PSXTMCPEGroupPostRoutingAllowedStats

Column Name	Column Type	Index	Description	CanAggregate	Aggregation Formula	Present in Reports
ENTITY	Entity	True	Entity Id (Generic Criteria Group Profile) for CPE Group at Post-Routing with traffic control.	False	N/A	Yes
ENTITY2	Entity	True	Entity Id2 (Sonus_NULL) for CPE Group at Post-Routing with traffic control.	False	N/A	Yes
VALUE	COUNTER	False	Number of allowed calls to CPE Group at Post-Routing with traffic control.	True	SUM	Yes

PSXTMCPEGroupPostRoutingBlockedStats

Column Name	Column Type	Index	Description	CanAggregate	Aggregation Formula	Present in Reports
ENTITY	Entity	True	Entity Id (Generic Criteria Group Profile) for CPE Group at Post-Routing with traffic control.	False	N/A	Yes
ENTITY2	Entity	True	Entity Id2 (Sonus_NULL) for CPE Group at Post-Routing with traffic control.	False	N/A	Yes
VALUE	COUNTER	False	Number of blocked calls to CPE Group at Post-Routing with traffic control.	True	SUM	Yes

PSXTMHpcExemptionStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
GSX_NAME	STRING	No	The name of the GSX to which the Traffic Management HPC Exemption counters apply
EXEMPTED_CALLS	COUNTER	No	The Traffic Management HPC Exemption counters per GSX count exempted calls that are traffic control exempted for any reason AND HPC call

PSXTriggeredService**PSXTriggeredServiceStats**

Column Name	Column Type	Index	Description	canAggregate
TRIGG_SERVICE_NAME	STRING	true	The name of the service that triggered the counters as the license is available.	false
TRIGG_SERVICE_COUNT	COUNTER64	false	The number of times service triggered.	true

PSXTriggeredServiceStats_AG

Column Name	Column Type	Index	Description	canAggregate	Aggregation Type
TRIGG_SERVICE_NAME	STRING	true	The name of the service that triggered the counters as the license is available.	false	NA
TRIGG_SERVICE_COUNT	COUNTER64	false	The number of times service triggered.	true	SUM

PsxVerificationFailStats

Column Name	Column Type	Index	Description	canAggregate
VERIFICATION_FAILURE_E3	COUNTER	False	Keeps track of the number of E3 error received from verification server.	False
VERIFICATION_FAILURE_E4	COUNTER	False	Keeps track of the number of E4 error received from verification server.	False
VERIFICATION_FAILURE_E5	COUNTER	False	Keeps track of the number of E5 error received from verification server.	False
VERIFICATION_FAILURE_E6	COUNTER	False	Keeps track of the number of E6 error received from verification server.	False
VERIFICATION_FAILURE_E7	COUNTER	False	Keeps track of the number of E7 error received from verification server.	False
VERIFICATION_FAILURE_E8	COUNTER	False	Keeps track of the number of E8 error received from verification server.	False
VERIFICATION_FAILURE_E9	COUNTER	False	Keeps track of the number of E9 error received from verification server.	False
VERIFICATION_FAILURE_E10	COUNTER	False	Keeps track of the number of E10 error received from verification server.	False
VERIFICATION_FAILURE_E11	COUNTER	False	Keeps track of the number of E11 error received from verification server.	False
VERIFICATION_FAILURE_E12	COUNTER	False	Keeps track of the number of E12 error received from verification server.	False
VERIFICATION_FAILURE_E13	COUNTER	False	Keeps track of the number of E13 error received from verification server.	False
VERIFICATION_FAILURE_E14	COUNTER	False	Keeps track of the number of E14 error received from verification server.	False
VERIFICATION_FAILURE_E15	COUNTER	False	Keeps track of the number of E15 error received from verification server.	False

Column Name	Column Type	Index	Description	canAggregate
VERIFICATION_FAILURE_E16	COUNTER	False	Keeps track of the number of E16 error received from verification server.	False
VERIFICATION_FAILURE_E17	COUNTER	False	Keeps track of the number of E17 error received from verification server.	False
VERIFICATION_FAILURE_E18	COUNTER	False	Keeps track of the number of E18 error received from verification server.	False
VERIFICATION_FAILURE_E19	COUNTER	False	Keeps track of the number of E19 error received from verification server.	False
VERIFICATION_FAILURE_E20	COUNTER	False	Keeps track of the number of E20 error received from verification server.	False
VERIFICATION_FAILURE_E21	COUNTER	False	Keeps track of the number of E21 error received from verification server.	False
VERIFICATION_FAILURE_E22	COUNTER	False	Keeps track of the number of E22 error received from verification server.	False
VERIFICATION_FAILURE_E23	COUNTER	False	Keeps track of the number of E23 error received from verification server.	False
VERIFICATION_FAILURE_X1	COUNTER	False	Keeps track of the number of X1 error received from verification server.	False
VERIFICATION_FAILURE_X2	COUNTER	False	Keeps track of the number of X2 error received from verification server.	False
VERIFICATION_FAILURE_X3	COUNTER	False	Keeps track of the number of X3 error received from verification server.	False
VERIFICATION_FAILURE_X4	COUNTER	False	Keeps track of the number of X4 error received from verification server.	False
VERIFICATION_FAILURE400	COUNTER	False	Keeps track of the number of 400 error received from verification server.	False
VERIFICATION_FAILURE404	COUNTER	false	Tracks the number of 404 error received from verification server.	false
VERIFICATION_FAILURE405	COUNTER	true	Tracks the number of 405 error received from verification server.	false

Column Name	Column Type	Index	Description	canAggregate
VERIFICATION_FAILURE406	COUNTER	false	Tracks the number of 406 error received from verification server.	false
VERIFICATION_FAILURE411	COUNTER	false	Tracks the number of 411 error received from verification server.	false
VERIFICATION_FAILURE415	COUNTER	false	Tracks the number of 415 error received from verification server.	false
VERIFICATION_FAILURE500	COUNTER	False	Keeps track of the number of 500 error received from verification server.	False
VERIFICATION_FAILURE503	COUNTER	False	Keeps track of the number of 503 error received from verification server.	False
VERIFICATION_FAILURESVC4000	COUNTER	false	Tracks the number of service exception 4000 error received from verification server.	false
VERIFICATION_FAILURESVC4001	COUNTER	false	Tracks the number of service exception 4001 error received from the verification server.	false
VERIFICATION_FAILURESVC4002	COUNTER	false	Tracks the number of service exception 4002 error received from the verification server.	false
VERIFICATION_FAILURESVC4003	COUNTER	false	Tracks the number of service exception 4003 error received from the verification server.	false
VERIFICATION_FAILURESVC4004	COUNTER	false	Tracks the number of service exception 4004 error received from the verification server.	false
VERIFICATION_FAILURESVC4005	COUNTER	false	Tracks the number of service exception 4005 error received from the verification server.	false
VERIFICATION_FAILURESVC4006	COUNTER	false	Tracks the number of service exception 4006 error received from the verification server.	false
VERIFICATION_FAILURESVC4007	COUNTER	false	Tracks the number of service exception 4007 error received from the verification server.	false

Column Name	Column Type	Index	Description	canAggregate
VERIFICATION_FAILUREPOL4050	COUNTER	false	Tracks the number of service exception 4050 error received from the verification server.	false
VERIFICATION_FAILUREPOL5000	COUNTER	false	Tracks the number of service exception 5000 error received from the verification server.	false

ScpaStats

Column Name	Column Type	Index	Description
OPEN_CONVERSATIONS	COUNTER	No	Records the number of open conversation transactions at a given time.

ServiceUsageStats

Column Name	Column Type	Index	Description
DEFAULT_SVCS	COUNTER	No	Default Service: Tracks how many times default service is executed. The counter is incremented when no service is provisioned and the default service is executed.
SUBS_SCREENING	COUNTER	No	Subscriber Screening: Keeps track of how many times Subscriber Screening Service is executed. The counter is incremented when screening service provisioned for subscriber is executed.
SUBS_BLOCKING	COUNTER	No	Subscriber Blocking: Tracks how many times Subscriber Blocking Service is executed. The counter is incremented when blocking service provisioned for subscriber is executed.

Column Name	Column Type	Index	Description
NON_SUBS_SCREENING	COUNTER	No	Non Subscriber Screening: Tracks how many times Non Subscriber Screening Service is executed. This counter is incremented when the calling party is not present in the Subscriber database table and the nonsubscriber call is screened.
NON_SUBS_BLOCKING	COUNTER	No	Non Subscriber Blocking: Tracks how many times Subscriber Blocking Service is executed. This counter is incremented when the calling party is not present in the Subscriber database table and the nonsubscriber call is blocked.
SUBS_FORCED_ROUTING	COUNTER	No	Subscriber Forced Routing: Tracks how many times Subscriber Forced Routing Service is executed. The counter is incremented when forced routing service provisioned for subscriber is executed.
SUBS_HI_FRAUD_BLOCKING	COUNTER	No	Subscriber HiFraud Blocking: Tracks how many times Subscriber HiFraud Blocking Service is executed. The counter is incremented when HiFraud Blocking service provisioned for subscriber is executed.
SUBS_SAC_NON_SAC_ROUTES	COUNTER	No	Subscriber SAC/NonSAC Routes: Tracks how many times Subscriber SAC/NonSAC Routing Service is executed. The counter is incremented when SAC/NonSAC Routing service provisioned for subscriber is executed.
DEST_NUM_FORCED_ROUTING	COUNTER	No	Destination Number Forced Routing: Tracks how many times Destination Number Forced Routing Service is executed. The counter is incremented when Destination Number Forced Routing service provisioned for subscriber, Carrier, Trunk group or Gateway is executed.

Column Name	Column Type	Index	Description
CIC_PHONE_SCREENING	COUNTER	No	CIC Phone Screening: Tracks how many times incoming phone type calls are not allowed.
CIC_SCREENING	COUNTER	No	CIC Screening: Tracks how many times CIC Screening Service is executed. The counter is incremented when screening service provisioned for carrier is executed.
CIC_BLOCKING	COUNTER	No	CIC Blocking: Tracks how many times CIC Blocking Service is executed. The counter is incremented when blocking service provisioned for carrier is executed.
CIC_FORCED_ROUTING	COUNTER	No	CIC Forced Routing: Tracks how many times CIC Forced Routing Service is executed. The counter is incremented when Forced Routing service provisioned for carrier is executed.
CIC_HI_FRAUD_BLOCKING	COUNTER	No	CIC HiFraud Blocking: Tracks how many times CIC HiFraud Blocking Service is executed. The counter is incremented when HiFraud Blocking service provisioned for carrier is executed.
CIC_SAC_NON_SAC_ROUTES	COUNTER	No	CIC SAC/NonSAC Routes: Tracks how many times CIC SAC/NonSAC Routing Service is executed. The counter is incremented when SAC/NonSAC Routing service provisioned for carrier is executed.
TRUNKGROUP_SCREENING	COUNTER	No	Trunk group Screening: Tracks how many times Trunk group Screening Service is executed. The counter is incremented when screening service provisioned for trunk group is executed.

Column Name	Column Type	Index	Description
TRUNKGROUP_BLOCKING	COUNTER	No	Trunk group Blocking: Tracks how many times Trunk group Blocking Service is executed. The counter is incremented when blocking service provisioned for trunk group is executed.
TRUNKGROUP_FORCED_ROUTING	COUNTER	No	Trunk group Forced Routing: Tracks how many times Trunk group Forced Routing Service is executed. The counter is incremented when forced routing service provisioned for trunk group is executed.
TRUNKGROUP_HI_FRAUD_BLOCKING	COUNTER	No	Trunk group HiFraud Blocking: Tracks how many times Trunk group HiFraud Blocking Service is executed. The counter is incremented when HiFraud service provisioned for trunk group is executed.
TRUNKGROUP_SAC_NON_SAC_ROUTES	COUNTER	No	Trunk group SAC/NonSAC Routes: Tracks how many times Trunk group SAC/NonSAC Routing Service is executed. The counter is incremented when SAC/NonSAC Routing service provisioned for trunk group is executed.
CASUAL_CALL_UNALLOWED	COUNTER	No	Casual calls not allowed: Tracks how many times casual calls are not allowed through the network. The counter is incremented when the explicitly dialed carrier code incoming call type (for example, 1010321) is not allowed at one of the following levels of granularity: Infodigit, Carrier, Trunk group, Gateway, and SoftSwitch.
NON_SUBSCRIBER_CALLS_UNALLOWED	COUNTER	No	Non Subscriber calls not allowed: Tracks how many times non subscriber calls are not allowed through the network. This counter is incremented when a calling party is not present in the subscriber database and the casual routing is not allowed at Carrier, Trunk group, or Gateway level.

Column Name	Column Type	Index	Description
GATEWAY_SCREENING	COUNTER	No	Gateway Screening: Tracks how many times Gateway Screening Service is executed. The counter is incremented when screening service provisioned for gateway is executed.
GATEWAY_BLOCKING	COUNTER	No	Gateway Blocking: Tracks how many times Gateway Blocking Service is executed. The counter is incremented when blocking service provisioned for gateway is executed.
GATEWAY_FORCED_ROUTING	COUNTER	No	Gateway Forced Routing: Tracks how many times Gateway Forced Routing Service is executed. The counter is incremented when Forced Routing service provisioned for gateway is executed.
GATEWAY_HI_FRAUD_BLOCKING	COUNTER	No	Gateway HiFraud Blocking: Tracks how many times Gateway HiFraud Blocking Service is executed. The counter is incremented when HiFraud Blocking service provisioned for gateway is executed.
GATEWAY_SAC_NON_SAC_ROUTES	COUNTER	No	Gateway SAC/NonSAC Routes: Tracks how many times Gateway SAC/NonSAC Routing Service is executed. The counter is incremented when SAC/NonSAC Routing service provisioned for gateway is executed.
AUTH_CODE_SCREENING	COUNTER	No	Authcode Screening: Tracks how many times the Authcode Screening Service is executed. The counter is incremented when the screening service provisioned for Authcode is executed.

Column Name	Column Type	Index	Description
AUTH_CODE_BLOCKING	COUNTER	No	Authcode Blocking: Tracks how many times the Authcode Blocking service is executed. The counter is incremented when the blocking service provisioned for Authcode is executed.
AUTH_CODE_FORCED_ROUTING	COUNTER	No	Authcode Forced Routing: Keeps track of how many times the Authcode Forced Routing service is executed. The counter is incremented when the Forced Routing service provisioned for Authcode is executed.
UTHCODE_HI_FRAUD_BLOCKING	COUNTER	No	Authcode HiFraud Blocking: Keeps track of how many times the Authcode HiFraud Blocking service is executed. The counter is incremented when the HiFraud Blocking service provisioned for Authcode is executed.
AUTH_CODE_SAC_NON_SAC_ROUTES	COUNTER	No	Authcode SAC/NonSAC Routes: Keeps track of how many times the Authcode SAC/NonSAC Routing service is executed. The counter is incremented when the SAC/NonSAC Routing service provisioned for Authcode is executed.
INFO_DIGIT_SCREENING	COUNTER	No	Infodigit Screening: Keeps track of how many times the Infodigit Screening Service is executed. The counter is incremented when the screening service provisioned for Infodigit is executed.
INFO_DIGIT_BLOCKING	COUNTER	No	Infodigit Blocking: Keeps track of how many times the Infodigit Blocking service is executed. The counter is incremented when the blocking service provisioned for Infodigit is executed.
INFO_DIGIT_FORCED_ROUTING	COUNTER	No	Infodigit Forced Routing: Keeps track of how many times the Infodigit Forced Routing service is executed. The counter is incremented when the Forced Routing service provisioned for Infodigit is executed.

Column Name	Column Type	Index	Description
INFO_DIGIT_HI_FRAUD_BLOCKING	COUNTER	No	Infodigit HiFraud Blocking: Keeps track of how many times the Infodigit HiFraud Blocking service is executed. The counter is incremented when the HiFraud Blocking service provisioned for Infodigit is executed.
INFO_DIGIT_SAC_NON_SAC_ROUTES	COUNTER	No	Infodigit SAC/NonSAC Routes: Keeps track of how many times the Infodigit SAC/NonSAC Routing service is executed. The counter is incremented when the SAC/NonSAC Routing service provisioned for Infodigit is executed.
SOFTSWITCH_SCREENING	COUNTER	No	Softswitch Screening: Keeps track of how many times the SoftSwitch Screening Service is executed. The counter is incremented when the screening service provisioned for SoftSwitch is executed.
SOFTSWITCH_BLOCKING	COUNTER	No	Softswitch Blocking: Keeps track of how many times the SoftSwitch Blocking service is executed. The counter is incremented when the blocking service provisioned for SoftSwitch is executed.
SOFTSWITCH_FORCED_ROUTING	COUNTER	No	Softswitch Forced Routing: Keeps track of how many times the SoftSwitch Forced Routing service is executed. The counter is incremented when the Forced Routing service provisioned for SoftSwitch is executed.
SOFTSWITCH_HI_FRAUD_BLOCKING	COUNTER	No	Softswitch HiFraud Blocking: Keeps track of how many times the SoftSwitch HiFraud Blocking service is executed. The counter is incremented when the HiFraud Blocking service provisioned for SoftSwitch is executed.
SOFTSWITCH_SAC_NON_SAC_ROUTES	COUNTER	No	Softswitch SAC/NonSAC Routes: Keeps track of how many times the SoftSwitch SAC/NonSAC Routing service is executed. The counter is incremented when the SAC/NonSAC Routing service provisioned for SoftSwitch is executed.

SoftSwitchScpaSpasStats

Note

SoftSwitchScpaSpasStats performance statistics table is not available on PSX versions 9.3 and later.

Column Name	Column Type	Index	Description
DEVICE_ID	STRING	Yes	The SPAS device name
START_DIALOG	COUNTER	No	Tracks the number of START_DLG messages sent by the PSX
END_DIALOG	COUNTER	No	Tracks the number of END_DLG messages sent by the PSX
ABORT_DIALOG	COUNTER	No	Tracks the number of ABRT_DLG messages sent/received by the PSX
SEND_CONFIRM	COUNTER	No	Tracks the number of SD_CNFRM messages received by the PSX
CONTINUE	COUNTER	No	Tracks the number of CONT messages received by the PSX
CONT_RSLT	COUNTER	No	Tracks the number of CONT_RSLT messages sent by the PSX
XFER	COUNTER	No	Tracks the number of XFER messages received by the PSX
XFER_RES	COUNTER	No	Tracks the number of XFER_RSLT messages sent by the PSX

Column Name	Column Type	Index	Description
XFER_TERM	COUNTER	No	Tracks the number of XFER_TERM messages sent by the PSX
CONT_TERM	COUNTER	No	Tracks the number of CONT_TERM messages sent by the PSX
RSET_CFNA	COUNTER	No	Tracks the number of RSET_CNFA messages received by the PSX
IGNORE	COUNTER	No	Tracks the number of IGNORE messages received by the PSX
RLS	COUNTER	No	Tracks the number of RLS messages received by the PSX
REG	COUNTER	No	Tracks the number of REG messages received by the PSX
REG_ACK	COUNTER	No	Tracks the number of REG_ACK messages sent by the PSX
KA_SENT	COUNTER	No	Tracks the number of KA messages sent by the PSX
KA_RCVD	COUNTER	No	Tracks the number of KA messages received by the PSX
KA_ACK_RCVD	COUNTER	No	Tracks the number of KA_ACK messages received by the PSX
KA_ACK_SENT	COUNTER	No	Tracks the number of KA_ACK messages sent by the PSX
TOTAL_MSG	COUNTER	No	Tracks the number of total messages counted in Round Trip Time (RTT) calculation
TOTAL_RTT	COUNTER64	No	This is the total Round Trip Time (RTT) in milliseconds
AVG_RTT	GAUGE	No	This is the average RTT value that is, $TOTAL\_RTT / TOTAL\_MSG$
SES_IN_PROG	GAUGE	No	Tracks the number of SPAS sessions in progress

SoftSwitchScpaTtcTcStats

Column Name	Column Type	Index	Description
QUERY_SENT	COUNTER	No	Tracks the number of TTC TCAP queries sent by the PSX
RETURN_SUCCESS	COUNTER	No	Tracks the number of TTC TCAP responses received successfully by the PSX
RETURN_ERROR	COUNTER	No	Tracks the number of TTC TCAP error messages received by the PSX
RETURN_ABORT	COUNTER	No	Tracks the number of TTC TCAP abort messages received by the PSX
UDTS_REPLIED	COUNTER	No	Tracks the number of TTC TCAP UDTS replies received by the PSX
RSP_TIMEOUT	COUNTER	No	Tracks the number of TTC TCAP queries timed out by the PSX

SoftswitchSipe

SoftSwitchSipeMiscStats

Column Name	Column Type	Index	Description
NUM_OF_GCED_CALLS	COUNTER	No	Tracks the number of transactions which have remained in the system for too long and have been removed by the Garbage Collector
GUARD_TIMER_CLR_CALLS	COUNTER	No	Tracks the number of transactions that are removed by Guard Timer Expiry

SoftSwitchSipeProxyReqSentStats

Column Name	Column Type	Index	Description
INVITE	COUNTER	No	Tracks the number of INVITE requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.
BYE	COUNTER	No	Tracks the number of BYE requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.
CANCEL	COUNTER	No	Tracks the number of CANCEL requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.
OPTIONS	COUNTER	No	Tracks the number of OPTIONS requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.
OTHER	COUNTER	No	Tracks the number of miscellaneous requests sent by the SIP process in proxy mode (and are not counted in specific counters). Retransmissions of messages (while the original one is being processed) are not counted.
REGISTER	COUNTER	No	Tracks the number of REGISTER requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.
SUBSCRIBE	COUNTER	No	Tracks the number of SUBSCRIBE requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.
NOTIFY	COUNTER	No	Tracks the number of NOTIFY requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.

Column Name	Column Type	Index	Description
RE_SENT_INVITE	COUNTER	No	Tracks the number of INVITE requests resent by the SIP process in proxy mode.
MESSAGE	COUNTER	No	Tracks the number of MESSAGE requests sent by the SIP process in proxy mode. Retransmissions of messages are not counted.

SoftSwitchSipeProxyRspRcvdStats

Column Name	Column Type	Index	Description
RSP_RCV_2XX	COUNTER	No	Tracks the number of 2XX responses received by the SIP process in proxy mode. Retransmissions of messages are not counted.
RSP_RCV_3XX	COUNTER	No	Tracks the number of 3XX responses received by the SIP process in proxy mode. Retransmissions of messages are not counted.
RSP_RCV_4XX	COUNTER	No	Tracks the number of 4XX responses received by the SIP process in proxy mode. Retransmissions of messages are not counted.
RSP_RCV_5XX	COUNTER	No	Tracks the number of 5XX responses received by the SIP process in proxy mode. Retransmissions of messages are not counted.
RSP_RCV_6XX	COUNTER	No	Tracks the number of 6XX responses received by the SIP process in proxy mode. Retransmissions of messages are not counted.

Column Name	Column Type	Index	Description
RCVD_NON_INV	COUNTER	No	Tracks the number of non INVITE responses received by the SIPE process in proxy mode.

SoftSwitchSipeProxyStats

Column Name	Column Type	Index	Description
LOCAL_RECUR_COUNTER	COUNTER	No	Tracks the number of times the local recursion service of SIPE proxy caused a final response to be handled locally, and another request was sent toward the next route in the route list.
TIMER_C	COUNTER	No	Tracks the number of times the SIPE proxy Timer C expired where the request is cancelled and a final response is sent back to the UAC.

SoftSwitchSipeReqRcvdStats

Column Name	Column Type	Index	Description
INVITE	COUNTER	No	Tracks the number of INVITE requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
BYE	COUNTER	No	Tracks the number of BYE requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
CANCEL	COUNTER	No	Tracks the number of INVITE requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.

Column Name	Column Type	Index	Description
OPTIONS	COUNTER	No	Tracks the number of OPTIONS requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
OTHER	COUNTER	No	Tracks the number of miscellaneous requests received (and are not counted in specific counters) by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
REGISTER	COUNTER	No	Tracks the number of REGISTER requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
SUBSCRIBE	COUNTER	No	Tracks the number of SUBSCRIBE requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
NOTIFY	COUNTER	No	Tracks the number of NOTIFY requests received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
NOTIFY_MWI_ON	COUNTER	No	Tracks the number of NOTIFY requests with MWI ON status, received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
NOTIFY_MWI_OFF	COUNTER	No	Tracks the number of NOTIFY requests with MWI OFF status, received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.

Column Name	Column Type	Index	Description
NOTIFY_MWI_REG	COUNTER	No	Tracks the number of NOTIFY requests with Registration event, received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
INVITEWITH_ETS_RPH	COUNTER	No	Tracks the number of INVITE requests with ETS RPH, received by the SIP process. of messages (while the original one is being processed) are not counted.
INVITEWITH_ETS_DN	COUNTER	No	Tracks the number of INVITE requests with ETS DN but no ETS RPH, received by the SIP process. Retransmissions of messages (while the original one is being processed) are not counted.
RESP_WITH417_REASON	COUNTER	No	Tracks the number of 400 Response messages with 417 Reason Code received by the SIP process.
WITH_ETS_RPH_OVERLOAD	COUNTER	No	Tracks the number of requests with ETS RPH discarded due to overload.
WITHOUT_ETS_RPH_OVERLOAD	COUNTER	No	The counter keeps track of the number of Requests without ETS RPH discarded due to overload.
RCVD_CNAMESSUBSCRIBE	COUNTER	No	Tracks the number of SUBSCRIBE Requests for CNAME query. Event type - calling-name. Retransmissions are not counted.
MESSAGE	COUNTER	No	Tracks the number of MESSAGE requests received by the SIP process. Retransmissions of messages (while the original one is processing) are not counted.

SoftSwitchSipeRspSentStats

Column Name	Column Type	Index	Description
RSP_SENT_2XX	COUNTER	No	Tracks the number of 2XX responses sent by the SIP process. Retransmissions of messages are not counted.
RSP_SENT_3XX	COUNTER	No	Tracks the number of 3XX responses sent by the SIP process. Retransmissions of messages are not counted.
RSP_SENT_4XX	COUNTER	No	Tracks the number of 4XX responses sent by the SIP process. Retransmissions of messages are not counted.
RSP_SENT_5XX	COUNTER	No	Tracks the number of 5XX responses sent by the SIP process. Retransmissions of messages are not counted.
RSP_SENT_6XX	COUNTER	No	Tracks the number of 6XX responses sent by the SIP process. Retransmissions of messages are not counted.
SENT_NON_INVITE	COUNTER	No	Tracks the number of responses sent by the SIPE process in non INVITE transactions. Retransmissions of messages are not counted.
SENT_INVITE_WITH_ETSRPH	COUNTER	No	Tracks the number of INVITE requests sent with ETS RPH sent by the SIP process. Retransmissions of messages are not counted.

SoftSwitchSipeSumStats

Column Name	Column Type	Index	Description
AVG_TRANS_TIMER	GAUGE	No	This is the average time in milliseconds it took to process a SIPE request. - For Redirector, this is from the time a request is received to the time a 3XX is sent back. - For Proxy, this is from the time the request is received to the time the request is forwarded.
AVG_CALL_RATE	GAUGE	No	This is the average number of requests per second, which the SIPE is receiving.
TOTAL_REDIRECT_REQ	COUNTER	No	Tracks the number of redirected requests.
TOTAL_PROXY_REQ	COUNTER	No	Tracks the number of requests which were proxied. Requests that might otherwise be proxied but are rejected by routing (for example, no route found) are not counted.
PARSE_ERROR	COUNTER	No	Tracks the number of SIP Parse errors.
RETRANS_OTHER_MSG	COUNTER	No	Tracks the number of retransmitted messages other than INVITE.

TmCalling

TmCallingNumberAllowedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TMORIG_COUNTERS_ALLOWED_ENT	STRING	Yes	Entity ID (National Number) for origination with traffic control

Column Name	Column Type	Index	Description
TMORIG_COUNTERS_ALLOWED_ENT2	STRING	Yes	Entity ID2 (Country ID) for origination with traffic control
TMORIG_COUNTERS_ALLOWED_VALUE	COUNTER	No	The Number of allowed calls from origination with traffic control

TmCallingNumberBlockedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TMORIG_COUNTERS_BLOCKED_ENT	STRING	Yes	Entity ID (National Number) for origination with traffic control
TMORIG_COUNTERS_BLOCKED_ENT2	STRING	Yes	Entity ID2 (Country ID) for origination with traffic control
TMORIG_COUNTERS_BLOCKED_VALUE	COUNTER	No	The Number of blocked calls from origination with traffic control

TmDialed

TmDialedDestAllowedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (national number) for dialed destination with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (country id) for dialed destination with traffic control
TM_VALUE	COUNTER	No	Number of allowed calls to dialed destination with traffic control

TmDialedDestBlockedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (national number) for dialed destination with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (country id) for dialed destination with traffic control
TM_VALUE	COUNTER	No	Number of blocked calls to dialed destination with traffic control

TMFinal

TMFinalCallingNumAllowedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (trunk group id) for final calling number with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (gateway id) for final calling number with traffic control
TM_VALUE	COUNTER	No	Number of allowed calls from final calling number with traffic control

TMFinalCallingNumBlockedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (trunk group id) for final calling number with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (gateway id) for final calling number with traffic control
TM_VALUE	COUNTER	No	Number of blocked calls from final calling number with traffic control

TMFinalDestinationAllowedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (trunk group id) for final calling number with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (gateway id) for final calling number with traffic control
TM_ENTITY_TYPE	INTEGER	Yes	Call Processing entity type to identify source of final destination allowed counter
TM_VALUE	COUNTER	No	Number of allowed calls from final calling number with traffic control

TMFinalDestinationBlockedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (trunk group id) for final calling number with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (gateway id) for final calling number with traffic control
TM_ENTITY_TYPE	INTEGER	Yes	Call Processing entity type to identify source of final destination allowed counter
TM_VALUE	COUNTER	No	Number of blocked calls from final calling number with traffic control

TMTrans

TmTransDestAllowedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (national number) for translated destination with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (country id) for translated destination with traffic control
TM_VALUE	COUNTER	No	Number of allowed calls to translated destination with traffic control

TmTransDestBlockedStats

Note

The performance statistics file is generated only if a traffic control profile is configured and the specified control type condition is triggered during an actual call.

For information on how to configure a Traffic Management profile, refer to [Traffic Control Application Screen](#).

Column Name	Column Type	Index	Description
TM_ENTITY	STRING	Yes	Entity Id (national number) for translated destination with traffic control
TM_ENTITY2	STRING	Yes	Entity Id2 (country id) for translated destination with traffic control
TM_VALUE	COUNTER	No	Number of blocked calls to translated destination with traffic control

TollFreeStats

Column Name	Column Type	Index	Description
TFC_NUM_REQUESTS	COUNTER	No	Number of requests that need Tollfree translation: Total number of requests received by the Ribbon SoftSwitch which require toll free translation.
TFC_NUM_REQUESTS_T O_SCP	COUNTER	No	Number of Toll free requests sent to SCP: Total number of requests sent to the SCP for translation.
TFC_NUM_REQUESTS_T RANSLATED	COUNTER	No	Number of Toll free requests translated: The number of toll free requests that were successfully translated.
TFC_NUM_REQUESTS_TI MED_OUT	COUNTER	No	Number of timed out toll free requests: Number of toll free requests that timed out.
TFC_NUM_REQUESTS_R EQ_ERRORS	COUNTER	No	Number of toll free request Errors: Number of toll free requests that resulted in an error.

SBC Core Statistics

The performance statistics supported for SBC Core are covered in this section.

- [MRFP Statistics](#)
- [SBC 5400 and SBC SWe Statistics](#)
- [SBC 7000 Statistics](#)
- [SBC CNF Statistics](#)
- [SLB Statistics](#)

MRFP Statistics

In the following tables, rows that are colored red (as shown below) describe counters that are not applicable for MRFP. The CSV files are exported for these counters but with null values.

CallCountIntervalStats

Column Name	Column Type	Index	Description	canAggregate
NAME	INTEGER	True	This adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	True
MAX_SESSION_COUNT	COUNTER	False	Displayed as maxSessionCallCount. The high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable.	True

Column Name	Column Type	Index	Description	canAggregate
MAX_POL_RTU_COUNT	INTEGER	False	Displays the same count as MAX_SESSION_COUNT if the SBC is using SBC-POL-RTU license. If the SBC is not using the SBC-POL-RTU license, the count is displayed as 0.	True
ENCRYPT_COUNT	COUNTER	False	Displayed as system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True
S RTP_COUNT	COUNTER	False	Displayed as system wide total Secure Real-time Transport Protocol (S RTP) Call Count; The high watermark of total number of S RTP calls for the specified interval.	True
VIDEO_COUNT	COUNTER	False	Displayed as system wide total video Call Count. The high watermark of total number of video calls for the specified interval.	True
AMRNB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval	True
AMRWB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval	True
EVRC_COUNT	COUNTER	False	The high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval	True
NICEREC_COUNT	COUNTER	False	The current high watermark of total number of NICE recording calls	True
MRFSESS_COUNT	COUNTER	False	The current high watermark of total number of Media Resource Function (MRF) calls	True

Column Name	Column Type	Index	Description	canAggregate
MAX_PSX_RTU_COUNT	INTEGER	False	Displays MAX_SESSION_COUNT when the SBC is using the SBC-PSX-RTU license. If the SBC is not using SBC-PSX-RTU license it displays the count as 0.	True
VDSPRTU_COUNT	COUNTER	False	The high watermark of total number of trans-coded sessions for the specified interval	True
PDCS_COUNT	COUNTER	False	The high watermark of total number of pdcs header sessions for the specified interval	True
SIPREC_COUNT	COUNTER	False	The current high watermark of total number of sip recording calls	True
LI_ENABLED	INTEGER	False	Set based on whether LI license is available at the SBC	True
DSPG722_ENABLED	INTEGER	False	Set based on whether DspG722 license is available at the SBC	True
GMP4X1_ENABLED	INTEGER	False	Set based on whether 4X1GMP license is available at the SBC	True
SIPI_ENABLED	INTEGER	False	Set based on whether Sipi license is available at the SBC	True
SIP323_ENABLED	INTEGER	False	Set based on whether SipRec license is available at the SBC	True
GMP1X10_ENABLED	INTEGER	False	Set based on whether 1X10GMP license is available at the SBC	True
CAPACITY_ENABLED	INTEGER	False	Set based on whether Capacity license is available at the SBC	True
E911_ENABLED	INTEGER	False	Set based on whether E911 license is available at the SBC	True
ENUM_ENABLED	INTEGER	False	Set based on whether ENUM license is available at the SBC	True

Column Name	Column Type	Index	Description	canAggregate
SWINSTANCE_ENABLED	INTEGER	False	Set based on whether Swe Instance license is available at the SBC	True
EVS_COUNT	COUNT	False	The high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval	True
SILK_COUNT	COUNT	False	The high watermark of total number of SILK Codec Transcode calls for the specified interval	True
SBCRCS_COUNT	COUNT	False	The high watermark of total number of OOD calls that use an RCS based service for the specified interval	True
HPC_QUE_ATTEMPT	COUNT	No	The number of HPC calls successfully placed on HPC Call Queuing queues for the reporting interval	True
SLBSESS_COUNT	COUNT	No	Displayed as system wide total stable SLB sessions Count. The high watermark of the total number of active calls for the reporting interval.	True
LBINSTANCE_ENABLED	INTEGER	No	Set based on whether SLB license is available at the SLB	False
HPC_QUE_OVERFLOW	COUNT	No	The number of HPC calls which experienced unsuccessful call queuing attempts due to full queues for the reporting interval	True
HPC_QUE_ABANDON	COUNT	No	The number of queued HPC calls abandoned before call completion during the reporting interval	True
HPC_QUE_TIMEOUTS	COUNT	No	The number of HPC calls removed from the queue due to expiration of the queue timeout timer for the reporting interval	True
HPC_CTL_TFC_EXEM	COUNT	No	The HPC traffic control exemptions for this reporting interval	True

Column Name	Column Type	Index	Description	canAggregate
SOSBC_RTU_COUNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True
WEB_SOCKET_COUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval	True
CE_NAME	STRING	False	The name of the compute element for this entry	False

CallCountIntervalStats_AG

Column Name	Column Type	Index	Description	canAggregate
NAME	INTEGER	True	This adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	True
MAX_SESSION_COUNT	COUNTER	False	Displayed as maxSessionCallCount. The high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable.	True
MAX_POL_RTU_COUNT	INTEGER	False	Displays the same count as MAX_SESSION_COUNT if the SBC is using SBC-POL-RTU license. If the SBC is not using the SBC-POL-RTU license, the count is displayed as 0.	True
ENCRYPT_COUNT	COUNTER	False	Displayed as system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True

Column Name	Column Type	Index	Description	canAggregate
SRTP_COUNT	COUNTER	False	Displayed as system wide total Secure Real-time Transport Protocol (SRTP) Call Count; The high watermark of total number of SRTP calls for the specified interval.	True
VIDEO_COUNT	COUNTER	False	Displayed as system wide total video Call Count; The high watermark of total number of video calls for the specified interval.	True
AMRNB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval.	True
AMRWB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval.	True
EVRC_COUNT	COUNTER	False	The high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval.	True
NICEREC_COUNT	COUNTER	False	The current high watermark of total number of NICE recording calls.	True
MRFSESS_COUNT	COUNTER	False	The current high watermark of total number of Media Resource Function (MRF) calls.	True
MAX_PSX_RTU_COUNT	INTEGER	False	Displays MAX_SESSION_COUNT when the SBC is using the SBC-PSX-RTU license. If the SBC is not using SBC-PSX-RTU license it displays the count as 0.	True
VDSPRTU_COUNT	COUNTER	False	The high watermark of total number of trans-coded sessions for the specified interval.	True
PDCS_COUNT	COUNTER	False	The high watermark of total number of pdcS header sessions for the specified interval.	True

Column Name	Column Type	Index	Description	canAggregate
SIPREC_COUNT	COUNTER	False	The current high watermark of total number of sip recording calls.	True
LI_ENABLED	INTEGER	False	Set based on whether LI license is available at the SBC.	True
DSPG722_ENABLED	INTEGER	False	Set based on whether DspG722 license is available at the SBC.	True
GMP4X1_ENABLED	INTEGER	False	Set based on whether 4X1GMP license is available at the SBC.	True
SIPI_ENABLED	INTEGER	False	Set based on whether Sipi license is available at the SBC.	True
SIP323_ENABLED	INTEGER	False	Set based on whether SipRec license is available at the SBC.	True
GMP1X10_ENABLED	INTEGER	False	Set based on whether 1X10GMP license is available at the SBC.	True
CAPACITY_ENABLED	INTEGER	False	Set based on whether Capacity license is available at the SBC.	True
E911_ENABLED	INTEGER	False	Set based on whether E911 license is available at the SBC.	True
ENUM_ENABLED	INTEGER	False	Set based on whether ENUM license is available at the SBC.	True
SWINSTANCE_ENABLED	INTEGER	False	Set based on whether Swe Instance license is available at the SBC.	True
EVS_COUNT	COUNT	False	The high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval.	True
SILK_COUNT	COUNT	False	The high watermark of total number of SILK Codec Transcode calls for the specified interval.	True
SBCRCS_COUNT	COUNT	False	The high watermark of total number of OOD calls that use an RCS based service for the specified interval.	True

Column Name	Column Type	Index	Description	canAggregate
HPC_QUE_ATTEMPT	COUNT	No	The number of HPC calls successfully placed on HPC Call Queuing queues for the reporting interval.	True
SLBSESS_COUNT	COUNT	No	Displayed as system wide total stable SLB sessions Count. The high watermark of the total number of active calls for the reporting interval.	True
LBINSTANCE_ENABLED	INTEGER	No	Set based on whether SLB license is available at the SLB.	False
HPC_QUE_OVERFLOW	COUNT	No	The number of HPC calls which experienced unsuccessful call queuing attempts due to full queues for the reporting interval.	True
HPC_QUE_ABANDON	COUNT	No	The number of queued HPC calls abandoned before call completion during the reporting interval.	True
HPC_QUE_TIMEOUTS	COUNT	No	The number of HPC calls removed from the queue due to expiration of the queue timeout timer for the reporting interval.	True
HPC_CTL_TFC_EXEM	COUNT	No	The HPC traffic control exemptions for this reporting interval.	True
SOSBC_RTU_COUNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True
WEB_SOCKET_COUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval.	True
CE_NAME	STRING	False	The name of the compute element for this entry.	False

DspResDspCallIntervalStats

Column Name	Type	Index	Description	canAggregate
SYSTEM_NAME	STRING	True	The name of the system	False
NUM_CALL_NO_DSP_ALLOC_FAIL	COUNTER	False	The count of successful calls without DSP resource allocation failure during an interval time	True
NUM_CALL_WITH_DSP_ALLOC_FAIL	COUNTER	False	The count of successful calls with DSP resource allocation failure during an interval time	True
NUM_CALL_FAIL_NO_G729	COUNTER	False	The count of calls failed due to lack of G729 DSP resource during an interval time	True
NUM_CALL_FAIL_OTHER_ON_G729	COUNTER	False	The count of calls failed due to reasons other than lack G729 DSP resource during an interval time	True
NUM_CALL_SUCCESS_NO_G729	COUNTER	False	The count of successful calls even with the lack of G729 DSP resource during an interval time	True
NUM_CALL_FAIL_NO_G726	COUNTER	False	The count of calls failed due to lack of G726 DSP resource during an interval time	True
NUM_CALL_FAIL_OTHER_ON_G726	COUNTER	False	The count of calls failed due to reasons other than lack G726 DSP resource during an interval time	True
NUM_CALL_SUCCESS_NO_G726	COUNTER	False	The count of successful calls even with the lack of G726 DSP resource during an interval time	True
NUM_CALL_FAIL_NO_G711_PACKET	COUNTER	False	The count of calls failed due to lack of G711 Packet DSP resource during an interval time	True
NUM_CALL_FAIL_ON_G711_PACKET	COUNTER	False	The count of calls failed due to reasons other than lack G711 Packet DSP resource during an interval time	True

Column Name	Type	Index	Description	canAggregate
NUM_CALL_NO_G711_PACKET	COUNTER	False	Number of call was successful even with the lack of G711 Packet DSP resource during an interval time	True
NUM_CALL_FAIL_NO_G723	COUNTER	False	Number of call failed due to lack of G723 DSP resource during an interval time	True
NUM_CALL_FAIL_ON_G723	COUNTER	False	The count of calls failed due to reasonss other than lack G723 DSP resource during an interval time	True
NUM_CALL_NO_G723	COUNTER	False	Number of call was successful even with the lack of G723 DSP resource during an interval time	True
NUM_CALL_FAIL_NO_ILBC	COUNTER	False	Number of call failed due to lack of ILBC DSP resource during an interval time	True
NUM_CALL_FAIL_ON_ILBC	COUNTER	False	The count of calls failed due to reasonss other than lack ILBC DSP resource during an interval time	True
NUM_CALL_NO_ILBC	COUNTER	False	Number of call was successful even with the lack of ILBC DSP resource during an interval time	True
NUM_CALL_FAIL_NO_EVRCB	COUNTER	False	Number of call failed due to lack of EVRCB0 DSP resource during an interval time	True
NUM_CALL_FAIL_ON_EVRCB	COUNTER	False	The count of calls failed due to reasonss other than lack EVRCB0 DSP resource during an interval time	True
NUM_CALL_NO_EVRCB	COUNTER	False	Number of call was successful even with the lack of EVRCB0 DSP resource during an interval time	True

Column Name	Type	Index	Description	canAggregate
NUM_CALL_FAIL_NO_GSM	COUNTER	False	Number of call failed due to lack of AMRNB DSP resource during an interval time	True
NUM_CALL_FAIL_ON_GSM	COUNTER	False	The count of calls failed due to reasonss other than lack AMRNB DSP resource during an interval time	True
NUM_CALL_NO_GSM	COUNTER	False	Number of call was successful even with the lack of AMRNB DSP resource during an interval time	True
NUM_CALL_FAIL_NO_AMRWB	COUNTER	False	Number of call failed due to lack of AMRWB DSP resource during an interval time	True
NUM_CALL_FAIL_ON_AMRWB	COUNTER	False	The count of calls failed due to reasonss other than lack AMRWB DSP resource during an interval time	True
NUM_CALL_NO_AMRWB	COUNTER	False	Number of call was successful even with the lack of AMRWB DSP resource during an interval time	True
NUM_CALL_FAIL_NO_G722	COUNTER	False	Number of call failed due to lack of G722 DSP resource during an interval time	True
NUM_CALL_FAIL_ON_G722	COUNTER	False	The count of calls failed due to reasonss other than lack G722 DSP resource during an interval time	True
NUM_CALL_NO_G722	COUNTER	False	Number of call was successful even with the lack of G722 DSP resource during an interval time	True
NUM_CALL_FAIL_NO_TONE	COUNTER	False	Number of call failed due to lack of TONE DSP resource during an interval time	True

Column Name	Type	Index	Description	canAggregate
NUM_CALL_FAIL_ON_TONE	COUNTER	False	The count of calls failed due to reasons other than lack TONE DSP resource during an interval time	True
NUM_CALL_NO_TONE	COUNTER	False	Number of call was successful even with the lack of TONE DSP resource during an interval time	True
NUM_CALL_FAIL_NO_EVRC	COUNTER	False	Number of call failed due to lack of EVRC DSP resource during an interval time	True
NUM_CALL_FAIL_OTHER_ON_EVRC	COUNTER	False	The count of calls failed due to reasons other than lack EVRC DSP resource during an interval time	True
NUM_CALL_SUCCESS_NO_EVRC	COUNTER	False	Number of call was successful even with the lack of EVRC DSP resource during an interval time	True
NUM_CALL_FAIL_NO_G7221	COUNTER	False	Number of call failed due to lack of G7221 DSP resource during an interval time	True

IcmpGeneralGroupStats

Column Name	Type	Index	Description	canAggregate
CE_NAME	STRING	True	The name of the compute element for this entry	False
IN_MSGS	COUNTER	False	The total number of ICMP messages that the entity received. This counter includes all those counted by icmpInErrors	True
IN_ECHOS	COUNTER	False	The number of ICMP Echo (request) messages received	True
IN_ECHO_REPS	COUNTER	False	The number of ICMP Echo Reply messages received	True
IN_DEST_UNREACHS	COUNTER	False	The number of ICMP Destination Unreachable messages received	True
IN_ERRORS	COUNTER	False	The number of ICMP messages that the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and such)	True
OUT_MSGS	COUNTER	False	The total number of ICMP messages that this entity attempted to send. This counter includes all those counted by icmpOutErrors	True
OUT_ERRORS	COUNTER	False	The number of ICMP messages that this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. Some implementations may not have the types of error that contribute to this counter's value	True
OUT_ECHOS	COUNTER	False	The number of ICMP Echo (request) messages sent	True

Column Name	Type	Index	Description	canAggregate
OUT_ECHO_REP S	COUNTER	False	The number of ICMP Echo Reply messages sent	True
OUT_DEST_UNR EACHS	COUNTER	False	The number of ICMP Destination Unreachable messages sent	True

IpGeneralGroupStats

Column Name	Type	Index	Description	canAggregate
CE_NAME	STRING	True	The name of the compute element for this entry	False

Column Name	Type	Index	Description	canAggregate
IN_RECEIVES	COUNTER	False	The total number of input datagrams received from interfaces, which includes those received in error	True
IN_HDR_ERRORS	COUNTER	False	The number of input datagrams discarded due to errors in their IP headers, which includes bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and such	True
IN_ADDR_ERRORS	COUNTER	False	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address for this entity to receive. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported Classes (for example, Class E). For entities that are not IP routers and do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address	True
IN_UNKNOWN_PROTOCOLS	COUNTER	False	The number of locally-addressed datagrams successfully received but discarded because of an unknown or unsupported protocol	True
IN_DISCARDS	COUNTER	False	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which the Ribbon Application Management Platform (RAMP) discards (for example, for lack of buffer space). This counter does not include any datagrams discarded while awaiting re-assembly	True
IN_DELIVERS	COUNTER	False	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP)	True
OUT_REQUESTS	COUNTER	False	The total number of IP datagrams that local IP user- protocols (including ICMP) supplied to IP in requests for transmission. This counter does not include any datagrams counted in ipForwDatagrams	True

Column Name	Type	Index	Description	canAggregate
OUT_DISCARDS	COUNTER	False	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space). This counter includes datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.	True
OUT_NO_ROUTE S	COUNTER	False	The number of IP datagrams discarded because no route is found to transmit them to their destination. This counter includes any packets counted in ipForwDatagrams that meet this no-route criterion, which includes any datagrams that a host cannot route because all of its default routers are down.	True
REASM_TIMEOU T	INTEGER	False	The maximum number of seconds that received fragments are held while they await reassembly at this entity	True
REASM_REQDS	COUNTER	False	The number of IP fragments received that need to reassemble at this entity	True
REASM_OKS	COUNTER	False	The number of IP datagrams successfully re-assembled	True
REASM_FAILS	COUNTER	False	The number of failures detected by the IP re-assembly algorithm (timed out, errors, and such). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received	True
FRAG_OKS	COUNTER	False	The number of IP datagrams that successfully fragmented at this entity	True
FRAG_FAILS	COUNTER	False	The number of IP datagrams that discard because they need to fragment at this entity but could not, for example, because their Don't Fragment flag was set	True

DEST_IP_PORT	INTEGER	False	The destination IP port of the table entry.	True

Column Name	Type	Index	Description	canAggregate
IP_PROTOCOL	INTEGER	False	The IP Protocol of the table entry.	True
ETHER_TYPE	INTEGER	False	The first ethertype found in the Ethernet packet.	True
DISCARD_COUNT	COUNTER	False	The number of packets discarded by the policer.	True
RING_TYPE	INTEGER	False	The media ring type.	False
SOURCE_UNIQUE	INTEGER	False	Determines if all discards were from a unique source address.	False
CE_NAME	STRING	False	The name of the compute element for this entry.	False

SBX5KSystemDspStatusDspUsageStats

Column Name	Type	Index	Description	canAggregate
SYSTEM_NAME	STRING	True	Name of the system	False
COMPRESSION_TOTAL	INTEGER	False	Total compression resource capacity on this server	False
COMPRESSION_UTILIZATION	INTEGER	False	Percentage utilization of compression resources on this server	False
COMPRESSION_ALLOCATION_FAILURES	INTEGER	False	Percentage of compression resources allocation failures on this server	False
G711_TOTAL	INTEGER	False	Total G.711 resource capacity on this server	False
G711_UTILIZATION	INTEGER	False	Percentage utilization of G711 resources on this server	False
G726_TOTAL	INTEGER	False	Total G.726 resource capacity on this server	False

Column Name	Type	Index	Description	canAggregate
G726_UTILIZATION	INTEGER	False	Percentage utilization of G726 resources on this server	False
G729AB_TOTAL	INTEGER	False	Total G.729A+B resource capacity on this server	False
G729AB_UTILIZATION	INTEGER	False	Percentage utilization of G729A+B resources on this server	False
G7231_TOTAL	INTEGER	False	Total G.7231 resource capacity on this server	False
G7231_UTILIZATION	INTEGER	False	Percentage utilization of G7231 resources on this server	False
ILBC_TOTAL	INTEGER	False	Total iLBC resource capacity on this server	False
ILBC_UTILIZATION	INTEGER	False	Percentage utilization of iLBC resources on this server	False
ILBC_ALLOC_FAILURES	INTEGER	False	Percentage of iLBC resources allocation failures on this server	False
ECM_TOTAL	INTEGER	False	Total T.38 ECM resource capacity on this server	False
ECM_UTILIZATION	INTEGER	False	Percentage utilization of T.38 ECM resources on this server	False
ECM_ALLOC_FAILURES	INTEGER	False	Percentage of T.38 ECM resources allocation failures on this server	False
TONE_TOTAL	INTEGER	False	Total tone resource capacity on this server	False
TONE_UTILIZATION	INTEGER	False	Percentage utilization of tone resources on this server	False

Column Name	Type	Index	Description	canAggregate
TONE_ALLOC_FAILURES	INTEGER	False	Percentage of tone resource allocation failures on this server	False
EVRCB0_TOTAL	INTEGER	False	Total EVRCB0 resource capacity on this server	False
EVRCB0_UTILIZATION	INTEGER	False	Percentage utilization of EVRCB0 resources on this server	False
EVRCB0_ALLOC_FAILURES	INTEGER	False	Percentage of EVRCB0 resources allocation failures on this server	False
AMRNB_TOTAL	INTEGER	False	Total AMR-NB resource capacity on this server	False
AMRNB_UTILIZATION	INTEGER	False	Percentage utilization of AMR-NB resources on this server	False
AMRNB_ALLOC_FAILURES	INTEGER	False	Percentage of AMR-NB resources allocation failures on this server	False
AMRWB_TOTAL	INTEGER	False	Total AMR-WB resource capacity on this server	False
AMRWB_UTILIZATION	INTEGER	False	Percentage utilization of AMR-WB resources on this server	False
AMRWB_ALLOC_FAILURES	INTEGER	False	Percentage of AMR-WB resources allocation failures on this server	False
G722_TOTAL	INTEGER	False	Total G.722 resource capacity on this server	False
G722_UTILIZATION	INTEGER	False	Percentage utilization of G.722 resources on this server	False
G722_ALLOC_FAILURES	INTEGER	False	Percentage of G.722 resources allocation failures on this server	False

Column Name	Type	Index	Description	canAggregate
EVRC0_TOTAL	INTEGER	False	Total EVRC0 resource capacity on this server	False
EVRC0_UTILIZATION	INTEGER	False	Percentage utilization of EVRC0 resources on this server	False
EVRC0_ALLOC_FAILURES	INTEGER	False	Percentage of EVRC0 resources allocation failures on this server	False
COMPRESSION_AVAILABLE	INTEGER	False	Number of compression resources currently unused and available on this server	False
TONE_AVAILABLE	INTEGER	False	Number of tone resources currently unused and available on this server	False
G7221_TOTAL	INTEGER	False	Total G.722.1 resource capacity on this server	False
G7221_UTILIZATION	INTEGER	False	Percentage utilization of G.722.1 resources on this server	False
EFR_TOTAL	INTEGER	False	Total EFR resource capacity on this server	False
EFR_UTILIZATION	INTEGER	False	Percentage utilization of EFR resources on this server	False
G711SS_TOTAL	INTEGER	False	Total G.711SS (silence suppression) resource capacity on this server	False
G711SS_UTILIZATION	INTEGER	False	Percentage utilization of G.711SS (silence suppression) resources on this server	False
SLOT1_RESOURCES_UTILIZED	INTEGER	False	Total compression/tone resources in use on this module slot	False

Column Name	Type	Index	Description	canAggregate
SLOT2_RESOURCES_UTILIZED	INTEGER	False	Total compression/tone resources in use on this module slot	False
SLOT3_RESOURCES_UTILIZED	INTEGER	False	Total compression/tone resources in use on this module slot	False
SLOT4_RESOURCES_UTILIZED	INTEGER	False	Total compression/tone resources in use on this module slot	False
G711V8_TOTAL	INTEGER	False	Total G.711 V8 resource capacity on this server	False
G711V8_UTILIZATION	INTEGER	False	Percentage utilization of G.711 V8 resources on this server	False
G711SSV8_TOTAL	INTEGER	False	Total G.711SS (silence suppression) V8 resource capacity on this server	False
G711SSV8_UTILIZATION	INTEGER	False	Percentage utilization of G.711SS (silence suppression) V8 resources on this server	False
G726V8_TOTAL	INTEGER	False	Total G.726 V8 resource capacity on this server	False
G726V8_UTILIZATION	INTEGER	False	Percentage utilization of G.726 V8 resources on this server	False
G7231V8_TOTAL	INTEGER	False	Total G723.1 V8 resource capacity on this server	False
G7231V8_UTILIZATION	INTEGER	False	Percentage utilization of G.7231 V8 resources on this server	False

The statistics tables listed in the page are applicable for the following products:

- SBC 5400
- SBC Software Edition (SWe)

Note

- The statistics tables names are listed in the following format
<name of the table in the exported CSV file>/<name of the table in the Ribbon Application Management Platform (RAMP) PM profile>
- If the table name is same in the exported CSV file and the RAMP PM profile, it is listed only once.

The following columns are listed in the exported CSV files:

- #NODE_ID
The name of the node from which the performance statistics data is collected.

Note

#NODE_ID is available only in stats tables collected at the node level.

#CLUSTER_ID

- The name of the cluster from which the performance statistics data is collected.

Note

#CLUSTER_ID is available only in stats tables aggregated at the cluster level.

- **TIMESTAMP**

The date and time at which the performance statistics data is collected.

Call Stats

CallCountIntervalStats

Column Name	Column Type	Index	Description	canAggregate
NAME	INTEGER	True	This adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	True
MAX_SESSION_COUNT	COUNTER	False	Displayed as maxSessionCallCount. The high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable.	True
MAX_POL_RTU_COUNT	INTEGER	False	Displays the same count as MAX_SESSION_COUNT if SBC is using SBC-POL-RTU license. If SBC is not using SBC-POL-RTU license, the count is displayed as 0.	True
ENCRYPT_COUNT	COUNTER	False	Displayed as system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True
SRTP_COUNT	COUNTER	False	Displayed as system wide total Secure Real-time Transport Protocol (SRTP) Call Count; The high watermark of total number of SRTP calls for the specified interval.	True
VIDEO_COUNT	COUNTER	False	Displayed as system wide total video Call Count; The high watermark of total number of video calls for the specified interval.	True
AMRNB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval.	True

Column Name	Column Type	Index	Description	canAggregate
AMRWB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval.	True
EVRC_COUNT	COUNTER	False	The high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval.	True
NICEREC_COUNT	COUNTER	False	The current high watermark of total number of NICE recording calls.	True
MRFSESS_COUNT	COUNTER	False	The current high watermark of total number of Media Resource Function (MRF) calls.	True
MAX_PSX_RTU_COUNT	INTEGER	False	Displays MAX_SESSION_COUNT when SBC is using SBC-PSX-RTU license. If SBC is not using SBC-PSX-RTU license it displays the count as 0.	True
VDSPRTU_COUNT	COUNTER	False	The high watermark of total number of trans-coded sessions for the specified interval.	True
PDCS_COUNT	COUNTER	False	The high watermark of total number of pdcs header sessions for the specified interval.	True
SIPREC_COUNT	COUNTER	False	The current high watermark of total number of sip recording calls.	True
LI_ENABLED	INTEGER	False	Set based on whether LI license is available at the SBC.	True
DSPG722_ENABLED	INTEGER	False	Set based on whether DspG722 license is available at the SBC.	True
GMP4X1_ENABLED	INTEGER	False	Set based on whether 4X1GMP license is available at the SBC.	True
SIPI_ENABLED	INTEGER	False	Set based on whether Sipl license is available at the SBC.	True

Column Name	Column Type	Index	Description	canAggregate
SIP323_ENABLED	INTEGER	False	Set based on whether SipRec license is available at the SBC.	True
GMP1X10_ENABLED	INTEGER	False	Set based on whether 1X10GMP license is available at the SBC.	True
CAPACITY_ENABLED	INTEGER	False	Set based on whether Capacity license is available at the SBC.	True
E911_ENABLED	INTEGER	False	Set based on whether E911 license is available at the SBC.	True
ENUM_ENABLED	INTEGER	False	Set based on whether ENUM license is available at the SBC.	True
SWINSTANCE_ENABLED	INTEGER	False	Set based on whether Swe Instance license is available at the SBC.	True
EVS_COUNT	COUNT	False	The high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval.	True
SILK_COUNT	COUNT	False	The high watermark of total number of SILK Codec Transcode calls for the specified interval.	True
SBCRCS_COUNT	COUNT	False	The high watermark of total number of OOD calls that use an RCS based service for the specified interval.	True
HPC_QUE_ATTEMPT	COUNT	False	The number of HPC calls successfully placed on HPC Call Queuing queues for the reporting interval.	True
SLBSESS_COUNT	COUNT	False	Displayed as system wide total stable SLB sessions Count. The high watermark of the total number of active calls for the reporting interval.	True
LBINSTANCE_ENABLED	INTEGER	False	Set based on whether SLB license is available at the SLB.	False

Column Name	Column Type	Index	Description	canAggregate
HPC_QUE_OVERFLOW	COUNT	False	The number of HPC calls which experienced unsuccessful call queuing attempts due to full queues for the reporting interval.	True
HPC_QUE_ABANDON	COUNT	False	The number of queued HPC calls abandoned before call completion during the reporting interval.	True
HPC_QUE_TIMEOUTS	COUNT	False	The number of HPC calls removed from the queue due to expiration of the queue timeout timer for the reporting interval.	True
HPC_CTL_TFC_EXEM	COUNT	False	The HPC traffic control exemptions for this reporting interval.	True
SOSBC_RTU_COUNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True
WEB_SOCKET_COUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval.	True
NOTRUF_AUTH	INTEGER	True	Set based on whether NOTRUF license is available at the SBC.	False
CE_NAME	STRING	False	The name of the compute element for this entry.	False
CALL_COUNT_CNE	COUNTER	False	Displayed as system wide total CNE sessions Count. The high water mark of total number of active calls for the reporting interval.	True
L16_LEG_COUNT	COUNTER	False	The high water mark of total number of L16 call legs for the reporting interval.	True
T140	INTEGER	False	Set based on whether the t140 code is used on at least one call leg for the current interval.	True

Column Name	Column Type	Index	Description	canAggregate
DOD	INTEGER	False	Set based on when the application is running in DOD mode.	True
FIPS	INTEGER	False	Set based on when the application is running in FIPS mode.	True
CNEINSTANCE_ENABLED	INTEGER	False	Set based on whether cneInstance license is available at the SBC.	True

CallCountIntervalStats_AG

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
NAME	INTEGER	True	This adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	false	N/A
SUM_MAX_SESSION_COUNT	COUNTER	False	The sum of the high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable. Displayed as maxSessionCallCount.	True	SUM
SUM_MAX_POL_RTU_COUNT	INTEGER	False	The sum of the MAX_SESSION_COUNT if SBC is using SBC-POL-RTU license. If SBC is not using SBC-POL-RTU license, the count is displayed as 0.	True	SUM
SUM_ENCRYPT_COUNT	COUNTER	False	The sum of the system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_SRTP_COUNT	COUNTER	False	The sum of the system wide total Secure Real-time Transport Protocol (SRTP) Call Count; The high watermark of total number of SRTP calls for the specified interval.	True	SUM
SUM_VIDEO_COUNT	COUNTER	False	The sum of the system wide total video Call Count; The high watermark of total number of video calls for the specified interval.	True	SUM
SUM_AMRNB_COUNT	COUNTER	False	The sum of the high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval.	True	SUM
SUM_AMRWB_COUNT	COUNTER	False	The sum of the high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval.	True	SUM
SUM_EVRC_COUNT	COUNTER	False	The sum of the high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval.	True	SUM
SUM_NICEREC_COUNT	COUNTER	False	The sum of the current high watermark of total number of NICE recording calls.	True	SUM
SUM_MRFSESS_COUNT	COUNTER	False	The sum of the current high watermark of total number of Media Resource Function (MRF) calls.	True	SUM
SUM_MAX_PSSX_RTU_COUNT	INTEGER	False	The sum of the MAX_SESSION_COUNT when SBC is using SBC-PSX-RTU license. If SBC is not using SBC-PSX-RTU license it displays the count as 0.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_VDSPRT U_COUNT	COUNTER	False	The sum of the high watermark of total number of trans-coded sessions for the specified interval.	True	SUM
SUM_PDCS_C OUNT	COUNTER	False	The sum of the high watermark of total number of pdcs header sessions for the specified interval.	True	SUM
SUM_SIPREC_ COUNT	COUNTER	False	The sum of the current high watermark of total number of sip recording calls.	True	SUM
SUM_LI_ENAB LED	INTEGER	False	The sum of the count of LI licenses available at the SBC.	True	SUM
SUM_DSPG72 2_ENABLED	INTEGER	False	The sum of the count of DspG722 licenses available at the SBC.	True	SUM
SUM_GMP4X1 _ENABLED	INTEGER	False	The sum of the count of 4X1GMP licenses is available at the SBC.	True	SUM
SUM_SIPI_EN ABLED	INTEGER	False	The sum of the count of Sipl licenses available at the SBC.	True	SUM
SUM_SIP323_ ENABLED	INTEGER	False	The sum of the count of SipRec licenses available at the SBC.	True	SUM
SUM_GMP1X1 0_ENABLED	INTEGER	False	The sum of the count of 1X10GMP licenses available at the SBC.	True	SUM
SUM_CAPACIT Y_ENABLED	INTEGER	False	The sum of the count of Capacity licenses available at the SBC.	True	SUM
SUM_E911_EN ABLED	INTEGER	False	The sum of the count of E911 licenses available at the SBC.	True	SUM
SUM_ENUM_E NABLED	INTEGER	False	The sum of the count of ENUM licenses available at the SBC.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_SWINST ANCE_ENABLED	INTEGER	False	The sum of the count of SWe Instance licenses available at the SBC.	True	SUM
SUM_EVS_CO UNT	COUNT	False	The sum of the high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval.	True	SUM
SUM_SILK_CO UNT	COUNT	False	The sum of the high watermark of total number of SILK Codec Transcode calls for the specified interval.	True	SUM
SUM_SBCRCS _COUNT	COUNT	False	The sum of the high watermark of total number of OOD calls that use an RCS based service for the specified interval.	True	SUM
SUM_LBINSTA NCE_ENABLED	INTEGER	False	The sum of the count of SLB licenses available at the SLB.	True	SUM
SUM_SLB_SES S_COUNT	COUNTER	False	The sum of the total stable SLB sessions count across the system. The high watermark of total number of active calls for the reporting interval.	True	SUM
SUM_HPC_QU E_ATTEMPT	COUNTER	False	The sum of the number of HPC calls that were successfully placed on HPC Call Queuing queues for the reporting interval.	True	SUM
SUM_HPC_QU E_OVERFLOW	COUNTER	False	The sum of the number of HPC calls for which HPC call queuing attempts were unsuccessful because queues were full for the reporting interval.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_HPC_QUEUE_ABANDON	COUNTER	False	The sum of the number of HPC calls that were placed in HPC Call Queuing queues, but were subsequently abandoned before they are completed for the reporting interval.	True	SUM
SUM_HPC_QUEUE_TIMEOUTS	COUNTER	False	The sum of the number of HPC calls that were placed in HPC Call Queuing queues, but were subsequently abandoned before they are completed for the reporting interval.	True	SUM
SUM_HPC_CTRL_TFC_EXEM	COUNTER	False	The sum of the HPC traffic control exemptions for this reporting interval.	True	SUM
SUM_SOSBC_RTU_COUNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True	SUM
AVG_LBINSTANCED_ENABLE	INTEGER	False	Set based on whether the SLB license is available at the SLB.	True	MEAN
AVG_LICENSE_MODE	INTEGER	False	Displays the licensing mode of the SBC.	True	MEAN
WEB_SOCKET_COUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval.	True	SUM
CE_NAME	STRING	False	The name of the compute element for this entry.	False	N/A

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
IN_CALL_FAIL_PROTOCOL_ERROR	COUNTER	No	The number of failed inbound calls due to a protocol error for this trunk group for the specified interval. The SBC increments the counter for this statistic when it receives unrecognized parameters, or all the required parameters are not configured.	True	
IN_CALL_FAIL_UNSPECIFIED	COUNTER	No	Number of inbound failed calls for an unspecified reason for this trunk group for the specified interval.	True	
OUT_CALL_FAIL_NO_ROUTES	COUNTER	No	Number of outbound failed calls due to no route available for this trunk group for the specified interval.	True	
OUT_CALL_FAIL_NO_RESOURCES	COUNTER	No	The number of failed outbound calls due to unavailable resources for this trunk group for the specified interval. The SBC increments the counter for this statistic when the route is not configured and it fails to find the necessary resources.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
OUT_CALL_FAIL_NO_SERVICE	COUNTER	No	The number of failed outbound calls due to service unavailability for this trunk group for the specified interval. The SBC increments the counter for this statistic when outbound call service is not available for this trunk group during the specified interval.	True	
OUT_CALL_FAIL_INVALID_CALL	COUNTER	No	Number of outbound failed calls due to invalid call attempt for this trunk group for the specified interval.	True	
OUT_CALL_FAIL_NETWORK_FAILURE	COUNTER	No	Number of outbound failed calls due to network failure for this trunk group for the specified interval.	True	
OUT_CALL_FAIL_PROTOCOL_ERROR	COUNTER	No	The number of failed outbound calls due to a protocol error for this trunk group for the specified interval. The SBC increments the counter for this statistic when it receives unrecognized parameters, or all the required parameters are not configured.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
OUT_CALL_FAIL_UNSPECIFIED	COUNTER	No	The number of failed outbound calls due to an unspecified reason for this trunk group for the specified interval. The SBC increments the counter for this statistic if the SIP Signaling Port for the egress is disabled while calls are in progress.	True	
ROUTING_FAILURES_RESERVED	COUNTER	No	Number of routing failures due to all circuits reserved for this trunk group for specified interval.	True	
ALLOC_FAIL_BW_LIMIT	COUNTER	No	The number of failed bandwidth requests due to the current usage exceeding the configured bandwidth limit for this trunk group for the specified interval.	True	
ALLOC_FAIL_CALL_LIMIT	COUNTER	No	The number of failed call handling requests due to the current number of concurrent calls exceeding the configured call limit for this trunk group for the specified interval.	True	
NO_PBX_ROUTE	COUNTER	No	Number of failed calls on an ingress trunk group due to no routes returned from the ERE for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
CALL_ABANDONED	COUNTER	No	Number of calls on a toll-free TG that were abandoned while dialing for the specified interval.	True	
CALL_FAIL_POLICING	COUNTER	No	The number of calls for a trunk group that failed during the specified interval due to configured policing rules in the SBC.	True	
SIP_REG_FAIL_POLICING	COUNTER	No	Number SIP registration attempts that failed due to policing on TG for specified interval.	True	
SIP_REG_FAIL_INTERNAL	COUNTER	No	Number SIP registration attempts that failed due to other reasons (signaling failures, and so on) on a trunk group for the specified interval.	True	
SIP_REG_FAIL_OTHER	COUNTER	No	The current number SIP registration attempts that failed due to other reasons (signaling failures, and so on) on a trunk group for the specified interval.	True	
SECURITY_FAIL	COUNTER	No	Number of calls that failed due to mismatch between the peer security and route packet service profile security on trunk group for specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
NON_REG_CALLS_FAILED	COUNTER	No	Number of failed calls due to registration requirement for SIP trunk group for the specified interval.	True	
NON_MATCH_SRC_IP_CALLS_FAILED	COUNTER	No	Number of calls that failed due to mismatched source IP of IAD according to its RCB for the specified interval.	True	
INVALID_SIP_CALLS_FAILED	COUNTER	No	Number of failed calls due to mismatched ingress signaling port from CP according to RCB for the specified interval.	True	
SIP_SUBS_FAIL_POLICING	COUNTER	No	Number of SIP Subscribe attempts that failed due to policing on a trunk group.	True	
SIP_OTHER_REQ_FAIL_POLICING	COUNTER	No	Number of SIP other non-invite attempts that failed due to policing on trunk group.	True	
SIP_OTHER_REQ_FAIL_INTERNAL	COUNTER	No	The count of SIP other non-invite attempts that failed due to policing on a trunk group.	True	
SIP_OTHER_REQ_FAIL_OTHER	COUNTER	No	The count of SIP other non-invite attempts that failed due to policing on a trunk group.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
VIDEO_THRESHOLD_LIMIT	COUNTER	No	The count of exceeded video threshold limits for this shared CAC limits pool.	True

CallIntervalStats

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	False	Show Table Address Context
ZNAME	STRING	Yes	The name of the address context zone.	False	
NAME	STRING	Yes	The name of this trunk group.	True	
IN_USAGE	COUNTER	No	The duration, in seconds, for which all inbound calls in a given interval are using the trunkgroup. This metric is derived using the formula: (total # of inbound calls on the TG) * (interval size) * 60	False	
OUT_USAGE	COUNTER	No	The duration, in seconds, for which all outbound calls in a given interval are using the trunkgroup. This metric is derived using the formula: (total # of outbound calls on the TG) * (interval size) * 60.	True	
IN_CALLS	COUNTER	No	Number of completed inbound calls on this trunk group for the specified interval.	True	
OUT_CALLS	COUNTER	No	Number of completed outbound calls on this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
IN_CALL_ATTEMPTS	COUNTER	No	Number of inbound call attempts on this trunk group for the specified interval.	True	
OUT_CALL_ATTEMPTS	COUNTER	No	Number of outbound call attempts on this trunk group for the specified interval.	True	
MAX_COMPLETED_CALLS	COUNTER	No	The high watermark of total number of active calls in both the inbound and outbound directions on the trunk group for the specified interval. This statistic accounts for calls that are setting up, stable, or tearing down.	True	
CALL_SETUP_TIME	COUNTER	No	Total call setup time for all completed calls in inbound and outbound directions for this trunk group for specified interval measured in hundredths of a second.	True	
CALL_SETUPS	COUNTER	No	Total number of calls setup but not necessarily completed in the inbound and outbound directions for this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ROUTING_ATTEMPTS	COUNTER	No	The number of routing attempts for this trunk group for the specified interval. Each PSX dip can return up to 200 routes. The SBC selects routes based on a number of criteria such as CAC and bandwidth availability. In some cases, crankback/ route advance is needed if the first selected route fails. This metric counts the number of routes attempted before the call succeeded. If the first route succeeds, this counter = 1.	True	
IN_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in Kbits per second multiplied by call duration in seconds) for every inbound call associated with this trunk group for the specified interval.	True	
OUT_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in Kbits per second multiplied by call duration in seconds) in the outbound direction for this trunk group in seconds in the current interval. The trunk group usage is defined as the time a trunk is seized to the time a trunk is released.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
MAX_ACTIVE_BW_USAGE	GAUGE	No	High watermark bandwidth usage (in Kbits per second) in either direction associated with this trunk group for the specified interval.	True	
CALLS_WITH_PKT_OUTAGE	COUNTER	No	Number of calls with a maximum packet outage whose duration exceeds the configured minimum for this trunk group for the specified interval.	True	
CALLS_WITH_PKT_OUTAGE_AT_END	COUNTER	No	Number of calls whose maximum packet outage occurs at the end of the call for this trunk group for the specified interval.	True	
TOTAL_PKT_OUTAGE	COUNTER	No	Summation of packet outage duration (in milliseconds) whose duration exceeds the configured minimum which is reported during the specified performance interval.	True	
MAX_PKT_OUTAGE	GAUGE	No	Single longest maximum reported packet outage duration (in milliseconds) experienced during the specified performance interval for this trunk group.	True	
POD_EVENTS	COUNTER	No	Number of Packet Outage Detection (POD) Events detected for this peer group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
PLAYOUT_BUFFER_GOOD	COUNTER	No	Number of calls with all sub-intervals reporting GOOD playout buffer quality for this trunk group for the specified interval.	True	
PLAYOUT_BUFFER_ACCEPTABLE	COUNTER	No	Number of calls with all sub-intervals reporting ACCEPTABLE or better playout buffer quality for this trunk group for the specified interval.	True	
PLAYOUT_BUFFER_POOR	COUNTER	No	Number of calls with all sub-intervals reporting POOR or better playout buffer quality for this trunk group for the specified interval.	True	
PLAYOUT_BUFFER_UNACCEPTABLE	COUNTER	No	Number of calls with at least one sub-interval reporting UNACCEPTABLE playout buffer quality for this trunk group for the specified interval.	True	
SIP_REG_ATTEMPTS	COUNTER	No	Current number of SIP registration attempts on a trunk group for the specified interval.	True	
SIP_REG_COMPLETIONS	COUNTER	No	Current number of SIP registrations that have successfully completed on a trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
CALLS_WITH_PSX_DIPS	COUNTER	No	The number of calls that made a PSX Dip during the interval (applies to ERE, ePSX and external ePSX).	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
TOTAL_PSX_DIPS	COUNTER	No	The total number of PSX dips for the specified interval (applies to ERE, ePSX and external ePSX). To see the number of calls which made PSX Dips during the interval, see CALLS_WITH_PSX_DIPS metric. Example During the specified interval, two calls made three dips each (due to call redirection, etc.) to the PSX. This is logged as: CALLS_WITH_PSX_DIPS = 2 and TOTAL_PSX_DIPS = 6. If calls do not involve redirection or other complex scenarios such as two-stage dialing and transfers, these two metrics can use the same value.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ACTIVE_REGS	COUNTER	No	Interval number of active registrations on this trunk group.	True	
MAX_ACTIVE_REGS	GAUGE	No	Maximum active registrations on this trunk group (high-watermark achieved on this trunk group).	True	
CALL_LIMIT	GAUGE	No	CALL_LIMIT is the summation of TOTAL_CALLS_AVAILABLE, INBOUND_CALLS_USAGE, PRIORITY_CALL_USAGE, and OUTBOUND_CALLS_USAGE from NBS5200TrunkGroup StatusStats table (when it is not unlimited). Note CALL_LIMIT is different from the Call Limit configured at the SBC 5x00 device.	True	
ACTIVE_SUBS	COUNTER	No	Current number of active subscriptions on this trunk group.	True	
MAX_ACTIVE_SUBS	GAUGE	No	Maximum number of active subscriptions on this trunk group (high-watermark achieved on this trunk group).	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
PEAK_CALL_RATE	GAUGE	No	The current system peak call arrival rate.	True	
ONGOING_CALLS	INTEGER	No	Total number of ongoing calls (nonstable + stable) on this trunk group	True	
STABLE_CALLS	INTEGER	No	Total number of stable calls on this trunk group	True	
CALL_UPDATES	INTEGER	No	Total number of call updates on this trunk group	True	
EMERGENCY_STABLE_CALLS	INTEGER	No	Total number of stable emergency calls on this trunk group	True	
EMERGENCY_ONGOING_CALLS	INTEGER	No	Total number of emergency calls (stable + nonstable) on this trunk group	True	
CE_NAME	STRING	No	The name of the compute element for this entry.	False

QUERIES	GAUGE	No	The number of queries made by the DNS client to this DNS server.	False	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
TIMEOUTS	GAUGE	No	The number of timeouts resulting from the queries made by the DNSC client to this DNS server.	False	
ERRORS	GAUGE	No	The number of errors resulting from the queries made by the DNSC client to this DNS server.	False	
REFERRALS	GAUGE	No	The number of referrals resulting from the queries made by the DNSC client to this DNS server.	False	
TOTAL_TCP_CONNECTION	GAUGE	No	The number of tries for connecting to DNS server.	True	
TCP_CONNECTION_FAILED	GAUGE	No	The number of times SBC failed to connect to DNS server.	True	
TCP_CONNECTION_SUCCESS	GAUGE	No	The number of successful TCP connection to DNS server.	True	
TCP_CONNECTION_TORN_DOWN	GAUGE	No	The number of TCP connection torn down with DNS server.	True	
TCP_FALLBACK	GAUGE	No	The number of times tcp fallback with DNS server.	True	
EDNS_STATUS	INTEGER	No	The number of times tcp fallback with DNS server.	True	
CE_NAME	STRING	No	The name of the compute element for this entry.	False	

DSP Stats

DspResDspCallIntervalStats

Column Name	Column Type	Index	Description	CLI Command Reference
SYSTEM_NAME	STRING	Yes	Name of the system.	Show Table System
NUM_CALL_NO_DSP_ALLOC_FAIL	COUNTER	No	Number of call was successful without DSP resource allocation failure during an interval.	
NUM_CALL_WITH_DSP_ALLOC_FAIL	COUNTER	No	Number of call was successful with DSP resource allocation failure during an interval.	
NUM_CALL_FAIL_NO_G729	COUNTER	No	Number of call failed due to lack of G729 DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_G729	COUNTER	No	Number of call fails due to reason other than lack G729 DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_G729	COUNTER	No	Number of call was successful even though lack of G729 DSP resource during an interval.	
NUM_CALL_FAIL_NO_G726	COUNTER	No	Number of call failed due to lack of G726 DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_G726	COUNTER	No	Number of call fails due to reason other than lack G726 DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_SUCCESS_NO_G726	COUNTER	No	Number of call was successful even though lack of G726 DSP resource during an interval.	
NUM_CALL_FAIL_NO_G711_PACKET	COUNTER	No	Number of call failed due to lack of G711 Packet DSP resource during an interval.	
NUM_CALL_FAIL_ON_G711_PACKET	COUNTER	No	Number of call fails due to reason other than lack G711 Packet DSP resource during an interval.	
NUM_CALL_NO_G711_PACKET	COUNTER	No	Number of call was successful even though lack of G711 Packet DSP resource during an interval.	
NUM_CALL_FAIL_NO_G723	COUNTER	No	Number of call failed due to lack of G723 DSP resource during an interval.	
NUM_CALL_FAIL_ON_G723	COUNTER	No	Number of call fails due to reason other than lack G723 DSP resource during an interval.	
NUM_CALL_NO_G723	COUNTER	No	Number of call was successful even though lack of G723 DSP resource during an interval.	
NUM_CALL_FAIL_NO_ILBC	COUNTER	No	Number of call failed due to lack of ILBC DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_ON_ILBC	COUNTER	No	Number of call fails due to reason other than lack ILBC DSP resource during an interval.	
NUM_CALL_NO_ILBC	COUNTER	No	Number of call was successful even though lack of ILBC DSP resource during an interval.	
NUM_CALL_FAIL_NO_EVRCB	COUNTER	No	Number of call failed due to lack of EVRCB0 DSP resource during an interval.	
NUM_CALL_FAIL_ON_EVRCB	COUNTER	No	Number of call fails due to reason other than lack EVRCB0 DSP resource during an interval.	
NUM_CALL_NO_EVRCB	COUNTER	No	Number of call was successful even though lack of EVRCB0 DSP resource during an interval.	
NUM_CALL_FAIL_NO_GSM	COUNTER	No	Number of call failed due to lack of AMRNB DSP resource during an interval.	
NUM_CALL_FAIL_ON_GSM	COUNTER	No	Number of call fails due to reason other than lack AMRNB DSP resource during an interval.	
NUM_CALL_NO_GSM	COUNTER	No	Number of call was successful even though lack of AMRNB DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_NO_AMRWB	COUNTER	No	Number of call failed due to lack of AMRWB DSP resource during an interval.	
NUM_CALL_FAIL_ON_AMRWB	COUNTER	No	Number of call fails due to reason other than lack AMRWB DSP resource during an interval.	
NUM_CALL_NO_AMRWB	COUNTER	No	Number of call was successful even though lack of AMRWB DSP resource during an interval.	
NUM_CALL_FAIL_NO_G722	COUNTER	No	Number of call failed due to lack of G722 DSP resource during an interval.	
NUM_CALL_FAIL_ON_G722	COUNTER	No	Number of call fails due to reason other than lack G722 DSP resource during an interval.	
NUM_CALL_NO_G722	COUNTER	No	Number of call was successful even though lack of G722 DSP resource during an interval.	
NUM_CALL_FAIL_NO_TONE	COUNTER	No	Number of call failed due to lack of TONE DSP resource during an interval.	
NUM_CALL_FAIL_ON_TONE	COUNTER	No	Number of call fails due to reason other than lack TONE DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_NO_TONE	COUNTER	No	Number of call was successful even though lack of TONE DSP resource during an interval.	
NUM_CALL_FAIL_NO_EVRC	COUNTER	No	Number of call failed due to lack of EVRC DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_EVRC	COUNTER	No	Number of call fails due to reason other than lack EVRC DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_EVRC	COUNTER	No	Number of call was successful even though lack of EVRC DSP resource during an interval.	
NUM_CALL_FAIL_NO_G7221	COUNTER	No	Number of call failed due to lack of G7221 DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_G7221	COUNTER	No	Number of call fails due to reason other than lack G7221 DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_G7221	COUNTER	No	Number of call was successful even though lack of G7221 DSP resource during an interval.	
NUM_CALL_FAIL_NO_EFR	COUNTER	No	Number of call failed due to lack of Efr DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_OTHER_ON_EFR	COUNTER	No	Number of call fails due to reason other than lack Efr DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_EFR	COUNTER	No	Number of call was successful even though lack of Efr DSP resource during an interval.	
NUM_CALL_FAIL_NO_OPUS	COUNTER	No	Number of call failed due to lack of OPUS DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_OPUS	COUNTER	No	Number of call fails due to reason other than lack of OPUS DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_OPUS	COUNTER	No	Number of call was successful even though lack of OPUS DSP resource during an interval.	
NUM_CALL_FAIL_NO_SILK8	COUNT	No	Number of calls failed due to lack of SILK_8 DSP resource.	
NUM_CALL_FAIL_OTHER_SILK8	COUNT	No	Number of calls failed due to reason other than lack of SILK_8 DSP resource.	
NUM_CALL_SUCCESS_NO_SILK8	COUNT	No	Number of calls successful even with lack of SILK_8 DSP resource.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_NO_SILK16	COUNT	No	Number of calls successful even with lack of SILK_8 DSP resource.	
NUM_CALL_FAIL_OTHER_SILK16	COUNT	No	Number of calls failed due to reason other than lack of SILK_16 DSP resource.	
NUM_CALL_SUCCESS_NO_SILK16	COUNT	No	Number of calls successful even with lack of SILK_16 DSP resource.	
NUM_CALL_FAIL_NO_EVS	INTEGER	No	The number of call fails due to the lack of EVS DSP resource during a time interval.	
NUM_CALL_FAIL_OTHER_EVS	INTEGER	No	The number of call fails due to a reason other than the lack of EVS DSP resource during a time interval.	
NUM_CALL_SUCCESS_NO_EVS	INTEGER	No	The number of calls was successful despite the lack of EVS DSP resource during a time interval.	
NUM_CALL_FAIL_L16	COUNT	False	The number of call failed due to lack of L16 DSP resource during a interval time.	
NUM_CALL_FAIL_OTHER_L16	COUNT	False	The number of call fails due to reason other than lack of L16 DSP resource during a interval time.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_SUCCESS_L16	COUNT	False	The number of call was successful even though lack of L16 DSP resource during a interval time.	
CE_NAME	STRING	No	The name of the compute element for this entry.

H245_MESSAGES_SENT	COUNTER64	No	Number of H.245 messages that sent since system boot up.	

Column Name	Column Type	Index	Description	CLI Command Reference
H245_MESSAGE_BYTES_SENT	COUNTER64	No	Number of bytes of H.245 messages that sent since system boot up.	
H245_MESSAGES_RCVD	COUNTER64	No	Number of H.245 messages that are received since system boot up.	
H245_MESSAGE_BYTES_RCVD	COUNTER64	No	Number of bytes of H.245 messages that are received since system boot up.	
ACTIVE_CALLS	INTEGER	No	Number of Active calls at this moment.	
H225_TCP_PORTS_OPENED	INTEGER	No	Number of H.225 TCP ports opened at this moment.	
H245_TCP_PORTS_OPENED	INTEGER	No	Number of H.245 TCP ports opened at this moment.	
H245_TCP_PORTS_ALLOCATED	INTEGER	No	Number of H.245 TCP ports allocated at this moment.	
CE_NAME	STRING	No	The name of the compute element for this entry.	

IcmpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	NA
IN_MSGS	COUNTER	No	The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.	

Column Name	Column Type	Index	Description	CLI Command Reference
IN_ECHOS	COUNTER	No	The number of ICMP Echo (request) messages received.	
IN_ECHO_REPS	COUNTER	No	The number of ICMP Echo Reply messages received.	
IN_DEST_UNREACHS	COUNTER	No	The number of ICMP Destination Unreachable messages received.	
IN_ERRORS	COUNTER	No	The number of ICMP messages which the entity received but determined as having ICMP-specific errors (such as, bad ICMP checksums, bad length).	
OUT_MSGS	COUNTER	No	The total number of ICMP messages which this entity attempted to send. Note that this counter includes all those counted by icmpOutErrors.	
OUT_ERRORS	COUNTER	No	The number of ICMP messages which this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations, any type of error that contributes to the value of this counter may not exist.	
OUT_ECHOS	COUNTER	No	The number of ICMP Echo (request) messages sent.	
OUT_ECHO_REPS	COUNTER	No	The number of ICMP Echo Reply messages sent.	

Column Name	Column Type	Index	Description	CLI Command Reference
OUT_DEST_UN REACHS	COUNTER	No	The number of ICMP Destination Unreachable messages sent.

IpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	NA

Column Name	Column Type	Index	Description	CLI Command Reference
IN_RECEIVES	COUNTER	No	The total number of input datagrams received from interfaces, including those received in error.	
IN_HDR_ERRORS	COUNTER	No	The number of input datagrams discarded due to errors such as errors in IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options.	
IN_ADDR_ERRORS	COUNTER	No	The number of input datagrams discarded because the IP address in the destination field of the IP header was not a valid address for this entity to receive. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported Classes (for example, Class E). For entities which are not IP routers and do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.	
IN_UNKNOWN_PROTOS	COUNTER	No	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.	

Column Name	Column Type	Index	Description	CLI Command Reference
IN_DISCARDS	COUNTER	No	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.	
IN_DELIVERS	COUNTER	No	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).	
OUT_REQUESTS	COUNTER	No	The total number of IP datagrams which local IP user- protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.	
OUT_DISCARDS	COUNTER	No	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space). Note that this counter includes datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.	

Column Name	Column Type	Index	Description	CLI Command Reference
OUT_NO_ROUTE	COUNTER	No	The number of IP datagrams discarded because no route could transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this no-route criterion. This also includes any datagrams which a host cannot route because all of its default routers are down.	
REASM_TIMEOUT	INTEGER	No	The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.	
REASM_REQDS	COUNTER	No	The number of IP fragments received that this entity needs to reassemble.	
REASM_OKS	COUNTER	No	The number of IP datagrams successfully re-assembled.	
REASM_FAILS	COUNTER	No	The number of failures detected by the IP re-assembly algorithm (for reasons such as timed out, errors). Note that this is not necessarily a count of discarded IP fragments since some algorithms (like the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.	
FRAG_OKS	COUNTER	No	The number of IP datagrams successfully fragmented at this entity.	
FRAG_FAILS	COUNTER	No	The number of IP datagrams discarded because this entity must, but cannot, fragment the IP datagrams. For example, because their Don't Fragment flag was set.	

IpPolicingSystemIntStats

Column Name	Column Type	Index	Description	CLI Command Reference

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_MAJOR_DECRYPT_ALARM_DURATION	COUNTER	No	The average of current duration of the major alarms in seconds for SRTP decrypt discards.	True	SUM
CE_NAME	STRING	No	The name of the compute element for this entry.	False	N/A

Link Stats

LinkDetectionGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Link Detection Group - CLI
NAME	STRING	Yes	The link failure statistics per trunk group.	
SINGLE_FAILURES	INTEGER	No	The number of times a link monitor within this link detection group failed to receive a single echo reply. The first reattempt was successful.	
DOUBLE_FAILURES	INTEGER	No	The number of times a link monitor within this link detection group failed to receive two consecutive echo replies. The second (next) reattempt was successful.	
FAILURES	INTEGER	No	The number of times a link monitor within this link detection group declared itself failed.	
CE_NAME	STRING	No	The name of the compute element for this entry.	

LinkMonitorStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Link Detection Group - CLI
GNAME	STRING	Yes	The name of the address context group.	
NAME	STRING	Yes	The name of the link monitor that monitors a link to a destination for a specific interface.	
MIN_TIME	INTEGER	No	The minimum time (in microseconds) used to get a reply for an echo request packet.	
MAX_TIME	INTEGER	No	The maximum time (in microseconds) used to get a reply for an echo request packet.	
AVERAGE_TIME	INTEGER	No	The average time (in microseconds) used to get a reply for an echo request packet.	
SINGLE_FAILURES	INTEGER	No	The number of single failures for this IP interface.	
DOUBLE_FAILURES	INTEGER	No	The number of double failures for this IP interface.	
FAILURES	INTEGER	No	The number of failures for this IP interface.	
REPLIES	INTEGER	No	The total number of replies.	
DUPLICATE_REPLIES	INTEGER	No	The number of duplicate replies.	
LATE_REPLIES	INTEGER	No	The number of late replies.	

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	No	The name of the compute element for this entry.

AVG_TX_ACTUAL_BWUTIL	Gauge	False	Tracks the average outgoing BW utilization during the KPI bin interval based on total available BW instead of negotiated BW.	
PEAK_TX_ACTUAL_BWUTIL	Gauge	False	Tracks the maximum outgoing BW utilization during the KPI bin interval expressed as a percentage of the available BW.	
BWALARM_THRESHOLD_EXCEEDED	Gauge	False	Tracks the total number of times the BW alarm threshold was passed in the upward direction during the bin interval	

Column Name	Column Type	Index	Description	CLI Command Reference
BWALARM_CLEARED	GAUGE	False	Tracks the total number of times the BW clear alarm threshold was passed in the downward direction during the bin interval.	
AVG_USAGE_BW	GAUGE	False	Tracks the Average Bandwidth Usage during KPI bin interval	
PEAK_USAGE_BW	GAUGE	False	Tracks the Peak Bandwidth Usage during KPI bin interval.	
CE_NAME	STRING	True	The host name of the server.	
PORT_NAME	STRING	True	The name of this port.	
NEGOTIATED_SPEED	INTEGER	False	The interface speed. Packet port speed is not negotiable.	
LINK_STATE	INTEGER	False	The state of the interface.	
MAX_BANDWIDTH	GAUGE	False	Maximum bandwidth this port can support, bytes/sec.	
ALLOCATED_BANDWIDTH	GAUGE	False	Bandwidth the active media streams on this port reserve, bytes/sec.	
RX_BANDWIDTH	GAUGE	False	Actual Rx bandwidth in use on this port, bytes/sec.	
TX_BANDWIDTH	GAUGE	False	Actual Tx bandwidth in use on this port, bytes/sec.	
BANDWIDTH_USAGE	GAUGE	False	Percentage of maximum bandwidth allocated on this port.	
BANDWIDTH_DEVIATION	GAUGE	False	Percentage of deviation of actual bandwidth from the allocated bandwidth.	
MAC_ADDRESS	STRING	False	The MAC address of the network interface.	

Column Name	Column Type	Index	Description	CLI Command Reference
IF_INDEX	GAUGE	False	The unique ifIndex of this Packet NIF.

USAGE_AMR_WBT140_TOTAL	INTEGER	False	Total AMR-WB with T.140 resource capacity in the server.		

Column Name	Column Type	Index	Description	Aggregate Type	CLI Command Reference
USAGE_AMR_WBT140_UTILIZATION	INTEGER	False	The utilization percentage of AMR-WB with T.140 resource in the server.		
COMP_HP_UTILIZATION	INTEGER	False	Percentage utilization of AMR-WB with T.140 resource on this server.		
RESOURCE_HP_UTILIZATION	INTEGER	False	Percentage utilization of tone resources used for high priority calls on this server.		
DSP_EVS_T140_TOTAL	INTEGER	False	Total EVS with T.140 resource capacity on this server.		
DSP_EVS_T140_UTILIZATION	INTEGER	False	Percentage utilization of EVS with T.140 resources on this server		
G711T140_TOTAL	GAUGE	False	The total G711 with T.140 resource capacity on this server.	MEAN	
G711T140_UTILIZATION	GAUGE	False	The percentage utilization of G711 with T.140 resources on this server.	MEAN	
G711SST140_TOTAL	GAUGE	False	The total G711SS with T.140 resource capacity on this server.	MEAN	

Column Name	Column Type	Index	Description	Aggregate Type	CLI Command Reference
G711SST140_UTILIZATION	GAUGE	False	The percentage utilization of G711SS with T.140 resources on this server.	MEAN	
OPUST140_TOTAL	GAUGE	False	The total Opus with T.140 resource capacity on this server.	MEAN	
OPUST140_UTILIZATION	GAUGE	False	The percentage utilization of Opus with T.140 resources on this server.	MEAN	
G722T140_TOTAL	GAUGE	False	The total G722 with T.140 resource capacity on this server.	MEAN	
G722T140_UTILIZATION	GAUGE	False	The percentage utilization of G722 with T.140 resources on this server.	MEAN	
G722V8T140_TOTAL	GAUGE	False	The total G722 V8 with T.140 resource capacity on this server.	MEAN	
G722V8T140_UTILIZATION	GAUGE	False	The percentage utilization of G722 V8 with T.140 resources on this server.	MEAN	
G711V8T140_TOTAL	GAUGE	False	The total G711 V8 with T.140 resource capacity on this server.	MEAN	

Column Name	Column Type	Index	Description	Aggregate Type	CLI Command Reference
G711V8T140_UTILIZATION	GAUGE	False	The percentage utilization of G711 V8 with T.140 resources on this server.	MEAN	
G711SSV8T140_TOTAL	GAUGE	False	The total G711SS V8 with T.140 resource capacity on this server.	MEAN	
G711SSV8T140_UTILIZATION	GAUGE	False	The percentage utilization of G711SS V8 with T.140 resources on this server.	MEAN	
L16_TOTAL	GAUGE	False	The total L16 resource capacity on this server.	MEAN	
L16_UTILIZATION	GAUGE	False	The percentage utilization of L16 resources on this server.	MEAN	
CE_NAME	STRING	False	The name of the compute element for this entry.	N/A

CE_NAME	STRING	No	The name of the compute element for this entry.	False	N/A	

Shared CAC Stats

SharedCacFailureIntStats

Column Name	Column Type	Index	Description	canAggregate
NAME	STRING	True	The name of this shared CAC-limits pool.	False

Column Name	Column Type	Index	Description	canAggregate
ALLOC_FAIL_BW_LIMIT	GAUGE	False	The number of BW Requests which fail because the specified interval for this shared CAC limits pool exceeds the configured bandwidth limit.	True
ALLOC_FAIL_CALL_LIMIT	GAUGE	False	The number of BW Requests which fail because the specified interval for this shared CAC limits pool exceeds the configured call limit.	False
ALLOC_FAIL_PARENT_CONSTRAINT	GAUGE	False	The current number of failures because of a parent limit denial for the specified interval.	False
ALLOC_FAIL_SIP_REG	GAUGE	False	The number of SIP registration attempts that fail because the specified interval for this shared CAC limits pool exceeds the configured registration limit.	False
SIP_SUBS_FAIL_POLICING	GAUGE	False	The current number of SIP Subscribe attempts that failed due to policing on a trunk group.	False
SIP_OTHER_REQ_FAIL_POLICING	GAUGE	False	The current number of SIP other non-invite attempts that failed due to policing on a trunk group.	False
VIDEO_THRESHOLD_LIMIT	COUNTER	False	The number of exceeded video threshold limits for this shared CAC limits pool.	True
CE_NAME	STRING	False	The name of the compute element for this entry.	False

SharedCacIntervalStatistics

Column Name	Column Type	Index	Description	canAggregate
NAME	STRING	True	The name of this shared CAC-limits pool.	False

Column Name	Column Type	Index	Description	canAggregate
MAX_ACTIVE_CALLS	GAUGE	False	The current high watermark of total number of active calls in both the inbound and outbound directions using limits from this shared CAC limits pool.	False
IN_BW_USAGE	GAUGE	False	The sum of BW usage (expected data rate in bits per second multiplied by call duration in seconds) for every inbound call associated with this shared CAC limits pool for the specified interval.	False
OUT_BW_USAGE	GAUGE	False	The sum of BW usage (expected data rate in bits per second multiplied by call duration in seconds) for every outbound call associated with this shared CAC limits pool for the specified interval.	False
MAX_ACTIVE_BW_USAGE	GAUGE	False	The high watermark of BW usage in either direction associated with this shared CAC limits pool for the specified interval.	False
ACTIVE_REGS	GAUGE	False	The current number of active registrations of this shared CAC-limits pool.	False
MAX_ACTIVE_REGS	GAUGE	False	The number of maximum active registrations of this shared CAC-limits pool (this is the high-watermark achieved on this pool during this interval).	False
ACTIVE_SUBS	GAUGE	False	The current number of active subscriptions on this shared CAC-limits pool.	False
MAX_ACTIVE_SUBS	GAUGE	False	The current number of maximum active subscriptions on this shared CAC-limits pool. (This is the high-watermark achieved on this shared CAC).	False
CE_NAME	STRING	False	The name of the compute element for this entry.	False

ROUTE_ATTEMPTS_ORR	GAUGE	No	The number of reroute attempts due to ORR for this trunk group for the specified interval.	
ROUTE_ATTEMPTS_SORR	GAUGE	No	The number of reroute attempts due to SORR for this trunk group for the specified interval.	
SUCCESSFUL_IRR	GAUGE	No	The number of successful reroutes due to IRR for this trunk group for the specified interval.	
SUCCESSFUL_SIRR	GAUGE	No	The number of successful reroutes due to SIRR for this trunk group for the specified interval.	
SUCCESSFUL_ORR	GAUGE	No	The number of successful reroutes due to ORR for this trunk group for the specified interval.	
SUCCESSFUL_SORR	GAUGE	No	The number of successful reroutes due to SORR for this trunk group for the specified interval.	
CE_NAME	STRING	No	The name of the compute element for this entry.	

UdpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	Show Table Address Context
IN_DATAGRAMS	COUNTER	No	The total number of UDP datagrams delivered to UDP users.	
OUT_DATAGRAMS	COUNTER	No	The total number of UDP datagrams sent from this entity.	
UNKNOWN_PORTS	COUNTER	No	The total number of received UDP datagrams for which there was no application at the destination port.	
IN_ERRORS	COUNTER	No	The number of received UDP datagrams that this entity cannot deliver for reasons other than the lack of an application at the destination port.

Note

- SBX7K is considered as a subtype now. Hence, the names of all the statistics are same as SBX5K. To get the exported file names in the SBX7K format, enable **Use Sub Type in file name** and **Use Sub Type in exported SBX7K file names** in [Configure Performance Management Export Options](#). For example, the earlier exported file name used to be: SBC7KSystemDspStatusDspUsageStats. The new file name is SBX5KSystemDspStatusDspUsageStats.
- The statistics tables names are listed in the following format
<name of the table in the exported CSV file>/<name of the table in the Ribbon Application Management Platform (RAMP) PM profile>
- If the table name is same in the exported CSV file and the RAMP PM profile, it is listed only once.

Call Stats

CallCountIntervalStats

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
NAME	INTEGER	True	Adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	True	
MAX_SESSION_COUNT	COUNTER	False	Displayed as maxSessionCallCount. The high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable.	True	
MAX_POL_RTU_COUNT	INTEGER	False	Displays the same count as MAX_SESSION_COUNT if SBC is using SBC-POL-RTU license. If SBC is not using SBC-POL-RTU license, the count is displayed as 0.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ENCRYPT_COUNT	COUNTER	False	Displayed as system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True	
SRTP_COUNT	COUNTER	False	Displayed as system wide total Secure Real-time Transport Protocol (SRTP) Call Count; The high watermark of total number of SRTP calls for the specified interval.	True	
VIDEO_COUNT	COUNTER	False	Displayed as system wide total video Call Count; The high watermark of total number of video calls for the specified interval.	True	
AMRNB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval.	True	
AMRWB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval.	True	
EVRC_COUNT	COUNTER	False	The high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval.	True	
NICEREC_COUNT	COUNTER	False	The current high watermark of total number of NICE recording calls.	True	
MRFSESS_COUNT	COUNTER	False	The current high watermark of total number of Media Resource Function (MRF) calls.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
MAX_PSX_RTU_COUNT	INTEGER	False	Displays MAX_SESSION_COUNT when SBC is using SBC-PSX-RTU license. If SBC is not using SBC-PSX-RTU license it displays the count as 0.	True	
VDSPRTU_COUNT	COUNTER	False	The high watermark of total number of trans-coded sessions for the specified interval.	True	
PDCS_COUNT	COUNTER	False	The high watermark of total number of pdcs header sessions for the specified interval.	True	
SIPREC_COUNT	COUNTER	False	The current high watermark of total number of sip recording calls.	True	
LI_ENABLED	INTEGER	False	Set based on whether LI license is available at the SBC.	True	
DSPG722_ENABLED	INTEGER	False	Set based on whether DspG722 license is available at the SBC.	True	
GMP4X1_ENABLED	INTEGER	False	Set based on whether 4X1GMP license is available at the SBC.	True	
SIPI_ENABLED	INTEGER	False	Set based on whether Sipl license is available at the SBC.	True	
SIP323_ENABLED	INTEGER	False	Set based on whether SipRec license is available at the SBC.	True	
GMP1X10_ENABLED	INTEGER	False	Set based on whether 1X10GMP license is available at the SBC.	True	
CAPACITY_ENABLED	INTEGER	False	Set based on whether Capacity license is available at the SBC.	True	
E911_ENABLED	INTEGER	False	Set based on whether E911 license is available at the SBC.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ENUM_ENABLED	INTEGER	False	Set based on whether ENUM license is available at the SBC.	True	
SWINSTANCE_ENABLED	INTEGER	False	Set based on whether Swe Instance license is available at the SBC.	True	
EVS_COUNT	COUNT	False	The high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval.	True	
SILK_COUNT	COUNT	False	The high watermark of total number of SILK Codec Transcode calls for the specified interval.	True	
SBCRCS_COUNT	COUNT	False	The high watermark of total number of OOD calls that use an RCS based service for the specified interval.	True	
SLBSESS_COUNT	COUNT	False	Displayed as system wide total stable SLB sessions Count. The high watermark of the total number of active calls for the reporting interval.	True	
LBINSTANCE_ENABLED	INTEGER	False	Set based on whether SLB license is available at the SLB.	False	
HPC_QUEUE_ATTEMPT	COUNT	False	The number of HPC calls successfully placed on HPC Call Queuing queues for the reporting interval.	True	
HPC_QUEUE_OVERFLOW	COUNT	False	The number of HPC calls which experienced unsuccessful call queuing attempts due to full queues for the reporting interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
HPC_QUE_ABANDON	COUNT	False	The number of queued HPC calls abandoned before call completion during the reporting interval.	True	
HPC_QUE_TIMEOUTS	COUNT	False	The number of HPC calls removed from the queue due to expiration of the queue timeout timer for the reporting interval.	True	
HPC_CTL_TFC_EXEM	COUNT	False	The HPC traffic control exemptions for this reporting interval.	True	
SOSBC_RT_U_COUNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True	
WEB_SOCKET_COUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval.	True	
CE_NAME	STRING	No	The name of the compute element for this entity.	False	

CallFailIntervalStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context
ZNAME	STRING	Yes	The name of the address context zone.	
NAME	STRING	Yes	The name of this trunk group.	
IN_CALL_FAIL_NO_ROUTES	COUNTER	No	Number of inbound failed calls because there was no route available for this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
IN_CALL_FAIL_NO_RESOURCE_S	COUNTER	No	Number of inbound failed calls because there was an unavailable resource for this trunk group for the specified interval.	
IN_CALL_FAIL_NO_SERVICE	COUNTER	No	Number of inbound failed calls because there was an unavailable service for this trunk group for the specified interval.	
IN_CALL_FAIL_INVALID_CALL	COUNTER	No	Number of inbound failed calls because there was an invalid call attempt for this trunk group for the specified interval.	
IN_CALL_FAIL_NETWORK_FAILURE	COUNTER	No	Number of inbound failed calls because there was a network failure for this trunk group for the specified interval.	
IN_CALL_FAIL_PROTOCOL_ERROR	COUNTER	No	Number of inbound failed calls because there was a protocol error for this trunk group for the specified interval.	
IN_CALL_FAIL_UNSPECIFIED	COUNTER	No	Number of inbound failed calls for an unspecified reason for this trunk group for the specified interval.	
OUT_CALL_FAIL_NO_ROUTES	COUNTER	No	Number of outbound failed calls due to no route available for this trunk group for the specified interval.	
OUT_CALL_FAIL_NO_RESOURCES	COUNTER	No	Number of outbound failed calls due to unavailable resource for this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
OUT_CALL_FAIL_NO_SERVICE	COUNTER	No	Number of outbound failed calls due to unavailable service for this trunk group for the specified interval.	
OUT_CALL_FAIL_INVALID_CALL	COUNTER	No	Number of outbound failed calls due to invalid call attempt for this trunk group for the specified interval.	
OUT_CALL_FAIL_NETWORK_FAILURE	COUNTER	No	Number of outbound failed calls due to network failure for this trunk group for the specified interval.	
OUT_CALL_FAIL_PROTOCOL_ERROR	COUNTER	No	Number of outbound failed calls due to protocol error for this trunk group for the specified interval.	
OUT_CALL_FAIL_UNSPECIFIED	COUNTER	No	Number of outbound failed calls for an unspecified reason for this trunk group for the specified interval.	
ROUTING_FAILURES_RESV	COUNTER	No	Number of routing failures due to all circuits reserved for this trunk group for specified interval.	
ALLOC_FAIL_BANDWIDTH_LIMIT	COUNTER	No	Number of bandwidth Requests which fail because the specified interval of this trunk group exceeds the configured bandwidth limit.	
ALLOC_FAIL_CALL_LIMIT	COUNTER	No	Number of bandwidth Requests which fail because the specified interval of this trunk group exceeds the configured call limit.	

Column Name	Column Type	Index	Description	CLI Command Reference
NO_PSX_ROUTE	COUNTER	No	Number of failed calls on an ingress trunk group due to no routes returned from the ERE for the specified interval.	
CALL_ABANDONED	COUNTER	No	Number of calls on a toll-free TG that were abandoned while dialing for the specified interval.	
CALL_FAIL_POLICING	COUNTER	No	Number of calls on a trunk group that failed due to policing for the specified interval.	
SIP_REG_FAIL_POLICING	COUNTER	No	Number SIP registration attempts that failed due to policing on TG for specified interval.	
SIP_REG_FAIL_INTERNAL	COUNTER	No	Number SIP registration attempts that failed due to other reasons (signaling failures, and so on) on a trunk group for the specified interval.	
SIP_REG_FAIL_OTHER	COUNTER	No	The current number SIP registration attempts that failed due to other reasons (signaling failures, and so on) on a trunk group for the specified interval.	
SECURITY_FAIL	COUNTER	No	Number of calls that failed due to mismatch between the peer security and route packet service profile security on trunk group for specified interval.	
NON_REG_CALLS_FAILED	COUNTER	No	Number of failed calls due to registration requirement for SIP trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NON_MATCH_SRC_IP_CALLS_FAIL	COUNTER	No	Number of calls that failed due to mismatched source IP of IAD according to its RCB for the specified interval.	
INVALID_SPCALLS_FAILED	COUNTER	No	Number of failed calls due to mismatched ingress signaling port from CP according to RCB for the specified interval.	
SIP_SUBS_FAIL_POLICING	COUNTER	No	Number of SIP Subscribe attempts that failed due to policing on a trunk group.	
SIP_OTHER_REQ_FAIL_POLICING	COUNTER	No	Number of SIP other non-invite attempts that failed due to policing on trunk group.	
SIP_OTHER_REQ_FAIL_INTERNAL	COUNTER	No	The number of SIP other non-invite attempts that failed due to policing on a trunk group.	
SIP_OTHER_REQ_FAIL_OTHER	COUNTER	No	The number of SIP other non-invite attempts that failed due to policing on a trunk group.	
VIDEO_THRESH_HOLD_LIMIT	COUNTER	No	The number of video threshold limits that the specified interval for this trunk group exceeds.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

CallIntervalStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context

Column Name	Column Type	Index	Description	CLI Command Reference
ZNAME	STRING	Yes	The name of the address context zone.	
NAME	STRING	Yes	The name of this trunk group.	
IN_USAGE	COUNTER	No	The duration, in seconds, for which all inbound calls in a given interval are using the trunkgroup. This metric is derived using the formula: (total # of inbound calls on the TG) * (interval size) * 60	
OUT_USAGE	COUNTER	No	The duration, in seconds, for which all outbound calls in a given interval are using the trunkgroup. This metric is derived using the formula: (total # of outbound calls on the TG) * (interval size) * 60.	
IN_CALLS	COUNTER	No	Number of completed inbound calls on this trunk group for the specified interval.	
OUT_CALLS	COUNTER	No	Number of completed outbound calls on this trunk group for the specified interval.	
IN_CALL_ATTEMPTS	COUNTER	No	Number of inbound call attempts on this trunk group for the specified interval.	
OUT_CALL_ATTEMPTS	COUNTER	No	Number of outbound call attempts on this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
MAX_COMPLETED_CALLS	COUNTER	No	The high watermark of total number of active calls in both the inbound and outbound directions on the trunk group for the specified interval. This statistic accounts for calls that are setting up, stable, or tearing down.	
CALL_SETUP_TIME	COUNTER	No	Total call setup time for all completed calls in inbound and outbound directions for this trunk group for specified interval measured in hundredths of a second.	
CALL_SETUPS	COUNTER	No	Total number of calls setup but not necessarily completed in the inbound and outbound directions for this trunk group for the specified interval.	
ROUTING_ATTEMPTS	COUNTER	No	The number of routing attempts for this trunk group for the specified interval. Each PSX dip can return up to 200 routes. The SBC selects routes based on a number of criteria such as CAC and bandwidth availability. In some cases, crankback/route advance is needed if the first selected route fails. This metric counts the number of routes attempted before the call succeeded. If the first route succeeds, this counter = 1.	

Column Name	Column Type	Index	Description	CLI Command Reference
IN_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in Kbits per second multiplied by call duration in seconds) for every inbound call associated with this trunk group for the specified interval.	
OUT_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in Kbits per second multiplied by call duration in seconds) in the outbound direction for this trunk group in seconds in the current interval. The trunk group usage is defined as the time a trunk is seized to the time a trunk is released.	
MAX_ACTIVE_BW_USAGE	GAUGE	No	High watermark bandwidth usage (in Kbits per second) in either direction associated with this trunk group for the specified interval.	
CALLS_WITH_PKT_OUTAGE	COUNTER	No	Number of calls with a maximum packet outage whose duration exceeds the configured minimum for this trunk group for the specified interval.	
CALLS_WITH_PKT_OUTAGE_AT_END	COUNTER	No	Number of calls whose maximum packet outage occurs at the end of the call for this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
TOTAL_PKT_OUTAGE	COUNTER	No	Summation of packet outage durations (in milliseconds) whose duration exceeds the configured minimum which is reported during the specified performance interval.	
MAX_PKT_OUTAGE	GAUGE	No	Single longest maximum reported packet outage duration (in milliseconds) experienced during the specified performance interval for this trunk group.	
POD_EVENTS	COUNTER	No	Number of Packet Outage Detection (POD) Events detected for this peer group for the specified interval.	
PLAYOUT_BUFFER_GOOD	COUNTER	No	Number of calls with all sub-intervals reporting GOOD playout buffer quality for this trunk group for the specified interval.	
PLAYOUT_BUFFER_ACCEPTABLE	COUNTER	No	Number of calls with all sub-intervals reporting ACCEPTABLE or better playout buffer quality for this trunk group for the specified interval.	
PLAYOUT_BUFFER_POOR	COUNTER	No	Number of calls with all sub-intervals reporting POOR or better playout buffer quality for this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
PLAYOUT_BUFFER_UNACCEPTABLE	COUNTER	No	Number of calls with at least one sub-interval reporting UNACCEPTABLE playout buffer quality for this trunk group for the specified interval.	
SIP_REG_ATTEMPTS	COUNTER	No	Current number of SIP registration attempts on a trunk group for the specified interval.	
SIP_REG_COMPLETIONS	COUNTER	No	Current number of SIP registrations that have successfully completed on a trunk group for the specified interval.	
CALLS_WITH_PBX_DIPS	COUNTER	No	The number of calls that made a PBX Dip during the interval (applies to ERE, ePBX and external ePBX).	

Column Name	Column Type	Index	Description	CLI Command Reference
TOTAL_PSX_DIPS	COUNTER	No	The total number of PSX dips for the specified interval (applies to ERE, ePSX and external ePSX). To see the number of calls which made PSX Dips during the interval, see <code>CALLS_WITH_PSX_DIPS</code> metric. Example During the specified interval, two calls made three dips each (due to call redirection, etc.) to the PSX. This is logged as: <pre>CALLS_WITH_P SX_DIPS = 2 and TOTAL_PSX_DIPS = 6.</pre> If calls do not involve redirection or other complex scenarios such as two-stage dialing and transfers, these two metrics can use the same value.	
ACTIVE_REGS	COUNTER	No	Interval number of active registrations on this trunk group.	
MAX_ACTIVE_REGS	GAUGE	No	Maximum active registrations on this trunk group (high-watermark achieved on this trunk group).	

Column Name	Column Type	Index	Description	CLI Command Reference
CALL_LIMIT	GAUGE	No	CALL_LIMIT is the summation of TOTAL_CALLS_AVAILABLE, INBOUND_CALLS_USAGE, PRIORITY_CALL_USAGE, and OUTBOUND_CALLS_USAGE from NBS5200TrunkGroupStatusStats table (when it is not unlimited). CALL_LIMIT is different from the Call Limit configured at the SBC 7000 device.	
ACTIVE_SUBS	COUNTER	No	Current number of active subscriptions on this trunk group.	
MAX_ACTIVE_SUBS	GAUGE	No	Maximum active subscriptions on this trunk group (high-watermark achieved on this trunk group).	
PEAK_CALL_RATE	GAUGE	No	The current system peak call arrival rate.	
ONGOING_CALLS	INTEGER	False	Total On Going Calls (Non-Stable + Stable) on this trunk group.	
STABLE_CALLS	INTEGER	False	Total Stable Calls on this trunk group.	
CALL_UPDATES	INTEGER	False	Total Call Updates on this trunk group.	

Column Name	Column Type	Index	Description	CLI Command Reference
EMERGENCY_STABLE_CALLS	INTEGER	False	Total Emergency Stable Calls on this trunk group.	
EMERGENCY_ONGOING_CALLS	INTEGER	False	Total Emergency Calls Stable + Non-Stable on this trunk group.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

NBS5200CallCountStats

Column Name	Column Type	Index	Description	CLI Command Reference
KEY	IMPLIEDSTRING	False	Key value for the call.	Show Table System
CALL_ATTEMPTS	COUNTER	True	Number of call attempts on this server.	
CALL_COMPLETIONS	COUNTER	True	Total number of completed call attempts on this server.	
ACTIVE_CALLS	GAUGE	True	Current number of active managed calls on this server.	
STABLE_CALLS	GAUGE	True	Current number of stable managed calls on this server.	
MAX_LICENSE_LIMIT	INTEGER	True	This object indicates maximum license limit of this server.	
CE_NAME	STRING	True	The name of the compute element for this entity.	

DiamNodeRfIntervalStatistics

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context
DNAME	STRING	Yes	The name of this Diameter Node.	
NAME	STRING	Yes	The name of the peer.	
RF_SUCCESS	GAUGE	No	The count of successful ACR/ACA exchanged.	
RF_FAILED	GAUGE	No	The count of un-successful ACR/ACA exchanged.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

DnsGroupDnsServerStats

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	False	DNS Group - CLI
GNAME	STRING	Yes	The name of the address context group.	False	
IND	GAUGE	Yes	The DNS server statistics index for this address context.	False	
IP_ADDRESS	INETADDRESSES	No	The IP address of the DNS server requested for the statistics data.	False	
QUERIES	GAUGE	No	The number of queries made by the DNS client to this DNS server.	False	

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
TIMEOUTS	GAUGE	No	The number of timeouts resulted from queries made by the DNSC client to this DNS server.	False	
ERRORS	GAUGE	No	The number of errors resulted from queries made by the DNSC client to this DNS server.	False	
REFERRALS	GAUGE	No	The number of referrals resulted from queries made by the DNSC client to this DNS server.	False	
TOTAL_TCP_CONNECTION	GAUGE	No	The number of tries for connecting to DNS server.	True	
TCP_CONNECTION_FAILED	GAUGE	No	The number of times SBC failed to connect to DNS server.	True	
TCP_CONNECTION_SUCCESS	GAUGE	No	The number of successful TCP connection to DNS server.	True	
TCP_CONNECTION_TORN_DOWN	GAUGE	No	The number of TCP connection torn down with DNS server.	True	
TCP_FALLBACK	GAUGE	No	The number of times tcp fallback with DNS server.	True	
EDNS_STATUSES	INTEGER	False	The number of times tcp fallback with DNS server.	True	
EDNS_FAILURES	GAUGE	False	The number of times tcp fallback with DNS server.	True	

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
CE_NAME	STRING	No	The name of the compute element for this entity.	False	

DSP Stats

DspResDspCallIntervalStats

Column Name	Column Type	Index	Description	CLI Command Reference
SYSTEM_NAME	STRING	Yes	Name of the system.	Show Table System
NUM_CALL_NO_DSP_ALLOC_FAIL	COUNTER	No	Number of call was successful without DSP resource allocation failure during an interval.	
NUM_CALL_WITH_DSP_ALLOC_FAIL	COUNTER	No	Number of call was successful with DSP resource allocation failure during an interval.	
NUM_CALL_FAIL_NO_G729	COUNTER	No	Number of call failed due to lack of G729 DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_G729	COUNTER	No	Number of call fails due to reason other than lack G729 DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_G729	COUNTER	No	Number of call was successful even though lack of G729 DSP resource during an interval.	
NUM_CALL_FAIL_NO_G726	COUNTER	No	Number of call failed due to lack of G726 DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_OTHER_ON_G726	COUNTER	No	Number of call fails due to reason other than lack G726 DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_G726	COUNTER	No	Number of call was successful even though lack of G726 DSP resource during an interval.	
NUM_CALL_FAIL_NO_G711_PACKET	COUNTER	No	Number of call failed due to lack of G711 Packet DSP resource during an interval.	
NUM_CALL_FAIL_ON_G711_PACKET	COUNTER	No	Number of call fails due to reason other than lack G711 Packet DSP resource during an interval.	
NUM_CALL_NO_G711_PACKET	COUNTER	No	Number of call was successful even though lack of G711 Packet DSP resource during an interval.	
NUM_CALL_FAIL_NO_G723	COUNTER	No	Number of call failed due to lack of G723 DSP resource during an interval.	
NUM_CALL_FAIL_ON_G723	COUNTER	No	Number of call fails due to reason other than lack G723 DSP resource during an interval.	
NUM_CALL_NO_G723	COUNTER	No	Number of call was successful even though lack of G723 DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_NO_ILBC	COUNTER	No	Number of call failed due to lack of ILBC DSP resource during an interval.	
NUM_CALL_FAIL_ON_ILBC	COUNTER	No	Number of call fails due to reason other than lack ILBC DSP resource during an interval.	
NUM_CALL_NO_ILBC	COUNTER	No	Number of call was successful even though lack of ILBC DSP resource during an interval.	
NUM_CALL_FAIL_NO_EVRCB	COUNTER	No	Number of call failed due to lack of EVRCB0 DSP resource during an interval.	
NUM_CALL_FAIL_ON_EVRCB	COUNTER	No	Number of call fails due to reason other than lack EVRCB0 DSP resource during an interval.	
NUM_CALL_NO_EVRCB	COUNTER	No	Number of call was successful even though lack of EVRCB0 DSP resource during an interval.	
NUM_CALL_FAIL_NO_GSM	COUNTER	No	Number of call failed due to lack of AMRNB DSP resource during an interval.	
NUM_CALL_FAIL_ON_GSM	COUNTER	No	Number of call fails due to reason other than lack AMRNB DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_NO_GSM	COUNTER	No	Number of call was successful even though lack of AMRNB DSP resource during an interval.	
NUM_CALL_FAIL_NO_AMRWB	COUNTER	No	Number of call failed due to lack of AMRWB DSP resource during an interval.	
NUM_CALL_FAIL_ON_AMRWB	COUNTER	No	Number of call fails due to reason other than lack AMRWB DSP resource during an interval.	
NUM_CALL_NO_AMRWB	COUNTER	No	Number of call was successful even though lack of AMRWB DSP resource during an interval.	
NUM_CALL_FAIL_NO_G722	COUNTER	No	Number of call failed due to lack of G722 DSP resource during an interval.	
NUM_CALL_FAIL_ON_G722	COUNTER	No	Number of call fails due to reason other than lack G722 DSP resource during an interval.	
NUM_CALL_NO_G722	COUNTER	No	Number of call was successful even though lack of G722 DSP resource during an interval.	
NUM_CALL_FAIL_NO_TONE	COUNTER	No	Number of call failed due to lack of TONE DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_ON_TONE	COUNTER	No	Number of call fails due to reason other than lack TONE DSP resource during an interval.	
NUM_CALL_NO_TONE	COUNTER	No	Number of call was successful even though lack of TONE DSP resource during an interval.	
NUM_CALL_FAIL_NO_EVRC	COUNTER	No	Number of call failed due to lack of EVRC DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_EVRC	COUNTER	No	Number of call fails due to reason other than lack EVRC DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_EVRC	COUNTER	No	Number of call was successful even though lack of EVRC DSP resource during an interval.	
NUM_CALL_FAIL_NO_G7221	COUNTER	No	Number of call failed due to lack of G7221 DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_G7221	COUNTER	No	Number of call fails due to reason other than lack G7221 DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_G7221	COUNTER	No	Number of call was successful even though lack of G7221 DSP resource during an interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_FAIL_NO_EFR	COUNTER	No	Number of call failed due to lack of Efr DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_EFR	COUNTER	No	Number of call fails due to reason other than lack Efr DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_EFR	COUNTER	No	Number of call was successful even though lack of Efr DSP resource during an interval.	
NUM_CALL_FAIL_NO_OPUS	COUNTER	No	Number of call failed due to lack of OPUS DSP resource during an interval.	
NUM_CALL_FAIL_OTHER_ON_OPUS	COUNTER	No	Number of call fails due to reason other than lack of OPUS DSP resource during an interval.	
NUM_CALL_SUCCESS_NO_OPUS	COUNTER	No	Number of call was successful even though lack of OPUS DSP resource during an interval.	
NUM_CALL_FAIL_NO_SILK8	COUNT	No	Number of calls failed due to lack of SILK_8 DSP resource	
NUM_CALL_FAIL_OTHER_SILK8	COUNT	No	Number of calls failed due to reason other than lack of SILK_8 DSP resource	

Column Name	Column Type	Index	Description	CLI Command Reference
NUM_CALL_SUCCESS_NO_SILK8	COUNT	No	Number of calls successful even with lack of SILK_8 DSP resource	
NUM_CALL_FAIL_NO_SILK16	COUNT	No	Number of calls successful even with lack of SILK_8 DSP resource	
NUM_CALL_FAIL_OTHER_SILK16	COUNT	No	Number of calls failed due to reason other than lack of SILK_16 DSP resource	
NUM_CALL_SUCCESS_NO_SILK16	COUNT	No	Number of calls successful even with lack of SILK_16 DSP resource	
NUM_CALL_FAIL_NO_EVS	INTEGER	No	The number of call fails due to the lack of EVS DSP resource during a time interval.	
NUM_CALL_FAIL_OTHER_EVS	INTEGER	No	The number of call fails due to a reason other than the lack of EVS DSP resource during a time interval.	
NUM_CALL_SUCCESS_NO_EVS	INTEGER	No	The number of calls was successful despite the lack of EVS DSP resource during a time interval.	
CE_NAME	STRING	No	The name of the compute element for this entity.

IcmpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	NA
IN_MSGS	COUNTER	No	The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.	
IN_ECHOS	COUNTER	No	The number of ICMP Echo (request) messages received.	
IN_ECHO_REPS	COUNTER	No	The number of ICMP Echo Reply messages received.	
IN_DEST_UNREACHS	COUNTER	No	The number of ICMP Destination Unreachable messages received.	
IN_ERRORS	COUNTER	No	The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and so on).	
OUT_MSGS	COUNTER	No	The total number of ICMP messages which this entity attempted to send. Note that this counter includes all those counted by icmpOutErrors.	

Column Name	Column Type	Index	Description	CLI Command Reference
OUT_ERRORS	COUNTER	No	The number of ICMP messages which this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations, any type of error that contributes to the value of this counter may not exist.	
OUT_ECHOS	COUNTER	No	The number of ICMP Echo (request) messages sent.	
OUT_ECHO_REPS	COUNTER	No	The number of ICMP Echo Reply messages sent.	
OUT_DEST_UNREACHS	COUNTER	No	The number of ICMP Destination Unreachable messages sent.

POLICER_DISCARDS	COUNTER	No	The number of times the policer for this rule discarded packets.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

IpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	NA
IN_RECEIVES	COUNTER	No	The total number of input datagrams received from interfaces, including those received in error.	
IN_HDR_ERRORS	COUNTER	No	The number of input datagrams discarded due to errors such as errors in IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options.	

Column Name	Column Type	Index	Description	CLI Command Reference
IN_ADDR_ERR ORS	COUNTER	No	The number of input datagrams discarded because the IP address in the destination field of the IP header was not a valid address this entity could receive. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported Classes (for example, Class E). For entities which are not IP routers and do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.	
IN_UNKNOWN_ PROTOS	COUNTER	No	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.	
IN_DISCARDS	COUNTER	No	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.	
IN_DELIVERS	COUNTER	No	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).	

Column Name	Column Type	Index	Description	CLI Command Reference
OUT_REQUESTS	COUNTER	No	The total number of IP datagrams which local IP user- protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.	
OUT_DISCARDS	COUNTER	No	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space). Note that this counter includes datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.	
OUT_NO_ROUTEES	COUNTER	No	The number of IP datagrams discarded because no route can transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this no-route criterion. This also includes any datagrams which a host cannot route because all of its default routers are down.	
REASM_TIMEOUT	INTEGER	No	The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.	
REASM_REQDS	COUNTER	No	The number of IP fragments received that this entity must reassemble.	
REASM_OKS	COUNTER	No	The number of IP datagrams successfully re-assembled.	

Column Name	Column Type	Index	Description	CLI Command Reference
REASM_FAILS	COUNTER	No	The number of failures detected by the IP re-assembly algorithm (for reasons such as timed out, errors). Note that this is not necessarily a count of discarded IP fragments since some algorithms (like the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.	
FRAG_OKS	COUNTER	No	The number of IP datagrams successfully fragmented at this entity.	
FRAG_FAILS	COUNTER	No	The number of IP datagrams discarded because this entity must, but cannot, fragment them. For example, because their Don't Fragment flag was set.	

IpPolicingSystemIntStats

Column Name	Column Type	Index	Description	CLI Command Reference
SYSTEM_NAME	STRING	Yes	Name of the system.	IP Policing - CLI
BAD_HDR_DISCARD_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the bad Ethernet/IP Header policer.	
BAD_HDR_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the bad Ethernet/IP Header policer.	
BAD_HDR_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the bad Ethernet/IP Header policer.	

Column Name	Column Type	Index	Description	CLI Command Reference
BAD_HDR_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the bad Ethernet/IP Header policer.	
BAD_HDR_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the bad Ethernet/IP Header policer.	
BAD_HDR_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the bad Ethernet/IP Header policer.	
ARP_DISCARD_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the ARP policer.	
ARP_ACCEPT_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the ARP policer.	
ARP_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the ARP policer.	
ARP_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the ARP policer.	
ARP_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the ARP policer.	
ARP_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the ARP policer.	
ARP_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the ARP policer.	

Column Name	Column Type	Index	Description	CLI Command Reference
UFLOW_DISCARD_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the micro flow policer.	
UFLOW_ACCEPT_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the micro flow policer.	
UFLOW_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the micro flow policer.	
UFLOW_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the micro flow policer.	
UFLOW_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the micro flow policer.	
UFLOW_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the micro flow policer.	
UFLOW_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the micro flow policer.	
ACL_DISCARD_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the access control list policer.	
ACL_ACCEPT_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the access control list policer.	
ACL_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the access control list policer.	

Column Name	Column Type	Index	Description	CLI Command Reference
ACL_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the access control list policer.	
ACL_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the access control list policer.	
ACL_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the access control list policer.	
ACL_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the access control list policer.	
AGGREGATE_DISCARD_PKT_COUNT	COUNTER64	No	The current number of discarded packets for the aggregate policer.	
AGGREGATE_ACCEPT_PKT_COUNT	COUNTER64	No	The current number of discarded packets for the aggregate policer.	
AGGREGATE_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the aggregate policer.	
AGGREGATE_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the aggregate policer.	
AGGREGATE_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the aggregate policer.	
AGGREGATE_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the aggregate policer.	

Column Name	Column Type	Index	Description	CLI Command Reference
AGGREGATE_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the aggregate policer.	
IP_DISCARD_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the IPSEC Decrypt policer.	
IP_ACCEPT_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the IPSEC Decrypt policer.	
IP_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the IPSEC Decrypt policer.	
IP_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the IPSEC Decrypt policer.	
IP_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the IPSEC Decrypt policer.	
IP_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the IPSEC Decrypt policer.	
IP_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the IPSEC Decrypt policer.	
MEDIA_DISCARD_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the media policer.	
MEDIA_ACCEPT_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the media policer.	

Column Name	Column Type	Index	Description	CLI Command Reference
MEDIA_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the media policer.	
MEDIA_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the media policer.	
MEDIA_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the media policer.	
MEDIA_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the media policer.	
MEDIA_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the media policer.	
ROGUE_MEDIA_DISCARD_PKT_COUNT	COUNTER64	No	The current number of discarded packets for the rogue media policer.	
ROGUE_MEDIA_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the rogue media policer.	
ROGUE_MEDIA_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the rogue media policer.	
ROGUE_MEDIA_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the rogue media policer.	
ROGUE_MEDIA_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the rogue media policer.	

Column Name	Column Type	Index	Description	CLI Command Reference
ROGUE_MEDIA_MAJOR_ALARM_DUR	COUNTER	No	The current duration of the major alarms in seconds for the rogue media policer.	
DISCARD_RULE_PACKET_COUNT	COUNTER64	No	The current number of discarded packets for the IPSEC Decrypt policer.	
DISCARD_PEAK_DISCARD_RATE	GAUGE	No	The current peak discard rate for the discard rule.	
DISCARD_MINOR_ALARM_COUNT	COUNTER	No	The current number of minor alarms for the discard rule.	
DISCARD_MINOR_ALARM_DURATION	COUNTER	No	The current duration of the minor alarms in seconds for the discard rule.	
DISCARD_MAJOR_ALARM_COUNT	COUNTER	No	The current number of major alarms for the discard rule.	
DISCARD_MAJOR_ALARM_DURATION	COUNTER	No	The current duration of the major alarms in seconds for the discard rule.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

Link Stats

LinkDetectionGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Link Detection Group - CLI

Column Name	Column Type	Index	Description	CLI Command Reference
NAME	STRING	Yes	The link failure statistics per trunk group.	
SINGLE_FAILURES	INTEGER	No	The number of times a link monitor within this link detection group failed to receive a single echo reply. The first reattempt was successful.	
DOUBLE_FAILURES	INTEGER	No	The number of times a link monitor within this link detection group failed to receive two consecutive echo replies. The second (next) reattempt was successful.	
FAILURES	INTEGER	No	The number of times a link monitor within this link detection group declared itself failed.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

LinkMonitorStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Link Detection Group - CLI
GNAME	STRING	Yes	The name of the address context group.	
NAME	STRING	Yes	The name of the link monitor that monitors a link to a destination for a specific interface.	
MIN_TIME	INTEGER	No	The minimum time (in microseconds) used to get a reply for an echo request packet.	

Column Name	Column Type	Index	Description	CLI Command Reference
MAX_TIME	INTEGER	No	The maximum time (in microseconds) used to get a reply for an echo request packet.	
AVERAGE_TIME	INTEGER	No	The average time (in microseconds) used to get a reply for an echo request packet.	
SINGLE_FAILURES	INTEGER	No	The number of single failures for this IP interface.	
DOUBLE_FAILURES	INTEGER	No	The number of double failures for this IP interface.	
FAILURES	INTEGER	No	The number of failures for this IP interface.	
REPLIES	INTEGER	No	The total number of replies.	
DUPLICATE_REPLIES	INTEGER	No	The number of duplicate replies.	
LATE_REPLIES	INTEGER	No	The number of late replies.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

SipLocalRegistrarRegCountIntStats

Column Name	Column Type	Description	Index	canAggregate
NAME	INTEGER	The name of the system.	True	False

SIP_REG_CHALLENGED_COUNT	GAUGE	The current number of challenged SIP registrations	False	True

Column Name	Column Type	Description	Index	canAggregate
SIP_REG_FAILED_403_COUNT	GAUGE	The total number of SIP registrations failed with 403	False	True
SIP_REG_FAILED_404_COUNT	GAUGE	The total number of SIP registrations failed with 404	False	True
SIP_REG_FAILED_503_COUNT	GAUGE	The total number of SIP registrations failed with 503	False	True
SIP_REG_FAILED_OTHERS_COUNT	GAUGE	The total number of SIP registrations failed with other response codes	False	True
SIP_REG_STABLE_COUNT	GAUGE	The current number of stable SIP registrations	False	True
LICENSE_MODE (Metric column)	INTEGER	It is copy of SBX7KLicenseUsageStats.LICENSE_MODE	False	True
CE_NAME	STRING	The name of the compute element for this entity.	False	False

NBS5200TrunkGroupStatusStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of this Address Context.	Show Table System
ZNAME	STRING	Yes	The name of this Zone.	
NAME	STRING	Yes	The name of this IP trunk group.	
STATE	INTEGER	No	Current operational state of the IP trunk group.	
TOTAL_CALLS_AVAILABLE	GAUGE	No	The sum of all available or unblocked calls for this trunk group.	

Column Name	Column Type	Index	Description	CLI Command Reference
TOTAL_CALLS_INBOUND_RESERVED	GAUGE	No	The reserved count as specified by the percentage configured for this IP trunk group. This object shows the total number of calls that are reserved for inbound calls on this IP trunk group. This is applicable only for IP trunk groups that are configured for inbound or both directions.	
INBOUND_CALLS_USAGE	GAUGE	No	The current inbound or incoming usage count of this IP trunk group. This is applicable only for IP trunk groups that are configured for inbound or both directions.	
OUTBOUND_CALLS_USAGE	GAUGE	No	The current outbound, non-priority usage count of this IP trunk group.	
TOTAL_CALLS_CONFIGURED	GAUGE	No	The total number of calls that are configured on this IP trunk group.	
PRIORITY_CALL_USAGE	GAUGE	No	The current priority usage count of this IP trunk group. This is applicable for IP trunk groups that are configured with call reserved state enabled.	
TOTAL_OUTBOUND_CALLS_RESERVED	GAUGE	No	The reserved count as specified by the percentage configured for this IP trunk group. This object reflects the total number of calls that are reserved for outbound calls on this IP trunk group. This is applicable for IP trunk groups that are configured for incoming call reservation.	

Column Name	Column Type	Index	Description	CLI Command Reference
BW_CURRENT_LIMIT	INTEGER	No	The current bandwidth limit for this IP trunk group. It is initially set to the configured bandwidth limit but the packet outage detection events may reduce the limit.	
BW_AVAILABLE	INTEGER	No	Bandwidth available for allocation.	
BW_INBOUND_USAGE	GAUGE	No	Bandwidth in use for inbound traffic.	
BW_OUTBOUND_USAGE	GAUGE	No	Bandwidth in use for outbound traffic.	
PACKET_OUT_DETECT_STATE	INTEGER	No	This object indicates the packet outage detection state. - normal - No packet outage is declared - packetOutageState - Packet outage is declared The packet outage detection bandwidth limit reduction reduces the current bandwidth limit.	
TG_UTIL_PERCENT	INTEGER	No	This is calculated as: $\left(\frac{((\text{PSTN\_INBOUND\_USAGE} + \text{PSTN\_OUTBOUND\_USAGE}) * 100)}{\text{PSTN\_TOTAL\_CONFIGURED}} \right)$	
PRIORITY_BW_USAGE	GAUGE	No	The current media bandwidth in use for oversubscribed HPC/emergency calls (in Kbits/sec).	
CE_NAME	STRING	No	The name of the compute element for this entity.	

RelayIntervalStatistics

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	False	Show Table Address Context
KEY	STRING	Yes	Key value for the call.	False	
NEW_CONN_CREATED	GAUGE	No	Total number of new relay connections created.	True	
CONN_TERM_GRACEFULLY	GAUGE	No	The number of connections terminated gracefully.	True	
CONN_TERM_NON_GRACEFULLY	GAUGE	No	The number of connections terminated non-gracefully.	True	
CE_NAME	STRING	No	The name of the compute element for this entity.	False

NUM_S8HR_OUT_REG_FAIL	COUNTER	No	Indicates the number of S8HR Outbound Roaming Users's registrations failed.	True	
TOTAL_NUM_S8HR_OT_NML_CALL	COUNTER	No	Indicates the total number of normal calls initiated from S8HR Outbound Roaming Users.	True	
NUM_OF_S8HR_OT_NML_CALL_SUC	COUNTER	No	Indicates the number of successful normal calls from S8HR Outbound Roaming Users.	True	
NUM_OF_S8HR_OT_NML_CALL_FAIL	COUNTER	No	Indicates the total number of failed normal calls from S8HR Outbound Roaming Users.	True	
NUM_OF_S8HR_OT_EMG_CALL_REJ	COUNTER	No	Indicates the number of S8HR Outbound Roaming User's emergency calls rejected.	True	
NUM_OF_S8HR_IN_EMG_REG_SUC	COUNTER	No	Indicates the number of Successful registration from S8HR Inbound Roaming Users.	True	
NUM_OF_S8HR_IN_EMG_REG_FAIL	COUNTER	No	Indicates the number of S8HR Inbound User's registration rejected.	True	
NUM_OF_S8HR_IN_EMG_CALL_SUC	COUNTER	No	Indicates the number of successful emergency calls from S8HR Inbound User.	True	

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
NUM_OF_S8 HR_IN_EMG _CALL_FAIL	COUNTER	No	Indicates the number of S8HR Inbound Users emergency calls failed.	True	
NUM_OF_IN_ HPC_CALL_ ACC	INTEGER	No	Indicates the total number of (interval) Ingress HPC calls accepted.	True	
NUM_OF_OU T_HPC_CALL _ACC	INTEGER	No	Indicates the total number of (interval) Egress HPC calls accepted.	True	
NUM_OF_HP C_4XX_MSG _SENT	INTEGER	No	Indicates the total number of (interval) sent HPC 4xx messages.	True	
CE_NAME	STRING	No	The name of the compute element for this entity.	False	

sipOcsCallIntervalStatistics

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context
ZNAME	STRING	Yes	The name of the address context zone.	
NAME	STRING	Yes	The name of this SIP trunk group.	
ATTEMPTED_C ALLS	GAUGE	No	Current Attempted OCS Call statistics.	
RELAYED_CALL S	GAUGE	No	Current Relayed OCS Invite to Egress side statistics.	

Column Name	Column Type	Index	Description	CLI Command Reference
ESTABLISHED_CALLS	GAUGE	No	Current Established OCS Call statistics.	
SUCCESSFUL_CALLS	GAUGE	No	Current Successful OCS Call statistics.	
FAILED_CALLS	GAUGE	No	Current Failed OCS Call statistics.	
PENDING_CALL	GAUGE	No	Current Pending OCS Call statistics.	
REJECTED_CALL	GAUGE	No	Current SBX Rejected OCS Call statistics.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

SipIpPeerOptionsIntervalStats

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type	Present in Post Paid Reports
ACNAME	STRING	Yes	The name of the address context.	False	N/A	N/A
ZNAME	STRING	Yes	The name of this Zone.	False	N/A	N/A
SIP_IP_PEER_OPTIONS_NAME	STRING	Yes	The name of this SIP IP Peer.	False	N/A	N/A
SIP_IP_PEER_OPTIONS_DIRECTION	STRING	Yes	Indicates the direction of the (interval) SIP Options/Response messages.	False	N/A	N/A
SIP_IP_PEER_OPTIONS_MESSAGE	STRING	Yes	Indicates the cause code of the (interval) SIP Options/Response messages.	False	N/A	N/A

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type	Present in Post Paid Reports
SIP_IP_PEER_OPTIONS_MSG_COUNT	COUNTER	No	Indicates the total number of (interval) SIP Options/Response messages for the specified cause code.	True	Sum	N/A
CE_NAME	STRING	No	The name of the compute element for this entity.	False	No	N/A

SipRegCountStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context
NAME	INTEGER	Yes	Name of the system.	
SIP_REG_COUNT_ATTEMPTS	COUNTER	No	Indicates the number of SIP registration attempts.	
SIP_REG_COUNT_CUM_COMPLETIONS	COUNTER	No	Indicates the accumulative number of completed SIP registration attempts.	
SIP_REG_COUNT_PENDING	COUNTER	No	Indicates the current number of pending SIP registrations.	
SIP_REG_COUNT_STABLE	COUNTER	No	Indicates the current number of stable SIP registrations.	
SIP_REG_COUNT_TOTAL	COUNTER	No	Indicates the total number of current SIP registrations.	
SIP_EMERGENCY_REG_ACCEPT_TOTAL	COUNTER	No	Indicates the total number of accepted emergency SIP registrations.	

Column Name	Column Type	Index	Description	CLI Command Reference
SIP_EMERGENCY_REG_ACTIVE_TOTAL	COUNTER	No	Indicates the total number of active emergency SIP registrations.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

SipSigConnStatisticsStats

Column Name	Column Type	Index	Description	canAggregate
ACNAME	STRING	Yes	The name of the address context.	False
ZNAME	STRING	Yes	The name of the address context zone.	False
IND	GAUGE	Yes	The index of this SIP Signaling Port.	False
TCP_CONNECTION	COUNTER	No	Number of current TCP connections	True
TOTAL_TCP_CONNECTION	COUNTER	No	Number of total TCP connections made.	True
ACTIVE_TLS_TCP_CONNECTION	COUNTER	No	Number of current TLS-TCP connections made.	True
TOTAL_TLS_TCP_CONNECTION	COUNTER	No	Number of total TLS-TCP connections.	True
CE_NAME	STRING	No	The name of the compute element for this entity.	False

SipSigPortStatisticsStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context

Column Name	Column Type	Index	Description	CLI Command Reference
ZNAME	STRING	Yes	The name of the address context.	
IND	GAUGE	Yes	The index of this SIP Signaling Port.	
CALL_RATE	INTEGER	No	number of SIP calls per second during the last minute.	
ORIG_CALLS	INTEGER	No	Total number of outgoing calls sent out from this signaling port.	
TERM_CALLS	INTEGER	No	Total number of incoming calls received on this signaling port.	
TX_PDUS	COUNTER64	No	The total number of signaling PDUS sent out on this port.	
RX_PDUS	COUNTER64	No	The total number of signaling PDUS received on this port.	
TX_BYTES	COUNTER64	No	The total number of signaling BYTES sent out from this port.	
RX_BYTES	COUNTER64	No	The total number of signaling BYTES received by this port.	
IN_REGS	INTEGER	No	Total number of inbound registration(s) received on this signaling port.	
OUT_REGS	INTEGER	No	Total number of outbound registration(s) sent on this signaling port.	
TX500S	INTEGER	No	The total number of 500 responses generated by the SLB when it is unable to forward a request.	

Column Name	Column Type	Index	Description	CLI Command Reference
TX503S	INTEGER	No	The total number of 503 responses generated by the SLB when there are no backend SBCs able to handle the request due to the congestion or the cac restrictions.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

Note

SipSigPortTlsStats is not supported from SBC 4.1 onwards.

SipSigPortTlsStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	NA
ZNAME	STRING	Yes	The name of the address context zone.	
IND	GAUGE	Yes	The index of this SIP Signaling Port.	
CURRENT_CLIENT_SESSIONS	INTEGER	No	Number of client sessions currently active.	
CURRENT_SERVER_SESSIONS	INTEGER	No	Number of server sessions currently active.	
CURRENT_SUSPENDED_SESSIONS	INTEGER	No	Number of server sessions currently suspended.	
TOTAL_CLIENT_SESSIONS	INTEGER	No	Cumulative total number of client sessions.	
TOTAL_SERVER_SESSIONS	INTEGER	No	Cumulative total number of server sessions.	

Column Name	Column Type	Index	Description	CLI Command Reference
CURRENT_CLIENT_HANDSHAKES	INTEGER	No	Number of incomplete client handshakes.	
CURRENT_SERVER_HANDSHAKES	INTEGER	No	Number of incomplete server handshakes.	
SESSION_RESUMPTIONS	INTEGER	No	Number of server sessions that resume.	
NO_CIPHER_SUITE	INTEGER	No	Number of handshake failures due to inability to converge on a cipher suite.	
HANDSHAKE_TIMEOUTS	INTEGER	No	Number of handshakes that timed out before completing.	
HIGHER_AUTH_TIMEOUT	INTEGER	No	Number of handshakes in which the SBC was the server and the client did not authenticate itself through TLS and failed to authenticate itself through any higher level protocol (for example, SIP) before timing out.	
CLIENT_AUTH_FAILURES	INTEGER	No	Number of times peer failed TLS authentication with SBC as the client.	
SERVER_AUTH_FAILURES	INTEGER	No	Number of times peer failed TLS authentication with SBC as the server.	
FATAL_ALERTS_RECEIVED	INTEGER	No	Number of FATAL Alerts received.	
WARNING_ALERTS_RECEIVED	INTEGER	No	Number of WARNING Alerts received.	
HANDSHAKE_FAILURES	INTEGER	No	Cumulative total of all handshake failures.	

Column Name	Column Type	Index	Description	CLI Command Reference
RECEIVE_FAILURES	INTEGER	No	Number of receive failures (failure to decrypt).	
SEND_FAILURES	INTEGER	No	Number of send failures (failure to encrypt).	
NO_AUTH_DROPS	INTEGER	No	Number of SIP messages dropped due to lack of peer authentication at the SIP level.	
NO_AUTH488	INTEGER	No	Number of SIP messages rejected with 488 due to lack of peer authentication at the SIP level.	
MID_CONNECTION_HELLO	INTEGER	No	Number times a peer sent a TLS Hello on a connection that was already up (that is, the peer tried to renegotiate.).	
NO_CLIENT_CERT	INTEGER	No	Number times we were the client and we failed to derive a certificate to send the server.	
VALIDATION_FAILURES	INTEGER	No	Number of failed certificate validations.	
CURRENT_CLIENT_CONNECTIONS	INTEGER	No	Current number of client tls connections.	
TOTAL_CLIENT_CONNECTIONS	INTEGER	No	Cumulative total number of client tls connections.	
CURRENT_SERVER_CONNECTIONS	INTEGER	No	Current number of server tls connections.	
TOTAL_SERVER_CONNECTIONS	INTEGER	No	Cumulative total number of server tls connections.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

SipSubCountStats

Column Name	Column Type	Index	Description
ACNAME	STRING	Yes	The name of the address context.
NAME	INTEGER	Yes	Name of the system.
SIP_SUB_COUNT_ATTEMPTS	COUNTER	No	Indicates the number of SIP relayed subscription attempts.
SIP_SUB_COUNT_CUM_COMPLETIONS	COUNTER	No	Indicates the accumulative number of completed SIP subscription attempts.
SIP_SUB_COUNT_STABLE	COUNTER	No	Indicates the current number of stable SIP subscription.
SIP_SUB_COUNT_TOTAL	COUNTER	No	Indicates the total number of current SIP subscription on this card (SIP_SUB_COUNT_ATTEMPTS + SIP_SUB_COUNT_CUM_COMPLETIONS).
RX_BYTES	COUNTER64	No	The number of received bytes.
TX_BYTES	COUNTER64	No	The number of transmitted bytes.
SIP_SUB_COUNT_FAILURE	COUNTER	False	Indicates the number of SIP relayed subscription failures.
CE_NAME	STRING	No	The name of the compute element for this entity.

SipTrunkGroupOptionsIntervalStats

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type	Present in Post Paid Reports
ACNAME	STRING	Yes	The name of the address context.	False	N/A	No
ZNAME	STRING	Yes	The name of this zone.	False	N/A	No
SIP_TG_OPTIONS_NAME	STRING	Yes	The name of this SIP trunk group.	False	N/A	No

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type	Present in Post Paid Reports
SIP_TG_OPTIONS_DIRECTION	STRING	Yes	The direction of the (interval) SIP Options/Response messages.	False	N/A	No
SIP_TG_OPTIONS_MESSAGE	STRING	Yes	The cause code of the (interval) SIP Options/Response messages.	False	N/A	No
SIP_TG_OPTIONS_MESSAGE_COUNT	COUNTER	No	The total number of (interval) SIP Options/Response messages for the specified cause code.	True	SUM	No
CE_NAME	STRING	No	The name of the compute element for this entity.	False	N/A	No

Sys Stats

SysCpuUtilIntStatsSts

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	This object indicates the configured CE name.	Show Status System
CPU	GAUGE	Yes	The CPU number.	
AVERAGE	GAUGE	No	The average CPU utilization for this interval.	
HIGH	GAUGE	No	The high CPU utilization for this interval.	
LOW	GAUGE	No	The low CPU utilization for this interval.	

SysMemoryUtilIntStatsSts

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	This object indicates the configured CE name.	Show Status System
AVERAGE	GAUGE	No	The average memory utilization for this interval.	
HIGH	GAUGE	No	The high memory utilization for this interval.	
LOW	GAUGE	No	The low memory utilization for this interval.	
AVERAGE_SWAP	GAUGE	No	The average swap memory utilization for this interval.	
HIGH_SWAP	GAUGE	No	The high swap memory utilization for this interval.	
LOW_SWAP	GAUGE	No	The low swap memory utilization for this interval.	

SystemCongestionIntervalStats

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
NAME	INTEGER	Yes	Name of the system.	False	Show Status System
LEVEL_MC1_COUNT	COUNTER	No	The number of transitions into MC1 for the specified interval.	False	
LEVEL_MC1_TOTAL_TIME	COUNTER	No	The sum of time spent in MC1 for the specified interval.	False	
LEVEL_MC2_COUNT	COUNTER	No	The number of transitions into MC2 for the specified interval.	False	
LEVEL_MC2_TOTAL_TIME	COUNTER	No	The sum of time spent in MC2 for the specified interval.	False	
LEVEL_MC3_COUNT	COUNTER	No	The number of transitions into MC3 for the specified interval.	False	
LEVEL_MC3_TOTAL_TIME	COUNTER	No	The sum of time spent in MC3 for the specified interval.	False	
OVERLOAD_REJECTS	COUNTER	No	The number of calls rejected due to System congestion for the specified interval.	False	
AVG_CALL_RATE	GAUGE	No	The system average call arrival rate for the specified interval.	False	

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
PEAK_CALL_RATE	GAUGE	No	The system peak call arrival rate for the specified interval.	False	
CALL_ARRIVALS	COUNTER	No	The number of call arrivals for the specified interval.	False	
EMERGENCY_CALL_ARRIVALS	COUNTER	No	The number of SIP emergency calls arrived for the specified interval.	False	
EMERGENCY_CALL_REJECTS	COUNTER	No	The number of SIP emergency calls arrived for the specified interval.	False	
SIP_REG_ARRIVALS	COUNTER	No	The number of SIP registrations arrived for the specified interval.	False	
SIP_REG_REJECTS	COUNTER	No	The number of SIP registrations rejected for the specified interval.	False	
AVG_REG_RATE	GAUGE	No	The average SIP registration arrival rate for the specified interval.	False	
PEAK_REG_RATE	GAUGE	No	The peak SIP registration arrival rate for the specified interval.	False	
MAX_ACTIVE_CALLS	GAUGE	No	High watermark of the total number of active calls in current interval for system level.	True	

Column Name	Column Type	Index	Description	Aggregated	CLI Command Reference
SIP_SUBS_ARRIVALS	GAUGE	No	The current number of SIP subscribes arrived.	True	
SIP_SUBS_REJECTS	GAUGE	No	The current number of SIP subscribes rejected.	True	
AVG_SUBS_RATE	GAUGE	No	The current average SIP subscribe arrival rate.	True	
PEAK_SUBS_RATE	GAUGE	No	The current peak SIP subscribe arrival rate.	True	
CE_NAME	STRING	No	The name of the compute element for this entity.	False	

SystemLicenseInfoStats

Column Name	Column Type	Index	Description	CLI Command Reference
FEATURE_NAME	STRING	Yes	This object indicates the feature name	Show Table System
LICENSE_ID	STRING	Yes	This object indicates the license Id.	
EXPIRATION_DATE	STRING	No	This object indicates the licence expiry date for a feature.	
USAGE_LIMIT	INTEGER	No	This object indicates the usageLimit of a feature.	
SOURCE	STRING	No	This object indicates where the licenses is located, nodeLocked or domain.	

Column Name	Column Type	Index	Description	CLI Command Reference
IN_USE	GAUGE	No	This object indicates the number of licenses used by the application.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

SystemLicenseInfoStats is available only if SBC 3.1 Device Manager is installed.

TcpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	NA
ESTABLISHED_CONNECTIONS	GAUGE	No	The number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT (currEstab).	
CLIENT_CONNECTIONS	COUNTER	No	The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state (activeOpens).	
SERVER_CONNECTIONS	COUNTER	No	The number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state (passiveOpens).	

Column Name	Column Type	Index	Description	CLI Command Reference
FAILED_ATTEMPTS	COUNTER	No	The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state (attemptFails).	
IN_SEGMENTS	COUNTER	No	The total number of segments received, including those received in error. This count includes segments received on currently established connections.	
OUT_SEGMENTS	COUNTER	No	The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.	
RETRANS_SEGMENTS	COUNTER	No	The total number of segments retransmitted - that is, the number of TCP segments transmitted containing one or more previously transmitted octets.	
IN_ERRORS	COUNTER	No	The total number of segments received in error (for example, bad TCP checksums).	
IN_RESETS	COUNTER	No	The number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state (estabResets).	

Column Name	Column Type	Index	Description	CLI Command Reference
OUT_RESETS	COUNTER	No	The number of TCP segments sent containing the RST flag.	

TrafficControlStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context
ZNAME	STRING	Yes	The name of the address context zone.	
NAME	STRING	Yes	The name of this trunk group.	
SILC	GAUGE	No	The number of calls cancelled due to SILC for this trunk group for the specified interval.	
STR_CANT	GAUGE	No	The number of calls cancelled due to STR for this trunk group for the specified interval.	
STR_SKIP	GAUGE	No	The number of calls skipped due to STR for this trunk group for the specified interval.	
SKIP	GAUGE	No	The number calls skipped due to the SKIP traffic control for this trunk group for the specified interval.	
CANT	GAUGE	No	The number of calls cancelled due to CANT for this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
CANF	GAUGE	No	The number of calls cancelled due to CANF for this trunk group for the specified interval.	
ACC_CANT	GAUGE	No	The number of calls cancelled due to ACC for this trunk group for the specified interval.	
ACC_SKIP	GAUGE	No	The number of calls skipped due to ACC for this trunk group for the specified interval.	
ROUTE_ATTEMPTS_IRR	GAUGE	No	The number of reroute attempts due to IRR for this trunk group for the specified interval.	
ROUTE_ATTEMPTS_SIRR	GAUGE	No	The number of reroute attempts due to SIRR for this trunk group for the specified interval.	
ROUTE_ATTEMPTS_ORR	GAUGE	No	The number of reroute attempts due to ORR for this trunk group for the specified interval.	
ROUTE_ATTEMPTS_SORR	GAUGE	No	The number of reroute attempts due to SORR for this trunk group for the specified interval.	
SUCCESSFUL_IRR	GAUGE	No	The number of successful reroutes due to IRR for this trunk group for the specified interval.	
SUCCESSFUL_SIRR	GAUGE	No	The number of successful reroutes due to SIRR for this trunk group for the specified interval.	

Column Name	Column Type	Index	Description	CLI Command Reference
SUCCESSFUL_ORR	GAUGE	No	The number of successful reroutes due to ORR for this trunk group for the specified interval.	
SUCCESSFUL_SORR	GAUGE	No	The number of successful reroutes due to SORR for this trunk group for the specified interval.	
CE_NAME	STRING	No	The name of the compute element for this entity.	

CURRENT_CLIENT_SESSIONS, CURRENT_SUSPENDED_SESSIONS, TOTAL_CLIENT_SESSIONS are not valid for SBC 4.0 and higher versions.

UdpGeneralGroupStats

Column Name	Column Type	Index	Description	CLI Command Reference
CE_NAME	STRING	Yes	The name of the compute element for this entry.	NA
IN_DATAGRAMS	COUNTER	No	The total number of UDP datagrams delivered to UDP users.	
OUT_DATAGRAMS	COUNTER	No	The total number of UDP datagrams sent from this entity.	
UNKNOWN_PORTS	COUNTER	No	The total number of received UDP datagrams for which there was no application at the destination port.	
IN_ERRORS	COUNTER	No	The number of received UDP datagrams that this entity cannot deliver for reasons other than the lack of an application at the destination port.	

ZoneIntervalStatisticsStats

Column Name	Column Type	Index	Description	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	Show Table Address Context
NAME	STRING	Yes	The name of this zone.	
INGRESS_FAIL_CALL_LIMIT	COUNTER	No	Number of incoming Calls failed due to Call Limit check on Zone.	
EGRESS_FAIL_CALL_LIMIT	COUNTER	No	Number of outgoing Calls failed due to Call Limit check on Zone.	
INGRESS_FAIL_CALL_POLICIN G	COUNTER	No	Number of incoming Calls failed due to Call Policer check on Zone.	
EGRESS_FAIL_CALL_POLICIN G	COUNTER	No	Number of outgoing Calls failed due to Call Policer check on Zone.	
INGRESS_FAIL_BWLIMIT	COUNTER	No	Number of incoming Calls failed due to Bandwidth Limit check on Zone.	
EGRESS_FAIL_BWLIMIT	COUNTER	No	Number of outgoing Calls failed due to BW Limit check on Zone.	
INGRESS_SIP_REG_FAIL_LIMI T	COUNTER	No	Number of incoming SIP Registrations failed due to Registrations Limit check on Zone.	
EGRESS_SIP_R EG_FAIL_LIMIT	COUNTER	No	Number of outgoing SIP Registrations failed due to Registrations Limit check on Zone.	
INGRESS_SIP_REG_POLICING	COUNTER	No	Number of incoming SIP Registrations failed due to ingress Policer check on Zone.	

Column Name	Column Type	Index	Description	CLI Command Reference
EGRESS_SIP_R EG_POLICING	COUNTER	No	Number of outgoing SIP Registrations failed due to egress Policer check on Zone.	
VIDEO_THRES HOLD_LIMIT	COUNTER	No	The number of exceeded video threshold limits for this zone.	
CE_NAME	STRING	No	The name of the compute element for this entity.

CallCountIntervalStats

Column Name	Column Type	Index	Description	canAggregate
NAME	INTEGER	True	This adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	True
MAX_SESSION_COUNT	COUNTER	False	Displayed as maxSessionCallCount. The high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable.	True
MAX_POL_RTU_COUNT	INTEGER	False	Displays the same count as MAX_SESSION_COUNT if SBC is using SBC-POL-RTU license. If SBC is not using SBC-POL-RTU license, the count is displayed as 0.	True
ENCRYPT_COUNT	COUNTER	False	Displayed as system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True
SRTP_COUNT	COUNTER	False	Displayed as system wide total Secure Real-time Transport Protocol (SRTP) Call Count; The high watermark of total number of SRTP calls for the specified interval.	True
VIDEO_COUNT	COUNTER	False	Displayed as system wide total video Call Count; The high watermark of total number of video calls for the specified interval.	True
AMRNB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval.	True
AMRWB_COUNT	COUNTER	False	The high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval.	True

Column Name	Column Type	Index	Description	canAggregate
EVRC_COUNT	COUNTER	False	The high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval.	True
NICEREC_COUNT	COUNTER	False	The current high watermark of total number of NICE recording calls.	True
MRFSESS_COUNT	COUNTER	False	The current high watermark of total number of Media Resource Function (MRF) calls.	True
MAX_PSX_RTU_COUNT	INTEGER	False	Displays MAX_SESSION_COUNT when SBC is using SBC-PSX-RTU license. If SBC is not using SBC-PSX-RTU license it displays the count as 0.	True
VDSPRTU_COUNT	COUNTER	False	The high watermark of total number of trans-coded sessions for the specified interval.	True
PDCS_COUNT	COUNTER	False	The high watermark of total number of pdcs header sessions for the specified interval.	True
SIPREC_COUNT	COUNTER	False	The current high watermark of total number of sip recording calls.	True
LI_ENABLED	INTEGER	False	Set based on whether LI license is available at the SBC.	True
DSPG722_ENABLED	INTEGER	False	Set based on whether DspG722 license is available at the SBC.	True
GMP4X1_ENABLED	INTEGER	False	Set based on whether 4X1GMP license is available at the SBC.	True
SIPI_ENABLED	INTEGER	False	Set based on whether Sipl license is available at the SBC.	True
SIP323_ENABLED	INTEGER	False	Set based on whether SipRec license is available at the SBC.	True
GMP1X10_ENABLED	INTEGER	False	Set based on whether 1X10GMP license is available at the SBC.	True

Column Name	Column Type	Index	Description	canAggregate
CAPACITY_ENABLED	INTEGER	False	Set based on whether Capacity license is available at the SBC.	True
E911_ENABLED	INTEGER	False	Set based on whether E911 license is available at the SBC.	True
ENUM_ENABLED	INTEGER	False	Set based on whether ENUM license is available at the SBC.	True
SWINSTANCE_ENABLED	INTEGER	False	Set based on whether Swe Instance license is available at the SBC.	True
EVS_COUNT	COUNT	False	The high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval.	True
SILK_COUNT	COUNT	False	The high watermark of total number of SILK Codec Transcode calls for the specified interval.	True
SBCRCS_COUNT	COUNT	False	The high watermark of total number of OOD calls that use an RCS based service for the specified interval.	True
HPC_QUEUE_ATTEMPT	COUNT	False	The number of HPC calls successfully placed on HPC Call Queuing queues for the reporting interval.	True
SLBSESS_COUNT	COUNT	False	Displayed as system wide total stable SLB sessions Count. The high watermark of the total number of active calls for the reporting interval.	True
LBINSTANCE_ENABLED	INTEGER	False	Set based on whether SLB license is available at the SLB.	False
HPC_QUEUE_OVERFLOW	COUNT	False	The number of HPC calls which experienced unsuccessful call queuing attempts due to full queues for the reporting interval.	True
HPC_QUEUE_ABANDON	COUNT	False	The number of queued HPC calls abandoned before call completion during the reporting interval.	True

Column Name	Column Type	Index	Description	canAggregate
HPC_QUE_TIMEO UTS	COUNT	False	The number of HPC calls removed from the queue due to expiration of the queue timeout timer for the reporting interval.	True
HPC_CTL_TFC_E XEM	COUNT	False	The HPC traffic control exemptions for this reporting interval.	True
SOSBC_RTU_CO UNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True
WEB_SOCKET_C OUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval.	True
NOTRUF_AUTH	INTEGER	True	Set based on whether NOTRUF license is available at the SBC.	False
CE_NAME	STRING	False	The name of the compute element for this entry.	False
CALL_COUNT_CN E	COUNTER	False	Displayed as system wide total CNE sessions Count. The high water mark of total number of active calls for the reporting interval.	True
L16_LEG_COUNT	COUNTER	False	The high water mark of total number of L16 call legs for the reporting interval.	True
T140	INTEGER	False	Set based on whether the t140 code is used on at least one call leg for the current interval.	True
DOD	INTEGER	False	Set based on when the application is running in DOD mode.	True
FIPS	INTEGER	False	Set based on when the application is running in FIPS mode.	True
CNEINSTANCE_E NABLED	INTEGER	False	Set based on whether cneInstance license is available at the SBC.	True

CallCountIntervalStats_AG

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
NAME	INTEGER	True	This adds a dummy key to non-config scalar element container, even though only one row is allowed in container. Without the key, tailf treats the container non-dynamic and calls get_elem per leaf instead of calling get_object per row.	false	N/A
SUM_MAX_SESSION_COUNT	COUNTER	False	The sum of the high watermark of total number of calls for the specified interval. This statistic accounts for calls that are stable. Displayed as maxSessionCallCount.	True	SUM
SUM_MAX_POL_RTU_COUNT	INTEGER	False	The sum of the MAX_SESSION_COUNT if SBC is using SBC-POL-RTU license. If SBC is not using SBC-POL-RTU license, the count is displayed as 0.	True	SUM
SUM_ENCRYPT_COUNT	COUNTER	False	The sum of the system wide total encrypt Call Count. The high watermark of total number of encrypt calls for the specified interval.	True	
SUM_SRTP_COUNT	COUNTER	False	The sum of the system wide total Secure Real-time Transport Protocol (SRTP) Call Count; The high watermark of total number of SRTP calls for the specified interval.	True	SUM
SUM_VIDEO_COUNT	COUNTER	False	The sum of the system wide total video Call Count; The high watermark of total number of video calls for the specified interval.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_AMRNB_COUNT	COUNTER	False	The sum of the high watermark of total number of Adaptive Multi-Rate Narrowband (AMRNB) calls for the specified interval.	True	SUM
SUM_AMRWB_COUNT	COUNTER	False	The sum of the high watermark of total number of Adaptive Multi-Rate Wideband (AMRWB) calls for the specified interval.	True	SUM
SUM_EVRC_COUNT	COUNTER	False	The sum of the high watermark of total number of Enhanced Variable Rate Codec (EVRC) calls for the specified interval.	True	SUM
SUM_NICEREC_COUNT	COUNTER	False	The sum of the current high watermark of total number of NICE recording calls.	True	SUM
SUM_MRFSESS_COUNT	COUNTER	False	The sum of the current high watermark of total number of Media Resource Function (MRF) calls.	True	SUM
SUM_MAX_PSEX_RTU_COUNT	INTEGER	False	The sum of the MAX_SESSION_COUNT when SBC is using SBC-PSX-RTU license. If SBC is not using SBC-PSX-RTU license it displays the count as 0.	True	SUM
SUM_VDSPRTU_COUNT	COUNTER	False	The sum of the high watermark of total number of trans-coded sessions for the specified interval.	True	SUM
SUM_PDCS_COUNT	COUNTER	False	The sum of the high watermark of total number of pdcs header sessions for the specified interval.	True	SUM
SUM_SIPREC_COUNT	COUNTER	False	The sum of the current high watermark of total number of sip recording calls.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_LI_ENABLED	INTEGER	False	The sum of the count of LI licenses available at the SBC.	True	SUM
SUM_DSPG722_ENABLED	INTEGER	False	The sum of the count of DspG722 licenses available at the SBC.	True	SUM
SUM_GMP4X1_ENABLED	INTEGER	False	The sum of the count of 4X1GMP licenses is available at the SBC.	True	SUM
SUM_SIPI_ENABLED	INTEGER	False	The sum of the count of Sipl licenses available at the SBC.	True	SUM
SUM_SIP323_ENABLED	INTEGER	False	The sum of the count of SipRec licenses available at the SBC.	True	SUM
SUM_GMP1X10_ENABLED	INTEGER	False	The sum of the count of 1X10GMP licenses available at the SBC.	True	SUM
SUM_CAPACITY_ENABLED	INTEGER	False	The sum of the count of Capacity licenses available at the SBC.	True	SUM
SUM_E911_ENABLED	INTEGER	False	The sum of the count of E911 licenses available at the SBC.	True	SUM
SUM_ENUM_ENABLED	INTEGER	False	The sum of the count of ENUM licenses available at the SBC.	True	SUM
SUM_SWINSTANCE_ENABLED	INTEGER	False	The sum of the count of SWe Instance licenses available at the SBC.	True	SUM
SUM_EVS_COUNT	COUNT	False	The sum of the high watermark of total number of Enhanced Voice Services (EVS) calls for the specified interval.	True	SUM
SUM_SILK_COUNT	COUNT	False	The sum of the high watermark of total number of SILK Codec Transcode calls for the specified interval.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_SBCRCS_COUNT	COUNT	False	The sum of the high watermark of total number of OOD calls that use an RCS based service for the specified interval.	True	SUM
SUM_LBINSTANCE_ENABLED	INTEGER	False	The sum of the count of SLB licenses available at the SLB.	True	SUM
SUM_SLB_SESSIONS_COUNT	COUNTER	False	The sum of the total stable SLB sessions count across the system. The high watermark of total number of active calls for the reporting interval.	True	SUM
SUM_HPC_QUEUE_ATTEMPT	COUNTER	False	The sum of the number of HPC calls that were successfully placed on HPC Call Queuing queues for the reporting interval.	True	SUM
SUM_HPC_QUEUE_OVERFLOW	COUNTER	False	The sum of the number of HPC calls for which HPC call queuing attempts were unsuccessful because queues were full for the reporting interval.	True	SUM
SUM_HPC_QUEUE_ABANDON	COUNTER	False	The sum of the number of HPC calls that were placed in HPC Call Queuing queues, but were subsequently abandoned before they are completed for the reporting interval.	True	SUM
SUM_HPC_QUEUE_TIMEOUTS	COUNTER	False	The sum of the number of HPC calls that were placed in HPC Call Queuing queues, but were subsequently abandoned before they are completed for the reporting interval.	True	SUM
SUM_HPC_CTL_TFC_EXEM	COUNTER	False	The sum of the HPC traffic control exemptions for this reporting interval.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_SOSBC_RTU_COUNT	COUNTER	False	The system wide total stable SOSBC sessions count. The high water mark of total number of active calls for the reporting interval.	True	SUM
AVG_LBINSTANCE_ENABLED	INTEGER	False	Set based on whether the SLB license is available at the SLB.	True	MEAN
AVG_LICENSE_MODE	INTEGER	False	Displays the licensing mode of the SBC.	True	MEAN
WEB_SOCKET_COUNT	COUNTER	False	The high water mark of total number of web socket calls for this reporting interval.	True	SUM
CE_NAME	STRING	False	The name of the compute element for this entry.	False	N/A

CallFailIntervalStats

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	False	Show Table Address Context
ZNAME	STRING	Yes	The name of the address context zone.	False	
NAME	STRING	Yes	The name of this trunk group.	True	
IN_CALL_FAIL_NO_ROUTES	COUNTER	No	Number of inbound failed calls because there was no route available for this trunk group for the specified interval.	False	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
IN_CALL_FAIL_NO_RESOURCES	COUNTER	No	Number of inbound failed calls because there was an unavailable resource for this trunk group for the specified interval.	True	
IN_CALL_FAIL_NO_SERVICE	COUNTER	No	Number of inbound failed calls because there was an unavailable service for this trunk group for the specified interval.	True	
IN_CALL_FAIL_INVALID_CALL	COUNTER	No	Number of inbound failed calls because there was an invalid call attempt for this trunk group for the specified interval.	True	
IN_CALL_FAIL_NETWORK_FAILURE	COUNTER	No	Number of inbound failed calls because there was a network failure for this trunk group for the specified interval.	True	
IN_CALL_FAIL_PROTOCOL_ERROR	COUNTER	No	The number of failed inbound calls due to a protocol error for this trunk group for the specified interval. The SBC increments the counter for this statistic when it receives unrecognized parameters, or all the required parameters are not configured.	True	
IN_CALL_FAIL_UNSPECIFIED	COUNTER	No	Number of inbound failed calls for an unspecified reason for this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
OUT_CALL_FAIL_NO_ROUTES	COUNTER	No	Number of outbound failed calls due to no route available for this trunk group for the specified interval.	True	
OUT_CALL_FAIL_NO_RESOURCES	COUNTER	No	The number of failed outbound calls due to unavailable resources for this trunk group for the specified interval. The SBC increments the counter for this statistic when the route is not configured and it fails to find the necessary resources.	True	
OUT_CALL_FAIL_NO_SERVICE	COUNTER	No	The number of failed outbound calls due to service unavailability for this trunk group for the specified interval. The SBC increments the counter for this statistic when outbound call service is not available for this trunk group during the specified interval.	True	
OUT_CALL_FAIL_INVALID_CALL	COUNTER	No	Number of outbound failed calls due to invalid call attempt for this trunk group for the specified interval.	True	
OUT_CALL_FAIL_NETWORK_FAILURE	COUNTER	No	Number of outbound failed calls due to network failure for this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
OUT_CALL_FAIL_PROTOCOL_ERROR	COUNTER	No	The number of failed outbound calls due to a protocol error for this trunk group for the specified interval. The SBC increments the counter for this statistic when it receives unrecognized parameters, or all the required parameters are not configured.	True	
OUT_CALL_FAIL_UNSPECIFIED	COUNTER	No	The number of failed outbound calls due to an unspecified reason for this trunk group for the specified interval. The SBC increments the counter for this statistic if the SIP Signaling Port for the egress is disabled while calls are in progress.	True	
ROUTING_FAILURES_RESERVED	COUNTER	No	Number of routing failures due to all circuits reserved for this trunk group for specified interval.	True	
ALLOC_FAIL_BW_LIMIT	COUNTER	No	The number of failed bandwidth requests due to the current usage exceeding the configured bandwidth limit for this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ALLOC_FAIL_CALL_LIMIT	COUNTER	No	The number of failed call handling requests due to the current number of concurrent calls exceeding the configured call limit for this trunk group for the specified interval.	True	
NO_PSX_ROUTE	COUNTER	No	Number of failed calls on an ingress trunk group due to no routes returned from the ERE for the specified interval.	True	
CALL_ABANDONED	COUNTER	No	Number of calls on a toll-free TG that were abandoned while dialing for the specified interval.	True	
CALL_FAIL_POLICING	COUNTER	No	The number of calls for a trunk group that failed during the specified interval due to configured policing rules in the SBC.	True	
SIP_REG_FAIL_POLICING	COUNTER	No	Number SIP registration attempts that failed due to policing on TG for specified interval.	True	
SIP_REG_FAIL_INTERNAL	COUNTER	No	Number SIP registration attempts that failed due to other reasons (signaling failures, and so on) on a trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
SIP_REG_FAIL_OTHER	COUNTER	No	The current number SIP registration attempts that failed due to other reasons (signaling failures, and so on) on a trunk group for the specified interval.	True	
SECURITY_FAIL	COUNTER	No	Number of calls that failed due to mismatch between the peer security and route packet service profile security on trunk group for specified interval.	True	
NON_REG_CALLS_FAILED	COUNTER	No	Number of failed calls due to registration requirement for SIP trunk group for the specified interval.	True	
NON_MATCH_SRC_IP_CALLS_FAIL	COUNTER	No	Number of calls that failed due to mismatched source IP of IAD according to its RCB for the specified interval.	True	
INVALID_SP_CALLS_FAILED	COUNTER	No	Number of failed calls due to mismatched ingress signaling port from CP according to RCB for the specified interval.	True	
SIP_SUBS_FAIL_POLICING	COUNTER	No	Number of SIP Subscribe attempts that failed due to policing on a trunk group.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
SIP_OTHER_REQ_FAIL_POLICING	COUNTER	No	Number of SIP other non-invite attempts that failed due to policing on trunk group.	True	
SIP_OTHER_REQ_FAIL_INTERNAL	COUNTER	No	The count of SIP other non-invite attempts that failed due to policing on a trunk group.	True	
SIP_OTHER_REQ_FAIL_OTHER	COUNTER	No	The count of SIP other non-invite attempts that failed due to policing on a trunk group.	True	
VIDEO_THRESHOLD_LIMIT	COUNTER	No	The count of exceeded video threshold limits for this shared CAC limits pool.	True	
CE_NAME	STRING	No	The name of the compute element for this entry.	False

CallIntervalStats

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ACNAME	STRING	Yes	The name of the address context.	False	Show Table Address Context
ZNAME	STRING	Yes	The name of the address context zone.	False	
NAME	STRING	Yes	The name of this trunk group.	True	
IN_USAGE	COUNTER	No	The duration, in seconds, for which all inbound calls in a given interval are using the trunkgroup. This metric is derived using the formula: (total # of inbound calls on the TG) * (interval size) * 60	False	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
OUT_USAGE	COUNTER	No	The duration, in seconds, for which all outbound calls in a given interval are using the trunkgroup. This metric is derived using the formula: (total # of outbound calls on the TG) * (interval size) * 60.	True	
IN_CALLS	COUNTER	No	Number of completed inbound calls on this trunk group for the specified interval.	True	
OUT_CALLS	COUNTER	No	Number of completed outbound calls on this trunk group for the specified interval.	True	
IN_CALL_ATTEMPTS	COUNTER	No	Number of inbound call attempts on this trunk group for the specified interval.	True	
OUT_CALL_ATTEMPTS	COUNTER	No	Number of outbound call attempts on this trunk group for the specified interval.	True	
MAX_COMPLETED_CALLS	COUNTER	No	The high watermark of total number of active calls in both the inbound and outbound directions on the trunk group for the specified interval. This statistic accounts for calls that are setting up, stable, or tearing down.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
CALL_SETUP_TIME	COUNTER	No	Total call setup time for all completed calls in inbound and outbound directions for this trunk group for specified interval measured in hundredths of a second.	True	
CALL_SETUPS	COUNTER	No	Total number of calls setup but not necessarily completed in the inbound and outbound directions for this trunk group for the specified interval.	True	
ROUTING_ATTEMPTS	COUNTER	No	The number of routing attempts for this trunk group for the specified interval. Each PSX dip can return up to 200 routes. The SBC selects routes based on a number of criteria such as CAC and bandwidth availability. In some cases, crankback/ route advance is needed if the first selected route fails. This metric counts the number of routes attempted before the call succeeded. If the first route succeeds, this counter = 1.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
IN_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in Kbits per second multiplied by call duration in seconds) for every inbound call associated with this trunk group for the specified interval.	True	
OUT_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in Kbits per second multiplied by call duration in seconds) in the outbound direction for this trunk group in seconds in the current interval. The trunk group usage is defined as the time a trunk is seized to the time a trunk is released.	True	
MAX_ACTIVE_BW_USAGE	GAUGE	No	High watermark bandwidth usage (in Kbits per second) in either direction associated with this trunk group for the specified interval.	True	
CALLS_WITH_PKT_OUTAGE	COUNTER	No	Number of calls with a maximum packet outage whose duration exceeds the configured minimum for this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
CALLS_WITH_PKT_OUTAGE_AT_END	COUNTER	No	Number of calls whose maximum packet outage occurs at the end of the call for this trunk group for the specified interval.	True	
TOTAL_PKT_OUTAGE	COUNTER	No	Summation of packet outage duration (in milliseconds) whose duration exceeds the configured minimum which is reported during the specified performance interval.	True	
MAX_PKT_OUTAGE	GAUGE	No	Single longest maximum reported packet outage duration (in milliseconds) experienced during the specified performance interval for this trunk group.	True	
POD_EVENTS	COUNTER	No	Number of Packet Outage Detection (POD) Events detected for this peer group for the specified interval.	True	
PLAYOUT_BUFFER_GOOD	COUNTER	No	Number of calls with all sub-intervals reporting GOOD playout buffer quality for this trunk group for the specified interval.	True	
PLAYOUT_BUFFER_ACCEPTABLE	COUNTER	No	Number of calls with all sub-intervals reporting ACCEPTABLE or better playout buffer quality for this trunk group for the specified interval.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
PLAYOUT_BUFFER_POOR	COUNTER	No	Number of calls with all sub-intervals reporting POOR or better playout buffer quality for this trunk group for the specified interval.	True	
PLAYOUT_BUFFER_UNACCEPTABLE	COUNTER	No	Number of calls with at least one sub-interval reporting UNACCEPTABLE playout buffer quality for this trunk group for the specified interval.	True	
SIP_REG_ATTEMPTS	COUNTER	No	Current number of SIP registration attempts on a trunk group for the specified interval.	True	
SIP_REG_COMPLETIONS	COUNTER	No	Current number of SIP registrations that have successfully completed on a trunk group for the specified interval.	True	
CALLS_WITH_PBX_DIPS	COUNTER	No	The number of calls that made a PBX Dip during the interval (applies to ERE, ePBX and external ePBX).	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
TOTAL_PSX_DIPS	COUNTER	No	The total number of PSX dips for the specified interval (applies to ERE, ePSX and external ePSX). To see the number of calls which made PSX Dips during the interval, see CALLS_WITH_PSX_DIPS metric. Example During the specified interval, two calls made three dips each (due to call redirection, etc.) to the PSX. This is logged as: CALLS_WITH_PSX_DIPS = 2 and TOTAL_PSX_DIPS = 6. If calls do not involve redirection or other complex scenarios such as two-stage dialing and transfers, these two metrics can use the same value.	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
ACTIVE_REGS	COUNTER	No	Interval number of active registrations on this trunk group.	True	
MAX_ACTIVE_REGS	GAUGE	No	Maximum active registrations on this trunk group (high-watermark achieved on this trunk group).	True	
CALL_LIMIT	GAUGE	No	CALL_LIMIT is the summation of TOTAL_CALLS_AVAILABLE, INBOUND_CALLS_USAGE, PRIORITY_CALL_USAGE, and OUTBOUND_CALLS_USAGE from NBS5200TrunkGroup StatusStats table (when it is not unlimited). Note CALL_LIMIT is different from the Call Limit configured at the SBC 5x00 device.	True	
ACTIVE_SUBS	COUNTER	No	Current number of active subscriptions on this trunk group.	True	
MAX_ACTIVE_SUBS	GAUGE	No	Maximum number of active subscriptions on this trunk group (high-watermark achieved on this trunk group).	True	

Column Name	Column Type	Index	Description	canAggregate	CLI Command Reference
PEAK_CALL_RATE	GAUGE	No	The current system peak call arrival rate.	True	
ONGOING_CALLS	INTEGER	No	Total number of ongoing calls (nonstable + stable) on this trunk group	True	
STABLE_CALLS	INTEGER	No	Total number of stable calls on this trunk group	True	
CALL_UPDATES	INTEGER	No	Total number of call updates on this trunk group	True	
EMERGENCY_STABLE_CALLS	INTEGER	No	Total number of stable emergency calls on this trunk group	True	
EMERGENCY_ONGOING_CALLS	INTEGER	No	Total number of emergency calls (stable + nonstable) on this trunk group	True	
CE_NAME	STRING	No	The name of the compute element for this entry.	False

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_OUT_BW_USAGE	COUNTER	No	Sum of bandwidth usage (expected data rate in bits per second multiplied by call duration in seconds) for every outbound call associated with this trunk group for the specified interval.	True	SUM
AVG_MAX_ACTIVE_BW_USAGE	GAUGE	No	The high water mark of BW usage in either direction associated with this peer group for the specified interval.	True	MEAN
SUM_CALLS_WITH_PKT_OUTAGE	COUNTER	No	Number of calls with a maximum packet outage whose duration exceeds the configured minimum for this trunk group for the specified interval.	True	SUM
SUM_CALLS_WITH_PKT_OUTAGE_AT_END	COUNTER	No	Number of calls whose maximum packet outage occurs at the end of the call for this trunk group for the specified interval.	True	SUM
SUM_TOTAL_PKT_OUTAGE	COUNTER	No	Summation of packet outage durations (in milliseconds) whose duration exceeds the configured minimum which is reported during the specified performance interval.	True	SUM
AVG_MAX_PKT_OUTAGE	GAUGE	No	The single longest maximum reported packet outage duration (in milliseconds) experienced during the specified performance interval for this peer group.	True	MEAN

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_POD_EVENTS	COUNTER	No	Number of Packet Outage Detection (POD) Events detected for this peer group for the specified interval.	True	SUM
SUM_PLAYOUT_BUFFER_GOOD	COUNTER	No	Number of calls with all sub-intervals reporting GOOD playout buffer quality for this trunk group for the specified interval.	True	SUM
SUM_PLAYOUT_BUFFER_ACCEPTABLE	COUNTER	No	Number of calls with all sub-intervals reporting ACCEPTABLE or better playout buffer quality for this trunk group for the specified interval.	True	SUM
SUM_PLAYOUT_BUFFER_POOR	COUNTER	No	Number of calls with all sub-intervals reporting POOR or better playout buffer quality for this trunk group for the specified interval.	True	SUM
SUM_PLAYOUT_BUFFER_UNACCEPTABLE	COUNTER	No	Number of calls with at least one sub-interval reporting UNACCEPTABLE playout buffer quality for this trunk group for the specified interval.	True	SUM
SUM_SIP_REG_ATTEMPTS	COUNTER	No	The current number of SIP registration attempts on a peer group for the specified interval.	True	SUM
SUM_SIP_REG_COMPLETIONS	COUNTER	No	The current number of SIP registrations that have successfully completed on a peer group for the specified interval.	True	SUM
SUM_CALLS_WITH_PSX_DIPS	COUNTER	No	The number of calls that made a PSX Dip during the interval (applies to ERE, ePSX and external ePSX).	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
SUM_TOTAL_PSX_DIPS	COUNTER	No	The total number of PSX dips for the specified interval (applies to ERE, ePSX and external ePSX). To see the number of calls which made PSX Dips during the interval, see CALLS_WITH_PSX_DIPS metric. Example During the specified interval, two calls made three dips each (due to call redirection, etc.) to the PSX. This is logged as: CALLS_WITH_PSX_DIPS = 2 and TOTAL_PSX_DIPS = 6. If calls do not involve redirection or other complex scenarios such as two-stage dialing and transfers, these two metrics can use the same value.	True	SUM
SUM_ACTIVE_REGS	COUNTER	No	The Interval number of active registrations on this peer group.	True	SUM
AVG_MAX_ACTIVE_REGS	GAUGE	No	The Interval number of maximum active registrations on this peer group (this is the high-watermark achieved on this peer group).	True	MEAN
SUM_ACTIVE_SUBS	COUNTER	No	The Interval number of active subscribe on this peer group.	True	SUM

Column Name	Column Type	Index	Description	canAggregate	Aggregate Type
AVG_MAX_ACTIVE_SUBS	GAUGE	No	The Interval number of maximum active subscribe on this peer group (this is the high-watermark achieved on this peer group).	True	MEAN
AVG_PEAK_CALL_RATE	GAUGE	No	Peak call arrival rate within a specified interval on this trunk group.	True	MEAN
AVG_ONGOING_CALLS	INTEGER	No	Total On Going Calls (Non-Stable + Stable) on this trunk group.	True	MEAN
AVG_STABLE_CALLS	INTEGER	No	Total Stable Calls on this trunk group.	True	MEAN
AVG_CALL_UPDATES	INTEGER	No	Total Call Updates on this trunk group.	True	MEAN
AVG_EMERGENCY_STABLE_CALLS	INTEGER	No	Total Emergency Stable Calls on this trunk group.	True	MEAN
AVG_EMERGENCY_ONGOING_CALLS	INTEGER	No	Total Emergency Calls Stable + Non-Stable on this trunk group.	True	MEAN
AVG_CALL_LIMIT	GAUGE	No	The sum of TOTAL_CALLS_AVAILABLE, INBOUND_CALLS_USAGE, PRIORITY_CALL_USAGE, and OUTBOUND_CALLS_USAGE from NBS5200TrunkGroupStatusStats table.	True	MEAN
CE_NAME	STRING	No	The name of the compute element for this entry.	False	N/A

CnfDnsGroupDnsServerStats

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
ACNAME	STRING	True	The name of the address context.	True	
CNF_PODNAME	STRING	True	The name of the pod.	False	
GNAME	STRING	True	The name of the address context group.	False	
IND	GAUGE	True	The DNS server statistics isIndex for this address context.	False	
IP_ADDRESS	INETADDRESS	False	The IP address of the requested DNS server requested for statistics data.	False	
QUERIES	GAUGE	False	The number of queries made by the DNSC client to this DNS server.	True	
TIMEOUTS	GAUGE	False	The number of timeouts resulting from the queries made by the DNSC client to this DNS server.	True	
ERRORS	GAUGE	False	The number of errors resulting from the queries made by the DNSC client to this DNS server.	True	
REFERRALS	GAUGE	False	The number of referrals resulting from the queries made by the DNSC client to this DNS server.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
TOTAL_TCP_CONNECTION	GAUGE	False	The number tries for connecting to the DNS server.	True	
TCP_CONNECTION_FAILED	GAUGE	False	Number of times the SBC failed to connect to the DNS server.	True	
TCP_CONNECTION_SUCCESS	GAUGE	False	The number of successful TCP connections to the DNS server.	True	
TCP_CONNECTION_TORN_DOWN	GAUGE	False	Number of TCP connections torn down with the DNS server.	True	
TCP_FALLBACK	GAUGE	False	Number of times the TCP fallback to the DNS server.	True	
EDNS_STATUS	INTEGER	False	Number of times the TCP fallback to the DNS server.	True	
EDNS_FAILURES	GAUGE	False	Number of times the TCP fallback to the DNS server.	True	
CE_NAME	STRING	True	The host name of the server.	False	

CnfEthernetPortPacketStats

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
CNF_PODNAME	STRING	True	The name of the pod.	False	
CE_NAME	STRING	True	The host name of the server.	False	
PORT_NAME	STRING	True	The name of the port.	False	
RX_PACKETS	COUNTER	False	The number of packets received.	True	
TX_PACKETS	COUNTER	False	The number of packets transmitted.	True	
RX_ERRORS	COUNTER	False	The number of bad packets received.	True	
TX_ERRORS	COUNTER	False	The number of packet transmit failures.	True	
RX_DROPPED	COUNTER	False	The number of packets dropped due to no receive buffers.	True	
TX_DROPPED	COUNTER	False	The number of packets dropped due to no transmit buffers.	True	
RX_BYTES	COUNTER	False	The number of bytes received.	True	
TX_BYTES	COUNTER	False	The number of bytes transmitted.	True	

CnflcmpGeneralGroupStats

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
CNF_PODNAME	STRING	True	The name of the pod.	False	
CE_NAME	STRING	True	The name of the compute element for this entry.	False	
IN_MSGS	COUNTER	False	The total number of ICMP messages received by this entity. Note This counter includes messages counted by icmpInErrors.	True	
IN_ECHOS	COUNTER	False	The number of ICMP Echo (request) messages received.	True	
IN_ECHO_REPS	COUNTER	False	The number of ICMP Echo reply messages received.	True	
IN_DEST_UNREACHS	COUNTER	False	The number of ICMP Destination Unreachable messages received.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
IN_ERRORS	COUNTER	False	The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, etc.).	True	
OUT_MSGS	COUNTER	False	The total number of ICMP messages attempted to send by this entity. Note This counter includes all messages counted by icmpOutErrors.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
OUT_ERRORS	COUNTER	False	The number of ICMP messages which this entity did not send due to problems discovered within the ICMP. For example, lack of buffer. This value should not include errors discovered outside the ICMP layer. For example, the inability of IP to route the resultant datagram. Based on the implementation, there may be no errors with respect to storageDataTypes, which contribute to this counter's value.	True	
OUT_ECHOS	COUNTER	False	The number of ICMP Echo (request) messages sent.	True	
OUT_ECHO_REPS	COUNTER	False	The number of ICMP Echo reply messages sent.	True	
OUT_DEST_UNREACHS	COUNTER	False	The number of ICMP destination unreachable messages sent.	True

MATCHES	COUNTER	False	The number of times this rule has been matched.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
POLICER_DISCARDS	COUNTER	False	The number of times the policer for this rule discarded packets.	True	
CE_NAME	STRING	True	The host name of the server.	False	

CnflpGeneralGroupStats

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
CNF_PODNAME	STRING	True	The name of the pod.	False	
CE_NAME	STRING	True	The name of the compute element for this entry.	False	
IN_RECEIVES	COUNTER	False	The total number of input datagrams received from interfaces, including those received in error.	True	
IN_HDR_ERRORS	COUNTER	False	The number of input datagrams discarded due to errors in IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
IN_ADDR_ERRORS	COUNTER	False	The number of input datagrams discarded due to invalid address in the IP address header destination. This count includes invalid addresses, for example, 0.0.0.0. It also includes addresses of unsupported classes, for example, 0.0.0.0. For entities which are not IP routers and do not forward datagrams, this counter includes discarded datagrams due to destination address not being a local address.	True	
IN_UNKNOWN_PROTOCOLS	COUNTER	False	The number of locally-addressed datagrams received successfully, but discarded because of an unknown or unsupported protocol.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
IN_DISCARDS	COUNTER	False	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded, for example, lack of buffer space. Note This counter does not include any datagrams discarded while awaiting re-assembly.	True	
IN_DELIVERS	COUNTER	False	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
OUT_REQUE STS	COUNTER	False	The total number of IP datagrams in which the local IP user- protocols (including ICMP) supplied to IP, in requests for transmission. Note This counter does not include any datagram s counted in ipForwDat agrams.		

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
OUT_DISCARDS	COUNTER	False	The number of output IP datagrams for which no problem was encountered to prevent their transmission to the destination, but which were discarded, for example, due to lack of buffer space. Note This counter includes datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
OUT_NO_ROUTES	COUNTER	False	The number of IP datagrams discarded because no route is found to transmit them to their destination. Note This counter includes any packets counted in ipForwDatagrams which meets the no-route criterion. Note This includes any datagram which a host cannot route because all of its default routers are down.	True	
REASM_TIME_OUT	INTEGER	False	The maximum number of seconds for which received fragments are held while awaiting reassembly at this entity.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
REASM_REQDS	COUNTER	False	The number of IP fragments received which needs to be reassembled at this entity.	True	
REASM_OKS	COUNTER	False	The number of IP datagrams successfully re-assembled.	True	
REASM_FAILURES	COUNTER	False	The number of failures detected by the IP re-assembly algorithm, for example, timed out, errors, etc). Note This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
FRAG_OKS	COUNTER	False	The number of IP datagrams that have been successfully fragmented at this entity.	True	
FRAG_FAILS	COUNTER	False	The number of IP datagrams that are discarded because they need to be fragmented at this entity but could not be. For example, their Don't Fragment flag was set.	True

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
NAME	INTEGER	True	A dummy key to be added to the non-config scalar element container, although only one row is allowed in the container. Without the key, <code>tailf</code> treats the container non-dynamic and calls the <code>get_elem</code> per leaf instead of calling <code>get_object</code> per row.	False	
LEVEL_MC1_COUNT	COUNTER	False	The current number of transitions into MC1.	True	
LEVEL_MC1_TOTAL_TIME	COUNTER	False	The current sum of time spent in MC1.	True	
LEVEL_MC2_COUNT	COUNTER	False	The current number of transitions into MC2.	True	
LEVEL_MC2_TOTAL_TIME	COUNTER	False	The current sum of time spent in MC2.	True	
LEVEL_MC3_COUNT	COUNTER	False	The current number of transitions into MC3.	True	
LEVEL_MC3_TOTAL_TIME	COUNTER	False	The current sum of time spent in MC3.	True	
OVERLOAD_REJECTS	COUNTER	False	The current number of calls rejected due to System congestion.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
AVG_CALL_RATE	GAUGE	False	The current system average call arrival rate.	True	
PEAK_CALL_RATE	GAUGE	False	The current system peak call arrival rate.	True	
CALL_ARRIVALS	COUNTER	False	The current number of call arrivals.	True	
EMERGENCY_CALL_ARRIVALS	COUNTER	False	The current number of SIP emergency calls arrived.	True	
EMERGENCY_CALL_REJECTS	COUNTER	False	The current number of SIP emergency calls rejected.	True	
SIP_REG_ARRIVALS	COUNTER	False	The current number of SIP registrations arrived.	True	
SIP_REG_REJECTS	COUNTER	False	The current number of SIP registrations rejected.	True	
AVG_REG_RATE	GAUGE	False	The current average SIP registration arrival rate.	True	
PEAK_REG_RATE	GAUGE	False	The current peak SIP registration arrival rate.	True	
MAX_ACTIVE_CALLS	GAUGE	False	High water mark of the total number of active calls in current interval for system level.	True	
SIP_SUBS_ARRIVALS	GAUGE	False	The current number of SIP subscribes arrived.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
SIP_SUBS_REJECTS	GAUGE	False	The current number of SIP subscribes rejected.	True	
AVG_SUBS_RATE	GAUGE	False	The current average SIP subscribe arrival rate.	True	
PEAK_SUBS_RATE	GAUGE	False	The current peak SIP subscribe arrival rate.	True	
CE_NAME	STRING	True	This object indicates the configured CE name.	False	

CnfTcpGeneralGroupStats

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
CNF_PODNAME	STRING	True	The name of the pod.	False	
CE_NAME	STRING	True	This object indicates the configured CE name.	False	
ESTABLISHED_CONNECTIONS	GAUGE	False	The number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT. (currEstab)	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
CLIENT_CONNECTIONS	COUNTER	False	The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state. (activeOpens).	True	
SERVER_CONNECTIONS	COUNTER	False	The number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state. (passiveOpens).	True	
FAILED_ATTEMPTS	COUNTER	False	The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state. (attemptFails)	True	
IN_SEGMENTS	COUNTER	False	The total number of segments received, including those received in error. This count includes segments received on currently established connections.	True	

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
OUT_SEGMENTS	COUNTER	False	The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.	True	
RETRANS_SEGMENTS	COUNTER	False	The total number of segments retransmitted, that is, the number of TCP segments transmitted containing one or more previously transmitted octets.	True	
IN_ERRORS	COUNTER	False	The total number of segments received in error. For example, bad TCP checksums.	True	
IN_RESETS	COUNTER	False	The number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state. (estabResets)	True	
OUT_RESETS	COUNTER	False	The number of TCP segments sent containing the RST flag.	True	

CnfUdpGeneralGroupStats

Column Name	Column Type	Index	Description	Can Aggregate	CLI Command Reference
CNF_PODNAME	STRING	True	The name of the pod.	False	
CE_NAME	STRING	True	This object indicates the configured CE name.	False	
IN_DATAGRAMS	COUNTER	False	The total number of UDP datagrams delivered to UDP users.	True	
OUT_DATAGRAMS	COUNTER	False	The total number of UDP datagrams sent from this entity.	True	
UNKNOWN_PORTS	COUNTER	False	The total number of received UDP datagrams for which there was no application at the destination port.	True	
IN_ERRORS	COUNTER	False	The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port.	True

CURRENT_CLIENT_SESSIONS	INTEGER	No	Number of client sessions currently active.	
CURRENT_SERVER_SESSIONS	INTEGER	No	Number of server sessions currently active.	
CURRENT_SUSPENDED_SESSIONS	INTEGER	No	Number of server sessions currently suspended.	
TOTAL_CLIENT_SESSIONS	INTEGER	No	Cumulative total number of client sessions.	
TOTAL_SERVER_SESSIONS	INTEGER	No	Cumulative total number of server sessions.	

Column Name	Column Type	Index	Description	CLI Command Reference
CURRENT_CLIENT_HANDSHAKES	INTEGER	No	Number of incomplete client handshakes.	
CURRENT_SERVER_HANDSHAKES	INTEGER	No	Number of incomplete server handshakes.	
SESSION_RESUMPTIONS	INTEGER	No	Number of resumed server sessions.	
NO_CIPHER_SUITE	INTEGER	No	Number of handshake failures due to inability to converge on a cipher suite.	
HANDSHAKE_TIMEOUTS	INTEGER	No	Number of handshakes that timed out before completing.	
HIGHER_AUTH_TIMEOUT	INTEGER	No	Number of handshakes in which the SBC was the server and the client did not authenticate itself through TLS and failed to authenticate itself through any higher level protocol (for example, SIP) before timing out.	
CLIENT_AUTH_FAILURES	INTEGER	No	Number of times peer failed TLS authentication with SBC as the client.	
SERVER_AUTH_FAILURES	INTEGER	No	Number of times peer failed TLS authentication with SBC as the server.	
FATAL_ALERTS_RECEIVED	INTEGER	No	Number of FATAL Alerts received.	
WARNING_ALERTS_RECEIVED	INTEGER	No	Number of WARNING Alerts received.	
HANDSHAKE_FAILURES	INTEGER	No	Cumulative total of all handshake failures.	

Column Name	Column Type	Index	Description	CLI Command Reference
RECEIVE_FAILURES	INTEGER	No	Number of receive failures (failure to decrypt).	
SEND_FAILURES	INTEGER	No	Number of send failures (failure to encrypt).	
NO_AUTH_DROPS	INTEGER	No	Number of SIP messages dropped due to lack of peer authentication at the SIP level.	
NO_AUTH488	INTEGER	No	Number of SIP messages rejected with 488 due to lack of peer authentication at the SIP level.	
MID_CONNECTION_HELLO	INTEGER	No	Number times a peer sent a TLS Hello on a connection that was already up (that is, the peer tried to renegotiate.).	
NO_CLIENT_CERT	INTEGER	No	Number times we were the client and we failed to derive a certificate to send the server.	
VALIDATION_FAILURES	INTEGER	No	Number of failed certificate validations.	
CURRENT_CLIENT_CONNECTIONS	INTEGER	No	Current number of client tls connections.	
TOTAL_CLIENT_CONNECTIONS	INTEGER	No	Cumulative total number of client tls connections.	
CURRENT_SERVER_CONNECTIONS	INTEGER	No	Current number of server tls connections.	
TOTAL_SERVER_CONNECTIONS	INTEGER	No	Cumulative total number of server tls connections.	
CE_NAME	STRING	No	The name of the compute element for this entry.

SLBEthernetPortPacketPortStatus

Column Name	Column Type	Index	Description	canAggregate
AVG_RX_ACTUAL_BW	GAUGE	False	Tracks the Average Incoming Bandwidth used during KPI bin interval in bytes/sec.	True
AVG_TX_ACTUAL_BW	GAUGE	False	Tracks the Average Outgoing Bandwidth used during KPI bin interval in bytes/sec.	True
PEAK_RX_ACTUAL_BW	GAUGE	False	Tracks the Peak Incoming Bandwidth used during KPI bin interval in bytes/sec.	True
PEAK_TX_ACTUAL_BW	GAUGE	False	Tracks the Peak Outgoing Bandwidth used during KPI bin interval in bytes/sec.	True
AVG_RX_ACTUAL_BWUTIL	GAUGE	False	Tracks the average incoming BW utilization based on total available port BW instead of negotiated BW.	True

Column Name	Column Type	Index	Description	canAggregate
PEAK_RX_ACTUAL_BWUTIL	Gauge	False	Tracks the maximum incoming BW utilization during the KPI bin interval expressed as a percentage of the available BW.	True
AVG_TX_ACTUAL_BWUTIL	Gauge	False	Tracks the average outgoing BW utilization during the KPI bin interval based on total available BW instead of negotiated BW.	True
PEAK_TX_ACTUAL_BWUTIL	Gauge	False	Tracks the maximum outgoing BW utilization during the KPI bin interval expressed as a percentage of the available BW.	True
BWALARM_THRESHOLD_EXCEEDED	Gauge	False	Tracks the total number of times the BW alarm threshold was passed in the upward direction during the bin interval	True
BWALARM_CLEARED	Gauge	False	Tracks the total number of times the BW clear alarm threshold was passed in the downward direction during the bin interval.	True
AVG_USAGE_BW	Gauge	False	Tracks the Average Bandwidth Usage during KPI bin interval	True
PEAK_USAGE_BW	Gauge	False	Tracks the Peak Bandwidth Usage during KPI bin interval.	True
CE_NAME	String	True	The host name of the server.	False
PORT_NAME	String	True	The name of this port.	False
NEGOTIATED_SPEED	Integer	False	The interface speed. Packet port speed is not negotiable.	True
LINK_STATE	Integer	False	The state of the interface.	True
MAX_BANDWIDTH	Gauge	False	Maximum bandwidth this port can support, bytes/sec.	True
ALLOCATED_BANDWIDTH	Gauge	False	Bandwidth the active media streams on this port reserve, bytes/sec.	True
RX_BANDWIDTH	Gauge	False	Actual Rx bandwidth in use on this port, bytes/sec.	True

Column Name	Column Type	Index	Description	canAggregate
TX_BANDWIDTH	Gauge	False	Actual Tx bandwidth in use on this port, bytes/sec.	True
BANDWIDTH_USAGE	Gauge	False	Percentage of maximum bandwidth allocated on this port.	True
BANDWIDTH_DEVIATION	Gauge	False	Percentage of deviation of actual bandwidth from the allocated bandwidth.	True
MAC_ADDRESS	STRING	False	The MAC address of the network interface.	False
IF_INDEX	Gauge	False	The unique ifIndex of this Packet NIF.	True

SLBEthernetPortPacketStats

Column Name	Column Type	Index	Description	canAggregate
PORT_NAME	STRING	true	The name of this port.	false
RX_PACKETS	COUNTER64	false	The number of received packets.	false
TX_PACKETS	COUNTER64	false	The number of transmitted packets.	false
RX_ERRORS	COUNTER	false	The number of bad packets received	false
TX_ERRORS	COUNTER	false	The number of packet transmit failures.	false
RX_DROPPED	COUNTER	false	The number of packets dropped due to no receive buffers.	false
TX_DROPPED	COUNTER	false	The number of packets dropped due to no transmit buffers.	false
RX_BYTES	COUNTER64	false	The number of received bytes.	false

Column Name	Column Type	Index	Description	canAggregate
TX_BYTES	COUNTER64	false	The number of transmitted bytes.	false

SLBIcmpGeneralGroupStats

Column Name	Column Type	Index	Description	canAggregate
CE_NAME	STRING	true	The name of the compute element for this entry.	false
IN_MSGS	COUNTER	false	The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.	false
IN_ECHOS	COUNTER	false	The number of ICMP Echo (request) messages received.	false
IN_ECHO_REPS	COUNTER	false	The number of ICMP Echo Reply messages received.	false
IN_DEST_UNREACHS	COUNTER	false	The number of ICMP Destination Unreachable messages received.	false
IN_ERRORS	COUNTER	false	The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, etc.).	false
OUT_MSGS	COUNTER	false	The total number of ICMP messages which this entity attempted to send. Note that this counter includes all those counted by icmpOutErrors.	false

Column Name	Column Type	Index	Description	canAggregate
OUT_ERRORS	COUNTER	false	The number of ICMP messages which this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.	false
OUT_ECHOS	COUNTER	false	The number of ICMP Echo (request) messages sent.	false
OUT_ECHO_REPS	COUNTER	false	The number of ICMP Echo Reply messages sent.	false
OUT_DEST_UNREACHS	COUNTER	false	The number of ICMP Destination Unreachable messages sent.	false

SLBIntervalStatistics

Column Name	Column Type	Index	Description	canAggregate
ID	GAUGE	true	Instance id of the SIP client.	false
VNFID	STRING	false	The VNF ID of the SIP client.	false
MSGSENT	COUNTER	false	Number of messages sent to the SIP client.	false
INVITE_MSGSENT	COUNTER	false	Number of INVITEs sent to the SIP client.	false
OOD_MSGSENT	COUNTER	false	Number of out-of-dialog requests sent to the SIP client.	false
REGISTER_MSGSENT	COUNTER	false	Number of out-of-register requests sent to the SIP client.	false
CE_NAME	STRING	false	The name of the compute element for this entity.	false

SLBIPAcIOverallStats

Column Name	Column Type	Index	Description	canAggregate
ACNAME	STRING	true	The name of the address context.	false
NAME	IMPLIEDSTRING	true	The name of the address context.	false
MATCHED_NO_RULE	COUNTER	false	The number of times no rule matches.	false
CE_NAME	STRING	No	The name of the compute element for this entity.	false

SLBIPAcIRuleStats

Column Name	Column Type	Index	Description	canAggregate
ACNAME	STRING	true	The name of the address context.	false
NAME	STRING	true	The name of this IP access control list rule.	false
MATCHES	COUNTER	false	The number of times this rule has been matched.	false
POLICER_DISCARDS	COUNTER	false	The number of times the policer for this rule discarded packets.	false
CE_NAME	STRING	No	The name of the compute element for this entity.	false

SLBIPGeneralGroupStats

Column Name	Column Type	Index	Description	canAggregate
CE_NAME	STRING	true	The name of the compute element for this entry.	false
IN_RECEIVES	COUNTER	false	The total number of input datagrams received from interfaces, including those received in error.	false

Column Name	Column Type	Index	Description	canAggregate
IN_HDR_ERRORS	COUNTER	false	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.	false
IN_ADDR_ERRORS	COUNTER	false	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.	false
IN_UNKNOWN_PROTOS	COUNTER	false	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.	false
IN_DISCARDS	COUNTER	false	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.	false
IN_DELIVERS	COUNTER	false	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).	false
OUT_REQUESTS	COUNTER	false	The total number of IP datagrams which local IP user- protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.	false

Column Name	Column Type	Index	Description	canAggregate
OUT_DISCARDS	COUNTER	false	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.	false
OUT_NO_ROUTE ES	COUNTER	false	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.	false
REASM_TIMEOUT	INTEGER	false	The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.	false
REASM_REQDS	COUNTER	false	The number of IP fragments received which needed to be reassembled at this entity.	false
REASM_OKS	COUNTER	false	The number of IP datagrams successfully re-assembled.	false
REASM_FAILS	COUNTER	false	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.	false
FRAG_OKS	COUNTER	false	The number of IP datagrams that successfully fragmented at this entity.	false
FRAG_FAILS	COUNTER	false	The number of discarded IP datagrams that were not successfully fragmented due to some issue (e.g., the Don't Fragment flag was set).	false

SLBIPolicingSystemIntStats

Column Name	Column Type	Index	Description	canAggregate
SYSTEM_NAME	STRING	true	Name of the system.	false
BAD_HDR_DISCARD_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the bad Ethernet/IP Header policer.	false
BAD_HDR_PEAK_DISCARD_RATE	GAUGE	false	The current peak discard rate for the bad Ethernet/IP Header policer.	false
BAD_HDR_MINOR_ALARM_COUNT	GAUGE	false	The current number of minor alarms for the bad Ethernet/IP Header policer.	false
BAD_HDR_MINOR_ALARM_DURATION	GAUGE	false	The current duration of the minor alarms in seconds for the bad Ethernet/IP Header policer.	false
BAD_HDR_MAJOR_ALARM_COUNT	GAUGE	false	The current number of major alarms for the bad Ethernet/IP Header policer.	false
BAD_HDR_MAJOR_ALARM_DURATION	GAUGE	false	The current duration of the major alarms in seconds for the bad Ethernet/IP Header policer.	false
ARP_DISCARD_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the ARP policer.	false
ARP_ACCEPT_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the ARP policer.	false
ARP_PEAK_DISCARD_RATE	GAUGE	false	The current peak discard rate for the ARP policer.	false
ARP_MINOR_ALARM_COUNT	GAUGE	false	The current number of minor alarms for the ARP policer.	false
ARP_MINOR_ALARM_DURATION	GAUGE	false	The current duration of the minor alarms in seconds for the ARP policer.	false

Column Name	Column Type	Index	Description	canAggregate
ARP_MAJOR_ALARM_COUNT	GAUGE	false	The current number of major alarms for the ARP policer.	false
ARP_MAJOR_ALARM_DURATION	GAUGE	false	The current duration of the major alarms in seconds for the ARP policer.	false
UFLOW_DISCARD_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the micro flow policer.	false
UFLOW_ACCEPT_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the micro flow policer.	false
UFLOW_PEAK_DISCARD_RATE	GAUGE	false	The current peak discard rate for the micro flow policer.	false
UFLOW_MINOR_ALARM_COUNT	GAUGE	false	The current number of minor alarms for the micro flow policer.	false
UFLOW_MINOR_ALARM_DURATION	GAUGE	false	The current duration of the minor alarms in seconds for the micro flow policer.	false
UFLOW_MAJOR_ALARM_COUNT	GAUGE	false	The current number of major alarms for the micro flow policer.	false
UFLOW_MAJOR_ALARM_DURATION	GAUGE	false	The current duration of the major alarms in seconds for the micro flow policer.	false
ACL_DISCARD_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the access control list policer.	false
ACL_ACCEPT_PACKET_COUNT	COUNTER64	false	The current number of discarded packets for the access control list policer.	false
ACL_PEAK_DISCARD_RATE	GAUGE	false	The current peak discard rate for the access control list policer.	false

Column Name	Column Type	Index	Description	canAggregate
ACL_MINOR_ALARM_COUNT	GAUGE	false	The current number of minor alarms for the access control list policer.	false

SBCEDGEChannelStatusStats

Column Name	Column Type	Index	Description	canAggregate
SHELF_NUMBER	GAUGE	Yes	shelf number this channel is attached to.	False
SLOT_NUMBER	GAUGE	Yes	Indicates slot number this channel is attached to.	False
PORT_NUMBER	GAUGE	Yes	Indicates port number this channel is attached to.	False
CHANNEL_NUMBER	GAUGE	Yes	Indicates (port-based) channel number this channel is attached to.	False
ADMIN_STATE	INTEGER	No	Indicates Admin state of the channel, whether administratively blocked or not.	True
OPER_STATE	INTEGER	No	Indicates all the channel states similar to the channel monitor view on Web UI.	True
IN_USE_SECONDS	COUNTER	No	Indicates the total accumulated channel connected time in seconds.	True

SBCEDGENWDLLicenseStats

Column Name	Column Type	Index	Description	canAggregate
MANAGEMENT_ID	STRING	Yes	Swelite Management Id.	False
LICENSE_NAME	STRING	Yes	Feature License Name.	False
LICENSE_USAGE	GAUGE	No	License Used.	True

SBCEDGEPTStats

Column Name	Column Type	Index	Description	canAggregate
INDEX_PT	GAUGE	Yes	Indicates Index for the port table.	False

Column Name	Column Type	Index	Description	canAggregate
SHELF	GAUGE	No	Indicates the shelf number this port is assigned to.	True
SLOT	GAUGE	No	Indicates the (slot-based) port this port is assigned to.	True
PORT	GAUGE	No	Indicates the (slot-based) port this port is assigned to.	True
CURRENT_CALLS	GAUGE	No	Indicates the Current number of active managed calls on this server.	True
TOTAL_CALLS	GAUGE	No	Indicates the Current number of stable managed calls on this server.	True
CONNECTED_CALLS	COUNTER	No	Indicates the number of calls answered on this port.	True
REFUSED_CALLS	COUNTER	No	Indicates the number of calls refused on this port.	True
ERRORED_CALLS	COUNTER	No	Indicates the number of errors on this port.	True
EGRESS_CALL_ATTEMPTS	COUNTER	No	Indicates the total number of Egress call attempts on this port	True
EGRESS_CALLS_ACCEPTED	COUNTER	No	Indicates the number of Egress successful call attempts on this port.	True
EGRESS_CALLS_COMPLETED	COUNTER	No	Indicates the number of successfully completed Egress calls on this port.	True
EGRESS_CALLS_REJECTED	COUNTER	No	Indicates the number of Egress calls from this port that were rejected.	True
INGRESS_CALL_ATTEMPTS	COUNTER	No	Indicates the total number of Ingress call attempts on this port.	True

Column Name	Column Type	Index	Description	canAggregate
INGRESS_CALLS_ACCEPTED	COUNTER	No	Indicates the total number of Ingress calls accepted on this port.	True
INGRESS_CALLS_COMPLETED	COUNTER	No	Indicates the number of successfully completed Ingress calls on this port.	True
INGRESS_CALLS_REJECTED	COUNTER	No	Indicates the number of Ingress calls to this port that were rejected.	True
BLOCKED_CALLS	COUNTER	No	Indicates number of calls blocked per channel per port.	True
EGRESS_BLOCKED_CALLS	COUNTER	No	Indicates number of Egress calls blocked on this port.	True
INGRESS_BLOCKED_CALLS	COUNTER	No	Indicates number of Ingress calls blocked on this port.	True
EGRESS_CURRENT_CALLS	COUNTER	No	Indicates number of Egress active calls on this port.	True
INGRESS_CURRENT_CALLS	COUNTER	No	Indicates number of Ingress active calls on this port.	True
BHCCARATE	COUNTER	No	Indicates BHCA rate per DS1.	True
BHCCRATE	COUNTER	No	Indicates BHCC rate per DS1.	True

SGX4000M2paM2paLinkAvailStats

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
LINK_NAME	STRING	Yes	The existing M2PA link name.
DUR_IN_ISSTATE	GAUGE	No	The time duration for which link was in inService status.
DUR_UN_AVAILABLE	GAUGE	No	The time duration for which link was unavailable.
DUR_UN_AVAILABLE_RSN_FAIL	GAUGE	No	The time duration for which link was unavailable due to link failure.
DUR_OF_LOCAL_LINK_BUSY	GAUGE	No	The time duration for which link was locally busy.
NUM_OF_ALIGN_OR_PROVIDE_FAIL	GAUGE	No	The number of link alignment OR proving failure.
NUM_OF_SIG_UNIT_RECEIVED_IN_ERR	GAUGE	No	The number of signal units received in error.
NUM_OF_LINK_FAILURES	GAUGE	No	The number of link failures.

SGX4000M2paM2paLinkMeasStats

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
LINK_NAME	STRING	Yes	The existing M2PA link name.
SIF_TRANSMITTED	GAUGE	No	The number of SIF messages transmitted.

Column Name	Column Type	Index	Description
SIF_RECEIVED	GAUGE	No	The number of SIF messages received.
SIO_TRANSMITTED	GAUGE	No	The number of SIO messages transmitted.
SIO_RECEIVED	GAUGE	No	The number of SIO messages received.
MSU_TRANSMITTED	GAUGE	No	The number of MSUs transmitted.
MSU_RECEIVED	GAUGE	No	The number of MSUs received.
NUM_OF_LOCAL_CONG_IND	GAUGE	No	The number of local congestion indications received.
CUM_DUR_OF_LINK_CONG	GAUGE	No	The cumulative time duration for which link was in congestion status
MSU_DISCARDED_RSN_CONG	GAUGE	No	The number of MSUs discarded due to link level congestion.
NUM_OF_CONG_RESULT_LOSS_MSU	GAUGE	No	The number of times the link was congested leading to MSU loss.
ISUP_MSG_TRANSMITTED	GAUGE	No	The number of ISUP messages transmitted.
ISUP_MSG_RECEIVED	GAUGE	No	The number of ISUP messages received.
SCCP_MSG_TRANSMITTED	GAUGE	No	The number of SCCP messages transmitted.
SCCP_MSG_RECEIVED	GAUGE	No	The number of SCCP messages received.
ISUP_OCTETS_TRANSMITTED	GAUGE	No	The number of ISUP octets transmitted.
ISUP_OCTETS_RECEIVED	GAUGE	No	The number of ISUP octets received.
SCCP_OCTETS_TRANSMITTED	GAUGE	No	The number of SCCP octets transmitted.

Column Name	Column Type	Index	Description
SCCP_OCTETS_RECEIVED	GAUGE	No	The number of SCCP octets received.

SGX4000M3uaAspLinkAvailStats

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
LINK_NAME	STRING	Yes	The existing M3UA ASP link name.
TIME_LINK_UP	GAUGE	No	The time duration for which link was in ASP UP status.
TIME_LINK_DOWN	GAUGE	No	The time duration for which link was unavailable.
TIME_LINK_DOWN_REASON_FAIL	GAUGE	No	The time duration for which link was unavailable due to link failure.
NUM_LINK_FAILURES	GAUGE	No	The number of link failures.

SGX4000M3uaAspLinkMeasureStats

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
LINK_NAME	STRING	Yes	The existing M3UA ASP link name.
ASP_ACTIVE_RECVD	COUNTER	No	The number of ASP ACTIVE messages received.
ASP_ACTIVE_XMIT	COUNTER	No	The number of ASP ACTIVE messages transmitted.
ASP_ACTIVE_ACK_RECVD	COUNTER	No	The number of ASP ACTIVE ACK messages received.
ASP_ACTIVE_ACK_XMIT	COUNTER	No	The number of ASP ACTIVE ACK messages transmitted.

Column Name	Column Type	Index	Description
ASP_DOWN_RECVD	COUNTER	No	The number of ASP DOWN messages received.
ASP_DOWN_XMIT	COUNTER	No	The number of ASP DOWN messages transmitted.
ASP_DOWN_ACK_RECVD	COUNTER	No	The number of ASP DOWN ACK messages received.
ASP_DOWN_ACK_XMIT	COUNTER	No	The number of ASP DOWN ACK messages transmitted.
ASP_IN_ACTIVE_RECVD	GAUGE	No	The number of ASP INACTIVE messages received.
ASP_IN_ACTIVE_XMIT	GAUGE	No	The number of ASP INACTIVE messages transmitted.
ASP_IN_ACTIVE_ACK_RECVD	GAUGE	No	The number of ASP INACTIVE ACK messages received.
ASP_IN_ACTIVE_ACK_XMIT	GAUGE	No	The number of ASP INACTIVE ACK messages transmitted.
ASP_UP_RECVD	COUNTER	No	The number of ASP UP messages received.
ASP_UP_XMIT	COUNTER	No	The number of ASP UP messages transmitted.
ASP_UP_ACK_RECVD	COUNTER	No	The number of ASP UP ACK messages received.
ASP_UP_ACK_XMIT	COUNTER	No	The number of ASP UP ACK messages transmitted.
BEAT_RECVD	COUNTER	No	The number of BEAT messages received.
BEAT_XMIT	COUNTER	No	The number of BEAT messages transmitted.
BEAT_ACK_RECVD	COUNTER	No	The number of BEAT ACK messages received.

Column Name	Column Type	Index	Description
BEAT_ACK_XMIT	COUNTER	No	The number of BEAT ACK messages transmitted.
DATA_RECVD	COUNTER	No	The number of DATA messages received.
DATA_XMIT	COUNTER	No	The number of DATA messages transmitted.
DAUD_RECVD	COUNTER	No	The number of DAUD messages received.
DAUD_XMIT	COUNTER	No	The number of DAUD messages transmitted.
DAVA_RECVD	COUNTER	No	The number of DAVA messages received.
DAVA_XMIT	COUNTER	No	The number of DAVA messages transmitted.
DEREG_REQUEST_RECV D	GAUGE	No	The number of DEREG REQ messages received.
DEREG_REQUEST_XMIT	GAUGE	No	The number of DEREG REQ messages transmitted.
DEREG_RESPONSE_RECV D	GAUGE	No	The number of DEREG RSP messages received.
DEREG_RESPONSE_XMIT	GAUGE	No	The number of DEREG RSP messages transmitted.
DUNA_RECVD	COUNTER	No	The number of DUNA messages received.
DUNA_XMIT	COUNTER	No	The number of DUNA messages transmitted.
DUPU_RECVD	COUNTER	No	The number of DUPU messages received.
DUPU_XMIT	COUNTER	No	The number of DUPU messages transmitted.

Column Name	Column Type	Index	Description
ERROR_MSG_RECVD	GAUGE	No	The number of ERR messages received.
ERROR_MSG_XMIT	GAUGE	No	The number of ERR messages transmitted.
NOTIFY_MSG_RECVD	GAUGE	No	The number of NOTIFY messages received.
NOTIFY_MSG_XMIT	GAUGE	No	The number of NOTIFY messages transmitted.
REG_REQUEST_RECVD	GAUGE	No	The number of REG REQ messages received.
REG_REQUEST_XMIT	GAUGE	No	The number of REG REQ messages transmitted.
REG_RESPONSE_RECVD	GAUGE	No	The number of REG RSP messages received.
REG_RESPONSE_XMIT	GAUGE	No	The number of REG RSP messages transmitted.
SCON_RECVD	COUNTER	No	The number of SCON messages received.
SCON_XMIT	COUNTER	No	The number of SCON messages transmitted.
INVALID_MSG_RECVD	GAUGE	No	The number of invalid messages received.
UNRECOGNIZED_MSG_RECVD	GAUGE	No	The number of unrecognized messages received.

SGX4000M3uaSgpLinkAvailStats

Column Name	Column Type	Index	Description

NUM_OF_LOCAL_OUTAGE_IND	GAUGE	No	The number of local outage indications received.

Column Name	Column Type	Index	Description
NUM_OF_REMOTE_OUTAGE_IND	GAUGE	No	The number of remote outage indications received.
SIGNALING_LINK_FAILURES_ALL	GAUGE	No	The number of signaling link failure for all reasons.

SGX4000Ss7SccpErrorStats

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
HOP_COUNTER_VIOLATION	COUNTER	No	The number of hop counter violation over the given period of time interval.
MSG_RECVD_SYNTAX_ERROR	COUNTER	No	The number of messages received with syntax error.
MSG_TOO_LARGE_FOR_SEGMENT	COUNTER	No	The number of messages that were too large for segmentation.
ROUTEFAIL_NET_CONGESTION	GAUGE	No	The number of routing failures due to network congestion.
ROUTEFAIL_NO_GTT_ADDR_NATURE	GAUGE	No	The number of routing failures due to unavailable GTT for address of such nature.
ROUTEFAIL_NO_GTT_SPECI_ADDR	GAUGE	No	The number of routing failures due to unavailable GTT for this specific address.
ROUTEFAIL_SS7_DEST_UNAVAIL	GAUGE	No	The number of routing failures due to unavailable SS7 destination.
ROUTEFAIL_SUBSYS_UNAVAIL	GAUGE	No	The number of routing failures due to unavailability of SCCP sub system.
ROUTEFAIL_SUBSYS_CONGESTION	GAUGE	No	The number of routing failures due to congestion at SCCP sub system
ROUTEFAIL_SUBSYS_UNEQUIPPED	GAUGE	No	The number of routing failures due to unequipped SCCP sub System.

Column Name	Column Type	Index	Description
ROUTEFAIL_UNQUALI_US ER	GAUGE	No	The number of routing failures due to unqualified SCCP user.
REASSEM_ERR_NO_SPAC E	GAUGE	No	The number of reassembly errors due to unavailability of reassembling space.
REASSEM_ERR_TIMER_E XPIRY	GAUGE	No	The number of reassembly errors due to reassembly timer expiry.
REASSEM_ERR_FAILED	GAUGE	No	The number of reassembly errors due to reassembly failure.
REASSEM_ERR_SEGMEN T_OOS	GAUGE	No	The number of reassembly errors due to receipt of segmented message out of sequence.
SEG_ERROR_FAILED	GAUGE	No	The number of segmentation errors due to segmentation failure.

SGX4000Ss7T1E1TrunkStats

Note

The minimum collection interval configured on SGX4000 can be 15 minutes.

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
TRUNK_NAME	STRING	Yes	The existing T1/E1 trunk name.
BIPOLAR_VIOLATIONS	GAUGE	No	This gives the count of bipolar violations.
CRC_ERRORS	GAUGE	No	This gives the count of CRC errors.
FRAME_SLIPS	GAUGE	No	This gives the count of frame slips.
ALIGNMENT_ERRS	GAUGE	No	This gives the count of alignment errors.

Column Name	Column Type	Index	Description
ERRS_PER_SEC	GAUGE	No	This gives the number of times any anomaly events occurred such as CRC, Frame Slip in one second time period.
SEVERE_ERRS_PER_SEC	GAUGE	No	This gives the number of times any severe errors occurred such as RED alarm, yellow alarm in one second time period.
UNAVAIL_SECS	GAUGE	No	This gives the number of seconds the trunk was unavailable
SEVERELY_ERRORED_FRAMING_SEC	GAUGE	No	This gives the number of Severely Errored Framing Seconds.
CONTROLLED_SLIP_SECONDS	GAUGE	No	This gives the number of Controlled Slip Seconds.
PATH_CODE_VIOLATIONS	GAUGE	No	This gives the number of Path Code Violations
LINE_ERRORED_SECONDS	GAUGE	No	This gives the number of Line Errored Seconds.
BURSTY_ERRORED_SECONDS	GAUGE	No	This gives the number of Bursty Errored Seconds
DEGRADED_MINUTES	GAUGE	No	This gives the number of Degraded Minutes.
LINE_CODING_VIOLATIONS	GAUGE	No	This gives the number of Line Coding Violations

Note

The columns BIPOLAR_VIOLATIONS, CRC_ERRORS, FRAME_SLIPS, and ALIGNMENT_ERRS are not supported.

ASP_ACTIVE_ACK_RECVD	GAUGE	No	The number of ASP ACTIVE ACK messages received.
ASP_ACTIVE_ACK_XMIT	GAUGE	No	The number of ASP ACTIVE ACK messages transmitted.
ASP_DOWN_RECVD	GAUGE	No	The number of ASP DOWN messages received.
ASP_DOWN_XMIT	GAUGE	No	The number of ASP DOWN messages transmitted.
ASP_DOWN_ACK_RECVD	GAUGE	No	The number of ASP DOWN ACK messages received.
ASP_DOWN_ACK_XMIT	GAUGE	No	The number of ASP DOWN ACK messages transmitted.
ASP_IN_ACTIVE_RECVD	GAUGE	No	The number of ASP INACTIVE messages received.
ASP_IN_ACTIVE_XMIT	GAUGE	No	The number of ASP INACTIVE messages transmitted.
ASP_IN_ACTIVE_ACK_RECVD	GAUGE	No	The number of ASP INACTIVE ACK messages received.
ASP_IN_ACTIVE_ACK_XMIT	GAUGE	No	The number of ASP INACTIVE ACK messages transmitted.
ASP_UP_RECVD	GAUGE	No	The number of ASP UP messages received.
ASP_UP_XMIT	GAUGE	No	The number of ASP UP messages transmitted.
ASP_UP_ACK_RECVD	GAUGE	No	The number of ASP UP ACK messages received.
ASP_UP_ACK_XMIT	GAUGE	No	The number of ASP UP ACK messages transmitted.

Column Name	Column Type	Index	Description
BEAT_RECVD	GAUGE	No	The number of BEAT messages received.
BEAT_XMIT	GAUGE	No	The number of BEAT messages transmitted.
BEAT_ACK_RECVD	GAUGE	No	The number of BEAT ACK messages received.
BEAT_ACK_XMIT	GAUGE	No	The number of BEAT ACK messages transmitted.
CLDR_RECVD	GAUGE	No	The number of CLDR messages received.
CLDR_XMIT	GAUGE	No	The number of CLDR messages transmitted.
CLDT_RECVD	GAUGE	No	The number of CLDT messages received.
CLDT_XMIT	GAUGE	No	The number of CLDT messages transmitted.
DAUD_RECVD	GAUGE	No	The number of DAUD messages received.
DAUD_XMIT	GAUGE	No	The number of DAUD messages transmitted.
DAVA_RECVD	GAUGE	No	The number of DAVA messages received.
DAVA_XMIT	GAUGE	No	The number of DAVA messages transmitted.
DEREG_REQUEST_RECV D	GAUGE	No	The number of DEREG REQ messages received.
DEREG_REQUEST_XMIT	GAUGE	No	The number of DEREG REQ messages transmitted.
DEREG_RESPONSE_RECV VD	GAUGE	No	The number of DEREG RSP messages received.

Column Name	Column Type	Index	Description
DEREG_RESPONSE_XMIT	GAUGE	No	The number of DEREG RSP messages transmitted.
DUNA_RECVD	GAUGE	No	The number of DUNA messages received.
DUNA_XMIT	GAUGE	No	The number of DUNA messages transmitted.
DUPU_RECVD	GAUGE	No	The number of DUPU messages received.
DUPU_XMIT	GAUGE	No	The number of DUPU messages transmitted.
ERROR_MESSAGES_RECV VD	GAUGE	No	The number of ERR messages received.
ERROR_MESSAGES_XMIT	GAUGE	No	The number of ERR messages transmitted.
NOTIFY_MESSAGES_RECV VD	GAUGE	No	The number of NOTIFY messages received.
NOTIFY_MESSAGES_XMIT	GAUGE	No	The number of NOTIFY messages transmitted.
REG_REQUEST_RECVD	GAUGE	No	The number of REG REQ messages received.
REG_REQUEST_XMIT	GAUGE	No	The number of REG REQ messages transmitted.
REG_RESPONSE_RECVD	GAUGE	No	The number of REG RSP messages received.
REG_RESPONSE_XMIT	GAUGE	No	The number of REG RSP messages transmitted.
SCON_RECVD	GAUGE	No	The number of SCON messages received.
SCON_XMIT	GAUGE	No	The number of SCON messages transmitted.

Column Name	Column Type	Index	Description
INVALID_MSG_RECVD	GAUGE	No	The number of invalid messages received.
UNRECOGNIZED_MSG_RE CVD	GAUGE	No	The number of unrecognized messages received.

SGX4000SystemCPUUtilStats

Column Name	Column Type	Index	Description
CE_NAME	STRING	Yes	This object indicates the configured CE name.
CPU	GAUGE	No	The CPU number.
AVERAGE	GAUGE	No	The average CPU % utilization for this interval.
HIGH	GAUGE	No	The high CPU % utilization for this interval.
LOW	GAUGE	No	The low CPU % utilization for this interval

SGX4000SystemMemoryUtilStats

Column Name	Column Type	Index	Description

AVERAGE	GAUGE	No	The average memory % utilization for this interval.
HIGH	GAUGE	No	The high memory % utilization for this interval.
LOW	GAUGE	No	The low memory % utilization for this interval.
AVERAGE_SWAP	GAUGE	No	The average swap % memory utilization for this interval.

Column Name	Column Type	Index	Description
HIGH_SWAP	GAUGE	No	The high swap % memory utilization for this interval.
LOW_SWAP	GAUGE	No	The low swap % memory utilization for this interval.

RAMP System Configuration

In this section:

- [System Registration](#)
- [Application Configuration](#)
- [Change IP Address](#)
- [System Activity Logging](#)
- [Exporting Logs to a Remote Syslog Server](#)
- [Device REST Credentials](#)
- [SSH Active Channels](#)
- [RAMP Profile Settings](#)
- [Database Configuration](#)
- [PSX Call Trace Destination](#)
- [PSX Manager Version Compatibility](#)
- [GSX User Interface](#)
 - [Restrict Access to GSX Commands](#)
 - [Configuration Files for GSX Navigator and Task Configurator](#)
 - [Set GSX Navigator Discovery](#)
 - [Sort GSX Trunk Groups](#)
- [SSH Configuration](#)

Use the windows under **System** to configure options and use controls that manage the Ribbon Application Management Platform (RAMP) system.

System Registration

Note

This window is not available unless the EdgeView (EV) service is installed and running on RAMP.

Use the **System Registration** window to enter registration credentials if your Ribbon Application Management Platform (RAMP) deployment manages SBC SWe Edge devices. The credentials consist of a registration key and password provided by Ribbon during the sales process, along with the email address associated with that transaction. You must enter this information for RAMP to validate the SBC Edge device's Management ID during registered.

Use the following procedure to access the **System Registration** window and enter RAMP registration credentials.

Note

System registration credentials are not applicable to SBC 1000/2000 and Edge 8000.

Note

The system registration is also required if RAMP deployment manages EdgeMarc devices to support auto provisioning of EdgeMarc.

Prerequisites

Registration credentials from Ribbon to enable managing SBC Edge devices with RAMP. Contact your Ribbon representative to obtain registration credentials.

Start

1. Log on to the RAMP GUI.
2. Navigate to **System > System Registration**.
3. In **Email Address**, enter the email associated with the RAMP registration credentials.
4. In **Key** and **Password**, enter the registration key and registration password that Ribbon provided.
5. Click **Register**.

Application Configuration

Note

The RAMP will continue to include EMS-labeled parameters and screens to facilitate the SBC migrations from older releases. Accordingly, any references to "EMS" in this documentation pertains to the RAMP platform.

Use the **Application Config** window to configure parameters for different processes and applications running on the Ribbon Application Management Platform (RAMP).

Use the following procedure to access the **Application Config** window [and configure parameters for one or more components](#):

Start

1. Log on to the RAMP GUI.
2. Navigate to **System > Application Config**.
3. In **Devices**, click the name of your RAMP system. The **Components** list is populated.
4. Click on a name in the **Components** list to open an area with the configurable parameters for that specific component.
5. Enter or select values for the parameters using the tables below.
6. Click **Apply**.
7. Select additional components until you have reviewed all of the parameters and made any necessary changes.

Agent Parameters

Parameter	Description
Use FTPS for Agent FTP	Specifies whether to use FTPS (FTP over SSL/TLS) when making an FTP connection to a device agent. The default value is True.

Call Analysis Parameters

Parameter	Description
Purger Task Frequency	Specifies how often the system runs the Purger task to remove old call trace files. • Every day (default) • Every 2 days • Every week
Purger Task Start Time	Specifies when to start running the Purger task. Subsequent times are determined by Purger Task Frequency . Use the format: (day of week:hh:mm:AM / PM). For example, Fri:02:30:PM. The default value is Sun:05:00:AM.

Parameter	Description
Call Trace Retention Period	Specifies the interval of call trace data that the system retains in the database. • None • 1 day • 2 days (default) • 1 week • 2 weeks • 3 weeks • 4 weeks

Cluster Parameters

Parameter	Description
The max polling count for configuration push status check	Specifies the maximum number of times to poll for status (at 30 seconds intervals), after pushing a configuration to a device, before the push is declared as timed out. The default value is 120.
Retention period (in minutes) for Configuration push context file	Specifies the amount of time (in minutes) before an unused configuration push context file created is deleted. Range: 15 to 45. The default value is 30 minutes.
The time (in min) before a trap is generated to indicate an SBC Core head end has been used to update the cluster configuration but not yet activate it	Specifies the amount of time (in minutes) before a <code>sonusEmsClusterConfigHeadendOutofsyncNotification</code> trap is sent out if the SBC Core Headend has been updating a cluster configuration but has not yet activated it. Range is 10 to 1440. The default value is 60 minutes.
Cluster configuration limit enabled	Specifies whether setting a limit on the number of configurations on a cluster is enabled. • False • True (default)
The max number of cluster configurations stored	Specifies a limit on the number of cluster configurations to store. When the limit is reached, older configurations are deleted. range is 1 to 200. The default value is 50.

Parameter	Description
Rate-Limit on API request enabled	Specifies whether to enable basic rate-limiting on cluster management API requests. This rate-limit applies only to the cluster configuration download API. • False (default) • True
Rate-limit maximum number of allowed permits	Specifies the maximum number of concurrent permits/requests allowed. • 5 (default) • 10 • 15 • 25 • 50
Rate-limit wait time duration	Specifies the interval to wait (in seconds) for each permit to become available again after it is acquired by a previous request. • 10 (default) • 20 • 30 • 40 • 50 • 60

EMS API Parameters

Parameter	Description
Deploy PSX version 7.1.0 to Deploy PSX version 8.4.14	Specifies whether to to deploy the RAMP PSX API (on a per version basis). • False (default) • True
Deploy PSX version 9.0.0 to Deploy PSX version 14.1.0	Specifies whether to to deploy the RAMP PSX API (on a per version basis). • False • True (default)
Maximum batch size	Specifies the maximum allowable batch size when using batch operations. The default value is "Max batch size = 500".

Parameter	Description
Operations Logging Level	Specifies how much information is logging for each operation. • NORMAL – (Default) Each operation is logged. • OFF – No information is logged. • Entity level details are logged. Note that VERBOSE logging may impact performance.

Note

Ribbon recommends to deploy only the RAMP PSX API for the versions in use. Use of the API capabilities also requires the presence of the appropriate license.

Entity Manager Parameters

Parameter	Description
Connection Timeout	Specifies the timeout (in seconds) for initial socket connection to PSX. The default value is 10 seconds.
Read Timeout	Specifies the timeout (in seconds) for socket read from PSX. The maximum value allowed is 1800 seconds. The default value is 60 seconds.

GSX Upgrade Parameters

Parameter	Description
NFS Disk Space Minimum	Specifies the minimum amount of free disk space (in megabytes) required on the NFS before allowing a software copy operation to the NFS. Range: 200-10,000 MB. The default value is 1000 MB.
Local Disk Space Minimum	Specifies the minimum amount of free disk space (in megabytes) required on the local file system before allowing import operations. Range: 200-10,000 MB. The default value is 1000 MB.
Tasks Per Job	Specifies the maximum number of simultaneous GSXs allowed with an 'In Progress' status, per Job. Range: 1-4 GSXs per Job. The default value is 4.

Parameter	Description
Total Tasks	Specifies the maximum number of simultaneous GSXs allowed with an 'In Progress' status, per RAMP (across all Jobs). Range: 1-16 tasks. The default value is 16.
Audit Log Purger Task Frequency	Specifies how often the system runs the data Purger that removes old audit logs from the database. • Every week (default) • Every 4 weeks
Audit Log Purger Task Start Time	Specifies how often to run the data Purger task. Subsequent times are determined by Purger Task Frequency. Use the format: (Day of week:hh:mm:AM / PM). For example, Fri:02:30:PM. The default value is Sun:02:00:AM.
Audit Log Retention Period	Specifies the interval to retain audit logs in the database. Range: 3-24 months (in three-month increments). The default value is 12 months.
Firmware Upgrade Timeout	Specifies the number of minutes to wait, per card, for the GSX firmware upgrade to complete before timing out. Range: 5-30 minutes. The default value is 10 minutes.
LSWU Upgrade Timeout	Specifies the number of minutes to wait for the GSX LSWU to complete before timing out. Range: 60-300 minutes. The default value is 120 minutes.
PIF Write Timeout	Specifies the number of seconds to wait to save the GSX pif file during protection mode check and LSWU initiation. Range: 20-300 seconds. The default value is 60 seconds.
SFTP Client Connect Timeout	Specifies the number of milliseconds to wait for the SFTP client to connect while downloading the GSX installer files from DSI/ NFS while performing a GSX upgrade. The default value is 20000.

Hornet Management Parameters

Parameter	Description
Maximum Connection Wait Time	Specifies the time to wait (in seconds) for a client to connect to Netconf. The default value is 8 seconds.
Maximum Connection Idle Time	Specifies the duration (in seconds) a connection remains idle before terminating. The default value is 960 seconds.
Minimum MINASSH Connection Timeout	Specifies the minimum duration (in seconds) before a MINASSH connection timeout occurs. Range: 20-120 seconds. The default value is 20 seconds. Note In most cases, the default value is sufficient. If the device discovery fails, increase the timeout value in increments until the discovery succeeds.
Minimum MINASSH Connection kex Timeout	Specifies the minimum duration (in seconds) for the key exchange (kex) before a MINASSH connection timeout occurs. Range: 20-120 seconds. The default value is 20 seconds. Note In most cases, the default value is sufficient. If the device discovery fails, increase the timeout value in increments until the discovery succeeds.
Netconf Session Cleaner Thread Running Interval	Specifies the interval (in seconds) for the Netconf session cleaner thread. The default value is 90 seconds.

Hornet Management Ext Parameters

Parameter	Description
Copy SW backup Files if SW backup Base Directory is Changed	Specifies whether to copy software backup files from the old directory to the new directory. • False • True (default)
Software backup Local Directory	Specifies the base directory where all software backups are stored and loaded from RAMP. The default location is <code>/export/home/ems/weblogic/sonusEms/data/\$DEVICETYPE\$/swbackup/</code>
Software backup Remote File	Specifies the file where a software backup is stored and loaded from the device. The default path is <code>/home/admin/saveCdb.tar.</code>
Copy Config Files if Config Base Directory is Changed	Specifies whether to copy config files from the old directory to the new directory. • False • True (default)
Clone Config Base Directory	Specifies the base directory where all exported, edited, and imported configurations are stored. The default path is <code>/export/home/ems/weblogic/sonusEms/data/\$DEVICETYPE\$/</code>
File Download Timeout	Specifies a timeout interval (in seconds) for downloading files from a device. The default value is 900 seconds.
Netconf Session Timeout	Specifies a timeout interval (in seconds) for how long a user can hold an idle session. The default value is 180 seconds.
Max Number of Displayed Instances	Specifies the maximum number of instances to display at a time, for an object. The default value is 100.

List All Parameters

Parameter	Description
Listall Path	Specifies the internal directory path for listall functionality. The default path is <code>/export/home/ems/weblogic/sonusEms/data/cli/internal</code> .
Listall Result Path	Specifies the directory path for listall result files. The default path is <code>/export/home/ems/weblogic/sonusEms/data/cli/listall</code>
Listall Jobs File	Specifies the file to store listall jobs. The default path/filename is <code>/export/home/ems/weblogic/sonusEms/data/cli/listall/CurrentListallJobs</code>
Listall Timeout Minutes	Specifies the number of minutes to elapse for listall jobs to complete before getting terminated by the system. The default value is 60 minutes.
Listall Maximum Jobs Size	Specifies the maximum number of listall jobs to execute at any given time for all the PSXs. The default value is 10.
Listall Maximum Jobs per PSX	Specifies the maximum number of listall jobs to execute at any given time for a given PSX. The default value is 1.
Listall Command File	Specifies the listall command file executed by the system. The default path/filename is <code>/export/home/ems/weblogic/sonusEms/data/cli/internal/listallTable.pl</code>
Listall Perl Path	Specifies the directory path to the perl executable. The default path is <code>/export/home/ems/perl/bin/perl</code>
Listall File Retention Period	Specifies the number of days to retain the Results files. The range is 1-60 days. The default value is 7 days.

LNP Adaptor Parameters

Note

The **LNP Adaptor** option is enabled only when the LNP is deployed.

Parameter	Description
Max Records Count	Maximum number of records to fetch during each synchronization increment. Each IAS can contain different values. Range: 100-10000. The default value is 500.
LNP provisioning batch size	The transaction size of LNP data that are provisioned in batches on PSX. Range: 10-1000. The default value is 100.
Country ID	Specifies the country ID sent to PSX. Range: 1-1000. The default value is 1.
LNP data request timeout	The timeout in seconds for the LNP data request. Range: 1-300. The default value is 30.
Primary PSX Name	The Primary PSX name to use LNP provisioning. This is required when more than one Primary PSX is registered in RAMP. An alarm is generated if the PSX node name is invalid. The Primary PSX name is case sensitive.

MNP Services Parameters

Parameter	Description
Receive Messages From Telcordia MCH	Specifies whether RAMP should start processing broadcast messages from Telcordia MCH. • False – (default) If false, RAMP drops any broadcast message that is sent by MCH. • True – Set to true once bulk data is completely uploaded to all PSXs.

Parameter	Description
Audit Log Update Frequency - Telcordia	Specifies how often (in minutes) to update the audit log with Telcordia statistics. Range: 5-60 minutes. The default value is 5 minutes.
Receive Messages From Syniverse MCH	Specifies whether RAMP should start processing broadcast messages from Syniverse MCH. - False – (default) If false, RAMP drops any broadcast message that is sent by MCH. - True – Set to true once bulk data is completely uploaded to all PSXs.
Audit Log Update Frequency - Syniverse	Specifies how often (in minutes) to update the audit log with Syniverse statistics. Range: 5-60 minutes. The default value is 5 minutes.
Primary PSX Name	The name of the primary PSX to use for mobile number portability (MNP) provisioning. This is required when more than one primary PSX is registered in RAMP. An alarm is generated if the PSX node name is invalid. The name is case sensitive.
Receive Messages From Generic NPC	Specifies whether RAMP should start processing broadcast messages from Generic NPC. - False – (default) If false, RAMP drops any broadcast message that is sent by NPC. - True – Set to True once bulk data is completely uploaded to all PSXs.
Audit Log Update Frequency - Generic NPC	Specifies how often (in minutes) to update the audit log with NPC statistics. Range: 5-60 minutes. The default value is 5 minutes.

NHR Parameters

Parameter	Description
Max Rows to Display	Specifies the maximum number of rows to generate when running on-demand or scheduled reports. The valid range is 1 - 100000. The default value is 500.

Parameter	Description
Reload Report Repository	Specifies whether to reload the report repository to pick up new reports at runtime, without requiring a restart of the RAMP. • False • True This parameter automatically resets to False after a reload.
Discover Network Topology	Specifies whether to run discovery of the entire network topology. This process may take several minutes to complete. • False • True This parameter automatically resets to False after the discovery.
Cancel All Scheduled Reports	Specifies whether to cancel all currently scheduled reports. • False • True This parameter automatically resets to False after the cancellation.
Purger Task Frequency	Specifies how often to run the Purger that removes old records from the database and corresponding archived CSV files. • Every day (default) • Every 2 days • Every week
Purger Task Start Time	Specifies when to start running the Purger task. Subsequent times are determined by Purger Task Frequency. Use the format: (Day of week:hh:mm:AM / PM). For example, Fri:02:30:PM. The default value is Sun:05:00:AM.
Report Retention Period	Specifies the interval of data that the system retains in the database. This setting also affects CSV archive file retention. • None • 1 day • 2 days (default) • 1 week • 2 weeks • 3 weeks • 4 weeks

Node Admin Parameters

Parameter	Description
Node Status Change Purger Task Start Time	Specifies when to run the Node Status Change Purger daily task. Use the format: (hh:mm:[AM/PM]). The default value is 02:00:AM.
Retention period (in days)	Specifies the retention period (in days), entries older than the set duration are removed. The default value is 30 days.
Connection Timeout	Specifies the connection timeout duration (in seconds) for initial socket connection to WRTC. The default value is 30 seconds.
Read Timeout	Specifies the timeout (in seconds) for socket read from WRTC. The default value is 30 seconds.
Max connections	Specifies the maximum number of connections allowed. The range is 10-300 connections. The default value is 50 connections.
Max connections per WRTC	Specifies the maximum number of connections allowed per WRTC. The default value is 5.
Certificate Hostname Verification	Specifies whether to verify the certificate hostname for WRTC. • False (default) • True

PSX CLI Parameters

Parameter	Description
CLI Script Path	Specifies the directory path for PSX CLI scripts. The default path is <code>/export/home/ems/weblogic/sonusEms/data/cli/scripts</code>

Parameter	Description
Script Transaction Size	Specifies the number of commands wrapped in a transaction when executing PSX scripts. The range is 0-11 integers. The default value is 100.
Number of Retries for Deadlocked Transactions	Specifies the number of retries for deadlocked transactions when executing PSX scripts. The range is 0-10 integers. The default value is 3.

RADIUS Parameters

Parameter	Description
GUI Localization	Specifies location used to configure certain fields and forms in the PSX Manager when launched from RAMP using a RADIUS authenticated account. • North America (default) • Generic
Default Country	Specifies the default country for configuring Global User Account information. Select the country from the menu. The default value is 1 - United States of America, Canada and the Caribbean.
Secondary Login Timeout	Specifies the number of seconds a user has to log in using the local login screen after attempting to authenticate through RADIUS, but finding the RADIUS server(s) unavailable. The range is 10-300. The default value is 30 seconds.

Report Framework Parameters

Parameter	Description
CSV Reports Archive Base Directory	Specifies the base directory for writing CSV reports. The default directory is <code>/opt/sonus/ems/weblogic/sonusEms/data/report_archive</code>
Max Scheduled Threads	Defines the maximum number of threads to use for scheduled report execution. The range is 1-4. The default value is 2.

Note

You must restart RAMP for this new thread setting to take effect.

SBC GUI Parameters

Parameter	Description
Enable SSO	Specifies whether to enable SSO. • False – The SBC Configuration Manager login page launches before accessing the SBC Configuration Manager. • True – The SBC Configuration Manager is accessed directly from RAMP and is no login required.

SGX API Parameters

Parameter	Description
Deploy version 5.2.1	Specifies whether to deploy SGX API 5.2.1. • False • True (default)

SBC API Parameters

Parameter	Description
Connection Timeout	Specifies the timeout (in seconds) for initial socket connection to the SBC Core. The range is 10-120 seconds. The default value is 30 seconds.
Read Timeout	Specifies the timeout (in seconds) for socket read from the SBC Core. The range is 10-5400 seconds. The default value is 30 seconds.
Max connections	Specifies the maximum number of outbound connections allowed from RAMP to the SBC Cores. The range is 10-300. The default value is 50.
Max connections per SBC Core	Specifies the maximum number of connections allowed per SBC Core. The range is 1-10. The default value is 2.

Parameter	Description
Protocol	Specifies the protocol to use to connect the SBC Core. • https (default) • http
Connection Port	Specifies the connection port to use to connect to the SBC Core. 0-11 integers. The default value is 443.
SBC Core Datastore	Specifies the SBC Core datastore to use to access configuration entities. The default value is <code>config</code> . Note Ribbon recommends you contact Product Support before modifying the default value.
SBC Core status Datastore	Specifies the SBC Core datastore to use to access status entities. The default value is <code>operational</code> . Note Ribbon recommends you contact Product Support before modifying the default value.
Certificate Hostname Verification	Specifies whether to perform certificate hostname verification. • False (default) • True

SBC Management Parameters

Parameter	Description
Successful Audit Purger Frequency (in days)	Specifies how long to retain successful audit purger details. • 1 day (default) • 2 days

Parameter	Description
Failed Audit Purger Frequency (in days)	Specifies how long to retain failed audit purger details. The range is 7-14 days. The default value is 7 days.
Completed Job Purger Frequency (in days)	Specifies how long to retain completed job purger details. The range is 0-7 days. The default value is 7 days.
Job Purger Task Start Time	Specifies when to run the job purger daily task. Use the format: (hh:mm:[AM/PM]). Example: 02:30:AM.
Audit Purger Task Start Time	Specifies when to run the audit purger daily task. Use the format: (hh:mm:[AM/PM]). Example: 02:30:AM.
Backup Catalogue Purger Task Start Time	Specifies when to run the backup catalogue purger daily task. Use the format: (hh:mm:[AM/PM]). Example: 02:30:AM.
Connection Timeout (in seconds)	Specifies the SFTP connection timeout. 0 specifies an infinite timeout. The range is 0-3600 seconds. The default value is 213 seconds.
Upgrade Status Check Retry Interval (in minutes)	Specifies the upgrade status-check retry interval, after the upgrade starts. This is used for SBC Core upgrade. The range is 5-20 minutes. The default value is 10 minutes.
Upgrade Status Check Retry Interval for SBC Edge (in minutes)	Specifies the upgrade status-check retry interval, after the upgrade starts. This is used for SBC Edge upgrade. The range is 3-10 minutes. The default value is 3 minutes.
Upgrade Status Check Retry Count	Specifies the upgrade status-check retry count, after the upgrade starts. The upgrade is considered failed if the retry count is exhausted. This is used for all upgrade types. The range is 6-144. The default value is 18.

Parameter	Description
Upgrade Status Check Retry Count Increment per Upgrade Order	Specifies the upgrade status-check retry count increment per order in the waiting queue. This is used for SBC Core upgrade. The range is 1-240 seconds. The default value is 10 seconds.
Upgrade Status Check Retry Count Increment per Upgrade Order for SBC Edge	Specifies the upgrade status-check retry count increment per order in the waiting queue. This is used for SBC Edge upgrade. The range is 1-240 seconds. The default value is 15 seconds.

Telnet Session Manager Parameters

Parameter	Description
Telnet Connect Timeout	Specifies the timeout value for connecting to Telnet through GSX, SBC Core and SGX. • 1 second • 2 seconds • 4 seconds (default) • 8 seconds • 16 seconds
Telnet Retry Time	Specifies the timeout value for retrying to connect to Telnet through GSX, SBC Core and SGX. • 2 seconds • 4 seconds • 6 seconds • 8 seconds • 10 seconds (default) • 20 seconds • 30 seconds • 1 minute • 2 minutes • 5 minutes • 10 minutes • 15 minutes • 30 minutes

Parameter	Description
Telnet Read Timeout	Specifies the timeout value for reading GSX, SBC Core and SGX Telnet response. • 16 seconds • 32 seconds • 64 seconds • 128 seconds (default) • 192 seconds • 256 seconds • 320 seconds • 640 seconds • 1280 seconds
Telnet Wait Timeout	Specifies the timeout value for waiting for GSX, SBC Core and SGX telnet response. This value specifies how long RAMP waits for the release of a Telnet connection by other users before sending a timeout message to a waiting user. If necessary, increase the Wait Timeout to allow for high network traffic. Setting this value too high potentially increases the response time. • 1 second • 2 seconds • 4 seconds • 8 seconds • 16 seconds • 32 seconds (default) • 64 seconds • 128 seconds • 192 seconds
Telnet Idle Timeout	Specifies the timeout value for an idle GSX, SBC Core and SGX telnet session. The Idle Timeout ensures that the RAMP does not consume the limited number of Telnet sessions a GSX supports. The RAMP maintains a session (even when not in use) in anticipation of follow-up requests to the connected GSX. This reduces any connecting/disconnecting overhead. If a connection remains inactive for the specified period, the session disconnects. • 2 minutes • 5 minutes (default) • 10 minutes • 15 minutes • 20 minutes • 25 minutes • 30 minutes

Parameter	Description
Maximum Telnet sessions per GSX	Specifies the maximum number of Telnet sessions allowed per GSX (i.e., the maximum number of concurrent Telnet connections that the RAMP can open for each GSX). The GSX supports a maximum of eight simultaneous connections; however, you may want to reserve sessions so users can Telnet directly to a GSX. The range is 1-8 sessions. The default value is 4 sessions.
Maximum Telnet Sessions per SBC Core	Specifies the maximum number of Telnet sessions allowed per SBC Core (i.e., the maximum number of concurrent Telnet connections that the RAMP can open for each SBC). The SBC supports a maximum of eight simultaneous connections; however, you may want to reserve sessions so users can Telnet directly to an SBC. The range is 1-6 sessions. The default value is 4 sessions.
Maximum Telnet Sessions per SGX	Specifies the maximum number of Telnet sessions allowed per SGX. The range is 1-6 sessions. The default value is 4 sessions.
Allow CLI session to non-SSO SBX	This option allows CLI sessions to older SBC versions that do not support SSO. • True: (default) The RAMP CLI session is established for SBCs with older versions prior to 11.x. • False: The RAMP CLI session is not established for SBCs with older versions prior to 11.x.

Trunkgroup Validator Parameters

Parameter	Description
Trunk Group validation	Specifies whether to enable trunk group existence validation. • False (default) • True

UI Gen Parameters

Parameter	Description
Check Models Update	Specifies whether to enable model file changes. • False (default) • True

Parameter	Description
Model Scanning Interval	Specifies model files scanning interval (in milliseconds). The range is 0-600000000 milliseconds. The default value is 60000 milliseconds.

Utilities Parameters

Parameter	Description
Minimum thread-pool size	Specifies the minimum number of threads in the RAMP thread pool. 0-1234567890 threads. The default value is 10 threads.
Maximum thread-pool size	Specifies the maximum number of threads in the RAMP thread pool. 0-1234567890 threads. The default value is 40 threads.
CDR Search timeout value	Specifies the timeout value (in milliseconds) for the Call History Report generation tool to avoid a time-out during the parsing of large ACT files. The range is 10000-300000 milliseconds. The default value is 10000 milliseconds.
Timeout for FTP Connections	Specifies the timeout value (in seconds) for FTP connections to test the FTP credentials during device discovery. Range: 1-25. The default is 2 seconds.
PSX Manager restricted to 10.3 or later	Specifies whether to restrict PSX Manager to version 10.3 or later. - False – (default) Access is allowed to all versions. - True – Access is only allowed to PSX 10.3 or later versions.
Status of Ctrl+Alt+Del configuration	Specifies whether to enable the Ctrl+Alt+Del feature. - False (default) - True The default is False.

Parameter	Description
Ctrl+Alt+Del configuration - Count	Note This parameter is not supported. Specifies the number of times to receive the Ctrl+Alt+Del signal within the period specified by Time Period. Range: 3-6. The default is 5.
Ctrl+Alt+Del configuration - Time Period	Note This parameter is not supported. Specifies the time period (in seconds) to receive the number of Ctrl+Alt+Del signals specified by Count. Range: 1-6. The default is 1 second.
REST Client Establish Connection Timeout	Specifies the timeout duration (in seconds) when trying to make initial socket connection. If you change this value, you must restart the RAMP for the updated value to take effect. Range: 5-120 seconds. The default is 30 seconds.
REST Client Socket Timeout	Specifies the timeout duration (in seconds) for socket inactivity. If you change this value, you must restart the RAMP for the updated value to take effect. Range: 5-120 seconds. The default is 30 seconds.
REST Client Connection Pool Size	Specifies the number of connections that are allowed to be pooled. If you change this value, you must restart the RAMP for the updated value to take effect. Range: 10-1000. The default is 500.
REST Client Connection Pool Size per Route	Specifies the number of connections to pool per URL. If you change this value, you must restart the RAMP for the updated value to take effect. Range: 1-3. The default is 2.
PM Micro Service IP Address	IP Address of the PM microservice. Supports IPv4 and IPv6 addresses.

Parameter	Description
Certificate Hostname Verification	Specifies whether to perform certificate hostname verification for the PM microservice. • False (default) • True
PM Micro Service REST Client Connection Establishment Timeout	Specifies the timeout duration (in seconds) to make an initial socket connection to the PM microservice. If you change this value, you must restart the RAMP for the updated value to take effect. The range is 5-120 seconds. The default is 30 seconds.
PM Micro Service REST Client Socket Timeout	Specifies the timeout duration (in seconds) for socket inactivity. If you change this value, you must restart the RAMP for the updated value to take effect. The range is 5-120 seconds. The default is 30 seconds.
PM Micro Service REST Client Connection Pool Size	Specifies the number of connections allowed to pool. If you change this value, you must restart the RAMP for the updated value to take effect. The range is 10-1000 connections. The default is 500 connections.
PM Micro Service REST Client Connection Pool Size per Route	Specifies the number of connections to pool per URL. If you change this value, you must restart the RAMP for the updated value to take effect. The range is 1-3 connections. The default is 2 connections.
Filesystem Cleanup Percentage	Specifies the percentage of filesystem usage which triggers cleanup of the <code>/opt</code> partition. The range is 0-100. The default is 60.
Maximum CDR file age (in days)	Specifies the maximum number of days to keep CDRs in the <code>/opt</code> partition. The range is 1-365. The default is 7.
Enable CLI/API username logging	Specifies whether to enable logging of RAMP CLI/API user name for CLI/API operations. Navigate to PSX Manager GUI > admin > audit log to view the logs. • False (default) • True

Change IP Address

Use this procedure to change the management IP address of Ribbon Application Management Platform (RAMP) to be able to connect to a different RAMP.

Prerequisites

RAMP should be up and running.

Start

1. Log on to the KVM/VMWare host and access the RAMP console.
2. As Insight user stop RAMP and `emsMgmt` processes:

```
#/opt/sonus/ems/emsMgmt stop
```

3. Login as root user to disable and stop the `opensaf` processes:

```
#sudo su
#systemctl disable opensafd.service
#systemctl stop opensafd.service
```

4. Access the file where the IP addresses are stored:

```
vi /etc/hosts
```

5. To edit and change the IP address::
 - a. Using `nmtui` you can edit the connection, deactivate, and then activate. Run the `nmtui` and perform the following:
 - i. To change the existing IP address, for example, if the new RAMP IP is 192.168.199.47, then:

```
eth0> 192.168.199.47
```

- ii. Deactivate the new connection in the `nmtui`:

```
nmcli con down eth0
nmcli con up eth0
```

- iii. Restart the network manager service:

```
systemctl restart NetworkManager.service
```

- b. To view if the IP address is changed, run the following command. You will see the new IP address.

```
ifconfig
```

6. At the prompt, change to `root` user:

```
sudo su
```

7. Navigate to the configuration directory and change the RAMP IP address (for example if the new IP is 192.168.199.47):

```
cd /opt/sonus/ems/conf/  
./changeIpAddress.sh -i 192.168.199.47 -d -l /tmp/ChangeIPAddress.log
```

8. Using the new IP address, log on to RAMP as admin user.
9. Switch to root user:

```
sudo su
```

10. Start and enable `opensaf` :

```
systemctl start opensafd.service  
systemctl enable opensafd.service
```

When `Opensaf` is enable and active, it starts RAMP.

11. You can check the `opensaf` status in the log file by accessing the `emsProcMgmt.log` file. Navigate to the log file:

```
/opt/sonus/ems/logs/emsProcMgmt.log
```

12. To check if all the processes are running, run the following commands to change to `insight` user and check the status:

```
su - insight  
/opt/sonus/ems/emsMgmt status
```

13. You can now disassociate and associate all the registered nodes with the old IP address. Refer to [Modify Managed Device Association](#).

System Activity Logging

In this section:

- [View the System Activity Log](#)
- [View Live System Activity Messages](#)

Ribbon Application Management Platform (RAMP) provides a system activity log (`ems_trace_log`) that records system activities and error conditions. Because of the large number of records in the system log, RAMP provides controls to filter and search the list. It also provides an option to view log activity as it occurs.

Use the following procedures to open and work with the system activity log.

View the System Activity Log

To view recent system activity log entries:

1. Log on to the RAMP GUI.
2. Navigate to **System > Troubleshooting > System Activity**.
3. In **Num Lines**, enter the number of records you want to display. The minimum is 5000.
4. Click **View Log**. The log entries appear with the oldest entries first.

To Search Within the System Activity Log

On the **System Activity** window:

In **Filter**, enter a search value and then click **Search**.

To Filter Out Warning Messages

You have the option to disable logging of warning messages in the system activity log. This filtering applies to records added to the log file going forward.

On the **System Activity** window:

1. Click **Log Filter** to open the **System Activity Log Filter** window.
2. Click to uncheck the **Enable Logging: Warning** check box.
3. Click **Apply**.

View Live System Activity Messages

The listing of log entries in the main **System Activity** window does not refresh automatically. However you can open a window to monitor system activity messages as they occur.

On the **System Activity** window:

Click **Live Log** to open the **Live System Activity** window.

Live System Activity Controls

In the **Live System Activity** window you can:

- Click **Pause** to temporarily pause the display of new log entries.
- Click **Copy** to copy the current contents of the window to the clipboard so that you can paste it in another location.
- Click **Clear** to clear the current contents of the window and continue displaying new entries.
- Enter a filter value in the **Filter by** field to display only entries containing the search term.

Exporting Logs to a Remote Syslog Server

In this section:

- [Overview](#)
- [Sample Configuration file \(/etc/rsyslog.conf\) for Remote Syslog Server](#)

Overview

Ribbon Application Management Platform (RAMP) supports sending application and system level logs to a Remote Syslog server, including user activity logs. To enable sending logs to an external location you must provide the remote Syslog Server IP address in the RAMP GUI by navigating to **System > Interfaces > Logs**. To receive the logs on the Remote Syslog server, edit the configuration in the file `/etc/rsyslog.conf` which determines the facility through which the logs are received.

Note

Upon upgrade of RAMP, you must apply the configuration on the RAMP GUI by navigating to **system > interface > logs** to enable log forwarding.

Note

The default transport protocol used is TCP. If you want to change it to UDP, the you must include the parameter `SYSLOG_TRANSPORT` in the `SystemConfig.txt` file by navigating to `/opt/rbbn/ems/weblogic/sonusEms/data/sys/SystemConfig.txt`.

For example,

`SYSLOG_TRANSPORT=UDP`

The parameter `SYSLOG_TRANSPORT` is not present initially in `SystemConfig.txt`. Add this parameter only if you change the transport protocol.

Use the following procedure to provide the remote Syslog server address:

Start

1. Log on to the RAMP GUI.
2. Navigate to **System > Interfaces > Logs**.
3. In **Remote Syslog server IP**, enter the IP address of the remote Syslog server. If you want to enter multiple IP addresses, separate them with a comma (,). You can also specify a different port number other than the default port (514). For example (17.52.19.229:528,17.52.19.239:514).

Note

Please enter a valid IP address. Invalid IP address may lead to failure.

4. Click the adjacent checkbox to enable sending logs to the remote server.
5. **Enable/Disable** the **State** of services using the radio button to forward the logs to remote syslog servers.
6. Modify the **Facility** for each microservice based on the following table:

Note

Enter a valid facility. If there is an invalid facility, RAMP uses the default syslog facility (local6). Do not modify the facility for system logs.

Service	Facility
System	Set to "default". The default value contains logs from: ◦ authpriv ◦ cron ◦ ftp ◦ local1 ◦ local2 ◦ local7 ◦ mail ◦ user This value is not changeable.
PM	local0
FM	local1

7. Click **Apply**.

Sample Configuration file (/etc/rsyslog.conf) for Remote Syslog Server

Here is a sample configuration file `/etc/rsyslog.conf` for the Remote Syslog Server. Please modify this based on your requirements.

```

# rsyslog configuration file

# For more information see /usr/share/doc/rsyslog-*/rsyslog_conf.html
# or latest version online at http://www.rsyslog.com/doc/rsyslog_conf.html
# If you experience problems, see http://www.rsyslog.com/doc/troubleshoot.html

#### MODULES ####

module(load="imuxsock"      # provides support for local system logging (e.g. via logger
command)
        SysSock.Use="off") # Turn off message reception via local log socket;
        # local messages are retrieved through imjournal now.
module(load="imjournal"     # provides access to the systemd journal
        StateFile="imjournal.state") # File to store the position in the journal
#module(load="imklog") # reads kernel messages (the same are read from journald)
#module(load="immark") # provides --MARK-- message capability

# Provides UDP syslog reception
# for parameters see http://www.rsyslog.com/doc/imudp.html
#module(load="imudp") # needs to be done just once
#input(type="imudp" port="514")

# Provides TCP syslog reception
# for parameters see http://www.rsyslog.com/doc/imtcp.html
module(load="imtcp") # needs to be done just once
input(type="imtcp" port="514")

#### GLOBAL DIRECTIVES ####

# Where to place auxiliary files
global(workDirectory="/var/lib/rsyslog")

# Use default timestamp format
module(load="builtin:omfile" Template="RSYSLOG_TraditionalFileFormat")
module(load="imfile" mode="inotify")

module(load="mmutf8fix") #if $fromhost-ip == "10.0.0.1" then
action(type="mmutf8fix")

# Include all config files in /etc/rsyslog.d/
include(file="/etc/rsyslog.d/*.conf" mode="optional")

$template myFormat,"%msg%\n"
$ActionFileDefaultTemplate myFormat

#### RULES ####

# Log all kernel messages to the console.
# Logging much else clutters up the screen.
#kern.*                                          /dev/console

# Log anything (except mail) of level info or higher.

```

```

# Don't log private authentication messages!
*.info;mail.none;authpriv.none;cron.none;local0.none;local1.none;local7.none -/var/log/
ramp_system.log
Note: Add local7.none along with location of log file to redirect default logs to
specified log file.

if $syslogtag contains 'lsyncd:' then /var/log/lsyncd/lsyncd.log
else /var/log/messages # This will contain application and system logs which can be
stored in a custom file instead of messages

# The authpriv file has restricted access.
authpriv.* /var/log/secure

# Log all the mail messages in one place.
mail.* -/var/log/maillog

# Log cron stuff
cron.* /var/log/cron

# Everybody gets emergency messages
*.emerg :omusrmsg:*

# Save news errors of level crit and higher in a special file.
uucp,news.crit /var/log/spooler

# Save boot messages also to boot.log
local7.* /var/log/boot.log

#local0.info /var/log/ems/opensaf_audits.log

local1.info /var/log/ems/ems_login.log

#local0.debug /var/log/ems/opensaf_components_health.log

local0.* /var/log/pm.log
local1.* /var/log/fm.log

    Severity="info"
    Facility="local2")
```

Device REST Credentials

Cloud-based devices that dynamically register with Ribbon Application Management Platform (RAMP) must provide a REST user ID and password during the registration process. For registration to be successful, those responsible for instantiating cloud-based nodes must be aware of the valid REST credentials. The parameters on the **Device REST Credentials** window specify what these parameters are for your RAMP system.

Use the following procedure to configure REST credentials for your system.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Interfaces > Device REST Credentials**
3. In **REST Username**, enter a name for the REST user. The default username is "restuser," with a default password of "sonus123."

4. In both **REST Password** and **Re-Enter Password**, enter the new password.
5. Click **Apply**.

Note

If you change the REST credentials, update any instantiated cloud nodes with the new credentials.

SSH Active Channels

The Ribbon Application Management Platform (RAMP) uses Secure Shell (SSH) to connect with registered PSX devices. The table on the **SSH Active Channels** window provides details on RAMP's current SSH connections to PSX devices. Under some circumstances, you may be instructed by Ribbon Product Support to terminate a connection. This might be to clear stale connections or as a troubleshooting step.

Use the following procedure to view and optionally terminate an active SSH channel.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System>Interfaces>SSH Admin>Active Channels**. The list of active SSH channels appears.
3. To terminate a channel, click the **Terminate** action button in the row of the channel you want to terminate.

RAMP Profile Settings

Use the **RAMP Profile Settings** window to determine which features are accessible in the Ribbon Application Management Platform (RAMP) graphical user interface (GUI) and which device types appear in the Node Registration window. The changes you make to **RAMP Profile Settings** apply to the system as a whole and therefore change the view for all users.

Some components of the RAMP GUI cannot be disabled, but the profile settings give you the option to remove menu items and windows for some features if they do not apply to your specific deployment. Note that the list of features that you cannot disable is summarized on the window.

Use the following procedure to configure RAMP profile settings for your system.

Prerequisites

You have Super User [privileges](#) for **Insight Administration** within the **Core Resources** application.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > RAMP Profile Settings**
3. In the **Global Feature Availability** area, use the toggle controls to enable or disable services and features in the RAMP GUI. By default all options are enabled.

Feature	Description
Fault Management	Controls whether the Fault Management options appear under Observability.
Performance Management	Controls whether the Performance Management options appear under Obser

Feature	Description
Backup	Controls whether the Backup options appear under Operations. Note that Backup options do not appear in the GUI until at least one device of those types is registered.
Health Reports	Controls whether the Health Reports options appear under Operations.
Provisioning	Controls whether the Provisioning options appear under Operations. Note that the Provisioning options do not appear in the GUI until at least one device of those types is registered.
Upgrade	Controls whether the Upgrade options appear under Operations. Note that the Upgrade options do not appear in the GUI until at least one device of those types is registered.

4. In the **Global Node Type Registration** area, use the toggle controls to select which types of devices appear in the Device list when registering devices or creating clusters. By default all device types are enabled.
5. Click **Save Settings** to apply your changes.

Database Configuration

Use the **Database Configuration** window to modify Ribbon Application Management Platform (RAMP) database connection settings if you are directed to do so by Ribbon Product Support. Otherwise, to ensure proper database operations, these settings should not be changed.

Use the following procedure to access the **Database Configuration** window when directed.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > Database Configuration**
3. Enter a new value in **Maximum Connections**, if directed. This setting specifies the size of the database connection pool RAMP uses to communicate with the database. An insufficient value can cause data to be dropped and application errors. The minimum value is 6 and maximum is 100. Ribbon recommends a value of 40, which is the default.
4. Enter a new value in **Connection Timeout**, if directed. This setting specifies how long RAMP will wait for a connection to the database before timing out. The default is 30 seconds. RAMP logs an error in the system log for each timeout that occurs.
5. Restart RAMP to apply the change.

PSX Call Trace Destination

Use the **Trace Destinations** window to provision or change where PSX call traces are sent. By default, the traces are directed to the Ribbon Application Management Platform (RAMP) deployment with which the PSX is registered. On the RAMP that manages the PSX, this default destination is indicated by the value `localhost:9004`. Configure the trace destination option on primary PSX Policy Servers. The primary PSX propagates the trace destination information to each of its replica PSXs.

Use the following procedure to configure the trace destination for a PSX.

Prerequisites

You have Super User [privileges](#) for the **Insight Administration** resource within the **Core Resources** application.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > PSX Policy Server > Trace Destinations**. A list of registered primary PSX devices appears.
3. In the **PSX Policy Server** list, locate the primary PSX whose trace destination you want to change and enter the new destination in the corresponding **Trace Destination** field. Enter either the hostname or the IP address, followed by a colon and the port number. For example, `10.10.10.10:9004`.
4. Click **Update**. This change does not require a reboot of the PSXs.

PSX Manager Version Compatibility

Use the **PSX Manager Version** window to review the list of PSX Manager versions that are supported by the currently installed version of the [Ribbon Application Management Platform \(RAMP\) application](#). If the version of the PSX you want to run is not listed, you must install the comparable version of PSX Manager.

Use the following procedure to access the **PSX Manager Version** window to review the list of PSX Manager versions to determine if a different version is required.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > PSX Policy Server > PSX Manager Versions**
3. If you load a new version of PSX Manager, click **Reload** to make it available. It is not necessary to restart RAMP.

GSX User Interface

In this section:

- [Restrict Access to GSX Commands](#)
- [Configuration Files for GSX Navigator and Task Configurator](#)
- [Set GSX Navigator Discovery](#)
- [Sort GSX Trunk Groups](#)

Use the windows under **GSX User Interface** to configure options related to using the user interface that you launch from Ribbon Application Management Platform (RAMP) to configure GSX devices.

Restrict Access to GSX Commands

The Ribbon Application Management Platform (RAMP) users with Administrative privileges can restrict the access to GSX Navigator commands based on the roles.

For example, if the administrator places a restriction on the “TRUNKGROUP:Delete” command with respect to the role “default”, then users associated with the “default” role are unable to view (or execute) the “TRUNKGROUP:Delete” command.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > GSX User Interface > Command Access Control**. The GSX commands display.
3. Locate the command you want to restrict. The same command may be bound to more than one object. With the cursor in the list, use **<CTRL>F** to open a search dialog box.
4. Enter the **Role** at the end of the line. Separate multiple entries with commas. When typing the role, ensure that it is typed exactly as it appears (case sensitive). A list of valid roles appears above the

command list. To ensure accuracy, copy a role name from this location and paste it in the appropriate location(s).

5. Click **Apply**. You are prompted to confirm.
6. Click **OK** to confirm the changes.

Configuration Files for GSX Navigator and Task Configurator

Use the Configuration Files page to open a user interface that allows you to designate and/or reload new Command Configuration and Task Configuration files. Only Ribbon technicians should initiate changes to these files. Any changes to these files directly affect the proper operation of the GSX Navigator and Task Configurator.

Note

Close all open Task Lists within the Task Configurator before reloading Command and Task Based Configurations.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > GSX User Interface > Configuration Files**. The **Configuration Files** window opens.
3. Use the following table to configure the parameters and then click **Save**.

Configuration File Settings

Setting	Description
Command and Task Based Configuration File	This configuration file contains commands executed from the GSX Navigator and Tcl Procs executed from the Task Configurator.
Reload Command and Task Configurations	Reloads the GSX Navigator and Task Configurator software with changes to their respective configuration files.
Refresh Trunk Group Validator Cache	Refreshes the PSX Trunk Group on Ribbon Application Management Platform (RAMP).
Enable Core GSX entity Authorization	Enables core GSX entity access restriction after upgrading from Release 8.3 or later. By default, the core GSX entity access restriction is enabled after installation. To modify GSX Management privilege levels, see Set Privileges for Users by Adding Roles.

Setting	Description
Note To automatically enable core GSX entity authorization after upgrade, set <code>EnableCoreGSXentityAccess</code> to true in the SystemConfig.txt file. The SystemConfig.txt file is available in the following location: <code><BASE_DIR>/weblogic/sonusEms/data/sys/SystemConfig.txt</code>	

Set GSX Navigator Discovery

Ribbon Application Management Platform (RAMP) users with administrative privileges can select tree discovery type for the GSX Navigator tree. RAMP does not do full discovery when the GSX navigation tree is not in use. The system updates the navigation tree for a given GSX only when displaying the tree.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > GSX User Interface > Discovery Parameters**. The **GSX Discovery Type Configuration** pane displays.
3. Select one of the following options:
 - **manually**: Click the Discover new tree button to initiate a discovery manually, updating the tree with the latest data.
 - **automatically**: When tRAMP receives the PIF trap that indicates the GSX configuration has changed, the system initiates a full discovery, automatically updating the tree with the latest data.
 - **optimally** (default): When RAMP receives the PIF trap that indicates the GSX configuration has changed, a full discovery is initiated, updating the tree with the latest data only if it is not aware of the configuration changes.
4. Click **Apply**. The discovery type for GSX Navigator is updated.

Sort GSX Trunk Groups

Ribbon Application Management Platform (RAMP) allows you to select the ordering algorithm for displaying GSX trunk group in GSX Navigator. You can select to display the trunk group names in either alphanumeric or alphabetical order.

Start

1. Log onto the RAMP GUI.
2. Navigate to **System > Settings > GSX User Interface > Trunk Group Ordering**. The **Insight Trunk Group Ordering** pane displays.
3. Select one of the following options:
 - **Alphanumerically**: The alphabetical prefix of the trunk group names are ordered alphabetically and the numeric suffix of the trunk group names are sorted in ascending order.
For example, tg10, tg25, tg40, tg50, tg100, tg300 tg5abc, tg5abc1, tgabc2, tg5abc110, tga, tgb
 - **Alphabetically**: The trunk group names, in their entirety, are sorted alphabetically. For example, tg10, tg100, tg25, tg300, tg40, tg50, tg5abc, tg5abc1, tg5abc110, tg5abc2, tga, tgb
4. Click **Apply**. The sorting order for displaying GSX trunk groups is set.

SSH Configuration

In this section:

- [Configure SSH Properties](#)

You must enable the use of SSH by setting the path to the SCP executable and the SSH installation path. You can perform this task by editing the `ssh.properties` file manually (`scpCmd` and `sshPath` parameters). You must stop and restart the RAMP for the changes to take effect.

Before enabling or disabling the SSH Configuration, terminate all the connections from RAMP to PSX. These connections include PSX Manager, CLI, API, and LNP tools.

After updating and discovering the PSX with the new SSH configuration, restart the services that connect to the PSX.

Configure SSH Properties

To configure SSH properties:

1. Log on to the RAMP CLI as the admin user.
2. Change to the Insight user:

```
sudo su - insight
```

3. Edit the following file:

```
/opt/sonus/ems/weblogic/insight/ems/resources/properties/main/properties/ssh.properties
```

4. Enter or modify the values. The following table represents the parameters in `ssh.properties`:

Parameter	Description	Mandatory (M)/ Optional (O)	Range with example
idleTunnelGraceMillis	The interval in milliseconds to terminate idle SSH tunnels. The idle tunnels are discarded after the set interval.	M	1 - 120
defaultSshEnabled	The flag to enable SSH.	M	◦ FALSE ◦ TRUE (default)
sshPort	The PSX port used for SSH.	M	22 (default)

Parameter	Description	Mandatory (M)/ Optional (O)	Range with example
sshPath	The SSH installation directory.	M	/usr (default)
scpCmd	The path to SCP executable.	M	/usr/bin/scp (default)
sshTunnelConnect Attempts	The count of attempts for connecting to the SSH tunnel.	M	5 (default)
sshTunnelCreation Delay	The interval in milliseconds for the RAMP to wait until an SSH tunnel is created.	M	400 (default)
directSshNotSupportedTypes	The device types not supported for direct SSH connection on the RAMP.	M	
sshReadTimeoutSecs	The interval in seconds to wait for the SSH response.	M	60 (default)
scpTransferTimeout Secs	The interval in seconds to wait for the SCP response.	M	300 (default)
minaSshProps	Apache MINA SSH timeout interval properties.	M	idle-timeout 18000000 long,nio2-read-timeout 18030000 long,heartbeat-interval 60000 long
minaIoThreads	The count of IO threads used by the MINA SSH library.	O	10 - 15 default: 10
sshChannelOpenWaitTimeout	The timeout interval for the thread to wait until the channel gets opened. If the channel does not open before timeout, it shows "SSH Exception".	O	15000 - 60000 default: 60000

5. Save the file.
6. Restart the RAMP for the changes to take effect.

RAMP Tools

In this section:

- [Call Trace](#)
- [Call History](#)
 - [Call History Settings](#)
- [Inventory](#)
- [Report Scheduler](#)
- [Trunk Group](#)
 - [Renaming Trunk Groups](#)
- [GSX System](#)
- [Number Portability Services](#)
 - [Mobile Number Portability](#)
 - [Local Number Portability](#)

Ribbon Application Management Platform (RAMP) provides tools you can use to visualize data from managed SBC Core devices.

- [Call Trace](#) – to view call traces initiated on a selected SBC device.
- [Call History](#) – to generate call history reports derived from Call Detail Records (CDRs) from a selected SBC device.
- [NP Services](#) – for configuring number portability services.

The articles in this section describe these tools.

Call Trace

Related articles:

- [Call Trace and Packet Capture - Call Trace \(SBC Core\)](#)
- [Call Trace \(GSX\)](#)
- [PSX Call Trace Destination](#)

Ribbon Application Management Platform (RAMP) provides an interface to view call traces initiated on managed SBC Core/GSX devices. Call trace information can be used in debugging policy and call routing issues. The options for configuring call trace filters and for initiating call traces are set on the SBC device, however the traces themselves can be viewed on RAMP.

- Refer to [Call Trace and Packet Capture - Call Trace](#) for information on call trace configuration on the SBC.
- Refer to [Call Trace](#) for information on call trace configuration on the GSX.
- Refer to [PSX Call Trace Destination](#) for information on call trace configuration on the PSX.

Use the following procedure to select call trace information from the SBC Core device/GSX or from logs stored on an associated PSX.

Note

Use of Call Tracing can have significant impact on the network performance of an SBC/GSX and its associated PSX Policy Server. Ribbon strongly recommends that you take great care in configuring call trace filters, that result in only a small number of calls being traced. Ribbon also recommends that you delete a call trace filter once you have obtained the necessary information.

Prerequisites

- Call Trace Filter configuration is completed on the SBC Core/GSX device and call traces have been run.
- You have Super User [privileges](#) for **Tools** within the **Core Resources** application.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Tools > Call Trace**
3. To retrieve call trace information for a specific SBC Core device:
 - a. In **Node Type**, select **SBC Core / GSX**.
 - b. In **Node List**, select an SBC Core/GSX device.
 - c. In **Filter**, select a call trace filter to define which call trace logs to view. The list contains the names of call trace filters configured on the selected SBC/GSX device.
 - d. In **Records**, enter the number of records you want to view between 1 and 2048 (default).
 - e. In **Sort by**, select an option for sorting the records: **GCID** (global call identifier), **ICID** (IMS charging identifier), or **Time**.
 - f. Click **View**. RAMP applies the selected filter for the selected SBC Core/GSX device and displays the matching call trace information.
4. To retrieve call trace information for a specific PSX device:
 - a. In **Node Type**, select **PSX**.
 - b. In **Node List**, select a PSX device.
 - c. Click **View**. RAMP displays the unfiltered call trace information for the selected PSX.

Call History

Related articles:

- [Call History Settings](#)

Ribbon Application Management Platform (RAMP) provides an option to generate call history reports derived from Call Detail Records (CDRs) from a selected SBC Core device. When generating these reports, you have the option to specify either file-based or time-based selection criteria that determines which CDR records to include.

Use the following procedure to generate a call history report.

Prerequisite

You have Super User [privileges](#) for **Tools** within the **Core Resources** application.

Start

1. Log onto the RAMP GUI.
2. Navigate to **Observability > Tools > Call History**

3. In **Node**, select the SBC Core device whose CDRs you want to include in the call history report.
4. Click **Create Report** to open a window where you can specify selection criteria for the CDRs. You can specify either file-based criteria or time-based criteria.
5. To specify file-based criteria for selecting records, complete the following on the **File Based Search** tab:
 - a. In **Time Span**, select a time range to select a set of CDR records. If needed, click **Show Details** to see the time ranges in a tabular format that is easier to read.
 - b. In **Record Type**, select the type of CDR records to include: **Start**, **Stop**, **Intermediate**, **Attempt**, or **All**.
 - c. In the **Search Criteria** area, use the following table to enter criteria to select CDRs.

Field	Description
Originating Time	The time the call originated.
Disconnect Time	The time the call ended.
Call Duration	The period of time the call was in progress.
Originating Line Info	The originating line information (OLIP), also known as info digits.
Carrier Code	The carrier identification code of the carrier used on the egress trunk (5 characters maximum).
Calling Party Category	A 4-character (8bit hexadecimal code starting with 0x) representing the category of the calling party. For example, 0x0f represents a category of Pay Phone.
Calling Number	The calling number address digits sent out on the egress signaling side after any digit manipulation and address translation performed by the PSX (during the policy request processing) on the calling number received from ingress signaling. (30 characters maximum)
Called Number	The called number address digits sent out on the egress signaling side after any digit manipulation and address translation performed by the PSX (during the policy request processing) on the called number received from ingress signaling. (30 characters maximum)
Dialed Number	The called number digits received by the SBC from the ingress signaling group, before any digit manipulation or address translations are performed by the PSX (30 characters maximum).
Billing Number	One of the following, in order of precedence (30 characters maximum): • the billing number returned by the SCP. • the billing number present in the incoming signaling message. • the billing number configured against the ingress trunk on the PSX.

Field	Description
Ingress TG Name	The origination gateway logs the name of the external trunk group between the ingress network and the origination gateway. The destination gateway logs the name of the internal IP trunk group between the origination gateway and destination gateway.
Egress TG Name	The origination gateway logs the name of the internal IP trunk group between the destination gateway and the origination gateway. The destination gateway logs the name of the external trunk group between the destination gateway and the egress network.
Announcement ID	The 5-decimal digit announcement ID of the last announcement played by the SBC for the call.
Disconnect Reason	The Disconnect Reason code.
Redirecting Number	The redirecting number.
Max. Setup Time	The maximum setup time allowed, in seconds.
Call Answer Time	The time a call was answered (GMT). Click on Select to open a window where you can select the date and time.

- d. (Optional) Click **Include Japanese variants in search** to expand an area where you can enter Japanese variant search options. Use the following table to configure these options.

Field	Description
Called IN Number	The called IN number.
Called Directory Number	The called directory number from the Called Directory Number parameter.

Field	Description
Calling Party Member Status	The Calling Member Status Information in the IAM either received or set after screening is done on the PSX (1 decimal character, 08, or empty). The valid values are: • 0 Pseudo Subscriber • 1 Member • 2 Member (stop service) • 3 Pseudo subscriber (stop service) • 4 Pseudo subscriber (out of service) • 5 Non member • 6 (No definition) • 7 Member1 • 8 Member1 (stop service)
Called Party Member Status	The Called Member Status Information after called member screening is performed (1 decimal character, 08, or empty). The valid values are: • 0 Pseudo Subscriber • 1 Member • 2 Member (stop service) • 3 Pseudo subscriber (stop service) • 4 Pseudo subscriber (out of service) • 5 Non member • 6 (No definition) • 7 Member1 • 8 Member1 (stop service)

- e. In **Display Direction**, select a direction for the report, **Ascending** or **Descending**.
- f. In **Maximum Number of Records**, enter the number of records to include. The maximum allowed is 2048.
6. To specify time-based criteria, specify the following criteria for selecting records on the **Time Based Search** tab:
 - a. In **Record Type**, select the type of CDR records to include: **Start**, **Stop**, **Intermediate**, **Attempt**, or **All**.
 - b. In **Calling Number**, enter a calling number for records to include.
 - c. In **Called Number**, enter a called number for records to include.
 - d. In the **From** and **To** fields under **Call Start Time Range**, click on **Select** to open windows where you can select the beginning and end time for the range of call-start times to include.
 - e. In **Maximum number of records this search will return**, enter the number of records to include. The maximum allowed is 2048.
7. Click **OK** to generate the report.

Call History Settings

When you create a Call History Report, some default settings are specified in the **Ribbon Application Management Platform (RAMP) SystemConfig.txt** file. You can adjust several **systemlevel** parameters in this file to change these defaults. The file resides in the `<BASE_DIR>/weblogic/sonusEMS/data/sys` directory. If you change any parameter values, you must restart RAMP for the changes to take effect.

You can change the following parameters:

Parameter	Default Value	Definition
<code>cdrMaxFiles</code>	32	The maximum number of time spans to list in the Create Call History Report Search window.
<code>cdrMaxRecords</code>	2048	The maximum number of records displayed in a history report.
<code>cdrAlternateExt</code>	ACT	The alternate file extension for CDR files (GSX only).
<code>cdrAlternatePath</code>	N/A	The path to backed-up CDR files (GSX only).
<code>maxNumOfCdrViewer</code>	2	The maximum number of simultaneous Call History sessions allowed.

Note

The `cdrAlternateExt` and `cdrAlternatePath` parameters have no effect if you have configured your GSX(s) to stream CDRs to the DSI.

Inventory

Ribbon Application Management Platform (RAMP) tracks the physical configuration of all registered GSX. Everytime a discovery takes place for a given GSX, RAMP records changes from the previous configuration. RAMP maintains a history of all hardware adds, moves and deletes. The following are examples of some of the reports you can generate:

- The present hardware configuration of a device or of multiple devices
- Configuration changes to a device over a period of time
- The network wide inventory of a particular card type, version, or model number
- The location history of a card with a given serial number
- The software revision of all cards in the network

Note

The list above represents only a small subset of the possible reports.

Prerequisites

- You have Super User [privileges](#) for **Tools** within the **Core Resources** application.
- A GSX device is registered on RAMP.

Start

1. Log onto the RAMP GUI.
2. Navigate to **Observability > Tools > Inventory**.

3. Select a report from the **Reports** drop-down menu. A dialog box displays
4. Select a GSX device from the **Desired GSX Node** drop-down menu.
5. Click the **Create** button to launch the Inventory Reports Wizard.
6. In the **Date Range** window, choose either an inventory snapshot at a specified time, inventory covering a specified range of times, or snapshot of the most recent available inventory information and click **Next**.
7. Select the nodes that you want to inventory. Selecting **All Nodes** includes any new nodes added to the system the next time you run the report template. Click **Next**.
8. Select the modules that you want to include in the inventory. Selecting All Modules includes any new cards added to the system the next time you run the report template. Click **Next**.
9. Select the serial numbers of specific hardware if desired and click **Next**.
10. Select the sort order for the report output and click **Next**.
11. Enter a name for the report and add a description (optional).
12. Select either **Save template and run the report when finished**, **Just save template when finished**, or, **Just run report when finished**. If you select either of the first two options, the report template appears in the Reports pull-down menu for future use.
13. Click **Finish**.

Inventory Reports

Report Name	Description
Latest_All_GSXs	This report shows the most current information on all of the GSX nodes currently configured in the system.
Latest_All_MNS10	This report shows the most current information on all of the MNS10 cards currently installed.
Time_Range_All_GSXs	This report shows information for all GSX nodes over a given time range.
Time_Range_All_MNS10	This report shows information for all MNS10 cards over a given time range.

The following table describes the fields of the Inventory report.

Report Name	Description
GSX Node Name	The name of the GSX containing the server modules.
Inventory reports indicate an unregistered node by placing an asterisk next to the node name.	
Shelf	The shelf number of the GSX
Slot	The slot number of the server module
SubIndex	The index of the CPIM cards in the slot
HW Type	The type of the server module

Report Name	Description
HW Rev	The revision level of the server module
P/N	The Ribbon part number of the server module
P/N Rev	The revision level of the Ribbon part number
Serial #	The serial number of the server module
Inserted Time	The time the system first discovered the server module inserted in the slot

If a server module is present, but not booted, or the HW Type of a server module is unknown, then the P/N, P/N Rev, and Serial # fields will contain the value "N/A".

Report Scheduler

In this section:

- [Report Formats](#)
- [Report Location](#)
- [Report Fields](#)

Ribbon Application Management Platform (RAMP) allows you to schedule generating following reports for GSX devices:

- (Hardware) Inventory (all GSX nodes)
- Blocked ANI (on a selected node)
- Trunk Group reports (all GSX nodes)

After generating the reports, you can save these report locally and forward them to a designated server or location through SCP.

Note

Each report selection results in the generation of a single report containing all information.

When you click on the Report Scheduler, RAMP displays information on all scheduled reports. The start time and frequency settings determine the data selected for a given report. The data contained in (hardware) Inventory reports, Blocked ANI reports, and Trunk Group reports is a snapshot of the applicable records at each designated time interval.

Prerequisites

- You have Super User [privileges](#) for **Tools** within the **Core Resources** application.
- A GSX device is registered on RAMP.

Start

1. Log onto the RAMP GUI.
2. Navigate to **Observability > Tools > Report Scheduler**.
3. Click the **Create** button to open the Create Scheduling Entry dialog box.
4. In the **Report** field, select the type of report to schedule.
 - **Erlang Hourly Data Exporter Report:** The new erlang hourly report generates the report at a scheduled time of the day. The .csv report contains erlang hourly data for previous day from 00:00 hrs to 23:59 hrs. An option is available to generate report for all the GSX devices in the same report or can select report for a selected GSX device.
 - **Erlang Aggregated Data Exporter Report:** The aggregated erlang report scheduled generates a .csv erlang report with a peak erlang usage value, the timestamps when the value was at peak and the average erlang value for the period of 24 hrs, generated at the scheduled time of the day. The report would have report of the previous day. An option is available to generate report for all GSX's together or for one selected GSX device.
5. Perform one of the following as appropriate:
 - If you selected the Blocked ANI report, from the Nodes list, select the name of the node on which you wish to run the report.
 - If you selected either the Trunk Groups or Hardware Inventory reports, the Node field automatically displays All GSXs.
6. In the **Frequency** field, set the frequency (that is, how often you want the system to generate the report) of report generation from the pull-down list of options.
7. In the **Start Time** field, set the day and time for the first report generation. The system generates subsequent reports based upon this start time and the frequency setting.
8. If you wish to save the report file locally, select the **Save to Insight Server Disk** check box.
9. If you wish to transmit the report to a remote location, select the **Save to SCP location** check box, enter the address in the **SCP Hostname** field (for example, *insight.Sonusnet.com.*), the destination directory on the host in the **SCP Directory** field, and enter a valid **User Name** and **Password**. The user name and password must allow read/write access to the specified directory on the remote host.

The acronym, SCP, refers to Secure Copy Program.

10. Click the **Add** button, to add the report destination to the list.

You can add other destinations for the report by repeating Steps 8 and 9. You can modify or delete existing destinations by highlighting the entry and clicking either the Update or Delete buttons.

11. Click **Apply** to save your schedule entry and keep the dialog box open, or click **OK** to save your schedule entry and close the dialog box.

Scheduled Report Fields

Field	Definition
Select	A checkbox used to select the entry for edit or deletion.

Field	Definition
Task ID	The ID of the task of the specific report.
Report	The type of report.
Nodes	A list of the nodes selected for the report.
Frequency	How often the system generates the report. Selectable intervals are: 5 minutes, 15 minutes, 1 hour, 2 hours, 4hours, 6 hours, 12 hours, 1 day, and 1 week.
Next Execution Time	The next execution time based upon the frequency interval and start time. The format is Day, Hours:Minutes AM/PM.
Local	If checked, the system saves a copy of the report locally.
SCP Hostname	The hostname of the system designated for report uploading
SCP Directory	The destination directory for report uploading on the system specified by the SCP Hostname field.

Report Formats

The system generates each report in a comma separated value (.csv) format. The name each scheduled report, whether saved locally or to a remote location, uses the following format:

<Table Name>YYYYMMDDHHMM.csv where YYYYMMDDHHMM represents the time the system created the archive

Example: HW_Inventory2007913530.csv is a hardware inventory report created on September 13, 2007 at 5:30 AM.

or

TrunkGroup20079122148.csv is a trunk group report created on September 12, 2007 at 9:48 PM

Report Headers

Each report contains header information detailing the report type, a report generated timestamp, and field names. Several of the report headers also include a timestamp representing the time of data collection. For example, the header of a Trunk Group report contains a timestamp representing the time the last table synchronization with the GSX occurred. The next section of the report header contains the field names separated by commas. The section that follows the header is the actual report data.

Example (Header form Trunk Group report with excerpt of data)

```
# Trunk Group,2007913956,20079121437
#GroupName,ClusterProfileId,GsxNodeName,Shelf,Slot,Port,Ds3,Ds1,Ds0,T1PortName,TrunkGroup
pName,
```

```

TrunkGroupId,TrunkGroupDescription,TrunkGroupType,TrunkGroupState,TrunkGroupMode,CirResv
State,
PriorityCallReserve,IncomingCallReserve,OutgoingCallReserve,Ds1State,Ds1Mode,Ds0State,Ds
0Mode,
IsupLocalPointCode,IsupRemotePointCode,IsupCic,IsdnChannelType,IsdnInterfaceIdentifier
Default Group,,Demon,1,5,1,0,1,1,T1151,TGISUP1,null,null,ISUP,2, 1,1,1,1,10,2,2,2,2,2530,8
185,0,,
Default Group,,Demon,1,5,1,0,1,2,T1151,TGISUP1,null,null,ISUP,2, 1,1,1,1,10,2,2,2,2,2530,8
185,6,,
Default Group,,Demon,1,5,1,0,1,3,T1151,TGISUP1,null,null,ISUP,2, 1,1,1,1,10,2,2,2,2,2530,8
185,12,,
Default Group,,Demon,1,5,1,0,1,4,T1151,TGISUP1,null,null,ISUP,2, 1,1,1,1,10,2,2,2,2,2530,8
185,18,,

```

Report Location

When you select the option, Save to local disk, the system saves each report to a directory specified in the `SystemConfig.txt` file.

The default locations are as follows:

Default Report Location

Report Type	Location
Hardware Inventory for all GSXs	<BASE_DIR>/weblogic/sonusEms/data/ HwInventoryReports
Blocked ANI Data Exporter	<BASE_DIR>/weblogic/sonusEms/data/ blockedANI_archive/<node name>
Trunkgroups for all GSXs	<BASE_DIR>/weblogic/sonusEms/data/ TrunkGroupReports
Erlang Hourly Data Exporter	<BASE_DIR>/weblogic/sonusEms/data/ ErlangHourlyReports
Erlang Aggregated Data Exporter	<BASE_DIR>/weblogic/sonusEms/data/ ErlangAggregatedReports

To change the default locations, edit the following parameters in the `SystemConfig.txt` file:

- `hwInventoryExportDir=<your new path>`
- `blockedAniExportDir=<your new path>` (Do not include the node name.)
- `trunkgroupExportDir=<your new path>`
- `erlangHourlyExportDir=<your new path>`
- `erlangAggregatedExportDir=<your new path>`

Note

Report files are not replicated for any reports in a Disaster Recovery set up.

If you wish to export reports to a single location (or both), use SCP option and add both DR Source and Target as export locations. You can also export to a third server from both Source and Target.

Report Fields

The following table supply definitions for the various fields contained in the reports you can generate using the Report Scheduler.

Note

Inventory reports indicate an unregistered node by placing an asterisk next to the Node Name.

Hardware Inventory Report Fields

Field	Description
groupName	The name of the device group to which the GSX belongs
CLUSTER_PROFILE_ID	The ID of the Cluster Profile to which the GSX belongs as defined in the GATEWAY table of the PSX.
gsxNodeName	The name of the GSX containing the server modules
SwRevision	The version of the software on the GSX. For example, V07.01.00R000
Shelf	The shelf number of the GSX
Slot	The slot number of the server module

Field	Description
HW Type	The type of the server module. The values are defined as follows: • none = 1 • UNIX = 2 • CUPSS02 = 12 • CUPSS01= 13 • MIN = 14 • VME = 15 • MNS10 = 16 • PNS10 = 17 • CNS10 = 18 • CNS30 = 19 • MTA01 = 20 • MNA10 = 21 • PNA10_QUAD = 22 • CNA33 = 23 • CNA10 = 24 • CNA30 = 25 • SONICPLANE01 = 26 • FANTRAY01 = 27 • MTA10 = 28 • CNA01 = 29 • CNA03 = 30 • CNS20 = 31 • PNS20 = 32 • SPS60 = 33 • CNA20 = 34 • CNA21 = 35 • PNA21 = 36 • PNA23 = 37 • CNS61 = 38 • CNA61 = 39 • MTA20 = 40 • MTA21 = 41 • CNA06 = 42 • CNS31 = 43 • CNS25 = 44 • CNA25 = 45 • PNS30 = 46 • PNA30 = 47 • SONICPLANE02 = 48 • CNA02 = 49 • CNA05 = 50 • CNS60 = 51 • CNS70 = 52 • CNA60 = 53 • CNA70 = 54 • CNA07 = 55 • CPIM70 = 56 • CPIM71 = 57

Field	Description
	• MNS11 = 58 • MTA30 = 59 • CNS71 = 60 • SPS70 = 61 • CNA73 = 62 • PNA35 = 63 • MNS20 = 64 • MNA20 = 65 • MNA21 = 66 • MNA25 = 67 • MNS25 = 68 • PNS40 = 69 • PNS41 = 70 • PNA40 = 71 • PNA41 = 72 • PNA45 = 73 • GNS15 = 74 (GSX4010) • GNA10 = 75 (GSX4010) • FMP10 = 76 (GSX4010) • GNS16 = 77 • GNS30 = 78 • GNA30 = 79 • FMP30 = 80 • GCA30 = 81 • GCA31 = 82 • GNS31 = 83 • GNS35 = 84 • GNS36 = 85 • CNS40 = 86 • CNS45 = 87 • CNS80 = 88 • CNS81 = 89 • CNS85 = 90 • CNS86 = 91 • SPS80 = 92 • CNA40 = 93 • CNA80 = 94 • CNA81 = 95 • CPIM81 = 96 • CNA08 = 97 • CNA04 = 98 • MNS21 = 99 • MNS26 = 100
HW Rev	The revision level of the server/adaptor module

Field	Description
Server or Adaptor	Defines whether the server module is a server or adaptor module. Possible values are: • Server = 1 • Adaptor = 2 • MTA = 3 • CPIM = 4
P/N	The Ribbon part number of the server module
P/N Rev	The revision level of the Ribbon part number
Serial #	The serial number of the server module
Inserted Time	The time the system first discovered the server module inserted in the slot
Sub-Index	1 for upper CPIM71 or CPIM81 and 2 for lower CPIM71 or CPIM81 and 0 for all other hardware types.

Note

The following cards are not supported ; MNS11, PNS10, PNS20, PNS30, PNS30a, CNS10, CNS25, CNA01, CNA02, CNA05, CNA10, CNA20, CNA21, CNA25, CNS30, CNS30a, CNS31, CNA33, MNS10, MNA10, PNA10, CNA30, CNA03, CNS20, SPS60, PNA21, PNA23, CNS61, CNA61, CNA06, PNA30, CNS60, CNS70, CNA70, CNA07, CPIM70, CPIM71, CNS71, SPS70, CNA73, PNA35, MNS20, MNS25, PNS40, PNA41.

Trunkgroup (Details) Report Fields

Field	Definition
groupName	The name of the device group to which the GSX belongs
ClusterProfileId	The ID of the Cluster Profile to which the GSX belongs as defined in the GATEWAY table of the PSX.
gsxNodeName	The name of the GSX containing the server modules
Shelf	The shelf number of the GSX
Slot	The slot number of the server module
Port	The Port index

Field	Definition
Ds3	The DS3 index
Ds1	The DS1 index
Ds0	The DS0 index
T1PortName	The name of the port
TrunkGroupName	The name of the trunk group (Trunkgroup CLI)
TrunkGroupID	The ID of the trunkgroup as defined in the TRUNKGROUP_ID2 field of the PSX TRUNKGROUP table.
TrunkGroupDescription	Description text for the trunkgroup as entered in the DESCRIPTION field of the PSX TRUNKGROUP table.
TrunkGroupType	The trunkgroup type. Possible values are: ISUP, CAS, or ISDN.
TrunkGroupState	The administrative state of the trunkgroup. Possible values are: 1 if disabled, or 2 if enabled. All trunk groups are created in a disabled state and must be enabled to allow calls.
TrunkGroupMode	Operation mode for this trunkgroup. Possible values are: 1 for inService, or 2 for outOfService.
CirResvState	The administrative state of the circuit reservation feature on the trunk group. Possible values are: 1 if disabled, or 2 if enabled. All trunk groups are created with this feature in a disabled state. If you enable this feature, then the SonusTgInboundReserved feature is overridden.
PriorityCallReserve	Minimum number of priority call allowed set for this trunk group when SonusTgCirResvState is set to enabled. Possible values: Integer in the range of 0 to 100.
IncomingCallReserve	Minimum number of incoming call allowed set for this trunk group when SonusTgCirResvState is set to enabled. Possible values: Integer in the range of 0 to 128.
OutgoingCallReserve	Minimum percent of outgoing call allowed set for this trunk group when SonusTgCirResvState is set to enabled. Possible values: Integer in the range of 0 to 100.

Field	Definition
Ds1State	The administrative state of this T1/E1 span. Possible values are: 1 for disabled, 2 for enabled, 3 for deleted, 4 for inservice, or 5 for dryingUp.
Ds1Mode	The service state of this T1/E1 span. Possible values are: 1 for outOfService, or 2 for inService.
Ds0State	The administrative state of this DS0 channel. Possible values are: 1 for unavailable, or 2 for available.
Ds0Mode	The service state of this DS0 channel. Possible values are: 1 for outOfService, or 2 for inService.
IsupLocalPointCode	The SS7 point code assigned to this SS7 Node for the gateway. Format: three octet data type representing NetworkClusterMember values respectively. Applicable only to ISUP trunk group type. Set to 0 for other (CAS and ISDN) trunk group types. Integer value with range of 0 to 16777215.
IsupRemotePointCode	The SS7 Point Code of the ISUP Service Group in decimal format, the least significant three bytes representing NetworkClusterMember values. Set to 0 for CAS and ISDN trunk group types.
IsupCic	Identifies the circuit identity code (CIC) for the ISUP circuit. Integer values in the range 0 ... 16383. Set to 0 for CAS and ISDN trunk group types.
IsdnChannelType	The ISDN channel type. Possible (integer) values: 1 for ISDN B Channel, 2 for ISDN Primary D Channel, or 3 for Backup D Channel
IsdnInterfaceIdentifier	The Q931 interface identifier of the ISDN Service Group interface.

Trunkgroup (Summary) Report Fields

Field	Definition
groupName	The name of the device group to which the GSX belongs
ClusterProfileId	The ID of the Cluster Profile to which the GSX belongs as defined in the GATEWAY table of the PSX.
gsxNodeName	The name of the GSX containing the server modules
TrunkGroupName	The name of the trunk group (Trunkgroup CLLI)

Field	Definition
TrunkGroupID	The ID of the trunk group as defined in the TRUNKGROUP_ID2 field of the PSX TRUNKGROUP table.
TrunkGroupDescription	Description text for the trunkgroup as entered in the DESCRIPTION field of the PSX TRUNKGROUP table.
TrunkGroupState	The administrative state of the trunk group. Possible values are: 1 if disabled, or 2 if enabled. All trunk groups are created in a disabled state and must be enabled to allow calls.
TrunkGroupMode	Operation mode for this trunk group. Possible values are: 1 for inService, or 2 for outOfService.
CirResvState	The administrative state of the circuit reservation feature on the trunk group. Possible values are: 1 if disabled, or 2 if enabled. All trunk groups are created with this feature in a disabled state. If you enable this feature, then the SonusTgInboundReserved feature is overridden.
PriorityCallReserve	Minimum number of priority call allowed set for this trunk group when SonusTgCirResvState is set to enabled. Possible values: Integer in the range of 0 to 100.
IncomingCallReserve	Minimum number of incoming call allowed set for this trunk group when SonusTgCirResvState is set to enabled. Possible values: Integer in the range of 0 to 128.
OutgoingCallReserve	Minimum percent of outgoing call allowed set for this trunk group when SonusTgCirResvState is set to enabled. Possible values: Integer in the range of 0 to 100.
TotalConfiguredDSOs	The sum of all configured and registered PSTN channels for this trunk group. This number is obtained from the SonusTgPstnTotalConfigured field of SonusTgStatusTable MIB table. Consequently, to get correct values, you must enable performance data collection for all nodes.

Field	Definition
TotalEnabledDSOs	Current effective number of DSOs enabled. This count more correctly reflects the effective enabled DSOs channel count, based on whether the channels are being used for call handling. Consequently, to get correct values, you must enable performance data collection for all nodes. This number is the sum of the following fields of the SonusTgStatusTable MIB table: • SonusTgPstnTotalAvailable — The sum of all available or unblocked PSTN channels for this trunk group. • SonusTgPstnInboundUsage — This is only meaningful for PSTN trunk groups that are configured for inbound or both directions. This reflects the current inbound or incoming usage count of this trunk group. • SonusTgPstnOutboundUsage — This is only meaningful for PSTN trunk groups that are configured for outbound or both directions. This reflects the current outbound, outgoing or nonpriority usage count of this trunk group. • SonusTgPriorityCallUsage — This is only meaningful for ISUP trunk groups that are configured and when SonusTgCirResvState is enabled. This reflects the current priority usage count of this trunk group.

Blocked ANI Report Fields

Field	Definition
Automatic Number ID	The ID of the blocked subscriber.
Blocked Reason	The reason for the block either Access, or Fraud

Trunk Group

In this section:

- [Trunk Group Reports](#)
- [Trunk Group Report Fields](#)
- [Trunk Group Wizard Profile](#)
- [Trunk Group Wizard for PSX](#)
- [Trunk Group Wizard ISUP Service Group](#)
- [Trunk Group Wizard CIC](#)

Related articles:

- [Renaming Trunk Groups](#)

Ribbon Application Management Platform (RAMP) supports generating Trunk Groups reports.

The Trunk Group Wizard provides a centralized mechanism for the creation of trunk groups and supporting entities across the Ribbon platform (GSX, PSX, and SGX nodes).

For more information on GSX trunk groups, refer to [Trunk Group](#).

Prerequisites

- Super User [privileges](#) for **Tools** within the **Core Resources** application.
- GSX Super User privileges for creating a task list using the Trunk Group Wizard (a minimum level of GSX Provisioner to run the task list). The system disables access to the Trunk Group Wizard for users with lower privilege levels.
- PSX read/write privileges for the PSX Trunk Group to access the PSX configuration section of the Trunk Group Wizard.
- A GSX device is registered on RAMP.
- Before you can successfully employ the Trunk Group Wizard to create ISUP trunk groups, you must create and configure the following objects on the GSX and the PSX:
 - At least one Carrier on the GSX
 - At least one SS7 node on the GSX
 - At least one CNS server on the GSX
 - (If you plan to create the trunk group on a PSX) The PSX on the GSX the PSX must be a registered node in **RAMP** with the same name
 - (If you plan to create the trunk group on a PSX) A Carrier with the same ID (as on the GSX) must exist on the PSX
 - Enable Data Collection for the GSX (enabling incremental PIF recommended) and verify data collection is up-to-date.

Start

1. Log onto the [RAMP](#) GUI.
2. Navigate to **Observability > Tools > Trunk Group**.
3. Select a report from the **Reports** drop-down menu. A dialog box displays
4. Select a GSX device from the **Desired GSX Node** drop-down menu.
5. Click **OK**. The report displays.

Trunk Group Reports

Node Object	Report (Command)
Shelf, Hardware, CNS/CNA, GNS/GNA, and Port	• Report Dependent Trunk Groups Detail • Report Dependent Trunk Groups Summary • Report Unassigned Channels Detail • Report Unassigned Channels Summary • Report Used Channels Detail
Trunk Group(s)	• Report Unassigned CICs • Report Used CICs Summary • Report Used Channels • Report Used Channels Detail • Report Used Ports • Report Used Slots

The header of each report contains general information about the report (that is, Report Name, Node, Report Generation (date), Data Collected (date), etc.). Report for a single GSX trunk group or a consolidated report for all the GSXs in the entire network can be generated.

Trunk Group Report Fields

Report Name	Field/Definition
Dependent Trunk Groups Detail	• Slot — The chassis slot where the server module resides • Port — Assigned name of the port. Syntax is TypeShelfSlotIndexSpan (for example, T11815) • Trunk Group — The name assigned to the Trunk Group • Trunk Group Type — The Trunk Group type (that is, ISUP, ISDN, etc.) • Channels — Number of channels on the span
Dependent Trunk Groups Summary	• Slot — The chassis slot where the server module resides • Trunk Group — The name assigned to the Trunk Group
Unassigned Channels Detail	• Slot — The chassis slot where the server module resides • Port — Assigned name of the port. Syntax is TypeShelfSlotIndexSpan (for example, T11815) • Unassigned Channels — The channel number(s) of unassigned channels on the span
Unassigned Channels Summary	• Slot — The chassis slot where the server module resides • Number of Unassigned Channels — The quantity of unassigned channels associated with the server module in the designated slot
Used Channels Detail	• Trunk Group — The name assigned to the Trunk Group • Trunk Group Type — The Trunk Group type (that is, ISUP, ISDN, etc.) • Port — Assigned name of the port. Syntax is TypeShelfSlotIndexSpan (for example, T11815) • Slot — The chassis slot where the server module resides • Channel — The channel number on the span • LPC — The local point code of the ISUP circuit • LPC (Decimal) — The local point code of the ISUP circuit in decimal format • RPC — The remote point code of the ISUP circuit • RPC (Decimal) — The remote point code of the ISUP circuit in decimal format • CIC — The circuit identifier of the ISUP circuit • ISDN Channel Type — The ISDN channel type • ISDN Interface ID — The ISDN interface identifier

Report Name	Field/Definition
Unassigned CICs and Used CICs Summary	• Trunk Group — The name assigned to the Trunk Group • Trunk Group Type — The Trunk Group type (that is, ISUP, ISDN, etc.) • LPC — The local point code of the ISUP circuit • LPC (Decimal) — The local point code of the ISUP circuit in decimal format • RPC — The remote point code of the ISUP circuit • RPC (Decimal) — The remote point code of the ISUP circuit in decimal format • CICs — The range of circuit identifiers of the ISUP circuit
Used Channels	• Trunk Group — The name assigned to the Trunk Group • Trunk Group Type — The Trunk Group type (that is, ISUP, ISDN, etc.) • Port — Assigned name of the port. Syntax is TypeShelfSlotIndexSpan (for example, T11815) • Slot — The chassis slot where the server module resides • Channels — Number of channels on the span
Used Ports	• Trunk Group — The name assigned to the Trunk Group • Slot — The chassis slot where the server module resides • Ports Used — a list of the physical ports used by this Trunk Group
Used Slots	• Trunk Group — The name assigned to the Trunk Group • Slots Used — The chassis slot (location of the server module) used for this Trunk Group

Trunk Group Wizard Profile

Carrier Name and SS7 Node Name are mandatory fields. The listed carriers may change depending upon whether you selected to skip the PSX trunk group creation. If you selected the **Skip PSX Trunk Group Creation** check box, then the carriers listed are those configured on the GSX. If you did not select the **Skip PSX Trunk Group Creation** check box, then the carriers listed are those common to both the GSX and the PSX.

Field	Definition
Existing Profile (optional)	Selection of an existing Trunk Group profile populates the required fields with information from the profile. You may override any of this information by changing the field value.
Carrier Name (required)	Select the carrier associated with the trunk group. The carrier must exist on both the GSX and the PSX Policy Server (unless you disabled the PSX configuration see Note above).
SS7 Node Name (required)	Select the name of the SS7 Node that provides SS7 signaling for the trunk group.

Field	Definition
Inbound Reserve (%) (optional)	Specifies the percent of channels reserved for inbound calls in PSTN trunk groups. (Defined in increments of 5. Default = 0) If enabled, the Circuit Reserve State overrides this parameter.
Mode (optional)	Defines if the trunk group will be in service or out of service after creation. • inService • outOfService
Num Verify	Specifies whether the Trunk Group may require verification for the calling number.
Num 800	Specifies whether the Trunk Group may require 800 number translation for the called number.
Priority Call Reserve (%) (optional)	Specifies the percent of channels reserved for priority calls in PSTN trunk groups. (Defined in increments of 5. Default = 0). The system uses this parameter only if the Circuit Reserve state is enabled.
Incoming Call Reserve (%) (optional)	Specifies the percent of channels reserved for incoming calls in PSTN trunk groups. (Defined in increments of 5. Default = 0). The system uses this parameter only if the Circuit Reserve state is enabled.
Outgoing Call Reserve (%) (optional)	Specifies the percent of channels reserved for outgoing calls in PSTN trunk groups. (Defined in increments of 5. Default = 0). The system uses this parameter only if the Circuit Reserve state is enabled.

Field	Definition
Circuit Reserve State (optional)	If the Circuit Reserve State is enabled then system ignores the Inbound Reserve parameter and uses the Priority, Incoming, and Outgoing Call Reserve parameters. If disabled, the system uses the Inbound Reserve parameter.
Hunt Method (required)	The method of hunting through service groups for trunk groups: • leastcost — examines the leastcost service group first, then the next least etc. • configured — examines the first configured service group first, then the second, etc. • circularforward — the search for an available resource proceeds through all service groups in the order that they registered to the trunk group. This selection overrides the hunt method for the service group. • circularbackward — the search for an available resource proceeds through all service groups in the opposite (reverse) order that they registered to the trunk group. This selection overrides the hunt method for the service group
LNP Trans	Select True or False
SILC Cong. Level 1 Calls Allowed	The percentage of call to allow when the first congestion level trigger is surpassed. This should be set to a higher value than the Level 2 Calls Allowed setting.
SILC Cong. Level 2 Calls Allowed	The percentage of call to allow when the second congestion level trigger is surpassed. This should be set to a lower value than the Level 1 Calls Allowed setting.
SILC State	The state of the Selective Incoming Load Control either Disabled or Enabled .

Trunk Group Wizard for PSX

If you selected the **Skip PSX Trunk Group Creation** check box on the first wizard window, then the wizard does not display this window. Go to the Fourth Window: ISUP Service Groups.

You can use this window to enter PSX related trunk group information. There are no mandatory parameters. However, you may wish to populate many of the optional fields. The following table provides information about the optional fields.

Field	Definition
Unrestricted Flag (optional)	Indicates if this trunk group may carry 64 kbps clearchannel data call or is restricted to 56 kbps
Gateway (required)	The name of the GSX node to which this trunk group belongs.

Field	Definition
Description (optional)	An optional description of the trunk group.
Business Group (optional)	The ID of the business group assigned to this trunk group.
Business Location (optional)	The ID of the business location assigned to this trunk group. • Generic • JAPAN • North America • Unknown
Calling Area	The calling area in which this trunk group is located. Used for local call determination and AMA billing.
Call Processing Localized Variant (optional)	This field defines the PSX Call Processing Localized Variant to use for this trunk group.
PSX Carrier	Not editable. Populated from selection in previous window.
Carrier Selection Priority (optional)	The carrier selection priority used for this trunk group.
Country (optional)	The country code of the country at the far-end of the trunk group.
Destination Switch Type (required)	Identifies the far end switch type connected to this trunk group. Possible selections are: • Access • Tandem • EAEO • nonEAEO • IXC • International
Direction (required)	Indicates which call directions are allowed on this trunk group. This setting must match the setting for the trunk group members (ISUP circuits) provisioned on the GSX. • Unknown • Two Way Allows both inbound and outbound • One Way In Allows inbound calls only • One Way Out Allows outbound calls only.
Element Routing Priority Profile (optional)	The Element Routing Priority profile used for outgoing calls on this trunk group. • DEFAULT • JAPAN • NA

Field	Definition
Feature Control Profile (required)	The feature control profile to use for this trunk group.
LATA (optional)	The LATA that contains the far end of the trunks in this trunk group. Outside North America, the LATA you choose has no effect on calls.
Max. Satellite Hops	Specifies the maximum number of hops allowed for a trunk group designated as a satellite trunk group. Possible values are: • None • One Hop • Two Hops • Three or more Hops
Numbering Analysis Profile (optional)	Specifies the number analysis profile for this trunk group.
Number Length Enforcement (optional)	The number length enforcement entry for this trunk group.
Originating Carrier (required)	The carrier code of the carrier owning the CO switch at the far end of the trunks in this group.
PPR Profile (optional)	The ID of the Prefix Partition Routing Profile assigned to this trunk group.
Pseudo Carrier (required)	The subscriber's assigned carrier. Use this field when the subscriber belongs to a carrier that does not have a CIC, or when the subscriber belongs to a reseller.
Routing Criteria Profile (optional)	The Routing Criteria priority profile used for outgoing calls on this trunk group.
SCP Business Service Group (0255) (required)	The SCP Business Service Group associated with the trunk group.
Signaling Profile (optional)	The Signaling Profile specifies outgoing signaling parameters overriding the default behavior directed by the signaling flag.
Signaling Flag (required)	The type of call control signaling used to set and tear down calls on this trunk group.
SIP Domain (optional)	The regional domain name assigned to this trunk group.
TDM Trunk Type (required)	Defines the type of TDM trunks.

Field	Definition
Trunk Group Class of Service (optional)	The trunk group class of service (COS) associated with this trunk group. Either an Egress COS or Ingress COS that you previously define in the Trunk Group COS Profile.
Trunk Group Class of Service Profile (optional)	The associated Trunk Group COS Profile. Select a Trunk Group COS Profile for ingress trunk groups only.
Trunk Group Domain (optional)	The default domain to use for this trunk group if no other domain is specified.
Trunk Number (optional)	The five digit trunk number.
ZZ Profile (optional)	The ZZ profile to be used for outgoing calls on this trunk group. This applies to channel associated signaling (CAS) trunk groups only.
POI Level (required)	Specifies the Point of Interface (POI) Level. • 0 – The Trunk Group does not have multiple POI levels • 1 – PSX Fixed Services (for carriers with more than one POI level) • 2 – Mobile Services (for carriers with more than one POI level)
POI Charge Area (optional)	The Point of Interface (POI) Charge Area represents the point of demarcation between two carriers. If the PSX does not find the HNPA Charge Area Code during pre-routing, it uses this value to determine the Charge Area Code for the called or calling number.
Own Carrier ID	The carrier code of the carrier used as the call carrier if Carrier Selection Priority indicates Trunk Group as the source.
Release Tone Treatment (0999)	Not used in this release. Enter 0.
NOA Profile (optional)	The Nature of Address profile.
Prefix Profile (optional)	The Prefix Profile for this trunk group.
Owning Carrier Profile ID (optional)	(Japan variant only) The profile defines the owning carrier for certain calling and called numbers or number prefixes on this trunk group.
Carrier Type Profile (optional)	(Japan variant only) When provisioned, the PSX determine the carrier type based on the call type, ingress destination switch type, and egress destination switch type.

Field	Definition
Ingress Charge Indicator (required)	Defines if there is a charge associated with the call. Possible values: • None Used for backward compatibility or test calls with no charge indicator. • No Charge The call is not charged. • Charge The call is charged.
Default CPC (optional)	The default Calling Party Category to use for this trunk group
Default OLIP (0255) (required)	The default Originating Line Information Parameter digits (Infodigits) to associate with calls coming from this trunk group when the inbound call IAM message does not contain an OLIP value. This indicates the call source (prison, payphone, etc.) to upstream switches.
Dial Plan Profile (optional)	The dial plan profile used for this trunk group. Use this profile to enforce standard dialing rules.
In DM/PM Rule (optional)	Digit manipulation/Parameter manipulation rule applied to the calling party and/or called party digits when calls for calls received on this trunk group.
JIP (required)	The default Jurisdiction Information Parameter for this access trunk group. This defines the jurisdiction (NPANXX) of the trunk group to upstream switches, and applies only to Access trunks. If this is not an Access trunk group, enter 0.
NPA (required)	Default NPA applied to called numbers received on this trunk group. The system applies this only if the IAM message does not contain an NPA (for example, in 7digit dialing scenarios).
Numbering Plan (optional)	The numbering plan used for calls originating on this trunk group. The PSX includes two pre-populated numbering plans to select from or you can define your own: • NANP_ACCESS—Use this numbering plan if the calls that originate on this trunk group are North American calls (for example, if this trunk group is connected to a PBX and the PSX performs North American digit analysis of the called and calling numbers). • NANP_IXC—Use this numbering plan if calls originating on this trunk group are IXC calls (for example, if the trunk group is connected to another switch which has already performed North American digit analysis). • User Defined
Overlap Dialing (optional)	Select to enable overlap dialing on this trunk group

Field	Definition
TNS Circuit Code Based Routing (optional)	Select the check box to enable Transit Network Selection (TNS) circuit-based routing on this trunk group. If G.394 signaling is used, the TNS parameter is sent in the signaling. The TNS parameter includes the circuit code. The circuit code contains information that identifies a call as an international call or other network specific call type. The far-end IXC switch can perform routing based on the TNS parameter.
Egress Charge Indicator (optional)	See Charge Indicator
Out DM/PM Rule (optional)	The outbound digit manipulation/parameter manipulation rule applied to the calling party and/or called party digits before the system routes calls out on this trunk group.
Billing Plan (optional)	The Billing Plan for this trunk group.
Billing Information (optional)	The Billing Profile for this trunk group.
Default Billing Number (optional)	The Billing Number for this trunk group.
Billing NOA (required)	The Nature of Address used when the PSX derives the Billing Number from the trunk group.
Billing NPI (required)	The Numbering Plan Indicator to be used when the system derives the Billing Number from the trunk group.
Calling Party (optional)	The default calling party number for calls originating on this trunk group. The PSX uses this value only if the IAM message does not provide the calling party number.
Calling Party NOA (required)	The Nature of Address when the system derives the Calling Party Number from the trunk group.
Calling Party NPI (required)	The Numbering Plan Indicator used when the system derives the Calling Party Number from the trunk group.
CPN Presentation (required)	Specifies the presentation method used for the calling party number (CPN) for calls originating on this trunk group. • None • Allowed • Number Unavailable • Restricted • Spare

Field	Definition
CPN Screening (required)	Specifies the screening method used for the calling party number (CPN) for calls originating on this trunk group. • None • Network Provided Not Screened • User Provided Failed Network Screening • User Provided Not Screened • User Provided Passed Network Screening
Default CPN Presentation (required)	Specifies the default presentation method used for the calling party number (CPN) for calls originating on this trunk group. • None • Allowed • Number Unavailable • Restricted • Spare
Business Group from CLI (Calling Line ID) (optional)	If selected, the PSX obtains the business group ID from the calling line identification (CLID) number provisioned on the Business Group Subscriber screen for calls from business group subscribers received on this ingress trunk group
Out of Service (optional)	Select the check box to take this trunk group out of service for egress of calls. In particular, if this check box is selected, the PSX deletes any route which includes this Trunk Group from the list of returned routes.
Do Not Use Fallback Bearer Capability (optional)	If selected, the PSX does not use this trunk group for fallback routing.
Satellite Trunk	Use this flag to designate this trunk group as a satellite trunk group.
Escaped (optional)	Specify if you wish to designate this trunk group as an escaped trunk group.
Preferred Packet Service Profile (optional)	The preferred packet service provider assigned to this trunk group.
Destination Override	Packet service profile destination override check box: • Selected—The PSX uses the egress (destination) trunk group's packet service profile. • Cleared—The PSX uses the ingress (originating) trunk group's packet service profile.

Field	Definition
Trunk Group Reservation Level 1 (optional)	When congestion has reduced number of free circuits to this setting, the system automatically applies the Selective Trunk Reservation (STR) control designated for this level.
Trunk Group Reservation Level 2 (optional)	See Trunk Group Reservation Level 1 above.
Screening	Defines the type of screening. Select one of the following: • Not Screened • Screened Normal • Screened Fraud
Class of Service ID (optional)	Enables you to select a trunk group class of service (COS).
Exception Profile (optional)	The Exception Profile for this trunk group.

Trunk Group Wizard ISUP Service Group

You use this window to enter information related to the creation of an ISUP service group on the GSX. If you previously created an ISUP Service Group Profile on the GSX, you can select it from the list box and wizard populates the field values with the values from the profile. You can override any profile setting by changing the value in that field. The following table provides information about the fields in this window.

Field	Description
Existing Profile (optional)	Select an existing Service Group Profile
Service Group Name (required)	Assign a name to the Service Group.
Destination PC (required)	The destination point code of the central office switch connected to this service. The range of legal values for this triplet depends upon the revision of ISUP protocol supported by this service: • ANSI1992 and ANSI1995 (0255)(0255)(0255) The field length is 8bits8bits8bits for this protocol. • ITU and ETSI2 (07)(0255)(07) The field length is 3bits 8bits 3bits for this protocol. The DPC format in the ISUP Service Group must match the LPC format of the selected SS7 node.
Operation Mode	The operational state of the ISUP service: The system automatically sets this field to in service and can not be edited.
Signaling Profile (optional)	The name of the ISUP signaling profile to apply to this ISUP service.

Field	Description
Proto Revision (optional)	The ISUP protocol revision supported for this ISUP service: Options are: • ansi1992 Use this protocol if this ISUP service connects to either a dms or an ess SWITCHTYPE. • ansi1995 • ansiatt • argentina • argentinaidt • belgacom • brazil • chile • chinacnc • denmarkic • etsi2 use for Germany and Netherlands • etsi2plus • etsi3 • hongkongic • india • israel • italy • itu1988 • itu1993 • itu1997 • ituq767 Same as etsii (has been renamed) • korea • mexicoic • nttcom NTT Communications protocol for Japan • nttfcc For Japan • portugaloni • singapore • spain • spirou • ukisup
Hunt Algorithm (optional)	The hunting method used to select circuits for calls to the Service Group destination. Possible values are: • bottom2top • top2bottom • circuiti2lo • circuitlo2hi • mostnleastidle • circularbottom2top • circulartop2bottom
Relative Cost (optional)	The relative cost of using the CICs configured in this service. Valid values are between 0 and 100, where a value of 100 represents the highest possible cost.

Field	Description
CIC Control (optional)	The set of CICs controlled by this GSX for the sake of resolving dualseizure scenarios. Additionally, if the HUNT parameter is set to mostnleasidle, a CIC search algorithm is also implied. • nocics — This GSX does not control the CICs in the service group. If HUNT is mostnleasidle, CIC hunting is LastInFirstOut (LIFO). • allcics — The GSX controls all CICs in the service group. If HUNT is mostnleasidle, CIC hunting is FirstInFirstOut (FIFO). • oddcics — The GSX controls odd numbered CICs (1,3,5, etc.) in this service group. If HUNT is mostnleasidle, these CICs are hunted FIFO while even numbered CICs are controlled by the remote switch and hunted LIFO. • evencics — The GSX controls even numbered CICs (2,4,6 etc.) in this service group. If HUNT is mostnleasidle, these CICs are hunted FIFO while odd numbered CICs are controlled by the remote switch and hunted LIFO
Continuity Test Frequency (optional)	Identifies the frequency of continuity test performed on each circuit. Options are: • 0 do not perform continuity test • 1 perform continuity test per call • 2 to 16 perform continuity test every nth call
Hop Count Value (required)	Defines the Hop Count Value. You must set the Hop Count State to enabled for this parameter to apply. (Valid values are between 10 and 32.) If you set a Hop Count Value, you should set the Hop Count State to enabled.
Switch Type (optional)	Defines the type of central office switch connected to this service. Options are: • lucent4ESS • lucent5ESS • dms100 • dms200 • dms250 • dms500

Field	Description
Hop Count State (optional)	Defines the Hop Count State for the Service Group. Options are: • enabled — The procedures are in effect. This state requires that the ISUP protocol revision be ANSI1992 or ANSI1995. • disabled — The procedures are not in effect. When Hop Counting is enabled: • If the GSX receives a Hop Counter parameter from the ingress leg of the call, the GSX decrements and includes the count in the outgoing IAM message. If the GSX does not receive a Hop Counter in the ingress leg of the call, the GSX includes a value in the outgoing IAM message based upon the setting in the Hop Count Value field. • If the GSX receives a Hop Counter value of zero in the ingress leg of the call, the GSX releases the call with a cause of "exchange routing error". When Hop Counting is disabled: • If the GSX receives a Hop Counter parameter from the ingress leg of the call, the GSX passes it transparently in the outgoing IAM message. • If the GSX receives a Hop Counter value of zero in the ingress leg of the call, the GSX releases the call with a cause of "exchange routing error"
Disconnect Treatment Profile (optional)	Defines the Disconnect Treatment Profile used to map a disconnect reason code to a Disconnect Signaling Sequence Profile (SSP) for the ISUP service.
Tone Package (optional)	The name of a tone package used by the ISUP service.
GRS at Startup (optional)	Specifies whether to issue the GroupReset (GRS) message on all circuits when initializing the CNS module. All circuits that belong to the ISUP service controlled by the module receive the GRS message. If GRS is not supported, individual RSC messages will be issued on CNS restart. • unsupported — do not issue the GRS message on startup • supported — issue the GRS message on startup
Exchange Type (optional)	Specifies the Exchange Type to which this service applies: • none • typeA — single user services. • typeB — services that affect multiple users
Acc L1 AR Cancel (%) (optional)	Defines the Automatic Congestion Control (ACC) Level 1 (L1) Alternate Routed (AR) Cancel Percentage. If a congested condition occurs, the GSX releases this percentage of alternaterouted calls.

Field	Description
Acc L1 DR Cancel (%) (optional)	Defines the Automatic Congestion Control (ACC) Level 1 (L1) Direct Routed (DR) Cancel Percentage. If a congested condition occurs, the GSX releases this percentage of directrouted calls. A direct routed call is a call that first arrives to a service group for routing, but the GSX has not attempted a retry.
Acc L2 AR Cancel (%) (optional)	Defines the Automatic Congestion Control (ACC) Level 2 (L1) Alternate Routed (AR) Cancel Percentage. If a congested condition occurs, the GSX releases this percentage of alternaterouted calls.
Acc L2 DR Cancel (%) (optional)	Defines the Automatic Congestion Control (ACC) Level 2 (L1) Direct Routed (DR) Cancel Percentage. If a congested condition occurs, the GSX releases this percentage of directrouted calls. A direct routed call is a call that first arrives to a service group for routing, but the GSX has not attempted a retry.
Acc L3 AR Cancel (%) (optional)	Defines the Automatic Congestion Control (ACC) Level 3 (L1) Alternate Routed (AR) Cancel Percentage. If a congested condition occurs, the GSX releases this percentage of alternaterouted calls.
Acc L3 DR Cancel (%) (optional)	Defines the Automatic Congestion Control (ACC) Level 3 (L1) Direct Routed (DR) Cancel Percentage. If a congested condition occurs, the GSX releases this percentage of directrouted calls. A direct routed call is a call that first arrives to a service group for routing, but the GSX has not attempted a retry.
Acc Resp Process (optional)	Sets the Automatic Congestion Control (ACC) Response Process to disabled or enabled. • disabled • enabled When you enable ACC response handling for the service group, and the remote node has indicates a congested (by use of the ACL parameter) state, calls destined to go out the trunk group are set to SKIP (try alternate route) or CANCEL (release the call) depending on the other ACC parameter settings.
Acc Send Acl (optional)	Specifies the maximum ACL value sent to a remote node for this ISUP Service Group. Valid values are between 0 and 3 where 0 disables ACC.

Field	Description
Inspection Time (optional)	Inspection time, specified in datetime format. The INSPECTION parameters provide a method of configuring automatic, regular testing and synchronization of call and maintenance states on all circuits in the ISUP service group. INSPECTION TIME specifies the first datetime at which inspection will occur. Specified in universal octet datetime format. For example, to represent Tuesday May 26, 1992 at 1:30:15 PM EDT, you would specify: 1992526,10:30:15.0,4:0
Inspection Frequency (optional)	Inspection frequency: • onehour • threehours • sixhours • twelvehours • oneday • twodays The default inspection frequency is once per day. The GSX calculates the datetime for each inspection based upon the initial INSPECTION TIME and the frequency. This method maintains the correct frequency and timing even if the GSX has been rebooted.
Inspection State (optional)	Enables or disables circuit inspections
Gateway Outage (optional)	Specifies whether the ISUP service group attempts to keep active calls if the gateway disconnects: Option are: • keepCalls — preserve calls • removeCalls — release calls
OLIP Check (optional)	This setting determines if the GSX performs an Originating Line Information Parameters (OLIP) check on arriving calls with a Charge Number and a Calling Party Number. Options are: on — check for OLIP and reject call if not present off — do not check for OLIP
Info Request Profile	Name of the INR INF profile used by this ISUP service. This name is identical to the name of the ISUP signaling profile used by this ISUP service. This profile specifies the information the system requests if it is not received in the IAM. The GSX provides a default INR INF profile for each ISUP revision.

Field	Description
Satellite Circuits	Specifies whether the circuits in the service group are connected to a satellite: • enabled — circuits are connected to a satellite • disabled — circuits are not connected to a satellite
CLLI Town Code	Specifies the town code used in the CLLI parameter for ANSI GR317 circuit validation test failure. Must be a four character string, default is "0000".
CLLI State Code	Specifies the state code used in the CLLI parameter for ANSI GR317 circuit validation test failure. Must be a two character string, default is "00".
CLLI Building Code	Specifies the building code used in the CLLI parameter for ANSI GR317 circuit validation test failure. Must be a two character string, default is "00".
CLLI Building SubDivision Code	Specifies the building subdivision code used in the CLLI parameter for ANSI GR317 circuit validation test failure. Must be a three character string, default is "000".
Cluster Routing (optional)	Specifies whether this DPC supports cluster routing (also known as member routing). The options are: • supported • unsupported
Sending OLIP Check (optional)	This field turns OLIP checking on or off. When a call with a Charge Number and a Calling Party Number is sent, by default the GSX checks for Originating Line Information Parameters (OLIP) and rejects the call if they are not present. You may wish to disable OLIP checking for certain switches that do not supply OLIP information: • on — check for OLIP • off — do not check for OLIP This check applies only when the GSX, acting as an originating exchange, sends an IAM, the call ingress is nonANSI, and the call egress is ANSI.

Field	Description
Confirmation Tone Name (optional)	Specifies a confirmation tone to play when answering the ISUP call (prior to media cut through). You must configure the confirmation tone as part of the ISUP service group's TONE PACKAGE. Typically, a calling PBX uses a confirmation tone to begin billing.
Alert Tone Name (optional)	The name of a tone type to play on the ingress call when the egress side of the call received an ALERTING message. This may be a ring back tone.
Min Digit for Sending DS Query (optional)	Specifies the minimum number of CalledAddress digits to collect before attempting a route query, when overlap addressing is supported and CalledAddress receive is not complete. The valid range is between 0 and 30 with a default value of 0 (digits).
Confirmation Tone Override (optional)	Specifies support for subscriber level confirmation tone: • supported — a confirmation tone plays for all ingress calls. • unsupported — (default) use the Calling Party Subscriber screen on the PSX to activate the confirmation tone.
Answer Supervision Timeout in Seconds (optional)	If you enable answer supervision, this value specifies the timeout period, in seconds, from the egress receiving the first backwards message from the called party exchange (Call Proceeding, Alerting, Call Progress) until the call is answered. The expiration of the timeout period triggers the answer supervision action specified.
Answer Supervision Timeout Action (optional)	Specifies the action to take if the answer supervision timer expires (that is, no signaled answer is received): • release (default) — release the call. • softanswer — answer the call.
Cut thru Override ACM Received with BCI (optional)	Specifies whether to override the protocol specific cut through direction when the ACM is received with a backward call indicator (BCI) of Interworking Encountered: • unsupported (default) — no override will occur and the protocol specific cut through controls remain in effect. • fullduplexcutthru — perform a full duplex cut through. • nocutthru — perform no cut through
Crankback Profile (optional)	The index number of the Crankback Profile to use with this ISUP service group. You must specify a Call Crankback profile index in the range 1 10. The default is 1.

Field	Description
Sequential GRS (optional)	Specifies whether to issue the Circuit Group Reset Message (GRS) in parallel or sequentially to the circuits. • unsupported — Issue the reset messages in parallel on the circuits. • supported — Reset all circuits by sequentially issuing GRS one at a time per remote point code. This may be necessary for interworking with carriers who become congested or overloaded when processing large numbers of GRS messages at once.

Trunk Group Wizard CIC

This window displays the available CIC ranges for the physical resources selected and allows you to define starting CIC assignments, circuit properties, skip strategies (optional field), starting trunk group member (optional field) and Bellcore CIC assignments for each selected physical resource.

Field	Description
Resources	A list of the physical resources selected in the previous window. To change the selected resources, use the Back button to return to the ISUP Circuits window.
Starting CIC (required)	Defines the starting CIC number for assignment. The system assigns all available channels a CIC number starting with the number entered.
Channels per Span (required)	Defines the number of channels per T1/E1 span
Mode (required)	Defines the mode (blocked or unblocked) of the new circuits
Bellcore	Checking the box indicates the use of the standard Bellcore CIC assignment strategy. Do not use this option if you plan to use a skip channel scenario.
Starting TG Member (optional)	Defines the starting index for assignment of trunk group members. The system assigns trunk group members sequentially starting at the specified index value.
Skip Channel (optional)	Defines a channel index on the resource to skip. If the resource is an E1 or contains E1s, you should use a value of 15; otherwise, leave the field blank. Do not use this option if you plan to use the Bellcore CIC assignment strategy.
Circuit Profile (optional)	Defines the use of a Circuit Service Profile previously configured on the target GSX.

Field	Description
Direction (required)	Indicates which call directions are allowed on this CIC. • Two Way Allows both inbound and outbound • One Way In Allows inbound calls only • One Way Out Allows outbound calls only.

If you need to create additional Service Groups, click the **Another** button to return to the ISUP Service Group window. After creating additional Service Groups, the CIC ranges displayed, will depend upon the Destination Point Code specified. If the DPC is the same as an existing Service Group, the CIC range displayed is for the current Service Group with allowances for CICs allocated to the original Service Group.

Renaming Trunk Groups

You can rename GSX trunk groups on Ribbon Application Management Platform (RAMP). RAMP supports renaming trunk groups on the GSX and the PSX without impacting service.

Unable to render include or excerpt-include. Could not retrieve page.

Prerequisites

- Super User [privileges](#) for **Tools** within the **Core Resources** application.
- A GSX device is registered on RAMP.
- GSX Super User or Provisioner privileges.
- PSX Read/Write privileges for Trunk Group entity.

Start

1. Log on to the [RAMP](#) GUI.
2. Navigate to **Observability > Tools > Trunk Group**.
3. Click the **Renaming** button.
4. Select the GSX from the drop-down list.
5. In the Current Name field, enter the name of the trunk group you wish to rename. The name is case-sensitive and must be exact.
6. Enter the new name for the trunk group in the **New Name** field.
7. Click the **Apply** button. Insight supplies feedback on the process in the **Status** area.

When you use this feature, Insight issues commands that perform the following tasks:

- The system renames the trunk group on the GSX. At this point, the call can be routed to both the old trunk group name and the new trunk group name.
- The system renames the trunk group on the PSX. Since the rename operation takes place on the Primary PSX, the system waits for confirmation from the primary that the information has been replicated to the replica PSXs.
- Upon confirmation of the success of the rename operation on the PSX, the system removes the old trunk group name from the GSX.

If the rename operation succeeds on the GSX, but fails on the PSX, then both trunk group names remain active on the GSX (the old name appears as an Alternate Name under the new named trunk group). Once you resolve the cause of the failure on the PSX you may manually remove the old trunk group name on the GSX using the **Clear Alternate Trunk Group Name** command in the GSX Navigator.

GSX System

Ribbon Application Management Platform (RAMP) allows you to initiate tasks containing one or more GSX commands across all managed GSX devices.

The only supported operation is **Globally Set ISUP Service Message Priority Reset On**, which issues the following CLI commands to each managed GSX devices:

```
SHOW ISUP SERVICE ALL ADMIN
CONFIGURE ISUP SERVICE ALL MESSAGE PRIORITY RESET ON
```

Prerequisites

- Super User [privileges](#) for **Tools** within the **Core Resources** application.
- A GSX device is registered on RAMP.

Start

1. Log onto the RAMP GUI.
2. Navigate to **Observability > Tools > GSX System**.
3. Select a report from the **Reports** drop-down menu. A dialog box displays
4. Select a command from the **Tasks** drop-down menu.
5. Click the **Select** button. A dialog box displays prompting you to confirm.
6. Click **OK**. The task is initiated.

Number Portability Services

In this section:

- [Mobile Number Portability](#)
 - [Deploy MNP Services](#)
 - [Endpoint URLs](#)
 - [Configuring Generic NP Service in RAMP](#)
 - [Configuring the Syniverse MNP Service](#)
 - [Configuring Telcordia MNP Service Information](#)
- [Local Number Portability](#)
 - [Bulk Data Download](#)
 - [View SSH-Keys](#)
 - [Configuring Incremental Client Management](#)
 - [Possible Errors and Troubleshooting](#)

Ribbon Application Management Platform (RAMP) supports the following Number Portability (NP) Services.

- **MNP**: MNP is for Mobile Number Portability in India and other regions. The MNP services are provided by Syniverse Mobile Clearing House (MCH), Telcordia MCH, and Generic Number Portability Clearing House (NPC). The MNP service provides the facility to retain the mobile number when the user switches to another mobile network operator. In India, Donor-led system is used to implement MNP. In this system, the user gets the Porting Authorization Code (PAC) from the current operator and proves the PAC to the new network to continue with the port process.
- **LNP Adaptor**: LNP is for local number portability for US.

Number Portability (NP) services are displayed in the RAMP GUI after deploying LNP and registering a PSX.

Ribbon Application Management Platform (RAMP) provides the following synchronization functionality to support Indian Mobile Number Portability (MNP).

Indian MNP service is supported only on Linux platform.

- Bulk Data Synchronization
- Real-time Incremental Synchronization

The above synchronization mechanisms are used to update the hosted MNP data between MCHs database and Local MNP database.

In India, the MCHs are hosted by the following two vendors:

- **Syniverse** – hosts MNP data for northern and western part of India
- **Telcordia** – hosts MNP data for southern and eastern part of India

Generic NP hosts MNP data for any region.

RAMP provides a North Bound Interface (NBI) that implements the SOAP/XML web service interfaces for both the Syniverse and Telcordia MCH to request/receive the bulk/real-time incremental data that contains the MNP data.

When RAMP requests for bulk data synchronization, the MCH creates the bulk files and notifies RAMP. RAMP will process the bulk files and provision the PSX.

The MNP data synchronization must be performed using Bulk Data Synchronization method at the first time. For Bulk Data Synchronization, you need to perform Bulk Data Download (BDD) on RAMP to get the hosted MNP data. The Bulk Data Download is classified into two types as follows:

- **Full Bulk Data Download:** Provides the snapshot of their database as on a particular date. Operators can upload this file onto PSX as part of initial setup.
- **Partial Bulk Data Download:** Provides the list of transactions for a period not exceeding a week. This contains information of ported as well as numbers which returned to their original network.

To enable MNP services, refer to [Deploy MNP Services](#).

To configure the MNP Application Management settings, refer to [MNP Services Parameters](#).

POL-LNP-STORE and RAMP-LNP-FEED-D licenses are required to use this functionality. For more information about these licenses, refer to [Node Locked Licenses on RAMP](#).

If licenses are to be associated/disassociated, MNP services should be restarted.

Deploy MNP Services

The MNP services are deployed with the LNP adaptor. MNP services along with LNP are not deployed by default.

Enable the LNP Adaptor after installing or upgrading the Ribbon Application Management Platform (RAMP).

If the LNP Adaptor is not deployed, the following message appears:

Note

If the configuration fields are set or modified, restart the MNP service.

The Local Number Portability (LNP) Adaptor is not deployed by default on the RAMP.

Start

1. SSH to RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Stop RAMP:

```
/opt/sonus/ems/emsMgmt stop
```

3. Change to the root user:

```
su - root
```

4. Deploy LNP application:

```
/opt/sonus/ems/conf/deployLNPAApplication.sh
```

5. Change to insight user:

```
sudo su - insight
```

6. Start RAMP:

```
/opt/sonus/ems/emsMgmt start
```

7. For a redundancy RAMP set-up, deploy the LNP Adaptor on RAMP active and standby nodes.

Endpoint URLs

Only the user with admin rights can access Endpoint URLs. If proper credentials are not used, the HTTP 401 error is reported.

- For Syniverse, no user credentials are required for broadcasting.
- For Telcordia, the broadcast credentials will be shared by Telcordia. The **Ribbon Application Management Platform (RAMP)** operator has to configure the given broadcast credentials in the Telcordia MNP page.
- For Generic MNP, the broadcast credentials will be shared by the **RAMP** operator to the Clearing House. Clearing House will pass these credentials.

The following tables provide endpoints information for Syniverse, Telcordia, and Generic NP.

Generic URLs

Endpoint	Information
Service name: {SonusGenericNP.xsd} sonusGeneriNPService	Address:: https://<RAMP IP address>:443/genericNP/ sonusGenericNPService
Port Name: {SonusGenericNP.xsd} sonusGenericNPServicePort	WSDL: https://<RAMP IP address>:443/ genericNP/sonusGenericNPService?wsdl

Syniverse URLs

Endpoint	Information
Service name: {MNPProtocol.xsd}mnp-service	Address:: https://<RAMP IP address>:1688/ syniverseMnp/mnp-service
Port Name: {MNPProtocol.xsd}mnp-servicePort	WSDL: https://<RAMP IP address>:1688/ syniverseMnp/mnp-service?wsdl

Telcordia URLs

Endpoint	Information
Service name: {http://ws.inpac.telcordia.com} NPCWebService	Address:: https://<RAMP IP address>:443/ telcordiaMnp/telcordiamnp-service
Port Name: {http://ws.inpac.telcordia.com} NPCWebServiceHttpSoap12Endpoint	WSDL: https://<RAMP IP address>:443/ telcordiaMnp/telcordiamnp-service?wsdl

Configuring Generic NP Service in RAMP

Generic NP provisioning is not region specific. The Generic NP service consists of the following:

- Full or partial Bulk File upload
- Partial provisioning
- Real-time Number Portability Synchronization

The initial data from the NPC is populated to each of the primary and replica PSX using the PSX BDD tool.

To provision **Ribbon Application Management Platform (RAMP)** Generic NP Service:

1. Configure the primary PSX name if more than one PSX device is registered in RAMP. Refer to [Register a PSX Device](#) for additional details.
2. Configure Generic NP Service Information.
 - a. Log on to RAMP GUI.
 - b. Navigate to **Observability > Tools > NP Services**.
The **NP Services** window displays.
 - c. Expand **Applications**.
 - d. Click **Generic NP**. The **Generic NP Service Information** pane displays.
 - e. Configure Generic NP Service Information.
 - i. Enter the URL in the **NPC Web Service URL :** field.

For example: `http://10.70.52.125:8080/mockService?WSDL`

If the Web Service URL is modified, disable Generic MNP service and enable again.

- ii. Enter the company name in the **Company Name** field.
- iii. Enter the password password in the **Password** field.
- iv. Click **Update**.

The Local Listener Status must no be **NOT LISTENING FOR BROADCAST MESSAGES FROM NPC**.

- f. Upload and provision the Partial Bulk Data file.

Only partial BDD files can be provisioned. However, complete BDD files can also be uploaded.

- i. Click **Browse** and open the bulk file on local system.
- ii. Click **Upload/Provision**.

The status changes to **PROVISIONING**. It is an asynchronous operation, as provisioning takes more time based on the data.

If provisioning is successful, the alarm [sonusEmsNPBulkProvisioningCompletedNotification](#) is raised and the status changes to **PROVISIONED**.

If provisioning fails, the alarm [sonusEmsNPBulkProvisioningFailedNotification](#) is raised and the status changes to **UPLOAD_FAILED**.

- Set the parameter **Receive Messages from Generic NPC** to True, refer to [MNP Services Parameters](#).

Configuring the Syniverse MNP Service

Related articles:

- [Bulk Data File Request for Syniverse MNP](#)

Syniverse MNP hosts MNP data for northern and western part of India.

Follow this procedure to configure Syniverse MNP Service Information on Ribbon Application Management Platform (RAMP):

Note

All the information needed for provisioning will be provided by Syniverse.

- Log on to RAMP GUI.
- Navigate to **Observability > Tools > NP Services**.
- Expand **Applications**.
- Click **Syniverse MNP**.
- Enter the URL in the **MCH Web Service URL** field.

For example: `http://<Syniverse MCH IP>:1689/mnpserver/services/mnp-service`

Note

For Syniverse, the messages from the MNP service needs to be redirected to the port 443. To enable redirection of the messages that arrive at port 1688 to the service at 443, enter the following command on RAMP as a `root` user.

```
iptables -t nat -A PREROUTING --src 0/0 --dst <RAMP IP address> -p tcp --dport 1688 -j REDIRECT --to-ports 443
```

- Provide the ID of the Syniverse MCH that you need to use in the **Syniverse MCH ID** field.
- Provide an appropriate operator ID in the **Operator ID** field.
- Click on **Update**.

Note

The Local Listener Status will be **LISTENING FOR BROADCAST MESSAGES FROM MCH** or **NOT LISTENING FOR BROADCAST MESSAGES FROM MCH**.

Bulk Data File Request for Syniverse MNP

Perform the following procedure on Ribbon Application Management Platform (RAMP) to request the bulk data file from MCH:

1. Log on to RAMP GUI.
2. Navigate to **Observability > Tools > NP Services**.
3. Expand **Applications**.
4. Click **Syniverse MNP**.
5. Select the required database type from the **Database Type** option.

Database types include Full or Partial. If the option selected is partial, mention the dates under **Date range** option. Ensure the Date range is not more than a week.

6. Click **Request Bulk File**.

On clicking **Request Bulk File**, the "Last Download Request Status" table is added with a new request **"WAITING_MCH_RESPONSE"**. Once the MCH generates the bulk file, it sends a bulk file response to RAMP. RAMP then raises a trap [sonusEmsNPBulkFileReadyNotification](#) and the status changes to **MCH_RESPONSE_RECEIVED**.

If there is an error in the request, MCH rejects the request and sends an error response. In this case, RAMP raises a trap [sonusEmsNPBulkFileRequestRejectedNotification](#). On refreshing the page the status of the request changes to **MCH_ERROR**.

Views the summary of the error from the "Detail" window of the Bulk File Request or from the "Trap Summary" of the Fault Manager.

7. Refresh the Syniverse MNP page to view the file location. The **Last Download Request Status** screen appears as shown below.

Syniverse Last Download Request Status

Last Download Request Status						
☐	Transaction ID	Type	Sent Time	Status	Received Time	File Location
☐	808-201404090459540000	FULL	2014-04-09 04:59:54.0	MCH_RESPONSE_RECEIVED	2014-04-09 05:02:03.0	DL401
☐	808-201404090500010000	PARTIAL	2014-04-09 05:00:01.0	MCH_RESPONSE_RECEIVED	2014-04-09 05:02:56.0	DL442

Bulk Data File Path:

8. The Bulk files are generated and stored in the location mentioned under **File Location** field.
9. Download the bulk files manually from MCH portal to the local system. MCH portal link and credentials will be shared by Syniverse.

MCH generates 11 *.gz files for a single bulk file request. Hence, gzip compressed tar archive (.tar.gz) of the 11 *.gz files have to be created and the .tar.gz file needs to be uploaded to RAMP.

10. Browse the downloaded bulk file on local system.
11. Upload to RAMP using **Upload/Provision** Button. The **Last Download Request Status** with the status as **Uploaded** is as shown below:

Syniverse Last Download Request Status-Uploaded

Last Download Request Status						
☐	Transaction ID	Type	Sent Time	Status	Received Time	File Location
☒	808-201404090459540000	FULL	2014-04-09 04:59:54.0	UPLOADED	2014-04-09 05:02:03.0	DL401
☐	808-201404090500010000	PARTIAL	2014-04-09 05:00:01.0	MCH_RESPONSE_RECEIVED	2014-04-09 05:02:56.0	DL442

Bulk Data File Path:

Full BDD file shall only be uploaded to RAMP. For provisioning the full BDD file to PSX, refer to [PSX Provisioning](#) documentation. After uploading, the status changes to either UPLOADED or UPLOAD_FAILED. It is a synchronous operation.

In case of Partial BDD, the status changes to **PROVISIONING**. It is an asynchronous operation, since provisioning takes more time based on the data. RAMP raises either of the two traps ([sonusEmsNPBulkProvisioningCompletedNotification](#) and [sonusEmsNPBulkProvisioningFailedNotification](#)). On refreshing the page, the status changes to either **PROVISIONED** or **PROVISIONING_FAILED**.

Configuring Telcordia MNP Service Information

Related articles:

- [Bulk Data File Request](#)

Telcordia MNP hosts MNP data for southern and eastern part of India.

Follow this procedure to configure the Telcordia MNP Service Information on Ribbon Application Management Platform (RAMP).

All the information needed for provisioning will be provided by Telcordia.

1. Log on to RAMP GUI.
2. Navigate to **Observability > Tools > NP Services**.
3. Expand **Applications**.
4. Click **Telcordia MNP**.
5. Provide the URL in the **MCH Web Service URL** field.
For example: `https://<Telcordia MCH IP>/NPCWebApp/services/NPCWebService`
6. Provide the participant ID in the **Participant ID** field.
7. Under **MCH Service Credentials**, provide the user name and password in the **User Name** and **Password** fields.
8. Under **Broadcast Validation Credentials**, provide the user name and password in the **User Name** and **Password** fields.
9. Click on **Update**.

The Local Listener Status will be **NOT LISTENING FOR BROADCAST MESSAGES FROM MCH** or **LISTENING FOR BROADCAST MESSAGES FROM MCH**.

Bulk Data File Request

Perform the following procedure on Ribbon Application Management Platform (RAMP) to request the bulk data file from MCH.

1. Log on to RAMP GUI.
2. Navigate to **Observability > Tools > NP Services**.
3. Expand **Applications**.
4. Click **Telcordia MNP**.
5. Select the required database type from the **Database Type** option.
6. Click **Request Bulk File**.

On clicking **Request Bulk File**, the “Last Download Request Status” table is added with a new request “**WAITING_MCH_RESPONSE**”. Once the MCH generates the bulk file, it sends a bulk file response to RAMP. RAMP then raises a trap “sonusEmsNPBulkFileReadyNotification” and the status changes to **MCH_RESPONSE_RECEIVED**.

If there is an error in the request, MCH rejects the request and sends an error response. In this case, RAMP raises a trap “sonusEmsNPBulkFileRequestRejectedNotification”. On refreshing the page the status of the request changes to **MCH_ERROR**. The summary of the error can be viewed in Detail window of the Bulk File Request or in Trap Summary in Fault Manager.

7. Refresh the Telcordia MNP page to view the file location. The **Last Download Request Status** screen appears as shown below.

Bulk Data File Path:

Full BDD file shall only be uploaded to RAMP. For provisioning the full BDD file to PSX, refer to [PSX Provisioning](#) documentation. After uploading, the status changes to either `UPLOADED` or `UPLOAD_FAILED`. It is a synchronous operation.

In case of Partial BDD, the status changes to **PROVISIONING**. It is an asynchronous operation, since provisioning takes more time based on the data. RAMP raises either of the two traps (`sonusEmsNPBulkProvisioningCompletedNotification`, `sonusEmsNPBulkProvisioningFailedNotification`). On refreshing the page, the status changes to either **PROVISIONED** or **"PROVISIONING_FAILED"**.

Local Number Portability

Related articles:

- [Bulk Data Download](#)
- [View SSH-Keys](#)
- [Configuring Incremental Client Management](#)
- [Possible Errors and Troubleshooting](#)

The Local Number Portability (LNP) Adaptor synchronizes and sends LNP data received from the National Portability Administration Center (NPAC) at multiple locations simultaneously. NPAC, the national database, contains the routing information for all ported and pooled numbers in the US and Canada. NPAC supports Local Number Portability (LNP) across service providers.

The PSX is the repository for the LNP data received from NPAC. [Ribbon Application Management Platform \(RAMP\)](#) receives the LNP data from NPAC via the SIP-IX interface. RAMP parses and provisions the LNP data into the PSX Primary using the PIPE interface. The PSX-Replica stores this data in its database. Refer to [Hosted LNP Service](#).

Ribbon supports incremental LNP updates over SOAP from NPAC and offline bulk data download (BDD) files. You can add multiple NPAC servers on RAMP to support BDD and Incremental Synchronizer Management.

RAMP receives the first LNP data snapshot in the form of an initial BDD file. An administrator can download the BDD file from RAMP. The BDD file is available on RAMP until the operator deletes it.

The BDD files are stored on RAMP at `opt/sonus/ems/weblogic/sonusEms/data/lnp/`. The file is carried forward during release upgrades.

You can add and delete NPAC servers on RAMP and download and synchronize LNP data from all the servers.

The LNP Adaptor object tree contains the following node objects:

- Bulk Data Download
- Incremental Client Management

POL-LNP-STORE and RAMP-LNP-FEED licenses are required to use this functionality. For more information about these licenses, refer to [Node Locked Licenses on RAMP](#).

Bulk Data Download

Bulk data download is covered in this section.

Prerequisites

For Ribbon Application Management Platform (RAMP) on cloud, perform the FTP on the PSX as the insight user. To log on to the RAMP as the insight user, change the insight password. Refer to [Change Linux Insight User Password on RAMP Standalone](#).

Start

To download BDD file from the external FTP server:

1. Log on to the [RAMP GUI](#).
2. Navigate to **Observability > Tools > NP Services**.
The **NP Services** window displays.
3. From the **Applications** object tree, select **Bulk Data Download**. The **LNP Adaptor - Bulk Data File FTP Download** pane displays.
4. Click the **Add NPAC** button. The **Add NPAC** pane displays.
5. In the **Bulk Data File Path** field, enter the bulk data file path.
6. In the **FTP Server IP Address** field, enter the FTP server IP Address to download the bulk data file.
7. In the **FTP Server User Name** field, enter the FTP server user name.
8. Perform one of the following:
 - To use SSH-Key authentication, select the **SSH-Key** tab. Refer to [View SSH-Keys](#).
 - To use Password authentication:
 - i. Select the **Password** tab.
 - ii. In the **FTP Server Password** field, enter the FTP server password.
9. Click **Download**. The BDD files are downloaded.

After successful BDD file download, the Download Status displays as COMPLETED and the Last Transaction ID is displayed. For more information, refer to [BDD parameters](#).

Note

The BDD files occupy additional disk space which can slow down RAMP. Before initiating BDD, delete the files in the following folders:

- `/opt/sonus/ems/weblogic/sonusEms/data/lnp/tmp/<NPAC ID>`
- `/opt/sonus/ems/weblogic/sonusEms/data/lnp/final/<NPAC ID>`

The NPAC ID is created automatically when BDD is initiated through the RAMP GUI.

The files required by the PSX are located in the directory `/opt/sonus/ems/weblogic/sonusEms/data/lnp/final/<NPAC ID>`.

Save these files in another location for future use.

BDD Parameters

Field	Definition
Bulk Data File Path	The bulk data file path to download the BDD file.
FTP Server IP Address	The FTP server IP address to download the bulk data file.
FTP Server User Name	The FTP server user name.
FTP Server Password	The FTP server password.
Authentication Type	The FTP authentication method. Select one of the following: • SSH-Key: To use SSH-Key authentication. • Password: To use Password authentication.
FTP Server Password	The parameter is applicable only if the Authentication Type is set as password.
Last Download Request Status	The download status and the last transaction ID. After a successful BDD file download, the last transaction ID displays. This ID is generated only if the status is COMPLETE. Status messages during download: • NOT STARTED: Download is yet to start. • IN PROGRESS: Download operation is still in process. • DOWNLOAD ERROR: Error during download. • PARSE ERROR: Package download is completed, but there is an error while obtaining the last transaction ID. For obtaining the last transaction ID, refer to PARSE_ERROR. • COMPLETED: BDD files are downloaded and the last transaction ID is obtained. • FILE_NOT_FOUND: File is not available on the FTP server.

View SSH-Keys

Share the SSH keys and Ribbon Application Management Platform (RAMP) IP address with the NPAC third-party administrator before downloading the LNP file. For (RAMP redundancy, share the IP addresses and SSH keys of the active and standby nodes.

To view SSH keys:

1. Log on to the RAMP GUI.
2. Navigate to **Monitoring > Tools > NP Services**. The **NP Services** pane displays.
3. From the **Applications** object tree, select **Bulk Data Download**. The **LNP Adaptor - Bulk Data File FTP Download** pane displays.
4. Click the **SSH Keys** button. The SSH Keys dialog box displays.
5. Click the **Copy** button to copy the SSH keys.

Configuring Incremental Client Management

The Ribbon Application Management Platform (RAMP) receives periodic updates from NPAC. Configure Incremental Client Management for periodic download.

To configure Incremental Client Management for periodic download of the LNP data:

Note

The incremental feed can be enabled only after the LNP BDD data has been loaded to all the PSX devices. Refer to [Hosted LNP Service](#).

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Tools > NP Services**. The **NP Services** pane displays.
3. From the **Applications** object tree, select **Incremental Synchronizer Management**. The **LNP Adaptor - Incremental Synchronizer Management** pane appears.
4. In the **Web Services URL** field, enter the URL to access the Web Service.
5. In the **Context** field, enter the context to access the NPAC server.
6. In the **Synchronization Interval** drop-down menu, select an interval.
7. In the **Last Synchronized Transaction ID** field, enter the transaction ID.
8. Click **Start**.

The NPAC servers are synchronized with RAMP to periodically download LNP data from for the NPAC servers.

Note

Click **Reschedule** to reschedule the incremental synchronizer.

Click **Stop** to terminate the process.

NPAC parameters for Incremental Synchronizer Management

Field	Description
Web Services URL	The URL to access the Web Service.
Context	The context to access the NPAC server. This parameter is used for authorization of incremental synchronization requests from RAMP. Enter the value "ribbon".
Synchronization Interval	The interval for synchronizing the LNP data interval.
Manually override Transaction Id	The BDD is initiated from the PSX. Manually override and enter the ID when a BDD is initiated on the PSX using BDD Command Center Tool and incremental synchronizer is run on RAMP. The ID is obtained from the BDD file name. The transaction ID is the last value in a BDD file name. For example: In <i>ne.sv_BDD_PSTN_17-02-2015092157.21846810.bdd</i>, the transaction id is <i>21846810</i>. For more information on how BDD is initiated from the PSX, refer to Starting the BDD Command Center Tool and BDD Command Center Tool Menu Options.

Field	Description
Last Synchronized Transaction ID	The last transaction ID is obtained from the BDD file or from the last periodic synchronization interval based on how the BDD is initiated. BDD is initiated from RAMP. Obtain the last transaction ID from Last Download Request Status window, refer to Bulk Data Download. Note Last Transaction ID is visible only if Last Download Request Status is displayed as Complete.
Synchronization Status	Displays the synchronization status. It displays the Client Status, Last Synchronized Transaction Identifier, and Last Successful Synchronization Time.
Locked by Insight	Releases the synchronization if locked by RAMP.

Possible Errors and Troubleshooting

The following section provides information on possible errors on Ribbon Application Management Platform (RAMP) and actions that you can take to rectify the situation.

PARSE_ERROR

- The package download is complete, but there is an error while obtaining the last transaction ID.

To obtain the last transaction ID, perform the following procedure:

- SSH to RAMP.
- Navigate o the directory to `/opt/sonus/ems /weblogic/sonusEms/data/lmp/tmp/`.
- Extract the tar containing BDD files.
- Move `*SV*BDD` and `*BLOCK*BDD` files to `/opt/sonus/ems/weblogic/sonusEms/data/lmp/final/`.

These BDD file names contain last transaction ID.

The BDD file names for LNP data use the following format:

```
<Region>.<BDD_type>_BDD_PSTN_<DD-MM-YYYYHHMMSS>.<TRANS_ID>
```

For example:

```
mw.lrn_BDD_PSTN_26-05-2009212322.1000074.bdd
```

The last transaction ID in the example is 1000074 and it is used for starting incremental changes.

- Use this transaction ID to start incremental changes by overriding last transaction ID.

Joint Interoperability Test Command

In this section:

- [Workflow to Deploy JITC on RAMP](#)
- [Update the Configuration File for JITC](#)
- [Configure RAMP GUI to Comply with JITC](#)
- [Configure RAMP for TLS Communication](#)
- [Configure NTP Server Authentication](#)

The Ribbon Application Management Platform (RAMP) supports Joint Interoperability Test Command (JITC) / Federal Information Processing Standard (FIPS) and Security Technical Implementation Guidelines (STIGs). JITC is the Department of Defence's joint interoperability compliance test agency for information technology.

For RAMP to support JITC/FIPS, enable the FIPS and STIG parameters when you install RAMP. Perform the steps outlined in the [Workflow to Deploy JITC on RAMP](#) to enable and configure RAMP for JITC/FIPS.

Note

- To disable JITC/FIPS in RAMP, re-install RAMP again, without enabling the FIPS/JITC parameters.
- If JITC/FIPS is disabled in RAMP, all registered devices are supported.
- Migration from EMS to FIPS/ JITC-enabled RAMP is not supported.
- To upgrade, perform the regular delete/ create procedures and enable the JITC/ FIPS during the installation.

Note

RAMP with JITC/FIPS enabled does not facilitate direct upgrades.

- RAMP CNF does not support JITC/FIPS.

Workflow to Deploy JITC on RAMP

Perform the following steps to enable, configure, and use Joint Interoperability Test Command (JITC) / Federal Information Processing Standard (FIPS) and Security Technical Implementation Guidelines (STIGs) on the Ribbon Application Management Platform (RAMP).

Start

Step	Action
1	Manually install RAMP based on your deployment model: • Installing RAMP on VMware Manually. • Installing RAMP on KVM Manually. Note When you are updating the configuration file, refer to Update the Configuration File for JITC.

Step	Action
2	Configure RAMP GUI to Comply with JITC.
3	Configure RAMP for TLS Communication.
4	Enable the remote syslog server. For more information, refer to Exporting Logs to a Remote Syslog Server .
5	Change the default passwords.
6	Update the certificates.
7	Configure local and external authentication of admin users. Note • The minimum password length for a JITC/FIPS enabled RAMP is 15 alphanumeric characters. • Enable the Password Aging threshold parameter field and set it to 60 days.
8	For local accounts, enable Force Password Change on initial login. For more information, refer to Add Users .
9	Set the User Timeout Session to 10 minutes using Set Session Expiry in RAMP GUI .

Step	Action
10	Disable SOAP API settings. 1. Disable to PSX SOAP API Settings: Note Set anything with Deploy PSX version X.X.X as False. This is to ensure that none of the PSX SOAP APIs are deployed. For more information, refer to Application Configuration EMS API Parameters. 2. Disable SGX SOAP API Settings Note ◦ Set Deploy version 5.2.1 to False. ◦ Disable SGX SOAP API settings. For more information, refer to Application Configuration SGX API Parameters.
11	Set the disk usage threshold to 75%. For more information, refer to Create a Threshold. Use the following values: • Node Type: RAMP • Category: InsightFsUsageStats • Name: USAGE • Trigger value: 75 • Clearing value: 65 • Severity: MAJOR • Notify on clearing threshold crossed: ON • Enabled: ON Note When the file system usage crosses 75% an alarm is raised. It is automatically cleared when the usage drops to 65% and less.
12	Take a Backup of RAMP.
13	Network Time Protocol (NTP) server authentication: Add NTP Servers. NTP server authentication: Configure NTP Server Authentication.

Step	Action
14	For RAMP to support JITC/FIPS, enable SNMPv3 on the PSX and SBC devices. Refer to Register a PSX Device and Register an SBC Core Device. Use the following values to update the SNMPv3 settings: • SNMPv3 Security Level: AuthNoPriv • SNMPv3 User: <username> • SNMPv3 Authentication Protocol: SHA • SNMPv3 Auth Passphrase: <passphrase> • SNMPv3 Privacy Protocol: AES • SNMPv3 Privacy Passphrase: <passphrase> Note AES128 and SHA are used.
15	To temporarily disable remote access, refer to How to Start and Stop RAMP .

Update the Configuration File for JITC

Update the configuration file to deploy an instance of the Ribbon Application Management Platform (RAMP) on the Kernel Virtual Machine (KVM) for Joint Interoperability Test Command (JITC). RAMP uses the values in this file during installation.

Start

1. Log on to the KVM host as a `root` user.
2. Navigate to the directory in which the `qcow2` and `configDriveImgDeployment.img` files are downloaded.
3. Create a temporary mount directory:

Example

```
mkdir -p /tmp/vmconf
```

4. Mount the `configDriveImgDeployment.img` file in the temporary mount directory:

```
mount -o loop configDriveImgDeployment.img /tmp/vmconf
```

Note

Use a different mount directory to create multiple instances of KVM and create a `configDriveImgDeployment.img` file for each instance.

5. Modify the `configDriveImgDeployment.img` file for your deployment using the values in the following table:

```
vim /tmp/vmconf/user-data
```

user-data Parameters

Key Name	Description	Mandatory (M)/Optional (O)	Example Value
timezone	Specifies the time zone for your network in which the VM is created.	M	Asia/Kolkata
ntpServer	Specifies the NTP server IP address, if applicable. To add multiple NTP servers (up to 5 are allowed), enter the NTP server IP addresses in the following format: servers: ◦ \$ntpServer1 ◦ \$ntpServer2 ◦ \$ntpServer3 ◦ \$ntpServer4 ◦ \$ntpServer5	M	servers: ◦ 10.128.254.67 ◦ 10.128.254.68 ◦ 10.10.211.119
dnsServer	Specifies the IP address of the DNS server.	O	IPV4: 10.128.254.67 IPV6: 0:0:0:0:ffff:c0a8:101
dnsSearchPath	Search path for the DNS server.	O	rbbn.com
InstanceName	Specifies the RAMP instance or virtual machine (VM) name. The <code>InstanceName</code> criteria: ◦ Uppercase or lowercase letters [a-z], [A-Z]. ◦ Digits [0-9]. ◦ Do not begin the name with a digit. ◦ Do not use special characters, including the hyphen.	M	rampSA

Key Name	Description	Mandatory (M)/Optional (O)	Example Value
EnableFips	Enter Y to enable FIPS while installing RAMP for JITC. The options are: ◦ Y: enable FIPS. ◦ N: disable FIPS. By default FIPS is disabled.	M	N/A
EnableStig	Enter Y to enable STIG while installing RAMP for JITC. The options are: ◦ Y: enable STIG. ◦ N: disable STIG. By default STIG is disabled.	M	N/A

Key Name	Description	Mandatory (M)/Optional (O)	Example Value														
stigIDs	The variable specifying the application impacting STIGs: Update the following STIG IDs in the configuration drive based on your requirements:	M	N/A														
	<table><tr><th>STIG-ID</th><th>Description</th></tr><tr><td>V230313</td><td>RHEL 8 must disable core dumps for all users.</td></tr><tr><td>V230496</td><td>RHEL 8 must disable the stream control transmission protocol (SCTP).</td></tr><tr><td>V230384</td><td>RHEL 8 must set the unmask value to 077 for all local interactive user accounts</td></tr><tr><td>V230344</td><td>RHEL 8 must include root when automatically locking an account until the locked account is released by an administrator when three unsuccessful logon attempts occur during a 15-minute time period.</td></tr><tr><td>V237643</td><td>RHEL 8 must require re-authentication when using the "sudo" command.</td></tr><tr><td>V230489</td><td>RHEL 8 must not have the <code>sendmail</code> package installed.</td></tr></table>			STIG-ID	Description	V230313	RHEL 8 must disable core dumps for all users.	V230496	RHEL 8 must disable the stream control transmission protocol (SCTP).	V230384	RHEL 8 must set the unmask value to 077 for all local interactive user accounts	V230344	RHEL 8 must include root when automatically locking an account until the locked account is released by an administrator when three unsuccessful logon attempts occur during a 15-minute time period.	V237643	RHEL 8 must require re-authentication when using the "sudo" command.	V230489	RHEL 8 must not have the <code>sendmail</code> package installed.
	STIG-ID			Description													
	V230313			RHEL 8 must disable core dumps for all users.													
	V230496			RHEL 8 must disable the stream control transmission protocol (SCTP).													
	V230384			RHEL 8 must set the unmask value to 077 for all local interactive user accounts													
	V230344			RHEL 8 must include root when automatically locking an account until the locked account is released by an administrator when three unsuccessful logon attempts occur during a 15-minute time period.													
	V237643			RHEL 8 must require re-authentication when using the "sudo" command.													
V230489	RHEL 8 must not have the <code>sendmail</code> package installed.																

Key Name	Description		Mandatory (M)/Optional (O)	Example Value			
	<table><tr><th>STIG-ID</th><th>Description</th></tr><tr><td>V244545</td><td>RHEL 8 must enable Fapolicy module configurations to employ a deny-all, permit-by-exception policy to allow the running of authorized software programs.</td></tr></table>	STIG-ID	Description	V244545	RHEL 8 must enable Fapolicy module configurations to employ a deny-all, permit-by-exception policy to allow the running of authorized software programs.		
STIG-ID	Description						
V244545	RHEL 8 must enable Fapolicy module configurations to employ a deny-all, permit-by-exception policy to allow the running of authorized software programs.						
IF1							
GWV4	NOTE: This parameter is applicable only if you are creating a RAMP VM in an IPv4 network. The gateway IP address from the available network pool in IPv4. "1" indicates the interface number.	M	192.168.1.1				
IPV4	NOTE: This parameter is applicable only if you are creating a RAMP VM in an IPv4 network. The fixed management IPv4 address for the interface. ◦ IF1Ipaddr is the IP address of eth0 ◦ IF2Ipaddr is the IP address of eth1	M	192.168.1.7/24				
GWV6	NOTE: This parameter is Mandatory if RAMP is configured as IPV6. The gateway IP address from the available network pool in IPV6. "101" indicates the interface number	O/M	0:0:0:0:ffff:c0a8:101				

Key Name	Description	Mandatory (M)/Optional (O)	Example Value
IPV6	NOTE: This parameter is Mandatory if RAMP is configured as IPV6. The fixed management IPv6 address for the interface and netmask. ◦ IF1paddrv6 is the IP address of eth0 ◦ IF2lpaddrv6 is the IP address of eth1	O/M	0:0:0:0:ffff:c0a8:107/64
Port	The network port number for the interface. The interface numbering is in the following pattern: ◦ eth0 ◦ eth1 ◦ eth2	M	eth0

Example of an Input File

```
#cloud-config
timezone: "Asia/Kolkata"
ntp:
  enabled: true
  ntp_client: chrony
  config:
    conffpath: /etc/chrony.conf
    check_exe: chronyd
    packages:
      - chrony
    service_name: chronyd
    template: |
      ## template:jinja
      # My NTP Client config
      {%- if servers %}# servers
      {% endif %}
      {% for server in servers -%}
      server {{server}} iburst
      {% endfor %}
  servers:
    - 10.xx.xx.xx
    - $ntpServer2
    - $ntpServer3
    - $ntpServer4
    - $ntpServer5
```

```

manage_resolv_conf: true
resolv_conf:
  nameservers: ['$dnsServer']
  searchdomains:
    - $dnsSearchPath
write_files:
  - path: /opt/rbbn/userData.json
    permissions: '0644'
    content: |
      {
        "IF1": {"GWV4": "10.xx.xx.1", "IPV4": "10.xx.xx.xx/24", "Port": "eth0"},
        "IF2": {"GWV4": "", "IPV4": "/", "Port": ""},
        "growpart": { "opt" : 60, "pgsql": 30, "home": 10},
        "InstanceName": "rampinstance1",
        "EnableFips": "Y",
        "EnableStig": "Y",
        "stigIDs" : ["V230313", "V230344", "V237643", "V230489", "V230496", "V230384", "V244545"]
      }
    owner: root:root
  runcmd:
    - usermod -p '$1$admin$1kgWpnZpUx.vTroWPXPIB0' admin

```

You can enable just FIPS alone without STIGs by adding "EnableFips" = "Y" entry alone in the user-data file

6. Save and close the configuration file.
7. Unmount the image:

```
umount /tmp/vmconf
```

8. Delete the temporary mount point:

```
rm -rf /tmp/vmconf
```

9. Return to the workflow on [Installing RAMP on KVM Manually](#).

Configure RAMP GUI to Comply with JITC

In this section:

- [Create an Interface for Client Certificate](#)
- [Create and Sign the Certificate Authority, Server Certificate, and Client Certificate](#)
- [Customize the Logon Banner](#)
- [Install Certificates on RAMP and the Browser](#)
- [Log on to JITC Enabled RAMP](#)

Related topics:

- [Joint Interoperability Test Command](#)
- [Workflow to Deploy JITC on RAMP](#)
- [Update the Configuration File for JITC](#)
- [Manually Enable or Disable FIPS/JITC and STIG](#)

Perform the following procedures to configure the Ribbon Application Management Platform (RAMP) to comply with the Joint Interoperability Test Command (JITC) / Federal Information Processing Standard (FIPS):

Create an Interface for Client Certificate

Prerequisites

For the list of user and roles administration, refer to [Authentication and Authorization information on User Privileges in RAMP](#).

Start

1. Log on to the RAMP GUI using `admin/admin` as the username and password.
2. Navigate to **Management > Authentication & Authorization > Users**. The **Users** window displays.
3. Click **+ Add User** to create a new user. For more information on creating a new user, refer to [Add Users](#).

Note

Ensure the created user name and the name of the client certificate are identical.

Create and Sign the Certificate Authority, Server Certificate, and Client Certificate

Use the following procedure to create certificates on RAMP:

Note

Replace all occurrences of `"ramp-client-cert-user-name"` with your RAMP client certificate user name and `"emailAddress"` with your email address.

1. Log on as a `root` user.
2. Create a common directory for all the certificates:

```
sudo su -
cd /etc/httpd/conf
mkdir jitc
cd jitc
```

3. Generate the Certificate Authority (CA) for `cakey.pem` and `cacert.pem`:

```
openssl genpkey -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -pkeyopt
rsa_keygen_pubexp:65537 -out cakey.pem
openssl req -new -x509 -key cakey.pem -out cacert.pem -days 1095 -subj '/C=US/
ST=MA/L=Westford/O=Ribbon/OU=Ribbon CA/CN=ramp-client-cert-user-name/
emailAddress=admin@rbbn.com'
```

4. Generate the server key and request:

```
openssl genpkey -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -pkeyopt
rsa_keygen_pubexp:65537 -out rampKey.pem
openssl req -new -key rampKey.pem -out rampreq.csr -subj '/C=US/ST=MA/L=Westford/
O=.Ribbon/OU=.Ribbon CA/CN=ramp-client-cert-user-name/emailAddress=admin@rbbn.com'
```

5. Sign the server certificate:

```
cp cakey.pem /etc/pki/CA/private/
cp cacert.pem /etc/pki/CA/
touch /etc/pki/CA/index.txt
echo 02 > /etc/pki/CA/serial
openssl ca -in rampreq.csr -out rampcert.pem
Sign the certificate? [y/n]:y
1 out of 1 certificate requests certified, commit? [y/n]y
```

Note

If the error message "ERROR:Serial number 02 has already been issued,..." displays after repeating this step, resolve the error by ensuring that the `/etc/pki/tls/openssl.conf` file includes the following configuration:

```
dir = /etc/pki/CA # TSA root directory
Change the attribute in /etc/pki/CA/index.txt.attr: "unique_subject =
no"
Or empty /etc/pki/CA/index.txt
```

6. Verify the Server Certificate:

```
cp cacert.pem cert-ourca.crt
openssl verify -CAfile cert-ourca.crt rampcert.pem
```

A Sample Output

```
rampcert.pem: OK
```

7. Generate the client certificate:

```
cd /etc/httpd/conf/jitc
openssl genrsa -out clientuser.key 2048
openssl req -new -key clientuser.key -out clientuser.csr -subj '/C=US/ST=MA/
L=Westford/O=.Ribbon/OU=.Ribbon CA/CN=ramp-user-name/emailAddress=admin@rbbn.com'
openssl ca -in clientuser.csr -out clientuser.pem
```

8. Verify the client certificate and generate `clientuser.p12` :

```
cp clientuser.pem clientuser.crt
openssl verify -CAfile cert-ourca.crt clientuser.pem
openssl pkcs12 -export -in clientuser.crt -CAfile cert-ourca.crt -inkey
clientuser.key -out clientuser.p12
"Enter" twice to leave password blank (2nd time won't have this step)
"Enter" twice to leave password blank
```

9. Update the Apache configuration with the CA and `servercert` path.

a. Log on as an `insight` user.

- i. Edit the `/opt/sonus/ems/weblogic/sonusEms/data/sys/emsapps_apacheproxy_virtual_host.conf` file and comment out the current path as following:

```
##### Mutual TLS Support: comment start
#####
    SSLCertificateFile    /etc/httpd/conf/InsightCert.cert
    SSLCertificateKeyFile /etc/httpd/conf/InsightCertKey.pem
##### Mutual TLS Support: comment end
#####
```

- ii. Un-comment and update the paths as following:

```
##### uncomment and update start
#####
# SSLVerifyClient optional
# SSLVerifyDepth 10
# SSLCertificateFile "/etc/httpd/conf/jitc/rampcert.pem"
# SSLCertificateKeyFile "/etc/httpd/conf/jitc/rampKey.pem"
# SSLCACertificateFile "/etc/httpd/conf/jitc/cert-ourca.crt"
##### uncomment and update end
#####
```

b. Log on as a `root` user.

- i. Run the following commands:

```
# cp /etc/httpd/conf/jitc/cert-ourca.crt /home/admin/
# chown insight:insight /home/admin/cert-ourca.crt
# chmod 775 /home/admin/cert-ourca.crt
```

c. Log on as `insight` user.

- i. Run the following commands:

```
cp -p /opt/rbbn/pm/conf/secure/pm-ms.truststore /opt/rbbn/pm/conf/secure/pm-
ms.truststore.original
```

```
keytool -importcert -file /home/admin/cert-ourca.crt -alias <alias>
-keystore /opt/rbbn/pm/conf/secure/pm-ms.truststore -storetype BCFKS
-storepass ribbonpm

cp -p /opt/rbbn/lm/config/secure/lm-ms.truststore /opt/rbbn/lm/config/secure/
lm-ms.truststore.original
keytool -importcert -file /home/admin/cert-ourca.crt -alias <alias>
-keystore /opt/rbbn/lm/config/secure/lm-ms.truststore -storetype BCFKS
-storepass ribbonlm

cp -p /opt/devMgmt/conf/secure/devmgmt-ms.truststore /opt/devMgmt/conf/
secure/devmgmt-ms.truststore.original
keytool -importcert -file /home/admin/cert-ourca.crt -alias <cert name>
-keystore /opt/devMgmt/conf/secure/devmgmt-ms.truststore -storetype BCFKS
-storepass ribbonpm

cp -p /opt/sonus/ems/weblogic/sonusEms/data/sys/ems.keystore /opt/sonus/ems/
weblogic/sonusEms/data/sys/ems.keystore.original
keytool -importcert -file /home/admin/cert-ourca.crt -alias <cert name>
-keystore /opt/sonus/ems/weblogic/sonusEms/data/sys/ems.keystore -storetype
BCFKS -storepass sonusems
```

d. Restart the system:

```
/opt/sonus/ems/emsMgmt stop; /opt/sonus/ems/emsMgmt start
```

Customize the Logon Banner

Customize the **Logon Banner** by providing your text.

Start

1. Log on to the RAMP GUI using admin/admin as the username and password.
2. Navigate to **System > Settings > Logon Banner**. The **Logon Banner** window displays.
3. Update the message to display on the Logon page. The message allows up to 300 characters.
4. Update the banner content for JITC authentication. The banner allows up to 1500 characters.
5. Click **Apply** to save the updates.

Install Certificates on RAMP and the Browser

Perform the following procedure to install the certificates created in the above procedure, on RAMP and on the browser. Only on completion of these procedures, RAMP is JITC/FIPS enabled.

Prerequisites

- For the list of user and roles administration, refer to [Authentication and Authorization information on User Privileges in RAMP](#).
- Download the `clientuser.p12` and `cert-ourca.crt` files from the `JITC` directory.
- The `cert-ourca.crt` and `cacert.pem` certificates are available on the system where RAMP is accessed.

Start

1. Log on to the RAMP GUI using `admin/admin` as the username and password.
2. Navigate to **Management > Authentication & Authorization > Certificates**. The Certificates window displays.
3. Click **+ Add Certificate** to upload a certificate. For more information, refer to [Manage Certificates](#).
 - a. Upload the `cert-ourca.crt` and `cacert.pem` certificates.
4. From the web browser of your computer, import the certificates from the local machine.
5. On the RAMP GUI, the **Select a Certificate** window displays.
6. Select the certificate and click **OK**. The RAMP log on banner is displayed.
7. Accept the terms and click **OK**.
8. Log on to RAMP using your user name and password. The customized Logon banner is displayed.
9. Accept the terms and conditions displayed in the Logon banner and click **OK**.

Log on to JITC Enabled RAMP

After completing the previous procedures, perform the following procedure to log onto the JITC-enabled RAMP.

Prerequisites

- Perform all the procedures listed above.
- The client certificate is generated.
- Download the `clientuser.p12` and `cert-ourca.crt` files from the `JITC` directory.
- The `cert-ourca.crt` and `cacert.pem` certificates are available on the system where RAMP is accessed.
- The log on banner is customized.

Start

1. Log on to the RAMP GUI using your username and password. The customized Logon banner is displayed.
2. Accept the terms and conditions displayed and click **OK**.
3. You are now logged onto a JITC-enabled RAMP.

Configure RAMP for TLS Communication

This section explains configuring the Ribbon Application Management Platform (RAMP) for Transport Layer Security (TLS) communication.

Note

Refer to the SBC page [Security Configuration - TLS Profile](#) to configure TLS communication between FIPS/JITC enabled SBC and RAMP.

Note

For a geographically redundant (GR) RAMP, perform this procedure on both, the active and standby RAMPs.

Start

1. Import the SBC Certificate Authority (CA) certificate into the `ems.keystore` and `devmgmt-ms.truststore`.

- a. Log on as an `insight` user:

```
# su - insight
```

- b. Run the `manageCert` command:

```
$ /opt/sonus/ems/conf/cert/bin/manageCert import-othercert -n <sbcc name> -f <CA cert file>
```

2. Import the SBC CA cert into the `jssecacerts`:

- a. Log on as a `root` user.

- b. Import the SBC CA certificate into the `jssecacerts`:

```
# cp -p /opt/sonus/ems/jre/lib/security/jssecacerts /opt/sonus/ems/jre/lib/security/jssecacerts.original
# keytool -importcert -file <CA cert file> -alias <sbcc name> -keystore /opt/sonus/ems/jre/lib/security/jssecacerts -storetype BCFKS -storepass <password>
```

Note

If the intermediate CA cert file is available on the SBC, import it using the command:

```
# keytool -importcert -file <intermediate CA cert file> -alias <intermediate CA alias name> -keystore /opt/sonus/ems/jre/lib/security/jssecacerts -storetype BCFKS -storepass <password>
```

- c. Import the SBC CA certificate in to the License Manager (LM) truststore:

```
keytool -importcert -file <Root CA cert file> -alias <RootCAName> -keystore /opt/rbbn/lm/config/secure/lm-ms.truststore -storetype BCFKS -storepass <password>
```

Note

If the intermediate CA cert file is available on the SBC, import it using the command:

```
keytool -importcert -file <Intermediate CA cert file> -alias <IntermediateCAName> -keystore /opt/rbbn/lm/config/secure/lm-ms.truststore -storetype BCFKS -storepass <password>
```

3. Restart RAMP after the certificate is imported:

```
# su - insight -c '/opt/sonus/ems/emsMgmt stop; /opt/sonus/ems/emsMgmt start'
```

Configure NTP Server Authentication

Perform the following procedure to use authentication on the Network Time Protocol server:

Start

1. Perform the following procedure for the Server Configuration:
 - a. Update the configuration `/etc/chrony.conf` file:

```
allow x.x.x.x/yy <----- this should be device IP range
keyfile /etc/chrony.keys
```

- b. Specify the server-side key:

```
# vi /etc/chrony.keys
```

An example of the key file:

```
# Example of valid key:
1 SHA1 HEX:B2159C05D6A219673A3B7E896B6DE07F6A440995
```

- c. Restart the chrony service:

```
# systemctl restart chronyd.service
```

2. Perform the following for the client configuration:
 - a. Ensure that the client has the same key as the server in `/etc/chrony.keys` file.
An example:

```
# cat /etc/chrony.keys
1 SHA1 HEX:B2159C05D6A219673A3B7E896B6DE07F6A440995
```

- b. For example, if the key Id is 1, (as in the above example), the client's `chrony.conf` file must have a line in the following format:

```
server 192.168.122.33 key 1
```

Notifications

Any micro-service within the Ribbon Application Management Platform (RAMP) can use the optional Notifications service. To use it, the RAMP administrator adds the service manually after a RAMP installation.

When performing an EdgeMarc bulk action, specify whether you want to receive notifications for the action status.

Prerequisites

- The Notification service is deployed.

Note

- The bulk action Notification only displays if you enable the Notification option on an Edgemarc device Bulk action.
- Notifications gets purged after a specific configurable time.
- The Bell icon and Enable Notification field are visible only after configuring the notification service.
- The maximum number of notifications stored is limited for each user (1024 by default). Once the limit is reached, the old notifications are deleted. The Notification service properties are used to configure the limits.

Perform the following procedure to access the Notification list:

Start

1. Log on to RAMP GUI.
2. Click the Bell icon on the top right corner.
3. The **Notification** window appears with the following information.
 - a. List of notifications.
 - b. The Count of unacknowledged notifications.

Note

The count is displayed in the bell icon.

- c. Details of a particular notification.
 - d. Option to Acknowledge the notification.
 - e. Option to Acknowledge Bulk actions.
4. Use the following options to filter notifications:

Parameter	Description
Date/Time	The date and time interval at which you want to check the notifications.
Severity	The level of severity.
Type	The type of notification.
Source	The source from where the notification was initiated.
Summary	The summary provided.
Acknowledge	The list of Acknowledged and unacknowledged notifications.

5. Click the **Expand** button to get additional information about a notification. The "Description" and "Notification" details are displayed.
6. You can acknowledge a notification by clicking the **Acknowledge** button in an open notification row or by clicking the check icon in a closed one.

Note

To acknowledge multiple Notifications together, select the required notifications and click acknowledge from the Bulk action drop list.

Acknowledgements are accepted per user; if a notification goes to two users and only one acknowledges it, only one acknowledgment displays.

Security Best Practices

In this section:

- [RAMP Security Best Practices Introduction](#)
- [Managing RAMP Users and Accounts](#)
- [Managing RAMP Network Security](#)
 - [RAMP Secure Network Configuration](#)
- [Certificate Management](#)
- [RAMP Event Logging for Security](#)
 - [SFTP File Transfer Logs](#)

This guide provides information and procedures related to security practices on Ribbon Application Management Platform (RAMP).

RAMP Security Best Practices Introduction

In this section:

- [Security Concerns](#)
 - [Elevation of Privilege](#)
 - [Information Disclosure](#)
 - [Denial of Service](#)

Ribbon Application Management Platform (RAMP) is the element management system for the various Ribbon network elements. It provides full FCAPS (Fault, Configuration, Accounting, Performance, Security) management of those network elements. In many networks, RAMP must expose its northbound interface to untrusted networks, and so it is critical that RAMP be secured against potential attacks.

Security Concerns

RAMP has the same security concerns as any other Linux system if not properly secured. Since RAMP can have network interfaces on public networks, there is a risk of information disclosure, elevation of privileges, and denial of service attacks. The standard security best practices for any Linux system apply to RAMP as well. RAMP has various ports which are open which must be secured, and RAMP ships with all open ports featuring some security in place.

Elevation of Privilege

Privilege escalation is when a normal user can gain access to more permissions than he should have. For example, the user can gain access to the same or similar permissions to the root user.

The primary way to avoid privilege escalation is to secure the Linux user accounts and making sure that all software is running the latest versions.

RAMP periodically ships maintenance releases which include the latest security patches for the Linux operating system and the RAMP application itself. Ribbon recommends that customers upgrade RAMP to the latest maintenance release on the particular release stream that they are running to minimize security vulnerabilities. In addition, we recommend the following:

- During RAMP installation, the user is prompted to change the default password for root. Choose a hard-to-guess password with sufficient complexity and length as per the standard Linux recommendations for setting passwords.
- RAMP user passwords are set to expire every 90 days, and the user will be prompted to change them 7 days before they are set to expire. You can also update that parameter to a smaller value as required by your own corporate security standards.
- You must not enable SSH access for the root user (this is disabled by default and should not be re-enabled).

Information Disclosure

Potential sources for information disclosure is by accessing the data via one of the northbound interfaces (UI, API, CLI).

All of the northbound interfaces are secured via username / password credentials, and so those credentials must be managed in a secure fashion. Users should work to properly secure their own passwords and follow standard recommendations on proper storage and management of passwords (e.g. users should not share passwords with others or write them down, etc.). In addition, if access to RAMP should only be allowed from certain networks (internal for example), then firewalls should be used to limit access to those interfaces on RAMP.

Denial of Service

Denial of service attacks against RAMP will not impact call processing capabilities of the other Ribbon network elements, but it can certainly impact a user's ability to monitor the network. RAMP doesn't have any denial of service protections other than those provided in the Linux operating system and the Apache web server. The best way to determine that a DoS attack is happening is by monitoring the standard Linux logs as well as the Apache web server logs.

Managing RAMP Users and Accounts

In this section

- [Use a Master-Key to Encrypt RAMP Passwords](#)
- [Follow Standard Linux Password Guidelines](#)
- [Change Any Default Passwords](#)
- [Manage Administrative Accounts](#)
- [Avoid Customization of the Linux Environment](#)

The following security guidelines apply when managing Ribbon Application Management Platform (RAMP) user accounts.

Use a Master-Key to Encrypt RAMP Passwords

Periodically generate a master-key to encrypt RAMP passwords.

Refer to [Generate a Master Key to Encrypt RAMP Passwords](#).

Follow Standard Linux Password Guidelines

Protect your password

Don't write down your password - memorize it. In particular, don't write it down and leave it anywhere, and don't place it in an unencrypted file. Use unrelated passwords for systems controlled by different organizations. Don't give or share your password, in particular to someone claiming to be from computer support or a vendor. Don't let anyone watch you enter your password. Use the password for a limited time and change it regularly.

Choose a hard-to-guess password

The Linux command to change passwords ("passwd") through the calls to the pam_cracklib PAM module will try to prevent you from choosing a really bad password, but it isn't foolproof; create your password wisely. Don't use something you'd find in a dictionary (in any language or jargon). Don't use a name (including that of a spouse, parent, child, pet, fantasy character, famous person, and location) or any variation of your personal or account name. Don't use accessible information about you (such as your phone number, license plate, or social security number) or your environment. Don't use a birthday or a simple pattern (such as backwards, followed by a digit, or preceded by a digit. Instead, use a mixture of upper and lower case letters, as well as digits or punctuation. When choosing a new password, make sure it's unrelated to any previous password. Use long passwords (say at least 8 characters long). You might use a word pair with punctuation inserted, a passphrase (an understandable sequence of words), or the first letter of each word in a passphrase.

These principles are partially enforced by the system, but only partly so. Vigilance on your part will make the system more secure.

Change Any Default Passwords

RAMP has system-level user accounts and application-level user accounts. Some of those accounts have default passwords. For security purposes, it is highly recommended that any default passwords be changed to something more secure.

For user account names, default passwords, and how to change those passwords; refer to [Manage RAMP Account Names and Passwords](#).

Manage Administrative Accounts

Administrative accounts should be defined and managed in accordance with your organization's security posture. The following is a recommended best practice:

- Do not share accounts between individuals.
- Provide each individual with an account consistent with their role.
- Minimize access to Linux passwords.

Avoid Customization of the Linux Environment

Do not make changes to the embedded Linux operating environment unless they are reviewed and authorized by Ribbon. This includes:

- Addition of new packages
- Changes to existing packages
- Operational changes such as crontab updates

Managing RAMP Network Security

In this section:

- [RAMP Secure Network Configuration](#)
 - [RAMP Security Group Rules](#)
 - [RAMP Ports Descriptions](#)
 - [RAMP Ports Descriptions for EdgeView](#)

Ribbon highly recommends to place all the network elements that talk to Ribbon Application Management Platform (RAMP) in a trusted network.

RAMP Secure Network Configuration

In this section:

- [RAMP Security Group Rules](#)
- [RAMP Ports Descriptions](#)
- [RAMP Ports Descriptions for EdgeView](#)

Along with the standard ports for various protocols, there are many other system ports that are open by default for all these communications on Ribbon Application Management Platform (RAMP).

It is recommended to control access to these ports to secure the equipment and data. Use an external firewall as needed.

For more information on ports and their purpose on RAMP, refer to [RAMP Ports Descriptions](#).

RAMP Security Group Rules

This page describes the summary of all the ports used in Ribbon Application Management Platform (RAMP) on cloud. The ports are specific to an application or a feature and are only applicable when in use.

In the cloud environment, these ports are allowed in the security group associated with the instance type. The various fields are described in the table below.

Security Rule Field Descriptions

Field	Description
Direction (initial)	For UDP, this is both directions. For TCP, this is Outbound for clients and inbound for servers (to match the direction of the initial connection). NOTE: This definition matches the way firewall rules are defined.
Ether Type	It is either IPv4 or IPv6. Separate rules are supplied when both IPv4 and IPv6 are supported.
IP Protocol	UDP or TCP.
Local Port	An exact port number, or a wildcard. TCP clients usually use an ephemeral local port is wildcarded.
Local IP/interface	The local interface or internal object (such as SIP SP).
Remote Port	An exact port number, or a wildcard. TCP clients usually use an ephemeral local port which is wildcarded.
Remote Peers	Peer type. Use this to set the most constrained remote network prefix.

The following table provides security rules for the RAMP.

Note

The rules apply to both IPv4 and IPv6.

RAMP Security Rules

Direction (Initial)	IP Protocol	Local Port	Local IP/Interface	Remote Port	Remote Peers	Notes
Ingress	TCP	22	Mgt	*	SSH clients	SSH connection
Egress	TCP	*	Mgt	22	PSX, RAMP, SBC	SSH connection (tunneled protocols such as PIPE, and so on.) SBC for SBC CLI proxy.

Direction (Initial)	IP Protocol	Local Port	Local IP/Interface	Remote Port	Remote Peers	Notes
Egress	UDP	*	Mgt	53	DNS server	Post-paid registration and usage reporting URLs.
Both	UDP	123	Mgt	123	NTP server	NTP
Both	UDP	161	Mgt	161	PSX, SBC	SNMP polling
Both	UDP	162	Mgt	162	PSX, SBC	SNMP traps
Ingress	TCP	443	Mgt	*	RAMP client	RAMP GUI Access (HTTPS)
Egress	TCP	*	Mgt	443	SBC, SBC Configurator	SBC Manager, REST calls to SBC or SBC Manager
Egress	TCP	*	Mgt	444	SBC	
Egress	UDP/TCP	514	Mgt	514		rsyslog (either UDP or TCP depending on the remote rsyslog host)
Egress	UDP	*	Mgt	1812	Radius Server	Radius Authentication port (configurable - this is the default).
Egress	UDP	*	Mgt	1813	Radius Server	Radius Accounting port (configurable - this is the default).
Egress	TCP	*	Mgt	2022	SBC, SBC Configurator	NETCONF Session to SBC Configurator and SBC
Egress	TCP	*	Mgt	2024	SBC, SBC Configurator	SFTP to SBC, SBC Configurator
Both	UDP	5200	Mgt	*	SNMP agent	SNMP - Agent Trap Forwarder

Direction (Initial)	IP Protocol	Local Port	Local IP/Interface	Remote Port	Remote Peers	Notes
Both	TCP	5432	Mgt	5432	RAMP	PostgreSQL listener process on remote RAMP (redundancy)
Both	TCP	6432	Mgt	6432	RAMP	Pgbouncer
Egress	TCP	*	Mgt	6462	PSX	RAMP and PSX communication (SFTP stats collection) using REST
Ingress	TCP	6462	Mgt	*	RAMP	RAMP SFTP stats collection from remote RAMP (using REST)
Both	TCP	6700	Mgt	6700	RAMP	OpenSAF
Both	TCP	6900	Mgt	6900	RAMP	OpenSAF
Ingress	TCP	8122	Mgt	*	CLI client	SSH CLI (for provisioning the PSX by CLI)
Egress	TCP	*	Mgt	8890	DSC	Inventory Audit port
Both	UDP	9004	Mgt	*	PSX	PSX call trace
Both	TCP	9092	Mgt	9092	RAMP	Kafka
Egress	TCP	*	X1 intf	15005	SS8 Server	(SS8-based LI Only) X1 configuration interface to SS8 (non-secure). The port-numbers may differ. Obtain the actual port-number provided by SS8. NOTE: Do not use non-secure ports. Use secure ports instead.

Direction (Initial)		IP Protocol		Local Port	Local IP/Interface	Remote Port	Remote Peers	Notes		
Egress		TCP		*	X1 intf	55700	SS8 Server	(SS8-based LI Only) X1 configuration interface to SS8 (secure). The port-numbers may differ. Obtain the actual port-number provided by SS8.		
Ingress		TCP		19991	Mgt	*	RAMP	Sonus agent configuration		
Egress		TCP		*	Mgt	19991	PSX, RAMP	Sonus agent configuration		
Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
RAP (Ribbon Audit Portal)	Egress	TCP	443	HTTPS	License Manager	IPv4 / IPv6	Used by the License Manager process to upload postpaid reports to RAP.	IPv4 / IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open

Optional ports on RAMP

This section covers ports supported for optional services on the **RAMP**. Open these ports on your private/public cloud instances to use the optional services.

RAMP security rules for optional services

Direction (Initial)	Ether Type	IP Protocol	Local Port	Local IP/Interface	Remote Port	Remote Peers	Notes
Egress	IPv4/v6	TCP	8080	Mgt		STI	The port to use for the STI service.

Direction (Initial)	Ether Type	IP Protocol	Local Port	Local IP/Interface	Remote Port	Remote Peers	Notes
Egress	IPv4/v6	TCP	2379	Mgt		etcd VMs	The port to connect to etcd instances for RAMP GR monitoring.

RAMP Ports Descriptions

In this section:

- [RAMP Ports](#)
- [ETCD VM Ports](#)

The Ribbon Application Management Platform (RAMP) listens to the network ports in the following table. Some ports are unavailable if the corresponding product features are not configured.

RAMP Ports

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
SSH client	Ingress	TCP	22	SSH	sshd	IPv4/IPv6	Secure login from the console terminal to the RAMP through SSH.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
Send mail client on RAM	Ingress	TCP	25	SMTP	mail agent	IPv4/IPv6	Simple Mail Transfer Protocol (SMTP), used for user-level client mail applications , sends email notifications .	IPv4(loopback i/f:127.0.0.1)	IPv4/IPv6 address of the peer	Only open for traffic from loopback and local IP address.
DHCP Server	Ingress	UDP	68	DHCP	dhclient	IPv4	DHCP for IPv4 cloud instances.	IPv4 address of the RAM	IPv4 address of the peer	Open for IPv4 deployments
NTP server	Both	UDP	123	NTP	ntpd	IPv4/IPv6	Network Time Protocol for clock synchronization.	IPv4/IPv6 address of the RAM	IPv4/IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
RAMP GR system	Both	UDP	161	SNMP	Agent	IPv4/IPv6	SNMP reachability polling for the RAMP node. The RAMP GR also uses it to monitor the Agent on the other host.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
Any Ribbon device	Both	UDP	162	SNMP	FM Trap Receiver	IPv4/IPv6	SNMP Event notification V2 trap from other devices to the RAMP.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
HTTP clients	Ingress	TCP	443	HTTPS	Apache httpd	IPv4/IPv6	Redirects requests to the JBoss application server. The RAMP Web GUI, SOAP and REST APIs. Note: EdgeMarc and Edge Devices will contact the RAMP on port 443.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
RAP (Ribbon Audit Portal) ZTP	Egress	TCP	443	HTTPS	License Manager Edge View service (EV service)	IPv4/IPv6	Used by the License Manager process to upload postpaid reports to RAP. Fetch C2E during Swe Edge registration and auto provisioning of EdgeMarc devices.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
Syslog server	Both	UDP	514	syslog	rsyslogd	IPv4/IPv6	syslogd	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	
DHCP server	Ingress	UDP	546	DHCP	dhclient	IPv6	DHCP	IPv6 address of the RAMP	IPv6 address of the peer	Open for IPv6 deployments

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
Local RAM P	Both	UDP	1610	SNMP	snmpd	IPv4/ IPv6	SNMP listener fetches hardware-level traps and sends them to the Agent.	IPv4 address of the RAM P	IPv4/ IPv6 address of the peer	
RAM P GR	Both	TCP	5000	HTTPS	DBaaS Service Monitor or REST API	IPv4/ IPv6	DBaaS Service Monitor REST API.	IPv4/ IPv6 address of the RAM P	IPv4/ IPv6 address of the peer	Always open
HTTP Client	Both	UDP	5200	SNMP	Agent	IPv4/ IPv6	Agent Trap Receiver Port used for receiving the hardware traps sent from port 1610.	IPv4/ IPv6 address of the RAM P	IPv4/ IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
Local RAMP/GR system	Ingress	TCP	5432	PostgreSQL proprietary	Postgres	IPv4/IPv6	PostgreSQL database – internal DB connections and connections for RAMP/GR.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
Device, RAMP	Ingress	TCP	5671	AMQP	nginx docker container	IPv4/IPv6	For establishing a communication channel between RAMP and device (EMPath).			
Local RAMP/GR system	Ingress	TCP	6432	PostgreSQL proprietary	Postgres	IPv4/IPv6	PostgreSQL database – internal DB connections and connections for the RAMP/GR.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
local RAMP	Ingress	TCP	6462	HTTPS	Agent	IPv4/IPv6	Used to enable FTP statistics collection from the RAMP.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
Local RAMP/GR system	Ingress	TCP	6700	OpenSAF proprietary	OpenSAF	IPv4/IPv6	RAMP/GR Redundancy	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
Local RAMP/GR system	Ingress	UDP	6800	OpenSAF proprietary	OpenSAF	IPv4/IPv6	RAMP/GR Redundancy	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
Local RAMP/GR system	Ingress	UDP	6900	OpenSAF proprietary	OpenSAF	IPv4/IPv6	RAMP/GR Redundancy	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
RAMP	Ingress	TCP	8022	ssh	sshd process running inside the docker services container	IPv4/IPv6	Device Open GUI functionality from the RAMP			
STI	Egress	TCP	8080	SSH	sshd	IPv4/IPv6	The port to use for the STI service.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always Open
RAMP	Ingress	TCP	8081	HTTP	Kafka Schema Registry port	IPv4/IPv6	FM service			
CLI Client	Ingress	TCP	8122	SSH	RAMP	IPv4/IPv6	Remote access to the RAMP CLI from client to RAMP through SSH.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Open only if the RAMP-CLI license is deployed in the Ribbon-provided Dell Server.

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
RAM P	Ingress	TCP	8444	http	nginx docker container	IPv4/IPv6	Device Open GUI functionality from RAMP.			
Client desktop running PSX Manager	Ingress	TCP	9001	Ribbon proprietary	RAMP	IPv4/IPv6	Client/Server Communication from PSX Manager to RAMP through PSX proxy server over https (SSL).	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open
PSX	Ingress	UDP	9004	Ribbon proprietary	Call Trace Listener	IPv4/IPv6	Call Trace event notification from other devices to RAMP.	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	
Local RAMP/GR	Ingress	TCP	9092	Kafka proprietary	Kafka	IPv4/IPv6	Kafka	IPv4/IPv6 address of the RAMP	IPv4/IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
HTTP Client	Ingress	TCP	9992 (disabled by default)	HTTP	RAM P	IPv4/IPv6	JBoss Management Console.	IPv4/IPv6 address of the RAM P	IPv4/IPv6 address of the peer	
OBS Probe	Ingress	TCP	13313	HTTP		IPv4/IPv6	To observer health check.	IPv4/IPv6 eth0 address of the OBS		Always open
RAM P/GR	Ingress	TCP	19991	HTTPS	Agent	IPv4/IPv6	To perform the device and agent configuration: - Setting trap destinations - Set SNMP read/write community strings. - JMX communication from the RAM P to device agent.	IPv4/IPv6 address of the RAM P	IPv4/IPv6 address of the peer	Always open

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
OBS Probe	Ingress	TCP	9101	HTTP	otelcol	IPv4/IPv6	This is a Prometheus port.	IPv4/IPv6 eth0 address of the OBS		Always open
RAMP	Egress	TCP	2379	HTTP		IPv4/IPv6	RAMP (client) to ETCD (server) Communication. Use GRPC protocol.			

ETCD VM Ports

Peer Type	Direction	Transport Protocol	Client Port	Server Port	Optional / Mandatory	Usage
ETCD Peer	Ingress	TCP	Ephemeral	2380	Mandatory	ETCD Peer Server to ETCD Local Server Communication (Ingress)
ETCD Peer	Egress	TCP	Ephemeral	2380	Mandatory	ETCD Local Server to ETCD Peer Server Communication (Egress)
RAMP	Ingress	TCP	Ephemeral	2379	Mandatory	RAMP (client) to ETCD (server) Communication. Use GRPC protocol.
ETCD Peer	Ingress	TCP	Ephemeral	2379	Mandatory	Used between 2 ETCD servers during installation Use GRPC protocol.

Peer Type	Direction	Transport Protocol	Client Port	Server Port	Optional / Mandatory	Usage
ETCD Peer	Egress	TCP	Ephemeral	2379	Mandatory	ETCD Local Server to ETCD Peer Server Communication (Egress)
VM Access	Ingress	TCP	Ephemeral	22	Mandatory	SSH access to VM
Prometheus Client (Scrape) used for Node-Exporter metrics	Ingress	TCP	Ephemeral	9100	Optional	A remote Prometheus client can get Metrics generated by the server (CPU, memory, ...)
Prometheus Client (Scrape) used for Fluentbit Metrics	Ingress	TCP	Ephemeral	24231	Optional	A remote Prometheus client can get Metrics generated by Fluentbit

RAMP Ports Descriptions for EdgeView

Ribbon Application Management Platform (RAMP) listens to the network ports listed in the following table. Some of these ports are not available if the corresponding product features are not configured.

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
Device, RAMP	Ingress	TCP	5671	AMQP S	nginx docker container	IPv4/IPv6	For establishing communication channel between RAMP and device (EMPath).	IPv4/IPv6 addresses of RAMP	IPv4/IPv6 address of SBC Swe Edge, SBC 1000, and SBC 2000.	Open when the EV service is deployed.

Peer Type	Direction	Transport Protocol	Local Port	Application Level Protocol	Process Name	Ether Type	Usage	Local IP/Interface	Remote Peers	iptables rule
RAMP	Ingress	TCP	8022	ssh	sshd process running inside docker services container	IPv4/IPv6	Device Open GUI functionality from the RAMP.	IPv4/IPv6 addresses of RAMP	IPv4/IPv6 address of SBC Swe Edge, SBC 1000, and SBC 2000.	Open when the EV service is deployed
RAMP	Ingress	TCP	8444	http	nginx docker container	IPv4/IPv6	Device Open GUI functionality from RAMP.	IPv4/IPv6 addresses of RAMP	IPv4/IPv6 addresses of the systems which connect to RAMP GUI using a web browser.	Open when the EV service is deployed

Certificate Management

Ribbon Application Management Platform (RAMP) ships with two default certificates which are self-signed and are not recommended for production use. One certificate is used for the https connections to RAMP (on ports 443 / 9001), and the other certificate is used to secure the https connection to the Agent (running on port 19991).

It is highly recommended that customers replace all of the default certificates shipped with RAMP with production certificates signed by a recognized certificate authority.

The procedures for replacing the certificates can be found here:

- [Secure Login to the RAMP GUI](#)
- [Secure Communication Between RAMP and Devices](#)

RAMP Event Logging for Security

In this section

Ribbon Application Management Platform (RAMP) has a variety of log files which store information on user and system activity that can be reviewed from a security perspective.

System Activity Logs

The primary log file for all application related logging is `/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log`.

If you see any errors in the system, it is likely that some detail will be found in this log file. You can view the system activity log on the **RAMP** GUI without logging into the Linux shell. It could be useful when you are debugging errors that may have resulted from unauthorized access.

For more information, refer to [System Activity Logging](#).

User Activity Logs

RAMP tracks all application user activity when the user is logged into the system. This information is not logged to the disk but instead stored in the database. This log is useful to track who made configuration changes, especially if you are suspicious that someone has gained unauthorized access to the system.

For more information, refer to [Monitor User Activity](#).

In addition, all failed logins to the **RAMP** UI are tracked here:

`/var/log/ems/ems_login.log`

Web Request Logs

Although the file is very verbose, **RAMP** has a log file which tracks every single web request to **RAMP**, including the source IP where the request originated from. It is the standard Apache httpd log, and it can be found in `/var/log/httpd`. The log file is called `access_log`, and it is archived and compressed when the log file exceeds the threshold. The `access_log` file is accessible only to root users on **RAMP**.

API and CLI Usage Logs

If you want to track the usage of **RAMP** APIs or actions on the command line, you can find the information on all access to those in the following files:

- API security-related information (including failed logins):
`/opt/sonus/ems/weblogic/sonusEms/logs/sys/api_security_log`
- Command line security-related information (including failed logins):
`/var/log/ems/ems_login.log`
- RAMPAPI provisioning operations:
`/opt/sonus/ems/weblogic/sonusEms/logs/sys/emsapi_prov_log`
- RAMP command-line provisioning operations:
`/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_cli_log`

Remote Syslog

RAMP supports sending the most critical logs to a remote Syslog server. This is highly recommended as this means the logs are stored externally. There are two types of logs which can be streamed to a remote Syslog server: security-specific logs and the primary **RAMP** application log (`ems_trace_log`). Within the **RAMP** GUI you can specify the remote Syslog server IP address to enable remote Syslog logging.

For more information on enabling remote Syslog, refer to [Exporting Logs to a Remote Syslog Server](#).

SFTP File Transfer Logs

The file transfers using SFTP protocol are logged in the file *sftp.log* available at */var/log/*.

Only the root user on Ribbon Application Management Platform (RAMP) can access the *sftp.log* file.

Up to 10 *sftp.log* files (1 MB each) are stored. When the size of file reaches 1 MB, the file is compressed in gzip format. When the number files reach the threshold, older files are overwritten.

The following is an example the *sftp.log* file:

```
May 25 06:15:26 vinaydeepems11a016 sftp-server[1519]: session opened for local user root
from [10.70.52.206]
May 25 06:15:26 vinaydeepems11a016 sftp-server[1519]: received client version 3
May 25 06:15:57 vinaydeepems11a016 sftp-server[1519]: opendir "/opt/sonus/ems/"
May 25 06:15:57 vinaydeepems11a016 sftp-server[1519]: closedir "/opt/sonus/ems/"
May 25 06:15:57 vinaydeepems11a016 sftp-server[1519]: realpath "/opt/sonus/ems/"
May 25 06:16:43 vinaydeepems11a016 sftp-server[1519]: open "/opt/sonus/ems/
emsRestart.log" flags READ mode 0666
May 25 06:16:43 vinaydeepems11a016 sftp-server[1519]: close "/opt/sonus/ems/
emsRestart.log" bytes read 40838 written 0
May 25 06:17:00 vinaydeepems11a016 sftp-server[1519]: session closed for local user root
from [10.70.52.206]
```

- May 25 06:15:26
Indicates the time of the transfer.
- vinaydeepems11a016
Indicates the host name of RAMP.
- [1519]
Indicates the process ID (PID).
- session opened for local user root from [10.70.52.206]
Indicates the details of the activity.
The details include:
 - [10.70.52.206]
the client server IP address
 - opendir
directory opened
 - closedir
directory closed
 - realpath
location of the directory or file

Configuring RAMP Redundancy

In this section:

- [Generate Redundancy Templates](#)
- [Configuring RAMP GR](#)
- [Configuring RAMP GR with Automatic Switchover Enabled](#)
 - [Setting Up an etcd Cluster](#)
 - [etcd Alerts](#)
 - [List of Traps and Alerts](#)
 - [Updating the SNMP trapTarget](#)
 - [RAMP etcd System Requirements](#)

Related articles:

- [Deployment Models](#)
- [Managing Redundancy](#)

Ribbon Application Management Platform (RAMP) supports configuring geographical redundancy (GR) between two RAMP devices.

A GR deployment on RAMP begins as two RAMP standalone devices at different geographical locations that you configure to work together in a GR fashion. The RAMP device at one of the GR sites functions as a "source" or active RAMP node and the other functions as a "target" or standby RAMP node. You can run the GR configuration procedure on either standalone RAMP node, but note that the device on which you configure GR becomes the source RAMP node. The process involves using a template file in which you set parameters for the deployment.

After GR is configured, there is constant replication of data from the source RAMP to the target RAMP. If the source RAMP goes down, you can perform a failover from the target RAMP. Similarly, you can also do a switchover and change the source and target roles. If necessary, you can also teardown the GR setup and resume having two standalone RAMP devices. If one device fails, you have the option to replace it with a new device. Refer to [Managing Redundancy](#) for information on monitoring the deployment and management procedures. Refer to [Configuring RAMP GR](#) for information on setting up a standard GR deployment.

As an alternative to initiating manual switchovers, RAMP also supports a deployment model that enables automatic switchover between GR instances. To enable automatic switchover, you must deploy three additional VMs, each running an instance of etcd. The etcd instances continually monitor whether they are able to communicate with the RAMP instances and use that information to function as arbitrators that determine which RAMP instance should be active. A switchover occurs automatically when a majority of the etcd instances determine that the current active instance is no longer reachable. Refer to [Configuring RAMP GR with Automatic Switchover Enabled](#) for more information on switchover processing, the resources required to implement automatic switchover, and how to deploy etcd.

Generate Redundancy Templates

Related articles:

- [Deployment Models](#)
- [Configuring RAMP GR](#)
- [Managing Redundancy](#)
- [Configuring RAMP GR with Automatic Switchover Enabled](#)

Use the script `RDbuild_config.sh` to generate a redundancy template for a Ribbon Application Management Platform (RAMP) geographically redundant (GR) deployment. You use the redundancy template when you [configure RAMP for GR](#) to configure redundancy parameters for the deployment.

Note

The following procedure describes creating a template for a standard GR deployment in which switchovers are triggered manually. RAMP also supports a deployment model that enables automatic switchover between GR instances. To enable automatic switchover, you must deploy three additional VMs, each running an instance of etcd. You also specify different redundancy template parameters to enable automatic switchover. Refer to [Configuring RAMP GR with Automatic Switchover Enabled](#) for more information.

Start

1. On the RAMP device that you intend to use as the source/active node in the GR deployment, SSH to the RAMP CLI as the `admin` user.
2. Change to the `root` user:

```
sudo su -
```

3. Enter the following command:

```
/etc/sonus/RDbuild_config.sh -o /<directory for the template>/<name for the template>.conf -g <the redundancy model>:<IP schema>
```

The following is an example that generates the redundancy template file in the `/opt` directory. See the first table below for more information on the script's parameters.

```
/etc/sonus/RDbuild_config.sh -o /opt/GR.conf -g gr:ipv4
```

4. Edit the generated template file to suit your deployment. Use the second table below for more information on the parameters in the redundancy template.
5. After you create your redundancy template file, refer to [Configuring RAMP GR](#) for the procedure to configure your GR deployment.

Reference Tables

As shown in step 3, the basic format for the script is: `RDbuild_config.sh -o <name for the template> .conf -g <the redundancy model> : <IP schema>`

The following table describes the parameters you can use with the script, including optional parameters.

RDbuild_config.sh Parameters

Parameter	Optional (O) / Mandatory (M)	Description
-o	M	Use to specify the file name of the configuration file. Use this option along with the <code>-g</code> option.
-g	M	Use to generate a cluster configuration template using the specified redundancy model and IP schema.
<the redundancy model>	M	Specifies the redundancy model. Currently, <code>gr</code> is the supported redundancy model.
<IP schema>	M	The IP address schema. Enter one of the following: <code>ipv4</code> for an IPV4 network <code>ipv6</code> for an IPv6 network
oss	O	Use, in the following format, to enable the option to send SNMP traps concerning GR status to an Operations Support Systems (OSS). <code>RDbuild_config.sh -o <name for the template>.conf -g <the redundancy model> : <IP schema>:oss</code>
-h	O	Use to list the help information for the script.

The following table describe the parameters you can configure in the redundancy template.

Redundancy Template Configuration Parameters

Parameter	Description	Value
Fixed Settings		
<code>_primaryServer</code>	The IP address of the RAMP active node. The IP address of the node in which the cluster set-up was initiated.	A valid IP address

Parameter	Description	Value
_clusterName	The name of the cluster.	Alphanumeric characters
_numSites	The number of sites in the cluster	• 2: For GR
_numNodes	The number of nodes in a site.	• 1: For GR
_totalNodes	The total number of nodes in the cluster.	• 2: For GR
_ipschema	The IP address mode.	• ipv4 • ipv6
_pm_export_sync_to_standby	The flag to set sync of pm export reports.	• true: enable report sync. • false: disable report sync.
_site<site number>_name	The name for site <site number>.	Alphanumeric characters
_site<site number>_vip_v4prefix	The length of the virtual IPv4 address prefix for the site.	integer
_site<site number>_vip_v6prefix	The length of the virtual IPv6 address prefix for the site.	integer
_oss_info	The flag to configure Operations Support Systems (OSS) on the RAMP.	yes: Enables OSS no: Disables OSS
_oss_ip	The IP address of the OSS system. Discard this parameter if _oss_info is set to "no".	A valid IP address

Parameter	Description	Value
_oss_snmp_port	Discard this parameter if _oss_info is set to "no". The SNMP port number of the OSS system.	A valid port
_oss_snmp_community_str	Discard this parameter if _oss_info is set to "no". The SNMP community string of the OSS system.	Alphanumeric characters
Node		
_node<node number>	The host name of the node <node number>.	Alphanumeric characters
_node<node number>_id	The sequence number of node <node number>.	• 1 • 2
_node<node number>_ip	The IP address of node <node number>.	A valid IP address
_node<node number>_site	The site name of node <node number>.	Alphanumeric characters

Configuring RAMP GR

Related articles:

- [Managing Redundancy](#)
- [Generate Redundancy Templates](#)
- [Configuring RAMP GR with Automatic Switchover Enabled](#)

Use the following procedure to configure a geographically redundant (GR) Ribbon Application Management Platform (RAMP) deployment. Prior to running the procedure you must generate a redundancy template file to specify configuration details for the deployment. Refer to [Generate Redundancy Templates](#).

Run the procedure on the RAMP device that you want to be the source/active node for the GR deployment. It is not necessary to repeat the setup on the target/standby device.

RAMP GR is supported in KVM, VMware, and OpenStack environments.

Note

The following procedure describes configuring a standard GR deployment in which switchovers are triggered manually. RAMP also supports a deployment model that enables automatic switchover between GR instances. To enable automatic switchover, you must deploy three additional VMs, each running an instance of etcd. You also specify different redundancy template parameters to enable automatic switchover. Refer to [Configuring RAMP GR with Automatic Switchover Enabled](#) for more information.

Prerequisites

- Two RAMP devices are up and running in the same environment with the same version.
- If the optional EdgeView (EV) service that enables managing SBC Edge devices is deployed, it should be deployed on both RAMP devices.
- For RAMP on KVM/VMware, the two RAMP devices are running on separate host servers.
- The standby device is accessible from the active device, and vice versa.

Note

If you have restored the database on an OpenStack deployment, password-less SSH from the active RAMP device to the standby RAMP device (and vice versa) is not possible until GR is configured.

- You can ping the standby device from the active device and you can ping the active device from the standby device.
- The same password is set for the `admin` and `insight` users on the active and standby devices.

Note

The `insight` password is reset in the RAMP active device after restoring the database (with the password of the old database).

- If cron entries are created manually on the RAMP active device, you must also create the same cron entries on the standby device. In RAMP GR, cron entries are not copied and synchronized from active to standby, or vice versa.
- Ensure you have the redundancy template file generated for the deployment. Refer to [Generate Redundancy Templates](#).
- Before you run the `RDsetup.sh` command, modify the session timeout interval and set it to zero (0) by performing the procedure at [Modify User Session Timeout Interval](#). After you modify the session timeout interval, re-initiate a new SSH session and then run the `RDsetup.sh` command.

Start

1. On the RAMP device you want to establish as the source/active node in the GR deployment, log onto the CLI as the `admin` user.
2. Change to the `root` user:

```
sudo su -
```

3. Enter the following command, specifying the path and name for the redundancy template file generated for your GR deployment:

```
/etc/sonus/RDsetup.sh <absolute path to the redundancy template file>
```

The following is an example that specifies a redundancy template file, `GR.conf`, in the `/opt` directory.

```
/etc/sonus/RDsetup.sh /opt/GR.conf
```

Example

```
[16:17:41] Starting redundancy cluster setup .....  
[16:17:42]  
Building RD configuration locally .....  
Please enter Password of admin user for all nodes (press ENTER if not needed) ->  
admin
```

4. Enter the `admin` password:

Note

If you are configuring a GR deployment on OpenStack and the password-less authentication for the `admin` user from the active RAMP device to the standby RAMP device is enabled, press ENTER.

The script completes setting up GR and the RAMP processes start shortly.

5. Change to the `insight` user to run a status check to verify that the system is healthy:

```
su - insight
```

6. Enter the following to check the RAMP status:

```
/opt/sonus/ems/emsMgmt status
```

7. Log onto the CLI of the standby RAMP device as the `admin` user.
8. Change to the `insight` user:

```
sudo su - insight
```

9. Enter the following to check the status on the RAMP standby node:

```
/opt/sonus/ems/emsMgmt status
```

10. Restore the session timeout interval to 750 by performing the procedure at [Modify User Session Timeout Interval](#).

Note

If the configuration process is interrupted and you resume `RDsetup.sh`, the RAMP offers the following option:

```
Record showing the <script name> script was being executed and was not completed.
Do you want to resume the operation from the previous point of failure (yes|no)?.
```

Perform one of the following:

- Enter "yes" to resume the operation from the point of failure.
- Enter "no" to execute the script again. The RAMP shows the following message:

```
Do you want to proceed with a fresh new operation (yes|no)? ->
```

Perform one the following:

- Enter "yes" to execute the script.
- Enter "no" to terminate the session.

Note

All micro services certificates present on the primary RAMP are copied to the target RAMP containing the CN and SAN details for the primary RAMP.

Configuring RAMP GR with Automatic Switchover Enabled

In this section:

- [Generate a Redundancy Template](#)
- [Configure RAMP GR Parameters](#)

Related articles:

- [Setting Up an etcd Cluster](#)
- [Deployment Models](#)
- [Configuring RAMP Redundancy](#)
- [Managing Redundancy](#)
- [RAMP CNF - Resiliency](#)

As an alternative to initiating manual switchovers, Ribbon Application Management Platform (RAMP) supports a deployment model that enables automatic switchover between geographically redundant (GR) instances. To enable automatic switchover, you must deploy three additional virtual machines (VMs) to monitor the RAMP GR

deployment. You must allocate an IP address to each VM. Also, ensure each VM is running an instance of etcd. Refer to [Setting Up an etcd Cluster](#) for the procedures to deploy the necessary VMs.

In a typical GR deployment, RAMP instances are deployed at two separate geographic sites. To enable automatic switchover, a VM running etcd is deployed at each RAMP site and at a third, “neutral” site. Together, the three etcd instances determine which RAMP instance is active.

RAMP GR is configured to use the etcd instances to select which RAMP instance is the active or “leader” instance. Before electing a site as the leader, etcd requires that the potential active instance achieves a “quorum” from the etcd instances. The concept of a quorum applies to the etcd cluster layer wherein at least two etcd nodes are needed to maintain a quorum amongst the etcd nodes in an etcd cluster.

Subsequently, if the standby RAMP instance finds it cannot communicate with the active RAMP, it communicates with etcd to see if the active RAMP is still reachable. As long as the active RAMP communicates with at least one etcd node and that etcd node has a quorum with the peer etcd nodes, no auto-switchover occurs. If fewer than two etcd nodes (one etcd node) communicate with the active RAMP, and the only etcd node that communicates with the active RAMP loses the quorum with the other etcd nodes in the etcd Cluster, then the RAMP triggers an auto-switchover.

In scenarios where the ETCD quorum is lost, although the communication is intact between the active and standby RAMPs, the OpenSAF controller stops all the RAMP processes on both the nodes to prevent a potential split-brain condition, resulting in both the nodes being moved to standby.

RAMP GR is supported for RAMP instances deployed in KVM, VMware, and OpenStack environments.

Prerequisites

- To enable the automatic switchover capability, ensure you have deployed the required three etcd VMs. Refer to [Setting Up an etcd Cluster](#).
- Two RAMP devices are up and running in the same environment with the same version.
- If the optional EdgeView (EV) service that enables managing SBC Edge devices is deployed, deploy it on both RAMP devices.
- For RAMP on KVM/VMware, the RAMP devices are running on separate host servers.
- The standby device is accessible from the active device, and vice versa.

If you have restored the database on an OpenStack deployment, password-less SSH from the active RAMP device to the standby RAMP device (and vice versa) is not possible until GR is configured.

- The same password is set for the `admin` and `insight` users on the active and standby devices.

The `insight` password is reset in the RAMP active device after restoring the database (with the password of the old database).

- If cron entries are created manually on the RAMP active device, you must also create the same cron entries on the standby device. In RAMP GR, cron entries are not copied and synchronized from active to standby, or vice versa.

To configure RAMP GR with automatic switchover, you must first create a redundancy template for the deployment and then run the GR setup script.

Generate a Redundancy Template

Use the script `RDbuild_config.sh` to generate a redundancy template for your GR deployment. This template is used to configure the deployment's redundancy parameters, including enabling the automatic switchover option.

1. Use the following command to generate a redundancy template. The script options are listed in the table below. Note that the example includes the "as" option to enable automatic switchover.

```
/etc/sonus/RDbuild_config.sh -o /opt/GRauto.conf -g gr:ipv4:as
```

Redundancy Template Script Parameters

Parameter	Description	Example	Optional (O) / Mandatory (M)?
-o	Name for the configuration file. Use this option along with -g.	<code>/etc/sonus/RDbuild_config.sh -o /opt/GRauto.conf -g gr:ipv4:as</code>	M
-g	Specify to generate a cluster configuration template. <code>RDbuild_config.sh -o <name for the template>.conf -g <the redundancy model>: <IP schema></code>	<code>/etc/sonus/RDbuild_config.sh -o /opt/GRauto.conf -g gr:ipv4:as</code>	M
<the redundancy model>	The redundancy model. Enter the following: ◦ gr for geographical redundancy	<code>/etc/sonus/RDbuild_config.sh -o GRauto.conf -g gr:ipv4:as</code>	M
<IP schema>	The IP schema. Enter the following: ◦ ipv4 for an IPv4 network ◦ ipv6 for an IPv6 network	<code>/etc/sonus/RDbuild_config.sh -o GRauto.conf -g gr:ipv4:as</code>	M

Parameter	Description	Example	Optional (O) / Mandatory (M)?
as	Option to enable automatic switchover	/etc/sonus/ RDbuidl_config.sh -o /opt/ GRauto.conf -g gr:ipv4:as	O
-h	List help topics.		O

2. Edit the generated template file to suit your deployment. Use the table below for more information on the parameters and values consistent with enabling automatic switchover.

Template File Parameters for GR Automatic Switchover

Parameter	Description	Value
Fixed Settings		
_primaryServer	The IP address of the node in which the cluster set up was initiated.	A valid IPv4/IPv6 address.
_clusterName	The name of the cluster.	Alphanumeric characters
_numSites	The number of sites in the cluster	2
_numNodes	The number of nodes in a site.	1
_pm_export_sync_to_standby	The flag to enable the PM export sync between active and standby nodes.	true or false
_totalNodes	The total number of nodes in the cluster.	2

Parameter	Description	Value
_ipschema	The IP address mode.	ipv4/ipv6
_site<site number>_name	The name for site <site number>.	Alphanumeric characters.
_auto_switchover	The flag to enable auto switchover.	yes
_arbitrator<number>_ip	The IP address of the arbitrator (etcd instance). For each of the 3 etcd instances.	A valid IPv4/IPv6 address.
_arbitrator<number>_port	The port number of the arbitrator (etcd instance). For each of the 3 etcd instances.	2379
_oss_info	The flag to configure Operations Support Systems (OSS) on RAMP.	no
Create Node (RAMP node information.)		
_node<node number>	The host name of the RAMP node <node number>.	Alphanumeric characters.
_node<node number>_id	The sequence number of the RAMP node <node number>.	1 or 2
_node<node number>_ip	The IP address of the RAMP node <node number>.	A valid IPv4/IPv6 address.
_node<node number>_site	The site name of the RAMP node <node number>.	Alphanumeric characters.

Configure RAMP GR Parameters

Use the following procedure to configure a RAMP GR deployment with automatic switchover enabled. Prior to running the procedure generate a redundancy template file that specifies to enable automatic switchover, as described in the previous section.

Run the GR configuration procedure on the RAMP device that you want as the source/active node for the GR deployment. It is not necessary to repeat the set up procedure on the target/standby device.

Start

1. On the RAMP device you want to establish as the source/active node in the GR deployment, log onto the CLI as the admin user.

2. Change to the `root` user.

```
sudo su -
```

3. Enter the following command, specifying the path and name for the redundancy template file generated for your GR deployment:

```
/etc/sonus/RDsetup.sh <absolute path to the redundancy template file>
```

An example specifying a redundancy template file, GRauto.conf, in the /opt directory:

```
/etc/sonus/RDsetup.sh /opt/GRauto.conf
```

An example output:

```
[16:17:41] Starting redundancy cluster setup .....  
[16:17:42]  
Building RD configuration locally .....  
Please enter Password of admin user for all nodes (press ENTER if not needed) ->  
admin
```

4. Enter the `admin` password.
The script completes setting up GR and the RAMP processes start shortly.
5. Log on to the activeRAMP node.
6. Change to the `insight` user to run a status check to verify that the system is healthy:

```
su - insight
```

7. Check the RAMP status:

```
/opt/sonus/ems/emsMgmt status
```

8. Log on to the CLI of the standby RAMP device as the `admin` user.
9. Change to the `insight` user:

```
sudo su - insight
```

10. Check the status on the RAMP standby node:

```
/opt/sonus/ems/emsMgmt status
```

If the configuration process is interrupted and you resume `RDsetup.sh`, the RAMP offers the following option:

```
Record showing the <script name> script was being executed and was not
completed.
Do you want to resume the operation from the previous point of failure (yes|
no)?.
```

Perform one of the following:

- Enter "yes" to resume the operation from the point of failure.
- Enter "no" to execute the script again. The RAMP shows the following message:

```
Do you want to proceed with a fresh new operation (yes|no)? ->
```

Perform one the following:

- Enter "yes" to execute the script.
- Enter "no" to terminate the session.

Setting Up an etcd Cluster

In this section:

- [Set up ETCD VMs on VMware](#)
 - [Create an ISO Configuration Drive for VMware](#)
 - [Create the etcd VMs Using the VMware GUI](#)
- [Set up the etcd VMs on KVM](#)
 - [Create an ISO Configuration Drive for KVM](#)
 - [Create the etcd VMs on a KVM Platform](#)
- [Set up etcd VMs on OpenStack](#)
- [Health Check etcd](#)

Related articles:

- [RAMP etcd System Requirements](#)
- [Configuring RAMP GR with Automatic Switchover Enabled](#)
- [Deployment Models](#)
- [RAMP Security Group Rules](#)
- [Configuring RAMP Redundancy](#)
- [Managing Redundancy](#)

For the purposes of monitoring a RAMP geographically redundant (GR) deployment to enable automatic switchover, three etcd VMs are required. Refer to [Configuring RAMP GR with Automatic Switchover Enabled](#) for information on how the etcd VMs are involved in the GR deployment.

You can instantiate these VMs on VMware, KVM, or OpenStack. You are not required to deploy the etcd VMs on the same platform as the RAMP instances.

Prerequisites

- Three free IPs are available to allocate to the etcd instances.
- The recommended configuration is 1 vCPU, 2GB of memory, and a minimum of 50GB of disk space. For more information, refer to [RAMP etcd System Requirements](#).
- Verify the network interfaces are connected and operable.
- Verify whether you have obtained the necessary installation files:
 - ISO configuration files
 - VMDK disk image files

Refer to [Download Files from Ribbon Support Portal](#) for information on using the portal.

Set up ETCD VMs on VMware

To set up ETCD on VMware-based VMs, first create an ISO configuration drive.

Create an ISO Configuration Drive for VMware

Complete the following procedure to set up an ISO configuration drive.

Start

1. Log on to the Ribbon Support portal. Download the `AppServices-configDrive.img` and the `AppServices-xx.xx.xxRxxx-xxxxx_vmCCS-x.x.x-xxxxx-xxx_xx.vmdk` files (refer to the release notes for the .vmdk file name).
Refer to [Download Files from Ribbon Support Portal](#) for information on using the portal.
2. Log on to a Linux server as the `root` user. On this server, create an `.iso` file from the provided template file (`AppServices-configDrive.img`) to use as a configuration drive for the VMs.
3. Create a temporary directory. In the following example the directory name is "etcd":

```
mkdir -p /tmp/etcd
```

4. Mount the image:

```
sudo mount AppServices-configDrive.img /tmp/etcd
```

5. Edit the cloud configuration. Refer to the following table for information on the parameters:

```
vim /tmp/etcd/user-data
```

Cloud Configuration Parameters

Parameters To Edit	Description	Example	Notes
hostname	Hostname of the VM in use	<code>hostname: "amm anetcd"</code>	

Parameters To Edit	Description	Example	Notes
fqdn	FQDN of the VM in use	fqdn: "ammanetc d.local"	
timezone	Choose the time zone	timezone: "Asia/ Kolkata"	
ntp	NTP server IP	servers: ["10.128.254.67"]	

Parameters To Edit	Description	Example	Notes
VnfName GatewayIpv4/ GatewayIpv6 ExternalIp	Name of the VNF as in "amman-ramp-geo-cluster" Gateway IP address of the etcd instance IP address of the etcd instance	# Ribbon vmCCS userdata: - content: { "VnfName": "amman-ramp-geo-cluster",	◦ Net{1,2,3}: Definition for the interface IF{1,2,3} ◦ Enabled : Indicates if the interface is enabled. Enabled is mandatory. You must set this to "true" or "false". ◦ GatewayIpv4: IPv4 gateway address for this interface, used to create a default route for egress packets with the source IP assigned to this interface ◦ GatewayIpv6: IPv6 gateway address for this interface, used to create a default route for egress packets with the source IP assigned to this interface. ◦ ExternalIp: External IP address for this interface ◦ Categories: List of category of traffic on this interface. By default, management is on net1, signaling and internal are on net2, and nothing is configured for net3. ◦ IsDefault: Indicates whether or not to assign the default route to this interface. Only one interface may have IsDefault=true . If false for all interfaces, the first interface with a gateway configured is assigned the default route. This parameter is not required if only one gateway was specified in the network-config file.

Parameters To Edit	Description	Example	Notes
		<pre> "Networks": { "Net1": { "Enabled": "True", "GatewayIpv4": "10.54.8.1", "GatewayIpv6": "", "ExternalIp": "10.54.8.166", "Categories": [], "IsDefault": "True" }, "Net2": { "Enabled": "False", "GatewayIpv4": "", "GatewayIpv6": "", "ExternalIp": "", "Categories": [], "IsDefault": "" }, "Net3": { "Enabled": "False", "GatewayIpv4": "", "GatewayIpv6": "", "ExternalIp": "", "Categories": [], "IsDefault": "" } }, </pre>	

Parameters To Edit	Description	Example	Notes
Etcd	Etcd configuration	<pre> "Etcd": { "ExistingEndpoints" : [], "PersistentDataPath" : "", "PersistentBackupPath" : "", "RootPassword" : "", "UserName" : "", "UserPassword" : "", "ClientCert" : "", "ClientKey" : "", "ClientCaCert" : "", "ServerCert" : "", "ServerKey" : "", "ServerCaCert" : "", "PeerCert" : "", "PeerKey" : "", "PeerCaCert" : "", "HeartbeatInterval" : "", "ElectionTimeout" : "", "BackupDiskMaxUse" : "", "BackupDiskKeepFree" : "", </pre>	◦ PersistentDataPath: Path to the persistent disk to use for Etcd data. The virtio number corresponds to the Etcd data volume ID provided in the deployment. ◦ RootPassword: The Etcd database password for the root user. If left blank, no authentication is enabled on the database. In a HA setup, the passwords must match on all the virtual machines. ◦ UserName: The name of a user to create in the Etcd database. This field is ignored if the RootPassword is empty. No user is created if this field is left blank. ◦ UserPassword: The password of a user to create in the Etcd database. This field is ignored if the RootPassword is empty. No user is created if this field is left blank. ◦ HeartbeatInterval: The interval (in ms) at which the leader notifies followers that it is still the leader. The recommended value to set is around the maximum of average round-trip time (RTT) between members, it is normally around 0.5-1.5x the round-trip time. If this field is left blank or omitted, the default value is 100 ms.

Parameters To Edit	Description	Example	Notes
		<pre>"BackupStartTime" : "", "BackupFullPeriod" : "0", "BackupRetention" : "" },</pre>	◦ ElectionTimeout: The duration (in ms) that a follower node performs without hearing a heartbeat before attempting to become the leader. The recommended value to set must be at least 10 times the RTT to account for a variance in the network. If this field is left blank or omitted, the default value is 1000 ms. ◦ BackupDiskMaxUse: The maximum percentage of the disk that allowed to be occupied by the Etcd backup files. The default value is 15. ◦ BackupDiskKeepFree: The percentage of disk that must be left free on the file system. The oldest backup files are deleted when this limit is reached. The default value is 30. ◦ BackupStartTime: The time of day when the scheduled backup starts. The format is in hh:mm±hh:mm. The first part of the format is the start time and second part is an offset (from UTC) to specify the time zone. If the time zone is not specified, then the local time zone of the virtual machine processing the request is used as the default time zone. The default value is 02:00.

Parameters To Edit	Description	Example	Notes
			◦ BackupFullPeriod : The interval at which a full backup of the etcd full is performed. This is expressed in the format of weeks and/or days, or hours. For example, 1w2d or 4h. Hours are not allowed to be provided with days or weeks. • The maximum allowed value for hours is 23h. • The minimum allowed value is 1h. • 0 means that no backup is performed. The default value is 1d. Note Set the BackupFullPeriod as 0 (Zero). ◦ BackupRetention : Specifies how long the backup files are retained before deleting the file(s). An empty value means that the backup files are retained for 7 days. This is expressed in the format of weeks, days and/or hours. For example, 1w24h or 2d.

Parameters To Edit	Description	Example	Notes
EtcdRegistries	IP addresses of any etcd instances created before	<pre>"VnfOperations": { "EtcdRegistries": [], "EtcdUserName": "admin", "EtcdUserPassword": "admin", "Salt": "mysalt@123"</pre>	VM communicate uses this function with the ETCD cluster for network function coordination, for example to register this VM for monitoring. Information on how to reach the ETCD cluster members and the options on how to fill this field are explained below: ◦ Recommended: Single entry pointing to an SRV FQDN that then points to all ETCD instances. This is recommended because SRV records can be updated with topology changes. ◦ Empty: This will cause the VM to always communicate to the local ETCD which has knowledge of the List of all planned members IPs.
VnfExistingInstances	IP addresses of any etcd instances created before	<pre>"VnfExistingInstances" : ["10.54.8.166","10.54.8.165"], "VnfReplaceInstance" : "", "UseMongoDB" : "", "UseEtcd" : "True", "UsePrometheus" : "", "UseAlertManager" : "";</pre>	While creating the first instance, "VnfExistingInstances" does not contain any value. While creating the second instance, "VnfExistingInstances" must contain the IP address of first etcd instance that was created. While creating the third instance, "VnfExistingInstances" must contain the IP addresses of the first and second etcd instances that were created.

6. Issue the following command to edit the network configuration:

```
vim /tmp/etcd/network-config
```

Edit the following parameters in the network-config file:

Parameters To Edit	Description	Example
addresses gateway4/gateway6	IP address to assign to this interface. The default gateway.	# DO NOT CHANGE version: 2 # List of network interfaces ethernets: # Network 1 eth0: addresses: # List of IP[v4,v6] addresses to assign to this interface - 10.54.48.60/23 # example: 10.20.30.5/24, fd00:10:6b50:5180::24/60 # Disable if not using IPv4 gateway4: "10.54.48.1" # Default IPv4 gateway – you can move it to another interface, if desired (example: default gateway on eth2) # Enable if using IPv6 # gateway6: "" # Default IPv6 gateway – you can move it to another interface, if desired (example: default gateway on eth2)

7. Run `genisoimage` command to create the `.iso` file:

```
genisoimage -o etcd.iso -V cidata -r /tmp/etcd
```

8. After creating the `.iso` file, issue the following commands to remove the temporary `etcd` directory:

```
sudo umount /tmp/etcd  
rm -rf /tmp/etcd
```

The ISO configuration is now complete.

9. Copy the `.iso` file created and the `AppServices-xx.xx.xxRxxx-xxxxxx_vmCCS-x.x.x-xxxxxx-xxx_xx.vmdk` files (refer to the release notes for the `.vmdk` file name) to the VMware host datastore location (`/vmfs/volumes/datastore1/etcdvnf`).

Create the etcd VMs Using the VMware GUI

Complete the following steps to instantiate the etcd VMs using the VMware GUI.

- Log on to the VMware ESXi GUI.
- Upload the VMDK and ISO installation files to the VMware server using the VMware ESXi GUI:
 - In the left navigation menu, select **Storage**.

- b. Under **Storage**, select a datastore device to which you want to upload.
- c. Select **Datastore browser**.
- d. Within the datastore, select an existing directory where you want to store the original images, or click **Create directory** to create a new directory for this purpose. **Example directory name:**
`etcdvnf-orig`.
- e. In the target directory, select **Upload** and then navigate to one of the installation files and upload it. Select **Upload** again and repeat the process to locate and upload each VMDK and ISO file until you have uploaded all of the installation files.
- f. Check the Datastore browser status or check the VMware GUI's "Recent Tasks" pane to ensure that all of the uploads are completed before continuing.

The uploaded VMDK files are in a sparse format. Sparse disk images cannot be used directly to launch a VM. These files must be converted to a flat format. The process of copying the files, as described in the following step, automatically converts the files to the flat format that is required to launch a VM.

3. Create a copy of the appropriate VMDK image file (AppServices) for each VM you plan to deploy.

Copies are essential because, during the VM creation process, the VMDK image file is transformed into a disk image. This means you cannot reuse the same file to create another VM instance. To launch multiple VM instances, you need to make a copy of the original VMDK image file for each instance. Each time you create a copy, the VMDK file is automatically converted into a flat VMDK file, which can then be used to launch a VM.

To copy a VMDK image file:

- a. In the **Datastore browser**, select an original VMDK file that was uploaded and select **Copy**.
- b. Select an existing folder that you want to hold the active VM disk images or click **Create directory** to create a new directory for this purpose. **Example directory name:** `etcdvnf`.
- c. Name the image file copies appropriately according to the type of VM they will launch. Ribbon recommends to include the version in the name to avoid confusion during upgrade.
Examples: `vmwappdb1_23.02.00R000.vmdk`, `vmwappdb2_23.02.00R000.vmdk`.
- d. Repeat the previous steps to copy an original VMDK image file for each VM that you plan to launch.

4. Create the first VM.

These instructions apply to all the VMs: initially to the first Services VM, and then to the second and third Services VMs, respectively.

For CPU, memory (RAM), Hard Disk and Host OS requirements of each VM, refer to [RAMP etcd System Requirements](#).

- a. Create the new VM.
 From the VMware GUI home menu, use the menus to create a new VM.
 - i. Select *Virtual Machines -> Create / Register VM -> Create a new virtual machine*.
 - ii. Click **Next** to continue.
 - iii. In the **Select a name and guest OS** menu:
 1. Provide the host name for the VM.
Example host name for the first Services VM: `vmwappdb1`

2. Select the Operating System (OS).
Example: Compatibility ESXi 6.7 virtual machine, Guest OS Family Linux, Guest OS Version **Red Hat Enterprise Linux 8 (64-bit)**.
 - iv. Click **Next** to continue.
 - v. In the **Select storage** menu:
 1. If the Standard and Persistent Memory options appear, select **Standard** for the storage type.
 2. Choose the appropriate datastore for the VM's configuration files and virtual disks.
Example datastore name: datastore1, Capacity: 500 GB, Free: 460 GB, Type: VMFS6, Thin provisioning: Supported, Access: Single
 - vi. Click **Next** to continue.
- b. Customize the new VM.
- In the **Customize settings** menu, configure the VM hardware.
- i. Select the **VM Options** tab.
 1. Click **Boot options** from the list.
 2. Select **BIOS** for Firmware.
 - ii. Select the **Virtual Hardware** tab.
 - iii. Configure the VM CPU and memory.
Example configurations:
 1. Select **1 CPU and 2 GB RAM** for a Services VM.
 - iv. Set up the VMDK (Virtual Machine Disk) hard drive.
 1. Delete the default hard disk (Hard disk 1) by selecting the "X" next to it.
 2. Select **Add hard disk**.
 3. In the pop-up window select **Existing hard disk**.
 4. In the **Datastore browser** window, browse the datastore folder and select the file corresponding to the appropriate VMDK file you created earlier.
 - a. Example file name if creating a Services VM: vmwappdb1.vmdk (or vmwappdb2.vmdk or vmwappdb3.vmdk)
 5. Click **Select** to continue.
 6. Change the **Controller location** (or "Virtual Device Node") and "Virtual Device Node unit" to **IDE controller 0** and **Master**.
 7. Click the expand/contract triangle of the **New Hard disk** list to contract the list and make the rest of the **Customize settings** visible.
 - v. Set up the ISO configuration drive.
- Warning**

Even after initial installation, the configuration drive must remain mounted.
1. On the CD/DVD Drive change the drop down to **Datastore ISO file**.
 2. In the **Datastore browser** window, browse the datastore folder and select the file corresponding to the appropriate ISO file you transferred earlier.
 - a. Example file name if creating a Services VM:
vmwappdb1.iso (or vmwappdb2.iso or vmwappdb3.iso if creating the second or third Services VM)
 3. Click **Select** to continue.
- vi. **Configure Networking.**
Select the appropriate network.
- c. Finish creating the new VM and power it on.
- i. Click **Next** in the **Customize settings** menu to continue.

- ii. In the **Ready to complete** menu, review the settings you have selected.
- iii. Click **Finish** to complete the creation of the VM.
- iv. Power on (activate) the VM.
In the list of Virtual Machines, right-click the VM you just created.
Select *Power* -> *Power on*.
- v. Verify the services that are running on the VM. After about ten minutes, run the `vmccs-status` command from the SSH login to verify all services are running on the VM.

Note

Once all services are up and running, you can start the next VM.

Set up the etcd VMs on KVM

To set up ETCD on KVM-based VMs, first create an ISO configuration drive.

Create an ISO Configuration Drive for KVM

Complete the following procedure to set up an ISO configuration drive.

Start

1. Log on to the Ribbon Support portal. Download the `AppServices-configDrive.img` and the `AppServices-22.07.00R000-B3500_vmCCS-1.4.1-B2297-x86_64.qcow2` files. Refer to [Download Files from Ribbon Support Portal](#) for information on using the portal.
2. Log onto a Linux server as the `root` user. On this server, create an `.iso` file from the provided template file (`AppServices-configDrive.img`) to use as a configuration drive for the VMs.
3. Create a temporary directory. In the following example the directory name is "etcd":

```
mkdir -p /tmp/etcd
```

4. Mount the image.

```
sudo mount AppServices-configDrive.img /tmp/etcd
```

5. Issue the following command to edit the cloud configuration. Refer to the following table for information on the parameters:

```
vim /tmp/etcd/user-data
```

Cloud Configuration Parameters

Parameters To Edit	Description	Example	Note
hostname	Hostname of the VM in use	hostname: "amma netcd"	

Parameters To Edit	Description	Example	Note
fqdn	FQDN of the VM in use	fqdn: " ammanetc d .local"	
timezone	Choose the time zone	timezone: "Asia/ Kolkata"	
ntp	NTP server IP	servers: ["10.128.254.67"]	

Parameters To Edit	Description	Example	Note
VnfName GatewayIpv4/ GatewayIpv6 Externallp	hostname: ammanetcd1 VnfName: amman- ramp-geo-cluster Gateway IP address of the etcd instance Externally visible IP address of the ETCD instance.	# Ribbon vmCCS userdata: - content: { "VnfName": "amman-ramp-geo- cluster",	◦ Net{1,2,3}: Definition for the interface IF{1,2,3} ◦ Enabled : Indicates if the interface is enabled. Enabled is mandatory. You must set it to "true" or "false". ◦ GatewayIpv4: IPv4 gateway address for this interface, used to create a default route for egress packets with the source IP assigned to this interface ◦ GatewayIpv6: IPv6 gateway address for this interface, used to create a default route for egress packets with the source IP assigned to this interface ◦ ExternalIp: The IP used to access the interface from an external source may differ. For instance, if the virtual machine (VM) is behind a NAT, like when using a floating IP in an OpenStack environment, the externally visible IP will not match the internal IP configured on the VM's interface. This is necessary to ensure that we present the correct external IP to the outside world. ◦ Categories: List of category of traffic on this interface. By default, management is on net1, signaling and internal are on net2, and nothing is configured for net3.

Parameters To Edit	Description	Example	Note
		<pre> "Networks": { "Net1": { "Enabled": "True", "GatewayIpv4": "", "GatewayIpv6": "fd00:10:6b50:40c0: :1", "Externallp": "fd00:10:6b50:40c0: :24", "Categories": [], "IsDefault": "True" }, "Net2": { "Enabled": "False", "GatewayIpv4": "", "GatewayIpv6": "", "Externallp": "", "Categories": [], "IsDefault": "" }, "Net3": { "Enabled": "False", "GatewayIpv4": "", "GatewayIpv6": "", "Externallp": "", "Categories": [], "IsDefault": "" } } </pre>	◦ IsDefault: Indicates whether or not to assign the default route to this interface. Only one interface may have IsDefault=true. If false for all interfaces, the first interface with a gateway configured is assigned the default route. This parameter is not required if only one gateway was specified in the network-config file.

Parameters To Edit	Description	Example	Note
Etcd	Etcd configuration	<pre> "Etcd": { "ExistingEndpoints" : [], "PersistentDataPath" : "", "PersistentBackupPath" : "", "RootPassword" : "", "UserName" : "", "UserPassword" : "", "ClientCert" : "", "ClientKey" : "", "ClientCaCert" : "", "ServerCert" : "", "ServerKey" : "", "ServerCaCert" : "", "PeerCert" : "", "PeerKey" : "", "PeerCaCert" : "", "HeartbeatInterval" : "", "ElectionTimeout" : "", "BackupDiskMaxUse" : "", "BackupDiskKeepFree" : "" </pre>	◦ PersistentDataPath: Path to the persistent disk to use for Etcd data. The virtio number corresponds to the Etcd data volume ID provided in the deployment. ◦ RootPassword: The Etcd database password for the root user. If left blank, no authentication is enabled on the database. In a HA setup, the passwords must match on all the virtual machines. ◦ UserName: The name of a user to create in the Etcd database. This field is ignored if the RootPassword is empty. No user is created if this field is left blank. ◦ UserPassword: The password of a user to create in the Etcd database. This field is ignored if the RootPassword is empty. No user is created if this field is left blank. ◦ HeartbeatInterval: The interval (in ms) at which the leader notifies followers that it is still the leader. The recommended value to set is around the maximum of average round-trip time (RTT) between members, it is normally around 0.5-1.5x the round-trip time. If this field is left blank or omitted, the default value is 100 ms.

Parameters To Edit	Description	Example	Note
		<pre>"BackupStartTime" : "", "BackupFullPeriod" : "0", "BackupRetention" : "" },</pre>	◦ ElectionTimeout: The duration (in ms) that a follower node performs without hearing a heartbeat before attempting to become the leader. The recommended value to set must be at least 10 times the RTT to account for a variance in the network. If this field is left blank or omitted, the default value is 1000 ms. ◦ BackupDiskMaxUse: The maximum percentage of the disk that allowed to be occupied by the Etcd backup files. The default value is 15. ◦ BackupDiskKeepFree: The percentage of disk that must be left free on the file system. The oldest backup files are deleted when this limit is reached. The default value is 30. ◦ BackupStartTime: The time of day when the scheduled backup starts. The format is in hh:mm±hh:mm. The first part of the format is the start time and second part is an offset (from UTC) to specify the time zone. If the time zone is not specified, then the local time zone of the virtual machine processing the request is used as the default time zone. The default value is 02:00.

Parameters To Edit	Description	Example	Note
			◦ BackupFullPeriod : The interval at which a full backup of the Etcd full is performed. This is expressed in the format of weeks and/or days, or hours. For example, 1w2d or 4h. Hours are not allowed to be provided with days or weeks. • The maximum allowed value for hours is 23h. • The minimum allowed value is 1h. • 0 means that no backup is performed. The default value is 1d. NOTE: Set the BackupFullPeriod as 0 (Zero). ◦ BackupRetention : Specifies how long the backup files are retained before deleting the file(s). An empty value means that the backup files are retained for 7 days. This is expressed in the format of weeks, days and/or hours. For example, 1w24h or 2d.

Parameters To Edit	Description	Example	Note
EtcdRegistries	Information to connect to the ETCD cluster	<pre>"VnfOperations": { "EtcdRegistries": [], "EtcdUserName": "admin", "EtcdUserPassword": "admin", "Salt": "mysalt@123"</pre>	VM communicate uses this function with the ETCD cluster for network function coordination, for example to register this VM for monitoring. Information on how to reach the ETCD cluster members and the options on how to fill this field are explained below: ◦ Recommended: Single entry pointing to an SRV FQDN that then points to all ETCD instances. This is recommended because SRV records can be updated with topology changes. ◦ Empty: This will cause the VM to always communicate to the local ETCD which has knowledge of the List of all planned members IPs.
VnfExistingInstances	IP addresses of any etcd instances created before	<pre>"VnfExistingInstances": ["10.54.8.166","10.54.8.165"], "VnfReplaceInstance" : "", "UseMongoDB" : "", "UseEtcd" : "True", "UsePrometheus" : "True", "UseAlertManager" : "True",</pre>	While creating the first instance, "VnfExistingInstances" does not contain any value. While creating the second instance, "VnfExistingInstances" must contain the IP address of first etcd instance that was created. While creating the third instance, "VnfExistingInstances" must contain the IP addresses of the first and second etcd instances that were created.

Parameters To Edit	Description	Example	Note
Prometheus	Prometheus configuration	"Prometheus": { "PersistentDataPath" " : "", "MaxDiskUsage" : "40" }	Prometheus configuration Fields: ◦ PersistentDataPath: Path to the persistent disk to use for Prometheus and AlertManager data. The virtio number corresponds to the Prometheus data volume ID provided in the deployment. ◦ MaxDiskUsage: Maximum disk usage allowed by Prometheus data in percent of the total disk size.

Example etcd userdata:

```
#cloud-config

# Hostname to use for this VM
hostname: "ammanetcd"

# FQDN to use for this VM, usually just <hostname>.local
fqdn: "ammanetcd.local"

# DO NOT CHANGE
preserve_hostname: false

# DO NOT CHANGE
manage_etc_hosts: true

# List of groups to create on this VM
groups:
  # User part of this group can read backup files
  - backup_group # This group name is used by ansible during the VM initial
  configuration

# List of users to create/update on this VM
users:
  # Recommended user for systems administrators
  - name: root
    plain_text_passwd: "Sonus@123"
    lock_passwd: false

  - name: sysadm
    plain_text_passwd: "shipped!!"
```

```

lock_passwd: false

            "BackupDiskMaxUse"        : "15",

```

```

        "BackupDiskKeepFree"    : "30",
        "BackupStartTime"       : "02:00",
        "BackupFullPeriod"      : "0",
        "BackupRetention"       : ""
    },

    "Prometheus": {
        "PersistentDataPath"    : "",
        "MaxDiskUsage"          : "40"
    }
}
path: /etc/rbbn/appservices/userdata.json
owner: root:root
permissions: '0600'

# DO NOT CHANGE
runcmd:
  # Launch main vmCCS playbook (downstream plays are launched by this playbook)
  - ansible-playbook /etc/rbbn/podman/configure.yml

```

6. Issue the following command to edit the network configuration:

```
vim /tmp/etcd/network-config
```

Edit the following parameters in the network-config file:

Parameters To Edit	Description	Example
addresses	IP address to assign to this interface.	# DO NOT CHANGE version: 2
gateway4/ gateway6	The default IP gateway.	# List of network interfaces ethernets: # Network 1 eth0: addresses: # List of IP[v4,v6] addresses to assign to this interface - 10.54.48.60/23 # example: 10.20.30.5/24, fd00:10:6b50:5180::24/60 # Disable if not using IPv4 gateway4: "10.54.48.1" # Default IPv4 gateway – can move it to another interface, if desired (example: default gateway on eth2) # Enable if using IPv6 # gateway6: "" # Default IPv6 gateway – you can move it to another interface if desired (example: default gateway on eth2)

7. Issue the `genisoimage` command to create the ISO file:

```
genisoimage -o etcd.iso -V cidata -r /tmp/etcd
```

8. After creating the ISO file, issue the following commands to remove the temporary etcd directory:

```
sudo umount /tmp/etcd
rm -rf /tmp/etcd
```

The ISO configuration is now complete.

9. Copy the `.iso` file created and the `AppServices-22.07.00R000-B3500_vmCCS-1.4.1-B2297-x86_64.qcow2` to the KVM host.

Create the etcd VMs on a KVM Platform

Complete the following steps to instantiate the etcd VMs on a KVM platform.

Start

1. Install the VNF using `virt-install`.

In the following example command:

`--network` assumes that a bridge called `br0` is the VNF's network interface. If you choose to deploy with two network interfaces, add another `--network` statement with the bridge for the second interface. The order of `--network` is the same as the order of interfaces in the VM (`eth0`, `eth1`, ...).

```
export VNF_NAME=ammanetcd # Replace with your desired VM name

sudo virt-install \
  --name $VNF_NAME \
  --memory 2048 \
  --disk /var/lib/libvirt/images/AppServices-22.07.00R000-B3500_vmCCS-1.4.1-B2297-x86_64.qcow2,device=disk,bus=virtio \
  --disk /var/lib/libvirt/images/etcd.iso,device=disk,bus=virtio,readonly=on \
  --os-type linux \
  --os-variant rhel8.2 \
  --graphics none \
  --network bridge=br0,model=virtio \
  --import
```

To validate that services are running once the VM is ready, check the status of `appservices` using the following command as `sysadm` user.

```
$ vmccs-status
```

Example vmccs-status output:

```

$ vmccs-status
Validating backup-manager services status...
    backup-manager: active (running)
backup-manager is active

Validating Etcd services status...
    etcd: active (running)
Etcd is active

Validating Fluentbit services status...
    td-agent-bit: active (running)
    fluent-sd: active (running)
    fluent-sd-watch: active (running)
Fluentbit is active

Validating nginx services status...
    nginx: active (running)
    nginx-exporter: active (running)
nginx is active

Validating Node Exporter services status...
    node-exporter: active (running)
Node Exporter is active

Validating Prometheus services status...
    prometheus: active (running)
    prometheus-autoconfig: active (running)
    alertmanager: active (running)
    alertmanager-watch: active (running)
Prometheus is active

Validating SDR services status...
    sdr: active (running)
SDR is active

Validating VNF Operations services status...
    vnf-operations: active (running)
VNF Operations is active

All required vmCCS services are active.

```

Network **interface** roles

```

.-----+-----+-----+-----+
| Default Gateway | Management | Internal  | Signaling |
.-----+-----+-----+-----+
|      eth0      |      eth0  |      eth0 |      eth0  |
.-----+-----+-----+-----+

```

Set up etcd VMs on OpenStack

Complete the following steps to instantiate VMs on OpenStack on which you will run etcd.

Start

1. Log on to the Ribbon Support portal. Download the Heat template file (heat_template.yml) and image file (AppServices-22.12.00R000-B4256_vmCCS-1.5.3-x86_64.qcow2). Refer to [Download Files from Ribbon Support Portal](#) for information on using the portal.
2. Create or re-use an existing flavor that specifies the recommended configuration (1 vCPU, 2GB of memory, 50GB of disk space). Refer to [Create an OpenStack Flavor](#).
3. Create a security group that defines "allow" rules for the following ingress and egress traffic. Refer to [Create a Security Group](#).

Port	Description
2381	etcd Prometheus exporter
9013	Nginx Prometheus exporter
9100	Prometheus node exporter (metrics)
9292	Backup-manager Prometheus exporter
9090	Prometheus
9093	Prometheus AlertManager client
9801	Service Discovery Representative (SDR) Prometheus exporter
9802	nf-operations exporter
9803	vnf-operations exporter
24231	Fluentbit Prometheus exporter
9094	Prometheus AlertManager cluster communication
2379	etcd client requests
2380	etcd peer communication

4. Configure an external network for your deployment. Refer to [Create an External Network](#).

Name	Description	Default
ext_net1	Public network with floating IP addresses for network 1. Used to allocate a floating IP to the instance.	EXT_OAM_0_STATIC

5. Create a ETCD image on the Glance image server using the qcow2 image file you downloaded. Refer to [Create a Glance Image](#).
6. Use the OpenStack GUI to launch the etcd instance. On the **Launch Stack** window, use the following table to edit the following configurations, as needed, for your environment.

Parameter	Description	Mandatory	Example
image	Image to use for the etcd VM, use the image uploaded in step 5	Yes	AppServices-22.12.00A000-B4225_vmCCS-1.6.0-alpha-B2575-x86_64.qcow2
flavor	OpenStack flavour to use, use the flavour created at step 2	Yes	46fd3493-108e-456d-9c47-66a1ea95d699
security group	Security group to use for the VM, use the security group create at step 3	Yes	default
authorized key	SSH public keys authorized to connect to this VNF.	Yes	
availability zone	Network availability zone for this VNF.	No	
management interface hostname	Hostname to use for management interface.	No	ammanetcd
management interface domain name	Domain name to use for management interface.	No	local
user root password	Password for the root user of the VNF instance.	No	Sonus@123
user sysadm password	Password for the <code>sysadm</code> user of the VNF instance. (<code>sysadm</code> is the administrative account)	Yes	Sonus@123

Parameter	Description	Mandatory	Example
Etcd registries	VM communicate uses this function with the etcd cluster for network function coordination, for example to register this VM for monitoring. Information on how to reach the etcd cluster members and the options on how to fill this field are explained below: ◦ Recommended: Single entry pointing to an SRV FQDN that then points to all etcd instances. This is recommended because SRV records can be updated with topology changes. ◦ Empty: This will cause the VM to always communicate to the local etcd which has knowledge of the List of all planned members IPs.	No	
Existing VNF instances	IP addresses of any etcd instances created before.	Yes	fd00:10:6b50:61b0::4c7,fd00:10:6b50:61b0::1bc
Etcd username	Name of an etcd user with read/write permissions to all keys related to VNF operations.	No	
Etcd password	Password of for the etcd user with read/write permissions to all keys related to VNF operations.	No	
Salt	Salt value for cryptography operations done during VNF operations. Ensure it is the same for all VMs of a deployment. Ribbon recommends making it unique per deployment.	No	
Use Etcd	Provide etcd as a service.	Yes	true
Use_prometheus	Provide Prometheus as a service.	Yes	true

Parameter	Description	Mandatory	Example
Use_alertmanager	Provide Prometheus Alertmanager as a service.	Yes	true
Use_mongo	Provide a MongoDB server as a service.	Yes	False
etcd_data_volume_id	Identifier of the Cinder volume to use for etcd data.	No	
etcd_backup_volume_id	Identifier of the Cinder volume to use for etcd backup.	No	
etcd_root_password	Password for the etcd root user. This user has all access to etcd including creation of users, policies, removing kes store etc.	No	
etcd_user_name	Username for a etcd user. This user has read/write permission on path with same name.	No	
etcd_user_password	Password for the etcd user.	No	
etcd_client_cert	etcd GRPC client certificate. Used for init and etcdctl commands.	No	
etcd_client_key	etcd GRPC client private key. Used for init and etcdctl commands.	No	
etcd_client_ca_cert	etcd GRPC client CA certificate. Used for init and etcdctl commands.	No	
etcd_server_cert	etcd GRPC server certificate. Used for grpc server.	No	
etcd_server_key	etcd GRPC server private key. Used for grpc server.	No	
etcd_server_ca_cert	etcd GRPC server CA certificate. Used for grpc server.	No	
etcd_peer_cert	etcd GRPC peer certificate. Used for clustering.	No	

Parameter	Description	Mandatory	Example
etcd_peer_key	etcd GRPC peer private key. Used for clustering.	No	
etcd_peer_ca_cert	etcd GRPC peer CA certificate. Used for clustering.	No	
etcd_heartbeat_interval	Interval in ms at which the leader will notify followers that it is still the leader.	No	
etcd_election_timeout	Describes how long in ms a follower node will go for without hearing a heartbeat before attempting to become leader itself.	No	
etcd_backup_disk_max_use	Maximum percentage of the disk that may be occupied by etcd backup files.	No	
etcd_backup_disk_keep_free	Percentage of disk that must be left free on the file system. The oldest backup files will be deleted when this limit is reached.	No	
etcd_backup_start_time	Time of day when backup schedule starts in hh:mm+hh:mm or hh:mm-hh:mm format. First part of the format is the start time and second part is an offset (from UTC) for specifying the time zone. If the time zone is not specified, local time zone of the VM processing the request will be used as the default time zone.	No	
etcd_backup_full_period	Interval at which the etcd full backups are performed. Expressed in weeks and/or days, or hours format, e.g. 1w2d or 4h. Hours cannot be provided with days or weeks. Maximum value for hour is 23h. 0 means that no backup is performed.	No	

Parameter	Description	Mandatory	Example
etcd_backup_retention	Time specifies how long to wait before deleting the file(s). Empty value means that we keep the files for 7 days. It is expressed in weeks, days and/or hours format, e.g. 1w24h or 2d.	No	
prometheus_data_volume_id	Identifier of the Cinder volume to use for Prometheus and/or AlertManager data.	No	
prometheus_max_disk_usage_in_percent	Maximum disk usage allowed by Prometheus data in percent of the total disk size.	No	
DNS nameserver(s)	Comma-separated list of DNS nameservers to use in the private subnet.	No	fd00:10:6b50:61c0::4d1,fd00:10:6b50:61c0::4d2
DNS search domains	Comma-separated list of DNS search domains to use in the private subnet.	No	rbbn.com
NTP server(s)	Comma-separated list of time servers to use for clock synchronization.	No	fd00:10:6b50:61c0::4d3
NTP time zone	Time zone used for clock synchronization.	No	America/New_York
elasticsearch_host_addr	Remote Elasticsearch node's hostname or IP address. Used for log aggregation.	No	
elasticsearch_host_port	Remote Elasticsearch node port. Used for log aggregation.	No	
elasticsearch_index	Index name to use for Elasticsearch logging destination. Used for log aggregation.	No	
elasticsearch_http_user	Username credential for X-Pack access.	No	

Parameter	Description	Mandatory	Example
elasticsearch_http_password	Password for user defined in HTTP_User.	No	
elasticsearch_tls_enabled	Enable or disable TLS support.	Yes	Off
elasticsearch_tls_verify	Force certificate validation.	Yes	On
elasticsearch_record_type_filters	Comma-separated list of record type filter(s) to use for elasticsearch (tdr, log)	Yes	tdr, log
syslog_host_addr	Remote syslog node's hostname or IP address. Used for log aggregation.	Yes	10.54.21.201
syslog_host_port	Remote syslog node's port. Used for log aggregation.	Yes	514
syslog_protocol	Remote syslog node's transport protocol. Used for log aggregation.	Yes	"udp", "tcp", "tls"
syslog_record_type_filters	Comma-separated list of record type filter(s) to use for syslog (tdr, log)	Yes	tdr,log
syslog_ca_cert	Remote syslog node's CA certificate. Used for sending logs over TLS (protocol set to 'tls'). Line breaks must be converted to '\n' - see user guide.	No	
fluent_host_addr	FluentD/Fluent Bit aggregator node hostname or IP address. Used for log aggregation.	No	
fluent_host_port	FluentD/Fluent Bit aggregator node port. Used for log aggregation.	No	
fluent_record_type_filters	Comma-separated list of record type filter(s) to use for FluentD/Fluent Bit aggregator node (tdr, log).	Yes	

Parameter	Description	Mandatory	Example
ext_net1	Network 1 used to allocate an IP to the instance.	Yes	EXT_OAM_0_STATIC
use_net2	If true, add a second network interface.	Yes	False
ext_net2	Network 2 used to allocate an IP to the instance.	No	
use_net3	If true, add a third network interface.	Yes	False
ext_net3	Network 3 used to allocate an IP to the instance.	Yes	
default_net	Network on which default gateway is defined. This determines the interface which is assigned the 0.0.0.0/0 route in the server.	Yes	
management_net	Network used for configuration, management and metrics traffic. If network 2 or 3 are specified, they must be enabled.	Yes	1
signaling_net	Network used for signaling traffic. If network 2 or 3 are specified, they must be enabled.	Yes	2
internal_net	Network used for database & application-internal traffic. If network 2 or 3 are specified, they must be enabled.	Yes	2
routes_net1	Comma-delimited list of destination subnets for which traffic should be sent through eth0 (network 1). These routes should align with the ingress networks configured above. Multiple routes may be specified as a comma-delimited list.	No	

Parameter	Description	Mandatory	Example
routes_net2	Comma-delimited list of destination subnets for which traffic should be sent through eth1 (network 2). These routes should align with the ingress networks configured above. Multiple routes may be specified as a comma-delimited list.	No	
routes_net3	Comma-delimited list of destination subnets for which traffic should be sent through eth2 (network 3). These routes should align with the ingress networks configured above. Multiple routes may be specified as a comma-delimited list.	No	
service_registries	Comma-separated list of service registry servers to use for service discovery.	No	
dns_nameservers	Comma-separated list of DNS nameservers to use in private subnet.	No	
dns_search	Comma-separated list of DNS search domains to use in private subnet.	No	
ntp_servers	Comma-separated list of time servers to use for clock synchronization.	Yes	10.128.254.67
time_zone	Time zone used for clock synchronization. Format: time zone database, e.g. 'America/New_York'	Yes	Asia/Kolkata
vnf_instances	Comma-separated list of existing VNF instance(s) IP address. The internal interface IPs of the previously instantiated instances in the AppServices cluster should be applied here.	No	

Parameter	Description	Mandatory	Example
vnf_replace	Existing VNF instance IP address to replace. This new instance will replace the instance specified here.	No	
use_etcd	Provide etcd as a service.	True	
use_prometheus	Provide Prometheus as a service.	True	
use_alertmanager	Provide Prometheus Alertmanager as a service.	True	
backup_username	Defines a user that can access and retrieve the DB backup files.	Yes	backup_user
backup_user_password	Password for the backup user of the VNF instance. If left blank, user will not be created.	No	
backup_user_key	SSH public key authorized to connect to the backup user account. Use this parameter with caution in production settings.	No	
mongo_data_volume_id	Identifier of the Cinder volume to use for MongoDB data.	No	
mongo_backup_volume_id	Identifier of the Cinder volume to use for MongoDB backup.	No	
mongo_authkey	Authentication key used to authenticate each MongoDB instances together. Only required when using password authentication.	No	MongoDB auth key must be between 6 and 1024 characters and use base64 characters only.
mongo_admin_password	Password for the MongoDB admin user. This user has read/write permissions in all databases. If this is left empty, MongoDB will be configured without authentication.	No	

Parameter	Description	Mandatory	Example
mongo_user_name	Username for a MongoDB user. This user has read/write permissions on a database of the same name.	No	
mongo_user_password	Password for the MongoDB user. Allowed special characters are: ! [*._]~+-(){}^=/@#?;&`<>	No	
mongo_backup_disk_max_use	Maximum percentage of the disk that may be occupied by MongoDB backup files.	Yes	15
mongo_backup_disk_keep_free	Percentage of disk that must be left free on the file system. The oldest backup files will be deleted when this limit is reached.	Yes	30
mongo_backup_start_time	Time of day when backup schedule starts in hh:mm+hh:mm or hh:mm-hh:mm format. First part of the format is the start time and second part is an offset (from UTC) for specifying the time zone. If the time zone is not specified, local time zone of the VM processing the request will be used as the default time zone.	Yes	02:00
mongo_backup_full_period	Interval at which the MongoDB full backups are performed. Expressed in weeks and/or days, or hours format, e.g. 1w2d or 4h. Hours cannot be provided with days or weeks. Maximum value for hour is 23h. 0 means that no backup is performed.	Yes	1d
mongo_backup_differential_period	Interval at which the MongoDB differential backups are performed. Expressed in weeks and/or days, or hours format, e.g. 1w2d or 4h. Hours cannot be provided with days or weeks. Maximum value for hour is 23h. 0 means that no backup is performed.	Yes	4h

Parameter	Description	Mandatory	Example
mongo_backup_retention	Time specifies how long to wait before deleting the file(s). Empty value means that we keep the files for 7 days. It is expressed in weeks, days and/or hours format, e.g. 1w24h or 2d. When retention is more than a day, the extra hours of a day would be trimmed and retention value would be rounded down to the closest day.	No	
etcd_existing_endpoints	Comma-separated list of existing etcd endpoint(s) <scheme>://<host address>:<client port>. For etcd clustering, this will take precedence over 'Existing VNF instances'	No	
etcd_data_volume_id	Identifier of the Cinder volume to use for etcd data.	No	
etcd_backup_volume_id	Identifier of the Cinder volume to use for etcd backup.	No	
etcd_root_password	Password for the etcd root user. This user has all access to etcd including creation of users, policies, removing kes store etc.	No	
etcd_user_name	Username for a etcd user. This user has read/write permission on path with same name.	No	
etcd_user_password	Password for the etcd user.	No	
etcd_client_cert	etcd GRPC client certificate. Used for init and etcdctl commands.	No	
etcd_client_key	etcd GRPC client private key. Used for init and etcdctl commands.	No	
etcd_client_ca_cert	etcd GRPC client CA certificate. Used for init and etcdctl commands.	No	

Parameter	Description	Mandatory	Example
etcd_server_cert	etcd GRPC server certificate. Used for grpc server.	No	
etcd_server_key	etcd GRPC server private key. Used for grpc server.	No	
etcd_server_ca_cert	etcd GRPC server CA certificate. Used for grpc server.	No	
etcd_peer_cert	etcd GRPC peer certificate. Used for clustering.	No	
etcd_peer_key	etcd GRPC peer private key. Used for clustering.	No	
etcd_peer_ca_cert	etcd GRPC peer CA certificate. Used for clustering.	No	
etcd_heartbeat_interval	Interval in ms at which the leader will notify followers that it is still the leader.	Yes	100
etcd_election_timeout	How long in ms a follower node will go for without hearing a heartbeat before attempting to become leader itself.	Yes	1000
etcd_backup_disk_max_use	Maximum percentage of the disk that may be occupied by etcd backup files.	Yes	15
etcd_backup_disk_keep_free	Percentage of disk that must be left free on the file system. The oldest backup files will be deleted when this limit is reached.	Yes	30
etcd_backup_start_time	Time of day when backup schedule starts in hh:mm+hh:mm or hh:mm-hh:mm format. First part of the format is the start time and second part is an offset (from UTC) for specifying the time zone. If the time zone is not specified, local time zone of the VM processing the request will be used as the default time zone.	Yes	02:00

Parameter	Description	Mandatory	Example
etcd_backup_full_period	Interval at which the etcd full backups are performed. Expressed in weeks and/or days, or hours format, e.g. 1w2d or 4h. Hours cannot be provided with days or weeks. Maximum value for hour is 23h. 0 means that no backup is performed.	Yes	0
etcd_backup_retention	Time specifies how long to wait before deleting the file(s). Empty value means that we keep the files for 7 days. It is expressed in weeks, days and/or hours format, e.g. 1w24h or 2d.	No	
prometheus_data_volume_id	Identifier of the Cinder volume to use for Prometheus and/or AlertManager data.	No	
prometheus_max_disk_usage_in_percent	Maximum disk usage allowed by Prometheus data in percent of the total disk size.	Yes	40
snmp_trap_target_ip	snmp trap target address.	Yes	10.34.146.134
snmp_trap_target_port	snmp trap target Port	Yes	162

To validate that services are running once the VM is ready, check the status of appservices using the following command as sysadm user.

```
$ vmccs-status
```

Example vmccs-status output:

```
$ vmccs-status
Validating backup-manager services status...
  backup-manager: active (running)
backup-manager is active

Validating Etcd services status...
  etcd: active (running)
Etcd is active
```

```

Validating Fluentbit services status...
  td-agent-bit: active (running)
  fluent-sd: active (running)
  fluent-sd-watch: active (running)
Fluentbit is active

Validating nginx services status...
  nginx: active (running)
  nginx-exporter: active (running)
nginx is active

Validating Node Exporter services status...
  node-exporter: active (running)
Node Exporter is active

Validating Prometheus services status...
  prometheus: active (running)
  prometheus-autoconfig: active (running)
  alertmanager: active (running)
  alertmanager-watch: active (running)
Prometheus is active

Validating SDR services status...
  sdr: active (running)
SDR is active

Validating VNF Operations services status...
  vnf-operations: active (running)
VNF Operations is active

All required vmCCS services are active.

```

Network **interface** roles

Default Gateway	Management	Internal	Signaling
eth0	eth0	eth0	eth0

Health Check etcd

You can check the status of cluster synchronization and health of any node.

Prerequisites

- The etcd is up and running.

Health check on etcd

- Log on as `root` user.
- Check the health of the cluster:

```
root@services3 ~]# etcdStatus.py
```

Name	ID	Endpoint	Leader	Healthy
services1	64386b664d63723b	http://172.29.86.21:2379	false	true
services2	81dcb39d0b4f7142	http://172.29.86.81:2379	true	true
services3	c88e907d0579400a	http://172.29.86.69:2379	false	true

etcd Alerts

In RAMP, to provide fault alerting, enable both the Prometheus and Alertmanager on the services VMs as part of a standard deployment. A Prometheus is a commonly used, open-source tool for retrieving real-time metrics. Alertmanager is a Prometheus component that manages notifications for alerts derived from Prometheus metrics. You can configure one or more SNMP destinations to receive traps derived from the Prometheus alerts. After you configure and enable an SNMP destination, use the management REST API to configure the SNMP destinations. For more information, refer [Updating the SNMP trapTarget](#).

The alerts generated by the Prometheus rules are expected to be sent to a *Prometheus AlertManager* instance. This AlertManager takes care of deduplicating, grouping, and routing the alerts to the correct destination. It is also possible to look at the currently active alerts using the AlertManager UI at <http://<alertmanager ip>:9093/>.

After deploying ETCD, login to any one of the ETCD and check the AlertManager and Prometheus details. The below command gives the AlertManager and Prometheus IP, username and password details. Use these details to log in to <https://<alertmanager IP>:9093/>.

Sample alertmanager configuration:

```
# curl -X GET http://127.0.0.1:8084/v1/config/nf/info 2>/dev/null | jq
{
  "alertmanager": {
    "password": "f1kLB,ov913i5wUv14bn20b=eo{}ZwWW",
    "url": [
      "https://172.19.52.129:9093",
      "https://172.19.52.139:9093",
      "https://172.19.52.209:9093"
    ],
    "username": "alertmanager"
  },
  "prometheus": {
    "password": "*8#aSIxLAKWRtdMr8H1{919,1UlwQ2Ch",
    "url": [
      "https://172.19.52.129:9090",
      "https://172.19.52.139:9090",

```

```

    "https://172.19.52.209:9090"
  ],
  "username": "prometheus"
}
}

```

List of Traps and Alerts

An overview of the various traps and alerts utilized within the RAMP are provided in this page, to monitor and manage application performance and security. Each entry includes a detailed description of the alert or trap, its purpose, and the necessary steps for resolution. All traps generated from the ETCD VM contain the following parameters:

- **trapUniqueId** – The OID of the trap.
- **trapSeverity** – The severity of the trap with one of the following values: critical, warning, or info. An info value is sent when an alert is cleared.
- **trapSummary** – A detailed description of the alert, including a list of all components impacted by the alert. If the list of impacted components changes, the system sends an updated alert. When the alert is cleared, the content is "Status: OK"

There are no explicit clear traps. To clear an alert, the system sends a trap with the same OID, but with a trapSeverity value of info. This section list the alerts that can be generated based on the metrics of AppServices VNF. All platform alerts can also be generated on this VNF.

Node Alerts

Name	Severity	Condition	SNMP OID
HostOutOfMemory	warning	< 10% free memory.	1.3.6.1.4.1.52694.1.1.1.1.0.1
HostMemoryUnderMemoryPressure	warning	> 1000 page faults per minute.	1.3.6.1.4.1.52694.1.1.1.1.0.2
HostUnusualNetworkThroughputIn	warning	Ingress traffic > 50 MB/s for over a minute.	1.3.6.1.4.1.52694.1.1.1.1.0.3
HostUnusualNetworkThroughputOut	warning	Egress traffic > 50 MB/s for over a minute.	1.3.6.1.4.1.52694.1.1.1.1.0.4
HostUnusualDiskReadRate	warning	Disk read > 50 MB/s for over a minute.	1.3.6.1.4.1.52694.1.1.1.1.0.5
HostUnusualDiskWriteRate	warning	Disk write > 50 MB/s for over a minute.	1.3.6.1.4.1.52694.1.1.1.1.0.6
HostOutOfDiskSpace	warning	< 10% free disk space for a partition.	1.3.6.1.4.1.52694.1.1.1.1.0.7

Name	Severity	Condition	SNMP OID
HostDiskWillFillIn4 Hours	critical	Linear prediction: expect disk partition to be full in the next 4 hours.	1.3.6.1.4.1.52694.1.1.1.1 .0.8
HostOutOfInodes	warning	< 10% free inodes.	1.3.6.1.4.1.52694.1.1.1.1 .0.9
HostUnusualDiskRead Latency	warning	Read latency > 100ms for over a minute.	1.3.6.1.4.1.52694.1.1.1.1 .0.10
HostUnusualDiskWrite Latency	warning	Write latency > 100ms for over a minute.	1.3.6.1.4.1.52694.1.1.1.1 .0.11
HostHighCpuLoad	warning	CPU usage over 80% for over 5 minutes.	1.3.6.1.4.1.52694.1.1.1.1 .0.12
HostSwapIsFillingUp	warning	> 80% swap memory used.	1.3.6.1.4.1.52694.1.1.1.1 .0.13
HostSystemdServiceCrashed	warning	The specified systemd service is in failed state.	1.3.6.1.4.1.52694.1.1.1.1 .0.14
HostKernelVersionDeviations	warning	Kernel version changed detected.	1.3.6.1.4.1.52694.1.1.1.1 .0.15
HostOomKillDetected	critical	Out-of-memory kill detected in the last 5 minutes.	1.3.6.1.4.1.52694.1.1.1.1 .0.16
HostNetworkReceiveErrors	warning	Ingress traffic error detected in the last 5 minutes.	1.3.6.1.4.1.52694.1.1.1.1 .0.17
HostNetworkTransmitErrors	warning	Egress traffic error detected in the last 5 minutes.	1.3.6.1.4.1.52694.1.1.1.1 .0.18
HostLowEntropy	warning	Entropy bits available is < 250.	1.3.6.1.4.1.52694.1.1.1.1 .0.19
PrometheusTargetMissing	critical	Exporter is not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.1 .0.20

Name	Severity	Condition	SNMP OID
HostClockNotSynchronizing	warning	VM clock is not synchronized with NTP.	1.3.6.1.4.1.52694.1.1.1.1.0.21

SDR Alerts

Name	Severity	Condition	SNMP OID
SdrOutOfFileDescriptor	warning	> 90% available file descriptors used.	1.3.6.1.4.1.52694.1.1.1.3.0.2
SdrRegistryUnreachable	warning	SDR is unable to contact a service registry.	1.3.6.1.4.1.52694.1.1.1.3.0.3
SdrRegistryAllUnreachable	critical	SDR is unable to contact all service registries.	1.3.6.1.4.1.52694.1.1.1.3.0.4
PrometheusTargetMissing	critical	Exporter is not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.3.0.1

Fluent Alerts

Name	Severity	Condition	SNMP OID
FluentOutputError	warning	Fluent is reporting output errors.	1.3.6.1.4.1.52694.1.1.1.2.0.2
PrometheusTargetMissing	critical	Exporter is not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.2.0.1

Etcd Alerts

Name	Severity	Condition	SNMP OID
EtcdInsufficientMembers	critical	Etcd cluster should have an odd number of members.	1.3.6.1.4.1.52694.1.1.1.5.0.2

Name	Severity	Condition	SNMP OID
EtcdNoLeader	critical	Etcd cluster has no leader.	1.3.6.1.4.1.52694.1.1.1.5.0.3
EtcdHighNumberOfLeaderChanges	warning	Etcd leader changed more than 3 times during the last hour.	1.3.6.1.4.1.52694.1.1.1.5.0.4
EtcdHighNumberOfFailedGrpcRequests	warning	More than 1% GRPC request failures detected in Etcd for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.5
	critical	More than 5% GRPC request failures detected in Etcd for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.6
EtcdGrpcRequestsSlow	warning	GRPC requests slowing down, 99th percentile is over 0.15s for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.7
EtcdHighNumberOfFailedHttpRequests	warning	More than 1% HTTP failures detected in Etcd for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.8
	critical	More than 5% HTTP failures detected in Etcd for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.9
EtcdHttpRequestsSlow	warning	HTTP requests slowing down, 99th percentile is over 0.15s for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.10
EtcdMemberCommunicationSlow	warning	Etcd member communication slowing down, 99th percentile is over 0.15s for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.11
EtcdHighNumberOfFailedProposals	warning	Etcd server got more than 5 failed proposals in the past hour.	1.3.6.1.4.1.52694.1.1.1.5.0.12
EtcdHighFsyncDurations	warning	Etcd WAL fsync duration increasing, 99th percentile is over 0.5s for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.13
EtcdHighCommitDurations	warning	Etcd commit duration increasing, 99th percentile is over 0.25s for 5 minutes.	1.3.6.1.4.1.52694.1.1.1.5.0.14
PrometheusTargetMissing	critical	Exporter not reporting metrics / Etcd instance unreachable.	1.3.6.1.4.1.52694.1.1.1.5.0.1

Prometheus Alerts

Name	Severity	Condition	SNMP OID
PrometheusTargetMissing	critical	Exporter not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.7.0.1
PrometheusAllTargetsMissing	critical	Prometheus does not have a reachable target.	1.3.6.1.4.1.52694.1.1.1.7.0.2
PrometheusConfigurationReloadFailure	warning	Prometheus configuration reload failure.	1.3.6.1.4.1.52694.1.1.1.7.0.3
PrometheusTooManyRestarts	warning	Prometheus has restarted more than twice in the last 15 minutes and might be crashlooping.	1.3.6.1.4.1.52694.1.1.1.7.0.4
PrometheusNotConnectedToAlertmanager	critical	Prometheus cannot connect the Alertmanager.	1.3.6.1.4.1.52694.1.1.1.7.0.5
PrometheusRuleEvaluationFailures	critical	Prometheus encountered rule evaluation failures, potentially leading to ignored alerts.	1.3.6.1.4.1.52694.1.1.1.7.0.6
PrometheusTemplateTextExpansionFailures	critical	Prometheus template text expansion failures.	1.3.6.1.4.1.52694.1.1.1.7.0.7
PrometheusRuleEvaluationSlow	warning	Prometheus rule evaluation took more time than the scheduled interval.	1.3.6.1.4.1.52694.1.1.1.7.0.8
PrometheusNotificationsBacklog	warning	The Prometheus notification queue has not been empty for 10 minutes.	1.3.6.1.4.1.52694.1.1.1.7.0.9
PrometheusTargetScrapingSlow	warning	Prometheus is scraping exporters slowly.	1.3.6.1.4.1.52694.1.1.1.7.0.10
PrometheusLargeScrape	warning	Prometheus has many scrapes that exceed the sample limit.	1.3.6.1.4.1.52694.1.1.1.7.0.11

Name	Severity	Condition	SNMP OID
PrometheusTargetScrapeDuplicate	warning	Prometheus rejected many samples due to duplicate timestamps, but different values.	1.3.6.1.4.1.52694.1.1.1.7.0.12
PrometheusTsdbCheckpointCreationFailures	critical	Prometheus encountered time-series database (TSDB) checkpoint creation failures.	1.3.6.1.4.1.52694.1.1.1.7.0.13
PrometheusTsdbCheckpointDeletionFailures	critical	Prometheus encountered TSDB checkpoint deletion failures.	1.3.6.1.4.1.52694.1.1.1.7.0.14
PrometheusTsdbCompactionsFailed	critical	Prometheus encountered TSDB compaction failures.	1.3.6.1.4.1.52694.1.1.1.7.0.15
PrometheusTsdbHeadTruncationsFailed	critical	Prometheus encountered TSDB head truncation failures.	1.3.6.1.4.1.52694.1.1.1.7.0.16
PrometheusTsdbReloadFailures	critical	Prometheus encountered TSDB reload failures.	1.3.6.1.4.1.52694.1.1.1.7.0.17
PrometheusTsdbWALCorruptions	critical	Prometheus encountered TSDB write-ahead log (WAL) failures.	1.3.6.1.4.1.52694.1.1.1.7.0.18
PrometheusTsdbWALTruncationsFailed	critical	Prometheus encountered TSDB WAL truncation failures.	1.3.6.1.4.1.52694.1.1.1.7.0.19

Alertmanager Alerts

Name	Severity	Condition	SNMP OID
PrometheusTargetMissing	critical	Exporter not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.8.0.1
AlertmanagerConfigurationReloadFailure	warning	Alertmanager configuration reload error.	1.3.6.1.4.1.52694.1.1.1.8.0.2

Name	Severity	Condition	SNMP OID
AlertmanagerConfigNotSynced	warning	The configurations of Alertmanager cluster instances are out of sync.	1.3.6.1.4.1.52694.1.1.1.8.0.3
AlertmanagerNotificationFailing	critical	Alertmanager is failing to send notifications.	1.3.6.1.4.1.52694.1.1.1.8.0.4
AlertmanagerTooManyRestarts	warning	Alertmanager has restarted more than twice in the last 15 minutes and might be crashlooping.	1.3.6.1.4.1.52694.1.1.1.8.0.5

Nf-Operations Alerts

Name	Severity	Condition	SNMP OID
PrometheusTargetMissing	critical	Exporter not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.9.0.1
nfUsageReportUploadedQueued	warning	Usage reports are not uploading.	1.3.6.1.4.1.52694.1.1.1.9.0.2
nfPrometheusConnectionFailing	critical	Connection to all Prometheus instances is failing, cannot fetch data.	1.3.6.1.4.1.52694.1.1.1.9.0.3

Nginx Alerts

Name	Severity	Condition	SNMP OID
PrometheusTargetMissing	critical	Exporter not reporting metrics / Nginx target is missing.	1.3.6.1.4.1.52694.1.1.1.10.0.1

Backup-Manager exporter alerts

Name	Severity	Condition	SNMP OID
PrometheusTargetMissing	critical	Exporter not reporting metrics.	1.3.6.1.4.1.52694.1.1.1.11.0.1

Name	Severity	Condition	SNMP OID
BackupmanagerScheduleFailed	critical	Backup-manager has failed to run a schedule in the last four hours	1.3.6.1.4.1.52694.1.1.1.1.0.2
SendBackupToSftpFailure	critical	Backup-manager has failed to send the backup file to SFTP location in the last hour	1.3.6.1.4.1.52694.1.1.1.1.0.3

SNMP Heartbeat Trap

If configured, the SNMP agent sends a heartbeat trap at a specified interval to your SNMP destination to verify the connection remains active. The following table provides details on the heartbeat trap. Refer to [Updating the SNMP trapTarget](#) for information on configuring the heartbeat trap interval.

SNMP Heartbeat Trap

Trap	Severity	Triggering Event	SNMP OID
clusterHeartbeat	info	Trap sent at a regular interval to allow the destination to monitor that this network function remains present and accessible.	1.3.6.1.4.1.52694.1.1.1.6.0.1

Updating the SNMP trapTarget

Ribbon Service app supports specifying one or more external SNMP destinations to which you want to send traps derived from Prometheus alerts. If you are using SNMP in your network, Service app also provides an option to configure an SNMP "heartbeat" to monitor the connection between the Service app deployment and your SNMP destination. When configured, the heartbeat mechanism triggers a heartbeat alert at an interval you specify so that the SNMP destination regularly receives traps that confirm the connection is active.

Service app supports sending traps in both SNMPv2c and SNMPv3 formats. The version type of the destination determines which parameters you must configure for the destination. An SNMPv3 destination requires both authentication and encryption parameters and general SNMP destination parameters. An SNMPv2c destination requires only general SNMP destination parameters. The following tables describe these parameters.

SNMP Authentication and Encryption Parameters

The following table describes the authentication and encryption parameters required by SNMPv3 and defined within the `snmpUser` object in the API.

SNMP Authentication and Encryption Parameters

Parameter	Description
<code>authPassphrase</code>	This parameter specifies an SNMP authentication passphrase. Include this parameter if you are enabling authentication.
<code>authProtocol</code>	This parameter specifies the SNMP authentication protocol. Specify either <code>MD5</code> or <code>SHA</code> , or use an empty string to disable authentication.
<code>name</code>	This parameter specifies the name of this SNMP security user definition. Specify this name as the <code>securityName</code> in the general SNMP destination parameters to associate this set of authentication and encryption settings with the destination. This parameter is required within the body of a POST (add) request and is included in the path of a PUT (update) request.
<code>privPassphrase</code>	This parameter specifies an SNMP privacy passphrase. Include this parameter if you are enabling encryption.
<code>privProtocol</code>	This parameter specifies the SNMP privacy protocol. Specify either <code>DES</code> or <code>AES-128</code> , or use an empty string to disable encryption.

SNMP Destination Parameters

The following table describes the SNMP destination parameters defined within the `snmpDestination` object in the API. The final two columns (X=supported) indicate whether a parameter applies to SNMPv2c, SNMPv3, or both SNMP versions.

SNMP Destination Parameters

Parameter	Description	v2c	v3
community	This parameter specifies the SNMP community string. The default value is <code>public</code> .	X	
contextEngineId	This parameter specifies the SNMP context engine ID. If not specified, this defaults to the security engine ID.		X
contextName	This parameter specifies the SNMP context name used to address a specific instance of a managed object.		X
host	This parameter identifies the host of the SNMP destination. The value can be either an IP address or an FQDN. An FQDN will be resolved using service discovery.	X	X
name	This parameter assigns a name to this SNMP destination definition and is used by the API. This parameter is required within the body of a POST (add) request and is included in the path of a PUT (update) request.	X	X
port	This parameter specifies the target port on the SNMP destination. The range allowed is 1 to 65535 and the default value is <code>162</code> .	X	X
securityEngineId	This parameter specifies the SNMP security engine ID.		X
securityName	This parameter specifies the SNMP security username and must match a name assigned to an <code>snmpUser</code> object. This associates the authentication and encryption settings for the specified <code>snmpUser</code> with this destination.		X
state	This parameter specifies the state of the SNMP destination. The values allowed are <code>enabled</code> or <code>disabled</code> . The Service app SNMP agent does not send traps to a disabled destination. The default value is <code>enabled</code> .	X	X
version	This parameter specifies the version of the SNMP protocol to use for this destination. The values allowed are <code>v3</code> and <code>v2c</code> . The default value is <code>v2c</code> .	X	X

Heartbeat Parameter

The following table describes the heartbeat interval parameter defined with the `heartbeat` object in the API.

Heartbeat Parameter

Parameter	Description
<code>interval</code>	This parameter specifies the interval, in seconds, at which Service app SNMP agent triggers a heartbeat alert as a mechanism for monitoring the connection between the Service app deployment and SNMP destinations. 0 means the alert is disabled and is the default value.

Create a New SNMPv3 Destination

To create a new SNMPv3 destination, you must first define an SNMP security user (`snmpUser`) to specify authentication and encryption settings. Then, include the name you assigned to the SNMP security user within the general SNMP destination configuration (`snmpDestination`) to associate the authentication and encryption settings with the destination.

1. Use curl to submit the following request to create an SNMP security user. Use the descriptions in the first table above to define the SNMP security user settings to include in your request.

```
POST <127.0.0.1>:8084/v1/config/nf/snmp/users
```

2. Use curl to submit the following request to create an SNMP destination. Use the descriptions in the second table above to define the settings for the destination. Be sure to include the name of the appropriate SNMP security user as the `securityName` in your request, as well as the other parameters applicable to SNMPv3, as appropriate.

```
POST <127.0.0.1>:8084/v1/config/nf/snmp/destinations
```

Create a New SNMPv2c Destination

To create an SNMPv2c destination, you must define appropriate general SNMP destination settings (`snmpDestination`).

Use curl to submit the following request to create an SNMP destination. Use the descriptions in the second table above to define the settings for the destination. Be sure to include the parameters applicable to SNMPv2c, as appropriate.

```
POST <127.0.0.1>:8084/v1/config/nf/snmp/destinations
```

Example to add snmp traptarget

Sample output to add snmp traptarget:

```
$ curl -H 'Content-Type: application/json' \
  -d '{ "name": "snmptarget-1", "host": "10.34.146.134", "port": 162, "version": "v2c",
    "community": "public" }' \
```

```
-X POST \  
http://127.0.0.1:8084/v1/config/nf/snmp/destinations
```

To check the SNMP trapTargets, use the below command:

```
$ curl -X GET http://127.0.0.1:8084/v1/config/nf/snmp/destinations  
[{"community":"public","host":"10.34.146.134","name":"snmptarget-1","port":162,"state":"  
enabled","version":"v2c"}]
```

Work with Existing SNMP Destination Configuration

You can use the API to return the settings for currently configured SNMP destinations, make updates to the configurations, or to delete a destination.

Retrieve Existing SNMP Destinations

Use curl to submit the following request to return the list of currently configured SNMP destinations.

```
GET <127.0.0.1>:8084/v1/config/nf/snmp/destinations
```

The command returns the set of SNMP destinations currently stored in the ETCD.

Use curl to submit the following request to return the configuration for the SNMP destination matching the `name` you specify.

```
GET <127.0.0.1>:8084/v1/config/nf/snmp/destinations/{name}
```

The command returns the configuration for the specific SNMP destination you specified.

Edit an Existing SNMP Destination

Use curl to submit the following request to update the configuration of the SNMP destination matching the `name` you specify.

```
PUT <127.0.0.1>:8084/v1/config/nf/snmp/destinations/{name}
```

The command updates the values for the parameters you include in your request in the configuration of the SNMP destination you specified.

Delete an Existing SNMP Destination

Use curl to submit the following request to delete the SNMP destination matching the `name` you specify.

```
DELETE <127.0.0.1>:8084/v1/config/nf/snmp/destinations/{name}
```

The command deletes the SNMP destination you specified.

Work with Existing SNMP User Configuration

You can use the API to return the settings for currently configured SNMP users, make updates to the configurations, or to delete an SNMP user.

Retrieve Existing SNMP Users

Use curl to submit the following request to return the list of currently configured SNMP users.

```
GET <127.0.0.1>:8084/v1/config/nf/snmp/users
```

The command returns the set of SNMP users currently stored in the ETCD.

Use curl to submit the following request to return the configuration for the SNMP users matching the `name` you specify.

```
GET <127.0.0.1>:8084/v1/config/nf/snmp/users/{name}
```

The command returns the configuration for the specific SNMP user you specified.

Edit an Existing SNMP User

Use curl to submit the following request to update the configuration of the SNMP user matching the `name` you specify.

```
PUT <127.0.0.1>:8084/v1/config/nf/snmp/users/{name}
```

The command updates the values for the parameters you include in your request in the configuration of the SNMP user you specified.

Delete an Existing SNMP User

Use curl to submit the following request to delete the SNMP user matching the `name` you specify.

```
DELETE <127.0.0.1>:8084/v1/config/nf/snmp/users/{name}
```

The command deletes the SNMP user you specified.

Configure an SNMP Heartbeat Interval

Use curl to submit the following request to specify an interval, in seconds, at which ETCD sends a heartbeat alert. When set to 0 (default) the heartbeat alert is disabled.

```
POST <127.0.0.1>:8084/v1/config/nf/heartbeat
```

Retrieve the Current Heartbeat Configuration

Use curl to submit the following request to return the current heartbeat configuration.

```
GET <127.0.0.1>:8084/v1/config/nf/heartbeat
```

RAMP etcd System Requirements

In this section:

- [Resource Requirements](#)
- [Environment-Specific Minimum Resource Requirements](#)

The system requirements for deploying `etcd` on the Ribbon Application Management Platform (RAMP) are described below.

Resource Requirements

This table covers the minimum resource requirements for a single `etcd` instance. Use three instances with this configuration for a three-node `etcd`.

Resource	Environment			
	KVM	VMware ESXi	OpenStack	CNF
Disk (GB)	50		50 (HDD)	21 (external volume)
RAM (GB)	2			3
vCPU	1			2
vNIC	1			
Network attributes				
Max round-trip-time	100 ms			

Environment-Specific Minimum Resource Requirements

Environment-specific minimum resource requirements for `etcd` are covered in this table.

Environment	Resource	Version		
KVM	KVM (Kernel Virtual Machine)	3.10.0		
	Compilation library	libvirt 4.5.0		
	Library	libvirt 4.5.0		
	API	QEMU 4.5.0		
	Hypervisor	QEMU 1.5.3		
VMware	VMware ESXi	6.5	6.7	7.0
	Virtual Machine	13	14	14
	Hard Disk Type	Thick provisioned, lazily zeroed.		

Environment	Resource	Version
OpenStack	Red Hat OpenStack Platform (RHOSP)/ Host operating system	• 10 / RHEL 7.3 • 13 / RHEL 7.5 • 16 & 16.1/ RHEL 8.1

This guide provides information on using Ribbon Application Management Platform (RAMP) as part of the Ribbon Lawful Intercept solution.

Ribbon Lawful Intercept Overview

In this section:

- [Ribbon Lawful Intercept Topology](#)
 - [Intercept Server](#)
 - [SBC Network Border Switch](#)

- [PSX Policy Server](#)

Statutes such as the Communication Assistance for Law Enforcement Act (CALEA, 1994, United States) define the ability of law enforcement to intercept wire and electronic communications and obtain call data and call content for calls under surveillance.

Telecom carriers may have to provide the means to collect call data and call content (voice streams) from their customers in response to lawful authorization. The core of this ability is provided by an Intercept Server (IS) at the carrier's premises that formats call content and data according to various national standards.

The IS is provisioned with specific targets, typically subscriber phone numbers. When the carrier's equipment detects the start of a call involving a target, it sends messages to the IS at various stages of the call. It also taps into the voice streams and sends copies of them to an IP address designated by the IS, if so configured. The IS then forwards call data and call content on to law enforcement Delivery Function (DF) devices at the LEA premises, which will filter as appropriate per outstanding warrants.

The carrier's equipment, such as that supplied by Ribbon Communications, is capable of identifying calls involving the provisioned targets and collect call data and content, without the callers being aware.

The Ribbon Lawful Intercept solution is an integrated system for identifying LI targets, collecting call data and content, and forwarding it to Law Enforcement Agency. It includes an Intercept Server from partners. The Intercept Server provides the human interface for provisioning. It provides a fan out capability so that multiple Law Enforcement Agencies (LEAs) can intercept each target. It also communicates with network provider intercept equipment.

Ribbon Lawful Intercept Topology

This section describes the network topology of the Ribbon Lawful Intercept (LI) solution.

In a Ribbon deployment, calls may arrive at the SBC Core for VoIP calls.

The following call information can be collected:

- **Call content**
The real-time audio streams of a call under surveillance, forwarded from the SBC Core to the address provided by the IS.

The call under surveillance is unaware of this wiretap.

- **Call data**
A series of real-time call-identifying information messages sent from an SBC Core device to the IS.

Intercept Server

Intercept server (IS) or Mediation Device is supplied by a Ribbon partner or the carrier. The IS interfaces to one or more law enforcement agencies, and to other network provider intercept equipment.

IS has interfaces to Ribbon equipment for provisioning, call data, and call content. IS serves as the carrier's interface for provisioning intercept targets in response to lawful target authorization requests. It formats this data as necessary and communicates it via the Lawful Intercept API to Ribbon Application Management Platform (RAMP).

Intercept server interacts with RAMP for all provisioning. RAMP distributes this provisioning to all other Ribbon devices as needed. IS interacts with the Ribbon network element for call data and call content.

When the SBC Core identifies a call to be trapped, the devices send Call Data messages to the IS at various stages of the call. In response, the IS tells the SBC the IP address and port number(s) to send the collected call content RTP streams.

When the SBC Core devices identify a call to be trapped, the devices send Call Data messages to the IS at various stages of the call. In response, the IS triggers the SBC devices to send the collected call content RTP streams using the IP address and ports.

RAMP

RAMP receives and processes Lawful Intercept target provisioning data from the IS via SOAP-based API.

RAMP then distributes this data to all primary PSX devices, and generates success or failure responses to IS. Ribbon Lawful Intercept solution allows you to manage the lawful intercept capabilities of the Intercept Server/Mediation device.

RAMP, PSX, and SBC Core

You can access the following through Lawful Intercept shortcut in RAMP:

Note

Lawful Intercept shortcut is visible only if the Lawful Intercept license has been applied to RAMP and you have Lawful Intercept privileges.

- CDC Provisioning interface:
It allows you to configure the IP address, UDP port, and other parameters used for communication between the Ribbon devices and the intercept server.
- Report interface:
It retrieves and displays CDC information for all the nodes.

SBC Network Border Switch

After call information arrives, SBC sends a policy request to PSX. When directed by the policy response from the PSX, the SBC acts as an intercept access point (IAP) and establishes a Call Data channel for messages and status over UDP/IP to the Intercept Server. SBC also sends the call voice streams (call content) RTP copy to an IP address provided by the IS.

PSX Policy Server

PSX maintains the database of all subscribers, including the provisioning information from the IS as relayed by RAMP. When the call parameters in a policy request (for example, Called or Calling Number) from the SBC Core devices matches any provisioned Lawful Intercept criteria, the PSX adds information about the matching LI criteria to its policy response to the SBC Core.

Lawful Intercept for RAMP

The Lawful Interception solution has three discrete interfaces between the network element and mediation server to provide provisioning, call data (signaling) and call content (media) information. These interfaces are created after the connection is established between the mediation server Delivery Function (DF) and the network

element Access Function (AF). The Mediation Function (MF) provides the required interworking by interfacing to the Law Enforcement Agency (LEA) through Handover Interfaces (HI1, HI2, HI3) on one side and to the VoIP packet network element(s) through X3 (for collection of media). The interface from the mediation server to the lawful interception agency is standardized. The interfaces between AF and DF are defined as:

- X1 or INI-1 interface is supported by Ribbon Application Management Platform (RAMP) for provisioning targets and the targets data is stored in PSX database. This is based on SS8 provisioning interface.

Where, X interface is specified by 3GPP standard while INI is specified by ETSi standard.

Lawful Interface Architecture

Following is the P-Com.Session-Info LI architecture which consists of Ribbon network elements (RAMP, PSX, S-SBC, and M-SBC) with SS8 as the mediation server. The Ribbon LI solution supports only X1 and X3 interfaces.

Lawful Intercept Topology

The Intercept server has interfaces to Ribbon equipment for provisioning and call content. The Intercept Server interacts with RAMP for provisioning and with network element for call content. RAMP acts as a AF (Administrative Function) from an SS8 mediation function perspective to terminate provisioning of the targets. The SBC acts as CC IAPs (call content IAPs) for bearer interception. SS8 is only applicable for a customer-specific deployment.

For SBC Core LI flavors, refer to [Lawful Intercept](#).

Enabling Lawful Intercept on RAMP

To intercept media packets, Ribbon Application Management Platform (RAMP) must be either the same version or a higher version as that of the SBC and PSX devices.

Start

1. Access RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.

2. Stop RAMP:

```
/opt/sonus/ems/emsMgmt stop
```

3. Edit the `/opt/sonus/ems/weblogic/sonusEms/data/sys/SystemConfig.txt` file and add `defaultCaleaUser=true`.

This creates a default "calea" user in RAMP with LI privileges and a default password "calea".

4. Start RAMP:

```
/opt/sonus/ems/emsMgmt start
```

5. Log on to RAMP GUI as "calea" user with the default password.
6. Change the default "calea" password.
7. You can create additional user account(s) with CALEA privileges.

The username and password of an account with CALEA privileges will be configured in the IS and sent in the header of each LI API provisioning message.

8. Install RAMP-LI license on RAMP. For more information on the license, refer to [Node Locked Licenses on RAMP](#).
9. Create one or more users with LI privileges on RAMP.
10. Configure Call Data Channel (CDC) information on the SBC devices.
11. Configure the Intercept Server, per its manufacturer's instructions, to enable sending LI target information through the LI API.

Lawful Intercept under **OBSERVABILITY** in RAMP GUI is visible only if a PSX or SBC device is registered.

When you log on to RAMP GUI with CALEA privileges, **Lawful Intercept** will appear in the **OBSERVABILITY** tab.

After LI is established on the Ribbon equipment, you can use the existing RAMP Performance Manager and Fault Manager interfaces to monitor the system.

Configuring Call Data Channel

In this section:

- [Configure CDC for All Nodes](#)
- [Configure CDC for GSX Nodes](#)
- [Configure CDC for SBC Core Nodes](#)
 - [Configure CDC for an SBC Core Node](#)
 - [Configuring CDC for SBC SWe on Cloud](#)
 - [Configuring Mediation Server for SBCs](#)

- [Delete a Mediation Server Created for SBC Core](#)

Use Ribbon Application Management Platform (RAMP) to configure the Ribbon network elements and point them at the appropriate mediation devices for call data and call content delivery.

CDC Configuration

The Network Element ID generated and assigned by RAMP identifies every Ribbon network element. If necessary, configure assigned NE IDs in the partner's mediation device.

Note

Configure IS/MD with the assigned Network Element IDs.

Note

Configure CDC information for the SBC Core devices to perform Call Data and Call Content delivery for intercepted calls.

Every Ribbon SBC Core device is statically associated with a specific intercept server/mediation device (IS/MD) as a Call Data Channel entity. You must configure the SBC Core device with Call Data Channel (CDC) information to perform their LI function.

An authorized LI provisioner can select a SBC Core device and enter the relevant CDC information and configure the SBC Core device.

The Ribbon network element sends one message at a time to the intercept server. The Ribbon network element ensures reliable and ordered delivery of messages to the intercept server by retransmitting unacknowledged messages, based upon configuration.

Multiple network element may send call data messages to the intercept server for a single intercepted call. Since these call data messages use the same intercept criteria, the intercept server can correlate these messages. If more than one party in a call is an intercept target, the Ribbon network element delivers the call data for each target separately using different intercept criteria.

Every Ribbon network element sends a Media Report message to the intercept server with the following channel states:

- Open – Start call content delivery
- Close – End call content delivery

Note

RAMP supports adding up to 16 mediation servers in the Call Data Channel (CDC) for IMS LI.

Configure CDC for All Nodes

Use the following procedure to configure Call Data Channel (CDC) for all the SBC Core\GSX nodes in Ribbon Application Management Platform (RAMP). If any nodes are already configured, the new configuration replaces the existing one.

Prerequisites

Nodes are registered with RAMP.

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Select or enter the values. Refer to [Configure CDC Device parameters](#).
4. Click **Configure All Devices**.

Configure CDC Device Parameters

Attribute	Description	Value range
Primary IP	The IP address of the mediation device. The Ribbon network element sends the call data to this IP Address. The IP address of the port being used is included in every call data message. The intercept server responds to these messages using the IP address received from the network element. The network element sends one message at a time to the intercept server.	A valid IPv4 address.
UDP Port	UDP port on the mediation device. The network element sends the call data to this UDP Port.	1 to 65535
Secondary IP (optional)	The secondary IP address of the mediation device.	A valid IPv4 address.
Keep Alive Timer	Interval for CDC keep-alive messages from the network element to the mediation device.	0 to 65535
Keep Alive Retries	Number of retries for keep-alive messages.	1 to 10
NIF/ IP Interface Group Name (Applicable for GSX and SBC only)	Specifies the name of the Network Interface group on the GSX or SBC.	Up to 23 alphanumeric characters
Send Noa Param (Version >= 8.3.0)	Specifies whether to send Nature of Address (NoA) information for E.164 numbers. Note The parameter applies only to the GSX.	- ENABLED - DISABLED (Default)
Server Type (Applicable for GSX only)	Specifies the name of the mediation device server type.	Default: Used for the default VERINT functionality. Zeel: Use this parameter when ZEEL mediation device is used for LI.

Configure CDC for GSX Nodes

To configure CDC for GSX nodes:

1. Log on to the Ribbon Application Management Platform (RAMP) as CALEA user.
2. Click **Monitoring > Lawful Intercept**. The **Lawful Intercept CDC Provisioning** window appears.
3. Click **Configure CDC** on the left navigation pane. The **Lawful Intercept/Configure CDC** window appears.
4. Perform the following steps to configure a GSX node or all the GSX nodes, as applicable:
 - To configure CDC for a specific GSX node:
 - i. Expand **GSXs** in the navigation pane and click **Configured** or **Non Configured**.
 - ii. Click on a node. The **Configure CDC Device** window appears.
 - iii. Select or enter the values. Refer to the table below for additional information.
 - iv. Click **Configure GSX**.
 - To configure CDC for all the GSX nodes:
 - i. Click **GSXs** in the navigation pane. The following window appears.
 - ii. Select or enter the values. Refer to the table below for additional information.
 - iii. Click **Configure All GSXs**.

Attribute	Description	Value range
Gateway Name	Gateway name for the node.	
Network Element ID	The Network Element ID uniquely identifies each Ribbon network element. Network Element ID is generated and assigned by the RAMP during the node registration process. The Network Element ID is included in the Call Data sent to the IS/MD. The IS/MD determines the origination point for the intercept (the SBC or GSX). You need to configure the partner's mediation device separately to identify the assigned NE IDs, if necessary. The system includes the node number in every CDC message as per the PacketCable PKT-SP-EM-I08-040113 specification.	0 to 99999
Node Number	The global unique node number for the SBC used by the LI Server for ID.	
Send Noa Param (Version >= 8.3.0)	Specifies whether to send Nature of Address (NoA) information for E.164 numbers. This field is used to enable or disable the Nature of Address (NoA) support.	• ENABLED • DISABLED (Default)
Server Type (Version >= 9.0)	Specifies the name of the mediation device server type. The attribute is available from Release 9.0 and later.	• Default: Used for the default VERINT functionality. • Zeel: Use this parameter when ZEEL mediation device is used for LI.

Attribute	Description	Value range
Primary IP	The IP address of the Lawful Intercept device.	A valid IPv4 address
UDP Port	UDP port on the mediation device. The Ribbon network element sends the call data to this UDP Port.	1 to 65535
Secondary IP	(optional) Secondary IP address of the mediation device.	
Keep Alive Timer	Interval for CDC keep alive messages from the Ribbon network element to the mediation device.	0 to 65535
Keep Alive Retries	Number of retries for keep alive messages.	1 to 10
NIF Group Name	The name of the Network Interface group on the GSX.	Up to 23 alphanumeric characters
IP InterfaceGroup Name	The name of the Network Interface group on the SBC Core device.	Up to 23 alphanumeric characters

Configure CDC for SBC Core Nodes

In this section:

- [Configure CDC for an SBC Core Node](#)
 - [Configure CDC for Legacy LI](#)
 - [Configure CDC for IMS](#)
 - [Configure CDC for PCSI LI](#)
 - [Configure CDC for PacketCable 2.0](#)
 - [Create Diameter Peer for SBC Nodes with PacketcableVTwo](#)
 - [Create Diameter Realm Routes for SBC Nodes with PacketcableVTwo](#)
- [Configuring CDC for SBC SWe on Cloud](#)
 - [Viewing Nodes](#)
 - [Node Level LI Statistics](#)
- [Configuring Mediation Server for SBCs](#)
- [Delete a Mediation Server Created for SBC Core](#)

This section covers configuring Call Data Channel (CDC) for SBC Core nodes on **Ribbon Application Management Platform (RAMP)**.

If any of the nodes are already configured, the new configuration replaces the existing configuration.

Prerequisites

- SBC Core nodes are registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Click **SBCs** in the navigation pane.
4. Perform one of the following:
 - To configure all SBC Core nodes:
 - i. Click **SBCs** in the navigation pane.
 - ii. Select or enter the values. Refer to [Configure CDC for SBC Core Nodes](#).
 - iii. Click **Configure All SBCs**.
 - To configure all configured SBC Core nodes:
 - a. Click **SBCs** in the navigation pane.
 - b. Click **Configured**.
 - c. Select or enter the values. Refer to [Configure CDC for SBC Core Nodes](#).
 - d. Click **Configure All Configured SBCs**
5. To configure all non-configured SBC Core nodes:
 - a. Click **SBCs** in the navigation pane.
 - b. Click **Non Configured**.
 - c. Select or enter the values. Refer to [Configure CDC for SBC Core Nodes](#).
 - d. Click **Configure All Non Configured SBCs**
6. Click **Configure All SBCs**

Configure CDC parameters

Attribute	Description	Value Range
Interception Standard	The interception standard.	• 3gpp – 3rd Generation Partnership Project • etsi – European Telecommunication Standards Institute • packetcable (default) – PacketCable, the industry consortium founded by CableLabs. • packetcablePlusEtsi • packetcableVTwo

Attribute	Description	Value Range
Vendor ID	The ID of the vendor.	• none • ss8 • ultimaco • atos atos displays only if Interception Standard is set to "packetcableVTwo". • verint • groupTwoThousand SS8 displays only if Interception Standard is set to "packetcable".
Primary Mode	The operating mode of the Primary Intercept server. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	• Active • Standby • Out of Service

Attribute	Description	Value Range
Primary State	The state of the Primary Intercept server. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	• Enabled: Enables communication to the primary LI server. • Disabled: Disables communication to the primary LI server.
Secondary Mode	The operating mode of the Secondary Intercept Server. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	• Active • Standby • Out of Service
Secondary State	The state of the Secondary Intercept server. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	• Enabled: Enables communication to secondary LI Server. • Disabled: Disables communication to secondary the LI server.

Attribute	Description	Value Range
Primary IP	Enter the IP address of the Lawful Intercept device. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	A valid IPv4 address
UDP Port	UDP port on the mediation device. The Ribbon network element sends the call data to this UDP Port. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	0 to 65535
Secondary IP (optional)	Secondary IP address of the mediation device. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	A valid IPv4 address

Attribute	Description	Value Range
Keep Alive Timer	Interval for CDC keep alive messages from the Ribbon network element to the mediation device. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	0 to 65535
Keep Alive Retries	Number of retries for keep alive messages. The parameter displays only when the following conditions are met: • The SBC personality is not media (M-SBC). • Interception Standard is any of the following: ◦ packetcable ◦ packetcablePlusEtsi • Vendor ID is any of the following: ◦ verint ◦ utimaco ◦ none	1 to 10
Li Pol Dip For Regd Ood Msg	The parameter Li Pol Dip For Regd Ood Msg when enabled is used to indicate SBC to send policy request to PSX for registered Out-Of-Dialog requests(messages) to be intercepted. When this parameter is disabled, policy request is not sent to PSX for registered Out-Of-Dialog requests (messages). This field displays only when Interception Standard is "etsi" or "threeGpp".	• Enabled • Disabled

Attribute	Description	Value Range
RTCP Interception	Use this field to enable or disable Real-Time Control Protocol (RTCP) interception for the mediation server. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	• Enabled • Disabled
Mediation Server Name	Enter a name for the mediation server. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	
Interception Type	Select any of the following as Interception type. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	• Media • Signaling: Signaling is supported only when the following conditions are met: ◦ Interception Standard is "etsi" or "threeGpp" ◦ Protocol Transport Type is "TCP".
Protocol Transport Type	The transport protocol type. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	• TCP (default): Transmission Control Protocol • UDP: User Datagram Protocol
DSCP	Enter a value for Access Function application. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	0 to 63 Default value: 32

Attribute	Description	Value Range
Operational State	Set the operation status of the link between the mediation server and RAMP. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	• In-Service: The transport link is operational. • Out-of-Service: The transport link is not operational.
Administrative State	The Admin State. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	• Enabled: Enables the connection between RAMP and the mediation server. • Disabled: Terminates the connection between RAMP and mediation server.
IP Address	Enter the IP address of the mediation device. The Ribbon network element sends the call data to this IP Address. The IP address of the port being used is included every call data message. The intercept server responds to these messages using the IP address received from the Ribbon network element. The Ribbon network element sends one message at a time to the intercept server. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	A valid IPv4 or IPv6 address
Port	Enter the port on the mediation device. The Ribbon network element sends the call data to this port. This field displays only when either of the following conditions are met: • Interception Standard is "etsi" or "threeGpp" • Interception Standard is "packetcable" and Vendor ID is "ss8"	1 to 65535

Attribute	Description	Value Range
IP Interface Group Name	Enter the name of the Network Interface group on the SBC Core device to which the call data channel is associated.	Up to 23 characters
Media IP InterfaceGroup Name	Enter the name of the IP interface group used to stream media packets to the LI server. The parameter displays only if the SBC personality is not signaling (S-SBC).	Up to 23 characters
DSR Version	Enter the DSR (X2) Protocol Version value. This field displays only when Interception Standard is set as "etsi" or "threeGpp".	• 0 • 1

Configure CDC for an SBC Core Node

In this section:

- [Configure CDC for Legacy LI](#)
- [Configure CDC for IMS](#)
- [Configure CDC for PCSI LI](#)
- [Configure CDC for PacketCable 2.0](#)
 - [Create Diameter Peer for SBC Nodes with PacketcableVTwo](#)
 - [Create Diameter Realm Routes for SBC Nodes with PacketcableVTwo](#)

This section covers configuring Call Data Channel (CDC) for an SBC Core node.

Configure CDC for Legacy LI

This section covers configuring CDC for Legacy LI nodes SBC Core on Ribbon Application Management Platform (RAMP). If any nodes are already configured, the new configuration replaces the existing one.

Prerequisites

- SBC Core node is registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC.**
3. Click **SBCs** in the navigation pane.
4. Click **Configured.**
5. Click on a node.
6. Select or enter the CDC parameters.
7. Click **Configure** <SBC node name>

CDC Parameters

Attribute	Description	Value
Gateway Name	Gateway name for the node.	
Network Element ID	The Network Element ID uniquely identifies each Ribbon network element. Network Element ID is generated and assigned by RAMP during the node registration process. The Network Element ID is included in the Call Data sent to the IS/MD. The IS/MD determines the origination point for the intercept the SBC. Configure the partner's mediation device separately to identify the assigned NE IDs, if necessary. The system includes the node number in every CDC message as per the PacketCable PKT-SP-EM- I08-040113 specification.	
Node Number	The global unique node number for the SBC used by the LI Server for ID.	
CDC Name	The name of the LI Call Data Control Channel configured by the user.	Up to 23 alphanumeric characters. The characters #%^&(){}<>,/\;`[]=!\$"*? ~ and SPACE are not allowed.
Interception Standard	The interception standard.	packetcable (default) – PacketCable, the industry consortium founded by CableLabs.
Vendor ID	The ID of the vendor.	• none
Primary Mode	The operating mode of the Mediation server for X2 signaling.	• Active • Standby • Out of Service

Attribute	Description	Value
Primary State	The state of the Primary Intercept server.	• Enabled: Enables communication to the primary LI server. • Disabled: Disables communication to the primary LI server.
Secondary Mode	The operating mode of the Secondary Intercept Server.	• Active • Standby • Out of Service
Secondary State	The state of the Secondary Intercept server.	• Enabled: Enables communication to secondary LI Server. • Disabled: Disables communication to secondary the LI server.
Primary IP	Enter the IP address of the Mediation server for X2 signaling.	A valid IPv4 address
UDP Port	UDP port on the mediation device. The Ribbon network element sends the call data to this UDP Port.	0 to 65535
Secondary IP (optional)	The secondary IP address of the mediation device.	A valid IPv4 address
Keep Alive Timer	Interval for CDC keep-alive messages from the Ribbon network element to the mediation device.	0 to 65535
Keep Alive Retries	Number of retries for keep-alive messages.	1 to 10
IP Interface Group Name	Enter the name of the IP interface Group to send the X2 messages.	Up to 23 characters
Media IP InterfaceGroup Name	Enter the name of the IP interface group used to stream media packets to the LI server.	Up to 23 characters

Configure CDC for IMS

This section covers configuring Call Data Channel (CDC) with IMS LI for an SBC Core node on Ribbon Application Management Platform (RAMP). If the nodes are already configured, the new configuration replaces the existing one.

Prerequisites

- The SBC Core node is registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

Use this procedure to configure CDC for IMS:

1. Log on to the RAMP GUI as `calea` user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Click **SBCs** in the navigation pane.
4. Click **Configured**.
5. Click on a node.
6. Select the **Create Mediation Server** checkbox. Additional fields are displayed.
7. Select or enter the **CDC parameters**.
8. Click **Configure** <SBC node name>.

Note

Repeat steps 7 to 8 to add additional Mediation Servers. Up to 16 Mediation Servers are supported.

CDC Parameters

Attribute	Length/Range	Description
Gateway Name	N/A	Gateway name for the node. This field is auto-populated and not editable.
Network Element ID	N/A	The Network Element ID uniquely identifies each Ribbon network element. This field is auto-populated and not editable. Network Element ID is generated and assigned RAMP during the node registration process. The Network Element ID is in the Call Data sent to the IS/MD. The IS/MD determines the origination point to intercept the SBC. Configure the partner's mediation device separately to identify the assigned NE Ids, if necessary. The system includes the node number in every CDC message. The parameter is sent in the DSR messages.

Attribute	Length/Range	Description
Node Number	N/A	The global unique node number for the SBC used by the LI server for ID. This field is auto populated and cannot be edited.
CDC Name	Up to 23 alphanumeric characters.	The name of the LI Call Data Control Channel configured by the user. (Characters not allowed: #%^&(){}<>,/\;`[]=!\$"*? ~ and SPACE key)
Interception Standard	N/A	The interception standard to use. • 3gpp – 3rd Generation Partnership Project • ETSI - European Telecommunication Standards Institute
Vendor ID	N/A	The global unique node number for the SBC used by the LI Server for ID. You can choose the Vendor ID from the drop-down list. The Default value is none.
Li Pol Dip For Regd Ood Msg	N/A	Enable this flag to notify the SBC to send policy requests to the PSX for the registered Out-Of-Dialog requests (messages) to intercept. • Enabled • Disabled (Default)
RTCP Interception	N/A	Enable this flag for the Mediation Server to perform Real-Time Control Protocol (RTCP) interception. • Enabled • Disabled (Default)
DSR Version	N/A	Enter the DSR (X2) Message version value. • 0 (Default) • 1
IP InterfaceGroup Name	Up to 23 characters	Enter the name of the IP Interface group on the SBC Core device to initiate the X2 messages.
Media IP InterfaceGroup Name	Up to 23 characters	Enter the name of the Media IP Interface Group that streams media packets to the LI server.

Attribute	Length/Range	Description
Note When you use an invalid SIP Trunk Group (TG) name to configure IMS LI CDC, the SBC rejects the request, and the RAMP shows an error in the GUI. You must separate SIP TGs with commas (Do not use multiple commas in a row or other characters). You can configure supported or exempted SIP TGs.		
sipTrunkGroupSupportedList	Up to 4096 characters	List of Trunk Groups (TGs) marked for Lawful interception. For example: TG1,TG2,TG3.
sipTrunkGroupExemptedList	Up to 4096 characters	List of Trunk Groups (TGs) exempted from Lawful interception. For example: TG1,TG2,TG3.
Mediation Server		
Mediation Server Name	No character restrictions.	Enter a name for the Mediation Server.
Interception Type	N/A	The type of interception to use for this Media Server. • Media (Default) • Signaling
Protocol Transport Type	N/A	The IP transport type to use for media/signaling. • TCP – (Default) Transmission Control Protocol • TLS – Transport Layer Security • UDP – User Datagram Protocol Note UDP is not applicable for Signaling.
IP Address	N/A	Enter the IP address of the mediation device. The Ribbon network element sends the call data/call content to this IP Address. By default, the field is empty.
Port	1 to 65535	Enter the port on the mediation device. The Ribbon network element sends the call data/call content to this port.

Attribute	Length/Range	Description
DSCP	0 to 63	Enter a value for the DSCP for the X2/X3 packets. The default value is 32.
Operational State	N/A	Set the operation status of the link between the Mediation Server and RAMP. • In-Service: The transport link is operational. • Out-of-Service: (Default) The transport link is not operational.
Administrative State	N/A	The administrative state of this Mediation Server. • Enabled – Enables the connection between the SBC Core and the Mediation Server. • Disabled – (Default) Terminates the connection between RAMP and the Mediation Server.
DF Group Name	Supports up to 63 characters.	Use this optional field in the Mediation Server when • the Interception Type is set to "Signaling", • the Interception Standard is set to "3gpp" or "etsi," and • the Vendor ID is set to "verint," "groupTwoThousand," "utimaco" or "none." • After creating the Mediation Server, you can modify/remove the DF Group Name.
Keep Alive Time	0 to 65535	Interval for CDC keep-alive messages from the Ribbon network element to the mediation device. By default, the field is empty.
Keep Alive Interval	1 to 60	The keep-alive interval, in seconds, for signal generation. By default, the field is empty.
Keep Alive Probe	1 to 20	The maximum number of TCP keep-alive probes to send until the SBC decides that the connection is broken. By default, the field is empty.

Attribute	Length/Range	Description
TLS Profile Name	N/A	You can create multiple TLS Profiles on the SBC. A Calea user on RAMP can select any of these TLS Profiles in the Media Server configuration's TLS Profile Name attribute. You can modify the TLS profile after creating the Mediation Server. The default value is "defaultTlsProfile".

Configure CDC for PCSI LI

This section covers configuring CDC with P-Com.Session-Info (PCSI) for an SBC Core node on Ribbon Application Management Platform (RAMP). If the nodes is already configured, the new configuration replaces the existing configuration.

Prerequisites

- SBC Core node is registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Click **SBCs** in the navigation pane.
4. Click **Configured**.
5. Click on a node.
6. Select the **Create Mediation Server** check-box. Additional fields appear.
7. Select or enter the CDC parameters.
8. Click **Configure** <SBC node name>.

Attribute	Description	Value
Gateway Name	Gateway name for the node.	

Attribute	Description	Value
Network Element ID	The Network Element ID uniquely identifies each Ribbon network element. Network Element ID is generated and assigned by the RAMP during the node registration process. The Network Element ID is included in the Call Data sent to the IS/MD. The IS/MD determines the origination point for the intercept the SBC. You need to configure the partner's mediation device separately to identify the assigned NE IDs, if necessary. The system includes the node number in every CDC message as per the PacketCable PKT-SP-EM- 108-040113 specification.	
Node Number	The global unique node number for the SBC used by the LI Server for ID.	
CDC Name	The name of the LI Call Data Control Channel configured by the user.	Up to 23 alphanumeric characters. The characters #%^&(){}<>./\;`[]=!\$"*? ~ and SPACE are not allowed.
Interception Standard	The interception standard.	packetcable (default) – PacketCable, the industry consortium founded by CableLabs.
Vendor ID	The ID of the vendor.	ss8
RTCP Interception	Enable or disable Real-Time Control Protocol (RTCP) interception for the mediation server.	- Enabled - Disabled
Media IP InterfaceGroup Name	Enter the name of the IP interface group used to stream media packets to the LI server.	Up to 23 characters
Mediation Server		
Mediation Server Name	Enter a name for the mediation server.	
Interception Type	Interception type.	Media
Protocol Transport Type	The transport protocol type.	TCP (Transmission Control Protocol)

Attribute	Description	Value
IP Address	Enter the IP address of the mediation device. The Ribbon network element sends the call content to this IP Address.	A valid IPv4 or IPv6 address
Port	Enter the port on the mediation device. The Ribbon network element sends the call content to this port.	1 to 65535
DSCP	Enter a value for Access Function application.	0 to 63 Default value: 32
Operational State	Set the operation status of the link between the mediation server and the SBC.	• In-Service: The transport link is operational. • Out-of-Service: The transport link is not operational.
Administrative State	The Admin State.	• Enabled: Enables the connection between RAMP and the mediation server. • Disabled: Terminates the connection between RAMP and mediation server.
Keep Alive Time	Interval for CDC keep alive messages from the Ribbon network element to the mediation device.	0 to 65535
Keep Alive Interval	The interval in seconds for keep alive signal generation in seconds.	1 to 60
Keep Alive Probe	The maximum number of TCP Keep-alive probes to send until SBC decides that the connection is broken.	1 to 20

Configure CDC for PacketCable 2.0

In this section:

- [Create Diameter Peer for SBC Nodes with PacketCableVTwo](#)
- [Create Diameter Realm Routes for SBC Nodes with PacketCableVTwo](#)

This section covers configuring CDC with PacketCable 2.0 for an SBC Core node on Ribbon Application Management Platform (RAMP). If the nodes are already configured, the new configuration replaces the existing configuration.

Prerequisites

- SBC Core node is registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).
- The Diameter node is configured.

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Click **SBCs** in the navigation pane.
4. Click **Configured**.
5. Click on a node.
6. Select the **Create Mediation Server** check-box. Additional fields appear.
7. Select or enter the CDC parameters.
8. Click **Configure** <SBC node name>.

Note

Repeat steps 7 to 9 to add up to 16 mediation servers.

CDC Parameters

Attribute	Description	Value
Gateway Name	Gateway name for the node.	
Network Element ID	The Network Element ID uniquely identifies each Ribbon network element. RAMP generates and assigns the Network Element ID during the node registration process. The Call Data sent to the IS/MD includes the Network Element ID. The IS/MD determines the origination point for the intercept (the SBC Core). Configure the partner's mediation device separately to identify the assigned NE IDs, if necessary. The system includes the node number in every CDC message as per the PacketCable PKT-SP-EM- I08-040113 specification.	
Node Number	The global unique node number for the SBC used by the LI Server for ID.	

Attribute	Description	Value
CDC Name	The name of the LI Call Data Control Channel configured by the user.	Up to 23 alphanumeric characters. The characters #%^&(){}<>./\;>[]=!\$"*? ~ and SPACE are not allowed.
Interception Standard	The interception standard.	packetcableVTwo packet cable version 2.0
Vendor ID	The vendor name of the LI server.	• none • atos
Li Pol Dip For Regd Ood Msg	Sets SBC Core to send policy request to PSX for registered Out-of-Dialog requests (messages) to be intercepted. When this parameter is disabled, policy request is not sent to the PSX for registered Out-of-Dialog requests (messages).	• Enabled • Disabled
RTCP Interception	Specifies whether to intercept Real-Time Control Protocol (RTCP) information for the mediation server.	• Enabled: SBC intercepts RTCP information • Disabled: SBC does not intercept RTCP information.
Diameter Node Name	Specifies the name assigned to the SBC Diameter node configuration. The SBC configuration includes a single Diameter node to define the SBC side of the Diameter interface. If Diameter is used for more than one purpose on the SBC then the Diameter node is shared. Note A user with admin privilege must complete Diameter node configuration. Using this parameter, a "calea" user enters the Diameter node name in the CDC for a PC 2.0 LI. The "calea" user creates additional Diameter objects within the CDC.	Up to 32 characters
Embed TapId In CccId	Sets whether to embed the tapId in the CCCID.	• Disabled (default) • Enabled

Attribute	Description	Value
IP Interface Group Name	The name of the Network Interface group on the SBC Core device to which the call data channel is associated.	Up to 23 characters
Media IP InterfaceGroup Name	The name of the IP interface group used to stream media packets to the LI server.	Up to 23 characters
Mediation Server		
Mediation Server Name	The name for the mediation server.	
Interception Type	Interception Type.	• Media • Signaling
Protocol Transport Type	The transport protocol type. Note The field displays only if the "Interception Type" is "Media".	UDP (User Datagram Protocol)
IP Address	Specifies the IP address of the mediation device. The Ribbon network element sends the call data to this IP Address. Every call data message includes the IP address of the port used. The intercept server responds to these messages using the IP address received from the Ribbon network element. The Ribbon network element sends one message at a time to the intercept server. Note The field displays only if the "Interception Type" is media.	A valid IPv4 or IPv6 address

Attribute	Description	Value
Port	The port on the mediation device. The Ribbon network element sends the call data to this port. Note The field displays only if the "Interception Type" is "Media".	1 to 65535
DSCP	The value for Access Function application. Note The field displays only if the "Interception Type" is "Media".	0 to 63 Default value: 32
Operational State	The operation status of the link between the mediation server and RAMP.	- In-Service: The transport link is operational. - Out-of-Service: The transport link is not operational.
Administrative State	The administrative status.	- Enabled: Enables the connection between RAMP and the mediation server. - Disabled: Terminates the connection between RAMP and mediation server.
Realm Name	The name of the realm in which the mediation server is configured. Note The field displays only if the "Interception Type" is "Signaling".	

Attribute	Description	Value
DF Group Name	The name of the DF group to which the call data of the target under surveillance is delivered. The DF Group name must correspond to the name of Delivery Function Server Group configured on the SBC Core node. Provision Delivery Function Server Group on the SBC core node prior to provisioning surveillances. Using the DF group name, the SBC Core node maps the Realm name for routing DIAMETER X2 traffic. Note The field displays only for SBC Core 10.0 and later versions with Interception Type as Signaling.	Up to 63 characters in the FQDN format

Create Diameter Peer for SBC Nodes with PacketcableVTwo

The X2 interface is an extension of the Diameter base protocol for event-based messaging using Diameter Accounting messages. The X2 Diameter-based interface supports sending intercepted Call Data (CD) and associated call events to the DF. This procedure covers creating a Diameter Peer for SBC Core devices on Ribbon Application Management Platform (RAMP).

Note

The procedure is applicable only for PacketcableVTwo.

Prerequisites

- SBC Core node is registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Click **SBCs** in the navigation pane.
4. Create a Diameter Peer for all SBC nodes, or just one node, using a sub-step below:
 - To create Diameter Peer for all SBC nodes:
 - i. Click **Configured**.
 - ii. Click **Create Diameter Peer for All SBCs**.
The "Create Peer For All SBCs" dialog box displays.
 - iii. Proceed to step 5 to populate the dialog box fields.
 - To create Diameter Peer for a single SBC node:
 - i. Click **Configured**.
 - ii. Under the **Configured** tree, select an SBC node:

- iii. Click **Create Diameter Peer**.
The "Create New Peer" dialog box displays.
 - iv. Continue to step 5 to populate the dialog box fields.
5. Enter or select the values. For the values, refer to [Create Diameter Peer for SBC Nodes with PacketcableVTwo](#).
 6. Click **Create**.

Diameter Peer parameters

Parameter	Description	Value Range	Default Value	Mandatory (M)/ Optional (O)
CDC Name	The name of the LI Call Data Control Channel configured by the user.	Up to 32 alphanumeric characters. The characters #%^&(){}<>, \, ;, ` [] = ! \$ " ' ? ~ and SPACE are not allowed.		M
Diameter Peer Name	The logical name of the Diameter peer. Use unique names for Diameter peers under calea and admin users.	Up to 32 alphanumeric characters. The characters #%^&(){}<>, \, ;, ` [] = ! \$ " ' ? ~ and SPACE are not allowed.		M
State	The Admin state of the peer.	- enabled - disabled	disabled	M
IP Address	The optional IP address of the peer.	0 to 63		O
DSCP	The DSCP value for the peer.	0 to 63	16	
FQDN	The FQDN for the peer to use in the DNS query if the IP address is not configured.	Up to 256 characters		O
TCP Port	The TCP port number of the peer.	0 to 65535	3868	O
Device Watchdog Timer	The interval for the SBC to send Device-Watchdog-Requests.	0 to 100000 milliseconds	1000	O

Parameter	Description	Value Range	Default Value	Mandatory (M)/ Optional (O)
Device Watchdog Timer Answer Timeout	The timeout interval for the SBC to receive a Device-Watchdog-Answer from the peer for every Device-Watchdog-Request. If the peer does not send Device-Watchdog-Answer before the timeout expires, the SBC treats the peer as down.	50 to 500000 milliseconds	2000	O
Session Distribution	The order of distributing new sessions to multiple IP connections under the peer.	- honor-reply-order - round-robin	honor-reply-order	O

View Diameter Peers

To view Diameter Peers:

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Under the **CDC Devices** tree, click **SBCs**.
4. Click **Configured**.
5. Under the **Configured** tree, select an SBC node:
6. Click **View All Diameter Peers**.

The **View All Diameter Peers** pane displays.

Create Diameter Realm Routes for SBC Nodes with PacketcableVTwo

This procedure covers creating a create Realm Route for the SBC nodes on Ribbon Application Management Platform (RAMP)

Note

The procedure is applicable only for PacketcableVTwo.

Prerequisites

- SBC Core node is registered with RAMP.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Under the **CDC Devices** tree, click **SBCs**.
4. Create a Realm Route for all SBC nodes, or just one node, using a sub-step below:
 - To create Realm Route for all SBC nodes:
 - i. Click **Configured**.
 - ii. Click **Create Realm Route for All SBCs**.

- The "Create Realm Route for All SBCs" dialog box displays.
- iii. Proceed to step 5 to populate the dialog box fields.
 - To create Realm Route for an SBC node:
 - i. Click **Configured**.
 - ii. Under the **Configured** tree, select an SBC node:
 - iii. Click **Create Diameter Realm Route**.

The **Create New Realm Route** dialog box displays.

 - iv. Continue to step 5 to populate the dialog box fields.
 5. Enter or select the values. For the values, see [Realm Route parameters](#).
 6. Click **Create**.

Parameter	Description	Value Range	Default Value	Mandatory (D)/ Optional (O)
CDC Name	The name of the LI Call Data Control Channel configured by the user.	Up to 23 alphanumeric characters. The characters #%^&(){}<>,/,;`[]=!\$"*? ~ and SPACE are not allowed.		M
Diameter Realm Route Name	The logical name of this Diameter Realm Route. Use unique names for Diameter Realm Route under calea and admin users.	Up to 32 alphanumeric characters. The characters #%^&(){}<>,/,;`[]=!\$"*? ~ and SPACE are not allowed.		M
Diameter Peer Name	The logical name of the Diameter peer. Use unique names for Diameter peers under calea and admin users.	Up to 32 alphanumeric characters. The characters #%^&(){}<>,/,;`[]=!\$"*? ~ and SPACE are not allowed.		M
Priority	The priority of the Realm Route. A lower the number indicates higher priority.	0 to 100	0	O
Realm	The Realm (FQDN) for the route.	Up to 256 alphanumeric characters.		M
App Id	The application ID for the route.	• x2 • x1	x2	M
State	The Admin state of the route.	• enabled • disabled	disabled	M

View Diameter Routes

To view Realm Routes:

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Under the **CDC Devices** tree, click **SBCs**.
4. Click **Configured**.
5. Under the **Configured** tree, select an SBC node:
6. Click **View All Realm Routes**.
The **View All Realm Routes** pane displays.

Configuring CDC for SBC SWe on Cloud

In this section:

- [Viewing Nodes](#)
- [Node Level LI Statistics](#)

You can configure the Ribbon network elements and point them at the appropriate mediation devices for call data and call content delivery.

Configure the LI Call Data Channel on SBC SWe cloud nodes to support interception. For LI, configure the CDC using the CDC Configuration Manager through Ribbon Application Management Platform (RAMP).

Prerequisites

- A cloud SBC SWe instance is created.
- An [SBC SWe cluster](#) is created.

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Cluster CDC**.
3. Select the SBC cluster.
4. Click **Launch CDC Configuration Manager**. The **SBC Configuration Manager** window displays. For more information, refer to [Configuring the SBC for Lawful Interception](#).
5. Log out from the RAMP GUI.
6. Log on to the RAMP GUI as the admin user.
7. Navigate to **Device Management > Cluster Management > Manage VNFs**.
8. Select the SBC SWe cluster with the configuration.
9. Under the **Configurations** tab, click **Activate Configuration**.

Viewing Nodes

The LI configuration is distributed to the newly added nodes in a cluster. The existing nodes takes the LI configuration after rebooting the existing nodes.

To view the nodes in the cluster:

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Cluster CDC**.
3. Click **View Nodes**. The nodes list in the cluster appears.

Node Level LI Statistics

Ribbon Application Management Platform (RAMP) queries the status information for all the mediation servers configured and displays this information on the UI. The SBC statistics related to LI against media SBC and S-SBC are available for viewing.

Note

Only the 'calea' user can view the LI statistics.

Use the following procedure to view the LI statistics.

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Cluster CDC**.
3. Select a cluster.
4. Click **View Nodes**. The nodes list in the cluster appears.
5. Select a node.
6. Click **Launch Node LI Stats**. The **SBC Configuration Manager** window appears.

Configuring Mediation Server for SBCs

The SBC in the network acts as an Integrated SBC (I-SBC) to provide peering between an IMS network and other peering networks. The mediation server provisions network elements to intercept. Network elements expose provisioning, call data, and call content interface towards the mediation server for legal interception.

The mediation servers connect to the SBC through X2 and X3 interfaces to obtain call data and call content.

Mediation Server is supported only for the following configurations:

- IMS
- PacketCable and SS8
- PacketCable 2.0

Up to 16 mediation servers are supported in CDC.

The following procedure covers configuring a mediation server for SBCs through Ribbon Application Management Platform (RAMP).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Expand **CDC Devices**.
4. Expand **SBCs**.
5. Click **Configured**.
6. Click on a node. The **Configure CDC Device** window appears.
7. Select the **Create Mediation Server** check-box. Additional fields appear.
8. Select or enter values. Refer to [Configure CDC for SBC Core Nodes](#).
9. Click **Configure** <the device name>.

Delete a Mediation Server Created for SBC Core

This section covers deleting a mediation server created for SBC Core nodes in Ribbon Application Management Platform (RAMP).

Prerequisites

The Operational State is "Out Of Service" and the Administrative State is "Disabled" for the mediation server.

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Configure CDC**.
3. Expand **CDC Devices**.
4. Expand **Configured**.
5. Expand a gateway name.
6. Expand a mediation server.
7. Click on the mediation server properties.
8. Click **Delete Mediation Server**. A message appears, prompting you to confirm.
9. Click **OK**. The mediation server is deleted.

Managing Mediation Servers

In this section:

- [Create a Mediation Server](#)
- [Importing TLS Security Certificate to RAMP](#)

Managing mediation server is supported only in some customer-specific deployments.

Ribbon Application Management Platform (RAMP) supports establishing a transport connection towards the mediation server with or without Transport Layer Security (TLS). Additionally, **RAMP** supports Lawful Intercept (LI) target provisioning over the TLS to accommodate SS8 delivery function communication over this interface. **RAMP** accomplishes this by enabling CALEA Intercept Access Points (IAP) to support multiple (two instances) regionally-deployed SS8 Delivery Function systems.

Mediation servers interact with **RAMP** over the X1 interface to provision LI targets. These mediation servers are ADMF servers.

Note

If you remove the LI license from **RAMP**, you cannot use the Lawful Intercept feature.

Note

Before you remove the LI license, remove the mediation servers configured.

Create a Mediation Server

In this section:

- [Update a Mediation Server](#)
- [Disable a Mediation Server](#)
- [Delete a Mediation Server](#)

This section covers creating a mediation server for a customer specific deployment in Ribbon Application Management Platform (RAMP). This procedure may not be applicable for your deployment.

Prerequisites

- The SBC Core node is registered with **RAMP**.
- The CALEA credentials are set for the SBC Core device registered on RAMP. Refer to [Register an SBC Core Device](#).

Start

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Mediation Server**.
3. Click **Create**.
4. Select or enter values. Refer to [Create a Mediation Server](#). Click **Save**. The mediation server is added successfully.
5. Click **Enable** to activate the new mediation server. If the mediation server goes down, **RAMP** tries to connect to it six times. After six attempts, the mediation server is automatically disabled. You must manually enable the mediation server.

Mediation Server parameters

Attribute	Description
Mediation Server Name	Enter a name for the mediation server.
Mediation Server IP Address	Enter Mediation Server IP address in any of the following formats: • IPv4 • IPv6
Mediation Server Port	Mediation Server Port Number.
TLS	Set Transport Layer Security to any of the following: • Enabled Enables the TLS connection towards the mediation server. • Disabled Disables the TLS connection towards the mediation server.

Attribute	Description
Admin State	Admin State can be any of the following: - Enabled The connection between RAMP and the mediation server is enabled. - Disabled The connection between RAMP and the mediation server is disabled.
Operational State	The status of the link between the mediation server and RAMP . - In-Service The transport link is operational. - Out-of-Service The transport link is not operational.
DSCP	Enter Access Function application DSCP value. Range: 1 to 63 Default value: 32
Allow Bulk Audit	RAMP allows for bulk audits in the Mediation Server. - Enabled (Default) RAMP returns multiple targets (Maximum 255) in the Target Service List to the mediation server. The Ribbon LI solution supports a total of 5000 targets to be audited in the LI target table. - Disabled RAMP returns single target to the mediation server.
Select File	Certificate details and file path. Select File is enabled only if you set TLS to enabled.

Update a Mediation Server

1. Log on to the **RAMP** GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Mediation Server**.
3. Expand **Mediation Servers**.
4. Select a mediation server.
5. Click **Disable**. The Mediation server is disabled.
6. Modify the parameters. Refer to [Create a Mediation Server](#).
7. Click **Update**. The Mediation server parameters are updated.
8. Click **Enable** to activate mediation server.

Disable a Mediation Server

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Mediation Server**.
3. Expand **Mediation Servers**.
4. Select a mediation server.
5. Click **Disable**. The mediation server is disabled. A message *Mediation Server is disabled successfully* appears.

Delete a Mediation Server

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Mediation Server**.
3. Expand **Mediation Servers**.
4. Select a mediation server.
5. Click **Disable**. The mediation server is disabled. A message *Mediation server is disabled successfully* appears.
6. Click **Delete**. A message *Mediation Server is deleted successfully* appears.

Importing TLS Security Certificate to RAMP

Use the following procedure to copy the TLS security certificate (required if HTTPS) to Ribbon Application Management Platform (RAMP). After you upgrade and configure the GR, import the security certificate from the cinder volume path: `/opt/raid/configuration/liCertificates`, as it is not copied to RAMP after the upgrade.

Start

1. After the RAMP upgrade completes and the GR is configured, copy the certificate from the path `/opt/raid/configuration/liCertificates` to your desktop.
2. Log on to the RAMP GUI as "calea" user.
3. Navigate to **Observability > Lawful Intercept > Mediation Server**.
4. Select a mediation server.
5. Click **Disable**. The Mediation server is disabled.
6. Click **Browse** and import the security certificate from the desktop, which was copied.
7. Click **Enable** to activate the mediation server with the new security certificate. The Mediation server is activated.
The Operation State changes to 'In Service'.

Mediation Server parameters

Attribute	Description	Value range
Mediation Server Name	A name for the mediation server.	
Mediation Server IP Address	The mediation server IP address.	• IPv4 • IPv6 (default)

Attribute	Description	Value range
Mediation Server Port	The port number of the mediation server.	
TLS	The Transport Layer Security.	• Enabled Enables the TLS connection towards the mediation server. • Disabled Disables the TLS connection towards the mediation server.
Admin State	Admin State of the mediation server.	• Enabled The connection between RAMP and the mediation server is enabled. • Disabled The connection between RAMP and the mediation server is disabled.
Operational State	The status of the link between the mediation server and RAMP.	• In-Service The transport link is operational. • Out-of-Service The transport link is not operational.
DSCP	Access Function application string.	1 to 32 Default value: 32
Select File	Certificate details and file path. Note Select File is enabled only if you set TLS to enabled.	

Provisioning LI Targets

In this section:

- [Overview](#)

- [Provisioning Limitations](#)

Additional topics:

- [Target Provisioning Sequence](#)
 - [Set LI API on Intercept Server](#)
 - [IS Generation of LI API Messages to RAMP](#)
 - [IS Generation of LI API Messages to RAMP for Packet Cable 2.0](#)
 - [Forwarding Target Data to PSX](#)
- [Apply Restrictions on Lawful Intercept Targets](#)

Overview

Provisioning Lawful Interface (LI) targets on the Ribbon system involves sending data from the LI provisioning API and exchanging messages between the Intercept Server (IS) and Ribbon Application Management Platform (RAMP).

The IS can use the LI Provisioning API to create, retrieve, update, and delete specific Lawful Intercept targets, and to retrieve a list all Lawful Intercept targets.

Note

The `ingressCalltoWirelessSub` parameter is read-only.

You can specify the LI target by these Intercept Criteria: Directory number, MSISDN/MDN, IMSI, IMEI, ESN, Business Group and Private VPN number, Authcode, SIP URI, Billing number.

Note

Only Directory Numbers (Called, Calling, or translated) and SIP URI are supported as LI criteria.

You can specify the interception Type: `Pen_and_Trap` (Calling party Pen Register data and Called party Trap and Trace data) only, or Title III Intercept with call data and content.

You can also specify:

- whether to intercept forwarded calls, and
- whether the provisioned intercept target is enabled.

Note

Ribbon systems perform a Title III intercept and send calling party data, called party data, and call content (when available and as directed) to the IS, which is responsible to deliver only what a warrant requires (Title III, Pen Register, or Trap and Trace) to the Law Enforcement Agency.

The Lawful-Intercept Identifier (LIID), or TAP-ID, identifier is assigned to every target configured using the X1 interface. In the mediation server, each TAP-ID uniquely identifies a single target record that is added by the ADMF server.

RAMP propagates each target's TAP-ID to the PSX and SBC Core systems for further processing.

RAMP does not support auditing the target information based on TAP-ID.

Provisioning Limitations

- Wildcards are supported for the target. An asterisk (*) is used as a wildcard indicator in the INTERCEPT_CRITERIA2_ID (for Type DN) or INTERCEPT_CRITERIA1_ID (for type SIP_URI) of the X1 interface messages. RAMP does not validate the Intercept criteria numbers.
- RAMP adds TAP-ID to all the X1 messages CREATE and UPDATE as an optional parameter.
- The valid range for the TAP-ID is between 1 and 2147483647 (4 bytes).
- TAP-ID is an optional field. If the target is created without a TAP-ID, then on retrieving it, RAMP does not send the TAP-ID in the response. The default value "0" is stored only on the PSX. This is to make RAMP compatible with existing clients who do not have TAP-ID.
- If the TAP-ID is not set for a target, RAMP does not add TAP-ID in the response of Retrieve and List requests.
- The DF Group Name (dfGroupName) is an optional field and supports up to 63 characters.

Target Provisioning Sequence

In this section:

- [Set LI API on Intercept Server](#)
- [Forwarding Target Data to PSX](#)

After the LI functionality establishes on the Ribbon equipment, and the IS communicates with Ribbon Application Management Platform (RAMP), provisioning of intercept targets follows the basic sequence shown in the figure below.

Lawful Intercept Provisioning

1. Lawful Intercept target provisioning data is entered into the IS through the partner's Surveillance Administration System. This procedure may be performed manually or through electronic provisioning, as determined by the carrier and law enforcement agencies.
2. For each intercept target, the IS generates a message over the SOAP-based API over TCP/IP to RAMP, specifying the intercept criteria.
3. RAMP processes the intercept criteria based upon the configured LI target settings (refer to [Apply Restrictions on Lawful Intercept Targets](#)) and replies to the IS with a message indicating success/failure of target provisioning.
4. RAMP distributes the target data to all primary PSX devices through the existing PIPE protocol.

The procedure to implement a Lawful Surveillance Intercept is as follows:

1. A court order is delivered to the service provider and the law enforcement agency identifying a targeted DN and authorizing it for pen register (egress call data), trap and trace (ingress call data), or Title III (call data and content) surveillance.
2. The service provider provisions the authorized surveillance on the appropriate network elements (in this case, on the PSX through RAMP that serve the targeted DN. This allows call data to be captured and delivered to the LEA. At the LEA, a collection function is provisioned to receive the data.
3. As calls are placed to/from the targeted DN, the switches (the SBC and GSX) retrieve the surveillance authorization from the PSX and capture the authorized data and deliver it to the IS, which passes it to the collection function at the LEA.
4. When surveillance authorization expires, the targeted DN is re-provisioned and the switches no longer capture call data.

Set LI API on Intercept Server

In this section:

- [IS Generation of LI API Messages to RAMP](#)
- [IS Generation of LI API Messages to RAMP for Packet Cable 2.0](#)

The Intercept Server sends LI provisioning data to **Ribbon Application Management Platform (RAMP)** via the LI API. The carrier must provide the following:

- The LI provisioning human interface and link to government servers on the Intercept Server.
- The functionality necessary for the Intercept Server to generate LI API messages.

The carrier must also configure the Intercept Server with the following information:

- The IP address and port on **RAMP** to send the API messages.
- **RAMP** LI administrator login and password, for inclusion in the header of API messages.

For details of the Ribbon LI API, including the WSDL defining the interface messages, refer to the Ribbon Lawful Intercept Interface Specification. To obtain the specification document, contact the Ribbon Global Support (GPS).

IS Generation of LI API Messages to RAMP

The API used to provision LI targets on the **Ribbon** equipment uses standard SOAP syntax (XML over HTTP) with the added **Ribbon**-specific definitions provided by a web services definition language (WSDL) file.

It is the service provider's responsibility to implement the LI API functionality at the Intercept Server.

Every SOAP message contains a valid user and password of the **Ribbon Application Management Platform (RAMP)** Lawful Intercept administrator, in the SOAP header to authenticate and authorize the received the API message.

Lawful Interception Operating System (LIOS) can replicate X2/X3 streams to different law enforcement agencies (LEAs), duplicate targets with different tap IDs are provisioned. Two operations "retrieveLawfulInterceptTargetV2" and "deleteLawfulInterceptTargetV2" takes the complex type "LawfulInterceptTargetKeys" as the input. The following complex type is available in Web Services Description Language (WSDL):

```
<complexType name="LawfulInterceptTargetKeys">
  <sequence>
    <element type="tns:interceptCriteriaTypeEnum" name="interceptCriteriaType"/>
    <element type="xsd:string" name="interceptCriteriaId"/>
    <element type="xsd:int" name="tapId"/>
  </sequence>
</complexType>
```

The IS/MD sends API messages to **RAMP** to perform the following operations:

- Create a Lawful Intercept target
- Retrieve a Lawful Intercept target
- Update a Lawful Intercept target
- Delete a Lawful Intercept target
- List all provisioned Lawful Intercept targets

Lawful Intercept Provisioning

Column name	Data type	NULL ?	Description
INTERCEPT_CRITERIA_TYPE	NUMBER (3)	No	Set Lawful Intercept target to any of the following: • 1 = DirectoryNo • 2 = MSISDN_MDN • 3 = IMSI • 4 = ESN • 5 = BusinessGroup_PrivateVPNNum • 6 = Authcode • 7 = SIP_URI • 8 = BillingNum Note Only Directory Numbers (Called, Calling, or translated) and SIP URI are supported as LI criteria.
INTERCEPT_CRITERIA_1_ID	VARCHAR(128)	No	Part 1 of Intercept criteria. The value is based on Intercept type as follows: • CountryId for Intercept types 1,2,3,8 • Electronic Seq Number for Intercept type 4 • Business Group Id for Intercept type 5 • AuthcodeId for Intercept type 6 • SIP URI for Intercept type 7
INTERCEPT_CRITERIA_2_ID	VARCHAR(64)	No	Part 2 of Intercept criteria. The value is based on Intercept type as follows: • NationalId for Intercept types 1,2,3,8 • Sonus_NULL for Intercept types 4,6,7 • VPN for Intercept type 5
INTERCEPTION_TYPE	NUMBER (3)	Yes	Type of Interception Read-only field. PSX can only allow provisioning. • 1 = PEN_AND_TRAP • 2 = INTERCEPT
FORWARDED_CALL_INTERCEPT	NUMBER (3)	Yes	Indicates if the forwarded call should be intercepted or not • 1 = A forwarded call should be intercepted. • 2 = A forwarded call should NOT be intercepted.

Column name	Data type	NULL ?	Description
INGRESS_CALL_WIRELESS_SUB	NUMBER (3)	Yes	This parameter (when set to true) is used to disable Ingress calls to wireless subs from being tapped unless they are forwarded at the GMSC (call delivery calls can continue to be intercepted at the Traffic MSC).
ENABLED	NUMBER (3)	Yes	Indicates if intercept criteria is enabled • 1 = Intercept Enabled for this target (Default). • 2 = Intercept Not Enabled for this target.
DATA	VARCHAR(3)	No	This parameter stores the Initialization Vector (IV). The IV is computed for each row of LI data using the INTERCEPT_CRITERIA1_ID and INTERCEPT_CRITERIA2_ID parameters.

For every Lawful Intercept target, specify the intercept type. The Ribbon equipment treats all intercepts as Title III (call data and content), and only reverts to Pen and Trap (data only) if no GSX or SBC device is available.

IS Generation of LI API Messages to RAMP for Packet Cable 2.0

In this section:

- [Lawful Intercept Deployment](#)
- [SOAP API Message Provisioning Behavior](#)
 - [X1 Message Structure](#)
 - [AddSurveillance](#)
 - [ModifySurveillance](#)
 - [RemoveSurveillance](#)
 - [RemoveAllSurveillance](#)
 - [GetSurveillance](#)
 - [GetAllSurveillance](#)
 - [Error Handling](#)

Ribbon LI supports PacketCable 2.0 for Q-SBC. Ribbon Application Management Platform (RAMP). RAMP supports the X1 interface-equivalent to the Q-SBC. The X1 interface towards the ADMF server for intercept provisioning is supported using SOAP API.

Lawful Intercept Deployment

- The SBC Core is deployed in Active-standby mode with **RAMP** and the external PSX.
- **RAMP** supports multiple CALEA users and ADMF (LI Administration Function) servers.
- The ADMF servers operate independently to configure the targets interfacing to **RAMP** using X1 over SOAP (HTTPS).

Note

When multiple ADMF servers are supported, TapID is unique across the mediation servers.

- Multiple DF2 servers connect to the SBC Core using Diameter (over optional IPsec).
- Multiple DF2 servers connect to the SBC Core using UDP (over optional IPsec).

RAMP accepts encrypted connections using TLS (with self-generated or external certificates) from any mediation server with valid credentials.

SOAP API Message Provisioning Behavior

SOAP API message provisioning behavior is described below:

- SOAP authentication is performed using the credentials of a dedicated CALEA user.
- Auditing and pagination is performed using TapID. TapID is the key for all operations.
- RAMP uses a different WSDL for PC 2.0 and old LI flavors. RAMP differentiates WSDL services using different URLs.
- RAMP secures the X1 interface using HTTPS. The TLS certificates are self-signed and locally generated or CA signed certificates.

The TLS 1.0 authentication patterns are listed below:

Ciphersuite	Key Exchange Method	Server Authentication Method	Encryption Algorithm (key size)	Message Authentication Hash
TLS_RSA_WITH_AES_128_CBC_SHA	RSA	RSA	AES(128) CBC mode	SHA-1
TLS_DHE_RSA_WITH_AES_128_CBC_SHA	DHE	RSA	AES(128) CBC mode	SHA-1

X1 Message Structure

A surveillance provisioned via the SOAP based X1 interface consists of basic surveillance information. Use the following commands on RAMP for provisioning the PSX using the WSDL:

The WSDL defines two basic requests:

- `editConfig`: Add, modify, or delete surveillance provisioning
- `getConfig`: Retrieve a provisioned surveillance

Within the `editConfig` request, use the following commands to specify a command type:

- `addSurveillance`: Add a surveillance
- `modifySurveillance`: Modify a surveillance
- `removeSurveillance`: Delete a surveillance
- `removeAllSurveillance`: Delete all surveillance defined by a DF user

Within the `getConfig` request, use the following commands based on the filtering supplied in the request:

- `getSurveillance`: Retrieve a provisioned surveillance

The getConfig request option is indicated by the presence of a “tapId” block within the getConfig request.

- *getAllSurveillance*: Retrieve all surveillance provisioned by a DF user

Every request must contain the credentials block with the CALEA user details shared with the ADMF server.

AddSurveillance

The *AddSurveillance* command adds a surveillance record similar to *CreateLawfulInterceptTargetRequest*. **RAMP** sends create request to the PSX.

For more information on the commands, refer to Ribbon SBC Lawful Intercept Interface Specification for Packetcable 2.0.

The following parameters are used in this command.

Parameter	Description	Value range	Mandatory (M)/ Optional (O)
deviceName	The host name of RAMP .	string	M
pni	The parameter determines whether to intercept Call Content involving a target behind private or obscure network. If pni is set to True, the following parameters are mandatory: • Target Transmit Call Content DF Address • Target Transmit Call Content DF Port • Target Receive Call Content DF Address • Target Receive Call Content Port If pni is set to false, only the call data is intercepted.	boolean (True/False)	O

Parameter	Description	Value range	Mandatory (M)/ Optional (O)
txCcDfName	An optional string if Call Content is required for the target. The value is an IP address of the DF to which call content transmitted by the target is sent. If the parameter <i>txCcDfName</i> is set to true, the following parameters are mandatory: • Transmit CC DF Port • Receive CC DF Address/Port	IPv4/v6 address (string)	O
txCcDfPort	The port of the DF to which the call content transmitted by the target under surveillance is delivered. If the parameter <i>txCcDfPort</i> is set to true, the following parameters are mandatory: • Transmit CC DF Address • Receive CC DF Address/Port fields	standard port number 1 to 65535	O
rxCcDfName	An optional string if Call Content is required for the target. The value is an IP address of the DF to which call content received by the target is sent. If the parameter <i>rxCcDfName</i> is set to true, the following parameters are mandatory: • Transmit CC DF Address/Port • Receive CC DF Port	IPv4/v6 address (string)	O
rxCcDfPort	The port of the DF to which the call content received by the target under surveillance is delivered. If the parameter <i>rxCcDfPort</i> is set to true, the following parameters are mandatory: • Transmit CC DF Address/Port • Receive CC DF Address	standard port number 1 to 65535	O

Parameter	Description	Value range	Mandatory (M)/ Optional (O)
targetId	A string identifying the user agent under surveillance in the format of a username and host portion of a SIP URI or a DN (Directory Number) in a SIP or TEL URI. For example, username@domain, "6034565555" It must correspond to at least one of the possible contents of a SIP (or TEL) URI representing the surveillance target for calls/ signaling traversing the SBC.	string up to 255 characters	M
cdDfGroupName	The name of the DF group to which the call data pertaining to the target under surveillance is delivered.	string in FQDN format up to 63 characters	M
tapId	An alphanumeric string that uniquely identifies the surveillance. If the tapId is embedded in the CCCID (for X3), the acceptable range for tapId is a decimal value between 1 and 65534 as the tapId is embedded in 2 bytes out of the 4 bytes of CCCID. • If the tapId is null, it is converted to 0. • If the tapId is a decimal value in the range of 1 to 65534 (if the TapID is not a decimal number or out of range), it is converted to 65535 or hex 0xFFFF. The hexadecimal equivalent of the decimal value passed forms the two most significant bytes of the generated CCCID. If TapID is not embedded in CCCID, it is an alphanumeric string.	string up to 255 characters	M

Parameter	Description	Value range	Mandatory (M)/ Optional (O)
errorOption	The errorOption field is applicable only to editConfig requests with more than one surveillanceConfig block (in a single request message). If the errorOption field is not populated, the errorOption is set to “stop-on-error” by default. If an editConfig request contains a single surveillanceConfig block, the value of the errorOption field has no impact on the behavior of the request processing. • “ignore-error” ◦ If an error is encountered while processing multiple surveillanceConfig blocks (within a single editConfig request), then that error is noted, and processing continues with the next surveillanceConfig block. ◦ The response contains the errorTag value of “Partial Operation” and the error information corresponding to the first error that occurred. • “stop-on-error” ◦ If an error is encountered while processing multiple surveillanceConfig blocks (within a single editConfig request), the error is returned in the response and subsequent surveillanceConfig block are not processed.	Not used: Use of multiple surveillanceConfig blocks within a single editConfig request is not supported. The field is ignored as RAMP supports only one command per request.	O
credential	Every X1 SOAP request must contain an authentication block that contains user credentials (userid and password).	block	M
user	The userid, a member of the “calea” user group on RAMP.	string	M

Parameter	Description	Value range	Mandatory (M)/ Optional (O)
Password	The password of the calea user.	string	M

The IP address in txCcDfName and rxCcDfName supports IPv4 and IPv6 addresses.

The LI flavor treats the tapID along with the TargetID as the primary key. Multiple records are not added with the same tapID. Multiple records are not added for the same TargetID. Multiple ADMF servers require unique TapIDs.

ModifySurveillance

The *ModifySurveillance* command modifies the surveillance.

The `ModifySurveillance` command takes the same inputs as `AddSurveillance` identical processing. See [AddSurveillance](#).

RemoveSurveillance

The *removeSurveillance* command deletes a surveillance.

RAMP accepts the following parameters in the `removeSurveillance` command:

- `deviceName` : If the deviceName received does not match the SBC or the RAMP host name, the command is rejected.
- `tapID` : RAMP passes this info to PSX to fetch and delete from the database.

The command fails if the target record is not found with the tapID.

RemoveAllSurveillance

RAMP accepts the following parameters in the `removeAllSurveillance` command:

- `deviceName`: If the deviceName received does not match the SBC or RAMP host name, the command is rejected.

RAMP triggers the PSX to delete all the surveillance added (`addSurveillance`) by the DF user. The PSX deletes all the records that match the DF_USER.

The `removeAllSurveillance` command deletes all surveillance created by a specific DF user. Surveillance added by other DF users are not affected.

GetSurveillance

The *getSurveillance* command retrieves a single surveillance.

RAMP accepts the following parameters in the `getSurveillance` command:

- `deviceName` : If the deviceName received does not match the RAMP host name, the command is rejected.
- `tapID` : RAMP passes this info to the PSX to fetch from the database.

RAMP fetches the surveillance data from the PSX and sends the X1 response.

The response includes the following information:

- `deviceName`
- `pni`
- `cdDfGroupName`
- `txCcDfName`
- `txCcDfPort`
- `rxCcDfName`
- `rxCcDfPort`
- `targetID`
- `tapID`

GetAllSurveillance

The `getAllSurveillance` command retrieves multiple surveillance activities.

Only the surveillance added by the DF user specified in the `getConfig` request are retrieved. Any surveillance added by different DF users are not retrieved.

The control of the paged response message content is performed using of the following optional `getSurveillanceConfig` request attributes:

- `pageSize`: default value = 100, maximum value = 1000
- `pageIndex`: default value = 1

Surveillances contained in the `getAllSurveillance` response are ordered by `tapID`.

One `getAllSurveillance` request message results in only one response message (one page). If the number of surveillance provisioned by the DF user exceeds the count supported in one page, the DF is executed in a sequence of request/response messages in which the specified `pageIndex` value is incremented by one in every subsequent request. The DF can retrieve sequential pages of provisioned surveillance (ordered by `tapID`).

The combination of `pageSize` and `pageIndex` represents an absolute index to the surveillance table (filtered by `dfuser` and ordered by `tapID`). Separate request/response transactions are required to retrieve each page of surveillance.

RAMP accepts the following parameters in the `getAllSurveillance` command:

- `deviceName` : If the `deviceName` received does not match RAMP host name, the command is rejected.
- `pageIndex` : Page index indicates the current page to retrieve in which the surveillance are sorted based on `tapID` and partitioned into pages based on the `pageSize`.
- `pageSize` : Page size indicates the count of records that are required in the next response.

RAMP supports up to 1000 records per page

RAMP fetches the surveillance data from the PSX and sends the X1 response with all the records information bundled in a single response.

Error Handling

An X1 request in incorrect format results in a basic SOAP validation error.

Application errors include the following details.

- `errorTtype`: The field is always set to "application".

- **errorTag:** The errorTag field is populated with a value from the ErrorTag enumerated type defined in the error.xsd file. The ErrorTag value that is populated in the errorTag field is the error condition that closely aligns with the actual error.
- **errorSeverit:** This field is always set to “error”.
- **errorNumber:** The errorNumber field is populated with an integer that represents the actual error condition. The errorNumber has a 1:1 mapping with the text string that is displayed in the errorMessage field.
- **errorMessage:** Description of the actual error condition. Each string used in this field has a corresponding unique integer value which is displayed in the errorNumber field.

errorNumber	errorMessage	errorTag	Description
1	Badly formed request	OPERATION_FAILURE	The SOAP request is malformed.
2	Invalid user credentials	ACCESS_DENIED	The user credentials are not in the correct format.
3	Userid is not a member of the dfuser group	ACCESS_DENIED	The user ID is not of CALEA.
4	Internal credential validation error	OPERATION_FAILURE	The user authentication failed.
5	Internal Error	OPERATION_FAILURE	Any other internal error.
6	Missing SurveillanceConfig block	MISSING_ATTRIBUTE	NA
7	Missing SurveillanceConfig command	MISSING_ATTRIBUTE	NA
8	Missing SurveillanceConfig surveillance data	MISSING_ATTRIBUTE	NA
9	Missing device name	MISSING_ATTRIBUTE	The device name is missing.
10	Invalid device name	INVALID_VALUE	The device name does not match the RAMP host name.
11	Missing DfUser	MISSING_ATTRIBUTE	The username is missing.
12	Invalid PNI	INVALID_VALUE	The PNI value not Boolean.

errorNumber	errorMessage	errorTag	Description
13	Invalid TxCcAddress	INVALID_VALUE	The address is not in valid IP format.
14	Invalid RxCcAddress	INVALID_VALUE	The address is not in valid IP format.
15	Invalid TxCcPort	INVALID_VALUE	The port number is not in valid format.
16	Invalid RxCcPort	INVALID_VALUE	The port number is not in valid format.
17	Missing TxCcAddress	MISSING_ATTRIBUTE	The X3 Tx IP address is missing when PNI=true.
18	Missing RxCcAddress	MISSING_ATTRIBUTE	The X3 Rx IP address is missing when PNI=true.
19	Missing TxCcPort	MISSING_ATTRIBUTE	The X3 Tx port is missing when PNI=true.
20	Missing RxCcPort	MISSING_ATTRIBUTE	The X3 Rx port is missing when PNI=true.
21	Tap ID too long	INVALID_VALUE	Invalid TapID.
22	Invalid Tap ID	INVALID_VALUE	invalid TapID.
23	Missing Tap ID	MISSING_ATTRIBUTE	NA as tapID missing and treated as zero.
24	Tap ID already exists	DATA_EXISTS	Duplicate record insertion error.
25	Tap ID with given DfUser does not exist	OPERATION_FAILURE	Audit failure as the record was not created by the same user.
26	Invalid Target ID	INVALID_VALUE	Invalid targetID.
27	Missing Target ID	MISSING_ATTRIBUTE	targetID is missing.

errorNumber	errorMessage	errorTag	Description
28	Invalid Call Data DF Group Name	INVALID_VALUE	Cannot validate in RAMP.
29	Missing Call Data DF Group Name	MISSING_ATTRIBUTE	CDFGroup name is missing.
30	Invalid pageIndex	INVALID_VALUE	Audit page index out of bounds.
31	Invalid pageSize	INVALID_VALUE	Audit page size > 1000.
32	DB Insertion Error	OPERATION_FAILED	Add operation failed.
33	DB Modification Error	OPERATION_FAILED	Modify operation failed.
34	DB Remove Error	OPERATION_FAILED	Remove operation failed.
35	DB RemoveAll Error	OPERATION_FAILED	Remove all operation failed.
36	DB Get Error	OPERATION_FAILED	Audit failure.
37	DB Get ALL Error	OPERATION_FAILED	Audit failure without tapID.

Forwarding Target Data to PSX

When Ribbon Application Management Platform (RAMP) receives a provisioning message from the LI API, it converts the message data, as needed, and forwards it to every primary PSX for provisioning. RAMP automatically provisions one or many primary PSXs in the network.

Every primary PSX automatically creates, deletes, updates, or lists the specified LI_Target entities received from RAMP. However, there is no PSX GUI to provision or read LI content.

The provisioned LI criteria are compared with call data received in each Policy Request from an SBC Core device, or derived during call processing by the PSX. If there is a match, the PSX returns the matching LI criteria in the Policy Response.

Info

The default LI X2 messages has no information element to communicate the TapID to the Mediation Server.

Apply Restrictions on Lawful Intercept Targets

You can add restrictions on lawful Intercept targets in Ribbon Application Management Platform (RAMP).

RAMP allows you set the following:

- Restrict access to LI targets only for existing subscribers. Only the existing subscribers are designated as intercept targets.
 - Restrict access to LI targets only for the target owners (the user who created the target). A CALEA user can access only the LI targets created by that user. A user cannot access LI targets created by other users.
 - Send an error message if an operator attempts to delete an LI target (subscriber) that does not exist in the PSX database.
1. Log on to the RAMP GUI as "calea" user.
 2. Navigate to **Observability > Lawful Intercept > LI Target Settings**.
 3. Select or clear the checkboxes.
 4. Click **Apply**.

Check box	Description
Allow Lawful Intercept Targets for existing subscribers only	Restrict LI targets to existing subscribers only. Before creating an LI target, the PSX validates the subscriber DN in the database and returns an error if the DN is not found. When a Subscriber DN is deleted, the PSX removes all LI information from the database before deleting the DN. This option is not enabled by default. Note If you dynamically add a Softswitch entry to the PSX database, you must re-provision the “Allow Lawful Intercept Targets for existing subscribers only” setting.
Return an error when attempting to delete a non-existent LI target	Generate an error message through the RibbonLI API when the PSX attempts to delete an LI target that does not exist in the database. This option is disabled by default.

Check box	Description
Restrict access of LI targets by other CALEA users	Restrict access to LI targets created by other CALEA users. The restriction does not apply to existing targets, only applicable for the targets created after enabling the restriction. If you enable this restriction before deleting the targets and creating them again, the list and retrieve operation will not fetch the existing targets which do not contain the username stored in the PSX database. RAMP sends the username to the PSX only if the flag "Restrict access of LI targets by other CALEA users" is enabled. This option is disabled by default.

Call Processing

Contents

- [Call Data Interface](#)
 - [Call Data Channel Establishment](#)
 - [Call Data Messages](#)
- [Call Content Interface](#)
- [GSX Lawful Intercept Basic Call Processing](#)
- [SBC Lawful Intercept Basic Call Processing](#)

This section describes the processing of calls that meet the provisioned LI criteria, including the information sent from the PSX to the GSX in the routing response, the Call Data Interface messages exchanged between the GSX and the IS, and the Call Content streams delivered to a specified server. It contains the following sections:

- [Call Data Interface](#) describes the functionality of the Call Data interface used to transmit call progress messages from the GSX and SBC to the Intercept Server.
- [Call Content Interface](#) describes the RTP mechanism by which the GSX and SBC Core forward the voice content.
- [SBC Lawful Intercept Basic Call Processing](#) provides an example of interception of a call received by the SBC.

Call Data Interface

In this section:

- [Call Data Channel Establishment](#)
- [Call Data Messages](#)

When an LI call is in progress, the SBC and GSX send call progress information to the Intercept Server over the Call Data interface. This interface uses Radius over a UDP connection with a protocol based on the CableLabs

PKT-SP-EM- I08-040113 PacketCable Event Messages Specification, but with Ribbon-specific attributes and event messages added. Refer to the Ribbon **Lawful Intercept Interface Specification** for more information.

Call Data Channel Establishment

The GSX and SBC Core platforms include the following behavior when establishing Call Data Channels (CDCs) to the Intercept Server (IS):

- The GSX/SBC establishes a CDC over UDP/IP to the IS for sending call data of all intercepted calls to the IS. The GSX and SBC also send messages to the IS over this channel.
- The user configures the GSX/SBC with the UDP/IP address of the IS; refer to [Configuring Call Data Channel](#) for more information. The GSX/SBC periodically sends keep-alive messages to the IS to ensure it is reachable.
- The GSX/SBC includes the local IP address in the Radius NAS-IP-Address in the messages it sends to the IS. The IS uses this IP address to send a response to the GSX/SBC to avoid configuring the Ribbon platform's address information in the IS.

The GSX use both ports on the active MNS card and supports a switchover to the standby MNS card. The GSX first attempts to use the primary call data channel, if enabled. After a configurable number of retries is reached without an acknowledgment, the GSX attempts to use the secondary CDC, if enabled. This process repeats until an acknowledgment is received. Upon an MNS switchover, the GSX maintains the state of the CDC and continues in that state. The sequence number is reset after an MNS switchover.

Call Data Messages

In this section:

- [Startup and Keepalive](#)
- [Call Data Message Types](#)
- [Indication Messages](#)

When the policy response from the PSX indicates that an interception is needed, the GSX or SBC formats and sends call data messages to the Intercept Server for many stages of call processing.

The GSX or SBC expects to receive an ACK for each of the Packet Cable Event messages sent to the Intercept Server (IS). The IS re-transmits a message based on configuration and issues traps if the maximum number of re-transmissions is reached. The GSX or SBC transmits the next message to the IS only when receiving an ACK for the previously transmitted message.

Startup and Keepalive

Upon reboot, the GSX or SBC Core sends restart messages to the Intercept Server (IS) until it receives an acknowledgment.

The GSX or SBC Core periodically sends keepalive messages to the IS whenever the call data channel is idle for the configurable keepalive timer time. The GSX restarts the keepalive timer after receiving a message from the IS. If the IS fails to respond, the GSX or SBC tries sending the message for a configured number of times, after which it fails over to the backup IS, if configured.

Call Data Message Types

The types of call data messages sent by the SBC Core and GSX devices and the events that trigger them are listed in the following table. Refer to Ribbon Lawful Intercept Interface Specification for further details.

Call Data Message Types

Used by GSX	Used by SBC Core	Event	Call Data Message (Sent to IS unless otherwise stated)
✓	✓	Reboot	Restart
✓	✓	Enable the device to send subsequent messages	Restart Response from Intercept Server
✓	✓	Keepalive	Keepalive
✓	✓	Policy response with LI	Signaling Start - contains calling party, called party, and digits dialed from policy response.
✓	✓	IP addresses and ports to send upstream and downstream call content via RTP	Signaling Start Response from Intercept Server
✓	✓	Policy response with LI	Media Report
✓		Call Teardown step 2	
✓		The leg becomes passive (channel closed)	
✓		Hook flash (upstream channel put on hold)	
✓		Hook flash (un-hold)	
✓		SDP Update	
✓	✓	Call Forward	Service Instance
		Conferencing (MS)	
✓	✓	Ringback	Signal Instance
		Alerting	

Used by GSX	Used by SBC Core	Event	Call Data Message (Sent to IS unless otherwise stated)
		Hook flash (new call or to put on hold)	
		Hook flash (un-hold)	
		Event Message to call leg (e.g., generate ring splash)	
✓	✓	Call Answer	Call Answer
✓	✓	Call Teardown step 1	
		The leg becomes passive (call previously answered)	
✓	✓	Call Teardown step 3	Signaling Stop
		Passive leg disconnect	
✓	✓	GSX intercept failures and alarms.	Indication
✓	✓	none	QOS Reserve (present but not used)
✓	✓	none	QOS Release (present but not used)
✓	✓	none	QOS Commit (present but not used)

Indication Messages

The GSX generates traps for any LI events that do not include data identifying an intercept subject (failure of call data channel, failure to get intercept resources, etc.). These traps also go into the signaling event log. When possible, the traps are also sent to the Intercept Server via the Indication message. Events containing sensitive information are sent to the Intercept Server but not put into the event log.

Indication messages for abnormal events include:

- Internal failure
- Memory Allocation failure
- Xmit Intercept Mgr msg failure
- Invalid state
- Intercept not enabled
- Could not map incoming msg to CC blk
- Invalid Channel address family
- Msg status code failure
- LSWU issue

- Codec map failure

Call Content Interface

The GSX and SBC Core each use a pair of RTP connections to send Call Content media streams to the Intercept Server for all intercepted calls using one RTP connection to the Intercept Server (IS) for each direction of the intercepted call.

The IS provides Call Content Channel IP address and UDP ports for the RTP connections in a Signaling Start Response message over the Call Data Channel.

The GSX/SBC network elements support the following audio encodings:

- G.711 a or u law
- G.729A
- G.729AB (silence suppression)
- G.723.1 with or without Annex A and both 5.3 and 6.4Kpbs
- G.726 @32Kbps
- ILBC
- ILBC (silence suppression)
- AMR
- EFR
- T38 Fax Relay
- G.722
- G.722 (silence suppression)
- G.722.1
- G.722.1 (silence suppression)
- G.722.2 (AMR-WB)
- G.728
- G.728 (silence suppression)
- EVRC
- EVRCB

The GSX and SBC network elements detect out-of-band tones and RFC2833 DTMF Relay RTP packets, and then sends the appropriate call data messages to the intercept server. However, the GSX/SBC does not perform in-band tone detection.

In “direct media” call scenarios, the GSX/SBC network elements are not part of the media path. In these scenarios, GSX/SBC network elements send a Media Report message with the IP address of another network element in the media path and with the “direct media” attribute set.

GSX Lawful Intercept Basic Call Processing

Currently, all LI calls are handled as Title III intercepts, which includes Calling party data (Pen Register), Called party data (Trap and Trace), and Call Content for all call parties.

Currently, the GSX identifies LI calls on the basis of Calling or Called number for calls originated, redirected and or terminated to a subject.

The following figure demonstrates the basic call processing sequence for calls handled by the GSX.

Before call processing begins, the GSX establishes redundant Call Data channels for messages and status over UDP/IP to the Intercept Server. For more information, refer to [Call Data Channel Establishment](#).

The call processing sequence is typically as follows:

1. Call information (such as an ISUP IAM or a SIP Invite) arrives at the GSX via network signaling.
2. The GSX sends a policy request to the PSX containing the received signaling information such as Calling and Called number. The PSX maintains the database of all subscribers, including any provisioned LI information from the IS/MD as relayed by the **Ribbon Application Management Platform (RAMP)**. When PSX processing of the Policy Request results in a match with any provisioned Lawful Intercept criteria, the PSX returns the matching Lawful Intercept criteria in the Policy Response.
3. The GSX sends the appropriate network signaling to route the call. The GSX also begins its duties as an intercept access point (IAP) by sending a **Signaling_Start** message over the Call Data Channel to the configured IS/MD address. Currently, all LI calls are handled as Title III intercepts, which includes Calling party data (Pen Register), Called party data (Trap and Trace), and Call Content for all call parties.

Ingress intercept call data signaling is started after the IS response has been processed, and the egress intercept call data signaling is started after routes are resolved.

4. The IS/MD sends a **Signaling_Start_Response** (SSR) message to the GSX (at the source address/port of the received **Signaling_Start** message) that includes the IP/ports to which to send the collected call content RTP streams. The GSX establishes two RTP connections for call content to the IP address and port specified in the SSR. The GSX then sends a **Media_Report** message to the IS indicating that the voice channels are open.
5. When signaling indicates that the call has been answered, the GSX sends a **Call_Answer** message to the IS. When signaling indicates the call is finished, the GSX sends a **Call_Disconnect** message to the IS, along with a **Media_Report** indicating that the voice channels are closed and no longer being streamed, and a **Signaling_Stop** message indicating that call signaling is complete and no further Call Data messages will be sent for this call.

6. The Intercept Server processes the Call Data as necessary, and forwards it to Law Enforcement Agency servers as required.

The GSX always performs a Title III intercept and sends calling party data, called party data, and call content (as directed) to the Intercept server. It is the responsibility of the IS to deliver only what the warrant requires (Title III, Pen Register, or Trap and Trace) to the Law Enforcement Agency.

The GSX does not support LI for IP-looped “hairpin” calls on PNS10 or PNS30 servers.

SBC Lawful Intercept Basic Call Processing

The following figure demonstrates the basic call processing sequence for calls handled by the SBC.

All LI calls are handled as Title III intercepts, which include Calling party data (Pen Register), Called party data (Trap and Trace), and Call Content for all call parties.

LI calls are identified based on Calling or Called numbers for calls originated, redirected and or terminated to a subject.

Before call processing begins, the SBC establishes redundant Call Data channels for messages and status over UDP/IP to the Intercept Server. For more information, refer to [Call Data Channel Establishment](#).

The call processing sequence is typically as follows:

1. Call information (such as an ISUP IAM or a SIP Invite) arrives at the SBC via network signaling.
2. The SBC sends a policy request to the PSX containing the received signaling information such as Calling and Called number. The PSX maintains the database of all subscribers, including any provisioned LI information from the IS/MD as relayed by Ribbon Application Management Platform (RAMP). When PSX processing of the Policy Request results in a match with any provisioned Lawful Intercept criteria, the PSX returns the matching Lawful Intercept criteria in the Policy Response.

3. The SBC sends the appropriate network signaling to route the call.
The SBC also begins its duties as an intercept access point (IAP) by sending a **Signaling_Start** message over the Call Data Channel to the configured IS/MD address. Currently, all LI calls are handled as Title III intercepts, which include Calling party data (Pen Register), Called party data (Trap and Trace), and Call Content for all call parties.

Ingress intercept call data signaling is started after the IS response has been processed, and the egress intercept call data signaling is started after routes have been resolved.

4. The IS/MD sends a **Signaling_Start_Response** (SSR) message to the SBC (at the source address/port of the received **Signaling_Start** message) that includes the IP/ports to which to send the collected call content RTP streams.
The SBC establishes two RTP connections for call content to the IP address and port specified in the SSR. The SBC then sends a **Media_Report** message to the IS indicating that the voice channels are open.
5. When signaling indicates that the call has been answered, the SBC sends a **Call_Answer** message to the IS.
When signaling indicates the call is finished, the SBC sends a **Call_Disconnect** message to the IS, along with a **Media_Report** indicating that the voice channels are closed and no longer being streamed, and a **Signaling_Stop** message indicating that call signaling is complete and no further Call Data messages are sent for this call.
6. The Intercept Server processes the Call Data as necessary and forwards it to Law Enforcement Agency servers as required.

The SBC always performs a Title III intercept and sends calling party data, called party data, and call content (as directed) to the Intercept server. It is the responsibility of the IS to deliver only what the warrant requires (Title III, Pen Register, or Trap and Trace) to the Law Enforcement Agency.

Viewing CDC Status Report

Ribbon Application Management Platform (RAMP) automatically retrieves CDC configuration information for all registered SBC and GSX nodes.

You can view the Call Channel Data (CDC) for the nodes configured with LI in Ribbon Application Management Platform (RAMP).

To determine SBC CDC status, refer to [Show Status Address Context - Intercept](#).

1. Log on to the RAMP GUI as "calea" user.
2. Navigate to **Observability > Lawful Intercept > Report**.

CDC report for the GSX is displayed only if PIF collection is enabled for the GSX.

In addition to the CDC configuration (see [Table](#)), the report also displays the following information:

- Primary State
The state of the Primary Intercept Server (Enabled, Disabled, or N/A).
- Primary Mode
The operating mode of the Primary Intercept Server (Active, Out of Service, Standby, or N/A).
- Secondary State
The state of the Secondary Intercept Server.

- **Secondary Mode**
The operating mode of the Secondary Intercept Server.

View GSX CDC Report Using CLI

You can also use the following commands to determine GSX CDC status via the CLI:

```
SHOW INTERCEPT CALL DATA CHANNEL ALL ADMIN
```

```
SHOW INTERCEPT CALL DATA CHANNEL <text> ADMIN
```

These commands generate a report similar to the following:

```
Node: None Date: 2003/07/24 17:14:49 GMT
Zone: GMTMINUS05-EASTERN-US
Name:      liConfig
NIF Group Name      foo
UDP Port           3002
Primary Channel State      ENABLED
Primary Channel Mode      ACTIVE
Primary Channel IP Address 10.6.3.83
Secondary Channel State    DISABLED
Secondary Channel Mode     OUTOFSERVICE
Secondary Channel IP Address 10.6.3.84
Keep Alive Timer (seconds) 5
Number of Retries         3
```

LI Performance Management

In this section:

- [GSX LI Performance Reports](#)
 - [GSX CDC Performance Reports via CLI](#)
- [SBC LI Performance Reports](#)

Lawful Intercept related Call Data Channel message statistics available through Ribbon Application Management Platform (RAMP) Performance Manager. LI-related Call Data Channel message statistics, generated by the GSX and SBC for intercepted calls, are available to users with the proper Performance Management privileges on RAMP. The available LI-specific statistics are listed in the following table.

SBC	GSX	Message Count
✓	✓	Signaling Start sent (successful, unsuccessful)
✓	✓	Signaling Stop sent (successful, unsuccessful)
✓	✓	Call Answer sent (successful, unsuccessful)
✓	✓	Media Report sent (successful, unsuccessful)
✓	✓	Signaling Start Response received
✓	✓	Call Disconnect sent (successful, unsuccessful)
✓	✓	Service Instance sent (successful, unsuccessful)
✓	✓	Signal Instance sent (successful, unsuccessful)
		Conference Party Change sent (successful, unsuccessful)
✓	✓	Keep Alive sent (successful, unsuccessful)
✓	✓	Restart sent (successful, unsuccessful)
✓	✓	Indication sent (successful, unsuccessful)
✓	✓	Radius Acknowledgement received
✓	✓	Radius message code unknown received

A successful message counter is updated when a message is acknowledged by the IS.

GSX LI Performance Reports

Related article:

- [GSX CDC Performance Reports via CLI](#)

You can initiate the GSX LI performance reports shown in the following table through the Performance Report Wizard:

GSX Performance Reports

Report Name	Sub-Category	Description
Failed Intercept Message Stats Report	Lawful Intercept Stats Reports	Provides statistics concerning Lawful Intercept Failed Intercept Messages including: • # Signaling Start Msgs Failed • # Call Answer Msgs Failed • # Call Disconnect Msgs Failed • # Media Report Msgs Failed • # Service Instance Msgs Failed • # Signaling Instance Msgs Failed • # Indication Msgs Failed • # Signaling Stop Msgs Failed
Interface Maintenance Message Stats Report	Lawful Intercept Stats Reports	Provides statistics concerning Lawful Intercept Interface Maintenance Messages including: • # Primary Operation Status • # Secondary Operation Status • # Keep Alive Msgs Succeeded • # Keep Alive Msgs Failed • # Restart Msgs Succeeded • # Restart Msgs Failed • # Radius Acknowledge Received • # Radius Unknown Msg Received
Successful Intercept Message Stats Report	Lawful Intercept Stats Reports	Provides statistics concerning Lawful Intercept Successful Intercept Messages including: • # Signaling Start Msgs Succeeded • # Call Answer Msgs Succeeded • # Call Disconnect Msgs Succeeded • # Media Report Msgs Succeeded • # Service Instance Msgs Succeeded • # Signaling Instance Msgs Succeeded • # Indication Msgs Succeeded • # Signaling Start Response Received • # Signaling Stop Msgs Succeeded

The below tables provide information about how each GSX LI Performance Report field maps to a corresponding Statistics Table field. This information is provided to facilitate your ability to find definitions/descriptions of the various report fields.

Failed Intercept Messages Stats Report

Report Field	Statistics Table Field	Statistics Table
# Signaling Start Msgs Failed	SIGNAL_START_UNSUCCESS	GSX LI Performance Reports
# Call Answer Msgs Failed	CALL_ANSWER_UNSUCCESS	
# Call Disconnect Msgs Failed	CALL_DISCONNECT_UNSUCCESS	
# Media Report Msgs Failed	MEDIA_REPORT_UNSUCCESS	
# Service Instance Msgs Failed	SERVICE_INSTANCE_UNSUCCESS	
# Signaling Instance Msgs Failed	SIGNAL_INSTANCE_UNSUCCESS	
# Indication Msgs Failed	INDICATION_UNSUCCESS	
# Signaling Stop Msgs Failed	SIGNAL_STOP_UNSUCCESS	

Interface Maintenance Messages Stats Report

Report Field	Statistics Table Field	Statistics Table
# Primary Operation Status	PRI_OPER_STATE	GSX LI Performance Reports
# Secondary Operation Status	SEC_OPER_STATE	
# Keep Alive Msgs Succeeded	KEEP_ALIVE_SUCCESS	
# Keep Alive Msgs Failed	KEEP_ALIVE_UNSUCCESS	
# Restart Msgs Succeeded	RESTART_SUCCESS	
# Restart Msgs Failed	RESTART_UNSUCCESS	
# Radius Acknowledge Received	RADIUS_ACK_RECEIVED	
# Radius Unknown Msg Received	RADIUS_UNKNOWN_MSG_RECEIVED	

Successful Intercept Messages Stats Report

Report Field	Statistics Table Field	Statistics Table
# Signaling Start Msgs Succeeded	SIGNAL_START_SUCCESS	GSX LI Performance Reports
# Call Answer Msgs Succeeded	CALL_ANSWER_SUCCESS	
# Call Disconnect Msgs Succeeded	CALL_DISCONNECT_SUCCESS	
# Media Report Msgs Succeeded	MEDIA_REPORT_SUCCESS	
# Service Instance Msgs Succeeded	SERVICE_INSTANCE_SUCCESS	
# Signaling Instance Msgs Succeeded	SIGNAL_INSTANCE_SUCCESS	
# Indication Msgs Succeeded	INDICATION_SUCCESS	
# Signaling Start Response Received	SIGNAL_START_RESPONSE_RECEIVED	
# Signaling Stop Msgs Succeeded	SIGNAL_STOP_SUCCESS	

The table below provides information on the GSX LI statistic tables you can export, in the form of .csv (comma separated values) files, via the Data Collection Profile settings.

GSXImStatusStats

Column Name	Column Type	Index ?	Description
IMSTATUSINDEX	INTEGER	Yes	A unique value for each intercept manager entry between 1 and maximum allowed.
PRI_OPER_STATE	INTEGER	No	Current operational state of the Primary Call Data Channel.
SEC_OPER_STATE	INTEGER	No	Current operational state of the Secondary Call Data Channel.
SIGNAL_START_SUCCES S	COUNTER	No	The number of successful Signal Start messages sent on the active call data channel.
SIGNAL_START_UNSUCC ESS	COUNTER	No	The number of unsuccessful Signal Start messages sent on the active call data channel.
CALL_ANSWER_SUCCES S	COUNTER	No	The number of successful Call Answer messages sent on the active call data channel.
CALL_ANSWER_UNSUCC ESS	COUNTER	No	The number of unsuccessful Call Answer messages sent on the active call data channel.
CALL_DISCONNECT_SU CCESS	COUNTER	No	The number of successful Call Disconnect messages sent on the active call data channel.
CALL_DISCONNECT_UN SUCCESS	COUNTER	No	The number of unsuccessful Call Disconnect messages sent on the active call data channel.
MEDIA_REPORT_SUCCE SS	COUNTER	No	The number of successful Media Report messages sent on the active call data channel.
MEDIA_REPORT_UNSUCC CESS	COUNTER	No	The number of unsuccessful Media Report messages sent on the active call data channel.

Column Name	Column Type	Index ?	Description
SERVICE_INSTANCE_SUCCESS	COUNTER	No	The number of successful Service Instance messages sent on the active call data channel.
SERVICE_INSTANCE_UNSUCCESS	COUNTER	No	The number of unsuccessful Service Instance messages sent on the active call data channel.
SIGNAL_INSTANCE_SUCCESS	COUNTER	No	The number of successful Signal Instance messages sent on the active call data channel.
SIGNAL_INSTANCE_UNSUCCESS	COUNTER	No	The number of unsuccessful Signal Instance messages sent on the active call data channel.
INDICATION_SUCCESS	COUNTER	No	The number of successful Indication messages sent on the active call data channel.
INDICATION_UNSUCCESS	COUNTER	No	The number of unsuccessful Indication messages sent on the active call data channel.
KEEP_ALIVE_SUCCESS	COUNTER	No	The number of successful Keep Alive messages sent on the active call data channel.
KEEP_ALIVE_UNSUCCESS	COUNTER	No	The number of unsuccessful Keep Alive messages sent on the active call data channel.
RESTART_SUCCESS	COUNTER	No	The number of successful Restart messages sent on the active call data channel.
RESTART_UNSUCCESS	COUNTER	No	The number of unsuccessful Restart messages sent on the active call data channel.
RADIUS_ACK_RECEIVED	COUNTER	No	The number of Radius Acknowledgement messages received on the active call data channel.

Column Name	Column Type	Index ?	Description
RADIUS_UNKNOWN_MS G_RECEIVED	COUNTER	No	The number of messages received with an unknown Radius message code on the active call data channel.
SIGNAL_START_RESPON SE_RECEIVED	COUNTER	No	The number of Signaling Start Response messages received on the active call data channel.
SIGNAL_STOP_SUCCE S	COUNTER	No	The number of successful Signal Stop messages sent on the active call data channel.
SIGNAL_STOP_UNSUC CESS	COUNTER	No	The number of unsuccessful Signal Stop messages sent on the active call data channel.

GSX CDC Performance Reports via CLI

You can also get statistics on GSX call data channel performance by using these CLI commands:

```
SHOW INTERCEPT CALL DATA CHANNEL <> STATISTICS
SHOW INTERCEPT CALL DATA CHANNEL ALL STATISTICS
```

For example, this CLI command:

```
% SHOW INTERCEPT CALL DATA CHANNEL <CDC_id> STATISTICS
```

Will generate the following:

```
Node: COUGAR                               Date: 2007/08/21 15:42:22 GMT
                                           Zone: GMTMINUS05-EASTERN-US

      INTERCEPT CALL DATA CHANNEL STATISTICS
Call Data Channel Name:                   CDC_id
Primary Channel Operational State:        INSERVICE
Secondary Channel Operational State:      OUTOFSERVICE

              Sent                      Received
      Successful      Unsuccessful
-----
Signaling Start      2              0
Signaling Stop       2              0
Call Answer           2              0
Call Disconnect       2              0
Media Report          4              0
Service Instance      0              0
Signal Instance       0              0
```

Indication	0	0	
Keep Alive	14445	18	
Restart	1	0	
Radius Acknowledge			14458
Unknown Message			0
Signaling Start Response			2

SBC LI Performance Reports

The Ribbon Application Management Platform (RAMP) does not include SBC LI Performance Reports.

LI Fault Management

In this section:

- [GSX Lawful Intercept Alarms](#)
 - [sonusImPriOperStateChange](#)
 - [sonusImSecOperStateChange](#)
- [SBC Lawful Intercept Alarms](#)
- [RAMP Lawful Intercept Alarms](#)
 - [sonusEMSLIX1InterfaceDownNotification](#)
 - [sonusEMSLIX1InterfaceUpNotification](#)

Ribbon Application Management Platform (RAMP) manages any Lawful Intercept-related traps supported by the Ribbon devices through the generic Fault Management component in RAMP. There is no indication of the intercept criteria in any of these traps, so there are no added security requirements for viewing LI-related traps. LI-related alarms for intercepted calls are available to users with the proper Fault Management privileges via RAMP.

GSX Lawful Intercept Alarms

In this section:

- [sonusImPriOperStateChange](#)
- [sonusImSecOperStateChange](#)

The GSX Lawful Intercept alarms are covered in this section.

sonusImPriOperStateChange

Description	This trap indicates the intercept manager's primary call data channel operational state has changed. The varbind sonusImStatusPriOperState indicates the new state.
Instance Fields	sonusImAdmnName
Severity	Minor
Event Codes	sonusImAdmnName—The name of this Intercept Manager instance. sonusImStatusPriOperState—Current operational state of the Primary call data channel: • inService(1) • outOfService(2) • standBy(3)
Repetition	No
Impact	The GSX cannot send intercepted call contents and call data over to Intercept Manager server if the operational state of both primary and secondary call data channel are OOS.
Action	If IM operational state changed to outOfService(2), check both the Intercept Manager Server and the IM configuration in the GSX to get more information. The following CLI commands can be used to get IM configuration and statistics. <pre>SHOW INTERCEPT CALL DATA CHANNEL ALL ADMIN SHOW INTERCEPT CALL DATA CHANNEL ALL STATISTICS</pre>
Clearing	Automatic

sonusImSecOperStateChange

Description	This trap indicates the Intercept Manager's secondary call data channel operational state has changed. The varbind sonusImStatusSecOperState indicates the new state.
Instance Fields	sonusImAdmnName
Severity	Minor

Event Codes	sonusImAdmnName—The name of this Intercept Manager instance. sonusImStatusSecOperState—Current operational state of the Secondary call data channel: • inService(1) • outOfService(2) • standBy(3)
Repetition	No.
Impact	The GSX cannot send intercepted call contents and call data over to Intercept Manager server if the operational state of both primary and secondary call data channel are OOS.
Action	If IM operational state changed to outOfService(2), check both the Intercept Manager Server and the IM configuration in the GSX to get more information. The following CLI commands can be used to get IM configuration and statistics. <pre>SHOW INTERCEPT CALL DATA CHANNEL ALL ADMIN SHOW INTERCEPT CALL DATA CHANNEL ALL STATISTICS</pre>
Clearing	Automatic

SBC Lawful Intercept Alarms

The following Lawful Intercept alarms exist on the SBC Core:

- [sonusSbxImMediationServerTcpLinkDown](#) - MAJOR
- [sonusSbxImMediationServerTcpLinkUp](#) - MAJOR
- [sonusSbxImPriOperStateChange](#) - MAJOR
- [sonusSbxImSecOperStateChange](#) - MAJOR
- [sonusSbxImMediationServerX2MsgBufferFull](#) - MAJOR
- [sonusSbxImMediationServerX2MsgBufferAvailable](#) - MAJOR
- [sonusLiCryptoFailureNotification](#) - MAJOR
- [sonusLiCryptoSuccessNotification](#) - MAJOR

RAMP Lawful Intercept Alarms

Additional Topics:

- [sonusEMSLIX1InterfaceDownNotification](#)
- [sonusEMSLIX1InterfaceUpNotification](#)

Ribbon Application Management Platform (RAMP) Lawful Intercept alarms are covered in this section.

sonusEMSLIX1InterfaceDownNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.107
Definition:	This notification is raised when the X1 interface connection terminates.
Action:	None required.
Clearing:	Automatic, sonusEMSLIX1InterfaceUpNotification
Repetition:	No
Instance Fields:	mediationServerIP
Event Code(s):	• sysName: An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. • sysObjectID: The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.' • sonusEventTime: Provides timestamp of when the event occurs. • sonusEventDescription: Describes the event. • sonusEventClass: Lists the associated event class. • mediationServerIP: IP address of the mediation server.

sonusEMSLIX1InterfaceUpNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.108
Definition:	This notification is raised when the X1 interface connection establishes.
Action:	None required.
Clearing:	Automatic
Repetition:	No
Instance Fields:	mediationServerIP

Event Code(s):	sysName: An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID: The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.' sonusEventTime: Provides timestamp of when the event occurs. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. mediationServerIP: IP address of the mediation server.

LI Security

In this section:

- [Separate LI Provisioning and System Management](#)
- [Provisioning Only via API from Intercept Server](#)
- [Write-Only RAMP LI Provisioning](#)
- [PSX Security](#)
- [IS Handling of Ribbon IP Addresses](#)
- [GSX and SBC Handling of Call Content IP Address](#)
- [Billing](#)
- [Protocol Security](#)

The Ribbon Lawful Intercept solution provides several features to maintain security of Lawful Intercept activities.

Separate LI Provisioning and System Management

Though management of the Ribbon equipment and provisioning of LI targets are both handled by Ribbon Application Management Platform (RAMP), they are controlled through two separate and distinct interfaces: Surveillance administration is via LI API messages from the IS to RAMP. Ribbon system administration is via RAMP GUI management system from a separate System Administration interface. Data provided through the LI API is invisible to the RAMP GUI.

Provisioning Only via API from Intercept Server

LI targets can only be provisioned via LI API messages sent to the specified IP/port on RAMP. LI targets cannot be provisioned via any other means, such as the GSX CLI or direct PSX database writes.

Write-Only RAMP LI Provisioning

LI target provisioning data are not stored in RAMP but are sent directly to the PSX database. Target data cannot be read from the PSX database via RAMP, and are obscured from PSX database queries. The IS can send RAMP a message via the LI API to retrieve, update, or delete a specific currently provisioned Lawful Intercept target, or list all currently provisioned Lawful Intercept targets. Based upon the query, information is retrieved from the PSX database and returned in an API response to the IS.

The SBC, and GSX do not store information about intercept subjects.

PSX Security

There is no GUI screen to view/modify/delete the contents of Lawful Intercept Criteria table. There is also no logging of LI-related events in log files such as pes.log, pipe.log, and so on.

IS Handling of Ribbon IP Addresses

During LI call processing, the IS responds to Call Data messages from SBCs and GSXs using the Source IP addresses of the messages. The IS never initiates Call Data exchange with the SBC or GSX, so it need not be provisioned with their IP addresses beforehand.

GSX and SBC Handling of Call Content IP Address

The GSX and SBC devices are configured with the IP address (for example, of the IS) to which to send Call Data messages. However, during call processing, only in response to the GSX call data, the IS sends the GSX an SSR message containing the IP address to which the GSX should send its Call Content RTP streams.

Billing

Lawful Intercept calls generate the same call detail records as non-LI calls.

Protocol Security

You can run secure protocols for all communication links between the intercept server and RAMP and between RAMP and the Ribbon devices.

- Intercept Server to RAMP
The SOAP interface is secured using SSL. The authentication and authorization mechanism is on RAMP user and role management.
- RAMP to PSX
The PIPE connection between RAMP and PSX can be secured over SSH.
- RAMP to SBC
The only information configured within the SBC by the RAMP is the IP and Port of the IS(s), which is not considered to be a security risk if sent over the network.

Deploying liTestWebApp in RAMP

To deploy liTestwebapp in Ribbon Application Management Platform (RAMP):

1. Enable Lawful Intercept (LI) on RAMP. Refer to [Enabling Lawful Intercept on RAMP](#).
2. Download "testTools-<RAMP VERSION>.tar.gz" from the Ribbon support portal and copy it to a temporary directory in RAMP.
3. Unzip the file as shown in the following example:

```
gzip -d testTools-V21.11.00R000.tar.gz
```

4. Untar the file as shown in the following example.

```
tar -xvf testTools-V21.11.00R000.tar
```

5. Change to insight user.
6. Copy *liTestwebapp.war* to */opt/sonus/ems/weblogic/insight/deployments*.
7. Navigate to the directory */opt/sonus/ems/weblogic/insight/deployments*.
8. Execute the following:

```
chown -R insight:insight liTestWebApp.war
```

9. Enter the following command:

```
chmod -R 775 liTestWebApp.war
```

10. Enter the following command:

```
touch liTestWebApp.war.dodeploy
```

11. To launch liTestwebapp in browser, enter <https://<host-ip>/liTestWebApp/>.

 - [Resource Usage Threshold Matrix](#)

This guide provides detailed alarm information for devices you manage with **Ribbon Application Management Platform (RAMP)** to aid in isolating and troubleshooting system fault conditions. Each alarm description provides the alarm definition, severity level, associated event codes, impact to the system, action(s) to rectify the fault condition, alarm repetition, and clearing information.

New and Deprecated Alarms

In this section:

- [New Alarms](#)
 - [New Alarms in 24.09R000 Release](#)
- [Deprecated Alarms](#)
 - [Deprecated Alarms in 24.09R000 Release](#)

New Alarms

New Alarms in 24.09R000 Release

There are no new alarms in this release.

Deprecated Alarms

Deprecated Alarms in 24.09R000 Release

The following are the deprecated alarms in this release:

- sonusV2VfyMgrApplVersionFailNotification
- sonusV2VfyMgrApplVersionSuccessNotification
- sonusV2VfyMgrMgmtClientFailNotification
- sonusV2VfyMgrMgmtClientSuccessNotification
- sonusV2VfyMgrSnmpAccessFailNotification
- sonusV2VfyMgrSnmpAccessSuccessNotification
- sonusV2VfyMgrAgentVersionFailNotification
- sonusV2VfyMgrAgentVersionSuccessNotification
- sonusVfyMgrSnmpAccessFailNotification

Managing Device Faults

In this section:

- [Fault Instrumentation](#)
- [Fault Notification](#)

Fault Instrumentation

In this section:

- [What is Monitored](#)
- [Running Customer Supplied Instrumentation Agents](#)

What is Monitored

Depending on hardware/software and which instrumentation components are running on a device, the following categories of fault information are available:

- Environmental alarms (temperature, fan)
- Host resource utilization (CPU, memory, file system)
- Java Agent Framework (Chassis, Process Mgmt)

- Database Replication
- Process monitoring
- Geographical Redundancy (GR) faults
- Device-specific faults (Refer to the appropriate alarm references for device-specific faults.)

Running Customer Supplied Instrumentation Agents

Ribbon strongly recommends not using customer-supplied instrumentation agents on Ribbon hosts to avoid performance/interoperability repercussions. If necessary, please contact Ribbon Global Product Support for additional details.

Fault Notification

SNMP Traps

The Ribbon Application Management Platform (RAMP) devices use SNMP traps to notify management applications of faults. Use RAMP or a third-party management application to view traps from all devices. If any node or application malfunctions, a fault notification is initiated at the device and forwarded to the RAMP or third-party management application for processing.

The following SNMP trap types are supported:

- All Ribbon devices support SNMP v2 or v3 traps.
- RAMP supports V1, V2, and V3 trap forwarding.

RAMP Alarms

This page describes the alarm notifications generated by Ribbon Application Management Platform (RAMP) and provides links to each alarm category.

RAMP Alarm Categories

The RAMP alarms are categorized according to the device or application that generated the alarm:

- [Access Management Alarms](#)
- [Cluster Alarms](#)
- [Cron Job Alarms](#)
- [Database Alarms](#)
- [Device Management Alarms](#)
- [EdgeMarc Alarms](#)
- [GSX Discovery](#)
- [High Availability Alarms](#)
- [Licensing Management Alarms](#)
- [Normalized Alarms](#)
- [Number Portability Alarms](#)
- [OSS Trap Resync Alarms](#)
- [Performance Management Alarms](#)
- [RAMP CNF - Alarms](#)
- [Reachability Alarms](#)
- [Redundancy Alarms](#)
- [SBC Edge Alarms](#)
- [Threshold Alarms](#)
- [Verification Manager Alarms](#)
- [linkUp](#)

- [linkDown](#)

Alarm Field Definitions

RAMP alarm notifications are defined by the fields:

- **Type**—Represents the severity level assigned by the device. Possible severity levels are Critical, Major, Minor, and Informational.
- **Description**—Describes the purpose of the alarm.
- **Impact**—Describes the impact of the alarm on the system when the indicated failure or fault occurs.
- **Action**—Details the action the operator must take to eliminate/prevent the failure condition. When appropriate, step-by-step procedures will be provided.
- **Clearing**—This field identifies how an alarm clears from the Fault Manager Event List. Alarm clearing is either automatic or manual.
- **Repetition**—Identifies if an alarm is repeated for each occurrence of a particular failure relating to the same managed object instance. When appropriate, repetition interval information is included in this field.
- **Instance Fields**—By default, all alarms are instanced by the source host and trap type. For some alarms, an Instance ID field is included to uniquely identify the alarms. The Instance ID is created by appending the values of the instance fields to the default instance information. In this guide, when instance fields exist for an alarm, the Instance Fields category in the alarm description is populated with one or more instance fields.
- **Event Code(s)**—Identifies detailed event information contained in the alarm (event levels and classes, threshold types, clearing strings, and so forth). This field may not always be included.

The following alarms are raised on RAMP, but the error condition is on the device. and not on the RAMP:

- [sonusEmsV2RisingEventNotification](#)
- [sonusEmsV2FallingEventNotification](#)
- [sonusEmsV2NodeUnreachableNotification](#)
- [sonusEmsV2HostUnreachableNotification](#)
- [sonusEmsV2NodeReachableNotification](#)
- [sonusEmsV2HostReachableNotification](#)
- [sonusEmsV2NodeRestartedNotification](#)
- [sonusEmsV2NodeCfgFailNotification](#)
- [sonusV2VfyMgrNodeTypeFailNotification](#)
- [sonusV2VfyMgrNodeTypeSuccessNotification](#)
- [sonusEmsV2PifCollectFailNotification](#)
- [sonusEmsPMPProfileAssignmentFailedNotification](#)
- [sonusEmsV2PifCollectDoneNotification](#)
- [sonusEmsV2PMStatsFileCollectionFailed](#)

Access Management Alarms

Contents

- [sonusEmsV2LoginFailureNotification](#)
- [sonusEmsLDAPServerErrorNotification](#)
- [ribbonCertificateExpiryStatusNotification](#)
- [ribbonCertificateExpiredNotification](#)
- [ribbonRadiusAuthServerUnreachable](#)
- [ribbonRadiusAuthServerReachable](#)

This section covers alarms related to accessing Ribbon Application Management Platform (RAMP).

sonusEmsV2LoginFailureNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.81
Definition	A login attempt failed for the user specified in the field sonusEmsLoginUserName from the host specified in the field sonusEmsV2LoginIPAddress.
Repetition	Yes. Repeats every time a login failure occurs.
Event Codes	sonusEmsLoginUserName: The user name provided during a login attempt. sonusEmsV2LoginIPAddress: The IP address of the node from which the login attempt is initiated. sonusEmsV2LoginIPAddressType: The address type of sonusEmsV2LoginIPAddress. • 1 indicates IPv4. • 2 indicates IPv6.
Instance Fields	sonusEmsLoginUserName, sonusEmsV2LoginIPAddress, sonusEmsV2LoginIPAddressType
Action	If the alarm occurs repeatedly, investigate user/host activities for which the login the failure occurred.
Impact	No impact to the system.
Clearing	Manual.

sonusEmsLDAPServerErrorNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.131
Description	An error occurred while authenticating the user on the LDAP server.
Repetition	Yes. Repeats every time Ribbon Application Management Platform tries to verify the authentication mechanism.
Event Codes	N/A
Instance Fields	N/A
Action	Check the Security Realm configuration and LDAP server status.
Impact	The LDAP-based user Authentication fails.
Clearing	Manual

ribbonCertificateExpiryStatusNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.161
Definition	Ribbon Application Management Platform (RAMP) sends a daily notification when certificates are about to expire within the configured threshold. To set how many days in advance you want to be notified of the certificate expiry, navigate to Management > Authentication & Authorization > Administration and enter the number of days in the field "Number of days for certificate expiry notification." Range: 15 to 365 days, default: 15 days
Repetition	Yes, repeats daily (once every 24 hours) based on the configured threshold.
Event Codes	- sonusEventTime: The timestamp of the event. - sonusEventDescription: The description of the event. - sonusEventClass: The event class. - sonusEventLevel: The event level.
Instance Fields	sonusHostID: The unique ID or serial number for this host.
Action	Update the certificates.
Impact	Certificates will expire.

Clearing	Manual

ribbonCertificateExpiredNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.160
Definition	Ribbon Application Management Platform (RAMP) sends a daily notification when the certificates in the truststore have expired.
Repetition	Yes, repeats daily (once every 24 hours).
Event Codes	- sonusEventTime: The timestamp of the event. - sonusEventDescription: The description of the event. - sonusEventClass: The event class. - sonusEventLevel: The event level.
Instance Fields	sonusHostID: The unique ID or serial number for this host.
Action	Update the certificate
Impact	The certificate cannot be used.
Clearing	Manual

ribbonRadiusAuthServerUnreachable

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.173
Definition	This trap is raised when there is a connection failure.
Repetition	Yes. Repeats every time if there is a connection failure.
Event Codes	sonusHostID

Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime, ribbonRadiusIpAddressOrFQDN
Action	None
Impact	None
Clearing	Automatic, ribbonRadiusAuthServerReachable

ribbonRadiusAuthServerReachable

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.174
Definition	It is the clearing alarm for ribbonRadiusAuthServerUnreachable.
Repetition	Yes. Repeats on successful connection.
Event Codes	sonusHostID
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime, ribbonRadiusIpAddressOrFQDN
Action	None
Impact	None
Clearing	Automatic

Cluster Alarms

Contents

- [sonusEmsClusterInstanceUpNotReceivedNotification](#)
- [sonusEmsClusterNodeDeRegistrationNotification](#)
- [sonusEmsClusterNodeDiscoveryFailedNotification](#)
- [sonusEmsClusterNodeIPsInUseNotification](#)
- [sonusEmsClusterNodeIPsInUseUnRegisterNotification](#)
- [sonusEmsClusterNodePurgeNotification](#)
- [sonusEmsClusterNodeRegistrationRejectedNotification](#)
- [sonusEmsNodeSnmpV3SetFailedNotification](#)

This section covers alarms related to cluster management.

sonusEmsClusterInstanceUpNotReceivedNotification

Type: **CRITICAL**

OID	1.3.6.1.4.1.2879.2.1.7.2.0.96
Description	This notification indicates the Ribbon Application Management Platform (RAMP) does not receive instance up request for dynamic register nodes within node registration completion interval.
Repetition	Yes. Repeats every time node discovery fails and node is deregistered from RAMP.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEmsClusterInstanceUpNotReceivedNotification
Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: 1. <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> 2. Take corrective action to fix the problem.
Impact	RAMP deregisters the existing cloud node.
Clearing	Manual

sonusEmsClusterNodeDeRegistrationNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.99
Description	A deregistration is requested by the cloud node to Ribbon Application Management Platform (RAMP).
Repetition	Yes. Repeats every time a cloud node initiates a deregistration request.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEMSClusterNodeDeRegistrationNotification
Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> - Take corrective action to fix the problem.
Impact	RAMP deregisters the cloud node.
Clearing	Manual

sonusEmsClusterNodeDiscoveryFailedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.101
Description	The cloud node discovery fails, and the specified node state changes to offline.
Repetition	Yes. Repeats when cloud nodes discover operation fail.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEMSClusterNodeDiscoveryFailedNotification

Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: 1. <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> 2. Take corrective action to fix the problem.
Impact	the cloud node state changes to offline, and the node is not reachable by Ribbon Application Management Platform (RAMP).
Clearing	Manual

sonusEmsClusterNodeIPsInUseNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.97
Description	Ribbon Application Management Platform (RAMP) rejects dynamic node registration because the device IP is already in use.
Repetition	Yes. Repeats each time node registration fails.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEmsClusterInstanceUpNotReceivedNotification
Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: 1. <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> 2. Take corrective action to fix the problem.
Impact	The RAMP fails to register the cloud node.
Clearing	Manual

sonusEmsClusterNodeIPsInUseUnRegisterNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.102

Description	Ribbon Application Management Platform (RAMP) rejects dynamic node re-registration with because the device IP is already in use.
Repetition	Yes. Repeats each time node re-registration fails.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEmsClusterNodeIPsInUseUnRegisterNotification
Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> - Take corrective action to fix the problem.
Impact	RAMP fails re-register a cloud node.
Clearing	Manual

sonusEmsClusterNodePurgeNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.100
Description	The Ribbon Application Management Platform (RAMP) invokes a purge operation on the specified cloud nodes which exceed unregistered node interval.
Repetition	Yes. Repeats each time when nodes exceeds unregistered node interval.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEMSClusterNodePurgeNotification

Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: 1. <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> 2. Take corrective action to fix the problem.
Impact	Cloud nodes are purged from RAMP.
Clearing	Manual

sonusEmsClusterNodeRegistrationRejectedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.95
Description	Ribbon Application Management Platform (RAMP) rejected a dynamic node registration request.
Repetition	Yes. Repeats each time the node registration fails.
Event Codes	ClusterName: This describes the name of the cluster which is associated with the node.
Instance Fields	sonusEmsClusterNodeRegistrationRejectedNotification
Action	View the log file for relevant error information indicating a problem. The log file is specified in the <code>log4j.xml</code> file in the appropriate configuration directory: 1. <code>/opt/sonus/ems/weblogic/sonusEms/logs/sys/ems_trace_log</code> 2. Take corrective action to fix the problem.
Impact	RAMP failed to register the specified cloud node.
Clearing	Manual

sonusEmsNodeSnmpV3SetFailedNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.124

Description	Unable to set SNMPv3 security level parameters on the node while creating or editing cluster configurations on Ribbon Application Management Platform (RAMP), as communication with the managed device fails (node is down).
Repetition	Yes. Repeats each time communication with the device fails.
Event Codes	ClusterName: Describes the name of the cluster associated with the node.
Instance Fields	sonusEmsNodeSnmpV3SetFailedNotification
Action	Resync the SNMP settings of the cluster profile again.
Impact	RAMP fails to support authentication and encryption of SNMPv3 traps from the managed devices.
Clearing	Manual

Cron Job Alarms

In this section:

- [ribbonCronJobExecutionMissed](#)

ribbonCronJobExecutionMissed

Type: MINOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.175
Description	This event is generated when a scheduled cron job fails to execute at a specific time. A variety of reasons can cause this failure, such as resource constraints or software errors. Monitoring and addressing these events can help ensure the system performs as expected.
Repetition	Yes

Event Codes	- sonusHostID - sonusEventDescription - sonusEventClass - sonusEventLevel - sonusEventTime - ribbonMissedCronJobName
Instance Fields	None
Action	View the cron logs at: <code>/var/log/cron</code> to identify the cause of failure. The job name and the misfire time(s) are reported by varbind "<code>ribbonMissedCronJobName</code>" and "<code>sonusEventDescription</code>"
Impact	Misfired cron job can lead to improper functioning of the system.
Clearing	Manual

Database Alarms

Contents

- sonusEmsInsightDBConnectionPoolExhaustedNotification
- sonusDBaasDownNotification
- sonusDBaasClearNotification
- sonusDBaasFileSystemUtilizationNotification
- sonusDBaasFileSystemUtilizationClearNotification
- sonusDBaasDatabaseConnectionNotification
- sonusDBaasDatabaseConnectionClearNotification
- sonusDBaasCertificateNotification
- sonusDBaasCertificateClearNotification
- sonusDBaasReplicationLagNotification
- sonusDBaasReplicationLagClearNotification
- sonusDBaasDownstreamNodesConnectedNotification
- sonusDBaasDownstreamNodesConnectedClearNotification
- sonusDBaasInactiveReplicationSlotsNotification
- sonusDBaasInactiveReplicationSlotsClearNotification

sonusEmsInsightDBConnectionPoolExhaustedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.119
Description	The alarm is raised when there are not sufficient database connections in the RAMP connection pool.
Repetition	None
Event Codes	sysName: An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID: The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it can assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.' sonusEventTime: The timestamp of the event. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level.
Instance Fields	None
Action	Increase the connection pool size.

Impact	Loss of functionality in Ribbon Application Management Platform (RAMP), the RAMP GUI may not be able to function. PM collection may not be successful.
Clearing	Manual

sonusDBaaSDownNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.126
Description	The DbaaS services are down on Ribbon Application Management Platform (RAMP).
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	1. As the postgres user on RAMP, check database status with the command “dbaas_service status”. 2. Perform one of the following: ◦ If the database is down, attempt to start it. Refer to Start DBaaS Service in RAMP. ◦ If the database does not start, check the logs in /var/log/postgres.
Impact	Database is down. • If this is the active node, then all RAMP services are also down. • If this is a standby node, then it is not a viable fail-over option.
Clearing	Automatic; sonusDBaaSClearNotification

sonusDBaaSClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.129

Description	Clear alarm for sonusDBaaSDownNotification
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	None
Impact	None
Clearing	Automatic

sonusDBaaSFileSystemUtilizationNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.125
Description	The disk utilization is more than configured value.
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	Find excessive disk utilization by executing the following command as the root user: du -sh *
Impact	No immediate impact, but could cause RAMP services to go down if disk utilization increases to 100%.

Clearing	Automatic, sonusDBaaSFileSystemUtilizationClearNotification

sonusDBaaSFileSystemUtilizationClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.132
Description	Clear alarm for sonusDBaaSFileSystemUtilizationNotification
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	None
Impact	None
Clearing	Automatic

sonusDBaaSDatabaseConnectionNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.133
Description	The applications are unable to connect to the database.
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime

Action	1. Check RAMP Status 2. Check the dbaas connectivity status in the output.
Impact	The database or pgbouncer is down.
Clearing	Automatic, sonusDBaaSDatabaseConnectionClearNotification

sonusDBaaSDatabaseConnectionClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.134
Description	Clear alarm for sonusDBaaSDatabaseConnectionNotification
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	None
Impact	None
Clearing	Automatic

sonusDBaaSCertificateNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.135
Description	The DbaaS service certificate is not valid.
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.

Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	1. Issue the root certificate again. 2. Replace the old certificate with the new certificate.
Impact	• The database is down. • If the error condition is on the active node, all the RAMP services are down. • If the error condition is on the standby node, failover is not viable.
Clearing	Automatic, sonusDBaasCertificateClearNotification

sonusDBaasCertificateClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.136
Description	Clear alarm for sonusDBaasCertificateNotification
Repetition	No
Event Codes	sonusHostID —The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Instance Fields	sonusHostID, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusEventTime
Action	None
Impact	None
Clearing	Automatic

sonusDBaasReplicationLagNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.137
Description	Replication lag notification.

Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusEventDescription
Action	1. Navigate to <code>/etc/sonus/RDSyncStatus.sh</code> 2. Check the network latency within the EMS node cluster.
Impact	The database is down or the I/O operation speed is slow.
Clearing	Automatic, sonusDBaaSReplicationLagClearNotification

sonusDBaaSReplicationLagClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.138
Description	This is a clearing alarm for sonusDBaaSReplicationLagNotification .
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusEventDescription
Action	None

Impact	None
Clearing	None

sonusDBaaSDownstreamNodesConnectedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.139
Description	Downstream nodes connected notification.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusEventDescription
Action	1. Navigate to <code>/etc/sonus/RDSyncStatus.sh</code>. 2. Check if the DB on the standby node is up and running and connectivity is working.
Impact	The standby database is down. If this is the active node, the DB replication is stopped since the standby DB is not reachable. If this is a standby node, then it is not an option.
Clearing	Automatic, sonusDBaaSDownstreamNodesConnectedClearNotification .

sonusDBaaSDownstreamNodesConnectedClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.140

Description	This is the clearing alarm for sonusDBaaSDownstreamNodesConnectedNotification .
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusEventDescription
Action	None
Impact	None
Clearing	None

sonusDBaaSInactiveReplicationSlotsNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.141
Description	Inactive replication slots notification.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusEventDescription

Action	1. Check the status of the standby and try to restore the service. 2. Check network service.
Impact	If this is the active node, then the standby is not being replicated. It is not applicable on the standby node.
Clearing	Automatic, sonusDBaaSInactiveReplicationSlotsClearNotification

sonusDBaaSInactiveReplicationSlotsClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.142
Description	This is the clearing alarm for sonusDBaaSInactiveReplicationSlotsNotification .
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusEventDescription
Action	None
Impact	None
Clearing	None

This section covers alarms related to device management.

sonusEmsUpgradeJobFailedErrorNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.89
Description	This alarm indicates SBC management Upgrade schedule failed. The Ribbon Application Management Platform will raise this alarm on SBC 1000/2000 Upgrade operation failure.
Repetition	No
Event Codes	None
Instance Fields	Node, Alarm Name, scheduleId.
Action	Re-execute the upgrade job for failed devices.
Impact	Upgrade for one or more devices failed as part SBC upgrade Job.
Clearing	Manual

sonusEmsBackupJobFailedErrorNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.90
Description	This alarm indicates SBC management Backup schedule failed. The Ribbon Application Management Platform will raise this alarm on an SBC Edge Backup operation failure.

Repetition	No
Event Codes	None
Instance Fields	Node, Alarm Name, scheduleId.
Action	Re-execute the backup job for failed devices.
Impact	Backup for one or more devices failed as part SBC upgrade Job.
Clearing	Manual

sonusEmsConfigurationJobFailedErrorNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.91
Description	This alarm indicates the SBC management Configuration schedule failed. The Ribbon Application Management Platform raises this alarm on a SBC 1000/2000 configuration operation failure.
Repetition	No
Event Codes	None
Instance Fields	Node, Alarm Name, scheduleId.
Action	Re-execute the configuration job for the failed devices.
Impact	The configuration for one or more devices failed as part of the SBC configuration Job.
Clearing	Manual

sonusEmsRestoreFailedErrorNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.92
Description	This alarm reports an SBC management Restore operation failure. The Ribbon Application Management Platform raises this alarm on an SBC 1000/2000 Restore operation failure.

Repetition	No
Event Codes	None
Instance Fields	Node, Alarm Name, scheduleId.
Action	Re-execute the operation for the failed device.
Impact	Restore operation failed for a specific device.
Clearing	Manual

sonusEmsPartialConfigurationJobFailedErrorNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.94
Description	This alarm indicates the SBC Core management Partial Configuration schedule failed.
Repetition	No
Event Codes	None
Instance Fields	• sysName, • sysObjectID, • sonusEventTime, • sonusEventDescription, • sonusEventClass, • sonusEventLevel, • scheduleId, • scheduleName, • failedNodes
Action	Re-execute the Partial Configuration job for the failed devices.
Impact	Partial Configuration for one or more SBC Core devices failed as part of the SBC Configuration Job.
Clearing	Manual

sonusEmsV2NodeCfgDoneNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.57
Description	Successfully configured the specified node.
Repetition	Yes. The registration code maintains the specified host's last state. If the state changes to 'success', an alarm is generated.
Event Codes	sonusEmsNodeid—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeid
Action	None required.
Impact	None.
Clearing	Automatic, clears in 2 minutes

sonusEmsV2NodeCfgFailNotification

This alarm is raised on the device not on the Ribbon Application Management Platform (RAMP).

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.56
Description	RAMP failed to complete PIF collection for the specified node.
Repetition	Yes. The registration code maintains the specified host's last state. If the state changes to 'fail', an alarm is generated.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	The action to take for this fault depends upon what version and device RAMP is communicating with when this fault occurs. Please refer to matrix of versions/devices and recommended actions to take when troubleshooting. Also, verify connectivity to the device in question via ping or similar tool that uses same protocol the RAMP uses to configure the device.
Impact	RAMP cannot manage the affected node.
Clearing	Automatic, sonusEmsV2NodeCfgDoneNotification

sonusEmsV2NodeCfgPartialNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.61
Description	The Ribbon Application Management Platform (RAMP) partially configured the specified node. One of the hosts of a redundant configuration was not successfully configured.
Repetition	Yes. The registration code maintains the specified host's last state. If the state changes to 'partial', an alarm is generated. Note that 'partial' indicates that one node in a redundancy setup is not configured correctly
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	None.
Action	Do the following: 1. Verify connectivity between the RAMP and the hosts defined for this node. 2. Verify that the Sonus agent is running on each of the hosts.
Impact	The node for which the configuration is incomplete may not be manageable by RAMP.
Clearing	Automatic, sonusEmsV2NodeCfgDoneNotification

sonusEmsFingerprintChangeNotification

Type: **CRITICAL**

OID	1.3.6.1.4.1.2879.2.1.7.2.0.122
Description	The alarm is raised if the fingerprint changes on the device.
Repetition	No, the Ribbon Application Management Platform (RAMP) raises the alarm during device discovery.
Event Codes	• sonusEventTime: Provides timestamp of when the event occurs. • sonusEventDescription: Describes the event. • sonusEventClass: Lists the associated event class. • sonusEventLevel: Lists the associated event level (severity).
Instance Fields	• sysName • sysObjectID • sonusEventTime • sonusEventDescription • sonusEventClass • sonusEventLevel
Action	Check whether the fingerprint on the device changed. If the fingerprint displayed in the alarm is not identical to the device, verify the fingerprint manually. If the fingerprints do not match, unregister and reregister the device.
Impact	• Possible case of man-in-the-middle attack An attacker tries to intercept the communication between the RAMP and the device. The device is compromised. • A normal notification on fingerprint change The fingerprint of the device genuinely changed. No impact.
Clearing	Manual

sonusEmsFingerprintMismatchNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.123
Description	The alarm is raised if fingerprint verification fails on the device.
Repetition	None
Event Codes	• sonusEventTime: Provides timestamp of when the event occurs. • sonusEventDescription: Describes the event. • sonusEventClass: Lists the associated event class. • sonusEventLevel: Lists the associated event level (severity).

Instance Fields	• sysName • sysObjectID • sysName • sysObjectID • sonusEventTime • sonusEventDescription • sonusEventClass • sonusEventLevel
Action	Check whether the fingerprint on the connecting device changed. If the fingerprint changed, discover the device again.
Impact	The Ribbon Application Management Platform tries to establish a connection with an attacker.
Clearing	Manual

EdgeMarc Alarms

In this section:

- [EdgeMarc:ribbonApplicationDiagnosticReport](#)
- [EdgeMarc:ribbonDeviceDown](#)
- [EdgeMarc:ribbonDeviceUp](#)
- [EdgeMarc:ribbonKernelDiagnosticReport](#)
- [EdgeMarc:ribbonLANStatusDown](#)
- [EdgeMarc:ribbonMOSBelowThreshold](#)
- [EdgeMarc:ribbonSIPServerChange](#)
- [EdgeMarc:ribbonSIPServerModeChange](#)
- [EdgeMarc:ribbonSIPServerUnavailable](#)
- [EdgeMarc:ribbonT1StatusDown](#)
- [EdgeMarc:ribbonWANLinkChange](#)

EdgeMarc:ribbonApplicationDiagnosticReport

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.10

Description	This event is generated when any application crashes on the Edgemarc device.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None
Action	Check the diagnostic files generated by the event.
Impact	No impact on RAMP.
Clearing	No

EdgeMarc:ribbonDeviceDown

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.1
Description	If the Device Down rule is configured for an EdgeMarc device or a resource group, and if the connection between the RAMP and the device gets disconnected, then the ribbonDeviceDown alarm is raised.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None
Action	The only action for this rule is notifying recipients.
Impact	You cannot perform operations on the EdgeMarc device.
Clearing	Manual, EdgeMarc:ribbonDeviceUp

EdgeMarc:ribbonDeviceUp

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.2
Description	If the Device Up rule is configured for an EdgeMarc device or a resource group, and if the connection between the RAMP and the device is re-established, then the ribbonDeviceUp alarm is raised.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None
Action	The only action for this rule is notifying recipients.
Impact	None
Clearing	N/A

EdgeMarc:ribbonKernelDiagnosticReport

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.11
Description	This event is generated when the kernel crashes on an EdgeMarc device.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None

Action	Check the diagnostic file generated by the event.
Impact	The EdgeMarc device remains in an offline state until the kernel restarts on the EdgeMarc device. You cannot perform any operations on the device until it is online.
Clearing	N/A

EdgeMarc:ribbonLANStatusDown

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.8
Description	If the LAN Status Down rule is configured for an EdgeMarc device or a resource group and if the LAN interface goes down on the EdgeMarc device then the ribbonLANStatusDown alarm is raised.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None
Action	The only action for this rule is notifying recipients.
Impact	No impact on RAMP.
Clearing	N/A

EdgeMarc:ribbonMOSBelowThreshold

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.3
Description	If MOS score falls below pre-configured threshold on an individual device.
Repetition	No

Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	ribbonMOSBelowThersholdCount: The number of occurrences per device when MOS is below threshold. ribbonMOSBelowThresholdMinutes : Duration in minutes to count the MOS below threshold.
Action	Retrieve Ring Buffer contents for the time period.
Impact	No impact on RAMP.
Clearing	N/A

EdgeMarc:ribbonSIPServerChange

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.6
Description	If the SIP Server Change rule is configured for an EdgeMarc device or a resource group, and if the SIP server changes for the EdgeMarc device, then the ribbonSIPServerChange alarm is raised.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	ribbonSIPServerState : SIP Server State ("Up Down Unknown")
Action	Retrieve Ring Buffer contents for the time period.
Impact	No impact on RAMP. SIP Calls may be affected due to the server change.
Clearing	N/A

EdgeMarc:ribbonSIPServerModeChange

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.5
Description	If the SIP Server Mode Change rule is configured for an EdgeMarc device or a resource group, and if the SIP server mode changes for the EdgeMarc device, then the ribbonSIPServerModeChange alarm is raised.
Repetition	No
Event Codes	sonusHostID : The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	ribbonSIPServerMode: SIP Server Mode ("Up Down Unknown")
Action	Retrieve Ring Buffer contents for the time period.
Impact	No impact on RAMP.
Clearing	N/A

EdgeMarc:ribbonSIPServerUnavailable

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.4
Description	If the SIP Server Unavailable rule is configured for an EdgeMarc device or a resource group, then whenever the SIP server goes offline and is unavailable for the EdgeMarc device then the ribbonSIPServerUnavailable alarm is raised.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None
Action	Retrieve Ring Buffer contents for the time period.

Impact	No impact on RAMP. SIP calls will be affected as the server is unavailable.
Clearing	N/A

EdgeMarc:ribbonT1StatusDown

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.9
Description	If the T1 Status Down rule is configured for an EdgeMarc device or a resource group, and if the T1 interface is down on the EdgeMarc device then the ribbonT1tatusDown alarm is raised.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	None
Action	The only action for this rule is notifying recipients.
Impact	No impact on RAMP.
Clearing	N/A

EdgeMarc:ribbonWANLinkChange

Type: User-specified

OID	1.3.6.1.4.1.2879.2.1.20.2.1.7
Description	If the WAN Link Change rule is configured for an EdgeMarc device or a resource group, and if the connectivity switches from a WAN interface to another interface on an EdgeMarc device then the ribbonWANLinkChange alarm is raised.
Repetition	No

Event Codes	sonusHostID: The unique ID or serial number for this host. sonusEventDescription: The description of the event. sonusEventClass: The event class. sonusEventLevel: The event level. sonusEventTime: The timestamp of the event.
Instance Fields	ribbonWANLinkState: WAN Link State ("Up Down Unknown")
Action	Retrieve Ring Buffer contents for the time period.
Impact	The EdgeMarc device is offline for a few minutes. You cannot perform any operations on an EdgeMarc device if it is in an offline state.
Clearing	N/A

GSX Discovery

In this section:

- [sonusEmsV2PifCollectDoneNotification](#)
- [sonusEmsV2PifCollectFailNotification](#)

sonusEmsV2PifCollectDoneNotification

This alarm is raised on the device not on the Ribbon Application Management Platform (RAMP).

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.78
Description	This notification indicates that the PIF was processed successfully for the specified GSX node <nodeId>.
Repetition	Yes. Repeats each time PIF collection succeeds.

Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	None required. Any accumulated sonusEmsV2PifCollectFailNotification alarms are automatically cleared.
Impact	None.
Clearing	Automatic, clears in two minutes

sonusEmsV2PifCollectFailNotification

This alarm is raised on the device not on the Ribbon Application Management Platform (RAMP).

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.77
Description	This notification occurs under two conditions: 1. COPY Error – A PIF file is not copied from DSI to RAMP for the specified GSX node (nodeID). 2. PROCESS Error – A PIF file is not processed by the RAMP for the specified GSX node (nodeID).
Repetition	Yes. Repeats each time PIF collection fails.

Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining `what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	Take appropriate action: COPY Error 1. If agent is configured to copy the PIF file, verify that the agent is running. 2. If DSI file system is mounted for file copying, verify that the file system is mounted correctly and is not stale. PROCESS Error 1. If PIF file is corrupted, ensure the PIF file is generated by the released GSX images. 2. If data failed to load from <code>ctl</code> and <code>dat</code> files to database, ensure <code>oracle_home</code> is defined correctly under Oracle account.
Impact	Many RAMP features (Trunk Group reports, Trunk Group wizards, Traffic Management provisioning, etc.) rely on PIF data that is collected and loaded into the database. When PIF data collection ceases, the associated RAMP feature(s), when used, are accessing out-of-date information from the database.
Clearing	Automatic, sonusEmsV2PifCollectDoneNotification

High Availability Alarms

The alarms listed in this section are the PSX High Availability (HA) alarms.

In this section:

- [sonusHAConnectToPeerFailureExtendedNotification](#)
- [sonusHAConnectToPeerSuccessExtendedNotification](#)
- [sonusHAFailoverInitiatedNotification](#)
- [sonusHAHeartBeatFailureNotification](#)
- [sonusHAResourceAcquireFailureNotification](#)
- [sonusHAResourceReleaseFailureNotification](#)
- [sonusHAStateChangeNotification](#)

sonusHAConnectToPeerFailureExtendedNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.5.17.2.0.8
Description	Failure to connect to peer.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters. sonusHAPeerExtendedIpType: The IP type (IPv4 or IPv6). sonusHAPeerExtendedIpAddress: IPv4 or IPv6 Address of the Softswitch (required parameter). sonusHAPeerExtendedIpAddressType: IP Address type of the Softswitch (required parameter). sonusHACurrentState: The present high availability state of this host. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusHAPeerExtendedIpAddress
Action	Investigate to determine why the system cannot connect to the peer. Validate the following conditions: - Network connections - Network routing - Configured peer IP addresses
Impact	If the number of retries exceeds a configurable parameter named "Number of Retries Before Assert," the system starts the process to become active.

Clearing	Automatic, sonusHAConnectToPeerSuccessExtendedNotification .

sonusHAConnectToPeerSuccessExtendedNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.5.17.2.0.9
Description	Successfully connected to the peer.
Repetition	No
Event Codes	sonusHostID: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters. sonusHAPeerExtendedIpType: The IP type (IPv4 or IPv6). sonusHAPeerExtendedIpAddress: IPv4 or IPv6 Address of the Softswitch (required parameter). sonusHAPeerExtendedIpAddressType: IP Address type of the Softswitch (required parameter). sonusHACurrentState: The present high availability state of this host. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusHAPeerExtendedIpAddress
Action	None
Impact	None
Clearing	Automatic, clears in two minutes.

sonusHAFailoverInitiatedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.5.17.2.0.1
Description	The HA failover process is initiated.
Repetition	Yes. Repeats each time a failover is initiated.
Event Codes	sonusHAFailoverReason: The reason for failover. sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	None
Action	If the alarm is initiated by an operator, then no action is needed. Else, investigate the reason for the failover and take corrective action. This trap is cleared by the transition of sonusHAStateChange to active state.
Impact	During failover, the clients will lose connectivity for a few minutes until the new active system is fully operational.
Clearing	Automatic, sonusHAStateChangeNotification , (state change = active(1)).

sonusHAHeartBeatFailureNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.5.17.2.0.7
Description	The peer did not respond to the heartbeat request.
Repetition	Yes. Repeats each time a heartbeat failure occurs.

Event Codes	sonusHAResource: The resource values like database, disk, network, and wellknownip. sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	None
Action	The probable cause of failure is related problems. Validate the following conditions: - Network connections - Network routing - Configured peer IP addresses
Impact	If the number of keep-alive missed messages exceeds a configurable parameter (Keep Alive Retries), the system starts the process to become active.
Clearing	Automatic, clears in three minutes.

sonusHAResourceAcquireFailureNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.5.17.2.0.5
Description	The HA component was unable to acquire the specified resource during a failover procedure.
Repetition	Yes. Repeats each time an attempt to acquire the specified resource fails.

Event Codes	sonusHAResource: The resource values like, database, disk, network, and wellknownlp. sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusHostID
Action	Find the events surrounding the attempt by the resource to become active, and take corrective action. Contact Ribbon Support for assistance.
Impact	The identified resource is down. When a system tries to acquire resources, it is attempting to become active. Hence, when an acquire operation fails, the system cannot become active.
Clearing	Automatic, sonusHAStateChangeNotification , (state change = active(1)).

sonusHAResourceReleaseFailureNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.5.17.2.0.6
Description	The HA component is unable to release the specified resource during a failover procedure.
Repetition	Yes. Repeats each time an attempt to release the specified resource fails.

Event Codes	sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.
Instance Fields	sonusHostID
Action	Find the events surrounding the attempt by the resource to become active, and take corrective action. Contact Ribbon Support for assistance.
Impact	The identified resource is down. When a system is unable to release resources, its peer cannot acquire the resources. As a result, the peer cannot become active and it will also be down.
Clearing	Automatic, sonusHAStateChangeNotification , (state change = active(1)).

sonusHAStateChangeNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.5.17.2.0.4
Description	The host's HA state has changed.
Repetition	Yes. Repeats each time the HA state changes for the specified host.
Event Codes	sonusHAPrevState: The previous high availability state of this host. sonusHANewState: The new high availability state of this host. sonusHostID: The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusEventTime: Provides the timestamp of when the event occurs.

Instance Fields	sonusHANewState
Action	If the alarm is initiated by an operator, then no action is needed. Else, investigate the event and take corrective action. Look for a prior trap that may have triggered this state change trap, and resolve this failure.
Impact	A change of state during a system startup is normal. But a state change while a system is running is a cause for concern. This may indicate a failover is taking place.
Clearing	Automatic, sonusHANewState = active(1).

Licensing Management Alarms

This section covers alarms related to license management.

sonusLicExpiredNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.1
Description	A license identified by the tuple sonusTargetType, sonusTargetId, sonusFeatureId has expired as of sonusLicExpireTime.

Repetition	No.
Event Codes	sonusLicExpireTime —The date/time when the license expires. sonusLicFeatureId —The license feature identifier. sonusLicTargetId —The license target identifier. sonusLicTargetType —The license target type.
Instance Fields	sonusLicTargetType, sonusLicTargetId, sonusLicFeatureId
Action	Contact Ribbon account team for a new license, if required.
Impact	The associated feature is disabled on the target device.
Clearing	Manual.

sonusLicStatusNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.2
Description	This notification is sent when a license is about to expire.
Repetition	No.
Event Codes	sonusLicExpireTime —The date/time when the license expires. sonusLicFeatureId —The license feature identifier. sonusLicTargetId —The license target identifier. sonusLicTargetType —The license target type.
Instance Fields	sonusLicTargetId
Action	Contact Ribbon account team for a new license, if required.
Impact	The license for the specified feature is approaching expiration; the target device will disable the feature once the license expires.
Clearing	Automatic, sonusLicStatusClearNotification .

sonusLicUsageExceededNotification

Note

The sonusLicUsageExceededNotification trap only applies to Node-Locked licenses.

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.3
Description	The current usage (sonusLicPresentValue) for the license identified by the tuple (sonusTargetType, sonusTargetId, sonusFeatureId) exceeded the configured maximum value (sonusLicConfiguredValue).
Repetition	Yes. Repeats every 15 minutes as long as sonusLicPresentValue exceeds maximum value of sonusLicConfiguredValue.
Event Codes	sonusLicConfiguredValue —The current configured maximum usage. sonusLicFeatureId —The license feature identifier. sonusLicPresentValue —The current license usage. sonusLicTargetId —The license target identifier. sonusLicTargetType —The license target type.
Instance Fields	sonusLicTargetType, sonusLicTargetId, sonusLicFeatureId
Action	Contact your Ribbon account representative to obtain a new license to increase the license usage limit.
Impact	The target device may reject further provisioning of the specified feature since the maximum usage limit is exceeded.
Clearing	Manual.

sonusLicUsageStatusNotification**Type: CRITICAL**

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.4
Description	Current usage, sonusLicPresentValue, for the license identified by the tuple sonusTargetType, sonusTargetId, sonusFeatureId is approaching the configured maximum value of sonusLicConfiguredValue.
Repetition	Yes. Repeats every 15 minutes as long as sonusLicPresentValue is within the prescribed range of maximum value of sonusLicConfiguredValue.

Event Codes	sonusLicConfiguredValue —The current configured maximum usage. sonusLicFeatureId —The license feature identifier. sonusLicPresentValue —The current license usage. sonusLicTargetId —The license target identifier. sonusLicTargetType —The license target type.
Instance Fields	sonusLicTargetType, sonusLicTargetId, sonusLicFeatureId
Action	Contact Ribbon account team for a new license to increase usage limit.
Impact	The maximum usage limit is about to be reached. The target device may reject further provisioning of the specified feature once the limit is reached.
Clearing	Manual.

sonusLicSBCLicMismatchNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.7
Description	The alarm is raised if the count of SBC-RTU and SBC-POL-RTU licenses are not equal after the licenses are installed.
Repetition	Yes
Event Codes	sonusEventTime : Provides timestamp of when the event occurs. sonusEventDescription : Describes the event. sonusEventClass : Lists the associated event class. sonusEventLevel : Lists the associated event level (severity). sonusLicTargetType : The license target type.
Instance Fields	sonusEventTime sonusEventDescription, sonusEventClass sonusEventLevel sonusLicTargetType
Action	Manual
Impact	No impact on the Ribbon Application Management Platform.

Clearing	Automatic, sonusLicSBCLicMismatchClearNotification

sonusLicSBCLicMismatchClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.8
Description	This notification occurs when the license count is of SBC-RTU and SBC-POL-RTU is same.
Repetition	Yes
Event Codes	sonusEventTime: Provides timestamp of when the event occurs. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusLicTargetType: The license target type.
Instance Fields	sonusEventTime sonusEventDescription sonusEventClass sonusEventLevel sonusLicTargetType
Action	None
Impact	No impact on the Ribbon Application Management Platform.
Clearing	Automatic

sonusLicFailedToSendUsageFileNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.9
Description	This alarm is raised when the Ribbon Application Management Platform (RAMP) fails to send the auto-generated post-paid license usage file.
Repetition	None

Event Codes	sonusEventTime: Provides timestamp of when the event occurs. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusLicPPDFFileName: The license PDF file name.
Instance Fields	sonusEventTime sonusEventDescription sonusEventClass sonusEventLevel sonusLicPPDFFileName
Action	Check whether the URL for IT is reachable from RAMP.
Impact	Auto-generated post-paid license reports are not sent to IT.
Clearing	Manual

sonusLicFailedToRegisterWithITNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.10
Description	This alarm is raised when the Ribbon Application Management Platform (RAMP) fails to register with IT.
Repetition	None
Event Codes	sonusEventTime: Provides timestamp of when the event occurs. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity).
Instance Fields	sonusEventTime sonusEventDescription sonusEventClass sonusEventLevel
Action	Check whether the URL for IT is reachable from RAMP.
Impact	Auto-generated post-paid license reports will not be sent to IT.

Clearing	Manual

sonusLicDeviceRegisterFailedNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.12
Description	Devices whose licenses are managed by Ribbon Application Management Platform (RAMP) must periodically register with the License Manager (LM) service. The registration fails and LM responds with an error response if there are no usage level statistics from the device for the last 90 days.
Repetition	Repeats when the SBC sends another registration request to the LM.
Event Codes	sonusEventTime, sonusEventDescription, sonusEventClass, sonusEventLevel, sonusLicTargetId, sonusLicTargetType, sonusLicPresentValue, sonusLicConfiguredValue
Instance Fields	None
Action	The LM service sends a failed response to the SBC along with the last collection epoch time, once the RAMP threshold is reached.
Impact	The SBC cannot register with the LM service, therefore the SBC license grace period is started.
Clearing	Manual

sonusLicStatusClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.5
Description	This notification is sent when a license is renewed.
Repetition	Yes. This notification is sent every-time a license is renewed.

Event Codes	sonusEventTime : Provides timestamp of when the event occurs. sonusEventDescription : Describes the event. sonusEventClass : Lists the associated event class. sonusEventLevel : Lists the associated event level (severity).
Instance Fields	sonusLicTargetId : The license target identifier.
Action	None
Impact	The license validity is extended. The associated feature can be used till the renewed validity date.
Clearing	Automatic

sonusLicPostPaidReportGenFailNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.13
Description	This alarm is raised if the postpaid report was not auto generated for the previous day.
Repetition	Yes. Once every day.
Event Codes	sonusEventTime : Provides timestamp of when the event occurs. sonusEventDescription : Describes the event. sonusEventClass : Lists the associated event class. sonusEventLevel : Lists the associated event level (severity). sonusLicTargetType : The license target type.
Instance Fields	sonusLicTargetType
Action	Manual. Check for the reason of this alarm.
Impact	Postpaid reports are not available to share with Ribbon. So billing is affected.
Clearing	Automatic, sonusLicPostPaidReportGenFailClearNotification

sonusLicPostPaidReportGenFailClearNotification**Type: CLEAR**

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.14
Description	This alarm is raised after postpaid report auto-generation resumes.
Repetition	No
Event Codes	sonusEventTime: Provides timestamp of when the event occurs. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusLicTargetType: The license target type.
Instance Fields	sonusLicTargetType
Action	None
Impact	Postpaid reports are available to share with Ribbon.
Clearing	Automatic.

sonusLicProfileAssociationFailNotification**Type: MAJOR**

OID	1.3.6.1.4.1.2879.2.1.7.3.2.0.15
Description	This alarm is raised if License Profile Association Fails.
Repetition	No

Event Codes	sonusEventTime: Provides timestamp of when the event occurs. sonusEventDescription: Describes the event. sonusEventClass: Lists the associated event class. sonusEventLevel: Lists the associated event level (severity). sonusLicTargetType: The license target type.
Instance Fields	sonusLicTargetType
Action	Manual, check for the reason of this alarm.
Impact	No impact on the Ribbon Application Management Platform.
Clearing	Manual

Normalized Alarms

In this section:

- [GVAlarmCritical](#)
- [GVAlarmMajor](#)
- [GVAlarmMinor](#)
- [GVAlarmWarning](#)
- [GVAlarmClear](#)
- [GVFaultMessage](#)

The normalized alarm forwarding interface supports the following standard alarms. All the received network element alarms are mapped to one of the standard alarms based on the severity.

Attribute	Description	OID
GVAlarmCritical	Maps to all Insight Critical alarms.	.1.3.6.1.4.1.5584.2.3.0.1
GVAlarmMajor	Maps to all Insight Major alarms.	.1.3.6.1.4.1.5584.2.3.0.2
GVAlarmMinor	Maps to all Insight Minor alarms.	.1.3.6.1.4.1.5584.2.3.0.3
GVAlarmWarning	Maps to all Insight Warning alarms.	.1.3.6.1.4.1.5584.2.3.0.4

Attribute	Description	OID
GVAlarmClear	Maps to all Insight Clear alarms.	.1.3.6.1.4.1.5584.2.3.0.5
GVFaultMessage	Maps to all Insight non-fault events.	.1.3.6.1.4.1.5584.2.3.0.6

GVAlarmCritical

Note

All the Critical alarms (irrespective of node types) are forwarded to the upstream OSS system with the alarm name as "GVAlarmCritical."

Before forwarding, all the attributes of the original alarm are mapped to the attributes mentioned.

Normalized alarm supports the following attributes.

Alarm attributes

Attribute	Type	OID	Description
alarmActiveIndex	Counter64	.1.3.6.1.4.1.5584.2.3.3.1.1	A running counter that uniquely identifies every alarm and acts as a correlation identifier for upstream OSS system. It supports the following correlations: - duplicate alarms - the same identifier is used for duplicate alarms. - clear alarms - the same identifier is used for raise and clearing alarms.
gvAlarmEventTy e	IANAItuEventType Types of gvAlarmEventType: communicationsAlar m, qualityOfServiceAlar m, processingErrorAlar m, equipmentAlarm, environmentalAlarm.	.1.3.6.1.4.1.5584.2.3.3.1.4	The event type as described in IANA-ITU-ALARM-TC-MIB.

Attribute	Type	OID	Description
gvAlarmProbableCause	IANAItuProbableCause	.1.3.6.1.4.1.5584.2.3.3.1.5	The probable cause of the event as described in IANA-ITU-ALARM-TC-MIB.
gvAlarmComponentID	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.7	The string contains host name and fully distinguished name of sub-component under alarm. It maps to Event Code(s) and Instance Fields as name value pairs in the format – "TYPE=SBC, HOST=[host name], COMPONENT=[component name]. The TYPE and HOST strings are derived from the Ribbon Application Management Platform node attributes that are received during node registration. The Component string is derived as comma separated key value pairs; where the keys are Event Code(s)/Instance fields with the corresponding values received from the agent that generated the alarm.
gvAlarmAdditionalText	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.10	The Definition, Impact, Recommended Action, and Repetition as name value pairs.
alarmActiveDateAndTime	DateAndTime	.1.3.6.1.4.1.5584.2.3.3.1.2	The timestamp of the the event.
alarmActiveDescription	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.3	The description of the event.
gvAlarmEventTypeString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.12	The event type. If a device event type value is not found in IANA scheme and a custom text is included for for event type.
gvAlarmCauseString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.11	The cause of the event. If a device has not found a cause value in IANA scheme it includes a text value for cause.
gvAlarmName	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.6	The original alarm name from the node.

Attribute	Type	OID	Description
gvAlarmManualClear	INTEGER	.1.3.6.1.4.1.5584.2.3.3.1.8	Specifies whether alarm clearing is manual or automatic. • 2 indicates automatic clearing. • 3 indicates manual clearing.

GVAlarmMajor

Note

All the Major alarms (irrespective of node types) are forwarded to the upstream OSS system with the alarm name as "GVAlarmMajor."

Before forwarding, all the attributes of the original alarm are mapped to the attributes mentioned.

Normalized alarm supports the following attributes.

Alarm attributes

Attribute	Type	OID	Description
alarmActiveIndex	Counter64	.1.3.6.1.4.1.5584.2.3.3.1.1	A running counter that uniquely identifies every alarm and acts as a correlation identifier for upstream OSS system. It supports the following correlations: • duplicate alarms - the same identifier is used for duplicate alarms. • clear alarms - the same identifier is used for raise and clearing alarms.
gvAlarmEventType	IANAItuEventType Types of gvAlarmEventType: communicationsAlarm, qualityOfServiceAlarm, processingErrorAlarm, equipmentAlarm, environmentalAlarm.	.1.3.6.1.4.1.5584.2.3.3.1.4	The event type as described in IANA-ITU-ALARM-TC-MIB.

Attribute	Type	OID	Description
gvAlarmProbableCause	IANAItuProbableCause	.1.3.6.1.4.1.5584.2.3.3.1.5	The probable cause of the event as described in IANA-ITU-ALARM-TC-MIB.
gvAlarmComponentID	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.7	The string contains host name and fully distinguished name of sub-component under alarm. It maps to Event Code(s) and Instance Fields as name value pairs in the format – "TYPE=SBC, HOST=[host name], COMPONENT=[component name]. The TYPE and HOST strings are derived from the Ribbon Application Management Platform node attributes that are received during node registration. The Component string is derived as comma separated key value pairs; where the keys are Event Code(s)/Instance fields with the corresponding values received from the agent that generated the alarm.
gvAlarmAdditionalText	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.10	The Definition, Impact, Recommended Action, and Repetition as name value pairs.
alarmActiveDateAndTime	DateAndTime	.1.3.6.1.4.1.5584.2.3.3.1.2	The timestamp of the the event.
alarmActiveDescription	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.3	The description of the event.
gvAlarmEventTypeString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.12	The event type. If a device event type value is not found in IANA scheme and a custom text is included for for event type.
gvAlarmCauseString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.11	The cause of the event. If device has not found a cause value in IANA scheme then this include a text value for cause.
gvAlarmName	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.6	The original alarm name from the node.

Attribute	Type	OID	Description
gvAlarmManualClear	INTEGER	.1.3.6.1.4.1.5584.2.3.3.1.8	Specifies whether alarm clearing is manual or automatic. • 2 indicates automatic clearing. • 3 indicates manual clearing.

GVAlarmMinor

Note

All the Minor alarms (irrespective of node types) are forwarded to the upstream OSS system with the alarm name as "GVAlarmMinor."

Before forwarding, all the attributes of the original alarm are mapped to the attributes mentioned.

Normalized alarm supports the following attributes.

Alarm attributes

Attribute	Type	OID	Description
alarmActiveIndex	Counter64	.1.3.6.1.4.1.5584.2.3.3.1.1	A running counter that uniquely identifies every alarm and acts as a correlation identifier for upstream OSS system. It supports the following correlations: • duplicate alarms - the same identifier is used for duplicate alarms. • clear alarms - the same identifier is used for raise and clearing alarms.
gvAlarmEventType	IANAItuEventType Types of gvAlarmEventType: communicationsAlarm, qualityOfServiceAlarm, processingErrorAlarm, equipmentAlarm, environmentalAlarm.	.1.3.6.1.4.1.5584.2.3.3.1.4	The event type as described in IANA-ITU-ALARM-TC-MIB.

Attribute	Type	OID	Description
gvAlarmProbableCause	IANAItuProbableCause	.1.3.6.1.4.1.5584.2.3.3.1.5	The probable cause of the event as described in IANA-ITU-ALARM-TC-MIB.
gvAlarmComponentID	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.7	The string contains host name and fully distinguished name of sub-component under alarm. It maps to Event Code(s) and Instance Fields as name value pairs in the format – "TYPE=SBC, HOST=[host name], COMPONENT=[component name]. The TYPE and HOST strings are derived from the Ribbon Application Management Platform node attributes that are received during node registration. The Component string is derived as comma separated key value pairs; where the keys are Event Code(s)/Instance fields with the corresponding values received from the agent that generated the alarm.
gvAlarmAdditionalText	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.10	The Definition, Impact, Recommended Action, and Repetition as name value pairs.
alarmActiveDateAndTime	DateAndTime	.1.3.6.1.4.1.5584.2.3.3.1.2	The timestamp of the the event.
alarmActiveDescription	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.3	The description of the event.
gvAlarmEventTypeString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.12	The event type. If a device event type value is not found in IANA scheme and a custom text is included for for event type.
gvAlarmCauseString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.11	The cause of the event. If device has not found a cause value in IANA scheme then this include a text value for cause.
gvAlarmName	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.6	The original alarm name from the node.

Attribute	Type	OID	Description
gvAlarmManualClear	INTEGER	.1.3.6.1.4.1.5584.2.3 .3.1.8	Specifies whether alarm clearing is manual or automatic. • 2 indicates automatic clearing. • 3 indicates manual clearing.

GVAlarmWarning

Note

All the Warning alarms (irrespective of node types) are forwarded to the upstream OSS system with the alarm name as "GVAlarmWarning."

Before forwarding, all the attributes of the original alarm are mapped to the attributes mentioned.

Normalized alarm supports the following attributes.

Alarm attributes

Attribute	Type	OID	Description
alarmActiveIndex	Counter64	.1.3.6.1.4.1.5584.2.3 .3.1.1	A running counter that uniquely identifies every alarm and acts as a correlation identifier for upstream OSS system. It supports the following correlations: • duplicate alarms - the same identifier is used for duplicate alarms. • clear alarms - the same identifier is used for raise and clearing alarms.
gvAlarmEventType	IANAItuEventType Types of gvAlarmEventType: communicationsAlarm, qualityOfServiceAlarm, processingErrorAlarm, equipmentAlarm, environmentalAlarm.	.1.3.6.1.4.1.5584.2.3 .3.1.4	The event type as described in IANA-ITU-ALARM-TC-MIB.

Attribute	Type	OID	Description
gvAlarmProbableCause	IANAItuProbableCause	.1.3.6.1.4.1.5584.2.3.3.1.5	The probable cause of the event as described in IANA-ITU-ALARM-TC-MIB.
gvAlarmComponentID	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.7	The string contains host name and fully distinguished name of sub-component under alarm. It maps to Event Code(s) and Instance Fields as name value pairs in the format – "TYPE=SBC, HOST=[host name], COMPONENT=[component name]. The TYPE and HOST strings are derived from the Ribbon Application Management Platform node attributes that are received during node registration. The Component string is derived as comma separated key value pairs; where the keys are Event Code(s)/Instance fields with the corresponding values received from the agent that generated the alarm.
gvAlarmAdditionalText	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.10	The Definition, Impact, Recommended Action, and Repetition as name value pairs.
alarmActiveDateAndTime	DateAndTime	.1.3.6.1.4.1.5584.2.3.3.1.2	The timestamp of the the event.
alarmActiveDescription	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.3	The description of the event.
gvAlarmEventTypeString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.12	The event type. If a device event type value is not found in IANA scheme and a custom text is included for for event type.
gvAlarmCauseString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.11	The cause of the event. If device has not found a cause value in IANA scheme then this include a text value for cause.
gvAlarmName	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.6	The original alarm name from the node.

Attribute	Type	OID	Description
gvAlarmManualClear	INTEGER	.1.3.6.1.4.1.5584.2.3 .3.1.8	Specifies whether alarm clearing is manual or automatic. • 2 indicates automatic clearing. • 3 indicates manual clearing.

GVAlarmClear

Note

All the Clear alarms (irrespective of node types) are forwarded to the upstream OSS system with the alarm name as "GVAlarmClear."

Before forwarding, all the attributes of the original alarm are mapped to the attributes mentioned.

Normalized alarm supports the following attributes.

Alarm attributes

Attribute	Type	OID	Description
alarmActiveIndex	Counter64	.1.3.6.1.4.1.5584.2.3 .3.1.1	A running counter that uniquely identifies every alarm and acts as a correlation identifier for upstream OSS system. It supports the following correlations: • duplicate alarms - the same identifier is used for duplicate alarms. • clear alarms - the same identifier is used for raise and clearing alarms.
gvAlarmEventType	IANAItuEventType Types of gvAlarmEventType: communicationsAlarm, qualityOfServiceAlarm, processingErrorAlarm, equipmentAlarm, environmentalAlarm.	.1.3.6.1.4.1.5584.2.3 .3.1.4	The event type as described in IANA-ITU-ALARM-TC-MIB.

Attribute	Type	OID	Description
gvAlarmProbableCause	IANAItuProbableCause	.1.3.6.1.4.1.5584.2.3.3.1.5	The probable cause of the event as described in IANA-ITU-ALARM-TC-MIB.
gvAlarmComponentID	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.7	The string contains host name and fully distinguished name of sub-component under alarm. It maps to Event Code(s) and Instance Fields as name value pairs in the format – "TYPE=SBC, HOST=[host name], COMPONENT=[component name]. The TYPE and HOST strings are derived from the Ribbon Application Management Platform node attributes that are received during node registration. The Component string is derived as comma separated key value pairs; where the keys are Event Code(s)/Instance fields with the corresponding values received from the agent that generated the alarm.
gvAlarmAdditionalText	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.10	The Definition, Impact, Recommended Action, and Repetition as name value pairs.
alarmActiveDateAndTime	DateAndTime	.1.3.6.1.4.1.5584.2.3.3.1.2	The timestamp of the the event.
alarmActiveDescription	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.3	The description of the event.
gvAlarmEventTypeString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.12	The event type. If a device event type value is not found in IANA scheme and a custom text is included for for event type.
gvAlarmCauseString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.11	The cause of the event. If device has not found a cause value in IANA scheme then this include a text value for cause.
gvAlarmName	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.6	The original alarm name from the node.

Attribute	Type	OID	Description
gvAlarmManualClear	INTEGER	.1.3.6.1.4.1.5584.2.3.3.1.8	Specifies whether alarm clearing is manual or automatic. 2 indicates automatic clearing. 3 indicates manual clearing.

GVFaultMessage

Note

All the Fault Messages (irrespective of node types) are forwarded to the upstream OSS system with the alarm name as "GVAlarmFaultMessage."

Before forwarding, all the attributes of the original alarm are mapped to the attributes mentioned.

Normalized alarm supports the following attributes.

Alarm attributes

Attribute	Type	OID	Description
alarmActiveIndex	Counter64	.1.3.6.1.4.1.5584.2.3.3.1.1	A running counter that uniquely identifies every alarm and acts as a correlation identifier for upstream OSS system. It supports the following correlations: - duplicate alarms - the same identifier is used for duplicate alarms. - clear alarms - the same identifier is used for raise and clearing alarms.
gvAlarmEventType	IANAItuEventType Types of gvAlarmEventType: communicationsAlarm, qualityOfServiceAlarm, processingErrorAlarm, equipmentAlarm, environmentalAlarm.	.1.3.6.1.4.1.5584.2.3.3.1.4	The event type as described in IANA-ITU-ALARM-TC-MIB.

Attribute	Type	OID	Description
gvAlarmProbableCause	IANAItuProbableCause	.1.3.6.1.4.1.5584.2.3.3.1.5	The probable cause of the event as described in IANA-ITU-ALARM-TC-MIB.
gvAlarmComponentID	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.7	The string contains host name and fully distinguished name of sub-component under alarm. It maps to Event Code(s) and Instance Fields as name value pairs in the format – "TYPE=SBC, HOST=[host name], COMPONENT=[component name]. The TYPE and HOST strings are derived from the Ribbon Application Management Platform node attributes that are received during node registration. The Component string is derived as comma separated key value pairs; where the keys are Event Code(s)/Instance fields with the corresponding values received from the agent that generated the alarm.
gvAlarmAdditionalText	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.10	The Definition, Impact, Recommended Action, and Repetition as name value pairs.
alarmActiveDateAndTime	DateAndTime	.1.3.6.1.4.1.5584.2.3.3.1.2	The timestamp of the the event.
alarmActiveDescription	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.3	The description of the event.
gvAlarmEventTypeString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.12	The event type. If a device event type value is not found in IANA scheme and a custom text is included for for event type.
gvAlarmCauseString	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.11	The cause of the event. If device has not found a cause value in IANA scheme then this include a text value for cause.
gvAlarmName	SnmpAdminString	.1.3.6.1.4.1.5584.2.3.3.1.6	The original alarm name from the node.

Attribute	Type	OID	Description
gvAlarmManualClear	INTEGER	.1.3.6.1.4.1.5584.2.3.3.1.8	Specifies whether alarm clearing is manual or automatic. • 2 indicates automatic clearing. • 3 indicates manual clearing.

This section covers alarms related to mobile number portability (MNP) services.

sonusEmsNPBulkFileReadyNotification**Type:** MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.85
Description	This alarm is raised by the Syniverse/Telcordia MNP listener service of the Ribbon Application Management Platform to indicate that the bulk file response is received for the request sent by the Ribbon Application Management Platform.
Repetition	No
Event Codes	sonusEmsNodeId —The internal ID of the node that was polled. sonusHostID —The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription — Describes the event. SonusEventTime — Provides timestamp of when the event occurs. sonusEmsNPServicesMCHName — Name of the vendor that hosts Mobile Number Portability Clearing House. sonusEmsNPServicesBulkRequestTransactionId — Transaction Id of the Bulk File Request sent to MCH.
Instance Fields	Node Name, Event Name, sonusEmsNPServicesMCHName, sonusEmsNPServicesBulkRequestTransactionId
Action	When the bulk file is generated, operator has to perform the following: 1. Logon to Syniverse/Telcordia MCH portal. 2. Download the file generated via HTTP/FTP to the local system. 3. In the Ribbon Application Management Platform, browse the file in the local system and perform Upload/Provision action, by selecting the request for which response is received.
Impact	MCH has generated the bulk file corresponding to request sent by the Ribbon Application Management Platform and is ready for download.
Clearing	Manual

sonusEmsNPBulkFileRequestRejectedNotification**Type:** WARNING

OID	1.3.6.1.4.1.2879.2.1.7.2.0.86
Description	This alarm is raised by the Syniverse/Telcordia MNP client of the Ribbon Application Management Platform, when the MCH rejects the Bulk file request sent.
Repetition	No
Event Codes	sonusEmsNodeId —The internal ID of the node that was polled. sonusHostId —The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription — Describes the event. SonusEventTime — Provides timestamp of when the event occurs. sonusEmsNPServicesMCHName — Name of the vendor that hosts Mobile Number Portability Clearing House. sonusEmsNPServicesBulkRequestTransactionId — Transaction Id of the Bulk File Request sent to MCH.
Instance Fields	Node Name, Event Name, sonusEmsNPServicesMCHName, sonusEmsNPServicesBulkRequestTransactionId
Action	Operator has to check the request sent and resend the bulk file request.
Impact	MCH has rejected the bulk file generation request. Possible reasons include incorrect time range, invalid user credentials.
Clearing	Manual

sonusEmsNPBulkProvisioningCompletedNotification

Type: WARNING

OID	1.3.6.1.4.1.2879.2.1.7.2.0.87
Description	This alarm is raised by the HostedLnpProvisioner of the Ribbon Application Management Platform when the provisioning of bulk file to PSX is completed successfully.

Repetition	No
Event Codes	sonusEmsNodeId —The internal ID of the node that was polled. sonusHostId —The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription — Describes the event. SonusEventTime — Provides timestamp of when the event occurs. sonusEmsNPServicesMCHName — Name of the vendor that hosts Mobile Number Portability Clearing House. sonusEmsNPServicesBulkRequestTransactionId — Transaction Id of the Bulk File Request sent to MCH.
Instance Fields	Node Name, Event Name, sonusEmsNPServicesMCHName, sonusEmsNPServicesBulkRequestTransactionId
Action	When the provisioning of all the bulk files (both full and partial are completed), the operator has to enable the MNP broadcast listener service to start real-time synchronization of MNP data.
Impact	Provisioning of Partial Bulk File to PSX is completed successfully.
Clearing	Manual

sonusEmsNPBulkProvisioningFailedNotification

Type: WARNING

OID	1.3.6.1.4.1.2879.2.1.7.2.0.88
Description	This alarm is raised by the HostedLnpProvisioner of the Ribbon Application Management Platform when the provisioning of bulk file to PSX is failed
Repetition	No

Event Codes	sonusEmsNodeId — The internal ID of the node that was polled. sonusHostId — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription — Describes the event. SonusEventTime — Provides timestamp of when the event occurs. sonusEmsNPServicesMCHName — Name of the vendor that hosts Mobile Number Portability Clearing House. sonusEmsNPServicesBulkRequestTransactionId — Transaction Id of the Bulk File Request sent to MCH.
Instance Fields	Node Name, Event Name, sonusEmsNPServicesMCHName, sonusEmsNPServicesBulkRequestTransactionId
Action	Operator has to identify the cause of failure from the mnp_trace_log, resolve the issue and re-provision the file.
Impact	Provisioning of Partial Bulk File is failed. Possible reasons include the following : 1. PSX pipe server is down. 2. POL-LNP-STORE license is not installed/associated to PSX. 3. Bulk file data is invalid. 4. Bulk file is not in a valid format. 5. No/Multiple PSX is registered in the Ribbon Application Management Platform.
Clearing	Manual

sonusEmsLnpDataSyncErrorNotification

This alarm is applicable to the MNP services.

Type: WARNING

OID	1.3.6.1.4.1.2879.2.1.7.2.0.84
Description	This alarm is raised by the Syniverse/Telcordia MNP listener service of the Ribbon Application Management Platform to indicate that the broadcast message sent by MCH is not provisioned to PSX.
Repetition	No

Event Codes	sonusEmsNodeId — The internal ID of the node that was polled. sonusHostId — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription — Describes the event. SonusEventTime — Provides timestamp of when the event occurs. sonusEmsNPServicesMCHName — Name of the vendor that hosts Mobile Number Portability Clearing House.
Instance Fields	Node Name, Event Name, sonusEmsNPServicesMCHName, sonusEmsNPServicesBulkRequestTransactionId
Action	Operator has to identify the cause of synchronization error from the mnp_trace_log and resolve the issue.
Impact	Real-time MNP data synchronization error. Possible reasons include the following: 1. MNP Listener service is not enabled. 2. Required license(EMS-LNP-FEED, POL-LNP-STORE) is not installed. 3. PSX pipe server is down. 4. No/Multiple PSX is registered in the Ribbon Application Management Platform.
Clearing	Manual

LNP Adaptor Alarms

Contents

- [sonusEmsLnpBddFileDownloadErrorNotification](#)
- [sonusEmsLnpBddFileDownloadCompletedNotification](#)
- [sonusEmsLnpDataSyncErrorNotification \(LNP Adaptor\)](#)

This section covers alarms related to local number portability (LNP). The LNP Adaptor synchronizes and sends LNP data received from the National Portability Administration Center (NPAC) SIP-IX to the Primary PSX. NPAC contains information for all ported and pooled numbers to support LNP in the US and Canada.

The LNP Adaptor alarm also includes sonusEmsLnpDataSyncErrorNotification, refer to [sonusEmsLnpDataSyncErrorNotification](#).

sonusEmsLnpBddFileDownloadErrorNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.82
Description	This alarm is raised by the BDDFileManager when it is unable to download the BDD files from the FTP server.
Repetition	No
Event Codes	sonusEmsNodeid—The internal ID of the node that was polled. sonusHostid—The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription— Describes the event. SonusEventTime—Provides timestamp of when the event occurs.
Instance Fields	sonusEmsNodeid.
Action	When there is a PARSE_ERROR, when you download the file, perform the following to obtain the last transaction ID: 1. Logon to the Ribbon Application Management Platform through telnet or ssh 2. Change the directory to <code><BASE_DIR>/weblogic/sonusEms/data/ lnp/tmp</code> 3. Extract the tar containing BDD files. 4. Move *SV*BDD and *BLOCK*BDD files to <code><BASE_DIR>/weblogic/sonusEms/data/lnp/final/</code> . These BDD file names contain last transaction ID The BDD file names for LNP data use the following format <code><Region>.<BDD_type>_BDD_PSTN_<DD-MM-YYYYHHMMSS>.<TRANS_ID></code> For example: <code>mw.lrn_BDD_PSTN_26-05-2009212322.1000074.bdd</code> The last transaction ID in the example is 1000074 and it is used for starting incremental changes 5. Use this transaction ID to start incremental changes by overriding last transaction ID.

Impact	Unable to download the BDD file.
Clearing	Manual.

sonusEmsLnpBddFileDownloadCompletedNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.83
Description	This alarm is raised by the BDDFile Manager when it correctly downloads the BDD file and is able to extract the last transaction ID.
Repetition	No.
Event Codes	sonusEmsNodeid—The internal ID of the node that was polled. sonusHostid—The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription— Describes the event. SonusEventTime—Provides timestamp of when the event occurs.
Instance Fields	sonusEmsNodeid
Action	None required.
Impact	Downloaded the BDD files successfully.
Clearing	Manual.

sonusEmsLnpDataSyncErrorNotification (LNP Adaptor)

This alarm is applicable to the LNP Adaptor.

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.84
Definition	This trap is raised by the SIP-IX Client on the Ribbon Application Management Platform to indicate the error while receiving the incremental changes.

Repetition	Yes.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusHostID—The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. SonusEventLevel — Provides event severity (critical, major, minor, informational), which is subsequently mapped to a Ribbon Application Management Platform display severity level. SonusEventClass — Lists the associated event class. SonusEventDescription— Describes the event. SonusEventTime—Provides timestamp of when the event occurs.
Instance Fields	sonusEmsNodeId
Action	Contact Ribbon Global Product Support (GPS) with your findings for the resolution.
Impact	Unable to fetch the error difference in the file download time.
Clearing	Manual

OSS Trap Resync Alarms

Contents

- [sonusEmsTrapReSyncDelimiterNotification](#)

This section covers alarms associated with the [OSS Trap Resync](#) process.

sonusEmsTrapReSyncDelimiterNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.130

Description	Ribbon Application Management Platform (RAMP) sends a notification to the OSS when the trap resync starts or finishes.
Repetition	No
Event Codes	N/A
Instance Fields	sonusEventDescription, sonusEventLevel, sonusEmsFmTrapReSyncDelimiter The sonusEmsFmTrapReSyncDelimiter value is either 1 (start alarm) or 2 (stop alarm).
Action	None
Impact	None
Clearing	N/A

Performance Management Alarms

Contents

- [sonusEmsPMProfileAssignmentFailedNotification](#)
- [sonusEmsV2PMStatsFileCollectionFailed](#)
- [sonusEmsPMExportSFTPFailNotification](#)

This section covers alarms related to performance management.

sonusEmsPMProfileAssignmentFailedNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.105
Description	This notification occurs when the PM profile assignment to the device fails even after the maximum retry attempts.
Repetition	Yes. Repeats each time the PM profile assignment fails to the device.

Event Codes	• sysName: An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. • sysObjectID: The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining `what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.' • sonusEventTime: Provides timestamp of when the event occurs. • sonusEventDescription: Describes the event. • sonusEventClass: Lists the associated event class. • sonusEventLevel: Lists the associated event level. • sonusEmsV2NodeIpAddressType: The address type of sonusEmsV2NodeIpAddress. • sonusEmsV2NodeIpAddress: The IP address of the node polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddress. • sonusEmsNodeid: The internal ID of the node that is polled.
Instance Fields	None
Action	Increase the read idle timeout for maximum retry attempts and try again. Wait for the command output to timeout.
Impact	The PM profile is not assigned to the device instance.
Clearing	Manual

sonusEmsV2PMStatsFileCollectionFailed

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.93
Description	The statistics download from the node fails.
Repetition	Yes. Repeats every time the PM collection task stops.

Event Codes	sysName: An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID: The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it assigns the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.' sonusEventTime: The timestamp of the event. sonusEventDescription: Description of the event. sonusEventClass: The associated event class. sonusEventLevel: The event severity (critical, major, minor, informational), which is subsequently mapped to a displayRAMP severity level. sonusEmsV2NodeIpAddressType: The address type of sonusEmsV2NodeIpAddress. sonusEmsV2NodeIpAddress: The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsNodeId: The internal ID of the node that was polled.
Instance Fields	sysName sysObjectID sonusEventTime sonusEventDescription sonusEventClass sonusEventLevel sonusEmsV2NodeIpAddressType sonusEmsV2NodeIpAddress sonusEmsNodeId
Action	Contact GPS.
Impact	Performance management statistics collection for the node fails.
Clearing	Manual

sonusEmsPMExportSFTPFailNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.1.31
Description	This alarm generates when the Ribbon Application Management Platform (RAMP) loses connectivity to the host IP and is no longer able to send statistics to the remote statistics server.
Repetition	This alarm repeats once for each remote server.
Event Codes	• sysName – Name of RAMP. • sonusEventTime – Time when the event occurred. • sonusEventDescription – Describes the event. • sonusEventClass - Lists the associated event class. • sonusEventLevel - Lists the associated event level (severity). • sonusRemoteServer – Remote server where SFTP fails.
Instance Fields	• sysName • sonusEventTime • sonusEventDescription • sonusEventClass • sonusEventLevel • sonusRemoteServer
Action	Check the accessibility of the remote server.
Impact	The export of the PM statistics fails on a remote location.
Clearing	Manual

RAMP CNF - Alarms

Note

There are no new RAMP CNF Alarms. The RAMP CNF supports all existing [RAMP Alarms](#).

Note

The [Resource Usage Threshold Crossing Alarms](#) are not supported for RAMP CNF.

Reachability Alarms

Contents

- [sonusEmsV2HostReachableNotification](#)
- [sonusEmsV2HostRestartedNotification](#)
- [sonusEmsV2HostUnreachableNotification](#)
- [sonusEmsV2NodeReachableNotification](#)
- [sonusEmsV2NodeRestartedNotification](#)
- [sonusEmsV2NodeUnreachableNotification](#)

This section covers alarms related to reachability management.

sonusEmsV2HostReachableNotification

This alarm is raised on the device, not on the Ribbon Application Management Platform (RAMP).

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.75
Description	The specified host is now reachable by RAMP.
Repetition	Yes. The Reachability Manager maintains the specified host's state. An alarm is generated each time the host's state transitions to 'reachable'.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	None required.

Impact	RAMP has established connectivity to the host.
Clearing	Automatic, clears in 2 minutes.

sonusEmsV2HostRestartedNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.76
Description	The specified host has restarted since the last poll by the Ribbon Application Management Platform (RAMP).
Repetition	Yes. Repeats each time the sysUptime polled value is less than the last value.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	None.
Action	Investigate why the host restarted.
Impact	Any active sessions open to the host will terminate when the restart occurs. RAMP polls to the host during the restart period will fail.
Clearing	Manual.

sonusEmsV2HostUnreachableNotification

This alarm is raised on the device, not on the Ribbon Application Management Platform (RAMP).

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.74
Description	The HA physical interface is not reachable by RAMP.
Repetition	Yes. The Reachability Manager maintains the specified host's state. An alarm is generated each time the host's state transitions to 'unreachable'.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sonusEmsV2HostUnreachableNotification—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	Determine the reason connectivity is lost, and take action to rectify it. Possible reasons include, but are not limited to: • Network issues • Sonus agent not running on the host • Incorrect authentication information for host on RAMP
Impact	RAMP is unable to manage the node.
Clearing	Automatic, sonusEmsV2HostReachableNotification

sonusEmsV2NodeReachableNotification

This alarm is raised on the device, not on the Ribbon Application Management Platform (RAMP).

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.54
Description	The specified node is now reachable by RAMP. This alarm is also raised when the connection is restored between RAMP target and source nodes.
Repetition	Yes. The Reachability Manager maintains the specified node's state. An alarm is generated each time the node's state transitions to 'reachable'.
Event Codes	sonusEmsNodeid—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeid
Action	None required.
Impact	None.
Clearing	Automatic, clears in 2 minutes.

sonusEmsV2NodeRestartedNotification

This alarm is raised on the device, not on the Ribbon Application Management Platform (RAMP).

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.55
Description	The specified node has restarted since last polled by RAMP.
Repetition	Yes. Repeats each time the sysUptime value of either host in an HA pair polled is less than the last value.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	No action required if restart is intentional. If not, investigate reason for node restart.
Impact	None.
Clearing	Manual.

sonusEmsV2NodeUnreachableNotification

This alarm is raised on the device, not on the Ribbon Application Management Platform (RAMP).

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.53

Description	Any type of registered device not reachable by RAMP. This alarm is also raised when target RAMP detects that it lost connection to source. The target RAMP sends the alarm to the configured OSS or NMS.
Repetition	Yes. The Reachability Manager maintains the specified node's state. An alarm is generated each time the node's state transitions to 'unreachable'.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsHostId
Action	Investigate loss of communication to the specified node. Verify the following: - Network connectivity to the device exists. - The maximum number of management clients has not been exceeded on the device. The GSX limits this to eight (8). Use the <code>CLI SHOW MGMT CLIENT SUMMARY</code> command to check this. - The following three settings are correct: - IP address - SNMP community strings To check the status of device, navigate to Device Management > Node Management > Function Manager.
Impact	Node cannot be managed by RAMP.
Clearing	Automatic, sonusEmsV2NodeReachableNotification

This section covers alarms related to Ribbon Application Management Platform (RAMP) redundancy.

sonusHARACProcessDownNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.1
Description	A Ribbon Application Management Platform (RAMP) process is down.
Repetition	No, once a trap is sent another will not be sent unless it has been automatically cleared.

Event Codes	sonusHostID: The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusRACHostID: The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusRACProcess: Denotes the RAMP process which is down now. Processes are as follows: ◦ sonus.agent: Sonus Agent ◦ sonus.sbcManager: The SBC Manager ◦ sonus.callTraceListener: Call Trace Listener ◦ sonus.databaseCheck: Denotes the process to check whether the database is up and running on the host. ◦ sonus.dataHandler: PM Data Handler ◦ sonus.dask: PM Dask ◦ sonus.dbaaS: DBaaS (database) ◦ sonus.fileReplication: File Replication ◦ sonus.fmTrapReceiver: FM Trap Receiver ◦ sonus.ftp_pm: The PM FTP Poller. ◦ sonus.hotDeploy: Denotes the RAMP Jboss process after invoking Transition to Active MBean. ◦ sonus.idhService: IDH (optional feature). ◦ sonus.jmx_pm: PM JMX Poller. ◦ sonus.kafka: Kafka ◦ sonus.kafkaConnect: Kafka Connect. ◦ sonus.kafkaSchemaRegistry: Kafka Schema Registry. ◦ sonus.kafkaMirror: Kafka Mirroring. ◦ sonus.owl: The Owl. ◦ sonus.snmp_pm: The PM SNMP Poller. ◦ sonus.stiService: STI (optional feature). ◦ sonus.trapProbe: Trap Probe. ◦ sonus.warmDeploy: Denotes the process that Jboss is started in standby mode. ◦ sonus.apacheproxy: Denotes the process that ApacheProxy is started in active mode. ◦ sonus.zookeeper: The Zookeeper.
Instance Fields	sonusRACProcess sonusRACHostID
Action	Though OpenSAF tries to bring the process up and running again and the trap should be cleared, it would still be worth investigating why the process has gone down.
Impact	This may impact normal functioning of RAMP.
Clearing	Automatic, sonusHARACProcessUpNotification.

sonusHARACProcessUpNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.2
Description	A Ribbon Application Management Platform (RAMP) process has successfully been started.
Repetition	No
Event Codes	sonusHostID: The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusRACHostID: Denotes unique host id in a RAC cluster. sonusRACProcess: Denotes the RAMP process which is up now. Processes are as follows: • sonus.agent: The Sonus Agent. • sonus.sbcManager: The SBC Manager • sonus.callTraceListener: Call Trace Listener. • sonus.databaseCheck: Denotes the process to check whether the database is up and running on the host. • sonus.dataHandler: PM Data Handler. • sonus.dask: The PM Dask. • sonus.dbaaS: DBaaS (database). • sonus.fileReplication: File Replication. • sonus.fmTrapReceiver: The FM Trap Receiver. • sonus.ftp_pm: The PM FTP Poller. • sonus.hotDeploy: Denotes the RAMP Jboss process after invoking Transition to Active MBean. • sonus.idhService: IDH (optional feature). • sonus.jmx_pm: PM JMX Poller. • sonus.kafka: Kafka • sonus.kafkaConnect: Kafka Connect. • sonus.kafkaSchemaRegistry: Kafka Schema Registry. • sonus.kafkaMirror: Kafka Mirroring. • sonus.owl: The Owl. • sonus.snmp_pm: The PM SNMP Poller. • sonus.stiService: STI (optional feature). • sonus.trapProbe: Trap Probe. • sonus.warmDeploy: Denotes the process that Jboss is started in standby mode. • sonus.apacheproxy: Denotes the process that ApacheProxy is started in active mode. • sonus.zookeeper: The Zookeeper.
Instance Fields	sonusRACProcess sonusRACHostID
Action	None
Impact	This may indicate that normal functioning of RAMP was impacted by the previous trap indicating that a process was down.

Clearing	Automatic

sonusHARACStateChangeNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.3
Description	This is a notification that the state of a Ribbon Application Management Platform (RAMP) node has been changed.
Repetition	No
Event Codes	sonusHARACPrevState: Denotes the previous state of this node. The previous high availability state of this node. • 0 offline • 1 active • 2 standby sonusHARACNewState: Denotes the new state of this node. The new high availability state of this node. • 0 offline • 1 active • 2 standby
Instance Fields	sonusHARACPrevState sonusHARACNewState
Action	Manual action can trigger a state change or automatic one. For the automatic state change the reason for state change trigger can be investigated.
Impact	This may impact normal functioning of RAMP.
Clearing	Manual

sonusHARACFailoverInitiatedNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.4
Description	This is to notify that a relocate action has been initiated to switch the roles of the system from active to standby and vice versa.
Repetition	No

Event Codes	sonusHARACFailoverReason: This describes the reason for the failure of the active box. sonusHARACClusterName: Denotes the name of the HA RAC Cluster.
Instance Fields	None
Action	None
Impact	The standby should become active.
Clearing	Manual

sonusHARACFailoverStandbyTimeoutNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.5
Description	This is to notify that, after failover, the original active node does not become standby within the set period of time.
Repetition	No
Event Codes	sonusHARACClusterName: Denotes the name of the HA RAC Cluster. sonusHARACNodeName: Denotes the name of the node.
Instance Fields	sonusHARACClusterName, sonusHARACNodeName
Action	Unless the node is intentionally brought down, or the failover does not succeed, check the log and other traps to check if any component failure prevents the node to become standby. It is also possible that the node takes longer time to recover and eventually becomes standby successfully, in that case this notification can be ignored.
Impact	After the original standby node takes over the active role, the original active node should normally become standby within 3 minutes after failover.
Clearing	Manual

sonusHARACFailoverSuccessful

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.14

Description	This notifies that the switch over to the standby box has completed successfully.
Repetition	No
Event Codes	None
Instance Fields	None
Action	None
Impact	The standby becomes active.
Clearing	Manual

sonusHARACFailoverFailed

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.15
Description	This notifies that the switch over to the standby box has failed.
Repetition	No
Event Codes	None
Instance Fields	None
Action	This needs to be investigated.
Impact	The standby could not become active.
Clearing	Manual

sonusHARACArbitratorDownNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.16
Description	This is to notify that the etcd instance designated as the arbitrator is down. etcd is a leader-based distributed system.
Repetition	No

Event Codes	None
Instance Fields	sysName, sonusEventTime, sonusEventDescription, sonusEventLevel, sonusHARACArbitratorIp
Action	None
Impact	The auto-switchover does not work if the active RAMP node fails.
Clearing	Automatic, sonusHARACArbitratorUpNotification

sonusHARACArbitratorUpNotification

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.5.3339.2.0.17
Description	The etcd instance designated as the arbitrator is up.
Repetition	No
Event Codes	None
Instance Fields	sysName, sonusEventTime, sonusEventDescription, sonusEventLevel, sonusHARACArbitratorIp
Action	None
Impact	None
Clearing	Automatic

This section covers alarms related to managing SBC Edge devices.

ribbonDeviceNotConnectedLast24Hours

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.156
Description	The SBC Edge device has not checked in with Ribbon Application Management Platform (RAMP) for 24 hours.
Repetition	Yes, repeats every midnight until the SBC Edge device checks-in.
Event Codes	• sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	sonusHostID : The unique ID or serial number for this host.
Action	Check the connectivity between the SBC Edge device and RAMP.
Impact	The SBC Edge device is unable to communicate with RAMP.
Clearing	Automatic, ribbonDeviceNotConnectedLast24HoursClear

ribbonDeviceNotConnectedLast24HoursClear

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.157
Description	The SBC Edge device has now checked in with Ribbon Application Management Platform (RAMP). The clear alarm for ribbonDeviceNotConnectedLast24Hours .
Repetition	No
Event Codes	- sonusEventTime: The timestamp of the event. - sonusEventDescription: The description of the event. - sonusEventClass: The event class. - sonusEventLevel: The event level.
Instance Fields	sonusHostID: The unique ID or serial number for this host.
Action	None
Impact	The SBC Edge device has resumed communication with RAMP.
Clearing	Automatic

ribbonDeviceNotConnectedLast90Days

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.158
Description	The SBC Edge device has not checked in with Ribbon Application Management Platform (RAMP) for the last 90 days.
Repetition	Yes, repeats every midnight until the SBC Edge device checks-in.
Event Codes	- sonusEventTime: The timestamp of the event. - sonusEventDescription: The description of the event. - sonusEventClass: The event class. - sonusEventLevel: The event level.
Instance Fields	sonusHostID: The unique ID or serial number for this host.
Action	Check the connectivity between the SBC Edge device and RAMP.
Impact	The SBC Edge device is unable to communicate with RAMP.
Clearing	Automatic, ribbonDeviceNotConnectedLast90DaysClear

ribbonDeviceNotConnectedLast90DaysClear

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.159
Description	The SBC Edge device has checked in with Ribbon Application Management Platform (RAMP). The clear alarm for ribbonDeviceNotConnectedLast90Days .
Repetition	No
Event Codes	• sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	sonusHostID: The unique ID or serial number for this host.
Action	None
Impact	The SBC Edge device has resumed communication with RAMP.
Clearing	Automatic

ribbonEVServiceZTPConnectivityLostClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.152
Description	EdgeView service establishes connection with Zero Touch Provisioning (ZTP) server. The clear alarm for ribbonEVServiceZTPConnectivityLostNotification .
Repetition	No
Event Codes	• sonusHostID: The unique ID or serial number for this host. • sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	None
Action	None

Impact	None
Clearing	Automatic

ribbonEVServiceZTPConnectivityLostNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.151
Description	The EdgeView service lost connectivity with the Zero Touch Provisioning (ZTP) server.
Repetition	Yes
Event Codes	- sonusHostID: The unique ID or serial number for this host. - sonusEventTime: The timestamp of the event. - sonusEventDescription: The description of the event. - sonusEventClass: The event class. - sonusEventLevel: The event level.
Instance Fields	None
Action	Check the connectivity between the EdgeView service and the ZTP server.
Impact	- If an SBC Edge node is trying register with Ribbon Application Management Platform (RAMP) for the first time, registration fails. - If an SBC Edge node is trying to re-register with RAMP, registration succeeds using the details in the RAMP database. - ZTP APIs will not work.
Clearing	Automatic, ribbonEVServiceZTPConnectivityLostClearNotification

ribbonEVServiceZTPDeviceRetrievalFailedClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.154

Description	The EdgeView service successfully retrieved the details of the SBC Edge device from the Zero Touch Provisioning (ZTP) server. The clear alarm for ribbonEVServiceZTPDeviceRetrievalFailedNotification .
Repetition	No
Event Codes	• sonusHostID: The unique ID or serial number for this host. • sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	None
Action	None
Impact	The SBC Edge node is successfully registered on Ribbon Application Management Platform (RAMP).
Clearing	Automatic

ribbonEVServiceZTPDeviceRetrievalFailedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.153
Description	EdgeView service fails to retrieve details of the SBC Edge device from Zero Touch Provisioning (ZTP) server. However, ZTP server is accessible.
Repetition	Yes. This alarm is repeated whenever the device tries to re-register and the c2e retrieval from ZTP fails.
Event Codes	• sonusHostID: The unique ID or serial number for this host. • sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	None
Action	Check the connectivity between EdgeView service and ZTP server.

Impact	- If an SBC Edge node is trying register with RAMP for the first time, registration fails. - If an SBC Edge node is trying to re-register with RAMP, registration succeeds using the details in the RAMP database.
Clearing	Automatic, ribbonEVServiceZTPDeviceRetrievalFailedClearNotification

ribbonEVServiceZTPDeviceRetrievalFailedTimeBasedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.155
Description	The EdgeView service failed to retrieve the details of the SBC Edge device from the Zero Touch Provisioning (ZTP) server within the default interval. However, the ZTP server is accessible.
Repetition	Yes. This alarm is repeated whenever the device tries to register again and the c2e retrieval from ZTP fails.
Event Codes	- sonusEventTime – Time when the event occurred. - sonusEventDescription – Describes the event. - sonusEventClass - Lists the associated event class. - sonusEventLevel - Lists the associated event level (severity). - sonusHostID—The unique ID or serial number for this host.
Instance Fields	None
Action	Check the connectivity between the EdgeView service and the ZTP server.
Impact	The SBC Edge node registration with Ribbon Application Management Platform (RAMP) failed.
Clearing	Manual

ribbonEVServiceZTPNotRegisteredClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.144

Description	EdgeView device is registered with Zero Touch Provisioning (ZTP) server. The clear alarm for ribbonEVServiceZTPNotRegisteredNotification .
Repetition	No
Event Codes	• sonusHostID: The unique ID or serial number for this host. • sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	• ribbonEVServiceZTPIpAddressType: The IP address type of the ZTP server. • ribbonEVServiceZTPIpAddress: The IP address of the ZTP server.
Action	None
Impact	None
Clearing	Automatic

ribbonEVServiceZTPNotRegisteredNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.143
Description	EdgeView service is not registered with Zero Touch Provisioning (ZTP) server.
Repetition	Yes
Event Codes	• sonusEventTime – Time when the event occurred. • sonusEventDescription – Describes the event. • sonusEventClass - Lists the associated event class. • sonusEventLevel - Lists the associated event level (severity).
Instance Fields	• ribbonEVServiceZTPIpAddressType - The IP address type of the ZTP server. • ribbonEVServiceATPIpAddress - The IP address of the ZTP server.
Action	Use the EdgeView GUI to register EdgeView service with the ZTP server.

Impact	Unable to register the SBC Edge node with Ribbon Application Management Platform (RAMP).
Clearing	Automatic, ribbonEVServiceZTPNotRegisteredClearNotification

ribbonEVServiceZTPRegisteredSucceededNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.146
Description	EdgeView service is successfully registered with Zero Touch Provisioning (ZTP) server. The clear alarm for ribbonEVServiceZTPRegistrationFailedNotification .
Repetition	No
Event Codes	• sonusEventTime: The timestamp of the event. • sonusEventDescription: The description of the event. • sonusEventClass: The event class. • sonusEventLevel: The event level.
Instance Fields	• ribbonEVServiceZTPIpAddressType: The IP address type of the ZTP server. • ribbonEVServiceATPIpAddress: The IP address of the ZTP server.
Action	None
Impact	None
Clearing	Automatic

ribbonEVServiceZTPRegistrationFailedNotification

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.145
Description	EdgeView service failed to register with Zero Touch Provisioning (ZTP) server.
Repetition	Yes

Event Codes	- sonusEventTime – Time when the event occurred. - sonusEventDescription – Describes the event. - sonusEventClass - Lists the associated event class. - sonusEventLevel - Lists the associated event level (severity).
Instance Fields	- ribbonEVServiceZTPIpAddressType - The IP address type of the ZTP server. - ribbonEVServiceATPIpAddress - The IP address of the ZTP server.
Action	Try to connect ZTP server again. Contact Ribbon Global Support if needed.
Impact	ZTP server is not available, unable to register EdgeView service.
Clearing	Automatic, ribbonEVServiceZTPRegisteredSucceededNotification

sbcEdgeHAInvalidC2eModeClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.172
Description	This alarm is raised to clear sbcEdgeHAInvalidC2eModeNotification .
Repitition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	Only HA devices with same c2e mode can be registered with RAMP.
Impact	Registration for the devices with incorrect c2e mode are rejected.
Clearing	Automatic

sbcEdgeHAInvalidC2eModeNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.168
Description	This alarm is raised if the registration request of Edge HA nodes have different c2e mode values.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	Only Edge HA devices with the same c2e mode must be registered with RAMP.
Impact	HA will not be registered for nodes having different c2e modes.
Clearing	Automatic. sbcEdgeHAInvalidC2eModeClearNotification

sbcEdgeHANodeCountInvalidClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.163
Description	This alarm is raised after the sbcEdgeHANodeCountInvalidNotification alarm is raised for clearing from the FM side.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None

Action	Alarm details will be deleted from the database.
Impact	HA pair will have correct node count.
Clearing	Automatic

sbcEdgeHANodeCountInvalidNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.162
Description	If less than two nodes are registered on an Edge HA pair then this alarm is raised.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	Register only two nodes to an Edge HA pair.
Impact	The Device Manager may not be able to display the HA pair details correctly.
Clearing	Automatic, sbcEdgeHANodeCountInvalidClearNotification

sbcEdgeHANodesDuplicateRoleClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.165
Description	This is the clearing alarm for sbcEdgeHANodesDuplicateRoleNotification that is raised during registration, if the role type for both nodes is same.
Repetition	No

Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	None
Impact	Clears the trap sbcEdgeHANodesDuplicateRoleNotification
Clearing	Automatic

sbcEdgeHANodesDuplicateRoleNotification

Type: MINOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.164
Description	Swelite registration requests for an HA pair are considered valid if both the nodes have distinct role type. If the role type for both nodes is same then the EVService raises an alarm after accepting the registration request. This alarm is cleared once the role type is corrected/updated only through registration.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	The role for any node can be updated to be an appropriate distinct through a new registration request.
Impact	1. An HA pair consists of only two nodes. If any more nodes are registered with RAMP then it is an incorrect depiction of HA pair. 2. The Device Manager UI may not be able to correctly display the HA pair details.

Clearing	Automatic, sbcEdgeHANodesDuplicateRoleClearNotification

sbcEdgeHANodesSplitBrainClearNotification

Type: CLEAR

OID	1.3.6.1.4,1.2879.2.1.7.2.0.171
Description	This alarm is raised if the split brain condition is resolved.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	None
Impact	None
Clearing	Automatic

sbcEdgeHANodesSplitBrainNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.170
Description	This alarm is raised if there is a possibility of split brain situation.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None

Action	Correct the role on the Device side and trigger the registration request.
Impact	The Device Manager may not be able to display the HA pair details correctly.
Clearing	Automatic, sbcEdgeHANodesSplitBrainClearNotification

sbcEdgeHASTandbyNodeDownClearNotification

Type: CLEAR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.167
Description	This alarm is raised after the sbcEdgeHASTandbyNodeDownNotification alarm for clearing it from FM side.
Repetition	No
Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	Alarm details are deleted from the DB.
Impact	The HA pair will have distinct role of nodes.
Clearing	Automatic

sbcEdgeHASTandbyNodeDownNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.166
Description	This alarm will be raised if the standby node on the Swelite HA pair goes down/offline.
Repetition	No

Event Codes	sonusHostID sonusEventDescription sonusEventClass sonusEventLevel sonusEventTime
Instance Fields	None
Action	1. Restart the device and ensure heartbeat is sent to RAMP. 2. If device is up and sending heartbeat, RabbitMQ service needs to be checked if its running. If RMQ service is down all the nodes should be marked offline.
Impact	The availability in the HA pair is compromised.
Clearing	Automatic, sbcEdgeHAStandbyNodeDownClearNotification

Threshold Alarms

Contents

- [sonusEmsV2FallingEventNotification](#)
- [sonusEmsV2RisingEventNotification](#)

This section covers alarms related to configured performance thresholds.

sonusEmsV2FallingEventNotification

This alarm is raised on the device, not on the Ribbon Application Management Platform.

Type: User-defined

OID	1.3.6.1.4.1.2879.2.1.7.2.0.52

Description	A falling event notification informs that a given performance measure for which a previous rising event notification was generated has returned below a defined falling value for that threshold and should be cleared.
Repetition	No. 1. The state is maintained. Once the rising threshold is breached, a sample value below the falling threshold causes this alarm to be generated. 2. Also, when the PM threshold config is changed (Observability -> Performance Management -> Thresholding), the alarm is generated.
Event Codes	sonusEmsThresholdIdentifier—A key that uniquely identifies this threshold for managing duplicate alarms and clearing (matching the falling and rising notifications). sonusEmsV2ThresholdIpAddress—The IP address of the device on which the threshold was crossed. The type of this address is determined by the value of sonusEmsV2ThresholdIpAddressType. sonusEmsV2ThresholdIpAddressType—The address type of sonusEmsV2ThresholdIpAddress. sonusEmsThresholdLocationIndexes—The indexes of the location within the device at which the threshold was crossed; may be shelf, slot number, interface number, trunk group number, etc., depending on where the threshold event occurred. sonusEmsThresholdObjectId—The OID of the performance measure that was crossed. sonusEmsThresholdSampleValue—The actual value measured that denotes that the threshold was crossed (should be greater than or equal to the rising trigger value or less than or equal to the falling trigger value). sonusEmsThresholdTriggerValue—The threshold value that was crossed (the rising or falling value set for the threshold). sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectId—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsThresholdObjectId, sonusEmsThresholdIdentifier
Action	Determined by each location.
Impact	None.
Clearing	Automatic, clears in 2 minutes.

sonusEmsV2RisingEventNotification

This alarm is raised on Ribbon Application Management Platform (RAMP). However, the error condition is on the device. Identify the device using the IP address included in the alarm description.

Type: User-defined

OID	1.3.6.1.4.1.2879.2.1.7.2.0.51
Description	A rising event notification informs that a given performance measure has crossed a given threshold (it has risen above a defined rising threshold value).
Repetition	alarm is generated once. Additional samples above the threshold do not cause this alarm to repeat. This alarm resets once the falling threshold is met.

Event Codes	sonusEmsThresholdIdentifier—A key that uniquely identifies this threshold for managing duplicate alarms and clearing (matching the falling and rising notifications). sonusEmsThresholdIpAddress—The IP address of the device on which the threshold was crossed. The type of this address is determined by the value of sonusEmsV2ThresholdIpAddressType. sonusEmsThresholdIpAddressType—The address type of sonusEmsV2ThresholdIpAddress. sonusEmsThresholdLocationIndexes—The indexes of the location within the device at which the threshold was crossed; may be shelf, slot number, interface number, trunk group number, etc., depending on where the threshold event occurred. sonusEmsThresholdObjectId—The OID of the performance measure that was crossed. sonusEmsThresholdSampleValue—The actual value measured that denotes that the threshold was crossed (should be greater than or equal to the rising trigger value or less than or equal to the falling trigger value). sonusEmsThresholdTriggerValue—The threshold value that was crossed (the rising or falling value set for the threshold). sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	Determined by each location.
Action	sonusEmsThresholdObjectId, sonusEmsThresholdIdentifier
Impact	User-defined.
Clearing	Automatic, sonusEmsV2FallingEventNotification

Verification Manager Alarms

Contents

- [sonusV2VfyMgrNodeTypeFailNotification](#)
- [sonusV2VfyMgrNodeTypeSuccessNotification](#)

This section covers alarms related to the Verification Manager. The Verification Manager listens for agent restart traps, determines which registered node(s) relate to the traps, and runs a verification task to ensure that the Ribbon Application Management Platform (RAMP) model of the device is correct.

sonusV2VfyMgrNodeTypeFailNotification

This alarms is raised on the device not on Ribbon Application Management Platform (RAMP).

Type: CRITICAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.64
Description	The agent on the host identified by sonusHostID does not contain the instrumentation component needed to manage the registered node. The RAMP models HA nodes as a single entity, however, each participating host can send traps that relate explicitly to that host using the sonusHostID component as the identifier.
Repetition	Yes. The Verification Manager maintains the state. This alarm is generated if a transition occurs.

Event Codes	sonusEmsNodeID—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sonusHostID—The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router'.
Instance Fields	sonusEmsNodeID
Action	Investigate why the application-specific management blade is not running on the host.
Impact	RAMP is unable to fully manage the device.
Clearing	Automatic, sonusV2VfyMgrNodeTypeSuccessNotification

sonusV2VfyMgrNodeTypeSuccessNotification

This alarm is raised on the device not on Ribbon Application Management Platform (RAMP).

Type: INFORMATIONAL

OID	1.3.6.1.4.1.2879.2.1.7.2.0.65
Description	The agent on the host identified by sonusHostID contains the instrumentation component needed to manage the registered node. The RAMP models HA nodes as a single entity, however, each participating host can send traps that relate explicitly to that host using the sonusHostID component as the identifier.

Repetition	Yes. The Verification Manager maintains the state. This alarm is generated if a transition occurs.
Event Codes	sonusEmsNodeId—The internal ID of the node that was polled. sonusEmsV2NodeIpAddress—The IP address of the node that was polled. The type of this address is determined by the value of sonusEmsV2NodeIpAddressType. sonusEmsV2NodeIpAddressType—The address type of sonusEmsV2NodeIpAddress. sonusHostId—The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sysName—An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. sysObjectID—The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router.'
Instance Fields	sonusEmsNodeId
Action	None required.
Impact	None.
Clearing	Automatic, clears in 2 minutes

linkUp

Type: Cleared

OID	1.3.6.1.6.3.1.1.5.4
Definition:	This notification is raised when the Secondary interface state Up.
Action:	None required.
Clearing:	Automatic, clears in 2 minutes
Repetition:	No

Instance Fields:	ifIndex: Physical address
Event Code(s):	• sysName: An administratively assigned name for this managed node. By convention, this is the node's fully qualified domain name. If the name is unknown, the value is the zero-length string. • sonusEventTime: Provides timestamp of when the event occurs. • sonusEventDescription: Describes the event. • Physical address: IP address of Secondary interface. • ifDescr: Provides the Secondary interface description. • ifIndex: The Secondary Interface Id (e.g., 2)

linkDown

Type: Critical

OID	1.3.6.1.6.3.1.1.5.3
Definition:	This notification is raised when the Secondary interface state Down.
Action:	None required.
Clearing:	Automatic, linkUp
Repetition:	No
Instance Fields:	ifIndex: Physical address
Action	Do the following: 1. Determine what circumstances caused the link to go down and rectify. 2. Bring the link back up.
Event Code(s):	• sysName: An administratively assigned name for this managed node. By convention, this is the node's fully qualified domain name. If the name is unknown, the value is the zero-length string. • sonusEventTime: Provides timestamp of when the event occurs. • sonusEventDescription: Describes the event. • Physical address: IP address of Secondary interface. • ifDescr: Provides the Secondary interface description . • ifIndex: The Secondary Interface Id (e.g., 2)

- [Communicator Process Management Alarms](#)
 - [sonusCommProcMgmtGiveUpRestartNotification](#)
 - [sonusCommProcMgmtProcessRestartedNotification](#)
 - [sonusCommProcMgmtProcessRestartFailureNotification](#)

This section covers Agent Framework alarms originating from the Ribbon Communicator. The Communicator is a software “management chassis” that allows device instrumentation modules (blades) to be dynamically deployed.

Alarm Field Definition

In this guide, alarm notifications are defined by the fields: Severity, Definition, Impact, Action, Clearing, Repetition, Instance Field(s), and Event Code(s).

- **Severity** — Represents the severity level assigned by the device, and is displayed in bold green font directly underneath the alarm name. Possible severity levels are: Critical, Major, Minor, and Informational.
- **Definition** — Describes the purpose of the alarm.
- **Impact** — Describes the impact to the system when the indicated failure or fault occurs.

- **Action** — Details action to take by the operator to eliminate/prevent the failure condition. When appropriate, step-by-step procedures will be provided.
- **Clearing** — This field identifies how an alarm clears from the Fault Manager Event List. Alarm clearing is either automatic or manual.
- **Repetition** — Identifies if an alarm is repeated for each occurrence of a particular failure relating to the same managed object instance. When appropriate, repetition interval information is included in this field.
- **Instance Fields** — By default, all alarms are instanced by source host and trap type. For some alarms, an Instance ID field is included to uniquely identify the alarms. The Instance ID is created by appending values of the instance fields to the default instance information. In this guide, when instance fields exist for an alarm, the Instance Fields category in the alarm description is populated with one or more instance fields.
- **Event Code(s)** — Identifies detailed event information contained in the alarm (event levels and classes, threshold types, clearing strings, and so forth). This field may not always be included

Agent Framework Alarm Categories

Agent Framework alarms are classified into the following categories:

- [Communicator Chassis Alarm](#)
- [Communicator Process Management Alarms](#)

Communicator Chassis Alarm

Contents

- [sonusCommChassisStartupNotification](#)
- [sonusCommChassisTestNotification](#)
- [sonusCommChassisCriticalTestNotification](#)
- [sonusCommChassisMajorTestNotification](#)
- [sonusCommChassisMinorTestNotification](#)
- [sonusCommChassisWarnTestNotification](#)
- [sonusCommChassisClearTestNotification](#)

sonusCommChassisStartupNotification

Definition	The Sonus Communicator Chassis has started. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Informational
Impact	Device management is not possible until the agent has restarted.

Action	Unless this is a manual agent shutdown, investigate the reason for agent restart.
Clearing	Manual
Repetition	No
Instance Fields	None
Event Code(s)	sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

sonusCommChassisTestNotification

Definition	This notification is for test purposes. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap.
Severity	Informational
Impact	None
Action	None Required
Clearing	Manual
Repetition	Yes
Instance Fields	sonusEventDescription
Event Code(s)	sonusEventDescription — A description of the event that generated the trap sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters

sonusCommChassisCriticalTestNotification

Definition	Test trap for critical severity
Severity	Critical

Impact	None
Action	None; information only
Clearing	Manual
Repetition	No
Instance Fields	sonusEventTime,sonusEventDescription,sonusEventClass,sonusEventLevel, sonusHostID
Event Codes	sonusEventTime: The date and time of the event that generated the trap.
	sonusEventDescription: A description of the event that generated the trap.
	sonusEventClass: The category of the event that generated the trap.
	sonusEventLevel: The severity level of the event that generated the trap.
	sonusHostID: The unique id or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It can contain non-numeric characters.

sonusCommChassisMajorTestNotification

Definition	Test trap for major severity
Severity	Major
Impact	None
Action	None; information only
Clearing	Manual
Repetition	No
Instance Fields	sonusEventTime,sonusEventDescription,sonusEventClass,sonusEventLevel, sonusHostID

Event Codes	sonusEventTime: The date and time of the event that generated the trap.
	sonusEventDescription: A description of the event that generated the trap.
	sonusEventClass: The category of the event that generated the trap.
	sonusEventLevel: The severity level of the event that generated the trap.
	sonusHostID: The unique id or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

sonusCommChassisMinorTestNotification

Definition	Test trap for minor severity
Severity	Minor
Impact	None
Action	None; information only
Clearing	Manual
Repetition	No
Instance Fields	sonusEventTime,sonusEventDescription,sonusEventClass,sonusEventLevel, sonusHostID
Event Codes	sonusEventTime: The date and time of the event that generated the trap.
	sonusEventDescription: A description of the event that generated the trap.
	sonusEventClass: The category of the event that generated the trap.
	sonusEventLevel: The severity level of the event that generated the trap.

sonusHostID: The unique id or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

sonusCommChassisWarnTestNotification

Definition	Test trap for warning severity
Severity	Warning
Impact	None
Action	None; information only
Clearing	Manual
Repetition	No
Instance Fields	sonusEventTime,sonusEventDescription,sonusEventClass,sonusEventLevel, sonusHostID
Event Codes	sonusEventTime: The date and time of the event that generated the trap.
	sonusEventDescription: A description of the event that generated the trap.
	sonusEventClass: The category of the event that generated the trap.
	sonusEventLevel: The severity level of the event that generated the trap.
	sonusHostID: The unique id or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

sonusCommChassisClearTestNotification

Definition	Test trap for clearing severity
Impact	None
Severity	Clearing
Action	None; information only
Clearing	Manual
Repetition	No
Instance Fields	sonusEventTime,sonusEventDescription,sonusEventClass,sonusEventLevel, sonusHostID
Event Codes	sonusEventTime: The date and time of the event that generated the trap.
	sonusEventDescription: A description of the event that generated the trap.
	sonusEventClass: The category of the event that generated the trap.
	sonusEventLevel: The severity level of the event that generated the trap.
	sonusHostID: The unique id or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

Communicator Process Management Alarms

Contents

- [sonusCommProcMgmtGiveUpRestartNotification](#)
- [sonusCommProcMgmtProcessRestartedNotification](#)
- [sonusCommProcMgmtProcessRestartFailureNotification](#)

sonusCommProcMgmtGiveUpRestartNotification

Definition	Process Management has given up attempting to restart the specified process. This will occur after Process Management has failed to restart the process a specified number of times over a specified time interval. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Major
Impact	Varies depending upon the process that failed and customer priorities.
Action	Do the following: 1. Investigate restart failure. 2. Examine log files and look for associated traps. 3. Restart process using <code>./sonusEms start <processName> script</code>. Refer to figure Process Management Notification Flow for a general methodology flow diagram.
Clearing	Manual
Repetition	No
Instance Fields	None
Event Code(s)	sonusCommProcMgmtProcessName — This object defines the process name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

sonusCommProcMgmtProcessRestartedNotification

Definition	Process Management has given up attempting to restart the specified process. This will occur after Process Management has failed to restart the process a specified number of times over a specified time interval. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Major
Impact	Current service from the specified process may not be available.
Action	Do the following: 1. Investigate restart failure. 2. Examine log files and look for associated traps. 3. Look for associated traps. Once the problem is corrected, the process automatically restarts and returns to normal operation unless the restart process has timed out. If a restart time-out occurs, restart the process manually using <code>. / sonusEms start <processName> script.</code> Refer to figure Process Management Notification Flow for a general methodology flow diagram.
Clearing	Manual
Repetition	Yes. Depends on restart policy. If enabled and process continually fails, the alarm will be sent every restart interval until GiveUpRestart is sent.
Instance Fields	None
Event Code(s)	sonusCommProcMgmtProcessName — This object defines the process name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

sonusCommProcMgmtProcessRestartFailureNotification

Definition	An attempt by Process Management to restart the process specified by the object "sonusCommProcMgmtProcessName" has failed. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Major
Impact	The services provided by this process are not available.
Action	Do the following: 1. Investigate restart failure. 2. Examine log files and look for associated traps. 3. Look for associated traps. Once the problem is corrected, the process automatically restarts and returns to normal operation unless the restart process has timed out. If a restart time-out occurs, restart the process manually using <code>. / sonusEms start <processName> script</code>. Refer to figure Process Management Notification Flow for a general methodology flow diagram.
Clearing	Manual
Repetition	Yes. Depends on restart policy. If enabled and process continually fails, the alarm will be sent every restart interval until GiveUpRestart is sent.
Instance Fields	None
Event Code(s)	sonusCommProcMgmtProcessName — This object defines the process name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.

Process Management Notification Flow

Host Monitoring Alarms

Contents

 - [CPU Usage Thresholds](#)
 - [Memory Usage Thresholds](#)
 - [Swap Space Usage Thresholds](#)
 - [File System Usage Thresholds](#)
 - [Application CPU Usage Thresholds](#)
 - [Application Memory Usage Thresholds](#)

This section covers the alarms generated and managed by the Host-Monitoring subagent.

Application Monitoring Alarms

Contents

- [Process Number Mismatch](#)
 - [sonusHostApplicationRuntimeErrorNotification](#)
 - [sonusHostApplicationRuntimeErrorRecoverNotification](#)
- [Process Termination](#)
 - [sonusHostApplicationExitNotification](#)
 - [sonusHostApplicationStartupNotification](#)

The host-monitoring agent monitors an application (see the table below for a list of applications per network element) by sending two sets of traps. For each application, it monitors the number of processes for this application plus the startup and exit of a process for this application.

Applications Per Network Element

PSX
ssmgr (PSX manager) ssa (PSX event generator)

Process Number Mismatch

Contents

- [sonusHostApplicationRuntimeErrorNotification](#)
- [sonusHostApplicationRuntimeErrorRecoverNotification](#)

When the number of processes do not match, the agent generates a problem alarm called *sonusHostApplicationRuntimeErrorNotification*. When the number of processes is matched, it generates *sonusHostApplicationRuntimeErrorRecoverNotification* alarm, which clears the previous problem alarm.

sonusHostApplicationRuntimeErrorNotification

Definition	Number of processes for an application do not match. This alarm is raised when license server process exits (shut down gracefully or forcefully) abnormally or normally. One alarm is raised for every license server. Run-time errors for application lserv occurs; mismatch in the number of expected instances and number of discovered instances.
Severity	Critical
Impact	One or more instance of a critical application on a host platform is not running. The impact is specific to the host platform. For example, on an SGX2000 platform, an eventProbe application is a critical application monitored by the agent. If no instance of eventProbe is running, the SGX2000 agent will generate this trap. The significance here is that the EMS and other management clients will lose alarms-monitoring capability to this particular SGX2000. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Action	Investigate immediately the events surrounding this alarm condition, and take appropriate action. The cause is most likely a major failure on the host platform.
Clearing	Automatic, sonusHostApplicationRuntimeErrorRecoverNotification
Repetition	No
Instance Fields	sonusHostExecName

Event Code(s)	sonusHostExpectedInstanceCount — Expected number of application instances. sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostSampleInstanceCount — Actual number of application instance from sampling poll.

sonusHostApplicationRuntimeErrorRecoverNotification

Definition	Number of processes for an application match. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters. Run-time errors for application lserv is recovered; the number of expected instances and number of discovered instances are same.
Severity	Clear
Impact	None
Action	None Required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostExecName
Event Code(s)	sonusHostExpectedInstanceCount — Expected number of application instances. sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostSampleInstanceCount — Actual number of application instance from sampling poll.

Process Termination

Contents

- [sonusHostApplicationExitNotification](#)
- [sonusHostApplicationStartupNotification](#)

Independently, if a process for the application exits, the agent generates the alarm [sonusHostApplicationExitNotification](#).

When a process for the application starts up, it generates the alarm [sonusHostApplicationStartupNotification](#).

The severity of these alarms is always Warning.

sonusHostApplicationExitNotification

Definition	A process for an application (see Table Application Per Network Element) exits. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters. This alarm is raised when license server process exits (shut down gracefully or forcefully). One alarm is raised for every license server.
Severity	Minor
Impact	The impact is specific to the host platform and the application running on it.
Action	Do the following: 1. Analyze events leading up to the exit of the application process for a root cause. 2. Determine whether this is a scheduled or unexpected event. 3. If this notification is unexpected, report the alarm to Ribbon Global Product Support (GPS) and troubleshoot further.
Clearing	Automatic, sonusHostApplicationStartupNotification
Repetition	Yes
Instance Fields	sonusHostExecName
Event Code(s)	sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostProcessID — The process ID

sonusHostApplicationStartupNotification

Definition	A process for an application (see Table Application Per Network Element) exits. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters. The alarm is raised when license server starts up.
Severity	Clear
Impact	None.
Action	None Required
Clearing	Automatic, clears in 2 minutes.
Repetition	No
Instance Fields	sonusHostExecName
Event Code(s)	sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostProcessID — The process ID

Disk Monitoring Alarms

This section lists the disk monitoring alarms on the Ribbon Application Management Platform (RAMP).

- [sonusHostDiskMonHardErrorNotification](#)

sonusHostDiskMonHardErrorNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.12.2.0.20

Description	This alarm triggers when a disk I/O error occurs. The RAMP uses a cron job to monitor the <code>/var/log/messages</code> file for any disk I/O errors every 30 minutes.
Repetition	No
Event Codes	sonusHostDiskDevName—Disk device name in descriptive format. sonusHostDiskErrorCount—Error count representing the difference between the last and present polled value. sonusHostID—The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters.
Instance Fields	sonusHostDiskDevName, sonusHostID.
Action	Perform the following to investigate the cause of the error: 1. Check the <code>/var/log/messages</code> logs for disk-related error messages. 2. Take note of potential impacts to the system as a result of the errors and contact Ribbon Global Product Support if normal operations are affected.
Impact	The impact depends on the disk reporting the errors. Frequent disk errors may indicate imminent failure. Determine which file system is affected by a failure using: <pre>df -hk</pre>
Clearing	Manual

Performance Management Backlog Alarms

Contents

- [sonusEmsPMBacklogExportNotification](#)
- [sonusHostPMStatsFileGenerationFailedNotification](#)

This section covers alarms generated for performance management backlog.

sonusEmsPMBacklogExportNotification

Type: MAJOR

OID	1.3.6.1.4.1.2879.2.1.7.2.0.110

Definition	This notification indicates the occurrence of a Ribbon Application Management Platform (RAMP) export of a performance management backlog file for a node.
Impact	RAMP backlog files are collected for the specified node.
Action	No action required.
Clearing	Manual
Repetition	This alarm is triggered when backlog is collected.
Instance Fields	
Event Code(s)	• sysName • sysObjectID • sonusEventTime • sonusEventDescription • sonusEventClass • sonusEventLevel • sonusEmsV2NodeIpAddressType • sonusEmsV2NodeIpAddress • sonusEmsNodeid

sonusHostPMStatsFileGenerationFailedNotification

Definition	Reports an event when the generation of a Performance Statistics tar file fails. Detailed message are specified in <i>sonusEventDescription</i>.
Severity	Major
Impact	PM SFTP will fail to collect .tar files for that specific interval.
Action	Check the agent logs.
Clearing	
Repetition	Whenever file creation fails in PSX agent, this alarm will be triggered.
Instance Fields	
Event Code(s)	INFO

Resource Usage Threshold Crossing Alarms

- [sonusHostCpuAvgUsageRisingThresholdNotification](#)
- [sonusHostCpuUsageFallingThresholdNotification](#)
- [sonusHostCpuUsageRisingThresholdNotification](#)

sonusHostCpuAvgUsageFallingThresholdNotification

Definition	This “clear” alarm is generated when the CPU average usage (among all CPUs) falls below the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Critical/Minor/Major
Impact	None
Action	None required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostCpuAvgUsageRisingThresholdNotification

Definition	This alarm is generated when the CPU average usage (among all CPUs) rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Critical/Major/Minor

Impact	CPU processing may be degraded.
Action	Do the following: 1. Check application log files to monitor for failures. 2. To find out the CPU usage, run the following commands: ◦ <code>vmstat</code> — To find an initial view of the overall CPU usage behavior ◦ <code>sar -q</code> — To find the length of the run queue ◦ <code>uptime</code> — To find the recent load averages ◦ <code>mpstat</code> — To identify the consumption per cpu averages This helps you to isolate whether the cpu usage utilizes too much work (run queue and load averages) or resource constraint (cpu:sy) or process (cpu:us), and identifies the processes that utilizes the maximum cpu (<code>prstat -cLm</code>) 3. Contact Ribbon Global Product Support (GPS) for assistance
Clearing	Automatic, <code>sonusHostCpuAvgUsageFallingThresholdNotification</code>
Repetition	No
Instance Fields	<code>sonusHostThresholdName</code>
Event Code(s)	<code>sonusHostClrSet</code> — Alarm clear and set flag for an event. <code>sonusHostCpuID</code> — CPU identifier. <code>sonusHostID</code> — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. <code>sonusHostThresholdName</code> — Threshold name configured for a threshold-crossing notification. <code>sonusHostThresholdSampleValue</code> — Actual sampling value that trigger a threshold-crossing event. <code>sonusHostThresholdTriggerValue</code> — Threshold trigger value.

sonusHostCpuUsageFallingThresholdNotification

Definition	This alarm is generated whenever an individual CPU usage falls below the established threshold. The <code>sonusHostID</code> component of this trap specifies a unique identifier of the particular host that sent the trap. <code>sonusHostID</code> object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.

Severity	Informational
Impact	None
Action	None required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostCpuID — CPU identifier. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostCpuUsageRisingThresholdNotification

Definition	This alarm is generated whenever an individual CPU usage rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters
Severity	User-defined
Impact	CPU usage on the host exceeds what users are expecting.
Action	Check to see if any application is using too much CPU time, or if the processor speed is adequate for your environment and configuration.
Clearing	Automatic, sonusHostCpuUsageFallingThresholdNotification

Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostCpuID — CPU identifier. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

Memory Usage Thresholds

Contents

- [sonusHostMemUsageFallingThrshldNotification](#)
- [sonusHostMemUsageRisingThrshldNotification](#)

Note
See the [Resource Usage Threshold Matrix](#) for a breakdown of threshold values per severity level.

Sample values used for the thresholding calculations are available in these files on the host that originated the alarm in the agent logs directory:

- resources.stats.audit
- application.stats.audit

sonusHostMemUsageFallingThrshldNotification

OID	1.3.6.1.4.1.2879.2.1.12.2.0.8

Definition	This “clear” alarm is generated whenever the memory usage falls below the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Critical/Major/Minor
Impact	None
Action	None required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostMemUsageRisingThrshldNotification

OID	1.3.6.1.4.1.2879.2.1.12.2.0.9
Definition	This alarm is generated whenever the memory usage rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters

Severity	Critical/Major/Minor
Impact	If memory runs out, applications may slow down, cease to function, or crash.
Action	Do the following: 1. Check application log files to monitor if any failures arise. 2. Run the “top” utility to determine which process is using a large amount of the system resource. 3. Contact Ribbon Global Product Support (GPS) for assistance.
Clearing	Automatic, sonusHostMemUsageFallingThrshldNotification
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

Swap Space Usage Thresholds

Contents

- [sonusHostSwapUsageFallingThresholdNotification](#)
- [sonusHostSwapUsageRisingThresholdNotification](#)

Note

See the [Resource Usage Threshold Matrix](#) for a breakdown of threshold values per severity level.

Sample values used for the thresholding calculations are available in these files on the host that originated the alarm in the agent logs directory:

- resources.stats.audit
- application.stats.audit

sonusHostSwapUsageFallingThresholdNotification

Definition	This “clear” alarm is generated whenever the swap space usage falls below the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Critical/Major/Minor
Impact	none
Action	None required
Clearing	Automatic, clears in two minutes
Repetition	No
Objects	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostSwapUsageRisingThresholdNotification

Definition	This alarm is generated when swap space usage rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.

Severity	Warning
Impact	No impact on the applications.
Action	None
Clearing	Automatic, sonusHostSwapUsageFallingThresholdNotification
Repetition	No
Objects	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

File System Usage Thresholds

Contents

- [sonusHostFsUsageFallingThresholdNotification](#)
- [sonusHostFsUsageRisingThresholdNotification](#)

Note

See the [Resource Usage Threshold Matrix](#) for a breakdown of threshold values per severity level.

Also note that the following file system types are not monitored:

- proc — Special file system for process table
- fd — Fixed disk (floppy, CD-ROM, etc.)
- autofs — auto-mounted file systems
- hsfs — High Sierra file system

Sample values used for the thresholding calculations are available in these files on the host that originated alarm in the agent logs directory:

- resources.stats.audit
- application.stats.audit

sonusHostFsUsageFallingThresholdNotification

Definition	This “clear” alarm is generated when file system usage falls below the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Critical/Major/Minor
Impact	None
Action	None Required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostFileSystemPath — File system path name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostFsUsageRisingThresholdNotification

Definition	This alarm is generated when file system usage rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Critical/Informational
Impact	If file system runs out, applications may slow down, cease to function, or even crash.
Action	Do the following: Check application log files to monitor if any failures arise. Use the <code>du</code> and <code>df</code> utilities to determine file system usage. Contact Ribbon Global Product Support for assistance.
Clearing	Automatic, sonusHostFsUsageFallingThresholdNotification
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostFileSystemPath — File system path name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value

Application CPU Usage Thresholds

Contents

- [sonusHostApplCpuUsageFallingThresholdNotification](#)

- [sonusHostApplCpuUsageRisingThresholdNotification](#)

Note

See the [Resource Usage Threshold Matrix](#) for a breakdown of threshold values per severity level.

Sample values used for the thresholding calculations are available in these files on the host that originated the alarm in the agent logs directory:

- resources.stats.audit
- application.stats.audit

sonusHostApplCpuUsageFallingThresholdNotification

Definition	This “clear” alarm is generated when the host application CPU usage falls below the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Major/Informational
Impact	None
Action	None required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostThresholdName

Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostProcessID — The process identifier. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostApplCpuUsageRisingThresholdNotification

Definition	This alarm is generated when the host application CPU usage rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Major/Informational
Impact	If the host application CPU usage runs out, applications may slow down, cease to function, or crash.
Action	Do the following: 1. Check application log files to monitor if any failures arise. 2. Run the “top” utility to determine which process is using a large amount of the system resource. 3. Contact Ribbon Global Product Support for assistance.
Clearing	Automatic, sonusHostApplCpuUsageFallingThreshold
Repetition	No
Instance Fields	sonusHostThresholdName

Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostProcessID — The process identifier. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

Application Memory Usage Thresholds

Contents

- [sonusHostApplMemUsageFallingThresholdNotification](#)
- [sonusHostApplMemUsageRisingThresholdNotification](#)

Note

See the [Resource Usage Threshold Matrix](#) for a breakdown of threshold values per severity level.

Sample values used for the thresholding calculations are available in these files on the host that originated the alarm in the agent logs directory:

- resources.stats.audit
- application.stats.audit

sonusHostApplMemUsageFallingThresholdNotification

Definition	This “clear” alarm is generated when the host application memory usage falls below the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.

Severity	Major/Informational
Impact	None
Action	None required
Clearing	Automatic, clears in 2 minutes
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostProcessID — The process identifier. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value.

sonusHostApplMemUsageRisingThresholdNotification

Definition	This alarm is generated when the host application memory usage rises above the established threshold. The sonusHostID component of this trap specifies a unique identifier of the particular host that sent the trap. sonusHostID object: The unique ID or serial number for the specified host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine, and may contain non-numeric characters.
Severity	Major/Informational
Impact	If the host application memory usage runs out, applications may slow down, cease to function, or crash.

Action	Do the following: Check application log files to monitor if any failures arise. Run the “top” utility to determine which process is using a large amount of the system resource. Contact Ribbon Global Product Support for assistance.
Clearing	Automatic, sonusHostApplMemUsageFallingThresholdNotification
Repetition	No
Instance Fields	sonusHostThresholdName
Event Code(s)	sonusHostClrSet — Alarm clear and set flag for an event. sonusHostExecName — The executable name. sonusHostID — The unique ID or serial number for this host. The serial number is an ASCII representation of the hardware-specific serial number of the physical machine. It may contain non-numeric characters. sonusHostProcessID — The process identifier. sonusHostThresholdName — Threshold name configured for a threshold-crossing notification. sonusHostThresholdSampleValue — Actual sampling value that trigger a threshold-crossing event. sonusHostThresholdTriggerValue — Threshold trigger value

Resource Usage Threshold Matrix

The thresholds for raising the threshold alarms on Ribbon Application Management Platform (RAMP) are listed in this section.

Resource Usage Threshold Matrix:

Threshold Type: associated alarms	DSI	RAMP	PSX
CPU Usage Thresholds: sonusHostCpuUsageRisingThresholdNotification sonusHostCpuUsageFallingThresholdNotification sonusHostCpuAvgUsageRisingThresholdNotification sonusHostCpuAvgUsageFallingThresholdNotification	Minor: 50% - 45% Major: 70% - 65% Critical: 90% - 85%	Minor: 50% - 45% Critical: 90% - 85%	Minor: 70%-65% Major: 80%-75% Critical: 90%-85%
Memory Usage Thresholds: sonusHostMemUsageRisingThresholdNotification sonusHostMemUsageFallingThresholdNotification	Minor: 85%-80% Major: 95%-90%	Minor: 85%-80% Major: 95%-90%	Major: 95%-90%

- [Forward Alarms to an External Destination](#)
- [Monitor Fault Management Activity](#)

The goal of fault management is to quickly identify device and network conditions that require attention so that a business can take action before negative consequences result. The Ribbon Application Management Platform (RAMP) Fault Management (FM) service is a common collection point for alarms coming from all of the managed devices registered with RAMP. RAMP provides a highly-customizable interface for working with these alarms in real-time and also supports sending alarms to an external system using the SNMP protocol.

The following sections introduce the key concepts and capabilities of RAMP fault management.

Planning for Fault Management

Each enterprise must determine the most effective strategy for managing the flow of alarms coming from their network devices. The FM user interface provides a wide range of controls that determine which alarms are presented to a user. For example, you might configure the system so that particular users see alarms from devices of a particular type, or from devices in a particular region, or alarms that are categorized with a critical severity.

To enable this type of flexibility, RAMP administrators must coordinate their FM configuration with their use of resource groups and user groups. Resource groups logically group devices within the network and user groups determine which users can work with particular resource groups. Therefore, administrators must be sure that devices whose alarms should be viewed together are part of the same resource group. Similarly, they must ensure that users who will work with those alarms are members of user groups that have access to the resource group.

Refer to [Work with Resource Groups](#) for more information on resource groups.

Refer to [Add User Groups](#) for more information on user groups.

Enable Sending Alarms from Devices to RAMP

Once a device is registered with RAMP, either manually or dynamically, alarms generated by the device are sent to RAMP. No additional configuration is required to enable sending faults to RAMP.

Refer to [Registering Devices on RAMP](#) for more information on device registration.

Customize the Alarm Interface

RAMP administrators have a wide range of controls to determine which alarm data users see in their FM user interface. Administrators can configure multiple Views and Charts to provide the optimal set of alarm data for each role in fault management. Administrators then control which Views users can access through their user group assignments.

For example, an administrator can limit the alarm set to those owned by the current user or they can filter the alarm set based on the alarm acknowledgment status. They are also able to select which alarm severity levels appear in the bar charts and which types of data appear in the active alarm list.

The FM user interface provides tools to highlight when particular alarm-related situations occur. Within Views, the administrator can activate audible alarms for different alarm severity levels, to provide users with a quick indicator of the current alarm status when they open a View. When configured, a sound file plays for the highest severity level that is currently represented within the unacknowledged alarms.

Within Charts, the administrator can configure tripwire alerts which appear in the bar chart when significant conditions are detected. Rate tripwires trigger when the rate of incoming alarm exceeds a configured threshold. Alarm tripwires trigger when any of up to four selected alarms appears within the alarm set.

Refer to [Customize the Alarm Interface](#) for more information on configuring Views and Charts.

Work with Active Alarms on the FM Dashboard

FM users access active alarms from the FM Dashboard. The currently selected View determines which alarms are visible. Within a View, one or more charts encapsulate selected sets of alarms in a color-coded, bar-chart format that provides a quick visual overview of the alarm status. Clicking on the chart opens the set of alarms in a window where the user can work with them individually or in groups.

Within the alarm list, users can perform a range of actions to address alarms such as acknowledging alarms, assigning alarms to specific users, clearing alarms, or adding written comments.

Refer to [Monitor Alarms](#) for more information on working with alarms on the FM Dashboard.

View Alarm History

The FM interface also provides an Alarm History list that users can access, when needed, to review both past and current alarms.

Refer to [Work with Alarm History](#) for more information on viewing alarm history.

Reclassify the Alarm Content

Administrators have the option to modify some attributes of alarms, such as severity level or summary, to better align them with their specific network environment or to convey business-specific information to their users. These changes are reflected both when the alarm appears in the FM alarm lists and in alarms forwarded to an external destination.

Refer to [Reclassify Alarm Content](#) for more information on reclassifying alarms.

Send Email Notifications

To ensure that important fault information reaches users even when they are not logged into RAMP, administrators can configure email notifications to be sent to specified email accounts when selected alarms occur.

Refer to [Send Email Notifications for Alarms](#) for more information on configuring email notifications.

Send Alarms to an External Destination

For businesses that want to send alarms from RAMP-managed devices to an external system such as an Operations Support System (OSS), RAMP can be configured to forward alarms to specified external destinations using the SNMP protocol. The RAMP administrator specifies criteria for which alarms to forward and specifies the destination to receive the alarms. The administrator also has the option to configure FM to allow the OSS system to request a resynchronization of alarms.

Refer to [Forward Alarms to an External Destination](#) for more information on sending alarms to an external destination.

Administer Fault Management

Alarms travel from many individual devices to RAMP and can be subject to network delays or interruptions. To ensure that alarm information is current and complete, RAMP administrators can configure policies that manage synchronizing alarms between devices and RAMP that are based on the characteristics of their network. Over time, the amount of alarm data can be significant, particularly in large networks. Therefore administrators can also control when alarms are purged, taking into consideration their alarm traffic and the capacity for storage in their deployment.

Refer to [Resynchronize Alarms](#) for more information on configuring device resynchronizing controls.

Refer to [Purge Alarms](#) for more information on purging alarms.

Fault Management Workflows

Overview

The Ribbon Application Management Platform (RAMP) Fault Management (FM) service supports a range of FM tasks. The following workflows outline the main steps required to complete key FM tasks. Each step links to a page where you can obtain detailed information and procedures.

- [Manage Alarms](#) – manage alarms for a selected set of registered devices
- [Forward Alarms](#) – forward alarms to an external destination
- [Reclassify Alarms](#) – reclassify alarm severity or modify the summary information provided with an alarm
- [Configure Alarm Notifications](#) – send email notifications when certain alarms occur
- [Troubleshoot EdgeMarc Devices](#) – troubleshoot EdgeMarc devices and resource groups

Prerequisite

For all FM workflows, you must register devices with RAMP to enable monitoring and forwarding of their alarms.

Workflows

Manage Alarms

Step	Action
1	Create a View to select the devices whose alarms you want to monitor (Optionally apply filtering).
2	Use the FM Dashboard to view a summary of the alarms from the selected devices.
3	Open an alarm list to manage the individual alarms.

Forward Alarms

Step	Action
1	Configure a Filter Profile to specify which alarms to forward.
2	Configure a Forwarding Profile to specify the alarm destination.

Reclassify Alarms

Step	Action
1	Configure Reclassification Rules.
2	Use the FM Dashboard and alarm list to view the reclassified alarms.

Configure Alarm Notifications

Step	Action
1	Configure the email server on RAMP.
2	Enable sending email notifications.
3	Configure Notifications to specify which alarms trigger notifications and to which recipients.

Troubleshoot EdgeMarc Devices

Step	Action
1	View Created Rules
2	Add Rule
3	Job Status
4	Create Email Notifications for Triggers
5	EdgeMarc Alarms

Work with Active Alarms

In this section:

- [Understand the FM Dashboard](#)
 - [Views](#)
 - [Charts](#)
 - [Total and Unique Alarms](#)
 - [Audible Alarms](#)
 - [Tripwire Alerts](#)
 - [Active Alarm List](#)
 - [Pausing](#)
 - [Filtering Alarms](#)

Related articles:

- [Customize the Alarm Interface](#)
- [Monitor Alarms](#)
- [Configure FM Dashboard Administration Settings](#)
- [Clearing Alarms](#)

Use the Fault Management (FM) service to monitor fault events and view active alarms generated by registered devices. Device alarms are forwarded to the Ribbon Application Management Platform FM service. You can view these faults using the options discussed in this section.

To monitor faults in Fault Management:

- [Create Views](#) to graphically see alarm information for selected devices/device types/clusters.
- Monitor alarms using the Views created.

- Address the alarms using the functionalities the FM service provides.

Understand the FM Dashboard

To work with active alarms, users interact with the FM dashboard. The following sections provide an overview of the FM dashboard and its features:

Views

A View allows administrators and provisioners to work with alarms from the alarm database based on Resource Groups. Resource Groups are collections of managed devices that are grouped for the purpose of assigning access control policies that apply to the group. For more information, refer to [Work with Resource Groups](#).

Once you create a View, it is available for selection on the FM Dashboard. On the FM Dashboard, select a Resource Group to choose from the Views available for that particular Resource Group.

Charts

Charts are graphical representations of Views. While a View is defined for Resource Groups as a whole, a chart within a View focuses on a sub-group of devices within a Resource Group. The FM service allows you to create a maximum of 30 individual charts within a View, each of which is a customized alarm filter.

On the FM Dashboard, the color-coded bar charts provide a quick view of all the active alarms within that View.

Total and Unique Alarms

The RAMP allows you to choose to display either all instances of a particular type of alarm within a View or just the unique alarms within that View. Select either **Total** or **Unique** from the **Alarm View** option on the FM Dashboard.

Audible Alarms

The FM dashboard provides audible alarms. When you open a View, RAMP can play selected sounds that correspond to one or more selected alarm severity levels present in the View. Audible alarms are optional, but can be an immediate indicator to the user of the status of the system.

Tripwire Alerts

The FM Dashboard provides an option to highlight the occurrence of significant conditions with tripwire alerts. Tripwire alerts appear as notifications within the bar chart when specified conditions are met. The administrator defines these conditions based on the rate at which alarms of selected severity levels are occurring or when specific alarms occur.

There are two types of tripwire alerts:

- **Rate Tripwires** – The Fault Management service triggers rate tripwires when alarms of selected severity levels occur at a defined rate.
- **Alarm Tripwires** – The Fault Management service triggers alarm tripwires when specific alarms occur.

Active Alarm List

When you click on a chart the Fault Management service opens an active alarm list. Active alarm lists are a more detailed representation of alarms represented by the charts. RAMP provides options to configure this detailed, tabular representation. From a predefined list of display settings, you can decide the level of detail you want to see. Within the alarm list, you can perform several actions like acknowledging alarms, assigning alarms to specific users, clearing alarms, or adding written comments. You can perform these actions either on individual alarms or groups of alarms. RAMP also allows you to download or print the alarm list.

Note

Clear the Alarms from the RAMP DB using an option below:

- Manual clearing of Alarms using the user interface.
- Automatic clearing of Alarms when the clear is received for a problem.
- Timer-based alarms, which get cleared automatically after some time based on the timer value, set for that particular alarm.

Pausing

The FM Dashboard allows you to pause the live refresh of the displayed alarms. You can use this feature while you reconfigure Views or check an alarm in more detail.

Filtering Alarms

In addition to choosing charts for subsets of the alarms, you can further filter the alarms displayed in a View based on the alarms' ownership and acknowledgment status. For example, for a specific Resource Group, you can monitor just unacknowledged alarms assigned to you. Configure this, if required, in the View settings.

Customize the Alarm Interface

In this section:

- [Create Views and Charts](#)
- [Modify Views and Charts](#)
 - [Edit a View](#)
 - [Delete a View](#)
 - [Edit a Chart](#)
 - [Delete a Chart](#)

The Ribbon Application Management Platform (RAMP) allows you to customize the visible alarm data required by creating Views. Views define at least one bar chart to graphically display alarm information for specified devices within a specified Resource Group.

Create Views and Charts

To create a View, enter general characteristics of the View in three categories: General Info, Alarm Info, and Audible Alarms.

- General information includes a name for the View, an optional description, and the resource group or groups for which you are creating the View.
- Alarm information settings optionally filter the alarms displayed based on alarm ownership and acknowledgment status. You also choose which columns of alarm data appear when opening an active alarm list from a Chart.
- Audible Alarm settings specify whether to play selected sounds when a View is opened based on the severity level of alarms that are present.

After you enter general View characteristics, create one or more Charts for the View. A Chart specifies a sub-group of devices whose alarms are reflected in a bar chart within the View. A Chart also provides options to configure tripwire alerts.

Use the following procedure to create a View and Chart. For PSX GR deployments, create Views for both instances because Views are not shared by the instances. If the recovery PSX must become active, this ensures that a View is available.

Prerequisite

- Review the information on [Work with Active Alarms](#) to make sure you are familiar with Views and Charts.
- You require Super User or Provisioner level [privileges](#) for Fault Management to create, modify or delete Views.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Views**.
3. Click **Add View**.
4. In the **General Info** area, enter the following information:

Field	Description
View Name	Enter a name for the View. The field accepts alphanumeric characters, spaces, dashes, underscores, and parentheses up to 32 characters.
Description (Optional)	Enter a description for the View of up to 255 characters.
Resource Groups	Select the Resource Group containing the devices you want to monitor with the view.

5. In the **Alarm Info** area, specify whether to filter alarms based on ownership and acknowledgment status and which alarm information appears in an Active Alarm list.

Field	Description
Alarm Ownership	Choose whether you want the View to display All events, only those events assigned to the FM user (Self Only), or the events assigned to the FM user plus any unassigned events (Self and Unassigned).
Alarm Acknowledgment Status	Choose whether you want the View to display only Acknowledged events, only Unacknowledged events, or All .

Field	Description
Display Columns	Choose the alarm information to be displayed in the active alarm list. Select the column display scheme for use with this view. The available schemes are: ◦ Default – columns include Alarm Name, Device Type, Device Name, Last Occurrence, and Summary. ◦ Minimal – columns include Alarm Name and Last Occurrence. ◦ Minimal2 – columns include Alarm Name, Last Occurrence, and Summary. ◦ Variation1 – columns include Alarm Name, Device Type, Device Name, Last Occurrence, and Summary. ◦ Variation2 – columns include Alarm Name, Device Type, Device Name, Last Occurrence, and Summary. ◦ Variation3 – columns include Alarm Name, Device Type, Device Name, First Occurrence, Last Occurrence, Count, and Summary. ◦ Variation4 – columns include Alarm Name, Severity, Owner, Device Type, Device Name, First Occurrence, Last Occurrence, and Count. ◦ All – columns include Alarm Name, Severity, Owner, Device Type, Device Name, First Occurrence, Last Occurrence, Count, and Summary.

6. (Optional) In the **Audible Alarms** area, select audible alarm tones for one or more of the listed alarm severities. RAMP plays the selected alarm tone when you open the View on the FM Dashboard if alarms of that severity are present.
7. Click **Add Chart** to create a new graphical bar for the View.
8. In **Chart Name**, enter a name for the Chart.
9. In the **Devices** area, specify whether you want to select a group of devices for the Chart based on **Device**, **Cluster**, or **Device Type**.
10. Move devices from the **Available** to the **Selected** list to include their alarms in the Chart.
11. (Optional) Configure a **Rate Tripwire** for the Chart. RAMP adds a tripwire alert to the Chart if the rate of alarms for selected severities exceeds your specified limit. To configure a **Rate Tripwire**:
 - a. Select the **Tripwire will be activated for selected severities if** checkbox.
 - b. Specify the alarm rate that triggers the tripwire.
 - c. Select the severities for which you want to activate Rate Tripwires from the **Severity Table**.
12. (Optional) Configure an **Alarm Tripwire** for the Chart. RAMP adds a tripwire alert to the Chart when any of the selected alarms are present. To configure an **Alarm Tripwire**, move alarms from the **Available Alarms** to the **Selected Alarms** list using the arrow buttons.
13. Click **Save** to save the Chart and close the **Add Chart** window.
14. Repeat steps 6 to 12 until you have added all of the Charts you want to include with the View.
15. Click **Save**.

Modify Views and Charts

Edit a View

To edit an existing View:

1. Navigate to **Observability > Fault Management > Views**.
2. In the Views list, click on the View to edit.

3. Make required changes to the View settings.
4. Click **Save**.

Delete a View

To delete an existing View:

1. Navigate to **Observability > Fault Management > Views**.
2. Select **Delete** from the Actions list for the View you want to delete.
3. Confirm the deletion when prompted.

Edit a Chart

To edit an existing Chart:

1. Navigate to **Observability > Fault Management > Views**.
2. In the Views list, click on the View that contains the Chart you want to edit.
3. In the **Charts** list, click on the name of the Chart to edit.
4. Make the required changes to the Chart settings.
5. Click **Save**.

Delete a Chart

Note

The Fault Management Views automatically deletes a chart from the **Views** if there is only one node associated to a chart and that node is deleted.

The Fault Management Views automatically deletes a chart from the **Views** if there is only one cluster associated to a chart and that cluster is deleted.

When a chart is deleted automatically in such circumstances and the **View** does not have any other associated chart, then the View is deleted automatically.

To delete an existing Chart:

1. Navigate to **Observability > Fault Management > Views**.
2. In the Views list, click on the View that contains the Chart you want to delete.
3. In the **Charts** list, select **Delete** from the Actions list for the Chart you want to delete.
4. Confirm the deletion when prompted.

Monitor Alarms

Use the FM Dashboard to view a graphical representation of real-time alarms. On the FM Dashboard, select a resource group and choose from the list of available views to display the stacked bar charts showing the alarm sets. The system updates the charts at regular intervals if new alarms occur that impact the current view. Use the FM Administration view to set the update frequency. If the audible alarms are provisioned and alarms with the configured severity exist, an alarm triggers when you open the View mode. Click any chart to open a detailed alarms list chart to examine for specific alarm information. This allows you to actively manage real-time alarms using several functionalities.

Note

The Application Server (AS) does not support unacknowledged alarms and manual clear operations for outstanding alarms. If you perform any of these operations on the RAMP GUI for AS alarms, they are only performed on RAMP and are not updated on the AS.

Use the following procedure to use the FM Dashboard to process alarms:

Start

1. Log on to the RAMP GUI and navigate to **Observability > Fault Management > FM Dashboard**.
2. Select the Resource Group for the devices whose alarms you want to monitor.
3. Select the View that presents the alarms for the resource group with the filters and options you desire. If you do not configure Views, consult the person in your organization responsible for configuring Views. Each View can contain a maximum of 30 bar charts, each of which is a customized alarm filter.
4. On the FM Dashboard, perform the following actions to control your alarm view:
 - a. **Pause live refresh**—By default, the View charts update with any new alarm every 15 seconds. Click the pause icon next to **Live** to pause the updates. This allows you to examine a static chart.
 - b. **Change the view to show total or unique alarm counts**—Select the **Total** or **Unique** options to view the total number of active or unique alarms.
 - c. **Modify a View**—You can edit the RAMP Views on the FM Dashboard. To modify a View, click the name of the underlined View. For more information, refer to [Customize the Alarm Interface](#). A Super User privilege is mandatory to modify a View.
5. Each View is represented by a chart or several charts. Click on a chart to open a window with a tabular list of all the alarms associated with that chart. The alarm list, by default, contains information such as the alarm name, severity, acknowledgment status, name and type of the device that raised the alarm, date and time of the last occurrence, and a brief summary.
6. The following alarm list options are available:
 - a. **View individual alarm details**—Click an alarm name or select **Details** from the **Actions** list to open a window with more information about the selected alarm.
 - b. **Acknowledge an alarm**—Manually acknowledge an alarm so that it no longer appears in any alarm list that filters acknowledged alarms.
 - i. For any additional alarms of this type, do not change the acknowledged state of the alarm.
 - ii. Select **Acknowledge** from the **Actions** list or on the individual alarm details window.
 - iii. You can also select multiple alarms and acknowledge them using **Bulk Actions**.
 - c. **Unacknowledge an alarm**—Change the state of an Acknowledged alarm by manually changing the acknowledged state.
 - i. Select **Unacknowledge** from the **Actions** list or on the individual alarm details window.
 - ii. You can also select multiple alarms and unacknowledge them using **Bulk Actions**.
 - d. **Clear an alarm**—Clearing an alarm removes it from the database and all alarm lists.
 - i. Any journal entries added for this alarm are lost.
 1. Only new instances of this alarm appear in the alarm list.
 2. Select **Clear** from the **Actions** list on the individual alarm details window.
 3. You can also select multiple alarms and clear them using **Bulk Actions**.
 - e. **Add a comment**—Add a comment or journal entry for an alarm.
 - i. Once you enter a comment, it will appear as a Journal Entry in the alarm details window.
 - ii. Select **Comment** from the **Actions** list or enter your comment in the **Journal Entries** field in the individual alarm details window.
 - f. **Assign ownership**—Use this option to assign ownership of a selected alarm to a selected user.
 - i. Once you assign ownership, only the administrator and assigned owner can update the alarm (acknowledge, unacknowledge, comment, and clear).
 - ii. You must have either Super User or Provisioner level access to assign alarms to other users.

- g. **Clear with Forward**—Use this option to select alarms to clear from the internal database and forward the Clear Alarm/Event to the northbound customer. The Alarm History displays the cleared alarms.
- You can select up to 200 alarms.
 - If you select more than 200 alarms, a warning message notifies you that the "Clear with Forward" action will not be performed because you exceeded the 200 alarm limit.
The operation is allowed once the number of alarms are reduced to 200 or less.

The FM service also provides the following options to help you efficiently work with alarms in an alarm list:

Option	Description
Wrap	Select Wrap to word-wrap fields. This makes the table more compact and eliminates the need for horizontal scrolling.
Pause/Live	Click Pause adjacent to Live to pause the live refresh of the selected alarm list corresponding to a chart. - When paused, the Last Update box displays the time the View was last updated. - Click Play adjacent to Pause to re-enable updates. The system updates the View with any cached alarms from the period when the display was paused. Pause is automatically enabled when you select one or more alarms in an alarm list. You cannot enable the view again until all options are cleared.
Export Table	Click the ellipses at the top right corner of the pop-up dialog and select Export Table to export the list of alarms. The Export Table Data pop-up then displays. - Provide details such as Filename, File Format, Delimiter, Page, Current Option, and Limit Records. - Click Submit to export the list of alarms to your local machine.
Help	Select Help from the Actions menu to get more information about specific alarms on the alarm list. The Trap Guide opens with a description for each alarm. You can add company-specific comments and links to supporting online documentation for each Ribbon and third-party alarm listed in the Trap Guide. All users can view these comments.

Configure FM Dashboard Administration Settings

The Ribbon Application Management Platform (RAMP) allows you to configure administrative settings for the **FM Dashboard**. Configure ownership policies to decide if you want users to be able to perform operations on owned alarms only and set limits on the maximum number of alarm lists that all users on a server can open simultaneously.

Prerequisite

Super User [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Administration**.
3. In the **FM Dashboard** section on the **Administration** page, select the **Allow operations on owned alarms only** checkbox to configure the ownership policy. This option specifies whether or not users are allowed to perform operations on alarms assigned to other users, limiting users' access to alarms they own.
4. Under **Alarm List Limits**, configure the **Maximum per server** and **Auto Refresh Interval (in seconds)**. These options set an overall server limit on the number of alarm lists all users can open simultaneously and the live refresh interval for alarms.
5. Select the **Alarms For Disabled Devices** checkbox to display alarms and their counts for disabled devices that are unregistered and partially registered:
 - a. If enabled, the alarms generated for devices in an Unregistered, Partially registered, or Prepared Recovery state are displayed in the **FM Dashboard** Event list, **Home Dashboard**, and the **Resource Group Dashboard Alarm** section.
 - b. If disabled, the alarms generated for devices in an Unregistered, Partially registered, or Prepared Recovery state are not displayed in the **FM Dashboard** Event list, **Home Dashboard**, and the **Resource Group Dashboard Alarm** section.

Clearing Alarms

The following alarm-clearing options are available on the RAMP:

- Manually – The user clears the alarm using the UI.
- Automatically – The alarm clears when the 'Clear' alarm triggers after the problem is resolved.
- Timer-based alarms – The alarm clears once the configurable timer value is reached.

The RAMP includes the following configurations and default values in the `/opt/fm/conf/correlator/bootstrap.properties` file. Changing these values requires a correlator process restart.

1. To discard all old alarms during startup whose timer has expired. This is more than the configured threshold in the state store (By default, the value is 240 minutes). The alarms that cross (240*60 + timer value in seconds) are cleared.

```
StreamsConfig.timer.alarms.discard.threshold.minutes=240
```

2. To discard old alarms that cross the threshold.

```
StreamsConfig.timer.alarms.discard.old=true
```

3. To limit the maximum number of alarms cleared, send them to the DB and then forward them one at a time. If any changes are made, the correlator must be restarted.

```
StreamsConfig.timer.alarms.max.clear.count=750
```

Changing these values is not recommended since they were defined after extensive testing.

Ribbon recommends performing all UI trap operations within 30 minutes of starting the process. This applies to all upgrades from releases prior to RAMP 24.09 to RAMP 24.09 onwards.

Work with Alarm History

The Alarm History window allows you to view all the archived alarms stored in the Ribbon Application Management Platform (RAMP) database. This provides a record of alarm history for nodes registered with RAMP. All users can view the alarm history. Make sure that you purge the alarm history regularly so that it doesn't get too large. Refer to [Purge Alarms](#) for more information on purging alarms.

To view the alarm history, navigate to **Observability > Fault Management > Alarm History**.

Purge Alarms

In this section:

- [Automatic Purge](#)
- [Manual Purge](#)

The Ribbon Application Management Platform (RAMP) allows you to purge active and historical alarms you no longer need. This prevents the accumulation of large amounts of alarm data over time. You can choose when to purge the alarms depending on the size of your network, your alarm traffic, and your storage capacity.

Automatic Purge

Use the following procedure to schedule an automatic purge of old or unwanted alarms from the fault database.

Note

By default, the Fault Management automatic purge frequency for active alarms is set to "Daily" with a start time of "01:00", and the automatic purge frequency for historical alarms is set to "Hourly" with a start time of "01:00".

Prerequisite

- **Super User** [privileges](#) under **Fault Management** to purge alarm data.

Start

1. Log onto the RAMP GUI.

2. Navigate to **Observability > Fault Management > Administration**.
3. In the **Alarm Schedule Purge** area, select a Frequency (**Hourly**, **Daily**, or **Weekly**) for the purge.
 - a. You can also disable automatic purges by selecting **Disable**.
4. Set the Start time, and then select a **Start Day** (If the Frequency is **Weekly**) and select a time (hour: minute) for the purge to occur.
5. Select **Active** or **History** from the Alarms list depending on whether you want to clear active or historical alarms.
6. Specify the purge criteria by doing one of the following:
 - a. Select the **Older than** checkbox and enter a value in hours. In this case, when the purge job runs, it automatically removes all events of the selected severity level(s) older than the designated value.
Or
 - b. Select the **Max number of alarms** checkbox,.
 - c. Select a **Purge To** percent (50%, 75%, or 90%) and enter a value in the **of max size** field.
 - i. In this case, if the number of events in the database exceeds the maximum setting, the system determines the number of events that should remain in the database (maximum number of alarms * purge to percent) after the purge.
 - ii. The purge job then runs deleting events of the selected severity level(s), from oldest to newest, until it reaches the desired quantity of remaining events.
 - iii. If the number of events in the database does not exceed the maximum setting, the purge job does not run.
7. In the "Severity of alarms to purge" area, select the severity level(s) you want the purge job to remove.
8. Click **Save** to save your settings.

Manual Purge

Use this procedure to manually purge old or unwanted alarms from the Fault database:

Prerequisite

- **Super User** [privileges](#) under **Fault Management** to purge alarm data.

Start

1. Log onto the RAMP GUI.
2. Navigate to **Observability > Fault Management > Administration**.
3. In the **"Alarm Manual Purge"** area, select **Active** or **History** from the Alarms list, depending on whether you want to clear active or historical alarms.
4. Click **Time earlier than** to open a Date/Time control where you can set a base date and time. The system purges all alarms (of the types selected in the next step) that are older than the base date and time.
5. In the **Severity** area, select the types of alarms to purge. You must specify at least one type.
6. Click **Purge active alarms** to purge the records.
7. When prompted, confirm that you want to purge the alarms.

Ribbon recommends performing all UI operations on the traps 30 minutes after starting the process. This applies to all upgrades starting with 24.09 and does not apply if the older release version is already 24.09.

Reclassify Alarm Content

The Ribbon Application Management Platform (RAMP) allows you to reclassify the severity, class, and description fields displayed in the alarm lists by creating reclassification rules. This allows you to classify alarms according to your network requirements.

When you create or modify a reclassification rule, the new rule applies only to new alarms, not to alarms already received.

Prerequisite

You require Super User level [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > SNMP > Reclassification Rules**.
3. To create a new rule, click **Add Rule**.
4. Enter the following information:

Field	Description
MIB	Select the MIB corresponding to the device for which you want to configure a reclassification rule.
Trap Names	Select the trap to which you want to apply the rule. Note: To see definitions of the traps or to set custom comments for a trap, click Trap Guide .
Severity	Select the severity to apply to the selected trap, or leave as "system-defined."
Class	Select the class to apply to the selected trap, or leave as "system-defined."
Summary	To add a custom description for the selected trap, clear the Use system defined Summary check box and enter your description.
Enable	Select checkbox to enable the new reclassification rule.

5. To save the alarm rule click **Save**.

To edit an existing rule, select the alarm rule you want to edit from the list and apply your changes using the preceding table.

To delete an existing rule, click the delete icon corresponding to the alarm rule you want to delete.

Send Email Notifications for Alarms

Related articles:

- [Enable Sending Alarm Notifications](#)
- [Configure Alarm Notifications](#)

The Ribbon Application Management Platform (RAMP) allows you to send alarm notifications through email. This notifies network operators or administrators of specific alarms even when they are not connected to the application. This ensures that critical network problems are not missed.

Note

Alarm notification through email is disabled by default.

Complete the following steps to set up email alarm notifications:

1. Obtain your email server IP address from your email administrator. Use this IP address as the email server for RAMP.
2. Enable alarm notifications through email on RAMP. Refer to [Enable Sending Alarm Notifications](#).
3. Send a test notification to confirm connectivity between RAMP and the mail server. This ensures that alarm notifications are not blocked. If you do not receive email notifications, check with your email administrator. Refer to [Enable Sending Alarm Notifications](#) for the procedure to send test notifications.
4. Set your email source address. Refer to [Enable Sending Alarm Notifications](#) for the procedure to set a source address.
5. Configure email alarm notifications on RAMP to specify which alarms trigger emails and to whom they are sent. Refer to [Configure Alarm Notifications](#).

Enable Sending Alarm Notifications

The Alarm notifications through email are generated on RAMP and relayed to a mail server (SMART_HOST). It is the mail server configured to accept relaying from the RAMP server and to further process incoming messages from the RAMP server.

The administrator of the remote mail server (SMART_HOST) must configure the mail server to accept emails from the RAMP server.

Prerequisites

- You require Super User [privileges](#) for Fault Management.
- You require the IP address of an email server in your network to handle relaying RAMP email notifications.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Administration**.
3. In the **Email Notification** area, select the **Schedule Notification** checkbox.
4. You can also set the notification frequency by entering the required time in the **Notification Frequency (in minutes)** field.
5. Click **Save**.
6. Log on to the RAMP CLI as the root user. Refer to [Log onto the RAMP CLI](#).
7. Issue the following command to add the mail server. If RAMP will be deployed in a GR configuration, run the command on the active instance after setting up the GR configuration.

```
/opt/sonus/ems/conf/enableEmailNotification.sh <SMART_HOST IP address>
```

8. Set your email source address:

- a. Navigate to **Observability > Fault Management > Notifications**.
- b. Click **Edit** adjacent to **Email Source Address**.
- c. In the **Email Address** field, enter an email address.
- d. Click **Save**. This email address is used as the "From:" header field as per RFC5322.
9. Send a test notification to confirm connectivity between RAMP and the mail server.
 - a. Navigate to **Observability > Fault Management > Notifications**.
 - b. Enter an email addresses in the **Send a Test Notification to email address** field.
 - c. Click **Send**. A success message is displayed once a test notification is sent.

Configure Alarm Notifications

In this section:

- [Add a Notification](#)
- [Edit a Notification](#)
- [Delete a Notification](#)

Configure email alarm notifications on Ribbon Application Management Platform (RAMP) to choose which alarms trigger email notifications and when they trigger them. In a notification, you also choose who to send email notifications to. You can configure multiple recipients to receive email alarm notifications.

RAMP sends alarm notification emails at predefined intervals in an HTML format. If multiple alarms occur during the interval they are grouped into a single email. Duplicate alarms are suppressed; if there are multiple alarms of the same type, the alarm is mentioned only once in an email. The subject of the emails includes the alarm count.

You can filter alarms based on the criteria set in a notification and **RAMP** send emails automatically.

Add a Notification

Use the procedures in this section to add a notification.

Prerequisite

You require Super User [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Notifications**. The **Notifications** window opens.
3. Click **Add Notification**.
4. Enter the following information to define a set of criteria that trigger an email notification:

Field	Description
Notification Name	Enter a name for the notification.
Email Addresses	Enter the recipient email addresses to receive emails for this notification. You can specify multiple e-mail addresses. Separate e-mail addresses with commas.
Severity	Select the alarm severity levels for which you want RAMP to generate emails from this notification.

Field	Description
Select Network Element via	Select one of the following options to specify which devices' alarms will trigger emails for this notification: ◦ Type – Select Type to select devices by device types. The Cluster / Node Type list appears for you to select the device types. ◦ Resource Group – Select Resource Group to select devices by specific Resource Groups. The Resource Group list appears for you to select the Resource Groups. ◦ Specific Element – Select Specific Element to select devices by name. The Specific Clusters and Specific Nodes lists appear for you to select the devices.
Alarm List	Select the triggering alarms from the Alarm List . The list of alarms available is filtered by your device selection.
Time Frame Use the Time Frame options to either specify times during which the email-triggering rules will apply, or to specify that the rules apply at any time.	
Any Time	Select this checkbox to receive alarm notifications for alarms occurring anytime. The other time frame options are disabled.
Only alarms between On these days	Select the time range during the day and the days of the week during which you want to receive alarm notifications if triggering alarms occur. Enter a start and end time, and select the days.
Alarm Information	
Info included in notification	Select the alarm fields to be displayed in the alarm notifications.
Notification Description	Enter any additional text to include in the email notification along with the alarm information. This text appears in the notification email.

5. Click **Save** to save the notification.

Edit a Notification

To edit an existing notification:

1. Navigate to **Observability > Fault Management > Notifications**.
2. In the Notifications list, click on the notification to edit.
3. Make required changes to the notification settings.

4. Click **Save**.

Delete a Notification

To delete an existing notification:

1. Navigate to **Observability > Fault Management > Notifications**.
2. Select **Delete** from the Action list for the notification you want to delete.
3. Confirm the deletion when prompted.

Forward Alarms to an External Destination

In this section:

- [Configure Forwarding Criteria in a Filter Profile](#)
- [Configure the Alarm Destination in an Export Profile](#)
- [Modify Existing Profiles](#)
 - [Edit a Filter Profile](#)
 - [Delete a Filter Profile](#)
 - [Edit an Export Profile](#)
 - [Delete an Export Profile](#)

Related articles:

- [Resynchronize Alarms](#)

You can configure Ribbon Application Management Platform (RAMP) to forward alarms to third-party applications. A RAMP administrator creates forwarding profiles to specify which traps to forward and where to send them. RAMP also allows you to configure Trap Resync to ensure that no alarms are missed, in case of a network or device failure. Refer to [Resynchronize Alarms](#).

To forward alarms, create the following type of forwarding profiles:

- Filter Profile – Filter Profiles determine what types of alarms from which source addresses are forwarded.
- Export Profile – Export Profiles determine the export parameters for alarms.

Configure Forwarding Criteria in a Filter Profile

Use the following procedures to create a filter profile that specifies trap forwarding criteria.

Prerequisite

You require Super User [privileges](#) for Fault Management to create, modify or delete forwarding profiles.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > SNMP > Forwarding Profiles**.
3. Select the **Filter** tab.
4. Click **Add Filter Profile**.
5. Enter the following information:

Field	Description
Profile Name	Enter a name for the filter profile.

Field	Description
Description (Optional)	Enter a description for the profile.
Filter Profile Enabled	Select this checkbox to enable/activate this filter profile.
Nodes/Nodes Types/Clusters Available	Select the source nodes/node types/clusters for the alarms that you want forward.
Trap Type Filter Set values for at least one of the following to determine which traps to forward.	
Types Available	Select the traps to forward from the list.
Severity	Select the severity levels of the alarms to forward.
Alarm Class	Select the classes of the alarms to forward.

6. To save the Filter Profile, click **Save**.

Configure the Alarm Destination in an Export Profile

Use the following procedures to create an export profile that specifies export parameters for alarms and the alarm destination.

Prerequisite

You require Super User [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > SNMP > Forwarding Profiles**.
3. Select the **Export** tab.
4. Click **Add Export Profile**.
5. Enter the following information:

Field	Description
Profile Name	Enter a name for the export profile.
Description (Optional)	Enter a description for the profile.
Associated Filter Profile	Select a filter profile to associate with the export profile. Only enabled filter profiles are shown in the list.
Export Profile Enabled	Select this checkbox to enable/activate this export profile.

Field	Description
Maximum Rate	Select the maximum number of traps to be forwarded per second.
OSS Resync Enabled	Select this checkbox to enable OSS Trap Resync. Refer to Resynchronize Alarms for more information about OSS Trap Resync.
Data Format	Specifies the data format in which the traps are forwarded. Note: Only the SNMP data format is available.
IP Address	Enter the IP address of the destination to receive the traps
Port	Enter the port number to use at the destination.
Version	Select the SNMP Trap version from the following options: ◦ SNMP v1 – If you select SNMP v1, enter a community string. By default, it is "public". ◦ SNMP v2c – If you select SNMP v2c, enter a community string. By default, it is "public". ◦ SNMP v3 (default) – If you select SNMP v3, select a security levels from the Security Level list:
Security Level	This parameter is applicable only for SNMPv3. If you select SNMPv3, select one of the following security levels from the Security Level list: ◦ NoAuthNoPriv – users that connect with this level have no authentication, and the messages they send and receive are not private. ◦ AuthNoPriv – connections that use this model must authenticate, but the messages are sent without any encryption. ◦ AuthPriv – authentication is required, and messages are encrypted.
Community	The parameter is applicable only for SNMP v1. Enter a value for the SNMP community string. A value is set by default.

Field	Description
Username	The parameter is applicable only for SNMP v3. Enter a username for authentication.
SNMP v3 Authentication Protocol	This parameter is applicable only if Security Level is set to one of the following: ◦ AuthNoPriv ◦ AuthPriv Select a Data Encryption Standard (DES) or Advanced Encryption Standard (AES) authentication protocol from the following: ◦ DES ◦ AES128 ◦ AES192 ◦ AES256
Auth Password	The parameter is applicable only if Security Level is set to one of the following: ◦ AuthNoPriv ◦ AuthPriv Enter a password for authentication. The minimum member of characters required for the password is as follows: ◦ DES: 8 ◦ AES128: 16 ◦ AES192: 24 ◦ AES256: 32

Field	Description
SNMP v3 Privacy Protocol	The parameter is applicable only if Security Level is set to AuthPriv. Privacy protocols enable private interactions over secure channels. Select a Message Digest (MD5), Secure Hash Algorithm (SHA), or Hash-Based Message Authentication Code (HMAC) from the following: ◦ MD5 ◦ SHA ◦ HMAC128SHA224 ◦ HMAC192SHA256 ◦ HMAC256SHA384 ◦ HMAC384SHA512
Priv Password	The parameter is applicable only if Security Level is set to one of the following: ◦ AuthNoPriv ◦ AuthPriv Enter a password for authentication. The minimum number of characters required for the password is as follows: ◦ MD5: 16 ◦ SHA: 20 ◦ HMAC128SHA224: 28 ◦ HMAC192SHA256: 32 ◦ HMAC256SHA384: 48 ◦ HMAC384SHA512: 64
Normalize alarms	Select this checkbox to normalize alarm forwarding. If enabled, all alarms are forwarded to upstream systems in a standard format.
Add device hostname to alarms	Select this checkbox to add device hostnames to forwarded alarms. Note: This option is not available if alarms are normalized.
Add epoch oid to alarms	Select this checkbox to add sonusSequenceEpoch variable binding (varbind) in the forwarded traps. Clear this check box to exclude sonusSequenceEpoch varbind from the forwarded traps. Note: This option is not available if alarms are normalized.

Field	Description
Enable single device source address	Select this checkbox to use a single IP address as the source address when forwarding traps for nodes with multiple IP addresses. The system displays the IP address from the Default IP Address field of the device's Node Information. ◦ Traps received on any of the IP addresses registered in RAMP forward through the first IP address in the host. ◦ Traps received on an IP address that is not registered in RAMP forward through the same IP address. ◦ Traps received on a logical IP address forward through the same logical IP address.
Enable loop checking	Select this checkbox to check whether a received trap has already been forwarded. If the trap forwarder determines the trap was previously forwarded, it does not forward it again. This check eliminates the possibility of two systems forwarding the same trap back and forth.

6. To save the Export Profile, click **Save**.

Once you create a filter profile and export profile, forwarding of alarms matching the profile criteria begins immediately.

Modify Existing Profiles

Use the following procedures to edit or delete existing profiles.

Edit a Filter Profile

To edit an existing filter profile:

1. Navigate to **Observability > Fault Management > SNMP > Forwarding Profiles**.
2. Select the **Filter** tab.
3. In the Filter Profiles list, click on the filter profile to edit.
4. Make required changes to the filter profile settings.
5. Click **Save**.

Delete a Filter Profile

To delete an existing filter profile:

1. Navigate to **Observability > Fault Management > SNMP > Forwarding Profiles**.
2. Select the **Filter** tab.
3. Click the Delete icon corresponding to the filter profile you want to delete. You cannot delete a filter profile associated with an export profile.
4. Confirm the deletion when prompted.

Edit an Export Profile

To edit an existing export profile:

1. Navigate to **Observability > Fault Management > SNMP > Forwarding Profiles**.
2. Select the **Export** tab.
3. In the Export Profiles list, click on the export profile to edit.

4. Make required changes to the export profile settings.
5. Click **Save**.

Delete an Export Profile

To delete an existing export profile:

1. Navigate to **Observability > Fault Management > SNMP > Forwarding Profiles**.
2. Select the **Export** tab.
3. Click the Delete icon corresponding to the export profile you want to delete.
4. Confirm the deletion when prompted.

Resynchronize Alarms

In this section:

- [Enable and Configure Device Trap Resync](#)
- [Configure Resyncing Traps from RAMP to the OSS](#)
- [Edit Trap Resync Settings](#)
- [Delete Trap Resync Settings](#)

Along with trap forwarding, the Ribbon Application Management Platform (RAMP) also allows you to configure Trap Resync parameters to enable retrieving alarms from registered devices to ensure that no alarms are missed in case of a network or device failure.

RAMP supports a northbound interface to synchronize active alarms with an upstream operations support system (OSS). When the OSS sets a specific varbind (OID) on the northbound MIB, RAMP triggers alarm synchronization based on the export profile.

RAMP also supports a southbound interface for synchronizing alarms with registered devices. RAMP maintains the sequence number of forwarded traps and provides a user interface to enable system-wide trap resynchronization for managed devices with trap history support. If there is a trap loss and trap resynchronization is enabled, the Fault Management service retrieves the lost traps stored in the corresponding devices. When trap resynchronization is enabled and no traps are received from a device for a configurable idle time period, the Fault Management service queries the device for the sequence number of the last trap sent and compares it with its record of the last received trap from the device. If there is a mismatch, RAMP consider it a loss of traps and it retrieves the lost traps.

Note

Some traps might be present in DSC and appear on the RAMP Dashboard, even when cleared. Clear these alarms manually.

Enable and Configure Device Trap Resync

Trap Resync is disabled by default. Use the following procedure to enable it and configure trap resync parameters.

Prerequisite:

Super User level [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Administration**.
3. In the **Process** area, enable trap resync by selecting the **Enable Trap Resync (from supported devices)** checkbox.
4. Enter the following information to configure the resync parameters:

Field	Description
Max no. of traps to resync	Enter the maximum number of traps RAMP can resynchronize at a time.
Max no. of resync retries	Enter the maximum number of retries the Fault Management service can attempt to resync in the event of failures.
Resync connection timeout (in secs)	Enter the timeout limit when the initial REST connection is being made.
Max no. of alarms per state-sync request	Enter the maximum number of alarms allowed in one REST request to the device during a bulk state-sync operation like acknowledge/clear/comment.
Resync read timeout (in secs)	Enter the wait period before timing out when reading data from the device.
Trigger Proactive Resync every _ seconds	Enter the time duration after which RAMP proactively queries for traps from managed devices.
Trap retention period on device (in minutes)	To support lost trap recovery, each node stores the traps in its database for a configurable time period, starting from the time the trap is generated. This time period is termed as the trap retention time period. The default value of Trap Retention Time Period is 120 minutes and the valid range is 0 to 120 minutes.

5. Click **Save** to save the parameter configuration.

Configure Resyncing Traps from RAMP to the OSS

Configure OSS trap resync to resync alarms from **RAMP to the OSS**.

Create trap resync settings for **RAMP** to trigger alarm synchronization based on the forwarding profile. Alarm synchronization is supported for regular and normalized alarms. If the alarm synchronization with the OSS is disrupted, **RAMP** does not retry alarm synchronization.

Alarm resync between an OSS and RAMP is not supported for SNMP v1.

Prerequisite:

Super User [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Administration**.
3. In the **Process** area under **OSS Trap Resync**, enter the following information:

Field	Description
Resync Port	Enter the port to which the OSS resync agent is bound for processing SNMP set-requests from authorized OSS clients. The default port number is 1161.
Oss Resync EngineId	Specifies the SNMP engine ID of the OSS resync agent. This is used by the OSS clients while sending SNMP set-requests.
Authoritative EngineId	Specifies the SNMP engine ID that is set in the SNMP traps that are forwarded to the OSS.

4. Click **Save**.
5. To create trap resync settings, navigate to **Observability > Fault Management > SNMP > OSS Trap Resync**.
6. Click **Add Resync Setting**.
7. Enter the following information:

Field	Description
SNMP Version	Select the SNMP Trap version from the following options: ◦ V2 – Select V2 for SNMP v2. ◦ V3 – Select V3 for SNMP v3. The other fields mentioned in this table appear based on your SNMP Version selection.
OSS IP Address	Enter the IP address of the OSS. IPv4 and IPv6 formats are allowed.
SNMP Write Community	This field appears when you select V2 as the SNMP Version. Enter the community string to send for the SNMP set-request by the OSS. The character length should be between 8 and 32.
Security Name	This field appears when you select SNMP V3 version. Enter a name for the SNMP v3 user for the OSS. The character length should be between 8 and 32.

Field	Description
Security Level	This menu appears when you select V3 as the SNMP Version. select one of the following security levels from the Security Level list: ◦ NoAuthNoPriv ◦ AuthPriv i. In the Authentication Protocol field, select an authentication protocol. ii. In the Authentication Passphrase field, enter an authentication passphrase. The character length should be between 8 and 32. iii. In the Privacy Protocol field, select a privacy protocol. iv. In the Privacy Passphrase field, enter a privacy passphrase. The character length should be between 8 and 32. ◦ AuthNoPriv i. In the Authentication Protocol field, select an authentication protocol. ii. In the Authentication Passphrase field, enter an authentication passphrase. The character length should be between 8 and 32.

8. Click **Save** to save the resync setting.

Edit Trap Resync Settings

To edit an existing trap resync setting:

1. Navigate to **Observability > Fault Management > SNMP > OSS Trap Resync**.
2. In the resync settings list, click **resync setting** to edit.
3. Make the required changes to the trap resync setting. You cannot edit the OSS IP address after creating a Resync Setting. To modify the OSS IP address, delete the Resync Settings and create another one with the new IP address.
4. Click **Save**.

Delete Trap Resync Settings

To delete an existing trap resync setting:

1. Navigate to **Observability > Fault Management > SNMP > OSS Trap Resync**.
2. Click the Delete icon corresponding to the resync setting you want to delete.
3. Confirm the deletion when prompted.

Monitor Fault Management Activity

The Ribbon Application Management Platform (RAMP) allows you to monitor Fault Management activity that may impact the application's performance or storage.

Prerequisite

You require Super User level [privileges](#) for Fault Management.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > Administration**.
3. Scroll down to the **Present Usage** section.
4. The following information is displayed:
 - **Number of active alarm records** – This shows the total number of alarms in the active alarms record. This includes cleared alarms.
 - **Number of alarm history records** – This shows the total number of alarms in historical table.
 - **Number of alarm lists currently open across Insight** – This shows the total number of alarm lists opened currently by RAMP users.
5. To update the information with current numbers, click the **Refresh** button.

Troubleshooting Guide

This guide provides troubleshooting advice for the Ribbon Application Management Platform (RAMP) and the devices it manages.

EdgeMarc Troubleshooting

Use this section to troubleshoot EdgeMarc devices managed by the Ribbon Application Management Platform (RAMP).

In this section:

- [Create Trigger Notification Rules for EdgeMarc Devices](#)
- [Troubleshooting EdgeMarc Devices](#)
 - [View EdgeMarc Device Analysis Details](#)

- [EdgeMarc Diagnostic Files](#)
- [Run Health Reports on EdgeMarc Devices](#)

Create Trigger Notification Rules for EdgeMarc Devices

In this section:

- [View Existing Rules](#)
- [Add a Rule](#)
- [Retrieve Ring Buffer Contents](#)
- [Create Email Notifications for Triggers](#)

Use the Ribbon Application Management Platform (RAMP) to set the threshold levels (rules) that trigger notifications for EdgeMarc devices when events occur such as Device Down, Device Up, severity of the Application Diagnostic Report, and Kernel Report. The RAMP supports creating notification triggers for either individual EdgeMarc devices or resource groups.

The EdgeView service generates and sends traps to RAMP's Fault Management when reaching the threshold condition set on the RAMP for an EdgeMarc device or resource group. These traps are listed on the [Fault Management](#) page.

Prerequisites

Super User [privileges](#) in Fault Management.

View Existing Rules

Use this procedure to view the list of existing rules.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > EdgeMarc Troubleshooting**. This dialog box lists the rules created to trigger notifications. These notifications are created based on previously defined trigger rules and actions. The columns on the **EdgeMarc Troubleshooting** page are:

Column Name	Description
Name	Name of the rule.
Severity	Severity of the rule
Applies to	Scope of the rule. When created on an EdgeMarc device, it displays the device <code>mac_address</code> . When made on a resource group, it shows the name of the resource group.
Trigger Type	The type of trigger.
Action	The action associated with the trigger.

Column Name	Description
Last Trigger	The date and time of the last trigger for a particular rule.
Status	The active or inactive state of the rule.
Actions	Edit or delete a particular rule.

Add a Rule

Use this procedure to add a rule for each EdgeMarc device or resource group to trigger and define notifications.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Observability > Fault Management > EdgeMarc Troubleshooting**.
3. Click **+Add Rule**.
4. Use the following table to add rules to trigger notifications and then click **Save**.

Note

- If you create the same type of rule for an EdgeMarc device and the resource group containing that EdgeMarc device, then the alarm is raised only for the device and not the resource group.
- Creating multiple rules of the same type on the same scope (device or resource group) is restricted. For example, you cannot create multiple **Device Down** types of rules on the same device or resource group.

Add Rule Parameters

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
Define Triggers and Actions						
Trigger Type						
Name	Provide a name for the rule.	N/A	N/A	N/A	Alphanumeric characters - and _ are allowed.	M

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
Application Diagnostic Report	This notification is triggered when the application crashes on the EdgeMarc device. The EdgeMarc device sends this crash event to RAMP and a diagnostic T-Info File containing the application crash details like stack trace, etc. RAMP accepts the T-Info file and uploads it to the configured object store. The format of the uploaded file is <code>tinfo-2023-12-27-03-59-53-472231.ev</code>. RAMP then creates a record of this file in the database. You can view, download, or delete these files. For more information, refer to EdgeMarc Diagnostic Files.	N/A	N/A	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
Device Down	Notifies that the particular device is down or the devices from the resource group are down.	Notification is triggered as soon as the device is down.	The only action for this rule is notifying recipients.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O
Device Up	Notifies that the particular device is up or the devices from the resource group are up. The default value is "Critical".	Notification is triggered as soon as the device is down.	The only action for this rule is notifying recipients.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
Kernel Diagnostic Report	This notification is triggered when the kernel crashes on the EdgeMarc device. The EdgeMarc device sends this crash event to RAMP and a diagnostic T-Info file, containing the kernel crash details. RAMP accepts the T-Info files, and uploads them to the configured object store. The format of the uploaded is:: <pre>kernellog-2023-12-20-17-10-21-256548000.ev</pre> RAMP then creates a record of this file in the database. You can view, download, or delete these files. For more information, refer to EdgeMarc Diagnostic Files.	N/A	N/A	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
LAN Status Down	This notification is triggered when the LAN status changes to DOWN, The Edgemarc device sends the LAN status data to RAMP regularly. If RAMP receives the LAN information having an interface with <code>StatusChange= YES</code> and <code>Status= DOWN</code> then the rule is triggered and the SNMP alarm notification is sent to RAMP's Fault Management.	Notification is triggered as soon as the LAN Status is down.	The only action for this rule is notifying recipients.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
MOS Below Threshold	Notifies that the MOS score falls below a pre-configured threshold on an EdgeMarc device.	Specify the number of events allowed to occur over a period of time in minutes.	(Optional) Select the action to perform when the rule is triggered. For example, retrieve Ring Buffer contents for all affected devices for the period.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	Occurrences: 1 to 1000. Duration: 1 to 1500 minutes.	O
SIP Server Change	SIP Server Change is triggered due to a redundancy on the EdgeMarc device. In such instances, the EdgeMarc device switches to the next SIP server on the list or switches back to one with a higher priority.	Notifies that there is a SIP Server change.	(Optional) Select the action to perform when the rule is triggered. For example, retrieve Ring Buffer contents for all affected devices for the time period.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
SIP server Mode Change	SIP server Mode Change is triggered when an EdgeMarc device goes in or out of survivability.	Notifies that the SIP Server has a mode change.	(Optional) Select the action to perform when the rule is triggered. For example, retrieve Ring Buffer contents for all affected devices for the time period.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O
SIP server Unavailable	This notification is triggered when an EdgeMarc device loses contact with the SIP server.	Notifies that the SIP Server is unavailable.	(Optional) Select the action to perform when the rule is triggered. For example, For all affected devices, retrieve Ring Buffer contents for the time period.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
T1 Status Down	This notification is triggered when the status of T1 changes to DOWN. The EdgeMarc device sends the T1 status data to RAMP at regular intervals. If RAMP receives T1 information having the interface <code>StatusChange= YES</code> and <code>Status= DOWN</code>, then the rule is triggered and the SNMP alarm notification is sent to RAMP's to Fault Management.	Notifies that the T1 Controller Status is down.	The only action for this rule is notifying recipients.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
WAN link Change	This notification is triggered when the WAN link changes on the device. For example, when the role of the current primary WAN is taken over by another WAN due to traffic. or vice-versa. This rule is configurable to perform an action when triggered.	Notifies that the there is a WAN Link change.	(Optional) Select the action to perform when the rule is triggered. For example, For all affected devices, retrieve Ring Buffer contents for the time period.	◦ Critical ◦ Major ◦ Minor ◦ Warning ◦ Intermediate The default value is "Critical".	N/A	O
Define Scope	Select either a resource group or the EdgeMarc device to apply the rule. ◦ Resource Group- Select the resource group to apply the rule. ◦ Device- Select the EdgeMarc device to apply the rule.	N/A	N/A	N/A	N/A	M

Parameter	Description	Rule	Action	Rule Severity	Length/Range	Mandatory/Optional
Status	Once the rule is created, it is enabled by default and the rule is implemented. Uncheck to make the rule inactive.	N/A	N/A	N/A	N/A	M

Retrieve Ring Buffer Contents

You can enable **Action** to retrieve **Ring Buffer** details while creating certain rules, for example, SIP server Change. If this rule is triggered then the diagnostic snapshot is invoked on the EdgeMarc device or the resource group. To view diagnostic snapshot refer to [Snapshot Diagnostics for EdgeMarc devices](#).

You can also view the diagnostic snapshot job on the **Job Status** page. For more information, refer to [Job Status](#). On the **Job Status** page, the **Type** column displays the type as **Rule** and the **Source** column displays the name of the rule triggering the job.

Create Email Notifications for Triggers

RAMP allows you create and send alarm notifications through email. For more information on creating email notifications, refer to [Send Email Notifications for Alarms](#).

Troubleshooting EdgeMarc Devices

In this section:

- [View EdgeMarc Device Analysis Details](#)
- [EdgeMarc Diagnostic Files](#)
- [Run Health Reports on EdgeMarc Devices](#)

The Ribbon Application Management Platform (RAMP) allows you to view details like packet capture and snapshot diagnostics, diagnostic files, and run health reports for a selected EdgeMarc device.

View EdgeMarc Device Analysis Details

In this section:

- [View Recent Calls, Packet Capture, and Snapshot Diagnostics](#)
- [Packet Capture](#)
- [Snapshot Diagnostics](#)

Use the Ribbon Application Management Platform (RAMP) to view call analysis details, including viewing and scheduling Packet Capture and Snapshot Diagnostics for selected EdgeMarc devices.

Note

Packet Capture and Snapshot Diagnostics are not supported for IPv6 addresses on the RAMP 23.12.

Prerequisites

- Posses **Super User** [privileges](#) for **Insight Administration** under **Core Resources**.
- Posses **Devices, Resource Groups** [privileges](#) under **Device Management**.

View Recent Calls, Packet Capture, and Snapshot Diagnostics

Perform the following procedure to view the list of most recent calls, captured packets and snapshot diagnostics.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Device Management > Devices**. The **Devices** window displays.
3. In the nodes list, click on the **Node Name** of an EdgeMarc device to view its details.
4. Click the **Analysis** tab. The **Most Recent Calls, Packet Capture, and Snapshot Diagnostics** for the selected EdgeMarc device are displayed.

Packet Capture

Perform this procedure to collect packet capture for all WAN, LAN, or both the interfaces on EdgeMarc devices through RAMP.

The EdgeMarc device stores the collected packet capture details as a single file and uploads it to RAMP. The **Status** column is updated as **Complete** when one of the conditions or parameters is met. Packet capture is allowed for a maximum duration of two days or for a maximum size of 4 GB. If the packet capture does not complete, the capture is marked as **Failed**.

Note

If you run any bulk action on the selected EdgeMarc device, then you are not allowed to run Packet Capture and Diagnostic Snapshot operations on the same device.

If PCAP or Diagnostic Snapshot operations are running, you are allowed to run any bulk action on the same EdgeMarc device simultaneously.

By default, you are allowed to run a maximum of 50 Packet Captures simultaneously on different EdgeMarc devices. You can configure the default limit from the properties file.

Start

1. Click **Start Packet Capture** to start a new Packet Capture and provide the following details:

Packet Capture stops when it runs for the specified maximum duration or accumulates the maximum size provided as input, whichever occurs first.

Parameter	Length/Range	Description
Max Duration	01m-48hrs	The maximum duration to capture the packets.
Max Size	1-4096 MB	The maximum size of each packet.
Interface		Select one of the of the following: ◦ All ◦ LAN ◦ WAN The default value is "All".
Capture Filter	Default value is "None".	Performed to capture the packets which gets transmitted over a network. There are various types, of packets that are captured. For example, some packets contain call related information, some packets contain media related information, etc. Packet Capture filter provides a way to filter packets based on our need.
Comment	Enter comments or a note for your reference.	Enter comments or a note for your reference.

- When you complete specifying the details for packet capture, click **Start** to start the packet capture.
- When packet capture starts, the **Status** column is updated as **Running**.

Note

When the status is **Running**, you are not allowed to create another packet capture for the same device. The **Start Packet Capture** button is disabled for that duration.

- The **Status** column is updated as **Complete or Failed** when one of the conditions or parameters is met. The status depends on what the device has sent. Packet capture is allowed for a maximum duration of two days or for a maximum size of 4 GB. If the packet capture does not complete, the capture is marked as **Failed**. Only when the status is either completed or failed, you are allowed to delete and download a packet capture file from the **Actions** column.

Refresh the table to see the change in the status.

- From the **Actions** column, download the packet capture file. A download is allowed only if the status is either **Complete** or **Failed**.
- You are allowed to delete a packet capture file from the **Actions** column.
- You are allowed to stop packet capture from the **Actions** column. This is possible only when the status is **Running**.

Snapshot Diagnostics

RAMP allows you to collect the diagnostic reports for that instant. When you take a snapshot from the **Analysis** tab in **Device Overview**, RAMP connects to the selected EdgeMarc device and collects the diagnostic snapshot. This report is uploaded to the RAMP's private object store. You can download this report from the **Actions** column.

Start

1. Click **Take Snapshot**.
2. The **Status** column is updated as **Running**.

When the status is **Running**, you are not allowed to take another snapshot for the same device. The **Take Snapshot** button is disabled for that duration.

3. From the **Actions** column download the snapshot when the **Status** column is updated as **Complete** or **Failed**. Download is allowed only if the status is either **Complete** or **Failed**.
4. You are allowed to delete the snapshot details from the **Actions** column.
5. You are allowed to stop snapshot diagnostics from the **Actions** column. This is possible only when the status is **Running**.

EdgeMarc Diagnostic Files

The Ribbon Application Management Platform (RAMP) allows you to view the diagnostic files for a selected EdgeMarc device. When an application crashes on the EdgeMarc device the rules specific to diagnostic reports are triggered. The EdgeMarc device sends this crash event to RAMP along with a diagnostic T-Info File, containing the application crash details like stack trace, etc. RAMP accepts the T-Info file and uploads them to the configured object store. The format of the uploaded file is: `tinfo-2023-12-27-03-59-53-472231.ev`. AMP then creates a record of this file in the database.

You can view, download, or delete these files.

Prerequisites

- **Super User** [privileges](#) for **Insight Administration** under **Core Resources**.
- **Devices** and **Resource Groups** [privileges](#) under **Device Management**.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Device Management > Devices**. The **Devices** window displays.
3. In the nodes list, click on the **Node Name** of an EdgeMarc device to view its details.
4. Click the **Diagnostic Files** tab.

The **Diagnostic Files** tab displays the list of T-info files.

Run Health Reports on EdgeMarc Devices

The Ribbon Application Management Platform (RAMP) allows you to run health reports on selected EdgeMarc devices. When you run the health report for the desired devices, the attached **Devices** tab lists all the devices associated with the selected EdgeMarc device. For more information on Attached Devices, refer to [View Attached Devices for EdgeMarc](#).

Prerequisites

- **Super User** [privileges](#) for **Insight Administration** under **Core Resources**.
- **Devices, Resource Groups, and Job Status** [privileges](#) under **Device Management**.

Start

1. Log on to the RAMP GUI.
2. Navigate to **Device Management > Devices**.
3. Select the EdgeMarc device to run the health report.
4. From the **Bulk Actions** menu, select **Run Health Report**. The **Run Health Report** window displays.
5. The **Included Devices** panel lists the configured EdgeMarc devices on RAMP.
6. Use the following table to update the **Frequency** to run the health report.

Parameters

Parameter	Description	Length/Range
Frequency		
One Time Only		
Perform Now	The default value is One Time Only, Perform Now .	
Perform Later	Select this option to generate health report by providing: • Date • Time	• 1 - 30 or 1- 31 depending on the calendar month. • 00:00:00 - 23:59:59
Comments	Enter comments or a note for your reference.	
Notification	Enable this option to receive in-app notification about the status when the particular action is completed. NOTE: This option is only available when the Notification Service is deployed on the RAMP.	

Database Troubleshooting

Additional Topics:

- [Cleaning Debezium Data](#)
- [Start DBaaS Service in RAMP](#)
- [Stop DBaaS Service in RAMP](#)

Troubleshooting the Ribbon Application Management Platform (RAMP) database is covered in this section.

Cleaning Debezium Data

Use the `./cleanupDBZData.sh` script to address disk congestion issues. If Ribbon Application Management Platform (RAMP) is down for a considerable amount of time (e.g., hours), the debezium replication slot size grows (increases the `pg_wal` size at `/var/lib/pgsql/12/data/pg_wal`), which eventually increases the disk size. The presence of this large replication slot prevents RAMP from deleting the WAL logs.

Start

1. Login to RAMP as `insight`.
2. Use the following command to navigate to `/conf` folder:

```
cd /opt/sonus/ems/conf/
```

3. Run the following script to stop the kafka process, delete the connect offsets file, and drop the debezium replication slot:

```
./cleanupDBZData.sh
```

Start DBaaS Service in RAMP

Ribbon Application Management Platform (RAMP) uses PostgreSQL Database as a Service (DBaaS).

To start DBaaS service in RAMP:

1. Log on to the RAMP node as admin user.
2. Change to "postgres" user:

```
sudo -iu postgres
```

3. Start the DBaaS service:

```
dbaas_service start
```

Stop DBaaS Service in RAMP

Ribbon Application Management Platform (RAMP) uses PostgreSQL Database as a Service (DBaaS).

To stop DBaaS for troubleshooting RAMP, follow this procedure.

1. Log on to the RAMP node as the admin user.
2. Change to "postgres" user:

```
sudo -iu postgres
```

3. Stop the DBaaS service:

```
dbaas_service stop
```

Fault Manager Troubleshooting

Use this section to resolve common Fault Manager issues in Ribbon Application Management Platform (RAMP).

Issue	Solution
Check the status of the Fault Management (FM) processes	Enter the following commands as the insight user: <pre>/opt/fm/bin/fm status</pre> You can view the logs related to the FM background processes in the <code>/opt/fm/logs/</code> directory. You can view the log to Fault management UI in the <code>/opt/fm/logs/ui/</code> directory
Enable debug for FM process.	Every FM process has a <code>Log4j.xml</code> in the <code>/opt/fm/conf/<process>/</code> directory. The log level of process needs to be modified from info to debug in the process specific <code>log4j2.xml</code> for Logger name="com.rbbn".
Enable debug for FM GUI web applications	Every UI web application has a <code>Log4j.xml</code> in the <code>/opt/fm/conf/fm-ui/<ui-application-name>/</code> directory. The log level of process needs to be modified from info to debug in the process specific <code>log4j2.xml</code> for Logger name="com.rbbn".
The timestamp in the active alarms are incorrect.	The system stores timestamps in UTC and changes it to RAMP time zone before viewing. The timestamps for Ribbon devices are included in the trap information, so verify the time and time zone settings on the applicable device.

Issue	Solution
Alarms do not display for a node even though it is registered with RAMP.	• Navigate to Device Management > Node Management > Function Manager and click Discover for the appropriate device to ensure that RAMP is configured as a trap destination on the remote agent. This is necessary if you reinstall the agent after registering the node. • Ensure that the source IP address of traps from the device is registered in RAMP. The trap receiver rejects alarms originating from an IP address if the associated device is not registered with RAMP. Check <code>/opt/fm/logs/trap.log</code> to see all traps received. Search for “UnRegistered Node” text to find unknown IP addresses received.
View alarm count	To view count of active alarms, navigate to Fault Manager > Administration > Present Usage > Number of active alarm records. To view count of alarms in history, navigate to Fault Manager > Administration > Present Usage > Number of alarm history records

General Troubleshooting

This page provides information on some general issues which may occur while operating Ribbon Application Management Platform (RAMP).

Issue	Solution
The RAMP GUI does not launch after login.	Verify that you have disabled any popup blockers installed on your system. These applications interfere with the proper operation of RAMP.
RAMP is slow.	Often, the cause of excessively slow operation and response from RAMP is due to insufficient computer resources or a slow network connection. Verify the adequacy of your network connection.
“java.io.IOException: Not enough space” error message in RAMP trace log or popup message.	This error indicates that the /tmp directory on your UNIX system may have reached capacity. The tmp directory is used for many UNIX system operations and lack of space in this directory will make your system unusable. You must clean up the tmp directory.

Issue	Solution
After closing the RAMP , another user can reopen it without entering a username and password.	Use the Exit icon to close Insight. After Insight is closed verify that ALL browser windows are closed to clear cached passwords.

Issue	Solution
RAMP reboots continuously when the disk is full.	When the disk is full, all operations fail and Ribbon Application Management Platform (RAMP) reboots continuously, up to three times. To resolve this issue, free up space in the disk and perform the following procedure: 1. Log onto the RAMP as the admin user. 2. Change to the root user: <pre data-bbox="737 583 1453 667">sudo su -</pre> 3. Navigate to the following directory: <pre data-bbox="737 730 1453 814">/opt/sonus/ems/kafka/data/zookeeper/version-2</pre> 4. List the log files: <pre data-bbox="737 877 1453 961">ls -ltr</pre> Example <pre>total 460712 -rw-r-----. 1 insight insight 67108880 Aug 2 10:04 log.1 -rw-r--r--. 1 insight insight 67108880 Aug 5 01:55 log.c3 -rw-r--r--. 1 insight insight 61264 Aug 12 16:41 snapshot.1ad9e -rw-r--r--. 1 insight insight 67108880 Aug 12 16:41 log.56dc -rw-r--r--. 1 insight insight 67108880 Aug 16 04:02 log.1ada0 -rw-r--r--. 1 insight insight 67108880 Aug 16 05:06 log.249ee -rw-r--r--. 1 insight insight 67108880 Aug 17 07:25 log.24bef -rw-r--r--. 1 insight insight 67108880 Aug 20 12:24 log.27ccc -rw-r-----. 1 insight insight 67108880 Aug 20 12:28 log.30d50 -rw-r--r--. 1 insight insight 67108880 Aug 24 00:19 log.30d59</pre> 5. Delete the latest log.* file.

Issue	Solution
	Example <pre>rm log.30d59</pre>

GSX Troubleshooting

In this section:

- [GSX Navigator Troubleshooting](#)
- [GSX Upgrade Troubleshooting](#)

GSX Navigator Troubleshooting

This page provides information on GSX Navigator issues and handling solutions.

Issue	Solution
GSX Navigator slow or does not work	treeAgeOverrideMinutes is a configurable parameter in SystemConfig.txt. By default, this parameter is not set. If treeAgeOverrideMinutes is set to 0, GSX Navigator tree will be re-discovered after 60 minutes from the last discovery. Without setting this parameter in SystemConfig.txt, Nav tree will be rediscovered after 5 years from the last discovery, means the tree was accepted up to 5 years old. It can be set to any integer, for example 30, means the tree will be accepted for 30 minutes old without new discovery. For "manual" discovery type, set this parameter to 0 for the tree to update with the configuration changes from Navigator in 60 minutes after the last discovery.
No node names appear in the Node pull-down list.	Register the GSX9000 nodes first with Ribbon Application Management Platform (RAMP) before you manage the nodes with RAMP. Register the appropriate GSX9000 nodes from the Node tab in the Administration section.

Issue	Solution
What is the discovery time of the displayed Navigator Tree?	Position the mouse over the Up To Date text area located at the bottom left corner of the Node Objects window. A popup tooltip will display the date and time the last discovery took place.
The Object tree appears to be out of date with the device configuration on the GSX9000.	The displayed Object tree is usually the most recent one available on RAMP. Occasionally RAMP may not be notified of configuration changes that take place on the GSX9000 made by another user with RAMP or another management application. Click the Get button to force a new discovery of the device.
The Object tree appears to be frequently out of date with the device configuration on the GSX9000.	The displayed Object tree is usually the most recent one available on RAMP. RAMP relies on traps from the GSX9000 for notifications that the configuration of the device has been changed from another management application or telnet session.
Discovery of a GSX9000 device takes a long time.	Typical discovery of a GSX9000 device should take between 2 and 30 seconds, depending on the device configuration, on network latency and the load on RAMP.
An error message indicating a timeout is displayed when attempting to discover a GSX9000.	If the GSX9000 device cannot be reached after 30 seconds, an attempt is made by RAMP to cycle through the alternate IP Addresses for the device. If necessary, an attempt is made to register RAMP as a management client on the GSX9000 if an existing entry cannot be found. If none of the above are successful, an error message will be displayed indicating that a timeout was experienced while contacting the device. If the GSX9000 cannot be reached: • Verify the correct IP Addresses, SNMP community strings and Telnet password under the Node tab in the Administration section. • Verify that the maximum number of management clients has not been exceeded on the device. • Verify network connectivity to the device.

GSX Upgrade Troubleshooting

In this section:

- [Package Import Failures](#)
- [Software Copy Failures](#)
- [GSX Runtime Check Failures](#)
- [Firmware Upgrade Failures](#)
- [Software Upgrade Failure](#)
- [Post Upgrade Script Failures](#)
- [RAMP Failover During GSX Upgrade Process](#)

While Ribbon has endeavored to make this feature robust, the process of upgrading a GSX, either manually or automatically using this feature, is a complicated operation and may halt/fail for a variety of reasons. The following sections provide information on possible causes of failure and actions that you can take to rectify the situations.

Note

The sections that follow do not represent all possible modes of failure. In the event of failure, review the "GSX Installation and Upgrade Guide" and/or contact Ribbon Support.

From DSI v15.1 onwards, the "root" user is disabled by default. Enable the "root" user manually under `/etc/ssh/sshd_config` file, restart the service, discover the DSI with "root" credentials in the node registration page, and initiate the GSX upgrade.

Package Import Failures

As part of the package import process, Ribbon Application Management Platform (RAMP) untars the software release package and then uncompresses and untars the Install package. During this process, RAMP verifies the images contained in the Install package. The package import operation may fail due to any of the following:

- The import fails if the required space is not available in the RAMP staging directory. The minimum required space is configurable using the parameter **Local Disk Space Minimum** located in **System > Settings > Application Config**. Refer to [Application Configuration](#). To rectify this issue, free additional space in the staging directory `/opt/rbbn/ems/weblogic/sonusEms/data/gsxSwStaging` or change the minimum setting.
- The import fails, if the GSX software image is invalid. In most cases RAMP generates an error message providing information concerning the image. To rectify this issue, obtain a new software image from Ribbon.
- The import fails if the image is for an older, unsupported software image. You must upgrade to a later, supported release to use this feature. Refer to the appropriate *GSX Release Notes* and/or the *GSX Installation and Upgrade Guide* to verify your upgrade path.

Software Copy Failures

When you start an Upgrade Task, RAMP uses SCP to copy the GSX software installation packages to the associated DSI/NFS servers.

One possible failure point for the copy operation is incorrect or missing DSI/NFS passwords. If the copy operation fails, first verify that the DSI/NFS password supplied on the Node Registration page is correct.

Note

If you start multiple upgrade tasks on the GSXs in an Upgrade Job and a copy failure occurs for one or more GSX software packages, **RAMP** transitions the failed tasks to an ERROR state, but allows the other tasks to continue until achieving the GSX_UPGRADE_READY state. At this point, you can either continue operations with the non-ERROR state tasks or correct the error and restart all tasks.

If a copy operation fails and the passwords are correct, perform the following instructions:

- Examine the Audit Log for any of the error codes shown in the table below. The table also provides a mapping of the error code to issue. Use this mapping to correct the problem indicated:

Audit Log Error to Reason Mapping

Error Code	Reason
11	Failure: Malformed or out of range ipAddress
12	Failure: Installation files not copied to NFS
31	Failure: Staging dir not created on NFS
51	Failure: User dsi not setup on NFS
52	Failure: Could not untar GSX package on NFS
53	Failure: Date not current for some of the installed images on NFS
54	Failure: verify Image failed on NFS
55	Failure: Could not copy scripts to new software release directory on NFS
56	Failure: GSX software install failed
57	Failure: Could not find tar to install GSX software
58	Failure: Insufficient disk space on the NFS

Note

If you receive an Error Code 58, adjust the space required on the DSI/NFS during verification through the NFS Disk Space Minimum setting in **System > Settings > Application Config > GsxUpgrade**. For more information, refer to [Application Configuration](#).

If after examining the Audit Log, if the mode of failure is undeterminable, examine the nfsSetup.log file for error messages that might indicate the problem. This file is located either in `/global/home/gsxUpgradeStaging` or `/export/home/gsxUpgradeStaging` directory of the DSI/NFS.

After correcting the issue causing the copy failure, click **Start** to retry the software copy operation by clicking the **Start** button.

Note

If you are unable to determine the cause of the copy failure and elect to copy the files manually, perform the remaining upgrade process manually.

GSX Runtime Check Failures

The GSX runtime checks consists of three operations: a Gateway Signaling Port Status check, a GSX Protection Mode check, and a Link Status check. Each of these operations may fail. Some possible causes/remedies are:

- A failure of the Gateway Signaling Port Status check fails indicates that some gateway signaling ports are not in service. Manually return all gateway signaling port to an in service state. After remedying the issue, restart the upgrade process by clicking the **Start** button.
- If the Protection Mode check fails, one possible cause is that the GSX could not write its parameter file in the allotted time. This can occur due to a slow network connection to the DSI/NFS server. If the parameter file is not written in the allotted time, increase the value of the **PIF Write Timeout** setting in **System > Settings > Application Config > GsxUpgrade**. For more information, refer to [Application Configuration](#). After increasing this value, restart the upgrade by clicking the **Start** button.
- If the Protection Mode check fails because the GSX is not fully protected, consult the applicable *GSX Installation and Upgrade Guide* for additional information concerning protection before attempting to proceed with your upgrade. The GSX Upgrade Automation application supports upgrades only for GSXs that are fully protected.
- If the Link Status check fails, one possible cause is that the number of standby port failures exceeds the number of active port failures. It is also possible that the number of active failures exceeds the configured threshold. In either case you must correct the issue on the GSX before proceeding with the upgrade.

Firmware Upgrade Failures

If the firmware upgrade fails, you must manually correct the problem on the GSX before continuing with the upgrade. Refer to the applicable *GSX Installation and Upgrade Guide* for details regarding firmware upgrades. Once you correct the issue causing the problem, restart the upgrade by clicking **Start**.

Software Upgrade Failure

If a GSX LSWU failure occurs while the GSX is in the `SW_UPGRADE_RUNNING` state, the Upgrade Automation process does not complete the required LSWU operations. You must intervene to fix the cause of the failure and manually complete the software upgrade. After manually completing the software upgrade, return to the Automation Upgrade GUI and click **Start** to synchronize the state information on [RAMP](#) and the GSX (state =

`SW_UPGRADE_FINISHED` after the synchronization). You can then initiate any post-upgrade scripts, if required, and commit the software upgrade.

Post Upgrade Script Failures

If a post upgrade script fails, commit the software upgrade and then repair and rerun the script manually. If needed, abort the task and enter any notes required.

RAMP Failover During GSX Upgrade Process

If RAMP experiences an HA failover from the primary system to the standby while a GSX Automated Upgrade task is running, the state of the tasks as displayed on the new active system will depend upon the state prior to failover and may require user intervention to synchronize with the GSX's actual state. The following table provides details concerning the original state, state shown on the new active system and any user intervention required to continue the upgrade.

States After RAMP HA Failover

State Before Failover	State After Failover	User Action Required
UPGRADE_TASK_START	UPGRADE_TASK_CREATED	Click Start
COPYING_TO_PRI_NFS	UPGRADE_TASK_CREATED	Click Start
SW_COPIED_PRI_NFS	UPGRADE_TASK_CREATED	Click Start
COPYING_TO_SEC_NFS	UPGRADE_TASK_CREATED	Click Start
FW_VERSION_MISMATCH	FW_VERSION_MISMATCH	Click Upgrade FW
FW_UPGRADE_RUNNING	FW_VERSION_MISMATCH	Click Upgrade FW
SW_UPGRADE_READY	SW_UPGRADE_READY	Click Upgrade FW
SW_UPGRADE_RUNNING	SW_UPGRADE_READY	Click Upgrade FW
COMMIT_REQUIRED	COMMIT_REQUIRED	Click Commit
POST_UPGRADE_SCRIPT_RUNNING	COMMIT_REQUIRED	Click Commit
GSX_UPGRADE_FINISHED	GSX_UPGRADE_FINISHED	None
ABORTED	ABORTED	None
ERROR	ERROR	None

RAMP CNF Troubleshooting

In this section:

- [Identify Container Restart](#)
- [Invalid timeZone Causes a RAMP Container to Restart](#)
- [Check I/O of a RAMP Pod](#)

Use this section to troubleshoot and recover the Ribbon Access Management Platform (RAMP) Cloud Native Functionality (CNF) device.

Identify Container Restart

Identify a container that unexpectedly restarted in a specific pod:

```
oc get pods
```

check the RESTARTS column.

Example

```
[ssequira@cli-server ~]$ oc get pod
NAME                READY   STATUS    RESTARTS   AGE
sanrampsdr-rampcnf-0 2/2     Running   3          45d
[ssequira@cli-server ~]$
```

If a pod displays the restart value as non-zero, for example, `sanrampsdr-rampcnf-0`, use the command `oc describe pod <pod_name>` to check:

- which container restarted,
- reason for the container to restart,
- the container restart time, and
- to check the events.

```
[ssequira@cli-server ~]$ oc describe pod sanrampsdr-rampcnf-0
Name:                sanrampsdr-rampcnf-0
Namespace:           ems-svt
Priority:              0
Node:                worker-3.ott-ocp1.lab.rbbn.com/172.29.114.28
Start Time:          Tue, 06 Jun 2023 02:48:53 -0400
Labels:               app=sanrampsdr-rampcnf-pod
                     app.kubernetes.io/instance=sanrampsdr

```

Invalid timeZone Causes a RAMP Container to Restart

The RAMP CNF container unexpectedly restarts if the timeZone value is invalid. In such a scenario, the DbaaS startup fails. Check the validity of the timeZone value that was set in the `/var/log/dbaas/dbaas_service.*.log` during the RAMP CNF deployment.

A sample output of `/var/log/dbaas/dbaas_service.10353.log`

```

waiting for server to start....2023-07-26 06:30:07.315 GMT [30750] LOG:  invalid value
for parameter "TimeZone": "IST"
2023-07-26 06:30:07.315 GMT [30750] LOG:  invalid value for parameter "log_timezone":
"IST"
2023-07-26 06:30:07.315 GMT 172.29.115.220 [30750 start=2023-07-26 06:30:07 GMT]: u=[]
db=[] app=[] c=[] s=[64c0bd6f.781e:3] tx=[:0]FATAL:  configuration file "/var/lib/pgsql/
13/data/postgresql.auto.conf" contains errors
stopped waiting
pg_ctl: could not start server
Examine the log output.

```

Check the validity of the timeZone value that was set during the RAMP CNF deployment.

Example of an invalid timezone

```
[hasingh@cli-blr-1 rbbn-ramp-cnf]$ helm get values hasingh | grep timeZone
timeZone: IST
```

Set the timeZone to one of the values in the "TZ identifier" column in the list of timezones at: https://en.wikipedia.org/wiki/List_of_tz_database_time_zones.

Example

```
[ssequeira@cli-blr-1 rbbn-ramp-cnf]$ helm get values sanrampblr4 | grep timeZone
timeZone: Asia/Kolkata
```

Check I/O of a RAMP Pod

If RAMP CNF is restarting, check the I/O speed. To check the I/O of RAMP CNF, login to the RAMP CNF container and execute `/opt/sonus/ems/conf/benchmark.sh`. This command provides the disk write performance (seconds) of ephemeral and persistent volume. Recommended values for ephemeral disk is less than 2 and persistent volume is less than 50.

```
-bash-4.4$ /opt/sonus/ems/conf/benchmark.sh
```

Reference output from 16vcpu 64GB RAMP CNF on Ribbon OCP cluster ,working dir /opt/rbbn/ems

```

RAMP GR Auto-Switchover Troubleshooting

In this section:

- [etcd RAMP Interactions](#)
- [RAMP GR when One etcd is Down](#)
 - [Check etcd Health on etcd](#)
 - [Check etcd Health Using RAMP](#)
- [RAMP GR when Multiple etcds are Down](#)
 - [Check etcd Health on etcd](#)
 - [Check etcd Health Using RAMP](#)
 - [RAMP Recovery Procedure](#)

Use this section to troubleshoot and recover from a RAMP GR automatic switchover after an etcd outage.

Three etcd VMs are required to monitor a Ribbon Application Management Platform (RAMP) Geographically Redundant (GR) deployment for automatic switchover. For information on how the etcd VMs are involved in the GR deployment, refer to [Configuring RAMP GR with Automatic Switchover Enabled](#).

In a typical GR deployment, RAMP instances are deployed at two separate geographic sites. To enable automatic switchover, a VM running etcd is deployed at each RAMP site and at a third, “neutral” site. Together, the three etcd instances are responsible for determining which RAMP instance is active.

etcd RAMP Interactions

The etcd is a key value store deployed as a quorum of three nodes. This makes the etcd highly available when one of the nodes is down. The RAMP maintains etcd as a marker for high availability to mark its current node. The RAMP sets itself active by adding its node identifier as a value to a unique set of keys in etcd.

Below are the set of keys:

Use the lock key to determine if the current node is Active. Most actions are performed on the key to set the node values (SC-1 and SC-3) while relocating or processing the kill failure. SC-1 refers to the configured Active instance, and SC-3 is the Standby instance:

```
/opensaf_<clustername>_<epoch>/opensaf_consensus_lock
```

The `opensaf_write_test` is a test key is only set when a new node tries to monitor etcd (in case of a reboot scenario):

```
/opensaf_<clustername>_<epoch>/opensaf_write_test
```

Perform the following steps to get the value from etcd for a specific key:

Start

1. Check current key and values on etcd using the following procedure:
 - a. Log on to etcd as `sysadm` user.
 - b. Switch to `root` user.

```
sudo su -
```

- c. Log on to the etcd pod:

```
podman exec -it etcd-pod-etcd bash
```

- d. Get the value for a specific key:

```
etcdctl get <Key>
```

Example output:

```
etcd@dndetcd1:/opt/bitnami/etcd$ etcdctl get /opensaf_emscluster_1724546650/
opensaf_consensus_lock
/opensaf_emscluster_1724546650/opensaf_consensus_lock SC-1
```

2. Check the current key and values on RAMP:

- a. Log on to the RAMP as an `admin` user.
- b. Switch to `root` user.
- c. Run the `osaf-utils` command:

```
/opt/opensaf/osaf-utils
```

- d. Select option 5 in the Menu to retrieve the value from `etcd`.

Note

The Opensaf Consensus interacts with the etcd quorum. The interactions between RAMP and etcd can be found in the log file located at `/var/log/opensaf/etcd.log`. RAMP uses a cron job to monitor the reachability of etcd nodes on both the active and standby RAMP instances. If connectivity between these nodes is lost, an alarm is triggered through user insight.

Example output:

```
[2024-08-08 15:16:54 root@rakeshgr02: /opt/sonus/ems/conf/opensaf ]# ./osaf-utils
```

```
~~~~~
```

```

- Retrieving current key value from etcd...
- etcd result: /opensaf_emsclusterrakk_1722230877/opensaf_consensus_lock: 'SC-3'

etcd Alarms

RAMP 1 State	RAMP2 State	N/w b/w RAMP1 & RAMP2	etcd Quorum	RAMP1 to etcd Quorum	RAMP2 to etcd Quorum	Effect
Active	Standby	YES	YES	YES	YES	In Service.
Active	Standby	YES	YES	YES	YES	In Service. No switchover as the ETCD quorum is available, 1/3 of ETCD nodes are reachable, and the ETCD quorum is available.
Active	Standby	YES	YES	YES	NO	In Service. No Switchover/failover.
Active	Standby	YES	YES	NO	YES	Active RAMP - reboot after 10 minutes of connection lost between RAMP and ETCD. Standby Node - becomes Active.
Active	Standby	YES	NO	NO	NO	Continuous reboots between Active and Standby, As the Active node cannot be established because all the etcds are down.
Active	Standby	NO	YES	YES	YES	Active node - In Service. State of Standby - node down, Standby goes for reboot.

RAMP 1 State	RAMP2 State	N/w b/w RAMP1 & RAMP2	etcd Quorum	RAMP1 to etcd Quorum	RAMP2 to etcd Quorum	Effect
Active	Standby	NO	YES	YES	NO	Active node - In Service. State of Standby - node down Standby goes for reboot.
Active	Standby	NO	YES	NO	YES	Active Node - reboot after 10 minutes of connection lost b/w ramp and etcd. Standby Node - becomes Active.

Refer to the [RAMP Release Notes](#) for the ETCD version(s) tested with RAMP.

When the ETCD Quorum is lost and does not recover, the RAMP reboot occurs. To stop this scenario, when the ETCD quorum fails, keep the current active node intact until the ETCD can be recovered. The current behavior of ETCD is as follows:

Scenario	RAMP 1 State	RAMP 2 State	N/w b/w RAMP1 & RAMP2	Etcd Quorum	RAMP1 to etcd Quorum	RAMP2 to etcd Quorum	Effect	Fix
RAMP Active connection fail with etcd Quorum	Active	Standby	YES	YES	NO	YES	Active RAMP - reboot after 10 minutes of connection lost between the RAMP and the etcd. Standby Node - becomes Active.	Active will remain active unless it breaks cause of other issues. after that changes will not affect the flow. Standby - remains in Standby.

Quorum Fails	Active	Standby	YES	NO	NO	NO	Continuous Reboots between Active and Standby as Active Node cannot be established, this will happen until <code>opensaf</code> limit is reached, which is 5.	Active will remain active unless it breaks cause of other issues. after that changes will not affect the flow. Standby - will remain on standby.

RAMP GR when One etcd is Down

There is no impact on the RAMP GR if one etcd is down. Recover the etcd and check the etcd cluster status.

Check etcd Health on etcd

Use this procedure to check the etcd health on the etcd:

Start

1. Log on to one of the etcd VMs as a `root` user.
2. Check the cluster state:

```
root@services3 ~]# /etc/rbbn/appservices/scripts/etcdStatus.py
```

Example

```
root@services3 ~]# /etc/rbbn/appservices/scripts/etcdStatus.py
+-----+-----+-----+-----+-----+
| Name | ID | Endpoint | Leader | Healthy |
+-----+-----+-----+-----+-----+
| services1 | 64386b664d63723b | http://10.52.23.94:2379 | false | true |
| services2 | 81dcb39d0b4f7142 | http://10.52.23.249:2379 | true | true |
| services3 | c88e907d0579400a | http://10.52.22.115:2379 | false | true |
+-----+-----+-----+-----+-----+
```

Check etcd Health Using RAMP

Use this procedure to health-check the etcd through RAMP:

Start

1. Log on to the RAMP as a `root` user
2. Connect etcd to the RAMP:

```
# /opt/opensaf/osaf-utils
```

Example

```
# /opt/opensaf/osaf-utils

~~~~~
-- MENU
~~~~~

1) DISPLAY: OpenSAF Controller Status
2) DISPLAY: OpenSAF Process Monitor Status
3) DISPLAY: Insight SG status

4) DISPLAY: etcd Server Health
5) DISPLAY: osaf key value from etcd
6) DISPLAY: ALL etcd keynames

7) SWACT: OpenSAF Controller
8) SWACT: OpenSAF Process Monitor

9) ALIGN Process Monitor with OpenSAF Controller
10) RESET Process Monitor SUS

0) Exit
Please enter your choice:
```

3. Enter **4** to check etcd server health.

Example

```
- Checking etcd health - OSAF_ENDPOINTS:
'10.52.23.94:2379,10.52.23.249:2379,10.52.22.115:2379'
10.52.22.115:2379 is healthy: successfully committed proposal: took = 3.891546ms
10.52.23.249:2379 is healthy: successfully committed proposal: took = 4.620617ms
10.52.23.94:2379 is healthy: successfully committed proposal: took = 5.579312ms
```

RAMP GR when Multiple etcds are Down

The RAMP stops working if multiple etcds are down. In such scenarios, you must check to ensure network connectivity and that the etcds are shut down. Check the etcd status after the etcds are recovered and the etcd VM are up and running.

Check etcd Health on etcd

Use this procedure to check the etcd health on the etcd:

Start

1. Log on to one of the etcd VMs as a `root` user.
2. Check the cluster state:

```
root@services3 ~]# /etc/rbbn/appservices/scripts/etcdStatus.py
```

Example

```
root@services3 ~]# /etc/rbbn/appservices/scripts/etcdStatus.py
```

Name	ID	Endpoint	Leader	Healthy
services1	64386b664d63723b	http://10.52.23.94:2379	false	true
services2	81dcb39d0b4f7142	http://10.52.23.249:2379	true	true
services3	c88e907d0579400a	http://10.52.22.115:2379	false	true

Check etcd Health Using RAMP

Use this procedure to health-check the etcd through RAMP:

Start

- 1. Log on to the RAMP as a root user.
- 2. Connect etcd to RAMP:

```
# /opt/opensaf/osaf-utils
```

Example

```
# /opt/opensaf/osaf-utils

-- MENU

1) DISPLAY: OpenSAF Controller Status
2) DISPLAY: OpenSAF Process Monitor Status
3) DISPLAY: Insight SG status

4) DISPLAY: etcd Server Health
5) DISPLAY: osaf key value from etcd
6) DISPLAY: ALL etcd keynames

7) SWACT: OpenSAF Controller
8) SWACT: OpenSAF Process Monitor

9) ALIGN Process Monitor with OpenSAF Controller
10) RESET Process Monitor SUs
```

```
0) Exit
Please enter your choice:
```

3. Enter **4** to check etcd server health.

Example

```
- Checking etcd health - OSAF_ENDPOINTS:
'10.52.23.94:2379,10.52.23.249:2379,10.52.22.115:2379'
10.52.22.115:2379 is healthy: successfully committed proposal: took = 3.891546ms
10.52.23.249:2379 is healthy: successfully committed proposal: took = 4.620617ms
10.52.23.94:2379 is healthy: successfully committed proposal: took = 5.579312ms
```

RAMP Recovery Procedure

The `opensaf` process stops running if the etcd is down for over two hours. Use this procedure to recover RAMP:

Start

1. Log on to the active RAMP as an `admin` user.
2. Change to `root` user:

```
# sudo su -
```

3. Start the `opensafd` process:

```
# systemctl start opensafd
```

4. Check `opensafd` process status. It should be running:

```
# systemctl status opensafd
```

5. Ensure that the RAMP related processes are running. For more information, refer to [Check RAMP Status](#).
6. Log on to the standby RAMP as an `admin` user.
7. Change to `root` user:

```
# sudo su -
```

8. Start the `opensafd` process:

```
# systemctl start opensafd
```

9. Ensure the `opensafd` process is up and running:

```
# systemctl status opensafd
```

10. Ensure that the RAMP-related processes are running. For more information, refer to [Check RAMP Status](#).

Note

- If any process fails, you can disable/enable the health check of the particular process using `manage0saf.sh` script. For more information, refer to [Retrieve System Information](#).
- The `/opt/sonus/ems/gr_standby` file is applicable only if the auto failover mode is disabled on RAMP. The `gr_standby` should not be created in the auto failover enabled RAMP.

The alarms `sonusHARACArbitratorDownNotification` and `sonusHARACArbitratorUpNotification` are raised if the `etcd` is down. For more information on alarms, refer to:

- [sonusHARACArbitratorDownNotification](#)
- [sonusHARACArbitratorUpNotification](#)

Retrieve System Information

In this section:

- [View RAMP Log Files](#)
- [Analyze System Performance](#)
- [Debug OpenSAF](#)

If Ribbon Global Product Support (GPS) personnel ask you to retrieve certain log files or information from your Ribbon Application Management Platform (RAMP) device to assist in diagnosing an issue, use the following steps to gather and forward the details.

View RAMP Log Files

To generate log files for debugging:

1. Access RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Generate a tar file containing log and configuration files associated with RAMP:

```
/opt/sonus/ems/conf/archiveLogs.sh
```

3. When prompted to enter comments, type a description or a reason for creating the log file. The following is an example:

```
Following upgrade operation.
```

4. Press ENTER to move to the next line.
5. Enter a period (.) and press ENTER to conclude your comments and to save the logs.
The script shows status messages as it creates the file.

The log files are stored as a single tar.gz file at `/opt/sonus/ems` in the format `logFiles-<RAMP host name>-<timestamp>.tar.gz`

Analyze System Performance

If you experience problems with RAMP performance, GPS can request that you run a utility to gather system performance data.

To run the performance analysis utility:

1. Access RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the root user.
2. Check the RAMP performance settings and statistics:

```
/etc/sonus/analyzeSystem.sh
```

RAMP displays performance settings and statistics related to the following:

- RAMP installation
 - System configuration
 - CPU configuration
 - Memory configuration
 - TMPFS (Temp File System) usage
 - Process information
 - Memory map for RAMP process
 - Postgres processes
 - Postgres process shared memory
 - Other processes
 - Shared memory stats
 - Disk usage
 - TCP protocol statistics
 - UDP protocol statistics
 - TCP driver configuration
 - Network interface configuration
 - ETCD Arbitrators Health for GR systems which has auto-switchover enabled
3. You can run following command for additional information:

```
/etc/sonus/analyzeSystem.sh -health
```

Some of the key performance metrics displayed as a result of this command are:

Metrics	Summary
Output of <code>/opt/sonus/ems/emsMgmt status</code>	◦ EMS instantiated version. ◦ Status of each process. ◦ HA Mode ◦ Configured and Current states. ◦ of EMS HA Nodes. ◦ Hostnames of HA/GR peers. ◦ IP addresses of HA/GR peers. ◦ SBCAPI deployment location.
Output of <code>/etc/sonus/RDSyncStatus</code>	◦ Replication Status on current node ◦ Log sequence number and any lag between primary and standby ◦ Sync status
Host Information	◦ Hostname ◦ Kernel Version ◦ Uptime ◦ Last Reboot Time ◦ OS Architecture ◦ Current System Date & Time
Disk Usage	◦ Currently Mounted File System ◦ Disk Usage on all mounted file system ◦ Health status on each mounted disk usage
IO Stats	The following are captured from 3 samples with a 3 second delay: ◦ Average CPU Util % based on idle % ◦ Average IO WAIT % ◦ Average Steal Time %
Inode Usage	◦ Inode usage ◦ Inode usage percentage ◦ Health status on each inode usage
CPU Usage	◦ All core utilization ◦ Utilization Summary ◦ Overall load average
Netstat Report	◦ Packets In ◦ Packets Out ◦ Packets Dropped ◦ MTU ◦ Overall Health by pkts drop

Metrics	Summary
ETCD Arbitrators	Health for all ETCD Arbitrators configured for GR systems which has auto-switchover enabled.
Top 10 Process Analysis	Top 10 CPU/MEM processes

Debug OpenSAF

If directed by GPS to make changes to OpenSAF on your device, RAMP provides a utility for this purpose.

To run the OpenSAF utility:

- 1. Access RAMP as the root user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the root user.
- 2. View OpenSAF commands:

```
/opt/sonus/ems/conf/manage0saf.sh
```

Sample output:

```
# /opt/sonus/ems/conf/manage0saf.sh

*****
*****
***
*** 1.  Disable OpenSAF (disables the link) ***
*** 2.  Disable & Stop OpenSAF             ***
*** 3.  Enable OpenSAF                     ***
*** 4.  Start OpenSAF                      ***
*** 5.  EMS Status Check                   ***
*** 6.  OpenSAF status check                ***
*** 7.  Stop EMS(w/o OpenSAF)              ***

Which action do you want to perform :
```

- 3. Enter the number for the option requested by GPS.
The output from the utility depends on the chosen option. Continue to work with GPS on the next steps to take.

Tools Troubleshooting

This page provides information on Tools issues on Ribbon Application Management Platform (RAMP) and handling solutions.

Issue	Solution
I am not receiving Call Trace information. I only receive error messages.	Check the Call Trace error log file. <code><BASE_DIR>/weblogic/callTraceSlave/ctslave.log.err</code>
What do I do if the user gets “ERROR:INTERNAL:NFS server(s) may not be configured properly. Inform System Administrator to consult error logs.”	Check the Call Trace error log file. <code><BASE_DIR>/weblogic/callTraceSlave/ctslave.log.err</code>
Error “server is busy processing another request.”	By default, only two users are allowed to use the Call History tool simultaneously due to the excessive load it creates on RAMP. This error means that two other RAMP users are using the Call History tool and you should wait a few seconds before trying again.
Create Report dialog remains blank for about 30 seconds after coming up.	This means that the primary or the secondary NFS is down and the Call History tool is timing out while trying to automount the file systems. The dialog should be populated with information after the timeout period.
It takes a long time for the CDRs to get displayed after inputting filters and clicking OK in the Create Report dialog.	If the filters are too broad, then a large number of CDRs need to be formatted and displayed on the HTML page, which could take a while. Try providing narrower filters which will return less number of records.
Trunk Group Rename > Failure to rename the trunk group on the PSX.	Verify that the PSX is properly configured on the GSX and RAMP. Verify that the trunk group you are renaming exists on the PSX and is associated with the GSX gateway. If the renaming operation failed due to a primary/replica replication failure, consult the PSX documentation set for information concerning recovery from primary/replica replication failures

RAMP will not start if it cannot establish a connection to its Database Instance. Any one of a number of problems can prevent RAMP from establishing a connection to the database.

These problems include:

- Configuration Errors.
- One of the required database processes are not running.

Unlock or Recover a User Account for Sysadmin or Any Admin User

This procedure is intended for VMware, KVM, RHEV, and OpenStack sysadmin or admin users to unlock their accounts when the password has expired or they exceeded the number of password attempts.

Perform the following procedure to recover a locked admin or sysadmin user.

Note

Use IDRAC virtual console or an equivalent remote access controller virtual console to get the grub menu for ROHOS host OS user recovery

The grub parameters in grub menu entry may vary from Host OS to Guest OS.

This procedure is applicable for all supported platforms like VMware, KVM, RHEV, and OpenStack platforms.

Start

1. Log on to the cockpit of the KVM hypervisor or an equivalent Virtual Machine (VM) manager for different hypervisors.
2. Select the required VM.
3. Open the serial console and reset or reboot the Virtual machine.
4. Press the **e** key to edit on the GRUB 2 boot screen:

```
Red Hat Enterprise Linux (4.18.0-477.27.1.el8_8.x86_64) 8.8 (0otpa)
Red Hat Enterprise Linux (0-rescue-d0f44f32d4a540bcaa411f2c5d9a9ec1) 8.8→

Use the ↑ and ↓ keys to change the selection.
Press 'e' to edit the selected item, or 'c' for a command prompt.
The selected entry will be started automatically in 1s.
```

5. Provide the GRUB root credentials using the default username as `root` and the default password as `shipped`. For the ROHOS host default grub credentials, the username as `root` and the password as `ribbon`.

6. Delete the highlighted text in the following screen:

```
load_video
set gfx_payload=keep
insmod gzio
linux ($root)/vmlinuz-4.18.0-477.27.1.el8_8.x86_64 root=/dev/mapper/vg00-root \
ro console=tty0 splash=silent showopts intel_iommu=on iommu=pt nmi_watchdog=0 \
rd.live ram rd.lvm.lv=vg00/root biosdevname=0 net.ifnames=0 console=tty0 console=ttyS0 crashkernel=auto NOHZ=OFF pti=on audit=1 audit_backlog_limit=8192 ipv6.disable=0 fips=1 boot=UUID=28515e7c-6388-425c-80a6-627a186463a6 page_poison=1 vsyscall=none slub_debug=P
initrd ($root)/initramfs-4.18.0-477.27.1.el8_8.x86_64.img $tuned_initrd

Press Ctrl-x to start, Ctrl-c for a command prompt or Escape to
discard edits and return to the menu. Pressing Tab lists
possible completions.
```

7. Add the following parameters at the end of the Linux command.

```
rd.break
rd.lvm.lv=vg00/var_log
```

```
load_video
set gfx_payload=keep
insmod gzio
linux ($root)/vmlinuz-4.18.0-477.27.1.el8_8.x86_64 root=/dev/mapper/vg00-root \
ro console=tty0 splash=silent showopts intel_iommu=on iommu=pt nmi_watchdog=0 \
rd.live ram rd.lvm.lv=vg00/root rd.lvm.lv=vg00/var_log biosdevname=0 net.ifnames=0 crashkernel=auto NOHZ=OFF pti=on audit=1 audit_backlog_limit=8192 ipv6.disable=0 fips=1 boot=UUID=28515e7c-6388-425c-80a6-627a186463a6 page_poison=1 vsyscall=none slub_debug=P rd.break
initrd ($root)/initramfs-4.18.0-477.27.1.el8_8.x86_64.img $tuned_initrd

Press Ctrl-x to start, Ctrl-c for a command prompt or Escape to
discard edits and return to the menu. Pressing Tab lists
possible completions.
```

8. When the system is ready, press **Ctrl+x** to boot the system with the changed parameters.
9. If the file system is read-only and is mounted on `/sysroot/`. Mount the `var_log lvm` since faillock tally directory exist on `/var/log/`. Remount the file system as writable and Enter chroot system:

```
switch_root:/# mount -o remount,rw /sysroot
switch_root:/# mkdir -p /sysroot/var/log/
switch_root:/# mount /dev/vg00/var_log /sysroot/var/log/
switch_root:/# chroot /sysroot
```

10. To unlock:
- A specific user:

```
faillock --reset --user <USERNAME>
```

- b. A sysadmin user

Example

```
faillock --reset --user sysadm
```

- c. All locked users:

```
faillock --reset
```

11. Force the file-system relabeling:

```
touch /.autorelabel
```

12. Use the `exit` command to exit the `chroot` system.

13. Unmount the logical volume:

```
#umount /sysroot/var/log
```

14. Run the reboot command to reboot the server.

Wait for the file-system relabeling to complete. Depending on your system speed and number of files this might take some time. Be patient.

15. Log on after the system reboots.

This guide is intended for users with RAMP administrator privileges to perform administrative tasks required to manage Ribbon Application Management Platform (RAMP).

Accessing RAMP VNF Using Active Directory

The Ribbon Application Management Platform (RAMP) allows user authentication through an active directory. The default authentication mechanism on Linux systems is through the local system database: `/etc/passwd` and `/etc/shadow`. All the systems, applications, and operational users are authenticated using the local database. This process is extended by using Microsoft Active Directory or any other equivalent tool if your Linux system is registered with such an active directory domain.

Using the procedure on this page, configure the Linux system to register in the Active Directory domain and enable extending user authentication to be performed from the Active Directory Domain Controller (ADDC). Then, active directory users are allowed access to the Linux system.

SAMBA and Winbind are used to add the Linux system to the active directory and for user authentication.

Prerequisites

To register a linux system to the ADDC and centralized authentication:

- The Windows Server is installed.
- Networks are configured in the Windows Server, including Internet Protocol (IP), Netmask, and Gateway.
- ADDC is installed on the Windows Server.
- The Domain Name Server (DNS) is configured in the Windows Server, DNS pointing to the active directory server (if DNS is hosted in the domain controller).
- The Windows Server is configured as the domain controller.
- The domain name for ADDC is set.
- The clock is synchronized between the Linux system and the active directory server.

- You are able to reach (ping) the Linux system from the Windows Server.
- Create operational users from the active directory. Only these users are authenticated through the active directory.
- Provide passwords to the active directory users while adding them.

The procedure to configure the Linux system is based on the example values provided in this table for the active directory server. Replace all these example values according to your active directory and Linux parameters.

Parameters with Example Values

Parameter	Example Value
Active Directory Domain name	sonusqa.net
Domain Netbios name	sonusqa
Windows Server computer name	PSXAD2019
Short Domain name	testdom
Windows Server admin user name	administrator
Linux Hostname	cmpsource

Note

The procedure is based on Windows server 2012 R2 active directory server.

Note

You are allowed to provide a Hostname for the Linux system up to 15 characters. For more information, refer to <https://learn.microsoft.com/en-us/troubleshoot/windows-server/active-directory/naming-conventions-for-computer-domain-site-ou>.

Configure the Linux System

Perform this procedure to register the Linux system to the active directory domain on the Linux system:

Start

1. Log on to the Linux system as `root` user.
2. To ensure the RPM Package Managers (RPM) are installed, use the command:

Example:

```
rpm -qa | grep samba
```

Example output:

```
samba-ldb-ldap-modules
samba-common-libs
samba-winbind-clients
samba-common
samba-client-libs
samba-winbind
samba-client
samba-libs
samba-dcerpc
samba-winbind-modules
samba
samba-common-tools
```

3. Ensure the Windows active directory server IP address is reachable (ping) from the Linux system:

```
ping <Windows Server IP>
```

4. Create a backup directory to store all the files that may change as part of this procedure:

```
mkdir backup
```

5. Backup the files to the newly created `backup` directory:

```
cp --parents -p /etc/hosts backup
cp --parents -p /etc/resolv.conf backup
cp --parents -p /etc/samba/smb.conf backup
cp --parents -p /etc/nsswitch.conf backup
cp --parents -p /etc/pam.d/fingerprint-auth backup
cp --parents -p /etc/pam.d/smartcard-auth backup
cp --parents -p /etc/pam.d/password-auth backup
cp --parents -p /etc/pam.d/system-auth backup
```

6. To ensure the Linux system resolves the hostname for the ADCC, configure the `/etc/hosts` file:

```
127.0.0.1      "linux-hostname"."Active Directory Domain name" "linux-hostname"
host_IP "linux-hostname"."Active Directory Domain name" "linux-hostname"
```

```
Windows server IP    "Windows Server computer name" "Windows Server computer
name"."Active Directory Domain name" "Domain netbios name" "Domain netbios name
in caps" "Active Directory Domain name"
```

Verify the file: `/etc/hosts` :

Note

The names are provided based on the Example Values table. Replace all these example values according to your active directory and Linux parameters.

```
127.0.0.1    localhost
::1         localhost
127.0.0.1    localhost.localdomain
172.19.52.153 cmpsource cmpsource.localdomain
10.54.48.246 PSXAD2019 PSXAD2019.sonusqa.net sonusqa SONUSQA sonusqa.net
```

7. Verify the IP address of the active directory in the `/etc/resolve.conf` file:

Note

Ribbon recommends adding the name server details to the heat template while creating the instance.

For KVM/VMware deployments, do this through the `configdrive.iso` file.

```
nameserver <IP address of the Windows Active Directory server>
```

Example:

```
nameserver 10.54.48.246
```

8. Provide the Windows Server name to ensure it is reachable (ping) and the DNS is resolved:

```
ping "<Windows Server name>". "<Active Directory Domain name>"
```

The ping and name resolution must be successful.

Note

The server time offset should be minimal or zero. If it is not zero, ensure the clock time in the Windows Server is correct, the Network Time Protocol (NTP) server is up and running, and the time zone is configured accurately in the Linux host.

Ensure the `chronyd.service` is running.

Ensure the NTP is in the synchronized state. To synchronize, refer to [Synchronize RAMP with the NTP Server](#).

9. Configure the active directory domain name, realm, and User Identification (UID) mapping in the SAMBA configuration file: `/etc/samba/smb.conf` based on the following table:

Active Directory Configuration Parameters

Parameter	Default Value	Description
Workgroup		The domain Netbios name. The workgroup for the client, You can specify the <code>Netbios</code> name of the domain or a short domain name.
realm		Active Directory Domain name. The domain the client is a part-of. Provide the full domain name.
client user spnego	Yes	To enable Simple and Protected NEGOTiation.
winbind enum users	Yes	If the <code>winbind enum</code> users parameter is No , the calls to the <code>getpwent</code> system call does not return any data. If set to Yes , the " <code>getent passwd</code> " query lists all the users (including the active directory users).
winbind enum groups	Yes	To return all groups (including the active directory group) when queried using " <code>getent group</code> ".
winbind use default domain	No	If set to No (recommended), always specify the active directory users along with the domain name. For example, " <code>DOMAIN_NAME+ADusername</code> ".

Parameter	Default Value	Description
winbind separator	+	Separator for winbind between the DOMAIN_NAME and the AD_USERNAME . For example, " DOMAIN_NAME+ADusername "
idmap config * : backend	tdb	The mapping mechanism between the User id (UID) and the Test DB (tdb) is Test DB. It enables to allocate the user IDs of the new active directory users.
idmap config * : range		The UID range allocated to the active directory users. In Lintel systems, the UID range for users is specified in the file: /etc/login.defs . Adjust the range according to your preference: Non lintel systems: 1500-2000 Lintel systems: 1000-60000
template shell	/bin/bash	Specifies the shell to allocate for a new user: /bin/bash

To configure, replace the workgroup and realm to suit your environment and run:

```
cat >/etc/samba/smb.conf
```

Example:

```
cat >/etc/samba/smb.conf << EOF
[global]
workgroup = SONUSQA
realm = SONUSQA.NET
netbios name = SANRAMPTest
security = ADS
client use spnego = yes
server signing = auto
server string = Samba Server
winbind enum users = yes
winbind enum groups = yes
winbind use default domain = no
winbind separator = +

idmap config * : backend = tdb
```

```
idmap config * : range = 1500-2000

template shell = /bin/bash
EOF
```

10. Update the `krb5.conf` with the active directory domain name:

Example output:

```
# cat /etc/krb5.conf
# To opt out of the system crypto-policies configuration of krb5, remove the
# symlink at /etc/krb5.conf.d/crypto-policies which will not be recreated.
includedir /etc/krb5.conf.d/

[logging]
    default = FILE:/var/log/krb5libs.log
    kdc = FILE:/var/log/krb5kdc.log
    admin_server = FILE:/var/log/kadmind.log

[libdefaults]
    dns_lookup_realm = false
    ticket_lifetime = 24h
    renew_lifetime = 7d
    forwardable = true
    rdns = false
    pkinit_anchors = FILE:/etc/pki/tls/certs/ca-bundle.crt
    spake_preauth_groups = edwards25519
#    default_realm = EXAMPLE.COM
    default_ccache_name = KEYRING:persistent:%{uid}
    default_realm = SONUSQA.NET
    dns_lookup_realm = false
    dns_lookup_kdc = true

[realms]
SONUSQA.NET = {
    kdc = PSXAD2019.sonusqa.net
    admin_server = PSXAD2019.sonusqa.net
}

[domain_realm]
.sonusqa.net = SONUSQA.NET
sonusqa.net = SONUSQA.NET
```

11. Join the domain, for example: sonusqa.net from the Linux system:

Note

To join the Linux system to the active directory domain, you must know the Windows Server user name and password with administrative privileges. For example in this instance: The user name is "administrator" and the password is "administrator".

Example:

```
net ads join -S "<Windows Server computer name>".<Active Directory Domain name>"  
-U administrator
```

The system prompts you to provide the password:

Example:

```
net ads join -S PSXAD2019.sonusqa.net -U Administrator
```

Note

This is an expected warning and can be ignored:
DNS update failed: NT_STATUS_UNSUCCESSFUL

12. To verify the success of the `net ads join -S "<Windows Server computer name>"` command:

```
net ads testjoin
```

Example output:

```
Join is OK
```

13. Ensure that the Name Service Switch (NSS) configuration file: `/etc/authselect/user-nsswitch.conf` is having an entry pointing to `winbind` for password, group, and shadow database. Edit and add `winbind` database for password, group, and shadow. Ensure the file: `/etc/authselect/user-nsswitch.conf` is having these entries.
- a. Copy the `/etc/nsswitch.conf` file to `/etc/authselect/user-nsswitch.conf`:

```
yes | cp /etc/nsswitch.conf /etc/authselect/user-nsswitch.conf  
cp: overwrite '/etc/authselect/user-nsswitch.conf'?
```

- b. Append `winbind` details in `/etc/authselect/user-nsswitch.conf`:

```
passwd:    files winbind  
shadow:    files winbind  
group:     files winbind
```

Here the order of the database in the file is important, because it directs the system to first go for local authentication, if it fails then tries `winbind` authentication from the active directory.

14. Recheck to ensure all the information is correct:

```
net ads info
```

Example output:

```
# net ads info
LDAP server: 10.54.48.246
LDAP server name: PSXAD2019.SONUSQA.NET
Realm: SONUSQA.NET
Bind Path: dc=SONUSQA,dc=NET
LDAP port: 389
Server time: Mon, 25 Nov 2024 20:27:38 IST
KDC server: 10.54.48.246
Server time offset: 712
Last machine account password change: Mon, 25 Nov 2024 19:56:04 IST
```

15. Start and enable the `winbind` service:

```
systemctl enable winbind
systemctl start winbind
systemctl status winbind
```

Example output:

```
# systemctl enable winbind
Created symlink /etc/systemd/system/multi-user.target.wants/winbind.service → /usr/lib/systemd/system/winbind.service.
# systemctl start winbind
# systemctl status winbind
• winbind.service - Samba Winbind Daemon
   Loaded: loaded (/usr/lib/systemd/system/winbind.service; enabled; vendor preset: disabled)

```

16. Verify if the the system is able to access the active directory:

- a. Check if the trust secret through RPC calls succeeded:

```
wbinfo -t
```

Example output:

```
checking the trust secret for domain SONUSQA via RPC calls succeeded
```

- b. List the active directory groups:

```
wbinfo -g
```

Example output:

```

SONUSQA+domain computers
SONUSQA+domain controllers
SONUSQA+schema admins
SONUSQA+enterprise admins
SONUSQA+cert publishers
SONUSQA+domain admins
SONUSQA+domain users

```

```

SONUSQA+domain guests
SONUSQA+group policy creator owners
SONUSQA+ras and ias servers
SONUSQA+allowed rodc password replication group
SONUSQA+denied rodc password replication group
SONUSQA+read-only domain controllers
SONUSQA+enterprise read-only domain controllers

```

17. To create a user's home directory if it does not already exist when an active directory user logs on to the RAMP, append, `session required pam_mkhomedir.so skel=/etc/skel/ umask=002` in the file: `/etc/pam.d/password-auth` :

```
cat /etc/pam.d/password-auth
```

Example output:

```

# Generated by authselect on Tue Nov 26 05:01:30 2024
# Do not modify this file manually.

auth      required                                pam_env.so
auth      required                                pam_faildelay.so
delay=2000000
auth      sufficient                              pam_unix.so nullok
auth      [default=1 ignore=ignore success=ok]    pam_usertype.so isregular
auth      sufficient                              pam_winbind.so
use_first_pass
auth      required                                pam_deny.so

account   required                                pam_unix.so broken_shadow
account   sufficient                              pam_localuser.so
account   sufficient                              pam_usertype.so issystem

session      required      pam_mkhomedir.so skel=/
etc/skel/ umask=002

```

18. If the line, `AllowUsers` exists in the file: `/etc/ssh/sshd_config` comment it. Additionally, set `UseDNS` as `no` and `ChallengeResponseAuthentication` as `no` in the same file. Restart the SSH daemon to apply the changes: and restart the `sshd`.

For example:

Before commenting:

```
AllowUsers admin postgres insight guouser
```

After commenting:

```
#AllowUsers admin postgres insight guouser
```

- a. Update `UseDNS` and `ChallengeResponseAuthentication` in `/etc/ssh/sshd_config`:

```
UseDNS no

ChallengeResponseAuthentication no
```

- b. Restart `sshd`:

```
systemctl restart sshd
```

- c. Check the status of `sshd`:

```
systemctl status sshd
```

Example output:

```

sshd.service - OpenSSH server daemon
  Loaded: loaded (/usr/lib/systemd/system/sshd.service; enabled; vendor
 preset: enabled)
  Active: active (running) since Mon 2024-11-25 20:34:10 IST; 8s ago
    Docs: man:sshd(8)
          man:sshd_config(5)

```

```

Main PID: 204508 (sshd)

Nov 25 20:34:10 cmpsource sshd[204508]: Server listening on :: port 22.
Nov 25 20:34:10 cmpsource systemd[1]: Started OpenSSH server daemon.

```

19. To provide a sudo privilege for a specific active directory user, at the end of the `/etc/sudoers` file, include the following:

```
<Domain Netbios name>+<ADuser_name> ALL=(ALL) ALL
```

20. To provide a sudo privilege for all the users of an active directory group, at the end of the `/etc/sudoers` file, include the following:

```
%ActiveDirectoryUserGroup ALL=(ALL:ALL) ALL
```

Example output:

```
%SONUSQA+domain\ users ALL=(ALL:ALL) ALL

%Linux\ Admins ALL=(ALL:ALL) NOPASSWD:ALL
```

Where, "SONUSQA+domain\ users" and "Linux Admins" are group names in the active directory.

21. To provide `su` privileges to an active directory user, comment the following lines in the file: `/etc/pam.d/su`.

```
auth          sufficient      pam_wheel.so trust use_uid
auth          required        pam_wheel.so  use_uid
```

22. Copy the active directory configurations to the file: `/opt/raid` :

```
cp -pr /opt/rbbn/ems/conf/docker/activedirectory/ /opt/raid/
```

Example output:

```
#cp -pr /opt/rbbn/ems/conf/docker/activedirectory/ /opt/raid/
```

```

[2024-11-13 08:38:20 root@cmpsource: /opt/raid ]# cd /opt/raid/

```

23. Change your directory to: `/opt/raid/activedirectory`:

```
cd /opt/raid/activedirectory
```

24. Create a directory `files` in the directory: `/opt/raid/activedirectory`:

```
mkdir files
```

25. Change the owner details to `insight`:

```
chown insight:insight files
```

Example output:

```
[2024-11-13 08:38:27 root@cmpsource: /opt/raid ]# cd /opt/raid/activedirectory
[2024-11-13 08:41:38 root@cmpsource: /opt/raid/activedirectory ]# mkdir files
[2024-11-13 08:42:05 root@cmpsource: /opt/raid/activedirectory ]# chown

```

26. Update the password in the file: `/opt/raid/activedirectory/activedirectoryConfig.yml` :

Update password and domain in `/opt/raid/activedirectory/activedirectoryConfig.yml`

Example output:

```
cat /opt/raid/activedirectory/activedirectoryConfig.yml
files_to_move:
- src: activedirectory/files/smb.conf
  dest: /etc/samba/smb.conf
- src: activedirectory/files/krb5.conf
  dest: /etc/krb5.conf
- src: activedirectory/files/nsswitch.conf
  dest: /etc/authselect/user-nsswitch.conf
- src: activedirectory/files/password-auth
  dest: /etc/pam.d/password-auth
- src: activedirectory/files/sshd_config
  dest: /etc/ssh/sshd_config
- src: activedirectory/files/sudoers
  dest: /etc/sudoers
password: U29udXNAMTIz
domain: PSXAD2019.sonusqa.net
```

27. Backup the current active directory configurations to the directory `/opt/raid/` . These backed up configurations are used to retain the configurations after a RAMP upgrade:

`/opt/raid/activedirectory/activedirectoryConfiguration.sh -a`

Example output:

```
[2024-11-13 08:44:20 root@cmpsource: /opt/raid/activedirectory ]# /opt/raid/
activedirectory/activedirectoryConfiguration.sh -a
[2024-11-13 08:44:42 root@cmpsource: /opt/raid/activedirectory ]#
[2024-11-13 08:45:16 root@cmpsource: /opt/raid/activedirectory ]# ls -ltr files/
total 24
-rw-r-----. 1 root root  385 Nov 13 08:19 smb.conf
-rw-r-----. 1 root root 5458 Nov 13 08:20 sshd_config
-rw-r-----. 1 root root  891 Nov 13 08:21 krb5.conf
-rw-r-----. 1 root root 1845 Nov 13 08:26 password-auth
-rw-r-----. 1 root root 2976 Nov 13 08:26 nsswitch.conf
[2024-11-13 08:45:26 root@cmpsource: /opt/raid/activedirectory ]#
```

28. Enable `winbind` authentication and creation of user's home directory:

```
authselect select --force winbind with-mkhomedir
```

Example output:

```
# authselect select --force winbind with-mkhomedir
Backup stored at /var/lib/authselect/backups/2024-11-24-03-56-12.H1FwMi
Profile "winbind" was selected.
The following nsswitch maps are overwritten by the profile:
- passwd
- group

Make sure that winbind service is configured and enabled. See winbind
documentation for more information.

- with-mkhomedir is selected, make sure pam_oddjob_mkhomedir module
  is present and oddjobd service is enabled and active
- systemctl enable --now oddjobd.service
```

29. To enable and start the `oddjobd` service immediately:

```
systemctl enable --now oddjobd.service
```

Example output:

```
# systemctl enable --now oddjobd.service
```

```
Created symlink /etc/systemd/system/multi-user.target.wants/oddjobd.service → /usr/lib/systemd/system/oddjobd.service.
```

30. Apply the changes:

```
authselect apply-changes
```

Example output:

```
authselect apply-changes

Changes were successfully applied.
```

31. List of bus services before restarting `dbus` :

```
busctl | grep ^: | awk '{ print $6 }' | sort -u | tee /tmp/before
```

Example output:

```
# busctl | grep ^: | awk '{ print $6 }' | sort -u | tee /tmp/before
init.scope
NetworkManager.service
oddjobd.service
polkit.service
session-134.scope
systemd-logind.service
timedatex.service
user@0.service
user@1001.service
user@2056.service
```

32. Restart the `dbus` service:

```
systemctl restart dbus
```

33. List the bus services after restarting `dbus` :

```
busctl | grep ^: | awk '{ print $6 }' | sort -u | tee /tmp/after
```

Example output:

```
# busctl | grep ^: | awk '{ print $6 }' | sort -u | tee /tmp/after
crond.service
init.scope
oddjobd.service
opensafed.service
polkit.service
session-134.scope
timedatex.service
```

34. Identify and restart services that are in before but not in `after`, using `join` to compare the two lists:

```
systemctl restart $(join -v 1 /tmp/before /tmp/after)
```

35. Verify the RAMP `ssh` login using active directory. Refer to [Authenticating an Active Directory User](#)

Reconfiguring Active Directory

Use this procedure to reconfigure the active directory on the Ribbon Application Management Platform (RAMP).

Start

1. Configure the active directory:

```
/opt/raid/activedirectory/activedirectoryConfiguration.sh all
```

Example output:

```
/opt/raid/activedirectory/activedirectoryConfiguration.sh all
```

2. Verify the RAMP `ssh` login using active directory. Refer to, [Authenticating an Active Directory User](#).

Authenticating an Active Directory User

Use this procedure to log on to the Ribbon Application Management Platform (RAMP) using `ssh` with an active directory username.

Start

1. Test if the authentication for an active directory user is successful using the loopback address (127.0.0.1):

```
ssh DOMAIN_NAME+ADuser_name@127.0.0.1
```

When prompted, provide a valid password for a successful login:

```
DOMAIN_NAME+ADaduser_name@127.0.0.1's password:
```

Example output:

```
# ssh SONUSQA+sanjays@127.0.0.1
The authenticity of host '127.0.0.1 (127.0.0.1)' can't be established.
ECDSA key fingerprint is SHA256:RoUCVv27wGhkyWoqWPm30tGMj/d40Q6xi0emj+nABYw.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '127.0.0.1' (ECDSA) to the list of known hosts.
SONUSQA+sanjays@127.0.0.1's password:
*****

```

2. Test for successful authentication of an active directory user with the RAMP IP address:

```
ssh DOMAIN_NAME+ADuser_name@<RAMP IP Address>
```

When prompted, provide a valid password for a successful login:

```
ssh DOMAIN_NAME+ADuser_name@<RAMP IP Address>
```

Example output:

```
ssh SONUSQA+sanjays@172.19.52.153
Warning: Permanently added '172.19.52.153' (ECDSA) to the list of known hosts.
SONUSQA+sanjays@172.19.52.153's password:
X11 forwarding request failed on channel 0
```

```

Accessing RAMP CNF Using Active Directory

The Ribbon Application Management Platform (RAMP) allows user authentication through an active directory. The default authentication mechanism on Linux systems is through the local system database: `/etc/passwd` and `/etc/shadow`. All the systems, applications, and operational users are authenticated using the local database. This process is extended by using Microsoft Active Directory or any other equivalent tool if your Linux system is registered with such an active directory domain.

Using the procedure on this page, configure the Linux system to register in the Active Directory domain and enable extending user authentication to be performed from the Active Directory Domain Controller (ADDC). Then, active directory users are allowed access to the Linux system.

SAMBA and Winbind are used to add the Linux system to the active directory and for user authentication.

Prerequisites

To register a linux system to the ADDC and centralized authentication:

- The Windows Server is installed.
- Networks are configured in the Windows Server, including Internet Protocol (IP), Netmask, and Gateway.
- ADDC is installed on the Windows Server.
- The Domain Name Server (DNS) is configured in the Windows Server, DNS pointing to the active directory server (if DNS is hosted in the domain controller).
- The Windows Server is configured as the domain controller.
- The domain name for ADDC is set.
- The clock is synchronized between the Linux system and the active directory server.
- You are able to reach (ping) the Linux system from the Windows Server.
- Create operational users from the active directory. Only these users are authenticated through the active directory.
- Provide passwords to the active directory users while adding them.

The procedure to configure the Linux system is based on the example values provided in this table for the active directory server. Replace all these example values according to your active directory and Linux parameters.

Parameters with Example Values

Parameters	Example Value
Active Directory Domain name	sonusqa.net
Domain Netbios name	sonusqa
Windows Server computer name	PSXAD2019
Short Domain name	testdom
Windows Server admin user name	administrator
Linux Hostname	cmpsource

Note

The procedure is based on Windows server 2012 R2 active directory server.

Note

You are allowed to provide a Hostname for the Linux system up to 15 characters. For more information, refer to <https://learn.microsoft.com/en-us/troubleshoot/windows-server/active-directory/naming-conventions-for-computer-domain-site-ou>.

Configure the Linux System

Perform this procedure to register the Linux system to the active directory domain on the Linux system:

Start

1. Log on to the RAMP container using the command `oc exec :`

```
oc exec -it <pod_name> -n <namespace> -- /bin/bash
```

2. To ensure the RPM Package Managers (RPM) are installed, use the command:

Example:

```
rpm -qa | grep samba
```

Example output:

```
samba-ldb-ldap-modules
samba-common-libs
samba-winbind-clients
samba-common
samba-client-libs
samba-winbind
samba-client
samba-libs
samba-dcerpc
samba-winbind-modules
samba
samba-common-tools
```

3. Ensure the Windows active directory server IP address is reachable (ping) from the Linux system:

```
ping <Windows Server IP>
```

4. Create a backup directory to store all the files that may change as part of this procedure:

```
mkdir backup
```

5. Backup the files to the newly created `backup` directory:

```
cp --parents -p /etc/hosts backup
cp --parents -p /etc/resolv.conf backup
cp --parents -p /etc/samba/smb.conf backup
cp --parents -p /etc/nsswitch.conf backup
cp --parents -p /etc/pam.d/fingerprint-auth backup
cp --parents -p /etc/pam.d/smartcard-auth backup
cp --parents -p /etc/pam.d/password-auth backup
cp --parents -p /etc/pam.d/system-auth backup
```

6. To add the active directory server details in the RAMP host file and DNS file, refer to [Custom Host and DNS Configuration for Kubernetes Pods](#).
7. To ensure the Linux system resolves the hostname for the ADCC, configure the `/etc/hosts` file:

```
127.0.0.1      "linux-hostname"."Active Directory Domain name" "linux-hostname"
host_IP "linux-hostname"."Active Directory Domain name" "linux-hostname"
Windows server IP "Windows Server computer name" "Windows Server computer
name"."Active Directory Domain name" "Domain netbios name" "Domain netbios name
in caps" "Active Directory Domain name"
```

Verify the file: `/etc/hosts` :

Note

The names are provided based on the Example Values table. Replace all these example values according to your active directory and Linux parameters.

```
127.0.0.1    localhost
::1         localhost
127.0.0.1    localhost.localdomain
172.19.52.153 cmpsource cmpsource.localdomain
10.54.48.246 PSXAD2019 PSXAD2019.sonusqa.net sonusqa SONUSQA sonusqa.net
```

8. Verify the IP address of the active directory in the `/etc/resolve.conf` file:

```
nameserver <IP address of the Windows Active Directory server>
```

Example:

```
nameserver 10.54.48.246
```

9. Provide the Windows Server name to ensure it is reachable (ping) and the DNS is resolved:

```
ping "<Windows Server name>". "<Active Directory Domain name>"
```

The ping and name resolution must be successful.

The server time offset should be minimal or zero. If it is not zero, ensure the clock time in the Windows Server is correct, the Network Time Protocol (NTP) server is up and running, and the time zone is configured accurately in the Linux host.

Ensure the `chronyd.service` is running.

Ensure the NTP is in the synchronized state. To synchronize, refer to [Synchronize RAMP with the NTP Server](#).

10. Configure the active directory domain name, realm, and User Identification (UID) mapping in the SAMBA configuration file: `/etc/samba/smb.conf` based on the following table:

Active Directory Configuration Parameters

Parameter	Default Value	Description
Workgroup		The domain Netbios name. The workgroup for the client, You can specify the <code>Netbios</code> name of the domain or a short domain name.
realm		Active Directory Domain name. The domain the client is a part-of. Provide the full domain name.
client user spnego	Yes	To enable Simple and Protected NEGOTiation.
winbind enum users	Yes	If the <code>winbind enum</code> users parameter is No , the calls to the <code>getpwent</code> system call does not return any data. If set to Yes , the " <code>getent passwd</code> " query lists all the users (including the active directory users).
winbind enum groups	Yes	To return all groups (including the active directory group) when queried using " <code>getent group</code> ".
winbind use default domain	No	If set to No (recommended), always specify the active directory users along with the domain name. For example, " <code>DOMAIN_NAME+ADusername</code> ".
winbind separator	+	Separator for <code>winbind</code> between the <code>DOMAIN_NAME</code> and the <code>AD_USERNAME</code> . For example, " <code>DOMAIN_NAME+ADusername</code> "
idmap config * : backend	tdb	The mapping mechanism between the User id (UID) and the Test DB (tdb) is Test DB. It enables to allocate the user IDs of the new active directory users.

Parameter	Default Value	Description
idmap config * : range		The UID range allocated to the active directory users. In Lintel systems, the UID range for users is specified in the file: <code>/etc/login.defs</code>. Adjust the range according to your preference: Non lintel systems: 1500-2000 Lintel systems: 1000-60000
template shell	/bin/bash	Specifies the shell to allocate for a new user: <code>/bin/bash</code>

To configure, replace the workgroup and realm to suit your environment and run:

```
cat >/etc/samba/smb.conf
```

Example:

```
cat >/etc/samba/smb.conf << EOF
[global]
  unix charset = UTF-8
  dos charset = ASCII
  workgroup = SONUSQA
  realm = SONUSQA.NET
  netbios name = SANRAMPTest
  security = ADS
  client use spnego = yes
  server signing = auto
  server string = Samba Server
  winbind enum users = yes
  winbind enum groups = yes
  winbind use default domain = no
  winbind separator = +

  idmap config * : backend = tdb
  idmap config * : range = 1500-2000

  template shell = /bin/bash
EOF
```

11. Update the `krb5.conf` with the active directory domain name:

Example output:

```
# cat /etc/krb5.conf
# To opt out of the system crypto-policies configuration of krb5, remove the
# symlink at /etc/krb5.conf.d/crypto-policies which will not be recreated.
includedir /etc/krb5.conf.d/

[logging]
    default = FILE:/var/log/krb5libs.log
    kdc = FILE:/var/log/krb5kdc.log
    admin_server = FILE:/var/log/kadmind.log

[libdefaults]
    dns_lookup_realm = false
    ticket_lifetime = 24h
    renew_lifetime = 7d
    forwardable = true
    rdns = false
    pkinit_anchors = FILE:/etc/pki/tls/certs/ca-bundle.crt
    spake_preauth_groups = edwards25519
#    default_realm = EXAMPLE.COM
    default_ccache_name = KEYRING:persistent:%{uid}
    default_realm = SONUSQA.NET
    dns_lookup_realm = false
    dns_lookup_kdc = true

[realms]
SONUSQA.NET = {
    kdc = PSXAD2019.sonusqa.net
    admin_server = PSXAD2019.sonusqa.net
}

[domain_realm]
.sonusqa.net = SONUSQA.NET
sonusqa.net = SONUSQA.NET
```

12. Join the domain, for example: sonusqa.net from the Linux system:

Note

To join the Linux system to the active directory domain, you must know the Windows Server user name and password with administrative privileges. For example in this instance: The user name is "administrator" and the password is "administrator".

Example:

```
net ads join -S "<Windows Server computer name>". "<Active Directory Domain name>"
-U administrator
```

The system prompts you to provide the password:

Example:

```
net ads join -S PSXAD2019.sonusqa.net -U Administrator
```

Note

This is an expected warning and can be ignored:
DNS update failed: NT_STATUS_UNSUCCESSFUL

13. To verify the success of the `net ads join -S "<Windows Server computer name>` command:

```
net ads testjoin
```

Example output:

```
Join is OK
```

14. Ensure that the Name Service Switch (NSS) configuration file: `/etc/authselect/user-nsswitch.conf` is having an entry pointing to `winbind` for password, group, and shadow database. Edit and add `winbind` database for password, group, and shadow. Ensure the file: `/etc/authselect/user-nsswitch.conf` is having these entries.

- a. Copy the `/etc/nsswitch.conf` file to `/etc/authselect/user-nsswitch.conf`:

```
yes | cp /etc/nsswitch.conf /etc/authselect/user-nsswitch.conf  
cp: overwrite '/etc/authselect/user-nsswitch.conf'?
```

- b. Append `winbind` details in `/etc/authselect/user-nsswitch.conf`:

```
passwd:    files winbind  
shadow:    files winbind  
group:     files winbind
```

Here the order of the database in the file is important, because it directs the system to first go for local authentication, if it fails then tries `winbind` authentication from the active directory.

15. Recheck to ensure all the information is correct:

```
net ads info
```

Example output:

```
# net ads info
LDAP server: 10.54.48.246
LDAP server name: PSXAD2019.SONUSQA.NET
Realm: SONUSQA.NET
Bind Path: dc=SONUSQA,dc=NET
LDAP port: 389
Server time: Mon, 25 Nov 2024 20:27:38 IST
KDC server: 10.54.48.246
Server time offset: 712
Last machine account password change: Mon, 25 Nov 2024 19:56:04 IST
```

16. Start and enable the `winbind` service:

```
systemctl enable winbind
systemctl start winbind
systemctl status winbind
```

Example output:

```
# systemctl enable winbind
# systemctl start winbind
# systemctl status winbind

winbind.service - Samba Winbind Daemon

    Loaded: loaded (/usr/lib/systemd/system/winbind.service, enabled)

    Active: active (running)

#
```

17. Verify if the the system is able to access the active directory:
- a. Check if the trust secret through RPC calls succeeded:

```
wbinfo -t
```

Example output:

```
checking the trust secret for domain SONUSQA via RPC calls succeeded
```

- b. List the active directory groups:

```
wbinfo -g
```

Example output:

```
SONUSQA+domain computers
SONUSQA+domain controllers
SONUSQA+schema admins
SONUSQA+enterprise admins
SONUSQA+cert publishers
SONUSQA+domain admins
SONUSQA+domain users
SONUSQA+domain guests
SONUSQA+group policy creator owners
SONUSQA+ras and ias servers
SONUSQA+allowed rodc password replication group
SONUSQA+denied rodc password replication group
SONUSQA+read-only domain controllers
SONUSQA+enterprise read-only domain controllers
SONUSQA+cloneable domain controllers
SONUSQA+protected users
SONUSQA+key admins
SONUSQA+enterprise key admins
SONUSQA+dnsadmins
SONUSQA+dnsupdateproxy
```

18. To create a user's home directory if it does not already exist when an active directory user logs on to the RAMP, append, `session required pam_mkhomedir.so skel=/etc/skel/ umask=002` in the file: `/etc/pam.d/password-auth` :

```
cat /etc/pam.d/password-auth
```

Example output:

```
# cat /etc/pam.d/password-auth
#%PAM-1.0
# This file is auto-generated.
# User changes will be destroyed the next time authselect is run.
auth      required      pam_env.so
auth      sufficient    pam_unix.so try_first_pass nullok
auth      required      pam_deny.so

account   required      pam_unix.so
```

```

password    requisite    pam_pwquality.so try_first_pass local_users_only retry=3
authtok_type=
password    sufficient   pam_unix.so try_first_pass use_authok nullok sha512
shadow
password    required      pam_deny.so

session     optional     pam_keyinit.so revoke
session     required     pam_limits.so
#-session   optional     pam_systemd.so
session     [success=1 default=ignore] pam_succeed_if.so service in crond quiet
use_uid
session     required     pam_unix.so
session     required     pam_mkhomedir.so skel=/etc/skel/ umask=002

```

19. If the line, `AllowUsers` exists in the file: `/etc/ssh/sshd_config` comment it. Additionally, set `UseDNS` as `no` and `ChallengeResponseAuthentication` as `no` in the same file. Restart the SSH daemon to apply the changes: and restart the `sshd`.

For example:

Before commenting:

```
AllowUsers admin postgres insight guouser
```

After commenting:

```
#AllowUsers admin postgres insight guouser
```

- a. Update `UseDNS` and `ChallengeResponseAuthentication` in `/etc/ssh/sshd_config`:

```
UseDNS no

ChallengeResponseAuthentication no
```

- b. Restart `sshd`:

```
ps -eaf | grep sshd | grep -v grep | awk '{print $2}' | xargs kill -9
```

- c. Check the status of `sshd`:

```
ps -ef | grep sshd
```

Example output:

```
# ps -ef | grep sshd

root      359672      41  0 10:06 ?          00:00:00 runsv sshd
```

```

root      359673  359672  0 10:06 ?          00:00:00 /usr/sbin/sshd -D
root      362482  83084  0 10:07 pts/0    00:00:00 grep --color=auto sshd

```

20. To provide a sudo privilege for a specific active directory user, at the end of the `/etc/sudoers` file, include the following:

```
<Domain Netbios name>+<ADuser_name> ALL=(ALL) ALL
```

21. To provide a sudo privilege for all the users of an active directory group, at the end of the `/etc/sudoers` file, include the following:

```
%ActiveDirectoryUserGroup ALL=(ALL:ALL) ALL
```

Example output:

```

%Domain\ Users ALL=(ALL:ALL) ALL
%Domain\ Admins ALL=(ALL:ALL) NOPASSWD:ALL
%Linux\ Admins ALL=(ALL:ALL) NOPASSWD:ALL

```

Where, "Domain Users", "Domain Admins", and "Linux Admins" are group names in the active directory.

22. To provide `su` privileges to an active directory user, comment the following lines in the file: `/etc/pam.d/su`:

```

auth      sufficient      pam_wheel.so trust use_uid
auth      required        pam_wheel.so   use_uid

```

23. Update the password in the file: `/opt/raid/activedirectory/activedirectoryConfig.yml`:

```
Update password and domain in /opt/raid/activedirectory/activedirectoryConfig.yml
```

Example output:

```

cat /opt/raid/activedirectory/activedirectoryConfig.yml
files_to_move:
- src: activedirectory/files/smb.conf
  dest: /etc/samba/smb.conf
- src: activedirectory/files/krb5.conf
  dest: /etc/krb5.conf
- src: activedirectory/files/nsswitch.conf
  dest: /etc/authselect/user-nsswitch.conf

```

```

- src: activedirectory/files/password-auth
  dest: /etc/pam.d/password-auth
- src: activedirectory/files/sshd_config
  dest: /etc/ssh/sshd_config
- src: activedirectory/files/sudoers
  dest: /etc/sudoers
password: U29udXNAMTIz
domain: PSXAD2019.sonusqa.net

```

24. Backup the current active directory configurations to the directory `/opt/raid/`. These backed up configurations are used to retain the configurations after a RAMP upgrade:

```
/opt/raid/activedirectory/activedirectoryConfiguration.sh -a
```

Example output:

```

[2024-11-13 08:44:20 root@cmpsource: /opt/raid/activedirectory ]# /opt/raid/
activedirectory/activedirectoryConfiguration.sh -a
[2024-11-13 08:44:42 root@cmpsource: /opt/raid/activedirectory ]#
[2024-11-13 08:45:16 root@cmpsource: /opt/raid/activedirectory ]# ls -ltr files/
total 24
-rw-r-----. 1 root root  385 Nov 13 08:19 smb.conf
-rw-r-----. 1 root root 5458 Nov 13 08:20 sshd_config
-rw-r-----. 1 root root  891 Nov 13 08:21 krb5.conf
-rw-r-----. 1 root root 1845 Nov 13 08:26 password-auth
-rw-r-----. 1 root root 2976 Nov 13 08:26 nsswitch.conf
[2024-11-13 08:45:26 root@cmpsource: /opt/raid/activedirectory ]#

```

25. Enable `winbind` authentication and creation of user's home directory:

```
authselect select --force winbind with-mkhomedir
```

Example output:

```

# authselect select --force winbind with-mkhomedir
Backup stored at /var/lib/authselect/backups/2024-11-24-03-56-12.H1FwMi
Profile "winbind" was selected.
The following nsswitch maps are overwritten by the profile:
- passwd
- group

Make sure that winbind service is configured and enabled. See winbind
documentation for more information.

- with-mkhomedir is selected, make sure pam_oddjob_mkhomedir module

```

```
is present and oddjobd service is enabled and active
- systemctl enable --now oddjobd.service
```

26. To enable and start the `oddjobd` service immediately:

```
systemctl enable --now oddjobd.service
```

Example output:

```
# systemctl enable --now oddjobd.service
```

27. Apply the changes:

```
authselect apply-changes
```

Example output:

```
authselect apply-changes

Changes were successfully applied.
```

28. Verify the RAMP `ssh` login using active directory.. Refer to [Authenticating an Active Directory User](#).

Custom Host and DNS Configuration for Kubernetes Pods

Use this procedure to add the Active Directory server details to the `/etc/hosts` and `/etc/resolv.conf` files of the Ribbon Application Management Platform (RAMP) pod. To configure the `/etc/hosts` and DNS settings for a RAMP pod through the `values.yaml` file in a Helm chart, modify the RAMP Helm chart templates to inject the necessary configuration in to the pod's `/etc/hosts` and DNS settings. Once the configuration is complete, proceed with the RAMP instantiation procedure. Refer to [RAMP CNF - Standalone Deployment Using Helm Charts](#).

Start

Edit the RAMP `value.yaml` file.

Parameters with Example Values

Parameter	Example Value
Active Directory Domain name	sonusqa.net
Domain Netbios name	sonusqa
Windows Server computer name	PSXAD2019
Short Domain name	testdom
Windows Server admin user name	administrator
Linux Hostname	sanrampperf2-rampcnf-0
AD server	10.54.48.246

```
## @param activedirectory to enable activedirectory
## set enabled to true to use activedirectory
activedirectory:
  enabled: true
  hostAliases:
    - ip: "10.52.186.164"
      hostnames:
        - "sanrampperf2-rampcnf-0.sonusqa.net"
        - "sanrampperf2-rampcnf-0"
    - ip: "10.54.48.246"
      hostnames:
        - "psxad2019"
        - "psxad2019.sonusqa.net"
        - "sonusqa"
        - "sonusqa.net"
  dnsConfig:
    nameservers:
      - "10.54.48.246"
    # searches:
    # -
    # options:
    # - name: ndots
    #   value: "2"
```

Daily Maintenance Activities

This section describes activities you should perform on a daily basis on Ribbon Application Management Platform (RAMP).

Continuous Monitoring

The most important task to proactively maintain system health and performance is continuous (real-time) system-level monitoring enabled by the Ribbon Application Management Platform (RAMP) functions.

Continuous system monitoring typically includes the following activities:

- Monitor system traps and alarms using the RAMP Fault Management (FM) service. For information on isolating and troubleshooting system fault conditions, refer to [RAMP Alarms Guide](#).
- Monitor RAMP performance metrics using the RAMP Performance Management (PM) service, refer to [Performance Management](#).

Daily Maintenance Tasks

Perform the following tasks on a daily basis:

- Check uncleared RAMP alarms, and delete alarms that are not required.
- View the System Activity log by navigating to **System > Troubleshooting > System Activity** and selecting the **View Log** button.
- [Check RAMP status](#), the output should indicate that all components listed for the device are running.

Daily Database Backups

Ribbon recommends backing up the RAMP database on a daily basis. Refer to [Take a Backup of RAMP for Daily Maintenance](#).

How to Start and Stop RAMP

Start RAMP

Use this procedure to start Ribbon Application Management Platform (RAMP). If you have deployed RAMP with redundancy, perform this procedure on the active RAMP device.

1. Access RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Start RAMP:

```
/opt/sonus/ems/emsMgmt start
```

Stop RAMP

Use this procedure to stop Ribbon Application Management Platform (RAMP). If you have deployed RAMP with redundancy, perform this procedure on the active RAMP device.

1. Access RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Stop RAMP:

```
/opt/sonus/ems/emsMgmt stop
```

How to Start and Stop Sonus Agent

Use the following procedures if you are directed to stop or start the sonus agent.

To stop sonus agent:

1. Log on as the `Insight` user.
2. Issue the following command:

```
/opt/sonus/sonusComm/bin/sonusAgent stop
```

The following is a sample output:

```
-- Removing sonusAgent keep-alive cron job.  
-- Stopping sonusAgent...
```

To start sonus agent:

1. Log on as the `insight` user.
2. Change to the directory `/opt/sonus/sonusComm/bin` using the following command:

```
cd /opt/sonus/sonusComm/bin
```

3. Issue the following command:

```
./sonusAgent start
```

The following is sample output.

```
-- Starting sonusAgent ...  
-- Adding keep-alive cron job for sonusAgent.
```

How to Rediscover the localhost

Use the following procedure to rediscover the Ribbon Application Management Platform (RAMP) instance. When a RAMP instance is initially created, it automatically registers and discovers itself. However, after a configuration change, migration, backup and restore, or upgrade, it may become necessary to rediscover the localhost to ensure that the current parameters are stored. The "localhost" entry in the RAMP devices list refers to the RAMP instance itself. You can use the localhost entry to initiate a discovery of the RAMP instance if needed.

Prerequisites

- The device is up and running.
- Super User [privileges](#) for **Insight Administration** under **Core Resources**.
- **Devices** and **Resource Groups** [privileges](#) under **Device Management**.

Start

1. Log on to the RAMP GUI.
2. Navigate to **DEVICE MANAGEMENT > Devices**.
3. In the **Nodes** list row for the localhost (standalone or GR) you want to discover, click the ellipses (...) menu under **Action** and select **Discover**.
A success message displays.

Note

To edit RAMP registration parameters, refer to [Edit RAMP Device Registration](#).

How to Control the Network Range

Occasionally, the internal network assigned by the docker service is identical to the network used on your premises. This leads to a conflict in the network causing connectivity issues. In such a scenario, specify the docker service to pick the provided IP address from the pool for docker internal network.

The Ribbon Application Management Platform (RAMP) allows you to add a file `/opt/rbbn/dockerNetworksFile` through the user data if your internal network clashes with the networks created by the docker service.

This file validates and writes the data to the `/etc/docker/daemon.json` file.

Note

You must add a minimum of seven networks for the RAMP 24.03 release. You are allowed to add networks that suit you, but do not change the variable names.

IPv6 support is currently disabled.

Example code to write files

```
write_files:
  - path: /opt/rbbn/dockerNetworksFile
    permissions: '0744'
    owner: root:root
    content: |
      dockerNetwork1=172.37.0.0/16
      dockerNetwork2=172.38.0.0/16
      dockerNetwork3=172.39.0.0/16
      dockerNetwork4=172.30.0.0/16
      dockerNetwork5=172.31.0.0/16
      dockerNetwork6=172.32.0.0/16
      dockerNetwork7=172.33.0.0/16
```

Example creation of user data

```
#cloud-config
timezone: "Asia/Kolkata"
ntp:
  enabled: true
  ntp_client: chrony
  config:
```

```

confpath: /etc/chrony.conf
check_exe: chronyd
packages:
  - chrony
service_name: chronyd
template: |
  ## template:jinja
  # My NTP Client config
  {%- if servers %}# servers
  {% endif %}
  {% for server in servers -%}
  server {{server}} iburst
  {% endfor %}
servers:
  - 10.128.254.68
manage_resolv_conf: true
resolv_conf:
  nameservers: ['$dnsServer']
  searchdomains:
    - $dnsSearchPath
write_files:
  - path: /opt/rbbn/userData.json
    permissions: '0644'
    content: |
      {
        "IF1": {"GWV4": "10.11.14.1", "IPV4": "10.11.15.153/23","Port": "eth0"},
        "IF2": {"GWV4": "", "IPV4": "/", "Port": ""},
        "growpart": { "opt" : 60, "pgsql": 30, "home":10},
        "InstanceName": "VinayRamp"
      }
  owner: root:root
  - path: /opt/rbbn/dockerNetworksFile
    permissions: '0777'
    content: |
      dockerNetwork1=172.37.0.0/16
      dockerNetwork2=172.38.0.0/16
      dockerNetwork3=172.39.0.0/16
      dockerNetwork4=172.30.0.0/16
      dockerNetwork5=172.31.0.0/16
      dockerNetwork6=172.32.0.0/16
      dockerNetwork7=172.33.0.0/16
  owner: root:root
runcmd:
  - usermod -p '$1$admin$1kgWpnZpUx.vTroWPXIB0' admin
  - usermod -f -1 admin

```

How to Prepare RAMP for ROHOS Upgrade

This procedure is applicable only for KVM installed on the **Ribbon Dell servers**.
Skip this procedure if you are not using **Ribbon Dell servers**.

Use this procedure to prepare the Ribbon Application Management Platform (RAMP) for the Hypervisor upgrade:

Start

1. Back up the RAMP and copy the backup to a remote/external server. For more information, refer to [Take a Backup of RAMP for Daily Maintenance](#).
2. Shut down the RAMP. For more information, refer to [How to Start and Stop RAMP](#).
3. Ensure you note down the RAMP Virtual Machine (VM) name. If you are unaware of the VMs on your system, list the VMs on the host OS:

```
virsh list --all
```

4. Shut down the RAMP VM on the host OS:

```
virsh shutdown <VMName>
```

5. Perform the ROHOS upgrade procedure after the VM is powered off. For more information, refer to [Update Ribbon OEM Host OS Software](#).
6. Power on the VM after you complete the ROHOS upgrade.
7. Log on to the host OS.
8. Start the RAMP VM on the host OS:

```
virsh start <vm_name>
```

9. Observe that the RAMP starts automatically after the VM booted successfully.
10. Check the RAMP running status. For more information, refer to [Check RAMP Status](#).
11. If the RAMP fails to start, perform the [How to Start and Stop RAMP](#) procedure, to start it manually.
12. Ensure you can log in to the RAMP GUI through <https://<RAMP_IP>.

Access RAMP Database

Use this procedure to access the Ribbon Application Management Platform (RAMP) database.

Start

1. SSH to the RAMP device as the `admin` user.
2. Change to the `postgres` user:

```
sudo su - postgres
```

3. Enter the following command:

```
psql -U dbimpl -d dbimpl -h <The IP address of the RAMP host>
```

The following is an example:

```
psql -U dbimpl -d dbimpl -h 127.0.0.1
```

The following prompt displays:

```
Password for user dbimpl:
```

For the default `dbimpl` password, refer to [Manage RAMP Account Names and Passwords](#).

4. Enter the `dbimpl` password. Now you can enter postgres (RAMP database) commands.

Attach RAMP to Multiple Disjointed IP Networks

Related articles:

- [Using RAMP as a PSX Proxy](#)
- [Separation of OAM and Signaling Networks on Call Trace in RAMP](#)

Many Internet Protocol (IP) networks provide any-to-any connectivity between any two endpoints. In such an environment, a single point of attachment (Ethernet port) is required for all IP connectivity. Some IP networks, however, are configured to be segmented and disjointed from other networks for security or performance reasons. In such an environment, some nodes may need to be attached to more than one of the disjointed networks. Examples of such dedicated networks include:

- **Operations, Administration, and Management (OAM) Network** — where NOC personnel or other users may reside and access Ribbon Application Management Platform (RAMP) GUI/API/CLI services.
- **Service/Signaling Network** — where core network equipment (PSX, SBC, DSI, and so on) provide services.
- **Backup/Restoration or VM Network** — where large periodic traffic flows are isolated from other networks. The interface on this subnet is also used to backup data from the RAMP.

RAMP on OpenStack supports multiple interfaces. This handles the Lawful Interface (LI) communication on the eth1 interface. The following diagram uses a single interface to manage the devices.

IP Multimedia Subsystem (IMS) LI is not supported on the eth1 interface.

RAMP in customer network

Using RAMP as a PSX Proxy

If separate networks are configured for OAM and service equipment, then Ribbon Application Management Platform (RAMP) may need to be configured as a proxy server, so that the PSX Manager can connect to PSX through the RAMP host acting as a proxy.

In a standalone RAMP deployment with two different networks for OAM and service/signaling, PSX Manager connects to RAMP through the RAMP OAM IP address, if PSX proxy mode is enabled..

Ribbon Application Management Platform (RAMP) acts as a proxy server for both the PSX Manager and the PSX server to maintain a secured communication. If a direct/unsecured connection to PSX connection is preferred, then change the following settings as per the following table.

The proxy from RAMP is only supported for PSX Manager. The proxy is not supported for 4331 (PSX manager test db), 5330 (PSX manager shadow mode), and 3091 (ssreq).

For RAMP GR, configure active and standby nodes to act as proxy servers.

PSX Proxy parameters

Parameter	Description	Values
psxProxyEnabled	Set RAMP to act as a proxy server for PSX Manager and the PSX server. Note The parameter <code>sslProxyEnabled</code> takes precedence over <code>psxProxyEnabled</code>. If <code>psxProxyEnabled</code> is set to false and <code>sslProxyEnabled</code> is set to true RAMP uses TLS. Set the flag to false if you need a direct connection from PSX Manager to the PSX server. If you disable the <code>psxProxyEnabled</code> flag, the network traffic is not secure.	• true • false
sslProxyEnabled	Use the cryptographic protocol to secure traffic from PSX Manager to RAMP. If you set this flag to false, the traffic from PSX manager to RAMP is not secure. Note The connection uses TLS not SSL. RAMP uses the <code>sslProxyEnabled</code> variable to determine whether to establish a TLS connection. Note If <code>sslProxyEnabled</code> is set to true, for non-cloud nodes provide direct SSH login credentials in the PSX node registration page to secure the communication between RAMP and PSX.	• true • false

To configure **RAMP** to act as a proxy server, install SSH on both systems and edit the file `/opt/sonus/ems/weblogic/sonusEms/data/sys/SystemConfig.txt`. Set the following parameters in the `SystemConfig.txt`.

RAMP can act as a proxy server for both the PSX Manager and the PSX server. In such a configuration, the traffic diagram involves PSX Manager <> Insight <> PSX.

The protocol used is Ribbonproprietary PIPE messaging. You can secure the traffic from the PSX Manager to RAMP using TLS and the traffic from RAMP to the PSX using SSH.

Parameters in SystemConfig.txt

Parameter	Default Setting	Change to	
psxPorts	4330 (PSX manager PIPE server) 4331 (PSXmanagertestdb) 5330 (PSX manager shadow mode) 3091 (ssreq)	Add or change the PSX ports that the proxy is allowed to connect based on your system-wide policy server configuration.	
tcpListenPort	9000	Change only if using a different port.	—
sslListenPort	9001	Change only if using a different port.	—
proxyPreferredIp	none	This parameter allows you to set the IP address that RAMP uses when launching the PSX Mgr. Add this parameter only if RAMP has multiple IP addresses and the client workstations cannot reach the default IP address. If all PSX Mgr launch traffic is to be sent to RAMP on only an IP address then set this proxyPreferredIp in SystemConfig.txt to this IP address. Set this parameter to the well-known IP address or to the fully qualified domain name. Also, verify that all RAMP client workstations are reachable at this IP address or domain name.	
	Standalone Mode	Single Public IP	M u l t i p l e P u b l i c I P

Parameter	Default Setting	Change to	
		none	Manually configure the IP that is used by the GUI clients.

Parameter	Default Setting	Change to	
proxyPreferredIp2	none	It is potentially a second IP address used to launch the PSX Mgr depending on the IP configuration of the launching PC and RAMP. These two settings can contain an IP address (or name such as "localhost") and an optional port. If the PSX Mgr traffic is sent to RAMP on an IP address and port, defining proxyPreferredIp and proxyPreferredIp2 depends on the RAMP destination port. If the destination port is 443, which is https traffic, then define proxyPreferredIp to route to this port on RAMP. All subsequent traffic between the PSX Mgr and RAMP will be non-https traffic. proxyPreferredIp2 will need to be set to the same IP address or name but with a different port. This port may be 9001 which is for the RAMP SSH tunnel between the PSX Mgr and PSX. proxyPreferredIp and proxyPreferredIp2 can specify ports to enable communication with a tunnel configuration on the PC. For example, if the PC is on an IPv4 network and uses a jump-station to connect to RAMP IPv6 network: • local port 9990 is used to connect to the RAMP port 443 • local port 9991 is used to connect to the RAMP port 9001 proxyPreferredIp=localhost:9990 It will be matched with this Putty SSH tunnel on the PC (if the IPv6 RAMP address is 2000:184::10:158:184:30): L9990 [2000:184::10:158:184:30]:443 proxyPreferredIp2=localhost:9991 It will be matched with this Putty SSH tunnel on the PC (if the IPv6 RAMP address is 2000:184::10:158:184:30): L9991 [2000:184::10:158:184:30]:9001 The login to RAMP is initiated through https://localhost:9990/ and the PSX Mgr java application uses port 9001 between the jumpstation and RAMP.	

Parameter	Default Setting	Change to	
	Standalone Mode	Single Public IP	M u l t i p l e P u b l i c I P
		none	M a n u a l l y c o n f i g u r e t h e I P t h a t i s u s e d b y t h e G U I c l i e n t s.

After making the changes, you must stop and restart RAMP.

You also need to properly configure the Node Registration information for RAMP and the PSX on the Node Registration pages.

Refer to [Register a PSX Device](#) and [Edit RAMP Device Registration](#).

Separation of OAM and Signaling Networks on Call Trace in RAMP

The section describes a scenario where the signaling and OAM networks are separated out, and necessary updates in Ribbon Application Management Platform (RAMP) is performed to support this network.

RAMP communicates with DSI/GSX using OAM network interface. However, GSX can communicate with DSI/NFS using Signaling network.

The IP Address from the Signaling network interface are configured as primary and secondary NFS address on the RAMP node registration of the GSX.

DSI has two interfaces. One interface on OAM network for communicating with **RAMP** and other interface on Signaling network for communicating with **GSX**.

For any **GSX** CDRs, CTRs, and PIF operations, **RAMP** fetches the IP address of the configured DSI/NFS from the **GSX**.

Since **GSX** is connected to DSI using a signaling network, **GSX** responds to **RAMP** with the signaling IP of DSI when the query for DSI is configured.

Note

Call Trace Reports and Call Data Reports work in both DSI-NFS and DSI - Streaming Mode. However, PIF works only with the DSI-NFS Mode.

By default, Node registry searches only the default and secondary IPs provided during registration to search a node.

By enabling the Alternate IP Address field, you can retrieve all IPs configured for that node.

RAMP has complete list of reachable and non-reachable IPs of a node.

This enables **RAMP** to use reachable IPs of DSI even when **GSX** provides us with non-reachable IPs of DSI by comparing with the available IP list for the respective DSI.

Backup and Restore

This section includes the following Ribbon Application Management Platform (**RAMP**) backup and restore operations. These procedures also apply to the **RAMP** Cloud Native Functionality (CNF).

- [Take a Backup of RAMP for Daily Maintenance](#)
- [Take a Backup of RAMP for Upgrade](#)
- [Restore from Backup on RAMP Standalone](#)
- [Restore from Backup on RAMP GR](#)
- [Restore a Master Key File](#)
- [Restore a Master Key File \(.KF\) Manually](#)

Take a Backup of RAMP for Daily Maintenance

Use this procedure to backup the Ribbon Application Management Platform (**RAMP**) database. For **RAMP** Geographically Redundant (GR) deployments, perform this procedure on the active (source) device.

As a security measure, when backing up the database, you have the option to store the master key encryption file in a remote location separate from other backup files. To enable this option, you must generate a template file that identifies the remote location for the master key file and provide the password to access the location.

Taking a backup of the **RAMP** database does not affect other services on **RAMP**.

- The insight password is retained after restoring the backup.
- The admin password is not retained after restoring the backup; use the default password "admin" after restoring a backup and refer to [Managing RAMP Users and Accounts](#) for information on changing the password.

Prerequisites

- A host is available to store the backup files.

Note

Ensure the following folders are empty:

`/opt/raid/devmgmtbkp`

`/var/lib/pgsql/13/backups`

`/var/lib/pgsql/12/backups`

Start

1. Access RAMP as the `root` user. Refer to [Log onto the RAMP CLI](#) to access the RAMP as the `root` user.
2. Create a directory for storing backup files on the RAMP. Ensure that this directory has sufficient space for the backup files.
 - a. For cloud-based RAMP devices, use a directory under `/opt/raid`.
 - b. For non-cloud RAMP devices, use a directory under `/opt`. The following is an example:

```
mkdir -p /opt/raid/backup
```

3. (Optional) If you want to back up the master key file in a remote location, complete the following:
 - a. Navigate to the following directory:

```
cd /opt/rbbn/ems/conf/
```

- b. Generate a template file that contains backup configuration options for the key file:

```
./manualBackup.sh -g
```

Sample output

```
Generating template /opt/sonus/ems/./secureKFBackup.conf
Template Generation complete /opt/sonus/ems/./secureKFBackup.conf
```

- c. Establish a `passwordless` connection between RAMP and the remote location to which you are backing up the key file. Refer to [Establish Passwordless Connection from an External Server to RAMP](#).
- d. Edit the `/opt/sonus/ems/./secureKFBackup.conf` template file for your backup parameters:

Template file secureKFBBackup.conf

```
IP=<The IP address of the remote server.>
User=root
remote_master_key_location=<The location of the remote_master_key.>
Secure_Master_Key=true
Secure_Option=AUTOMATIC
master_key_filename=
```

Refer to the following descriptions to set the file parameters:

- `IP` - The IP address of the remote location.
- `user` - The user name to use to access the remote location to store the backup.
- `master_key_filename` - Name of the master key file to store in the secure location.

Note

The master key file name is generated automatically by the manualBackup.sh script.

- `remote_master_key_location` - The path to the remote storage location.

Note

Ensure that the path to the remote location is accessible.

- `Secure_Master_Key` - Use `true` to specify to secure the master key file separately. The available options are, "true" and "false".
- `Secure_Option` - Use AUTOMATIC to specify to store the file automatically. The available options are, "AUTOMATIC" and "MANUAL."

Example of an edited file:

```
IP=10.54.28.89
user=root
remote_master_key_location=/opt/backup
Secure_Master_Key=true
Secure_Option=AUTOMATIC
master_key_filename=
```

Note

You must provide valid data in the configuration file. Otherwise, a secure backup of the master key file will fail.

- e. Save and exit the template file.

- f. Initiate a backup with a separate master key file:

```
/etc/sonus/manualBackup.sh -b -s -d <path to backup directory>
```

Example:

```
/etc/sonus/manualBackup.sh -b -s -d /opt/raid/backup
```

When prompted, confirm that you want to take a backup of the `pm_archive` file.

When prompted, provide the password to the remote location for the master key file.

When prompted, confirm if you want to take a backup of inventory reports.

4. To initiate a backup:

- Initiate a backup without a separate master key file:

```
/etc/sonus/manualBackup.sh -b -d <path to backup directory>
```

Example output:

```
# /etc/sonus/manualBackup.sh -b -d /opt/raid/
All backup will be taken.

```

5. Copy the backup files to a remote server.

Note

Do not change any configuration on RAMP until the backup operation is complete.

The following table summarizes the parameters available with the script `manualBackup.sh` :

Options for manualBackup.sh

Parameter	Optional (O) / Mandatory (M)?	Description
-b	M	Generate the backup file.
-d	M	Directory to copy the configuration files.
-e	O	Take a backup of EdgeView.
-f	O	Take a backup of Fault Management.

Parameter	Optional (O) / Mandatory (M)?	Description
-i	O	To take a backup of the insight.
-g	O	Specify to generate a configuration template for securely backing up the master Key file. Use this separately from other options.
-l	O	Take a backup of License Management.
-n	O	Take a backup of the Device Manager.
-m	O	For migration.
-o	O	Object Store Service backup.
-j	O	Notification Service backup.
-p	O	Take a backup of Performance Management.
-q	O	Exclude the pm-archive folder in the backup tar without manually answering.
-Q	O	Exclude the pm-parquet folder in the backup tar without manually answering, without -Q, the pm-parquet will be backedup
-r	O	Include the dm inventory reports folder in the backup tar without manually answering.
-s	O	Secure a backup of the master key.
-t	O	Exclude the dm inventory reports folder in backup tar without manually answering.
-u	O	ACS backup.
-x	O	Include the pm-archive folder in backup tar without manually answering.

To restore the backup, perform one of the following:

- For RAMP standalone, refer to [Restore from Backup on RAMP Standalone](#).
- For RAMP GR, refer to [Restore from Backup on RAMP GR](#).

Take a Backup of RAMP for Upgrade

Use the following procedure to take a backup of the Ribbon Application Management Platform (RAMP) database. For RAMP Geographically Redundant (GR) deployments, perform this procedure on the active (source) device.

As a security measure when backing up the database, you can store the master key encryption file in a remote location separate from other backup files. To enable this option, generate a template file that identifies the remote location for the master key file and provide the password to access the location.

Taking a backup of the RAMP database does not affect other services on RAMP.

- The insight password is retained after restoring the backup.
- The admin password is not retained after restoring the backup. Use the default password "admin" after restoring the backup. For more information on password changes, refer to [Managing RAMP Users and Accounts](#).

Prerequisites

- A host is available to store the backup files.

Start

1. Access RAMP as the "root" user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the "root" user.
2. Upgrading from 21.11 and 22.02 to 23.0x:
 - a. Perform the pre-upgrade/pre-backup steps on the current RAMP 21.11/22.02 node.
 - i. Download the latest RAMP `rampBootstrap.tar` to RAMP 21.11/22.02.
 - ii. `tar xvf <rampBootstrap.tar> correctLmCsd.sh`
 - iii. `./correctLmCsd.sh`
 - b. Take a backup. For more information, refer to [Take a Backup of RAMP for Daily Maintenance](#).
3. To upgrade from release 22.12 and onwards, continue to the next step.
4. Create two directories.
 - a. Create a directory for storing backup files in RAMP. Ensure that this directory has sufficient space for the backup files. For non-cloud RAMP devices, use a directory under `/opt/sonus`.
 - b. Create a directory for copying bootstrap files.

Example

```
mkdir -p /opt/sonus/backup
mkdir -p /opt/sonus/BootStrap
```

5. Navigate to the BootStrap directory:

```
cd /opt/sonus/BootStrap
```

6. Download the `rampBootstrap-V<version>.tar` file for the target RAMP version.
7. Extract the `rampBootstrap-V<version>.tar` file: where <version> is the RAMP version to which you are upgrading.

```
tar -xvf rampBootstrap-V<version>.tar
```

8. Initiate a backup without a separate master key file: `/opt/sonus/BootStrap/manualBackup.sh -b -d <path to backup directory>`.

```
/opt/sonus/BootStrap/manualBackup.sh -b -d /opt/sonus/backup
```

9. Back up the master key in a remote location:

Note

This step is not needed if you perform step 8.

- a. Generate a template file that contains backup configuration options for the key file:

```
./manualBackup.sh -g
```

Sample output

```
Generating template /opt/sonus/ems/./secureKFBackup.conf
Template Generation complete /opt/sonus/ems/./secureKFBackup.conf
```

- b. Establish passwordless connection between RAMP and the remote location to which you are backing up the key file. Refer to [Establish Passwordless Connection from an External Server to RAMP](#).
- c. Edit the `/opt/sonus/ems/./secureKFBackup.conf` template file for your backup parameters:

Template file secureKFBackup.conf

```
IP=<The IP address of the remote server.>
User=root
remote_master_key_location=<The location of the remote_master_key.>
Secure_Master_Key=true
Secure_Option=AUTOMATIC
master_key_filename=
```

Refer to the following descriptions to set the file parameters:

- `IP` - The IP address of the remote location.
- `user` - The user name to use to access the remote location to store the backup.
- `master_key_filename` - Name of the master key file to store in the secure location.

Note

The master key file name is generated automatically by the manualBackup.sh script.

- `remote_master_key_location` - The path to the remote storage location.

Note

Ensure that the path to remote location is accessible.

- `Secure_Master_Key` - Use true to specify to secure the master key file separately. Options available are "true" and "false".
- `Secure_Option` - Use AUTOMATIC to specify to store the file automatically. Options are "AUTOMATIC" and "MANUAL."

The following is an example of an edited file:

```
IP=10.54.28.89
user=root
remote_master_key_location=/opt/backup
Secure_Master_Key=true
Secure_Option=AUTOMATIC
master_key_filename=
```

You must provide valid data in the configuration file. Otherwise, secure back up of the master key file will fail.

- d. Save and exit the template file.
- e. Initiate a backup with a separate master key file:

```
/opt/sonus/BootStrap/manualBackup.sh -b -s -d <path to backup directory>
```

Example

```
/opt/sonus/BootStrap/manualBackup.sh -b -s -d /opt/sonus/backup
```

When prompted, provide the password to the remote location for the master key file.

10. When prompted, confirm that you want to take a backup of the pm_archive file.
11. When prompted, confirm that if you want to take a backup of inventory reports.

The following is sample output from a backup where the master key file is stored separately:

All backup will be taken.

Taking FM backup

Taking backup of fmdb

Updating Backup with DM backup

Updating Backup with EV backup

Updating Backup with AA backup

Backup procedure completed successfully. Check `/opt/sonus/ems/logs/manualBackup.log` for more details.

12. Copy the backup files to a remote server.

Do not change any configuration on **RAMP** until the backup operation is complete.

The following table summarizes the parameters available with the script `manualBackup.sh`.

manualBackup.sh Options

Parameter	Optional (O) / Mandatory (M)?	Description
-b	M	Generate the backup file.
-d	M	Directory to copy the configuration files.
-e	O	Take a backup of EdgeView.
-f	O	Take a backup of Fault Management.
-i	O	To take a backup of the insight.
-g	O	Specify to generate a configuration template for securely backing up the master Key file. Use this separately from other options.
-l	O	Take a backup of License Management.
-n	O	Take a backup of the Device Manager.
-m	O	For migration.
-o	O	Object Store Service backup.
-p	O	Take a backup of Performance Management.
-q	O	Exclude the pm-archive folder in backup tar without manually answering.
-r	O	Include the dm inventory reports folder in the backup tar without manually answering.
-s	O	Secure a backup of the master key.

Parameter	Optional (O) / Mandatory (M)?	Description
-t	O	Exclude the dm inventory reports folder in backup tar without manually answering.
-u	O	ACS backup.
-x	O	Include the pm-archive folder in backup tar without manually answering.

To restore the backup, perform one of the following:

- For RAMP standalone, refer to [Restore from Backup on RAMP Standalone](#).
- For RAMP GR, refer to [Restore from Backup on RAMP GR](#).

Restore from Backup on RAMP Standalone

Use this procedure to restore a Ribbon Application Management Platform (RAMP) instance from a backup.

If you are restoring the backup to a new RAMP instance, the instance must include the same IP address. If the RAMP hostname is changed, manually add the insight ssh key for RAMP on every PSX at `/export/home/ssuser/.ssh/authorized_keys`.

When you restore from a backup, RAMP does not restore the following:

- Configurations associated the RHEL operating system.
- Custom Cron jobs created by RAMP users.
- Custom scripts or jobs deployed at the Linux level.

Prerequisites

- [Backup](#) files are available.
- If you have stored the master key file (.KF) separately from RAMP backup data, refer to [Restore a Master Key File](#) to collect the configuration file details that identify where to retrieve the .KF file from a remote location where it is backed up.

The Action service is enabled by default only if the backup file contains both the Action and EdgeView (EV) service tar files in the RAMP backup. If the backup file contains only the Action service tar file, then Action will not be available after the 24.03R1 upgrade.

Note

Ensure the following folders are empty:

```
/opt/raid/devmgmtbkp
```

```
/var/lib/pgsql/13/backups
```

```
/var/lib/pgsql/12/backups
```

Start

1. Access **RAMP** as the root user. Refer to [Log onto the RAMP CLI](#) for accessing **RAMP** as the root user.
2. Restore from a backup:

```
/etc/sonus/emsRestore.sh -b <Location of the directory that contains the backup.>
```

Example:

```
/etc/sonus/emsRestore.sh -b /opt/sonus/backup/
```

The following output displays:

```
....
```

```
Do you wish to continue [y|Y,n|N] ?
```

3. Enter "Y".

```
Checking if backupFiles.tar is present under "/opt/sonus/backup/"
```

```
.....
```

```
.....
```

```
Insight has been started
```

```
The Sonus Insight migration is complete. Check /opt/sonus/ems/logs/emsRestore.log  
for more details.
```

4. Rediscover the localhost, refer to [How to Rediscover the localhost](#).

You can use the command `emsRestore.sh` with the following options.

usage: `emsRestore.sh [-s] [-b backupDir] [-p proxyPreferredIp] [-h]`

Parameter	Optional (O) / Mandatory (M)?	Description
-b	M	Usage: -b <backup the directory of backupFiles.tar>
-p	O	Usage: -p <the proxy preferred IP address> Format to use: ./emsRestore.sh -b <backup dir location> -p <proxy preferred IP> Example: ./emsRestore.sh -b <backup dir location> -p <proxy preferred IP>
-s	O	Silent mode execution if used with b option. Format to use: ./emsRestore.sh -s -b <path for the backup files>
yes	O	Run restore operation in the background. Command: yes ./emsRestore.sh -b <path for the backup files> & Example: yes ./emsRestore.sh -b </opt/sonus/backup> & NOTE: This option is recommended only if you encounter a connection timeout error. The restore operation continues in the background even if a session timeout occurs.
-h	O	usage: emsRestore.sh -h

Restore from Backup on RAMP GR

Use this procedure to restore a Ribbon Application Management Platform (RAMP) geographically redundant (GR) deployment from backup files..

If you are restoring from backup to a new RAMP instance, the instance must include the same IP address. If the RAMP hostname is changed, manually add the `insight` ssh key for RAMP on every PSX at `/export/home/ssuser/.ssh/authorized_keys`.

When you restore from backup, RAMP does not restore the following:

- Configurations associated with the RHEL operating system.
- Custom Cron jobs created by RAMP users.
- Custom scripts or jobs deployed at the Linux level.

Prerequisites

- Backup files are available.

Note

Ensure the following folders are empty:

```
/opt/raid/devmgmtbkp
```

```
/var/lib/pgsql/13/backups
```

```
/var/lib/pgsql/12/backups
```

Start

1. On the active (source) instance, access RAMP as the `root` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the `root` user.
2. Restore from backup:

```
/etc/sonus/emsRestore.sh -b <Location of the directory that contains the backup.>
```

The following is an example:

```
/etc/sonus/emsRestore.sh -b /opt/raid/backup/
```

The following output displays:

```
.....
```

```
All existing Insight-controlled passwords on this box will be wiped out and
replaced with the passwords from the restored data.
```

```
#####
#####
```

```
Do you wish to continue [y|Y,n|N] ?
```

3. Enter "Y".

```
Checking if backupFiles.tar is present under "/opt/raid/backup/"
```

```
Redundancy Setup Detected; Will have to Tear-Down the setup. Do you want to
continue [y|Y,n|N]? (Default:N)
```

4. Enter "Y". The following is sample output:

```
Tearing down the setup...
```

```
.....
.....
```

```
Do you want to switch back to Redundancy Setup [y|Y,n|N]? (Default:Y)
```

5. Enter "y" and press **ENTER**. The following is sample output:

```
....
Please enter Password of admin user for all nodes (press ENTER if SSH Passwordless
login has been setup) ->
```

6. Enter the `admin` password, or press ENTER if SSH password-less login has been setup. The following is sample output:

```
[21:40:23] Building RD configuration locally .....
```

```
.....
Do you want to proceed with this setup (yes|no)? ->
```

7. Enter "yes" and press **ENTER**. The following is sample output:

```
[21:40:25] Proceed setting up the cluster with accepted configuration .....
```

```
.....
Restoring the passwords on peer nodes...
```

```
The Sonus Insight migration is complete. Check /opt/sonus/ems/logs/emsRestore.log
for more details.
```

8. Rediscover the localhost, refer to [How to Rediscover the localhost](#).

The following table summarizes the options you can use with the command `emsRestore.sh`.

emsRestore.sh Options

Parameter	Optional (O) / Mandatory (M)?	Description
-b	M	The directory for backupFiles.tar.
-p	O	Update proxy preferred IP address.
-s	O	Silent mode if used with the b option
-h	O	Lists the help topics.

Restore a Master Key File

While performing a Ribbon Application Management Platform (RAMP) backup, you can back up and store the master key file (.KF) separately from other files on a remote machine. Refer to [Take a Backup of RAMP for Daily Maintenance](#).

If you have stored the master key file (.KF) separately from RAMP backup data, follow this procedure to collect the configuration file details and the .KF file from the remote machine.

To find the remote location details, copy the `backupFiles.tar` file to the `/tmp` directory and perform the following steps:

1. Issue the following command:

```
/bin/tar -xvf /tmp/backupFiles.tar /opt/rbbn/secureKFBackup.conf
```

- If the following error message is displayed, then the backup was taken with the master key file in it. Follow [Restore a Master Key File \(.KF\) Manually](#).

Error

```
/bin/tar: opt/rbbn/secureKFBackup.conf: Not found in archive  
/bin/tar: Exiting with failure status due to previous errors
```

- If the following message is displayed, then the configuration file was extracted. Go to **Step 2**.

Error

```
/bin/tar: Removing leading `/' from member names  
/opt/rbbn/secureKFBackup.conf
```

2. Execute the following command to view the configuration properties:

```
/bin/cat /tmp/opt/rbbn/secureKFBackup.conf
```

Review the parameter settings and perform one of the following:

- If the parameters are set as "`Secure_Master_Key=true`" and "`Secure_Option=AUTOMATIC`"
 - i. Perform [Establish Passwordless Connection from an External Server to RAMP](#) with the specified IP address.
- If the parameters are set as "`Secure_Master_Key=true`" and "`Secure_Option=MANUAL`" :
 - i. Refer to [Restore a Master Key File \(.KF\) Manually](#) to restore.

Note

The system prompts to restore the master key file manually from the remote machine to the location `/opt/rbbn/ems/weblogic/sonusEms/data/sys` as the .KF file during the restoration process.

Restore a Master Key File (.KF) Manually

To restore a master key file (.KF) manually from Ribbon Application Management Platform (RAMP) backup files:

1. If you are using an SSH session to RAMP, disable the SSH client session timeout:

- a. As the root user, navigate to the directory `/etc/ssh`
- b. Modify the file `sshd_config` to set the value of `ClientAliveInterval` to 0.

Note down the original value of `ClientAliveInterval` to reset the original value later.

- c. Restart the `sshd` service by issuing the following:

```
systemctl restart sshd
```

2. Create a directory under `/opt/rbbn/<directory name>`.
3. Copy the `backupFiles.tar` file to the directory `/opt/rbbn/<directory name>`.
4. Issue the following commands:

```
cd /opt/rbbn/ems/conf/jumpstart
```

```
./emsRestore.sh -b /opt/rbbn/<directory name>
```

The following message displays:

```
#####
#####
You are going to migrate a previous RAMP onto this system. Please make sure you
understand what you are
doing. Before you proceed, you should also have already run manualBackup.sh on the
system you want to
migrate from, which generated backupFiles.tar

All existing Insight-controlled passwords on this box will be wiped out and
replaced with the passwords from the restored data.
#####
#####

Do you wish to continue [y|Y,n|N] ?
```

5. Enter "y."
- The following message displays:

```
Stopping running Insight...
Restore the securely backed up Master Key and the process will resume
automatically.
```

The RAMP restoration process resumes once the master key file is restored.

The following message displays:

Restoring data from Migrated backup. This will take a **while**

Database has been successfully restored

6. If you are using an SSH session to RAMP, reset the SSH client session timeout:
 - a. As the root user, navigate to the directory `/etc/ssh`
 - b. In the file `sshd_config`, reset `ClientAliveInterval` to its original value.
 - c. Restart the service by issuing the following:

```
systemctl restart sshd
```

Check Software Versions

In this section:

- [Check RAMP Version](#)
- [Check LINTEL Platform Version in RAMP](#)
- [Check Red Hat Enterprise Linux Server Version in RAMP](#)
- [Check PostgreSQL Version in RAMP](#)
- [Check Java Version in RAMP](#)
- [Check DBaaS Version in RAMP](#)
- [Check Platform Kernel Version in RAMP](#)

Check RAMP Version

Use this procedure to check the Ribbon Application Management Platform (RAMP) release version.

Start

1. SSH to RAMP. To access RAMP through SSH, refer to [Log onto the RAMP CLI](#).
2. Enter the following command as the root, admin, or insight user:

```
rpm -qa SONSems
```

Check LINTEL Platform Version in RAMP

Use this procedure to check the Linux platform version in Ribbon Application Management Platform (RAMP).

Start

1. SSH to the RAMP device as the admin user.

You can enter the command in step 2 as the root, admin, or insight user.

2. Enter the following command:

```
cat /etc/os_version
```

Check Red Hat Enterprise Linux Server Version in RAMP

Use this procedure to check the Red Hat Enterprise Linux Server version on Ribbon Application Management Platform (RAMP).

Start

1. SSH to the RAMP device as the admin user.

You can enter the command in step 2 as the root, admin, or insight user.

2. Enter the following command:

```
cat /etc/redhat-release
```

Check PostgreSQL Version in RAMP

Use this procedure to check the PostgreSQL database version on Ribbon Application Management Platform (RAMP).

Start

1. SSH to the RAMP device as the admin user.
2. Change to the postgres user.

```
sudo su - postgres
```

3. Enter the following command:

```
postgres -V
```

Check Java Version in RAMP

Use this procedure to check the Java Virtual Machine (JVM)/RPM Package Manager (RPM) version on Ribbon Application Management Platform (RAMP).

Start

1. SSH to the RAMP device as the admin user.

Note

You can enter the command in step 2 and step 3 as the root, admin, or insight user.

2. To check the Java Server version:

```
java -version
```

3. To check the Java RPM Package Manager (RPM) version:

```
rpm -qa | grep -i jdk
```

Check DBaaS Version in RAMP

Use this procedure to check the Database-as-a-Service (DBaaS) version on Ribbon Application Management Platform (RAMP).

Start

1. SSH to the RAMP device as the admin user.

You can enter the command in step 2 as the root, admin, or insight user.

2. Enter the following command:

```
rpm -qa | grep dbaas
```

Check Platform Kernel Version in RAMP

Use this procedure to check the platform kernel version on Ribbon Application Management Platform (RAMP).

Start

1. SSH to the RAMP device as the admin user.

You can enter the command in step 2 as the root, admin, or insight user.

2. Enter the following command:

```
uname -r
```

Check Status

In this section:

- [Check RAMP Status](#)
- [Check Deployment Status of Services in RAMP](#)

Check RAMP Status

Use this procedure to check the status of Ribbon Application Management Platform (RAMP). If you have deployed RAMP with redundancy, perform this procedure on the active RAMP device.

All processes/services on the RAMP device automatically start after installation is complete.

1. Access RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Check the status of RAMP:

```
/opt/sonus/ems/emsMgmt status
```

Understanding RAMP status from the command output

Parameter	Description
EMS VERSION	RAMP software version.
HA MODE	RAMP deployment model: • SA: standalone • GR: Geographical Redundancy
<service/process name> Running	Name of a service/process currently running in RAMP. If a service is not running, the status shows <service name> Not Running. In RAMP GR deployments, two instances of a service name indicates that the service is running on both the active and standby devices. Some processes run only on the active device, for example, Fault Management.
<service/process name> Not Running:	Name of a service/process currently not running in RAMP.
Configured State	Original state of the device when RAMP was configured. • SA: The device is originally configured as a standalone node. • Active: The device is originally configured as the active node in a cluster for redundancy. • Standby: The device is originally configured as the standby node in a cluster for redundancy.
Current State	Current state of the device. • SA: The device is currently acting as a standalone node. • Active: The device is currently acting as the active node in a cluster for redundancy. If the current state is different from the configured state, failover has occurred. Multiple occurrences of failover may restore a device to its configured state. • Standby: The device is currently acting as the standby node a cluster for redundancy. If the current state is different from the configured state, failover has occurred. Multiple occurrences of failover may restore a device to its configured state.

Check Deployment Status of Services in RAMP

Use the following procedure to show the deployment status of the services on the Ribbon Application Management Platform (RAMP) device. If you have deployed RAMP with redundancy, perform this procedure on the RAMP active device.

Start

1. SSH to the RAMP device as the admin user.
2. Change to the insight user:

```
sudo su - insight
```

3. Enter the following command:

```
/opt/sonus/ems/conf/serviceDeployed.sh
```

Change Time Zone on RAMP

The Ribbon Application Management Platform (RAMP) allows you to change the time zone. You can change the existing time zone of the RAMP server, the system clock, and the settings. The RAMP can accurately set and adjust time zones, ensuring that all time-sensitive operations, such as logging, scheduling, and reporting, are synchronized correctly. Proper time zone configuration is essential for maintaining the consistency and reliability of data across different geographical locations. By following the below steps, you can ensure that your RAMP setup is correctly aligned with your operational requirements, enhancing both efficiency and accuracy in your application management processes.

Perform the following procedure to change the time zone:

Start

1. Stop the RAMP:
 - a. Log on to the RAMP as an `insight` user. For more information, refer to [Log onto the RAMP CLI](#).
 - b. Stop the RAMP:

```
/opt/sonus/ems/emsMgmt stop
```

2. To change the time zone, run the following command as `root` user:

```
timedatectl set-timezone <timeZone>
```

Example Output:

```
[2024-05-16 16:00:04 root@RAMP2403: /home/admin ]# timedatectl set-timezone Asia/Irkutsk
```

3. Reboot the RAMP:

```
reboot
```

4. You can verify if the timezone has been updated by running `timedatectl` command:

Example Output:

```
timedatectl
          Local time: Thu 2024-05-16 16:15:16 IST
          Universal time: Thu 2024-05-16 10:45:16 UTC
            RTC time: Thu 2024-05-16 10:45:16
            Time zone: Asia/Kolkata (IST, +0530)
System clock synchronized: no
          NTP service: active
          RTC in local TZ: no
```

Deploy Optional Services on RAMP

In this section:

- [Deploy the Action Service](#)
- [Backup/ Restore/ Upgrade](#)
- [Deploy the EdgeView Service](#)
- [Deploy the Object Store Service](#)

The Ribbon Application Management Platform (RAMP) allows you to manage the SBC Edge, SBC 1000/2000, Edge 8000 series or EdgeMarc devices based on the services you deploy.

Deploy the Action Service

Action Service is developed to manage and support the actions applicable to the devices. Action service is responsible for the fulfilment of actions details on the RAMP GUI, handling user inputs, performing the action request and handling the action logs and status. In current release this feature is limited to Edge Marc device actions.

Use this procedure to deploy the action service. To control the network range of the new docker networks, refer to [How to Control the Network Range](#).

Note

Deploy the Action Service (ACS) before deploying the EdgeView Service on RAMP.

Start

1. SSH to RAMP as the `Insight` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the `Insight` user.
2. Check the status of RAMP. For more information, refer to [Check RAMP Status](#).

3. Based on the output perform one of the following:
 - a. If the Action service status shows as "Running", no further action is required. Skip the remaining steps to deploy the Action service.
 - b. If Action service is not listed in the output of "emsMgmt status," deploy the Action service:
 - i. Access RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
 - ii. Change to root user:

```
sudo su -
```

- iii. Deploy the Action service:

```
/opt/action_service_config add
```

Backup/ Restore/ Upgrade

Backup:

The backup is created when the Action service is installed, and the backup tar file is included in the RAMP backup files. If the Action service is not installed, no backup will be created.

Restore:

During the restoration process, if the RAMP backup file contains action-service backup data and action-service is not installed on the setup where the restore is being performed:

- If action-service is not installed, it will be installed first and then restored.
- If action-service is already installed, it will be restored.

Upgrade:

In case of upgrade, if action-service is installed on the setup that is being upgraded then it will be upgraded. If action-service is not installed, then it will not be considered for upgrade.

Deploy the EdgeView Service

To manage SBC Edge, SBC 1000/2000, Edge 8000 series or EdgeMarc devices on the Ribbon Application Management Platform (RAMP), you must deploy the EdgeView service on RAMP. The EdgeView service is not deployed by default on RAMP. Use the following procedure to deploy the EdgeView Service on RAMP. This procedure begins by checking the status of the EdgeView service on RAMP with a step to deploy the EdgeView service if it is not already deployed. After installing the EdgeView Service, two additional docker interfaces are created on RAMP. To control the network range of the new docker networks, refer [How to Control the Network Range](#).

Start

1. SSH to RAMP as the `Insight` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the `Insight` user.
2. Check the status of RAMP. For more information, refer to [Check RAMP Status](#).
3. Based on the output, perform one of the following:
 - If the "EdgeView" status shows as "Running", no further action is required. Skip the remaining steps to deploy the EdgeView service.

- If "EdgeView" is not listed in the output of "emsMgmt status," then deploy the EdgeView service:
 - i. Access [RAMP](#) as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing [RAMP](#) as the admin user.
 - ii. Change to root user:

```
sudo su -
```

- iii. Deploy the EdgeView service:

```
/opt/sonus/ems/conf/edge_view_config add
```

Deploy the Object Store Service

The Object Store service is currently optional. You can add it separately after [RAMP](#) is deployed. The Object Store Service includes the Apache Ozone S3 Object Store which is responsible to store the EdgeMarc device diagnostic snapshots and packet capture files. In this release, this service is applicable only for the EdgeMarc device. After installing the [Object service](#), two additional docker interfaces are created on [RAMP](#). To control network range of the new docker networks, refer [How to Control the Network Range](#).

Note

The Object Store service is only applicable for EdgeMarc services.

Start

1. SSH to [RAMP](#) as root user. Refer to [Log onto the RAMP CLI](#) for accessing [RAMP](#) as the root user.
2. Check the status of [RAMP](#). For more information, refer to [Check RAMP Status](#).
3. Based on the output, perform one of the following:
 - a. If the Object Store status shows as "Running", no further action is required. Skip the remaining steps to deploy the Object Store service.
 - b. If the Object Store is not listed in the output of "emsMgmt status", run the following steps to deploy the Object Store service:
 - i. Access [RAMP](#) as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing [RAMP](#) as the admin user.
 - ii. Change to root user:

```
sudo su -
```

- iii. Deploy the Object Store service:

```
/opt/object_store_service_config add
```

Download Files from Ribbon Support Portal

Use this procedure to download Ribbon product software bundles, patches and files.

Start

1. Log in to the [Ribbon Support Portal](#) with your Ribbon-provided username and password.
2. From the menu bar, click **Downloads** to view the Software Center page.

3. From the Software Center page, click **Download Software**.

Before attempting to download product software, ensure your user profile is updated to view the software associated with your products and solutions.

You are redirected to the Global Software Center.

4. From the menu bar, hover your cursor over **Software Releases** and then choose "Advanced Search."

5. In the **Search** field, enter the name or description of the desired product software bundle, patch or documentation and click **Submit**.

Note

You may select options for **Status**, **Software Type**, and **Search Fields** as required or leave them as default.

6. Double-click the product you want to download.
7. Select **Download** in the **Action** column for the file you wish to download.
8. The first time you download a software file, enter the end user name and address details. Click **Submit**.

9. Read the **End User License Agreement**. If you click **I Agree**, the software bundle/file/document downloads.

Export the RAMP Configuration Tables

In this section:

- [Schedule a Cron Job Automatically](#)
- [Export the Configuration Table Automatically](#)

Use the `configExport.sh` script to export the Ribbon Application Management Platform (RAMP) configuration tables in **Application Management** within **Insight Administration** and any other tables that store the RAMP configuration. The configuration tables are exported in CSV format. You can use the exported CSV files to perform audits against a "golden configuration" and compare lab configurations to production.

The CSV files are exported to the directory `/opt/sonus/ems/weblogic/sonusEms/data/configExport` in the RAMP.

One CSV file is generated for every table.

The list of exportable RAMP configuration tables is shown below.

Note

The following files are empty when exported:

- `config_app.device_group.csv`
- `config_license.licenseproperty.csv`

Exportable RAMP Configuration Tables

<code>config_license.licensehost.csv</code>
<code>config_license.licenseinfo.csv</code>
<code>pm.collection_cluster_map.csv</code>
<code>pm.collection_node_map.csv</code>
<code>pm.collection_profile.csv</code>
<code>pm.collection_profile_association.csv</code>

pm.pm_config_properties.csv
pm.pm_data_retention.csv
pm.pm_export_job.csv
pm.pm_export_loc_assoc.csv
pm.pm_export_location.csv
pm.pm_export_profile.csv
pm.pm_export_profile_cluster_map.csv
pm.pm_export_profile_node_map.csv
pm.pm_export_stats.csv
pm.pm_report_filters.csv
pm.pm_report_template.csv
pm.pm_reports.csv
pm.pm_thresholdcrossingevents.csv
pm.pm_thresholddescriptors.csv
fm.email_notification.csv
fm.email_notification_filter.csv
fm.en_alarm_information.csv
fm.filterprofiles.csv
fm.exporter_profile.csv
fm.sourceaddress.csv
fm.traptypefilter.csv
auth.access_control_association_t.csv

auth.user_config_t.csv
auth.service_privs_config_t.csv
auth.user_group_association_t.csv
auth.realm_config_t.csv
auth.tenant_config_t.csv
auth.user_group_config_t.csv
devmgmt.clustergroup.csv
devmgmt.clustergroupproperties.csv
devmgmt.clustergroupsnmpconfig.csv
devmgmt.resource_group.csv
devmgmt.resource_group_node.csv
devmgmt.resource_group_cluster.csv
devmgmt.resource_group_node_type.csv
devmgmt.resource_group_cluster_type.csv
config_common.config_properties.csv
config_app.emsconfiguration.csv
config_app.feature_permissions.csv
config_sys.systemconfig.csv

Schedule a Cron Job Automatically

Perform the following procedure to schedule a Cron Job to automatically export the tables at regular intervals.

Start

1. Log on to the RAMP as insight user.
2. Execute the following command:

```
crontab -e
```

3. Add the following string:

```
*/<Interval in minutes at which the configuration tables are exported from the  
RAMP> * * * * . /opt/sonus/ems/.profile; /opt/sonus/ems/conf/configExport.sh
```

Example with two-minute interval

```
*/2 * * * * . /opt/sonus/ems/.profile; /opt/sonus/ems/conf/configExport.sh
```

4. Save the changes.

Export the Configuration Table Automatically

Perform the following procedure to export the configuration tables manually.

Start

1. Navigate to the following directory in the RAMP:

```
/opt/sonus/ems/conf/
```

2. Run the `configExport.sh` script:

```
./configExport.sh
```

Sample output

```
Validating table list .....

```

All columns in the configuration tables are exported. The first line in the file contains a header listing the names of the table's columns.

Every subsequent line in the file corresponds to a row in the table.

For each export, the audit files are overwritten to prevent filling up the disk partition with these files.

You can run the script as a Cron Job and set the frequency and time of running the Cron Job.

The log file for the `configExport.sh` command is `configExport.log`. It is located in the RAMP at `/opt/sonus/ems/logs`.

Install PSX Manager on RAMP

Use this procedure to install the PSX Manager on Ribbon Application Management Platform (RAMP).

Start

1. SSH to RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Verify if the PSX Manager version is the latest version:

```
rpm -qa | grep SONSpssx
```

Note

If the PSX Manager version is not the latest then download the respective PSX Manager GUI TAR file (SSGUI_<Version>_RHEL.tar) and execute upgrade steps from Step 3 onwards.

3. Stop RAMP:

```
/opt/sonus/ems/emsMgmt stop
```

4. Change to root user.

5. If the /opt/sonus/install/ directory is not available, create the directory:

```
mkdir -p /opt/sonus/install/
```

6. Download the SSGUI_V<version>_RHEL.tar file from the Ribbon Support Portal to the local system.

7. Copy the SSGUI_V<version>_RHEL.tar file from the local system to the /opt/sonus/install/ directory on RAMP.

8. Navigate to /opt/sonus/install/ directory:

```
cd /opt/sonus/install/
```

9. Untar the SSGUI_V<version>_RHEL.tar file:

```
tar -xvf SSGUI_V<version>RHEL.tar
```

10. Navigate to the /opt/sonus/install/SSGUI directory :

```
cd /opt/sonus/install/SSGUI
```

11. Change the permissions of GuiClient.sh to executable:

```
chmod 777 GuiClient.sh
```

12. Enter the following command:

```
./GuiClient.sh
```

- If an older version of PSX Manager does not exist, the following output displays.

```
...
```

```
package SONSPsx is not installed
```

```
Installing SONSPsx.
```

```
Preparing... ##### [100%]
```

```
Updating / installing...
```

```
 1:SONSPsx-<version> ##### [100%]
```

- If a prior version of PSX Manager exists, a confirmation message to remove the existing version displays.

```
/opt/sonus/ems/weblogic/insight/deployments/insight.ear/emsGui.war/external
SONSPsx-V13.00.00-R000.x86_64
```

```
Version V<version> already exists. It must be removed to proceed.
```

```
Remove the existing version? (default: N) [y|Y,n|N]:
```

- i. Enter **y** to uninstall the prior version and install the latest version of PSX Manager. The following message displays.

```
Removing SONSPsx.
```

```
Installing SONSPsx.
```

```
Preparing... ##### [100%]
```

```
]
```

```
Updating / installing...
```

```
 1:SONSPsx-<version> ##### [100%]
```

```
]
```

13. Verify that the `SONSPsx` package is installed:

```
rpm -qa | grep SONSPsx
```

14. Change to the insight user.
15. Start RAMP:

```
/opt/sonus/ems/emsMgmt start
```

16. Log on to the RAMP GUI.
17. Check [PSX Manager version compatibility with RAMP](#).
18. Click **Reload** to integrate the new PSX Manager version to RAMP.

This section covers account names and passwords associated with Ribbon Application Management Platform (RAMP).

The RAMP default accounts include those associated with the Linux and those associated with the underlying Insight database.

Note

All the user accounts listed in this section are mandatory. You cannot disable or remove any of these users.

RAMP Application-Specific Accounts

This section provides list of accounts name and passwords associated with the RAMP application.

Account name	User ID	Default password	How to change the password?
RAMP GUI account	admin	admin	Change User Password
RAMP REST API account	restuser	sonus123	Device REST Credentials

RAMP Linux Accounts

Account name	User ID	Default password		How to change the password?	Usage	Password expiry
		non-cloud (KVM/VMWare)	cloud (Openstack/AWS/Azure)			
Admin user	admin	admin	admin	- To change admin password on RAMP standalone, refer to Change Linux Admin User Password on RAMP Standalone. - To change admin password on RAMP GR, refer to Change Linux Admin User Password on RAMP GR.	The super user account used for all administrative activities. This account has sudo permissions.	90 days Note The admin user account password expiry does not apply to RAMP CNF.

Account name	User ID	Default password		How to change the password?	Usage	Password expiry
		non-cloud (KVM/VMWare)	cloud (Openstack/AWS/Azure)			
Insight	insight	insight	insight	- To change insight password on RAMP standalone, refer to Change Linux Insight User Password on RAMP Standalone. - To change insight password on RAMP GR, refer to Change Linux Insight User Password on RAMP GR.	The primary account used for all non-administrative tasks including maintenance activities.	never
Postgres	postgres	N/A	N/A	Change the Insight Postgres DB User Password	Manage the Postgres database running on RAMP.	never

Password Aging

Perform the following procedure to modify the password aging:

As a `root` user and modify `maximum password aging days` parameter:

```
chage -M <MAX_PASS_DAYS> <username>
```

An example to change the password expiry to 180 days:

Example

```
chage -M 180 admin
```

RAMP Database Accounts

Account name	User ID	Default password (weak passwords only)	How to change the password?	Usage
Data base User	dbimpl	dbimpl123	Change the Insight Database User Password	The insight database account used for connecting to the database.

Insight Agent Account

Account Name	User ID	Default password (weak password only)	How to change the password?	Usage
Insight Agent Admin User	admin	admin	Change the admin Password for the Insight Agent	All configuration operations and retrieval of data from the Agent. This includes PM statistics collection and configuring the PM collection interval and the RAMP IP addresses which will be managing the Agent.

RAMP Keystore Password

Account name	User ID	Default password	How to change the password?	Usage
N/A	N/A	sonusems	Change RAMP Keystore Password	Secure the keystore which contains the certificate used by RAMP for all clients to RAMP HTTPS/TLS connections.

Change Linux Admin User Password on RAMP Standalone

Use this procedure to change the admin passwords on Ribbon Application Management Platform (RAMP) standalone. To change the admin password on RAMP GR, refer to [Change Linux Admin User Password on RAMP GR](#).

Password Criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 16 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
  4. Insight Postgres DB User (postgres)
  5. Insight Agent (admin)
  6. Insight GUI Admin User (admin)
  7. Insight REST API user (restuser)

Usage:-
  changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Enter the following command:

```
changePassword -o 2
```

The following prompt displays:

```
Please enter new password:
```

5. Enter the new password. The following prompt is displayed:

```
Please re-enter new password:
```

6. Enter the new password again. The following output displays.

```
2020-07-30 10:59:29.237386 changePassword :
    Linux ADMIN password change in progress
2020-07-30 10:59:29.252160 changeLinuxAdminPassword :
    Password changing in progress for Linux 'admin'
2020-07-30 10:59:29.701414 changeLinuxAccountHelper :
    Password changed for 'admin' user on local EMS
```

7. Exit the `changePassword.py` script:

```
exit
```

Change Linux Admin User Password on RAMP GR

Use this procedure to change the admin passwords on RAMP GR. To change admin password on RAMP standalone, refer to [Change Linux Admin User Password on RAMP Standalone](#).

Password Criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 16 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
```

```

4. Insight Postgres DB User (postgres)
5. Insight Agent (admin)
6. Insight GUI Admin User (admin)
7. Insight REST API user (restuser)

Usage:-
    changePassword -o <option_number>
-----
(Enter command or ?) :

```

4. Enter the following command:

```
changePassword -o 2
```

The following prompt displays:

```
Please enter new password:
```

5. Enter the new password. The following prompt displays:

```
Please re-enter new password:
```

6. Enter the new password again. The following output is displayed. At the end of the output, you are prompted to enter the current password of the remote machine.

```

Please enter new password:
Please re-enter new password:
2020-07-27 10:47:32.138682 changePassword :
Linux ADMIN password change in progress
2020-07-27 10:47:32.144469 changeLinuxAdminPassword :
Password changing in progress for Linux 'admin'
2020-07-27 10:47:32.498220 changeLinuxAccountHelper :
Password changed for 'admin' user on local EMS

```

7. Exit the `changePassword.py` script:

```
exit
```

Change Linux Insight User Password on RAMP Standalone

This procedure covers changing the Linux insight password on Ribbon Application Management Platform (RAMP) standalone.

To change the Linux insight password on RAMP GR, refer to [Change Linux Insight User Password on RAMP GR](#).

Password Criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.

- At least 16 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

Start

1. SSH to **RAMP** as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
  4. Insight Postgres DB User (postgres)
  5. Insight Agent (admin)
  6. Insight GUI Admin User (admin)
  7. Insight REST API user (restuser)

Usage:-
  changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Enter the following command:

```
changePassword -o 1
```

The following prompt is displayed:

```
Please enter new password:
```

5. Enter the new password.
The following prompt is displayed:

```
Please re-enter new password:
```

6. Enter the new password again. The following output is displayed.

```

2020-07-27 01:47:58.894646 changePassword :
    Linux INSIGHT password change in progress, may take 2 - 5 minutes
    depending on EMS type
2020-07-27 01:48:19.575101 changeInsightPasswordHelper :
    Password changed for Insight user
2020-07-27 01:48:19.678126 changePassword :
    Linux INSIGHT Password Change Successful!
(Enter command or ?) :

```

7. Exit the `changePassword.py` script:

```
exit
```

Change Linux Insight User Password on RAMP GR

This procedure covers changing the Linux insight password on Ribbon Application Management Platform (RAMP) GR.

To change the Linux insight password on RAMP standalone, refer to [Change Linux Insight User Password on RAMP Standalone](#).

Password criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 16 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```

EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
    1. Linux Insight User (insight)
    2. Linux Admin User (admin)

```

```

3. Insight DB User (dbimpl)
4. Insight Postgres DB User (postgres)
5. Insight Agent (admin)
6. Insight GUI Admin User (admin)
7. Insight REST API user (restuser)

Usage:-
    changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Execute the following command:

```
changePassword -o 1
```

The following prompt is displayed:

```
Please enter new password:
```

5. Enter the new password.
The following prompt is displayed:

```
Please re-enter new password:
```

6. Enter the new password again. The following output is displayed.

```

2020-07-27 11:06:09.409630 changePassword :
    Linux INSIGHT password change in progress, may take 2 - 5 minutes
    depending on EMS type
2020-07-27 11:06:09.411459 changeInsightPassword :
    This is a GR EMS - peer EMS Linux 'insight' user will be updated too
```

7. Exit the `changePassword.py` script:

```
exit
```

Change RAMP Keystore Password

The Ribbon Application Management Platform (RAMP) certificate used for the TLS connections is stored in the keystore.

This section covers how to change the RAMP keystore password with the `changeKeystorePassword.sh` script. For the default password, refer to [Manage RAMP Account Names and Passwords](#).

Perform this procedure only after obtaining and importing your own SSL certificate. Refer to [Secure Login to the RAMP GUI](#).

Note

You cannot perform this procedure using the demo site certificate that comes with the RAMP.

Prerequisites

The password can contain any character.

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changeKeystorePassword.sh
```

The following prompt appears:

```
Please enter the current EMS keystore password:
```

4. Enter the password.
The following prompt appears:

```
Please enter the private key alias:
```

5. Enter the private key alias.

Note

If `genCertRequest` script is used to generate the private key, then the private key alias is `insight`. Refer to [Secure Login to the RAMP GUI](#).

The following prompt appears:

```
Please enter the private key password:
```

6. Enter the private key password.

The following prompt appears:

```
Please enter new password:
```

7. Enter the new RAMP keystore password.
8. When prompted, re-enter the password.
The script runs to completion.

Change the Insight Database User Password

Use this procedure to change the database user (dbimpl) password for the Ribbon Application Management Platform (RAMP) database.

For RAMP GR, enter this command on the RAMP active node.

Password Criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 8 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

For example, "Ribbon#12_3"

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
  4. Insight Postgres DB User (postgres)
  5. Insight Agent (admin)
  6. Insight GUI Admin User (admin)
  7. Insight REST API user (restuser)

Usage:-
  changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Enter the following command:

```
changePassword -o 3
```

The following prompt displays:

```
Please enter new password:
```

5. Enter the new password. The following prompt displays:

Please re-enter new password:

6. Enter the new password again. The following output displays.

```
2020-07-30 11:32:43.578122 changePassword :
    Insight DB (dbimpl) password change in progress, may take up to 10 minutes
    as EMS will be rebooted
2020-07-30 11:32:44.487649 changeInsightDBPassword :
    Changing DBIMPL password
2020-07-30 11:32:44.699947 changeInsightDBPasswordHelper :
    Changing password for DB user, please wait
2020-07-30 11:32:46.493564 changeInsightDBPassword :
    Insight DB user password changed
2020-07-30 11:32:46.596132 changePassword :
    Insight DB (dbimpl) Password Change Successful!
(Enter command or ?) :
```

7. Exit the `changePassword.py` script:

```
exit
```

Validate password change

1. SSH to [RAMP](#) as the admin user.
2. Enter the following command:

```
su - postgres
```

3. Enter the password.
4. Execute the following command:

```
psql -U dbimpl -d dbimpl -h <the IP address of RAMP> -p 5432
```

The following is an example:

```
psql -U dbimpl -d dbimpl -h 10.54.58.189 -p 5432
```

The following message displays:

```
Password for user dbimpl:
```

5. Enter the password. The following message displays:

```
psql (12.1)
Type "help" for help.

dbimpl=>
```

Change the Insight Postgres DB User Password

Use this procedure to change the password for the postgres database user on Ribbon Application Management Platform (RAMP) standalone or GR.

Password criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 8 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

For example, "Ribbon#12_3"

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
  4. Insight Postgres DB User (postgres)
  5. Insight Agent (admin)
  6. Insight GUI Admin User (admin)
  7. Insight REST API user (restuser)

Usage:-
    changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Enter the following command:

```
changePassword -o 4
```

The following prompt displays:

Please enter **new** password:

5. Enter the new password again. The following prompt displays:

Please re-enter **new** password:

6. Enter the new password again.
The following output displays.

```
2020-07-31 02:13:11.519155 changePassword :
      Postgres password change in progress
2020-07-31 02:14:09.217555 changePostgresPassword :
      Changing password for Postgres DB.
(Enter command or ?) :
```

7. Exit the `changePassword.py` script:

```
exit
```

Change the admin Password for the Insight Agent

For Ribbon Application Management Platform (RAMP) GR, change the password on the active node.

When you change the password for Linux Agent (admin) password on the **RAMP** active node, the password on the **RAMP** node also changes.

Password criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 8 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - `_` or `#`

For example, "Ribbon#12_3"

Start

1. SSH to **RAMP** as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
  4. Insight Postgres DB User (postgres)
  5. Insight Agent (admin)
  6. Insight GUI Admin User (admin)
  7. Insight REST API user (restuser)

Usage:-
  changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Enter the following command:

```
changePassword -o 5
```

The following prompt is displayed:

```
Enter current password:
```

5. Enter the current password. The following prompt displays:

```
Please enter new password:
```

6. Enter the current password. The following prompt is displayed:

```
Please re-enter new password:
```

7. Enter the new password again.

The following output displays for RAMP standalone.

```
2020-07-31 04:03:07.465399 changePassword :
    Agent ADMIN password change in progress, may take 2 - 4 minutes depending
on EMS type
2020-07-31 04:03:07.481202 loginToAgent :
    Trying logon admin, attempt 0
2020-07-31 04:03:08.502273 changeAgentPasswordHelper :
    Logon success, now changing the password
2020-07-31 04:03:10.164652 changeAgentPasswordHelper :
    Password change successful
2020-07-31 04:04:10.164652 changePassword :
    Agent ADMIN Password Change Successful!
```

```
(Enter command or ?)
```

The following output displays for RAMP GR.

```
2020-07-31 02:28:37.663837 changePassword :
    Agent ADMIN password change in progress, may take 2 - 4 minutes depending
on EMS type
2020-07-31 02:28:37.669726 loginToAgent :
    Trying logon admin, attempt 0
2020-07-31 02:28:38.673715 changeAgentPasswordHelper :
    Logon success, now changing the password
2020-07-31 02:28:40.348156 changeAgentPasswordHelper :
    Password change successful
2020-07-31 02:28:40.652218 changeAgentPassword :
    This is a EMS RD cluster - updating remote agent's password on
10.54.58.174
2020-07-31 02:28:40.654397 loginToAgent :
    Trying to connect 10.54.58.174
2020-07-31 02:28:41.903192 loginToAgent :
    Trying logon admin, attempt 0

    Logon success, now changing the password
2020-07-31 02:28:44.828762 changeAgentPasswordHelper :
    Password change successful
2020-07-31 02:28:45.333281 changePassword :
    Agent ADMIN Password Change Successful!
(Enter command or ?) :
```

8. Exit the `changePassword.py` script:

```
exit
```

Change the Insight (RAMP) GUI Admin User Password

Follow this procedure to change the Ribbon Application Management Platform (RAMP) GUI admin user password.

For RAMP GR, enter this command on the RAMP active node.

Password Criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 8 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - `_` or `#`

For example, "Ribbon#12_3"

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```
EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)
  3. Insight DB User (dbimpl)
  4. Insight Postgres DB User (postgres)
  5. Insight Agent (admin)
  6. Insight GUI Admin User (admin)
  7. Insight REST API user (restuser)

Usage:-
    changePassword -o <option_number>
-----
(Enter command or ?) :
```

4. Enter the following command:

```
changePassword -o 6
```

The following prompt is displayed:

```
Enter current password:
```

5. Enter the current password. The following prompt is displays:

```
Please enter new password:
```

6. Enter the current password. The following prompt displays:

```
Please re-enter new password:
```

7. Enter the new password again. The following output is displayed.

```
2018-08-06 07:56:25.116092 changePassword :
    GUI ADMIN password change in progress
```

```

2018-08-06 07:56:25.316712 guiAndRestUserPasswordHelper :
    Just a debug line to say prompt found
2018-08-06 07:56:28.256228 guiAndRestUserPasswordHelper :
    Password changed for GUI 'admin' user
2018-08-06 07:56:28.358615 changePassword :
    GUI ADMIN Password Change Successful!
(Enter command or ?) :

```

8. Exit the `changePassword.py` script:

```
exit
```

Change the restuser Password for the Insight (RAMP) REST API

Use this procedure to change the REST API user password on Ribbon Application Management Platform (RAMP).

For RAMP GR, enter this command on the RAMP active node.

Password Criteria

The password must meet the following criteria:

- Start with an upper case or lower case letter.
- At least 8 characters.
- Contain characters from each of the following four categories:
 - lowercase letters
 - uppercase letters
 - numerals
 - _ or #

For example, "Ribbon#12_3"

Start

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/changePassword.py
```

The following prompt displays:

```

EMS Password changing tool
-----
This Script is able to change following EMS (Standalone|GR|HA) accounts password
  1. Linux Insight User (insight)
  2. Linux Admin User (admin)

```

3. Insight DB User (dbimpl)
4. Insight Postgres DB User (postgres)
5. Insight Agent (admin)
6. Insight GUI Admin User (admin)
7. Insight REST API user (restuser)

Usage:-

```
changePassword -o <option_number>
```

(Enter command or ?) :

4. Enter the following command:

```
changePassword -o 7
```

The following prompt is displayed:

Enter current password:

5. Enter the current password. The following prompt is displayed:

Please enter **new** password:

6. Enter the current password. The following prompt is displayed:

Please re-enter **new** password:

7. Enter the new password again. The following output is displayed.

```
2020-07-31 04:25:33.963660 changePassword :
    RestUser password change in progress
2020-07-31 04:25:34.282819 guiAndRestUserPasswordHelper :
    Just a debug line to say prompt found
2020-07-31 04:25:37.054207 guiAndRestUserPasswordHelper :
    Password changed for REST 'restuser' user
2020-07-31 04:25:37.155938 changePassword :
    RestUser Password Change Successful! The system will need to be re-started
```

8. Exit the `changePassword.py` script:

```
exit
```

Reset RAMP GUI Admin Password

Use the procedure on this page to reset the Ribbon Application Management Platform (RAMP) GUI password.

On a Geographically Redundant (GR) RAMP, perform this procedure on the active node:

If you know your password and want to change it, refer to [Change the Insight \(RAMP\) GUI Admin User Password](#).

Start

1. SSH to the RAMP as the `admin` user. Refer to [Log onto the RAMP CLI](#) to access the RAMP as the `admin` user.
2. Change to root user:

```
sudo su -
```

3. Reset the admin password:

```
/opt/sonus/auth/serviceScript.sh reset_admin_password
```

The following prompt is displayed:

```
Invoking password creation tool...  
Please enter the password:
```

Output:

```
Updating database to set new password for admin user...  
Password updated successfully! Please restart Auth service immediately to make the  
new password in effect.
```

4. Change to insight user:

```
sudo su - insight
```

5. Stop RAMP:

```
/opt/sonus/ems/emsMgmt stop
```

6. Start RAMP:

```
/opt/sonus/ems/emsMgmt start
```

The RAMP GUI password is reset. You can now log on to the RAMP GUI with the new password.

Unlock Database User dbimpl

If the database user (dbimpl) is locked out of the database, to unlock the database user (dbimpl):

1. SSH to RAMP as the admin user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command:

```
/opt/sonus/ems/conf/unlockDbimplUser.sh
```

Generate a Master Key to Encrypt RAMP Passwords

After Ribbon Application Management Platform (RAMP) installation, RAMP uses a default master key to encrypt all passwords. Use the following procedure to generate a new master key. When generating the master key you must specify a key size (128 bits or 256 bits). Once the new master key is generated, all RAMP passwords are decrypted using the old key, and then re-encrypted using the new master key.

Access the RAMP GUI at least once before generating a new master key to encrypt passwords with the initial key.

To generate a new master-key (for RAMP geo-redundant (GR) deployments, perform this procedure on the active node):

1. Log into RAMP as the `insight` user. Refer to [Log onto the RAMP CLI](#) for information.
2. Navigate to the following directory in the RAMP:

```
cd /opt/rbbn/ems/conf/
```

3. Perform one of the following depending on the key size you want:
 - To generate a master-key using a 128-bit key size, issue the following:

```
./masterKeyGenerator.sh AES_128
```

- To generate a master key using a 256-bit key size, issue the following:

```
./masterKeyGenerator.sh AES_256
```

If you do not specify a key size, then the new master key is generated using the default key size of 256 bits (AES_256).

The following output displays after successfully generating the master key and re-encrypting the existing passwords:

```
Keystore file change successfully.
```

RAMP restarts after the master key change. After the master key is generated and the existing passwords are encrypted, all RAMP credentials remain the same.

Manage User Accounts

In this section:

- [Unlock a User Account](#)
- [Set User Permissions](#)
- [Modify Passwords](#)
- [Modify User Session Timeout Interval](#)
- [Limit the Maximum Number of Login Sessions](#)
- [Configure User Account Lock Settings](#)
- [Enable Users to Create Cron Jobs](#)
- [Enable Users to Create 'at' Jobs](#)

Unlock a User Account

To maintain system security, a Ribbon Application Management Platform (RAMP) user account locks under certain circumstances.

Perform the following procedure if the account is locked due to user inactivity:

1. Log on as `admin` user.
2. Change to `root` user.
3. Use the following command:

```
#faillock --user <locked user> --reset
```

Note

To unlock your admin account or any sysadmin account locked due to expiry or invalid attempts, refer to [Unlock or Recover a User Account for Sysadmin or Any Admin User](#)

Set User Permissions

Perform the following procedure to set permissions for a normal user to execute privilege commands:

1. To add permission on a particular command, enter the following command:

```
# chmod +s <absolute_path_to_command_binary_file>
```

For example, to add the setuid permission on `passwd` command, enter the following

```
# chmod +s /usr/bin/passwd
```

2. To remove permission on a particular command, enter the following command as:

```
# chmod -s <absolute_path_to_command_binary_file>
```

For example, to remove the setuid permission on passwd command, enter the following command:

```
# chmod -s /usr/bin/passwd
```

Modify Passwords

You can change the password, modify its aging, and perform several other tasks. See the following topics for information:

Modifying Password Aging

Perform the following procedure to modify the password aging:

1. Log on as insight user.
2. Change to root user.
3. Modify `maximum password aging days` field:

```
chage -M <MAX_PASS_DAYS> <username>
```

By default, the password expires in 90 days.

For example: If the username is user01 and maximum password aging days is 90, then enter the following:

```
chage -M 90 user01
```

Restricting the User to Change Password on First Login

Perform the following procedure to create first password and force the user to change password on first login:

1. Log on as insight user.
2. Change to root user.
3. After creating the user, assign a default password:

```
# passwd <username>
```

For example, if the username is user01, then enter the following:

```
passwd user01
```

4. Compel the user to change the password during first time login:

```
chage -d 0 <username>
```

For example, if the username is user01, then enter the following:

```
chage -d 0 user01
```

Change Password

Perform the following procedure if root user needs to change the other user password:

1. To change the other user password as a root user, enter the following command:

```
passwd <username>
```

For example, if the username is user01, then enter the following:

```
passwd user01
```

2. To change your own password, enter the following command:

```
passwd
```

Modify User Session Timeout Interval

Perform the following procedure to modify the user session timeout interval.

1. Log on as insight user.
2. Change to root user.
3. Modify `ClientAliveInterval` property:

```
# vi /etc/ssh/sshd_config
```

The `ClientAliveInterval` is calculated in seconds. By default, the user session time-out interval is 750 seconds.

For example, if session time-out interval is one hour, then enter 3600 seconds.

```
ClientAliveInterval 3600
```

4. Restart sshd server using "service sshd restart":

```
# service sshd restart
```

Limit the Maximum Number of Login Sessions

For each Ribbon Application Management Platform (RAMP) user, the maximum number of login sessions in a system are currently limited, by default, to 10. The maximum limit is configurable for all users except a root user.

Perform the following procedure to limit the maximum login sessions for each user:

- Execute the following command as `root` user:

```
cat /etc/security/limits.conf
```

Where, `#<domain>`, `<type>`, `<item>` and `<value>` are used for informational purpose and do not appear in the actual output.

Additionally, you can modify the login limit for a particular user or group.

Modifying the login limit for a user

If a particular user has specific login limits, the following entry can be used where the `<username>` must be replaced with actual user name and value can be modified as per requirement:

```
# <domain>      <type>      <item>      <value>
@<username>    hard          5
```

Modifying the login limit for a group

If a particular group has specific login limits, then the following entry can be used where `<groupname>` must be replaced with actual group name and value can be modified as per requirement:

```
# <domain>      <type>      <item>      <value>
@<groupname>    hard          4
```

Configure User Account Lock Settings

If a user of the Ribbon Application Management Platform (RAMP) enters an incorrect password for more than the configured limit (default: 5), the user's account is locked for the configured time (default: 10 minutes). During this time period, the user cannot log on even with the correct password.

Use this procedure to specify settings for locking user accounts:

Start

1. Log in as `admin` user.
2. Change to `root` user:

```
sudo su -
```

3. Navigate to `/etc/security/` and edit the `faillock.conf` file:

```
/etc/security/faillock.conf
```

Uncomment the pre-defined settings in the `faillock.conf` file to edit the values:

- a. `fail_interval = 900`
- b. `silent`
- c. `audit`
- d. `unlock_time = 900`

- e. `dir = /var/log/faillock`
- f. `deny = 5`
- g. `even_deny_root`
- 4. Edit the `unlock_time` value to specify the time, in seconds, before unlocking a user's password.
- 5. Edit the `deny` value to specify the number of failed password attempts before locking a user account.

Enable Users to Create Cron Jobs

Use the following procedure to enable users to create cron jobs.

1. Ensure that the user does not exist in the `/etc/cron.deny` file.
2. Add the user to the `/etc/cron.allow` file.

Enable Users to Create 'at' Jobs

Use the following procedure to enable users to create `at` jobs.

1. Ensure that the user does not exist in the `/etc/at.deny` file.
2. Add the user to the `/etc/at.allow` file.

Establish Passwordless Connection from an External Server to RAMP

Use this procedure to establish the passwordless connection from an external server (remote server) to the Ribbon Application Management Platform (RAMP) device.

Start

1. Log on to the remote server.
2. Copy the RAMP user private key to the remote server.
For example, you can copy the file `cloud_ats_ems.key` to the `/tmp` directory in the remote server `fd00:10:6b50:5c30::1c`.
To generate the SSH keys, refer to [Generate SSH Keys for RAMP Users](#).
3. Create a file `~/.ssh/config` and add the following content:

```
Host <IP Address of RAMP Server>
  Port 22
  User <UserName>
  IdentityFile <absolute path of the RAMP private key file>
```

Example:

```
Host fd00:10:6b50:5c30::1c
  Port 22
  User admin
  IdentityFile /tmp/cloud_ats_ems.key
```

4. Enter the following command:

```
ssh-copy-id -f -i <public key file of the remote server> <the RAMP user>@<RAMP IP>
```

Example:

```
/usr/bin/ssh-copy-id -f -i ~/.ssh/id_rsa.pub admin@fd00:10:6b50:5c30::1c
```

Sample output:

```
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/admin/.ssh/
id_rsa.pub"
#####
#
# This system is restricted to authorized users only.      #
# Unauthorized access or access attempts to this system  #
# or services are prohibited. All user activity is logged. #
# Evidence of unauthorized use collected during monitoring #
# may be provided to appropriate personnel for           #
# administrative, criminal or other adverse action.      #
#
#####

Number of key(s) added: 1

Now try logging into the machine, with:  "ssh 'admin@fd00:10:6b50:5c30::1c'"
and check to make sure that only the key(s) you wanted were added.
```

5. Test the passwordless communication by entering the following command on the remote server:

```
ssh <the RAMP user>@<the RAMP IP address>
```

Example:

```
ssh admin@fd00:10:6b50:5c30::1c
```

Establish RAMP CNF Active-Standby Instance Passwordless Connection

Passwordless SSH Connection

Perform the following procedure to ensure a passwordless SSH connection between the RAMP active and standby instances and vice-versa.

1. Log onto the RAMP active instance as the `admin` user.
2. Change to insight user:

```
su - insight
```

3. Navigate to the `.ssh` directory:

```
cd .ssh
```

4. SSH to the RAMP standby instance:

```
ssh insight@<IP address of the RAMP standby instance>
```

If the SSH password-less connection is intact, you are not prompted for a password.

5. Log on to the RAMP standby instance as the `admin` user.
6. Change to insight user: :

```
su - insight
```

7. Navigate to the `.ssh` directory:

```
cd .ssh
```

8. SSH to the RAMP standby instance:

```
ssh insight@<IP address of the RAMP active instance>
```

If the SSH password-less connection is intact, you are not prompted for a password.

Change the GRUB Password

Ribbon recommends changing all default passwords as a security best practice.

The Grub password protects the boot loader.

Start:

1. Access RAMP as the admin user.
2. Change to the root user:

```
sudo su -
```

3. Enter the command:

```
grub2-setpassword
```

The following message displays:

```
Enter password:
```

4. Enter the password. The following message displays:

```
Confirm password:
```

5. Enter the password again.

Managing Log Files

In this section:

- [Change Log Level](#)
- [Configure Silent Auth for Jboss CLI](#)
- [RAMP Log Files](#)
- [Reset Admin Password for Jboss CLI](#)

The Ribbon Application Management Platform (RAMP) lists the available log files, allows you to change the log file locations, and levels.

Change Log Level

In this section

- [Change the Log Level to DEBUG](#)
- [Change the Log Level to INFO](#)

The Ribbon Application Management Platform (RAMP) allows you to change the log level. You need not restart JBoss for the changes to take effect.

Note

`Silent Auth` is enabled (on) in RAMP by default.

To run the JBoss CLI command:

The username is: admin

The default password is: Sonus@123

If you forget the admin JBoss CLI password or need to reset, refer to [Reset Admin Password for Jboss CLI](#).

Prerequisite

RAMP is and running.

Change the Log Level to DEBUG

Use this procedure to change the log level to DEBUG:

Start

1. Log on to the RAMP as `Insight` user. For more information, refer to [Log onto the RAMP CLI](#).
2. Navigate to the following directory:

```
cd /opt/sonus/jboss/bin
```

3. Run the following command to list the current settings of all loggers:
Do not use username and password when `Silent Auth` is enabled. To check the status of `Silent Auth` for JBoss CLI, refer to [Configure Silent Auth for Jboss CLI](#).

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=*:read-resource" | egrep 'logger|level'
```

Example output

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=*:read-resource" | egrep 'logger|level'  
    ("logger" => "com.sonus.agent.framework")

(logger" => "org.jboss.as.jpa")
"level" => "INFO",
(logger" => "org.jboss.resteasy.spi.ResteasyDeployment")
"level" => "INFO",
(logger" => "org.jboss.ws.cxf.metadata")
"level" => "INFO",
(logger" => "org.hornetq.core.server")
"level" => "INFO",
(logger" => "net.sf.ehcache")
"level" => "INFO",
-bash-4.2$

```

4. Run the following command:

```

./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/
logger=<Name of the logger category>:add"

```

Refer to Logger List.

Example output

```

./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/
logger=com.sonus.logging.category:add"

```

If the operation is successful, the following is displayed.

Output

```
{"outcome" => "success"}
```

- To change the log level to DEBUG, type the following (replace `com.sonus.logging.category` with the correct logger name), and run:

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=com.sonus.logging.category:write-attribute(name=level,value=DEBUG)"
```

If the operation is successful, the following output is displayed.

```
{"outcome" => "success"}
```

Note

Once the issue is reproduced, you must set the loggers to INFO for the loggers that you set the level to DEBUG.

Change the Log Level to INFO

Use the following procedure to change the log level to INFO:

Start

- Log on to the RAMP as the `Insight` user.
- Navigate to the following directory:

```
cd /opt/sonus/jboss/bin
```

- Run the following command:

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=<Name of the logger category>:write-attribute(name=level,value=INFO)"
```

See Logger List. The following is displayed:

Example output

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=com.sonus.logging.category:write-attribute(name=level,value=INFO)"
```

If the operation is successful, the following is displayed.

Output

```
{"outcome" => "success"}
```

4. Remove the logging category created in Step 3, and run the following command:

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=<Name of the logger category>:remove"
```

Example output

```
./jboss-cli.sh --user=admin --password=Sonus@123 -c "/subsystem=logging/  
logger=com.sonus.logging.category:remove"
```

If the operation is successful, the following is displayed.

Output

```
{"outcome" => "success"}
```

The following table represents the logger list:

Configure Silent Auth for Jboss CLI

The Ribbon Application Management Platform (RAMP) allows you to enable or disable Silent Auth for JBoss CLI.

Note

- Silent Auth is enabled on the RAMP by default.
- Silent Auth on: User password is not needed for running JBoss CLI commands.
- Silent Auth off: User password is needed for running JBoss CLI commands.
- Do not use username and password when Silent Auth is enabled.
- To check if Silent Auth is enabled, use: `./configureJbossCliSilentAuth.sh status`

Prerequisite

RAMP is up and running.

Start

Use this procedure to enable or disable Silent Auth.

1. Log on to the RAMP as an Insight user. For more information, refer to [Log onto the RAMP CLI](#).
2. Navigate to `/opt/sonus/ems/conf/security/` and to know the working of this script usage:

Example

```
-bash-4.4$ ./configureJbossCliSilentAuth.sh -help
```

Example output

```
Usage: ./configureJbossCliSilentAuth.sh on/off jboss_cli_password
```

```
Usage: ./configureJbossCliSilentAuth.sh status
```

```
    on:      Enable Silent Auth for Jboss Cli
```

```
    off:     Disable Silent Auth for Jboss Cli
```

```
    status:  Check Silent Auth for Jboss Cli, Enabled means no user name/
paswrk asked for running jboss cli cmds.
```

```
           Disabled means user name/paswrk asked for running jboss cli cmds
```

Note

If you forgot the admin JBoss CLI password or need to reset, refer to [Reset Admin Password for Jboss CLI](#).

3. Check the current state of `Silent Auth`:

```
./configureJbossCliSilentAuth.sh status
```

Example output

```
Silent Auth is enabled
```

4. If you want to disable `Silent Auth`:

```
-bash-4.4$ ./configureJbossCliSilentAuth.sh off <jboss_cli_password>
```

Example output

```
Disabling Silent Auth for Jboss Cli.
{
  "outcome" => "success",
  "response-headers" => {
    "operation-requires-reload" => true,
    "process-state" => "reload-required"
  }
}
Executing reload..
Silent Auth for Jboss Cli has been disabled
```

Check current the status of Silent Auth using:

```
./configureJbossCliSilentAuth.sh status
```

5. If you want to enable Silent Auth :

```
-bash-4.4$ ./configureJbossCliSilentAuth.sh on <jboss_cli_password>
```

Example output

```
Enabling Silent Auth for Jboss Cli.
{
  "outcome" => "success",
  "response-headers" => {
    "operation-requires-reload" => true,
    "process-state" => "reload-required"
  }
}
Executing reload..
Silent Auth for Jboss Cli has been enabled
```

Check the current status of Silent Auth using:

```
./configureJbossCliSilentAuth.sh status
```

RAMP Log Files

In this section:

- [Generate Log Files for Debugging](#)
- [List of Important RAMP Log Files](#)

This section lists some of the log files available in the Ribbon Application Management Platform (RAMP) system and the file locations (prescribed default locations at time of initial installation).

Generate Log Files for Debugging

To generate log files for debugging:

1. Log on to the RAMP CLI as the admin user.
2. Change to the insight user:

```
sudo su - insight
```

3. Use one of the following commands to archive the logs:
 - a. To archive the logs in the default directory:

```
/opt/sonus/ems/conf/archiveLogs.sh
```

The following message displays:

```
-bash-4.4$ ./archiveLogs.sh
```

This will create a tar file containing all log and configuration files associated with Insight EMS. Additionally, you will be able to enter comments below describing the problem or reason which has prompted you to create **this** archive file.

kafka topics - insight.node.change insight.node.info insight.config_node.node are used **for** collecting topic contents, **if** more topic is of interest, please add that in TOPICS_TO_COLLECT

Enter comments below. End comments with single "." character in **new** line

OR

- b. To archive the logs in a specific directory:

```
./archiveLogs.sh -d /opt/raid/
```

Note

-d lets you specify a destination directory for the archive tar ball. You are allowed to specify a different location beyond the default directory `/opt/sonus/ems` if the disk space is insufficient. The **-d** parameter is optional and defaults to `/opt/sonus/ems` when no directory is specified with **-d**.

Note

```
-bash-4.4$ ./archiveLogs.sh -d /opt/raid/
Using custom archive directory: /opt/raid/
```

This will create a tar file containing all log and configuration files associated with Insight EMS in /opt/raid/. You have the option to choose a different destination directory using the -d option.

Additionally, you will be able to enter comments below describing the problem or reason which has prompted you to create this archive file.

Kafka topics - insight.node.change insight.node.info insight.config_node.node are used for collecting topic contents, if more topic is of interest, please add that in TOPICS_TO_COLLECT

Enter comments below. End comments with single "." character in new line.

4. Enter a description for the log file. The following is an example:

```
The upgrade operation.
```

5. Press ENTER to move to the next line.
6. Enter a period (.) and press ENTER to save the logs. A message similar to the following displays:

```
#####
Creating a report on the Insight version information.
#####

#####
Gathering Linux Version Information.
#####

#####
Gathering Java Version Information.
#####

#####
Creating a snapshot of the system process table.
#####

#####
Capturing a list of the java processes and their arguments.
#####

#####
Creating a report on the system's free blocks on its disks.
#####

#####
Creating a report on the system's IP configuration
```

```
#####

#####
Creating a report on the system's processors.
#####

#####
Creating a report on the system's real memory size.
#####

#####
Creating a report on the system swap space.
#####

#####
Capturing the crontab.
#####

#####
Capturing ulimit settings.
#####

#####
Capturing output from dmesg.
#####

#####
Capturing Installed packages names
#####

#####
Capturing output from sysdef/sysctl.

Adding Node/ PM/ Licensing level report to logFiles-emssa-2020-11-20_114133.tar
.

#####
Adding POSTGRES LOGS /var/lib/pgsql/12/data/log/* to logFiles-emssa-2020-11-20_
114133.tar.
#####

#####
Adding CURRENT POSTGRES LOG /var/lib/pgsql/12/data/current_logfiles to
logFiles-emssa-2020-11-20_114133.tar.
#####

The archive file has been created and is located at:
/opt/sonus/ems/logFiles-emssa-2020-11-20_114133.tar.gz

-bash-4.2$

```

The log files are stored as a single `tar.gz` file at `/opt/sonus/ems` or at a customized location (as depicted in the above example `/opt/raid`) in the format `logFiles-<the RAMP hostname>-<timestamp>.tar.gz`

List of Important RAMP Log Files

The following logs are accessible via RAMP GUI under the Insight Administration option:

- User Activity Log—Records all user activity within RAMP server and PSX DB changes performed via the PSX Manager.
To view User Activity Log, refer to [Monitor User Activity](#).

- **System Activity Log**—Records error and warning messages regarding activity within the RAMP server. To view System Activity Log, refer to [System Activity Logging](#).
- **SSH Historical Log**—Provides detailed information about SSH events. There are six types of events logged. Depending upon the type of event, the system provides additional information pertaining to the log entry. In all cases the system begins the log entry with the day, date, and time of the event.
- **ems cli log**—Records results of executing PSX CLI scripts. Log files will have the format `ems_cli_log.<n>`, where <n> represents a sequence number from 1 to 5.

File name	Directory	Description
aggGSXSysDspResHighestUsageStat.log	/opt/sonus/pm/logs/	Contains information about the GSXSysDspResHighestUsageStat aggregation.
aggregator.log	/opt/sonus/pm/logs/	Contains information on PM Hourly Aggregator.
api_security_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains all of the RAMP API related authentication failures due to invalid or missing credentials.
authOutput.log	/opt/sonus/auth/logs/	Contains information on the abnormal events (exceptions) and information on the lifecycle of the Apache TomEE application server of the main Authentication & Authorization process.
authService.log	/opt/sonus/auth/logs/	Contains information related to the Authentication & Authorization startup.
auth_trace.log	/opt/sonus/auth/logs/	Contains logging information from the Authentication & Authorization. This log provides the most detailed information on the User/User Group/Role Management, tenant management, certificate management, realm management, and session management functionalities.
diagnose.log	/opt/sonus/auth/logs/	Contains information related to all the services exposed from Authentication & Authorization.
cm_trace_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information on the agent managed device model framework (for configuring devices such as DSI).
converter.log	/opt/fm/logs/	Contains the logs for FM converter.

File name	Directory	Description
correlator.log	/opt/fm/logs/	Contains the logs for FM correlator.
correlator_schema_id.log	/opt/fm/logs/	Contains information on the fm correlator schema id.
cluster_aggregator.log	/opt/sonus/pm/logs/	Contains information on the PM cluster aggregator.
csrfguard.log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains all of anti-CSRF related logs (security).
Datahandler.log	/opt/sonus/pm/logs/	Contains the logs of PM Datahandler.
DataPurger.log	/opt/sonus/pm/logs/	Contains the logs of PM Data purging activity.
dbsink.log	/opt/fm/logs/	Contains the logs for FM dbsink
debezium_connect.log	/opt/fm/logs/	Contains the logs for FM debezium.
decoder_schema_id.log	/opt/fm/logs/	Contains information on the fm decoder schema id.
devMgmt_administration_trace_log	/opt/devMgmt/logs/	Contains the logs for DM administration.
devMgmt_auth_utils_trace_log	/opt/devMgmt/logs/	Contains the logs for DM authentication.
devMgmt_clustermgmtui_trace_log	/opt/devMgmt/logs/	Contains the logs for cluster management GUI operations.
devMgmt_dynamic_node_trace_log	/opt/devMgmt/logs/	Contains REST requests from dynamically registered nodes.
devMgmt_nodemgmt_trace_log	/opt/devMgmt/logs/	Contains REST requests from RAMP GUI and discovery.
devMgmt_inventory_service_trace_log	/opt/devMgmt/logs/	Contains the information on DM inventory service.
devMgmt_jpa_log	/opt/devMgmt/logs/	Contains the information of DM jpa logs

File name	Directory	Description
devMgmtOutput.log	/opt/devMgmt/logs/	Contains the information of DM service start/stop.
devMgmt_rg_service_trace_log	/opt/devMgmt/logs/	Contains the information for DM RG service.
devMgmt_utils_trace_log	/opt/devMgmt/logs/	Contains the DM utility trace logs.
di_trace_log	/opt/sonus/ems/weblogic /sonusEms/logs/sys	Contains information related to the DI (Device Inventory) feature. It contains details related to the hardware inventory collection process.
diagnose.log	/opt/fm/logs/	Contains the logs for FM diagnose.
dm_micro_service_logs	/opt/devMgmt/logs/	Contains information on every single reachability request which is set to the nodes to determine if they are up. Includes details on when the request was sent, which node name / IP address, and what the response was.
ems_ip_table_rules.log	/opt/sonus/ems/weblogic/ sonusEms/logs/sys	Contains the output of all of the iptables rules configuration.
ema_trace_log	/var/log/sonus/unityexp/log/ ema_trace.log	Contains logging information from the SBC Configuration Manager.
ems_cli_log	/opt/sonus/ems/weblogic/ sonusEms/logs/sys	Contains information on all CLI related activity performed on the RAMP.
ems_trace_log	/opt/sonus/ems/weblogic/ sonusEms/logs/sys	The most detailed log file about what is occurring in the main RAMP JBoss process. This is the same content which is reflected in the UI as the System Activity Log. The log includes details of the API request including version and revision of the cluster configurations.

File name	Directory	Description
emsapi_debug_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains information related to the RAMP API deployment and other details related to operations that may fail. When DEBUG is enabled, the entire SOAP message is logged.
emsapi_prov_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains information on all of the RAMP API operations that are performed including the user/IP performing the operation, what operation was invoked, and at what time the operation was invoked.
emsOutput.log	/opt/sonus/ems	Contains information about abnormal events (exceptions) as well as information about the startup of the JBoss application server for the main RAMP process.
emsRestart.log	/opt/sonus/ems/logs/ emsProcMgmt.log	Contains details about when the various RAMP processes are started and stopped.
exporter.log	/opt/fm/logs/	Contains the logs for FM exporter.
exportStatsPerNode.log	/opt/sonus/pm/logs/	Contains information on the statistics exported for PM perNode.
filter.log	/opt/fm/logs/	Contains the logs for FM filter.
fm.converter.log	/opt/fm/logs/	Contains start/stop information for the fm converter process.
fm.correlator.log	/opt/fm/logs/	Contains start/stop information for the fm correlator process.
fm.dbsink.log	/opt/fm/logs/	Contains start/stop information for the fm dbsink process.
fm.debezium_connect.log	/opt/fm/logs/	Contains start/stop information for the fm debezium_connect process.
fm.exporter.log	/opt/fm/logs/	Contains start/stop information for the fm exporter process.

File name	Directory	Description
fm.receiver.log	/opt/fm/logs/	Contains start/stop information for the fm receiver process.
fm.filter.log	/opt/fm/logs/	Contains start/stop information for the fm filter process.
fm.ossresync-agent.log	/opt/fm/logs/	Contains start/stop information for the fm ossresync-agent process.
fm.preprocessor.log	/opt/fm/logs/	Contains start/stop information for the fm preprocessor process.
fm.rest.log	/opt/fm/logs/	Contains start/stop information for the fm rest process.
fm.sequence-generator.log	/opt/fm/logs/	Contains start/stop information for the fm sequence-generator process.
fm.sequencer.log	/opt/fm/logs/	Contains start/stop information for the fm sequencer process.
genericNP_audit_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains logging related to LNP/MNP.
generic_kafka_log	/opt/devMgmt/logs/	Contains the DM generic kafka logs
gsxUpgrade_trace_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains logging information related to the GSX upgrade feature.
hibernate_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains logging information related to Hibernate, the tool used to persist data to the RAMP database.
hornet_trace_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains information related to the Netconf connections to the SBC.
kafka.log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains Kafka related logs.

File name	Directory	Description
li_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains logging related to the LI (Lawful Intercept) provisioning feature.
lm_diagnose_log	/opt/sonus/lm/logs/	Contains the logs for LM diagnose.
lm_trace_log	/opt/sonus/lm/logs/	Contains the logs for the complete LM service.
lmOutput.log	/opt/sonus/lm/logs/	Contains information about abnormal events (exceptions) as well as information about the startup of the Spring services for the LM.
lnp_trace_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains logging related to the LNP (Local Number Portability) feature.
logFiles- <EMS host name>- <timestamp in YYYY-MM-DD-HHMMSS format>.tar.gz Example: logFiles-emssa- 2020-11-20 _114133.tar.gz	/opt/sonus/ems	A tar.zip file which includes logs and PM yaml files for debugging the RAMP. mnpsyniverse_audit_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains information on the count of MNP Syniverse messages received calculated every 5 minutes. If you are not using the feature, the log file will just contain entries with all 0s.
mnptelcordia_audit_log	/opt/sonus/ems/ weblogic/ sonusEms/logs/sys	Contains information on the count of MNP Telcordia messages received calculated every 5 minutes. If you are not using the feature, the log file will just contain entries with all 0s.

File name	Directory	Description
mnp_trace_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains logs related to the MNP feature.
nhr_trace_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains logs related to the Health Reports feature.
oss-resync-agent.log	/opt/fm/logs/	Contains the logs for FM oss-resync-agent.
oss_resync_stats.log	/opt/fm/logs/	Contains the logs for FM oss_resync_stats.
partialConfigUpdate_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information related to the SBC partial configuration update feature.
persister.log	/opt/sonus/pm/logs/	Contains information related to the PM persister.
pm_administration_trace_log	/opt/sonus/pm/logs/	Contains information related to the PM administration service.
pm_copier_service_trace_log	/opt/sonus/pm/logs/	Contains information related to the copier service.
pm_datahandler_trace_log	/opt/sonus/pm/logs/	Contains information related to the PM datahandler service.
pm_diagnose_log	/opt/sonus/pm/logs/	Contains the logs for PM diagnose.
pm_diagnose_post_aggregator.log	/opt/sonus/pm/logs/	Contains the logs for PM aggregator diagnose.
pm_diagnose_post_exporter.log	/opt/sonus/pm/logs/	Contains the logs for PM exporter diagnose.
pm_diagnose_post_processor.log	/opt/sonus/pm/logs/	Contains the logs for PM post processor diagnose.
pm_exporter_trace_log	/opt/sonus/pm/logs/	Contains the logs for the PM exporter service.

File name	Directory	Description
pm_jmx_collector_trace_log	/opt/sonus/pm/logs/	Contains the logs for PM JMX Collection.
pm_pmc_trace_log	/opt/sonus/pm/logs/	Contains information about enabling/disabling a profile on a node.
pm_reports_trace_log	/opt/sonus/pm/logs/	Contains information about PM reports that are generated in UI.
pm_retention_trace_log	/opt/sonus/pm/logs/	Contains information related to the retention service.
pm_snmp_collector_trace_log	/opt/sonus/pm/logs/	Contains the logs for PM SNMP collection.
pm_sftp_collector_trace_log	/opt/sonus/pm/logs/	Contains the logs for PM SFTP collection.
pm_thresholder_trace_log	/opt/sonus/pm/logs/	Contains information about thresholder service.
pm_uai_log	/opt/sonus/pm/logs/	Contains the PM user activity logs.
pmOutput.log	/opt/sonus/pm/logs/	Contains info about PM microservices status.
preprocessor.log	/opt/fm/logs/	Contains information related to the FM preprocessor service.
processor.log	/opt/sonus/pm/logs/	Contains information related to the PM processor service.
processorStdrr.log	/opt/sonus/pm/logs/	Contains information about any errors/warns that are generated by python scripts.
preprocessor_schema_id.log	/opt/fm/logs/	Contains information related to the FM preprocessor schema_id.
purgerStdrr.log	/opt/sonus/pm/logs/	Contains the logs for PM purger error information.

File name	Directory	Description
quartz_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information on the Quartz scheduler (used to schedule various job/tasks within the main RAMP JBoss instance).
ramp_trap.log	/opt/fm/logs/	Contains the logs for RAMP's traps.
reachability_audit_log	/opt/devMgmt/logs/	Contains the reachability audit information.
reachability_kafka_log	/opt/devMgmt/logs/	Contains the reachability kafka information.
reachability_quartz_log	/opt/devMgmt/logs/	Contains the reachability quartz information.
reachability_trace_log	/opt/devMgmt/logs/	Contains the reachability trace information.
receiver.log	/opt/fm/logs/	Contains information related to the FM receiver service.
sbcapi_prov_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information on all of the SBC API operations that are performed including the user/IP performing the operation, what operation was invoked, and at what time the operation was invoked.
sequence-generator.log	/opt/fm/logs/	Contains information related to FM sequence-generator service.
sequencer.log	/opt/fm/logs/	Contains the logs for FM sequencer service.
sequencer_schema_id.log	/opt/fm/logs/	Contains the fm sequencer schema_id information.
sgxapi_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information on all of the SGX API operations that are performed including the user/IP performing the operation, what operation was invoked, and at what time the operation was invoked.

File name	Directory	Description
ssh.log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains logging information related to SSH connections to other nodes. This typically just contains errors indicating failures when connecting.
ssh_log	/opt/devMgmt/logs/	Contains the DM ssh log information.
tm_trace_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information about Traffic Management related operations.
tr746.log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains logging information related to the TR746 interface.
trap.log	/opt/fm/logs/	Contains the trap log information.
trap_stats.log	/opt/fm/logs/	Contains the trap stats log information.
fm_microservice_logs and other fm_micro_service_logs	/opt/fm/logs/	Contains information related to the trap resync feature.
UA_ <MM_DD_YYYY_hh_mm > .log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains the exported logs from the User Activity Log from the database at the given date and time that are specified in the filename.
ual_trace_log	/opt/sonus/auth/logs	Contains logging related to the User Activity Logger task which generates the UA_<MM_DD_YY_hh_mm>.log files.
vlan_trace_log	/opt/sonus/ems/weblogic/sonusEms/logs/sys	Contains information related to the VLAN feature.

Reset Admin Password for Jboss CLI

Reset the Admin password for the JBoss CLI using the Ribbon Application Management Platform (RAMP).

Prerequisite

RAMP is up and running.

Start

Use this procedure to reset the admin password for the JBoss CLI.

1. Log on to the RAMP as the `Insight` user. For more information, refer to [Log onto the RAMP CLI](#).
2. Use the `help` command to see the password hints on resetting the admin password for JBoss CLI:

```
/opt/rbbn/ems/conf/security/resetJbossCliAdminPass.sh -help
```

Output

The password must satisfy the following requirements:

It must contain at least 8 characters.

It must contain at least one alphabetic character.

It must contain at least one digit.

It must contain at least one non-alphanumeric symbol.

3. Reset the JBoss CLI admin password:

```
/opt/rbbn/ems/conf/security/resetJbossCliAdminPass.sh
```

At the prompts, enter and then re-enter the new password:

Output

```
-bash-4.4$ /opt/rbbn/ems/conf/security/resetJbossCliAdminPass.sh
```

```
Enter new Password :
```

```
Re-enter the Password :
```

```
Password Reset completed successfully.
```

Managing the NTP Server

In this section:

- [Add Multiple NTP Servers for RAMP](#)
- [Synchronize RAMP with the NTP Server](#)

Add Multiple NTP Servers for RAMP

To add multiple NTP IP addresses for Ribbon Application Management Platform (RAMP):

1. Log on to the RAMP CLI as the admin user.
2. Change to the root user:

```
sudo su -
```

3. Edit `/etc/chrony.conf`.
4. Append below lines at the end of the file:

```
server <NTP IP addresses 1> iburst  
restrict <NTP IP addresses 1> iburst
```

The following is an example:

```
server 10.128.254.67 iburst  
server 10.128.254.68 iburst
```

5. Save the file.
6. Restart NTP service:

```
systemctl restart chronyd
```

7. Run the `chronyc sources` to see the updated status.

Synchronize RAMP with the NTP Server

Your Unix/Linux administrator must synchronize Ribbon Application Management Platform (RAMP) and all network elements in the deployed network to the same NTP server. Synchronizing ensures that the timestamps in the RAMP logs are consistent with the timestamps on the other network elements. Failure to do so could also introduce error into certain statistics, most notably the Trunk Group performance statistics.

Note

If you elect to synchronize with more than one NTP server, you must ensure that the NTP servers are also synchronized. Conflicting time information from multiple NTP servers may cause RAMP system errors.

Start

Perform the following procedure to configure the NTP server in Linux. Ensure all nodes are set in the NTP server. By default, the GSX has the NTP server set.

1. SSH to RAMP as the admin user.
2. Change to root user:

```
sudo su -
```

3. Enter the following command to stop the NTP service:

```
# systemctl stop chronyd.service
```

- Using the vi editor, update `/etc/chrony.conf` file and add the NTP server IP address `<ntp_server_ip> iburst`.
For example:

```
# server 10.128.144.50 iburst
```

- Enter the command `chronyd -q server <ntp_server_ip> iburst` to synchronize the RAMP with the NTP server:
For example:

```
# chronyd -q server 10.128.144.50 iburst
```

- Start the NTP server:

```
# systemctl start chronyd
```

- After 10 seconds run the following command to ensure you are able to ping the NTP server:

```
chronyc tracking
```

Or

```
chronyc sources
```

Managing Redundancy

In this section:

- [Check Database and File Replication Status](#)
- [Change the Role of a Node in RAMP GR](#)
- [Reconfigure a Standby Node in RAMP GR](#)
- [Tear Down RAMP GR](#)
- [Replace a Node in RAMP GR](#)

A geographically redundant (GR) deployment on Ribbon Application Management Platform(RAMP) begins as two RAMP standalone instances at different geographical locations that you configure to work together in a GR fashion. The RAMP instance at one of the GR sites functions as a "source" or active RAMP and the other functions as a "target" or standby RAMP instance. GR configuration can be run on either standalone RAMP instance; the instance on which you configure GR becomes the source RAMP. Refer to [Configuring RAMP GR](#).

After GR is configured, there is constant replication of data from the source RAMP to the target RAMP. If the source RAMP goes down, you can perform a failover from the target RAMP instance. Similarly, you can also do a switchover and change the source and target roles. If necessary, you can also teardown the GR setup and resume having two standalone RAMP instances. If one instance fails, you have the option to replace it with a new instance.

As an alternative to initiating manual switchovers, RAMP also supports a deployment model that enables automatic switchover between GR instances. To enable automatic switchover, you must deploy three additional

VMs, each running an instance of etcd. The etcd instances continually monitor whether they are able to communicate with the RAMP instances and use that information to function as arbitrators that determine which RAMP instance should be active. A switchover occurs automatically when a majority of the etcd instances determine that the current active instance is no longer reachable. Refer to [Configuring RAMP GR with Automatic Switchover Enabled](#) for more information on switchover processing, the resources required to implement automatic switchover, and how to deploy etcd.

In a RAMP GR setup, the target instance monitors the source and raises the following alarms to a configured Operations Support Systems (OSS) when necessary:

- `sonusEmsV2NodeUnreachableNotification` target RAMP sends the alarm to OSS when the source RAMP is down.
- `sonusEmsV2NodeReachableNotification` target RAMP sends the alarm to OSS when the source RAMP is up and running.

Check Database and File Replication Status

To check the database and file replication status in a geographically redundant (GR) Ribbon Application Management Platform (RAMP) deployment, enter the following command on the active device as the `root` user:

```
/opt/sonus/ems/conf/RDSyncStatus.sh
```

The following is a sample output:

```
[2022-06-20 15:51:52 root@sanrampr1: /home/admin ]# /opt/sonus/ems/conf/RDSyncStatus.sh

This node is configured as a PHYSICAL replication PRIMARY.

Downstream Node Name | Node IP | State | Local LSN | Remote LSN | Lag(MB)
-----+-----+-----+-----+-----+-----
+-----+-----+
sanrampr2 | 172.19.52.66 | streaming | 0/5939B558 | 0/5939B558 | 0.000

-----
Component | Status
-----
PM | Sync completed
Inventory Report | Sync completed
SBC Image | Sync completed
```

Change the Role of a Node in RAMP GR

Use the following procedure to change the role of a Ribbon Application Management Platform (RAMP) node from active (source) to standby (target), or vice versa, in a geographically redundant (GR) deployment.

Note

The SBC Edge nodes take approximately 5 to 18 minutes to display the online status on the devices page after they are relocated.

You can change the role of a **RAMP** node (relocate) in either of the following scenarios. The scenario determines on which node to run the procedure.

- Switchover: Planned relocate operation on a node.
- Failover: Unplanned relocation operation as the other node failed.

Start

1. Accomplish one of the following role changes:
 - a. Failover: SSH to the **RAMP** standby **RAMP** node as insight user.
 - b. Switchover: SSH to the **RAMP** active **RAMP** node as insight user.
2. Change to the insight user:

```
sudo su - insight
```

3. Enter the following command:

```
nohup ./emsMgmt relocateGR &
```

Note

This command runs the process in the background.

Note

If you relocate a node for a failover, when the failed active node is restored it resumes operation as active, which can result in two active GR nodes. To resolve this issue, follow the procedure [Reconfigure a Standby Node in RAMP GR](#).

Note

Use the `tail -f nohup.out` command to see the progress.

Reconfigure a Standby Node in RAMP GR

In a Ribbon Application Management Platform (RAMP) geographically redundant (GR) deployment, if the active (source) instance is down, you can promote the standby (target) instance to be the active instance. However, when the active instance recovers, it comes up as active. This results in two active instances (dual-active condition) simultaneously.

To avoid the dual-active condition, use the following procedure to reconfigure the recovered active instance to be the standby instance.

1. SSH to the recovered RAMP active instance as the `admin` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the `admin` user.
2. Change to insight user:

```
sudo su - insight
```

3. Enter the following command:

```
/opt/sonus/ems/emsMgmt grStandby
```

4. Exit the insight user session:

```
exit
```

5. Change to root user:

```
sudo su -
```

6. Reboot the node:

```
reboot
```

Tear Down RAMP GR

Use the following procedure to split a Ribbon Application Management Platform (RAMP) Geographically Redundancy (GR) deployment into two standalone instances for troubleshooting (recovery) or upgrade purposes. The RAMP GR devices are configured to work as an active (source) and standby (target) pair. When you tear down the GR configuration, these devices become standalone instances.

Prerequisites

Two healthy RAMP nodes, up and running.

Start

1. SSH to the RAMP active instance in the GR pair as the `admin` user. To access RAMP CLI as the `admin` user, refer to [Log onto the RAMP CLI](#).
2. Change to root user:

```
sudo su -
```

Note

Enter the Admin password if JITC is enabled.

Please enter Password of admin user **for** all nodes ->

3. Enter the following command:

Note

Use `-h` to list the options available when you run the `./RDtearDown.sh` command.

For example,

```
/etc/sonus/RDtearDown.sh -h
```

- h Show help information
- f FreshStart the RDteardown, instead of resuming from previous point of failure
- r RemoveSite with id or Node ID
- p Force Remove Remote Node or teardown when Gr is in bad state , when Remote Node is not Reachable/Down

```
/etc/sonus/RDtearDown.sh
```

The following message displays:

```
....  
Node 1 will be excluded because it is the local node  
Please enter the numeric site number to be removed ->
```

4. Enter the node number which you want to remove. For example, 2. The following message displays:

```
.....  
[12:08:27] Redundancy cluster node removal completed.  
Please check log file: /var/log/ems/RDtearDown.sh.7393.log
```

If the teardown process is interrupted and you resume `RDtearDown.sh`, RAMP shows the following message:

```
Record showing the <script name> script was being executed and was not
completed.
Do you want to resume the operation from the previous point of failure (yes|
no)?.
```

Perform one of the following:

- Enter "yes" to resume the operation from the point of failure.
- Enter "no" to execute the script again. RAMP shows the following message:

```
Do you want to proceed with a fresh new operation (yes|no)? ->
```

Perform one the following:

- Enter "yes" to execute the script.
- Enter "no" to terminate the session.

Note

The new certificates are generated for the target RAMP containing the CN and SAN details of the target.

Replace a Node in RAMP GR

If a Ribbon Application Management Platform (RAMP) instance in a geographically redundant (GR) deployment becomes corrupted, you can replace the corrupted RAMP instance with a new RAMP instance.

If an active GR instance fails but is not corrupted and could recover, manually promote the standby instance to the active role. Refer to [Change the Role of a Node in RAMP GR](#).

Start

1. Delete the corrupted RAMP instance.
2. Install a new RAMP instance with the same IP address and hostname of the corrupted instance.
3. Log onto the new RAMP instance through CLI as the `admin` user.
4. Change to the `root` user:

```
sudo su - root
```

5. Find the `_node<number>_id` of the corrupted node:

```
cat /etc/rd.conf
```

6. Execute the following command:

```
/etc/sonus/RDupdateNode.sh <_node_id of the corrupted node>
```

The following is an example:

```
/etc/sonus/RDupdateNode.sh 02
```

The following is a sample output:

```
....
Please enter Password of admin user for all nodes (press ENTER if not needed) ->
```

7. Enter the password of the admin user. The following is a sample output:

```
.....
Do you want to proceed with updating this node (yes|no)?
```

8. Enter "yes". The following is a sample output:

```
....
You can login as insight user and invoke "./emsMgmt status" to check the cluster status.
```

If the replacement process is interrupted and you resume `RDupdateNode . sh` , RAMP shows the following message:

```
Record showing the <script name> script was being executed and was not completed.
Do you want to resume the operation from the previous point of failure (yes|no)?.
```

Perform one of the following:

- Enter "yes" to resume the operation from the point of failure.
- Enter "no" to execute the script again. The RAMP shows the following message:

```
Do you want to proceed with a fresh new operation (yes|no)? ->
```

Perform one the following:

- Enter "yes" to execute the script.
- Enter "no" to terminate the session.

Managing Resources

In this section:

- [Manage Resources for RAMP on KVM](#)

- [Change CPU Count in the RAMP on KVM Using CLI](#)
- [Change Memory Allocation in the RAMP on KVM Using CLI](#)
- [Manage Resources for RAMP on OpenStack](#)
 - [Detach a Cinder Volume from an Instance](#)
 - [Delete Stack](#)
 - [Delete a Cinder Volume](#)
 - [Recovering RAMP from Nova Compute Failure](#)

 - [Change CPU Count in RAMP on VMware](#)
 - [Change Memory Allocation in RAMP on VMware](#)

Manage Resources for RAMP on KVM

In this section:

- [Change CPU Count in the RAMP on KVM Using CLI](#)
- [Change Memory Allocation in the RAMP on KVM Using CLI](#)

Change CPU Count in the RAMP on KVM Using CLI

Use this procedure to change the CPU count for a Ribbon Application Management Platform (RAMP) device deployed on KVM.

To change the CPU count:

1. Log onto the KVM host as root user.
2. List all the instances and select the instance from the list that you want to update.

```
virsh list --all
```

Sample output:

Id	Name	State

44	ems-image-based-install	running

3. Shut down the VM:

```
virsh shutdown <vm_name>
```

Sample output:

```
virsh shutdown  ems-image-based-install

Domain ems-image-based-install is being shutdown
```

4. Verify whether the VM is shut off:

```
virsh dominfo ems-image-based-install | grep State
```

Sample output:

```
State: shut off
```

5. Check the CPU count in the VM instance:

```
virsh dominfo <vm_name> | grep CPU
```

Sample output:

```
virsh dominfo ems-image-based-install | grep CPU
CPU(s):      4
```

6. Check whether topology is defined:

```
virsh dumpxml <vm_name> | grep -C 1 cores
```

Sample output that indicates a predefined topology (4 vCPUs):

```
<cpu>
  <topology sockets='1' cores='2' threads='2' />
</cpu>
```

Note

If there is no predefined topology, no output is displayed.

7. If sample output exists indicating a predefined topology, perform the following sub-step. Otherwise, skip to step 8.
 - Edit the XML and edit your <CPU> topology depending on your requirement and change the VCPU allocation to match.

If you have defined the topology (socket, core and threads), edit both the maximum count and the topology.

```
virsh edit <vm_name>
```

Sample output (6 cores):

```
virsh edit ems-image-based-install
```

```
Domain ems-image-based-install XML configuration edited.
```

```
-----
<cpu>
  <topology sockets='1' cores='3' threads='2' />
</cpu>
```

8. Update the CPU count:

```
virsh setvcpus <vm_name> <vcpu_count> --config --maximum
virsh setvcpus <vm_name> <vcpu_count> --config
```

Sample output (changing CPU count to 6):

```
virsh setvcpus ems-image-based-install 6 --config --maximum

virsh setvcpus ems-image-based-install 6 --config

virsh dominfo ems-image-based-install | grep CPU
CPU(s):          6
```

Change Memory Allocation in the RAMP on KVM Using CLI

Use the following procedure to change the memory allocation for a Ribbon Application Management Platform (RAMP) device deployed on KVM.

1. Log onto the KVM host as the root user.
2. List all the instances and select the instance from the list that you want to change.

```
virsh list --all
```

Sample output:

```
virsh list --all

  Id      Name                                State
  -----
  44      ems-image-based-install              running
```

3. Shut down the RAMP VM:

```
virsh shutdown <vm_name>
```

Sample output:

```
virsh shutdown ems-image-based-install
```

```
Domain ems-image-based-install is being shutdown
```

4. Verify whether the VM is shut off:

```
virsh dominfo ems-image-based-install | grep State
```

Sample output:

```
State:          shut off
```

5. Check the memory allocation of the instance.

```
virsh dominfo <vm_name> | grep memory
```

Sample output:

```
virsh dominfo ems-image-based-install | grep memory
Max memory:    66969600 KiB
Used memory:    66969600 KiB
```

6. Change the memory allocation:

```
virsh setmaxmem <vm_name> <memsize> --config
virsh setmem <vm_name> <memsize> --config
```

Sample output:

```
virsh setmaxmem ems-image-based-install 73400320 --config

virsh setmem ems-image-based-install 73400320 --config

virsh dominfo ems-image-based-install | grep memory
Max memory:    73400320 KiB
Used memory:    73400320 KiB
```

Manage Resources for RAMP on OpenStack

In this section:

- [Detach a Cinder Volume from an Instance](#)
- [Delete Stack](#)
- [Delete a Cinder Volume](#)
- [Recovering RAMP from Nova Compute Failure](#)

Detach a Cinder Volume from an Instance

You can detach a cinder volume that is associated with an instance of Ribbon Application Management Platform (RAMP).

To detach a cinder volume:

1. Log onto the OpenStack Dashboard GUI.
2. Click **Project -> Volumes**.
3. Select the cinder volume to detach.
4. From the **Actions** drop-down list, select **Manage Attachments**.
The **Manage Volume Attachments** dialog box is displayed.
5. Click **Detach Volume**.
You are prompted to confirm.

Once a cinder volume is no longer attached you can delete the cinder volume if appropriate, refer to [Delete a Cinder Volume](#).

Delete Stack

When you upgrade Ribbon Application Management Platform (RAMP) on OpenStack, you must delete the instance's stack as part of the upgrade process. When you delete a stack on OpenStack, this removes the instance that was spawned using the respective stack and also disassociates any attached Cinder volume. However, the Cinder volume is not deleted; it can be reused.

Start

1. Log onto the OpenStack Dashboard GUI.
2. Click **Project > Compute > Instances**.
From the **Instances** list, note down the floating IP associated with the instance you plan to delete. The IP address will be released when you delete the stack.
3. Click **Project > Compute > Volumes**. Note down the Cinder volume associated with the RAMP instance. This Cinder volume is disassociated from the instance when you delete the stack, but the data persists as long as the Cinder volume is not deleted. If you delete the Cinder volume, the data is lost.
4. Click **Project > Orchestration > Stacks**. Select the RAMP stack for the instance you want to terminate and click **Delete Stacks**.
5. Confirm the deletion when prompted.
6. Click **Project > Compute > Instances** and verify that the RAMP instance is no longer listed.
7. Click **Project > Compute > Volumes** and verify that the Cinder volume is disassociated from the RAMP instance.
8. (Optional) If you are no longer planning to reuse the data on the Cinder volume, you can delete the Cinder volume. Select the Cinder volume and click **Delete Volumes** to delete the Cinder volume.
9. Confirm the deletion when prompted.

Deleting the Cinder volume results in loss of backup data.

10. Check if the Cinder volume is deleted from the **Volumes** list.

Delete a Cinder Volume

You can delete a cinder volume that is not attached to any instance to save disk space.

To delete a cinder volume:

1. Log onto the OpenStack Dashboard GUI.

2. Click **Project -> Volumes**.
3. Select a cinder volume to delete and confirm when prompted.
4. Click **Delete Volumes**.
The cinder volume is deleted.

Recovering RAMP from Nova Compute Failure

Use this procedure to recover (evacuate) a Ribbon Application Management Platform (RAMP) instance from a failed Nova Compute node.

Prerequisites

- RAMP is running on a multi-host OpenStack setup with multiple Compute nodes running.

For this procedure, assume Compute nodes A and B are running in Openstack and you want to evacuate the RAMP instance from node A (which is now down) to node B.

Start

1. Verify that Compute node A is down by entering the following command:

```
nova service-list
```

2. Evacuate the instance by entering the following command.

```
nova evacuate <instance name> <compute B>
```

The RAMP instance on Compute node A is moved to the second host (Compute node B).

3. Verify if RAMP and all its processes are running on Compute node B. Refer to [Check RAMP Status](#).
4. Log onto the RAMP GUI and verify that the RAMP GUI displays.

Manage Resources for RAMP on VMware ESXi

In this section:

- [Change CPU Count in RAMP on VMware](#)
- [Change Memory Allocation in RAMP on VMware](#)

This section covers managing system resources for Ribbon Application Management Platform (RAMP) on VMware ESXi.

Change CPU Count in RAMP on VMware

Use the following procedure to change the CPU count for a Ribbon Application Management Platform (RAMP) device deployed on VMware ESXi.

To change the number of CPUs:

1. Enter the VMware host machine IP address in your web browser and log in as the `root` user.
2. In the left navigation pane under **Virtual Machines**, select the VM you want to configure.
3. Power off the VM.
4. Click **Edit**.
The **Edit settings** window opens for the selected VM.
5. In **CPU**, select a CPU count as needed.
6. Click **Save**.
7. Power on the VM.

Change Memory Allocation in RAMP on VMware

Use the following procedure to change the memory allocation for a Ribbon Application Management Platform (RAMP) device deployed on VMware ESXi.

To change the memory allocation:

1. Enter the VMware host machine IP address in your web browser and log in as the `root` user.
2. In the left navigation pane under **Virtual Machines**, select the VM you want to configure.
3. Power off the VM.
4. Click **Edit**.
The **Edit settings** window opens for the selected VM.
5. In **Memory**, enter the new memory allocation quantity.
6. Click **Save**.
7. Power on the VM.

Managing Secure Communications

In this section:

- [Secure Login to the RAMP GUI](#)
 - [Generate a Certificate Request for the RAMP GUI](#)
 - [Import Trusted Certificates for the RAMP GUI](#)
 - [Import Previously Generated TLS Certificate](#)
- [Secure Communication Between RAMP and Devices](#)

Secure Login to the RAMP GUI

Related articles:

- [Generate a Certificate Request for the RAMP GUI](#)
- [Import Trusted Certificates for the RAMP GUI](#)
- [Import Previously Generated TLS Certificate](#)

Hypertext Transfer Protocol Secure (HTTPS) is used to secure logins to the Ribbon Application Management Platform (RAMP) GUI. RAMP requires an SSL certificate in order to use HTTPS. Installing an SSL certificate will prevent errors and warnings on the RAMP login page. Without a certificate, the RAMP login page will show a “Not Secure” warning.

HTTPS is enabled by default. However, the default site certificate on RAMP is only a demo version. You can use this demo certificate only for testing and training.

To support production use, Ribbon recommends that you obtain a site certificate for each RAMP device from a trusted Certificate Authority (CA) designated by your organization. System administrators must coordinate closely with their chosen CA. For more information, refer to <https://docs.oracle.com/javase/8/docs/technotes/guides/security/cert3.html>.

For RAMP GR, repeat the procedures to secure the communication on both the active and standby devices.

To get help on certificate commands, enter the following command when logged in as the insight user. Refer to [Log onto the RAMP CLI](#) for information on accessing RAMP as the insight user.

```
/opt/sonus/ems/conf/cert/bin/manageCert -h
```

Logs for RAMP GUI certificate commands are available at `/opt/sonus/ems/logs/cert_mgmt.log`.

Workflow – Secure Login to RAMP GUI

Step	Action
1	Generate a Certificate Request for the RAMP GUI
2	Import Trusted Certificates for the RAMP GUI

Generate a Certificate Request for the RAMP GUI

The Ribbon Application Management Platform (RAMP) requires an SSL certificate for users to log into the GUI securely. SSL certificates are issued by a Certificate Authority (CA). To obtain certificates, the RAMP administrator needs to send a certificate service request (CSR) to a CA.

This section covers generating a CSR.

Prerequisites

SSH credentials for the RAMP `insight` user.

Note

The RAMP supports certificates with key size ranging from 2048 to 4096 bits. If you migrate data to a new RAMP system, any certificates with a key size less than 2048 are not restored. You must generate a new certificate using the following procedure.

Start

1. Access RAMP as the `insight` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the `insight` user.
2. Perform one of the following:
 - Create a configuration file with an IP address for CSR generation:

```
/opt/sonus/ems/conf/cert/bin/manageCert config-csr
```

Example output:

```
-bash-4.4$ /opt/sonus/ems/conf/cert/bin/manageCert config-csr
Generating certificate request template config file for EMS site IP ...
Successfully created template config file: /opt/sonus/ems/conf/cert/conf/
request-cert.cfg

Please fill in rest of the details here before using this config file for
certificate request generation.
-bash-4.4$
```

OR

- Create a configuration file without an IP address for certificate request generation:

```
/opt/sonus/ems/conf/cert/bin/manageCert config-csr -e
```

Example Output:

```
-bash-4.4$ /opt/sonus/ems/conf/cert/bin/manageCert config-csr -e
Generating certificate request template config file for EMS site IP ...
Successfully created template config file: /opt/sonus/ems/conf/cert/conf/
request-cert.cfg

Please fill in rest of the details here before using this config file for
certificate request generation.
-bash-4.4$
```

3. Edit the certificate request configuration file. No commas are allowed for the key values.

Parameter	Description	Example	Mandatory (M)/ Optional (O)
cert.FQDN	The Fully Qualified Domain Name (FQDN) of the RAMP site. For example: If you plan to access your RAMP site from a browser using <code>https://emshost.yourdomain.com</code>, enter the FQDN value as "emshost.yourdomain.com". The FQDN must contain only alphanumeric characters, hyphens, and periods. Note Ensure you have created a DNS entry for the FQDN to resolve it correctly to the RAMP IP address.	emsha1.rbbn.com	M
cert.IP	Note Do not enter any value for the <code>cert.IP</code> parameter if you have generated the certificate service request (CSR) without an IP address. RAMP's IP address.	10.155.75.200	M
cert.CN	The Common Name (CN) for the hostname.	ribbon.com	O
cert.organizationUnit	The department or division in the organization.	Purchasing	O
cert.organizationName	The organization name.	Ribbon Communications	O
cert.localityName	The locality name.	Westford	O
cert.stateName	The state or province name.	Massachusetts	O

Parameter	Description	Example	Mandatory (M)/ Optional (O)
cert.country	The two-letter country code.	US	O
cert.rsa.keySize	The RSA encryption key length (in bits) to generate an RSA key pair during CSR generation. ◦ 2048 bits – For general-purpose encryption and secure communication to provide a good balance between security and performance. ◦ 4096 bits – (Default) This offers the highest level of protection for highly sensitive data and long-term security requirements, but it may require more computational resources.	4096	M

4. Save the file.

Sample request-cert.cfg details

```
-bash-4.4$ cat /opt/sonus/ems/conf/cert/conf/request-cert.cfg
#
# Fully Qualified Domain Name (FQDN) of the EMS site.
#
# For example:
#   If you plan to access your EMS site from the browser as: https://
#   emshost.yourdomain.com
#   Then the FQDN value should be: emshost.yourdomain.com
#
# Please make sure that you have created a DNS entry for this FQDN so that it
# resolves correctly to the IP: 10.54.141.76
#
# RSA Key Bit Size. Min Size Supported=2048, Max Size Supported=4096
cert.rsa.keySize=4096

# Create/Update the value below as appropriate
cert.FQDN=venus2ems.$dnsSearchPath

# IP address of EMS site (Well-known/virtual IP in case of EMS HA) - you usually
# would not need to change this
cert.IP=10.54.141.76

# Common Name (CN) for the hostname, e.g., "sonusnet.com"
cert.CN=
```

```
# Small organization (e.g., department or division) name, e.g., "Purchasing."
cert.organizationUnit=

# Large organization (Company) name, e.g., "ABCSystems."
cert.organizationName=

# Locality (city) name, e.g., "Palo Alto"
cert.localityName=

# Full State or province name, e.g., "California."
cert.stateName=

# Two-letter country code, e.g., "US"
cert.country=

-bash-4.4$
```

5. Generate the CSR. The validity of a certificate is set to 1 year (365 days) by default. Change the certificate validity (in days) using the `-v` argument. Perform one of the following.
 - Generate a CSR without an IP address. The example requests certificates with 30 days of validity.

```
/opt/sonus/ems/conf/cert/bin/manageCert gen-csr -v 30 -e
```

Example output:

```
-bash-4.4$ /opt/sonus/ems/conf/cert/bin/manageCert gen-csr -v 30 -e

Creating a certificate requestwith thee following settings:

Fully Qualified Domain Name .. ....: rampdemo.rbbn.com
RSA Key Bit Size.....: 4096 bits
Certificate validity period .....: 30 days

Do you want to proceed? [y|n]: y

Starting certificate request generation with validity of 30 days.
Creating working copy of keystore file ems.keystore as ems.keystore.staging...
Removing old key first from keystore...
Generating key pairs...
Generating certificate request file /opt/sonus/ems/conf/cert/conf/
rampDemo_SonusEMS.csr...
Successfully completed certificate request file generation.

Please use the following file to request a new site certificate:
/opt/sonus/ems/conf/cert/conf/rampDemo_SonusEMS.csr
-bash-4.4$
```

- Generate a CSR with an IP address. The example requests certificates with 30 days of validity.

```
/opt/sonus/ems/conf/cert/bin/manageCert gen-csr -v 30
```

6. When a prompt "Do you want to proceed? [y|n]:" displays, enter "y". The CSR file is generated.
7. **Verify the CSR before sending it to the CA:**

```
/opt/sonus/ems/conf/cert/bin/manageCert verify-csr
```

Example Output:

```
-bash-4.4$ /opt/sonus/ems/conf/cert/bin/manageCert verify-csr
Printing contents of certificate request file: /opt/sonus/ems/conf/cert/conf/
rampDemo_SonusEMS.csr

PKCS #10 Certificate Request (Version 1.0)
Subject: CN=rampdemo.rbbn.com, OU=SVT, O=Ribbon Communications, L=Bangalore,
ST=Karnataka, C=IN
Format: X.509
Public Key: 4096-bit RSA key
Signature algorithm: SHA256withRSA

Extension Request:

#1: ObjectId: 2.5.29.17 Criticality=false
SubjectAlternativeName [
  DNSName: rampdemo.rbbn.com
  IPAddress: 10.34.146.32
]

#2: ObjectId: 2.5.29.14 Criticality=false
SubjectKeyIdentifier [
KeyIdentifier [
0000: E2 25 27 EB A3 A6 85 56  0C 30 13 C8 91 AE 89 E4  .%'....V.0.....
0010: 2B FC 8D 04                      +...
]
]
```

- a. **Check the hostname:**

```
hostname
```

- b. (Optional) Remove ^M characters from the CSR:

```
dos2unix /opt/sonus/ems/conf/cert/conf/<hostname>_SonusEMS.csr
```

- c. **Check the contents in the CSR:**

```
cat /opt/sonus/ems/conf/cert/conf/<hostname>_SonusEMS.csr
```

8. Send the CSR to a CA and follow the procedure to obtain certificates. After obtaining the certificates, import them to RAMP. Refer to [Import Trusted Certificates for the RAMP GUI](#) for additional information.

Troubleshooting:

1. Refer to the log file `/opt/sonus/ems/logs/cert_mgmt.log`.
2. For detail logging, edit the file `/opt/sonus/ems/conf/cert/conf/log4j.xml`.

Import Trusted Certificates for the RAMP GUI

Use this procedure to import trusted certificates obtained from a Certificate Authority (CA) to Ribbon Application Management Platform (RAMP). You will usually receive two or three certificate files (root, intermediate, and site) from a request. The 'site' certificate is for the RAMP host, and can have a dependency on an 'intermediate' certificate or 'root' certificate, or both. The intermediate certificate is optional.

RAMP certificates in X.509 format may have different extensions (.cer, .crt, .pem, .der, and so on). The certificates will work if they are in PEM (ASCII) or DER (Binary) format, irrespective of the file extension.

Prerequisites

- A [Certificate Request](#) for the RAMP GUI exists.

Start

1. Copy the certificates to the RAMP host in the directory `/tmp`.
2. Access RAMP as the root user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the root user.
3. Add permissions for the insight user to access the certificate files:

```
chown insight:insight /tmp/ramp-site.cer
chown insight:insight /tmp/verisign-root-ca.cer
chown insight:insight /tmp/verisign-intermediate-ca.cer
```

4. Change to insight user:

```
sudo su - insight
```

5. Verify certificates are available in RAMP:

```
ls -ltr /tmp/*.cer
```

The following is an example of three files containing certificates:

```
-rw-r--r--. 1 insight insight 1854 Jan 11 19:49 /tmp/ramp-site.cer
-rw-r--r--. 1 insight insight 1964 Jan 11 19:50 /tmp/verisign-intermediate-ca.cer
```

```
-rw-r--r--. 1 insight insight 1566 Jan 11 19:50 /tmp/verisign-root-ca.cer
```

6. Add the paths for certificates into the `conf/import-cert.cfg` config file, starting with the root certificate. You can keep any alias (key) for the root and intermediate certificates in the config file, but the alias has to be 'insight' for the site certificate (reply for the certificate request sent to CA earlier). If the root and intermediate certificates have been imported, they do not need to be specified again in the config file. The site certificate (with the 'insight' alias name) is required. The following is an example of the config file after the update:

```
cat /opt/sonus/ems/conf/cert/conf/import-cert.cfg
# Specify the certificates to be imported, in ORDER, starting with the root CA
cert,
# and ending with the cert for Insight EMS site (with alias name 'insight').
#
# In case you have received a single cert file which already contains the
certificate chain, then specify
# that file path with the alias name 'insight'
#
# Entries should be in the following format: <alias>=<path to certificate file>
# For example:
#
# verisign-root-ca=/opt/sonus/ems/tmp/verisignca.crt
# geotrust-intermediate-ca=/opt/sonus/ems/tmp/geotrust-intermediate.pem
# insight=/opt/sonus/ems/tmp/sonusems.der
#
# Only X.509 format certificates are supported, certificates in other formats (e.g
PKCS #7) need to be
# manually converted to X.509 first before being used by this script.
#
# Certificate files need to be encoded in either 'PEM' (ascii) or 'DER' (binary),
extension doesn't matter.
# Alias names are case-insensitive and should be unique.
# Alias for the Insight EMS site certificate should be 'insight' (without quotes)
insight=/tmp/ramp-site.crt
verisign-root-ca=/tmp/verisign-root-ca.crt
```

```
grep -v "#" /opt/sonus/ems/conf/cert/conf/import-cert.cfg | grep =
verisign-root-ca=/tmp/verisign-root-ca.cer
verisign-intermediate-ca=/tmp/verisign-intermediate-ca.cer
insight=/tmp/ramp-site.cer
```

7. If the certificates from the CA are obtained in a bundle format, for example as a PKCS 12 (.pfx file) or PKCS 7 (.p7b file), manually split the file into individual PEM encoded certificate files and then add the paths to those files in the `import-cert.cfg` file. For example, if you receive a .p7b file, you can convert it into a PEM-encoded file as follows (change input and output file names appropriately):

```
$ openssl pkcs7 -print_certs -in /tmp/incerts.p7b -out /tmp/outcerts.cer
```

8. Open the output file and place each BEGIN CERTIFICATE and END CERTIFICATE block (including those two lines), and place them in separate files.

9. Place the paths for these separate files into the *import-cert.cfg* file.
10. Verify the certificates before importing them to the **RAMP** keystore. It is recommended that you verify the certificate fingerprints with the fingerprints provided by the CA. You can also specify the alias name using the `-n` argument to view the certificate for only that alias name, as specified in the *import-cert.cfg* configuration file. If no arguments are provided, all the certificates mentioned in the configuration file are displayed. For example, enter the following command to view and verify the certificate details for only the **insight** alias (site certificate):

```
/opt/sonus/ems/conf/cert/bin/manageCert verify-cert -n insight
```

Sample output

```
$ /opt/sonus/ems/conf/cert/bin/manageCert verify-cert -n insight
Validating certificate config
Printing contents of single certificate file /tmp/ramp-site.crt with alias name
'insight'...

11. Import certificate:

```
/opt/sonus/ems/conf/cert/bin/manageCert import-cert
```

Sample output

```
Starting certificate imports
Validating certificate config
Importing following certificates:
  1. verisign-root-ca [file: /tmp/verisign-root-ca.cer]
  2. verisign-intermediate-ca [file: /tmp/verisign-intermediate-ca.cer]
  3. insight [file: /tmp/ramp-site.cer]
Do you want to proceed? [y|n]:
```

12. Enter "y". The certificates are imported.

```
/opt/sonus/ems/conf/cert/bin/manageCert import-cert
Starting certificate imports
Validating certificate config

Importing following certificates:

  1. insight [file: /tmp/ramp-site.crt]
  2. verisign-root-ca [file: /tmp/verisign-root-ca.crt]

Do you want to proceed? [y|n]: y

Starting import of CA certificate file /tmp/verisign-root-ca.crt with alias name
'verisign-root-ca'
Checking whether certificate 'verisign-root-ca' file /tmp/verisign-root-ca.crt is
in DER format
Certificate not in DER format, checking if in PEM format
Certificate in PEM format, will be converting to DER format
Saving original file as .orig
Starting conversion to DER format
Verifying DER encoded certificate...
Successfully converted certificate file /tmp/verisign-root-ca.crt to DER format
Completed format check for certificate 'verisign-root-ca'
Deleting old certificate 'verisign-root-ca', if any, from keystore before adding
new one
Importing CA certificate 'verisign-root-ca'
Successfully imported CA certificate file /tmp/verisign-root-ca.crt with alias
name 'verisign-root-ca'
Starting import of SITE certificate file /tmp/ramp-site.crt with alias name
'insight'
Checking whether certificate 'insight' file /tmp/ramp-site.crt is in DER format
Certificate not in DER format, checking if in PEM format
Certificate in PEM format, will be converting to DER format
Saving original file as .orig
Starting conversion to DER format
Verifying DER encoded certificate...
Successfully converted certificate file /tmp/ramp-site.crt to DER format
Completed format check for certificate 'insight'
Importing SITE certificate 'insight'
Successfully imported SITE certificate file /tmp/ramp-site.crt with alias name
'insight'
Finally deleting the demo certificate if present.
Finally deleting the demo certificate if present.
Finally updating the keystore in use...
Setting up keys for Apache proxy
Extracting key...
Successfully extracted key, now converting key to PKCS#12 format
Successfully created PKCS#12 file, now converting to PEM format.
Removing passphrase from PEM file.
Setting file permissions
Completed setting up keys for Apache proxy.
```

Completed certificate imports

13. Stop the RAMP. For more information, refer to [How to Start and Stop RAMP](#).
14. Start the RAMP. For more information, refer to [How to Start and Stop RAMP](#).
15. Confirm whether certificates are imported to RAMP:

```
/opt/sonus/ems/conf/cert/bin/manageCert show-cert -n <alias name>
```

Viewing the 'insight' (site) certificate example

```
/opt/sonus/ems/conf/cert/bin/manageCert show-cert -n insight
```

You can now securely log on to the RAMP GUI.

Import Previously Generated TLS Certificate

The Ribbon Application Management Platform (RAMP) allows you to install a certificate by raising a request even from a third-party system. You need not go to RAMP, run the script, and generate the request. RAMP allows you to import certificates whose Certificate Signing Request (CSR) is raised from a different system.

Prerequisites

RAMP supports PKCS#12 (.p12) format.

PKCS#12 is a binary format for storing the server certificate, intermediate certificates, and private key in one file. This conveniently packages both the certificate and private key together simplifying the import process.

PKCS#12 files are particularly suited for importing certificates into your application due to the following reasons:

- It includes both a certificate and a private key, making it easier to manage and import all necessary certificate components.
- It provides enhanced security to ensure that sensitive data is securely handled during the import process.
- Its simplicity helps in streamlining the import process and reduces the risk of errors.

Perform the following to import SSL/TLS certificates into the RAMP application's keystore.

These certificates are generated using external tools or processes rather than through the application's built-in CSR generation procedure.

Start

1. Download the PKCS#12 File.

- a. Obtain the certificates provided by the Certificate Authority (CA).

It will typically be in the form of a .p12, includes the private key, the public certificate, and potentially intermediate certificates.

- b. Download this PKCS#12 file from the CA or the IT department.
2. Transfer the PKCS#12 File to RAMP.
 - a. Upload the .p12 file to the /tmp directory on the application server.
 - b. Ensure that the file has the correct ownership and permissions
 - i. Owner: insight
 - ii. Group: insight
 - iii. Permissions: 640
 - c. Execute the command.

```
chown insight:insight /tmp/yourfile.p12
```

- d. Execute the command.

```
chmod 640 /tmp/yourfile.p12
```

3. Import the PKCS#12 File into the RAMP's Keystore.
 - a. Login to RAMP and run the Import Script as 'insight' user.
 - b. Execute the command.

```
/opt/sonus/ems/conf/cert/bin/manageCert import-pkcs12 -p /tmp/yourfile.p12
```

- c. The script will securely prompt for the PKCS#12 password/passphrase ensuring that the password is not displayed in the console during entry.
 - d. Enter the password to complete the import.
4. Extract/Split certificates from the downloaded PKCS#12 file.
 - a. Use OpenSSL command to extract the certificates.

Example

```
openssl pkcs12 -in /tmp/yourfile.p12 -nokeys -out /tmp/all_certs.pem
```

- b. After extracting the certificates, manually split and save each certificate into its own file.

The extracted certificates need to be saved individually, with clear naming to distinguish between the root, intermediate, and site certificates. Each certificate begins with -----BEGIN CERTIFICATE----- and ends with -----END CERTIFICATE-----.

- c. Open the `all_certs.pem` file in a text editor, and for each certificate block.
 - i. Save the root certificate as `root.cer`.
 - ii. Save the intermediate certificate (if present) as `intermediate.cer`.
 - iii. Save the site certificate as `site.cer`.
5. Prepare for the final Import.
 - a. To import the certificates, refer to [Import Trusted Certificates for the RAMP GUI](#).

Secure Communication Between RAMP and Devices

Related articles:

- [Generate Certificate Request for Agent](#)
- [Import Certificates for Agent](#)
- [Add an Intermediate Certificate in SSL Handshake](#)
- [Renew RAMP Certificates](#)

Hypertext Transfer Protocol Secure (HTTPS) is used on Ribbon Application Management Platform (RAMP) for secure communication with registered devices. HTTPS is enabled by default, but the agent on RAMP requires an SSL certificate in order to use HTTPS. However, the default site certificate on RAMP is only a demo version. You can use the demo certificate only for testing and training.

To support production use, Ribbon recommends you obtain a site certificate for each RAMP device from a trusted Certificate Authority (CA) designated by your organization. System administrators must coordinate closely with their chosen CA. For more information, refer to <https://docs.oracle.com/javase/8/docs/technotes/guides/security/cert3.html>.

For RAMP GR deployments, repeat procedures to secure to communication on both the active and standby devices.

To get help on certificate commands, enter the following command as the insight user. Refer to [Log onto the RAMP CLI](#) for information on accessing RAMP as the insight user.

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert -h
```

Logs for RAMP agent commands are available at `/opt/sonus/sonusComm/logs/cert_mgmt.log`.

Workflow – Secure Communication Between RAMP and Devices

Step	Action
1	Generate Certificate Request for Agent
2	Import Certificates for Agent
3	(Optional) Add an Intermediate Certificate in SSL Handshake

For managing certificates for PSX Agent, refer to [PSX Agent Certificate Management](#).

Generate Certificate Request for Agent

The agent on Ribbon Application Management Platform (RAMP) requires an SSL certificate for secure communication between RAMP and registered devices. SSL certificates are issued by a Certificate Authority (CA). To issue certificates, a RAMP administrator must send a certificate service request (CSR) to a CA.

This section covers generating a CSR.

Start

1. Access RAMP as the insight user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the insight user.
2. Create the configuration file:

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert config-csr
```

The configuration file `request-cert.cfg` is generated.

3. Edit the file `request-cert.cfg`. No commas are allowed for the key values.

Parameter	Description	Example	Mandatory (M)/ Optional (O)
cert.FQDN	The Fully Qualified Domain Name (FQDN) of the RAMP site. For example, if you plan to access your RAMP site from a browser using https://emshost.yourdomain.com, enter the FQDN value as "emshost.yourdomain.com". The FQDN must contain only alphanumeric characters, hyphens, and periods. Ensure that you have created a DNS entry for the FQDN to resolve it correctly to the RAMP IP address.	emsha1.sonusnet.com	M
cert.IP	The IP address of RAMP . Do not enter any value for the cert.IP parameter if you have generated the certificate service request (CSR) without an IP address.	10.155.75.200	M
cert.CN	The Common Name (CN) for the hostname.	ribbon.com	O
cert.organizationUnit	The department or division in the organization.	Purchasing	O
cert.organizationName	The name of the organization.	Ribbon Communications	O
cert.localityName	The name of the locality.	Westford	O
cert.stateName	The name of the state or province.	Massachusetts	O
cert.country	The two-letter country code.	US	O

4. Save the file.

5. Generate the CSR. The validity of a certificate is set to 1 year (365 days) by default. Change the certificate validity (in days) using the `-v` argument. The following is an example for generating a certificate service request with 30 days validity:

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert gen-csr -v 30
```

Sample output:

```
Creating a certificate request with following settings:
Fully Qualified Domain Name .. ....: treebeardVM3
Certificate validity period ....., 30 days
Do you want to proceed? [y|n]:
```

6. Enter "y". The request file is generated at `/opt/sonus/sonusComm/conf/cert/conf/treebeardVM3_SonusAgent.csr`.
7. Verify the certificate service request before sending it to the CA:

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert verify-csr
```

- a. Check the hostname:

```
hostname
```

- b. (Optional) Remove ^M characters in the CSR:

```
dos2unix /opt/sonus/sonusComm/conf/cert/conf/<hostname>_SonusAgent.csr
```

- c. Check the contents in the CSR:

```
cat /opt/sonus/sonusComm/conf/cert/conf/<hostname>_SonusAgent.csr
```

8. Share the CSR with a CA to obtain certificates. To share the CSR with the CA, refer to [Import Certificates for Agent](#).

Import Certificates for Agent

This section covers importing certificates obtained from a Certificate Authority (CA) to the Ribbon Application Management Platform (RAMP). You will usually receive two or three certificate files (root, intermediate, and site). The 'site' certificate is for the RAMP host. The site certificate can have a dependency on an 'intermediate' certificate or 'root' certificate, or both. The intermediate certificate is optional.

RAMP certificates in X.509 format may have different extensions (.cer, .crt, .pem, .der, and so on). The certificates will work if they are in PEM (ascii) or DER (binary) format, irrespective of the file extension.

Prerequisites

- A [Certificate Request](#) for RAMP Agent is generated.

Start

1. Copy the certificates to the RAMP host, in the directory `/tmp`.
2. Access RAMP as the `root` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as the `root` user.
3. Add permissions for the insight user to access the certificate files:

```
chown insight:insight /tmp/agent-site.cer
chown insight:insight /tmp/verisign-root-ca.cer
chown insight:insight /tmp/verisign-intermediate-ca.cer
```

4. Change to insight user:

```
sudo su - insight
```

5. Verify the certificates are available in RAMP:

```
ls -ltr /tmp/*.cer
```

Example output of three files containing certificates:

```
-rw-r--r--. 1 insight insight 1854 Jan 11 19:49 /tmp/agent-site.cer
-rw-r--r--. 1 insight insight 1964 Jan 11 19:50 /tmp/verisign-intermediate-ca.cer
-rw-r--r--. 1 insight insight 1566 Jan 11 19:50 /tmp/verisign-root-ca.cer
```

6. Add the paths for the certificates into the `conf/import-cert.cfg` config file, starting with the root certificate. You can keep any alias (key) for the root and intermediate certificates in the config file, but the alias has to be 'agent' for the site certificate (reply for the certificate request sent to CA earlier). If the root and intermediate certificates have been imported, they do not need to be specified again in the config file. The site certificate (with the 'agent' alias name) is required.

```
grep -v "#" /opt/sonus/sonusComm/conf/cert/conf/import-cert.cfg | grep =
verisign-root-ca=/tmp/verisign-root-ca.cer
verisign-intermediate-ca=/tmp/verisign-intermediate-ca.cer
agent=/tmp/agent-site.cer
```

7. If the certificates from the CA are obtained in a bundle format, for example as a PKCS 12 (`.pfx` file) or PKCS 7 (`.p7b` file), manually split the file into individual PEM-encoded certificate files, and then add the paths of those files in the `import-cert.cfg` file. For example, if you receive a `.p7b` file, you can convert it into a PEM-encoded file as follows (change input and output file names appropriately):

```
$ openssl pkcs7 -print_certs -in /tmp/incerts.p7b -out /tmp/outcerts.cer
```

8. Open the output file and place each `BEGIN CERTIFICATE` and `END CERTIFICATE` block (including those two lines), and place them in separate files.
9. Place the paths for these separate files into the `import-cert.cfg` file.
10. Verify the certificates before importing it to the Agent keystore. It is recommended that you verify the certificate fingerprints with the fingerprints provided by the CA. You can also specify the alias name using the `-n` argument to view the certificate for only that alias name, as specified in the `import-cert.cfg`

configuration file. If no arguments are provided, all the certificates mentioned in the configuration file are displayed.

For example, enter the following command to verify the certificate details for only the `agent` alias (site certificate):

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert verify-cert -n agent
```

11. Perform one of the following, to import :
12. Stop the RAMP. Refer to [How to Start and Stop RAMP](#).
13. Import the certificate:

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert import-cert
```

Example output:

```
Starting certificate imports
Validating certificate config
Importing following certificates:
  1. verisign-root-ca [file: /tmp/verisign-root-ca.cer]
  2. verisign-intermediate-ca [file: /tmp/verisign-intermediate-ca.cer]
  3. insight [file: /tmp/agent-site.cer]
Do you want to proceed? [y|n]:
```

14. Enter "y". The certificates are imported.
15. Start the RAMP. Refer to [How to Start and Stop RAMP](#).
16. Check whether certificates are installed on the RAMP:

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert show-cert -n <alias name>
```

Example output of viewing the installed 'agent' (site) certificate

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert show-cert -n agent
```

Communication between the RAMP and registered devices is secured.

Add an Intermediate Certificate in SSL Handshake

If an intermediate certificate on the Ribbon Application Management Platform (RAMP) is expired, perform the following procedure to add an intermediate certificate in the SSL handshake:

Start

1. Access RAMP as an `insight` user. Refer to [Log onto the RAMP CLI](#) for accessing RAMP as an `insight` user.
2. Stop the RAMP. Refer to [How to Start and Stop RAMP](#).
3. Import the certificate:

```
/opt/sonus/sonusComm/conf/cert/bin/manageCert import-cert
```

4. Enter "y". The certificates are imported.
5. Copy the intermediate certificate (or certificate bundle) to the directory `/etc/httpd/conf/`.
6. Edit the file `/opt/sonus/ems/weblogic/sonusEms/data/sys/emsapps_apacheproxy_virtual_host.conf`.
7. Uncomment the following line and update it with the correct name for the intermediate certificate (or certificate bundle):

```
SSLCertificateChainFile /etc/httpd/conf/<Name of Intermediate Cert>
```

Example output:

```
SSLCertificateChainFile /etc/httpd/conf/DigiCertCA.crt
```

8. Start the RAMP. Refer to [How to Start and Stop RAMP](#).

Renew RAMP Certificates

In this section:

- [Generate certificates](#)
- [Regenerate the Default Self-Signed RAMP GUI Certificates](#)
- [Regenerate DBaaS Certificates](#)
- [Generate Certificates for Upgraded Versions of pre 24.12 RAMP](#)
 - [Cloud Upgrade](#)
 - [KVM/VMWare Backup and Restore](#)
 - [Generate Certificates for RAMP 24.12 and Forward](#)

To renew certificates expiring on the Ribbon Application Management Platform (RAMP), generate new certificates for existing RAMP versions below RAMP 24.12. Renew the certificates using the scripts `generateCerts.sh` and `updateRDCerts.sh`. These scripts are available in the `rampbootstrap.tar` file.

You are allowed to run only the `generateCerts.sh` script. If the RAMP is in a geographically redundant (GR) setup, the `updateRDCerts.sh` is run automatically within the file `generateCerts.sh`.

These scripts support both Standalone and GR scenarios.

Prerequisite

All services are deployed before triggering the `generateCerts.sh` and `updateRDCerts.sh` scripts.

Generate certificates

Use the following procedure to generate a new certificate:

Start

1. Log on to the RAMP as an `admin` user.
2. Download the `rampbootstrap.tar` file from the Ribbon Support Portal.
3. Copy the downloaded files from the `generateCertificate` folder to the RAMP `/home/admin/` directory:

```
cp /home/admin/
```

4. Change permissions of both the files:

```
chmod 740 generateCerts.sh  
chmod 740 updateRDCerts.sh
```

5. For a GR setup:

Note

This step is applicable only for a GR RAMP.

- a. Log on to the active or standby RAMP as an `admin` user.
- b. Navigate to the folder where the files are extracted and copy the files to the directory `/home/admin/`:

```
scp generateCerts.sh updateRDCerts.sh admin@<target-ip>:/home/admin/
```

For a RAMP GR, the system does not prompt for a password.

6. Stop the RAMP. Refer to [How to Start and Stop RAMP](#).

Note

For a RAMP GR, perform this command on either the active or standby.

7. Run the script `generateCerts.sh`. Provide the function name to generate the certificates for a specific purpose:
 - a. Change to `root` user:

```
sudo su -
```

- b. Run the `generateCerts.sh` command:

```
[root@rakeshramp: /home/admin ]#./generateCerts.sh
```

Example output:

```
[2024-11-07 12:11:08 root@rakeshramp: /home/admin ]#./generateCerts.sh
Usage: ./generateCerts.sh <function_name>
function_name :-
    generateDemoCert - Generate Demo Insight Certificate

    generatenewCertsall - Generate All Certificates MS and Insight

    DistributeCert - Distribute keys to Target , need UpdateRDCerts file to run
    this on both servers

    copycerts - copy certificates to RAID
    dm_gen_cert - DEVGMT certificate Generation
    pm_gen_cert - PM certificate Generation
    lm_gen_cert - LM certificate Generation
    aa_gen_cert - AA certificate Generation
    generate_acs_certificate - AS certificate Generation
    generate_oss_certificate - OSS certificate Generation
    generate_gss_certificate - GSS certificate Generation
    generate_nms_certificate - NMS certificate Generation
    generate_ev_certificate - EV certificate Generation
```

Regenerate the Default Self-Signed RAMP GUI Certificates

This procedure regenerates the default self-signed RAMP GUI certificates. For the RAMP GR, perform this procedure on both, the active and standby RAMPs.

Start

1. Log on to the RAMP as an `admin` user.
2. Download the `rampbootstrap.tar` file from the Ribbon Support Portal.
3. Copy the downloaded files from the `generateCertificate` folder to the RAMP `/home/admin/` directory:

```
cp /home/admin/
```

4. Change the permissions of both the files:

```
chmod 740 generateCerts.sh
chmod 740 updateRDCerts.sh
```

5. For a GR setup:

Note

This step is applicable only for a GR RAMP.

- a. Log on to the active or standby RAMP as an `admin` user.
- b. Navigate to the folder where the files are extracted and perform the following:

```
scp generateCerts.sh updateRDCerts.sh admin@<target-ip>:/home/admin/
```

Since it is a RAMP GR, the system should not ask for a password.

6. Stop the RAMP. Refer to [How to Start and Stop RAMP](#).
7. Run the `./generateCerts.sh generateDemoCert` script on the RAMP. If it is a GR setup, run this script on the active and standby RAMPs:

```
[root@rakeshramp: /home/admin ]# ./generateCerts.sh generateDemoCert
```

8. Start the RAMP. Refer to [How to Start and Stop RAMP](#).

The self-signed GUI certificate is updated.

Regenerate DBaaS Certificates

Use this procedure only when you want to generate the DBaaS certificates.

Reusing Cinder on the new RAMP with a change in the IP address results in reuse of the certificates in the folder `/opt/raid/CA/` from the older RAMP that was deleted. The certificates have the SAN IP address and the Hostname of the old RAMP.

To update the certificates with the latest SAN IP address, run the command `generateCerts.sh` with the option `generatenewCertsall`.

Start

1. Log on to the RAMP as `admin` user.
2. Download the `rampbootstrap.tar` file from the Ribbon Support Portal.
3. Copy the downloaded files from the `generateCertificate` folder to the RAMP `/home/admin/` directory:

```
cp /home/admin/
```

4. Change permissions of both the files:

```
chmod 740 generateCerts.sh  
chmod 740 updateRDCerts.sh
```

5. For a GR RAMP setup:

Note

This step is applicable only for a GR RAMP.

- a. Log on to the active RAMP as an `admin` user.
- b. Copy the files to the standby RAMP, if the files already exist, then both the files should be in the same path as the active RAMP path:

```
scp generateCerts.sh updateRDCerts.sh admin@<target-ip>:/home/admin/
```

Since it is a RAMP GR, the system should not ask for a password.

6. Stop the RAMP. Refer to [How to Start and Stop RAMP](#).

For a RAMP GR, perform this command on either the active or standby.

7. To regenerate the certificates:

```
[root@sanrampperf1-rampcnf-0: /home/admin ]# ./generateCerts.sh  
generatenewCertsall
```

You do not have to run this command on the standby RAMP.

8. Start the RAMP. Refer to [How to Start and Stop RAMP](#).

On completion of this procedure:

- All the services are running with the latest certificates.
- The system backs up the Insight Certificates in the `/opt/raid/CA` folder. These certificates are used during an upgrade.

Generate Certificates for Upgraded Versions of pre 24.12 RAMP

If you regenerated the certificates for the RAMP based on the above procedures for the RAMP GUI and DBaaS certificates, then RAMP retains these regenerated certificates when you upgrade the RAMP to any version less than the RAMP 24.12.

Cloud Upgrade

Certificates are generated when you upgrade, for the RAMP versions less than 24.12 and if you did not regenerate the certificates performing the above procedures for the RAMP GUI and DBaaS Certificates.

To upgrade, refer to [Upgrading RAMP](#).

KVM/VMWare Backup and Restore

If certificates are regenerated before taking a backup of the RAMP, when restoring the backup it uses the existing certificates. If not, it generates new certificates at the end of restore.

Prerequisites

Perform the procedures in sections:

- Regenerate the Default Self Signed RAMP GUI Certificate and
- Regenerate DBaaS Certificates

To backup and restore the RAMP, refer to [Backup and Restore](#).

Generate Certificates for RAMP 24.12 and Forward

Certificates are generated when you install the RAMP.

You need not regenerate the certificates. To regenerate certificates while troubleshooting, perform the following procedure:

Reusing Cinder on the new RAMP with a change in the IP address results in reuse of the certificates in folder `/opt/raid/CA/` from the older RAMP that was deleted. The deleted files have the SAN IP address and the Hostname of the old RAMP.

To update the certificates with the latest SAN IP address, run the command `generateCerts.sh` with the option `generatenewCertsall`.

Start

1. Log on to the RAMP as an `admin` user.
2. Change to root user:

```
sudo su -
```

3. Stop the RAMP. Refer to [How to Start and Stop RAMP](#).

For a RAMP GR, perform this command on either the active or standby.

4. Navigate to the folder `/opt/sonus/ems/conf/`

```
cd /opt/sonus/ems/conf/
```

5. Run the script: `generateCerts.sh` with the function `generatenewCertsall` to generate certificates for RAMP and all the microservices (Regenerate DBaaS certificates):

```
[root@rakeshramp: opt/sonus/ems/conf]# ./generateCerts.sh generatenewCertsall
```

6. Regenerate the certificates using:

```
[root@rakeshramp: opt/sonus/ems/conf]# ./generateCerts.sh generateDemoCert
```

Enable Key-Based Authentication for SSH

Use this procedure to enable key-based authentication for SSH on a host machine.

After completing this procedure, you can log into a target machine using a target user account from a host machine, without any password. The following is the explanation of the terms used in the procedure:

- Host Machine: This machine is used to log onto the target machine.
- Host User: The user on the host machine used to log into the host machine.
- Target Machine: The machine to which you want to log onto from another machine.
- Target User: The user account on the target machine to use to log onto the target machine.

Start

1. Log onto the host user account on the host machine using SSH.
2. Change to the host user's ssh directory:

```
$ cd .ssh
```

3. Check if `id_rsa` and `id_rsa.pub` exists by executing the following command:

```
$ ls
```

If `id_rsa` and `id_rsa.pub` files exist, go to step 6.

4. Execute `ssh-keygen` to generate the public or private RSA key pair:

```
$ ssh-keygen -t rsa
```

5. Press **ENTER** to save the key files or passphrase.

The `ssh-keygen` utility generates a private key file as `id_rsa` and a public key file as `id_rsa.pub`.

6. Copy the `id_rsa.pub` file to `<hostname>.pub` file:

```
$ cp id_rsa.pub <hostname>.pub
```

For example, if the hostname is `jupiter`, then enter the following:

```
$ cp id_rsa.pub jupiter.pub
```

7. Copy the public key file `<hostname>.pub` to the target user's `.ssh` directory on the target machine:

```
$ scp <hostname>.pub <targetuser>@<targetmachine>:~/.ssh/<hostname>.pub
```

For example, if the hostname is `jupiter`, `targetuser` is `admin`, and `targetmachine` is `nmhost`, then enter the following:

```
$ scp jupiter.pub admin@nmhost:~/.ssh/jupiter.pub
```

8. Log into the target user's account on the target machine using SSH:

```
$ ssh <targetuser>@<targetmachine>
```

For example, if `targetuser` is `admin` and `targetmachine` is `nmhost`, then enter the following:

```
$ ssh admin@nmhost
```

9. Change to the target user's `.ssh` directory:

```
$ cd .ssh
```

10. Append the contents of the host user public key file to the file `authorized_keys`:

```
$ cat <hostname>.pub >> authorized_keys
```

For example, if the hostname is jupiter, then enter the following:

```
$ cat jupiter.pub >> authorized_keys
```

11. Change the permissions on the file `authorized_keys`:

```
$ chmod 644 authorized_keys
```

12. Exit the target machine and log into the target machine again from the host machine:

```
$ ssh <targetuser>@<targetmachine>
```

For example, if targetuser is admin and targetmachine is nmhost, then enter the following:

```
$ ssh admin@nmhost
```

Obtain the RAMP SSH Keys

Use the following procedure to obtain the SSH keys for Ribbon Application Management Platform (RAMP) after the instance is up and running. If your network includes a Ribbon PSX that will be managed by RAMP, the PSX uses the RAMP key when it is instantiated. In case of a disaster, you need the SSH keys to restore a RAMP instance.

After obtaining the SSH keys, copy the key information to an external server.

Complete the following steps to obtain the SSH key information from RAMP:

1. SSH to the RAMP IP address, for example:

```
ssh insight@10.14.55.120
```

2. Execute the following command:

```
cd .ssh
```

3. Execute the following command:

```
ls -l
```

The following is a sample output:

```
-rw-----. 1 insight insight 397 May 22 18:48 authorized_keys
-rw-----. 1 insight insight 1679 May 22 18:12 id_rsa
-rw-r-----. 1 insight insight 394 May 22 18:12 id_rsa.pub
-rw-r--r--. 1 insight insight 32644 May 25 17:36 known_hosts
```

4. Enter the following command to obtain the public SSH key:

```
cat id_rsa.pub
```

The SSH key is displayed, for example:

```
ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAQCYpnuLMLZLJxgxvgkUdiy3SW5xL4uLLcpAQy2P6fdyrThWL0PiPH
8R0JjXn6PeYvcj69Qis0Hgb736RpoapaLpYcsA1qcHL07503174ImNsjr3c8b9uza50Bt5dXgo4ChBZjW
9cKa4DCyqiemeFvg3bot7q1LoVi/
cS43VFv+EPLL8fxQAZ2p8+6B2c0fsgREGTeAS111i9b2i456uC+fWvgiimMk8Zuzg9kCqkhneb7LHPmR/
KiDlhv5krXE0+P3g6co/01Mxi1bx7/8bprbTq6m71uOP4e6H+F9/fD++BmP/
dk7x1uB289Y6ZHtFXjdHRHLpk1CFmw7toyZ0Swj
insight@keep-freis-ems-a310
```

Note

When instantiating a PSX primary in OpenStack, there is a parameter called EMS Public Ssh Key. Use the key you retrieved with that parameter to enable RAMP to access the PSX without a password.

5. Enter the following command to obtain the private ssh key:

```
cat /opt/sonus/ems/.ssh/id_rsa
```

The SSH key is displayed, for example:

```
-----BEGIN RSA PRIVATE KEY-----
MIIIEowIBAAKCAQEA3szwWsndur3T72jJIDoKiMaIk0kuKdKMqADc0jtFvE8GWdYz

-----END RSA PRIVATE KEY-----
```

6. Perform any of the following:
 - Copy the output from steps 4 and 5 to a text file, and copy to an external server.
 - Transfer the `id_rsa` and `id_rsa.pub` files to an external server.
7. Copy `authorized_keys` to an external server.
8. Copy `known_hosts` to an external server.

Manually Generate Traps and Verify Alarm Handling

In this section:

- [Parse MIB to JSON/HTML](#)
 - [Examples to parse MIB to JSON](#)
- [Generate Traps](#)
- [Configure SNMPv3 Receiver Using snmptrapd to Test SNMPv3 Traps](#)

The Ribbon Application Management Platform (RAMP) supports the `genTraps.sh` script. As a `root` user, you can use this script to send alarms and events manually to pre-configured IP addresses (IPv4, IPv6, and FQDN) and ports. This script is in `/opt/fm/bin/random-trap-generator/genTraps.sh`.

Use the `genTraps.sh` script to generate all the SNMP traps based on a MIB file and verify that all the available alarms are handled appropriately.

Note

This feature is not REST exposed and is only available if invoked from the Linux shell. This feature does not support clearing of problem events/traps/notifications. Problem and Clearing events are treated as independent notifications. This feature does not support filtering/skipping deprecated alarms. Hence, any alarm marked as deprecated is generated unless filtered with the option of filtering traps.

Note

While using the `genTraps.sh` script, you may encounter certain errors and warnings, although traps are generated successfully. Ribbon assures you that these occurrences, though noted, do not necessarily indicate a failure to complete the task. Ribbon's tool is designed to manage various scenarios gracefully, ensuring successful process completion.

Ribbon advises you to proceed confidently and avoid being deterred by transient error messages. Further investigation is needed only if the command does not work as expected to address any underlying issues. Such logs are then helpful in proceeding with the investigation.

The `genTraps.sh` script may generate error messages such as:

Example Error Message:

```

Textual convention doesn't map to real type (Unsigned64): At line 38 in /opt/fm/
metadata/mib/import/SMIv2/SNMPv2-SMI
: (is a reserved word): At line 38 in /opt/fm/metadata/mib/import/SMIv2/SNMPv2-SMI

L4-SWITCH-GROUP-MIB
Cannot adopt OID in xxxx-MIB: etherStats2Entry ::= { etherStats2Table 1 }
Cannot adopt OID in xxxx-MIB: hostControl2Entry ::= { hostControl2Table 1 }

```

Prerequisites

- mib2c - MIB parser. This is part of the net-snmp-perl Linux package.
- To configure an SNMPv3 trap receiver, use the `engineId` as 80001370010a360d50b0aabc25, which is required for the trap sender to send it to the receiver.

Parse MIB to JSON/HTML

Parse the MIB and generate the JSON file:

```
genTraps.sh -d <MIB-DIR-PATH> -m <MIB-MODULE-NAME> [-k] [-o <JSON OUTPUT DIR>] [-j <JSON FILE PATH>]
```

Parameters

Parameter	Length/Range	Description	Mandatory/Optional
Name	1 to 64 characters. Do not use special characters like <code>^[^<>.:,;+=*?\"<> !@#\$\$%^&() `{}]*\$</code>	Name of the MIB module. The default name is <code>sonusEmsMib</code> . The <code>sonusEmsMib</code> is the base module containing all the RAMP traps defined in the MIB files in the MIB directory.	M

Parameter	Length/Range	Description	Mandatory/Optional
Directory Path		Path to the directory where all the MIBs are stored. The default path is located in the RAMP alarms MIB <code>/opt/fm/metadata/mib/import/SMIv2</code>	M
Output Directory		The output directory where the <code>.JSON</code> file is generated. The default directory is <code>/tmp/</code> .	M
-h		Provides the list of parameters and options used along with the command.	NA
Parser Parameters			
-d		Specify the directory containing MIBs and its dependencies.	M
-m		Specify the MIB Module Name.	M
SNMP Parameters			
-i		The trap receiver address [IPv4 / IPv6 / FQDN].	M
-p		The trap receiver port.	M
-u		USM Username.	M
-w		SNMPv3 AuthNoPriv. Specify Authentication Protocol MD5/SHA.	M
-x		SNMPv3 AuthNoPriv. Specify Authentication PassPhrase	M
-y		SNMPv3 AuthPriv. Specify Privacy Protocol [AES/DES/DES3]	M
-z		SNMPv3 AuthPriv. Specify Privacy PassPhrase	M
Optional Parameters			

Parameter	Length/Range	Description	Mandatory/Optional
-v	1 - 3	The SNMP version. v1/v2c/v3. The default value is 2.	O
-n		The trap interval in nanoseconds. The default is 200000ns resulting trap-rate = 500tps.	O
-j		The .JSON file to generate the notifications contained in it.	O
-f		The text file contains the event/alarm name list to filter during trap generation.	O
-o		The output directory for .JSON/HTML file generation. The default value is /tmp .	O
-k		Parse the MIB and generate documentation in HTML format.	O
-q		For random trap generation. Specify in seconds how long trap generation will run. The default value is 0.	O

Examples to parse MIB to JSON

In this scenario, `sonusConnexIpTrapsMIB` is an example MIB file.

Perform the following procedure to generate traps from `sonusConnexIpTrapsMIB` :

1. Create the directory `sbcMIBs` :

```
mkdir /opt/sbcMIBs/
```

2. To generate traps using `genTraps.sh`, ensure all the required MIB files are available in one directory. In this case, `sonusConnexIpTrapsMIB` relies on the MIBs found in `/opt/fm/metadata/mib/SBX5K/SMIv2/` and `/opt/fm/metadata/mib/import/SMIv2/`. Copy all the MIB files from these two directories into `/opt/sbcMIBs/` to generate traps from `sonusConnexIpTrapsMIB`.
 - a. Copy the MIB files from `/opt/fm/metadata/mib/SBX5K/SMIv2/`

```
cp -r /opt/fm/metadata/mib/SBX5K/SMiv2/* /opt/sbcmibs/
```

- b. Copy the MIB files from `/opt/fm/metadata/mib/import/SMiv2/`

```
cp -r /opt/fm/metadata/mib/import/SMiv2/* /opt/sbcmibs/
```

3. Change the directory to `random-trap-generator` :

```
cd /opt/fm/bin/random-trap-generator
```

4. Parse only the alarms:

```
./genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -i <ramp-ip> -p <port>
```

Example input:

```
./genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -i 10.52.161.96 -p 162
```

Example output:

```
[2024-07-11 22:16:42 root@sanramp-rampcnf-0: /opt/fm/bin/random-trap-
generator ]# ./genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -i 10.52.161.
96 -p 162
-----DEFAULTS / INPUTS-----
MIB2C PATH = /bin/mib2c
Translate MIB to JSON = Yes
MIB2c Config = /opt/fm/conf/random-trap-generator/mib2json.conf
MIB Location = /opt/sbcmibs/
MIB Module Name = sonusConnexIpTrapsMIB
JSON Location = /tmp/
Generate Alarms = Yes
IP = 10.52.161.96
PORT = 162
SNMP Version = 2
TRAP Interval (Nanoseconds) = 20000000
TRAP Filter File = 0
Trap Generation = Sequential
-----

Successfully generated JSON : /tmp/sonusConnexIpTrapsMIB.json
Total Events in MIB : 20
Filter Applied : false
```

```

Trap Generation : Non-timed Trap Generation
Starts sending alarms... 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13,
14, 15, 16, 17, 18, 19, 20, Done
Total traps triggered: 20
Time elapsed: 0.40 seconds
Rate: 50.13/sec

[2024-07-11 22:16:46 root@sanramp-rampcnf-0: /opt/fm/bin/random-trap-generator ]#

```

Parse and send RAMP alarms:

```
./genTraps.sh -i 127.0.0.1 -p 162
```

Parse only the alarms:

```
./genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -o /opt/
```

Parse and send SNMPv2:

```
./genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -i 10.85.56.35 -p 2300
```

Parse, filter, and send SNMPv2:

```
/genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -i 10.54.28.96 -p 162 -f /opt/
trapList.txt
```

Parse and send SNMPv3:

```
./genTraps.sh -d /opt/sbcmibs/ -m sonusConnexIpTrapsMIB -i 10.54.5.53 -p 162 -v 3 -u
ribbon -w SHA -x sonus123 -y DES -z sonus123
```

Parse MIB to HTML:

In this example the MIB is stored in `/opt/fm/metadata/mib/import/SMIv2`

```
genTraps.sh -d /opt/fm/metadata/mib/import/SMIv2/ -m sonusEmsMIB -k
```

Generate Traps

To generate the traps:

```
genTraps.sh [-k] [-o <JSON OUTPUT DIR>] [-j <JSON FILE PATH>] [-f <TrapList File>] [-n
TrapInterval] [-q <TimeToRun>] -i <IP> -p <Port> [-v <SNMPVersion>] [[-u<Username> -w
<AuthProtocol> -x <AuthPassPhrase> [-y <PrivacyProtocol> -z <PrivacyPassPhrase>]]
```

Parameters to generate traps

Parameter	Description	Range/Length
Username	Provide a unique user name.	1 to 64 characters. Do not use special characters like <code>^[^<>.:,+=*?\"<> !@#\$\$%^&() `{}]*\$</code>
USM Security Name	Provide the security name needed for SNMPv3.	5 to 32 alphanumeric characters.
Authentication Protocol	Specify the authentication protocol. Select Message Digest (MD5) or Secure Hash Algorithm (SHA) as the protocol to enable private interactions over secure channels. - MD5 - SHA The default value is "SHA".	NA
Authentication Passphrase	This is the SNMPv3 authorization password. The default value is "admin123".	8 to 32 characters.
Privacy Protocol	Select Data Encryption Standard (DES) or Advanced Encryption Standard (AES) authentication protocol. - AES - DES The default value is "AES".	
Privacy Passphrase	This is the SNMPv3 privacy password. The default value is "admin123".	8 to 32 characters.
Destination IPv4 / IPv6 address / FQDN	Provide the trap receiver's address. - IPv4 address - IPv6 address - FQDN	
Destination Port	Provide the destination port number. The default value is "162".	

For example, `trapListFile.txt` contains four event names that are filtered from the `.JSON` file and sent to the receiver:

Example:

```
trapListFile.txt---
sonusEmsPMExportSFTPFailClearNotification
sonusEmsPMExportSFTPFailNotification
ribbonNodeCeasedOpsNotification
ribbonEVServiceZTPConnectivityLostNotification
```

Configure SNMPv3 Receiver Using snmptrapd to Test SNMPv3 Traps

To generate and test the SNMPv3 alarms, configure the SNMPv3 receiver using the same `engineID` that is received from the sender.

Start

1. Log on to RAMP as `root`.
2. Create a file `/tmp/snmptrapd.conf`
 - a. Use `80001370010a360d50b0aabc25` for engine Id:

```
createUser -e 0x<SENDER_ENGINE_ID> <Username> <AuthProtocol> <AuthPassPhrase>
<PrivProtocol> <PrivPassphrase>
```

- b. `authuser log <Username>`
3. Identify the process running on the default port 162 and stop the process.
 - a. Identify the process:

Example:

```
[2023-07-27 21:39:19 root@cmpsource: /home/admin ]# lsof -i:162
```

Example Output:

COMMAND	PID	USER	FD	TYPE	DEVICE	SIZE/OFF	NODE	NAME
java	13153	insight	14u	IPv6	88472	0t0	UDP	*:snmptrap

- b. Stop the process:
- ```
kill -9 13153
```
4. Start the `snmptrapd`. This runs in the foreground, uses only the specified config file and logs the value in the `stderr`:

**Example:**

```
snmptrapd -f -C -c /tmp/snmptrapd.conf -Le
```

**Example Output:**

```
[2023-07-27 21:40:35 root@cmpsource: /home/admin]# snmptrapd -f -C -c
/tmp/snmptrapd.conf -Le
NET-SNMP version 5.8 AgentX subagent connected
NET-SNMP version 5.8
```

5. Use the `./genTraps.sh` to display the SNMPv3 alarms on the `snmptrapd` receiver console.

**Note**

snmptrapd may not support auth/priv protocols other than SHA/MD5 & AES/DES

## Proxy Manager

The proxy manager meets the Ribbon Application Management Platform (RAMP) security requirements. You can route all external RAMP connections through the HTTPS proxy server, which is exclusively used for external connections to services such as Ribbon Audit Portal (RAP), IDH/STI Server, ZTP Server, AWS billing uploads, and other similar services.

The RAMP provides a UI option to configure multiple proxy servers with each GR site with different proxy servers. The attributes of the proxy server configuration include:

- **Proxy Name** – A unique Proxy Name
- **Proxy Host IP** – Proxy IP Address
- **Proxy Port** – Proxy Port
- **Proxy Username** – Proxy Username
- **Proxy Password** – Proxy Password
- **HostName Matching Pattern** – A regex pattern used to help choose proxies to corresponding instances such as in a geo-redundant deployment.
- **Description** – Proxy Description (if any)

**Prerequisites:**

- The host and port parameters are essential to establish a proxy server and are unique with each configuration. The username and password parameters are optional to restrict access to the proxy.
- The `hostnameMatchingPattern` parameter is a regex pattern associating a proxy configuration with a specific hostname. This helps to assign proxies to corresponding instances in a geo-redundant deployment.

**Note**

The applications: LM, EV, and STI use the same proxy, and opt whether to use a proxy or not. An application-level configuration is provided to determine enable/disable the use of proxy. When the proxy is down, the RAP registration and the postpaid report upload fails.

The Primary RAMP interface connects the RAMP to the proxy, and the Secondary IP for device communication.

Perform the following procedure to forward the external RAMP connections through the HTTPS proxy server:

**Start**

You can have multiple proxy servers, but the RAMP follows only the hostname matching based pattern.

1. Log on to the RAMP GUI.
2. Navigate to **SYSTEM > Interfaces > Https proxy**.
3. To create a proxy, click **Add Proxy**.
4. Enter the details that includes **Proxy Name, Proxy Host IP, Proxy Port, Proxy Username, Proxy Password, HostName Matching Pattern, Description** and click **Save**. A message displays confirming the new HTTP Proxy is created.

To use the proxy in any application that supports communication through a proxy, go to the respective application and enable the option (the option is set to false by default). You can create, edit, or delete the proxy as you require. If you delete the proxy, the application loses internet connectivity.

5. If you desire to use a proxy, use the option **Use Proxy configured on the RAMP to connect to IT** in the **Administration** page.

For edge features like ZTP registration/AWS billing, navigate to **EdgeView Service Administration** and enable the **RAMP Internet Proxy** option.

## Legacy Device Management

The Ribbon Application Management Platform (RAMP) supports legacy device management when **Federal Information Processing Standards (FIPS)** are disabled.

You can configure OpenSSH to use older or weaker algorithms when dealing with legacy devices like GSX/DSI/SBC (that are not updated to support modern cryptographic standards).

Modern OpenSSH configurations typically disable these older algorithms by default for security reasons. This causes RAMP connectivity issues with devices offering weak ciphers.

The script `updateSystemCryptoPolicy.sh` is designed to manage cryptographic policies on a Linux system, focusing on ensuring the policy is set to default. If not, it provides options to restore the original policy. It also checks if the user is root and if FIPS mode is disabled, as these conditions impact the ability to change the cryptographic policies. The default policy allows the weaker algorithms while dealing with legacy devices such as GSX/DSI (that are not updated to support modern cryptographic standards).

You can access the script at `/opt/sonus/ems/conf/security`.

**Note**

For non-FIPS environments, this script allows RAMP to manage communication between legacy devices like GSX-DSI over SSH and other GSX functionalities that need SSH tunneling to DSI over weak ciphers.

When FIPS is enabled, no action is taken, and the script exits.

The new root owned script `/opt/sonus/ems/conf/security` updates the system-wide crypto policies.

Perform the following to execute `updateSystemCryptoPolicy.sh` script.

**Start**

1. Log on as a `root` user.

```
cd /opt/sonus/ems/conf/security
```

2. Verify the current crypto policy.

```
update-crypto-policies --show
```

**Example Output:**

```
DEFAULT:NO-SHA1:NO-CBC:NO-HMAC-SHA1
```

```
The RHEL8 system default policy is DEFAULT:NO-SHA1:NO-CBC:NO-HMAC-SHA1
```

3. Run the following, to change the policy to default to allow weaker algorithms.

```
./updateSystemCryptoPolicy.sh
```

**Example Output:**

```
Current crypto policy: DEFAULT:NO-SHA1:NO-CBC:NO-HMAC-SHA1
Backing up the current policy...
System-wide crypto policy is successfully set to DEFAULT
```

4. Verify the current policy.

```
update-crypto-policies --show
```

**Example Output:**

```
DEFAULT
```

5. Verify the SSH communication by discovering the GSX.

## Revert Procedure

This restores the original cryptographic policy from a backup file ( `/etc/crypto-policies/system-default-policy.txt` ).

1. Log on as a `root` user.

```
cd /opt/sonus/ems/conf/security
```

2. Run the following command as a `root` user, if the policy needs to be reverted to system default.

```
./updateSystemCryptoPolicy.sh -r
```

**Example Output:**

```
./updateSystemCryptoPolicy.sh -r
Reverting crypto policy to system default: DEFAULT:NO-SHA1:NO-CBC:NO-HMAC-SHA1
Crypto policy is successfully reverted to system default: DEFAULT:NO-SHA1:NO-
CBC:NO-HMAC-SHA1
```

### 3. Verify the policy.

```
update-crypto-policies --show
```

**Example Output:**

```
DEFAULT:NO-SHA1:NO-CBC:NO-HMAC-SHA1
```

# REST API Documentation

- [Example API Requests and Responses](#)

This document provides information and examples for using Ribbon Application Management Platform (RAMP) Representational State Transfer (REST) APIs.

Ribbon Application Management Platform (RAMP) provides Open API 3.0-compliant REST APIs as an alternative way to accomplish many of the tasks that users perform using the RAMP user interface (UI). This enables users to programmatically manage or script these tasks if they choose.

The RAMP APIs adhere to the simple, stateless architecture style defined by REST and they follow the typical client-server model. Users can use a REST client tool, such as Postman, to compose and submit requests to the RAMP API resources. For security, requests to the RAMP APIs must be submitted using HTTPS. Any language may be used to access the API for example, Python, Perl, Javascript, Java, C++ and so on.

RAMP REST APIs are closely aligned with the presentation of its UI. Currently, RAMP provides APIs for key functional areas within the UI including Authentication/Authorization, Fault Management (FM), Performance Management (PM), and License Management (LM) functions. Ribbon plans to expand RAMP API support in subsequent releases.

## Accessing the API Documentation from RAMP

The RAMP provides access to its primary API documentation directly from the RAMP UI. This comprehensive API specification is comprised of a set of definition files ( `.yaml files` ) each corresponding to a functional area within RAMP, such as PM Collection Profiles, LM Features, FM Notifications, and so on. Users select a file based on the type of operations they want to perform. When selected, the file contents appear within a user interface.

Each file contains a listing of the methods and resource paths provided to submit specific requests for the selected functional area. Click on an entry in the list to see details on the required parameters and structure for the related request and responses. The listing of requests is followed by detailed schema definitions for the objects within the requests/responses.

## View RAMP API User Documentation

To select and display an API definition file within a user interface:

### Start

1. Log on to the RAMP UI.
2. On the right side of the top bar, click **Menu**.
3. In the menu, select **REST API Documentation** to open the API documentation interface. By default, the definition file for **Authentication & Authorization** opens.
4. In the **Select a definition** list, the full list of definition files appears in alphabetical order. Select the file you want to open.
5. Click within the interface to expand sections to get more details on selected requests or schemas.

Note that RAMP uses the OpenAPI (Swagger) user interface to display the API definition files. Refer to <https://swagger.io/tools/swagger-ui/> for more information on using the Swagger UI.

## Download RAMP API Definition Files

To view or download the definition ( `.yaml` ) file contents so you can use it in another environment or with another API tool:

### Start

1. Complete the steps in the previous section to open a selected API file. The path to the selected file appears at the top of the page. For example, in the following figure, the path (in blue) is:  
`/auth/v1.0/discovery/getyaml/FM/fm-view-api.yaml`  

2. To view the file, click on the path. The source file opens in a separate tab.
3. To download the file, right-click on the path and select **Save as** and select a location on your system where you want to save a copy of the file.

## Authentication Requirements

To ensure that only authenticated users can use the API, users must submit credentials to request an authentication token from RAMP. The user must include this token in an Authorization header in each subsequent API request. Refer to [Example API Requests and Responses](#) to see how the authentication token is included in a request.

By default an authentication token expires in 15 minutes, but a user can request to refresh the token to continue submitting requests within the same session. Note that the duration before an authentication token expires is configurable within Authentication & Authorization admin settings.

Users can obtain authentication tokens using the below three ways.

- Using a Username and Password.
- Using a SAML service provider.
- Using a certificate.

## Obtain a Token Using a Username and Password

A user can submit an API request to receive an authentication token by submitting a valid RAMP username and password in a request. RAMP returns an authentication token in its response. The user includes this authentication token in subsequent API requests to authenticate the request.

| Method | URI                                                            | Body                                                            |
|--------|----------------------------------------------------------------|-----------------------------------------------------------------|
| POST   | https://<RAMP IP address or domain>/auth/v1.0/session/password | {<br>"username": "<username>",<br>"password": "<password>"<br>} |

## Obtain a Token using a SAML Service Provider

For deployments that have implemented a Security Assertion Markup Language (SAML)-based security realm, users can log into their SAML service provider and obtain an access token. The user then submits an API request for an authentication token that includes the SAML access token. RAMP returns an authentication token in its response. The user includes this authentication token in subsequent API requests to authenticate the request.

| Method | URI                                                               | Query Parameter | Body                               |
|--------|-------------------------------------------------------------------|-----------------|------------------------------------|
| POST   | https://<RAMP IP address or domain>/auth/v1.0/session/accessToken | tokentype=saml  | {<br>"token" : "<SAML token>"<br>} |

## Obtain a Token using a Certificate

For deployments that have imported or added certificates, the users can log into RAMP using certificate and obtain an access token. The user submits an API request for an authentication token that includes the certificate as a token part of request body. The RAMP returns an authentication token in its response. The user includes this authentication token in subsequent API requests to authenticate the request.

| Method | URI                                                                                | Body                                      |
|--------|------------------------------------------------------------------------------------|-------------------------------------------|
| POST   | https://<RAMP IP address or domain>/auth/v1.0/session/accessToken?type=certificate | {<br>"token" : "<certificate token>"<br>} |

When using Third-Party CA signed certificates, ensure that you have imported the CA certificate as well along with the certificate that you are using to get an authentication token. For more information, refer to [Importing Third Party Certificates](#).

## Refresh an Authentication Token

To continue a session for longer than the 15 minutes expiration for authentication tokens, before the token expires, a user can request to refresh the token. RAMP returns a new authentication token in its response. The user includes the new authentication token in subsequent API requests to authenticate the request.

| Method | URI                                                                                                                                                                               | Body                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| PUT    | <a href="https://&lt;RAMP IP address or domain&gt;/auth/v1.0/session/password/sessionToken">https://&lt;RAMP IP address or domain&gt;/auth/v1.0/session/password/sessionToken</a> | <pre>{   "token" : "&lt;token&gt;" }</pre> |

## Role-Based User Access Requirements

Role-based user access rules apply when submitting API requests to RAMP. The user account used to obtain the authentication token must have the same permission level as a user must have to complete the operation with the RAMP UI. The API definition files include information on the user privilege level required to submit different types of requests.

## Terminating a Session

Although tokens eventually expire, security best practice is to submit a request to logout and terminate a session.

| Method | URI                                                                                                                                   | Body                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| DELETE | <a href="https://&lt;RAMP IP address or domain&gt;/auth/v1.0/session">https://&lt;RAMP IP address or domain&gt;/auth/v1.0/session</a> | <current authentication token string> |

- [REST API Documentation](#)

The following sections contain examples of RAMP API requests and responses to illustrate the typical contents. Many methods and tools are available to work with REST APIs; therefore, your format may differ depending on your specific environment. Note that in the examples, tokens are shortened for readability.

## User Authentication Using a Password

In this example, a log on request is sent to the RAMP with a valid username and password for a user in the local authentication realm.

### Request Contents

**Request Method:** POST

**Request URI:** `https://<RAMP IP address>/auth/v1.0/session/password`

**Headers:**     Accept: application/json, application/javascript, text/javascript, text/json  
                  Content-Type: application/json; charset=UTF-8

**Request Body:**

```
{

 "username": "string",
 "password": "string"

}
```

### Curl Example

```
curl -k -i --request POST --location 'https://<RAMP IP address>/auth/v1.0/session/
password' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json'
\
--header 'Content-Type: application/json' \
--data '{

 "username": "admin",
 "password": "admin"

}'
```

#### Note

The "-k" option is required if you are using the default RAMP certificate which is insecure but won't be necessary after you install your own certificate. Refer to [Secure Login to the RAMP GUI](#) for information on adding certificates to your system.

The "-i" option displays the response headers.

## Successful Response

```
HTTP/1.1 200
Date: Thu, 27 Oct 2021 18:37:26 GMT
Content-Type: application/json

{
 "token": "eyJhbGciOiJSUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA"
}
```

## User Authentication Using a Certificate

In this example, a log on request is sent to the RAMP using a certificate. A successful response returns an authentication token.

### Request Contents

**Request Method:** POST

**Request URI:** `https://<RAMP IP address>/auth/v1.0/session/accessToken?type=certificate`

**Headers:**     Accept: application/json, application/javascript, text/javascript, text/json  
              Content-Type: application/json; charset=UTF-8

**Request Body:**

```
{
 "token": "MIIFXjCCA0agAw ... zmZQqgB7CwxVI4HhvVOA=="
}
```

## Curl Example

```
curl -k -i --request POST --location 'https://<RAMP IP address>/auth/v1.0/session/accessToken?type=certificate' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json' \
--data '{
```

```
"token":"MIIFXjCCA0agAw ... zmZQqgB7CwxVI4HhvVOA=="
}'
```

The "-k" option is required if you are using the default RAMP certificate, which is insecure but is not necessary after you install your own certificate. Refer to [Secure Login to the RAMP GUI](#) for information on adding certificates to your system. The "-i" option displays the response headers.

### Successful Response

```
HTTP/1.1 200
Date: Mon, 29 Jul 2024 10:33:46 GMT
Content-Type: application/json
{"token":"eyJhbGciOiJSUzI1NiJ9 ... XZ8PcjHsj2awnvGg"}
```

## Retrieve the List of User Roles

This example is to retrieve a request to retrieve information on the currently configured list of user roles.

### Request Contents

**Request Method:** GET

**Request URI:** `https://<RAMP IP address>/auth/v1.0/config/roles`

**Headers:**     **Authorization:** *<authentication token returned after successful authentication>*  
                   **Accept:** application/json, application/javascript, text/javascript, text/json  
                   **Content-Type:** application/json; charset=UTF-8

### Curl Example

```
curl --request GET --location 'https://<RAMP IP address>/auth/v1.0/config/roles' \
--header 'Authorization: eyJhbGciOiJSUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA1' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json'
```

### Successful Response

HTTP/1.1 200

Date: Thu, 27 Oct 2021 18:47:26 GMT

Content-Type: application/json

```
[
 {
 "id": "1001",
 "name": "admin",
 "description": "admin role",
 "tenantId": "38400000-8cf0-11bd-b23e-10b96e4ef00d",
 "tenantName": "root"
 },
 {
 "id": "1003",
 "name": "calea",
 "description": "calea role",
 "tenantId": "38400000-8cf0-11bd-b23e-10b96e4ef00d",
 "tenantName": "root"
 },
 {
 "id": "1002",
 "name": "default",
 "description": "default role",
 "tenantId": "38400000-8cf0-11bd-b23e-10b96e4ef00d",
 "tenantName": "root"
 }
]
```

## Add a Collection Profile

In this example, a request to create a new Performance Management collection profile is given for collecting performance management statistics for a specified type of managed device:

### Request Contents

**Request Method:** POST

**Request URI:** https://<RAMP IP address>/collection-service/v1/collection

**Headers:** Authorization: <authentication token returned after successful authentication>  
Accept: application/json, application/javascript, text/javascript, text/json  
Content-Type: application/json; charset=UTF-8

**Request Body:**

```
[
 {
 "id": "string",
 "name": "string",
 "deviceType": "string",
 "deviceDisplayType": "string",
 "interfaceType": "string",
 "generationFreq": "string",
 "collectionFreq": "5",
 "overrides": number,
 "devicesAssoc": number,
 "isDefault": boolean,
 "statistics": [
 {
 "id": "string",
 "name": "string",
 "deviceType": "string",
 "deviceDisplayType": "string",
 "generationStatus": boolean,
 "generationFreq": "string",
 "collectionStatus": boolean,
 "collectionFreq": "string",
 "aggregationStatus": boolean,
 "isOverride": boolean,
 "mandatory": boolean
 }
]
 }
]
```

## Curl Example

```
curl --request POST --location 'https://<RAMP IP address>/collection-service/v1/
collection' \
--header 'Authorization: eyJhbGciOiJSUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA1' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json' \
--data '{
 "id": null,
 "name": "Edge_SFTP",
 "deviceType": "EDGE",
 "deviceDisplayType": null,
 "interfaceType": "SFTP",
 "generationFreq": "5",
 "collectionFreq": "5",
 "overrides": null,
```

```
"devicesAssoc": null,
"isDefault": null,
"statistics": [
{
 "id": "EdgeSBCChannelStatusStats",
 "name": "SBCEDGEChannelStatusStats",
 "deviceType": "EDGE",
 "deviceDisplayType": "SBC Edge",
 "generationStatus": true,
 "generationFreq": "5",
 "collectionStatus": true,
 "collectionFreq": "5",
 "aggregationStatus": false,
 "isOverride": false,
 "mandatory": false
},
{
 "id": "EDGESBCEDGENWDLLicenseStats",
 "name": "SBCEDGENWDLLicenseStats",
 "deviceType": "EDGE",
 "deviceDisplayType": "SBC Edge",
 "generationStatus": true,
 "generationFreq": "5",
 "collectionStatus": true,
 "collectionFreq": "5",
 "aggregationStatus": false,
 "isOverride": false,
 "mandatory": true
},
{
 "id": "EDGESBCEDGEPTStats",
 "name": "SBCEDGEPTStats",
 "deviceType": "EDGE",
 "deviceDisplayType": "SBC Edge",
 "generationStatus": true,
 "generationFreq": "5",
 "collectionStatus": true,
 "collectionFreq": "5",
 "aggregationStatus": false,
 "isOverride": false,
 "mandatory": false
}
]
}'
```

## Successful Response

HTTP/1.1 200

Date: Thu, 27 Oct 2021 18:39:26 GMT

## Change Collection Profile Assignment

In this example, a request to change the Performance Management collection profile assignment for a specified device. Use an array to specify changes for more than one device.

The identifiers for nodes, clusters, and profiles can be returned using a GET for collection-assignments,

### Request Contents

**Request Method:** PUT

**Request URI:** `https://<RAMP IP address>/collection-service/v1/collection-assignments`

**Headers:** Authorization: <authentication token returned after successful authentication>  
Accept: application/json, application/javascript, text/javascript, text/json  
Content-Type: application/json; charset=UTF-8

**Request Body:**

```
[
 {
 "id": number,
 "clusterId": "string",
 "nodeId": number,
 "oldCollectionProfileId": number,
 "newCollectionProfileId": number,
 "collectionStatus": boolean
 }
]
```

### Curl Example

```
curl --request POST --location 'https://<RAMP IP address>/collection-service/v1/
collection-assignments' \
--header 'Authorization: eyJhbGciOiJSUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA1' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json' \
--data '[
 {
 "id": 545,
 "clusterId": null,
 "nodeId": 10001,
 "oldCollectionProfileId": 306,
 "newCollectionProfileId": 1632,
```

```
 "collectionStatus": true
 }
]
```

## Successful Response Example

```
HTTP/1.1 200
```

```
Date: Thu, 27 Oct 2021 18:39:26 GMT
```

## Retrieve RAMP License Keys

The following example shows a request to retrieve the RAMP node-locked (legacy) and domain-locked (pubic) license keys that are required when generating a license:

## Request Contents

**Request Method:** GET

**Request URI:** `https://<RAMP IP address>/lm/v1.0/keys`

**Headers:**     **Authorization:** *<authentication token returned after successful authentication>*  
                  **Accept:** application/json, application/javascript, text/javascript, text/json  
                  **Content-Type:** application/json; charset=UTF-8

### Curl Example

```
curl --request GET --location 'https://<RAMP IP address>/lm/v1.0/keys' \
--header 'Authorization: eyJhbGciOiJSUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA1' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json'
```

## Successful Response

```
HTTP/1.1 200
```

```
Date: Thu, 27 Oct 2021 18:42:26 GMT
```

```
Content-Type: application/json
```

```
{
 "legacy": [
```

```
"85416452d65941b8b0ee3d442cd31c48"
],
"public": "MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAsc5/G+sZl/
Me88wboDimLGuWgoSQQcP37at0N00BcICgTYC6dD7KuUzsVjGsTfUe5+F7EwUoXn4eG1/
tBs1h794l7MzExsAr9HyDZHC0mQJAmA7Fk9bxYQjdYK0uBa9xTelGnq3yL9TXR6m4djKLWWeV4QXHuLxoV0yPbF1
1ozHtCeK1lEBJ3Ciayw5EICVWJwknjHWzmfflX940BlzbH2F8GSXGqogkkoLKfTC0t8fcuzZ/
X2+ZYYx4MUHoUhSrDykmDQUdd+PX+eSxDUM6B3lepIHBrevSLSBsDe/NM3DyhI9o02o0h7Jf4u5Gb2h8/
yBn76bySjKm2jRQHN2hJQIDAQAB"
}
```

## Retrieve Usage Level for a Licensed Feature

In this example, a request to retrieve the average usage of a specified feature during a specified time range. The feature is defined as a path parameter ("SBC-POL-RTU-D") and the time range is specified as query parameters (epoch time):

### Request Contents

**Request Method:** GET

**Request URI:** `https://<RAMP IP address>/lm/v1.0/feature/licenses/<feature ID>/chart/averageusage?epochStart=<start time>&epochEnd=<end time>`

**Headers:**     Authorization: <authentication token returned after successful authentication>  
                  Accept: application/json, application/javascript, text/javascript, text/json  
                  Content-Type: application/json; charset=UTF-8

### Curl Example

```
curl --request GET --location 'https://<RAMP IP address>/lm/v1.0/feature/licenses/SBC-
POL-RTU-D/chart/averageusage?epochStart=1633629119000&epochEnd=1633632720000' \
--header 'Authorization: eyJhbGciOiJIUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA1' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json'
```

### Successful Response

HTTP/1.1 200

Date: Thu, 27 Oct 2021 18:42:26 GMT

Content-Type: application/json

## Configure OSS Trap Resync Parameters

In this example, a request to configure parameters for re-synchronizing traps with an Operation Support System (OSS). Depending on the SNMP version, different parameters are configured. This example shows configuration for SNMP v2.

### Request Contents

**Request Method:** POST

**Request URI:** `https://<RAMP IP address>/trap-resync-service/v1.0/trap-resync-setting`

**Headers:**     **Authorization:** *<authentication token returned after successful authentication>*  
                  **Accept:** application/json, application/javascript, text/javascript, text/json  
                  **Content-Type:** application/json; charset=UTF-8

**Request Body:**

```
{
 "snmpVersion": "string",
 "ossIpAddress": "string",
 "snmpWriteCommunity": "string",
 "securityName": "string",
 "securityLevel": "string",
 "authenticationProtocol": "string",
 "authenticationPassphrase": "string",
 "privacyProtocol": "string",
 "privacyPassphrase": "string"
}
```

### Curl Example

```
curl --request POST --location 'https://<RAMP IP address>/trap-resync-service/v1.0/trap-resync-setting' \
--header 'Authorization: eyJhbGciOiJIUzI1NiJ9 ... yPvtfeXx9L05QkD1LIqT3JuA1' \
--header 'Accept: application/json, application/javascript, text/javascript, text/json' \
--header 'Content-Type: application/json' \
--data '{
 "snmpVersion": "V2",
 "ossIpAddress": "1.2.3.4",
 "snmpWriteCommunity": "community123",
 "securityName": null,
 "securityLevel": null,
 "authenticationProtocol": null,
 "authenticationPassphrase": null,
```

```
"privacyProtocol": null,
"privacyPassphrase": null
'
```

## Successful Response

HTTP/1.1 200

Date: Thu, 27 Oct 2021 18:40:26 GMT

Content-Type: application/json

# RAMP Release Information

## Contents

## About Ribbon Application Management Platform Release Notes

This document describes new features, latest hardware and software requirements, known limitations and other pertinent release information for the latest release of the Ribbon Application Management Platform.

**Note**

All Ribbon bugs reported by the customers on a given software release are fixed in the latest release of that software release branch.

To view and download the latest End of Product Sale (EoPS) and other End Of Life (EOL) notices, open a web browser and navigate to the Resource Library on the corporate website (<https://ribboncommunications.com/company/get-help/resource-library>)

## Release Notes Use and Distribution

Ribbon product release notes are protected under the copyright laws of the United States of America. This work contains proprietary information of [Ribbon Communications](#). Use, disclosure or reproduction in any form is strictly prohibited without prior authorization from [Ribbon Communications](#).

## Associated Ribbon Announcements

The following Ribbon announcements (formerly known as WBAs) are referenced in this release note:

**Warning-24-000008211:** FM process restart issue post switchover in the RAMP GR.

**Note:** If you use RAMP GR on a pre-23.12 release, apply this WBA and upgrade to 24.12R0.

**To view/subscribe to announcements (Warnings, Bulletins, Alerts, or PCNs):**

1. [Click here](#) to go to the "Announcements" page in the Ribbon Support Portal.
2. Enter the announcement number (last eight numbers) in the search field and click the magnifying glass icon (or press **Return**). You can alternatively use the filter tools located on the left side of the screen to narrow your search.

## Problems or Questions

For problems or questions, contact the Global Support Assistance Center:

**Ribbon Support Portal:** <https://ribboncommunications.com/services/ribbon-support-portal>

**Voice:** +1-833-RIBBON1 (1-833-742-2661)

## Ribbon Application Management Platform

The Ribbon Application Management Platform (RAMP) provides a centralized, cloud-optimized solution for the efficient management of every Ribbon element in a customer's network. RAMP provides a complete Fault, Configuration, Accounting, Performance, and Security solution with a robust portfolio of management and provisioning tools that allow service providers and enterprises to easily perform management of their network, quickly remediate issues, leading to an improved customer experience and reduced costs.

## Compatibility with Ribbon Products

Refer to the [Ribbon Application Management Platform Interoperability Matrix](#) for the latest and minimum compatible product versions supporting this release.

**Ribbon Elements Supported**

- Application Server

- Centralized Policy and Routing Server (PSX), and PSX Software Edition (PSX SWe)
- C20 Call Session Controller
- C3 Call Controller
- Data stream Integrator (DSI)
- Dell Servers
- Diameter Signaling Controller (DSC)
- Edge 8000
- EdgeMarc
- General Media Server ( GMS)
- G5 Line Access Gateway
- G6 Universal Gateway
- G9 Media Gateway
- Layer 2 Manager (L2MGR)
- Multimedia Resource Function Processor (MRFP)
- Ribbon Media Gateway (GSX9000)
- Session Border Controller Software Edition (SBC SWe)
- Session Border Controller 5400
- Session Border Controller 7000
- Session Border Controller CNe
- Session Border Controller SWe Edge
- Session Border Controller 1000
- Session Border Controller 2000
- Signaling Gateway (SGX4000)
- SIP Load Balancer

**Note**

In the RAMP 24.12 GUI or documentation, any instance of the SBC Core refers to **SBC 7000/5400/SWe/CNe** and **MRFP** products, unless otherwise noted. Any instance of the SBC Edge refers to the **SBC1000/2000** and **SBC SWe Edge**.

**Note**

The following table lists the supported/unsupported EdgeMarc Subtypes:

**Supported EdgeMarc Subtypes**

- 302
- 304
- 2900
- 2900A
- 2900E
- 2900PoE
- 4550v2
- 4551
- 4552
- 4555
- 4600T4
- 4601
- 4603
- 4604T4
- 4608PoE
- 4700
- 4701
- 4750
- 4751
- 4800
- 4808
- 4806v2
- 4808v2
- 4808
- 6000
- 7301
- 7400
- 8000

**Tip**

When upgrading your network, ensure to upgrade each product to the most current release to take advantage of the latest features, enhancements, and fixes.

## New Features and Functionalities

### New Features in Release 24.12.00R000

The New Features of RAMP 24.12.00R000 are available in:

- [New in RAMP 24.12.00R000](#)

**Note**

Beginning with the RAMP 24.12 release, the node-level postpaid reports are disabled by default, and the RAMP generates only the network-level postpaid reports. To enable the node-level postpaid reports, a new setting, "Generate Node-Level Postpaid Reports," is introduced to the LM administration page.

## New Features in Previous Releases

For the list of features in previous 24.09.xx releases, refer to the following release note:

- [New in RAMP 24.09R001](#)

## SOAP API Deprecation Notice

The RAMP SOAP API support for the SBC Core is only supported for EMS migrations to allow backwards compatibility. The RAMP SOAP API supports the SBC functionality through the SBC release 12.X. The functionality is targeted to deprecate in Q4 2024. Users need to migrate to the REST API for the SBC API access.

## Security Vulnerabilities

The following security vulnerabilities (CVEs) are fixed in this release:

**Note**

The severity is based on the CVSSv3.x scores. For more details about the individual CVE, refer to <https://nvd.nist.gov/vuln/search>. These are listed verified CVEs in 24.09R1 Release.

| Severity | CVE numbers                                                                                                                                                                                |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Critical | CVE-2022-42889, CVE-2022-42920                                                                                                                                                             |
| High     | CVE-2022-45688, CVE-2024-47554, CVE-2023-5072, CVE-2013-4002, CVE-2012-0881, CVE-2022-25647                                                                                                |
| Medium   | CVE-2021-29425, CVE-2020-13956, CVE-2022-45146, CVE-2015-5262, CVE-2020-14338, CVE-2022-23437, CVE-2009-2625, CVE-2023-2976, CVE-2015-5262, CVE-2021-38153, CVE-2024-29857, CVE-2024-30171 |
| Low      | CVE-2020-8908                                                                                                                                                                              |

## Hardware and Software Requirements

This section provides information about any release-specific Ribbon Application Management Platform software requirements.

### Note

- RAMP 24.12.00R000 is minimum supported on 16 vCPU. Contact Ribbon Support team for the upgrade-related assistance.
- The disk size is changed from 130GB to 150GB for the RAMP 23.09.00R000 and above releases. The templates are updated to reflect this change.
- Refer to the update, Warning-23-000007983.

## Software Bundles

Download the RAMP 24.12.00R000 software bundle from the Support Portal.

The following files are delivered as part of RAMP 24.12.00R000:

| Files                                                                                                                                                                                                       | Environment | Description                          |

**Note**

- The 24.12.00R000 release supports deployment of the RAMP in Cloud Native Functionality (CNe). For the RAMP CNe installation/deployments, contact your Ribbon sales representative.
- If you are running the EMS/RAMP on the RHV platform, contact your Ribbon sales representative for upgrade/migration.

## Ribbon OEM Host Operating System (ROHOS)

The minimum ROHOS version and the Dell firmware versions compatible with the RAMP 24.12.00R000 release are provided below:

| ROHOS                           | Dell Firmware                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 02.08.16 or higher <sup>1</sup> | <ul style="list-style-type: none"><li>• iDRAC: iDRAC9</li><li>• BIOS: 5.00.20.10</li><li>• Firmware: 2.17.1</li></ul> |
| Tested Version                  | VERSION=02.08.26<br>VERSION=02.08.23                                                                                  |

<sup>\*1</sup>For ROHOS versions higher than 02.08.16, refer to the [ROHOS Release Notes](#) for supported iDRAC, BIOS, and firmware versions.

## App Service

| Component | VNF                                                | CNF                     |
|-----------|----------------------------------------------------|-------------------------|
| RAMP      | 24.12.00R000-580                                   | 24.12.00R000-78         |
| ETCD      | AppServices-24.12.00R000-B7623_vmCCS-1.14.1-x86_64 | helm version: 1.4.0     |
|           |                                                    | bitnami/etcd: 3.5.16    |
|           |                                                    | bitnami/kubectl: 1.31.1 |
|           |                                                    | OBS: 3.2.2              |

**Key Changes:**

- Updated the OS patches
- update prometheus-autoconfig to 1.8.16
- update vmCCS to 1.14.1
- PLTF-5009: update third-party containers
  - Update etcd to 3.5.16

- Update prometheus to 2.54.1
- PLTF-5164: resize /dev/sda3 instead of /dev/sda2 after CommonOS added Secure Boot support

**Known Issues (VNF)**

None.

**Known Issues (CNe)**

None.

## Upgrade Notes

The following upgrade paths are supported in this release. The upgrade paths are supported for all platforms.

| Platform  | Release      |
|-----------|--------------|
| KVM       | 23.09.00R000 |
| VMware    | 23.12.00R000 |
| OpenStack | 24.03.00R001 |
| AWS       | 24.03.00R002 |
| Azure     | 24.06.00R000 |
| CNe       | 24.09.00R001 |

**Note**

To upgrade the RAMP from a pre-23.09 release , contact the Ribbon Support team.

## Migration Notes

The following migration paths are supported in this release.

| Platform  | EMS Release      |
|-----------|------------------|
| KVM       | 15.X, 14.x, 13.x |
| VMware    | 15.X, 14.x, 13.x |
| OpenStack | 15.X, 14.x, 13.x |
| AWS       | 15.X, 14.x, 13.x |

**Note**

Reach out to Ribbon Professional Service for more information about the EMS-to-RAMP Migration process.

**Note**

Current and last release Resolved and Known issues listed in this Release notes. For issues fixed in previous releases, refer to the corresponding Release Notes.

## Checksums and ID Details

## Resolved Issues

### RAMP 24.12.00R000

The following issues are resolved in RAMP 24.12R0 release:

#### Severity 1 Issue

The following table lists the resolved severity 1 issue in this release:

| Issue ID  | Original Issue | Sev | Problem Description                                              | Resolution                                                                                                                                                                                                       |
|-----------|----------------|-----|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-10746 | NA             | 1   | Unable to run the STI signing and verification on the same call. | <b>Impact Statement:</b> Unable to perform the STI signing and verification on the same call.<br><b>Resolution Details:</b> The RAMP 24.12 is enhanced to support STI signing and verification on the same call. |

#### Severity 2 and 3 Issues

The following table lists the resolved severity 2 and 3 issues in this release:

| Issue ID  | Original Issue | Sev | Problem Description                                                                                                                            | Resolution                                                                                                                                                                                                                                                                            |
|-----------|----------------|-----|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-8977  | NA             | 3   | The RAMP displays database and Kafka exceptions when users open 50 event lists.                                                                | <b>Impact Statement:</b> N/A<br><b>Resolution Details:</b> Modified the code to handle the exceptions.                                                                                                                                                                                |
| AFM-9984  | NA             | 3   | The RAMP generates alarms for the Agent version mismatch.                                                                                      | <b>Impact Statement:</b> The RAMP generates the<br><code>sonusV2VfyMgrApplVersionFailNotification /</code><br><code>sonusV2VfyMgrAgentVersionFailNotification</code> alarms when the RAMP agent restarts.<br><b>Resolution Details:</b> Removed obsolete alarms to resolve the issue. |
| AFM-10048 | NA             | 3   | After implementing the relocateGR on the RAMP 23.09, the node turns offline, and relocation fails (Random occurrence).                         | <b>Impact Statement:</b> Unlock for the Peer fails due to the timeout, resulting in relocation failure.<br><b>Resolution Details:</b> Increased the timeout value to 600 seconds while performing the unlock operation.                                                               |
| AFM-10369 | NA             | 3   | The RAMP waits five minutes to display the failure status for the Device Backup job.                                                           | <b>Impact Statement:</b> The User must wait five minutes to see the failure status on the GUI.<br><b>Resolution Details:</b> Modified the code to handle the error scenarios and report the errors correctly.                                                                         |
| AFM-11142 | NA             | 3   | The Instanceup fails with the error, "Node is unregistered" when the SBC Direct Single node is started after it is unregistered from the RAMP. | <b>Impact Statement:</b> The Instanceup fails with the error, "Node is unregistered".<br><b>Resolution Details:</b> Modified the code to update both the node status and host status to "Partially Registered" status when the active node re-registers.                              |

| Issue ID  | Original Issue | Sev | Problem Description                                                                       | Resolution                                                                                                                                                                                                                                                                                                                                                                           |

| AFM-11473 | NA             | 3   | Realign the Tab key usage flow for the User Creation screen.                              | <p><b>Impact Statement:</b> The Tab key usage flow to navigate the User Creation screen is not correctly aligned.</p> <p><b>Resolution Details:</b> Updated the form field elements to place the "username", "password", and "re-enter password" fields in one div element on the left hand side and the "tenant" and the "description" on the right-hand side.</p>                  |
| AFM-11581 | NA             | 2   | The GSX Navigator and Task Configuration buttons do not respond when the network is slow. | <p><b>Impact Statement:</b> The GSX Navigator and Task Configuration buttons use a flat styling without any hover or click effect. Because of this, the user could not tell if an operation (click) was happening, giving the impression that buttons were not responding when the network was slow.</p> <p><b>Resolution Details:</b> Removed the styling to resolve the issue.</p> |
| AFM-11788 | NA             | 3   | Document the etcd upgrade procedure with the RAMP upgrade procedure.                      | <p><b>Impact Statement:</b> The etcd upgrade procedure is not available.</p> <p><b>Resolution Details:</b> Documented the etcd upgrade procedure. For more information, refer to <a href="#">Upgrading etcd</a>.</p>                                                                                                                                                                 |
| AFM-11871 | NA             | 2   | The EdgeMarc PCAP and Diagnostic Snapshot do not work on the public IP address setup.     | <p><b>Impact Statement:</b> Certain EdgeMarc features were not working when deploying the EdgeMarc with a Public IP.</p> <p><b>Resolution Details:</b> Modified the code to resolve this issue.</p>                                                                                                                                                                                  |
| AFM-11918 | NA             | 2   | The PSX Manager <code>Jsonlp</code> file download failings after migrating to the RAMP.   | <p><b>Impact Statement:</b> The <code>proxyPreferredIp</code> value was missing after a migration, which caused a PSX Manager launch failure.</p> <p><b>Resolution Details:</b> Modified the code to resolve this issue.</p>                                                                                                                                                         |

| Issue ID  | Original Issue | Sev | Problem Description                                                         | Resolution                                                                                                                                                                                                                                                                                                                                                               |

| AFM-12511 | NA                | 3   | The RAMP fails to query the server error for the AD user.                                        | <b>Impact Statement:</b> The RAMP fails to query the server error due to a missing step in the document.<br><b>Resolution Details:</b> Updated the document to add the missing step. For more information, refer to <a href="#">Post-Upgrade Procedures for RAMP</a> .                                                                                                                                                                                                                                         |
| AFM-12549 | NA                | 3   | Fields in the inventory report contain NULL for the primary SBC node name.                       | <b>Impact Statement:</b> The Inventory Report contains NULL for the primary SBC HA hostname.<br><b>Resolution Details:</b> Modified the code to set the correct hostname for the SBC HA.                                                                                                                                                                                                                                                                                                                       |
| AFM-12592 | NA                | 3   | Some of the commands fail in the GSX CLI through the RAMP.                                       | <b>Impact Statement:</b> The Incorrect role, gsx.prov, was used for an auth check when running these commands through the GSX CLI in the RAMP, resulting in provisioning failures.<br><b>Resolution Details:</b> Updated the role to devices.prov.                                                                                                                                                                                                                                                             |
| AFM-12595 | AFM-10338 (24.03) | 2   | The RAMP performed an automatic switchover due to a healthCheck failure on the InsightHotDeploy. | <b>Impact Statement:</b> Occasionally, the system resources memory/CPU goes high, which causes the Linux OOM killer to kick in and kill the INSIGHT JBoss process, initiating a SWACT.<br><b>Resolution Details:</b> To avoid a SWAT, the INSIGHT JBoss process's OOM score is reduced to "-300" whenever it is spawned. This ensures the Linux OOM killer does not pick the INSIGHT JBoss process, which avoids SWACT. Even if killed, the rest of the processes restart on the same instance within seconds. |

|-----------|----------------|-----|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-13198 | NA             | 3   | Update the documented procedure "Configure RAMP for TLS Communication". | <b>Impact Statement:</b> The missing steps prevented RAMP from pushing licensing data to the SBC for a JITC-enabled RAMP.<br><b>Resolution Details:</b> Updated the procedure with the required steps. For more information, refer to <a href="#">Configure RAMP for TLS Communication</a> . |

## RAMP 24.09.00R001

The following issue is resolved in RAMP 24.09R1 release:

### Severity 1 Issue

The following table lists the resolved severity 1 issue in this release:

| Issue ID  | Original Issue | Sev | Problem Description                           | Resolution                                                                                                                                            |
|-----------|----------------|-----|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLTF-4086 | N/A            | 1   | Security vulnerabilities in the RAMP (23.09). | <b>Impact Statement:</b> Security vulnerabilities are observed in various scans.<br><b>Resolution Details:</b> Resolved the critical vulnerabilities. |

### Severity 2 and 3 Issues

The following table lists the resolved severity 2 and 3 issues in this release:

| Issue ID | Original Issue | Sev | Problem Description                                                        | Resolution                                                                                                                                                                                                                                      |
|----------|----------------|-----|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-7376 | N/A            | 3   | The RAMP CLI does not disconnect after the configured idle timeout period. | <b>Impact Statement:</b> The CLI session stays active even after the configured idle timeout.<br><b>Resolution Details:</b> Modified the code to disconnect the EMS CLI session when the CLI inactivity exceeds the configured disconnect time. |

| AFM-11370 | N/A            | 3   | The RAMP fails to retain the Force Password Change option after a migration. | <p><b>Impact Statement:</b> The user settings of the Force Password Change option are not retained/updated after the migration from the EMS to the RAMP.</p> <p><b>Resolution Details:</b> The RAMP uses double negation to understand the EMS DB equivalent field, <code>exempt_aging</code> <code>forcepasswordchange</code> value in the RAMP. The EMS-mapped field is <code>password_change</code>. If the Force Password Change option is enabled on the EMS, <code>password_change</code> is 3 in the EMS DB. However, the RAMP migration script always mapped the field with <code>!= 0</code> and set it to "True" for the <code>forcepasswordchange</code>. An explicit check in the RAMP migration script is performed to check for the values and fix them.</p> |
| AFM-11378 | N/A            | 3   | Schema mismatch causing FM to restart after an upgrade from 23.09 to 24.03.  | <p><b>Impact Statement:</b> When the RAMP is upgraded from 23.09 to later versions, a Kafka message schema compatibility issue is observed, as the old schema is registered with the schema registry. This schema gets registered with the schema registry when the UI operations are performed on the alarms received from the SBC and the DSC.</p> <p><b>Resolution Details:</b> The fix for this issue is communicated through a bulletin and provided a patch to apply after the upgrade from 23.09 to 24.03 and before GR setup.</p>                                                                                                                                                                                                                                  |
| AFM-11381 | N/A            | 3   | The RAMP GUI TLS certificate (2k vs 4k).                                     | <p><b>Impact Statement:</b> The user cannot generate the CSR with a key size greater than 2048.</p> <p><b>Resolution Details:</b> The script <code>manageCert</code> is modified to support the CSR generation with a key size between 2048 and 4096 bits. The key size is configurable in the CSR configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|-----------|----------------|-----|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-12006 | N/A            | 2   | A few of the SBC nodes take longer than expected to display online on the RAMP.                           | <p><b>Impact Statement:</b> If more than one SBC discovery is in progress, it takes a long time for all of them to complete and for the nodes to go online. The REST client connection pool in the Device Manager only allows two connections per route. Many requests go internally to other microservices and use the same route through Apache. One of these requests did not release the connection, which led to blocking other requests waiting for a thread.</p> <p><b>Resolution Details:</b> Added the missing "close" action to ensure the thread gets released. Also increased the number allowed connections per route to account for the number of requests that use Apache.</p>                                                                      |
| AFM-12042 | N/A            | 2   | The RAMP fails to establish the connection when launching the PSX Manager since the RAMP FIPS is enabled. | <p><b>Impact Statement:</b> The RAMP fails to provision the PSX.</p> <p><b>Resolution Details:</b> Modified the code to launch the PSX manager with FIPS enabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AFM-12070 | N/A            | 2   | The Retry Mechanism for the SBC<br><code>setConfigStore</code> to handle the failure case.                | <p><b>Impact Statement:</b> At the end of a dynamic SBC node discovery, the <code>config store</code> parameter is set to enable the SBC to upload the configurations to the RAMP. If this fails, the configuration upload fails without indication, and there is no upload reattempt. A network interruption or other cause that allows a subsequent attempt to succeed can lead to this failure.</p> <p><b>Resolution Details:</b> Added the <code>config store</code> parameter setting to the discovery retry mechanism to ensure if the upload fails, another discovery attempt is made. If the upload fails, but the maximum number of discovery retry attempts is reached, the failure reason indicates that the config store parameter setting failed.</p> |

| AFM-12203 | N/A            | 2   | The PM collection issue exists on the SGX 10.0.6R0. | <p><b>Impact Statement:</b> For SGX version 10.0.6R0, the memory usage-related counters in the PM statistics are not pegged or pegged as "0." This is a known issue in the SGX 10.0.6R0 release, and the fix is available for a higher release. Ribbon previously provided a script in the EMS to run as a cron job to collect memory information from the SGX. This is also needed in the RAMP CNF for the SGX 10.0.6R0 to retrieve memory information.</p> <p><b>Resolution Details:</b> The script <code>/opt/sonus/ems/conf/sgx-mem-collector.sh</code> is added in the RAMP CNF to run as an Insight cron job every 15 minutes in RAMP by default.</p> |
| AFM-12244 | N/A            | 2   | Missing support for the old versions of PSX APIs.   | <p><b>Impact Statement:</b> The user holds the PSX version 14.1.3 and provisions through the RAMP API with the PSX WSDL version r07_03_02.</p> <p><b>Resolution Details:</b> The RAMP is enhanced to support the older versions of PSX APIs (from 7.0.x to 8.2.x).</p>                                                                                                                                                                                                                                                                                                                                                                                      |
| AFM-12244 | N/A            | 2   | Support the old PSX API version.                    | <p><b>Impact Statement:</b> The support for 07_00_00 and above versions were missing in the RAMP.</p> <p><b>Resolution Details:</b> Added the support from 07_00 to 08_02_00 in the RAMP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| AFM-12296 | N/A            | 2   | The RAMP fails to launch the SBC Manager GUI.       | <p><b>Impact Statement:</b> The RAMP fails to launch the SBC Manager GUI when the .KF file is generated using the DES algorithm since the SBC Manager in the RAMP does not support the DES algorithm.</p> <p><b>Resolution Details:</b> Support for the DES algorithm was added in the SBC Manager.</p>                                                                                                                                                                                                                                                                                                                                                     |

| Issue ID  | Original Issue    | Sev | Problem Description                                                                                       | Resolution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|-------------------|-----|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-12361 | N/A               | 2   | Error logs are generated in the <code>ems_trace_log</code> when the PSX API provisioning is accomplished. | <p><b>Impact Statement:</b> When the Application Config -&gt; Utils -&gt; Enable CLI/API username logging is set to True, an exception is observed in the logs, and the connection is not freed. When the flag is set to True, the <code>nodeId</code> is passed into <code>freeConnection</code> as "<code>nodeId+userName</code>," causing an exception when trying to retrieve the provisioning PSX.</p> <p><b>Resolution Details:</b> Added a <code>freeConnection</code> to match the <code>getConnection</code> and handle the extra username parameter.</p>                                                                              |
| AFM-12369 | N/A               | 2   | SBC CNe: The SBC Manager GUI connection through the RAMP window relaunches.                               | <p><b>Impact Statement:</b> The SBC GUI running on the RAMP frequently runs a REST call to the SBC on port 443 to check if the SBC is up and running. Occasionally, the REST call fails with an error "Connection reset by peer (connect failed)", leading the SBC GUI to consider that the SBC is down, and the GUI relaunches with only limited functionality. After an interval, the REST call succeeds, and the GUI is relaunched with complete functionality.</p> <p><b>Resolution Details:</b> Implemented the retry mechanism to address the failure while connecting to the device before reporting failure to the SBC Manager GUI.</p> |
| AFM-12399 | AFM-12456 (24.06) | 2   | Allow MAC and KEX algorithms on the RAMP 8122 CLI.                                                        | <p><b>Impact Statement:</b> A few deprecated MAC and KEX algorithms were removed as part of security updates. However, these algorithms are required while connecting to older devices using the RAMP CLI.</p> <p><b>Resolution Details:</b> The RAMP is enhanced to read the MAC and KEX algorithms from <code>/opt/sonus/ems/weblogic/sonusEms/data/cli/framework/resources/Listener.properties</code> file.</p>                                                                                                                                                                                                                              |

| Issue ID  | Original Issue | Sev | Problem Description                                                                                              | Resolution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|----------------|-----|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-12407 | N/A            | 2   | The RAMP fails to export the <code>DspResDspUsageIntervalStats</code> to the IT systems due to an SBC7K upgrade. | <p><b>Impact Statement:</b> The SBC7K device fails to process <code>DspResDspUsageIntervalStats</code>. The <code>mdjson</code> file used by the PM Persister component is missing a few expected fields for SBC 11.2.x devices.</p> <p><b>Resolution Details:</b> This issue is resolved in the previous version of the RAMP and verified in RAMP 24.09.</p>                                                                                                                                                                 |
| PLTF-4305 | N/A            | 2   | Deprecated SSH cryptographic ciphers.                                                                            | <p><b>Impact Statement:</b> The SSH cipher vulnerabilities are reported in the Qualys scan. When the Crypto policy is set to DEFAULT/FIPS, the deprecated ciphers are enabled in those configuration files, and vulnerabilities are reported.</p> <p><b>Resolution Details:</b> Added strict MACs and Ciphers on the RHEL7 in both the <code>/etc/ssh/ssh_config</code> and <code>/etc/ssh/sshd_config</code> files.</p>                                                                                                      |
| PLTF-4478 | N/A            | 2   | RAMP 24.06: etcd upgrade support.                                                                                | <p><b>Impact Statement:</b> The etcd upgrade-related documentation is not available.</p> <p><b>Resolution Details:</b> Created the documents for different upgrade configurations. ## Known Issues

### Severity 1 Issues

There are no severity 1 known issues in this release.

### Severity 2 and 3 Issues

The following table lists the severity 2 and 3 known issues in this release:

| Issue ID | Sev | Problem Description                                                                                                                                                               | Impact/Workaround                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-4461 | 2   | When the active RAMP goes down in an Active/Active scenario, the Standby registers a "relocate" action while the Active becomes active again, resulting in loss of functionality. | <b>Impact Statement:</b> The RAMP server goes down, and manual intervention is required to bring it up.<br><b>Workaround:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                             |
| AFM-6966 | 2   | Retain all the passwords after a restore (Upgrade/Migration).                                                                                                                     | <b>Impact Statement:</b><br><ol style="list-style-type: none"><li>1. Linux Insight user (insight) - Reset post restore</li><li>2. Linux Admin user (admin) - Reset post restore</li><li>3. Insight DB user - Retained</li><li>4. Insight Postgres DB user - Reset</li><li>5. Insight Agent (admin) - Retained</li><li>6. Insight GUI Admin user (admin) - Reset</li><li>7. Insight REST API user (restuser) - Retained</li><li>8. Insight GUI Admin User (admin) - Reset</li></ol> <b>Workaround:</b> Set the password again. |
| AFM-7086 | 3   | Localhost Auto discovery failed (CNF).                                                                                                                                            | <b>Impact Statement:</b> The Localhost registration failed. The PM and other functionalities are impacted.<br><b>Workaround:</b> Navigate to the DM page and manually re-discover the local host.                                                                                                                                                                                                                                                                                                                             |
| AFM-7320 | 3   | The SBC CNe nodes are not registered in the extended IPv6 format.                                                                                                                 | <b>Impact Statement:</b> No functionality impact. IPv6 addresses display in short form.<br><b>Workaround:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                             |

| Issue ID | Sev | Problem Description                                                                                                           | Impact/Workaround                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| AFM-7578 | 3   | The node service must stop if the reachability consumer stops due to an exception.                                            | <p><b>Impact Statement:</b> The node management application starts even if the KAFKA consumer reachability stops due to an unexpected error, which results in an inconsistent system state.</p> <p><b>Workaround:</b> If the node status is not updated according to the reachability polling results, follow these instructions to restart the dynamic node services.</p> <ol style="list-style-type: none"> <li>1. Log on as an insight user.</li> <li>2. Run the following commands: <pre>cd /opt/devMgmt/bin ./dynamicNodeService stop ./dynamicNodeService start</pre> </li> </ol> |
| AFM-7891 | 3   | The SBC SWe Edge configuration fails on the RAMP.                                                                             | <p><b>Impact Statement:</b> The RAMP fails to launch the SBC GUI configuration on the SBC SWe Edge. This is a rare occurrence attributed to a tunnel creation failure.</p> <p><b>Workaround:</b> Reboot the SBC SWe Edge instance.</p>                                                                                                                                                                                                                                                                                                                                                  |
| AFM-8483 | 2   | The <code>PeerIPAddress</code> field contains the worker node IP address instead of the RAMP IP address in the SNMP receiver. | <p><b>Impact Statement:</b> The <code>PeerIPAddress</code> field contains the worker node IP address and port. The <code>PeerIPAddress</code> field must contain RAMP's eth1 IP address instead of the worker node IP address because the worker node IP address changes when the pod is moved from one worker node to another.</p> <p><b>Workaround:</b> N/A</p>                                                                                                                                                                                                                       |
| AFM-8777 | 3   | The SBC registration fails with <code>emsIpAddressOverride</code> .                                                           | <p><b>Impact Statement:</b> The SBC registration fails with <code>emsIpAddressOverride</code> if the RAMP IP address is changed.</p> <p><b>Workaround:</b> Remove the Node ID from the SBC User Data and resend the Registration Request.</p>                                                                                                                                                                                                                                                                                                                                           |

| Issue ID  | Sev | Problem Description                                                                                                                                                              | Impact/Workaround                                                                                                                                                                                                                                                                                              |
|-----------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-9595  | 3   | Legacy devices such as GSX PM metrics are not available in the Prometheus if the number of devices is greater than 15.                                                           | <p><b>Impact Statement:</b> The RAMP CNF observability performance issues limit the capacity of the observability component to process the GSX metrics.</p> <p><b>Workaround:</b> Export the PM data to an external server.</p> <p>Note: Maximum of 10,000 metrics are exported to Prometheus.</p>             |
| AFM-9658  | 3   | Missing clearing event <code>sonusHARACProcessUPNotification</code> for problem event <code>sonusHARACProcessDownNotification</code> for FM processes restarted by the openSAF.  | <p><b>Impact Statement:</b> The clearing event does not occur through the FM process.</p> <p><b>Workaround:</b> Run the <code>emsMgmt</code> command to verify the state of the FM process.</p>                                                                                                                |
| AFM-10033 | 3   | The RAMP fails to fetch the complete <code>oam</code> , <code>snmp</code> , <code>trapTarget</code> using the CLI in IPv6.                                                       | <p><b>Impact Statement:</b> The RAMP CLI issue occurs when the RAMP fails to display the complete response if the response size exceeds 80 characters for the particular column. The window size is truncated whenever it reaches 80 characters. This applies to all tables.</p> <p><b>Workaround:</b> N/A</p> |
| AFM-11210 | 3   | Performance Load: When all the nodes go offline, the RAMP takes time to bring up all the nodes online as reachability timeout is high, which results in waiting for the threads. | <p><b>Impact Statement:</b> When a huge number of nodes goes offline, the RAMP takes time to bring all the nodes back online.</p> <p><b>Workaround:</b> N/A</p>                                                                                                                                                |
| AFM-11222 | 3   | Multi-Tenancy: Limit the Resource Group access within the tenant hierarchy.                                                                                                      | <p><b>Impact Statement:</b> The user can edit/delete the resource group above the tenant hierarchy.</p> <p><b>Workaround:</b> N/A</p>                                                                                                                                                                          |

| Issue ID  | Sev | Problem Description                                                                                                                 | Impact/Workaround                                                                                                                                                                                                                                                                                                                                   |

| AFM-13210 | 2   | Include re-generating CSR in post-migration steps.                                                    | <p><b>Impact Statement:</b> Discovery fails on the RAMP after a migration.</p> <p><b>Workaround:</b> Added note in <a href="#">Migrate Insight EMS to RAMP</a>. If the user holds a CA-signed agent certificate on the EMS with MD5withRSA signature algorithm, perform the following procedure after migrating from the EMS to the RAMP, before discovering the nodes:</p> <ol style="list-style-type: none"><li>1. Re-generate the CSR. For more information, refer to <a href="#">Generate Certificate Request for Agent</a>.</li><li>2. Re-import the certificate to the agent keystore. For more information, refer to <a href="#">Import Certificates for Agent</a>.</li><li>3. Restart administration service:<pre># sudo su - insight # cd /opt/devMgmt/bin/ # ./administrationService stop;./ administrationService start</pre></li></ol> |
| AFM-13229 | 2   | RAMP 24.12: The Calea user does not hold permission to access the DM UI after a migration.            | <p><b>Impact Statement:</b> By default, the Calea user does not hold permission to access the DM UI after a migration.</p> <p><b>Workaround:</b> The user needs to add the permission manually.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| AFM-13339 | 3   | The RAMP generates Active Directory Configuration issues during the upgrade and non-cloud deployment. | <p><b>Impact Statement:</b> Active Directory configurations are not retained during the upgrade, causing login failures in non-cloud deployment.</p> <p><b>Workaround:</b> Perform <a href="#">Post-Upgrade Procedures for RAMP</a> and <a href="#">Reconfiguring Active Directory</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Issue ID  | Sev | Problem Description                                                                                                                            | Impact/Workaround                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-13365 | 3   | In multiple interfaces configured on the SBC setup, if the primary interface is disabled, the RAMP discovery fails for SBC after a switchover. | <b>Impact Statement:</b> If one of the interfaces is disabled on the SBC that is returned as the first interface by the SBC, the disabled interface is updated as the primary IP address. If there is an SBC switchover, the node does not come online on the RAMP.<br><b>Workaround:</b> Update the Host IP address fields from the UI after every SBC switchover and do not discover the node after that. |

## Known Limitations

The following limitations exist in this release:

1. Dual-stack RAMP deployment is not supported in the RAMP.
2. IPv6 deployment is not supported on the Azure and AWS platforms.
3. RAMP does not support High Availability redundancy.
4. RAMP supports only standalone deployments on the Azure and AWS platforms.
5. AMP does not support the REST API provisioning for SBC versions less than 11.1.
6. UI dashboard and other FM/PM UIs have issue with Multi-tenancy. They are GUI issues and will be address in Release 25.X release.
7. The following items are not restored as part of the RAMP restore operation.
  - a. Platform-related configurations
  - b. Custom Cron jobs configured by users
  - c. Custom scripts or jobs deployed at the Linux level

## New in RAMP 24.12.00R000

### RAMP 24.12.00R000

The Ribbon Application Management Platform (RAMP) includes the following new features in this release:

#### Note

The Beta features refer to software features available for access within the software build but are still under development. Early access is provided to gather feedback from users. The capability may have limited functionality. The availability of the Beta feature in the current RAMP version does not guarantee that the feature will be available in the future. Ribbon may withdraw the Beta features from any future RAMP release without notice.

| JIRA ID  | Feature Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| AFM-5686 | <p><b>Bulk Action Notifications (Beta)</b></p> <p>The RAMP is enhanced with a notification microservice. This capability is targeted for the EdgeMarc device. While initiating actions, users can enable notifications for particular actions. When performing an EdgeMarc bulk action, users can specify whether they need to receive notifications for the action status. It is an optional microservice, and the user can manually add the service after the RAMP installation.</p> <p>For more information, refer to:</p> <ul style="list-style-type: none"><li>• <a href="#">Notifications</a></li><li>• <a href="#">Back up EdgeMarc Devices</a></li><li>• <a href="#">Change Password for EdgeMarc Devices</a></li><li>• <a href="#">Restore EdgeMarc Devices</a></li><li>• <a href="#">Run Health Reports on EdgeMarc Devices</a></li><li>• <a href="#">Upgrade Firmware for EdgeMarc Devices</a></li><li>• <a href="#">Reboot EdgeMarc Devices</a></li><li>• <a href="#">Configure Devices on EdgeMarc</a></li></ul> |
| AFM-5784 | <p><b>Framework Update for User Interface Improvements</b></p> <p>The RAMP UI framework has been updated to enhance the performance and support the Web Content Accessibility Guidelines (WCAG) requirements.</p> <p>For more information, refer to:</p> <ul style="list-style-type: none"><li>• <a href="#">Provision SBC Core</a></li><li>• <a href="#">Compare Uploaded Configurations for SBC Core or SLB Devices</a></li><li>• <a href="#">Provision SBC Edge Devices</a></li><li>• <a href="#">Take Backup of SBC Edge Devices</a></li><li>• <a href="#">Take Backup of SBC Core and SLB Devices</a></li><li>• <a href="#">SBC Edge Devices Catalog Management</a></li><li>• <a href="#">SBC Core and SLB Catalog Management</a></li><li>• <a href="#">Customize the Logon Banner</a></li><li>• <a href="#">Exporting Logs to a Remote Syslog Server</a></li><li>• <a href="#">SSH Active Channels</a></li></ul>                                                                                                        |
| AFM-6413 | <p><b>Forward Manually Cleared Alarms to OSS</b></p> <p>The RAMP is enhanced to support manually clearing an alarm and sending a clear alarm message to the northbound system. An action called Clear with Forward is introduced to generate a warning message when the alarm count limit exceeds.</p> <p>For more information, refer to <a href="#">Monitor Alarms</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| JIRA ID   | Feature Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AFM-7310  | <b>Resource Group Dashboard (Beta)</b><br>The RAMP is enhanced to display a dashboard view screen to show all resource groups in a card-style format. You can filter the resource group cards based on criteria.<br>For more information, refer to: <ul style="list-style-type: none"><li>• <a href="#">Dashboard</a></li><li>• <a href="#">Resource Group Dashboard</a></li></ul>                                                                                                                                                                                                                                                                                                                                                               |
| AFM-9216  | <b>Global Search (Beta)</b><br>The RAMP is enhanced by providing a Global Search Service (GSS) to search components and devices available on the RAMP GUI. This functionality is available after manually installing an optional microservice GSS using the script <code>global_search_service_config</code> after installing the RAMP. When this microservice runs, the RAMP publishes a confirmation message over the Kafka topic, <code>service.availability_status</code> . The other microservices consume the Kafka message and then register themselves with the GSS by sending the register request, enabling access to the GSS to display the search results.<br>For more information, refer to <a href="#">Global Search Service</a> . |
| AFM-10192 | <b>Test Migration from EMS 14.1 to RAMP with HP Primary PSX 14.0</b><br>The RAMP 24.12R0 supports the discovery and registration of the HP Primary PSX 14.0 on the RAMP, including the HP Primary PSX 14.0 alarms, logs, statistics, and Performance Management reports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| AFM-10364 | <b>RAMP Support for ESXi 8.0</b><br>The RAMP supports VMware ESXi 8.0.<br>For more information, refer to <a href="#">System Requirements</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| AFM-10788 | <b>RAMP Default Certificates Update/Renew Before the Expiry Date</b><br>Beginning with the 24.12 release, the RAMP provides scripts that allow the operator to renew existing certificates or create new ones. For the RAMP versions less than RAMP 24.12, you can either renew the existing certificates or create new certificates using the scripts <code>generateCerts.sh</code> and <code>updateRDCerts.sh</code> . These scripts are available in the <code>rampbootstrap.tar</code> file.<br>For more information, refer to <a href="#">Renew RAMP Certificates</a> .                                                                                                                                                                     |

| JIRA ID   | Feature Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
