## 4. Population Rules for RLslnktms

**Relation Description**
Time-multiplexed switch (TMS) links.

This relation describes the network control and timing (NCT) links on the TMS. The characteristics described by this relation include the equipage status of the link and the identifier of Local Switching Module (LSM), Host Switching

Copyright © 1999 Lucent Technologies 

Module (HSM), Optically Remote switching Module (ORM), or Two-Mile optically Remote (TRM) connected to the NCT link. LSM/HSM/ORM/TRM connected to the NCT link.

There may be several pair of tuples in RLslnktms for each operational LSM/HSM/ORM/TRM that is described by a tuple in RLmodatt. The members of each pair each describe an even and odd NCT link to which the LSM/HSM/ORM/TRM is connected. The number of entries depends on the number of NCT links connected between an SM and the TMS. Non-SM-2000 SMs have only 2 links between any SM and the TMS, thus they have four entries per tuple in RLmodatt (2 pairs). SM-2000s can have a maximum of 96 entries per tuple in RLmodatt (48 pairs). The important point is that for SMs, there will only be 2 pairs of tuples in this relations, while SM-2000s will have a minimum of 4 pairs (ORM2000s) or 8 pairs (HSM-2000 or SM-2000) and a maximum of 48 pairs.

See discussion on relation dependencies in the Population Rules section in RLmodatt.

Note that no tuples are needed for RSMs in RLslnktms since they are not directly connected to the TMS.

**Attribute: lnknum**

**Fullname:** Link number

**Attribute Description** This attribute will identify two TMS NCT links, one on each TMS system side. This attribute is used as part of the key to this relation, along with the side attribute described next.

For a communication module model 2 compact (CM2C) office, there are no quad link interface (QLI) boards. Rather the CM2C TMS is equipped with a switching module link interface (SMLI) which can interface to a maximum of four NCT links (hardware provides eight but only four are used). Also, the TMS fabric type is always single fabric. The range then for CM2C NCT links is two through five.

The following is for non-CM2C offices:

The domain of this attribute is BFUNS9, or an unsigned bit field that is nine bits long. The range of values that this attribute can assume is given by the following chart.

| TMS Vintage | TMS Fabric Type | Range |
|---|---|---|
| CM1 | dual fabric | 2 to 61 |
| CM2 | single fabric | 2 to 189 |
| CM2 | dual fabric | 2 to 381 |

The value assumed by this attribute has implications on the physical characteristics of the link for a tuple is being defined. The following charts illustrate the values that this attribute can assume depending on whether an office is CM1, CM2 Single Fabric, or CM2 Dual Fabric.

**Attribute: side**

**Fullname:** Side

**Attribute Description** This attribute identifies the system side of the TMS that owns the NCT link described by a tuple. This attribute is used as part of the key to this relation along with the lnknum attribute described here.

The domain of this attribute is BFSIDE, or one bit. The enumeration (DMSIDE) values that can be assumed by this attribute are SM5SIDE0 for system side 0 and SM5SIDE1 for system side 1.

If the NCT link described by a tuple is owned by the TMS on system side 0, populate this attribute with SM5SIDE0. Otherwise, populate this attribute with SM5SIDE1.

**Attribute: imnum**

Copyright © 1999 Lucent Technologies 

**Fullname:** SM number.

**Attribute Description** This attribute identifies the LSM/HSM/ORM/TRM that is connected to the NCT link described by this tuple. Note that there will be two tuples in this relation for each LSM/HSM/ORM/TRM in the office, since each LSM/HSM/ORM/TRM requires an even and odd NCT link.

The domain of this relation is BFMODULE, or an unsigned bit field that is eight bits wide. The values that can be assumed by this attribute range from 1 to 48 for a CM1 office, and 1 to 192 for a CM2/CM2C office.

This attribute should be populated with the identifier of the LSM/HSM/ORM/TRM that is connected to the NCT link described by this tuple.

A SM-2000 interfaced to a CM2C will have four entries per tuple in RLmodatt (2 pairs) since a maximum of 2 NCT links per ONTC side is supported.

***NOTE:*** During growth of a TMSLNK, there may be no associated SM number. Therefore if the equipage state of the TMSLNK is SMGROW, then imnum will equal 0.

**Attribute: eqstat**

**Fullname:** Equipage status

**Attribute Description** This attribute describes the equipage status of the NCT link described by the tuple.

The domain of this attribute is BFEQSTAT, or three bits. The enumeration (DMEQSTAT) values that can be assumed by this attribute are:

SMOPER - The NCT link described by this relation is equipped.

SMGROW - The NCT link is being grown.

SMSGRO - The LSM/HSM/ORM/TRM connected to this NCT link is in the SMSGRO state. A link in this state can be initialized, and can have its interrupts enabled but can not be used for setting up Level 2 protocol.

SMUNEQ - The NCT link is unequipped.

Populate this attribute with SMOPER for all equipped NCT links that are connected to an SM (local or host). Note that in a CM2 office for each equipped QLI, there must be four TMS links defined in the ODD, that is, four tuples in this relation. Again, each link among those four that is connected to an SM must be marked SMOPER and the remaining ones must be marked SMGROW. This applies to all QLIs except QLI 0 in shelves 0 and 1. As is evident from the previous charts, those QLIs should only have two tuples.

**Attribute: sl_spr1**

**Fullname:** Spare attribute #1

**Attribute Description** Currently unused.

**Attribute: sl_spr2**

Copyright © 1999 Lucent Technologies 

**Fullname:** Spare attribute #2.

**Attribute Description** Currently unused.

**Attribute: qli_cli**

**Fullname:** QLI(2) CLI value.

**Attribute Description** This attribute contains the QLI(2) CLI value for the QLI that terminates the specified TMSLNK. There is no assumption being made concerning QLI(2) replacement (that is, QLIs can be different on different ONTC sides), so provisions are made in this relation for QLI(2) boards to have independent CLI values.

The QLI CLI value for the Small Office CM2C should be set DGVNULL (0x00).

***NOTE:*** A QLI(2) will terminate 4 TMS links, yet each entry in this relation will specify only one link. Thus, there is some redundancy in the QLI(2) CLI value. Since DGN is the only place where this data is be needed, and faults occur on a link basis, it was decided that this is the proper place to store QLI(2) CLI values. Whenever a QLI(2) is replaced, maintenance will need to modify RLslnktms for ONLY ONE of the (possible) 4 links associated with the changed QLI. RC/V will calculate tha other affected links and change their qli_cli attribute values automatically.

NOTE: QLI2 is not supported by ORM or ORM 2000.

**Attribute: trcu_pi**

**Fullname:** TRCU path index.

**Attribute Description** This is the TRCU path that this TMSLNK connects.

**Defines:**
"db/DMclidef.h",
"db/DMrellnkno.h"

# SM_DCHN

## 1. Description

This relation contains the SM and D-channel index to D-channel port and PRI group mapping. This relation will exist in 5E12SU and 5E13SU but will not be populated by ODA or RC. All software that references the relation is deleted and the trigger is changed to a stub. The relation will be deleted in 5E14 BMI.

## 2. Data Dictionary Values

## 4. Population rules for RLsm_dchn

### Relation Description

SM (Switching Module) to D-Channel and PRI (Primary Rate Interface) Group Mapping.

This relation, which resides on the AM, contains a tuple for each PRI D-channel in the office. The tuple will contain the SM and D-channel index into the DD key for the D-channel, the D-channel port, the PRI group of the D-channel, and the SM and index of the D-channel backup mate, if one exists. This relation provides a mapping of the D-channel index

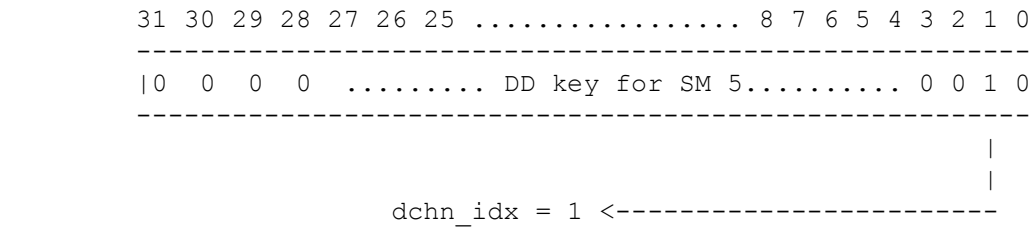
Copyright © 1999 Lucent Technologies

to the D-channel port, etc. This relation will be used by the OP:OFFNORM-PRI I/O command to find the D-channel information for a given D-channel index and SM.

**Attribute:**
sm
**Fullname:**
Switching Module
**Attribute Description:**
Gives the number of the SM {1 thru 192} where the D-channel is provisioned.

**Attribute:**
dchn_idx
**Fullname:**
D-channel index
**Attribute Description:**
Each PRI D-channel in an SM will be assigned a unique dchn_idx by ODA and RC/V. That index corresponds to a bit position in a PRI DD key. A copy of the PRI DD key from each SM is kept in the AM. If a bit 1 is set in the DD key for SM 5, for example, then the keys sm = 5 and dchn_idx = 1 are used to get the tuple in this relation for the D-channel corresponding to the set bit.

The mapping is as follows:



**Attribute:**
dport
**Fullname:**
D-channel port
**Attribute Description:**
This is the port name of the D-channel.

**Attribute:**
dchndesg
**Fullname:**
D-Channel Designation
**Attribute Description:**
The designation of the D-channel (either Primary or Secondary) that indicates the primary D-channel to be used when the DCBU feature is provisioned.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
prigrp
**Fullname:**
primary rate interface group name
**Attribute Description:**
This is the PRI group that the D-channel belongs to.

**Attribute:**
mate_sm
**Fullname:**
Switching Module of the Mate D-channel.
**Attribute Description:**
Gives the number of the SM {0 thru 192} where the mate D-channel is provisioned. The mate D-channel would only exist in the case of D-channel BackUp (DCBU).

**Attribute:**
mate_idx
**Fullname:**
Mate D-channel index
**Attribute Description:**
Each PRI D-channel in an SM will be assigned a unique dchn_idx by ODA and RC/V. (See dchn_idx description seen here.) When a PRI group has the D-channel Backup feature provisioned, then each D-channel has a mate D-channel (to form a D-channel pair). This attribute contains the index for the mate D-channel, if there is a mate provisioned.

## 4. Population Rules for RLsmaddsc

**Relation Description**
Abbreviated dialing list count.

See general information section.

There is a tuple in this relation for every speed calling list: 1 digit, 2 digit(unshared). This occurs for 1 digit speed calling if the list is associated with a line that belongs to an SC modular feature. The list then has 6 entries. This can also occur if the list has been built specifically with entries in it that total a different number than the default. ( 8 for 1digit and 30 for 2digit).

Except for the following circumstances:

a) For 1 digit (unshared) if the adcount is 8, no tuple is required in this relation.

b) For 2 digit (unshared) if the adcount is 30, no tuple is required in this relation.

**Attribute: adid**

Copyright © 1999 Lucent Technologies 

**Fullname:** abbreviated dialing identifier

**Attribute Description**

adid Indicates the internal id for the unshared abbreviated dial list. Valid values: number from 1 to 65535. This is sc_list_id from the relation RLsc_port only if sc_shared=DBNO

**Attribute: class**

**Fullname:** class

**Attribute Description**

class Indicates the type of speed call list. The following enumerated values are valid: FACAD1- 1 digit speed call list. FACAD2- 2 digit speed call list.

**Attribute: module**

**Fullname:** module

**Attribute Description**

module SM Module number: Valid values are from 1 to 192

**Attribute: adcount**

**Fullname:** abbreviated dialing list count

**Attribute Description**

adcount Indicates the number of entries in the speed call list. Valid values: number from 1 to 120.

```

## 4. Population Rules for RLsmconf

**Relation Description**
SM configuration.

This relation contains the configuration associated with each switch module (SM).

(1) RLsmconf has a dependency on the following global parameter. GLconfigname - This parameter indicates which configuration is in each SM and must populated with the same value.

(2) For 5E3, the config attribute may not be updated from D_STANDARD to D_LOADED. In 5E3, once the config attribute is populated, it is not recent changeable. In 5E3, tuples may only be inserted not updated.

(3) This relation must remain within one contiguous page for retrofit purposes. If attributes need to be added, this restriction must be complied with.

**Attribute: module**

Copyright © 1999 Lucent Technologies

**Fullname:** module.

**Attribute Description** This attribute uniquely identifies each SM and CMP with which the office is equipped. This attribute is used as the key for this relation.

The domain (DMMODULE) of this attribute is unsigned 8 bits, therefore the maximum range is 0 to 255. However, actual range is smaller than that. For a CM1 office, the maximum number of SMs is 48 so the valid range is 1 to 48 for the SMs and 194 and 206 for the CMPs. For a CM2 office, the maximum number of SMs is 192, so the valid range is 1 to 192 for the SMs and 194 and 206 for for the CMPs Note that the value 193 is used to represent the administrative module (AM), although no tuple is needed in this relation to represent the AM.

SMs should be assigned numbers that are consistent with the range limits of the office vintage as described in the preceding paragraph. Also, the assigned numbers must uniquely identify each SM in the office.

**Attribute: smconfig**

**Fullname:** SM configuration.

**Attribute Description** This attribute specifies the configuration of the SM. The configuration only indicates the software packages that will be resident in an SM. The software packages that are loaded for each configuration can be found in the feature database file, fdbtables, and should not be listed in the following descriptions since changes to fdbtables would cause inconsistencies with the descriptions that would be difficult to avoid. Likewise, references to hardware units that may or may not be supported for a given configuration should not be included in the descriptions. The domains for the configurations are defined as enums in DMsmconfig.G.

The valid configurations are:

```
CNFG000  Basic
CNFG001  Standard
CNFG002  Loaded
CNFG2K00 SM-2000
CNFG003  SIGNALING
CNFG001  is to be used for the CMP.
```

This attribute, smconfig, depends on the global parameter GLconfigname which also specifies the configuration of a SM. Both must be populated with the same value.

**Attribute: oddpart**

**Fullname:** ODD partition number.

**Attribute Description** This attribute indicates the ODD partition number for the SM, which is the disk out-board pair number that the SM ODD resides. Its value is 1 - 6.

To determine the ODD partition number, the rules are described in the following:

(1) The sizes of ODD partitions are known, that is, the disk configurations are known, which are determined from an ODA input form (ecdopt for initial offices, retinfo for retrofits and large terminal growths) which shows how each disk pair is used, and, secondly from a fixed, generic-dependent table specifying how much space is available based on how the office is using each disk pair.

The generic-dependent table can be found in the customer documentation manual:

Copyright © 1999 Lucent Technologies 

*ADMINISTRATION AND ENGINEERING GUIDELINES* - 235-070-100 under the following headings:

```
AM/CMP RESOURCE UTILIZATION
AM DISK DRIVE FACILITIES
MEMORY MANAGEMENT
```

(2) The sizes of SM ODDs are known, which are determined from DBGEN output messages.

(3) In each ODD partition, reserve a fixed amount of space for files other than SM ODDs. For 5E4(2), reserve 8 Megabytes in each SM ODD partition for the imodd.scr scratchpad file.

(4) Assign SM ODDs to ODD partitions so that each SM ODD partition has at least 10% unused space.

(5) Assign SM ODDs sequentially to ODD partitions filling one ODD partition at a time until no more SM ODDs can be assigned to the ODD partition per the previous requirements.

For a CMP the oddpart should be set to zero.

## 4. Population rules for RLsmfacids

### Relation Description

```
        SM internal FAC identifier

        Maintains list of available FAC ids for
        Unshared Abbreviated Dialing Lists.

        This relation contains the data required for allocating
        unique SM facids.  A tuple exists in this relation for each
        class, and subclass that has allocated SM facids. This is
        called the master tuple for the given class and subclass.
        RLsmfacids tracks the use of facids for unshared speed
        call lists for a given SM ( it is SM partitioned ).  This
        relation consists of four link lists or queues containing
        available SM FAC ids. This strategy supports concurrency
        by allowing upto four users retrieve indices simultaneously.
        This relation is to each SM for unshared speed calling as
```

Copyright © 1999 Lucent Technologies

RLfacids is to the 5ESS(R)-2000 switch office for shared speed calling. The master tuple contains a last used field which holds the value of the last sequentially assigned facid. The master tuple also contains the head of a link list of facids for that class and subclass which were used but now are no longer in use.

| facid | class | subclass | qid | reclaimid | lastused |
|---|---|---|---|---|---|
| 0 | FACAD1 | SCL_BAS | 0 | 0 | 0 |
| 0 | FACAD1 | SCL_BAS | 1 | 0 | 0 |
| 0 | FACAD1 | SCL_BAS | 2 | 0 | 0 |
| 0 | FACAD1 | SCL_BAS | 3 | 0 | 0 |

the associated master tuple for the extended relation should be created along with the first page of tuples for the extended relation as follows:

Four queues of available indices are maintained for facids with subclass of SCL_BAS. Free facids are added to the appropriate queue which is determined by dividing the facid value by the number of queues. The remainder of this division is the appropriate queue number. If this queue is busy, the index is placed on a non-busy queue. Recent Change retrieves indices by using the best fit algorithm. The best fit algorithm reads the master cell of each queue and retrieves an index from a non-busy queue containing available indices. If the non-busy queues are empty, the index is retrieved from the queue containing the lowest index value of the attribute lastused. The value of lastused in that queue is incremented by the number of queues. The attribute lastused defines the next index value for each queue.

If the master tuple for 1digit unshared lists is created the following should be created.

1) master tuple for 1digit extended relation as follows:

| facid | class | subclass | qid | reclaimid | lastused |
|---|---|---|---|---|---|
| 0 | FACAD1 | SCL_EXT | 0 | 0 | 0 |

2) first 32 tuples added for RLad1e_idp
   key=0-31 and Null digits in all 22 digit positions

If the master tuple for 2digit unshared lists is created then the following should be created.

1) master tuple for 2digit extended relation as follows:

| facid | class | subclass | qid | reclaimid | lastused |
|---|---|---|---|---|---|
| 0 | FACAD2 | SCL_EXT | 0 | 0 | 0 |

2) first 32 tuples added for RLad2e_idp
   key=0-31 and Null digits in all 22 digit positions

Available facids with subclass SCL_EXT will be retrieved and placed in one queue. The qid within these tuples will be zero. The index value of lastused is retrieved if the queue of available indices is empty. The attribute

Copyright © 1999 Lucent Technologies 

lastused defines the last used highest index value.
In addition, a tuple exists in this relation for each SM facid to be reclaimed for a given class, and subclass.

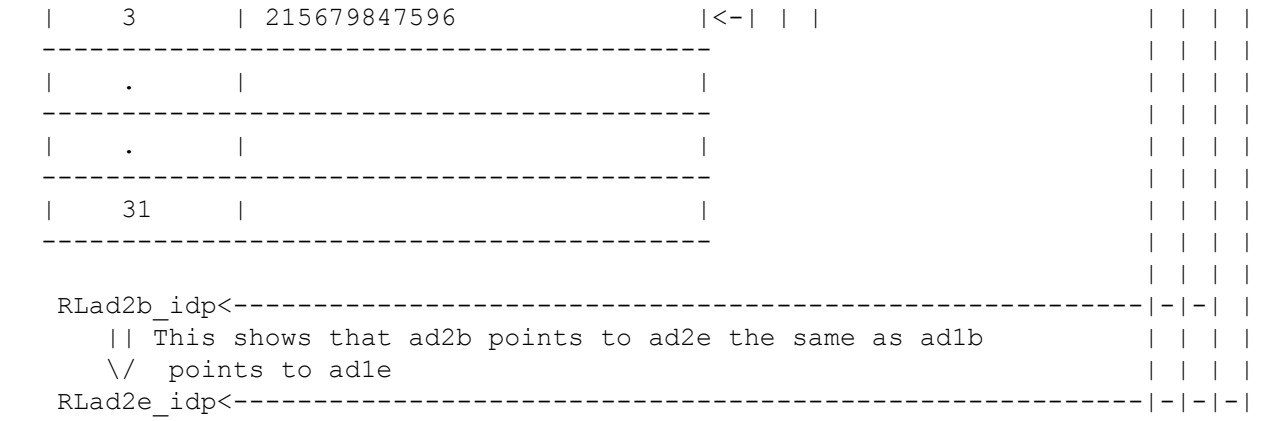
**Copyright © 1999 Lucent Technologies** 



**Attribute:**
facid
**Fullname:**
internal FAC identifier
**Attribute Description:**
When facid is zero, the tuple is known as the subclass master tuple and contains the lastused subclass id. Thus there are two subclass master tuples for classes FACAD1 and FACAD2. If fid is non-zero, the tuple represents a reclaimable fid for this sub-class.
Dependencies: None.

**Attribute:**
class
**Fullname:**
identifies class of facid
**Attribute Description:**
Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space.

Valid classes are:
FACAD1- name of a 1 digit speed call list.
FACAD2- name of a 2 digit speed call list.
Dependencies: None.

**Attribute:**
subclass
**Fullname:**
identifies subclass of facid

**Attribute Description:**
Each class can be divided into two subclasses.

**Copyright © 1999 Lucent Technologies** 

```
        Each of which shares the same
        name space,  however each subclass has its own
        set of identifiers.

        Valid subclasses are:

        SCL_BAS: This subclass defines the sequential
                 ids for basic tuples RLad1b_idp and
                 RLad2b_idp.
        SCL_EXT: This subclass defines the sequential
                 ids for extended tuples RLad1e_idp and
                 RLad2e_idp.
        If class == FACAD1 || FACAD2 then
        subclass == {SCL_BAS || SCL_EXT}
        Dependencies: None.
```

**Attribute:**
qid
**Fullname:**
queue identifier
**Attribute Description:**
This attribute defines the queue is being referenced.

**Attribute:**
reclaimid
**Fullname:**
next FAC id to be reclaimed
**Attribute Description:**
This attribute is used to keep a linked list of tuples representing the internal facids to be reclaimed for a given class, and subclass. If the value is zero this indicates the end of the linked list. If > 0 it indicates the existence of another tuple in this relation keyed by the class, and subclass, and facid equal to the reclaimed id in this relation.
Default: 0 for master tuple.
Dependencies: None.

**Attribute:**
lastused
**Fullname:**
last FAC id used
**Attribute Description:**
If this is the master tuple for a given class, and subclass then this field indicates the highest internal identifier allocated. If this is a reclaim tuple, then this attribute is set to zero.
Default: 0 for non-master tuples.
Dependencies: None.

## 4. Population Rules for RLsmportbl

**Relation Description**
Inter-SM ports in the home SM which are connected to a specific mate SM.

This relation defines the inter-SM ports (up to 32) on this SM which have a ISM path termination to the indicated mate SM.

**Attribute: mate_sm**

**Fullname:** SM number of the mate SM

**Attribute Description** The SM number of the mate SM which is connected via the Inter-SM path to all of the following 'home' SM's DLT ports mentioned. Populate with the mate SM number (1-192) which is specified in the MATE_SM field in RLismpath relation. This SM number cannot match the 'home' SM number.

**Attribute: dlt_cnt**

**Fullname:** the (number minus 1) of DLT ports

**Attribute Description** The (number minus 1) of DLT ports populated in the DLT port array. This number should be the index to the last element in the array that contains a valid DLT port name; therefore, its value is 1 less than the actual number of ports stored in PORTS array.

**Attribute: ports[*]**

**Fullname:** ports

**Attribute Description** This is an array with 32 elements which contains the port index's of the DLT port names of the ports in the 'home' SM connected to the MATE_SM.

## 4. Population Rules for RLsmscu

**Relation Description**
Side of the Message Switch Control Unit.

Information concerning this section is not available at this time. CM2 MSCU3 Hardware Cost Reduction i6242.

**Attribute: side**

**Fullname:** side of the CP hardware unit

**Attribute Description** This attribute is used as the key to this relation. It is used to determine which MSCU a tuple describes.

The domain of side is BFSIDE, or a bit field that 1 bit wide. The enumeration (DMSIDE) value that

Copyright © 1999 Lucent Technologies 

side may assume is SM5SIDE0 or SM5SIDE1.

There should only be two tuples in this relation. On one tuple, side should be populated with SM5SIDE0, and on the other, side should be populated with SM5SIDE1.

**Attribute: iia_normal**

**Fullname:** interrupt inhibited or allowed

**Attribute Description** This attribute describes the state of the MSCU interrupts when the MSCU is operating normally, that is, whether the interrupts should be allowed or inhibited.

The domain of iia_normal is BFSTATUS, or a bit field that is 1 bit wide. The enumeration (DMSTATUS) value iia_normal may assume is SMALLOW or SMINHIBIT.

This attribute should be populated with SMALLOW.

**Attribute: filenm**

**Fullname:** filename

**Attribute Description** This attribute describes the name of the file that contains the partial patch for the MSCU2 firmware. This attribute is meaningless for the MSCU1 since the MSCU1 can not be pumped.

The domain of filenm is a 14-character string. The string values that this attribute can assume are of the following format:

MSCUCMvxxxxxxx

where, v indicates the vintage of the MSCU, that is, 1 or 2 (Note: the MSCU2 enumeration for vintage will also be used for MSCU3), and xxxxx describes the version of the RAM code file.

For a CM1 office, populate this attribute with the following string:

MSCUCM1NULL

For a CM2 office, populate this attribute with the following string:

MSCUCM20000000

## 4. Population rules for RLsmseqidx

### Relation Description

```
        SM Sequential Indexing
        This is an SM relation which is designed
        for tracking relations whose key needs to
        be sequentially assigned.

        This is a relation to maintain linked lists of removed
        application tuples for reuse and to maintain sequential
        order in application-key assignment.
        Each application class consists of 4 linked lists
        whose head tuples are identified by  seq_key = 0.

        HEAD TUPLE
        ----------
        When there no pre-allocated application tuples,  ODA
        should populate the empty head tuples as follows:
```

Copyright © 1999 Lucent Technologies

Example: 4 empty head tuples for SLE_SCAR

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 0 | 0 |
| 1 | SLE_SCAR | 0 | 1 | 0 |
| 2 | SLE_SCAR | 0 | 2 | 0 |
| 3 | SLE_SCAR | 0 | 3 | 0 |

This set of four empty head tuples must be populated
for every application class defined in the APPL_CLS
domain.

A head tuple contains
1) qid whose purpose is to distribute the selection
   of the head cell to use upon allocating or
   deallocating application tuples.
2) appl_cls which indicates the application class.
3) seq_key which is zero.
4) next_idx which is the index to be assigned to
   the application tuple (LSFSCA tuple for example)
   if there is no deleted tuple in this list,
   When an application tuple is to be allocated and
   there is no free tuple (last_key of the head tuple
   is equal to zero), this next_idx will be assigned
   to the application. This field will be incremented
   by 4 (four) upon completion of allocation.
5) last_key which is an index to the tuple at the end of
   the linked list (SMSEQIDX relation)
   This tuple contains the index to the deleted
   application tuple. (such as, LSFSCA)
   Since the index is assigned sequentially, this last_key
   also means the number of deleted application tuples
   linked in this list (head tuple).
   When an application tuple is to be allocated, this
   last_key of the head tuple will be examined.
   If the last_key is non-zero, the index to be assigned
   to the application tuple is the next_idx of the tuple
   pointed by the last_key of the head tuple.
   The tuple will be removed from the linked list and
   the last_key will be decremented when the allocation
   is complete.
   When an application tuple is deleted, the index will
   be stored in the next_idx field of a tuple of SMSEQIDX
   relation whose key is (last_key + 1).
   This SMSEQIDX tuple will be attached at the end of
   the list and the last_key field of the head tuple
   will be incremented by one.

Copyright © 1999 Lucent Technologies 

```
CONCURRENCY
-----------
Four (4) head tuples are allocated to resolve RC/V
concurrency issues. To maintain the parallelism to
other existing mechanisms (speed calling and ICLID
features), the same 'qid' concept is employed in
this relation.
RC/V can select any of four head tuples (or queues)
to allocate or to de-allocate application tuples.
This implies that up to 4 RC/V transactions can be
open without blocking each other.

Choosing a head tuple (or queue)
--------------------------------
Explaining the detailed design is not the author's
intention but here are design recommendations:
1) Maintain a local dynamic data structure which
   contains next_idx and last_key of each head
   tuple.  Manipulating a local dynamic structure
   in the AM is much faster than working with
   static data structures on a SM to select the
   proper head tuple.
2) When allocating a tuple, the first choice of
   the head tuple is one with the largest last_key.
   If the last_key's are same for all four head tuples,
   one with the smallest next_idx will be the first
   choice.
3) When de-allocating a tuple, the first choice of
   the head tuple is one with the smallest last_key.
4) Selecting the head tuple should be done by manipulating
   the local dynamic data structure.
5) Once a head tuple is selected, the transaction will
   begin. The dynamic data should be updated so that they
   match with the next_idx and last_key of the head tuple.
6) If there is a big discrepancy between the dynamic data
   and the head tuple (next_idx and last_key), it will be
   assumed that the dynamic data is corrupted (whatever
   reason).  In this case, three other head tuples will
   be read and the dynamic data will be updated from the
   head tuples.
   This 'self-audit' mechanism guarantees the integrity
   of the dynamic data.

ALLOCATION/DE-ALLOCATION of TUPLES - 5E6 LASS SCREEN LIST
---------------------------------------------------------
Thirty-two head tuples are needed to maintain eight 5e6 LASS
application classes: SLE_SCAR, SLE_GSCAR, SLE_SCF, SLE_GSCF,
SLE_SCR, SLE_GSCR, SLE_SDA and SLE_GSDA (4 head tuples per
each application class)

Example of LSFSCA
-----------------------------------------------------
1. Allocating the first tuple of LSFSCA relation
    Before allocating a tuple
```

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 0 | 0 |
| 1 | SLE_SCAR | 0 | 1 | 0 |
| 2 | SLE_SCAR | 0 | 2 | 0 |
| 3 | SLE_SCAR | 0 | 3 | 0 |

After allocating a tuple

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 4 | 0 |
| 1 | SLE_SCAR | 0 | 1 | 0 |
| 2 | SLE_SCAR | 0 | 2 | 0 |
| 3 | SLE_SCAR | 0 | 3 | 0 |

The next_idx of the first head tuple (qid = 0) was incremented by four. The index of sca_idx (key to the LSFSCA) is 1.
After allocating the next five tuples of LSFSCA relation

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 8 | 0 |
| 1 | SLE_SCAR | 0 | 9 | 0 |
| 2 | SLE_SCAR | 0 | 6 | 0 |
| 3 | SLE_SCAR | 0 | 7 | 0 |

Now, there will be 6 LSFSCA tuples whose key ranges are {0 through 5}.
Note that the next index to be assigned is 6 which is the next_idx value of the third head tuple (qid = 2).
Also note that the next_idx was incremented by 4 (number of queues) every time a new key is assigned.
2. After assigning 104 tuples, without deletion, the head tuples will look like this:

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 104 | 0 |

Copyright © 1999 Lucent Technologies 

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 1 | SLE_SCAR | 0 | 105 | 0 |
| 2 | SLE_SCAR | 0 | 106 | 0 |
| 3 | SLE_SCAR | 0 | 107 | 0 |

3. When a tuple in LSFSCA whose key is 29 (sca_idx = 29) is removed,

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 104 | 1 |
| 1 | SLE_SCAR | 0 | 105 | 0 |
| 2 | SLE_SCAR | 0 | 106 | 0 |
| 3 | SLE_SCAR | 0 | 107 | 0 |
| 0 | SLE_SCAR | 1 | 29 | 0 |

The first head tuple (qid = 0) indicates that there is one deleted tuple (last_key = 1) and the next index to be assigned will be 29 instead of 104. Note that the index to the first free tuple is 1 (last_key) and this value also indicates the number of free tuples.

3. After removing 6 tuples in LSFSCA whose keys are 35, 6, 19, 21, 47, 17 in order:

| qid | appl_cls | seq_key | next_idx | last_key |
|---|---|---|---|---|
| 0 | SLE_SCAR | 0 | 104 | 2 |
| 1 | SLE_SCAR | 0 | 105 | 2 |
| 2 | SLE_SCAR | 0 | 106 | 2 |
| 3 | SLE_SCAR | 0 | 107 | 1 |
| 0 | SLE_SCAR | 1 | 29 | 0 |
| 0 | SLE_SCAR | 2 | 21 | 0 |
| 1 | SLE_SCAR | 1 | 35 | 0 |
| 1 | SLE_SCAR | 2 | 47 | 0 |

Copyright © 1999 Lucent Technologies

```
|  2    | SLE_SCAR |    1    |     6    |      0   |
-----------------------------------------------------
|  2    | SLE_SCAR |    2    |    17    |      0   |
-----------------------------------------------------
-----------------------------------------------------
|  3    | SLE_SCAR |    1    |    19    |      0   |
-----------------------------------------------------
```

**Attribute:**
qid
**Fullname:**
Queue ID
**Attribute Description:**
This is a queue id to handle concurrency issues.

**Attribute:**
appl_cls
**Fullname:**
Application Class
**Attribute Description:**
This field is used to maintain a unique linked structure per application class.

**Attribute:**
seq_key
**Fullname:**
Sequential Key
**Attribute Description:**
This is a logical key of the SMSEQIDX

**Attribute:**
next_idx
**Fullname:**
Next application tuple index
**Attribute Description:**
This is the index to be assigned to application.

**Attribute:**
last_key
**Fullname:**
Last Key of the SMSEQIDX tuple used
**Attribute Description:**
This is the key to the last tuple used to store the index of the deleted application tuple.

## 4. Population Rules for RLsncref

**Relation Description**
Network Clock (NCLK) Reference States.

This relation describes the equipage and interrupt states of the NCLK references. There is one tuple for each equipped NCLK reference.

The network clock type as defined by the nc_type attribute of RLscore determines the number and types of references that a network clock can have.

Copyright © 1999 Lucent Technologies

**Attribute: ncrefunit**

**Fullname:** NCLK Reference Unit Type

**Attribute Description** This attribute defines the type of NCLK reference described by a tuple. A NCLK1 reference may either be a cross-reference to the other NCLK, a primary T1 reference and a secondary T1 reference. This relation has 2 tuples for each type of NCLK reference, one for each system side. This attribute is used as part of the key to this relation along with the side attribute as described.

The domain of this attribute is an unsigned character. This attribute may assume one of the following values for NCLK1:

SM5XC - - Cross reference

SM5TIP - - Primary T1 reference

SM5TIS - - Secondary T1 reference

Two tuples should have ncrefunit populated as SM5XC, two more as SM5TIP, and the remaining two with SM5TIS.
If the office is equipped with a NCLK2 then the relation should be populated for each equipped reference as follows:

```
Two tuples for each--
     SM5XC2     -     Cross couple for NCLK2
     SM5REF1    -     Reference 1
     SM5REF2    -     Reference 2
     ...
     SM5REF8    -     Reference 8
```

NCLK2 will ALWAYS have the SM5XC2 tuple populated, and any of the reference tuples as required per office. If the clock type is stand alone, then ONLY the tuples for SM5XC2 will be populated. In a 24-channel office there may be a maximum of two digital and one analog reference equipped, for a total of 3 references:

```
     If there are no analog references, then the digital
     references should be numbered from SM5REF1 to SM5REF2.
     If there is one analog, then it must be numbered
     SM5REF1, and the digitals may go SM5REF2 to SM5REF3.
     There are three references per sync pack (TN1274)
     one analog and two digital, yielding this numbering
     scheme.
```

In a 30-channel office, there are a maximum of eight references: two analog and six digital. However, on the TN1275 there are five inputs for references, but only four may be used.

```
     If no analog references are used, then the digital
     may be numbered SM5REF1-SM5REF8.  If one analog
     reference is used, then it must be numbered
     SM5REF1 and the digitals may go from SM5REF2-SM5REF8.
     If two analog references are used, they should be
     numbered SM5REF1 and SM5REF5.  The digitals in this
     case may be SM5REF2-SM5REF4 and SM5REF6-SM5REF8.
```

In a 30-channel communication module model 2 compact (CM2C) office, there are a maximum of four references: one analog and three digital. However, on the TN1275 there are five inputs for references, but only four may be used.

```
    If no analog references are used, then the digital may
```

Copyright © 1999 Lucent Technologies 

```
be numbered SM5REF1-SM5REF4.  If one analog reference is
used, then it must be numbered SM5REF1 and the digitals
may go from SM5REF2-SM5REF4.
```

**Attribute: side**

**Fullname:** System side

**Attribute Description** This attribute specifies the system side to which the NCLK that owns this reference belongs. This attribute is used as part of the key to this relation along with the ncrefunit attribute described.

The domain of this attribute is BFSIDE, or 1 bit. The enumeration (DMSIDE) values that this attribute may assume are:

SM5SIDE0 - - The reference belongs to a NCLK on system side 0

SM5SIDE1 - - The reference belongs to a NCLK on system side 1

This attribute should be populated as indicated.

**Attribute: iia_normal**

**Fullname:** Interrupt Inhibit/Allow Normal

**Attribute Description** This attribute describes the normal state of interrupts from a NCLK reference. That is, whether interrupts should be allowed or inhibited when the office network timing complex (ONTC) is operating normally.

The domain of this attribute is BFSTATUS, or 1 bit. The enumeration (DMSTATUS) values that may assumed by this attribute are:

SMALLOW - - Interrupts should be allowed if the ONTC is operating normally.

SMINHIBIT - - Interrupts should be inhibited even if the ONTC is operating normally.

This attribute should be populated with SMALLOW for tuples for equipped references, for example, eqstat attribute (described in the following) is set to SMOPER. For other tuples, this attribute should be set with SMINHIBIT.

**Attribute: eqstat**

**Fullname:** Equipage State

**Attribute Description** This attribute describes the equipage state of the NCLK reference represented by each tuple.

The domain of this attribute is BFEQSTAT or three bits. The enumeration (DMEQSTAT) values that this attribute can assume are:

SMOPER - - If the reference described by a tuple is operational.

SMGROW - - If the reference described by a tuple is being grown.

SMUNEQ - - If the reference described by a tuple is unequipped.

Copyright © 1999 Lucent Technologies 

**Attribute: ref_type**

**Fullname:** Reference Type

**Attribute Description** Assign each equipped NCLK2 reference tuple with the type of trunk used. The clock type referred to may be found in RLscore.nc_type.

SMDS1REF - - 24 channel domestic T1 trunks. Clock type must be SM5DS1 or SM24NC2.

SM30REF - - 30 channel international. Clock type must be SM530CHAN or SM30NC2.

SMANALREF - - Analog reference, for example, Bell System Reference Frequency. The clock type may be either SM24NC2 or SM30NC2.

Default value (in a NCLK1 office): SMDS1REF

**Attribute: ref_par**

**Fullname:** Reference Parameter

**Attribute Description** This parameter specifies the 'weighting' or 'priority' for each reference in a NCLK2. For 5E2(2) offices (always Hierarchical in RLscore 'sync_type')

```
The highest stability or 'most preferred' reference
should have a reference parameter of 1.  The next 'most
preferred' reference should have a parameter of 2, and
so on for all equipped references.  For each reference
this parameter should be the same on each side of
the clock.
```

Even though the numbers do not have to be sequential they must be unique for each reference.

Default value (in a NCLK1 office): 0

**Attribute: fmt_ref**

**Fullname:** Reference Signal Format

**Attribute Description** Assign the reference signal format to this attribute for each equipped NCLK2 reference tuple:

```
30-channel AMI Format          AMI
30-channel HDB3 Format         HDB3
24-channel D4-No ZCS Format    D4WOZ
24-channel D4-B8ZS Format      D4B8
24-channel D4-ZCS Format       D4WZC
24-channel Fe-No ZCS Format    FEWOZ
24-channel Fe-B8ZS Format      FEB8
24-channel Fe-ZCS Format       FEWZC
```

If the ref_type is SMDS1REF and the network clock is a model 1 DS1 24-channel clock (SM5DS1) or a Stand-alone clock (SM5STDALNE), the format should be one of the D4 (superframe) 24-channel types.

If the ref_type is SMDS1REF and the network clock is a model 2 DS1 24-channel clock (SM24NC2) or a stand-alone clock (SMSANC2), the format should be one of either the D4 (superframe) or FE (extended superframe) 24-channel types.

Copyright © 1999 Lucent Technologies 

If ref_type is SM30REF, the format should be one of the 30-channel types.

**Attribute: sm_num**

**Fullname:** Switching module (SM) Number

**Attribute Description** This attribute is only populated with a value if the clock type (RLscore.nc_type) is SM30CHAN2 for a 30 channel NCLK2. The information here is for the location of the reference source from the ANN8 circuit pack located in the digital facility interface (DFI). This location may be uniquely identified by the SM number, digital line trunk unit (DLTU) number, and the DFI number of the specific ANN8 serving as the source for each reference.

**Attribute: dltu_num**

**Fullname:** Digital Line Trunk Unit Number

**Attribute Description** This attribute is only populated with a value if the clock type (RLscore.nc_type) is SM30CHAN2 for a 30 channel NCLK2. The information here is for the location of the reference source from the ANN8 circuit pack located in the DFI. This location may be uniquely identified by the SM number, DLTU number, and the DFI number of the specific ANN8 serving as the source for each reference.

**Attribute: dfi_num**

**Fullname:** Digital Facility Interface Number

**Attribute Description** This attribute is only populated with a value if the clock type (RLscore.nc_type) is SM30CHAN2 for a 30 channel NCLK2. The information here is for the location of the reference source from the ANN8 circuit pack located in the DFI. This location may be uniquely identified by the SM number, DLTU number, and the DFI number of the specific ANN8 serving as the source for each reference.

## 4. Population Rules for RLspc

**Relation Description**
RLspc describes the characteristics of the peripheral controllers with which the office is equipped.

There are five types of PCs, namely, the Foundation Peripheral Controller (FPC), the Pump Peripheral Controller (PPC), the Module Message Processor (MMP), the Communication Module Processor (CMP), and the Quad Link Gateway Processor (QGP). There is one tuple in this relation for each equipped PC.

Population rules are expressed as a function of the vintage of the Communication Module, either CM1 or CM2, per message switch side. CM1 or CM2 vintage for sides 0 and 1 is expressed by the value of the corresponding global parameter Glcm0vint or Glcm1vint respectively. These parameters are populated from the CM vintage enumerated data type (DMCMVINT) with the value SMCM1VINT or SMCM2VINT.

Relation Dependencies:

The official term for Full or Quad (4 MMPs) is Dual MMPs. The official term for Half (2 MMPs) is Single MMPs. The terms Dual and Single are used in most customer documentation for these MMP configurations. Starting in 5E6, the CM2 office data will allow a Single MMP, a Dual MMP or a combination of both Single and Dual (that is, some SMs can be connected to 2 MMPs and others to 4 MMPs in the same office) equipage options. For generics prior to 5E6, the CM2 office data will allow only the Single MMP equipage option.

For each SM in a CM1 office or a CM2 office with a full MMP equipage, there must be 4 tuples in RLspc. The four tuples must represent operational MMPs. In a CM2 office with a half MMP equipage option, there must be two tuples that represent operational MMPs.

Note that the terms half MMP equipage and full MMP equipage are precursors of the terms single MMP equipage and dual MMP equipage, respectively. Unfortunately, the population rules for CM relations had to be written (and they were) before the latter pair of terms were coined and/or widely accepted. In any case, half MMP equipage and single MMP equipage both mean two MMPs per logical device group. That is, only the alpha (even) MMP on system side 0 and the beta (odd) MMP on system side 1 are equipped in each logical device group. On the other hand, full MMP equipage and dual MMP equipage both mean four MMPs per logical device group.

For each RLspc tuple that represents an operational MMP, there must be at least one tuple in RLssdlc that represents an operational SDLC/XPC (one to many). Conversely, for each RLssdlc tuple, there must be one RLspc tuple (many to one).
In CM2 offices, a new peripheral processor is being added as part of the *5ESS*®-2000 switch project. The processor is called a Quad Link Gateway Processor (QGP). It connects to the Quad-Link Packet Switch (QLPS) which is being added to the Switch to provide a high bandwidth message transport for the SM-2000s. The QGP provides the interface between the QLPS and existing processors, such as existing SMs, AMs, etc.
For release 1 of the *5ESS*®-2000 switch, there may be 0, 2, or 4 QGPs in an office.

**Attribute: phys_id**

> **Fullname:** the physical identification of a PC
>
> **Attribute Description** A PC's physical identification is composed of three physical properties, namely, the IOMI to which the PC belongs, the PC community to which the PC belongs, and finally, the position of the PC's packs in the community. This attribute is used as the key to this relation along with the ms_side attribute which is described here. The physical identification of a PC is a 6-bit value, say iiccpp, where:

**Copyright © 1999 Lucent Technologies** 

ii - is the Input/Output Microprocessor Interface (IOMI) used by the PC community to which a PC belongs. For a CM1 office, the valid values for this field are 0 and 1 only. For a CM2 office, the valid values are 0 to 3.

cc - is the PC community to which a PC belongs. The valid values are 0 to 3.

pp - is the identification of the PC within its community. The valid values are 0 to 3.

As stated earlier, the domain of phys_id is an unsigned bit field that is 6 bits wide. This attribute can assume the values 0, 4, 5, 6, 8 through 31, and 40 through 63. The values 4 and 5 are the physical identifiers for the PPC and FPC, respectively: values 0 and 6 are for CMPs in CM2 and CM1 respectively. The remaining values are for MMPs. MMP physical identifiers 32 through 35 are not used because those MMPs would have been assigned a set of CTS numbers that would include CTS number 0. CTS number 0 can not be used. Thus, to simplify matters, MMPs 32 - 35, which would belong to a beta community and MMPs 36 - 39, which would be the matching alpha community, are not used. Instead, MMPs 56 - 63 are used. Values 32 and 33, which are not used for MMPs, are used for the QGP.
RLspc must contain tuples for MMP 8 and MMP 12. Tuples must also exist in RLspc for FPC 5 on MSGS side 0 and on MSGS side 1.
If a PC is a PPC, this attribute should be populated with 4. If a PC is a FPC, this attribute should be populated with 5. For an MMP, populate this attribute according to the chart:

| Logical PC IOMI Number | MMP's Position Community Number | MMP in its Community | MMP phys id | MMP log id | Logical PC IOMI Number | MMP's Position Community Number | MMP in its Community | MMP phys id | MMP log id |
|---|---|---|---|---|---|---|---|---|---|
| 0 | 2 | 0 | 8 | 0 | 2 | 10 | 0 | 40 | 25 |
| 0 | 2 | 1 | 9 | 2 | 2 | 10 | 1 | 41 | 27 |
| 0 | 2 | 2 | 10 | 4 | 2 | 10 | 2 | 42 | 29 |
| 0 | 2 | 3 | 11 | 6 | 2 | 10 | 3 | 43 | 31 |
| 0 | 3 | 0 | 12 | 1 | 2 | 11 | 0 | 44 | 24 |
| 0 | 3 | 1 | 13 | 3 | 2 | 11 | 1 | 45 | 26 |
| 0 | 3 | 2 | 14 | 5 | 2 | 11 | 2 | 46 | 28 |
| 0 | 3 | 3 | 15 | 7 | 2 | 11 | 3 | 47 | 30 |
| 1 | 4 | 0 | 16 | 8 | 3 | 12 | 0 | 48 | 33 |
| 1 | 4 | 1 | 17 | 10 | 3 | 12 | 1 | 49 | 35 |
| 1 | 4 | 2 | 18 | 12 | 3 | 12 | 2 | 50 | 37 |
| 1 | 4 | 3 | 19 | 14 | 3 | 12 | 3 | 51 | 39 |
| 1 | 5 | 0 | 20 | 9 | 3 | 13 | 0 | 52 | 32 |
| 1 | 5 | 1 | 21 | 11 | 3 | 13 | 1 | 53 | 34 |
| 1 | 5 | 2 | 22 | 13 | 3 | 13 | 2 | 54 | 36 |
| 1 | 5 | 3 | 23 | 15 | 3 | 13 | 3 | 55 | 38 |
| 1 | 6 | 0 | 24 | 16 | 3 | 14 | 0 | 56 | 41 |
| 1 | 6 | 1 | 25 | 18 | 3 | 14 | 1 | 57 | 43 |
| 1 | 6 | 2 | 26 | 20 | 3 | 14 | 2 | 58 | 45 |
| 1 | 6 | 3 | 27 | 22 | 3 | 14 | 3 | 59 | 47 |
| 1 | 7 | 0 | 28 | 17 | 3 | 15 | 0 | 60 | 40 |
| 1 | 7 | 1 | 29 | 19 | 3 | 15 | 1 | 61 | 42 |
| 1 | 7 | 2 | 30 | 21 | 3 | 15 | 2 | 62 | 44 |
| 1 | 7 | 3 | 31 | 23 | 3 | 15 | 3 | 63 | 46 |

For a CMP, populate this attribute according to this chart:

Copyright © 1999 Lucent Technologies 

```
        Logical
         PC      CMP's
         Commu-  Position   CMP   CMP
IOMI     nity    in its     phys  log
Number   Number  Community  id    id
______   ______  _________  ____  ___
  0        0        0        0     0
  0        1        2        6     0
For a Quad Link Gateway Processor (QGP), populate this attribute
as follows:
```

(The QGP is equipped at IOMI 2, PC community 0 within that IOMI and positions 0 and 1 in that community. This equipage equates to a logical PC position of 8.)

```
                Logical          QGP's
                PC               Position         QGP
IOMI            Community        in its           phys
Number          Number           Community        id
------          ---------        ---------        ----
  2                 8                0             32
  2                 8                1             33
```

The first 2 QGPs assigned in the office should be populated with 32 on MSGS side 0 and 32 on MSGS side 1. If 4 QGPs are assigned in the office, then 32 and 33 will both be used on each MSGS side.

**Attribute: ms_side**

**Fullname:** Specifies the system side of the Message Switch (MSGS) to which the PC belongs

**Attribute Description** The domain of this attribute is BFSIDE, or 1 bit. The following are the enumeration values (DMSIDE) that can be assigned to ms_side.

```
SM5SIDE0 - the PC is on MSGS system side 0
SM5SIDE1 - the PC is on MSGS system side 1
```

Assign the enumeration value SM5SIDE0 to this attribute on tuples that are for PCs on MSGS system side 0, and assign SM5SIDE1 to attribute on tuples that are for PCs on MSGS system side 1.

**Attribute: type**

**Fullname:** PC Type

**Attribute Description** This attribute specifies whether a PC is a FPC, PPC, MMP, CMP, or QGP.

The domain of this attribute is an unsigned character. The following are the valid enumeration (DMPCTYPE) values that this attribute may assume:

```
SM5FPC - the PC is a FPC
SM5PPC - the PC is a PPC
SM5MMP - the PC is a MMP
SM5PIP - the PC is a CMP
SM5QGP - the PC is a QGP
```

Populate this attribute depending on the type of PC as indicated here.

**Attribute: pcfilenm**

**Fullname:** The file name of the RAM code with which a PC is pumped.

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute is a 14-character string that specifies the file name of the RAM code with which a PC is pumped. The file is located in the /no5text/prc directory in the AM.

For the FPC, PPC, and MMP, this attribute may assume character string values of the form pppCMnvvvvvvvv where:

ppp - FPC, PPC, MMP, or CMP depending upon the type of the PC that owns the code.

n - 1 if the system side is of CM1 vintage, or 2 if the system side is of CM2 vintage.

vvvvvv is a numeric string that indicates the version number of the RAM code.
For the QGP, this attribute must be the character string "QGPCM2OPER.out".
This attribute should be populated as follows for a CM1 office:

| PC type | value |
|---|---|
| FPC | FPCCM100000000 |
| PPC | PPCCM100000000 |
| MMP | MMPCM100000000 |
| CMP | CMPCM100000000 |

This attribute should be populated as follows for a CM2 office:

| PC type | value |
|---|---|
| FPC | FPCCM200000000 |
| PPC | PPCCM200000000 |
| MMP | MMPCM200000000 |
| CMP | CMPCM200000000 |
| QGP | QGPCM2OPER.out |

**Attribute: mib_bus**

**Fullname:** The MIB type used by the community to which a PC belongs.

**Attribute Description** This attribute specifies the MIB type used by the community to which a PC belongs. That is, whether the community is alpha or beta. Alpha communities are assigned even TMS CTS, whereas beta communities are assigned odd TMS CTS.

The domain of this attribute is BFMIBTYPE or 1 bit. The enumeration (DMMIBTYPE) values that this attribute can assume are:

```
SMALPHA   - for alpha communities
SMBETA    - for beta communities
```

The following chart gives the population rule for this attribute:

| PC phys_ids for which mib_bus is SMALPHA | PC phys_ids for which mib_bus is SMBETA |
|---|---|
| 0 | 4, 5, 6 |
| 8 - 11 | 12 - 15 |
| 16 - 19 | 20 - 23 |
| 24 - 27 | 28 - 31 |
| 44 - 47 | 40 - 43 |
| 52 - 55 | 48 - 51 |
| 60 - 63 | 56 - 59 |

Copyright © 1999 Lucent Technologies 

For QGP's (phys_id 32 and 33), use SMALPHA.

**Attribute: grweqstat**

**Fullname:** The equipage state of the MMP growth board.

**Attribute Description** This attribute describe the equipage state of the MMP growth board. Thus, this attribute is used only on MMP tuples, and then only for CM1 MMPs. Recall that a CM1 MMP, or MMP1, is initially equipped with 4 SDLCs. To equip it with 4 more, a 2nd TN858, also known as the growth board, is needed.
The domain of this attribute is BFEQSTAT, or 3 bits. The enumeration (DMEQSTAT) values that this attribute may assume are:

SMUNEQ - indicates that the PC described by the tuple is not equipped with the growth board.

SMGROW - indicates that the MMP described by the tuple is in the process of being equipped with the growth board.

SMOPER - indicates that the MMP described by the tuple is equipped with a growth board.

This attribute should be populated with SMUNEQ for tuples for the PPC, FPC, CMP, QGPs and CM2 MMPs. For a CM1 MMP, if it is equipped with only 4 SDLCs, that is, linked to only 4 or less SMs, This attribute should be populated with SMUNEQ also. For a CM1 MMP that is equipped with 8 SDLCs, this attribute should be populated with SMOPER.

**Attribute: iia_normal**

**Fullname:** Indicates the normal state of the interrupts of the PC.

**Attribute Description** This attribute indicates the normal state of the interrupts of the PC described by this tuple. That is, whether the interrupts should be allowed or inhibited when the PC is operating normally.
The domain of this attribute is BFSTATUS, or 1 bit. The enumeration (DMSTATUS) values that this attribute may assume are:

SMALLOW - interrupts should be allowed if the PC is operating normally

SMINHIBIT - interrupts should be inhibited even if the PC is operating normally

**Attribute: eqstat**

**Fullname:** The equipage status of the PC.

**Attribute Description** The domain of eqstat is BFEQSTAT, or 3 bits. The enumeration (DMEQSTAT) values that eqstat may assume are the following:

SMOPER - indicates that the PC is equipped

SMGROW - indicates that the PC is in growth

**Attribute: cli**

**Fullname:** The hardware version of the PC.

Copyright © 1999 Lucent Technologies 

**Attribute Description**

| Circuit Type | MSGS Vintage | CLI Bit Value | Description |
|---|---|---|---|
| SM5FPC | CM2 | 0x00 [DGVNULL] | [J5D020AB-1, L1A] |
| SM5FPC | CM2 | 0x04 [DGVFPC_CMP] | CMP grown through 5E5 to 5E6 generic retrofit procedures. [J5D020AB-1, L1A] |
| SM5PPC | CM2 | 0x00 [DGVNULL] | [J5D020AB-1, L1A] |
| SM5MMP | CM2 | 0x00 [DGVNULL] | [J5D020AC-1, L1A or L2A or L4A] |
| SM5PIP | CM2 | 0x00 [DGVNULL] | [J5D020AF-1, L1 or L2A or L3] |
| SM5PIP | CM2 | 0x01 [DGVCMPEM] | [J5D020AF-1, L1 or L2A or L3] |
| SM5FPC | CM1 | 0x00 [DGVNULL] | [J5D006AD-1, L7] |
| SM5FPC | CM1 | 0x04 [DGVFPC_CMP] | CMP grown through 5E5 to 5E6 generic retrofit procedures. [J5D006AD-1, L7] |
| SM5PPC | CM1 | 0x00 [DGVNULL] | [J5D006AD-1, L7] |
| SM5MMP | CM1 | 0x00 [DGVNULL] | [J5D006AD-1, L6 or L3] |
| SM5PIP | CM1 | 0x01 [DGVCMPEM] | [J5D020AF-1, L1 or L2A or L3] |
| SM5PIP | CM1 | 0x02 [DGVCM1CMPEM] | [J5D006AD-1, L8D] |
| SM5PIP | CM1 | 0x00 [DGVNULL] | [J5D006AD-1, L8] |
| SM5QGP | CM2 | 0x00 [DGVNULL] | [J5D020AF] |

NOTE 1: The following CLI must be "OR"ed with the CLI value associated with the other hardware equipped.

| | | | |
|---|---|---|---|
| | CM2 | 0x400 [DGAPRCM2] | SN516B C/D with APR (Auto Power Recovery). CLI for CM2(C) only. APR only available in CM2(C). Backwards compatible with SN516. [J5D020A-1, L46B,L50,L51] [J5D020A-2, L1H] |

NOTE 2: When an office has APR (Auto Power Recovery) all CM2(C) unit/circuit CLI's "have" to have the APR bit(s) set. This includes all PC cli's and the MI, NC2, and TMS cli's (see RLscore).

**Defines:**
"db/DMclidef.h"

## 4. Population Rules for RLspid

**Relation Description**
User Service Profile IDentifier (USPID) to Logical PORT (LPORT) mapping relation.

This relation is used to equate an ISDN SPID with its corresponding LPORTs and User Service Order Profile (USOP) parameters. The user's SPID is the USPID consisting of the USPID digits that are externally entered by the Service Provider and a USPID digit count field that is internally generated by the switch. This digit count provides the count of the specified USPID digits.

**Attribute: uspid**

**Fullname:** User Service Profile Identifier

**Attribute Description** The USPID indicates the Service Provider assigned User Service Profile IDentifier.

For custom ISDN interface the USPID can be anywhere from 1 thru 10 digits. For standard ISDN interface the USPID can be anywhere from 1 thru 18 digits. The universal USPID value of 010101010101 is reserved and is not valid for this field. No duplicate USPID allowed in the *5ESS*®-2000 switch database. (the USPID digit count is generated internally, not specifically input).

New USPID = uspid.digcnt,uspid.dig1, uspid.dig2,...uspid.dig18.

Digits will be right justified when less than 18 are specified, that is, least significant digit stored in uspid.dig18. Unused digits = 0. Digits will be stored in BCD.

**Attribute: uspid.digcnt**

**Fullname:** The USPID digit count

**Attribute Description** Gives the digit count for the specified USPID digits

**Copyright © 1999 Lucent Technologies** 

**Attribute: uspid.dig[*]**

**Fullname:** Digit 1, Digit 2, .. ,Digit 17,Digit 18

**Attribute Description** Digits 1 thru 18 of USPID

**Attribute: dsl**

**Fullname:** The Digital Subscriber Loop (DSL) D channel PORT (DPORT)

**Attribute Description** This attribute is used to bind the SPID to a particular DSL's DPORT.

**Attribute: ckt_lport**

**Fullname:** Circuit (CKT) Logical PORT (LPORT)

**Attribute Description** The LPORT is a sequentially assigned number administered by recent change. For more information on the allocation of LPORTs, refer to the population rules for RLrc_lphol and RLrc_qidx. This LPORT is used to bind users with:

```
Circuit Switched Voice  (CSV)
Circuit Switched Data   (CSD)
Voice Band Data         (VBD)
```

capabilities to this USOP. An implied LPT_TYPE of LPT_ISDN applies to this LPORT.

**Attribute: odp_lport**

**Fullname:** On Demand Packet (ODP) Logical PORT (LPORT)

**Attribute Description** The LPORT is a sequentially assigned number administered by recent change. For more information on the allocation of LPORTs, refer to the population rules for RLrc_lphol and RLrc_qidx. This LPORT is used to bind an ODP user to this USOP. In 5E5, ODP is limited to ODP over the B channel. An implied LPT_TYPE of LPT_PKT applies to this LPORT.

**Attribute: ppd_lport**

**Fullname:** Permanent Packet D (PPD) Logical PORT (LPORT)

**Attribute Description** The LPORT is a sequentially assigned number administered by recent change. For more information on the allocation of LPORTs, refer to the population rules for RLrc_lphol and RLrc_qidx. This LPORT is used to bind a PPD user to this USOP. An implied LPT_TYPE of LPT_PKT applies to this LPORT.

**Attribute: ppb1_usr**

**Fullname:** Permanent Packet B1 (PPB) user

**Attribute Description** This attribute is used to indicate that this USOP has access to PPB on the B1 channel. This allows Recent Change the ability to move the PPB1 feature to another dsl with the user.

If a user has PPB1 (ppb1_usr = DBYES), then the user cannot be assigned ACSR.

If a user has this field set to DBYES and the user is moved to a different DSL, the PPB1 feature must be also moved to the new DSL except when:

**Copyright © 1999 Lucent Technologies** 

— The new DSL already has PPB1.

— The new DSL has users that are explicitly using the B1 channel.

When PPB1 is removed from the DSL, any user on the DSL that has the field set to DBYES must have the field changed to DBNO.

**Attribute: ppb2_usr**

**Fullname:** Permanent Packet B2 (PPB) user

**Attribute Description** This attribute is used to indicate that this USOP has access to PPB on the B2 channel. This allows Recent Change the ability to move the PPB2 feature to another dsl with the user.

If a user has PPB2 (ppb2_usr = DBYES), then the user cannot be assigned ACSR.

If a user has this field set to DBYES and the user is moved to a different DSL, the PPB2 feature must be also moved to the new DSL except when:

— The new DSL already has PPB2.

— The new DSL has users that are explicitly using the B2 channel.

When PPB2 is removed from the DSL, any user on the DSL that has the field set to DBYES must have the field changed to DBNO.

**Attribute: blk_call**

**Fullname:** Call Blocking indicator bit

**Attribute Description** This attribute is used to indicate that this USOP is in the process of an Automatic Customer Station Rearrangement (ACSR) move. Originating and terminating calls will be blocked for this USOP.

**Attribute: fip_req**

**Fullname:** Fully Initializing Protocol (FIP) terminal required

**Attribute Description** This attribute is used to indicate that this USOP can only be accessed by terminals that support FIPs. If any sub attribute in RLrc_spid.fipmap is set to DBYES, then a FIP terminal is required, and "fip_req" is set to DBYES. Otherwise, "fip_req" is set to DBNO, and any terminal may access this USOP.

See RLrc_spid.fipmap for the features that require a FIP terminal.

**Attribute: ddn**

**Fullname:** Default Directory Number

**Attribute Description** This attribute indicates if this user is a default DN user.

**Attribute: pfixtei**

**Fullname:** Fixed Terminal Endpoint Identifier (TEI)

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute indicates if this user is a fixed TEI user.

## 4. Population Rules for RLsrcref

**Relation Description:** Remote Clock Reference.

This relation describes the equipage states of the Remote Clock (RCLK) references (RCREFs). There is one tuple for each equipped RCLK reference. There should be exactly two Remote Clock (RCLK) references (RCREFs) equipped when a Remote Clock (RCLK) is installed at a site.

For the 5E8 generic a new attribute ext_ref was added to this relation (RLsrcref) in order to provide the ability to specify if RCLK reference is from external source or from HSM-RSM umbilical. The restriction that RCLK reference must come from HSM-RSM umbilical is no longer true.

**Attribute: rcrefunit**

**Fullname:** type of RCLK reference

**Attribute Description** This attribute defines the type of RCLK reference described by a tuple and

Copyright © 1999 Lucent Technologies 

is the key to this relation. This attribute should be populated as follows: 2 tuples for each--

```
SM5XC2 - Cross couple for RCLK
SM5REF1 - Reference 1
SM5REF2 - Reference 2
...
SM5REF8 - Reference 8
```

RCLK will ALWAYS have the SM5XC2 tuple populated, and any of the reference tuples as required per office. For 5E2_2, the maximum number of RCRFs is 2. The only allowed references are SM5REF1 and SM5REF2 and the SM5XC2.

**Attribute: side**

**Fullname:** RCLK SM side (0/1)

**Attribute Description** This attribute specifies the RCLK side to which the RCLK that owns this reference belongs. This attribute is used as part of the key to this relation along with the rcrefunit attribute as described.
The enumeration (DMSIDE) values that this attribute may assume are:

```
SM5SIDE0 - the reference belongs to a RCLK on
           side 0
SM5SIDE1 - the reference belongs to a RCLK on
           side 1
```

This attribute should be populated as indicated.

**Attribute: ref_type**

**Fullname:** Reference Type of Trunk

**Attribute Description** Assign each equipped RCLK reference tuple with the type of trunk used:

```
SMDS1REF - 24 channel domestic T1 trunks
           Clock type must be SM5DS1 or SM24NC2.
```

**Attribute: ref_par**

**Fullname:** Referenced Parameter

**Attribute Description** This parameter specifies the weighting or priority for each reference in a RCLK. For 5E2(2) offices (always Master/Slave sync).

```
The highest stability or most preferred reference
should have a reference parameter of 1.  The next most
preferred reference should have a parameter of 2, and
so on for all equipped references.  For each reference
this parameter should be the same on each side of
the clock.
```

Even though the numbers do not have to be sequential they must be unique for each reference. The SM5XC2 should have a zero reference parameter. A reference (for example, SM5REF1 or SM5REF2) must have a non-zero value.

**Attribute: fmt_ref**

**Fullname:** Reference Signal Format

**Attribute Description** Assign the reference signal format to this attribute for each equipped RCLK reference tuple:

Copyright © 1999 Lucent Technologies 

```
24-channel Fe-B8ZS Format       FEB8    - supported on umbilicals
24-channel Fe-ZCS Format        FEWZC       ,,     ,,     ,,
24-channel D4-ZCS Format        D4WZC   - not supported on umbilicals
If the ref_type is SMDS1REF, the format should be
one of the 24 channel types.
See Warning in rc-oda rules section for the source for RCLK reference.
```

**Attribute: dfi_name**

**Fullname:** DFI Facility Circuit Name

**Attribute Description** This attribute specifies the digital facility interface (DFI) facility circuit name that is used as a remote clock (RCLK) reference. This attribute must contain a valid, operational PCT1FAC internal circuit name, with a tuple in this RSM's RLCKTDATA relation whose key is this attribute, and whose type is PCT1FAC.
In addition, this RSM's RLRCB_HCB relation, whose key is also the PCT1FAC internal circuit name, must have attribute 'rcrefunit' equal to the key to THIS relation (RLSRCREF).

If RCLK uses external references (indicated by ext_ref field set to DBYES) then dfi_name attribute may be set to null circuit name or it may contain circuit name of valid PCT1FAC facility from which the external reference is derived.

**Attribute: ext_ref**

**Fullname:** Is this RCLK Reference Coming from External Source?

**Attribute Description** This attribute specifies if the RCLK reference is from external source (that is, BITS clock) or from HSM-RSM umbilicals. If the reference is external than the value of this attribute has to be DBYES, otherwise the RCLK reference is coming from RSM umbilicals and the value of this attribute must be DBNO.

## 4. Population Rules for RLsrv_dest

**Relation Description**
Service Destination.

This relation provides a mapping of a service destination to a *5ESS*®-2000 switch routing type and associated routing code such as a route index.

The maximum number of tuples will be 512. This is based on a maximum of 4 service destinations per service ID with a maximum of 128 service IDs. The expected average number of tuples is 256.

**Attribute: serv_dest**

**Fullname:** Service Destination

**Attribute Description** This attribute is used to designate the service destination ID.

Copyright © 1999 Lucent Technologies 

**Attribute: eis_id**

**Fullname:** EIS Identification

**Attribute Description** This attribute is used to indicate the EIS ID. This allows the same destination IDs to be used by different vendor systems. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: rte_type**

**Fullname:** Route Type

**Attribute Description** This attribute is used to indicate the *5ESS*®-2000 switch route type. Prior to 5E6(2), only the following values are allowed: OAANFI_RT, OAXANRI_RT, OAOPR_RT, OAANRI_RT.

**Attribute: rtg_code**

**Fullname:** Routing Code

**Attribute Description** This attribute is used to designate the route index. In later generics, this will also designate a route code. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: oaff1**

**Fullname:** spare 1

**Attribute Description** Spare for fast feature use

**Attribute: oaff2**

**Fullname:** spare 2

**Attribute Description** Spare for fast feature use

**Attribute: oaff3**

**Fullname:** spare 3

**Attribute Description** Spare for fast feature use

**Relation Description**

```
        Automatic Terminal Setup Service Descriptions
        This relation contains the service descriptions for all
        feature button actions allowable on Standard Terminals.
        THERE SHOULD NOT BE TUPLES IN THIS RELATION FOR
        CUSTOM BRI feature button actions!
        The relation contains a feature button action ID and an
```

Copyright © 1999 Lucent Technologies

associated 20 character ASCII text string describing the action. The text string is always terminated with the null character (\\0) by RC and ODA.
NOTE: EACH SOFTWARE RELEASE FEATURE THAT ADDS / DELETE'S ENUMERATIONS IN DMmcactn.G MUST ADD / DELETE THAT ENUM FROM THREE PLACES IN THIS PRL FILE:
1. retrofit-oda table describing the action
3. attribute: action, update the check section
The following standard should be observed when entering the servdesc attribute text via RC and ODA:
A text string in all capital letters is for a 5ESS(R)-2000 switch only feature action and a text string with mixed upper and lower case is for a Bellcore defined text string.
This standard naming convention is not enforced by RC or ODA but is recommended to be followed by the switch personnel when updating the default descriptions provided by ODA and described in the retrofit-oda rules below.

**Attribute:**
action
**Fullname:**
ISDN Feature Button Action ID
**Attribute Description:**
This attribute contains the action ID of a ISDN feature button. The action ID must be allowed for Standard DSLs and Standard configuration groups. The action describes what occurs when a standard terminal button is depressed.
The only downloadable actions are those listed as domain values below.

**Attribute:**
servdesc
**Fullname:**
ISDN Feature Button Action Service Description
**Attribute Description:**
This attribute contains up to 20 characters of ASCII text describing in words, the action taken when a standard terminal feature button containing a feature of this action is depressed. The first character of this attribute must be alphanumeric or the space character in order to ensure correct ODIN operation on RC and ODA views. The first character may not be the null (\\0) character. The remaining 19 characters may be any ASCII/IA5 characters in the range 0x20 to 0x7e (from space to tilde including all printable characters).

This text string is case sensitive where a text string of all capital letters is for a 5ESS(R)-2000 switch only feature action and a text string with mixed upper and lower case is for a Bellcore defined text string. This naming convention is a recommended standard and is not enforced by RC or ODA. The initial values provided by ODA in the

**Copyright © 1999 Lucent Technologies** 

```
5e9.1 software release may be updated for individual
operating company use.
This text string must be terminated by the null character (\\0).
The domain allows up to 21 characters with the last (21st)
character always being reserved for the null character.
When the string is less than 20 characters, RC and ODA will
terminate the string with the null character after the last
character and also in the 21st character position.
```

## 4. Population Rules for RLss7tmrs

**Relation Description**
Signaling System 7 Timers.

Holds names and values for timers for national and international versions of TSS7, TSS6, CCS7 (North American) and British Telecom TUP. These timers are needed for the Message Transfer Part and the User Part.

**Attribute: ss7tmr**

Copyright © 1999 Lucent Technologies

**Fullname:** Signaling System 7 Timer Name

**Attribute Description** This is the CCS timer ID.

**Attribute: tval**

**Fullname:** Timer value, in milliseconds.

**Attribute Description** Nominal (default) time values for each timer.

## 4. Population Rules for RLssdlc

**Relation Description**
This relation describes each SDLC/XPC with which each MMP in the office is equipped.

Copyright © 1999 Lucent Technologies

This relation describes each SDLC/XPC with which each MMP in the office is equipped. Each MMP can be equipped with a maximum of 8 SDLC/XPC devices. Recall that an SDLC is the protocol device for a Model 1 MMP (MMP1) and an XPC for a Model 2 MMP (MMP2). In addition to the SDLC/XPC's equipage state, this relation identifies the SM to which the SDLC/XPC is connected.

For each tuple in RLssdlc there must be a tuple in RLspc that describes the parent MMP. That is, the MMP whose phys_id and ms_side key attributes correspond to the phys_id and ms_side key attributes of the RLssdlc tuple. For the proper number of RLssdlc tuples for an operational MMP see RLspc

Also, for each tuple in RLmodatt that describes an operational SM, there should be at least two tuples in RLssdlc. The official term for Full or Quad (4 MMPs) is Dual MMPs. The official term for Half (2 MMPs) is Single MMPs. The terms Dual and Single are used in most customer documentation for these MMP configurations. Starting in 5E6, the CM2 office data will allow a Single MMP, a Dual MMP or a combination of both Single and Dual (that is, some SMs can be connected to 2 MMPs and others to 4 MMPs in the same office) equipage options. For generics prior to 5E6, the CM2 office data will allow only the Single MMP equipage option.

In a CM1 office or a CM2 office with a full MMP equipage option, the four tuples should represent operational SDLC/XPCs. In a CM2 office with a half MMP equipage option, two tuples should represent operational XPCs.

Note that MMPs in a CM1 are initially equipped with only 4 SDLCs (sdlcnum 0 through 3). The other 4 SDLCs (sdlcnum 4 through 7) may be equipped only if the growth board (the 2nd TN858) is equipped. Thus there must be 4 RLssdlc tuples for each RLspc tuple that is an MMP with the growth board unequipped, and there must be 8 RLssdlc tuples for each RLspc tuple that is an MMP has the growth board equipped.

On the other hand, MMPs in a CM2 are always equipped with 8 XPCs. Thus, there must be 8 RLssdlc tuples associated for each RLspc tuple that is an MMP. This check is done in RLspc for efficiency.

**Attribute: phys_id**

**Fullname:** physical identifier

**Attribute Description** This attribute specifies the physical identification of the MMP that owns this SDLC/XPC. See the phys_id attribute in the RLspc relation for a description of this attribute. This attribute is used as the key to this relation along with the ms_side and sdlcnum attributes described in the following.

This attribute should be populated with the physical identifier of the MMP that owns the SDLC/XPC described by this tuple.

**Attribute: ms_side**

**Fullname:** system side

**Attribute Description** This attribute specifies the system side to which the MMP that owns this SDLC/XPC. See the RLspc relation for a description of this attribute. This attribute is used as the key to relation along with the phys_id attribute described previously and the sdlc attribute described in the following.

This attribute should be populated with SMSIDE0 if the MMP that owns this SDLC/XPC is on the system side 0. Otherwise, this attribute should be populated with SMSIDE1.

**Attribute: sdlcnum**

**Fullname:** SDLC number

**Attribute Description** This attribute identifies this SDLC/XPC from the other SDLC/XPC with

Copyright © 1999 Lucent Technologies 

which the MMP that owns this SDLC/XPC may be equipped. This attribute is used as the key to this relation along with the phys_id and ms_side attributes described previously.

The domain of sdlcnum is an unsigned bit field of 3 bits. The values that may be assumed by this attribute are 0 to 7.

This attribute should be populated with a value between 0 and 7 that uniquely identifies the SDLC/XPC from the other SDLC/XPCs with which its parent MMP may be equipped.

**Attribute: imnum**

**Fullname:** SM number

**Attribute Description** This attribute specifies the SM to which this SDLC/XPC is connected. This attribute contains the same information as the module attribute in the relation RLmodatt. See that relation for a detailed discussion.

This attribute should be populated with the identifier of the SM to which this SDLC/XPC is connected. If the SDLC/XPC is not connected to a SM, this attribute should be populated with 0.

**Attribute: eqstat**

**Fullname:** equipage state of this SDLC/XPC

**Attribute Description** The following are the enumeration values that eqstat may assume:

```
SMOPER - the SDLC/XPC is equipped and the SM to which
         it is connected is operational
SMGROW - the SDLC/XPC is equipped and the SM to which
         it is to be connected is either unequipped or
         in growth. See the following Relation dependencies.
SMSGRO - the SDLC/XPC is equipped and the SM to which
         it is to be connected is in special growth. A
         SDLC/XPC in special growth can be initialized
         and diagnosed and its interrupts may be allowed,
         but can not be used to set up Level 2 protocol.
SMUNEQ - the SDLC/XPC is unequipped.
```

An SDLC/XPC should be in the operational state (SMOPER) when the SDLC/XPC is assigned to an operational SM. An SDLC/XPC should be in the growth state (SMGROW) when the SDLC/XPC is physically in the system but not assigned to an operational SM. In CM1 this situation may occur since each TN858 board (2 per MMP) physically contains 4 SDLCs. If not all 4 SDLCs are being utilized, then the unused SDLCs will be placed in the growth state (SMGROW) until more SMs are grown into the office in the future. Analogously, in CM2 this situation may occur since each TN870 board (1 per MMP) physically contains 8 XPCs. If not all 8 XPCs are being utilized, then the unused XPCs will be placed in the growth state (SMGROW) until more SMs are grown into the office in the future.

## 4. Population Rules for RLssn_user

**Relation Description**
SCCP Subsystem Definition Relation.

This relation defines the mapping between subsystem numbers and the associated SCCP users. It is used by the SCCP routing control (SCRC) to determine the local user that corresponds to a particular subsystem.

***NOTE:*** The subsystem number 1 is pre-defined as SCCP management in the SCCP code. It shouldn't be defined by this relation.

**Attribute: ssn**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** SCCP Subsystem Number

**Attribute Description** This attribute specifies the subsystem number.

**Attribute: scp_user**

**Fullname:** SCCP User Function

**Attribute Description** This attribute specifies the user function that is associated with the subsystem number.

**Attribute: calling_addr.digcnt**

**Fullname:** Calling Party Address Digit Count

**Attribute Description** This attribute gives the number of digits in the dn[*] portion of the calling party address structure.

**Attribute:**
calling_addr.dn0,
calling_addr.dn1,
calling_addr.dn2,
calling_addr.dn3,
calling_addr.dn4,
calling_addr.dn5,
calling_addr.dn6,
calling_addr.dn7,
calling_addr.dn8,
calling_addr.dn9,
calling_addr.dn10,
calling_addr.dn11,
calling_addr.dn12,
calling_addr.dn13,
calling_addr.dn14
**Fullname:** Calling Party Address Digits
**Attribute Description**
These attributes are the digits of the calling party address of this sub-system (SCCP User).

**Attribute: trans_type**

**Fullname:** SCCP Translation Type

**Attribute Description** This attribute declares the type of SCCP translation that the digit string in calling_addr represents.

**Attribute: num_plan**

**Fullname:** SCCP Numbering Plan

**Attribute Description** SCCP numbering plan of the calling address.

**Attribute: nai**

**Fullname:** SCCP Nature of Address Indicator

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** SCCP nature of address indicator of the calling address.

## 4. Population rules for RLssp_ann

Copyright © 1999 Lucent Technologies

**Relation Description**

Service Switching Point Announcement code.

Service switching point announcement code associated to internal treatment.

**Attribute:**

sspacode

**Fullname:**

Service Switching point announcement code.

**Attribute Description:**

Service Switching Point code is the integer representation of the announcement code digits in the TCAP message recieved from the SCP database.

**Attribute:**

ann_ri

**Fullname:**

Announcement route index.

**Attribute Description:**

SSP announcement route index.
For each cust_hdr value in this relation, there should be a corresponding tuple in the RLannc_hdr relation with application FCPVN_CA. For each cust_trl value in this relation, there should be a corresponding tuple in the RLannc_trl relation with application FCPVN_CA. The RLannc_hdr and RLannc_trl tuples with application FCPVN_CA are not populated on all SMs, but it is recommended that they be populated redundantly across all SMs equipped with DSU2s used by the ASP application. These SMs should be marked in a tuple in the RLannc_apl relation with application FCPVN_CA.
This is a route index of a trunk group in this office. All route indices in this relation must have a corresponding tuple in RLrt_routing and the trunk group assigned to this route index in RLrt_routing must be of type
RTANNCMNT ( announcement type).
RTTWOWAY ( two way trunk )
RTOUTGO ( outgoing trunk )

**Attribute:**

cust_hdr

**Fullname:**

Customized header identification.

**Attribute Description:**

This attribute maps announcement ids from the SCP database to customized announcement phrases on the DSU2 (Digital Service Unit).

**Attribute:**

cust_trl

Copyright © 1999 Lucent Technologies

**Fullname:**

Customized trailer identification.

**Attribute Description:**

This attribute maps announcement ids from the SCP database to customized announcement phrase on the DSU2 ( Digital Service Unit ).

**Attribute:**

tone_type

**Fullname:**

Network tone type.

**Attribute Description:**

This attribute will provide a network tone with universal tone generator (UTG) as one of the possible treatments to the SCP networ announcement request.

## 4. Population Rules for RLst2vpidb

**Relation Description**
STS to Virtual PIDB.

This relation associates a SONET STS-1 facility with a virtual peripheral interface data bus (VPIDB). A VPIDB is a structure on a peripheral control and timing (PCT) link.

Copyright © 1999 Lucent Technologies

**Attribute: sts_cktname**

**Fullname:** STS-1 circuit name

**Attribute Description** The circuit name of the STS-1 facility.

**Attribute: tsi_lnk[*]**

**Fullname:** Time Slot Interchanger link number

**Attribute Description** The TSI link number where the STS-1 is terminated.

**Attribute: facmap[*]**

**Fullname:** Bitmap of facilities associated with VPIDBs

**Attribute Description** This attribute identifies the bitmap of the VPIDBs associated with a PCT link. There is one bit for each of 32 possible VPIDBs. If the bit is a 1, then the facility associated with the VPIDB is equipped. Otherwise the facility associated with the VPIDB is not equipped.

## 4. Population rules for RLstinfo

**Copyright © 1999 Lucent Technologies** 

**Relation Description**

Serving Team Information

This relation contains information associated with OSPS and C-ACD serving teams.

Tuples of this relation record information related to OSPS DA, T&A and Commercial ACD serving teams.

**Attribute:**
serv_tm
**Fullname:**
Serving Team Number
**Attribute Description:**
RC/V Note: deletions of tuples in this relation must check the following relation(s) for dependencies:

CTINFO, OLOGINID

Deletion of a serv_tm from this relation should be reflected in RLaut_rec and RLid_st, resulting in the removal of all occurrences of deleted serv_tm number from RLaut_rec and RLid_st.
If a tuple is inserted or deleted from STINFO, then a tuple with the same key must be also be inserted or deleted in relation INTERFLW.

**Attribute:**
dasc_avail
**Fullname:**
DAS/C datalink availability
**Attribute Description:**
Indicates whether there is a DAS/C datalink available for use by this serving team. That is, can this serving team request automated announcements?

The rules and restrictions for this attribute (dasc_avail) apply only if st_optype = OSPSDA. If st_optype = OSPSTA then switch personnel should not be allowed to update this attribute. In this case, the dasc_avail attribute should have a DEFAULT value of DBNO. NOTE: if st_optype = OSPSDA, it is MANDATORY that the rules set up for this attribute are followed.
May not be set to DBYES if Gldasc_vendor = FCDAS_NONE.

**Attribute:**
oaedi
**Fullname:**
Serving team external dialing indicator
**Attribute Description:**
Indicates whether serving team allowed to dial external numbers.
The rules and restrictions for this attribute (oaedi), apply only if st_optype = OSPSDA, or if st_optype = OSPSTA and

Copyright © 1999 Lucent Technologies 

the operator is on a Listing Services type call.
If st_optype = OSPSTA and the operator is on any other
T&A type call (0-, 0+, coin, etc.), the operator will be
unrestricted, independent of how this attribute is set.

**Attribute:**
resxdl_idx
**Fullname:**
Restricted external dialing table index
**Attribute Description:**
When members of the serving team are allocate to dial external numbers,
this attribute indicates where any restrictions are defined. It is
the index to the restricted external dialing table.
If oaedi equals OA_RES, then this attribute must be in the range 1-64.
If oaedi equals OA_UNRES, and there is an ologinid tuple whose
extdl_per equals OA_RES and whose serv_tm matches this tuple's
serv_tm, then this resxdl_idx attribute must be in the range 1-64.
For every non-zero value of resxdl_idx, there must be the same value in
relation RLresxdl.

**Attribute:**
carrid
**Fullname:**
Carrier ID
**Attribute Description:**
Identifies the carrier to be used when dialing external numbers
When the carrid is specified, it must be a valid carrier id which
exists in the RLfc_carr relation.
(Note: this value is independent of the mass presubscribed
carrier: Glcarrid). If st_optyp = OSPSTA, the carrid field is
not used and should be restricted to the default value.

**Attribute:**
pic2
**Fullname:**
Primary Intra-LATA-Toll Carrier ID
**Attribute Description:**
Identifies the Intra-LATA-Toll carrier to be used when dialing
external numbers. When the pic2 is specified, a valid carrier
must exist in RLfc_carr. It is mapped to the three letters 'LEC'
on the RC/ODA view. The value of #NULL_BCARID is assigned if the
serving team has a non-existing carrier ID. The value of
#NULL_BCARID is not displayed on the RC/ODA view. It is mapped
to unknown.

**Attribute:**
ffcf1
**Fullname:**
spare unsigned short 14

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Spare unsigned short 14

**Attribute:**
pic4
**Fullname:**
Presubscribed international carrier ID
**Attribute Description:**
This attribute identifies the presubscribed international carrier ID.

**Attribute:**
emerg_conf
**Fullname:**
Emergency Conference permission
**Attribute Description:**
Indicates whether serving team members are allowed to conference for emergency calls.

**Attribute:**
conf_q
**Fullname:**
Conference Queue
**Attribute Description:**
Queue to be used to get to a conference operator/agent for an emergency call.

If emerg_conf equals DBNO, conf_q=0, else Range: 1-128 and there must be a tuple in RLctinfo whose key matches this value.

**Attribute:**
sa_q
**Fullname:**
Service Assistant queue call type
**Attribute Description:**
Defines queue to be used to reach a service assistant.
If greater than 0, there must be a tuple in RLctinfo whose key is equal to this value.

**Attribute:**
ctmask1
**Fullname:**
Call Type Mask part 1
**Attribute Description:**
Mask for call types 1-32. Low order bit represents call type 1. ctmask1 through ctmask4 form a 128 bit mask. A 1 indicates that this team serves the call type, a 0 indicates that it does not. If the bit mask is all 0s, then the serv_tm should not appear in the CTINFO relation. ctmask1 thru ctmask4 is used by the principal

**Copyright © 1999 Lucent Technologies** 

serving team only. The first serving team in a call type queue's list is called the principal serving team (attribute serv_tm in RLctinfo), all others are called supporting serving teams (attribute sup_tm(1-8)) in RLctinfo).

If a bit is set in a given mask, the same bit in the same mask for a different serv_tm must NOT be set. For each bit set in a mask for a serv_tm, there must exist a corresponding tuple in CTINFO having the same call type and serv_tm.

**Attribute:**
ctmask2
**Fullname:**
Call Type Mask part 2
**Attribute Description:**
DESCR: Mask for call types 33-64. Low order bit represents call type 33.

**Attribute:**
ctmask3
**Fullname:**
Call Type Mask part 3
**Attribute Description:**
Mask for call types 65-96. Low order bit represents call type 65.

**Attribute:**
ctmask4
**Fullname:**
Call Type Mask part 4
**Attribute Description:**
Mask for call types 97-128. Low order bit represents call type 97.

**Attribute:**
ct_count
**Fullname:**
CT mask bit count
**Attribute Description:**
This is a count of how many bits are set to 1 in ctmask1 through ctmaks4.
Essentially this is the count of principal call types. This is an internally maintained count of bits set and does not appear in any ODA forms.

**Attribute:**
screen_x
**Fullname:**
Screening Index
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute allows for different billing rates on outgoing calls. In addition to handling special billing, this index allows for routing the calls to the appropriate trunk location. The relation RLrt_scrning must have tuple(s) corresponding to this index.

**Attribute:**
digtree
**Fullname:**
Digit analysis table identifier for normal dialing
**Attribute Description:**
Digit analysis table identifier which is used in normal operator external dialing to tell what table to start at in analyzing the dialed numbers.
The relation RLda_digstrt must contain an entry corresponding to this index. The rules and restrictions for this attribute apply for either setting of st_optype. When st_optype = OSPSTA, this digtree is only used when the operator enters a forward, conference or route number on a delay call and there is no valid back number.
For st_optype = OSPSTA, it is MANDATORY that the rules set up for this attribute are followed.

**Attribute:**
digtree2
**Fullname:**
Secondary digit analysis tree identifier
**Attribute Description:**
Secondary Digit analysis table identifier which is used for Operator Special Dial Codes. The relation RLda_digstrt must contain an entry corresponding to this index except if digtree2 is 0, indicating OSDCs may not be dialed. If st_optyp = OSPSTA, digtree2 is not used. It should be restricted to the default value of 0.

**Attribute:**
ci_dial
**Fullname:**
Carrier Dialing status
**Attribute Description:**
Specifies the carrier dialing permissions.
Examples of possible values are:
CI_ALLOWED (may dial 10XX)
CI_PROHIBITED (cannot dial 10XX)
CI_REQUIRED (must dial 10XX).
TEST_ALLOW (test call may dial 10XXX)
TEST_PROHIB (test call cannot dial 10XXX)
TEST_REQ (test call must dial 10XXX)
If st_optyp = OSPSTA, ci_dial is not used. This field should be set to the default of CI_PROHIBITED.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
st_optype
**Fullname:**
Serving Team Operator Type
**Attribute Description:**
Type of operator that handles this serving team. The st_optype attribute may not be updated by RC/V - it may only be specified during an RC/V insertion.

**Attribute:**
st_acdtype
**Fullname:**
Serving Team commercial ACD type
**Attribute Description:**
This serving team is used to handle OSPS commercial ACD calls. For this to be set to DBYES the st_optype must be set to OSPSDA.

**Attribute:**
nisp
**Fullname:**
Non-ISP calls handled indicator
**Attribute Description:**
Indicates if the serving team handles non-ISP and TA (ISP) calls. It must be DBYES or DBNO if st_optype is OSPSTA. It can be DBYES only if st_optype is OSPSTA and nisp_only is DBNO.

**Attribute:**
nisp_only
**Fullname:**
Non-ISP calls ONLY indicator
**Attribute Description:**
Indicates if the serving team handles only non-ISP calls. It must be DBYES or DBNO if st_optype is OSPSTA. It can be DBYES only if st_optype is OSPSTA and nisp is DBNO.

**Attribute:**
sctmsk1
**Fullname:**
Supporting call type to serving team mask, part 1
**Attribute Description:**
Mask for supporting call types 1-32. Low order bit represents call type 1.

Attributes sctmsk1 thru sctmsk4 is used by Intraflow. It indicates supporting call types for this serving team. A supporting call type is a call type that is handled by a supporting serving team. This bit field is used to indicate the supporting call queues this supporting serving team handles.
For example, assume a tuple in RLstinfo has a key value of 3.

**Copyright © 1999 Lucent Technologies** 

If a tuple keyed by call type 1 in RLctinfo has supporting team 1 equal to 3 (sup_tm1=3 in RLctinfo) and a tuple keyed by call type 5 in RLctinfo has supporting team 1 equal to 3 (sup_tm1=3 in RLctinfo) bits 1 and 5 would be set in sctmsk1 indicating the secondary call types served by this supporting serving team.

(binary) sctmsk1=00000000000000000000000000010001
(hex) sctmsk1=0x00000011

This bit field is maintained and updated internally and does not appear on any RC/ODA form.

**Attribute:**
sctmsk2
**Fullname:**
Supporting call type to serving team mask, part 2
**Attribute Description:**
Mask for supporting call types 33-64. Low order bit represents supporting call type 33.

**Attribute:**
sctmsk3
**Fullname:**
Supporting call type to serving team mask, part 3
**Attribute Description:**
Mask for supporting call types 65-96. Low order bit represents supporting call type 65.

**Attribute:**
sctmsk4
**Fullname:**
Supporting call type to serving team mask, part 4
**Attribute Description:**
Mask for supporting call types 97-128. Low order bit represents supporting call type 97.

**Attribute:**
sct_count
**Fullname:**
Supporting Call Type mask bit count
**Attribute Description:**
This is a count of how many bits are set to 1 in sctmask1 through sctmaks4. Essentially this is the count of secondary call types. This is an internally maintained count of bits set and does not appear in any ODA forms.

**Attribute:**
intra_alwd
**Fullname:**
Intraflowed calls allowed

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

This attribute indicates whether the serving team is allowed to receive intraflowed calls.
An ODA warning message should be displayed if the intra_alwd attribute is DBYES and the global parameter Glac_intra is set to DBNO.

**Attribute:**

mxpcntsup

**Fullname:**

Maximum Percent of serving team available for support call types

**Attribute Description:**

Max % [0-100] of the serving team that is allowed to handle calls from supporting call queues.

Example: (assume no delay outflow threshold)

1. team 3's team threshold is 50% (mxpcntsup=50), it has 4 agents(operators) logged in, 2 are busy with calls from supporting queues (2/4= 50% at the threshold),
2. team 4's team threshold is 75% (mxpcntsup=75%), it has 10 agents(operators) logged in, 1 is busy with a call from a supporting queue (1/10= 10% under the threshold),

When a call arrives it's principal team has calls queued, it tries to go to team 3 but it would go over the 50 % threshold, so it tries team 4 and finds it can be intraflowed to this team and remain under the threshold of 75 % :

If mxpcntsup = 0 then RLstinfo.intra_alwd must be DBNO.
For a mxpcntsup > 0, RLstinfo.intra_alwd could be DBNO or DBYES.

**Attribute:**

mus_routex

**Fullname:**

Music on hold Route Index

**Attribute Description:**

This attribute specifies the route index of the music source to be used when a member of the serving team puts a call on hold.

**Attribute:**

mus_selctd

**Fullname:**

Music on hold selected for serving team

**Attribute Description:**

This attribute indicates whether music is to be provided to calls members of this serving team put on hold.

**Attribute:**

ospsff

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

OSPS fast feature item

**Attribute Description:**

The item is to be used for future OSPS special feature development.

**Attribute:**

stinfsp1

**Fullname:**

stinfo spare 1

**Attribute Description:**

stinfo spare attribute.

**Attribute:**

stinfsp2

**Fullname:**

stinfo spare 2

**Attribute Description:**

stinfo spare attribute.

**Attribute:**

autoclosendanc

**Fullname:**

Automated Close End Announcement

**Attribute Description:**

This field is used for the OSPS activation/deactivation parameter used to control the application of automated close-end announcement treatment based on the operator serving team as defined in the OSPS Serving Team view.

**Defines:**

"db/DMcarr_val.h"

## 4. Population Rules for RLstparm

**Relation Description**
Serving Team Parameters.

Copyright © 1999 Lucent Technologies

This relation contains information associated with ACD/BRCS serving teams.

**Attribute: serv_tm**

**Fullname:** Serving Team Number

**Attribute Description** This key attribute is the serving team number for ACD/BRCS.

**Attribute: emerg_conf**

**Fullname:** Emergency Conference Permission

**Attribute Description** Indicates whether serving team members are allowed to conference for emergency calls.

**Attribute: conf_q**

**Fullname:** Emergency Conference Queue

**Attribute Description** Queue to be used to get to a conference agent for an emergency call.

**Attribute: sa_q**

**Fullname:** Service Assistant Queue Call

**Attribute Description** Defines queue to be used to reach a service assistant.

**Attribute: intra_alwd**

**Fullname:** Intraflowed Calls Allowed

**Attribute Description** This attribute indicates whether the serving team is allowed to receive intraflowed calls.

**Attribute: mxpcntsup**

**Fullname:** Maximum Percent of Serving Team Available for Support Call Queues

**Attribute Description** Max % [0-100] of the serving team that is allowed to handle calls from supporting call queues. Example: (assume no delay outflow threshold)

1. Team 3's team threshold is 50% (mxpcntsup=50), it has 4 agents logged in, 2 are busy with calls from supporting queues (2/4= 50% at the threshold).
2. Team 4's team threshold is 75% (mxpcntsup=75%), it has 10 agents logged in, 1 is busy with a call from a supporting queue (1/10= 10% under the threshold).

When a call arrives it's principle team has calls queued, it tries to go to team 3 but it would go over the 50% threshold, so it tries team 4 and finds it can be intraflowed to this team and remain under the threshold of 75%.

**Attribute: aft_call_wk**

**Fullname:** After Call Work State (Auto Make Busy) Indicator

**Attribute Description** If aft_call_wk is DBYES, then the ACD/BRCS position will enter the 'MakeBusy with ACD call' state after the agent services a hunted call.

**Copyright © 1999 Lucent Technologies** 

**Attribute: live_mike**

**Fullname:** Live Mike (During Service Observe) Indicator

**Attribute Description** If live_mike is DBYES then the ACD/BRCS service observer is by default given a 2-way connection when service observing (such as, monitoring). If live_mike is DBNO then the ACD/BRCS service observer is by default given a 1-way connection when service observing (such as, monitoring).

**Attribute: mon_tones**

**Fullname:** Service Observe Monitoring Tone Direction

**Attribute Description** mon_tones specifies whether, during an ACD/BRCS service observe session, warning tones are:

1) not provided;
2) provided to the observed agent and observer;
3) provided to the observed agent, observer, and far party;
4) provided one time to the observed agent, observer, and far party.

**Attribute: tgid**

**Fullname:** Terminal Group Identifier

**Attribute Description** tgid is used to associate the serving team (serv_tm) with an ACD/BRCS customer. See also RLcqparm.tgid.

**Attribute: acdgrp**

**Fullname:** ACD/BRCS Group Number Identifier

**Attribute Description** This attribute identifies a "sub-terminal group" to allow customers to divide their call centers into smaller groups. This will allow different groups to exist within the same ACD/BRCS customer with the same level of security that exists between different ACD/BRCS customers.
When this attribute has a value of 1000, there are no restrictions on this serving team within its terminal group ID. RC and ODA do not currently support this "wild card" value.
See also RLcqparm.acdgrp.

**Attribute: psap**

**Fullname:** E911 Public Safety Answering Point

**Attribute Description** This attribute is used for the ACD E911 Public Safety Answering Point Special Feature to indicate if this serving team is an ACD E911 PSAP. The ACD E911 special feature is a secured feature (SFID 143). This attribute must not be set to DBYES unless the special feature has been purchased.

Copyright © 1999 Lucent Technologies 

# STSPTRC

## 1. Description

This relation uses the "transmitted" data to send out a 64 byte message on the STS-1 path using the J1 byte. On the receiving end of the same STS-1 path the "expected" 64 bytes of data are compared with the incoming 64 bytes of the STS-1 to ensure we are tracing the correct path.

## 2. Data Dictionary Values

## 4. Population rules for RLstsptrc

### Relation Description

STS-1 Path Trace

This relation stores the STS-1 Path Trace string is transmitted in the STS-1 facility of either SONET interface; STSX-1 or OC-3. In addition, this relation stores the STS-1 Path trace that it expects to receive in the STS-1 facility. The STS-1 Path Trace is a 64 character string that is transmitted in the J1 byte of the STS Path Overhead. The 64 character string is comprised of 62 characters (specified by the customer) terminated by CR (Carriage Return) and LF (Line Feed) characters. The 62 character customer provisionable portion of the STS-1 Path Trace can be any printable ASCII characters and is stored in this relation. This is according to customer requirement SI-dnus_custreq-2101-4730. The 62nd and 63rd characters will be initialized to CR and LF by software at the time that the entire 64 character string will be required.

**Attribute:**
name
**Fullname:**
Circuit Name
**Attribute Description:**
This attribute is the circuit name of the STS-1 facility.

**Attribute:**
transmit
**Fullname:**
Transmitted STS-1 Path Trace
**Attribute Description:**
This attribute specifies the 62 character customer provisionable portion of STS-1 Path Trace transmitted in the STS-1 facility.

Copyright © 1999 Lucent Technologies 

**Attribute:**
expected
**Fullname:**
Expected STS-1 Path Trace
**Attribute Description:**
This attribute specifies the 62 character customer provisionable portion of STS-1 Path Trace expected to be received in the STS-1 facility.

## 4. Population Rules for RLsubdata

**Relation Description**
This  Wireless Centrex (WCTX) relation contains the Subscriber and testset data.

This relation is to assign subscriber and testset information.

**Attribute: pcs_idx**

**Fullname:** Index into the hlr data

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This relation contains subscriber data common to the Home Location Register (HLR) and Visitor Location Register (VLR)

**Attribute: esn**

**Fullname:** Electronic Serial Number

**Attribute Description** It uniquely identifies the Subscriber Unit (SU). Change to it requires the ssd_flag in relation RLpcs_hlr to be set to DBYES.

**Attribute: tid**

**Fullname:** Terminal IDentifier

**Attribute Description** It is used in conjunction with the ESN to authenticate the SU as being valid.

**Attribute: miniprof**

**Fullname:** Mini Profile.

**Attribute Description** Indicates subscribers use of three-way calling or call waiting.

**Attribute: tntgrpid**

**Fullname:** Tenant Group IDentifier.

**Attribute Description** Identifies a Tenant Group which contains a list of private registration areas.

**Attribute: wspid**

**Fullname:** WCTX Service Provider IDentifier

**Attribute Description** A SPID is an unique identifier for each service provider.

**Attribute: a_key**

**Fullname:** Authentication key.

**Attribute Description** Security key established between the network management and the SU. Change to it requires the ssd_flag in relation RLpcs_hlr to be set to DBYES.

**Attribute: tn**

**Fullname:** Telephone Number

**Attribute Description** It contains a subscriber Telephone Number (TN) or a testset TN.

**Attribute: testset**

**Fullname:** Test Set

**Attribute Description**

```
Used to mark the subscriber data as a testset.
DBYES when the TN is a testset DN.
DBNO when the TN is a subscriber DN.
```

## 4. Population Rules for RLsup_mdii

**Relation Description**
This relation holds the MDII and trunk group number that the specified type of MDII is being suppressed for.

This relation is only populated by an input message.

**Attribute: mdii**

**Fullname:** Machine detected interoffice irregularities (MDII)

**Attribute Description** The type of MDII being suppressed for the given trunk group.

**Attribute: trk_grp**

**Fullname:** Trunk Group number

**Attribute Description** The trunk group number that MDIIs are being suppressed for.

**Attribute: suppress**

**Fullname:** MDII suppression indicator.

**Attribute Description** The status of MDII suppression for the given MDII and trunk group.

## 4. Population Rules for RLt1access

**Relation Description** T1.5 Access Signaling

Copyright © 1999 Lucent Technologies

This relation contains the custom information display text associated with a PBX Billing Number. The PBX-specific text is displayed to an operator when a SS7 Signaled Access PBX call comes to an OSPS operator position.

**Attribute: pbx_npa**

**Fullname:** PBX NPA

**Attribute Description** This is the key for the relation. It is used to specify the NPA portion of the PBX billed number.

**Attribute: pbx_nxx**

**Fullname:** PBX NXX

**Attribute Description** This is the key for the relation. It is used to specify the NXX portion of the PBX billed number.

**Attribute: begline**

**Fullname:** Beginning Line

**Attribute Description** This is the key for the relation. It is used to specify the individual line number (that is the, XXXX portion of PBX billed number) or the beginning line number in a range of lines.

**Attribute: endline**

**Fullname:** Ending Line

**Attribute Description** This attribute is used to specify the last line number in a range of lines.

**Attribute: pbxtext**

**Fullname:** PBX Text

**Attribute Description** This is the text which is to be displayed on the VDT. It consists of up to 116 printing ASCII characters which will be displayed at the VDT as 4 lines of 29 characters each. There is no default value for this attribute; however, this attribute must contain at least one non-null character.

## 4. Population Rules for RLtalk_key

**Relation Description** Talking trunk to keying trunk. CAMA operator trunk mate association.

**Attribute: talktrk**

**Fullname:** Talking trunk port.
**Attribute Description** Talking trunk gport of CAMA operator trunk pair. This is used as the index into the relation. The gport should be of either FC_CP_TALKING or FC_TCI_TT class of service (see FC_TRUNK - FC_PORTTYPE). All CAMA operator trunk keying trunk gports should be represented by a tuple in this relation. This check is in RLfc_porttyp.p

**Attribute: talktrk.member**

**Fullname:** Trunk member.
**Attribute Description** Trunk member.

**Attribute: talktrk.module**

Copyright © 1999 Lucent Technologies

**Fullname:** Module.
**Attribute Description** Module.

**Attribute: keytrk**

**Fullname:** Keying Trunk.
**Attribute Description** keying trunk gport of a CAMA operator trunk pair. The gport should be a port of either FC_CP_KEYING or FC_TCI_KT class of service. No duplications can exist (that is, 1-1 correspondence between keying and talking trunks). Both the keying and talking trunks of a CAMA pair must be on the same SM.

**Attribute: keytrk.member**

**Fullname:** Trunk member.
**Attribute Description** Trunk member.

**Attribute: keytrk.module**

**Fullname:** Module.
**Attribute Description** Module.

## 4. Population rules for RLtatype

### Relation Description

```
        Tones type.
         Types of tones and announcements.
         ATTN: The PRL check section does not include any checks
         for export population rules.
```

**Attribute:**

```
        tatype
```

**Fullname:**

```
        routing tone or announcement type.
```

**Attribute Description:**

```
        The value, FC_IV_NO_DIG, is used to indicate
        that an invalid number of digits has been
        received from the Inter-LATA carrier.  A tuple
        must exist for this key and should be populated
        to reflect the Service Provider wishes.
        The values RT_DPAT, RT_UNDEF, and RT_ACT are used
        as IDP error treatment indicators.  A tuple with
        key RT_DPAT must exist if the RLidp_gp attributes
        dpat_ertrt is IDANNOUNCE and dpat_ann is 0.  A
        tuple with RT_UNDEF must exist if the RLidp_gp
```

Copyright © 1999 Lucent Technologies

```
attributes idp_ertrt is IDANNOUNCE and idp_ann is
0.  A tuple with key RT_ACT must exist if the
RLidp_act attributes ertrt is IDANNOUNCE and ann
is 0.  A tuple with either RT_DPAT, RT_UNDEF, or
RT_ACT as keys should have toneind set to DBNO
pctone set to DB_PCNULL.
    Export Note: A tatype of RT_NO_TKO indicates that, for one
                  of several reasons, it was not possible to create a
                 Trunk Offering (TKO) process to camp on a busy port.
                 This will be used as a reason in the route fail message
                 sent to the originating terminal process. For Saudi
                 Arabia it will result in the provision of a reorder
                 (congestion) tone. Only this relation need be populated.
                 For RT_NO_TKO, pctone must be set to PCREORDR for Saudi
                 Arabia.
*************************************************************
* NOTE: In 5E6, 2-LEVEL COT/AC will be using the fixed route  *
*       index type (RLtatype.tatype) of RT_ACSR.  This will  *
*       be replaced in 5E7 with the tatype of RT_2LEVEL.      *
*************************************************************
Valid Fixed Route Types, Usages and Requirements
------------------------------------------------
tatype          Usage and Requirements
------          ----------------------
CC_UIA          The Unauthorized INWATS Announcement
                provides routing to a tone or announcement for
                an 800 Service call at an Originating Screening
                Office (OSO) for INward Wide Area Telephone
                Service (INWATS).  It must point to REORDER or to
                an announcement trunk group.  The customer is
                connected to this announcement when the owner of
                the 800 number being called has not authorized
                toll free calls from the area code in which the
                call is being originated.  This fixed route type
                will be required in all Toll OSO offices for which
                destination type FCOSOIWTS is populated in
                DAPRIMDGT.  It is also required in relation
                RT_FIXEDRI.  If toneind is 'DBYES', then
                pctone should be 'PCREORDER'; otherwise, pctone
                is 'PCNULL'.
CC_NCD          Provides routing to a tone or an announcement
                for Network Call Denial.  A customer is routed
                to this announcement when a database query
                discloses that the calling number is associated
                with a delinquent AT&T-C customer.  It must
                point to an announcement trunk group.  The
                relation RT_FIXEDRI must include this fixed route
                type.  This must be populated in all Point Of
                Presence (POP) toll offices.
CC_CGC          Provides routing to a tone or announcement
                when a Circuit Group Congestion backward
                fail message is received on a CCS trunk.
                REQUIRED if the office has any RLFC_TRUNK tuple
                with in_sigtype or out_sigtype of
```

Copyright © 1999 Lucent Technologies 

```
                DBTUP7 or DBISUP7.
CC_NNC          Provides routing to a tone or announcement
                when a National Network (Trunk) Congestion
                message is received on a CCS trunk.
                REQUIRED if the office has any RLFC_TRUNK tuple
                with in_sigtype or out_sigtype of DBCCIS6,
                DBTUP7, or DBISUP7.
CC_SEC          Provides routing to a tone or announcement
                when a Switching Equipment Congestion backward
                fail message is received on a CCS trunk.
                REQUIRED if the office has any RLFC_TRUNK tuple
                with in_sigtype or out_sigtype of DBCCIS6,
                DBTUP7, or DBISUP7.
CC_SSI          Provides routing to a tone or announcement
                when a Send Special Information Tone backward
                fail message is received on a CCS trunk.
                REQUIRED if the office has any RLFC_TRUNK tuple
                with in_sigtype or out_sigtype of
                DBTUP7 or DBISUP7.
FC_EASMRT       Provides routing to a tone or an announcement
                for Equal Access Signaling calls misrouted to
                a Toll (AT&T-C) switch from an end office or
                access tandem (calls with unexpected information
                digits and Customer Interactive Dialing calls).
                It must point to an announcement trunk group. The
                relation RT_FIXEDRI must include this fixed route
                type.  This must be populated in all Point of
                Presence (POP) toll offices.
TMTSTTK         Provides routing to first available member
                of a FIFO hunted trunk group containing
                outgoing LTD test trunk circuits.  Used
                for line originated LTD call.
                Refer to LTD population rules section.
RT_NSANNC        Provides routing to a tone or an announcement
                   for PVN announcements given by the DSU2-RAF-DTA.
                   Dependencies:
                     if (Glpvn_ofc equals DBPVN_SSP) then
                        begin
                          for every tuple in RLtatype
                            begin
                              find exactly one tuple in RLtatype
                              where  (RLtatype.tatype equals RT_NSANNC)
                            end;
                        end;
                   for every tuple in RLtatype
                     begin
                       if (RLtatype.tatype is_equal_to RT_NSANNC) then
                         begin
                           Glpvn_ofc must_be DBPVN_SSP and
                           RLtatype.toneind must_be DBNO and
                           RLtatype.annind must_be DBNO and
                           RLtatype.pctone must_be DB_PCNULL
                         end;
                       end;
```

Copyright © 1999 Lucent Technologies 

```
                    for every tuple in RLtatype
                      begin
                        if (RLtatype.tatype equals RT_NSANNC) then
                          begin
                            for every tuple in RLrt_fixedri
                              begin
                               must find exactly 1 tuple in RLrt_fixedri
                               where (RLtatype.tatype is_equal_to
                                      RLrt_fixedri.ritype)
                              end;
                          end;
                      end;
RT_TOLL_ACCT    Provides routing to a 5E Toll Account Code SAS
                dial-through-announcement (NOTE: Not DSU2-RAF).
                This will route to an idle SAS port from a trunk
                group defined in the RLrt_trkg relation. The
                RLrt_trkg.type must equal RT_RAF for SAS.
RT_SCD             Provides routing to a tone or an announcement
                     for calls blocked by Selective Carrier Denial
                screening.
                     Checks:
                     must find exactly one tuple in RLtatype
                       where (RLtatype.tatype equals RT_SCD);
                when found
                     begin
                    if (Rltatype.toneind equals DBNO) then
                    begin
                             RLtatype.annind must_equal DBNO;
                             RLtatype.pctone must_equal DB_PCNULL;
                        must find exactly one tuple in RLrt_fixedri
                             where (RLtatype.tatype equals
                                    RLrt_fixedri.ritype);
                             when found
                           begin
                               RLrt_fixedri.noc must_equal 0;
                             end;
                         end;
                     end;
RT_ACT_PROCERR  Provides routing to an announcement
                when the Unidentified Call Rejection (UCR)
                activation code is dialed.
RT_DEAC_PROCER  Provides routing to an announcement
                when the Unidentified Call Rejection (UCR)
                deactivation code is dialed.
RT_DENY_ORIG    Used for the Secured feature, Unidentified Call
                Rejection(UCR). Provides routing to an
                announcement for UCR announcements given by
                13A/14A announcement interface. This value is only
                populated if the UCR Feature has been purchased.
RT_INVCAC       Provides Error treatment when the user has dialed
                an invalid Carrier Access Code (CAC). The user
                dialed 10XXX in an office that only supports
                101XXXX dialing in the Feature Group D POST
                PERMISSIVE phase.
```

```
RT_REVRBANN     Provides routing to a tone or announcement
                when an originator is going to be rung
                back due to Multi-Party Revertive Ringing.
                This is part of the REA Revertive
                Announcement Feature, and is available
                with 5E9 and later Software Releases.
                Checks:
                   RLtatype.annind must_equal DBNO;
                   if (Rltatype.toneind equals DBNO) then
                   begin
                           RLtatype.pctone must_equal DB_PCNULL;
                   end;
                   must find exactly one tuple in RLrt_fixedri
                   where ((RLrt_fixedri.ritype equals RLtatype.tatype)
                      and (RLrt_fixedri.noc equals 0));
RT_REVOHANN     Provides routing to a tone or announcement
                when a multi-party line goes offhook after
                being rung back due to Multi-Party Revertive
                Ringing.  This is part of the REA
                Revertive Announcement Feature, and is
                available with 5E9 and later Software
                Releases.
                Checks:
                   RLtatype.annind must_equal DBNO;
                   if (Rltatype.toneind equals DBNO) then
                   begin
                           RLtatype.pctone must_equal DB_PCNULL;
                   end;
                   must find exactly one tuple in RLrt_fixedri
                   where ((RLrt_fixedri.ritype equals RLtatype.tatype)
                      and (RLrt_fixedri.noc equals 0));
RT_CWDBUSY      Provides routing for the Call Waiting Deluxe (CWD)
                Special Feature using CWD BUSY Announcement given by
                13A or 14A. This will route to an idle port from a
                trunk group defined in the RLrt_trkg relation.
RT_CWDHOLD      Provides routing for the Call Waiting Deluxe (CWD)
                Special Feature using CWD HOLD Announcement given by
                13A or 14A. This will route to an idle port from a
                trunk group defined in the RLrt_trkg relation.
RT_DFLTRT       Provides routing to announcement for
                Special Feature ASP Default Routing for
                3/6/10-Digit Triggers.
                The exact treatment will be provided by the
                TCA, but it is expected that they would be
                routed to an announcement provided by the 13A
                announcement unit.  The tuple for RT_DFLTRT will
                point to a route index which in turn will point
                to trunk group containing the announcement trunk
                port.  Required when 'dfltrt' attribute is set to
                DFLT_ANNC in RLDAPRMFNL or RLDAPRLFNL.
RT_CWDREMDR     Provides routing for the Call Waiting Deluxe
                (CWD) Special Feature using CWD REMINDER
                Announcement given by 13A or 14A.  This will
                route to an idle port from a trunk group
```

Copyright © 1999 Lucent Technologies 

```
                defined in the RLrt_trkg relation.
        RT_CWDDFANC     Provides routing for the Call Waiting Deluxe (CWD)
                        Special Feature using CWD DEFAULT
                        Announcement given by 13A or 14A.  This will
                        route to an idle port from a trunk group
                        defined in the RLrt_trkg relation.
```

**Attribute:**
toneind
**Fullname:**
Tone applied boolean.
**Attribute Description:**
DBYES: tone applied: value of annind must be DBNO.
DBNO: tone not applied. See additional population rules.

**Attribute:**
annind
**Fullname:**
announcement boolean.
**Attribute Description:**
DBYES: announcement applied: value of toneind must be DBNO.
DBNO: announcement not applied. See additional population rules.
Not used by Domestic -- default to DBNO.

**Attribute:**
playannc
**Fullname:**
Play an announcement.
**Attribute Description:**

```
        **********************************************************************
        ADDED FOR K4.0 IN NEW POPGEN FORMAT  (k7104)
        **********************************************************************
                This attribute indicates whether a tone/announcement
                should be played on an ISUP7 trunk which is crossing
                a network boundary.
                DBYES - indicates the announcement should be played.
                DBNO  - means the announcement will not be played and
                        the corresponding cause value will be sent in
                        an ISUP7 REL message to the next office.
                The corresponding cause values for Unauthorized INWATS
                or Network Call Denial should never be passed across
                network boundaries.
                ******************************************************
                *  The following note is not recent change enforceable *
                *  but is an ODA recommendation for populating offices *

## 4. Population Rules for RLtc_ltp

**Relation Description** Test Calls Logical Test Port Counts relation.

This relation provides the number of logical test ports for test calls on a per SM and service class basis. Thus the number of tuples populated in RLfc_porttype, RLgroup_port and RLport_group relation for the logical test port types on an SM must be equal to the counts in the RLtc_ltp relation.

**Attribute: sm**

**Fullname:** Switching Module

**Attribute Description** SM number which provides the test call logical test ports.

**Attribute: servclass**

**Fullname:** Class of Service

**Attribute Description** Test Call service classes.

**Attribute: ltp_cnt**

**Fullname:** Logical Test Port count

**Attribute Description** Value of this attribute provides the number of test call logical test port available on a per SM and service class basis.

Copyright © 1999 Lucent Technologies

# TCCID

## 1. Description

This relation contains the telephone credit card (TCR) issuer ID digits, 2-7 digits. If the number of digits in the key is not adequate to determine the issuer, nxtkey will indicate the number of digits to try next. If number of digits in the key is sufficient to determine the issuer, the number of digits in the TCR issuer identification number, the TCR account number, the TCR check number outside account number, and the TCR PIN number fields will be filled in.

## 2. Data Dictionary Values

## 4. Population rules for RLtccid

### Relation Description

Telephone Credit Card Identification Table
Telephone Credit Card Identification Table.
This table is used to identify a calling card
using the first 2 - 7 digits of the
TCR issuer identification number.
The nxtkey attribute specifies the number of digits which must be
used in the key of this relation to identify the card. If nxtkey
is zero, then the card can be identified with the number of digits
used in the current key.
This relation is populated for domestic generics only.
Engineering Information:
Maximum # Tuples: 3000
Average # Tuples: 300

**Attribute:**
issiddgt
**Fullname:**
Card Issuer Identification Number
**Attribute Description:**
Identifies the first 2-7 digits entered in the card issuer
identification field.

**Attribute:**
nxtkey

Copyright © 1999 Lucent Technologies 

**Fullname:**
Next key size
**Attribute Description:**
If more digits are needed to identify a calling card, the nxtkey attribute is used to identify the next size key to be referenced.

**Attribute:**
issnmdgt
**Fullname:**
Number of digits for issuer identification.
**Attribute Description:**
Identifies the number of digits entered in the issuer id field

**Attribute:**
accnmdgt
**Fullname:**
Number of digits for account number
**Attribute Description:**
Identifies the number of digits entered in the account number field.

**Attribute:**
chknmdgt
**Fullname:**
Number of digits for check number
**Attribute Description:**
Identifies the number of digits entered in the check number field.

**Attribute:**
pinnmdgt
**Fullname:**
Number of digits for Personal Identification Number (PIN).
**Attribute Description:**
Identifies the number of digits entered in the Personal Identification Number (PIN) field.
NOTE: Currently the maximum length of the PIN is 13 digits. If this number changes, the following check must be enforced:
The length of number of digits in issuer id plus acct nbr plus check number plus pin cannot be greater than 32.
(RLtccid.issnmdgt + RLtccid.accnmdgt + RLtccid.chknmdgt
+ RLtccid.pinnmdgt must_not_be_greater_than 32)

**Attribute:**
trans_type
**Fullname:**
Translation type
**Attribute Description:**
A query is sent from the 5ESS(R)-2000 switch along the network to a No. 2 Signal Transfer Point (2STP). The 2STP uses the

**Copyright © 1999 Lucent Technologies** 

translation type found in the query it received and using internal tables found in the 2STP figures out the proper database to route the query to. The translation type is used during global title translation to map the global title field of the query [card number] into the query destination address.

**Attribute:**
crd_attr
**Fullname:**
Card Attribute Key
**Attribute Description:**
Key into relation RLcrd_attr

**Attribute:**
csr_attr_id
**Fullname:**
Carrier Specific Routing Attribute ID
**Attribute Description:**
Key into relation RLcsr_attr

**Attribute:**
country
**Fullname:**
Country Identifier
**Attribute Description:**
Identifies country of the card issuer.

**Attribute:**
iccvdbn
**Fullname:**
ICCV Database Number
**Attribute Description:**
Used as key into RLiccvdb to retrieve software alarm information.

**Attribute:**
lang_val
**Fullname:**
Language Value
**Attribute Description:**
Identifies issuer language for card announcements.

**Attribute:**
home_call
**Fullname:**
Home call

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
If this is an ICCV card, indicates whether home country calls are allowed by this card issuer.

**Attribute:**
oaff1
**Fullname:**
Spare 1
**Attribute Description:**
Spare field for special feature.

**Attribute:**
cardtype
**Fullname:**
Card Type
**Attribute Description:**
Card type for this card.

**Attribute:**
disposable
**Fullname:**
Disposable card
**Attribute Description:**
Indicates whether this card is a disposable card, that is, one with a preset balance that is decremented as used and no longer usable once the balance is completely depleted.

**Attribute:**
carrgrp
**Fullname:**
Carrier Group ID
**Attribute Description:**
Identification number for the group of carriers which accept this card. Zero means all carriers accept this card.

**Attribute:**
oaff2
**Fullname:**
Spare 2
**Attribute Description:**
Spare field for fast features.

**Attribute:**
isstxt
**Fullname:**
Issuer ID text
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This is the issuer ID text to be displayed on the operator position by the ACCS for CCC feature.

**Attribute:**
exp_date
**Fullname:**
Expiration date handling specifier
**Attribute Description:**
This specifies whether the card is to be given expiration date treatment or PIN treatment.

**Attribute:**
quietheartrmt
**Fullname:**
Quiet Hear Treatment
**Attribute Description:**
This field is used for the QUIET HEAR TRMT field, which is the Quiet Hear treatment eligibility parameter used to control the application of Quiet Hear based on the entry for a non-LEC card's Issuer Identifier as defined in the OSPS Card Recognition table.

**Attribute:**
vmselig
**Fullname:**
VMS eligible
**Attribute Description:**
This field is the VMS ELIGIBLE field, which indicates whether this card is eligible for VMS treatment.

**Attribute:**
issid_alw
**Fullname:**
DA Call Completion Allowed
**Attribute Description:**
Indicates whether the card's Issuer Identification is eligible for CICADA call completion.

**Attribute:**
oaff3
**Fullname:**
Spare 3
**Attribute Description:**
Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute:**

# TCR_F2DV

## 1. Description

This relation identifies a telephone credit card (TCR) by using the first two digits of TCR issuer identification number. TCR stands for telephone credit card other than 14-digit LEC card. If the first two digits indicates more digits are needed to determine a TCR card, it will point to the next table tcr_f3dv, tcr_f4dv, tcr_f5dv, tcr_f6dv, or tcr_f7dv. If first two digits are sufficient to determine as a TCR card, it will give the number of digits in the TCR issuer identification number, the TCR account number, the TCR check number outside account number and the TCR PIN number fields.

# TCR_F5DV

## 1. Description

This relation identifies a telephone credit card (TCR) card by using the first five digits of TCR issuer identification number. Even if the table indicates a TCR card and the customer enters only 14 digits, it will be considered as a 14-digit LEC card. If the first five digits indicates more digits are needed to determine as a TCR card, it will be point to the next table tcr_f6dv, or tcr_f7dv. If first five digits are sufficient to determine as a TCR card, it will give the number of digits in the TCR issuer identification number, the TCR account number, the TCR check number and the TCR personal identification number (PIN) number fields.

## 4. Population Rules for RLtcscc

**Relation Description** Terminating Code Screening based on Country Code
This relation is used to determine termination screening conditions for OSPS calls based on the Country Code (CC) of the forward number and the originating NPA and station type of the back number.

This relation should be populated for domestic generics only.

Engineering Information:

Copyright © 1999 Lucent Technologies

Maximum # tuples: 585
Average # Tuples: 335

**Attribute: cc**

**Fullname:** country code

**Attribute Description** This is the country code portion of the forward number converted to binary.

**Attribute: add_digits**

**Fullname:** additional digits

**Attribute Description** Additional digits is an additional refinement of the country code for screening purposes.

**Attribute: onpa**

**Fullname:** Originating NPA

**Attribute Description** This is the originating NPA of the back number converted to binary. The 0 (zero) value is used to indicate all NPAs (100 thru 999) are treated the same for a particular Country Code (CC). When an ONPA of 0 is populated for a CC, no other ONPAs are allowed for that CC.

**Attribute: scrncode**

**Fullname:** screen code

**Attribute Description** This is the terminating code screening screen code.

**Attribute: tcsrt**

**Fullname:** restricted call routing

**Attribute Description** If any calling card restrictions apply, whether the call should be sent to reorder (DBYES) or routed to an operator (DBNO).

**Attribute: mech**

**Fullname:** eligible for MECH treatment

**Attribute Description** Indicates whether or not calls to cc are eligible for MECH treatment(DBYES) or not eligible (DBNO).

**Attribute: oaff1**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: oaff2**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: oaff3**

**Fullname:** Spare Field

## 4. Population Rules for RLtcsnpa

**Relation Description** Terminating Code Screening by NPA and NPA-NXX
This relation is used to determine termination screening conditions for OSPS calls based on the NPA or NPA-NXX of the forward number and the originating NPA and station type of the back number.

This relation should be populated for domestic generics only.

Engineering Information:

Maximum # Tuples: 3335
Average # Tuples: 1900

**Attribute: bnpanxx**

**Fullname:** Binary NPA NXX

**Attribute Description** This is the NPA-NXX portion of the forward number converted to binary. It is a 6 digit number and can take on any valid NPA-NXX combination: an NPA with either a zero NXX (to mean the entire NPA) or a normal NXX can be used.

Copyright © 1999 Lucent Technologies

**Attribute: onpa**

**Fullname:** Originating NPA

**Attribute Description** This is the originating NPA of the back number converted to binary. The 0 (zero) value is used to indicate all NPAs are treated the same for a particular Country Code (CC). When an ONPA of 0 is populated for a CC, no other ONPAs are allowed for that CC.

**Attribute: scrncode**

**Fullname:** Screen Code

**Attribute Description** This is the terminating code screening screen code. Zero is reserved to mean not screened.

**Attribute: tcsrt**

**Fullname:** Call Sent or Routed To????

**Attribute Description** If any calling card restrictions apply, whether the call should be sent to reorder (DBYES) or routed to an operator (DBNO).

**Attribute: mech**

**Fullname:** eligible for MECH treatment

**Attribute Description** Indicates whether or not calls terminating at npa-nxx are eligible for MECH treatment

**Attribute: oaff1**

**Fullname:** Spare field

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: oaff2**

**Fullname:** Spare field

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population Rules for RLtcsscrn

**Relation Description** Terminating code screening (TCS) screening restriction bits. This relation contains the restriction bits associated with a TCS screen code.
Engineering Information:
Maximum # Tuples: 128
Average # Tuples: 60

**Attribute: scrncode**

**Fullname:** screencode
**Attribute Description** This is the TCS screen code. It is used to retrieve the restriction bits associated with the TCS. Zero is reserved to mean not screened.

**Attribute: coll_dny**

**Fullname:** Collect denied
**Attribute Description** DBYES - all collect service is denied.

Copyright © 1999 Lucent Technologies

**Attribute: statn_dny**
**Fullname:** Station collect denied
**Attribute Description** DBYES - Station collect service is denied.

**Attribute: coll_restr**
**Fullname:** Collect restricted
**Attribute Description** DBYES - Collect service is restricted to manual operator outpulsing.

**Attribute: ccr_pub**
**Fullname:** calling card restricted from public stations
**Attribute Description** DBYES - calling card service is restricted from public stations.

**Attribute: ccr_hotel**
**Fullname:** calling card service restricted from hotels
**Attribute Description** DBYES - calling card service is restricted from hotels.

**Attribute: ccr**
**Fullname:** calling card restricted
**Attribute Description** DBYES - calling card service is restricted from non-hotel and non-public stations.

**Attribute: dny3_pub**
**Fullname:** third number denied from public stations
**Attribute Description** DBYES - third number billing is denied from public stations.

**Attribute: dny3_hotel**
**Fullname:** third number denied from hotels
**Attribute Description** DBYES - third number billing is denied from hotel stations.

**Attribute: dny3_oth**
**Fullname:** third number denied from other stations
**Attribute Description** DBYES - third number billing is denied from non-hotel and non-public stations.

**Attribute: oaff1**
**Fullname:** spare field
**Attribute Description** This is a spare field added so the database manager won't ignore a record fully populated with screencode at maximum value and all booleans set to DBYES.

**Attribute: oaff2**
**Fullname:** spare field
**Attribute Description** This is a spare field added so the database manager won't ignore a record fully populated with screencode at maximum value and all booleans set to DBYES.

## 4. Population rules for RLtcw_parm

### Relation Description

Talking Call Waiting (TCW) Parameters

For 99-5E-4605, Talking Call Waiting Call Processing, this relation is needed for the parameters of screening index, das, DN1 (DN sent to the IP for tone + name generation) DN2 (DN sent to the IP for name only generation).

**Attribute:**
tcw_id
**Fullname:**
TCW ID
**Attribute Description:**
Key for this relation. Dummy key, only value DBNO used, 1 tuple.

**Attribute:**
si
**Fullname:**
Screening Index
**Attribute Description:**
The screening index for tcw. The tcw screening index is a unique index into the RLrt_scrning relation.

**Attribute:**
das
**Fullname:**
digit analysis selector
**Attribute Description:**
The digit analysis selector (DAS) is a number that indicates the digit interpreter tables that will be used in analyzing the incoming digit stream.

Copyright © 1999 Lucent Technologies 

**Attribute:**
dn1
**Fullname:**
directory number 1
**Attribute Description:**
DN sent to the IP for tone + name generation.

**Attribute:**
dn2
**Fullname:**
directory number 2
**Attribute Description:**
DN sent to the IP for name only generation

## 4. Population Rules for RLtd_cf

**Relation Description** Time of day constructed feature.
The following is a list of valid service classes for ports assigned this feature:
LINES

**Copyright © 1999 Lucent Technologies** 

```
-----
FC_INDVDL
FC_ATTENDANT
FC_4WIRE_INDV
FC_PBX
FC_ISDN
FC_ISATND

TRUNKS
------
FC_LATA_CONN
FC_PF
FC_PFLASH
```

**Attribute: feat_id**

**Fullname:** Feature ID.
**Attribute Description** Identifies time of day constructed feature ID.

**Attribute: max_ap**

**Fullname:** Maximum number of Action Points.
**Attribute Description** Indicates maximum number of action points. This attribute controls the number of tuples in RLtd_code. For each line which is assigned this time of day feature, there can be td_cf.max_ap tuples in RLtd_code with RLtd_code.td_id = RLtrmfeats.todid where the key to RLtrmfeats is the lport and lpt_type of the line.

**Attribute: maxcode0**

**Fullname:** Maximum number of zero parameter codes.
**Attribute Description** Indicates the maximum number of zero parameter codes. If RLtd_cf. maxcode0 == 0, then RLtd_cf.maxcode1 <> 0.
This attribute controls the population of data in RLtd_code. If this feature is assigned to a line, the RLtd_code tuples associated with that line's todid can have a maximum of maxcode0

**Attribute: maxcode1**

**Fullname:** Maximum number of one parameter codes.
**Attribute Description** Indicates the maximum number of one parameter code lists.
If RLtd_cf. maxcode1 == 0, then RLtd_cf.maxcode0 <> 0.
This attribute controls the population of data in RLtd_code. If this feature is assigned to a line, the RLtd_code tuples associated with that line's todid can have a maximum of maxcode1 codes in their one parameter code lists.

**Attribute: cntrlln**

**Fullname:** Control line.
**Attribute Description** Controls changes to line private data.

```
If RLtd_cf.cntrlidp,
RLtd_cf.cntrlars, RLtd_cf.cntrlacct, RLtd_cf.cntrlacvt,
RLtd_cf.cntrltk, and RLtd_cf.cntrlath == DBNO:
then RLtd_cf.cntrlln == DBYES.
```

**Attribute: cntrltk**

**Fullname:** Control trunk.
**Attribute Description** Controls changes to trunk data. Range of
If RLtd_cf.cntrlidp, RLtd_cf.cntrlars, RLtd_cf.cntrlacct, RLtd_cf.cntrlacvt, RLtd_cf.cntrlath, and RLtd_cf.cntrlln == DBNO: then RLtd_cf.cntrltk == DBYES. If this feature is assigned to a trunk,

Copyright © 1999 Lucent Technologies 

there will be a tuple in RLtd_code for each assigned action point.

**Attribute: cntrlidp**

**Fullname:** Controls IDP group.
**Attribute Description** Controls changes to IDP group data.
If cntrlidp is DBNO, one of RLtd_cf.cntrlln, cntrltk, cntrlars, cntrlacct, cntrlacvt or cntrlath must be DBYES. The distribution over SMs of RLtd_code and RLtd_sched tuple for this group is a union of all groups on the line.

**Attribute: cntrlars**

**Fullname:** Control ARS group.
**Attribute Description** Controls changes to ARS group data.

If RLtd_cf.cntrlln, cntrltk, cntrlidp, cntrlacct, contrlacvt, cntrlath == DBNO, then RLtd_cf.cntrlars == DBYES. The distribution over SMs of RLtd_code and RLtd_sched tuple for this group is a union of all groups on the line.

**Attribute: cntrlacct**

**Fullname:** Control ACCT group.
**Attribute Description** Controls changes to account code group data.
If RLtd_cf.cntrlln, cntrlidp, cntrltk, cntrlars, cntrlacvt, cntrlath == DBNO, then RLtd_cf.cntrlacct == DBYES. If this feature is assigned to a line or trunk, there will be a tuple in RLtd_code for each assigned action The RLtd_code tuples, as well as the RLtd_sched tuples for this line, will be distributed over the SMs on which this account code group data resides.

**Attribute: cntrlath**

**Fullname:** Control ATH group.
**Attribute Description** Controls changes to authorization code group data.
If RLtd_cf.cntrlln, cntrlidp, cntrltk, cntrlars, cntrlacvt, and cntrlacct == DBNO, then RLtd_cf.cntrlath == DBYES. If this feature is assigned to a line or trunk, there will be a tuple in RLtd_code for each assigned action point. The RLtd_code tuples, as well as the RLtd_sched tuples for this line, will be distributed over the SMs on which this authorization code group data resides.

**Attribute: cntrlacvt**

**Fullname:** Control ACVT group.
**Attribute Description** Controls changes to ACVT group data.
If RLtd_cf.cntrlln, cntrltk, cntrlidp, cntrlacct, cntrlath, cntrlars == DBNO, then RLtd_cf.cntrlacvt == DBYES. The distribution over SMs of RLtd_code and RLtd_sched tuple for this group is a union of all groups on the line.

**Attribute: act**

**Fullname:** Activation.
**Attribute Description** Indicates whether customer is allowed (DBYES) or not allowed (DBNO) to activate the feature.
RLfacftdsc tuple keyed by this feature ID must contain the actions ACN_TDACT and ACN_TDDCT if td_cf.act == DBYES.

**Attribute: chg_at**

**Fullname:** Change action time.
**Attribute Description** Indicates whether action time option can (DBYES) or cannot (DBNO) be changed.
RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TDATCH if td_cf.chg_at == DBYES.

Copyright © 1999 Lucent Technologies 

**Attribute: chg_ows**

**Fullname:** Change one-week schedule.
**Attribute Description** Indicates whether one-week schedule option can (DBYES) or cannot (DBNO) be changed.
RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TDOWCH if td_cf.chg_ows == DBYES.

**Attribute: chg_add0**

**Fullname:** Change add 0.
**Attribute Description** Indicates whether a 0 parameter code list item can (DBYES) or cannot (DBNO) be added.
RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TDADZP if td_cf.chg_add0 == DBYES.

**Attribute: chg_add1**

**Fullname:** Change add 1.
**Attribute Description** Indicates whether a 1 parameter code list item can (DBYES) or cannot (DBNO) be added.
RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TD1PAD if td_cf.chg_add1 == DBYES.

**Attribute: chg_del0**

**Fullname:** Change 0 parameter delete.
**Attribute Description** Indicates whether a 0 parameter code list item can (DBYES) or cannot (DBNO) be deleted.
td_cf.chg_add0 must = td_cf.chg_del0 or if td_cf.chg_add0 == DBYES then td_cf.chg_delall must = DBYES also. RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TDZPDEL if chg_del0 == DBYES.

**Attribute: chg_del1**

**Fullname:** Change 1 parameter delete.
**Attribute Description** Indicates whether a 1 parameter code list item can (DBYES) or cannot (DBNO) be deleted.
td_cf.chg_add1 must = td_cf.chg_del1 or if td_cf.chg_add1 == DBYES then td_cf.chg_delall must = DBYES also. RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TDDEL1P if td_cf.chg_del1 == DBYES.

**Attribute: chg_delall**

**Fullname:** change delete all.
**Attribute Description** Indicates whether all code lists of a specified action point can (DBYES) or cannot (DBNO) be deleted.
If DBYES then RLtd_cf.chg_add0 and RLtd_cf.chg_add1 = RLtd_cf.chg_delall. RLfacftdsc tuple keyed by this feature ID must contain the action ACN_TDDALL if td_cf.chg_delall == DBYES.

**Attribute: bill**

**Fullname:** Billing type.
**Attribute Description** Boolean structure indicating the combination of several types of billing. In each case a DBYES indicates that type of billing is applicable and DBNO indicates it is not. See domain DMmc_bill for a description of each subattribute.
If flat == DBYES, all other subattributes = DBNO.
If flat == DBNO, RLcw_cf.actvn = ACTCD.
If one or more subattributes other than flat == DBYES, flat = DBNO.

**Attribute: bill.flat**

Copyright © 1999 Lucent Technologies 

**Fullname:** Flat
**Attribute Description** Flat rate.

**Attribute: bill.usefreq1**
**Fullname:** Frequent user 1.
**Attribute Description** Frequent user 1.

**Attribute: bill.usefreq2**
**Fullname:** User frequent 2.
**Attribute Description** Frequent user 2.

**Attribute: bill.usefreq3**
**Fullname:** User frequent 3.
**Attribute Description** Frequent user 3.

**Attribute: bill.usefreq4**
**Fullname:** User frequent 4.
**Attribute Description** Frequent user 4.

**Attribute: bill.actchrg**
**Fullname:** Activation charge.
**Attribute Description** Activation charge.

**Attribute: bill.dactchrg**
**Fullname:** Deactivation charge.
**Attribute Description** Deactivation charge.

**Attribute: bill.duration**
**Fullname:** Duration.
**Attribute Description** Charge for Duration?.

**Attribute: bill.change**
**Fullname:** Parameter change
**Attribute Description** User charge for change of parameter.

# TD_CODE

## 1. Description

This is the time of day code list relation.

This is a virtual relation. The tree diagram depicts the stored structure of virtual relation TD_CODE.

The tree diagram Figure 1 depicts the stored structure of virtual relation TD_CODE.

## 4. Population Rules for RLtd_code

**Relation Description** The time of day code list relation.
This relation contains the Time Of Day (TOD) code list for a user. There must be one code list tuple for each non-null action point in the corresponding RLtd_sched tuple. The schedule tuple contains the time and days of the week for each action point, while the code list tuples contain the actual dial codes to be performed at those times.

**Copyright © 1999 Lucent Technologies** 

**Attribute: td_id**

**Fullname:** time of day identifier

**Attribute Description** Dependencies: For every unique RLtd_code.td_id, there must be tuples in: `RLfactodsc such that RLfactodsc.todid = td_id`

RLfacids such that RLfacids.class = FACTODLST and RLfacids.subclass = SCL_NULL and RLfacids.facid = 0

RLname2id such that RLname2id.name = code list name and RLname2id.class = FACTODLST

RLdb_amgpd such that RLdb_amgpd.grp_type = GPDTOD and RLdb_amgpd.grpid = RLtd_code.td_id.

**Attribute: api**

**Fullname:** action point index

**Attribute Description** RLtd_code.api must_be_less_then RLtd_sched.max_ap for every tuple where RLtd_code.td_id equals RLtd_sched.td_id.

**Attribute: n_item0**

**Fullname:** number of zero parameter items

**Attribute Description** RLtd_code.n_item0 must_be 0 if attributes item0_0 through item0_7 are null.

**Attribute: n_item1**

**Fullname:** number of one parameter items

**Attribute Description** RLtd_code.n_item1 must_be 0 if attributes item1_0 through item1_7 are null.

**Attribute: item0[*]**

**Fullname:** zero parameter items

**Attribute Description** Zero parameter items.

The number of item0_0 through item0_7 attributes which are not null values must be less than or equal to the value of n_item0.

**Attribute: item0[*].code**

**Fullname:** dialed action code

**Attribute Description** This field holds a dialed action code of an action not requiring a parameter. This dial code must appear in either the IDP digit tree associated with the line, or the Office Dialing Plan.

**Attribute: item0[*].fid**

**Fullname:** constructed feature id

**Attribute Description** This fid must be the fid associated with the dial code in RLtd_code.item0_*.code and must be found in the same digit tree entry.

**Attribute: item0[*].act**

**Fullname:** action

Copyright © 1999 Lucent Technologies 

**Attribute Description** This field holds the action associated with the dial code in RLtd_code.item0_*.code and must be found in the same digit tree entry.

**Attribute: item0[*].useidp**

**Fullname:** Use IDP to analyze dial code

**Attribute Description** This field determines whether or not to use the IDP digit trees when doing digit analysis on the dial code in the code field.

**Attribute: item1[*]**

**Fullname:** one parameter items

**Attribute Description** One parameter items.

The number of item1_0 through item1_7 attributes which are not null values must be less than or equal to the value of n_item1.

**Attribute: item1[*].code**

**Fullname:** dialed action code

**Attribute Description** This field holds a dialed action code of an action requiring a parameter. This dial code must appear in the IDP digit tree associated with the line or in the Office Dialing Plan.

**Attribute: item1[*].act**

**Fullname:** action

**Attribute Description** This field holds the action associated with the dial code in RLtd_code.item1_*.code and must be found in the same digit tree entry.

**Attribute: item1[*].useidp**

**Fullname:** Use IDP to analyze dial code

**Attribute Description** This field determines whether or not to use the IDP digit trees when doing digit analysis on the dial code in the code field.

**Attribute: item1[*].fid**

**Fullname:** constructed feature id

**Attribute Description** This fid must be the fid associated with the dial code in RLtd_code.item1_*.code and must be found in the same digit tree entry.

**Attribute: item1[*].parm**

**Fullname:** parameter

**Attribute Description** Parameter to be used with the dial code. Valid values are as follows:

```
for ARSCP or DARSCP: 1 to 6
for ACT_ON or ACTOFF: 1 to 32
for GRPCARCH: a valid group carrier id
for ATHREQ or ATHNRQ: parm is a fid (DMUNS16).
         This fid may be checked by ODA against the fcos
         (RLath_fcos) relation if desired.
```

**Defines:** "db/DMcarrid.h"

# TD_SCHED

## 1. Description

This relation contains the time of day action point schedule.

The tree diagram Figure 1 depicts the stored structure of virtual relation TD_SCHED.

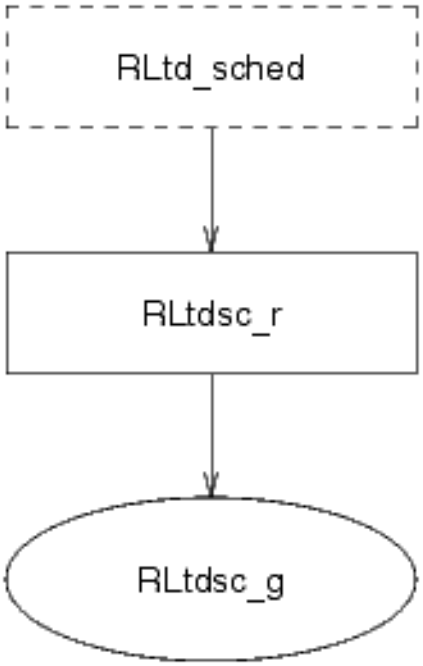

**Figure 1 Stored Structure of Virtual Relation TD_SCHED**

## 2. Data Dictionary Values

| | |
|---|---|
| access type | DBACC_OPV |
| distribution | FG |
| relation type | DBSTATIC |
| trigger function | DBtd_sched |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| corcable | DBYES |
| permutation type | un_perm |

## 3. Field Layout

```
TD_SCHED    relid = 489   DBSTATIC   DBACC_OPV   DBNOTODD  FG      NULL

## 4. Population rules for RLtd_sched

### Relation Description

Time of day schedule
This relation contains the time of day action point schedule.

**Attribute:**
td_id
**Fullname:**
Time of day identifier
**Attribute Description:**
Time of day identifier. There will be 1 identifer for each time of day list identifier (todid) in RLtrmfeats.

**Attribute:**
acctgpid
**Fullname:**
Account code group ID
**Attribute Description:**
This attribute identifies the account code group ID if this line controls account code data. If acctgpid > 0 then this port must belong to this account code group. If RLtd_sched.valid = DBYES then this RLtd_sched tuple must be distributed to each SM where this account code group is present.

**Attribute:**
athgpid
**Fullname:**
Authorization code group ID
**Attribute Description:**
This attribute identifies the authorization code group ID if this line controls authorization code data. If RLtd_sched.athgpid > 0, then the port must belong to this authorization code group. If RLtd_sched.valid = DBYES, then the RLtd_sched tuple must be distributed to each SM where an authorization code group is present.

Copyright © 1999 Lucent Technologies 

**Attribute:**
athdtgpid
**Fullname:**
Authorization code data group id
**Attribute Description:**
This attribute is used for identifying authorization code data grou id. If a nonzero athdtgpid is specified, a tuple must exist in RLath_grp keyed by athgpid, and the group type in that tuple must be BR_CSD (circuit-switched data).

**Attribute:**
lport
**Fullname:**
Logical port
**Attribute Description:**
The logical port of the user.

**Attribute:**
lpt_type
**Fullname:**
Logical port type
**Attribute Description:**
Logical port type of the user.

**Attribute:**
lport_mod
**Fullname:**
Logical port module
**Attribute Description:**
The SM that the logical port is located on.

**Attribute:**
max_ap
**Fullname:**
Maximum action points
**Attribute Description:**
This attribute indicates the maximum number of action points.

**Attribute:**
max0p
**Fullname:**
Maximum 0 parameters
**Attribute Description:**
This attribute indicates the maximum number of 0 parameter codes in an action point.

Copyright © 1999 Lucent Technologies 

**Attribute:**
max1p
**Fullname:**
Maximum 1 parameters
**Attribute Description:**
This attribute indicates the maximum number of 1 parameters in an action point.

**Attribute:**
active
**Fullname:**
Active
**Attribute Description:**
This attribute indicates whether the feature on the line is (DBYES) or is not (DBNO) active.

**Attribute:**
armed
**Fullname:**
Armed
**Attribute Description:**
This attribute indicates whether the feature on the line is (DBYES) or is not (DBNO) armed.

**Attribute:**
valid
**Fullname:**
Valid
**Attribute Description:**
This attribute indicates whether this schedule is (DBYES) or is not (DBNO) executable.

**Attribute:**
cntrlln
**Fullname:**
Control line
**Attribute Description:**
Indicates whether there is line private changes for each valid action point.

**Attribute:**
cntrltk
**Fullname:**
Control trunk
**Attribute Description:**
Indicates whether TOD controls actions of BRCS features assigned to a trunk.

Copyright © 1999 Lucent Technologies 

**Attribute:**
cntrlars
**Fullname:**
Control ARS
**Attribute Description:**
If RLtd_sched.valid = DBYES and RLtd_sched.cntrlars = DBYES, this list may control the active pattern group and alternate frl tables for the ars group. If RLtd_sched.valid = DBYES, and RLtd_sched.cntrlars = DBNO, then this list cannot control these ars group features. If RLtd_sched.valid = DBNO, then cntrlars is meaningless.

**Attribute:**
cntrlidp
**Fullname:**
Control IDP
**Attribute Description:**
If RLtd_sched.valid = DBYES, then if RLtd_sched.cntrlidp is DBYES, this list may control an idp group. If RLtd_sched.valid = DBYES, then if RLtd_sched.cntrlidp is DBNO, this list cannot control an idp group. If RLtd_sched.valid = DBNO, then cntrlidp is meaningless.

**Attribute:**
cntrlacct
**Fullname:**
Control account
**Attribute Description:**
If RLtd_sched.valid = DBYES and RLtd_sched.cntrlacct = DBYES, this list may control an account code group. If RLtd_sched.cntrlacct = DBNO, this list cannot control an account code group.
If RLtd_sched.valid = DBNO, then cntrlacct is meaningless.

**Attribute:**
cntrlath
**Fullname:**
Control authorization
**Attribute Description:**
If RLtd_sched.valid = DBYES and RLtd_sched.cntrlath = DBYES, this list may control an authorization code group.
If RLtd_sched.cntrlath = DBNO, this list cannot control an authorization code group.
If RLtd_sched.valid = DBNO, then cntrlath is meaningless.

**Attribute:**
cntrlacvt
**Fullname:**
Control ACVT

**Attribute Description:**
If RLtd_sched.valid = DBYES and RLtd_sched.cntrlacvt = DBYES, this list may control an acvt group. If RLtd_sched.cntrlacvt = DBNO, this list cannot control an acvt group. If RLtd_sched.valid = DBNO, then cntrlacvt is meaningless.

**Attribute:**
ltsb_alwd
**Fullname:**
Line Time Slot Bridging Allowed
**Attribute Description:**
If RLtd_sched.ltsb_alwd = DBYES then TOD is assigned to an LTSB line.

**Attribute:**
acvt_gpid
**Fullname:**
ACTV group ID
**Attribute Description:**
Identifies actv group ID if this line controls actv group data. If RLtd_sched.acvt_gpid > 0, then the port must belong to this acvt group. If RLtd_sched.valid = DBYES, then this RLtd_sched tuple must be distributed to each SM where this acvt group is present.

**Attribute:**
idpgpid
**Fullname:**
IDP group ID
**Attribute Description:**
Identifies idp group id if this line controls idp data. If RLtd_sched.idpgpid <> 0, then the port must belong to this idp group. If RLtd_sched.valid = DBYES, then this RLtd_sched tuple must be distributed to each SM where this idp group is present.

**Attribute:**
arsgpid
**Fullname:**
ARS group ID
**Attribute Description:**
Identifies ars group id if this line controls ars data. If RLtd_sched.arsgpid <> 0, then the port must belong to this ars group. If RLtd_sched.valid = DBYES, then this RLtd_sched tuple must be distributed to each SM where this ars group is present.

**Attribute:**
ardtgpid
**Fullname:**
Automatic route selection data group id

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Identifies an ARS data group. If a non-zero, ardtgpid is specified, a tuple must exist in RLargp with ar_gpid as the key, and the group type in that tuple must be BR_CSD.

**Attribute:**
ap[*]
**Fullname:**
Action point
**Attribute Description:**
Indicates action points. This is a structure of two members:
ows - one week schedule
at - action time.

**Attribute:**
ap[*].ows
**Fullname:**
One week schedule
**Attribute Description:**
A bit map of the week with the high order bit representing Monday and the low order bit representing Sunday.

**Attribute:**
ap[*].at
**Fullname:**
Action time
**Attribute Description:**
Action time.

## 4. Population Rules for RLtd_tm

**Copyright © 1999 Lucent Technologies** 

**Relation Description** This relation keeps track of billing and permissions for different time of day option packages.

The default code list can no longer be created from the equipment number (EN) due to the OE expansion from eight to ten characters. If there are any existing code lists that were created this way, they may stay since any eight characters are legal, but the feature definition view has been changed so that no new code lists will be created using the EN to generate the code list name.

**Attribute: feat_id**

**Fullname:** Feature identifier
**Attribute Description** This attribute identifies the time of day constructed feature ID.

**Attribute: max_ap**

**Fullname:** Maximum action points
**Attribute Description** This attribute indicates the maximum number of action points.

**Attribute: maxcode0**

**Fullname:** Maximum zero parameter code lists
**Attribute Description** This attribute indicates the maximum number of zero parameter code lists.

**Attribute: maxcode1**

**Fullname:** Maximum one parameter code lists
**Attribute Description** This attribute indicates the maximum number of one parameter code lists.

**Attribute: cntrlln**

**Fullname:** Control line
**Attribute Description** This attribute controls changes to line private data. If this feature is assigned to a line, there will be a tuple in RLtd_code for each assigned action point.

**Attribute: cntrltk**

**Fullname:** Control trunk
**Attribute Description** This attribute controls changes to trunk data. If this feature is assigned to a trunk, there will be a tuple in RLtd_code for each assigned action point.

**Attribute: cntrlidp**

**Fullname:** Control individual dialing plan (IDP) group
**Attribute Description** This attribute controls changes to IDP group data. If this feature is assigned to a line, there will be a tuple in RLtd_code for each assigned action point. This RLtd_code tuple as well as the RLtd_sched tuple for this line will be distributed over the SMs on which the line's group data resides.

**Attribute: cntrlars**

**Fullname:** Control automatic route selection (ARS) group
**Attribute Description** This attribute controls changes to ARS group data. If this feature is assigned to a line, there will be a tuple in RLtd_code for each assigned action point. This RLtd_code tuple as well as the RLtd_sched tuple for this line will be distributed over the SMs on which the line's group data resides.

**Attribute: cntrlacct**

**Fullname:** Control account group
**Attribute Description** This attribute controls changes to account code group data. If this feature is assigned to a line/trunk, there will be a tuple in RLtd_code for each assigned action point. These RLtd_code tuples as well as the RLtd_sched tuples for this line/trunk will be distributed over the SMs on which lines/trunks with an account code group data that TOD feature controls resides.

**Attribute: cntrlath**

Copyright © 1999 Lucent Technologies 

**Fullname:** Control authorization group
**Attribute Description** This attribute controls changes to authorization code group data. If this feature is assigned to a line/trunk, there will be a tuple in RLtd_code for each assigned action point. The RLtd_code tuples as well as the RLtd_sched tuples for this line/trunk will be distributed over the SMs on which lines/trunks with an authorization code group data that TOD feature controls reside.

**Attribute: cntrlacvt**
**Fullname:** Control activate (ACTV) group
**Attribute Description** This attribute controls changes to ACTV group data. If this feature is assigned to a line, there will be a tuple in RLtd_code for each assigned action point. This RLtd_code tuple as well as the RLtd_sched tuple for this line will be distributed over the SMs on which the group data resides.

**Attribute: act**
**Fullname:** Customer selected activation
**Attribute Description** This attribute indicates whether customer is allowed to activate the feature using dialed code.

**Attribute: chg_at**
**Fullname:** Change action time
**Attribute Description** This attribute indicates whether or not the action time option can be changed.

**Attribute: chg_ows**
**Fullname:** Change one week schedule
**Attribute Description** This attribute indicates whether or not the one-week schedule option can be changed.

**Attribute: chg_add0**
**Fullname:** Change 0 parameter list by addition
**Attribute Description** This attribute indicates whether or not a 0 parameter code list item may be added.

**Attribute: chg_add1**
**Fullname:** Change 1 parameter list by addition
**Attribute Description** This attribute indicates whether or not a 1 parameter code list item may be added.

**Attribute: chg_del0**
**Fullname:** Change 0 parameter list by deletion
**Attribute Description** This attribute indicates whether or not a 0 parameter code list item may be deleted.

**Attribute: chg_del1**
**Fullname:** Change 1 parameter list by deletion
**Attribute Description** This attribute indicates whether or not a 1 parameter code list item may be deleted.

**Attribute: chg_delall**
**Fullname:** Change by deleting all
**Attribute Description** This attribute indicates whether or not all code lists of a specified action point may be deleted.

**Attribute: bill**

Copyright © 1999 Lucent Technologies 

**Fullname:** Billing options
**Attribute Description** This attribute is a boolean structure indicating the combination of several types of billing.

**Attribute: bill.flat**
**Fullname:** Flat rate
**Attribute Description** This sub-attribute indicates whether or not billing is done on a flat rate. A flat rate means that there are no usage sensitive charges.

**Attribute: bill.usefreq1**
**Fullname:** Usage frequency charge for use of event 1
**Attribute Description** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 1.

**Attribute: bill.usefreq2**
**Fullname:** Usage frequency charge for use of event 2
**Attribute Description** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 2.

**Attribute: bill.usefreq3**
**Fullname:** Usage frequency charge for use of event 3
**Attribute Description** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 3.

**Attribute: bill.usefreq4**
**Fullname:** Usage frequency charge for use of event 4
**Attribute Description** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 4.

**Attribute: bill.actchrg**
**Fullname:** Usage charge for activation
**Attribute Description** This sub-attribute indicates whether or not billing is to include a usage charge for activation.

**Attribute: bill.dactchrg**
**Fullname:** Usage charge for deactivation
**Attribute Description** This sub-attribute indicates whether or not billing is to include a usage charge for deactivation.

**Attribute: bill.duration**
**Fullname:** Usage charge for duration of use
**Attribute Description** This sub-attribute indicates whether or not billing is to include a usage charge for duration of use.

**Attribute: bill.change**
**Fullname:** Usage charge for change of parameter
**Attribute Description** This sub-attribute indicates whether or not billing is to include a usage charge for change of parameter.

**Attribute: dfcl**
**Fullname:** Default code list
**Attribute Description** This attribute indicates whether the name of the time of day list is to be predetermined.
If RLtd_tm.dfcl = TN, then the name of the time-of-day list should be the telephone number of the line.

Copyright © 1999 Lucent Technologies 

If RLtd_tm.dfcl = TK, then the name of the time-of-day list should be the trunk group and member number of the trunk.
When a list is automatically named, it means that at the time the feature is assigned to a line, a list name and list are created. This means that RLfacname is populated with a list name, RLfacids is incremented for time of day lists, a tuple is created in RLfactodsc with the list ID as key, the list ID is entered in RLtrmfeats as todid, an RLtd_sched tuple is created with the list ID as key, and RLtd_code tuples are created with list ID and api(s) from 0 to RLtd_sched.maxap. A tuple is created in RLdb_amgpd with list ID GPDTOD as keys. The contents of these relations must be set as specified by their population rules. The array of action points in RLtd_sched and the arrays of codes in RLtd_code may be defaulted.

```

## 4. Population Rules for RLtdassign

**Relation Description** Traffic data to customer feature assignment.

**Attribute: gcsrid**

**Fullname:** Business customer ID
**Attribute Description** Customer should have the same gcsrid for all features that require it.

**Attribute: apid**

**Fullname:** Applications processor ID (APID)
**Attribute Description** There must be a tuple in RLcmapdata with RLcmapdata.site_id = apid.

**Attribute: tdactive**

**Fullname:** Traffic data to customer feature active
**Attribute Description** Traffic data active. Indicates whether the traffic data to customer location feature has been activated for this customer.

**Attribute: acaactive**

**Fullname:** Automatic circuit assurance feature active
**Attribute Description** Automatic circuit assurance active. Indicates whether the automatic circuit assurance feature has been activated for this customer.

Copyright © 1999 Lucent Technologies 

**Attribute: hssactive**

**Fullname:** Enhanced private switched communication service (EPSCS) 100 second scan feature active

**Attribute Description** EPSCS 100 second scan (HSS) feature active. Indicates whether the HSS feature has been assigned to this customer.

(1) If hssactive == DBYES, a tuple must exist in RLcmapdata for the 'apid' such that:

RLcmapdata.module != 0

(2) If hssactive == DBYES, a tuple must be placed in the relation RLhssasgn with:

```
RLhssasgn.bcid      =   RLtdassign.gcsrid
RLhssasgn.apid      =   RLtdassign.apid
RLhssasgn.hssactive =   DBYES
```

## 4. Population Rules for RLtdec_ckt

**Relation Description** This relation is used by measurements scanning procedures.

**Attribute: circuit**

**Fullname:** circuit name
**Attribute Description** Use first circuit name per each universal tone decoder.

**Attribute: dummy**

**Fullname:** dummy field use zero
**Attribute Description** Information concerning this section is not available at this time.

## 4. Population Rules for RLtdr_rti

**Relation Description** Time dependent routing information.
Time dependent routing information relation. RLtdr_rti is ancillary relation to RLtdr. RLtdr_rti is TORCable. TORC : Time Originated Recent Change.

**Attribute: irte_idx**

**Fullname:** Incoming route index

**Attribute Description** Incoming route index.

**Attribute: orte_idx**

**Fullname:** Outgoing route index

**Attribute Description** Outgoing route index.

# TDR

## 1. Description

This Time dependent routing (TDR) relation allows definitions of time intervals where a route index is replaced by a new route index.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 4095 |
| expected tuples in relation | 200 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LPFG |
| application | GCRTG |
| relation type | DBSTATIC |
| trigger function | RTtdr_trig |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLtdr

**Relation Description** Time dependent routing information
Time dependent routing information relation. RLtdr contains time intervals which are used to alter routing.

The trigger function RTtdr_trig() will be associated with RC/V 10.39 for Time Dependent Routing.

**Attribute: rte_idx**

**Fullname:** Route index

**Attribute Description** Route index

**Attribute: intvl0**

**Fullname:** Time interval 0

**Attribute Description** Time interval 0

**Attribute: intvl1**

**Fullname:** Time interval 1

**Attribute Description** Time interval 1

**Attribute: intvl2**

# TDSC_G

## 1. Description

This is the time of day code list GK storage relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 500 |
| expected tuples | 20 |
| access type | DBACC_GK |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTORAGE |
| head page size | 256 |
| intermediate page size | 256 |
| data page size | 512 |
| page level | 3 |
| ks key store | DBNO |
| foldtype | DBGC31 |
| permutation type | perm |
| gkidxrel reverse index | rlTDSC_I |

## 3. Field Layout

### Relation Description

There are no population rules for this relation.

# TDSC_R

## 1. Description

Time of day code list relation. This is a root storage relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 28800 |
| expected tuples in relation | 5 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTORAGE |

## 3. Field Layout

```

## 4. Population rules for RLtdxcartb

### Relation Description

Copyright © 1999 Lucent Technologies

Feature data of carriers for which the Toll Platform Service Provider offers transport service. This is also known as the LDP (Long Distance Platform) Carrier Table.

This relation contains the defaults for ANI (Automatic Number Identification) Table processing for TDX (Toll Digital Exchange) calls which used the specified carrier.

The relations RLldpindx, RLanidx[XXX] and RLtdxcartb are related and are used together to determine how LDP calls are processed.

Note: Terminology was changed from "Toll Digital Exchange (TDX)" to "Long Distance Platform (LDP)". The database still contains names with "tdx" whereas the customers will see "ldp" on ODA forms and RC views.

**Attribute:**
tdx_carr
**Fullname:**
toll digital exchange carrier id
**Attribute Description:**
This is a carrier id for which the Toll Platform Service Provider offers transport service. Specifications for ANI Table Processing of all calls to this carrier are stored in the tuple keyed by tdx_carr.

**Attribute:**
presub
**Fullname:**
presubscribed bit
**Attribute Description:**
DBYES indicates that the caller is presubscribed to this carrier (tdx_carr). DBNO indicates that the caller is not presubscribed to this carrier (tdx_carr).

**Attribute:**
digtree
**Fullname:**
digit analysis selector
**Attribute Description:**
Default DAS for TDX call. Must be populated with a valid line DAS. This digtree will be used when there is no digtree in an ANI table entry.

**Attribute:**
ncd
**Fullname:**
network call denial

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Default NCD for TDX call. A DBNO indicates the call is allowed, a DBYES indicates the call should be routed to final handling treatment.

**Attribute:**
acclen
**Fullname:**
account code length
**Attribute Description:**
Default ACCLEN for TDX call. This field indicates number of account code digits to be entered by the caller. A value of zero indicates caller has no account code feature assigned. A non-zero value up to 15 indicates the maximum number of digits that may be entered by the caller. The entered digits appear in the AMA record for the call, if one is generated. No validation is performed on the entered digits. The default value of this field is zero(0).

**Attribute:**
trignum
**Fullname:**
SCP trigger number
**Attribute Description:**
Default TRIGGER for TDX call. Contain ASP trigger number value ranging from 0-255. If the field is 0, no SCP query will be sent. If the field is 1-255, the number will indicate the AIN R0.1 Trigger Number to use for the SCP query.

NOTE: The trignum value assigned in Default ANI table must be a valid ASP Trigger Number as defined by Recent Change View 9.35 (RLns_trig).

**Attribute:**
carrid
**Fullname:**
Carrier id for fixed carrier routing
**Attribute Description:**
Carrier id used for fixed carrier routing on FC_LATA_CONN trunks which are marked tdx_trk=Y on RC View 5.1 (RLrctgrprk). This field is optional. If the service provider does not want the call to be routed based on digit analysis then carrier id should be populated. The call will be routed via carrier id's route indices.

**Attribute:**
screen_x
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

screening index

**Attribute Description:**

Normally associated with a line or trunk, the screening index allows for different billing rates and routing. The default value for screen_x is zero (0), meaning not populated.

**Attribute:**

tnsc

**Fullname:**

Terminating Network Selection Code

**Attribute Description:**

Used to segregate traffic for MINT signaling

**Attribute:**

ii_screen

**Fullname:**

Information digits screening indicator

**Attribute Description:**

When this indicator is set to DBYES, the ANI data should be taken from the RLiidigits relation

**Attribute:**

ffcf1

**Fullname:**

Boolean reserved for future field feature

**Attribute Description:**

See fullname description

**Attribute:**

ffcf2

**Fullname:**

Boolean reserved for future field feature

**Attribute Description:**

See fullname description

**Attribute:**

ffcf3

**Fullname:**

Boolean reserved for future field feature

**Attribute Description:**

See fullname description

**Attribute:**

ffcf4

**Fullname:**

Boolean reserved for future field feature

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

See fullname description

**Attribute:**
ffcf5
**Fullname:**
Unsigned short (8) reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**
ffcf7
**Fullname:**
Unsigned short (2) reserved for future field feature
**Attribute Description:**
See fullname description

# TERA_MS

## 1. Description

Trunk error analysis relation created to store the values for peer groups (trunk groups) having measurement counts pegged on them.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 20 |
| access type | DBACC_LIN |
| memory type | DBPRAM |
| distribution | LP |
| application | TERA |
| relation type | DBSTATIC |
| trigger function | MS24dbtrig |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 3. Field Layout

## 4. Population Rules for RLtera_ms

**Relation Description** This relation holds the trunk group number of a trunk group that is having measurement counts pegged. This relation is populated using recent change (RC).

**Attribute: peerid**

**Fullname:** Trunk Group number
**Attribute Description** The trunk group number that is having measurements pegged.

**Attribute: xshort**

**Fullname:** Spare attribute.
**Attribute Description** This field is a spare attribute that could be used for the expansion of RLtera_ms in the future.

# TERMCADN

## 1. Description

This static relation resides in every SM but is only used in ISDN SMs. It contains 1 tuple for every set of call appearances for EKTS(TM) CACH Standard Terminals (up to 2047).

The key for this relation is the logical port (lport) number and is 13 bits in length. The most significant bit (MSB) of each subaddr attribute corresponds to the highest number of the given range (except for the subaddr7 attribute where the MSB is reserved / not used). The MSB of the subaddr7 attribute is always zero. The least significant bit (LSB) of each subaddr attribute corresponds to the lowest number of the given range (except for the subaddr0 attribute where the LSB is reserved / not used). The LSB of the subaddr0 attribute is always zero.

The lport value used for this relation is always of type LPT_ISDN.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 8192 |
| expected tuples in relation | 2048 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| ks key store | DBNO |
| permutation type | unperm |

## 4. Population Rules for RLtermcadn

**Relation Description** Standard terminal call appearance DN/MLHG member assignment.
This relation contains a tuple for every set of call appearances of an EKTS(TM) CACH standard terminal provisioned on a ISDN SM in the office. The relation is to be populated by lport for every circuit switched standard terminal (that is, the lport type can only be LPT_ISDN).
The relation stores a 256 bit array for each EKTS(TM) CACH standard terminal where the bits 0 and 255 are unused. All other bits (1 through 254) are used to indicate whether or not this call appearance is the first call appearance of a DN/MLHG member on this terminal. There can be up to 64 DN/MLHG members on a terminal and each DN/MLHG member can have up to 16 call appearances up to a maximum of 254 call appearances per terminal.
The 256 bit array is broken into eight 32-bit 'bitmaps' as follows:

```
attribute subaddr0 stores sub-address 31 - 1 (0 is unused)
attribute subaddr1 stores sub-address 63 - 32
attribute subaddr2 stores sub-address 95 - 64
attribute subaddr3 stores sub-address 127 - 96
attribute subaddr4 stores sub-address 159 - 128
attribute subaddr5 stores sub-address 191 - 160
attribute subaddr6 stores sub-address 223 - 192
attribute subaddr7 stores sub-address 254 - 224 (255 is reserved)
```

Note that subaddr0 does not use the least significant bit (LSB), zero, and subaddr7 does not use the most significant bit (MSB), 255. Also note that the MSB of each attribute contains the highest number in the range of valid numbers.

**Attribute: lport**

**Fullname:** Logical Port number
**Attribute Description** This attribute contains the Circuit Switched user logical port number of each Standard Terminal D-channel on this SM that has sub-address 0 assigned. The lport must be related to a circuit switched Terminal only (lport type equal LPT_ISDN).
The range of values is from 1 through 8191 since zero is not valid.

**Attribute: subaddr0**

**Fullname:** bitmap 0 indicating Sub Address 31 through 1 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 31 through 1. The Least Significant Bit (bit position 0) must always be zero. See the relation description for more information.
If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

**Attribute: subaddr1**

**Fullname:** bitmap 1 indicating Sub Address 63 through 32 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 63 through 32. See the relation description for more information.

If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

Copyright © 1999 Lucent Technologies 

**Attribute: subaddr2**

**Fullname:** bitmap 2 indicating Sub Address 95 through 64 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 95 through 64. See the relation description for more information.

If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

**Attribute: subaddr3**

**Fullname:** bitmap 3 indicating Sub Address 127 through 96 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 127 through 96. See the relation description for more information.
If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

**Attribute: subaddr4**

**Fullname:** bitmap 4 indicating Sub Address 159 through 128 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 159 through 128. See the relation description for more information.
If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

**Attribute: subaddr5**

**Fullname:** bitmap 5 indicating sub address 191 through 160 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 191 through 160. See the relation description for more information.
If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

**Attribute: subaddr6**

**Fullname:** bitmap 6 indicating Sub Address 223 through 192 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH Standard Terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 223 through 192. See the relation description for more information.
If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

**Attribute: subaddr7**

**Fullname:** bitmap 7 indicating Sub Address 254 through 224 assigned
**Attribute Description** This attribute is a bitmap that indicates whether sub-address 0 on a EKTS(TM) CACH standard terminal is assigned to a call appearance. This bitmap stores bits corresponding to call appearances 254 through 224. The most significant bit (bit position 31) must always be zero. See the relation description for more information.
If the sub-address is for a call appearance that is linked to an intercom group, that bit must be set to zero (unassigned).

## 4. Population Rules for RLtermkydn

**Relation Description** Provides terminal and call appearance conversion to DN, subaddress.

**Attribute: lport**

**Fullname:** logical port.
**Attribute Description** Logical port number of the D-channel associated with the BRI port. Must have an entry in RLis_term with this key of lport and termno.

**Attribute: termno**

**Fullname:** terminal number.
**Attribute Description** Terminal number for this BRI. The terminal number associated with this directory number or multi-line hunt line.

Copyright © 1999 Lucent Technologies

**Attribute: ca**

**Fullname:** Call Appearance number.
**Attribute Description** All CA's must be consecutive for a given combination of module and port and dn. All CA's cannot be overlapped. If RLis_term.cpetype = IS_TYPEATT, IS_TYPEB or IS_TYPED, the ca represents a physical button number of the call appearance button. If RLis_term.cpetype = IS_TYPEC, the ca represents a logical call appearance number.

**Attribute: lead_module**

**Fullname:** lead module.
**Attribute Description** Lead module for the ltm_idxi associated with this call appearance.

**Attribute: ltm_idxi**

**Fullname:** Logical termination index.
**Attribute Description** logical termination index.

**Attribute: subaddr**

**Fullname:** sub-address.
**Attribute Description** Identifies the subaddress associated with this DN, call appearance, and terminal combination. This value will be assigned sequentially starting at zero, for example, if there exist RLtermkydn.subaddr=1 there is a RLtermkydn.subaddr=0 with the same value for ltm_idxi.
Dependencies:

```
If RLis_line(lead_module, ltm_idxi).shared
        == DBNO
then RLis_line(same keys).frst_ca + subaddr
        must equal ca.
else (shared == DBYES)
        find the right RLshterm element in
        RLshterm(lead_module,
                ltm_idxi,
                0 or 1).sharedX
        where X may 1,2,3 or 4 such that
        RLshterm().sharedX.lport = lport
        and

### Relation Description

ANI II Digits mapping Relation.

This relation is used by the Pay Phone Compensation for Toll Free Calls and Toll Free Calling Enhancements for Flexible ANI features (99-5E-4868/99-CP-4847). These features are secured by SFID 332.

**Attribute:**

orig_ii

**Fullname:**

Original ANI II digits.

**Attribute Description:**

This field stores the II digits that have been determined to be used for the call. These II digits will be mapped for NS800 calls, if SFID 332 is active and if the carrier allows the II digits to be mapped

Copyright © 1999 Lucent Technologies

**Attribute:**
tf_ii
**Fullname:**
Toll Free ANI II digits.
**Attribute Description:**
This field is used to map the Original ANI II digits in the case of an NS800 translated call.

**Attribute:**
default_ii
**Fullname:**
Default ANI II digits.
**Attribute Description:**
This field is used to map the Original ANI II digits in the case of a Non-translated NS800 call.

## 4. Population Rules for RLtg_cf

**Relation Description** Terminal group constructed feature.

**Attribute: feat_id**

**Fullname:** Feature id

**Attribute Description** This attribute is the key to this relation and uniquely identifies the MCC constructed feature.

**Attribute: actvn**

**Fullname:** Activation

**Attribute Description** Indicates method of activating MCC features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. The allowed options are as shown in the following layout:

| Combination | Act/Deact | Activation | Deactivation | |
|---|---|---|---|---|
| 1. Always active | | ACTNONE | DCTNONE | |
| 2. Customer selected | | ACTCD | DCTCD | activation/deactivation |
| 3. Customer selected | | ACTCD | DCTAUTO | activation/deactivation for one call only |

**Attribute: dctvn**

**Fullname:** Deactivation

**Attribute Description** Indicates method of deactivating MCC features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. The allowed options are as shown in the previous table for attribute actvn.

**Attribute: sr_orig**

**Fullname:** Originating station restriction

**Attribute Description** This attribute describes the station restriction for an originating terminal with station restriction active.

**Attribute: sr_odef**

**Fullname:** Originating station restriction default

**Attribute Description** This attribute describes the station restriction for an originating terminal with station restriction deactivated.

**Attribute: o_errtrt**

**Fullname:** Originating terminal error treatment

**Attribute Description** This attribute describes the error treatment for an originating terminal when

Copyright © 1999 Lucent Technologies 

a call is blocked due to station restriction.

**Attribute: sr_term**

**Fullname:** Station restriction for a terminating terminal

**Attribute Description** This attribute describes the station restriction for a terminating terminal with station restriction activated.

**Attribute: sr_tdef**

**Fullname:** Station restriction for a terminating terminal default

**Attribute Description** This attribute describes the station restriction for a terminating terminal with station restriction deactivated.

**Attribute: t_errtrt**

**Fullname:** Terminating terminal error treatment

**Attribute Description** This attribute describes the error treatment for a terminating terminal when a call is blocked due to station restriction.

**Attribute: ffcf[*]**

**Fullname:** Future field feature

**Attribute Description** The three attributes, ffcf1 through ffcf3, are booleans reserved for future field feature use.

**Attribute: sr_term**

**Fullname:** terminating station restriction

**Attribute Description** This attribute describes the station restriction for a terminating terminal with station restriction activate.
Dependencies: None

**Attribute: sr_tdef**

**Fullname:** terminating station restriction default

**Attribute Description** This attribute describes the station restriction for a terminating terminal with station restriction deactivated.
Dependencies: None

**Attribute: t_errtrt**

**Fullname:** terminating station error treatment

**Attribute Description** This attribute describes the error treatment for a terminating terminal when a call is blocked due to station restriction.

**Attribute: moh_act**

**Fullname:** Music On Hold Active

**Attribute Description** Is the Music On Hold Feature active for this TGSR feature? Range of values: DBYES or DBNO

```
Default: DBNO
moh_act = DBYES: Music On Hold is active
moh_act = DBNO: Music On Hold is not active.
```

**Attribute: ffcf1**

**Fullname:** future field feature

**Attribute Description** Booleans reserved for future field feature use.

**Attribute: ffcf2**

**Fullname:** future field feature

**Attribute Description** Booleans reserved for future field feature use.

**Attribute: ffcf3**

**Fullname:** future field feature

**Attribute Description** Booleans reserved for future field feature use.

**Attribute: tg_id**

**Fullname:** terminal group ID

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute identifies the MCC terminal group to which this line belongs.

**Attribute: disp_rstrct**

**Fullname:** Customer Defined Displayed Restriction

**Attribute Description** disp_rstrct contains a value that indicates, to a called ISAT attendant, a customer defined restriction for the calling party. This value is used only for display to an ISAT attendant and is not enforced by switch software. A value of DBTOLL_RST means, to the ISAT attendant, the caller is restricted from making toll calls. A value of DBNULL_RST means, to the ISAT attendant, the caller has no customer defined restrictions.

**Attribute: o_fwdtdn**

**Fullname:** originating forward-to dn

**Attribute Description** This attribute specifies the forward-to DN when a call is blocked because of an originating station restriction.

**Attribute: o_fwdtdn.dcnt32**

**Fullname:** digit count

**Attribute Description** Specifies the number of digits in the DN default 0 for null DN.

**Attribute: o_fwdtdn.edn32**

**Fullname:** DN digit string

**Attribute Description** An array of up to 32 extended digits range of values: 0 thru 9, *, #.

**Attribute: t_fwdtdn**

**Fullname:** terminating forward-to dn

**Attribute Description** This attribute specifies the forward-to DN when a call is blocked because of a terminating station restriction.

**Attribute: t_fwdtdn.dcnt32**

**Fullname:** digit count

**Attribute Description** Specifies the number of digits in the DN default 0 for a null DN.

**Attribute: t_fwdtdn.edn32**

**Fullname:** DN digit string

**Attribute Description** DN digit string: an array of up to 32 extended digits.
Range of values: 0 thru 9, *, #.

**Attribute: o_an_ind**

**Fullname:** originating error announcement route index

**Attribute Description** Specifies an announcement index to be used if a call is blocked due to an originating station restriction and originating error treatment of ER_ANNC.

**Attribute: t_an_ind**

**Fullname:** terminating error announcement route index

**Attribute Description** Specifies an announcement index to be used if a call is blocked due to a terminating station restriction and terminating error treatment of ER_ANNC.

Copyright © 1999 Lucent Technologies 

**Attribute: cnigi**

**Fullname:** Calling number identification service delivery option. Intra-Group Only.

**Attribute Description** The cnigi field indicates whether members of the terminal group have restrictions on delivery of calling party number and forwarding number information, as provided by the CNIS, CPN/BND, RN Delivery, CgPS Delivery and ICLID features. Based on the cnigi field, these may be restricted to intra-group calls only. CNIGI is NOT a separate assignable feature. The CNIGI field may be overridden on a per line or per trunk basis, by setting the CNIGI field to a value other than NULL.

The possible settings of Intra-group CNIS option are:
`FCNULLCNIGI- Default. Consult the Glcnigi Office Parameter.`

FCNRSTCNIGI- No Restrictions apply to Display/deliver CPN or RN information on all calls.

FCIGOCNIGI - Display/deliver CPN or RN information only on intra-group calls.

# TG_LTMER

## 1. Description

Terminal group error treatment data for a logical termination index.

Defines the forward-to DN and the routing index data if terminal group station restriction error treatment is to be applied.

The tree figure 1 diagram depicts the stored structure of virtual relation TG_LTMER.

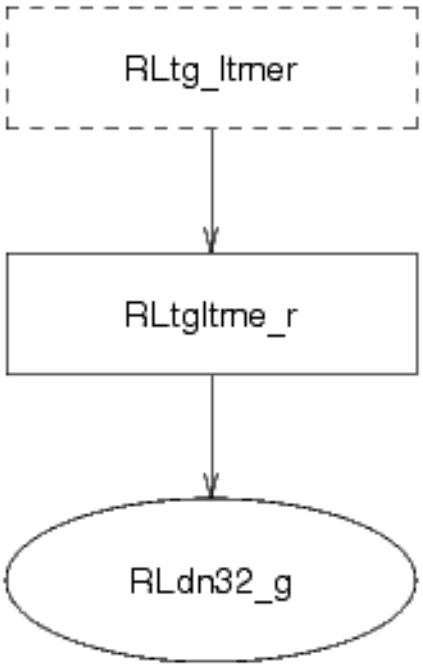

**Figure 1 Stored Structure of Virtual Relation TG_LTMER**

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 0 |
| access type | DBACC_OPV |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| permutation type | perm |

## 3. Field Layout

## 4. Population Rules for RLtg_ltmer

**Relation Description** Defines the forward-to DN and the routing index data if terminal group station restriction error treatment is to be applied.
The following is a list of valid service classes for LTports assigned this feature:

| LINES | TRUNKS |
|---|---|
| FC_ATTENDANT | FC_AUX_TRNK |
| FC_INDVDL | FC_PDID |
| FC_PBX | FC_PF |
| FC_SATSTLN | FC_PFLASH |
| FC_HOTMOTL | FC_PFITT |
| PBXHOTMOT | FC_LTOLL_CONN |
| FC_4WIRE_INDV | FC_PFCPE |
| FC_ISDN | FC_PRI_INTOLL |
| FC_ISATND | FC_TTOLL_CONN |
| FC_MODEM | FCEDSL |
| | FCEDSLHM |

**Attribute: lead_module**

**Fullname:** Lead module
**Attribute Description** When lead_module is zero and ltm_type = LTM_ISDN then a BFG tuple exists. Otherwise lead_module range is 1-192, and the tuple is not BFG.

**Attribute: ltm_type**

**Fullname:** Logical Termination Index type
**Attribute Description** LTM_ISDN includes ISDN and shared analog lines. LTM_OTHER includes trunks and unshared analog lines.

**Attribute: ltm_idx**

**Fullname:** Logical Termination Index
**Attribute Description** The existence of an index implies the value 1 or greater, therefore, ltm_idx must be greater than 0 in this relation. If this is a BFG tuple (lead_module = zero and ltm_type = LTM_ISDN) then the range of attribute ltm_idx must start with 256.

**Attribute: ffcf1**

**Fullname:** Future field feature

**Attribute Description** The attributes ffcf1 thru ffcf3 are booleans reserved for future field feature use.

Copyright © 1999 Lucent Technologies 

**Attribute: ffcf2**

**Fullname:** Future field feature

**Attribute Description** The attributes ffcf1 thru ffcf3 are booleans reserved for future field feature use.

**Attribute: ffcf3**

**Fullname:** Future field feature

**Attribute Description** The attributes ffcf1 thru ffcf3 are booleans reserved for future field feature use.

**Attribute: o_fwdtdn**

**Fullname:** Originating Forward-to DN
**Attribute Description** This attribute specifies the forward-to DN when a call is blocked because of an originating station restriction and originating error treatment is ER_RERTE. This attribute is a structure consisting of 2 sub-attributes, dcnt32 and edn32.

**Attribute: o_fwdtdn.dcnt32**

**Fullname:** Digit count
**Attribute Description** Specifies the number of digits in the DN. The default value (0) indicates a null DN.

**Attribute: o_fwdtdn.edn32**

**Fullname:** DN Digit String
**Attribute Description** An array of up to 32 extended digits.

**Attribute: t_fwdtdn**

**Fullname:** Terminating Forward-to DN
**Attribute Description** This attribute specifies the forward-to DN when a call is blocked because of a terminating station restriction and terminating error treatment is ER_RERTE. This attribute is a structure consisting of 2 sub-attributes, dcnt32 and edn32.

**Attribute: t_fwdtdn.dcnt32**

**Fullname:** Digit count
**Attribute Description** Specifies the number of digits in the DN.

**Attribute: t_fwdtdn.edn32**

**Fullname:** DN digit string
**Attribute Description** An array of up to 32 extended digits.

**Attribute: o_an_ind**

**Fullname:** Originating Error Announcement Index
**Attribute Description** Specifies an announcement index to be used if a call is blocked due to an originating station restriction and originating error treatment of ER_ANNC.

**Attribute: t_an_ind**

**Fullname:** Terminating Error Announcement Index
**Attribute Description** Specifies an announcement index to be used if a call is blocked due to a terminating station restriction and terminating error treatment of ER_ANNC.

# TG2M_G

## 1. Description

Trunk group member maps. This is a child storage relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 8000 |
| expected | 200 |
| access type | DBACC_GK |
| distribution | FP |
| relation type | DBSTORAGE |
| memory type | DBPRAM |
| foldtype | DBGC31 |
| ks key store | DBNO |
| gkidxrel GK-index relation | rlTG2M_I |

## 3. Field Layout

```

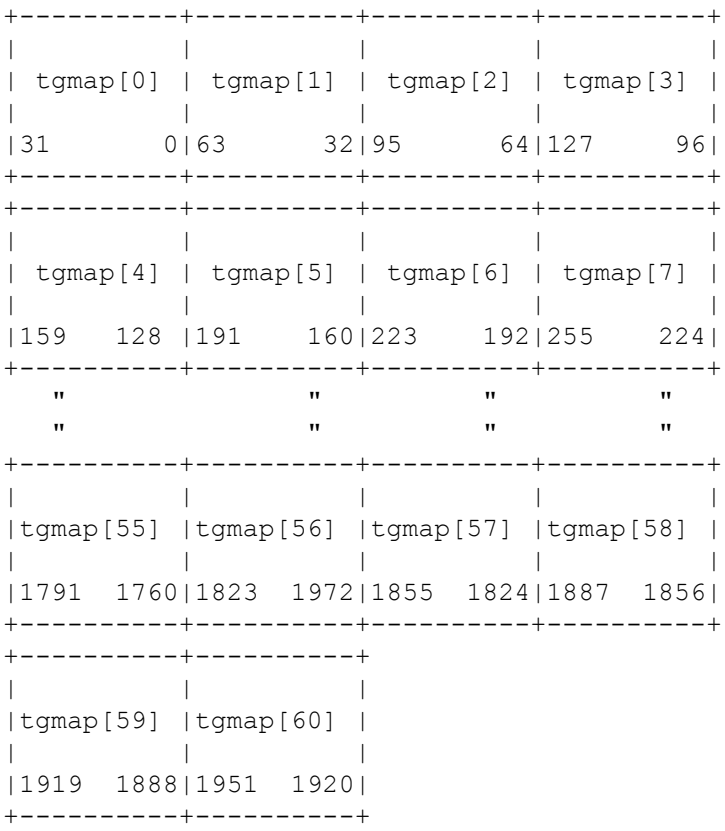
## 4. Population Rules for RLtg2mbr

**Relation Description** Trunk Group to 5E DCS member
MappingThis relation contains a bit map of all members of a 5E DCS trunk group present on a particular SM.

The following diagram illustrates the layout of the trunk members as they are represented in the bit map. TG member 0 will be in the low order bit of tgmap[0] and TG member 1951 will be the highest member number stored in tgmap[60].

A value of 0 means that the TG has no members on this SM, a value of 1 means that it does.



**Attribute: tgnum**

**Fullname:** Trunk Group Number

**Attribute Description** Primary key to the relation.

**Attribute: servclass**

**Fullname:** Class of Service.

**Attribute Description** Trunk class of service.

**Attribute: tgmap[*]**

**Fullname:** Bit map for trunk group members 1 -1951

**Attribute Description** Each tuple can contain up to 61 maps ( tgmap0 - tgmap60 ). If bit is on, the 5E DCS trunk group contains a member whose number corresponds to the position in the bitmap. The 0 bit in tgmap[0] is not used.

## 4. Population Rules for RLtg2sm

**Relation Description** Trunk Group to SM Mapping
This relation contains a bit map of all SMs that contain members of a trunk group. It is used for AML processing.

**Attribute: tgnum**

**Fullname:** Trunk Group Number

**Attribute Description** Primary key to the relation.

**Attribute: smmap0**

**Fullname:** Bit map for block of 32 SMs.

**Attribute Description** If bit is on, the SM contains members of the trunk group. If the last member of the trunk group on an SM is deleted, the bit representing that SM must be turned off.

**Attribute: smmap1**

**Fullname:** Bit map for block of 32 SMs.

**Attribute Description** If bit is on, the SM contains members of the trunk group. If the last member of the trunk group on an SM is deleted, the bit representing that SM must be turned off.

**Attribute: smmap2**

**Fullname:** Bit map for block of 32 SMs.

**Attribute Description** If bit is on, the SM contains members of the trunk group. If the last member of the trunk group on an SM is deleted, the bit representing that SM must be turned off.

**Attribute: smmap3**

**Fullname:** Bit map for block of 32 SMs.

**Attribute Description** If bit is on, the SM contains members of the trunk group. If the last member of the trunk group on an SM is deleted, the bit representing that SM must be turned off.

**Attribute: smmap4**

**Fullname:** Bit map for block of 32 SMs.

**Attribute Description** If bit is on, the SM contains members of the trunk group. If the last member of the trunk group on an SM is deleted, the bit representing that SM must be turned off.

**Attribute: smmap5**

**Fullname:** Bit map for block of 32 SMs.

**Attribute Description** If bit is on, the SM contains members of the trunk group. If the last member of the trunk group on an SM is deleted, the bit representing that SM must be turned off.

## 4. Population Rules for RLtgcntmsk

**Relation Description** Trunk Group Control Mask
There will be one tuple in this relation for each 100s group that needs to be controlled by a Remote Busy Verify Trunk group. The mask is used to mask out DNs that should not be controlled by the designated group. This verification is for the ISAT Remote Busy Verification feature.

**Attribute: hgid**

**Fullname:** Hundreds Group Identifier

**Attribute Description** Contains the noc, thousand weighted digit, and hundred weighted digit.

The hundred group identifier (hgid) has three sub-fields:

```
noc     Normalized Office Code
        Range: 1 - AVNOCMAX()
        Default: none
```

d4 Thousand weighted digit Range: 0 - 9 Default: none

d3 Hundred weighted digit Range: 0 - 9 Default: none
NOTE: The following example explains how the 'hgid' value is derived.

For the DN# 220-4321:

Read RLnoccode to convert nxx to noc;

For RLnoccode.nxx equal to 220 (Office Code) RLnoccode.noc equals 118 (Normalized Office Code)

**Copyright © 1999 Lucent Technologies** 

118 = noc  4 = digit4 (d4)  3 = digit3 (d3)  2 = digit2 (d2)  1 = digit1 (d1)

The 'noc', 'd4', and 'd3' will be used to determine the 'hgid' value.

noc = 118(0x76)  shift 2 left  = 0x7600

d4 = 4 (0x04)  shift 1 left  = 0x0040

d3 = 3 (0x03)  = 0x0003

hgid = 0x7600 + 0x0040 + 0x0003

= 0x7643

**Attribute: tgn**

**Fullname:** Trunk Group Number

**Attribute Description** Contains the group number of the incoming ISAT Busy Verify Trunk Group.

**Attribute: dnmsk[*]**

**Fullname:** Mask of DNs

**Attribute Description** Mask of 100 bits which is used to determine which DNs can be controlled by a Busy Verify Trunk group.

```
dnmsk1     first byte (8 bits) of 100s group mask
           each bit that equals '0' denotes DN not
           associated with attendant MLHG, and
           each bit that equals '1' denotes DN is
           associated with a Busy Verify Trunk group.
           Hundred digit number 1st byte

                 -------------------------
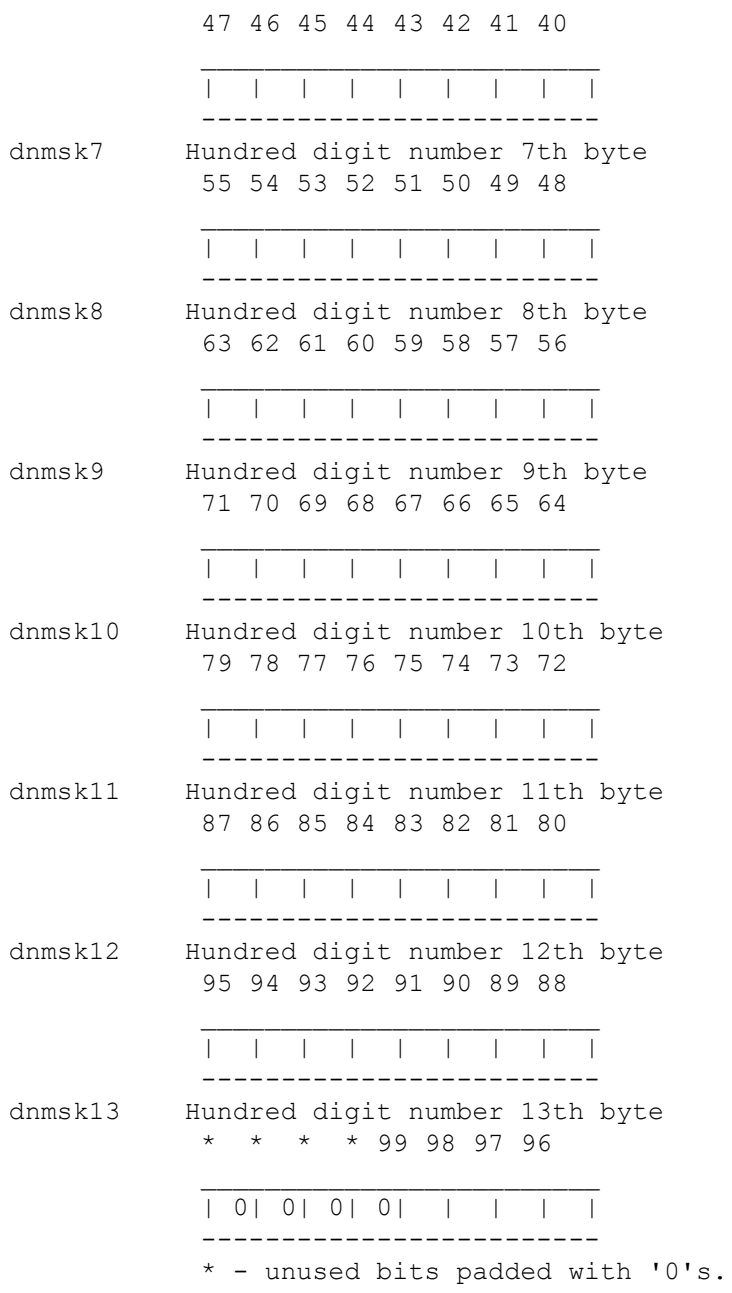
     dnmsk6     Hundred digit number 6th byte
```

**Copyright © 1999 Lucent Technologies** 



Each bit with '0' indicates that the DN is NOT a member of the set of DNs that this given Busy Verify Trunk group (based on this group's number) can control.

Each bit with '1' indicates that the DN is a member of the set of DNs that this given Busy Verify Trunk group (based on this group's number) can control.

## 4. Population Rules for RLtgltm

**Relation Description** Terminal group station restriction line/trunk parameter relation.

TGSR feature line parameters on this logical termination index which are in addition to line parameters found in RLtg_ltmer and RLdn_feats (that is, dn_feats.tgid).

**Attribute: lead_module**

**Fullname:** Lead SM for ltm_idx

**Attribute Description** Lead Module For Termination Index.

**Attribute: ltm_type**

**Fullname:** Logical Termination Type

**Attribute Description** Logical Termination Type associated with line that has TGSR feature assigned.

**Attribute: ltm_idx**

**Fullname:** Logical Termination Index

**Attribute Description** Logical Termination Index with TGSR feature assigned.

**Attribute: moh_act**

**Fullname:** Music On Hold Active

**Attribute Description** Is Music On Hold active for this logical termination index?

**Attribute: ffcf1**

**Fullname:** Future Field Feature Bit 1

**Attribute Description** Future Field Feature Usage.

**Attribute: disp_rstrct**

**Fullname:** Customer Defined DISPlayed ReSTRiCTion

**Attribute Description** disp_rstrct contains a value that indicates, to a called ISAT attendant, a customer defined restriction for the calling party. This value is used only for display to an ISAT attendant and is not enforced by switch software. A value of DBTOLL_RST means, to the ISAT attendant, the caller is restricted from making toll calls. A value of DBNULL_RST means, to the ISAT attendant, the caller has no customer defined restrictions.

**Attribute: cnigi**

**Fullname:** Calling number identification service delivery option. Intra-Group Only.

**Attribute Description** The cnigi field indicates whether members of the terminal group have restrictions on delivery of calling party number and forwarding number information, as provided by the CNIS, CPN/BND, RN Delivery, CgPS Delivery and ICLID features. Based on the cnigi field, these may be restricted to intra-group calls only. CNIGI is NOT a separate assignable feature. This per-line cnigi field, if not set to FCNULLCNIGI overwrites per-terminal-group and per-office flags.

on a per line or per trunk basis, by setting the CNIGI field to a value other than NULL.

The possible settings of Intra-group CNIS option are:

```
FCNULLCNIGI- Default. Consult  RLrt_tg.cnigi, or if that tuple
             does not exist, consult the Glcnigi Office Parameter.
```

Copyright © 1999 Lucent Technologies 

```
FCNRSTCNIGI- No Restrictions apply to Display/deliver CPN
             or RN information on all calls.
FCIGOCNIGI - Display/deliver CPN or RN information only
             on intra-group calls.
```

**Attribute: ffcf2**

**Fullname:** Future Field Feature Bit 2

**Attribute Description** Future Field Feature Usage.

**Attribute: ffcf3**

**Fullname:** Future Field Feature Bit 3

**Attribute Description** Future Field Feature Usage.

# TGLTME_R

## 1. Description

Terminal group error treatment data for a logical termination index. This is a root storage relation.

Defines the forward-to DN and the routing index data if terminal group station restriction error treatment is to be applied.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 28800 |
| expected number of tuples | 123 |
| density | 27 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTORAGE |
| foldtype | DBGC31 |

## 3. Field Layout

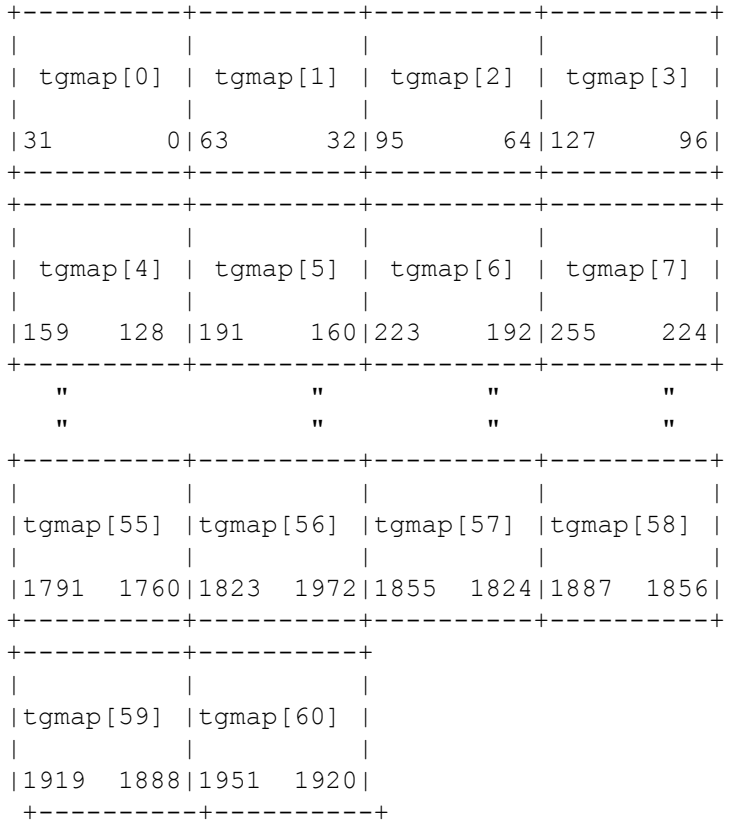
## 4. Population Rules for RLtgmbr_am

**Relation Description** Trunk Group to 5E DCS member

MappingThis relation contains a bit map of all members across all SM's for each *5ESS*®-2000 switch DCS trunk group.

The following diagram illustrates the layout of the trunk members as they are represented in the bit map. TG member 0 will be in the low order bit of tgmap[0] and TG member 1951 will be the highest member number stored in tgmap[60].

A value of 0 means that the TG has no members on this SM, a value of 1 means that it does.



**Attribute: tgnum**

**Fullname:** Trunk Group Number

**Attribute Description** Primary key to the relation.

**Attribute: servclass**

**Fullname:** Class of Service.

**Attribute Description** Trunk class of service.

**Attribute: tgmap[*]**

**Fullname:** Bit map for trunk group members 1 -1951

**Attribute Description** Each tuple can contain up to 61 maps ( tgmap0 - tgmap60 ). If bit is on, the 5E DCS trunk group contains a member whose number corresponds to the position in the bitmap. The 0 bit in tgmap[0] is not used.

# TGNLEC

## 1. Description

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes to an OSPS operator position. The text is specified by/for the LEC whose traffic the trunk carries.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 8191 |
| expected tuples in relation | 219 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population Rules for RLtgnlec

**Relation Description** Mapping of Trunk Group Number to Operator Display Text

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes to an OSPS operator position. The text is specified by or for the local exchange carrier whose traffic the trunk carries.

**Attribute: tgn**

**Fullname:** Trunk Group Number

**Attribute Description** A trunk group number entered in this relation is assumed to be a local exchange carrier for whom identification/branding/restriction at the operator position is desired.

**Attribute: ospsff1**

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes to an OSPS operator position. The text is specified by or for the local exchange carrier whose traffic the trunk carries.

**Fullname:** OSPS fast feature
**Attribute Description** This attribute is to be used for future OSPS fast feature development. Recent Changeable.

**Attribute: lecidx**

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes

Copyright © 1999 Lucent Technologies 

to an OSPS operator position. The text is specified by or for the local exchange carrier whose traffic the trunk carries.

**Fullname:** Index into Table of Local Exchange Carrier Identifying Text
**Attribute Description** This is an index into a table (RLlectext) of Local Exchange Carrier (LEC) identifying text.

**Attribute: ospsff2**

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes to an OSPS operator position. The text is specified by or for the local exchange carrier whose traffic the trunk carries.

**Fullname:** OSPS fast feature
**Attribute Description** This attribute is to be used for future OSPS fast feature development. Recent Changeable.

## 4. Population Rules for RLtgntnsc

**Relation Description**Trunk Group Number for the Terminating Network Selection Code

This relation is used to translate the incoming Terminating Network Selection Code value for a given trunk group.

**Attribute: grpnum**

**Fullname:** Trunk group number

**Attribute Description** The trunk group number.

Copyright © 1999 Lucent Technologies

**Attribute: inc_tnsc**

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes to an OSPS operator position. The text is specified by or for the local exchange carrier whose traffic the trunk carries.

**Fullname:** Incoming Terminating Network Selection Code
**Attribute Description** The Incoming Terminating Network Selection Code.

**Attribute: tnsc**

This relation maps a TGN to the appropriate text to be displayed to an operator when a call comes to an OSPS operator position. The text is specified by or for the local exchange carrier whose traffic the trunk carries.

**Fullname:** Terminating Network Selection Code
**Attribute Description** Used to segregate traffic for MINT signaling.

**Defines:** "db/DMtnsc.h"

## 4. Population Rules for RLtgtoatt

**Relation Description** Trunk Group to Attendant

The population of this relation associates an ISDN Attendant (ISAT) Multi-Line Hunt Group (MLHG) with a physical trunk group or simulated facility group that is to be monitored and/or controlled by the ISAT MLHG.

If a RLtgtoatt tuple exist there must exist a RLrt_mhg tuple where:

RLrt_mhg.isat_idx equals RLtgtoatt.isat_idx.
If a physical trunk group is associated with an ISAT Multi-Line Hunt Group (MLHG), for example, a RLtgtoatt tuple exists where RLtgtoatt.pftype equals PFPHYS, then a RLrt_trkg tuple must exist where:
RLrt_trkg.grpnum equals RLtgtoatt.grpnum
RLrt_trkg.isdntgbwl will only be set to DBYES if the busy/idle status of the physical trunk group is monitored by an ISAT group. In addition, if RLrt_trkg.isdntgbwl is set to DBYES then a corresponding RLtgtoatt tuple must exist.
If a simulated facility group is associated with an ISAT Multi-Line Hunt Group (MLHG), that is, a RLtgtoatt tuple exists where RLtgtoatt.pftype equals PFSFG, then a RLrt_sfg tuple must exist where:
RLrt_sfg.grpnum equals RLtgtoatt.grpnum
RLrt_sfg.isdntgbwl will only be set to DBYES if the busy/idle status of the simulated facility group is monitored by an ISAT group. In addition, if RLrt_sfg.isdntgbwl is set to DBYES then a corresponding RLtgtoatt tuple must exist.

**Attribute: grpnum**

**Fullname:** Trunk Group Number

**Attribute Description** Indicates group number of the simulated facility group or physical trunk

Copyright © 1999 Lucent Technologies 

group.

**Attribute: pftype**

**Fullname:** Physical or Simulated Trunk Group

**Attribute Description** Indicates if this is a simulated facility group (PFSFG) or a physical trunk group (PFPHYS).

**Attribute: isat_idx**

**Fullname:** ISAT Index

**Attribute Description** ISAT index is the abstract version of the ISAT Multi-Line Hunt Group (MLHG) number. RLtgtoatt.isat_idx must be equal to RLrt_mhg.isat_idx of the ISAT Multi-Line Hunt Group (MLHG) monitoring and/or controlling this physical trunk group or simulated facility group.

## 4. Population Rules for RLthcostat

**Relation Description** Cutover status of thousand groups in the office.

Copyright © 1999 Lucent Technologies

This relation is populated for gradual (1000-Line Group) or large terminal growth office cutovers.
An example population for a 'New' office for 3 1000-Line Groups in two normalized office codes would be as follows:

| NOC | DIGIT | PRECUT | POSTCUT | ALT_RTE |
|---|---|---|---|---|
| 1 | 1 | coinactive | coinactive | 10* |
| 1 | 9 | coinactive | coinactive | 144** |
| 2 | 4 | coinactive | coinactive | 146** |

* Where 10 is an RI resulting in reorder tone as treatment to a customer call. ** Where 144 and 146 are RIs resulting in routing the call back to the old office that serves the subscriber.
The data in this relation is only operative when the Cutover Program has been activated. For more information refer to ATT Practice ATT 5D5-105-200 Precutover and Cutover Procedures.

**Attribute: noc**

**Fullname:** Normalized Office Code.
**Attribute Description** All normalized office codes in the office. This is one of the keys to this relation.

**Attribute: digit**

**Fullname:** digit
**Attribute Description** This is the 'thousands' digit of all possible LOCDN's in an office, per normalized office code. This is the second key of this relation see the following example. For an office with nocs 0, 1 the relation would be populated as follows for a flash cut.

| NOC | DIGIT | PRECUT | POSTCUT | ALT_RTE |
|---|---|---|---|---|
| 0 | 1 | coinactive | coactive | 12* |
| 0 | 2 | ' ' | ' ' | '' |
| 0 | 3 | ' ' | ' ' | '' |
| 0 | 4 | ' ' | ' ' | '' |
| 0 | 5 | ' ' | ' ' | '' |
| 0 | 6 | ' ' | ' ' | '' |
| 0 | 7 | ' ' | ' ' | '' |
| 0 | 8 | ' ' | ' ' | '' |
| 0 | 9 | ' ' | ' ' | '' |
| 0 | 0 | ' ' | ' ' | '' |
| 1 | 1 | ' ' | ' ' | '' |
| 1 | 2 | ' ' | ' ' | '' |
| 1 | 3 | ' ' | ' ' | '' |
| 1 | 4 | ' ' | ' ' | '' |
| 1 | 5 | ' ' | ' ' | '' |
| 1 | 6 | ' ' | ' ' | '' |
| 1 | 7 | ' ' | ' ' | '' |
| 1 | 8 | ' ' | ' ' | '' |
| 1 | 9 | ' ' | ' ' | '' |
| 1 | 0 | ' ' | ' ' | '' |

*Where 12 is an RI resulting in reorder tone as treatment to a customer call.

**Attribute: precut**

**Fullname:** active/inactive line status in precut office state.
**Attribute Description** The coactive or coinactive state of a thousands group within a particular noc. In most cases, this should be populated as coinactive for a 'new' office. (After a cutover, the switch personnel uses RC/V to update this attribute to coactive. This prevents the office from 'slipping' or reverting to the inactive precut state).

**Attribute: postcut**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** active/inactive line status in postcut office state.
**Attribute Description** The coactive or coinactive state of a particular thousands group within a particular noc when the office is in the postcut state. Those lines not slated for cutover will be marked as coinactive, while those slated for cutover will be marked as coactive.

**Attribute: alt_rte**

**Fullname:** Alternate Route Index
**Attribute Description** This is an alternate RI used by RTA to route calls attempting to terminate to an inactive line (lines with a coinactive line state). This route index may be used to route to an announcement, reorder tone or outgoing trunk to the 'old' office.

## 4. Population Rules for RLtid_indx

**Relation Description** This wireless Centrex (WCTX) relation contains the TID HLR/VLR data.

Copyright © 1999 Lucent Technologies

This relation is to map the TID to HLR index. The index is used to index into the relations RLsubdata, RLpcs_hlr and the dynamic relation RLpcs_vlr.

**Attribute: tid**

**Fullname:** Terminal Identifier number

**Attribute Description** It contains the terminal identifier(TID).

**Attribute: tid.dn[*]**

**Fullname:** Terminal Identifier number

**Attribute Description** Used to authenticate the subscriber unit (SU).

**Attribute: tid.digcnt**

**Fullname:** digit count

**Attribute Description** Number of digits.

**Attribute: pcs_idx**

**Fullname:** Index into the hlr data.

**Attribute Description** This relation contains subscriber data common to the home location register (HLR) and visitor location register (VLR).

**Attribute: rest_lst**

**Fullname:** Restriction List

**Attribute Description** This is the registration restriction list for the testset.

## 4. Population Rules for RLtidgrp

**Relation Description** Translates TID hundreds group to module number.

This relation is to map the TID to SM. The last two digits of a TID are stored along with a SM number. This TID and SM will be used when a WCTX subscriber data is entered. The data will be mapped to the SM specified in this relation.

**Attribute: tidgrp_rt**

**Fullname:** Terminal identifier (TID) number hundreds group. This is the last two digits of the TID.

**Attribute Description** This is the last two digits of the TID.

**Attribute: vsm**

**Fullname:** The switch module number.

**Attribute Description** This is the switching module number the VLR data will be mapped to.

## 4. Population Rules for RLtime_set

**Relation Description** Improved 3rd Number Acceptance (ITNA) time set list.

Relation used for ITNA to determine what times are appropriate for doing bill to 3rd number verbal verifications

**Attribute: timeset_id**

**Fullname:** Improved 3rd Number Acceptance time set ID number

**Attribute Description** Used as a key to RLtime_set to determine the associated begin and end times when automatic outpulsing to the third party number for verbal billing acceptance is appropriate.

**Attribute: start_hr**

**Fullname:** starting hour value for time-set-id.

**Attribute Description** This attribute is used for starting hour value for a time set ID. The valid range of values for start_hr is 00 through 23.

**Attribute: start_min**

**Fullname:** starting minute value for a time set ID.

Copyright © 1999 Lucent Technologies 

**Attribute Description** This value of this attribute marks the starting minute value for a time set ID. The valid range of values for start_min is 00 through 59.

**Attribute: end_hr**

**Fullname:** Ending hour value for a time set ID,

**Attribute Description** This attribute is used for ending hour value for a time set ID. The valid range of values for end_hr is 00 through 23.

**Attribute: end_min**

**Fullname:** Ending minute value for a time set ID.

**Attribute Description** This value of this attribute marks the ending minute value for a time set ID. The valid range of values for end_min is 00 through 59.

**Attribute: ts_cnt**

**Fullname:** Time Set Count used to determine the number of times a particular time set ID is used.

**Attribute Description** This attribute is used to keep a count of the number of times a particular time set id is used. This is required by recent change (RC) for cases when a deletion is to be performed. RC must know if a particular time set id is being used prior to deleting from the RLtime_set relation. The relations that reference time set ids populated in RLtime_set are: RLitnalnex, RLitnalrng, RLitnatgn and RLitnatrng.

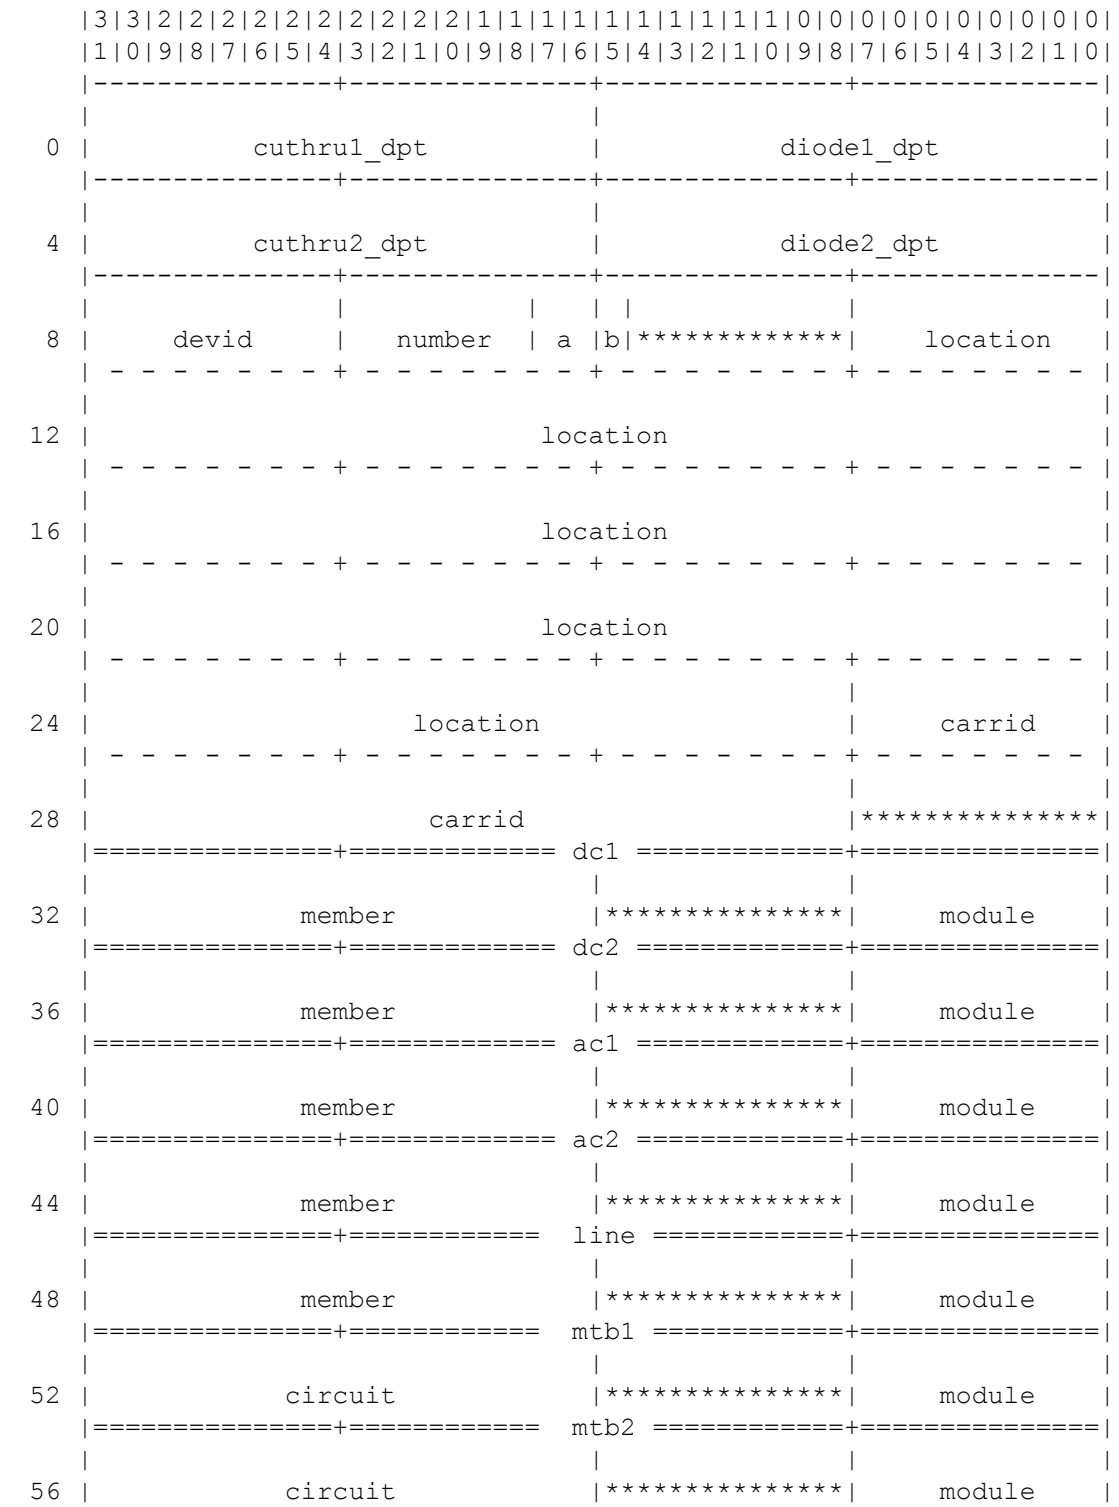
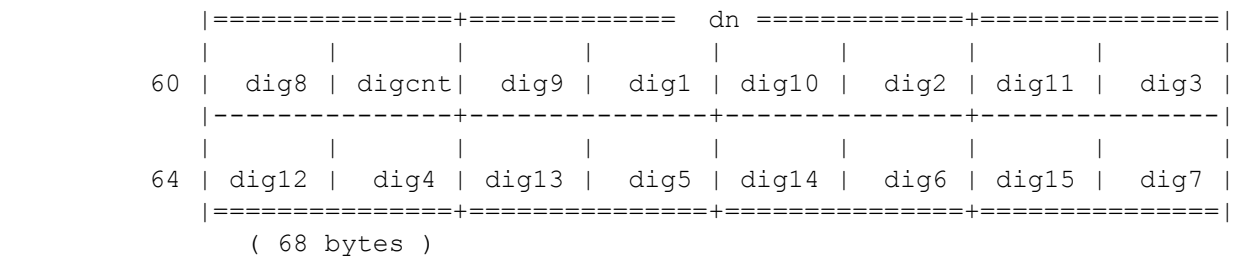
Stored Tuple Layout TLWSR





## 4. Population rules for RLtlwsr

### Relation Description

Trunk and line work station (TLWS) per work station resources
TLWS per work station resources.

**Attribute:**
number
**Fullname:**
TLWS number in American Standard Code for Information Interchange (ASCII) used by the user.
**Attribute Description:**
TLWSR relation (TLWSR) number in ASCII used by the user.
Each TLWSR is assigned a unique number in the range
1 to 32. The following assignments are recommended:

| devid | number* | comment |
|---|---|---|
| 'a' | 1 | MCC in office |

Remaining number (2 to 32) will be assigned to supplementary trunk and line work stations (STLWSs).
*number is the key to RLTLWSR.

**Attribute:**
devid
**Fullname:**
Device ID
**Attribute Description:**
Device number for the TLWS terminal.

**Attribute:**
location
**Fullname:**
Location
**Attribute Description:**
Location the TLWS is physically kept. This is a remark area that can be filled in with alpha-numerics. Suggested remarks would be 'LOCAL', 'SCC', 'RSM', name of the office, name of the user assigned to the TLWS. Initial value would be blank.

Copyright © 1999 Lucent Technologies 

**Attribute:**
jack_ind
**Fullname:**
Jack indicator
**Attribute Description:**
Indicates whether the TLWS has jacks.

**Attribute:**
dc[*]
**Fullname:**
Direct current (DC) jack
**Attribute Description:**
Port name of DC jack.

**Attribute:**
dc[*].member
**Fullname:**
Member
**Attribute Description:**
Port of DC jack. This is a logical test port name.
The logical test port is taken from relation FC_PORTTYP.
and it is found in attribute 'servclass' as an
enumeration of TM_DCJACK.

**Attribute:**
dc[*].module
**Fullname:**
Module
**Attribute Description:**
Switching module (SM) number of DC jack.

**Attribute:**
ac[*]
**Fullname:**
Alternating current (AC) jack
**Attribute Description:**
Port name of AC jack.

**Attribute:**
ac[*].member
**Fullname:**
Member
**Attribute Description:**
Port of AC jack. This should be a four-wire ear and mouth (E&M) trunk
found in CKTDATA relation with attribute 'type' and enumeration of
PCTC4EM and in FC_PORTTYP relation with attribute 'servclass' having
an enumeration of TM_ACJACK.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ac[*].module
**Fullname:**
Module
**Attribute Description:**
SM number of AC jack.

**Attribute:**
line
**Fullname:**
Port name of call back line
**Attribute Description:**
Port name of call back line.

**Attribute:**
line.member
**Fullname:**
Member
**Attribute Description:**
If tm_phone equals TMP_GPORT, then member is the port name of talk and monitor (T&M) line. Port is in the FC_PORTTYP relation and attribute 'servclass' should be an enumeration of TM_CALLBK.
If tm_phone equals TMP_LTP, then member is the port name of T&M logical test port. Port is in the FC_PORTTYP relation and attribute 'servclass' is an enumeration of TM_CALLBK.

**Attribute:**
line.module
**Fullname:**
Module
**Attribute Description:**
If tm_phone equals TMP_GPORT, then module is the SM number of the T&M line.
If tm_phone equals TMP_LTP, then module is the SM number of the T&M logical test port.

**Attribute:**
tm_phone
**Fullname:**
Does the TLWS have local, remote or no phone.
**Attribute Description:**
Determines the type of phone populated for this relation. Valid types are:
TMP_NULL - no phone number was entered. This TLWS has no T&M phone associated with it.
TMP_GPORT - An office telephone number (TN) was entered. This is generally a line which terminates on this switch.
TMP_LTP - A remote TN was entered. This is generally a line

Copyright © 1999 Lucent Technologies 

which does not terminate on this switch. A logical test port must be populated for use in originating calls to the remote T&M phone associated with this TLWS.

**Attribute:**
dn
**Fullname:**
Directory number
**Attribute Description:**
Call back directory number.

**Attribute:**
dn.digcnt
**Fullname:**
Digit count
**Attribute Description:**
Total number of digits contained in DN.

**Attribute:**
dn.dn
**Fullname:**
Directory number (DN)
**Attribute Description:**
DN of the T&M phone.
LOCAL - Either assign the DN to an individual line or part of a multi-line hunt (MLHG) group. The DN should represent a port (or a group of ports for MLHG) that its service class be an enumeration of TM_CALLBK. Please refer to line.member subattribute. This local DN can be entered as a 7 or 10 digit DN, however, it is stored as a 10 digit DN. Assign to an individual if there is only one TLWS. Assign to an MLHG if there are more than one local TLWSs. This will allow incoming calls to terminate at an idle T&M phone if one of the T&M phones is in use. Note: MLHG is recommended, the T&M phones could also be assigned as individual lines.
REMOTE - The remote location will supply the DN of their T&M phone. A numbering plan area (NPA) can be included with the DN. This can be a 7, 8, 10, or 11 digit DN.

**Attribute:**
carrid
**Fullname:**
Carrier ID
**Attribute Description:**
Indicates the carrier through which a call to a remote TLWS will be routed if the DN is outside the local access and transport area (LATA). It must be a four-digit character string where each

Copyright © 1999 Lucent Technologies 

of the characters can be '0' through '9'. The carrier ID value must be an existing one in the RLfc_carr relation. The default is '\0'.

**Attribute:**
mtb1
**Fullname:**
Metallic test busname 1
**Attribute Description:**
The metallic test busname for DC jack 1.

**Attribute:**
mtb1.circuit
**Fullname:**
Circuit
**Attribute Description:**
Port name of metallic test bus (MTB) for DC jack 1. One of the unused MTBs from relation CKTDATA, attribute 'type' with enumeration of PCMSMTB should be picked. This is located in the metallic service unit (MSU) portion of CKTDATA relation.

**Attribute:**
mtb1.module
**Fullname:**
Module
**Attribute Description:**
SM number for metallic test bus of DC jack 1.

**Attribute:**
cuthru1_dpt
**Fullname:**
Distribute point for cut through relay DC jack 1
**Attribute Description:**
Distribute point for cut thru relay of DC jack 1.
This should be an unused distributor point
from service group 0.

**Attribute:**
diode1_dpt
**Fullname:**
Distribute point for diode DC jack 1
**Attribute Description:**
Distribute point for diode of DC jack 1. This is supplied as the MTB was supplied.

**Attribute:**
mtb2

Copyright © 1999 Lucent Technologies 

**Fullname:**
Metallic test bus 2
**Attribute Description:**
The metallic test bus name of DC jack 2.

**Attribute:**
mtb2.circuit
**Fullname:**
Circuit
**Attribute Description:**
Metallic test bus name for DC jack 2. Supplied the same as attribute 'mtb1.circuit' but name is taken from service group 1 (SG 1) instead of service group 0 unless this MSU is on a compact service unit (CSU). For a CSU, do not check for SG 1; the CSU does not have a SG 1.

**Attribute:**
mtb2.module
**Fullname:**
Module
**Attribute Description:**
SM number for metallic test bus of DC jack 2.

**Attribute:**
cuthru2_dpt
**Fullname:**
Distribute point for cut through relay DC jack 2
**Attribute Description:**
Distribute point for cut through relay of DC jack 2. Supplied as attribute 'cuthru1_dpt', but name taken from service group 1.

**Attribute:**
diode2_dpt
**Fullname:**
Distribute point for diode DC jack 2
**Attribute Description:**
Distribute point for diode for DC jack 2. Same as for attribute 'diode1_dpt', but taken from service group 1.

**Defines:**
"db/DMlocdig.h",
"db/DMnpanxx.h"

## 4. Population rules for RLtm_attt

### Relation Description

```
automatic trunk test table for outgoing trunk

Trunk Test information for Automatic Progression Testing (APT)
and TST:TRK.

This relation defines the Terminal Maintenance (TM)
Automatic Trunk Test Table (ATTT) for outgoing test calls.
The table is used in the Automatic Progression Testing (APT)
of trunks and as a default for the 'TYPE' and/or 'OPDN' parameters
on the TST:TRK command.  Each trunk group has an atttn
which is used as the index into this table.  APT and TST:TRK
use this value to determine what type of test to execute.
*
APT will only execute the test that is specified
by the attribute 'tstcode'.  TST:TRK will also use
'tstcode' if the parameter 'TYPE' is not specified on
the command line.
*
Once the test type is determined, the outpulsed digits
are filled in from the corresponding attribute.
*
Example:
       If the attribute 'tstcode' is TCOGINV,
       then the attribute 'og_inv' is used to get
         the number of digits to be outpulsed 'og_inv.digcnt'
```

Copyright © 1999 Lucent Technologies 

```
            and the actual digits to be outpulsed 'og_inv.dn'
        *
        When the TST:TRK parameter 'TYPE' is given, but the 'OPDN' is not,
        then the outpulsed digits (opdn) are looked up in the attribute
        corresponding to that test type (in the tuple that corresponds to
        the trunk groups atttn index number)."
```

**Attribute:**
atttn
**Fullname:**
index to be stored for trunk group in APTT
**Attribute Description:**
The attn is an index for every trunk group which provides entry into the automatic trunk test table for outgoing test calls. This table is used in automatic progression testing (APT) and for providing default 'TYPE' and/or 'OPDN' parameters for the TST:TRK command if those parameters are not specified on the command line.

**Attribute:**
og_100
**Fullname:**
outpulsed digits
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOG100, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_100.digcnt and og_100.dn[15].

**Attribute:**
og_100.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_100.dn
**Fullname:**
digits to be outpulsed for 100 test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_102

Copyright © 1999 Lucent Technologies 

**Fullname:**
outpulsed digits
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOG102, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_102.digcnt and og_102.dn[15].

**Attribute:**
og_102.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_102.dn
**Fullname:**
digits to be outpulsed for 102 test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_syn
**Fullname:**
digits to be outpulsed for syn test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOGSYN, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_syn.digcnt and og_syn.dn[15].

**Attribute:**
og_syn.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_syn.dn
**Fullname:**
digits outpulsed for syn test
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_nsyn
**Fullname:**
digits to be outpulsed for nsyn test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOGNSYN, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_nsyn.digcnt and og_nsyn.dn[15].

**Attribute:**
og_nsyn.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_nsyn.dn
**Fullname:**
digits to be outpulsed for nsyn test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_105
**Fullname:**
digits to be outpulsed for 105 test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOG105, and if[ the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_105.digcnt and og_105.dn[15].

**Attribute:**
og_105.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

Copyright © 1999 Lucent Technologies 

**Attribute:**
og_105.dn
**Fullname:**
digits to be outpulsed for 105 test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_pb
**Fullname:**
digits to be outpulsed for pb test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOGPB, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_pb.digcnt and og_pb.dn[15].

**Attribute:**
og_pb.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_pb.dn
**Fullname:**
digits to be outpulsed for pb test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_103
**Fullname:**
digits to be outpulsed for 103 test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOG103, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_103.digcnt and og_103.dn[15].

Copyright © 1999 Lucent Technologies 

**Attribute:**
og_103.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_103.dn
**Fullname:**
digits to be outpulsed for 103 test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_104
**Fullname:**
digits to be outpulsed for 104 test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOG104, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_104.digcnt and og_104.dn[15].

**Attribute:**
og_104.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_104.dn
**Fullname:**
digits to be outpulsed for 104 test
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_inv
**Fullname:**
digits to be outpulsed for inverted transmission tests

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
If the TSTCODE attribute is determined to be TCOGINV, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_inv.digcnt and og_inv.dn[15].

**Attribute:**
og_inv.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_inv.dn
**Fullname:**
digits outpulsed for an ISTF non-inverting loopback transmission test d
**Attribute Description:**
This is a digital test that expects the far end to invert all the non-signaling bits (0->1, 1->0)

**Attribute:**
og_ninv
**Fullname:**
digits to be outpulsed for non-inverted transmission tests
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOGNINV, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_inv.digcnt and og_inv.dn[15].

**Attribute:**
og_ninv.digcnt
**Fullname:**
digit count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_ninv.dn
**Fullname:**
digits outpulsed for an ISTF non-inverting loopback transmission test
**Attribute Description:**
This is a digital test call that expects the far end to return the non-signaling bits without alternation (0->0, 1->1)

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
og_106
**Fullname:**
digits to be outpulsed for 106 test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOG106, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_106.digcnt and og_106.dn[15].

**Attribute:**
og_106.digcnt
**Fullname:**
digit count
**Attribute Description:**
If Gldsnopt == DBNO then og_106.digcnt must = 0.

**Attribute:**
og_106.dn
**Fullname:**
digits outpulsed for 106 test
**Attribute Description:**
If Gldsnopt == DBNO then must be blank.

**Attribute:**
og_catl
**Fullname:**
digits to be outpulsed for catl test
**Attribute Description:**
If the TSTCODE attribute is determined to be TCOGCATL, and if the OPDN is not specified, then this attribute is used to determine the digits to be outpulsed through its 2 subattributes og_catl.digcnt and og_catl.dn[15].

**Attribute:**
og_catl.digcnt
**Fullname:**
digit count
**Attribute Description:**
not used by domestic

**Attribute:**
og_catl.dn
**Fullname:**
digits to be outpulsed for catl test
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

if catl is defined this relation must be populated with at least two tuples:
one tuple for trunks having pulse signaling, define the digit string 11,1
one tuple for trunks having MFC signaling, define the digit string I-13,1
Not used by Domestic -- default to null.

**Attribute:**
og_sxsdig
**Fullname:**
digits to be outpulsed for step by step test call
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_sxscnt
**Fullname:**
digti count
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_ctx2dig
**Fullname:**
digits to be outpulsed for Phase II Centrex test call
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_ctx2cnt
**Fullname:**
count of digits to be outpulsed for Phase II Centrex test call
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_ctx3dig
**Fullname:**
digits to be outpulsed for Phase III Centrex test call
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this

Copyright © 1999 Lucent Technologies 

subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_ctx3cnt
**Fullname:**
count of digits to be outpulsed for Phase III Centrex test call
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_109dig
**Fullname:**
digits to be outpulsed for an RMS-D3 109 test call
**Attribute Description:**
Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_109cnt
**Fullname:**
count of digits to be outpulsed for an RMS-D3 109 test call
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
og_606dig
**Fullname:**
digits to be outpulsed for an RMS-D3 606 test call

Once the number of digits to be outpulsed is determined, this subattribute is used to determine the actual digits that need to be outpulsed.

**Attribute:**
og_606cnt
**Fullname:**
count of digits to be outpulsed for an RMS-D3 606 test call
**Attribute Description:**
Once the test TYPE is determined, this subattribute is used to determine the number of digits to be outpulsed.

**Attribute:**
tstcode

**Copyright © 1999 Lucent Technologies** 

**Fullname:**

default terminal maintenance test code

**Attribute Description:**

tstcode can take on any value shown in its corresponding base domain DMtcattt
A value of TCOGNULL is possible and would be appropriate for a trunk group where the service of automatic look-up of test line numbers is desired, but automatic progression testing is handled at the far end.
When tstcode has a value other than TCOGNULL, then a corresponding attribute in this relation must be populated as shown in the following diragram. Note that TCOGCONT does not have a corresponding attribute.

| tstcode | attribute which must be populated |
|---|---|
| TCOGNULL | N/A |
| TCOGSYN | og_syn.digcnt<br>.dn |
| TCOGNSYN | og_nsyn.digcnt<br>.dn |
| TCOGPB | og_pb.digcnt<br>.dn |
| TCOGCONT | N/A |
| TCOGCATL | export use only |
| TCOGINV | og_inv.digcnt<br>.dn |
| TCOGNINV | og_ninv.digcnt<br>.dn |
| TCOGSXS | og_sxscnt<br>og_sxsdig |
| TCOGCTX2 | og_ctx2cnt<br>og_ctx2dig |
| TCOGCTX3 | og_ctx3cnt<br>og_ctx3dig |
| TCOG103 | og_103.digcnt<br>.dn |
| TCOG100 | og_100.digcnt<br>.dn |
| TCOG102 | og_102.digcnt<br>.dn |
| TCOG102LB | N/A |
| TCOGSHCT | N/A |
| TCOG104 | og_104.digcnt<br>.dn |
| TCOG105 | og_105.digcnt<br>.dn |
| TCOG106 | og_106.digcnt<br>.dn |
| TCOG109 | og_109dig<br>og_109cnt |
| TCOG606 | og_606dig<br>og_606cnt |

Copyright © 1999 Lucent Technologies 

```
*
                  The value of tstcode, and the corresponding
                  attribute, if any, that determines the digit string
                  to be outpulsed, has no relationship to how many
                  other attributes in this tuple may be populated.
                  tstcode is used for automatically run operational
                  test calls and when TYPE is not specified in a
                  TST:TRK command line.
*
The remaining description applies to non Autoplex(R) trunks
( RT_TRKG.dcs_trk = DBNO ).  Autoplex(R) specific rules will
be expressed only in the check section.
For trunks groups that specify a value
of atttn in RLrt_trkg.atttn then the
following rule applies:
                      if RLrt_trkg out_sigtype ==  DBCCIS6 or
                                                   DBISUP7 or
                              DBIUP7
                           (Common Channel Signaling CCS Trunks)
   then
       tstcode must be        TCOGNULL or
                              TCOGCONT or
                              TCOGPB
*
                      if RLrt_trkg out_sigtype not DBCCIS6 or
                                                   DBISUP7 or
                                                   DBTUP7
                           (non CCS trunks)
                      then
                            tstcode must not be   TCOGCONT
*
   if RLfc_porttyp servclass == FCEDSL or FCEDSLHM
       (FCEDSLHM is for EDSL trunks with hotel/motel to TSPS service
        and FCEDSL is for all other EDSL trunks)
   then
       tstcode must be        TCOGINV or
                              TCOGNINV
   (Both RLFC_PORTTYP and RLRCTGRPRK relations have servclass
    in them but RLRCTGRPRK will be used in the CHECK section
    as it is simpler to use it with the 'trunk group' as the
    key. RLFC_PORTTYP has 'port name' as the key so RLTRUNK_GROUP
    relation would have to be read to convert trunk group to
    port name to read RLFC_PORTTYP).
*
   if RLfc_porttyp servclass == OA_IFOPER
       (OSPS PRI outgoing B-channel trunks)
   then
       tstcode must be        TCOGINV or
                              TCOGNINV
```

**Attribute:**
dpc
**Fullname:**
Destination Point Code
**Attribute Description:**
The DPC indicates the signaling point
for the far end office. See RLlab7prt.

**Attribute:**
sigtype
**Fullname:**
Signaling Type
**Attribute Description:**
The signaling type (protocol) of the trunks associated with
the OPC/DPC pair. (that is, DBTUP7, DBTUP7I, DBTUP7BT, DBNLISUP7,
DBBSSAP, DBISUP7N, and DBISUP7I from DMdigsig domain).

**Attribute:**
opc
**Fullname:**
Origination Point Code
**Attribute Description:**
The OPC indicates the signaling point which is assigned to this
office. See RLlab7prt.

**Attribute:**
mstates
**Fullname:**
Multiple Blocking States
**Attribute Description:**
Used to indicate if the far end exchange can handle multiple
remote blocking states. If the far end exchange (DPC) can handle
multiple blocking states for the specified signaling type, then
this attribute should be set to DBYES, otherwise it is set to
DBNO.
This attribute is not used when the signaling type is DBTUP7BT.
This attribute is always set to DBNO when the signaling type is
DBBSSAP.

**Attribute:**
grm
**Fullname:**
Group Reset Messages
**Attribute Description:**
Used to indicate if the far end exchange accepts CCS Group Reset
messages. If the far end exchange (DPC) accepts CCS group reset
messages for the specified signaling type, then this attribute
should be set to DBYES, otherwise it is set to DBNO.
This attribute is always set to DBNO when the signaling type is

**Copyright © 1999 Lucent Technologies** 

DBBSSAP.

**Attribute:**

gbm

**Fullname:**

Group Blocking Messages

**Attribute Description:**

Used to indicate if the far end exchange accepts CCS group blocking messages. If the far end exchange (DPC) accepts CCS group blocking messages for the specified signaling type, then this attribute should be set to DBYES, otherwise it is set to DBNO.

This attribute is always set to DBNO when the signaling type is DBBSSAP.

### Relation Description

Terminal maintenance digital test parameter values
and result threshold
This relation will store the parameter values of duration and
block size for digital tests and thresholds against which the
digital test results will be measured to determine
the pass/marginal/fail criteria for the tests.

**Attribute:**

atttn

**Fullname:**

Automatic trunk test table number

**Attribute Description:**

The key to the relation. This allows the test result

Copyright © 1999 Lucent Technologies

thresholds based on trunk group numbers.

**Attribute:**
duration
**Fullname:**
Duration
**Attribute Description:**
Total duration of the test in seconds.

**Attribute:**
blksize
**Fullname:**
Block size
**Attribute Description:**
Block size of the digital bit streams used in the test.

**Attribute:**
acc_ber
**Fullname:**
Acceptable bit error ratio
**Attribute Description:**
Acceptable bit error ratio for the digital test bit stream.
The range is 0 to 7.
0 indicates no errors.
1 indicates 1 error in 10 bits.
2 indicates 1 error in 100 bits.
3 indicates 1 error in 1000 bits.
4 indicates 1 error in 10000 bits. And so on.
The minimum duration for acc_ber values 1 through 4
is 1 second.

### Relation Description

Terminal Maintenance Noise or Return Loss Thresholds
This relation will store the noise or return loss thresholds for 105, and 102LB test calls. This will be used to define the pass/marginal/fail status for the test calls.

**Attribute:**

atttn

**Fullname:**

Automatic Trunk Test Table Number

**Attribute Description:**

The atttn attribute is one of the keys to this relation. It allows the definition of noise or return loss based on a trunk group basis.

Copyright © 1999 Lucent Technologies

**Attribute:**
testtype
**Fullname:**
Test type
**Attribute Description:**
The testtype attribute is one of the keys to the relation. It defines the type of test the noise or return loss thresholds are defined for.

**Attribute:**
nrltype
**Fullname:**
Noise or Return Loss type
**Attribute Description:**
This is one of the keys to the relation. "nrltype" defines the type of noise or return loss the threshold is defined for.

**Attribute:**
al_min
**Fullname:**
Minimum acceptable limit
**Attribute Description:**
This is the acceptable limit threshold for the noise or return loss.
The unit type of this attribute varies depending on "nrltype". For "nrltype" of TMERL, TMSRL, TMSHI the unit is dB. For "nrltype" of TMN, TMRN and TMNT the unit is dBrnC.

**Attribute:**
ial_min
**Fullname:**
Minimum immediate action limit
**Attribute Description:**
This value defines the "immediate action limit" above which the test will be deemed failed.
The unit type of this attribute varies depending on "nrltype". For "nrltype" of TMERL, TMSRL, TMSHI the unit is dB. For "nrltype" of TMN, TMRN and TMNT the unit is dBrnC.

**Relation Description**

Terminal Maintenance Tone Measurement Threshold
This relation defines the tone measurement thresholds for 105 and 102LB test calls. These threshold values define the pass/marginal/fail criteria for the test calls.

**Attribute:**
atttn
**Fullname:**
Automatic Trunk Test Table Number.
**Attribute Description:**
The atttn attribute is one of the keys to the relation. It allows the definition of tone measurement thresholds on a trunk group basis.

**Attribute:**
testtype
**Fullname:**
Test type.
**Attribute Description:**
The testtype attribute is one of the keys to the relation. It allows the identification of the test for which the tone measurement thresholds have been defined.

**Attribute:**
tonetype
**Fullname:**
Tone type.
**Attribute Description:**
The tonetype attribute is one of the keys to the relation. It allows the identification of the tone for which the measurement thresholds have been defined.

**Attribute:**
al_min
**Fullname:**
Minimum acceptance Limit.
**Attribute Description:**
The value of minimum acceptance limit marks the lower bound of the range of tone level to be deemed "passed".
This attribute has a range of -48 to +3 dB in increments of 1 dB.

**Attribute:**
ial_min
**Fullname:**
Minimum immediate action limit.
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

The value of minimum immediate action limit marks the lower bound where all tone levels lower than this value will fail. Values between the minimum acceptence limit and immediate action limit are considered marginal.
This attribute has a range of -48 to +3 dB in increments of 1 dB.

**Attribute:**
al_max
**Fullname:**
Maximum acceptance Limit.
**Attribute Description:**
The value of maximum acceptance limit marks the upper bound of the range of tone level to be deemed "passed".
This attribute has a range of -48 to +3 dB in increments of 1 dB.

**Attribute:**
ial_max
**Fullname:**
Maximum immediate action limit.
**Attribute Description:**
The value of maximum immediate action limit marks the upper bound where all tone levels higher than this value will fail. Values between the minimum acceptence limit and immediate action limit are considered marginal.
This attribute has a range of -48 to +3 dB in increments of 1 dB.

**Attribute:**
pos_duna
**Fullname:**
Positive deviation, unacceptable
**Attribute Description:**
The positive deviation allowed for the tone detected in the unacceptable range.
This attribute has a range of 0 to 9 dB in increments of 1 dB.

**Attribute:**
neg_duna
**Fullname:**
Negative deviation, unacceptable
**Attribute Description:**
The negative deviation allowed for the tone detected in the unacceptable range.
This attribute has a range of 0 to 9 dB in increments of 1 dB.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

pos_dmar

**Fullname:**

Positive deviation, marginal

**Attribute Description:**

The positive deviation allowed for the tone detected in the marginal range.
This attribute has a range of 0 to 9 dB in increments of 1 dB.

**Attribute:**

neg_dmar

**Fullname:**

Negative deviation, marginal

**Attribute Description:**

The negative deviation allowed for the tone detected in the marginal range.
This attribute has a range of 0 to 9 dB in increments of 1 dB.

# TM_WS101

## 1. Description

This relation contains all of the Trunk Work Stations (TWSs) that are assigned for terminating Incoming 101 Test Line calls at its Talk and Monitor phone. The 101 Test Line (101TL) call can be directed to one of the following TWSs:

```
In the No. 5ESS(R)-2000 switch office:
     1. Master Control Center/Trunk and Line Work   Station (MCC/TLWS)
     2. Supplementary Trunk and Line Work Station(STLWS).
In a remote location (thatis, Switching Control Center(SCC)):
     3. Remote MCC/TLWS
     4. Central Trunk Test Unit (CTTU).
```

## 2. Data Dictionary Values

## 4. Population rules for RLtm_ws101

### Relation Description

```
Terminating Trunk Work Stations 101

Contains all of the Trunk Work Stations (TWSs) that
```

Copyright © 1999 Lucent Technologies

are assigned for Terminating Incoming 101 Test Line
calls at its Talk and Monitor phone.

The 101 Test Line (101TL) call can be directed to one
of the following TWSs:
    In the No. 5ESS(R)-2000 switch office:
       1. Master Control Center/Trunk and Line Work Station
          (MCC/TLWS)
       2. Supplementary Trunk and Line Work Station (STLWS)
    In a remote location (that is, Switching Control Center (SCC)):
       3. Remote MCC/TLWS
       4. Central Trunk Test Unit (CTTU).

Supporting Documentation:
DS5R 5.04.03.12, 101 Test Line Requirements
DS5D 5.04.03.12, 101 Test Line Design

General Description:
---
This relation is used in determining which Talk and Monitor
phone to connect to when the general purpose 101 test call
is invoked. Therefore only TLWS's which have a Talk and
Monitor phone assigned to them should have tuples in TM_WS101.
(that is, RLtlwsr.tm_phone != TMP_NULL)
When the general purpose test call is made, the global parameter
Gltm_rt101 is read to determine which type of Talk and Monitor
to attempt to connect to first (Gltm_rt101.tws_1st). Then
the position busy table (indexed by TLWS number) is searched
for an idle position that matches the type in Gltm_rt101.
This is when RLtm_ws101.type is used because it has the same
key as the position busy table. If there is no idle position
of that type, the next attribute in Gltm_rt101 is used to
match on (tws_2nd) and if no match is found there, the last
attribute in Gltm_rt101 is used (tws_3rd).
The exception to the above condition is when the office has
access to a Central Trunk Test Unit (CTTU) as identified
by the global parameter Glcttu set to DBYES. In that case
an additional tuple must be added in RLtm_ws101.

**Attribute:**
number
**Fullname:**
Trunk Work Station (TWS) ID number.
**Attribute Description:**
This is the key for RLtm_ws101. Tuples in RLtlwsr
which have Talk and Monitor phones will have a
corresponding entry in RLtm_ws101 or if the office
has access to a CTTU.
This field corresponds to the 'number' attribute in RLtlwsr
or when Glcttu = DBYES, this field must be set to 33.

Copyright © 1999 Lucent Technologies 

**Attribute:**
type_tws
**Fullname:**
Type of TWS.
**Attribute Description:**
This field depends on how the talk and monitor phone is populated in RLtlwsr as follows:
if RLtlwsr.tm_phone = TMP_NULL, no tuple in RLtm_ws101.
if RLtlwsr.tm_phone = TMP_GPORT, set to 'TM_LOCAL'.
if RLtlwsr.tm_phone = TMP_LTP, set to 'TM_REMOTE'.
if Glcttu = Yes, set to 'TM_CTTU'.

## 4. Population rules for RLtmblist

### Relation Description

Multiline hunt group terminal make busy key
On any given SM, ORM or RSM, for every tuple in the relation HUNTKEYS, where the attribute huntkey_type is FCMEMMKBUSY, the secondary index for that tuple should have it's corresponding tuple in TMBLIST, populated on the same modules as the HUNTKEYS tuple.

**Attribute:**
scndindex
**Fullname:**
secondary index
**Attribute Description:**
Key to relation. Obtained from the relation HUNTKEYS where the attribute huntkey_type is FCMEMMKBUSY.

**Attribute:**
length
**Fullname:**
number of ports in the list
**Attribute Description:**
Number of members under the control of the multiline hunt group member make busy key.

**Attribute:**
grpnum
**Fullname:**
group number of a mutiline hunt group
**Attribute Description:**
RLtmblist.grpnum must equal RLrt_mhg.grpnum

**Attribute:**
htype
**Fullname:**
hunting type
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Indicates the type of hunting for this group.
This attribute is not used, set to the default value.

**Attribute:**
bsytrt
**Fullname:**
busy treatment
**Attribute Description:**
Indicates the type of busy treatment associated
with this set of members.

**Attribute:**
member[*]
**Fullname:**
member
**Attribute Description:**
The member number of a member under control.

# TMSPIPE

## 1. Description

This relation defines the network side of a QLPS (Quad-Link Packet Switch) pipe. A pipe is a high bandwidth path from a QLPS QTMSLNK through the TMS to a given QLPS end-point. QLPS is used in the *5ESS*®-2000 switch for high bandwidth message transport.

## 4. Population rules for RLtmspipe

### Relation Description

QLPS TMS Pipe relation

This relation defines the network side of a QLPS pipe. QLPS is an optional high bandwidth message transport being developed as part of Service Net-2000. A QLPS pipe is a path from a QLPS through the TMS, through the TSI to a QLPS endpoint. For release 1 of SN-2000, the QLPS endpoint in an SM-2000 is a Message Handler MH).

**Attribute:**
qnetwork
**Fullname:**
QLPS Network
**Attribute Description:**
This attribute identifies the QLPS network, which can only be 0 or 1 in release 1 of 5E-2000. Future releases may have networks 2 and 3, which must be allowed for.

**Attribute:**
qendpt
**Fullname:**
QLPS Endpoint
**Attribute Description:**
This attribute indicates the endpoint of the pipe being defined. In release 1, this will be a MH endpoint id (which is the same number as the SM-2000 where the MH resides) Note that QGLs,

Copyright © 1999 Lucent Technologies 

which are pipes from the QLPS to a QGP are hard-wired and are not defined in ODD).

**Attribute:**
pipetype
**Fullname:**
QLPS Pipe Type
**Attribute Description:**
This attribute specifies the type of QLPS pipe being defined. For release 1, the only allowable type of pipe is a MH pipe.

**Attribute:**
qtmslnk
**Fullname:**
QLPS QTMSLNK (TMS link)
**Attribute Description:**
This attribute defines the TMS link (called a QTMSLNK) at the QLPS end of the pipe. Each QLPS has 4 TMS links (QTMSLNKs) associated with it and this is one of those 4 QTMSLNKs for the QLPS network for which this pipe is being defined.

**Attribute:**
hdchan
**Fullname:**
QLPS HDLC Channel
**Attribute Description:**
This attribute defines the HDLC channel on the QTMSLNK (see attribute qtmslnk) that is to be used for this pipe. On each QTMSLNK, there are 30 HDLC channels available to be used for pipes.

**Attribute:**
tmslnk
**Fullname:**
TMS Link for QLPS Endpoint
**Attribute Description:**
This attribute specifies the TMS link that will be used for the path through the TMS to the destination endpoint MH's. The TMS link is to the SM-2000 where the MH reside. For SM-2000s used as LSMs and HSMs, there are actually 2 TMS links for each NCT2 link to an SM-2000. For a MH pipe, the lowest order number of the 2 TMS links to the primary NLI must be chosen for population in this attribute (tmslnk_0 in RLnli_lnk). For example, for an even NCT2 link the TMS links may be 4 and 6. In that case 4 would be populated in this relation.)

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
num_slots
**Fullname:**
Number of Pipe Timeslots
**Attribute Description:**
For Service Net-2000 release 1, a MH pipe must have 14 timeslots.

**Attribute:**
slots[*]
**Fullname:**
Pipe Network Side Timeslots bit map
**Attribute Description:**
These 8 attributes, slots0 through slots7, make up a 256 bit map (8 words of 32 bits each) of timeslots assigned to a pipe. A bit is set in the map for each timeslot assigned to a pipe. Since the default for the number of timeslots is 14 in this release, there must be 14 bits set in this map.

These timeslots are the timeslots for which 2 way connections are made through the TMS for the pipe. These timeslots are assigned to a pipe both at the QTMSLNK (TMS link for the QLPS) and at the TMS link for the destination SM-2000.

## 4. Population rules for RLtmtsc

### Relation Description

```
        TM test codes
        DNs associated with TM test codes (test lines).  This relation
        is used for access to toll trunk test lines from trunks where
        rlDNTRAN is not used to route calls.  To use this toll test
        line mechanism, a destination index must be chosen and placed
        in digit analysis to link the routing mechanism to a
        RLrt_routing.route_type = RTE_TM.  Tuples in this relation then
        discriminate the exact test line that corresponds to the digit
```

Copyright © 1999 Lucent Technologies

pattern that was dialed. A tuple is needed for each digit pattern which may be dialed from a trunk to access a test line. Digit patterns that are supported in rlDN_TRAN with termclass equal to RTTC_TMTST for access to test lines should not appear in this relation.

**Attribute:**
dn
**Fullname:**
Directory number
**Attribute Description:**
Digits which correspond to test line numbers.

**Attribute:**
dn.digcnt
**Fullname:**
Digit count
**Attribute Description:**
Number of digits in the DN digit string.

**Attribute:**
dn.dn
**Fullname:**
Digit string
**Attribute Description:**
Digit string

**Attribute:**
tstcode
**Fullname:**
Test code
**Attribute Description:**
Enum value of the test line which is to be accessed when the caller dials digits shown in the dn attribute.

## 4. Population rules for RLtn_ssn

### Relation Description

Translation number to non-local Signaling Connection Control Part (SCCP) Subsystem Number (SSN)
This relation is needed by the Signaling Connection Control Part of the CCSNA7 transport in the Packet Switch Unit (PSU). This transport is used for sending direct signaling information in a Signaling System No. 7 network. An SCCP user is identified at a Point Code in the network by a SCCP Subsystem Number.
This relation is used to store the Destination Point Code (DPC) and the SCCP SSN of each non-local SCCP Subsystem in the network that this switch must maintain status of.
(The SCCP Subsystem Number of the ACP Subsystem local to this switch is stored in the global parameter Glacpssn.)
If there is a mate subsystem (that is,a backup) for this subsystem, then a translation number index is assigned and the tuple for that index is populated with the DPC and SSN of the mate subsystem.

Copyright © 1999 Lucent Technologies

The bk_tn attribute in the two tuples must be populated to reflect that the two subsystems are mates (that is, backups for each other.) In each tuple, the bk_tn attribute is populated with the translation number index of the mate.

**Attribute:**
tn_indx
**Fullname:**
Translation number index
**Attribute Description:**
For each non-local SCCP Subsystem in the network that this switch must maintain status of, a translation number index assigned and the tuple for that index is populated with the Destination Point Code (DPC) and SubSystem Number (SSN) of that SCCP Subsystem.
This translation number index is generated by using the RLfacids relation (facid = 0, class = FAC_SCCP, subclass = SCL_NULL). (See the population rules for RLfacids for a description of the link list maintained for each class.)
Translation number indexes will be assigned sequentially in the range 1 through 31 and must never exceed 31, so checks must be made against the index retrieved using RLfacids since the RLfacids indexes are 16 bits.

**Attribute:**
dpc
**Fullname:**
Destination Point Code
**Attribute Description:**
The destination point code is an arbitrary number which is assigned to a node in the signaling network. This dpc must be a known point code in the RLnapcndx relation. See the population rules for the RLnapcndx relation to see how the dpc is formatted.

**Attribute:**
ssn
**Fullname:**
Subsystem Number
**Attribute Description:**
The Subsystem number is a number which is assigned to a SCCP user (that is, Subsystem) at a node in the signaling network. The following standard SCCP Subsystem numbers have been defined by ANSI(R):

1 = SCCP Management
2 = Telephone User Part
3 = ISDN user part
4 = OA&M

Network specific Subsystem numbers are normally assigned in descending order starting with 254.
In a network using SCCP to transport information to a Network

Copyright © 1999 Lucent Technologies 

Control Point (NCP) (BT-DDSN for example), there are only 3 SCCP subsystems that need to be populated at the ACP. They are:

1. the DSD application Subsystem at an NCP. Global title translation will be done to this Subsystem, so the tn_indx for this subsystem will be used in populating the RLgtt and RLfuncts relations when applicable.
2. the NSPS Subsystem at an NCP
3. the NDM subsystem at an NCP.

Subsystems at other ACPs in the network do not need to be populated since direct signaling messages are never sent to SCCP at another ACP.

**Attribute:**

bk_tn

**Fullname:**

Backup subsystem translation number

**Attribute Description:**

This is the translation number generated for the mate subsystem, if one exists. If there is no mate, then the value of bk_tn should be zero. If bk_tn is non-zero, there must be another tuple in this relation keyed by bk_tn. Furthermore, the value of bk_tn in the other tuple must be the same as tn_indx in this tuple, and a non-local subsystem can not be mated to itself.

## 4. Population rules for RLtnt2reg

### Relation Description

This WIRELESS Centrex (WCTX) relation contains the Tenant Group to the Registration Area Identifier data.

**Attribute:**
tntgrpid
**Fullname:**
Tenant Group Identifier
**Attribute Description:**
Identifies a group of subscribers within a WNC.

**Attribute:**
reg[*]
**Fullname:**
Registration Area Identifier
**Attribute Description:**
It uniquely identifies for each registration area.

```

## 4. Population rules for RLtonetime

### Relation Description

```
       This relation indicates if a tone is timed and how long tone should be timed
        For the attribute tonetype 5ODA only supports the following
        seven enumerations on the input form TNTYP:
                ROH
                REORDER
```

Copyright © 1999 Lucent Technologies

```
        BUSY
        PRMPTON
        DSNROH
        HIGHTONE
        HIGH60
        HIGH120
    Default information for the following
    TONE TYPEs for each new office:
        TONE TYPE       TIMED?          HOW MANY SECONDS?
        BUSY              N
        HIGHTONE          N
        REORDER           N
        ROH               Y                    045
        HIGH60            N
        AUDIBLE           Y                    255
    For RLtonetime.tonetype=PCAUDIBLE, time may be either 0, showing
    that audible is not timed and may be played until the caller
    hangs up (possibly forever),
    or time may be nonzero thus limiting the time audible ringing tone
    is applied in an excessive call delay scenario.  It is recommended
    that a non-zero value of 255, the largest possible value for this
    field (4 min 15 sec), be used to limit the time audible ring may
    be applied to a network resource (e. g. an MF trunk).
    Recent change only seems to support this limited set of
    enumerations.
```

**Attribute:**
tonetype
**Fullname:**
Tone type.
**Attribute Description:**
Name of tone

**Attribute:**
timeind
**Fullname:**
Tone timing.
**Attribute Description:**
Is tone timed.

**Attribute:**
time
**Fullname:**
time
**Attribute Description:**
Number of seconds tone is timed.

**Copyright © 1999 Lucent Technologies** 

# TPR_CC

## 1. Description

Relation containing information about country code and corresponding carrier id to determine terminating point restriction. This relation is to have a distribution of FG (fixed group), with a grp_type of GPD_OSPS, and a grp_id of 3. The maximum number of tuples for this relation is 256. However, based on current customer practices, the average number of tuples should be 10 or less. This relation will be used by the 5E6 OSPS DIOR feature. Use of this relation for other purposes will require a boolean be added for the DIOR feature (plus additional booleans for the new features), and that DIOR code be modified to accomodate this change.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 256 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 256 |
| foldtype | DBGC31 |

## 3. Field Layout

```
TPR_CC      relid = 1272  DBSTATIC   DBACC_HASH  DBPRAM    FG      NULL
     carr        DMBCARID     (ushort: 14)    <--- key

                               ( 4 bytes )
```

## 4. Population rules for RLtpr_cc

**Relation Description**

The relation RLtpr_cc specifies countries to which direct international origination (DIOR) calls are allowed to terminate.

**Attribute:**

cc

**Fullname:**

Terminating country code

**Attribute Description:**

This attribute is used to determine terminating point restrictions for a DIOR call using the terminating country code. If a tuple with the country code from the international forward number is found in this relation for the carrier identified by trunk group data, then the DIOR call is allowed.

**Attribute:**

Copyright © 1999 Lucent Technologies

carr

**Fullname:**

Carrier providing DIOR service to the country specified by the attribute cc

**Attribute Description:**

This attribute is used to identify the DIOR service provider for calls placed to the country specified by the terminating country code attribute cc.

**Defines:**

"db/DMcarr_val.h"

Copyright © 1999 Lucent Technologies

# TPR_NPA

## 1. Description

Table containing the NPA & NXX information to block call termination for the carrier "carr". This relation is to have a distribution of FR (fixed redundant).

This relation will be used by the 5E6 OSPS DIOR feature. Use of this relation for other purposes will require a boolean be added for the DIOR feature (plus additional booleans for the new features), and that DIOR code be modifiesd to accomodate this change.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 544 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |

## 4. Population rules for RLtpr_npa

**Relation Description**

```
        Terminating Restrictions of NPA-NXXs
        This relation contains the terminating point restriction data
        for a DIOR, AATOS, AATLSOS, or wireless call with a domestic
        forward number.  If a tuple
```

Copyright © 1999 Lucent Technologies

containing the NPA-NXX of the forward number is found, then the DIOR, AATOS, AATLSOS, or wireless call of the service provider carr are blocked.
This relation contains the information necessary to determine the terminating point restrictions for a DIOR call with a domestic forward number. If a tuple with NPA and/or NPANXX of the forward number is found in the chart, then the DIOR call is blocked for the carrier indicated by the carr value.

**Attribute:**
npa
**Fullname:**
Three digit NPA of a domestic forward number
**Attribute Description:**
If a tuple with NPA and/or NPA & NXX of the forward number is found, the DIOR, AATOS, AATLSOS, or wirelessn call is blocked.

**Attribute:**
nxx
**Fullname:**
Three digit NXX of a domestic forward number
**Attribute Description:**
If a tuple with NPA and/or NPA & NXX of the forward number is found, the DIOR, AATOS, AATLSOS, or wirelessn call is blocked.

**Attribute:**
carr
**Fullname:**
Carrier for the DIOR, AATOS, AATLSOS, or wireless call
**Attribute Description:**
Used to identify the TPR service provider/carrier for the call.

**Attribute:**
line
**Fullname:**
Line
**Attribute Description:**
U.S. Forward Number Line Number

**Attribute:**
diortrmt
**Fullname:**
Treatment for a DIOR call
**Attribute Description:**
Treatment when this is a DIOR call to this U.S. forward number (cast to DMtprtreat.G)

Copyright © 1999 Lucent Technologies 

**Attribute:**
aatostrmt
**Fullname:**
Treatment for an AATOS call
**Attribute Description:**
Treatment when this is a AATOS call to this U.S. forward number (cast to DMtprtreat.G)

**Attribute:**
aatlsostrmt
**Fullname:**
Treatment for an AATLSOS call
**Attribute Description:**
Treatment when this is an AATLSOS call to this U.S. forward number (cast to DMtprtreat.G)

**Attribute:**
wirelesstrmt
**Fullname:**
Treatment for a wireless call
**Attribute Description:**
Treatment when this is a wireless call to this U.S. forward number (cast to DMtprtreat.G)

**Attribute:**
quietheartrmt
**Fullname:**
Quiet Hear Treatment
**Attribute Description:**
This field is used for the Quiet Hear eligibility parameter used to control the application of Quiet Hear based on a domestic forward number as defined in the OSPS Terminating NPA NXX Restrictions Table.

**Attribute:**
oaff1
**Fullname:**
OA fast feature spare 1
**Attribute Description:**
spare

**Attribute:**
oaff2
**Fullname:**
Spare2
**Attribute Description:**
Spare field for future special features.

# TPRINTL

## 1. Description

Table containing the information for screening call termination to the international forward number. This relation is to have a distribution of FR (fixed redundant). This relation will be used by the OSPS International Terminating Point Restrictions feature.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population rules for RLtprintl

### Relation Description

This relation is being used by the International Terminating Point Restrictions (ITPR) feature starting in 5e10.

**Attribute:**
termcc
**Fullname:**
Terminating Country Code
**Attribute Description:**
1 - 3 digit terminating country code

**Attribute:**
oaff1
**Fullname:**
Spare 1
**Attribute Description:**
unsigned 6 spare

**Attribute:**
oaff2
**Fullname:**
Spare 2
**Attribute Description:**
unsigned short spare

**Attribute:**
intldn
**Fullname:**
Packed 15 Digits + Count Key
**Attribute Description:**
Packed 15 digits + count key of which a maximum of 14 digits may be used.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

intldn.dn0
**Fullname:**
Digit0 of DN
**Attribute Description:**
First digit of dn

**Attribute:**
intldn.dn1
**Fullname:**
Digit1 of DN
**Attribute Description:**
Second digit of dn

**Attribute:**
intldn.dn2
**Fullname:**
Digit2 of DN
**Attribute Description:**
Third digit of dn

**Attribute:**
intldn.dn3
**Fullname:**
Digit3 of DN
**Attribute Description:**
Fourth digit of dn

**Attribute:**
intldn.dn4
**Fullname:**
Digit4 of DN
**Attribute Description:**
Fifth digit of dn

**Attribute:**
intldn.dn5
**Fullname:**
Digit5 of DN
**Attribute Description:**
Sixth digit of dn

**Attribute:**
intldn.dn6
**Fullname:**
Digit6 of DN
**Attribute Description:**
Seventh digit of dn

Copyright © 1999 Lucent Technologies 

**Attribute:**
intldn.dn7
**Fullname:**
Digit7 of DN
**Attribute Description:**
Eighth digit of dn

**Attribute:**
intldn.dn8
**Fullname:**
Digit8 of DN
**Attribute Description:**
Ninth digit of dn

**Attribute:**
intldn.dn9
**Fullname:**
Digit9 of DN
**Attribute Description:**
Tenth digit of dn

**Attribute:**
intldn.dn10
**Fullname:**
Digit10 of DN
**Attribute Description:**
Eleventh digit of dn

**Attribute:**
intldn.dn11
**Fullname:**
Digit11 of DN
**Attribute Description:**
Twelfth digit of dn

**Attribute:**
intldn.dn12
**Fullname:**
Digit12 of DN
**Attribute Description:**
Thirteenth digit of dn - unused if termcc > 99

**Attribute:**
intldn.dn13
**Fullname:**

Copyright © 1999 Lucent Technologies 

Digit13 of DN
**Attribute Description:**
Fourteenth digit of dn - unused if termcc > 9

**Attribute:**
intldn.dn14
**Fullname:**
Digit14 of DN
**Attribute Description:**
Unused

**Attribute:**
intldn.digcnt
**Fullname:**
Digit Counter
**Attribute Description:**
This field holds the count of digits in the intldn.dn[*] array.

**Attribute:**
carrier
**Fullname:**
Carrier Identification code
**Attribute Description:**
Carrier Identification code

**Attribute:**
oaff3
**Fullname:**
Spare 3
**Attribute Description:**
tri-state boolean spare

**Attribute:**
diortrmt
**Fullname:**
DIOR Treatment
**Attribute Description:**
DIOR Treatment.

**Attribute:**
aatostrmt
**Fullname:**
AATOS Treatment
**Attribute Description:**
AATOS Treatment.

## 4. Population rules for RLtr8conv

### Relation Description

**** Recent Change only relation ****
TR8 specific data saved for a short time after a conversion of an IDCU TR8 RT to an IDCU TR303 RT.
This relation contains information which is necessary to convert a TR8 RT on an IDCU back to a TR303 RT. This relation is only created during the conversion process from TR8 to TR303. It's purpose is to allow the TR8 to TR303 conversion to be reversed in the event of trouble

(that is, hardware that worked find in TR8 mode won't work in the TR303 mode).
Any RC update to this RT after the RT conversion will remove this tuple (and possibly the RLftth_sig tuple associated with this RT).

**Attribute:**
module
**Fullname:**
Module number on which IDCU resides
**Attribute Description:**
This is the module number on which the IDCU is located.

**Attribute:**
idcu
**Fullname:**
IDCU number
**Attribute Description:**
This attribute is the IDCU number on which the RT is located

**Attribute:**
rtnum
**Fullname:**
RT number relative to IDCU
**Attribute Description:**
This is the RT number relative to the IDCU, this is the external RT numbering.

**Attribute:**
chan[*]
**Fullname:**
Channel Units on RT
**Attribute Description:**
These attributes contain the channel unit type equipped on the RT. 'chan1' represents slots 01 and 02 while 'chan48' represents slots 95 and 96.
NOTE: This attribute should be of domain DMchanutyp. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMchanutyp before using.

**Attribute:**
lptype[*]
**Fullname:**
Logical Port Type
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

These are the logical port types associated with the 96 possible ports on the TR8 RT prior to the conversion.

**Attribute:**
eqstat_a
**Fullname:**
Equippage State for digroup A
**Attribute Description:**
This is the equippage state for digroup A of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMeqstat. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMeqstat before using.

**Attribute:**
eqstat_b
**Fullname:**
Equippage State for digroup B
**Attribute Description:**
This is the equippage state for digroup B of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMeqstat. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMeqstat before using.

**Attribute:**
eqstat_c
**Fullname:**
Equippage State for digroup C
**Attribute Description:**
This is the equippage state for digroup C of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMeqstat. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMeqstat before using.

**Attribute:**
eqstat_d
**Fullname:**
Equippage State for digroup D
**Attribute Description:**
This is the equippage state for digroup D of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMeqstat. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should

**Copyright © 1999 Lucent Technologies** 

cast this attribute to DMeqstat before using.

**Attribute:**
cli_a
**Fullname:**
Change level indicator digroup A
**Attribute Description:**
This is the CLI for digroup A of the TR8 RT
before it was converted.

**Attribute:**
cli_b
**Fullname:**
Change Level Indicator for digroup B
**Attribute Description:**
This is the CLI for digroup B of the TR8 RT
before it was converted.

**Attribute:**
cli_c
**Fullname:**
Change Level Indicator for digroup C
**Attribute Description:**
This is the CLI for digroup C of the TR8 RT
before it was converted.

**Attribute:**
cli_d
**Fullname:**
Change Level Indicator for digroup D
**Attribute Description:**
This is the CLI for digroup D of the TR8 RT
before it was converted.

**Attribute:**
mode_a
**Fullname:**
Digroup Mode for digroup A
**Attribute Description:**
This is the mode for digroup A of the TR8 RT
before it was converted.
NOTE: This attribute should be of domain DMs96mode. To make
the alternate structure match, the domain was changed to be of
domain DMuchar. Anyone using the rlTR8CONV structure should
cast this attribute to DMs96mode before using.

**Attribute:**

Copyright © 1999 Lucent Technologies 

mode_b

**Fullname:**

Digroup Mode for digroup B

**Attribute Description:**

This is the mode for digroup B of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMs96mode. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMs96mode before using.

**Attribute:**

mode_c

**Fullname:**

Digroup Mode for digroup C

**Attribute Description:**

This is the mode for digroup C of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMs96mode. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMs96mode before using.

**Attribute:**

mode_d

**Fullname:**

Digroup Mode for digroup D

**Attribute Description:**

This is the mode for digroup D of the TR8 RT before it was converted.
NOTE: This attribute should be of domain DMs96mode. To make the alternate structure match, the domain was changed to be of domain DMuchar. Anyone using the rlTR8CONV structure should cast this attribute to DMs96mode before using.

# TRAN_GP

## 1. Description

This relation provides for SCCP information about translation groups as to what incoming message will map to the corresponding translation group.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 256 |
| expected number of tuples | 4 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCtran_gp |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 3. Field Layout

```
TRAN_GP     relid = 2529  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

```

## 4. Population rules for RLtran_gp

### Relation Description

```
        SCCP Global Title Mapping Relation

        This relation specifies for what values in the SCCP message should
        map to the appropriate translation group and octet number
        Global Title Translation or the appropriate destination network
        number and octet number for Point Code Extraction.
```

**Attribute:**

```
        gti
```

Copyright © 1999 Lucent Technologies

**Fullname:**
SCCP Global Title Indicator
**Attribute Description:**
This attribute is the Global Title Indicator expected in the incoming SCCP message.

**Attribute:**
tran_type
**Fullname:**
SCCP Global Title Translation / Translation Type
**Attribute Description:**
This attribute specifies the expected translation type in the SCCP incoming message.

**Attribute:**
nat_of_add
**Fullname:**
SCCP Global Title Indicator Nature of Address Indicator
**Attribute Description:**
This attribute specifies the expected nature of address values in the incoming SCCP message.

**Attribute:**
tran_gp
**Fullname:**
SCCP Translation Group
**Attribute Description:**
This attribute specifies the translation group for this SCCP service when performing SCCP Global Title Translation.

**Attribute:**
st_octet
**Fullname:**
Starting Octet Number
**Attribute Description:**
This attribute specifies the starting octet number when doing either Global Title Translation or Point Code Extraction.

For point code extraction, this is the starting octet and for the global title translation, this is the starting digit. Octets/digits are counted from the first octet in the address information field of the calling/called party address.

**Attribute:**
dest_net
**Fullname:**
Destination Network Number
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute is used when doing Point code extraction to specify the destination network number. It will be set to 0 when performing Global Title Translation. If greater than 0, then Point Code extraction is being performed.

**Attribute:**

psn_index

**Fullname:**

Point Code/Subsystem Number/Network Number Index

**Attribute Description:**

This attribute specifies an index that represents a Destination Point Code, Subsystem Number and Network Number tuple.

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLtrcupath

### Relation Description

Transmission Rate Converter Unit path relation.

This relation describes the attributes of a TRCU path.

**Attribute:**
sm
**Fullname:**
module number
**Attribute Description:**
This attribute uniquely identifies each module with which the office is equipped.

The domain (DMMODULE) of this attribute is unsigned 8 bits, therefore the maximum range is 0 to 255. However, actual range is smaller than that.

**Attribute:**
trcu_pi
**Fullname:**
TRCU path index
**Attribute Description:**
This is the TRCU path index for this SM. If this is a SM values of only 0 and 1 will be found.

For an EXM, for each pair of NLI, a pair of TRCU PATH are created where the trcu_pi correspond with the NLI numbers.

**Attribute:**
tcts
**Fullname:**
The control time slot used to communicate to the TRCU3.
**Attribute Description:**
The TCTS number is (from the SM's perspective) a TMSLNK time slot number on the TMSLNK identified by the attribute tcts. This time slot is a nail up between the MI and the TMSLNK connecting the TRCU3. (For NLIs the sublink 0 is used.) The channel created uses CPI (Central processor Intervention) to communicate to the host TRCU. At the remote end an alternate data ram entry corresponding to the tcts is used to communicate with the remote TRCU.

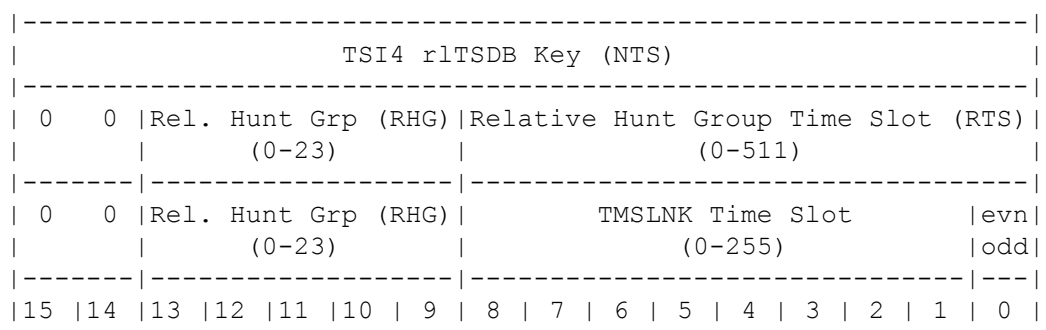
The value of 0 is defind as invalid by software.

To get the mapping from TCTS to NTSTYPE the following algorithms need to be followed. NOTE 1 is for an SM-2000. NOTE 2 is for SM.

Copyright © 1999 Lucent Technologies 

NOTE: 1.

SM-2000 TCTS to RLtsdb key



Inputs:
-------
a. NLI (nli): NLI number 0-23. Equals tpath.trcu_pi.

b. SUBLINK (slk): Always 0 for TCTS (constant).

c. SUBLINK_TIME_SLOT or TMSLNK Time Slot (sts): 8-bit control time slot number, range 0-255. Determined in step #1.

Algorithm:
----------
PCNST2NTS( nli, slk, sts ) =

```
     PCRHGRTS2NTS( PCNLISLK2RHG( nli, slk ), ((sts) << 1 ) | ((nli) & 1 ))

     |             \\----------------------/  \\-------------------------/
     |                          |                          |
     |               The definition of PCNLISLK2RHG        |
     |               is changing as part of TRCU3          |
     |               so it will be the same for            |
     |               all SM-2000s:                         |
     |                                                     |
     |               (((nli) & ~1 ) | (slk)) =             |
     |                                                     |
     |               (((nli) & 0xfffe) | (0)) =            |
     |                                                     |
     |                  ( nli & 0xfffe )                   |
     |                        |                            |
     v                        v                            v
     PCRHGRTS2NTS(           rhg,                        rts )  =

               ( ( (rhg) << PCRHG_SHFT )    | (rts) ) =
```

**********
*

**Copyright © 1999 Lucent Technologies** 

```
*  ( ((nli & 0xfffe) << 9) | (sts  << 1 ) | (nli & 1 )) & 0x3fff *
*                                                               *
*****************************************************************

BNOTE: 2.

Classic SM TCTS to RLtsdb key

     Desired Output:
     ---------------
     - rlTSDB key (tsnum also known as, NTS)
     - Provide two TCTS per DLI (one per TMS link)

        |-----------------------------------------------------------------|
        |                     TSI4 rlTSDB Key (NTS)                       |
        |-----------------------------------------------------------------|
        | 0   0 |Rel. Hunt Grp (RHG)|Relative Hunt Group Time Slot (RTS)|
        |       |      (0-23)       |              (0-511)              |
        |-------|-------------------|-----------------------------------|
        | 0   0 |Rel. Hunt Grp (RHG)|        TMSLNK Time Slot       |evn|
        |       |      (0-23)       |             (0-255)           |odd|
        |-------|-------------------|-------------------------------|---|
        |15 |14 |13 |12 |11 |10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
        |-----------------------------------------------------------------|

     Inputs:
     -------
     a. Relative Hunt Group: Always 0 for SM

     b. Even or Odd (even=0, odd=1)

     c. SUBLINK_TIME_SLOT or TMSLNK Time Slot (sts): 8-bit control time
        slot number, range 0-255.   Determined in step #1.

     Algorithm:
     ----------
     Even TCTS = ((sts << 1) | 0 ) & 0x1ff
     Odd TCTS =  ((sts << 1) | 1 ) & 0x1ff
```

**Attribute:**
type
**Fullname:**
type.
**Attribute Description:**
This is the type of TRCUs being used to create this path. Any one TRCU path must use the same TRCU type at the host and remote ends.

**Attribute:**
host_number
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

host number.

**Attribute Description:**

This is the number of the host TRCU being used for this TRCU path.

**Attribute:**

host_ckt

**Fullname:**

host circuit

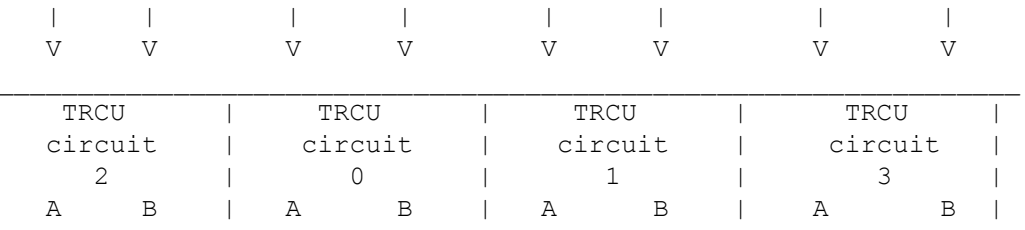
**Attribute Description:**

The circuit being used in the host TRCU for this TRCU path.

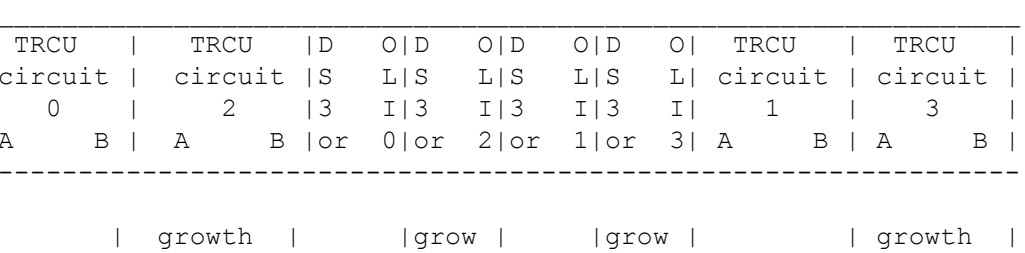
Valid trc_ckt values are 0-3.

|---------- TRCU models 1 and 2 ----------

| TRCU circuits 0 and 1 must be assigned to the same ORM or same ORM2000.
| TRCU circuits 2 and 3 must be assigned to the same ORM or same ORM2000.
| TRCU circuits 0 and 2 must be assigned to TMS links on ONTC side 0.
| TRCU circuits 1 and 3 must be assigned to TMS links on ONTC side 1.
|
| When growing a time multiplexed switch link, population of
| the transmission rate converter unit should be done as
| illustrated.
|
|
| TRCU-E (SMTRCU):



| TRCU-O (version 2 SMTRCU2):



| NOTE - an even and odd TMS link is connected to one TRCUcircuit.
| - A = even TMS NCT link

**Copyright © 1999 Lucent Technologies** 

```
|            - B = odd TMS NCT link
|-------------------------------------------------------------------------

|------------------------------ TRCU model 3 ------------------------------
```

**Attribute:**
host_cli
**Fullname:**
host change level indicator.
**Attribute Description:**
The cli value of the 2 host TRCU circuit packs in this path.

**Attribute:**
remote_number
**Fullname:**
remote number.
**Attribute Description:**
This is the number of the remote TRCU being used for this TRCU path.

**Attribute:**
remote_ckt
**Fullname:**
remote circuit
**Attribute Description:**
The circuit being used in the remote TRCU for this TRCU path.

**Attribute:**
remote_cli
**Fullname:**
remote change level indicator.
**Attribute Description:**
The cli value of the 2 remote TRCU circuit packs in this path.

**Attribute:**
spare2
**Fullname:**
Spare field number 2.
**Attribute Description:**
A spare field.

**Attribute:**
spare3
**Fullname:**
Spare field number 3.
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

A spare field.

## 4. Population rules for RLtrcurmk

**Relation Description**

Transsmission Rate Converter Unit path remark.
This relation provide the office personal a way of identifying what and/or where the TRCU path hooks into the transmission world.

Copyright © 1999 Lucent Technologies

**Attribute:**
sm
**Fullname:**
module number
**Attribute Description:**
This attribute uniquely identifies each module with which the office is equipped.
The domain (DMMODULE) of this attribute is unsigned 8 bits, therefore the maximum range is 0 to 255. However, actual range is smaller than that.

**Attribute:**
trcu_pi
**Fullname:**
TRCU path index
**Attribute Description:**
This is the TRCU path index for this SM. If this is a SM values of only 0 and 1 will be found.
For an EXM, for each pair of NLI, a pair of TRCU PATH are created where the trcu_pi coorespond with the NLI numbers.

**Attribute:**
host_rmk
**Fullname:**
Host remark
**Attribute Description:**
This is the remark about where the host TRCU is hooked in the transmission world.

**Attribute:**
remote_rmk
**Fullname:**
Remote remark
**Attribute Description:**
This is the remark about where the remote TRCU is hooked in the transmission world.

**Defines:**

# TREE_BLF

## 1. Description

100s group line distribution tree structure.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 255 |
| expected tuples in relation | 50 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| corcable relation | DBNO |
| trigger function | RTtree_trig |
| insert trigger | DBYES |
| update trigger | DBNO |
| delete trigger | DBYES |
| end of transaction trigger | DBNO |
| permutation type | unperm |

## 3. Field Layout

```
TREE_BLF    relid = 936   DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population rules for RLtree_blf

**Relation Description**

Hundreds Group Line Distribution Tree Structure

For each hundreds group (group of one hundred DNs) that contains DNs that are Busy Lamp Field (BLF) monitored by an ISDN Attendant (ISAT) there must exist an RLtree_blf tuple on the routing module, also known as the Hundreds Group Controller (HGC), keyed by hgid. This tuple contains a list of SMs where the monitored DNs reside.

This relation is used to direct messages from the routing SM for the group of 100 DNs to the SMs where the ports reside which are associated with this group of 100 DNs.

Note: Refer to the population rules of Gltreeablf, Glmodh_blf, Glmodm_blf and Glreplyblf. It is critical to have the proper corresponding value in these global parameters, otherwise the ISDN Attendant (ISAT) Busy Lamp Field (BLF) will not work properly.

**Attribute:**

hgid

**Fullname:**

Hundreds Group Identifier

**Attribute Description:**

Contains the noc, thousand weighted digit, and hundred weighted digit. Used as a key to find the correct RLtree_blf tuple.

Copyright © 1999 Lucent Technologies 

```
        hundred group identifier (hgid) has three sub-fields:

                noc     Normalized Office Code
                        Range: 1 - AVNOCMAX()
                        Default: none

                d4      Thousand weighted digit
                        Range: 0 - 9
                        Default: none

                d3      Hundred weighted digit
                        Range: 0 - 9
                        Default: none

                NOTE: The following example explains how the 'hgid' value
                      is derived.

                For the DN# 220-4321:

                Read RLnoccode to convert nxx to noc.

                For RLnoccode.nxx equal to 220 (Office Code)
                RLnoccode.noc equals 118 (Normalized Office Code)

                        118 = noc
                          4 = digit4 (d4)
                          3 = digit3 (d3)
                          2 = digit2 (d2)
                          1 = digit1 (d1)

                The 'noc', 'd4', and 'd3' will be used to determine
                the 'hgid' value.

                        noc = 118(0x76)
                        shift 2 left            = 0x7600

                        d4 = 4  (0x04)
                        shift 1 left            = 0x0040

                        d3 = 3  (0x03)          = 0x0003

                        hgid = 0x7600 + 0x0040 + 0x0003

                                                = 0x7643
```

**Attribute:**

sm[*]

## 4. Population rules for RLtrmfeats

### Relation Description

Terminal features

List of business and residential customer service (BRCS) constructed features assigned to a BRCS user (a user is defined to be an analog

Copyright © 1999 Lucent Technologies 

terminal, a trunk, or an integrated services digital network (ISDN) user).

Null feature entries contain the following values:

```
fid = 0
mastsw = DBNO
active = DBNO
intratg = DBNO
intraoff = DBNO
interoff = DBNO
pf = DBNO
attndnt = DBNO
ath = DBNO
selcrit = SC_NULL
```

Non-null feature entries must precede null feature entries in the feature list (null feature entries cannot be interspersed among non-null feature entries).

If there is a tuple with a range equal to x then for all tuples range less than x and the other keys the same there are no null feature entries.

**Attribute:**
range
**Fullname:**
Range
**Attribute Description:**
Indicates which group of six feature ID (FID) entries to be accessed.

**Attribute:**
lport
**Fullname:**
Logical port
**Attribute Description:**
Logical port of the user being assigned the BRCS features.

**Attribute:**
lpt_type
**Fullname:**
Logical port type
**Attribute Description:**
Logical port type of the user.

**Attribute:**
feat_cnt
**Fullname:**

Copyright © 1999 Lucent Technologies 

Feature count

**Attribute Description:**

Indicates the number of features assigned.

**Attribute:**

ffcf1

**Fullname:**

Future field feature

**Attribute Description:**

Boolean reserved for future field feature.

**Attribute:**

ffcf[*]

**Fullname:**

Future field feature

**Attribute Description:**

Boolean reserved for future field feature.

**Attribute:**

todid

**Fullname:**

Time of day ID

**Attribute Description:**

Indicates the time of day list identifier assigned to this user.

**Attribute:**

ftent[*]

**Fullname:**

Feature entry

**Attribute Description:**

Each tuple can contain up to six feature entries.

**Attribute:**

ftent[*].fid

**Fullname:**

Feature ID (FID)

**Attribute Description:**

Indicates the constructed FID. If non-zero there must be a tuple in RLfacname with a facid equal to this FID. The class associated with the facid in RLfacname must be equal to FACBRCS.

The following feature types are valid
MFACB, MFACCT, MFARS, MFATH, MFCWT,
MFICM, MFID, MFSC, MFMDR, MFMWY, MFPFA,
MFPUO, MFTOD
MFDISP,
MFACTR

Copyright © 1999 Lucent Technologies 

MFAR, MFAC, MFCOT, MFACSR
MFHI,
MFASI

The following feature types are prohibited from being assigned to Standard BRIs, analog lines sharing their DN with Standard BRI or BFGs containing Standard BRI members:
MFACB,
MFACSR,

If MFDISP is assigned to a standard BRI terminal, the time_date option in RLdisp_cf must be DBNO.

If the feature type is LASS AR (MFAR), and if RLar_opts.filtr_op == DBYES, then a terminal group feature (MFTGR) must also be assigned to the terminal or in its BFG group.

If the feature type is LASS AC (MFAC), and if RLac_opts.filtr_op == DBYES, then a terminal group feature (MFTGR) must also be assigned to the terminal or in its BFG group.

If the feature type is ACBC (MFACB), and if RLacb_opts.filtr_op == DBYES, then a terminal group feature (MFTGR) must also be assigned to the terminal or in its BFG group.

**Attribute:**
ftent[*].mastsw
**Fullname:**
Master switch
**Attribute Description:**
Indicates the on/off status on the master switch for this FID. DBNO indicates the master switch is on.

If port is a pseudo BFG port then mastsw = active = RLbfgmatch.act and the low order 11 bits of port are equal to RLbfgmatch.bfgid.

**Attribute:**
ftent[*].active
**Fullname:**
Feature ID active status
**Attribute Description:**
Indicates the current run status of this FID. DBNO indicates the FID is inactive: DBYES indicates the FID is active.

If RLtrmfeats.port is BFG pseudo-port then, only features with modular feature type of MFCWT

**Copyright © 1999 Lucent Technologies** 

is allowed to be assigned with customer
control options of ACTCD and DCTCD. The
call waiting terminating BFG feature
activation/deactivation is maintained in
RLfc_line.cwt_on.
Call waiting originating BFG feature
activation/deactivation is maintained in
RLfc_line.cwo_on.
NOTE: No more than one call waiting terminating
feature may be assigned.
No more than one call waiting originating
feature may be assigned.

Otherwise,

Features should be assigned as active or inactive
dependent on the status of their activation and
constructed feature and/or template base relation
for the corresponding feature definition according
to these rules.
1) If the actvn field in a feature's feature
definition relation is ACTNONE, or there is no
actvn field in that relation, active can be DBYES
or DBNO. It will usually be DBYES, since the
subscriber will not be able to use customer oriented
recent change (CORC) to activate it. If it is set to
DBNO, recent change will have to be used to activate it.
This also applies to time of day features where
RLtd_cf.act is DBNO.
2) All features with activation of ACTCD or
ACTSCAN and deactivation of DCTAUTO or DCTSCAN
should be assigned inactive.
Active and inactive with DBNO and DBYES respectively
3) All features with ACTCD to activate
and ACTCD to deactivate can be assigned at the
customer's discretion.
Active and inactive with DBNO and DBYES respectively.

**Attribute:**
ftent[*].rasalwd
**Fullname:**
Remote access service (RAS) allowed
**Attribute Description:**
This bit determine if RAS is supported for this feature entry.

For the 5E5 generic, the only feature that can have
this attribute set to DBYES is call forwarding.
This implies:
(fid >> 10 ) equals DMmftype.MFCFW
Because call forwarding is a DN feature (that is, it has an
entry in RLdn_feats), this further implies that this is
ALWAYS DBNO in 5E5.

Copyright © 1999 Lucent Technologies 

In 5E8 the Remote Access to Advanced Service Interface (RASI) special feature can have this attribute set to DBYES if this feature is not in a BFG.
In 5E9 RASI can have this attribute set to DBYES if it is in a BFG also since starting in 5E9 remote access for features in a BFG are allowed.

**Attribute:**
ftent[*].intratg
**Fullname:**
Terminal in the same terminal group
**Attribute Description:**
DBYES - this FID can be selected for calls between terminals in the same terminal group.
DBNO - This FID will not be selected for calls between terminals in the same terminal group. This attribute must be identical to the intratg attribute for this FID in RLfacftdsc(fid).ptyfilt.

**Attribute:**
ftent[*].intraoff
**Fullname:**
Terminals in the same office
**Attribute Description:**
This FID can/cannot be selected for calls between terminals in the same office.

**Attribute:**
ftent[*].interoff
**Fullname:**
Inter-office calls
**Attribute Description:**
This FID can/cannot be selected for inter-office calls.

**Attribute:**
ftent[*].pf
**Fullname:**
Private facility
**Attribute Description:**
This FID can/cannot be selected for private facility calls.

**Attribute:**
ftent[*].attndnt
**Fullname:**
Attendant
**Attribute Description:**
This FID can be selected for attendant calls.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ftent[*].ath
**Fullname:**
Authorization
**Attribute Description:**
DBYES - This feature requires an authorization code for use.
DBNO - This feature does not require an authorization code for use.

For ODA only, if ath = DBYES then the feature defined by the fid attribute must be in the RLath_fcos relation. Default for BFG is DBNO. A subscriber can only be assigned to a BFG if, and only if, the features and authorization codes (ATH) are identical. If the authorization codes do not match, the current feature selection request is rejected.

For the modular feature type of MFDISP and MFACTR RLtrmfeats.ftent[n].ath will equal DBNO.

**Attribute:**
ftent[*].selcrit
**Fullname:**
Selection criteria
**Attribute Description:**
This is the selection criteria for this FID. This field is an enumerated value that must be identical to the selcrit for this fid in RLfacftdsc.p See population rules for the selcrit attribute in RLfacftdsc.P for a complete description

Copyright © 1999 Lucent Technologies 

# TRMFTS_R

## 4. Population rules for RLtscount

### Relation Description

Time slot count.

This relation defines on a per SM basis the number of TSIU network side time slot, ICL time slot, and PIDB/PCT time slot used by Inter-SM nailups, Internal Protocol (IP) nailups, X.75' trunk ports, BRI cut through (such as, D and B channel) nailups, EOC/TMC cut through, Primary Rate Interface (PRI) (such as, EDSL, OSPS interflow) nailups, X.75 trunk ports, X.25 packet switching on a T1 facility (XAT) port nailups , PSU Pipe (PP) nailups, Speech Handler (SH) nailups,

Copyright © 1999 Lucent Technologies 

Signaling Data Link Terminal (ST-DLT) nailups and Remote Protocol Access (RPA) PSU PIDB/PCT time slot allocations.

**Attribute:**
module
**Fullname:**
module.
**Attribute Description:**
SM module number which contains packet switching nailups, CDMA Packet Pipe trunk nailups, CDMA SH trunk nailups or ST-DLTs. This SM must have an RLmodatt.eqstat = SMOPER.
A tuple for a given switching module is required if any TSIU or PSU shelf time slot count for that SM is greater than 0.

The ism_icl and ism_umb were not included in the module attribute's population rules. They are sub-classifications of the ism_tsiu attribute.

**Attribute:**
edsl_tsiu
**Fullname:**
Number of TSIU network time slots occupied by Primary Rate Interface (PRI) and OSPS EDSL D-channel nailups.
**Attribute Description:**
Number of TSIU network side time slots occupied by PRI and OSPS EDSL D-channel nailups on the SM specified in the key, module.

For SM, do the following:

1) This attribute is incremented by two whenever the RLdslgdata.dslg_cnt attribute is incremented, if servclass is FCEDSL, OA_IFOPER, or OA_IFTERM.

2) This attribute is decremented by two whenever the RLdslgdata.dslg_cnt attribute is decremented, if servclass is FCEDSL, OA_IFOPER, or OA_IFTERM.

For an SM-2000, this field is not used and must be zero. PRI and OSPS D-channels can only be nailed-up within an SM or within an SM-2000. However, since the path is intra-SM, the path does not use network side TSIU time slots on an SM-2000.

**Attribute:**
ism_tsiu
**Fullname:**
TSIU network side time slots occupied by ISM.
**Attribute Description:**
Number of TSIU network side time slots occupied by ISM nailups on the SM specified in the key, module.

**Copyright © 1999 Lucent Technologies** 

This attribute is incremented whenever the
RLdslgdata.ism_cnt attribute is incremented.
This attribute is decremented whenever the
RLdslgdata.ism_cnt attribute is decremented.

**Attribute:**
ip_tsiu
**Fullname:**
Number of TSIU network side time slot occupied by IP nailups.
**Attribute Description:**
Number of TSIU network side time slots occupied by IP
nailups on the SM specified in the key, module.

For SM, do the following:

1) This attribute is incremented by two whenever the
RLdslgdata.trk_cnt attribute is incremented.

2) This attribute is decremented by two whenever the
RLdslgdata.trk_cnt attribute is decremented.

For an SM-2000, this field is not used and must be 0.
IPs can only be nailed-up within an SM or within an SM-2000.
Since the path is intra-SM, the path does not use network
side TSIU time slots when this is an SM-2000.

**Attribute:**
x75_tsiu
**Fullname:**
number of TSIU network side time slots occupied by X.75 nailups.
**Attribute Description:**
Number of TSIU network side time slots occupied by X.75
nailups on the SM specified in the key, module.

For SM, do the following:

1) This attribute is incremented by two whenever the
RLdslgdata.x75_cnt attribute is incremented.

2) This attribute is decremented by two whenever the
RLdslgdata.x75_cnt attribute is decremented.

For an SM-2000, this field is not used and must be set to
zero. X.75 trunks can only be nailed-up within an SM or
within an SM-2000. Since the path is intra-SM,
the path does not use network side TSIU time slots when this
is an SM-2000.

**Attribute:**

Copyright © 1999 Lucent Technologies 

x75p_tsiu

**Fullname:**

Number of tsiu network side time slots occupied by X.75' nailups.

**Attribute Description:**

Number of TSIU network side time slots occupied by X.75' nailups on the SM specified in the key, module.

For SM, do the following:

1) This attribute is incremented by two whenever the RLdslgdata.x75p_cnt attribute is incremented.

2) This attribute is decremented by two whenever the RLdslgdata.x75p_cnt attribute is decremented.

For an SM-2000, this field is not used and must be zero. X.75prime trunks can only be nailed-up within an SM or within an SM-2000. Since the path is intra-SM, the path does not use network side TSIU time slots on an SM-2000.

**Attribute:**

bri_tsiu

**Fullname:**

Number of TSIU network side time slots occupied by cut through BRIs. (that is D Chan and B Chan) Note: Not ODBs

**Attribute Description:**

Number of TSIU network side time slots on the SM specified in the key, module.

For SM, do the following:

A) This attribute is incremented by two whenever:

   1) a tuple is populated in RLdslequip for a DSL packet switched B-channel (B-channel port can be determined by keying into RLfc_porttyp with RLdslequip.dsl and the tuple having a port index of 0x0001 or 0x0002) corresponding to a line card with a utype in RLcktdata of SMRISLU or DNU-S (the line card circuit can be found by keying into RLfc_porttyp with RLdslequip.dsl and using the attribute RLfc_porttyp.cktname to access RLcktdata).

   2) a bit is set (1) in RLdgrp_ri.whlgpmask.

B) This attribute is decremented by two whenever:

   1) a tuple is deleted from RLdslequip for a DSL packet switched B-channel (B-channel port can be determined by keying into RLfc_porttyp with RLdslequip.dsl and the tuple having a port index of 0x0001 or 0x0002) corresponding to a line card with a utype in RLcktdata

**Copyright © 1999 Lucent Technologies** 

of SMRISLU or DNU-S(the line card circuit can be found by keying into RLfc_porttyp with RLdslequip.dsl and using the attribute RLfc_porttyp.cktname to access RLcktdata).

2) a bit is cleared (0) in RLdgrp_ri.whlgpmask.

For an SM-2000, this field is not used and must be zero. Since the path is intra-SM, the path does not use network side TSIU time slots on an SM-2000.

**Attribute:**
xat_tsiu
**Fullname:**
XAT nailup TSIU time slot count.
**Attribute Description:**
Number of TSIU network side time slots occupied by XAT nailups on the SM specified in the key, module.

For the SM, do the following:

1) This attribute is incremented by two whenever the RLdslgdata.dslg_cnt attribute is incremented and the RLfc_porttyp.servclass is PSX25_T1.

2) This attribute is decremented by two whenever the RLdslgdata.dslg_cnt attribute is decremented and the RLfc_porttyp.servclass is PSX25_T1.

Note: The RLdslgdata.dslg_cnt attribute is also incremented and decremented when a BRI D or B channel is assigned or unassigned respectively to a DSL group. Therefore, the exact count of TSIU time slots occupied by XAT nailups can be determine by the number of ports in this SM which have a servclass equal to PSX25_T1 and lp_type equal to PCXAT in the RLfc_porttyp relation.

For an SM-2000, this field is not used and must be 0. XATs can only be nailed-up within an SM or within an SM-2000. Since the path is intra-SM, the path does not use network side TSIU time slots on an SM-2000.

**Attribute:**
pp_tsiu
**Fullname:**
Number of TSIU network side time slots occupied by Packet Pipe (PP).
**Attribute Description:**
Number of TSIU network side time slots occupied by Packet Pipe (PP) nailups on this SM. Default is 0.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ccs_tsiu
**Fullname:**
Number of TSIU network side time slots occupied by CCS signaling nailups on this SM.
**Attribute Description:**
Number of TSIU network side time slots occupied by CCS signaling nailups on this SM.

**Attribute:**
ism_umb
**Fullname:**
Number of umbilical time slots occupied by ISM nailups.
**Attribute Description:**
Number of umbilical time slots occupied by ISM nailups on the SM specified in the key, module.

This attribute is incremented when a tuple is added to RLismpath in this SM and one of the following conditions is true.

1) the RLmodatt.imtype for this SM is SM5RSM and the RLmodatt.imtype for RLismpath.mate_sm is NOT SM5RSM.
2) the RLmodatt.imtype for this SM is SM5RSM and the RLmodatt.imtype for the RLismpath.mate_sm is SM5RSM but the RLmodatt.clid attributes of the two RSMs do NOT match (the RSMs are in different clusters).

Populate this attribute with value of 0 if the RLmodatt.imtype for this sm is not SM5RSM.

When a tuple is deleted from RLismpath, the checks mentioned here must be made to determine if this attribute can be decremented.

**Attribute:**
ism_icl
**Fullname:**
Number of TSIU network side time slots occupied by ISM nailups on intra-cluster links.
**Attribute Description:**
Number of TSIU network side time slots occupied by ISM nailups on intra-cluster links (ICLs).

This number is incremented for every tuple added to RLismpath in this SM and the following condition is true.

1) the RLmodatt.imtype for this SM is SM5RSM and the RLmodatt.imtype for the RLismpath.mate_sm is SM5RSM and the RLmodatt.clid attributes of the two RSMs do match (the RSMs are in the same cluster).

**Copyright © 1999 Lucent Technologies** 

Populate this attribute with value of 0 if the RLmodatt.imtype for this sm is not SM5RSM.

This number is decremented for every tuple deleted from RLismpath in this SM and the condition is true.

**Attribute:**
edsl[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by PRI and OSPS EDSL D-channel nailups.
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by PRI and OSPS EDSL D-channel nailups on this SM. Up to 4 PIDBs or 1 PCT link may exist per shelf and the count is accumulated on a per PSU shelf basis with a maximum of 5 shelves, numbered 0 - 4.

For every increment of RLdslgdata.dslg_cnt, one edsl_shlf[] entry must be incremented, if servclass is FC_EDSL, OA_IFOPER, or OA_IFTERM. To determine which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the edsl_shlf[] array.

For every decrement of RLdslgdata.dslg_cnt one of the edsl_shlf[] entries must be decremented, if servclass is FC_EDSL, OA_IFOPER, or OA_IFTERM. To determine which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the edsl_shlf[] array.

**Attribute:**
ism[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by ISM nailups
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by ISM nailups. Up to 4 PIDBs or 1 PCT link may exist per shelf and the count is accumulated on a per PSIU shelf basis with a maximum of 5 shelves, numbered 0 - 4.

For every increment of RLdslgdata.ism_cnt, one ism_shlf[] entry must be incremented. To determine which PSIU shelf a logical PH (that is dsl_group) resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the ism_shlf[] array. Increment

Copyright © 1999 Lucent Technologies 

the appropriate array element.

For every decrement of RLdslgdata.ism_cnt one of the ism_shlf[] entries must be decremented. To determine which PSIU shelf a logical PH (that is dsl_group) resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the ism_shlf[] array. Decrement the appropriate array element.

**Attribute:**
ip[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by IP nailups on this SM.
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by IP nailups. Up to 4 PIDBs or 1 PCT link may exist per shelf and the count is accumulated on a per PSU shelf basis with a maximum of 5 shelves, numbered 0 - 4.

For every increment of RLdslgdata.trk_cnt, one ip_shlf[] entry must be incremented. To determine which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the ip_shlf[] array.

For every decrement of RLdslgdata.trk_cnt one of the ip_shlf[] entries must be decremented. To determine which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the ip_shlf[] array.

**Attribute:**
x75[*]shlf
**Fullname:**
number of PSU PIDB/PCT time slots occupied by X.75 nailups.
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by X.75 nailups. Up to 4 PIDBs or 1 PCT link may exist per PSU shelf and the count is accumulated on a per PSU shelf basis with a maximum of 5 shelves, numbered 0 - 4.

For every increment of RLdslgdata.x75_cnt, one x75_shlf[] entry must be incremented. To determine which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the x75_shlf[] array.

For every decrement of RLdslgdata.x75_cnt one of the x75_shlf[] entries must be decremented. To determine

Copyright © 1999 Lucent Technologies 

which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions): the remaining quotient is the index to the x75_shlf[] array.

**Attribute:**
x75p[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by X.75' nailups.
**Attribute Description:**
Number of PIDB/PCT shelf 0 time slots occupied by X.75' nailups. Up to 4 PIDBs or 1 PCT link may exist per shelf and the count is accumulated on a per PSU shelf basis with a maximum of 5 shelves number 0 - 4.

For every increment/decrement of RLdslgdata.x75p_cnt, one x75p_shlf[] entry must be incremented/decremented. To determine which PSU shelf a dsl_group resides on, divide RLdslgdata.dsl_group by 16: the remaining quotient is the index to the x75p_shlf[] array.

**Attribute:**
bri[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by cut through BRIs.
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by cut through BRIs. Up to 4 PIDBs or 1 PCT link may exist per PSU shelf and the count is accumulated on a per shelf basis with a maximum of 5 shelves, numbered 0 - 4.

**Attribute:**
xat[*]shlf
**Fullname:**
XAT nailup PSU shelf PIDB/PCT time slot count.
**Attribute Description:**
Number of PSU shelf PIDB/PCT time slots occupied by XAT nailups. Up to 4 PIDBs or 1 PCT link may exist per shelf and the count is accumulated on a per PSU shelf basis.

For every increment of RLdslgdata.dslg_cnt, where the servclass is to PSX25_T1 and lp_type is equal to PCXAT in the RLfc_porttyp relation, one edsl_shlf[] entry must be incremented.
To determine which PSU shelf a logical PH (that is dsl_group) resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions), the remaining quotient is the index to the xat_shlf[] array.
Increment the appropriate array element, which in this case is xat_shlf[n].

For every decrement of RLdslgdata.dslg_cnt, where the servclass is

Copyright © 1999 Lucent Technologies 

to PSX25_T1 and lp_type is equal to PCXAT in the RLfc_porttyp relation, one of the edsl_shlf[] entries must be decremented. To determine which PSU shelf a logical PH (that is dsl_group) resides on, divide RLdslgdata.dsl_group by 16 (or shift RLdslgdata.dsl_group right 4 positions), the remaining quotient is the index to the xat_shlf[] array.
Decrement the appropriate array element, wich in this case is xat_shlf[n].

**Attribute:**
rpa[*]shlf
**Fullname:**
Remote Protocol Access PSU PIDB/PCT time slots occupied for this PSU shelf.
**Attribute Description:**
This attribute is used by the Remote Protocol Access feature to keep track of the number of PSU PIDB/PCT time slots that are reserved by RPA BRI monitor sessions on this SM. The count is accumulated on a per PSU/PCT shelf basis and the valid values are 0, 2, 4 or 6. The PSU PIDB/PCT time slots used by RPA are reserved from the available PIDB/PCT time slots on a given PH shelf and are not part of the PSU nail-up time slots. The sum of RLpsiupidb.shts_di0 + RLpsiupidb.shts_di1 + RLpsiupidb.rpa_ts for each PSU shelf must be <= (RLpsiupidb.oper_pidb * 32) or they must be <= 768 time slots in the case where PCT link is used in place of the PIDBs.

**Attribute:**
pp[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by PP nailups.
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by PP nailups on this SM. The count is accumulated on a per PSU shelf basis. Default is 0.

**Attribute:**
sh[*]shlf
**Fullname:**
Number of PSU PIDB/PCT time slots occupied by Speech Handler (SH) nailups.
**Attribute Description:**
Number of PSU PIDB/PCT time slots occupied by SH nailups on this SM. The count is accumulated on a per PSU shelf basis. Default is 0.

**Attribute:**
ccs[*]shlf
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Number of PSU PIDB/PCT time slots occupied by CCS signaling nailups.

**Attribute Description:**

Number of PSU PIDB/PCT time slots occupied by CCS signaling nailups on this SM. The count is accumulated on a per PSU shelf basis.

**Attribute:**

eoctmc[*]shlf

**Fullname:**

Number of PSU PIDB/PCT time slots per shelf count for EOC/TMC cut through.

**Attribute Description:**

Number of PSU PIDB/PCT time slots occupied by EOC/TMC on this SM. The count is accumulated on a per PSU shelf basis.

**Attribute:**

odbmin[*]shlf

**Fullname:**

Minimum number of on demand packet-B (ODB) cut through time slots reserved per shelf.

**Attribute Description:**

Minimum number of on demand packet-B (ODB) time slots reserved on this SM. The count is accumulated on a per PSU shelf basis.

Copyright © 1999 Lucent Technologies

# TSM_BMAP

## 1. Description

This relation provides a bitmap of monitored terminals via the TSM (Telephone Status Monitor and Select) feature and is used by the TM subsystem to refresh lamps after a monitored line initializes.

It shows which TSM_BTN tuples exist for this monitoring port. Each bit is associated with the port. Each bit is associated with the str_param (key into TSM_BTN).

Up to 254 terminals can be monitored by a single terminal, though only 150 will be supported by RC/V in 5e12.1.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 64 |
| expected tuples in relation | 20 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

```
TSM_BMAP    relid = 2782  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population rules for RLtsm_bmap

### Relation Description

Telephone Status Monitor and Select (TSM) bit map.
This relation provides a bitmap of monitored terminals.
It is used by Terminal Maintenance any time the monitoring terminal is initialized. It is used to identify which TSM lamps are being used by the terminal. Each bit in the bitmap represents one stored parameter value. These stored parameter values then provide the keys to the rlTSM_BTN tuples for this monitoring terminal. rlTSM_BTN identifies which port is being monitored by that button/stored parameter.

**Attribute:**
mlport
**Fullname:**
Monitoring port
**Attribute Description:**
This attribute is the key to the relation and identifies the logical port of the monitoring terminal.

**Attribute:**
ebitmap1
**Fullname:**
Monitored bitmap 1
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 1 thru 31 (bit 0 is not used).

**Attribute:**
ebitmap2
**Fullname:**
Monitored bitmap 2
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 32 thru 63.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ebitmap3
**Fullname:**
Monitored bitmap 3
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 64 thru 95.

**Attribute:**
ebitmap4
**Fullname:**
Monitored bitmap 4
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 96 thru 127.

**Attribute:**
ebitmap5
**Fullname:**
Monitored bitmap 5
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 128 thru 159.

**Attribute:**
ebitmap6
**Fullname:**
Monitored bitmap 6
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 160 thru 191.

**Attribute:**
ebitmap7
**Fullname:**
Monitored bitmap 7
**Attribute Description:**
A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 192 thru 223.

**Attribute:**
ebitmap8

**Copyright © 1999 Lucent Technologies** 

**Fullname:**

Monitored bitmap 8

**Attribute Description:**

A bit map representation of the str_param values in use by TSM on this mlport. This 32 bit bitmap identifies str_param 224 thru 253.

## 4. Population rules for RLtsm_btn

**Relation Description**

Telephone Status Monitor and Select (TSM) button

Copyright © 1999 Lucent Technologies

This relation determines the SM, DN, lpt_idx and lpt_type of the monitored terminal from the feature button and cpe_component of the monitoring terminal. The keys into the relation are the lport and stored parameter of the monitoring terminal

**Attribute:**
mlport
**Fullname:**
monitoring port
**Attribute Description:**
This attribute is one of the keys to the relation and identifies the logical port of the monitoring terminal.

**Attribute:**
str_param
**Fullname:**
stored parameter
**Attribute Description:**
This attribute is the one of the keys to the relation and is the stored parameter value. This value is a random number managed and stored internally by Recent Change which maps to the associated TSM feature button for the monitored terminal.

**Attribute:**
cpe_comp
**Fullname:**
CPE component
**Attribute Description:**
This attribute is the CPE component of the monitoring terminal. This attribute, along with the button number of the monitoring terminal, determines the feature button associated with a monitored terminal.

**Attribute:**
button
**Fullname:**
button number
**Attribute Description:**
This attribute is the button number on the monitoring terminal. This attribute, along with the cpe component of the monitoring terminal, determines the feature button associated with a monitored terminal.

**Attribute:**
tsm_dss
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

TSM Direct Station Selection (DSS)

**Attribute Description:**

This attribute determines whether the terminal is allowed to use the TSM button for DSS.

**Attribute:**

elocdn

**Fullname:**

directory number of the monitored port

**Attribute Description:**

This attribute is the directory number of the monitored terminal associated with the TSM feature button of the monitoring terminal.

**Attribute:**

esm

**Fullname:**

SM of the monitored port

**Attribute Description:**

This attribute is the switching module of the monitored terminal that is associated with the TSM feature button of the monitoring terminal.

**Attribute:**

eltm_idx

**Fullname:**

ltm_idx of the monitored terminal

**Attribute Description:**

This attribute is the logical termination index of the monitored terminal associated with the TSM feature button of the monitoring terminal.

**Attribute:**

eltm_type

**Fullname:**

ltm_type of the monitored terminal

**Attribute Description:**

This attribute is the logical termination index of the monitored terminal associated with the TSM feature button of the monitoring terminal.

# TSM_UMAP

## 1. Description

This relation is used only by Recent Change to manage holes in the str_param value of rlBNFEAT for TSM (Telephone Status Monitor and Status). The usemap fields identify which str_param values are being used by this config group so the holes can be reused as TSM buttons are deleted.

The str_pram is only managed internally and is not displayed on the RC view. The str_param is used a key (along with the monitoring lport) to rlTSM_BTN which identifies the monitored DN.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 400 |

## 4. Population rules for RLtsm_umap

### Relation Description

TSM monitored terminal to monitoring terminal
This relation is used only by Recent Change
to manage holes in the str_param value of
rlBNFEAT for TSM (Telephone Status Monitor and Status).
The usemap fields identify which
str_param values are being used by this
config group so the holes can be reused as TSM
buttons are deleted.
The str_pram is only managed internally and is
not displayed on the RC view. The str_param is
used a key (along with the monitoring lport) to
rlTSM_BTN which identifies the monitored DN.

**Attribute:**
config
**Fullname:**
button configuration
**Attribute Description:**
ISDN configuration identifier.
The same as in RLrc_cfgbm.config.
Initially, this number must be assigned sequentially.
Hole-reuse is also implemented.
Must be created and put in RLfacname.facid and
RLfid2name.facid before being assigned to RLis_term.config.

**Attribute:**
usemap1
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 1 thru 31 (bit 0 is not used).

**Attribute:**
usemap2
**Fullname:**
**Attribute Description:**

Copyright © 1999 Lucent Technologies

A bit map representation of the str_param
for str_param 32 thru 63.

**Attribute:**
usemap3
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 64 thru 95.

**Attribute:**
usemap4
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 96 thru 127.

**Attribute:**
usemap5
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 128 thru 159.

**Attribute:**
usemap6
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 160 thru 191.

**Attribute:**
usemap7
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 192 thru 223.

**Attribute:**
usemap8
**Fullname:**
**Attribute Description:**
A bit map representation of the str_param
for str_param 224 thru 253.

# TSMB_G

## 1. Description

The storage relation for RLtsm_tring contains four monterm terminals. This is a child storage relation .

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10000 |
| expected tuples in relation | 500 |
| access type | DBACC_GK |
| memory type | DBPRAM |
| distribution | FPFG |
| relation type | DBSTORAGE |
| ks key store | DBNO |
| foldtype | DBGC31 |
| permutation type | perm |
| gkidxrel - generated key index relation | rlTSMB_I |

## 3. Field Layout

```

# TSMTRING

## 1. Description

This relation Provides relationship between TSM monitored terminals to monitoring terminals.
This relation determines the lports and SMs of terminals that are using TSM to monitor a given terminal. It is used to determine which ports to send messages to when monitored terminal status changes. A terminal can be monitored by up to 32 monitoring terminals.

This is a virtual update relation. The tree diagram 1 depicts the stored structure of virtual relation TSMTRING.

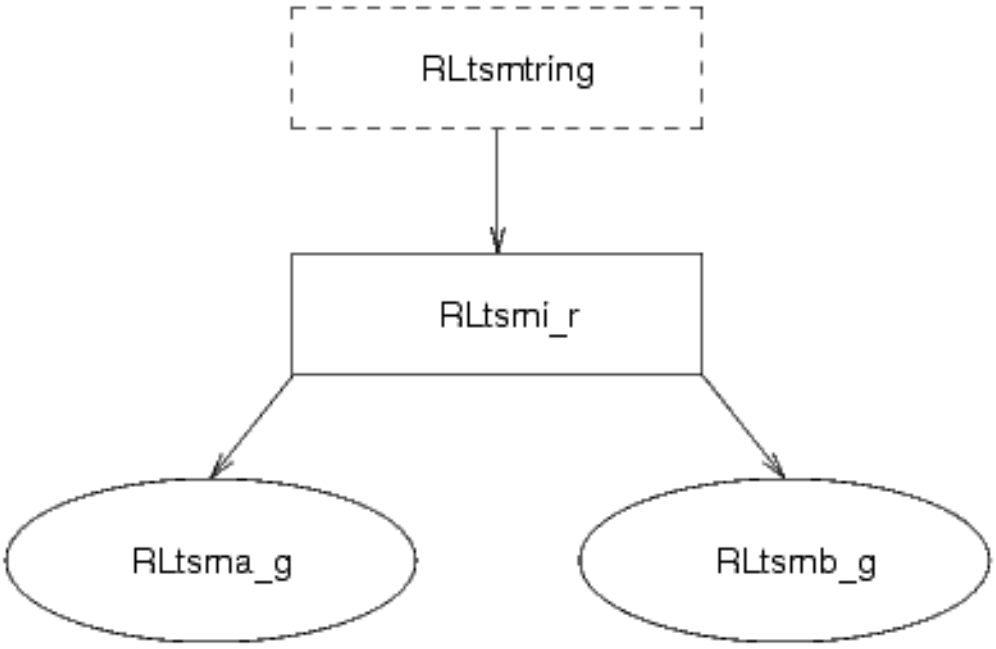

**Figure 1 Stored Structure of Virtual Relation TSMTRING**

## 2. Data Dictionary Values

| | |
|---|---|
| access type | DBACC_OPV |
| distribution | FPFG |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```
TSMTRING    relid = 2774  DBSTATIC   DBACC_OPV   DBNOTODD  FPFG    NULL

## 4. Population Rules for RLtsmtring

**Relation Description** TSM monitored terminal to monitoring terminal

Provides relationship between TSM monitored terminals to monitoring terminals. This relation determines the lports and SMs of terminals that are using TSM to monitor a given terminal. It is used to determine which ports to send messages to when monitored terminal status changes. A terminal can be monitored by up to 32 monitoring terminals.

**Attribute: esm**

**Fullname:** TSM monitored's switching module.

**Attribute Description** This attribute is the monitored's switching module for the Terminal Status Monitoring feature. (key)

**Attribute: eltm_type**

**Fullname:** Logical termination type of the monitored terminal

**Attribute Description** This attribute is the Logical termination type of the monitored terminal (key)

**Attribute: eltm_idx**

**Fullname:** Logical termination index of the monitored terminal

**Attribute Description** This attribute is the Logical termination index of the monitored terminal (key)

**Attribute: msm[*]**

**Fullname:** Monitoring Switching Module

**Attribute Description** This attribute is the switching module number of the monitoring terminals. msm0 thru msm31 must be filled sequentially without gaps.

**Attribute: x_strparm[*]**

**Fullname:** rlBNFEAT Stored Parameter in hex

**Attribute Description** This attribute is the value of the rlBNFEAT str_param that is associated with the monitoring terminals. x_strparm0 thru x_strparm31 must be filled sequentially without gaps.

Copyright © 1999 Lucent Technologies 

**Attribute: count**

**Fullname:** count

**Attribute Description** This attribute is the count of the number of monitoring terminals in this relation. (that is, if the count is 10, then
the attributes msm0 thru msm9,
mtrm0.monterm0 thru mtrm0.monterm3,
mtrm1.monterm0 thru mtrm1.monterm3, and
mtrm2.monterm0 thru mtrm2.monterm1
will have monitoring terminal data.

**Attribute: mtrm[*]**

**Fullname:** monitoring terminal structure

**Attribute Description** This attribute is the monitoring terminal structure that contains the mlport, button, cpe_comp and tsm_ping. The mtrm[*] represents mtrm0 thru mtrm7 and the monterm[*] represents monterm0 thru monterm3. This allows up to 32 monitoring ISDN terminals of a single monitored terminal.

**Attribute: mtrm[*].mlport**

**Fullname:** monitoring terminal logical port number

**Attribute Description** This attribute is the monitoring terminal logical port number

**Attribute: mtrm[*].button**

**Fullname:** monitoring terminal button number

**Attribute Description** This attribute is the button number on the monitoring terminal used to indicate the status of the monitored directory number.

**Attribute: mtrm[*].cpe_comp**

**Fullname:** monitoring terminal Customer Premises Equipment (CPE) component

**Attribute Description** This attribute is the Customer Premises Equipment (CPE) component on the monitoring terminal used to indicate the status of the monitored directory number.

**Attribute: mtrm[*].tsm_ping**

**Fullname:** monitoring terminal ping ring indicator

**Attribute Description** This attribute indicates if a ping ring is heard on the monitoring terminal when the status of the monitored directory changes to ringing.

# TSP2APP

## 1. Description

This relation maps the circuit name of the transport facility it rides on (such as, a PCDS1SFAC in U.S. or a PCT tributary in INTL) to the circuit name of an application (such as, PCRDTDS1 in U.S. and RISLU2 DFI in INTL). RLtsp2app is the inverse mapping of RLapp2tsp. Note that transport facilities used for trunking will have an entry here, but not in RLapp2tsp, since there is no application unit for them.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1008 |
| expected tuples in relation | 337 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | PCtsp2app_trg |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 4. Population Rules for RLtsp2app

**Relation Description** Transport Facility to Application Data

This relation maps the circuit name of the transport facility it rides on to the circuit name of an application. It is the inverse mapping of RLapp2tsp. Note that transport facilities used for trunking (that is, they have the "trunk" application) will have an entry here in RLtsp2app (as do all transport facilities), but will NOT have a corresponding

Copyright © 1999 Lucent Technologies 

entry in RLapp2tsp. This happens because RLapp2tsp is keyed by application circuit name, and there is no application circuit for the trunk application.

**Attribute: tsp_name**
**Fullname:** Transport circuit name

**Attribute Description** (key) circuit name of the transport facility.

**Attribute: app_name**
**Fullname:** Application circuit name

**Attribute Description** Circuit name of the application using the transport facility.

**Attribute: ac_type**
**Fullname:** Application circuit type

**Attribute Description** Circuit type of the application using the transport facility.

**Attribute: app_type**
**Fullname:** Application type

**Attribute Description** Application type of the application using the transport facility.

**Attribute: unitno**
**Fullname:** Application unit number

**Attribute Description** Unit number of the application using the transport facility.

**Attribute: appunit_asgnd**
**Fullname:** Application Unit Assigned Indicator

**Attribute Description** Indicates if this transport has an application unit actually assigned, or is in a "limbo" state. Note that the "app_type" attribute may indicate the type of application to be assigned to this transport (in the near future), even if this attribute indicates it hasn't been assigned yet.

**Attribute: appcntlckt**
**Fullname:** Application Control Circuit name

**Attribute Description** Name of application control circuit subtending to this transport facility (if it exists).

**Attribute: appcntlside**
**Fullname:** Application Control Circuit Side

**Attribute Description** Side (service group number) of the application control circuit subtending to this transport facility (if it exists).

**Attribute: unittype**
**Fullname:** Application unit type

**Attribute Description** Unit type of the application using the transport facility.

## 4. Population Rules for RLtstp2unit

**Relation Description** Configuration Information about Remote Peripherals(RP) that are testable via a particular Test Application Pack

Poprules in this relation apply to RPs such as RAIU.

This relation is modeled after the RLrpsite relation. Each tuple in this relation represents a single Test AP. Each Test AP is associated with a single remote site and a remote site can have up to eight RPs. A remote site may be hosted by several switching modules; also a switching module may host several remote sites.

**Attribute: sitid**

**Fullname:** Logical remote peripheral site number

**Attribute Description** This is the identification number of the set of RPs which comprise the RP site. RP site numbers may range from 500 through 999. This range (see DMRISITID) is defined so as not to conflict with RSM site numbers (the latter are currently restricted to the range 1-174).

**Attribute: remote_unit[*]**

**Fullname:** SM/RP Numbers Of The Nth RP At The Site

**Attribute Description** These remote member attributes are populated so as to identify the RPs at the RP site, in terms of the hosting SM number (1-192) and the RAIU/RISLU unit number. The "circuit0_name" member of each attribute also indicates what type of test equipment (if any) is connected to the Remote Site Test Bus (RSTB) that is connected to COMDAC 0 of the RAIU. The "circuit1_name" indicates the same for COMDAC 1 of the RAIU.

The remote_unit[0-7] attributes may be listed in any order (no correlation with any physical property is implied). Whenever possible, assigned attribute pairs should be consecutive starting with remote_unit0. If holes develop through degrowth, they should be filled when growing the next RISLU/RAIU. The remote_unit[0-7] attributes can be filled in with any combination of RPs.

## 4. Population Rules for RLttf_cnt

**Relation Description** Transmission test functions counts relation.

This relation provides the number of resources available of TTF processor, tone generator, responder, tone detectors, interface, ToucHEXTone test line and DSP's on a per SM basis.

**Attribute: sm**

**Fullname:** Switching Module

**Attribute Description** This attribute is the key into the relation. Thus the data populated in this relation is on a per SM basis.

**Attribute: intf_cnt**

**Fullname:** TTF Interface count

**Attribute Description** The value of this attribute provides the number of TTF interface available on a per SM basis.

**Attribute: tgen_cnt**

**Fullname:** TTF Tone Generator count

**Attribute Description** Value of this attribute provides the number of TTF tone generator available on a per SM basis.

**Attribute: tttl_cnt**

**Fullname:** TTF ToucHEXTone test line count

**Attribute Description** Value of this attribute provides the number of TTF ToucHEXTone test line available on a per SM basis.

**Attribute: tdsp_cnt**

**Fullname:** TTF Tone DSP count

**Attribute Description** Value of this attribute provides the number of TTF tone DSP available on a per SM basis.

**Attribute: dcut_cnt**

**Fullname:** TTF port to circuit under test tone detector count

**Attribute Description** Value of this attribute provides the number of TTF port to circuit under test tone detector available on a per SM basis.

**Attribute: dptc_cnt**

**Fullname:** TTF port to carot tone detector count

**Attribute Description** Value of this attribute provides the number of TTF port to carot tone

Copyright © 1999 Lucent Technologies 

detector available on a per SM basis.

**Attribute: resp_cnt**

**Fullname:** TTF Tone Responder count

**Attribute Description** The value of this attribute provides the number of TTF tone responder available on a per SM basis.

**Attribute: mdsp_cnt**

**Fullname:** TTF Measure DSP count

**Attribute Description** Value of this attribute provides the number of TTF measure DSP available on a per SM basis.

**Attribute: proc_cnt**

**Fullname:** TTF Processor count

**Attribute Description** The value of this attribute provides the number of TTF processor available on a per SM basis.

## 4. Population Rules for RLucnf_ckt

**Relation Description**
Universal conference circuit names.

For GDSU:
Each TN234 3-port conference circuit board generates 2 tuples for this relation. It also generates 6 CKTDATA tuples. Exactly one of the CKTDATA tuples must have CKTDATA.cktbrd = DBYES. This is the CKTDATA tuple corresponding to port 0 on the TN234 board.

Each TN841 3-port conference circuit board generates 5 tuples for this relation. It also generates 15 CKTDATA tuples. Exactly one of the CKTDATA tuples must have CKTDATA.cktbrd = DBYES. This is the CKTDATA tuple corresponding to port 0 on the TN841 board.

RLcktdata.p does the check for one of the previous tuples to equal DBYES. RLcktdata.p also checks for the correct number of tuples in this relation for the corresponding TN board. Therefore, this relation only checks for tuples in RLcktdata corresponding to the circuit attribute, not for the type of TN board they are associated with.

For GDSF:
each 3-port conference leading circuit generates a tuple for this relation.

**Attribute: circuit**

**Fullname:** Circuit name

**Attribute Description** For GDSU: Each TN234 3-port conference circuit board generates 2 tuples

Copyright © 1999 Lucent Technologies 

for this relation. It also generates 6 CKTDATA tuples. Exactly one of the CKTDATA tuples must have CKTDATA.cktbrd = DBYES; this is the CKTDATA tuple corresponding to port 0 on the TN234 board. The LEAD CIRCUIT NAME is the value of the CKTDATA.name attribute for that tuple. The 2 UCNF_CKT tuples for that board will then have

```
ckt_indx = LEAD CIRCUIT CKT_INDX
ckt_indx = LEAD CIRCUIT CKT_INDX + 3
The check for DBYES and for 2 existing tuples for TN234
is done in RLcktdata.p, not here.
```

Each TN841 3-port conference circuit board generates 5 tuples for this relation. It also generates 15 CKTDATA tuples. Exactly one of the CKTDATA tuples must have

```
CKTDATA.cktbrd = DBYES;
```

this is the CKTDATA tuple corresponding to port 0 on the TN841 board. The LEAD CIRCUIT NAME is the value of the CKTDATA.name attribute for that tuple. The 5 UCNF_CKT tuples for that board will then have

```
ckt_indx = LEAD CIRCUIT CKT_INDX
ckt_indx = LEAD CIRCUIT CKT_INDX + 3
ckt_indx = LEAD CIRCUIT CKT_INDX + 6
ckt_indx = LEAD CIRCUIT CKT_INDX + 9
ckt_indx = LEAD CIRCUIT CKT_INDX + 0xc
The check for DBYES and for 5 existing tuples for TN841
IS DONE IN RLcktdata.p, NOT HERE.
```

For GDSF:
One (1) tuple for each 3-port conference leading circuit.

**Attribute: unitnum**

**Fullname:** Unit number

**Attribute Description** Digital Services Unit Number of the GDSU/GDSF containing the circuit.

Copyright © 1999 Lucent Technologies 

# UN_ONRMK

## 1. Description

Remark assoc. with private on network number view. This is a virtual update relation the root storage relation is RLonrmk_r.G The tree diagram Figure 1 depicts the stored structure of virtual relation UN_ONRMK.

## 4. Population Rules for RLun_onrmk

**Relation Description**
Uniform numbering on network remark.

This relation provides access to descriptive remarks associated with an ARS group and an on-network number which has a corresponding off-network number defined.

This relation provides access to descriptive remarks associated with an ARS group, and an on-network number which has a corresponding off-network number defined.

RLun_onrmk is keyed by ar_gpid and onnet_digs.

RLunonoff is keyed by ar_gpid and rnx (the 3-digit prefix of onnet_digs).

RLunon_di is keyed by ar_gpid, previous, and digit and allows digit by digit translation to recognize any substring of onnet_digs.

The following POPULATION RULES apply: For each RLunonoff tuple with non-null ar_gpid, and table values, there must be from 1 - 10 RLunon_di tuples keyed by ar_gpid, previous (alias table), and digit. Each resulting 'set' of RLunon_di tuples which, when traversed (by digit string), terminate at a tuple with null next, and non-null delete, prefix, and dig_pfx fields requires a corresponding RLun_onrmk tuple exist, keyed by ar_gpid, and onnet_digs.

**Copyright © 1999 Lucent Technologies** 

For each RLunonoff tuple with non-null ar_gpid, rnx, but with null table field, there must exist a corresponding RLun_onrmk tuple, keyed by ar_gpid, and onnet_digs.

Keys are obtained from form/view input. The RLun_onrmk rem field is populated with \0 if there are no remarks.

**Attribute: ar_gpid**

**Fullname:** ARS group id

**Attribute Description**This attribute contains the key ARS group identifier.
Circuit switch voice UNP will be used by circuit switch data groups. A circuit switch data group can only be created after a valid circuit switch voice group.

**Attribute: onnet_digs**

**Fullname:** On Network Digits

**Attribute Description** This attribute contains the key of on-network digits which have a public off-network number for this ar_gpid.

**Attribute: rem**

**Fullname:** Remarks

**Attribute Description** This attribute contains a 1 to 16 character remark associated with the incoming digits.

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLuncnflct

**Relation Description**
Digit  Analysis Table for Conflict Resolution.

This is the digit analysis table for conflict resolution.

If an ars customer requires selective destination screening, applied  to a particular conflict digit string, this results in

Copyright © 1999 Lucent Technologies 

a RLuncnflct tuple with 'row' value of either UNAMBIG or UNFINISH, and attribute 'ars_type' value of either UNNORMON, UNNORMOFF, or UNESCPOTS, having its attribute 'conv_indx' value set. This value is a key into RLunsds. The SDS string to be recognized must be longer than the substring which recognized the conflict in RLundtre.

**Attribute: table**

**Fullname:** table identifier

**Attribute Description** Table number from a relation tuple in RLundtre.next.

**Attribute: digits**

**Fullname:** number of digits previously received

**Attribute Description** The count of digits dialed or inpulsed since the last digit analyzed in RLundtre.

```
Range of values: 0 to 17 (since at least 1 digit analyzed)
                 if the IDDD15 secured feature (SFID223) has
                 been purchased and turned on, otherwise 0 to 14.
```

**Attribute: ar_gpid**

**Fullname:** automatic route selection group id

**Attribute Description** Dependencies: Verify that RLfacname has a tuple such that:

```
RLfacname.facid = RLargp.ar_gpid
RLfacname.class = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of a tuple in RLundtre with RLundtre.ar_gpid = RLuncnflct.ar_gpid, and another tuple in relation RLundpinfo with RLundpinfo.ar_gpid = RLuncnflct.ar_gpid.
In addition, no more than 200 ars groups will be defined in ODD (enforced by ODA and RCV mappings).

**Attribute: ars_idx**

**Fullname:** ARS route index

**Attribute Description** Non-null value must be set when ars_type is UNNORMON, UNNORMOFF. All other ars_type require a null ars_idx. There must exist at least one tuple in ARS screening relation with RLarscrn.ars_idx = RLuncnflct.ars_idx for the matching ar_gpid when RLuncnflct.ars_type is UNNORMON, or UNNORMOFF.

**Attribute: un_dpln**

**Fullname:** uniform numbering dialing plan

**Attribute Description**

```
RLundtre.ar_gpid = RLuncnflct.ar_gpid and
RLundtre.un_dpln = RLuncnflct.un_dpln
```

**Attribute: frl**

**Fullname:** facility restriction level associated with dialed digits

**Attribute Description** Facility restriction level associates with off network numbers that do not

Copyright © 1999 Lucent Technologies 

have private destinations.

The use of this attribute FRL values 0 - 16 is valid only if the ars_type is UNESCPOTS. ARFRL_NONUSE (31) must be set for other types of ars_type.

**Attribute: route_type**

**Fullname:** type of route

**Attribute Description** When ars_type is UNNORMON or UNNORMOFF, route_type must be non-null. All other ars_type imply a null route_type.

**Attribute: conv_indx**

**Fullname:** conversion index

**Attribute Description** Conversion index indicates the index number associated with off to on conversion for ars_type of UNOFFON. The generation of the index value for this case is a result of form/view input.

For ars_type UNNORMON, UNNORMOFF, or UNESCPOTS, the index number is associated with selective destination screening. Generation of the index value for this case is derived from an SDS index generator. Refer to RLrc_unidx pop rules for index generation.

The interpretation of conv_indx depends on the `ars_type` and should be null for all other ars_type not listed here.

**Attribute: row**

**Fullname:** type of row entry

**Attribute Description** Indicates the tuple type and is the principal determining factor for the valid values in all other attributes. Range of values: The valid values are the following subset of domain UNROW:

UNAMBIG - - Ambiguous state. Additional digits will be analyzed in the same relation with an incremented digit count if digits are received before time- out (as determined from the critical timing value in the da_timer relation tuple corresponding to the originators characteristics). If no digits are received before time- out, attribute ars_type specifies the call treatment.

UNCONT - - Continue digit analysis in uncnflct with the next digit received.

UNFINISH - - Done with digit analysis. Attribute ars_type determines the call treat- ment.

Null value: None.

**Attribute: ars_type**

**Fullname:** destination type used in PNDP

**Attribute Description** A destination type used to indicate various actions to be taken on receipt of this number of digits. Range of Values: Valid values are the following subset of the UNDSTN domain:

UNNORMON - - on-net number

Copyright © 1999 Lucent Technologies 

UNNORMOFF - - off-net number

UNOFFON - - off-net number with on-net route

UNDARS - - ARS deactivation code

UNESCPOTS - - Escape to Office Dialing Plan

UNULLDST - - null value

Dependencies: See the following chart.

ROW AND ARS_TYPE DEPENDENCIES:

Primary dependencies are based upon the row and ars_type attributes. The following list specifies the only valid combinations of row and ars_type values. Each combination requires non-null values of the attributes as indicated in the list. Unspecified non-key attributes require the null value.

| row | ars_type | Non-null attributes and dependencies within the RLuncnflct tuple |
|---|---|---|
| UNAMBIG | UNNORMON | ars_idx, route_type,<br>conv_indx - optional (for SDS)<br>sdn - optional |
| | UNNORMOFF | ars_idx, route_type,<br>conv_indx - optional (for SDS)<br>sdn - optional |
| | UNESCPOTS | frl - optional,<br>conv_indx - optional (for SDS) |
| | UNOFFON | conv_indx - required<br>sdn - optional |
| | UNFINISH<br>UNOFFON | conv_indx - required<br>sdn - optional |
| | UNNORMON | ars_idx, route_type - required<br>conv_indx - optional (for SDS),<br>sdn - optional |
| | UNNORMOFF | ars_idx, route_type - required,<br>conv_indx - optional (for SDS)<br>sdn - optional |
| | UNESCPOTS | frl - optional,<br>conv_indx - optional, (for SDS)<br>all other attributes are null |
| | UNCONT<br>UNULLDST | |

**Attribute: sdn**

**Fullname:** indicator to identify a software defined network call which route through ARS

**Attribute Description** This field indicates whether incoming dialed digits represents a Software Defined Network call. It should be set to DBYES when incoming digits (RNX) represent a SDN call. This field is needed for this relation because two digit strings (RNXs) may be the same, but the following digits identify a SDN call. (that is, 221 + 7 digit is SDN call, 221 + 10 digit is not a SDN call.)

Copyright © 1999 Lucent Technologies 

DBYES: - Software Defined Network call

DBNO: - not a Software Defined Network call

**Attribute: nodal_56k**

**Fullname:** EOLN 56K data call indicator

**Attribute Description** This field indicates whether the bearer capability of the call shall be changed to 56Kbps data or not. SFID218 must be active before setting this field.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLundpinfo

**Relation Description**
Uniform numbering dialing plan information

This relation contains the Uniform numbering dialing plan information.

**Attribute: ar_gpid**

**Fullname:** Automatic route selection voice group ID.

**Attribute Description** Indicates the ARS group.

Verify that RLfacname has a tuple such that:

```
RLfacname.facid = RLargp.ar_gpid
RLfacname.class = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of a tuple in RLargp keyed by this ar_gpid.

Copyright © 1999 Lucent Technologies

In addition, no more than 200 ARS groups will be defined in the office-dependent database (ODD) (enforced by office data administration [ODA] and recent change [RCV] mappings).

Circuit switch voice uniform numbering plan (UNP) will be used by circuit switch data groups. A circuit switch data group can only be created after a valid circuit switch voice group.

FOR ODA only:
There must be at least one entry in relation RLundtre with same combination of RLundtre.ar_gpid = RLundpinfo.ar_gpid and RLundtre.un_dpln = RLundpinfo.un_dpln.

**Attribute: un_dpln**

**Fullname:** Uniform numbering dialing plan number

**Attribute Description** Uniform numbering dialing plan number.

**Attribute: da_strt**

**Fullname:** Specifies starting digit analysis table

**Attribute Description** Number associated with starting digit in digit analysis relation RLundtre.

Verify existence of tuple in RLundtre keyed by this ar_gpid and RLundtre.previous equal to RLundpinfo.da_strt. This check is performed only by ODA. Note that the da_strt can only occur for a given ar_gpid and un_dpln. No two un_dpln(s) for a given ar_gpid can share the same da_strt.

The value of da_strt is generated internally. Each time a new RLundpinfo tuple is created, a new index value must be generated. Refer to RLundtre and RLrc_unidx pop rules for global information about da_strt index generation.

**Attribute: undp_ert**

**Fullname:** Dialing plan error treatment

**Attribute Description** Indicates the type of error treatment for dialing plan.

If 'undp_ert' is UNANNOUNCE, there must exist a tuple in relation RLargp where RLargp.ar_gpid=RLundpinfo.ar_gpid with non-zero annc_ri attribute.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLundtre

Copyright © 1999 Lucent Technologies

**Relation Description**
Uniform numbering digit analysis table.

This is the Uniform numbering digit analysis table relation.

Background: ARS customers with private digit analysis needs will require tuples in RLundtre. A given customer group may define one or two private dialing plans (to separate off-net and on-net dialing sequences/privileges for example) within this relation. Attributes 'ar_gpid', and 'un_dpln' are keys into RLundpinfo, which provides the initial entry into RLundtre via attribute 'previous'.

**Attribute: ar_gpid**

**Fullname:** Automatic route selection group id

**Attribute Description** Verify that RLfacname has a tuple such that:

```
RLfacname.facid = RLargp.ar_gpid
RLfacname.class = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of a tuple in RLargp with RLargp.ar_gpid = RLundtre.ar_gpid, and verify tuple in relation RLundpinfo with values ar_gpid, and un_dpln which match RLundtre ar_gpid/un_dpln values.

In addition, no more than 200 ars groups will be defined in ODD (enforced by ODA and RCV mappings).

**Attribute: previous**

**Fullname:** table id from previous digit

**Attribute Description** Table number from either the undpinfo relation or from the undtre tuple corresponding to the previous analyzed digit.

**Attribute: digit**

**Fullname:** current digit

**Attribute Description** The current dialed or inpulsed digit. The symbols '*' and '#' can only be used as the first digit, while digits can appear in any position.

**Attribute: conv_indx**

**Fullname:** conversion index

**Attribute Description** Conversion index is associated with off to on conversion when ars_type is UNOFFON. The generation of the index value for this case is a result of form/view input.

Conversion index is associated with a network service code when ars_type is UNNSC. Generation of the index value for this case is derived from an NSC index generator. Refer to RLrc_unidx rules for index generation.

A non-null conversion index with ars_type of UNNORMON, UNNORMOFF, or UNESCPOTS is associated with selective destination screening. A successful SDS form/view request requires that the SDS string be at least one digit longer than the number of digits in the substring recognized in RLundtre or in RLuncnflct.

Copyright © 1999 Lucent Technologies 

Generation of the index value for this case is derived from an SDS index generator. Refer to RLrc_unidx rules for index generation.

Dependencies: The interpretation/generation of conv_indx depends on the ars_type and should be null for all ars_type values not explicitly listed here.

| ARS_TYPE | DEPENDENCY |
|---|---|
| UNNSC - | - There must exist a tuple in relation RLunnsc with RLunnsc.conv_indx = RLundtre.conv_indx |
| UNOFFON - | There must exist a tuple in relation UNOFFON with RLunoffon.conv_indx = RLundtre.conv_indx. |
| - | UNNORMON,UNNORMOFF,UNESCPOTS The conv_indx attribute is optional for these destinations. When non null there must exist a tuple in RLunsds with RLunsds.previous = RLundtre.conv_indx, for given ar_gpid and un_dpln. |

**Attribute: next**

**Fullname:** next table

**Attribute Description** If row is UNCNFLCT, UNTWOCONF or UNRANGE, then the `next` value provides key RLuncnflct.table, and is non-null. There must be a tuple in RLuncnflct keyed by ar_gpid, digits, and table. It is required that RLundtre.un_dpln = RLuncnflct.un_dpln.

If row is UNAMBIG or UNCONT, then the `next` value provides non-null key RLundtre.previous, which along with the next analyzed digit, and ar_gpid, indicates another tuple in RLundtre (there must be such a tuple).

For any other enumerated `row` value, `next` is null.

**Attribute: ars_idx**

**Fullname:** ARS route index

**Attribute Description** Non-null value must be set when `ars_type` is UNNORMON, or UNNORMOFF. For any other ars_type, ars_idx must be null. There must exist at least one tuple in the ARS screening relation with RLarscrn.ars_idx = RLundtre.ars_idx, and with RLarscrn.ar_gpid = RLundtre.ar_gpid. This check is performed by ODA only.

**Attribute: un_dpln**

**Fullname:** uniform numbering dialing plan number

**Attribute Description** An ars group may independently define routing treatment for digit strings in each of its dialing plans. Attributes un_dpln, and ar_gpid key RLundpinfo which in turn must provide a start index value for RLundtre.previous. There must be a tuple in RLundtre keyed by ar_gpid, previous, and initial digit of each digit string.

**Attribute: frl**

**Fullname:** facility restriction level

**Attribute Description** Facility restriction level associates with off network numbers that do not

Copyright © 1999 Lucent Technologies 

have private destination. The use of this attribute's FRL values 0-16 is valid only if the ars_typ is UNESCPOTS. ARFRL_NONUSE (31) value must be set for other types of ars_type.

**Attribute: ars_type**

**Fullname:** ars destination type

**Attribute Description** An ars destination type indicates actions to be taken on receipt of this digit. Valid values are the following subset of the
UNDSTN domain:

UNNORMON - - on-net number

UNNORMOFF - - off-net number

UNNSC - - network service code Note that nsc must be either 1, 2, or 3 digits in length.

UNOFFON - - off-net number with on-net route

UNDARS - - ARS deactivation code

UNESCPOTS - - Escape to Office Dialing Plan

UNULLDST - - default value

UNACLD - - Account Code lead digit This ars_type is associated with one or more characters: the first character is the lead Account Code character; the remaining characters are part of the Account Code (ACCT).

Due to the nature of the *5ESS*®-2000 switch dialing plan, the only restriction placed on the sequence of digits that result in ars_type UNACLD is that it is a unique and unambiguous sequence in the dialing plan. The value for 'nbr digits' entered on the ODA form/RCV view must equal the number of digits entered into 'unincdig' on the form/view.

Whatever the sequence is, the first character dialed is not stored as part of the ACCT.

Also see the row and ars_type dependency chart.

********** A NOTE TO AVOID CONFUSION **********
remaining variables in domain UNDSTN which do not appear (used only for form/view input or in call processing) are: UNCONFLCT, UNINVALID

**Attribute: route_type**

**Fullname:** type of route

**Attribute Description** When ars_type is UNNORMON or UNNORMOFF, route_type must be non-null. All other ars_type imply a null route_type in the RLundtre tuple.

**Attribute: digits**

**Fullname:** number of remaining digits

**Attribute Description** The usage depends upon the value of the row attribute.

**Copyright © 1999 Lucent Technologies** 

If row is UNRANGE, 'digits' indicates the remaining number of digits which will be collected before RLuncnflct is accessed. A tuple must exist in RLuncnflct keyed by 'ar_gpid', 'table', and 'digits'; RLundtre.digits = RLuncnflct.digits. An RLuncnflct tuple must exit for every value of 'digits' in the range less than or equal to the value of RLundtre.maxdigits, where 'maxdigits' is always > 'digits'.

If row is UNCNFLCT, 'digits' is the maximum remaining number of digits which will be collected. RLuncnflct is keyed using RLuncnflct.digits = 0, through RLuncnflct.digits = RLundtre.digits. There must be an RLuncnflct tuple for each value (0-'digits' inclusive).

If row is UNTWOCONF, 'digits' is the smaller of the two valid remaining numbers of digits to analyze in the uncnflct relation. There must be an RLuncnflct tuple keyed by 'digits' and by 'maxdigits'.

If row is UNREMAIN then 'digits' indicates the remaining number of digits to collect (not the total number collected).

For all other 'row' states, 'digits' is null valued.

```
Range of values: 0 to 17 (since at least 1 digit analyzed) if the
                 IDDD15 secured feature (SFID223) has been purchased
                 and turned on, otherwise 0 to 14.
```

**Attribute: maxdigits**

**Fullname:** maximum digits remaining

**Attribute Description** Maximum number of digits remaining to collect. If maxdigits is non-null it must be > digits and digits must be non-null. The usage depends upon the value of the row attribute.

If row is UNRANGE, maxdigits is the maximum remaining number of digits which may be collected. Refer to the description for UNRANGE 'digits'.

If row is UNTWOCONF, maxdigits is the larger of the two valid remaining numbers of digits to analyze in the uncnflct relation.

For all other values of row 'maxdigits' is null.

```
Range of values: 0 to 17 (since at least 1 digit analyzed) if the
                 IDDD15 secured feature (SFID223) has been purchased
                 and turned on, otherwise 0 to 14.
```

**Attribute: row**

**Fullname:** type of row entry

**Attribute Description** Indicates the tuple type and is the principal determining factor for the valid values in all other attributes.
Range of Values: Following subset of domain DMUNROW:

UNAMBIG - - Ambiguous state. Additional digits will be analyzed in RLundtre if received before time-out (as determined from the critical timing value in the da_timer relation tuple corresponding to the originators characteristics). If no digits are received before time- out, attribute ars_type specifies the call treatment.

UNCNFLCT - - Indicates that a code conflict exists among three or more digit strings of non-contiguous lengths. Each quantity of remaining digits from 0 until a time-out (or # dialed) is analyzed in RLuncnflct relation.

Copyright © 1999 Lucent Technologies 

UNCONT - - Continue digit analysis in undtre with the next digit received.

UNREMAIN - - Used when digit analysis is complete but additional digits are to be col- lected without digit analysis.

UNTWOCONF - - Indicates that a code conflict exists which may be resolved by collecting exactly two quantities of additional digits dialed (or inpulsed) and analyzing in RLuncnflct relation.

UNRANGE - - Indicates that a code conflict exists among a contiguous range of quantities of additional digits dialed. Each of the quantities in the range is analyzed in the RLuncnflct relation.

UNFINISH - - Done with digit analysis. Attribute ars_type determines the call treatment.

```
Null value: None.
Dependencies: See the following chart.
ROW AND ARS_TYPE DEPENDENCIES:
------------------------------
```

Primary dependencies are based upon the row and ars_type attributes. The following list specifies the only valid combinations of row and ars_type values. Each combination requires non-null values of the attributes as indicated in the list. Unspecified non-key attributes require the null value.

| row | ars_type | Non-null attributes and dependencies within the RLundtre tuple |
|---|---|---|
| UNAMBIG | UNNSC | conv_indx, next - required<br>sdn - optional |
| | UNNORMON | next, ars_idx, route_type, - required<br>sdn - optional |

| | UNESCPOTS | next, - required, frl - optional,<br>all other attributes are null |
| UNREMAIN | UNNSC | conv_indx, digits - required<br>sdn - optional |
| | UNOFFON | digits, conv_indx - required<br>sdn - optional |
| | UNNORMON | ars_idx, route_type, digits - required<br>conv_indx - optional<br>sdn - optional |
| | UNNORMOFF | ars_idx, route_type, digits - required<br>conv_indx - optional<br>sdn - optionall |
| | UNDARS | digits - required |
| | UNESCPOTS | digits - required ,frl - optional<br>conv_indx - optional |
| UNFINISH | UNNSC | conv_indx -required<br>sdn - optional |
| | UNOFFON | conv_indx - required<br>sdn - optional |
| | UNNORMON | ars_idx, route_type - required<br>sdn - optional |
| | UNNORMOFF | ars_idx, route_type - required |

Copyright © 1999 Lucent Technologies 

```
                              sdn - optional
              UNACLD          all other attributes are null
              UNDARS          all other attributes  are null
              UNESCPOTS       frl - optional,
                              all  other attributes are null
UNCONT        UNULLDST        next - required
UNCNFLCT      UNULLDST        next - required
                              digits  - optional
UNTWOCONF     UNULLDST        next, maxdigits - required
                              digits - optional
UNRANGE       UNULLDST        nex, maxdigits - required
                              digits - optional
```

**Attribute: sdn**

**Fullname:** software defined network indicator

**Attribute Description** This field indicates whether incoming dialed digits is a Software Defined Network through ARS call. It should be set to DBYES when Uniform Numbering Plan number represents SDN RNX.

DBYES: - ARS Software Defined Network.

DBNO: - Not a ARS Software Defined Network

**Attribute: nodal_56k**

**Fullname:** EOLN 56K data call indicator

**Attribute Description** This field indicates whether the bearer capability of the call shall be changed to 56Kbps data or not. SFID218 must be active before setting this field.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLunit_ckt

**Relation Description**
Unit,  unit type, and circuit index to circuit name.

Convert a unit number, unit type and circuit index to their corresponding  circuit name. RLcktdata is keyed by the circuit name. To retrieve information  about a circuit without knowing its logical circuit name, you must calculate (acquire) its circuit index along with its unit type and unit number and retrieve  the corresponding tuple in RLunit_ckt. This will give you the circuit name.  In addition to the attributes in RLunit_ckt, will have access to RLcktdata

Copyright © 1999  Lucent Technologies 

attributes that are not found in RLunit_ckt through a virtual read-only RLunitdata OPVIEW relation by accessing the OPVIEW with the unit number, unit type, and circuit index.

**Attribute: ckt_indx**

**Fullname:** Circuit index for the circuit

**Attribute Description** This is the circuit index that will distinguish the circuit within a unit type on a particular unit number.

**Attribute: utype**

**Fullname:** The unit type

**Attribute Description** This is the type of unit that the circuit is on.

**Attribute: unit**

**Fullname:** unit number

**Attribute Description** The unit number of the unit that the circuit belongs to on the SM.

**Attribute: cktname**

**Fullname:** logical circuit name

**Attribute Description** The circuit name that corresponds the unit number, unit type, and circuit index that were used to key into RLunit_ckt.

**Defines:** "db/DMcircuit.h"

Copyright © 1999 Lucent Technologies 

# UNIT_MH

## 1. Description

This relation maps from peripheral unit to its associated Message Handler (MH) and channel. This relation provides the inverse mapping of RLmh_unit.

## 4. Population Rules for RLunit_mh

**Relation Description**
Peripheral Unit to Message Handler

This relation associates a peripheral unit with a Message Handler. It is the reverse mapping of the RLmh_unit relation. For each entry in RLunit_mh there must be an associated entry in RLmh_unit.

**Attribute: mh_num**

**Fullname:** Message Handler Number

**Attribute Description** This attribute identifies the Message Handler that is equipped in the SM.

**Attribute: channel**

**Fullname:** MH Channel Number

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute identifies the logical channel number in the MH. The range is 0 through 31. Channel 0 is not assigned by RC/V or ODA. It is used in the MH to associate all the unused timeslots.

**Attribute: unittype**

**Fullname:** Peripheral Unit Type

**Attribute Description** They type of peripheral unit that uses the MH channel.

**Attribute: unitnumber**

**Fullname:** unit number

**Attribute Description** The unit number that identifies the peripheral unit.

**Attribute: serv_grp**

**Fullname:** Service Group number

**Attribute Description** Service group of the peripheral unit where the MH is connected.

**Attribute: protocol**

**Fullname:** Protocol

**Attribute Description** Peripheral messaging protocol used on the channel.

**Attribute: mhts_used**

**Fullname:** MH Timeslot Usage Bitmap

**Attribute Description** This attribute is a bitmap containing 32 bits that specifies whether the associated SPYDER-T timeslot is included in the logical channel specified by the "channel" attribute. If the associated bit is 1, then that timeslot is included in the SPYDER-T channel.

## 4. Population Rules for RLunit2mab

**Relation Description**
Information about what type of test equipment is connected to the remote unit.

Poprules in this relation currently apply only to RPs such as RAIU.

**Attribute: unit_no**

**Fullname:** Remote peripheral unit number

**Attribute Description** This identifies the number of remote unit.

**Attribute: unittype**

**Fullname:** Remote peripheral unit type

**Attribute Description** This identifies type of the remote peripheral unit.

**Attribute: mab0_use**

**Fullname:** Metallic Access Bus 0 usage

**Attribute Description** This attribute defines the type of test equipment (if any, and its' respective global circuit name) that is connected to MAB 0 of this remote peripheral unit.

**Attribute: mab1_use**

**Fullname:** Metallic Access Bus 1 usage

**Attribute Description** This attribute defines the type of test equipment (if any, and its' respective global circuit name) that is connected to MAB 1 of this remote peripheral unit.

## 4. Population Rules for RLunit2rdt

**Relation Description**
Maps an internal RT unit number to a Remote Digital Terminal.

This relation maps an internal RT unit number (a sequential number of each TR303 in an SM) to the RT circuit name. Inverse of RLrdt2unit.

**Attribute: rdt_unit**

**Fullname:** Remote Digital Terminal unit number

**Attribute Description** This is an internal RT unit number which is a sequential number assigned to each TR-303 RDT in an SM.

**Attribute: rtname**

**Fullname:** RT circuit name

Copyright © 1999 Lucent Technologies

**Attribute Description** This is an internal circuit name of the RT.

**Attribute: bu_link**

**Fullname:** Back up EOC/TMC data links

**Attribute Description** RDT DS1 which carries the back up EOC/TMC data links.

**Attribute: rtnum**

**Fullname:** RDT number

**Attribute Description** RDT number with respect to the 5ESS peripheral.

**Attribute: tsp_unit**

**Fullname:** Transport facility unit number

**Attribute Description** This is the unit number of the transport facility supporting the application.

**Attribute: tsp_utype**

**Fullname:** Transport facility unit type

**Attribute Description** This is the unit type of the transport facility supporting the application.

## 4. Population Rules for RLunittyp

**Relation Description**
Unit type.

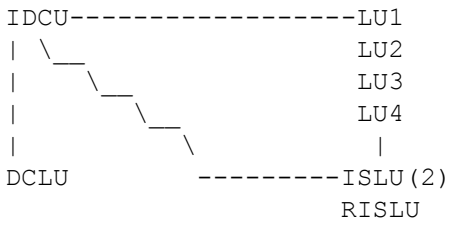
This relation is used to determine what types of line units are served by the given SM.

GENERAL NOTE on line unit numbers:

The following diagram denotes which peripherals must have mutually exclusive unit numbers. Units in the same

Copyright © 1999 Lucent Technologies 

node or in adjacent nodes, that is, nodes connected by a single edge must have distinct unit numbers.



The IDCU resides in both the line unit numbering universe and the DCLU unit numbering universe. Therefore, the IDCU must have a different unit number than any LU, (R)ISLU, ISLU2, or DCLU in the same SM. Also, no LU can have the same unit number as a (R)ISLU and ISLU2. Finally, all units of the same type within an SM must have distinct unit numbers, that is, there cannot be two IDCUs on the same SM with the same unit number.

A DCLU can have the same unit number as an LU, a (R)ISLU, or ISLU2, but cannot have the same unit number as an IDCU.

**Attribute: module**

**Fullname:** Module.

**Attribute Description** SM number.

**Attribute: uclass**

**Fullname:** Unit class.

**Attribute Description** General identification given to like units.

**Attribute: unit**

**Fullname:** Unit number.

**Attribute Description** unit number of the unit on that sm.

**Attribute: utype**

**Fullname:** Unit type.

**Attribute Description** unit type must be one of the following: SMLU, SMDCLU, SMLU3, SMLU4, SMC1LU, SMISLU, SMRISLU, SMISLU2, SMIDCU, SMDLTU, SMDLTU2, SMTU and SMDNU_S. SMNULLUNIT if the 'x' utype pair does not reflect a valid (populated) entry.

## 4. Population Rules for RLunnsc

**Relation Description**
Uniform numbering network service code data.

This relation translates a network service code conversion index to an expanded telephone number.

Background: Network service codes provide an abbreviated code which private dialing plan ARS customers may use to access a variety of services (eg, private operator assistance). A valid network service code is 1, 2, or 3 digits in length.

In order to provide the maximum flexibility possible, an ARS group is allowed to define an NSC conversion

Copyright © 1999 Lucent Technologies

associated with one dialing plan (in RLundtre), and specify that the conversion number obtained from RLunnsc be translated in the other dialing plan defined by the ARS group.

This flexibility produces one caveat. Assume an ARS customer uses RC/V to request deletion of a private dialing plan (say DP1) and there exists a tuple in RLundtre for that ar_gpid, with un_dpln = DP2, which recognizes NSC as the call destination. If the customer has specified that the DP2 network service code expands to a number which is to be analyzed in the deleted DP1 dialing plan, RC/V must fail the transaction to avoid creating a database inconsistency (which if allowed would result in manual action asserts from UNP digit analysis every time the DP2 nsc was dialed!)

ODA note - each RLundtre.conv_idx generated for NSC, associated with a given ar_gpid must map to a unique RLunnsc tuple.

**Attribute: ar_gpid**

**Fullname:** Automatic route selection (ARS) group ID.

**Attribute Description** Indicates the ARS group.
Verify that RLfacname has a tuple such that:

```
RLfacname.facid    = RLargp.ar_gpid
RLfacname.class    = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of a tuple in RLundpinfo keyed by this ar_gpid.

Indicates the ARS group. Circuit Switch Voice UNP will be used by Circuit Switch Data groups. A Circuit Switch Data group can only be created after a valid Circuit Switch Voice group.

In addition, no more than 200 ARS groups will be defined in ODD (enforced by ODA and RC/V mappings).

**Attribute: conv_indx**

**Fullname:** Network service code conversion index number.

**Attribute Description** Indicates the index number associated with this on network service code. There must exist a tuple in RLundtre with
`RLundtre.conv_indx = RLunnsc.conv_indx and`
`RLundtre.ars_type = UNNSC for a given ar_gpid`
The RLundtre.un_dpln and RLunnsc.un_dpln are INDEPENDENT of one another. The former indicates the dialing plan which recognizes the nsc; the latter defines the dialing plan used to analyze the expanded number.

The index value is generated internally for each RLunnsc tuple. The rules for generation are in RLrc_unidx pop rules.

**Attribute: dig_cnt**

**Fullname:** Number of digits in new_dn.

**Attribute Description** A count of the number of digits contained in the expanded NSC TN. Must be set to the number of digits contained in the new_dn attribute.

**Attribute: un_dpln**

**Fullname:** Uniform Numbering dialing plan number.

Copyright © 1999 Lucent Technologies 

**Attribute Description** Uniform Numbering dialing plan number associated with the expanded NSC telephone number. There must be a tuple in RLundpinfo with RLundpinfo.un_dpln = RLunnsc.un_dpln and RLundpinfo.ar_gpid = RLunnsc.ar_gpid.

**Attribute: new_dn**

**Fullname:** Fully expand DN to use.

**Attribute Description** Full expanded telephone number associated with this network service code. Range of values: 0-9 are the only valid digits. The expression can be ('^[0-9]{7,11}$') The position of the new_dn will be left justification. Unused digits should be set to '\0' (Null value). Dependencies: Number of significant digits must be equal to the digit count in the dig_cnt attribute. The new_dn digit string must be defined in RLundtre for this ar_gpid, un_dpln.

## 4. Population Rules for RLunoffon

**Relation Description**
Uniform numbering off network relation.

This relation is used for uniform numbering off network to on network conversion data.Since ar_gpid is a key to this relation, please refer to the distribution rules for group partioned relations described in the relation RLargp.

**Attribute: ar_gpid**

**Fullname:** Automatic Route Selection group ID.

Copyright © 1999 Lucent Technologies

**Attribute Description** Indicates the ARS group. Verify existence of a tuple in RLundpinfo keyed by the ar_gpid and un_dpln contained in this tuple.Circuit switch voice UNP will be used by circuit switch data groups. A circuit switch data group can only be created after a valid circuit switch voice group.In addition, no more than 200 ARS groups will be defined in ODD (enforced by ODA and RC/V mappings).

**Attribute: conv_indx**

**Fullname:** Off to On conversion index number.

**Attribute Description** This attribute indicates the index number associated with this off to on conversion.

```
There must be a tuple in RLundtre with RLundtre.
{_conv_indx = RLunoffon.conv_indx and RLundtre.ars_type
= UNOFFON for a given ar_gpid and un_dpln.
```

**Attribute: dig_pfx**

**Fullname:** 3 to 7 Digits to be prefixed to the Trunk Number

**Attribute Description** Three to seven digits to be prefixed to the Telephone Number. The digit position for dig_pfx should be left justified. Unused digits should be set to '\0' (null value). The expression is:

```
('^[2-9][0-9][0-9]{1,5}$')
RNX(XXXX)
R - any digit 2-9
N - any digit 0-9
X - any digit 0-9
```

**Attribute: dig_dlt**

**Fullname:** Number of digits to be deleted from off net number.

**Attribute Description** This attribute indicates the number of digits to be deleted from an off net number. There must exist at least one tuple in RLundtre, or RLuncnflct (not mutually exclusive) with RLundtre/conflct.conv_indx = RLunoffon.conv_indx and RLundtre/cnflct.ars_type = UNOFFON for a given ARS group. The number of digits collected in RLundtre/RLuncnflct must be greater than or equal to the value of RLunoffon.dig_dlt.

**Attribute: un_dpln**

**Fullname:** Indicates the PNDP which will interpret the converted On Net TN.

**Attribute Description** Indicates which dialing plan to use to interpret the converted on-net number.There must exist at least one tuple in RLundtre, or RLuncnflct (not mutually exclusive) with RLundtre/cnflct.ars_type = UNOFFON and RLundtre/cnflct.conv_indx = RLunoffon.conv_indx for a given ar_gpid.

The RLundtre.un_dpln or RLuncnflct.un_dpln value will be INDEPENDENT of the value of RLunoffon.un_dpln, since the former is the dialing plan in which the off-to-on conversion was recognized, and the latter is the dialing plan in which the on-net conversion will be analyzed.

**Attribute: use_count**

**Fullname:** Number of occurrences of On Net conversion index.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This attribute indicates how many occurrences of this On Net conversion index are in the PNDPs for this ARS group. Since form/view input defines the off-to-on attribute value 'conv_indx' and it is possible to associate that index with more than one RLundtre tuple, a use_count is maintained for RC/V verification during deletions.

A value of 0 indicates that the tuple is eligible for removal, that is NO RLundtre or RLuncnflct tuple refers to this tuple.

The number of RLundtre and RLuncnflct tuples having the attributes ar_gpid and conv_indx must match 'use_count'.

## 4. Population Rules for RLunon_di

**Relation Description**
Uniform Numbering on-network digit interpreter for off-network conversion.

This relation, in conjunction with RLunonoff, is used to convert an on-network TN into the public off-net TN. Typically, the RNX can be used to map to the associated NPA-NXX for the off net TN. This is the translation done

Copyright © 1999 Lucent Technologies 

by relation RLunonoff. However, there are situations when the thousands digit or even the hundreds digit determines the associated NPA-NXX. This occurs when a single RNX is associated with several locations. In this case the relation RLunonoff provides the initial table index into relation RLunon_di. RLunon_di then does digit by digit interpretation until the NPA-NXX can be determined.

**Attribute: ar_gpid**

**Fullname:** Automatic Route group ID.

**Attribute Description** Indicates the Automatic Route group ID. Verify that RLfacname has a tuple such that:

```
RLfacname.facid = RLargp.ar_gpid
RLfacname.class = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of tuple(s) in RLargp keyed by this ar_gpid.

Indicates the automatic route group ID. circuit switch voice UNP will be used by circuit switch data groups. A circuit switch data group can only be created after a valid circuit switch voice group.

In addition, no more than 200 ARS groups will be defined in ODD (enforced by ODA and RC/V mappings).

**Attribute: previous**

**Fullname:** previous digit

**Attribute Description** Table number from either the RLunonoff relation or from the RLunon_di (same relation) tuple corresponding to the previous digit. One of the following must be true:

(1) There must exist a tuple in relation RLunonoff with the RLunonoff.table = RLunon_di.previous.

or

(2) There must exist another tuple in RLunon_di with a 'next' attribute equal this tuple's 'previous'.

**Attribute: digit**

**Fullname:** digit to interpret.

**Attribute Description** The current digit being interpreted.

**Attribute: next**

**Fullname:** next table index.

**Attribute Description** Identifies the next table to interpret the next digit.
A non-null value implies existence of another tuple in this relation with 'previous' equal to this tuple's 'next'. In addition the delete, prefix, and dig_pfx attributes must be null values.

When next is null then delete, prefix, and dig_pfx must be non-null.

The value 'next' is an internally generated index. A digit position in the on-to-off digit string could require up to 10 tuples and defines a table. IF the next digit position is to be analyzed in a given string AND there is no tuple in RLunon_di for that table, THEN generate the index. For index

Copyright © 1999 Lucent Technologies 

generation information refer to RLrc_unidx pop rules.

**Attribute: delete**

**Fullname:** digit to be deleted.

**Attribute Description** Number of digits to be deleted from the On Net telephone number (TN), from the most leftmost digit position.Must be null when 'next' is not null.

**Attribute: prefix**

**Fullname:** number of digits to prefix.

**Attribute Description** Number of digits to be prefixed to build the Of Net TN.

Must be null when 'next' is not null.

**Attribute: dig_pfx**

**Fullname:** the digit string to prefix.

**Attribute Description** Indicates the string of digits to be prefixed to build the Off Net TN. This is a character string of 0 to 11 digits. The digit position of dig_pfx should be left justified. Unused digits should be set to '\0' (Null value).

The expression: ('^[0-9]{0,11}$')

Number of digits determined by prefix.

Must be null when `next` is not null.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLunonoff

**Relation Description**
Uniform numbering on-network to off-network conversion data.

This relation, in conjunction with RLunon_di, is used to convert an on-network TN into the public off-net TN. Typically, the RNX can be used to map to the associated NPA-NXX for the off net TN. This is the translation done by this relation. However, there are situations when the thousands digit or even the hundreds digit determines the

Copyright © 1999 Lucent Technologies

associated NPA-NXX. This occurs when a single RNX is associated with several locations. The relation RLunon_di provides the additional digit interpretation when this situation occurs (see associated population rules).

**Attribute: ar_gpid**

**Fullname:** Automatic Route group ID.

**Attribute Description** Indicates the Automatic Route Selection group.

Verify that RLfacname has a tuple such that:

```
RLfacname.facid    = RLunonoff.ar_gpid
RLfacname.class    = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of tuple(s) in RLargp keyed by this ID.

Circuit Switch Voice UNP will be used by Circuit Switch Data groups. A Circuit Switch Data group can only be created after a valid Circuit Switch Voice group.

In addition, no more than 200 ARS groups will be defined in ODD (enforced by ODA and RC/V mappings).

**Attribute: rnx**

**Fullname:** three digit RNX to be converted.

**Attribute Description** Three digit on net RNX to be converted to the TN.

**Attribute: table**

**Fullname:** Table, index to the digit by digit interpreter.

**Attribute Description** Index into the digit by digit interpreter for on to off conversion. This is populated when the RNX is not sufficient to determine the appropriate off-network TN. If the RNX is sufficient then table is set to the null value and further digit by digit interpretation is not required.

A non-null value implies the existence of at least one tuple in RLunon_di keyed by 'ar_gpid' and 'table' values in this tuple, (RLunonoff.table = RLunon_di.previous).

If 'table' is null then 'delete', 'prefix', and 'dig_pfx' must be non-null in this tuple.

The value 'table' is an internally generated index. The value 'table' is generated when a tuple is placed in RLunonoff which requires interpretation beyond RNX in RLunon_di. Refer to the generation description in RLrc_unidx pop rules.

Note: It is NOT possible to define both an RNX conversion and RNX +X based conversion for a given 'ar_gpid', 'rnx' pair. It is possible to define both an RNX+X and an RNX+Y conversion.

**Attribute: delete**

**Fullname:** digits to delete.

**Attribute Description** Number of digits to be deleted from the On Net TN. Must be null when table is not null.

**Attribute: prefix**

**Fullname:** number of digits to build prefix.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Number of digits to be prefixed to build the Off Net TN. Must be null when table is not null.

**Attribute: dig_pfx**

**Fullname:** digit string to prefix.

**Attribute Description** Indicates the string of 0 to 11 digits to be prefixed to build the Off Net TN which will returned to ARS. The digit position of dig_pfx should be left justified. Unused digit should be set to '\0' (Null value). The expression: (^[0-9]{0,11}$')
Number of digits determined by prefix. Must be null when `table` is not null.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLunsds

**Relation Description**
Uniform numbering selective destination.

Uniform numbering selective destination digit interpreter.

Since ar_gpid is a key to this relation, please refer to the means to define selective routing treatment for a set of dialed numbers. This set of numbers will be a subset of those recognized by RLundtre or RLuncnflct which then collect but don't analyze some number of trailing digits.

Copyright © 1999 Lucent Technologies

This rule is a conditional statement:
IF a digit string of length N is recognized in RLundtre OR RLuncnflct, AND for that string SDS is required for K additional digits which are recognized in RLunsds, THEN give the selective destination routing, ELSE give the standard routing.

added by k7112

Software Defined Network (SDN) is defined in both RLundtre and RLuncnflct.

SDN is not allowed for Selective Destination Screening (SDS), therefore SDN bit is not defined in RLunsds.

**Attribute: ar_gpid**

**Fullname:** Automatic route selection group id.

**Attribute Description** Indicates the Automatic Route selection group.

Verify that RLfacname has a tuple such that:

```
RLfacname.facid = RLargp.ar_gpid
RLfacname.class = FACARS
RLfacname.subclass = SCL_NULL
```

Verify existence of tuple in RLundpinfo keyed by this ar_gpid, and un_dpln pair.

Indicates the Automatic Route selection group. Circuit Switch Voice UNP will be used by Circuit Switch Data groups. A Circuit Switch Data group can only be created after a valid Circuit Switch Voice group.

In addition, no more than 200 ars groups will be defined in ODD (enforced by ODA and RCV mappings).

**Attribute: previous**

**Fullname:** previous digits.

**Attribute Description** Index value conv_indx from the either RLundtre or RLuncnflct tuple: or from the preceding RLunsds tuples next (from the previous digit).

One of the following must be true:

(1) There must exist a tuple in relation RLundtre or in RLuncnflct with:

```
RLundtre/cnflct.conv_indx = RLunsds.previous;
RLundtre/cnflct.un_dpln = RLunsds.un_dpln;
RLundtre/cnflct.ar_gpid = RLunsds.ar_gpid;
              or
```

(2) There must exist another tuple in RLunsds such that RLunsds.previous = RLunsds.next, for this 'ar_gpid' and 'un_dpln' pair.

**Attribute: digit**

**Fullname:** current digit.

**Attribute Description** Indicates the current digit being interpreted. The valid range is from 0 to 9.

**Attribute: next**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** next table to interpret digits.

**Attribute Description** Identifies the next table to interpret the next digit.

A non-null value implies the existence of another tuple in this relation such that:

```
RLunsds.next = RLunsds.previous.
If RLunsds.next != Null then RLunsds.ars_idx, RLunsds.ars_type,
and RLunsds.route_type must be Null.
If RLunsds.next = Null Then
```

(1) RLunsds.ars_type must not be Null.

(2) If RLunsds.ars_type = (UNNORMON or UNNORMOFF) Then RLunsds.ars_idx, and RLunsds.route_type must not be Null.

(3) If RLunsds.ars_type = UNESCPOTS Then RLunsds.ars_idx, and RLunsds.route_type must be Null.

The value 'next' is an internally generated index. A digit position in the selective destination digit string could require up to 10 tuples and defines a table. If the next digit position requires analysis in a given string and there is no tuple in RLunsds for that table, then generate an index. For index generation information refer to RLrc_unidx pop rules.

**Attribute: ars_idx**

**Fullname:** Automatic Route Selection index.

**Attribute Description** ARSindex from 0 (null value) to AVRIMAX().

when not null there must exist a tuple in ARS screening relation with RLarscrn.ars_idx =RLunsds.ars_idx, for this ar_gpid.

This attribute must be null if `next` is not null. If ars_idx is not null then ars_type and route_type must not be Null.

**Attribute: ars_type**

**Fullname:** Automatic Route Selection type.

**Attribute Description** destination type associated with the dialed digits. The only valid values are:

UNNORMON - - on-net number

UNNORMOFF - - off-net number

UNESCPOTS - - Escape to Office Dialing Plan

UNULLDST - - null value

ars_type must be null if next is not null.

```
If ars_type = (UNNORMON or UNNORMOFF) Then
       ars_idx and route_type must Not be Null.
If ars_type = UNESCPOTS Then
       ars_idx and route_type must be Null.
```

Copyright © 1999 Lucent Technologies 

**Attribute: route_type**

**Fullname:** route type.

**Attribute Description** Route type. The valid values are:

(1) UN_MC

(2) UN_MCTRAN

(3) UN_NULL

route_type must be null when next is not null. route_type must not be Null when ars_idx is not Null, and ars_type = (UNNORMON or UNNORMOFF). route_type must be Null when ars_type = UNESCPOTS.

**Attribute: un_dpln**

**Fullname:** Uniform Numbering dialing plan number.

**Attribute Description** Uniform Numbering dialing plan number.

All the associated entries for a given ar_gpid and un_dpln coming from either RLundtre or RLuncnflct with the matched ar_gpid and un_dpln must be consistent in this entry.

As N Since an ar_gpid can have two dialing plans, in such case a tuple in RLunsds can never be shared by the two dialing plans with the same ar_gpid. That is, for the same ar_gpid, each dialing plan has its own digit link list (digit tree) in RLunsds. The two link lists can never merge at a common point.

**Attribute: frl**

**Fullname:** facility restriction level associated with dialed string

**Attribute Description** Facility Restriction Level associated with off-network numbers, that do not have private destination.

The use of this attribute frl, values 0 - 16 is valid only if the ars_type is UNESCPOTS. ARFRL_NONUSE (31) value must be set for other types of ars_type.

**Attribute: nodal_56k**

**Fullname:** EOLN 56K data call indicator

**Attribute Description** This field indicates whether the bearer capability of the call shall be changed to 56Kbps data or not. SFID218 must be active before setting this field.

## 4. Population Rules for RLvaloffc

**Relation Description**
Valid office codes.

Data associated with ISP operator trunks for which the OSPS operator can enter a billing number.

**Attribute: tgroup**

**Fullname:** trunk group number

**Attribute Description** This is populated for those trunk groups where the corresponding tuple in

RLrctgrprk servclass is FC_ISPOPR or FC_OPR_DIOR.

**Attribute: oamap1**

**Fullname:** ONI/ANIF map

**Attribute Description** Valid NXXs bit mapped (recent changeable). The range of the bit map is 000-799, which corresponds to valid NXXs within the 200-999 range. This bit map is comprised of 25 fields, OAMAP1 - OAMAP25. Each field contains information for 32 NXXs. Each bit of the NXX bit string represents a valid NXX (200-999 for all map fields). NXX 200 is represented by bit 0, NXX 201 is represented by bit 1, etc. Bit 0 is the low order bit. Each bit is independently set to either a 0 or 1.

| | | |
|---|---|---|
| OAMAP1 | NXXs | 200-231 |

## 4. Population Rules for RLvpidb_f

**Relation Description**
Virtual PIDB to Facility Number.

This relation associates a Virtual Peripheral Interface Data Bus (VPIDB) with a SONET STS-1 facility. A VPIDB is a structure on a Peripheral Control and Timing (PCT) link. This relation is the reverse mapping of the RLf_vpidb relation. For each entry in RLvpidb_f there must be an associated entry in RLf_vpidb.

**Attribute: unittype**

**Fullname:** Peripheral Unit Type

Copyright © 1999 Lucent Technologies

**Attribute Description** The type of peripheral unit that terminates the facility.

**Attribute: unitnumber**

**Fullname:** unit number

**Attribute Description** The unit number that identifies the peripheral unit.

**Attribute: pct_link**

**Fullname:** peripheral control and timing link number

**Attribute Description** This attribute identifies the relative PCT link number for the peripheral. The range is 0 through 11 with links 0 through 5 being in data group 0 and links 6 through 11 in data group 1. There is only one tuple in this relation for every pair of peripheral links connected to the CDs.

**Attribute: vpidb**

**Fullname:** virtual PIDB number

**Attribute Description** This attribute identifies the structure on the associated PCT link.

**Attribute: sts_num**

**Fullname:** STS-1 Path number

**Attribute Description** This attribute identifies the parent STS-1 path of the specified SONET facility number.

**Attribute: app_type**

**Fullname:** Application type

**Attribute Description** This attribute is the application using the VPIDB on the PCT link. Note that this field is not updateable. In order to change the application type of a tributary it is necessary to delete the tributary and then re-insert it with the desired application.

**Attribute: fac_ckt**

**Fullname:** Facility Circuit

**Attribute Description** This attribute contains the circuit name of the VT1 associated with the VPIDB.

**Attribute: appunit_asgnd**

**Fullname:** Application Unit Assigned Indicator

**Attribute Description** This attribute indicates whether a transport facility with the ability to host a remote application actually has a remote unit assigned, or if it is in the "limbo" state. Note that the "app_type" attribute may indicate the type of application to be assigned to this transport (in the near future), even if this attribute (appunit_asgnd) indicates it hasn't been assigned yet.

**Attribute: sfacno**

**Fullname:** SONET Facility Number

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute identifies the subtending SONET DS1 facility on a STS-1 path.

**Defines:** "db/DMcircuit.h",
"db/DMvpidb.h"

## 4. Population Rules for RLwbtblock

**Relation Description**
Wide Band Trunk block data.

This relation is used to obtain the switching module (SM), bmap, and base_cic for a wideband trunk block. A trunk block is a group of 24 members in a wideband trunk group starting with member 0 or any multiple of 24. This relation will only be populated for wideband trunk groups (which can be integrated services digital network [ISDN] user part 7 [ISUP7] or primary rate interface [PRI] trunk groups).

**Attribute: grpnum**

**Fullname:** Wideband trunk group number

**Attribute Description** This attribute is one of the keys to this relation. It contains the number of the wideband trunk group.

**Attribute: tblock**

**Fullname:** Wideband trunk block

**Attribute Description** This attribute specifies the trunk block number and is one of the keys to this relation. A trunk block is a group of 24 members within a trunk group starting with the first member. For example, trunk group members 0 - 23 belong to trunk block zero. Members 24 - 47 belong to trunk block one. Members 48 - 71 belong to trunk block two and so on. To compute the trunk block number for a given member, divide the member number by 24 using integer division (truncate the remainder).

**Attribute: sm**

**Fullname:** Switching module

**Attribute Description** This attribute represents the switching module which contains the specified trunk group and trunk block.

**Attribute: prigrp**

**Fullname:** PRI group

**Attribute Description** This attribute contains the number of the PRI group which this wideband trunk is part of. All B-channels within a wideband PRI trunk group on this facility must be within the same PRI group. This attribute must be 0 for ISUP trunks.

**Attribute: bmap**

**Fullname:** Trunk member assignment bitmap

**Attribute Description** This attribute represents the bitmap of members that belong to the specified trunk group and trunk block. If a bit is set to zero, the corresponding member is not on the facility. If a bit is set to one, the corresponding member is on the facility. Bit 0 (the least significant bit) corresponds to channel 1 and bit 23 (the most significant bit) corresponds to channel 24.

**Attribute: base_cic**

Copyright © 1999 Lucent Technologies 

**Fullname:** Base channel's circuit identification code

**Attribute Description** This attribute represents the CIC of the base channel. This attribute does not apply to PRI trunk blocks and must be zero.

**Attribute: port[*]**

**Fullname:** Channel Ports

**Attribute Description** This specifies up to 24 channel ports that can be use to make wideband(for example, NxDS0) call.

## 4. Population Rules for RLwtestset

**Relation Description**
This WCTX relation contains the wireless centrex test set data.

This relation provides the wierless test set capability on the WNC.

**Attribute: tn**

**Fullname:** Telephone Number

**Attribute Description** This is the key to the relation and is the TN of the wtestset that is defined.

**Attribute: tsttn**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** The TN of the phone being tested.

**Attribute Description** The telephone number of the subscriber unit (SU) begin tested.

**Attribute: tstport**

**Fullname:** Test Port

**Attribute Description** The analog port of the phone being tested.

**Attribute: state**

**Fullname:** state.

**Attribute Description** Indicates if the wtestset is currently assigned.

**Attribute: endtime**

**Fullname:** end time

**Attribute Description** Indicates when the tsetset state should be changed.

# XAT_PORT

## 1. Description

This relation defines on a per switching module (SM) basis, the number of X.25 packet switching on a T1 facility (XAT) port located on that SM and the port name of each XAT port.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1 |
| access type | DBACC_LIN |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 512 |
| page level | 0 |
| permutation type | un_perm |

## 3. Field Layout

```
XAT_PORT    relid = 1249  DBSTATIC   DBACC_LIN   DBPRAM    FP      NULL

## 4. Population Rules for RLxat_port

**Relation Description**
X.25 Packet Switching on a T1 Facility Port name.

This relation defines on a per Switching Module basis, the number of X.25 packet switching on a T1 facility (XAT) port located on that SM and the port name of each XAT port.

**Attribute: lp_type**

**Fullname:** Logical Port Type.

**Attribute Description** Logical Port type associated with XAT ports.

**Attribute: xat_cnt**

**Fullname:** X.25 Packet Switching on a T1 Facility Port Count.

**Attribute Description** Number of XAT ports located on the SM containing this relation.

When an XAT port is assigned to this SM, then this attribute must be incremented and the port name populated in the xat_port attribute indicated by the xat_cnt.

When an XAT port is unassigned from this SM, then this attribute must be decremented and the xat_port attribute containing the port name being unassigned must be located and overwritten with the port name pointed at by the xat_cnt + 1 attribute (last port name that was populated).

**Attribute: xat[*]port**

**Fullname:** XAT port name

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute indicates that if the attribute is populated, then there are at least the number of XAT ports indicated by the number in the attribute name

**Defines:** "db/DMcircuit.h", "db/DMport.h"

## 4. Population Rules for RLxcvr_ckt

**Relation Description**
Tone transceiver circuit name.

This Population Rule is used by Measurement scanning procedures. The memory engineering of this relation makes use of the fact that the upper 2 bits of the key attribute (circuit) are not used. (For tone transceivers, the upper 3 bits of the circuit name indicate the Control Interface, and currently the only valid values for this are 0 and 1.) If this should ever change, this relation should be re-engineered.

**Attribute: circuit**

**Fullname:** circuit name

Copyright © 1999 Lucent Technologies

**Attribute Description** These circuits can only be provided with DSU2-LDSUF. A maximum of 30 tuples are built for the tone transceivers per LDSUF service group. The circuit names here correspond to those populated in RLcktdata for type=PCT_XCVR.

**Attribute: dummy**

**Fullname:** dummy field
**Attribute Description** Dummy field uses 0.

# XDCTUMTB

## 1. Description

This relation specifies the Metallic Test Busses (MTBs) that are associated with, or connected to, a given DCTUPORT. circuit.

When a PGTC port is wired on the MTB between the DCTU and the MMSU, the 'lodist_pt' field contains the port name of the distribute point which is connected to the HIGH valued resistors controlling the low sleeve current toward the PGTC. Otherwise the 'lodist_pt' is set to GLNULPORT.

## 4. Population rules for RLxdctumtb

**Relation Description**

Connection of specific MTB(s) associated with DCTU

Specifies the Metallic Test Busses (MTBs) that are associated with (connected to) a given DCTU port circuit.

"This relation specifies the Directly Connected Test Unit (DCTU) port circuit (DCTUPORT) that is physically connected to a Metallic Test Bus (MTB) in a Metallic Service Unit (MSU). Up to four MTBs from an MSU service group, one per metallic shelf, can be connected to a single DCTUPORT circuit. The MTBs connect to the DCTU base pack, SN423, which then uses the EAN (equal access network) to connect to the PMU packs, SM248. MTBs are physical tip and ring pairs that are part of the Metallic Access (MA) circuit pack, TN138, in a Modular MSU (MMSU). Besides DCTUPORTs, MTBs connect to analog line units, analog trunk units, Pair Gain Test Controller circuits, and Test Bus Controller Units.

This data is used by Terminal Maintenance operational software when making a DCTU metallic connection. This relation resides currently in the AM/CMP. The DCTU and the MSU(s) that it connects to may or may not be in the same SM. Additional information pertaining to DCTUPORTs or MTBs may be found in population rules for RLcktdata.

In general, the DCTUPORTs should be distributed across MSU service groups in the office. There are no other engineering rules in this regard and no internal cross checks required to support this requirement.

DCTUPORTs must be grown in groups of 4, which correspond to the number of PORTs per PMU.

The maximum tuple size for this relation (currently 64 tuples) should be enough to handle two fully equipped DCTUs in a 5ESS(R)-2000 switch HOST processing entity of up to 120,000 lines (24 DCTUPORTs) and up to ten (10) RSMs (ORMs or TRMs) each connecting a minimally equipped DCTU (4 DCTUPORTs). More DCTUs in RSMs (ORMs or TRMs) can be supported either by increasing maximum tuple size or decreasing the number of DCTUPORTs supporting the HOST 5ESS(R)-2000 switch. Since a 5ESS(R)-2000 switch can support 192 SMs with one DCTU in each SM, the theoretical maximum number of tuples could be:

( 12 DCTUPORTs/DCTU ) x (1 DCTU/SM) x (192 SM/office)

= 2,304 DCTUPORTs/office

OPTIONAL EQUIPMENT:
---

Copyright © 1999 Lucent Technologies 

When a DCTU is used to test a line connected to a Universal-SLC(R) system, a Pair Gain Test Controller (PGTC) is required to achieve metallic bypass.

There are 3 configurations for the PGTC:

1. The PGTC is direct wired on a specific No Test Trunk (located between the testing center and the NTT). The PGTC is controlled via sleeve lead control provided from the testing center over the No Test Trunk sleeve and ground leads.

   No ODD is required to support this configuration and the switch software is not even aware of the existence and use of the PGTC in this manner. It is described here for completeness in documenting PGTC configurations.

2. The PGTC is connected to a pair of MTBs (the first MTB provides the connection toward the DCTU, the second toward the line under test). The PGTC is switched into the connection only when required and is a shared resource used whenever a DCTU connects to a Universal-SLC(R) system.

   Distribute points under 5ESS(R)-2000 switch software control, regulate sleeve lead current to control the PGTC (~12 ma for low current and ~28 ma for high). These distribute points must be equipped sequentially on the same distribute pack (which must be in the same SM as the Metallic Access pack which terminates the MTB of the PGTC).

   Since the PGTC is not directly associated with any specific RLDCTUMTB4 tuple, the 'lodist_pt' field is set to GLNULPORT in this relation's tuple. The 'lodist_pt' attribute of the 'RLPGTC' tuple which represents the PGTC connected to the MSU via MTBs dedicated only to that PGTC. Again, this description is only included for completeness of configurations.

3. The PGTC is direct wired to the DCTU MTB between the DCTU and the MMSU. The PGTC is only activated for DCTU connections to Universal-SLC(R) system lines.

   Distribute points control the PGTC and have the same assignment restrictions (sequential points and location relative to MTB) as configuration 2 above.

   In this configuration, the PGTC is associated with one (and only one) DCTUPORT. Therefore there is no need for an RLPGTC tuple. Instead, the RLDCTUMTB4 tuple for that DCTUPORT will contain the port name of the low distribute point in the attribute 'lodist_pt'. The value of the RLDCTUMTB4 'lodist_pt' attribute should never be GLNULPORT in this case. The high distribute point port name is derived from the low distribute

Copyright © 1999 Lucent Technologies 

point port name using the following algorithm:

Locate the RLFC_PORTTYP tuple for the low distribute point port. Increment the value of the 'port_indx' attribute of that tuple to give the port index of the 'cktname' attribute from RLFC_PORTTYP (which is the circuit name of the DIST pack) and the calculated port index of the high distribute point. The 'port' attribute of the RLCKT_PORT relation is the port name of the high distribute point.

All 3 configurations can exist in the same office simultaneously.

**Attribute:**
dctuid
**Fullname:**
global circuit name of DCTUPORT circuit
**Attribute Description:**
global circuit name of DCTUPORT circuit.

**Attribute Description:**
The set of MTB(s) that connects to the DCTUPORT.
All MTB's which connect to a given DCTUPORT are from a single MSU SG.

**Attribute:**
mtb_idx[*]
**Fullname:**
circuit index/indices of the MSU MTB's connected to the DCTUPORT
**Attribute Description:**
Circuit index of the MTB(s) connected to the DCTUPORT

Copyright © 1999 Lucent Technologies 

**Attribute:**
lodist_pt
**Fullname:**
MSU distribute point wired to HIGH resistor value for PGTC
**Attribute Description:**
The Distribute (DIST) pack that terminates this distribute point must exist in the same MMSU as the MA pack that terminates the DCTU MTB. PC software will construct the portname for the associated 'hidist_pt' based on the requirement that the distribute points are assigned sequentially and are on the same DIST pack.

The high distribute port name is obtained by incrementing the circuit index for 'lodist_pt' found in RLfc_porttyp and then reading RLckt_port using the incremented port index and the 'lodist_pt' circuit name found in RLfc_porttyp.

This field will have an entry in rlFC_PORTTYP with 'servclass' set to TMDSTPGTC.

If there is no PGTC wired to the DCTU MTB, then the value for 'lodist_pt' must be GLNULPORT.

**Attribute:**
msu_sm
**Fullname:**
the SM where the MTB is located.
**Attribute Description:**
the sm where the MTB is located.
All MTB's which connect to a given DCTUPORT are from a single MSU SG.

# XNDLDSL

## 1. Description

Inverse relation to RLDLDSL. This relation maps the external name of an ISDN "data link" digital subscriber line (DSL) to the associated global port name and service class.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 378 |
| expected number of tuples | 6 |
| density | 25 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application | ACDQ |
| relation type | DBSTATIC |

## 3. Field Layout

```
XNDLDSL     relid = 750   DBSTATIC   DBACC_HASH  DBPRAM    LP      ACDQ
     xnamrl      DMXNAMRL     (ushort: 13)     <--- key

## 4. Population Rules for RLxndldsl

**Relation Description**
external name data link ISDN digital subscriber lines.

This relation is needed in a Logical Processor only to provide an efficient mapping from 'data link' DSL external name and servclass to global port.

See RLdldsl relation for more information.

**Attribute: xnamid**

**Fullname:** data link external name ID

Copyright © 1999 Lucent Technologies

**Attribute Description** ID portion of the data link DSL external name. See RLdldsl.xnamid for more information.

**Attribute: xnamrl**

**Fullname:** external name Relative link

**Attribute Description** Relative link portion of the data link DSL. See RLdldsl.xnamrl for more information

**Attribute: servclass**

**Fullname:** Service class

**Attribute Description** Service class of the data link DSL. See RLdldsl.servclass for more information.

**Attribute: gdport**

**Fullname:** gdport

**Attribute Description** Global data link DSL PORT name See RLdldsl.gdport for more info.

**Attribute: gdport.member**

**Fullname:** port member for gdport

**Attribute Description** See gdport.

**Attribute: gdport.module**

**Fullname:** module for gdport

**Attribute Description** See gdport.

**Defines:** "db/DMport.h"

## 4. Population Rules for RLxndsl

**Relation Description**
'Data link' ISDN Digital Subscriber Link.

Relation contains information about 'data link' ISDN digital subscriber lines (DSL)s. The switch personnel are informed of the data link DSL status through MCC displays and alarmed output messages. These features are

Copyright © 1999 Lucent Technologies 

available only for data link DSLs.

Each tuple in this relation represents a 'data link' ISDN DSL. The switch personnel are alerted to problems involving data link DSLs by means of MCC display pages and alarmed tty output messages.

In Generic 5E4, data link DSLs requiring internal to external name conversion are DSLs to application processors (AP)s. The ISDN BRCS AP communication package uses this relation to define the relative DSL data link number for each AP on a specific SM.

The maximum number of data links per AP is sixteen (16) when the AP is on a SM. The maximum number of data links per AP is thirty (30) when the AP is on a SM-2000.

The xnamid will be APn (such as, AP5) while the xnamrl is the relative link (such as, AP5-3 is AP5 relative link 3).

This relation is to be SM Partitioned. Each SM will have only the RLXNDSL tuples for data the link DSLs that it terminates.

An inverse relation for RLXNDSL, named RLDSLXN, also exists."

**Attribute: xnamid**

**Fullname:** ID portion of the data link DSL external name.

**Attribute Description** Data link DSL's are assigned external names in lieu of directory numbers. The external name consists of two parts - an AP number (xnamid) and a relative link (xnamrl) number. AP's hosted by ISDN SM's will have xnamid values between 4 and 99.

For every tuple with servclass PS_APDSL, a corresponding tuple must exist in RLcmapdata, where RLcmapdata.apindex equals xnamid. For a given AP, this relation may have up to 16 tuples (that is, 16 xnamrl) with servclass equal to PS_APDSL and the AP is on an SM. For APs on SM-2000s, this relation may have up to 30 tuples (that is, 30 xnamrl).

The maximum number of tuples per SM with servclass PS_APDSL is sixteen (16). The maximum number of tuples per SM-2000 with servclass PS_APDSL is thirty (30).

**Attribute: xnamrl**

**Fullname:** Relative Link portion of the data link DSL.

**Attribute Description** For an AP with data links (servclass = PS_APDSL), xnamrl can have values between 1 and 16 for SMs and between 1 and 30 for SM-2000s. The number of tuples in this relation will be from 1 to 16 on SMs and 1 to 30 on SM-2000s. The actual number depends upon the number of data links to an AP.

The xnamrl attribute corresponds to a bit position in RLcmapdata.link_map. Thus, if RLcmapdata.apindex = xnamid = 5 and RLcmapdata.link_map has bits 2 and 4 set, this relation will have two tuples: one for AP5-2 and one for AP5-4 (that is, xnamid=5, xnamrl=2 and xnamid=5, xnamrl=4).

**Attribute: servclass**

**Fullname:** Service class of the data link DSL.

**Attribute Description** AP DSL data links will have a servclass of PS_APDSL.

An SM can have from 0 to 16 RLdslxn tuples with servclass PS_APDSL.

Copyright © 1999 Lucent Technologies 

Dependencies (taken, as is, from RLxndsl.P)--RLfc_porttyp: Each port in RLdslxn must also be present in RLfc_porttyp of the SM hosting terminating the data link DSL. The DSL port must be a D-channel port with servclass set to PS_APDSL.

**Attribute: dport**

**Fullname:** D-channel port name of the data link DSL as defined in RLequipdsl and RLdslequip.

**Attribute Description** A tuple must also exist in RLfc_porttyp with a value of dport and servclass of PS_APDSL.

The maximum number of tuples with servclass PS_APDSL is 16 per SM.
The maximum number of tuples with servclass PS_APDSL is 30 per SM-2000.

# DBdphysblks

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| DBdphysblks | LP | DMblockid |

### 1.1 DBdphysblk

Global Office Parameter DBdphysblks

### 1.2 Description:

Gives number of blocks allocated for the disk (1 block = 2K bytes). Initially this parameter will be constant for the generic - set to 2560 for 5E2(1), but may later be used to engineer ODD disk size on per office basis.

There is a DBM dependency requiring that DBdphysblks be aligned on a 16K boundary. The DBGEN tools ensure that this requirement is met.

***Type:*** DBLONGPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBNO

***Classification:*** EQUIPMENT

Global Office Parameter DBmavuodd

### 1.2 Description

Minimum percent of available Unprotected ODD space that must exist before a warning is issued. This value is ODBE updateable. The default is 20 percent of available Unprotected ODD space. When this limit is reached a warning will be issued. Changing this value will set the lower bound at which a warning of limited Unprotected ODD space will be output to the craft. No population rules available.

# Gl_brit

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_brit | FR | DMckttype |

### 1.1 Fullname:

Global Office Parameter Gl_brit

### 1.2 Description:

This office parameter specifies the default type of DSL line card circuit to be assigned in the office. It is used on a DSL assignment (views 23.2 & 23.8), to indicate the subscriber's Network Termination (NT1) type, if a BRI TYPE is not specified on the assignment. This office parameter is provided to help reduce the number of attributes that need to be specified on a DSL assignment.

To function a U-DSL requires a NT1 at the subscribers location to terminate the U interface. With the 5E6(1) software release there are two types of U-DSLs(AMI and ANSI(R) 2B1Q) supported. Since there are now two types it is important to assign a subscriber to a line card (equipment number) with the same type as the subscriber's NT1. If the wrong type is assigned the DSL will not go in service and the subscriber will not get dial tone.

This office parameter may take on one of six values - 5E4 T-card (PCTCARD), 5E4 Phase 1 U-card (PCPUCARD), 5E4 Phase 2 U-card (PCUCARD), 5E6 ANSI(R) Standard U-card (PCU_ANSI), 5E10 U-circuit (PCI2UCKT), or 5E10 T-circuit (PCI2TCKT).

This office parameter can be set by ODA through the ODA Office Option form (5509) and is recent change updatable. There is no default for this global parameter. A type must be specified.

# Gl_cacd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_cacd | LRFR | DMbool |

### 1.1 Fullname:

Global Office Parameter Gl_cacd

### 1.2 Description:

This parameter specifies whether the OSPS Commercial ACD feature is on. DBYES means the feature is on. DBNO means the feature is off.

When this parameter is DBNO, OSPS-ACD code is not entered, so the values of the other OSPS-ACD global parameters don't matter. Changes to the other parameters (with the exception of Glospson) are completely independent of Gl_cacd.

This parameter must be DBNO unless there is at least one ISDN SM in the office. This parameter cannot be set to DBYES if Glospson is set to DBNO.

| Gl_cars | LR | DMcount |

### 1.1 Gl_cars

Global Office Parameter Gl_cars

### 1.2 Description

Number of interconnect carriers in the office that are enabled for measurement collection. RC/V and ODA will enforce measurable carriers to be at a limit of Gl_mx_car, which is defined as a constant value of 500.

When a MEASURABLE carrier is added to or deleted from an office, (that is, a tuple inserted to or deleted from the RLfc_carr or RLfc_fgbcarr relation,) the Gl_cars parameter must be incremented or decremented by 1.

# Gl_cfl

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_cfl | LR | DMcflcnt |

### 1.1 Gl_cfl

Global Office Parameter Gl_cfl

### 1.2 Description

Parameter for the constructed feature limit. The maximum number of additional constructed features which may be defined in the ODD (either via recent change (RC) on the *5ESS*®-2000 switch, or via ODA). The value is an unsigned long integer. If the value is zero, the switch has no feature construction capability. For the 5e2_1 generic the allowable values are 0, 8, 24, 65535.

# Gl_cpe

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_cpe | FR | DMbool |

### 1.1 Gl_cpe

Global Office Parameter Gl_cpe

### 1.2 Description

This parameter is set to DBYES in every SM when the *5ESS*®-2000 switch is configured as customer premises equipment (CPE), which must comply with FCC rules Part 68, 'Harms to the Network'. This is almost always the case when the *5ESS*®-2000 switch is configured as a PBX. When this parameter is set to DBYES, the power level of dial tone generated by the switch is lowered and the loss plan for talking connections is altered. This is done to comply with the FCC requirements. When this parameter is set to DBNO, no digital loss is inserted on line to line connections, and no digital loss is inserted in the path from the line to the trunk on line to trunk connections. By setting Gl_cpe to DBYES, 3dB of digital loss is inserted in each direction on line to line connections. For line to trunk connections, 3dB of digital loss is inserted from the line to the trunk. See RLrc_tktxc.P for the population rules for 'trnktyp' and 'fetlcls'. 2dB of analog loss can be added to these values for each line that has 'els_loss' set to DBYES. See RLfc_portt.P for the population rules for 'els_loss' in the relation RLfc_porttyp. All SMs in a switch must have the same value of Gl_cpe. The value of Gl_cpe must be maintained across offline ODA processes. Gl_cpe replaces the use of Glim7dummy in 5e3(1). When retrofiting from 5e2(2) to 5e3(1), Gl_cpe must be set to DBYES in 5e3(1) only if Glim7dummy was set to 1 (one) in 5e2(2).

# Gl_dfflex

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_dfflex | FP | DMpsuflx |

### 1.1 Gl_dfflex

SM Global Office Parameter Gl_dfflex

### 1.2 Description

Gl_dfflex indicates whether the PSU in that SM contains DF/CF Flex firmware.

- Gl_dfflex equals SMNOFLX: PSU does not have DF/CF Flex on either side 0 or 1.
- Gl_dfflex equals SMSG0FLX: PSU has DF/CF Flex on side 0 only.
- Gl_dfflex equals SMSG1FLX: PSU has DF/CF Flex on side 1 only.
- Gl_dfflex equals SMALLFLX: PSU has DF/CF Flex on both sides 0 and 1.

ODA NOTE:

SMSG0FLX and SMSG1FLX reflect the status of the PSU frame during the conversion and are used by the following subsystems: DG/DN, PC, SMIM, AU, RC/V. When not in conversion, the valid values for Gl_dfflex are SMNOFLX and SMALLFLX.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBALPHA

***SM Initial Value:*** SMALLFLX

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules: NOTE:*** Currently only SMALLFLX is supported, therefore Gl_dfflex should always be populated with SMALLFLX.

***Retrofit Rules:*** None.

***Default Rules:***

```
default = SMALLFLX;
```

***Distribution Rules:***

# Gl_dtuim

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_dtuim | FP | DMcount |

### 1.1 Gl_dtuim

Global Office Parameter Gl_dtuim

### 1.2 Description

Number of digital line and trunk units (DLTU) and DLTU2s in an SM.

This parameter must be assigned the value of either the highest numbered DLTU assigned in the SM, or the highest numbered DLTU2 assigned in the SM (whichever is greater), plus 1.

Examples:

```
If an SM has DLTUs 0,1,2, and 3 assigned,
Gl_dtuim must be set to 4.

If an SM has DLTUs 1,2, and 3 assigned
( but not 0 ), Gl_dtuim must be set to 4.

If an SM has DLTUs 0,1,2,6, and 7 assigned,
Gl_dtuim must be set to 8.

If an SM has DLTUs 0,1,and 2 assigned, and
DLTU2s 5 and 6 assigned, Gl_dtuim must be
set to 7.

If an SM has DLTUs 5,6, and 7 assigned, and
DLTU2s 1 and 2 assigned, Gl_dtuim must be
set to 8.
```

Gl_dtuim does not necessarily represent the actual number of DLTUs on the SM, but in order to report Traffic

Copyright © 1999 Lucent Technologies 

Measurements correctly on DLTUs its value must be set to the highest DLTU/DLTU2 plus 1. This parameter is only used for traffic measurements. However, it can be updated by recent change/verify (RC/V) for growth or degrowth situations.

***Type:*** DBSHORTPAR

# Gl_dus

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_dus | LR | DMshort |

### 1.1 Gl_dus

Global Office Parameter Gl_dus

### 1.2 Description

The number of digital line and trunk units ( DLTU ) and digital line and trunk unit-2s ( DLTU2 ) in the office.

This parameter must be equal to the sum of all the Gl_dtuim parameters from all the SMs in the office. This may be different from the actual count of the number of DLTUs and DLTU2s present. If the value of a Gl_dtuim parameter in an SM is added to or subtracted from, the corresponding amount must be applied ( added or subtracted ) to Gl_dus. This parameter is used only for traffic measurements and must be accurate in order to correctly report measurements for DLTUs. This parameter can also be updated by recent change/verify (RC/V) for growth or degrowth situations.

# Gl_isluz

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_isluz | LR | DMshort |

### 1.1 Gl_isluz

Global Office Parameter Gl_isluz

### 1.2 Description

This parameter indicates the total number of equipped ISLUs and RISLUs with Z cards (0-1536 for 192 SM office) in the office. It should be initially populated, via ODA, with the combined total number of ISLUs and RISLUs with Z cards that exist in an office, otherwise, the default is zero. It must be updated by recent change (RC) when ISLUs or RISLUs with Z cards are grown or de-grown.

# Gl_lims

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_lims | LR | DMcount |

### 1.1 Gl_lims:

Global Office Parameter Gl_lims

### 1.2 Description:

This parameter contains the number of IMs in the office that are neither HIMs or RIMs. This parameter must be updated every time a LIM status changes. The range is from one to Gl_max_ims, subject to the constraint that the sum Gl_lims + Gl_hims + Gl_rims can not be larger than Gl_max_ims, which is the maximum number of IMs allowed in this generic.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 1

# Gl_ltmax

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_ltmax | FP | DMltm_idx |

### 1.1 Gl_ltmax

Global Office Parameter Gl_ltmax

### 1.2 Description

Gl_ltmax is populated from data in the RLis_line static relation. It contains the maximum value of IS_LINE.ltm_idxi from IS_LINE for all tuples which have IS_LINE.lead_module equal to current module. For example if there are four RLis_line tuples on a given SM, and the value of the ltm_idxi attributes are 1, 2, 17, and 4, the value which Gl_ltmax should have is 17. This parameter should exist on all SMs. If there are no RLis_line tuples for this SM, the value of Gl_ltmax should be zero. Supported by none.

***Type:*** DBLONGPAR

# Gl_luim

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_luim | FP | DMcount |

### 1.1 Fullname:

Global Office Parameter Gl_luim

### 1.2 Description:

This global parameter contains the number of analog line units ( LU ) in module.

This parameter must be assigned the value equal to the highest numbered LU plus 1 that is assigned in the SM.
Examples:

```
If an SM has LUs 0,1,2, and 3 assigned,
Gl_luim must be set to 4.
If an SM has LUs 1,2 and 3 (but not 0),
Gl_luim must be set to 4.

If an SM has LUs 0,1,2,6,7 assigned,
Gl_luim must be set to 8.
```

Gl_luim does not necessarily represent the actual number of LUs assigned in the SM but in order to report Traffic Measurements correctly for all LUs, its value has to equal the highest numbered LU plus 1. This parameter is used only by Traffic Measurements, however it can be updated by RC/V for growth or degrowth situations.

# Gl_lus

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_lus | LR | DMcount |

### 1.1 Gl_lus

Global Office Parameter Gl_lus

### 1.2 Description

Number of operational analog line units (LU) in the office.

This parameter must equal a count of all the operational analog line units from all the operational SMs in the office. Therefore, if line units are added (made operational) or removed (made unoperational), in any SM, the corresponding number of line units involved must be applied (added or subtracted) to the Gl_lus parameter.

# Gl_oso

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_oso | LRFR | DMbool |

### 1.1 Gl_oso

Global Office Parameter Gl_oso

### 1.2 Description

This global office parameter indicates whether or not an office is an originating screening office (OSO) for INward wide area telephone service (INWATS) 800 Service calls (dest_type FCOSOIWTS in relation DAPRIMDGT). If the parameter is set to DBYES by the Office database assembler (ODA) or by the office database Editor (ODBE), then 800 Service calls originating on trunks will cause the INWATS network control point (NCP) database to be queried and a 10-digit POTS number will be received in response. Routing of the call is then done based on translation of this number.

# Gl_qgp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_qgp | LRFP | DMshort |

### 1.1 Gl_qgp

Global Office Parameter Gl_qgp (Quad link Gateway Processor)

### 1.2 Description:

This parameter indicates the number of Quad link Gateway Processors (QGPs) in the office. For *5ESS®*-2000 switch release 1, there can be 0 through 4 QGP's in the office.

This parameter is used by QLPS message routing and by Switch Maintenance to determine, using the RLspc relation, the number of operational or growth QGPs in the office.

It is used by UT to determine if the QGP (optional unit) is supported in the office before accepting a UT input message for it.

It is used by diagnostics to derive endpoints for packet sources.

# Gl_sm2k

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_sm2k | LR | DMcount |

### 1.1 Gl_sm2k:

Global Office Parameter Gl_sm2k

### 1.2 Description:

This parameter contains the number of operational SM-2000 SMs in the office. This parameter must be updated every time an SM-2000 status changes within an office.

Note that SM-2000 defines a class of SMs, which is comprised of SM-2000(SMSM2000) and SM2005(SMSM2005).

The SMxxxx without a "dash" is an "altval" used by RCV and ODA.

The (SMSMxxxx) defines the SM's unittype.

Also note that the use of the SM-2000 and SM-2000 names throughout the prl files has not been used consistently, and therefore may be used in such a way that does not correspond to the above definition.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

# Gl_spa

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_spa | LR | DMbool |

### 1.1 Gl_spa

Global Office Parameter Gl_spa

### 1.2 Description

This parameter is used to determine if the special access feature is active or inactive in a *5ESS*®-2000 toll switch office. To be active implies that at least one special access customer is or will be connected to the *5ESS*®-2000 toll switch. A special access customer is one who has their PBX (digital or analog) directly connected to the DLTU of a *5ESS*®-2000 toll switch.

The default value DBNO indicates that there is no connected special access customers; therefore, the special access feature is inactive. The value DBYES indicates that there is at least one connected (or will be) special access customer; therefore, the special access feature is active.

Before special access TG member information can be added using RC view 5.5, Gl_spa must be set to DBYES. This includes TG members with a service class equal to FC_SPAWATS, FC_SPAMEG, FC_SPAB800 or FC_SPAM800. TG, billing, band screening and exempt NXX information can be added regardless of the value in Gl_spa.

Gl_spa has no affect on special access call processing.

When Gl_spa is set to DBNO, special access TRFC30 measurements will be automatically inhibited for collection and output to the ROP. When Gl_spa is set to DBYES, special access TRFC30 measurements will be allowed for collection and output to the ROP unless the special access section (Section 98 of TRFC30) has been inhibited.

# Gl_tinsp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_tinsp | FR | DMushort |

### 1.1 Gl_tinsp

Global Parameter timer for inspect

### 1.2 Description

This parameter specifies the length of time (in seconds) that a user has, after initial depression of the Inspect feature button, to select another button or call appearance for inspection. The timer starts when the user presses the Inspect button and stops either when the timer expires or the user presses another feature button or call appearance. The timer is to accommodate a range of values from 1 to 10 seconds, in 1 second increments with a default value of 3 seconds. This global must have a non-zero value greater than or equal to 1.

# Gl_tuim

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_tuim | FP | DMcount |

### 1.1 Gl_tuim

Global Office Parameter Gl_tuim

### 1.2 Description

The number of analog trunk units (TU) assigned to the SM.

This parameter must be assigned the value equal to the highest numbered TU plus 1.

Examples:

If an SM has TUs 0,1,2 and 3 assigned, Gl_tuim must be set to 4.
If an SM has TUs 1,2, and 3 assigned ( but not TU 0 ), Gl_tuim must be set to 4.
If an SM has TUs 0,1,2,6, and 7 asigned, Gl_tuim must be set to 8.

Gl_tuim does not necessarily represent the actual number of TUs assigned on the SM but in order to report traffic measurements correctly on all TUs, its value must equal the highest numbered TU plus 1. This parameter is used only by traffic measurements, however it can be updated by recent change/verify (RC/V) for growth or degrowth situations.

***Type:*** DBSHORTPAR

# Gl_tus

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl_tus | LR | DMcount |

### 1.1 Gl_tus

Global Office Parameter Gl_tus

### 1.2 Description

The count of the total number of analog trunk units (TU) in the office.

This parameter must be equal to the sum of all the Gl_tuim parameters in all the SMs in the office. This may be different from the actual count of the TUs that are actually present. If the value of a Gl_tuim parameter in an SM is added to or subtracted from, the corresponding amount must be applied ( added or subtracted ) to Gl_tus. This parameter is only used by traffic measurements, however it can be updated by recent change/verify (RC/V) for a growth or degrowth situation.

# Gl1accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl1accskey | FP | DMoah32 |

### 1.1 Gl1accskey

Global Office Parameter Gl1accskey

### 1.2 Description

Gl1accskey is specified in hex. This parameter, in conjunction with four others: Gl2accskey, Gl3accskey, Gl4accskey, and Gl5accskey, is the means by which values of the 'accsdb_key' attribute located in the LPRT_ACCS static relation are to be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available.

This global only should be populated on SM's having at least one tuple with servclass = FC_RAFDTA in the RLfc_porttyp relation.

***NOTE:*** This assumes that the OSPS ACCS feature is the only user of the FC_RAFDTA servclass. On those SM's where at least one of the FC_RAFDTA tuples do not exist, this global should contain a value of 0.

At SM initialization, upon the initialization of the LPRT_ACCS relation, this parameter will be updated by ODA to indicate which of the available 'accsdb_key' values are in use. This is done on a 'per' SM basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_ACCS, which contains the information needed to populate the global), and, depending on the VALUE of the accsdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_ACCS is read, and the value of the accsdb_key attribute is 31, then the 31st bit (when referenced from the low-order to the high-order bit) will be turned on (set to 1). If the next RLLPRT_ACCS tuple contains an accsdb_key value of 1, then the bit which represents this value, (or the 1st bit (lowest order bit)), will be turned on (set to 1). If these two tuples were the only tuples in LPRT_ACCS, then, after the Gl1accskey was populated, it would look like this:

```
    32.............................1

    ---------------------------------

    |01000000000000000000000000000001|

    ---------------------------------

      ^                             ^

      |                             |

(31st bit on)                 (1st bit on)
```

***NOTE:*** The above is simply an example. The order of the accsdb_key values is not necessarily 31 and then 1, nor is it fixed or sequential. Its only requirement is to be a unique number between the range of 1-160. This is indicated in the RLlprtaccs.P poprules.

The range of 'accsdb_key' values is 1-160. Each bit in this parameter (Gl1accskey) will represent accsdb_key

Copyright © 1999 Lucent Technologies 

values of 1-32. For example, the lowest-order bit of this parameter will represent accsdb_key 1. The highest-order bit will represent accsdb_key 32.

As there are only 32 bits in this global, and a possibility of 1-160 accsdb_key values, only the VALUES 1-32 are handled by this global. The other values are handled by the next globals: Gl2accskey, Gl3accskey, Gl4accskey, and Gl5accskey.

When the LPRT_ACCS relation is updated by recent change/verify (RC/V), RC/V will get the next available value of the accsdb_key attribute by reading this global parameter (Gl1accskey), and, if necessary, the next four (Gl2accskey, Gl3accskey, Gl4accskey, and Gl5accskey). The first 0 bit (from low-order to high-order bits) will be the first available accsdb_key value, and its position will be its value. If all the bits in this global are turned on, then RC/V will read Gl2accskey in the same order, and so on until a zero bit is found.

In the case of a deletion, RC/V will update this global to indicate the availability of that particular accsdb_key value. The availability of the accsdb_key value will be indicated by turning the appropriate bit in the global off (setting it to zero).

This global does not appear on a RC/V view.

# Gl1arpl

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl1arpl | LR | DMbool |

### 1.1 Gl1arpl

Global Office Parameter Gl1arpl

### 1.2 Description

This parameter is used to activate the pseudo point code feature. The pseudo point code feature should be activated during precutover testing of ISUP7 trunks where a *5ESS* ®-2000 switch is replacing a 1AESS switch which has operational ISUP7 trunks. The *5ESS*®-2000 switch has been assigned a pseudo point code that will be replaced by the actual 1AESS point code when actual switch replacement occurs.

A value of DBNO means that the feature is turned off. A value of DBYES means that the Pseudo Point Code Feature is active. When this feature is active, the software will apply pseudo point code processing to both incoming and outgoing ISUP7 trunk signaling messages.

This parameter is only updatable using ODBE since its value is only changed during a precutover testing interval. Refer to 1AESS switch replacement procedure documentation before turning on this feature.

This parameter is replacing the old dummy parameter, Glcp2dummy which was used in the 5E5 generic.

# Gl1poskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl1poskey | FP | DMoah32 |

### 1.1 Gl1poskey

Global Office Parameter Gl1poskey

### 1.2 Description:

This parameter, in conjunction with six others: Gl2poskey, Gl3poskey, Gl4poskey, is the means by which Gl5posk, Gl6posk, and Gl7posk values of the 'posdb_key' attribute located in the LPRT_POS and POS_LPRT static relations will be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available. Gl1poskey is specified in hex.

This global should only be populated on SM's where the osps_sm attribute in RLmodatt is set to DBYES. On those SM's where the osps_sm attribute is set to DBNO, this global should contain a value of 0.

At SM initialization, upon the initializaton of the LPRT_POS and POS_LPRT relations, this parameter will be updated by ODA to indicate which of the available 'posdb_key' values are in use. This is done on a 'per' SM basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_POS (or RLPOS_LPRT, as these two relations are dependent upon each other, and both contain the information needed to populate the global), and, depending on the VALUE of the posdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_POS is read, and the value of the posdb_key attribute is 31, then the 31st bit (when referenced from the low-order to the high-order bit) will be turned on (set to 1). If, then, the next RLLPRT_POS tuple contains a posdb_key value of 1, then the bit which represents this value, (or the 1st bit (lowest order bit)), will be turned on (set to 1). If these two tuples were the only tuples in LPRT_POS, then, after the Gl1poskey was populated, it would look like this:

```
    32.............................1

    ---------------------------------

    |01000000000000000000000000000001|

    ---------------------------------

      ^                             ^

      |                             |

(31st bit on)                 (1st bit on)
```

***NOTE:*** The above is simply an example. The order of the posdb_key values is not necessarily 31 and then 1, nor is it fixed or sequential. It's only requirement is to be a number between the range of 1-200. This is indicated in the RLlprt_pos.P poprules as well as in the RLpos_lprt.P poprules.

The range of 'posdb_key' values is 1-200. Each bit in this parameter (Gl1poskey) will represent posdb_key values of 1-32. For example, the lowest-order bit of this parameter will represent posdb_key 1. The highest-order bit will represent posdb_key 32.

Copyright © 1999 Lucent Technologies 

As there are only 32 bits in this global, and a possiblity of 1-200 posdb_key values, only the VALUES 1-32 are handled by this global. The other values are handled by the globals: Gl2poskey, Gl3poskey, and Gl4poskey, Gl5posk, Gl6posk, and Gl7posk.

When the LPRT_POS or POS_LPRT relations are updated by recent change/verify (RC/V), RC/V will get the next available value of the posdb_key attribute by reading this global parameter (Gl1poskey), and, if necessary, the next six (Gl2poskey, Gl3poskey, Gl4poskey, Gl5posk, Gl6posk, and Gl7posk). The first 0 bit (from low-order to high-order bits) will be the first available posdb_key value, and its position will be its value. If all the bits in this global are turned on, then RC/V will read Gl2poskey in the same order, and so on until a zero bit is found.

In the case of a deletion, RC/V will update this global to indicate the availability of that particular posdb_key value. The availability of the posdb_key value will be indicated by turning the appropriate bit in the global off (setting it to zero).

This global does not appear on a RC/V view.

# Gl2accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl2accskey | FP | DMoah32 |

### 1.1 Gl2accskey

Global Office Parameter Gl2accskey

### 1.2 Description

This global parameter, in conjunction with four others: Gl1accskey, Gl3accskey, Gl4accskey, and Gl5accskey, is the means by which values of the 'accsdb_key' attribute located in the LPRT_ACCS static relation are to be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available. Gl2accskey is specified in hex.

This global only should be populated on SM's having at least one tuple with servclass = FC_RAFDTA in the RLfc_porttyp relation.

***NOTE:*** This assumes that the OSPS ACCS feature is the only user of the FC_RAFDTA servclass. On those SM's where at least one of the FC_RAFDTA tuples do not exist, this global should contain a value of 0.

At SM initialization, upon the initialization of the LPRT_ACCS relation, this parameter will be updated by ODA to indicate which of the available 'accsdb_key' values are in use. This is done on a 'per' SM basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_ACCS, which contains the information needed to populate the global), and, depending on the VALUE of the accsdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_ACCS is read, and the value of the accsdb_key attribute is 43, then the 43rd bit (when referenced from the low-order to the high-order bit) will be turned on (set to 1). If the next RLLPRT_ACCS tuple contains an accsdb_key value of 61, then the bit which represents this value, (or the 61st bit (lowest order bit)), will be turned on (set to 1). If the next tuple contains an accsdb_key of 3, then the 3rd bit in the Gl1accskey variable (because that is the global variable which represents values 1-32) would be turned on. If these three tuples were the only tuples in LPRT_ACCS, then, after the Gl2accskey was populated, it would look like this:

```
64.............................33

---------------------------------

|00010000000000000000010000000000|

---------------------------------

   /|\               /|\

    |                 |

(61st bit on)       (43rd bit on)
```

***NOTE:*** The previous is simply an example. The order of the accsdb_key values is not necessarily as suggested, nor is it fixed or sequential. Its only requirement is to be a unique number between the range of 1-160. This is indicated in the RLlprtaccs.P poprules.

Copyright © 1999 Lucent Technologies 

The range of 'accsdb_key' values is 1-160. Each bit in this parameter (Gl2accskey) will represent accsdb_key values of 33-64. For example, the lowest-order bit of this parameter will represent accsdb_key 33. The highest-order bit will represent accsdb_key 64.

As there are only 32 bits in this global, and a possibility of 1-160 accsdb_key values, only the VALUES 33-64 are handled by this global. The other values are handled by the other four globals: Gl1accskey, Gl3accskey, Gl4accskey, and Gl5accskey.

When the LPRT_ACCS relation is updated by RC/V, RC/V will get the next available value of the accsdb_key attribute by first reading the Gl1accskey parameter, and, if necessary, this parameter (Gl2accskey) and the next three (Gl3accskey, Gl4accskey, and Gl5accskey). The first 0 bit (from low-order to high-order bits) will be the first available accsdb_key value and its position will be its value. If all the bits in this global are turned on, then RC/V will read Gl3accskey in the same order, and so on until a zero bit is found.

In the case of a deletion, RC/V will update this global to indicate the availability of that particular accsdb_key value. The availability of the accsdb_key value will be indicated by turning the appropriate bit in the global off (setting it to zero).

This global does NOT appear on a RC/V view.

# Gl2pani

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl2pani | FP | DMbool |

### 1.1 Gl2pani

Global Office Parameter Gl2pani

### 1.2 Description

This global parameter indicates whether two-party should receive ANI or ONI. It has value ranges of

DBYES - - ANI should be received or

DBNO - - ONI should be received.

This parameter should NOT have a default value; it should be set explicitly by the office to either DBYES or DBNO at the time of office data assembly.

Two (2) party line assignments for both conventional ringing and multifrequency ringing MUST require NO MORE than 1 tip party assignment and NO MORE than 1 ring party assignment per port.

***NOTE:*** For two-party lines, RLfc_porttyp.servclass will equal either FC_TWOPTY or FC_2PTY. Two RLfc_line tuples may exist for the port.

If two tuples exist for the port, one RLfc_line.party MUST specify the tip party assignment and the other RLfc_line.party must specify the ring party assignment. ( No restrictions apply if only one RLfc_line.party is assigned to the port. )

# Gl2poskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl2poskey | FP | DMoah32 |

### 1.1 Gl2poskey

Global Office Parameter Gl2poskey

### 1.2 Description

This global parameter, in conjunction with six others: Gl1poskey, Gl3poskey, and Gl4poskey, Gl5posk, Gl6posk, and Gl7posk, is the mean by which values of the 'posdb_key' attribute located in the LPRT_POS and POS_LPRT static relations will be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available. Glposkey is specified in hex.

This global should only be populated on SM's where the osps_sm attribute in RLmodatt is set to DBYES. On those SM's where the osps_sm attribute is set to DBNO, this global should contain a 0 value.

At SM initialization, upon the initialization of the LPRT_POS and POS_LPRT relations, this parameter will be updated by ODA to indicate which of the available 'posdb_key' values are in use. This is done on a 'per' SM basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_POS (or RLPOS_LPRT, as these two relations are dependent upon each other, and both contain the information needed to populate the global), and, depending on the VALUE of the posdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_POS is read, and the value of the posdb_key attribute is 43, then the 43rd bit (when referenced from the low-order to the high-order bit) will be turned on (set to 1). If, then, the next RLLPRT_POS tuple contains a posdb_key value of 61, then the bit which represents this value, (or the 61st bit) will be turned on (set to 1). If the next tuple is 3, then the 3rd bit in the global Gl1poskey (since that is the global which represents values 1-32) would be turned on. If these three tuples were the only tuples in LPRT_POS, then, after the Gl2poskey was populated, it would look like this:

```
64.............................33

---------------------------------

|00010000000000000000010000000000|

---------------------------------

   /|\               /|\

    |                 |

(61st bit on)       (43rd bit on)
```

***NOTE:*** The previous is simply an example. The order of the posdb_key values is not necessarily as suggested, nor is it fixed or sequential. It's only requirement is to be a number between the range of 1-200. This is indicated in the RLlprt_pos.P poprules as well as in the RLpos_lprt.P poprules.

The range of 'posdb_key' values is 1-200. Each bit in this parameter (Gl2poskey) will represent posdb_key values of 33-64. For example, the lowest-order bit of this parameter will represent posdb_key 33. The highest-order bit will

Copyright © 1999 Lucent Technologies 

represent posdb_key 64.

As there are only 32 bits in this global, and a possibility of 1-200 posdb_key values, only the VALUES 33-64 are handled by this global. The other values are handled by the other globals: Gl1poskey, Gl3poskey, and Gl4poskey, Gl5posk, Gl6posk, and Gl7posk.

When the LPRT_POS or POS_LPRT relations are updated by RC/V, RC/V will get the next available value of the posdb_key attribute by reading first the Gl1poskey parameter, and, if necessary, this parameter (Gl2poskey) and the next 5 (Gl3poskey, and Gl4poskey, Gl5posk, Gl6posk, and Gl7posk). The first 0 bit (from low-order to high-order bits) will be the first available posdb_key value, and its position will be its value. If all the bits in this global are turned on, then RC/V will read Gl2poskey in the same order, and so on until a zero bit is found.

In the case of a deletion, RC/V will update the appropriate of these four globals to indicate the availability of that particular posdb_key value. The availability of the posdb_key value is indicated by turning off (setting to 0) the bit which represents the value of the posdb_key.

This global will NOT appear on a RC/V view.

Global Office Parameter Gl2spdt

### 1.2 Description

The Gl2spdt global parameter specifies the maximum limit for partial dial timing during the second stage of a traditional 2-stage international outbound call. At expiration of the timer the call is torn down. Gl2spdt is specified in milliseconds.

# Gl3accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl3accskey | FP | DMoah32 |

### 1.1 Gl3accskey

Global Office Parameter Gl3accskey

### 1.2 Description

This parameter, in conjunction with four others: Gl1accskey, Gl2accskey, Gl4accskey, and Gl5accskey, is the means by which values of the 'accsdb_key' attribute located in the LPRT_ACCS static relation are to be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available. Gl3accskey is specified in hex.

This global only should be populated on SM's having at least one tuple with servclass = FC_RAFDTA in the RLfc_porttyp relation.

***NOTE:*** This assumes that the OSPS ACCS feature is the only user of the FC_RAFDTA servclass. On those SM's where at least one of the FC_RAFDTA tuples do not exist, this global should contain a value of 0.

At SM initialization, upon the initialization of the LPRT_ACCS relation, this parameter will be updated by ODA to indicate which of the available 'accsdb_key' values are in use. This is done on a 'per' SM basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_ACCS, which contains the information needed to populate the global), and, depending on the VALUE of the accsdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_ACCS is read, and the value of the accsdb_key attribute is 68, then the 68th bit (when referenced from the low-order to the high-order bit) will be turned on (set to 1). If the next RLLPRT_ACCS tuple contains an accsdb_key value of 89, then the bit which represents this value, (or the 89th bit (lowest order bit)), will be turned on (set to 1). If the next tuple contains an accsdb_key of 27, then the 27th bit in the Gl1accskey variable (because that is the global variable which represents values 1-32) would be turned on. If the fourth tuple contains an accsdb_key of 45, then the 45th bit in the Gl2accskey variable (because that is the global variable which represents values 33-64) would be turned on. If these four tuples were the only tuples in LPRT_ACCS, then, after the Gl3accskey was populated, it would look like this:

```
96.............................65

---------------------------------

|00000001000000000000000000001000|

---------------------------------

        ^                   ^

        |                   |

(89th bit on)          (68th bit on)
```

***NOTE:*** The above is simply an example. The order of the accsdb_key values is not necessarily as suggested, nor is it fixed or sequential. Its only requirement is to be a unique number between the range of 1-160. This is

Copyright © 1999 Lucent Technologies 

indicated in the RLlprtaccs.P poprules.

The range of 'accsdb_key' values is 1-160. Each bit in this parameter (Gl3accskey) will represent accsdb_key values of 65-96. For example, the lowest-order bit of this parameter will represent accsdb_key 65. The highest-order bit will represent accsdb_key 96.

As there are only 32 bits in this global, and a possibility of 1-160 accsdb_key values, only the VALUES 65-96 are handled by this global. The other values are handled by the other four globals: Gl1accskey, Gl2accskey, Gl4accskey, and Gl5accskey.

When the LPRT_ACCS relation is updated by recent change/verify (RC/V), RC/V will get the next available value of the accsdb_key attribute by first reading the Gl1accskey, Gl2accskey, and Gl3accskey parameters, and, if necessary, this parameter (Gl4accskey) followed by Gl5accskey. The first 0 bit (from low-order to high-order bits) will be the first available accsdb_key value and its position will be its value. If all the bits in this global are turned on, then RC/V will read Gl3accskey in the same order, and so on until a zero bit is found.

In the case of a deletion, RC/V will update this global to indicate the availability of that particular accsdb_key value. The availability of the accsdb_key value will be indicated by turning the appropriate bit in the global off (setting it to zero).

This global does NOT appear on a RC/V view.

# Gl3poskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl3poskey | FP | DMoah32 |

### 1.1 Gl3poskey

Global Office Parameter Gl3poskey

### 1.2 Description

This parameter, in conjunction with six others: Gl1poskey, Gl2poskey, Gl4poskey, Gl5posk, Gl6posk, and Gl7posk, is the mean by which values of the 'posdb_key' attribute located in the LPRT_POS and POS_LPRT static relations will be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available. Gl3poskey is specified in hex.

This global should only be populated on SM's where the osps_sm attribute in RLmodatt is set to DBYES. On those SM's where the osps_sm attribute is set to DBNO, this global should contain a value of 0.

At SM initialization, upon the initializaton of the LPRT_POS and POS_LPRT relations, this parameter will be updated by ODA to indicate which of the available 'posdb_key' values are in use. This is done on a 'per SM' basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_POS (or RLPOS_LPRT, as these two relations are dependent upon each other, and both contain the information needed to populate the global), and, depending on the VALUE of the posdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_POS is read, and the value of the posdb_key attribute is 68, then the 68th bit (when referenced from the low-order to the high-order bit) will be turned on (set to 1). If, then, the next RLLPRT_POS tuple contains a posdb_key value of 89, then the bit which represents this value, (or the 89th bit) will be turned on (set to 1). If the next tuple is 27, then the 27th bit in the global Gl1poskey (since that is the global which represents values 1-32) would be turned on. If the fourth tuple had a posdb_key of 45, then the 45th bit in Gl2poskey would be turned on (set to 1), since that is the global which represents posdb_key values of 33-64. If these four tuples were the only tuples in LPRT_POS, then, after the Gl3poskey was populated, it would look like this:

```
   96.............................65
   --------------------------------
   |00000001000000000000000000001000|
   --------------------------------
            ^                   ^
            |                   |
  (89th bit on)           (68th bit on)
```

***NOTE:*** The above is simply an example. The order of the posdb_key values is not necessarily as suggested, nor is it fixed or sequential. It's only requirement is to be a number between the range of 1-200. This is indicated in the RLlprt_pos.P poprules as well as in the RLpos_lprt.P poprules.

The range of 'posdb_key' values is 1-200. Each bit in this parameter (Gl3poskey) will represent posdb_key values of 65-96. For example, the lowest-order bit of this parameter will represent posdb_key 65. The highest-order bit will represent posdb_key 96.

As there are only 32 bits in this global, and a possiblity of 1-200 posdb_key values, only the VALUES 65-96 are handled by this global. The other values are handled by the other globals: Gl1poskey, Gl2poskey, and Gl4poskey, Gl5posk, Gl6posk, and Gl7posk.

Copyright © 1999 Lucent Technologies 

When the LPRT_POS or POS_LPRT relations are updated by recent change/verify (RC/V), RC/V will get the next available value of the posdb_key attribute by reading first the Gl1poskey parameter, and, if necessary, the Gl2poskey, followed by this parameter (Gl3poskey), Gl4poskey, Gl5posk, Gl6posk, and Gl7posk. The first 0 bit (from low-order to high-order bits) will be the first available posdb_key value, and its position will be its value. If all the bits in this global are turned on, then RC/V will read Gl2poskey in the same order, and so on until a zero bit is found.

In the case of a deletion, RC/V will update the appropriate of these four globals to indicate the availability of that particular posdb_key value. The availability of the posdb_key value is indicated by turning off (setting to 0) the bit which represents the value of the posdb_key.

This global will NOT appear on a RC/V view.

# Gl5accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl5accskey | FP | DMoah32 |

### 1.1 Gl5accskey

Global Office Parameter Gl5accskey

### 1.2 Description

This parameter, in conjunction with four others: Gl1accskey, Gl2accskey, Gl3accskey, and Gl4accskey, is the means by which values of the 'accsdb_key' attribute located in the LPRT_ACCS static relation are to be monitored. 'Monitoring' these values means keeping track of which values are in use and which are available. Gl5accskey is specified in hex.

This global only should be populated on SM's having at least one tuple with servclass = FC_RAFDTA in the RLfc_porttyp relation.

***NOTE:*** This assumes that the OSPS ACCS feature is the only user of the FC_RAFDTA servclass. On those SM's where at least one of the FC_RAFDTA tuples do not exist, this global should contain a value of 0.

At SM initialization, upon the initialization of the LPRT_ACCS relation, this parameter will be updated by ODA to indicate which of the available 'accsdb_key' values are in use. This is done on a 'per' SM basis.

This global parameter will be populated as follows by ODA:

ODA will read each tuple in RLLPRT_ACCS, which contains the information needed to populate the global), and, depending on the VALUE of the accsdb_key attribute, will turn on the bit in this global which represents that value. For example, if the 1st tuple of RLLPRT_ACCS is read, and the value of the accsdb_key attribute is 68, then the 68th bit of the Gl3accskey variable (because that is the global variable which represents values 65-96) would be turned on (set to 1). If the next RLLPRT_ACCS tuple contains an accsdb_key value of 130, then the bit which represents this value, (or the 130th bit) of this global (Gl5accskey), will be turned on (set to 1). If the next LPRT_ACCS contains an accsdb_key of 156, then the 156th bit of this global (Gl5accskey) would be turned on. If the fourth tuple contains an accsdb_key of 27, the 27th bit in the Gl1accskey variable (because that is the global variable which represents values 1-32) would be turned on. If these four tuples were the only tuples in LPRT_ACCS then, after the Gl5accskey was populated, it would look like this:

```
160.............................129
---------------------------------
|00001000000000000000000000000010|
---------------------------------
     ^                           ^
     |                           |
 (156th bit on)              (130th bit on)
```

***NOTE:*** The above is simply an example. The order of the accsdb_key values is not necessarily as suggested, nor is it fixed or sequential. Its only requirement is to be a unique number between the range of 1-160. This is indicated in the RLlprtaccs.P poprules.

The range of 'accsdb_key' values is 1-160. Each bit in this parameter (Gl5accskey) will represent accsdb_key values of 129-160. For example, the lowest-order bit of this parameter will represent accsdb_key 129. The highest-order bit will represent accsdb_key 160.

Copyright © 1999 Lucent Technologies 

As there are only 32 bits in this global, and a possibility of 1-160 accsdb_key values, only the VALUES 129-160 are handled by this global. The other values are handled by the other four globals: Gl1accskey, Gl2accskey, Gl3accskey, and Gl4accskey.

When the LPRT_ACCS relation is updated by recent change/verify (RC/V), RC/V will get the next available value of the accsdb_key attribute by first reading the Gl1accskey, Gl2accskey, Gl3accskey, Gl4accskey parameters, and, finally this parameter (Gl5accskey). The first 0 bit (from low-order to high-order bits) will be the first available accsdb_key value and its position will be its value. If all the bits in this global are turned on, and all of the bits in Gl1accskey, Gl2accskey, Gl3accskey, and Gl4accskey are turned on, no new tuples can be added to LPRT_ACCS. This will be the case until a zero bit in any of the parameters is found.

In the case of a deletion, RC/V will update this global to indicate the availability of that particular accsdb_key value. The availability of the accsdb_key value will be indicated by turning the appropriate bit in the global off (setting it to zero).

This global does NOT appear on a RC/V view.

# Gl64k_flag

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl64k_flag | FP | DMbool |

### 1.1 Gl64k_flag

Global Office Parameter Gl64k_flag

### 1.2 Description

This is a flag indicating if the T1 links between the RSM and its host and between the RSM and other RSMs in a cluster support 64kb/s clear channel. It is set to DBYES if the dfimode is SMDFB8ZS or SMDFRZBTSI for all the RSM-HOST and RSM-RSM DFIs and T1FAC facilities; otherwise, it is set to DBNO. An RSM always has tuple(s) defined in circuit data, RLcktdata.G, with circuit type PCRDFI for DFIs terminating links between the RSM and its Host SM. In addition to circuit type PCRDFI, if the RSM is a member of a RSM cluster, it will have RLcktdata.G tuple(s) defined with circuit type PCCDFI for DFIs terminating links between RSMs. If an RSM is equipped with a DLTU2, then the RDFI-2s and CDFI-2s will also have T1FAC and CFAC tuples associated with them. In this case, the facilities' transmission mode is contained in the individual facility tuples. The Gl64k_flag is set to DBYES for this RSM, if all the dfimode attributes of PCRDFIs and PCCDFIs (if they exist) or dfimode attributes of PCT1FACs and PCCFACs (if DFI-2s) are SMDFB8ZS or SMDFRZBTSI, otherwise, Gl64k_flag is set to DBNO.

# Gl6accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl6accskey | FP | DMoah32 |

### 1.1 Gl6accskey

Global Office Parameter Gl6accskey

### 1.2 Description

Gl6accskey is specified in hex. This parameter, in conjunction with seven others: Gl1accskey-Gl5accskey, Gl7accskey, Gl8accskey are a bitmap that keeps track of the 'accsdb_key' values located in the RLLPRT_ACCS static that are used.

This global only should be populated on SM's having at least one tuple with RLfc_porttyp.servclass = FC_RAFDTA.

ODA should populate the Gl[1-8]accskey values setting bits sequentially corresponding from [1-(# tuples in RLLPRTACCS)]. See RLlprtaccs.R for more information.

Recent change/verify (RC/V) will populate a zero in the corresponding accsdb_key value when a tuple is deleted. If at least 192 tuples exist in RLLPRTACCS initially and the tuples with RLLPRTACCS accsdb_key value of [162-191] are deleted, then only the 32nd bit and 1st bit will be left on.

Gl6accskey would look like this:

```
 1                               1
 9                               6
 2.............................1
----------------------------------
|10000000000000000000000000000001|
----------------------------------
 ^                              ^
 |                              |
(32nd bit on)                  (1st bit on)
high order                     low order
```

The range of 'accsdb_key' values are 1-256. Each bit in this parameter (Gl6accskey) will represent accsdb_key values of 161-192.

Other accsdb_key values besides [161-192] are handled by the other globals (Gl[0-5,7,8]accskey).

When a new RLLPRTACCS tuple is inserted by recent change/verify (RC/V), RC/V will find the next available value of the accsdb_key attribute by starting with Gl1accskey parameter and looking for a first 0 starting with the low-order bit. RC/V will step through each of Gl[1-8]accskey globals in the same way until a 0 bit is found.

This global does NOT appear on a RC/V view.

# Gl7accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl7accskey | FP | DMoah32 |

### 1.1 Gl7accskey

Global Office Parameter Gl7accskey

### 1.2 Description

Gl7accskey is specified in hex. This parameter, in conjunction with seven others: Gl1accskey-Gl6accskey, Gl8accskey are a bitmap that keeps track of the 'accsdb_key' values located in the RLLPRTACCS that are used.

This global should be populated on SM's having at least one tuple with RLfc_porttyp.servclass = FC_RAFDTA in the RLfc_porttyp relation.

ODA should populate the Gl[1-8]accskey values setting bits sequentially corresponding from [1-(# tuples in RLLPRTACCS)].

Recent change/verify (RC/V) will populate a zero in the corresponding accsdbkey value when a tuple is deleted. For example, if at least 224 tuples exist in RLLPRTACCS initially and the tuples with RLLPRTACCS accsdb_key value of [194-223] are deleted, then only the 1st and 32nd bits will be left on.

Gl7accskey would then look like this:

```
 2                                1
 2                                9
 4................................3
----------------------------------
|10000000000000000000000000000001|
----------------------------------
 ^                               ^
 |                                |
(32nd bit on)                    (1st bit on)
high order                       low order
```

The range of 'accsdb_key' values are 1-256. Each bit in this parameter (Gl7accskey) will represent accsdb_key values of 193-224.

Other accsdb_key values besides [193-224] are handled by the other globals (Gl[0-6,8]accskey).

When a new RLLPRTACCS tuple is inserted by recent change/verify (RC/V), RC/V will get the next available value of the accsdb_key attribute by starting with Gl1accskey parameter and looking for a first 0 starting with the low-order bit. RC/V will step through each of Gl[1-8]accskey globals the same way until a 0 bit is found.

This global does NOT appear on a RC/V view.

# Gl800_das

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl800_das | FR | DMda_tree |

### 1.1 Gl800_das

Global Office Parameter Gl800_das

### 1.2 Description

This parameter is used as the digit analysis selector (DAS) for retranslating service switching point (SSP) 800 calls after querying the external service control point (SCP) database if the originators DAS is not desired. At a SSP office a query is made to an external SCP database to obtain routing information necessary to complete the call. This parameter points to RLda_digstrt, and is used to indicate where translations should begin in digit analysis for routing numbers which are returned from the SCP database. The default value 0 indicates no SSP800 DAS to be used for retranslating returned routing numbers. The originators DAS is used.

# Gl8accskey

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl8accskey | FP | DMoah32 |

### 1.1 Gl8accskey

Global Office Parameter Gl8accskey

### 1.2 Description

Gl8accskey is specified in hex. This parameter, in conjunction with seven others: Gl1accskey-Gl7accskey, is a bitmap that keeps track of the 'accsdb_key' values located in the RLLPRTACCS that are used.

This global only should be populated on SM's having at least one tuple with RLfcport_typ.servclass = FC_RAFDTA.

ODA should populate the Gl[1-8]accskey values setting bits sequentially corresponding from [1-(# tuples in RLLPRTACCS)]. See RLlprtaccs.R for more information.

Recent change/verify (RC/V) populates a zero in the corresponding accsdbkey value when a tuple is deleted.

For example, if 256 tuples exist in RLLPRTACCS initially and the tuples with RLLPRTACCS accsdb_key value of [226-255] are deleted, then only the 1st and 32nd bits should be left on.

Gl8accskey would look like this:

```
 2                                2
 5                                2
 6................................5
-----------------------------------
|10000000000000000000000000000001|
-----------------------------------
 ^                               ^
 |                                |
(32nd bit on)                    (1st bit on)
high order                       low order
```

The range of 'accsdb_key' values are 1-256. Each bit in this parameter (Gl8accskey) will represent accsdb_key values of 225-256.

Other accsdb_key values besides [225-256] are handled by the other globals (Gl[0-7]accskey).

When a new RLLPRTACCS tuple is inserted by recent change/verify (RC/V), RC/V will find the next available value of the accsdb_key attribute by starting with Gl1accskey parameter and looking for a first 0 starting with the low-order bit in each parameter. RC/V will step through each of Gl[1-8]accskey globals until a 0 bit is found.

This global does NOT appear on a RC/V view.

# Gl8hrfq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl8hrfq | FR | DMshort |

### 1.1 Gl8hrfq

Global Office Parameter Gl8hrfq

### 1.2 Description

This parameter is used to specify the scanning frequency (in hours) associated with the 8-Hour Passed MDR capability (h541). The scanning frequency specifies how often the call records are scanned looking for calls that have the 8-hour passed MDR capability assigned and have been in progress for at least 8 hours. The start time for the call record scan is specified by office parameter, Gl8hrst. The 8-hour passed MDR capability is assigned by setting the 'hr8_passed' attribute in the MDR group relation, RLmdr_gp. If the MDR capability is not assigned for an office, then updating this parameter will be insignificant.

For example, if the scanning frequency, Gl8hrfq, is set to 6 and the start time, Gl8hrst, is set to 7, then the call record scan will occur at 7am, 1pm, 7pm, and 1am.

The 8-hour passed MDR capability is administrated by the following static data components: Gl8hrst, Gl8hrfq, Gl8hrsc and RLmdr_gp.

***Type:*** DBSHORTPAR

# Gl8hrsc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl8hrsc | FR | DMbool |

### 1.1 Gl8hrsc

Global Office Parameter Gl8hrsc

### 1.2 Description

This parameter is used to specify whether the 8-hour passed MDR scanning software can be executed or not for the 8-Hour Passed MDR capability (h541). The 8-hour passed MDR capability is assigned by setting the 'hr8_passed' attribute in the MDR group relation, RLmdr_gp.

If this parameter is DBYES, then the scanning software will be executed periodically throughout a day (at times specified by the office parameters, Gl8hrfq and Gl8hrst). If there are calls that have been in progress for at least eight hours and have the 8-hour passed MDR capability assigned, the 8-hour passed MDR records will be generated for those calls.

If this parameter is DBNO, then the scanning software will not be executed, the 8-hour passed MDR records will not be generated regardless the duration of the calls or the assignment of the 8-hour passed MDR capability.

If there is no 8-hour passed MDR capability assigned in the office, and this parameter is set to DBYES, then the scanning software will be executed, and real time will be wasted since no 8-hour passed MDR records will be generated.

If there is 8-hour passed MDR capability assigned in the office, but this parameter is set to DBNO, then the scanning software will not be executed. Therefore no 8-hour passed MDR records will be generated.

# Gl8hrst

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl8hrst | FR | DMshort |

### 1.1 Gl8hrst

Global Office Parameter Gl8hrst

### 1.2 Description

This parameter is used to specify the starting time (in hours past midnight) associated with the 8-Hour Passed MDR capability (h541). The start time specifies when the scan of call records should start looking for calls that have the 8-hour passed MDR capability assigned and have been in progress for at least 8 hours. The same call record scan will occur every 2, 4, 6 or 8 hours based on the value of office parameter, Gl8hrfq. The 8-hour passed MDR capability is assigned by setting the 'hr8_passed' attribute in the MDR group relation, RLmdr_gp. If the MDR capability is not assigned for an office, then updating this parameter will be insignificant.

For example, if Gl8hrst is set to 13 then the starting time will be 1 PM and the first scan for 8-hour passed MDR records to generate will occur at 1 PM and then every 2, 4, 6, or 8 hours, based on Gl8hrfq. If Gl8hrst is set to 2, then the starting time will be 2 AM.

The 8-hour passed MDR capability is administrated by the following static data components: Gl8hrst, Gl8hrfq, Gl8hrsc and RLmdr_gp.

# Gl900fw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl900fw | FP | DMhex32 |

### 1.1 Fullname

Feature Activation Word for OSPS900 Services defines: "db/DMparty.h"

### 1.2 Description

This global is used to activate processing OSPS 900 calls. It has the following meaning: if 0, OSPS900 processing is off; if 1, processing is on; and if greater than 1, then only OSPS900 calls arriving on a designated trunk receive treatment. When Gl900fw is greater than 1, the value is cast to the domain DMGPORT, which is the port number and module of a test trunk over which calls should receive OSPS900 treatment. Gl900fw is used as the key into the relation RLgroup_port to retrieve the trunk group and member number of the designated trunk.

***Type:*** DBLONGPAR

# Gl911dtim

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gl911dtim | FP | DMlong |

### 1.1 Gl911dtim

Global Office Parameter Gl911dtim

### 1.2 Description

This parameter is used to define the timing delay for extra digits after dialing 911 or equivalent three digit code.

The value is entered in by the user in seconds and stored in milliseconds as follows:

| Entered As: | Stored As: | Meaning |
|---|---|---|
| 0 | 0 | No timing dealy (delay) |
| 1 | 1000 | Delay 1-2 seconds |
| 2 | 2000 | Delay 2-3 seconds |
| 3 | 3000 | Delay 3-4 seconds |

ODA should initialize the parameter to 0 for new offices.

There are no crosschecks defined.

# Glabrcscnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glabrcscnt | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter BRCS Count

### 1.2 Description:

The Glabrcscnt global parameter contains an SM's count of analog lines that have BRCS features. Include are lines that have either terminal or DN features. Its value is maintained over all initializations and updated via trigger functions as analog lines with BRCS features are inserted or deleted. It is also updated when an existing analog line is assigned its first BRCS feature and the last BRCS feature is removed from an analog line.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as analog lines are inserted or deleted or features are assigned or removed. Its value can increase and decrease.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***

# Glac_access

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glac_access | LRFP | DMaccess |

### 1.1 Glac_access

Global Office Parameter Glac_access

### 1.2 Description

This parameter is used to indicate LASS Automatic Callback (AC) feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the AC feature, whether the feature is generally available or whether the feature is temporarily unavailable for use.

The AM parameter reflects the office standard value and is typically used to set the SM parameters after SM growth.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** UNAVAILABLE

***AM Initial Value:*** UNAVAILABLE

***CMP Initial Value:*** UNAVAILABLE

***RC/ODA Rules:*** It should initially be populated with UNAVAILABLE. The AM value for this parameter is defaulted to UNAVAILABLE. The AM parameter is changed by RC/V only when the 'ALL' value is used for the SM key on the LASS Feature Access View.

***Retrofit Rules:*** ODA must retain its value across retrofits to post 5E5 generics.

***Default Rules:***

```
default = UNAVAILABLE;
```

***Distribution Rules:***

# Glac_featid

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glac_featid | FR | DMfid |

### 1.1 Glac_featid

Global Office Parameter Glac_featid

### 1.2 Description

This parameter is used by LASS AC and contains a feature id for generally available feature access. This will be used by call processing to determine which tuple to read in the _cf and _opts relations for generally available features. Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the generally available feature name, /LACGA, as the key.

# Glac_intra

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glac_intra | LRFR | DMbool |

### 1.1 Glac_intra

Global Office Parameter Glac_intra

### 1.2 Description

This parameter indicates whether OSPS Intraflow is turned ON or OFF for this switch.

Intraflow allows an automatic call distributor (ACD) or OSPS administrator to designate for each call queue a single principal serving team and up to 8 supporting serving teams with associated delay outflow thresholds. Each serving team has a threshold indicating the maximum percentage of the team that can be handling calls from its supporting queues simultaneously. A queue intraflows traffic from its principal serving team to a supporting team when the delay of the oldest call on queue exceeds the outflow threshold for the supporting team. The supporting serving team accepts the call as long as doing so would not violate the team's supporting queue call percentage threshold.

Similarly, a server on a team may serve its supporting queues, subject to the existing Delay Ratio Queuing (DRQ) algorithm, only when there are no other available servers on its team and there are no calls in any of its principal queues. The same team threshold and outflow thresholds are checked before a server can accept a call from one of its supporting queues.

# Glacblk_ri

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glacblk_ri | FR | DMlong |

### 1.1 Glacblk_ri

Automatic Callback Blocked to Private Number Route Index

### 1.2 Description

This parameter provides the route index of the announcement to use when an Automatic Callback (AC) attempt is blocked because the last incoming call was private and the AC Blocked to Private Number feature is active. If Glacblk_ri has a value of 0 and AC is blocked due to these conditions, reorder treatment will be provided.Glacblock.

# Glacblock

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glacblock | FR | DMbool |

### 1.1 Glacblock

Automatic Callback Blocked to Private Number

### 1.2 Description

Global parameter for Automatic Callback (AC) Blocked to Private Number special feature. When set to DBYES, the switch will block attempts to invoke AC to a private number and route the customer to a rejection announcement. When set to DBNO, attempts to invoke AC to a private number will not be blocked. This parameter can be set to DBYES only if the AC Blocked to Private Number feature is active in the office (SFID111 is on).

# Glacintra

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glacintra | LRFR | DMbool |

### 1.1 Glacintra

This global parameter is used to enable or disable the ACD/BRCS Intraflow feature on the switch.

### 1.2 Description

This global parameter is used to enable (DBYES) or disable (DBNO) the ACD/BRCS Intraflow feature on the switch.

Intraflow allows an Automatic Call Distributor/Business and Residence Custom Services (ACD/BRCS) administrator to designate for each call queue a single principal (or primary) serving team and up to 8 supporting (or secondary) serving teams with associated delay outflow thresholds. Each serving team has a threshold indicating the maximum percentage of the team that can be simultaneously handling calls from its supporting call queues. A call queue intraflows traffic from its principal serving team to a supporting team when the delay of the call at the head of the call queue exceeds the outflow threshold for the supporting team. The supporting serving team accepts the call as long as doing so would not violate the team's supporting queue call percentage threshold.

Similarly, a server on a team may serve its supporting queues, subject to the existing Delay Ratio Queuing (DRQ) algorithm, only when there are no other available servers on its team and there are no calls in any of its principal call queues. The same team threshold and outflow thresholds are checked before a server can accept a call from one of its supporting call queues.

# Glacqssm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glacqssm | LRFP | DMuns8 |

### 1.1 Glacqssm

Global Office Parameter Glacqssm

### 1.2 Description

This parameter points to which SM has the hotel billing information system (HOBIS) or hotel billing information center (HOBIC) and the optional Autoquote data links. Glacqssm should only be set to an SM equipped with HOBIS/HOBIC digital subscriber lines. If there is no HOBIS/HOBIC present on the OSPS, this value should be 0.

This parameter is group partitioned with grp_type=GPD_OPRT and grp_id=3. That is, it exists on all SMs with operator traffic trunks, and all loaded SMs.

An SM that carries operator traffic trunks is one in which one or more tuples in rlFC_PORTTYPE have the attribute servclass set to FC_ISPOPR.

# Glactprmpt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glactprmpt | FR | DMgacct_pr |

### 1.1 Fullname:

This parameter contains the Long Distance Platform Account Code feature prompt

### 1.2 Description:

Service provider office option parameter to provide the following LDP Account Code feature prompts:

- BEEP2: Account code prompt of two audible beeps
- ANNC: SAS announcement
- CARRIER: 400Hz carrier tone

If a LDP customer subscribes to the Account Code feature and Glactprmpt is set to ANNC the caller hears the Account Code announcement. At any time after the Account Code announcement begins, the caller enters the digits. Once the caller begins entering digits the SAS circuit stops playing the announcement. A fixed route of TACCT must exist on view 10.1 in order for a caller to hear the announcement. When set to BEEP2 the caller hears the Account Code prompt (2 beeps) and enters digits. When set to CARRRIER the caller hears the 400Hz tone and enters digits.

# Glactry

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glactry | FR | DMuns3 |

### 1.1 Glactry

Global Office Parameter AC Retries

### 1.2 Description

This parameter is used to indicate the number of times the user will be allowed to enter an incorrect digit (a digit other than a '1') in response to the interactive recorded announcement prompt when using 2-level activation of an AC feature. This parameter only has meaning when Glacact is DBYES.

# Gladb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gladb | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Gladb

### 1.2 Description:

The Gladb global parameter contains an SM's current rlADB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCadbcnt.c which is the init code for Gladb. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

# Glaisda

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glaisda | FP | DMda_tree |

### 1.1 Glaisda

Global office parameter Glaisda

### 1.2 Description

Intercept digit analysis selector.

The DAS is used as the starting point in digit analysis for digits signaled over incoming intercept trunks using MF signalling. Using this DAS, an INDIT/LDIT combination can be found, which defines the valid signaling patterns for these trunks. Valid patterns should have a call type of NORMAL, while invalid should use VACANT code.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** A tuple must exist in RLda_digstrt where RLda_digstrt.digtree equals Glaisda, when Glaisda is not zero. RC must not allow this global to be changed to zero if this would cause a violation of the poprules for RLfc_oprtk. ODA and RC/V should equate unknown with zero and only allow 1 - 99.

***Retrofit Rules:*** not applicable

***Default Rules:***
```
default = 0;
```

# Glaisdi

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glaisdi | FP | DMdestidx |

### 1.1 Glaisdi

Global office parameter Glaisdi

### 1.2 Description

Intercept destination index.

The setting of this global variable indicates how OSPS should treat an incoming intercept call when a signaling irregularity is detected. In all cases, an MDII (Machine Detected Interoffice Irregularity) is printed at the ROP. If set to 0, then the call is sent to reorder, but if set to a non-zero value, this destination index is used to determine the OSPS call queue for the call. When Glaisdi is not zero:

```
must find at least 1 tuple in Rlac_destx
where (RLac_destx.destx equals Glaisdi)
when found
begin
      must find at least 1 tuple in RLac_cqdet
      where (RLac_cqdet.ta_pcid equals Rlac_destx.ta_pcid and
              RLac_cqdet.ta_type equals OATA_AIS);
end
```

***Type:*** DBSHORTPAR

# Glalitrng

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glalitrng | LR | DMalitrng |

### 1.1 Glalitrng

Global Office Parameter Glalitrng

### 1.2 Description

Gives the switch personnel the ability to change the range of testing for Automatic Line Insulation Testing (ALIT).

Glalitrng is contained in the global header file 'data/Glcpofopt.G'. This file is used in conjunction with the domain global header file 'db/DMalitrng.G'. The parameter values have the following meanings: TM_D=0, TM_C=1, TM_B=2, and TM_A=3. The altval values are TM_D=D (5M ohm high range), TM_C=C (2.5M ohm high range), TM_B=B (1.25M ohm high range) and TM_A=A (320K ohm high range).

# Glalittyp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glalittyp | LR | DMlittyp |

### 1.1 Glalittyp

Global Office Parameter Glalittyp

### 1.2 Description

Used to allow the switch personnel to change the type of test being used for automatic line insulation testing (ALIT).

Glattyp is used in conjunction with the new domain global header file 'db/DMlittyp.G'. The meaning of the parameter values are: TM_F = 1, TM_S = 2, TM_T = 3, TM_G = 4. The altval values are: TM_F = FEMF (foreign potential test), TM_S = SRG (short circuit and ring to ground), TM_T = TRG (tip and ring to ground), and TM_G = GENERAL (test which includes FEMF, TRG and SRG).

# Glalw_oc3

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glalw_oc3 | LRFR | DMbool |

### 1.1 Fullname:

This global parameter is used to enable or disable population of OC-3 OFIs in the switch.

### 1.2 Description:

The Glalw_oc3 parameter must always be set to DBNO. This parameter is introduced because 5E13_1Y will not have all of the necessary code or hardware to support the OC-3 feature when 5E13_1Y is deployed to the field. So, in order to prevent the customer from growing in the feature before the appropriate time, a check of Glalw_oc3 will be performed in RLcktdata. This global parameter will be made unavailable to RC/V and ODA.

OC-3 growth will be INHIBITED by checking Glalw_oc3 in RLcktdata population rules. OC-3 growth will be ALLOWED by removing the RLcktdata population rule check of Glalw_oc3.

***Type:*** DBENUMPAR

# Glamaopt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glamaopt | LRFR | DMamaopt |

### 1.1 Glamaopt

Global Office Parameter Glamaopt

### 1.2 Description:

This parameter is used by AMA to determine billing method.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** AMATPS

***AM Initial Value:*** AMATPS

***CMP Initial Value:*** AMATPS

***RC/ODA Rules:*** Populated with one of the values from the domain DMAMAOPT as follows:

AMATPS allows a small office to use teleprocessing.

AMATPS1 makes the billing system act like AMATPS, but should only be used when the office is normally a Dual Stream office that is operating in a 'degraded' single stream mode defaulting to stream 1. The 'stream' attribute in RLMODATT is ignored.

AMATPS2 should only be used when the office should be operating in a 'degraded' single stream mode defaulting to stream 2. The 'stream' attribute in RLMODATT is ignored.

AMADUAL allows the office to operate as a full Dual Stream office, with billing traffic going to two separate streams. This allows large offices to process and send two separate billing streams simultaneously. Each SM belongs to one stream or the other depending upon the 'stream' attribute in the RLMODATT relation.

AMNONE turns off all billing options in an office except for CAMA billing. If administration enters AMNONE then RC and ODA message asking whether the administration really wants to do this.

***NOTE:*** AMARC BILLING IS NO LONGER A VALID OPTION.

# Glamqlmh

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glamqlmh | LP | DMshort |

### 1.1 Fullname:

Global Office Parameter Glamqlmh

### 1.2 Description:

This parameter indicates the total number of Message Handler's (MH's) in SM-2000 processors in the office that have connectivity to a QLPS via 1 or more MH pipes. For release 1, there is only 1 MH (that is, MH0) that terminates pipes in an SM-2000, so the number of MHs that have connectivity to a QLPS will be the same number as the number of SM-2000's that have connectivity.

It should also be noted that, in release 1, a MH may have 1) no pipes, 2) 1 pipe or 3) 2 pipes to a QLPS. This parameter DOES NOT indicate the number of pipes. It merely indicates the number of MH's (that is, the number of SM-2000's) that have connectivity, that is, any pipes, to a QLPS.

This parameter is used by measurements to size reports and by diagnostics to derive a source of packets for diagnosing the QLPS.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** ---

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is populated in the AM only. It is initially set to 0 indicating no SM-2000s have access to QLPS via MH pipes. It is incremented by 1 when the first MH pipe is assigned to an SM-2000. It is not incremented when additional pipes are assigned to that SM-2000, only the first one. Likewise, it is incremented by 1 when the first MH pipe is assigned to second SM-2000 in the office, but not when additional pipes are assigned to that SM-2000, etc. It is decremented by 1 when all pipes to an SM-2000 are removed.

***Retrofit Rules:*** ODA must preserve this parameter during a retrofit.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
        /* Standard */
        ;
```

# Glanalm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glanalm | LR | DMuns7 |

### 1.1 Glanalm

891/CCC *ANSI*® Transaction Capabilities Application Part (TCAP) query software alarm threshhold

### 1.2 Description

Glanalm: Indicates the *ANSI*® TCAP query software alarm threshold. Every fifteen minutes, counts of the number of *ANSI*® TCAP queries attempted and the number of queries with reply valid are sent to the direct signaling - system process (DS SP). The *ANSI*® TCAP query success rate is calculated from these counts and is compared versus Glanalm. If Glanalm is either 0 or less than the success rate, no violation has occurred against the threshold . Glanalm is a TCA specifiable value, with a range of 0 - 100 and a default of 95. See global parameter Glanmin.

Every 15 minutes

```
if total ANSI® TCAP queries > Glanmin
then
  if (successful ANSI® TCAP queries / total ANSI® TCAP queries)
      *100 < Glanalm
  then
      TCA alarm message sent to ROP (Read Only Printer)
   endif
endif

# Glanmin

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glanmin | LR | DMuns7 |

### 1.1 Glanmin

Minimum Number of 891/CCC *ANSI*® TCAP Queries Attempted

### 1.2 Description

Glanmin: Indicates the minimum number of *ANSI*® TCAP queries which must be attempted in a fifteen minute period in order for *ANSI*® TCAP software alarm calculations to proceed. Every fifteen minutes, a count of the number of *ANSI*® TCAP queries attempted is collected in the AM/DLN and sent in a message buffer to the DS SP. If this count is less than Glanmin, no further alarm calculations are performed. This is a TCA specifiable value with a range of 1 - 64 and a default of 40.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glap_option | LRFR | DMap_opts |

### 1.1 Glap_option

Global Office Parameter Glap_option

### 1.2 Description:

This parameter indicates whether a *5ESS*®-2000 switch has one of these types of Application Processor (AP) setups.

```
AP_NO   - No APs on this switch
AP_AM   - Only AM IOP APs on this switch
AP_SM   - Only ISDN SM APs on this switch
AP_AMSM - Both AM IOP and ISDN SM APs on this switch
```

# Glapdu

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glapdu | FP | DMushort |

### 1.1 Fullname:

Count of rlAPDU tuples present in SM

### 1.2 Description:

This global parameter contains the count of rlAPDU tuples which are present in a given SM. This is done to allow engineering and auditing of rlAPDU.

For an SM loaded with the ID303APP (IDCU) or ISDNBASE (ATS) loadable packages:

The number of rlAPDU tuples is nominally based on the number of rlRTLB tuples, the number of TR303 RTs present in the SM, a fixed number, 60, for Automatic Terminal Setup (ATS) software, and the incremental global parameter (Gliapdu).

If there are no TR303 RTs in the SM then Glapdu is equal to 60 (30 per ATS_DCOLL terminal process) + Gliapdu. This is the default number of tuples required for ATS.

If there are TR303 RTs in the SM, then the TR303 component for calculating the number of rlAPDU tuples is dependent on the number of TR303 rlRTLB tuples in the SM. Note that the nomenclature xxx:yyy means the value for both the SM (xxx) and SM-2000 (yyy). The total number of rlAPDU tuples when TR303 RTs are present is determined by:

```
    Number of TR303 rlRTLB tuples (A) + 96 (B) + 4 (C) + 60 (D) +
    Gliapdu up to the maximum of 359:507 (limit of rlAPDU tuples
    in SM) which is then rounded up to the next power of 2
    less 1 (511).

    Where:
      A = The number of TR303 rlRTLB tuples is derived to be
          4 (E) * number of TR303 RTs (Glrt303cnt) + 22:54 (A')
      A'= Maximum number of TPs statistically possible for 1 RT:
          1 (a) + 34:66 (b) - 11 (c) + 2 (d) - 4 (E) = 22:54
            a = Maximum TR303 rlRTLB tuples set aside for recovery
            b = Maximum number of TR303 TPs per SM possible
            c = The maximum number of concurrent TR303 manual procces
                ses is not realistic, so take them away
            d = Realistic maximum number of TR303 manual jobs to a
                given RT
      B = Maximum number of messages allowed to be queued to any
          single TR303 application TP (PCAPP_PDU_MAX)
      C = Maximum TR303 rlAPDU tuples set aside for recovery
      D = Number of ATS rlAPDU tuples
      E = Number of TR303 TPs per each additional RT

For an SM not loaded with the ID303APP (IDCU) and ISDNBASE (ATS)
loadable packages:
```

Copyright © 1999 Lucent Technologies

```
The number of rlAPDU tuples is 0.
```

Note that the number of operational/grow TR303 RTs in the SM is available in the Glrt303cnt global parameter.

Note that the customer can increase the value of this global parameter by increasing the incremental global parameter (Gliapdu).

# Glapivc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glapivc | FP | DMushort |

### 1.1 Glapivc

Global office parameter Glapivc.

### 1.2 Description

This parameter is used by the Inter_Switch Voice Messaging (ISVM) feature in 5E7. It keeps track of the number of APs that are attached to an ISDN SM and are used for ISVM.

This parameter, Glapivc, is the number of APs being used by ISVM on an ISDN SM. Since this value will only be populated for ISDN SMs, the value of Glapivc for a given ISDN SM will equal the number of tuples in the CMAPDATA relation for that SM that has the use_isvm attribute set to DBYES.

This parameter is Recent Change supported and generated but is not displayed on any RC view.

The following PRL code assists in the description:

```
      int i;          /* counter */
      for every tuple in RLcmapdata
      begin
            i = 0;
            for every TUPcmapdata in RLcmapdata
            where (TUPcmapdata.module equals RLcmapdata.module and
                  TUPcmapdata.use_isvm equals DBYES)
            begin
                  i = i + 1;
            end
            Glapivc must_equal i on sm(RLcmapdata.module);
      end

RC-ACCESS:
      No display; RC will update by incrementing/
      decrementing the parameter's value when an AP
      is designated/removed for ISVM.

ODA-ACCESS:
      No - does not appear on ODA form.  ODA must
      increment/decrement the parameter's value
      when an AP is designated/removed for ISVM.
```

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***TRIGGER:*** FCimsmwida

***Classification:*** OPTION

Copyright © 1999 Lucent Technologies

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ODA must set this parameter so that the MSS System Process will create the dynamic relation RLmsmwida for the ISVM during SM initialization. If this parameter is set to 0, no dynamic relation for ISVM will be created and no OSDS messages will be sent between the MSS SP and the TCAP SP to control a client's MWI on another switch.

***Retrofit Rules:*** Initially for 5E7, Glapivc should be set to 0.

# Glapnumb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glapnumb | LR | DMuns7 |

### 1.1 Glapnumb

Global Office Parameter Glapnumb

### 1.2 Description

This parameter is used by the Applications Processor Communications capability for 5E4. It is used for measurements and is a count of the total number of APs on the *5ESS* ®-2000 switch.

The range for this parameter is 0 - 99. (96 - ISDN SM APs and 3 - IOP APs) For VCDX, the range is 0-10 ISDN APs with an SM and 0-30 ISDN APs with an SM-2000. This is asserted in the poprules for Glapsmnum. IOP APs are not supported.

This parameter is Recent Change supported and generated but is not displayed on any RC view.

The Glapnumb is the total number of APs for the Switch while Glapsmnum is for each SM.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** The ODA must set the value of the Glapnumb to the total number of APs the Switch will support in order for AP communication capability to work properly.

Glapnumb = sum of Glapsmnum for all SMs
plus APs supported by IOP.

OR Glapnumb = Glapsmnum for VCDX.

# Glapsdn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glapsdn | LR | DMbool |

### 1.1 Glapsdn

Global Office Parameter Glapsdn

### 1.2 Description

This parameter is used to indicate that this office serves as an Action Point (ACP) for the Software Defined Network (SDN).

An office can not be an ACP and a Service Switching point (SSP) concurrently. Also, this parameter is dependent on Glccs.

All SDN ACP offices must be equipped with a Common Network Interface (CNI) to provide Common Channel Signaling (CCS) transport.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** NONE

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** This parameter must be set to DBNO if the global parameter Glssp is set to DBYES.

This parameter must not be set to DBYES if Glccs indicates no CNI is equipped.

***Retrofit Rules:*** not applicable

***Default Rules:***

# Glapsmnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glapsmnum | FP | DMapsmnum |

### 1.1 Glapsmnum

Global Office Parameter Glapsmnum

### 1.2 Description

This Glapsmnum global parameter contains an SM's count of Application Processors (AP)s. It is also equal to the number of tuples in the RLapsite static data relation for that SM.

This parameter is Recent Change supported and generated but is not displayed on any RC view.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ODA must set this parameter accordingly for the SM to create the database for the AP communication during the SM initialization. If this parameter is set to zero, no dynamic relations for the AP communication will be created and there will be no communication between the SM and APs.

***Retrofit Rules:*** not applicable

***Default Rules:*** none

***Distribution Rules:***

# Glaptyp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glaptyp | FP | DMaptyp |

### 1.1 Fullname:

Automated position protocol

### 1.2 Description:

This determines the status, or protocol, of Automated Positions (AP) in this office.

The OSPS Automated Position automates the handling of 0+ dialed calls with collect, third number, card, and person-to-person billing. Two different protocols are provided for delivering calls to the APs: one stage and two stage. In a one stage office, APs provide automation of calling card, collect, third number, and person-to-person billing. The one stage protocol sends all 0+ dialed calls from line numbers selected by Originating Line Screening (OLS) on incoming trunks marked for AP handling.

In a two stage office, ACCS provides the automation for calling card billing, and the APs automate collect, third number, and person-to- person billing. In a two stage protocol, the caller is sent to an AP if the party fails to respond (timeout, flash, or dials 0) to the ACCS offering of calling card billing and the incoming trunk is marked for AP handling. In this situation, the AP then provides the secondary automation for collect, third number, and person-to-person billing. This is a secured feature.

# Glapx_mxhr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glapx_mxhr | LRFR | DMshort |

### 1.1 Glapx_mxhr

Maximum duration of *Autoplex*® task

### 1.2 Description

This global variable will define the maximum time (in hours) that certain *Autoplex*® OA&M tasks will be allowed to run in the *5ESS*® -2000 switch.

This variable exists in the AM and is redundant in the SM. This variable will limit the duration of all tasks performed by the *Autoplex*® automatic task administrator (AATA).

Most short running AATA tasks that run from a few seconds to about 2 hours, have generic preset limits. Tasks in this category include (but are not limited to) Port Status, Carrier Group Alarm, Selective Trunk Reset, Trunk Group Status, Reset Resource, TIA Trunk Maintenance, and Unit Type Status requests.

Most other tasks (usually tasks that can run longer than 2 hours) are intended to be controlled by the global variable Glapx_mxhr. Tasks in this category include (but are not limited to) trunk test demand, intervender (IVT) loop-back, and dedicated switch connection (DSC) loop-back requests.

If Glapx_mxhr is less than any generic preset limit, then the Glapx_mxhr value will take precedence. If Glapx_mxhr is greater than any preset limit, then the preset limit will take precedence. Typically, short running tasks have generic preset limits. Longer running tasks are typically limited only by Glapx_mxhr.

The value of Glapx_mxhr is the maximum number of hours a task can operate (in hours). The range is 0 to 168 (168 corresponds to 7 days). A value of 0 is equivalent to 24 hours. (tasks that run longer than 168 hours will be terminated). The recommended default value is 24.

The purpose of this variable is to limit excess use of *5ESS*®-2000 switch system resources. It is not recommended that values greater than 24 hours be used. Values greater than 24 hours are intended for TEMPORARY use to permit debugging difficult problems (software or hardware).

# Glar_access

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_access | LRFP | DMaccess |

### 1.1 Glar_access

Global Office Parameter Glar_access

### 1.2 Description

This parameter is used to indicate LASS AR feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the AR feature, whether the feature is generally available or whether the feature is temporarily unavailable for use.

The AM parameter reflects the office standard value and is typically used to set the SM parameters after SM growth.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** UNAVAILABLE

***AM Initial Value:*** UNAVAILABLE

***CMP Initial Value:*** UNAVAILABLE

***RC/ODA Rules:*** It should initially be populated with UNAVAILABLE. The AM value for this parameter is defaulted to UNAVAILABLE.

The AM parameter is changed by RC/V only when the 'ALL' value is used for the SM key on the LASS Feature Access View.

***Retrofit Rules:*** ODA must retain its value across retrofits to post 5E5 generics.

***Default Rules:***
```
default = UNAVAILABLE;
```

***Distribution Rules:***
```
for modatt in RLmodatt

# Glar_featid

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_featid | FR | DMfid |

### 1.1 Glar_featid

Global Office Parameter Glar_featid

### 1.2 Description

This parameter contains a LASS AR feature ID for generally available feature access. This will be used by call processing to determine which tuple to read in the _cf and _opts relations for generally available features.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the generally available feature name, /LARGA, as the key.

# Glar_maxrngbk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_maxrngbk | FR | DMuns4 |

### 1.1 Glar_maxrngbk

Global Office Parameter Glar_maxrngbk

### 1.2 Description

This parameter is used by LASS Automatic Recall (AR) and LASS Automatic Callback (AC) to indicate the maximum number of ringback attempts per LASS AR or LASS AC invocation. It can range in value from one to twelve ringbacks and should initially be populated with one ringback.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 1

***AM Initial Value:*** 0

# Glar_rngcycls

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_rngcycls | FR | DMuns4 |

### 1.1 Glar_rngcycls

Global Office Parameter Glar_rngcycls

### 1.2 Description

This parameter is used to indicate the number of ring cycles for ringback for LASS AC and LASS AR. There can be from 2-7 cycles, each cycle being 6 seconds.

Glar_rngcycl is specified in cycles

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 4

***AM Initial Value:*** 0

# Glar_scanmode

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_scanmode | FR | DMscanmode |

### 1.1 Glar_scanmode

Global Office Parameter Glar_scanmode

### 1.2 Description

This parameter is used to indicate the first choice of scanning to be used in the office by LASS Automatic Callback (AC) or LASS Automatic Recall (AR). Originating or terminating are the choices of scanning.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** LASS_TERM

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** The parameter should initially be populated with the enum LASS_TERM for terminating scanning.

***Retrofit Rules:*** not applicable

***Default Rules:***

```
default = LASS_TERM;
```

***Distribution Rules:*** standard

***Checks:***

```

# Glar_tcap

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_tcap | FR | DMuns7 |

### 1.1 Glar_tcap

Global Office Parameter Glar_tcap

### 1.2 Description

This parameter is used to indicate the wait period for a response to LASS AC/AR CCS TCAP queries. The wait period should be from 1-10 seconds.

Glar_tcaps is specified in seconds.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 3

***AM Initial Value:*** 0

# Glar_timeout

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glar_timeout | FR | DMuns6 |

### 1.1 Glar_timeout

Global Office Parameter Glar_timeout

### 1.2 Description

This parameter is used by LASS AC and LASS AR to indicate the feature timeout interval when scanning is being performed. The length of scanning can be from 15-45 minutes, in one minute intervals.

Glar_timeout is specified in minutes.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 30

Global Office Parameter Glasi_on

### 1.2 Description

This parameter specifies whether the Advanced Service Interface (ASI) feature is on. DBNO means the feature is off. This parameter can only be set to DBYES if the ASI feature has been purchased ( SFID093 is set to DBYES ).

***Type:*** DBENUMPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

# Glasidef10

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glasidef10 | LRFR | DMbool |

### 1.1 Glasidef10

Global Office Parameter Glasidef10 - the default ASI subscriber's TN must default to 10-digits.

### 1.2 Description

Allow 10-digit TNs for the default Subscriber's Identification (SID) associated with the ASI Intelligent Peripheral (IP).

When the SID default parameter is not specified on RC View 12.61, then the subscriber's TN is used and displayed as the default SID on RC View 1.61 according to the following rule:

```
if ( Glasidef10 == DBYES )
then
       10 digits of the subscriber's TN (stored as DMLOCDN)
       are displayed as the default SID
else
       last 7 digits of the subscriber's TN (stored as DMLOCDN)
       are displayed as the default SID
```

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** This parameter is supported by RC and ODA. The value of this parameter is populated by ODA and is updated from RC View 8.1.

The office must first be provisioned with the Number Portability - NPA-NXX Growth Feature (SFID198) on RC View 8.22 before the parameter Glasidef10 can be set to DBYES.

```
if (Glasidef10 == DBYES) then {

          SFID198 == DBYES; }
```

***Retrofit Rules:*** This value should be preserved during a generic retrofit.

***Default Rules:***

```
default = DBNO;
```

```
/*      Glaspbase is_in {0 thru (DBQNNS_BIL - DBSFNS_BIL)};     */
        Glaspbase is_in {0 thru (32000 - 0)};
end

/* FUNCTION */

/*
 * If the Number Portability (NP) secured feature, NP - AMA
 * Access Billing, SFID199 has been unlocked and a port
 * has been ported, the number of ASP base dynamic relations
 * should be increased.
 *
 *
 * let calls_lported = 10 * call rate per lines * number of ported lines
 *
 *
 * let calls_tported = 10 * call rate per trunk * number of non-ISUP7
 *                      ported trunks
 *
 *
 * let calls_tisup7 = 10 * call rate per trunk * number of ISUP7 trunks *
 *                      number of CCS calls with a JIP (assume 100%)
 *
 * NOTE: The previous variables all contain a "10 *" term (such as,
 *       calls_ported = 10 * calls per line * number of ported lines).
 *       This is used later in this calculation to reduce the
 *       number of divisions to 1.  Decreasing the number of
 *       divisions is used to decrease the truncation errors (since PRL
 *       is unable to do floating point math).
 *
 *
 * let calls_termpbx = call rate per trunk * number of non-ISUP7 ported trunks
 *
 *      (calls_termpbx * 10%) equals the number of calls terminating
 *      to ported PBX trunks that aren't covered by other factors in
 *      this calculation (the originator isn't a ported line, a ported
 *      non-ISUP7 trunk, or an ISUP7 trunk).  The amount of 10% is an
 *      estimation of the number of calls terminating to PBX trunks
 *      that fit this criterion.
 *
 * NOTE: Gllnpama indicates that SFID199 is unlocked
 *
 * let lnpama = ((Gllnpama == DBYES) ? ZZZ : 0);
 *       where ZZZ is defined as follows:
 *
 *
 * ZZZ = ( ((call rate per lines * number of ported lines) +
 *          (call rate per trunks * number of non-ISUP7 ported trunks) +
 *          (call rate per trunks * number of ISUP7 trunks * number of
 *           incoming CCS calls with a JIP (assume 100%)) *
 *           holding time * percentage of calls that are originating
```

Copyright © 1999 Lucent Technologies 

```
            (assume 50%) ) +
*           (call rate per trunks * number of non-ISUP7 ported trunks * 10%) *
*              holding time * percentage of calls that are terminating
*              (assume 50%) )
*
* with:
*      calls per line = 2.5
*      calls per trunk = 8
*      holding time (both lines and trunks) = 210/3600
*
*
* By replacing
*
*      (call rate per lines * number of ported lines)
*              with    (.10 * calls_lported),
*
*      (call rate per trunks * number of non-ISUP7 ported trunks)
*              with    (.10 * calls_tported),
*
*      (call rate per trunks * number of ISUP7 trunks)
*              with    (.10 * calls_tisup7),
*
* and  (call rate per trunks * number of non-ISUP7 ported trunks)
*              with    (calls_termpbx),
*
* ZZZ equals the following:
*
* ( ((.10 * calls_lported) + (.10 * calls_tported) +
*    (.10 * calls_tisup7 * 100%)) * holding time * 50%)
*  + (calls_termpbx * 10%) * holding time * 50% )
*
*
* Further reducing ZZZ (factoring out the .5, .1, and holding time):
*
* (calls_lported + calls_tported + calls_tisup7 + calls_termpbx)
*      * (.10 * holding time * .50)
*
*
* Reducing and replacing holding time with 210/3600:
*
* (calls_lported + calls_tported +
*      calls_tisup7 + calls_termpbx) * 7/2400
*
*
* Using the known values for calls per line
* and calls per trunk; calls_lported,
* calls_tported, calls_tisup7, and calls_termpbx
* equal the following:
*
*      calls_lported = 25 * Gllportcnt
*      calls_tported = 80 * Gltportcnt
*      calls_tisup7 = 80 * Glisuptk_cnt
*      calls_termpbx = 8 * Gltportcnt
*
```

Copyright © 1999 Lucent Technologies 

```
 *
 * Then change mu to be mu + lnpama.

# Glatcocitr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glatcocitr | FR | DMuns11 |

### 1.1 Glatcocitr

Global Office Parameter Glatcocitr

### 1.2 Description

This Automation of TCS/CPS override (ATCO) timing parameter specifies the duration threshold for which the International card verification center (ICVC) attendant must provide a final call disposition after the verification conversation has begun (that is, the caller was unsplit). A timeout will result in a warning announcement/tone being played. This timer shall be specified in increments of 1 second with a range of 1 to 1800 with no default value. A value of 0 will map internally to a blank on the recent change view.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

# Glatcocstr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glatcocstr | FR | DMuns6 |

### 1.1 Glatcocstr

Global Office Parameter Glatcocstr

### 1.2 Description

This Automation of TCS/CPS Override (ATCO) timing parameter specifies the threshold from the time the OSPS routes the call to the International Card Verification Center (ICVC) until the ICVC returns answer supervision (or network "busy" or "block" is received). A timeout indicates a problem with the routing and results in the call being sent to an OSPS operator position for handling. This timer shall be specified in increments of 1 second with a range of 1 to 60 with no default value. The internal value of 0 will be mapped to a blank on the recent change view.

# Glatconum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glatconum | FR | DMdn |

### 1.1 Glatconum

Global Office Parameter Glatconum

### 1.2 Description

This parameter is used as the 10-digit routing number for the International Card Verification Center for the Automation of TCS/CPS overide (ATCO) feature.

The value for this parameter is a 10 digit [0-9] number (not restricted to directory number format). The value of blank will initially be populated, but must be updated to a valid 10 digit number, as determined by the service provider, in order for the ATCO feature to be activated.

Since this is a DMdn, both fields of it must be set. The array dn of this DMdn should be set to the desired digits, while the digcnt field of the DMdn should be set to the number of digits in the dn field. The digcnt should be 10 for a 10 digit number or 0 for no number. A number of less than 10 digits is not valid.

# Glathct

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glathct | LR | DMfacuscnt |

### 1.1 Glathct

Global Office Parameter Glathct

### 1.2 Description

This parameter specifies the maximum number of authorization codes that an office is permitted to define.

For 5e5.1 all offices will have this parameter set to 100000 except those 12 CNO/FTS2000 (listed here) and other non-cno/toll offices that are processed thru ODA within the 12 office time interval. These offices will have this parameter set to 250000. These are the 12 offices that NEED 250,000 codes.

| OFFICE | BASE AND CONTROL |
|---|---|
| Atlanta, GA | 3585d0 |
| Dallas, TX | 8363d0 |
| New York, NY | 9084d0 |
| Washington 3, DC | OR40d0 |
| Chicago, IL | 4E25d0 |
| Los Angeles, CA | 4X81d0 |
| Philadelphia, PA | 1R73d1 |
| Rochester, NY | 4J55d0 |
| Oakland, CA | 4X52d0 |
| St Paul, MN | AAA7d0 |
| Pittsburgh, PA | 1R45d0 |
| White Plains, NY | 8987d0 |

# Glatmap

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glatmap | FP | DMbool |

### 1.1 Glatmap

Global Office Parameter Glatmap

### 1.2 Description

Specifies whether this *5ESS*®-2000 switch performs LATA mapping to determine inter-lata or intra-lata type of call interconnection is being made. This parameter is used for *5ESS* ®-2000 switches which have operator services position system (OSPS) or intermediate switch point (ISP) facilities.

The parameter must be present in all PSM's and SM's which have ISPOPR trunks.

```
Group type = GPD_OPRT

Group id = 2
```

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** This parameter would be set to DBNO when the office contains multiple digit trees (one per LATA served by the OSPS). This is the case for an OSPS integrated with an access tandem (AT) switch or resides in the local switching network.

A value of DBYES will be used when the office does not contain multiple digit trees and must perform LATA mapping to determine the type of carrier interconnect call (INTRA vs INTER LATA). This is the case for an OSPS integrated with a toll switch, resides in the toll switching network OR when the office has trunks which serve more than one LATA.

***Default Rules:***

```
default = DBNO;

/* Default is: DBNO for a BOC (local network) office.

 * DBYES for an ATT-C (toll network) office.,";
```

# Glatsact

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glatsact | FP | DMbool |

### 1.1 Glats_tcnt

Automatic terminal setup activation.

### 1.2 Description

This global parameter will be used to control the activation of the 5e9.1 software update Automatic Terminal Setup capability software. This parameter will be initialized in 5e9.1 to DBNO by ODA and will not be supported by RC. The parameter is to exist on every SM in the office.

This parameter's initial value was changed in 5e9.2 to DBYES so that the ATS software will always be active on the switch. ODA will provide the initial value as DBYES for 5e9.2 and all future software releases. Any retrofit after the 5e9.2 software release should preserve the populated value the switch personnel provisioned prior to the office data base dump.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBYES

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** RC will not populate this global parameter. ODA will initialize this parameter to DBNO in 5e9.1 and to DBYES in 5e9.2 and later software releases (see relation description for more on parameter initialization). The switch personnel will be instructed to change this parameter thru ODBE when the ATS feature software update is applied.

***Retrofit Rules:*** For the 5e9.1 to 5e9.2 software release retrofit, ODA should update any SM containing the value DBNO to DBYES for all SMs in the office. For all retrofits after the 5e9.2 software release, ODA should preserve the value that appears in the office data base at the time of retrofit.

***Default Rules:***

```
default = DBYES;
```

# Glbcl3mnth

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glbcl3mnth | FR | DMunl11 |

### 1.1 Glbcl3mnth

Minimum threshold value of BC trunk layer 3 errors

### 1.2 Description

This office parameter is used to indicate the minimum (troubled) threshold for service-affecting level 3 errors on BCs for the entire switch. When this threshold (Glbcl3mnth) is reached, an entry for this BC trunk will be placed in a table that tracks BCs experiencing errors and the entry is time-stamped. If the maximum (remove) threshold (Glbclmxth) is reached, the current time and the time-stamp of the table entry are compared. If the time difference is less than a pre-defined time, the BC is taken out-of-service. If the time difference is greater than the pre-defined time, then the error count is decremented by a pre-defined amount.

# Glblcycle

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glblcycle | LP | DMblcycle |

### 1.1 Glblcycle

Bulk Calling Line IDentification Billing Cycle

### 1.2 Description

This parameter holds the billing cycle in hours of BCLID feature. This parameter can hold one of the following values:

```
DBBL1   For 1 hour billing interval

DBBL2   For 2 hours billing interval

DBBL3   For 3 hours billing interval

DBBL4   For 4 hours billing interval

DBBL6   For 6 hours billing interval

DBBL8   For 8 hours billing interval

DBBL12  For 12 hours billing interval

DBBL24  For 24 hours billing interval
```

This parameter applies only for customers with usage-sensitive billing. The billing cycle determines how often the AMA will collect the BCLID counts from the SMs for the usage-sensitive customers.

# Glblorsnd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glblorsnd | LRFR | DMshort |

### 1.1 Glblorsnd

Global Office Parameter Glblorsnd

### 1.2 Description

Glblorsnd is the time interval to wait before resending a CCS blocking signal (TUP/ISUP protocols) when failing to receive the acknowledgement in response to the initial CCS blocking signal sent. This parameter is used in the AM and SM and is specified in seconds.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 10

***AM Initial Value:*** 10

***CMP Initial Value:*** 10

***RC/ODA Rules:*** ODA should populate with default value for new office but preserve value from data base during retrofits and growths. This parameter is used only when the office contains CCS7 trunks as shown when one or more tuples of RLrt_trkg have in_sigtype or out_sigtype set to DBISUP7 or DBTUP7.

Insure that the SM value is the same as the AM value.

***Retrofit Rules:*** The original value in the AM should be populated in the SMs.

***Default Rules:***

```
default = 10;
```

***Distribution Rules:*** standard

***Checks:***

# Glbrcsacd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glbrcsacd | LRFR | DMbool |

### 1.1 Glbrcsacd

ACD/BRCS measurements status for whole office.

### 1.2 Description

This parameter specifies whether the ACD/BRCS feature is on. DBYES means the feature is on. DBNO means the feature is off. In support of System Resource Engineering, this global parameter is being distributed to the AM/CMP and to each SM. A trigger function is being added to administer rlCV_STATE dynamic relation tuples. Changes to the other parameters (including Gl_cacd) are completely independent of Glbrcsacd.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** RC and ODA will base the value of this global parameter on Secure Feature SFID121. When SFID121 is active, Glbrcsacd is DBYES. When SFID121 is inactive, Glbrcsacd is DBNO.

***Retrofit Rules:*** This value should be preserved over a generic retrofit.

***Default Rules:***
```
default = DBNO;
```

***Distribution Rules:***
```
/* standard */
```

***Import:***
```
"chk_apperm.R"
```

***Checks:***
```
/* RULE about ACD permitted by office type */

if (c_aperm(PVOBRACD,CONFIGMAX) == false) then
begin
        Glbrcsacd == DBNO;
end
```

# Glbrcsdb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glbrcsdb | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glbrcsdb

### 1.2 Description:

The Glbrcsdb global parameter contains an SM's current rlBRCSDB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCbrcscnt.c which is the init code for Glbrcsdb. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as ISDN lines and users are assigned and DNs are shared. It will never be decreased.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
        for modatt in RLmodatt

# Glbrirdta

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glbrirdta | LP | DMuns4 |

### 1.1 Glbrirdta

Global Office Parameter Glbrirdta, RDTA session limit

### 1.2 Description

This global office parameter will contain the limit to the number of simultaneous Remote Digital Test Access sessions for BRI monitoring in an SM. The parameter is not used in any way for PRI monitoring. The parameter is populated on the AM. A value of zero will disallow any BRI monitoring RPA sessions from being active but does not disallow BRI monitoring RPA sessions or PRI monitoring sessions from being populated.

# Glc1monittr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glc1monittr | FR | DMdn |

### 1.1 Glc1monittr

Global Office Parameter Glc1monittr

### 1.2 Description

CAMA trunk trouble code. Currently these four parameters Glc1monittr Glc2monittr Glc3monittr and Glc4monittr are populated with DNs for a CAMA operator to use. These signify that some sort of trouble was experienced on connection to the customer.

These are only used for offices which contain a TSPS CAMA operator interface. There are no checks currently which verify that any of these are input for those offices however, it should be normal procedure to at least populate one of the fields (999-999 is commonly used). For the Spencer port offices, there is no TSPS interface for CAMA operators. This means that a ONI-destined call should be switched to an outgoing AN1 trunk group with the AN1 digits telling the *4ESS™* switch (or other toll office) to request ON1. This will be done if the four parameters are all set to default values. Thus, if any of these is set, normal ON1 operation applies, if all are defaults, redirected ON1 applies.

# Glc7alm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glc7alm | LR | DMuns7 |

### 1.1 Glc7alm

Customer Account Services, Transaction Capabilities

### 1.2 Description

Glc7alm: Indicates the Customer Account Services (CAS) Transaction Capabilities Application Part (TCAP) query software alarm threshold. Every fifteen minutes, counts of the number of CAS TCAP queries attempted and the number of queries with reply valid are sent to the Direct Signal System Process. The CAS TCAP query success rate is calculated from these counts and is compared to Glc7alm. If the percentage rate falls below this threshold an alarm is activated. Glc7alm is a TCA specifiable value, with a range of 0 - 100 and a default of 95. 95 being a percentage (such as, 95%).

### 1.1 Glc7npms

Number of policed TSS 7 STP Point Codes in the national and international GSMs

### 1.2 Description

This parameter stores the total number of policed TSS 7 STP Point Codes in the national or international GSMs.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBNODISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ***NOTE:*** The STP Policing features are not supported, therefore Glc7npms should be populated with 0.

***Retrofit Rules:*** None.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
pcrlist[193] = true;

for gsm_opc in RLgsm_opc
begin
      pcrlist[gsm_opc.gsm] = true;
end
```

***Checks:***

```
if ((current_pcr == am) || (current_pcr is_in sm_all)) then
begin
      /* Glc7npms should equal 0. */
      Glc7npms == 0;
end
```

# Glcadalen

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcadalen | LRFR | DMshort |

### 1.1 Glcadalen

Global Office Parameter Glcadalen

### 1.2 Description

Length of cadence A in 50ms. This parameter indicates the number of 50ms. intervals in cadence A. Example: Domestic standard cadence is 6 seconds. There are 20 50ms. intervals in 1 second, thus 120 intervals in 6 seconds. The default value for domestic is 120.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 120

***AM Initial Value:*** 120

***CMP Initial Value:*** 120

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** not applicable

***Default Rules:***

```
default = 120;
```

***Distribution Rules:*** standard

# Glcadblen

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcadblen | LRFR | DMshort |

### 1.1 Glcadblen

Global Office Parameter Glcadblen

### 1.2 Description

Length of cadence B in 50ms. This parameter indicates the number of 50ms. intervals in cadence B. Since this is a secondary cadence for domestic, the domestic default is 0.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

# Glcal_info

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcal_info | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter RLCAL_INFO tuple count.

### 1.2 Description:

The Glcal_info global parameter contains an SM's current RLCAL_INFO tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 25

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA as well as its initial value and will be updated by trigger functions as Glical_inf is increased.
This global parameter needs special support for the Large Terminal Growth (LTG) process. As per requirements ODA is not supporting an equivalent ODA form.
Whenever adding or deleting a population rule for CALEA that has LTG impact, you must contact the ODA Support Group for LTG to modify the CALEA #include file.

***Retrofit Rules:*** This value should be preserved over a generic retrofit.

***Default Rules:***
```
default = 25;
```

***Distribution Rules:***
```
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;
```

***Checks:***
```
     /* RULE about Glcal_info.values: */
     if (current_pcr is_in sm_all) then
     begin

         /* Glcal_info is_in {25 thru (DBQNCAL_INFO - DBSFCAL_INFO)}; */
            Glcal_info is_in {25 thru (511 - 0)};
```

Copyright © 1999 Lucent Technologies 

```
    /* RULE about Glcal_info: */

    /* if (25 + Glical_inf <= (DBQNCAL_INFO - DBSFCAL_INFO)) then */
       if (25 + Glical_inf <= (511 - 0)) then
                    Glcal_info >= (25 + Glical_inf);
       else
    /* Glcal_info == DBQNCAL_INFO - DBSFCAL_INFO;   */
       Glcal_info is_in {25 thru (511 - 0)};
end
```

# Glcal_trnk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcal_trnk | FP | DMushort |

### 1.1 Fullname:

CALEA trunk total

### 1.2 Description:

This Global Parameter will count the number of CALEA trunks on an sm that are assigned to a surveillance.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** Recent Change will increment and decrement Glcal_trnk by 1 when RLfc_trunk.cal_state is updated to and from PC_CTONE_CALEA respectively. The value of this parameter is established by ODA and is initially set to 0.

```
/* Rule about Glcal_trnk and the SFID */
if (Glcal_trnk > 0) then
begin
       SFID 509 == Y;
end
```

This global parameter needs special support for the Large Terminal Growth (LTG) process. As per requirements ODA is not supporting an equivalent ODA form.
Whenever adding or deleting a population rule for CALEA that has LTG impact, you must contact the ODA Support Group for LTG to modify the CALEA #include file.

***Retrofit Rules:*** This value should be preserved over a generic retrofit.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;
```

***Checks:***

```
 if (current_pcr is_in sm_all) then
begin
```

# Glcal1usr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcal1usr | LP | DMuns8 |

### 1.1 Fullname:

CALEA user id storage.

### 1.2 Description:

The id of a user that has logged onto the CALEA system.

An SECM process will populate this global parameter with a user id.

***Type:*** DB8STRPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** ---

***AM Initial Value:*** \0

***CMP Initial Value:*** \0

***RC/ODA Rules:*** ODA will create one default tuple that will not come from any RC/ODA view.
This global parameter is not recent changeable.
This global parameter needs special support for the Large Terminal Growth (LTG) process. As per requirements ODA is not supporting an equivalent ODA form.
Whenever adding or deleting a population rule for CALEA that has LTG impact, you must contact the ODA Support Group for LTG to modify the CALEA #include file.

***Retrofit Rules:*** Retrofitting from 5e13.1 to 5e14.1 requires no evolution of this global parameter, the default value will be used by DBGEN. For all future generics the value of this parameter will be preserved over a retrofit.

***Default Rules:***
```
default = "\0";
```

***Distribution Rules:***
```
        /* standard - LP (am) */

# Glcalltrn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcalltrn | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter of Call Transfer Count for Lines/Trunks

### 1.2 Description:

The Glcalltrn global parameter contains an SM's count of lines and trunks which have a MFMWY feature assigned. Each SM will have it's own value of this count.

Its established by ODA and is updated by recent change mapping code. Its value is maintained over all initializations and updated via RC when an MW call transfer feature with the xfer option allowed is assigned or removed.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***TRIGGER:*** OSincpcb,

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** The value of this parameter is established by ODA and will be updated by RC when an MW call transfer feature with xfer option allowed is assigned or removed. Its value can increase and decrease.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
        for modatt in RLmodatt

# Glcaloc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcaloc | FR | DMca_loc |

### 1.1 Glcaloc

Global Office Parameter Glcaloc

### 1.2 Description

Cause Value location field.

This parameter is used to determine the value of the Location Field when a Q.931 Cause Value information element (IE) is generated for a BRI or PRI.

If PUB_LOCAL is used, the Location Field in the Q.931 message will have a value of 0x2. If PRIV_LOCAL is used, the Location Field in the Q.931 message will have a value of 0x1.

A value of PUB_LOCAL should be used when the switch is deployed in a public network. A value of PRIV_LOCAL should be used when the switch is deployed in a private network.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

# Glcalpwdag

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcalpwdag | LP | DMuns8 |

### 1.1 Fullname:

CALEA password aging

### 1.2 Description:

This global parameter contains the number of days allowed before a CALEA password expires.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** ---

***AM Initial Value:*** 30

***CMP Initial Value:*** 30

***RC/ODA Rules:*** ODA will create one default tuple that will not come from any RC/ODA view.
This global parameter is not recent changeable, it will be supported by MML commands.
This global parameter needs special support for the Large Terminal Growth (LTG) process. As per requirements ODA is not supporting an equivalent ODA form.
Whenever adding or deleting a population rule for CALEA that has LTG impact, you must contact the ODA Support Group for LTG to modify the CALEA #include file.

***Retrofit Rules:*** Retrofitting from 5e13.1 to 5e14.1 requires no evolution of this global parameter, the default value will be used by DBGEN. For all future generics the value of this parameter will be preserved over a retrofit.

***Default Rules:***

```
default = 30;
```

***Distribution Rules:***

```
        /* standard - LP (am) */
        ;
```

# Glcastime

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcastime | LRFR | DMuns7 |

### 1.1 Glcastime

Global Office Parameter Glcastime

### 1.2 Description

This parameter specifies the value, in tenths of seconds, of the time to wait for a customer accounts services (CAS) query reply. The parameter can be changed in tenths of seconds increments.

This parameter indicates the longest period of time that call processing will wait for a CAS reply from the data base. A timeout will result in call processing continuing the call as indicated by the Glcas_indblk.

Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value.

# Glccctbong

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glccctbong | FR | DMuns7 |

### 1.1 Glccctbong

Global Office Parameter Glccctbong

### 1.2 Description

This parameter indicates the timing interval from the 'BONG' tone to initial digit reception for the customer dialed 0+ ACCS call. Timeout will bailout this call to an operator position.

It will have no effect unless Glccc_on is set to DBYES.

The unit for this parameter is tenths of seconds and can be changed in tenths of seconds increments.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

# Glccctrest

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glccctrest | FR | DMuns7 |

### 1.1 Glccctrest

Global Office Parameter Glccctrest

### 1.2 Description

For the customer dialed 0+ ACCS call, this parameter indicates the inter-digit timing interval for all card types (CAS, CCC, and TEL) from the first digit after the 'BONG' tone, with a value of 1-9, until the last of a maximum of 34 digits is received. A timeout will be considered to be the end of the calling card number entry process. Call processing will give proper treatment to this call depending on the received calling card number.

Note that if the account number has a variable number of digits, this parameter is used to determine the end of calling card number entry process.

It will have no effect unless Glccc_on is set to DBYES.

The unit for this parameter is tenths of seconds and can be changed in tenths of seconds increments.

# Glccode

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glccode | LRFR | DMhex16 |

### 1.1 Glccode

Country Code

### 1.2 Description

This global parameter is used to store the country code of the country in which the switch (exchange) resides. This parameter is populated for switches with GATEWAY application, ETSI ISDN feature and Wireless application.

For calls entering the gateway office and terminating in the country (the country in which the gateway resides), the country code field of the call accounting and traffic data record will be set equal to the parameter, Glccode.

```
RANGE: 0x000 to 0x999, inclusive

EXAMPLE: For Mondial Gateway, the country code is 44. Store

         as three hexadecimal characters with the rightmost

         twelve bits having the value 0000 0100 0100.

         Glccode must_equal 0x044;
```

***NOTE:*** This global parameter must be populated for all gateway offices.

This Glccode parameter is also used for ETSI ISDN validation of user provided calling and connected directory numbers. The user provided country code is checked against country code in Glccode.

Note that a country code may not have a leading digit of "0".

# Glcdptrks

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcdptrks | FP | DMushort |

### 1.1 Glcdptrks

Trunks with an Advanced Services Platform custom dialing plan

### 1.2 Description

The Glcdptrks global parameter contains an SM's count of ASP custom dialing plan features assigned to trunks and active in RLasp_port. Its value is maintained over all initializations and updated via trigger functions as custom dialing plan features are inserted or deleted.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as custom dialing plan features are inserted or deleted.

Its value can increase and decrease.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

# Glcfr_dn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcfr_dn | FP | DMdn |

### 1.1 Glcfr_dn

Global Office Parameter Glcfr_dn

### 1.2 Description

This parameter is used in one of two ways. The first use is as the preselect (default) directory number for external conferencing via the conference connection. The other possible use is as the pseudo ANI digits that are outpulsed when feature group D signaling is used. The choice of these two usages is dependent upon the keying sequence used by the OSPS operator. The value for this parameter is a 10 digit [0-9] number (not restricted to directory number format) or 0 if no external conferencing or ANI digits for feature group D signaling are used. Since this is a DMdn, both fields of it must be set. The array dn of this DMdn should be set to the desired digits, while the digcnt field of the DMdn should be set to the number of digits in the dn field. The digcnt should be 10 for a 10 digit number or 0 for no number.

# Glcfscpi

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcfscpi | FP | DMshort |

### 1.1 Glcfscpi

Global Office Parameter Glcfscpi

### 1.2 Description

The Glcfscpi global parameter is defined to be an incremental or decremental value used to increase or decrease the number of RLcfscop tuples allocated in the SM during initialization or RLcf_ltm triggers. A negative value only affects full and selective initializations. Its value is established via ODA or RC/V and is maintained over retrofits.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***TRIGGER:*** FCtrcfscpi

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** A RC/V view (SREINCR) and ODA form (SREINCR) per-SM field is required and the value can not be increased by more than 50 during an update.

***Retrofit Rules:*** The value of this parameter is preserved over a retrofit.

# Glcicp_blk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcicp_blk | FR | DMbool |

### 1.1 Glcicp_blk

Carrier Identification Code Parameter block

### 1.2 Description

This global parameter will be used to control whether the ISUP carrier identification code parameter (CICP) is included in an IAM message at an access tandem switch which was arrived at via inband signaling. If the parameter is set to DBNO, CICP will be included in the outgoing IAM. If the parameter is set to DBYES, CICP will not be included in the outgoing IAM. This parameter can only be set to DBYES if CICP feature has been purchased (SFID009 is set to DBYES).

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** This parameter is populated by Recent Change.

***Retrofit Rules:*** The global parameter is being added in 5E9(2) for carrier identification code parameter (CICP) Special Feature. In a 5E9(1) to 5E9(2) retrofit or a 5E9(1) to 5E10 retrofit skip, the value of Glsf11dumm in 5E9(1) should be copied into the new global parameter Glcicp_blk in 5E9(2) or 5E10 to maintain the value for CICP special feature. The dummy parameter Glsf11dumm should be restored with default value of DBNO in 5E9(2) or 5E10.

***Default Rules:***

```
default = DBNO;
```

***Distribution Rules:*** standard

***Checks:***

```
/* RULE about Glcicp_blk.values: */

       Glcicp_blk is_in {DBNO, DBYES};

# Glcindx7

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcindx7 | LPFP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glcindx7 - total number of rlCINDX7 tuples

### 1.2 Description:

The Glcindx7 global parameter contains an AM or SM's count of rlCINDX7 tuples. Its value is maintained over all initializations and updated as rlCINDX7 tuples are inserted.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ODA ONLY This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as rlCINDX7 tuples are inserted. This is the "Total" global parameter used by the SRE functionality. Its value can only increase.
The following algorithm is used to calculate Glentry7:

```
in AM and SM-2000:
       Glcindx7 must be between 0 and 1600
       Glcindx7 must be 0 if Glentry7 is 0
       Glcindx7 must be 40 if Glicindx7 + (2 * Glpci7lab) +
               ((Glentry7 + 49)/50) is > 0 and < 40 Glcindx7
                 must be 1600 if Glicindx7 + (2 * Glpci7lab) +
                 ((Glentry7 + 49)/50) is > 1600 otherwise
                   Glcindx7 is Glicindx7 + (2 * Glpci7lab) +
                   ((Glentry7 + 49)/50)
in an SM:
        Glcindx7 must be between 0 and 1600
        Glcindx7 must be 0 if Glentry7 is 0
        Glcindx7 must be 40 if Glicindx7 + (2 * Glpci7lab) +
                ((Glentry7 + 49)/50) is > 0 and < 40 Glcindx7
                  must be Glpci7lab + 80 if Glicindx7 +
                  (2 * Glpci7lab) + ((Glentry7 + 49)/50) is >
                  ( Glpci7lab + 80 )
       otherwise
       Glcindx7 is Glicindx7 + (2 * Glpci7lab) +
```

Copyright © 1999 Lucent Technologies

```
                ((Glentry7 + 49)/50)
end SM
```

Note that in this PRL file we use the idiom "((Glentry7 + 49)/50)", but in the corresponding TMCALC_CINDX7() macro, which is used by triggers, we use the idiom "(((Tentry7) + 50)/50))". The reason for this is because the TMCALC_CINDX7() macro is processed by the C compiler which does integer division (truncates) because all of the expression arguments are integer, whereas the PRL compiler does floating point division (rounds). Until the PRL compiler is corrected, we must modify the PRL source file in this manner in order to make the C compiler and PRL compiler output match.

***Retrofit Rules:*** The value of this parameter should be recalculated during a generic retrofit.

# Glcl_offset

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcl_offset | FP | DMuns4 |

### 1.1 Glcl_offset

Global Office Parameter Glcl_offset

### 1.2 Description

Gives the cluster offset for each member of a remote cluster, indicating the relative position within the cluster. For MMRSMs this parameter gives the relative RSM number (1-4) within the MMRSM of the RSM that the parameter is populated in. For ORMs and TRMs, this parameter is always set to 1. This number must agree with:

(1) The 'cl_offset' attribute in the AM relation RLMODATT for the tuple whose key is the module number of the ORM/TRM/RSM this parameter is populated on.

(2) The 'cl_offset' attribute in the SM relation RLMATATT for each tuple corresponding to this RSM.

(3) The XX part of the corresponding rmXX attribute (actually one of rm01 - rm10) of the AM relation RLCLIDAT for the tuple corresponding to the cluster this module is in. The key to the CLIDAT tuple is the same as the 'clid' attribute of the MODATT tuple discussed in (1) above. The correct rmXX attribute (from which the XX = 'cl_offset' comes from) is the one which has as its value the SM number of the ORM/TRM/RSM this parameter is populated on.

RLMODATT defines the population rules for initially determining the cl_offset number. All other instances of this attribute are then determined from the RLMODATT entry. This number can be from one to four for RSMs and always one in ORMs and TRMs. For all other module types, the null value of zero is populated.

# Glcldbnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcldbnum | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glcldbnum

### 1.2 Description:

The Glcldbnum global parameter contains an SM's current rlCLDB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCcldbcnt.c which is the init code for Glcldbnum. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

***Type:*** DBSHORTPAR

# Glcllqdb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcllqdb | LRFR | DMushort |

### 1.1 Glcllqdb

Count of the total number of initialized ACD/BRCS Call Queue Data Block (rlCLLQDB) tuples

### 1.2 Description

This global parameter contains a count of the total number of initialized ACD/BRCS Call Queue Data Block tuples. It is initialized by the rlCLLQDB initialization function to equal the actual number of tuples in rlCLLQDB. If the rlCLLQDB initialization succeeds then Glcllqdb will be set to the value of the Glcqmcs Global Parameter. In case of an initialization failure, Glcllqdb will reflect the actual number of rlCLLQDB tuples successfully initialized.

The rlCQPARM trigger function will increase the value of Glcllqdb as additional rlCLLQDB tuples are inserted in response to increases in the value of Glcqmcs. The rlCQPARM trigger function will insert rlCLLQDB tuples and correspondingly increase Glcllqdb such that Glcllqdb is not less than the value of Glcqmcs. Glcllqdb is specified in decimal.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is supported by ODA but the value does NOT appear on any ODA form. It is initialized by ODA to equal the value of the Glcqmcs Global Parameter. The Logical Processor from which to obtain the value of Glcqmcs is identified by the Glpacdbrcs Global Parameter.This parameter is supported in verify only mode by RC.

|---|---|---|
| Glcloffset_o | FP | DMuns4 |

### 1.1 Glcloffset_o

Global Office Parameter Glcloffset_o

### 1.2 Description

Glcl_offset shadow parameter used by DBclidattrg(). Gives the cluster offset for each member of a remote cluster, indicating the relative position within the cluster. For MMRSMs this parameter gives the relative RSM number (1-4) within the MMRSM RSM that the parameter is populated in. For ORMs and TRMs, this parameter is always set equal to 1. This number must agree with:

(1) The global office parameter, Glcl_offset.

(2) The 'cl_offset' attribute in the AM relation RLMODATT for the tuple whose key is the module number of the ORM/TRM/RSM this parameter is populated on.

(3) The 'cl_offset' attribute in the SM relation RLMATATT for each tuple corresponding to this RSM.

(4) The XX part of the corresponding rmXX attribute (actually one of rm01 - rm10) of the AM relation RLCLIDAT for the tuple corresponding to the cluster this module is in. The key to the CLIDAT tuple is the same as the 'clid' attribute of the MODATT tuple discussed in (1) above. The correct rmXX attribute (from which the XX = 'cl_offset' comes from) is the one which has as its value the SM number of the ORM/TRM/RSM this parameter is populated on.

RLMODATT defines the population rules for initially determining the cl_offset number. All other instances of this attribute are then determined from the RLMODATT entry. This number can be from one to four for RSMs and is always one in ORMs and TRMs. For all other module types, the null value of zero is populated.

# Glcmc_conn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcmc_conn | FR | DMbool |

### 1.1 Glcmc_conn

Global Office Parameter Glcmc_conn

### 1.2 Description

This parameter is used to determine if a call from a Cellular Mobile Carrier (CMC) to a Feature Group D (FGD) Carrier should use the seizure time when a seizure is detected on an incoming trunk from the CMC or the connect time when the initial wink is received from the FGD carrier. The default value is DBNO, which represents seizure time.

This parameter cannot be set to DBYES unless the Type 2A AMA special feature is purchased and SFID128 is set.

# Glcnd_tim

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcnd_tim | FP | DMuns16 |

### 1.1 Glcnd_tim

Global office parameter Glcnd_tim

### 1.2 Description

This parameter specifies the value, in milliseconds, of the time to wait for an AP response to a Calling Name Display (CND) request before sending out an information message with available data.

This parameter should be populated in all the ISDN SMs only. Therefore, for the SMs with the GLISDNBASE software loadable package, the range of values for Glcnd_tim is between 2000 - 6000 milliseconds. The default is 2000 milliseconds. The value should be the same in every ISDN SM. The initial value should be set to 2000 (decimal). Afterwards this parameter will be recent changeable. The value of this parameter should be retained during retrofits and growths.

For the SMs with software loadable package other than GLISDNBASE, Glcnd_tim is set to 0.

***Type:*** DBSHORTPAR

# Glcnmech

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcnmech | FP | DMshort |

### 1.1 Fullname:

Percentage of COIN and MECH traffic in the office.

### 1.2 Description:

The Glcnmech global parameter holds the summation of the percentage of COIN traffic in the office and MECH traffic in the office. Its value is established via ODA or RC/V and is maintained over retrofits.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***TRIGGER:*** OAalo_coinot,

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** This parameter must have the same value on all SMs where it is populated. For offices retrofitting to 5e9.2 and for initial offices, ODA should populate this parameter with the value 80, unless directed by the customer to use a different value (the customer may determine a different value based on actual or projected call volumes).

***Retrofit Rules:*** This value should remain intact over a generic retrofit.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
        /* Though this global parameter is not populated everywhere,
         * as for all FP global parameters, there is storage allocated
         * for it on all SMs.  Thus the following distribution rules.
         */

# Glcoinfst

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcoinfst | FP | DMbool |

### 1.1 Glcoinfst

Global Office Parameter Glcoinfst

### 1.2 Description

Coin foreign station sets? Dial Tone First (DTF) coin telephone sets must lift a coin deposit ground during the talk (line loop current) state to prevent being hung to an operator trunk during line reverse battery conditions. This option should be set=DBYES if DTF coin set options do not comply with this requirement but may experience noise from A/C induction on operator trunk calls while the line battery is reversed. This option can only be set to DBYES via ODBE.

On retrofit, preserve existing value.

# Glcongupd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcongupd | FP | DMcongupd |

### 1.1 Glcongupd

Global Office Parameter Glcongupd

### 1.2 Description

This parameter is only used by the National Version of Standardization Sector (SS7) , formerly CCITT7. GLcongupd indicates which congestion update method is being used by the GSM.

There are three possible congestion update methods defined in an enumeration found in the domain DMcongupd.G. They are CCNULLUPD, CCRCTMSG and CCCGTIMER. The enumerations CCRCTMSG and CCCGTIMER will be used only when the congtype found in RLgsm_opc is set to Multiple Congestion With Priorities.

CCNULLUPD will be used as a default for this Global Parameter on all Non-Global SMs.

CCRCTMSG is the method by which a Route Set Congestion Test Message is sent. CCCGTIMER is the method of setting a timer and lowering the congestion level after the timer expires.

# Glcot_access

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcot_access | LRFP | DMaccess |

### 1.1 Glcot_accessGlcot_contact

Global Office Parameter Glcot_access

### 1.2 Description

This parameter is used to indicate COT feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the COT feature, whether the feature is generally available or whether the feature is temporarily unavailable for use. It should initially be populated with UNAVAILABLE. The AM value for this parameter is defaulted to 'UNAVAILABLE'. ODA must retain its value across retrofits to post 5E5 generics. The AM parameter is changed by RC/V only when the 'ALL' value is used for the SM key on the LASS Feature Access View. The AM parameter reflects the office standard value and is typically used to set the SM parameters after SM growth.

# Glcot_featid

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcot_featid | FR | DMfid |

### 1.1 Glcot_featid

Global Office Parameter Glcot_featid

### 1.2 Description

This parameter contains a feature id for generally 'AVAILABLE' feature access. This will be used by call processing to determine which tuple to read in the _cf and _opts relations for generally 'AVAILABLE' features. Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the generally available feature name, /COTGA, as the key.

# Glcotparam

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcotparam | LR | DMlong |

### 1.1 Glcotparam

COT parameters for mode and priority

### 1.2 Description

This global parameter is used by the COT Transparency Feature. It stores three pieces of information. Bits 0-2 (where 0 is the least significant bit) indicate the COT message priority (1-5).

Bit 3 indicates the `mode` the COT feature is operating:

```
    1 = operate in the 1A Transparent mode where

        channel to be used is indicated in the CLASSDEF form.

    0 = operate in the original `mode` where

        dedicated channel tty45 is used.
```

Bit 4 indicates whether mode and priority have been initialized or not. If this field is a 1, then they have been initialized. If this field is 0, then the COT process will initialize this parameter to 20 (Dedicated mode of priority=4 and initialized bit set to 1).

These two pieces of information (mode and priority) are administered via craft input message and are not accessible via Recent Change.

# Glcotrept

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcotrept | FR | DMshort |

### 1.1 Glcotrept

Global Office Parameter Glcotrept

### 1.2 Description

Glcotrept, specified in seconds, is the time between the repeated CCS continuity tests (CCIS6/TUP/ISUP protocols). ODA should populate with default value for new office but preserve value from data base during retrofits and growths. This parameter is used only when the office contains CCS trunks as shown when one or more tuples of RLrt_trkg have in_sigtype or out_sigtype set to DBISUP7, DBTUP7 or DBCCIS6.

# Glcp1dummy

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcp1dummy | LR | DMlong |

### 1.1 Glcp1dummy

Global Office Parameter Glcp1dummy

### 1.2 Description

This parameter is used to control access to the disk. When a disk access results in a failure this parameter is set with the current timestamp. Future disk accesses are only allowed when the current timestamp is two minutes past the timestamp value contained in this parameter.

This parameter is set at system process initialization by the DB function DBdiskinit(), in response to a message MDSI_DBDSK received from AIM, or at routine intervals if the disk becomes inaccessible (DDSDSDP OFFNORMAL).

This parameter will be replaced in 5E6 with Glthrdisk.

# Glcp12dummy

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcp12dummy | LR | DMlong |

### 1.1 Glcp12dummy

Global Office Parameter Glcp12dummy

### 1.2 Description

This parameter is used by the Recent Change Downward Compatibility Capability (u1150) for 5E8.1. This parameter provides a means for setting the office default for the 'version' APPTEXT session parameter. The valid values (for 5E8.1) are 0, 6, 7, and 8. If this parameter is set to '6' on the AM, all input to any APPTEXT sessions initiated in the office is expected to be in 5E6.1 format. If this parameter is set to '7' on the AM, all input to any APPTEXT sessions initiated in the office is expected to be in 5E7.1 format. If this parameter is set to '0' or '8' on the AM, all input to any APPTEXT sessions initiated in the office is expected to be in 5E8.1 format.

The value of this parameter on the CMP is not significant.

This functionality will be moved to global parameter Gldfltvers in 5E9(1).

# Glcpdls

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcpdls | LR | DMuns9 |

### 1.1 Glcpdls

Global Office Parameter Glcpdls

### 1.2 Description

Glcpdls keeps count of the total number of External Information System (EIS) call processing data links on the *5ESS*®-2000 switch (all SMs). As EIS CPDLs are added or removed from any SM, this global is incremented or decremented accordingly.

The Glcpdls global must always equal the sum of the global Gleisdl across all SMs.

# Glcperleak

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcperleak | FR | DMuchar |

### 1.1 Glcperleak

Speech Handler (SH) Channel Trunk leak rate

### 1.2 Description

This office parameter indicates the protocol error record (PER) leak rate for the speech handler channel trunks. The parameter applies to all trunks on a switch. The leak rate represents the number of PERs to be leaked in a period of time.

Example: If the value of this global parameter is set to 5 and the time interval is 3 minutes, then every 3 minutes 5 PERs will be leaked.

# Glcperthrs

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcperthrs | FR | DMuchar |

### 1.1 Glcperthrs

Speech handler (SH) Voice channel trunks PER threshold

### 1.2 Description

This office parameter indicates the protocol error record (PER) error threshold for speech handler channel trunks. This parameter applies to all the trunks on a switch. A report is generated when the defined PER threshold value is met.

Example: If this global parameter is set to 15, then when the PER count for a trunk reaches 15 a report is generated. An internal counter is reset so that the next report is only generated when a new PER count of 15 is reached.

# Glcqdbx

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcqdbx | LRFR | DMuns13 |

### 1.1 Glcqdbx

Global Office Parameter Glcqdbx

### 1.2 Description

This parameter is initialized by ODA to equal the sum of the Glctmcs and Glictmc Global Parameters. The Logical Processor from which to obtain the values of Glctmcs and Glictmc is identified by Glpacdg.

This parameter does not appear on any ODA form. This parameter is initialized by the RLCQDB initialization function to equal the actual number of tuples in RLCQDB. If the RLCQDB initialization succeeds then Glcqdbx will be set to the sum (Glctmcs + Glictmc). In case of initialization failure, Glcqdbx will reflect the actual number of RLCQDB tuples successfully initialized.

This parameter is displayed (read only) on the RC/V OSPS Office Parameters view 8.9 in the field named 'ACTUAL CQDB' in the 'CALL QUEUE SLOTS' section.

The RLCTINFO trigger function will increase the value of Glcqdbx as additional RLCQDB tuples are inserted in response to increases to Glctmcs and Glictmc. The RLCTINFO trigger function will insert RLCQDB tuples and correspondingly increase Glcqdbx such that Glcqdbx is not less than the sum (Glctmcs + Glictmc). Glcqdbx is specified in decimal.

# Glcsron

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcsron | FR | DMbool |

### 1.1 Glcsron

Customer Account Services (CAS) Carrier Specific Routing (CSR) Feature Activation Parameter

### 1.2 Description

This global is used to activate/deactivate the processing of CAS CSR calls. It has the following meaning:

```
If the parameter is set to DBNO,

then CAS CSR processing is off.

If the parameter is set to DBYES,

then CAS CSR processing is on.
```

***Type:*** DBENUMPAR

# Glcst_das

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcst_das | FR | DMda_tree |

### 1.1 Glcst_das

Global Office Parameter Glcst_das

### 1.2 Description

This parameter is used for the Digit Analysis Selector (DAS) of incoming Circuit Switched Trunk (CST) calls for the Circuit Switched Trunk Enhancement (CSTE) feature. The DAS is a number that indicates the digit interpreter tables that will be used in analyzing the incoming digit stream for trunks. The default value 0 indicates no CST DAS is to be used for routing CST calls, then the incoming trunk group DAS will be used to analyze the incoming digits.
SUPPORTED BY: RC, ODA, and ODBE

ODA DEFAULT: 0

RC DEFAULT: 0

RANGE: 0 - 99

***Type:*** DBSHORTPAR

# Glcstlri

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcstlri | FP | DMsysid |

### 1.1 Glcstlri

Global Office Parameter Glcstlri

### 1.2 Description

Contains a Route Index (RI) for Terminal Maintenance (TM) Coin Station Test Line (CSTL) calls. This parameter is used only in routing CSTL calls originated from Remote Switching Modules (RSM)s, Optically Remote switching Modules (ORM)s, Two-mile optically Remote switching Modules (TRM)s, and clusters of remote switching modules (MMRSM). Modules that are non-RSM/ non-ORM/non-TRM/non-MMRSM route CSTL calls using fixed routing (CSTL treatment type), and therefore the value of this parameter must be set to the default value of zero (0). The route index value populated in the parameter Glcstlri for RSM/ORM/TRM/MMRSM/ points to a trunk group of one or more outgoing SN107 circuits, all of which must reside within the remote module or cluster.

Each remote module or cluster for which CSTL testing is to be supported must contain its own metallic facilities, including outgoing SN107 CSTL trunk group(s), MMSU, and MTBs.

Each module within a cluster must contain a non-zero value for the parameter Glcstlri (if CSTL testing is to be supported from the module). This value must point to a trunk group within the module or cluster. Failure to populate Glcstlri to a non-zero value will result in metallic routing failure during CSTL calls originated from that module. Population of Glcstlri to a route index value pointing to a trunk group outside of the remote module or cluster will also result in metallic routing failures.

# Glctcst

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glctcst | FR | DMchar4 |

### 1.1 Glctcst

Global Office Parameter COT Cost

### 1.2 Description

This global parameter is used to indicate the cost of using a COT feature. This cost is voiced to the user when using 2-level activation of a COT feature. This parameter only has meaning when Glctact is DBYES. This parameter is a character field in the form of XX dollars and XX cents, where each X must be in the range of NULL or 0 to 9. If this parameter is entirely NULL, a different announcement will be played when using 2-level activation of a COT feature. There is a difference between a cost of 0000 and a not specified (NULL) cost.

# Glctmcs

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glctmcs | LP | DMuns13 |

### 1.1 Fullname:

Global Office Parameter Glctmcs

### 1.2 Description:

The Logical Processor to populate according to the following rules is identified by Glpacdq. Other Logical Processors should be populated with the value zero.

This parameter (Call Type Maximum Calls Sum) is initialized by ODA to equal the sum of the RLCTINFO.max_calls. This parameter does not appear on any ODA form.

The Recent Change views 21.22 (RC_CTYP) mapping code will maintain the value of Glctmcs as Recent Changes to this views modify the sum of RLCTINFO.max_calls attributes. The RLCTINFO trigger function will insert additional tuples into RLCQDB such that the number of tuples (reflected in Glcqdbx) is not less than the sum (Glctmcs + Glictmc).

The sum (Glctmcs + Glictmc) is displayed (read only) on the OSPS Office Parameters view 8.9 in the field named 'REQUIRED CQDB' in the 'CALL QUEUE SLOTS' section. Recent Change and ODA are both required to disallow the sum (Glctmcs + Glictmc) from exceeding 5000. Glctmcs is specified in decimal.

***Type:*** DBSHORTPAR

# Glctone

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glctone | FR | DMpcsignal |

### 1.1 Fullname:

CALEA C-tone.

### 1.2 Description:

Identify what is used for C-tone on CALEA trunks marked as assigned to a case.

This global parameter provides an option for either tone or silence (idle code). The intent is to align what the switch can do with the recent FCC ruling on the J-standard, while keeping a tone option for those customers/collection boxes that want it.

***Type:*** DBENUMPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DB_PCNULL

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** This global parameter is populated from RC view C.1 (CALEA parameters).
This global parameter needs special support for the Large Terminal Growth (LTG) process. As per requirements ODA is not supporting an equivalent ODA form.
Whenever adding or deleting a population rule for CALEA that has LTG impact, you must contact the ODA Support Group for LTG to modify the CALEA #include file.

***Retrofit Rules:*** Retrofitting from 5e13.1 to 5e14.1 requires no evolution of this global parameter, the default value will be used by DBGEN. For all future generics the value of this parameter will be preserved over a retrofit.

***Default Rules:***
```
default = DB_PCNULL;
```

***Distribution Rules:***

# Glcv_state

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcv_state | FP | DMushort |

### 1.1 Fullname:

Count of RLcv_state tuples present in an SM.

### 1.2 Description:

The Glcv_state global parameter contains an SM's current rlCV_STATE tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions when call vectoring is assigned. It is also updated by trigger functions as lines and trunks are assigned and when rlCQDB tuples are inserted. It will never be decreased.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;
```

***Import:***
```

# Glcvaga

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcvaga | FR | DMuns8 |

### 1.1 Glcvaga

Global Office Parameter Glcvaga

### 1.2 Description

This global specifies the maximum number of GOTOAGE/GOTOQUE/GOTOSTA/GOTOAVL steps that can be processed for a given call. When this limit is reached for a given call, vector processing is stopped. If the call has been previously placed into a queue, the call remains in that queue and any currently active delay treatment (MUSIC/RING/QUIET) continues. If the call has not been previously queued, the call is given reorder.

When the global parameter contains zero (0), no limit is enforced.

# Glcvanq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcvanq | FR | DMuns8 |

### 1.1 Glcvanq

Global Office Parameter Glcvanq

### 1.2 Description

Glcvanq is the maximum number of seconds an announcement can last when a call routed to that announcement has not been previously placed into a ACD queue. The purpose of this limit is to detect when what should have been the Route Index (RI) for an announcement is mistakenly used for a music source. The result would be that any ANNOUNC step using this RI will never end. If a call has been previously queued, this is of little concern. However when the call has not been queued, an error of this sort can tie up all vectoring resources (such as, RLcv_state tuples) with non-productive calls.

When the global parameter contains zero (0), no limit is enforced.

# Glcvrga

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcvrga | FR | DMuns8 |

### 1.1 Glcvrga

Global Office Parameter Glcvrga

### 1.2 Description

This global specifies the maximum number of GOTOAGE/GOTOQUE/GOTOAVL/GOTOSTA steps that can be processed without pausing. The counter used to count the steps is reset whenever an ANNOUNC, MUSIC, RING, or QUIET step is successfully processed. If the counter reaches the limit specified by this global, vector processing is paused for the number of seconds defined by Glcvpau and all resettable limit counters are cleared. If the call has been previously placed into a queue, the pause will end early if an agent becomes available during the pause. Any currently active delay treatment (MUSIC/RING/QUIET) continues during the pause. If no delay treatment is active, the caller will hear silence during the pause.

When the global parameter contains zero (0), no limit is enforced.

# Glcvtmn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcvtmn | FR | DMuns8 |

### 1.1 Glcvtmn

Global Office Parameter Glcvtmn

### 1.2 Description

Glcvtmn is a limit (given in seconds) on the total time a call can be vectored without being placed on a queue. The purpose of this parameter is to guarantee that a call cannot be given vectoring treatment (such as, connected to announcements and music) indefinitely if it has not been placed into a queue. It is needed in commercial ACD applications where callers expect to wait for a long period of time (hours) to prevent a vectoring error from tying up global vectoring resources (such as, RLcv_state tuples) with unproductive calls (Without this limit, these calls may only be cleared from the switch by initializing the SMs).

When the global parameter contains zero (0), no limit is enforced.

| Glcwdeftim | FR | DMlong |

### 1.1 Glcwdeftim

Global Office Parameter Call Waiting Deluxe Default Timer

### 1.2 Description

This global parameter is used by the call waiting deluxe special feature and indicates the amount of time the switch waits before providing the CWD default treatment, if the CWD customer has not selected a CWD per-call option or the waited party has not disconnected. Glcwdeftim can be set to a value from 0 to 110 seconds in increments of 1 second and is stored as milliseconds.

# Glcyctm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glcyctm | FP | DMuchar |

### 1.1 Glcyctm

Global office parameter Glcyctm

### 1.2 Description

This parameter defines the country dependent cycle time used for cyclic retesting of abnormally blocked E & M trunks. This cycle time is the cycle time of trying to recover an abnormally blocked trunk by sending the clear forward signal. In Saudi Arabia this cycle time is 1 minute, ie. every 1 minute a clear forward will be sent and a release guard expected. If the release guard is seen then the trunk becomes free. Used by Export.

# Gldadatlink

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldadatlink | FP | DMbool |

### 1.1 Gldadatlink

Global Office Parameter Gldadatlink

### 1.2 Description

This parameter indicates whether a DAS/C vendor may have one or more data links on this SM. These data links must exist in the FC_PORTTYP relation with a servclass of FC_DASC. These data links cannot be operational until Gldadatlink is set to DBYES. This parameter must be DBNO unless this is a loaded SM. This parameter is set to DBYES by RC when the first DASC data link is grown on this SM, and set to DBNO by RC when the last DASC data link is removed from this SM. It does not appear on a Recent Change view.

***Type:*** DBENUMPAR

# Gldascdls

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldascdls | FP | DMuns2 |

### 1.1 Gldascdls

Global Office Parameter Gldascdls

### 1.2 Description

This parameter specifies the quantity of Directory Assistance System Computer (DAS/C) data link DSLs that are connected to the SM. This parameter is populated by ODA and RC but does not appear on any view. Each SM's parameter is set to the number of RLDLDSL tuples in that SM with the servclass attribute set to FC_DASC.

# Gldatat_chk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldatat_chk | FP | DMbool |

### 1.1 Gldatat_chk

Global Office Parameter Gldatat_chk

### 1.2 Description

Determine if it is necessary to make the data terminal check for incoming trunk terminating calls. This parameter must be populated to DBYES in a country that uses on A party category of 'data transmission' and is able to send the A party category end to end, such as the value should be DBYES for SA since 'data transmission' is used and the address signaling on all trunks is MFC. The value should be DBNO for CO, KO and NL since the 'data transmission' category is not used. The range is enumerated. Used by Export.

# Gldbcnd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldbcnd | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter rlDBCND Tuple Count.

### 1.2 Description:

The Gldbcnd global parameter contains an SM's current rlDBCND tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCdbcndcnt.c which is the init code for Gldbcnd. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

# Gldcowait

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldcowait | FR | DMshort |

### 1.1 Gldcowait

Global Office Parameter Gldcowait

### 1.2 Description

Gldcowait is the time between the initial CCS continuity test failure and the first retry (TUP/ISUP protocols). ODA should populate with default value for new office but preserve value from database during retrofits and growths. This parameter is used only when the office contains CCS7n trunks as shown when one or more tuples of RLrt_trkg have in_sigtype or out_sigtype set to DBISUP7 or DBTUP7. Gldcowait is specified in seconds.

# Gldfltcnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldfltcnt | LP | DMcount |

### 1.1 Gldfltcnt

Global Office Parameter Gldfltcnt

### 1.2 Description

DESCRIPTION: This parameter contains the number of tuples in RLbfgmatch that are used for default service. The parameter is used during an RC insert to determine the difference between the number of default service tuples currently in existence and the maximum number allowable (as indicated by Gldfltmax). If the insertion of the new default service group tuple would cause Gldfltcnt to be greater than Gldfltmax, then the insert is denied.

POPULATION: The parameter can be calculated at ODA initialization time by stepping through all tuples in RLbfgmatch and checking the attribute 'def_svc.' For each tuple that has this attribute set to DBYES, increment this count. This attribute does not appear on an RC view or ODA form.

```
- ODA population:

  Gldfltcnt := 0;

  for all tuples in RLbfgmatch

      begin

          if ( RLbfgmatch.def_svc equals DBYES ) then

             Gldfltcnt := Gldfltcnt + 1;

      end;

- RC/V RLbfgmatch insert (RLbfgmatch.def_svc equals DBYES):

  if ( Gldfltcnt equals Gldfltmax )

      then ERROR( 'Default service limit exceeded' ):

      else Gldfltcnt := Gldfltcnt + 1;

- RC/V RLbfgmatch deletion (RLbfgmatch.def_svc equals DBYES):

  Gldfltcnt := Gldfltcnt - 1;
```

# Gldi0_0ptss

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldi0_0ptss | FP | DMulong |

### 1.1 Gldi0_0ptss

Global Office Parameter Gldi0_0ptss

### 1.2 Description

These parameters are the PSU time slot set bit masks. These parameters are used to reserve TSIU time slots for use by PSU nail up connections on DI 0. Each bit that is set will reserve a TSIU channel time slot via a tuple in RLcktdata of type PCPSU_TS (see poprules for RLcktdata for more details). At least as many bits must be set as the number of TSIU channel time slots required for nail ups on the PSU PIDBs connecting to DI 0 for the following port types: ISM, RISLU, IP trunks, X.75'/X.75 trunks, XAT, ESDL/OSPS trunks, PSU Pipe (PP), and Speech Handler (SH) trunks (see Gldi0tscnt). If the SM is not an ISDN SM, these parameters should not be populated. It is recommended that no more than a SM total of 128 time slots be used for nail ups if inter SM call processing takes place on this SM.

The following cross-check will verify the integrity of these parameters: for all nonzero values, in descending order, of RLpsiupidb.shts_di0, the bits set in these parameters must satisfy the conditions:

(1) Each set bit can only represent one value (that is, a bit can not be used by more than one shelf).

(2) The set bits must follow the algorithm shown here for each shelf:

```
count   <-- RLpsiupidb.shts_di0

#pidb0s <-- count of non-zero pidb_*a where

            corresponding di_pidb == 0

timeslots_available <-- 0

slot_counted[] <-- 0 (array of 32 which indicates how many

                      times a given timeslot has been

                      counted for a shelf)

for (ptss=0; ptss < 8; ptss+)

{

    for (timeslot=0; timeslot < 32; timeslot++)

    {

        if (bit on in ptss bit map and

# Gldi0_2ptss

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldi0_2ptss | FP | DMulong |

### 1.1 Gldi0_2ptss

Global Office Parameter Gldi0_2ptss

### 1.2 Description

These parameters are the PSU time slot set bit masks. These parameters are used to reserve TSIU time slots for use by PSU nail up connections on DI 0. Each bit that is set will reserve a TSIU channel time slot via a tuple in RLcktdata of type PCPSU_TS (see poprules for RLcktdata for more details). At least as many bits must be set as the number of TSIU channel time slots required for nail ups on the PSU PIDBs connecting to DI 0 for the following port types: ISM, RISLU, IP trunks, X.75'/X.75 trunks, XAT, EDSL/OSPS trunks, PSU Pipe (PP), and Speech Handler (SH) trunks (see Gldi0tscnt). If the SM is not an ISDN SM, these parameters should not be populated. It is recommended that no more than a SM total of 128 time slots be used for nail ups if inter SM call processing takes place on this SM.

The following cross-check will verify the integrity of these parameters: for all nonzero values, in descending order, of RLpsiupidb.shts_di0, the bits set in these parameters must satisfy the conditions:

(1) Each set bit can only represent one value (that is, a bit can not be used by more than one shelf).

(2) The set bits must follow the algorithm shown here for each shelf:

```
count <-- RLpsiupidb.shts_di0 #pidb0s <-- count of non-zero pidb_*a where

       corresponding di_pidb == 0

timeslots_available <-- 0 slot_counted[] <-- 0 (array of 32 which indicates how
many

               times a given timeslot has been counted for a shelf)

for (ptss=0; ptss < 8; ptss+) {

  for (timeslot=0; timeslot < 32; timeslot++)

  {

    if (bit on in ptss bit map and

        slot_counted[timeslot] <= #PIDB0s)

    {

           timeslots_available++;
```

Copyright © 1999 Lucent Technologies

```
                slot_counted[timeslot]++;

          }

        }

      }

      assert (count <= timeslots_available)
```

This parameter is unused by SM-2000. It will initially be populated with default (0).
