.

The **no** form of this command disables OSPF LSA filtering (normal operation).

**Default** no lsa-filter-out

## multicast-import

**Syntax** [no] multicast-import

**Context** config>service>vprn>ospf  
config>service>vprn>ospf3

|                    |                                                                                                                                                                                                        |

Multiple message digest keys can be configured.<br><br>This command is not valid in the OSPF3 context.<br><br>The <b>no</b> form of the command removes the message digest key identified by the <i>key-id</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>     | No message digest keys are defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <b>keyid</b> — the <i>keyid</i> is expressed as a decimal integer<br><br><b>Values</b> 1 to 255<br><br><b>md5</b> <i>key</i> — The MD5 key. The <i>key</i> can be any alphanumeric string up to 16 characters in length.<br><br><b>md5</b> <i>hash-key</i> — The MD5 hash key. The <i>key</i> can be any combination of ASCII characters up to 32 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").<br>This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.<br><br><b>hash</b> — Specifies the key is entered in an encrypted form. If the <b>hash</b> parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> parameter specified. |

## metric

|                |                                                                       |
|----------------|-----------------------------------------------------------------------|
| <b>Syntax</b>  | <b>metric</b> <i>metric</i><br><b>no metric</b>                       |
| <b>Context</b> | config>service>vprn>ospf>area>if<br>config>service>vprn>ospf3>area>if |

```
config>service>vprn>ospf>area>sham-link
```

**Description** This command configures an explicit route cost metric for the OSPF interface that overrides the metrics calculated based on the speed of the underlying link.

The **no** form of the command deletes the manually configured interface metric, so the interface uses the computed metric based on the **reference-bandwidth** command setting and the speed of the underlying link.

**Default** no metric — the metric is based on **reference-bandwidth** setting and the link speed

**Parameters** *metric* — the metric to be applied to the interface expressed as a decimal integer

**Values** 1 to 65535

## mtu

**Syntax** **mtu** *bytes*  
**no mtu**

**Context** config>service>vprn>ospf>area>if  
config>service>vprn>ospf3>area>if

**Description** This command configures the OSPF packet size used on this interface. If this parameter is not configured OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:

```
config>port>ethernet
config>port>sonet-sdh>path
config>port>tdm>t3-e3
config>port>tdm>t1-e1>channel-group
```

If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned context is used.

To determine the actual packet size add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.

Use the **no** form of this command to revert to default.

**Default** no mtu — Uses the value derived from the MTU configured in the **config>port** context.

**Parameters** *bytes* — the MTU to be used by OSPF for this logical interface in bytes

**Values** 512 to 9198 (9212-14) (Depends on the physical media)

## passive

**Syntax** [**no**] **passive**

---

| <b>Description</b> | <p>This command configures the priority of the OSPF interface that is used an election of the designated router on on the subnet.</p> <p>This parameter is only used if the interface is of type broadcast. The router with the highest priority interface becomes the designated router. A router with priority 0 is not eligible to be Designated Router or Backup Designated Router.</p> <p>The <b>no</b> form of the command reverts the interface priority to the default value.</p> |
| <b>Default</b>     | priority 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><i>number</i> — The interface priority expressed as a decimal integer. A value of 0 indicates the router is not eligible to be the Designated Router of Backup Designated Router on the interface subnet.</p> <p><b>Values</b>      0 to 255</p>                                                                                                                                                                                                                                       |

|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>This command creates the context to configure an OSPF Not So Stubby Area (NSSA) and adds/removes the NSSA designation from the area.</p> <p>NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is an NSSA has the capability to flood external routes that it learns throughout its area and via an ABR to the entire OSPF domain.</p> <p>Existing virtual links of a non-stub or NSSA area will be removed when the designation is changed to NSSA or stub.</p> <p>An area can be designated as stub or NSSA but never both at the same time.</p> <p>By default, an area is not configured as an NSSA area.</p> <p>The <b>no</b> form of the command removes the NSSA designation and configuration context from the area.</p> |
| <b>Default</b>     | no nssa — The OSPF area is not an NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b> | <p>This command enables the generation of a default route and its LSA type (3 or 7) into a Not So Stubby Area (NSSA) by an NSSA Area Border Router (ABR) or Autonomous System Border Router (ASBR).</p> <p>When configuring an NSSA with no summaries, the ABR will inject a type 3 LSA default route into the NSSA area. Some older implementations expect a type 7 LSA default route.</p> <p>The <b>no</b> form of the command disables origination of a default route.</p> |
| <b>Default</b>     | no originate-default-route — A default route is not originated.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <p><b>type-7</b> — Specifies that a type 7 LSA should be used for the default route.</p> <p>Configure this parameter to inject a type 7 LSA default route into an NSSA configured with no summaries, instead of a type 3 LSA.</p> <p>To revert to a type 3 LSA, execute the <b>originate-default-route</b> command without the <b>type-7</b> parameter.</p> <p><b>Default</b> type 3 LSA default route</p>                                                                    |

**no-adjacency-check** — Specifies whether or not adjacency checks are performed before originating a default route. If this parameter is configured, then no area 0 adjacency is required for the ABR to advertise the default route.

**Default** Adjacency checks are performed, and an area 0 adjacency is required for the ABR to advertise the default route

## redistribute-external

| <b>Description</b> | <p>This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA area border router (ABR) that is exporting the routes into non-NSSA areas.</p> <p>NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via an Area Border Router to the entire OSPF domain.</p> <p>The <b>no</b> form of the command disables the default behavior to automatically redistribute external routes into the NSSA area from the NSSA ABR.</p> |
| <b>Default</b>     | redistribute-external — External routes are redistributed into the NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b> | <p>This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR). This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or nssa area. By default, summary route advertisements are sent into the stub area or NSSA.</p> <p>The <b>no</b> form of the command disables sending summary route advertisements and, for stub areas, only the default route is advertised by the ABR.</p> |
| <b>Default</b>     | summaries — Summary routes are advertised by the ABR into the stub area or NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Context</b>     | config>service>vprn>ospf>area<br>config>service>vprn>ospf3>area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b> | <p>This command enables access to the context to configure an OSPF stub area and adds/removes the stub designation from the area. External routing information is not flooded into stub areas. All routers in the stub area must be configured with the <b>stub</b> command. An OSPF area cannot be both an NSSA and a stub area. Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.</p> <p>By default, an area is not a stub area.</p> <p>The <b>no</b> form of the command removes the stub designation and configuration context from the area.</p> |
| <b>Default</b>     | no stub — The area is not configured as a stub area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b> | <p>This command configures the metric used by the area border router (ABR) for the default route into a stub area. The default metric should only be configured on an ABR of a stub area. An ABR generates a default route if the area is a <b>stub</b> area.</p> <p>The <b>no</b> form of the command reverts to the default value.</p> |
| <b>Default</b>     | default-metric 1                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <i>metric</i> — the metric expressed as a decimal integer for the default route cost to be advertised into the stub area<br><b>Values</b> 1 to 16777215                                                                                                                                                                                  |

## virtual-link

|                |                                                                              |
|----------------|------------------------------------------------------------------------------|
| <b>Syntax</b>  | <b>[no] virtual-link</b> <i>router-id</i> <b>transit-area</b> <i>area-id</i> |
| <b>Context</b> | config>service>vprn>ospf>area<br>config>service>vprn>ospf3>area              |

**Description** This command configures a virtual link to connect area border routers to the backbone via a virtual link. The backbone area (area 0.0.0.0) must be contiguous and all other areas must be connected to the backbone area. If it is not practical to connect an area to the backbone (see area 0.0.0.2 in the picture below) then the area border routers (routers 1 and 2 in the picture below) must be connected via a virtual link. The two area border routers will form a point-to-point like adjacency across the transit area (area 0.0.0.1 in the picture below). A virtual link can only be configured while in the area 0.0.0.0 context.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of the command deletes the virtual link.

**Default** No virtual link is defined.

**Parameters** *router-id* — the router ID of the virtual neighbor in IP address dotted decimal notation

**transit-area** *area-id* — the area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone

The OSPF backbone area, area 0.0.0.0, must be contiguous and all other areas must be connected to the backbone area. The backbone distributes routing information between areas. If it is not practical to connect an area to the backbone (see Area 0.0.0.5 in [Figure 47](#)) then the area border routers (such as routers Y and Z) must be connected via a virtual link. The two area border routers form a point-to-point-like adjacency across the transit area (see Area 0.0.0.4).

| <b>Context</b>     | config>service>vprn>ospf                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b> | <p>This command enables OSPF summary and external route calculations in compliance with RFC1583 and earlier RFCs.</p> <p>RFC1583 and earlier RFCs use a different method to calculate summary and external route costs. To avoid routing loops, all routers in an OSPF domain should perform the same calculation method.</p> <p>Although it would be favorable to require all routers to run a more current compliancy level, this command allows the router to use obsolete methods of calculation.</p> <p>This command is not supported in OSPF3.</p> <p>The <b>no</b> form of the command enables the post-RFC1583 method of summary and external route calculation.</p> |
| <b>Default</b>     | compatible-rfc1583 — RFC1583 compliance is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b> | <p>This command associates export route policies to determine which routes are exported from the route table to OSPF. Export polices are only in effect if OSPF is configured as an ASBR.</p> <p>If no export policy is specified, non-OSPF routes are not exported from the routing table manager to OSPF.</p> <p>If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.</p> <p>The <b>no</b> form of the command removes all policies from the configuration.</p> |
| <b>Default</b>     | no export — No export route policies specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <i>policy-name</i> — The export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes.                                                                                                                                                                                                                                                                                                                                                                                                                              |

The specified name(s) must already be defined.

| <b>Description</b> | <p>This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the LSDB and specifies a wait timer before processing these after the limit is exceeded.</p> <p>The <i>limit</i> value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the <i>limit</i>, the table is in an overflow state. When in an overflow state, the router will not originate any new AS-external-LSAs. In fact, it withdraws all the self-originated non-default external LSAs.</p> <p>The <i>interval</i> specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period preventing the router from continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.</p> <p>The <b>external-db-overflow</b> must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.</p> <p>The <b>no</b> form of the command disables limiting the number of non-default AS-external-LSA entries.</p> |
| <b>Default</b>     | no external-db-overflow — No limit on non-default AS-external-LSA entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b>  | <p><i>limit</i> — the maximum number of non-default AS-external-LSA entries that can be stored in the LSDB before going into an overflow state expressed as a decimal integer</p> <p><b>Values</b>     -1 to 2147483647</p> <p><i>interval</i> — the number of seconds after entering an overflow state before attempting to process non-default AS-external-LSAs expressed as a decimal integer</p> <p><b>Values</b>     0 to 2147483647</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | <p>This command configures the preference for OSPF external routes.</p> <p>A route can be learned by the router from different protocols in which case the costs are not comparable; when this occurs the preference is used to decide which route will be used.</p> <p>Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the following table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.</p> <p>If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the <b>ecmp</b> in the config&gt;router context.</p> <p>The <b>no</b> form of the command reverts to the default value.</p> |
| <b>Default</b>     | external-preference 150 — OSPF external routes have a default preference of 150.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>preference</i> — The preference for external routes expressed as a decimal integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>1</sup> |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| RIP                    | 100        | Yes              |
| OSPF external          | 150        | Yes              |
| IS-IS level 1 external | 160        | Yes              |
| IS-IS level 2 external | 165        | Yes              |
| BGP                    | 170        | Yes              |

**Note:**

1. Preference for OSPF internal routes is configured with the **preference** command

**Values** 1 to 255

## ignore-dn-bit

|                |                          |
|----------------|--------------------------|
| <b>Syntax</b>  | [no] ignore-dn-bit       |
| <b>Context</b> | config>service>vprn>ospf |

**Description** This command specifies whether to ignore the DN bit for OSPF LSA packets for this instance of OSPF on the router. When enabled, the DN bit for OSPF LSA packets will be ignored. When disabled, the DN bit will not be ignored for OSPF LSA packets.

## loopfree-alternate

**Syntax** **[no] loopfree-alternate**

**Context** config>service>vprn>ospf  
config>service>vprn>ospf3

**Description** This command enables Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level, or under the OSPF routing protocol instance level.

When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next-hop and an LFA next-hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next-hop is only available after the LFA SPF is completed. When found, the LFA next-hop is populated into the routing table along with the primary next-hop for the prefix.

The **no** form of this command disables the LFA computation by IGP SPF.

**Default** no loopfree-alternate

## overload

**Syntax** **overload [timeout seconds]**  
**no overload**

**Context** config>service>vprn>ospf  
config>service>vprn>ospf3

**Description** This command changes the overload state of the local router so that it appears to be overloaded. When overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic destined to directly attached interfaces continue to reach the router.

To put the IGP in an overload state enter a timeout value. The IGP will enter the overload state until the timeout timer expires or a **no overload** command is executed.

If the **overload** command is encountered during the execution of an [overload-on-boot](#) command then this command takes precedence. This could occur as a result of a saved configuration file where both parameters are saved. When the file is saved by the system the **overload-on-boot** command is saved after the **overload** command.

Use the **no** form of this command to return to the default. When the **no overload** command is executed, the overload state is terminated regardless the reason the protocol entered overload state.

|                   |                                                                                      |
|-------------------|--------------------------------------------------------------------------------------|
| <b>Default</b>    | no overload                                                                          |
| <b>Parameters</b> | <b>timeout</b> <i>seconds</i> — specifies the number of seconds to reset overloading |
|                   | <b>Values</b> 60 to 1800                                                             |
|                   | <b>Default</b> 60                                                                    |

## if-attribute

|                    |                                                                                                                                                             |

| <b>Description</b> | <p>This command configures the admin group membership of an interface. The user can apply admin groups to an IES, VPRN, network IP, or MPLS interface.</p> <p>Each single operation of the <b>admin-group</b> command allows a maximum of five (5) groups to be specified at a time. However, a maximum of 32 groups can be added to a given interface through multiple operations. Once an admin group is bound to one or more interface, its value cannot be changed until all bindings are removed.</p> <p>The configured admin-group membership will be applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.</p> <p>Only the admin groups bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the <b>traffic-engineering</b> option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.</p> |

The **no** form of this command deletes one or more of the admin-group memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

**Parameters** *group-name* — Specifies the name of the group with up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

## srlg-group

**Syntax** **srlg-group** *group-name* [*group-name...*(up to 5 max)]  
**no srlg-group** *group-name* [*group-name...*(up to 5 max)]  
**no srlg-group**

**Context** config>router>interface>if-attribute  
config>service>ies>if>if-attribute  
config>service>vpn>if>if-attribute  
config>router>mpls>interface

**Description** This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership will be applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

**Parameters** *group-name* — Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

## lfa-policy-map

**Syntax** **lfa-policy-map** *route-nh-template* *template-name*  
**no lfa-policy-map**

**Context** config>router>ospf>area>interface  
config>router>ospf3>area>interface  
config>router>isis>interface

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                    | <pre>config&gt;service&gt;vprn&gt;ospf&gt;area&gt;interface config&gt;service&gt;vprn&gt;ospf3&gt;area&gt;interface</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | <p>This command applies a route next-hop policy template to an OSPF or IS-IS interface.</p> <p>When a route next-hop policy template is applied to an interface in IS-IS, it is applied in both level 1 and level 2. When a route next-hop policy template is applied to an interface in OSPF, it is applied in all areas. However, the command in an OSPF interface context can only be executed under the area in which the specified interface is primary and then applied in that area and in all other areas where the interface is secondary. If the user attempts to apply it to an area where the interface is secondary, the command will fail.</p> <p>If the user excluded the interface from LFA using the command <b>loopfree-alternate-exclude</b>, the LFA policy, if applied to the interface, has no effect.</p> <p>Finally, if the user applied a route next-hop policy template to a loopback interface or to the system interface, the command will not be rejected, but it will result in no action being taken.</p> <p>The <b>no</b> form deletes the mapping of a route next-hop policy template to an OSPF or IS-IS interface.</p> |
| <b>Parameters</b>  | <i>template-name</i> — specifies the name of the template, up to 32 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b> | <p>This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.</p> <p>The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.</p> <p>If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF. Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.</p> <p>The default action of the <b>loopfree-alternate-exclude</b> command, when not explicitly specified by the user in the prefix policy, is a “reject”. Thus, regardless if the user did or did not explicitly add the statement “default-action reject” to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.</p> <p>The <b>no</b> form deletes the exclude prefix policy.</p> |

**Parameters**     *prefix-policy prefix-policy* — Specifies the name of the prefix policy, up to 32 characters. The specified name must have been already defined.

| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                          |
| <b>Description</b> | When the router is in an overload state, the router is used only if there is no other router to reach the destination. This command configures the IGP upon bootup in the overload state until one of the following events occur: <ul style="list-style-type: none"><li>• The timeout timer expires.</li></ul> |

- A manual override of the current overload state is entered with the **no overload** command.

The **no overload** command does not affect the **overload-on-boot** function.

The **no** form of the command removes the overload-on-boot functionality from the configuration.

|                   |                                                                                       |
|-------------------|---------------------------------------------------------------------------------------|
| <b>Default</b>    | no overload-on-boot                                                                   |
| <b>Parameters</b> | <b>timeout</b> <i>seconds</i> — Specifies the number of seconds to reset overloading. |
|                   | <b>Values</b> 60 to 1800                                                              |

| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b> | <p>This command configures the preference for OSPF internal routes.</p> <p>A route can be learned by the router from different protocols in which case the costs are not comparable, when this occurs the preference is used to decide to which route will be used.</p> <p>Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the following table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.</p> <p>If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the <b>ecmp</b> in the config&gt;router context.</p> <p>The <b>no</b> form of the command reverts to the default value.</p> |
| <b>Default</b>     | preference 10 — OSPF internal routes have a preference of 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b>  | <i>preference</i> — The preference for internal routes expressed as a decimal integer.<br>Defaults for different route types are listed in the following table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>1</sup> |
| IS-IS level 1 internal | 15         | Yes              |

| Route Type             | Preference | Configurable |
|------------------------|------------|--------------|
| IS-IS level 2 internal | 18         | Yes          |
| RIP                    | 100        | Yes          |
| OSPF external          | 150        | Yes          |
| IS-IS level 1 external | 160        | Yes          |
| IS-IS level 2 external | 165        | Yes          |
| BGP                    | 170        | Yes          |

**Note:**

1. Preference for OSPF internal routes is configured with the **preference** command

**Values** 1 to 255

## reference-bandwidth

|                    |                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>reference-bandwidth</b> <i>reference-bandwidth</i><br><b>no reference-bandwidth</b>                                                                                                |
| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                 |
| <b>Description</b> | This command configures the reference bandwidth in kilobits per second (Kbps) that provides the reference for the default costing of interfaces based on their underlying link speed. |

The default interface cost is calculated as follows:

$$\text{cost} = \text{reference} - \text{bandwidth} \div \text{bandwidth}$$

The default *reference-bandwidth* is 100,000,000 Kbps or 100 Gbps, so the default auto-cost metrics for various link speeds are as follows:

- 10 Mbps link default cost of 10000
- 100 Mbps link default cost of 1000
- 1 Gbps link default cost of 100
- 10 Gbps link default cost of 10

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command in the **config>router>ospf>area>interface** *ip-int-name* context.

The **no** form of the command reverts the reference-bandwidth to the default value.

**Default** reference-bandwidth 100000000 — Reference bandwidth of 100 Gbps.

| <b>Context</b>     | config>service>vprn>ospf                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command specifies whether CE-PE functionality is required or not. The OSPF super backbone indicates the type of the LSA generated as a result of routes redistributed into OSPF. When enabled, the redistributed routes are injected as summary, external or NSSA LSAs. When disabled, the redistributed routes are injected as either external or NSSA LSAs only. |
| <b>Default</b>     | no super-backbone                                                                                                                                                                                                                                                                                                                                                       |

|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | This command specifies whether to suppress the setting of the DN bit for OSPF LSA packets generated by this instance of OSPF on the router. When enabled, the DN bit for OSPF LSA packets generated by this instance of the OSPF router will not be set. When disabled, this instance of the OSPF router will follow the normal procedure to determine whether to set the DN bit. |
| <b>Default</b>     | no suppress-dn-bit                                                                                                                                                                                                                                                                                                                                                                |

## timers

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Context</b>     | config>service>vprn>ospf<br>config>service>vprn>ospf3                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b> | <p>This command enables the context that allows for the configuration of OSPF timers. Timers control the delay between receipt of a link state advertisement (LSA) requiring a Dijkstra (Shortest Path First (SPF)) calculation and the minimum time between successive SPF calculations.</p> <p>Changing the timers affect CPU utilization and network reconvergence times. Lower values reduce convergence time but increase CPU utilization. Higher values reduce CPU utilization but increase reconvergence time.</p> |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b> | <p>This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs can be controlled with this command. Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the <i>spf-second-wait</i> interval. For example, if the <i>spf-second-wait</i> interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the <b>spf-wait</b> value. The SPF interval will stay at the <b>spf-wait</b> value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to <i>spf-initial-wait</i>.</p> <p>The timer must be entered in increments of 100 milliseconds. Values entered that do not match this requirement will be rejected.</p> <p>Use the <b>no</b> form of this command to return to the default.</p> |
| <b>Default</b>     | no spf-wait                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b> | <p>This command specifies the route tag for an OSPF VPN on a PE router. This field is set in the tag field of the OSPF external LSAs generated by the PE. This is mainly used to prevent routing loops. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance.</p> <p>This command is not supported in OSPF3.</p> |

| <b>Context</b>     | config>service>vprn>ospf>timers<br>config>service>vprn>ospf3>timers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | This parameter customizes the throttling of OSPF LSA-generation. Timers that determine when to generate the first, second, and subsequent LSAs can be controlled with this command. Subsequent LSAs are generated at increasing intervals of the <i>Isa-second-wait</i> timer until a maximum value is reached. Configuring the <b>Isa-arrival</b> interval to equal or less than the <i>Isa-second-wait</i> interval configured in the <b>Isa-generate</b> command is recommended.<br><br>Use the <b>no</b> form of this command to return to the default. |
| <b>Default</b>     | no Isa-generate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <i>max-Isa-wait</i> — Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSA being generated.<br><br><b>Values</b> 10 to 600000<br><b>Default</b> 5000<br><br><i>Isa-initial-wait</i> — Specifies the first waiting period between link-state advertisements (LSA) originate(s), in milliseconds. When the LSA exceeds the <b>Isa-initial-wait</b> timer value and the topology changes, there is no wait period and the LSA is immediately generated.                                                              |

When an LSA is generated, the initial wait period commences. If, within the specified **lsa-initial-wait** period and another topology change occurs, then the **lsa-initial-wait** timer applies.

**Values** 10 to 600000  
**Default** 5000

*lsa-second-wait* — Specifies the hold time in milliseconds between the first and second LSA generation. The next topology change is subject to this second wait period. With each subsequent topology change, the wait time doubles (this is 2x the previous wait time). This assumes that each failure occurs within the relevant wait period.

**Values** 10 to 600000  
**Default** 5000

### 3.9.2.30 PIM Commands

#### pim

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Context</b>     | config>service>vprn                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | <p>This command configures a Protocol Independent Multicast (PIM) instance in the VPRN service. When an PIM instance is created, the protocol is enabled. PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The router supports PIM sparse mode (PIM-SM).</p> <p>The <b>no</b> form of the command deletes the PIM protocol instance removing all associated configuration parameters.</p> |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

#### apply-to

|                    |                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Description</b> | <p>This command configures multicast group IPv4 prefixes for the multicast GRT/VRF with per group mapping extranet functionality. Multiple lines are allowed. Duplicate prefixes are ignored. Operator can either configure specific groups for extranet or specify all groups by using key-word any. The two options are mutually exclusive in configuration.</p> <p>When the starg option is specified, extranet functionality is enabled for PIM ASM as for the specified group. When the option is not specified (not recommended with PIM ASM), the PIM ASM join will be mapped and data plane will be established, but the control plane will not be updated on SPT switchover, unless the switchover is driven by a CPE router on a receiver side.</p> <p>The <b>no</b> form of the command deletes specified prefix from the list, or removes mapping of all prefixes if group-prefix any was specified.</p> |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <i>ip-address/mask</i> — specifies the IPv4 multicast address prefix with mask                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b> | <p>This command specifies the import route policy to be used for determining which routes are accepted from peers. Route policies are configured in the <b>config&gt;router&gt;policy-options</b> context. When an import policy is not specified, BGP routes are accepted by default.</p> <p>The <b>no</b> form of the command removes the policy association from the IGMP instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>     | no import join-policy<br>no import register-policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <p><b>join-policy</b> — Use this command to filter PIM join messages which prevents unwanted multicast streams from traversing the network.</p> <p><b>register-policy</b> — This keyword filters register messages. PIM register filters prevent register messages from being processed by the RP. This filter can only be defined on an RP. When a match is found, the RP immediately sends back a register-stop message.</p> <p><i>policy-name</i> — The route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes. Route policies are configured in the <b>config&gt;router&gt;policy-options</b> context.</p> |

## interface

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] interface</b> <i>ip-int-name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Context</b>     | config>service>vprn>pim                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | <p>This command enables PIM on an interface and enables the context to configure interface-specific parameters. By default interfaces are activated in PIM based on the <a href="#">apply-to</a> command, and do not have to be configured on an individual basis unless the default values must be changed.</p> <p>The <b>no</b> form of the command deletes the PIM interface configuration for this interface. If the <a href="#">apply-to</a> command parameter is configured, then the <b>no interface</b> form must be saved in the configuration to avoid automatic (re)creation after the next <a href="#">apply-to</a> is executed as part of a reboot.</p> <p>The <b>shutdown</b> command can be used to disable an interface without removing the configuration for the interface.</p> |
| <b>Default</b>     | Interfaces are activated in PIM based on the <a href="#">apply-to</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Parameters** *ip-int-name* — Specifies the interface name. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes

## assert-period

**Syntax** **assert-period** *assert-period*  
**no assert-period**

**Context** config>service>vprn>pim>if

**Description** This command configures the period in seconds for periodic refreshes of PIM Assert messages on an interface.

The **no** form of the command reverts to the default.

**Default** 60

**Parameters** *assert-period* — specifies the period, in seconds, for periodic refreshes of PIM Assert messages on an interface

**Values** 1 to 300

## bfd-enable

**Syntax** [**no**] **bfd-enable** [ipv4 | ipv6]

**Context** config>service>vprn>pim>if

**Description** This command enables the use of bi-directional forwarding (BFD) to control the state of the associated protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command under the IP interface.

The **no** form of this command removes BFD from the associated IGP protocol adjacency.

**Default** no bfd-enable

## bsm-check-rtr-alert

**Syntax** [**no**] **bsm-check-rtr-alert**

**Context** config>service>vprn>pim>if

**Description** This command enables the checking of router alert option in the bootstrap messages received on this interface.

**Default** no bsm-check-rtr-alert

---

## hello-interval

|                    |                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>hello-interval</b> <i>hello-interval</i><br><b>no hello-interval</b>                                                                                                             |
| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                                          |
| <b>Description</b> | <p>This command configures the frequency at which PIM Hello messages are transmitted on this interface.</p> <p>The <b>no</b> form of this command reverts to the default value.</p> |
| <b>Default</b>     | 30                                                                                                                                                                                  |
| <b>Parameters</b>  | <p><i>hello-interval</i> — Specifies the hello interval in seconds. A 0 (zero) value disables the sending of Hello messages.</p> <p><b>Values</b>      0 to 255 seconds</p>         |

## hello-multiplier

|                    |                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>hello-multiplier</b> <i>deci-units</i><br><b>no hello-multiplier</b>                                                                                                                                                                                                                                                                                                    |
| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | <p>This command configures the multiplier to determine the hold time for a PIM neighbor.</p> <p>The <b>hello-multiplier</b> in conjunction with the <b>hello-interval</b> determines the hold time for a PIM neighbor.</p>                                                                                                                                                 |
| <b>Parameters</b>  | <p><i>deci-units</i> — Specifies the value, specified in multiples of 0.1, for the formula used to calculate the hello-hold time based on the hello-multiplier:</p> $(\text{hello-interval} * \text{hello-multiplier}) / 10$ <p>This allows the PIMv2 default timeout of 3.5 seconds to be supported.</p> <p><b>Values</b>      20 to 100</p> <p><b>Default</b>     35</p> |

## improved-assert

|                    |                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] improved-assert</b>                                                                                                                                                                     |
| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                                                      |
| <b>Description</b> | This command enables improved assert processing on this interface. The PIM assert process establishes a forwarder for a LAN and requires interaction between the control and forwarding planes. |

The assert process is started when data is received on an outgoing interface. This could impact performance if data is continuously received on an outgoing interface.

When enabled, the PIM assert process is done entirely on the control-plane with no interaction between the control and forwarding plane.

**Default**      enabled

## instant-prune-echo

**Syntax**      **[no] instant-prune-echo**

**Context**      config>service>vprn>pim>interface

**Description**      This command enables PIM to send an instant prune echo when the router starts the prune pending timer for a group on the interface. All downstream routers will see the prune message immediately, and can send a join override if they are interested in receiving the group. Configuring instant-prune-echo is recommended on broadcast interfaces with more than one PIM neighbor to optimize multicast convergence.

The **no** form of the command disables instant Prune Echo on the PIM interface.

**Default**      no instant-prune-echo

## max-groups

**Syntax**      **max-groups** *value*  
**no max-groups**

**Context**      config>service>vprn>pim>if

**Description**      This command configures the maximum number of groups for which PIM can have downstream state based on received PIM Joins on this interface. This does not include IGMP local receivers on the interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed. When this object has a value of 0, there is no limit to the number of groups.

**Parameters**      *value* — specifies the maximum number of groups for this interface

**Values**      1 to 16000

## multicast-senders

**Syntax**      **multicast-senders {auto | always | never}**  
**no multicast-senders**

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                                                                                                                                                                              |
| <b>Description</b> | This command configures the way subnet matching is done for incoming data packets on this interface. An IP multicast sender is an user entity to be authenticated in a receiving host.                                                                                                                                  |
| <b>Parameters</b>  | <p><b>auto</b> — subnet matching is automatically performed for incoming data packets on this interface</p> <p><b>always</b> — subnet matching is always performed for incoming data packets on this interface</p> <p><b>never</b> — subnet matching is never performed for incoming data packets on this interface</p> |

## p2mp-ldp-tree-join

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b> | <p>This command configures the option to join P2MP LDP tree towards the multicast source for the VPRN service. If p2mp-ldp-tree-join is enabled, a PIM multicast join received on an interface is processed to join P2MP LDP LSP using the in-band signaled P2MP tree for the same multicast flow. LDP P2MP tree is setup towards the multicast source. Route to source of the multicast node is looked up from the RTM. The next-hop address for the route to source is set as the root of LDP P2MP tree.</p> <p>The <b>no</b> form of command disables joining P2MP LDP tree for IPv4 or IPv6 or both (if both or none is specified).</p> |
| <b>Default</b>     | no p2mp-ldp-tree-join                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters</b>  | <p><b>ipv4</b> — Enables dynamic mLDP in-band signaling for IPv4 PIM joins. IPv4 multicast must be enabled; see <a href="#">ipv4-multicast-disable</a>. For backward compatibility <b>p2mp-ldp-tree-join</b> is equivalent to <b>p2mp-ldp-tree-join ipv4</b>.</p> <p><b>ipv6</b> — Enables dynamic mLDP in-band signaling for IPv6 PIM joins. IPv6 multicast must be enabled; see <a href="#">ipv6-multicast-disable</a>.</p>                                                                                                                                                                                                               |

## priority

|                |                                                              |
|----------------|--------------------------------------------------------------|
| <b>Syntax</b>  | <p><b>priority dr-priority</b></p> <p><b>no priority</b></p> |
| <b>Context</b> | config>service>vprn>pim>if                                   |

---

|                    |                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>This command sets the priority value to become the rendezvous point (RP) that is included in bootstrap messages sent by the router. The RP is sometimes called the bootstrap router. The <b>priority</b> command indicates whether the router is eligible to be a bootstrap router.</p> <p>The <b>no</b> form of the command disqualifies the router to participate in the bootstrap election.</p> |
| <b>Default</b>     | 1 (The router is the least likely to become the designated router.)                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <p><i>dr-priority</i> — Specifies the priority to become the designated router. The higher the value, the higher the priority.</p> <p><b>Values</b> 1 to 4294967295</p>                                                                                                                                                                                                                               |

## sticky-dr

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b> | <p>This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) will be modified to the value configured in <i>dr-priority</i>. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.</p> <p>By enabling <b>sticky-dr</b> on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.</p> <p>The <b>no</b> form of the command disables sticky-dr operation on this interface.</p> |
| <b>Default</b>     | disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <p><b>priority</b> <i>dr-priority</i> — sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled</p> <p><b>Values</b> 1 to 4294967295</p>                                                                                                                                                                                                                                                                                                                                                                                           |

## three-way-hello

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>three-way-hello</b> [ <i>compatibility-mode</i> ]<br><b>no three-way-hello</b> |
| <b>Context</b>     | config>service>vprn>pim>if                                                        |
| <b>Description</b> | This command configures the compatibility mode for enabling the three way hello.  |
| <b>Parameters</b>  | <b>compatibility-mode</b> — specifies to enable the three way hello               |

## tracking-support

|                    |                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] tracking-support</b>                                                                                                                                    |
| <b>Context</b>     | config>service>vprn>pim>if                                                                                                                                      |
| <b>Description</b> | This command sets the the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to disable Join message suppression. |
| <b>Default</b>     | no tracking-support                                                                                                                                             |

## ipv4-multicast-disable

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] ipv4-multicast-disable</b>                                     |
| <b>Context</b>     | config>service>vprn>pim<br>config>service>vprn>pim>interface           |
| <b>Description</b> | This command administratively disables/enables PIM operation for IPv4. |
| <b>Default</b>     | no ipv4-multicast-disable                                              |

## ipv6-multicast-disable

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>ipv6-multicast-disable</b>                                          |
| <b>Context</b>     | config>service>vprn>pim<br>config>service>vprn>pim>interface           |
| <b>Description</b> | This command administratively disables/enables PIM operation for IPv6. |
| <b>Default</b>     | ipv6-multicast-disable                                                 |

## mc-ecmp-balance

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] mc-ecmp-balance</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Context</b>     | config>service>vprn>pim                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | <p>This command enables multicast balancing of traffic over ECMP links based on the number of (S, G) distributed over each link. When enabled, each new multicast stream that needs to be forwarded over an ECMP link is compared to the count of (S, G) already using each link, so that the link with the fewest (S, G) is chosen.</p> <p>This command cannot be used together with the <b>mc-ecmp-hashing-enabled</b> command.</p> <p>The <b>no</b> form of the command disables multicast ECMP balancing.</p> |

## mc-ecmp-balance-hold

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>mc-ecmp-balance-hold</b> <i>minutes</i><br><b>no mc-ecmp-balance-hold</b>                                          |
| <b>Context</b>     | config>service>vprn>pim                                                                                               |
| <b>Description</b> | This command configures the hold time for multicast balancing over ECMP links.                                        |
| <b>Parameters</b>  | <i>minutes</i> — specifies the hold time, in minutes, that applies after an interface has been added to the ECMP link |

## mc-ecmp-hashing-enabled

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Syntax</b>      | <b>[no] mc-ecmp-hashing-enabled [rebalance]</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Context</b>     | config>service>vprn>pim                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b> | <p>This command enables hash-based multicast balancing of traffic over ECMP links and causes PIM joins to be distributed over the multiple ECMP paths based on a hash of S and G (and possibly next-hop IP address). When a link in the ECMP set is removed, the multicast flows that were using that link are redistributed over the remaining ECMP links using the same hash algorithm. When a link is added to the ECMP set new joins may be allocated to the new link based on the hash algorithm, but existing multicast flows using the other ECMP links stay on those links until they are pruned.</p> <p>Hash-based multicast balancing is supported for both IPv4 and IPv6.</p> <p>This command cannot be used together with the <b>mc-ecmp-balance</b> command. Using this command and the <b>lag-usage-optimization</b> command on mixed port speed LAGs is not recommended, because some groups may be forwarded incorrectly.</p> <p>The <b>no</b> form of the command disables the hash-based multicast balancing of traffic over ECMP links.</p> <p>The <b>no mc-ecmp-hashing-enabled</b> form of the command means that the use of multiple ECMP paths if enabled at the <b>config&gt;router</b> or <b>config&gt;service&gt;vprn</b> context is controlled by the existing implementation and CLI commands <b>mc-ecmp-balance</b>.</p> |
| <b>Default</b>     | no mc-ecmp-hashing-enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <b>rebalance</b> — specifies to rebalance flows to newly added links immediately, instead of waiting until they are pruned                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## non-dr-attract-traffic

|               |                                    |
|---------------|------------------------------------|
| <b>Syntax</b> | <b>[no] non-dr-attract-traffic</b> |
|---------------|------------------------------------|

**Context** config>service>vprn>pim

**Description** This command specifies whether the router should ignore the designated router state and attract traffic even when it is not the designated router.

An operator can configure an interface (router or IES or VPRN interfaces) to IGMP and PIM. The interface IGMP state will be synchronized to the backup node if it is associated with the redundant peer port. The interface can be configured to use PIM which will cause multicast streams to be sent to the elected DR only. The DR will also be the router sending traffic to the DSLAM. Since it may be required to attract traffic to both routers a flag **non-dr-attract-traffic** can be used in the PIM context to have the router ignore the DR state and attract traffic when not DR. While using this flag, the router may not send the stream down to the DSLAM while not DR.

When enabled, the designated router state is ignored. When disabled, **no non-dr-attract-traffic**, the designated router value is honored.

**Default** no non-dr-attract-traffic

## rp

**Syntax** rp

**Context** config>service>vprn>pim

**Description** This command enables access to the context to configure the rendezvous point (RP) ) of a PIM protocol instance.

An Nokia PIM router acting as an RP must respond to a PIM register message specifying an SSM multicast group address by sending to the first hop router stop register message(s). It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range of 232/8 or from a multicast group address range that was explicitly configured for SSM.

**Default** rp enabled when PIM is enabled.

## anycast

**Syntax** [no] **anycast** *rp-ip-address*

**Context** config>service>vprn>pim>rp

**Description** This command configures a PIM anycast protocol instance for the RP being configured. Anycast enables fast convergence when a PIM RP router fails by allowing receivers and sources to rendezvous at the closest RP.

The **no** form of the command removes the anycast instance from the configuration.

**Default** n/a

**Parameters**    *rp-ip-address* — Configure the loopback IP address shared by all routes that form the RP set for this anycast instance. Only a single address can be configured. If another anycast command is entered with an address then the old address will be replaced with the new address. If no ip-address is entered then the command is simply used to enter the anycast CLI level.

**Values**        Any valid loopback address configured on the node.

## rp-set-peer

**Syntax**        **[no] rp-set-peer** *ip-address*

**Context**        config>service>vprn>pim>rp>anycast

**Description**    This command configures a peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum of addresses that can be configured in an RP-set, up to 15 multicast addresses is recommended.

The **no** form of the command removes an entry from the list.

**Default**        n/a

**Parameters**    *ip-address* — specifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

## auto-rp-discovery

**Syntax**        **[no] auto-rp-discovery**

**Context**        config>service>vprn>pim>rp

**Description**    This command enables auto-RP protocol in discovery mode. In discovery mode, RP-mapping and RP-candidate messages are received and forwarded to downstream nodes. RP-mapping messages are received locally to learn about availability of RP nodes present in the network.

Either **bsr-candidate** for IPv4 or **auto-rp-discovery** can be configured; the two mechanisms cannot be enabled together. **bsr-candidate** for IPv6 and **auto-rp-discovery** for IPv4 can be enabled together. **auto-rp-discovery** cannot be enabled together with **mdt-type sender-only** or **mdt-type receiver-only**, or **wildcard-spmsi** configurations.

The **no** form of the command disables auto-RP.

**Note:** Chassis mode D or higher must be enabled for **auto-rp-discovery**.

**Default** no auto-rp-discovery

## bootstrap-export

|                    |                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>bootstrap-export</b> <i>policy-name</i> [ <i>policy-name...</i> <b>up to five</b> ]<br><b>no bootstrap-export</b>                                                                                                          |
| <b>Context</b>     | config>service>vprn>pim>rp                                                                                                                                                                                                    |
| <b>Description</b> | This command exports policies to control the flow of bootstrap messages from the RP. Up to five policies can be defined.<br><br>The <b>no</b> form of this command removes the specified policy names from the configuration. |
| <b>Default</b>     | n/a                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <i>policy-name</i> — Specifies the policy name. The policy statement must already be configured in the config>router>policy-options context.                                                                                  |

| Syntax      | <b>hash-mask-len</b> <i>hash-mask-length</i><br><b>no hash-mask-len</b>                                                                                                                                                                                                                                                                                 |
| Context     | config>service>vprn>pim>rp>bsr-candidate                                                                                                                                                                                                                                                                                                                |
| Description | This command is used to configure the length of a mask that is to be combined with the group address before the hash function is called. All groups with the same hash map to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This mechanism is used to map one group or multiple groups to an RP. |
| Default     | 30                                                                                                                                                                                                                                                                                                                                                      |
| Parameters  | <i>hash-mask-length</i> — the hash mask length                                                                                                                                                                                                                                                                                                          |
| Values      | 0 to 32                                                                                                                                                                                                                                                                                                                                                 |

| Syntax      | <b>hash-mask-length</b> <i>hash-mask-length</i><br><b>no hash-mask-length</b>                                                                                                                                                                                                                                                                           |
| Context     | config>service>vprn>pim>rp>ipv6>bsr-candidate                                                                                                                                                                                                                                                                                                           |
| Description | This command is used to configure the length of a mask that is to be combined with the group address before the hash function is called. All groups with the same hash map to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This mechanism is used to map one group or multiple groups to an RP. |
| Default     | 126                                                                                                                                                                                                                                                                                                                                                     |
| Parameters  | <i>hash-mask-length</i> — the hash mask length                                                                                                                                                                                                                                                                                                          |
| Values      | 0 to 128                                                                                                                                                                                                                                                                                                                                                |

## priority

|                    |                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>priority</b> <i>bootstrap-priority</i>                                                                                                                                                                                        |
| <b>Context</b>     | config>service>vprn>pim>rp>bsr-candidate<br>config>service>vprn>pim>rp>ipv6>bsr-candidate                                                                                                                                        |
| <b>Description</b> | This command defines the priority used to become the rendezvous point (RP). The higher the priority value the more likely that this router becomes the RP. If there is a tie, the router with the highest IP address is elected. |
| <b>Parameters</b>  | <i>bootstrap-priority</i> — the priority to become the bootstrap router                                                                                                                                                          |
| <b>Values</b>      | 0 to 255                                                                                                                                                                                                                         |
| <b>Default</b>     | 0 (the router is not eligible to be the bootstrap router)                                                                                                                                                                        |

## ipv6

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Syntax</b>      | <b>ipv6</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Context</b>     | config>service>vprn>pim>rp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b> | <p>This command enables access to the context to configure the rendezvous point (RP) of a PIM IPv6 protocol instance.</p> <p>A Nokia IPv6 PIM router acting as an RP must respond to an IPv6 PIM register message specifying an SSM multicast group address by sending to the first hop router stop register message(s). It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range or from a multicast group address range that was explicitly configured for SSM.</p> |
| <b>Default</b>     | ipv6 RP enabled when IPv6 PIM is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## anycast

|                    |                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>anycast</b> <i>ipv6-address</i><br><b>no anycast</b> <i>ipv6-address</i>                                                                                                                                                                                                                                                    |
| <b>Context</b>     | config>service>vprn>pim>rp>ipv6                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | <p>This command configures an IPv6 PIM anycast protocol instance for the RP being configured. Anycast enables fast convergence when a PIM RP router fails by allowing receivers and sources to rendezvous at the closest RP.</p> <p>The <b>no</b> form of the command removes the anycast instance from the configuration.</p> |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                            |

**Parameters**     *ipv6-address* — Configures the loopback IP address shared by all routes that form the RP set for this anycast instance. Only a single address can be configured. If another anycast command is entered with an address then the old address will be replaced with the new address. If no address is entered then the command is simply used to enter the anycast CLI context.

**Values**

ipv6-address     : x:x:x:x:x:x:x (eight 16-bit pieces)  
                      x:x:x:x:x:d.d.d.d  
                      x [0 to FFFF]H  
                      d [0 to 255]D

rp-set-peer

**Syntax**     **[no] rp-set-peer** *ipv6-address*

**Context**     config>service>vprn>pim>rp>ipv6>anycast

**Description**     This command configures an IPv6 peer in the anycast rp-set. The address identifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

                      This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP- set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this rp-set.

                      Although there is no set maximum of addresses that can be configured in an rp-set, up to 15 multicast addresses is recommended.

                      The **no** form of the command removes an entry from the list.

**Default**     n/a

**Parameters**     *ipv6-address* — specifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node

**Values**

ipv6-address     : x:x:x:x:x:x:x (eight 16-bit pieces)  
                      x:x:x:x:x:d.d.d.d  
                      x [0 to FFFF]H  
                      d [0 to 255]D

embedded-rp

**Syntax**     **embedded-rp**

| <b>Context</b>     | config>service>vprn>pim>rp>rp-candidate<br>config>service>vprn>pim>ssm                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b> | <p>This command configures the group address or range of group addresses for which this router can be the rendezvous point (RP).</p> <p>Use the <b>no</b> form of this command to remove the group address or range of group addresses for which this router can be the RP from the configuration.</p>                                                                                                                                       |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <p><i>ip-prefix</i> — specifies the addresses or address ranges that this router can be an RP</p> <p><b>Values</b></p> <p>ipv4-prefix - a.b.c.d<br/> ipv4-prefix-le - [0 to 32]<br/> ipv6-prefix - x:x:x:x:x:x:x (eight 16-bitpieces)<br/> x:x:x:x:x:d.d.d.d<br/> x - [0 to FFFF]H<br/> d - [0 to 255]D<br/> ipv6-prefix-le - [0 to 128]</p> <p><i>mask</i> — specifies the address mask with the address to define a range of addresses</p> |

*netmask* — specifies the subnet mask in dotted decimal notation

**Values** :a.b.c.d (network bits all 1 and host bits all 0)

## holdtime

|                    |                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>holdtime</b> <i>holdtime</i><br><b>no holdtime</b> <i>holdtime</i>                                                                                                         |
| <b>Context</b>     | config>service>vprn>pim>rp>rp-candidate<br>config>service>vprn>pim>rp>ipv6>rp-candidate                                                                                       |
| <b>Description</b> | Use this command to define the length of time neighboring router consider this router to be up.<br><br>Use the <b>no</b> form of this command to revert to the default value. |
| <b>Default</b>     | 150                                                                                                                                                                           |
| <b>Parameters</b>  | <i>holdtime</i> — specifies the length of time, in seconds, that neighbor should consider the sending router to be operational<br><br><b>Values</b> 0 to 255                  |

## priority

|                    |                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>priority</b> <i>priority</i><br><b>no priority</b> <i>priority</i>                                                                                                                                                                         |
| <b>Context</b>     | config>router>pim>rp>local<br>config>service>vprn>pim>rp>rp-candidate                                                                                                                                                                         |
| <b>Description</b> | This command defines the priority used to become the rendezvous point (RP). The higher the priority value, the more likely that this router will become the RP.<br><br>Use the <b>no</b> form of this command to revert to the default value. |
| <b>Default</b>     | 1                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <i>priority</i> — Specifies the priority to become the designated router. The higher the value the more likely the router will become the RP.<br><br><b>Values</b> 0 to 255                                                                   |

## static

**Syntax** **static**

---

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | config>service>vprn>pim>rp                                                                                            |
| <b>Description</b> | This command enables access to the context to configure a static rendezvous point (RP) of a PIM-SM protocol instance. |
| <b>Default</b>     | n/a                                                                                                                   |

## address

|                    |                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] address</b> <i>ip-address</i>                                                                                                                           |
| <b>Context</b>     | config>service>vprn>pim>rp>static                                                                                                                               |
| <b>Description</b> | This command configures the static rendezvous point (RP) address.<br><br>The <b>no</b> form of this command removes the static RP entry from the configuration. |
| <b>Default</b>     | n/a                                                                                                                                                             |

## group-prefix

|                    |                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] group-prefix</b> { <i>grp-ip-address/mask</i>   <i>grp-ip-address netmask</i> }                                                                                                                                                                                                                       |
| <b>Context</b>     | config>service>vprn>pim>rp>static                                                                                                                                                                                                                                                                             |
| <b>Description</b> | The <b>group-prefix</b> for a static-rp defines a range of multicast-ip-addresses for which a certain RP is applicable.<br><br>The <b>no</b> form of the command removes the criterion.                                                                                                                       |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <i>grp-ip-address</i> — specifies the multicast IP address<br><i>mask</i> — defines the mask of the multicast-ip-address<br><br><b>Values</b> 4 to 32<br><i>netmask</i> — the subnet mask in dotted decimal notation<br><br><b>Values</b> 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0) |

## override

|                |                                   |
|----------------|-----------------------------------|
| <b>Syntax</b>  | <b>[no] override</b>              |
| <b>Context</b> | config>service>vprn>pim>rp>static |

|                    |                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | This command changes the precedence of static RP over dynamically learned Rendezvous Point (RP).<br><br>When enabled, the static group-to-RP mappings take precedence over the dynamically learned mappings. |
| <b>Default</b>     | no override                                                                                                                                                                                                  |

| <b>Context</b>     | config>service>vprn>pim                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | This command specifies whether SSM assert is enabled in compatibility mode for this PIM protocol instance. When enabled, for SSM groups, PIM will consider the SPT bit to be implicitly set to compute the value of CouldAssert (S,G,I) as defined in RFC 4601, <i>Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)</i> . When disabled, for SSM groups, PIM will not assume the SPT bit to be set. The SPT bit will be set by Update_SPTbit(S,G,iif) macro defined in RFC 4601. |
| <b>Default</b>     | ssm-assert-compatible-mode disable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <b>enable</b> — enables SSM assert in compatibility mode for this PIM protocol instance<br><b>disable</b> — disabled SSM assert in compatibility mode for this PIM protocol instance                                                                                                                                                                                                                                                                                                                                    |

## ssm-default-range-disable

|                    |                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>ssm-default-range-disable</b> ipv4                                                                                                                                                                                                                                     |
| <b>Context</b>     | config>service>vprn>pim                                                                                                                                                                                                                                                   |
| <b>Description</b> | This command specifies whether to disable the use of default range (232/8) for SSM so that it can be used by ASM to process (*,G). When enabled, the use of default range is disabled for SSM and it can be used by ASM. When disabled, the SSM default range is enabled. |
| <b>Default</b>     | ssm-default-range-disable                                                                                                                                                                                                                                                 |

## ssm-groups

|                    |                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] ssm-groups</b>                                                                                         |
| <b>Context</b>     | config>service>vprn                                                                                            |
| <b>Description</b> | This command enables access to the context to enable a source-specific multicast (SSM) configuration instance. |
| <b>Default</b>     | n/a                                                                                                            |

### 3.9.2.31 PPPoE Commands

**Note:** The commands described in this section apply only to the 7450 ESS and 7750 SR.

## pppoe

|                    |                                                                 |
|--------------------|-----------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] pppoe</b>                                               |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if                               |
| <b>Description</b> | This command enables the context to configure PPPoE parameters. |

## dhcp-client

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>dhcp-client</b>                                                       |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if>pppoe                                  |
| <b>Description</b> | This command enables the context to configure the PPPoE-to-DHCP options. |

## ccag-use-origin-sap

|                    |                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] ccag-use-origin-sap</b>                                                                                                                                                                                                                   |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if>pppoe>dhcp-client                                                                                                                                                                                               |
| <b>Description</b> | <p>This command enables the original VPLS SAP to be included in the circuit-id option to send to the DHCP server (in case this interface is connected to a VPLS by a CCA MDA).</p> <p>The <b>no</b> form of the command disables the feature.</p> |

**Default** no ccag-use-origin-sap

## pap-chap-user-db

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>pap-chap-user-db</b> <i>local-user-db-name</i><br><b>no pap-chap-user-db</b>                                                                                                                                                                                                                                                                                                                                  |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if>pppoe                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | This command configures the local user database to use for PPP Challenge-Handshake Authentication Protocol/Password Authentication Protocol (PAP/CHAP) authentication.<br><br>If an authentication policy is also configured, <b>pppoe-access-method</b> must be set to none in this authentication policy to use the local user database (in that case RADIUS authentication will not be used for PPPoE hosts). |
| <b>Parameters</b>  | <i>local-user-db-name</i> — specifies the local user database to use for authentication                                                                                                                                                                                                                                                                                                                          |

## pppoe-policy

|                    |                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>pppoe-policy</b> <i>pppoe-policy-name</i><br><b>no pppoe-policy</b>                                |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if>pppoe                                                               |
| <b>Description</b> | This command associates a PPPoE policy on this interface.                                             |
| <b>Default</b>     | default                                                                                               |
| <b>Parameters</b>  | <i>pppoe-policy-name</i> — specifies a a PPPoE policy up to 32 characters in length on this interface |

## sap-session-limit

|                    |                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sap-session-limit</b> <i>sap-session-limit</i><br><b>no sap-session-limit</b>                           |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if>pppoe                                                                    |
| <b>Description</b> | This command specifies the number of PPPoE hosts per SAP allowed for this group-interface.                 |
| <b>Default</b>     | 1                                                                                                          |
| <b>Parameters</b>  | <i>sap-session-limit</i> — specifies the number of PPPoE hosts per SAP allowed<br><b>Values</b> 1 to 20000 |

## session-limit

|                    |                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>session-limit</b> <i>session-limit</i><br><b>no session-limit</b>                           |
| <b>Context</b>     | config>service>vprn>sub-if>grp-if>pppoe                                                        |
| <b>Description</b> | This command specifies the number of PPPoE hosts allowed for this group interface.             |
| <b>Default</b>     | 1                                                                                              |
| <b>Parameters</b>  | <i>session-limit</i> — Specifies the number of PPPoE hosts allowed<br><b>Values</b> 1 to 20000 |

### 3.9.2.32 MSDP Configuration Commands

## msdp

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b> | <p>This command enables a Multicast Source Discovery Protocol (MSDP) instance. When an MSDP instance is created, the protocol is enabled. To start or suspend execution of the MSDP protocol without affecting the configuration, use the <b>[no] shutdown</b> command.</p> <p>For the MSDP protocol to function, at least one peer must be configured.</p> <p>When MSDP is configured and started, an appropriate event message should be generated.</p> <p>When <b>the</b> no form of the command is executed, all sessions must be terminated and an appropriate event message should be generated.</p> <p>When all peering sessions are terminated, an event message per peer is not required.</p> <p>The <b>no</b> form of the command deletes the MSDP protocol instance, removing all associated configuration parameters.</p> |
| <b>Default</b>     | no msdp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## active-source-limit

|                |                                                                           |
|----------------|---------------------------------------------------------------------------|
| <b>Syntax</b>  | <b>active-source-limit</b> <i>number</i><br><b>no active-source-limit</b> |
| <b>Context</b> | config>service>vprn>msdp                                                  |

```
config>service>vprn>msdp>group
config>service>vprn>msdp>group>peer
config>service>vprn>msdp>peer
config>service>vprn>msdp>source
```

**Description** This option controls the maximum number of active source messages that will be accepted by Multicast Source Discovery Protocol (MSDP), effectively controlling the number of active sources that can be stored on the system.

The **no** form of this command reverts the number of source message limit to default operation.

**Default** No limit is placed on the number of source active records.

**Parameters** *number* — defines how many active sources can be maintained by MSDP

**Values** 0 to 1000000

## data-encapsulation

**Syntax** [**no**] **data-encapsulation**

**Context** config>service>vprn>msdp

**Description** This command configures a rendezvous point (RP) using Multicast Source Discovery Protocol (MSDP) to encapsulate multicast data received in MSDP register messages inside forwarded MSDP source-active messages.

**Default** data-encapsulation

## export

**Syntax** **export** *policy-name* [*policy-name...*(**up to 5 max**)]  
**no export**

**Context** config>service>vprn>msdp  
config>service>vprn>msdp>group  
config>service>vprn>msdp>group>peer  
config>service>vprn>msdp>peer

**Description** This command specifies the policies to export source active state from the source active list into Multicast Source Discovery Protocol (MSDP).

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>    | No export policies are applied and all SA entries are announced.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters</b> | <p><i>policy-name</i> — Specifies the export policy name, up to 32 characters. Up to five policy-name arguments can be specified.</p> <p>If you configure an export policy at the global level, each individual peer inherits the global policy. If you configure an export policy at the group level, each individual peer in a group inherits the group's policy. If you configure an export policy at the peer level, then policy only applies to the peer where it is configured.</p> |

## group

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b> | <p>This command enables access to the context to create or modify a Multicast Source Discovery Protocol (MSDP) group. To configure multiple MSDP groups, include multiple group statements.</p> <p>By default, the group's options are inherited from the global MSDP options. To override these global options, group-specific options within the group statement can be configured.</p> <p>If the group name provided is already configured then this command only provides the context to configure the options pertaining to this group.</p> <p>If the group name provided is not already configured, then the group name must be created and the context to configure the parameters pertaining to the group should be provided. In this case, the \$ prompt to indicate that a new entity (group) is being created should be used.</p> <p>For a group to be of use, at least one peer must be configured.</p> |
| <b>Default</b>     | no group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <i>group-name</i> — specifies a unique name for the MSDP group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## import

|                    |                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>import</b> <i>policy-name</i> [ <i>policy-name...</i> (up to 5 max)]<br><b>no import</b>                                                |
| <b>Context</b>     | config>service>vpn>msdp<br>config>service>vpn>msdp>group<br>config>service>vpn>msdp>group>peer<br>config>service>vpn>msdp>peer             |
| <b>Description</b> | This command specifies the policies to import source active state from Multicast Source Discovery Protocol (MSDP) into source active list. |

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple import commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

If you configure an import policy at the global level, each individual peer inherits the global policy.

If you configure an import policy at the group level, each individual peer in a group inherits the group's policy.

If you configure an import policy at the peer level, then policy only applies to the peer where it is configured.

The **no** form of the command removes all policies from the configuration.

**Default** No import policies are applied and all source active messages are allowed.

**Parameters** *policy-name* — Specifies the import policy name. Up to five *policy-name* arguments can be specified.

## local-address

**Syntax** **local-address** *address*  
**no local-address**

**Context** config>service>vprn>msdp  
config>service>vprn>msdp>group  
config>service>vprn>msdp>group>peer  
config>service>vprn>msdp>peer

**Description** This command configures the local end of a Multicast Source Discovery Protocol (MSDP) session. For MSDP to function, at least one peer must be configured. When configuring a peer, you must include this *local-address* command to configure the local end of the MSDP session. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote peer.

If the user enters this command, then the address provided is validated and will be used as the local address for MSDP peers from that point. If a subsequent *local-address* command is entered, it will replace the existing configuration and existing sessions will be terminated.

Similarly, when the **no** form of this command is entered, the existing *local-address* will be removed from the configuration and the existing sessions will be terminated.

Whenever a session is terminated, all information pertaining to and learned from that peer will be removed.

Whenever a new peering session is created or a peering session is lost, an event message should be generated.

The **no** form of this command removes the local-address from the configuration.

|                   |                                                            |
|-------------------|------------------------------------------------------------|
| <b>Default</b>    | No local address is configured.                            |
| <b>Parameters</b> | <i>address</i> — specifies an existing address on the node |

## mode

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>mode</b> { <b>mesh-group</b>   <b>standard</b> }                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Context</b>     | config>service>vprn>msdp>group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | <p>This command configures groups of peers in a full mesh topology to limit excessive flooding of source-active messages to neighboring peers.</p> <p>Multicast Source Discovery Protocol (MSDP) peers can be configured grouped in a full-mesh topology that prevents excessive flooding of source-active messages to neighboring peers.</p> <p>In a meshed configuration, all members of the group must have a peer connection with every other mesh group member. If this rule is not adhered to, then unpredictable results may occur.</p> |
| <b>Default</b>     | mode standard (non-meshed)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b>  | <p><b>mesh-group</b> — Specifies that source-active message received from a mesh group member are always accepted but are not flooded to other members of the same mesh group. These source-active messages are only flooded to non-mesh group peers or members of other mesh groups.</p> <p><b>standard</b> — specifies a non-meshed mode</p>                                                                                                                                                                                                 |

## peer

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Context</b>     | config>service>vprn>msdp<br>config>service>vprn>msdp>group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b> | <p>This command configures peer parameters. Multicast Source Discovery Protocol (MSDP) must have at least one peer configured. A peer is defined by configuring a local-address that can be used by this node to set up a peering session and the address of a remote MSDP router. It is the address of this remote peer that is configured in this command and it identifies the remote MSDP router address.</p> <p>After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. It may be required to have multiple peering sessions in which case multiple peer statements should be included in the configurations.</p> |

By default, the options applied to a peer are inherited from the global or group-level. To override these inherited options, include peer-specific options within the peer statement.

If the peer address provided is already a configured peer, then this command only provides the context to configure the parameters pertaining to this peer.

If the peer address provided is not already a configured peer, then the peer instance must be created and the context to configure the parameters pertaining to this peer should be provided. In this case, the \$ prompt to indicate that a new entity (peer) is being created should be used.

The peer address provided will be validated and, if valid, will be used as the remote address for an MSDP peering session.

When the **no** form of this command is entered, the existing peering address will be removed from the configuration and the existing session will be terminated. Whenever a session is terminated, all source active information pertaining to and learned from that peer will be removed. Whenever a new peering session is created or a peering session is lost, an event message should be generated.

At least one peer must be configured for MSDP to function.

| <b>Description</b> | <p>This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read from the TCP session. It is possible that an MSDP/ RP router may receive a large number of MSDP protocol message packets in a particular source active message.</p> <p>After the number of MSDP packets (including source active messages) defined in the threshold have been processed, the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP session until the time (seconds) has elapsed.</p> <p>The <b>no</b> form of this command reverts this active-source limit to default operation.</p> |
| <b>Default</b>     | No limit is placed on the number of MSDP and source active limit messages will be accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b> | <p>This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.</p> <p>By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:</p> <ul style="list-style-type: none"> <li>• use the unicast route table only</li> <li>• use the multicast route table only or</li> <li>• use both the route tables</li> </ul>                                                                                                                                                                                                           |
| <b>Default</b>     | rtable-u                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><b>rtable6-m</b> — Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.</p> <p><b>rtable6-u</b> — Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.</p> <p><b>both</b> — Will always look up first in the multicast route table and, if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable6-u.</p> |

| <b>Context</b>     | config>service>vprn>msdp                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more than 90) could be useful to prevent instabilities in the MSDP cache. |
| <b>Default</b>     | 90                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters</b>  | <i>seconds</i> — specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable<br><b>Values</b> 90 to 600                                                                                                                                                                                                                                                             |

| <b>Description</b> | <p>This command limits the number of active source messages the router accepts from sources in the specified address range.</p> <p>If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.</p> <p>If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case, the \$ prompt to indicate that a new entity (source) is being created should be used.</p> <p>The <b>no</b> form of this message removes the source active rate limiter for this source address range.</p> |
| <b>Default</b>     | n/a. The source active <b>msdp</b> messages are not rate limited based on the source address range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <i>ip-prefix</i> — the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area<br><b>Values</b> ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*mask* — the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation

**Values** 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

## authentication-key

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b> | This command configures a Message Digest 5 (MD5) authentication key to be used with a specific Multicast Source Discovery Protocol (MSDP) peering session. The authentication key must be configured per peer as such no global or group configuration is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>     | Authentication-key. All MSDP messages are accepted and the MD5 signature option authentication key is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>  | <p><i>authentication-key</i> — The authentication key. Allowed values are any string up to 256 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), enclose the entire string in quotation marks (“ ”).</p> <p><i>hash-key</i> — The hash key. The key can be any combination of ASCII characters up to 451 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (“ ”).</p> <p>This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.</p> <p><b>hash</b> — Specifies the key is entered in an encrypted form. If the <b>hash</b> or <b>hash2</b> parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> or <b>hash2</b> parameter specified</p> <p><b>hash2</b> — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the <b>hash2</b> encrypted variable cannot be copied and pasted. If the <b>hash</b> or <b>hash2</b> parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> or <b>hash2</b> parameter specified.</p> |

## default-peer

|                |                                               |
|----------------|-----------------------------------------------|
| <b>Syntax</b>  | <b>default-peer</b><br><b>no default-peer</b> |
| <b>Context</b> | config>service>vprn>msdp>group>peer           |

```
config>service>vprn>msdp>peer
```

**Description** Using the default peer mechanism, a peer can be selected as the default Multicast Source Discovery Protocol (MSDP) peer. As a result, all source-active messages from the peer will be accepted without the usual peer-reverse-path-forwarding (RPF) check.

The MSDP peer-RPF check is different from the normal multicast RPF checks. The peer-RPF check is used to stop source-active messages from looping. A router validates source-active messages originated from other routers in a deterministic fashion.

A set of rules is applied in order to validate received source-active messages, and the first rule that applies determines the peer-RPF neighbor. All source-active messages from other routers are rejected. The rules applied to source-active messages originating at Router S received at Router R from Router N are as follows:

- If Router N and router S are one and the same, then the message is originated by a direct peer-RPF neighbor and will be accepted.
- If Router N is a configured peer, or a member of the Router R mesh group then its source-active messages are accepted.
- If Router N is the Border Gateway Protocol (BGP) next hop of the active multicast RPF route toward Router S then Router N is the peer-RPF neighbor and its source-active messages are accepted.
- If Router N is an external BGP peer of Router R and the last autonomous system (AS) number in the BGP AS-path to Router S is the same as Router N's AS number, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N uses the same next hop as the next hop to Router S, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N fits none of the above rules, then Router N is not a peer-RPF neighbor, and its source-active messages are rejected.

**Default** No default peer is established and all active source messages must be RPF checked.

### 3.9.2.33 MLD Configuration Commands

mld

**Syntax** [no] mld

**Context** config>service>vprn

**Description** This command enables the context to configure Multicast Listener Discovery (MLD) parameters.

The **no** form of the command disables MLD.

**Default** no mld

## interface

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Syntax</b>      | <b>[no] interface</b> <i>ip-int-name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Context</b>     | config>service>vprn>mld                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | <p>This command enables the context to configure an Multicast Listener Discovery (MLD) interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.</p> <p>The <b>no</b> form of the command deletes the MLD interface. The <b>shutdown</b> command in the <b>config&gt;router&gt;mld&gt;interface</b> context can be used to disable an interface without removing the configuration for the interface.</p>                                                                                                                                                                                                                      |
| <b>Default</b>     | no interface — No interfaces are defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <p><i>ip-int-name</i> — The IP interface name. Interface names must be unique within the group of defined IP interfaces for <b>config router interface</b> and <b>config service ies interface</b> commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes.</p> <p>If the IP interface name does not exist or does not have an IP address configured an error message will be returned.</p> <p>If the IP interface exists in a different area it will be moved to this area.</p> |

## disable-router-alert-check

|                    |                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] disable-router-alert-check</b>                                                                                                                               |
| <b>Context</b>     | config>service>vprn>mld>interface                                                                                                                                    |
| <b>Description</b> | <p>This command enables router alert checking for MLD messages received on this interface.</p> <p>The no form of the command disables the router alert checking.</p> |
| <b>Default</b>     | n/a                                                                                                                                                                  |

## import

|                    |                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>import</b> <i>policy-name</i><br><b>no import</b>                                                                                                                                                                   |
| <b>Context</b>     | config>service>vprn>mld>interface                                                                                                                                                                                      |
| <b>Description</b> | This command specifies the import route policy to be used for determining which membership reports are accepted by the router. Route policies are configured in the <b>config&gt;router&gt;policy-options</b> context. |

When an import policy is not specified, all the MLD reports are accepted.

The **no** form of the command removes the policy association from the MLD instance.

**Default** no import — No import policy specified.

**Parameters** *policy-name* — The route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

## max-groups

**Syntax** **max-groups** *value*  
**no max-groups**

**Context** config>service>vprn>mld>interface

**Description** This command specifies the maximum number of groups for which MLD can have local receiver information based on received MLD reports on this interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed.

**Default** 0, no limit to the number of groups.

**Parameters** *value* — specifies the maximum number of groups for this interface

**Values** 1 to 16000

## query-interval

**Syntax** **query-interval** *seconds*  
**no query-interval**

**Context** config>service>vprn>mld>interface

**Description** This command specifies the frequency that the querier router transmits general host-query messages. The host-query messages solicit group membership information and are sent to the all-systems multicast group address, 224.0.0.1.

**Default** 125

**Parameters** *seconds* — the time frequency, in seconds, that the router transmits general host-query messages

**Values** 2 to 1024

## query-last-member-interval

|                    |                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>query-last-member-interval</b> <i>seconds</i>                                                                                                                                                                                                        |
| <b>Context</b>     | config>service>vprn>mld>interface                                                                                                                                                                                                                       |
| <b>Description</b> | This command configures the frequency at which the querier sends group-specific query messages including messages sent in response to leave-group messages. The lower the interval, the faster the detection of the loss of the last member of a group. |
| <b>Default</b>     | 1                                                                                                                                                                                                                                                       |
| <b>Parameters</b>  | <i>seconds</i> — specifies the frequency, in seconds, at which query messages are sent<br><b>Values</b> 1 to 1024                                                                                                                                       |

## query-response-interval

|                    |                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>query-response-interval</b> <i>seconds</i>                                                                                                  |
| <b>Context</b>     | config>service>vprn>mld>interface                                                                                                              |
| <b>Description</b> | This command specifies how long the querier router waits to receive a response to a host-query message from a host.                            |
| <b>Default</b>     | 10                                                                                                                                             |
| <b>Parameters</b>  | <i>seconds</i> — specifies the length of time to wait to receive a response to the host-query message from the host<br><b>Values</b> 1 to 1023 |

## static

|                    |                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>static</b>                                                                                                                                                                            |
| <b>Context</b>     | config>service>vprn>mld>interface                                                                                                                                                        |
| <b>Description</b> | This command tests multicast forwarding on an interface without a receiver host. When enabled, data is forwarded to an interface without receiving membership reports from host members. |
| <b>Default</b>     | n/a                                                                                                                                                                                      |

| <b>Description</b> | <p>This command enables the context to add a static multicast group either as a (*,G) or one or more (S,G) records. Use MLD static group memberships to test multicast forwarding without a receiver host. When MLD static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.</p> <p>When static MLD group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static MLD group entries do not generate join messages toward the RP.</p> <p>The <b>no</b> form of the command removes the IPv6 address from the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><i>grp-ipv6-address</i> — Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.</p> <p><b>Values</b>    ipv6-address:</p> <ul style="list-style-type: none"> <li>• x:x:x:x:x:x:x (eight 16-bit pieces)</li> <li>• x:x:x:x:x:d.d.d.d</li> <li>• x: [0 to FFFF]H</li> <li>• d: [0 to 255]D</li> </ul> <p><b>start</b> <i>grp-ipv6-address</i> — specifies the start multicast group address</p> <p><b>Values</b>    ipv6-address:</p> <ul style="list-style-type: none"> <li>• x:x:x:x:x:x:x (eight 16-bit pieces)</li> <li>• x:x:x:x:x:d.d.d.d</li> <li>• x: [0 to FFFF]H</li> <li>• d: [0 to 255]D</li> </ul> <p><b>end</b> <i>grp-ipv6-address</i> — specifies the end multicast group address</p> <p><b>Values</b>    ipv6-address:</p> <ul style="list-style-type: none"> <li>• x:x:x:x:x:x:x (eight 16-bit pieces)</li> <li>• x:x:x:x:x:d.d.d.d</li> <li>• x: [0 to FFFF]H</li> <li>• d: [0 to 255]D</li> </ul> <p><b>step</b> <i>ipv6-address</i> — specifies the step increment</p> |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>This command specifies an IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.</p> <p>The <b>source</b> command is mutually exclusive with the specification of individual sources for the same group.</p> <p>The <b>source</b> command, in combination with the group, is used to create a specific (S,G) static group entry.</p> <p>The <b>no</b> form of the command removes the source from the configuration.</p> |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters</b>  | <i>src-ipv6-address</i> — specifies the IPv6 unicast address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## starg

| <b>Context</b>     | config>service>vprn>mld>interface                                                                                                                                                                                                                                                                                                   |
| <b>Description</b> | <p>This command specifies the MLD version. If routers run different versions, they will negotiate the lowest common version of MLD that is supported by hosts on their subnet and operate in that version. For MLD to function correctly, all routers on a LAN should be configured to run the same version of MLD on that LAN.</p> |
| <b>Default</b>     | 1                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters</b>  | <i>version</i> — specifies the MLD version number                                                                                                                                                                                                                                                                                   |
| <b>Values</b>      | 1, 2                                                                                                                                                                                                                                                                                                                                |

## robust-count

|                    |                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>robust-count</b> <i>robust-count</i><br><b>no robust-count</b>                                                                                                                                       |
| <b>Context</b>     | config>service>vprn>mld                                                                                                                                                                                 |
| <b>Description</b> | This command configures the robust count. The robust-count variable allows tuning for the expected packet loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased. |
| <b>Default</b>     | 2                                                                                                                                                                                                       |
| <b>Parameters</b>  | <i>robust-count</i> — specifies the robust count value<br><b>Values</b> 2 to 10                                                                                                                         |

## ssm-translate

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>ssm-translate</b>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Context</b>     | config>service>vprn>mld                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | This command enables the context to configure group ranges which are translated to SSM (S,G) entries. If the static entry needs to be created, it has to be translated from a IGMPv1 IGMPv2 request to a Source Specific Multicast (SSM) join. An SSM translate source can only be added if the starg command is not enabled. An error message is generated if you try to configure the <b>source</b> command with <b>starg</b> command enabled. |

## grp-range

|                    |                                                                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | [no] <b>grp-range</b> <i>start end</i>                                                                                                                                                                                                      |
| <b>Context</b>     | config>service>vprn>mld>ssm-translate                                                                                                                                                                                                       |
| <b>Description</b> | This command is used to configure group ranges which are translated to SSM (S,G) entries.                                                                                                                                                   |
| <b>Parameters</b>  | <i>start</i> — an IP address that specifies the start of the group range<br><i>end</i> — An IP address that specifies the end of the group range. This value should always be greater than or equal to the value of the <i>start</i> value. |

## source

|                |                                                 |
|----------------|-------------------------------------------------|
| <b>Syntax</b>  | [no] <b>source</b> <i>ip-address</i>            |
| <b>Context</b> | config>service>vprn>mld>ssm-translate>grp-range |

---

|                    |                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | This command specifies the source IP address for the group range. Whenever a (*,G) report is received in the range specified by <b>grp-range</b> <i>start</i> and <i>end</i> parameters, it is translated to an (S,G) report with the value of this object as the source address. |
| <b>Parameters</b>  | <i>ip-address</i> — specifies the IP address that will be sending data                                                                                                                                                                                                            |

### 3.9.2.34 RIP Commands

#### rip

|                    |                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] rip</b>                                                                                                                                                                   |
| <b>Context</b>     | config>service>vprn                                                                                                                                                               |
| <b>Description</b> | <p>This command enables the RIP protocol on the given VPRN IP interface.</p> <p>The <b>no</b> form of the command disables the RIP protocol from the given VPRN IP interface.</p> |
| <b>Default</b>     | no rip                                                                                                                                                                            |

| <b>Description</b> | <p>This command creates the context to configure the RIPng protocol instance.</p> <p>When a RIPng instance is created, the protocol is enabled by default. To start or suspend execution of the RIP protocol without affecting the configuration, use the <b>[no] shutdown</b> command.</p> <p>The <b>no</b> form of the command deletes the RIP protocol instance removing all associated configuration parameters.</p> |
| <b>Default</b>     | <b>no ripng</b> — No RIPng protocol instance defined.                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b> | <p>This command sets the authentication password to be passed between RIP neighbors.</p> <p>The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed.</p> <p>The <b>no</b> form of the command removes the authentication password from the configuration and disables authentication.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>     | no authentication-key — Authentication is disabled and the authentication password is empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters</b>  | <p><i>authentication-key</i> — The authentication key. The key can be any combination of ASCII characters up to 16 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").</p> <p><i>hash-key</i> — The hash key. The key can be any combination of ASCII characters up to 33 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").</p> <p>This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.</p> <p><b>hash</b> — Specifies the key is entered in an encrypted form. If the <b>hash</b> or <b>hash2</b> parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> or <b>hash2</b> parameter specified</p> <p><b>hash2</b> — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the <b>hash2</b> encrypted variable cannot be copied and pasted. If the <b>hash</b> or <b>hash2</b> parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the <b>hash</b> or <b>hash2</b> parameter specified.</p> |

| <b>Context</b>     | config>service>vprn>rip<br>config>service>vprn>rip>group<br>config>service>vprn>rip>group>neighbor                                                                                                                                                                                                                                       |
| <b>Description</b> | <p>This command defines the type of authentication to be used between RIP neighbors. The type and password must match exactly for the RIP message to be considered authentic and processed.</p> <p>The <b>no</b> form of the command removes the authentication type from the configuration and effectively disables authentication.</p> |
| <b>Default</b>     | no authentication-type                                                                                                                                                                                                                                                                                                                   |

**Parameters**    *none* — no authentication is used  
                  *simple* — a simple clear-text password is sent  
                  *md5* — MD5 authentication is used

## check-zero

**Syntax**        **check-zero {enable | disable}**  
                  **no check-zero**

**Context**        config>service>vprn>rip  
                  config>service>vprn>rip>group  
                  config>service>vprn>rip>group>neighbor  
                  config>service>vprn>ripng  
                  config>service>vprn>ripng>group  
                  config>service>vprn>ripng>group>neighbor

**Description**    This command enables checking for zero values in fields specified to be zero by the RIPv1 and RIPv2 specifications.

                  The **no** form of the command disables this check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

**Default**        no check-zero

**Parameters**    **enable** — enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages

**disable** — disables the checking and allows the receipt of RIP messages even if the mandatory zero fields are non-zero

## split-horizon

**Syntax**        **split-horizon {enable | disable}**  
                  **no split-horizon**

**Context**        config>service>vprn>rip  
                  config>service>vprn>rip>group  
                  config>service>vprn>rip>group>neighbor  
                  config>service>vprn>ripng  
                  config>service>vprn>ripng>group  
                  config>service>vprn>ripng>group>neighbor

**Description**    This command enables the use of split-horizon. RIP uses split-horizon with poison-reverse to protect from such problems as “counting to infinity”. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

**Default**      enabled

## export

**Syntax**      **export** *policy-name* [*policy-name...*(up to 5 max)]  
**no export**

**Context**      config>service>vprn>rip  
                 config>service>vprn>rip>group  
                 config>service>vprn>rip>group>neighbor  
                 config>service>vprn>ripng  
                 config>service>vprn>ripng>group  
                 config>service>vprn>ripng>group>neighbor

**Description**      This command specifies the export route policies used to determine which routes are exported to RIP. If no export policy is specified, non-RIP routes will not be exported from the routing table manager to RIP; RIP-learned routes will be exported to RIP neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

**Default**      no export — No export route policies specified.

**Parameters**      *policy-name* — The export route policy name. Allowed values are any string up to 32 characters in length and composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the string must be enclosed between double quotes. The specified names must already be defined.

## export-limit

**Syntax**      **export-limit** *number* [*log percentage*]

---

|                    |                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b> | This command enables the BGP MED to be used to configure the RIP metric at the BGP to RIP transition on egress routers. BGP always configures the BGP MED to the RIP metric at the ingress router. When <b>propagate-metric</b> is configured, the RIP metric at egress routers is configured as the BGP MED attribute added to the optional value configured with the <b>metric-out</b> command. |
| <b>Default</b>     | no propagate-metric<br><br>The RIP metric is configured to the optional value configured with the <b>metric-out</b> command plus 1.                                                                                                                                                                                                                                                               |

## receive

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b> | <p>This command sets the values for the update, timeout, and flush timers.</p> <ul style="list-style-type: none"> <li>• Update timer — Determines how often RIP updates are sent.</li> </ul>                   |

- Timeout timer — If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.
- Flush timer — Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of the command resets all timers to their default values of 30, 180, and 120 seconds respectively.

|                   |                                                         |
|-------------------|---------------------------------------------------------|
| <b>Default</b>    | no timers                                               |
| <b>Parameters</b> | <i>update</i> — the RIP update timer value in seconds   |
| <b>Values</b>     | 1 to 600                                                |
| <b>Default</b>    | 30                                                      |
|                   | <i>timeout</i> — the RIP timeout timer value in seconds |
| <b>Values</b>     | 1 to 1200                                               |
| <b>Default</b>    | 180                                                     |
|                   | <i>flush</i> — the RIP flush timer value in seconds     |
| <b>Values</b>     | 1 to 1200                                               |
| <b>Default</b>    | 120                                                     |

| <b>Context</b> | config>service>vprn>rip<br>config>service>vprn>ripng |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | <p>This command creates a context for configuring a RIP group of neighbors. RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration for RIP interfaces.</p> <p>The <b>no</b> form of the command deletes the RIP neighbor interface group. Deleting the group will also remove the RIP configuration of all the neighbor interfaces currently assigned to this group.</p> |
| <b>Default</b>     | no group — No group of RIP neighbor interfaces defined                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters</b>  | <i>group-name</i> — The RIP group name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes.                                                                                                                                                     |

## neighbor

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Context</b>     | config>service>vprn>rip>group<br>config>service>vprn>ripng>group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b> | <p>This command creates a context for configuring a RIP neighbor interface.</p> <p>By default, interfaces are not activated in any interior gateway protocol such as RIP unless explicitly configured.</p> <p>The <b>no</b> form of the command deletes the RIP interface configuration for this interface. The <b>shutdown</b> command in the <b>config&gt;router&gt;rip&gt;group</b> <i>group-name</i>&gt;<b>neighbor</b> <i>ip-int-name</i> context can be used to disable an interface without removing the configuration for the interface.</p> |
| <b>Default</b>     | no neighbor — No RIP interfaces defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <i>ip-int-name</i> — The IP interface name. Interface names must be unique within the group of defined IP interfaces for <b>config router interface</b> and <b>config service vprn interface</b> commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes.                                            |
|                    | If the IP interface name does not exist or does not have an IP address configured an error message will be returned.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Context</b>       | config>service>vprn                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>   | <p>This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge “port” where flooded traffic received on the spoke SDP is replicated on all other “ports” (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.</p> <p>The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.</p> <p>The SDP must already be defined in the <b>config&gt;service&gt;sdp</b> context in order to associate an SDP with a VPRN service. If the SDP-ID is not already configured, an error message is generated. If the SDP-ID does exist, a binding between that SDP-ID and the service is created.</p> <p>SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.</p> <p>The <b>no</b> form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.</p> |
| <b>Default</b>       | No SDP-ID is bound to a service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Special Cases</b> | <b>VPRN</b> — Several SDPs can be bound to a VPRN service. Each SDP must be destined to a different router. If two SDP-ID bindings terminate on the same router, an error occurs and the second SDP binding is rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters</b>    | <p><i>sdp-id</i> — The SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.</p> <p><i>vc-id</i> — the virtual circuit identifier</p> <p><b>Values</b> 1 to 4294967295</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### control-channel-status

|                |                                    |
|----------------|------------------------------------|
| <b>Syntax</b>  | <b>[no] control-channel-status</b> |
| <b>Context</b> | config>service>vprn>spoke-sdp      |

**Description** This command enables the configuration of static pseudowire status signaling on a spoke-SDP for which signaling for its SDP is set to OFF.

A control-channel-status no shutdown is allowed only if all of the following are true:

- The system is using network chassis mode D
- SDP signaling is off.
- The control-word is enabled (the control-word is disabled by default)
- The service type is Epipe, Apipe, VPLS, Cpipe, or IES/VP RN
- Mate SDP signaling is off (in vc-switched services)
- The pw-path-id is configured for this spoke-SDP.

The **no** form of this command removes control channel status signaling from a spoke-SDP. It can only be removed if control channel status is shut down.

**Default** no control-channel-status

## acknowledgment

**Syntax** [no] acknowledgment

**Context** config>service>vprn>spoke-sdp>control-channel-status

**Description** This command enables the acknowledgment of control channel status messages. By default, no acknowledgment packets are sent.

## refresh-timer

**Syntax** refresh-timer *value*  
no refresh-timer

**Context** config>service>vprn>spoke-sdp>control-channel-status

**Description** This command configures the refresh timer for control channel status signaling packets. By default, no refresh packets are sent.

**Default** no refresh-timer

**Parameters** *value* — specifies the refresh timer value

|                |                     |

| <b>Context</b>     | config>service>vprn>spoke-sdp>control-channel-status                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command is mutually exclusive with a non-zero refresh-timer value.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters</b>  | <p><i>timer1</i> — specifies the interval at which pseudowire status messages, including a reliable delivery TLV, with the “request” bit set, are sent</p> <p><b>Values</b> 10 to 65535 seconds</p> <p><b>retry-timer</b> <i>timer2</i> — specifies the timeout interval if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.</p> <p><b>Values</b> 0, 3 to 60 seconds</p> <p><b>timeout-multiplier</b> <i>multiplier</i> — If a requesting node does not receive a valid response to a pseudowire status request within this multiplier times the retry timer, then it will assume the pseudowire is down. This parameter is optional.</p> <p><b>Values</b> 3 to 20 seconds</p> |

## control-word

| <b>Description</b> | <p>The control word command provides the option to add a control word as part of the packet encapsulation for pseudowire types for which the control word is optional. These are Ethernet pseudowires (Epipe). ATM N:1 cell mode pseudowires (apipe vc-types atm-vcc and atm-vpc) and VT pseudowire (apipe vc-type atm-cell).</p> <p>The configuration for the two directions of the pseudowire must match because the control word negotiation procedures described in Section 6.2 of RFC 4447 are not supported. The C-bit in the pseudowire FEC sent in the label mapping message is set to 1 when the control word is enabled. Otherwise, it is set to 0.</p> <p>The service will only come up if the same C-bit value is signaled in both directions. If a spoke-sdp is configured to use the control word but the node receives a label mapping message with a C-bit clear, the node releases the label with the an “Illegal C-bit” status code as per Section 6.1 of RFC 4447. As soon as the user also enabled the control the remote peer, the remote peer will withdraw its original label and will send a label mapping with the C-bit set to 1 and the VLL service will be up in both nodes. The control word must be enabled to allow MPLS-TP OAM to be used on a static spoke-sdp in a apipe, epipe and cpipe service.</p> |

| <b>Description</b> | This command binds a service to an existing Service Distribution Point (SDP).                                                                                                                                                            |

A spoke SDP is treated like the equivalent of a traditional bridge “port” where flooded traffic received on the spoke SDP is replicated on all other “ports” (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a service. If the SDP-ID is not already configured, an error message is generated. If the SDP-ID does exist, a binding between that SDP-ID and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN services. All packets are forwarded over the default LSP.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

| <b>Context</b>     | config>service>vprn<br>config>service>vprn>spoke-sdp<br>config>service>vprn>if>spoke-sdp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | <p>This command enables the use of the hash label on a VLL, VPLS, or VPRN service bound to any MPLS-type encapsulated SDP as well as to a VPRN service using <b>auto-bind-tunnel</b> with the <b>resolution-filter</b> configured as any MPLS tunnel type. This feature is not supported on a service bound to a GRE SDP or for a VPRN service using the autobind mode with the gre option.</p> <p>When this feature is enabled, the ingress data path is modified such that the result of the hash on the packet header is communicated to the egress data path for use as the value of the label field of the hash label. The egress data path appends the hash label at the bottom of the stack (BoS) and sets the S-bit to 1 to indicate that.</p> <p>In order to allow for applications whereby the egress LER infers the presence of the Hash Label implicitly from the value of the label, the Most Significant Bit (MSB) of the result of the hash is set before copying into the Hash Label. This means that the value of the hash label will always be in the range [524,288 - 1,048,575] and will not overlap with the signaled/static LSP and signaled/static service label ranges. This also guarantees that the hash label will not match a value in the reserved label range.</p> |

The (unmodified) result of the hash continues to be used for the purpose of ECMP and LAG spraying of packets locally on the ingress LER. For VLL services, the result of the hash is overwritten and the ECMP and LAG spraying will be based on service-id when ingress SAP shared queuing is not enabled. However, the hash label will still reflect the result of the hash such that an LSR can use it to perform fine grained load balancing of VLL pseudowire packets.

Packets that are generated in CPM and forwarded labeled within the context of a service (for example, OAM packets) must also include a Hash Label at the BoS and set the S-bit accordingly.

The TTL of the hash label is set to a value of 0.

The **no** form of this command disables the use of the hash label.

**Default** no hash-label

## ingress

**Syntax** **ingress**

**Context** config>service>vprn>if>spoke-sdp  
config>service>vprn>red-if>spoke-sdp

**Description** This command configures the SDP context.

## qos

**Syntax** **qos** *network-policy-id* **fp-redirect-group** *queue-group-name* **instance** *instance-id*  
**no qos**

**Context** config>service>vprn>if>spoke-sdp>ingress

**Description** This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

**Step 1.** Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast, broadcast, unknown, or multicast).

- Step 2.** Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
- Step 3.** Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
- Step 4.** Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
- Step 5.** One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

- Step 1.** When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the MDA/FP.
- Step 2.** When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the MDA/FP.
- Step 3.** When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - a. When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.
  - b. When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the MDA/FP.
- Step 4.** If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the MDA/FP.

- Step 5.** If no network QoS policy is applied to the ingress context of the pseudowire, all packets of the pseudowire will feed:
- the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the MDA/FP. This is the default behavior.
  - a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group (csc-policing). The only exceptions to this behavior are for packets received from a IES/VP RN spoke interface and from an R-VPLS spoke-SPD, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the MDA/FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VP RN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

**Parameters** *network-policy-id* — Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

**fp-redirect-group** *queue-group-name* — Specifies the name of the queue group template up to 32 characters in length.

**ingress-instance** *instance-id* — Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 16384

## vc-label

**Syntax** **vc-label** *egress-vc-label*  
**no vc-label** [*egress-vc-label*]

| <b>Description</b> | This command associates an IP filter policy with an ingress or egress Service Access Point (SAP) or IP interface. An IP filter policy can be associated with spoke SDPs. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. |

The filter command is used to associate a filter policy with a specified ip-filter-id with an ingress or egress SAP. The ip-filter-id must already be defined before the filter command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use scope command within the filter definition to change the scope to local or global. The default scope of a filter is local.

**Parameters** **ip** *ip-filter-id* — Specifies IP filter policy. The filter ID must already exist within the created IP filters.

**Values** 1 to 65535

## qos

**Syntax** **qos** *network-policy-id* **port-redirect-group** *queue-group-name* [**instance** *instance-id*]  
**no qos** [*network-policy-id*]

config>service>vpls>spoke-sdp>egress  
config>service>vpls>mesh-sdp>egress  
config>service>pw-template>egress  
config>service>vprn>if>spoke-sdp>egress  
config>service>ies>if>spoke-sdp>egress

**Description** This command is used to redirect pseudowire packets to an egress port queue-group for the purpose of shaping.

The egress pseudowire shaping provisioning model allows the mapping of one or more pseudowires to the same instance of queues, or policers and queues, which are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

**Step 1.** Create an egress queue-group template and configure queues only or policers and queues for each FC that needs to be redirected.

- Step 2.** Apply the queue-group template to the network egress context of all ports where there exists a network IP interface on which the pseudowire packets can be forwarded. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
- Step 3.** Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
- Step 4.** Apply this network QoS policy to the egress context of a spoke-SPD inside a service or to the egress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-SPDs can have their FCs redirected to use queues only or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

- Step 1.** When a pseudowire FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SPD to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface on which the pseudowire packet is forwarded. This queue can be a queue-group queue, or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a pseudowire packet.
- Step 2.** When a pseudowire FC is redirected to use a queue or a policer, and a queue in a queue-group and the queue-group name exists, but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SPD to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the pseudowire packet is forwarded on.
- Step 3.** When a pseudowire FC is redirected to use a queue, or a policer and a queue in a queue-group, and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports which have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - a. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - b. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the pseudowire packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

**Step 4.** If a network QoS policy is applied to the egress context of a pseudowire, any pseudowire FC, which is not explicitly redirected in the network QoS policy, will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the pseudowire is redirected to exists and the redirection succeeds, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP is performed; according to the relevant mappings of the (FC, profile) in the egress context of the network QoS policy applied to the pseudowire. This is true regardless, whether an instance of the queue-group exists or not on the egress port to which the pseudowire packet is forwarded. If the packet profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet DEI/dot1p and the tunnel DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the pseudowire packet is forwarded.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

|                   |                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <i>network-policy-id</i> — Specifies the network policy identification. The value uniquely identifies the policy on the system. |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------|

**Values** 1 to 65535

**port-redirect-group** *queue-group-name* — This optional parameter specifies that the *queue-group-name* will be used for all egress forwarding class redirections within the network QoS policy ID. The specified *queue-group-name* must exist as a port egress queue group on the port associated with the IP interface.

**egress-instance** *instance-id* — specifies the identification of a specific instance of the queue-group

**Values** 1 to 16384

### 3.9.2.36 Threat Management Service Interface Commands

## tms-interface

**Syntax** **tms-interface** *interface-name* [**create**] [**off-ramp-vprn** *off-ramp-svc*] [**mgmt-vprn** *mgmt-svc*]  
**no tms-interface** *interface-name*

**Context** config>service>vprn

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <b>Description</b> | This command configure a Threat Management Service interface. |
|--------------------|---------------------------------------------------------------|

The **no** form of the command removes the interface name from the configuration.

|            |                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameters | <i>interface-name</i> — specifies the interface name up to 22 characters in length                                                                     |
|            | <b>create</b> — Creates the interface name. The <b>create</b> keyword requirement can be enabled/disabled in the <b>environment&gt;create</b> context. |
|            | <i>off-ramp-svc</i> — specifies the service ID or service name for the off-ramp VPRN                                                                   |
|            | <b>Values</b><br><i>service-id</i> : 1 to 2148007978<br><i>svc-name</i> : an existing service name up to 64 characters in length                       |
|            | <i>mgmt-svc</i> — specifies the service ID or service name for management VPRN                                                                         |
|            | <i>service-id</i> : 1 to 2148007978                                                                                                                    |
|            | <i>svc-name</i> : an existing service name up to 64 characters in length                                                                               |

address

|             |                                                                                                                                                                                                      |                   |                      |

| <b>Description</b> | <p>This command configures a password for the user.</p> <p>The <b>no</b> form of the command removes the password.</p>                                                                                                                                                                                                           |
| <b>Parameters</b>  | <i>password</i> — specifies the password for the TMS configuration                                                                                                                                                                                                                                                               |
| <b>Values</b>      | <p><i>password</i>      key1 delimvalue1 key2 <i>delim</i> value2 ...</p> <p><i>delim</i> is one of the following:</p> <ul style="list-style-type: none"><li>'=' value is unencrypted and remain unencrypted</li><li>':' value is unencrypted and to be encrypted</li><li> '%' value is encrypted and remain encrypted</li></ul> |

## port

|                    |                                                                                                                                                                                       |      |           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-----------|
| <b>Syntax</b>      | <b>port</b> <i>mda-id</i><br><b>no port</b>                                                                                                                                           |      |           |
| <b>Context</b>     | config>service>vprn>tms-if                                                                                                                                                            |      |           |
| <b>Description</b> | <p>This command specifies a chassis slot and MDA to bind the interface to a physical port.</p> <p>The no form of the command removes the MDA ID from the interface configuration.</p> |      |           |
| <b>Parameters</b>  | <i>mda-id</i> — specifies the chassis slot and MDA                                                                                                                                    |      |           |
|                    | <b>Values</b>                                                                                                                                                                         |      |           |
|                    | <slot>/<mda>                                                                                                                                                                          | slot | [1 to 10] |
|                    |                                                                                                                                                                                       | mda  | [1 to 2]  |

### 3.9.2.37 RADIUS Proxy Commands

#### radius-proxy

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| <b>Syntax</b>      | <b>radius-proxy</b>                                                  |
| <b>Context</b>     | config>service>vprn                                                  |
| <b>Description</b> | This command enables the context to configure RADIUS proxy commands. |

#### server

|                    |                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>server</b> <i>server-name</i> [ <b>create</b> ] [ <b>purpose</b> {[ <b>accounting</b> ][ <b>authentication</b> ]}]<br><b>no server</b> <i>server-name</i>                                                                 |
| <b>Context</b>     | config>service>vprn>radius-proxy                                                                                                                                                                                             |
| <b>Description</b> | This command configures the name of this RADIUS proxy server.                                                                                                                                                                |
| <b>Parameters</b>  | <b>purpose accounting</b> — specifies that this RADIUS proxy server will be used for accounting purposes<br><b>purpose authentication</b> — specifies that this RADIUS proxy server will be used for authentication purposes |

#### cache

|                    |                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>cache</b>                                                                                                                 |
| <b>Context</b>     | config>service>vprn>radius-proxy>server                                                                                      |
| <b>Description</b> | This command enables the context to configure caching parameters.<br><br>The <b>no</b> form of the command disables caching. |

#### key

|                    |                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>key</b> <i>packet-type</i> { <b>accept</b>   <b>request</b> } <b>attribute-type</b> <i>attribute-type</i> [ <b>vendor-id</b> <i>vendor-id</i> ]<br><b>no key</b> |
| <b>Context</b>     | config>service>vprn>radius-proxy>server>cache                                                                                                                       |
| <b>Description</b> | This command configures cache key parameters.<br><br>The <b>no</b> form of the command removes the parameters from the configuration.                               |

---

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## interface

|                    |                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] interface</b> <i>ip-int-name</i>                                                                                                                                               |
| <b>Context</b>     | config>service>vprn>radius-proxy>server                                                                                                                                                |
| <b>Description</b> | <p>This command associates an interface to the proxy server.</p> <p>The no form of the command removes the interface name from the proxy server configuration.</p>                     |
| <b>Default</b>     | n/a                                                                                                                                                                                    |
| <b>Parameters</b>  | <i>ip-int-name</i> — specifies the name of the IP interface. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed between double quotes |

## load-balance-key

|                    |                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>load-balance-key vendor</b> <i>vendor-id</i> [ <i>vendor-id...</i> (up to 5 max)] <b>attribute-type</b> <i>attribute-type</i> [ <i>attribute-type...</i> (up to 5 max)]<br><b>load-balance-key source-ip-udp</b><br><b>no load-balance-key</b>                                                       |
| <b>Context</b>     | config>service>vprn>radius-proxy>server                                                                                                                                                                                                                                                                 |
| <b>Description</b> | This command configures how to construct the key for load-balancing RADIUS messages between RADIUS servers.                                                                                                                                                                                             |
| <b>Default</b>     | load-balance-key                                                                                                                                                                                                                                                                                        |
| <b>Parameters</b>  | <b>vendor</b> <i>vendor-id</i> — specifies the RADIUS Vendor-Id<br><b>Values</b> 0 to 16777215<br><b>attribute-type</b> <i>attribute-type</i> — specifies a RADIUS attribute that must be used to construct the key for load-balancing RADIUS messages between RADIUS servers<br><b>Values</b> 1 to 255 |

## python-policy

|                    |                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>python-policy</b> <i>name</i><br><b>no python-policy</b>                                                                                 |
| <b>Context</b>     | config>service>vprn>radius-proxy>server<br>config>service>vprn>radius-server>server                                                         |
| <b>Description</b> | This common specifies a python policy. Python policies are configured in the <b>config&gt;python&gt; python-policy</b> <i>name</i> context. |

**Parameters**     *name* — specifies the name of an existing python script up to 32 characters in length

## secret

**Syntax**     **secret** *secret* [**hash** | **hash2**]  
**no secret**

**Context**     config>service>vprn>radius-proxy>server

**Description**     This command configures the secret key associated with the RADIUS server.  
  
The no form of the command removes the key from the configuration.

**Parameters**     *secret* — The secret key (password) to access the RADIUS server. This secret key must match the password on the RADIUS server.  
  
**Values**     Up to 32 characters in length.  
  
**hash** — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified  
  
**hash2** — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

## send-accounting-response

**Syntax**     [**no**] **send-accounting-response**

**Context**     config>service>vprn>radius-proxy>server

**Description**     This command specifies if this RADIUS proxy server itself responds with an Accounting-Response message to each received Accounting-Request instead of proxying them to a configured RADIUS server.  
  
The **no** form of the command disables the accounting response messages.

**Default**     disabled

## username

**Syntax**     **username** *user-name* **prefix-string** [128 chars max] [**accounting-server-policy** *policy-name*] [**authentication-server-policy** *policy-name*]  
**no username** [1 to 32]

|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | config>service>vpn>radius-proxy>server                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b> | This command configures username-to-RADIUS-server-policy associations.<br><br>The <b>no</b> form of the command removes the associations from the configuration.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>     | n/a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters</b>  | <p><i>username</i> — specifies the user name</p> <p><b>Values</b> 1 to 32</p> <p><b>prefix-string</b> — specifies the prefix-string for the association</p> <p><b>Values</b> 128 characters, maximum</p> <p><b>accounting-server-policy</b> <i>policy-name</i> — specifies the default accounting RADIUS server policy up to 32 characters in length</p> <p><b>authentication-server-policy</b> <i>policy-name</i> — specifies the default authentication RADIUS server policy up to 32 characters in length</p> |

## radius-server

|                    |                                                                         |
|--------------------|-------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>radius-server</b>                                                    |
| <b>Context</b>     | config>service>vpn                                                      |
| <b>Description</b> | This command enables the context to configure RADIUS server parameters. |

## server

|                    |                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>server</b> <i>server-name</i> [ <b>address</b> <i>ip-address</i> ] [ <b>secret</b> <i>key</i> ] [ <b>hash</b>   <b>hash2</b> ] [ <b>port</b> <i>port</i> ] [ <b>create</b> ]<br><b>no server</b> <i>server-name</i>                                                                                                                                                            |
| <b>Context</b>     | config>service>vpn>radius-server                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b> | This command configures RADIUS server parameters.<br><br>The <b>no</b> form of the command removes the parameters from the configuration.                                                                                                                                                                                                                                         |
| <b>Parameters</b>  | <p><i>server-name</i> — specifies the name of this RADIUS server</p> <p><b>address</b> <i>ip-address</i> — specifies the IP address of the RADIUS server</p> <p><b>secret</b> <i>key</i> — Specifies the secret key (password) to access the RADIUS server. This secret key must match the password on the RADIUS server.</p> <p><b>Values</b> Up to 32 characters in length.</p> |

**hash** — Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

**hash2** — Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**port port** — specifies the UDP port number on which to contact the RADIUS server

## accept-coa

|                    |                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] accept-coa</b>                                                                               |
| <b>Context</b>     | config>service>vpn>radius-server                                                                     |
| <b>Description</b> | This command specifies if this RADIUS server is allowed to process Change of Authorization messages. |

## coa-script-policy

|                    |                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>coa-script-policy</b> <i>script-policy-name</i><br><b>no coa-script-policy</b>                                                                                                                                        |

### 3.10.1.3 Debug Commands

For protocol debugging commands, see the Unicast Routing Protocols Guide and Multicast Routing Protocols Guide.

```
debug
 — service
 — id service-id
 — [no] arp-host
 — [no] dhcp
 — detail-level {low | medium | high}
 — no detail-level
 — mode {dropped-only | ingr-and-dropped | egr-ingr-and-dropped}
 — no mode
 — [no] sap sap-id
 — [no] sdp sdp-id:vc-id
 — [no] event-type {config-change | svc-oper-status-change | sap-oper-
 status-change | sdpbind-oper-status-change}
 — [no] host-connectivity-verify
 — [no] ip ip-address
 — [no] mac ieee-address
 — [no] sap sap-id
 — [no] sap sap-id
 — event-type {config-change | oper-status-change}
 — [no] sdp sdp-id:vc-id
 — event-type {config-change | oper-status-change}
```

## 3.10.2 Command Descriptions

### 3.10.2.1 VPRN Show Commands

**Note:** The command outputs in the following section are examples only; actual displays may differ depending on supported functionality and user configuration.

#### egress-label

|             |                                                                   |
|-------------|-------------------------------------------------------------------|
| Syntax      | <b>egress-label</b> <i>egress-label1</i> [ <i>egress-label2</i> ] |
| Context     | show>service                                                      |
| Description | Display services using the range of egress labels.                |

If only the mandatory *egress-label1* parameter is specified, only services using the specified label are displayed.

If both *egress-label1* and *egress-label2* parameters are specified, the services using the range of labels X where *egress-label1* <= X <= *egress-label2* are displayed.

Use the **show router ldp bindings** command to display dynamic labels.

**Parameters** *egress-label1* — The starting egress label value for which to display services using the label range. If only *egress-label1* is specified, services only using *egress-label1* are displayed.

**Values** 0, 2049 to 131071

*egress-label2* — the ending egress label value for which to display services using the label range

**Values** 2049 to 131071

**Default** the *egress-label1* value

**Output** **Show Service Egress Command Output**

[Table 47](#) describes show service egress label output fields.

**Table 47 Show Service Egress Field Descriptions**

| Label                    | Description                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------|
| Svc Id                   | the ID that identifies a service                                                                  |
| Sdp Id                   | the ID that identifies an SDP                                                                     |
| Type                     | indicates whether the SDP binding is a spoke or a mesh                                            |
| I. Lbl                   | the VC label used by the far-end device to send packets to this device in this service by the SDP |
| E. Lbl                   | the VC label used by this device to send packets to the far-end device in this service by the SDP |
| Number of bindings found | the total number of SDP bindings that exist within the specified egress label range               |

### Sample Output

```
*A:ALA-12# show service egress-label 0 10000

| <b>Description</b> | <p>This command displays SAP information.</p> <p>If no optional parameters are specified, the command displays a summary of all defined SAPs.</p> <p>The optional parameters restrict output to only SAPs matching the specified properties.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><b>sap-id</b> — specifies the physical port identifier portion of the SAP definition</p> <p><b>interface</b> — specifies matching SAPs with the specified IP interface</p> <p><b>ip-address</b> — the IP address of the interface for which to display matching SAPs</p> <p><b>Values</b> 1.0.0.0 to 223.255.255.255</p> <p><b>ip-int-name</b> — the IP interface name for which to display matching SAPs</p> <p><b>dyn-script</b> — displays dynamic service SAPs information</p> <p><b>ingress</b> — specifies matching an ingress policy</p> <p><b>egress</b> — specifies matching an egress policy</p> <p><b>qos-policy</b> <i>qos-policy-id</i> — the ingress or egress QoS Policy ID for which to display matching SAPs</p> <p><b>Values</b> 1 to 65535</p> <p><b>atm-td-profile</b> <i>td-profile-id</i> — displays SAPs using this traffic description</p> <p><b>filter</b> <i>filter-id</i> — the ingress or egress filter policy ID for which to display matching SAPs</p> <p><b>Values</b> 1 to 65535</p> <p><b>authentication-policy</b> <i>policy name</i> — specifies an existing authentication policy</p> |
| <b>Output</b>      | <p><b>Show Service SAP</b></p> <p><a href="#">Table 49</a> describes show service SAP output fields.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 49** Show Service SAP Field Descriptions

| Label    | Description                                                    |
|----------|----------------------------------------------------------------|
| Port ID  | the ID of the access port where the SAP is defined             |
| Svc ID   | the service identifier                                         |
| SapMTU   | the SAP MTU value                                              |
| I.QoS    | the SAP ingress QoS policy number specified on the ingress SAP |
| I.MAC/IP | the MAC or IP filter policy ID applied to the ingress SAP      |
| E.QoS    | the SAP egress QoS policy number specified on the egress SAP   |
| E.Mac/IP | the MAC or IP filter policy ID applied to the egress SAP       |
| A.Pol    | the accounting policy ID assigned to the SAP                   |
| Adm      | the desired state of the SAP                                   |
| Opr      | the actual state of the SAP                                    |

## sdp

- Syntax** **sdp** [*sdp-id* | **far-end** *ip-address*] [**detail** | **keep-alive-history**]
- Context** show>service
- Description** Displays SDP information.
- If no optional parameters are specified, a summary SDP output for all SDPs is displayed.
- Parameters** *sdp-id* — the SDP ID for which to display information
- Values** 1 to 17407
- Default** all SDPs
- far-end** *ip-address* — displays only SDPs matching with the specified far-end IP address
- Default** SDPs with any far-end IP address
- detail** — displays detailed SDP information
- Default** SDP summary output
- keep-alive-history** — displays the last fifty SDP keepalive events for the SDP
- Default** SDP summary output
- Output** **Show Service SDP**
- [Table 50](#) describes show service SDP output fields.

**Table 50** Show Service SDP Field Descriptions

| Label      | Description                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Id     | the SDP identifier                                                                                                                                                        |
| Adm MTU    | specifies the largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented        |
| Opr MTU    | specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented |
| IP address | specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP                                                                                  |
| Adm        | Admin State — specifies the state of the SDP                                                                                                                              |

**Table 50**      **Show Service SDP Field Descriptions (Continued)**

| Label               | Description (Continued)                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Opr                 | Oper State —specifies the operating state of the SDP                                                                                                                                                                                                                                 |
| Flags               | specifies all the conditions that affect the operating status of this SDP                                                                                                                                                                                                            |
| Signal              | Signaling — specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP                                                                                                                                         |
| Last Status Change  | Specifies the time of the most recent operating status change to this SDP                                                                                                                                                                                                            |
| Last Mgmt Change    | specifies the time of the most recent management-initiated change to this SDP                                                                                                                                                                                                        |
| Number of SDPs      | specifies the total number of SDPs displayed according to the criteria specified                                                                                                                                                                                                     |
| Hello Time          | specifies how often the SDP echo request messages are transmitted on this SDP                                                                                                                                                                                                        |
| Deliver             | Delivered — specifies the type of delivery used by the SDP: GRE or MPLS                                                                                                                                                                                                              |
| Number of SDPs      | specifies the total number of SDPs displayed according to the criteria specified                                                                                                                                                                                                     |
| Hello Time          | specifies how often the SDP echo request messages are transmitted on this SDP                                                                                                                                                                                                        |
| Hello Msg Len       | specifies the length of the SDP echo request messages transmitted on this SDP                                                                                                                                                                                                        |
| Hello Timeout       | specifies the number of seconds to wait for an SDP echo response message before declaring a timeout                                                                                                                                                                                  |
| Unmatched Replies   | specifies the number of SDP unmatched message replies                                                                                                                                                                                                                                |
| Max Drop Count      | specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault                                                                                                                                       |
| Hold Down Time      | specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault                                                                                                                                       |
| TX Hello Msgs       | specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared                                                                                                                                            |
| Rx Hello Msgs       | specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared                                                                                                                                               |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS |

**Sample Output**

```
*A:ALA-12# show service sdp

## sdp-using

|                    |                                                                                 |
|--------------------|---------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sdp-using</b> [ <i>sdp-id[:vc-id]</i> ]   <b>far-end</b> <i>ip-address</i> ] |
| <b>Context</b>     | show>service                                                                    |
| <b>Description</b> | Display services using SDP or far-end address options.                          |
| <b>Parameters</b>  | <i>sdp-id</i> — displays only services bound to the specified SDP ID            |
| <b>Values</b>      | 1 to 17407                                                                      |

*vc-id* — the virtual circuit identifier

**Values** 1 to 4294967295

**far-end ip-address** — displays only services matching with the specified far-end IP address

**Default** services with any far-end IP address

#### Output **Show Service SDP Using**

[Table 51](#) describes show service sdp-using output fields.

**Table 51 Show Service SDP-Using Field Descriptions**

| Label         | Description                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------|
| Svc ID        | the service identifier                                                                          |
| Sdp ID        | the SDP identifier                                                                              |
| Type          | type of SDP: <b>spoke</b> or <b>mesh</b>                                                        |
| Far End       | the far end address of the SDP                                                                  |
| Oper State    | the operational state of the service                                                            |
| Ingress Label | the label used by the far-end device to send packets to this device in this service by this SDP |
| Egress Label  | the label used by this device to send packets to the far-end device in this service by this SDP |

[Table 53](#) describes the show all service-id command output fields.

**Table 53**      **Show All Service-ID Field Descriptions**

| Label                        | Description                                                                                                             |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Service Detailed Information |                                                                                                                         |
| Service Id                   | the service identifier                                                                                                  |
| VPN Id                       | the number which identifies the VPN                                                                                     |
| Customer Id                  | the customer identifier                                                                                                 |
| Last Status Change           | the date and time of the most recent change in the administrative or operating status of the service                    |
| Last Mgmt Change             | the date and time of the most recent management-initiated change to this customer                                       |
| Admin State                  | the current administrative state                                                                                        |
| Oper State                   | the current operational state                                                                                           |
| Route Dist.                  | displays the route distribution number                                                                                  |
| AS Number                    | displays the autonomous system number                                                                                   |
| Router Id                    | displays the router ID for this service                                                                                 |
| ECMP                         | displays equal cost multipath information                                                                               |
| ECMP Max Routes              | displays the maximum number of routes that can be received from the neighbors in the group or for the specific neighbor |
| Max Routes                   | displays the maximum number of routes that can be used for path sharing                                                 |
| Auto Bind                    | specifies the automatic binding type for the SDP assigned to this service                                               |
| Vrf Target                   | specifies the VRF target applied to this service                                                                        |
| Vrf Import                   | specifies the VRF import policy applied to this service                                                                 |
| Vrf Export                   | specifies the VRF export policy applied to this service                                                                 |
| SDP Id                       | the SDP identifier                                                                                                      |
| Description                  | generic information about the service                                                                                   |
| SAP Count                    | the number of SAPs specified for this service                                                                           |
| SDP Bind Count               | the number of SDPs bound to this service                                                                                |
| Split Horizon Group          | name of the split horizon group for this service                                                                        |
| Description                  | description of the split horizon group                                                                                  |
| Last Changed                 | the date and time of the most recent management-initiated change to this split horizon group                            |

**Table 53**      **Show All Service-ID Field Descriptions (Continued)**

| Label                             | Description                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ETH-CFM Service Specifics         |                                                                                                                                                                  |
| Tunnel Faults                     | Whether tunnel faults are ignored or accepted                                                                                                                    |
| Service Destination Points (SDPs) |                                                                                                                                                                  |
| SDP Id                            | the SDP identifier                                                                                                                                               |
| Type                              | Indicates whether this Service SDP binding is a spoke or a mesh                                                                                                  |
| Admin Path MTU                    | the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented |
| Oper Path MTU                     | the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented  |
| Delivery                          | specifies the type of delivery used by the SDP: GRE or MPLS                                                                                                      |
| Admin State                       | the administrative state of this SDP                                                                                                                             |
| Oper State                        | the operational state of this SDP                                                                                                                                |
| Ingress Label                     | the label used by the far-end device to send packets to this device in this service by this SDP                                                                  |
| Egress Label                      | the label used by this device to send packets to the far-end device in this service by this SDP                                                                  |
| Ingress Filter                    | the ID of the ingress filter policy.                                                                                                                             |
| Egress Filter                     | the ID of the egress filter policy                                                                                                                               |
| Far End                           | specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP                                                                         |
| Last Changed                      | the date and time of the most recent change to this customer                                                                                                     |
| Signaling                         | specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP                                |
| Admin State                       | specifies the operating status of the keepalive protocol                                                                                                         |
| Oper State                        | the current status of the keepalive protocol                                                                                                                     |
| Hello Time                        | specifies how often the SDP echo request messages are transmitted on this SDP                                                                                    |
| Hello Msg Len                     | specifies the length of the SDP echo request messages transmitted on this SDP                                                                                    |
| Max Drop Count                    | specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault                   |
| Hold Down Time                    | specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state                                                  |

**Table 53**      **Show All Service-ID Field Descriptions (Continued)**

| Label                  | Description                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDP Delivery Mechanism | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field.<br>If the SDP type is GRE, then the following message displays:<br>SDP delivery mechanism is not MPLS |
| Max Drop Count         | specifies the maximum number of consecutive SDP Echo Request messages that can be unacknowledged before the keepalive protocol reports a fault                                                                                                                                       |
| Number of SDPs         | the total number SDPs applied to this service ID                                                                                                                                                                                                                                     |
| Service Access Points  |                                                                                                                                                                                                                                                                                      |
| Service Id             | the service identifier                                                                                                                                                                                                                                                               |
| Port Id                | the ID of the access port where this SAP is defined                                                                                                                                                                                                                                  |
| Description            | Generic information about the SAP                                                                                                                                                                                                                                                    |
| Encap Value            | the value of the label used to identify this SAP on the access port                                                                                                                                                                                                                  |
| Admin State            | the desired state of the SAP                                                                                                                                                                                                                                                         |
| Oper State             | the operating state of the SAP                                                                                                                                                                                                                                                       |
| Last Changed           | the date and time of the last change                                                                                                                                                                                                                                                 |
| Admin MTU              | the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented                                                                                                                     |
| Oper MTU               | the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented                                                                                                                      |
| Ingress qos-policy     | the SAP ingress QoS policy ID                                                                                                                                                                                                                                                        |
| Egress qos-policy      | the SAP egress QoS policy ID                                                                                                                                                                                                                                                         |
| Ingress Filter-Id      | the SAP ingress filter policy ID                                                                                                                                                                                                                                                     |
| Egress Filter-Id       | the SAP egress filter policy ID                                                                                                                                                                                                                                                      |
| Multi Svc Site         | indicates the multi-service site that the SAP is a member                                                                                                                                                                                                                            |
| Ingress sched-policy   | indicates the ingress QoS scheduler for the SAP                                                                                                                                                                                                                                      |
| Egress sched-policy    | indicates the egress QoS scheduler for the SAP                                                                                                                                                                                                                                       |
| Acct. Pol              | indicates the accounting policy applied to the SAP                                                                                                                                                                                                                                   |
| Collect Stats          | specifies whether accounting statistics are collected on the SAP                                                                                                                                                                                                                     |
| SAP Statistics         |                                                                                                                                                                                                                                                                                      |

**Table 53 Show All Service-ID Field Descriptions (Continued)**

| Label                 | Description                                                                        |
|-----------------------|------------------------------------------------------------------------------------|
| Dropped               | the number of packets or octets dropped                                            |
| Offered Hi Priority   | the number of high priority packets, as determined by the SAP ingress QoS policy   |
| Offered Low Priority  | the number of low priority packets, as determined by the SAP ingress QoS policy    |
| Forwarded In Profile  | the number of in-profile packets or octets (rate below CIR) forwarded              |
| Forwarded Out Profile | the number of out-of-profile packets or octets (rate above CIR) forwarded          |
| Queueing Stats        |                                                                                    |
| Dropped In Profile    | the number of in-profile packets or octets discarded                               |
| Dropped Out Profile   | the number of out-of-profile packets or octets discarded                           |
| Forwarded In Profile  | the number of in-profile packets or octets (rate below CIR) forwarded              |
| Forwarded Out Profile | the number of out-of-profile packets or octets (rate above CIR) forwarded          |
| SAP per Queue stats   |                                                                                    |
| Ingress Queue 1       | the index of the ingress QoS queue of this SAP                                     |
| High priority offered | the packets or octets count of the high priority traffic for the SAP               |
| High priority dropped | the number of high priority traffic packets/octets dropped                         |
| Low priority offered  | the packets or octets count of the low priority traffic                            |
| Low priority dropped  | the number of low priority traffic packets/octets dropped                          |
| In profile forwarded  | the number of in-profile packets or octets (rate below CIR) forwarded              |
| Out profile forwarded | the number of out-of-profile octets (rate above CIR) forwarded                     |
| Egress Queue 1        | the index of the egress QoS queue of the SAP                                       |
| In profile forwarded  | the number of in-profile packets or octets (rate below CIR) forwarded              |
| In profile dropped    | the number of in-profile packets or octets dropped for the SAP                     |
| Out profile forwarded | the number of out-of-profile packets or octets (rate above CIR) forwarded          |
| Out profile dropped   | the number of out-of-profile packets or octets discarded                           |
| State                 | specifies whether DHCP relay is enabled on this SAP                                |
| Info Option           | specifies whether Option 82 processing is enabled on this SAP                      |
| Action                | specifies the Option 82 processing on this SAP or interface: keep, replace or drop |

## authentication

**Syntax**      **authentication**

**Context**     show>service>id

**Description**    This command enables the context to display subscriber authentication information.

## statistics

**Syntax**      **statistics [policy name] [sap sap-id]**

**Context**     show>service>id>authentication

**Description**    This command displays session authentication statistics for this service.

**Parameters**    **policy name** — specifies the subscriber authentication policy statistics to display  
**sap sap-id** — specifies the SAP ID statistics to display

### Output

#### Sample Output

```
*A:ALA-1# show service id 11 authentication statistics
=====
Authentication statistics
=====
Interface / SAP Authentication Authentication
 Successful Failed

abc-11-90.1.0.254 1582 3

## arp

- Syntax** **arp** [*ip-address*] | [*mac ieee-address*] | [*sap sap-id*] | [*interface ip-int-name*] [*sdp sdp-id:vc-id*] [*summary*]
- Context** show>service>id
- Description** This command displays the ARP table for the IES instance.
- Parameters** *ip-address* — displays only ARP entries in the ARP table with the specified IP address
- Default** all IP addresses
- mac ieee-address* — Displays only ARP entries in the ARP table with the specified 48-bit MAC address. The MAC address can be expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.
- Default** all MAC addresses
- sap sap-id* — displays SAP information for the specified SAP ID
- port id* — specifies matching service ARP entries associated with the specified IP interface
- ip-address* — the IP address of the interface for which to display matching ARP entries
- Values** 1.0.0.0 to 223.255.255.255
- ip-int-name* — the IP interface name for which to display matching ARPs
- Output** **Show Service-ID ARP**
- [Table 54](#) describes the show service-id ARP output fields.

**Table 54 Show Service-ID ARP Field Descriptions**

| Label      | Description               |
|------------|---------------------------|
| Service ID | the service ID number     |
| MAC        | the specified MAC address |

**Table 54** Show Service-ID ARP Field Descriptions (Continued)

| Label             | Description                                               |
|-------------------|-----------------------------------------------------------|
| Source-Identifier | the location the MAC is defined                           |
| Type              | Static — FDB entries created by management                |
|                   | Learned — dynamic entries created by the learning process |
|                   | OAM — entries created by the OAM process                  |
| Age               | the time elapsed since the service was enabled            |
| Interface         | the interface applied to the service                      |
| Port              | the port where the SAP is applied                         |

**Sample Output**

```
*A:ALA-12# show service id 2 arp

|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>base</b>                                                                                         |
| <b>Context</b>     | show>service>id                                                                                     |
| <b>Description</b> | Displays basic information about the service ID including service type, description, SAPs and SDPs. |
| <b>Parameters</b>  | <i>temp</i> — delete after conversion                                                               |
| <b>Output</b>      | <b>Show Service-ID Base</b>                                                                         |

[Table 55](#) describes the show service-id base output fields:

**Table 55** Show Service-ID Base Field Descriptions

| Label            | Description                                                                       |
|------------------|-----------------------------------------------------------------------------------|
| Service Id       | the service identifier                                                            |
| Vpn Id           | specifies the VPN ID assigned to the service                                      |
| Service Type     | specifies the type of service                                                     |
| Description      | generic information about the service                                             |
| Customer Id      | the customer identifier                                                           |
| Last Mgmt Change | the date and time of the most recent management-initiated change to this customer |
| Adm              | the desired state of the service                                                  |
| Oper             | the operating state of the service                                                |
| Mtu              | the largest frame size (in octets) that the service can handle                    |

**Table 55 Show Service-ID Base Field Descriptions (Continued)**

| Label           | Description                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Def. Mesh VC Id | this object is only valid in services that accept mesh SDP bindings. It is used to validate the VC ID portion of each mesh SDP binding defined in the service           |
| SAP Count       | the number of SAPs defined on the service                                                                                                                               |
| SDP Bind Count  | the number of SDPs bound to the service                                                                                                                                 |
| Identifier      | specifies the service access (SAP) and destination (SDP) points                                                                                                         |
| Type            | specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP                                        |
| AdmMTU          | specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented |
| OprMTU          | specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented  |
| Opr             | the operating state of the SDP                                                                                                                                          |

## statistics

- Syntax** **statistics** [*sap sap-id*]  
**statistics** [**sdp** *sdp-id:vc-id*]  
**statistics** [**interface** *interface-name*]
- Context** show>service>id>dhcp
- Description** This command displays DHCP statistics information.
- Parameters** *sap-id* — specifies the physical port identifier portion of the SAP definition  
*sdp-id* — the SDP identifier  
**Values** 1 to 17407  
*vc-id* — the virtual circuit ID on the SDP ID for which to display information  
**Values** 1 to 4294967295  
**interface** *interface-name* — displays information for the specified IP interface
- Output** **Show DHCP Statistics Output**  
[Table 56](#) describes the output fields for DHCP statistics.

**Table 56** Show DHCP Statistics Field Descriptions

| Label            | Description                                          |
|------------------|------------------------------------------------------|
| Received Packets | the number of packets received from the DHCP clients |

**Table 56 Show DHCP Statistics Field Descriptions (Continued)**

| Label                      | Description                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmitted Packets        | the number of packets transmitted to the DHCP clients                                                                                                                                                                    |
| Received Malformed Packets | the number of corrupted/invalid packets received from the DHCP clients                                                                                                                                                   |
| Received Untrusted Packets | the number of untrusted packets received from the DHCP clients. In this case, a frame is dropped due to the client sending a DHCP packet with Option 82 filled in before "trust" is set under the DHCP interface command |
| ClientPacketsDiscarded     | the number of packets received from the DHCP clients that were discarded                                                                                                                                                 |
| ClientPacketsRelayed       | the number of packets received from the DHCP clients that were forwarded                                                                                                                                                 |
| ClientPacketsSnooped       | the number of packets received from the DHCP clients that were snooped                                                                                                                                                   |
| ServerPacketsDiscarded     | the number of packets received from the DHCP server that were discarded                                                                                                                                                  |
| ServerPacketsRelayed       | the number of packets received from the DHCP server that were forwarded                                                                                                                                                  |
| ServerPacketsSnooped       | the number of packets received from the DHCP server that were snooped                                                                                                                                                    |

| <b>Description</b> | This command displays GSMP neighbor information.                                                                                                                                                                                                                                             |
| <b>Parameters</b>  | <p><b>group</b> — a GSMP group defines a set of GSMP neighbors which have the same properties</p> <p><i>name</i> — specifies a GSMP group name is unique only within the scope of the service in which it is defined</p> <p><i>ip-address</i> — specifies the ip-address of the neighbor</p> |
| <b>Output</b>      |                                                                                                                                                                                                                                                                                              |

### Sample Output

These commands show the configured neighbors per service, regardless of the fact there exists an open TCP connection with this neighbor. The admin state is shown because for a neighbor to be admin enabled, the service, gsmp node, group node and the neighbor node in this service must all be in 'no shutdown' state. Session gives the number of session (open TCP connections) for each configured neighbor.

```

to-cel No 0/0 Keep Up
 sap:1/1/10:1 0/0

Interfaces: 3
=====
A:ALA-49#

```

**interface**

- Syntax** **interface** {[*ip-address* | *ip-int-name*] [*interface-type*] [**detail**] [**family**]} | **summary**}
- Context** show>service>id
- Description** Displays information for the IP interfaces associated with the service.
- If no optional parameters are specified, a summary of all IP interfaces associated to the service are displayed.
- Parameters** *ip-address* — the IP address of the interface for which to display information
- Values** 1.0.0.0 — 223.255.255.255
- ip-int-name* — the IP interface name for which to display information
- family** — specifies the family to display
- Values** ipv4, ipv6

*interface-type* — specifies the interface type

**Values** subscriber, group, redundant

**detail** — displays detailed IP interface information

**Default** IP interface summary output

**Output**

```
A:cses-V96# /show service id 1 interface
- interface [{[<ip-address|ip-int-name>] [interface-type] [detail]
 [family]}|summary]
<ip-int-name|ip-ad*> : ip-int-name - 32 chars max
 ipv4-address - a.b.c.d
 ipv6-address - x:x:x:x:x:x:x:x (eight 16-bit
 pieces)
 x:x:x:x:x:x:d.d.d.d
 x - [0..FFFF]H
 d - [0..255]D

<detail> : keyword - adds details to the display
<family> : ipv4|ipv6
<interface-type> : subscriber|group|redundant
<summary> : keyword - displays summary
```

Table 58 describes the show service-id interface output fields:

**Table 58** Show Service-ID Interface Field Descriptions

| Label          | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| Interface-Name | the name used to refer to the interface                               |
| Type           | specifies the interface type                                          |
| IP-Address     | specifies the IP address/IP subnet/broadcast address of the interface |
| Adm            | the desired state of the interface                                    |
| Opr            | the operating state of the interface                                  |
| Interface      |                                                                       |
| If Name        | the name used to refer to the interface                               |
| Admin State    | the desired state of the interface                                    |
| Oper State     | the operating state of the interface                                  |
| IP Addr/mask   | specifies the IP address/IP subnet/broadcast address of the interface |

**Table 58**      **Show Service-ID Interface Field Descriptions (Continued)**

| Label             | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ignore Port State | Indicates whether or not the <b>tools perform service id service-id interface ip-int-name ignore-sap port-state</b> command has been executed for a service interface directly connected to a SAP:<br>none — the command has not been executed for or accepted by the interface<br>active — the command has been executed and accepted, and the port state check is currently being bypassed for the interface<br>pending — the command has been executed and accepted, but the port state for the interface is already operational |
| Details           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| If Index          | The index corresponding to this interface. The primary index is 1. For example, all interfaces are defined in the Base virtual router context.                                                                                                                                                                                                                                                                                                                                                                                      |
| If Type           | specifies the interface type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Port Id           | specifies the SAP's port ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SNTP B.Cast       | specifies whether SNTP broadcast client mode is enabled or disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Arp Timeout       | specifies the timeout for an ARP entry learned on the interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MAC Address       | specifies the 48-bit IEEE 802.3 MAC address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ICMP Mask Reply   | specifies whether ICMP mask reply is enabled or disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Cflowd            | specifies whether Cflowd collection and analysis on the interface is enabled or disabled                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ICMP Details      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Redirects         | specifies the rate for ICMP redirect messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Unreachables      | specifies the rate for ICMP unreachable messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TTL Expired       | specifies the rate for ICMP TTL messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

```

sap

- Syntax**     **sap sap-id [detail]]**
- Context**    show>service>id

- Description** Displays information for the SAPs associated with the service.
- If no optional parameters are specified, a summary of all associated SAPs is displayed.
- Parameters** *sap-id* — The ID that displays SAPs for the service  
**detail** — Displays detailed information for the SAP
- Output** **Show Service-ID SAP**
- [Table 59](#) describes the show service SAP fields:

**Table 59 Show Service-ID SAP Field Descriptions**

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Id         | the service identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SAP                | the SAP and qtag                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Encap              | the encapsulation type of the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Ethertype          | specifies an Ethernet type II Ethertype value                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Admin State        | the administrative state of the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Oper State         | the operating state of the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Flags              | specifies the conditions that affect the operating status of this SAP<br>Display output includes: ServiceAdminDown, SapAdminDown, InterfaceAdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngressQoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrcMac, ParentIfAdminDown, NoSapPipeCelpAddr, SapParamMismatch, CemSapNoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, SapIngressNamedPoolMismatch, SapEgressNamedPoolMismatch, NoSapEpipeRingNode. |
| Last Status Change | specifies the time of the most recent operating status change to this SAP                                                                                                                                                                                                                                                                                                                                                                                                           |
| Last Mgmt Change   | specifies the time of the most recent management-initiated change to this SAP                                                                                                                                                                                                                                                                                                                                                                                                       |
| Admin MTU          | the desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.                                                                                                                                                                                                                                                                                                                    |
| Oper MTU           | the actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented                                                                                                                                                                                                                                                                                                                      |
| Ingress qos-policy | the ingress QoS policy ID assigned to the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Egress qos-policy  | the egress QoS policy ID assigned to the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Ingress Filter-Id  | the ingress filter policy ID assigned to the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Egress Filter-Id   | the egress filter policy ID assigned to the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Acct. Pol          | the accounting policy ID assigned to the SAP                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 59 Show Service-ID SAP Field Descriptions (Continued)**

| Label               | Description (Continued)                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Collect Stats       | specifies whether collect stats is enabled                                                                                                                               |
| Dropped             | the number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.                                            |
| Off. HiPrio         | the number of high priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip                                           |
| Off. LowPrio        | the number of low priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip                                            |
| Off. Uncolor        | the number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip                                               |
| Dro. HiPrio         | the number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc. |
| Dro. LowPrio        | the number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.  |
| For. InProf         | the number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip                                                                              |
| For. OutProf        | the number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |
| Dro. InProf         | the number of in-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                          |
| Dro. OutProf        | the number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.                                      |
| For. InProf         | the number of in-profile packets and octets (rate below CIR) forwarded by the egress Qchip                                                                               |
| For. OutProf        | the number of out-of-profile packets and octets (rate above CIR) forwarded by the egress Qchip                                                                           |
| Ingress TD Profile  | the profile ID applied to the ingress SAP                                                                                                                                |
| Egress TD Profile   | the profile ID applied to the egress SAP                                                                                                                                 |
| Alarm Cell Handling | the indication that OAM cells are being processed                                                                                                                        |
| AAL-5 Encap         | the AAL-5 encapsulation type                                                                                                                                             |

|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sdp</b> [ <i>sdp-id</i>   <b>far-end</b> <i>ip-addr</i> ] [ <b>detail</b> ]                                                                                                                                                                                                                                                                                                  |
| <b>Context</b>     | show>service>id                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | Displays information for the SDPs associated with the service. If no optional parameters are specified, a summary of all associated SDPs is displayed.                                                                                                                                                                                                                          |
| <b>Parameters</b>  | <p><i>sdp-id</i> — displays only information for the specified SDP ID</p> <p><b>Values</b>      1 to 17407</p> <p><b>Default</b>     all SDPs</p> <p><b>far-end</b> <i>ip-addr</i> — displays only SDPs matching with the specified far-end IP address</p> <p><b>Default</b>      SDPs with any far-end IP address</p> <p><b>detail</b> — displays detailed SDP information</p> |
| <b>Output</b>      | <p><b>Show Service-ID SDP</b></p> <p><a href="#">Table 60</a> describes the show service-id SDP output fields:</p>                                                                                                                                                                                                                                                              |

**Table 60**      **Show Service-ID SDP Field Descriptions**

| Label               | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sdp Id              | the SDP identifier                                                                                                                                                           |
| Type                | indicates whether the SDP is a spoke or a mesh                                                                                                                               |
| Split Horizon Group | name of the split horizon group that the SDP belongs to                                                                                                                      |
| VC Type             | displays the VC type: ether or vlan                                                                                                                                          |
| VC Tag              | displays the explicit dot1Q value used when encapsulating to the SDP far end                                                                                                 |
| I. Lbl              | the VC label used by the far-end device to send packets to this device in this service by the SDP                                                                            |
| Admin Path MTU      | the operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case.) |
| Oper Path MTU       | the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented              |
| Far End             | specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP                                                                                     |
| Delivery            | specifies the type of delivery used by the SDP: GRE or MPLS                                                                                                                  |
| Admin State         | the administrative state of this SDP                                                                                                                                         |
| Oper State          | the operational state of this SDP                                                                                                                                            |
| Ingress Label       | the label used by the far-end device to send packets to this device in this service by this SDP                                                                              |
| Egress Label        | the label used by this device to send packets to the far-end device in this service by the SDP                                                                               |
| Last Changed        | the date and time of the most recent change to the SDP                                                                                                                       |
| Signaling           | specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.                                           |
| Admin State         | the administrative state of the keepalive process                                                                                                                            |
| Oper State          | the operational state of the keepalive process                                                                                                                               |
| Hello Time          | specifies how often the SDP echo request messages are transmitted on this SDP                                                                                                |
| Max Drop Count      | specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault                               |
| Hello Msg Len       | specifies the length of the SDP echo request messages transmitted on this SDP                                                                                                |
| Hold Down Time      | specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state                                                              |

**Table 60 Show Service-ID SDP Field Descriptions (Continued)**

| Label               | Description (Continued)                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I. Fwd. Pkts.       | specifies the number of forwarded ingress packets                                                                                                                                                                                                                                    |
| I. Dro. Pkts.       | specifies the number of dropped ingress packets                                                                                                                                                                                                                                      |
| E. Fwd. | Description | This command displays information for the SDPs associated with the service.<br><br>If no optional parameters are specified, a summary of all associated SDPs is displayed.                                                                                                                                                                                                          |

**Parameters**

***sdp-id*** — specifies the SDP ID for which to display information

**Values** 1 to 17407

**Default** all SDPs

***pw-port-id*** — specifies the pseudo-wire port identifier

**Values** 1 to 10239

***far-end ip-address*** — displays only SDPs matching with the specified far-end IP address

**Default** SDPs with any far-end IP address

***detail*** — displays detailed SDP information

**Default** SDP summary output

***keep-alive-history*** — displays the last fifty SDP keepalive events for the SDP

**Default** SDP summary output

## pw-port

- Syntax** **pw-port** [*pw-port-id*] [**detail**]  
**pw-port sdp** *sdp-id*  
**pw-port sdp none**
- Context** show>pw-port
- Description** Displays pseudo-wire port information.
- If no optional parameters are specified, the command displays a summary of all defined PW ports. The optional parameters restrict output to only ports matching the specified properties.
- Parameters** *pw-port-id* — specifies the pseudo-wire port identifier
- Values** 1 to 10239
- detail** — displays detailed port information that includes all the **pw-port** output fields
- sdp** *sdp-id* — the SDP ID for which to display matching PW port information
- Values** 1 to 17407
- Output** **Show PW-Port**
- [Table 61](#) describes **show pw-port** output fields:

**Table 61 Show PW-Port Field Descriptions**

| Label   | Description                              |
|---------|------------------------------------------|
| PW Port | the PW Port identifier                   |
| Encap   | the encapsulation type of the PW Port    |
| SDP     | the SDP identifier                       |
| IfIndex | the interface index used for the PW Port |
| VC-Id   | the Virtual Circuit identifier           |

**Table 61 Show PW-Port Field Descriptions (Continued)**

| Label       | Description (Continued)                |
|-------------|----------------------------------------|
| Description | the description string for the PW Port |

## subscriber-hosts

- Syntax** **subscriber-hosts** [**sap** *sap-id*] [**ip** *ip-address*[/*mask*]] [**mac** *ieee-address*] [**sub-profile** *sub-profile-name*] [**sla-profile** *sla-profile-name*] [**detail**]  
**subscriber-hosts** [**detail**] **wholesaler** *service-id*
- Context** show>service>id
- Description** This command displays subscriber host information.
- Parameters** *sap sap-id* — displays the specified subscriber host SAP information
- ip-address/mask* — The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.
- Values** 1.0.0.0 to 223.255.255.255 (with support of /31 subnets).  
mask: 1 to 32
- ieee-address* — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.
- sub-profile** *sub-profile-name* — Specifies an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.
- sla-profile** *sla-profile-name* — Specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.
- detail** — displays detailed information
- wholesaler** *service-id* — the VPRN service ID of the wholesaler (applies only to the 7750 SR)
- Values** 1 to 2147483648

## filter-id

- Syntax** **filter-id** [*filter-id*]

|                    |                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | show>service>log                                                                                                                                                                                                                                    |
| <b>Description</b> | <p>This command displays event file log information.</p> <p>If no command line parameters are specified, a summary output of all event log files is displayed.</p> <p>Specifying a file ID displays detailed information on the event file log.</p> |
| <b>Parameters</b>  | <i>log-file-id</i> — displays detailed information on the specified event file log                                                                                                                                                                  |
| <b>Output</b>      | <b>Log File Output</b>                                                                                                                                                                                                                              |

[Table 62](#) describes the output fields for a log file summary.

**Table 62 Filter-ID Field Descriptions**

| Label           | Description                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file-id         | the log file ID                                                                                                                                                |
| rollover        | the rollover time for the log file which is how long in between partitioning of the file into a new file                                                       |
| retention       | the retention time for the file in the system which is how long the file should be retained in the file system                                                 |
| admin location  | the primary flash device specified for the file location<br>n/a — indicates no specific flash device was specified                                             |
| backup location | the secondary flash device specified for the file location if the admin location is not available<br>n/a — Indicates that no backup flash device was specified |
| oper location   | the actual flash device on which the log file exists                                                                                                           |
| file-id         | the log file ID                                                                                                                                                |
| rollover        | the rollover time for the log file which is how long in between partitioning of the file into a new file                                                       |
| retention       | the retention time for the file in the system which is how long the file should be retained in the file system                                                 |
| file name       | the complete pathname of the file associated with the log ID                                                                                                   |
| expired         | indicates whether or not the retention period for this file has passed                                                                                         |
| state           | in progress — indicates the current open log file<br>complete — indicates the old log file                                                                     |

| <b>Context</b>     | show>service>log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b> | <p>This command displays an event log summary with settings and statistics or the contents of a specific log file, SNMP log, or memory log.</p> <p>If the command is specified with no command line options, a summary of the defined system logs is displayed. The summary includes log settings and statistics.</p> <p>If the log ID of a memory, SNMP, or file event log is specified, the command displays the contents of the log. Additional command line options control what and how the contents are displayed.</p> <p>Contents of logs with console, session or syslog destinations cannot be displayed. The actual events can only be viewed on the receiving syslog or console device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <p><i>log-id</i> — Displays the contents of the specified file log or memory log ID. The log ID must have a destination of an SNMP or file log or a memory log for this parameter to be used.</p> <p><b>Values</b> 1 to 99</p> <p><b>Default</b> displays the event log summary</p> <p><i>severity severity-level</i> — displays only events with the specified and higher severity</p> <p><b>Values</b> cleared, indeterminate, critical, major, minor, warning</p> <p><b>Default</b> all severity levels</p> <p><i>application application</i> — displays only events generated by the specified application</p> <p>The following values apply to the 7750 SR and 7950 XRS only:</p> <p><b>Values</b> (bgp, cflowd, chassis, debug, igmp, lldp, mirror, ospf, pim, port, snmp, system, user, vrtr)</p> <p>The following values apply only to the 7450 ESS:</p> <p><b>Values</b> chassis, dhcp, debug, filter, ip, isis, lag, ldp, logger, mirror, mpls, oam, ospf, port, ppp, rip, route_policy, rsvp, security, snmp, stp, svcmgr, system, user, vrrp, vrtr, ospf_ng, ntp</p> <p><b>Default</b> all applications</p> <p><b>expression</b> — specifies to use a regular expression as match criteria for the router instance string</p> <p><i>sequence from-seq [to-seq]</i> — Displays the log entry numbers from a particular entry sequence number (<i>from-seq</i>) to another sequence number (<i>to-seq</i>). The <i>to-seq</i> value must be larger than the <i>from-seq</i> value.</p> |

If the *to-seq* number is not provided, the log contents to the end of the log is displayed unless the **count** parameter is present in which case the number of entries displayed is limited by the **count**.

**Values** 1 to 4294967295

**Default** all sequence numbers

*count count* — limits the number of log entries displayed to the *number* specified

**Values** 1 to 4294967295

**Default** all log entries

*router-instance* — specifies a router name up to 32 characters to be used in the display criteria.

*subject subject* — Displays only log entries matching the specified text *subject* string. The subject is the object affected by the event, for example the port-id would be the subject for a link-up or link-down event.

**regexp** — specifies to use a regular expression as parameters with the specified **subject** string

*ascending | descending* — Specifies sort direction. Logs are normally shown from the newest entry to the oldest in **descending** sequence number order on the screen. When using the **ascending** parameter, the log will be shown from the oldest to the newest entry.

**Default** descending

#### Output Show Log-ID Output

[Table 63](#) describes the log ID field output.

**Table 63 Show Log-ID Field Descriptions**

| Label       | Description                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log Id      | an event log destination                                                                                                                                                                                                                                  |
| Source      | no — the event log filter is not currently in use by a log ID<br>yes — the event log filter is currently in use by a log ID                                                                                                                               |
| Filter ID   | The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination. |
| Admin State | Up — indicates that the administrative state is up<br>Down — indicates that the administrative state is down                                                                                                                                              |
| Oper State  | Up — indicates that the operational state is up<br>Down — indicates that the operational state is down                                                                                                                                                    |

**Table 63** Show Log-ID Field Descriptions (Continued)

| Label       | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logged      | the number of events that have been sent to the log source(s) that were forwarded to the log destination                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Dropped     | the number of events that have been sent to the log source(s) that were not forwarded to the log destination because they were filtered out by the log filter                                                                                                                                                                                                                                                                                                                                                                                                               |
| Dest. Type  | Console — All selected log events are directed to the system console. If the console is not connected, then all entries are dropped.<br>Syslog — All selected log events are sent to the syslog address.<br>SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables.<br>File — All selected log events will be directed to a file on one of the CPM's compact flash disks. (7750 SR and 7450 ESS only)<br>Memory — All selected log events will be directed to an in-memory storage area. |
| Dest ID     | the event log stream destination                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Size        | the allocated memory size for the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Time format | the time format specifies the type of timestamp format for events sent to logs where log ID destination is either syslog or file.<br>When the time format is UTC, timestamps are written using the Coordinated Universal Time value.<br>When the time format is local, timestamps are written in the system's local time.                                                                                                                                                                                                                                                   |

## snmp-trap-group

**Syntax** `snmp-trap-group [log-id]`

**Context** `show>service>log`

**Description** This command displays SNMP trap group configuration information.

**Parameters** *log-id* — displays only SNMP trap group information for the specified trap group log ID

**Values** 1 to 99

**Output** **SNMP Trap Group Output**

[Table 64](#) describes SNMP trap group output fields.

**Table 64** SNMP Trap Group Field Descriptions

| Label          | Description                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log-ID         | the log destination ID for an event stream                                                                                                                                                                                                    |
| Address        | the IP address of the trap receiver                                                                                                                                                                                                           |
| Port           | the destination UDP port used for sending traps to the destination, expressed as a decimal integer                                                                                                                                            |
| Version        | specifies the SNMP version format to use for traps sent to the trap receiver. Valid values are snmpv1, snmpv2c, snmpv3                                                                                                                        |
| Community      | the community string required by <b>snmpv1</b> or <b>snmpv2c</b> trap receivers                                                                                                                                                               |
| Security-Level | the required authentication and privacy levels required to access the views on this node                                                                                                                                                      |
| Replay         | indicates whether or not the replay parameter has been configured, enabled or disabled, for the trap-target address                                                                                                                           |
| Replay from    | Indicates the sequence ID of the first missed notification that will be replayed when a route is added to the routing table by which trap-target address can be reached. If no notifications are waiting to be replayed this field shows n/a. |
| Last Replay    | Indicates the last time missed events were replayed to the trap-target address. If no events have ever been replayed this field shows never.                                                                                                  |

## syslog

**Syntax** **syslog** [*syslog-id*]

**Context** show>service>log

**Description** This command displays syslog event log destination summary information or detailed information on a specific syslog destination.

**Parameters** *syslog-id* — displays detailed information on the specified syslog event log destination

**Values** 1 to 10

**Output** **Syslog Event Log Destination Summary Output**

[Table 65](#) describes the syslog output fields.

**Table 65** Show Log Syslog Field Descriptions

| Label               | Description                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog ID           | the syslog ID number for the syslog destination                                                                                                                                        |
| IP Address          | the IP address of the syslog target host                                                                                                                                               |
| Port                | the configured UDP port number used when sending syslog messages                                                                                                                       |
| Facility            | the facility code for messages sent to the syslog target host                                                                                                                          |
| Severity Level      | the syslog message severity level threshold                                                                                                                                            |
| Below Level Dropped | A count of messages not sent to the syslog collector target because the severity level of the message was above the configured severity. The higher the level, the lower the severity. |
| Prefix Present      | Yes — a log prefix was prepended to the syslog message sent to the syslog host                                                                                                         |
|                     | No — a log prefix was not prepended to the syslog message sent to the syslog host                                                                                                      |
| Description         | a text description stored in the configuration file for a configuration context                                                                                                        |
| LogPrefix           | the prefix string prepended to the syslog message                                                                                                                                      |
| Log-id              | events are directed to this <i>destination</i>                                                                                                                                         |

## aggregate

**Syntax**     **aggregate [active]**

**Context**     show>router

**Description**     This command displays aggregated routes.

**Parameters**     **active** — This keyword filters out inactive aggregates.

**Output**     **Show Aggregate Output Fields**

[Table 66](#) describes router aggregate output fields.

**Table 66 Show Aggregate Field Descriptions**

| Label             | Description                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Prefix            | displays the destination address of the aggregate route in dotted decimal notation                                                      |
| Summary           | specifies whether the aggregate or more specific components are advertised                                                              |
| AS Set            | displays an aggregate where the path advertised for the route consists of all elements contained in all paths that are being summarized |
| Aggr AS           | displays the aggregator path attribute to the aggregate route                                                                           |
| Aggr IP-Address   | the IP address of the aggregated route                                                                                                  |
| State             | the operational state of the aggregated route                                                                                           |
| No. of Aggregates | the total number of aggregated routes                                                                                                   |

**Sample Output**

```

## arp

**Syntax** `arp [ip-address | ip-int-name | mac ieee-mac-addr]`

**Context** `show>router`

**Description** This command displays the router ARP table sorted by IP address.

If no command line options are specified, all ARP entries are displayed.

**Parameters** *ip-addr* — only displays ARP entries associated with the specified IP address  
*ip-int-name* — only displays ARP entries associated with the specified IP interface name  
*mac ieee-mac-addr* — only displays ARP entries associated with the specified MAC address

**Output** **ARP Table Output**

[Table 67](#) describes ARP table output fields:

**Table 67 ARP Table Field Descriptions**

| Label       | Description                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address  | the IP address of the ARP entry                                                                                                                                                                                        |
| MAC Address | the MAC address of the ARP entry                                                                                                                                                                                       |
| Expiry      | the age of the ARP entry                                                                                                                                                                                               |
| Type        | Dyn — the ARP entry is a dynamic ARP entry<br>Inv — the ARP entry is an inactive static ARP entry (invalid)<br>Oth — the ARP entry is a local or system ARP entry<br>Sta — the ARP entry is an active static ARP entry |

**Table 67 ARP Table Field Descriptions (Continued)**

| <b>Description</b> | <p>This command displays BGP routes with have been dampened due to route flapping. This command can be entered with or without a route parameter.</p> <p>When the keyword <b>detail</b> is included, more detailed information displays.</p> <p>When only the command is entered (without any parameters included except <b>detail</b>), then all dampened routes are listed.</p> <p>When a parameter is specified, then the matching route or routes are listed.</p> <p>When a <b>decayed</b>, <b>history</b>, or <b>suppressed</b> keyword is specified, only those types of dampened routes are listed.</p>          |
| <b>Parameters</b>  | <p><i>ip-prefix/mask</i> — displays damping information for the specified IP prefix and mask length</p> <p><i>ip-address</i> — displays damping entry for the best match route for the specified IP address</p> <p><i>damp-type</i> — displays damping type for the specified IP address</p> <p><b>decayed</b> — displays damping entries that are decayed but are not suppressed</p> <p><b>history</b> — displays damping entries that are withdrawn but have history</p> <p><b>suppressed</b> — displays damping entries suppressed because of route damping</p> <p><b>detail</b> — displays detailed information</p> |
| <b>Output</b>      | <b>Show Damping Output Fields</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

[Table 68](#) describes BGP damping output fields:

**Table 68** Show Damping Field Descriptions

| Label         | Description                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------|
| BGP Router ID | the local BGP router ID                                                                                                   |
| AS            | the configured autonomous system number                                                                                   |
| Local AS      | the configured or inherited local AS for the specified peer group. If not configured, then it is the same value as the AS |
| Network       | Route IP prefix and mask length for the route                                                                             |

## group

**Syntax**     **group** [*name*] [*detail*]

**Context**     show>router>bgp

**Description**     This command displays group information for a BGP peer group. This command can be entered with or without parameters.

When this command is entered without a group name, information about all peer groups displays.

When the command is issued with a specific group name, information only pertaining to that specific peer group displays.

The 'State' field displays the BGP group's operational state. Other valid states are:

- Up - BGP global process is configured and running.
- Down - BGP global process is administratively shutdown and not running.
- Disabled - BGP global process is operationally disabled. The process must be restarted by the operator.

**Parameters**     *name* — displays information for the BGP group specified

**detail** — displays detailed information

**Output**     **Standard and Detailed Group Output**

[Table 69](#) describes the standard and detailed command output fields for a BGP group:

**Table 69     Standard and Detailed Group Field Descriptions**

| Label      | Description                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group      | BGP group name                                                                                                                                                          |
| Group Type | No Type — peer type not configured<br>External — peer type configured as external BGP peers<br>Internal — peer type configured as internal BGP peers                    |
| State      | Disabled — the BGP peer group has been operationally disabled<br>Down — the BGP peer group is operationally inactive<br>Up — the BGP peer group is operationally active |
| Peer AS    | the configured or inherited peer AS for the specified peer group                                                                                                        |
| Local AS   | the configured or inherited local AS for the specified peer group                                                                                                       |

**Table 69 Standard and Detailed Group Field Descriptions (Continued)**

| Label            | Description (Continued)                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Address    | the configured or inherited local address for originating peering for the specified peer group                                                                                                                                                                                                |
| Loop Detect      | the configured or inherited loop detect setting for the specified peer group                                                                                                                                                                                                                  |
| Connect Retry    | the configured or inherited connect retry timer value                                                                                                                                                                                                                                         |
| Authentication   | n/a — no authentication is configured<br>MD5 — MD5 authentication is configured                                                                                                                                                                                                               |
| Local Pref       | the configured or inherited local preference value                                                                                                                                                                                                                                            |
| MED Out          | the configured or inherited MED value assigned to advertised routes without a MED attribute                                                                                                                                                                                                   |
| Min Route Advt.  | the minimum amount of time that must pass between route updates for the same IP prefix                                                                                                                                                                                                        |
| Min AS Originate | the minimum amount of time that must pass between updates for a route originated by the local router                                                                                                                                                                                          |
| Multihop         | the maximum number of router hops a BGP connection can traverse                                                                                                                                                                                                                               |
| Multipath        | the configured or inherited multipath value, determining the maximum number of ECMP routes BGP can advertise to the RTM                                                                                                                                                                       |
| Prefix Limit     | No Limit — no route limit assigned to the BGP peer group<br>1 to 4294967295 — the maximum number of routes BGP can learn from a peer                                                                                                                                                          |
| Passive          | Disabled — BGP attempts to establish BGP connections with neighbors in the specified peer group.<br>Enabled — BGP will not actively attempt to establish BGP connections with neighbors in the specified peer group.                                                                          |
| Next Hop Self    | Disabled — BGP is not configured to send only its own IP address as the BGP nexthop in route updates to neighbors in the peer group.<br>Enabled — BGP sends only its own IP address as the BGP nexthop in route updates to neighbors in the specified peer group.                             |
| Aggregator ID 0  | Disabled — BGP is not configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates sent to the neighbor in the peer group.<br>Enabled — BGP is configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates sent to the neighbor in the peer group. |
| Remove Private   | Disabled — BGP will not remove all private AS numbers from the AS path attribute in updates sent to the neighbor in the peer group.<br>Enabled — BGP removes all private AS numbers from the AS path attribute in updates sent to the neighbor in the peer group.                             |
| Damping          | Disabled — The peer group is configured not to dampen route flaps.<br>Enabled — The peer group is configured to dampen route flaps.                                                                                                                                                           |

**Table 69**      **Standard and Detailed Group Field Descriptions (Continued)**

| Label          | Description (Continued)                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Export Policy  | the configured export policies for the peer group                                                                                                                   |
| Import Policy  | the configured import policies for the peer group                                                                                                                   |
| Hold Time      | the configured hold time setting                                                                                                                                    |
| Keep Alive     | the configured keepalive setting                                                                                                                                    |
| Cluster Id     | n/a — No cluster ID has been configured.                                                                                                                            |
| Client Reflect | Disabled — The BGP route reflector will not reflect routes to this neighbor.<br>Enabled — The BGP route reflector is configured to reflect routes to this neighbor. |
| NLRI           | the type of NLRI information that the specified peer group can accept<br>Unicast — IPv4 unicast routing information can be carried.                                 |
| Preference     | the configured route preference value for the peer group                                                                                                            |
| List of Peers  | a list of BGP peers configured under the peer group                                                                                                                 |
| Total Peers    | the total number of peers configured under the peer group                                                                                                           |
| Established    | the total number of peers that are in an established state                                                                                                          |

**Sample Output (7450 ESS and 7750 SR)**

```

*A:ALA-12# show router 3 bgp group

| <b>Description</b> | <p>This command displays BGP neighbor information. This command can be entered with or without any parameters.</p> <p>When this command is issued without any parameters, information about all BGP peers displays.</p> <p>When the command is issued with a specific IP address or ASN, information regarding only that specific peer or peers with the same AS display.</p> <p>When either <b>received-routes</b> or <b>advertised-routes</b> is specified, then the routes received from or sent to the specified peer is listed (see second output example). This information is not available by SNMP.</p> <p>When either <b>history</b> or <b>suppressed</b> is specified, then the routes learned from those peers that either have a history or are suppressed (respectively) are listed.</p> <p>The 'State' field displays the BGP peer's protocol state. In addition to the standard protocol states, this field can also display the 'Disabled' operational state which indicates the peer is operationally disabled and must be restarted by the operator.</p> |
| <b>Parameters</b>  | <p><i>ip-addr</i> — displays the BGP neighbor with the specified IP address</p> <p><b>family</b> <i>family</i> — specifies the type of routing information to be distributed by the BGP instance</p> <p><b>Values</b>      ipv4, vpn-ipv4</p> <p><i>filter1</i> — specifies route criteria</p> <p><b>Values</b>      received-routes, advertised-routes, history, suppressed, detail</p> <p><i>filter2</i> — specifies route criteria</p> <p><b>Values</b>      history, suppressed, detail</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Output</b>      | <b>Standard and Detailed Neighbor</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

[Table 70](#) describes the standard and detailed command output fields for a BGP neighbor:

**Table 70      Standard and Detailed Neighbor Field Descriptions**

| Label | Description                                        |
|-------|----------------------------------------------------|
| Peer  | the IP address of the configured BGP peer.         |
| Group | the BGP peer group to which this peer is assigned. |

**Table 70**      **Standard and Detailed Neighbor Field Descriptions (Continued)**

| Label         | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Peer AS       | the configured or inherited peer AS for the peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Peer Address  | the configured address for the BGP peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Peer Port     | the TCP port number used on the far-end system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Local AS      | the configured or inherited local AS for the peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Local Address | the configured or inherited local address for originating peering for the peer group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Local Port    | the TCP port number used on the local system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Peer Type     | External — Peer type configured as external BGP peers.<br>Internal — Peer type configured as internal BGP peers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| State         | Idle — the BGP peer is not accepting connections. (Shutdown) is displayed in addition, if the peer is administratively disabled.<br>Active — BGP is listening for and accepting TCP connections from this peer.<br>Connect — BGP is attempting to establish a TCP connection from this peer.<br>Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer.<br>Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION.<br>Established — BGP has successfully established a peering and is exchanging routing information. |
| Last State    | Idle — the BGP peer is not accepting connections.<br>Active — BGP is listening for and accepting TCP connections from this peer.<br>Connect — BGP is attempting to establish a TCP connection from this peer.<br>Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer.<br>Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION.                                                                                                                                                                                   |

**Table 70 Standard and Detailed Neighbor Field Descriptions (Continued)**

| Label            | Description (Continued)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Event       | <p>start — BGP has initialized the BGP neighbor.</p> <p>stop — BGP has disabled the BGP neighbor.</p> <p>open — BGP transport connection opened.</p> <p>close — BGP transport connection closed.</p> <p>open — BGP transport connection opened.</p> <p>close — BGP transport connection closed.</p> <p>openFail — BGP transport connection failed to open.</p> <p>error — BGP transport connection error.</p> <p>connectRetry — Connect retry timer expired.</p> <p>holdTime — Hold time timer expired.</p> <p>keepAlive — Keepalive timer expired.</p> <p>recvOpen — receive an OPEN message</p> <p>revKeepalive — receive an KEEPALIVE message</p> <p>recvUpdate — receive an UPDATE message</p> <p>recvNotify — receive an NOTIFICATION message</p> <p>None — No events have occurred.</p> |
| Last Error       | displays the last BGP error and sub-code to occur on the BGP neighbor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Connect Retry    | the configured or inherited connect retry timer value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Local Pref.      | the configured or inherited local preference value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Min Route Advt.  | the minimum amount of time that must pass between route updates for the same IP prefix                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Min AS Originate | the minimum amount of time that must pass between updates for a route originated by the local router                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Multihop         | the maximum number of router hops a BGP connection can traverse                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Multipath        | the configured or inherited multipath value, determining the maximum number of ECMP routes BGP can advertise to the RTM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Damping          | <p>Disabled — BGP neighbor is configured not to dampen route flaps.</p> <p>Enabled — BGP neighbor is configured to dampen route flaps.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Loop Detect      | <p>Ignore — The BGP neighbor is configured to ignore routes with an AS loop.</p> <p>Drop — The BGP neighbor is configured to drop the BGP peering if an AS loop is detected.</p> <p>Off — AS loop detection is disabled for the neighbor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MED Out          | the configured or inherited MED value assigned to advertised routes without a MED attribute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Authentication   | <p>None — No authentication is configured.</p> <p>MD5 — MD5 authentication is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 70**      **Standard and Detailed Neighbor Field Descriptions (Continued)**

| Label             | Description (Continued)                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Next Hop Self     | Disabled — BGP is not configured to send only its own IP address as the BGP nexthop in route updates to the specified neighbor.<br>Enabled — BGP will send only its own IP address as the BGP nexthop in route updates to the neighbor.                 |
| AggregatorID Zero | Disabled — The BGP Neighbor is not configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates.<br>Enabled — The BGP Neighbor is configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates.               |
| Remove Private    | Disabled — BGP will not remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor.<br>Enabled — BGP will remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor. |
| Passive           | Disabled — BGP will actively attempt to establish a BGP connection with the specified neighbor.<br>Enabled — BGP will not actively attempt to establish a BGP connection with the specified neighbor.                                                   |
| Prefix Limit      | No Limit — no route limit assigned to the BGP peer group<br>1 to 4294967295 — the maximum number of routes BGP can learn from a peer                                                                                                                    |
| Hold Time         | the configured hold time setting                                                                                                                                                                                                                        |
| Keep Alive        | the configured keepalive setting                                                                                                                                                                                                                        |
| Active Hold Time  | the negotiated hold time, if the BGP neighbor is in an established state                                                                                                                                                                                |
| Active Keep Alive | the negotiated keepalive time, if the BGP neighbor is in an established state                                                                                                                                                                           |
| Cluster Id        | the configured route reflector cluster ID<br>None — No cluster ID has been configured.                                                                                                                                                                  |
| Client Reflect    | Disabled — The BGP route reflector is configured not to reflect routes to this neighbor.<br>Enabled — The BGP route reflector is configured to reflect routes to this neighbor.                                                                         |
| Preference        | the configured route preference value for the peer group                                                                                                                                                                                                |
| Num of Flaps      | the number of flaps in the neighbor connection                                                                                                                                                                                                          |
| Recd. Prefixes    | the number of routes received from the BGP neighbor                                                                                                                                                                                                     |
| Active Prefixes   | the number of routes received from the BGP neighbor and active in the forwarding table                                                                                                                                                                  |
| Recd. Paths       | the number of unique sets of path attributes received from the BGP neighbor                                                                                                                                                                             |

**Table 70 Standard and Detailed Neighbor Field Descriptions (Continued)**

| Label            | Description (Continued)                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| Suppressed Paths | the number of unique sets of path attributes received from the BGP neighbor and suppressed due to route damping |
| Input Queue      | the number of BGP messages to be processed                                                                      |
| Output Queue     | the number of BGP messages to be transmitted                                                                    |
| i/p Messages     | total number of packets received from the BGP neighbor                                                          |
| o/p Messages     | total number of packets sent to the BGP neighbor                                                                |
| i/p Octets       | total number of octets received from the BGP neighbor                                                           |
| o/p Octets       | total number of octets sent to the BGP neighbor                                                                 |
| i/p Updates      | total number of BGP updates received from the BGP neighbor                                                      |
| o/p Updates      | total number of BGP updates sent to the BGP neighbor                                                            |
| Export Policy    | the configured export policies for the peer group                                                               |
| Import Policy    | the configured import policies for the peer group                                                               |

### Sample Output

```
*A:ALA-12# show router 3 bgp neighbor

### Show Advertised and Received Routes Output

[Table 71](#) describes the command output fields for both the standard and detailed information for a neighbor:

**Table 71** Show Advertised and Received Routes Field Descriptions

| Label         | Description                                                                              |
|---------------|------------------------------------------------------------------------------------------|
| BGP Router ID | the local BGP router ID                                                                  |
| AS            | the configured autonomous system number                                                  |
| Local AS      | The configured local AS setting. If not configured, then it is the same value as the AS. |

**Table 71** Show Advertised and Received Routes Field Descriptions

| Label     | Description (Continued)                                         |
|-----------|-----------------------------------------------------------------|
| Flag      | u – used                                                        |
|           | s – suppressed                                                  |
|           | h – history                                                     |
|           | d – decayed                                                     |
|           | * – valid                                                       |
|           | i – igp                                                         |
|           | ? – incomplete                                                  |
|           | > – best                                                        |
| Network   | route IP prefix and mask length for the route                   |
| Next Hop  | BGP nexthop for the route                                       |
| LocalPref | BGP local preference path attribute for the route               |
| MED       | BGP Multi-Exit Discriminator (MED) path attribute for the route |
| AS Path   | the BGP AS path for the route                                   |

### Sample Output

## paths

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <b>Syntax</b>      | <b>paths</b>                                            |
| <b>Context</b>     | show>router>bgp                                         |
| <b>Description</b> | This command displays a summary of BGP path attributes. |
| <b>Output</b>      | <b>Show Path Output</b>                                 |

[Table 72](#) describes the command output fields for a BGP path.

**Table 72** Show Path Field Descriptions

| Label            | Description                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP Router ID    | the local BGP router ID                                                                                                                          |
| AS               | the configured autonomous system number                                                                                                          |
| Local AS         | the configured local AS setting. If not configured, then the value is the same as the AS                                                         |
| Path             | the AS path attribute                                                                                                                            |
| Origin           | EGP — The NLRI is learned by an EGP protocol.<br>IGP — The NLRI is interior to the originating AS.<br>INCOMPLETE — NLRI was learned another way. |
| Next Hop         | the advertised BGP nexthop                                                                                                                       |
| MED              | the Multi-Exit Discriminator value                                                                                                               |
| Local Preference | the local preference value                                                                                                                       |
| Refs             | the number of routes using a specified set of path attributes                                                                                    |
| ASes             | the number of autonomous system numbers in the AS path attribute                                                                                 |
| Segments         | the number of segments in the AS path attribute                                                                                                  |
| Flags            | EBGP-learned — path attributes learned by an EBGP peering<br>IBGP-Learned — path attributes learned by an IBGP peering                           |
| Aggregator       | the route aggregator ID                                                                                                                          |
| Community        | the BGP community attribute list                                                                                                                 |
| Originator ID    | the originator ID path attribute value                                                                                                           |
| Cluster List     | the route reflector cluster list                                                                                                                 |

| Description | <p>This command displays BGP route information.</p> <p>When this command is issued without any parameters, then the entire BGP routing table displays.</p> <p>When this command is issued with an IP prefix/mask or IP address, then the best match for the parameter displays.</p>                                                                                                                                                                                                                                                                |
| Parameters  | <p><b>family</b> <i>family</i> — specifies the type of routing information to be distributed by the BGP instance</p> <p><b>Values</b>     <b>ipv4</b> — displays only those BGP peers that have the IPv4 family enable and not those capable of exchanging IP-VPN routes</p>                                                                                                                                                                                                                                                                       |

**vpn-ipv4** — displays the BGP peers that are IP-VPN capable  
**ipv6** — displays the BGP peers that are IPv6 capable  
**mcast-ipv4** — displays the BGP peers that are mcast-ipv4 capable

*prefix* — specifies the type of routing information to display

| Values | rd   [rd:]ip-address[/mask]                                |                 |
|--------|------------------------------------------------------------|-----------------|
| rd     | {ip-address:number1 as-number1:number2 as-number2:number3} |                 |
|        | number1                                                    | 1 to 65535      |
|        | as-number1                                                 | 1 to 65535      |
|        | number2                                                    | 0 to 4294967295 |
|        | as-number2                                                 | 1 to 4294967295 |
|        | number3                                                    | 0 to 65535      |
|        | ip-address                                                 | a.b.c.d         |
|        | mask                                                       | 0 to 32         |

*ipv6-prefix[/prefix-length]* — specifies the type of IPv6 routing information to display

| Values             |                     |                       |
|--------------------|---------------------|-----------------------|
| ipv6-prefix        | x:x:x:x:x:x:x       | (eight 16-bit pieces) |
|                    | x:x:x:x:x:x:d.d.d.d |                       |
|                    | x:                  | [0 to FFFF]H          |
|                    | d:                  | [0 to 255]D           |
| ipv6-prefix-length | 0 to 128            |                       |

*filter* — specifies route criteria

**Values**    **hunt** — displays entries for the specified route in the RIB-In, RIB-Out, and RTM.  
              **longer** — displays the specified route and subsets of the route.  
              **detail** — displays the longer, more detailed version of the output.

**aspath-regex** *“reg-exp”* — displays all routes with an AS path matching the specified regular expression *reg-exp*

**community** *comm.-id* — displays all routes with the specified BGP community

| Values | [as-number1:comm-val1   ext-comm   well-known-comm] |  |

## summary

- Syntax** **summary [all]**
- Context** show>router>bgp
- Description** This command displays a summary of BGP neighbor information.
- If confederations are not configured, that portion of the output will not display.
- The “State” field displays the global BGP operational state. The valid values are:
- Up — BGP global process is configured and running.
  - Down — BGP global process is administratively shutdown and not running.
  - Disabled — BGP global process is operationally disabled. The process must be restarted by the operator.
  - For example, if a BGP peer is operationally disabled, then the state in the summary table shows the state ‘Disabled’
- Parameters** **all** — displays BGP peers in all instances
- Output** **Show BGP Summary Output**

[Table 74](#) describes the command output fields for a BGP summary:

**Table 74 Show BGP Summary Field Descriptions**

| Label            | Description                                                                        |
|------------------|------------------------------------------------------------------------------------|

**Table 74 Show BGP Summary Field Descriptions (Continued)**

| Label                   | Description                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Member Confederations   | the configured members of the BGP confederation                                                                                        |
| Number of Peer Groups   | the total number of configured BGP peer groups.                                                                                        |
| Number of Peers         | the total number of configured BGP peers                                                                                               |
| Total BGP Active Routes | the total number of BGP routes used in the forwarding table                                                                            |
| Total BGP Routes        | the total number of BGP routes learned from BGP peers                                                                                  |
| Total BGP Paths         | The total number of unique sets of BGP path attributes learned from BGP peers                                                          |
| Total Path Memory       | total amount of memory used to store the path attributes                                                                               |
| Total Suppressed Routes | total number of suppressed routes due to route damping                                                                                 |
| Total History Routes    | total number of routes with history due to route damping                                                                               |
| Total Decayed Routes    | total number of decayed routes due to route damping                                                                                    |
| Neighbor                | BGP neighbor address                                                                                                                   |
| AS (Neighbor)           | BGP neighbor autonomous system number                                                                                                  |
| PktRcvd                 | total number of packets received from the BGP neighbor                                                                                 |
| PktSent                 | total number of packets sent to the BGP neighbor                                                                                       |
| InQ                     | the number of BGP messages to be processed                                                                                             |
| OutQ                    | the number of BGP messages to be transmitted                                                                                           |
| Up/Down                 | the amount of time that the BGP neighbor has either been established or not established depending on its current state                 |
| State Recv/Actv/Sent    | the BGP neighbor's current state (if not established) or the number of received routes, active routes and sent routes (if established) |

**Sample Output**

```

interface

- Syntax** **interface** *[[ip-address | ip-int-name] [detail]]* | *[summary]* | *[exclude-services]*
- Context** show>router
- Description** This command displays the router IP interface table sorted by interface index.
- Parameters**

*ip-address* — only displays the interface information associated with the specified IP address

*ip-int-name* — only displays the interface information associated with the specified IP interface name

**detail** — displays detailed IP interface information

**summary** — displays summary IP interface information for the router

**exclude-services** — Displays IP interface information, excluding IP interfaces configured for customer services. Only core network IP interfaces are displayed.
- Output** **Standard IP Interface Output**

Table 76 describes the standard output fields for an IP interface:

Table 76 Standard IP Interface Field Descriptions

| Label          | Description                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface-Name | the IP interface name                                                                                                                                                                                                                                                                  |
| Type           | n/a — No IP address has been assigned to the IP interface, so the IP address type is not applicable.<br>Pri — The IP address for the IP interface is the Primary address on the IP interface.<br>Sec — The IP address for the IP interface is a secondary address on the IP interface. |
| IP-Address     | the IP address and subnet mask length of the IP interface<br>n/a — indicates no IP address has been assigned to the IP interface                                                                                                                                                       |
| Adm            | Down — The IP interface is administratively disabled.<br>Up — The IP interface is administratively enabled.                                                                                                                                                                            |

| Label           | Description (Continued)                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ingress Filter  | The ingress IP filter policy ID associated with the IP interface.<br>none — indicates no ingress filter policy is associated with the interface                                                                                                                  |
| QoS Policy      | the QoS policy ID associated with the IP interface                                                                                                                                                                                                               |
| SNTP Broadcast  | False — Receipt of SNTP broadcasts on the IP interface is disabled.<br>True — Receipt of SNTP broadcasts on the IP interface is enabled.                                                                                                                         |
| MAC Address     | the MAC address of the IP interface                                                                                                                                                                                                                              |
| Arp Timeout     | the ARP timeout for the interface, in seconds, which is the time an ARP entry is maintained in the ARP cache without being refreshed                                                                                                                             |
| IP MTU          | the IP Maximum Transmission Unit (MTU) for the IP interface                                                                                                                                                                                                      |
| ICMP Mask Reply | False — The IP interface will not reply to a received ICMP mask request.<br>True — The IP interface will reply to a received ICMP mask request.                                                                                                                  |
| Cflowd          | specifies the type of Cflowd analysis that is applied to the interface<br>acl — ACL Cflowd analysis is applied to the interface.<br>interface — Interface cflowd analysis is applied to the interface.<br>none — No Cflowd analysis is applied to the interface. |
| Redirects       | specifies the maximum number of ICMP redirect messages the IP interface will issue in a given period of time (time in s)<br>Disabled — indicates the IP interface will not generate ICMP redirect messages                                                       |
| Unreachables    | specifies the maximum number of ICMP destination unreachable messages the IP interface will issue in a given period of time<br>Disabled — indicates the IP interface will not generate ICMP destination unreachable messages                                     |
| TTL Expired     | the maximum number (Number) of ICMP TTL expired messages the IP interface will issue in a given period of time (Time (seconds))<br>Disabled — indicates the IP interface will not generate ICMP TTL expired messages                                             |

**Sample Output (7450 ESS and 7750 SR)**

```

*A:ALA-12# show router 3 interface detail

### Summary IP Interface Output

[Table 78](#) describes the summary output fields for the router IP interfaces.

**Table 78** Summary IP Interface Field Descriptions

| Label       | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Instance    | the router instance number                                                  |
| Router Name | the name of the router instance                                             |
| Interfaces  | the number of IP interfaces in the router instance                          |
| Admin-Up    | the number of administratively enabled IP interfaces in the router instance |
| Oper-Up     | the number of operationally enabled IP interfaces in the router instance    |

### Sample Output

## neighbor

- Syntax** **neighbor** [*ip-address* | *ip-int-name*] [**detail**] [**advertised-routes**]
- Context** show>router>rip
- Description** Displays RIP neighbor interface information.
- Parameters** *ip-address* | *ip-int-name* — displays information for the specified IP interface
- Default** all neighbor interfaces
- advertised-routes** — Displays the routes advertised to RIP neighbors. If no neighbors are specified, then all routes advertised to all neighbors are displayed. If a specific neighbor is given then only routes advertised to the given neighbor/interface are displayed.
- Default** displays RIP information
- Output** **Standard Show RIP Neighbor Output**

[Table 80](#) describes the standard command output fields for a RIP group.

**Table 80** Standard Show RIP Neighbor Field Descriptions

| Label      | Description                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------|
| Neighbor   | the RIP neighbor interface name                                                                                        |
| Adm        | Down — The RIP neighbor interface is administratively down.<br>Up — The RIP neighbor interface is administratively up. |
| Opr        | Down — The RIP neighbor interface is operationally down.<br>Up — The RIP neighbor interface is operationally up.       |
| Primary IP | the primary IP address of the RIP neighbor interface                                                                   |

**Table 80** Standard Show RIP Neighbor Field Descriptions (Continued)

| Label     | Description                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send Mode | Bcast — specifies that RIPv2 formatted messages are sent to the broadcast address<br>Mcast — specifies that RIPv2 formatted messages are sent to the multicast address<br>None — specifies that no RIP messages are sent (i.e., silent listener)<br>RIPv1 — specifies that RIPv1 formatted messages are sent to the broadcast address |
| Recv Mode | Both — specifies that RIP updates in either version 1 or version 2 format will be accepted<br>None — specifies that RIP updates will not be accepted<br>RIPv1 — specifies that RIP updates in version 1 format only will be accepted<br>RIPv2 — specifies that RIP updates in version 2 format only will be accepted                  |
| Metric In | the metric added to routes received from a RIP neighbor                                                                                                                                                                                                                                                                               |

| Label           | Description (Continued)                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary IP      | the RIP neighbor interface primary IP address                                                                                                                                                                                                                                                                                                                     |
| Group           | the RIP group name of the neighbor interface                                                                                                                                                                                                                                                                                                                      |
| Admin State     | Down — The RIP neighbor interface is administratively down.<br>Up — The RIP neighbor interface is administratively up.                                                                                                                                                                                                                                            |
| Oper State      | Down — The RIP neighbor interface is operationally down.<br>Up — The RIP neighbor interface is operationally up.                                                                                                                                                                                                                                                  |
| Send Mode       | Bcast — specifies that RIPv2 formatted messages are sent to the broadcast address<br>Mcast — specifies that RIPv2 formatted messages are sent to the multicast address<br>None — specifies that no RIP messages are sent (i.e., silent listener)<br>RIPv1 — specifies that RIPv1 formatted messages are sent to the broadcast address                             |
| Recv Mode       | Both — specifies that RIP updates in either version 1 or version 2 format will be accepted<br>None — specifies that RIP updates will not be accepted<br>RIPv1 — specifies that RIP updates in version 1 format only will be accepted<br>RIPv2 — specifies that RIP updates in version 2 format only will be accepted                                              |
| Metric In       | the metric value added to routes received from a RIP neighbor                                                                                                                                                                                                                                                                                                     |
| Metric Out      | the value added to routes exported into RIP and advertised to RIP neighbors                                                                                                                                                                                                                                                                                       |
| Split Horizon   | Disabled — Split horizon disabled for the neighbor.<br>Enabled — Split horizon and poison reverse enabled for the neighbor.                                                                                                                                                                                                                                       |
| Check Zero      | Disabled — checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications are not checked allowing receipt of RIP messages even if mandatory zero fields are non-zero for the neighbor<br>Enabled — checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages is enabled for the neighbor |
| Message Size    | the maximum number of routes per RIP update message                                                                                                                                                                                                                                                                                                               |
| Preference      | the preference of RIP routes from the neighbor                                                                                                                                                                                                                                                                                                                    |
| Auth. Type      | specifies the authentication type                                                                                                                                                                                                                                                                                                                                 |
| Update Timer    | the current setting of the RIP update timer value expressed in seconds                                                                                                                                                                                                                                                                                            |
| Timeout Timer   | the current RIP timeout timer value expressed in seconds                                                                                                                                                                                                                                                                                                          |
| Export Policies | the export route policy that is used to determine routes advertised to all peers                                                                                                                                                                                                                                                                                  |
| Import Policies | the import route policy that is used to determine which routes are accepted from RIP neighbors                                                                                                                                                                                                                                                                    |

### Sample Output

```
*A:ALA-12# show router 3 rip peers
=====
RIP Peers

## peer

|                    |                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>peer</b> [ <i>ip-int-name</i> ]                                                                                                        |
| <b>Context</b>     | show>router>rip                                                                                                                           |
| <b>Description</b> | Displays RIP peer information.                                                                                                            |
| <b>Parameters</b>  | <i>ip-int-name</i> — displays peer information for peers on the specified IP interface<br><b>Default</b> display peers for all interfaces |
| <b>Output</b>      | <b>Show RIP Peer Output</b>                                                                                                               |

[Table 82](#) describes the command output fields for a RIP peer:

**Table 82 Show RIP Peer Field Descriptions**

| Label          | Description                              |
|----------------|------------------------------------------|
| Peer IP Addr   | the IP address of the peer router        |
| Interface Name | the peer interface name                  |
| Version        | the version of RIP running on the peer   |
| Last Update    | the number of days since the last update |
| No. of Peers   | the number of RIP peers                  |

## statistics

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <b>Syntax</b>      | <b>statistics</b> [ <i>ip-addr</i>   <i>ip-int-name</i> ] |
| <b>Context</b>     | show>router>rip                                           |
| <b>Description</b> | Display Interface level statistics for the RIP protocol.  |

If no IP address or interface name is specified, then all configured RIP interfaces are displayed.

If an IP address or interface name is specified, then only data regarding the specified RIP interface is displayed.

**Parameters** *ip-addr | ip-int-name* — displays statistics for the specified IP interface

**Output** **Show RIP Statistics Output**

[Table 83](#) describes the output fields for RIP statistics.

**Table 83** Show RIP Statistics Field Descriptions

| Label                | Description                                                                                                                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Learned Routes       | the number of RIP-learned routes were exported to RIP neighbors                                                                                                                                                                                                                                                                                        |
| Timed Out Routes     | the number of routes that have been timed out                                                                                                                                                                                                                                                                                                          |
| Current Memory       | the amount of memory used by this RIP router instance                                                                                                                                                                                                                                                                                                  |
| Maximum Memory       | the amount of memory allocated for this RIP router instance                                                                                                                                                                                                                                                                                            |
| Interface            | displays the name of each interface configured in RIP and associated RIP statistics                                                                                                                                                                                                                                                                    |
| Primary IP           | the interface IP address                                                                                                                                                                                                                                                                                                                               |
| Update Timer         | the current setting of the RIP update timer value expressed in seconds                                                                                                                                                                                                                                                                                 |
| Timeout Timer        | the current RIP timeout timer value expressed in seconds                                                                                                                                                                                                                                                                                               |
| Flush Timer          | the number of seconds after a route has been declared invalid that it is flushed from the route database                                                                                                                                                                                                                                               |
| Updates Sent         | Total — the total number of RIP updates that were sent<br>Last 5 Min — the number of RIP updates that were sent in the last 5 minutes<br>Last 1 Min — the number of RIP updates that were sent in the last 1 minute                                                                                                                                    |
| Triggered Updates    | Total — The total number of triggered updates sent. These updates are sent before the entire RIP routing table is sent.<br>Last 5 Min — the number of triggered updates that were sent in the last 5 minutes<br>Last 1 Min — the number of triggered updates that were sent in the last 1 minute                                                       |
| Bad Packets Received | Total — the total number of RIP updates received on this interface that were discarded as invalid.<br>Last 5 Min — the number of RIP updates received on this interface that were discarded as invalid in the last 5 minutes.<br>Last 1 Min — the number of RIP updates received on this interface that were discarded as invalid in the last 1 minute |

**Table 83 Show RIP Statistics Field Descriptions (Continued)**

| Label                   | Description                                                                                                                                                                                                                                                                                                                              |

## route-table

- Syntax** `route-table [ip-prefix [Imask] [longer] | [protocol protocol] | [summary]]`
- Context** `show>router`
- Description** This command displays the active routes in the routing table.
- If no command line arguments are specified, all routes are displayed, sorted by prefix.
- Parameters** *ip-prefix[Imask]* — displays routes only matching the specified *ip-prefix* and optional *mask*
- longer* — displays routes matching the *ip-prefixImask* and routes with longer masks
- protocol protocol* — displays routes learned from the specified protocol
- Values** `bgp, isis, local, ospf, rip, static, aggregate`
- summary* — displays a route table summary information
- Output** **Standard Show Route Table Output**
- [Table 84](#) describes the standard output fields for the route table.

**Table 84** Standard Show Route Table Field Descriptions

| Label         | Description                                       |
|---------------|---------------------------------------------------|
| Dest Address  | the route destination address and mask            |
| Next Hop      | the next hop IP address for the route destination |
| Type          | Local — The route is a local route                |
|               | Remote — The route is a remote route              |
| Protocol      | the protocol through which the route was learned  |
| Age           | the route age in seconds for the route            |
| Metric        | the route metric value for the route              |
| Pref          | the route preference value for the route          |
| No. of Routes | the number of routes displayed in the list        |

## static-arp

**Syntax** **static-arp** [*ip-address* | *ip-int-name* | **mac** *ieee-mac-addr*]

**Context** show>router

**Description** This command displays the router static ARP table sorted by IP address.

If no options are present, all ARP entries are displayed.

**Parameters** *ip-address* — only displays static ARP entries associated with the specified IP address

*ip-int-name* — only displays static ARP entries associated with the specified IP interface name

**mac** *ieee-mac-addr* — only displays static ARP entries associated with the specified MAC address

**Output Static ARP Table Output**

[Table 86](#) describes the output fields for the ARP table.

**Table 86 Static ARP Table Field Descriptions**

| Label      | Description                            |
|------------|----------------------------------------|
| IP Address | the IP address of the static ARP entry |

**Table 86 Static ARP Table Field Descriptions (Continued)**

| Label              | Description (Continued)                                                |
|--------------------|------------------------------------------------------------------------|
| MAC Address        | the MAC address of the static ARP entry                                |
| Age                | the age of the ARP entry. Static ARPs always have 00:00:00 for the age |
| Type               | Inv — The ARP entry is an inactive static ARP entry (invalid).         |
|                    | Sta — The ARP entry is an active static ARP entry.                     |
| Interface          | the IP interface name associated with the ARP entry                    |
| No. of ARP Entries | the number of ARP entries displayed in the list                        |

**Sample Output**

static-route

- Syntax

static-route [*ip-prefix Imask*] | [**preference** *preference*] | [**next-hop** *ip-addr*] [**detail**]
- Context

show>router
- Description

This command displays the static entries in the routing table.

If no options are present, all static routes are displayed sorted by prefix.
- Parameters

*ip-prefix Imask* — displays static routes only matching the specified *ip-prefix* and *mask*

**preference** *preference* — only displays static routes with the specified route preference

**Values** 0 to 65535

**next-hop** *ip-addr* — only displays static routes with the specified next hop IP address

**detail** — displays detailed information about the static route
- Output

**Show Static Route Output**

Table 87 describes the output fields for the static route table:

Table 87 Show Static Route Field Descriptions

| Label        | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Addr/mask | the static route destination address and mask                                                                                                                                                                                                                                                                                                                                                               |
| Pref         | the route preference value for the static route                                                                                                                                                                                                                                                                                                                                                             |
| Metric       | the route metric value for the static route                                                                                                                                                                                                                                                                                                                                                                 |
| Type         | BH — The static route is a black hole route. The Nexthop for this type of route is black-hole.<br>ID — The static route is an indirect route, where the nexthop for this type of route is the non-directly connected next hop.<br>NH — The route is a static route with a directly connected next hop. The Nexthop for this type of route is either the next hop IP address or an egress IP interface name. |
| Next Hop     | the next hop for the static route destination                                                                                                                                                                                                                                                                                                                                                               |

**Table 87 Show Static Route Field Descriptions (Continued)**

| Label          | Description (Continued)                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | the egress IP interface name for the static route<br>n/a — indicates there is no current egress interface because the static route is inactive or a black hole route |
| Active         | N — The static route is inactive; for example, the static route is disabled or the next hop IP interface is down.<br>Y — The static route is active.                 |
| No. of Routes: | the number of routes displayed in the list                                                                                                                           |

| Description | <p>This command displays tunnel table information.</p> <p>Auto-bind GRE tunnels are not displayed in <b>show</b> command output. GRE tunnels are not the same as SDP tunnels that use the GRE encapsulation type. When the <b>auto-bind-tunnel</b> command is used when configuring a VPRN service, it means the MP-BGP NH resolution is referring to core routing instance for IP reachability. For a VPRN service this object specifies the lookup to be used by the routing instance if no SDP to the destination exists.</p> |
| Parameters  | <p><i>ip-address[/mask]</i> — displays the specified tunnel table’s destination IP address and mask</p> <p><b>protocol protocol</b> — displays LDP protocol information</p> <p><b>sdp sdp-id</b> — displays information pertaining to the specified SDP</p> <p><b>summary</b> — displays summary tunnel table information</p>                                                                                                                                                                                                    |
| Output      | <p><b>Show Tunnel Table Output</b></p> <p><a href="#">Table 88</a> describes tunnel table output fields:</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Values</b>      | 1 to 10 (depending on chassis model)                                                                                                                                                                 |               |                                      |                |          |
| <b>Default</b>     | all IOMs                                                                                                                                                                                             |               |                                      |                |          |

## interface

|                    |                                                                                                                                                                                                                                                                               |                |                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-------------------|
| <b>Syntax</b>      | <b>interface</b> [ <i>ip-int-name</i>   <i>ip-addr</i> ] [ <b>icmp</b> ]                                                                                                                                                                                                      |                |                   |
| <b>Context</b>     | clear>router                                                                                                                                                                                                                                                                  |                |                   |
| <b>Description</b> | This command clears IP interface statistics.<br><br>If no IP interface is specified either by IP interface name or IP address, the command will perform the clear operation on all IP interfaces.                                                                             |                |                   |
| <b>Parameters</b>  | <i>ip-int-name</i>   <i>ip-addr</i> — the IP interface name or IP interface address <table> <tr> <td><b>Default</b></td><td>all IP interfaces</td></tr> </table> <p><b>icmp</b> — specifies to reset the ICMP statistics for the IP interface(s) used for ICMP rate limit</p> | <b>Default</b> | all IP interfaces |
| <b>Default</b>     | all IP interfaces                                                                                                                                                                                                                                                             |                |                   |

## damping

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>damping</b> [[ <i>ip-prefix/mask</i> ] [ <b>neighbor</b> <i>ip-address</i> ]]   [ <b>group</b> <i>name</i> ] |
| <b>Context</b>     | clear>router>bgp                                                                                                |
| <b>Description</b> | This command clears or resets the route damping information for received routes.                                |

- Parameters** *ip-prefix/mask* — clears damping information for entries that match the IP prefix and mask length
- neighbor** *ip-address* — clears damping information for entries received from the BGP neighbor
- group** *name* — clears damping information for entries received from any BGP neighbors in the peer group

## bgp

- Syntax** **bgp** *[[ip-prefix/mask] [neighbor ip-address]] | [group name]*
- Context** clear>router>bgp
- Description** This command clears or resets the route damping information for received routes.
- Parameters** *ip-prefix/mask* — clears damping information for entries that match the IP prefix and mask length
- neighbor** *ip-address* — clears damping information for entries received from the BGP neighbor
- group** *name* — clears damping information for entries received from any BGP neighbors in the peer group

## flap-statistics

- Syntax** **flap-statistics** *[[ip-prefix/mask] [neighbor ip-addr]] | [group group-name] | [regex reg-exp] | [policy policy-name]*
- Context** clear>router>bgp
- Description** This command clears route flap statistics.
- Parameters** *ip-prefix/mask* — clears route flap statistics for entries that match the specified IP prefix and mask length
- neighbor** *ip-addr* — clears route flap statistics for entries received from the specified BGP neighbor
- group** *group-name* — clears route flap statistics for entries received from any BGP neighbors in the specified peer group
- regex** *reg-exp* — clears route flap statistics for all entries which have the regular expression and the AS path that matches the regular expression
- policy** *policy-name* — clears route flap statistics for entries that match the specified route policy

## neighbor

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Context</b>     | clear>router>bgp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b> | This command resets the specified BGP peer or peers. This can cause existing BGP connections to be shutdown and restarted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <p><i>ip-addr</i> — resets the BGP neighbor with the specified IP address</p> <p><b>as</b> <i>as-number</i> — resets all BGP neighbors with the specified peer AS</p> <p><b>external</b> — resets all EBGp neighbors</p> <p><b>all</b> — resets all BGP neighbors</p> <p><b>soft</b> — The specified BGP neighbor(s) re-evaluates all routes in the Local-RIB against the configured export policies</p> <p><b>soft-inbound</b> — The specified BGP neighbor(s) re-evaluates all routes in the RIB-In against the configured import policies.</p> <p><b>statistics</b> — the BGP neighbor statistics</p> |

## protocol

|                    |                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>protocol</b>                                                                                                                         |
| <b>Context</b>     | clear>router>bgp                                                                                                                        |
| <b>Description</b> | This command resets the entire BGP protocol. If the AS number was previously changed, the BGP AS number does not inherit the new value. |

## database

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <b>Syntax</b>      | <b>database</b>                                      |
| <b>Context</b>     | clear>router>rip                                     |
| <b>Description</b> | This command flushes all routes in the RIP database. |

## statistics

|                    |                                                                                 |
|--------------------|---------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>statistics</b> [ <b>neighbor</b> { <i>ip-address</i>   <i>ip-int-name</i> }] |
| <b>Context</b>     | clear>router>rip                                                                |
| <b>Description</b> | This command clears statistics for RIP neighbors.                               |

|                   |                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>neighbor</b> { <i>ip-address</i>   <i>ip-int-name</i> } — clears the statistics for the specified RIP interface |
| <b>Default</b>    | clears statistics for all RIP interfaces                                                                           |

## id

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <b>Syntax</b>      | <b>id</b> <i>service-id</i>                                   |
| <b>Context</b>     | clear>service<br>clear>service>statistics                     |
| <b>Description</b> | This command clears commands for a specific service.          |
| <b>Parameters</b>  | <i>service-id</i> — the ID that uniquely identifies a service |
| <b>Values</b>      | 1 to 2147483648                                               |

## sap

|                    |                                                                                      |
|--------------------|--------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sap</b> <i>sap-id</i> { <b>all</b>   <b>counters</b>   <b>stp</b> }               |
| <b>Context</b>     | clear>service>statistics                                                             |
| <b>Description</b> | This command clears SAP statistics for a SAP.                                        |
| <b>Parameters</b>  | <i>sap-id</i> — specifies the physical port identifier portion of the SAP definition |

## dhcp

|                    |                                                            |
|--------------------|------------------------------------------------------------|
| <b>Syntax</b>      | <b>dhcp</b>                                                |
| <b>Context</b>     | clear>router>dhcp                                          |
| <b>Description</b> | This command enables the context to clear DHCP parameters. |

## lease-state

|                    |                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>lease-state</b><br><b>lease-state ip-address</b> <i>ip-address</i><br><b>lease-state mac</b> <i>ieee-address</i><br><b>lease-state sap</b> <i>sap-id</i><br><b>lease-state sdp</b> <i>sdp-id:vc-id</i> |
| <b>Context</b>     | clear>service>id>dhcp                                                                                                                                                                                     |
| <b>Description</b> | This command clears DHCP lease state information for this service.                                                                                                                                        |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).</p> <p><i>ieee-address</i> — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.</p> <p><i>sap-id</i> — specifies the physical port identifier portion of the SAP definition</p> <p><i>sdp-id</i> — the SDP ID to be cleared</p> <p><b>Values</b> 1 to 17407</p> <p><i>vc-id</i> — the virtual circuit ID on the SDP ID to be cleared</p> <p><b>Values</b> 1 to 4294967295</p> |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## site

|                    |                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>site</b> <i>service-id</i>                                                                                                          |
| <b>Context</b>     | clear>service>id                                                                                                                       |
| <b>Description</b> | This command clears site-specific information for the service.                                                                         |
| <b>Parameters</b>  | <p><i>service-id</i> — specifies the service ID or service name up to 64 characters in length</p> <p><b>Values</b> 1 to 2147483648</p> |

## spoke-sdp

|                    |                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>spoke-sdp</b> <i>sdp-id:vc-id ingress-vc-label</i>                                                                                                                                           |
| <b>Context</b>     | clear>service>id                                                                                                                                                                                |
| <b>Description</b> | This command clears and resets the spoke SDP bindings for the service.                                                                                                                          |
| <b>Parameters</b>  | <p><i>sdp-id</i> — the spoke SDP ID to be reset</p> <p><b>Values</b> 1 to 17407</p> <p><i>vc-id</i> — the virtual circuit ID on the SDP ID to be reset</p> <p><b>Values</b> 1 to 4294967295</p> |

## sdp

|                    |                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>sdp <i>sdp-id</i> keep-alive</b>                                                            |
| <b>Context</b>     | clear>service>statistics                                                                       |
| <b>Description</b> | This command clears keepalive statistics associated with the SDP ID.                           |
| <b>Parameters</b>  | <i>sdp-id</i> — the SDP ID for which to clear keepalive statistics<br><b>Values</b> 1 to 17407 |

## counters

|                    |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <b>Syntax</b>      | <b>counters</b>                                                   |
| <b>Context</b>     | clear>service>statistics>id                                       |
| <b>Description</b> | Clears all traffic queue counters associated with the service ID. |

## spoke-sdp

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>spoke-sdp <i>sdp-id</i>[:<i>vc-id</i>] {all   counters   stp}</b>                                                                                                                                                                                                                                                                                                                                                             |
| <b>Context</b>     | clear>service>statistics>id                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b> | This command clears statistics for the spoke SDP bound to the service.                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>  | <i>sdp-id</i> — the spoke SDP ID for which to clear statistics<br><b>Values</b> 1 to 17407<br><i>vc-id</i> — the virtual circuit ID on the SDP ID to be reset<br><b>Values</b> 1 to 4294967295<br><b>all</b> — clears all queue statistics and STP statistics associated with the SDP<br><b>counters</b> — clears all queue statistics associated with the SDP<br><b>stp</b> — clears all STP statistics associated with the SDP |

## stp

|                    |                                                                      |
|--------------------|----------------------------------------------------------------------|
| <b>Syntax</b>      | <b>stp</b>                                                           |
| <b>Context</b>     | clear>service>statistics>id                                          |
| <b>Description</b> | This command clears all spanning tree statistics for the service ID. |

### 3.10.2.3 VPRN Debug Commands

#### id

|                    |                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] id</b> <i>service-id</i>                                                                                  |
| <b>Context</b>     | debug>service                                                                                                     |
| <b>Description</b> | This command debugs commands for a specific service.<br><br>The <b>no</b> form of the command disables debugging. |
| <b>Parameters</b>  | <i>service-id</i> — the ID that uniquely identifies a service                                                     |

#### arp-host

|                    |                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] arp-host</b>                                                                                                          |
| <b>Context</b>     | debug>service>id                                                                                                              |
| <b>Description</b> | This command enables and configures ARP host debugging.<br><br>The <b>no</b> form of the command disables ARP host debugging. |

#### dhcp

|                    |                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] dhcp</b>                                                                                                       |
| <b>Context</b>     | debug>service>id                                                                                                       |
| <b>Description</b> | This command enables the context for DHCP debugging.<br><br>The <b>no</b> form of the command disables DHCP debugging. |

#### detail-level

|                    |                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>detail-level</b> { <b>low</b>   <b>medium</b>   <b>high</b> }<br><b>no detail-level</b>                          |
| <b>Context</b>     | debug>service>id>dhcp                                                                                               |
| <b>Description</b> | This command configures the DHCP tracing detail level.<br><br>The <b>no</b> form of the command disables debugging. |

## mode

|                    |                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>mode</b> { <b>dropped-only</b>   <b>ingr-and-dropped</b>   <b>egr-ingr-and-dropped</b> }<br><b>no mode</b> |
| <b>Context</b>     | debug>service>id>dhcp                                                                                         |
| <b>Description</b> | This command configures the DHCP tracing mode.<br><br>The <b>no</b> form of the command disables debugging.   |

## host-connectivity-verify

|                    |                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] host-connectivity-verify</b>                                                                                                                   |
| <b>Context</b>     | debug>service>id                                                                                                                                       |
| <b>Description</b> | This command enables Subscriber Host Connectivity Verification (SHCV) debugging.<br><br>The <b>no</b> form of the command disables the SHCV debugging. |

## ip

|                    |                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] ip</b> <i>ip-address</i>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular IP address.                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>  | <i>ip-address</i> — The IP address of the IP interface. The <i>ip-address</i> portion of the <b>address</b> command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets). |

## mac

|                    |                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] mac</b> <i>ieee-address</i>                                                                         |
| <b>Context</b>     | debug>service>id>host-connectivity-verify                                                                   |
| <b>Description</b> | This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular MAC address. |

---

**Parameters**     *mac-address* — Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

## sap

**Syntax**     **[no] sap sap-id**

**Context**     debug>service>id>host-connectivity-verify

**Description**     This command displays Subscriber Host Connectivity Verification (SHCV) events for a particular SAP.

**Parameters**     *sap-id* — specifies the physical port identifier portion of the SAP definition

## sap

**Syntax**     **[no] sap sap-id**

**Context**     debug>service>id  
debug>service>id>dhcp  
debug>service>stp

**Description**     This command enables STP debugging for a specific SAP.  
  
The **no** form of the command disables debugging.

**Parameters**     *sap-id* — specifies the physical port identifier portion of the SAP definition

## sdp

**Syntax**     **[no] sdp sdp-id:vc-id**

**Context**     debug>service>id  
debug>service>id>dhcp  
debug>service>stp

**Description**     This command enables STP debugging for a specific SDP.  
  
The **no** form of the command disables debugging.

## event-type

**Syntax**     **[no] event-type {config-change | svc-oper-status-change | sap-oper-status-change |**

**sdpbind-oper-status-change}**

|                    |                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>     | debug>service>id                                                                                                         |
| <b>Description</b> | This command enables debugging for a particular event type.<br><br>The <b>no</b> form of the command disables debugging. |

**event-type**

|                    |                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] event-type {config-change   oper-status-change}</b>                                                              |
| <b>Context</b>     | debug>service>id>sap                                                                                                     |
| <b>Description</b> | This command enables debugging for a particular event type.<br><br>The <b>no</b> form of the command disables debugging. |

**stp**

|                    |                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] stp</b>                                                                                                  |
| <b>Context</b>     | debug>service>id                                                                                                 |
| <b>Description</b> | This command enables the context for debugging STP.<br><br>The <b>no</b> form of the command disables debugging. |

**all-events**

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>all-events</b>                                                                                               |
| <b>Context</b>     | debug>service>id>event-type                                                                                     |
| <b>Description</b> | This command enables STP debugging for all events.<br><br>The <b>no</b> form of the command disables debugging. |

**bpdu**

|                    |                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] bpdu</b>                                                                                                                    |
| <b>Context</b>     | debug>service>stp                                                                                                                   |
| <b>Description</b> | This command enables STP debugging for received and transmitted BPDUs.<br><br>The <b>no</b> form of the command disables debugging. |

## core-connectivity

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] core-connectivity</b>                                                                                      |
| <b>Context</b>     | debug>service>stp                                                                                                  |
| <b>Description</b> | This command enables STP debugging for core connectivity.<br>The <b>no</b> form of the command disables debugging. |

## exception

|                    |                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] exception</b>                                                                                       |
| <b>Context</b>     | debug>service>stp                                                                                           |
| <b>Description</b> | This command enables STP debugging for exceptions.<br>The <b>no</b> form of the command disables debugging. |

## fsm-state-changes

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] fsm-state-changes</b>                                                                                      |
| <b>Context</b>     | debug>service>stp                                                                                                  |
| <b>Description</b> | This command enables STP debugging for FSM state changes.<br>The <b>no</b> form of the command disables debugging. |

## fsm-timers

|                    |                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>[no] fsm-timers</b>                                                                                             |
| <b>Context</b>     | debug>service>stp                                                                                                  |
| <b>Description</b> | This command enables STP debugging for FSM timer changes.<br>The <b>no</b> form of the command disables debugging. |

## port-role

|                |                       |
|----------------|-----------------------|
| <b>Syntax</b>  | <b>[no] port-role</b> |
| <b>Context</b> | debug>service>stp     |

**Description** This command enables STP debugging for changes in port roles.  
The **no** form of the command disables debugging.

## port-state

**Syntax** [no] port-state  
**Context** debug>service>stp  
**Description** This command enables STP debugging for port states.  
The **no** form of the command disables debugging.

## igmp

**Syntax** [no] igmp  
**Context** debug>router  
**Description** This command enables debugging for IGMP.  
The **no** form of the command disables debugging.

## interface

**Syntax** [no] interface [*ip-int-name* | *ip-address*]  
**Context** debug>router>igmp  
**Description** This command enables debugging on the IGMP interface.  
The **no** form of the command disables debugging.  
**Parameters** *ip-int-name* — only displays the information associated with the specified IP interface name  
*ip-address* — only displays the information associated with the specified IP address  
**Output**

### Sample Output

```
A:FA# debug router 100 igmp interface
A:FA#
A:FA# show debug
debug
 router "100"
 igmp
```

```

 interface
 exit
 exit
exit
*A:FA#

## 3.11.2 Command Descriptions

### 3.11.2.1 Tools Commands

#### tools

|                    |                                                                 |
|--------------------|-----------------------------------------------------------------|
| <b>Syntax</b>      | <b>tools</b>                                                    |
| <b>Context</b>     | root                                                            |
| <b>Description</b> | This command enables the context to configure or display tools. |

#### dump

|                    |                                                                |
|--------------------|----------------------------------------------------------------|
| <b>Syntax</b>      | <b>dump</b>                                                    |
| <b>Context</b>     | tools                                                          |
| <b>Description</b> | This command enables the context to display tools information. |

#### perform

|                    |                                                                                  |
|--------------------|----------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>perform</b>                                                                   |
| <b>Context</b>     | tools                                                                            |
| <b>Description</b> | This command enables the context to configure tools that perform specific tasks. |

#### service

|                    |                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>service</b>                                                                               |
| <b>Context</b>     | tools>perform<br>tools>dump                                                                  |
| <b>Description</b> | This command enables the context to configure and view tools for service debugging purposes. |

#### id

|               |                             |
|---------------|-----------------------------|
| <b>Syntax</b> | <b>id</b> <i>service-id</i> |
|---------------|-----------------------------|

---

|                    |                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Context</b>     | tools>dump>service<br>tools>perform>service                                                         |
| <b>Description</b> | This command specifies a service for which to enable and view tools for service debugging purposes. |
| <b>Parameters</b>  | <i>service-id</i> — Specifies the service ID                                                        |

## interface

|                    |                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>interface</b> <i>ip-int-name</i>                                                                       |
| <b>Context</b>     | tools>dump>service>id<br>tools>perform>service>id                                                         |
| <b>Description</b> | This command specifies an IP interface for which to enable and view tools for service debugging purposes. |
| <b>Parameters</b>  | <i>ip-int-name</i> — The name of the IP interface. 32 characters maximum.                                 |

## ignore-sap-port-state

|                    |                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>      | <b>ignore-sap-port-state</b>                                                                                   |
| <b>Context</b>     | tools>dump>service>id>interface                                                                                |
| <b>Description</b> | This command displays all service interfaces that have accepted an <b>ignore-sap-port-state start</b> command. |

This command can be executed without a *service-id* for a complete list of interfaces that have accepted an **ignore-sap-port-state start** command. The command can be executed within a specific *service-id* context for a list of all interfaces for the specified service that have accepted the **ignore-sap-port-state start** command. The *ip-int-name* parameter may be optionally configured to display results only for the specified interface. If the command is executed against a specific interface that has not accepted an **ignore-sap-port-state start** command, the display command will display a message indicating that no action has been started for the interface.

**Output** The following output is an example of **ignore-sap-port-state** information.

### Sample Output

```
tools dump service ignore-sap-port-state
=====
Interface Marked Ignore SAP Operational State
=====
SvcId Interface-Name Adm/Opr (v4/v6) Type Port/SapId
 IP-Address PfxState

```

| <b>Description</b> | <p>This command enables bypassing of the Ethernet port operational state check, which would otherwise be part of the Ethernet port SAP operational state checking function. All other checks are performed as normal.</p> <p>This command may be executed against IES and VPRN service IP interfaces directly configured over an Ethernet port SAP. When the command is executed against an operational Ethernet port SAP, the command enters a pending state, waiting for a non-operational change. Network interfaces have no SAP association and do not support this feature. When using <b>subscriber-interface</b> and <b>group-interface</b>, the command is only applicable to the <b>group-interface</b> associated with the SAP. R-VPLS does not have Ethernet SAPs directly configured under the interface, and is not supported. Ethernet SAPs configured over a LAG are not supported.</p> <p>This function is meant to allow service validation and reachability testing when a physical Ethernet port has not been connected. The command may be executed for a non-operational SAP that is cabled. However, if the SAP transitions to an operational state, ingress and egress packet processing may still occur.</p> <p>This command configuration does not survive a system restart.</p> |
| <b>Parameters</b>  | <p><b>start</b> — Enables port state bypass mode for the interface. If the Ethernet port SAP is already operational, there is no immediate effect of the command, and the Ignore Port state under the <b>show service id all</b> command will show “pending”. However, if the interface Ethernet port transitions to a non-operational state, the command then bypasses this port state and executes the remainder of the operational checks, and the flag for the Ignore Port state transitions to “active”. When this command is in effect, the SAP represents the state of the SAP ignoring the port state.</p> <p><b>stop</b> — Disables port state bypass mode for the interface attached to the SAP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Internet Protocol (IP) — General

draft-grant-tacacs-02, *The TACACS+ Protocol*

draft-ietf-vrrp-unified-spec-02, *Virtual Router Redundancy Protocol Version 3 for IPv4 and IPv6*

RFC 768, *User Datagram Protocol*

RFC 793, *Transmission Control Protocol*

RFC 854, *Telnet Protocol Specifications*

RFC 951, *Bootstrap Protocol (BOOTP)*

RFC 1034, *Domain Names - Concepts and Facilities*

RFC 1035, *Domain Names - Implementation and Specification*

RFC 1350, *The TFTP Protocol (revision 2)*

RFC 1534, *Interoperation between DHCP and BOOTP*

RFC 1542, *Clarifications and Extensions for the Bootstrap Protocol*

RFC 2131, *Dynamic Host Configuration Protocol*

RFC 2132, *DHCP Options and BOOTP Vendor Extensions*

RFC 2347, *TFTP Option Extension*

RFC 2348, *TFTP Blocksize Option*

RFC 2349, *TFTP Timeout Interval and Transfer Size Options*

RFC 2428, *FTP Extensions for IPv6 and NATs*

RFC 2784, *Generic Routing Encapsulation (GRE)*

RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*

RFC 2866, *RADIUS Accounting*

RFC 2867, *RADIUS Accounting Modifications for Tunnel Protocol Support*

RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*

RFC 3046, *DHCP Relay Agent Information Option (Option 82)*

RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*

RFC 3596, *DNS Extensions to Support IP version 6*

RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*

RFC 4250, *The Secure Shell (SSH) Protocol Assigned Numbers*

RFC 4251, *The Secure Shell (SSH) Protocol Architecture*  
RFC 4252, *The Secure Shell (SSH) Authentication Protocol* (publickey, password)  
RFC 4253, *The Secure Shell (SSH) Transport Layer Protocol*  
RFC 4254, *The Secure Shell (SSH) Connection Protocol*  
RFC 4632, *Classless Inter-domain Routing (CIDR): The Internet Address  
Assignment and Aggregation Plan*  
RFC 5082, *The Generalized TTL Security Mechanism (GTSM)*  
RFC 5656, *Elliptic Curve Algorithm Integration in the Secure Shell Transport Layer  
(ECDSA)*  
RFC 5880, *Bidirectional Forwarding Detection (BFD)*  
RFC 5881, *Bidirectional Forwarding Detection (BFD) IPv4 and IPv6 (Single Hop)*  
RFC 5883, *Bidirectional Forwarding Detection (BFD) for Multihop Paths*  
RFC 6398, *IP Router Alert Considerations and Usage (MLD)*  
RFC 6528, *Defending against Sequence Number Attacks*  
RFC 6929, *Remote Authentication Dial-In User Service (RADIUS) Protocol  
Extensions*  
RFC 7130, *Bidirectional Forwarding Detection (BFD) on Link Aggregation Group  
(LAG) Interfaces*

## **Internet Protocol (IP) — Multicast**

cisco-ipmulticast/pim-autorp-spec01, *Auto-RP: Automatic discovery of Group-to-RP  
mappings for IP multicast*  
draft-dolganow-bess-mvpn-expl-track-01, *Explicit Tracking with Wild Card Routes in  
Multicast VPN*  
draft-ietf-idmr-traceroute-ipm-07, *A "traceroute" facility for IP Multicast*  
draft-ietf-l2vpn-vpls-pim-snooping-07, *Protocol Independent Multicast (PIM) over  
Virtual Private LAN Service (VPLS)*  
RFC 1112, *Host Extensions for IP Multicasting*  
RFC 2236, *Internet Group Management Protocol, Version 2*  
RFC 2375, *IPv6 Multicast Address Assignments*  
RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*  
RFC 3306, *Unicast-Prefix-based IPv6 Multicast Addresses*  
RFC 3376, *Internet Group Management Protocol, Version 3*  
RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent  
Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*  
RFC 3590, *Source Address Selection for the Multicast Listener Discovery (MLD)  
Protocol*  
RFC 3618, *Multicast Source Discovery Protocol (MSDP)*

- 
- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*
- RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*
- RFC 3973, *Protocol Independent Multicast - Dense Mode (PIM-DM): Protocol Specification (Revised) (auto-RP groups)*
- RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*
- RFC 4601, *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*
- RFC 4604, *Using Internet Group Management Protocol Version 3 (IGMPv3) and Multicast Listener Discovery Protocol Version 2 (MLDv2) for Source-Specific Multicast*
- RFC 4607, *Source-Specific Multicast for IP*
- RFC 4608, *Source-Specific Protocol Independent Multicast in 232/8*
- RFC 4610, *Anycast-RP Using Protocol Independent Multicast (PIM)*
- RFC 4611, *Multicast Source Discovery Protocol (MSDP) Deployment Scenarios*
- RFC 5059, *Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)*
- RFC 5186, *Internet Group Management Protocol Version 3 (IGMPv3) / Multicast Listener Discovery Version 2 (MLDv2) and Multicast Routing Protocol Interaction*
- RFC 5384, *The Protocol Independent Multicast (PIM) Join Attribute Format*
- RFC 5496, *The Reverse Path Forwarding (RPF) Vector TLV*
- RFC 6037, *Cisco Systems' Solution for Multicast in MPLS/BGP IP VPNs*
- RFC 6512, *Using Multipoint LDP When the Backbone Has No Route to the Root*
- RFC 6513, *Multicast in MPLS/BGP IP VPNs*
- RFC 6514, *BGP Encodings and Procedures for Multicast in MPLS/IP VPNs*
- RFC 6515, *IPv4 and IPv6 Infrastructure Addresses in BGP Updates for Multicast VPNs*
- RFC 6516, *IPv6 Multicast VPN (MVPN) Support Using PIM Control Plane and Selective Provider Multicast Service Interface (S-PMSI) Join Messages*
- RFC 6625, *Wildcards in Multicast VPN Auto-Discover Routes*
- RFC 6826, *Multipoint LDP In-Band Signaling for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Path*
- RFC 7246, *Multipoint Label Distribution Protocol In-Band Signaling in a Virtual Routing and Forwarding (VRF) Table Context*
- RFC 7385, *IANA Registry for P-Multicast Service Interface (PMSI) Tunnel Type Code Points*

## **Internet Protocol (IP) — Version 4**

RFC 791, *Internet Protocol*  
RFC 792, *Internet Control Message Protocol*  
RFC 826, *An Ethernet Address Resolution Protocol*  
RFC 1519, *Classless Inter-Domain Routing (CIDR): an Address Assignment and Aggregation Strategy*  
RFC 1812, *Requirements for IPv4 Routers*  
RFC 1918, *Address Allocation for Private Internets*  
RFC 1981, *Path MTU Discovery for IP version 6*  
RFC 2003, *IP Encapsulation within IP*  
RFC 2401, *Security Architecture for Internet Protocol*  
RFC 3021, *Using 31-Bit Prefixes on IPv4 Point-to-Point Links*

## **Internet Protocol (IP) — Version 6**

RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*  
RFC 2464, *Transmission of IPv6 Packets over Ethernet Networks*  
RFC 2473, *Generic Packet Tunneling in IPv6 Specification*  
RFC 2529, *Transmission of IPv6 over IPv4 Domains without Explicit Tunnels*  
RFC 3122, *Extensions to IPv6 Neighbor Discovery for Inverse Discovery Specification*  
RFC 3587, *IPv6 Global Unicast Address Format*  
RFC 3633, *IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6*  
RFC 3646, *DNS Configuration options for Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*  
RFC 3736, *Stateless Dynamic Host Configuration Protocol (DHCP) Service for IPv6*  
RFC 3971, *SEcure Neighbor Discovery (SEND)*  
RFC 3972, *Cryptographically Generated Addresses (CGA)*  
RFC 4007, *IPv6 Scoped Address Architecture*  
RFC 4193, *Unique Local IPv6 Unicast Addresses*  
RFC 4291, *Internet Protocol Version 6 (IPv6) Addressing Architecture*  
RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*  
RFC 4861, *Neighbor Discovery for IP version 6 (IPv6)*  
RFC 4862, *IPv6 Stateless Address Autoconfiguration (router functions)*  
RFC 4941, *Privacy Extensions for Stateless Address Autoconfiguration in IPv6*  
RFC 5007, *DHCPv6 Leasequery*

RFC 5095, *Deprecation of Type 0 Routing Headers in IPv6*  
RFC 5952, *A Recommendation for IPv6 Address Text Representation*  
RFC 6106, *IPv6 Router Advertisement Options for DNS Configuration*  
RFC 6164, *Using 127-Bit IPv6 Prefixes on Inter-Router Links*

## **Internet Protocol Security (IPsec)**

draft-ietf-ipsec-isakmp-mode-cfg-05, *The ISAKMP Configuration Method*  
draft-ietf-ipsec-isakmp-xauth-06, *Extended Authentication within ISAKMP/Oakley (XAUTH)*  
RFC 2401, *Security Architecture for the Internet Protocol*  
RFC 2403, *The Use of HMAC-MD5-96 within ESP and AH*  
RFC 2404, *The Use of HMAC-SHA-1-96 within ESP and AH*  
RFC 2405, *The ESP DES-CBC Cipher Algorithm With Explicit IV*  
RFC 2406, *IP Encapsulating Security Payload (ESP)*  
RFC 2409, *The Internet Key Exchange (IKE)*  
RFC 2410, *The NULL Encryption Algorithm and Its Use With IPsec*  
RFC 2560, *X.509 Internet Public Key Infrastructure Online Certificate Status Protocol - OCSP*  
RFC 3526, *More Modular Exponential (MODP) Diffie-Hellman group for Internet Key Exchange (IKE)*  
RFC 3566, *The AES-XCBC-MAC-96 Algorithm and Its Use With IPsec*  
RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*  
RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*  
RFC 3947, *Negotiation of NAT-Traversal in the IKE*  
RFC 3948, *UDP Encapsulation of IPsec ESP Packets*  
RFC 4210, *Internet X.509 Public Key Infrastructure Certificate Management Protocol (CMP)*  
RFC 4211, *Internet X.509 Public Key Infrastructure Certificate Request Message Format (CRMF)*  
RFC 4301, *Security Architecture for the Internet Protocol*  
RFC 4303, *IP Encapsulating Security Payload*  
RFC 4307, *Cryptographic Algorithms for Use in the Internet Key Exchange Version 2 (IKEv2)*  
RFC 4308, *Cryptographic Suites for IPsec*  
RFC 4434, *The AES-XCBC-PRF-128 Algorithm for the Internet Key Exchange Protocol (IKE)*

RFC 4868, *Using HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 with IPsec*

RFC 4891, *Using IPsec to Secure IPv6-in-IPv4 Tunnels*

RFC 4945, *The Internet IP Security PKI Profile of IKEv1/ISAKMP, IKEv2 and PKIX*

RFC 5280, *Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile*

RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*

RFC 5998, *An Extension for EAP-Only Authentication in IKEv2*

RFC 7321, *Cryptographic Algorithm Implementation Requirements and Usage Guidance for Encapsulating Security Payload (ESP) and Authentication Header (AH)*

RFC 7383, *Internet Key Exchange Protocol Version 2 (IKEv2) Message Fragmentation*

## **Label Distribution Protocol (LDP)**

draft-ietf-mpls-ldp-ip-pw-capability-09, *Controlling State Advertisements Of Non-negotiated LDP Applications*

draft-ietf-mpls-ldp-ipv6-15, *Updates to LDP for IPv6*

draft-pdutta-mpls-ldp-adj-capability-00, *LDP Adjacency Capabilities*

draft-pdutta-mpls-ldp-v2-00, *LDP Version 2*

draft-pdutta-mpls-mldp-up-redundancy-00, *Upstream LSR Redundancy for Multipoint LDP Tunnels*

draft-pdutta-mpls-multi-ldp-instance-00, *Multiple LDP Instances*

draft-pdutta-mpls-tldp-hello-reduce-04, *Targeted LDP Hello Reduction*

RFC 3037, *LDP Applicability*

RFC 3478, *Graceful Restart Mechanism for Label Distribution Protocol (helper mode)*

RFC 5036, *LDP Specification*

RFC 5283, *LDP Extension for Inter-Area Label Switched Paths (LSPs)*

RFC 5443, *LDP IGP Synchronization*

RFC 5561, *LDP Capabilities*

RFC 5919, *Signaling LDP Label Advertisement Completion*

RFC 6388, *Label Distribution Protocol Extensions for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths*

RFC 6512, *Using Multipoint LDP When the Backbone Has No Route to the Root*

RFC 6826, *Multipoint LDP in-band signaling for Point-to-Multipoint and Multipoint-to-Multipoint Label Switched Paths*

## Layer Two Tunneling Protocol (L2TP) Network Server (LNS)

draft-mammoliti-l2tp-accessline-avp-04, *Layer 2 Tunneling Protocol (L2TP) Access Line Information Attribute Value Pair (AVP) Extensions*

RFC 2661, *Layer Two Tunneling Protocol "L2TP"*

RFC 2809, *Implementation of L2TP Compulsory Tunneling via RADIUS*

RFC 3438, *Layer Two Tunneling Protocol (L2TP) Internet Assigned Numbers: Internet Assigned Numbers Authority (IANA) Considerations Update*

RFC 3931, *Layer Two Tunneling Protocol - Version 3 (L2TPv3)*

RFC 4638, *Accommodating a Maximum Transit Unit/Maximum Receive Unit (MTU/MRU) Greater Than 1492 in the Point-to-Point Protocol over Ethernet (PPPoE)*

RFC 4719, *Transport of Ethernet Frames over Layer 2 Tunneling Protocol Version 3 (L2TPv3)*

RFC 4951, *Fail Over Extensions for Layer 2 Tunneling Protocol (L2TP) "failover"*

## Management

draft-ietf-snmpv3-update-mib-05, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*

RFC 7420, *Path Computation Element Communication Protocol (PCEP) Management Information Base (MIB) Module*

SFLOW-MIB, *sFlow MIB Version 1.3 (Draft 5)*

## **Multiprotocol Label Switching - Transport Profile (MPLS-TP)**

RFC 5586, *MPLS Generic Associated Channel*

RFC 5921, *A Framework for MPLS in Transport Networks*

RFC 5960, *MPLS Transport Profile Data Plane Architecture*

RFC 6370, *MPLS Transport Profile (MPLS-TP) Identifiers*

RFC 6378, *MPLS Transport Profile (MPLS-TP) Linear Protection*

RFC 6426, *MPLS On-Demand Connectivity and Route Tracing*

RFC 6427, *MPLS Fault Management Operations, Administration, and Maintenance (OAM)*

RFC 6428, *Proactive Connectivity Verification, Continuity Check and Remote Defect indication for MPLS Transport Profile*

RFC 6478, *Pseudowire Status for Static Pseudowires*

RFC 7213, *MPLS Transport Profile (MPLS-TP) Next-Hop Ethernet Addressing*

## Multiprotocol Label Switching (MPLS)

RFC 3031, *Multiprotocol Label Switching Architecture*

RFC 3032, *MPLS Label Stack Encoding*

RFC 3443, *Time To Live (TTL) Processing in Multi-Protocol Label Switching (MPLS) Networks*

RFC 4023, *Encapsulating MPLS in IP or Generic Routing Encapsulation (GRE)*

RFC 4182, *Removing a Restriction on the use of MPLS Explicit NULL*

RFC 5332, *MPLS Multicast Encapsulations*

RFC 6790, *The Use of Entropy Labels in MPLS Forwarding*

## Network Address Translation (NAT)

draft-ietf-behave-address-format-10, *IPv6 Addressing of IPv4/IPv6 Translators*

draft-ietf-behave-v6v4-xlate-23, *IP/ICMP Translation Algorithm*

draft-miles-behave-l2nat-00, *Layer2-Aware NAT*

draft-nishitani-cgn-02, *Common Functions of Large Scale NAT (LSN)*

RFC 4787, *Network Address Translation (NAT) Behavioral Requirements for Unicast UDP*

RFC 5382, *NAT Behavioral Requirements for TCP*

RFC 5508, *NAT Behavioral Requirements for ICMP*

RFC 6146, *Stateful NAT64: Network Address and Protocol Translation from IPv6 Clients to IPv4 Servers*

RFC 6333, *Dual-Stack Lite Broadband Deployments Following IPv4 Exhaustion*

RFC 6334, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Option for Dual-Stack Lite*

RFC 6888, *Common Requirements For Carrier-Grade NATs (CGNs)*

RFC 7383, *Internet Key Exchange Protocol Version 2 (IKEv2) Message Fragmentation*

## Open Shortest Path First (OSPF)

draft-ietf-ospf-prefix-link-attr-06, *OSPFv2 Prefix/Link Attribute Advertisement*

draft-ietf-ospf-segment-routing-extensions-04, *OSPF Extensions for Segment Routing*

RFC 1586, *Guidelines for Running OSPF Over Frame Relay Networks*

RFC 1765, *OSPF Database Overflow*

RFC 2328, *OSPF Version 2*

RFC 3101, *The OSPF Not-So-Stubby Area (NSSA) Option*

RFC 3509, *Alternative Implementations of OSPF Area Border Routers*

RFC 3623, *Graceful OSPF Restart Graceful OSPF Restart (helper mode)*  
RFC 3630, *Traffic Engineering (TE) Extensions to OSPF Version 2*  
RFC 4203, *OSPF Extensions in Support of Generalized Multi-Protocol Label Switching (GMPLS)*  
RFC 4222, *Prioritized Treatment of Specific OSPF Version 2 Packets and Congestion Avoidance*  
RFC 4552, *Authentication/Confidentiality for OSPFv3*  
RFC 4576, *Using a Link State Advertisement (LSA) Options Bit to Prevent Looping in BGP/MPLS IP Virtual Private Networks (VPNs)*  
RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*  
RFC 4970, *Extensions to OSPF for Advertising Optional Router Capabilities*  
RFC 5185, *OSPF Multi-Area Adjacency*  
RFC 5187, *OSPFv3 Graceful Restart (helper mode)*  
RFC 5243, *OSPF Database Exchange Summary List Optimization*  
RFC 5250, *The OSPF Opaque LSA Option*  
RFC 5309, *Point-to-Point Operation over LAN in Link State Routing Protocols*  
RFC 5340, *OSPF for IPv6*  
RFC 5709, *OSPFv2 HMAC-SHA Cryptographic Authentication*  
RFC 5838, *Support of Address Families in OSPFv3*  
RFC 6987, *OSPF Stub Router Advertisement*

## **OpenFlow**

ONF *OpenFlow Switch Specification Version 1.3.1* (OpenFlow-hybrid switches)

## **Path Computation Element Protocol (PCEP)**

draft-alvarez-pce-path-profiles-04, *PCE Path Profiles*  
draft-ietf-pce-segment-routing-05, *PCEP Extensions for Segment Routing*  
draft-ietf-pce-stateful-pce-11, *PCEP Extensions for Stateful PCE*  
RFC 5440, *Path Computation Element (PCE) Communication Protocol (PCEP)*

## **Point-to-Point Protocol (PPP)**

RFC 1332, *The PPP Internet Protocol Control Protocol (IPCP)*  
RFC 1377, *The PPP OSI Network Layer Control Protocol (OSINLCP)*  
RFC 1661, *The Point-to-Point Protocol (PPP)*  
RFC 1662, *PPP in HDLC-like Framing*

RFC 1877, *PPP Internet Protocol Control Protocol Extensions for Name Server Addresses*  
RFC 1989, *PPP Link Quality Monitoring*  
RFC 1990, *The PPP Multilink Protocol (MP)*  
RFC 1994, *PPP Challenge Handshake Authentication Protocol (CHAP)*  
RFC 2153, *PPP Vendor Extensions*  
RFC 2516, *A Method for Transmitting PPP Over Ethernet (PPPoE)*  
RFC 2615, *PPP over SONET/SDH*  
RFC 2686, *The Multi-Class Extension to Multi-Link PPP*  
RFC 2878, *PPP Bridging Control Protocol (BCP)*  
RFC 4638, *Accommodating a Maximum Transit Unit/Maximum Receive Unit (MTU/MRU) Greater Than 1492 in the Point-to-Point Protocol over Ethernet (PPPoE)*  
RFC 5072, *IP Version 6 over PPP*

## **Policy Management and Credit Control**

3GPP TS 29.212 Release 11, *Policy and Charging Control (PCC); Reference points (Gx support as it applies to wireline environment (BNG))*  
RFC 3588, *Diameter Base Protocol*  
RFC 4006, *Diameter Credit-Control Application*

## **Pseudowire**

draft-ietf-l2vpn-vpws-iw-oam-04, *OAM Procedures for VPWS Interworking*  
MFA Forum 12.0.0, *Multiservice Interworking - Ethernet over MPLS*  
MFA Forum 13.0.0, *Fault Management for Multiservice Interworking v1.0*  
MFA Forum 16.0.0, *Multiservice Interworking - IP over MPLS*  
MFA Forum 9.0.0, *The Use of Virtual trunks for ATM/MPLS Control Plane Interworking*  
RFC 3916, *Requirements for Pseudo- Wire Emulation Edge-to-Edge (PWE3)*  
RFC 3985, *Pseudo Wire Emulation Edge-to-Edge (PWE3)*  
RFC 4385, *Pseudo Wire Emulation Edge-to-Edge (PWE3) Control Word for Use over an MPLS PSN*  
RFC 4446, *IANA Allocations for Pseudowire Edge to Edge Emulation (PWE3)*  
RFC 4447, *Pseudowire Setup and Maintenance Using the Label Distribution Protocol (LDP)*  
RFC 4448, *Encapsulation Methods for Transport of Ethernet over MPLS Networks*  
RFC 4619, *Encapsulation Methods for Transport of Frame Relay over Multiprotocol Label Switching (MPLS) Networks*

- RFC 4717, *Encapsulation Methods for Transport Asynchronous Transfer Mode (ATM) over MPLS Networks*
- RFC 4816, *Pseudowire Emulation Edge-to-Edge (PWE3) Asynchronous Transfer Mode (ATM) Transparent Cell Transport Service*
- RFC 5085, *Pseudowire Virtual Circuit Connectivity Verification (VCCV): A Control Channel for Pseudowires*
- RFC 5659, *An Architecture for Multi-Segment Pseudowire Emulation Edge-to-Edge*
- RFC 5885, *Bidirectional Forwarding Detection (BFD) for the Pseudowire Virtual Circuit Connectivity Verification (VCCV)*
- RFC 6073, *Segmented Pseudowire*
- RFC 6310, *Pseudowire (PW) Operations, Administration, and Maintenance (OAM) Message Mapping*
- RFC 6391, *Flow-Aware Transport of Pseudowires over an MPLS Packet Switched Network*
- RFC 6575, *Address Resolution Protocol (ARP) Mediation for IP Interworking of Layer 2 VPNs*
- RFC 6718, *Pseudowire Redundancy*
- RFC 6829, *Label Switched Path (LSP) Ping for Pseudowire Forwarding Equivalence Classes (FECs) Advertised over IPv6*
- RFC 6870, *Pseudowire Preferential Forwarding Status bit*
- RFC 7023, *MPLS and Ethernet Operations, Administration, and Maintenance (OAM) Interworking*
- RFC 7267, *Dynamic Placement of Multi-Segment Pseudowires*

## **Quality of Service (QoS)**

- RFC 2430, *A Provider Architecture for Differentiated Services and Traffic Engineering (PASTE)*
- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 3140, *Per Hop Behavior Identification Codes*
- RFC 3260, *New Terminology and Clarifications for Diffserv*

## **Resource Reservation Protocol - Traffic Engineering (RSVP-TE)**

- draft-newton-mpls-te-dynamic-overbooking-00, *A Diffserv-TE Implementation Model to dynamically change booking factors during failure events*
- RFC 2702, *Requirements for Traffic Engineering over MPLS*
