Basic Service Manual

MOTOROLA

intelligence everywhere™

Foreword

This manual covers all models of the ASTRO® XTS™ 2500 / XTS™ 2250 / XTS™ 1500 Digital Portable Radio and the MT 1500 and PR 1500 Portable Radio, unless otherwise specified. It includes all the information necessary to maintain peak product performance and maximum working time, using the pass/fail service approach. This basic level of service is typical of some local service centers, self-maintained customers, and some distributors.

Included in this manual are: radio specifications for the 700/800 MHz , VHF and UHF frequency bands; a general description of XTS 2500 / XTS 2250 / XTS 1500 / MT 1500 / PR 1500 radio models; recommended test equipment, service aids, and tools; radio alignment procedures; fundamental disassembly/reassembly procedures; and general maintenance recommendations.

For details on the operation of the radio, or board or component-level troubleshooting, refer to the applicable manuals, available separately. To help you with your selection, a list is provided under “Related Publications” at the front of this manual.

Safety

Before operating an XTS 2500 / XTS 2250 / XTS 1500 / MT 1500 / PR 1500 radio, please read the RF energy awareness information and operating instructions in the Product Safety and RF Exposure booklet enclosed with your radio (Motorola Publication part number 6881095C98) to ensure compliance with RF energy exposure limits.

Manual Revisions

Changes which occur after this manual is printed are described in “FMRs.” These FMRs provide complete information on changes, including pertinent parts list data.

Computer Software Copyrights

The Motorola products described in this manual may include copyrighted Motorola computer programs stored in semiconductor memories or other media. Laws in the United States and other countries preserve for Motorola certain exclusive rights for copyrighted computer programs, including, but not limited to, the exclusive right to copy or reproduce in any form the copyrighted computer program. Accordingly, any copyrighted Motorola computer programs contained in the Motorola products described in this manual may not be copied, reproduced, modified, reverse-engineered, or distributed in any manner without the express written permission of Motorola. Furthermore, the purchase of Motorola products shall not be deemed to grant either directly or by implication, estoppel, or otherwise, any license under the copyrights, patents or patent applications of Motorola, except for the normal non-exclusive license to use that arises by operation of law in the sale of a product.

Commercial Warranty

Limited Warranty

MOTOROLA COMMUNICATION PRODUCTS

I. What This Warranty Covers And For How Long

MOTOROLA INC. (“MOTOROLA”) warrants the MOTOROLA manufactured Communication Products listed below (“Product”) against defects in material and workmanship under normal use and service for a period of time from the date of purchase as scheduled below:

ASTRO Digital XTS2500 Portable Units	One (1) Year
Product Accessories	One (1) Year

Motorola, at its option, will at no charge either repair the Product (with new or reconditioned parts), replace it (with a new or reconditioned Product), or refund the purchase price of the Product during the warranty period provided it is returned in accordance with the terms of this warranty. Replaced parts or boards are warranted for the balance of the original applicable warranty period. All replaced parts of Product shall become the property of MOTOROLA.

This express limited warranty is extended by MOTOROLA to the original end user purchaser only and is not assignable or transferable to any other party. This is the complete warranty for the Product manufactured by MOTOROLA. MOTOROLA assumes no obligations or liability for additions or modifications to this warranty unless made in writing and signed by an officer of MOTOROLA. Unless made in a separate agreement between MOTOROLA and the original end user purchaser, MOTOROLA does not warrant the installation, maintenance or service of the Product.

MOTOROLA cannot be responsible in any way for any ancillary equipment not furnished by MOTOROLA which is attached to or used in connection with the Product, or for operation of the Product with any ancillary equipment, and all such equipment is expressly excluded from this warranty. Because each system which may use the Product is unique, MOTOROLA disclaims liability for range, coverage, or operation of the system as a whole under this warranty.

II. General Provisions

This warranty sets forth the full extent of MOTOROLA'S responsibilities regarding the Product. Repair, replacement or refund of the purchase price, at MOTOROLA's option, is the exclusive remedy. THIS WARRANTY IS GIVEN IN LIEU OF ALL OTHER EXPRESS WARRANTIES. IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION, IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED TO THE DURATION OF THIS LIMITED WARRANTY. IN NO EVENT SHALL MOTOROLA BE LIABLE FOR DAMAGES IN EXCESS OF THE PURCHASE PRICE OF THE PRODUCT, FOR ANY LOSS OF USE, LOSS OF TIME, INCONVENIENCE, COMMERCIAL LOSS, LOST PROFITS OR SAVINGS OR OTHER INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE SUCH PRODUCT, TO THE FULL EXTENT SUCH MAY BE DISCLAIMED BY LAW.

III. State Law Rights

SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES OR LIMITATION ON HOW LONG AN IMPLIED WARRANTY LASTS, SO THE ABOVE LIMITATION OR EXCLUSIONS MAY NOT APPLY.

This warranty gives specific legal rights, and there may be other rights which may vary from state to state.

IV. How To Get Warranty Service

You must provide proof of purchase (bearing the date of purchase and Product item serial number) in order to receive warranty service and, also, deliver or send the Product item, transportation and insurance prepaid, to an authorized warranty service location. Warranty service will be provided by Motorola through one of its authorized warranty service locations. If you first contact the company which sold you the Product, it can facilitate your obtaining warranty service. You can also call Motorola at 1-888-567-7347 US/Canada.

V. What This Warranty Does Not Cover

- A) Defects or damage resulting from use of the Product in other than its normal and customary manner.
- B) Defects or damage from misuse, accident, water, or neglect.
- C) Defects or damage from improper testing, operation, maintenance, installation, alteration, modification, or adjustment.
- D) Breakage or damage to antennas unless caused directly by defects in material workmanship.
- E) A Product subjected to unauthorized Product modifications, disassemblies or repairs (including, without limitation, the addition to the Product of non-Motorola supplied equipment) which adversely affect performance of the Product or interfere with Motorola's normal warranty inspection and testing of the Product to verify any warranty claim.
- F) Product which has had the serial number removed or made illegible.
- G) Rechargeable batteries if:
 - any of the seals on the battery enclosure of cells are broken or show evidence of tampering.
 - the damage or defect is caused by charging or using the battery in equipment or service other than the Product for which it is specified.
- H) Freight costs to the repair depot.

- I) A Product which, due to illegal or unauthorized alteration of the software/firmware in the Product, does not function in accordance with MOTOROLA's published specifications or the FCC type acceptance labeling in effect for the Product at the time the Product was initially distributed from MOTOROLA.
- J) Scratches or other cosmetic damage to Product surfaces that does not affect the operation of the Product.
- K) Normal and customary wear and tear.

VI. Patent And Software Provisions

MOTOROLA will defend, at its own expense, any suit brought against the end user purchaser to the extent that it is based on a claim that the Product or parts infringe a United States patent, and MOTOROLA will pay those costs and damages finally awarded against the end user purchaser in any such suit which are attributable to any such claim, but such defense and payments are conditioned on the following:

- A) that MOTOROLA will be notified promptly in writing by such purchaser of any notice of such claim;
- B) that MOTOROLA will have sole control of the defense of such suit and all negotiations for its settlement or compromise; and
- C) should the Product or parts become, or in MOTOROLA's opinion be likely to become, the subject of a claim of infringement of a United States patent, that such purchaser will permit MOTOROLA, at its option and expense, either to procure for such purchaser the right to continue using the Product or parts or to replace or modify the same so that it becomes noninfringing or to grant such purchaser a credit for the Product or parts as depreciated and accept its return. The depreciation will be an equal amount per year over the lifetime of the Product or parts as established by MOTOROLA.

MOTOROLA will have no liability with respect to any claim of patent infringement which is based upon the combination of the Product or parts furnished hereunder with software, apparatus or devices not furnished by MOTOROLA, nor will MOTOROLA have any liability for the use of ancillary equipment or software not furnished by MOTOROLA which is attached to or used in connection with the Product. The foregoing states the entire liability of MOTOROLA with respect to infringement of patents by the Product or any parts thereof.

Laws in the United States and other countries preserve for MOTOROLA certain exclusive rights for copyrighted MOTOROLA software such as the exclusive rights to reproduce in copies and distribute copies of such Motorola software. MOTOROLA software may be used in only the Product in which the software was originally embodied and such software in such Product may not be replaced, copied, distributed, modified in any way, or used to produce any derivative thereof. No other use including, without limitation, alteration, modification, reproduction, distribution, or reverse engineering of such MOTOROLA software or exercise of rights in such MOTOROLA software is permitted. No license is granted by implication, estoppel or otherwise under MOTOROLA patent rights or copyrights.

VII. Governing Law

This Warranty is governed by the laws of the State of Illinois, USA.

Introduction

1

General

This manual covers information needed for level one and two troubleshooting. Level one troubleshooting consists of radio programming, tuning (via CPS/tuner), knobs replacement, and installation and removal of antenna, belt clip, battery, and universal connector cover. Level two troubleshooting consists of everything listed in level one, plus the identification and replacement of Field Replaceable Units (FRUs). No soldering will be allowed; only board swapping.

Included in this manual are radio specifications for the 700/800 MHz, VHF, and UHF frequency bands; a general description of ASTRO Digital XTS 2500, XTS 2250, and XTS 1500 models, and analog MT 1500 and PR 1500 models; recommended test equipment; service aids; radio alignment procedures; general maintenance recommendations; and procedures for basic assembly and disassembly.

NOTE: Hereinafter, the series of radios including the ASTRO Digital XTS 2500, XTS 2250, and XTS 1500, and analog MT 1500 and PR 1500, is referred to as the “XTS 2500/2250/1500 radios”.

Notations Used in This Manual

Throughout the text in this publication, you will notice the use of warnings, cautions, and notes. These notations are used to emphasize that safety hazards exist, and care must be taken and observed.

NOTE: An operational procedure, practice, or condition, etc., which is essential to emphasize.

Caution

CAUTION indicates a potentially hazardous situation which, if not avoided, may result in equipment damage.

WARNING

WARNING indicates a potentially hazardous situation which, if not avoided, could result in death or injury.

DANGER indicates an imminently hazardous situation which, if not avoided, will result in death or injury.

Radio Description

The XTS 2500/2250/1500 radios are among the most sophisticated two-way radios available.

These radios provide improved voice quality across more coverage area. The digital process, called “embedded signalling,” intermixes system signalling information with digital voice, resulting in improved system reliability, and the capability of supporting a multitude of advanced features. Such features add up to better, more cost-effective two-way radio communications.

The XTS 2500/2250/1500 radios are available in four basic models. Table 1 describes their basic features.

Table 1. ASTRO XTS 2500/2250/1500 Basic Features

Feature	Model I*	Model 1.5 (XTS 2500/2250)	Model II	Model III (XTS 2500/2250)
Display	None	LCD 6 lines/ 12 characters per line	LCD 6 lines/ 12 characters per line	LCD 6 lines/ 12 characters per line
Keypad	None	None	3 x 2 button with 4-Position Navigation button	3 x 6 button with 4-Position Navigation button
Channel Capability	48	48	255	255
Dialing from Prestored List	No	No	Yes	Yes
Programmable Softkeys	No	No	Yes	Yes

* “Model I” refers to XTS 2500 Model I, XTS 2250 Basic Model, XTS 1500, MT 1500, and PR 1500

FLASHport

The XTS 2500/2250/1500 radios utilize Motorola’s revolutionary FLASHport™ technology. FLASHport makes it possible to add software that drives the radio’s capabilities both at the time of purchase and later on. Previously, changing a radio’s features and capabilities meant significant modifications, or buying a new radio. But now, just as a computer can be loaded with different software, the radio’s features and capabilities can be upgraded with FLASHport software.

Basic Maintenance

2

Introduction to This Section

This section of the manual describes preventive maintenance and handling precautions. Each of these topics provides information vital to the successful operation and maintenance of your radio.

Preventive Maintenance

The XTS 2500/2250/1500 radios do not require a scheduled preventive maintenance program; however, periodic visual inspection and cleaning is recommended.

Inspection

Check that the external surfaces of the radio are clean, and that all external controls and switches are functional. A detailed inspection of the interior electronic circuitry is not needed.

Cleaning

The following procedures describe the recommended cleaning agents and the methods to be used when cleaning the external surfaces of the radio. External surfaces include the housing assembly and battery case. These surfaces should be cleaned whenever a periodic visual inspection reveals the presence of smudges, grease, and/or grime.

The only recommended agent for cleaning the external radio surfaces is a 0.5% solution of a mild dishwashing detergent, such as JOY[®], in water.

The effects of certain chemicals and their vapors can have harmful results on certain plastics. Aerosol sprays, tuner cleaners, and other chemicals should be avoided.

Cleaning External Plastic Surfaces

The detergent-water solution should be applied sparingly with a stiff, non-metallic, short-bristled brush to work all loose dirt away from the radio. A soft, absorbent, lintless cloth or tissue should be used to remove the solution and dry the radio. Make sure that no water remains entrapped near the connectors, cracks, or crevices.

Handling Precautions

Complementary metal-oxide semiconductor (CMOS) devices, and other high-technology devices, are used in this family of radios. While these devices have many attributes, their characteristics make them susceptible to damage by electrostatic discharge (ESD) or high-voltage charges. Damage can be latent, resulting in failures occurring weeks or months later. Therefore, special precautions must be taken to prevent device damage during disassembly, troubleshooting, and repair. Handling precautions are mandatory for this radio, and are especially important in low-humidity conditions.

Never heat the RF PA above 210°C while performing repair or rework procedures to maintain its integrity. Utilizing a Chipmaster (R1319 or R1321) top-side set point of 215°C and a Dragon (R1427) bottom-side pre-heat set point of 180°C has proven to satisfy this condition during the rework of the RF PA (note: the RF PA temperature does not reach the Chipmaster's internal set point temperature). All other parts on the transceiver board can be reworked with Chipmaster top-side heat alone.

Basic Theory of Operation

3

General Overview

The ASTRO Digital XTS 2500 / XTS 2250 / XTS 1500 radio and the MT 1500 / PR 1500 radio are wideband, synthesized, fixed-tuned radios available in the 700/800 MHz, VHF and UHF bands. The XTS 2500 / XTS 2250 / XTS 1500 radios are capable of both analog operation (12.5 kHz or 25 kHz bandwidths) and digital ASTRO mode operation (12.5 kHz only). The MT 1500 and PR 1500 radios operate in analog only.

The XTS 2500/2250/1500 radios include the following major assemblies (see Figure 1):

- **Main Board:** contains the microcontrol unit (MCU) and its associated memory and memory management integrated circuit (IC), the audio power amplifier, and a switching regulator. The board also contains the digital signal processor (DSP) and its support IC and associated memories. It further contains all transmit, receive, and frequency generation circuitry, including the digital receiver back-end IC and the reference oscillator.
- **Universal Flex:** contains the universal connector, speaker, and microphone.
- **Display (XTS 2500 Models 1.5, II and III and XTS 2250 1.5 and Advanced Model only):** a six-line, 12-character, liquid-crystal display (LCD).
- **Keypad (XTS 2500 Models II and III and XTS 2250 Advanced Model only):**
 - XTS 2500 Model II: a 3 x 2 keypad
 - XTS 2500 Model III and XTS 2250 Advanced Model: a 3 x 6 keypad.

Figure 1. XTS 2500 Overall Block Diagram

Analog Mode of Operation

Receiving

When the radio is *receiving* (see Figure 2), the signal comes from the antenna connector to the radio board, passes through the RX/TX antenna switch and into the receiver front end. A 15dB step attenuator is included in the front end to provide additional protection against strong signals. The attenuator is controlled by a DSP based algorithm that continuously monitors signal strength. When the ON threshold is exceeded (approximately -95dBm), the attenuator is activated via a DAC in the PCIC by the host. The attenuator remains activated until the signal drops below the OFF threshold (approximately -115dBm including the 15dB attenuation). Hysteresis and timer functions are included in the algorithm to enhance performance. The algorithm controlling the attenuator is enabled via the CPS for each personality. When the algorithm is disabled, the attenuator is essentially a short circuit from input to output. The signal is then filtered, amplified, and mixed with the first local-oscillator signal generated by the voltage-controlled oscillator (VCO).

Figure 2. Receiver Block Diagram

The resulting intermediate frequency (IF) signal is fed to the IF circuitry, where it is again filtered and amplified. This amplified signal passes to the digital back-end IC, where it is mixed with the second local oscillator to create the second IF (450 kHz for 700/800 MHz; 2.25 MHz for UHF). It is then converted to a digital bit stream and mixed a third time to produce a baseband signal. This signal is passed to the VOCON circuitry through a current-driven differential output.

In the VOCON circuitry, the digital-signal processor (DSP) support IC digitally filters and discriminates the signal, and passes it to the DSP. The DSP decodes the information in the signal and identifies the appropriate destination for it. For a voice signal, the DSP routes the digital voice data to the CODEC for conversion to an analog signal. The CODEC then presents the signal to the audio power amplifier, which drives the speaker. For signalling information, the DSP decodes the message and pass it to the microcontrol unit.

Transmitting

When the radio is *transmitting* (see Figure 3 and Figure 4), microphone audio is passed through gain stages to the CODEC where the signal is digitized. The CODEC passes digital data to the DSP where pre-emphasis and low-pass (splatter) filtering are done. The DSP passes this signal to a digital-to-analog (D/A) converter where it is reconverted into an analog signal and scaled for application to the voltage-controlled oscillator as a modulation signal.

Figure 3. RF Block Diagram for 700/800 MHz (Power and Control Omitted)

Figure 4. RF Block Diagram for VHF/UHF (Power and Control Omitted)

Transmitted signalling information is accepted by the DSP from the microcontrol unit, coded appropriately, and passed to the D/A converter, which handles it the same as a voice signal. Modulation information is passed to the synthesizer along the modulation line. A modulated carrier is provided to the RF PA, which transmits the signal under dynamic power control.

ASTRO Mode of Operation

In the ASTRO mode (digital mode) of operation, the transmitted or received signal is limited to a discrete set of deviation levels, instead of continuously varying. The receiver handles an ASTRO-mode signal identically to an analog-mode signal up to the point where the DSP decodes the received data. In the ASTRO receive mode, the DSP uses a specifically defined algorithm to recover information.

In the ASTRO transmit mode, microphone audio is processed identically to an analog mode with the exception of the algorithm the DSP uses to encode the information. This algorithm will result in deviation levels that are limited to discrete levels.

RF Basic Theory of Operation

The receiver front end consists of a preselector, an RF amplifier, a second preselector, and a mixer. Both preselectors are varactor-tuned, two-pole filters, controlled by the microcontroller unit through the D/A IC. The RF amplifier is a dual-gate, gallium-arsenide-based IC. The mixer is a double-balanced, active mixer, coupled by transformers. Injection is provided by the VCO through an injection filter. See Table 2 for local oscillator (LO) and first IF information.

Table 2. Local Oscillator and First IF Frequencies

	700 MHz	800 MHz	VHF	UHF
LO Frequency Range	--	--	--	--
First IF Frequency	109.65 MHz	109.65 MHz	44.85 MHz	73.35 MHz

For the 700/800 MHz band, the frequency generation function is performed by three ICs and associated circuitry. For the VHF/UHF band, the frequency generation function is performed by two ICs and associated circuitry. The reference oscillator provides a frequency standard to the synthesizer/prescaler IC, which controls the VCOB IC for 700/800 MHz, or the VCO buffer for VHF/UHF. The VCOB IC, or the VCO buffer, actually generates the first LO and transmit-injection signals and buffers them to the required power level. The synthesizer/prescaler circuit module incorporates frequency-division and comparison circuitry to keep the VCO signals stable. The synthesizer/prescaler IC is controlled by the microcontrol unit through a serial bus.

For the 700/800 MHz band, the receiver back end consists of a two-pole crystal filter, an IF amplifier, a second two-pole crystal filter, and the digital back-end IC. For the VHF/UHF band, the receiver back end consists of a three-pole crystal filter and the digital back-end IC. The crystal filters are wide enough to accommodate 4 kHz modulation. Final IF filtering is done digitally in the DSP.

The digital back-end IC consists of an amplifier, the second mixer, an IF analog-to-digital converter, a baseband down-converter, and a 2.4 MHz synthesis circuit to provide a clock to the DSP-support IC on the VOCON circuitry. The second LO is generated by discrete components external to the IC. The output of the digital back-end IC is a digital bit stream that is current driven on a differential pair for a reduction in noise generation.

The transmitter consists of an RF driver IC that gets an injection signal from the VCO and a final-stage power amplifier. Transmit power is controlled by a power-control IC that monitors the output of a directional coupler and adjusts PA control voltages correspondingly. The signal passes through a RX/TX switch that uses PIN diodes to automatically provide an appropriate interface to transmit or receive signals. Antenna selection is done mechanically in the control top.

VOCON Basic Theory of Operation

The vocoder and controller (VOCON) circuitry contains the radio's microcontrol unit with its memory and support circuits, the DSP, its memory devices, and the DSP-support IC, voltage regulators, audio, and power control circuits. Connected to the VOCON circuitry are the display board, RF circuitry, keypad board, and controls/universal flex.

The microcontrol unit controls receive/transmit frequencies, power levels, display, and other radio functions, using either direct logic control or serial communications paths to the devices. The microcontrol unit executes a stored program located in the FLASH ROM. Data is transferred to and from memory by the microcontrol unit data bus. The memory location from which data is read, or to which data is written, is selected by the address lines.

The DSP-support IC is supplied with a 16.8 MHz clock from the RF circuitry. Both the DSP and the microprocessor have their clocks generated by the DSP-support IC. They can both be adjusted so that the harmonics do not cause interference with the radio's receive channel.

The regulator and power-control circuits include 3.3-volt analog, 3.3-volt digital, and 5-volt regulators. The audio PA is sourced from 7.5V. The regulator's power-down mode is controlled by the microcontrol unit, which senses the position of the on/off switch. The 5-volt regulator has an error pin for low-voltage resets.

The DSP performs signalling and voice encoding and decoding, as well as audio filtering and volume control. This IC performs Private-Line®/Digital Private Line™ (PL/DPL) encode and alert-tone generation. The IC transmits pre-emphasis on analog signals and applies a low-pass (splatter) filter to all transmitted signals. It requires a clock on the EXTAL pin. An 8 kHz interrupt signal generated by the DSP-support IC is also required for functionality. It is programmed using parallel programming from the microcontrol unit.

The audio CODEC performs analog-to-digital (A/D), and digital-to-analog conversions on audio signals. The DSP controls squelch, deviation, and executes receiver and transmitter filtering. The DSP-support IC receives a 2.4 MHz clock, and also receives data, which it formats for the DSP.

Notes

Recommended Test Equipment and Service Aids

4

Recommended Test Equipment

The list of equipment contained in Table 3 includes all of the standard test equipment required for servicing two-way portable radios, as well as several unique items designed specifically for servicing this family of radios. The “Characteristics” column is included so that equivalent equipment may be substituted; however, when no information is provided in this column, the specific Motorola model listed is either a unique item or no substitution is recommended.

Table 3. Recommended Test Equipment

Motorola Model Number	Description	Characteristics	Application
R2600 Series	Communications System Analyzer	This monitor will substitute for items with an asterisk (*).	Frequency/deviation meter and signal generator for wide-range troubleshooting and alignment.
Fluke 8012	Digital Multimeter		Recommended for ac/dc voltage and current measurements
R1150_*	Code Synthesizer		Injection of audio and digital signalling codes
R1377_*	AC Voltmeter	1mV to 300V, 10-Megohm input impedance	Audio voltage measurements
R1094_	Dual-Trace Oscilloscope	20 MHz bandwidth 5mV to 5V/division	Waveform measurements
S1350_* ST1213_ (VHF)* ST1223_ (UHF)*	Wattmeter Plug-In Element RF Dummy Load	50-ohm, $\pm 5\%$ accuracy 10 watts, maximum 0-1000 MHz, 300W	Transmitter power output measurements
R1065_	Load Resistor	10-watt Broadband	For use with wattmeter
S1339_	RF Millivolt Meter	100 μ V to 3V RF	RF-level measurements
R1013_*	SINAD Meter		Receiver sensitivity measurements
S1347_ or S1348_ (programmable)	DC Power Supply	0-20Vdc, 0-5 Amps current limited	Bench supply for 7.5Vdc
*The R2600 Series monitor will substitute for these items.			

Service Aids

Refer to Table 4., “Service Aids,” for a listing and description of the service aids designed specifically for servicing this family of radios. These kits and/or parts are available from the Motorola Parts Division offices listed in the “Replacement Parts Ordering” section located on the inside back cover of this manual. While all of these items are available from Motorola, most are standard shop equipment items, and any equivalent item capable of the same performance may be substituted for the item listed.

Table 4. Service Aids

Motorola Part Number	Description	Application
6685666D01	Chassis Opener Tool	Used to remove radio knobs and to separate chassis from Front Cover.
RKN-4106_	RS232/Radio/Test Set Cable	Connects radio to RLN4460 Test Box and to RS232 computer connector (DB9).
0180305G54	Battery Eliminator	Interconnects radio to power supply.
RLN-4460	Portable Test Set	Enables connection to the universal connector. Allows switching for radio testing.
RVN-4181_	Customer Programming Software	Customer Programming Software (CPS)/Tuner on one CD-ROM.
58-80348B33	SMA to BNC Adaptor	Adapts radio’s antenna port to BNC cabling of test equipment.
RKN4105	USB/Radio/Test Set Cable	Connects radio to RLN4460 test box and to USB computer connector.
8180384M37	Test Fixture	Provides for troubleshooting the radio board when the back casting is removed.

NOTE: The Radio Interface Box (RIB), Smart Radio Interface Box (SRIB), and any cables that connect with those boxes are incompatible with the XTS 2500 radio and should NOT be used.

Field Programming Equipment

This family of radios can be aligned and programmed in the field. This requires specific equipment and special instructions. Refer to the applicable “CPS On-line Help” for complete field programming information.

Performance Checks

5

Introduction to This Section

This section covers performance checks used to verify that the radio meets published specifications. The recommended test equipment listed in the previous section approaches the accuracy of the manufacturing equipment, with a few exceptions. Accuracy of the equipment must be maintained in compliance with the manufacturer's recommended calibration schedule. Checks should be performed if radio performance degradation is suspected.

Setup

Supply voltage can be connected from the battery eliminator. The equipment required for alignment procedures is connected as shown in the "Radio Alignment Test Setup" diagram (Figure 5).

Figure 5. Radio Alignment Test Setup

Initial equipment control settings should be as indicated in the Table 5, and should hold for all alignment procedures except as noted.

Table 5. Initial Equipment Control Settings

System Analyzer	Test Set	Power Supply
Monitor Mode: Pwr Mon	Spkr Set: A	Voltage: 7.5Vdc
RF Attn: -70dB	Spkr/Load: Speaker	DC On/Standby: Standby
AM, CW, FM: FM	PTT: OFF (center)	Volt Range: 10Vdc
O'scope Source: Mod O'scope Horiz: 10mSec/Div O'scope Vert: 2.5 kHz/Div O'scope Trig: Auto Monitor Image: Hi Monitor BW: Nar Monitor Squelch: Mid CW Monitor Vol: 1/4 CW		Current: 2.5Amps

Display Radio Test Mode

Entering Display Radio Test Mode

1. Turn the radio on.
2. Within 10 seconds after “Self Test” is complete, press **Side button 3** five times in succession.
3. The radio will show a series of displays that will give information regarding various version numbers and subscriber specific information. The displays are described in Table 6.

Table 6. Front-Panel Access Test-Mode Displays

Name of Display	Description	Appears
“SERVICE”	The literal string indicates the radio has entered test mode.	Always.
Host Software Version	The version of host firmware.	Always.
DSP Software Version	The version of DSP firmware.	Always.
Model Number	The radio’s model number as programmed in the codeplug.	Always.
Serial Number	The radio’s serial number as programmed in the codeplug.	Always.
ROM Size	The memory capacity of the host FLASH part.	Always.
FLASHcode	The FLASH codes as programmed in the codeplug.	Always.

NOTE: All displays are temporary and will disappear without any user intervention. If information is longer than the physical length of the radio’s display, the information will wrap around to the next display. After the last display, “RF TEST” will be displayed. For **non-display** radios, refer to the CPS Radio Information Screen.

- 4a. Press **Side Button 1** to stop the displays and put the radio into the Control Top and Keypad test mode (display radio). The test mode menu “CH TEST” will be displayed. Go to the “Control Top and Keypad Test Mode (Display Radio)” section on page 16.

NOTE: Each press of **Side Button 1** will toggle between “CH TEST” and “RF TEST.”

OR

- 4b. Press the **Top Programmable Button** to stop the displays and put the radio into the RF test mode (display radio). The test mode menu “1 CSQ.” will be displayed, indicating test frequency 1, Carrier Squelch mode. Go to “RF Test Mode (Display Radio)” in the next section.

RF Test Mode (Display Radio)

When the ASTRO Digital XTS 2500 radio is operating in its normal environment, the radio's microcomputer controls the RF channel selection, transmitter key-up, and receiver muting, according to the customer codeplug configuration. However, when the unit is on the bench for testing, alignment, or repair, it must be removed from its normal environment via a special routine, called **TEST MODE** or “air test.”

- Each additional press of **Side Button 3** will advance to the next test channel. (Refer to Figure 7.)
- Pressing **Side Button 2** will scroll through and access test environments as shown in Figure 8.

NOTE: Transmit into a load when keying a radio under test.

Table 7. Test Frequencies

Frequency	700/800 MHz		VHF		UHF Range 1		UHF Range 2	
	RX	TX	RX	TX	RX	TX	RX	TX

3	TPL	Tone Private-Line	RX: unsquelch if carrier and tone (192.8 Hz) detected TX: mic audio + tone (192.8 Hz)
11	AST	ASTRO	RX: none TX: 1200Hz tone **
12	USQ	Carrier Unsquelch	RX: unsquelch always TX: mic audio
** All deviation values are based on deviation tuning of this mode.			

Control Top and Keypad Test Mode (Display Radio)

This test mode is used to verify proper operation of all radio buttons and switches if a failure is suspected.

1. Press and hold the **Top Programmable Button**; all segments on the display will light, and the LED on the control top will illuminate a red color.
2. Release the **Top Programmable Button**; “3/0” appears, indicating that the **Top Programmable Button** is in the open condition.
3. Press the **Top Programmable Button** again; “3/1” appears, indicating that the **Top Programmable Button** is in the closed condition.
4. Rotate the **Mode/Zone Selector Switch**; “4/0” through “4/15” appears, indicating that the selector switch is in mode/zone position 1 through 16.
5. Rotate the **Three-Position Concentric Switch**; “65/0” through “65/2” appear.
6. Cycle through the **16-Position Programmable Switch**; “67/0,” “67/1,” and “67/2” appear.
7. Rotate the **Volume Control**; “2/0” through “2/220” appear.
8. Press **Side Button 1**; “96/1” appears; release, “96/0” appears.
9. Press **Side Button 2**; “97/1” appears; release, “97/0” appears.
10. Press **Side Button 3**; “98/1” appears; release, “98/0” appears.
11. Press the **PTT Switch**; “1/1” appears; release, “1/0” appears.
12. Keypad Checks:

Model III Only—

- Press 0, “48/1” appears; release, “48/0” appears.
- Press 1, “49/1” appears; release, “49/0” appears.
- Press 2, “50/1” appears; release, “50/0” appears.
- Press 3, “51/1” appears; release, “51/0” appears.
- Press 4, “52/1” appears; release, “52/0” appears.
- Press 5, “53/1” appears; release, “53/0” appears.
- Press 6, “54/1” appears; release, “54/0” appears.

- Press 7, “55/1” appears; release, “55/0” appears.
- Press 8, “56/1” appears; release, “56/0” appears.
- Press 9, “57/1” appears; release, “57/0” appears.
- Press *, “58/1” appears; release, “58/0” appears.
- Press #, “59/1” appears; release, “59/0” appears.

All Display Models—

- Press V, “128/1” appears; release, “128/0” appears.
- Press h, “129/1” appears; release, “129/0” appears.
- Press U, “130/1” appears; release, “130/0” appears.
- Press the left-hand D key on the top row of keys, “131/1” appears; release, “131/0” appears.
- Press the center E key, “132/1” appears; release, “132/0” appears.
- Press the right-hand F key, “133/1” appears; release, “133/0” appears.
- Press @ button, “134/1” appears; release, “134/0” appears.
- Press X (up arrow), “135/1” appears; release, “135/0” appears.
- Press Y (down arrow), “136/1” appears; release, “136/0” appears.

Non-Display Radio Test Mode

Entering Non- Display Radio Test Mode

1. Turn the radio on.
2. Within 10 seconds after the top green LED turns off, press **Side button 3** five times in succession.
- 3a. Press **Side Button 1** to put the radio into the Control Top and Keypad test mode (non-display radio). Go to the “Control Top and Keypad Test Mode (Non-Display Radio)” section on page 18.

NOTE: Each press of **Side Button 1** will toggle between Control Top and Keypad test mode (non-display radio) and RF test mode (non-display radio).

OR

- 3b. Press the **Top Programmable Button** to stop the displays and put the radio into the RF test mode (non-display radio). Go to “RF Test Mode (Non-Display Radio)” in the next section.

RF Test Mode (Non- Display Radio)

When the ASTRO Digital XTS 2500 radio is operating in its normal environment, the radio's microcomputer controls the RF channel selection, transmitter key-up, and receiver muting according to the customer codeplug configuration. However, when the unit is on the bench for testing, alignment or repair, it must be removed from its normal environment via a special routine, called **TEST MODE** or “air test.”

1. Each additional press of **Side Button 3** will advance to the next test channel. (Refer to Table 7 on page 15.) The channel number is represented by the number of beeps

emitted by the radio after the button press (for example, five beeps indicates channel 5).

2. Pressing **Side Button 2** will scroll through and access test environments as shown in Table 8 on page 16. The test environment is represented by the number of beeps emitted by the radio after the button press (for example, 11 beeps indicate AST).

NOTE: Transmit into a load when keying a radio under test.

Control Top and Keypad Test Mode (Non-Display Radio)

This test mode is used to verify proper operation of all radio buttons and switches if a failure is suspected.

1. Press and hold the **Top Programmable Button**; the LED on the control top lights red, and the radio beeps.
2. Release the **Top Programmable Button**; the radio beeps again.
3. Press the **Top Programmable Button** again; the radio beeps, indicating that the **Top Programmable Button** is in the closed condition.
4. Rotate the **Three-Position Concentric Switch**; the radio beeps in each switch position.
5. Rotate the **Mode/Zone Selector Switch**; the radio beeps in each switch position.
6. Cycle through the **16-Position Programmable Switch**; the radio beeps in each switch position.
7. Rotate the **Volume Control**; the radio beeps at each new volume setting.
8. Press **Side Button 1**; the radio beeps.
9. Press **Side Button 2**; the radio beeps.
10. Press **Side Button 3**; the radio beeps.

Table 9. Receiver Performance Checks

Test Name	System Analyzer	Radio	Test Set	Comments
Reference Frequency	Mode: PWR MON 4th channel test frequency* Monitor: Frequency error. Input at RF In/Out	TEST MODE, 4 CSQ output at antenna	PTT to continuous (during the performance check)	Frequency error to be $\leq \pm 1.3$ kHz
Rated Audio	Mode: GEN Output level: 1.0mV RF 4th channel test frequency* Mod: 1 kHz tone at 3 kHz deviation Monitor: DVM: ac Volts	TEST MODE, 4 CSQ	PTT to OFF (center); meter selector to Audio PA	Set volume control to 3.74Vrms
Distortion	As above, except to distortion	As above	As above	Distortion < 3.0%
Sensitivity (SINAD)	As above, except SINAD; lower the RF level for 12dB SINAD	As above	PTT to OFF (center)	RF input to be < 0.35 μ V
Noise Squelch Threshold (only radios with conventional system need to be tested)	RF level set to 1mV RF	As above	PTT to OFF (center); meter selection to Audio PA; spkr/load to speaker	Set volume control to 3.74Vrms
	As above, except change frequency to a conventional system. Raise RF level from zero until radio unsquelches.	Out of TEST MODE; select a conventional system	As above	Unsquelch to occur at < 0.25 μ V. Preferred SINAD = 5-8dB
*See Table 7 on page 15.				

Table 10. Transmitter Performance Checks

Test Name	System Analyzer	Radio	Test Set	Comments
Reference Frequency	Mode: PWR MON 4th channel test frequency* Monitor: Frequency error. Input at RF In/Out	TEST MODE, 4 CSQ	PTT to continuous (during the performance check).	Frequency error to be $\leq \pm 1.3$ kHz.
Power RF	As above	As above, 4 CSQ	As above	Refer to Maintenance Specifications page in front of manual.
Voice Modulation	Mode: PWR MON 4th channel test frequency* atten to -70 , input to RF In/Out. Monitor: DVM, ac Volts. Set 1 kHz Mod Out level for 0.025Vrms at test set, 80mVrms at ac/dc test set jack	As above, 4 CSQ	As above, meter selector to mic	Deviation: ≥ 4.1 kHz but ≤ 5.0 kHz
Voice Modulation (internal)	Mode: PWR MON 4th channel test frequency* atten to -70 , input to RF In/Out	TEST MODE, 4 CSQ, output at antenna	Remove modulation input	Press PTT switch on radio. Say “four” loudly into the radio mic. Measure deviation: ≥ 4.1 kHz but ≤ 5.0 kHz
PL Modulation (radios with conventional, clear mode, coded squelch operation only)	Change frequency to a conventional transmit frequency	Conventional coded squelch personality (clear mode operation) 4 TPL	As above	Deviation: ≥ 500 Hz but ≤ 1000 Hz
Talkaround Modulation (radios with conventional, clear mode, talk-around operation only)	Change frequency to conventional talk-around frequency. Mode: PWR MON deviation, attenuation to -70 , input to RF In/Out. Monitor: DVM, ac volts Set 1 kHz Mod Out level for 25mVrms at test set.	Conventional talkaround personality (clear mode operation) 1 CSQ	As above	Deviation: ≥ 4.1 kHz but ≤ 5.0 kHz
*See Table 7 on page 15				

Radio Alignment Procedures

6

Introduction to This Section

This section describes both receiver and transmitter radio alignment procedures.

General

A personal computer (PC) and tuner software are required to align the radio. Refer to the applicable manual for installation and setup procedures for the software. To perform the alignment procedures, the radio must be connected to the PC and to a universal test set as shown in Figure 5. Radio Alignment Test Setup on page 13.

Caution

These procedures should only be attempted by qualified service personnel. Failure to perform alignment procedures properly may result in seriously degraded radio or system performance.

Select **Tuner** from the **START** menu. To read the radio, use the **File** → **Read Device** menu or click on . Figure 6 illustrates how the alignment screens are organized. To access a screen, double-click on the desired screen name in the **Tuner** menu.

Figure 6. Tuner Menu Layout

The alignment screens introduce the concept of the “softpot,” an analog **SOFTWARE**-controlled **POT**entiometer used for adjusting all transceiver alignment controls.

Caution

Do NOT switch radios in the middle of any Alignment procedure. Always left-click the **Close** button on the screen to return to the MAIN menu screen before disconnecting the radio. Improper exits from the Alignment screens may leave the radio in an improperly configured state and result in seriously degraded radio or system performance.

Each alignment screen provides the ability to increase or decrease the softpot value by using a slider or the screen’s UP/DOWN arrow keys (▲ ▼), or by entering the new value from the keyboard. A graphical scale on the display indicates the minimum, maximum, and proposed value of the softpot; see Figure 7.

Figure 7. Typical Softpot Screen

Adjusting the softpot value sends information to the radio to increase (or decrease) a voltage in the corresponding circuit. For example, left-clicking the UP arrow ▲ on the **Reference Oscillator** screen instructs the radio’s microcomputer to increase the voltage across a varactor in the reference oscillator, which increases the frequency.

In ALL cases, the softpot value is just a relative number corresponding to a digital-to-analog (D/A) generated voltage in the radio.

Perform the following procedures in the sequence indicated.

NOTE: Some of the following screens may vary depending upon the radio under test and the version of tuner software you are using. Refer to the software’s on-line help.

Radio Information

Figure 8 shows a typical Radio Information screen.

Figure 8. Radio Information Screen

Reference
Oscillator
Alignment

Adjustment of the reference oscillator is critical for proper radio operation. Improper adjustment will result not only in poor operation, but also in a misaligned radio that will interfere with other users operating on adjacent channels. For this reason, the reference oscillator should be checked every time the radio is serviced, or once a year, whichever comes first. The frequency counter used for this procedure must have a stability of 0.1 ppm (or better).

NOTE: Reference oscillator alignment is required after replacing (or servicing) the transceiver board.

This test can be done with either the R-2670 Communication Analyzer or the 8901_Modulation Analyzer.

- Initial setup using the R-2670 Communication Analyzer:
 - RF Control: MONITOR
 - B/W: WB
 - Freq: CPS frequency under test
 - Attenuation: 20dB
 - Mon RF in: RF I/O
 - Meter: RF Display
 - Mode: STD
 - Input Level: uV or W
 - Display: Bar Graphs
 - Squelch: Mid-range or adjust as necessary
- Initial setup using the 8901_Series Modulation Analyzer:

- Press the green **Automatic Operation** button on the analyzer.
- Press the **FREQ** key.
- Type **7.1** followed by **SPCL** button to set the 8901B_ modulation analyzer for maximum accuracy.

To align the reference oscillator:

1. Select the **Reference Oscillator** alignment screen. See Figure 9.

Figure 9. Reference Oscillator Alignment Screen

2. Left-click the **PTT Toggle** button on the screen to make the radio transmit. The screen indicates whether the radio is transmitting.
3. Measure the transmit RF frequency with your service monitor.
4. Adjust the reference oscillator's softpot value until the measured value is as close as possible to the frequency shown on the screen. See Table 11.

Table 11. Reference Oscillator Alignment

Band	Target
VHF	±100 Hz
UHF	±100 Hz
700 MHz/800 MHz	±100 Hz

5. Left-click the **Program All** button on the screen to dekey the radio and save the tuned values.
6. Left-click the **Close** button on the screen to return to the **Transmitter Alignments** menu.

Transmit Power Alignment

This alignment procedure adjusts the transmit power of the radio and must be performed for three different power levels (Low, Mid, High), at multiple frequencies for each power level, to allow for proper alignment across the entire RF band. The RF band is divided into frequency zones with a calibration point (value) in each zone.

NOTES:

- The same softpot attenuation value will result in DIFFERENT radio output power levels at different frequencies.
 - All power measurements are to be made at the antenna port.
 - Transmit Power alignment is required after replacing (or servicing) the transceiver board.
1. Select the **TX Power** alignment screen. The screen will indicate the transmit frequencies to be used. See Figure 10.
 2. Left-click the desired frequency field (starting with the highest frequency shown).
 3. Left-click the **PTT Toggle** button on the screen to make the radio transmit. The screen indicates whether the radio is transmitting.
 4. Measure the transmit power of the radio with a service monitor.
 5. Adjust the softpot value until the required power, as shown in Table 12, is indicated on the service monitor.

Table 12. Transmit Power Settings

Power Level	Test Frequencies	
	700/800 MHz	UHF (both ranges)
Low (1 Watt)	1.2–1.4W	2.2–2.4W
Mid (2 Watts)	2.5–2.7W	–
High (3 Watts)	3.2–3.4W	5.2–5.4W

6. Repeat the above process for all frequencies and all power levels.

7. Left-click the **Program All** button on the screen to dekey the radio and save the tuned values.

Left-click the **Close** button on the screen to return to the **Transmitter Alignments** menu.

Frequency (MHz)	Radio Softpot Value	New Softpot Value
764.0125	46	46
769.0125	45	45
775.9875	45	45
794.0125	46	46
809.0125	47	47
823.9875	47	47
851.0125	46	46
860.0125	46	46
869.8875	47	47

Figure 10. Transmit Power Alignment Screen (Typical)

Transmit Deviation Balance Alignment

This alignment procedure balances the modulation contributions of the low- and high-frequency portions of a baseband signal. Proper alignment is critical to the operation of signalling schemes that have very low frequency components (for example, DPL) and could result in distorted waveforms if improperly adjusted.

This procedure needs to be performed at multiple frequencies to allow for proper alignment across the entire RF band. The RF band is divided into frequency zones with a calibration point (value) in each zone.

NOTE: This alignment is required after replacing (or servicing) the VOCON board or the transceiver board.

Proper alignment requires a modulation analyzer or meter with a frequency response to less than 10 Hz modulating frequency. The modulation analyzer settings during this test should be set for average deviation, a 15 kHz low-pass filter, no de-emphasis, and no high-pass filter, if these settings are supported.

This test can be done with either the R-2670 Communication Analyzer or the 8901_ Series Modulation Analyzer. The method of choice is the R-2670 analyzer.

1. Initial setup using the R-2670 Communication Analyzer:
 - Connect a BNC cable between the “DEMOD OUT” port and the “VERT/SINAD DIST/DMM COUNTER IN” port on the R-2670.
 - Press the **SPF** key on the R-2670 to display the “SPECIAL FUNCTIONS MENU.” Move the cursor to “High Pass,” and select 5 Hz on the soft key menu. Select 20 kHz for the “Low Pass” setting.
 - In the “RF Control” section of the R-2670, enter the frequency displayed on the RSS screen. Move the cursor to the “B/W” setting and select “WIDE +/- 100 kHz” on the soft key menu.
 - Place the R-2670 cursor in the “Display” zone. Select “AC VOLTS” on the soft key menu. Move the cursor to the “Range” setting and select “AUTO.”
2. Initial setup using the 8901_ Series Modulation Analyzer:
 - Press the **FM MEASUREMENT** button. (The “Error 03-input level too low” indication is normal until an input signal is applied.)
 - Simultaneously press the **Peak –** and **Peak +** buttons. Both LEDs on the buttons should light.
 - Press the 15 kHz LP filter key.
3. Select the **TX Deviation Balance** alignment screen. The screen indicates the transmit frequencies to be used. See Figure 11.
4. Left-click the desired frequency field (starting with the highest frequency shown).
5. Left-click the **PTT Toggle** button on the screen to make the radio transmit. The screen indicates whether the radio is transmitting.

Figure 11. Transmit Deviation Balance Alignment Screen

6. Left-click the **PTT Tone: Low** button.
7. Left-click the **PTT Toggle** button on the screen to enable transmission. The screen indicates whether the radio is transmitting. Wait approximately 5 seconds until the voltage shown on R-2670, or the deviation shown on the 8901_ analyzer, stabilizes.
8. Measure and record the ac voltage value from the R-2670 analyzer or the deviation value from the 8901_ series analyzer.
9. Left-click the **PTT Tone: High** button.
10. Adjust the softpot value until the measured deviation/voltage, when using the high tone, is within +/- 1.5% of the value observed when using the low tone.
11. Repeat the above process for all frequencies.
12. Left-click the **Program All** button on the screen to dekey the radio and save the tuned values.
13. Left-click the **Close** button on the screen to return to the **Transmitter Alignments** menu.

Transmit Deviation Limit Alignment

This alignment procedure limits the modulation of a baseband signal. It is used for primary modulation limiting.

This procedure needs to be performed at multiple frequencies to allow for proper alignment across the entire RF band. The RF band is divided into frequency zones with a calibration point (value) in each zone.

NOTE: This alignment is required after replacing (or servicing) the VOCON board or the transceiver board.

1. Select the **TX Deviation Limit** alignment screen. The screen will indicate the transmit frequencies to be used. See Figure 12.

Frequency (MHz)	Radio Softpot Value	New Softpot Value
764.0125	16451	16451
769.0125	17267	17267
775.9875	16178	16178
794.0125	16863	16863
809.0125	15767	15767
823.9875	16587	16587
851.0125	17403	17403

Program All Close PTT Toggle TRANSMITTER OFF - 764.0125 Help

Figure 12. Transmit Deviation Limit Alignment Screen

2. Left-click the desired frequency field (starting with the highest frequency shown).
3. Left-click the **PTT Toggle** button on the screen to make the radio transmit. The screen indicates whether the radio is transmitting.
4. Measure the transmitted signal deviation of the radio with a service monitor.
5. Adjust softpot value until the measured deviation is as close as possible to 2.83 kHz.
6. Repeat the above process for all frequencies.
7. Left-click the **Program All** button on the screen to dekey the radio and save the tuned values.

8. Left-click the **Close** button on the screen to return to the **Transmitter Alignments** menu.

Front End Filter Alignment

Caution

Refer to your Radio Service Manual for alignment procedure details.
This procedure should only be attempted by qualified service personnel.

Definition

This alignment procedure adjusts the front end receiver bandpass filters for best receiver sensitivity and selectivity. It should be performed for all test frequencies to allow for proper software interpolation for frequencies in between the test frequencies in the band (see Figure 13).

NOTE: Rx Front End Filter Alignment is required after replacing (or servicing) the transceiver board.

Procedure for 700 MHz Frequencies

1. Left-click the desired frequency field.
2. Apply an RF signal with no modulation at -90 dBm on the current operating frequency.
3. Start with a softpot value (approximately 10 or 20), increase softpot in ascending order, and note the RSSI values. The RSSI will reach a peak value and remain stable and then decrease. Allow the limits of the peak range to be defined as RSSI PEAK - 3. Choose the middle of the peak range and program the corresponding softpot value as the tuned softpot value.
4. Repeat the above process for all 700MHz frequencies.
5. Click on the “Program All” button to save the tuned values in the radio.

Procedure for 800 MHz Frequencies

1. Left-click the desired frequency field.
2. Apply an RF signal with no modulation at -90 dBm on the current operating frequency.
3. Start with a softpot value of 50, increase softpot in ascending order, and note the RSSI values. The RSSI will reach a peak value and remain stable and then decrease. Allow the limits of the peak range to be defined as RSSI PEAK - 3. Note the upper end of the peak range and program the corresponding softpot value as the tuned softpot value.
4. Repeat the above process for all 800MHz frequencies.
5. Click on the “Program All” button to save the tuned values in the radio.

Procedure for UHF/VHF

1. Left-click the desired frequency field.
2. Apply an RF signal with no modulation at -90 dBm on the current operating frequency.
3. Adjust the softpot value until the maximum RSSI value is found.
4. Repeat the above process for all frequencies.

Click on the “Program All” button to save the tuned values in the radio.

Figure 13. Front End Filter Alignment Screen

Bit Error Rate

Definition This screen is used to test the Bit Error Rate (BER) of the radio’s receiver at a desired frequency.

Bit Error Rate Fields This screen contains the following fields:

Rx Frequency:

This field selects the Receive Frequency directly in MHz.

Test Pattern:

This field selects the Digital test pattern — TIA. Choices are: Standard Tone Test Pattern (framed 1011) and Standard Interface Test Pattern (CCITT V.52).

Modulation Type:

This field represents the digital modulation type of the incoming signal on which BER is to be calculated.

Continuous Operation:

This field allows the user to make the BER test repeat indefinitely. A selection of Yes will cause the radio to calculate BER on a continuous basis and update the results on this screen after each integration time. A selection of No will cause the BER test to execute for only one sample of the integration time and then update the display.

Audio:

This field allows the user to select the audio output during a test. Selecting Internal will cause the radio's built-in speaker to unmute to any signals at the desired frequency which are present during the test. Selecting External will route the same signal to the radio's accessory connector audio output. Selecting Mute will disable the audio output.

Integration Time:

This field represents the amount of time over which the Bit Error Rate is to be calculated. The range is from 0.360 to 91.8 seconds in increments of 0.360 seconds.

NOTE: When Continuous Operation = Yes, all fields will be grayed out while test is in progress. They will be enabled when the STOP button is pressed.

When Continuous Operation = No, a wait cursor will be displayed while the test is in progress and return to normal when the test is done.

Field	Value
Px Frequency (MHz)	762.5
BER Integration Time (sec)	0.36
Test Pattern	Framed 1011
Number Of Frames	1
Modulation Type	C4FM
Continuous Operation	No
Audio	Mute
Number Of Bit Errors	
BER (%)	

Close START/STOP Press Start to Start BER Test Help

Figure 14. Bit Error Rate Screen

Transmitter Test Pattern

Definition

This screen is used to transmit specific test patterns at a desired frequency so that the user can perform tests on the radio's transmitter.

Transmitter Test Fields

This screen contains the following fields:

Tx Frequency:

This field selects the Transmit Frequency directly in MHz.

Channel Spacing:

This field allows the user to select the desired transmit deviation.

Test Pattern Type:

This field represents the type of test pattern which will be transmitted by the radio when "PTT TOGGLE" button is pressed.

NOTE: Channel Spacing and Test Pattern Type fields will be grayed out while radio is transmitting.

Figure 15. Transmitter Test Pattern Screen

XTS 2500 / XTS 2250 Model 1.5 Exploded View

Table 16. XTS 2500 / XTS 2250 Model 1.5 Exploded View Parts List

[illegible]

Introduction to This Section

This section contains basic procedures for removing and installing the following components of the XTS 2500 radio:

- Antenna
 - Battery
 - Belt Clip
 - Universal Connector Cover
 - Remote Speaker Microphone Adapter
 - Radio Disassembly—Detailed
 - Radio Reassembly—Detailed
-

Antenna

Attach the Antenna

With the radio off, turn the antenna clockwise to attach it.

Figure 16. Attaching the Antenna

Remove the Antenna

With the radio off, turn the antenna counter-clockwise to remove it.

Figure 17. Removing the Antenna

Battery

Attach the Battery

1. With the radio off, fit the three extensions at the bottom of the battery into the bottom slots on the radio.

Figure 18. Step 1, Attaching the Battery

2. Press the top of the battery against the radio until both latches click into place.

Figure 19. Step 2, Attaching the Battery

Remove the Battery

1. With the radio off, slide down the latches on the sides of the battery.

Figure 20. Step 1, Removing the Battery

2. Pull the top of the battery away from the radio.

Figure 21. Step 2, Removing the Battery

Belt Clip

Attach the Belt Clip

1. Align the grooves of the belt clip with those of the battery.

Figure 22. Attaching the Belt Clip

2. Press the belt clip downward until you hear a “click.”

Remove the Belt Clip

1. Use a flat-bladed object to press the belt clip tab away from the battery.

Figure 23. Removing the Belt Clip

2. Slide the belt clip upward to remove it.

Universal Connector Cover

The universal connector cover is located on the antenna side of the radio. It is used to cover the connector when not in use.

NOTE: To prevent damage to the connector, shield it with the connector cover when not in use.

Remove the Universal Connector Cover

1. Insert a flat-blade screwdriver into the area between the bottom of the cover and the slot below the connector.

Figure 24. Removing the Universal Connector Cover

2. Hold the top of the cover with your thumb while you pry the bottom of the cover away from the radio with the screwdriver.

Attach the Universal Connector Cover

1. Insert the, hooked end of the cover into the top of the connector.

Figure 25. Attaching the Universal Connector Cover

2. Press downward on the top of the cover to seat it into the slot.
3. Press the lower tab of the cover below the connector until it snaps in place.

Remote Speaker Microphone Adapter

The Remote Speaker Microphone (RSM) adapter is located on the back of the radio, just above the battery. **It must be used to connect the RSM to the radio. If the RSM is not used, the adapter must be removed.**

Remove the Adapter

Lift the larger side (below the antenna port) of the adapter away from the radio using your finger.

If you cannot easily remove the adapter with your finger, use a small, flat bladed screwdriver to pry the larger end side of the adapter away from the radio.

Figure 26. Removing the RSM Adapter

Attach the Adapter

1. With the Motorola side of the adapter facing out, snap the smaller end of the adapter into place in the shroud indent, below the On/Off Volume Control Knob.

Figure 27. Step 1, Attaching the RSM Adapter

2. Snap the larger end of the adapter into place in the shroud indent, below the antenna port.

Figure 28. Step 2, Attaching the RSM Adapter

Radio Disassembly— Detailed

When disassembling and reassembling the radio, pay particular attention to the snaps and tabs and how parts align with each other.

The following steps describe how to disassemble the radio. This includes the following major components:

- Front Cover
- Chassis
- Backup Battery
- Keypad
- Keypad/option board
- Display
- Speaker, microphone, universal flex connector
- PTT

Required Tools

- Small, flat-bladed screwdriver
- TORX™ T7-IP screwdriver
- Chassis Opener/Knob removal tool (Motorola part number 6685666D01)

Front Cover from Chassis Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio.

Table 17. Front Cover from Chassis Disassembly

Exploded View Item Number	Motorola Part Number	Description
1	1585746D03	Cover, Front Assembly Kit
3	8485939D01	Assembly Speaker/Microphone/Universal Connector Flex
21	2785889D01	Chassis Cover, Rear
24	3680529Z01	Knob, Volume
25	3685779C01	Knob, Frequency (16-Position Select)
27	4585782C01	Lever, Concentric Switch
30	Typical	Antenna
32	8485268D01	Board, Jumper Flex
37	Typical	Battery
39	0485667D01	Washer, Teflon

1. Turn off the radio.
2. Remove the battery completely from the radio (see Figure 20 and Figure 21 on page 40).
3. Remove the antenna (see Figure 17 on page 39).

4. Pull the **16-Position Select** and the **On/Off/Volume Control** knobs off their shafts using the Chassis Opener tool.

Figure 29. Knob Removal

5. After you remove the **On/Off/Volume Control** knob, remove the Teflon® washer and set it aside.
6. Separate the chassis from the front cover by inserting the chassis opener between the thin, plastic retaining wall and the metal chassis at the bottom of the radio.

WARNING

Be careful not to mar the O-ring sealing area on the housing. Marring the front cover O-ring sealing areas will prevent the radio from sealing properly.

Figure 30. Chassis Removal

7. Slowly pry the bottom of the chassis away from the front cover by pushing the chassis opener tool down. Rotate the handle of the tool over and behind the base of the radio. This prying action forces the thin inner plastic wall toward the base of the radio, releasing the two chassis tabs.
8. Remove the chassis assembly by holding the chassis in one hand while **slowly**, with a firm side-to-side motion, removing the chassis.

The chassis assembly has switches that can be damaged if the chassis is removed too quickly. Be careful not to damage the switches at the top of the board.

Figure 31. Chassis Separation

9. Lay the chassis down. Rotate the front cover backward and slightly away from the chassis.

Flexible ribbon circuits (flexes) connecting the front cover assembly and the chassis prevent you from completely separating the two units. Display radios and radios with option boards have two flexes.

Figure 32. Unlatching the Flex Connectors

10. Carefully lift the latches on the main circuit board to release the flexible circuits from their connectors.

NOTE: For proper reassembly, note how the flex circuits are folded.

11. Remove the concentric lever from the front cover assembly.

Chassis Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio.

Table 18. Chassis Disassembly

Exploded View Item Number	Motorola Part Number	Description
19	0385563D01	Screw (5 required)
21	2785787C01	Chassis Cover, Rear
22	3285270D01	Seal, Main O-ring
34	2685890D01 2686732Z01	Main Shield, 700/800 Main Shield, UHF/VHF
35	Typical	Main Board

1. If disassembly of the chassis or the main board is required, then use a TORX™ screwdriver with a T7-IP head to remove the five screws holding the main board and shield to the chassis.

Caution

Refer to the Handling Precautions on page 4 before removing the main board. Be sure to use ESD protection when handling circuit boards.

2. Remove the O-ring from around the bushing at the antenna connector
3. Lift the main board from the chassis as shown in Figure 33.

Figure 33. Removing the Main Board from the Chassis

- 4. Most repairs to the main board can be performed without further disassembly of the chassis. If it is necessary to replace the O-ring, remove the small O-ring retainers from their slots in the chassis. Note the alignment of the retainers for reassembly.
- 5. Remove the O-ring.

Backup Battery
Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio.

Table 19. Backup Battery Disassembly

Exploded View Item Number	Motorola Part Number	Description
23	4285633D01	Retaining Clip
26	6003710K08	Battery, Backup

- 1. The backup battery can be removed without disassembling the board or the chassis.
- 2. Remove the backup battery retaining clip by sliding it away from the main circuit board, as shown in Figure 34.
- 3. Insert a small, flat head screwdriver between the battery and the battery holder. Gently pry the battery out of the battery holder.

Figure 34. Remove the Backup Battery

Keypad and Keypad/Option Board Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio. (For the Model II keypad, please refer to the exploded view and parts list on page 36.)

Table 20. Keypad and Keypad/Option Board

Exploded View Item Number	Motorola Part Number	Description
2	0185948D01	Keypad Board, Model III
3	8485939D01	Assembly Speaker/Microphone/Universal Connector Flex
6	7285726C01 7285726C04	Display Module, 700/800 Display Module, VHF/UHF
7	7585776C01	Keypad, Full (for Model III only)
9	4285214D01	Retainer, Keypad
22	3285270D01	Seal, Main O-ring

1. The keypad and keypad board can be disassembled without the disassembly of the display or speaker/microphone flex assembly.
2. If the disassembly of the keypad or the keypad printed circuit board is required, lift the microphone flex circuit up to move it out of the way.
3. Disconnect the display connector, and move the tail of flex circuit out of the way.
4. To remove the keypad retainer shield, insert the tip of a “penknife size,” flat-bladed screwdriver in the opening at the end of the keypad retainer arm tab. Pry the tab away from the side of the front cover until it moves past the ledges on the side wall. Repeat this procedure for the four remaining retainer arm tabs.

WARNING

Be careful not to mar the O-ring sealing area on the housing. Marring the front cover O-ring sealing areas will prevent the radio from sealing properly.

Figure 35. Retainer Removal

5. Lift the keypad retainer out of the front cover.
6. The keypad/option board and the keypad can be removed without the use of tools.

Figure 36. Keypad Retainer and Boards Removal

Display Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio. (For the Model II display, please refer to the exploded view and parts list on page 36. For the Model 1.5 display, please refer to the exploded view and parts list on page 38.)

Table 21. Display Disassembly

Exploded View Item Number	Motorola Part Number	Description
1	1585746D03	Cover, Front
2	0185948D01	Keypad Board, Model III
6	7285726C01 7285726C04	Display Module, 700/800 Display Module, VHF/UHF
9	4285214D01	Retainer, Keypad

1. The display assembly can be removed without the disassembly of the keypad board or the speaker-microphone flex assembly. If the disassembly involves the removal of the display module, disconnect the display flex from the keypad option board connector.

Caution

Take care not to damage the display. Do not cut, bend, or pinch the heat seal. Display modules contain CMOS devices. Be sure to use ESD protection.

Figure 37. Display Disassembly

2. The display module snaps into the front cover assembly. Insert two flat-bladed screwdrivers between the flexible beam at the top of the display module (one on each side). Deflect the beam down until it moves past the hooks on the front cover. The display module is hooked to the front cover at the base of the display. Lift the top of the display module past the hooks and remove it from the front cover.

Speaker, Microphone, and Universal Connector Flex Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio.

Table 22. Speaker, Microphone, and Universal connector Flex Disassembly

Exploded View Item Number	Motorola Part Number	Description
1	1585746D03	Cover, Front
3	8485939D01	Assembly Speaker/Microphone/Universal Connector Flex
10	4285446D01	Retainer, Speaker
11	4285632D01	Retainer, Microphone Boot
12	4385717D01	Spacer, Plastic
14	1485218D01	Boot, Microphone

1. The speaker-microphone assembly can be removed without the disassembly of the display or the keypad assemblies. If disassembly of the speaker-microphone assembly is necessary, removal of the universal connector dust cover is optional (see Figure 24 on page 42).
2. Remove the plastic spacer at the bottom of the speaker. The spacer can be removed by pulling upward with a slight, side-to-side motion until it clears the retaining ribs in the front cover. Take special care to prevent damage to the tail of the speaker flex circuit while the flex is still in place.
3. Using a screwdriver, push down on the portion of the speaker retainer bracket that is pointing toward the bottom of the radio. Then, remove the retainer by slightly pushing it toward the top of the radio until you slide it past the front cover slot.
4. Remove the microphone boot retainer by inserting a penknife-sized screwdriver in the notch between the retainer and the housing. Pry the retainer away from the housing and remove the clip.
5. Remove the microphone rubber boot by sliding it out of the pocket in the front cover. Take care not to pull on the flex cable while pulling on the microphone boot. Unless you are replacing the microphone, leave it in the boot. At this point, the speaker and microphone are disconnected, but the assembly is still attached to the universal connector by 13 pins in the printed circuit backer board.
6. To remove the speaker-microphone flex circuit from the universal connector, carefully grasp the flex circuit at a point directly across from the universal connector pins. Applying firm pressure, gradually pull the flex away from the pins.

NOTE: There are notches on the ends of the 13-pin printed circuit backer board. If necessary, you can insert a small screwdriver in one of the notches to pry the backer board away from the front cover.

After the universal connector portion of the speaker-microphone flex circuit is detached, the assembly can be completely removed. If it is necessary to replace the speaker or the microphone, or both, do it while the flex circuit is removed from the front cover.

Figure 38. Speaker-Microphone Removal

PTT Disassembly

For this section, please refer to the Model III exploded view and parts list on page 37 for part numbers and more information on the location of parts in the radio.

Table 23. PTT Disassembly

Exploded View Item Number	Motorola Part Number	Description
1	1585746D03	Cover, Front
4	1385149D01	Bezel, PTT
5	7585959C01	Keypad, PTT/Side Controls

1. If required, the PTT bezel and the PTT seal assembly can be disassembled using a small screwdriver.
2. Remove the PTT bezel by pushing the snaps out at the top and pulling the bezel up toward the top of the front cover so that the T-tab slides up and out.
3. The PTT seal can be easily lifted from the bezel without the use of tools.

Figure 39. PTT Removal

Radio Reassembly— Detailed

The following steps describe how to reassemble the radio. This includes the following major components:

- PTT
- Keypad/option board
- Display
- Speaker, microphone, universal connector flex
- Chassis
- Backup Battery
- Chassis and front cover

PTT Reassembly

1. Put the PTT seal in the PTT bezel.
2. Align the PTT bezel and seal to the front cover housing so that the bottom tabs will engage with the opening in the front cover.
3. Slide the PTT bezel down so that the T-tab engages into the front cover opening.
4. Snap the top snaps.

NOTE: Look inside the front cover to be sure the T-tab and snaps are fully engaged with the front cover.

Keypad and Keypad Option Board Reassembly

1. Insert the keypad into the front cover. Align the keypad to the pins in the front cover.
2. Replace the board on the locator pins.
3. Replace the keypad retainer legs on the PTT side first. Then, press the retainer down and snap the other two legs into place on the universal connector side; make sure that all four legs snap into place. If necessary, use a small, flat-bladed screwdriver to put pressure on the corner bend of each retainer leg.

Figure 40. Lock Retainer Catches to Radio Body

Display Reassembly

1. Slide the two bottom tabs of the display module, with the LCD facing the front housing lens, into the grooves located above the keypad assembly area in the front cover housing. Gently press on the upper portion of the display until it snaps into place past the two small hooks in the housing.
2. Connect the display flex to the keypad option board connector.

Speaker, Microphone, and Universal Connector Flex Reassembly

1. Insert the microphone boot into the pocket in the front cover housing.
2. Insert the microphone boot plastic retainer. Make sure the retainer is securely hooked to the front cover.
3. Center the speaker in the speaker recess. Make certain the speaker is correctly nested inside the front cover.
4. Before you replace the speaker retainer, be sure the retainer is placed between the speaker-microphone flex circuit and the speaker. Insert the flat end of the speaker retainer into the opening in the front cover. Press the other end of the retainer against the speaker. Hold the retainer in place with your thumb while pushing down on the retainer with a flat-bladed screwdriver. Use the screwdriver to push down on the portion of the speaker retainer that is pointing toward the bottom of the radio. Move the retainer by pushing it toward the bottom of the radio. Slide it into the front cover slot above the display.
5. Connect the universal flex to the pins and press into place.

Chassis Assembly Reassembly

Before you assemble the main board to the chassis, make sure that the following steps are done to the chassis.

1. Replace the O-ring. The tabs on the O-ring should reach into the chassis and point down.
2. Stretch the O-ring to place it into the retaining pocket at the bottom end of the chassis.

NOTE: When properly assembled, the retainers on the O-ring should align with the slots on the chassis. If this is not the case, remove and replace the O-ring until it is aligned with the chassis and completely seated in place around the perimeter.

3. Replace the battery contact seal (if necessary) surrounding the battery contact.

NOTE: Be sure the battery contact seal protrudes through the chassis and is not pinched under the chassis.

4. Make sure the thermal pad is placed on top of the RF Power Amplifier on the main board.
5. Use the notch in the bottom of the main board and the protrusion at the bottom of the casting to align the board to the casting. Place the board against the casting. Make sure that the five screw holes are aligned.
6. Place the main shield assembly on the main board. Again, make sure that the five screw holes are aligned.
7. Use the TORX T7-IP screwdriver to fasten the screws holding the main board and shield to the chassis. Do not over torque. Torque limit is 4 inch-lbs.
8. Place the O-ring at the antenna connector over the antenna connector bushing.

Backup Battery Reassembly

1. Insert the backup battery (positive side up) into the battery holder, as shown in Figure 41.
2. Replace the retaining clip by sliding it into its recess on the board.

Figure 41. Reassemble the Backup Battery

Chassis and Front Cover Reassembly

1. Align the chassis assembly end-to-end with the front cover assembly.
2. Insert the tails of the flex circuits into their respective connectors at the bottom of the

chassis assembly.

3. Push down the latches on the connectors to hold the flex circuits to the main board.

NOTE: Be sure the concentric lever is not in place on the frequency knob shaft when reassembling the chassis with the front cover assembly.

4. Align the volume knob shaft and the frequency switch shaft with their respective holes in the front cover. Slowly reassemble the chassis and front cover assemblies. Slowly slide the volume knob and frequency switch shafts into their respective holes in the front cover.

NOTE: Make sure the flex circuits are correctly folded in place. Take special care to prevent pinching or excess binding of these flexes.

5. Push the chassis assembly completely into the top of the front cover until it settles in place.

NOTE: Be sure the O-ring is properly seated.

6. Press down at the bottom of the chassis until the chassis snaps into place in the front cover.

Figure 42. Fastening the Chassis

7. Reassemble the concentric lever to the frequency knob shaft by aligning the protrusions in the lever with the openings in the shaft. The triangular-shaped side of the lever should point toward the back of the radio.
8. Reassemble the Teflon washer to the volume knob shaft. Reassemble the knobs, dust cover, antenna, and battery.

Notes

Radio-Level Troubleshooting

9

Introduction to This Section

This section of the manual contains troubleshooting charts and error codes that will help you to isolate problems. Level one troubleshooting will support only radio alignment, programming, battery replacement, and knob replacement. If the radio needs further troubleshooting, it must be sent to the depot.

Board-level, component-level, and service information can be found in the *ASTRO Digital XTS 2500 Portable Radios Detailed Service Manual*, Motorola publication number 68P81094C10.

Power-Up Error Codes

When the radio is turned on (power-up), the radio performs cursory tests to determine if its basic electronics and software are in working order. Problems detected during these tests are presented as error codes on the radio's display. For non-display radios, the problem is indicated at power-up by a single, low-frequency tone. If cycling power and code plug reprogramming do not fix the error, the radio should be sent to the depot for repair. The presence of an error should prompt the user that a problem exists and that a service technician should be contacted.

Self-test errors are classified as either fatal or non-fatal. Fatal errors will inhibit user operation; non-fatal errors will not. Table 24. lists their descriptions and suggested corrective action.

Table 24. Power-Up Error Code Displays

Error Code	Description	Corrective Action
01/02	FLASH ROM Codeplug Checksum Non-Fatal Error	Reprogram the codeplug.
01/12	Security partition Checksum Non-Fatal Error	Send Radio to Depot.
01/22	Tuning Codeplug Checksum Non-Fatal Error	Send Radio to Depot.
01/81	Host ROM Checksum Fatal Error	Send Radio to Depot.
01/82	FLASH ROM Codeplug Checksum Fatal Error	Reprogram the codeplug.
01/88	External RAM FATAL Error -- Note: not a checksum failure	Send radio to depot.
01/90	General Hardware Failure Fatal Error	Turn the radio off, then on.
01/92	Security Partition Checksum Fatal Error	Send radio to depot.
01/93	Flashport AUTHENTICATION CODE failure	Send radio to depot.
01/98	Internal RAM Fail Fatal Error	Send radio to depot.
01/A0	ABACUS Tune failure Fatal Error	Turn the radio off, then on.
01/A2	Tuning Codeplug Checksum Fatal Error	Send radio to depot.
02/10	DSP Support IC Checksum Non-Fatal Error	Turn the radio off, then on.
02/81	DSP ROM Checksum Fatal Error	Send radio to depot.
02/88	DSP RAM Fatal Error -- Note: not a checksum failure	Turn the radio off, then on.
02/90	General DSP Hardware Failure (DSP startup message not received correctly)	Turn the radio off, then on.

NOTE: If the corrective action does not fix the failure, send the radio to the depot.

Operational Error Codes

During radio operation, the radio performs dynamic tests to determine if the radio is working properly. Problems detected during these tests are presented as error codes on the radio's display. An error code indicates that a problem exists and that a service technician should be contacted. Operational error codes are listed in Table 25..

Table 25. Operational Error Code Displays

Error Code	Description	Corrective Action
FAIL 001	Synthesizer Out-of-Lock	a. Reprogram external codeplug b. Send radio to depot
FAIL 002	Selected Mode/Zone Codeplug Checksum Error	Reprogram external codeplug

Table 26. Receiver Troubleshooting Chart

Symptom	Possible Cause	Correction or Test (Measurements Taken at Room Temperature)
Radio dead; Display does not light up	1. Dead Battery	Replace with charged battery.
	2. Blown Fuse	Send radio to depot.
	3. On/Off Switch	
	4. Regulators	
Radio dead; display lights up	1. VOCON	Send radio to depot.
	2. RF	
No receiver audio or receiver does not unmeet	Programming	a. Does the transmitted signal match the receiver configuration (PL, DPL, etc.)? b. With the monitor function enabled, can the radio be unmuted?
Audio distorted or not loud enough	Synthesizer Not On Frequency	Check synthesizer frequency by measuring the transmitter frequency; if off by more than $\pm 1000\text{Hz}$, realign.
RF sensitivity poor	1. Synthesizer Not On Frequency	Check synthesizer frequency by measuring the transmitter frequency; if off by more than $\pm 1000\text{Hz}$, realign.
	2. Antenna Switch	Send radio to depot.
	3. Receiver Front-End Tuning	Check RF front-end tuning for optimum sensitivity using the CPS.
Radio will not turn off	VOCON	Send radio to depot.

Table 27. Transmitter Troubleshooting Chart

Symptom	Possible Cause	Correction or Test (Measurements Taken at Room Temperature)
No RF power out	1. TX Power Level or Frequency	Check TX power level and frequency programming (from CPS).
	2. No PTT From Control Top	Send radio to depot.
	3. No Injection To Power Amplifier	
No modulation; Distorted modulation	1. Programming	Check deviation and compensation settings using the CPS.
	2. VOCON	Send radio to depot.
Bad microphone sensitivity	1. Check Deviation and Compensation	Realign if necessary.
	2. Microphone	Send radio to depot.
No/Low signalling (PL, DPL, MDC)	1. Programming	Check programming.
	2. VOCON	Send radio to depot.
Cannot set deviation balance	RF	Send radio to depot.

Notes

General

Motorola provides the following approved accessories to improve the productivity of your XTS 2500, XTS 2250, XTS 1500 and MT 1500 portable two-way radios.

For a list of Motorola-approved antennas, batteries, and other accessories, visit the following web site which lists approved accessories: <http://www.motorola.com/cgiss/index.shtml>

Antennas

NAD6563	VHF whip (136–174 MHz)
NAD6566	VHF (136–150.8 MHz)
NAD6567	VHF (150.8–162 MHz)
NAD6568	VHF (162–174 MHz)
NAE6546	UHF (380–435 MHz)
NAE6547	UHF (435–470 MHz)
NAE6548	UHF (470–520 MHz)
NAE6549	UHF whip (380–520 MHz)
NAF5037	800 MHz whip, halfwave (806–870 MHz)
NAF5039	800 MHz dipole (806–870 MHz)
NAF5042	800 MHz stubby, quarterwave (806–870 MHz)
NAF5080	700/800 MHz whip (764–870 MHz)

Batteries

NTN9815	NiCd high-capacity
NTN9816	NiCd high-capacity, Factory Mutual Intrinsically Safe
NTN9857	NiMH ultra-high-capacity, Factory Mutual Intrinsically Safe
NTN9858	NiMH ultra-high-capacity

Carry Accessories

Belt Clips

HLN6853	Belt clip, 2 1/4 inch
---------	-----------------------

Body-Worn

NNTN4115	Carrying case, leather with 3-in. swivel belt loop and T-strap
NNTN4116	Carrying case, leather with 2.5-in. swivel belt loop and T-strap
NNTN4117	Carrying case, leather with 3-in. belt loop and T-strap

NLN6349	Shoulder strap for carrying radio
NTN5243	Shoulder strap for carrying radio
TDN9675	Wrist strap for carrying radio

Chargers

NLN7967	Wall-mount kit for multi-unit charger
NLN7968	Rack-mount kit for multi-unit charger
NTN1168	Single-unit dual rate, rapid charger 120V
NTN1169	Single-unit dual rate, rapid charger 220V (2-prong Euro plug)
NTN1170	Single-unit dual rate, rapid charger 240V (3-prong UK plug)
NTN1177	Multi-unit, dual rate, rapid charger 110V
NTN1178	Multi-unit, dual rate, rapid charger 240V (3-prong UK plug)
NTN1179	Multi-unit, rapid charger 240V (UK 13 MAP Plug)
NTN1667	Tri-chemistry, 110V
NTN1668	Tri-Chemistry, 220V Single Unit Charger (2 Prong Euro Plug)
NTN1669	Tri-chemistry, 230V
NTN1873	IMPRES™ rapid charger 110V single-unit
NTN1874	IMPRES™ rapid charger 220V single-unit
NTN1875	IMPRES™ rapid charger 240V single-unit
NTN4796	Multi-unit, tri-chemistry, rapid rate, 110V
NTN7209	Single-unit dual rate, rapid charger w/o cord

Enhanced and Multi-Unit Line Cords

NTN7373	110V interchangeable line
NTN7374	220V interchangeable line (2-prong Euro plug)
NTN7375	240V interchangeable line (3-prong UK plug)

Microphones, Remote Speaker

NMN6191	Remote speaker mic, noise-canceling (includes 6.0-ft coiled cord assembly, 3.5-mm earjack, swivel clip, quick disconnect)
NMN6193	Remote speaker mic
NNTN4285	Remote speaker mic adapter
ZMN6031	Speaker mic, 3-piece
ZMN6032	Speaker mic, 2-piece
ZMN6038	Speaker mic, 2-piece, extra loud
ZMN6039	Speaker mic, 3-piece, extra loud

Surveillance Accessories

CommPort® Integrated Microphone/ Receivers

NTN1624	CommPort with palm PTT
NTN1625	CommPort ear mic with PTT for noise levels up to 100 dB (requires BDN6676 adapter)
NTN1663	CommPort ear mic with ring PTT for noise levels up to 100 dB (requires BDN6676 adapter)
NTN1736	CommPort ear mic with snap-on side PTT for noise levels up to 100 dB (requires BDN6676 adapter)

Earpieces

BDN6641	Ear mic, high noise level up to 105 dB, grey (must order BDN6671 interface module)
BDN6664	Earpiece with standard earphone, beige
BDN6665	Earpiece with extra-loud earphone (exceeds OSHA limits), beige
BDN6666	Earpiece with volume control, beige
BDN6667	Earpiece, mic and PTT combined, beige
BDN6668	Earpiece, mic and PTT separate, beige
BDN6669	Earpiece, mic and PTT combined, with extra-loud earphone (exceeds OSHA limits), beige
BDN6670	Earpiece, mic and PTT separate with extra-loud earphone (exceeds OSHA limits), beige
BDN6677	Ear mic, standard, noise up to 95 dB (must order BDN6671 interface module), black
BDN6678	Ear mic, standard, noise up to 95 dB (must order BDN6671 interface module), beige
BDN6719	Earpad, with 3.5mm threaded plug
BDN6726	Earpiece with standard earphone, black
BDN6727	Earpiece with extra-loud earphone (exceeds OSHA limits), black
BDN6728	Earpiece with volume control, black
BDN6729	Earpiece, mic and PTT combined, black
BDN6730	Earpiece, mic and PTT separate, black
BDN6731	Earpiece, mic and PTT combined, with extra-loud earphone (exceeds OSHA limits), black
BDN6732	Earpiece, mic and PTT separate, with extra-loud earphone (exceeds OSHA limits), black
BDN6780	Earbud, single with mic and PTT combined, beige
BDN6781	Earbud, single, receive only, black

Headsets and Headset Accessories

BDN6635	Heavy-duty VOX headset with noise-canceling boom mic (requires BDN6673 adapter)
BDN6636	Heavy-duty VOX headset with throat mic (requires BDN6673)
BDN6645	Noise-canceling boom mic headset with PTT on earcup
BDN6673	Headset adapter cable (for use with BDN6635 and BDN6645)
BDN6676	Jedi adapter
NMN1020	Safety helmet headset (requires BDN6676 adapter)
NMN6245	Light-weight headset
NMN6246	Ultralite headset with boom mic
NMN6258	Over-the-head headset with in-line PTT
NMN6259	Medium-weight, dual headset with NC mic
RMN4049	Jedi “TEMCO” temple transducer

Radio Interface Modules for Ear Microphones

BDN6671	Push-to-talk (PTT) and voice-activated (VOX) interface module (for use with BDN6641, BDN6677 and BDN6678)
BDN6708	PTT interface module (for use with BDN6641, BDN6677 and BDN6678)

Switches

0180300E83	Remote PTT body switch
NTN7660	Tilt / man down switch

Glossary

A/D	Analog-to-Digital converter; converts an instantaneous dc voltage level to a corresponding digital value.
ABACUS IC	Custom integrated circuit providing a digital receiver IF backend.
CPS	C ustomer P rogramming S oftware
CODEC	C oder/ D ecoder IC for analog-to-digital and digital-to-analog conversion.
D/A	D igital-to- A nalog converter; converts a digital value to a corresponding dc voltage value.
DTMF	D ual- T one M ulti- F requency
DPL	D igital P riate- L ine™
DSP	D igital S ignal P rocessor; microcontroller specifically tailored for signal processing computations. In this case refers specifically to Motorola DSP56603.
Firmware	Software or a software/hardware combination of computer programs and data, with a fixed logic configuration stored in a read-only memory; information can not be altered or reprogrammed.
FGU	F requency G eneration U nit
FLASHport™	A Motorola term that describes the ability of a radio to change memory. Every FLASHport radio contains a FLASHport EEPROM memory chip that can be software written and rewritten to, again and again.
Host	Motorola HC12A4 microcontrol unit U204 (see MCU).
Host Port	Parallel memory mapped interface consisting of eight registers in the DSP56603.
IC	I ntegrated C ircuit
IMBE	I mproved M ulti- B and E xcitation; a sub-band, voice encoding algorithm used in ASTRO digital voice.
MCU	M icro C ontrol U nit
MDC	M otorola D igital C ommunications
MISO	M aster I n S lave O ut; used by the slave device to send data to the master device
MOSI	M aster O ut S lave I n; used by the master device to send data to the slave device.
Open Architecture	A controller configuration that utilizes a microprocessor with extended ROM and RAM.
PC Board	P rinted C ircuit board
PCIC	P ower C ontrol I C
PL	P riate- L ine® tone squelch; a continuous sub-audible tone that is transmitted along with the carrier.
PLL	P hase- L ocked L oop; a circuit in which an oscillator is kept in phase with a reference, usually after passing through a frequency divider.

PTT	Push-To-Talk ; the switch located on the left side of the radio which, when pressed, causes the radio to transmit.
Registers	Short-term data-storage circuits within the microcontrol unit or programmable logic IC.
Repeater	Remote transmit/receive facility that re-transmits received signals in order to improve communications coverage.
RESET	Reset line; an input to the microcontroller that restarts execution.
RF PA	R adio F requency P ower A mplifier
RPT/TA	R e P e A ter/ T alk-Around
RX DATA	Recovered digital data line.
Signal Qualifier Mode	An operating mode whereby the radio is muted but still continues to analyze receive data to determine RX signal type.
SCI IN	S erial C ommunication I nterface I Nput line
Softpot	Software potentiometer; a computer-adjustable electronic attenuator.
Software	Computer programs, procedures, rules, documentation, and data pertaining to the operation of a system.
SPI	S erial P eripheral I nterface; how the microcontroller communicates to modules and ICs through the C LOCK and D ATA lines.
Squelch	Muting of audio circuits when received signal levels fall below a pre-determined value.
SRAM	S tatic- R AM chip used for volatile, program/data memory.
Standby Mode	An operating mode whereby the radio is muted but still continues to monitor data.
System Select	The act of selecting the desired operating system with the system-select switch (also, the name given to this switch).
TOT	T ime- O ut T imer; a timer that limits the length of a transmission.
TSOP	T hin S mall- O utline P ackage
UART	U niversal A synchronous R eceiver T ransmitter.
μC	Microcontrol unit (see MCU).
VCO	V oltage- C ontrolled O scillator; an oscillator whereby the frequency of oscillation can be varied by changing a control voltage.
Vocoder	V oice en C ODER; the DSP-based system for digitally processing the analog signals, includes the capabilities of performing voice compression algorithms or voice encoding.
VSWR	V oltage S tanding W ave R atio

Appendix:

Replacement Parts Ordering

Basic Ordering Information

When ordering replacement parts or equipment information, the complete identification number should be included. This applies to all components, kits, and chassis. If the component part number is not known, the order should include the number of the chassis or kit of which it is a part, and sufficient description of the desired component to identify it.

Crystal orders should specify the crystal type number, crystal and carrier frequency, and the model number in which the part is used.

Radio Board Ordering Information

When ordering a replacement Radio Board, refer to the applicable Model Chart in the front of this manual, read the note at the bottom of the Model Chart, and include the proper information with your order.

Motorola Online

Motorola Online users can access our online catalog at

<https://www.motorola.com/businessonline>

To register for online access:

- Domestic customers: please call 800-814-0601 (U.S. and Canada).
- International customers: please go to <https://www.motorola.com/businessonline> and click on “Sign Up Now.”

Mail Orders

Send written orders to the following addresses:

**United States and Canada Orders
(except for U.S. Federal
Government orders):**

Motorola Inc.
Radio Products and
Services Division*
Attention: Order Processing
2200 Galvin Drive
Elgin, IL 60123
U.S.A.

U.S. Federal Government Orders:

Motorola Inc.
U.S. Federal Government
Markets Division
Attention: Order Processing
7230 Parkway Drive
Landover, MD 21076
U.S.A.

International Orders:

Motorola Inc.
