## 4. Population Rules for RLfc_coinchg

**Relation Description** Coin charge
Charge information for coin phone calls.

This relation is not populated for Export.

**Attribute: chrgtabl_x**

**Fullname:** Charge table index

**Attribute Description** This index is used in relation CHRGIDXEXP, a call processing relation. The check for this attribute is done in that relation.

**Attribute: fcc_cltp**

**Fullname:** Destination type

**Attribute Description** There are four possible enumeration types that a coin call may be. FCC_LOCL is local and is charged accordingly. FCC_FREE is a free call and the coin, if used, would be returned. FCC_OPR is a call to the operator. FCC_LOVT is a local overtime call used for charging purposes.

Copyright © 1999 Lucent Technologies

**Attribute: fcc_inpd**

**Fullname:** Local overtime initial time period

**Attribute Description** When enumeration FCC_LOVT is used, the attribute should be populated with a number from 1 to 7. If the enumeration is not used, then this attribute should be populated with a zero.

**Attribute: fcc_ovpd**

**Fullname:** Local overtime time period

**Attribute Description** When enumeration FCC_LOVT is used, this attribute should be populated with a number from 1 to 7. If the enumeration is not used, then this attribute should be populated with a zero.

**Attribute: ffcf[*]**

**Fullname:** Future field

**Attribute Description** future field feature use.

## 4. Population Rules for RLfc_diopr

**Relation Description** Destination index for operator.

The RLfc_diopr relation is used by the intermediate switching point (ISP) feature. The non-key attributes consist of the primary destination index, primary overlap outpulse indicator and a six bits to determine traffic restriction associated with a particular carrier. If traffic restrictions do exist (a value greater than 0), then an alternate destination index and overlap outpulse indicator will be populated for the traffic type affected by the restriction. The alternate destination indexes and overlap outpulse indicators are provided for the following traffic types:

1) coin traffic,
2) ACQS auto quote,
3) ACQS voice quote,
4) 950 coin traffic,
5) 950 noncoin traffic,
6) teleconferencing traffic.

The default value for traffic restrictions is 0, meaning no traffic types are restricted. A destination index of 0 indicates the call will be handed off to the OSPS internal to the *5ESS*®-2000 switch. If the destination index is greater than 0 (1 - 4095), then the call should be routed to an external operator system (OS). The overlap outpulsing indicator is used only for calls that are routed to an external OS.

**Attribute: carrid**

**Fullname:** Carrier ID

**Attribute Description** Carrier ID of the carrier handling the call. The value of #LECBCARID is to be mapped to the three letters 'LEC' on the ODA/RC view.

**Attribute: bcarrier**

**Fullname:** Feature Group B Carrier

**Attribute Description** Indicates whether this is a feature group B carrier.

**Attribute: pri_dix**

**Fullname:** Primary destination index

**Attribute Description** Destination index of the operator system (OS) that handles operator calls for this carrier or of the announcement if no operator system is assigned. If the destination index is 0, this means the call will be handed off to an internal OSPS and not routed external to the *5ESS*®-2000 switch. A check must be made so that if the destination is set to 0, there is a OSPS on the switch. Destination index 0, must be reserved for calls being handed off to OSPS by the ISP capability.

**Attribute: traf_rest**

**Fullname:** Traffic Restricted

**Attribute Description** Indicates if any and what type of traffic cannot be handled by the primary OS. This is referred to as restricted traffic. This attribute is a six bit field as described here:

Copyright © 1999 Lucent Technologies 

```
BITS      MEANING
------    ------------------------------------
000000    No restrictions exist. Default value
000001    All coin traffic is restricted
000010    All ACQS auto quote traffic restricted
000100    All ACQS voice quote traffic restricted
001000    Coin 950 0+ XXX traffic restricted
001000    Coin 950 1+ XXX traffic restricted
010000    Noncoin 950 1XXX traffic is restricted
100000    Teleconferencing calls are restricted
```

Any combination of the previous bit settings are valid if multiple traffic types are restricted

**Attribute: pri_ovlp**

**Fullname:** Primary overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed to the primary OS.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: cn_dix**

**Fullname:** Restricted coin destination index

**Attribute Description** Destination index of OS or announcement for routing restricted coin traffic. Populate only if coin traffic is restricted. See rules for RLfc_diopr.pri_dix for detailed description.

**Attribute: aq_dix**

**Fullname:** Restricted ACQS-AQ destination index

**Attribute Description** Destination index of OS or announcement for routing restricted ACQS-AQ traffic. Populate only if ACQS-AQ traffic is restricted. See pop rules for pri_dix for detailed description.

**Attribute: vq_dix**

**Fullname:** Restricted ACQS-VQ destination index.

**Attribute Description** Destination index of OS or announcement for routing restricted ACQS-VQ traffic. Populate only if ACQS-VQ traffic is restricted. See pop rules for pri_dix for detailed description.

**Attribute: nc950_dix**

**Fullname:** Restricted NCN 950 destination index.

**Attribute Description** Destination index of OS or announcement for routing restricted NCN 950 traffic. Populate only if NCN 950 traffic is restricted. See pop rules for pri_dix for detailed description.

**Attribute: op950_dix**

**Fullname:** Restricted 1+ CN 950 destination index

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Destination index of OS or announcement for routing restricted 1+ CN 950 traffic. Populate only if CN 950 traffic is restricted. See poprules for pri_dix for detailed description.

**Attribute: zp950_dix**

**Fullname:** Restricted 0+ CN 950 destination index

**Attribute Description** Destination index of OS or announcement for routing restricted 0+ CN 950 traffic. Populate only if CN 950 traffic is restricted. See poprules for pri_dix for detailed description.

**Attribute: tc_dix**

**Fullname:** Restricted teleconferencing destination index

**Attribute Description** Destination index of OS or announcement for routing restricted teleconferencing traffic. Populate only if teleconferencing traffic is restricted. See rules for pri_dix for detailed description.

**Attribute: cn_ovlp**

**Fullname:** Coin overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on calls to the OS handling restricted coin traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: aq_ovlp**

**Fullname:** ACQS-AQ overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on calls to the OS handling restricted ACQS-AQ traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: vq_ovlp**

**Fullname:** ACQS-VQ overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on call to the OS handling restricted ACQS-AQ traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: nc950_ovlp**

**Fullname:** NCN 950 overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on calls to the OS handling restricted 1+ coin 950 traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
```

Copyright © 1999 Lucent Technologies 

```
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: op950_ovlp**

**Fullname:** 1+ 950 overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on calls to the OS handling restricted 1+ 950 traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: zp950_ovlp**

**Fullname:** 0+ 950 overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on calls to the OS handling restricted 0+ coin 950 traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

**Attribute: tc_ovlp**

**Fullname:** Teleconferencing overlap outpulsing

**Attribute Description** Indicates if overlap outpulsing is allowed on calls to the OS handling restricted teleconferencing traffic.

```
Boolean:
DBYES - Overlap outpulsing allowed
DBNO  - Overlap outpulsing not allowed.
```

## 4. Population Rules for RLfc_dircon

**Relation Description** Direct connect DNS.

**Attribute: port**

**Fullname:** Port.

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute is divided into sub-attribute port. member and port.module. Port.member is the port number and port.module is the IM number.
Port may be a TEN, DEN, LEN, FC_TDIRC, or SLEN. The trunk relation called FC_TDIRC is for direct connect trunks (that is, TENs and DENs).

**Attribute: port.member**

**Fullname:** Port member.
**Attribute Description** Port.member is the port number

**Attribute: port.module**

**Fullname:** Port module.
**Attribute Description** Port.module is the IM number.

**Attribute: party**

**Fullname:** Party.
**Attribute Description** Tells whether this is an individual, 2-party, 4-party 8-party, 5-party (MFR), or 10-party (MFR) line. Direct connect is not allowed with 4 and 8 party or 5 and 10 party lines. It is allowed on 2-party lines.
If this port is a trunk, party is a 'don't care' value, set to FCP_INDI. This is applicable for 5E1(2)3 only.
Multiparty ringing is not supported by Export. Party must be FCP_INDI.

**Attribute: dn**

**Fullname:** Directory Number.
**Attribute Description** Directory number direct connected to.

**Attribute: dn.digcnt**

**Fullname:** Digit count.
**Attribute Description** Total number of digits used for directory number direct connected to.

**Attribute: dn.dn**

**Fullname:** Directory number.
**Attribute Description** Directory number being directly connected. If this port has also been assigned a MFPP feature then in addition to '*', '#', and '0'-'9', the following digits are allowed to be stored in dn.dn: O(0x4f),F(0x46), I(0x49), and P(0x50).
A port has been assigned a PP feature if there exists a tuple in RLpp_line such that: key RLpp_line.port == port.

## 4. Population Rules for RLfc_fgbcarr

**Relation Description** Feature Group B (FGB) Carrier data
This relation provides carrier data for FGB carriers only.

This relation is being added by the FGB Carrier Identification Code Expansion Capability - u1038.

Copyright © 1999 Lucent Technologies

**Attribute: fgb_carrid**

**Fullname:** Feature Group B Carrier Identifier

**Attribute Description** fgb_carrid indicates the Feature Group B carrier identifier. This is a 4 digit character string, where each of the characters can be '0' thru '9'.

Note : If for example, carrier = 0288, only 288 needs to be entered.

**Attribute: fgb_di**

**Fullname:** Feature Group B destination index

**Attribute Description** The destination index for Feature Group B carriers.

**Attribute: fgb_ri**

**Fullname:** Feature Group B route index

**Attribute Description** Route index for Feature Group B carriers.

**Attribute: dig_route**

**Fullname:** Route on dialed digits for Feature Group B

**Attribute Description** Set to DBYES if calls to FGB carrier should be routed based on the dialed digits.

**Attribute: ci_acctp**

**Fullname:** FGB access type

**Attribute Description** Indicates the dialing access allowed by the carrier

**Attribute: trans_carid**

**Fullname:** Transition carrier id

**Attribute Description** If this is FGB with access type of TRANSITION or T_TRANSITION then trans_carid must consist of the last three characters of the fgb_carrid value padded with a leading zero. The default NULL equals '\0'.

**Attribute: osps_icos**

**Fullname:** Operator services indicator

**Attribute Description** An indicator as to whether or not the carrier wants LEC operator services. Indicator is set to DBYES when LEC operator services are wanted.

**Attribute: long_rec**

**Fullname:** Long billing record

**Attribute Description** Set to DBYES indicates a terminating detailed (long) billing record should be generated.

**Attribute: send_ani**

**Fullname:** Send SCRIDX associated ANI II digits flag.

**Attribute Description** DBYES indicates that the carrier is allowed to send the SCRIDX associated ANI II digits. send_ani can only be DBYES if the secured feature, Flexible ANI Enhancements (FANI-E, SFID142) has been purchased and turned on, otherwise must be DBNO.

**Attribute: ffcf1**

Copyright © 1999 Lucent Technologies 

**Fullname:** Future feature.

**Attribute Description** Future feature.

**Attribute: ffcf2**

**Fullname:** Future feature.

**Attribute Description** Future Feature.

**Attribute: ffcf3**

**Fullname:** Future feature.

**Attribute Description** Future Feature.

## 4. Population rules for RLfc_genra

### Relation Description

General Recorded Announcements via DSU2-RAF

This relation contains the announcement data for a fixed route type. It should be populated only in those SMs which are equipped with a DSU2-RAF or SAS.

The set of fixed route types which are associated with general recorded announcements and for which a RLfc_genra tuple may be populated are listed in the ATTRIBUTE section for attribute rt_type. In any particular office, only a subset of these fixed route types will be populated in accordance with the previously population rule stated.

Copyright © 1999 Lucent Technologies

For non stop listening, the calling party hears the announcement repeatedly until he hangs up, the attributes ann_cycl and ann_time have to be set to zero. However this is only valid when the application is FCGENRAF.
For other applications either the ann_cycl or ann_time must be specified but not both (one attribute must be zero).

The fixed route types listed in the ATTRIBUTE Section for attribute rt_type are the same as defined in the rta/RTgdata/RTraft_fat.c feature activation file. If new fixed route types are added to the list, then the same fixed route types must be added to the RTraft_fat.c file. Failure to update RTraft_fat.c will cause an assert to be fired when a call attempts to access the announcement associated with the missing fixed route type.

**Attribute:**
rt_type
**Fullname:**
Fixed Route Type
**Attribute Description:**
A fixed route type which is associated with a general or variable recorded announcement to be provided via a DSU2-RAF or SAS.

**Attribute:**
ann_var
**Fullname:**
Recorded Announcement Variants
**Attribute Description:**
The Recorded Announcement Variant is the second key needed to select an announcement.

**Attribute:**
ann_id
**Fullname:**
Announcement Identification Number
**Attribute Description:**
Announcement identification number to be used for this fixed route type.

**Attribute:**
ann_cycl
**Fullname:**
announcement cycle limit
**Attribute Description:**
This is the number of times an announcement is repeated per call. The full range is 0 thru 5.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ann_time
**Fullname:**
announcement time limit
**Attribute Description:**
This is the maximum period of time (in seconds) that the caller will be allowed to listen to the announcement. This should be long enough for the caller to hear at least one complete cycle. A value of zero DOES NOT mean that the caller will be allowed to listen to the announcement continuously.

**Attribute:**
trl_id
**Fullname:**
Trailer Identification Number
**Attribute Description:**
Trailer ID of the announcement will be played after all cycles of ann_id have finished.

## 4. Population rules for RLfc_hotel

**Copyright © 1999 Lucent Technologies** 

**Relation Description**

Feature control hotel

This relation contains information which describes a client of the automatic charge quotation service (ACQS). The client, such as a hotel, hospital or lawyers' office, requires the delivery of time and charge information for toll calls made by a party such as a hotel guest, hospital patient or lawyer for their client. The data is transmitted to the client in one of several methods.

The first method, network autoquote, has the 5ESS(R)-2000 switch transmit the time and charge data to a hotel billing information system (HOBIS) or a hotel billing information center (HOBIC). An individual at the HOBIS/HOBIC may then dial up a connection to a printer in the ACQS establishment and print the charge information on the printer.

The second method, private line autoquote, has the 5ESS(R)-2000 switch transmit the data, via a leased line, directly to a printer/computer operated by the client.

The third method, FAX quote, is similar to network autoquote, except instead of sending the information to the clients printer, the information is sent to their FAX machine.

The fourth method, voice quote, has the 5ESS(R)-2000 switch transmit the time and charge date to a HOBIS/HOBIC. An individual at the HOBIS/HOBIC then verbally forwards the data to the client.

This relation is not to be populated for export applications. Populate only in offices intended to serve OSPS.

retrofit-rules,
defaults: vqaq

**Attribute:**

acqsnpanxx

**Fullname:**

Automatic charge quotation system numbering plan area (NPA)-office code (NXX)

**Attribute Description:**

This is the NPA-NXX of the ACQS telephone number. This telephone number is the 10 digit calling number of a line used by an ACQS client.

**Attribute:**

acqslineno

**Fullname:**

Copyright © 1999 Lucent Technologies 

Automatic charge quotation system line number

**Attribute Description:**

This is the last four digits (line number) of the ACQS telephone number. This telephone number is the 10 digit calling number of a line used by an ACQS client.

**Attribute:**

vqaqnpanxx

**Fullname:**

Voice quote/autoquote NPA-NXX

**Attribute Description:**

This is the NPA-NXX of the network autoquote, private line autoquote, FAX quote, or voice quote number.

The network autoquote, FAX quote, and voice quote number is a number called to deliver a non-private line quote to an ACQS client via an alternate means (FAX, voice, or printer).

The private line autoquote number is a number, internal to the 5ESS(R)-2000 switch, used to establish a path between an auto quote digital subscriber line (DSL) link and the trunk port connected to a leased line, which in turn is connected to the printer or computer operated by an ACQS client.

In the event of a private line autoquote failure, this number is not the number used to deliver a non-private line quote.

The number must be the same for every line (ACQS telephone number) of an ACQS client. All ACQS client lines share the same identifiers (the attributes aqhid and htlnme in this relation). The vqaqnpanxx number can be used by one and only one ACQS client.

In the case of an ACQS private line client, the last seven digits (NXX-XXXX) of the number must be unique within the 5ESS(R)-2000 switch and the full 10-digit number must have its NPA and NXX appear in RLnoccode.npa and RLnoccode.nxx, respectively.

The 5ESS(R)-2000 switch has a system limit of 1000 trunk ports which can be used to connect to a leased line used by an ACQS auto quote client. The 10-digit number and the trunk port are a unique combination within the 5ESS(R)-2000 switch. Ergo, there is a limit of 1000 (as defined by Glaq_max) 10-digit numbers that can be used for ACQS private line autoquote clients.

**Attribute:**

vqaqlineno

Copyright © 1999 Lucent Technologies 

**Fullname:**
Voice quote/autoquote line number
**Attribute Description:**
This is the last four digits (line number) of the delivered to number.

**Attribute:**
trubill
**Fullname:**
True billing number
**Attribute Description:**
The 7-digit or 10-digit number that is to be used for billing purposes when the acqstelno is not to be used. This number will appear on the automatic message accounting (AMA) record.

The NPA associated with this number must be the same as the NPA of the number in the acqstelno attribute.

Whenever a true billing number is user-specified, another tuple must exist in this relation whose key (acqstelno) is equal to the true billing number ( a 7-digit number must be prefixed by the NPA of the acqstelno associated with the true billing number). This tuple must have its trubill.digcnt attribute set to '0'. Additionally, this tuple must have every attribute, except trubill and manpbx, in common with the tuple built for the original acqstelno.

Every line (acqstelno) serving an ACQS client should have the same true billing number.

Two or more ACQS clients should not share a true billing number. Even though ODA and RC do not enforce this rule it is highly suggested.

**Attribute:**
aqhid
**Fullname:**
Auto quote hotel ID
**Attribute Description:**
This attribute is unique for each ACQS client. An ACQS client is uniquely identified by the htlnme attribute in this relation. Thus, there will be a one-to-one correspondence between the htlnme and aqhid attributes.

The aqhid attribute is assigned by ODA or RC/V, as opposed to being user specified. The range is from 0 to 4095 (as defined by Glrc_hotel) and is assigned by using the relations RLfc_hotel and RLrc_hotel and the global GLrc_hotel.

**Copyright © 1999 Lucent Technologies** 

ODA will, for an initial or retrofit office, calculate the quantity of ACQS clients and set GLrc_hotel to the value that should be assigned to the first new ACQS client to be added through RC/V. ODA does not use or build RLrc_hotel.

When RC/V adds a new ACQS client, RLrc_hotel is examined for an available aqhid. An aqhid becomes 'available' when an ACQS client is deleted. RLrc_hotel is a bit-mapped representation of assigned and available aqhids. If RC/V does not find an available aqhid in RLrc_hotel, then the value in GLrc_hotel is used.

**Attribute:**
aqform
**Fullname:**
Auto quote message form
**Attribute Description:**
This attribute specifies the format of the printout of time and charge information for an ACQS private line auto quote client. The attribute is meaningless for an ACQS non-private line auto quote client. If the vqaq attribute is set to network auto quote, FAX, or voice quote, then this attribute must be set to OA_OSPFM.

**Attribute:**
manpbx
**Fullname:**
Manual private branch exchange (PBX)
**Attribute Description:**
This attribute should be set to DBYES when either of the following situations apply to the ACQS client line (acqstelno): a) the call is from a manual PBX; or b) the line is used by the ACQS client for administrative calls in some instances and for 'guest' calls, prefixed by 0, in other instances. An administrative call does not require a time and charge quotation, whereas a 'guest' call, such as a call from a hospital patient's room, does require a time and charge quotation.

**Attribute:**
vqaq
**Fullname:**
Voice quote or auto quote indicator
**Attribute Description:**
Used to indicate the type of quote delivery method used; network auto quote, private line auto quote, FAX quote, or voice quote.

**Attribute:**
htltrue

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Hotel true
**Attribute Description:**
When this attribute is set to DBYES, the line serves a 'true' hotel. When this attribute is set to DBNO, the line does not serve a 'true' hotel. A 'true' hotel is an ACQS client which rents lodging, as opposed to a hospital, lawyers' office, etc. The 5ESS(R)-2000 switch owner can use this attribute to tariff service to hotels and motels differently than other businesses.

**Attribute:**
htlnme
**Fullname:**
Hotel name
**Attribute Description:**
A unique identifier, comprised of three characters (upper case letters or digits) to be user specified for an ACQS client. Every line (acqstelno) serving an ACQS client would have the same htlnme attribute. Two or more ACQS clients may not share a htlnme.

Tuples which have a common htlnme must share the following attributes: vqaqnpanxx, vqaqlineno, aqhid, aqform, vqaq and htltrue.

**Attribute:**
dacc_alw
**Fullname:**
DA Call Completion Allowed
**Attribute Description:**
Indicates whether the ACQS number is eligible for CICADA call completion.

**Attribute:**
oaff1
**Fullname:**
OSPS fast feature
**Attribute Description:**
OSPS fast feature item - The item is to be used for future OSPS fast feature development.

For 5E8, used in conjunction with vqaq to form a 2 bit attribute.

**Attribute:**
oaff2
**Fullname:**
OSPS fast feature
**Attribute Description:**
OSPS fast feature item - The item is to be used for future OSPS fast feature development.

Copyright © 1999 Lucent Technologies 

**Attribute:**
oaff3
**Fullname:**
OSPS special feature
**Attribute Description:**
OSPS fast feature item - The item is to be used for future OSPS fast feature development.

**Attribute:**
oaff4
**Fullname:**
OSPS fast feature
**Attribute Description:**
OSPS fast feature item - The item is to be used for future OSPS fast feature development.

**Attribute:**
operatoronddd
**Fullname:**
Operator On DDD (Direct Distance Dialing)
**Attribute Description:**
This attribute specifies whether an ACQS line has been marked as a "1+ Time & Charges" (1+ T&C) line.

**Defines:**
"db/DMnxx.h",
"db/DMnpanxx.h"

## 4. Population rules for RLfc_line

### Relation Description

```
Line feature construction

 Individual line feature data.

"This file does not include any export crosschecks.

As of the 5e9 software release port names no longer contain any
physical information. Information formerly contained in the port
name can now be found in either RLfc_porttyp, RLckt_port, RLcktdata
or RLunit_ckt or a combination of these. See PCR text and data
documents (u1001, u1002).

*********************************************************
*  NOTE:                                                *
*                                                       *
*  Checks for servclass in fc_porttyp are not sufficient *
*  due to intercept, therefore checks for servclass are  *
*  being done by using RLrc_oeinfo then RLrc_lcc.        *
*                                                       *
*  For ACQS, RPA, nailup lines without a TN,            *
*  and default service BFG, RLrc_oeinfo                 *
*  doesn't exist, but many other checks don't apply in  *
*  those cases anyhow, so you can                       *
*       "find <= 1 rc_oeinfo in RLrc_oeinfo"            *
*  and do your service class checks within that.        *
*                                                       *
*  Try to read rc_oeinfo and rc_lcc immediately after   *
*  the "for fc_line in RLfc_line" so that loop jamming  *
*  will jam these reads in addition to the fc_line loop *
*  itself.                                              *
*********************************************************

Application specific poprules for RDTA ports

The remote protocol access (RPA) capability allows
RDTA ports to be equipped on an access switch using
either a pseudo basic rate interface (BRI) port or an
extended digital subscriber line (EDSL) PRI port.
Refer to the poprules in RLdn_rdta for more details.

Note:   No RLrc_oeinfo or RLrc_lcc tuples are populated
        for RDTA ports.  See the previous for service
        class information.
Also:   RLfc_line does not contain tuples for RDTA EDSL PRI
        ports.  They are populated in RLfc_trunk.
```

Copyright © 1999 Lucent Technologies 

TUPLE SEMANTICS
---

The following RLfc_line attributes are applicable for RPA Pseudo BRI B-channel and D-channel ports. The servclass in RLfc_porttyp must equal TM_P_BRI and testport must equal DBYES. RPA does not support any business and residential customer service (BRCS) feature interaction, intercept ports or BFG default service. All the attributes not listed shall use their default values or be set for their inactive value.

| | |
|---|---|
| port | - RPA gport populated in RLdn_rdta, RLfc_porttyp |
| party | - Zero. |
| lport | - Pseudo BRI lport defined in RLlpt_pt. |
| lpt_type | - LPT_ISDN |
| screen_x | - Zero. |
| line_screen | - DBNO. |
| digtree | - Zero (not used). |
| nodial | - FCND_NONE. |
| signal | - DBNULLSIG. |
| multidn | - DBNO. |
| ani7 | - DBNO. |
| busymon | - DBNO. |
| sercomp | - DBNO. |
| freeterm | - DBNO. |
| orig | - DBNO. |
| complaint | - DBNO. |
| slus | - DBNO. |
| denybv | - DBNO. |
| locdn.noc | - Equal to RLrt_dntran.dn.noc. |
| locdn.digits | - Equal to RLrt_dntran.dn.digits. |
| billdn | - Defaults to full dn (NPA+NXX+digits). |
| carrid | - Zero. |
| ci_dial | - TEST_PROHIB. |
| fga | - DBNO. |
| mca | - DBNO. |
| brc_dn | - DBNO. |
| brc_trm | - DBNO. |
| ltm_type | - LTM_OTHER. |
| ltm_idx | - Zero. |
| mfri | - DBNO. |
| intercept | - DBNO. |
| scd_scrn | - DBNO. |

**Attribute:**

port

**Fullname:**

Port

**Attribute Description:**

This attribute is divided into sub-attribute port.member and port.module. Member is the port name of a line that should be assigned as an announcement line in relation RLfc_line. Module refers to the switching module in which this line is located.

**Copyright © 1999 Lucent Technologies** 

Possibilities range from 1 to 192. (For BRI ports, this is the appropriate ISDN BRI D-channel portname. The member should be assigned as described in RLfc_porttyp.)

remote protocol access - pseudo BRI port

If the corresponding RLfc_porttyp tuple has a servclass of TM_P_BRI then this port is an RPA pseudo BRI port. A tuple must exist in the relation RLdn_rdta where RLdn_rdta.gport. module equals RLfc_line.port.module and RLdn_rdta.gport. member equals RLfc_line.port.member. The RLdn_rdta.dn.dn attribute should match this RLfc_line.bill_dn.dn attribute. There will be a corresponding RLrt_dntran tuple; however, tuples will not exist in RLdslequip, RLequipdsl, RLdslgdata, RLpsx25ln, RLdpidb_pt RLdgrp_ri or RLri_dgrp for RPA pseudo BRI ports. There is not a tuple in RLrc_oeinfo for either type of RPA port. Refer to population rules for RLdn_rdta.p.

**Attribute:**
port.member
**Fullname:**
Port member number
**Attribute Description:**
Port member number.

**Attribute:**
port.module
**Fullname:**
Module
**Attribute Description:**
Module where line is located.

**Attribute:**
party
**Fullname:**
User number
**Attribute Description:**
For ISDN lines, which are populated in RLfc_porttyp, and RLfc_porttyp.servclass = FC_ISDN, verify that the bit corresponding to this party value in RLdslequip(port).ptyequip is set. See pop rules for RLdslequip.ptyequip for further information.

Must have the value FCP_INDI if the port is a member of a line side stand-alone announcement multi-line hunt (MLH) group (MLHG) in a module that has the stand alone call processing option, that is, the port points to a MLH group which is local to a module and the parameter GLsalgrp contains that MLH group number.

Copyright © 1999 Lucent Technologies 

For export, party must be FCP_INDI. Multiparty ringing is not supported.

A party line will keep the same port module and member number, therefore this attribute is included as a key to this relation.

If the line uses multi-frequency ringing, then the party attribute defines the ringer configuration (tip-side, ring-side) and frequency (1-5). Refer to the table in DMparty.G for a mapping between 'old' party values and the current ones (this table is reproduced in the retrofit pop rules for 5E4(2) to 5E5 section).

A five-party service line may only be assigned ring-side MFR party values (one to five).

SLC(R) 96 lines may not be assigned tip-side MFR party values or FCMFR_R5. That is, party may take on values one to four only.

For lines on integrated digital carrier unit (IDCU) remote terminals, MFR party may take on values of one to five only.

For service class FC_ISATND and cpetype IS_TYPEATT, party must be marked as FCP_INDI.
For service class FC_MODEM, party must be FCP_INDI.
For service class OA_AQLINE, party must be FCP_INDI.
For service class FC_2WIRE_INDV, party must be FCP_INDI.

**Attribute:**
one_block
**Fullname:**
1+Blocking type
**Attribute Description:**
The one_block attribute is used to determine level of 1+blocking on a line.

**Attribute:**
lport
**Fullname:**
Logical port
**Attribute Description:**
This attribute defines the logical port and is a sequential key administered per SM. It is an RC/ODA assigned value. The lport and lpt_type values are used as key values to access relations such RLis_ilhb, RLis_term, RLtrmfeats and other user associated relations.

All lines (analog, ISDN and plain old digital service [PODS]) and BRCS trunks are assigned lports, although the ISDN and analog lport values will be tracked and assigned separately to conserve

Copyright © 1999 Lucent Technologies 

memory as is currently done with logical termination indexes. In the case of multi-party service, or multipoint BRI, each user will have an associated unique lport/lpt_type value.

The lport attribute values are assigned in new offices so that the assigned numbers are at the low end of the 1-8191 (SM) or 1-65531 (SM-2000) range with no holes. Recent change deletions will create holes in the spectrum of assigned numbers. These holes are recorded in RLrc_lphol or RLrc_alphol (depending on the lpt_type). The lport attribute assignments must be retained across all offline ODA processes.

For default service, the 'lport' is the 'bfgid' instead of a sequentially administered key.

lport = bfgid
lpt_type = LPT_BFG

**Attribute:**
lpt_type
**Fullname:**
Logical port type
**Attribute Description:**
Indicates whether the 'lport' is part of the LPT_ISDN range which includes ISDN (including PODS) and shared analog lines or is part of the LPT_OTHER range which covers unshared analog lines.

If the lpt_type is LPT_BFG, then this tuple is used for a default service BFG and the 'lport' contains the bfgid.

**Attribute:**
screen_x
**Fullname:**
Screening index
**Attribute Description:**
Allows for different billing rates. A coin line is an example of the need for this attribute. This tells the system about a special billing case. This index also allows for routing the calls to the appropriate trunk location. For a servclass of FC_SATSTLN, this should be set to zero and the value obtained from RLrc_lcc should be used to populate the screen_x attribute in RLrtsatln.

**Attribute:**
line_screen
**Fullname:**
Line screen
**Attribute Description:**
The 'line_screen' attribute indicates whether or not a line has any associated toll/code restriction/diversion or wide area telephone service (WATS) band screening. The line_screen bit should be set

Copyright © 1999 Lucent Technologies 

to DBYES if the line has any of these. Note that the 'line_screen' bit for the line class code assigned to this line should agree with this 'line_screen' bit. The default is DBNO.

**Attribute:**
insep
**Fullname:**
Incoming separation class
**Attribute Description:**
Incoming/originating separation class, used by division of revenue. The insep attribute is based on line class code and rate area exchange.

**Attribute:**
desep
**Fullname:**
Destination separations class
**Attribute Description:**
Destination separations class, used by division of revenue. The desep attribute is based on line class code.

**Attribute:**
digtree
**Fullname:**
Digit analysis tree
**Attribute Description:**
Digit analysis table identifier which is used in call processing to tell what table to start at in analyzing the dialed numbers. The relation DA_DIGSTRT contains the table information.

**Attribute:**
nodial
**Fullname:**
No dialing features
**Attribute Description:**
Allows for special no dialing features. Individual regular lines will say NONE and special no dial lines will say DIRCON or MANUAL. DIRCON is handled with the relation FC_DIRCON.

If this attribute has a value of FCND_MANUAL and this line has a terminal group feature associated with it, it is then recommended that the user consult with the population rule for attribute atnd_dn in the pop-rule file RLrt_tg.P

The no dialing feature is not supported for servclass FC_ISDN (nodial=FCND_NONE)

**Copyright © 1999 Lucent Technologies** 

```
if (nodial == FCND_MANUAL) then
begin
        must find no tuple in RLcf_ltm on sm
                (fc_line.port.module)
end

if (nodial == FCND_DIRCON) then
begin
        for every tuple in RLdn_feats on sm(GL_pcrid)
        where (RLdn_feats.lead_module equals module and
               RLdn_feats.ltm_type equals ltm_type and
               RLdn_feats.ltm_idx equals ltm_idx)
        when found
        begin
             for every attribute ftent in
             {RLdn_feats.ftent1..RLdn_feats.ftent6}
             where ((ftent.fid | 0x00) equals ftent.fid)
             when found
             begin
                 must find exactly 1 tuple in RLcf_opts
                 where (RLcf_opts.feat_id equals ftent.fid)
                 when found
                 begin
                     RLcf_opts.fwd_cndtn must_not_be_in
                     {CFN_DBUSY,CFN_DIDLE,CFN_DBSYIDL}
                     RLcf_opts.actvn must_be ACT_NONE
                 end
             end
        end
end

In addition, for international:
Subscriber lines with timed hotline feature are marked THOTLN.
These features are mutually exclusive.  DIRCON and THOTLN
use rlFC_DIRCON to provide the number to direct connect to.
Multiway features may not be assigned to the line which has
nodial say MANUAL.  For service class FC_2WIRE_INDV, nodial must
be FCND_NONE.
```

**Attribute:**

signal

**Fullname:**

Signal mode

**Attribute Description:**

Allows each line to be either 'touch tone/dial pulse' dual mode (DBTT) or 'dial pulse only' mode (DBDP). The symbol for 'touch tone only' mode (DBTO) should not be populated in this relation. If servlcass equals FC_ISDN, signal must be DBDCHAN.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
brc_trm
**Fullname:**
BRCS terminal features boolean
**Attribute Description:**
Specifies whether or not any terminal assignable BRCS features are assigned to this port.

If DBYES, a tuple will exist in RLtrmfeats with keys RLfc_line.lport, RLfc_line.lpt_type, and range equal to zero If more than six terminal features are assigned, additional tuples using range equal to one through four in sequential order will exist.

**Attribute:**
brc_dn
**Fullname:**
BRCS directory number (DN) features boolean
**Attribute Description:**
Specifies whether or not any DN assignable BRCS features are assigned to this primary LT port (DN or MLHG member). If DBYES, a tuple will exist in RLdn_feats with key RLfc_line.port.module, ltm_type, and ltm_idx and range equals zero. If more than six DN features are assigned, additional tuples using range = 1 thru 4 in sequential order will exist.

If fc_porttyp.servclass is FC_ISDN, then brc_dn can not be DBYES unless attribute mca is DBYES.

**Attribute:**
ltm_type
**Fullname:**
Logical termination type
**Attribute Description:**
Logical termination index type.

**Attribute:**
ltm_idx
**Fullname:**
Logical termination index
**Attribute Description:**
Logical termination index. An RC/ODA assigned ltm_idx value. The port.module and ltm_idx values are used as key values lead_module and ltm_idx, respectively to access the relations such as RLis_line, RLshterm, etc. See RLrc_qidx for rules for assigning the value. If ltm_type is equal to LTM_ISDN, RLis_line requires a tuple keyed by lead_module and ltm_idx.

This index is a sequential number assigned to correspond to the primary DN/MLHG member for this port. If a DN exists

**Copyright © 1999 Lucent Technologies** 

(RLfc_line.locdn), then fc_line.ltm_idx = RLrt_dntran.ltm_idx and fc_line.ltm_type is equal to RLrt_dntran.ltm_type. If an MLHG member exists that has a PGGPMAP tuple belonging to this port it is a primary MLHG member and not a secondary-only MLHG member. (The MLHG member is primary when the grpnum and member attributes in the RLpggpmap tuple translate to a primary MLHG member - this is known when RLis_line.primary is DBYES using keys RLis_line.lead_module and RLgroup_port.ltm_idx to access RLis_line. Note: group_port.ltm_type must be LTM_ISDN for IS_LINE to exist.) Then fc_line.ltm_idx is equal to RLgroup_port.ltm_idx and fc_line.ltm_type is equal to RLgroup_port.ltm_type

If both primary DN and MLHG member exist on this line then the ltm_type and ltm_idx values in RLfc_line, RLrt_dntran, RLgroup_port are the same.

Note: Attribute ltm_idx has a domain range of 0-8191 (SM) or 0-65535 (SM-2000). However, 65532-65535 are reserved for RC. Also, 0 is used for PODs lines as described in the following:

```
RLfc_line.brc_dn        = DBNO
RLfc_line.mca           = DBNO
RLfc_line.brc_trm       = DBNO
RLis_line.brc           = DBNO

The ltm_idx value must  be zero.
RLfc_line.ltm_idx       = Zero
RLis_line.ltm_idx       = Zero
RLrt_dntran.ltm_idx     = Zero
```

The existence of an index implies the value one or greater. If no index is defined, RLrc_qidx(ltm_type) would contain an index value of zero and no tuple would exist in this relation. Therefore, ltm_idx must be greater than zero in this relation.

**Attribute:**
mca
**Fullname:**
Multiple call appearance indicator
**Attribute Description:**
Multiple call appearance indicator. Set to DBYES if RLis_term.cpetyp (where RLfc_line.lport is the key to RLis_term) is IS_TYPEA, IS_TYPEB, IS_TYPEC, IS_TYPED, or IS_TYPATT. Otherwise, set to DBNO.

If 'mca' is DBYES, then ltm_type must be LTM_ISDN. For standard (STD) BRI users, 'mca' must be DBYES.

**Attribute:**
privacy
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Privacy indicator

**Attribute Description:**

Indicates whether this port has all-call privacy. If privacy indicator is set to PRIVATE, the LT port information will not be displayed at other terminals. If privacy indicator is set to PUBLIC, the LT port information will be displayed at the other terminals. If the privacy indicator is NOT_SET, the presentation status will depend on the setting of the acp_ind attribute in RLscridxpa or the office privacy parameter, Gldn_priv. Features such as the incoming calling line ID (ICLID) feature and the inspect feature would check the privacy indicator before displaying LT port information.

If the calling party number presentation (CPNP) special feature is active (SFID50 is set), then the default value for the privacy attribute is NOT_SET, otherwise the default value is PUBLIC.

**Attribute:**

mdc_member

**Fullname:**

Message desk center member

**Attribute Description:**

Indicates whether the port is a message desk center member.

DBYES is allowed only if the line is a member of a multi-line hunt group (MLHG) (that is, RLpggpmap has a tuple keyed by RLfc_line.port). If any member of an MLHG has mdc_member equal to DBYES, then all members of the MLHG must have mdc_member equal to DBYES. This means that RLrt_mhg(RLpggpmap(port).portgrp.grpnum).mdc must be DBYES.

DBYES is not allowed for STD BRI or analog shared with STD BRI.

**Attribute:**

threeway

**Fullname:**

Three-way calling

**Attribute Description:**

Three-way calling privileges.

**Attribute:**

flash

**Fullname:**

Flash activated features

**Attribute Description:**

Indicates if there are any flash activated features.

Copyright © 1999 Lucent Technologies 

**Attribute:**
multidn
**Fullname:**
Multiple directory number
**Attribute Description:**
This field is used to indicate that a port has multiple DNs associated with it.
This bit is only used when multiple DNs are strictly associated with a specific port, which in the case of MLHG depends on the hunt type, and the way in which the multiple DN is attached to the MLHG. A multiple DN can be associated with a specific port for a MLHG if, and only if, RT_DNTRAN.ucd_muph does not equal DBYES. Plain old telephone service (POTS) lines can also be assigned multiple DNs.

For service classes FC_ISDN and FC_ATND, if 'multidn' is DBYES, then RLis_line(keys).shared must be DBNO.

**Attribute:**
ani7
**Fullname:**
Automatic number identification (ANI) 7 boolean
**Attribute Description:**
This field is used to indicate ANI7 on the line for outpulsing a 7 to a centralized automatic message accounting (CAMA) or Traffic Service Position System (TSPS) operator for a special operator lookup. If ANI7 treatment is desired on the line the field should be set to DBYES, otherwise DBNO. If servclass is FC_ISDN, 'ani7' is DBNO. If servclass is FC_ISATND, 'ani7' is DBNO.

**Attribute:**
pingring
**Fullname:**
Ping ring
**Attribute Description:**
Indicates if ping ring tone should be given.

**Attribute:**
busy
**Fullname:**
Busy features
**Attribute Description:**
Indicates whether busy features are allowed.

**Attribute:**
busymon
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Busy monitorable

**Attribute Description:**

DBYES enables this port to be monitored by the ISDN attendant (ISAT) consoles associated ISAT group. The following servclasses (as found in FC_PORTTYP) that can be monitored by the BLF indicators. It should be interpreted as the maximum set that can be expected.

If this attribute is set to DBYES, the DN of this port must be reflected in the DN bit of the relations, RLMONI_BLF and RLMASK_BLF, for that particular tuple having the same normalized office code (NOC) and hundreds group. Example:

The directory number (DN) 979-1234 has seven digits. The '979' indicates the office code and the '12' indicates the hundreds group.

Note: The office code is not necessarily the same as the NOC. Refer to RLOfficecode poprules.

Also, this port must have a tuple in the relation, RLRC_OEINFO, with RLrc_oeinfo.att_grp having the value of the ISAT MLHG monitoring this DN. If the line is an MCA line, then RLfc_line.busymon must equal RLis_line.busymon. Refer to the poprules of RLis_line for more detail.

Note: If the DN of this port is a main DN of an MLHG, then this attribute is always DBNO.

Dependency: If DBYES, RLrc_oeinfo(RLfc_line.member, RLfc_line.module, FCP_INDI).att_grp must not be zero.

**Attribute:**

sercomp

**Fullname:**

Series completion

**Attribute Description:**

Indicates if the series completion feature is active.

**Attribute:**

freeterm

**Fullname:**

Free termination

**Attribute Description:**

Usually DBNO except for direct connect and manual lines. DBYES means the port is not billed. For service class OA_AQLINE, freeterm must be DBYES. For secondary only ISDN lines, freeterm must be DBNO. For service class FC_2WIRE_INDV, freeterm must be DBYES.

**Attribute:**

roh

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Receiver off tone
**Attribute Description:**
Receiver off hook tone. Normally set to DBYES. Set to DBNO for direct connect, manual lines and lines connected through a T1 carrier.

**Attribute:**
orig
**Fullname:**
Originator
**Attribute Description:**
Indicates if the customer is allowed to originate. For 911 lines 'orig' is always DBNO. For direct connect and manual lines 'orig' is DBYES. The orig attribute is always DBYES for the following servclass FC_COIN, FC_4PFS,FC_5PTY,FC_8PSS,FC_10PTY, and two-party operator number identification (ONI) lines. Suspend origination on a FC_4PSS line indicates bridged service line.

**Attribute:**
complaint
**Fullname:**
Complaint
**Attribute Description:**
Complaint observing. When complaint is DBYES, an AMA record is generated for every call coming out of the line. Default is DBNO.

**Attribute:**
slus
**Fullname:**
Subscriber line usage study
**Attribute Description:**
Subscribe line usage study.

**Attribute:**
fga
**Fullname:**
Feature group A (FGA)
**Attribute Description:**
Indicates DBYES if the line is a feature group A line, DBNO if it is not. The default is DBNO. FGA lines are either lines to inter-LATA carriers or inter-LATA foreign exchange lines. FGA lines cannot be two, four, eight, or ten-party, manual, coin, charge-a-call, hotel/motel, or ISDN.
FGA lines are allowed to series complete and may be part of an MLHG.

**Attribute:**
optdtail

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Optional detail billing
**Attribute Description:**
Set optdtail to DBYES when a more detailed customer bill needs to be generated. Default is DBNO.

**Attribute:**
traffic
**Fullname:**
Traffic
**Attribute Description:**
Traffic sampling study.

**Attribute:**
denybv
**Fullname:**
Deny busy verification
**Attribute Description:**
Allows RTA to selectively deny busy verification of a line.

**Attribute:**
ffcf22
**Fullname:**
ffcf22
**Attribute Description:**
Field feature bit for future use.

**Attribute:**
cidcw
**Fullname:**
cidcw
**Attribute Description:**
This field is used by Calling Identity Delivery on Call Waiting (CIDCW) Special Feature in 5e9.1 Software Release (SR). The cidcw field will be used to indicate whether CIDCW feature is active (DBYES) or in-active (DBNO). The default value is DBNO.

The CIDCW feature is allowed only on lines with service class of INDIV, 4WINDIV, ATTENDANT or PBX. It is not allowed on a MLHG lines. The cidcw cannot be DBYES unless office has SFID133 set Y (that is, the CIDCW feature is purchased) and the line has BRCS set to Y and Call Waiting Terminating and ICLID CND or CNAM features are assigned to the line.

**Attribute:**
ppm_ind

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Periodic pulse metering indicator
**Attribute Description:**
Not used by U.S. Default to LPNO_PPM.

**Attribute:**
trace
**Fullname:**
Malicious call trace
**Attribute Description:**
Type of malicious call trace that is active.

**Attribute:**
otrace
**Fullname:**
Originating malicious call trace
**Attribute Description:**
Type of originating malicious call trace that is active.

**Attribute:**
epls_pri
**Fullname:**
Emergency priority line service (EPLS) priority level
**Attribute Description:**
EPLS priority level.

**Attribute:**
ac_standing
**Fullname:**
Standing alarm call
**Attribute Description:**
Standing alarm call service.

**Attribute:**
ac_onetime
**Fullname:**
One-time alarm call service
**Attribute Description:**
One-time alarm call service.

**Attribute:**
mach_typ
**Fullname:**
Machine type
**Attribute Description:**
Indicates the presence of machine type equipment on the line. The domain used for this attribute is DMBOOL.

Copyright © 1999 Lucent Technologies 

DBYES indicates machine type equipment on the line, DBNO indicates no machine type equipment. The default is DBNO. DBYES is only possible when the subscriber signaling type applicable to the office (Glsub_sigtyp) equals RCSUBS02.

Note: Not used by U.S. Default to DBNO.

**Attribute:**
carrid
**Fullname:**
Carrier ID
**Attribute Description:**
Indicates the presubscribed carrier for the line. Once it is specified, it must be a valid carrier ID which exists in the RLfc_carr relation. (Note: This value is independent of the mass presubscribed carrier, GLcarrid).

**Attribute:**
pic2
**Fullname:**
Presubscribed intra-LATA-toll carrier ID
**Attribute Description:**
Identifies the presubscribed intra-LATA-toll carrier (PIC2) for the line.

The pic2 must be $NULL_BCARID (default) if the ICLATA SF (SFID 149) is not activated. When the pic2 is set, there must be a valid carrier in RLfc_carr corresponding to the pic2 value.

The presubscribed intra-LATA-toll carrier will be used for ICLATA calls dialed without a carrier identification code (CIC). This value is independent of the mass presubscribed intra-LATA-toll carrier, Glpic2.

Note: pic2 is stored as a binary (DMbcarid), unlike carrid (DMcarrid).

**Attribute:**
plc
**Fullname:**
Presubscribed intra-LATA local carrier ID for an alternate LSP
**Attribute Description:**
This attribute contains the presubscribed intra-LATA local carrier ID for an alternate LSP.

**Attribute:**
pic4

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Presubscribed international carrier ID
**Attribute Description:**
Identifies the presubscribed international carrier ID.

**Attribute:**
ci_dial
**Fullname:**
Carrier dialing status
**Attribute Description:**
Specifies the carrier dialing permissions. The possible values are:
CI_ALLOWED (may dial feature group D carrier access code)
CI_PROHIBITED (cannot dial feature group D carrier access code)
CI_REQUIRED (must dial feature group D carrier access code)
TEST_ALLOW (test call may dial feature group D carrier access code)
TEST_PROHIB (test call cannot dial feature group D carrier access code)
TEST_REQ (test call must dial feature group D carrier access code)
The default is CI_ALLOWED.

**Attribute:**
ln_type
**Fullname:**
Leased network type
**Attribute Description:**
Leased network type.
Must be LN_NULL if this is STD BRI or analog shared with STD BRI.

**Attribute:**
ccv_ind
**Fullname:**
Call charge verification
**Attribute Description:**
DBYES enables call charge verification (CCV). This indicator may only be set if the global parameter Glccvopt is DBYES (default DBNO).
NOTE: Not used by U.S. Default to DBNO.

**Attribute:**
secm_ind
**Fullname:**
Subscriber expensive call monitoring
**Attribute Description:**
DBYES enables the subscriber expensive call monitoring (SECM). This indicator may only be set if the global parameter Glsecmopt is DBYES (default DBNO). Not used by U.S. Default to DBNO.

**Attribute:**
datat

Copyright © 1999 Lucent Technologies 

**Fullname:**
Data terminal indicator
**Attribute Description:**
Not used by U.S. Default to DBNO.

**Attribute:**
dn_bfg
**Fullname:**
DN feature type BRCS feature group (BFG)
**Attribute Description:**
DN/member feature type BFG. Set to DBYES, if there exist RLdn_feats tuple with bfgid assigned as one of the keys.

**Attribute:**
trmbfg
**Fullname:**
Terminal feature type BFG
**Attribute Description:**
Terminal feature type BFG.
Set to DBYES, if there exist RLtrmfeats tuple with bfgid assigned as one of the keys.

**Attribute:**
bfgid
**Fullname:**
BRCS feature group ID
**Attribute Description:**
Identifier for the BRCS feature group.

**Attribute:**
cfv_on
**Fullname:**
Call forwarding variable (CFV) activation
**Attribute Description:**
Activation status bit for circuit switched voice (CSV) CFV or circuit switched data (CSD) CFV feature. If the terminal is assigned to a BFG with CSV CFV or CSD CFV feature, this bit is used by call processing to determine its activation status.

**Attribute:**
cfbl_on
**Fullname:**
Call forwarding busy line active
**Attribute Description:**
Activation status bit for CSV CFBL or CSD CFBL feature.
If the terminal is assigned to a BFG with CSV CFBL or CSD CFBL feature, this bit is used by call processing to determine its activation status.

Copyright © 1999 Lucent Technologies 

**Attribute:**
cfda_on
**Fullname:**
Call forwarding don't answer active
**Attribute Description:**
Activation status bit for CSV CFDA or CSD CFDA feature.
If the terminal is assigned to a BFG with CSV CFDA or CSD CFDA feature, this bit is used by call processing to determine its activation status.

**Attribute:**
disp_on
**Fullname:**
Display (DIS) active
**Attribute Description:**
Activation status bit for DIS feature. If the terminal is assigned to a BFG with DIS feature, this bit is used by call processing to determine its activation status.

### 5. FC_LINE Population rules continued.

**Attribute:**
cwo_on
**Fullname:**
Call waiting (CW) activation
**Attribute Description:**
Call waiting.

**Attribute:**
cwt_on
**Fullname:**
Call waiting
**Attribute Description:**
Activation status bit for CW feature. If the terminal is assigned to a BFG with CW feature, this bit is used by call processing to determine its activation status.

**Attribute:**
cnd_on
**Fullname:**
Call number delivery (CND) activation
**Attribute Description:**
Activation status bit for calling number delivery feature. If the terminal is assigned to a BFG with CND feature, this bit is used by call processing to determine its activation status. If this bit is set to DBYES, the terminal is active.

Copyright © 1999 Lucent Technologies 

**Attribute:**
cpnbn_on
**Fullname:**
Calling party number (CPN)/billing number (BN) activation
**Attribute Description:**
Activation status bit for CPN/BN feature. If the terminal is assigned to a BFG with CPN/BN feature, this bit is used by call processing to determine its activation status. This attribute must be set to DBYES when the CPN/BN feature is activated (on) for the directory number. This attribute must be set to DBNO when the CPN/BN feature is deactivated (off). This attribute is used when the BFG is assigned to analog lines.

**Attribute:**
asi_im_on
**Fullname:**
Advanced service interface (ASI) implicit mode active toggle (changeable via the customer oriented recent change [CORC])
**Attribute Description:**
Activation status bit for the implicit mode of ASI. If the terminal is assigned to a BFG with an implicit ASI feature, this bit is used by call processing to determine its activation status. This attribute must be set to DBYES when the implicit ASI feature is activated (on) for the directory number. This attribute must be set to DBNO when the implicit ASI feature is deactivated (off). This attribute is used when the BFG is assigned to analog lines.

**Attribute:**
bfg_asi
**Fullname:**
Advanced service interface BFG feature
**Attribute Description:**
Locator of ASI parameter tuple, utilized when 'bfgid' is not zero, and an ASI feature exists in the RLtrmfeats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find ASI parameter via pseudo port key).

**Attribute:**
bfg_ars
**Fullname:**
Auto route selection (ARS)
**Attribute Description:**
Locator of ARS parameter tuple, utilized when 'bfgid' is not zero, and an ARS feature exists in the RLtrmfeats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find ars parameter via port key).

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
bfg_puo
**Fullname:**
Pick up originating (PUO) BFG feature
**Attribute Description:**
Locator of PUO parameter tuple, utilized when 'bfgid' is not zero, and a PUO feature exists in the RLtrmfeats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find ars parameter via port key).

**Attribute:**
bfg_put
**Fullname:**
Pick up terminating (PUT) BFG feature
**Attribute Description:**
Locator of PUT parameter tuple, utilized when 'bfgid' is not zero, and a PUT feature exists in the RLdn_feats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find ars parameter via port key).

**Attribute:**
bfg_eds
**Fullname:**
Electronic directory service (EDS) BFG feature
**Attribute Description:**
Locator of EDS parameter tuple, utilized when 'bfgid' is not zero, and an EDS feature exists in the RLdn_feats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find ars parameter via port key).

**Attribute:**
bfg_idp
**Fullname:**
Individualized dialing plan (IDP) BFG feature
**Attribute Description:**
Locator of IDP parameter tuple, utilized when 'bfgid' is not zero, and an IDP feature exists in the RLtrmfeats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find ars parameter via port key).

**Attribute:**
mfri
**Fullname:**
Multi-frequency (MF) ringing individual
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute indicates if this is multi-frequency ringing individual. The attribute is only used for analog ports with a service class of 'individual' (FC_INDVDL).

**Attribute:**
ar_alw
**Fullname:**
Auto recall (AR) allowed
**Attribute Description:**
Local area signaling service (LASS) automatic recall allow indicator. Set to DBNO if the customer specifically wants access denied to this feature because of service class code restrictions. If this is not the case, the value is DBYES indicating the customer is allowed access to the feature. If a user subscribes to this feature, RC will automatically set this bit to DBYES. The following service class codes will allow the customer to access the LASS AR feature: FC_INDVDL, FC_ATTENDANT, FC_ISDN, FC_ISATND, FC_4WIRE_INDV, FC_PBX.

The LASS AR generally available feature will not be allowed on part IV terminals defined in the 5E4 BRI specification. For PODS terminals, RLfc_line.ltm_idx equals zero.

Use of AR on CSD calls is only allowed for STD BRI users. RC/ODA will block subscription of LASS AR constructed features by users' other than standard BRIs. When a generally available LASS AR feature supports CSD calls call processing code will block its use by users other than STD BRIs.

**Attribute:**
ac_alw
**Fullname:**
Auto callback (AC) allowed
**Attribute Description:**
LASS automatic callback allow indicator. Set to DBNO if the customer specifically wants access denied to this feature or because of service class code restrictions. If this is not the case, the value is DBYES indicating the customer is allowed access to the feature. If a user subscribes to this feature, RC will automatically set this bit to DBYES. This bit is not looked at by feature control (FC) if the feature is offered on a subscription basis. The following service class codes will allow the customer to access the LASS AC feature:

FC_INDVDL, FC_ATTENDANT, FC_ISDN, FC_ISATND, FC_4WIRE_INDV, FC_PBX

The LASS AC generally available feature will not be allowed on part IV terminals defined in the 5E4 BRI specification. These terminals (PODS) have the following characteristic: RLfc_line.ltm_idx equals zero.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
cot_alw
**Fullname:**
Customer originated trace (COT) allowed
**Attribute Description:**
Customer originated trace allow indicator. Set to DBNO if the customer specifically wants access denied to this feature or because of service class code restrictions. If this is not the case, the value is DBYES. When COT is offered on a generally available basis, FC code will look at this bit to determine if access to the COT feature is allowed (DBYES) or not allowed (DBNO). When COT is offered on a subscription basis, FC will not look at this bit. However, if a user subscribes to this feature, RC will automatically set this bit to DBYES so that Audits and RTA can look at this bit in order to save work in determining whether or not there should be an associated incoming line history block (ILHB) tuple. The following service class codes will allow the customer to access the COT feature:
FC_INDVDL, FC_ATTENDANT, FC_ISDN, FC_ISATND, FC_4WIRE_INDV, FC_PBX

**Attribute:**
ffcf19
**Fullname:**
ffcf19
**Attribute Description:**
Field feature bit for future use.

**Attribute:**
ffcf20
**Fullname:**
Unsigned 8 reserved for future field feature use
**Attribute Description:**
Not assigned yet.

**Attribute:**
ffcf21
**Fullname:**
Unsigned 6 reserved for future field feature use
**Attribute Description:**
Not assigned yet.

**Attribute:**
pcp_alw
**Fullname:**
Per-call privacy (PCP)

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

Per-call privacy allow indicator. Set to DBNO if the customer specifically wants access denied to this feature or because of service class code restrictions. If this is not the case, the value is DBYES indicating the customer is allowed access to the feature. If a user subscribes to this feature, RC will automatically set this bit to DBYES. This bit is not looked at by FC if the feature is offered on a subscription basis. The following service class codes will allow the customer to access the incoming line call identification (ICLID) PCP feature:

FC_ATTENDANT, FC_INDVDL, FC_4WIRE_INDV, FC_ISDN, FC_ISATND, FC_911, FC_SATSTLN, TM_CALLBK, FC_PBX.

Note: The following service class codes will allow the customer to access the ICLID PCP feature only if the calling party number presentation (CPNP) special feature is active (SFID50 is set):

FC_TWOPTY,FC_HOTMOTL,FC_COIN,FC_2PTY. FC_CHGACALL, PBXHOTMOT

If the CPNP special feature is not active (SFID50 is not set), pcp_alw must be set to DBNO.

The LASS ICLID PCP generally available feature will not be allowed on part IV terminals defined in the 5E4 BRI specification.

**Attribute:**

intercept

**Fullname:**

Intercept

**Attribute Description:**

This bit indicates that the DN associated with this 'user' has been placed on intercept. Intercept basically denies the user origination and termination capabilities. It can be determined from the termclass in RLrt_dntran (termclass equals RTTC_AGING).

**Attribute:**

bfg_sc1

**Fullname:**

One-digit speed calling (SC) parameter

**Attribute Description:**

Locator of SC parameter tuple, utilized when bfgid is not zero, and an one-digit SC feature exists in the RLtrmfeats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find sc1 parameter via port key).

Copyright © 1999 Lucent Technologies 

**Attribute:**
bfg_sc2
**Fullname:**
Two-digit speed calling parameter
**Attribute Description:**
Locator of SC parameter tuple, utilized when bfgid is not zero, and an two-digit SC feature exists in the RLtrmfeats tuple which corresponds to the bfgid assigned to this terminal.

DBYES (find sc1 parameter via port key).

**Attribute:**
lsf_sub
**Fullname:**
LASS selective feature subscription boolean
**Attribute Description:**
Set this field to DBYES if at least one of the DNs associated with this terminal (where this terminal is the lead terminal of associated DNs), including MLHG DNs, is subscribed to any of the 5E6 LASS features: selective call rejection (SCR), selective call acceptance (SCA), computer access restriction (CAR), selective call forwarding (SCF) and selective distinctive alert (SDA).

The RC/V should set this field to DBYES if 'lsf_cnt' in the associated RC_OEINFO is non-zero.

The RC/V should reset this field to DBNO if no more LASS features are assigned to any of DNs associated with this terminal (lsf_cnt equals zero).

This field is used to determine whether there needs to be an associated ILHB because of subscription to the 5E6 LASS features. If this field is set to DBYES, the audits and RTA should make sure of existence of a corresponding ILHB.

The allocation of the ILHB through general availability of 5E6 LASS features is covered by allow/deny fields: scr_gen_alw, sca_gen_alw, scf_gen_alw and sda_gen_alw.

**Attribute:**
scr_on
**Fullname:**
Selective call rejection active
**Attribute Description:**
This field indicates whether the feature is active (DBYES) for all analog lines whose 'ltm_type' is equal to LTM_OTHER. (Note: The 'ltm_type' of shared analog lines is LTM_ISDN.)

Through RC/V or CORC, the feature can be activated or deactivated by setting this field to either

**Copyright © 1999 Lucent Technologies** 

DBYES or DBNO respectively.
For those lines which have a corresponding tuple in
RLltsbport, this attribute is only be maintained on
the main(lead) port of line time slot bridging lines
(LTSB). The value of this attribute on an associated
non-lead port is a `don't care'.

ODA must set this field to DBNO for new start offices.

Activation conditions:
---

A feature will not be activated unless
1. there is at least one DN stored in the screen list.
2. Remote telephone number (RTN) or forward-to-DN is defined for SCF and SCA/CAR.
3. Non-acceptance termination treatment (NAT) is defined for SCA/CAR.
   If NAT is defined as NAT_RCRD, RTN is not required to be populated.
4. For the subscription case, the master switch in DN_FEATS is on (DBYES).

For individual DNs (non-MLHG DNs) or no-hunt DNs
of MLHG members, this is the only field to be updated
in order to activate or de-activate the feature.
The active field in DN_FEATS (for subscription case)
will not be updated.

Multi-line hunt group:
---

If this is the member one of an MLHG, the feature status of the
MLHG, 'scr_on' in MHG_CF relation, should be updated when this field,
'scr_on', or/and the master switch, 'mastsw', in DN_FEATS is (are)
changed.

The truth table is:

| FC_LINE scr_on | DN_FEATS mastersw | MHG_CF scr_on |
|---|---|---|
| DBNO | DBNO | DBNO |
| DBYES | DBNO | DBNO |
| DBNO | DBYES | DBNO |
| DBYES | DBYES | DBYES |

**Attribute:**
scf_on
**Fullname:**
Selective call forwarding active
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

Selective call forwarding active. See the scr_on description.

**Attribute:**
sca_on
**Fullname:**
Selective call acceptance active
**Attribute Description:**
Selective call acceptance active. See the scr_on description.

**Attribute:**
sda_on
**Fullname:**
Selective distinctive alerting active
**Attribute Description:**
Selective distinctive alerting active. See the scr_on description.

**Attribute:**
scr_gen_alw
**Fullname:**
SCR through general availability
**Attribute Description:**
This field does not have any impact on subscription
but indicates whether a customer is allowed access
to the LASS SCR feature through the general availability.

This field should be set to DBYES unless a customer
specifically wants access to be denied to this
feature or service class code restricts the access.
This field is also used to populate a dynamic data
structure, ILHB. If this allow field is set to DBYES
and the office access parameter, Glscrac, is equal
to GEN_AVAIL, an ILHB tuple should be populated.
When the RC/V updates this field, the FC_LINE trigger
function RTtrfcline() should check whether an ILHB needs
to be populated or removed.

MLHG is not allowed to access the feature through
GEN_AVAIL. The 'alw' field does not affect MLHG.

Only the following service class codes are
allowed to access:

FC_INDVDL, FC_ISDN, FC_4WIRE_INDV, FC_PBX

The 5E6 LASS selective features will not be allowed on part IV
terminals defined in the 5E4 BRI specification through
generally available.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

scf_gen_alw

**Fullname:**

SCF through general availability

**Attribute Description:**

This bit indicates whether a customer is allowed to access to the LASS SCF feature through the general availability. See the scr_gen_alw description. Only the following service class codes are allowed to access:

FC_INDVDL, FC_ISDN, FC_4WIRE_INDV, FC_PBX

The 5E6 LASS selective features will not be allowed on part IV terminals defined in the 5E4 BRI specification through generally available.

**Attribute:**

sca_gen_alw

**Fullname:**

SCA through general availability

**Attribute Description:**

This bit indicates whether a customer is allowed to access to the LASS SCA feature through the general availability. See the scr_gen_alw description.

Only the following service class codes are allowed to access:

FC_INDVDL, FC_ISDN, FC_4WIRE_INDV, FC_PBX

The 5E6 LASS selective features will not be allowed on part IV terminals defined in the 5E4 BRI specification through generally available.

**Attribute:**

sda_gen_alw

**Fullname:**

SDA through general availability

**Attribute Description:**

This bit indicates whether a customer is allowed to access to the LASS SDA feature through the general availability. See the scr_gen_alw description.

Only the following service class codes are allowed to access:

FC_INDVDL, FC_ISDN, FC_PBX

Service class FC_4WIRE_INDV is not allowed to access SDA feature.

Copyright © 1999 Lucent Technologies 

The 5E6 LASS selective features will not be allowed on part IV terminals defined in the 5E4 BRI specification through generally available.

**Attribute:**
ls_alt_lang
**Fullname:**
Alternate Language LASS Announcement Capability.

**Attribute Description:**
Provided the user has access to the LASS features using SLE and TWO LEVEL:
When set to DBNO(default) it means the user has access to announcements in the main language.
When set to DBYES it means the user has access to announcements in the alternate language.

This attribute should not be set to DBYES if the corresponding special feature SFID119 is not active.

**Attribute:**
tgsr_on
**Fullname:**
Terminal group station restriction active on BFG
**Attribute Description:**
When an unshared analog user has its terminal group station restriction feature in a BFG, this attribute indicates whether TGSR is active or inactive.

**Attribute:**
locdn
**Fullname:**
Location directory number
**Attribute Description:**
NOC and local digits. Each port should have its corresponding NOC and local digits as populated in RLRT_DNTRAN.
For those members of a MLHG that do not have individual directory numbers assigned, populate the locdn as zero.

**Attribute:**
locdn.noc
**Fullname:**
Normalized office code
**Attribute Description:**
Normalized office code.

**Attribute:**
locdn.digits

Copyright © 1999 Lucent Technologies 

**Fullname:**
Digits
**Attribute Description:**
Digits.

**Attribute:**
bill_dn
**Fullname:**
Billing directory number
**Attribute Description:**
If a 'bill_dn' is specified, default to full DN equivalent of bill_dn. If 'locdn' is present default to 'locdn'. If there is a non-lead member of a regular or circular hunt group, default to full DN equivalent of the 'locdn'; however if there is a lead member, default to full DN equivalent of group DN. If there is a member of a uniform call distribution group, default to full DN equivalent of member's 'locdn' if known, otherwise default to full DN equivalent of group DN. If there is a member of an MLGH, default to full DN equivalent of subgroup TN corresponding to that member. If the member is a ISAT hunt group, default to the full equivalent subgroup TN for ISAT subgroup TN 1 (this subgroup must always exist).

A default service tuple has a bill_dn specified by the RLbfgmatch.bill_dn field. Refer to the application specific population rules for more details.

**Attribute:**
bill_dn.digcnt
**Fullname:**
Digit count
**Attribute Description:**
Digit count.

**Attribute:**
bill_dn.dn
**Fullname:**
Directory number
**Attribute Description:**
Directory Number.

**Attribute:**
erco_asgn
**Fullname:**
Executive ringer cutoff (ERCO) assigned
**Attribute Description:**
This attribute will be set to DBYES if the feature ERCO has been assigned.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
erco_act
**Fullname:**
Executive ringer cutoff active
**Attribute Description:**
Activation status bit for ERCO. This bit is used by call processing to determine its activation status. If this bit is set to DBYES, then ERCO is active.

The erco_asgn and erco_act attributes will be used to determine the value of the attribute erco_on in the RLtedb relation.

**Attribute:**
britl_alw
**Fullname:**
BRI test line originations allowed
**Attribute Description:**
This bit indicates whether or not the end customer is allowed to originate calls to the BRI dial up test line. DBYES indicates that originations are allowed. DBYES is not allowed on standard BRI.

**Attribute:**
ffcf4
**Fullname:**
Future field feature
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
ffcf5
**Fullname:**
Future field feature
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
ffcf6
**Fullname:**
Future field feature
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
mcld_ov
**Fullname:**
Modified calling line disconnect (MCLD) override

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Indicates if the modified calling line disconnect special feature should be overridden. The MCLD feature is activated via an office parameter using the transparency feature optioning system, RCFOP009. If active, permanent signal treatment is given to an originating line when it remains offhook after the called line has gone onhook. When this attribute is set to DBYES, the originator will not receive permanent signal treatment but will eventually return to dialtone after the called line goes onhook.

If the MCLD feature is not activated via TFOS, this attribute will be ignored. Therefore, without the MCLD feature active or with this attribute set to DBYES, the originator will eventually return to dialtone after the called line goes onhook.

This feature does not apply to ISDN, shared analog, coin, direct connect or manual lines. Due to serious retrofit issues, however, checks will not be implemented through RC/V to insure this attribute is correct for ISDN, shared analog, direct connect, manual or coin. Rather, call processing code will ignore the value of this attribute.

**Attribute:**
scd_scrn
**Fullname:**
Selective carrier denial (SCD) screening
**Attribute Description:**
Set to DBYES if at least one carrier has requested SCD screening for this line.

**Attribute:**
ffcf10
**Fullname:**
Future field feature
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
clss
**Fullname:**
Calling line side supervision (CLSS)
**Attribute Description:**
Set to DBYES if line subscribes to CLSS feature. BRCS features are not allowed if a line subscribes to CLSS. Only the service classes FC_INDVDL, FC_PBX, and PBXHOTMOT are allowed. CLSS cannot be DBYES unless office has SFID063 set.

**Attribute:**

Copyright © 1999 Lucent Technologies 

ucr

**Fullname:**

Unidentified call rejection (UCR) for analog lines

**Attribute Description:**

UCR is a custom calling feature used to reject calls when the calling party requests that privacy is displayed to the called party. This feature is for analog users only and although not all analog users have display capabilities, it deters callers from attempting to reach a called party with privacy. When this field is set to DBYES, incoming calls requesting privacy will be rejected. When set to DBNO, normal call processing occurs, that is, privacy is displayed at the called terminal.

If SFID47 is not set, then 'ucr' must equal DBNO.

**Attribute:**

ucr_on

**Fullname:**

Unidentified call rejection toggle (changeable via CORC)

**Attribute Description:**

The ucr_on attribute is used by the customer to activate and deactivate the UCR feature. This attribute is also supported by Recent Change. Initial offices will populate the ucr_on attribute with a DBNO. The ucr_on value is maintained over retrofits when the 'ucr' attribute is DBYES. Otherwise, the ucr_on attribute must be set to DBNO during a retrofit.

**Attribute:**

dr_ldc

**Fullname:**

Distinctive ringing for long distance calls

**Attribute Description:**

Used to activate distinctive ringing for long distance calls.

If SFID091 is not set, then 'dr_ldc' must equal DBNO.

**Attribute:**

ustwc_alw

**Fullname:**

Usage sensitive three-way calling (USTWC) allowed

**Attribute Description:**

This boolean is used to indicate that USTWC is allowed/denied on this line. A value of DBYES indicates that this feature is allowed on this line. The default is DBYES. This feature is only valid on lines with a servclass of FC_INDVDL, FC_PBX and FC_4WIRE_INDV. It is not valid on lines with CLSS or direct connect or manual lines. It is also not valid on shared analog lines. All lines that USTWC is invalid should have a value of DBNO.

Copyright © 1999 Lucent Technologies 

Three global parameters are used along with this attribute
to determine if USTWC is active and what AMA records to
generate. They are Glustwcama, Glustwcchrg and Glustwcfid.
These are used to determine if AMA activation records are
generated, AMA charge records are generated and if the feature
is available.
The spontaneous version of USTWC changed the meaning of
the ustwc_alw bit.
The default is still DBYES.

The 8.1 RC view is used to define the availability of
the SP USTWC feature, which is reflected in the values
populated in the Glustwcac global parameter.

If Glustwcac == SP_UNAVAIL, the ustwc_alw bit is defining the
on/off status of the Access Code version of USTWC.
DBNO is off, DBYES is on.

If Glustwcac == SP_GENAVAIL the ustwc_alw bit is defining the
on/off status of the Spontaneous version of USTWC.
DBNO is off, DBYES is on.

**Attribute:**

ustwc_subscr

**Fullname:**

Spontaneous Usage sensitive three-way calling (USTWC) allowed for
subscribers only.

**Attribute Description:**

This boolean is used to indicate that Spontaneous USTWC is
allowed/denied on this line.

The default is DBNO, the feature is not allowed.

This feature is similar to the access code version of USTWC
defined previously by the ustwc_alw bit. The difference is
that no access code is required to use the feature.

The ustwc_subscr bit is only meaningful when
the 8.1 RC view has been used to set the availability of
the SP USTWC feature to SUBSCR,
which causes global parameter Glustwcac to be set to SP_SUBSCR.

If Glustwcac == SP_SUBSCR and ustwc_subscr == DBYES, the
Spontaneous Usage Sensitive 3-Way Calling feature is
available to this line.

If Glustwcac == SP_SUBSCR and ustwc_subscr == DBNO, the
Spontaneous Usage Sensitive 3-Way Calling feature is
NOT available to this line.

This feature is only valid on lines with a
servclass of FC_INDVDL, FC_PBX and FC_4WIRE_INDV. It is
not valid on lines with CLSS or direct connect or manual

Copyright © 1999 Lucent Technologies 

lines.
All lines where USTWC is invalid should have a value of DBNO.
If a user flashes to use this feature, the multiway feature id stored in global parameter Glustwcfid is the feature used.

Global parameters Glustwcama and Glustwcchrg are used to determine if AMA activation records and AMA charge records are generated.

**Attribute:**
lata
**Fullname:**
Local Access Transport Area
**Attribute Description:**
Used by the "TCAP (Transaction Capabilities Application Part) Improvements for a Switch Spanning Multiple LATAs" feature. A group of lines, based on line class code (LCC), may reside in a different lata than the office lata.

**Attribute:**
tsmed
**Fullname:**
Telephone Status Monitor and Select (TSM) monitored terminal
**Attribute Description:**
Indicates if this port is being monitored by TSM. It is populated for ISDN as well as analog lines.

**Attribute:**
ovr_dny_xfer
**Fullname:**
Override Deny Transfer
**Attribute Description:**
This attribute indicates that any transfer denials provisioned by the Deny Transfer of Digit Screened Calls feature will be overridden and thus allow the transfer on this line. If this attribute is set to DBYES, all transfers are allowed regardless of whether the digit strings are marked as "denied" or not.

**Attribute:**
o_bltrig_inh
**Fullname:**
Originating Busy Line Trigger Inhibit
**Attribute Description:**
This attribute will be used to indicate whether or not to inhibit the office Originating Busy Line Trigger. Default for this attribute is DBNO. When set to DBYES, the busy line trigger will be inhibited for this line. This attribute is secured by SFID #210.
This functionality was provided by ffcf11 in 5e11.

Copyright © 1999 Lucent Technologies 

**Attribute:**
o_natrig_inh
**Fullname:**
Originating No Answer Trigger Inhibit
**Attribute Description:**
This attribute will be used to indicate whether or not to inhibit the office Originating No Answer Trigger. Default for this attribute is DBNO. When set to DBYES, the no answer trigger will be inhibited for this line. This attribute is secured by SFID #210.
This functionality was provided by ffcf12 in 5e11.

**Attribute:**
tmalit_ihb
**Fullname:**
Automatic line insulation testing inhibit.
**Attribute Description:**
Indicates if automatic line insulation testing (ALIT)
is to be inhibited on this line.

For fiber to the Home RTs (only supported on IDUC),
ALIT is always inhibited.

**Attribute:**
tmslim_ihb
**Fullname:**
Subscriber line and instrument measurements inhibit.
**Attribute Description:**
Indicates if Subscriber line and instrument measurements (SLIM)
are to be inhibited on this line.

For fiber to the Home RTs (only supported on IDCU),
SLIM is always inhibited.

## 6. FC_LINE Population rules continued.

**Attribute:**
ported

**Fullname:**
ported indicator
**Attribute Description:**
This attribute indicates if the line associated with this tuple is individually ported by the Number Portability feature. However, if the line is in either a Multiline Hunt Group (MLHG) or a Terminal Group (TG), then the group ported indicator takes precedence over the individual ported indicator. The indicator that will be used (either the individual or the group ported indicator) will be determined by call processing.

**Attribute:**
unbundled
**Fullname:**
Network/LEC indicator, for calls to complete to an alternate LSP platform.
**Attribute Description:**
When unbundled = DBYES, (None/1)+ 7/10 digit intra-LATA local calls route using presubscribed local carrier (PLC) information. If PLC routing information is not populated, route via the LEC. When unbundled = DBNO, (None/1)+ 7/10 digit intra-LATA local calls always route via the LEC.

**Attribute:**
ctxid
**Fullname:**
Context Identifier
**Attribute Description:**
This attribute indicates if the line associated with this tuple is unbundled or resold. A line is unbundled if ctxid = CTXID_UNBNLD; it is resold if ctxid = CTXID_RESOLD.

**Attribute:**
caseindex
**Fullname:**
Case Index
**Attribute Description:**
Index into the CALEA cases

**Attribute:**
inhibit_del
**Fullname:**
Inhibit Deletion
**Attribute Description:**
inhibit deletion of line. If inhibit_del is DBYES, deletion through RC will be inhibited. See rc-oda-rules section.

## 4. Population Rules for RLfc_opertrk

**Relation Description** Feature Data for Operator Trunks
This relation contains the information associated with operator trunks.

Special Rule:
If rt_trkg.type is RAF then ret_aud must be blank or N, intersig must be blank, free must be blank or N, initret must be blank or N, finalret must be blank or N, tsps_type must be blank.

**Attribute: port**

**Fullname:** Logical Port

**Attribute Description** This attribute defines the trunk member port and switching module.

Copyright © 1999 Lucent Technologies

**Attribute: port.member**

**Fullname:** Operator port trunk group member identifier

**Attribute Description** Member is the port name of the trunk.

**Attribute: port.module**

**Fullname:** Operator port switching module identifier

**Attribute Description** This attribute refers to the SM Module in which this trunk is located.

**Attribute: outpuls**

**Fullname:** Outpulsing

**Attribute Description** If Outpulsing is required then DBYES should be used, otherwise if Outpulsing is NOT required then DBNO should be used.

***NOTE:*** Following servclass are assigned this value.

```
If servclass is TSPS    then outpuls = DBYES or DBNO
If servclass is RECCMPL then outpuls = DBNO
If servclass is AIS     then outpuls = DBYES
If servclass is SRVTRNK then outpuls = DBNO
If servclass is CAMA    then outpuls = DBYES
```

**Attribute: ret_aud**

**Fullname:** Return Audible Ringing

**Attribute Description** If Audible Ringing should be returned to the operator trunk then DBYES should be entered, otherwise if Audible Ringing is not to be returned to the operator trunk DBNO should be entered.

***NOTE:*** Following servclass are assigned this value.

```
If servclass is TSPS    then ret_aud = DBYES or DBNO
If servclass is RECCMPL then ret_aud = DBYES
If servclass is AIS     then ret_aud = DBYES or DBNO
If servclass is SRVTRNK then ret_aud = DBNO (DBYES if
          service trunk terminates at a switchboard).
If servclass is CAMA    then ret_aud = (no rule found)
```

**Attribute: intersig**

**Fullname:** Interoffice Signal Type for an Operator Trunk

**Attribute Description** There are four valid signal types:

FCNO_SIG - - the trunk does not signal In this case the control is given to operator trunk termination talk.

FCWINKONLY - - wink only signaling provides ringback signal on non-Coin Operator Trunks.

FCINBAND - - Regular Inband Signaling provides coin collect, coin return, and ringback signals from an operator system to a local switching system.

FCEXINBND - - Expanded Inband Signaling provides coin collect,coin return, ringback, and operator attached and operator released signals from an operator system to a local switching system.

**Copyright © 1999 Lucent Technologies** 

***NOTE:*** Following servclass are assigned this value.

```
If servclass is TSPS    then intersig must_be_in
     {FCNO_SIG,FCINBAND,FCEXINBND,FCWINKONLY}
If servclass is RECCMPL then intersig must_be_in
     {FCINBAND,FCEXINBND,FCWINKONLY}
If servclass is AIS     then intersig = FCNO_SIG
If servclass is SRVTRNK then intersig = FCNO_SIG
If servclass is CAMA    then intersig = FCNO_SIG
```

**Attribute: tsps_type**

**Fullname:** Traffic Service Position System Type for an Operator Trunk

**Attribute Description** This attribute indicates TSPS traffic types. There are four valid traffic types:

FCTS_SUPERCOM - - Combines all Call Types (0+,1+, 0-) in a single Trunk Group. For both Coin and Non-Coin Traffic.

FCTS_DACHARG - - DA (Directory Assistance)charge, for ANI (Automatic number identification information) is used to identify the called number and the billing number of calling party. Billing number is the identification code which identifies the service class of the calling party to the TSPS.

FCTS_COMBINED - - Combines all Call Types (0+,1+, 0-) but has separate Trunk Groups for Coin and Non-Coin Traffic.

```
0+, 0-  - Coin only to TSPS.
0+, 0-  - Non-Coin only to TSPS.
```

FCTS_NULL - - Null case.

***NOTE:*** Following servclass are assigned this value.

```
If servclass is TSPS  then tsps_type is_in
{FCTS_NULL,FCTS_SUPERCOM,FCTS_COMBINED,FCTS_DACHARG}
```

**Attribute: free**

**Fullname:** Free Termination for an Operator Trunk

**Attribute Description** Free termination are calls that are free over this trunk. An entry is permitted only for Outgoing Trunk Groups which have coin origination and terminates at an operator.

```
DBYES in this field, for coin originated traffic, will
      initiate coin return.
0+,0-, and 911 origination should be free termination to TSPS.

DBNO  in this field is used for shared trunk groups where traffic
      is both coin and non-coin, and a billing record is desired
      for the non-coin traffic, then this entry should be DBNO.
      Coins in this case are returned by defining a code index for
      free coin calls on the RAR form (5301 record) RC/V 10.10.
```

***NOTE:*** Following servclass are assigned this value.

```
      If servclass is_in {TSPS,RECCMPL,AIS,SRVTRNK or CAMA} then t
he
      attribute free requires a value of DBYES or DBNO.
```

**Attribute: initret**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Initial Coin Return

**Attribute Description** Coin return or retention should be specified for trunk group. It is used to determine if the initial deposit is to be returned or retained on (such as, certain operator system calls). If set to DBYES then deposit is return. If set to DBNO then deposit is retained.

***NOTE:*** Following servclass are assigned this value.

```
If servclass is TSPS    then initret = DBYES or DBNO
If servclass is RECCMPL then initret = DBYES or DBNO
If servclass is AIS     then initret = DBNO (or enter blank)
If servclass is SRVTRNK then initret = DBNO (or enter blank)
If servclass is CAMA    then initret = DBNO (or enter blank)
```

**Attribute: finalret**

**Fullname:** Final Coin Return

**Attribute Description** Are coin calls over this trunk allowed final coin return. If Final Coins are to be returned enter a DBYES; Otherwise enter DBNO.

***NOTE:*** Following servclass are assigned this value.

```
If servclass is TSPS    then finalret = DBYES or DBNO
If servclass is RECCMPL then finalret = DBYES or DBNO
If servclass is AIS     then finalret = DBNO (or enter blank
)
If servclass is SRVTRNK then finalret = DBNO (or enter blank
)
If servclass is CAMA    then finalret = DBNO (or enter blank
)
```

## 4. Population rules for RLfc_oprtk

**Copyright © 1999 Lucent Technologies** 

**Relation Description**

Operator trunks

This relation contains information related to operator trunks for the Operator Services Position System (OSPS) feature.

**Attribute:**

tgroup

**Fullname:**

Trunk group number

**Attribute Description:**

For every entry here, there must be an entry in RLrctgrprk which has a trunk class equal to FC_ISPOPR, FC_AISOA, FC_PF, FC_OPR_DIOR, FC_LTOLL_CONN, FC_TTOLL_CONN, FC_PRI_INTOLL, and FC_SEC_INTOLL. These are incoming and outgoing trunk groups. If the trunk class is not one of the previous, the trunk group must be used for toll and assistance (T&A) listing services (LSs).

**Attribute:**

traf_type

**Fullname:**

Traffic type

**Attribute Description:**

There are seven valid traffic types:

OA4D0_DED - Dedicated dial zero traffic.
OA4D0P_DED - Dedicated dial zero plus traffic. This value cannot be populated for dial pulse (DP) trunk groups. Information to determine if a trunk group is DP is obtained from the attribute in_sigtype located in the RLRT_TRKG relation. See `CHECK Section` for population rule language (PRL) implementation.
OA4D0M_DED - Dedicated dial zero minus traffic. This value cannot be populated for DP trunk groups. Information to determine if a trunk group is DP is obtained from the attribute in_sigtype located in the RLRT_TRKG relation. See `CHECK Section` for PRL implementation.
OA4D1P_DED - Dedicated dial one plus traffic.
OA4COMBIND - Combined (0-, 0+, 1+) traffic.
OA4SUP_COMB - Supercombined (cn/ncn 0-, 0+, 1+) traffic.
OA4AIS - Incoming automatic intercept system (AIS).

**Attribute:**

cn_ind

**Fullname:**

Coin indicator

**Attribute Description:**

Indicates if this trunk group carries coin traffic.

DBNO - Carries noncoin traffic (DEFAULT).

Copyright © 1999 Lucent Technologies 

DBYES - Carries coin traffic.
For traf_type of OA4SUP_COMB, this attribute is set to DBYES.

For listing services trunk groups (lstraf is equal to DBYES) with a service class other than FC_ISPOPR, cn_ind will indicate whether or not coin traffic, identified by originating line screening (OLS), is allowed on this trunk group. That is, if cn_ind is set to DBYES and OLS identifies the call as coin, it will be treated as coin. If cn_ind is set to DBYES and OLS does not identify the call as coin, it will be treated as non-coin. If cn_ind is set to DBNO and OLS identifies the call as coin, an error condition will be reported.

**Attribute:**
pp_ind
**Fullname:**
Postpay coin indicator
**Attribute Description:**
Indicates if this trunk group carries postpay coin traffic. Postpay coin traffic can be carried over noncoin trunk groups.

DBNO - No postpay coin traffic (DEFAULT).
DBYES - Trunk group carries postpay coin traffic.

**Attribute:**
acts_ind
**Fullname:**
Automated coin toll service indicator
**Attribute Description:**
Indicates if this trunk group carries coin traffic from phones that have been modified for automated coin toll service (ACTS)

DBNO - Coin traffic not automated.
DBYES - Coin traffic automated.

**Attribute:**
ani_ind
**Fullname:**
Automatic number identification (ANI) indicator
**Attribute Description:**
Indicates if ANI is expected on this trunk group.

DBNO - No ANI expected.
DBYES - ANI expected on the trunk group.

For intercept trunks and non intermediate switching point (ISP) listing services trunks, this attribute is 'not applicable' and cannot be entered on the recent change (RC)/office data administration (ODA) form.

Copyright © 1999 Lucent Technologies 

**Attribute:**
prot_nxx
**Fullname:**
Protected office code (NXX) indicator
**Attribute Description:**
Indicates if this trunk group has any protected NXXs.

DBNO - No protected NXXs on trunk group.
DBYES - Protected NXXs on trunk group.

**Attribute:**
cn_sig
**Fullname:**
Coin signal
**Attribute Description:**
Indicates one of four types of coin signaling. If the cn_ind is set to DBYES, then cn_sig must be either OASMW_SIG, OASIN_BAND or OASEX_IB. If the cn_ind is set to DBNO, then cn_sig must be either OASNOCN_SIG, OASMW_SIG or OASEX_IB.

OASNOCN_SIG - No coin signaling - (DEFAULT).
OASMW_SIG - Multiwink coin signaling.
OASIN_BAND - Inband coin signaling.
OASEX_IB - Expanded inband coin signaling.

**Attribute:**
cn_statyp
**Fullname:**
Coin station type
**Attribute Description:**
Indicates one of three types of coin station. If 'cn_ind' is set to DBYES, then 'cn_statyp' must be either OADTF, OACF, OACF_DTF.

OACN_NULL - Null value - (DEFAULT).
OADTF - Dial tone first protocol.
OACF - Coin first protocol.
OACF_DTF - Both coin first and dial tone first protocol.

Attribute will be set to OACN_NULL if 'cn_ind' is set to DBNO and 'pp_ind' is set to DBNO. If 'pp_ind' is set to DBYES and 'cn_ind' is set to DBNO, then 'cn_statyp' can be set to OACN_NULL, OADTF or OACF_DTF.

**Attribute:**
mfj_sig
**Fullname:**
Modification of final judgement (MFJ) signal
**Attribute Description:**
Indicates what type if incoming signaling is sent from originating

**Copyright © 1999 Lucent Technologies** 

office.

DBNO - Standard operator signaling is used (DEFAULT).
DBYES - MFJ operator signaling is used. Indicates call is from an equal access end office (EAEO).

**Attribute:**
cs_enf
**Fullname:**
Carrier selection enforced
**Attribute Description:**
Indicates if carrier selection should be enforced for this trunk group.

DBNO - Carrier selection is not enforced.
DBYES - Carrier selection is enforced.

For all intercept and listing services trunks, this attribute is 'not applicable' and must not be entered on the RC/ODA form.

**Attribute:**
acqs_scn
**Fullname:**
Automatic charge quotation system (ACQS) screen
**Attribute Description:**
Indicates how to identify ACQS traffic on the trunk group. If 'acqs_scrn' is set to OASCDED or OASCAIFO, then the 'ani_ind' must set the DBYES. The acqs_scn attribute can have one of the four values:

OATRNONE - No ACQS traffic carried over trunks in this trunk group (DEFAULT).
OATRDED - Trunk group is dedicated to ACQS traffic. If OATRDED is populated, the 'ani_ind' must be set to DBYES.
OATRAIFO - ACQS traffic is identified by ANI information digit(s) (0)6. If OATRAIFO is populated, the 'ani_ind' must be set to DBYES.
OATRASRCH - ACQS traffic identified by ANI search. If OATRASRCH is populated, the 'ani_ind' must be set to DBYES.

**Attribute:**
ols_scn
**Fullname:**
Originating line screening (OLS) screened traffic indicator
**Attribute Description:**
Indicates how to identify screened traffic on trunks in this trunk group. OLS states for originating line screening and can have one of four values:

**Copyright © 1999 Lucent Technologies** 

```
        OATRNONE      - No screened traffic carried by trunks in this
                        trunk group.
        OATRDED       - Trunk group dedicated to screened traffic.
        OATRAIFO      - Screened traffic identified by ANI information
                        digits(s) (0)7.
        OATRASRCH     - Screened traffic identified by ANI search.
```

**Attribute:**
orig_npa
**Fullname:**
Numbering plan area (NPA) of originating office
**Attribute Description:**
NPA of originating office. For intercept (traf_type equals OA4AIS), this is the NPA in which the intercepted number resides.

**Attribute:**
carr_typ
**Fullname:**
Carrier type
**Attribute Description:**
Specifies whether the trunks in this trunk group carry inter-LATA or intra-LATA traffic. If the trunk group signaling is dial pulse, then this value must be OATCBOTH. Signaling type can be determined from the FC_TRUNK relation under the attribute in_sigtype. Will take on one of three values:

```
        OATCINTRA     - Trunk group carries intra-LATA traffic.
        OATCINTER     - Trunk group carries inter-LATA traffic.
        OATCBOTH      - Trunk group carries both inter-LATA and intra-LATA
                        traffic.
```

**Attribute:**
scrn_idx
**Fullname:**
Screening index
**Attribute Description:**
Screening index for trunk group. If the trunk class is FIOPR or DIOR, the screening index must be entered and there must be an entry in the RLrt_scrning relation for every nonzero screening index. If the trunk class LATA or TTOLLCON, the screening index can be entered. In case of LATA trunk class with the nonzero screening index, there must be an entry in the RLrt_scrning. For other trunk classes the screening index is 'not applicable'.
The screening index ranges in value from 0 to 4095.

Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

intra_id

**Fullname:**

Intra-LATA toll carrier ID

**Attribute Description:**

Primary intra-LATA toll carrier (PIC2) assigned to this trunk group. The value of #LECBCARID is assigned if the carrier is not an inter-LATA carrier (IC) but is a local exchange carrier (LEC). It is mapped to the three letters 'LEC' on the RC/ODA view. This field is required even if the 'carr_typ' field is set to OATCINTER. It may be used when certain failure conditions occur when handling inter-LATA traffic. The value of #NULL_BCARID is assigned if the carrier has a non-existing carrier ID. This can be used for diagnosing the incorrect trunking condition. The value of #NULL_BCARID is not displayed on the RC/ODA view. It is mapped to unknown. When RLfc_oprtk.traf_type is OA4AIS, then RLfc_oprtk.carr_typ will be OATCBOTH. In this case, the actual carrier ID is not stored in this relation; instead it is #NULL_BCARID and the actual carrier ID is provided by the external information system (EIS) during call processing.

**Attribute:**

inter_id

**Fullname:**

Inter-LATA carrier ID

**Attribute Description:**

Carrier ID of carrier assigned to the inter-LATA traffic on this trunk group. The value of #LECBCARID is assigned if the carrier is not an IC but is an LEC. It is mapped to the three letters 'LEC' on the RC/ODA view. The value #NULL_BCARID indicates that no carrier ID is assigned and is not displayed on the RC/ODA view. It is mapped to unknown. If the carr_typ is OATCINTER or OATCBOTH, then there must be a valid carrier ID populated. When RLfc_oprtk.traf_type is OA4AIS, then RLfc_oprtk.carr_typ will be OATCBOTH. In this case, the actual carrier ID is provided by the EIS during call processing.

**Attribute:**

inc_id

**Fullname:**

International carrier ID

**Attribute Description:**

Carrier ID of carrier assigned to handle international traffic on this trunk group. The value of #LECBCARID is assigned if the carrier is an LEC. If no 'inc_id' carrier is assigned to this trunk group, then the value #NULL_BCARID should be populated. See 'inter_id' for a more detailed explanation.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
pic4_id
**Fullname:**
Primary intra-LATA local carrier ID
**Attribute Description:**
Carrier ID of carrier assigned to inter-LATA local traffic for this trunk group. The value of #LECBCARID is assigned if the carrier is not an IC but is a LEC. It is mapped to the three letters 'LEC' on the RC/ODA view. The value of #NULL_BCARID is assigned if the carrier has a non-existing carrier ID. This can be used for diagnosing the incorrect trunking condition. The value of #NULL_BCARID is not displayed on the RC/ODA view. It is mapped to unknown. When RLfc_oprtk.traf_type is OA4AIS, the RLfc_oprtk.carr_typ will be OATCBOTH. In this case, the actual carrier ID is not stored in this relation; instead it is #NULL_BCARID and the actual carrier ID is provided by the EIS during call processing.

**Attribute:**
strpuls
**Fullname:**
Start pulse
**Attribute Description:**
Indicates the start pulse to be used when call type cannot be determined due to transmission failure. Under these conditions, a noncoin start pulse will be used. However, start pulses are different depending on the incoming trunk characteristics. Also, the Telephone Company Administrator (TCA) can choose to turn back the call, that is idle the trunk. Therefore, the legal value that can be populated is as follows:

FCTURNBACK - legal value to be populated on any trunk group indicating the call will be turned back (DEFAULT).

Supercombined trunk group:
FCST2P - prefix digit 1
FCST3P - prefix digit 0

Combined trunk group:
FCST - prefix digit 1
FCSTP - prefix digit 0

Dedicated trunk group:
FCST, FCSTP, FCST2P, FCST3P can be used since trunk group data already identifies call type.

Note: Information to determine if a trunk group is supercombined combined or dedicated can be found in the RLfc_oprtk relation by attribute traf_type. The attribute values are as follows:

**Copyright © 1999 Lucent Technologies** 

```
OA4SUP_COMB => Supercombined
OA4COMBIND  => Combined
OA4D0_DED   => Dedicated
OA4D0P_DED  =>
OA4D0M_DED  =>
0A4D1P_DED  =>
```

**Attribute:**
exc_area
**Fullname:**
Exception areas
**Attribute Description:**
This attribute will be used by the ISP capability for exception area determination on trunks with calls originating from non-conforming end offices (NCEOs).

1. DBYES means exception areas exist in the local access and transport area (LATA) or one of the LATAs which this incoming FC_ISPOPR trunk group services.

2. DBNO means exception areas are not present in the LATA/LATAs which this trunk group serves.

3. Default to DBNO.

4. If the exc_area attribute is set to DBYES, then carr_typ attribute of this tuple must be BOTH. This means the trunk group may handle inter-LATA traffic which may be within an exception area.

5. Glexdet = DBYES
   (exception area determination is turned on in this office).

6. If 'exc_areas' is set to DBYES then the 'mfj_sig' must be DBNO.

7. For intercept, PF and non ISP listing services trunks, this attribute is 'not applicable' and cannot be entered on the RC/ODA form.

**Attribute:**
mech
**Fullname:**
More efficient call handling (MECH) on/off flag
**Attribute Description:**
Indicates if MECH on/off for incoming trunk.

**Attribute:**
ans_sup

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Answer supervision
**Attribute Description:**
This indicates if the incoming trunk group can return answer supervision to the network. For PF trunks, this determines if answer supervision should be returned for true answer to a forward party. This attribute applies only to intercept and non listing services PF trunks. For all other trunks, it is 'not applicable'.

**Attribute:**
cc_on
**Fullname:**
Call completion on
**Attribute Description:**
Indicates whether LS call completion is allowed for this trunk group.

**Attribute:**
taoprsys
**Fullname:**
From toll and assistance (T&A) operator system
**Attribute Description:**
Indicates whether T&A operator system previously handled this LS traffic. This indicates if a T&A operator system is bringing the calls into this system.

**Attribute:**
lstraf
**Fullname:**
Listing services traffic
**Attribute Description:**
Indicates whether there is T&A listing service traffic on this trunk group.

**Attribute:**
lscar_val
**Fullname:**
Listing services carrier valid
**Attribute Description:**
Indicates whether inter-LATA carrier may be used for inter-LATA listing services call completion calls? This indicates whether the carrier specified in the existing field, inter_id, can be used (is valid) as the carrier for inter-LATA LS call completion calls.

**Attribute:**
aatossdn

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Alternate access to operator services (AATOS) and software-defined network (SDN)/network remote access (NRA) traffic flag
**Attribute Description:**
Indicates this trunk carries AATOS and SDN/NRA traffic only.

DBYES - Traffic is AATOS and SDN/NRA only.
DBNO - Traffic is not AATOS and SDN/NRA.

**Attribute:**
local_ofc
**Fullname:**
Local office
**Attribute Description:**
This field indicates whether the office at the far end of the trunk is a local office.

DBYES - Trunk comes directly from a local office.
DBNO - Trunk does not come directly from a local office.

**Attribute:**
ap_automation
**Fullname:**
Automated position (AP) automation
**Attribute Description:**
Indicates whether AP automation is active on this trunk group. This attribute is used to mark an incoming OSPS trunk group which is to receive AP automation.

**Attribute:**
wl_ind
**Fullname:**
Wireless traffic indicator
**Attribute Description:**
This attribute is being used by the OSPS special feature (SF) 'AMA Recording from Wireless Service Providers'. The attribute is used to indicate whether the trunk group is dedicated to wireless traffic only.

DBYES - Indicates trunk group is dedicated to wireless traffic only.
DBNO - Indicates trunk group is not dedicated to wireless traffic only.

**Attribute:**
wl_sa
**Fullname:**
Wireless Special Application
**Attribute Description:**
This attribute is being used by the OSPS SF 'FGD Incoming Signaling for Special Application.'

Copyright © 1999 Lucent Technologies 

**Attribute:**
sel_ols
**Fullname:**
Selective OLS
**Attribute Description:**
This attribute is being used by this feature to specify whether SELECTIVE OLS is active.

**Attribute:**
alw7dig
**Fullname:**
Allow 7 digits
**Attribute Description:**
This attribute indicates whether seven-digit dialing is allowed on automated sequence calls for this trunk group. This field does not apply when the OSPS performs the checks on the number of digits dialed. This attribute must be entered on the RC/ODA form, except where specified otherwise in the PRL (alw7dig.rc-oda.9.1).

**Attribute:**
alwintrada
**Fullname:**
Allow intra DA
**Attribute Description:**
This attribute is being used by the DA/LOCDA feature to specify whether to allow or deny calls on a trunk group basis.

**Attribute:**
pp_overtime
**Fullname:**
Pre-paid overtime for coin
**Attribute Description:**
This attribute is being used by the Pre-paid Overtime for Coin feature to specify whether overtime on coin calls is to be pre-paid.

**Attribute:**
da_aggr_trk
**Fullname:**
DA/DACC aggregator trunk
**Attribute Description:**
This attribute indicates whether this trunk is beign used as a traffic aggregator for the OSPS Enhancements to DA and DACC for Wireline and Non-Wireline Users special feature

Copyright © 1999 Lucent Technologies 

**Attribute:**
carrierccs
**Fullname:**
Calling card screening by carrier
**Attribute Description:**
This attribute is used by the Calling Card Screening by Carrier feature to indicate whether this feature is active for this trunk group.

**Attribute:**
allowails
**Fullname:**
Allow AILS
**Attribute Description:**
This attribute is being used by the OSPS FGD - Release 2 special feature as a check as to whether or not Automated Inward Line Screening (AILS) treatment is to be given on calls received on this trunk group.

**Attribute:**
wireline
**Fullname:**
Wireline
**Attribute Description:**
This attribute is being used by the OSPS FGD - Release 2 special feature as a check as to whether or not this trunk will accept FGD signaling for non-wireless and non-Telecommunications Relay Service (TRS) OSPS calls.

**Attribute:**
carrierbrand
**Fullname:**
Carrier branding
**Attribute Description:**
This attribute is used to specify whether Carrier Specific Branding is active for this trunk group.

**Attribute:**
wlinedcis
**Fullname:**
Wireline direct connect incoming signaling
**Attribute Description:**
This attribute is being used by the OSPS FGD - MEANS feature as an indication of whether or not FGD wireline direct connect incoming signaling (DCIS) is active on this trunk group.

Copyright © 1999 Lucent Technologies 

**Attribute:**
wlessdcis
**Fullname:**
Wireless direct connect incoming signaling
**Attribute Description:**
This attribute is being used by the OSPS FGD - MEANS feature as an indication of whether or not FGD wireless direct connect incoming signaling (DCIS) is active on this trunk group.

**Attribute:**
ls_reconnect
**Fullname:**
Listing Services reconnect
**Attribute Description:**
This attribute is being used by the OSPS Customer-Controlled Reconnect to DA special feature as a check as to whether or not this feature applies to calls received on this trunk group.

**Attribute:**
accessid
**Fullname:**
Access ID
**Attribute Description:**
This attribute is being used by the OSPS AMA Recording of the Access ID for CAP Calls special feature as the id on a trunk group basis of an incoming Competitive Access Provider (CAP) call.

**Attribute:**
billinggrp
**Fullname:**
Billing group number
**Attribute Description:**
This attribute is being used by the OSPS Calling Card Screening by Call Type feature as the billing group id.

**Attribute:**
ospsff3
**Fullname:**
reserved for OSPS special features
**Attribute Description:**
This attribute is reserved and may be used when an OSPS feature is developed.

**Attribute:**
lnp_lrn

Copyright © 1999 Lucent Technologies 

**Fullname:**
LNP location routing number
**Attribute Description:**
This attribute is being used by the Local Number Portability feature as the location routing number.

**Attribute:**
lnp_query
**Fullname:**
Trunk Group Calling LNP Source Parameter
**Attribute Description:**
This attribute is being used by the Local Number Portability feature as the Trunk Group Calling LNP Source Parameter. A 0 (zero) means "no portability" (NOPT). A 1 (one) means "query" (QURY). A 2 (two) means "office code" (OFCD).

**Attribute:**
sasi_value
**Fullname:**
Special Access Service ID
**Attribute Description:**
This attribute is being used to indicate what the special access service ID value is.

**Attribute:**
adas_trunk
**Fullname:**
RaP/ADAS Trunk
**Attribute Description:**
This attribute is being used by the OSPS LS/DA Automation feature as a check as to whether or not calls should be routed to an automated position.

**Attribute:**
olns_act
**Fullname:**
Originating Line Number Screening(OLNS) activation parameter.
**Attribute Description:**
This attribute is being to activate OSPS Originating Line Number Screening(OLNS) feature.

**Attribute:**
honor_olns
**Fullname:**
Honor OLNS.
**Attribute Description:**
This attribute provides a means for the switch owner to designate

Copyright © 1999 Lucent Technologies 

whether the prohibition of caller request for an operator designated in an OLNS reply should be honored on calls arriving on a given trunk group.

**Attribute:**
olns_ama
**Fullname:**
OLNS AMA Module 219/019 Inclusion Parameter.
**Attribute Description:**
This attribute provides the operator system owner with a parameter to specify whether AMA Module 219 and 019 should be appended to an AMA record if OLNS applies to the call and if parameters were received that apply to Modules 219 and/or 019.

**Attribute:**
anigrpid
**Fullname:**
Originating line number screening automatic number identification group identifier.
**Attribute Description:**
The attribute indicates whether to send an OLNS query on all calls arriving on the trunk group, or to specify the ANI Group ID to be used on calls arriving on the incoming trunk group.

**Attribute:**
trk_pro_nxx
**Fullname:**
trunk group protected nxx
**Attribute Description:**
This attribute is being used by the NPA Handling By Trunk Group feature as the indicator as to weather or not trunk-group-protected nxx data must be populated.

**Attribute:**
interlcc_on
**Fullname:**
Inter-LATA DACC activation parameter
**Attribute Description:**
Indicates whether inter-LATA DACC is allowed or denied for a trunk group.

**Attribute:**
ospsff
**Fullname:**
reserved field for future OSPS fast features
**Attribute Description:**
This item is reserved and may be used when an OSPS fast feature is developed.

Copyright © 1999 Lucent Technologies 

**Attribute:**
annc_1
**Fullname:**
Reserved field for future OSPS Fast Feature
**Attribute Description:**
This item is reserved and may be used when an OSPS fast feature is developed.

**Attribute:**
annc_2
**Fullname:**
Reserved field for future OSPS Fast Feature
**Attribute Description:**
This item is reserved and may be used when an OSPS fast feature is developed.

**Attribute:**
ospsff1
**Fullname:**
reserved for future OSPS fast features
**Attribute Description:**
This item is reserved and may be used when an OSPS fast feature is developed.

**Attribute:**
oaff1
**Fullname:**
reserved for future OSPS SU features.
**Attribute Description:**
This item is reserved and may be used when an OSPS SU feature is developed.

**Attribute:**
lsspare
**Fullname:**
spare
**Attribute Description:**
Unknown

**Attribute:**
ospsff2
**Fullname:**
reserved for OSPS special features
**Attribute Description:**
This attribute is reserved and may be used when an OSPS feature is developed.

# FC_PORTTYP

## 1. Description

This relation contains the port name to service class.

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation FC_PORTTYP.

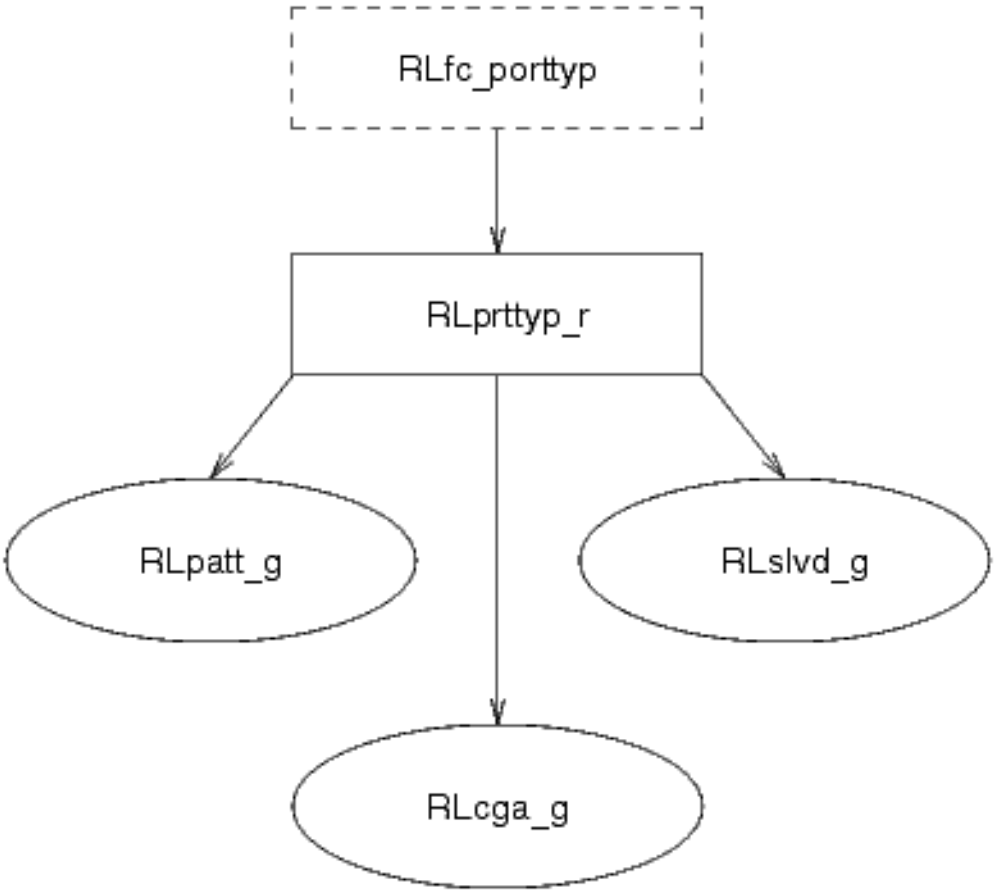

**Figure 1 Virtual Relation FC_PORTTYP**

## 2. Data Dictionary Values

| | |
|---|---|
| access type | DBACC_OPV |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | FCtr_porttyp |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| corcable | DBYES |

## 3. Field Layout

## 4. Population rules for RLfc_porttyp

### Relation Description

Port name to service class

Port name to service class.

Note: The check sections of this relation do not include any export population rules.

Note: See port usage section for port key format.

Application specific poprules for RPA remote digital test access (RDTA) ports

The RDTA capability allows ports to be equipped on an access switch using either a pseudo basic rate interface (BRI) port or an extended digital subscriber line (EDSL) primary rate interface (PRI) port. Pseudo BRI ports must be equipped on an integrated services line unit (ISLU) T line card, phase 2 U line card, American National Standards Institute (ANSI) U line card, ISLU2 T line card or an ISLU2 U line card. Refer to the population rules in RLdn_rdta for more details.

TUPLE SEMANTICS for pseudo BRI

The following RLfc_porttyp attributes are applicable for RDTA pseudo BRI use. All the attributes not listed shall use their default values.

| | |
|---|---|
| port | RDTA gport populated in RLdn_rdta. |
| servclass | TM_P_BRI. |
| hunt | DBNO. |
| sleevld | Zero. |

Copyright © 1999 Lucent Technologies 

```
slcpbx          DBNO.
lp_type         PCB_CHAN, PCUB_CHAN, PCRDTA_D, PCRDTA_UD.
sleevind        DBNO.
porttyp         TM_LINE.
testport        DBYES.
cadna           TMIIS.
sh_analog       DBNO.
ltsb_alwd       DBNO.
annc_apl        SVCNO_ANNC.

TUPLE SEMANTICS for EDSL PRI B-channel
--------------------------------------
The following RLfc_porttyp attributes are applicable for RDTA
EDSL PRI B-channel use (RDTA does not use EDSL D-channel for
data transmission).  All the attributes not listed shall use
their default values as listed for EDSL trunks.

port            RDTA gport populated in RLdn_rdta, RLgroup_port,
                and RLpggpmap.
servclass       FC_EDSL.
hunt            DBYES.
sleevld         Zero.
slcpbx          DBNO.
lp_type         PCTBCHAN.
sleevind        DBNO.
porttyp         TM_TRK.
testport        DBYES.
cadn            TMIIS.
sh_analog       DBNO.
ltsb_alwd       DBNO.
annc_apl        SVCNO_ANNC.
```

**Attribute:**

port

**Fullname:**

Port

**Attribute Description:**

This attribute is divided into sub-attributes port.member and port.module. Member is the port name of a line or trunk. This includes lines or trunks that have not been assigned but that do exist in the office. Module refers to the switching module number with possibilities from 1 to 192.

For additional information on the sub-attribute port.member, see DMport.G

Semi-postpay (SPP) coin service does not affect this attribute.

The format of port.member depends on the application and is specified in the following application specific population rules section. Module refers to the SM number of the port.

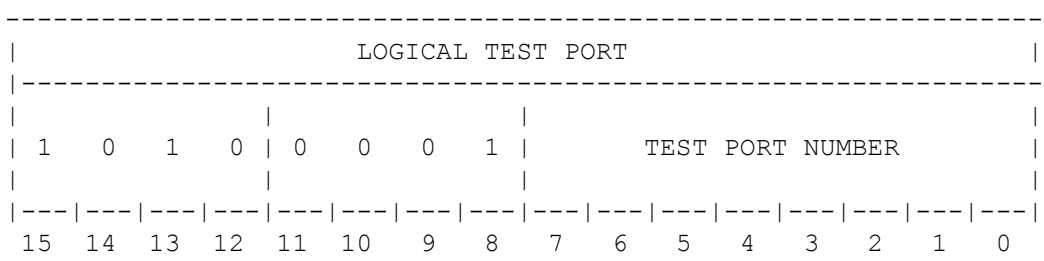
Structure:

**Copyright © 1999 Lucent Technologies** 

port.module range: 1-192.
port.member range: see the following.

Dependencies: See application sections.

Valid port formats and dependencies are:



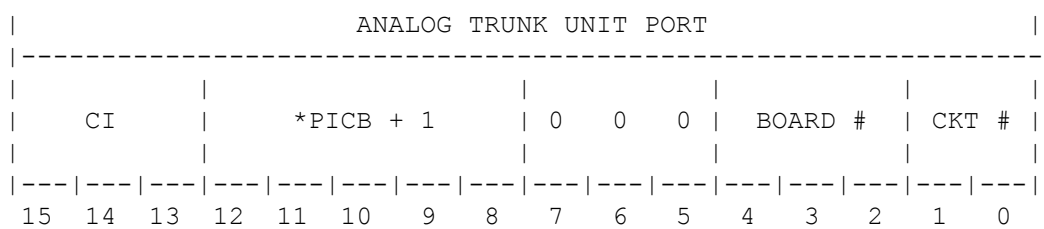
TEST PORT NUMBER - Logical transmission test function (TTF) test port (0 through 255)

Attribute servclass for logical test ports is limited to the following values:

DGLTPTTF,
DGPPMLTP,
DN_ELS_TTF,
TMDFTACLTP,
TMLTPDCTU,
TM_ALIT,
TM_SLIM,
TM_CALLBK,
TM_DCJACK,
TM_ICTC,
TM_MSU,
TM_OGTC,
TM_OTOTTF,
TM_ROTL,
TM_S96CTTTF,
TM_WSTTF.

---

TEN - trunk equipment number



- Previously the 'CI' and 'PICB+1' were considered as one eight bit field, and was referred to as the 'PICB + 1.'

**Copyright © 1999 Lucent Technologies** 

Historically, the 'CI' number has always been stored in the upper three bits (13-15) of the 'PICB+1'. Since in most cases its value was zero, it seemed invisible. However, it can also take the value of one, so this 'CI' field should be clearly identified as the prefix to the 'PICB+1' field. No code changes are needed to support this new delineation.

CI - Control interface (0,1).

PICB+1 - Peripheral interface control bus number + 1

BOARD number range is zero to seven.
CKT number range is zero to three.

Attribute servclass for analog trunk unit ports is limited to the following values:

FC_2WIRE_INDV,
FC_4WIRE_INDV,
FC_AIS,
FC_AISOA,
FC_ANNCMNT,
FC_AUX_TRNK,
FC_BSYVFY,
FC_ATNDVFY,

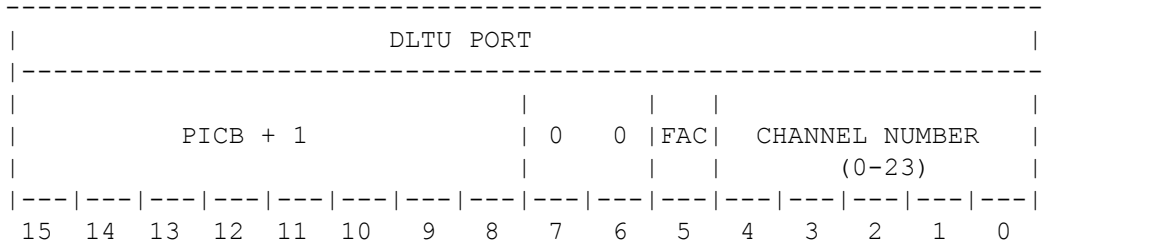
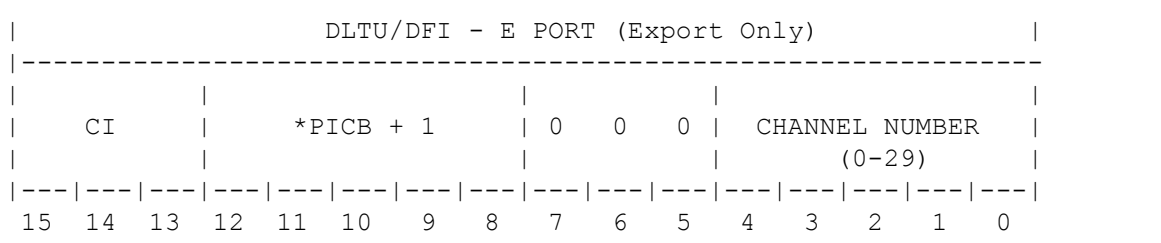
FCAPXS1CST,
FCAPXS2CST.

Copyright © 1999 Lucent Technologies 

DEN - digital equipment number





- See note in TEN / ANALOG TRUNK UNIT PORT case for more information on CI/PICB+1 history.

CI - Control interface (0,1).

PICB+1 - Peripheral interface control bus number + 1

FAC - Facility number: Zero for old DFI. Zero or one for DFI-2.

Attribute servclass for DLTU and DLTU export (DLTU-E) ports is limited to the following values:

FC_4WIRE_INDV,
FC_AIS,
FC_AISOA,
FC_AUX_TRNK,
FC_ANNCMNT,
FC_BSYVFY,
FC_ATNDVFY (for DLTU only),

DEPENDENCIES:
RLcktdata - One tuple for each port. The key into the RLcktdata relation is exactly like this key into RLfc_porttyp.

RLpicb - One tuple for the PICB used by this key. The key into the RLpicb relation is of type DMpicb. A DMpicb uses bits zero to four for the actual PICB number (not PICB+1), and bits five to seven for the CI number.

---

EDSL - DEN

Integrated services digital network (ISDN) extended digital subscriber line (EDSL)

| Port Name for D-channel or B-channel | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CI | | | *PICB + 1 | | | | | 0 | 0 | FAC | CHANNEL NUMBER (0-23) | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note: Logically, channel numbers are 0-23 as shown previously. For DFI, the facility (FAC) number is always zero. For DFI-2, the FAC number can be either zero or one. Only one channel, channel 23, can be assigned as a D-channel. Lucent Technologies custom PRIs will allow channels 0-22 to be assigned as B-channels, but Telcordia Technologies standard PRIs will allow channels 0-23 to be assigned as B-channels. If all 24 channels on a facility are assigned as B-channels, then a D-channel on another facility in the PRI group will handle the signaling. This is being done

Copyright © 1999 Lucent Technologies 

for the non-facility associated signaling (NFAS)/D-channel backup (DCBU) feature. NFAS allows a Telcordia Technologies standard PRI to have one D-channel for signaling and up to 479 B-channels. DCBU allows a second D-channel to be provisioned to a standard PRI to allow a backup D-channel for reliability. With DCBU, the PRI will have two D-channels (with only one actively carrying the signaling at a time) and up to 478 B-channels.

All channels on the DFI or DFI-2 are not required to be B-channels or D-channels. (They may be unassigned or assigned as nailed-up non-switched special service facilities that are not controlled by the D-channel.) Physically, channel numbers are 1-24 for DFI and 1-48 for DFI-2. For physical to logical representation conversion, channels 1-24 are mapped to channels 0-23 with FAC=0, and channels 25-48 are mapped to channels 0-23 with FAC=1.

- See note in TEN / ANALOG TRUNK UNIT PORT case for more information on CI/PICB+1 history.

CI - Control interface (0,1).

PICB+1 - Peripheral interface control bus number + 1

FAC - Facility number: Zero for old DFI. Zero or one for DFI-2.

---

Interswitch packet switching trunks - DEN

| Interswitch Packet Switching Trunks | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CI | | | *PICB + 1 | | | | | 0 | 0 | FAC | Channel Number | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

- See note in TEN / ANALOG TRUNK UNIT PORT case for more information on CI/PICB+1 history.

CI - Control interface (0,1).

PICB+1 - Peripheral interface control bus number + 1, where PICB = PICB of the DFI circuit.

FAC - Facility number: Zero for old DFI. Zero or one for DFI-2.

Channel Number - Channel number within the DFI circuit.

---

LEN - line equipment number

**Copyright © 1999 Lucent Technologies** 

```
Port names look like the following for the various line unit types:
port.member range: #GLMNPORT thru #GLMXPORT
NOTE: Since port.member is now just a logical number,
      refer to the port_indx section for details that may
      exist there.
-------------------------------------------------------------------
LTP - Logical Test Port

-------------------------------------------------------------------
NEN - Networking Equipment Number

Attribute servclass for NEN ports is
limited to the following values:

FC_4WIRE_INDV,
FC_AIS,
FC_AISOA,
FC_ANNCMNT,
FC_AUX_TRNK,
FC_BSYVFY,
FC_BV_INTOLL,
FC_BV_TOLLCMP,
FC_CAMA,

DEPENDENCIES:
RLcktdata - 1 tuple for each port.

NOTE: The NEN servclass values are listed previously to be
consistent with the other OEs. However the actual PRL
cross check appears in the RLfc_trunk relation based
on the unit type. Attribute servclass for EDSL ports
is limited to the following value:

FC_EDSL.
---
---
LCEN - (ISLU) Line Card Equipment Number

Attribute servclass for B-channel ports is limited to the following values:

FC_ISDN,
FC_ISATND,
OA_DAOPER,
OA_TAOPER,
AS_TCPIP,
TM_XDB.

OSPS population rules for ports
---

The switching module (SM) is equipped to handle more then 60 Operator Services Position System (OSPS) ports. These OSPS ports can be divided between one or more RISLU/ISLUs. With the possibility of commercial automatic call distribution (ACD) applications a customer may request more then 60 positions on a single RISLU/ISLU.

Line group controllers (LGCs) will be logically divided into four sub line group controllers (SLGs) each containing up to four OSPS line cards. The SLGs should be grown in order. This means that

Copyright © 1999 Lucent Technologies 

the first four line card (LC) positions should be installed in LC slots 16, 18, 20, and 22 of LGC 0 which is SLG 0. The next four LC positions should be installed in LC slots 16, 18, 20, and 22 of LGC 1 which is SLG 1. This should be done on all 16 LGCs before a fifth LC slot is equipped on any other LGC. Additional growth should start at LGC 0 and equip LC slots 8, 10, 12, and 14 which is SLG 16. This routine should be followed for each of the OSPS equipped line cards in the order of SLG numbers until the desired number of line cards are equipped.

OSPS ports which are connected to the RISLU/ISLU are divided into two groups. These groups are class-1 DSLs and class-2 DSLs. Class-1 DSLs are devices which use a B-channel or a B-channel and D-channel timeslot (such as BST, VDT, AMLB SRA, or Autoquote Z-card). Class-2 DSLs are devices which use a D-channel timeslot only (such as OAP, DAS/C, ACC, RTRS, HOBIS/HOBIC, RAS, Autoquote T-card).

The following diagram defines all of the SLGs that are provided for an OSPS equipped RISLU/ISLU.

| SLG | LGC | LINE CARDS | SLG | LGC | LINE CARDS |
|---|---|---|---|---|---|
| 0 | 0 | 16,18,20,22 | 32 | 0 | 24,26,28,30 |
| 1 | 1 | 16,18,20,22 | 33 | 1 | 24,26,28,30 |
| 2 | 2 | 16,18,20,22 | 34 | 2 | 24,26,28,30 |
| 3 | 3 | 16,18,20,22 | 35 | 3 | 24,26,28,30 |

Service class FC_DASC must be assigned in pairs for load-sharing data link operation of directory assistance system computer (DASC) unit. The line cards specified in a DASC pair must be on separate line group controllers. Only one pair can be assigned per packet switching module (PSM).

B AND D CHANNEL PORT NOTES:

1. The D-channel port, 0xBXXX, will map to B-channel ports 0x8XXX and 0x9XXX. This scheme allows for the 0B+D, 1B+D, and 2B+D configurations. This mapping is algorithmic and will be utilized by users via a global primitive interface. Consistency between hardware and software port naming is maintained algorithmically, that is the first B-port (B1) will always be 0x8XXX in software and the second (B2) will be 0x9XXX.

1. With Port-Circuit Renaming the D-channel port, will map to B-channel ports through their relationship with the parent circuit. This scheme allows for This mapping is relational and will be utilized by users via a global primitive or macro interface. Consistency between hardware and software port naming is maintained in the database. Particular ports are obtained by reading the desired tuple with the common cktname and a port_indx of 1 (for B1) or 2 (for B2). The D-channel port will have a port_indx of 0.

2. LU1, LU2, ISLU(2) and RISLU unit numbers are mutually exclusive. That is, if one of the unit types is assigned a specific unit number, then the same SM may not have the same unit number assigned to another of the unit types.

3. DSL unassigned (line card status = SMUNEQ): fc_porttype tuples do not exist for any port on the DSL.

4. DSL unassigned (line-card status = SMGRO or SMOPER): The D-channel fc_porttype tuple exists with servclass = RC_PORTUNA. (Note: The 'lptype' should be PCD_CHAN for T-cards, or PCUD_CHAN for U-cards.) The RLdslequip tuple does not exist.

5. DSL assigned (line-card status = SMOPER): The D-channel fc_porttype tuple exists with servclass assigned (see servclass assignment rules). A B-channel fc_porttype tuple exists for each assigned B-port. Depending upon the servclass, a DSL may have 0, 1, or 2 B-ports assigned. (See servclass population rules.) The corresponding RLdslequip tuple must exist and be populated. If the values for b1_serv and b2_serv in RLdslequip are not RT_NO_SRV then the corresponding B-channel is assigned. If the DSL is a circuit switched DSL, the a tuple exists in RLfc_line for each assigned users.

6. The following comprise the intercept population rules for RLfc_porttyp. Intercept can be assigned to a multi-line hunt group (MLHG) individual member directory number (DN) or a member, including cases where the individual member DN is the same as the precedence MLHG group DN (such as, member 1's DN for regular,

Copyright © 1999 Lucent Technologies 

circular or and preemption MLHG [PPMHG] hunt groups.)

RLrt_dntran.termclass is not equal to RTTC_PORTGRP or
RLpr_dntran.pstermcl is not equal to RTTC_PORTGRP .

if the one of the DNs on the DSL is placed on intercept but is still associated with its physical and logical data:

then RLrt_dntran.termclass should equal RTTC_AGING and RLrt_dntran.portname.module is not 0 and RLrt_dntran.portname.member is not 0.
Or
RLpr_dntran.pstermcl should equal RTTC_AGING and RLpr_dntran.module is not 0

and the service class was that of an ISDN DSL
before the DN was placed on intercept:

THEN [for these ISDN intercept DNs]
a. RLfc_porttyp(dport).servclass remains unchanged.
b. RLfc_porttyp(bport).servclass remains unchanged.
c. All other tuples populated when the DSL was originally inserted remain unchanged.

ELSE [for all other non-MLHG DNs on intercept]
a. RLfc_porttyp(dport).servclass is RC_PORTUNA.
b. RLfc_porttyp(bport).servclass is RC_UNASSIG.
c. All other tuples populated when the DSL was originally inserted remain unchanged.

The D-channel port, 0XBXXX, maps into B-channel ports OX8XXX and 0X9XXX for B-channels, B1 and B2 respectively.

7. The following comprise the intercept population rules for RLfc_porttyp for X.25 packet switching on a T1 facility (XAT) ports with a non-MLHG DN:

RLpr_dntran.pstermcl is not equal to RTTC_PORTGRP.

if the DN of the XAT port is placed on intercept but is still associated with its physical and logical data:

RLpr_dntran.pstermcl should equal to RTTC_AGING and RLpr_dntran.module is not equal to 0.

and the service class was that of an XAT port before the DN was placed on intercept:

RLfc_porttyp.servclass should equal to PSX25_T1.

THEN [for this intercepted XAT port's DN with a port]
All tuples populated when the XAT port was originally inserted remain unchanged.

Copyright © 1999 Lucent Technologies 

```
ELSE [for all other non-MLHG XAT port DNs on intercept without a port]
a. RLfc_porttyp(bport).servclass is RC_UNASSIG.
b. All tuples populated when the XAT port was originally inserted
   are deleted.

-----------------------------------------------------------------
RAF

-----------------------------------------------------------------------

ILEN - IDCU Port
        Line on RT
        ----------
        Port on PUB43801
        ----------------

-----------------------------------------------------------------------
LCKEN - (ISLU2) Line Circuit Equipment Number

Attribute servclass for D-channel ports is limited to the following
values:

TM_P_BRI,
FC_ISDN,
FC_ISATND,
OA_MIS_LNK,
PS_APDSL.

OSPS is not currently supported on an ISLU2 in US.

**Attribute:**

servclass

**Fullname:**

Service class

**Attribute Description:**

Class of service (COS). See DMservclass for descriptions. Valid values for U.S. applications and dependencies are as follows.

```
**********************************************
************ P L E A S E  N O T E *************
**********************************************

  TO UPDATE AND/OR MAINTAIN ANY SERVCLASS,
  THE FOLLOWING SHOULD BE CONSIDERED.
```

1. For existing servclass:
   a. If servclass has a population rule language (PRL) then update the PRL and the usage (comment) prior to it as necessary.

   b. If servclass does not have a PRL then, if no PRL is needed, update the usage section only.

      If PRL is needed, then move all comments related to that particular servclass to the check section and PRL code underneath.

2. For non-existing servclass, if PRL is needed, then move all comments related to that particular servclass to the check section and PRL code underneath. This should be done in the same manner as the existing file where usage description comes first then the 'when' statement follows with PRL code inside.

```
**********************************************
```

FC_ISPOPR - If there is a trunk with class of service FC_ISPOPR, there must be at least one tuple for FC_ISPOPR in RLda_timer. Also there must be an entry in the relation RLfc_oprtk with the trunk group number from the RLfc_trunk relation. For each tuple in RLfc_portyp with servclass of FC_ISPOPR, there may or may not be a corresponding tuple in RLsa_rmvtk (switch owner option) if the trunk resides in an RSM. For a port

**Copyright © 1999 Lucent Technologies** 

with class of service FC_ISPOPR (intermediate switch point for incoming operator trunk) there must be an entry in RLfc_trunk.G.

Class of service FC_ISPOPR cannot be used if the SM global parameter, Glconfigname = D_BASIC.

FC_OPR_DIOR - If there is a trunk with class of service FC_OPR_DIOR, there must be at least one tuple for FC_OPR_DIOR in RLda_timer. Also there must be an entry in the relation RLfc_oprtk with the trunk group number from the RLfc_trunk relation. For each tuple in RLfc_porttyp with servclass of FC_OPR_DIOR, there may or may not be a corresponding tuple in RLsa_rmvtk (switch owner option) if the trunk resides in an RSM. For a port with class of service FC_OPR_DIOR (direct international originations), there must be an entry in RLfc_trunk.G.

FC_OPRISP - One way outgoing trunk for the intermediate switching point (ISP) capability. This requires a corresponding tuple keyed by port in of the RLfc_trunk relation. This COS is used for call destined for operator systems with the exception of Traffic Service Position System (TSPS) Operator System (OS).

FC_OPRTSP - One way outgoing trunk for the ISP capability. This requires a corresponding tuple keyed by port in the RLfc_trunk relation. This COS is used for call destined for TSPS OS.

FC_PFCPE - U.S. only. Private facility (PF) customer premise equipment (CPE). This requires a corresponding tuple keyed by port in each of RLfc_trunk, RLpctrktxc, RLpggpmap and RLrc_trk. If RLfc_porttyp.servclass equals FC_PFCPE then RLfc_porttyp.lptype must equal PCCPEOTRK only. This servclass is applicable to analog trunks. See pop rules for rlFC_TRUNK.

FC_PFITT - PF intertandem tie trunk (ITT). Attribute lp_type must be one of PCCPEOTRK, PCTRKIC, PCTRKOG, PCDIGTRK, PCDIMOGT, PCDIMTRK, PCFXGRND, PCFXLOOP, PCOGDIGTRK, PCOGSPDLPTRK, PCTRUNK, PCDCCSTRK or PCACCSTRK. These servclasses are applicable to digital and analog trunks.

FC_PFLAMP - U.S. only. Distribute point corresponding to a PF busy lamp. Attribute lp_type must be PCLPNULL.

FC_PFLASH - U.S. only. Indicates either main - satellite trunk feature or, flash repeating trunks. This enumeration is same as PF for party filtering. This requires a corresponding tuple keyed by port in each of RLfc_trunk, RLpctrktxc, RLpggpmap and RLrc_trk. This

Copyright © 1999 Lucent Technologies 

also requires at least one corresponding tuple keyed by servclass in RLda_timer. Attribute lp_type must be one of PCCPEOTRK, PCTRKIC, PCTRKOG, PCDIGTRK, PCDIMOGT, PCDIMTRK, PCFXGRND, PCFXLOOP, PCOGDIGTRK, PCOGSPDLPTRK, or PCTRUNK. These servclasses are applicable to digital and analog trunks.

FC_PFSLV - PF scan point of sleeve lead. Attribute lp_type must be PCLPNULL.

FC_TOLL_OPER - U.S. and international. This requires a corresponding tuple keyed by port in each of RLfc_trunk, RLpctrktxc, RLpggpmap and RLrc_trk. This also requires at least one corresponding tuple keyed by servclass in RLda_timer.

PS_APDSL - The class of service is set to PS_APDSL for ports used for data links to an application processor (AP). The servclass, PS_APDSL, for ports must have a D-channel port only.

RC_TEST - U.S. and international.

SI_DTDA - U.S. and international.

TM_P_BRI - U.S. and international. The servclass is set to TM_P_BRI for ports used by RPA feature. There must exist a corresponding tuple in RLdn_rdta, RLfc_line and RLrt_dntran. There will not be tuples in RLpsx25ln, RLdslequip, RLequipdsl, RLdslgdata, RLdpidb_pt, RLdgrp_ri or RLri_dgrp. Refer to poprules for RLdn_rdta for more information.

## 5. FC_PORTTYP Population rules continued.

```
*****************************************************************
                MISCELLANEOUS CONSTRAINTS:
*****************************************************************
```

A line with multi-frequency ringing must be assigned a FC_INDVLD, FC_2PTY, FCPBX, PBXHOTMOT, FC_COIN, FC_5PTY, or FC_SATSTLN servclass value. FC_2PTY and FC_10PTY must not be assigned ISLC lp_type values.

This attribute has a dependency on the corresponding RLfc_trunk.sdnded. If RLfc_trunk.sdnded equals DBYES, then servclass must be one of the following:

FC_LATA_CONN,
FC_CA_ANI,
FC_CA_ONI,
FCEDSL,
FC_PF.

Any other servclass is not allowed to have RLfc_trunk.sdnded set to

Copyright © 1999 Lucent Technologies 

DBYES.

If the servclass is one of the following, a corresponding tuple must also exist in relations RLdldsl and RLxndldsl:

FC_DASC,
FC_RTRS,
FC_HOBIS,
FC_HOTVT,
FC_HOTRT,
HM_RAS,
OA_AQDSL,
AS_TCPIP,
TM_XDB,
OA_MIS_LNK,
FC_EIS_LNK.

(Note: For servclass TM_XDB & AS_TCPIP, RLdldsl and RLxndldsl tuples are to be populated only for the B1 channel, not for the D channel).

If the servclass is one of the following, a corresponding tuple must also exist in the relation RLdslequip:

OA_DAOPER,
FC_DASC,
AS_OAP,
HM_RAS,
OA_TAOPER,
FC_RTRS,
FC_HOBIS,
FC_HOTVT,
FC_HOTRT,
OA_AQDSL,
OA_MIS_LNK,
AS_TCPIP,
TM_XDB,
FC_EIS_LNK.

(Note: For servclass TM_XDB & AS_TCPIP, RLdslequip tuples for both the B1 channel and the D channel are to be populated, as described in population rules for RLdslequip).

If the servclass is one of the following, a corresponding tuple must also exist in the relation RLlprt_fw:

OA_DAOPER,
FC_DASC,
AS_OAP,
HM_RAS,
OA_MIS_LNK,
OA_TAOPER,
FC_RTRS,
FC_HOBIS,

Copyright © 1999 Lucent Technologies 

FC_HOTVT,
FC_HOTRT,
OA_AQDSL,
FC_EIS_LNK.

If the servclass is one of the following, the SM has to be a PSM:

OA_DAOPER,
FC_DASC,
AS_OAP,
OA_TAOPER.

Refer to RLdslgdata poprules for further info on dslg_cnt, usr_cnt, mlhg_cnt, dpkt_cnt and ts_cnt.

**Attribute:**
hunt
**Fullname:**
Hunted port
**Attribute Description:**
Indicates whether this port is hunted. This attribute should be DBYES for all trunks in trunk groups with hunt types other than RTH_NONE (that is, two-way, one-way outgoing, and recorded announcement trunks).

This attribute is not used by XAT ports. XAT ports can be members of packet switched MLHG, but ports which are part of a circuit switched MLHG would make use of this attribute.

It should also be DBYES for all hunted members of MLHGs(1 thru 2015) whose service class is not FC_ISDN or FC_ISATND.
OUTDIAL members of a MLHG (3001-3999) are not hunted. They are used for origination purposes. Therefore, for OUTDIAL members this hunt attribute must be DBNO.

SPP coin service does not affect 'hunt.'

For international, the hunt attribute must be DBNO for all lines in MLHGs which have a hunt type of RTH_NONE. In this case the MLHG is the originating group attached to a private branch exchange (PBX).

If this tuple corresponds to an ISDN or ISDN attendant (ISAT) line, then hunt is always set to DBNO.

**Attribute:**
sleevld
**Fullname:**
Sleeve lead global port name
**Attribute Description:**
This attribute is divided into subattributes sleevld.circuit and sleevld.module. It describes the circuit and module for a distribute point on the MSU that is used to short a tip/ring pair on the main distributing frame (MDF) when the port originates or terminates. SPP coin service does not affect 'sleevld'.

This attribute is not used by XAT ports; populate with zero for XAT ports.
sleevld.member and sleevld.module.
Note: The default for this attribute depends on the class of service. If servclass is HM_REM_ALM then the default would be 0xffff as indicated in the comment section of the servclass attribute. For all other types

Copyright © 1999 Lucent Technologies 

the default will be 0.

For CDMA, for the trunks with the servclass = TMAPXPPM (Packet Pipe Member trunks), this attribute will have the gport (global port) of its Packet Pipe (PP) trunk (CDMA trunk with the servclass = PSAPXPP), to point back to its PP trunk.

**Attribute:**
sleevld.member
**Fullname:**
sleeve lead port.
**Attribute Description:**
This attribute is not used by XAT ports.

**Attribute:**
sleevld.module
**Fullname:**
Module
**Attribute Description:**
This attribute is not used by XAT ports.

**Attribute:**
slcpbx
**Fullname:**
SLC(R) private branch exchange
**Attribute Description:**
This attribute is not used by XAT ports, populate with DBNO for XAT ports.

**Attribute:**
lp_type
**Fullname:**
Logical port type
**Attribute Description:**
This attribute allows the specification of specific line and trunk types. Examples are individual loop start line, individual ground start line, PBX ground start line, analog incoming trunk, analog outgoing trunk, two-way, immediate dial, recorded announcement, digital incoming or digital outgoing trunk.

In order for SPP coin service to be added to the 5ESS(R)-2000 switch, three new lp_types must be declared. The three new lp_types are: PCSPPCOIN, PCS96CSPPCOIN, and PCS96NSPPCOIN. These are for cases of SPP coin on normal lines, concentrated SLC(R) lines and non-concentrated SLC(R) lines. If the servclass for a line is 'coin,' the lp_type associated with that line must be one of the twelve 'coin' lp_types (that is, PCCFCOIN, PCDTFCOIN, PCSPPCOIN,

Copyright © 1999 Lucent Technologies 

PCS96CCFCOIN, PCS96CDTFCOIN, PCS96CSPPCOIN, PCS96NCFCOIN, PC303CFCOIN, PC303DTFCOIN, PC303SPPCOIN, PCS96NDTFCOIN, or PCS96NSPPCOIN).

For ground start lines, the lp_type is PCGSPOTSL or PCPBX. For concentrated SLC(R) ground start lines, populate as PCS96CPBX. For non-concentrated SLC(R) ground start lines, use PCS96NPBX.

Note: See the assignment rules for 'lptype' associated with the attribute field, 'servclass' described previously.

Set to PCFXGRND for FX trunk with ground start supervision
Set to PCFXLOOP for FX trunk with loop start supervision

Dependency: Verify that the tuple in RLfc_trunk with this port as key if it exists, meets the following:

If == PCFXGRND, rlFC_TRUNK.out_startsig = FCFXGRND
If == PCFXLOOP, rlFC_TRUNK.out_startsig = FCFXLOOP
If == PCFXGRND, rlFC_TRUNK.in_startsig = FCFXGRND
If == PCFXLOOP, rlFC_TRUNK.in_startsig = FCFXLOOP

The previous conditions exist except for the following condition: If rlFC_TRUNK.in_startsig == FCDIRCON and rlRT_TRKG.rlt_type == (RLT_TEMP | RLT_PERM), then RLfc_porttyp.lp_type = PCFXGRND.

'lp_type' constraints for DSL assignments

This attribute specifies the logical port type. It should be PCD_CHAN for T-card D-channel ports or PCUD_CHAN for U-cards D-channel ports. Similarly, the lptype should be set to PCB_CHAN for T-card B-channel ports (without packet switching) or PCUB_CHAN for U-card B-channel ports.

For B-channels with packet switching, the lptype should be populated based on RLcktdata.type which indicates if the B-channel is nailed up to a T-line or U-line card. The following diagram indicates the population rule for lptype for B-channels with packet switching.

| RLcktdata.type attribute | lp_type |
|---|---|
| PCTCARD | PCTXB_CHAN |
| PCUCARD | PCUXB_CHAN |
| PCSPRUCARD | PCUXB_CHAN |
| PCU_ANSI | PCUXB_CHAN |
| PCSPRU_ANSI | PCUXB_CHAN |
| PCI2TCKT | PCTXB_CHAN |
| PCI2UCKT | PCUXB_CHAN |
| PCI2SPRUCKT | PCUXB_CHAN |

PCU_ANSI and PCSPRU_ANSI are defined in Domain DMLPTYPE.

For XAT ports populate with PSXAT. This indicates that this port provides X.25 packet switching on a T1 facility.

Copyright © 1999 Lucent Technologies 

Valid values, descriptions and dependencies are as follows:

PCACCSTRK - Analog common channel signaling (CCS) trunk. U.S. and international. Attribute servclass must be one of FC_LTOLL_CONN, FC_TTOLL_CONN, FC_PRI_INTOLL, FC_SEC_INTOLL, FC_BV_INTOLL, FC_BV_TOLLCMP, FC_PFITT, FC_IEC, or FC_LATA_CONN.

PCACJACK - Trunk and line work station (TLWS) alternating current (AC) jack port. See TLWS AC JACK application section.

PCALIT - Automatic line insulation test (ALIT) MSU pack port. See ALIT logical test port application section.

PCB_CHAN - B-channel logical port type.

PCCFCOIN - Coin-first coin line.

PCCPEOTRK - Outgoing trunk to CPE.

PCDCCSTRK - Digital CCS trunk. U.S. and international. Attribute servclass must be one of FC_LTOLL_CONN, FC_TTOLL_CONN, FC_PRI_INTOLL, FC_SEC_INTOLL, FC_BV_INTOLL, FC_BV_TOLLCMP, FC_PFITT, FC_IEC, FC_LATA_CONN.

PCDCJACK - TLWS direct current (DC) jack port. See TLWS AC JACK application section.

PCDIGTRK - Digital trunk.

PCDIMOGT -

PCDIMTRK -

PCDTFCOIN - Dial-tone-first coin line.

PCD_CHAN - D-channel logical port type. For DSL D-port, the lptype is PCD_CHAN for T-cards.

PCFXGRND - Ground start supervision foreign exchange (FX) trunk. RLfc_trunk.out_startsig must be FCFXGRND. RLfc_trunk.in_startsig must be FCFXGRND.

PCFXLOOP - Loop start supervision FX trunk. RLfc_trunk.out_startsig must be FCFXLOOP. RLfc_trunk.in_startsig must be FCFXLOOP.

PCGRPALERT -

PCGSPOTSL - Ground start plain old telephone service (POTS) line (non-SLC(R)).

Copyright © 1999 Lucent Technologies 

PCIMMINCTRK -

PCIMMOGTRK -

PCIMMTRK - If a trunk is a 2-way trunk and the class of service is FC_LTOLL_CONN (local toll trunk) and the in_startsig from FC_TRUNK relation is FCIMMED, lp_type must be set to PCIMMTRK.

PCISMPT -

PC_ISTFLB - Integrated services test facility (ISTF) loopback logical test port.

PC_ISTFXMIT - ISTF transmission logical test port.

PCISWIP - Logical port type for interswitch packet trunks.

PCITSTK - Incoming local test desk (LTD) test trunk. Refer to application specific rules section for LTD test trunk.

PCLPNULL -

PCLSPOTSL -

PCLTPDCTU - PC logical DCTU test port.

PCMAJ - Metallic access junctor logical test port.

PCMD_DLT - Message delivery port.

PCMDFTSTPORT - Distributing frame test access circuit (DFTAC) logical port.

PCOGDIGTRK -

PCOGSPDLPTRK -

PCOTSTK - Outgoing LTD test trunk. Refer to the application specific rules section for LTD test trunk.

PCPBX - Ground start PBX line (non-SLC(R)).

PCPBXRLG - PBX with release guard.

PCPPMLTP - Modular metallic service unit (MMSU) periodic pulse metering (PPM) test circuit logical test port. International only.

PCRAFANN - For RAF and SAS trunk port, the lp_type should be FCRAFANN for ports having only the announcement capability (U.S. and international). For U.S. RAS, ACSR, SLE, ASP, and 2LV DSU2-RAF applications, lp_type type

Copyright © 1999 Lucent Technologies 

should not be set to PCRAFANN.

PCRAFCTR - For RAF and SAS trunk port, coin receiver announcement ports.

PCRAFDTA - For RAF and SAS trunk port, the lp_type should be FCRAFDTA for ports with the dial-through announcement capability. For U.S. RAS, ACSR, SLE, ASP, and 2LV DSU2-RAF applications, the brd0type attribute of the RLpicb tuple corresponding to the RAF unit should not be set to PCCTR.

PCRECDANN -

PCRPINCTRK - Revertive pulsing incoming trunk. U.S. only. The servclass must be FC_LTOLL_CONN.

PCRPOGTRK - Revertive pulsing outgoing trunk. U.S. only. The servclass must be FC_LTOLL_CONN.

PCS96CCFCOIN - Concentrated SLC(R) 96 coin-first coin.

PCS96CDTFCOIN - Concentrated SLC(R) 96 dial-tone-first coin.

PCS96CON -

PCS96CPBX - Concentrated SLC(R) 96 ground start PBX line.

PCS96CPOTS -

PCS96CSPPCOIN - Concentrated SLC(R) 96 SPP coin line.

PCS96CWATS -

PCS96NCFCOIN - Non-concentrated coin-first coin.

PCS96NCON -

PCS96NDTFCOIN - Non-concentrated dial-tone-first coin.

PCS96NPBX - Non-concentrated SLC(R) 96 ground start PBX line.

PCS96NPOTS -

PCS96NSPPCOIN - Non-concentrated SLC(R) 96 SPP coin line.

PCS96NWATS -

PCSDL - Signaling data line port.

PCSLIM - Logical test ports for subscriber look instrument measurements (SLIM).

PCSIMLINETRK -

Copyright © 1999 Lucent Technologies 

PCST_DLT - Signaling terminal ports.

PCSPPCOIN - International only. SPP coin line.

PCTBCHAN - EDSL B-channels.

PCTDCHAN - EDSL D-channels.

PCTRKIC -

PCTRKOG -

PCTRUNK -

PCTTF -

PCTXB_CHAN -

PCUD_CHAN - For DSL D-port, the lptype is PCUD_CHAN for U-cards.

PCUB_CHAN - For DSL B-port, the lptype is PCUB_CHAN for U-cards.

PCUXB_CHAN -

**Attribute:**
sleevind
**Fullname:**
Sleeve index
**Attribute Description:**
Set to DBYES if there is a distribute point on the MSU associated with the port. When this attribute is set to DBYES, the 'sleevld' attribute identifies the distribute point. SPP coin service does not affect 'sleevind.' This attribute is not used by XAT ports.

**Attribute:**
loaded
**Fullname:**
Loaded
**Attribute Description:**
This attribute is not used by XAT ports. Currently populated as DBNO. SPP coin service does not affect 'loaded.'

**Attribute:**
rangex
**Fullname:**
Range X
**Attribute Description:**
This attribute is not used by XAT ports. Currently populated as DBNO. SPP coin service does not affect 'rangex.'

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
balntwk
**Fullname:**
Balance network
**Attribute Description:**
This attribute allows to specify which balance network or which compensation loss is to be applied to the subscriber's analog line. The use of this attribute depends on the value of the global office parameter Glbalntwk.

If the parameter is DBYES, then the balntwk attribute is for balance network values. These balance networks are used to match the impedance with the customer line and 5ESS(R)-2000 switch in order to reduce the echo. There are four balance networks (PCBLNET0, PCBLNET1, PCBLNET2, and PCBLNET3) are available in the channel circuit. The balance network selection should be made depending upon the characteristic of the customer line.

If the parameter Glbalntwk is equal to DBNO, then balntwk is used for compensation loss values. The compensation loss is used to compensate for attenuation on the subscriber's loop. In the 5EE1(2) generic the only valid value for this attribute as compensation loss will be PCBLNET0. This results in a 0 dB compensation loss being applied.

The global parameter GLbalntwk is not used by U.S. The population of attribute balntwk for U.S. is based upon the values of loaded and rangex (as noted in the following.)

For countries which do not have different balance networks to choose from, the default ISLU-Z balance network is PCBLNET1.

For U.S., set balntwk according to loaded and rangex settings as given in the following table.

| rangex | loaded | balntwk |
|---|---|---|
| PCRENONE | DBNO | PCBLNET1 |
| PCRENONE | DBYES | PCBLNET0 |
| PCREEXTERNAL | N/A | PCBLNET2 |

This attribute is not used by XAT ports, populate with PCBLNET1 for XAT ports.

**Attribute:**
spectrn
**Fullname:**
Special transmission
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute is used by the PC subsystem to specify the customer loop type (loaded or non_loaded). It is also used to specify any additional loss to the line. Additional loss is applied only when normal loss is first applied but there are customer complaints about poor transmission, or a loop is misdesigned.

This attribute is not used by XAT ports.

**Attribute:**
crftlock
**Fullname:**
crftlock
**Attribute Description:**
Currently populated as DBNO. SPP coin service does not affect 'crtflock.'

This attribute is not used by XAT ports.

**Attribute:**
lneqclss
**Fullname:**
Line equipment class
**Attribute Description:**
This attribute allows the specification of the class of equipment which can be connected to a line port. DNNULLEQ is the default for all lines and the attribute may be updated by either RCV or system software. The 'lneqclss' attribute is used to store the additional MF outpulsing loss value for DSN trunks. SPP coin service does not affect 'lneqclss.' This attribute is not used by XAT ports.

lneqclss of DNCLS1EQ should be used on 4-wire data lines "FC_4WIRE_INDV" using 56Kb data service, voice routing.

lneqclss of DNCLS2EQ should be used on 4-wire data lines "FC_4WIRE_INDV" using 56Kb data service, data routing.

DNCLS1EQ and DNCLS2EQ provide 0db of loss.

**Attribute:**
lneqlock
**Fullname:**
Line equipment lock
**Attribute Description:**
DBYES only if the user changes the line equipment class using RCV and does not want system software to update the line equipment class. Must be DBNO for all ports except lines. SPP coin service does not affect 'lneqlock.' This attribute is not used by XAT ports.

Copyright © 1999 Lucent Technologies 

**Attribute:**
porttype
**Fullname:**
Port type
**Attribute Description:**
Two enumerations exist for this attribute, TM_LINE and TM_TRK. TM_TRK is used for all ports designated as trunks including all terminal maintenance ports. SPP does not affect 'porttyp.' For XAT ports, populate this attribute with TM_LINE. This indicates that this port supports line types of service.

PUB43801 ports which are unassigned have a porttype of TM_TRK. If they are assigned service from the analog line assignment view or are assigned, without a TN, directly on the nailup view, they will have a porttype of TM_LINE.

**Attribute:**
testport
**Fullname:**
Test port
**Attribute Description:**
DBYES if this is a special port used only for testing. Note that this is applicable to both analog and DSL B-channel or D-channel ports. SPP does not affect 'testport.' This attribute is not used by XAT ports.

**Attribute:**
chanutype
**Fullname:**
Channel unit type
**Attribute Description:**
Channel unit type. This attribute is not used by XAT ports. Populate with PCS96NULL for XAT ports.

**Attribute:**
els_loss
**Fullname:**
Electronic loop segregation (ELS) loss bit.
**Attribute Description:**
DBYES if this is a loss bit option parameter. SPP does not affect 'els_loss.' Must be DBNO for all ports except analog lines. This attribute is not used by XAT ports.

**Attribute:**
compenloss
**Fullname:**
Compensation loss
**Attribute Description:**
The compensation attenuation, set per line for the subscriber.

Copyright © 1999 Lucent Technologies 

Used for ISLU(2)-Z which is not currently supported for U.S. applications. In U.S. applications set to zero. For international, the compensation attenuation is set on a per country basis. Valid values are +3.0 to -9.0db in 0.5db increments. Global parameter Glsaloss must be added to 'compemnloss' before performing the range check. This attribute is not used by XAT ports, populate with zero for XAT ports.

**Attribute:**
cadn
**Fullname:**
Circuit administration
**Attribute Description:**
This attribute is used by the TM subsystem following an SM full initialization to determine the port status of a port. This allows the circuit administration (TMIOCD) status to be preserved over a SM full initialization. If the CADN attribute on the ODA input form is TMIOCD and the port is a trunk, this attribute should be populated to TMIOCD. Otherwise, this attribute should be populated to TMIIS (in-service).

For XAT ports, populate this attribute with TMIIS. This indicates that after an SM full initialization, an attempt should be made to bring this port in-service.

**Attribute:**
sh_analog
**Fullname:**
Shared analog
**Attribute Description:**
This attribute is set to DBYES when the analog port is a member of a key system group. Key system groups can only have one analog member. The rest of the members have a FC_ISDN class of service. When DBYES, then servclass = FC_INDVDL. Also RLis_line(RLfc_line(port,0)ltm_idx,lead_module) tuple will be populated for this 'lport'. See population rules in RLis_line.

This attribute is not used by XAT ports, populate with DBNO for XAT ports.

**Attribute:**
ltsb_alwd
**Fullname:**
Line time slot bridging (LTSB) allowed.
**Attribute Description:**
This attribute signifies whether or not the port is an LTSB port.

1. If ltsb_alwd equals DBYES and ialt_act equals DBNO, then:

   RLfc_line.port = RLfc_porttyp.port

**Copyright © 1999 Lucent Technologies** 

```
   servclass       = FC_INDVDL, FC_TWOPTY, FC_2PTY
2. If ltsb_alwd equals DBYES and ialt_act equals DBYES, then:

   RLfc_line.port  = RLfc_porttyp.port
   servclass       = FC_INDVDL

   (servclass coming from RLrc_lcc due to intercept condition.)

3. If servclass equals FC_INDVDL then:

   hunt            either DBNO or DBYES
   sleevld         Zero
   slcpbx          DBNO
   lp_type         Any valid type for a single party line
                   with an individual class of service.
   sleevind        DBNO
   porttype        TM_LINE
   testport        DBNO
   chanutype       Any valid type for a single party line
                   with an individual class of service.
   sh_analog       DBNO
   ialt_act        either DBNO or DBYES

4. If servclass equals FC_2PTY or FC_TWOPTY then:

   hunt            DBNO
   sleevld         Zero
   slcpbx          DBNO
   lp_type         Any valid type for a two party line
                   with a two party class of service.
   sleevind        DBNO
   porttype        TM_LINE
   testport        DBNO
   chanutype       Any valid type for a two party line
                   with a two party class of service.
   sh_analog       DBNO
   ialt_act        DBNO

In addition, the attribute 'testport' must be populated
identically for both RLfc_porttyp tuples in the LTSB
group, that is, if testport == DBYES for this tuple, then the
RLfc_porttyp tuple for RLltsbport.asoc_port on SM
RLltsbport.asoc_mod must also have testport == DBYES.
The RLltsbport tuple is found by using the lport from
the RLfc_line tuple identified previously in 1 (see the
poprules for RLfc_line and RLltsbport for details).

This attribute is not used by XAT ports; populate with DBNO for
XAT ports.
```

**Attribute:**

annc_apl

**Fullname:**

Announcement application

**Attribute Description:**

This attribute identifies the application using the port. The following is a list of ports and their lp_types:

PCRAFANN - Announcement ports
PCRAFDTA - Dial-through announcement ports
PCRAFCTR - Coin tone receiver

If the port is not one of the types listed previously, then this attribute should be set to SVCNO_ANNC indicating that no announcements have been assigned to the port.

The following is a list of attributes and their servclass:

SVC_DA - The servclass must be FC_RAFANNC.
SVC_ACCS - The servclass must be FC_RAFDTA.
SVC_COIN - The servclass must be FC_RAFCTR.
SVC_RAS - The servclass must be FC_RAFDTA.
SVC_ACSR - The servclass must be FC_RAFDTA.
SVC_PVN - The servclass must be FC_RAFDTA.
SVC_AOC - The servclass must be set to FC_RAFANNC.

This attribute is not used by XAT ports, populate with SVCNO_ANNC for XAT ports.

**Attribute:**

music_ind

**Fullname:**

Music indicator

**Attribute Description:**

Boolean which designates the port to be a music source. If this is not a music port, 'music_ind' equals DBNO. If this is a music port, 'music_ind' equals DBYES.

**Attribute:**

ialt_act

**Fullname:**

Intraswitch analog line transfer (IALT) active

**Attribute Description:**

This attribute cannot be changed from the default unless the special feature ID SFID080 is turned on.

This attribute is used to indicate that the IALT feature has been assigned to this line.

**Attribute:**

ffcf2

**Fullname:**

Boolean reserved for future field feature

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
See fullname description

**Attribute:**
ffcf3
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**

**Attribute:**
ffcf6
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**
ffcf7
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**
prov
**Fullname:**
Provisioning bit
**Attribute Description:**
The provisioning bit is used for lines on TR303 remote terminals. This bit denotes those lines which need to be provisioned in the TR303 RT, as a result of RC operations on RT lines. RC sets this bit to DBYES.

**Copyright © 1999 Lucent Technologies** 

After successful RT line provisioning, the TM provisioning software sets this bit to DBNO. This bit is also set to DBYES by ODA for all lines on TR303 RTs for new offices.

For TR303 RT ISDN lines, the provisioning bit is set to DBYES only for the ISDN D-channel tuple. Provisioning bit can not be set for ISDN B1 and B2 channel.

Putting this attribute in static data allows this information to be preserved over a full initialization of the SM.

**Attribute:**
dcs_trk
**Fullname:**
Autoplex(R) trunk indicator
**Attribute Description:**
Indicates whether or not a trunk is Autoplex(R).

**Attribute:**
ccssdl_dtrk
**Fullname:**
dual Sdl/Voice port
**Attribute Description:**
This attribute is used to indicate if the port is a dual Signaling Data Link (SdL) and Digital Trunk port. This dual port is used for Automatic Allocation of Signaling Data Links and Terminals.

Note: Automatic Allocation of SdLs isn't allowed.

**Defines:**
"db/DMcarr_val.h",
"db/DMportindx.h",
"db/DMparty.h",
"db/DMport.h"

## 4. Population Rules for RLfc_tdirc

**Relation Description** Trunk Direct Connect.
Direct connect DNs for trunks. When a member of a trunk group goes off-hook, the directory number in this relation is used for origination. It is populated for every member of a trunk group.

**Attribute: port**

**Fullname:** Global port

**Attribute Description** This attribute is divided into sub-attributes port.member and port.module.

**Attribute: port.member**

**Fullname:** Global port member

**Attribute Description** This attribute specifies the logical number assigned to the port.

**Attribute: port.module**

**Fullname:** Global port module

**Attribute Description** This attribute specifies the Switching Module number where the port is located.

**Attribute: dircon_dn**

**Fullname:** Direct Connect Directory Number Structure

**Attribute Description** This attribute, Direct Connect Directory Number Structure, is referenced when the trunk goes off hook. The directory number is used for digit analysis and routing the call to its destination.

**Attribute: dircon_dn.digcnt**

**Fullname:** Direct Connect Directory Number Digit Count

**Attribute Description** This attribute specifies the total number of digits in the directory number.

**Attribute: dircon_dn.dn**

**Fullname:** Direct Connect Directory Number

**Attribute Description** This attribute specifies the actual directory number used when the trunk goes off-hook instead of waiting for the directory number to be received. For an incoming seizure-only intercept trunk (this can be seen by the class of service of FC_AISOA and an in_startsig of FCDIRCON), the direct connect directory number must be only one digit long: 6 for ONI regular, 7 for ONI blank, or 8 for ONI trouble.

## 4. Population Rules for RLfc_tmzn

**Relation Description** Time Zone info.
Time zone for information by NPA for an OSPS.

See also fc_nxxzn.

**Attribute: npa**

**Fullname:** NPA

**Attribute Description** Each NPA of this office that spans more than one time zone.

Copyright © 1999 Lucent Technologies

**Attribute: time_zone**

**Fullname:** Time Zone

**Attribute Description** Time zone of the NPA-NXX. The valid values are:

```
OATZPRI_TIME, (same time as OSPS system time, primary time zone.)
OATZ1_ALT,    (time difference for alternate 1 time zone specified
               in Gla1zone.)
OATZ2_ALT,    (time difference for alternate 2 time zone specified
               in Gla2zone.)
```

**Attribute: exception**

**Fullname:** exception

**Attribute Description** exception. This NPA spans more than one time zone

## 4. Population rules for RLfc_trunk

### Relation Description

Feature data for trunks.

Feature data for trunks.

"Note: This relation does not include any PRL crosscheck for EXPORT.

```
**********************************************************************
*
* Application Specific poprules for Remote Digital Test Access
*     (RDTA) ports
*
* The 5e7 Remote Digital Test Access (RDTA) capability allows for
* ports to be equipped either on an Access Switch or a Remote
* Switch using either a Pseudo BRI port or an EDSL PRI port.
* Refer to the poprules in RLdn_rdta for more details.
*
* TUPLE SEMANTICS
* ---------------
* The following RLfc_trunk attributes are applicable for EDSL PRI
* B-Channel use only (RPA does not use EDSL D-Channel for data
* transmission).  The servclass in RLfc_porttyp must equal FCEDSL
* and the trunk must either be out going or two way (incoming
* trunks not supported by RPA).  Two way trunks may be either
* incoming or outgoing.  All the attributes not listed shall use
* their default values according to EDSL defaults.
*
* OUTGOING EDSL TRUNKS:
* ---------------------
* port  RPA gport populated in RLdn_rdta, RLgroup_port, RLpggpmap
* lport 0
* in_sigtype    DBNOSIG
* out_sigtype   DBDCHAN
* digtree       0 (not used)
* in_startsig   FCSSNULL
* out_startsig  FCSSNULL
* idle_state    DBON_HOOK
* glare GL_CONTROL
* hardware      FC_EM2
* type  RTOUTGO
```

* rdta_port     DBYES
**********************************************************************

RETROFIT RULES
FROM - 5E8
TO - 5E9(1)

The following text is supported by pop rules in this file
and in the population rules for RLprigrp.

Prior to 5E9(1), all D and B channels of an EDSL (also called
a PRI were populated in the RLedsldchn relation. The retrofit
to 5E9(1) will assign D-channels of class EDSL and B-channels
of class EDSL and EDSLHM to PRI groups. D and B channel
assignment data will no longer be populated in RLedsldchn.
It will be moved to new PRI group relations defined for 5E9(1).
Thus any tuples in this RLfc_trunk relation for PRI trunks
(D or B channels) will have to be populated with the PRI group
(prigrp attribute) and interface ID (interf_id attribute)
assigned to the trunk.
"
```

Copyright © 1999 Lucent Technologies 

**Attribute:**
port
**Fullname:**
Port.
**Attribute Description:**
This attribute is divided into sub-attributes port.member and port.module. Members is the port name of a trunk. Module refers to the Interface Module number, possibilities are from 1 to 192.

**Attribute:**
port.member
**Fullname:**
Member.
**Attribute Description:**
Port member.

**Attribute:**
port.module
**Fullname:**
Module.
**Attribute Description:**
Port module.

**Attribute:**
lport
**Fullname:**
Logical port.
**Attribute Description:**
This attribute defines the logical port number for this trunk and is used as part of the key to access relations associated with terminal assignable BRCS features. It is a sequential key administered per SM. It is an RC/ODA assigned value, within the range for lpt_type = LPT_OTHER.
If brc_trm=DBNO, lport = 0, if brc_trm=DBYES, lport > 0.

For each tuple in RLfc_trunk, verify a corresponding tuple in RLlpt_pt(RLfc_trunk.lport, lpt_type=LPT_OTHER) where RLlpt_pt.port = RLfc_trunk.port.member and RLlpt_port.party = FCP_TRUNK.

All lines (analog and ISDN) and BRCS trunks are assigned lports, although the ISDN and analog lport values will be tracked and assigned separately to conserve memory as is currently done with logical termination indexes. In the case of multi-party service, or multipoint DSL, each user will have an

Copyright © 1999 Lucent Technologies 

associated unique lport/lpt_type value.

lport values are assigned in new offices so that the assigned numbers are at the low end of 1-8191 range with no holes. Recent Change deletions will create holes in the spectrum of assigned numbers. These holes are recorded in RLrc_alphol. lport assignments must be retained across all offline ODA processes.

**Attribute:**
in_sigtype
**Fullname:**
incoming address signaling mode.
**Attribute Description:**
If this is an incoming trunk or two way trunk use enumerations DBDP, DBMF or DBCCIS6, DBTUP7, or DBISUP7 for CCS trunks depending on the signaling type of the trunk. Enumeration DBTT may also be used on incoming and two way trunks if the trunk class of service is FC_PF, FC_PFLASH, FC_PFITT, FC_TTOLL_CONN, or FC_LTOLL_CONN. If this is an incoming or two way trunk with servclass = FCEDSL or FCEDSLHM, or an ISDN link trunk with servclass = FCEDSL use enumeration DBDCHAN (See FC_TRUNK EDSL pop rules). If this is an outgoing trunk use enumeration DBNOSIG. If this is an RP trunk, use DBRP_EO or DBRP_TO. RP trunks can be incoming or outgoing, not two-way. If this is a two-way CCS trunk, in_sigtype and out_sigtype must be the same.

For export, DBCCIS6 and DBISUP7 are not valid values.

For domestic, DBTUP7 is not a valid value.

Additional rules for Export: if trunk uses MFC address signaling, this should be DBMFC_V1, _V2, _V3, or _V4. See rules for relation RLsndfwd for more details. If this is a two way MFC trunk, in_sigtype must be the same as out_sigtype.

Export CCS has defined a new dfimode = 'SMCCSHDB3' If the circuit defined for this trunk is assigned this new dfimode then the in_sigtype can only be:

DBTUP7 or DBISUP7

For SMs with Glconfigname = D_BASIC, DBCCIS6 is not a valid value.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

out_sigtype

**Fullname:**

outgoing address signaling mode

**Attribute Description:**

Outgoing or two way trunks use an enumeration of DBDP, DBMF, or DBCCIS6, DBTUP7 or DBISUP7 for CCS trunks. Outgoing, two way, or ISDN link trunks with servclass = FCEDSL and two way trunks with servclass = FCEDSLHM use enumeration DBDCHAN (See FC_TRUNK EDSL pop rules). Incoming trunks use DBNOSIG.
For Office to Office (OTO) Outgoing test trunks over non-CCS (where CCS is DBCCIS6, DBTUP7 or DBISUP7) trunks (service class is TM_OTOTK), the out_startsig should be FCIMMED if OTO test trunk interface with Step by Step offices, and the out_startsig should be FCWINK when OTO test trunk interfaces with Crossbar offices or ESSs.
If this is an RP trunk, use DBRP_EO or DBRP_TO.
RP trunks can be incoming or outgoing, not two-way.

For export, DBCCIS6 and DBISUP7 are not valid values.

For domestic, DBTUP7 is not a valid value.

If this is an outgoing trunk to the AUTOVON network with a service class of FC_LTOLL_CONN, then out_sigtype must be set to DBTT. A trunk to the AUTOVON network will have a tuple in RLpp_trunk such that:
key RLpp_trunk.port == port.

DBNOSIG is allowed for FC_LTOLL_CONN service class for one-way outgoing trunk to a DCSS conference bridge.
( ODA must allow DBNOSIG for FC_LTOLL_CONN service class. One way outgoing to a DCSS conference bridge can not be determined from the database. )

If this is a two-way CCS trunk, in_sigtype and out_sigtype must be the same.

If class of service = FC_TTOLL_CONN, and this is a one-way outgoing trunk, out_sigtype can have the value DBTT, DBMF, DBDP, DBISUP7 or DBNOSIG. DBNOSIG is used when connecting to a DCSS conference bridge.
( ODA must allow DBNOSIG for FC_LTOLL_CONN service class. One way outgoing to a DCSS conference bridge can not be determined from the database. )

If class of service = FC_TTOLL_CONN, and this is a two-way trunk, out_sigtype can have the value DBDP, DBMF, DBTT, DBCCIS6 or DBISUP7.

Additional rules for Export: if trunk uses MFC address signaling, this should be DBMFC_V1, _V2, _V3, or _V4. See rules

**Copyright © 1999 Lucent Technologies** 

for relation RLsndfwd for more details. If this is a two way MFC trunk, in_sigtype must be the same as out_sigtype.

Export CCS has defined a new dfimode = 'SMCCSHDB3'
If the circuit defined for this trunk is assigned this new dfimode then the out_sigtype can only be:

DBTUP7 or DBISUP7

For SMs with Glconfigname = D_BASIC,
DBCCIS6 is not a valid value.

If class of service = FC_AIS (Interface to Intercept Systems) then signaling type for the trunk must be DBMF. Thus, entry of other signaling types must no be allowed.

**Attribute:**
digtree
**Fullname:**
Digit analysis tree.
**Attribute Description:**
Incoming and two way trunks are assigned a table identifier which tells where to start interpreting the digits received in the relation DAPRELDGT. An outgoing trunk is populated with a zero.
An EDSL D channel trunk is populated with a zero.

The following rule is a matter of policy and is not intended to be enforced by software:
If the in_sigtype is DBCCIS6 or DBISUP7, the primary digit table for this trunk (as indicated in RLda_digstrt) must contain the 100, 101xx, 102, 104, and 105 digit strings with a corresponding destination type of FCTLNACC.

```
Dependency:
If != 0, verify existence of tuple in RLrc_das
such that:
    RLrc_das.digtree = digtree
Also,
If (servclass == FC_PF || servclass == FC_PFLASH
  || servclass == FCEDSL || servclass == FCEDSLHM
                || servclass == FC_PFITT)
    RLrc_das.pdit != 0 or
    RLrc_das.indit != 0
Else
    RLrc_das.pdit = 0, RLrc_das.indit !=0.

    RC/V Constraint/Crosscheck
    --------------------------
```

A digit analysis table identifier (DAS) can only be assigned to a port if (1) it is a valid DAS, and (2) if the DAS is currently assigned (that is, the LDIT for the DAS is populated) to the SM that owns the port. To determine if the DAS is assigned to the

**Copyright © 1999 Lucent Technologies** 

```
SM that owns the port, check RLDB_AMGPD with:
    grp_type = GPD_DA
    grp_id = 'digtree'
The attributes 'pcr_map1' through 'pcr_map7' represent a
processor bit map.  The bit position corresponding to the SM no.
that owns the port (that is, 'port.module') should be set to a 1.
If a DAS is not assigned to a SM, that DAS cannot be assigned
to any port in that SM.

When Glapsdn is set to DBYES (this is an Action
Point (ACP) in the Software Defined Network),
then digtree of 88 is NOT allowed to be assigned
to any trunk (digtree must not be 88).
The reason for this is, at an ACP, there must be
some trunks that have their sdnded attribute set
to DBYES.  When a call arriving at an ACP using
one of these trunks (sdnded == DBYES), the reserved
digtree of 88 will be used by call processing
to enter digit analysis to determine if a query is
to be sent to a remote database for routing
instruction for the associated call.  Only in the
case where routing instruction from the remote data
base instructs the ACP to route the associated call
via POTS domain, the original digtree assigned to this
trunk (!= 88) will be used.
```

**Attribute:**

```
in_startsig
```

**Fullname:**

```
incoming start signal type.
```

**Attribute Description:**

```
Incoming start signal type.  Outgoing trunks receive an
enumeration of FCSSNULL.
        In 5E1(2)3 incoming trunks which are direct connect will
        receive an enumeration of FCSSNULL.
Set to FCFXGRND for FX port using ground start supervision.
Set to FCFXLOOP for FX port using loop start supervision.
Dependency:
If == FCFXGRND, rlFC_PORTTYP.lptyp = PCFXGRND
If == FCFXLOOP, rlFC_PORTTYP.lptyp = PCFXLOOP
        if == FCDIRCON && rlRT_TRKG.rlt_type == RLT_PERM,
           rlFC_PORTTYP.lp_type = PCFXGRND

        if == FCDIRCON && rlRT_TRKG.rlt_type == RLT_TEMP,
           rlFC_PORTTYP.lp_type = PCFXGRND

For Export, if port type is FC_TOLL_OPER or FC_BSYVFY then
the value of in_startsig should be FCIMMED for a ROK load.

All CCS trunks should be set to FCSSNULL.

Trunks with service class of FCEDSL and FCEDSLHM should be set
to FCSSNULL.
```

Copyright © 1999 Lucent Technologies 

```
        Incoming revertive pulsing trunks should have an
        in_startsig of FCIMMED.

        For incoming or 2 way trunks,
        if in_startsig==FCDIRCON,
        then verify that rlRCTGRPRK.DBNO has been populated
                For 5e5(1) CAS/RLT the following must be followed for
                in_startsig=FCDIRCON.

                if rlFC_TRKG.rlt_type == RLT_PERM,
                   rlFC_PORTTYP.lp_type = PCFXGRND

                if rlFC_TRKG.rlt_type == RLT_TEMP,
                   rlFC_PORTTYP.lp_type = PCFXGRND
        (that is, !=0).  Populate rlFC_TDIRC such that:
            rlFC_TDIRC.port = rlFC_TRUNK.port
            rlFC_TDIRC.dircon_dn = rlRCTGRPRK.DBNO

        Domain value FCWNKDTONE is valid only
        for RLfc_porttyp.servclass =
        FC_TTOLL_CONN, FC_PF and FC_PFLASH.

        Additional rules for Export:  There are no known cases where
        an explicit start signal is used on trunks where MFC address
        signaling is performed.  If in_sigtype is either
        DBMFC_V1 or DBMFC_V2, then in_startsig should be FCSTARTNA.
```

**Attribute:**

```
        out_startsig
```

**Fullname:**

```
        outgoing start signal type.
```

**Attribute Description:**

```
        Outgoing start signal type.

        Outgoing trunks cannot have the value FCDIALTONE or FCANSDTONE.

        If == FCFXGRND, rlFC_PORTTYP.lptyp = PCFXGRND
        If == FCFXLOOP, rlFC_PORTTYP.lptyp = PCFXLOOP

        All CCS trunks should be set to FCSSNULL.

        Trunks with service class of FCEDSL and FCEDSLHM should be set
        to FCSSNULL.

        All trunks with rlFC_PORTTYP.servclass = FC_EIS_TRK
        must have out_startsig set to FCSSNULL.

        Outgoing revertive pulsing trunks should have an
        out_startsig of FCIMMED.
```

Copyright © 1999 Lucent Technologies 

For incoming only trunks (rlRT_TRKG.type == RTINCOM) with a service class (rlRCTGRPRK.servclass) of FC_PF or FC_PFLASH, and an in_startsig of FCDIRCON, the out_startsig should be FCFXGRND, FCFXLOOP or FCSSNULL.

The out_startsig for all other incoming only trunks should be FCSSNULL.

For access to private facility customer premise equipment (CPE) (radio paging, recorded telephone dictation and code calling) the trunks must be a Loop Start Outgoing (LSO) analog trunks.

For CPE without a sleeve lead
rlRT_TRKG.type == RTOUTGO,
rlRCTGRPRK.servclass == FC_PF,
out_startsig must be FCSSNULL
and rlFC_PORTYPE.lptype == PCCPEOTRK.

For CPE with a sleeve lead
rlRT_TRKG.type == RTOUTGO,
rlRCTGRPRK.servclass == FC_PFCPE,
out_startsig must be FCSSNULL
and rlFC_PORTYPE.lptype == PCCPEOTRK.

Additional rules for Export: There are no known cases where an explicit start signal is used on trunks where MFC address signaling is performed. If out_sigtype is either DBMFC_V1 or DBMFC_V2, then out_startsig should be FCSTARTNA.

**Attribute:**
idle_state
**Fullname:**
Idle state.
**Attribute Description:**
This attribute is used to control how on/off hook signals are sent on a trunk.

The default value is DBON_HOOK.

Non-ccs trunks are trunks which have RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype set to something other than DBCCIS6 or DBISUP7.

CCS6 trunks are trunks which have either RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equal to DBCCIS6.

For Non-CCS trunks, the following rules apply:

Copyright © 1999 Lucent Technologies 

if RLfc_tcitg.signal==DBSIG1 and RLfc_porttyp.servclass==FC_TCI_KT
then
RLfc_trunk.idle_state must_be DBOFF_HOOK

CCS7 trunks are trunks which have either
RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equal
to DBISUP7.

For CCS trunks, idle_state should be set to DBON_HOOK unless
the following statements apply to the facility used.
For CCS trunks, RLfc_trunk.idle_state should be
populated based on how the AB signaling bits should be
set during the talking state of a call. CCS software
will send AB=00 at all times except when
RLfc_trunk.idle_state is set to DBOFF_HOOK.
If RLfc_trunk.idle_state = DBOFF_HOOK, then CCS
software will handle AB signaling bits special for
outgoing calls. It will send AB=11 during the call setup
and talking state for outgoing calls and send AB=00 when
the circuit is idle. AB continues to be sent as 00 for
incoming calls.

The value of DBOFF_HOOK is used to control situations
where incompatibilities exist with certain transmission
equipment which requires in-band signaling. For this
equipment, AB=11 is needed to complete a transmission path.

The need to use a special value for RLfc_trunk.idle_state
usually arises when an in-band signaling trunk is
converted to ISUP7 and the existing facility contains
transmission equipment which was designed for use only
with in-band signaling.
One example of such equipment is dial pulse terminating channel
units. Other equipment of this type can be recognized by
consulting the circuit layout card for the trunk facility.
A special setting of RLfc_trunk.idle_state is potentially
needed on 1 way outgoing trunks where a D bank is present
in the facility using a SFC-CU plug-in card. See the
diagram here.

5ESS-DFI>-------one way T1 trunk------D Bank SFO-CU----->1AESS

If dial pulse terminating channel units are used, a value of
DBOFF_HOOK should be used. Not using this value in such a
connection could result in a poorer quality transmission path.

**Attribute:**
glare
**Fullname:**
Glare master.
**Attribute Description:**
This parameter indicates the method to be used on a trunk

**Copyright © 1999 Lucent Technologies** 

when dual seizure occurs.
Valid values are:

GL_CONTROL - this trunk will have control over glare and the far end office will yield to glare condition.
FCGL_RELEASE - this trunk will not have control in a glare situation and will yield to the far end office.

This attribute is populated as illustrated in the following.

NOTE: The following are the only valid combinations for RLrctgrprk.glare_action and RLfc_trunk.glare.

ONE-WAY TRUNKS:

One-way incoming and outgoing trunks are populated as follows:

| One-way Trunk Type | RLrctgrprk glare_action | | | | RLfc_trunk glare | |
|---|---|---|---|---|---|---|
| | ALLCTRL | NONECTRL | ODDEVEN | NULL | GL_CONTROL | FCGL_RELEASE |
| INCOMING | | | X | | | X |
| OUTGOING and others | | | X | | X | |

TWOWAY TRUNKS -- ISUP7

For 2-way CCS7 trunks, determine glare control as follows:

If RLrctgrprk.glare_action is set to ALLCTRL then
glare is set to GL_CONTROL.
If glare_action is set to NONECTRL then
glare is set to FCGL_RELEASE.
NOTE: For ISUP7 2-way trunks, check the capabilities of the far switch before setting this attribute to ALLCTRL or NONECTRL. The connecting office must be a 5E6 or later generic or have equivalent glare capability before a value of ALLCTRL or NONECTRL can be chosen.
If glare_action is set to ODDEVEN then compare the near end point code (that is, this office's Origination Point Code (OPC) from RLrt_trkg) to the far end point code (that is, this office's Destination Point Code (DPC) from RLrt_trkg.) If the OPC is higher, then this office sets glare to GL_CONTROL for the even numbered Circuit Identification Codes (CIC - from the RLprt7lab relation) and to FCGL_RELEASE for the odd numbered CICs. If the DPC is higher, then this office sets glare to GL_CONTROL for the

Copyright © 1999 Lucent Technologies 

odd numbered CICs and to FCGL_RELEASE for the even numbered CICs.

| | RLrctgrprk glare_action | | | | | RLfc_trunk glare | |
|---|---|---|---|---|---|---|---|
| | | | | OPC > | | GL_ | FCGL_ |
| Trunk Type | ALL CTRL | NONE CTRL | ODD EVEN | NULL | DPC | CIC | CONTROL | RELEASE |
| | X | | | | n/a | n/a | X | |
| | | X | | | n/a | n/a | | X |
| TWOWAY | | | X | | yes | even | X | |
| ISUP7 | | | X | | yes | odd | | X |
| | | | X | | no | even | | X |
| | | | X | | no | odd | X | |

TWOWAY TRUNKS -- CCIS6

For 2-way CCIS6 trunks, determine glare control as follows:

If this is a CCIS6 trunk (in_sigtype or out_sigtype = DBCCIS6), compare the near end CLLI code (ne_clli in the relation RLrctgrprk), with the far end CLLI code (fe_clli in the relation RLrctgrprk). If this office has the lower ASCII value of the two, then set glare to GL_CONTROL for the odd band member numbers and to FCGL_RELEASE for the even band member numbers. If the FE_CLLI is lower, set glare to GL_CONTROL for the even band member numbers and FCGL_RELEASE for the odd band member numbers.

| | RLrctgrprk glare_action | | | | | | RLfc_trunk glare | |
|---|---|---|---|---|---|---|---|---|
| | | | | | ne_clli < fe_clli | band member number | GL_ CONTROL | FCGL_ RELEASE |
| | | | | X | yes | odd | X | |
| TWOWAY | | | | X | yes | even | | X |
| CCIS6 | | | | X | no | odd | | X |
| | | | | X | no | even | X | |

TWO-WAY TRUNKS -- MF/DP and others

2-way MF/DP and other trunk types that are not illustrated are populated as follows:

| | RLrctgrprk glare_action | | | RLfc_trunk glare | |
|---|---|---|---|---|---|
| Trunk Type | ALL CTRL | NONE CTRL | ODD EVEN | NULL | GL_ CONTROL | FCGL_ RELEASE |
| MF/DP and others | X | | | | X | |
| | | X | | | | X |

;

**Attribute:**
hardware
**Fullname:**
EM or reverse battery.
**Attribute Description:**
This attribute allows the specification of an E&M trunk or a reverse battery trunk.

All analog trunks should use the default (FC_EM2) if not otherwise specified.

Digital trunks (whether CCS or not) should use the default (FC_EM2) if not otherwise specified. Digital trunks with a servclass of FC_TCI_KT and FC_TCI_TT should be allowed to have a hardware value of FC_RB for CAMA keying and talking trunks.

**Attribute:**
trkgmbgid
**Fullname:**
TrunK Group Multiswitch Business Group (MBG) IDentifier
**Attribute Description:**
trkgmbgid is an identifier used to describe a Multiswitch Business Group (MBG), for which the following indicated actions apply.

This is a unique number in the network with a range of {0,2-65535}. The value 1 is "Reserved for Public Network Identifier" (such as, non-MBG identification). A value of 0 denotes a null value; this trunk group contains public trunks, the trunk group is not associated with any single MBG. Trunks in this trunk group can be used to signal

Copyright © 1999 Lucent Technologies 

```
        public MBG related information.

        A value of 2 or greater indicates a single Multiswitch
        Business Group identifier value for which MBG calls are
        allowed to send the Generic Digits Parameter (GDP) with
        the type of off-net trunk encoded in the parameter.

        The GDP parameter may be populated and sent provided:
              (1) the call is a MBG call
              (2) trkgmbgid matches the MBG identifier that is
                dynamically associated with the outgoing call.

        /* RULE about RLfc_trunk.trkgmbgid */

        /* RLfc_trunk.trkgmbgid must be 0 unless */
        /* CENTREX Network for government Secure (CNS) */
        /* CNS_SFID #183 is on or VPN Expansion Package 2 (SFID270)
         * is on. */
```

**Attribute:**
type
**Fullname:**
Type.
**Attribute Description:**
Allows for the specification of an incoming, outgoing, two way, ISDN link, or announcement trunk.

If sdnded == DBYES, RLfc_trunk.type must be either incoming or twoway.

All trunks with rlFC_PORTTYP.servclass = FC_EIS_TRK must have type set to RTOUTGO.

**Attribute:**
screen_x
**Fullname:**
screening index.
**Attribute Description:**
Screening index. This index is used in processing a call on a two way or incoming trunk. Outgoing trunks receive a value of zero.

**Attribute:**
pbx_id
**Fullname:**
pbx identifier.
**Attribute Description:**
If the trunk belongs to a PBX this field contains the PBX identifier. For non-PBX trunks this will have the value 0. The default is 0. The full domain subrange is valid. If it

**Copyright © 1999 Lucent Technologies** 

is non-zero, then it is the key into the relation RLfc_pbx containing data relating to the whole PBX.
Starting in 5E6, this attribute is also used by domestic.
RLfc_pbx is used only by export and not by domestic.
RLfc_trunk.pbx_id must be the same as RLrt_trkg.pbx_id for each member of the trunk group.

This attribute will be used by CPN/BN for PRI screening. It will be used as a key into the relation RLsc_range which can contain up to 20 ranges of DNs to be screened. See poprules for RLsc_range in RLsc_range.p.

**Attribute:**
stop_go
**Fullname:**
stop go operation allowed.
**Attribute Description:**
Stop go operation allowed during outpulsing on immediate start trunk. Currently populated as DBNO.

**Attribute:**
tgroup
**Fullname:**
Trunk group.
**Attribute Description:**
Trunk group number. Each active trunk is assigned a trunk group number. The more members a trunk group has the more calls that can be processed. All trunks assigned to the same trunk group must carry the same enumerations in the previously defined attributes.

**Attribute:**
member
**Fullname:**
Member.
**Attribute Description:**
Each port in a trunk group is assigned a unique member number starting with member number zero.

For CCS trunks:
If the in_sigtype or out_sigtype is DBCCIS6, the members MUST begin with member zero and be inserted consecutively. If it is DBISUP7 or DBTUP7, for RC the members will be allowed to be inserted non-sequentially, to aid CCS conversion procedures. ODA is still required to insert all members sequentially.

**Attribute:**
insep
**Fullname:**

Copyright © 1999 Lucent Technologies 

incoming/originating separations class.

**Attribute Description:**

Incoming traffic separations class. This information is used to populate RLfc_line.insep and is assigned by the office. Insep is used by Division of Revenue (DOR) for domestic and by Traffic Dispersion for export. Insep is based on line class code and rate area exchange.

**Attribute:**

unitype

**Fullname:**

Equipment unit type.

**Attribute Description:**

This attribute is the trunk's hardware equipment type.

**Attribute:**

unitnum

**Fullname:**

Equipment unit number.

**Attribute Description:**

Equipment unit number.

**Attribute:**

brc_trm

**Fullname:**

brcs terminal features.

**Attribute Description:**

Specifies whether or not any terminal assignable BRCS features are assigned to this port.
If DBYES, a tuple will exist in RLtrmfeats with keys RLfc_trunk.lport, lpt_type = LPT_OTHER, and range = 0.
If more than 6 terminal features are assigned, additional tuples using range = 1 thru 4 in sequential order will exist.

**Attribute:**

brc_dn

**Fullname:**

brcs dn features.

**Attribute Description:**

Specifies whether or not any DN assignable BRCS features are assigned to this
trunk. If DBYES, a tuple will exist in RLdn_feats with key RLfc_trunk.port.module, ltm_type, and ltm_idx and range = 0. If more than 6 DN features are assigned, additional tuples using range = 1 thru 4 in sequential order will exist.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ltm_type
**Fullname:**
logical termination index type.
**Attribute Description:**
Logical Termination Index Type.
A RC/ODA assigned value.
Indicates which range the ltm_idx value is from.
See RLrc_qidx for rules for assigning the value.

**Attribute:**
ltm_idxo
**Fullname:**
logical termination index.
**Attribute Description:**
Logical Termination Index.
A RC/ODA assigned ltm_idx value.
The port.module and ltm_idx values are used as key values
lead_module and ltm_idx, respectively to access RLdn_feats
See RLrc_qidx for rules for assigning the value.

This index is a sequential number assigned to correspond
to this port. If trunk, ltm_idx = RLgroup_port.ltm_idx and
ltm_type = RLgroup_port.ltm_type.

Note: Attribute ltm_idx has a domain range of 0-8191.
The range in this relation specifies 1-8191.
As discussed in RLrc_qidx, the existence of an
index implies the value 1 or greater. If no index
is defined, RLrc_qidx(ltm_type) would contain an ltm_idx
value of 0 and NO TUPLE WOULD EXIST IN THIS RELATION.
Therefore, ltm_idx must be greater than 0 in this
relation.

**Attribute:**
cut_thru
**Fullname:**
Cut through trunk.
**Attribute Description:**
Indicates if the trunk is cut through (DBYES) or not (DBNO).
Must be DBNO for CCS trunks.

If cut_thru is DBYES, then trunk class of service must
be FC_PF, FC_PFLASH or FC_CPE.

**Attribute:**
time_flash
**Fullname:**
Timed flash trunk.
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Indicates if this trunk is to be timed for flash.

**Attribute:**
hold_busy
**Fullname:**
Hold busy.
**Attribute Description:**
Hold busy.

**Attribute:**
satellite
**Fullname:**
Satellite trunk
**Attribute Description:**
DBYES if trunk via satellite, else DBNO.

**Attribute:**
ani
**Fullname:**
automatic number identification.
**Attribute Description:**
This attribute will be used by switch personnel person
to validate the directory number assignments,
and to provide Automatic Number Identification
for private network trunks.

For trunks with servclasses of FC_PF, FC_PFLASH,
FC_PFITT or FC_LTOLL_CONN FCtrunk.ani may be set
to DBYES or DBNO as specified by the customer.
All other servclass values default FCtrunk.ani to DBNO.
For all members of a given trunk group, the ani bit
must be set to the same value.

ani has a dependency on sdnded which indicates this is
a trunk dedicated to SDN service access.
If RLfc_trunk.sdnded == DBYES and the 'servclass'
associated with this trunk is FC_PF then ani must
be DBYES."

Only trunks servclasses of FC_PF, FC_PFLASH, FC_PFITT and
FC_LTOLL_CONN are supported with FCtrunk.ani set to DBYES.

With servclass of FC_LTOLL_CONN and FCtrunk.ani
set to DBYES, the trunk group will provide CAMA-ANI type
signaling. The trunk group must also have out start dial
equal to "WINK" and out pulse equal to "MF".
The route index associated with this configuration
must be equal to TRAD (Traditional signaling).

Trunks with servclass of FC_LTOLL_CONN and FCtrunk.ani

Copyright © 1999 Lucent Technologies 

set to DBYES are considered a special case and regular interoffice and carrier interconnect traffic must not be routed over these trunks.

A typical use for this configuration is ANAC (Automatic Number Announcement Circuit), or any other service that requires ANI information to be outpulsed after an off hook / answer signal is received from the far end.

**Attribute:**
vpa_type
**Fullname:**
Voice Path Assurance (VPA) type.
**Attribute Description:**
This attribute, taken together with mai, is used to control how CCS software executes the voice path assurance test.
For detailed definition, refer to RLrctgrprk.vpa_type population rules.

For a description of high loss trunking, ICL, etc., refer to the RLrctgrprk relation.

The Trunk Group attribute vpa_rate controls how often the VPA tests are done. For CCS trunks, it is optional, but for non-CCS trunks it must be CCPCT0.
If vpa_rate does not equal CCPCT0, then the SMs containing trunks from this trunk group must have DSU2-LDSUF service groups equipped with tone transceivers (RLcktdata.type = PCT_XCVR).

## 5. FC_TRUNK Population rules continued.

**Attribute:**
datarate
**Fullname:**
Data rate.
**Attribute Description:**
This attribute is used to identify the data rate that this trunk is capable to handle for an inter switch ISDN data call. It is also used to identify the data rate that an ISDN EDSL trunk is capable of handling.

Data trunks are interoffice two-way digital trunks designated to transmit data to/from an ISDN CPE at 56kb/s, restricted 64kb/s or clear 64kb/s.

IDSN digital packet switching trunks have a servclass equal to PSPKT_TRK, PSX75_TK or PSX75P_TK. The datarate for PSX75_TK and PSX75P_TK trunks must equal DBDATA_56K. The datarate for PSPKT_TRK trunks may be DBDATA_56K or DBDATA_64K.

Copyright © 1999 Lucent Technologies 

Data trunks may also be EDSL trunks that have a servclass of FCEDSL or FCEDSLHM and can handle data rates of 56kb/s, clear 64kb/s, or restricted 64kb/s. EDSL datarates are specifically controlled by the RLcktdata.dfimode (see RLdslequip.dslrate for the valid combinations of dfimode and datarate).

All members of a trunk group must have the same data rate value. If the trunk is analog (unitype == SMTU), then datarate is always DBDATA_NULL. Digital trunks can have the full range of values. Digital trunks include the following values for unitype:
SMDLTU, SMDLTU2,
SMDNU_S

Range of values:
DBDATA_NULL for voice trunk.
DBDATA_56K for any trunk (segregated or not) able to carry 56 kb/s data calls.
DBDATA_R64K for any trunk (segregated or not) able to carry restricted 64 kb/s data calls.
DBDATA_64K for any trunk (segregated or not) able to carry 64 kb/s data calls.

'servclass' for this trunk group defined in RLfc_porttyp, RLgroup_port, and RLpggpmap can be FC_LTOLL_CONN, FC_TTOLL_CONN, FC_PRI_INTOLL, FC_SEC_INTOLL, FC_IEC, or FC_LATA_CONN.
or FC_PFITT, FC_PF or FC_PFLASH.
The 'type' attribute of this relation can be RTTWOWAY, RTINCOM, or RTOUTGO. This applies for all generics.

'servclass' for this trunk can also be FCEDSL with 'type' = RTTWOWAY, RTINCOM, RTOUTGO, RTISDNLK or FCEDSLHM with 'type' = RTTWOWAY, RTINCOM (See FC_TRUNK EDSL pop rules).

This attribute must have the same value as the datarate attribute defined in the RLrctgrprk tuple for the trunk group indicated in RLfc_trunk.tgroup.

If the trunk has servclass of FC_PF, FC_PFITT or FC_PFLASH and pulsing is not ISUP7 then datarate must equal DBDATA_56K or DBDATA_NULL.

**Attribute:**
ln_type
**Fullname:**
Leased Network type.
**Attribute Description:**
Attribute which marks the trunk as one of the following:
LN_NULL - trunks are not Leased Network

Copyright © 1999 Lucent Technologies 

```
LN_QRY   - Leased Network with query to the database
LN_NOQRY - Leased Network with no query to the database
LN_IMT   - Leased Network Intermachine trunks
```

**Attribute:**
ext_guard
**Fullname:**
Extended guard timing.
**Attribute Description:**
Indicates whether Extended Guard Timing is to be performed for this port. Extended Guard Timing performs guard timing of 1600ms.

**Attribute:**
sdnded
**Fullname:**
Software Defined Network (SDN) dedicated trunk.
**Attribute Description:**
Indicates if the trunk is assigned to SDN service access (DBYES) or not (DBNO). Note: Only the ACP offices will be allowed to have these trunks. BRCS features are not allowed for this attribute. RLrctgrprk.brcs will be set to no. The value for this attribute will be populated from RLrctgrprk.sdnded.

If sdnded is DBYES, then Glapsdn must be DBYES which indicates this switch is an Action Point in the Software Defined Network.

**Attribute:**
sgd
**Fullname:**
Station Group Designator (SGD).
**Attribute Description:**
Station Group Designator (SGD) is a digit at the end of a dialed digit string indicating the group to which a station belongs. This attribute indicates if a SGD is expected to be forwarded from the originating PBX to the Action Point (ACP) in the Software Defined Network (SDN).

This attribute may be set to DBYES only if this trunk is a SDN Direct Access trunk from a PBX to an ACP.

Copyright © 1999 Lucent Technologies 

```
If sgd == DBYES then
    sdnded must be DBYES
    and 'servclass' must be FC_PF

The value for this attribute will be
populated from RLrctgrprk.sgd.
```

**Attribute:**
ans_delay
**Fullname:**
answer delay timing.
**Attribute Description:**
Indicates whether answer delay timing is to be performed on this port.

**Attribute:**
unres_ea
**Fullname:**
unrestricted equal access signaling is allowed.
**Attribute Description:**
This attribute allows trunks to originate private virtual network calls using equal access signaling. This is assigned on a trunk group basis.

**Attribute:**
pvnterm
**Fullname:**
PVN terminating indicator.
**Attribute Description:**
This attribute allows all calls originating on the trunk to be marked as ASP terminal group originators. This allows termination to terminal groups with ASPF and ASPS restriction types.

**Attribute:**
privacy
**Fullname:**
private number.
**Attribute Description:**
This attribute is used for EAMF, CAMA, PRI, EDSL, and EDSLHM trunk groups to indicate whether the DN received is a private number or not. This attribute corresponds to, and should have the same value as, RLrctgrprk.privacy.
DBYES - indicates a private number
DBNO - indicates not a private number.

```
*******************************************************
* Note: The determination of the type of trunk group,  *
```

```
        *   EAMF, CAMA, PRI, EDSL, or EDSLHM, is not recent    *
        *   change enforceable but is a recommendation for     *
        *   ODA population of an office.  For trunk group      *
        *   types other than those listed previously this      *
        *   attribute should be set to DBNO.                   *
        ******************************************************
```

**Attribute:**
cpn_rstrct
**Fullname:**
Calling Party Number restriction.
**Attribute Description:**
This attribute is used to determine if the Calling Party Number (CPN) parameter should be passed in an ISUP7 Initial Address Message (IAM) to the next office.

This attribute is only used by operational software when servclass equals FC_LATA_CONN. It is ignored for all other trunk groups.

This attribute corresponds to, and should have the same value as, RLrctgrprk.cpn_rstrct.
DBNO - indicates the parameter should be passed to the next office (not restricted)
DBYES - indicates the parameter will not be passed to the next office and the CPN parameter will be deleted from the outgoing IAM (restricted).

For additional details, see poprules for RLrctgrprk.

**Attribute:**
chg_rstrct
**Fullname:**
Charge Number restriction.
**Attribute Description:**
attribute is used to determine if the Charge Number (CHG) parameter should be passed in an ISUP7 Initial Address Message (IAM) to the next office.

This attribute is only used by operational software when servclass equals FC_LATA_CONN. It is ignored for all other trunk groups.

This attribute corresponds to, and should have the same value as RLrctgrprk.chg_rstrct.
DBNO - indicates the parameter should be passed to the next office (not restricted)
DBYES - indicates the parameter will not be passed to the next office and the CHG parameter will be deleted from the outgoing IAM (restricted).

Copyright © 1999 Lucent Technologies 

For additional details, see poprules for RLrctgrprk.

**Attribute:**
uuiic_rstrct
**Fullname:**
User to User Information Parameter IXC Boundary Restriction Indicator
**Attribute Description:**
User to User Information Signaling transfer allows ISDN customers to exchange user data transparently through the network, in the User to User Information Parameter (UUI) of an ISUP message, during call setup and call clearing.

The User to User Information Parameter IXC Boundary Restriction Indicator is checked at network boundaries by the operational software to determine if the UUI parameter should be passed/accepted in an ISUP message to/from the far switch. (The UUI parameter may be included in any of the following ISUP messages: Initial Address Message (IAM), Address Complete Message (ACM), Answer Message (ANM), Call Progress Message (CPG), Release Message (REL).)

For LATA_CONN trunks:

DBNO: Indicates the UUI parameter should be accepted in forward messages / passed in backward messages by IXC switches at the access point.

Indicates that the UUI parameter should be passed in forward messages / accepted in backward messages by IXC switches at the egress point.

(Not Restricted)

DBYES: Indicates the UUI parameter should not be accepted in forward messages / passed in backward messages by IXC switches at the access point.

Indicates that the UUI parameter should not be passed in forward messages / accepted in backward messages by IXC switches at the egress point.

(Restricted)

For IEC trunks:

DBNO: Indicates the UUI parameter should be accepted in backward messages by LEC switches at the access point.

Indicates that the UUI parameter should be accepted in forward messages by LEC switches at the egress point.

(Not Restricted)

**Copyright © 1999 Lucent Technologies** 

DBYES: Indicates the UUI parameter should not be accepted in backward messages by LEC switches at the access point.

Indicates that the UUI parameter should not be accepted in forward messages by LEC switches at the egress point.

(Not Restricted)

The following guidelines should be followed when populating the fc_trunk.uuiic_rstrct attribute for ISUP trunks.

This attribute is used by the operational software only at network boundaries. Therefore, for trunks with service class of FCLATA_CONN or FC_IEC, this indicator should be optioned by the customer.

This attribute is ignored by the operational software for all other service class values.

This attribute corresponds to, and should have the same value as RLrctgrprk.uuiic_rstrct. For additional details, see the poprules for RLrctgrprk.

**Attribute:**

atpic_rstrct

**Fullname:**

Access Transport Parameter IXC Boundary Restriction Indicator

**Attribute Description:**

Q.931 Information Element transfer facilitates the transport of specific Q.931 information elements in the ISUP Access Transport Parameter (ATP) transparently between exchanges in the network.

The Access Transport Parameter IXC Boundary Restriction Indicator is checked at network boundaries by the operational software to determine if the ATP parameter should be passed/accepted in an ISUP message to/from the far switch. (The ATP parameter may be included in any of the following ISUP messages: Initial Address Message (IAM), Address Complete Message (ACM), Answer Message (ANM), Call Progress Message (CPG), Release Message (REL).)

For LATA_CONN trunks:

DBNO: Indicates the ATP parameter should be accepted in forward messages / passed in backward messages by IXC switches at the access point.

Indicates that the ATP parameter should be passed in forward messages / accepted in backward messages by IXC switches at the egress point.

Copyright © 1999 Lucent Technologies 

(Not Restricted)

DBYES: Indicates the ATP parameter should not be accepted in forward messages / passed in backward messages by IXC switches at the access point.

Indicates that the ATP parameter should not be passed in forward messages / accepted in backward messages by IXC switches at the egress point.

(Restricted)

For IEC trunks:

DBNO: Indicates the ATP parameter should be accepted in backward messages by LEC switches at the access point.

Indicates that the ATP parameter should be accepted in forward messages by LEC switches at the egress point.

(Not Restricted)

DBYES: Indicates the ATP parameter should not be accepted in backward messages by LEC switches at the access point.

Indicates that the ATP parameter should not be accepted in forward messages by LEC switches at the egress point.

(Not Restricted)

The following guidelines should be followed when populating the fc_trunk.atpic_rstrct attribute for ISUP trunks.

This attribute is used by the operational software only at network boundaries. Therefore, for trunks with service class of FCLATA_CONN or FC_IEC, this indicator should be optioned by the customer.

This attribute is ignored by the operational software for all other service class values.

This attribute corresponds to, and should have the same value as RLrctgrprk.atpic_rstrct. For additional details, see the poprules for RLrctgrprk.

**Attribute:**
cfn_rstrct
**Fullname:**
Confusion Message Restriction Indicator
**Attribute Description:**
In order to identify that unrecognized signaling information

Copyright © 1999 Lucent Technologies 

has been received at an exchange, a Confusion message (CFN) may be sent in either the forward or backward direction to an adjunct switch. (Unrecognized signaling information refers to those messages, optional parameters, and mandatory and optional parameter values of the ISDN UP protocol that an exchange has not yet implemented. [NI 2.0 SSD]

The Confusion Message Restriction Indicator is used by the incoming operational software when an incoming message is not understood. This attribute is checked to determine whether a Confusion Message should be generated and sent to an adjunct office.

This attribute corresponds to, and should have the same value as RLrctgrprk.cfn_rstrct.

DBNO: Indicates that the message should be generated/ sent to the adjunct office. (not restricted)

DBYES: Indicates that the message should be generated/ sent to the adjunct office. (restricted)

(The default setting of this attribute is 'not restricted'.)

The following guidelines should be followed when populating the RLfc_trunk.cfn_rstrct indicator for ISUP trunks.

1) The Confusion Message (CFN) should be generated only at LEC switches. Therefore, this attribute should be optioned by the customer.

2) The Confusion Message (CFN) should not be generated at AT&T toll offices. Therefore, this attribute does not apply at toll exchanges where ccs7_type equals TOLL. Also for CCS7 LATA_CONN trunks at an originating toll exchange where ccs7_type equals RBOC, the value of this attribute does not apply.

For additional details, see the poprules for RLrctgrprk.

**Attribute:**
rcd_3pt1_itc
**Fullname:**
Recode '3.1kHz Audio' Bearer Capability
**Attribute Description:**
This attribute is used to determine the bearer capability (IAM.USI.tr_cap value) to be sent out for outgoing ISUP calls with a bearer capability equal to '3.1kHz audio'.

This attribute is ONLY applicable under the following conditions.

Copyright © 1999 Lucent Technologies 

1.) The bearer capability of the outgoing call is '3.1kHz audio',
2.) This is an originating end office or a local tandem which received the call via an incoming inband signaling speech trunk, and
3.) An outgoing ISUP trunk was selected.

All members of a trunk group must have the same value for rcd_3pt1_itc.

The following diagram provides the value for rcd_3pt1_itc and the action that will be taken.

| Value: | Action: |
|---|---|
| DBNULLITC | No value has been defined, use the global office parameter Glrcd_3pt1 to determine the bearer capability value to be sent out. |
| DBSPEECH | Recode IAM.USI.tr_cap to 'speech' |
| DB3PT1KHZ | Send out the IAM.USI as is, (ie- '3.1kHz audio') |

This attribute must have the same value as the rcd_3pt1_itc attribute defined in the RLrctgrprk tuple for the trunk group indicated in RLfc_trunk.tgroup.

**Attribute:**
lsdel_ans
**Fullname:**
OSPS Listing Services Delay Answer Supervision.
**Attribute Description:**
This attribute is used by OSPS on Listing Services calls to determine when answer supervision should be relayed to the originating office. When set to DBYES, answer supervision is relayed upon receipt of a billing indicator from an external vendor system. When set to its default value DBNO, answer supervision is relayed upon operator position seizure.
DBYES - answer supervision after external vendor stimulus.
DBNO - answer supervision after operator position seizure.

**Attribute:**
ccs7_typ
**Fullname:**
CCS7 protocol type indicator.
**Attribute Description:**
This attribute is used by call processing software to trigger network specific handling of certain ISUP7 parameters. A value of DBTOLL indicates that RII and DLDN should be sent if known. It also means to handle the CPN parameter as billing number, provided that the network is operating in `old' mode.

Copyright © 1999 Lucent Technologies 

After toll network transition to `new' mode the CPN parameter will contain calling party number.

A value of DBRBOC means that ISUP7 parameters are to be handled as specified by Telcordia Technologies. For example, the CPN and CHG parameters should be sent when known. Also, the OLI parameter can be sent when known with a value showing the service id of the call. RBOC network specific handling of parameters occurs when ccs7_typ is set to DBRBOC.

Generally, all trunk groups that are in a local exchange carrier environment are populated with a value of DBRBOC. Conversely, all trunk groups that are in the AT&T-NOG environment are populated with a value of DBTOLL except LATA_CONN trunks which have a value of DBRBOC.

This attribute corresponds to and should have the same value as RLrctgrprk ccs7_typ.

**Attribute:**
staggered
**Fullname:**
Cascading announcement.
**Attribute Description:**
Indicate whether this trunk member is for 15A cascading announcement. This attribute must have the same value as RLrt_trkg.staggered. For additional details, see the poprules for RLrt_trkg.

**Attribute:**
utt
**Fullname:**
Utility Telemetry Trunk Indicator.
**Attribute Description:**
This bit is being used for the Suppressed Ringing special feature. This bit is used to mark this member as a member of a Utility Telemetry Trunk Group.

**Attribute:**
ffcf1
**Fullname:**
Future Feature spare bit
**Attribute Description:**
Boolean reserved for future field feature.

**Attribute:**
ffcf2
**Fullname:**

**Copyright © 1999 Lucent Technologies**

**Attribute:**

ffcf7

**Fullname:**

Boolean reserved for future field feature
ICOS trunk group detection

**Attribute Description:**

This attribute if set to YES, indicate a ICOS trunk group for servclass FCAPXIDCS. A corresponding spare attribute, ffcf5, in the relation RLrctgrprk must be set to 1 when this bit is set to DBYES; otherwise, this bit must be set to DBNO and the corresponding attribute in rctgrprk must be set to 0.

This spare attribute will be used in generic 5E11 and 5E12. In 5E13, this attribute will be replaced with new attribute called icos_trkg. The attribute ffcf7 will be released for use as a spare attribute.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ln_virt_on
**Fullname:**
FTS2000 Leased Network Virtual On-Net trunk.
**Attribute Description:**
This attribute is used to indicate whether this is a FTS2000 Leased Network virtual on-net trunk. This attribute corresponds to, and should have the same value as, RLrctgrprk.ln_virt_on.

DBYES - indicates a FTS2000 Leased Network virtual on-net trunk.
DBNO - otherwise.

**Attribute:**
ani_type
**Fullname:**
automatic number identification type
**Attribute Description:**
Used to differentiate between various direct access and switched access ANIs for outbound services. A value of 0 indicates that the outbound services ANI table (RLanitbl) will not be accessed for call processing data.

**Attribute:**
e911type
**Fullname:**
Enhanced 911 type
**Attribute Description:**
e911type specifies the type of trunk to which Enhanced 911 calls are being routed over.

**Attribute:**
esco
**Fullname:**
Emergency Service Central Office number
**Attribute Description:**
The esco number identifies the originating office of an E911 caller. It is read from this relation upon trunk originations, and is used in call processing to retrieve an Emergency Service Number (ESN) which is used for call routing and call transfer.

**Attribute:**
cama_psap
**Fullname:**
CAMA Public Safety Answering Point

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
This attribute is used to designate a trunk as a CAMA PSAP trunk.

**Attribute:**
rdta_port
**Fullname:**
Indicates the port is assigned to the RPA RDTA feature.
**Attribute Description:**
The attribute is used to indicate if the port is a EDSL PRI trunk port that has been assigned to the RPA Remote Digital Test Access feature. If the attribute is DBYES then a tuple must exist in RLdn_rdta and a tuple must exist in RLrt_dntran with the same TN defined in RLdn_rdta. The RLrt_dntran.rdta_port attribute must also be DBYES if this attribute is DBYES. The attribute is used only by RC/V but is supported by ODA mapping.

**Attribute:**
ani6
**Fullname:**
automatic number identification 6.
**Attribute Description:**
This attribute indicates to the operator system that the call may require special screening.

If RLfc_trunk.ani6 is DBYES then RLfc_trunk.ani7 must be DBNO. For trunks with servclasses of FC_PF, FC_PFLASH or FC_PFITT & type of RTINCOM or RTTWOWAY RLfc_trunk.ani6 may be set to DBYES or DBNO as specified by the customer. All other servclass values must set RLfc_trunk.ani6 to DBNO.
The ani6 bit may not be set to DBYES on a data trunk.
For all members of a given trunk group, the ani6 bit should be set to the same value.

RLfc_trunk.ani6 will be defaulted to DBNO.

**Attribute:**
ani7
**Fullname:**
automatic number identification 7.
**Attribute Description:**
This attribute indicates to the operator system that the call may require special screening.

If RLfc_trunk.ani7 is DBYES, RLfc_trunk.ani6 must be set to DBNO. For trunks with servclasses of FC_PF, FC_PFLASH or FC_PFITT & type of RTINCOM or RTTWOWAY RLfc_trunk.ani7 may be set to DBYES or DBNO as specified by the customer. All other servclass values must set RLfc_trunk.ani7 to DBNO.

Copyright © 1999 Lucent Technologies 

The ani7 bit may not be set to DBYES on a data trunk. For all members of a given trunk group, the ani7 bit should be set to the same value.

RLfc_trunk.ani7 will be defaulted to DBNO.

**Attribute:**
asi_use
**Fullname:**
Advanced Service Interface Use.
**Attribute Description:**
Indicates allowed use by Advanced Service Interface. This field is administered on a trunk group basis.

**Attribute:**
noexinbnd
**Fullname:**
No expanded inband signaling
**Attribute Description:**
This bit is used to prevent EXINBND signaling on a particular TSPS trunk member that has a signaling of FCWINKONLY. Set attribute noexinbnd to DBYES after the Global office parameter Glexinbnd is set to DBYES.

For non-TSPS trunk members the noexbnd bit is always DBNO.

Default : DBNO

**Attribute:**
fgdcicsz
**Fullname:**
Valid size for incoming Feature Group D Carrier Identification Code (CIC).
**Attribute Description:**
The purpose of this field is to indicate the allowed CIC size for Access Via Tandem (AVT) and International Carrier (INC) call types. In the case of trunks not supporting AVT and INC call types, a default value of FGDCIC3 is used.

**Attribute:**
trignum
**Fullname:**
Trigger Number
**Attribute Description:**
Trigger number for Network Services applications for Shared Interoffice Trunks.

Copyright © 1999 Lucent Technologies 

**Attribute:**
prigrp
**Fullname:**
Primary Rate Interface Group
**Attribute Description:**
This attribute will identify the PRI group to which the D and B channels belong.

**Attribute:**
interf_id
**Fullname:**
Interface ID for this facility in a PRI group
**Attribute Description:**
Each facility (T1) in a PRI group, is assigned a unique interface ID number within the PRI group. This number is used externally to identify the facility within a PRI group.

**Attribute:**
wbtsa_type
**Fullname:**
Wideband time-slot assignment type
**Attribute Description:**
The attribute wbtsa_type is used to specify the type of time-slot assignment scheme used by wideband trunk groups. The valid enumerations are: RTWBNULL, RTWBFLOAT, and RTWBFLEX.

RTWBNULL for non-wideband trunk groups or for wideband trunk groups that use fixed time-slot assignment,
RTWBFLOAT for wideband trunk groups that use floating time-slot assignment, and
RTWBFLEX for wideband trunk groups that use flexible time-slot assignment.

This attribute is also stored in RLrt_trkg so that RTA can access the information in the CMP, (wideband trunks are hunted globally so wideband trunk data is stored in the CMP). The attribute is included in this relation so that call processing software may access it.

**Attribute:**
wb_rate
**Fullname:**
Wideband trunk group rate for NxDS0
**Attribute Description:**
The attribute wb_rate is used to specify the rate of a wideband trunk group. The valid enumerations and an explanation of each enumeration follows:

Copyright © 1999 Lucent Technologies 

WB_NULL for non-wideband trunk groups,
WB_384K for wideband trunk groups which can handle
wideband 384 kb/s calls,
WB384_1536K for wideband trunk groups which can handle
wideband 384 kb/s or 1536 kb/s calls,
WB_1536K for wideband trunk groups which can handle
wideband 1536K calls,
WB_MR for wideband trunk groups that can handle NxDS0
calls which require from 2 - 24 trunks.

This attribute is also stored in RLrt_trkg so that RTA can access the information in the CMP during trunk hunt. The attribute is included here so that call processing software may access it.

**Attribute:**
fac_num
**Fullname:**
Facility number
**Attribute Description:**
The fac_num field indicates the facility number of the originating foreign exchange (FX) or tie trunk.

See checks in RLrctgrprk relation for fac_num & std_fxtie

**Attribute:**
std_fxtie
**Fullname:**
standard FX or Tie trunk
**Attribute Description:**
Identifies if this is a FX or Tie trunk.

**Attribute:**
cont_test
**Fullname:**
Continuity test indicator.
**Attribute Description:**
For Autoplex(R) Series I CS trunks, indicates whether or not a continuity test should be run.

**Attribute:**
spbool1
**Fullname:**
Spare Boolean 1
**Attribute Description:**
Reserved for future use.

**Attribute:**

Copyright © 1999 Lucent Technologies 

spbool2

**Fullname:**

Spare Boolean 2

**Attribute Description:**

Reserved for future use.

**Attribute:**

mltislcopt

**Fullname:**

Signaling option between MLT and ISLC.

**Attribute Description:**

Used by Improved DLC Operational Status Indications special feature. The mltislcopt field will be used to indicate whether enhanced MLT signaling is provided (DBYES) or the conventional signaling is provided (DBNO).

**Attribute:**

mai

**Fullname:**

Mode of access indicator

**Attribute Description:**

Used by OSPS Feature Group D Incoming Signaling for Special Applications - Release 2 feature. The mai field will be used to indicate whether the mode of access if "direct" or "switched". Default is "switched".

**Attribute:**

apicode

**Fullname:**

Access provider identifier code

**Attribute Description:**

The apicode field identifies an Access Provider Identifier (API) code for an incoming FGD trunk to an OSPS.

**Attribute:**

pci

**Fullname:**

Point Code Index

**Attribute Description:**

This attribute is used to map CCS7 trunks to an OPC/DPC combination.

**Attribute:**

cic

**Fullname:**

Circuit Identification Code

**Attribute Description:**

This attribute is used with OPC/DPC to identify a circuit

Copyright © 1999 Lucent Technologies 

for a CCS7 trunk.

**Attribute:**
asptoll
**Fullname:**
Advanced Services Platform Toll Indicator
**Attribute Description:**
The asptoll field indicates if all calls over this trunk group will generate an SCP query. When this field is set to DBYES all incoming calls will generate a query to the SCP. The query will contain the ANI and dialed number. The SCP will send back a reply with either the carrier or trunk group that should be used for routing. The 5E will also make an AMA record based on the SCP reply message.

**Attribute:**
asp_carrtrig
**Fullname:**
ASP Carrier Trigger detection
**Attribute Description:**
This attribute, if set to YES, indicates that if the carrier identified to use on this call has a trigger number provisioned, an ASP INFO_COLLECTED query to the SCP will be generated.

**Attribute:**
vpn_access
**Fullname:**
VPN Trigger detection
**Attribute Description:**
This attribute, if set to YES, indicates a VPN trunk group.

**Attribute:**
mbg_trans
**Fullname:**
MBG Transport
**Attribute Description:**
This attribute indicates whether the trunk supports receiving/sending MBG information on incoming/outgoing trunks between EO/localside and VPN switch. SFID270 must be unlocked via RC View 8.22 before mbg_trans may be set to DBYES.

**Attribute:**
far_e911
**Fullname:**
Far E911 indicator
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

The far_e911 attribute indicates if the Digital Cellular Switch (DCS) trunk group is dedicated to E911 traffic at the far end. A value of DBYES indicates that the far end of DCS trunk group is designated as being dedicated for E911 traffic. A value of DBNO indicates the trunk group is not a DCS trunk or the far end of a DCS trunk group is not designated as being dedicated for E911 traffic.

## 6. FC_TRUNK Population rules continued.

**Attribute:**
tdx_trk
**Fullname:**
Toll Digital Exchange Trunk
**Attribute Description:**
This attribute is used to indicate that the trunk is part of the Toll Digital Exchange (TDX) network. Only trunks having a service class of FC_LATA_CONN, FC_TTOLL_CONN, and FC_IEC may be part of this network. The TDX network can be used when feature SFID165 has been purchased.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute. Since this attribute applies to a trunk group, the detailed poprules are provided with the RLrctgrprk relation.

**Attribute:**
term_bill
**Fullname:**
Terminating Billing Indicator
**Attribute Description:**
This attribute indicates whether a call that egresses a Toll Digital Exchange (TDX) network should have an associated AMA billing record produced at the terminating TDX office. This attribute only applies to TDX trunks.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute. Since this attribute applies to a trunk group, the detailed poprules are provided with the RLrctgrprk relation.

**Attribute:**
ani_proc
**Fullname:**
TDX Automatic Numbering Identification (ANI) Table Processing indicator
**Attribute Description:**
This attribute indicates whether a call on a Toll Digital Exchange (TDX) trunk may have ANI Table Processing. TDX ANI Table Processing is a secured feature numbered SFID235. Both SFID165 and SFID235 must be active before the ani_proc attribute

Copyright © 1999 Lucent Technologies 

may be set to DBYES. Valid combinations of the TDX and ANI secured features are represented in the following diagram.

| SFID165 TDX | SFID235 ANI | Comments |
|---|---|---|
| Y | N | TDX Basic Call Processing only |
| Y | Y | TDX Basic CP and ANI Table Processing |
| N | N | neither feature |
| N | Y | invalid setting (if this condition is found during a retrofit, then SFID235 should be turned off and all the ani_proc attributes should be reset to N) |

In addition, this TDX ANI table processing indicator may only be set on trunks having an FC_LATA_CONN servclass.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute. Since this attribute applies to a trunk group, the detailed poprules are provided with the RLrctgrprk relation.

**Attribute:**
ccstrkidx
**Fullname:**
CCS Trunk Index
**Attribute Description:**
This attribute is used for SS7 PSU signaling only. The indexes are maintained by the RLrc_qidx relations.

**Attribute:**
isupmld
**Fullname:**
ISUP Message Loop Detection
**Attribute Description:**
ISUP message loop detection attribute. This attribute can only be set for SS7 trunk on per trunk group basis, which have RLrt_trkg.out_sigtype equal DBISUP7.

**Attribute:**
maxhopcnt
**Fullname:**
Maximum Hop Counter value
**Attribute Description:**
Maximum Hop Counter value, assignable on a per SS7 trunk group basis. Max Hop Counter value specifies the maximum number of contiguous SS7 inter-exchange circuits that are allowed per ISUP call. The initial value must be greater than the maximum number of exchanges that would normally

Copyright © 1999 Lucent Technologies 

be used to complete the call. The range for hop counter value is from 0 to 20. A value of 0 should only be used for non-isup trunk groups.

**Attribute:**
lrn_das
**Fullname:**
location routing number (LRN) digit analysis tree selector (DAS)
**Attribute Description:**
This attribute contains the digit analysis tree selector to be used for analyzing a location routing number that has been received in an IAM message associated with an ISUP trunk origination.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute. Since this attribute applies to a trunk group, the detailed poprules are provided with the RLrctgrprk relation.

**Attribute:**
mlppstage
**Fullname:**
Multi-Level Precedence and Preemption stage
**Attribute Description:**
Multi-Level Precedence and Preemption protocol stage on SS7 trunk group. STAGE1 protocol sends/receives PP Level in Calling Party Category. STAGE2 protocol sends/receives PP Level in MLPP Precedence Parameter. Only SS7 trunks having service class of FC_LTOLL_CONN, FC_TTOLL_CONN, or FC_PRI_INTOLL along with a PP trunk hunt-type may have this attribute set to either CCSPPST1 or CCSPPST2.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations.

**Attribute:**
ported
**Fullname:**
ported indicator
**Attribute Description:**
This attribute indicates if the trunk associated with this tuple is individually ported by the Number Portability feature. However, if the trunk is in a Terminal Group (TG), then the group ported indicator takes precedence over the individual ported indicator. The indicator that will be used (either the individual or the group ported indicator) will be the one that is displayed by Recent Change for the ported field on the line assignment views. See rc-oda-rules for more information.

**Attribute:**
mint_sig
**Fullname:**

Copyright © 1999 Lucent Technologies 

Mint signaling type.

**Attribute Description:**

This attribute is used to denote Mint signaling type

**Attribute:**

queue_inh

**Fullname:**

Queue inhibit indicator

**Attribute Description:**

This attribute is used to inhibit queuing

**Attribute:**

net_indicator

**Fullname:**

Network Indicator

**Attribute Description:**

Indicates if the call is entering or exiting an office from within (ON) or outside (OFF) of the network.

**Attribute:**

dal_egress

**Fullname:**

DAL (Direct Access Link) egress indicator

**Attribute Description:**

Indicates an outgoing or 2-way DAL trunk.

**Attribute:**

spc_pbx

**Fullname:**

Special PBX protocol indicator

**Attribute Description:**

This attribute identifies whether or not to send the new Dialed Number Identification Service (DNIS) protocols to the PBX. This is to distinguish PBXs that can only accept the standard protocol, versus the new protocol. If this bit is set to DBYES on RC View 5.1, the following protocols are sent, dependent upon the type of signaling used.

* DTMF - *ANI*DN* or **DN* or *ANI** or ***, depending on the information available
* MF - DN, without KP + ST

SFID271 must be unlocked via RC View 8.22 before spc_pbx may be set to DBYES.

**Attribute:**

dal_access

**Fullname:**

Direct Access Links (DAL) indicator

**Attribute Description:**

This attribute, if set to DBYES on RC View 5.1, indicates the Direct Access Links (DAL) feature is allowed for this trunk group.

SFID126 and SFID272 must be unlocked via RC View 8.22 before dal_access may be set to DBYES.

**Attribute:**

ct_trig

**Fullname:**

Cutthrough trigger

**Attribute Description:**

Trigger number to allow for triggering on feature group D (FGD) cutthrough calls

**Attribute:**

passani

**Fullname:**

Pass Automatic Number Identification (ANI) indicator

**Attribute Description:**

When this indicator is set to DBYES, then 2-stage Equal Access Multi-Frequency (EAMF) signaling will be used, that is, the ANI, if available, will be sent, on calls egressing the Long Distance Platform (LDP) network on a Local Area Transport Area (LATA) MF trunk to a Local Exchange Carrier (LEC) or a Private Branch Exchange (PBX).

When this indicator is set to DBNO, then the ANI may not be sent to the LEC or PBX (or the situation does not apply). Note that the ANI is normally sent to an Inter-Exchange Carrier (IC).

**Attribute:**

pref_npa

**Fullname:**

prefix NPA

**Attribute Description:**

This field is used to determine which NPA (if any) will be prefixed to a seven-digit destination number incoming to the switch on a LATA trunk.

**Attribute:**

dnis_user

**Fullname:**

Dialed Number Identification Service II (DNIS II) end user

**Attribute Description:**

This attribute, if set to DBYES, identifies a DNIS subscribed trunk for the Transport of Original Dialed Number feature. The original dialed number shall be sent out to the PBX as follows:

Copyright © 1999 Lucent Technologies 

PRI: At the terminating switch for PRI, in the Called Party Number Information Element of the Q.931 message.

MF: At the terminating switch for MF, in the Called Party Number signaling.

SFID498 must be unlocked before dnis_user may be set to DBYES. SFID498 is temporary and will only be supported in 5E13 BMI. Beginning in 5E13 SU, SFID498 will be replaced with SFID271.

**Attribute:**
acctprompt
**Fullname:**
Long Distance Platform (LDP) account code feature prompt
**Attribute Description:**
This attribute provides the LDP Account Code prompt type for incoming or two-way trunk groups where the LDP Account Code feature is active for the 400Hz Carrier Tone feature.

The following prompt types can be provided:

BEEP2: account code prompt of two audible beeps
ANNC: SAS announcement
CARRIER: 400Hz carrier tone
GLOBAL: prompt type assigned value of Glactprmpt

SFID498 must be unlocked before acctprompt may be assigned any value other than GLOBAL. SFID498 is temporary and will only be supported in 5E13 BMI. Beginning in 5E13 SU, SFID498 will be replaced with SFID165.

**Attribute:**
ct_for_dt
**Fullname:**
400Hz carrier tone for dial tone
**Attribute Description:**
Activation status for carrier tone to be applied instead of dial tone for an incoming or a 2-way trunk group.

**Attribute:**
ctxid
**Fullname:**
Context Identifier
**Attribute Description:**
This attribute indicates if the trunk associated with this tuple is unbundled or resold. A trunk is unbundled if ctxid = CTXID_UNBNLD; it is resold if ctxid = CTXID_RESOLD.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ldpsp1
**Fullname:**
Spare bit 1
**Attribute Description:**
A spare bit for future expansion

**Attribute:**
ldpsp2
**Fullname:**
Spare bit 2
**Attribute Description:**
A spare bit for future expansion

**Attribute:**
ldpsp3
**Fullname:**
Spare bit 3
**Attribute Description:**
A spare bit for future expansion

Corresponding tuples should have the same value for this attribute.

**Attribute:**
enh_psap_sig
**Fullname:**
Enhanced Public Safety Answering Point Signaling
**Attribute Description:**
This attribute is used to indicate that a trunk designated as a CAMA PSAP is using enhanced CAMA signaling. The cama_psap attribute must also be DBYES if this attribute is DBYES. This attribute can only be set to DBYES when the secured feature FGD Interface to E911 has been purchased ( SFID 299 is active ). SFID 299 is dependent on SFID 61.

**Attribute:**
tendigonly
**Fullname:**
E911 CAMA PSAP outpulse 10 digit only indicator
**Attribute Description:**
This attribute contains the E911 CAMA PSAP outpulse 10 digit only indicator. The enh_psap_sig attribute must be DBYES if this attribute is DBYES. When the tendigonly attribute is DBYES, only 10 digits will be outpulsed to the PSAP. If the tendigonly attribute is DBNO and enh_psap_sig attribute is DBYES, 20 digits will be outpulsed to the PSAP.

Copyright © 1999 Lucent Technologies 

**Attribute:**
cal_state
**Fullname:**
CALEA surveillance assignment state.
**Attribute Description:**
This field is used to indicate the assignment state for CALEA trunks for a specific case. If CRES, the trunk has not been assigned to a case. If CTONE, the trunk has been assigned to a specific case and the trunk may not be deleted.

**Attribute:**
inhibit_del
**Fullname:**
Inhibit Deletion
**Attribute Description:**
Inhibit deletion of trunk member. If inhibit_del is DBYES, deletion of member will be inhibited. See rc-oda-rules.

**Attribute:**
eonbill_dn
**Fullname:**
End Office Nodal (EON) Billing Number
**Attribute Description:**
The EON billing number is a ten digit DN which will be used to populate the ChargeNumber parameter of the TCAP Info_Collect message. When populated, eon_plan must also be populated. The format is NPA-XXX-XXXX.

SFID 515, must first be unlocked in order to assign this field a value.

**Attribute:**
eon_plan
**Fullname:**
End Office Nodal (EON) Numbering Plan
**Attribute Description:**
Numbering plan for the EON billing number. It identifies the numbering plan as ISDN or Action Point Number (APN). When populated eonbill_dn must also be populated.

SFID 515, must first be unlocked in order to assign this field a value.

**Attribute:**
eonpriv_ind
**Fullname:**
End Office Nodal (EON) Privacy Indicator

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Privacy indicator for the EON billing number. When set to DBYES it identifies the number as private.

**Attribute:**
eonpref_ind
**Fullname:**
End Office Nodal (EON) Prefix Indicator
**Attribute Description:**
When this indicator is set to DBYES, the FAR END NPA will be prefixed to a seven-digit dialed number incoming to the 5ESS-2000 switch on an EOLN2 trunk.

SFID 515 must first be unlocked in order to assign a value to this field.

**Attribute:**
rel_link_init
**Fullname:**
Release Link indicator
**Attribute Description:**
Indicates whether this trunk is eligible for Release Link processing.

**Defines:**
"db/DMnpanxx.h",
"db/DMpcidx.h",
"db/DMparty.h",
"db/DMlinkno.h",
"db/DMvpidb.h"

## 4. Population Rules for RLfc_wz1

**Relation Description** World zone one region digit lookup for CI.
World zone one region digit lookup for Carriers which provide connection between LATAs and serving areas where the calling and called customers are located in World Zone 1.

One can dial 1+npa+directory number for Alaska, Hawaii, Canada, Mexico, Caribbean, and Puerto Rico.

**Attribute: npa**

**Fullname:** world zone one area code

**Attribute Description** World zone one area code. The current NPAs are for Alaska (907), Hawaii (808), Canada (403, 604 204, 506, 709, 902, 519, 705, 613, 416, 514, 418, 306, 819, and 807), Mexico (706 and 905), and the Caribbean, including Puerto Rico (809). Other NPAs may be added as network conditions require.

**Attribute: wz1_r_dig**

**Fullname:** world zone one region digit

**Attribute Description** World zone one region digit.Ranges from 0 to 9.

## 4. Population Rules for RLfccavctk

**Relation Description** Feature control CAMA verification .
Feature control CAMA verification trunk information.

**Attribute: port**

**Fullname:** Port.

**Attribute Description** This attribute is divided into sub-attributes port.member and port.module. Member is the port name of the trunk. Module refers to the Switching Module number with possibilities from 1 to 192. All incoming CAMA trunks have a tuple in this relation. (that is, for each tuple in FC_PORTTYP with a class of service of FCCA_ANI or FCCA_ONI, a corresponding tuple exists in this relation.)

**Attribute: port.member**

**Fullname:** member.

**Attribute Description** Trunk member.

**Attribute: port.module**

**Fullname:** Module.

**Attribute Description** Residing Switching Module.

**Attribute: vcdata**

**Fullname:** Valid office data.

**Attribute Description** This attribute is divided into sub-attributes vcdata.offcnt, vcdata.orignpa, and vcdata.offcode. Offcnt is the number of office codes supported by this CAMA trunk (maximum of 8). This is a 3-bit field with an 8 represented by a 0. Orignpa is the area code for the subtending CAMA office supported by this port. Offcode is an array (max of 24) which stores the office codes supported by the subtending office. These office codes are used to verify CAMA billing numbers. Each office code is stored as a three-digit string indexed by offcnt. (For example, if offcnt = 2 then offcode contains 6 digits.) Non-used array elements are set to NULL. All members of a trunk group must have identical vcdata attributes and which must also match the vcdata attribute in the RLRCTGRPRK relation.

**Attribute: vcdata.offcnt**

**Fullname:** Office count.

**Attribute Description** Digits count.

Copyright © 1999 Lucent Technologies 

**Attribute: vcdata.orignpa**

**Fullname:** Originating NPA,

**Attribute Description** Originating NPA.

**Attribute: vcdata.offcode**

**Fullname:** Office code.

**Attribute Description** Office code.

**Attribute: trf_samp**

**Fullname:** Traffic sampled.

**Attribute Description** This attribute is set to DBYES if this CAMA trunk is traffic sampled.

**Attribute: ffcf[*]**

**Fullname:** Future feature reserve.

**Attribute Description** Boolean reserved for future field feature.

## 4. Population Rules for RLfceainfo

**Relation Description** EAS information digits for international and domestic calls.
Equal access signaling information digits for international and domestic calls.

As of 5e9(1), this relation could be populated according to the following chart:

| II | Description | Intl | Domes |
|---|---|---|---|
| 00 | Identified Line | FCEA10ANI | FCEA10ANI |
| 01 | ONI (Multiparty) | FCEABLOCK | FCEA3ANI |
| 02 | ANI Failure | FCEABLOCK | FCEA3ANI |

Copyright © 1999 Lucent Technologies

| | | | |
|---|---|---|---|
| 06 | Hotel/Motel | FCEA10ANI | FCEA10ANI |
| 07 | Coinless, Hospital, etc. | FCEA10ANI | FCEA10ANI |
| 08 | Inter-LATA Restriction | FCEABLOCK | FCEAALW800 |
| 10 | Test Call | FCEABLOCK | FCEATEST |
| 12-19 | Not Assigned, conflict INX | FCEABLOCK | FCEAINC |
| 20 | AIOD | FCEA10ANI | FCEA10ANI |
| 23 | Unknown-Coin or Coinless | FCEABLOCK | FCEA310ANI |
| 24 | Pretranslated 800 Call | FCEABLOCK | FCNONEA |
| 27 | Coin | FCEABLOCK | FCEA310ANI |
| 61 | Cellular Service | FCEA10ANI | FCEA10ANI |
| 68 | Inter-LATA Restr-Hotel/Mot | FCEABLOCK | FCEAALW800 |
| 78 | Inter-LATA Restr-Coinless | FCEABLOCK | FCEAALW800 |
| 95 | Test Call | FCEABLOCK | FCEATEST |

The other international II digits default to FCEABLOCK. The other domestic II digits default to FCNONEA.

**Attribute: iidig**

**Fullname:** Information Digits

**Attribute Description** Key - determines the type of calls that are allowed to be international or domestic outbound.

**Attribute: intl**

**Fullname:** EAS information digits for international calls.

**Attribute Description** Tells what EA calls are allowed based on the information (II) digits.

**Attribute: domes**

**Fullname:** EAS information digits for domestic calls.

**Attribute Description** Tells what EA calls are allowed based on the information (II) digits.

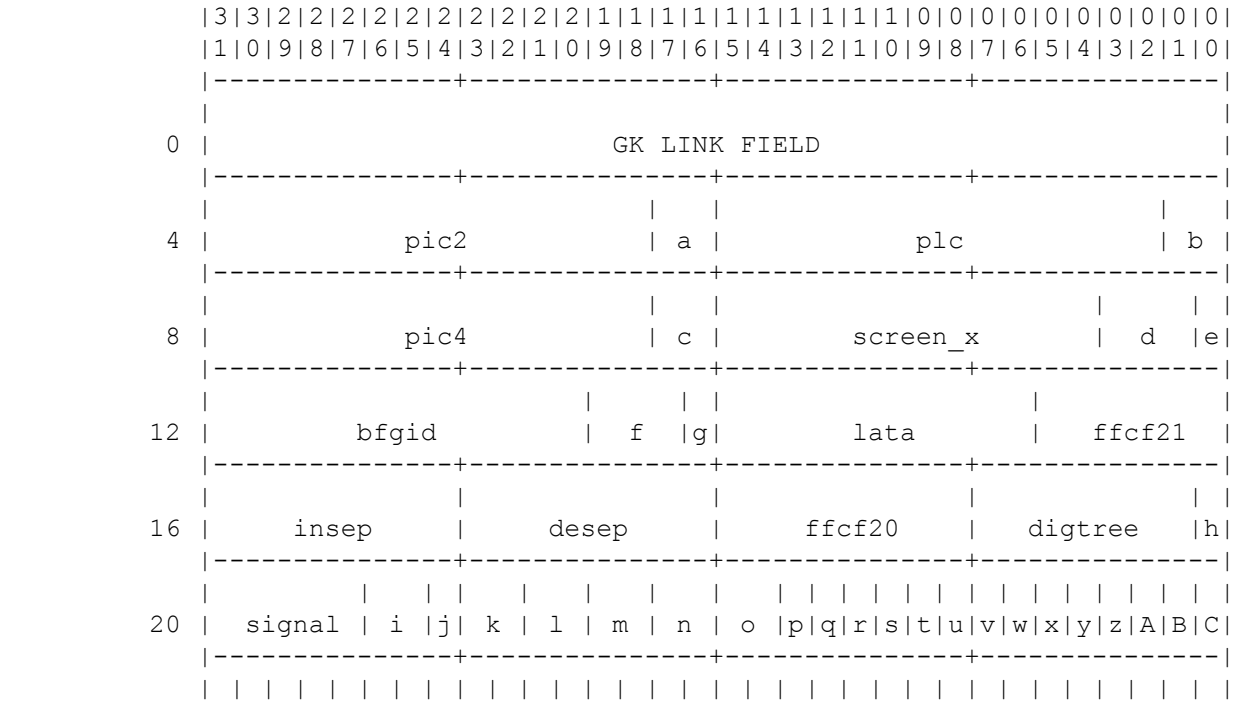
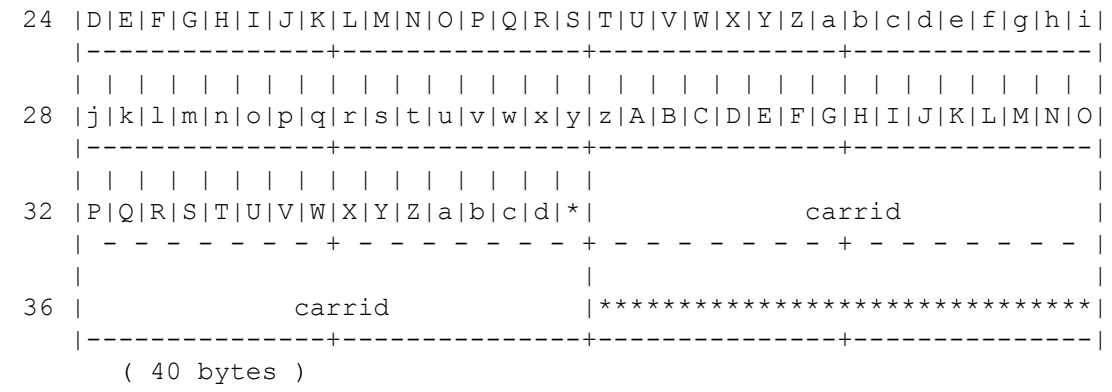
Stored Tuple Layout FCFT_G





## 4. Population rules for RLfcft_g

**Relation Description**

There are no population rules for this relation.

# FCGRP_G

## 1. Description

This relation contains the feature data for trunks. This is a root storage relation for RLfc_trunk that contains attributes that are common for trunks in a trunk group.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 2000 |
| expected tuples | 100 |
| access type | DBACC_GK |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTORAGE |
| ks key store | AUTO |
| foldtype | DBGC31 |
| spare space | 16s |
| gkidxrel GK-index relation | rlGRP_I |

## 3. Field Layout

## 4. Population Rules for RLfchotmot

**Relation Description** Hotel Motel register.

**Attribute: port_name**

**Fullname:** Port name.

**Attribute Description** Name of port controlling hotel motel terminal.

**Attribute: port_name.member**

**Fullname:** Member.

**Attribute Description** Port name representing the line that has a message register assigned to it. This same port_name must be defined in FC_PORTTYP relation and given a 'servclass' of PBXHOTMOT or FC_HOTMOTL. This line should route as all other lines but with a separate charge_index any MBI enumeration is acceptable.

**Attribute: port_name.module**

Copyright © 1999 Lucent Technologies

**Fullname:** Module.

**Attribute Description** IM number. The  tuple is populated on this module only.

**Attribute: mregister**

**Fullname:** Message Register.

**Attribute Description** Sleeve lead control  of hardware message register.

**Attribute: mregister.member**

**Fullname:** Member.

**Attribute Description** Port name represting  the distributor point of the register. This mregister port name must be defined  in relation FC_PORTTYP with all attributes marked as default values or null except for 'servclass' which should be equal to FC_MSGREG.

The same message register port MAY be assigned to more than one line.

**Attribute: mregister.module**

**Fullname:** Module.

**Attribute Description** IM Module.

## 4. Population rules for RLfcline_r

**Relation Description**

There are no population rules for this relation.

Copyright © 1999 Lucent Technologies

# FCNPAMAP

## 1. Description

This relation converts NPA-NXX to a value from 0-12799 which is combined with the line (XXXX) portion of the dn and used to retrieve screening information from the SM indicated by module. The keys are constructed by taking the NPA portion, converting it to binary, and using it as the first key; then taking the NXX portion, converting the result to binary, and using it as the second key. The keys are not stored.

## 2. Data Dictionary Values

## 4. Population Rules for RLfcnpamap

**Relation Description** NPA map
Used to map an NPA-NXX to a Large Normalize Office Code (LNOC) value.

Converts NPA-NXX to a value from 0-12799 which is combined with the line (XXXX) portion of the dn and used to retrieve screening information and/or true billing information for hotels from the SM indicated by module. The keys are constructed by taking the NPA portion, converting it to binary, and using it as the first key: then taking the NXX

Copyright © 1999 Lucent Technologies 

portion, converting it to binary, and using it as the second key.

The average number of tuples for this relation is 1000. The much larger maximum is provided for those OSPS offices with a broad geographic coverage.

Whenever an SM is removed from eligibility, any OSPS screening data MUST be redistributed among the remaining eligible SMs.

Each eligible SM should be indicated no more than the number of times given by MAXMOD = ((number of RLfcnpamap tuples) / (number of eligible SMs)) + 1. The purpose of this restriction is to distribute the screening data across all eligible SMs and divide the load on each SM.

If possible, it would be most efficient to assign screening data for an NPA-NXX to an SM on which calls from that NPA-NXX may terminate. This would eliminate the SM to SM messages necessary to retrieve the screening data for the call.

**Attribute: bnpa**

**Fullname:** binary NPA

**Attribute Description** This is the NPA for the line converted to binary.

**Attribute: bnxx**

**Fullname:** binary NXX

**Attribute Description** This is the NXX for the line converted to binary.

WARNING: NXXs under 200 do not conform to Bellcore Network Standards and may cause routing errors.

**Attribute: lnoc**

**Fullname:** large normalized office code

**Attribute Description** These should be assigned sequentially, beginning at zero as each NPA-NXX is populated. Value 12799 is reserved as the value for terminating exception area entries (see rules for the eai attribute).

**Attribute: module**

**Fullname:** module

**Attribute Description** This is the module number of the SM containing the screening data and/or true billing information for hotels for each NPA-NXX. An eligible SM is defined as an SM which is not an RSM and which is an operational SM, that is, an SM for which there is a type PCMP tuple in RLcktdata which has eqstat set to SMOPER or, alternatively, an SM whose entry in RLmodatt has eqstat = SMOPER and imtype != RSM. OSPS PSMs are considered eligible SMs. Only eligible SMs may be indicated by this attribute. The purpose for the restriction on RSMs is conservation of real-time. The distribution type indicates that eligible SMs should also be SMs which carry OSPS operator traffic, or are PSMs.

Zero is not allowed on the RC/ODA form and is to be mapped to unknown.

**Attribute: grupnm**

**Fullname:** trunk group number

**Attribute Description** trunk group number

**Attribute: grptype**

Copyright © 1999 Lucent Technologies 

**Fullname:** trunk group type

**Attribute Description** trunk group type - TM_TRK If multiple trunk groups serve the same NPA-NXX and exception areas, the exceptional area trunk should be selected. If grupnum is 0, operator initiated delayed calls are not allowed. If grupnum is non-0, operator initiated delayed calls are allowed and grupnum and grptype form a key of type porttype into RLrctgrprk. This determines screen_x and digtree used for the operator entered back number and forward number.

**Attribute: eai**

**Fullname:** exception area index

**Attribute Description** Population Rules for RLfcnpamap (FS-II) EAI and LATANUM attributes. RLfcporttyp.servclass = FC_ISPOPR.

(I) An OSPS Switch with multiple digit tree configuration. (As in an OSPS which resides in the Local network, such as integrated with an Access Tandem)

(1) Glatmap = DBNO (Lata mapping turned off)

(2) Glexdet = DBYES (exception area determination turned on)

(3) Populate entries for ORIGINATING NPA-NXX which are part of the OSPS served area AND is a privileged or compete exception area.

(a) LATANUM = 0 (default)

(b) EAI set to the value representing the area this NPA-NXX belongs to (may not be 0).

(II) An OSPS Switch which does not contain multiple digit trees. (As in an OSPS which resides in the Toll network, such as integrated with a Toll switch).

(1) Glatmap = DBYES (Lata Mapping turned on)

(2) Populate entries for ALL ORIGINATING NPA-NXX which are part of the OSPS served area. These must be populated regardless of the existence of exception areas.

(a) LATANUM set to a value representing the LATA which this NPA-NXX resides. A range from 2-31 (may not be 0).

(b) If this NPA-NXX is an exception area and exception area determination is to be used (Glexdet = DBYES) set EAI to a value representing this area. Otherwise set to 0 (default) to indicate not an exception area.

(3) Populate entries for ALL TERMINATING NPA-NXX which a caller may dial on a 0+7 digit or 1+7 digit basis and which will be routed to the OSPS over a trunk using standard (non-MFJ) operator signaling. When this is done, ISP determines the terminating LATA number from this relation rather than from digit analysis. Without regard to whether a call dialed like this is in the area served by this OSPS, the LATANUM and EAI should be set to appropriate values, as described in the following items a, b and c. If exception area mapping is not done, no entries are needed for TERMINATING NPA-NXX combinations not in the area served by this OSPS if they

Copyright © 1999 Lucent Technologies 

are dialed on a 0+10 Digit or 1+10 Digit basis or if they are dialed on a 7 digit basis and are signaled over trunks using operator equal access signaling.

(a) LATANUM set to a value representing the LATA in which this NPA-NXX resides. Valid entries range from 1-15 (may not be 0). This value must coincide with those values populated for RLdaprmfnl.term_lata for this NPA-NXX.

(b) If this NPA-NXX is an exception area and exception area determination is to be used (Glexdet = DBYES), set EAI to a value representing this area. Otherwise set to 0 (default).

(c) For a TERMINATING ONLY NPA-NXX it is valid to have a non-zero EAI and/or a LATANUM in the range from 1-15. It is not valid for both the EAI and the LATANUM to be zero if grupnm is zero.

(III) Common RLfcnpamap rules (Glatmap = DBNO or DBYES)

(1) Populate entries for all TERMINATING NPA-NXX which are NOT part of the OSPS served area, but are exception areas which this OSPS may terminate calls too.

(a) Glexdet = DBYES (exception area determination turned on)

(b) LATANUM = 1 (outside of OSPS served area)

(c) EAI set to the value representing the area this NPA-NXX belongs to (must be non-zero).

(d) Since this situation is for terminating entries, LNOC, trunk group and SM should be set to their appropriate default values:
LNOC = 12799

(2) EAI entries made into RLfcnpamap depend upon having at least one corresponding tuple in the RLoaexmap relation where the terminating (teai) or originating (oeai) attribute is equal to this EAI.

(3) Many NPA-NXX office codes in a given LATA may be consolidated into one exception area having one EAI representing them. This would be desirable when the exception area treatment is to be the same for all the office codes in this group.

***NOTE:*** Exception Areas refer to both privileged and compete areas where LEC's are allowed to carry inter-LATA traffic. From an AT or Toll switches perspective in the network there is no distinction between the two and are simply referred to as exception areas.

Exception area index: range 0-250.
zero, then the NPA-NXX is not an exception area. If non-zero then eai defines a unique index for a LATA exception area that must appear in a tuple in RLOAEXMAP.

Special cases:
On LATAs that are adjacent to LATAs that the OSPS serves, There must be a tuple for all PRIV (privileged) areas (Extended Area Service) and a tuple for NPA-NXXs which are exception areas but not served by OSPS. In this case, the other attributes may take on any values.

Copyright © 1999 Lucent Technologies 

Default: 0.

**Attribute: latanum**

**Fullname:** LATA number

**Attribute Description** SEE EAI usage also.
LATA number of NPA-NXX. All NPA-NXXs within a given LATA should have the same latanum. This defines the LATA index for a given NPA-NXX. If the NPA-NXX is outside of the area that the OSPS serves then latanum should be 1. Default is 0 when LATA mapping is turned off (Glatmap= DBNO). Range: 2-31 with 0 & 1 having special meaning as stated before

**Attribute: phr_id**

**Fullname:** announcement phrase id

**Attribute Description** This attribute contains the announcement phrase ID used by the Independent Company Announcement Branding feature in providing branding for 0+ intra-LATA calls. The phrase should contain the name of the carrier eligible for branding. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: spare**

**Fullname:** Spare

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population Rules for RLfcpcc_cc

**Relation Description** PCC to CC Translations
This relation does the Pseudo/Paired Country Code to Country Code Translation for the traditional 2-stage internation outbound call. The first stage (011 + PCC or 18X) of the signaling will be handled by the regular FC Call Processing through digit translation with destination type of FCIDDDFCA.

Copyright © 1999 Lucent Technologies 

The second stage of the international call will be the address sequence, containing either a Pseudo Country Code (PCC) or a Country Code (CC) and a National Number (NN), that is (KP + PCC/CC + NN + ST).

This relation will be read to accomplish one of two things:

(1) Convert a PCC to a CC or

(2) Determine the length of an incoming CC.

PCC is always 3 digits and a CC can be of variable length ( 1 to 3 digits). Multiple reads of the RLfcpcc_cc relation may be required. The first read will be analyzing all of the 3 digits just collected. If this read is successful and RLfcpcc_cc.pcc_ind is set to DBYES than the address sequence contains the PCC. If a PCC is present in the address sequence it must be replaced with the CC from the same tuple. If RLfcpcc_cc.pcc_ind is set to DBNO then a CC is present in the address sequence. On the other hand, if the first read failed then the first 3 digits were not a PCC or a 3 digit CC. We will read this relation again with only the first 2 digits. If this read successeds then we have a 2 digit CC. If the second read failed then we will read the relation again with the first digit. The read should successed indicating that a 1 digit CC is present. If the third read should fail, this indicates that there was not a valid PCC or CC is present.

This relation will contain all current pseudo/paired country codes and country codes.

All pseudo country codes will have another tuple in this relation for the matching country code. But not all country codes will have a matching (another tuple) pseudo country code."

**Attribute: digcnt**

**Fullname:** Digit Count

**Attribute Description** Key - Number of digits in the pcc_cc attribute.

**Attribute: pcc_cc**

**Fullname:** Pseudo Country Code or Country Code

**Attribute Description** This key could be a 3-digit Pseudo Country Code or a 1 to 3 digit Country Code. Pseudo Country Code (PCC) is the same as Paired Country Code. The PCC and CC are set up to be non-conflicting. That is, if there is a PCC 'XYZ', there will never be a CC which is X, XY, or XYZ.

**Attribute: cc**

**Fullname:** Country Code

**Attribute Description** The cc is the Country Code that the pcc_cc was converted to. If the pcc_cc is a country code then the cc is the same.

**Attribute: cc_len**

**Fullname:** Length of Country Code

**Attribute Description** Indicates length of the CC attribute

**Attribute: pcc_ind**

**Fullname:** PCC Indicator

**Attribute Description** Indicates if the pcc_cc attribute is a pseudo country code

```
DBYES   - Yes, pcc_cc is a pseudo country code
DBNO    - No, pcc_cc is not a pseudo country code
```

## 4. Population Rules for RLfcrsmcar

**Relation Description** RSM carrier data
Feature Control RSM/Carrier Data

**Attribute: carrid**

**Fullname:** Carrier ID

**Attribute Description** Indicates the carrier identifier.

**Attribute: featgrp**

**Fullname:** Feature Group carrier type

**Attribute Description** Indicates which feature group this carrier belongs to.

**Attribute: rsm_num**

**Fullname:** RSM number

**Attribute Description** RSM number.
All RSMs with the same cluster id as defined by RLmodatt should have the same non-key attribute values for each carrid.

**Attribute: intra_ind**

**Fullname:** Intra_LATA indicator

**Attribute Description** Set to DBYES if the carrier accepts intra_LATA calls, Set to DBNO, otherwise.

**Attribute: osps_serves**

**Fullname:** OSPS serves

**Attribute Description** This indicates that the osps serves calls with the carrier 'carrid' with the back party on the 'rsm_num' SM.
DBYES - serves calls

**Attribute: domes_di**

**Fullname:** Domestic destination index

**Attribute Description** A destination index which results in routing to carrier trunks. 0 means routing to carrier trunks not allowed.

**Attribute: domes_ri**

**Fullname:** Domestic route index

**Attribute Description** A route index which results in routing to carrier trunks. 0 means routing to carrier trunks not allowed.

**Attribute: trans_ri**

**Fullname:** transition calls destination index

**Attribute Description** Transition calls destination index. 0 means routing to carrier trunks not allowed.

**Attribute: trans_di**

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLfcscrcde

**Relation Description** Originating line screening (OLS) screen code table.

Relation is used by OLS to associate class-of-charge (COC) screening text with a screen code value.

The distribution class for RLFCSCRCDE is Group Partitioned. Each PSM contains a complete copy of the relation (a PSM is an SM with OSPS operator positions attached). RLFCSCRCDE is not populated in the AM or any SM without attached OSPS operator positions. This means that in RLDB_GPDUS the grp_type should be set to GPD_OSPS and the grp_id should be set to 1.

This relation is heavily interdependent with the RLFCSCRLNE and RLFCSCRRNG relation. As each screened dn is entered in RLFCSCRLNE or RLFCSCRRNG, this relation must be checked to verify that the screen code is populated."

**Attribute: scrncode**

**Fullname:** Screen code

**Attribute Description** 0 for this key means not screened. 999 is reserved for testing.

**Attribute: scrntext**

**Fullname:** screen text: text associated with the screen code to be displayed on the VDT

**Attribute Description** Any printing ASCII characters as comments for display on VDT.

Copyright © 1999 Lucent Technologies 

# FCSCRLNE

## 1. Description

Holds the screen code, coin line bit and routing flag bits associated with a directory number; indexed by large noc (NPA-NXX translation) + line number (XXXX). Key is not stored.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 250000 |
| expected number of tuples | 690 |

## 4. Population Rules for RLfcscrlne

**Relation Description** FC Screen Line number.

This relation holds the screen code, coin flag bit and routing flag bits associated with a directory number: indexed by large noc (NPA-NXX translation) + line number (XXXX). Key is not stored.

**Attribute: lnoc**

**Fullname:** lnoc

Copyright © 1999 Lucent Technologies

**Attribute Description** This consists of the lnoc translation for the NPA-NXX for the screened line.

**Attribute: lnnum**

**Fullname:** line number

**Attribute Description** This is the line number, a number from 0000-9999. (Lnoc + lnnum are referred to as lnocdn.)

**Attribute: scrncode**

**Fullname:** Screen Code

**Attribute Description** Any value from 0-999, zero is reserved to mean not screened; screen code 999 is reserved for testing.

**Attribute: to_pos**

**Fullname:** TO operator POSition
**Attribute Description** If all 0+ calls originating from this dn are to be routed to a position, this attribute is set to DBYES; otherwise DBNO. This is a local administration option, not necessarily related to any flags set in RLfcscrcde.

**Attribute: tbnf**

**Fullname:** True Billing Number Flag
**Attribute Description** If there is a true billing number associated with this dn, this attribute is set to DBYES; otherwise DBNO. Whenever this flag is set to DBYES, there must be an entry in RLFCTBNTBL for this lnocdn (subnbr).

**Attribute: coin_line**

**Fullname:** coin line
**Attribute Description** This bit indicates a coin line, which may or may not be screened. If this is not a coin line set to DBNO, otherwise set to DBYES if a coin line.

**Attribute: origtyp**

**Fullname:** ORIGinal station TYPe
**Attribute Description** This is the type of originating station.

**Attribute: sab**

**Fullname:** Subaccount Billing
**Attribute Description** This attribute is set to DBNO if Subaccount Billing is denied; otherwise DBYES.

**Attribute: spare1**

**Fullname:** spare bit 1
**Attribute Description** This attribute is to be used for fast/special features.

**Attribute: spare2**

**Fullname:** spare bit 2
**Attribute Description** This attribute is to be used for fast/special features.

**Attribute: spare3**

**Fullname:** spare bit 3
**Attribute Description** This attribute is to be used for fast/special features.

**Attribute: spare4**

**Fullname:** Spare Bit 4
**Attribute Description** Spare field for fast features. For ALL features, use the space from this field

**Copyright © 1999 Lucent Technologies** 

before increasing the tuple size of this relation.

**Attribute: spare5**

**Fullname:** Spare Field 5

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

# FCSCRRNG

## 1. Description

Holds the screen code, coin flag bit, and routing flag bits associated with a range of directory numbers; indexed by large noc (NPA-NXX translation).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 5120 |
| expected number of tuples | 27 |
| density | 61 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLfcscrrng

**Relation Description** FC Screened Range

Holds the screen code, coin flag bit and routing flag bits associated with a range of directory numbers: indexed by large noc (NPA-NXX translation).

**Attribute: tupnum**

**Fullname:** tuple number

**Attribute Description** A number indicating which tuple of ranges for an lnoc this one is.

**Attribute: lnoc**

**Fullname:** Large noc

**Attribute Description** Large noc. Each lnoc has an entry in RLfcnpamap.

**Attribute: entries**

**Fullname:** entries

**Attribute Description** The number of entries in the arrays of ranges. This counts all of the entries filled in all of the tuples with the same lnoc as part of the key.

**Attribute: range[*]**

**Fullname:** range

**Attribute Description** Each attribute contains the beginning and ending line numbers (XXXX) plus the screening information and coin information for that group of lines. Since these attributes represent ranges of screened and/or coin lines, not all will be used in some tuples.

**Attribute: range[*].begln**

**Fullname:** beginline

**Attribute Description** the first line number (XXXX, 0000-9999) of the range of screened lines.

Copyright © 1999 Lucent Technologies 

**Attribute: range[*].spare1**
**Fullname:** spare bit 1

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].spare2**
**Fullname:** spare bit 2

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].endln**
**Fullname:** endline

**Attribute Description** the last line number (XXXX, 0000-9999) of the range of screened lines.

**Attribute: range[*].to_pos**
**Fullname:** to position

**Attribute Description** If all 0+ calls originating from a dn in this range are to be routed to a position, this attribute is set to DBYES; otherwise DBNO. This is a local administration option, unrelated to flags set in RLfcscrcde.

**Attribute: range[*].coin_lines**
**Fullname:** coin lines

**Attribute Description** This flag indicates that this range belongs to coin lines ONLY (which may or may not be screened). When this bit is set, this range MUST only contain coin lines and may not be combined with other traffic (Noncoin, Hotel-Motel, etc). If a coin line range, this attribute is set to DBYES; otherwise DBNO.

**Attribute: range[*].scrncode**
**Fullname:** screencode

**Attribute Description** Any value from 0-999, zero is reserved to mean not screened; a range populated in this relation with a zero screen code should not have scr_cc or scr_pd set to DBNO. Each scrncode, except zero, must also have an entry in RLfcscrcde. Screen code 999 is reserved for testing.

**Attribute: range[*].tbnf**
**Fullname:** true billing number flag

**Attribute Description** If there is a true billing number associated with this range, this attribute is set to DBYES; otherwise DBNO. Whenever this flag is set to DBYES, there must be an entry in RLfctbntbl for the begln of the range.

**Attribute: range[*].origtyp**
**Fullname:** originating station type

**Attribute Description** This is the type of originating station, chosen from the enum values in DMsvc.

**Attribute: range[*].sab**
**Fullname:** subaccount billing

**Attribute Description** This attribute is set to DBNO if subaccount billing is denied for this range of back numbers; otherwise DBYES.

Copyright © 1999 Lucent Technologies 

**Attribute: range[*].spare3**

**Fullname:** spare bit 3

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].spare4**

**Fullname:** spare bit 4

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: range[*].spare5**

**Fullname:** spare field 5

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

# FCTBNTBL

## 1. Description

This relation holds the true billing number associated with a dn; accessed by large noc (NPA-NXX translation) + line number (XXXX).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 20480 |
| expected number of tuples | 92 |
| density | 73 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

## 4. Population Rules for RLfctbntbl

**Relation Description** true billing number table
Holds the true billing number associated with a dn; accessed by large noc (NPA-NXX translation) + line number (XXXX).

**Attribute: lnocdn**

**Fullname:** large noc dn

**Attribute Description** Large noc (0-12799) + line number (XXXX = 0000-9999). If the TBN is for a range, the lnocdn is the lnoc + the begln (from RLfcscrrng) of the range.

**Attribute: lnocdn.lnoc**

**Fullname:** large noc

**Attribute Description** large noc

**Attribute: lnocdn.digits**

**Fullname:** line number

**Attribute Description** Line number. The begln (from RLfcscrrng) of the range or lnnum for RLfcscrlne.

**Attribute: tbn**

**Fullname:** true billing number

**Attribute Description** A 7-digit (NXX-XXXX) or 10-digit (NPA-NXX-XXXX) true billing DN. The NPA and the NXX is of the format [2-9][0-9][0-9], where [n-m] defines the range of digits which are allowed in that position. This matches the current format for domestic USA NPA and NXX. XXXX is any number between 0000 and 9999.

**Defines:** "db/DMnpa.h",
"db/DMnxx.h",
"db/DMlocdig.h"

## 4. Population Rules for RLfeatbn

**Relation Description** ISDN feature to button.
Provides relationship between ISDN configuration group and feature to button function

For every tuple populated in rlFEATBN, there must a corresponding tuple in rlBNFEAT. In other words, if there is a rlFEATBN tuple for a particular CONFIG and BUTTON, there must be a rlBNFEAT tuple mapping the CONFIG and BUTTON to the same ACTION and MFT. I say MFT because the FID in rlFEATBN might be wildcard while the one in rlBNFEAT might not be.

The CONFIG, FID, and ACTION must be unique. The CONFIG, CPE_COMP, and BUTTON must also be unique. In other words, for a given configuration, a FID/ACTION pair maps to exactly one CPE_COMP/BUTTON pair and vice versa.

Copyright © 1999 Lucent Technologies

NUMBER OF TUPLES:
One tuple for each ISDN configuration, feature id and feature action combination that requires inverse mapping to RLbnfeat. The following subset of modular features and actions requires tuples here and in RLbnfeat.

| Modular Feat | Action | Description |
|---|---|---|
| AC: | ACN_ACCFB | LASS Automatic Callback cancel |
| | ACN_ACUFB | LASS Automatic Callback use |
| ACB: | ACN_ACBFBP | ISDN Act/Deact/Answer ACBC |
| ACTR: | ACN_IDNACT | ISDN Atnd change ACVT restriction for a DN |
| | ACN_ATFACT | ISDN Atnd activate ACVT feature for a DN |
| | ACN_ATFDCT | ISDN Atnd deactivate ACVT feature for a DN |
| | ACN_IGACT | ISDN Atnd change ACVT retriction for a group of DNs |
| | ACN_ATGACT | ISDN Atnd activate ACVT feature for a group of DNs |
| | ACN_ATGDCT | ISDN Atnd deactivate ACVT feature for a group of DNs |
| AR: | ACN_ARCFB | LASS Automatic Recall cancel |
| | ACN_ARUFB | LASS Automatic Recall use |
| ARS: | ACN_ARS1USE | use automatic route selection plan 1 |
| | ACN_ARS2USE | use automatic route selection plan 2 |
| | ACN_ARSUSE | use automatic route selection plan 2 |
| ASPO: | ACN_ASPNORM | ASP Originating / ODP |
| | ACN_IASNORM | ASP Originating / IDP |
| ATH: | ACN_ATHUSE | Authorization Codes use code |
| CFW: | ACN_BNTOG | ISDN Activate/Deactivate CF |
| | ACN_INIGHT | ISDN Atnd night service |
| | ACN_TOGDCT | ISDN Wild card action, deact all CF feats |
| | ACN_CFBN | Standard ISDN CF activate/ deactivate |
| COT | ACN_COTFBP | COT use |
| CPI: | ACN_CPNBNFBT | Activate/Deactivate CPN/BN feature |

The following data dependency rule is written for the MFCPI modular feature.

```
   RULE about RLfeatbn.action:
for every tuple in RLfeatbn
   begin
   if (RLfeatbn.action = ACN_CPNBNFBT) then
      begin
         type = (RLfeatbn.fid >> 10);
         if (type != MFCPI)
            begin
               error: 'Invalid modular feature type for action
                  ACN_CPNBNFBT';
            end
         must find exactly 1 tuple in RLcpnbn_cf
            where ((RLcpnbn_cf.fid equals RLfeatbn.fid) and
                   (RLcpnbn_cf.act_type equals ACTCD) and
                   (RLcpnbn_cf.deact_type equals DCTCD));
      end
   end
```

ACN_CLTOG      ACD/BRCS Closed
ACN_CWLMP      ACD/BRCS Calls Waiting Lamp
ACN_ECUSE      ACD/BRCS Event Code
ACN_EMUSE      ACD/BRCS Emergency
ACN_LGNTOG     ACD/BRCS Login/Logout
ACN_MBTOG      ACD/BRCS Make Busy
ACN_SAUSE      ACD/BRCS Service Assist
ACN_SOTOG      ACD/BRCS Service Observe
ACN_FLASH      WIRELESS Centrex FLASH
```

**Attribute: config**

**Fullname:** configuration id.

**Attribute Description** This number should be assigned sequentially starting with 1. Must be created before being assigned to RLis_term.config. A single config may be assigned to many ISDN BRCS terminals. This key is created sequentially with hole-reuse implemented.

Copyright © 1999 Lucent Technologies 

**Attribute: fid**

**Fullname:** feature id.

**Attribute Description** (KEY) Feature id associated with particular button number. Must have an entry in RLfacname and RLfid2name.

The wildcard fid must be used for all modular feature types regardless of the fid that is entered for RLbnfeat with four exceptions:

(1) For the action ACN_BNTOG for Call Forwarding (MFCFW), the RLfeatbn.fid must not be wildcard fid. The unique fid that is entered for RLbnfeat.fid is used in RLfeatbn.fid.

(2) For the action ACN_MWITD for Multiway (MFMWY), the RLfeatbn.fid must not be wildcard fid. The unique fid that is entered for RLbnfeat.fid is used in RLfeatbn.fid.

(3) For the action ACN_CNDFBP for ICLID Calling Number Delivery, the fid (either unique or wildcard) that is entered for RLbnfeat.fid is used in RLfeatbn.fid.

(4) For the actions ACN_DCTMWI, ACN_MRDUSE, and ACN_PODUSE for MSS, the fid (either unique or wildcard) that is entered for RLbnfeat.fid is used in RLfeatbn.fid.

The NULL modular feature does not have a Wildcard fid. More restriction to check the INVOKE type is needed. Only when the INVOKE type is CODE ( Dial Call Waiting ), the action ACN_CWDLU ( ISDN Call Waiting ) associated with the modular feature CWT can be assigned to the particular button number. That is, when RLcw_cf.typinv(bnfeat.fid) == CWIN_IDIAL, then RLbnfeat.fid must be of MF type CWT such that for that associated action : RLbnfeat.action = ACN_CWDLU.

**Attribute: action**

**Fullname:** action.

**Attribute Description** Subset of action enumerations in RLbnfeat. Not all actions in bnfeat are allowed here.

**Attribute: cpe_comp**

**Fullname:** Customer Premises Equipment component.

**Attribute Description** Customer Premises Equipment (CPE). On which this feature and action are assigned to button. CPE component is a unit of buttons on the terminal.

**Attribute: button**

**Fullname:** button.

**Attribute Description** ISDN station set button number to which the feature is assigned on this CPE component.

# FENT_G

## 1. Description

This relation contains a list of BRCS constructed features assigned to a ISDN BRCS DN/Member or BRCS feature group (BFG).

This is a child storage relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 13824 |
| expected tuples | 68 |
| access type | DBACC_GK |
| memory type | DBPRAM |
| distribution | LPFPFG |
| application | RCMAP |
| relation type | DBSTORAGE |
| ks key store | AUTO |
| foldtype | DBGC31 |
| gkidxrel GK-index relation | rlFENT_I |

## 3. Field Layout

## 4. Population rules for RLfid2name

**Relation Description**

Feature identification to name translation
This relation translates an ID (feature ID, BFG ID, etc.) to the 8 character ASCII name as shown on the view screen. It is basically an inverse of the RLfacname relation.
There is a tuple in this relation for every tuple in RLfacname. Each change to RLfacname must result in a corresponding change to RLfid2name, except for use counts in RLfacname. The inverse is also true. Each change to RLfid2name must result in a change to RLfacname.

**Attribute:**

facid

**Fullname:**

Copyright © 1999 Lucent Technologies

Feature assignment and construction identification

**Attribute Description:**

This is the internal identifier associated with the external name. This is a short with a range from 0 to 65535. For most names, this is treated as a simple number. But if the name represents a BRCS feature (class is FACBRCS and subclass is SCL_FEAT), the number is divided into two fields: a modular feature type (mftype [top 6 bits: bits 15 - 10]), and a unique identifier (bottom 10 bits: bits 9 - 0). The mftype is a enumerated data type with one of the values found in domain DMmftype. For the null feature (a preconstructed feature) both fields are 0, giving a facid of 0. For any other feature, the mftype is nonzero, and so is the unique identifier.

**Attribute:**

class

**Fullname:**

Feature assignment and construction class

**Attribute Description:**

Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space.

**Attribute:**

subclass

**Fullname:**

Feature assignment and construction subclass

**Attribute Description:**

Each class of names is divided into one or more subclasses. The subclasses of a given class all share the same name space, since subclass is not a key to RLfacname.

**Attribute:**

name

**Fullname:**

Name (in ASCII)

**Attribute Description:**

This is the externally known ASCII name. It can be from 1 to 8 characters long. If it is less than 8 characters long, the field is padded with binary zeros ('\0'). Names must be unique within a given class. Names from different classes need not be unique.

       ( 8 bytes )
```

## 4. Population Rules for RLfidb_sgn

**Relation Description** Translation Table from T1FAC/CFAC FIDB number to RDFI/CDFI PICB number
Defines the FIDB_SGN tuple required to represent the Facility Interface Data Bus (FIDB) associated with PCT1FAC and PCCFAC facility circuits. For each populated tuple in RLCKTDATA with 'type' attribute of PCT1FAC or PCCFAC, equip one FIDB_SGN tuple keyed by its FIDB number, which is found in the CKTDATA tuple's 'pidb' attribute.

DFI-1 circuit boards only terminate a single facility, while the newer DFI-2 circuit boards terminate up to two. Regardless of DFI type, facilities are numbered according to their relative position on the board. Facilities terminating on a DFI-1 can only be relative facility 0, while facilities terminating on a DFI-2 may be either relative facility 0 or 1, depending on the physical connection on the T1 side of the DFI-2.

**Attribute: fidb**

**Fullname:** FIDB number associated with this T1FAC/CFAC

**Attribute Description** FIDB number from CKTDATA tuple pidb attribute

**Attribute: picb**

Copyright © 1999 Lucent Technologies

**Fullname:** PICB number associated with the RDFI/CDFI

**Attribute Description** picb = CI/PICB + 1 for this PCT1FAC or PCCFAC circuit, obtained directly from CKTDATA baseadd{8:15} + 1

**Attribute: fidb_a**

**Fullname:** FIDB number associated with the relative facility 0 of this RDFI/CDFI

**Attribute Description**

```
fidb_a = if   ( this PCT1FAC/PCCFAC is relative facility 0 )
populate this field the same as the 'fidb' attribute
else ( this PCT1FAC/PCCFAC is relative facility 1 )
```

therefore, a tuple must exist in CKTDATA representing relative facility 0, on the same CI/PICB + 1. Populate this field with the pidb attribute of that CKTDATA tuple

**Attribute: fidb_b**

**Fullname:** FIDB number associated with relative facility 1 of this RDFI/CDFI ( IF EQUIPPED ), otherwise 0x7f (if UNEQUIPPED or not a DFI-2)

**Attribute Description**

```
fidb_b = if   ( this PCT1FAC/PCCFAC is relative facility 1 )
                populate this field the same as the 'fidb' attribute
         else ( this PCT1FAC/PCCFAC relative facility 0 )
                see if there is a tuple in CKTDATA representing relative
                facility 1 on the same CI/PICB + 1.
                if  ( relative facility 1 tuple exits )
                      populate this field with the pidb attribute of
                      that CKTDATA tuple
                else
                      populate this field with 0x7f (unequipped FIDB)
```

**Defines:** "db/DMcircuit.h"

## 4. Population Rules for RLfix_dig

**Relation Description** Fixed Digit String Definition Relation
This relation specifies information about the fixed digit string portion of the SCCP Global Title Address Digits.

**Attribute: tran_gp**

**Fullname:** SCCP Global Title Translation Group

Copyright © 1999 Lucent Technologies

**Attribute Description** This attributes specifies a translation group representing a SCCP service on which Global Title Translation needs to be performed.

**Attribute: dig1**

**Fullname:** First Digit in String

**Attribute Description** This attribute specifies the first digit of the fixed digit string.

**Attribute: dig2**

**Fullname:** Second Digit in String

**Attribute Description** This attribute specifies the second digit of the fixed digit string.

**Attribute: dig3**

**Fullname:** Third Digit in String

**Attribute Description** This attribute specifies the third digit of the fixed digit string.

**Attribute: dig4**

**Fullname:** Fourth Digit in String

**Attribute Description** This attribute specifies the fourth digit of the fixed digit string.

**Attribute: dig5**

**Fullname:** Fifth Digit in String

**Attribute Description** This attribute specifies the fifth digit of the fixed digit string.

**Attribute: dig6**

**Fullname:** Sixth Digit in String

**Attribute Description** This attribute specifies the sixth digit of the fixed digit string.

**Attribute: fds_ind**

**Fullname:** Fixed Digit String Index

**Attribute Description** This attribute specifies an index that can be used to represent the fixed digit string.

**Attribute: max_ent**

**Fullname:** Maximum number of Required + Optional Digits

**Attribute Description** This attribute specifies the maximum number of required plus optional digit entries in the RLgtt_0dpc or RLgtt_1dpc relation for this fixed digit string.

**Attribute: cur_ent**

**Fullname:** Current Number of Entries of Required + Optional Digit Strings

**Attribute Description** This attribute specifies the current number of entries in the RLgtt_0dpc or RLgtt_1dpc relation. It must be less then or equal to RLfix_dig.max_ent.

       ( 2 bytes )
```

## 4. Population Rules for RLflex_ani

**Relation Description** Flexible automatic number identification information.

This relation will associate ANI II digit pairs with a class of service.

Used for assigning flexible ANI II pairs to a class of service.

**Attribute: cos**

**Fullname:** class of service

**Attribute Description** Identifies a lines class of service

**Attribute: ani_ii_digs**

Copyright © 1999 Lucent Technologies

**Fullname:** ANI information (II) digit pairs

**Attribute Description** Two-digit information indicator used for equal access when an outgoing call using EA signaling (EAMF or EA-ISUP7), EAOSS signaling, EOSS signaling, and MEA signaling.

The ANI information indicator is defined and administered by Bellcore.

The 'ani_ii_digs' associated with a call can be obtained from various places in the system. If it is obtained from RLrt_mcrt relation, it is associated with a service such as, private facility access (PFA)/outward wide area telephone service (OUTWATS) or shared directory number (SDN) OUTWATS. If it is obtained from the RLflex_ani relation, it is associated with the class of service (COS) of the originating party. If it is obtained from the RLscridxpa relation, it is associated with a screening index of the originating party (The Flexible ANI Enhancement Secured Feature must be purchased and enabled, and the carrier must be allowed to send ANI II Digits). If it is obtained from the RLrt_routing relation it identifies the carrier through its association with the route index.

The ani_ii_digs attribute associated with the MCRI (RLrt_mcrt) has the highest precedence, followed by RI (RLrt_routing), SCRIDX (RLscridxpa) and the COS (RLflex_ani). The following layout illustrates the precedence and the ani_ii_digs attribute to be outpulsed with the call:

| RLrt_mcrt | RLrt_routing | RLscridxpa | RLflex_ani |
|---|---|---|---|
| ani_ii_digs | ani_ii_digs | ani_ii_digits | ani_ii_digs |
| defined | N/A | N/A | N/A |
| null | defined | N/A | N/A |
| null | null | defined | N/A |
| null | null | null | defined |

If the value of RLrt_mcrt.ani_ii_digs is FC_ANI_NULL, RLrt_routing.ani_ii_digs is FC_ANI_NULL, and RLscridxpa does not exist, then the ani_ii_digs will be derived from RLflex_ani and the value will be based on the COS of the originating party. Flexible ANI II feature is a secured feature and must be purchased to use. Flexible ANI Enhancements secured feature is depended on the Flexible ANI II secured feature.

## 4. Population rules for RLfmassign

### Relation Description

Facilities management feature assignment
This relation defines the facilities management features (business and residential customer services [BRCS] features) for a gcsrid/apid pair. A tupple is generated for each assigned gcsrid/apid pair in the switch.

**Attribute:**
gcsrid
**Fullname:**
Business customer ID (BCID)
**Attribute Description:**
A number 1 through 65535 defining BCID.

**Attribute:**
apid
**Fullname:**
Applications processor ID (APID)
**Attribute Description:**
A number 1 through 255 defining APID.

**Attribute:**
ars
**Fullname:**
Automatic route selection
**Attribute Description:**
Indicates if automatic route selection administration and control is allowed.

**Attribute:**
aca
**Fullname:**
Automatic circuit assurance
**Attribute Description:**
Indicates if the automatic circuit assurance (periodic measurement) administration and control is allowed.

**Attribute:**
auth
**Fullname:**
Authorization codes
**Attribute Description:**
Indicates if authorization codes administration and control is allowed.

Copyright © 1999 Lucent Technologies 

**Attribute:**
acct
**Fullname:**
Account codes
**Attribute Description:**
Indicates if account codes administration and control is allowed.

**Attribute:**
acsr
**Fullname:**
Automatic customer station rearrangement
**Attribute Description:**
Indicates if automatic customer station rearrangement administration and control is allowed.

**Attribute:**
mdr
**Fullname:**
Message detail recording
**Attribute Description:**
Indicates if message detail recording administration and control is allowed.

**Attribute:**
mod_que
**Fullname:**
Modular queuing
**Attribute Description:**
Indicates if the modular queuing administration and control is allowed.

**Attribute:**
td_to_cl
**Fullname:**
Traffic data to customer location
**Attribute Description:**
Indicates whether traffic data to customer location administration and control is allowed.

**Attribute:**
tod
**Fullname:**
Time of day option
**Attribute Description:**
Indicates whether time of day administration and control is allowed.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

amac

**Fullname:**

Customer billing option

**Attribute Description:**

This is a boolean structure indicating the combination of several types of billing. In each case a DBYES indicates that the type of billing is applicable and DBNO indicates that it is not. See domain DMmc_bill.

**Attribute:**

amac.flat

**Fullname:**

Flat rate billing

**Attribute Description:**

Indicates flat rate billing, no usage-sensitive charge. If flat = DBYES, then all other subattributes must equal DBNO. If flat = DBNO, then at least one sub-attribute must equal DBYES.

**Attribute:**

amac.usefreq1

**Fullname:**

Billing frequency 1

**Attribute Description:**

For use of event 1.

**Attribute:**

amac.usefreq2

**Fullname:**

Billing frequency 2

**Attribute Description:**

For use of event 2.

**Attribute:**

amac.usefreq3

**Fullname:**

Billing frequency 3

**Attribute Description:**

For use of event 3.

**Attribute:**

amac.usefreq4

**Fullname:**

Billing frequency 4

**Attribute Description:**

For use of event 4.

**Attribute:**

amac.actchrg

Copyright © 1999 Lucent Technologies 

**Fullname:**
Activation charge
**Attribute Description:**
Indicates charge for activation.

**Attribute:**
amac.dactchrg
**Fullname:**
Deactivation charge
**Attribute Description:**
Indicates usage charge for deactivation.

**Attribute:**
amac.duration
**Fullname:**
Duration charge
**Attribute Description:**
Indicates charge for duration of use.

**Attribute:**
amac.change
**Fullname:**
Change of parameter charge
**Attribute Description:**
Indicates change of parameter charge.

**Attribute:**
max_sessns
**Fullname:**
Maximum facilities management (FM) sessions allowed per gcsrid
**Attribute Description:**
Holds a value defining the maximum number of FM sessions allowed for every gcsrid.

**Attribute:**
timeout
**Fullname:**
No action timeout period
**Attribute Description:**
Indicates the automatic FM session termination when no action is seen.

## 4. Population Rules for RLfphchnls

**Relation Description** Fast Pump RDFI number and HDFI facility circuit name mapping.
Maps between Fast Pump RDFI number and HDFI facility circuit name

**Attribute: rsm**

**Fullname:** RSM module number

**Attribute Description** This attribute is one of three key attributes. It is of the type DMMODULE and can take values from 0 to 255. Because of the domain of type DMMODULE, no range check poprule is needed. Only equipped RSMs of a HSM will be in the relation.

Copyright © 1999 Lucent Technologies 

**Attribute: fpdfi**

**Fullname:** fast pump R-DFI number

**Attribute Description** This attribute is one of the two key attributes It is of the type DMUNS2 and can take the values from 0 to 3. These values must correspond to the four RDFIs (OA, OB, 1A, 1B) that can be chosen to set up Fast Pump paths on them. Because of the domain of type DMUNS2, no range check poprule is needed.

NOTE: The relative facility number is not accounted for in this relation, because fast pump paths can only be set up on T1 umbilicals which can carry the RSM Control Time-Slot (CTS), which are restricted to relative facility 0. Thus relative facility 0 is implied for these fast pump paths.

**Attribute: hchan**

**Fullname:** fast pump HDFI facility circuit name

**Attribute Description** The attribute hchan is of the type DMCIRCUIT and represents a Host DFI facility (PCHFAC) that can be used for the pump.

**Defines:** "db/DMcircuit.h", "db/DMmodule.h"

## 4. Population Rules for RLfrbc_svc

**Relation Description** This relation maps the FRBC to its FR SVCs.
This relation maps a Frame Relay Bearer Channel (FRBC) trunk port to its subtending Frame Relay Switched Virtual Circuit (FR SVC) trunk ports.

**Attribute: gport**

**Fullname:** Global port number of the FRBC trunk port (key)

**Attribute Description** This attribute has the global port number for the FRBC trunk port

**Attribute: num_mem**

**Fullname:** Number of FR SVCs associated with this FRBC.

**Attribute Description** This attribute gives the number of the FR SVCs associated with a given FRBC.

**Attribute: mport[*]**

**Fullname:** Port name for each FR SVC.

**Attribute Description** This attribute gives the port name for each FR SVC.

**Defines:** "db/DMport.h",
"db/DMcircuit.h",
"db/DMunitno.h"

## 4. Population Rules for RLftsccpni

**Relation Description** Federal telecommunications system country codes to route over the private network interface (PNI).

This relation contains those country codes for which federal telecommunications system network remote access (FTS NRA) calls must be routed over the private network interface (PNI).

The maximum number of tuples is 20.

**Attribute: cc**

**Fullname:** Country Code.

**Attribute Description** Country code to which FTS NRA calls must be routed over the PNI.

**Attribute: spare**

**Fullname:** Spare.

**Attribute Description** Spare field.

## 4. Population Rules for RLftth_sig

**Relation Description** This relation maps the TR8 remote terminal (RT) circuit name to the fiber to the home resistor signatures for the RT.

Resistor signatures for a particular RT must be supplied by the RT vendor.

**Attribute: module**

**Fullname:** Module Number

**Attribute Description** The module number is needed to determine which RT this tuple corresponds to.

**Attribute: rtname**

**Fullname:** RT Circuit Name

**Attribute Description** This is the internal circuit name for a TR8 RT.

**Attribute: phs1_dt**

**Fullname:** Phase 1 Distant Terminal Fiber Good

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for phase 1 distant terminal fiber good.

**Attribute: phs1_dt.r1_min**

**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: phs1_dt.r1_max**

**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: phs1_dt.r2_min**

**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: phs1_dt.r2_max**

**Fullname:** Tip-Ground Max

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: phs1_dt.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: phs1_dt.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: ndtm**
**Fullname:** RT-distant terminal fiber good and bad/no drop test module (DTM)

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good and bad/no DTM.

**Attribute: ndtm.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: ndtm.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: ndtm.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: ndtm.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: ndtm.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: ndtm.r3_max**
**Fullname:** Ring-Ground Max

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: drop_ok**
**Fullname:** RT-Distant Terminal Fiber Good and Drop Test OK

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good and drop test OK.

**Attribute: drop_ok.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: drop_ok.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: drop_ok.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: drop_ok.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: drop_ok.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: drop_ok.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: no_ringr**
**Fullname:** RT-Distant Terminal Fiber Good and No Ringer

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good and no ringer.

**Attribute: no_ringr.r1_min**
**Fullname:** Tip-Ring Min

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: no_ringr.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: no_ringr.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: no_ringr.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: no_ringr.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: no_ringr.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: dt_femf**
**Fullname:** RT-Distant Terminal Fiber Good and Distant Terminal Fails FEMF/Leakage.

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good and distant terminal fails FEMF/leakage.

**Attribute: dt_femf.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: dt_femf.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: dt_femf.r2_min**
**Fullname:** Tip-Ground Min

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: dt_femf.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: dt_femf.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: dt_femf.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: off_hook**
**Fullname:** RT-Distant Terminal Fiber Good and Receiver Off Hook

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good and receiver off hook.

**Attribute: off_hook.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: off_hook.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: off_hook.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: off_hook.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: off_hook.r3_min**
**Fullname:** Ring-Ground Min

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: off_hook.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: haz_volt**
**Fullname:** RT-Distant Terminal Fiber Good and Hazardous Voltage Detected at Distant Terminal

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good and hazardous voltage detected at distant terminal.

**Attribute: haz_volt.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: haz_volt.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: haz_volt.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: haz_volt.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: haz_volt.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: haz_volt.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: phs1_rt**
**Fullname:** RT-Distant Terminal Fiber Good, Phase 1.0 RT

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber good, phase 1.0 RT.

**Attribute: phs1_rt.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: phs1_rt.r1_max**
**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: phs1_rt.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: phs1_rt.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: phs1_rt.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: phs1_rt.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

**Attribute: fbr_oof**
**Fullname:** RT-Distant Terminal Fiber Out Of Frame

**Attribute Description** This is a structure containing six resistor values (tip-ring min, tip-ring max, tip-ground min, tip-ground max, ring-ground min, and ring-ground max) for RT-distant terminal fiber out of frame.

**Attribute: fbr_oof.r1_min**
**Fullname:** Tip-Ring Min

**Attribute Description** This is the tip-ring minimum resistor value in K-Ohms.

**Attribute: fbr_oof.r1_max**

Copyright © 1999 Lucent Technologies 

**Fullname:** Tip-Ring Max

**Attribute Description** This is the tip-ring maximum resistor value in K-Ohms.

**Attribute: fbr_oof.r2_min**
**Fullname:** Tip-Ground Min

**Attribute Description** This is the tip-ground minimum resistor value in K-Ohms.

**Attribute: fbr_oof.r2_max**
**Fullname:** Tip-Ground Max

**Attribute Description** This is the tip-ground maximum resistor value in K-Ohms.

**Attribute: fbr_oof.r3_min**
**Fullname:** Ring-Ground Min

**Attribute Description** This is the ring-ground minimum resistor value in K-Ohms.

**Attribute: fbr_oof.r3_max**
**Fullname:** Ring-Ground Max

**Attribute Description** This is the ring-ground maximum resistor value in K-Ohms.

## 4. Population Rules for RLfuncts

**Relation Description** North American CCS7 (CCSNA7) Signaling Connection Control Part (SCCP) Global Title Translation on function number
This relation provides the CCSNA7 SCCP Global Title Translation number index for a particular function number.

**Attribute: func_num**

**Fullname:** Function number

**Attribute Description** The function number that is to be translated. The function number is a CCIS6 network address that identifies a point code in the network. The function number is buried in the Destination CCIS6 (DCIS6) message and is extracted by DCIS6 so SCCP can do global title translation on it to determine the Destination Point Code (DPC) and Subsystem Number (SSN) of the destination for the message.

**Attribute: tn_indx**

**Fullname:** Translation number index

**Attribute Description** A translation number index identifying the Destination Point Code (DPC) and Subsystem Number (SSN) associated with this function number.

## 4. Population Rules for RLgckti

**Relation Description**
Global Service circuit Allocation Initialization.

**Attribute: im**

**Fullname:** switching module number

**Attribute Description** identifies the switching module number of the GDSU

**Attribute: unittype**

**Fullname:** Digital Service Unit Type

**Attribute Description** Identifies the Digital Service Unit Type;

**Attribute: dsu**

**Fullname:** digital services unit number

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** to identify the digital services unit number

**Attribute: sg**

**Fullname:** service group

**Attribute Description** Identifies the service group of the GDSU/GDSF. For GDSF, the service groups are the PICB number module by 2;

**Attribute: index**

**Fullname:** index

**Attribute Description**

```
index to RLCCATBL  (key ccadx)
*           Each tuple in this relation should have a different
*           index. Service groups 0 should start with an index
*           of 0 and continue 1, 2, ..., up to 127 (max).  Service
*           group  1 should start with an index of 255 and continue
*           254,253, ...,  down to 128(min).  Mix the GDSF
*           units with the existing GDSU service  groups.
*           Each GDSF unit exists in either service group
*            depends upon the associated PICB number, which
*           will balance  the conference circuits on GDSF to
*           both service group 0 and 1.   For example:
```

| TUPLE | SM | UNITTYPE | DSU | SG | INDEX |
|---|---|---|---|---|---|
| 1 | x | SMDSU | 1 | 0 | 0 |
| 3 | x | SMDSU | 2 | 0 | 1 |
| 5 | x | SMDSU | 3 | 0 | 2 |
| 7 | x | SMGDSF | 0 | 0 | 3 |
| 9 | y | SMDSU | 1 | 0 | 4 |
| 11 | y | SMDSU | 2 | 0 | 5 |
| 13 | y | SMGDSF | 0 | 0 | 6 |
| 15 | z | SMDSU | 1 | 0 | 7 |
| . | . | . | . | . | . |
| . | . | . | . | . | . |
| . | . | . | . | . | . |
| 16 | z | SMDSU | 1 | 1 | 248 |
| 14 | y | SMGDSF | 1 | 1 | 249 |
| 12 | y | SMDSU | 2 | 1 | 250 |
| 10 | y | SMDSU | 2 | 1 | 251 |
| 8 | x | SMGDSF | 1 | 1 | 252 |
| 6 | x | SMDSU | 3 | 1 | 253 |
| 4 | x | SMDSU | 2 | 1 | 254 |
| 2 | x | SMDSU | 1 | 1 | 255 |

**Attribute: rsm**

**Fullname:** remote switching module

**Attribute Description** DBYES if the switching module is an RSM; DBNO otherwise.

**Copyright © 1999 Lucent Technologies** 

**Attribute: sgn**

**Fullname:** service group number

**Attribute Description** service group number = PICB + 1 (service group number of internal circuit name)

**Attribute: board[*]**

**Fullname:** GDSU circuit board identifier

**Attribute Description** Each board has two (sub) attributes. The sub-attributes are used to show what hardware exists in this board slot.

**Attribute: board[*].typ**

**Fullname:** GDSU/GDSF circuit type

**Attribute Description** For GDSU: PCGC3CONF if slot contains a 3-port conference circuit (TN234 or TN841); PCGC6CONF if slot contains a 6-port conference circuit (TN1032); PCGCNULL if slot is empty (unequipped).
For GDSF; PCGC3CONF if unit contains a 3-port conference circuits. PCGC6CONF if unit contains a 6-port conference circuits. PCGC10CONF if unit contains a 10-port conference circuits. PCGCNULL if slot is not used.

**Attribute: board[*].nckts**

**Fullname:** number of circuits

**Attribute Description** FOR GDSU: 2 if slot contains a TN234 board; 5 if slot contains a TN841 board; 2 if slot contains a TN1032 board; 0 if slot is empty (unequipped).
For GDSF: The total number of 3-port conference leading circuits on this unit, it is populated with PCGC3CONF board type. The total number of 6-port conference leading circuits on this unit, it is populated with PCGC6CONF board type. The total number of 10-port conference leading circuits on this unit, it is populated with PCGC10CONF board type. 0 if it is populated with PCGCNULL board type.

## 4. Population Rules for RLgdsf_cnt

**Relation Description**
Global Digital Service Function Counts relation.

This relation provides the number of resources available of GDSF tone generator, tone transceiver and guard-data-guard tone transceiver on a per SM basis.

**Attribute: sm**

**Fullname:** Switching Module

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute is the key into the relation. Thus the data populated in this relation is on a per SM basis.

**Attribute: tgen_cnt**

**Fullname:** GDSF Tone Generator count

**Attribute Description** Value of this attribute provides the number of GDSF tone generator available on a per SM basis.

**Attribute: txcvr_cnt**

**Fullname:** GDSF Tone Transceiver count

**Attribute Description** The value of this attribute provides the number of GDSF tone transceiver available on a per SM basis.

**Attribute: gtxcvr_cnt**

**Fullname:** GDSF Guard-Data-Guard Tone Transceiver count

**Attribute Description** The value of this attribute provides the number of GDSF guard-data-guard tone transceiver available on a per SM basis.

## 4. Population Rules for RLgensca

**Relation Description**
LASS selective call acceptance screen list for generally available.

GENSCA is a SCA screening list for general available users tuples of this relation will be allocated/deallocated mainly through SLE session. But RC/V can also access this relation to review, or update the list.

The maximum number of DNs in a screening list a user can have for a particular feature is defined as office parameters. (such as Glscamx for SCA and Glcarmx for CAR).

A user is not allowed to add DNs beyond the office limits. However, a special care must be given when the office reduces the maximum. This is because there might be users who have DNs more than the new maximum number.

There is no immediate action required for this reduction of the office maximum. But here are subsequent actions SLE and RC/V should take.

SLE and RC/V should not allow those users to add new entries unless they remove enough DNs so that the total number of DNs in the list is below the new maximum.

Any mechanisms of surveying the largest list in an office will not be available in the 5E6 generic.

**Copyright © 1999 Lucent Technologies** 

**Attribute: sca_idx**

**Fullname:** Selective Call Acceptance Index

**Attribute Description** This is a logical key. Since the RLsca_ltm relation serves as a head cell of the SCA screening list tuples, RLgensca, there must be a corresponding RLsca_ltm with a matching sca_idx.
RLsca_ltm.gen_avail must be DBYES.

**Attribute: range**

**Fullname:** Range

**Attribute Description** This field is used to read subsequent SCA screen lists tuples. The range of the first tuple is equal to 0.

**Attribute: dn_cnt**

**Fullname:** DN count including the extensions

**Attribute Description** If an extension is requested to be entered (through SLE session only), the corresponding DN and the extension are stored in two consecutive dn-slots for voice-back purpose. (Note: These two numbers can be stored in two tuples: DN in the last dn-slot in a tuple and extension in the first dn_slot of the following tuple.)

The dn_cnt of the first tuple (whose range is 0), is equal to the total number of occupied slots in the screening list. (The actual number of DNs is scrn_cnt.) For the subsequent tuples (whose ranges are from 1 to 10), this field is should be set to 0.

**Attribute: scrn_cnt**

**Fullname:** Number of actual DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: priv_cnt**

**Fullname:** Number of private DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of private DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: dn1**

**Fullname:** First DN stored

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte. Example: A DN, 312-979-1234 is stored as

```
dn1[0] = 0x31
dn1[1] = 0x29
dn1[2] = 0x79
dn1[3] = 0x12
dn1[4] = 0x34
```

Copyright © 1999 Lucent Technologies 

```
   dn1[5] = 0x0a (digit count)
```

The first tuple (range = 0) can not have an extension in the first dn slot.

**Attribute: dn2**

**Fullname:** The second DN stored

**Attribute Description** See dn1.

**Attribute: dn3**

**Fullname:** The third DN stored

**Attribute Description** See dn1.

**Attribute: dn4**

**Fullname:** The fourth DN stored

**Attribute Description** See dn1.

**Attribute: dn5**

**Fullname:** The fifth DN stored

**Attribute Description** See dn1.

**Attribute: dn6**

**Fullname:** The sixth DN stored

**Attribute Description** See dn1.

**Attribute: ext_dn1**

**Fullname:** dn1 status flag

**Attribute Description** This field is used to indicate one of the following cases:

```
DN_NULL,  for a Null entry
DN_SEVEN, for a DN entered as a 7-digit DN by user
DN_TEN,   for a DN entered as a 10-digit DN by user
DN_PRIV,  for a private DN
DN_EXT,   Currently is not used by SLE.
DN_NUNXT, for a DN, converted from an extension entered by user.
NUEXT,    for an extension entered by the user. The corresponding DN
          is stored in the previous dn field marked as DN_NUNXT. The
          extension is stored for voice-back purpose during the SLE
          session.
```

Note: ext_dn = NUEXT is not allowed for the first dn (dn1[]) of the first tuple (range = 0)

**Attribute: ext_dn2**

**Fullname:** dn2 status flag

**Attribute Description** See the description of ext_dn1.

**Attribute: ext_dn3**

Copyright © 1999 Lucent Technologies 

**Fullname:** dn3 status flag

**Attribute Description** See the description of ext_dn1.

**Attribute: ext_dn4**

**Fullname:** dn4 status flag

**Attribute Description** See the description of ext_dn1.

**Attribute: ext_dn5**

**Fullname:** dn5 status flag

**Attribute Description** See the description of ext_dn1.

**Attribute: ext_dn6**

**Fullname:** dn6 status flag

**Attribute Description** See the description of ext_dn1.

## 4. Population Rules for RLgenscf

**Relation Description**
LASS selective call forwarding (SCF) screen

List general available users. GENSCF is a SCF screening list for general available users Tuples of this relation will be allocated/deallocated mainly through SLE session. But RC/V can also access this relation to review, or update the list.

The maximum number of DNs in a screening list a user can have for a particular feature is defined as office parameters. (such as Glscfmx)

A user is not allowed to add DNs beyond the office limits. However, a special care must be given when the office reduces the maximum. This is because there might be users who have DNs more than the new maximum number.

There is no immediate action required for this reduction of the office maximum. But here are subsequent actions SLE and RC/V should take.

SLE and RC/V should not allow those users to add new entries unless they remove enough DNs so that the total number of DNs in the list is below the new maximum.

Any mechanisms of surveying the largest list in an office will not be available in the 5E6 generic.

**Copyright © 1999 Lucent Technologies** 

**Attribute: scf_idx**

**Fullname:** Selective Call Forwarding Index

**Attribute Description** This is a logical key. Since the RLscf_ltm relation serves as a head cell of the SCF screening list tuples, RLgenscf, there must be a corresponding RLscf_ltm with a matching scf_idx. RLscf_ltm.gen_avail must be DBYES.

**Attribute: range**

**Fullname:** Range

**Attribute Description** This field is used to read subsequent SCF screen lists tuples. The range of the first tuple is equal to 0.

**Attribute: dn_cnt**

**Fullname:** DN count including the extensions

**Attribute Description** If an extension is requested to be entered (through SLE session only), the corresponding DN and the extension are stored in two consecutive dn-slots for voice-back purpose. (Note: These two numbers can be stored in two tuples: DN in the last dn-slot in a tuple and extension in the first dn_slot of the following tuple.)
The dn_cnt of the first tuple (whose range is 0), is equal to the total number of occupied slots in the screening list. (The actual number of DNs is scrn_cnt.) For the subsequent tuples (whose ranges are from 1 to 10), this field should be set to zero.

**Attribute: scrn_cnt**

**Fullname:** Number of actual DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: priv_cnt**

**Fullname:** Number of private DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of private DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: dn1**

**Fullname:** First DN stored

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte. Example: A DN, 312-979-1234 is stored as

```
dn1[0] = 0x31
dn1[1] = 0x29
dn1[2] = 0x79
dn1[3] = 0x12
dn1[4] = 0x34
dn1[5] = 0x0a (digit count)
```

Copyright © 1999 Lucent Technologies 

The first tuple (range = 0) can not have an extension in the first dn slot.

**Attribute: dn2**

**Fullname:** The second DN stored

**Attribute Description** See dn1.

**Attribute: dn3**

**Fullname:** The third DN stored

**Attribute Description** See dn1.

**Attribute: dn4**

**Fullname:** The fourth DN stored

**Attribute Description** See dn1.

**Attribute: dn5**

**Fullname:** The fifth DN stored

**Attribute Description** See dn1.

**Attribute: dn6**

**Fullname:** The sixth DN stored

**Attribute Description** See dn1.

**Attribute: ext_dn1**

**Fullname:** dn1 status flag

**Attribute Description** This field is used to indicate one of the following cases:

```
DN_NULL,  for a Null entry
DN_SEVEN, for a DN entered as a 7-digit DN by user
DN_TEN,   for a DN entered as a 10-digit DN by user
DN_PRIV,  for a private DN
DN_EXT,   currently is not used by SLE
DN_NUNXT, for a DN, converted from an extension entered by user.
NUEXT,    for an extension entered by the user. The corresponding
          DN is stored in the previous dn field marked as DN_NUNXT.
          The extension is stored for voice-back purpose during the
          SLE session.
Note: ext_dn = NUEXT is not allowed for the first dn
      (dn1[]) of the first tuple (range = 0)
```

**Attribute: ext_dn2**

**Fullname:** dn2 status flag

## 4. Population Rules for RLgenscr

**Relation Description**
LASS selective call rejection (SCR) screen list general available users.

GENSCR is a SCR screening list for general available users. Tuples of this relation will be allocated/deallocated mainly through SLE session. But RC/V can also access this relation to review, or update the list.

The maximum number of DNs in a screening list a user can have for a particular feature is defined as office parameters. (such as Glscrmx)

A user is not allowed to add DNs beyond the office limits. However, a special care must be given when the office reduces the maximum. This is because there might be users who have DNs more than the new maximum number.

There is no immediate action required for this reduction of the office maximum. But here are subsequent actions SLE and RC/V should take.

SLE and RC/V should not allow those users to add new entries unless they remove enough DNs so that the total number of DNs in the list is below the new maximum.

Any mechanisms of surveying the largest list in an office will not be available in the 5E6 generic.

**Copyright © 1999 Lucent Technologies** 

**Attribute: scr_idx**

**Fullname:** Selective Call Rejection Index

**Attribute Description** This is a logical key. Since the RLscr_ltm relation serves as a head cell of the SCR screening list tuples, RLgenscr, there must be a corresponding RLscr_ltm with a matching scr_idx. RLscr_ltm.gen_avail must be DBYES.

**Attribute: range**

**Fullname:** Range

**Attribute Description** This field is used to read subsequent SCR screen lists tuples. The range of the first tuple is equal to 0.

**Attribute: dn_cnt**

**Fullname:** DN count including the extensions

**Attribute Description** If an extension is requested to be entered (through SLE session only), the corresponding DN and the extension are stored in two consecutive dn-slots for voice-back purpose. (Note: These two numbers can be stored in two tuples: DN in the last dn-slot in a tuple and extension in the first dn_slot of the following tuple.)
The dn_cnt of the first tuple (whose range is 0), is equal to the total number of occupied slots in the screening list. (The actual number of DNs is scrn_cnt.) For the subsequent tuples (whose ranges are from 1 to 10), this field should be set to zero.

**Attribute: scrn_cnt**

**Fullname:** Number of actual DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: priv_cnt**

**Fullname:** Number of private DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of private DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: dn1**

**Fullname:** First DN stored

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte. Example: A DN, 312-979-1234 is stored as

```
dn1[0] = 0x31
dn1[1] = 0x29
dn1[2] = 0x79
dn1[3] = 0x12
dn1[4] = 0x34
dn1[5] = 0x0a (digit count)
```

The first tuple (range = 0) can not have an extension in the first dn slot.

Copyright © 1999 Lucent Technologies 

**Attribute: dn2**

**Fullname:** The second DN stored

**Attribute Description** See dn1.

**Attribute: dn3**

**Fullname:** The third DN stored

**Attribute Description** See dn1.

**Attribute: dn4**

**Fullname:** The fourth DN stored

**Attribute Description** See dn1.

**Attribute: dn5**

**Fullname:** The fifth DN stored

**Attribute Description** See dn1.

**Attribute: dn6**

**Fullname:** The sixth DN stored

**Attribute Description** See dn1.

**Attribute: ext_dn1**

**Fullname:** dn1 status flag

**Attribute Description** This field is used to indicate one of the following cases:

```
DN_NULL,  for a Null entry
DN_SEVEN, for a DN entered as a 7-digit DN by user
DN_TEN,   for a DN entered as a 10-digit DN by user
DN_PRIV,  for a private DN
DN_EXT,   currently is not used by SLE
DN_NUNXT, for a DN, converted from an extension entered by user.
NUEXT,    for an extension entered by the user. The corresponding
          DN is stored in the previous dn field marked as DN_NUNXT.
          The extension is stored for voice-back purpose during the
          SLE session.
Note: ext_dn = NUEXT is not allowed for the first dn
      (dn1[]) of the first tuple (range = 0)
```

## 4. Population Rules for RLgensda

**Relation Description**
LASS selective distinctive alert (SDA) screen list general available users.

GENSDA is a SDA screening list for general available users Tuples of this relation will be allocated/deallocated mainly through SLE session. But RC/V can also access this relation to review, or update the list.

The maximum number of DNs in a screening list a user can have for a particular feature is defined as office parameters. (such as Glsdamx)

A user is not allowed to add DNs beyond the office limits. However, a special care must be given when the office reduces the maximum. This is because there might be users who have DNs more than the new maximum number.

There is no immediate action required for this reduction of the office maximum. But here are subsequent actions SLE and RC/V should take.

SLE and RC/V should not allow those users to add new entries unless they remove enough DNs so that the total number of DNs in the list is below the new maximum.

Any mechanisms of surveying the largest list in an office will not be available in the 5E6 generic.

**Copyright © 1999 Lucent Technologies** 

**Attribute: sda_idx**

**Fullname:** Selective Distinctive Alert Index

**Attribute Description** This is a logical key. Since the RLsda_ltm relation serves as a head cell of the SDA screening list tuples, RLgensda, there must be a corresponding RLsda_ltm with a matching sda_idx. RLsda_ltm.gen_avail must be DBYES.

**Attribute: range**

**Fullname:** Range

**Attribute Description** This field is used to read subsequent SDA screen lists tuples. The range of the first tuple is equal to 0.

**Attribute: dn_cnt**

**Fullname:** DN count including the extensions

**Attribute Description** If an extension is requested to be entered (through SLE session only), the corresponding DN and the extension are stored in two consecutive dn-slots for voice-back purpose. (Note: These two numbers can be stored in two tuples: DN in the last dn-slot in a tuple and extension in the first dn_slot of the following tuple.)
The dn_cnt of the first tuple (whose range is 0), is equal to the total number of occupied slots in the screening list. (The actual number of DNs is scrn_cnt.) For the subsequent tuples (whose ranges are from 1 to 10), this field should be set to zero

**Attribute: scrn_cnt**

**Fullname:** Number of actual DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: priv_cnt**

**Fullname:** Number of private DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of private DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: dn1**

**Fullname:** First DN stored

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte. Example: A DN, 312-979-1234 is stored as

```
dn1[0] = 0x31
dn1[1] = 0x29
dn1[2] = 0x79
dn1[3] = 0x12
dn1[4] = 0x34
dn1[5] = 0x0a (digit count)
```

The first tuple (range = 0) can not have an extension in the first dn slot.

## 4. Population Rules for RLgpid_net

**Relation Description**
ARS Group ID to leased network ARSID.

This relation maps an internal automatic route selection (ARS) Group ID into an external leased network ARSID to be sent to a LN Via office in a CCS7 ISUP IAM.

This relation is the inverse of RLnet_gpid. There can be one or two tuples in this relation for each tuple in RLnet_gpid. If the ardtgpid attribute in RLnet_gpid is populated (non-zero), there will be two tuples in this relation, one keyed by RLnet_gpid.ars_gpid and one keyed by RLnet_gpid.ardtgpid. If RLnet_gpid.ardtgpid is not populated (set to zero) there will be one tuple in this relation keyed by RLnet_gpid.ars_gpid.

**Attribute: argp**

**Fullname:** Automatic Route Selection Group ID

**Attribute Description** Internal ARS group ID assigned to the associated ARS group name. This is the same as RLnet_gpid.ars_gpid for voice groups and RLnet_gpid.ardtgpid for data groups.

**Attribute: net_arsid**

**Fullname:** Leased Network ARSID

**Attribute Description** Leased Network ARSID received by the LN ACP from the LN NCP, or

Copyright © 1999 Lucent Technologies 

received by a LN Via office in a CCS7 ISUP IAM.

## 4. Population rules for RLgroup_port

### Relation Description

group to port.

Group and member number to port.

"Specific application section ****************************************

RLgroup_port (DCTU trunk groups and members)

DESCRIPTION:

Population rules regarding DCTU trunk groups and the corresponding DCTU trunk group members are presented.

NOTE:

(1) For each separate DCTU trunk group number (portgrp.grpnum) the DCTU trunk group MUST be defined in the relations RLRT_TRKG and RLRCTGRPRK. See the population rules for RLrt_trkg and RLrctgrprk.

(2) For each DCTU trunk group number, there MUST be a minimum of

Copyright © 1999 Lucent Technologies 

four (4) members. The maximum number can only be determined from the number of DCTUs that are part of any DCTU trunk group. The number of members in any DCTU trunk group should always be divisible by four.

(3) A DCTU trunk group CAN have members from any number of DCTUs in a HOST 5ESS(R)-2000 Switch processing entity. For each HOST DCTU trunk group member within a HOST DCTU trunk group, there MUST be a corresponding entry in RLFC_PORTTYP in the particular SM where the physical DCTUPORT circuit is defined. See the population rules for RLfc_porttyp and RLcktdata.

(4) For each RSM DCTU trunk group member within a RSM DCTU trunk group, there MUST be a corresponding entry in RLFC_PORTTYP in the SAME RSM where the physical DCTUPORT circuit is defined. See the population rules for RLcktdata and RLfc_porttyp.

(5) For each DCTU trunk group member, there MUST be a corresponding entry in RLQKEYPORT. A singular value for 'qkey' is required for each DCTU trunk group member since they are FIFO hunted. This rule includes DCTUs in both the HOST 5ESS(R)-2000 switch processing entity and RSMs. See the population rules for RLqkeyport.

(6) For each DCTU trunk group member, there MUST be a corresponding entry in RLpggpmap. This rule includes DCTUs in both the HOST 5ESS(R)-2000 switch processing entity and RSMs. See the population rules for RLpggpmap.

(7) For each DCTU trunk group member, there MUST be a corresponding entry in RLRC_TRK. This rule includes DCTUs in both the HOST 5ESS(R)-2000 switch processing entity and RSMs. See the population rules for RLrc_trk.

(8) There can be one fully equipped DCTU per SM that contains 12 DCTUPORTs. There is one DCTUPORT LTP defined for each DCTUPORT. There is one DCTU trunk group member per DCTUPORT LTP. There can be 192 DCTUs in an office. Therefore, the theoretical maximum number of tuples in this relation owing to DCTU trunk group members is:

( 1 DCTU/SM) x ( 192 SMs/office) x ( 12 DCTUPORTs/DCTU) x

( 1 (DCTUPORT LTP)/DCTUPORT ) x ( 1 member/(DCTUPORT LTP) )

= 2,304 members/office owing to the DCTU

(9) The same restrictions that apply to RSM also apply to ORM/TRM.

Copyright © 1999 Lucent Technologies 

QUANTITY OF TUPLES:

One tuple for each DCTU trunk group member defined in an office

TUPLE SEMANTICS:

```
portgrp.grpnum (KEY)  - DCTU trunk group number
                        Must be entry in RLrt_trkg and RLrctgrprk
portgrp.grptype (KEY) - TM_TRK
member (KEY)          - DCTU trunk group member number
port.member           - DCTUPORT logical test port name
port.module           - SM where DCTUPORT LTP is defined
                        entry MUST be defined in RLFC_PORTTYP
party                 - 0
qkey                  - same as entry in RLQKEYPORT
                        required since DCTU trunk group members
                        are FIFO hunted.
lport                 - 0
lpt_type              - LPT_OTHER
ltm_type              - LTM_OTHER
ltm_idx               - a valid value is assigned but is not
                        referenced or used.
```

**********

RLgroup_port (ISTF trunk groups and members)

DESCRIPTION:

Integrated Services Test Function (ISTF) trunk group members are real
ly
Logical Test Ports (LTP) and do not have actual hardware dedicated to them. These members are instead associated with the channels serving the ISTF. The trunk group itself has 1 group per LTP type (servclass=TM_ISTFLB, servclass=TM_ISTFXMIT). RLISTF contains an attribute for each service which indicates the number of members that board is contributing to the group. As an example, the number of loopback members is given by RListf.lb_cnt. All these members are part of the trunk group for loopback services for the system.

There is also a RLpggpmap relation which contains the exact same data. The data is just accessed with a different key.

QUANTITY OF TUPLES:

One tuple for each ISTF trunk group member defined in an office

TUPLE SEMANTICS:

```
portgrp.grpnum (KEY)  - ISTF trunk group number.  There is only
                        one group number per LTP type.  Must be
                        an entry in RLrt_trkg and RLrctgrprk.
```

Copyright © 1999 Lucent Technologies 

```
portgrp.grptype (KEY) - TM_TRK
member (KEY)          - ISTF trunk group member number.  The
                        RListf relation has a count field for
                        each LTP type.  These fields identify
                        how many members exist per ISTF board.
port.member           - ISTF logical test port name
port.module           - SM where ISTF LTP is defined
                        entry must be defined in RLFC_PORTTYP
party                 - 0
qkey                  - same as entry in RLQKEYPORT
                        required since ISTF trunk group members
lport                 - 0
lpt_type              - LPT_OTHER
ltm_type              - LTM_OTHER
ltm_idx               - a valid value is assigned but is not
                        referenced or used.
                        are FIFO hunted.
```

**********

RLgroup_port (for DSU2-RAF/SAS Port Groups and members)

DESCRIPTION:

This relation must be populated to define the mapping between DSU2-RAF/SAS Port Groups and their members. Each Port Group can contain member ports from one or more DSU2-RAFs/SASs spanning one or more SMs.

NOTE:

(1) For every RAF/SAS Port Group specified in this relation, a corresponding tuple must exist in RT_TRKG, RCTGRPRK and RC_TRK.

(2) For every port specified in this relation, a corresponding tuple must be populated in the port_group, QKEYPORT, FC_PORTTYP and RC_TRK, relations.

(3) In addition, for every RAF/SAS port specified here, population must exist in the relation RLcktdata for each port circuit.

(4) Any port defined to belong to a RAF/SAS Port Group as defined here CANNOT under any circumstances belong to any other RAF/SAS Port Group.

(5) A maximum of eight (8) DSU2-RAFs, or eight (8) SASs, or any combination of DSU2-RAFs and SASs totaling no more than eight (8) can reside on any one SM.
This implies an upper limit of 8 x 32 or 256 RAF/SAS ports on any one SM (across all Port Groups) (5E3).
For DSU2-RAFs having the Dial-Through Announcement (DTA) capability, this implies an upper limit of 8 x 20 or 160

Copyright © 1999 Lucent Technologies 

```
                RAF ports on any one SM (across all Port Groups).
                 DSU2-RAF-COIN:
                  For DSU2-RAFS having the coin capability, this implies an
                  upper limit of 8 x 20 or 160 RAF ports on any one SM
                  (across all Port Groups).
               SASs providing DTA or COIN functionality are not limited
               to 20 ports each like DSU2-RAFs, but support the full
               32 ports; therefore, the upper limit of SAS ports on
               any one SM is always the full 8 x 32 or 256.

         QUANTITY OF TUPLES:

               One tuple per RAF/SAS Port Group member

         TUPLE SEMANTICS:

               portgrp.grpnum  - RAF/SAS Port Group number (from RT_TRKG)
               portgrp.grptype - TM_TRK
               member          - RAF/SAS Port Group member number
                                 (assigned by office)
               port.module     - SM on which RAF/SAS port resides
               port.member     - RAF/SAS Port as previously defined
               party           - 0
               qkey            - same as entry in QKEYPORT
               lport           - 0
               lpt_type        - LPT_OTHER
               ltm_type        - LTM_OTHER
               ltm_idx         - same as entry in RLfc_trunk.ltm_idx

        ************************************************************************

                        RLgroup_port (ISDN MLHG groups and members)

                        NOTE: Also this relation must be populated if this is the lea
d
                              port for a secondary only MLHG member.

              portgrp.grpnum (KEY)  - ISDN MLHG group number.
                                      Must be an entry in RLrt_mhg.
              portgrp.grptype (KEY) - TM_LINE
              member (KEY)          - ISDN MLHG group member number
              port.member           - D-channel of the ISDN port or analog
                                      port if RLfc_porttyp(port).sh_analog = DBYES.
              port.module   - SM where the port member is defined
                              entry must be defined in RLfc_porttyp.
              party          - User number on this physical port.  For
                               users on a multipoint DSL, this value may range
                               from 0-7.
               qkey          - 0
               lport         - logical port.  Will have an entry in RLfc_line
                               keyed with RLgroup_port.port and RLgroup_port.party.
                               Range: 1 - max (See RLfc_line poprules)
                               Default: none
```

```
lpt_type      - LPT_ISDN

ltm_type      - indicates which type of ltm_idxs to use.
                If LTM_ISDN, there will be a RLis_line tuple with
                key ltm_idx.  See rules for ltm_idx.
                Range: LTM_OTHER, LTM_ISDN
                Default: LTM_OTHER
ltm_idx       - A RC/ODA assigned ltm_idx value.  The
                port.module and ltm_idx values are used as key values
                lead_module and ltm_idx, respectively to access
                relations such as RLis_line, RLdnfeats, RLshterm,
                etc. See RLrc_qidx for rules for assigning
                the value.  RLis_line requires a tuple keyed by
                port.module  and ltm_idx.

If this is the lead port for a secondary only MLHG member the
ltm_idx is mapped from RLis_line instead of RLfc_line. Note
that all other attributes in this section should be populated
the same as specified, regardless if the MLHG member is secondary
or not.
```

**Attribute:**
portgrp
**Fullname:**
port group id.
**Attribute Description:**
Trunk group or multiline hunt group.

**Attribute:**
portgrp.grpnum
**Fullname:**
Group number.
**Attribute Description:**
group number for trunk or multiline hunt group.

**Attribute:**
portgrp.grptype
**Fullname:**
group type.
**Attribute Description:**
Group type.

TM_LINE for MLHG
TM_TRK for trunk

**Attribute:**
member
**Fullname:**
member.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Trunk group member or MLHG member number.

The following population rules apply to OUTDIAL MLHG members:
Multiline Hunt Group members can now exist in the extended range of 3001-3999. This range is reserved for outdial members of a MLHG. A member one must still exist before any outdial members can exist.
These members are not hunted like other members in the multiline hunt group. They may or may not have a directory number. If not, then it is not possible to terminate to that member.
OUTDIAL members are not allowed to hunt groups with HTYPE = RTH_MUPH in rlRT_MHG.

**Attribute:**
port
**Fullname:**
Global port name.
**Attribute Description:**
Global port name.

**Attribute:**
port.member
**Fullname:**
Port member
**Attribute Description:**
Port member.

**Attribute:**
port.module
**Fullname:**
port module.
**Attribute Description:**
SM where member is defined.

**Attribute:**
party
**Fullname:**
Party value
**Attribute Description:**
User number on this physical port. For users on a multipoint DSL, this value may range from 0-7. If this tuple has LPT_TYPE equal to LPT_ISDN, and it is not for Shared analog lines in an analog MLHG, then the tuple in RLlpt_pt (keyed by RLgroup_port.lport and RLgroup_port.lpt_type) must have either csd_hunt or csv_hunt set to DBYES.

The DMparty domain has a range of 0-7 for ISDN users. The

**Copyright © 1999 Lucent Technologies** 

value represents the user on a DSL. The DMparty domain has a range of 0-9 for analog users. In addition, for analog, the class of service (in RLfc_porttyp) and the MFRI bit (in RLfc_line) are used to determine the type of ringing.

The following chart shows how RC and ODA map the old party enumerations to the new party values and MFRI bit. Any combinations not listed here map to a party value of zero.

With a service class of INDIV, the value of party is dependent on the MFRI bit.

| Service Class | Party | Party Enum | MFRI bit |
|---|---|---|---|
| INDIV | 0 | FCP_INDI | N |
| INDIV | 1 | FCMFR_R1 | Y |
| INDIV | 2 | FCMFR_R2 | Y |
| INDIV | 3 | FCMFR_R3 | Y |
| INDIV | 4 | FCMFR_R4 | Y |
| INDIV | 5 | FCMFR_R5 | Y |
| INDIV | 6 | FCMFR_T1 | Y |
| INDIV | 7 | FCMFR_T2 | Y |
| INDIV | 8 | FCMFR_T3 | Y |
| INDIV | 9 | FCMFR_T4 | Y |
| INDIV | 0 | FCMFR_T5 | Y |

The service classes of FC_PBX and PBXHOTMOT can also be assigned to MLHG Members which have MFRI ringing assigned. Thus, the party and MFRI information in the previous chart for INDIV also applies to these 2 service classes. This means that each instance of INDIV in the previous chart can be replaced by either FC_PBX or PBHOTMOT and the resulting statement will still be true.

**Attribute:**

tsi_link

**Fullname:**

Time Slot Interchanger (TSI) link associated with the port

**Attribute Description:**

This attribute is the TSI link associated with this trunk. It is used to support fast port inhibit.
This attribute is only used for trunks assigned to the following trunk units:

SMDNU_S
SMDLTU2
SMDLTU

**Attribute:**

vpidb

Copyright © 1999 Lucent Technologies 

**Fullname:**
Virtual Peripheral Interface Data Bus
**Attribute Description:**
This attribute identifies the channel on a Peripheral Control and Timing (PCT) link associated with the trunk.

This attribute identifies the PIDB on a DX. The PIDB is associated with a Digital Line Trunk Unit-2 (DLTU2) facility.

This attribute is only used for facilities assigned to the following trunk units:
SMDNU_S
SMDLTU2
SMDLTU

**Attribute:**
qkey
**Fullname:**
Arbitrary key.
**Attribute Description:**
Arbitrary key used by RC & RTA to represent certain hunt types.

The following rules apply to the qkey attribute in relations RLqkeyport, RLgroup_port:
If portgrp.grptype in relations RLgroup_port and RLpggpmap is TM_LINE, qkey in RLgroup_port is 0.
If portgrp.grptype in relations RLgroup_port and RLpggpmap is TM_TRK, then if trunk hunt type (htype in RLrt_trkg keyed by portgrp.grpnum) is RTH_FIFO, RTH_ROTATE, RTH_PRFIFO, or RTH_PLFIFO, then qkey value is allocated from base address in RLrc_idx. For other trunk hunt types, qkey is 0. If qkey is non-zero, then a tuple keyed by this qkey must exist in RLqkeyport, with gport = RLpggpmap.port.

If RLrt_trkg.htype = RTH_PSUCD, a different qkey is generated for RLqkeyport, RLpsgp_prt, and RLpsprt_gp such that
1. RLqkeyport.qkey = RLpsgp_prt.qkey = RLpsprt_gp.qkey
2. RLrt_trkg.portgrp.grpnum = RLpsgp_prt.grpnum
   RLpsprt_gp.grpnum
3. RLpsgp_prt.ph_number = RLpsprt_gp.ph_number
   RLqkeyport.ph_number
4. RLpsgp_prt.ph_cn = RLpsprt_gp.ph_cn
   RLqkeyport.ph_cn

**Attribute:**
lport
**Fullname:**
Logical port.
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

Logical port of the MLHG member or trunk group member. A
sequential number administered per SM.
If portgrp.grptype = TM_LINE (if a line) then
lport = RLfc_line(RLpggpmap.port,RLpggpmap.party).lport
AND
lpt_type = RLfc_line(RLpggpmap.port,RLpggpmap.party).lpt_type
If portgrp.grptype = TM_TRK (if a trunk) then
lport = RLfc_trunk(RLpggpmap.port).lport
AND
lpt_type = LPT_OTHER.

**Attribute:**
lpt_type
**Fullname:**
Logical port type.
**Attribute Description:**
The logical port type of the user.
LPT_ISDN (for ISDN MLHG member);
LPT_OTHER (for analog BRCS MLHG member and trunk member).

**Attribute:**
ltm_type
**Fullname:**
logical termination index type.
**Attribute Description:**
Logical termination index type.
Indicates which type of ltm_idxs to use.
LTM_ISDN - if:
1) RLis_term.cpetyp is IS_TYPEA, IS_TYPEB, IS_TYPEC,
IS_TYPED, IS_TYPEE, or IS_TYPATT, or
2) RLfc_porttyp.sh_analog = DBYES,
Indicates that this is an ISDN BRCS MLHG member.
Otherwise LTM_OTHER.
Indicates whether this is an analog MLHG member or trunk member.
If LTM_ISDN, there will be a RLis_line tuple with key ltm_idx.

**Attribute:**
ltm_idx
**Fullname:**
Logical termination index.
**Attribute Description:**
Logical termination index.
Indicates which type of ltm_idxs to use.
LTM_ISDN - if:
1) RLis_term.cpetyp is IS_TYPEA, IS_TYPEB, IS_TYPEC,
IS_TYPED, IS_TYPEE, or IS_TYPATT, or
2) RLfc_porttyp.sh_analog = DBYES,
Indicates that this is an ISDN BRCS MLHG member.
Otherwise LTM_OTHER.
Indicates whether this is an analog MLHG member or trunk member.

Copyright © 1999 Lucent Technologies 

If LTM_ISDN, there will be a RLis_line tuple with key ltm_idx.

**Attribute:**
lifo
**Fullname:**
Last In First Out indicator.
**Attribute Description:**
Indicates that the hunt sequence is either least idle or most idle if the hunt is RTH_MIDL_LIDL.

**Attribute:**
psu_mod
**Fullname:**
module number of the GSM used for SS7 PSU trunk signaling
**Attribute Description:**
This attribute is set to the GSM number when the trunk group uses that GSM for SS7 trunk signaling. Otherwise the psu_mod is set to 0.

**Defines:**
"db/DMvpidb.h",
"db/DMlinkno.h",
"db/DMparty.h"

## 4. Population Rules for RLgrp_mpm

**Relation Description**
Modem pool group & member to member information.

A Modem Pool Group, which is a type of Multi-Line Hunt Group, consists of Modem Pool Members. Each Modem Pool Member consists of a modem and a terminal adaptor. The modem connects to the *5ESS*®-2000 switch by an analog line. The terminal adaptor connects to the *5ESS*®-2000 switch by a digital subscriber line. The analog line has a non-hunting DN; the digital subscriber line has no DN. All normal Multi-Line Hunt Group tuples are populated along with this tuple.

This tuple is populated when a new Modem Pool Member is added to the Modem Pool Group. The group and member number are associated with the analog side. The dslport, ph_number, and ph_cn, party are associated with the digital subscriber line.

One tuple for each Modem Pool Group member defined in the office.

As of 5E9, Modem Pooling will not be supported on the PH2 Access Image; it will only be supported on PH3's. In 5e10, it will be supported on both PH3's and PH4's.

**Attribute: grpnum**

**Fullname:** multiline hunt group number

**Attribute Description** This group number must have a tuple in RLrt_mhg and RLrt_mpg (1st Key value)

**Attribute: member**

**Fullname:** member number within group

**Attribute Description** member number of member within grpnum group (2nd Key value)

**Attribute: module**

**Fullname:** SM module number the MPM resides

**Attribute Description** The terminal adaptor and the modem (forming a single modem pool number) must be on the same SM.

**Attribute: dslport**

**Fullname:** the port name of the DSL for this MPM

**Attribute Description** This port must be previously populated in relation RLfc_porttype with a servclass of FC_ISDN.

**Copyright © 1999 Lucent Technologies** 

**Attribute: dslport.member**

**Fullname:** member

**Attribute Description** member number of the DSL for this MPM

**Attribute: dslport.module**

**Fullname:** module

**Attribute Description** module number of the DSL for this MPM

**Attribute: ph_number**

**Fullname:** the PH number serving the DSL for this MPM

**Attribute Description** Verify existence of tuple in RLpsprt_gp with key value:

```
key   RLpsprt_gp.module = RLgrp_mpm.module
key   RLpsprt_gp.ph_number = RLgrp_mpm.ph_number
key   RLpsprt_gp.ph_cn = RLgrp_mpm.ph_cn
```

As of 5E9, Modem Pooling will not be supported on the PH2 Access Image; it will only be supported on PH3's. In 5e10, it will be supported on both PH3's and PH4's.

**Attribute: ph_cn**

**Fullname:** the PH channel number serving the DSL for this MPM

**Attribute Description** For a given ph_number and a ph_cn there must be a tuple in psx25ln, dslequip, equipdsl, and psprt_gp relations.

**Attribute: party**

**Fullname:** the user party on the DSL for this MPM

**Attribute Description** Specific user within an ISDN DSL D-channel.

**Attribute: alocdn**

**Fullname:** the modem pool member analog LOC directory number

**Attribute Description** Every MPM has a non-hunt directory number that is used by terminal maintenance (TM) to connect two MPMs together for testing. The DN corresponds to the analog line of the MPM. This analog DN must have a tuple in RLrt_dntran with termclass set to RTTC_INDIV and ucd_muph set to DBNO. The other attributes for this analog DN in RLrt_dntran must be set to the same values as they would be for a member of a regular Multi-Line Hunt Group. This non-hunt DN must not be given to external customers.

**Attribute: alocdn.noc**

**Fullname:** normalized office code

**Attribute Description** normalized office code for the modem pool member analog LOC DN

**Attribute: alocdn.digits**

**Fullname:** digits

## 4. Population Rules for RLgrp2ckt

**Relation Description**
Mapping of logical GSDB group name, and unit type to a physical unit, circuit number, and line group number

This relation represents the translation from a GSDB logical group number to a circuit name. This relation is the inverse of RLckt2grp, so the only check made here is to be sure every tuple in this relation exist in RLckt2grp.

Relation RLgrp2ckt is accessed by the logical GSDB group number and is used to audit GSDBs.

**Attribute: unit**

**Fullname:** Unit number

**Attribute Description** This is the unit number on the SM.

**Attribute: utype**

**Fullname:** Unit type

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the unit type.

**Attribute: ckt_no**

**Fullname:** Circuit numbers

**Attribute Description** The circuit numbers

**Attribute: grp_num**

**Fullname:** Line Group Number

**Attribute Description** The line group number is derived by dividing the RT line number by eight (8). The RT line number can be obtained from the port index. If The RT line is a TR8 the line number is located in bits 0-6 of the port index. If the RT line is a TR303 then the line number is located in bits 2-13 of the port index.

**Attribute: gsdb_grp**

**Fullname:** GSDB group name

**Attribute Description** The GSDB group name. The group name is selected from the next available sequential value from a pool of group names in relation RLrc_qidx.

```
      The bit layout of the gsdb_grp for IDCU follows:
-----------------------------------------------------------------
|           |                                                   |
| 1   1   0 |             LOGICAL  GSDB                         |
|           |                                                   |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0

LOGICAL GSDB (bits 0-12)  - number 1 through 8191 (0x1FFF)
                            (Unique for each IDCU GSDB/SM)
                            Zero (0) is illegal.
      The bit layout of the gsdb_grp for DNU-S follows:
-----------------------------------------------------------------
|                                                               |
|                         LOGICAL  GSDB                         |
|                                                               |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0

LOGICAL GSDB (bits 0-15)  - number 0x0001 through 0xFFFC
                            (Unique for each DNU-S GSDB/SM)
                            Zero (0) is illegal.
```

**Relation Description**

SCCP Global SM Network Definition Relation

This relation is used by SCCP as a definition of all GSM's and networks in the SCCP network served by this switch.

**Attribute:**
gsm
**Fullname:**
Global SM Number
**Attribute Description:**
This attribute specifies Global SM's part of the SCCP network. These SM's can be Standardization Sector (SS7) (formerly CCITT7) International or National.

**Attribute:**
sig_type
**Fullname:**
Message Transfer Part (MTP) Signaling Type
**Attribute Description:**
This attribute specifies the MTP signaling type under which SCCP is running.

**Attribute:**
net_num
**Fullname:**
SCCP Network Number
**Attribute Description:**
This attribute provides a mapping from SCCP Global SM's to SCCP network number.

**Attribute:**
sccp_type
**Fullname:**
Signaling Connection Control Part Type
**Attribute Description:**
This attribute specifies the Network Number of a SCCP Global SM.

**Attribute:**
sccp_init
**Fullname:**
SCCP Initializations Allowed
**Attribute Description:**
This attribute specifies whether SCCP is allowed to initialize. If this attribute is CCSCP_OPER, then SCCP is allowed. If this attribute is CCSCP_GROW, then SCCP is not allowed to initialize but SCCP RC/V screens can be used.

Copyright © 1999 Lucent Technologies 

**Attribute:**
sccp_prc
**Fullname:**
SCCP Processing Allowed
**Attribute Description:**
This attribute specifies whether SCCP message processing is allowed in the PH.

**Attribute:**
actv_scr
**Fullname:**
Activation and deactivation of SCCP screening
**Attribute Description:**
This attribute specifies whether screening of the SCCP messages feature activated or not.

**Attribute:**
sccp_acc
**Fullname:**
SCCP Accounting
**Attribute Description:**
The sccp_acc attribute will be set if the GSM (key) is performing SCCP Accounting. DBYES indicates the GSM is performing SCCP Accounting. DBNO indicates the GSM is NOT performing SCCP Accounting.

**Attribute:**
scp_version
**Fullname:**
SCCP Version
**Attribute Description:**
This attribute will be used to indicate the version of SCCP being used for this network and GSM.

**Attribute:**
hop_cnt
**Fullname:**
SCCP Hop Count
**Attribute Description:**
This attribute will contain the number of hops an SCCP XUDT or XUDTS message is allowed to take in the network.

**Attribute:**
reasmbtmr
**Fullname:**
SCCP Re-assembly Timer

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Re-assembly timer for SCCP XUDT or XUDTS message.

**Attribute:**
monitor
**Fullname:**
SCCP Display Monitor
**Attribute Description:**
SCCP Display Monitor - displays the performance data collected to the rop, in response to the output report SCCP Origination and Re-assembly Performance Report.

**Attribute:**
rmtsccpmgmnt
**Fullname:**
Remote SCCP Management
**Attribute Description:**
When this attribute has the value DBYES the Remote SCCP Management is performed. If value is DBNO the Remote SCCP Management is not performed.

**Attribute:**
lclinit_ssna
**Fullname:**
Local Initialization SSN Allowed
**Attribute Description:**
After Local Initialization, the states of the SSNs are initialized as Allowed, if the value of this parameter is DBYES and the lclinit_spec is of value DBYES. If the value of lclinit_ssna is DBNO and lclinit_spec is DBYES then the states are initialized as Prohibited. This parameter is not effective if lclinit_spec is DBNO.

**Attribute:**
lclinit_spec
**Fullname:**
Local Initialization Specific
**Attribute Description:**
The method of establishing the SSN status after an initialization is specific per GSM if its value is DBYES; else the SSN status is decided based upon sccp_type, attribute of this relation.

## 4. Population rules for RLgsm_opc

### Relation Description

GSM to OPC/Network Translation

This relation provides the basic mapping of global SM to OPC and network. It was implemented as part of the change to the multiple global SM soft-ware architecture. Each global SM that supports SS7 signaling, both national and international, is represented by a tuple in this relation.

**Attribute:**
gsm
**Fullname:**
Global SM Number
**Attribute Description:**
The number that specifies a global SM which supports national or international SS7 signaling.

**Attribute:**
gsmi
**Fullname:**
Global SM Index
**Attribute Description:**
This attribute is used as an abbreviated form of the global SM number.

**Attribute:**
network
**Fullname:**
SS7 Network
**Attribute Description:**
This attribute defines the SS7 network, national or international, supported by this global SM.

**Attribute:**
opc
**Fullname:**

Copyright © 1999 Lucent Technologies 

Origination Point Code

**Attribute Description:**

The value of this attribute is the point code assigned to this SS7 global SM.

**Attribute:**

active

**Fullname:**

Active/Standby Indicator

**Attribute Description:**

This attribute indicates whether the global SM is in active or standby mode. A value of DBYES indicates active. A value of DBNO indicates standby.

**Attribute:**

pc_length

**Fullname:**

Point Code Length

**Attribute Description:**

This attribute will hold the length of the Point Code in bits.

**Attribute:**

pc_fld1

**Fullname:**

Field 1 Point Code Size

**Attribute Description:**

This attribute will hold the number of bits in the highest ordered field of the Point Code.

**Attribute:**

pc_fld2

**Fullname:**

Field 2 Point Code Size

**Attribute Description:**

This attribute will hold the number of bits in the second highest ordered field of the Point Code.

**Attribute:**

pc_fld3

**Fullname:**

Field 3 Point Code Size

**Attribute Description:**

This attribute will hold the number of bits in the lowest ordered field of the Point Code.

**Attribute:**

congtype

Copyright © 1999 Lucent Technologies 

**Fullname:**
Type of Congestion
**Attribute Description:**
This attribute will hold the type of Congestion used by the GSM in this tuple.

**Attribute:**
n7var
**Fullname:**
SS7 National Variation Type
**Attribute Description:**
This attribute will hold the SS7 National Variation type for this GSM.

**Attribute:**
cic_length
**Fullname:**
Length of the Circuit Identification Code
**Attribute Description:**
This attribute will hold the length of the Circuit Identification Code.

**Attribute:**
ni
**Fullname:**
Network Indicator
**Attribute Description:**
This attribute will hold the Network Indicator Value.

**Attribute:**
off_type
**Fullname:**
Office Type
**Attribute Description:**
This attribute will hold the Office type Enumeration. The attribute could contain the enums CCSSEP, CCSSTP, or CCSSTEP.

**Attribute:**
alias_pc
**Fullname:**
Alias Point Code
**Attribute Description:**
The Alias Point Code will hold the optional alternative OPC of this GSM, which may be used by SCCP for routing. This attribute is meaningful only when the National Variation (n7var) is equal to CCANSI7V.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
mtp_acc
**Fullname:**
MTP Accounting
**Attribute Description:**
The mtp_acc attribute will be set if the GSM (key) is performing MTP Accounting. DBYES indicates the GSM is performing MTP Accounting. DBNO indicates the GSM is NOT performing MTP Accounting.

**Attribute:**
clu_bitmask
**Fullname:**
Cluster bitmask
**Attribute Description:**
A bit mask which zeroes out the member field of a DPC, leaving only the network+cluster fields intact.

**Attribute:**
net_bitmask
**Fullname:**
Network bitmask
**Attribute Description:**
A bit mask which zeroes out the cluster and member fields of a DPC, leaving only the network field intact.

**Attribute:**
clu_bitshift
**Fullname:**
Cluster bitshift
**Attribute Description:**
The number of bits to shift right the result of (pointcode & clu_bitmask) to get the network+cluster value.

**Attribute:**
net_bitshift
**Fullname:**
Network bitshift
**Attribute Description:**
The number of bits to shift right the result of (pointcode & net_bitmask) to get the network value.

/* Same for alias_opc2 thru alias_opc15 */

**Attribute:**
alias_opc1
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Alias Point code

**Attribute Description:**

Alias Point Code 1; can be partial key to RLlab7_pci (with dpc + network) and to RLlab7prt (with dpc + network + cic).

**Attribute:**

sls_expansion

**Fullname:**

SLS expansion

**Attribute Description:**

This attribute will indicate whether or not SLS expansion is enabled. If set to DBYES, SLS expansion is enabled, requiring 8-bit SLS code. If set to DBNO (the default), SLS expansion is disabled, requiring usage of existing 5-bit SLS code.

**Attribute:**

sufflnkprt

**Fullname:**

Sufficient links percentage.

**Attribute Description:**

Contains the value for the percentage of signaling links that must be made accessible before phase one of the MTP restart can be considered completed.

**Attribute:**

suffrteprt

**Fullname:**

Sufficient routes percentage.

**Attribute Description:**

Contains the value for the percentage of signaling routes (received TRAs) that must be made accessible before phase one of the MTP restart can be considered completed.

**Attribute:**

restart_opt

**Fullname:**

Restart option.

**Attribute Description:**

Indicates which restart method is to be employed during a local restart condition (ie: full GSM initialization, PSU duplex recovery).

**Attribute:**

gsmtype

**Fullname:**

global switching module type

**Attribute Description:**

Indicates the type of SM in terms of the type of CCS messaging

Copyright © 1999 Lucent Technologies 

supported on the SM. The value of this attribute is one of the following:

1. CCISLANDGSM - The SM is a GSM that supports CCS messaging for trunks and TCAP services on the SM but support of such messaging for trunks and TCAP services on other non-global SM's is not provisioned on the SM.
2. CCHOSTGSM - The SM is a GSM which supports sending and receiving of CCS messages for non-global SM's.

**Defines:**

"db/DMdpc.h",
"db/DMaliasopc.h"

# GTT_0DPC

## 1. Description

This relation provides for SCCP a mapping from a translation group and address digits to its corresponding psn_index. The psn_index points to a dpc, ssn, and network number.

This relation contains translation group and address digit combinations for translation groups that range from 0 to 31. See RLgtt_1dpc.G for translations groups 32 to 63.

## 2. Data Dictionary Values

Signaling Connection Control Part (SCCP) Global Title Translation Function mapping to a DPC / SSN / Network Number

This relation is used by SCCP Global Title Translation to map an address string from the incoming message to an end destination stored as a PSN_INDEX. This relation contains the digit strings for the SCCP Translation Groups that are within the range 0 thru 31.

**Attribute: tran_gp**

**Fullname:** SCCP Translation Group

**Attribute Description** This attribute is a way to map from an incoming message requesting a service to that particular translation group. This relation maps translation groups that are in the range 0 thru 31.

**Attribute: fds_ind**

**Fullname:** SCCP Fixed Digit String Index

**Attribute Description** This attribute maps an index to a fixed digit string that is the first part of the address string.

**Attribute: dig1**

**Fullname:** First Address Digit

**Attribute Description** This attribute specifies the first digit in the string to be used while doing global title translation.

**Attribute: dig2**

**Fullname:** Second Address Digit

**Attribute Description** This attribute specifies the second digit in the string to be used while doing global title translation.

**Attribute: dig3**

**Fullname:** Third Address Digit

**Attribute Description** This attribute specifies the third digit in the string to be used while doing global title translation.

**Attribute: dig4**

**Fullname:** Fourth Address Digit

**Attribute Description** This attribute specifies the fourth digit in the string to be used while doing global title translation.

**Attribute: dig5**

**Fullname:** Fifth Address Digit

**Attribute Description** This attribute specifies the fifth digit in the string to be used while doing global title translation.

**Copyright © 1999 Lucent Technologies** 

**Attribute: dig6**

**Fullname:** Sixth Address Digit

**Attribute Description** This attribute specifies the sixth digit in the string to be used while doing global title translation.

**Attribute: dig7**

**Fullname:** Seventh Address Digit

**Attribute Description** This attribute specifies the seventh digit in the string to be used while doing global title translation.

**Attribute: dig8**

**Fullname:** Eigth Address Digit

**Attribute Description** This attribute specifies the eigth digit in the string to be used while doing global title translation.

**Attribute: dig9**

**Fullname:** Ninth Address Digit

**Attribute Description** This attribute specifies the ninth digit in the string to be used while doing global title translation.

**Attribute: dig10**

**Fullname:** Tenth Address Digit

**Attribute Description** This attribute specifies the tenth digit in the string to be used while doing global title translation.

**Attribute: psn_index**

**Fullname:** Point Code / Subsystem Number / Network Number Index

**Attribute Description** This attribute is a mapping from an index to a point code / subystem number / network number.

Signaling Connection Control Part (SCCP) Global Title Translation Function mapping to a DPC / SSN / Network Number

This relation is used by SCCP Global Title Translation to map an address string from the incoming message to an end destination stored as a PSN_INDEX. This relation contains the digit strings for the SCCP Translation Groups that are within the range 32 thru 63.

**Attribute: tran_gp**

**Fullname:** SCCP Translation Group

**Attribute Description** This attribute is a way to map from an incoming message requesting a service to that particular translation group. This is a relative mapping. For this relation, RLgtt_1dpc, the value of tran_gp must be adjusted by 32 to obtain the true value for the translation group.

**Attribute: fds_ind**

**Fullname:** SCCP Fixed Digit String Index

**Attribute Description** This attribute maps an index to a fixed digit string that is the first part of the address string.

**Attribute: dig1**

**Fullname:** First Address Digit

**Attribute Description** This attribute specifies the first digit in the string to be used while doing global title translation.

**Attribute: dig2**

**Fullname:** Second Address Digit

**Attribute Description** This attribute specifies the second digit in the string to be used while doing global title translation.

**Attribute: dig3**

**Fullname:** Third Address Digit

**Attribute Description** This attribute specifies the third digit in the string to be used while doing global title translation.

**Attribute: dig4**

**Fullname:** Fourth Address Digit

**Attribute Description** This attribute specifies the fourth digit in the string to be used while doing global title translation.

**Attribute: dig5**

**Fullname:** Fifth Address Digit

**Attribute Description** This attribute specifies the fifth digit in the string to be used while doing global title translation.

Copyright © 1999 Lucent Technologies 

**Attribute: dig6**

**Fullname:** Sixth Address Digit

**Attribute Description** This attribute specifies the sixth digit in the string to be used while doing global title translation.

**Attribute: dig7**

**Fullname:** Seventh Address Digit

**Attribute Description** This attribute specifies the seventh digit in the string to be used while doing global title translation.

**Attribute: dig8**

**Fullname:** Eigth Address Digit

**Attribute Description** This attribute specifies the eigth digit in the string to be used while doing global title translation.

**Attribute: dig9**

**Fullname:** Ninth Address Digit

**Attribute Description** This attribute specifies the ninth digit in the string to be used while doing global title translation.

**Attribute: dig10**

**Fullname:** Tenth Address Digit

**Attribute Description** This attribute specifies the tenth digit in the string to be used while doing global title translation.

**Attribute: psn_index**

**Fullname:** Point Code / Subsystem Number / Network Number Index

**Attribute Description** This attribute is a mapping from an index to a point code / subystem number / network number.

## 4. Population Rules for RLgtt_mask

**Relation Description**
SCCP Global Title Address Digits Mask

This relation specifies the format expected of the address digits received in the incoming SCCP message.

**Attribute: tran_gp**

**Fullname:** SCCP Global Title Translation Group

**Attribute Description** This attribute specifies the translation group for a particular service.

**Attribute: num_fix**

**Fullname:** Number of Fixed Address Digits

**Attribute Description** This attribute specifies the part of minimal number of digits in the incoming SCCP message on which Global Title Translation will be performed.

Copyright © 1999 Lucent Technologies

**Attribute: num_req**

**Fullname:** Number of Required (Primary) Address Digits

**Attribute Description** This attribute specifies the number of required (primary) digits. This count will be used if more address digits are received than the total number of address digits that was expected.

**Attribute: num_opt**

**Fullname:** Number of Optional (Secondary) Address Digits

**Attribute Description** This attribute specifies the number of optional (secondary) digits that could be in the incoming SCCP message.

**Attribute: num_fds**

**Fullname:** Number of Fixed Digits Strings

**Attribute Description** This attribute specifies the number of currently populated fixed digit strings in this translation group.

**Attribute: str_mtch**

**Fullname:** How to Translate GTT digit strings

**Attribute Description** This attribute indicates how the GTT Digit strings should be initially matched using: Full String, Partial String or Variable string compares.

## 4. Population Rules for RLgtt

**Relation Description**
North American CCS7 (CCSNA7) Signaling Connection Control Part (SCCP) Global Title Translations on dialed digits

This relation is used by SCCP layer in the Signaling System #7 protocol for direct signaling messages.

**Attribute: digits**

**Fullname:** Dialed digits to be translated

**Attribute Description** This attribute will be populated with the specified digits (up to 7) on which the global title translation is to be done, followed by the number of digits. For example, for the digits 800777, the number that is populated in this attribute is 8007776. For the digits, 22222, the attribute is populated with 222225. For the digits 0222, the attribute should be populated with 02224. The range of the input is 0 - 9999999 while the range of the stored attribute is 01 - 99999997.

The number of digits were made variable (up to 7) to allow various countries to use SCCP. Each country may require that the global title translation be done on a different number of digits.

For the UK, the number of digits that the translation must be done on is 6. Other countries in the

Copyright © 1999 Lucent Technologies 

future may require a different number of digits for their global title translations.

For Spain, the number of digits that the translation must be done on is 6. Even though the flexibility is given for a variable number up to 7, only UK and Spain use this attribute currently. It is fixed at 6 for both of these.

**Attribute: tn_indx**

**Fullname:** Translation number index for dialed digits

**Attribute Description** This attribute is the translation number index identifying the Destination Point Code (DPC) and the SCCP subsystem number (SSN) that are the result of a SCCP global title translation on the dialed digits. This index will be one of the indices in the RLtn_ssn relation.

## 4. Population Rules for RLhcn_rts

**Relation Description**
Translation table from HIM DFI channel circuit name to RSM NCT time slot number.

This relation is the inverse of the RLrts_hcn relation. Whenever the data in RLrts_hcn or RLhcn_rts is modified, the data in the other relation must also be modified. The population rules for RLhcn_rts are identical to those for RLrts_hcn.

**Attribute: himcktname**

**Fullname:** HIM DFI channel circuit name

**Attribute Description** The himcktname attribute indicates the associated HIM DFI channel circuit

Copyright © 1999 Lucent Technologies 

name. Only the tuples for equipped T1 time slots should be in the relation.

**Attribute: nctts**

**Fullname:** RDM NCT time slot number

**Attribute Description** The nctts attribute corresponds to an NCT time slot in the RSM which is associated with a T1 transmission line.

**Defines:** "db/DMcircuit.h"

## 4. Population Rules for RLhdfi_con

**Relation Description**
Host digital facility interface connections.

Copyright © 1999 Lucent Technologies

Relation that gives the connection of DFI's between a HSM and its associated RSM. There is one tuple for every link connecting an HSM and an RSM in the *5ESS*®-2000 switch complex.

This relation directly reflects the office-engineered connection between host and remote DFIs. Only tuples for equipped RDFI/RDFI2s and HDFI/HDFI2s should be in the relation. The relation RLHDFI_CON and the relation RLRDFI_CON contain similar data: RLHDFI_CON keys from the HSM and RLRDFI_CON keys from the RSM. A change in one of these relations requires the corresponding change in the other relation.

**Attribute: hsm**

**Fullname:** Host Switching Module

**Attribute Description** SM number of HSM (1-192).

**Attribute: hdltu**

**Fullname:** Host Digital Line & Trunk Unit

**Attribute Description** DLTU and DLTU2 number at HSM end (0-5).

**Attribute: hdfi**

**Fullname:** Host Digital Facility Interface

**Attribute Description** HDFI/HDFI2 number at HSM end (1-10 for DLTU/.DLTU2, stored as 0-9).

**Attribute: hfac**

**Fullname:** Host Facility

**Attribute Description** Relative facility number on a host SM end host DFI (0) or HDFI2 (0-1).

**Attribute: rsm**

**Fullname:** Remote Switching Module

**Attribute Description** SM number of RSM (1-192).

**Attribute: rdltu**

**Fullname:** Remote Digital Line and Trunk Unit

**Attribute Description** DLTU, DLUT2

**Attribute: rdfi**

**Fullname:** Remote Digital Facility Interface

**Attribute Description** RDFI/RDFI2 number at RSM end (1-10 for DLTU/DLTU2, stored as 0-9).

**Attribute: rfac**

**Fullname:** Remote Facility

**Attribute Description** Relative facility number on a RSM end RDFI (0) or RDFI2 (0-1).

## 4. Population Rules for RLhi_cf

**Relation Description**
This relation provides the home intercom/single line variety package constructed feature information used in the SM.

The constructed feature can be assigned only to ANALOG lines with class of service FC_INDIV. This relation provides the home intercom/single line variety package constructed feature information used in the SM. The constructed feature can be assigned only to unshared ANALOG lines with class of service FC_INDIV.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description** A BRCS constructed feature ID consists of a modular feature type and a unique identifier. The key to this relation is just a unique identifier. The modular feature type is always MFHI, an enumeration of type DMftype, and thus is not needed as part of the key to this relation. For the home intercom/single line variety package constructed feature, the modular feature type is MFHI, which is an enumeration of type DMftype. The feature ID must have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: actvn**

**Fullname:** activation

**Attribute Description** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate using a feature button or dialed code) so that actvn always has the value ACTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: dctvn**

**Fullname:** deactivation

**Attribute Description** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate using a dialed code or feature button) so that dctvn always has the value DCTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: int_cd_dial**

Copyright © 1999 Lucent Technologies 

**Fullname:** intercom code dialing option

**Attribute Description** Indicates if intercom code dialing is allowed. This is an enumeration of type DMbool. If the value of int_cd_dial is DBYES, the subscriber will be allowed to invoke ringing pattern B by use of a dialed code. If the value is DBNO, the subscriber must dial his/her own DN to invoke ringing pattern B.

**Attribute: sel_int_dial**

**Fullname:** selective intercom dialing option

**Attribute Description** Indicates if selective intercom dialing is allowed: This is an enumeration of type DMbool. If the value of sel_int_dial is DBYES, the subscriber may invoke any one of four ringing patterns (A, B, C, or G) by dialing an appropriate dial code. If the value is DBNO, the subscriber can only invoke ringing pattern B for a HI/SVP call, either by using the intercom code dialing option (if it is selected), or by dialing his/her own DN.

**Attribute: sel_call_xfer**

**Fullname:** selective call transfer option

**Attribute Description** Indicates if selective call transfer is allowed. This is an enumeration of type DMbool. If the value of sel_call_xfer is DBYES, the subscriber may place an outside call on hold by flashing, then invoke any one of four ringing patterns (A, B, C, or G) by dialing an appropriate dial code. The subscriber can have sel_call_xfer with or without the private consult. Private consult gives subscribers the ability to talk privately before one user retrieves the outside. If the subscribers have sel_call_xfer with private consult the subscriber must flash to retrieve the call. If the subscribers do not have private consult the subscriber will automatically be connected to outside call.
This option allows the subscriber to flash: flash privilege is also allowed if dial_hold is DBYES and if no other flash feature is on the line.
If the value of sel_call_xfer is DBNO, and the value of dial_hold is DBYES, the subscriber may flash, but the dial codes for the ringing patterns are invalid.
If the value of sel_call_xfer is DBNO, and the value of dial_hold is DBNO, the subscriber may not flash.

**Attribute: priv_conf**

**Fullname:** private conference option

**Attribute Description** Indicates if private conference is allowed when selective call transfer is invoked. This is an enumeration of type DMbool. This option applies only when the selective call transfer option is invoked, and controls the way in which an outside party is picked up to resume talking after being put on hold, and after the terminals on the Hi/SVP line have been rung.
If the value of priv_conf is DBLYES, the subscriber must flash to pick the outside party which is on hold.
If the value of priv_conf is DBNO, the outside party is automatically picked up when the first HI/AVP terminal goes off-hook during the HI/SVP call.

**Attribute: dial_hold**

**Fullname:** dialable hold option

**Attribute Description** Indicates if dialable hold is allowed. This is a DMbool enumeration. If the value of dial_hold is DBYES, the subscriber may flash to put an outside call on hold, hang up, then

Copyright © 1999 Lucent Technologies 

resume talking to the outside party from another terminal on the same line.
This option allows the subscriber to flash: flash privilege is also allowed if sel_call_xfer is DBYES and if there is no other flash feature on the line.
If the value of sel_call_xfer is DBNO, and the value of dial_hold is DBNO, the subscriber may not flash.

**Attribute: remind_ring**

**Fullname:** reminder ring for dialable hold option

**Attribute Description** Indicates if a reminder ring will be provided for the dialable hold option. This is an enumeration of type DMbool. This option applies only when the dialable hold option is invoked. If the value of remind_ring is DBYES, a reminder ring will be applied to the subscriber's line once every minute until the subscriber goes off-hook, after putting an outside call on hold.

The value of remind_ring must always be DBNO to comply with the FSD. This attribute is being included to facilitate future development.

**Attribute: cw_enable**

**Fullname:** enable call waiting during home intercom calls

**Attribute Description** Indicates if a call waiting tone will be heard during a home intercom call that does not involve an outside party (pure home intercom call). This is a DMbool enumeration. This option does not provide the call waiting feature itself, it only allows the call waiting tone to be heard during the HI/SVP call.

If the value of cw_enable is DBYES, the subscriber will hear the call waiting tones during the HI/SVP call, and may flash to pick up the call which is waiting.

If the value is DBNO, call waiting will be disabled during the HI/SVP call, the subscriber will not hear the call waiting tone, and the outside caller will receive busy treatment.

The value of cw_enable must always be DBNO to comply with the FSD. This attribute is being included to facilitate future development.

**Attribute: cf_1a**

**Fullname:** enable call forwarding during home intercom calls

**Attribute Description** If the value of cf_1a is DBYES and call forwarding is activated and the home intercom subscriber dials own DN, call will be forwarded to the forward_to DN. If the value is DBNO the call will not be forwarded. This option is added to allow customer to remain 1A transparent during call forwarding active.

**Attribute: mdnl_ring1a**

**Fullname:** mdnl_ring1a

**Attribute Description** Indicates whether the 1AESS ringing pattern for the Master DN in an MDNL call will be used are the *5ESS*®-2000 switch version of the ringing pattern.
If the attribute mdnl_ring1a is set to DBYES HI/SVP calls to the master DN should ring with pattern B and calls to dependent DNs will ringing with the MDNL dependent DN pattern. If mdnl_ring1a is DBNO then HI/SVP calls to the Master and dependent DNs should ring with the MDNL pattern associated with the dialed DN.

# HMRSMCL

## 1. Description

This relation provides RSM communication link information for every host facility connected to a DLTU/2 or DNU-S. For control links, the information is duplicated for tuples keyed by host facility name or control circuit name.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 120 |
| expected tuples | 9 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population rules for RLhmrsmcl

**Relation Description**

HIM and RSM communication link
Provides RSM communication link information for every Host Transport.

**Attribute:**

ckt_id

Copyright © 1999 Lucent Technologies

**Fullname:**
circuit name of a Host Transport circuit or CTS circuit.
**Attribute Description:**
It is equal to the internal circuit name of a Host Transport circuit or it child CTS circuit for umbilicals carrying clnks.

**Attribute:**
type
**Fullname:**
circuit type of the Host Transport circuit
**Attribute Description:**
It is equal to the circuit type as defined in RLCKTDATA of the circuit represented by the attribute ckt_id. With the introduction of the RSM on DNU-S feature the control circuits on the Host Facility are also populated in this relation. The tuples will be populated with the identical data of the parent host transport with the exception of mckt_id which will contain the mate control circuit. The rationale for doing this is quicker access time to this data during clink management.

**Attribute:**
comm_link
**Fullname:**
RSM communication link Host Transport indication.
**Attribute Description:**
This field is of type DMBOOL and will take values of DBYES if the keyed Host Transport may carry an RSM control time slot. Otherwise it will be DBNO.
For DLTU host transports on SM-2000's,
the first two CTS must not be on the same DLTU2 fuse group.
HDFIs are assigned to fuse groups on the DLTU2 as follows:

| HDFI Number: | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|---|---|---|---|---|---|---|---|---|---|
| Fuse Group: | A | B | D | C | A | B | D | C | A | B |

where the Fuse Groups are designated A, B, C and D.
For DNU Hosted CTS links. The CTS pairs (1<->2 and 3<->4) must not be on the same STS. Also, CTS mates (1<->3 and 2<->4) must not be on the same STS. A 4-CTS rsm can be equipped using 2 STS's if they are assigned as follows:

| STS X | STS Y |
|---|---|
| CTS 1 | CTS 2 |
| CTS 4 | CTS 3 |

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
offset
**Fullname:**
offset in phase protected memory for manual isolation of RSM
**Attribute Description:**
This attribute will contain the offset of the rsm_num as indicated by the phase protected memory bits. The range of possible values depends on the type of HSM present.
If this is a HSM, the values are 1 thru 5.
If this is a HSM-2000, the values are 1 thru 30.
This value represents the bit offset for an RSM's isolation state in phase protected memory.
Gaps are allowed in this numbering spectrum.
For example, the first RSM to be populated could have an offset of 1, the next one an offset of 2, and so on up to the maximum (5 or 30). Now suppose you degrow the 2nd RSM (the one with the offset of 2), leaving populated offsets of 1, 3, 4, etc. If you were to grow another RSM again, offset 2 would be available for it.
Once the offset has been established for an RSM, then any addition of more umbilicals to that RSM will have the same established offset. Finally, this attribute matches the attribute offset in the AM relation db/RLmodatt.G.

**Attribute:**
chdb_num
**Fullname:**
channel data block number
**Attribute Description:**
This field takes a value from 0 to 31 for HSMs, and PIDB-determined values for HSM-2000s.
HFACs with comm_link equal to DBNO will have chdb_num equal to 0. Those HFACs with comm_link equal to DBYES the choice of value is made as follows:

For HSMs:
If the HFAC has a PIDB greater than or equal to 16 (the PIDB field in RLCKTDATA) and its stuff code (the DBCHAN field in RLCKTDATA) is not zero, then the channel number must be one of the following values {2,4,6,8,10,12,14}. If the HFAC has a PIDB less than 16 and its stuff code is not equal to zero, then the channel number must be one of the following values {1,3,5,7,9,11,13,15}. If the HFAC has a pidb greater than or equal to 16 and its stuff code is zero, then the channel must be one of the following values {16,18,20,22,24,26,28,30}.
Finally, if the HFAC has a PIDB less than 16 and its stuff code is zero, then the channel must be one of the following values {17,19,21,23,25,27,29,31}.
In addition, the channel selected should not be associated with any other PCHFAC in the relation. The channel allocated to these PCHFACs will be permanently unavailable to any other

Copyright © 1999 Lucent Technologies 

unit in the office.
If the PCHFAC interfaces to ITU-TS/CEPT 30 channel facilities:
For RSMs remoted on this type of facility, the PCHFAC does not employ any stuff code. The time slot mapping, therefore, is little more straightforward. If the PCHFAC has a PIDB greater than or equal to 16, then the channel must be one of the following values {16,18,20,22,24,26,28,30}. If the PCHFAC has a PIDB less than 16, then the channel must be one of the following values {17,19,21,23,25,27,29,31}. These numbers imply that 'dbchan' is always equal to 0. The channel should not be associated with any other PCHFAC in the relation.
For HSM-2000s (DLTU/2 only):

The channel depends solely on the HFAC's PIDB, which includes the TSI slice, link, and relative PIDB termination on the DX. This attribute should be populated with the TSI time-slot that maps to time-slot 1 on this PIDB (PIDB time-slot 0 is skipped due to hard-coded SM-2000 stuffing pattern of 0).
For both HSM and HSM-2000 (DLTU/2):
the channel selected should not be associated with any other HFAC in the relation. The channel allocated to these HFACs will be permanently unavailable to any other unit in the office.

For HSM-2000's (DNU-S only):
The channel depends solely on the PCT link number and DS1SFAC's vpidb. This channel should not be associated with any other DS1SFAC in this relation.

**Attribute:**
mchdb_num
**Fullname:**
mate channel data block number
**Attribute Description:**
DLTU/2 only:
This field takes a value from 0 to 31 for SMs, and PIDB-determined values for HSM-2000.
This field takes a value from 0 to 31 for SMs, and PIDB-determined values for HSM-2000. For a 2 CTS link RSM this field is 0. For a 4CTS link this field is the same as the field chdb_num of the mate PCHFAC.
PCHFAC mates are defined by their links to PCT1FACs in the RSM. By definition, T1FAC1 and T1FAC3 are assigned as mates because they share a common CTS. Similarly, T1FAC2 and T1FAC4 are mates. The mate of an HFAC, then, is found by determining the HFAC-T1FAC links: HFAC mates are linked to T1FAC mates. This implies that HFACs are equipped in pairs. In fact they are equipped in sets of four, one set for each equipped RSM on that HSM.
DNU-S only:

This is the same as the field chdb. It represents the chdb for the mate DS1SFAC. A mate is similar to the description seen here for HFACs

Copyright © 1999 Lucent Technologies 

**Attribute:**
tsdb_num
**Fullname:**
HSM TSI Network Time-Slot number
**Attribute Description:**
This field contains the HSM TSI network time-slot number carrying the RSM control time-slot which travels on this Host Transport.

**Attribute:**
mckt_id
**Fullname:**
Mate Host Transport circuit name or mate control circuit.
**Attribute Description:**
This field contains the circuit name of the host transport or control circuit which connects to the mate channel contained in the mchdb_num attribute if it exists.

**Attribute:**
rsm_num
**Fullname:**
RSM number
**Attribute Description:**
This field contains the number of the RSM whose control time slot travels on this Host Transport.

**Defines:**
"db/DMcircuit.h"

## 4. Population Rules for RLhsmrsm

**Relation Description**
Host Switching Module Remote SMs.

This relation defines all the RSMs under a given Host SM. There will be 1 tuple for each HSM. A maximum of 5 RSMs are allowed per HSM, and a maximum of 30 RSMs are allowed per HSM-2000.

**Attribute: hsmnum**

**Fullname:** Host SM number.

**Attribute Description** The SM number of the Host SM. When a RLmodatt tuple is added and the RLmodatt.imtype is SM5HIM, then RLmodatt.module is also used as the key to this relation. The valid range for this attribute is 1-192.

**Attribute: rsmnum[*]**

**Fullname:** RSM number from 0 to $SMMAXHRSM.

**Attribute Description** Each of these attributes can contain a unique RSM module number whose host is this HOSTNUM. Valid assigned values are 1-192, corresponding to a valid RSM number which is the key to a RLmodatt tuple with imtype = SM5RSM. No two rsmnumXX attributes can contain the same value, except the default value of 0. RSM number 0 is not used.

**Attribute: cts_ev[*]**

**Fullname:** Even Control Time Slots for RSMs.

**Attribute Description** Each element of this array contains the Even CTS for the corresponding RSM in the rsmnum[*] array.

**Attribute: cts_od[*]**

**Fullname:** Odd Control Time Slots for RSMs.

**Attribute Description** Each element of this array contains the Odd CTS for the corresponding RSM in the rsmnum[*] array.

**Defines:** "db/DMmodule.h"

## 4. Population Rules for RLhssasgn

**Relation Description**
100 second scan customer feature assignment relation.

This relation contains a tuple for each customer in the *5ESS*®-2000 switch that has trunk groups with the HSS feature assigned to them. The hssactive attribute indicates whether or not the feature has been turned on for that customer. This relation is mainly used by the as subsystem.

**Attribute: bcid**

**Fullname:** Business customer ID

**Attribute Description** Used when sending a message to an AP. It uniquely identifies the customer.

**Attribute: apid**

**Fullname:** Applications Processor (AP) Identification

**Attribute Description** Uniquely defines a set of data links that go to a particular AP.

**Attribute: hssactive**

Copyright © 1999 Lucent Technologies

**Fullname:** HSS active indicator

**Attribute Description** Indicates whether the EPSCS HSS feature has been activated for this customer.

## 4. Population rules for RLhtu2rsm

**Relation Description**

```
        Maps Host Transport Unit to the RSM module it is connected to.
        Maps Host Transport Unit to the RSM module it is connected to.
        This relation is the inverse of RLrsm2htu.

Attribute:
        htu_num
Fullname:
        Host Transport unit number.
Attribute Description:
        This is the unit number of the Host Transport UNIT (HTU).  An
```

Copyright © 1999 Lucent Technologies

HTU is an "abstract" unit defined to host all the umbilicals going to a RSM. The value will be identical to the RSM offset defined in MODATT for an RSM.

**Attribute:**
rsm_num
**Fullname:**
Remote Switching Module number.
**Attribute Description:**
This is the module number of a Remote Switching Module (RSM).

**Defines:**
/* NONE */

## 4. Population Rules for RLhuntkeys

Copyright © 1999 Lucent Technologies

**Relation Description**
hunt control keyshas information on various hunt control keys

POPULATION RULES FOR 5E2_2 AND BEYOND:

```
When RLhuntkeys.portgrp.grptype == TM_TRK OR
     RLhuntkeys.portgrp.grptype == TM_LINE AND
     RLhuntkeys.huntkey_type == FCIDVLMKBUSY
```

For the multimodule RSM development, the population of the relation is being modified again. This time it will be GRP_PART, with a grp_type of GPDAM_SM_PART. This means:

1. If port.module is not an RSM, the tuple will be populated on the SM indicated by port.module and on the AM.

2. If port.module is a module of a multimodule RSM, the tuple must be populated on the AM, and on every module within the multimodule RSM.

```
When RLhuntkeys.portgrp.grptype == TM_LINE and
        RLhuntkeys.huntkey_type == FCPOSMKBUSY or
        FCMEMMKBUSY or
        FCSTOPHUNT or
        FCGRPMKBUSY
        FCRMKBUSY
```

The distribution type of this relation when the portgrp.grptype is TM_LINE will be GPDSM_PART. This means:

1. If port.module is not an RSM, the tuple will be populated on the SM indicated by port.module, and the SM indicated in RLrt_mhg.module. Where the key to RLrt_mhg is RLhuntkeys.portgrp.grpnum.

2. If port.module is a module of a multimodule RSM, the tuple must be populated on the SM indicated by port.module, and the SM indicated in RLrt_mhg.module, and every module within the multimodule RSM.

***NOTE:*** When a line is assigned to a *SLC*® 96 equipment number, the default is that no individual mkbusy key is assigned. If required by local operating company practices, assignment of an individual mkbusy key is allowed.

**Attribute: port**

**Fullname:** port

**Attribute Description** see General Information

**Attribute: port.member**

**Fullname:** port number

**Attribute Description** port number of scan point

**Attribute: port.module**

**Fullname:** SM number

**Attribute Description** see General Information

**Attribute: huntkey_type**

**Fullname:** hunt key type

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Type of hunt key assigned.

FCGRPMKBSY: - Make Multi-Line Hunt Group Busy. This is not used for packet switching.

FCTRKGPMKBY: - trunk group make busy key of selected customer control of feature (SCCOF).

FCPOSMKBUSY: - Make attendant console position busy in multi-position hunt (MUPH) group.

FCSFGMKBUSY: - Make simulated facility group busy.

```
Dependency for enumeration values of -
FCPOSMKBUSY:
        ( portgrp.grpnum  =  valid group number > 0,
        portgrp.grptype = TM_LINE,
        1 <= scndindex <= 16,
        mkbusy_port = 0,
FCTRKGPMKBY:
        ( portgrp.grpnum  =  valid group number > 0,
        portgrp.grptype = TM_TRK,
        scndindex   = 0,
        mkbusy_port = 0,p
        Verify tuple in rlGROUP_PORT with this grpnum
        and member = 0 as key).
FCSFGMKBUSY:
        ( portgrp.grpnum  =  valid group number > 0,
        portgrp.grptype = Don't Care,
        scndindex = 0,
        mkbusy_port = 0,
        Verify tuple in rlRT_SFG with portgrp.grpnum
        as key ).
```

**Attribute: portgrp**

**Fullname:** port group

**Attribute Description** see General Information

**Attribute: portgrp.grpnum**

**Fullname:** group number

**Attribute Description** Group number of multiline hunt group using scan points. Individual make busy keys are used for individual lines and therefore have no group number.

The huntkey_types have a valid group number range as follows:

| huntkey_type | group number |
|---|---|
| FCPOSMKBUSY FCMEMMKBUSY FCSTOPHUNT | AVMLHGRPS() |
| FCGRPMKBUSY FCRMKBUSYFCTRKGPMKBY | AVTRKGRPS() |
| FCSFGMKBUSY | AVSFGRPS() |
| FCIDVLMKBUSY | 0 |

**Attribute: portgrp.grptype**

**Fullname:** group type

Copyright © 1999 Lucent Technologies 

**Attribute Description** see RLhuntkeys.portgrp.grpnum and General Information

**Attribute: scndindex**

**Fullname:** second index

**Attribute Description**Indicates the console position number in MUPH

```
if huntkey_type = FCPOSMKBUSY. (1-16)
        Indicates the console position number in MUPH
if huntkey_type = FCMEMMKBUSY.
        Key to a RLTMBLIST tuple
if huntkey_type = FCSTOPHUNT.
        member number in hunt group
All others: don`t care field, default to 0.
Range: If huntkey_type = FCPOSMKBUSY: 1 - 16.
 If huntkey_type = FCTRKGPMKBY: 0.
 If huntkey_type = FCSFGMKBUSY: 0.
 If huntkey_type = FCIDVLMKBUSY: 0.
 If huntkey_type = FCMEMMKBUSY: allocated sequentially starting with 1.
 If huntkey_type = FCRMKBUSY: allocated sequentially starting with 1,
 If huntkey_type = FCSTOPHUNT: 1 - 2047.
```

**Attribute: mkbusy_port**

**Fullname:** make busy port

**Attribute Description** make bust port for individual make busy

**Attribute: mkbusy_port.member**

**Fullname:** make busy port number

**Attribute Description** make busy port number assigned to individual make busy hunt key

**Attribute: mkbusy_port.module**

## 4. Population Rules for RLhwchks

**Relation Description**

This relation is a placeholder relation for *5ESS*®-2000 switch specific information.

It is also used in conjunction with the On-Switch Hardware capability of the SODD audit. The checks performed in the 'checks:' section are related exclusively to the SODD on-switch HW check capability. This relation contains the Target release checks that are SU'ed to the previous release to ensure that REQUIRED Hardware data is grown in properly prior to retrofit to the Target release.

**Attribute: dumkey**

**Fullname:** Dummy Key: DBYES,DBNO

**Attribute Description** Dummy key needed to access the relation

Copyright © 1999 Lucent Technologies 

**Attribute: dumattr**

**Fullname:** Dummy Attribute

**Attribute Description** Dummy attribute to satisfy a legal relation.

## 4. Population Rules for RLiamsac

**Relation Description**
IAM message/service access code.

This relation contains the information about IAM message parameters and service access codes.

**Attribute: access_code**

**Fullname:** Access Code

**Attribute Description** Service access code.

**Attribute: ccn_send**

**Fullname:** Send the calling card number

**Attribute Description** The send card number field indicates whether or not to send the credit card number.

**Attribute: sabn_send**

**Fullname:** Send the subaccount billing number

**Attribute Description** The send subaccount billing number field indicates whether or not to send the subaccount billing number.

**Attribute: bk_thrd_trn**

**Fullname:** Transfer the bill to a back third number.

**Attribute Description** The Back Third Transfer field indicates whether the customer may transfer the bill to a back third number.

**Attribute: ccs7sig**

**Fullname:** CCS7 signaling

**Attribute Description** The ccs7sig field will indicate whether CCS7 signaling.

**Attribute: bncc_tod**

**Fullname:** billing number credit card type of digits

**Attribute Description** This field is the decimal form of the binary value to be placed into an initial address message (IAM). This field will represent the billing number credit card type of digits used in the IAM.

**Attribute: bnpin_tod**

**Fullname:** billing number PIN type of digits used in an initial address message (IAM).

**Attribute Description** This field is the decimal form of the binary value to be placed into an IAM.

Copyright © 1999 Lucent Technologies 

This field will represent the billing number PIN type of digits used in an IAM.

**Attribute: cac_tod**

**Fullname:** CCC Authorization Code type of digits used in Initial Address Message.

**Attribute Description** This field is the decimal form of the binary value to be placed into an IAM. This field will represent the commercial credit card (CCC) authorization code type of digits used in an IAM.

**Attribute: sab_tod**

**Fullname:** subaccount billing number type of digits used in IAM.

**Attribute Description** This field is the decimal form of the binary value to be placed into an IAM. This field will represent the subaccount billing number type of digits used in an IAM.

**Attribute: thrd_type**

**Fullname:** third number type used in Initial Address Message.

**Attribute Description** This field is the decimal form of the binary value to be placed into an Initial Address Message message. This field will represent the third number type of digits used in an IAM.

**Attribute: lg_spare**

**Fullname:** Long Spare

**Attribute Description** Spare field for fast features.

**Attribute: sh_spare**

**Fullname:** Short Spare

**Attribute Description** Spare field for fast features.

**Attribute: spare8**

**Fullname:** Spare 8

**Attribute Description** Spare field for fast features.

**Attribute: bool1**

**Fullname:** Boolean 1

**Attribute Description** Spare field for fast features.

**Attribute: bool2**

**Fullname:** Boolean 2

**Attribute Description** Spare field for fast features.

**Attribute: bool3**

## 4. Population Rules for RLibmtgn

**Relation Description**
IBM Trunk Group.

This relation allows the OSPS owner to obtain *IBM*® Position ID's for each of the ARU trunk group ports (members) associated with the *IBM*® Directory Assistance System(s) (DAS). This relation is needed by ODA and RC/V to support the globals (Gltg[0-7]rn) for *IBM*® ports. On the ODA and RC forms, the customer associates a TGN with a particular global. Using this information, the corresponding *IBM*® port is calculated and displayed for the customer. Without this relation, ODA could not do any reverse mapping during retrofit, since the TGN to global relationship would be lost. On the other hand, without this relation, RC would be unable to enforce any poprules, since it would not know what TGN to global relationships already existed, except for the one instance being entered on the RC view. The user could enter any TGN, and RC would be unable to tell if the TGN conflicted with other TGNs already entered by the customer. Without this relation, RC could generate incorrect *IBM*® positions, which the customer would then use to fill out their *IBM*® forms. The tuple size of RLibmtgn is 8 bytes. The

Copyright © 1999 Lucent Technologies 

maximum number of tuples is 8; the expected number of tuples is 4.

**Attribute: glbl_indx**

**Fullname:** global parameter index

**Attribute Description** This number determines which global parameter (Gltg[0-7]rn) this tuple is associated with, and what trunk group numbers (TGN) are allowed in the tuple. Any TGN in this tuple must follow the following rule: The remainder of the TGN when divided by eight must equal glbl_indx (remainder of TGN/8 must equal glbl_indx).

**Attribute: tgn1**

**Fullname:** Trunk Group Number for *IBM*® DAS 1.

**Attribute Description** Trunk Group Number (TGN) of trunk group connected to *IBM*® DAS system 1. This TGN is associated with global parameter GltgXrn, where X equals the value of glbl_indx. If glbl_indx equals 2, then this TGN is associated with Gltg2rn and the remainder of TGN/8 must equal 2 (such as, TGN = 10, 18, 482, etc).
The trunk group can be either an internal OSPS DSU2-RAF, or an external ARU trunk group connected to an *IBM*® DAS ARU.

Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: tgn2**

**Fullname:** Trunk Group Number for *IBM*® DAS 2.

**Attribute Description** Trunk Group Number (TGN) of trunk group connected to *IBM*® DAS system 2. This TGN is associated with global parameter GltgXrn, where X equals the value of glbl_indx. If glbl_indx equals 2, then this TGN is associated with Gltg2rn and the remainder of TGN/8 must equal 2 (such as, TGN = 10, 18, 482, etc).
The trunk group can be either an internal OSPS DSU2-RAF, or an external ARU trunk group connected to an *IBM*® DAS ARU.

Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: tgn3**

**Fullname:** Trunk Group Number for *IBM*® DAS 3.

**Attribute Description** Trunk Group Number (TGN) of trunk group connected to *IBM*® DAS system 3. This TGN is associated with global parameter GltgXrn, where X equals the value of glbl_indx. If glbl_indx equals 2, then this TGN is associated with Gltg2rn and the remainder of TGN/8 must equal 2 (such as, TGN = 10, 18, 482, etc).
The trunk group can be either an internal OSPS DSU2-RAF, or an external ARU trunk group connected to an *IBM*® DAS ARU.

Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: tgn4**

**Fullname:** Trunk Group Number for *IBM*® DAS 4.

**Attribute Description** Trunk Group Number (TGN) of trunk group connected to *IBM*® DAS

**Copyright © 1999 Lucent Technologies** 

system 4. This TGN is associated with global parameter GltgXrn, where X equals the value of glbl_indx. If glbl_indx equals 2, then this TGN is associated with Gltg2rn and the remainder of TGN/8 must equal 2 (such as, TGN = 10, 18, 482, etc).
The trunk group can be either an internal OSPS DSU2-RAF, or an external ARU trunk group connected to an *IBM*® DAS ARU.

Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

# IBNS_CB

## 1. Description

This relation for IBNS Call Blocking exclusion list. This relation will have a distribution of FG (Fixed Group), with grp_type of GPD_OSPS, and a grpi_d of 4.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 5000 |
| expected number of tuples | 5000 |
| access type | DBACC_HASH |
| foldtype | DBDEFAULT |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| spare | 16s*2:8c*2 |

## 3. Field Layout

## 4. Population rules for RLibns_cb

### Relation Description

RLibns_cb is used for International Billed Number Screening (IBNS) Call Blocking feature.
This relation will store the directory numbers excluded from IBNS treatment.

**Attribute:**

npa

**Fullname:**

Numbering Plan Area (first key)

**Attribute Description:**

Stores directory number npa (area code).

Copyright © 1999 Lucent Technologies

**Attribute:**
nxx
**Fullname:**
Office Exchange (second key)
**Attribute Description:**
Stores directory number nxx (exchange office code).

**Attribute:**
line
**Fullname:**
Local directory number minus office code (third key)
**Attribute Description:**
Stores local dn minus office code.

## 4. Population Rules for RLic_lth

**Relation Description**
Individual calling line identification (ICLID) last ic_idx hole.

This relation is used to store the ICLID 'ic_idx' index holes for ICLID calling number delivery billing counts in a dual-link list.

The 'ic_idx' index holes are distributed between four queues. This strategy supports concurrency of four users by allowing up to four users to retrieve indices simultaneously. Each index is stored in the appropriate queue defined by the queue identifier attribute value. The appropriate queue is determined by dividing the index value by four. The remainder of this division represents the appropriate queue identifier value.

For a new office, four tuples will be initialized. Each tuple will contain the highest used index value corresponding to a queue. A tuple will be initialized for each queue, queue zero, one, two, and three. The 'succ' and 'pred' attribute values are zero when there are no index holes in the given queue.

**Attribute: module**

Copyright © 1999 Lucent Technologies 

**Fullname:** Lead SM

**Attribute Description** RC keeps separate ic_idx link lists for each SM. The head cell for each link list is the module number and 'ic_idx' equal to zero. RC adds a member to a link list when it is no longer needed. This may be due to a customer no longer subscribing to the CND feature. When an 'ic_idx' is required to be assigned to an 'ltm_idx' on an SM, RC uses the members from the link list.

**Attribute: ic_idx**

**Fullname:** ICLID index

**Attribute Description** This is a sequentially assigned index used by ICLID to keep track of CND counts for billing. It will be used to index into the dynamic relation RLcnddata which will contain the CND counts.

**Attribute: qid**

**Fullname:** Queue identifier

**Attribute Description** Queue identifier references one of the four index queues.

**Attribute: pred**

**Fullname:** Predecessor

**Attribute Description** The predecessor 'ic_idx' that is the key to the next less significant member of the link list or zero to indicate no or last member of the list.

**Attribute: succ**

**Fullname:** Successor

**Attribute Description** The successor 'ic_idx' that is the key to the more significant member of the link list or zero to indicate no or last member of the list.

## 4. Population Rules for RLiccvdb

**Relation Description**
International credit card validation (ICCV) database.

This layout is used to provide query success ratio percentage and minimum number of queries for software alarms on a card issuer basis. It includes a label which will be printed on the measurement and software alarm reports. Each entry is linked to the card issuer by the iccvdbn attribute in RLtccid.

Each entry in this layout contains information about an ICCV card issuer.

**Attribute: iccvdbn**

**Fullname:** ICCV database number

**Attribute Description** Key to this relation; used on office data administration (ODA) form TCCID or recent change (RC) view 27.55 to link the rest of the attributes to an ICCV card issuer.

**Attribute: dblabel**

Copyright © 1999 Lucent Technologies

**Fullname:** Database label

**Attribute Description** Used on software alarm and measurement reports to identify card issuer(s).

**Attribute: qratio**

**Fullname:** Query success ratio percentage

**Attribute Description** Query success ratio percentage applied to software query alarms.

**Attribute: minquery**

**Fullname:** Minimum query attempts

**Attribute Description** Minimum number of query attempts required before the query success ratio is applied.

**Attribute: oaff1**

**Fullname:** Spare field 1

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: oaff2**

**Fullname:** Spare field 2

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population Rules for RLicl_msk

**Relation Description**
ICL mask.

Relation containing special 'time slot availability' masks used in selection of RSM network side time slots for intra-RSM calls, ICL carried calls, and host umbilical carried calls.

**CAUTION:** The following data structure contains machine dependencies and may be hazardous to your portability. This relation is meant to be used with DMicl_msk which forms the union with rlICL_MSK and a similarly defined domain containing an array of DMUNLONGs replacing msk01 - msk16 (see db/DMicl_msk.h). Note that the array is dimensioned msk[2][8] and the first element is msk[0][0]. Due to a domain subrange limit, msk01 - msk16 have been defined as HEX signed longs (DMMASK) in this relation.

**Attribute: mod**

**Fullname:** module number

**Attribute Description** This attribute contains the module number of one of the modules which are connected to 'Glpcrid' or it contains 'Glpcrid' itself. There must be a tuple for each different value of 'mod.' This means that there are always at least two tuples for any given RSM. One of these tuples would have 'mod' equal to 'Glpcrid.' Subsequently this tuple will be referred to as the 'Intra' tuple. The second tuple, which should always be present, is the one in which 'mod' is equal to the module number of the Host SM for 'Glpcrid.' This will be called the 'Umbilical' tuple.

As a convenience, a third tuple will be available for each RSM. This tuple gives the time slots that are not owned by the module, or time slots that are control time slots. To access this tuple, the key 'mod' is set to 0.

In addition, RSM 'clusters' having more than a single RSM (Multimodule RSMs) will have tuples for each of the other modules in the RSM 'cluster.' These will be called 'ICL' tuples and will have 'mod' equal to the module number of particular 'cluster mate.'

**Attribute: msk[*]**

**Fullname:** a segment of a 512 bit mask

**Attribute Description** These attributes contains a total of 512 bits that correspond to the 512 network side time slots on an RSM. The 512 bits are partitioned into 16 segments of 32 bits each. These 16 segments are stored in the low order 32 bits of the 16 attributes. NOTE: that this depends upon length of a 'long' data type being at least 32 bits.

The time slots are assigned to the bits as follows:

```
000-062 (even numbers) --> msk01
064-126 (even numbers) --> msk02
                       .
                       .
448-510 (even numbers) --> msk08
001-063 ( odd numbers) --> msk09
065-127 ( odd numbers) --> msk10
                       .
                       .
449-511 ( odd numbers) --> msk16
```

Within each msk, the highest numbered time slot is assigned to the least significant bit position

Copyright © 1999 Lucent Technologies 

and remaining time slots are assigned in sequence from there.

The population of these time slot masks is rather complicated and follows the following rules stated.

MASK POPULATION GUIDELINES

The population rules for the time slot masks fall into five distinct cases. Each of these five cases has its own set of rules.

The five cases are the Intra case, the HiICL case, the LoICL case, the Umbilical case, and the NO_OWN case.

These five cases are defined as follows:

Intra - These are the rules for populating 'Intra' type tuples. (See the previous.) That is, tuples in which 'mod' equals 'Glpcrid'.

Umbilical - These are the rules for populating the 'Umbilical' type tuples. (that is, 'mod' equals the Host SM of 'Glpcrid'.)

HiICL - These are the rules for populating 'ICL' type tuples for which 'Glpcrid' is greater than 'mod'.

LoICL - These are the rules for populating 'ICL' type tuples which have 'Glpcrid' less than 'mod'.

NO_OWN - These are the rules for populating tuples representing time slots that are either control time slots or 'ICL' time slots that are not controlled by the module in which the relation resides.

Before specifying the population rules for these five cases, we should define one more thing.

The network side of a remote switching module (RSM) has a current capacity for terminating 20 T1 carriers. Each of these 20 carriers is associated with a FIDB. Each of these carriers has 23 channels that carry data (the 24th carries multiplexed signaling information) and that are associated with 23 network side time slots. The correspondence between a particular FIDB and the 23 network side time slots it handles is a relationship fixed in hardware. Therefore, if you know which FIDB a carrier connects to, you also know which 23 network side time slots it carries.

In the following population rules, when we speak about the 'time slots connected to mod' we mean 'all the network side time slots associated with FIDBs which terminate carriers to mod.' (We will not use this terminology when discussing Intra-tuples.)

The population rules for the masks are:

Umbilical - All the time slots that connect to the Host SM and are not control time slots are set to '1'. All the rest are set to '0'.

HiICL - All the time slots which connect to 'mod' and which are greater than 255 are set to '1'. All the rest are set to '0'.

LoICL - All the time slots which connect to 'mod' and which are less than 256 are set to '1'. All the rest are set to '0'.

Intra - All TSI network side time slots which do not terminate either T1 Umbilicals or

Copyright © 1999 Lucent Technologies 

ICLs on this (GI_pcrid) module should be set to '1' in this tuple. All other network side time slots with equipped T1 facilities will be set to '0.'

NO_OWN - For the key 'mod' of 0, the time slots that are control time slots are set to 1, as well as the time slots that are 'ICL' and not controlled (owned) by the module in which the relation resides. To obtain this, for each time slot set a 1 if the corresponding time slot is not set to 1 in any other mask for mod not equal to 0; set 0 otherwise.

NOTE:

(1) Control time slots never appear in any tuples except NO_OWN.

(2) For any given module, a given time slot should be marked as '1' in AT MOST one tuple. (ICL time slots which will be allocated by the far end module will not appear in any of the tuples on this processor except NO_OWN.)

(3) Growing/Degrowing an Umbilical T1 link will affect exactly 23 time slots in the Umbilical tuple AND 23 time slots in the Intra tuple.

(4) Growing/Degrowing an ICL to another module will affect either 11 time slots in the HiICL or 12 time slots in the LoICL tuples (11 if using FIDB 01 or 11) for this module as well as all 23 time slots (22 if using FIDB 01 or 11) in the Intra tuple. It will also affect the NO_own tuple. (There will be a comparable change in the tuples for the module at the other end of the ICL. However, different time slots may be affected since a different FIDB may be used. Also, if a HiICL tuple is affected here, then a LoICL tuple will be affected there - and vice versa.) Note that whenever a FIDB choice of 01 or 11 is made for the CDFI in either module, the corresponding ICL will be constrained to have only 22 time slots, not 23.

(5) The rules for ICL tuples are constructed so that the two network side time slots tied together by a given T1 channel will never be marked the same in both modules. If it is '1' in one module, it will be '0' in the other.

DESCRIPTION OF TIME SLOTS TO FIDBs

The connection between time slots and facility interface bus (FIDB) number is fixed by the hardware. The following layout indicates which time slot is present in which FIDB; the layout can be used to construct the masks. The first column of each row gives the binary representation (word) of the 32 bit long representing a mask if only this FIDB were connected (and the previous population rules allowed a non-zero value for this set of time slots). The complete mask is obtained by 'OR'ing all these words together for the complete set of FIDBs that are equipped.

Each bit in each word represents one time slot; the time-slot numbers increase from left to right in the word. The first 8 words of the array represent even time slots; the second 8 words represent odd. For example, the first word gives the available even time slots between 0 and 62. The first word of the second set of eight words gives the available odd time slots between 1 and 63.

Because of the hardware connections between the TSI of an RSM and the facility interface data bus (FIDB) that is associated with each of the possible 20 T1 links, FIDBs numbered 00-09 hexadecimal (hex) connect to even time slots, and FIDBs numbered 10-19 hex connect to odd time slots. The following layout displays the first 8 words assuming only one T1 link (for FIDBs numbered 00-09) is connected to an RSM. For these FIDBs, the remaining 8 words are 0.

The masks associated with having only a single T1 link for FIDBs numbered between 10-19 have

Copyright © 1999 Lucent Technologies 

the first 8 words 0. The second eight words are identical to those in the layout with the following label changes: add 0x10 to the FIDB number, and add 1 to the time-slot number.

The control time slots are time slots 0, 1, 2 and 3. The Time slot number is the lnkslot number 2 for even time slots, and (lnkslot number 2) + 1 for odd time slots.

TABLE

| -ndash;ndash;--------FIDB Number 00--------- | Lnkslot | Time slot |
|---|---|---|
| 10000000100000001000000000000000 | 0- 31 | 0- 62 |

# ICLIDIDX

## 1. Description

This relation is used to index into the Individual Calling Line Identification relation that keeps track of billing for Calling Number and Calling Name Delivery.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 28800 |
| expected number of tuples | 45 |
| density | 4 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| l1 length of subkey 1 | 1 |
| p1 position of subkey 1 | 16 |
| l2 length of subkey 2 | 16 |
| p2 position of subkey 2 | 0 |
| ks key store | AUTO |
| trigger function | RTrc_iclid |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBNO |

## 3. Field Layout

## 4. Population Rules for RLiclididx

**Relation Description:** ICLID index

Copyright © 1999 Lucent Technologies

This relation is used to index into the Individual Calling Line Identification relation that keeps track of billing for Calling Number Delivery and Analog Calling Name Delivery.

**Attribute: ltm_idx**

**Fullname:** logical termination index

**Attribute Description** This is a RC/ODA assigned value. See RLrc_qidx for rules for assigning the value. This index is a sequential number assigned to correspond to a DN. As discussed in RLrc_qidx, the existence of an index implies the value 1 or greater. If no index is defined, RLrc_qidx would contain an ltm_idx value of 0 and no tuple would exist in this relation. Therefore, ltm_idx must be greater than 0 in this relation.

**Attribute: ltm_type**

**Fullname:** logical termination index type

**Attribute Description** this is a logical termination index type.

**Attribute: ic_idx**

**Fullname:** ICLID index

**Attribute Description** This is an index used by ICLID to keep track of Calling Number and Calling Name Delivery counts for billing. It will be used to index into the dynamic relation RLcnddata which will contain the CND counts and the dynamic relation RLcnamdata which will contain the CNAM counts.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description** Type of billing to be performed. This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis. If it is set to DBNO, the billing will be done on a flat rate basis.

**Attribute: cnama_rec**

**Fullname:** Analog Calling Name Delivery billing type

**Attribute Description** Type of billing to be performed for the Analog Calling Name Delivery Special feature (SFID 40). This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed. If cnama_rec is set to DBYES, the billing will be done on a usage sensitive basis. If it is set to DBNO, the billing will be done on a flat rate basis.

**Attribute: lead_module**

**Fullname:** lead switching module

**Attribute Description** Identifies the lead module where the CND group resides

**Attribute: ffcf1**

**Fullname:** Boolean reserved for future filed feature.

Copyright © 1999 Lucent Technologies 

**Attribute Description** See fullname description.

**Attribute: ffcf2**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description** See fullname description.

**Attribute: ffcf3**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description** See fullname description.

**Attribute: ffcf4**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description** See fullname description.

**Attribute: ffcf5**

**Fullname:** unsigned 2 reserved for future special feature use

**Attribute Description** Not assigned yet

**Attribute: ffcf6**

**Fullname:** unsigned 2 reserved for future special feature use

**Attribute Description** Not assigned yet

**Defines:**"db/DMparty.h"

# ICM_1LST

## 1. Description

This relation provides in groups of ten the Directory Numbers (DNs), stored in LOCDN associated with a one digit ISDN Intercom group or a two digits ISDN Intercom group.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 40950 |
| expected tuples in relation | 1500 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| ks key store | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLicm_1lst

**Relation Description:** Intercom list.

This relation provides in groups of ten the Directory numbers(DNs), associated with an ISDN Intercom group.

**Attribute: range**

**Fullname:** range.

**Attribute Description** Index to choose tens block (indicated by tens dialing digit) to access.

**Attribute: icmgrp**

**Fullname:** ISDN Intercom groups.

**Attribute Description** To define the maximum number of ISDN Intercom groups.

**Attribute: dn0**

**Fullname:** Directory Number

**Attribute Description** Ten Directory Numbers are stored in DMLOCDN format (noc and 4 digits). These DNs are associated with an Intercom group. dn(X) identifies the dn associated with dialed code X. digit DN. ([1-9][0-9]*6)

***NOTE:*** DNs beginning with a 1 (that is, 107-XXXX) are currently being used by a customer who has a modified dialing plan. The poprules should allow these valid DNs to be inserted into ICOM groups.

Customers who follow the standard North America dialing plan should not insert DNs beginning with a 1, assuming they had DNs beginning with a 1 which is highly unlikely,

Copyright © 1999 Lucent Technologies 

into ICOM groups because digit analysis will time out when analyzing the DN.

Each dn must be primary on an ISDN terminal with class of service = FC_ISDN . ( A DN is primary when the tuple in RLis_line keyed by the lead_module and ltm_idxi of this dn has the primary attribute set to DBYES.) The terminal on which this DN is primary must have an ISDN Intercom feature (fid= 0x7000 - 0x73ff) assigned in the RLtrmfeats relation only for Feature Button ICOM (FB-ICOM). For Call Appearance ICOM (CA-ICOM), no such entry is required in RLtrmfeats relation. The terminal also must be associated with this icmgrp via terminal (line) parameters, that is, this icmgrp must be assigned in the RLicm_term tuple keyed by is_line.lead_lport. Only for FB-ICOM, this dn also must be assigned in RLdn_feats to the tgid (terminal group) associated with this ISDN Intercom group in the RLicm_grp relation. The dn must exist in this office, that is, FB-ICOM is an intraoffice, intraterminal group feature. For CA-ICOM there will not exist a RLdn_feats tuple. The TGSR restriction does not apply to CA-ICOM. A dn should be entered in this field only if the slot field of the line parameters (RLicm_term) contain a number correspond to this dn, and this range (RLicm_term.grpdataX.slot/10).

***NOTE:*** NOTE: Each primary TN should be unique per ICM group. That rule is not implemented in PRL.

**Attribute: dn0.noc**

**Fullname:** normalized office code

**Attribute Description** This sub-attribute is the normalized office code for first of ten DNs (dn0-dn9).

**Attribute: dn0.digits**

**Fullname:** last 4 digits of DN

**Attribute Description** This sub-attribute contains the last 4 digits of the first of ten DNs (dn0-dn9).

**Attribute: dn[*]**

**Fullname:** Directory Number

**Attribute Description** See the previous usage for dn0.

**Attribute: dn[*].noc**

**Fullname:** normalized office code of nth DN.

**Attribute Description** This sub-attribute contains the normalized office code for the nth DN.

**Attribute: dn[*].digits**

**Fullname:** last 4 digits of nth DN

**Attribute Description** This sub-attribute contains the last 4 digits of the nth DN.

**Attribute: digcnt0**

**Fullname:** unused attribute

**Attribute Description** unused attribute - default to zero

Copyright © 1999 Lucent Technologies 

**Attribute: digcnt[*]**

**Fullname:** unused attribute

**Attribute Description** unused attribute - default to zero

# ICM_CFDF

## 1. Description

This relation is used to populate the default values for the ICOM feature when feature assignment invokes the line parameter mapping code.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1024 |
| expected number of tuples | 2 |
| density | 29 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |
| ks key store | DBNO |
| corcable | DBNO |

## 4. Population Rules for RLicm_cfdf

**Relation Description:** ISDN Intercom Constructed Feature Definition.

This relation provides the default line (terminal) parameters which are used to populate RLicm_term when feature assignment assigns an ISDN Intercom feature to a terminal.

PRECONSTRUCTED FEATURE

```
ISDN Intercom has two preconstructed features, /ICM and /IC*.
/ICM feature has null default parameters, that is,
icm_cfdf.grpdata[0-3]].icmgrp = 0.
/IC* feature is identical to /ICM, but has a  value of
0x7001 and is used in configuration group
```

**Copyright © 1999 Lucent Technologies** 

```
population.  It is the icom wild card feature.
icm_cfdf.fid = 1
icm_cfdf.amac = DBYES
rest of relation defaults
icm_cfdf.grpdata[1-4].icmgrp = 0
icm_cfdf.grpdata[1-4].ones = 10
icm_cfdf.grpdata[1-4].tens = 10
icm_cfdf.grpdata[1-4].icmtype = NULL_DIG
icm_cfdf.grpdata[1-4].insrc = IS_INULL
icm_cfdf.grpdata[1-4].slot = 100

Attributes Dependencies Chart
============================
icmgrp  icmtype    insrc        tens    ones    slot    ltm_idx
======  =======    =====        ====    ====    ====    =======
  0     NULL_DIG   IS_NULL       10       10     100        0
 >0     ONE_DIG    IS_STORED      0      0-9     100        0
 >0     ONE_DIG    IS_DIALED     10       10     100        0
 >0     TWO_DIG    IS_STORED    0-9      0-9     100        0
 >0     TWO_DIG    IS_DIALED     10       10     100        0
```

**Attribute: fid**

**Fullname:** Feature Identification

**Attribute Description** A BRCS constructed feature ID consists of two parts when class = FACBRCS and subclass = SCL_FEAT: a modular feature type (top 6 bits: bits 10 - 15) and an unique identifier (bottom 10 bits: bits 0 - 9). The unique identifier ranges from 0x1 to 0x3ff).

```
Only the unique identifier is stored here since
the MFTYPE must equal MFICM.
Range: 0x1 to 0x3ff
Default Value: none
Dependencies:
     For an ICM constructed feature id, the
     modular feature type must equal MFICM (28
     = 0x1C), which is an enumeration of type DMMFTYPE.
     Verify that RLfid2name has a tuple such that:
        RLfid2name.facid = 0x7000 + fid
           (that is, top six bits = MFICM and bottom
            10 bits = fid)
        RLfid2name.class = FACBRCS
        RLfid2name.subclass = SCL_FEAT
      Verify that RLfacname has a tuple such that:
        RLfacname.facname = RLfid2name( with keys as
        described previously).name RLfacname.class = FACBRCS
```

**Attribute: amac**

**Fullname:** AMA Charging

**Attribute Description** Boolean value indicating whether flat rate AMA charging is applicable. This value is locked to DBYES

```
Range of values:
         DBYES - flat rate billing applies
```

**Copyright © 1999 Lucent Technologies** 

```
DBNO  - flat rate billing does not apply
```

**Attribute: grpdata[*]**

**Fullname:** Structure group data - repeated four times

**Attribute Description** Structure used for icmgrp, ones, tens, icmtype, inscr and slot.

**Attribute: grpdata[*].icmgrp**

**Fullname:** Intercom group associated with this terminal

**Attribute Description** Identifies the Intercom group associated with this terminal. Range: 0-1023 Default: 0 which implies no group assigned to this ICM feature.

```
Dependencies: Verify that RLfacname has a tuple such that:
      RLfacname.facid = icmgrp
      RLfacname.class = FACICM1
      RLfacname.subclass = SCL_NULL
```

**Attribute: grpdata[*].ones**

**Fullname:** Index to access RLicm_1lst

**Attribute Description** Index to choose which slot in tens block to access. Dependencies: If insrc is IS_DIALED or IS_NULL then ones must be 10. Else value must be 0-9.

**Attribute: grpdata[*].tens**

**Fullname:** Index to access RLicm_1lst

**Attribute Description** Index (0-9) to choose which tens block to access.

**Attribute: grpdata[*].icmtype**

**Fullname:** Type of ISDN Intercom Group

**Attribute Description** To identify the type of ISDN Intercom (one digit/two digit).

**Attribute: grpdata[*].insrc**

**Fullname:** Source of digits for an ISDN Intercom Call

**Attribute Description** Source of digits for an ISDN Intercom Call

**Attribute: grpdata[*].slot**

**Fullname:** Slot number

**Attribute Description** Location of directory number in group list

**Attribute: grpdata[*].ltmidxi**

**Fullname:** Logical Termination Index

**Attribute Description** For FB-ICOM this field will always have a zero value, ltmidxi is not used for CA-ICOM. This was added here due to change needed in DMgrpdata domain for RLicm_term relation.

## 4. Population Rules for RLicm_grp

**Relation Description**
There exists a tuple in this relation for each ISDN intercom group.

The group parameters are stored here while the dialing plans are stored in separate relations.

There exists a tuple in this relation for each ISDN intercom group. The group parameters are stored here while the

Copyright © 1999 Lucent Technologies 

dialing plans are in separate relations.

**Attribute: icmgrp**

**Fullname:** ISDN Intercom group identifier

**Attribute Description** Group range of values 1-4095.

**Attribute: grptype**

**Fullname:** ICOM group type

**Attribute Description** This attribute is to indicate the group type of the ISDN Intercom group.

**Attribute: icmbitmap**

**Fullname:** ICOM bit map

**Attribute Description** The corresponding bit position is set in this attribute to indicate which tens block (represented by tens dialing digits) in 2-digit Intercom group has been defined. The value of the key attribute (range) in RLicm_1lst can be obtained from icmbitmap.

```
For example: icm_grp.grptype = TWO_DIG
             icm_grp.icmbitmap = 16 (0000010000)
             icm_1lst.range = 4
```

**Attribute: tgid**

**Fullname:** Terminal group identifier

**Attribute Description** Indicates the terminal group identifier associated with the ISDN Intercom group.

```
     For each non-zero DN in the RLicm_1lst
     tuple keyed by icmgrp, there must exist,
     for feature button ICOM, a
     dnfeats(rt_dntran(dn).portname.module,
               rt_dntran(dn).ltm_type,
               rt_dntran(dn).ltm_idx, 0) tuple
     with dnfeats.tgid equal to icmgrp.tgid.
     For call appearance ICOM (CA-ICOM)
     this field can be set to any value,
     it is considered a do not care field.
```

## 4. Population Rules for RLicm_term

**Relation Description**
Integrated Services digital network (ISDN) intercom terminals.

This relation associates a terminal with up to four ISDN intercom (ICOM) groups. The particular group a ISDN intercom button depression maps to depends on the action associated with the button. For business and residential customer service (BRCS) feature group (BFG) purposes, intercom call (ICM) feature parameter type is LINE. Therefore, BFG pseudo port tuples will not be created for the port assigned to a BFG. Only individual port tuples are created for BFG assigned ports.

**Attribute: termno**

**Fullname:** Terminal number

**Attribute Description** Terminal number.

**Attribute: lport**

**Fullname:** Logical port

**Attribute Description** Logical sequential number of the ISDN BRCS digital subscriber line (DSL) or shared analog port.

Copyright © 1999 Lucent Technologies 

**Attribute: grpdata[*]**

**Fullname:** Group data 1

**Attribute Description** Group data. The following structure named grpdata[i] is repeated four times. Actions are associated with the group data by the following:

| action | data |
|---|---|
| ACN_I1ICOM | grpdata[0] |
| ACN_I2ICOM | grpdata[1] |
| ACN_I3ICOM | grpdata[2] |
| ACN_I4ICOM | grpdata[3] |

Attributes Dependencies Chart

| icmgrp | icmtype | insrc | tens | ones | slot | ltmidxi |
|---|---|---|---|---|---|---|
| 0 | NULL_DIG | IS_NULL | 10 | 10 | 100 | 0 |
| >0 | ONE_DIG | IS_STORED | 0 | 0-9 | 0-9 | 0-8191 |
| >0 | ONE_DIG | IS_DIALED | 10 | 10 | 0-9 | 0-8191 |
| >0 | TWO_DIG | IS_STORED | 0-9 | 0-9 | 0-99 | 0-8191 |
| >0 | TWO_DIG | IS_DIALED | 10 | 10 | 0-99 | 0-8191 |

When icmgrp is less than zero, the slot value of 100 is allowed but not recommended. The telephone number (TN) cannot be reached by the feature button corresponding to the icmgrp, if slot equals 100.

**Attribute: grpdata[*].icmgrp**

**Fullname:** ISDN intercom group

**Attribute Description** Identifies the ISDN intercom group associated with this terminal. Zero implies this is not a valid group. If non-zero, look for a RLfid2name tuple.

**Attribute: grpdata[*].ones**

**Fullname:** Ones

**Attribute Description** Index to choose which slot in associated tens block access.

**Attribute: grpdata[*].tens**

**Fullname:** Tens

**Attribute Description** Index to choose which tens block to access.

**Attribute: grpdata[*].icmtype**

**Fullname:** Intercom type

**Attribute Description** Type of ISDN intercom group.

**Attribute: grpdata[*].insrc**

**Fullname:** Source of digits

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Source of digits for an ISDN intercom call.

**Attribute: grpdata[*].slot**

**Fullname:** Slot

**Attribute Description** Location of directory number in group list. If this is populated with the position (0-99) of the DN in the ICOM group, then the DN must be added to the RLicm_1lst relation keyed by this icmgrp and this tens (tens = RLicm_1lst.range). If the DN has not been assigned a position in the ICOM group, then the value should be 100.

**Attribute: grpdata[*].ltmidxi**

**Fullname:** Logical termination index

**Attribute Description** This is a recent change (RC)/office data administration (ODA) assigned value. For CA-ICOM this value needs to be non-zero and there needs to be a corresponding tuple in RLis_line keyed by this ltm_idxi and the lead module in this case Gl_pcrid. See RLis_line poprules for ltm_idxi.

## 4. Population Rules for RLicnh_cas

**Relation Description**
Customer account services inverse contract NPA based head table.

CAS inverse contract NPA based head table - This relation indicates whether a contract exists for an AT&T call to be charged to a LEC card. This is based on NPA or NPA-NXX of the LEC card.

This check is known as inverse contract check.

This relation is populated for domestic generics only.

**Attribute: casdummy**

**Fullname:** CAS dummy key

**Attribute Description** This is a dummy key set to 1.

**Attribute: oaff1**

**Fullname:** Spare field 1

**Attribute Description** Spare field for fast features.

**Attribute: oaff2**

**Fullname:** Spare field 2

**Attribute Description** Spare field for fast features.

**Attribute: oamap00 through oamap49**

**Fullname:** OA map word 00 through 49

**Attribute Description** Each OA map word xx gives inverse contract state for 16 NPAs.

```
The allowed values for xx are:
     OACASALW  = 00
     OACASDENY = 01
     OACASPALW = 10(see domain DMCASSTAT for details)
```

# ICNPAMAP

## 1. Description

This relation converts NPA-NXX to a value from 0-12799 which is combined with the line (XXXX) portion of the dn and used to retrieve screening information from the SM indicated by module. The keys are constructed by taking the NPA portion, converting it to binary, and using it as the first key; then taking the NXX portion, converting the result to binary, and using it as the second key. The keys are not stored.

## 2. Data Dictionary Values

## 4. Population Rules for RLicnpamap

**Relation Description:** NPA map

Used to map an NPA-NXX to a large normalize office code (LNOC) value. Converts NPA-NXX to a value from 0-12799 which is combined with the line (XXXX) portion of the dn and used to retrieve screening information and/or true billing information for hotels from the SM indicated by module. The keys are constructed by taking the NPA portion, converting it to binary, and using it as the first key: then taking the NXX portion, converting it to binary, and using it as the second key. The average number of tuples for this relation is 1000. The much larger maximum is provided for those OSPS offices with a broad geographic coverage. Whenever an SM is removed from eligibility, any OSPS screening data *MUST* be redistributed among the remaining eligible SMs. Each eligible SM should be indicated no more than the number of times given by MAXMOD = ((number of RLicnpamap tuples) / (number of eligible SMs)) + 1. The purpose of this restriction is to distribute the screening data across all eligible SMs and divide the load on each SM. If possible, it would be most efficient to assign screening data for an NPA-NXX to an SM on which calls from that NPA-NXX may terminate. This would eliminate the SM to SM messages necessary to retrieve the screening data for the call.

**Attribute: bnpa**

**Fullname:** binary NPA

**Attribute Description** This is the NPA for the line converted to binary.

**Attribute: bnxx**

**Fullname:** binary NXX

**Attribute Description** This is the NXX for the line converted to binary. WARNING: NXXs under 200 do not conform to Bellcore Network Standards and may cause routing errors.

**Attribute: lnoc**

**Fullname:** large normalized office code

**Attribute Description** These should be assigned sequentially, beginning at zero as each NPA-NXX is populated. Value 12799 is reserved as the value for terminating exception area entries (see rules for the eai attribute).

**Attribute: module**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** module

**Attribute Description** This is the module number of the SM containing the screening data and/or true billing information for hotels for each NPA-NXX. An eligible SM is defined as an SM which is not an RSM and which is an operational SM, that is, an SM for which there is a type PCMP tuple in RLcktdata which has eqstat set to SMOPER or, alternatively, an SM whose entry in RLmodatt has eqstat = SMOPER and imtype != RSM. OSPS PSMs are considered eligible SMs. Only eligible SMs may be indicated by this attribute. The purpose for the restriction on RSMs is conservation of real-time. The distribution type indicates that eligible SMs should also be SMs which carry OSPS operator traffic, or are PSMs. Zero is not allowed on the RC/ODA form and is to be mapped to unknown.

**Attribute: spare1**

**Fullname:** Spare bit 1

**Attribute Description** Spare field for fast features.

**Attribute: spare2**

**Fullname:** Spare bit 2

**Attribute Description** Spare field for fast features.

**Attribute: spare3**

**Fullname:** Spare bit 3

**Attribute Description** Spare field for fast features.

**Attribute: spare4**

**Fullname:** Spare bit 4

**Attribute Description** Spare field for fast features.

**Attribute: spare5**

**Fullname:** Spare field 5

**Attribute Description** Spare field for fast features.

**Attribute: spare6**

**Fullname:** Spare field 6

**Attribute Description** Spare field for fast features.

## 4. Population Rules for RLicr

Copyright © 1999 Lucent Technologies

**Relation Description:** Intercom call restriction (ICR).

This relation defines intercom call restriction (ICR) simulated facilities group (SFG).

**Attribute: sfg_num**

**Fullname:** sfg group number

**Attribute Description** If RLicr.size is less than 97 then sfg_num must be greater than 0 and less than 1024. If RLicr.size is equal to or greater than 97 then sfg_num must be greater than 0 and less than 501. The grpnum used can not be repeated in the relation RLrt_sfg. that is, the relation keys can not be duplicated.

**Attribute: icr_act**

**Fullname:** icr service is activated or deactivated

**Attribute Description** Indicates if icr feature is activated or deactivated for this sfg.

**Attribute: size**

**Fullname:** the maximum number of simultaneous calls available to the customer for this sfg

**Attribute Description** Indicates the maximum number of simultaneous calls available to the customer for this sfg.

**Attribute: track_sm**

**Fullname:** the sm number where this sfg is tracked

**Attribute Description** Switching module on which this sfg group is tracked of busy counts etc.

If a module is not input, a SM will be chosen based on the following criteria:
IF RLicr.ama_stat is set equal to DBYES : select track_sm based on the smallest sfg_load found in AM relation RLicrsm AND RLicrsm.amasfgcnt is less than 50.
IF RLicr.ama_stat is set equal to DBNO : select track_sm based on the smallest sfg_load found in AM relation RLicrsm
Dependency: If RSM (not ORM or TRM) is input, it will be accepted, but default value will not be RSM.

**Attribute: ama_stat**

**Fullname:** AMA billing is tracking this sfg or not

**Attribute Description** Indicates whether an AMA hourly report is to be generated on this icr sfg.

**Attribute: bl_type**

**Fullname:** indicates if an icr busy lamp is associated with this sfg, if so, whether analog or ISDN attendant console

**Attribute Description** Indicates the type of icr sfg busy lamp associated with this sfg.
If bl_type = ANALOGBL then: Verify existence of tuple in RLrc_sfg such that key
`rlRC_SFG.grpnum = rlICR.sfg_num,`
and verify that a tuple does NOT exist in RLrt_tgbl such that key
`rlRT_TGBL.grpnum = rlICR.sfg_num`

**Copyright © 1999 Lucent Technologies** 

If bl_type = ISDNBL then: Verify existence of tuple in RLrc_icrtn such that key
```
rlICR.sfg_num = rlRC_ICRTN.sfg_acn[0] or
rlICR.sfg_num = rlRC_ICRTN.sfg_acn[1] or
rlICR.sfg_num = rlRC_ICRTN.sfg_acn[2] or
rlICR.sfg_num = rlRC_ICRTN.sfg_acn[3] or
rlICR.sfg_num = rlRC_ICRTN.sfg_acn[4] or
rlICR.sfg_num = rlRC_ICRTN.sfg_acn[5]
```

**Attribute: config**

**Fullname:** configuration ID of ISDN attendant console

**Attribute Description** Indicates configuration ID of attendant console. If bl_type in this relation is ISDNBL: Verify existence of tuple in RLrc_icrtn such that key
```
rlRC_ICRTN.config = rlICR.config
rlRC_ICRTN.dport = rlICR.port
rlRC_ICRTN.sm = rlICR.sm
```
config ID is calculated by converting dport to lport using lport to read RLis_term If bl_type in this relation is ANALOGBL or NOICRBL: this attribute must be 0.

**Attribute: port**

**Fullname:** port on which attendant console is connected to

**Attribute Description** Indicates port to which attendant console is connected. If bl_type in this relation is ISDNBL: port and sm together must be a valid attendant DN, with service class of FC_ISATND. Cpetype field in the relation RLis_term has to be set to IS_TYPATT. Verify existence of tuple in RLrc_icrtn such that:
```
key rlRC_ICRTN.dport = rlICR.port
key rlRC_ICRTN.sm = rlICR.sm
```
If bl_type in this relation is ANALOGBL: port and sm together must be valid metallic service unit busy lamp port. Verify existence of tuple in RLfc_porttyp such that key
```
rlFC_PORTTYP.port  = tgbl_port
rlFC_PORTTYP.servclass = FC_PFLAMP
the port and sm cannot exist in RLrt_tgbl.tgbl_port
```
If bl_type in this relation is NOICRBL: this attribute must be 0

**Attribute: sm**

**Fullname:** switching module on which attendant console is connected to

**Attribute Description** Switching module on which attendant console is connected to. If bl_type in this relation is ISDNBL: port and sm together must be a valid attendant DN, with service class of FC_ISATND. Verify existence of tuple in RLrc_icrtn such that key
```
rlRC_ICRTN.dport = rlICR.port
rlRC_ICRTN.sm = rlICR.sm
```
If bl_type in this relation is ANALOGBL: port and sm together must be valid metallic service unit tgbl port. Verify existence of tuple in RLfc_porttyp such that key
```
rlFC_PORTTYP.port  = tgbl_port
rlFC_PORTTYP.servclass = FC_PFLAMP
the port and sm cannot exist in RLrt_tgbl.tgbl_port
```
If bl_type in this relation is NOICRBL: this attribute must be 0

**Attribute: action**

Copyright © 1999 Lucent Technologies 

**Fullname:** action associated with busy lamp on ISDN attendant console

**Attribute Description** Action which will light busy lamp on ISDN attendant console. If bl_type in this relation is ISDNBL: A tuple must exist in RLrc_icrtn such that

```
 RLrc_icrtn.sfg_acnX = RLicr.sfg_num
  Where: RLrc_icrtn.sfg_acnX is one of the following tuples:
  sfg_acn[0],
  sfg_acn[1],
  sfg_acn[2],
  sfg_acn[3],
  sfg_acn[4] or
  sfg_acn[5]
  depending upon the value of the action attribute in this relation
Example: If this attribute is ACN_ICR4 then
  a tuple must exist in RLrc_icrtn such
  that rlRC_ICRTN.sfg_acn[3] = rlICR.sfg_num
  If bl_type in this relation is ANALOGBL or NOICRBL:
  this attribute must be ACN_NONE.
```

**Attribute: button**

**Fullname:** button number on ISDN attendant console

**Attribute Description** Indicates lamp number on ISDN attendant console associates with sfg. If bl_type in this relation is ISDNBL: This attribute cannot be 0. For a given config id, one button can not be duplicated for different sfg's (key) If bl_type in this relation is ANALOGBL or NOICRBL: this attribute must be 1

**Attribute: cpe_comp**

**Fullname:** CPE component

**Attribute Description** CPE component (module) to which this busy lamp resides If RLicr.bl_type is ISDNBL: This attribute is set to the component on which the busy lamp resides If RLicr.bl_type is ANALOGBL or NOICRBL: This attribute must be 0.

**Attribute: bil_ovfl**

**Fullname:** request to bill overflowed calls

**Attribute Description** Indicates that overflow billing is requested

## 4. Population Rules for RLicrh_cas

**Relation Description**
Customer account services inverse contract RAO based head table.

CAS inverse contract RAO based head table - This relation indicates whether an contract exists for an AT&T call to be charged to a LEC card. This is based on RAO of the LEC card.

Since this table is based on the RAO of the LEC card, no body table is required with this relation. The restrictions are made on a RAO basis, and all [0/1]XX of that RAO are inclusive in the restriction.

This relation is populated for domestic generics only.

**Attribute: casdummy**

**Fullname:** CAS dummy key

**Attribute Description** This is a dummy key set to 1.

**Attribute: oaff1**

**Fullname:** Spare field 1

**Attribute Description** Spare field for fast features.

**Attribute: oaff2**

**Fullname:** Spare field 2

**Attribute Description** Spare field for fast features.

**Attribute: oamap[*]**

**Fullname:** OA map word xx

**Attribute Description** Each OA map word xx gives contract state for 16 RAOs. The allowed values for xx are:
OACASALW = 00
OACASDENY = 01 (see domain DMCASSTAT for details)

## 4. Population Rules for RLicrsm

**Relation Description:** Intercom calling restriction (ICR) tracking SM load.

This relation is used to track the load for each ICR tracking SM. There should be one tuple in this relation for each operational SM in the office.

**Attribute: track_sm**

**Fullname:** tracking switching module for ICR SFG

**Attribute Description** Switching module (SM) on which the members of ICR SFG groups are tracked for busy/idle status and busy count.

**Attribute: sfg_load**

**Fullname:** SFG load for this tracking SM

**Attribute Description** Indicates the total of the sizes of SFGs to be tracked by this SM.

**Attribute: rsm**

**Fullname:** indicates whether this tracking SM is an RSM

Copyright © 1999 Lucent Technologies

**Attribute Description** Indicates if this is an RSM connected to an HSM. The ORM and TRM are not considered as RSMs here.

**Attribute: amasfgcnt**

**Fullname:** ICR SFG AMA report count

**Attribute Description** Indicates total number of hourly ICR SFG AMA reports to be generated for this tracking SM.

## 4. Population Rules for RLicscrn

**Relation Description:** Billing Number Screen Code Table

This relation is used by Billing Number Screening to associate screening text with a screen code value. The distribution class for RLICSCRN is Group Partitioned. Each PSM contains a complete copy of the relation (a PSM is an SM with OSPS operator positions attached). RLICSCRN is not populated in the AM or any SM without attached OSPS operator positions. This means that in RLDB_GPDUS the grp_type should be set to GPD_OSPS and the grp_id should be set to 1. This relation is heavily interdependent with the RLICSCRLNE and RLICSCRRNG relation. As each screened dn is entered in RLICSCRLNE or RLICSCRRNG, this relation must be checked to verify that the screen code is populated.

**Attribute: scrncode**

Copyright © 1999 Lucent Technologies 

**Fullname:** Screen code

**Attribute Description** 0 for this key means not screened. 999 is reserved for testing.

**Attribute: spare1**

**Fullname:** Spare bit 1.

## 4. Population Rules for RLicscrrng

**Relation Description:** IC Screened Range

This relation holds the screen code associated with a range of directory numbers: indexed by large noc (NPA-NXX translation).

**Attribute: tupnum**

**Fullname:** tuple number

**Attribute Description** A number indicating which tuple of ranges for an lnoc this one is.

**Attribute: lnoc**

**Fullname:** Large noc

**Attribute Description** Large noc. Each lnoc has an entry in RLicnpamap.

**Attribute: entries**

**Fullname:** entries

**Attribute Description** The number of entries in the arrays of ranges. This counts all of the entries filled in all of the tuples with the same lnoc as part of the key.

**Attribute: range[*]**

**Fullname:** range

**Attribute Description** Each attribute contains the beginning and ending line numbers (XXXX) plus the screening information for that group of lines. Since these attributes represent ranges of screened lines, not all will be used in some tuples.

**Attribute: range[*].begln**

**Fullname:** begin line

**Attribute Description** the first line number (XXXX, 0000-9999) of the range of screened lines.

**Attribute: range[*].Pare1**

**Fullname:** spare bit 1

**Attribute Description** This attribute is for fast/special features.

Copyright © 1999 Lucent Technologies 

**Attribute: range[*].Pare2**

**Fullname:** spare bit 2

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].endln**

**Fullname:** endline

**Attribute Description** the last line number (XXXX, 0000-9999) of the range of screened lines.

**Attribute: range[*].Pare3**

**Fullname:** spare bit 3

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].Pare4**

**Fullname:** spare bit 4

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].scrncode**

**Fullname:** screen code

**Attribute Description** Any value from 0-999, zero is reserved to mean not screened; Each scrncode, except zero, must also have an entry in RLicscrcde. Screen code 999 is reserved for testing.

**Attribute: range[*].Pare5**

**Fullname:** spare field 5

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].Pare6**

**Fullname:** spare field 6

**Attribute Description** This attribute is for fast/special features.

## 4. Population Rules for RLicx_ici

**Relation Description**
Associates with ISAT group and ICI index with real ICI. See general information.

**Attribute: isat_idx**

**Fullname:** ISAT index

**Attribute Description** ISAT index for ISAT multi-line hunt group number.

**Attribute: grpnum**

**Fullname:** multi-line hunt group number

**Attribute Description** This value of grpnum corresponds to the value of isat_idx, the key to this tuple. This correspondence is shown in the RLrt_mhg relation where both RLicx_ici.isat_idx and RLicx_ici.grpnum appear as attributes with the same names as in RLicx_ici. See population rules for RLrt_mhg.grpnum and RLrt_mhg.isat_idx for more details.

**Attribute: ici[*]**

**Fullname:** ISDN Call Identifier

**Attribute Description** A positional list of ici values that are subscribed to by a hunt group. ici1 - ici16: A real ici value is represented by this ici index (array index) for this group. ICI Values are assigned to calls based on digits dialed, events happening to the call, etc. ICI values are used for:
display (ICLID and OCLID)
hunting ISAT terminals
queuing for ISAT terminals
A maximum of 16 ici's are allowed for a particular group. Only values of ici for ICI_FX1-8, ICI_TIE1-8 and ICI_CNET have a corresponding tuple in RLrticitk. When a group subscribes to ICI_EMER, the group is treated as special with respect to the members in the group. If ICI_EMER is assigned to the ISAT group, then all members must subscribe to ICI_EMER. See RLisatmbr.ici_subr[63]. If ICI_QUE is assigned to the ISAT group, then all members must subscribe to ICI_QUE and RLrt_mhg.qihtns (keyed by grpnum) must be DBYES. Values - enumerated from DMICI, but only those notated in domain as valid for hunting should be used. See values the following. Every multi-line hunt group must subscribe to at least 1 of ICI_LDN1-8,

Copyright © 1999 Lucent Technologies 

ICI_WAT1-5. There must be a corresponding tuple in RLrtdn_mhg with RLrtdn_mhg.isat_hunt = DBYES. Also, if ONE of ICI_LDN1 thru ICI_LDN8 is used for a group, then there must be ONE corresponding tuple in RLrtdn_mhg such that RLrtdn_mhg.subgrp = 0. If TWO of ICI_LDN1 thru ICI_LDN8 are used for a group, then there must be TWO corresponding tuples in RLrtdn_mhg such that RLrtdn_mhg.subgrp = 0 for one tuple and RLrtdn_mhg.subgrp = 1 for the other tuple. If THREE of ICI_LDN1 thru ICI_LDN8 are used for a group, then there must be THREE corresponding tuples in RLrtdn_mhg such that RLrtdn_mhg.subgrp = 0 for one tuple, RLrtdn_mhg.subgrp = 1 for the another tuple, and RLrtdn_mhg.subgrp = 2 for the third tuple. If EIGHT of ICI_LDN1 thru ICI_LDN8 are used for a group, then there must be EIGHT corresponding tuples in RLrtdn_mhg such that RLrtdn_mhg.subgrp = 0 for one tuple, RLrtdn_mhg.subgrp = 1 for the another tuple, RLrtdn_mhg.subgrp = 2 for another tuple, etc. up to RLrtdn_mhg.subgrp = 7 for the eighth tuple. Similarly rules apply for WAT1 thru WAT5. That is, if the maximum of WAT1, WAT2, WAT3, WAT4, and WAT5 are used by a group, then there must be 5 corresponding tuples in RLrtdn_mhg with RLrtdn_mhg.subgrp ranging from 0 thru 4. The following listed ici's are precedence ici's.

`ICI_PPFOVR, ICI_PPFLSH, ICI_PPIMMD, ICI_PPPRIO`
`ICI_PPEXEC, ICI_PPROUT`

If any of these are subscribed to then you must have selected at least 1 of ICI_LDN1-8 or at least 1 of ICI_WAT1-5 but not both. In this case no other ICI's are valid except for ICI_EMER or ICI_QUE. Default: A value of ICI_NULL means that the array element is not defined. Dependencies: there should be a tuple in RLrticitk or RLrtisatmp which uses the corresponding i ci_idx value. In the case of RLrtisatmp, the ici should be the same. Each ISAT group must have at least one ici in the positional list. A user is not allowed to update all ici's to NULL.

## 4. Population Rules for RLid_cf

**Relation Description**
Construct the individualized dialing plan feature. Set the basic definition of the feature.

**Attribute: feat_id**

**Fullname:** Feature Identification

**Attribute Description** Identifies the constructed feature ID.

**Attribute: actvn**

**Fullname:** Activation Method

**Attribute Description** Indicates the method of activating BRCS features. The two attributes (actions), activation and deactivation together determine the customer options for the feature.

**Attribute: dctvn**

**Fullname:** Deactivation Method

**Attribute Description** Indicates the method of deactivating BRCS features. The two attributes (actions), activation and deactivation together determine the customer options for the feature.

**Attribute: ch_act**

**Fullname:** Change Alternate Code Treatment

**Attribute Description** Allowed to change alternate code treatment (ACT). If DBYES, then 2 tuples should exist in RLidp_dtre or RLidp_cnfl with action set to ACN_ACT_ON and ACN_ACT_OFF for the respective dial codes. (This rule is not presently enforced in all tuples, but it should be followed when appropriate.)

**Attribute: ch_gp_car**

**Fullname:** Change group carrier.

**Attribute Description** Allowed to change group carrier. If DBYES, then must a tuple should exist in RLidp_dtre or RLidp_cnfl with action set to ACT_GRPCARARCH for the dial code to change group carrier.

**Attribute: ch_pic2**

**Fullname:** Change primary intra-LATA-toll group carrier ID.

**Attribute Description** Is user allowed to change intra-LATA-toll group carrier? If DBYES, a tuple may exist in RLidp_dtre or Rlidp_cnfl with action set to ACN_PIC2CH for the dial code to change group carrier.

Copyright © 1999 Lucent Technologies 

**Attribute: ch_pic3**

**Fullname:** Change Primary International Group Carrier ID.

**Attribute Description** Is user allowed to change international group carrier? If DBYES, a tuple may exist in RLidp_dtre or Rlidp_cnfl with action set to ACN_PIC3CH for the dial code to change group carrier.

**Attribute: ch_pic4**

**Fullname:** Change Primary Intra-LATA-Local Group Carrier ID.

**Attribute Description** Is user allowed to change intra-LATA-local group carrier? If DBYES, a tuple may exist in RLidp_dtre or Rlidp_cnfl with action set to ACN_PIC4CH for the dial code to change group carrier.

**Attribute: stop_chrg**

**Fullname:** Stop Charge

**Attribute Description** Identify the type of calls which are not to be charged.

**Attribute: ffcf1**

**Fullname:** bit reserved for future field feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf2**

**Fullname:** bit reserved for future field feature use

**Attribute Description** Not assigned yet.

# ID_IFLOW

## 1. Description

Static relation that maps pattern ID to interflow reconfiguration data. The interflow data is a mapping the defines the next interflow state per serving team and the mapping of serving teams to interflow destinations. This data is used by auto-reconfiguration to set up serving team data for a scheduled interflow activation/deactivation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 84 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | ACDQ |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 1024 |
| page level | 2 |
| permutation indicator | un_perm |

## 3. Field Layout

```

## 4. Population Rules for RLid_iflow

**Relation Description**
Interflow data for an auto-reconfiguration pattern.

Interflow Activation/Deactivation pattern data. This is a static relation used by the OSPS auto-reconfiguration process to set up serving team data for a scheduled interflow activation/deactivation. It contains a mapping between an auto-reconfiguration pattern ID in RLaut_rec and interflow activation/deactivation pattern data in this relation. A pattern is a tuple that has data that will be acted upon at some time in the future as specified by the time data in the pattern. Pattern tuples in this relation contain data on a serving team basis. The data consists of the next scheduled interflow status (on or off) of a serving team and the destination where calls for the serving team will be interflowed.

**Attribute: pat_id**

**Fullname:** Pattern ID

**Attribute Description** Maps pattern data in this tuple to pattern tuple in RLaut_rec. The pattern ID is the key of the pattern (tuple) that is defined in RLaut_rec in terms of the time of day that the pattern will be processed. Pattern ID is also the key of a pattern tuple in this relation. The pattern ID links pattern data in this relation to the pattern definition in RLaut_rec.

**Attribute: idest[*]**

**Fullname:** interflow destination 1 thru interflow destination 128

**Attribute Description** Interflow destination per serving team 1 thru 128. The destination is a number 129 thru 144 that is referred to as an interflow serving team number. This number maps to

a PRI that is used for interflowing calls to a specific destination.

**Attribute: rdest[*]**

**Fullname:** reroute destination 1 thru reroute destination 128

**Attribute Description** Reroute destination per serving team 1 thru 128. This is a number 1 - 16 referred to as an internal reroute number. It corresponds to a specific destination to which calls for the serving team are being interflowed via reroute.

**Attribute: adbits[*]**

**Fullname:** activation/deactivation bit map 0 thru 7

**Attribute Description** Activation/deactivation status per serving team 1 thru 128. This is a 256-bit bitmap stored in 8 32-bit words. Each 2 bits represents the next scheduled interflow state of the serving team it corresponds to. There are 16 serving teams represented per word.

# ID_OPER

## 1. Description

Static relation defining mapping between aut_rec pattern ids and operator IDs.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 84 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | ACDQ |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 1024 |
| page level | 2 |
| permutation indicator | un_perm |

## 3. Field Layout

```

## 4. Population Rules for RLid_oper

**Relation Description**
ID operator.

Static relation defining mapping between aut_rec pattern IDs and operator IDs.

**Attribute: pat_id**

**Fullname:** Pattern ID

**Attribute Description** Integer pattern ID.

**Attribute: dummy**

**Fullname:** dummy

**Attribute Description** Dummy field used only for alignment of tuple.

**Attribute: oper[*]**

**Fullname:** Operator ID

**Attribute Description** The valid login IDs, which are four character strings, are composed only of alphanumeric characters 'A'-'Z', 'a'-'z', and '0'-'9' left-justified with trailing blanks. All ids must be padded to SZOPID chars

Note that login 0001 is different than login 1bbb, where b is a blank. The ids from 9000 to 9999 are NOT ALLOWED.

# ID_OPTS

## 1. Description

Individualized dialing plan feature definition options and defaults.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 500 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |
| l1 length of subkey1 | 10 |
| p1 position of subkey1 | 6 |
| ks key store | DBNO |
| ignore key bits | 0-5 |

## 3. Field Layout

## 4. Population Rules for RLid_opts

**Relation Description**
Individualized dialing plan feature options.

This relation is used to set the feature options for an individualized dialing plan (IDP) feature.

**Attribute: feat_id**

**Fullname:** Feature Identification

**Attribute Description** Identifies the feature constructed feature id.

**Attribute: actvn**

**Fullname:** Activation

**Attribute Description** Indicates the method of activating BRCS features. The two attributes (actions), activation and deactivation together determine the customer options for the feature.

**Attribute: dctvn**

**Fullname:** Deactivation

**Attribute Description** Indicates the method of deactivating the BRCS features. The two attributes (actions), activation and deactivation together determine the customer options for the feature.

**Attribute: ch_act**

**Fullname:** Change Alternate Code Treatment

Copyright © 1999 Lucent Technologies 

**Attribute Description** Change alternate code treatment. DBYES indicates changes will be allowed to the alternate code treatment. If ch_act = DBYES, then two tuples should exist in RLidp_dtre or RLidp_cnfl with action set to ACN_ACTON and ACN_ACTOFF for the respective dial codes. (This rule is not mandatory, but recommended.)

**Attribute: ch_gp_car**

**Fullname:** Change group carrier

**Attribute Description** Change group carrier. DBYES indicates the group carrier can be changed. If ch_gp_car = DBYES, then a tuple in RLidp_dtre or RLidp_cnfl should exist with action set to ACN_GRPCARCH for the dial code to change group carrier.

**Attribute: ch_pic2**

**Fullname:** Change Primary Intra-LATA-Toll Group Carrier ID.

**Attribute Description** Is user allowed to change Intra-LATA-Toll Group Carrier? If DBYES, a tuple may exist in RLidp_dtre or Rlidp_cnfl with action set to ACN_PIC2CH for the dial code to change group carrier.

**Attribute: ch_pic3**

**Fullname:** Change Primary International Group Carrier ID.

**Attribute Description** Is user allowed to change international group carrier? If DBYES, a tuple may exist in RLidp_dtre or Rlidp_cnfl with action set to ACN_PIC3CH for the dial code to change group carrier.

**Attribute: ch_pic4**

**Fullname:** Change primary intra-LATA-local group carrier ID.

**Attribute Description** Is user allowed to change intra-LATA-local group carrier? If DBYES, a tuple may exist in RLidp_dtre or Rlidp_cnfl with action set to ACN_PIC4CH for the dial code to change group carrier.

**Attribute: stop_chrg**

**Fullname:** Stop charges

**Attribute Description** Indicates the types of calls which are not to be charged.

**Attribute: idp_name**

**Fullname:** Default Name of Individualized Dialing Plan

**Attribute Description** Default individualized dialing plan group ID.

**Attribute: dpat_caty**

**Fullname:** Default dialing plan access treatment category.

**Attribute Description** Indicates the category of dialing plan access treatment assigned to the user. This is used along with the DPAT array in dial tree to determine a treatment.

Copyright © 1999 Lucent Technologies 

**Attribute: icrsfg**

**Fullname:** Intercom calling restriction simulate facility group number

**Attribute Description** Intercom calling restriction simulated facility group number assigned to the subscriber.

**Attribute: ffcf1**

**Fullname:** future field 1

**Attribute Description** future field feature use.

**Attribute: ffcf2**

**Fullname:** future field 2.

**Attribute Description** future field feature use.

# ID_PORT

## 1. Description

Individualized dialing plan feature per-port data. This relation is common for lines and trunks.

(defined (PSM) && (AVSMLINES + AVSMTRUNKS) > 65531)
syntax - The number of UNITTYPs needed has exceeded the maximum engineered.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 65531 |
| expected number of tuples | 128 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LPFPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| density | 12 |
| l1 length of subkey 1 | 2 |
| p1 position of subkey 1 | 16 |
| l2 length of subkey 2 | 16 |
| p2 position of subkey 2 | 0 |
| ks key store | AUTO |

## 3. Field Layout

```

## 4. Population Rules for RLid_port

**Relation Description**
Individualized Dialing Plan feature per-port data.

This relation is common for lines and trunks. In 5E6 and later generics, this information is found in RLid_port. Previously, the RLidp_port relation contained the information for individualized dialing plan and for speed calling. Speed Calling now has its own relation, RLsc_port.

**Attribute: lport**

Copyright © 1999 Lucent Technologies

**Fullname:** Logical Port

**Attribute Description** Logical port of the user being assigned the BRCS features. For further clarification of dependencies, see the Checks Section.

**Attribute: lpt_type**

**Fullname:** Logical Port Type of User

**Attribute Description**

Logical port of the user being assigned the BRCS features. There are 4 allowed values for this attribute:

```
LPT_ISDN     for ISDN and shared analog users
LPT_BFG      for BFG tuples,
LPT_PKT      for ODB and PPD packet services,
LPT_OTHER    for unshared analog lines and BRCS and trunks.
```

For further clarification of dependencies, see Checks Section.

**Attribute: idp_gpid**

**Fullname:** Individualized Dialing Plan Group Identification

**Attribute Description** Indicates the individualized dialing plan group. A value of zero indicates that a group dialing plan is not assigned, otherwise the id number of the group dialing plan is assigned. Zero is used as a temporary value, until a dialing plan is assigned. A value of zero would be typical in a growth situation, but would not be expected under normal conditions.

**Attribute: dpat_caty**

**Fullname:** Dialing Plan Access Treatment Category

**Attribute Description** Category of Dialing Plan Access Treatment assigned to the subscriber. DPAT_CATY is used with the DPAT array in the dial tree to determine a treatment.

**Attribute: icrsfg**

**Fullname:** Intercom Calling Restriction Simulated Facility Group Number

**Attribute Description** Intercom Calling Restriction simulated facility group number assigned to the subscriber.

**Attribute: ffcf1**

**Fullname:** Future field 1

**Attribute Description** future field feature use.

**Attribute: ffcf2**

**Fullname:** Future field 2

**Attribute Description** future field feature use.

## 4. Population Rules for RLid_st

**Relation Description**
ID serving teams.

Static relation defining the mapping of pattern IDs to serving teams for auto reconfig. Estimated average number of tuples: 16

**Attribute: pat_id**

**Fullname:** Integer Pattern ID

**Attribute Description** Integer pattern ID.

**Attribute: dummy**

**Fullname:** dummy

**Attribute Description** Dummy field used only for alignment of tuple.

**Attribute: srvtm[*]**

**Fullname:** Serving team ID

**Attribute Description** Serving team ID.

# ID2NAME

## 1. Description

This reation maps from an internal id to an external feature name. This relation is the "inverse" of RLname2id.G.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 3072 |
| expected tuples in relation | 300 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |

## 3. Field Layout

```
ID2NAME     relid = 2748  DBSTATIC   DBACC_HASH  DBPRAM    LP      RCMAP

## 4. Population Rules for RLid2name

**Relation Description**
identification(id) to name translation

This relation translates a ID to the 16 character ASCII name as shown on the view screen. It is basically the inverse of the RLname2id relation. "There is a tuple in this relation for every tuple in RLname2id. Each change to RLname2id must result in a corresponding change to RLid2name, except for use counts in RLname2id. The inverse is also true. Each change to RLid2name must result in a change to RLname2id."

**Attribute: id**

Copyright © 1999 Lucent Technologies

**Fullname:** assignment and construction identification

**Attribute Description** This is the internal identifier associated with the external name. This is a short with a range from 0 to 65535. For most names, this is treated as a simple number.

**Attribute: class**

**Fullname:** assignment and construction class

**Attribute Description** Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space.

**Attribute: subclass**

**Fullname:** assignment and construction subclass

**Attribute Description** Each class of names is divided into one or more subclasses. The subclasses of a given class all share the same name space, since subclass is not a key to RLid2name.

**Attribute: name**

**Fullname:** Name (in ASCII)

**Attribute Description** This is the externally known ASCII name. It can be from 1 to 16 characters long. If it is less than 16 characters long, the field is padded with binary zeros ('\0'). Names must be unique within a given class. Names from different classes need not be unique.

## 4. Population Rules for RLidam

**Relation Description**
INSEP DESEP Addressing Matrix.

This relation will map INSEPs and DESEPs to specific cell groups for the Division of Revenue report.

**Attribute: insep**

**Fullname:** Incoming/originating separations class

**Attribute Description** Incoming/originating separations class used as an index into the cell grouping matrix.

Copyright © 1999 Lucent Technologies

**Attribute: desep**

**Fullname:** Destination separations class

**Attribute Description** Destination separations class used as an index into the cell grouping matrix.

**Attribute: cellgrp**

**Fullname:** Cell grouping matrix

**Attribute Description** List of counters for the Division of Revenue report with each cell grouping containing a peg count and a usage count.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLidp_act

**Relation Description**
Individualized dialing plan alternate code treatment.

**Attribute: idp_gpid**

**Fullname:** idp group Id.

**Attribute Description** Indicates the individualized dialing plan group this act set applies to. See rule for actsetnum attribute here.

**Attribute: actsetnum**

**Fullname:** alternate code treatment set number

**Attribute Description** Number assigned in the dialing plan for each valid individualized dialing

Copyright © 1999 Lucent Technologies

code. Dependencies:
Existence of this tuple implies existence of a RLidp_gp tuple with a idp_gpid attribute value matching the value of idp_gpid in this tuple. Moreover, the act_alwd attribute of that RLidp_gp tuple must have the value DBYES.

**Attribute: use_count**

**Fullname:** Usage count.

**Attribute Description** Number of times this ACT is used by this idp group and this act set. that is, the number of RLidp_dtre and RLidp_cnfl tuples having the attribute actset_num the same value as actsetnum here. Value 0 indicates that tuple is eligible for removal. As noted just previously, value of use_count dependent on actsetnum attribute for all idp_dtre tuples for this same idp_gp.

**Attribute: ertrt**

**Fullname:** error treatment type

**Attribute Description** Indicates the type of error treatment to be given if alternate code treatment (act) error is encountered. Range of values: all enumerated values except IDESC_POTS

| Attribute Value | Dependency |
|---|---|
| IDANNOUNCE | RLidp_act.ann must be non-zero when treatment != IDANNOUNCE, ann = 0. |
| IDREROUTE | Insert tuple in RLidp_aert for this group indicating reroute to DN. |

**Attribute: ann**

**Fullname:** announcement number

**Attribute Description** MFC announcement route index. value must be non-zero when ertrt = IDANNOUNCE; otherwise, ann = 0. A non-zero value implies the existence of a tuple in RT_ROUTING keyed with the same value. NOTE: For generic 5e2(1) the previous is no longer true for the attribute ann. When the attribute ertrt = IDANNOUNCE, then ann must be 0.

**Attribute: act_active**

**Fullname:** act active / not active

**Attribute Description** Indicates if alternate code treatment is active (DBYES) or not active (DBNO).

## 4. Population Rules for RLidp_aert

**Relation Description**
Individualized dialing plan alternate code treatment error treatment.

See the attribute usage sections.

**Attribute: idp_gpid**

**Fullname:** individualized dialing plan group ID

**Attribute Description** Indicates the individualized dialing plan group.
Range of values: 1 - 65535.
Default value: None.
Dependencies: Verify existence of tuple in RLidp_gp for this key.

**Attribute: actsetnum**

**Fullname:** alternate code treatment set number

**Attribute Description** Indicates number assigned to dialing plan for each valid individualized dialing code.
Range 1 - 32.
Default value: None.
Dependencies: None.

**Attribute: dig**

**Fullname:** 32-digit string and digit count to reroute ACT errors

**Attribute Description** Indicates the number to which a call will be rerouted if an ACT error occurs and RLidp_act.ertrt = DREROUTE. This is a structure consisting of two members.

Copyright © 1999 Lucent Technologies 

**Attribute: dig.dcnt32**

**Fullname:** count of digits

**Attribute Description** The number of digits in RLidp_aert.dig.edn32.

**Attribute: dig.edn32**

**Fullname:** string of extended digits

**Attribute Description** 32-digit string.

## 4. Population Rules for RLidp_cnfl

**Relation Description**
Individualized dialing plan (IDP) conflict table.

Copyright © 1999 Lucent Technologies

**Attribute: idp_gpid**

**Fullname:** The individualized dialing plan group

**Attribute Description** Verify existence of tuple in RLidp_gp for this key.

**Attribute: table_id**

**Fullname:** Conflict analysis table ID

**Attribute Description** Indicates the individualized dialing plan digit analysis table ID (number) that should be accessed.
Dependencies: None.

**Attribute: num_dig**

**Fullname:** Number of digits dialed

**Attribute Description** Number of digits dialed. The meaning and value of this attribute depend upon the state of digit analysis.
Dependencies: None.

**Attribute: dial_st**

**Fullname:** Dial state

**Attribute Description** Indicates the dialing state as a result of the digits received so far.

| Attribute value | Dependency |
|---|---|
| IDCONT | All other attributes of this relation are "don't care" |
| IDAMBIG or IDFINISH | In this relation, set attributes feat_id, action, actset_num, icom_ars, dpat_array. |

**Attribute: feat_id**

**Fullname:** The MFC constructed feature ID

**Attribute Description** Dependencies: None.

**Attribute: icom_ars**

**Fullname:** The intercom range number or auto route selection ID for the latter feature use

**Attribute Description** Indicates the intercom range number if action == ACN_ICMUSE, ACN_POFO, ACN_POF, ACN_POP, ACN_POI, or ACN_PO. Not relevant for other action values. Zero indicates that the intercom component does not apply for the digits dialed. The plan is for this field to also hold the automatic route selection route pattern number when the action is ACN_ARUSE, in some future generic.

**Attribute: actset_num**

**Fullname:** The alternate code treatment (ACT) set number

**Attribute Description** Indicates the ACT set number for this dialed code. Zero indicates that no ACT applied for this dialed code.

Copyright © 1999 Lucent Technologies 

| Value | Dependency |
|---|---|
| 0 | RLidp_gp.act_alwd = DBNO, OR this code has no actset. |
| ! = 0 | RLidp_gp.act_alwd = DBYES. Verify existence of a tuple in RLidp_act for this actset_num value. |

**Attribute: action**

**Fullname:** The MFC feature action for this dialed digit sequence

**Attribute Description** Indicates the MFC feature action to be taken as a result of the dialed code.

The value ACN_NONE indicates no action applies for the digits dialed.

| Attribute value | Dependency |
|---|---|
| ACN_ICMUSE | Set icom_ars in this relation. Verify existence of a corresponding tuple in RLidp_icom. |
| ACN_POFO<br>ACN_POF<br>ACN_POI<br>ACN_POP<br>ACN_PO | Set icom_ars in this relation. Verify existence of a corresponding tuple in RLidp_icom with pots_accs set to DBYES. |
| Other | None |

**Attribute: dpat_array**

**Fullname:** Dial plan access treatment (DPAT) array

**Attribute Description** Each bit in dial plan access treatment array of 32 bits is set, read, interpreted, and modified individually. The DPAT categories 1 - 32 in RLidp_opts correspond to bits 0 - 31 in the dpat_array, 0 being the high-order bit. Each bit set to 1 allows access to a valid IDP code, and set to 0 denies access to that code.
Dependencies: None.

**Attribute: trignum**

**Fullname:** Trigger number

**Attribute Description** This field contains the network services trigger number which is the key to RLns_trig.

**Attribute: ffcf1**

**Fullname:** bit reserved for future field feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf2**

Copyright © 1999 Lucent Technologies 

**Fullname:** bit reserved for future field feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf3**

**Fullname:** bit reserved for future field feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf4**

**Fullname:** bit reserved for future field feature use

**Attribute Description** Not assigned yet.

## 4. Population rules for RLidp_dtre

**Relation Description**

Individualized dialing plan (IDP) digit analysis tree

**Attribute:**
idp_gpid
**Fullname:**
Individualized dialing plan group ID
**Attribute Description:**
An idp_dtre tuple may exist only if an RLidp_gp with this same key
value for idp_gpid.

**Attribute:**
table_id
**Fullname:**
Digit analysis table ID
**Attribute Description:**
A idp_dtre tuple may exist only if an idp_gp with this same value for its da_tbl1 exists, or if an idp_dtre with this same value for its nxt_tbl attribute.

**Attribute:**
digit
**Fullname:**
Digit
**Attribute Description:**
Dialed digit.

**Attribute:**
dpat_array
**Fullname:**
Dialing plan access treatment (DPAT) array
**Attribute Description:**
Dial plan access treatment is an array of 32 bits. The domain for this attribute is based on a long integer. Each bit position in this long integer is manipulated as if it was an array element or a structure member. Each bit is set, read, inter-preted and modified individually. The DPAT categories 1 - 32 in RLidp_opts correspond to bits 0 - 31 in the dpat_array, 0 being the high-order bit. Each bit set to 1 allows access to a valid IDP code, and set to 0 denies access to that code.

**Attribute:**
feat_id
**Fullname:**
Feature ID (FID)

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

A tuple must exist in RLfacname with this value in attribute facid. The /* (the null feature) can only be assigned to certain actions, such as ACN_AUCUSE. See RLbnfeat population rule for list of actions. Also, dependent upon dial_st, as seen previously.

This is to terminate the start of the previous comment. */

**Attribute:**

dial_st

**Fullname:**

Dial state

**Attribute Description:**

| | |
|---|---|
| IDCONT | set value of nxt_tbl: all other non-key fields should default. |
| IDREMAIN | set feat_id, digcnt, action, dpat_array: actset_num and icom_ars may be optionally set, see the following rules: next_tbl and max_dig should default. |
| IDFINISH | set feat_id, action, dpat_array: next_tbl and max_dig should default: actset_num and icom_ars may be optionally set, see the following rules. |
| IDAMBIG | set nxt_tbl, feat_id, action, dpat_array: max_dig should default: actset_num and icom_ars may be optionally set, see the following rules. |
| IDCNFLCT | set nxt_tbl, digcnt, and max_dig. Other non-key fields default. digcnt = 0: 2 < maxdig. Implies existence of at least 3 RLidp_cnfl tuples (with same value for key table_id): 1 with value for key num_dig same as digcnt, another with num_dig value same as maxdig, and others with all values between. |
| IDRANGE | Special case of IDCNFLCT handling to speed digit analysis (for the sake of critical digit timing and performance). Population same as for IDCNFLCT, except 1 < maxdig, and all the feat_id attributes of the associated RLidp_cnfl tuples are non-zero. |
| IDTWOCONF | Special case of IDCNFLCT handling to speed digit analysis (for the sake of critical digit timing and performance). Like population for IDCNFLCT except only 2 RLidp_cnfl |

**Copyright © 1999 Lucent Technologies** 

tuples exist, with num_dig values same as maxdig and digcnt, and 0 < maxdig.

IDPAUSE — This value is only valid for the PP feature in conjunction with the following action codes: ACN_DTONE, ACN_PPEO, ACN_PPFO, ACN_PPF, ACN_PPI, ACN_PPP, ACN_PPR, ACN_PAEO, ACN_PAFO, ACN_PAF, ACN_PAI, ACN_PAP, ACN_PAR, ACN_PRCD, ACN_PNTRC, ACN_PDTRC, ACN_ATHUSE, and ACN_ACCTUSE. Set feat_id, action, dpat_array: max_dig and icom_ars should default: actset_num and nxt_tbl may be optionally set, see the following rules:

**Attribute:**
maxdig
**Fullname:**
Maximum digits
**Attribute Description:**
Indicates the maximum number of digits expected after the digits received so far:

| | |
|---|---|
| 1-14 | When dial_st=IDTWOCONF. maxdig > digcnt. |
| 2-14 | When dial_st=IDRANGE. maxdig > digcnt. |
| 3-14 | When dial_st=IDCNFLCT. maxdig > digcnt. |
| 0 | All other values of dial_st. |

**Attribute:**
digcnt
**Fullname:**
Digit count
**Attribute Description:**
Indicates the minimum number of digits expected after the digits received so far:

| | |
|---|---|
| 1-14 | dial_st = IDREMAIN. |
| 0-13 | dial_st = IDTWOCONF. |
| 0-12 | dial_st = IDRANGE. |
| 0 | All other values of dial_st. |

**Attribute:**
nxt_tbl
**Fullname:**
Next table ID
**Attribute Description:**
!=0 — Only for dial_st=IDAMBIG or IDCONT (indicating next set of

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | idp_dtre tuple) or dial_st= IDCNFLCT, IDTWOCONF, or IDRANGE (indicating set of idp_cnfl tuples). |
| !=0 or 0 | For dial_st = IDPAUSE. |

**Attribute:**
icom_ars
**Fullname:**
Intercom alternate route
**Attribute Description:**
Indicates the intercom range number. Valid only for certain dial_st values, (IDREMAIN, IDFINISH, IDAMBIG) Implies existence of RLidp_icom tuple with key idp_gpid value same as this feat_id and key icom_range same as icom_ars. Only allowed if action=ACN_ICMUSE, ACN_POFO, ACN_POF, ACN_POI, ACN_POP, ACN_PO, or ACN_EMER. RLidp_icom.dig_dlt must be less than or equal to the number of incoming digits + RLidp_dtre.maxdig.

**Attribute:**
actset_num
**Fullname:**
Alternate code treatment set number
**Attribute Description:**
RLidp_gp.act_alwd = DBYES. Also dependent on certain dial_st values (IDREMAIN, IDFINISH, IDAMBIG, IDPAUSE). RLidp_act must have a tuple for this actset_num value with key idp_gpid same as this feat_id and key actsetnum same as actset_num.

**Attribute:**
action
**Fullname:**
Action
**Attribute Description:**

| | |
|---|---|
| all | Dependent on dial_st, as seen previously. |
| except | Must also be a legal action for feature identified by feat_id: that is, there must be a RLfacftdsc tuple with key FID having the same value as feat_id and having |

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | one of the actionXX attributes the same value as action. |
| ACN_ACFACT<br>ACN_ACFDCT | These actions are not valid for dialed code, and are internal to activation/deactivation software only. |
| ACN_ICMUSE | Also, set icom_ars (intercom range number). RLidp_icom must have a corresponding tuple, as seen previously. |
| ACN_POFO<br>ACN_POF<br>ACN_POI<br>ACN_POP<br>ACN_PO | Set icom_ars in this relation. Verify existence of a corresponding tuple in RLidp_icom with pots_accs set to DBYES. |
| ACN_DTONE | dial_st must be set to IDPAUSE. |
| ACN_PP1AREA,<br>ACN_PP2AREA,<br>ACN_PP3AREA,<br>ACN_PP4AREA,<br>ACN_PP5AREA | dial_st cannot be set to IDPAUSE for these enumerations. |
| N_NXTMSG,<br>N_NXTSEG,<br>N_NRMLUSE,<br>N_DQDUSE | These actions are not valid for dialed code but are invoked only with the user depressing a button (Q931 feature activation information element). |
| ACN_TODUSE,<br>ACN_AWTUSE,<br>ACN_QCUSE,<br>ACN_TCUSE,<br>ACN_TRKUSE, | These action codes are not valid for dialed codes, but may be used for feature buttons on ISDN terminals. |
| ACN_AUCUSE | This action code can only be allowed when feat_id is the null feature, /. |
| ACN_CA | This action code is not valid for dialed codes, but may be used to specify a call appearance button. |
| ACN_EMER | This action code assigns a value of ICI_EMER to the incoming call identification (ICI) associated with the call that dialed these digits. |

**Attribute:**

trignum

**Fullname:**

Trigger number

**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This field contains the network services trigger number which is the key to RLns_trig.

**Attribute:**

ffcf[*]

**Fullname:**

future field.

**Attribute Description:**

Future field feature use.

## 4. Population Rules for RLidp_ert

**Relation Description**
Individualized dialing plan error treatment.

See the idp_gpid, idp_dig, and dpat_dig usage sections.

**Attribute: idp_gpid**

**Fullname:** individualized dialing plan group

**Attribute Description** Indicates the individualized dialing plan group.
Range of values: 1 to 65535.
Default value: None
Dependencies: Verify existence of tuple in RLidp_gp for this key value.

**Attribute: idp_dig**

**Fullname:** 32-digit string and digit count to reroute idp errors

**Attribute Description** Reroute to DN. This is the number to which a call will be rerouted if an IDP error occurs and the error treatment is 'REROUTE'. This is a structure consisting of two elements.

**Attribute: idp_dig.dcnt32 Fullname:** count of digits - 32 max

**Attribute Description** The number of digits in RLidp_ert.idp_dig.edn32.

**Attribute: idp_dig.edn32**

**Fullname:** string of extended digits

**Attribute Description** 32-digit string; An array of up to 32 extended digits (0-9, #, *, Null ('') ).

**Attribute: dpat_dig**

**Fullname:** 32-digit string and digit count to reroute dpat errors

**Attribute Description** Reroute to DN. This is the number to which a call is rerouted if a DPAT error occurs and the error treatment is 'REROUTE'. This is a structure consisting of two elements.

**Attribute: dpat_dig.dcnt32**

**Fullname:** count of digits - 32 max

**Attribute Description** The number of digits in RLidp_ert.dpat_dig.edn32.

**Attribute: dpat_dig.edn32**

**Fullname:** string of extended digits

**Attribute Description** 32-digit string;
an array of up to 32 extended digits (0-9, #, *)

## 4. Population rules for RLidp_gp

**Relation Description**

Individualized dialing plan group.
Individualized dialing plan group.

**Attribute:**
idp_gpid
**Fullname:**
Individualized dialing plan group id.
**Attribute Description:**
Indicates the group number of this idp group.

**Attribute:**
gp_carr_id
**Fullname:**
group carrier id.
**Attribute Description:**
Identifies default carrier for this idp group.

**Attribute:**
gp_pic2
**Fullname:**
Group Primary Intra-LATA-Toll Carrier ID
**Attribute Description:**
Identifies carrier to use for Intra-LATA-Toll calls for this IDP. The gp_pic2 must be $NULL_BCARID if the ICLATA SF (SFID 149) is not activated.

**Attribute:**
gp_plc
**Fullname:**
Group presubscribed intra-LATA local carrier ID
**Attribute Description:**
This attribute contains the group presubscribed intra-LATA local carrier ID for an alternate LSP.

Copyright © 1999 Lucent Technologies 

**Attribute:**
gp_pic4
**Fullname:**
Group presubscribed international carrier ID
**Attribute Description:**
This attribute identifies the presubscribed international carrier ID.

**Attribute:**
idp_ertrt
**Fullname:**
idp error treatment.
**Attribute Description:**
Indicates the type of error treatment for idp errors.

**Attribute:**
dpat_ertrt
**Fullname:**
Dialing plan access treatment errors.
**Attribute Description:**
Indicates the type of error treatment for dial plan access treatment errors.

**Attribute:**
idp_ann
**Fullname:**
idp error treatment.
**Attribute Description:**
Indicates announcement route number if idp error treatment is DANNOUNCE. Currently always set to 0.

**Attribute:**
dpat_ann
**Fullname:**
dpat error treatment.
**Attribute Description:**
Indicates announcement route index for dpat error treatment. Currently always set to 0.

**Attribute:**
idp_active
**Fullname:**
idp active.
**Attribute Description:**
Indicates whether the idp feature is in active or deactive state.

**Attribute:**
act_alwd

Copyright © 1999 Lucent Technologies 

**Fullname:**
alternate code treatment allowed.
**Attribute Description:**
Indicates whether alternate code treatment (ACT) is allowed for thi
idp group.

**Attribute:**
dpat_alwd
**Fullname:**
dial plan access treatment allowed.
**Attribute Description:**
Indicates whether dial plan access treatment is allowed or not
for this idp group.

**Attribute:**
ffcf1
**Fullname:**
future field feature.
**Attribute Description:**
future feature entry.

**Attribute:**
ffcf3
**Fullname:**
future field feature.
**Attribute Description:**
future feature entry.

**Attribute:**
ffcf4
**Fullname:**
future field feature.
**Attribute Description:**
future feature entry.

**Attribute:**
da_tbl1
**Fullname:**
first digit analysis table id.
**Attribute Description:**
Indicates the first digit analysis table for this idp group.

**Attribute:**
rev_tbl1
**Fullname:**
first reverse digit analysis table id.
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Indicates the first reverse digigt analysis table id for thisidp_gpid.

**Attribute:**
star_lb
**Fullname:**
star(*) or pound(#).
**Attribute Description:**
This field indicates whether star(*) and/or pound (#) are used as idp digits
NO_STARLB: Neither * nor # are used as idp digits
STAR_ONLY: Only * isused as an idp digits
LB_ONLY: Only # isused as an idp digits
STARLB: Both * and # are used as idp digits

**Attribute:**
ftdn_iep
**Fullname:**
Forward To DN/IDP Escape to POTS
**Attribute Description:**
Indicates whether or not a dial tone is returned after dialing the escape to POTS code as part of the Call Forwarding remote DN on a per IDP basis.

**Attribute:**
esc_init_alw
**Fullname:**
Escape Code Initialization allowed
**Attribute Description:**
This attribute is set to DBYES for the construction of new IDP groups. When this attribute is equal to DBYES, idp_esc[] may be automatically populated with a DTPOTSA code, once idp_esc[] is populated, esc_init_alw is set to DBNO. This insures that idp_esc[] is only populated once.

**Attribute:**
idp_esc
**Fullname:**
Individualized dialing plan escape code
**Attribute Description:**
Contains the digits which comprise an escape to POTS code for this IDP. Although more than one may exist, the first one created is populated in this attribute.
Default: No escape code is stored, the digit count would be 0, and the digits would be set to null.
The IDP escape code is a set of 1 to 3 digits. The first digit may be 0-9, an '*' or a '#', which is stored as the values 10 or 11 in the attribute, respectively. If the number of digits stored is < 3, the null character

**Copyright © 1999 Lucent Technologies** 

```
(which in BCD is 0) is used to fill the remaining digits.
The digit count contains the number of digits
that are stored.
The digits are stored in BCD format, 4 bits per digit.
The domain is 3 bytes long, which allows the storage
of 3 digits, plus the digit count.  An entire byte is
required for the digit count by existing DBGEN code.
The digits are stored in the attribute starting with D1.
  byte 0  | byte 1  | byte 2  |
 -------------------------------
     |    |    |    | digit   |
  D1 | D2 | D3 | xxx| count   |
     |    |    |    |         |
 -------------------------------
high  low   high low
bits  bits  bits bits
Valid values of D1    - '#', '*', 0 - 9
Valid values of D2,D3 - 0 - 9
Valid values of digcnt- 0 - 3
```

**Attribute:**

unbundled

**Fullname:**

Network/LEC indicator, for calls to complete
to an alternate LSP platform.

**Attribute Description:**

When unbundled = DBYES, (None/1)+ 7/10 digit intra-LATA local calls route using presubscribed local carrier (PLC) information. If PLC routing information is not populated, route via the LEC. When unbundled = DBNO, (None/1)+ 7/10 digit intra-LATA local calls always route via the LEC.

**Defines:**

"db/DMcarr_val.h",
"db/DMcarrid.h"

## 4. Population Rules for RLidp_icom

**Relation Description**
Individualized dialing plan intercom.

idp_icom - individualized dialing plan intercom data.

**Attribute: idp_gpid**

**Fullname:** IDP Group ID

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Indicates the individualized dialing plan group id.

**Attribute: icom_range**

**Fullname:** Intercom Range Number

**Attribute Description** Indicates the range number of this intercom range.

**Attribute: dig_pfx**

**Fullname:** String of Digits to Prefix

**Attribute Description** Indicates the string of digits and the number of digits to be prefixed to the digits dialed. This is a structure of two members: edn32 - an array of up to 32 extended digits; and digcnt - the number of digits dialed.

**Attribute: dig_pfx.dcnt32**

**Fullname:** Number of Digits Dialed

**Attribute Description** Indicates the number of digits dialed.

**Attribute: dig_pfx.edn32**

**Fullname:** 32 Extended Digits

**Attribute Description** This is member: edn32 - an array of up to 32 extended digits.

**Attribute: use_count**

**Fullname:** Number of IDP Group Using This Tuple

**Attribute Description** Indicates the range number of this intercom.

**Attribute: pots_accs**

**Fullname:** POTS Access Allowed

**Attribute Description** Indicates whether POTS access is allowed(DBYES) or not allowed (DBNO).

**Attribute: dig_dlt**

**Fullname:** Number of Digits to Delete

**Attribute Description** Number of digits to be deleted from the digits.

**Relation Description**
Individualized dialing plan reverse digit analysis tree.

This relation is used in a reverse mapping that will derive a corresponding extension (if one exists) from a 10 digit public DN.

In addition to the LASS Auto Callback feature which already uses this relation, the 'Seven Digit Entry of Forward-to-DNs for IDP' transparency feature will use these relations to determine if an extension exists for a 7 or 10 digit public DN that is a forward-to-DN. This feature is available starting with general availability of 5E6 and including all offices which install the 5E5 BWM containing this feature.

It is suggested that if this relation is populated, the following other relations be populated likewise: RLIDPRICOM, and RLNMIMPDGTS. It is also important to populate the GLinpa global parameter.

**Attribute: idp_gpid**

**Fullname:** Individualized Dialing Plan group id

**Attribute Description** Indicates the Individualized Dialing Plan group.

**Attribute: table_id**

**Fullname:** reverse digit analysis table id

**Attribute Description** Indicates the Individualized Dialing Plan digit analysis table id that should be accessed.

**Attribute: digit**

**Fullname:** dialed digit to be analyzed

**Attribute Description** Dialed digit to be analyzed. AUTOVON will not be supported so F, O, I and P will not be in the valid range of values for this attribute.

**Attribute: dial_st**

**Fullname:** dial state

**Attribute Description** Indicates the dialing state as a result of the digits received so far.

**Attribute: ricom_rng**

**Fullname:** intercom range number

**Attribute Description** Indicates the range number of this intercom range.

**Attribute: nxt_tbl**

**Fullname:** Next Table ID

**Attribute Description** Indicates the next individualized dialing plan reverse digit analysis table id that should be accessed.

## 4. Population Rules for RLidpricom

**Relation Description**
Individualized dialing plan reverse digit analysis prefix and delete intercom data.

This relation contains individualized dialing Plan intercom data that will be used by reverse digit analysis to

Copyright © 1999 Lucent Technologies

reconstruct an extension from a 10 digit public DN.

In addition to the LASS auto callback feature which already uses this relation, the 'seven digit entry of forward-to-DNs for IDP' transparency feature will use these relations to determine if an extension exists for a 7 or 10 digit public DN that is a forward-to-DN. This feature is available starting with general availability of 5E6 and including all offices which install the 5E5 BWM containing this feature.

It is suggested that if this relation is populated, the following other relations be populated likewise: RLIDPRDTRE, and RLNMIMPDGTS. It is also important to populate the GLinpa global parameter.

```
dom_name     domain description
--------     ------ -----------
dc7          Compact structure which stores up to 7 BCD
             digits and a digit count.

structure layout
--------- ------
```

This structure is used to store BCD digit strings of size less than or equal to 7 digits. The ASCII strings are of the form:

DMADC7 ==>

```
|----|----|----|----|----|----|----|------|
|dig1|dig2|dig3|dig4|dig5|dig6|dig7|digcnt|  8 bytes
|----|----|----|----|----|----|----|------|
```

After conversion to BCD, the structure will be of the form:

DMDC7 ==>

```
|------/--|------/--|------/--|------/--|
|     /   |     /   |     /   |dig- /   |
|dig5/dig1|dig6/dig2|dig7/dig3|cnt /dig4|    4 bytes
|   /     |   /     |   /     |   /     |
|--/------|--/------|--/------|--/------|
population rules
---------- -----
refer to uhdr/db/DMbcd.G for BCD population rules
macro support
----- -------
```

(1) refer to uhdr/rc/RCbcd_macs.G for ASCII to BCD digit conversion macros in the AM.

(2) refer to uhdr/fc/FCbcd_macs.G for ASCII to BCD digit conversion macros in the SM.

**Attribute: idp_gpid**

**Fullname:** Individualized Dialing Plan group id

**Attribute Description** Indicates the group number of this IDP group.

**Attribute: ricom_rng**

**Fullname:** Intercom Range Number

**Attribute Description** Indicates the range number of this intercom range.

**Attribute: dig_dlt**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Number of Digits to Delete

**Attribute Description** This is the number of digits, up to 10, to be deleted from the dialed digits.

**Attribute: dig_pfx**

**Fullname:** String of Digits to Prefix

**Attribute Description** Indicates the string of digits, up to 7, and the number of digits to be prefixed to the digits dialed.

**Attribute: dig_pfx.dig5**

**Fullname:** digit prefix for digit 5

**Attribute Description** This is digit 5 of up to 7.

**Attribute: dig_pfx.dig1**

**Fullname:** digit prefix for digit 1

**Attribute Description** This is digit 1 of up to 7.

**Attribute: dig_pfx.dig6**

**Fullname:** digit prefix for digit 6

**Attribute Description** This is digit 6 of up to 7.

**Attribute: dig_pfx.dig2**

**Fullname:** digit prefix for digit 2

**Attribute Description** This is digit 2 of up to 7.

**Attribute: dig_pfx.dig7**

**Fullname:** digit prefix for digit 7

**Attribute Description** This is digit 7 of up to 7.

**Attribute: dig_pfx.dig3**

**Fullname:** digit prefix for digit 3

**Attribute Description** This is digit 3 of up to 7.

**Attribute: dig_pfx.digcnt**

**Fullname:** digit count

**Attribute Description** Count number of digits.

**Attribute: dig_pfx.dig4**

**Fullname:** digit prefix for digit 4

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is digit 4 of up to 7.

**Attribute: use_count**

**Fullname:** Intercom Range Use Count

**Attribute Description** Indicates how many intercom ranges in this idp group are using this tuple.

## 4. Population Rules for RLidx_gtt

**Relation Description:** SCCP Accounting Gt Index to GT Digit String

The relation RLidx_gtt will be used to reverse map the GTT Index back to the GTT Digit String. The relation will contain the DPC associated with the GTT Digit String as well as the translation group and number of digits involved. The maximum number of digits that can be used for an accounted GTT string is 8. There must be at least one primary digit defined. The number of fixed, primary and secondary digits will be contained in the definition of the Translation group.

**Attribute: gttindx**

**Fullname:** GT Digit String Index

**Attribute Description** This attribute will contain the index for an SCCP Accounted GTT Digit String.

**Attribute: bdpc**

**Fullname:** Backup DPC

**Attribute Description** The attribute will contain the backup Destination Point Code associated with the GTT Digit String

**Attribute: digit[*]**

**Fullname:** 1-8 Digits

**Attribute Description** These attributes contain the digits defining the Global Title Translation for SCCP Accounting.

**Attribute: num_digit**

**Fullname:** Number of Digits

**Attribute Description** This attribute will contain the number of digits defining the GT Digit String.

**Attribute: pdpc**

**Fullname:** Primary DPC

**Attribute Description** This attribute will contain the Primary Destination Point Code associated with this GTT Digit String.

**Attribute: tran_gp**

**Fullname:** Translation Group

**Attribute Description** The SCCP Translation Group used to define the digit string.

## 4. Population Rules for RLidx_pol

**Relation Description:** Index to Policed Point Code Mapping Table

This relation provides the mapping from the policing indices, and policing type to the policed Point Code associated with the index (pol_pc). When a point code (RLdpc_dpci.dpc) is inserted and one of the policing indices is set to a non zero value, a tuple will be inseted into this relation to allow for a reverse mapping back to the policed point code. When a point code (RLdpc_dpci.dpc) is deleted and one or more of the policing indices is set to a non zero value, the tuple(s) associated with the policed point code must be removed.

**Attribute: index**

**Fullname:** Policing Index Value.

**Attribute Description** This attribute will be used to store the index value of the policing indices for either OPC/DPC Policing or ILS/DPC Policing.

**Attribute: pol_type**

Copyright © 1999 Lucent Technologies 

**Fullname:** Policing Type

**Attribute Description** This attribute is used to differentiate the different policing features indexes. Currently the pol_type enumerations are:

```
CCNULPOLTYPE - no policing
CCOPCDPC     - OPC/DPC policing
CCLSPCPOL    - Incoming Linkset/DPC Policing
```

**Attribute: pol_pc**

**Fullname:** Policed point code.

**Attribute Description** Used to indicate the Point Code that is associated with the Policing index.

## 4. Population Rules for RLiftrans

**Relation Description**
Interflow translation identifiers for OSPS.

This relation will be used to define the valid translation identifiers for cooperating OSPSs. When any cooperating OSPS has a generic retrofit or update requiring translations at this OSPS, this relation will be updated with the new translation identifier. These translation identifiers are used to translate interflow messages that have changed to insure upward and downward compatibility of the differing software levels in an interflow complex. They also may be used to cause program flow to change depending on the software level.

**Attribute: transid**

**Fullname:** Translation identifier

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute is a valid translation identifier for a cooperating OSPS. (values 051 - 255) The first two digits should be the generic and the last digit should be the level within the generic. For instance, the transid for the first issue of generic 5E5 will be 051. This convention will be administratively enforced but not checked by RC or ODA.

**Attribute: remark**

**Fullname:** A remark to label the translation identifier (such as the generic name)

**Attribute Description** This attribute is a remark to label the identifier (such as a generic number or point load number).

## 4. Population rules for RLiidigits

**Relation Description**

```
        Information (II) Digits Screening Table for Long Distance
```

Copyright © 1999 Lucent Technologies

Platform (LDP) service

This relation contains the ANI (Automatic Number Identification) Table processing information for LDP calls when either of the relations RLldpindx, or RLtdxcartb indicate that information digit screening is to be performed.

This relation may have tuples with "wild card" key values. Tuples with wild card key values are not required, but may be used. If call processing software (CP) finds the ii_screen indicator is set in the ANI Table (RLldpindx) or LDP Carrier Table (RLtdxcartb), then (CP) will look for a match in this II Digits Table.

- First, CP looks for a tuple with the call's II digits and incoming trunk group.

- If not found, CP looks for a tuple with the call's II digits and a trunk group set to LDPANYTGRP, the "wild card" value for trunk groups.

- If still not found, CP looks for a tuple with II digits set to LDPANYIIDIG, the II digits wild card value, and a trunk group set to LDPANYTGRP.

- If still not found, CP uses the ANI feature information from the ANI Table or LDP Carrier Table, instead of from this II Digits Table.

**Attribute:**
ii_digits
**Fullname:**
information digits
**Attribute Description:**
This attribute is the information (II) digits associated with an LDP call. II digits indicate the type of call. They are received with the ANI in Equal Access Multi-Frequency (EAMF) signaling.

A value of LDPANYIIDIG is a "wild card" indicating that any II digits may be associated with the tuple.

**Attribute:**
trk_grp
**Fullname:**
trunk group number
**Attribute Description:**
This attribute is the trunk group associated with an LDP call. A value of LDPANYTGRP is a "wild card" indicating that any trunk group may be associated with the tuple.

Copyright © 1999 Lucent Technologies 

**Attribute:**
digtree
**Fullname:**
digit analysis selector (DAS)
**Attribute Description:**
DAS for LDP call. If digtree is not populated (that is, set to zero), then the DAS in the ANI Table or the LDP Carrier Table will be used. Otherwise, the value for digtree must be a valid line DAS.

**Attribute:**
ncd
**Fullname:**
network call denial
**Attribute Description:**
NCD for LDP call. A DBNO indicates the call is allowed; a DBYES indicates the call should be routed to final handling treatment.

**Attribute:**
acclen
**Fullname:**
account code length
**Attribute Description:**
ACCLEN for LDP call. This field indicates the number of account code digits to be entered by the caller. A value of zero indicates the caller has no account code feature assigned. A non-zero value up to 15 indicates the maximum number of digits that may be entered by the caller. The entered digits appear in the AMA record for the call, if one is generated. No validation is performed on the entered digits. The default value of this field is zero(0).

**Attribute:**
trignum
**Fullname:**
Service Control Point (SCP) trigger number
**Attribute Description:**
TRIGGER for LDP call. Contains Advanced Services Platform (ASP) trigger number value ranging from 0-255. If the field is 0, then no SCP query will be sent. If the field is 1-255, then the number will indicate the Advanced Intelligent Network (AIN) R0.1 Trigger Number to use for the SCP query.

**Attribute:**
carrid
**Fullname:**
Carrier id for fixed carrier routing

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Carrier id used for fixed carrier routing on FC_LATA_CONN trunks which are marked tdx_trk=Y on RC View 5.1 (RLrctgrprk). This field is optional. If the service provider does not want the call to be routed based on digit analysis then carrier id should be populated. The call will be routed via the carrier id's route index.

**Attribute:**
screen_x
**Fullname:**
screening index
**Attribute Description:**
Normally associated with a line or trunk, the screening index allows for different billing rates and routing. The default value for screen_x is zero (0), meaning not populated.

**Attribute:**
tnsc
**Fullname:**
Terminating Network Selection Code
**Attribute Description:**
Used to segregate traffic for Multifarious Intra-Network Trunks (MINT)

**Attribute:**
ffcf1
**Fullname:**

## 4. Population rules for RLiiflexan

**Relation Description**

```
        RLiiflexan is designated for the OSPS Flex ANI II feature
        (98-5E-4690).
```

Copyright © 1999 Lucent Technologies

RLiiflexan will be used for the OSPS Flex ANI II feature (98-5E-4690). The carrierid and rcvdaniiidigit are the 2 keys. The sentaniiidigit is an attribute.

The OSPS examines this table. If the carrier ID and received ANI II digits match entries in this table, the received ANI II digits are replaced by other ANI II digits, before outpulsing.

**Attribute:**
carrierid
**Fullname:**
Carrier Identification
**Attribute Description:**
This field is used to specify the Carrier Identification Code.

**Attribute:**
rcvdaniiidigit
**Fullname:**
Received ANI II Digits
**Attribute Description:**
This attribute is used to specify the ANI II information digits received by the OSPS in incoming signaling.

**Attribute:**
sentaniiidigit
**Fullname:**
Sent ANI II Digits
**Attribute Description:**
This attribute is used to specify the ANI information II digits that are sent in outgoing signaling from the OSPS on TRANS 0 SEND calls and on ISP calls not served at the OSPS.

**Attribute:**

## 4. Population Rules for RLilsd_pol

**Relation Description**
Incoming Linkset/Destination Point Code Policing Matrix

The relation RLilsd_pol will contain the linkset number which was marked as being ILS/DPC Policed (key into the relation), and a bitmap of all possible DPCs (indexed by the lspcindx attribute found in RLdpc_dpci). The relation is required for the i7866 ILS/DPC STP Policing Feature. RLilsd_pol will link an Incoming Linkset with all policed DPCs associated with the linkset.

**Attribute: lsnum**

**Fullname:** Incoming Linkset Number

**Attribute Description** This is used as key into the RLilsd_pol table and represents a Linkset that has been marked as a Policed Linkset in the ILS/DPC Policing Feature.

**Attribute: lspmp[*]**

**Fullname:** ILS/DPC Policed destination point codes.

**Attribute Description** This is a 16 element array containing a Hex 16 bit value. The attributes will hold the ILS/DPC Policing status bits for the policed ILS/DPC pairs. Each bit in this bitmap is used to represent the ILS/DPC status bits. The value of bit 0 in the attribute lspmp00, is not used for a status bit. A set bit in the attributes will represent the Allowed status for this particular point code. An unset bit will represent the Prohibited state.

## 4. Population Rules for RLimcostat

**Relation Description**
Cutover status of IM's residing in the office.

There are three types of office cutovers: flash cut, gradual cut, and large terminal growth cut. In a flash cut all lines in the office will be put into service at the same time. In a gradual cut lines will be put into service by, SM(s) (singularly or groups of SM's) or 1000-Line groups. Large terminal growth is a form of gradual cut. In either case there initially must be a tuple in this relation for each SM in the office.

An example population for a 'new' office for a gradual cut would be as follows: .in+.5i

| IM | PRECUT | POSTCUT | ALT_RTE |
|---|---|---|---|
| 3 | coinactive | coinactive | 10* |
| 5 | coinactive | coinactive | 144** |
| 7 | coinactive | coinactive | 146** |

* Where 10 is an RI resulting in reorder tone as treatment to a customer call.

** Where 144 and 146 are RI's resulting in routing the call back to the old office that serves the subscriber.

Copyright © 1999 Lucent Technologies

Note: All tuples exist in the CMP but only one would exist in an SM (except for RSM's - see distribution rules.)

The data in this relation is only operative when the cutover program has been activated. For more information refer to ATT practice ATT 5D5-105-200 "Precutover and Cutover Procedures".

**Attribute: im**

**Fullname:** interface module number

**Attribute Description** The attribute im implies SM, LSM, HSM, RSM, ORM, TRM.

**Attribute: precut**

**Fullname:** active/inactive line status in precut office state

**Attribute Description** The coactive or coinactive line state on the IM when the IM is in the Precut office state. This should be populated as coinactive for a 'new' office for both flash and gradual office cutovers. For large terminal growth this should be populated as coactive for all SM's already in service and coinactive for all SM's not in service.

**Attribute: postcut**

**Fullname:** active/inactive line status in postcut office state

**Attribute Description** The coactive or coinactive line state on the IM when the IM is in the Postcut office state. This should be populated as coactive for a 'new' office for flash cut. This should be populated as coinactive for a 'new' office for gradual cut. For large terminal growth this should be populated as coactive for all SM's already in service and coinactive for all SM's not in service.

**Attribute: alt_rte**

**Fullname:** Alternate Route Index

**Attribute Description** This is an alternate RI used by RTA to route calls attempting to terminate to an inactive line (lines with a coinactive line state). This route index may be used to route to an announcement, reorder tone or outgoing trunk to the 'old' office.

## 4. Population Rules for RLimesp

**Relation Description**
Switching module (SM) essential service protection (ESP) masks.

```
Interface Module Essential Service Protection Masks
TUPLE SEMANTICS:
grpname (KEY)   - group name (see the following appropriate section)
espmask         - 8 bit mask (bits zero through seven)
                  bit = 1 turns ESP ON for corresponding line
                  bit = 0 turns ESP OFF for corresponding line
                        corresponding bit
```

Copyright © 1999 Lucent Technologies

```
                        in espmask
                  esl   (see appropriate
                  value section here)
                  ----- -----------------
                  DBYES        1
                  DBNO         0
**********************************************************************
RLimesp (LU1 and LU4)
grpname The key for LU1 and LU4 is generated as follows:
----------------------------------------------------------------
|           |                        |               | G |       |
| 0   0   0 |       UNIT             |     GRID      | R | SW>>1 |
|           |                        |               | P |       |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0

          UNIT - The unit number 0 through 42,
                 found in RLcktdata.unit
          GRID - Grid number in upper byte of the circuit
                 index subtracted by 3
                 (RLcktdata.ckt_indx{8:15} - 3)
          GRP  - Group number is located in port index
                 (RLfc_porttyp.port_indx{5})
          SW   - Upper two bits of the switch number in the
                 port index (RLfc_porttyp.port_indx{3:4})
espmask   The espmask attribute contains 8 one-bit

          masks, one for each line in the group.  Bit 0
          contains the mask for Line 0 of the group.... and
          bit 7 contains the mask for Line 7 of the group.
          Bit 0 is the low order bit.  The Line number
          within the group serves as an index to the mask
          bit for that Line.  The Line number is found in
          bit positions 0-2 of the LEN.
          To prevent ESP Lines from blocking each other, there
          should be only 2 ESP Lines per group.  Furthermore,
          there should be at most one ESP line in Lines 4-7
          of the group and on ESP Line in Lines 0-3 of the group.
Example:
      If we wished to construct the key for an LU1 on an "SM",
      which is unit # 4, on grid 6 (as determined by the previous
      formula, group 1 and switch 2 would be:
      0  0  0  0  0  0  1  0  0  0  1  1  0  1  1  0   Key
      ^  ^  ^  ^  ^  ^  ^  ^  ^  ^  ^  ^  ^  ^  ^  ^
      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
      15 14 13 12 11 10 9  8  7  6  5  4  3  2  1  0   Bit #
**********************************************************************
      RLimesp (LU2 and LU3)
grpname           The key for LU2 and LU3 is generated as follows:
----------------------------------------------------------------
|           |                        |               | G |       |
| 0   0   0 |       UNIT             |     GRID      | R | SW>>1 |
|           |                        |               | P |       |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
```

15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0

          UNIT    - The unit number 0 through 42,
                    found RLcktdata.unit
          GRID    - Grid number in upper byte of the circuit
                    index subtracted by 3
                    (RLcktdata.ckt_indx{8:15} - 3)
          GRP     - The group number is populated different
                    from LU1. Group number is located in the
                    circuit index (RLcktdata.ckt_indx{5})
          SW      - Upper two bits of the switch number in the
                    port index (RLfc_porttyp.port_indx{3:4})

espmask   The espmask attribute contains 8 one-bit
          masks, one for each line in the group.  Bit 0
          contains the mask for Line 0 of the group.... and
          bit 7 contains the mask for Line 7 of the group.
          Bit 0 is the low order bit.  The Line number
          within the group serves as an index to the mask
          bit for that Line.  The Line number is found in
          bit positions 0-2 of the PORT.
          To prevent ESP Lines from blocking each other, there
          should be only 2 ESP Lines per group.  Furthermore,
          there should be at most one ESP line in Lines 4-7
          of the group and on ESP Line in Lines 0-3 of the group.
**********************************************************************
          RLimesp ((R)ISLU-Z, (R)ISLU-T, and (R)ISLU-U)
grpname   The key to RLimesp is grpname, which is
          generated as follows:
----------------------------------------------------------------
|           |                       |               |   |       |
| 0   1   0 |       UNIT            |     LGC       | 0 |CRD>>3 |
|           |                       |               |   |       |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0

           UNIT - The unit number 0 through 7,
                  found RLcktdata.unit
           LGC  - Line grid card, located in the top byte of
                  the circuit index subtracted by 3
                  (RLcktdata.ckt_indx{8:15}-3)
           CRD  - Card number shifted right 3 bits.
                  (RLcktdata.ckt_indx{3:4})
espmask   The espmask attribute contains 8 one-bit
          masks, one for each card in the group.  Bit 0
          contains the mask for card 0 of the group.... and
          bit 7 contains the mask for card 7 of the group.
          Bit 0 is the low order bit.  In other words, the bit
           representing the port is bits 0-2 of the portname.
**********************************************************************
          RLimesp (ISLU2-T and ISLU2-U)
grpname   The key to RLimesp is grpname, which is
          generated as follows:

```
|           |                       |              |           |
| 0   1   U |       UNIT            |       LGC    |   BOARD   |
|           |                       |              |           |
|---|---|---|---|---|---|---|---|---|---|---|---|---|-----------|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0
          U      - Used for Z-16 line boards if implemented.
          UNIT   - The unit number 0 through 42,
                   found RLcktdata.unit
          LGC    - Line group number 0 through 15.
          BOARD  - Line board number 0 through 7.

espmask - The espmask attribute contains 8 one-bit
          masks, one for each circuit on the board.  Bit 0
          contains the mask for circuit 0 of the board.... and
          bit 7 contains the mask for circuit 7 of the board.
          Bit 0 is the low order bit.  In other words,
          the bit representing the port is bits 0-2 of the portname.
          Note that for ISLU2, the group size is equal to
          the number of circuits on a board.  This is not
          normally the case for this relation.
**********************************************************************
RLimesp (SLC 96 on DCLU0 only)
DESCRIPTION:
       Indicates the Essential Service Protection (ESP) status
       (that is, ON or OFF) for each SLC 96 line.
       There are no restrictions
       as to the number of SLC 96 lines with ESP ON or
       their positions in the SLC 96 RT. All ESP lines are treated
       equally even if they are adjacent (that is blocking will not occur
       due to the selection of SLC 96 ESP lines).
grpname
       The key to RLimesp is grpname, which is generated as follows:
-----------------------------------------------------------------
|                    SLC 96 ESP KEY (Mode 1)                    |
|---------------------------------------------------------------|

-----------------------------------------------------------------
|                 SLC 96 ESP KEY (Mode 2 Special)               |
|---------------------------------------------------------------|
|           |                       | G |       | B |           |
| 1   0   0 |        UNIT           | R |INT-RT | N | 1   1   0 |
|           |                       | P |  NO.  | K |           |
```

**Copyright © 1999 Lucent Technologies** 

```
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0
    UNIT    - The unit number 0 through 42, found in RLcktdata.unit
    GRP = (RT - 1) / 3
    INT-RT = (RT - 1) modulus 3
    For convenience, we introduce the following variable:
    LINEMINUS1 = LINE - 1
    BNK = LINEMINUS1 / 48
    (BNK = 0 for shelves A and B,  BNK = 1 for shelves C and D)
    BYTE is the index to line group containing the line - see the following

MODE 1 specifics:
        T1TS = [ (LINEMINUS1 modulus 12) * 2 ]
             + [ (LINEMINUS1 / 12) & 0x1 ]
        SHF = (LINEMINUS1 / 24) & 0x1
              (SHF = 0 for shelves A and C,  SHF = 1 for shelves B and D)
        BYTE = T1TS / 6

MODE 2 specifics:
        TAU = PORT_INDEX & 0x003F
        or, if PORT_INDEX is not available, TAU layout is as follows:
            -------------------------
            |       A       | B | C |
            |---|---|---|---|---|---|
              5   4   3   2   1   0
                where
                A = LINEMINUS1 modulus 12
                B = (LINEMINUS1 / 12) & 0x1
                C = (LINEMINUS1 / 24) & 0x1
        BYTE =  5 if TAU = 0
                5 if TAU = 1
                (TAU-2) / 8  if TAU = 2 to 47
        SPECIAL BYTE = 6
espmask
        espmask provides bits for 8 ports, but not all bits are used for
        mode 1.  Which bit is used for a port depends on the mode.
        MODE 1:
                BIT position in espmask = f(INDEX)
                    where:
                    INDEX = T1TS modulus 6
                    INDEX  BIT
                      0 ->  1
                      1 ->  2
                      2 ->  3
                      3 ->  5
                      4 ->  6
                      5 ->  7
        MODE 2:
                BIT position in espmask = 1 if TAU = 0
                                          0 if TAU = 1
                                          7 - ((TAU - 2) modulus 8)
                                                   if TAU = 2 to 47
                SPECIAL: BIT position = f(TAU)
                    TAU  BIT
```

                    18 -> 7
*************************************************************************
        RLimesp (TR8 and TR303 RTs on IDCU)
DESCRIPTION:
       Indicates the Essential Service Protection (ESP) status (that is ON
       or OFF) for each TR8 or TR303 RT line.
       There are no restrictions
       as to the number of RT lines with ESP ON or
       their positions in the RT. All ESP lines are treated
       equally even if they are adjacent (that is blocking will not occur
       due to the selection of RT ESP lines).
grpname
       The key to RLimesp is grpname, (0xC001 - 0xDFFF) which is
       generated as follows:
-----------------------------------------------------------------
|           |                                                   |
| 1   1   0 |             LOGICAL  GSDB                         |
|           |                                                   |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0

LOGICAL GSDB (bits 0-12) - number 1 through 8191 (0x1FFF)
                           (Unique for each IDCU GSDB/SM)
                           Zero (0) is illegal.
                           The grpname is located in
                           RLgrp2ckt.gsdb_grp.
         For each group of 8 ports on an RT terminated by IDCU,
         no RLimesp tuple will exist if none of those ports have
         ESP.
espmask
         If one or more of the ports in a group of 8 have
         ESP, a tuple will exist in RLimesp with one or more of
         the bits set in the espmask attribute.  Each bit set
         represents a port with ESP. Each bit cleared represents
         a port without ESP.
         For IDCU, the algorithm for setting a particular bit
         in the espmask attribute for a given port is:
            new_espmask = old_espmask | (1 << (port_indx & 0x7))
```

**Attribute: grpname**

**Fullname:** Port group name

**Attribute Description** The key to this relation is 'grpname', which is generated in different ways depending on the type of unit the line resides on. The following sections tell how the key is generated. The RLimesp key is defined the same way as the RLgsdb key.

**Copyright © 1999 Lucent Technologies** 

**Attribute: espmask**

**Fullname:** One byte per group ('on' means ESP is enabled for this port)

**Attribute Description** A tuple in the relation RLimesp only needs to exist if a line in the group has ESP. The espmask attribute indicates which lines have ESP. ESP lines receive priority originating treatment during severe peak traffic conditions if the user has enabled ESP. Each line in a group will have a different bit for it in 'espmask'. Which bit a line uses is dependent on its relative position in the group and also the type of unit the line resides on. Note: The attribute, espmask will logically be a projection of the RLrc_oeinfo 'esl' attribute for analog lines. ISDN lines with ESP do not have RLrc_oeinfo.esl set to DBYES.

**Defines:**"db/DMcircuit.h"

## 4. Population Rules for RLimtgrps

**Relation Description:** SM trunk groups.

SM trunk group numbers. This relation exists in each SM and has a tuple for each unique feature group B (FGB) and feature group D (FGD) trunk group represented on the SM. RLimtgrps (for DCTU trunk groups) DESCRIPTION: The population rules for RLIMTGRPS regarding the directly connected test unit (DCTU) are defined for DCTU trunk groups. NOTE:

(1) The DCTU trunk group must be defined in relation RLRT_TRKG and RLRCTGPRK. See the population rules for RLrt_trkg and RLrctgprk.

(2) The DCTU trunk group is a group of logical test ports (LTPs) that have a one-to-one association with the test equipment DCTUPORTs that are part of the DCTU. This trunk group never leaves the office and there must never be a 'carrid associated with a DCTU trunk group. The null default value must be used.

Copyright © 1999 Lucent Technologies 

```
QUANTITY OF TUPLES:
One tuple representing a DCTU trunk group with at
least one member defined in the SM where the relation is populated.
TUPLE  SEMANTICS:
tgroup (KEY)    - DCTU trunk group number must be corresponding
                  entry in RLRT_TRKG, RLRCTGRPRK.
carrid          - NOT APPLICABLE, use null default.
featgrp         - NOT APPLICABLE, use null default.
free_ans        - Don't care for DCTU.
inc_tndwnk      - DBNO.
*********************************************************************
RLimtgrps (for DSU2-RAF/SAS Port Groups)
DESCRIPTION:
This relation must be populated for every digital service  unit model 2 (DSU2)-record
ed announcement facility (RAF) and/or service announcement  system (SAS) port group w
ith members on one or more SM.
 NOTE: The DSU2-RAF/SAS port group must be defined in relation RLRT_TRKG.
       See the population rules for RLrt_trkg.
QUANTITY OF TUPLES:
One tuple for each DSU2-RAF/SAS port group on each
SM where DSU2-RAF/SAS port group members in the given
DSU2-RAF/SAS port group  are defined.

TUPLE SEMANTICS:
tgroup (KEY)    - DSU2-RAF/SAS port group number.  Must be
                  corresponding entry in RLRT_TRKG.
carrid          - NOT APPLICABLE, use null default
featgrp         - NOT APPLICABLE, use null default
free_ans        - DBNO
inc_tndwnk      - DBNO
```

**Attribute: tgroup**

**Fullname:** Trunk group

**Attribute Description** Trunk group number, one tuple per trunk group.

**Attribute: carrid**

**Fullname:** Carrier identifier

**Attribute Description** Indicates the carrier identifier. It is a four character string, where each of the characters can be '0' through '9'. The carrid attribute must be specified when the trunk group is directly connected to a carrier, and only at that time. The default is a null string identified by \0.

**Attribute: featgrp**

**Fullname:** Feature group carrier type

**Attribute Description** Flags carrier ID as FGB_CARR if feature group B carrier or FGD_CARR if feature group D carrier.

**Attribute: free_ans**

**Fullname:** Free answer

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates whether answer supervision will be returned on the trunk group for calls to a free line. It must be set to DBYES for trunk groups directly connected to a carrier, and for trunk groups which handle carrier traffic and serve offices with free line service.

**Attribute: inc_tndwnk**

**Fullname:** Incoming (INC) tandem wink

**Attribute Description** Indicates whether the first wink received from the INC carrier at an access tandem will be relayed to the end office. The default is DBNO.

**Attribute: pp_trkind**

**Fullname:** Packet Pipe Trunk Indicator

**Attribute Description** Indicates whether a trunk group is a packet pipe (PP) trunk group or not.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLimtrks

Copyright © 1999 Lucent Technologies

**Relation Description**
Inter-module trunks

Defines each terminating end for inter-module trunk group members.

Consistency checks
---

For each inter-module trunk group member tuple inserted in a module office-dependent data (ODD), there must be a corresponding tuple inserted in the ODD of the module associated with the other end of this trunk group member (such as a tuple inserted into the ODD of module X with key RLimtrks.grpnum and RLimtrks.member should also result in a tuple being inserted into module RLimtrks.term_mod with key RLimtrks.term_grp and RLimtrks.term_mem). In other words, each tuple in module X corresponding to an inter-module trunk group member should have a mirror image tuple in the ODD of the module on the other end of the trunk pointing back to module X.

**Attribute: grpnum**

**Fullname:** Trunk group number

**Attribute Description** Trunk group number associated with the inter-module trunk.

**Attribute: member**

**Fullname:** Trunk group member

**Attribute Description** Trunk group member associated with an inter-module trunk.

**Attribute: term_mod**

**Fullname:** Terminating module number

**Attribute Description** Module number associated with the other end (that is, other trunk member) of the indicated trunk group and member number. Indicates where the other end of this inter-module trunk group member physically terminates.

**Attribute: term_grp**

**Fullname:** Terminating trunk group number

**Attribute Description** Trunk group number associated with the other end of this trunk group and member.

**Attribute: term_mem**

**Fullname:** Terminating trunk group member

**Attribute Description** Trunk group member associated with the other end of this trunk group and member.

# IND_DPC

## 1. Description

This relation provides for SCCP a mapping from a Point Code/Subsystem Number/Network Number Index to the Point Code, Subsystem Number, and Network Number. It also provides the backup psn_index.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 4096 |
| expected number of tuples | 256 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |

## 4. Population Rules for RLind_dpc

**Relation Description**
Point Code/Subsystem Number/Network Number Index to Destination Point Code Mapping

This relation maps from a point code/subsystem number/network number index to a destination point code, a subsystem number, and a network number along with a backup PSN_INDEX.

**Attribute: psn_index**

**Fullname:** Point Code/Subsystem Number/Network Number Index

**Attribute Description** This attribute specifies an index representing a point code, subsystem number, and network number tuple.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This attribute specifies a standardization sector (SS7) International or SS7 National destination point code.

**Attribute: ssn**

**Fullname:** Subsystem Number

**Attribute Description** This attribute specifies a subsystem number on a particular destination point code.

**Attribute: net_num**

**Fullname:** SCCP Network Number

**Attribute Description** This attribute is a mapping from Global SM number to an index called network number.

**Attribute: bck_index**

**Fullname:** Backup PSN Index

**Attribute Description** This attributes specifies a backup point code/subsystem number/network number to route messages to in the case this index is inaccessible.

**Attribute: tcap_cv**

**Fullname:** TCAP Conversion Flag

**Attribute Description** This attribute indicates when to perform TCAP Conversion.

## 4. Population rules for RLindx

**Relation Description**

```
        Index assignment
```

Copyright © 1999 Lucent Technologies

This relation is used strictly as an administrative relation to handle the assignment of indexes into various relations and tables for National Standardization Sector (SS7) (formerly CCITT7) and International SS7 Message Transfer Part (MTP). The exceptions are the CCS indices: CCACPCTOT, CCDPCINDX, CCDPCIMAX, CCAPCINDX, CCTRKINDX and CCTRKIMAX), where the assignment of indexes uses another method (See RLrc_qidx.R poprules). These values will be used to keet track of the number of CCS dpcs, apcs, trunks on the global SM and the maximum index used.

This relation is partitioned by global SM and must be populated independently in each Global SM. This relation resides in the National SS7 Global SM and the International SS7 Global SM. These Global SMs are designated by RLgsm_opc.

**Attribute:**
idx_name
**Fullname:**
Name of the index
**Attribute Description:**
The type of application that the index is used for.

**Attribute:**
max_idx
**Fullname:**
Maximum index value
**Attribute Description:**
This attribute holds the last used index for a particular idx_name.

## 4. Population Rules for RLinterflw

**Relation Description**
Interflow information for OSPS.

This relation will be used to determine if interflow is activated for a particular serving team. Provides mapping of serving teams to interflow serving teams and indicates the activation status. Also used for Non-T&A interflow

Copyright © 1999 Lucent Technologies 

(re-routing).

**Attribute: serv_tm**

**Fullname:** serving team

**Attribute Description** Indicates the OSPS serving team number.

**Attribute: iserv_tm**

**Fullname:** interflow serving team

**Attribute Description** Indicates the interflow serving team number.

**Attribute: if_on**

**Fullname:** Interflow on (activated) indicator.

**Attribute Description** Indicates if interflow is activated for the key serv_tm.

**Attribute: int_destid**

**Fullname:** Reroute internal destination ID.

**Attribute Description** Indicates the internal destination ID used for rerouting of DA and Non-ISP trunk calls to a VDT.

**Attribute: rr_on**

**Fullname:** Reroute on (activated) indicator.

**Attribute Description** Indicates that Non-T&A Interflow (reroute) is activated for the key serv_tm.

**Attribute: i_srv_tms**

**Fullname:** Interflow serving teams

**Attribute Description** Bit mapping of 16 interflow teams.

**Attribute: i_count**

**Fullname:** Interflow count

**Attribute Description** Count of interflow teams in i_srv_tms.

**Attribute: ospsff1**

**Fullname:** OSPS spare field 1

**Attribute Description** Spare for future development.

**Attribute: ospsff2**

## 4. Population rules for RLintfnam

**Relation Description**

```
        Interface Protocol (IP) Interface Name Relation
```

Copyright © 1999 Lucent Technologies

This relation converts an IP Interface index to an IP interface name, and also returns the SM number with which the interface is provisioned. This relation contains a list of all the IP interfaces on the switch, which must be distinct. The index is used instead of the name on the SMs to reduce memory usage.

**Attribute:**
intf_name
**Fullname:**
IP interface name
**Attribute Description:**
This attribute is the character name given to the IP interface on the switch.

**Attribute:**
sm_name
**Fullname:**
Switching module number
**Attribute Description:**
The number of the switching module associated with the IP interface.

**Attribute:**
indx_name
**Fullname:**
Index for interface name
**Attribute Description:**
Distinct index associated with the IP interface.

## 4. Population Rules for RLintopid

**Relation Description**
Internal operator ID.

When a new valid operator login is added to RLologinid this relation (RLintopid) should be checked first for a tuple. If there is a tuple, then it should be deleted and its corresponding intopid value used as the intopid attribute of the new tuple in the RLologinid relation. If there are no tuples in this relation and a new valid login is added, the global variable (GLintopcnt) should be incremented and the value of intopid in RLologinid should equal GLintopcnt. Whenever the RLologinid relation is empty (that is, there are no tuples), this relation should be cleared (delete all tuples) and Glintopcnt should be set to zero.

This relation is not to be populated for export applications. It should be populated in the domestic segment only in offices intended to serve OSPS. This relation is dependent on the relation RLologinid.G

Copyright © 1999 Lucent Technologies 

**Attribute: intopid**

**Fullname:** internal operator id

**Attribute Description** This is an internal operator id that is currently free for use. The largest value of intopid at any one time must be less than or equal to the global parameter Glintopcnt.

**Attribute: dummy**

**Fullname:** unused attribute

**Attribute Description** This attribute is unused and always set to 0.

## 4. Population Rules for RLintttf

**Relation Description:** Interrupt TTF.

Relates TTF interrupt register bit position to circuit actually causing the interrupt. RLINTTTF replaces RLINT_TTF starting in 5E2(1). This relation appears only in SMs containing TTFs.

**Attribute: procname**

**Fullname:** processor board circuit name from RLCKTDATA

**Attribute Description** For each TTF in a SM, there will be one tuple in RLintttf for each of the 16 interrupt bits in the TTF interrupt register. This key is the circuit name from RLCKTDATA.

**Attribute: ttf_bitnum**

**Fullname:** TTF interrupt register bit position

**Attribute Description** TTF interrupt register bit position. A tuple must be present for each of the 16 possible enumerations, whether the actual circuit is used and/or equipped. This field is also a

Copyright © 1999 Lucent Technologies 

key. The last four enumerations, even though not currently used, should be populated as shown in the example.

**Attribute: cktname**

**Fullname:** circuit name causing interrupt, from RLCKTDATA

**Attribute Description** The circuit name from RLCKTDATA of the circuit associated with the interrupt bit. For unused and/or unequipped circuits this attribute should be zero.

**Attribute: ckttype**

**Fullname:** PC circuit type, from RLCKTDATA

**Attribute Description** The circuit type from RLCKTDATA of the circuit associated with the interrupt bit. For unused and/or unequipped circuits this attribute should be PCNULLCKT.

## 4. Population rules for RLipaddrma

**Relation Description**

IP address mapping
Static IP address mapping to port number(s).
This relation is used to determine the physical location
(port number(s)) of a given destination IP address.

**Attribute:**
dest_ipaddr
**Fullname:**
Destination IP address
**Attribute Description:**
This attribute is the destination IP address.

**Attribute:**
orig_sm
**Fullname:**
Originating sm

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
This attribute designates the dedicated sm that the TCPIP links are connected to. These links handle the TCP/IP message handling.

**Attribute:**
subnet_mask
**Fullname:**
Subnetwork MASK
**Attribute Description:**
A mask that will furhter divide the host portion of an IP address into several internal networks of varying size depending on the IP address class and the mask itself.

**Attribute:**
bcast_addr
**Fullname:**
Broadcast address
**Attribute Description:**
An IP address that will allow a single IP datagram to be directed and received by more than one host, through use of a special IP address.

**Attribute:**
ip_rte1
**Fullname:**
IP route
**Attribute Description:**
Structure used to route IP datagrams to a DSL port.

**Attribute:**
ip_rte2
**Fullname:**
IP route
**Attribute Description:**
Structure used to route IP datagrams to a DSL port.

**Attribute:**

## 4. Population rules for RLipadrloc

**Relation Description**

Local Interface Protocol (IP) address relation.

Copyright © 1999 Lucent Technologies

This relation contains a list of all the IP addresses on the switch. It is keyed by a unique IP address index, and is used to reduce memory usage on the SMs.
It is the inverse relation of RLlocipadr.

**Attribute:**
indx_addr
**Fullname:**
IP address index
**Attribute Description:**
A unique index to represent the IP address. Used to save memory in the SMs.

**Attribute:**
ipaddr
**Fullname:**
IP address
**Attribute Description:**
This attribute is an IP address which has been assigned to either a processor (SM, PH, MH, etc) or an IP interface on this switch.

**Attribute:**
ip_vers
**Fullname:**
IP version.
**Attribute Description:**
This is the version (eg 4 or 6) of the IP address.

**Copyright © 1999 Lucent Technologies** 

# IPCS_PCI

## 1. Description

This relation maps OPC+DPC to PCI on a particular GSM. The OPC can be either the primary or an alias OPC of the GSM, and the DPC may be member-routed, cluster-routed, or network-routed. It takes the place of the "pci" attribute in RLdpc_dpci in 5e13 and earlier, which could only give the PCI corresponding to the primary OPC and a member-routed DPC.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 1024 |
| expected number of tuples | 28 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| relation type | DBSTATIC |
| distribution | FP |
| trigger function | CCipcs_pci |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

in RLdpc_dpci in 5e13 and earlier, which could only give the PCI corresponding to the primary OPC and a member-routed DPC.

**Attribute:**
isup_opc
**Fullname:**
Origination Point Code
**Attribute Description:**
Primary or alias OPC (from RLgsm_opc), partial key to RLlab7_pci, RLlab7prt.

**Attribute:**
isup_dpc
**Fullname:**
Destination Point Code
**Attribute Description:**
Destination Point Code, partial key to RLlab7_pci, RLlab7prt, can be key to RLdpc_dpci (but does not have to be any more).

**Attribute:**
pci
**Fullname:**
Point Code Index
**Attribute Description:**
Point Code Index - key to RLpci7_lab.

# IPINTCNF

## 1. Description

This relation contains the IP address to interface assignment.

This Virtual Update relation is used to assign IP addresses to an X.25 interface. The Root storage relation is RLintcnf_r.G. The Child storage relations are RLipaddr_g.G, RLipintf_g.G and RLmasks_g.G. The tree diagram Figure 1 depicts the stored structure of virtual relation IPINTCNF.

## 4. Population rules for RLipintcnf

### Relation Description

IP Address to Interface Configuration Assignment

This relation is used to assign IP addresses to an X.25 interface. The maximum tuple value is for a specific SM and is determined by the number of X.25 interfaces defined to be used by IP to connect to an external 5ESS(R)-2000 switch network

**Attribute:**
portnum
**Fullname:**
Portnum
**Attribute Description:**
The port number of the interface used. It is also identified by the PH channel group and member.

**Attribute:**
lcn
**Fullname:**
Logical channel number
**Attribute Description:**
The X.25 logical channel number used to identify the IP interface.

**Attribute:**
indx_name
**Fullname:**
Interface Name Index
**Attribute Description:**
Index for the name of the interface.

Copyright © 1999 Lucent Technologies 

**Attribute:**
gw_indx_addr[*]
**Fullname:**
Gateway IP Address Index
**Attribute Description:**
Index for the Gateway IP address1 assigned to the processor.

**Attribute:**
subnet_mask[*]
**Fullname:**
Subnetwork Mask
**Attribute Description:**
The subnetwork mask associated with the IP address[*].

**Attribute:**
ipmcast_addr
**Fullname:**
IP Multi-Cast Address
**Attribute Description:**
Multi-cast IP address for the interface.

**Attribute:**
max_mtu
**Fullname:**
Maximum Transmission Unit
**Attribute Description:**
This attribute states how large the IP datagrams can be in length.

**Attribute:**
calea_in_use
**Fullname:**
CALEA In Use
**Attribute Description:**
This attribute identifies if the IP interface is being used by the CALEA application.

### Relation Description

IP Routing Table Relation

This relation contains static IP datagrams to an external network, or host destination. This relation allows assigning a destination IP address to an external 5ESS(R)-2000 switch interface by interface name. For each interface assigned there may be one or more of these tuples.

**Attribute:**
destip_addr
**Fullname:**
Destination IP Address
**Attribute Description:**
The host or network IP address which can be reached via this route.

**Attribute:**
dest_ipvers
**Fullname:**
Destination IP Address Version
**Attribute Description:**
IP version associated with the destination IP address.

**Attribute:**
indx_name
**Fullname:**
Interface Name Index
**Attribute Description:**
This attribute is the index for the interface name.

**Attribute:**
dest_sub_msk
**Fullname:**
Destination Subnetworking Mask
**Attribute Description:**
The subnetwork mask associated with the destination IP address.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
gw_indx_addr
**Fullname:**
Gateway IP Address
**Attribute Description:**
Local gateway IP used to route IP datagrams to an external network.

**Attribute:**
is_net_addr
**Fullname:**
Is Network Address
**Attribute Description:**
This attribute determines if the IP address given is a network or host IP address.

**Attribute:**
iprt_metric
**Fullname:**
IP Routing Metric
**Attribute Description:**
This attribute is the route metric for the specific IP interface.

### Relation Description

IP To Processor Assignment Relation

This relation maps a local IP address to a specific 5ESS(R)-2000 switch processor. The processor may be a physical or logical processor. All processors involved with IP datagram processing will have at least 1 local IP address.

**Attribute:**
ip_addr
**Fullname:**
IP Address
**Attribute Description:**
IP address assigned to the processor

**Attribute:**
ip_vers
**Fullname:**
IP version
**Attribute Description:**
IP version associated with IP address.

**Attribute:**
pcr_name
**Fullname:**
Processor Name
**Attribute Description:**
Processor identification number and its associated qualifiers based on processor ID.

**Attribute:**
subnet_mask
**Fullname:**
Subnetwork Mask
**Attribute Description:**
The subnetwork mask associated with the IP address.

## 4. Population rules for RLis_line

### Relation Description

ISDN Digital Subscriber Line Logical Termination
Directory Number Data

This tuple is only populated to ltm_type = LTM_ISDN.

**Attribute:**
lead_module
**Fullname:**
the SM containing ltm_idx (SM of the lead port)
**Attribute Description:**
lead_module = RLrt_dntran.portname.module or
lead_module = RLgroup_port.port.module

**Attribute:**
ltm_idxi
**Fullname:**
logical termination index
**Attribute Description:**
ltm_idxi = RLrt_dntran.ltm_idx or ltm_idxi = RLgroup_port.ltm_idx.
See RLrt_dntran.P and RLgroup_port.P ltm_idxi and ltm_type
definitions for assignment rules.

Note ltm_type associated with this ltm_idxi is always LTM_ISDN
when used to create keys for relations such as RLdn_feats which
include both ltm_type and ltm_idx as part of the key.

For Call Appearance-Intercom(CA-ICOM) the ltm_idxi must have
an equivalent value in RLicm_term.grpdata for this lead_lport
& lead_termno.The grp_noc in the this is_line tuple is used
to index into grpdata field in the icm_term relation. The ltm index in
this grpdata field must be equal to the ltm index used to key this
is_line tuple. See checks for lttype.
ltm_idxi are generated the same way for CA-ICOM CAs as they are
for primary DN's. Only now there are more ltm indices for CA-ICOM.
A mention is made in RLdn_tran relation for CA-ICOM but the CA-ICOM CA
on the terminal does not have a DN directly associated with it.

For Secondary Only DNs the ltm_idxi will not match any
RLfc_line.ltm_idx. However if this is a Secondary Only MLHG then
there will be a tuple in RLgroup_port where
RLgroup_port(grp_noc,mem_dn).ltm_idx = ltm_idxi.
Also there can only be one such Secondary Only MLHG member for
a given terminal.

Note: Attribute ltm_idxi has a domain range of 0-65535.
In this relation, for SM-2000 ltm_idxi has a range of 1-65531,
for an SM ltm_idxi has a range of 1-8191. As discussed in
RLrc_qidx, the existence of an index implies the value 1 or
greater. If no index is defined, RLrc_qidx(LTM_IDXI) would
contain an index value of 1 and NO TUPLE WOULD EXIST IN THIS
RELATION. Therefore, ltm_idxi must be greater than 0 in this
relation.

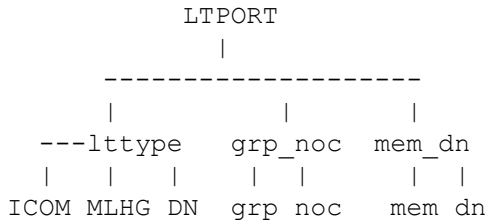
**Copyright © 1999 Lucent Technologies** 

**Attribute:**
lead_lport
**Fullname:**
lead logical port for this ltport
**Attribute Description:**
Every ISDN BRCS DN has one designated lead terminal.
If shared = DBYES, lead_lport must be the same as
RLshterm(lead_module, ltm_idxi,0).shared1.lport.

Dependency:
This lead_lport must be the same as
RLrt_dntran((noc,locdn)).lport.
For lttype of IS_ICOM the lead_port is set to the
same value as that of the primary DN for this terminal.
If lttype is IS_MLHG, then it is also true that lead_lport
must equal RLgroup_port(grp_noc).lport.

**Attribute:**
lead_termno
**Fullname:**
lead terminal number for this ltport
**Attribute Description:**
The lead terminal for this telephone number
or multiline hunt line or for the CA-ICOM.

**Attribute:**
lttype
**Fullname:**
logical termination type
**Attribute Description:**
The 3 attributes lttype, grp_noc and mem_dn constitute a LT port.
For CA-ICOM the lttype is set to IS_ICOM.
Only lttype & grp_noc constitute a LT port
since mem_dn will be set to 0 in this case.
A LT port (Logical Termination port) is another way
to refer to a DN or MLHG member. Also see grp_noc and mem_dn
attributes.



NOTE: When a MLHG member is assigned a DN value, the LT port
value will reflect the MLHG member value not the DN.

**Copyright © 1999 Lucent Technologies** 

When a MLHG member is shared onto one or more Standard BRI Basic EKTS(TM) terminals, an individual DN value must be assigned.

**Attribute:**
grp_noc
**Fullname:**
group or noc according to lttype
**Attribute Description:**
If lttype = IS_MLHG then grp_noc = grpnum with range of 1-AVMLHGRPS().
RLis_line.grp_noc = RLgroup_port.portgrp.grpnum.

If lttype = IS_DN then grp_noc = noc with range of 1-AVNOCMAX().
RLis_line.grp_noc = RLrt_dntran.dn.noc.

If lttype = IS_ICOM then grp_noc has range of 1-4.
The grp_noc in this tuple represents the index to grpdata field in RLicm_term (that is, it is equal to the 'x' in grpdata_x). The ltm index for that grpdata field needs to be greater than zero and needs to be equal to the key for this is_line tuple. See check in lttype.

Also see lttype and mem_dn.

**Attribute:**
mem_dn
**Fullname:**
member or directory number according to lttype
**Attribute Description:**
If lttype = IS_MLHG then mem_dn = member with range of 1-2015, 3001-3999.
RLis_line.mem_dn = RLgroup_port.portgrp.member.

If lttype = IS_DN then mem_dn = dn with range of 0000-9999.
RLis_line.mem_dn = RLrt_dntran.dn.digits.

If lttype = IS_ICOM then mem_dn = 0.

Also see lttype and grp_noc.

**Attribute:**
bill_flg
**Fullname:**
billing flag indicator
**Attribute Description:**
Specifies if the LT port stored here for TNs

**Copyright © 1999 Lucent Technologies** 

is the billing DN

Dependencies:
If DBNO:
if lttype is IS_ICOM then noc & loc will
be 0, the billing DN wil be the corresponding primary
DN in RLfc_line.

RLis_line.noc and RLis_line.loc will be
used to construct the billing DN.
If DBYES:
RLisbilldn(lead_module,ltm_idxi).billdn
contains the billing DN. Refer to RLisbilldn for
conditions when value is DBYES.

**Attribute:**
brc_dn
**Fullname:**
dn_feats type features indicator
**Attribute Description:**
Specifies whether or not any DN assignable brcs features
are assigned to this LT port ( DN or MLHG member).

Ca-ICOM cannot be assigned any BRCS features.
See lttype also.

Dependencies:
If DBYES, a tuple will exist in RLdn_feats with key
RLdn_feats.lead_module and ltm_idxi,
ltm_type = LTM_ISDN, and range = 0.

If more than 6 DN features are assigned, additional
tuples using range 1 thru 4 in sequential order
will exist.

If primary = DBYES then brc_dn must equal RLfc_line.brc_dn.
The keys to RLfc_line tuple is
module = RLis_line.lead_module
port = RLlpt_pt(lport=RLis_line.lead_lport,
lpt_type=LPT_ISDN).port
party = RLlpt_pt(lport=RLis_line.lead_lport,
lpt_type=LPT_ISDN).party

**Attribute:**
mdc_member
**Fullname:**
member of message desk center
**Attribute Description:**
Message Desk Center member

For CA-ICOM this field will be DBNO.

Copyright © 1999 Lucent Technologies 

See lttype checks.
Dependency:
If primary = DBYES, the mdc_member value must equal
RLfc_line(RLlpt_pt(lead_lport,lpt_type=LPT_ISDN).port,party)
.mdc_member.
If primary = DBNO and
RLrt_mhg(RLpggpmap(port).portgrp.grpnum).mdc = DBYES,
then mdc_member value must equal DBYES.
DBYES is not allowed for Standard BRI or analog shared with
Standard BRI.

**Attribute:**
huntkeys
**Fullname:**
hunt keys indicator
**Attribute Description:**
Indicates that if the line is a member of a multiline hunt group, then:

1) this MLHG member has button(s) representing one or more of the following functions:
   - member-make-busy
   - stop-hunt
   - group-make-busy
   - position-make-busy
   - random-make-busy

   OR

2) this MLHG member is a Secondary Only and it belongs to a Member-Make-Busy or Random-Make-Busy Subgroup.

Dependencies:
If RLis_line.huntkeys equals DBYES:

1) RLis_line.lttype must be IS_MLHG.

2) There must be an RLbikypm tuple keyed by the grpnum and member represented by attributes grp_noc and mem_dn from this RLis_line tuple.

3) RLis_line.primary can be DBNO only when this is a secondary only member-make-busy or random-make-busy sub-group member.

For CA-ICOM this field needs to be DBNO, see lttype.

**Attribute:**
primary
**Fullname:**
indicates if this DN is the primary DN on some terminal
**Attribute Description:**
Indicates whether this DN is a primary DN on

**Copyright © 1999 Lucent Technologies** 

some terminal.

For CA-ICOM primary must be set to DBNO.
See lttype for checks.
Dependency:
RLis_line.primary is DBYES when an
RLfc_line((lead_module,RLlpt_pt(lport,lpt_type=LPT_ISDN)
port,party)) tuple exists.

If primary is DBNO, RLis_term(lport,0) on
the lead_module must have cpetype of
IS_TYPEC or IS_TYPED.

Note: Cannot have multiple DNs assignment when
primary = DBNO. This rule cannot be enforced in RLis_line PRL
since there is no RLfc_line tuple for the secondary DN.
See RLrc_multidn PRL.

**Attribute:**
subaddr_cnt
**Fullname:**
how many subaddresses are associated with the ltport
**Attribute Description:**
The total number of subaddresses minus 1 on any of the
terminals using this ltport. If shared analog
(RLfc_porttyp(RLlpt_pt(lead_lport,lpt_type=LPT_ISDN)
.port).sh_analog = DBYES), then subaddr_cnt = 0.

For DNs appearing on Standard BRIs:
subaddr_cnt is used only if Basic or CACH EKTS(TM) is subscribed on
the terminal on which the DN appears.
If lead_lport is a Basic EKTS(TM) terminal, then subaddr_cnt must equal
0 because a Basic EKTS(TM) terminal is allowed only one appearance of
each DN it uses. DNs on non-EKTS(TM) terminals must also have subaddr_cnt
equal to 0 since this field is not-used for STD non-EKTS(TM) DNs.

Note: a value of zero is ambiguous since 0 represents both 1
appearance (1 minus 1) and 0 appearances (field not used).

**Attribute:**
o_reserv
**Fullname:**
origination reservation
**Attribute Description:**
Indicates origination reservation.

The following discussion applies to four related attributes.
The four attributes o_resrv, t_reserv, nsa_reserv, and
prior_map provide as an option to the ISDN customer the
reservation of idle subaddresses for a particular DN.
This reservation will be one of three types. These

Copyright © 1999 Lucent Technologies 

types of reservation are mutually exclusive.

1. Termination only - Any attempt to originate on this subaddress will be denied. Calls attempting to terminate will terminate normally.

2. Origination only - Any attempt to terminate to the reserved subaddress will result in busy treatment. Originations will be handled normally.

3. Origination and priority terminations only - Originations will be handled normally. Terminations will receive busy treatment unless they qualify as priority terminations as specified in prior_map. If they qualify as priority terminations, they will terminate normally.

A definition of exactly what are priority calls is necessary when this type of subaddress reservation is chosen. The choice of priority calls is:

a. Originating call waiting features (CWO, DCW, IPC, OPC),

b. ISDN Intercom calls

c. Incoming calls (incoming to the terminal group),

d. PP precedence calls,

One or more of the previous types must be chosen.

Subbaddress reservation for a DN applies to its highest numbered subaddresses (SAs). For example, if a DN has a total of 4 subaddresses (subaddr_cnt = 3) with two subaddresses reserved for origination, (t_reserv=DBNO, o_reserv=DBYES, nsa_reserv=1) then SA2 and SA3 are reserved for origination.

Dependencies:
If RLfc_porttyp(RLlpt_pt(lport,lpt_type=LPT_ISDN))
sh_analog = DBYES or lttype = IS_MLHG or IS_ICOM
See lttype for checks for o_reserv, t_reserv,nsa_reserv & prior_map. RLis_term(lport,0).cpe_type is IS_TYPEE or IS_TYPEATT on lead_module, then:

o_reserv = DBNO
t_reserv = DBNO
nsa_reserv = 0
prior_map = 0

Dependencies Table

| o_reserv | t_reserv | feature |
|---|---|---|
| DBNO | DBNO | NORMAL |
| DBYES | DBNO | ORIG only |
| DBNO | DBYES | TERM only |

Copyright © 1999 Lucent Technologies 

```
        DBYES       DBYES       ORIG + Priority termination
```

**Attribute:**
t_reserv
**Fullname:**
termination reservation
**Attribute Description:**
Indicates termination reservation.
Also see attribute o_reserv.

**Attribute:**
nsa_reserv
**Fullname:**
number of subaddresses reserved
**Attribute Description:**
The number of subaddresses minus 1 reserved.
Default if o_reserv and t_reserv are DBNO.
The nsa_reserv value must be less than or equal to the subaddr_cnt value.
Also see attribute o_reserv.

NOTE: The size of a Call Pickup Group (RLpugpast.size) needs to be updated based on the number of subaddresses available for termination for the DNs within that group.
The following algorithm details this statement:

```
If brc_dn == DBYES &&
  RLdn_feats(with keys for this relation) has an entry such
  that the leftmost 6 bits of RLdn_feats.fid == MFPUT (8) &&
  RLput_cf(RLdn_feats.fid).fea_fun == CAL_PU
then if o_reserv == DBYES && t_reserv == DBNO
  Read RLpu_ltm( with the rightmost 10 bits of
  RLdn_feats.fid,lead_module,ltm_idx,ltm_type(LTM_ISDN)
  obtain t_pred_q then read RLpugpast(t_pred_q)
  NOW update the size based on any change in the
  number of subaddresses available for termination
  for this DN.

  For Custom and Standard EKTS(TM):

  before.size = subaddr_cnt - nsa_reserv
  after.size = subaddr_cnt - nsa_reserv
  change = before - after
  RLpugpast.size = RLpugpast.size + change
else before.size = subaddr_cnt + 1
  after.size = subaddr_cnt + 1
  change = before - after
  RLpugpast.size = RLpugpast.size + change

  For Standard Non-EKTS(TM):
```

Copyright © 1999 Lucent Technologies 

```
            before.size = csv_climit - nsa_reserv
            after.size = csv_climit - nsa_reserv
            change = before - after
            RLpugpast.size = RLpugpast.size + change
          else before.size = csv_climit + 1
            after.size = csv_climit + 1
            change = before - after
            RLpugpast.size = RLpugpast.size + change
```

**Attribute:**
prior_map
**Fullname:**
bit map for priorityp termination reservation
**Attribute Description:**
A four bit map indicating the four types of priority calls to include combination allowed for ORIG + Priority termination. This field is only valid for o_reserv = DBYES and t_reserv = DBYES: if not, all bits must be 0. Priority bit map for the four types of priorities:

bit0 = INCOM - Incoming to Terminal Grp
bit1 = ICOM - ISDN ICOM
bit2 = OCW - Originating Call Waiting
bit3 = PP - Priority and Preemption
Bit 0 is low order.

Dependency:
if o_reserv and t_reserv are both DBYES, prior_map must be non-zero, otherwise it must be zero.
Also see attribute o_reserv.

**Attribute:**
frst_ca
**Fullname:**
first call appearance
**Attribute Description:**
Specifies the first call appearance number on the lead terminal associated with the DN or MLHG Member or CA-ICOM CA. The call appearances on the lead terminal associated with the DN or Member are given by the call appearance number = frst_ca + offset, where offset = {0...subaddr_cnt}. This applies to RLis_term.cpetyp = { IS_TYPEB, IS_TYPEC and IS_TYPED, IS_TYPEATT }, except for Basic EKTS(TM) on Standard BRI which also has a cpetype of IS_TYPEC. frst_ca is not used (is set to 0) when the DN or MLHG member is primary on a Basic EKTS(TM) terminal.

For CA-ICOM the values must be from 1-254, same as RLtermkydn.
See checks under lttype = IS_ICOM

Copyright © 1999 Lucent Technologies 

NOTE: Call appearances on an ISDN station set
MUST be sequentially numbered within
a given DN. For example if DN 1 has 3 call
appearances, the ca values could be 1,2,3 or
23,24,25 or 46,47,48 (any 3 consecutive values).

Dependencies:
If Rlis_term(lead_lport,lead_termno).cpetype is in
{IS_TYPEB, IS_TYPEC, IS_TYPED, IS_TYPATT} then
frst_ca must be non-zero, except for Basic EKTS(TM)
(cpetype = IS_TYPEC and ekts = EKTS_BASIC) which requires
frst_ca be zero.

If cpetype is some value other than IS_TYPEB, IS_TYPEC, I
STYPE_D or ISTYPE_ATT then frst_ca must be 0.

The sum of frst_ca and subaddr_cnt must be less than or
equal to 254. For frst_ca not equal to zero, there must
exist tuples in RLtermkydn on the lead_module
with the keys as follows:

RLtermkydn.lport = lead_lport
RLtermkydn.termno = lead_termno
RLtermkydn.ca = all values from frst_ca to
(frst_ca + subaddr_cnt) inclusive

For DN/MLHG mbrs appearing on a Basic EKTS(TM) terminal RLtermkydn is
not used. RLcgpn_ltm is a relation similar to RLtermkydn.
RLcgpn_ltm is used only by Basic EKTS(TM) which identifies DN/Mbr
appearances by 'DN' instead of by 'call appearance number'.
This crosscheck with RLcgpn_ltm is placed here only because it is
logically related to the crosscheck with RLtermkydn. There
must exist exactly 1 tuple in RLcgpn_ltm with keys as follows:

lport = lead_lport
cgpn = 7 digit DN corresponding to 'noc' and 'loc'

**Attribute:**
shared
**Fullname:**
indicates if this is a shared ltport
**Attribute Description:**
Indicates whether this LT port(DN or Member or CA-ICOM CA) is
shared. If set to DBYES, then RLshterm(lead_module,
ltm_idxi, range) will contain the associated
terminals that share this DN. See RLshterm.P.
RLis_term for this lead_lport exists such
that RLis_term.cpetype = IS_TYPEC or IS_TYPED
and it is not an attendant.

A CA-ICOM CA cannot be shared, set shared to DBNO.
See checks under lttype is IS_ICOM.
When shared = DBYES, RLfc_line.multidn must be DBNO.

Copyright © 1999 Lucent Technologies 

When shared = DBYES, max_shca is populated with
an appropriate value. See max_shca.

Dependency:
If DBNO, then max_shca must be 0.

If RLfc_porttyp( RLlpt_pt(lead_lport,lpt_type=LPT_ISDN).port)
.sh_analog on the lead_module = DBYES, shared must be DBYES.

If shared is DBYES, RLshterm( lead_module,
ltm_idxi, 0).shared1 attributes of lport, frst_ca, and
subaddr_cnt must match those in RLis_line.

The value of RLis_line.shared impacts the value of the
RLspid.fip_req attribute. See the RLspid poprules for
further details.

**Attribute:**
sh_analog
**Fullname:**
Shared Analog terminal
**Attribute Description:**
Indicates whether this LT port (DN or Member) is
shared analog. If set to DBYES,
then this terminal is the analog lead of a Shared
DN group.
This will set to DBNO for CA-ICOM.
See checks under lttype is IS_ICOM.

If sh_analog = DBYES, shared must also equal DBYES.
If sh_analog = DBYES, the corresponding sh_analog flag
in RLfc_porttyp must also be DBYES. The sh_analog
flag in RLis_line is just a copy of the sh_analog flag
in RLfc_porttyp.

**Attribute:**
max_shca
**Fullname:**
the max number of shared call appearances
**Attribute Description:**
Specifies the number of shared call appearances minus one
for this DN on the terminal that has the most shared call
appearances for this DN.
For CA-ICOM set to 0.
See checks under lttype is IS_ICOM.

Dependencies:
If shared is DBYES, then max_shca is the largest of all
RLshterm(lead_module,ltm_idxi,0).shared[2-4].subaddr_cnt's and
RLshterm(lead_module,ltm_idxi,1).shared[1-4].subaddr_cnt's

Copyright © 1999 Lucent Technologies 

(if range 1 tuple exists).
If shared is DBNO, max_shca must be 0.

**Attribute:**
noc
**Fullname:**
normalized office code of DN
**Attribute Description:**
Specifies the normalized office code for the DN.
Must be the same as grp_noc/memdn(as appropriate
unless member of an MLHG. If member of an MLHG,
noc/loc = RLrt_dntran.dn.noc (key to tuple)
For CA-ICOM since there is no associated DN, noc
will be set to 0.
See checks under lttype is IS_ICOM.
If bill_flg is DBNO, noc and loc will be
used to construct the billing DN.

**Attribute:**
loc
**Fullname:**
locdn in binary
**Attribute Description:**
Specifies the last 4 digits in BINARY of the DN.
loc = RLrt_dntran.dn.digits (key to tuple)
For CA-ICOM since there is no associated DN, loc
will be set to 0.
See checks under lttype is IS_ICOM.

**Attribute:**
busymon
**Fullname:**
indicates if this DN is monitorable by an ISDN attendant
**Attribute Description:**
DBYES enables this port to be monitored by the ISDN
attendant consoles associated ISAT Group.
The following servclasses (as found in FC_PORTTYP)
that can be monitored by the BLF indicators. It should
be interpreted as the maximum set that can be expected.
FC_INDVDL
FC_ISDN

Set this to DBNO for CA-ICOM. See lttype.
Note:
If the DN of this port is a main DN of a multi-line
hunt group, then this attribute is DBNO.

If this attribute is set to DBYES, the DN of this
port must be reflected in the DN bit map of relations:
RLmoni_blf

Copyright © 1999 Lucent Technologies 

RLmask_blf
for that particular tuple having the same NOC and
hundreds group. Also this port must have a tuple in
the relation RLrc_oeinfo, or RLrc_mminf, or RLrc_dninfo
with the att_grp attribute having the value of the
isatgroup monitoring this DN.

Association for non-MLHG DNs is in RLrc_oeinfo (primary DN)
or in RLrc_dninfo (secondary-only DN).

For MLHG members, UCD-Listed TN and non-UCD member 1
(primary/secondary) is associated in RLrc_mminf, while
UCD member >= 1 and non-UCD member > 1 are associated in
RLrc_oeinfo (primary) or in RLrc_dninfo (secondary-only).

Note:
If RLis_line.subaddr_cnt = RLis_line.nsa_reserv
then RLis_line.busymon must be DBNO.

**Attribute:**
dn_bfg
**Fullname:**
indicates if DN type brcs features are assigned to a BFG
**Attribute Description:**
Indicates existence of RLdn_feats tuple with
RLdn_feats.ltm_idx = bfgid and RLdn_feats.lead_module
equal zero if DBYES.
For CA-ICOM set to DBNO, see lttype

**Attribute:**
bfgid
**Fullname:**
brcs feature group id
**Attribute Description:**
Identifier for the BRCS Feature Group. This value
identifies which BFG is assigned to this line - when
ever an entry is made to RLltm_bfg regarding this
line, the corresponding bfgid value needs to be
reflected for this attribute. (Note: ODA is
responsible for updating this attribute when
they are creating the initial BFG Transition List.)

For CA-ICOM set to 0, see lttype.
Dependancy:
If bfgid < 256 then dn_bfg = DBNO
If bfgid > 0 then there exists a tuple in RLltm_bfg
with bfgid = RLltm_bfg.bfgid

**Attribute:**
cfv_on

Copyright © 1999 Lucent Technologies 

**Fullname:**
call forwarding variable active indicator
**Attribute Description:**
Activation Status bit for CSV CFV or CSD CFV Feature (CFV feature is identified when RLcf_cf.fwd_cndtn has as its value CFN_BSYIDL, CFN_DBSYIDL, or CFN_PRCV.) If ltport assigned to a BFG with CSV CFV or CSD CFV feature, this bit is used by call processing to determine its activation status.
The use of DBNO signifies one of the following:
(1) if BFG has CFV and this feature is inactive, or
(2) if BFG does not have CFV feature (default case).
For CA-ICOM set to DBNO; see lttype

**Attribute:**
cfbl_on
**Fullname:**
call forwarding variable active indicator
**Attribute Description:**
Activation Status bit for CSV CFBL or CSD CFBL Feature (CFBL feature is identified when RLcf_cf.fwd_cndtn has as its value CFN_BUSY, CFN_DBUSY, CFN_PRCB, or CFN_PPBUSY.) If ltport assigned to a BFG with CSV CFBL or CSD CFBL feature, this bit is used by call processing to determine its activation status.
The use of DBYES signifies one of the following:
(1) if BFG has a corcable CFBL and this feature is active,
(2) if BFG has a noncorcable CFBL feature, or
(3) if BFG does not have a CFBL feature (default case).
For CA-ICOM set to DBNO; see lttype

**Attribute:**
cfda_on
**Fullname:**
call forwarding don't answer active indicator
**Attribute Description:**
Activation Status bit for CSV CFDA or CSD CFDA Feature (CFDA feature is identified when RLcf_cf.fwd_cndtn has as its value CFN_IDLE, CFN_DIDLE, CFN_PRCI, CFN_PPIDLE, or CFN_ACDQIDL). If ltport assigned to a BFG with CSV CFDA or CSD CFDA feature, this bit is used by call processing to determine its activation status.

The use of DBYES signifies one of the following:
(1) if BFG has a corcable CFDA and this feature is active,
(2) if BFG has a noncorcable CFDA feature,

Note: If a user has a call forwarding feature with a CFN_ACDQIDL forwarding condition in a BFG, cfda_on must always be DBYES.

**Copyright © 1999 Lucent Technologies** 

(3) if BFG does not have a CFDA feature (default case).
For CA-ICOM set to DBNO; see lttype

**Attribute:**
disp_on
**Fullname:**
display active indicator
**Attribute Description:**
Activation Status bit for LID (DN version of DISP) Feature
If ltport assigned to a BFG with LID feature, this bit is
used by call processing to determine its activation status
NOTE: This is not used (CORC'd) for 5E4(2).
Set to DBYES for CA-ICOM, see lttype.

**Attribute:**
cnd_on
**Fullname:**
calling number delivery active indicator
**Attribute Description:**
Activation Status bit for CND Feature. If ltport assigned
to a BFG with CND feature, this bit is used by call
processing to determine its activation status.
If this bit is set to DBYES, the CND feature is active.
See checks under lttype is IS_ICOM.

**Attribute:**
bfg_put
**Fullname:**
PUT BFG tuple indicator
**Attribute Description:**
Set to DBYES, if PUT tuple exist with key as bfgid
See checks under lttype is IS_ICOM.

**Attribute:**
bfg_eds
**Fullname:**
EDS BFG indicator
**Attribute Description:**
Set to DBYES, if EDS tuple exist with key as bfgid
See checks under lttype is IS_ICOM.

**Attribute:**
ffcf1
**Fullname:**
boolean reserved for future field feature
**Attribute Description:**
boolean reserved for future field feature
See checks under lttype is IS_ICOM.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ffcf2
**Fullname:**
boolean reserved for future field feature
**Attribute Description:**
boolean reserved for future field feature
See checks under lttype is IS_ICOM.

**Attribute:**
ffcf3
**Fullname:**

**Attribute Description:**
see fullname description.
See checks under lttype is IS_ICOM.

**Attribute:**
ffcf9
**Fullname:**
unsigned 8 reserved for future Field Feature use.
**Attribute Description:**
see fullname description.
See checks under lttype is IS_ICOM.

**Attribute:**
psap
**Fullname:**
E911 Public Safety Answering Point indicator
**Attribute Description:**
This is a boolean used to indicate if the DN is an ISDN public safety answering point (PSAP).

**Attribute:**
mon_mode
**Fullname:**
monitor mode selection bit
**Attribute Description:**
This bit is reserved as a place holder for future ISDN Attendant Busy Lamp Field (BLF) development. This bit will be used to select the mode for monitoring the busy/idle status of this DN.
This bit will be set to DBNO for CA-ICOM, see lttype

**Attribute:**
pp_stat
**Fullname:**
PP feature indicator
**Attribute Description:**
Existence status bit for PP Feature assignment
Set to DBYES if PP feature is assigned either to the DN
(RLdn_feats(lead_module,ltm_type,ltm_idx,0-4)
or associated BFG
(RLdn_feats(0,LTM_ISDN,bfgid,0-4)
otherwise, set to DBNO.

Copyright © 1999 Lucent Technologies 

```
NOTE: This bit is set to DBYES if either of the two
following conditions are true:

1. A tuple exists in RLpp_ltm with the key

RLpp_ltm.lead_module = lead_module
RLpp_ltm.ltm_idx     = ltm_idxi
RLpp_ltm.ltm_type    = RLfc_line.ltm_type

2. If the bfgid of this tuple (in RLis_line) is >255:
then a tuple exists in RLpp_ltm with the following key
lead_module = zero
ltm_idxi    = bfgid
ltm_type    = LTM_ISDN (the default value of
ltm_type for BFG is
always LTM_ISDN, even
if the line is analog)

This bit is used by audits for the dynamic audit of
RLppsast. It is the basis for determining if the DN
is part of such audit.
Set to DBNO for CA-ICOM, see lttype.
```

## 5. IS_LINE Population rules continued.

**Attribute:**

intercept

**Fullname:**

indicates the DN associated with this tuple has been placed on intercept

**Attribute Description:**

```
This bit indicates that the DN associated with this tuple
has been placed on intercept.  Intercept basically denies
the DN origination and termination capabilities. It can
be determined from the termclass in RLrt_dntran (termclass
equals RTTC_AGING).

Range:
DBYES   DN is on intercept
DBNO    DN is not on intercept

Intercept set to DBNO, no associated DN for
CA-ICOM, see lttype.
Default: DBNO
derive based on RLrt_dntran and the following dependency
rules

Dependencies:
1) When intercept is assigned, the RLrt_dntran tuple must
   still be associated with its physical and logical data
   or a tuple won't exist here.
   When an MLHG member is placed on intercept,
   if the member's port is associated with a non-zero DN,
```

   end:

   end:

5) Refer also to the population rules for:
   - RLfc_line.P    (ISDN primary DN information)
   - RLfc_porttyp.P (servclass attribute and retrofit)
   - RLrc_dninf.P   (does not exists when DN is associated
     with its port data)
   - RLrc_multidn.P (terminals with multiple DNs assigned)
   - RLrc_oeinfo.P  (exists where intercept equals DBYES
     and port data is intact)
   - RLrt_dntran.P  (termclass dependencies)
   - RLrt_lgmem.P   (large MLHG members)
   - RLrt_mem.P     (small MLHG members)

6) DNs placed on intercept are not allowed to series
   complete

   if(RLis_line.intercept equals DBYES) then
   RLis_line.sercomp must_equal DBNO:
```

**Attribute:**

scr_on

**Fullname:**

selective call rejection active

**Attribute Description:**

The following description applies to attributes scr_on, scf_on, sca_on, and sda_on.

This field indicates whether the feature is active (DBYES) for lines whose ltm_type is equal to LTM_ISDN. Redundant active field in FC_LINE will be ignored.

Through RC/V or CORC, the feature can be activated or deactivated by setting this field to either DBYES or DBNO respectively.

ODA must set this field to DBNO for new start offices.

General availability access to LASS Selective Features is denied for the secondary only DNs.

Copyright © 1999 Lucent Technologies 

Activation conditions:
---

A feature will not be activated unless
1) there is at least one DN stored in the screen list.
2) RTN (Remote Telephone Number or Forward-to-DN) is defined for SCF and SCA/CAR.
3) NAT (Non-Acceptance Termination Treatment) is defined for SCA/CAR. If NAT is defined as NAT_RCRD, RTN is not required to be populated.
4) For the subscription case, the master switch in DN_FEATS is on (DBYES).
   (Note: This does not apply to RC/V.)

For individual DNs (non-MLHG DNs) or no-hunt DNs of MLHG members, this is the only field to be updated in order to activate or de-activate the feature. The active field in DN_FEATS (for subscription case) will not be updated.

scr_on, scf_on, sca_on, sda_on are not allowed to be active (DBYES) for any ltm_idx on a Standard BRI. No cross checks are written for the scr_on, scf_on, sca_on, sda_on flags because access to these features is blocked elsewhere. Both subscription and general availability access is blocked.

For CA-ICOM set scr_on, scf_on, sca_on, sda_on to DBNO, see lttype.

Multi-line Hunt Group:
---

If this is the member one (lead member) of a multi_line hunt group, the feature status of the multi-line hunt group, scr_on (or scf_on or sca_on or sda_on) in MHG_CF relation should be updated when this field(s), and/or the master switch, mastsw in DN_FEATS is (are) changed.

The truth table is:

| IS_LINE | DN_FEATS | MHG_CF |
|---|---|---|
| scr_on | mastsw | scr_on |
| DBNO | DBNO | DBNO |
| DBYES | DBNO | DBNO |
| DBNO | DBYES | DBNO |
| DBYES | DBYES | DBYES |

| scf_on | mastsw | scf_on |
|---|---|---|
| DBNO | DBNO | DBNO |
| DBYES | DBNO | DBNO |
| DBNO | DBYES | DBNO |
| DBYES | DBYES | DBYES |

**Fullname:**
series completion activation bit
**Attribute Description:**
Indicates whether the series completion feature is assigned on this DN. See RLscm_nscm for a complete set of poprules for the series completion feature.
For CA-ICOM set to DBNO,see lttype.

**Attribute:**
cpnbn_on
**Fullname:**

Copyright © 1999 Lucent Technologies 

CPN/BN activated for BFG

**Attribute Description:**

Activation Status bit for CPN/BN feature.
If ltport assigned to a BFG with CPN/BN feature, this bit is used by call processing to determine its activation status.
This attribute must be set to DBYES when the CPN/BN feature is activated (on) for the directory number or multiline hunt group member. This attribute must be set to DBNO when the CPN/BN feature is deactivated (off). This attribute is also used when the directory number is a shared analog line.
The corresponding attribute, RLfc_line.cpnbn_on, must be set to the value of this attribute when a shared analog line is unshared.
When an analog line is shared, the value of RLfc_line.cpnbn_on must be copied into RLis_line.cpnbn_on.
For CA-ICOM set to DBNO,see lttype.

**Attribute:**

tgsr_on

**Fullname:**

terminal group station restriction active on BFG

**Attribute Description:**

Activation status bit for TGSR feature. If an ISDN user is assigned to a BFG with a TGSR feature, this bit is used by call processing to determine its activation status.
If this bit is set to DBYES, the TGSR feature is active for this user.
For CA-ICOM set to DBNO,see lttype.

**Attribute:**

csv_aco

**Fullname:**

Circuit Switched Voice Additional Call Offering

**Attribute Description:**

csv_aco defines the type of ACO feature assigned for this DN for voice calls. If ACO is not subscribed, csv_aco is set to ACO_NONE. ACO is only subscribeable by primary DNs appearing on Standard ISDN BRI interfaces and subject to the further restriction the (single) terminal on which the DN appears must not subscribe to EKTS(TM) service.
For CA-ICOM set this to ACO_NONE, see lttype

**Attribute:**

csd_aco

**Fullname:**

Circuit Switched Data Additional Call Offering

**Attribute Description:**

csd_aco defines the type of ACO feature assigned for this DN for CSD calls. If ACO is not subscribed, csd_aco is set to ACO_NONE. ACO is only subscribeable by primary DNs appearing on Standard ISDN BRI interfaces and subject to the further

Copyright © 1999 Lucent Technologies 

restriction that the (single) terminal on which the DN appears must not subscribe to EKTS(TM) service.
For CA-ICOM set this to ACO_NONE, see lttype

**Attribute:**
csv_climit
**Fullname:**
Voice Call Reference Busy Limit
**Attribute Description:**
csv_climit is used only when this LTPORT is on a non-EKTS(TM) terminal on a Standard BRI. Otherwise it must be set to 0.

It is the number of call reference values allowed to be active simultaneously on this ltm_idx for CSV (voice) calls. A value of zero implies no voice service on this ltm_idx, a value of 1 implies only 1 call reference value may be associated with voice calls on this ltm_idx, etc.
A non-zero value of csv_climit when CSV ACO is not subscribed allows multiple calls on a ltm_idx only through Hold (that is, user puts an existing call on hold and originates another call).
csv_climit must be greater than zero if CSV ACO is subscribed.
Set csv_limit to 0 for CA-ICOM see lttype.

**Attribute:**
csd_climit
**Fullname:**
CSD Call Reference Busy Limit
**Attribute Description:**
csd_climit is used only when this LTPORT is on a terminal on a Standard BRI. Otherwise it must be set to 0.

It is the number of call reference values allowed to be active simultaneously on this ltm_idx for CSD (data) calls. A value of zero implies no CSD service on this ltm_idx, a value of 1 implies only 1 call reference value may be associated with CSD calls on this ltm_idx, etc.
A non-zero value of csd_climit when CSD ACO is not subscribed allows multiple calls on a ltm_idx only through Hold (that is, user puts an existing call on hold and originates another call). csd_climit must be greater than zero if CSD ACO is subscribed.

csd_climit can be set to 0 through 16 when the LTPORT appears on a non-EKTS(TM) terminal on a Standard BRI.
When the LTPORT appears on an EKTS(TM) terminal, the LTPORT must be primary and csd_climit is restricted to either 0 or 1.
Set csd_limit to 0 for CA-ICOM see lttype.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

csv_nblimit

**Fullname:**

Circuit Switched Voice Notification Busy Limit

**Attribute Description:**

This attribute indicates the maximum number of call references the switch will allow to be used concurrently for called-user notification of waiting voice calls.

For information on how csv_nblimit is populated see rc-oda rules and retrofit-oda rules.

Set to 0 for CA-ICOM, see checks for lttype.

**Attribute:**

csd_nblimit

**Fullname:**

Circuit Switched Data Notification Busy Limit

**Attribute Description:**

This attribute indicates the maximum number of call references the switch will allow to be used concurrently for called-user notification of waiting data calls.

For information on how to populate csd_nblimit see rc-oda rules and retrofit-oda rules.

Set to 0 for CA-ICOM, see checks for lttype.

**Attribute:**

cgps_alw

**Fullname:**

Calling Party Subaddress Allowed

**Attribute Description:**

This attribute indicates whether CgPS (Calling Party Number Subaddress is allowed on the directory number or to the multiline hunt group member. CgPS is allowed for Standard BRIs only. This attribute is set to DBYES if both this is a Standard BRI and the MFCPI (CPN/BN) feature is subscribed by this DN/MLHG member. Otherwise it is set to DBNO. This attribute is used to populate the dynamic relation RLcpnbncnt and is used by the CPNBNCNT and IS_LINE audits.
For CA-ICOM set to DBNO; see lttype.

**Attribute:**

dcpn_bill

**Fullname:**

Data CPN/BN billing option

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute indicates the billing option subscribed to for the CPN/BN feature. This attribute is set based on the billing option for the CPN/BN feature (MFCPI) and whether data (CSD) is assigned to the directory number or to the multiline hunt group member.

The CA-ICOM is billed a flat rate, so this attribute must be set to FLATRATE. See lttype.
This attribute is set to FLATRATE if flat rate billing is done. This attribute is set to USAGESENS if usage sensitive billing is done and CSD is assigned. If no CPN/BN feature is subscribed to, the attribute must be set to FLATRATE. This attribute is used to populate the dynamic relation RLcpnbncnt for keeping usage data billing counts and is used by the CPNBNCNT and IS_LINE audits.

**Attribute:**
bill_opt
**Fullname:**
CPN/BN billing option
**Attribute Description:**
This attribute indicates the billing option subscribed to for the CPN/BN feature. This attribute must be the same as the billing option for the CPN/BN feature (MFCPI) assigned to the directory number or to the multiline hunt group member except for ISDN primary DNs whose lead lports have no voice service. See dcpn_bill for CA-ICOM. Also see lttype.
This attribute is set to FLATRATE if flat rate billing is done and set to USAGESENS if usage sensitive billing is done. If no CPN/BN feature is subscribed to, the attribute must be set to FLATRATE. This attribute is used to populate the dynamic relation RLcpnbncnt for keeping usage billing counts and is used by the CPNBNCNT and IS_LINE audits

**Attribute:**
epo_on
**Fullname:**
enhanced professional office indicator
**Attribute Description:**
This attribute indicates that this DN or MLHG member is being tracked by the MIS as an Enhanced Professional Office (EPO) DN or member. The terminal that's assigned this DN must not be a standard ISDN terminal or an ACD/BRCS position.

**Attribute:**
freeterm
**Fullname:**
Free Termination
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

RLis_line.freeterm is used in SHDN to provide the
associate terminals with the lead member's free terminating
service state. DBYES means the calling party to this port
is not billed. For all tuples in RLis_line which have
RLis_line.primary equal to DBYES, the value of RLis_line.freeterm
is set to the value of RLfc_line.freeterm for that primary DN.
For CA-ICOM freeterm needs to be set to DBNO, see lttype.
For CA-ICOM primary will be set to DBNO.
For secondary only, RLis_line.freeterm is set to DBNO.

**Attribute:**
sa_orig
**Fullname:**
Subaddress for originations
**Attribute Description:**
Used for National ISDN (standard), not custom.
The lowest call appearance subaddress which is reserved for originations only. This attribute is used as an offset to frst_ca when finding the first call appearance reserved for originations only.

A value of 0 could indicate either the first subaddress reserved for originations or no subaddresses reserved, depending on the value of sa_orig_qty.

**Attribute:**
sa_orig_qty
**Fullname:**
Quantity of subaddresses for originations
**Attribute Description:**
Used for National ISDN (standard), not custom.
The total number of consecutive call appearance subaddresses, beginning with the subaddress specified in sa_orig, which are reserved for originations only. A value of 0 indicates that no subaddresses are reserved for originations only.

**Attribute:**
sa_term
**Fullname:**
Subaddress for terminations
**Attribute Description:**
Used for National ISDN (standard), not custom.
The lowest call appearance subaddress which is reserved for terminations only. This attribute is used as an offset to frst_ca when finding the first call appearance reserved for terminations only.

A value of 0 could indicate either the first subaddress reserved for terminations or no subaddresses reserved, depending on the value of sa_term_qty.

Copyright © 1999 Lucent Technologies 

**Attribute:**
sa_term_qty
**Fullname:**
Quantity of subaddresses for terminations
**Attribute Description:**
Used for National ISDN (standard), not custom.
The total number of consecutive call appearance subaddresses, beginning with the subaddress specified in sa_term, which are reserved for terminations only. A value of 0 indicates that no subaddresses are reserved for terminations only.

**Attribute:**
sa_prio
**Fullname:**
Subaddress for originations and priority incoming terminations
**Attribute Description:**
Used for National ISDN (standard), not custom.
The lowest call appearance subaddress which is reserved for originations and priority incoming terminations only. This attribute is used as an offset to frst_ca when finding the first call appearance reserved for originations and priority incoming terminations only.

A value of 0 could indicate either the first subaddress reserved for originations and priority incoming termination or no subaddresses reserved, depending on the value of sa_prio_qty.

**Attribute:**
sa_prio_qty
**Fullname:**
Quantity of subaddresses for originations and priority incoming terminations
**Attribute Description:**
Used for National ISDN (standard), not custom.
The total number of consecutive call appearance subaddresses, beginning with the subaddress specified in sa_prio, which are reserved for originations and priority incoming terminations only. A value of 0 indicates that no subaddresses are reserved for originations and priority incoming terminations only.

**Attribute:**
ported
**Fullname:**
ported indicator
**Attribute Description:**
This attribute indicates if the line associated with this tuple is individually ported by the Number Portability feature. However, if the line is in either a Multiline Hunt Group (MLHG)

**Copyright © 1999 Lucent Technologies** 

or a Terminal Group (TG), then the group ported indicator takes precedence over the individual ported indicator. The indicator that will be used (either the individual or the group ported indicator) will be determined by call processing.

**Attribute:**
tsmed
**Fullname:**
Telephone Status Monitor and Select monitored terminal
**Attribute Description:**
Indicates if this terminal is being monitored by the TSM feature. It is needed for secondary only DNs but is populated for all ISDN DNs.

**Attribute:**
ctxid
**Fullname:**
Context Identifier
**Attribute Description:**
This attribute indicates if the line associated with this tuple is unbundled or resold. A line is unbundled if ctxid = CTXID_UNBNLD; it is resold if ctxid = CTXID_RESOLD.

**Attribute:**
inhibit_del
**Fullname:**
Inhibit Deletion
**Attribute Description:**
Inhibit deletion of DSL. If inhibit_del is DBYES, deletion through RC will be inhibited. See rc-oda-rules section.

**Attribute:**
caseindex
**Fullname:**
Case Index
**Attribute Description:**
Index into the RLcase_idx relation.

Copyright © 1999 Lucent Technologies 

# IS_TERM

## 1. Description

This relation contains the digital subscriber line terminal feature data.

QUANTITY OF TUPLES:
There is one (1) tuple for each digital subscriber line (RLfc_porttyp.servclass = FC_ISDN or FC_ISATND) that has flexible call offering (MCA).

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation IS_TERM.

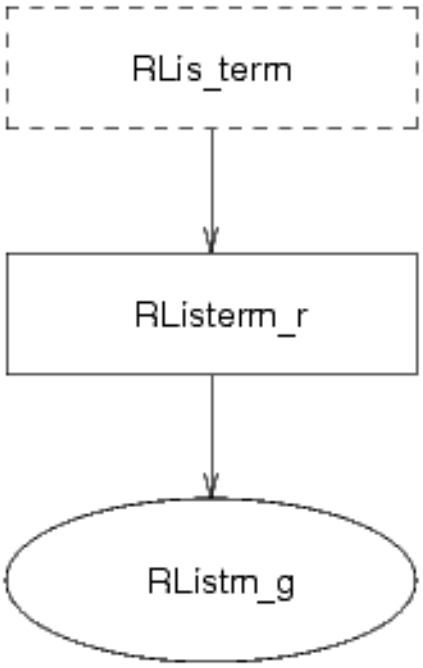

**Figure 1 Virtual Relation IS_TERM**

## 4. Population rules for RLis_term

### Relation Description

ISDN TERMINAL FEATURES

**Copyright © 1999 Lucent Technologies** 

Digital Subscriber Line Terminal Feature Data
QUANTITY OF TUPLES:
A RLis_term tuple is required for each terminal that has
a cpetype of IS_TYPEA, IS_TYPEB, IS_TYPEC, IS_TYPED,
IS_TYPEE, or IS_TYPATT."
This relation supports Simplified Custom ISDN Attendant - a TYPE D terminal with a servclass of FC_ISATND, providing attendant functionality for TYPE D terminals. This is a secured feature (SFID 292).

**Attribute:**
termno
**Fullname:**
ISDN Terminal Number
**Attribute Description:**
Terminal Number

**Attribute:**
lport
**Fullname:**
ISDN Terminal Logical Port
**Attribute Description:**
Logical port
Range: Always ISDN range.

**Attribute:**
config
**Fullname:**
ISDN Terminal Configuration Group Identifier
**Attribute Description:**
ISDN terminal configuration group identifier.
Must have RLfacname and RLfid2name
populated. (class = FACCONFIG, subclass =
SCL_NULL).
The value of RLis_term.config impacts the value of the RLspid.fip_req attribute. See the RLspid poprules for further details.

**Attribute:**
auto_hold
**Fullname:**
ISDN Terminal Auto Hold
**Attribute Description:**
Indicates if auto-hold or auto-drop applies to
a TMF type terminal (that is, cpetype = IS_TYPEB or IS_TYPED).
If DBYES then auto_hold.
If DBNO then auto_drop.
Either DBYES or DBNO is allowed for IS_TYPEB and
IS_TYPED terminals. Only DBNO is allowed for

**Copyright © 1999 Lucent Technologies** 

the other types of terminals. See cpetype attribute.

**Attribute:**
one_touch
**Fullname:**
ISDN Terminal One Touch
**Attribute Description:**
One touch operation indicator. Set to DBYES
if subscribed to this TMF feature.
Either DBYES or DBNO is allowed for IS_TYPEB and
IS_TYPED terminals. Only DBNO is allowed for
the other types of terminals. See cpetype attribute.

**Attribute:**
display
**Fullname:**
ISDN Terminal Display
**Attribute Description:**
Indicates whether there is a display module on the
station set.
For a standard BRI (RLdslequip.briclass == BRI_STD),
RLis_term.display is used to assign the Standard
Display feature. Standard Display feature allows
standard display information to appear on a standard
BRI CPE for outgoing and incoming calls. Information
is sent in the Q.931 Display Text Information Element.
The ISDN BRCS Individual Calling Line Identification
feature (such as, RLlid_cf.cnd_all) must be assigned
to allow the calling DN to be shown with the standard
display information. On a standard BRI, the ISDN BRCS
Outgoing Called Line Identification (OCLID) feature
is not used to provide displays for outgoing calls. A
standard BRI must have Standard Display feature assigned
(RLis_term.display == DBYES) and an ICLID feature
assigned to display information with the calling DN
for outgoing and incoming calls.
The Standard Display feature is a terminal feature
which means if RLis_term.display == DBYES, all call
appearances on the standard BRI CPE will receive
display information.

**Attribute:**
privacy
**Fullname:**
ISDN Terminal Privacy
**Attribute Description:**
Indicates whether the LT port (DN or Member)
associated with this terminal is
private. If privacy indicator is set to PRIVATE,
the LT port information will not be displayed at

Copyright © 1999 Lucent Technologies 

other terminals. If the privacy indicator is set to PUBLIC, the LT port information will be displayed at other terminals. If the privacy indicator is NOT_SET, the presentation status will depend on the setting of the acp_ind attribute in RLscridxpa or the office privacy parameter, Gldn_priv. Features such as the Incoming Calling Line ID (ICLID) feature and the inspect feature would check the privacy indicator before displaying any LT port information. If the Calling Party Number Presentation (CPNP) Special Feature is active (SFID50 is set), then the default value for the privacy attribute is NOT_SET, otherwise the default value is PUBLIC.

**Attribute:**
time_mode
**Fullname:**
ISDN Terminal Time Mode
**Attribute Description:**
Indicates whether the time should be displayed in 12-hour format (DBNO) or 24-hour (military time) format (DBYES). All features that display the time to the ISDN terminal will use this indicator.

**Attribute:**
cpepref
**Fullname:**
ISDN Terminal Call Appearance Preference
**Attribute Description:**
ISDN terminal call appearance preference indication. Either IS_IDLE or IS_RING is allowed for IS_TYPEB and IS_TYPED terminals. Only IS_IDLE is allowed for the other types of terminals. See cpetype attribute.

**Attribute:**
cpetype
**Fullname:**
ISDN Customer Premises Equipment Type
**Attribute Description:**
ISDN Customer Premises Equipment (terminal) type.
Range: IS_TYPEA, IS_TYPEB, IS_TYPEC
IS_TYPED, IS_TYPEE, IS_TYPATT.
The value of RLis_term.cpetype impacts the value of the RLspid.fip_req attribute. See the RLspid poprules for further details.
Beginning with 5E8, IS_TYPEA and IS_TYPEC are used for cpe on both custom (existing Lucent Technologies proprietary) and standard (Bellcore) cpe. The EKTS(TM) feature is the principal determinant controlling what other features may be assigned on a Standard terminal. The three EKTS(TM) cases are: no EKTS(TM), Basic EKTS(TM), and CACH

Copyright © 1999 Lucent Technologies 

EKTS(TM). 'no EKTS' on Std BRI is considered a TYPE A terminal.
Basic and CACH EKTS(TM) implies a TYPE C.

ISDN Terminal Descriptions - Part 1

| Terminal | Feature dial access | Feature button access | MCA | MDN + | SHDN$ | TMF | LT port* | SACOUNT pop.% |
|---|---|---|---|---|---|---|---|---|

| | | | | |
|---|---|---|---|---|
| Std BRI | | | | |
| NON-ATT. TYPE B | Y | N | N | Y |
| NON-ATT. TYPE C on Custom BRI or CACH on Std BRI | Y | N | N | N |
| NON-ATT. TYPE C BASIC Std BRI | N- | N | N | N |
| NON-ATT. TYPE D | Y | N | N | Y |
| ATT. CONSOLE | Y | N | N | N |
| NON-ATT. TYPE E | N | N | N | N |

ATT. - ATTENDANT
BASIC - EKTS(TM) service using Called/Calling DN
CACH - Call Appearance Call Handling EKTS(TM)
CA - Call Appearance
Custom - pre-5E8 Lucent Technologies ISDN interface
LT port - Logical Termination port
MCA - Multiple Call Appearance
MDN - Multiple Directory Numbers
SHDN - SHared Directory Numbers
Std - 5E8 Bellcore Standard ISDN interface
ACD - ACD/BRCS Position

* - LT port is a MLHG member/TN combined key. It is used as a key to ISDN BRCS relations.

& - MLHG members on Basic EKTS(TM) are required to have a DN.

$ - Primary MLHG member or Primary TN may be shared by Non-Attendant terminals types C or D. Non-Primary MLHG member or TN may also be shared by Non-Attendant terminal types C and D.

\+ - MDN in this ISDN context means having more than one DN assigned, each with its own appearance/set of appearances. This is distinguished from the multidn functionality which allows multiple DNs to be assigned on a single appearance/set of appearances, and for purposes of these rules is not considered MDN.

? - Multipile Call Appearances are not supported on this terminal type.

% - The subscriber subscribes to a number of subaddresses, up to 16. The subaddr_cnt attribute in rlIS_LINE is populated.

# - The following translation will exist.

Copyright © 1999 Lucent Technologies 

```
                    button number ==> LT port, SA
          Relations rlSHTERM, rlTERMKYDN are populated.
-   - Relations rlSHTERM, rlCGPN_LTM are populated
```

**Attribute:**
huntca
**Fullname:**
Highest ISDN call appearance.
**Attribute Description:**
Highest call appearance (RLtermkydn.ca value) that has ever been assigned to the isdn type c or d terminal ( for this is_term.lport ). It is used by RC/V view 23.21 Terminal Key System to speed up its processing. Whenever RC/V 23.21 is used in update mode, the huntca field is updated to the highest call appearance that is currently assigned to the terminal.
Basic EKTS(TM) terminals (which are marked as Type C) have huntca set to 0.
When RC/V view 23.20 is used to remove a list element, huntca is set to 0. When RC/V view 23.21 is used and huntca is 0, huntca is set to a value equal to the terminal's highest call appearance.

**Attribute:**
ltport_cnt
**Fullname:**
ISDN Terminal Logical Termination Port Count
**Attribute Description:**
Logical termination port count.
This represent the total number minus one of LT ports on this terminal.
Range: 0-63
Default: 0
Dependencies: If cpe_type is IS_TYPEA, IS_TYPEB, IS_TYPEE, IS_TYPATT, or IS_TYPED and an attendant, ltport_cnt must be 0.
For all termkydn tuples selected by
RLtermkydn.lport = RLis_term.lport and
RLtermkydn.termno = 0 and
RLtermkydn.ca in {1 thru 254} and
RLtermkydn.subaddr = 0
or in the special case of ekts = EKTS_BASIC,
for all RLcgpn_ltm tuples selected by
RLcgpn_ltm.lport = RLis_term.lport
the total number of tuples (either termkydn or cgpn_ltm as appropriate) must be the same as the ltport_cnt + 1 for cpe_type equal IS_TYPEC or IS_TYPED (not attendant).

**Copyright © 1999 Lucent Technologies** 

The value of RLis_term.ltport_cnt impacts the value of the RLspid.fip_req attribute. See the RLspid poprules or further details.

**Attribute:**
latidx
**Fullname:**
ISDN Terminal Logical Attendant Terminal Index
**Attribute Description:**
Logical ISDN attendant terminal index. Sequentially assigned number used to cause a dense packing of ISDN attendant keyed dynamic relations. The next available latidx is in the relation RLrc_lahol if there are unused latidx or in RLrc_qidx for the next available if there are no holes.

**Attribute:**
cpn_scrn
**Fullname:**
ISDN Terminal Calling Party Number Screening Indicator
**Attribute Description:**
This attribute is used to indicate if a user-provided calling party number (CPN) from an ISDN terminal should be screened by the switch on originations. If cpn_scrn is set to DBYES, the user-provided CPN will be matched against the primary directory number for the terminal. If the CPN does not match, it will be discarded and replaced with a switch provided CPN. This attribute should only be set to DBYES for those ISDN terminals that will supply a user-provided CPN. If cpn_scrn is set to DBNO, the switch will always provide the CPN even if the terminal sends a CPN. For terminals connected to a PBX, this attribute should always be set to DBNO since screening should not be done in a PBX.

**Attribute:**
posnum
**Fullname:**
position number
**Attribute Description:**
This attribute uniquely identifies an ACD/BRCS position. When this attribute has a value other than 0, this terminal is an ACD/BRCS position.
ACD/BRCS positions are required to have the following characteristics:
- circuit switch voice service
- service class of FC_ISDN
- DN features assigned
- terminal features assigned
- position DN which is primary

ACD/BRCS positions are not allowed to have the following

**Copyright © 1999 Lucent Technologies** 

characteristics or features:
- to be assigned to a Bellcore Standard BRI
- a shared primary (position) DN
- to be assigned series completion DNs
- a primary or secondary DN that is a MLHG member
- to be a circuit switch data MLHG member

For ACD/BRCS position DN feature requirements, see RLdn_feats.
For terminal feature requirements, see RLtrmfeats.
If posnum is not zero, there must be a tuple in RLACD_POS
for this posnum.

**Attribute:**
eponum
**Fullname:**
Enhanced Professional Office position number
**Attribute Description:**
This attribute uniquely identifies an Enhanced Professional Office (EPO) position. When this attribute has a value other than 0, this terminal is an EPO position.
EPO positions are required to have the following characteristics:
- circuit switch voice service
- originating service class of FC_ISDN
- terminal type B or D
- also supports Simplified ISAT which is service class FC_ISATND and terminal type D

EPO positions are not allowed to have the following characteristics or features:
- to be defined as an ACD/BRCS position
- to be assigned to a Bellcore Standard BRI
- both B channels configured for data only

If eponum is not zero, there must be a tuple in RLepo_pos
for this eponum.
The Enhanced Professional Office feature is a secured feature (SFID 179).

**Attribute:**
acdgrp
**Fullname:**
ACD/BRCS group number
**Attribute Description:**
This attribute uniquely identifies a "sub-terminal group" group to allow customers (or end-users) to divide their call centers into smaller groups. This will allow different groups to exist within the same ACD customer with the same level of security that exists between different ACD customers. When this attribute has a value of 1000, this ACD/BRCS group member will have unrestricted access to all "acdgrp" groups within the terminal group. RC and ODA does not currently support this "wild card" value.

**Attribute:**

Copyright © 1999 Lucent Technologies 

**Attribute:**
psap
**Fullname:**
E911 ISDN Public Safety Answering Point Indicator
**Attribute Description:**
This is a boolean used to indicate if the primary DN of this terminal is an ISDN Public Safety Answering Point.

**Attribute:**
ekts
**Fullname:**
Electronic Key Telephone Service
**Attribute Description:**
Electronic Key Telephone Service is a service available only to terminals on Standard BRIs. All terminals on Custom BRIs must have ekts set to the null value (EKTS_NONE).
The ekts attribute defines the type of EKTS(TM) service assigned for this user. If a non-null (not EKTS_NONE) EKTS(TM) service is assigned, the user's terminal must support the variety of Q.931 EKTS(TM) protocol required for the version of EKTS(TM) service, that is, either Basic or CACH EKTS(TM).
Basic EKTS(TM) service (ekts=EKTS_BASIC) uses Calling/Called Party Number information elements to identify the calling/called DN in originating/terminating SETUP messages. The terminal may have only one appearance of each of its DNs.
CACH EKTS(TM) service (ekts=EKTS_CACH) uses the Call Appearance Information element to identify the calling/called DN in originating/terminating SETUP messages.
The terminal may have multiple appearances of each of its DNs.
If ekts is non-null, the cpetype must equal ISTYPE_C. If ekts is EKTS_NONE and the interface type on which the terminal resides is Standard, the cpetype must equal ISTYPE_A.
IMR 374393: The ISDN Intercom feature is not allowed on any standard BRIs except for EKTS_CACH standard BRIs.

**Attribute:**
pasc
**Fullname:**
Personal Communications Access Services on a C-Interface.
**Attribute Description:**
Personal Communications Access Services on a C-Interface.
A C-Interface is a BRI interface to a Radio Port Control Unit(RPCU) for wireless services to the end user.
For a given USOP if the value of this field is set to PASC_PCSI then the associated user to that USOP has PCS services on a ISDN interface on the 5ESS(R) for switching and routing PCS calls.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

alt

**Fullname:**

Personal Communications Services Automatic Link Transfer(ALT) feature allowed for this USOP.

**Attribute Description:**

Personal Communications Services Automatic Link Transfer(ALT) feature allowed for this USOP.
The ALT feature allows a PCS user to transfer an existing call from one RPCU to another.

**Attribute:**

insp_ama

**Fullname:**

Inspect ama usage-sensitive

**Attribute Description:**

The insp_ama field indicates the type of billing to be performed for the Inspect feature.
This is an enumeration of type DMBOOL.
The billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed.
If insp_ama is set to DBYES, then the type of billing to be performed will be usage sensitive Inspect, whereas if it is set to DBNO, billing be done a flat rate basis. This usage sensitive Inspect billing is for National ISDN only.

**Attribute:**

tsmed

**Fullname:**

Telephone Status Monitor and Select (TSM) monitored terminal

**Attribute Description:**

Indicates if this terminal is being monitored by the TSM feature. It will be used primarily by the TM (Terminal Maintenance) subsytem. It is mapped to RLtedb.tsmed

**Attribute:**

tsming

**Fullname:**

Telephone Status Monitor and Select (TSM) monitoring terminal

**Attribute Description:**

Indicates if this terminal is using TSM to monitor another terminal. It can only be set for primary DNs and is mapped to the rlTEDB.tsming attribute.

**Copyright © 1999 Lucent Technologies** 

# ISACOF

## 1. Description

Maps an ACOF restriction to a button for each ISDN configuration group.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLisacof

**Relation Description:** ISDN ACOF

Maps an ACOF restriction to a button for each ISDN configuration group.

**Attribute: config**

**Fullname:** configuration group

**Attribute Description** ISDN configuration group This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: idp_gpid**

**Fullname:** individualized dialing plan group

**Attribute Description** Existence of this tuple implies existence of a RLidp_gp tuple with an idp_gpid attribute value matching the value of idp_gpid in this tuple. Moreover, the act_alwd

Copyright © 1999 Lucent Technologies

attribute of that RLidp_gp tuple must have the value DBYES.

**Attribute: actsetnum**

**Fullname:** number assigned in the dialing plan for each valid individualized dialing code

**Attribute Description** The RLbnfeat.str_param, which has the same config as this relation (RLisacof) and RLbnfeat.action = ACN_IACOF, is the BCD version of this actsetnum. Existence of this tuple implies the existence of a Rlidp_act tuple keyed by RLisacof.idp_gpid and RLisacof.actsetnum.

**Attribute: cpe_comp**

**Fullname:** CPE component (module)

**Attribute Description** This cpe_comp must be the same as RLbnfeat.cpe_comp which has an action of ACN_IACOF and the same config as this relation.

**Attribute: button**

**Fullname:** ISDN station set button number

**Attribute Description** This button number must be the same as RLbnfeat.button which has an action of ACN_IACOF and the same config as this relation.

Copyright © 1999 Lucent Technologies 

# ISAFIDX

## 1. Description

This relation provides information associated with an ACOF button for a particular attendant configuration group.

## 2. Data Dictionary Values

| | |

## 4. Population Rules for RLisafidx

**Relation Description**
Information associated with ACOF button index.

Gives information associated with an attendant control of facilities (ACOF) button for a particular attendant configuration group.

**Attribute: config**

**Fullname:** ISDN configuration group

**Attribute Description** This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: afidx**

**Fullname:** ACOF button index

Copyright © 1999 Lucent Technologies

**Attribute Description** This index is assigned in RLisatlmt in attribute afbitmap. See RLisatlmt.P for information on how the index is generated.

**Attribute: mod**

**Fullname:** Switching module on which control port resides

**Attribute Description** This mod is the same as in RLacoftran.lport_mod with the same config RLacoftran.config = RLisafidx.config.

**Attribute: idp_gpid**

**Fullname:** IDP group affected by this ACFO button

**Attribute Description** This idp_gpid is the same as in RLisacof.idp_gpid with the same config RLisacof.config = RLisafidx.config.

**Attribute: actsetnum**

**Fullname:** Alternate code treatment set number affected by this ACOF button

**Attribute Description** This idp_gpid is the same as in RLisacof.actsetnum with the same config RLisacof.config = RLisafidx.config

## 4. Population Rules for RLisatgrp

**Relation Description**
Associates isat hunt group number with ports of group members local to module.

For every RLisatgrp.config(i), { where (i) = 1, 2, 3, or 4 }, that is non-zero, a corresponding RLisatlmt tuple will exist keyed by RLisatgrp.config(i) = RLisatlmt.config. For every RLisatgrp.config(i), where (i) = 1, 2, 3, or 4, that is non-zero, this attribute cannot exist in any other tuple in this relation (RLisatgrp). The term ISAT refers to an ISDN Attendant Terminal. These terminals must be configured into hunt groups that are known as an ISAT multi-line hunt group.

**Attribute: isat_idx**

**Fullname:** isat index of ISAT hunt group
**Attribute Description** Index of ISdn attendant (ISAT) hunt group Dependency:
The tuple should exist on a given SM only if RLgroup_port.portgrp.grpnum = RLrt_mhg.grpnum and RLgroup_port.portgrp.grptype = TM_LINE.

**Attribute: config[*]**

**Fullname:** configuration group

**Attribute Description** Configuration group used by this group. Dependency:
For any member where mbrprt[i] is non zero and map indicates a 0 for config1 (1 for config2, 2 for config3, 3 for config4) at the i'th bit pair position, RLis_term keyed by lport(module and mbrprt)

**Copyright © 1999 Lucent Technologies** 

should have an equal RLis_term.config. If RLisatgrp.config[x] != 0, then a tuple will exist in RLisatlmt keyed by RLisatlmt.config = RLisatgrp.config[x].

**Attribute: cfwfid**

**Fullname:** call forwarding fid for the night service feature

**Attribute Description** Call forwarding fid for the night service feature. values: Most significant six bits = MFCFW from DMmftype. Least significant ten bits = any values except 0000000001.

Dependencies:
For member number 1 of this hunt group (obtain port and ltm_idx from RLgroup_port keyed by RLrt_mhg.grpnum and member=1), the RLdn_feats tuples keyed by this ltm_idx should contain this fid. Also, a tuple should exist in RLbnfeat on the module for member 1 keyed by the cpe component, button number and configuration which has RLbnfeat.fid = cfwfid and RLbnfeat.action = ACN_INIGHT. A tuple in RLfeatbn must also exist on the module for member 1 keyed by the magic fid for call forwarding (most significant six bits = MFCFW and least 10 significant 10 bits = 0000000001) and action = ACN_INIGHT.

**Attribute: map[*]**

**Fullname:** bit map of which members use which config groups

**Attribute Description** 128 bit wide map of which members use which config groups. Each attribute contains 8 bits which is the configuration data for 4 members of the hunt group.(2 bits for each member). The least significant 2 bits represents members 1,5,9 etc. The most significant 2 bits represents members 4,8,12 etc. The value in a particular 2 bit field shows which of the 4 configurations describes that member.

```
ms             ls
1    |- -|- -|- -|- -|
        4    3    2    1
2    |- -|- -|- -|- -|
        8    7    6    5
.
.
.
.
10   |- -|- -|- -|- -|
       40   39   38   37
11   |- -|- -|- -|- -|
       44   43   42   41
12   |- -|- -|- -|- -|
       48   47   46   45
13   |- -|- -|- -|- -|
       52   51   50   49
14   |- -|- -|- -|- -|
       56   55   54   53
15   |- -|- -|- -|- -|
       60   59   58   57
16     |- -|- -|- -|
          63   62   61
```

Only 4 configurations are allowed to be mixed in a given hunt group.

DEPENDENCIES:
If the i'th index in the mbrprt array is 0, the i'th bit pair position in map must be 0. If the mbrprt array

**Copyright © 1999 Lucent Technologies** 

field is nonzero, then if when the port in the mbrprt array field is translated to lport and for RLis_term.lport, the RLis_term.config group is config1, then the i'th position in the bit map must be 0, if it is config2, the bit should be 1, if it is config3, the bit map should be 2, if it is config4, the bit map should be 3:

```
config1       00
config2       01
config3       10
config4       11
```

**Attribute: mbrprt[*]**

**Fullname:** D-channel ports for members of this hunt group

**Attribute Description** Positional list of D-channel ports for members of this hunt group if on this module.

```
mbrprt1 = member # 1
   .
   .
mbrprtISATMAXMEM = member #ISATMAXMEM
```

Dependency:
If RLgroup_port.portgrp.grpnum = RLrt_mhg.grpnum (whose RLrt_mhg.isat_idx = this RLisatgrp.isat_idx), RLgroup_port.portgrp.grptype = TM_LINE, and RLgroup_port.member = member number (1-ISATMAXMEM) does not exist on the AM, then the value must be 0.

**Attribute: mbrmod[*]**

**Fullname:** module number

**Attribute Description** Positional list of modules numbers for members of this hunt group.

```
mbr_mod1 = module where member #1 resides.
mbr_mod2 = module where member #2 resides.
   ...
   ...
mbr_modISATMAXMEM = module where member #ISATMAXMEM resides.
```

Dependency:
If RLgroup_port.portgrp.grpnum = RLrt_mhg.grpnum (whose RLrt_mhg.isat_idx = this RLisatgrp.isat_idx), RLgroup_port.portgrp.grptype = TM_LINE, and RLgroup_port.member = member number (1-ISATMAXMEM) does not exist on the AM, then the value must be 0.

**Attribute: qbusy_dpn**

**Fullname:** Queue Busy Distribution Point

**Attribute Description** Used to alert when an ISAT MLHG queue is full. The distribution point closes to activate a lamp when the queue is full. Once the queue is no longer full, the distribution point opens to deactivate the lamp.

**Attribute: qbusy_dpn.member**

**Fullname:** Queue Busy Distribution Point Port

**Attribute Description** qbusy_dpn.member is the port that the distribution point is located on.

**Attribute: qbusy_dpn.module**

**Fullname:** Queue Busy Distribution Point Module

**Attribute Description** qbusy_dpn.module is the module that the distribution point is associated with.

**Defines:**"db/DMport.h"

# ISATLMT

## 1. Description

Gives number of DTGS, ACOF, and hundreds group select buttons for a particular attendant configuration group.

```
Maximum number of tuples derived as follows:
252    63 Maximum ISAT MLHG (isat_idx)
     x  4 configs (limited in RLisatgrp
The expected tuple data was extracted from a study of field equipment.
(AVISATGRPS  * 4) > 252)
  syntax - The number of ISATLMTs needed has exceeded the maximum engineered
```

## 2. Data Dictionary Values

       ( 8 bytes )
```

## 4. Population Rules for RLisatlmt

**Relation Description**
Integrated services digital network (ISDN) attendant button limits.

Gives number of direct trunk group selection (DTGS), and attendant control of facilities (ACOF) buttons for a particular attendant configuration group. The following two bit-map attributes represent the presence of DTGS buttons, and ACOF buttons. The number of bits in each bit map represent the maximum number of a specific type of button which may be present on an attendant console. A bit set to '1' indicates a button is present and has been assigned the index corresponding to the location of the bit in the bit map (rightmost bit is bit 0). For example, if the tgbitmap looks like: 0000000010100101 then this configuration group has four DTGS buttons with indexes of 0, 2, 5, and 7. The index for a button is used to identify the button in other related relations. See the poprules for each bit map for the appropriate relations for each button type.

**Attribute: config**

Copyright © 1999 Lucent Technologies

**Fullname:** ISDN configuration group

**Attribute Description** This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: tgbitmap**

**Fullname:** Bit map of DTGS buttons

**Attribute Description** DTGS buttons are assigned in RLbnfeat with action ACN_IDTGS. The relations which use the index assigned to each DTGS button are RListgidx and RLdtgstran.

Dependencies:

(1) The number of tuples in RLbnfeat for this config with action ACN_IDTGS must equal the number of '1's in this bit map.

(2) For every bit set to '1', there should be a tuple in RListgidx such that:
```
rlISTGIDX.config = rlISATLMT.config
rlISTGIDX.tgidx = position of this bit in the bit map
```

**Attribute: afbitmap**

**Fullname:** Bit maps of ACOF buttons

**Attribute Description** ACOF buttons are assigned in RLbnfeat with action ACN_IACOF. The relations which use the index assigned to each ACOF button are RLisafidx and RLacoftran.
Dependencies:

(1) The number of tuples in RLbnfeat for this config with action ACN_IACOF must equal the number of '1's in this bit map.

(2) For every bit set to '1', there should be a tuple in RLisafidx such that:
```
rlISAFIDX.config = rlISATLMT.config
rlISAFIDX.afidx = position of this bit in the bit map
```

## 4. Population Rules for RLisatmbr

**Relation Description**
ISDN Attendant Member.

Associates isat hunt group number with ICI subsets handled by each member, ICI subsets class under each priority and the call waiting lamp threshold.

**Attribute: isat_idx**

**Fullname:** ISAT index of ISAT hunt group

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is an abstract form of a multi-line hunt group number.
Value: 1-63

**Attribute: cwthres**

**Fullname:** Call waiting warning threshold

**Attribute Description** cwthres is used to turn on/off the call waiting warning lamp. This lamp is turned on when the number of calls in queue exceeds this value. The call waiting warning lamp remains lit when the calls in queue are equal to cwthres value. The call waiting warning lamp is turned off when the calls in the queue fall below the cwthres value. Values: 0-255. A value of 0 means that there is no call waiting warning lamp.
Default: 0

Dependency:
If the queuing feature, as specified by the tuple keyed by RLqu_cfdfl.feat_id, has RLqu_cfdfl.cwl = DBNO, to indicate no call waiting lamps assigned, then the cwthres should be 0 and will not be used. NOTE: ISAT groups can only have call waiting lamps that light based on number of calls. If cwthres is non-zero the RLqu_cfdfl.cwl must be DBYES and RLqu_cfdfl.threstyp must be IS_N.

**Attribute: icisbg[*]**

**Fullname:** ici bit maps for which ici's the member handles.

**Attribute Description** icisbg1 thru icisbg(ISATMAXMEM): Positional list of ISATMAXMEM 16 bit values representing ici's assigned to each hunt group member. Bits in each 16 bit quantity show the ici's that are subscribed to by that member. The least significant bit corresponds to ici_idx of 0. The most significant bit corresponds to ici_idx of 15. When a bit is set to 1 then that particular ici_idx can be served by this member. More than 1 ici can be served by a given member. ici_idx's shown here must be either identical to or a subset of those shown in RLicx_ici.ici1-16 for this isat_idx. If member does not exist, its indexed slot will be 0. If member does exist, the value must be non-zero. Values: 0-0xffff Dependency: If RLgroup_port in the AM keyed by RLrt_mhg.isat_idx and this index number does not exist on the AM, then value must be 0. Otherwise value must be non-zero. If the ISAT group subscribes to the emergency ici (ICI_EMER) then all members of that group must subscribe to ICI_EMER.

Note: The previous rules is being enforced in RLicx_ici.p
Default: 0

**Attribute: ici_pri[*]**

**Fullname:** ici bit maps for which ici's the priority includes.

**Attribute Description** ici_pri1 thru ici_pri8: Positional list of 8 16 bit quantities representing relative priorities of ici's that can be served by this hunt group. Every indicated ici_idx must have a priority value.
`ici_pri1 shows the ici's with the highest priority. (1)`
`ici_pri8 shows the ici's with the lowest priority. (8)`
The default priority for ICI_QUE is 1. The bit position with the 16 bit quantity shows which ici's have that given priority. The attribute ici_idx is used to compute this bit position.
`ici_idx = 0 refers to the least significant bit and`
`ici_idx = 15 refers to the most significant bit.`
More than 1 ici can be served with the same priority. If the priority is not used, its indexed slot will be 0. If priority is used, the value must be non-zero, and must indicate the ici(s) assigned that priority.

**Copyright © 1999 Lucent Technologies** 

Values: 0-0xffff
Dependency: If an ici's bit is set in one ici_pri attribute, it must not be set in any other. A given ici can have only one priority.
Default: 0

**Attribute: isat_thresh**

**Fullname:** ISAT threshold value for QWARN lamp

**Attribute Description** isat_thresh is used for ISAT MLHGs that have QWARN lamp. When the number of calls in the basic portion of the queue exceeds the isat_thresh value, the QWARN lamp is lit on all consoles that have the feature button assigned for the lamp. Once the number of calls falls below isat_thresh, the QWARN lamp is extinguished.

## 4. Population Rules for RLisatmod

**Relation Description**
ISDN attendant (ISAT) modules.

Associates an ISAT hunt group number with the modules of the members.

**Attribute: isat_idx**

**Fullname:** isat index of ISAT hunt group

**Attribute Description** This is an abstract representation of a multi-line hunt group number.

Dependencies:
A tuple in this relation is only needed when the hunt group corresponding to isat_idx has a tuple in RLrt_mhg where RLrt_mhg.isat_idx = RLisatmod.isat_idx and RLrt_mhg.htype = RTH_ISAT and the specified queuing module RLrt_mhg.qmodule is this SM.

**Attribute: mbrmod[*]**

**Fullname:** positional list of module numbers

**Attribute Description** Positional list of module numbers showing the processor number of each of the members of a multi-line hunt group. This attribute is used by the software to determine

Copyright © 1999 Lucent Technologies 

which processor to send a message to when a call is being dequeued at the queuing module. The 63 members (ISATMAXMEM) of a hunt group could each be on a different processor.

Dependencies:
If RLgroup_port.portgrp.grpnum = RLrt_mhg.grpnum (whose RLrt_mhg.isat_idx = this RLisatmod.isat_idx), RLgroup_port.portgrp.grptype = TM_LINE, and RLgroup_port.member = member number (1-ISATMAXMEM) does not exist on the AM, then the value must be 0.

    |---------------+---------------+---------------+---------------|
       ( 12 bytes )
```

## 4. Population Rules for RLisbilldn

**Relation Description**
ISDN billing directory number.

ISDN digital subscriber line billing DN for BRCS This relation is only populated when the billing DN is a DN other then the DN contained in RLis_line.

In ISDN BRCS, the billing will be by DN not by port (terminal). Since a BRI may have multiple DNs, the billing DN will correspond to a specific DN on the BRI terminals.

IF RLis_line(lead_module, ltm_idxi).bill_flg = DBNO this tuple will not exist.

If RLis_line(lead_module, ltm_idxi).bill_flg = DBYES this relation is populated with the billing DN.

This relation may be populated when a IS_LINE typle exists for shared analog DNs, secondary only DNs and ISDN terminal types (TYPEA, TYPEB, TYPEC, TYPEE, TYPATT) In general, ISBILLDN must be populated when the billing TN cannot be derived (it differs from) from IS_LINE.noc and is_line.loc.

Copyright © 1999 Lucent Technologies

Specifically populate when

(1) an optional billing DN is specified and differs from that derived from IS_LINE.noc, IS_LINE.loc.

(2) if a non-lead member of a regular or circular hunt group with IS_LINE, noc == 0 and IS_LINE, loc == 0 obtain the billing TN from member 1 of the MLHG.

(3) if member of UCD with IS_LINE.noc==0 and IS_LINE.loc==0 obtain the billing TN from the MLHG TN. (RLpgrprmk(grpnum).tn)

(4) if member of ISAT with IS_LINE.noc==0 and IS_LINE.loc==0 obtain the billing TN from subgroup TN 1 (an ISAT group must always have subgroup TN 1).

**Attribute: lead_module**

**Fullname:** Lead Module.

**Attribute Description** lead switching module
lead_module = RLis_line.lead_module

**Attribute: ltm_idxi**

**Fullname:** Logical Termination Index.

**Attribute Description** logical termination index
ltm_idxi = RLis_line.ltm_idxiNote:
ltm_type associated with this ltm_idxi is always LTM_ISDN when used to create keys for relations such as RLdn_feats which includes both ltm_type and ltm_idx as part of the key.

**Attribute: billdn**

**Fullname:** Billing Directory number.

**Attribute Description** Billing directory number. The billing dn is a 10 digit number that is, different than the DN in RLis_line(lead_module,ltm_idxi) tuple. This DN is assigned by the office. The billing number is a number of up to 10 digits ( no. digits = (1 <= no. digits <= 10)). Number of digits = 0 means no billing number is present. The digits are stored in BCD, two per character (byte). The domain used for bill_dn has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is < 10, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

| byte 0 | byte 1 | byte 2 | byte 3 | byte 4 | byte 5 |
|---|---|---|---|---|---|
| D1 \| D2 | D3 \| D4 | D5 \| D6 | D7 \| D8 | D9 \| D10 | no. dig. |

**Copyright © 1999 Lucent Technologies** 

# ISDTGS

## 1. Description

Maps a private facility to a button for each configuration group.

```
Maximum number of tuples derived as follows:
4032    63 Maximum ISAT MLHG (isat_idx)
      x  4 configs (limited in RLisatgrp)
      x 16 private facilities per config
The expected tuple data was extracted from a study
of field equipment.
(AVISATGRPS * 4 * 16) > 4032)

syntax - The number of ISDTGSs needed has exceeded the maximum engineered
```

## 4. Population Rules for RLisdtgs

**Relation Description**
Direct Trunk Group Selection.

Maps a private facility to a button for each configuration group.

**Attribute: config**

**Fullname:** configuration group

Copyright © 1999 Lucent Technologies

**Attribute Description** ISDN configuration group This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: pftype**

**Fullname:** private facility type

**Attribute Description** Indicates if this facility is a simulated facility group (PFSFG) or a physical trunk group (PFPHYS).

**Attribute: grpnum**

**Fullname:** group number

**Attribute Description** Indicates group number of the sfg or physical trunk group assigned to a DTGS key.

**Attribute: cpe_comp**

**Fullname:** CPE component

**Attribute Description** CPE component (module). This cpe_comp must be the same as RLbnfeat.cpe_comp which has an action of ACN_IDTGS and the same config as this relation.

**Attribute: button**

**Fullname:** ISDN station set button number

**Attribute Description** ISDN station set button number. This button number must be the same as RLbnfeat.button which has an action of ACN_IDTGS and the same config as this relation.

# ISLC_ALM

## 1. Description

Distribute and scan points for *SLC*® alarm types.

Maximum tuples based on the capacity of DMRT_ALMTP. The expected tuple data was extracted from a study of field equipment.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 8 |
| expected number of tuples | 8 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | CIO |
| relation type | DBSTATIC |
| ks key store | AUTO |
| trigger function | SMislc_trig |
| insert trigger | DBYES |
| update trigger | DBNO |
| delete trigger | DBYES |
| end of transaction trigger | DBNO |

## 3. Field Layout

```

**Relation Description**
Integrated *SLC*® alarm types.

This relation is to map integrated *SLC*® alarm types to their associated distribute/scan points.

**Attribute: alarm_type**

**Fullname:** Integrated *SLC*® (ISLC) alarm types

**Attribute Description** Indicates the ISLC alarm types.

**Attribute: type_spdp**

**Fullname:** ISLC alarm types to scan/distribute points

**Attribute Description** Map ISLC alarm types to associated scan/distribute points.

**Attribute: type_spdp.member**

**Fullname:** Port number

**Attribute Description** Port number used in mapping to RLfc_porttype.port.module.

**Attribute: type_spdp.module**

**Fullname:** Module number

**Attribute Description** Module number used in mapping to RLfc_porttyp.port.module.

**Defines:**"db/DMport.h"

# ISLP_TKG

## 1. Description

This relation contains the Inter-System Link Protocol (ISLP) Autoplex(R) trunks on a SM.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 192 |
| expected number of tuples | 90 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application type | CGA |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```

### Relation Description

Autoplex(R) Inter-System Link Protocol (ISLP) trunk group and member to Switching Module (SM)

List of ISLP Autoplex(R) trunk group and member numbers whose port terminates on a particular SM.

A tuple is keyed by the SM and range and consists of up to 15 entries. Each entry contains a single trunk group number and member number combination.

**Attribute:**
sm
**Fullname:**
Switching module
**Attribute Description:**
Primary key to the relation.

**Attribute:**
range
**Fullname:**
Range
**Attribute Description:**
The range indicates which tuple (set of 15 trunk group/members) to be accessed. Range is a primary key to the relation.

**Attribute:**
cnt
**Fullname:**
Count
**Attribute Description:**
Indicates the number of trunk group and member combinations that exist for this SM. The count is kept in the range zero

tuple.

**Attribute:**
tgnmem[*].tgrpid
**Fullname:**
Trunk group identification number
**Attribute Description:**
Indicates the trunk group number that the member is assigned to.

The '*' in tgnmem[*] has the range of 1 to 15;

**Attribute:**
tgnmem[*].member
**Fullname:**
Trunk member number
**Attribute Description:**
The trunk member number assigned to the trunk.

The '*' in tgnmem[*] has the range of 1 to 15;

## 4. Population Rules for RLislu2lg

**Relation Description**
ISLU2 Line Group Information

U.S. utilizes local line groups, therefore remote line groups are not applicable for U.S. in this relation. This relation is used for information related to ISLU2 line groups. ISLU2 line groups are pseudo-entities, provided as an administrative convenience. Unlike ISLUs, the ISLU2 does not have a line group controller. When the first line board is grown into a line group of an ISLU2, a tuple is created in this relation. When the last board is degrown, the tuple is deleted.

**Attribute: lg**

**Fullname:** Line Group circuit name

**Attribute Description** This is the line group of an ISLU2 with at least one board present

**Attribute: board[*]**

**Fullname:** Board in position N

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** For the 8 possible positions for the line board, this attribute holds the line board type if the board does not have an eqstat of SMUNEQ in RLcktdata. For U line boards, this value should be PCUBRD if the eqstat is not SMUNEQ. For Z line boards, this value should be PCZBRD if the eqstat is not SMUNEQ. For T line boards, this value should be PCTBRD if the eqstat is not SMUNEQ. Board[0-3] are in primary LIDB, or lower shelf, while board[4-7] are in secondary LIDB, or upper shelf.

**Attribute: remote**

**Fullname:** Remote Line Group

**Attribute Description** Is this Line Group remote or local? For Local Line Groups, remote is DBNO. For Remote Line Groups, remote is DBYES. This attribute is not currently used in the U.S.

**Attribute: duplex**

**Fullname:** Duplex RLGI Configuration

**Attribute Description** Is this Remote Line Group connected to a Simplex or Duplex RLGI configuration? Simplex RLGI Configurations have RLGI Service Group 0 connected to the RLG. Duplex RLGI Configurations have RLGI Service Group 0 and RLGI Service Group 1 connected to the RLG. For Local Line Groups, duplex is DBNO. For Remote Line Groups connected to a Simplex RLGI configuration, duplex is DBNO. For Remote Line Groups connected to a Duplex RLGI configuration, duplex is DBYES. This attribute is not currently used in the U.S.

**Attribute: cable_series**

**Fullname:** Backplane Cable Series (type).

**Attribute Description** Type (series) of cable between the backplane and the T1 Digital Cross-Connect (DSX) panel.

**Attribute: dpidb_mask**

**Fullname:** Mask for Available LIDB timeslots

**Attribute Description** The attribute dpidb_mask is a 32 bit mask that specifies the timeslots on an LG that are reserved for DPIDB permanent connections to the PSU. The low order bit represents LIDB/LG timeslot 0, the high order bit represents LIDB/LG timeslot 31. A bit set to '0' indicates a timeslot used for DPIDB connection. The default value is 0xffffffff, representing no dpidb timeslots are used. This will be true for any line group on a RISLU, since DPIDBs are not allowed for RISLU, and for any line group with NO operational or assigned digital (U or T) line circuits. The actual timeslots chosen for DPIDB connection can be found in the relations RLdpidb_pt and RLdslequip. The following layout shows which DPIDB's and timeslots may be used to connect D-channels from an ISLU2 to the PSU:

```
                LG   LIDB  timeslots
       30                  20                  10                   0
      1 0 9 8 7 6 5 4 3 2 1 0 9 8 7 6 5 4 3 2 1 0 9 8 7 6 5 4 3 2 1 0

| | \|--> | | | |

Thus, if a DPIDB designated A-J is shown in the layout under a LIDB timeslot number (0-31) for some line group, this DPIDB timeslot can be used for D-channels in the line group. The * designates control timeslots, 2 per line group, which cannot be used for D-channels The control timeslots for LG X is timeslot X and X + 16. An allocation of timeslots that conforms to the previous layout is said to conform to the 'Burley algorithm'. The Burley algorithm is desirable for fault-detection purposes, but is not a requirement. A customer can override the Burley algorithm, for example, and we may need to choose other timeslot during sparing operations. When allocating timeslots for D-channels, up to 4 quarter timeslots from the same line group may share a LIDB timeslot. This is called piggybacking timeslots. A piggy-backed timeslot is preferred over using a previously empty timeslot.

**Attribute: h_cable_len**

**Fullname:** Host cable length

**Attribute Description** Cable length in feet between the Host and the T1 Digital Cross-Connect (DSX) panel.

**Attribute: r_cable_len**

**Fullname:** Remote cable length

**Attribute Description** Cable length in feet between the Remote and the T1 Digital Cross-Connect (DSX) panel.

**Copyright © 1999 Lucent Technologies** 

**Attribute: lgtype**

**Fullname:** Line Group Type

**Attribute Description** lgtype will be used to distinguish between various types of line groups: such as ISLU2 line group with eight line circuits per line board (SMIS8LG), ISLU2 line group with sixteen line circuits per line board (SMIS16LG).

## 4. Population Rules for RLislulgc

**Relation Description**
Integrated services line unit (ISLU) line group controllers (LGC).

This relation describes all the line cards associated with a Line Group Controller on a RISLU/ISLU. This relation should not be used for ISLU2, which does not have a line group controller. It was replaced (for ISLU2) with the new relation RLislu2lg.

```

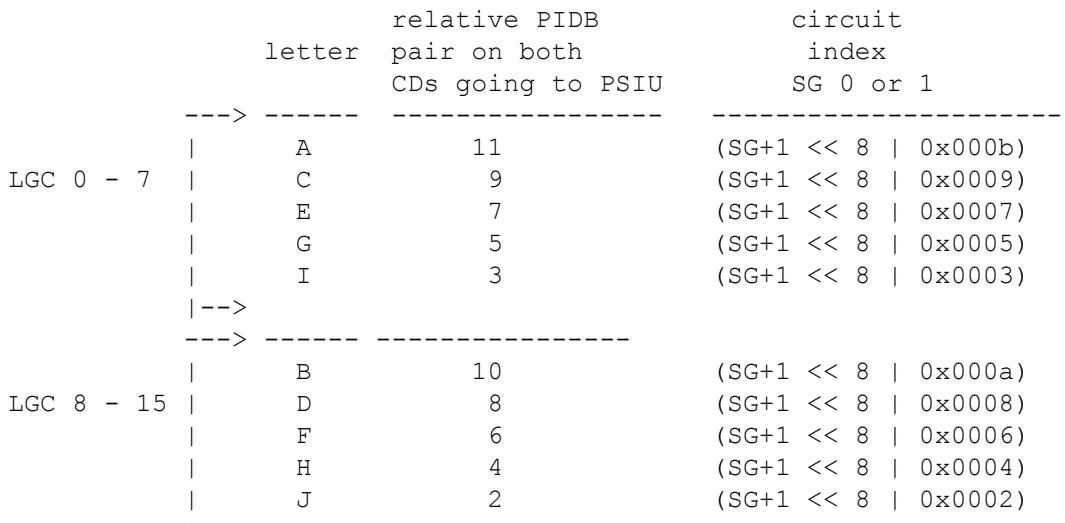
where:
                                                        DPIDB
```



If a bit is set in dpidb_mask, then one of the cards in the LGC is assigned the timeslot associated with the dpidb_mask bit. Note that LGC control timeslots cannot be used for any path through the LGC. The LGC control timeslots are equal to the LGC number and the LGC number plus 16. These timeslots must be a '1' in the 'dpidb_mask' attribute. As a cross-check, the relation RLDSLEQUIP should contain the line interface data bus (LIDB) timeslot number and directly connected peripheral interface data bus (DPIDB) service group 0 circuit name (attributes timeslot and dpidb, respectively) for at least one of the ports on a card on the LGC. As another cross-check, the relation RLdpidb_pt should have one or more of the attributes, ts_X_ports.portY (where X is from 0 - 15, Y is from 0 - 3) populated with a port from that LGC as per the previous layout.

An engineering consideration: 'dpidb_mask' reserves quarter time slots for integrated services digital network (ISDN) D-channels and full time slots for ISDN B-channels with packet switching (and therefore nailed up to a PH). NOTE: The assignment of a digital subscriber line (DSL) B-channel with packet switching (that is, DSL B-channel nailup to the protocol handler) will result in this relation being populated. The population of this relation for a DSL B-channel with packet switching is identical to the population of this relation for a DSL D-channel (except a B-channel uses a full time slot).

**Attribute: lgc**

**Fullname:** Line group controllers

**Attribute Description** Line group controllers which have a tuple in RLcktdata and an 'eqstat' of SMOPER or SMGROW must be represented by a tuple in this relation. If the LGC has an 'eqstat' of SMUNEQ, this relation should not be populated with a tuple.

**Attribute: card[*]**

**Fullname:** Card type

**Attribute Description** This attribute holds the type of the line card, if the line card's 'eqstat' in RLcktdata is SMOPER or SMGROW. The attribute is marked as PCLCNOCARD for line cards whose 'eqstat' in RLcktdata is SMUNEQ, or for cards which are not populated in RLcktdata. Line card type attributes for SMOPER or SMGROW line card include PCLCTCARD, PCLCZCARD and PCSPRZCARD. For 5E3(1) applications or later, line card type attributes for an SMOPER or SMGROW line card will also include PCLCSPRUCARD (phase 2 cards). The phase 2 line cards are similar to the T and Z-cards. For 5E6(1) applications or later, line card type attributes for an SMOPER or SMGROW line card will also include PCLCU_ANSI and PCLCSU_ANSI for the American National Standards Institute *(ANSI®)* standard U-card and *(ANSI®* standard spare

**Copyright © 1999 Lucent Technologies** 

U-card. The *(ANSI®* standard U-card is a single line card design, similar to the phase 2 U-card, and provides ISDN basic rate interface (BRI) 2B+D service to the customer. For 5E9(2) applications and later, provisioning support for the phase 1 U cards (PCPUCARD, PCSUCARD, PCSPRPUCARD, and PCSPRSUCARD) will discontinue. NOTE: The -5 volt auxiliary power converter (PCLCAPC) can be populated only in slot 8 of every line group (LG) of 32 line card slots. Whenever a LG is equipped with the LGP KCD2 power circuit pack and one or more Z or 5E4(2) U cards (that is, PCLCUCARD, or PCLCSPRUCARD), then the PCLCAPC must be populated. For 5E4(2) and beyond, if an LG is equipped with the LGPS 553A power circuit pack, slot 8 will be populated the same as 'card[0]'. An LG will not be equipped with both the Auxiliary Power Convertor (PCLCAPC) and either the LGPS 553A or the LGP 553B. Also, *(ANSI®* standard U-cards must be equipped in ISLU line groups that have the LGP 553B power circuit pack. NOTE: Line group powering arrangements within a single ISLU LG of 32 cards may be any one of the following:

(1) LGP KCD2 with T cards only, and no APC is populated.

(2) LGP KCD2 with T cards, Z cards, or 5E4 U cards and a -5 volt APC (PCLCAPC) in card slot 8 is populated.

(3) LGPS 553A with T cards, Z cards, or 5E4 U cards and no APC is populated.

(4) *ANSI®* standard U cards must only be populated with the LGP 553B power circuit pack.

(5) LGP 553B and any combination of T cards, U cards, or Z cards are populated, and no APC is populated.

**Attribute: dpidb_mask**

**Fullname:** DPIDB mask

**Attribute Description** This is a 32-bit mask that specified the timeslots on an LGC that are reserved for DPIDB permanent connections to the PSIU. If a bit in this mask is a '0', then the timeslot corresponding to that bit (0 being the low order bit) is reserved for a DPIDB connection. If the LGC is in a SMGROW or SMUNEQ state, dpidb_mask should be set to 0xffffffff, (since an LGC in these states cannot have cards that are SMOPER, hence, no DPIDB timeslots need be reserved for nailup to the PSIU.) The default value for populating this attribute is 0xffffffff. RISLU should always populate this attribute with 0xffffffff. The following table illustrates which timeslots on a particular LGC are valid candidates for nailup connections.

## 4. Population Rules for RLislupidb

**Relation Description**
Integrated Services Line Unit (ISLU(2)) Peripheral Interface Data Bus (PIDB) connections.

This relation describes the type and the connections of PIDBs associated with a RISLU, ISLU(2), or IDCU service group.

**Attribute: picb**

**Fullname:** Peripheral interface control bus (PICB)

**Attribute Description** The PICB of the service group. For RISLU, use the remote PICB number for the service group. A corresponding tuple is required in RLpicb, with unittype of SMISLU for ISLU, SMRISLU for RISLU, SMISLU2 for ISLU2, and SMIDCU for IDCU.

**Attribute: dchan**

**Fullname:** D-channel type

**Attribute Description** Valid values are PCDCUT for cut-through and PCDIRCON for directly connected. If PCDCUT on an RISLU, there must be at least one PIDB type (see the following attributes pidb0-pidb11) of PCRDUALPIDB and there may not be any PIDB types of PCDPIDB. PCDIRCON is the only valid D-channel type supported by ISLU(2) while PCDCUT is the only valid D-channel type for RISLU.

**Attribute: cdconfig**

**Fullname:** Common data pack (CD) configuration

**Attribute Description** Valid values are:

PCACTSTBY - - ISLU(2)/IDCU active/standby

PCLDSHRD - - ISLU(2) load shared

PCRACTSBY - - RISLU active/standby

PCROSPS - - RISLU active/standby, OSPS applications

PCSPROSPS - - RISLU active/standby, OSPS, facility sparing

If PCACTSTBY, there must be at least one PIDB type of PCDUAL PIDB in this tuple (no PCISLUPIDB's are allowed for PCACTSTBY cdconfig). If PCLDSHRD, there must be at least one

Copyright © 1999 Lucent Technologies 

PIDB type of PCISLUPIDB (for a B-channel). If PCRACTSBY, PCROSPS, or PCSPROSPS, the only valid PIDB type is PCRDUALPIDB.

| | port | dchan | cdconfig | PIDBtype |
|---|---|---|---|---|
| 1. | D channel | PCDIRCON | PCACTSBY | PCDPIDB |
| 2. | D channel | PCDIRCON | PCLDSHRD | PCDPIDB |
| 3. | D channel | PCDCUT | PCRACTSBY | PCRDUALPIDB |
| 4. | D channel | PCDCUT | PCROSPS | PCRDUALPIDB |
| 5. | D channel | PCDCUT | PCSPROSPS | PCRDUALPIDB |
| 8. | CS B channel | don't care | PCACTSTBY | PCDUALPIDB |
| 9. | CS B channel | don't care | PCLDSHRD | PCISLUPIDB |
| 10. | CS B channel | don't care | PCRACTSTBY | PCRDUALPIDB |
| 11. | CS B channel | don't care | PCROSPS | PCRDUALPIDB |
| 12. | CS B channel | don't care | PCSPROSPS | PCRDUALPIDB |
| 13. | PS B channel | PCDIRCON | PCACTSBY | PCDPIDB |
| 14. | PS B channel | PCDIRCON | PCLDSHRD | PCDPIDB |
| 15. | PS B channel | PCDCUT | PCRACTSBY | PCRDUALPIDB |
| 16. | PS B channel | PCDCUT | PCROSPS | PCRDUALPIDB |
| 17. | PS B channel | PCDCUT | PCSPROSPS | PCRDUALPIDB |
| 18. | CS Analog | don't care | PCACTSTBY | PCDUALPIDB |
| 19. | CS Analog | don't care | PCLDSHRD | PCISLUPIDB |
| 20. | CS Analog | PCDCUT | PCRACTSBY | PCRDUALPIDB |
| 21. | CS Analog | PCDCUT | PCROSPS | PCRDUALPIDB |
| 22. | CS Analog | PCDCUT | PCSPROSPS | PCRDUALPIDB |

CS = Circuit-switched
PS = Packet-switched

On an ISLU(2) with digital subscriber lines (DSLs), there must be at least one PCDUALPIDB or PCDPIDB to carry D-channels on a CD. To carry B-channels, there must be at least one PCDUALPIDB or PCISLUPIDB on a CD.

**Attribute: pidb[*]**

**Fullname:** PIDB

**Attribute Description** The 'x'th connection on the CD. For ISLU(2)/RISLU, connections zero through five are on board 1 and connections 6 through 11 are on board 1. This attribute is a structure of the following form:

name - - The circuit name of the PIDB in rlCKTDATA, and is of type DMCIRCUIT.

type - - The PIDB type of the PIDB, and is of type DMPIDBTYPE.

assoc_ckt - - The circuit to which the PIDB is attached, and is of type DMCIRCUIT.

assoc_dp - - The position on the packet switch interface unit (PSIU) shelf of a directly connected PIDB.

The following restrictions exist for the assignment of PIDBs and DPIDBs on IDCU:

pidb0 - always has a type of PCDUALPIDB and should always be equipped on the IDCU.

pidb1...pidb11 - may have a type of PCNULLPIDB or PCDUALPIDB as these pidb positions on the IDCU may not be equipped or may be connected to the TSIU on the SMP.

pidb12...pidb15 - may have any of the allowed types (PCNULLPIDB, PCDUALPIDB, or PDPIDB).

Copyright © 1999 Lucent Technologies 

pidb16...pidb22 - may have a type of PCNULLPIDB or PCDPIDB as they must either be unequipped or connect to the PSIU.

**Attribute: pidb[*].name**

**Fullname:** Circuit name

**Attribute Description** The circuit name of the PIDB. The PIDB must be represented in RLcktdata and vice versa. If the PIDB is not present in CKTDATA, then the name should be set to zero.

**Attribute: pidb[*].type**

**Fullname:** PIDB type

**Attribute Description** PIDB type from DMpidbtype.

PCDUALPIDB - - The PIDB is one of a pair of PIDBs running active/standby in the ISLU(2) or IDCU. PIDBs of type PCDUALPIDB must terminate at the time slot interchange unit (TSIU). A pair of dual PIDBs provides an active path and a standby path over a PIDB and its mate. This means that there must exist a PIDB of type PCDUALPIDB on the other service group with the same CD board and PIDB number as this PIDB. PIDBs of type PCDUALPIDB always have a 'mate' PIDB on the other service group. 'Mate' PIDBs that connect to the TSIU (such as PCDUALPIDB) must connect to the same TSIU DI at paired DI connections (0,1), (2,3), (4,5), (6,7), (8,9), (10,11), (12,13) or (14,15). The 'mate' PIDB from service group 0 must go to lower member of the pair; therefore, the mate PIDB from service group 1 must connect to the higher member of the pair. The 'pidb' attribute in RLcktdata for each PIDB of type PCDUALPIDB must reflect the correct DI connection for that PIDB. A PIDB of this type has an entry in RLpidb. One set of 32 PTSBs is allocated in dynamic data for the dual PIDB pair. This type is only valid on an ISLU(2) or IDCU.

PCISLUPIDB - The PIDB in the ISLU(2) provides a path to the TSIU. This PIDB is load-shared. This type is only valid on an ISLU(2). PIDBs of this type must terminate on a TSIU. Even though they are load-shared, PIDBs of type PCISLUPIDB always have a 'mate' PIDB on the other ISLU 'Mate' ISLU(2) PIDBs that connect to the TSIU (such as PCISLUPIDB) must connect to the same TSIU DI at paired DI connections (0,1), (2,3), (4,5), (6,7), (8,9), (10,11), (12,13) or (14,15). The 'mate' PIDB from ISLU(2) service group 0 must go to lower member of the pair; therefore, the mate PIDB from ISLU(2) service group 1 must connect to the higher member of the pair. The 'pidb' attribute in RLcktdata for each PIDB of type PCDUALPIDB must reflect the correct DI connection for that PIDB. A PIDB of this type has an entry in RLpidb. A PTSB is allocated in dynamic data for each of the 32 time slots on the PIDB. For each PCISLUPIDB, there must be a PCISLUPIDB with the same PIDB number on the other CD (that is, the PCISLUPIDBs must be equipped in pairs).

PCDPIDB - - The PIDB is one of a pair of PIDBs running active/standby in the ISLU(2) or IDCU. PIDBs of type PCDPIDB must terminate at the PSIU. A pair of directly connected PIDBs provides an active path and a standby path over a PIDB and its mate. This means that there must exist a PIDB of type PCDPIDB on the other service group with the same CD and PIDB number as this PIDB. One set of 32 PTSBs is allocated in dynamic data for the dual PIDB pair. PIDBs of type

**Copyright © 1999 Lucent Technologies** 

PCDPIDB on SG0, must have an entry in RLpsiupidb. PIDBs of this type on SG1, do not have a matching entry in RLpsiupidb. It is not allowed to connect any ISLU(2) PIDB of type PCDPIDB to a PSU shelf of circuit data type PCSHLFPSIU, with a cli of 0x3.

PCRDUALPIDB - - The PIDB is connected to a remote digital facility interface (DFI) using remote PIDB fan out, with active/standby CDs on the RISLU. One set of 32 PTSBs is allocated for the fan out pair. Only valid on RISLU.

***NOTE:*** If the PIDB is not present in CKTDATA, then the type feild should be set to PCNULLPIDB as a default value.

**Attribute: pidb[*].assoc**

**Fullname:** Associated circuit

**Attribute Description** The circuit the PIDB is associated with: If PIDB 'type' is PCDUALPIDB, populate 'assoc_ckt' with 0xffff. If PIDB 'type' is PCISLUPIDB, populate 'assoc_ckt' with 0xffff. If PIDB 'type' is PCDPIDB, populate 'assoc_ckt' with the side 0 PSIU shelf circuit name to which the PIDB is attached. If PIDB 'type' is PCRDUALPIDB populate 'assoc_ckt' with the name of DFI-H1 or DFI-H2 circuit that hosts the remote DFI to which the PIDB is connected.

***NOTE 1:*** If the PIDB is not present in CKTDATA, then the assoc_ckt field should be set to 0xffff as a default value.

***NOTE 2:*** Prior to PCR, the previous 0xffff had a NULL connotation. PCR defines NULL as 0x0000 and ERROR CKT as 0xffff. Hence, the values of 0xffff remain but the original NULL connotation was omitted.

**Attribute: pidb[*].assoc_dp**

**Fullname:** PSIU position of a directly connected PIDB

**Attribute Description** The position of the PIDB connection on the PSIU shelf for a directly connected PIDB. The PIDB in position XX should be the same as the PIDB named in the dpidbXX attribute in the RLpsiupidb relation. This attribute should be zero if the PIDB 'type' is not PCDPIDB.

**Defines:** "db/DMcircuit.h"

## 4. Population Rules for RLismpath

### Relation Description

Copyright © 1999 Lucent Technologies

Inter-sm Path.

This relation defines the inter-SM path for packet switching by defining the terminating ports of the ISM path. The DLT port (the key) in the home SM terminates across the inter-SM path on a DLT port in the mate SM.

**Attribute: dlt**

**Fullname:** Data Link Terminal port index.

**Attribute Description** (Key) ISM DLT port index. This port must be defined in the relation RLfc_porttyp with servclass PSPKT_ISM and lp_type PCISMPT. NOTE: The maximum number of DLT ports allowed on an SM is 160.

**Attribute: mate_sm**

**Fullname:** Mate sm.

**Attribute Description** The mate SM number (1-192) to which this DLT port is connected and which is served by the Inter-SM path. This SM number must be defined in RLmodatt with an equipment status of SMOPER. This SM number cannot match the 'home' SM number.

**Attribute: mate_dlt**

**Fullname:** Mate DLT.

**Attribute Description** the mate DLT 16-Bit Port Index which is served by the Inter-SM path must be define in RLfc_porttyp in the MATE SM with service class PSPKT_ISM and lp_type PCISMPT.

**Attribute: master**

**Fullname:** Master Inter-sm.

**Attribute Description** Populate with either of the following to indicate the controller of the Inter-SM path:
DBYES - controller of the path
DBNO - not controller of the path
One and only one DLT port may be the controller of the Inter-SM path. The corresponding Inter-SM entry in the relation RLismpath in the MATE SM must be checked to verify that the master attribute is populated with the opposite value. Assignment of the master of an ISM path is arbitrary; however, it is recommended that the designation of 'master' be balanced across all SMs as the 'master' performs more functions than the non-master.

## 4. Population Rules for RLismrsm

**Relation Description**
Integrated services module (ISM - now ISDN/IM) remote SMs.

This relation defines all the RSMs under a given host SM which have ISM nailups for packet switching. There will be 1 tuple in each HSM which has RSM with ISM nailups.
A maximum of 5 RSMs are allowed per HSM for SM.
A maximum of 30 RSMs are allowed per HSM-2000.

**Attribute: hostnum**

**Fullname:** Host SM number

**Attribute Description** The SM number of the Host SM which has RSMs which contain ISM nailups. When a RLtscount tuple is added and the RLmodatt.imtype of RLtscount.module is SM5RSM, then RLmodatt.hostnum is used as the key to this tuple. This tuple resides in the SM module number specified in HOSTNUM and valid values are 1-192.

**Attribute: rsm_cnt**

**Fullname:** RSM count

**Attribute Description** Index to the list of RSMNUM00-RSMNUM29 attributes indicating the position of the last valid entry. This number will always be 1 less than the number of RSMs with ISM nailups for the given HOSTNUM.
For an HSM, this number must be >= 0 and <= 4.
For an HSM-2000, this number must be >= 0 and <= 29.

**Attribute: rsmnum[*]**

**Fullname:** RSM number

**Attribute Description** Each of these 30 attributes can contain a unique RSM module number which has ISM nailups and whose host is this HOSTNUM. Valid assigned values are 1-192, corresponding to a valid RSM number which is the key of an RLtscount tuple. These attributes must be assigned values sequentially starting with RSMNUM00 but no two RSMNUMXX attributes can contain the same value, except the default value of 0. If an RSMNUMXX attribute has no value, its default is 0. This table cannot have any gaps. If an RSM number is deleted from this table, the last valid element in the table is inserted in place of the removed element and the rsm_cnt is decremented. In this way, gaps will never exist in this table.

## 4. Population Rules for RLisqu_cwl

**Relation Description**
ISDN calls waiting lamps parameter data.

RLisqu_cwl is used to store information about ISDN feature button multi-line hunt group (MLHG) call waiting lamps. ISDN feature button call waiting lamps are located on the lead member (member 1) of a MLHG. The lead member must therefore be an ISDN digital subscriber line. Up to 3 feature button call waiting lamps may be provided. The lamps turn on to indicate how long calls have been queued for the MLHG. At most one call waiting lamp can be on at a given time. RLisqu_cwl defines the number of call waiting lamps provided for a MLHG and the time thresholds for each lamp. RLqu_cwl provides equivalent information for non-ISDN distribution point call waiting lamps. The call waiting lamp feature button numbers are not defined in this relation. These can be determined as follows.

(1) Identify the MLHG lead member using RLgroup_port.
```
RLgroup_port.portgrp.grpnum is RLisqu_cwl.grpnum
RLgroup_port.portgrp.grptype is TM_LINE
RLgroup_port.member is 1.
```

(2) If member 1 is ISDN, identify the feature button configuration group for lead for member 1 using RLis_line.
```
RLis_line.ltm_idxi is RLgroup_port.ltm_idx.
RLis_line.lead_module is RLisqu_cwl.cwlmod.
```

(3) Predefined feature and actions identify the call waiting lamp feature buttons within the feature button configuration group. RLfeatbn.config is RLis_term.config.
```
RLfeatbn.fid is the queuing wild card feature.
RLfeatbn.action is ACN_QCW1L for call waiting lamp 1.
RLfeatbn.action is ACN_QCW2L for call waiting lamp 2.
RLfeatbn.action is ACN_QCW3L for call waiting lamp 3.
```

**Attribute: grpnum**

**Fullname:** hunt group number

**Attribute Description** This hunt group must be a key to RLrt_mhg, and the identified RLrt_mhg tuple must have qmodule = to the module that this isqu_cwl tuple is on and RLrt_mhg.qfid must be non-NULL. There must be a RLqu_cfdfl tuple keyed by RLrt_mhg.qfid. In that RLqu_cfdfl tuple RLqu_cfdfl.cwl must be DBYES and RLqu_cfdfl.lmptyp must be IS_FB (feature button) and RLqu_cfdfl.threstyp must be IS_T (time)

**Attribute: cwlmod**

**Fullname:** module of the lead member of the MLHG

**Attribute Description** For a RLis_line.ltm_idx that is:
```
a) primary, not shared-analog and has a configuration
   group assigned
```

Copyright © 1999 Lucent Technologies 

```
   OR
      b) secondary, not shared, with a configuration group
```

RLisqu_cwl.cwlmod is set to the module number where the lead member of this grpnum is located. To compute this, take grpnum together with member 1 as the key to RLgroup_port. For the chosen tuple, RLgroup_port port.module is referred to as the lead module or RLisqu_cwl.cwlmod. For all other cases, RLisqu_cwl.cwlmod is set to 0.

**Attribute: numcwl**

**Fullname:** number of calls waiting lamps allowed

**Attribute Description** Number of calls waiting lamps allowed.

**Attribute: cwth[*]**

**Fullname:** call waiting lamp threshold

**Attribute Description** The age of the oldest call in the MLHG queue determines which, if any, of the call waiting lamps is lit. At most 1 call waiting lamp is lit at any given time. The threshold times are given in terms of 6 second intervals. If 1 call waiting lamp is provided then when calls wait in the queue more than cwth1 6 second intervals then call waiting lamp1 is lit. If 2 or more call waiting lamps are provided then when calls wait in the queue more than cwth2 6 second intervals then call waiting lamp1 is turned off and call waiting lamp2 is lit. If 3 call waiting lamps are provided then when calls wait in the queue more than cwth3 6 second intervals then call waiting lamp2 is turned off and call waiting lamp3 is lit.

## 4. Population Rules for RLisrmblst

**Relation Description**
Multi-line hunt group random make busy list for ISDN voice groups.

This relation only applies to MLHG's that contain (non-ISAT) ISDN terminals. It is used to specify the MLHG members that is to be associated with a subgrp number for purposes of actions taken when a member make busy button is depressed. RLbikypm provides the mapping from grpnum, member to subgrp number. This concept of subgrp, similar to the analog definition of subgrp used in RLrmblst, is different from the concept of subgrp used for ISAT multi-line hunt groups. Analog subgrps are implicitly defined by using the same scan pt definition for several analog multi-line hunt groups members. For ISDN Multiline hunt group members, a different approach to subgrp definitions is used. ISDN Multiline hunt group members don't have scan points. When a RMB button is depressed then all members assigned to the scan point take this action. A particular tuple must be replicated to the Hunting SM of the group found by using RLhuntkeys.portgrp.grpnum to read RLrt_mhg where RLrt_mhg.module is the module designated as HUNTING MODULE, and as many SM's as contain 1 or more subgrp members. The RMB members are shown in the bitmap representation in this relation. All member numbers in this subgrp must be (non-ISAT) ISDN terminals even though the subgrp may be a part of a larger multi-line hunt group that contains analog members. The distribution type for this relation is GRP_PART. Processors where tuples should be located are listed in attributes RLisrmblst.modmap1 through RLisrmblst. modmap5 in addition to the Hunting SM of the group.

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description** Group number of the multi-line hunt group that this random make busy list is associated with.

Copyright © 1999 Lucent Technologies 

**Attribute: subgrp**

**Fullname:** Sub Group

**Attribute Description** The subgroup number of the random make busy list. The members in this group are a subset of a multi line hunt group.

**Attribute: bsytrt**

**Fullname:** Busy Treatment

**Attribute Description** Specifies what type of busy feature treatment applies to this set of members.

**Attribute: length**

**Fullname:** Length (size of subgroup)

**Attribute Description** Number of members under control of the Random Make Busy Key. (Number of members in the subgroup.)

**Attribute: fbown**

**Fullname:** Feature Button Owner

**Attribute Description** This is the number of the member who owns the feature button that controls the Random Make Busy Group. (Specifys the member whose feature button will be lit as a result of feature activation.)

**Attribute: mbr1**

**Fullname:** A 32 bit field of members

**Attribute Description** Used as a bit map of 32 members. Each 32 bit field represents 32 multi-line hunt group members. (A bit map of 2016 -- mbr 0 thru 2015) If the member is a part of the RMB group then the bit is ON ( 1 -- DBYES) else the bit is 0. bit 0 of mbr1 is unused. MLHG members are assigned in ascending order going from the least significant bit to the most signification bit.

```
examples:
mbr1 --> 31 - 0
mbr2 --> 63 - 32
mbr3 --> 95 - 64
mbr4 --> 127 - 96  (that is, mbr(1:63)).
```

**Attribute: mbr[*]**

**Fullname:** A 32 bit field of members

**Attribute Description** Used as a bit map of 32 members. Each 32 bit field represents 32 multi-line hunt group members. (A bit map of 2016 -- mbr 0 thru 2015) If the member is a part of the RMB group then the bit is ON ( 1 -- DBYES) else the bit is 0.

**Attribute: modmap0**

**Fullname:** Module Bit Map

Copyright © 1999 Lucent Technologies 

**Attribute Description** Bitmap of 32 SMs. Determines which SMs the members of the Random Make Busy Group are on.

```
modmap0 =  sm's 1 thru 32     --> (least significant bit = sm1)
modmap1 =  sm's 33 thru 64
modmap2 =  sm's 65 thru 96
modmap3 =  sm's 97 thru 128
modmap4 =  sm's 129 thru 160
modmap5 =  sm's 161 thru 192  --> (most significant bit = sm192)
```

**Attribute: modmap[*]**

**Fullname:** Module Bit Map

**Attribute Description** Bitmap of 32 SMs. Determines which SMs the members of the Random Make Busy Group are on.

```
modmap0 =  sm's 1 thru 32
modmap1 =  sm's 33 thru 64
modmap2 =  sm's 65 thru 96
modmap3 =  sm's 97 thru 128
modmap4 =  sm's 129 thru 160
modmap5 =  sm's 161 thru 192
```

# ISSATND

## 1. Description

Defines certain attributes of attendant configuration groups.

Maximum number of tuples derived as follows:

```
 63   Maximum number of ISAT groups
 x4   configurations allowed per ISAT (enforced by RLisatgrp).
 --
252
```

The expected tuple data was extracted from a study of field equipment.

(AVISATGRPS * 4) > 252)
syntax - The number of ISSATND needed has exceeded the maximum engineered

## 4. Population Rules for RLissatnd

**Relation Description**
ISDN attendant.

Defines certain attributes of attendant configuration groups. Information concerning this section is not available at this time.

**Attribute: config**

Copyright © 1999 Lucent Technologies

**Fullname:** configuration group

**Attribute Description** This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: fid**

**Fullname:** multiway feature ID stored under START button

**Attribute Description** This feature ID must be the same as that stored in RLbnfeat.fid with the same config as this relation and the RLbnfeat.action = ACN_ISTART.

**Attribute: cpe_pa**

**Fullname:** CPE component for ISDN attendant position available

**Attribute Description** Presently not used.

**Attribute: bn_pa**

**Fullname:** Button number for ISDN attendant position available

**Attribute Description** Presently not used.

**Attribute: cpe_er**

**Fullname:** CPE component of the ISDN attendant error indicator

**Attribute Description** Information concerning this section is not available at this time.

**Attribute: bn_er**

**Fullname:** Button number of the ISDN attendant error indicator

**Attribute Description** Information concerning this section is not available at this time.

## 4. Population Rules for RLissccof

**Relation Description**
Selective Customer Control Of Facilities Status.

Indicates SCCOF status on private facilities controlled by ISDN attendant consoles.

**Attribute: pftype**

Copyright © 1999 Lucent Technologies

**Fullname:** Private Facility type

**Attribute Description** Indicates if this facility is a simulated facility group (PFSFG) or a physical trunk group (PFPHYS).

**Attribute: grpnum**

**Fullname:** Facility group number

**Attribute Description** Indicates group number of the sfg or physical trunk group capable of having SCCOF invoked.

```
Dependencies:
If pftype = PFSFG
Verify existence of tuple in RLrt_sfg such that key
rlRT_SFG.grpnum = rlISSCCOF.grpnum
rlRT_SFG.sfgmkby = DBYES
If pftype = PFPHYS
Verify existence of type in RLrt_trkg such that key
rlRT_TRKG.grpnum = rlISSCCOF.grpnum
rlRT_TRKG.tkgpmkby = DBYES
```

**Attribute: sccof**

**Fullname:** Selective Customer Control Of Facilities

**Attribute Description** Indicates whether selective customer control of facilities (SCCOF) is active (DBYES) or not active (DBNO) for this group. This indicator (SCCOF) is CORC-able by the ISDN attendant

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RList_parm

### Relation Description

Interflow serving team parameters

Interflow serving team information for OSPS. This relation will be used to define an interflow serving team, identify the destination OSPS id and the unique trunk group numbers assigned for B and D EDSL channels. A trigger function ACtiservtm will be called for insert, update or delete of tuples in RList_parm. The dynamic relation RLhcservtm is modified accordingly.

**Attribute: iserv_tm**

**Fullname:** Interflow serving team number

**Attribute Description** Indicates the OSPS interflow serving team number.

**Attribute: osps_id**

**Fullname:** OSPS id number

**Attribute Description** Indicates the unique id of the destination OSPS switch.

**Attribute: dest_name**

**Fullname:** destination name OSPS

**Attribute Description** Indicates the unique name of the destination OSPS.

**Attribute: tgn_b**

**Fullname:** Trunk group number for B channels.

**Attribute Description** Indicates the trunk group number to a destination OSPS with class of service = OA_IFOPER and trunk direction = RTOUTGO.

**Attribute: tgn_d**

**Fullname:** Trunk group number for D channels.

**Attribute Description** Indicates the trunk group number to a destination OSPS with class of service = OA_IFOPER and trunk direction = RTISDNLK.

**Attribute: ldm_used**

**Fullname:** Last D-channel member used.

**Attribute Description** Last D-Channel trunk group member used to find a SM that the D-Channel trunk group resides on. Used by auto-reconfiguration in sending MGOAPDATA act/deac message to destination OSPS. ODA should set this attribute to zero (default). RC will populate this internally in the auto-reconfiguration mapping code. This attribute is populated only by auto-reconfiguration.

**Attribute: num_on**

**Fullname:** Number on.

**Attribute Description** Indicates the number of serving teams currently interflowed to the destination OSPS.

**Attribute: sctmsk1**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Supporting call type to serving team mask, part 1

**Attribute Description** Mask for supporting call types 1-32. Low order bit represents call type 1. Attributes sctmsk1 thru sctmsk4 is used by Intraflow. It indicates supporting call types for this serving team. A supporting call type is a call type that is handled by a supporting serving team. This bit field is used to indicate the supporting call queues this supporting serving team handles. For example, assume a tuple in RList_parm has an iserv_tm value of 129. If a tuple keyed by call type 1 in RLctinfo has supporting team 1 equal to 129 (sup_tm1=129 in RLctinfo) and a tuple keyed by call type 5 in RLctinfo has supporting team 1 equal to 129 (sup_tm1=129 in RLctinfo) bits 1 and 5 would be set in sctmsk1 indicating the secondary call types served by this supporting serving team.

```
(binary)sctmsk1=00000000000000000000000000010001
(hex)    sctmsk1=0x00000011
```

This bit field is maintained and updated internally and does not appear on any RC/ODA form.

**Attribute: sctmsk2**

**Fullname:** Supporting call type to serving team mask, part 2

**Attribute Description** Mask for supporting call types 33-64. Low order bit represents supporting call type 33.

**Attribute: sctmsk3**

**Fullname:** Supporting call type to serving team mask, part 3

**Attribute Description** Mask for supporting call types 65-96. Low order bit represents supporting call type 65.

**Attribute: sctmsk4**

**Fullname:** Supporting call type to serving team mask, part 4

**Attribute Description** Mask for supporting call types 97-128. Low order bit represents supporting call type 97.

**Attribute: sct_count**

**Fullname:** Supporting Call Type mask bit count

**Attribute Description** This is a count of how many bits are set to 1 in sctmsk1 through sctmsk4. Essentially this is the count of secondary call types. This is an internally maintained count of bits set and does not appear in any ODA forms.

**Attribute: intra_alwd**

**Fullname:** Intraflowed calls allowed

**Attribute Description** This attribute indicates whether the serving team is allowed to receive intraflowed calls. An ODA warning message should be displayed if the intra_alwd attribute is DBYES and the global parameter Glac_intra is set to DBNO.

**Attribute: mxpcntsup**

**Fullname:** Maximum Percent of serving team available for support call types

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Max % [0-100] of the serving team that is allowed to handle calls from supporting call queues Example: (assume no delay outflow threshold)

(1) team 3's team threshold is 50% (mxpcntsup=50), it has 4 agents(operators) logged in, 2 are busy with calls from supporting queues (2/4= 50% at the threshold),

(2) team 4's team threshold is 75% (mxpcntsup=75%), it has 10 agents(operators) logged in, 1 is busy with a call from a supporting queue (1/10= 10% under the threshold),

When a call arrives it's principal team has calls queued, it tries to go to team 3 but it would go over the 50 % threshold, so it tries team 4 and finds it can be intraflowed to this team and remain under the threshold of 75 % :

If mxpcntsup = 0 then RList_parm.intra_alwd must be DBNO. For a mxpcntsup > 0, RList_parm.intra_alwd could be DBNO or DBYES.

**Attribute: ctname**

**Fullname:** The name of the call type.

**Attribute Description** The alphanumeric characters ([0-9],[A-Z],[a-z]) and blanks are used. The character string in ctname should be left justified.

**Attribute: max_calls**

**Fullname:** Maximum number of calls allowed to queue on a call type queue

**Attribute Description** The max_calls field may range from 0 to the number of tuples allowed in RLcqdb.

**Attribute: del1_thresh**

**Fullname:** Spare - unused

**Attribute Description** Spare data for fast features

**Attribute: del2_thresh**

**Fullname:** Spare - unused

**Attribute Description** Spare data for fast features

**Attribute: del3_thresh**

**Fullname:** Spare - unused

**Attribute Description** Spare data for fast features

**Attribute: annc_on_lvl1**

**Fullname:** Announcement on level 1

**Attribute Description** Specifies whether an announcement on level 1 should be given when the caller is placed in the call queue. This announcement is used for initial operator requests, or on transfer to a serving team.

**Copyright © 1999 Lucent Technologies** 

**Attribute: ann1_routex**

**Fullname:** Route index for first delay announcement

**Attribute Description** Non-zero value must appear in RLrt_routing and must point to an announcement.

**Attribute: ann2_routex**

**Fullname:** Route index for second delay announcement

**Attribute Description** Non-zero value must appear in RLrt_routing and must point to an announcement.

**Attribute: ann3_routex**

**Fullname:** Route index for third delay announcement

**Attribute Description** Non-zero value must appear in RLrt_routing and must point to an announcement.

**Attribute: serv_obj**

**Fullname:** Spare - unused

**Attribute Description** Spare data for fast features.

**Attribute: oaff1**

**Fullname:** Oaff 1

**Attribute Description** Spare data for fast features.

**Attribute: oaff2**

**Fullname:** Oaff 2

**Attribute Description** Spare data for fast features.

**Attribute: oaff3**

**Fullname:** Oaff 3

**Attribute Description** Spare data for fast features.

# ISTERM_R

## 1. Description

Digital Subscriber Line Terminal Feature Data. This is a root storage relation.

QUANTITY OF TUPLES:
One tuple for each digital subscriber line (RLfc_porttyp.servclass = FC_ISDN or FC_ISATND) that has flexible call offering (MCA).

The maximum tuples is the maximum number of digital subscriber lines. The expected tuple and density data was extracted from a study of field equipment.

(PSM) && AVSMDLINES > 8191)
syntax - The number of ISTERM needed has exceeded the maximum engineered

## 4. Population Rules for RListf

**Relation Description**
Integration service test function

Application associated with each integrated services test function unit. This relation specifies the application data for the integrated Services test Function (ISTF) unit. The ISTF is an Application of the Digital Service Circuit (DSC) on the TN833 circuit pack. The unit itself is a pumped 'smart' peripheral which performs digital tests on the data transferred by the peripheral interface data bus (PIDB) connected to it. The PIDB has 32 channels which can be tested. Currently the ISTF is providing two types of services, loopback and transmission test. It can perform 31 simultaneous loopback services, three simultaneous transmission test services, or any combination which does not exceed one test per channel. The one exception is that the ISTF board requires that each digital signal processor (DSP) on the ISTF must be guaranteed to have an unassigned channel for the internal routine exercise (ERREX) to use. Since the loopback DSP can test the maximum number of channels, the maximum had to be reduced to 31 (this guarantees at least one unassigned channel). Because there are more services than channels, Logical Test Ports (LTPs) which represent the services are used to connect to the actual channel RLCKTDATA tuples. Each service type has an LTP type and a trunk group associated with it. Since there are two LTP types

Copyright © 1999 Lucent Technologies 

(servclass=TM_ISTFLB, servclass=TM_ISTFXMIT), 2 trunk groups can handle all the ISTF LTPs in the office. The routing for these trunks groups is different however. The loopback test is actually a near end loopback being provided by the ISTF. The digital circuit (usually a digital trunk) requiring the loopback makes its requests via dialed digits. The digits are used to get a route index and test code through the RLRTDN_TRAN and RLRT_SPECRI relations. The tstcode attribute will identify the type of loopback needed (inverted or non-inverted). The transmission test is requested either via a user command (Master Control Center [MCC] or trunk and Line Work Station [TLWS]) or via Automatic Progression Tests (APTs). Both these requests use fixed routing via the ritype TMXMITRIISTF in the relation RLRT_FIXEDRI. After retrieving the route index, all the ISTF services use the same mechanism for routing. Since each trunk group has its own Route Index (RI) and there are only two ISTF trunk groups containing all the members, the members are assigned by hunting First In/First Out (FIFO) as indicated in RLRT_TRKG. While both services are not required at the same time, at least one should be defined for the ISTF to be used.

QUANTITY OF TUPLES:
One tuple per ISTF common board

DEPENDENCIES:

```
RLcktdata     - One tuple defining the common control for the ISTF.
RLcktdata     - 31 tuples defining the channels for the ISTF.
RLpicb        - One tuple whose key is Peripheral Interface
                Control Bus (PICB) attribute-1.
RLpidb        - One tuple whose key is PIDB (can be found in RLpicb).
RLrc_loceq    - One tuple keyed by Switching Module (SM) number and
                PICB (+1).
RLrc_eqloc    - One tuple whose keys are SM number, unit number,
                service group number, and unit type.
                number, Service Group number, and Unit type.
                RLunit_ckt - 1 tuple for each circuit ISTF unit.
```

**Attribute: sm**

**Fullname:** Switching module identifier

**Attribute Description** SM number which ISTF is located on (1-192).

**Attribute: unit_no**

**Fullname:** Application number

**Attribute Description** Number used by MCC to distinguish one ISTF unit from another within the same SM.

**Attribute: picb**

**Fullname:** Peripheral interface control bus

**Attribute Description** PICB of ISTF (+1).

**Attribute: lb_cnt**

**Fullname:** Number of loopback services

**Attribute Description** Number of loopback services allowed (0-31).

**Attribute: xmit_cnt**

Copyright © 1999 Lucent Technologies 

**Fullname:** Number of transmission services

**Attribute Description** Number of transmission test services (0-3).

## 4. Population Rules for RListgidx

**Relation Description**
Direct Trunk Group Selection index.

Gives information associated with a direct trunk group selection (DTGS) button for a particular attendant configuration group.

**Attribute: config**

**Fullname:** ISDN configuration group

Copyright © 1999 Lucent Technologies

**Attribute Description** This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: tgidx**

**Fullname:** Direct trunk group selection (DTGS) button index

**Attribute Description** This index is assigned in RLisatlmt in attribute tgbitmap. See RLisatlmt.P (.p) for information on how the index is generated. Dependencies: The bit which corresponds to this index number in the tgbitmap field in RLisatlmt must be set to '1'.

**Attribute: mod**

**Fullname:** Module that owns this group

**Attribute Description** Not applicable

**Attribute: pftype**

**Fullname:** Facility type

**Attribute Description** Indicates if this facility is a simulated facility group (PFSFG) or a physical trunk group (PFPHYS).
Dependencies: This pftype is the same as in RLdtgstran.pftype with this config RLdtgstran.config = RListgidx.config

**Attribute: grpnum**

**Fullname:** Group number of the sfg or physical trunk

**Attribute Description** If pftype = PFSFG, verify existence of tuple in RLrt_sfg such that key rlRT_SFG.grpnum = rlISTGIDX.grpnum If pftype = PFPHYS, verify existence of tuple in RLrt_trkg such that key rlRT_TRKG.grpnum = rlISTGIDX.grpnum This grpnum is the same as in RLdtgstran.grpnum with this config
RLdtgstran.config = RListgidx.config

## 4. Population Rules for RListmblst

**Relation Description**
Multiline hunt group terminal make busy list for integrated services digital network (ISDN) voice groups.

The distribution type for this relation is GRP_PART. Processors where tuples should be located are listed in attributes RListmblst.modmap1 through RListmblst.modmap5 in addition to the Hunting SM of the group. This relation only applies to MLHG's that contain (non-ISAT) ISDN terminals. It is used to specify the MLHG members that are to be associated with a subgrp number for purposes of actions taken when a member make busy key is depressed. RLbikypm provides the mapping from grpnum, member to subgrp number. This concept of subgrp, similar to the analog definition of subgrp used in RLtmblst, is different from the concept of subgrp used for ISAT multi-line hunt groups. Analog subgrps were implicitly defined by using the same scan pt definition for several analog multi-line hunt group members. For ISDN Multiline hunt group members, a different approach to subgrp definitions is used. ISDN Multiline hunt group members don't have scan points. When a member make busy hunt key is depressed on an ISDN terminal, then all members of the subgrp will be busied out. Any of the members of the subgrp that have member make busy hunt keys can take this action. A particular tuple must be replicated to the Hunting SM of the group found by using RLhuntkeys.portgrp.grpnum to read RLrt_mhg where RLrt_mhg.module is the module designated as HUNTING MODULE, and as many SM's as contain 1 or more subgrp members. The members numbers, along with their SM representations, are shown in the attributes of this relation. All member numbers in this subgrp must be (non-ISAT) ISDN terminals even though the subgrp may be a part of a larger multi-line hunt group that contains analog members.

**Attribute: grpnum**

**Fullname:** Hunt Group Number

**Attribute Description** Dependencies: must exist as a key to rt_mhg

**Attribute: subgrp**

**Fullname:** Member make busy subgroup number

**Attribute Description** This relation only applies to ISDN (nonISAT) hunt groups
RLrt_mhg.isat_idx = 0

Copyright © 1999 Lucent Technologies 

and at least one member of the MLHG has a tuple in RLis_line. It should not be populated for groups where RLrt_mhg.isat_idx != 0
Dependencies: This subgrp must be nonzero in RLbikypm.

**Attribute: length**

**Fullname:** Number of nonzero entries in 'mbr_list'

**Attribute Description** Dependencies: Must agree with mbr1-32 field

**Attribute: bsytrt**

**Fullname:** Busy Treatment

**Attribute Description** Indicateds the type of busy treatment associated with this set of members.

**Attribute: mbr[*]**

**Fullname:** Multiline hunt group member number

**Attribute Description** This is one of up to 32 multi-line hunt group member numbers that should be made busy when a particular member make-busy key is depressed. A value of 0 means that the array element does not contain a member number. Thus, there can be no holes--every array element after the first zero array element must also be 0.

```
Each member shown must be an ISDN terminal. To check this,
read:  RLgroup_port.portgrp = RListmblist.grpnum
       RLgroup_port.member = mbr[i]
       RLgroup_port.type = TM_LINE
       RLgroup_port.lpt_type = LPT_ISDN
```

There must be a nonzero value for RLgroup_port.lport and the lport must correspond to a tuple in RLis_line keyed by RLgroup_port.ltm_idx. Dependencies: See dependency for subgrp.

**Attribute: modmap[*]**

**Fullname:** Bit maps of processors on which the listed members reside.

**Attribute Description** This is one of 6 attributes, which each contains 32 bits, for a total of 192 bits (1 bit for each SM). A 1 bit means that at least 1 hunt group member, which pertains to this member make-busy key, resides on that SM and the software must send a message to that SM when certain events occur.

```
modmap0 SM1   - SM32
modmap1 SM33  - SM64
modmap2 SM65  - SM96
modmap3 SM97  - SM128
modmap4 SM129 - SM160
modmap5 SM161 - SM192
```

## 4. Population Rules for RLitnalnex

**Relation Description**
Improved third number acceptance (ITNA) exception table relation for a single line number.

This relation is used by improved third number acceptance (ITNA) OSPS call processing code to determine if a single line number exists in the table with a corresponding time set ID. The keys to the relation are lnoc and lineno. The lnoc (large normalized office code) is a compressed version of the NPA-NXX. The lineno key consists of the line number of the calling party. Thus, the lnoc and lineno keys represent the NPA-NXX-XXXX of the calling party. The non-key attribute to this relation is the set_id. The set_id corresponds to an enumeration with values of OA_ALWAYS or OA_TS_1 through OA_TS_8. If the value is OA_ALWAYS, then call processing is required to automatically outpulse to the third party for verbal bill acceptance verification. If the set_id value is of the normal type (OA_TS_1 through OA_TS_8), then the call processing code will perform a database read of the RLtime_set relation to determine the begin and end times associated with the time set ID. The begin and end times correspond to a time of day range when it is acceptable to perform automatic outpulsing to the third party for verbal bill acceptance verification. This relation is read by the ITNA call processing only when the time set ID found in RLitnatgn (relation for single trunk group numbers) or RLitnatrng (relation for ranges of trunk group numbers) is OA_NEVER or when the time of day associated with a time set ID does not fall within the bounds of the time range. The RLitnalnex relation is used as an exception to the information populated in the RLitnatgn and RLitnatrng relation to isolate special cases for individual line numbers.

Copyright © 1999 Lucent Technologies 

**Attribute: lnoc**

**Fullname:** Improved 3rd Number Acceptance large normalized office code

**Attribute Description** Used as a key for determining if a time set ID (set_id) exists for the calling parties line number. The lnoc is a compressed version of the NPA-NXX and is obtained from the FCNPAMAP relation.

**Attribute: lineno**

**Fullname:** Improved 3rd Number Acceptance line number of the back party from 0000-9999.

**Attribute Description** Used as a key along with lnoc to determine the ITNA time set ID from the Exception Table.

**Attribute: intl**

**Fullname:** Improved 3rd Number Acceptance International destination indicator

**Attribute Description** Used as a key along with lnoc and lineno to determine the ITNA time set ID from the Exception Table for calls terminating to international destinations. This key is always DBNO at this time.

**Attribute: set_id**

**Fullname:** Improved 3rd Number Acceptance time set ID number

**Attribute Description** The set_id non-key attribute is used to provide information as to when third number verbal billing acceptance verification is required. If the value of set_id is OA_ALWAYS, then third number acceptance verification must always be performed. If the set_id is a normal time set ID (OA_TS_1 through OA_TS_8), then call processing must perform a database read of the RLtime_set relation to determine the time of day range when automatic outpulsing to the third party is acceptable.

## 4. Population Rules for RLitnalrng

**Relation Description**
Improved third number acceptance (ITNA) exception table relation for a range of line numbers.

This relation is used by OSPS call processing code to determine if a range of line numbers exist in the table with corresponding time set id. The keys to the relation are lnoc and tupnum. The lnoc (large normalized office code) is a compressed version of the NPA-NXX. The tupnum key consists of the tuple number for a line range. For each lnoc, a maximum of 9 tuples can be populated. Each tuple can have a maximum of 15 line ranges with an associated set_id populated. The non-key attributes to this relation are entries and range00 thru range 14. Entries contains a count of the number of line ranges that are currently populated for a given tuple. rangexx (where xx is 00 - 14) is a structure containing a begline and endline number with an associated time set ID (set_id). The set_id corresponds to an enumeration with values of OA_ALWAYS or OA_TS_1 thru OA_TS_8. If the value is OA_ALWAYS, then call processing is required to automatically outpulse to the third party for verbal bill acceptance verification. If the set_id value is of the normal type (OA_TS_1 through OA_TS_8), then the call processing code will perform a database read of the RLtime_set relation to determine the begin and end times associated with a time set id. The begin and end times correspond to a time of day range when it is acceptable to perform automatic outpulsing to the third party for verbal bill acceptance verification.

**Attribute: lnoc**

**Fullname:** Improved 3rd Number Acceptance large normalized office code (NPA-NXX) translation

**Attribute Description** Used as a key to determine the time set ID number for a range of back line numbers from Exception Table.

**Attribute: intl**

**Fullname:** Improved 3rd Number Acceptance International termination indicator

**Attribute Description** Used as a key to determine the time set ID number for a range of back line numbers from Exception Table terminating to international destinations. This key is always DBNO at this time.

Copyright © 1999 Lucent Technologies 

**Attribute: tupnum**

**Fullname:** Improved Third Number Acceptance tuple number for Exception Table

**Attribute Description** Used as a key containing the tuple number for a particular lnoc. Each lnoc can have a maximum of 9 tuples (0-8).

**Attribute: entries**

**Fullname:** Number of entries for a range array

**Attribute Description** Number of valid ranges for a tuple.

**Attribute: range00**

**Fullname:** Line number range00

**Attribute Description** Line number range00 and associated set_id

**Attribute: range00.begline**

**Fullname:** First line number in range00

**Attribute Description** first line number that start the range00

**Attribute: range00.endline**

**Fullname:** Last line number of range00

**Attribute Description** Marks the end of range00

**Attribute: range00.set_id**

**Fullname:** Improved Third Number Acceptance Time Set ID

**Attribute Description** Time set ID associated with a range of line numbers. The value of OA_NOTS is only used by ODA for initialization purposes

**Attribute: range01**

**Fullname:** Line number range01

**Attribute Description** Line number range01 and associated set_id

**Attribute: range01.begline**

**Fullname:** First line number in range01

**Attribute Description** first line number that start the range01

**Attribute: range01.endline**

**Fullname:** Last line number of range01

**Attribute Description** Marks the end of range01

**Attribute: range01.set_id**

Copyright © 1999 Lucent Technologies 

**Fullname:** Improved Third Number Acceptance Time Set ID

**Attribute Description** Time set ID associated with a range of line numbers. The value of OA_NOTS is only used by ODA for initialization purposes

**Attribute: range02**

**Fullname:** Line number range02

**Attribute Description** Line number range02 and associated set_id

**Attribute: range02.begline**

**Fullname:** First line number in range02

**Attribute Description** first line number that start the range02

**Attribute: range02.endline**

**Fullname:** Last line number of range02

**Attribute Description** Marks the end of range02

## 4. Population Rules for RLitnaols

**Relation Description**
Improved third number acceptance (ITNA) originating line screening (OLS) relation

This relation consists of originating station type (key), carrier (key), ols (key), intl (key), and set_id (non-key) attributes. It is used to determine a time set ID based on originating station type, carrier and OLS code. The time set id attribute consists of a value used to perform a database read of the RLtime_set relation to determine a

Copyright © 1999 Lucent Technologies 

begin and end time of day when automatic outpulsing to a third party number is acceptable for billing verification.

**Attribute: orig_stat**

**Fullname:** Improved third number acceptance (ITNA) originating station type

**Attribute Description** Used as a key for determining if a time set ID is available for a call using the originating station type.

**Attribute: carrier**

**Fullname:** Improved Third Number Acceptance carrier

**Attribute Description** Used as a key combined with originating station type and ols code for determining if a time set ID is available for a call. The value of #LECBCARID is assigned if the carrier is not an IC. It is mapped to the three letters 'LEC' on the RC/ODA view. The value of #NULL_BCARID is used to indicate a NULL carrier ID and provides a don't care condition for the carrier id. This value is not displayed on the RC/ODA view. It is mapped to unknown.

**Attribute: ols**

**Fullname:** Improved third number acceptance (ITNA) originating line screening code

**Attribute Description** Used as a key for determining if a time set ID is available for a call originating on a set of incoming trunk groups grouped by ols code. The ols attribute can have values ranging from (1 - 2000) for valid ols codes or 0 for a don't care value.

**Attribute: intl**

**Fullname:** Improved third number acceptance (ITNA) international call indicator

**Attribute Description** Used as a key for determining if a time set ID is available for a call originating on a set of incoming trunk groups grouped by ols code to an international destination.

**Attribute: set_id**

**Fullname:** Improved Third Number Acceptance time set ID number

**Attribute Description** Used as an index to RLtime_set to determine what time range should be applied for ITNA checks.

**Defines:**"db/DMcarr_val.h"

## 4. Population Rules for RLitnasac

**Relation Description**
Improved Third Number Acceptance (ITNA) Special Area Code Table Relation

The Special Area Table relation is used to store NPAs for areas that do not have third party numbers in the Billing Validation Application (BVA). A typical example of this is for TCAs that handle traffic for locations near the Canadian border and use the BVA for Billed Number Screening (BNS). Under these conditions, the BNS query returns an indeterminate reply because the Canadian third numbers are not in the BVA. To gain the benefits of ITNA automation, the special area table has been provided to store NPAs for these special areas. If the NPA for a special area is present in the special area table, then ITNA checks will be performed.

**Attribute: npa**

**Fullname:** Number Planned Area (NPA) for special area third party number.

**Attribute Description** Used as a key to determine whether or not the third party's number is designated as being is in a Special Area. The values of 100 through 999 are used.

## 4. Population Rules for RLitnastat

**Relation Description**
Improved third number acceptance (ITNA) relation used to determine carrier, tgn and set_id values based on originated station type.

This relation is used by the OSPS ITNA feature. It contains the following attributes:
orig_stat

Copyright © 1999 Lucent Technologies

```
---------
Originating  station type
intl
---------
international  termination indicator
carrier
-------
A boolean flag to determine  if the actual carrier ID
handling the call is to be used or a don't care value for carrier.
This information is used by both RC/V and  call processing code.
tgn
---
A boolean flag to determine if the actual trunk group
number on which the call originated is to be used
or a don't care value for TGN. This information is used
by both RC/V and call processing code.
ols
----
unused at this time
set_id
------
The set ID attribute will contain the actual time set id used by
ITNA treatment only if the carrier and tgn flags are both set to DBNO,
otherwise it will be set to OA_NOTS
meaning no time set ID can be determined by this relation,
other ITNA relations will have to be read to determine the
actual set ID to be used for ITNA treatment.
The general purpose of this relation from a call processing perspective:
------------------------------------------------------------------------
Based on originating station type, determine what values to use for
carrier and tgn.
```

If carrier flag is DBYES, then use the carrier ID identified by call processing for performing ITNA checks. If carrier flag is DBNO, then use the value of #NULL_BCARID for ITNA checks.

If tgn flag is DBYES, then use the trunk group number on which the call originated for performing ITNA checks. If tgn flag is DBNO, then use the value of 0 (NULL TGN) for ITNA checks.

When both the carrier and tgn flags are DBNO, then there is no need to look at additional ITNA relations to determine the time set id, therefore, the set ID in this relation must contain a time set ID other than OA_NOTS.

```
The general purpose of this relation from a RC/V perspective:
-------------------------------------------------------------
RC/V uses the information in this relation to determine
what ITNA relations need to be populated and what values
to use for population based on the carrier and tgn flags.
```

For example:

If the RC/V user enters a carriage return or a (') for the carrier field, then RC can assume the user does not care to treat specific carrier ids in a special manner. Therefore, all carrier ids will receive the same treatment and the carrier flag will be set to DBNO meaning don't care. The carrier ID in this case will be set to a value of #NULL_BCARID.

If the RC/V user enters a valid carrier ID (0 - 999 or LEC), then RC can assume the user would like to treat carrier

**Copyright © 1999 Lucent Technologies** 

ids in a specific manner. The carrier flag will then be set to DBYES and the carrier ID entered on the view will be used to populate additional ITNA relations.

If the RC/V user enters a carriage return or a (') for the trunk group number field, then

RC can assume the user does not care to treat specific trunk groups in a special manner. Therefore, all trunk groups will receive the same treatment and the tgn flag will be set to DBNO meaning don't care. The trunk group number in this case will be set to a value of 0 (NULL trunk group number).

If the RC/V user enters a valid trunk group number (1 - AVTRKGRPS()), then RC can assume the user would like to treat trunk groups in a specific manner. The tgn flag will then be set to DBYES and the trunk group number entered on the view will be used to populate additional ITNA relations.

**Attribute: orig_stat**

**Fullname:** Originating Station Type

**Attribute Description** The orig_stat is the key to this relation. This will determine, for a given originating station type whether the tgn and carrier values are populated in the RLitnatgn or RLitnatrng or if they are a don't care conditions. Originating station type can also be considered a don't care conditions if its value is CRSVUNKNOWN.

**Attribute: intl**

**Fullname:** International termination indicator

**Attribute Description** The intl bit is a secondary key to this relation that is always DBNO at this time.

**Attribute: carrier**

**Fullname:** Carrier flag to determine if carrier is a valid value or a don't care condition

**Attribute Description** The carrier attribute can be DBYES or DBNO to indicate if the carrier has a particular value or if is a don't care condition. If the value is DBYES, then call processing code will perform a database read using the actual carrier and if the value is DBNO, then a value of #NULL_BCARID will be used.

**Attribute: tgn**

**Fullname:** Trunk group number flag used to determine if the trunk group number is valid value or a don't care value.

**Attribute Description** The tgn attribute can take on the value of DBYES or DBNO to indicate if the tgn has a particular value or if it is a don't care condition. If the value is DBYES, then call processing code will use the actual trunk group number that the call originated on. If the value is DBNO, then the don't care value of 0 will be used for trunk group number. The carrier and trunk group number values will be used by call processing to perform a database read of other ITNA relations.

**Attribute: ols**

**Fullname:** Originating Line Screening

**Attribute Description** The ols bit is always DBNO at this time.

**Copyright © 1999 Lucent Technologies** 

**Attribute: set_id**

**Fullname:** Time Set Id

**Attribute Description** This attribute is used to specify a valid set ID only if both the carrier and tgn attributes are DBNO. If either carrier or tgn or both carrier and tgn are DBYES, then set_id must have the value of OA_NOTS (No Time Set).

## 4. Population Rules for RLitnatgn

**Relation Description**
Improved Third Number Acceptance (ITNA) single trunk group number relation

This relation consists of originating station type (key), carrier (key), trunk_num (key) and set_id (non-key) attributes. It is used to determine a time set id based on originating station type, carrier and trunk group number. The time set id attribute consists of a value used to perform a database read of the RLtime_set relation to determine a begin and end time of day when automatic outpulsing to a third party number is acceptable for billing verification.

**Attribute: orig_stat**

**Fullname:** Improved third number acceptance (ITNA) originating station type

**Attribute Description** Used as a key for determining if a time set id is available for a call using the originating station type

**Attribute: carrier**

Copyright © 1999 Lucent Technologies 

**Fullname:** Improved Third Number Acceptance carrier

**Attribute Description** This is used as a key combined with originating station type and trunk group number for determining if a time set id is available for a call. The value of #LECBCARID is assigned if the carrier is not an IC. It is mapped to the three letters 'LEC' on the RC/ODA view. The value of #NULL_BCARID is used to indicate a NULL carrier id and provides a don't care condition for the carrier id. This value is not displayed on the RC/ODA view. It is mapped to unknown.

**Attribute: trunk_num**

**Fullname:** Improved Third Number Acceptance (ITNA) trunk group number

**Attribute Description** This is used as a key for determining if a time set id is available for a call originating on a particular incoming trunk group number. The trunk_num attribute can have values ranging from (1 - AVTRKGRPS()) for valid trunk group numbers or 0 for a don't care value.

**Attribute: intl**

**Fullname:** International destination indicator

**Attribute Description** This is used as a key for determining if a time set id is available for a call originating on a particular incoming trunk group number terminating to an international destination. This key is always DBNO at this time.

**Attribute: set_id**

**Fullname:** Improved Third Number Acceptance time set id number

**Attribute Description** This is used as an index to RLtime_set to determine what time range should be applied for ITNA checks

**Defines:**"db/DMcarr_val.h"

## 4. Population Rules for RLitnatrng

**Relation Description**
Improved 3rd Number Acceptance time set by trunk group range.

This relation consists of originating station type (key), tuple number (key), carrier (key), number range (non-key) and a series of 16 trunk group number range structures. The purpose of the relation is to find a time set ID for a particular originating station type, carrier and trunk group range. The time set ID (set_id) consists of a value used to perform a database read of the RLtime_set relation for determining an associated time of day when automatic outpulsing to a third number party is acceptable for billing verification.

**Copyright © 1999 Lucent Technologies** 

**Attribute: orig_stat**

**Fullname:** Improved 3rd Number Acceptance originating station type

**Attribute Description** Used as a key for determining if a time set ID is available for a call using the originating station type.

**Attribute: tupnum**

**Fullname:** Improved 3rd Number Acceptance compressed trunk group number

**Attribute Description** Used as a key for determining the tuple containing the trunk group ranges. Each tuple can contain up to 16 trunk ranges.

**Attribute: carrier**

**Fullname:** Improved 3rd Number Acceptance carrier

**Attribute Description** Used as a key for determining if a time set ID is available for a call using the carrier for the call. The value of #LECBCARID is mapped to the three letters 'LEC' on the RC/ODA view. The value of #NULL_BCARID is used to indicate a NULL carrier ID and is not displayed on the RC/ODA view. It is mapped to unknown.

**Attribute: intl**

**Fullname:** Improved 3rd Number Acceptance International termination indicator

**Attribute Description** Used as a key for determining if a time set ID is available for a call using the carrier for the call terminating to an international destination. This key is always DBNO at this time.

**Attribute: num_rng**

**Fullname:** Number of valid ranges in a tuple

**Attribute Description** Used to limit the search for trunk group range to the number of valid trunk group ranges in the tuple.

**Attribute: tgnrng00**

**Fullname:** Trunk group range 0

**Attribute Description** Trunk group range 0 and associated time set ID.

**Attribute: tgnrng00.begtgn**

**Fullname:** First trunk group number in this range

**Attribute Description** Contains the first trunk group number for a particular range.

**Attribute: tgnrng00.endtgn**

**Fullname:** Last trunk group number in this range

**Attribute Description** Contains the last trunk group number for a particular range.

**Attribute: tgnrng00.set_id**

Copyright © 1999 Lucent Technologies 

**Fullname:** Improved 3rd Number Acceptance time set ID number

**Attribute Description** Contains the set_id for the particular trunk group number range.

**Attribute: tgnrng01**

**Fullname:** Trunk group range 1

**Attribute Description** Trunk group range 1 and associated time set ID.

**Attribute: tgnrng01.begtgn**

**Fullname:** First trunk group number in this range

**Attribute Description** Contains the first trunk group number for a particular range.

**Attribute: tgnrng01.endtgn**

**Fullname:** Last trunk group number in this range

**Attribute Description** Contains the last trunk group number for a particular range.

**Attribute: tgnrng01.set_id**

**Fullname:** Improved 3rd Number Acceptance time set ID number

**Attribute Description** Contains the set_id for the particular trunk group number range.

**Attribute: tgnrng02**

**Fullname:** Trunk group range 2

**Attribute Description** Trunk group range 2 and associated time set ID.

**Attribute: tgnrng02.begtgn**

**Fullname:** First trunk group number in this range

**Attribute Description** Contains the first trunk group number for a particular range.

**Attribute: tgnrng02.endtgn**

**Fullname:** Last trunk group number in this range

**Attribute Description** Contains the last trunk group number for a particular range.

**Attribute: tgnrng02.set_id**

**Fullname:** Improved 3rd Number Acceptance time set ID number

**Attribute Description** Contains the set_id for the particular trunk group number range.

**Attribute: tgnrng03**

**Fullname:** Trunk group range 3

## 4. Population Rules for RLivt_tkg

**Relation Description**
*Autoplex*® intervendor trunk group and member to switching module (SM).

List of intervendor *Autoplex* ® trunk group and member numbers whose port terminates on a particular SM.

A tuple is keyed by the SM and range and consists of up to 15 entries. Each entry contains a single trunk group number and member number combination.

**Attribute: sm**

**Fullname:** Switching module

**Attribute Description** Primary key to the relation.

**Attribute: range**

**Fullname:** Range

**Attribute Description** The range indicates which tuple (set of 15 trunk group/members) to be accessed. Range is a primary key to the relation.

**Attribute: cnt**

**Fullname:** Count

**Attribute Description** Indicates the number of trunk group and member combinations that exist for this SM. The count is kept in the range zero tuple.

**Attribute: tgnmem[*].tgrpid**

**Fullname:** Trunk group identification number

**Attribute Description** Indicates the trunk group number that the member is assigned to.

The '*' in tgnmem[*] has the range of 1 to 15;

Copyright © 1999 Lucent Technologies 

**Attribute: tgnmem[*].member**

**Fullname:** Trunk member number

**Attribute Description** The trunk member number assigned to the trunk.

The '*' in tgnmem[*] has the range of 1 to 15;

## 4. Population Rules for RLkey_talk

**Relation Description:** keying trunk to talking trunk.

CAMA operator trunk mate association. This relation is not populated for Export. Each tuple in this relation should have a matching one in the RLtalk_key relation.

**Attribute: keytrk**

**Fullname:** keying trunk.

**Attribute Description**keying trunk gport of CAMA operator trunk pair. This is used as the index into the relation. The gport should be a FC_CP_KEYING or FC_TCI_KT class of service (see FC_TRUNK - FC_PORTTYPE). All CAMA operator trunk keying trunk gports should be represented by a tuple in this relation. This check is in RLfc_porttyp.p

**Attribute: keytrk.member**

Copyright © 1999 Lucent Technologies 

**Fullname:** Member.

**Attribute Description**keying trunk Physical Port.

**Attribute: keytrk.module**

**Fullname:** Module.

**Attribute Description**keying trunk Module.

**Attribute: talktrk**

**Fullname:** Talking trunk.

**Attribute Description**Talking trunk gport of a CAMA operator trunk pair. The gport should be a port of FC_CP_TALKING or FC_TCI_TT class of service. No duplications can exist (that is, 1-1 correspondence between keying and talking trunks). Both the talking and keying trunks of a CAMA pair must be on the same SM.

**Attribute: talktrk.member**

**Fullname:** Member.

**Attribute Description**Talking trunk physical port.

**Attribute: talktrk.module**

**Fullname:** Module.

**Attribute Description**Talking trunk module.

## 4. Population Rules for RLkeylist

**Relation Description:** List of hunt control.

Information concerning this section is not available at this time.

**Attribute: port**

**Fullname:** group port

**Attribute Description**This attribute is divided into sub-attribute port. member and port.module. Port.module is the IM number and port.member is the port number of scan points assigned to multiline hunt group keys. These keys are group make busy, member make busy, stop hunt, position busy, and random make busy. Note that the random make busy key is not assigned to MUPH or ISAT multiline hunt groups. The position busy key is only assigned to MUPH multiline hunt groups. These should be established with the developer or office. Also include any member make busy scan points for individual lines.

# LAB6_PCI

## 1. Description

This relation translates a CCIS6 link pair into a Point Code Index (PCI). PCIs are arbitrary indexes used to save AM memory. Each trunk in the switch having a CCIS6 signaling type must have a relation in the AM to translate the CCIS6 routing label to a global port. Since a particular link pair (13 bits) appears many times in an office, it is converted to a PCI (8 bits) to save space. PCIs are also used for system 7 CCS trunks as described in the RLlab7_pci relation. Tuples in this relation are inserted, updated, or deleted based on information contained on the Trunk Group and Member form. Any transaction on this relation should result in a corresponding transaction on mirror relation, RLpci6_lab. Note, however, that only primary links appear in this relation while both the primary and mate link appear in RLpci6_lab.

## 2. Data Dictionary Values

## 4. Population rules for RLlab6_pci

### Relation Description

CCIS6 Routing Label to Point Code Index Relation
This relation translates a CCIS6 link pair into
a Point Code Index (PCI). (PCIs are arbitrary
indexes used to save AM memory. Each trunk in the
switch having a CCIS6 signaling type must have
a relation in the AM to translate the CCIS6
routing label to a global port. Since a particular
link pair (13 bits) appears many times in an
office, it is converted to a PCI (8 bits) to save
space. PCIs are also used for system 7 CCS trunks
as described in the RLlab7_pci relation.) Tuples
in this relation are inserted or deleted
based on information contained on the Trunk Group
and Member form.

NOTE !! Any transaction on this relation
should result in a corresponding transaction on
mirror relation, RLpci6_lab.
Note, that
both the primary and mate links appear in this relation.
CCIS 6 band and member numbers are assigned by CNAC ,
for the network.

For other North American Networks, the assignment
is made by local telephone company operating
instructions. A band and label and virtual link uniquely
defines a trunk. Relation RLlab6prt is used to obtain the port
( same attribute as port in RLfc_trunk).

**Attribute:**
sl_vlink
**Fullname:**
Signaling virtual link
**Attribute Description:**
See RLlab6prt.sl_vlink

**Attribute:**
sl_group
**Fullname:**
Signaling link group
**Attribute Description:**
See RLlab6prt.sl_group

**Attribute:**
sl_mem

Copyright © 1999 Lucent Technologies 

**Fullname:**
Signaling link group member
**Attribute Description:**
See RLlab6prt.sl_mem

**Attribute:**
pci
**Fullname:**
Point Code Index
**Attribute Description:**
PCI can range from 1 to 255 and provides a unique internal representation of a CCIS6 link pair. A link pair consists of two links, one designated as the primary link, the other the mate link. (A link consists of a unique combination of sl_vlink, sl_group, and sl_mem). A PCI is assigned for all new instances of a CCIS6 link pair. A link can only belong to one link pair. This means that once a primary and mate link have been specified together, then neither one can be used in combination with any other link.
PCIs are generated by using the RLfacid relation. (facid = 0, class = FAC_CCS, subclass = SCL_NULL see RLfacid for a description of the link list maintained for each class.
Note: The PCIs are only the facid field and for CCS are limited to a range of 1 to 255. PCIs must never exceed 255 so checks must be made against the index retrieved using RLfacid since the RLfacid indexes are 16 bits. PCIs are generated sequentially and must be unique across all CCIS6, ISUP7, and/or TUP7 trunks in an office. (That is, system 7 PCIs come from the same PCI pool as system 6 PCIs - see RLlab7_pci.)
PCIs are deleted when a trunk member is deleted and it is the last trunk to use the PCI (that is, trk_cntr attribute in this relation is equal to 1). Again, the RLfacids master for the CCS class is used to give back the PCI.

**Attribute:**
trk_cntr
**Fullname:**
Trunk counter
**Attribute Description:**
Trunk counter. This is an integer counter of the number of CCIS6 trunks currently using this link pair (or pci). This counter must be incremented/ decremented on every insertion/deletion of a CCIS6 trunk. Since 8192 trunks can be supported by a link pair, this counter must never exceed 4096.

Copyright © 1999 Lucent Technologies

NOTE: Since two tuples (that is, one primary link and one mate link) exist in this relation for each pci, this counter must be updated for each tuple. The value of trk_cntr for each tuple of a link pair, primary and mate tuple, must be identical.

Copyright © 1999 Lucent Technologies 

# LAB6PRT

## 1. Description

Each incoming CCS system 6 message contains a routing label which uniquely identifies the CCS trunk associated with the message. This label consists of a signaling link group, a signaling link member, a signaling virtual link, a band, and a band member. RLlab6prt is used by CCS software to translate this routing label to a global port. This relation should only be populated for domestic applications. A tuple must exist for every trunk with a signaling type of DBCCIS6. Tuples are inserted, deleted, or updated based on information on the Trunk Group and Member form. Any transaction on this relation should also result in a corresponding transaction on the mirror relation, RLprt6lab.

## 2. Data Dictionary Values

## 4. Population Rules for RLlab6prt

**Relation Description**
CCIS6 routing label to port relation.

Each incoming CCS system 6 message contains a routing label which uniquely identifies the CCS trunk associated with the message. This label consists of a signaling link group, a signaling link member, a signaling virtual link, a band, and a band member. RLlab6prt is used by the software to translate this routing label to a global port. This relation is mainly used by the ccs subsystem.

A tuple exists for both the primary link and for the secondary (mate) link. The global port must be determined from either the mate or primary link along with the band and label. Two tuples must exist for every trunk with a signaling type of DBCCIS6.

A trunk block is defined as a sequence of trunk group members which are all in the same trunk group and whose member numbers fall in the range 0-15, 16-31, 32-47, 48-63, etc.

When the combination of band number and link pair is specified for 1 trunk in a trunk block, then both the primary and mate links and the band for all additional trunks in that block must be identical to that of the first trunk in the block.

There is no required relationship between each trunk block within a trunk group. In other words, each trunk block within a group can use either the same or a different link pair. If the same link pair is used by 2 trunk blocks, then the band number must be different. If a different link pair is used, then the band number can be the same, but may also be different.

**Attribute: sl_group**

**Fullname:** Signaling link group

**Attribute Description** This refers to the group of the CNI signaling link associated with this trunk. Signaling links in CCIS6 are associated in a link pair for reliability, thus two tuples are present in this relation for each CCIS6 port. Messages destined for a port will (usually) arrive via the same signaling link. However, if a signaling link is congested or has failed, the other link will carry messages for the port.

**Attribute: sl_mem**

**Fullname:** Signaling link member

**Attribute Description** Signaling link member within a signaling link group. Supplied by CNAC (RBOC).

**Attribute: sl_vlink**

**Fullname:** Signaling link virtual link

**Attribute Description** When embedded CCIS is used (that is, CCIS6 messages passing over a 56 Kbs link), the physical link is divided into eight virtual links. This attribute specifies the virtual link. If the link pair is a 4.8 Kbs link, this value should be set to zero. This is supplied by CNAC

Copyright © 1999 Lucent Technologies 

(RBOC).

**Attribute: band**

**Fullname:** Band

**Attribute Description** Each CCIS6 trunk which uses a particular link (as previously specified) is identified by a band and a band member. (Very similar to trunk group and trunk group member except a band can only have 16 members.) The band attribute is provided by CNAC (RBOC).

**Attribute: bmem_num**

**Fullname:** Band member number

**Attribute Description** The member number within the band associated with the port. Odd band member numbers are assigned primary links, even member numbers are assigned mate.

**Attribute: gport**

**Fullname:** port

**Attribute Description** Port is divided into sub-attributes member and module. This is the same attribute as RLfc_trunk.port.

**Attribute: gport.member**

**Fullname:** member associated with the port

**Attribute Description** Member is assigned a unique number starting with zero.

**Attribute: gport.module**

**Fullname:** Module (Switching Module number)

**Attribute Description** The module number is the same as RLfc_trunk.port.module.

# LAB7_PCI

## 1. Description

This relation translates a CCS system 7 Destination/Origination Point Code and Network combination into a Point Code Index (PCI). (PCIS are arbitrary indexes used to save AM memory. Each trunk in the switch having a DBISUP7 (domestic only) or DBTUP7 (export only) signaling type must have a relation in the AM to translate the system 7 routing label to a global port. Since a particular OPC/DPC/network combination (49 bits) appears many times in an office, it is converted to a PCI (8 bits) to save space. PCIs are also used by CCIS6 trunks as described in the RLlab6_pci relation.) Tuples in this relation are inserted, deleted, or updated based on information contained on the Trunk Group form. Any transaction on this relation should result in a corresponding transaction on the mirror relation, RLpci7_lab.

**Relation Description**

Destination/Origination Point Code and Network to
Point Code Index conversion

This relation translates a CCS system 7 Destination/Origination
Point Code and Network combination into a Point Code Index (PCI).

"PCIs are arbitrary indexes used to save AM memory.
Each trunk in the switch having a DBISUP7
(domestic only) signaling type must have a
relation in the AM to translate the system 7
routing label to a global port.
Since a particular OPC/DPC/Network combination (49 bits)
appears many times in an office, it is converted
to a PCI (8 bits) to save space. PCIs are also
used by CCIS6 trunks as described in the
RLlab6_pci relation"

**Attribute:**

dpc

**Fullname:**

Destination Point Code

**Attribute Description:**

The DPC indicates the signaling point for the far-end
office, except for inter-module trunks which set the DPC
equal to a pseudo point code value that indicates the SM
numbers on which the inter-module trunk terminates (that
is, near-end SM and far-end SM).

See the poprules in RLrt_trkg.R for the rules describing the
format of dpc (RLrt_trkg.dpc).

**Attribute:**

opc

**Fullname:**

Origination Point Code

**Attribute Description:**

The OPC indicates the signaling point which is assigned to this
office. It has the same layout as the DPC and will be assigned in
the same manner.

See the poprules in RLrt_trkg.R for the rules describing the
format of opc (RLrt_trkg.opc).

**Attribute:**

network

**Fullname:**

Standardization Sector (SS7) (formerly CCITT7) Network to
which the PCI belongs.

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

The network to which the dpc/opc pair belongs.

Note: Only the NATIONAL network is allowed.

**Attribute:**
pci
**Fullname:**
Point Code Index
**Attribute Description:**
PCI can range from 1 to 1023 and provides a unique internal representation of a system 7 OPC/DPC/Network combination. (PCIs are also shared with CCIS6 trunks. That is, system 7 PCIs are generated from the same pool as system 6 PCIs - see RLlab6pci.)
System 7 PCIs are generated whenever a new combination of OPC, DPC and Network are inserted on the Trunk Group form. The OPC, DPC and Network are used to read this relation. If there is no existing tuple, then a new tuple is inserted with the PCI generated by using the RLfacid relation. (facid = 0, class = FAC_CCS, subclass = SCL_NULL - see RLfacid for rules on how arbitrary indexes are generated or deleted.)
PCIs must never exceed 1023 so checks must be made against the index retrieved using RLfacid since RLfacid indexes are 16 bits. PCIs are deleted when the last trunk group to use a PCI is deleted (that is, the tg_cntr attribute in this relation equals 1 and a trunk group is deleted). RLfacids is used to give back the PCI.

**Attribute:**
tg_cntr
**Fullname:**
Trunk Group counter
**Attribute Description:**
This is an integer counter of the number of system 7 trunk groups (DBISUP7 or DBTUP7 signaling types) currently using this OPC/DPC/Network combination. This counter must be incremented/decremented on every insertion/ deletion of a system 7 trunk group.

**Attribute:**
psu_mod
**Fullname:**
psu_mod
**Attribute Description:**
This attribute identifies whether the CNI or a GSM is used for CCS signaling. The value of psu_mod is

**Copyright © 1999 Lucent Technologies** 

```
        set to zero if the CNI is to be used for CCS signaling;
        otherwise psu_mod is set to the GSM number for PSU
        based CCS signaling.
```

**Defines:**

```
        "db/DMaliasopc.h"
```

Copyright © 1999 Lucent Technologies 

# LAB7_SM

## 1. Description

This relation identifies the SM number to which the Standardization Sector (SS7) (formerly CCITT7) trunk terminates. It is used for National and International SS7 Protocols. RLlab7_sm is the ISUP incoming routing data on the SS7 Global SM. It contains one tuple for each trunk that is signaled for by that GSM. It is keyed by a CCS trunk index, which is mapped to the PCI, CIC, and terminating SM of the trunk. The data from RLlab7_sm is put into a PHDA table in the ICR which is hashed with a key of PCI+CIC. The ICR ODR is pumped to the PHs.

## 2. Data Dictionary Values

## 4. Population rules for RLlab7_sm

### Relation Description

```
        SS7 routing label switching module

        This relation identifies the SM number to which the trunk
        terminates.  It is used for National and International SS7
        Protocols.  It translates the destination point code index (DPCI)
        and circuit identification code (CIC) to the SM number.
```

**Attribute:**
trunki
**Fullname:**
Trunk index
**Attribute Description:**
Trunk index that is a unique identifier to compact the database.

**Attribute:**
sm
**Fullname:**
Switching module
**Attribute Description:**
Identifies the SM on which the trunk terminates

**Attribute:**
cic
**Fullname:**
Circuit identification code
**Attribute Description:**
The CIC identifies the circuit (trunk) which has a direct connection between the DPC and this office.

**Attribute:**
pci
**Fullname:**
Point Code Index
**Attribute Description:**
The PCI is a trunk related Point Code Index, for the far-end of the trunk.

**Defines:**

# LAB7PRT

## 1. Description

Each incoming CCS system 7 (seven) message contains a routing label which uniquely identifies the CCS trunk associated with the message. This routing label consists of a Destination Point Code (DPC), an Origination Point Code (OPC), and Circuit Identification Code (CIC). The RLlab7prt is used by SM CCS software to translate this routing label to a *5ESS*®-2000 switch global port. A tuple must exist for each trunk in a SM with a signaling type of either DBISUP7 (domestic only) or DBTUP7 (export only). Tuples are inserted, updated, or deleted based on information given on the Trunk Group and Member form. The CLCI code TRK ID field is used for the CIC. The OPC, DPC are retrieved from trunk group information. Any transaction on this relation should have a corresponding transaction on the RLprt7lab relation which mirrors this relation.

## 2. Data Dictionary Values

## 4. Population Rules for RLlab7prt

### Relation Description

Copyright © 1999 Lucent Technologies

CCS7 routing label to global port relation

Each incoming CCS system 7 message contains a routing label which uniquely identifies the CCS trunk associated with the message. This routing label consists of a Destination Point Code (DPC), an Origination Point Code (OPC), and Circuit Identification Code (CIC). The RLlab7prt is used by SM CCS software to translate this routing label to a *5ESS®*-2000 switch global port. This relation is mainly used by the ccs subsystem.

**Attribute: dpc**

**Fullname:** Destination point code

**Attribute Description** The DPC indicates the signaling point for the far-end office, except for inter-module trunks which set the DPC equal to a pseudo point code value that indicates the SM numbers on which the inter-module trunk terminates (that is, near-end SM and far-end SM).

See the poprules in RLrt_trkg.R for the rules describing the format of dpc (RLrt_trkg.dpc) in the *5ESS®-2000 Switch Population Rules Language Data Manual* (235-600-123).

**Attribute: opc**

**Fullname:** Origination point code

**Attribute Description** The OPC indicates the signaling point which is assigned to this office. It has the same layout as the DPC and will be assigned in the same manner.

See the poprules in RLrt_trkg.R for the rules describing the format of opc (RLrt_trkg.opc) in the *5ESS®-2000 Switch Population Rules Language Data Manual* (235-600-123).

**Attribute: network**

**Fullname:** Network.

**Attribute Description** This attribute is used to indicate the network to which the standardization sector Telecommunicaton Standarization Sector (ITU-TS) routing label refers.

**Attribute: pci**

**Fullname:** Point Code Index

**Attribute Description** This attribute represents the point code index assigned to this DPC/OPC/network combination. The point code index is derived as part of the population rules for RLlab7_pci.

**Attribute: cic**

**Fullname:** Circuit identification code

**Attribute Description** The CIC uniquely identifies the circuit (trunk) among those directly interconnecting the DPC and OPC. This number is assigned by CNAC or the RBOC. The value will not be assigned by CNAC for other (RBOC, etc) networks.

For export networks, CIC is an arbitrary number from 0 to 4095.

**Attribute: gport**

**Fullname:** Global port

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** A *5ESS*®-2000 switch global port in an office. It consists of the SM number and the member. The DPC, OPC, network and CIC are used by this relation to translate the external CCS trunk representation into a *5ESS*®-2000 switch trunk appearance - the SM number and the trunk member number on the SM. This is the same attribute as port in the RLfc_trunk relation.

**Attribute: gport.member**

**Fullname:** Port member

**Attribute Description** The member number of the trunk on an SM.

**Attribute: gport.module**

**Fullname:** SM module number

**Attribute Description** Switching module that the trunk is associated with.

**Attribute: sls**

**Fullname:** Signaling link selection

**Attribute Description** For a given T1 facility which is marked as Fractional DS1 capable, the Signaling Link Selection(SLS) in the message routing label must be the same for all messages sent over any trunk on the T1 facility. The algorithm used to compute a SLS value is such that it achieves an approximately uniform distribution of SLS numbers over a large number of T1 facilities. The SLS value identifies the path link for all signaling messages for each trunk on a single T1 facility. The SLS value must be the same for all trunk group members that exist on a particular facility.

For wideband capable trunk groups which have members on a DNU, the SLS in the routing label is generated the same for all messages sent over any trunk of the trunk group.

## 4. Population Rules for RLlab7sm

**Relation Description**
SS7 routing label switching module

This relation identifies the SM number on which the trunk terminates. It is used for National and International SS7 Protocols. It translates the normalized destination point code (DPCI) and circuit identification code (CIC) to the sm (such as the SM number), and also contains the port and the protocol. This relation is only populated on the Global RM of a (multi-module ) RSM supporting SS7.

**Attribute: dpci**

**Fullname:** Destination point code index

**Attribute Description** Destination Point Code. The DPC indicates the signaling point for the far end office.

Copyright © 1999 Lucent Technologies 

**Attribute: cic**

**Fullname:** Circuit Identification Code

**Attribute Description** The Circuit Identification Code uniquely identifies a trunk linking this Local Signaling Point Code and a given Destination Point Code.

**Attribute: port**

**Fullname:** Port

**Attribute Description** Identifies the port on which the trunk terminates.

**Attribute: protocol**

**Fullname:** Protocol

**Attribute Description** Identifies the signaling protocol used for this trunk.

**Attribute: sm**

**Fullname:** Switching module

**Attribute Description** Identifies the SM on which the trunk terminates.

Trunk Group Number

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
A valid trunk group associated with a Call Content Channel (CCC) which along with a trunk group member number and the number of members identifies a set of CCCs.

**Attribute:**
memberno
**Fullname:**
(Trunk Group) Member Number
**Attribute Description:**
Identifies the first member number in the trunk group used as a CCC

**Attribute:**
numofmem
**Fullname:**
Number of (Trunk Group) Members
**Attribute Description:**
The number of trunk group members that are assigned to a subject.

## 4. Population rules for RLlaesprof

### Relation Description

Lawfully Authorized Electronic Surveillance (LAES) profile

The new Lawfully Authorized Electronic Surveillance (LAES) profile. relation defines a surveillance profile which specifies what messages parameters and content are to be a llowed. When a message field does not equal zero that message should be sent. To avoid large character keys, this relation has been designed using 2 new relations: RLlaesprof and RLnm2prid. The RLnm2prid sub relation allows the large character keys to be used in the CMP by Recent Change.

(2) ccc Packet Delivery

**Attribute:**
answer
**Fullname:**
Answer
**Attribute Description:**
A 16-bit bitmap indicating the options for answer.

This field is a bitmap that indicates if call processing should send an Answer Message, indicated by a non-zero value, and if so, the attributes that should be included in the message.

```
-------------------------------------------------
|15|14|13|12|11|10|09|08|07|06|05|04|03|02|01|00|
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| *| *| *| *| *| *| *| *| *| O| O| O| M| M| O| M|
-------------------------------------------------
```

'*' unused (always zero)
'M' mandatory (must be set if any bits are set)
'O' optional

```
0 = caseid      mandatory
1 = IAPsysid    optional
2 = timestamp   mandatory
3 = callident   mandatory
4 = ansprtyid   optional
5 = location    optional
6 = bearcap     optional

7-15 =          unused
```

**Attribute:**
ccclose
**Fullname:**
CCclose
**Attribute Description:**
A 16-bit bitmap indicating the options for ccclose.

This field is a bitmap that indicates if call processing should send a ccclose Message, indicated by a non-zero value, and if so, the attributes that should be included in the message.

```
-------------------------------------------------
|15|14|13|12|11|10|09|08|07|06|05|04|03|02|01|00|
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

0 = caseid      mandatory
1 = IAPsysid    optional
2 = timestamp   mandatory
3 = CCCid       mandatory

4-15 =          unused
```

**Attribute:**
cccopen
**Fullname:**
CCCopen
**Attribute Description:**
A 16-bit bitmap indicating the options for cccopen.

This field is a bitmap that indicates if call processing should send a cccopen Message, indicated by a non-zero value, and if so, the attributes that should be included in the message.

```
-------------------------------------------------
|15|14|13|12|11|10|09|08|07|06|05|04|03|02|01|00|

```

## 4. Population Rules for RLlang_tbl

**Relation Description**
Language table. An entry in this table maps the language value for a calling card to the announcement application type, a language activation flag, and an indicator for the operator display.

An entry in this table maps the language value for a calling card to the announcement application type so card announcements may be played in the appropriate language for a customer. Lang_val is equivalent to the language of preference (LOP) that may be returned in a calling card query reply from the customer account services (CAS) network control point (NCP) database.

**Attribute: lang_val**

**Fullname:** Language value

**Attribute Description** The language value is retrieved from the card issuer database (office data administration (ODA) form TCCID or recent change (RC) view 27.55) or is returned in a CAS card validation query as a language of preference. This table maps the language value to the proper set of announcements to play so that they are in the language that the card issuer or customer has selected.

**Attribute: active**

**Fullname:** Active

Copyright © 1999 Lucent Technologies 

**Attribute Description** This flag indicates whether this language has been activated, that is, whether the phrase set for this language has been populated on the appropriate RAF announcement board or SAS circuit packs.

**Attribute: appl**

**Fullname:** Announcement application type

**Attribute Description** Special announcement applications were defined to allow using the same announcement header IDs for non-English language announcements as are used for English operator services position system (OSPS) card announcements.

**Attribute: nacc_ldisp**

**Fullname:** Non-English announcements for card calls (NACC) language display

**Attribute Description** This is a three-character indicator displayed on the OSPS operator terminal to show which non-English language is associated with this call.

Engineering Information:
Maximum # tuples: 2047
Average # Tuples: 200

**Attribute: lang_code**

**Fullname:** language code

**Attribute Description** This is the language identifier code.

**Attribute: dest_indx**

**Fullname:** destination index

**Attribute Description** This field specifies the destination code index that is used to route the call.

**Attribute: language**

**Fullname:** language

**Attribute Description** This field is the text that is displayed to an operator.

**Attribute: calltype**

**Fullname:** call type

**Attribute Description** This field specifies the Automatic Call Distributor (ACD) call queue number assigned to this call type.

**Attribute: ama_code**

**Fullname:** ama code

**Attribute Description** This field is the number used by AMA recording.

**Attribute: spare1**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

**Attribute: spare2**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

**Attribute: spare3**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

## 4. Population Rules for RLlangmenu

**Relation Description**
Language menu code or language access code to language code table

Relation is used to map a language menu code. Or to map a language access code to language code. These two data types are mutually exclusive and share the same structure.

This relation should be populated for domestic generics only.

Engineering Information:
Maximum # tuples: 2400

Copyright © 1999 Lucent Technologies 

Average # Tuples: 200

**Attribute: lac**

**Fullname:** language access code

**Attribute Description** This field specifies the language menu code or the language access code.

**Attribute: lmclac**

**Fullname:** language menu code or language access code

**Attribute Description** This field indicates whether or not this data is for a language menu code.

**Attribute: oper**

**Fullname:** operator

**Attribute Description** This field specifies whether the lac number can be accessed by an operator.

**Attribute: cust**

**Fullname:** cust

**Attribute Description** This field specifies whether the lac number can be accessed by a customer.

**Attribute: lang_code**

**Fullname:** language code

**Attribute Description** This is the language identifier code.

**Attribute: spare1**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

**Attribute: spare2**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

**Attribute: spare3**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

# LAPBSUB

## 1. Description

For each DSL B-channel that is nailed up to a PH port for packet switching, this relation describes the subscriber-selected LAPB parameters.

```
bport
lapbt1 - T1 timer - timeout value for frame retransmissions
lapbn2 - N2 - maximum no. of frame retransmissions
lapbk  - K  - maximum no. of outstanding  I-frames (that is, window size)
lapbt3 - T3 timer - timeout for idle channel state
```

## 2. Data Dictionary Values

## 4. Population Rules for RLlapbsub

**Relation Description**

Link access procedures balanced (LAPB) level 2 parameters for subscribers.

For each B channel with packet switching that is nailed up to a protocol handler (PH) port, this relation describes the subscriber selected LAPB level 2 parameters.

The Service Provider must get the information for these parameters from the end customer. These parameters are

Copyright © 1999 Lucent Technologies 

defined in the protocol specifications for the end customers computer (which will usually be a host computer).

These parameters are standard parameters defined originally by the Telecommunicaton Standarization Sector (ITU-TS) international standards organization. These parameters are also defined in the protocol specifications for all specific implementations of the X.25 protocol (such as, the ATT practices entitled: Network System Group, X.25 DTE, Communication Protocol Specifications).

QUANTITY OF TUPLES: One tuple per nailed-up B-channel with packet switching.

**Attribute: bport**

**Fullname:** B channel port name.

**Attribute Description**Populate with digital subscriber line (DSL) B-channel port name. This port must be populated concurrently in RLfc_porttyp,RLdslequip, and RLequipdsl.

**Attribute: lapbt1**

**Fullname:** LAPB T1 timer timeout value.

**Attribute Description** Populate with the T1 timer timeout value for LAPB level 2 frame retransmissions. The range is 20 - 200 (2-20 seconds in two-tenths of a second, that is, .2 second increments).

**Attribute: lapbt3**

**Fullname:** LAPB T3 timer timeout value.

**Attribute Description** Populate with the T3 timer timeout value (in seconds) for LAPB idle channel state. The range is 3 - 30 seconds.The value of the T3 timer must be and should be significantly (Telecommunicaton Standarization Sector (ITU-TS)) greater than the value of the T1 timer. For example if T1 is 200 (20 seconds), then T3 might be 30. If T1 is 60 (6 seconds), then T3 might be 9 or larger.

**Attribute: lapbn2**

**Fullname:** LAPB N2 timer timeout value.

**Attribute Description** Populate with the N2 value for LAPB level 2, that is, maximum number of LAPB level 2 frame retransmissions. The range is 2 - 15.

**Attribute: lapbk**

**Fullname:** LAPB window K value.

**Attribute Description** Populate with the K value for the LAPB level 2 window size, that is, the maximum number of outstanding I - frames.

**Defines:** "db/DMport.h"

## 4. Population Rules for RLlassconv

**Relation Description**
LASS feature access conversions.

This relation controls LASS feature access conversions for LASS Automatic Callback, LASS Automatic Recall, and COT. The conversion information relates to the conversion of one feature access state to another for these features. This relation is administered by RC only.

**Attribute: dummy_key**

Copyright © 1999 Lucent Technologies

**Fullname:** dummy key

**Attribute Description** This relation does not need a key, but one is required. A dummy key is used for this relation.

**Attribute: cotconv**

**Fullname:** COT conversion to state

**Attribute Description**The COT conversion to state will key track of the feature access state that is being converted to.

**Attribute: acconv**

**Fullname:** LASS AC conversion to state

**Attribute Description**The AC conversion to state will keep track of the feature access state that is being converted to.

**Attribute: arconv**

**Fullname:** LASS AR conversion to state

**Attribute Description** The AR conversion to state will keep track of the feature access state that is being converted to.

**Attribute: scaconv**

## 4. Population rules for RLlat_lpt

### Relation Description

Logical ISDN Attendant to the Logical port.
Identifies the association of the logical ISDN attendant index (latidx) to the logical port (lport) and terminal number (termno) of the ISDN attendant DSL.

**Attribute:**

latidx

**Fullname:**

Logical ISDN Attendant.

**Attribute Description:**

Logical ISDN attendant terminal index.
Sequentially assigned number used to cause a dense packing of ISDN attendant keyed dynamic relation (RLattm_blf). If a tuple in RLis_term whose key is the lport and term has valid lport populated and the RLis_term.cpetyp = IS_TYPATT or IS_TYPED, then that RLis_term.latidx is populated in this tuple as the key.

Copyright © 1999 Lucent Technologies

**Attribute:**
lport
**Fullname:**
Logical Port.
**Attribute Description:**
If a tuple in RLis_term.lport has a valid lport populated, then this tuple uses that key and populates this tuple.

**Attribute:**
termno
**Fullname:**
Terminal Number.
**Attribute Description:**
Terminal number. In 5E4 set to 0.

## 4. Population rules for RLldpindx

### Relation Description

Automatic Number Identification index table

This relation consist of the Automatic Number Identification (ANI) Index Table to handle 6M ANI entries.

Provides ANI Table processing for Toll Digital Exchange (TDX) Calls based on options set in this relation.

The relations RLanidflt, RLanitbl, RLanidx[XXX] and RLtdxcartb are used together to determine how LDP calls are processed.

Note: Terminology was changed from "Toll Digital Exchange (TDX)" to "Long Distance Platform (LDP)". The database still contains names with "tdx" whereas the customers will see "ldp" on ODA forms and RC views.

**Attribute:**
index
**Fullname:**
Automatic Number Identification table index
**Attribute Description:**
A key for this relation. It is a pointer from RLanidx[XXX].R.

**Attribute:**
digtree
**Fullname:**
Digit analysis selector
**Attribute Description:**
DAS for TDX call. If digtree is not populated (that is, is set to zero), then the default DAS in

**Copyright © 1999 Lucent Technologies** 

RLldpindx.digtree (where RLldpindx.index == 0)
will be used. The value for digtree must be a
valid line DAS.

**Attribute:**
screen_x
**Fullname:**
screening index
**Attribute Description:**
Normally associated with a line or trunk, the screening index allows for different billing rates and routing. The default value for screen_x is zero (0), meaning not populated.

**Attribute:**
ncd
**Fullname:**
network call denial
**Attribute Description:**
Network Call Denial for TDX call. A DBNO indicates the call is allowed access to the network, a DBYES indicates the call should be denied access to the network. Default is DBNO.

**Attribute:**
acclen
**Fullname:**
account code length
**Attribute Description:**
ACCLEN for TDX call. This field indicates number of account code digits to be entered by the caller. A value of zero indicates caller has no account code feature assigned. A non-zero value up to 15 indicates the maximum number of digits that may be entered by the caller. The entered digits appear in the AMA record for the call, if one is generated. No validation is performed on the entered digits. The default value of this field is zero(0).

**Attribute:**
carrid
**Fullname:**
Carrier id for fixed carrier routing
**Attribute Description:**
Carrier id used for fixed carrier routing for this ANI. This field is optional. If the service provider does not want the call to be routed based on digit analysis then carrier id should be populated. The call will be routed via carrier id's route indices.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

trignum

**Fullname:**

Trigger Number

**Attribute Description:**

Contain ASP trigger number value ranging from 0-255. If the field is 0, no SCP query will be sent. If the field is 1-255, the number will indicate the AIN R0.1 Trigger Number to use for the SCP query.

NOTE: The trignum value assigned in ANI Table must be a valid ASP Trigger Number as defined by Recent Change View 9.35 (RLns_trig).

**Attribute:**

tnsc

**Fullname:**

Terminating Network Selection Code

**Attribute Description:**

Used to segregate traffic for MINT signaling

**Attribute:**

ii_screen

**Fullname:**

Information (II) digits screening indicator

**Attribute Description:**

When this indicator is set to DBYES, the ANI data should be taken from the RLiidigits relation

**Attribute:**

used_by_cnt

**Fullname:**

Used by count

**Attribute Description:**

Counts the number of ANI's in RLanidx[XXX] that use this particular ANI Table data set.

**Defines:**

"db/DMcarr_val.h",
"db/DMtnsc.h"

# LECCCID

## 1. Description

Local Exchange Carrier credit card issuer ID digits, 2-7 digits. If the number of digits in the key is not adequate to determine the issuer, nxtkey will indicate the number of digits to try next. If number of digits in the key is sufficient to determine the issuer, the number of digits in the issuer identification number, the account number, the check number outside account number, and the PIN number fields will be filled in.

## 4. Population Rules for RLlecccid

**Relation Description**
Local Exchange Carrier Credit Card Identification Table.

This table is a copy of the RLtccid table and is for OSPS Special Feature use.

**Attribute: issiddgt**

**Fullname:** Card Issuer Identification Number

**Attribute Description** Identifies the first 2-7 digits entered in the card issuer identification field.

**Attribute: nxtkey**

**Fullname:** Next key size

**Attribute Description** If more digits are needed to identify a calling card, the nxtkey attribute is used to identify the next size key to be referenced.

**Attribute: issnmdgt**

**Fullname:** Number of digits for issuer identification.

**Attribute Description** Identifies the number of digits entered in the issuer id field

**Attribute: accnmdgt**

**Fullname:** Number of digits for account number

**Attribute Description** Identifies the number of digits entered in the account number field.

**Attribute: chknmdgt**

**Fullname:** Number of digits for check number

**Attribute Description** Identifies the number of digits entered in the check number field.

**Attribute: pinnmdgt**

**Fullname:** Number of digits for personal identification number (PIN).

Copyright © 1999 Lucent Technologies 

**Attribute Description** Identifies the number of digits entered in the PIN field.

**Attribute: trans_type**

**Fullname:** Translation type

**Attribute Description** A query is sent from the 5ESS-2000 switch along the network to a No. 2 signal transfer point (2STP). The 2STP uses the translation type found in the query it received and using internal tables found in the 2STP figures out the proper database to route the query to. The translation type is used during global title translation to map the global title field of the query [card number] into the query destination address.

**Attribute: crd_attr**

**Fullname:** Card Attribute Key

**Attribute Description** Key into relation RLcrd_attr

**Attribute: csr_attr_id**

**Fullname:** Carrier Specific Routing Attribute ID

**Attribute Description** Key into relation RLcsr_attr

**Attribute: country**

**Fullname:** Country Identifier

**Attribute Description** Identifies country of the card issuer.

**Attribute: iccvdbn**

**Fullname:** ICCV Database Number

**Attribute Description** Used as key into RLiccvdb to retrieve software alarm information.

**Attribute: lang_val**

**Fullname:** Language Value

**Attribute Description** Identifies issuer language for card announcements.

**Attribute: home_call**

**Fullname:** Home call

**Attribute Description** If this is an ICCV card, indicates whether home country calls are allowed by this card issuer.

**Attribute: oaff1**

**Fullname:** Spare 1

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: cardtype**

Copyright © 1999 Lucent Technologies 

**Fullname:** Card Type

**Attribute Description** Card type for this card.

**Attribute: disposable**

**Fullname:** Disposable card

**Attribute Description** Indicates whether this card is a disposable card, that is one with a preset balance that is decremented as used and no longer usable once the balance is completely depleted.

**Attribute: carrgrp**

**Fullname:** Carrier Group ID

**Attribute Description** Identification number for the group of carriers which accept this card. Zero means all carriers accept this card.

**Attribute: oaff2**

**Fullname:** Spare 2

**Attribute Description**

Spare field for fast features.

**Attribute: isstxt**

**Fullname:** Issuer ID text

**Attribute Description**

This is the issuer ID text to be displayed on the operator position by the ACCS for CCC feature.

**Attribute: exp_date**

**Fullname:** Expiration date handling specifier

**Attribute Description** This specifies whether the card is to be given expiration date treatment or PIN treatment.

**Attribute: oaff3**

**Fullname:** Spare 3

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: oaff4**

**Fullname:** Spare 4

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population Rules for RLleccrd

**Relation Description**
Local exchange carrier (LEC) card recognition data

This relation holds the card recognition data for LEC cards. It contains the group ID for those carriers which accept this card for billing purposes.

**Attribute: npa**

**Fullname:** Numbering plan area

**Attribute Description** The area code or RAO of the LEC card.

**Attribute: ospsff1**

Copyright © 1999 Lucent Technologies

**Fullname:** OSPS spare field 1

**Attribute Description** spare for future development.

**Attribute: nxx**

**Fullname:** Office code

**Attribute Description** Office code of the LEC card. 1000 means all office codes for this NPA.

**Attribute: ospsff2**

**Fullname:** OSPS spare field 2

**Attribute Description** Spare for future development.

**Attribute: carrgrp**

**Fullname:** Carrier Group ID

**Attribute Description** Identification number for a group of carriers which all accept this card for billing. A zero means that all carriers accept this card for billing.

**Attribute: ospsff3**

**Fullname:** OSPS spare field 3

**Attribute Description** Spare for future development.

**Attribute: phrase_id**

**Fullname:** Announcement phrase ID

**Attribute Description** Phrase ID of the announcement to be used for carrier specific branding based on the NPA-NXX of the call. Zero means there is no branding phrase for this NPA-NXX.

**Attribute: blk_900da**

**Fullname:** Block 900 Directory Assistance

**Attribute Description** Indicates whether calls to 900 Directory Assistance (DA) destination numbers are allowed or denied. DBYES means that calls are denied and DBNO means that calls are allowed.

## 4. Population Rules for RLlecrng

**Relation Description**
Local exchange carrier (LEC) card recognition data ranges

This relation holds the card recognition data for LEC cards in ranges of NXXs based on NPA/RAO-NXX card identification. For each range, it contains the group ID for those carriers which accept this range of cards for billing purposes.

**Attribute: npa**

**Fullname:** NPA

**Attribute Description** The area code or RAO of the LEC card.

**Attribute: tupnum**

**Fullname:** Tuple number

**Attribute Description** A number indicating which tuple of ranges for an NPA this one is.

**Attribute: entries**

**Fullname:** Entries

Copyright © 1999 Lucent Technologies 

**Attribute Description** The number of entries in the arrays of ranges. This counts all of the entries filled in all of the tuples with the same NPA.

**Attribute: range[*]**

**Fullname:** Range

**Attribute Description** Each attribute contains the beginning and ending NXX numbers plus the cardtype for these NXXs.

**Attribute: range[*].begnxx**

**Fullname:** Beginning NXX

**Attribute Description** The first NXX number in the range of NXXs.

**Attribute: range[*].ospsff1**

**Fullname:** OSPS spare field 1

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].endnxx**

**Fullname:** Ending NXX

**Attribute Description** The last NXX number in the range of NXXs.

**Attribute: range[*].ospsff2**

**Fullname:** OSPS spare field 2

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].carrgrp**

**Fullname:** Carrier Group ID

**Attribute Description** Identification number for a group of carriers which all accept this range of cards for billing. A zero means that all carriers accept this card for billing for this NXX range.

**Attribute: range[*].ospsff3**

**Fullname:** OSPS spare field 3

**Attribute Description** This attribute is for fast/special features.

**Attribute: range[*].phrase_id**

**Fullname:** Announcement phrase ID

**Attribute Description** Phrase ID of the announcement to be used for carrier specific branding based on the NPA-NXX of the call. Zero means there is no branding phrase for this NPA-NXX.

**Attribute: range[*].blk_900da**

**Fullname:** Block 900 DA

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates whether calls to 900 Directory Assistance (DA) Destination Numbers (DN) are allowed or denied.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLlectext

**Relation Description**
Local exchange carrier (LEC) text. This relation contains the LEC-specific text to be displayed to an operator when a call comes to an OSPS operator position.

**Attribute: lecidx**

**Fullname:** LEC index

**Attribute Description** This is the key for the relation. It is an index retrieved from RLtgnlec. The value of the domain for lecidx is the range 0-2001, but 2000 & 2001 are reserved, so RC and ODA should only accept values 0-1999. ODBE should accept 0-2001.

**Attribute: lectext**

**Fullname:** LEC text

**Attribute Description** This is the text which is to be displayed on the VDT. It consists of up to 116 printing ASCII characters which will be displayed at the VDT as 4 lines of 29 characters each. There is no default value for this attribute; however, this attribute must contain at least one non-null character.

## 4. Population Rules for RLlectreat

**Relation Description**
Local exchange carrier (LEC) company treatment tables

Holds the treatment tables for LEC calls. This data is spare. When a feature is committed, these poprules will be refined.

**Attribute: treat_type**

**Fullname:** Treatment type

**Attribute Description** Number of the treatment table contained in this tuple.

**Attribute: spare1**

**Fullname:** Spare 1

**Attribute Description** Spare field.

**Attribute: spare2**

**Fullname:** Spare 2

**Attribute Description** Spare field.

**Attribute: svc[*]**

**Fullname:** Service

**Attribute Description** Each attribute contains a bit map of treatments based on class of charge service group.

**Attribute: rep[*]**

**Fullname:** Reply

**Attribute Description** Each attribute contains a bit map of treatments based on query reply types.

## 4. Population Rules for RLlgrpmem

**Relation Description**
Link group and member

This relation defines the set of spare SdLs for a Signaling Link to be used when the predefined(default) SdL fails. This relation resides in the AM and in the Global SMs as defined by the global parameters Glnatl7sm and Glintl7sm.

**Attribute: member**

**Fullname:** Link group member

**Attribute Description** Link group member.

**Attribute: lnkgrp**

**Fullname:** Link group number

**Attribute Description** Link group defines the set of spare SdLs to use when the predefined (default) SDL fails.

**Attribute: rting_module**

**Fullname:** Routing Module

**Attribute Description**This attribute defines the Routing Module for the trunk group to which the trunk represented by this tuple belongs. It is set to zero for tuples representing Signalling Links.

**Attribute: sdl_sm**

**Fullname:** Switching module where the signaling data link (SDL) resides

**Attribute Description** This attribute defines the SM number where the SDL resides.

Copyright © 1999 Lucent Technologies 

**Attribute: sdl_port**

**Fullname:** Signaling Data Link port number

**Attribute Description** This attribute defines the Signaling Data Link port number.

**Attribute: pre_sdl**

**Fullname:** Predefined SDL

**Attribute Description** This attribute defines if this SDL has been designated as a pre-defined SDL or not.

**Attribute: lptype**

**Fullname:** Logical port type

**Attribute Description** This attribute defines the logical port type of the SDL port.

**Attribute: trkgrp**

**Fullname:** Trunk group number

**Attribute Description** This attribute defines the trunk group number. The trunk group range for BT is 1 thru 4095 and for all other countries, the range is 1 thru AVTRKGRPS().

**Attribute: trkmem**

**Fullname:** Trunk group member number

**Attribute Description** This attribute defines the trunk group member number.

**Attribute: unitnum**

**Fullname:** Hardware Unit Number

**Attribute Description** This attribute defines the hardware unit number.

**Attribute: dfinum**

**Fullname:** Digital Facility Interface Number

**Attribute Description** This attribute defines the Digital Facility Interface (DFI) number.

**Attribute: cic**

**Fullname:** Circuit Identification Code

**Attribute Description** This attribute defines the Circuit Identification code.

## 4. Population Rules for RLlid_cf

**Relation Description**
Line identification constructed feature

Line identification constructed feature options - used in SM.

Valid service classes for lines assigned this feature are:

FC_ISDN, FC_ISATND, FC_ATTENDANT, FC_INDVDL, FC_4WIRE_INDV, FC_911, FC_PBX

```

```

**Attribute: feat_id**

**Fullname:** display constructed feature id

**Attribute Description** A BRCS constructed feature id consisting of a modular feature type and a unique identifier. For a line id constructed feature, the modular feature type is MFLID which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023. The feature id must have a class of FACBRCS and a subclass of SCL_FEAT.

```
RLfacname must have a tuple such that:
RLfacname.facid = feat_id
RLfacname.class = FACBRCS
RLfacname.subclass = SCL_FEAT
```

**Attribute: actvn**

**Fullname:** activation method

**Attribute Description** This is an enumeration of type DMMC_ACTYP. These features are always active (customer cannot activate via a dialed code or feature button) for 5E4(2) so that actvn always has the value ACTNONE. For 5E5, these features can be activated via a dialed code or feature button.

If actvn is set to ACTNONE, dctvn must be set to DCTNONE. If actvn is set to ACTCD, dctvn must be set to DCTCD.

Copyright © 1999 Lucent Technologies 

**Attribute: dctvn**

**Fullname:** deactivation method

**Attribute Description** This is an enumeration of type DMMC_DCTYP. These features are always active (customer cannot deactivate via a dialed code or feature button) for 5E4(2) so that dctvn always has the value DCTNONE. For 5E5, these features can be deactivated via a dialed code or feature button.

If dctvn is set to DCTNONE, actvn must be set to ACTNONE. If dctvn is set to DCTCD, actvn must be set to ACTCD.

**Attribute: cnd_prim**

**Fullname:** calling number delivery to primary DN only

**Attribute Description**Boolean value indicating that the calling directory number should be sent to only the terminal where the called DN is primary. (If the DN is not primary, then the lead port for this DN can have this option.) If this is a shared DN, only the terminal where the DN is primary (or is lead port) will receive the data associated with the incoming call. The terminals sharing the DN will not receive the data. The data displayed will consist of the call appearance identifier, the calling DN, the ISDN call identifier, the time and date, and the originating permissions (if the called party is an attendant serving the calling DN). This option can be assigned to any ltport on an ISDN terminal or shared analog line (class of service = FC_ISDN, FC_ISATND or FC_INDVDL).

In addition to assigning cnd_prim=DBYES, RLis_term.display must be DBYES for display information to be sent in the Display IE for a BRI CPE.

Dependencies: Cnd_prim and cnd_all cannot both have the value of DBYES. Also, if the called DN has an EDS constructed feature, then RLeds_cf.nd_prim and RLeds_cf.nd_dn must agree with the cnd_prim and cnd_all options. If cnd_prim has the value DBYES, then RLeds_cf.nd_prim can have the value DBYES or DBNO and RLeds_cf.nd_dn must have the value DBNO.

**Attribute: cnd_all**

**Fullname:** calling number delivery for all DNs

**Attribute Description** Boolean value indicating that the calling directory number should be sent to all the terminals that have the called DN. This option can be used with shared or non-shared DNs, but its effect is only seen with shared DNs. When this option is assigned to a shared DN, all terminals having the called DN can receive the data associated with the incoming call. The data displayed will consist of the call appearance identifier, the calling DN, the ISDN call identifier, the time and date, and the originating permissions (if the called party is an attendant serving the calling DN). This option can be assigned to any ltport on an ISDN terminal or shared analog line (class of service = FC_ISDN, FC_ISATND or FC_INDVDL).

In addition to assigning cnd_all=DBYES, RLis_term.display must be DBYES for display information to be sent in the Display IE for a BRI CPE.

For a standard BRI (RLdslequip.briclass == BRI_STD), RLlid_cf.cnd_all must be DBYES to have the calling DN sent in the Q.931 Display Text IE. The Standard Display feature provides the standard display information and will include the calling DN if RLlid_cf.cnd_all == DBYES. RLlid_cf.cnd_all is considered a DN feature which means the calling DN will only be shown on call appearances associated with DNs assigned RLlid_cf.cnd_all == DBYES. The standard display feature must be assigned (RLis_term.display == DBYES). If calling number delivery is assigned

Copyright © 1999 Lucent Technologies 

and standard display is not assigned (RLis_term.display == DBNO), then no displays will be sent. This dependency is not enforced during assignment.

Dependencies: Cnd_prim and cnd_all cannot both have the value of DBYES. Also, if the called DN has an EDS constructed feature, then RLeds_cf.nd_prim and RLeds_cf.nd_dn must agree with the cnd_prim and cnd_all options. If cnd_all has the value DBYES, then RLeds_cf.nd_all can have the value DBYES or DBNO and RLeds_cf.nd_prim must have the value DBNO.

**Attribute: oclid**

**Fullname:** outgoing called line id

**Attribute Description** Boolean value indicating that the OCLID display is allowed. When this option is selected, the data associated with the called DN will be displayed to the calling party. The data displayed consists of the call appearance identifier, the called DN, the ISDN call identifier, and the originating permissions of the called party (if the calling party is an attendant serving the called DN). This option can be assigned to any ltport on an ISDN terminal (class of service = FC_ISDN or FC_ISATND).

In addition to assigning oclid=DBYES, RLis_term.display must be DBYES for display information to be sent in the Display IE for a BRI CPE.

For a standard BRI (RLdslequip.briclass == BRI_STD), RLlid_cf.oclid is not referenced. The Standard Display feature allows displays to appear for both outgoing and incoming calls. The OCLID feature should not be assigned to a standard BRI, because software ignores the value assigned to RLlid_cf.oclid. This dependency is not enforced during assignment.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description** Type of billing to be performed. This is a value of type DMBOOL. Billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed. If ama_rec is set to DBYES, billing will be done on a usage sensitive basis. If it is set to DBNO, billing will be done on a flat rate basis.

**Attribute: cnam**

**Fullname:** Calling Name Delivery Feature Active Bit

**Attribute Description** Boolean value used to specify whether or not an ICLID CNAM feature is assigned to the terminating line.

This attribute is used by the Analog Calling Name Delivery Special Feature (SFID 040) and by Calling Name for BRI (SFID 225). It cannot be equal to 'DBYES' for constructed features unless the feature has been purchased (SFID 040 or SFID 225 is set) for the office.

**Attribute: cnam_ama**

**Fullname:** Calling Name Delivery, AMA Billing Bit

**Attribute Description** Boolean used to specify whether to use flat rate or usage sensitive billing for Calling Name Delivery. If cnam_ama is DBYES, billing will be done on a usage sensitive basis. If it is set to DBNO, billing will be done on a flat rate basis.

This attribute is used by the Calling Name Delivery Special Feature (SFID40) and by Calling Name

Copyright © 1999 Lucent Technologies 

for BRI (SFID 225).

**Attribute: ffcf1**

**Fullname:** Boolean reserved for future field feature use.

**Attribute Description** see fullname description.

**Attribute: ffcf2**

# LINERANGE

## 1. Description

This relation is use by the NPA Expansion Feature's exclusion line range assignment. This is the structure for the relation RLlinerange to be used when accessing npa data for line number exclusion.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1024 |
| access type | DBACC_DHSH |
| foldtype | DBDEFAULT |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| permutation type | unperm |
| spare | 3s |

## 3. Field Layout

```

## 4. Population rules for RLlinerang

### Relation Description

RLlinerange is designated for the OSPS NPA Expansion feature.

This relation is used by views 27.11R and 27.11V to store the NPA NXX XXXX line exclusion data for the OSPS NPA Code Expansion for BLV feature (98-5E-4281) in 5e11_1z, 5e12_1i, and 5e13_1y. This structure will be used in 5e14_1b.

Examples:

1) If NPA (312), NXX (979), BEGLINE (1) are input (ENDLINE is null) then the data will be stored as shown in the following column (1)

2) If NPA (312), NXX (979), BEGLINE (1) and ENDLINE (250) are input then the data will be stored as shown in the following column (2)

3) If there are multiple entries for an NPA, the data will be sorted and stored as shown in the following columns (3), (4), and (5).
   There is room in each data structure for 2 ranges. Each tuple will be numbered from 0 up to the maximum number of relations needed -1 in increments of 1. Unused data ranges will be blank. All of the LINE range pairs must be non-overlapping, unique ranges for each NPA. As additional entries are input, the pair will be inserted/deleted in order. If 5 line number ranges are input, 3 tuples will be needed. Tuple number 0 data is seen in column (3). Tuple number 1 is seen in column (4) and number 2 in column (5).

**Attribute:**
npa
**Fullname:**
first key
**Attribute Description:**
Used to store the numbering plan area (NPA) or the local routing number (LRN). The range is 200-999.

**Attribute:**
nxx
**Fullname:**
second key
**Attribute Description:**
Used to store the NXX. The range is 000-999.

**Attribute:**
tupnum
**Fullname:**
third key
**Attribute Description:**
Used to store TUPNUM which is a sequential number of tuples associated with each unique NXX.

**Attribute:**
entries
**Fullname:**
unsigned short attribute.
**Attribute Description:**
Used to store ENTRIES that will indicate the total number of line number ranges specified for this NPA-NXX.

**Attribute:**
begline[*]
**Fullname:**
unsigned short attribute.
**Attribute Description:**
Used to store the BEG LINE value. The range is 0000-9999.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**

endline[*]

**Fullname:**

unsigned short attribute.

**Attribute Description:**

Used to store the END LINE value. The range is 0000-9999.

If END LINE is not specified, then it will equal BEG LINE in the data.

## 4. Population Rules for RLlls_sm

**Relation Description**
CCITT 6 label/linkset to terminating sm relation

This relation identified the SM number to which a CCITT6 trunk terminates, given a label and linkset. This relation is used by CCITT Signaling System No. 6 Message Transfer Part. Populated with all tuples in the CCITT6 global SM only. This global SM is identified by the global parameter Glccitt6sm.

**Attribute: label**

**Fullname:** Band (that is label[4-10], upper 7 bits) and member number (that is, label[0-3], lower 4 bits).

**Attribute Description** The label consists of 11 bits the lower order 4 bits(label[0-3]) contain the band member number, the upper 7(label[4-10]) the band. This number is assigned by the administration. The following is the layout of label:

```
10 9 8 7 6 5 4 3 2 1 0
|-|-|-|-|-|-|-|-|-|-|-|
<--- band---->< label >
```

Copyright © 1999 Lucent Technologies

bit 0 is low order bit.

**Attribute: lsnum**

**Fullname:** signaling linkset

**Attribute Description** Signaling linkset is a number between 1 and 63 as assigned by the administration. A linkset represents a group of direct links connecting two CCITT6 exchanges, a CCITT6 exchange and an STP or two STPs. Current implementation will be no more than two links in a linkset.

For Singapore there will be no more than two links in a linkset.

**Attribute: primary**

**Fullname:** Primary flag

**Attribute Description** This flag indicates whether the link set/band is the primary or an alternate incoming link set/band. If it is a primary link set/band, the flag is set to DBYES. Otherwise, it is set to DBNO.

**Attribute: sm**

**Fullname:** switching module number

**Attribute Description** Switching module number is used to identify the sm to which a CCITT6 trunk terminates.

## 4. Population rules for RLlnk_pli

**Relation Description**

```
        TSI Link to Peripheral Link mapping

        This relation maps from the physical link position
        (with respect to the peripheral unit) to the Time Slot
        Interchanger (TSI) end of the PCT link.
        It is the reverse mapping of the RLpli_lnk relation.
        For each entry in RLlnk_pli there must be an associated
        tuple in RLpli_lnk.
```

**Attribute:**

```
        unittype
```

**Fullname:**

Peripheral Unit Type

**Attribute Description:**

The type of peripheral unit.

**Attribute:**

unitnumber

**Fullname:**

unit number

**Attribute Description:**

The number that identifies the selected peripheral unit.

**Attribute:**

pct_link

**Fullname:**

peripheral control and timing unit link number

**Attribute Description:**

This attribute identifies the relative PCT link number for the peripheral. The range depends on the type of peripheral unit:

SMPSIU : Range is the same as the lower 5 bits of PCTLNK circuit index. It represents the PSU shelf number and the PCT connection which is always 0.

SMDNU_S: Range is 0 through 11 with links 0 through 5 being in data group 0 and links 6 through 11 in data group 1. One tuple for each duplex PCT link connected to the CDs

**Attribute:**

tsi_link

**Fullname:**

TSI link number

**Attribute Description:**

This attribute identifies the TSI link associated with the specified PCT link.

**Attribute:**

is_ts_inv

**Fullname:**

Is Time Slot Inversion used?

**Attribute Description:**

This attribute will indicate if Time Slot Inversion is being used by the TSI link.

**Copyright © 1999 Lucent Technologies**

## 4. Population rules for RLlnk_use

### Relation Description

TSI Link Usage

This relation describes what is connected to each of the 44 TSI Links on an SM-2000.

NOTE: Unless otherwise specified, NLI will refer to both NLI and ENLI.

For every equipped TSI slice (pair of rlCKTDATA tuples with a circuit type of PCTSIS) 4 tuples are populated in this relation, one for each of the four TSI links on a TSI slice. If the TSI link is not connected to anything, the use attribute will be set to TS_UNEQ, otherwise it will be set to a value indicating how the TSI link is being used.

The first four TSI links have fixed uses, as follows:

| link | use | index | use in skeleton |
|---|---|---|---|
| 0 | TS_MCP | 0 | TS_MCP |
| 1 | TS_DX | 0 | TS_UNEQ |
| 2 | TS_NLI | 0 | TS_NLI |
| 3 | TS_NLI | 1 | TS_NLI |
| 2 | TS_LOOP | 0 | TS_LOOP |

**Attribute:**

link

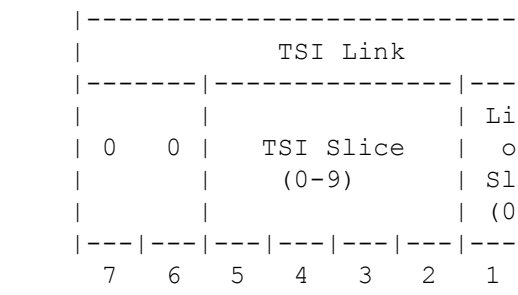
**Fullname:**

TSI Link Number

**Attribute Description:**

This is the TSI link number, which could also be thought of as a TSI slice number and a link number on that slice, as follows:

Copyright © 1999 Lucent Technologies 



**Attribute:**
is_oper
**Fullname:**
Operation Indicator
**Attribute Description:**
States whether the board is operational. If 'use' is TS_UNEQ, then 'is_oper' states whether both sides of the TSI are operational. If 'use' is not TS_UNEQ, then 'is_oper' states whether both sides of the peripheral or network connection are operational.

**Attribute:**
use
**Fullname:**
What TSI link is used for.
**Attribute Description:**
Sequential even-odd TSI link pairs (such as, 0 &1, 20 & 21, etc.) are serviced by a common SP, and must both be used for either a network connection (that is, NLI) or a peripheral connection (such as, DX).

**Attribute:**
lnk1spr
**Fullname:**
Spare attribute # 1
**Attribute Description:**
Currently unused.

**Attribute:**
lnk2spr
**Fullname:**
Spare attribute # 2
**Attribute Description:**
Currently unused.

**Attribute:**
lnk3spr
**Fullname:**
Spare attribute # 3

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Currently unused.

**Attribute:**
index
**Fullname:**
Index of circuit at far end of link
**Attribute Description:**
This attribute is meaningful only in combination with the 'use' attribute. The following layout shows what index contains for various 'use' values:

| use | index |
|---|---|
| TS_NLI | E/NLI Number 0-23 on SM-2000 ORM,LSM/HSM |
| TS_DX | DX Number (0-5) |
| TS_PLI | Logical PCT Link (0 to Glsmpctmax -1) |
| all others | 0 |

**Attribute:**
tmslnk_0
**Fullname:**
First TMSLNK connected to an NLI
**Attribute Description:**
This attribute is only used for tuples with use=TS_NLI. It contains the TMSLNK number of the TMSLNK connected to the NLI this TSI link is connected to.

**Attribute:**
tmslnk_1
**Fullname:**
Second TMSLNK connected to an NLI
**Attribute Description:**
This attribute is only used for tuples with use=TS_NLI. It contains the TMSLNK number of the second TMSLNK connected to the NLI this TSI link is connected to.
A NLI uses both TMSLNK sub links implying that tmslnk_1 should be a valid TMSLNK number.
A NLI1 and an ENLI use only one TMSLNK sublink implying that tmslnk_1 should be invalid.
CM2C offices uses a NLI1.
A NLI is used for a local SM-2000.
A NLI is also used for EXM with TRCU3.
A ENLI is used for EXM with TRCU or TRCU2.

**Attribute:**
trcu0_pi
**Fullname:**
TRCU path index connecting to NLI on ONTC side 0.
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

```
        This attribute is a duplicate of the one in RLnli_lnk.
        See RLnli_lnk.R for the complete checks against
        this attribute.
```

**Attribute:**

```
        trcu1_pi
```

**Fullname:**

```
        TRCU path index connecting to NLI on ONTC side 1.
```

**Attribute Description:**

```
        This attribute is a duplicate of the one in RLnli_lnk.
        See RLnli_lnk.R for the complete checks against
        this attribute.
```

**Defines:**

```
         "db/DMtmslnk.h",
         "db/DMclidef.h"
```

## 4. Population Rules for RLlnkgrp

**Relation Description**
Link Group Relation

This relation defines the link group, network, originating point code, destination point code and valid link group members of the link group. This relation resides in the AM and in the Global SMs as defined by the global parameters Glnatl7sm and Glintl7sm.

**Attribute: lnkgrp**

**Fullname:** Link Group number

**Attribute Description**

Copyright © 1999 Lucent Technologies 

The link group defines a pool of spare signaling data links (SDL) which can be used when the predefined(default) SDL fails.

**Attribute: valid_mbrs**

**Fullname:** Valid Members

**Attribute Description** This attribute defines which link group members have been defined as part of the link group by being added to relation RLlgrpmem. This attribute is a bit map. such as, if bit 3 equals 0, then link group member 3 is not defined. If bit 3 equals 1, then link group member 3 is defined.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This attribute defines the destination point code (DPC) of the link group.

**Attribute: network**

**Fullname:** SS7 network

**Attribute Description** The SS7 network (CCNATL or CCINTL) for which the link group is a part of.

**Attribute: opc**

**Fullname:** Originating Point Code

**Attribute Description** This defines the originating point code of the link group.

## 4. Population rules for RLlnkp_ls

### Relation Description

```
        Link port link set

        This relation consists of information on a particular link.
        The purpose of this relation is to provide a mapping of the DLT
        number assigned to the ST port to its assigned link set and member
        number.  Also, since the DLT number uniquely identifies a link,
        specific link information (such as, SLC(R), priority, SLS assignments)
        is also included.
```

Copyright © 1999 Lucent Technologies

This relation resides in the National SS7 Global SM (defined by the Glnat17sm office parameter) and/or in the International SS7 Global SM (defined by the Glint17sm office parameter).

NOTE: This relation is used by both the National and International versions of SS7. The Global SMs for these two versions must be separate, and any partitioned relations, like this one, must be populated independently on each GSM.

**Attribute:**
dltnum
**Fullname:**
Data link terminal number
**Attribute Description:**
The Data Link Terminal (DLT) number is the port name of the DLT port associated with the signaling terminal.

**Attribute:**
priority
**Fullname:**
Priority
**Attribute Description:**
The assigned priority of the link containing the DLT. Priorities are defined as follows:
Priority 1: link should be active and loaded.
Priority 2: link should be active but not loaded.
Priority 3: link is standby and not active nor loaded.

**Attribute:**
slc
**Fullname:**
Signaling link code
**Attribute Description:**
The value of the Signaling Link Code assigned to the link (containing the DLT) which uniquely identifies the link between two offices.

**Attribute:**
member
**Fullname:**
Link set member
**Attribute Description:**
The linkset member which contains the data link terminal (DLT).

**Attribute:**
lsnum
**Fullname:**

## 4. Population Rules for RLInkSls

**Relation Description**
Normal signaling link selection codes for links.

This relation lists the normal signaling link selection (SLS) codes for a particular number of active links.

**Attribute: numlnk**

**Fullname:** Number of active loaded (priority 1) links.

**Attribute Description** This attribute defines the number of active loaded (priority 1) links.

**Attribute: slslnk[*]**

**Fullname:** Signaling Link Selection codes for link x, where x corresponds to slslnkx

**Attribute Description** This defines the SLS code for link member x.

Copyright © 1999 Lucent Technologies

# LNNODE_M

## 1. Description

Leased network node mapping.

This relation maps the external switch ID used to communicate with switch personnel (CLLI) code into the internal switch ID (ars_idx) used to collect measurements. This is used for the collection and reporting of Leased Network node-to-node measurements.

## 2. Data Dictionary Values

## 4. Population Rules for RLlnnode_m

**Relation Description**
Leased network node mapping relation.

This relation is required to allow collection of node-to-node measurements in the Leased Network. For every final destination switch (regardless of intermediate via switches) identified by CLLI code, this relation specifies which ARS index is being used to route calls to that destination. There must be exactly one tuple in this relation for each

Copyright © 1999 Lucent Technologies 

destination switch in the leased network. A more complete description follows.

A leased network destination node is identified by specifying a switch and a voice/data route indicator. For example, the Seattle switch is two leased network nodes 'Seattle voice' and 'Seattle data.' A Leased Network access switch will collect data for calls to each destination node.

There must be a method to identify nodes for external communication with RNMS and the switch personnel, and there must be a method to identify nodes internally in the switch to collect the counts. The external node ID will consist of a common language location identifier (CLLI) code and a voice/data flag. The CLLI code is a universal code used to identify switches.

This external node ID will not facilitate data collection in the switch because the CLLI code is not available during call processing. The internal node ID will be based on the routing structure currently being used in the Leased Network. In this routing structure, an ARS index will correspond to a destination switch. The measurements will be collected by ARS index and the data rate returned in the NCP query will be used to distinguish voice and data calls.

There will be a new recent change view 10.28 and relation used to map the external switch IDs (CLLI code) to the internal switch IDs (ARS index) in the switch. Data can be reported only for destination switches entered in this view. The corresponding new relation will contain the CLLI code and ARS index for each destination switch for which data can be collected.

The ARS index used for leased network routes to be included in the node-to-node measurements will be restricted to values not greater than 1000. This is higher than any expected use and will save resources when indexing the counters.

Glln_nodes reflects the number of tuples in this relation, therefore it needs to be updated when an insert and/or delete is executed for this relation. Glln_nodes is used for TRFC30 measurements to size section 146 of their report.

**Attribute: clli**

**Fullname:** Common Language Location Identifier

**Attribute Description** This field will be used as an external identifier for a destination switch. It is not used in the switch other that as a means to communicate a switch ID to the switch personnel.

**Attribute: ars_idx**

**Fullname:** ARS Index

**Attribute Description** ARS Index will be used to internally identify a leased network destination switch. It will be used as an index to collect node-to-node measurements.

**Copyright © 1999 Lucent Technologies** 

# LOCIPADR

## 1. Description

This relation contains all of the local IP addresses assigned to one *5ESS*®-2000 switch. It is used by RC/V to verify uniqueness and to assign an index to each IP address.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population rules for RLlocipadr

**Relation Description**

Local Interface Protocol (IP) address relation.

Copyright © 1999 Lucent Technologies

This relation contains a list of all the IP addresses on the switch.

**Attribute:**
ip_addr
**Fullname:**
IP address
**Attribute Description:**
This attribute is an IP address which has been assigned to either a processor (SM, PH, MH, etc) or an IP interface on this switch.

**Attribute:**
ip_vers
**Fullname:**
IP version
**Attribute Description:**
This is the version (eg 4 or 6) of the IP address.

**Attribute:**
sm_name
**Fullname:**
Switching module number
**Attribute Description:**
The number of the switching module associated with the interface.

**Attribute:**
indx_addr
**Fullname:**
IP address index
**Attribute Description:**
A unique index to represent the IP address. Used to save memory in the SMs.

## 4. Population Rules for RLlocname

**Relation Description**
OSPS Automated Directory Assistance System (ADAS) Locality Name

RLlocname defines one of the relations (keyed by Locality Name) that is used for the ADAS Locality Number to Name Mapping table for the OSPS ADAS - Release 1 feature.

**Attribute: locname**

**Fullname:** Locality Name

**Attribute Description** The 1 - 20 character caller-provided location name where a Directory Assistance (DA) search will be performed.

**Attribute: locnbr**

**Fullname:** Locality Number

**Attribute Description** The number (1 - 65,535) associated with a Locality Name.

**Attribute: ospsff1**

**Fullname:** Spare 1

**Attribute Description**Spare field for fast feature development.

**Attribute: ospsff2**

**Fullname:** Spare 2

**Attribute Description** Spare field for fast feature development.

# LOG_TONE

## 1. Description

Maps logical tone names to memory block locations in UTG in SMs equipped with LDSU-E. IN SMs with LDSU2, this relation provides the wave_num associated with a given log_tn_name, and it specifies the frequency and power level information for the sine waves making up the waveform.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 128 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 256 |
| page level | 2 |
| l1 length of subkey 1 | 8 |
| p1 position of subkey 1 | 8 |
| ignore key bits | 0-7 |

## 3. Field Layout

```

## 4. Population Rules for RLloss_tbl

**Relation Description**
Analog and digital loss values for specific loss type.

RLloss_tbl is used by both U.S. and international.
RLloss_tbl is recent changeable for international only.

***NOTE:*** For U.S. offices all the RLloss_tbl tuples' aloss attributes should be set to 0 (zero) and all the dloss attributes should be set to 0 (zero).

No SMLU3 or SMLU4 tuples are needed. SMLU3 and SMLU4 use the same loss settings as SMC1LU and will use SMC1LU's tuples.

**Attribute: losstype**

**Fullname:** type of loss supplied to subscriber line

**Attribute Description** This attribute is of domain DMLOSSTYPE. It is one of two keys to the relation. A tuple is required for each enumeration in the domain DMLOSSTYPE, for each line unit

Copyright © 1999 Lucent Technologies 

(SMC1LU, SMISLU or SMRISLU) in the *5ESS*®-2000 switch. Note: Z-CARDS must exist in the RISLU/ISLU before that unittype needs to be populated.

**Attribute: unittype**

**Fullname:** line unit type

**Attribute Description** This attribute is also a key. It is of domain DMUNITTYPE. Valid values are SMC1LU, SMISLU and SMRISLU. For a *5ESS* ®-2000 switch containing one of these units, the tuple must be populated. Note: Z-CARDS must exist in the RISLU/ISLU before that unittype needs to be populated.

**Attribute: aloss**

**Fullname:** analog receive loss

**Attribute Description**This attribute is of domain DMISLOSS. The valid values for this attribute range from -3.0 (represented by -6) to +16.5 (represented by 33) in 0.5 steps. This attribute is the amount of receive analog loss to apply at the ISLU-Z line card.

**Attribute: dloss**

**Fullname:** digital loss

**Attribute Description** This attribute is of domain DMISLOSS. The valid values range from 0 to 15 (represented by 30) in 0.5 steps. This is the amount of digital loss applied at the TSI.

Copyright © 1999 Lucent Technologies 

# LPCONFIG

## 1. Description

Switching Module (SM) loadable packages contained in SM configurations. This is an existence relation, meaning the loadable package A is loaded in configuration 1 if and only if the tuple (1,A) exists.

This relation is pre-populated based on the feature database. It is generated by a tool during load building and distributed to ODA.

Currently it has a distribution of disk only since ODA is the only user of the relation. However, it is possible in future generics that *5ESS*®-2000 switch software (such as RC/V) may want to access this relation thus requiring the distribution type to be changed.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 750 |
| expected tuples | 200 |
| access type | DBACC_CIND |
| memory type | DBDISK |
| distribution | DO |
| relation type | DBSTATIC |

## 3. Field Layout

```

```

## 4. Population Rules for RLlpconfig

**Relation Description**
Loadable package to SM configuration mapping.

This relation lists what loadable packages are loaded in each SM configuration. This relation is a fixed relation that is populated at the time of the generic software compilation. The is an existence relation that has two attributes which are both keys, smconfig and package. Each tuple in the relation implies that the configuration contains the loadable package. If a combination of a configuration and loadable package does not exist as a tuple in this

Copyright © 1999 Lucent Technologies 

relation, then that configuration does not contain the loadable package.

**Attribute: smconfig**

**Fullname:** SM configuration.

**Attribute Description** One of the software configurations an SM can be assigned.

**Attribute: package**

**Fullname:** Loadable Package.

**Attribute Description** One of the loadable packages loaded in an SM configuration.

## 4. Population rules for RLlprt_fw

### Relation Description

```
        Local Port Firmware

        Local D-port mapping to servclass and firmware change level.

                DESCRIPTION OF FOLLOWING PAGES:
                HOW TO MAKE CHANGES TO THIS FILE
                SERVCLASS GLOSSARY
                24-BIT FIRMARE VALUE FOR OSPS UNITS
```

Copyright © 1999 Lucent Technologies

Following these pages is a description of the firmware values associated with each unit. On a per unit basis, there is a unit description along with the associated J-Drawing/Equipment Code and the 'servclasses' associated with the unit. Each unit description contains a Table of assigned firmware change level indicator (FWCLI) values for the unit. The columns in this table represent:

FWCLI: 9-character string representing the fwcli value
FWCLI HEX VALUE: 24-Bit hexadecimal equivalent of
the 9-character string representation

MC PRODUCT NUMBER: Microcode Product Number associated with
the firmware LDI

LIST NUMBER: Corresponding List Number for the firmware LDI
This field may be Not Applicable (NA) to some units.
SITE: The site this firmware is intended for.

RELEASE: The Generic Release this firmware was introduced for.

NOTES: An integer referencing a note describing the purpose
of this firmware change.

An fwcli value represented in these tables will reside in the firmware of the BST and VDT units and can be displayed in its 9-character string representation by local diagnostics. The fwcli value is transmitted to the switch on initialization of these units. In general, if the particular fwcli value is needed by switch-side Level 3 process to synchronize Level 3 protocol with the unit, the fwcli value will be placed in the relation RLlprt_fw either by ODA in the case of a new start or via Generic Retrofit or Recent Change in the case of a software/firmware retrofit.

HOW TO MAKE CHANGES TO THIS FILE:
Any change to this file must be approved by the following organizations:

The inclusion of a new OSPS unit must be accompanied by a description (on a new page) of the OSPS unit and its associated J-Drawing, servclasses and Table of assigned FWCLI values.

SERVCLASS GLOSSARY

NOTES

1. This is the base firmware for the Directory Assistance feature in Generic 5E4(1).

UNIT = TN1087

**Copyright © 1999 Lucent Technologies** 

UNIT DESCRIPTION:
The TN1087 is a Terminal Adapter first introduced in Generic 5E4(1). In asynchronous mode, it provides for the connection of OAPs, XDPs, ACCs, HOBIS computers, HOBIC voice quote equipment, HOBIC record quote printers, and Autoquote local modems. In synchronous mode, it provides for the connection of Directory Assistance System Computers (DASCs), Real-Time Rating Systems (RTRSs) and External Information Systems (EISs).
This unit supports transmission speeds of 110, 300, 1200, and 9600 baud.

J-DRAWING: J5D003FG
SERVCLASS(ES): FC_DASC, AS_OAP, HM_RAS, FC_RTRS, FC_HOBIS, FC_HOTVT, FC_HOTRT, OA_AQDSL OA_MIS_LNK, FC_EIS_LNK

  |    1.  This is the base firmware for the Toll and Assistance
  |        feature in Generic 5E4(2).
```

**Attribute:**
ldport
**Fullname:**
local D-port
**Attribute Description:**
key-local port assignment of D-channel.

**Attribute:**
servclass
**Fullname:**
Serve class
**Attribute Description:**
class of service (as defined in RLfc_porttyp).

**Attribute:**
fwcli
**Fullname:**
firmware change level indicator
**Attribute Description:**
The use of this attribute depends on the servclass.
For servclasses OA_IFTERM and OA_IFOPER, this attribute is used to identify the generic of the 5ESS(R)-2000 switch on the far end of the OSPS Interflow link. It may be necessary for the Level 3 code to use this information if a generic retrofit on the far end is not backward compatible at Level 3. The 5ESS(R)-2000 switch generic numbers will be identified by '# defines' in the db/DMfwclidef.h file. For these two servclasses, none of the bit field description given throughout the rest of this file apply!!

For all serveclasses OTHER than OA_IFTERM and OA_IFOPER
the following applies:
fwcli: 24-bit value

Descriptions of what the various bits being on or off represent is defined in the file 'db/DMfwclidef.h'
(SEE BIT FIELD DESCRIPTION IN THE GENERAL DESCRIPTION SECTION)
fwcli: a single valued variable representing the generic of the 5ESS(R)-2000 switch on the far end of the OSPS Interflow link. See db/DMfwclidef.h for #defined values. Currently, the 5E5 generic is defined and nine more values are for future use

| fwcli value | associated generic |
|---|---|
| PSIF0 | 5E5 generic - |

**Copyright © 1999 Lucent Technologies** 

```
                                    FWCLI = 0x000000000000
        PSIF1                     future use
        PSIF2                     future use
        PSIF3                     future use
        PSIF4                     future use
        PSIF5                     future use
        PSIF6                     future use
        PSIF7                     future use
        PSIF8                     future use
        PSIF9                     future use
        PSIF10                    future use

    The fwcli value (24-bits) should be input in RC or ODA
    as a text string of nine characters since this string
    may be used by the switch personnel for diagnostic purposes
    such as, FWCLI xxxyyyzzz
    Each group of three characters must be converted to
    a binary number and placed in the corresponding bits
    of the 24-bit fwcli attribute as follows:
    Characters xxx occupy bits 23 through 16
    Characters yyy occupy bits 15 through 8
    Characters zzz occupy bits  7 through 0
    xxx can range from 000 through 255
    yyy can range from 000 through 255
    zzz can range from 000 through 255
```

**Defines:**

```
     "db/DMport.h"
```

```

## 4. Population Rules for RLlprt_pos

**Relation Description**
Local B-channel port to position mapping.

This relation contains a mapping of local B-channel port to position. This relation should be consistent with the relations RLpos_port, RLport_pos and RLpos_lprt. Consistency means that corresponding tuples in the relations: RLpos_lprt, RLlprt_pos, RLpos_port, and RLport_pos must exist, and certain attributes in these tuples must have the same value. For a list of these attributes, and a description of which relations they must be consistent with see the comments in the check section.

**Attribute: lbport**

**Fullname:** local B-channel port

**Attribute Description** See RLpos_port.gbport.member.

**Attribute: posnum**

**Fullname:** position number

Copyright © 1999 Lucent Technologies 

**Attribute Description** Position number connected to this port.
Restrictions: Cannot be changed if the position is logged in.

**Attribute: posdb_key**

**Fullname:** posdb key

**Attribute Description** This attribute contains the key of the relation RLposdb (when pos_typ = OA_BST), and key of the relation RLtaposdb (when pos_typ = OA_VDT or OA_INT). This attribute should not show up on the recent change view. It should be handled internally when various other attributes change. There is one posdb_key associated with each port, and each position type. Therefore, if the lbport attribute is changed, so should the posdb_key attribute.

The posdb_key is an integer between 1-200. It must have a different value for every tuple.

There are seven globals which will be used in allocating the posdb_key values. They are: Gl1poskey, Gl2poskey, Gl3poskey, Gl4poskey, Gl5posk, Gl6posk, and Gl7posk. Each bit in each global will represent a separate value for the posdb_key attribute. The values are represented as follows:

Gl1poskey:
This global represents posdb_key values 1-32. The lowest order bit in this global will represent posdb_key value 1, the next low-order bit will represent posdb_key value 2, and so on until the highest order bit is reached, and it will represent posdb_key value 32.

Gl2poskey:
This global represents posdb_key values 33-64. The lowest order bit in this global will represent posdb_key value 33, the next low-order bit will represent posdb_key value 34, and so on until the highest-order bit is reached, and it will represent posdb_key value 64.

Gl3poskey:
This global represents posdb_key values 65-96. The lowest order bit in this global will represent posdb_key value 65, the next low-order bit will represent posdb_key value 66, and so on until the highest-order bit is reached, and it will represent posdb_key value 96.

Gl4poskey:
This global represents posdb_key values 97-128. The lowest order bit in this global will represent posdb_key value 97 , the next low-order bit will represent posdb_key value 98, and so on until the highest-order bit is reached, and it will represent posdb_key value 128.

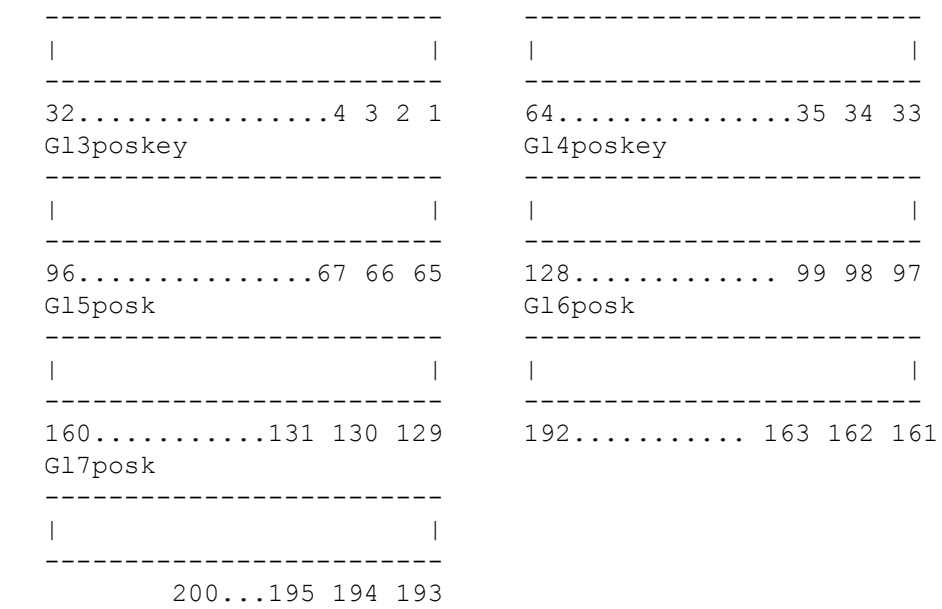
Gl5posk:
This global represents posdb_key values 129-160. The lowest order bit in this global will represent posdb_key value 129, the next low-order bit will represent posdb_key value 130, and so on until the highest-order bit is reached, and it will represent posdb_key value 160.

Gl6posk:
This global represents posdb_key values 161-192. The lowest order bit in this global will represent posdb_key value 161, the next low-order bit will represent posdb_key value 162, and so on until the highest-order bit is reached, and it will represent posdb_key value 192.

Gl7posk:
This global represents posdb_key values 193-200. Only the eight lowest-order bits are currently used in this global, with the lowest-order bit representing posdb_key value 193, and up through 200 from there.

```
Gl1poskey                    Gl2poskey
```

Copyright © 1999 Lucent Technologies 



They should only reside on SM's where the osps_sm attribute in RLmodatt is set to DBYES.

**Attribute: pos_typ**

**Fullname:** position type

**Attribute Description**ependencies: This parameter will be set to OA_INT only if this is an interflow position and the B-channel port associated with this position has a class of service (servclass) of OA_IFOPER in RLfc_porttyp. This attribute can only be changed if the port using this tuple is out of service. This is indicated in the bsc_state attribute in RLPORTLA as keyed by the local b-channel port of this tuple.

**Definese:** "db/DMport.h"

```

## 4. Population Rules for RLlprtaccs

**Relation Description**
This relation should be consistent with the dynamic SM relation RLaccsdb.

This relation will provide a sequential key to access RLaccsdb. The accsdb_key must be a non-overlapping value per switching module (SM).

**Attribute: lport**

**Fullname:** local port

**Attribute Description** Local port assignment of DSU2 port.

**Attribute: accsdb_key**

**Fullname:** ACCSdb sequence key

**Attribute Description** Sequence key for accsdb.

## 4. Population Rules for RLlpt_pt

### Relation Description

Copyright © 1999 Lucent Technologies

Logical port to port.

Logical port and port type to port and party mapping relation. Also contains B channel management information for an ISDN user.

Application Specific Population Rules - Default Service

BFG DESCRIPTION:
Each Default Service BFG requires a GPD tuple in RLlpt_pt. Default Service allows unknown CPE on a BRI (subscribing to Default Service) to allow originations. No terminations are allowed to a CPE utilizing Default Service.

QUANTITY OF TUPLES:
Each Default Service BFG id must have 1 tuple in RLlpt_pt populated on each SM having one or more DSL's assigned that Default Service BFG id. This is implemented using a distribution type of FG(GRP_PART) with type GPDBFG.

```
DISTRIBUTION RULES   - GROUP PARTIONED RELATION BY BFGID
                       GROUP TYPE = GPDBFG
```

This relation will be populated on the AM when the Default Service BFG is first constructed. The first time a DSL is associated with the Default Service BFG the group data will be deleted from the AM and moved to the SM associated with that DSL.

Once a Default Service BFG is deleted from the AM and inserted on an SM, the tuples will be copied from one SM to another as the Default Service BFG is assigned to DSL's on different SM's.

For further details on the specifics of handling Group Partioned Data, refer to RLdb_amgpd, RLdb_imgpd and RLdb_gpdus.

TUPLE SEMANTICS:

```
Attribute       Value
---------       ------
lport           - bfgid
lpt_type        - LPT_BFG
port            - #GLMNPORT - #GLMXPORT
party           - FCP_DFLTSRV (0)
max_bchan       - 1
csv_bchan       - 1
csd_bchan       - 0
odb_bchan       - 0
csv_hunt        - DBNO
csd_hunt        - DBNO
csv_fixed       - FCANY_CHAN
csd_fixed       - FCNO_BCHAN
```

**********

Application specific population rules - remote protocol access (RPA)

DESCRIPTION:
Remote Protocol Access ports are defined in RLdn_rdta and may be either Pseudo BRI ports or EDSL PRI trunk ports. The Pseudo BRI ports are defined in RLfc_porttyp with a servclass of TM_P_BRI and have an lport value. The trunk PRI ports have a servclass of FCEDSL, must have an lp_type of PCTBCHAN and do not have an lport value. There should not be tuples in this relation for RPA EDSL PRI trunk ports! The Pseudo BRI ports will have corresponding tuples in RLfc_line and RLrt_dntran but will not have tuples in RLpsx25ln, RLdslequip, RLequipdsl,

**Copyright © 1999 Lucent Technologies** 

RLdslgdata, RLdpidb_pt, RLdgrp_ri, RLlpt_spid, RLspid or RLri_dgrp.

TUPLE SEMANTICS for RPA Pseudo BRI Ports:

```
Attribute   Value
---------   ---------
 lport       1  - 8190
 lpt_type    LPT_ISDN
 port        valid port values (must match with  port in RLdn_rdta)
 party       0
 csv_hunt    DBNO
 csd_hunt    DBNO
 csv_fixed   FCNO_BCHAN
 csd_fixed   FCNO_BCHAN
 csv_bchan   0
 csd_bchan   0
 odb_bchan   0
 max_bchan   0
```

**Attribute: lport**

**Fullname:** logical port.

**Attribute Description** The LPORT is a sequentially assigned number administered by recent change. For more information on the allocation of LPORTs, refer to the population rules for RLrc_lphol and RLrc_qidx.

**Attribute: lpt_type**

**Fullname:** logical port type.

**Attribute Description** Logical port type of a user.

**Attribute: port**

**Fullname:** port.

**Attribute Description** port - D-channel or analog port.

**Attribute: party**

**Fullname:** party value.

**Attribute Description** If lpt_type==LPT_OTHER party = 0-9 else party = 0-7

**Attribute: csv_hunt**

**Fullname:** Circuit switched voice hunt.

**Attribute Description** Indicate if user is a member of circuit switched voice and multi-line hunt group.

**Attribute: csd_hunt**

**Fullname:** circuit switched data hunt.

**Attribute Description** Indicate if user is a member of circuit switched data multi-line hunt group.

Copyright © 1999 Lucent Technologies 

**Attribute: csv_fixed**

**Fullname:** circuit switched voice B channel fixed.

**Attribute Description** This attribute restricts the B channel to be used for circuit switched voice to a particular B channel.

If the value of this attribute is FCB1_CHAN or FCB2_CHAN, then the briclass must by BRI_PP. The other values for this attribute, FCNO_BCHAN and FCANY_CHAN, are allowed for BRI_MP and BRI_STD.

**Attribute: csd_fixed**

**Fullname:** circuit switched data B channel fixed.

**Attribute Description** This attribute restricts the B channel to be used for circuit switched data to a particular B channel.

If the value of this attribute is FCB1_CHAN or FCB2_CHAN, then the briclass must by BRI_PP. The other values for this attribute, FCNO_BCHAN and FCANY_CHAN, are allowed for BRI_MP and BRI_STD.

**Attribute: csv_bchan**

**Fullname:** circuit switched voice B channels.

**Attribute Description**The number of B channels allowed for circuit switched voice calls.

**Attribute: csd_bchan**

**Fullname:** circuit switched data B channels.

**Attribute Description** The number of B channels allowed for circuit switched data calls.

**Attribute: odb_bchan**

**Fullname:** Packet Switched On-Demand B-Channels

**Attribute Description** This attribute contains the number of B channels allowed for On-Demand B-Channel packet switched calls. The values of this attribute range from 0 to 2. The default for this attribute is 0.

If the Logical Port Type is not packet (LPT_PKT), then the number of On-Demand B-Channels allowed is 0. If the Logical Port Type is packet and this is an On-Demand B-Channel, then the number of On-Demand B-Channels must match RLodpsop.

**Attribute: max_bchan**

**Fullname:** maximum number of B channels.

**Attribute Description** Maximum number of B channels that this vport may use simultaneously for any on-demand service.

**Defines:** "db/DMparty.h"

## 4. Population Rules for RLlpt_spid

**Relation Description**
Logical PORT (LPORT) and Logical PorT TYPE (LPT_TYPE) to Service Profile IDentifier (SPID) mapping relation

This relation is used to equate an ISDN LPORT and LPT_TYPE to its corresponding USPID,EPDN,NATYPE & NPID. The user's SPID is the USPID consisting of the USPID digits that are externally entered by the service provider, and a USPID digit count field that is internally generated by the switch.

The LPORT and LPT_TYPE are used as keys to other Service Order Profile (SOP) relations.

This relation is static and domestic.

**Attribute: lport**

**Fullname:** Logical PORT (LPORT)

**Attribute Description** The LPORT is a sequentially assigned number administered by recent change. For more information on the allocation of LPORTs, refer to the population rules for RLrc_lphol and RLrc_qidx.

**Attribute: lpt_type**

**Fullname:** Logical PorT TYPE (LPT_TYPE)

**Attribute Description** The LPT_TYPE indicates the logical port type of this LPORT.

**Attribute: natype**

**Fullname:** Network Address TYPE (NATYPE)

**Attribute Description** The NATYPE is a one bit indicator which indicates if the attribute locdn is populated or if mepdn is populated. The attribute locdn contains a NOC and 4 digit Directory Number (DN). MEPDN has a Multi-Line Hunt Group (MLHG) and member representation.

**Attribute: npid**

**Fullname:** Numbering Plan IDentifier (NPID)

**Attribute Description** The NPID indicates the type of numbering plan associated with this EPDN. Currently, only circuit and packet NPIDs are supported. The domain may allow private numbering plans in the future.

**Attribute: locdn**

**Fullname:** Local directory number

**Attribute Description** This attribute consists of the NOC (normalized office code) and four directory number digits. Note: when natype == NAT_MLHG, the locdn attribute does not contain useful information and should never be used. When natype == NAT_MLHG, locdn.noc == 8191(a pseudo NOC) and locdn.digits="0000". These values are there so that this OPVIEW relation will work correctly.

**Attribute: locdn.noc**

**Fullname:** Normalized office code

Copyright © 1999 Lucent Technologies 

**Attribute Description** Normalized office code

**Attribute: locdn.digits**

**Fullname:** Digits

**Attribute Description** The local dn minus the office code.

**Attribute: mepdn**

**Fullname:** Multi-line hunt group epdn

**Attribute Description** Multi-Line Hunt Group (MLHG) and Member representation.

**Attribute: uspid**

**Fullname:** User Service Profile Identifier

**Attribute Description** The USPID indicates the service provider assigned User Service Profile IDentifier.

For custom ISDN interface the USPID can be anywhere from 1 thru 10 digits. For standard ISDN interface the USPID can be anywhere from 1 thru 18 digits. No duplicate USPID allowed in the *5ESS*®-2000 switch database.

(The uspid digit count is generated, not specifically input).

New USPID = uspid.digcnt,uspid.dig1, uspid.dig2,...uspid.dig18.

Digits will be right justified when less than 18 are specified - that is, least significant digit stored in uspid.dig18. Unused digits = 0. Digits will be stored in BCD.

**Attribute: uspid.digcnt**

**Fullname:** The USPID digit count

**Attribute Description** Specifies the number of digits assigned in the USPID

**Attribute: uspid.dig[*]**

**Fullname:** Digit 1, Digit 2, .. Digit 17,Digit 18

**Attribute Description** Digits 1 thru 18 of USPID

# LPTSPID

## 1. Description

Logical port and port type to Service Profile IDentifier mapping. The only logical port types currently populated in this relation are LPT_ISDN and LPT_PKT.

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation LPTSPID.

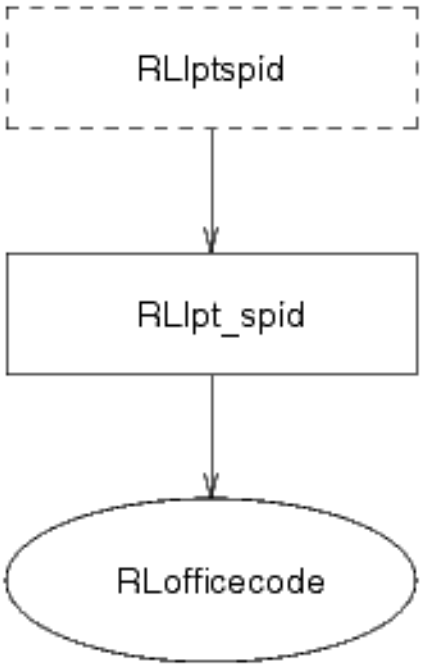

**Figure 1 Virtual Relation LPTSPID**

# LRNTBL

## 1. Description

This is the location routing number table (LRNTB) relation.

For local number portability, this relation is used to determine a location routing number (LRN) given the LRN index (a shorthand representation for the LRN).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 127 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| expected number of tuples | 10 |

## 3. Field Layout

## 4. Population Rules for RLlrntbl

**Relation Description**
Location Routing Number Table

For local number portability, this relation is used to determine a location routing number (LRN) given the LRN index (a shorthand representation for the LRN).

**Attribute: lrn_idx**

**Fullname:** location routing number index

**Attribute Description** This attribute maps directly to a location routing number.

**Attribute: lrn**

**Fullname:** location routing number

**Attribute Description** This attribute stores the maximum of 10 BCD digits and a digit count of the location routing number.

**Attribute: portdn_das**

**Fullname:** Ported directory number digit analysis tree selector

**Attribute Description** This attribute is currently a spare to be used in the future.

**Attribute: spare1**

**Fullname:** spare ushort

**Attribute Description** This is a spare field for future use.

**Attribute: spare2**

**Fullname:** spare char

**Attribute Description** This is a spare field for future use.

**Attribute: spare3**

**Fullname:** spare bit

**Attribute Description** This is a spare field for future use.

# LS_CLS

## 1. Description

This relation gives all the combined link sets of which the link set is a member of.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 256 |
| expected number of tuples | 4 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population Rules for RLls_cls

**Relation Description**
Link set to combined link set mapping

This relation defines the combined link sets of which the link set is a member.

**Attribute: lsnum**

**Fullname:** Link set number

**Attribute Description**This attribute defines the link set number.

**Attribute: cls[*]**

**Fullname:** Combined Link Set

**Attribute Description** These attributes define the Combined Link sets of which the link set is a member.

# LS_CLUST

## 1. Description

This relation will indicate every cluster that might possibly be affected by a change in the status of a linkset. It is keyed by the linkset number, and has a bitmap with one bit for each cluster index. The bit for a cluster index will be set if the linkset is a part of the routeset for the cluster.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 256 |
| expected number of tuples | 4 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| relation type | DBSTATIC |
| distribution | FP |
| permutation type | un_perm |

## 3. Field Layout

### 3.2 LS_CLUST Field Layout

## 4. Population rules for RLls_clust

**Relation Description**

Linkset to cluster index relation

This relation will indicate every cluster that might possibly be affected by a change in the status of a linkset. It is keyed by the linkset number, and has a bitmap with one bit for each cluster index. The bit for a cluster index will be set if the linkset is a part of the routeset for the cluster.

**Attribute:**
lsnum
**Fullname:**
Link Set Number
**Attribute Description:**
Link Set number, also key to RLls_grp

```
/* Same for clix01 thru clix200 */
```

**Attribute:**
clix00
**Fullname:**
CLIX bitmap
**Attribute Description:**
201 32-bit bitmaps that indicate which cluster indexes can be served by this linkset.

**Defines:**
"db/DBls_stat.h",
"ccs/CCc7_param.h",
"ct/CTrstatus.h"

## 4. Population Rules for RLls_dpc

**Relation Description**
Link set to destination point code mapping.

For every destination point code being engineered, a link set/combined link set (CLS) may be assigned as a normal or alternate link set/CLS to serve the destination. A link set/CLS may be assigned many times to serve a variety of destinations as either the normal or alternate link set/CLS. Thus this relation is used to define the set of destinations which can be served by the link set or component of the combined link set.

This relation provides for the mapping of one link set to 2000 destinations.

When a tuple is created for RLls_grp, a tuple for this relation (RLls_dpc) must also be created and initialized with all zeroes except for dpci_00 bit 0, which is set to 1 to indicate that no dpci's are yet assigned to this link set.

This relation is used by both the national and international versions of Standardization Sector (SS7). The global SMs for these two versions must be separate, and any partitioned relations, like this one, must be populated independently on each global SM. This includes any index values retrieved from the RLindx relation that are used to populate this relation. RLindx is also global SM partitioned, so the proper partitioned data must be used from RLindx when populating any attributes in this relation.

**Attribute: lnk_set**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Link set number.

**Attribute Description** Indicates link set number.

**Attribute: dpci[*]**

**Fullname:** Destination point code index (dpci) bit arrays (each containing bits for dpci 0 thru 31).

**Attribute Description** Attributes dpci_00 thru dpci_62 comprise an array of bits which are used to indicate which dpci's are served by the link set or components of combined link set. The layout of the dpci bit array is shown here.

|-------------------------  ...  ------------------------|
```

When a link set is assigned to serve a dpc as either a normal or alternate link set, an entry is made in the link set's bit array, or when a CLS is assigned to serve a dpc as either a normal or alternate CLS, an entry is made in the component link set's bit array as follows:

1. Divide the dpci being served by 32 to obtain the element in the array to be modified (such as, for dpci == 0..31, modify dpci_00: for dpci == 32..63, modify dpci_01, etc.)

2. Set the dpci = dpci & 0x1f to obtain a bit position in the array element.

3. Set the bit position to 1. Whenever a destination's assigned dpci changes, all link sets or components of CLS which can be used to serve the destination must zero the bit associated with the old dpci and set the bit associated with the new dpci. Also, if a link set/CLS is deleted from the set of the link sets/CLSs which can serve a destination, then the bit associated with the destination's dpci must be set to 0.

Since a dpci of 0 is not a valid dpci, setting bit 0 of array element dpci_00 to 1 is used to indicate that the link set has not yet been assigned to any dpci.

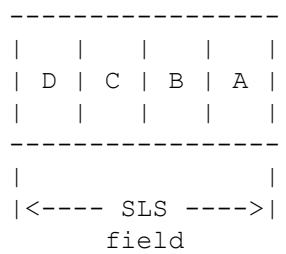
## 4. Population rules for RLls_grp

### Relation Description

Link set group.

The purpose of this relation is to provide information on a link set basis, that is, the number of links in this link set, the number of active links in this link set, the number of loaded links in the link set, the number of combined link sets of which the link set is a member, if Automatic Allocation of Signaling Data Links is on or off for this link set, the policing index, the adjacent point code index and whether or not the link set terminates on an 'other liscensed operator'.

This relation indicates the two adjacent bits in the SLS field used for link selection. The attribute used for it is lnk_sel in the set {CCLNK_BA, CCLNK_CB, CCLNK_DC, CCLNK_AD}, domain DMLNKSEL.



This relation is resides in the National SS7 Global SM (as defined by the Glnat17sm office parameter) and/or in the International SS7 Global SM (as defined by the Glint17sm office parameter).

NOTE:
This relation is used by both the National and International versions of SS7. The Global SMs for these two versions must be separate, and any partitioned relations, like this one, must be populated independently on each GSM. This includes any index values retrieved from the RLindx relation that are used to populate this relation.

Every time a tuple is inserted or deleted to this relation the global parameter Gl_ss7sls should be updated accordingly.

**Attribute:**

lsnum

**Fullname:**

Link set number.

**Attribute Description:**

The number that uniquely identifies this link set.

Copyright © 1999 Lucent Technologies 

**Attribute:**
numcls
**Fullname:**
Number of combined link sets of which the link set is a member.
**Attribute Description:**
This attribute defines the number of combined link sets (CLSs) of which the link set is a member.

**Attribute:**
polindx
**Fullname:**
Policing index.
**Attribute Description:**
The policing index for this link set.

**Attribute:**
inh_protocol
**Fullname:**
Management Inhibit Protocol Specifier.
**Attribute Description:**
Specifies Management Inhibit protocol. DBYES means that management inhibit will follow Blue Book specifications and DBNO means that management inhibit will follow specifications existing prior to Blue Book.

**Attribute:**
apci
**Fullname:**
Adjacent point code index
**Attribute Description:**
The value of this attribute is the index of the APC to which this link set goes.

**Attribute:**
nlnks
**Fullname:**
Number of links.
**Attribute Description:**
This attribute defines the physical number of members (links) in this link set.

**Attribute:**
alnks
**Fullname:**
Active links;
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute defines the number of active members (links) in this link set.

**Attribute:**
llnks
**Fullname:**
Loadsharing links.
**Attribute Description:**
This attribute defines the number of loadsharing members (links) in this link set.

**Attribute:**
oloterm
**Fullname:**
Other licensed operator termination.
**Attribute Description:**
Indicates if the link set terminates on an other licensed operator (OLO).

**Attribute:**
auto_alloc
**Fullname:**
Automatic Allocation.
**Attribute Description:**
This defines if the link set has Automatic Allocation of signaling data links or not.

**Attribute:**
sif_cap
**Fullname:**
signaling information field - capability information.
**Attribute Description:**
This attribute defines the method (referred to as the SL-Capability Method) used in determining the maximum size (referred to as the SL-Capability) of the Signaling Information Field (SIF) that can be transmitted/received across Members of a SS7 Link Set. The SL-Capability can be either 62 or 272 octets. If this attribute has the value CCLSSU then the SL-Capability is determined at Link Initialization.
If this attribute has the value CCDATA62 then the SL-Capability is set to 62 octets.
If this attribute has the value CCDATA272 then the SL-Capability is set to 272 octets.

**Attribute:**
internal
**Fullname:**
internal signaling links indicator field.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
This attribute indicates whether the signaling links which are members of this signaling linkset are internal or external.

**Attribute:**
lnk_sel
**Fullname:**
link selection indicator.
**Attribute Description:**
This attribute indicates the two adjacent bits in the SLS field chosen to be used for link selection in the linkset. The valid values are in the set { CCLNK_BA, CCLNK_CB, CCLNK_DC, CCLNK_AD}.

**Attribute:**
jtls_sel
**Fullname:**
Japan Application linkset selection
**Attribute Description:**
This attribute indicates the Linkset Selection for the Japan Application.

**Attribute:**
ilsdpol
**Fullname:**
Incoming Linkset/DPC Policing flag
**Attribute Description:**
This attribute will be used to indicate whether the linkset keyed by this tuple is be used in the ILS/DPC Policing feature. DBYES will be used to indicate the Linkset is participating in the policing. DBNO will indicate the linkset is not being policed. DBNO will be used as a default value.

**Attribute:**
acclsindx
**Fullname:**
MTP Accounting Linkset Index
**Attribute Description:**
This attribute will be used to store the index value of the MTP Accounting Linkset Index. This will also provide a forward mapping of the Linkset number to the value of the Accounting Linkset Index.

**Attribute:**
link_type
**Fullname:**
Linkset link type

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

This attribute specifies the "type" of a linkset. The type can be 'A', 'E' or 'F'.

## 4. Population rules for RLIs_lnk

### Relation Description

Link set link

This relation consists of information on a particular link. The purpose of this relation is to provide information on an individual link basis. The information consists of the link's SDL and ST ports, and the SM that the SDL port is found in.

**Attribute:**
lsnum
**Fullname:**
Link set number.
**Attribute Description:**
The number that uniquely identifies this link set.

**Attribute:**
member
**Fullname:**
Member number.
**Attribute Description:**
Link set member number.

**Attribute:**
lnkgrp

Copyright © 1999 Lucent Technologies 

**Fullname:**
Link group number.
**Attribute Description:**
This attribute defines the link group (LG) which is a pool of spare SDLs.

**Attribute:**
lnkgrpmem
**Fullname:**
Link group member number.
**Attribute Description:**
This attribute defines the link group member number. The link group and the link group member number determine the predefined SDL.

**Attribute:**
unittype
**Fullname:**
Hardware unit type of the SDL port.
**Attribute Description:**
This attribute defines the hardware unit type of the SDL port. The SDL port can be located on a DLTU(2) or DNU-S.

**Attribute:**
unitnum
**Fullname:**
Hardware unit number.
**Attribute Description:**
This attribute defines the hardware unit number of the Basic Allocation Signaling Data Link.

**Attribute:**
master
**Fullname:**
Internal SL master.
**Attribute Description:**
This attribute is the master SM indicator for an internal Signaling Link. The master SM for a given internal Signaling Link is the global SM with the greater Signaling Point Code.

**Attribute:**
dfinum
**Fullname:**
Digital Facility Interface number.
**Attribute Description:**
This attribute defines the Digital Facility Interface number of the Basic Allocation Signaling Data Link.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
st_dlt
**Fullname:**
Signaling terminating port data link terminating number.
**Attribute Description:**
This attribute is the Data Link Terminating number (DLT) which is assigned to the Signaling Terminating (ST) port of this link.

**Attribute:**
sdl_sm
**Fullname:**
Signaling data link port sm.
**Attribute Description:**
This attribute defines the SM where the Basic Allocation Signaling Data Link port resides.

**Attribute:**
sdl_port
**Fullname:**
Signaling data link port number.
**Attribute Description:**
This attribute is the Basic Allocation Signaling Data Link port number.

**Defines:**
"db/DMlnkiset.h"

Copyright © 1999 Lucent Technologies

# LS_NETID

## 1. Description

This relation will indicate every network that might possibly be affected by a change in the status of a linkset. It is keyed by the linkset number, and has a bitmap with one bit for each possibly network ID (000-255, for ANSI). The bit for the network ID will be set if the linkset is part of the routeset for the network.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population rules for RLIs_netid

**Relation Description**

Link set to Network Identifier Index relation

This relation will indicate every network that might possibly
be affected by a change in the status of a linkset. It is
keyed by the linkset number, and has a bitmap with one
bit for each possible network ID (000-255, for ANSI).
The bit for the network ID will be set if the linkset is
part of the routeset for the network.

**Attribute:**
lsnum
**Fullname:**
Link Set Number
**Attribute Description:**
Link Set Number

**Attribute:**
rtes_exist
**Fullname:**
Flag to indicate whether any bits in the bitmaps are marked
**Attribute Description:**
Flag to indicate whether any bits are marked or not. (Since zero
might be a valid network ID in some future application, even though
it isn't used in the NAR market, we don't want to play the same
trick that was played in RLls_dpc and RLls_clust, and use the
zero bit of the bitmap as the indicator, which we could do safely
in those relations because the bits represent indexes (dpci or clix),
and we could ensure that zero was never a valid index.

/* Same for netid1 thru netid7 */

**Attribute:**
netid0
**Fullname:**
Bitmap
**Attribute Description:**
An array of eight 32-bit bitmaps that indicate which netid's can be
served by this link set.

**Defines:**
"ccs/CCc7_param.h",
"db/DBls_stat.h"

## 4. Population Rules for RLls6_lnk

**Relation Description**
Link set/link to its corresponding possible bands used.

This relation provides information about a link set: the links assigned to it, the signaling terminal's assigned DLT number, and the possible bands which could be associated with it, the unit number and service group for both sdl ports. This relation is used by CCITT Signaling System No. 6 Message Transfer Part.

**Attribute: lsnum**

**Fullname:** link set number.

**Attribute Description**Linkset number: assigned by the administration: represents a group of signaling links directly connecting two exchanges.

**Attribute: cntrl_off**

**Fullname:** Control office for the link set.

**Attribute Description** Indicates if office is the controlling office during emergency restart procedure. DBYES = controlling office. DBNO = non-controlling office. If an office is the controlling office for a link set, the ODD record at the far end office for this link set must be marked as the noncontrolling office.

**Attribute: dummy**

**Fullname:** dummy field.

**Attribute Description** Unused.

**Attribute: stph1**

**Fullname:** STPH of regular link in the link set.

**Attribute Description** ST-PH corresponding to the link set. This link is always used to carry traffic when the link is available. STPH number 96 indicates that this stph is unknown/NULL.

**Attribute: stph2**

**Fullname:** STPH of synchronized link in the link set.

**Attribute Description** ST-PH corresponding to the link set, used to carry traffic when the regular link is unavailable. STPH number 96 is NULL/unknown.

**Attribute: dltnum1**

**Fullname:** data link terminal number for regular link in the link set.

**Attribute Description** The data link terminating number assigned to the signaling terminating port of the stph1.

Copyright © 1999 Lucent Technologies 

**Attribute: dltnum2**

**Fullname:** data link terminal number for the synchronized reserve link in the link set.

**Attribute Description** The data link terminating number assigned to the signaling terminating port of the stph2.

**Attribute: sdl_sm1**

**Fullname:** The SM number where signaling dataport number associated with regular link terminates.

**Attribute Description** Populate with the SM where the signaling port link associated with regular link terminates.

**Attribute: sdl_sm2**

**Fullname:** signaling data port number for the synchronized reserve link.

**Attribute Description** Populate with the SM where the signaling port link associated with the synchronized reserve link terminates.

**Attribute: sdlport1**

**Fullname:** Signaling data port number associated with circuitry associated with the regular link in the link set.

**Attribute Description** Signaling data port number associated with circuitry associated with the regular link in the link set.

**Attribute: sdlport2**

**Fullname:** Signaling data port number associated with circuitry associated with the synchronized reserve link in the link set.

**Attribute Description** Signaling data port number associated with circuitry associated with the synchronized reserve link in the link set.

**Attribute: ls_band[*]**

**Fullname:** set of outgoing bands that could have traffic on the link set.

**Attribute Description** These attributes indicate which bands are served by this link set. The attributes make up a 128-bit map. A bit is set to 0 if that band is not served by the link set and 1 if it can be served by that link set. The bits are numbered 0 to 127 starting with the lower order bits in ascending order. ls_band0 represents bit 0 thru bit 31. Since the link set will not server any bands when it is created, populate values in ls_band0, ls_band1, ls_band2, and ls_band3 to 0.

The following is the layout of ls_ban0 - ls_band3

```
field           ls_band0
band  31       23       15       7        0
      |--------|--------|--------|--------|
bits  31       23       15       7        0
field           ls_band1
band  63       55       47       39       32
      |--------|--------|--------|---------|
```

Copyright © 1999 Lucent Technologies 

```
bits  31       23       15       7         0
field           ls_band2
band  95       87       79       71       64
      |--------|--------|--------|---------|
bits  31       23       15       7         0
field           ls_band3
band  127      119      111      103      96
      |--------|--------|--------|---------|
bits  31       23       15       7         0
```

**Attribute: unum1**

**Fullname:** Unit number of first SDL port.

**Attribute Description** This attribute defines the hardware unit number of the first SDL port.

**Attribute: unum2**

**Fullname:** Unit number of second SDL port.

**Attribute Description** This attribute defines the hardware unit number of the second SDL port.

**Attribute: srv_grp1**

**Fullname:** Service group number for first signaling data link.

**Attribute Description** This attribute defines the service group number for the first Signaling data link (SDL).

**Attribute: srv_grp2**

**Fullname:** Service group number for the second signaling data link.

**Attribute Description**This attribute defines the service group number of the second signaling data link.

## 4. Population Rules for RLlsb_lsb

**Relation Description**
Mapping from routeset id to the routes.

This relation provides information on a routeset. It maps from a routeset id(that is, ls_band) to corresponding routes (primary, first alternate, second alternate). This relation is used by CCITT6 outgoing routing for locally originating and STP messages.

For every link set defined in this relation there must be a tuple in the RLls6_lnk relation. The corresponding bands must be set (ls_band_0[0-3]) to 1.

**Attribute: ls_band**

**Fullname:** link set/band.

**Attribute Description** Represents the link set and band assigned by the network administration: The lower order 7 bits(ls_band[0-6]) represent the band (range of 0 -127) the next 6 bits(ls_band[7-12]) the link set(range of 1 - 63).

**Attribute: lsbindx**

**Fullname:** Index for link set/band route set.

**Attribute Description** Index for link set/band route set.

**Attribute: msgtype**

**Fullname:** type of message being sent out : STP or locally originating.

**Attribute Description** Indicator of type of message being sent out: STP or locally originating.

**Attribute: quasi**

**Fullname:** Indicator of quasi-associated.

**Attribute Description** This field indicate whether outgoing routes are quasi-associated or not. 1 = quasi-associated. 0 = not quasi-associated. This 3 bit field, [-2-|-1-|-0-] (0 bit is right most bit), represent 3 routes. Bit 0 represents the primary route, bit 1 the first alternate route, and bit 2 the second alternate route. Currently, this field is not used.

**Attribute: altlsb1**

**Fullname:** primary link set/band.

Copyright © 1999 Lucent Technologies 

**Attribute Description**Primary link set/band.

**Attribute: altlsb2**

**Fullname:** First alternate link set/band.

**Attribute Description** First alternate link set/band.

**Attribute: altlsb3**

**Fullname:** second alternate link set/band.

**Attribute Description** Second alternate link set/band.

## 4. Population Rules for RLlsf_cf

**Relation Description**
This is the constructed feature (CF) relation for the four modular local area signaling services (LASS) features offered in the 5E6 generic.

Copyright © 1999 Lucent Technologies

This is the combined _CF relation for four 5E6 LASS modular features: SCA/CAR, SCF, SCR and SDA. This relation is also used in the AM in place of _OPTS relation

```
PRE-CONSTRUCTED FEATURES:
-------------------------
 NAME:  /SCAGA   SCA General Available Feature
ama_rec    :  DBYES

bs_rg_ind   :  DBNO
```

**Attribute: feat_id**

**Fullname:** LASS constructed feature ID

**Attribute Description**

This field is used for constructed feature IDs for 5E6 LASS features (SCA/CAR, SCF, SCR, SDA) High 6 bits of the feat_id reflect the modular feature type.

| Modular Feature Type | ENUM | 6 BITS |
|---|---|---|
| MFSCA for SCA/CAR | 32 | 100000 |
| MFSCF for SCF | 33 | 100001 |
| MFSCR for SCR | 34 | 100010 |
| MFSDA for SDA | 35 | 100011 |

The unique identifier (lower 10 bits of the feat_id) ranges from 1 to 1023 (excluding 0). Therefore, the valid values for each feature is:

| Modular Feature | Range of feat_id |
|---|---|
| MFSCA | (0x8001, 0x83ff) |
| MFSCF | (0x8401, 0x87ff) |
| MFSCR | (0x8801, 0x8bff) |
| MFSDA | (0x8c01, 0x8fff) |

Both RLfacname and RLfid2name relations should have corresponding entires.

**Attribute: ama_rec**

**Fullname:** AMA record

**Attribute Description** DBYES in this field indicates that the billing is usage sensitive. DBNO for flat rate.

**Attribute: car**

**Fullname:** Computer Access Restriction

**Attribute Description** The computer access restriction (CAR) is offered as a part of 5E6 LASS Selective Call Acceptance (SCA) feature without a separate modular feature type. This field is used to indicate whether the current constructed feature is for the CAR or not. To construct a CAR feature, set this field to DBYES and modular feature type to SCA. For other features, this field must be to set to DBNO.

**Attribute: harsh**

**Fullname:** Harsh or Gentle rejection announcement

**Attribute Description** This field is used by the 5E6 LASS selective call rejection (SCR) feature in order to indicate whether a harsh announcement will be given to the rejected calling party. This field does not have any meaning to other constructed features.

**Attribute: bs_rg_ind**

**Fullname:** Base Station Reminder Ringing (Ping Ring) indicator

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This field indicates whether the base station reminder ringing (ping ring) will be given or not when a call is forwarded. This field must be DBNO except for SCF features.

```
DEFAULTS:  DBYES for SCF
           otherwise DBNO
```

## 4. Population Rules for RLlsfhca

**Relation Description**
LASS Selective Call Acceptance Screen List for Multi-Line Hunt Group.

This is a SCA screen list.
The screen list (LSFHCA) for the multi-line hunt group (MLHG) is copied from member one's individual screen list (LSFSCA). However, LSFHCA contains DNs only. All DNs in LSFHCA must match with the DNs in LSFSCA of the member 1.

**Copyright © 1999 Lucent Technologies** 

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description** This is a logical key.

**Attribute: dn_bits**

**Fullname:** DN bits

**Attribute Description** Each bit field indicates whether an associated DN is occupied. 0 in the bit field indicates the corresponding DN is empty.

**Attribute: dn1**

**Fullname:** First DN entry of the screening list for this MLHG.

**Attribute Description**Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte.

Example: A DN, 312-979-1234 is stored as

```
dn1[0] = 0x31
dn1[1] = 0x29
dn1[2] = 0x79
dn1[3] = 0x12
dn1[4] = 0x34
dn1[5] = 0x0a (digit count)
```

No extension number can be stored for MLHG.

**Attribute: dn2**

**Fullname:** The second DN stored

**Attribute Description** See dn1.

**Attribute: dn3**

**Fullname:** The third DN stored

**Attribute Description** See dn1.

**Attribute: dn4**

**Fullname:** The fourth DN stored

member 1.

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description** This is a logical key.

**Attribute: dn_bits**

**Fullname:** DN bits

**Attribute Description** Each bit field indicates whether an associated DN is occupied. 0 in this bit field indicates the corresponding DN is empty.

**Attribute: dn1**

**Fullname:** First DN stored in 5 characters

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte. Example: A DN, 312-979-1234 is stored as

```
dn1[0] = 0x31
dn1[1] = 0x29
dn1[2] = 0x79
dn1[3] = 0x12
dn1[4] = 0x34
dn1[5] = 0x0a (digit count)
```

**Attribute: dn2**

**Fullname:** The second DN stored

**Attribute Description** See dn1.

**Attribute: dn3**

**Fullname:** The third DN stored

**Attribute Description** See dn1.

**Attribute: dn4**

**Fullname:** The fourth DN stored

**Attribute Description** See dn1.

**Attribute: dn5**

**Fullname:** The fifth DN stored

## 4. Population Rules for RLlsfsca

**Relation Description**
LSFSCA is a SCA screening list for subscribers.

Tuples of this relation will be allocated/deallocated ONLY through RC/V. SLE will not allocate or deallocate tuples of this relation.

The maximum number of DNs in a screening list a user can have for a particular feature is defined as office parameters. (such as Glscamx for SCA and Glcarmx for CAR)

A user is not allowed to add DNs beyond the office limits. However, a special care must be given when the office reduces the maximum. This is because there might be users who have DNs more than the new maximum number.

There is no immediate action required for this reduction of the office maximum. But here are subsequent actions SLE and RC/V should take.

SLE and RC/V should not allow those users to add new entries unless they remove enough DNs so that the total number of DNs in the list is below the new maximum.

Any mechanisms of surveying the largest list in an office will not be available in the 5E6 generic.

**Copyright © 1999 Lucent Technologies** 

**Attribute: sca_idx**

**Fullname:** Selective Call Acceptance Index

**Attribute Description** This is a logical key. Since the RLsca_ltm relation serves as a head cell of the SCA screening list tuples, RLlsfsca, there must be a corresponding RLsca_ltm with a matching sca_idx. RLsca_ltm.gen_avail must be DBNO.

**Attribute: range**

**Fullname:** Range

**Attribute Description** This field is used to read subsequent SCA screen lists tuples. The range of the first tuple is equal to 0.

**Attribute: dn_cnt**

**Fullname:** DN count including the extensions

**Attribute Description** If an extension is requested to be entered (through SLE session only), the corresponding DN and the extension are stored in two consecutive dn-slots for voice-back purpose. (Note: These two numbers can be stored in two tuples: DN in the last dn-slot in a tuple and extension in the first dn_slot of the following tuple.)

The dn_cnt of the first tuple (whose range is 0), is equal to the total number of occupied slots in the screening list. (The actual number of DNs is scrn_cnt.) For the subsequent tuples (whose ranges are from 1 to 10), this field should be set to 0.

**Attribute: scrn_cnt**

**Fullname:** Number of actual DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: priv_cnt**

**Fullname:** Number of private DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of private DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: dn1**

**Fullname:** First DN stored

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte.

```
Example: A DN, 312-979-1234 is stored as:
           dn1[0] = 0x31
           dn1[1] = 0x29
           dn1[2] = 0x79
           dn1[3] = 0x12
```

Copyright © 1999 Lucent Technologies 

```
dn1[4] = 0x34
dn1[5] = 0x0a (digit count)
```

The first tuple (range = 0) can not have an extension in the first dn slot.

**Attribute: dn2 through dn6**

**Fullname:** The second through the sixth DN stored

**Attribute Description** See dn1.

**Attribute: ext_dn1**

**Fullname:** dn1 status flag

**Attribute Description** This field is used to indicate one of the following cases:

```
DN_NULL,  for a Null entry
DN_SEVEN, for a DN entered as a 7-digit DN by user
DN_TEN,   for a DN entered as a 10-digit DN by user
DN_PRIV,  for a private DN
DN_EXT,   Currently is not used by SLE.
DN_NUNXT, for a DN, converted from an extension entered by user.
NUEXT,    for an extension entered by the user. The corresponding DN
          is stored in the previous dn field marked as DN_NUNXT. The
          extension is stored for voice-back purpose during the
          SLE session.
    Note: ext_dn = NUEXT is not allowed for the first dn
          (dn1[]) of the first tuple (range = 0)
```

**Attribute: ext_dn2 through ext_dn6**

**Fullname:** dn2 through dn6 status flag

**Attribute Description** See the description of ext_dn1.

## 4. Population Rules for RLlsfsda

**Relation Description**
LSFSDA is a SDA screening list for subscribers.

Tuples of this relation will be allocated/deallocated ONLY through RC/V. SLE will not allocate or deallocate tuples of this relation.

The maximum number of DNs in a screening list a user can have for a particular feature is defined as office parameters (such as Glsdamx).

A user is not allowed to add DNs beyond the office limits. However, a special care must be given when the office reduces the maximum. This is because there might be users who have DNs more than the new maximum number.

There is no immediate action required for this reduction of the office maximum. But here are subsequent actions SLE and RC/V should take.

SLE and RC/V should not allow those users to add new entries unless they remove enough DNs so that the total number of DNs in the list is below the new maximum.

Any mechanisms of surveying the largest list in an office will not be available in the 5E6 generic.

Copyright © 1999 Lucent Technologies 

**Attribute: sda_idx**

**Fullname:** Selective Distinctive Alert Index

**Attribute Description** This is a logical key. Since the RLsda_ltm relation serves as a head cell of the SDA screening list tuples, RLlsfsda, there must be a corresponding RLsda_ltm with a matching sda_idx. RLsda_ltm.gen_avail must be DBNO.

**Attribute: range**

**Fullname:** Range

**Attribute Description** This field is used to read subsequent SDA screen lists tuples. The range of the first tuple is equal to 0.

**Attribute: dn_cnt**

**Fullname:** DN count including the extensions

**Attribute Description** If an extension is requested to be entered (through SLE session only), the corresponding DN and the extension are stored in two consecutive dn-slots for voice-back purpose. (Note: These two numbers can be stored in two tuples: DN in the last dn-slot in a tuple and extension in the first dn_slot of the following tuple.)

The dn_cnt of the first tuple (whose range is 0), is equal to the total number of occupied slots in the screening list. (The actual number of DNs is scrn_cnt.) For the subsequent tuples (whose ranges are from 1 to 10), this field should be set to zero

**Attribute: scrn_cnt**

**Fullname:** Number of actual DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of DNs stored for the screening excluding the number of extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: priv_cnt**

**Fullname:** Number of private DNs for screening

**Attribute Description** For the first tuple (whose range is 0), this field indicates the total number of private DNs stored for the screening excluding the number of non-unique extensions. For the subsequent tuples, this field should be set to zero.

**Attribute: dn1**

**Fullname:** First DN stored

**Attribute Description** Each element of this array consists of two BCD digits of the first DN. Digit count is stored in the last byte.

```
Example: A DN, 312-979-1234 is stored as
           dn1[0] = 0x31
           dn1[1] = 0x29
           dn1[2]  = 0x79
           dn1[3] = 0x12
```

Copyright © 1999 Lucent Technologies 

```
          dn1[4] = 0x34
          dn1[5]  = 0x0a (digit count)
 The first tuple (range = 0) can not have an extension
  in the first dn slot.
```

**Attribute: dn2 through dn6**

**Fullname:** The second through the sixth DN stored

**Attribute Description** See dn1.

**Attribute: ext_dn1**

**Fullname:** dn1 status flag

**Attribute Description**This field is used to indicate one of the following cases:

```
DN_NULL,  for a Null entry
DN_SEVEN, for a DN entered as a 7-digit DN by user
DN_TEN,   for a DN entered as a 10-digit DN by user
DN_PRIV,  for a private DN
DN_EXT,   Currently is not used by SLE.
DN_NUNXT, for a DN, converted from an extension entered by user.
NUEXT,    for an extension entered by the user. The corresponding DN
          is stored in the previous dn field marked as DN_NUNXT. The
          extension is stored for voice-back purpose during the
          SLE session.
Note: ext_dn = NUEXT is not allowed for the first dn
      (dn1[]) of the first tuple (range = 0)
```

**Attribute: ext_dn2 through ext_dn6**

**Fullname:** dn2 through dn6 status flag

**Attribute Description** See the description of ext_dn1.

Carrier id

**Attribute Description:**

This attribute is the intra-LATA local carrier ID. It must be entered as a 4 digit character string, where each digit can be '0' thru '9'.

**Attribute:**

desttype

**Fullname:**

Destination type

**Attribute Description:**

This attribute specifies the type of local calls handled by the alternate local service providers ((OPER (0-), NORMAL0P (0+), NORMAL1P ((None/1)+ 7/10 digit non-operator), LOCDA (411), DA ((NPA)-555-1212), REPAIR (611), and BUSFOC (811) calls).

**Attribute:**

cdi

**Fullname:**

Code index

**Attribute Description:**

This attribute is the code index for LSP calls.

**Attribute:**

rti

**Fullname:**

Route index

**Attribute Description:**

This attribute is the route index for LSP calls.

**Attribute:**

signal

**Fullname:**

Signal type for local carriers

**Attribute Description:**

This attribute is the signal type used for signaling local carrier calls. It can have three values; None (default), start pulse (ST), which indicates that the call is going to an inter-exchange carrier and start pulse prime (STP), which indicates that the call is LEC or presubscribed intra-LATA local carrier (PLC) routed.

**Attribute:**

### Relation Description

Alternate local service provider conversion DN
This relation contains the alternate local service provider conversion DN.

**Attribute:**

carrid

**Fullname:**

Carrier id

**Attribute Description:**

This attribute is the intra-LATA local carrier ID.
It must be entered as a 4 digit character string,
where each digit can be '0' thru '9'.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
desttype
**Fullname:**
Destination type
**Attribute Description:**
This attribute is the destination type for LOCDA (411), DA ((NPA)-555-1212), REPAIR (611), and BUSOFC (811) calls.

**Attribute:**
convdn
**Fullname:**
Conversion DN
**Attribute Description:**
This attribute is the conversion DN. Code converted DNs can be provisioned on a per PLC carrier basis for the following types of calls: DA (NPA)-555-1212 and BUSOFC 811. This code converted DN can be any valid 15 digit sequence including "800", "900", 611, and 411 type numbers.

## 4. Population Rules for RLlsspare

**Relation Description**
LS spare for service digits.

This relation indicates the action to be taken upon reception of a digit when using an internal ARU for listing services call completion (LSCC). The attributes indicate the action to be taken for the digit entered by the customer. This allows flexibility for the switch administrator in choosing what numbers the customer is allowed to enter. Currently, this is a spare relation and is not supported by Recent Change or ODA.

Copyright © 1999 Lucent Technologies

The maximum number of tuples is 128 and is based on the maximum number of possible call types (RLctinfo).

**Attribute: serv_id**

**Fullname:** Service ID

**Attribute Description** Service ID for Listing Services call completion.

**Attribute: digit**

**Fullname:** Dialed digit

**Attribute Description** Customer touch tone digit indicating requested action. RC and ODA must allow the keys on the phone pad (0 - 9, *, #) to be valid entries for this field. The pound sign (#) is mapped to the number 10 in the database. The asterisk (*) is mapped to the number 11 in the database.

**Attribute: action**

**Fullname:** action

**Attribute Description** Action to be taken for this service ID and dialed digit.

## 4. Population rules for RLltm_bfg

**Relation Description**

```
        Link lists of all ltm indexes which are assigned to specific BFG(s).
```

Copyright © 1999 Lucent Technologies

```
 This relation holds the ltm_indx of every DN or line assigned to a BFG.
 It is in link list order by bfgid, module number, ltm_type, and ltm_indx.

" * ltm_bfg      Keeps track of global ltm_idxs on a bfgid (BFG groupid).
  *              A global ltm_idx consists of the lead module
  *              mod (module it is located on), type_ltm (logical
  *              termination index type whose value
  *              may be derived from RLdnfeats.ltm_idx), and local
  *              ltm_idx (logical termination index).

  *              This is a linked list relation  used to search
  *              all ltm_idxs associated with a bfgid. This relation
  *              will contain two types of tuple as described
  *              in the following paragraphs.
  *
  *              The first type of tuple is the bfgid master
  *              tuple.  The master tuple will be keyed by a bfgid,
  *              switching module, type_ltm = LTM_OTHER and
  *              ltm_idx = 0. The bfgid master tuple is used as a
  *              starting place to find all of the global ltm_idxs
  *              associated with a bfgid for a given switching module.
  *
  *              The second type of tuple is the one where the
  *              actual data is stored.  These are the tuples
  *              that the master tuples point to.  They are
  *              keyed by the current global ltm_idx and bfgid
  ********************************************************************
  *
  *      The following is an example to help understand the interconnection
  *      between tuples of this relation.
  *
  *      A port portx is represented here as a triple (M,type_ltm,ltm_idx),
  *      where M is the module on which portx resides,
  *      type_ltm & ltm_idx is the global ltm_idx which represents portx.
  *
  *      An RLltm_bfg tuple is represented here as follows:
  *               ------------------------------------
  *               |  mod   |type_ltm|ltm_idx| bfgid  |
  *               ------------------------------------
  *               |nexttype|nextidx|bitflags|prevtype|
  *               ------------------------------------
  *               |previdx|
  *               ---------
  *
  *      Consider 2 ports: port1 (M1, LTM_ISDN, ltm_idx1)
  *                  and   port2 (M2, LTM_OTHER, ltm_idx2).
  *
  *      bfgid ,b1, is assigned to 2 ports: port1 & port2;
  *      The following diagram illustrates the relation RLltm_bfg:
  *
  *
  *            port1                   port2
  *      -------------------------     -------------------------
  *      |M1|LTM_ISDN |ltm_idx1|0 |     |M1|LTM_OTHER|ltm_idx2|0 |
```

```
*      -------------------------       -------------------------
*      |LTM_OTHER|0|0 |LTM_OTHER|      |LTM_OTHER|0| 0|LTM_OTHER|
*      -------------------------       -------------------------
*      |0 |                            |0|
*      ----                            ---
*
*
*      The assignment of bfgid ,b1, to port1 and port2 leads to:
*
*
*      -------------------------           -------------------------
*      |M1|LTM_OTHER|   0    |b1|           |M1|LTM_ISDN |ltm_idx1|b1|
*      -------------------------           -------------------------
*      |LTM_ISDN |ltm_idx1|0|LTM_O          |LTM_OTHER|ltm_idx2|0|LTM_O
*      -------------------------           -------------------------
*      |0 |                                |0 |
*      ----                                ----

*      -------------------------
*      | M1|LTM_OTHER|ltm_idx2|b1|
*      -------------------------
*      |LTM_OTHER|0| 0|LTM_ISDN  |
*      -------------------------
*      |ltm_idx1|
*      ----------
*
*************************************************************************"
```

**Attribute:**
mod
**Fullname:**
module
**Attribute Description:**
Module represents the processor on which this BFG is being used by a specific entity (line, MLHG line, DN, etc).

**Attribute:**
type_ltm
**Fullname:**
type_ltm is the type of logical termination
**Attribute Description:**
type_ltm is either LTM_ISDN if line is ISDN
or LTM_OTHER if line is not ISDN

**Attribute:**
ltm_idx
**Fullname:**
logical termination index
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

ltm_indx identifies a unique logical termination in use on a given processor

**Attribute:**
bfgid
**Fullname:**
brcs feature group identifier
**Attribute Description:**
bfgid represents the existence of a BRCS feature group on the switch

**Attribute:**
nexttype
**Fullname:**
next type (linked on the link list)
**Attribute Description:**
nexttype represents the TYPE_LTM of the next LTM_IDX of the link list for a given BFG.

**Attribute:**
nextidx
**Fullname:**
Next logical index
**Attribute Description:**
Next_indx is the ltm_indx of the next item on the link list.

**Attribute:**
ltm_std
**Fullname:**
Standard LTM
**Attribute Description:**
This attribute is not used.

**Attribute:**
ltm_tn
**Fullname:**
terminal ltm
**Attribute Description:**
this attribute is not used.

**Attribute:**
ltm_dn
**Fullname:**
DN LTM
**Attribute Description:**
This attribute is not used.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ltm_para
**Fullname:**
parameter ltm
**Attribute Description:**
This attribute is not used.

**Attribute:**
ltm_parb
**Fullname:**
parameter b
**Attribute Description:**
This attribute is not used.

**Attribute:**
prevtype
**Fullname:**
previous type_ltm
**Attribute Description:**
The previous TYPE_LTM identifies what kind of entity
is linked previously in this link list.

**Attribute:**
previdx
**Fullname:**
previous ltm_indx
**Attribute Description:**
The previous ltm_indx is the logical termination index of the previous
tuple of this link list.

## 4. Population rules for RLltm_clst

**Relation Description**

```
        logical terminal - cluster assignment
```

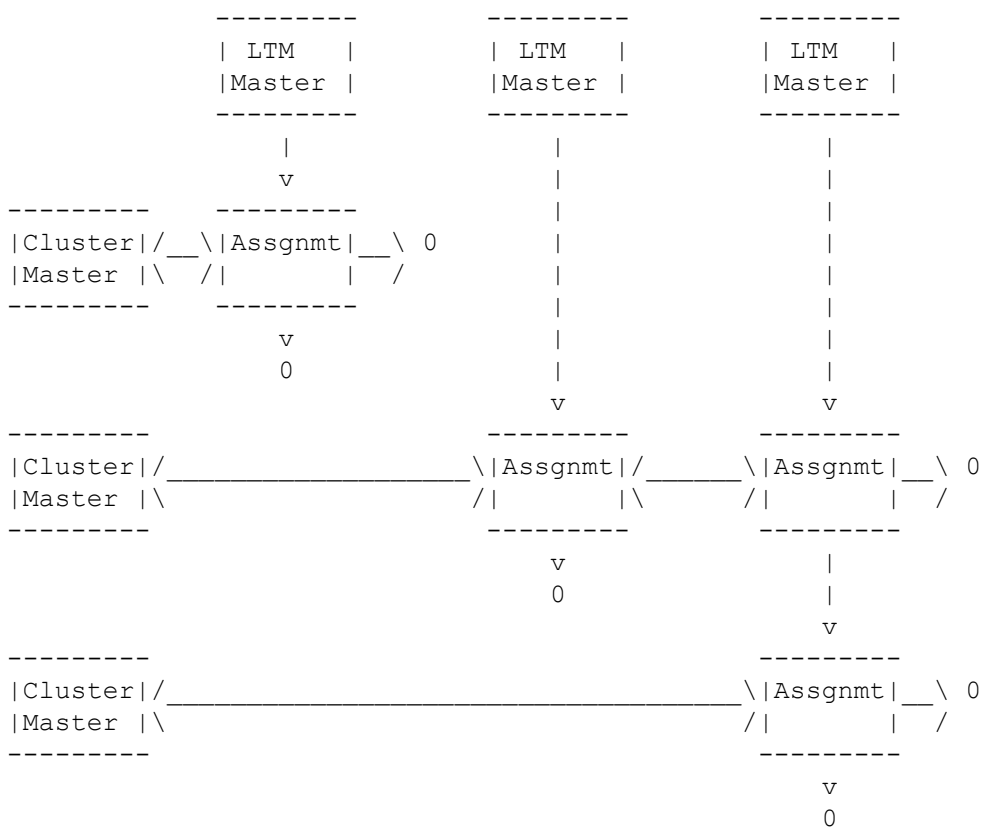
Copyright © 1999 Lucent Technologies

This relation lists the assignments of BRCS feature clusters to logical terminals (LTMs). It may be accessed to test a particular cluster to LTM assignment. Using master tuples, it may also be accessed to find all clusters assigned to an LTM and/or to find all LTMs which have been assigned a cluster.

There are three distinct type of tuples in this relation:

1) The assignment tuple specifies the assignment of the cluster to the LTM, according to the keys of the tuple.
2) The cluster master tuple provides the entry point to find the assignment tuples for all LTMs which are assigned the cluster. The cluster master tuple must exist when the cluster is assigned to any LTM.
3) The LTM master tuple provides the entry point to find the assignment tuples for all clusters assigned to the LTM. The LTM master tuple must exist when any cluster is assigned to the LTM.

The three types of tuples are combined to form a bidirectional linked list of all LTMs which are assigned a cluster, overlaid with a unidirectional linked list of all clusters assigned to an LTM, as shown in the following diagram.



The cluster master tuple is keyed by the cluster ID, with the LTM zeroed. The LTM master tuple is keyed by the LTM with the cluster ID zeroed.

Copyright © 1999 Lucent Technologies 

The RLltm_clst tuple contains 2 cluster IDs and 3 LTM triples (mod, type, idx). One cluster ID (cid) and one LTM (mod, ltm_type, ltm_idx) form the tuple keys. The other cluster ID (nextcid) points to another tuple to indicate the assignment of a different cluster to the LTM. This is an unidirectional linked list. The other LTMs point to other tuples to indicate the assignment of the cluster to different LTMs. A bidirectional linked list is formed with the previous LTM (prev_mod, prevtype, previdx) and the next LTM (next_mod, nexttype, nextidx).

**Attribute:**
mod
**Fullname:**
switching module
**Attribute Description:**
Contains the switching module of the logical terminal (LTM) that is assigned the cluster.

**Attribute:**
ltm_type
**Fullname:**
logical terminal type
**Attribute Description:**
Contains the type of the logical terminal (LTM) that is assigned the cluster.

**Attribute:**
ltm_idx
**Fullname:**
logical terminal index
**Attribute Description:**
Contains the index of the logical terminal (LTM) that is assigned the cluster.

**Attribute:**
cid
**Fullname:**
cluster identifier
**Attribute Description:**
Contains the internal identifier corresponding to the cluster which is assigned to the logical terminal (LTM).
