## 4. Population Rules for RLltm_port

**Relation Description**
Analogical line or trunk member logical termination index to physical port mapping relation.

Its tuples are to distributed to the same modules as the RLfc_porttyp tuples corresponding to the port attribute value.

See RLrc_qidx.P population rules.

Copyright © 1999 Lucent Technologies

**Attribute: ltm_idxo**

**Fullname:** logical termination index

**Attribute Description**See RLrt_dntran and RLgroup_port ltm_idx and ltm_type definitions for assignment rules.

```
ltm_idxo = RLrt_dntran.ltm_idx
        for RLrt_dntran.ltm_type = LTM_OTHER
or
ltm_idxo = RLgroup_port.ltm_idx.
        for RLgroup_port.ltm_type = LTM_OTHER
```

**Attribute: port**

**Fullname:** port for this ltm_idxo

**Attribute Description** Same as RLfc_line.port.member or RLfc_trunk.port.member. Indicates the port to which the ltm_idxo is assigned.

**Attribute: party**

**Fullname:** station identifier

**Attribute Description**Same as RLfc_line.party for lines or FCP_TRUNK for trunks.

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLltsbport

### Relation Description

```
Line Time Slot Bridging Port Relation

Contains all LTSB Port Specific Information
```

Copyright © 1999 Lucent Technologies

RLltsbport supports both 1 TN and 2 TN Line Time Slot Bridging port tuples. For both the 1 TN and 2 TN cases one port is considered the lead port and the other is not. This is denoted by the lead_line attribute in RLltsbport. The ports for both 1 TN and 2 TN may exist on the same SM or each may be on a separate SM. RLfc_line and also RLfc_porttyp tuples exist for each port and are populated on the individual SM of each port. 1 TN LTSB will have 1 RLrt_dntran tuple populated on the routing SM of the TN. 2 TN LTSB will have 2 RLrt_dntran tuples each populated on the routing SM for their TN. RLltsbport also supports the Intraswitch Analog Line Transfer (IALT) feature. IALT is similar to 1-TN LTSB in that 2 ports are associated with 1 TN where one port is considered the lead port. The two ports may be on the same SM or may be on two different SMs. The population of RLfc_line and RLrt_dntran are identical for IALT and LTSB. The distinguishing piece of data is a bit in RLfc_porttyp (ialt_act). If this bit is Y, it is an IALT line, otherwise it is LTSB. The assignment of IALT and LTSB are mutually exclusive.

Multiple Directory Numbers (multidn) are allowed for IALT and 1 TN LTSB. Multidn is not allowed for 2 TN LTSB.
INWATS is not allowed for IALT.
All BRCS feature types are supported with IALT. BRCS data is duplicated on both ports. The population of the port data for terminal features is the same as the population described below for RLtrmfeats for LTSB lines.

The following Line features are allowed on 1 TN LTSB: Multi Line Hunt Group, Direct Connect, and Series Completion with restrictions as follows:

MLHG:
- 1 TN LTSB:
  One RLfc_porttyp tuple is defined for each port and fc_porttyp.hunt is set to DBYES for the lead line and DBNO for the non-lead line.
- 2 TN LTSB - Invalid for MLHG

Series Completion:
- 1 TN LTSB:
  One RLscm_nscm tuple is defined for the lead line and not defined for the non-lead line.
- 2 TN LTSB - Invalid for Series Completion.

Direct Connect:
- 1 TN LTSB:
  One RLfc_porttyp tuple is defined for each port and fc_porttyp.nodial is set to FCND_DIRCON
- 2 TN LTSB - Invalid for Direct Connect.

The DN features will also need to be associated with both ports and the rules for data population in RLdn_feats and the feature specific relations are as follows:

If both ports are on the same SM, there is one tuple on the SM keyed by the ltm_idx of the lead port. If the two ports are

Copyright © 1999 Lucent Technologies 

```
not on the same SM,  there is one tuple on the lead SM which
is keyed by the ltm_idx of the lead port and one tuple on the SM
of the non-lead port which is also keyed by the ltm_idx of the
lead port.
However, for LASS features, the feature specific data is kept on
the lead SM only.
The following BRCS features are supported on LTSB ports
with certain restrictions as follows:

DN Features:
  The following DN features are supported on LTSB: Call Forwarding,
  Message Service System, Incoming Line Identification, Calling Name
  Display, Distinctive Ringing, Terminal Group Station Restriction
  LASS (SCA, SCF, SCR and SDA) and Bulk Calling Line Identification.
  DN features are populated in RLdn_feats and the specific feature
  relations as described below. The distribution depends on whether
  the two ports reside on the same SM or each on a separate SM.
  Refer to specific rules:
  RLdn_feats:  1 TN LTSB where both ports are defined on same SM:
                 One RLdn_feats tuple is populated on the SM and is
                 used for both ports.
               1 TN LTSB where ports are defined on separate SMs:
                 RLdn_feats is populated on both SMs with the port
                 information (module, ltm_idx) of the lead port.
               2 TN LTSB - Invalid for DN features.
  MFCFW:  Features must exist in RLcf_cf with fwd_cndtn = CFN_BSYIDL,
          CFN_BUSY or CFN_IDLE.
          1 TN CFW where both ports are defined on same SM:
            One RLcf_ltm tuple is populated on the SM and is
            used for both ports.
          1 TN CFW where ports are defined on separate SMs:
            RLcf_ltm is populated on both SMs with the port
            information (module, ltm_idx) of the lead port.
          2 TN CFW - Invalid for DN features.
  MFSCA:  Features must exist in RLlsf_cf.
          1 TN LASS SCA where both ports are defined on same SM:
            One RLsca_ltm tuple is populated on the SM and is
            accessible only by the lead port.
          1 TN LASS SCA where ports are defined on separate SMs:
            RLsca_ltm is populated only on the SM of the lead
            module (RLltsbport.lead_line = DBYES ) with the port
            information (module, ltm_idx) of the lead port.
          2 TN LASS SCA - Invalid for DN features.
  MFSCF:  Features must exist in RLlsf_cf.
          1 TN LASS SCF where both ports are defined on same SM:
            One RLscf_ltm tuple is populated on the SM and is
            accessible only by the lead port.
          1 TN LASS SCF where ports are defined on separate SMs:
            RLscf_ltm is populated only on the SM of the lead
            module (RLltsbport.lead_line = DBYES ) with the port
            information (module, ltm_idx) of the lead port.
          2 TN LASS SCF - Invalid for DN features.
  MFSCR:  Features must exist in RLlsf_cf.
          1 TN LASS SCR where both ports are defined on same SM:
```

Copyright © 1999 Lucent Technologies 

```
          One RLscr_ltm tuple is populated on the SM and is
          accessible only by the lead port.
        1 TN LASS SCR where ports are defined on separate SMs:
          RLscr_ltm is populated only on the SM of the lead
          module (RLltsbport.lead_line = DBYES ) with the port
          information (module, ltm_idx) of the lead port.
        2 TN LASS SCR - Invalid for DN features.
MFSDA:  Features must exist in RLlsf_cf.
        1 TN LASS SDA where both ports are defined on same SM:
          One RLsda_ltm tuple is populated on the SM and is
          accessible only by the lead port.
        1 TN LASS SDA where ports are defined on separate SMs:
          RLsda_ltm is populated only on the SM of the lead
          module (RLltsbport.lead_line = DBYES ) with the port
          information (module, ltm_idx) of the lead port.
        2 TN LASS SDA - Invalid for DN features.
MFTGR:  Features must exist in RLtg_cf
        1 TN TGR where both ports are defined on same SM:
          One RLtgltm tuple is populated on the SM and is
          used for both ports.
        1 TN TGR where ports are defined on separate SMs:
          RLtgltm is populated on both SMs with the port
          information (module, ltm_idx) of the lead port.
        2 TN TGR - Invalid for DN features.
MFDR:   Features must exist in RLdr_cf
        1 TN DR where both ports are defined on same SM:
          One RLdr_ltm tuple is populated on the SM and is
          used for both ports.
        1 TN DR where ports are defined on separate SMs:
          RLdr_ltm is populated on both SMs with the port
          information (module, ltm_idx) of the lead port.
        2 TN DR - Invalid for DN features.
MFBCL:  Features must exist in RLbcl_cf
        1 TN BCL where both ports are defined on same SM:
          One RLbcl_ltm tuple is populated on the SM and is
          accessible only by the lead port.
        1 TN BCL where ports are defined on separate SMs:
          RLbcl_ltm is populated only on the SM of the lead
          module (RLltsbport.lead_line = DBYES ) with the port
          information (module, ltm_idx) of the lead port.
        2 TN BCL - Invalid for DN features.
MFMDS:  Features must exist in RLmds_opts.
        1 TN MSS where both ports are defined on same SM:
          One RLmds_port tuple is populated on the SM and is
          used for both ports.
        1 TN MSS where ports are defined on separate SMs:
          RLmds_port is populated on both SMs with the port
          information (module, ltm_idx) of the lead port.
        2 TN MSS - Invalid for DN features.
MFLID:  Features must exist in  RLlid_cf with .cnd_prim
        or cnd_all or cnam set to DBYES.
        1 TN LID where both ports are defined on same SM:
          One RLiclididx tuple is populated on the SM and is
          accessible only by the lead port.
```

Copyright © 1999 Lucent Technologies 

```
          1 TN LID where ports are defined on separate SMs:
            RLiclididx is populated only on the SM of the lead
            module (RLltsbport.lead_line = DBYES ) with the port
            information (module, ltm_idx) of the lead port.
          2 TN LID - Invalid for DN features.
Terminal Features:
  The following Terminal features are supported on LTSB: LASS
  Automatic Callback, LASS Automatic Recall, Call Waiting
  Terminating, Call Waiting Originating, Dial Call Waiting, Caller ID
  on Call Waiting, Private Facilities Access, Individualized Dial Plan,
  Customer Originated Trace, Message Detail Recording and Directory
  Number Privacy, one and two digit Speed Calling, Multiway Calling,
  Account Codes, Authorization codes, Automatic Route Selection,
  Call Waiting Deluxe, Time of Day, and Advanced Services Interface
  (ASI) Proxy.
  Terminal features are populated in RLtrmfeats and the specific
  feature relations described below.  Terminal features have normal
  distribution for LTSB ports. All the stated features are available
  on 1 TN LTSB whereas only un-shared Speed Calling is valid for
  2 TN LTSB.
  Refer to specific rules:
  RLtrmfeats:  1 TN LTSB where both ports are defined on same SM:
                 Two RLtrmfeats tuples are populated on the SM each
                 having the port information of the individual ports.
                 Each tuple is used for the individual port.
               1 TN LTSB where ports are defined on separate SMs:
                 RLtrmfeats is populated on both SMs with the port
                 information for each individual port populated
                 on that SM.
               2 TN LTSB - RLtrmfeats populated the same as 1 TN LTSB
                 for ports defined on separate SMs.
  MFAC:  Features assigned to the ports must exist in RLac_cf.
         RLcw_port will be populated with the same rules as RLtrmfeats.
         LASS Automatic Callback features are NOT valid for 2 TN LTSB.
  MFAR:  Features assigned to the ports must exist in RLcw_cf.
         RLcw_port will be populated with the same rules as RLtrmfeats.
         LASS Automatic Recall features are NOT valid for 2 TN LTSB.
  MFCWT: Features assigned to the ports must exist in RLcw_cf.
         RLcw_port will be populated with the same rules as RLtrmfeats.
         Call Waiting features are NOT valid for 2 TN LTSB.
  MFMWY: Features assigned to the ports must exist in RLmwcf.
         RLmwport will be populated with the same rules as RLtrmfeats.
         Multiway features are NOT valid for 2 TN LTSB.
  MFSC:  Features assigned to the port(s) must exist in RLsc_cf.
         RLsc_port will be populated with the same rules as RLtrmfeats.
         1 TN speed call lists MUST be shared for both ports.
         2 TN speed call lists MAY NOT be shared between the ports."
  MFDISP:Features assigned to the ports must exist in RLdisp_cf.
         Directory Number Privacy (per call only) is not valid
         for 2 TN LTSB.
  MFCOT: Features assigned to the port(s) must exist in RLcot_cf.
         cot_alw bit in RLfc_line must be set to DBYES.
  MFMDR: Features assigned to the ports must exist in RLmdr_cf
         RLmdr_port will be populated with the same rules as
```

Copyright © 1999 Lucent Technologies 

RLtrmfeats. Message Detailed Recording feature is NOT valid for 2 TN LTSB.

MFID: Features assigned to the ports must exist in RLid_cf RLid_port will be populated with the same rules as RLtrmfeats. Individualized Dialing Plan features are NOT valid for 2 TN LTSB.

MFPFA: A tuple must exist in RLpf_port. RLpf_port will be populated with the same rules as RLtrmfeats. Private Facility Access features are NOT valid for 2 TN LTSB.

MFTOD: Features assigned to the ports must exist in RLtd_sched. RLtd_sched will be populated with the same rules as RLtrmfeats. Time of Day feature is NOT valid for 2 TN LTSB.

MFASI: Features assigned to the ports must exist in RLasi_cf. RLasi_port will be populated with the same rules as RLtrmfeats. Advanced Service Interface feature is NOT valid for 2 TN LTSB.

MFACCT:Features assigned to the ports must exist in RLacct_cf. RLacct_prt will be populated with the same rules as RLtrmfeats. Account Codes feature is NOT valid for 2 TN LTSB.

MFARS: Features assigned to the ports must exist in RLarcf. RLarport will be populated with the same rules as RLtrmfeats. Automatic Route Selection feature is NOT valid for 2 TN LTSB.

MFATH: Features assigned to the ports must exist in RLath_cf. RLath_prt will be populated with the same rules as RLtrmfeats. Authorization Codes feature is NOT valid for 2 TN LTSB.

## 4. Population Rules for RLluwavg

**Relation Description**
LU weighted average measurements.

The RLluwavg relation stores the weighted average measurement data for each LU component, and contains one tuple per LU. The value of the weighted average measurement data in this relation are between 0 and 65000, which is the amount of LU usage in hundred call seconds (CCS). When the Craft enters or verifies the data, that value can be in Erlangs times 1000, or CCS. The value of the global parameter Glmsusgtyp is checked to find if

Copyright © 1999 Lucent Technologies 

the unit of measurement is in Erlang or CCS. If the unit if measurement is Erlang then the weighted average measurement data in the base relation will be converted from CCS, and displayed in Erlangs times 1000.

Information concerning this section is not available at this time.

**Attribute: lunum**

**Fullname:** LU identifier - IM#,

**Attribute Description** Lunum corresponds to each operational line unit within a particular RSM or IM.

**Attribute: lunum.pcrid**

**Fullname:** process id

**Attribute Description** Information concerning this section is not available at this time.

**Attribute: lunum.lu**

**Fullname:** lint unit

**Attribute Description** Information concerning this section is not available at this time.

**Attribute: luwavg**

## 4. Population Rules for RLmask_blf

**Relation Description:** Busy lamp field mask.

There will be one tuple in this relation for each 100s group that has at least one member associated with an ISAT group and is Busy Lamp Field (BLF) monitorable by the ISAT group, that is:

```
RLfc_line.busymon = DBYES
OR
RLis_line.busymon = DBYES
OR
RLrt_mhg.monitor = DBYES
```

NOTE: PRL check for these dependencies are in the PRL files RLfc_line, RLis_line and RLrt_mhg.

A TN may be associated with and monitored by only one ISAT group, however, each TN within a 100s group may be associated with and monitored by a different ISAT group. So, for each ISAT group, that is associated with a member of a 100s group that is made busy monitorable, there should exist a RLmask_blf tuple. The mask is used to mask out TNs that should not be busy monitorable by the designated ISDN Attendant group.

***NOTE:*** TNs with the following types of servclass;

```
RLfc_porttyp.servclass = FC_ISATND
RLfc_porttyp.servclass = FC_ATTENDANT
```

May not be associated with and busy monitored by an ISDN attendant(ISAT) Multiline Hunt Group.

**Attribute: hgid**

**Fullname:** 100s group identifier

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** hundred group identifier in hex with three sub-fields:

```
noc     normalized office code         Range: 0 - 250
d4      thousand weighted digit         Range: 0 - 9
d3      hundred weighted digit         Range: 0 - 9
example : TN=2204321
          noc = 118(0x76)    shift  2 left = 0x7600
           d4 = 4  (0x04)    shift 1 left  = 0x0040
           d3 = 3  (0x03)
        hgid = 0x7600 + 0x0040 + 0x0003
             = 0x7643
             = 7643 <== IN HEX
CALCULATING THE 'hgid':
----------------------
For example:
```

For RLfc_line entries:

For every RLis_line tuple where RLis_line.primary = DBYES, there exists a corresponding RLfc_line tuple. For every RLis_line tuple where RLis_line.primary = DBNO, refer to the next section for RLis_line tuples.

```
If DN# 220-4321 has its 'busymon' attribute set to DBYES.
then read RLnoccode to convert nxx to noc;
     RLnoccode.nxx = 220 (Office Code)
     RLnoccode.noc = 118 (Normalized  Office Code)
For the DN# 220-4321:
     118 = noc
       4 = digit4 (d4)
       3 =  digit3 (d3)
       2 = digit2 (d2)
       1 = digit1 (d1)
The 'noc', 'd4', and 'd3' will be used to determine the RLmask_blf.hgid
key value to access the appropriate RLmask_blf.
       noc = 118(0x76)
             shift 2 left = 0x7600
       d4 = 4  (0x04)
             shift 1 left = 0x0040
       d3 = 3  (0x03)
     hgid = 0x7600 + 0x0040 + 0x0003
          = 0x7643
          = 7643 <== IN HEX
```

The 'd2' and 'd1' will be used to determine the appropriate bit to be set in RLmask_blf.dnmask. Setting the bit to '1' means 'busymon' equals DBYES. Setting the bit to '0' means 'busymon' equals DBNO.

For the DN# 220-4321: the following bit would be set;

```
Hundred digit number
    dnmask3
        23 22 21 20 19 18 17 16
       ------------------------
       |  |  | 1|  |  |  |  |  |
       ------------------------
      RLmask_blf.dnmask3 = 0x20
```

**Copyright © 1999 Lucent Technologies** 

For RLis_line entries where RLis_line.primary = DBNO (Secondary Only):

```
For every RLis_line tuple where RLis_line.primary = DBYES,
there exists a corresponding RLfc_line tuple.  So,
for every RLis_line  tuple where RLis_line.primary = DBYES,
refer to the previous section  for RLfc_line tuples.

If DN# 220-4321 has its 'busymon' attribute set to DBYES.
then read RLnoccode to convert nxx to noc;
      RLnoccode.nxx = 220 Office Code)
      RLnoccode.noc  = 118 (Normalized Office Code)
For the DN# 220-4321:
       118 = noc
         4 =  digit4 (d4)
         3 = digit3  (d3)
         2 = digit2 (d2)
         1 = digit1 (d1)
The 'noc', 'd4', and 'd3' will be used to determine
the  RLmask_blf.hgid key value to access the appropriate
RLmask_blf tuple.
       noc = 118(0x76)
             shift 2 left = 0x7600
       d4 = 4  (0x04)
             shift 1 left = 0x0040
       d3 = 3  (0x03)
     hgid = 0x7600 + 0x0040 + 0x0003
          = 0x7643
          = 7643 <== IN HEX
```

The 'd2' and 'd1' will be used to determine the appropriate bit to be set in RLmask_blf.dnmask. Setting the bit to '1' means 'busymon' equals DBYES. Setting the bit to '0' means 'busymon' equals DBNO.

For the DN# 220-4321: the following bit would be set;

```
Hundred digit number
    dnmask3

             23 22 21 20 19 18 17 16
            _________________________
            |  |  | 1|  |  |  |  |  |
            -------------------------
            RLmask_blf.dnmask3 = 0x20
```

For RLrt_mhg entries where RLrt_mhg.monitor = DBYES:

```
            RLrt_mhg.monitor = DBYES,
            RLrt_mhg.grp_noc =  118 (76 in hex), and
            RLrt_mhg.grp_loc = 9854,
                          9 = digit4 (d4)
                          8 = digit3 (d3)
                          5 = digit2 (d2)
                          4 = digit1  (d1)
```

Copyright © 1999 Lucent Technologies 

then 'RLrt_mhg.grp_noc', and 'd4', 'd3' of RLrt_mhg.grp_loc will be used to determine the RLmask_blf.hgid key value to access the appropriate RLmask_blf tuple.

```
RLrt_mhg.grp_noc = 118(0x76)
shift 2 left     = 0x7600
             d4 = 9  (0x09)
shift 1 left     = 0x0090
             d3 = 8  (0x08)
hgid = 0x7600 + 0x0090 + 0x0008
     = 0x7698
     = 7698 <== IN HEX
```

The 'd2' and 'd1' will be used to determine the appropriate bit to be set in RLmask_blf.dnmask. Setting the bit to '1' means 'monitor' equals DBYES. Setting the bit to '0' means 'monitor' equals DBNO.

For RLrt_mhg.grp_loc = 9854: the following bit should be set;

```
Hundred digit number
         dnmask7
              55 54  53 52 51 50 49 48
             _________________________
             |  | 1|   |  |  |  |  | |
             -------------------------
             RLmask_blf.dnmask7 = 0x40
```

**Attribute: isat_idx Fullname:** ISDN attendant console index

**Attribute Description** the ISDN attendant group index

This tuple should only be populated if there is a RLrt_mhg tuple keyed by some grpnum where; RLrt_mhg.htype = RTH_ISAT RLrt_mhg.isat_idx != 0

and there is an existing tuple in RLisatgrp; RLisatgrp.isat_idx = RLrt_mhg.isat_idx

in the SM indicated by the RLrt_mhg.module (hunting SM for the ISAT group).

**Attribute: dnmask1 Fullname:** hundred digit number

**Attribute Description** first byte of 100s group mask, 8 bits, each bit with '0' denoting DN not busy monitorable, each bit with '1' denoting DN is busy monitorable.

```
Hundred digit number
      1st byte   07 06 05 04 03 02 01 00
                 _________________________
                 |  |  |  |  |  |  |  |  |
                 -------------------------
```

```
Example:
If the following TN's are busy monitorable by an ISAT;
          2208000           2208001           2208002
then the following bits would be set;
Hundred digit number
         1st byte  07 06 05 04 03 02  01  00
```

**Copyright © 1999 Lucent Technologies** 

```

## 4. Population Rules for RLmatatt

**Relation Description:** mate attributes

Mate attributes - Relation containing information about other modules in the same multimodule RSM.

This relation gives information about mate RSMs in the same multimodule RSM. There will be one tuple for each mate: n-1 total tuples if there are n modules in this multimodule RSM.

**Attribute: mate**

**Fullname:** sm number of a mate RSM

**Attribute Description** This must be a valid, equipped RSM, as shown by a tuple in RLMODATT whose key is the same as this attribute. In addition, it must be an RSM in the same multimodule RSM, as shown by (1) equal 'clid' attributes in the relation RLMODATT for the tuples with keys equal to this attribute and the SM number of the RSM this relation is populated on, and by (2) an entry equal to this attribute in one of the attributes rm01 - rm10 in the relation RLCLIDAT for the tuple corresponding to this cluster. The key to the CLIDAT tuple is the same as the 'clid' attribute of the AM relation RLMODATT discussed previously.

**Attribute: cl_offset**

**Fullname:** the relative index number in the multimodule RSM for 'mate'

**Attribute Description** This attribute gives the relative RSM number (1-4) in the multimodule RSM. This number must agree with the cl_offset attribute of the relation RLMODATT for the previous

Copyright © 1999 Lucent Technologies 

tuple whose key is 'mate', and with the office parameter Glcl_offset populated in the RSM specified by 'mate'. Further, this attribute should be consistent with the corresponding one of the rm01 - rm10 attributes in the tuple in the AM relation RLCLIDAT for the cluster this RSM is in. (The CLIDAT tuple is the same one as described previously in 'mate' rules.) For example, in the CLIDAT tuple, if attribute rm02 is set to the same value as the previous 'mate', then cl_offset should be set to 2.

**Attribute: num_icls**

**Fullname:** number of ICLs

**Attribute Description** The count of the number of operational ICLs (0-18) between this module and mate. This should agree with the number of non-zero attributes in the cdfi0-cdfi17 group for this tuple.

**Attribute: cdfi[*]**

**Fullname:** indicates an ICL going between the module this relation is populated on and 'mate'

**Attribute Description** These attributes (cdfi0-cdfi17) hold the internal circuit name for each Communication Facility (PCCFAC) which terminates an ICL connecting far RSM 'mate' to this RSM. The PCCFAC circuits must also be populated in this RSM's RLCKTDATA relation, with keys equal to these attributes, and type equal to PCCFAC.

cdfi0 - cdfi17 attributes (abbreviated cdfiXX) which do not correspond to active ICLs must be populated with #GLNULCKT. The PCCFACs may populate these attributes in any order, but should start from the lowest number index, preferably leaving no holes, although holes are permissible to accommodate de-growth without having to re-pack the information.

This array should be consistent with the relation RLCDFI_MAP such that there is a tuple in RLCDFI_MAP for each non-zero entry in this group of attributes. The key to the CDFI_MAP relation is the same as these attributes.

The utype attribute of the PCCFAC's CKTDATA tuple can be consulted to determine unit type (SMDLTU or SMDLTU2).

**Defines:**
"db/DMcircuit.h"

## 4. Population Rules for RLmbg2tg

**Relation Description** This relation translates a multiswitch business group (MBG) identifier to a terminal group number. It also stores information relative to the MBG.

**Attribute: mbg_id**

**Fullname:** Multiswitch business group (MBG) identifier

**Attribute Description** mbg_id is an identifier used to describe a multiswitch business group (MBG) that has multiswitch business group elements (MBGE) in 1 or more switches. This is a unique number in the network with a range of {2-65535}. The value 1 is "Reserved for Public Network Identifier" (such as, non-MBG identification.

Copyright © 1999 Lucent Technologies 

```
RULE about RLmbg2tg.mbgid
This relation should not exist unless the
Centrex Network (CN) CN_SFID #181 is on.
```

**Attribute: tgid**

**Fullname:** Terminal Group IDentifier - identification of this modular feature customization terminal group

**Attribute Description** tgid is a unique identifier used to describe a group of terminals. Terminal group ID of the lines (not the attendant's TGID) that get toll diverted or have manual line service or get re-routed to the attendant directory number (DN).

**Attribute: cwd_campon**

**Fullname:** campon dialed call waiting

**Attribute Description** cwd_campon is the low order 10 bits of a feature identifier that is used to apply call waiting tone for an incoming ISUP7 MBG call from an attendant. This value is used for the call when an incoming ISUP7 call has an IAM message with the following IAM message content. Business group (BG) parameter indicating an ISAT terminal is calling service activation parameter (SAP) indicating dialed call waiting is active for the call. Note that the SAP parameter value shows that call waiting is active and tells nothing about the type of treatment to be given to the called party.

Example values for this field are:

```
/CWD  - a preconstructed feature for dialed call waiting
XYZ   - a user defined feature
```

**Attribute: cwo_campon**

**Fullname:** campon call waiting originating

**Attribute Description** cwd_campon is the low order 10 bits of a feature identifier that is used to apply call waiting tone for an incoming ISUP7 MBG call from an attendant. This value is used for the call when an incoming ISUP7 call has an IAM message with the following IAM message content. Business group (BG) parameter indicating an ISAT terminal is calling service activation parameter (SAP)indicating call waiting originating is active for the call. Note that the SAP parameter value shows that call waiting is active and tells nothing about the type of treatment to be given to the called party.

Example values for this field are:

```
/CWO  - a preconstructed feature for call waiting originating
XYZ   - a user defined feature
```

**Attribute: bcid**

**Fullname:** Business Customer IDentifier

**Attribute Description** bcid is used to perform BCID screening on trunk originated MBG calls that

**Copyright © 1999 Lucent Technologies** 

have been forwarded to a multi-line hunt group (MLHG) associated with either voice mail system (VMS) or an attached processor (AP).

```
RULE about RLmbg2tg.bcid
RLmbg2tg.bcid must be 0 unless the
CENTREX network with iSVM (CNISVM)
CNISVM_SFID #182 is on.
```

**Attribute: cns**

**Fullname:** CENTREX Network government Secure

**Attribute Description** CNS is an indicator showing subscription to the CENTREX network government secure feature.

```
RULE about RLmbg2tg.cns
RLmbg2tg.cns must be DBNO unless the
CENTREX network government secure (CNS)
CNS_SFID_183 is on.
```

**Attribute: cn_isvm**

**Fullname:** CENTREX interswitch voice mail (ISVM) system

**Attribute Description** cn_isvm is an indicator showing subscription to the CENTREX network ISVM feature.

```
RULE about RLmbg2tg.cn_isvm
RLmbg2tg.cn_isvm must be DNBO unless the
CENTREX network with ISVM (CNISVM)
CNISVM_SFID_182 is on.
```

**Attribute: grupnm**

**Fullname:** Group number

**Attribute Description** Multi-line hunt group number. Verify RLrt_mhg has a tuple such that
RLrt_mhg.grpnum = grupnm and
RLrt_mhg.htype = RTH_UCD || RTH_LGUCD ||
RTH_REGULAR ||
RTH_LGREG ||
RTH_ISAT ||
RTH_MUPH ||
RTH_PPSMHG ||
RTH_PPLMHG ||
RTH_CIRCULAR ||
RTH_LGCIR.

Verify that: RLrt_mhg.mdc = DBYES

Verify that RLrc_msusr has a tuple such that: RLrc_msusr(grupnm).mdc_no = grupnm

**Attribute: ap_id**

Copyright © 1999 Lucent Technologies 

**Fullname:** Application processor (AP) ID

**Attribute Description** Application processor ID (APID).

If RLrt_mhg.htype = RTH_ISAT then, ap_id must equal 0 If RLrt_mhg.htype = RTH_MUPH then ap_id must NOT equal 0 (Multi-Position Hunt Multi-Line Hunt Groups cannot be Basic Message Service Centers because they are analog sets and cannot have feature buttons required for Basic MSC) If ap_id is not zero then, Verify that RLcmapdata has a tuple such that:
`RLcmapdata.site_id = RLmdc_grp.ap_id and`
`RLcmapdata.module is non-zero.`

**Attribute: msrmnt**

**Fullname:** Measurement flag

**Attribute Description** Measurement flag. Boolean value indicating whether or not measurements are to be taken.

If the tuple in RLms_ap with RLms_ap(MDS, DBYES) has a mlhg_n* such that mlhg_n* = RLmdc_grp.grupnm, then RLmdc_grp.msrmnt = DBYES else RLmdc_grp.msrmnt = DBNO. When deleting a tuple from this relation and msrmnt = DBYES, then zero this mlhg_n* and decrement by 1 the idscnt field in the RLms_ap(MDS, DBYES).

**Attribute: msc_scrn**

**Fullname:** Business customer ID (BCID) screening option for message service center

**Attribute Description** Indicates whether or not BCID screening is needed. It is intended that ISVM subscribers to call answering will forward their calls to an unscreened MSC MLHG.

With the introduction of ISVM in 5E7, MSC can be categorized into eight types as follows:

| Basic/Deluxe | Screening | No-Screening |
|---|---|---|
| OCDN Option | 1B/1D | 3B/3D |
| RDN Option | 2B/2D | 4B/4D |

Note that B indicates 'Basic' and D indicates 'Deluxe'. 'Deluxe' means there is an AP or Virtual Machine (VM) associated with the MSC. MSC types 1B and 1D are existing pre-5E7 MSCs. MSC types 2B, 3B, and 4B should be blocked.

If mdc_grp.msc_scrn = DBNO, then verify that mdc_grp.ap_id != 0. This will block 3B and 4B types of MSCs.

If mdc_grp.msc_scrn = DBYES, then verify that at least one of the fields, gcsrid1 through gcsrid6, must be non-zero.

If RLrt_mhg.htype = RTH_ISAT, then verify that mdc_grp.msc_scrn = DBYES. This indicates that call screening will not be done, but a BASIC MSC must have BCIDs to do attendant message waiting indicator (MWI) control. ISAT MSC MLHG will be of type 1B.

**Attribute: client_typ**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Client telephone number (TN) type

**Attribute Description** Indicates the client TN type sent to message service center. One of the two types, that is, MSS_OCDN (original called Directory Number [DN]) or MSS_RDN (redirecting DN), must be specified here.

If mdc_grp.client_typ = MSS_RDN then, verify that mdc_grp.ap_id != 0. This is to block 2B or 4B type of MSCs.

If RLrt_mhg.htype = RTH_ISAT then, verify that mdc_grp.client_type = MSS_OCDN.

**Attribute: intraswocdn**

**Fullname:** Intra-switch client Directory Number (DN) indicator NOTE: Attribute will be renamed in 5E10.

**Attribute Description** Boolean used to indicate whether the intra-switch or inter-switch directory number (Original Called DN (OCDN) or Redirecting DN (RDN) based on the client TN type attribute - client_typ) is to be sent to the Voice Messaging System (VMS). A DBNO indicates that the OCDN or RDN will be sent to the VMS even if that DN is on another switch. A DBYES indicates that the DN passed to the VMS is the first or last DN the call terminates to on this switch.

***NOTE:*** For pre-5e9(2) MSS functionality where msc_scrn is set to DBYES, set intraswocdn to DBYES.

**Attribute: delay_ring**

**Fullname:** Delay power ringing for 2 seconds of a 'Deluxe' MSC MLHG

**Attribute Description** Boolean used to indicate whether the power ringing of the MSC MLHG is to be delayed for 2 seconds so that the AP/VMS has time to process the call history information sent from the switch.

**Attribute: ovride_prv**

**Fullname:** Override privacy of calling number for ISVM MSC

**Attribute Description** Boolean used to indicate whether to override a privacy indication of the Calling DN for both direct and forwarded calls and deliver the DN in the Call History Information message to the AP if this MSC is setup to be used for ISVM.

```
if mdc_grp.ovride_prv = DBYES, then
verify that mdc_grp.mdc_scrn = DBNO,
            mdc_grp.intraswocdn = DBNO and
            there is tuple in RLcmapdata such that
            when cmapdata.site_id = mdc_grp.ap_id, then
                        cmapdata.use_isvm = DBYES
```

**Attribute: gcsrid[*]**

**Fullname:** Business customer ID.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** A no screening MSC MLHG is not required to have BCID. For detailed explanation see USAGE section under msc_scrn.

Copyright © 1999 Lucent Technologies 

# MDPATH

## 1. Description

This relation relates a Message Delivery (MD) Data Link Terminal (DLT) port to its corresponding DLT port in the MD path.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 256 |
| expected number of tuples | 1 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCmdpath |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 4. Population Rules for RLmdpath

**Relation Description** Message delivery path.

This relation relates a message delivery (MD) data link terminal (DLT) port to its corresponding DLT port in the MD path. It provides the switching module (SM) number in which the corresponding MD DLT lies, the corresponding DLT port name, and whether the DLT is in the global SM and controls the MD path or not.

**Attribute: dlt**

**Fullname:** Data link terminal.

**Attribute Description** 16-bit port name.

**Attribute: mate_sm**

Copyright © 1999 Lucent Technologies 

**Fullname:** Mate switching module.

**Attribute Description** The mate switching module (SM) number which is served by the message delivery (MD) path.

**Attribute: mate_dlt**

**Fullname:** Mate data link terminal.

**Attribute Description** The mate DLT port name which is served by the message delivery path.

**Attribute: master**

**Fullname:** Master (controller of message delivery path).

**Attribute Description** Indicates whether DLT is the controller of the message delivery (MD) path.

      grpchngalw    DBNO
      amac          DBYES for flat,  DBNO for all other attributes
```

**Attribute: feat_id**

**Fullname:** Feature ID.

**Attribute Description** A BRCS constructed feature ID consists of two parts when class = FACBRCS and subclass = SCL_FEAT: a modular feature type (top 6 bits: bits 10 - 15 ) and an unique identifier (bottom 10 bits: bits 0 - 9). For an MDR constructed feature ID, the modular feature type must equal MFMDR (17 = 0x11), which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff).

**Attribute: actvn**

**Fullname:** Activation method.

**Attribute Description** Method of activating constructed feature.

```
Enum. Value   Dependency
ACTNONE    1) RLmdr_opts.dctvn = DCTNONE, DCTCD
           2) RLmdr_opts.amac.flat = DBYES
ACTCD      1) RLmdr_opts.dctvn = DCTAUTO, DCTCD
           2) Verify that RLdaprlfnl or RLidp_dtre
                   *** ODA ONLY WARNING ***
                   *** (NOT SUPPORTED BY RC) ***
              has a tuple for a given dial code
              such that:
              RLdaprlfnl.action = ACN_MDRACT
              RLidp_dtre.action = ACN_MDRACT
```

**Attribute: dctvn**

**Fullname:** Deactivation type.

**Attribute Description** Method of deactivating constructed feature.

```
Enum. Value     Dependency
DCTNONE     1) RLmdr_opts.actvn = ACTNONE
DCTAUTO     1) RLmdr_opts.actvn = ACTCD
DCTCD       1) RLmdr_opts.actvn = ACTNONE, ACTCD
```

Copyright © 1999 Lucent Technologies 

```
2) Verify that RLdaprlfnl or RLidp_dtre
   *** ODA ONLY WARNING ***
   *** (NOT SUPPORTED BY RC) ***
   has a tuple for a given dial code
   such that:
   RLdaprlfnl.action = ACN_MDRDCT
   RLidp_dtre.action = ACN_MDRDCT
```

**Attribute: grpchngalw**

**Fullname:** Group Change Allowed.

**Attribute Description** Boolean value indicating whether a dialed code can be used to change the MDR group status. The MDR group effected is the MDR group to which the originating port belongs.

```
Enum. Value   Dependency
DBNO          none
DBYES         Verify that RLdaprlfnl or RLidp_dtre
              has a tuple for a given dial code
              such that:
              RLdaprlfnl.action = ACN_MDROFF
              RLdaprlfnl.action = ACN_MDR_ON
              RLidp_dtre.action = ACN_MDROFF
              RLidp_dtre.action = ACN_MDR_ON
```

**Attribute: amac**

**Fullname:** AMA Charging.

**Attribute Description** Boolean structure indicating the combination of several types of AMA charging. In each case, a DBYES indicates that type of billing is applicable and DBNO indicates it is not. See domain DMmc_bill for a description of each sub-attribute.

Range: DBYES, DBNO for each sub-attribute. Default Value: DBYES for flat, DBNO for all other sub-attributes.

If flat == DBYES, all other sub-attributes = DBNO.

**Attribute: amac.flat**

**Fullname:** Flat Charging.

**Attribute Description** Flat rate - no usage sensitive charge.

**Attribute: amac.usefreq1**

**Fullname:** User Frequent 1.

**Attribute Description** User frequent usage event.

**Attribute: amac.usefreq[*]**

**Fullname:** User Frequent Event.

**Attribute Description** Usage frequency charge - for use of 'event'.

Copyright © 1999 Lucent Technologies 

**Attribute: amac.actchrg**

**Fullname:** Activation Charge.

**Attribute Description** Usage charge for activation.

**Attribute: amac.dactchrg**

**Fullname:** Deactivation Charge.

**Attribute Description** Usage deactivation charge.

**Attribute: amac.duration**

**Fullname:** Duration charge.

**Attribute Description** Usage duration charge.

**Attribute: amac.change**

**Fullname:** Change parameter.

**Attribute Description** Change parameter charg.

## 4. Population Rules for RLmdr_cnts

**Relation Description** MDR counts record specification. A single tuple is always required for this relation (rlMDR_CNTS).

**Attribute: dummy_key**

**Fullname:** Dummy key.

**Attribute Description** This relation does not need a key, but one is required. A 'dummy key' is used for this relation.

**Attribute: ids_in_use**

**Fullname:** Number of rec_id structures in use.

**Attribute Description** This attribute specifies the current number record ID's currently in use. The rec_id structures must be populated in sequential order, rec_id1 first, then rec_id2, and so on.

**Attribute: rec_id[*]**

**Fullname:** MDR counts record ID

**Attribute Description** MDR counts record ID. This domain is a structure with the following elements:

```
gcsrid - business customer ID
ap_id  - applications processor ID
```

Each pair of these values (or each structure) specifies the destination of an MDR counts record.

**Attribute: rec_id[*].gcsrid**

**Fullname:** Business customer ID

**Attribute Description** The gcsrid and ap_id are treated as pairs. For each pair, if gcsrid > 0, then ap_id > 0.

**Attribute: rec_id[*].ap_id**

**Fullname:** Applications processor ID (APID)

**Attribute Description** The gcsrid and ap_id are treated as pairs. For each pair, if ap_id > 0, then gcsrid > 0.

```
Verify that RLcmapdata and RLmdr_gp have
tuples such that:
RLcmapdata.site_id = ap_id
RLmdr_gp.ap_id = ap_id
```

## 4. Population Rules for RLmdr_gp

**Relation Description** Message detail recording feature group parameter data. Message detail recording groups may be assigned to both circuit and packet switched integrated ser

vices digital network (ISDN) users. The group may have both circuit and packet types active or only one of the types active. If the group is defined in RLmdr_gp with the attribute pkt_mdr set to DBYES and all of the circuit MDR attributes (orig_priv, in_priv and public) are DBNO then this is a packet only MDR group. When packet only groups are assigned to packet services there will not be a tuple in RLmdr_port or RLrt_sfg, and there will be at least one RLpsx25ln tuple populated with the attribute pmdr_grp equal to this group. When MDR groups with both circuit and packet options active are assigned to circuit users and packet services the group will be populated in RLmdr_port, RLrt_sfg, and the RLpsx25ln. RLmdr_port and/or RLrt_sfg are populated for circuit MDR, and RLpsx25ln is only populated for packet MDR.

Packet MDR groups assigned to different digital subscriber line (DSL) packet services may be the same group or different for each packet service. The MDR activation status of each packet service may be either on or off independent of the other DSL packet services MDR activation.

**Attribute: mdr_gpid**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Message detail recording (MDR) group identification

**Attribute Description** The MDR group ID is an identifier resulting from the conversion from an 8 character MDR group name using RLfacname. An MDR group ID of zero is invalid for this relation.

The key is 16 bits. The first 6 bits are always zero since the number of MDR groups is limited to 1000 ( < 2**10 ). Therefore, a subkey is used: where p1 is the position of the start of subkey 1 and l1 is the length of subkey 1. It is important that when a subkey is used, the key attribute MUST be the first attribute in the relation. This can be achieved by using un_perm or by using perm and specifying head between key and the attribute name. For example,

key head DMFACID mdr_gpid

The un_perm method provides the best space allocation for this relation.

```
Key -       | 0 0 0 0  0 0 x x  x x x x  x x x x |   16 bits
Subkey1 -     --- p1 ----> <------- l1 -------->     p1 = 6: l1 = 10
Index -                   <---------->              index = 6 bits
```

Tuple size = 8 bytes Head table size = 2**6 * 2 = 64 * 2 = 128 Data page size = 2**(10-6) = 2**4 * 8 = 16 * 8 = 128

**Attribute: gcsrid Fullname:** Business customer ID

**Attribute Description** Business customer ID.

**Attribute: ap_id**

**Fullname:** Applications processor ID (APID)

**Attribute Description** No comment.

**Attribute: orig_priv**

**Fullname:** Originating private MDR record allowed

**Attribute Description** No comment.

**Attribute: in_priv**

**Fullname:** Incoming private MDR record allowed

**Attribute Description** No comment.

**Attribute: public**

**Fullname:** Public MDR record allowed

**Attribute Description** No comment.

**Attribute: sta_sta**

**Fullname:** Station to station MDR allowed

**Attribute Description** No comment.

**Copyright © 1999 Lucent Technologies** 

**Attribute: eff_o**

**Fullname:** Effective attempt for originating private record

**Attribute Description** If DBYES, you want originating private record generated for effective call attempts. If DBNO, you do not want originating private record generated for effective call attempts.

**Attribute: ineff_o**

**Fullname:** Ineffective attempts for originating private record

**Attribute Description** If DBYES you want originating private record generated for ineffective call attempts. If DBNO, you do not want originating private record generated for ineffective call attempts.

**Attribute: eff_i**

**Fullname:** Effective attempt for incoming private record

**Attribute Description** If DBYES, you want incoming private record generated for effective call attempts. If DBNO, you do not want incoming private record generated for effective call attempts.

**Attribute: ineff_i**

**Fullname:** Ineffective attempts for incoming private record

**Attribute Description** If DBYES, you want incoming private record generated for ineffective call attempts. If DBNO, you do not want incoming private record generated for ineffective call attempts.

**Attribute: eff_p**

**Fullname:** Effective attempt for public record

**Attribute Description** If DBYES, you want public record generated for effective call attempts. If DBNO, you do not want public record generated for effective call attempts.

**Attribute: ineff_p**

**Fullname:** Ineffective attempts for public record

**Attribute Description** If DBYES, you want public record generated for ineffective call attempts. If DBNO, you do not want public record generated for ineffective call attempts.

**Attribute: eff_s**

**Fullname:** Effective attempt for station-to-station record

**Attribute Description** If DBYES, you want station-to-station records generated for effective call attempts. If DBNO, you do not want station-to-station records generated for effective call attempts.

**Attribute: ineff_s**

**Fullname:** Ineffective attempts for station-to-station records

Copyright © 1999 Lucent Technologies

**Attribute Description** If DBYES, you want station-to-station records generated for ineffective call attempts. If DBNO, you do not want incoming station-to-station records generated for ineffective call attempts.

**Attribute: hr8_passed**

**Fullname:** 8-hour passed MDR allowed

**Attribute Description** If hr8_passed is DBYES, then one or more of the following attributes must equal DBYES: orig_priv, in_priv, or public. NOTE: If this attribute is set to DBYES, but the office parameter GI8hrsc is DBNO, then the 8-hour passed MDR records will not be generated in that office.

**Attribute: pkt_mdr**

**Fullname:** Packet MDR indicator

**Attribute Description** This attribute indicates packet MDR record generation for packet users assigned to this MDR group.

If the MDR group has both circuit and packet MDR options activated and also has the control line option active the user may disable both circuit and packet MDR options with a customer-oriented recent change (CORC) changing the grpstatus bit to DBMDROFF. If the MDR group has only packet MDR options active the control line is not applicable.

If this attribute is DBNO then the attributes modem_pool and intra_pbg must also be DBNO.

**Attribute: modem_pool**

**Fullname:** Packet MDR modem pool recording indicator

**Attribute Description** This attribute indicates whether modem pool packet MDR records are allowed to be generated for packet services assigned to this MDR group.

Packet MDR groups should not be assigned directly to modem pool members. When this attribute is active and a DSL assigned with the group accesses a modem pool two packet MDR records are generated (one for the packet call and one for the modem pool access). Otherwise, one packet MDR record would be generated for the packet call only.

**Attribute: intra_pbg**

**Fullname:** Intra packet business group MDR indicator

**Attribute Description** This attribute indicates whether packet MDR records for intra packet business groups are allowed to be generated.

**Attribute: grpstatus**

**Fullname:** Message detail recording (MDR) status (on or off)

**Attribute Description** If the group status is on (DBMDRON), the allowed record type fields are treated as specified (DBYES or DBNO). If the group status is off (DBMDROFF), the allowed record type fields are all treated as DBNO.

      dctvn        DCTNONE
      grpchngalw   DBNO
      amac         DBYES for flat,  DBNO for all other attributes
```

**Attribute: feat_id**

**Fullname:** Feature ID.

**Attribute Description** A BRCS constructed feature ID consists of two parts when class = FACBRCS and subclass = SCL_FEAT: a modular feature type (top 6 bits: bits 10 - 15) and an unique identifier (bottom 10 bits: bits 0 - 9). For an MDR constructed feature id, the modular feature type must equal MFMDR (17 = 0x11), which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff).

**Attribute: actvn**

**Fullname:** Activation method.

**Attribute Description** Method of activating constructed feature.

```
Enum. Value   Dependency
ACTNONE       1) RLmdr_opts.dctvn = DCTNONE, DCTCD
              2) RLmdr_opts.amac.flat = DBYES
ACTCD         1) RLmdr_opts.dctvn = DCTAUTO, DCTCD
              2) Verify that RLdaprlfnl or RLidp_dtre
                    *** ODA ONLY WARNING ***
                    *** (NOT SUPPORTED BY RC) ***
                 has a tuple for a given dial code
                 such that:
                 RLdaprlfnl.action = ACN_MDRACT
                 RLidp_dtre.action = ACN_MDRACT
```

**Attribute: dctvn**

**Fullname:** Deactivation type.

Copyright © 1999 Lucent Technologies 

**Attribute Description** Method of deactivating constructed feature.

```
Enum. Value Dependency
DCTNONE     1) RLmdr_opts.actvn = ACTNONE

DCTCD       1) RLmdr_opts.actvn = ACTNONE, ACTCD
            2) Verify that RLdaprlfnl or RLidp_dtre
                  *** ODA ONLY WARNING ***
                  *** (NOT SUPPORTED BY RC) ***
               has a tuple for a given dial code
               such that:
               RLdaprlfnl.action = ACN_MDRDCT
               RLidp_dtre.action = ACN_MDRDCT
```

**Attribute: grpchngalw**

**Fullname:** Group Change Allowed.

**Attribute Description** Boolean value indicating whether a dialed code can be used to change the MDR group status. The MDR group effected is the MDR group to which the originating port belongs.

```
Enum. Value   Dependency
DBNO          none
DBYES         Verify that RLdaprlfnl or RLidp_dtre
              has a tuple for a given dial code
              such that:
              RLdaprlfnl.action = ACN_MDROFF
              RLdaprlfnl.action = ACN_MDR_ON
              RLidp_dtre.action = ACN_MDROFF
              RLidp_dtre.action = ACN_MDR_ON
```

**Attribute: amac**

**Fullname:** AMA Charging.

**Attribute Description** Boolean structure indicating the combination of several types of AMA charging. In each case, a DBYES indicates that type of billing is applicable and DBNO indicates it is not. See domain DMmc_bill for a description of each sub-attribute.

The sole permissible values for 5E3 are DBYES for flat and DBNO for all others.

Range: DBYES, DBNO for each sub-attribute. Default Value: DBYES for flat, DBNO for all other sub-attributes.

If flat == DBYES, all other sub-attributes = DBNO.

**Attribute: amac.flat**

**Fullname:** Flat Charging.

**Attribute Description** Flat rate - no usage sensitive charge.

**Attribute: amac.usefreq1**

**Fullname:** User Frequent 1.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** User frequent usage event.

**Attribute: amac.usefreq[*]**

**Fullname:** User Frequent Event.

**Attribute Description** Usage frequency charge - for use of 'event'.

**Attribute: amac.actchrg**

**Fullname:** Activation Charge.

**Attribute Description** Usage charge for activation.

**Attribute: amac.dactchrg**

**Fullname:** Deactivation Charge.

**Attribute Description** Usage deactivation charge.

**Attribute: amac.duration**

**Fullname:** Duration charge.

**Attribute Description** Usage duration charge.

**Attribute: amac.change**

**Fullname:** Change parameter.

**Attribute Description** Change parameter charge.

**Attribute: mdrgroup**

**Fullname:** MDR group name.

**Attribute Description** This attribute is the default parameter for the MDR GROUP field in the RC/V MDR line/trunk parameter views.

If there is a group name entered in this attribute the group must not be packet MDR only (RLmdr_gp must be populated for this group name with at least one of the following attributes {orig_priv, in_priv, public} set to DBYES as well as the attribute pkt_mdr set to DBYES or DBNO). The group name is invalid if the pkt_mdr attribute equals DBYES and the other previous three attributes equal DBNO. The restriction applies only to packet MDR.

## 4. Population Rules for RLmdr_port

**Relation Description** Message Detail Recording Port.

Message Detail Recording (MDR) feature line/trunk parameter data.

Copyright © 1999 Lucent Technologies

MDR feature parameters assigned to a BRCS User (a User is defined to be an analog terminal, a trunk, or an ISDN User). line/trunk parameter data

When ever a tuple is added to this relation for a trunk member then a message should be printed for the switch personnel to go to the RC view 24.4 and look at the bit'mdruse'. If this bit is off then it must be turned on( 1 ), for the trunk group to which this trunk member belongs. This change in description is being added because of a new 5e5 feature.

**Attribute: lport**

**Fullname:** Logical Port

**Attribute Description** Logical port of the User being assigned the BRCS features. If lpt_type != LPT_BFG, RLmdr_port.lport must equal RLfc_line.lport (if a line) or RLfc_trunk.lport (if a trunk). The keys for RLfc_line & RLfc_trunk are:

```
RLfc_line.port  = RLlpt_pt(RLmdr_port.lport,RLmdr_port.lpt_type).port
RLfc_line.party = RLlpt_pt(RLmdr_port.lport,RLmdr_port,lpt_type).party
RLfc_trunk.port = RLlpt_pt(RLmdr_port.lport,RLmdr_port.lpt_type).port
If lpt_type     = LPT_BFG, then
```

RLmdr_port.lport contains a BFG group ID.

**Attribute: lpt_type**

**Fullname:** Logical Port Type

**Attribute Description** N/A

**Attribute: feat_id**

**Fullname:** Feature ID

**Attribute Description** A BRCS constructed feature id consists of two parts when class = FACBRCS and subclass = SCL_FEAT: a modular feature type (top 6 bits: bits 10 - 15) and an unique identifier (bottom 10 bits: bits 0 - 9). For an MDR constructed feature ID, the modular feature type must equal MFMDR (17 = 0x11), which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff).

**Attribute: mdr_gpid**

**Fullname:** MDR Group ID

**Attribute Description** N/A

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLmds_cf

**Relation Description** Message Desk Service (MDS) constructed feature options.

**Attribute: feat_id**

**Fullname:** MDS constructed feature id

**Attribute Description** A BRCS constructed feature ID consists of two parts when class = FACBRCS and subclass = SCL_FEAT a modular feature type (top 6 bits 10 - 15) and an unique identifier (bottom 10 bits: bits 0 - 9). For an MDS constructed feature ID, the modular feature type must equal MFMDS (25 = 0x19), which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff). Range: 0x6401 to 0x67ff (25601 to 26623)

```
Dependencies:
Verify that RLfacname has a tuple such that:
RLfacname.facid = feat_id
RLfacname.class = FACBRCS
RLfacname.subclass = SCL_FEAT
```

Verify that RLfid2name has a tuple keyed by: RLfacname.facid = feat_id RLfacname.class = FACBRCS RLfacname.subclass = SCL_FEAT

Verify that RLmds_opts has a tuple keyed by: RLmds_cf.feat_id

**Attribute: atnd_cvrg**

**Fullname:** attendant coverage indicator

**Attribute Description** Boolean value indicating whether attendant coverage is allowed.

Dependencies: If atnd_cvrg = DBYES, when assigning to a line/DN, a voice call forwarding feature must be assigned too (this rule is enforced in RLmds_port).

**Attribute: lwc_o**

**Fullname:** leave word calling outgoing

**Attribute Description** Boolean value indicating whether leave word calling outgoing is allowed. Assignable per DN/line.

Dependencies:
Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_LWCUSE or
RLidp_dtre.action = ACN_LWCUSE
```

If lwc_o = DBYES then, clwc must be DBYES. If lwc_o = DBYES then, lwc_io must be DBNO. If DBYES, then a non-zero ap_id must exist in the RLmds_grp at the assignment time.

**Attribute: lwc_io**

Copyright © 1999 Lucent Technologies 

**Fullname:** leave word calling incoming and outgoing

**Attribute Description** Boolean value indicating whether leave word calling incoming outgoing is allowed. Provided per primary DN basis.

Dependencies:
When assigned to an MLHG member that is not the first member verify that RLfc_line(port,party).locdn != 0.

```
Verify that RLdaprlfnl or RLidp_dtre has a tuple for
a given dial code such that:
RLdaprlfnl.action = ACN_LWCUSE or
RLidp_dtre.action = ACN_LWCUSE
```

If lwc_io = DBYES then, clwc must be DBYES. If lwc_io = DBYES then, lwc_o must be DBNO. If lwc_io = DBYES then, RLmds_cf.amwi || RLmds_cf.vmwi must be DBYES. If DBYES, then a non-zero ap_id must exist in the RLmds_grp at assignment time.

**Attribute: clwc**

**Fullname:** cancel leave word calling

**Attribute Description** Boolean value indicating whether cancel leave word calling is allowed. Assignable per DN/line.

Dependencies:
If clwc = DBYES then, RLmds_cf.lwc_io || RLmds_cf.lwc_o must be DBYES.

```
Verify that RLdaprlfnl or RLidp_dtre has a tuple for
a given dial code such that:
RLdaprlfnl.action = ACN_CLWCUSE or
RLidp_dtre.action =  ACN_CLWCUSE
RLmds_cf.lwc_io || RLmds_cf.lwc_o
must be DBYES.
```

If DBYES, then a non-zero ap_id must exist in the RLmds_grp at assignment time.

**Attribute: mrd**

**Fullname:** message retrieval display

**Attribute Description** Boolean value indicating whether message retrieval display is allowed. Is provided per primary DN basis.

Dependencies:
If DBYES, then a non-zero ap_id must exist in the RLmds_grp at assignment time.

**Attribute: pod**

**Fullname:** printout on demand

**Attribute Description** Boolean value indicating whether print-on demand is allowed. Provided per primary DN basis.

Dependencies:
Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_PODUSE or
```

Copyright © 1999 Lucent Technologies 

```
RLidp_dtre.action = ACN_PODUSE
```

If DBYES, then a non-zero ap_id must exist in the RLmds_grp at the assignment time.

**Attribute: amwi**

**Fullname:** audible message waiting indicator

**Attribute Description** Boolean value indicating whether audible message waiting indicator is assigned. Provided per primary DN basis.

Dependencies:
if DBYES, When assigned to an MLHG member that is not the first member verify that RLfc_line(port,party).locdn != 0.

If DBYES and atnd_cvrg = DBNO, then a non-zero ap_id must exist in the RLmds_grp at assignment time.

**Attribute: vmwi**

**Fullname:** visual message waiting indicator

**Attribute Description** Boolean value indicating whether visual message waiting indicator is assigned. Provided per primary DN basis.

Dependencies:
if DBYES, When assigned to an MLHG member that is not the first member verify that RLfc_line(port,party).locdn != 0.

If DBYES and atnd_cvrg = DBNO, then a non-zero ap_id must exist in the RLmds_grp at assignment time.

**Attribute: mwi_dct**

**Fullname:** message waiting indicator deactivation

**Attribute Description** Boolean value indicating whether message waiting deactivation is allowed. Provided per primary DN basis.

Dependencies:
if DBYES, When assigned to an MLHG member that is not the first member verify that RLfc_line(port,party).locdn != 0.

Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_DCTMWI or
RLidp_dtre.action =  ACN_DCTMWI
```

If mwi_dct = DBYES then, RLmds_cf.amwi || RLmds_cf.vmwi must be DBYES.

**Attribute: aucsu**

**Fullname:** auto call set up

**Attribute Description** Boolean value indicating whether auto call set-up is allowed. Provided per primary DN basis. It is assignable to the ISDN lines only, that is, RLfc_porttyp(port).servclass must be equal to FC_ISDN or FC_ISATND (enforced in RLmds_port).

Copyright © 1999 Lucent Technologies 

Dependencies:
if DBYES, When assigned to an MLHG member that is not the first member verify that (RLfc_line(port,party).locdn != 0 or that RLmds_cf.mrd = DBYES).

Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_AUCUSE or
RLidp_dtre.action =  ACN_AUCUSE
```

If DBYES, then a non-zero ap_id must exist in the RLmds_grp at assignment time.

**Attribute: mwi_scty**

**Fullname:** message waiting indicator security check option.

**Attribute Description** Enumerated value indicating whether MWI message security check is needed. Provided per primary DN basis.

If amwi or vmwi set to DBYES, then mwi_scty must be set to MC_YES or MC_NO. Else mwi_scty must be set to MC_NULL.

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLmds_grp

**Relation Description**

```
        Message Desk Service (MDS) group id

        This relation provides MDS group id information.
```

**Attribute:**

```
        mds_grpid
```

**Fullname:**

```
        Message Desk Service group id
```

**Attribute Description:**

```
        MDS group id, is an identifier resulting from the conversion
        from an 8 character MDS group name using RLfacname. The group
```

Copyright © 1999 Lucent Technologies

id must be assigned sequentially starting from 1. When an mds_grpid is freed-up, that position will be re-claimed before adding one more to the end of the list.

Dependencies:
A tuple must exist in this relation for each non-zero MDS group id in the RLmds_port relation.

Verify that RLfacname has a tuple such that:
  RLfacname.facid = mds_grpid
  RLfacname.class = FACMDS
  RLfacname.subclass = SCL_NULL

Verify that RLfid2name has a tuple keyed by:
  RLfid2name.facid = mds_grpid
  RLfid2name.class = FACMDS
  RLfid2name.subclass = SCL_NULL

**Attribute:**
gcsrid
**Fullname:**
business customer id
**Attribute Description:**
Dependencies:

A non-zero gcsrid is required for a MDS group with grp_type equal to MS_MSS.

A zero gcsrid is required for a MDS group with grp_type equal to MS_ISVM. Hence, with the introduction of ISVM in 5e7, gcsridis allowed to have a value of zero.

If a line is a member of an MDS group and an EDS group, the gcsrid of the EDS group must be the same as the gcsrid of the MDS group (provided that the grp_type equals MS_MSS) to which the line is assigned.

**Attribute:**
mdc_no
**Fullname:**
Message Desk Center number
**Attribute Description:**
If grp_type equals MS_MSS, then
  Verify that a tuple exists in RLrt_mhg such that:
  RLrt_mhg(mdc_no).grpnum = mdc_no
                  or RTH_ISAT or RTH_REGULAR
                  or RTH_LGREG or RTH_CIRCULAR
                  or RTH_LGCIR
  RLrt_mhg(mdc_no).mdc = DBYES

Verify that RLmdc_grp has a tuple such that:

**Copyright © 1999 Lucent Technologies** 

```
if RLmdc_grp.msc_scrn equals DBYES then
  RLmdc_grp(mdc_no).gcsrid* = gcsrid
endif

Verify that RLrc_msusr has a tuple such that:
  RLrc_msusr.mdc_no = mdc_no
    and there is only one mds_idxx such that:
  RLrc_msusr(mdc_no).mds_idxx = mds_grpid
    (where xx is a number between 00 thru 17)
endif

If grp_type equals MS_ISVM, then mdc_no must equal 0.
```

**Attribute:**
ap_id
**Fullname:**
Application Processor id
**Attribute Description:**

```
If RLrt_mhg = RTH_ISAT then, ap_id must equal 0

If ap_id is not zero then, verify that RLcmapdata has a
tuple such that:
  RLcmapdata.site_id = ap_id  and
  RLcmapdata.module is non-zero.

Verify that RLmdc_grp has a tuple such that:
  RLmdc_grp(mdc_no).ap_id = ap_id

If grp_type is equal to MS_ISVM, then ap_id must equal 0.
```

**Attribute:**
serv_id
**Fullname:**
service identifier
**Attribute Description:**

```
Service identifier, serv_id, is used to identify
the message service system that is providing
message service for a MSS group when more than
one message service is being provided by an
Applications Processor (AP).

If grp_type equals MS_ISVM, then serv_id must equal 0.
```

**Attribute:**
psswrd
**Fullname:**
password option
**Attribute Description:**

```
Boolean value to indicate whether the password
option is assigned.
```

**Copyright © 1999 Lucent Technologies** 

If grp_type equals MS_ISVM, then psswrd must equal DBNO.

**Attribute:**
msrmnt
**Fullname:**
measurement flag
**Attribute Description:**
Boolean value indicating whether or not
measurements are to be taken.
Dependencies:
If the tuple in RLms_ap has a edmsgp* such that
RLms_ap(MDS, DBNO).edmsgp* = mds_grpid, then
RLmds_grp.msrmnt = DBYES
else RLmds_grp.msrmnt = DBNO.

When deleting a tuple from this relation and
the msrmnt flag is set to DBYES then, zero
this edmsgp* and decrement the idscnt in the
RLms_ap(MDS, DBNO).

If grp_type equals MS_ISVM, then msrmnt must equal DBNO.

**Attribute:**
grp_type
**Fullname:**
MDS group type.
**Attribute Description:**
MDS group type identifier, grp_type, is used to identify
the group type of the associated MDS.

Dependencies:
The ISVM group will have a value of zero or DBNO for all
other attributes.

If grp_type = MS_MSS, then verify that the business customer id
is not equal to 0 and mdc_no is not equal to 0.

Copyright © 1999 Lucent Technologies

```

**Attribute: feat_id**

**Fullname:** MDS constructed feature ID

**Attribute Description** A BRCS constructed feature ID consists of two parts when class = FACBRCS and subclass = SCL_FEAT a modular feature type (top 6 bits : bits 10-15) and an unique identifier (bottom 10 bits: 0-9). For an MDS constructed feature ID, the modular feature type must equal MFMDS (25 = 0x19), which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff).

```
Dependencies:
Verify that RLfacname has a tuple such that:
RLfacname.facid = feat_id
```

Copyright © 1999 Lucent Technologies 

```
RLfacname.class = FACBRCS
RLfacname.subclass = SCL_FEAT

Verify that RLfid2name has a tuple keyed by:
RLfacname.facid  = feat_id
RLfacname.class = FACBRCS
RLfacname.subclass = SCL_FEAT

Verify that RLmds_cf has a tuple keyed by: RLmds_opts.feat_id
```

**Attribute: mds_group**

**Fullname:** message desk service group name

**Attribute Description** This attribute is the default parameter for MDS GROUP field in the RC/V line/trunk parameter views.

**Attribute: atnd_cvrg**

**Fullname:** attendant coverage

**Attribute Description** Boolean value indicating whether attendant coverage is allowed.

Dependencies:
If atnd_cvrg = DBYES, then when assigning this option to a line/DN, a voice call forwarding feature (fwd_cndtn is CFN_BUSY,CFN_IDLE,CFN_BSYIDL,CFN_PRCB, CFN_PRCI,CFN_PRCV,CFN_PPBUSY, or CFN_PPIDLE) must be assigned to the line/DN too (enforced in RLmds_port).

**Attribute: lwc_o**

**Fullname:** leave word calling outgoing

**Attribute Description** Boolean value indicating whether leave word calling outgoing is allowed.

```
Dependencies:
If DBYES, Verify that RLdaprlfnl or RLidp_dtre has
a tuple for a given dial code such that:
RLdaprlfnl.action = ACN_LWCUSE or
RLidp_dtre.action = ACN_LWCUSE
```

If lwc_o = DBYES then, lwc_io must be DBNO. If lwc_o = DBYES then, clwc must be DBYES.

**Attribute: lwc_io**

**Fullname:** leave word calling incoming and outgoing

**Attribute Description** Boolean value indicating whether leave word calling incoming outgoing is allowed. Provided per primary DN basis.

Dependencies:
If DBYES, When assigned to an MLHG member that is not the first member, verify that RLfc_line(port,party).locdn != 0. Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_LWCUSE or
RLidp_dtre.action = ACN_LWCUSE
```

Copyright © 1999 Lucent Technologies 

If lwc_io = DBYES then, lwc_o must be DBNO. If lwo_io = DBYES then, RLmds_opts.amwi || RLmds_opts.vmwi must be DBYES. If lwo_io = DBYES then, clwc must be DBYES.

**Attribute: clwc**

**Fullname:** cancel leave word calling

**Attribute Description** Boolean value indicating whether cancel leave word calling is allowed.

Dependencies:
If DBNO, RLmds_opts.lwc_o && RLmds_opts.lwc_io must be DBNO.

if DBYES, Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:
```
RLdaprlfnl.action = ACN_CLWCUSE or
RLidp_dtre.action =  ACN_CLWCUSE
```

RLmds_opts.lwc_o || RLmds_opts.lwc_io must be DBYES.

**Attribute: mrd**

**Fullname:** message retrieval display

**Attribute Description** Boolean value indicating whether message retrieval display is allowed. Provided per primary DN basis.

**Attribute: pod**

**Fullname:** printout on demand

**Attribute Description** Boolean value indicating whether print on demand is allowed. Provided per primary DN basis.

Dependencies:
If DBYES, Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:
```
RLdaprlfnl.action = ACN_PODUSE or
RLidp_dtre.action = ACN_PODUSE
```

**Attribute: amwi**

**Fullname:** audible message waiting indicator

**Attribute Description** Boolean value indicating whether audible message waiting indicator is assigned. Provided per primary DN basis.

Dependencies:
If DBYES, When assigned to an MLHG member that is not the first member, verify that RLfc_line(port,party).locdn != 0.

If DBYES and atnd_cvrg = DBNO, then a non-zero ap_id must exist in RLmds_grp at assignment time.

**Attribute: vmwi**

**Fullname:** visual message waiting indicator

**Attribute Description** Boolean value indicating whether visual message waiting indicator is

Copyright © 1999 Lucent Technologies 

assigned. Provided per primary DN basis.

Dependencies:
If DBYES, When assigned to an MLHG member that is not the first member, verify that RLfc_line(port,party).locdn != 0.

If DBYES and atnd_cvrg = DBNO, then a non-zero ap_id must exist in RLmds_grp at assignment time.

**Attribute: mwi_dct**

**Fullname:** message waiting indicator deactivation

**Attribute Description** Boolean value indicating whether message waiting deactivation is allowed. Provided per primary DN basis.

Dependencies:
If DBYES, When assigned to an MLHG member that is not the first member, verify that RLfc_line(port,party).locdn != 0. Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_DCTMWI or
RLidp_dtre.action =  ACN_DCTMWI
RLmds_opts.amwi || RLmds_opts.vmwi must be DBYES.
```

**Attribute: aucsu**

**Fullname:** Auto Call set up

**Attribute Description** Boolean value indicating whether auto call set-up is allowed. Provided per primary DN basis but, it can be activated from any call appearance on a terminal which this option is assigned to it's primary DN.

This option is assignable only to ISDN lines, that is, RLfc_porttyp(port).servclass must be FC_ISDN or FC_ISATND. This rule is enforced in RLmds_port.

Dependencies:

```
If DBYES, When assigned to an MLHG member that is not the
first member, verify that (RLfc_line(port,party).locdn != 0
or that RLmds_opts.mrd = DBYES).
```

Verify that RLdaprlfnl or RLidp_dtre has a tuple for a given dial code such that:

```
RLdaprlfnl.action = ACN_AUCUSE or
RLidp_dtre.action =  ACN_AUCUSE
```

**Attribute: mwi_scty**

**Fullname:** message waiting indicator security check option.

**Attribute Description** Enumerated value indicating whether MWI message security check is needed. Provided per primary DN basis.

If amwi or vmwi set to DBYES, then mwi_scty must be set to MC_YES or MC_NO.

Copyright © 1999 Lucent Technologies 

# MDS_PORT

## 1. Description

Message desk service line parameter.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 115200 |
| expected number of tuples | 75 |
| density | 63 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| corcable relation | DBYES |

```

## 4. Population Rules for RLmds_port

**Relation Description** This relation provides the MDS group ID (mds_grpid), the audible message waiting indicator (amwi) status indicator, and the visual MWI (vmwi) status indicator.

For BFG purposes, MDS feature parameter type is LINE. Therefore, BFG pseudo port tuples will not be created for the port assigned to a BFG. Only individual port tuples are created for BFG assigned ports.

With the introduction of DTC in 5E6, multiple MSS features, maximum of four, may be assigned to a single port as long as they have different feature IDs.

The addition/removal of an MDS feature from an ISDN line impacts the value of the RLspid.fip_req attribute. See the RLspid poprules for further details."

**Attribute: lead_module**

Copyright © 1999 Lucent Technologies

**Fullname:** lead module

**Attribute Description** Indicates the lead module.

**Attribute: ltm_type**

**Fullname:** logical termination index type

**Attribute Description** Indicates the logical termination index type in use.

**Attribute: ltm_idx**

**Fullname:** logical termination index

**Attribute Description** Attribute ltm_idx has a domain range that starts with 0. In this relation, the ltm_idx range starts with 1. As discussed in RLrc_qidx, the existence of an index implies the value 1 or greater. If no index is defined, RLrc_qidx(sm, ltm_type) would contain an index value of 0 and no tuple would exist in this relation. Therefore, ltm_idx must be greater than 0 in this relation.

```
Dependencies:
If ltm_type is equal to LTM_OTHER, then verify
there is an entry in the RLltm_port such that:
   RLltm_port(ltm_idx) = ltm_idx
Verify that a tuple exists in RLfc_line such that:
   RLfc_line(RLltm_port(ltm_idx),
   RLltm_port(party)) = RLltm_port(ltm_idx).port
If ltm_type is equal to LTM_OTHER, then verify that:
   RLfc_line(RLltm_port(ltm_idx),
        RLltm_port(party)).dn_bfg = DBYES or
   RLfc_line(RLltm_port(ltm_idx),
        RLltm_port(party)).brc_dn = DBYES.
If ltm_type is equal to LTM_ISDN, then verify that:
   RLis_line(lead_module, ltm_idx).dn_bfg = DBYES or
   RLis_line(lead_module, ltm_idx).brc_dn = DBYES.
If ltm_type is equal to LTM_ISDN then a tuple
must exist in the RLis_line relation such that:
   RLis_line(lead_module, ltm_idx).lead_module = lead_module and
   RLis_line(lead_module, ltm_idx).ltm_idx = ltm_idx
```

**Attribute: feat_id**

**Fullname:** MDS constructed feature ID

**Attribute Description** A BRCS constructed feature ID consists of two parts when class = FACBRCS and subclass = SCL_FEAT a modular feature type (top 6 bits 10 - 15) and an unique identifier (bottom 10 bits: bits 0 - 9). For an MDS constructed feature ID, the modular feature type must equal MFMDS (25 = 0x19), which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff).

```
Dependencies:
Verify that RLfacname has a tuple such that:
    RLfacname.facid = feat_id
    RLfacname.class = FACBRCS
    RLfacname.subclass = SCL_FEAT
```

Copyright © 1999 Lucent Technologies 

```
Verify that RLdn_feats has a tuple such that:
    RLdn_feats(lead_module, ltm_type, ltm_idx).ftent[i].fid = feat_id
MLHG with the MUPH hunt type can not be assigned the vmwi option,
that is, RLmds_opts(feat_id).vmwi must be DBNO.  A DN belongs to a
MUPH MLHG if:
    ltm_type is equal to LTM_OTHER and
    RLfc_porttyp(port).hunt is equal to DBYES and
    hunt type in the:
    RLrt_mhg(RLpggpmap(port).portgrp.grpnum).htype
        is equal to RTH_MUPH.

Verify that RLmds_opts has a tuple such that:
    RLmds_opts.feat_id = feat_id.
When assigning a MDS feat_id with atnd_cvrg option
    (that is, RLmds_opts(feat_id).atnd_cvrg is equal to DBYES),
    verify that a CF feature is also assigned to the line/DN.
If RLmds_opts(feat_id).vmwi is equal to DBYES and assigning
the feat_id to an analog line, that is,
    ltm_type is equal to LTM_OTHER or
    ltm_type is equal to LTM_ISDN and
    RLfc_porttyp(RLlpt_pt(RLis_line(lead_module,
       ltm_idx).lead_lport,lpt_type=LPT_ISDN).port).sh_analog
    is equal to  DBYES then,
verify that at least five tuples exists in the RLxcvr_ckt
relation  on the lead_module SM that can be used for VBS.

Verify when RLmds_opts(feat_id).vmwi = DBYES and
    RLmds_opts(feat_id).atnd_cvrg = DBNO that
    RLmds_grp(mds_grpid).ap_id != 0, provided that the
       associated group type is MS_MSS.

Verify when RLmds_opts(feat_id).amwi = DBYES and
    RLmds_opts(feat_id).atnd_cvrg = DBNO that
    RLmds_grp(mds_grpid).ap_id != 0, provided that the
       associated group type is MS_MSS.
For the Modular Feature Type of MFMDS,
    RLdn_feats.ftent[n].ath will equal DBNO.
New rule for DTC introduced in 5E6:
A maximum of 4 fids may be assigned to a port.  Namely,
int count:  /* counter for features on DN  */
count := 0:
For every tuple in RLmds_port on sm(GL_pcrid)
begin
if (((RLmds_port.lead_module = lead_module)
and (RLmds_port.ltm_type = ltm_type))
and (RLmds_port.ltm_idx = ltm_idx)) then
begin
count := count + 1:
end
 end
if ( count > 4) then
begin
error (Maximum features exceeded!):
end
```

Copyright © 1999 Lucent Technologies 

```
New rule for DTC in 5E6:
When RLmds_opts(feat_id).lwc_o  = DBYES or
RLmds_opts(feat_id).lwc-io = DBYES,
verify that there are no other MSS features assigned
to this port that have either the lwc_o or lwc_io
feature options.  Namely,
if (RLmds_opts(feat_id).lwc_o  = DBYES or
RLmds_opts(feat_id).lwc-io = DBYES) then
begin
For all tuples in RLmds_port
where (RLmds_port.lead_module = lead_module
and RLmds_port.ltm_type = ltm_type
and RLmds_port.ltm_idx = ltm_idx
and RLmds_port.feat_id != feat_id)
begin
find exactly (1) tuple in RLmds_opts
where RLmds_opts.feat_id equals RLmds_port.feat_id
when found
begin
RLmds_opts(fid).lwc_o  must equal DBNO
and
RLmds_opts(fid).lwc_io must equal DBNO
end
end
end
New rule for DTC in 5E6:
If multiple features are assigned to the same port
and if these features have the mrd option,
then the ap_id's in RLmds_grp(RLmds_port.mds_grpid)
for these features must be different.
Namely,
int fid, grp: fid := RLmds_port.feat_id:
grp := RLmds_port.mds_grpid:
for all tuples in RLmds_port
where (RLmds_port.lead_module = lead_module
and RLmds_port.ltm_type    = ltm_type
and RLmds_port.ltm_idx     = ltm_idx
and RLmds_port.feat_id    != fid)
begin
if (RLmds_opts(feat_id).mrd = DBYES and
RLmds_opts(fid).mrd     = DBYES)
then begin RLmds_grp(mds_grpid).ap_id
must_not_equal
RLmds_grp(grp).ap_id
end
end
New rule for DTC in 5E6:
If multiple features are assigned to the same port and
if these features have the pod option,
then the ap_id's in RLmds_grp(RLmds_port.mds_grpid)
for these features must be different.
Namely,
int fid, grp:
fid := RLmds_port.feat_id:
```

Copyright © 1999 Lucent Technologies 

```
grp := RLmds_port.mds_grpid:
for all tuples in RLmds_port
where (RLmds_port.lead_module = lead_module
and RLmds_port.ltm_type    = ltm_type
and RLmds_port.ltm_idx     = ltm_idx
and RLmds_port.feat_id    != fid)
begin
if (RLmds_opts(feat_id).pod = DBYES and
RLmds_opts(fid).pod     = DBYES) then
begin
RLmds_grp(mds_grpid).ap_id
must_not_equal
RLmds_grp(grp).ap_id
end
end
```

**Attribute: mds_grpid**

**Fullname:** message desk service group ID

**Attribute Description** MDS group ID (10 bits: bits 0-9), is an identifier resulting from the conversion from an 8 character MDS group name using RLfacname. The mds_grpid is arranged sequentially starting at 1. When an mds_grpid is freed-up, that position will be re-claimed before adding one more to the end of the list.

```
Dependencies:
Verify that a tuple exists in the RLfacname
relation such that:
RLfacname.facid = mds_grpid.
(compare RLfacname.facid low order bits, bits0-9)
RLfacname.class = FACMDS
RLfacname.subclass = SCL_NULL
```

Verify that RLmds_grp has a tuple such that: RLmds_grp.mds_grpid = mds_grpid

Verify that RLmds_opts has a tuple such that: RLmds_opts(feat_id) = feat_id and in that tuple if any of the following bits: lwc_io, lwc_o, mrd, pod or aucsu is equal to DBYES then the ap_id in the RLmds_grp(mds_grpid) relation must be non-zero.

If the aucsu bit in the RLmds_opts(feat_id) tuple is equal to DBYES then:
RLrc_lcc(RLrc_oeinfo(port, portmod, party).lcc, RLrc_oeinfo(port, portmod, party).rax).servclass must be equal to FC_ISDN or FC_ISATND. To find the port if ltm_type is equal to LTM_OTHER then:
port = RLltm_port(ltm_idx).port, if ltm_type is equal to LTM_ISDN then:
port=RLlpt_pt(RLis_line(lead_module, ltm_idx).lead_lport, lpt_type=LPT_ISDN).port

If ltm_type is equal to LTM_ISDN and any of the following bits: lwc_io, mrd, pod, amwi, vmwi, mwi_dct or aucsu is equal to DBYES in the RLmds_opts(feat_id), then verify that:
RLis_line(lead_module, ltm_idx).primary is equal to DBYES.

New Rule introduced in 5E6: When multiple MSS features are assigned to a line and the ap_id's in the assigned MSS groups are identical, then the serv_id of an MSS group may not be zero and must be different from the serv_id's of the other MSS groups, provided that the associated group type is MS_MSS. Namely,

Copyright © 1999 Lucent Technologies 

int fid, grp: fid := RLmds_port.feat_id: grp := RLmds_port.mds_grpid: for all tuples in RLmds_port where (RLmds_port.lead_module = lead_module and RLmds_port.ltm_type = ltm_type and RLmds_port.ltm_idx = ltm_idx and RLmds_port.feat_id != fid) begin if (RLmds_grp(grp).ap_id equals RLmds_grp(mds_grpid).ap_id) then begin ((RLmds_grp(mds_grpid).serv_id must_not_equal 0) and (RLmds_grp(grp).serv_id must_not_equal 0)) and (RLmds_grp(grp).serv_id must_not_equal RLmds_grp(mds_grpid).serv_id)) end end

New Rule Introduced in 5E7: If the MDS group id is associated with an ISVM group, then the associated RLmds_opts.mwi_scty must equal MC_NO and RLmds_opts.lwc_o, RLmds_opts.lwc_io, RLmds_opts.clwc, RLmds_opts.mrd, RLmds_opts.pod, and RLmds_opts.aucsu must all equal DBNO.

**Attribute: vmwi**

**Fullname:** visual message waiting indicator

**Attribute Description** This bit is always set to DBNO at the time the tuple is created via ODA or RC. The status of this bit must be set to DBNO across ODA retrofit or growth processing.

**Attribute: amwi**

**Fullname:** audible message waiting indicator

**Attribute Description** This bit is always set to DBNO at the time the tuple is created via ODA or RC. The status of this bit must be set to DBNO across ODA retrofit or growth processing.

## 4. Population Rules for RLmeasfltr

**Relation Description** Terminal Maintenance Filter.

This relation specifies the coefficients to the filters used to detect the tones at the GDSF. This relation is market dependent on a per country basis and so not changed through RC/V. The key into this relation is filterid which has a domain of DMfilterid. The attributes are 50 unsigned 16 bit integers (domain DMHEX16) which correspond to 17, 32 bit DSP32 floating point filter coefficients. One of the coefficients is a gain factor, while the remaining 16 are used to produce four cascaded four-coefficient biquadratic sections.

**Attribute: filterid**

**Fullname:** Filter Identification

**Attribute Description** This attribute is the key to the relation and defines the identity of the filter.

**Attribute: filtercnt**

**Fullname:** Number of active filter coefficients

**Attribute Description** This attribute indicates number of active filter coefficients exist.

**Attribute: filcoe[*]**

**Fullname:** Coefficients for the filter.

**Attribute Description** This attribute defines one of the coefficients for the filter.

## 4. Population Rules for RLmeetme

**Relation Description** This relation contains those NPA's for which part or all of the NXX's can be restricted from using meet-me *Alliance* ® teleconferencing.

**Attribute: npa**

**Fullname:** NPA

**Attribute Description** This is an NPA served by this OSPS for which some NXXs are restricted from originating meet-me *Alliance* ® teleconferencing calls.

**Attribute: allrest**

**Fullname:** Allrest

**Attribute Description** This is a boolean flag which indicates if all NXXs are restricted (DBYES) or just some (or none) (DBNO).

**Attribute: bits[*]**

**Fullname:** Bits

**Attribute Description** These are 800 boolean flags stored in 25 32-bit words, with a bit being a flag for each NXX within the NPA to indicate whether the NXX is restricted (1) or not (0). The low order bits are populated with boolean status of lower NXXs in ascending order. Thus NXXs 200 to 231 will correspond to bit 0 to bit 31 within the attribute bits00.

## 4. Population Rules for RLmh_tslot

**Relation Description:** This relation indicates which SPYDER-T time slots and channels are allocated to a given MH.

Copyright © 1999 Lucent Technologies

**Attribute: sm**

**Fullname:** Switch Module Number

**Attribute Description** This attribute identifies the SM where the MH is located.

**Attribute: mh_num**

**Fullname:** Message Handler Unit Number

**Attribute Description** This attribute identifies the message handler that is equipped in the SM.

**Attribute: ch_used**

**Fullname:** Channel usage bitmap

**Attribute Description** This attribute is a bitmap containing 32 bits that specifies whether the associated SPYDER-T channel is allocated in the MH. If the associated bit is a 1, then the channel is assigned in the MH. For example if bits 1, 4, and 20 are set to 1, then channels 1, 4, and 20 are allocated to peripherals.

**Attribute: ts_used**

**Fullname:** Timeslot usage bitmap

**Attribute Description** This attribute is a bitmap containing 32 bits that specifies whether the associated SPYDER-T time slot is allocated to a channel. If the associated bit is a 1, then the time slot is assigned in the MH. For example if bits 2, 6, and 11 are set to 1, then time slots 2, 6, and 11 are allocated to peripherals.

Copyright © 1999 Lucent Technologies 

# MH_UNIT

## 1. Description

This relation maps from Message Handler (MH) and channel to its associated peripheral unit. This relation provides the inverse mapping of RLunit_mh.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLmh_unit

**Relation Description** Message Handler to Peripheral Unit

This relation associates a Message Handler with a peripheral unit. It is the reverse mapping of the RLunit_mh relation. For each entry in RLmh_unit there must be an associated entry in RLunit_mh.

**Attribute: mh_num**

**Fullname:** Message Handler Number

**Attribute Description** This attribute identifies the Message Handler that is equipped in the SM.

**Attribute: channel**

Copyright © 1999 Lucent Technologies

**Fullname:** MH Channel Number

**Attribute Description** This attribute identifies the logical channel number in the MH. The range is 0 through 31. Channel 0 is not assigned by RC/V or ODA. It is used in the MH to associate all the unused timeslots.

**Attribute: unittype**

**Fullname:** Peripheral Unit Type

**Attribute Description** The type of peripheral unit that uses the MH channel.

**Attribute: unitnumber**

**Fullname:** unit number

**Attribute Description** The unit number that identifies the peripheral unit.

**Attribute: serv_grp**

**Fullname:** Service Group number

**Attribute Description** Service group of the peripheral unit where the MH is connected.

**Attribute: protocol**

**Fullname:** Protocol

**Attribute Description** peripheral messaging protocol used on the channel

**Attribute: mhts_used**

**Fullname:** MH Timeslot Usage Map

**Attribute Description** This attribute is a bitmap containing 32 bits that specifies whether the associated Spyder timeslot is included in the logical channel specified by the "channel" attribute. If the associated bit is 1, then that timeslot is included in the Spyder channel.

## 4. Population rules for RLmhg_cf

### Relation Description

```
        CF activation on Multi Line Hunt Group

        This relation saves the status of CF activation on
        Multi Line Hunt Group

       "for every tuple in RLrt_mhg
        where (RLrt_mhg.grpnum equals RLmhg_cf.grpnum)
        when found
        begin
        must find exactly 1 tuples in RLmhg_cf on RLrt_mhg.module
        end"
```

**Attribute:**
grpnum
**Fullname:**
the group number associated with this MLHG
**Attribute Description:**
this number is same as that of group number in RLrt_mhg

**Attribute:**
cfvind
**Fullname:**
call forwarding variable indicator
**Attribute Description:**
indicates if call forwarding variable is assigned and active for member 1 (lead) port of this multiline hunt group. DBYES indicates that the feature is assigned && active. DBNO indicates that the feature is not assigned OR not active.

For PSMCP cfvind = DBNO.

**Attribute:**
cfb_ind
**Fullname:**
call forwarding busy indicator
**Attribute Description:**
indicates if call forwarding busy is assigned and active for member 1 (lead) port of this multiline hunt group. DBYES indicates that the feature is assigned && active. DBNO indicates that the feature is not assigned OR not active.

For PSMCP cfb_ind = DBNO (enforced in RULE about RLmhg_cf.cfvind).

Copyright © 1999 Lucent Technologies 

If call forwarding busy is assigned to member 1
of a MLH group, RLfc_line.brc == DBYES or DBNO for
members other than the lead member to indicate
which members have BRCS features.

**Attribute:**
cfvppind
**Fullname:**
N/A
**Attribute Description:**
unused

**Attribute:**
cfbppind
**Fullname:**
N/A
**Attribute Description:**
unused

**Attribute:**
cfnsind
**Fullname:**
fixed night service call forwarding indicator
**Attribute Description:**
indicates if Fixed Night Service call forwarding for
member 1 (lead member of a Multiline Hunt Group) is assigned
and active.
DBYES indicates that the feature is assigned && active.
DBNO indicates that the feature is not assigned OR not
active.

**Attribute:**
dummy1
**Fullname:**
dummy variable
**Attribute Description:**
extra BOOL if the design calls for one

**Attribute:**
scr_on
**Fullname:**
selective call rejection active
**Attribute Description:**
This feature status of a multi-line hunt group should
be updated when the feature status, scr_on, or/and
the master swtch, mastsw, of the member 1 is (are)
changed. The feature status of the member one is

**Copyright © 1999 Lucent Technologies** 

defined in FC_LINE for ltm_type = LTM_OTHER or
in IS_LINE for ltm_type = LTM_ISDN.
The master switch is defined in DN_FEATS.

The truth table is:

| FC_LINE/IS_LINE | DN_FEATS | MHG_CF |
|---|---|---|
| scr_on | mastersw | scr_on |
| DBNO | DBNO | DBNO |
| DBYES | DBNO | DBNO |
| DBNO | DBYES | DBNO |
| DBYES | DBYES | DBYES |

**Attribute:**
scf_on
**Fullname:**
selective call forwarding active
**Attribute Description:**
Refer to the description of scr_on

**Attribute:**
sca_on
**Fullname:**
selective call acceptance active
**Attribute Description:**
Refer to the description of scr_on

**Attribute:**
sda_on
**Fullname:**
selective distinctive altering active
**Attribute Description:**
Refer to the description of scr_on

**Attribute:**
car
**Fullname:**
Computer Access Restriction
**Attribute Description:**
If the Selective Call Acceptance or Computer Access
Restriction feature is assigned to member 1
this field indicates if the feature assigned is
SCA or CAR. DBYES indicates CAR is assigned.
If SCA or CAR is assigned to member 1
there will be a tuple in SCA_LTM on member 1 SM whose
keys are the ltm_type and ltm_idx of member 1.
For this tuple, SCA_LTM.car = MHG_CF.car.

Copyright © 1999 Lucent Technologies 

If such a tuple does not exist in SCA_LTM (feature not assigned), MHG_CF.car = DBNO.

**Attribute:**
sca_nat
**Fullname:**
Selective Call Acceptance Non-Acceptance Treatment
**Attribute Description:**
If member 1 is assigned the SCA or CAR feature, this field indicates what type of non-acceptance treatment the calling party will receive. This field should be defined as
NAT_NULL, if the NAT is unspecified.
NAT_FWRD, if the call will be forwarded.
NAT_RCRD, if an announcement will be given.
If SCA or CAR is assigned to member 1 there will be a tuple in SCA_LTM on member 1 SM whose keys are the ltm_type and ltm_idx of member 1.
For this tuple, SCA_LTM.sca_nat = MHG_CF.sca_nat.
If such a tuple does not exist in SCA_LTM (feature not assigned), MHG_CF.sca_nat = NAT_NULL.

**Attribute:**
cfimb
**Fullname:**
Call Forwarding Busy Line Inhibit Make Busy
**Attribute Description:**
This attribute indicates whether call forwarding busy line is inhibited or not if Circuit Switched Voice Multi-Line Hunt Group is made busy by group make busy key or group make busy feature button. The cfimb option can not be assigned to Circuit Switched Data MLHG and the hunt type must be in RTH_CIRCULAR, RTH_LGCIR, RTH_REGULAR, RTH_LGREG, RTH_UCD and RTH_LGUCD.

**Attribute:**
cfilb
**Fullname:**
Call Forwarding Busy Line Inhibit Line Busy
**Attribute Description:**
This attribute indicates whether call forwarding busy line is inhibited or not if Circuit Switched voice Multi_Line Hunt Group is busy but not made busy by group make busy key/ feature button. The group make busy key/feature button should be assigned to the Multi-Line Hunt Group. The cfilb option can not be assigned to Circuit Switched Data MLHG and the hunt type must be in RTH_CIRCULAR, RTH_LGCIR, RTH_REGULAR, RTH_LGREG, RTH_UCD and RTH_LGUCD

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ovfcfi
**Fullname:**
Overflow Tone for Call Forwarding Busy Line Inhibit
**Attribute Description:**
If this field is set to yes, then the overflow tone (reorder) should be given to the originating party when call forwarding inhibit make busy (cfimb) or call forwarding inhibit line busy (cfilb) option is assigned to the MLHG. If this field is not set then busy tone is provided. When this field is set to yes cfimb or cfilb must be set to yes.

**Attribute:**
tat_on
**Fullname:**
Terminating Attempt Trigger on.
**Attribute Description:**
Indicates active TAT assignment to a MLHG. This is a corcable attribute.

**Attribute:**
ohd_act
**Fullname:**
Off Hook Delay Trigger active.
**Attribute Description:**
Indicates active OHD assignment to a MLHG.

**Attribute:**
mffcf1
**Fullname:**
Boolean reserved for future field feature use.
**Attribute Description:**
see fullname description.

**Attribute:**
mffcf2
**Fullname:**
Boolean reserved for future field feature use.
**Attribute Description:**
see fullname description.

**Attribute:**
mffcf3
**Fullname:**
bit reserved for future field feature use
**Attribute Description:**
Not assigned yet

Copyright © 1999 Lucent Technologies 

**Attribute:**
mffcf4
**Fullname:**
bit reserved for future field feature use
**Attribute Description:**
Not assigned yet

**Attribute:**
mffcf5
**Fullname:**
unsigned 8 reserved for future field feature use
**Attribute Description:**
Not assigned yet

**Attribute:**
tbl_on
**Fullname:**
Terminating Busy Line Trigger On
**Attribute Description:**
This attribute indicates Terminating Busy Line Trigger assignment to a MLHG. This is a corcable attribute.

## 4. Population Rules for RLmhg_opts

**Relation Description** Multi-line hunt group (MLHG) feature definition's options and defaults.

Copyright © 1999 Lucent Technologies

**Attribute: feat_id**

**Fullname:** feature ID

**Attribute Description** One tuple per multi-line hunt constructed feature. For each tuple there must be a tuple in RLfacname containing this feature id, a class of FACBRCS, and a subclass of SCL_FEAT, and a tuple in RLfacftdsc with this feature ID. High order byte must have a modular feature type of MFMLHG from DMmftype. Low order byte is unrestricted. RLmhg_opts.feat_id = this feat.id.

**Attribute: htype**

**Fullname:** Hunt type

**Attribute Description**

```
RTH_REGULAR  - regular linear
RTH_CIRCULAR - circular hunt
RTH_UCD      - uniform call distribution
RTH_MUPH     - multiposition hunt
RTH_PPSMHG   - MLHG with PP feature
RTH_PSUCD    - uniform call distribution for packet calls
RTH_ISAT     - ISAT groups
```

If htype is RTH_MUPH, distinctive ringing may not be assigned to a member of a hunt group which bears this feature. (This rule is enforced in RLdr_ltm.)

All members of MLHGs must be in the same terminal group See poprules under RLdn_feats.tgid.

Default: None (a group must have a hunt type).

**Attribute: beartyp**

**Fullname:** Bearer type

**Attribute Description** This attribute is the same as in the RLrt_mhg tuple which has been associated with this feat_id.

beartyp can be associated with a predefined feature which is in turn associated with a multi-line hunt group. Its value is an indication of the type of calls that can be routed to the multi-line hunt group.

ISAT, MUPH, and precedence and preemption MLHGs must have a beartyp of BR_VOICE. Packet switched MLHGs must have a beartyp of BR_PACK. Regular, Circular, and UCD MLHGs must have a beartyp of either BR_VOICE or BR_CSD. Possible values for beartyp are: circuit switched voice (BR_VOICE), circuit switched data (BR_CSD) and packet switched (BR_PACK).

**Attribute: ofvreg**

**Fullname:** Overflow register

**Attribute Description**

```
DBYES - this feature allows an overflow register
DBNO - this feature does not allow an overflow register
```

Overflow registers are assigned on a per MLHG group basis, not on a per feature basis. The per MLHG group overflow register indicator is RLrt_mhg.reg. A rule in RLrt_mhg specifies that

Copyright © 1999 Lucent Technologies 

```
if (RLrt_mhg.reg equals DBYES) then
begin
   must find exactly 1 tuple in RLrc_pgrprmk
   where (RLrc_pgrprmk.portgrp.grpnum equals RLrt_mhg.grpnum)
   when found
   begin
      must find exactly 1 tuple in RLmhg_opts
      where (RLmhg_opts.feat_id equals RLrc_pgrprmk.feat_id)
      when found
      begin
         RLmhg_opts.ofvreg must_equal DBYES;
      end
   end
end
```

**Attribute: inwats**

**Fullname:** Inwats group indicator

**Attribute Description**

```
DBYES - groups have inwats.
DBNO - groups do not have inwats.
```

RLrt_mhg.inwats must be DBNO if RLmhg_opts.inwats equals DBNO and RLrt_mhg.grpnum equals RLrc_pgmprmk.grpnum and RLrc_pgmprmk.feat_id equals this feat_id.

**Attribute: cfbusy**

**Fullname:** Call forward busy

**Attribute Description**

```
DBYES - Groups may have call forwarding busy features assigned to
        member number 1.
DBNO  - Groups not may have call forwarding busy features assigned to
        member number 1.
```

RLmhg_cf.cfb_ind must be DBNO if RLmhg_opts.cfbusy equals DBNO and RLmhg_cf.grpnum equals RLrc_pgmprmk.grpnum and RLrc_pgmprmk.feat_id = this feat_id.

**Attribute: cfvar**

**Fullname:** call forward variable

**Attribute Description**

```
DBYES - Groups may have call forwarding variable features
        assigned to member number 1.
DBNO  - Groups may not have call forwarding variable features
        assigned to member number 1.
```

RLmhg_cf.cfvind must be DBNO if RLmhg_opts.cfvar equals DBNO and RLmhg_cf.grpnum = RLrc_pgmprmk.grpnum and RLrc_pgmprmk.feat_id = this feat_id. Call forwarding variable features assigned to member number 1 of hunt groups must have don't answer timing of 0 (enforced in RLcf_opts).

## 4. Population Rules for RLmhg_tgsr

**Relation Description** Multi-line hunt group (MLHG) terminal group restrictions.

Contains information to check the TGSR and/or attendant control of voice terminal (ACVT) restrictions between the originating and the terminating MLHG.

**Attribute: mlhgrp**

**Fullname:** MLHG Group Number

**Attribute Description** Key is the groups number.

**Attribute: tg_id**

**Fullname:** Terminal Group ID (number)

**Attribute Description** Terminal Group in which MLHG belongs.

**Attribute: tgfid**

**Fullname:** Terminal Group Feature ID

**Attribute Description** Key to relation RLtg_cf, to get TGSR placed on MLHG.

**Attribute: grpcos**

**Fullname:** Class of Service for First Member of a MLHG.

**Attribute Description** Used to check TGSR and/or ACVT between originator and MLHG.

**Attribute: mstsw**

**Fullname:** Feature Master Switch

**Attribute Description** Are features inactive due to Master Switch setting.

**Attribute: actsw**

**Fullname:** Activation Switch

**Attribute Description** Individual Feature Activation.

**Copyright © 1999 Lucent Technologies** 

**Attribute: acvt_flag**

**Fullname:** ACVT Flag

**Attribute Description** Does Member One of MLGH have a terminating ACVT feature.

**Attribute: acvt_mstsw**

**Fullname:** ACVT Feature Master Switch

**Attribute Description** Is the ACVT feature inactive due to Master Switch setting.

**Attribute: acvt_actsw**

**Fullname:** ACVT Feature Activation Switch

**Attribute Description** Is the ACVT feature inactive due to Feature Activation.

***NOTE:*** This attribute is corcable.

**Attribute: acvt_res**

**Fullname:** ACVT Restriction level

**Attribute Description** The ACVT restriction level of the port.

**Attribute: acvt_gpid**

**Fullname:** ACVT group ID, key to RLat_grp

**Attribute Description** The ACVT restriction group ID.

# MHPIPE

## 1. Description

This relation defines the peripheral side of a Quad-Link Packet Switch (QLPS) Message Handler (MH) pipe. A pipe is a high bandwidth path from a QLPS QTMSLNK through the TMS to a given QLPS end-point (in this case the endpoint is a Message Handler (MH) in an SM-2000.) QLPS is used in the *5ESS*®-2000 switch for high bandwidth message transport.

## 4. Population Rules for RLmhpipe

**Relation Description** QLPS Message Handler Pipe relation

This relation is used in an SM-2000 to identify the timeslots through the TSI that are to be used for an MH pipe to a QLPS network. This relation will be used by PC to nail-up the timeslots for the pipe and will be used to determine the Spyder-T timeslots in the MH, where the MH pipes terminate. QLPS is an optional overlay network to provide high bandwidth message transport. It is being developed as part of Service net-2000 release 1.

**Attribute: qnetwork**

**Fullname:** QLPS Network

**Attribute Description** This attribute is the QLPS network number. In release 1, there will be 2 QLPS networks 0 and 1, but networks 2 and 3 may be added in the future and must be allowed for.

**Attribute: qtlnkpos**

**Fullname:** QTMSLNK (QLPS Tms Link) Position

**Attribute Description** This attribute is the position within the QLPS of the QTMSLNK that terminates this MH pipe at the QLPS.

**Attribute: num_slots**

**Fullname:** Number of Pipe Timeslots

**Attribute Description** This attribute contains the number of timeslots in the MH pipe being defined. For release 1, this will be fixed at 14, but this attribute is being supplied for future use when the number of timeslots in a pipe may be recent changeable.

**Attribute: per[*]**

**Fullname:** MH Pipe Peripheral Side Timeslot map

**Attribute Description** These attributes form a 768 bit map (24 words of 32 bit each) of timeslots for the MH pipe defined. The first attribute, per0, is for timeslots 0 thru 31, the second attribute, per1, is for timeslots 32 thru 63, etc. (For release 1, MH pipes terminate at MH 0 and timeslots are FIXED based on that fact.) A fixed bit is set in this 768 bit map for each of the 14 timeslots of the MH pipe for the given QLPS network. (Divide the timeslot number assignment by 24 to get the Spyder-T timeslot for each pipe.)

**Attribute: nli**

**Fullname:** NLI for network timeslots

**Attribute Description** This attribute identifies the NLI that the network side timeslots terminate at the SM-2000. For release 1, all QLPS pipes use the primary NLI's.

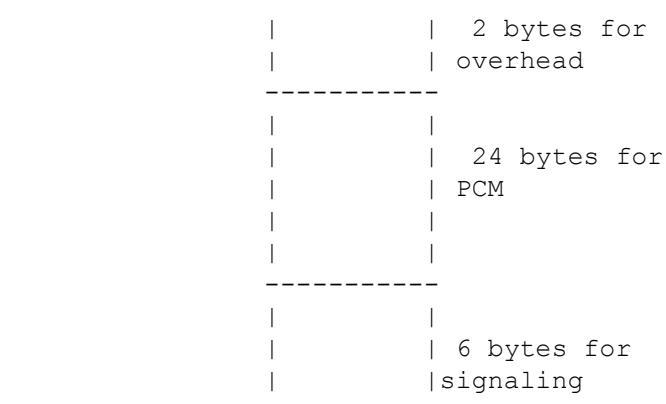
**Attribute: net[*]**

**Fullname:** MH pipe Network Side timeslot Map

Copyright © 1999 Lucent Technologies 

**Attribute Description** These attributes are 24 words of 32 bits each that form a 768 bit map of timeslots that define a pipe from the QLPS to the MH in this SM-2000. The network side timeslots (thru the TMS) have been defined in the AM relation RLtmspipe. (See the RLtmspipe poprules for more information.) For this pipe (from a given QLPS to MH 0 in this SM-2000), the network side timeslots need to be copied from RLtmspipe.slot{0-7} and converted to a PC numbering scheme used for network side timeslots used by PC in an SM-2000. The mapping scheme is:

Each frame on a TSI link has 1024 bytes, 32 blocks which contain 32 bytes each. In each block, the 32 bytes are assigned as follows:



The PCM bytes are where the QLPS pipe data is carried. The 24 bytes for PCM are divided into 3 chunks of 8 each. Only the first and third chunk of 8 out of every 24 are transmitted on the NCT2 links for a total of 16 transmitted timeslots in each block. Given 32 blocks, there is a total of 16 * 32 = 512 transmitted (usable) timeslots.

Refer to figure 30.20.3.2-5 "Mapping of NCT2 Time Slots to TSI Link Time Slots" in Hardware/Software Interface Document for TSIU4 in ~co2k/002000/v1001/30 directory for a detail explanation of how the Time Slots are mapped.

## 4. Population Rules for RLmlt_lata

**Relation Description** Multiple LATAs for TCAP improvements relation

This relation translates a direct signaling application type and lata into destination point codes.

This relation will be populated for the "TCAP (Transaction Capabilities Application Part) Improvements for a Switch Spanning Multiple LATAs" feature. This is a special feature and the special feature ID is SFID171. The feature must be purchased and SFID171 must be set to populate this relation.

Copyright © 1999 Lucent Technologies

WARNING!!
If any new application enumerations are added, please contact the module owner of ct/CTdlndb. A change will be required to increase the maximum tuple size in the DLN.

**Attribute: lata**

**Fullname:** Local Access Transport Area

**Attribute Description** The lata value that a class of lines resides in.

**Attribute: application**

**Fullname:** Direct signaling application type

**Attribute Description** The direct signaling application type that is providing a service that uses the CCS7 protocol. Valid values for application are:

```
CCLASS  - Local Area Signaling Services (LASS)
CCACND  - Analog Calling Name Delivery (ACND).
```

**Attribute: trans_type**

**Fullname:** Translation Type

**Attribute Description** Used for the specific direct signaling application type.

**Attribute: dpc1**

**Fullname:** Destination Point Code 1

**Attribute Description** The Destination Point Code of the STP.

**Attribute: dpc2**

**Fullname:** Destination Point Code 2

**Attribute Description** The alternate Destination Point Code of the STP. Call processing will toggle between dpc1 and dpc2 for load sharing.

**Attribute: spare1**

**Fullname:** 8 bit spare

**Attribute Description** Used for anything.

**Attribute: spare2**

**Fullname:** Boolean spare

**Attribute Description** Used for anything.

## 4. Population rules for RLmodatt

### Relation Description

Switching module (SM) information

This relation contains information associated with SMs of all functional types, namely, local SMs (LSMs), host SMs (HSMs), remote SMs (RSMs), optically remote SMs (ORMs), and two mile ORMs (TRMs). In addition, it contains information related to communication module processors (CMPs) and the administrative module (AM). There is one tuple in this relation for each module in the office. Each tuple describes a module's properties, such as, functional type, the time multiplexed switch (TMS) network control and timing (NCT) links and control time slots (CTSs) assigned to the module, etc. In those offices hosting the Operator Services Position System (OSPS) feature, this relation must be populated before the global parameter GLospson is set to DBYES.

The reader should be aware of a difference in terminology used for SMs and the AM in documentation and code. The original term used for SMs was interface module (IM) and the AM was central processor (CP) and those terms are still widely used in code. New documentation and new code are being made consistent with the official policy of using SM and AM. However, no special effort is required nor is being made to make existing code and documentation, for that matter, to be consistent with that policy due to the volume of work involved.

Note that SM-2000 defines a class of SMs, which is comprised of SM-2000(SMSM2000) and SM2005(SMSM2005).

The SMxxxx without a "dash" is an "altval" used by RCV and ODA.

The (SMSMxxxx) defines the SM's unittype.

Also note that the use of the SM-2000 and SM2000 names throughout the prl files has not been used consistently, and therefore may be used in such a way that does not correspond to the previous definition.

The official term for full or quad (four module message processors [MMPs]) is dual MMPs. The official term for half (two MMPs) is single MMPs. The terms dual and single are used in most customer documentation for these MMP

Copyright © 1999 Lucent Technologies 

configurations. The communication module model 2 (CM2) office data allows a single MMP, a dual MMP or a combination of both single and dual (that is, some SMs can be connected to two MMPs and others to four MMPs in the same office) equipage options.

RLmodatt has dependencies on the following relations:

RLslnktms - For each tuple in RLmodatt that describes an operational LSM/HSM/ORM/TRM, there must be at least four tuples in RLslnktms that describe the operational TMS NCT links to which the LSM/HSM/ORM/TRM is connected. The exact number of tuples depends on the (E)NLI equipage (SMs have only four entries, while SM-2000s can have a maximum of 96 entries).

RLnli_lnk - for each tuple in RLmodatt, there must be as many entries in RLnli_lnk as the value for the attribute eq_lis.

Note that the attribute eq_lis will have a value of zero for SMs, which implies that there will not be any entries in RLnli_lnk for SMs.

RLspc - For each tuple in RLmodatt that describes an operational SM, there must be at least two corresponding tuples in RLspc. In a communications module, model 1 (CM1) office or a CM2 office with a full MMP equipage option, four RLspc tuples must represent operational MMPs. In a CM2 office with a half MMP equipage option, two RLspc tuples must represent two operational MMPs.

RLssdlc - For each tuple in RLmodatt that describes an operational SM, there must be at least two corresponding tuples in RLssdlc. In a CM1 office or a CM2 office with a full MMP equipage option, four RLssdlc tuples must represent operational SDLC/XPCs. In a CM2 office with a half MMP equipage option, two RLssdlc tuples must represent two operational XPCs.

RLclidat - See population rules for attributes clid and cl_offset.

RLmatatt - See population rules for cl_offset attribute.

**Attribute:**

module

**Fullname:**

Module number

**Attribute Description:**

This attribute uniquely identifies each module with which

the office is equipped. Note that the value 193 is used to represent the AM.

The domain (DMMODULE) of this attribute is unsigned 8 bits, therefore the set of possible values is 0 to 255. However, the actual range is smaller.

For a CM1 office (Glcm0vint=SMCM1VINT), the maximum number of SMs is 48 and they must be numbered in the range 1-48. The maximum number of CMPs is constrained to four by CM1 hardware, so the valid set of CM1 module numbers is 1-48 (SMs), 193 (AM), and 194-195, 206-207 (CMPs).

For a CM2 office (Glcm0vint=SMCM2VINT), the maximum number of SMs is 192 and the maximum number of CMPs is 24, so the valid range of CM2 module numbers is 1 to 217.

In a communications module, model 2 compact (CM2C) office, the maximum number of SM tuples cannot exceed eight.

Modules should be assigned numbers that are consistent with the range limits of the office vintage as described in the preceding paragraph. Also, the assigned numbers must uniquely identify each module in the office.

**Attribute:**

dcturi

**Fullname:**

Directly connected test unit (DCTU) route index

**Attribute Description:**

This attribute specifies a route index associated with a DCTU that can test lines and trunks metallically in the SM specified by the key module. This DCTU route index tells operational software which DCTU to use when metallically testing a line or trunk in the SM specified by module.

Note: DCTUs that serve lines and trunks in a host 5ESS(R)-2000 switch processing entity can never be used to test lines in an RSM/ORM/TRM. Conversely, DCTUs that are connected to and test lines within an RSM or RSM cluster can never be used to test lines or trunks in the host 5ESS(R)-2000 switch processing entity.

The following examples serve to illustrate the possible configurations and assignment rules.

1. All the modules are of imtype SM5IM and there is only one DCTU equipped in the office. There must be only one DCTU route index defined in RLRT_ROUTING that is associated with only one DCTU trunk group. This DCTU trunk group must be defined in RLRT_TRKG and RLRCTGRPRK.

Copyright © 1999 Lucent Technologies 

See the population rules for RLrt_routing, RLrt_trkg, and RLrctgrprk. The value of the DCTU route index (dcturi) associated with this DCTU must then be the same for each tuple in this relation (RLMODATT).

2. All the modules are of imtype SM5IM and there are two DCTUs equipped in the office. It is recommended that there be two singular DCTU route indices defined in RLRT_ROUTING and two singular DCTU trunk groups defined in RLRT_TRKG and RLRCTGRPRK. Each DCTU is guaranteed to reach any line in the office by virtue of the 5ESS(R)-2000 switch metallic network. It is recommended that the DCTU testing load be split across modules. It is the responsibility of office engineering to decide the appropriate DCTU that should test to each module. When that decision is made, the value of dcturi for each module must correspond to the DCTU chosen to test lines in that SM.

3. All the modules are of imtype SM5IM and there are two DCTUs equipped in the office. It is valid that there be only one DCTU trunk group assigned with trunk members that include all the DCTU trunks members (DCTUPORTs) from both DCTUs. There would be only one DCTU route index assigned to this DCTU route index. Each DCTU is guaranteed to reach any line in the office by virtue of the 5ESS(R)-2000 switch metallic network. The value of the DCTU route index (dcturi) associated with this DCTU trunk group must be the same for each tuple of key module in this relation (RLMODATT).

4. Items 2 and 3 can be expanded to include the cases where there are more than two DCTUs serving the 5ESS(R)-2000 switch host processing entity.

5. If the office decides that lines or trunks in any particular SM and/or RSM are not to be tested by the DCTU, the value for dcturi must be assigned a null value. This null value can either be zero or the office route index value for REORDER. This value is defined in the relation RLRT_ROUTING for a route type route_type of RTE_REORDER. This rule can also serve as the default value for dcturi.

6. If host 5ESS(R)-2000 switch processing entities are modules of imtype SM5IM or SM5HIM, the same rules as described in Items 1, 2, 3, 4, and 5 apply.

7. The module is of imtype SM5RSM and not part of an RSM cluster. If the office requires that the lines in this RSM be tested metallically from the Switching Control Center (SCC), trunk and line work station (TLWS), centralized trunk test unit (CTTU), and mechanized loop testing system generation 2 (MLT-2) via the integrated MLT-2 (IMLT-2) data link, there must be a DCTU located in this RSM. This DCTU can only test lines in this RSM.

Copyright © 1999 Lucent Technologies 

There must be a singular DCTU route index and singular DCTU trunk group defined for this DCTU in this RSM. The value of dcturi for this module of imtype SM5RSM must be set to this DCTU route index.

8. The module is of imtype SM5RSM and not part of an RSM cluster. If a DCTU does not exist in this RSM, then metallic testing of lines from the SCC, TLWS, CTTU, or MLT-2 via the IMLT-2 data link is not possible. The value for dcturi for this module of imtype SM5RSM must be set to the office assigned route index value of REORDER or to zero.

9. The module is of imtype SM5RSM and is part of an RSM cluster. Each RSM in this cluster has its own DCTU. This example reduces to the single RSM not in a cluster previously defined in Item 7. The value for dcturi for this module of imtype SM5RSM in the RSM cluster must be assigned the singular DCTU route index corresponding to the DCTU located in the particular RSM.

10. All the RSMs in a cluster are served by only one DCTU that is physically connected to one RSM within the cluster. The only way for this RSM DCTU to serve all the lines in all the RSMs in the cluster is for the metallic service unit (MSU) containing the metallic test buses (MTBs) that connect to the physical DCTUPORTs to have MTBs that connect to all the line units in all the cluster RSMs. It is not possible to interconnect MSUs in each of the separate RSMs to any other MSU in any of the other RSMs in the cluster via metallic test interconnect buses (MTIBs) as is possible for the metallic network in the host 5ESS(R)-2000 switch processing entity. Assuming the correct configuration conditions have been met, the value for dcturi for each module representing a RSM in the cluster with imtype of SM5RSM should be set to the singular DCTU route index that corresponds to the DCTU serving the RSM cluster.

13. Each ORM/TRM in a single module complex must have its own DCTU in order to do metallic tests. And each ORM/TRM must have its own unique DCTU route index just as a single module RSM would (see Items 5, 6 and 7). If there is no DCTU in the ORM/TRM, the DCTU route index for the ORM/TRM should be set to a null value.

14. All the ORM/TRMs in the same physical location (one or more ORM/TRM complexes) are served by only one DCTU that is physically connected to one ORM/TRM. The only way for this ORM/TRM DCTU to serve all the peripherals in all the ORM/TRMs in the location is for the MSU containing the MTBs that connect to the physical DCTUPORTs to have MTBs that connect to all the peripherals in all the location's ORM/TRMs. It is not

Copyright © 1999 Lucent Technologies 

possible to interconnect MSUs in each of the separate ORM/TRMs to any of the other ORM/TRMs in the location via MTIBs as is possible for the metallic network in the host 5ESS(R)-2000 switch processing entity. Assuming the correct configuration conditions have been met, the value for dcturi for each module representing an ORM/TRM in the location with imtype of SM5ORM/SM5TRM should be set to the singular DCTU route index that corresponds to the DCTU serving the ORM/TRM location.

15. For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

16. All the modules are of imtype SM5ORM or SM5TRM. If they are all located in the same building (co-located) and there is one DCTU equipped in the building, there must be only one DCTU route index defined in RLRT_ROUTING that is associated with only one DCTU trunk group. This DCTU trunk group must be defined in RLRT_TRKG and RLRCTGRPRK. The value of the DCTU route index (dcturi) associated with this DCTU must then be the same for each tuple in this relation (RLmodatt)

**Attribute:**

alit_ri

**Fullname:**

Automatic line insulation test (ALIT) route index

**Attribute Description:**

For every type of SM (local, host, remote) which has one or two MSUs or one or two modular MSUs (MMSUs) with at least one ALIT type pack (TN328, TN329, TN330) assigned requires a unique ALIT ROUTE INDEX. Each of these indices are associated with a unique port group. The valid range for ALIT ROUTE INDICES is from 0 to AVRIMAX(). The route indices can be numbered randomly. For every unique alit_ri, the route index must exist in the relation RT_ROUTING. The group number and type found in RT_ROUTING must exist in the relations GROUP_PORT and PGGPMAP. In GROUP_PORT and PGGPMAP, a logical test port must exist for every ALIT circuit marked equipped and operational. The group type in GROUP_PORT and PGGPMAP must be TM_TRK. For every logical test port, information must be found in the SM relation FC_PORTTYP. The key to the information is the member of GROUP_PORT and PGGPMAP. The service class, hunt, and lp_type fields in FC_PORTTYP must equal TM_ALIT, DBYES, and PCALIT respectively. The ALIT ROUTE INDEX must be zero if the SM does not contain an MSU or an MMSU. The ALIT ROUTE INDEX must also be zero if an SM contains an MSU or an MMSU, but no ALIT packs are assigned to the MSU or to the MMSU.

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

Copyright © 1999 Lucent Technologies 

**Attribute:**
slim_ri

**Fullname:**
SLIM route index

**Attribute Description:**
For every type of Switching Module (SM) (local, host, remote) which has one or two Modular Metallic Service Units (MMSUs) with at least one SLIM circuit assigned requires a unique SLIM ROUTE INDEX.
Each of these indices are associated with a unique Port Group. The valid range for SLIM ROUTE INDICES is from 0 to AVRIMAX(). The route indices can be numbered randomly. For every unique 'slim_ri', the route index must exist in the relation RLrt_routing. The group number and type found in RLrt_routing must exist in the relations RLgroup_port. In RLgroup_port ,three logical test ports must exist for every SLIM circuit marked equipped and operational. The group type in RLgroup_port must be TM_TRK. For every logical test port, information must be found in the SM relation RLfc_porttyp. The key to the information is the member of RLgroup_port. The service class, hunt, and lp_type fields in RLfc_porttyp must equal TM_SLIM, DBYES, and PCSLIM respectively. The SLIM ROUTE INDEX must be zero if the SM does not contain a MMSU. The SLIM ROUTE INDEX must also be zero if an SM contains an MMSU, but no SLIM circuits are assigned to the MMSU.

For all tuples with an imtype of SM5PIM (CMP) or SM5AM (AM) this attribute is zero.

**Attribute:**
maj_ri
**Fullname:**
Metallic access junctor route index
**Attribute Description:**
For every SM which requires a unique ALIT ROUTE INDEX, a unique METALLIC ACCESS JUNCTOR ROUTE INDEX must also exist. Each of these indices are associated with a port group. The valid range for METALLIC ACCESS JUNCTOR ROUTE INDICES is from 0 to AVRIMAX(). The route indices can be numbered randomly. For every unique maj_ri, the route index must exist in the relation RT_ROUTING. The group number and type found in RT_ROUTING must exist in the relations GROUP_PORT and PGGPMAP. In GROUP_PORT and PGGPMAP, a logical test port must exist for every metallic access junctor marked equipped and operational. The group type in GROUP_PORT and PGGPMAP must be TM_TRK. For every logical test port, information must be found in the SM relation FC_PORTTYP. The key to the information is the member of GROUP_PORT and PGGPMAP. The service class, hunt, and lp_type fields in FC_PORTTYP must equal TM_MSU, DBYES, and PCMAJ respectively. The METALLIC ACCESS JUNCTOR ROUTE INDEX must be zero if the SM does not contain an MSU or an MMSU, or does not

**Copyright © 1999 Lucent Technologies** 

require a unique ALIT ROUTE INDEX

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
ppm_ri
**Fullname:**
Periodic pulse metering (PPM) route index
**Attribute Description:**
This attribute is only used by international offices and should be populated with zero in U.S. offices.

**Attribute:**
imtype
**Fullname:**
The functional type of an SM
**Attribute Description:**
This attribute specifies the functional type of an SM, that is, whether the SM is an LSM, an HSM, an RSM, an ORM, a TRM, the AM or a CMP.

The domain of this attribute is seven bits. The enumeration (DMIMTYPE) values that this attribute can assume are the following:

SM5IM - Specifies an SM to be an LSM.
SM5HIM - Specifies an SM to be an HSM.
SM5RSM - Specifies an SM to be an RSM.
SM5ORM - Specifies a SM to be an ORM.
SM5TRM - Specifies a SM to be a TRM.
SM5AM - Specifies a module to be the AM.
SM5PIM - Specifies a module to be a CMP.

This attribute should be populated to specify the functional type of the module described by a tuple.

In a CDX office with CM2C, a maximum of two SMs in any combination of LSMs, ORMs, TRMs or HSMs may be equipped. Out of these two SMs one can be a SM-2000. At most Six RSMs may be equipped in a CDX office.

**Attribute:**
offset
**Fullname:**
Offset
**Attribute Description:**
If the imtype is an RSM, then this attribute will contain a number between one and ten (zero if imtype not an RSM) depending upon how many RSMs are equipped on the associated HSM. This attribute matches the offset determined for the HSM relation db/RLhmrsmcl.r.

**Copyright © 1999 Lucent Technologies** 

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
stream
**Fullname:**
Billing stream
**Attribute Description:**
This attribute determines which AMA data stream the billing information from this module goes into. Two streams are available. The possible values for this attribute are stream 1 (AMASTRM1) or stream 2 (AMASTRM2). The SMs are assigned to a billing stream on any arbitrary basis that the user wants. The main purpose for assigning SMs to different streams is to balance out the billing traffic over the two data links. Therefore, it is up to the user to change this attribute as the traffic in the office changes or as lines are reassigned to other modules. The initial value of this attribute should be AMASTRM1, which indicates that the SM's data goes to billing stream 1. Billing will look at this attribute only when the global office parameter, Glamaopt, is set to AMADUAL (Glamaopt values of AMATPS1 and AMATPS2 override this attribute and force billing information to go to stream one or stream two). If the office is not operating as a dual stream office (that is, Glamaopt = AMATPS or NONE), this attribute is not used, but it is still safer to have it set to AMASTRM1 because it will only access the first protected application segment (PAS) shared data segment (SDS) in the advent of Glamaopt being set incorrectly. If the office is not operating in the dual stream mode, the second PAS SDS may not be there.

To retrofit an older release to one that has the dual stream capability, the value of this attribute is of no consequence. Just before conversion, the WRT:AMADATA command should be used to clear AMA data to disk. Then the global parameter, Glamaopt, should be set to AMNONE to turn off billing while conversion is taking place. After the new generic is running, the Glamaopt should be changed to some form of AMATPS.

For all tuples with am imtype of SM5PIM or SM5AM this attribute is AMASTRM1.

**Attribute:**
hostnum
**Fullname:**
SM's parent HSM
**Attribute Description:**
If this SM is an RSM, this attribute is used to identify this SM's parent HSM. Otherwise, this attribute is not used.

The domain of this attribute is DMMODULE, or unsigned eight bits.

Copyright © 1999 Lucent Technologies 

As mentioned earlier, the value of this attribute must identify another tuple in this relation that describes this RSM's parent HSM.

If this SM is an RSM, this attribute should be populated with the value of the module attribute of the parent HSM of this RSM. Otherwise, this attribute should be populated with zero.

**Attribute:**
clid
**Fullname:**
Cluster ID (CLID)
**Attribute Description:**
If the functional type of an SM is an RSM, ORM or TRM, then this attribute should be the number of the cluster of which it is a member. Otherwise, if the SM type is not an RSM/ORM/TRM, then a default value of zero is inserted. The cluster ID is assigned in the RLCLIDAT relation.

Any ORM, TRM, or single module RSM is considered to be a single module cluster. As such, they will need to be given a unique 'clid' in the RLmodatt relation. Non-RSM/ORM/TRM modules will be given the default value of zero.

For all tuples with am imtype of SM5PIM or SM5AM see checks section for this attribute.

**Attribute:**
cl_offset
**Fullname:**
Cluster offset
**Attribute Description:**
This attribute is used only in tuples corresponding to modules of types RSM, ORM and TRM. It is zero otherwise. The cl_offset (cluster offset) gives the relative number of the module within the cluster. It can take on values of from one to four. It is determined based on the order that the modules are grown into a cluster. The first one grown in the cluster is given a cl_offset of one, the next two, etc. The cl_offset equals the XX part of the corresponding rmXX attribute (from the group rm01 - rm10) in the tuple in the AM relation CLIDAT for the cluster this module is in. The key for the CLIDAT tuple is equal to the 'clid' attribute of this MODATT tuple. The appropriate rmXX is the one which has as its value the SM number of this RSM (that is, 'module'). For example, in the relation CLIDAT, in the tuple whose key is equal to 'clid', if attribute rm02 is set to 'module', cl_offset for this tuple is set to two.

Further, cl_offset should agree with the office parameter Glcl_offset populated in 'module', and the cl_offset attribute in the SM relation MATATT for each tuple corresponding to this remotely located module.

Copyright © 1999 Lucent Technologies 

All single module RSMs are considered to be a multimodule RSM with a single SM in the RSM cluster. Its cl_offset should be set to one.
Also, all ORMs or TRMs are considered to be a single module cluster with a cl_offset equal to one. Non-RSM/ORM/TRM modules will be given the default value of zero.

**Attribute:**
rbpsc
**Fullname:**
The remote alarm input option for reporting of building and power alarms
**Attribute Description:**
This attribute determines if a RSM, ORM or TRM has the remote alarm input option for reporting of building and power alarms.

Non-RSM/ORM/TRM modules should be given the default value of DBNO. The rbpsc attribute reflects the assignment state of scan points on the SM equipped with an MSU serving remote alarms. This attribute is DBYES if remote alarm building and power scan points are assigned. It is DBNO when no remote alarm building and power scan points are assigned, that is., the remote alarm input option is not equipped.

**Attribute:**
osps_sm
**Fullname:**
OSPS SM
**Attribute Description:**
If the SM is an OSPS SM that will have OSPS operator data, this should be set to DBYES, otherwise DBNO. An SM with interflow positions or real positions should be considered a PSM and osps_sm should be set to DBYES. This value is independent of the imtype. The value of this SM's "smconfig" attribute in RLsmconf must be CNFG002.

If the imtype is RSM and osps_sm is DBYES, then the SM must be single module RSM cluster. This is identified by a rm_cnt of one in the RLclidat tuple that has the clid attribute as its key.

Default value: DBNO
Required value for export: DBNO

For all tuples with am imtype of SM5PIM or SM5AM this attribute is DBNO. This implies that OSPS SMs can NOT be an SM-2000 SM.

**Attribute:**
cts_even

**Copyright © 1999 Lucent Technologies** 

**Fullname:**

Even control time slot

**Attribute Description:**

This attribute specifies the even CTS used by the SM described by this tuple. The CTS number is (from the SM's perspective) a TMSLNK time slot number on the TMSLNK identified by the attribute tmsevennct. Note that for SM-2000, there can be several even TMSLNKs connected to an SM, but only the TMSLNK with the CTS is populated in RLmodatt. All other TMSLNKs are populated in RLnli_lnk. From the MSGS perspective, the CTS number assigned to an SM is a function of the physical characteristics of the synchronous data link controller (SDLC)/BX.25 level 2 protocol controller (XPC) that is used by the communication link to the SM.

1. The SDLC/XPC that is serving the SM. Recall that an MMP can have a maximum eight SDLC/XPCs.

2. The pack position of the SDLC/XPC's MMP in its PC community. Recall that a PC community can have a maximum of four PCs, MMPs in this case.

3. The PC community to which the MMP belongs. Recall that an input/output microprocessor interface (IOMI) can have a maximum of four PC communities.

4. The IOMI used by the PC community to which the MMP belongs.

The previous items 3 and 4 determine the message interface bus (MIB) used by the PC community to which the MMP belongs. (Each MIB, of course, terminates into an MI slot, thus there is a 1-to-1 mapping between the MIB number and the MI slot number). The previous items 1 and 2 determine the MIB control time slot (MIBCTS) that is assigned to the SDLC/XPC in the MMP that is serving the SM. Items 3 and 4 and MIBCTS, in turn, determine the TMS control time slot that is assigned to an SM. Also, Items 3 and 4, when concatenated, form the logical community number which is a value within the range 0 to 15.

A CTS to an SM can be constructed as an eight-bit value, say ppsssjcc, where:

pp - the MMP's pack position in its community
sss - the MMP's SDLC/XPC that is supporting the SM
j - the less significant bit of the two bits that represent the IOMI used by the MMP's PC community
cc - the two bits that represent the PC community number.

Note that this CTS assignment scheme is shared between CM1 and CM2 single and dual fabric. This is especially desirable when converting a CM1 office to CM2 because the CTS numbers which are hard-switched in each existing SM will not have to be altered.

Copyright © 1999 Lucent Technologies 

The domain of this attribute is an unsigned eight bits. The values that can be assumed by this attribute range from 2 to 255.

The cts_even attribute should be populated according to the following diagram.

| IOMI Number | Logical PC Community Number | MMP's Position in its Community | MMP log ID | MMP phys ID | cts_even SDLC/XPC Number 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 3 | 15 | 3 | 46 | 63 | 199 | 207 | 215 | 223 | 231 | 239 | 247 | 255 |

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**

cts_odd

**Fullname:**

Odd control time slot

**Attribute Description:**

This attribute specifies the odd CTS used by the SM described by this tuple. The CTS number is (from the SM's perspective) a TMSLNK time slot number on the TMSLNK identified by the attribute tmsoddnct. Note that for SM-2000, there can be several odd TMSLNKs connected to an SM, but only the TMSLNK

**Copyright © 1999 Lucent Technologies** 

with the CTS is populated in RLmodatt. All other TMSLNKs are populated in RLnli_lnk. See cts_even for a discussion on the construction of CTS numbers based on the physical characteristics of MSGS hardware.

The domain of this attribute is eight bits. The values that can be assumed by this attribute range from 2 to 255.

Cts_odd should be populated according to the following diagram.

| IOMI Number | Logical PC Community Number | MMP's Position in its Community | MMP log ID | MMP phys ID | cts_odd SDLC/XPC Number 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 0 | 3 | 0 | 1 | 12 | 3 | 11 | 19 | 27 | 35 | 43 | 51 | 59 |
| 0 | 3 | 1 | 3 | 13 | 67 | 75 | 83 | 91 | 99 | 107 | 115 | 123 |
| 0 | 3 | 2 | 5 | 14 | 131 | 139 | 147 | 155 | 163 | 171 | 179 | 187 |
| 0 | 3 | 3 | 7 | 15 | 195 | 203 | 211 | 219 | 227 | 235 | 243 | 251 |

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**

eq_lis

**Fullname:**

equipped LIs (NLI/ENLI)

**Attribute Description:**

Value shows the number of equipped (E)NLIs for a particular ONTC side. This attribute will have a value of zero for SMs, and will be a multiple of 2 for SM-2000s.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
eq_tmslnks
**Fullname:**
equipped TMSLNKs
**Attribute Description:**
The number of TMSLNKs connected to a non-RSM from a particular ONTC side. An RSM will have the value 0 for this attribute.

**Attribute:**
tmsevennct
**Fullname:**
The even TMS NCT link number
**Attribute Description:**
This attribute specifies the even TMS link used for Control Time Slot (CTS) transport between the SM described by the tuple and the TMS. For SMs, this is the only even TMS link, also called an NCT link. If the SM described by the tuple is an RSM, this attribute will contain the value of RLmodatt.tmsevennct of its HSM.

See the lnknum attribute of RLslnktms for a description of the domain and range of this attribute.

This attribute must be populated with the number that uniquely identifies the even TMS NCT link that is connected to this SM.

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
tmsoddnct
**Fullname:**
The odd TMS NCT link number
**Attribute Description:**
This attribute specifies the odd TMS link used for Control Time Slot (CTS) transport between the SM described by the tuple and the TMS. For SMs, this is the only odd TMS link, also called an NCT link. If the SM described by the tuple is an RSM, this attribute will contain the value of RLmodatt.tmsoddnct of its HSM.

See the lnknum attribute of RLslnktms for a description of the domain and range of this attribute.

This attribute must be populated with the number that uniquely identifies the odd TMS NCT link that is connected to this SM.

Copyright © 1999 Lucent Technologies 

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
iia_normal
**Fullname:**
The normal interrupt state of SM
**Attribute Description:**
This attribute specifies the normal interrupt state of the SM described by this tuple.

The domain of this attribute is BFSTATUS or one bit. The enumeration (DMSTATUS) value that this attribute can assume is SMALLOW if the interrupts are to be allowed if the SM is operating normally, or SMINHIBIT if the interrupts are to be inhibited even if the SM is operating normally.

This attribute should be populated with SMALLOW.

For all tuples with am imtype of SM5PIM or SM5AM this attribute is SMALLOW.

**Attribute:**
eqstat
**Fullname:**
The equipage state of SM
**Attribute Description:**
This attribute describes the equipage state of the SM described by a tuple in this relation

The domain of this attribute is BFEQSTAT or three bits. The enumeration (DMEQSTAT) values that this attribute can assume are the following:

SMOPER - If the SM is equipped and is operational.
SMSGRO - If the SM is in the process of being grown into the office.
SMUNEQ - If the SM is unequipped.

A tuple will exist only for SMs with which an office is equipped. Therefore this attribute should be populated with SMOPER.

For all tuples with am imtype of SM5PIM or SM5AM this attribute is SMOPER.

**Attribute:**
unittype
**Fullname:**
Hardware unit type
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute describes hardware configuration of the MC and TSI.

There are four types of MCTSI hardware configurations:

1. SMMC - Module controller. (TSIU-SMPU)

2. SMCRIMPU - Cost reduced (single-shelf) switching module processor unit. (TSIU2-SMPU2)

3. SMIMPU3 - Model 3 TSIU (single-shelf TSIU) can be used only with SMPU2. (TSIU3-SMPU2)

4. SMSMP20 - MC68020 processor used in the module controller. This includes the TSIU3 hardware. (MCTU2)

NOTE: For the ORM a model 3 TSIU is necessary.

For 5e9 there is a fifth hardware configuration of the MCTSI:

5) SMSM2000: MC68040 processor used in the module controller. This includes the TSIU4 hardware.

NOTE: For the ORM a Model 3 or 4 TSIU is necessary.

For 5e10(1) there is a sixth hardware configuration for the MCTSI:

6) SMMCTU3: SB20CORE (with a MC68040 as the microprocessor), and a TSIU3.
7) SMSM2005: MC68060 processor used in the module controller. This includes the TSIU4 hardware.

**Attribute:**
bstr_cli
**Fullname:**
Change level indicator (CLI) value for the bootstrapper
**Attribute Description:**
The btsr_cli attribute is the same as the PCBTSR CLI attribute. see POPULATION RULES FOR THE MCTSI in relation RLcktdata for the bootstrapper circuit (PCBTSR).

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

Copyright © 1999 Lucent Technologies 

**Attribute:**
mctsi0_cli
**Fullname:**
MCTSI side 0 CLI
**Attribute Description:**
For a module containing an MCTSI 0, the mctsi0_cli attribute is the same as the PC_MP CLI attribute. See POPULATION RULES FOR THE MCTSI in relation RLcktdata for the module processor circuit (PC_MP).

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
mctsi1_cli
**Fullname:**
MCTSI side 1 CLI
**Attribute Description:**
For a module containing an MCTSI 1, the mctsi1_cli attribute is the same as the PC_MP CLI attribute. See POPULATION RULES FOR THE MCTSI in relation RLcktdata for the module processor circuit (PC_MP).

For all tuples with am imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
dli0_cli
**Fullname:**
Dual link interface (DLI) side 0 CLI
**Attribute Description:**
For a module containing a DLI 0, the dli0_cli attribute is the same as the PCDLI or PCRLI (remote module) CLI attributes. See POPULATION RULES FOR THE MCTSI in relation RLcktdata for the dual link interface circuit (PCDLI) or remote link interface circuit (PCRLI).

For all tuples with an imtype of SM5PIM or SM5AM this attribute is zero.

**Attribute:**
dli1_cli
**Fullname:**
DLI side 1 CLI
**Attribute Description:**
For a module containing a DLI 1, the dli1_cli attribute is the same as PCDLI or PCRLI (remote module) CLI attributes. See POPULATION RULES FOR THE MCTSI in relation RLcktdata for the dual link interface circuit (PCDLI) or remote link interface circuit (PCRLI).

For all tuples with am imtype of SM5PIM or SM5AM

Copyright © 1999 Lucent Technologies 

this attribute is zero.

**Attribute:**
mh[*]_cli
**Fullname:**
Message Handler CLI for MCTSI Side (0:1)
**Attribute Description:**
For an SM-2000, this attribute contains the change level indicator for the first Message Handler (MH) in MCTSI side (0:1). See population rules for the MCTSI in relation RLcktdata for the Message Handler circuit (PCMH).

For all tuples with a unittype other than SMSM2000 or SMSM2005 this attribute is 0.

**Attribute:**
tsi[*]_cli
**Fullname:**
TSI Common Board CLI for MCTSI Side (0:1)
**Attribute Description:**
For an SM-2000, this attribute contains the change level indicator for the TSI Common Board (TSICOM) in MCTSI side (0:1). See population rules for the MCTSI in relation RLcktdata for the TSI Common circuit (PCTSI).

For all tuples with a unittype other than SMSM2000 or SMSM2005 this attribute is 0.

**Attribute:**
post_pump
**Fullname:**
Post pump
**Attribute Description:**
This attribute is used by SM and RSM growth. It is used to tell if the SM or RSM has ever been fully pumped. If it has not the attribute = DBNO, after it has been pumped by using the SM view in recent change the attribute is updated to DBYES and relations are populated in the SM that could not be populated by the skeleton.

If SM eqstat=SMUNEQ, post_pump=DBNO. If SM eqstat=SMSGRO post_pump=DBNO and then updated to DBYES after first pump. If SM eqstat=SMOPER post_pump=DBYES.

**Attribute:**
log_act
**Fullname:**
Logically active processor number
**Attribute Description:**
This attribute applies only to CMPs and indicates whether this

**Copyright © 1999 Lucent Technologies** 

is a logically active processor number.

**Attribute:**
mscu_norm
**Fullname:**
Message switch (MSGS) normalized data
**Attribute Description:**
This attribute is only for CMPs and indicates the MSGS side that this CMP should be on when the MSGS is normalized

**Attribute:**
ql_ntwk0
**Fullname:**
QLPS network 0 MH pipe
**Attribute Description:**
This attribute is used to indicate the existence of a QLPS MH pipe to the given SM-2000 for QLPS network 0.

**Attribute:**
ql_ntwk1
**Fullname:**
QLPS network 1 MH pipe
**Attribute Description:**
This attribute is used to indicate the existence of a QLPS MH pipe to the given SM-2000 for QLPS network 1.

**Attribute:**
ccitt6sm

**Fullname:**
Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) Common Channel Signaling System 6 SM

**Attribute Description:**
This attribute is used to indicate if this SM has a direct interface with ITU-TS CCS6 signaling on the PSU.

Note: No CCS6 signaling is allowed on the PSU at this time.

**Attribute:**
ccs7sm

**Fullname:**
Common Channel Signaling System 7 SM

**Attribute Description:**
This attribute is used to indicate if this SM has a direct interface CCSNA7 signaling on the PSU.

Copyright © 1999 Lucent Technologies 

Note: No CCSNA7 signaling is allowed on the PSU at this time.

**Attribute:**
intl7sm

**Fullname:**
Standardization Sector (SS7) (formerly CCITT7)
international network SM

**Attribute Description:**
This attribute is used to indicate if this SM has a direct
interface with ITU-TS INTL SS7 signaling on the PSU.

**Attribute:**
natl7sm

**Fullname:**
Standardization Sector (SS7) (formerly CCITT7) national
network SM

**Attribute Description:**
This attribute is used to indicate if this SM has a direct
interface with ITU-TS NATL SS7 signaling on the PSU.

**Attribute:**
billsm

**Fullname:**
Global Billing SM

**Attribute Description:**
This attribute is used to indicate the Global Billing SM
which will send records to the collector system over the external
Ethernet(R) links for Real Time Call Detail.(RTCD)

**Attribute:**
eecsm

**Fullname:**
External Echo Canceller SM

**Attribute Description:**
This attribute is used for the Jupiter project and referred to
as external echo canceller SM, this SM has external Ethernet(R) links
to Jupiter system.

## 4. Population Rules for RLmodcli

Copyright © 1999 Lucent Technologies 

**Relation Description** Switching Modules CLI information

This relation contains CLI information associated with switching modules (SMs) of all functional types, namely, local SMs (LSMs), host SMs (HSMs), remote switching modules (RSMs). There is one tuple in this relation for each SM in the office. The CLIs in the relation are zeroed during the odd-create step of the SM growth procedure.

This relation is intended to hold all SM sub unit CLI values that will be cleared by odd-create. This includes all sub units that have their own RC growth view. In the future, as more units become growable and thus have their own RC view, their CLI values should be moved from RLmodatt to here (if they already exist), or added here initially (for new units).

**Attribute: module**

**Fullname:** SM number

**Attribute Description** This attribute uniquely identifies each SM with which the office is equipped. This attribute is used as the key for this relation.
For a CM1 office, the valid range is 1 to 48.
For a CM2 office, the valid range is 1 to 192.
Note that the value 193 is used to represent the administrative module (AM), although no tuple is needed in this relation to represent the AM.

**Attribute: membd[*]_cli**

**Fullname:** CLI value for memory board 0 thru 5

**Attribute Description**

(1) When 'unittype' is not equal to SMSMP20, SMCRIMPU, SMIMPU3, SMSM2000, or SMSM2005 these attributes are unused and all entries should be 0.

(2) When 'unittype' is equal to SMSMP20, SMCRIMPU, SMIMPU3, SMSM2000, or SMSM2005 these attributes contain the CLI values for the SMP memory boards during growth. (Note: Because the MCTU3 does not support memory boards, this attribute should always be 0 when 'unittype' is equal to SMMCTU3.)

These attributes must be zero for operational SMs. The relation RLcktdata contains the current CLI values and is updated by memory board views for operational SMs (type PCMEMBD; see "POPULATION RULES FOR THE MEMORY BOARD" in relation RLcktdata for the Memory board).

**Attribute: tsis_cli**

**Fullname:** TSI Slice 0 CLI for MCTSI Side (0 and 1)

**Attribute Description** For an SM-2000, this attribute contains the change level indicator for the first TSI Slice (TSIS 0) in both MCTSI sides (0,1). Note that it is required that the TSIS 0 be IDENTICAL on both sides when the SM is initially grown. After the SM is operational, the CLI for these boards are split into two per-side CLI values, and as such it will then be possible for TSIS 0 to be different in the two sides.

The ODDCREAT process will zero out this value when the SM becomes operational. The CLI data for TSIS 0 will then be kept in the RLcktdata relation. See population rules for the TSIS in relation RLcktdata (PCTSIS) for more details.

Copyright © 1999 Lucent Technologies 

For all tuples with a unittype other than SMSM2000 or SMSM2005 this attribute is 0.

**Attribute: ci[*]_cli**

**Fullname:** First two pairs of CI CLIs for Control Interface Boards Side 0 and 1

**Attribute Description** For SM and SM-2000 growth, these attributes contain the change level indicator for the first two pairs of CI boards in both MCTSI sides (0,1). The first two pairs of CI boards are located in the SMC cabinet. It is required that both CIs in a pair be IDENTICAL on both sides when the SM is initially grown (although the two pairs may have different values). The first pair is always required. The second pair is required only for RSMs.

Valid values are DGVNULL for CI without broadcast and real time capability, and DGVCIBDCAST for CIs with broadcast and real time capability. For SM-2000 valid values are DGVNULL and DGVCIBDCAST and for SMs is DGVNULL.

**Defines:**
"db/DMmodule.h",
"db/DMclidef.h"

## 4. Population Rules for RLmoni_blf

**Relation Description** monitoring busy lamp field

Hundreds (100s) group busy lamp field being monitored, line equipment or MLHG dn allocation.

**Attribute: hgid**

**Fullname:** Hundreds group ID.

**Attribute Description** hundred group identifier in hex with three sub-bit fields:

```
noc     Normalized Office Code
        Range: 1 - AVNOCMAX()
        Default: none
d4      Thousand weighted digit
        Range: 0 - 9
        Default: none
 d3     Hundred weighted digit
        Range: 0 - 9
        Default: none
```

**Attribute: index**

**Fullname:** 100s group line status database index

**Attribute Description** MONI_BLF.index is sequentially assigned within each SM.

After a MONI_BLF tuple is added or deleted, the global parameters Glmoniablf and Glreplyblf

Copyright © 1999 Lucent Technologies 

should also be updated in the same SM as the MONI_BLF tuple. Refer to the population rules for these two global parameters.

Hundreds (100s) group line status database index. This is the actual key used to access the associated LDAT_BLF dynamic relation tuple. This index MUST be unique for each MONI_BLF tuple in the SM. To the extent possible they should be allocated contiguously.

For each unique number assigned to the index in MONI_BLF, the corresponding bit in the global parameter Glmoni1x - Glmoni8x should be set to '1'. These global parameters contain 32 bits each, for a combined total BIT MAP of 256 bits. The lowest order bit of Glmoni1x indicates assignment of index '0'. Since index '0' is not used, this bit should never be set to '1'. The next bit (bit position 1) is used to indicate equipage of index '1', etc. The lowest order bit of Glmoni2x indicates assignment of index '32', etc.

The global parameter GlmoniablF is the number of equipped indices (the number of tuples in the SM relation MONI_BLF). It also represents the number of bits that should be set to '1' in Glmoni1x - Glmoni8x.

***NOTE:*** Refer to the population rules of Glmoni1x - Glmoni8x,

> It is CRITICAL that the corresponding bit in Glmoni1x - Glmoni8x be set for each assigned index, otherwise Recent Change will NOT work.

**Attribute: hgleq[*]**

**Fullname:** 100s group line equipment or MLHG dn allocation

**Attribute Description** This attribute is implemented as 13 fields (hgleq1 to hgleq13) which can be viewed as an array of bits, where each field is one byte in length. Each bit is used to indicate that a corresponding DN is BLF monitorable by an ISDN Attendant (ISAT).

For example:

hgleq1 contains the first byte (8 bits) of 100s group hglneq, where each bit set to '0' denotes DN is not monitorable, and each bit set to '1' denotes DN is monitorable.

```
hgleq1              Hundred digit number          (1st byte)
                    07 06 05 04 03 02 01 00

# MONTOQ

## 1. Description

List of MLHG queues monitored by a queue monitor console. The queue monitor console has from one to eight MLHG Queue Status Feature Buttons (QSFBs) used to request queue status data for different MLHGs. The action in RLbnfeat associated with a QSFB determines which MLHG applies. If RLbnfeat.action is ACN_LQ1DISP then the QSFB is associated with RLmontoq.mlhg1. If RLbnfeat.action is ACN_LQ2DISP then the QSFB is associated with RLmontoq.mlhg2, etc.

## 2. Data Dictionary Values

## 4. Population Rules for RLmontoq

**Relation Description** Multi-line hunt group (MLHG) queue monitor console to MLHG queues.

This relation contains the information on the eight multiline hunt groups and their queuing switching modules (SM)s monitored by the queue monitor console.

To better utilize the resources of the switch each queue monitor console should be located on the queuing SM for the multiline hunt groups that the queue monitor console monitors. The queue monitor console's SM is the SM

**Copyright © 1999 Lucent Technologies** 

containing the RLmontoq tuple. The MLHG queuing SMs are RLmontoq.q_sm1, RLmontoq.q_sm2, ..., RLmontoq.q-Sm8."

**Attribute: lport**

**Fullname:** logical port

**Attribute Description** The feature CSD queuing enables one queue monitor console to monitor eight different Multi-Line Hunt group's queues. The logical port number and the terminal number constitutes unique identification for queue monitor console which monitors at most eight different MLHG's queues.

**Attribute: termno**

**Fullname:** terminal number

**Attribute Description** A terminating digital subscriber line can have one to eight terminal numbers. Logical port and terminal number constitutes the unique identification for the queue monitor console.

**Attribute: mlhg1**

**Fullname:** Multiline Hunt group one

**Attribute Description** The mlhg1 is the multi-line hunt group number associated with the feature button for action ACN_LQ1DISP.

**Attribute: mlhg2**

**Fullname:** multi-line hunt group two

**Attribute Description** The mlhg2 is a multi-line hunt group number associated with feature button for action ACN_LQ2DISP.

**Attribute: mlhg3**

**Fullname:** multi-line hunt group three

**Attribute Description** The mlhg3 is a multi-line hunt group number associated with the feature button for action ACN_LQ3DISP.

**Attribute: mlhg4**

**Fullname:** multi-line hunt group four

**Attribute Description** The mlhg4 is the multiline hunt group number associated with the feature button for action ACN_LQ4DISP.

**Attribute: mlhg5**

**Fullname:** multi-line hunt group five

**Attribute Description** The mlhg5 is a multi-line hunt group number associated with the feature button for action ACN_LQ5DISP.

**Attribute: mlhg6**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** multi-line hunt group six

**Attribute Description** The mlhg6 is multi-line hunt group number associated with the feature button for action ACN_LQ6DISP.

**Attribute: mlhg7**

**Fullname:** multi-line hunt group seven

**Attribute Description** The mlhg7 is the multi-line hunt group number associated with the feature button for action ACN_LQ7DISP.

**Attribute: mlhg8**

**Fullname:** multi-line hunt group eight

**Attribute Description** The mlhg8 is the multi-line hunt group number associated with the feature button for action ACN_LQ8DISP.

**Attribute: q_sm1**

**Fullname:** queuing switching module one

**Attribute Description** The queue status information for mlhg1 resides in q_sm1 in static relation RLqu_os and in dynamic relation RLqo_mlhg.

**Attribute: q_sm2**

**Fullname:** queuing switching module two

**Attribute Description** The queue status information for mlhg2 resides in q_sm2 in static relation RLqu_os and in dynamic relation RLqo_mlhg

**Attribute: q_sm3**

**Fullname:** queuing switching module three

**Attribute Description** The queue status information for mlhg3 resides in q_sm3 in static relation RLqu_os and in dynamic relation RLqo_mlhg

**Attribute: q_sm4**

**Fullname:** queuing switching module four

**Attribute Description** The queue status information for mlhg4 resides in q_sm4 in static relation Rlqu_os and in dynamic relation Rlqo_mlhg

**Attribute: q_sm5**

**Fullname:** queuing switching module five

**Attribute Description** The queue status information for mlhg5 resides in q_sm5 in static relation Rlqu_os and in dynamic relation RLqo_mlhg

**Attribute: q_sm6**

**Fullname:** queuing switching module six

Copyright © 1999 Lucent Technologies 

**Attribute Description** the queue status information for mlhg6 resides in q_sm6 in static relation RLqu_os and in dynamic relation RLqo_mlhg

**Attribute: q_sm7**

**Fullname:** queuing switching module seven

**Attribute Description** The queue status information for mlhg7 resides in q_sm7 in static relation RLqu_os and in dynamic relation RLqo_mlhg

**Attribute: q_sm8**

**Fullname:** queuing switching module eight

**Attribute Description** The queue status information for mlhg8 resides in q_sm8 in the static relation RLqu_os and in dynamic relation RLqo_mlhg.

## 4. Population Rules for RLms_acsr

**Relation Description:** This relation specifies the group ID's of the ACSR groups to be measured. A maximum of 25 ACSR groups can be measured simultaneously.

Referenced relations: RLfacname:

**Attribute: module**

**Fullname:** Module;

**Attribute Description** Module is a dummy key value that always has a value of 0.

**Attribute: ids_in_use**

**Fullname:** Group Id's in use;

**Attribute Description** This attribute indicates the number of 'grp_id' attributes that are in use or the number of ACSR groups being measured.

**Attribute: grp_id[*]**

**Fullname:** Group Identifier;

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute specifies the group id of the ACSR group to be measured. This attribute is one of several group ID's. The groupid must be unique, that is, it may appear in at most one grp_id{1-25} field.

## 4. Population Rules for RLms_ap

**Relation Description** Measurement counts.

Measurement counts for EDS and MDS.

There must always be three (3) tuples in the RLms_ap relation. One for EDS and two for MDS:

(1) 1 tuple for the Electronic Directory Service user which stores the eds_grpid(1-25) for which the measurements are to be taken. mftype = MFEDS and mdc = DBNO

(2) 1 tuple for the Message Desk Service user which stores the mds_grpid(1-25) for which the measurements are to be taken. mftype = MFMDS and mdc = DBNO

(3) 1 tuple for the Message Desk Center which stores the mlhg_n(1-25) for which measurements are to be taken. mftype = MFMDS and mdc = DBYES

The attributes edmsgp1 thru edmsgp25 and mlhg_n1 thru mlhg_n25 in RLms_ap must be assigned contiguously.

A tuple for eds_grpid, mds_grpid and mlhg_n should be initialized as follows:

| mftype: | md: | eds_grpid: | mds_grpid: | mlhg_n: |
|---|---|---|---|---|
| MFEDS | DBNO | 0 | 0 | 0 |

```
MFMDS       DBNO        0           0             0
MFMDS       DBYES       0           0             0
```

**Attribute: mftype**

**Fullname:** Modular Feature type.

**Attribute Description** Modular Feature id. Only EDS (mftype = MFEDS) or MDS (mftype = MFMDS) is valid for mftype.

**Attribute: mdc**

**Fullname:** Message Desk Center.

**Attribute Description** Message Desk Center.
If this bit is set to DBYES then the mftype must be = MFMDS and edmsgp1 thru edmsgp25 must be = 0.
If DBNO then mftype must be = MFEDS or MFMDS and mlhg_n1 thru mlhg_n25 must be = 0.

**Attribute: idscnt**

**Fullname:** number of in use mlhg_n.

**Attribute Description** This attribute specifies the number of mlhg_n(1-25) or edmsgp(1-25) currently in use.
If no mlhg_n(1-25) or edmsgp(1-25) are in use, the idscnt = 0 and the tuple must not be deleted.

The number of edmsgp(1-25) or mlhg_n(1-25) populated.

**Attribute: edmsgp[*]**

**Fullname:** EDS/MDS Counts record id.

**Attribute Description** EDS/MDS group id

If any edmsgp(1-25) is not zero then mdc flag must be equal to DBNO.

```
For every non-zero edmsgp(1-25) and
mftype = MFMDS there must be one tuple in
RLmds_grp such that:
RLmds_grp.mds_grpid = RLms_ap.edmsgp(1-25)
AND
RLmds_grp.grp_type equals MS_MSS and
RLmds_grp(mds_grpid).msrmnt = DBYES.
```

For every non-zero edmsgp(1-25) and mftype = MFEDS there must be one tuple in RLeds_grp such that: RLeds_grp.eds_grpid = RLms_ap.edmsgp(1-25) AND RLeds_grp(eds_grpid).msrmnt = DBYES.

**Attribute: mlhg_n[*]**

**Fullname:** MDC mlhg number for which measurements is taken.

**Attribute Description** MDC MLHG number. The measurement will be taken only for the mdc which their mlhg_n(1-25) is specified in this relation.

```
For each non-zero mlhg_n(1-25)
```

Copyright © 1999 Lucent Technologies 

```
verify a tuple exists in RLrt_mhg such that
RLrt_mhg.grpnum = mlhg_n(1-25) and
RLrt_mhg.mdc = DBYES.
```

If any non-zero mlhg_n(1-25) exists then mdc flag must be set to DBYES.

For every non-zero mlhg_n(1-25) which exists there must be a tuple in RLmdc_grp such that RLmdc_grp.grupnm = mlhg_n(1-25) and set RLmdc_grp.msrmnt = DBYES.

## 4. Population Rules for RLms_att

**Relation Description** Measurements for attendant groups.

**Attribute: im_id**

**Fullname:** interface module identifier

**Attribute Description** Identifies an interface module. Only module 0 applies.

**Attribute: gps_in_use**

**Fullname:** groups in use

**Attribute Description** Indicates the number of groups currently identified within the specified IM number tuple.

**Attribute: gp_id[*]**

**Fullname:** group identifier

**Attribute Description** Indicates a specified group identification number which is being measured. gp_id1 thru gp_id200 will contain either a 0 (default) or a valid attendant group id. The groupid must be unique, that is, it may appear in at most one gp_id{1-200} field in any one tuple.

# MS_CFT

## 1. Description

Measurements for constructed feature groups.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | EADAS |
| relation type | DBSTATIC |
| head table size | 512 |
| data page size | 512 |
| page level | 1 |
| l1 length of subkey1 | 1 |
| p1 position of subkey1 | 7 |
| ignore key bits | 0-6 |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population Rules for RLms_cft

**Relation Description:** Measurements for BRCS constructed feature groups.

**Attribute: im_id**

**Fullname:** interface module identifier

**Attribute Description** Interface module identifier. Module 0 only applies.

**Attribute: gps_in_use**

**Fullname:** groups in use

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Indicates the number of groups currently identified within the specified IM number tuple.

**Attribute: gp_id[*]**

**Fullname:** group identification number

**Attribute Description** Indicates a specified group identification number which is being measured. gp_id fields must be a valid fid or 0. If gp_id field is populated, verify the existence of the fid in FACNAME. Note: gp_id field is Decimal where as FACNAME fid is Hex. The facid must be unique, that is, it may appear in at most one gp_id{1-100} field in any one tuple.

# MS_IDP

## 1. Description

Measurements for IDP Groups.
This relation identifies which IDP groups are being measured on each given module.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 256 |
| access type | DBACC_CIND |
| memory type | DBDISK |
| distribution | DO |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 2048 |
| page level | 2 |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLms_idp

**Relation Description:** Measurements for IDP Groups

This relation identifies which IDP groups are being measured on each given module.

**Attribute: im_id**

**Fullname:** Interface Module Identifier

**Attribute Description** Identifies an interface module. Dependencies: Require module 0 tuple and one tuple for each SM. Tuples must be populated.

**Attribute: gps_in_use**

**Fullname:** Groups in Use

**Attribute Description** Indicates the number of groups currently identified within the specified IM number tuple.

**Attribute: gp_id[*]**

**Fullname:** Group Identifier

**Attribute Description** Indicates a specified group identification number which is being measured. gp_id fields must be valid idp groupid or 0. Fields must be populated.

Dependencies: If a gp_id number exists in im_id=0 tuple, then said ID can only appear in the same field of a tuple with key <> 0 that is, if gp_id 7 = X of module 0 tuple then for all tuples where im_id <> 0 gp_id 7 can only be X or 0.
The groupid must be unique, that is, it may appear in at most one gp_id{1-150} field in any one tuple.

# MS_LUSDY

## 1. Description

Identifies SM and LUs (ISLUs) allowed for study.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10 |
| expected tuples in relation | 5 |
| access type | DBACC_LIN |
| memory type | DBPRAM |
| distribution | LP |
| application | EADAS |
| relation type | DBSTATIC |
| trigger function | MSlusd_trig |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | unperm |

## 3. Field Layout

## 4. Population Rules for RLms_lusdy

**Relation Description** Measurements for switch groups (SG) and line group controllers (LGC).

Relation for SG and LGC measurements. This relation identifies the SMs and LUs ((R)ISLUs) enabled for measurements generation by the switch personnel. Up to 100 ids can be allowed per study group (up to 5 study groups). Measurements will be provided on all SGs (LGCs) on the given SM/LU ((R)ISLU).

**Attribute: lu_type**

**Fullname:** Line Unit Type

**Attribute Description** This field indicates the type of line unit (selectors LU or ISLU) of this study group. If the line unit type selected is LU, all LU identifiers entered the must be of the type LU1, LU2, LU3 and LU4 If the line unit type selected is ISLU, all LU identifiers must be ISLUs, ISLU2s or RISLUs. Line Unit types LU1, LU2, LU3 and LU4 can be specified within the same study set. ISLUs and RISLUs can also be specified within the same study set, but (for example) LU1 and ISLUs cannot exist on the same study set.

**Attribute: studygrp**

**Fullname:** Study group identifier

**Attribute Description** This field is used to store the study group identifier. Valid study group identifiers are 1 thru 5. There are a total of 10 study groups: 5 study groups for line unit types LU1, LU2, LU3 and LU4 (LU), and 5 study groups for types ISLU, ISLU2 or RISLU.

**Attribute: ids[*]**

**Fullname:** Identifiers.

**Attribute Description** The switch personnel must enter two identifiers - switching module and line unit (or (remote) integrated services line unit) to enable measurements generation and collection. Measurements are provided for all operational SGs (LGCs) on the specified identifier(s).

**Attribute: ids[*].smid0**

**Fullname:** Switching Module Identifier

**Attribute Description** Switching Module entered by the switch personnel. One of 100 (max).

**Attribute: ids[*].luid0**

**Fullname:** Line Unit ((R)ISLU) identifier.

**Attribute Description** Line unit or (remote) integrated services line unit entered by the switch personnel. One of 100 (max). Measurements will be generated for all operational switch groups or line group controllers on the specified line unit or ISLU.

**Attribute: ids[*].smid50**

# MS_MLHG

## 1. Description

Measurements for multi-line hunt groups.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | EADAS |
| relation type | DBSTATIC |
| head table size | 1024 |
| data page size | 1024 |
| page level | 1 |
| l1 length of subkey1 | 1 |
| p1 position of subkey1 | 7 |
| ignore key bits | 0-6 |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLms_mlhg

**Relation Description** Measurements for multi-line hunt groups.

**Attribute: im_id**

**Fullname:** interface module identifier

**Attribute Description** Module 0 only applies. Dependencies: Relation must be populated.

**Attribute: gps_in_use**

**Fullname:** number of groups in use

**Attribute Description** Indicates the number of groups currently identified within the specified IM number tuple.

**Attribute: gp_id[*]**

**Fullname:** group identification number

**Attribute Description** Indicates a specified group identification number which is being measured.

Dependencies: All gp_id fields must be populated with either 0 (the default) or a valid MLHG ID.

The groupid must be unique, that is, it may appear in at most one gp_id{1-200} field in any one tuple.

If a gp_id number exists in this tuple then verify the existence of a tuple in RLrt_mhg with: grpnum in RLrt_mhg, which MLHG must have at least one member.

# MS_PFA

## 1. Description

Measurements for private facilities access groups.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | EADAS |
| relation type | DBSTATIC |
| head table size | 1024 |
| data page size | 1024 |
| page level | 1 |
| l1 length of subkey1 | 1 |
| p1 position of subkey1 | 7 |
| ignore key bits | 0-6 |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population Rules for RLms_pfa

**Relation Description** Measurements for private facilities access type of simulated facility groups.

**Attribute: im_id**

**Fullname:** interface module identifier

**Attribute Description** Module 0 only applies.

**Attribute: gps_in_use**

**Fullname:** number of groups in use for each interface module

**Attribute Description** Indicates the number of groups currently identified within the specified IM number tuple.

**Attribute: gp_id[*]**

**Fullname:** group identification number

**Attribute Description** Indicates a specified group identification number which is being measured. All gp_id fields must be populated either with 0 (the default) or a valid PFA id.

## 4. Population Rules for RLms_qan

**Relation Description** Measurements for Queue Announcements.

Measurements for queue announcements.

**Attribute: sm_id**

**Fullname:** Switching Module ID.

**Attribute Description** Identifies a switching module.
If sm_id=0 then the grps_in_use and gp_id[] attributes must reflect the union of all the other sm_id's for the grptyp given:

| sm_id | grptyp | gps_in_use | gp_id[1] | gp_id[2] | gp_id[3] |
|---|---|---|---|---|---|
| 0 | TM_QLINE | 2 | 5 | 21 | 0 |
| 0 | TM_QTRK | 3 | 6 | 23 | 27 |
| 0 | TM_QSFG | 1 | 9 | 0 | 0 |
| 1 | TM_QLINE | 1 | 5 | 0 | 0 |
| 1 | TM_QTRK | 2 | 0 | 23 | 27 |
| 1 | TM_QSFG | 0 | 0 | 0 | 0 |
| 4 | TM_QLINE | 1 | 0 | 21 | 0 |
| 4 | TM_QTRK | 1 | 6 | 0 | 0 |
| 4 | TM_QSFG | 1 | 9 | 0 | 0 |

In this example for the grptyp TM_QTRK, the gps_in_use field for sm_id = 0, has the value 3, which is the sum of all the unique gp_ids across all the other SM tuples (sm_id != 0) for that grptyp.

Note that the gps_in_use field for each SM tuple (sm_id != 0) is the total number of non-zero gp_ids in that tuple. Also note that any non-zero gp_id field in each SM tuple must be unique to only that SM tuple and grptyp.

For tuples where sm_id is non-zero, the sm_id must correspond to the queuing SM. Thus for gp_id = 5 of type TM_QLINE to appear in the example in tuple sm_id = 1, that group number must be associated with queuing SM 1, as determined by the proper MLHG relation, that is,

```
RLrt_mhg.grpnum = 5
RLrt_mhg.qmodule = 1
```

**Attribute: grptyp**

**Fullname:** Group Type.

Copyright © 1999 Lucent Technologies 

**Attribute Description** A tuple for each sm_id in the office must be initialized for each grptype. Thus the number of tuples in this relation will be 3 times the number of SMs plus 3 (one for each of the( sm_id=0,grptyp) tuples)in the office.

**Attribute: gps_in_use**

**Fullname:** Group In Use.

**Attribute Description** Indicates the number of non-zero groups currently identified within the specified SM number tuple (also refer to usage for attribute sm_id).

Attributes gp_id1 to gp_id100 For grptype TM_QTRK or TM_QSFG, gps_in_use must be less than or equal to 75.

**Attribute: gp_id[*]**

**Fullname:** Group Identification Number

**Attribute Description** Indicates a specified group identification number which is being measured. All gp_id fields must be populated either with 0 (the default) or a valid QAN group id. The groupid must be unique, that is, it may appear in at most one gp_id{1-100} field in any one tuple.

## 4. Population Rules for RLms_qu

**Relation Description** Measurements for Queues

Measurements for queues.

**Attribute: sm_id**

**Fullname:** Identifies a switching module.

**Attribute Description** Identifies a switching module. Part of the key to this relation. Module 0 only applies.

**Attribute: gptyp**

**Fullname:** Group Type

**Attribute Description** Part of the key to this relation. A tuple for each gptyp (TM_QLINE, TM_QTRK, TM_QSFG) should be initialized.

**Attribute: gps_in_use**

**Fullname:** Number of groups in use for each switching module.

**Attribute Description** Indicates the number of groups currently identified within the specified SM number tuple. Dependencies: For gptyp equal TM_QTRK or TM_QSFG, gps_in_use must be less than or equal to 75.

**Attribute: gp_id[*]**

**Fullname:** Group Identification Number

**Attribute Description** Indicates a specified group identification number which is being measured. All gp_id fields must be populated either with 0 (the default) or a valid QU group id. The groupid must be unique, that is, it may appear in at most one gp_id{1-100} field in any one tuple.

## 4. Population Rules for RLms_sc

**Relation Description** Measurements information about the number of operational High Level Service Circuits (HLSC).

Relation for counting the number of High Level Service Circuits (HLSC) per Line Unit. This relation is read to determine the number of operational HLSCs on a given Switching Module and Line Unit (LU) (or (Remote) Integrated Services Line Unit ((R)ISLU)). Whenever the status of a HLSC is changed from non-operational to operational, 'lu_hlsc_cnt' is incremented. If the status is changed from operational to non-operational or is deleted from operational, 'lu_hlsc_cnt' is decremented.

**Attribute: lu_id**

**Fullname:** Line Unit Identification.

**Attribute Description** The Line Unit ID uniquely identifies a LU on a given SM.

**Attribute: lu_type**

**Fullname:** Line Unit Type.

**Attribute Description** This attribute specifies the LU type of this particular LU.

Copyright © 1999 Lucent Technologies 

**Attribute: lu_hlsc_cnt**

**Fullname:** Line Unit High Level Service Circuit count.

**Attribute Description** This attribute holds the count of HLSCs that are available by LU = lu_id for a given SM.

## 4. Population Rules for RLms_sgeq

**Relation Description** Measurements information about the number of operational Switch Groups and Line Groups.

**Copyright © 1999 Lucent Technologies** 

Relation for Switch Group (SG) (a.k.a half-grid) and Line Group (LG) Measurements. This relation is read to determine the number of operational SGs or LGs on a given Switching Module and Line Unit (LU) (or (Remote) Integrated Services Line Unit ((R)ISLU)). Whenever the status of a SG or LG is changed from non-operational to operational, luX_sgcnt is incremented. If the status is changed from operational to non-operational or is deleted from operational, luX_sgcnt is decremented.

**Attribute: lu_type**

**Fullname:** Line Unit Type

**Attribute Description** This field indicates the type of line unit (LU or ISLU) of the luX_sgcnt attributes.

**Attribute: smid**

**Fullname:** Switching Module identifier

**Attribute Description** This field indicates the Switching Module number.

**Attribute: lu[*]_sgcnt**

**Fullname:** Line Unit Switch Group (or (Remote) Integrated Services Line Unit Line Group) Count.

**Attribute Description** Structure for attribute luX_sgcnt (where X equals 0-42).

**Attribute: lu[*]_sgcnt.lu_sgcnt**

**Fullname:** Line Unit Switch Group (or (Remote) Integrated Services Line Unit Line Group) Count

**Attribute Description** This field indicates the number of SGs or LGs on LU ((R)ISLU) number x (where x is 0 - 42).

**Attribute: lu[*]_sgcnt.pad**

**Fullname:** Padded

**Attribute Description** Not used.

## 4. Population Rules for RLms_sgsdy

**Relation Description** Study Groups for Switch Group and Line Group Controller Measurements.

Relation for Switch Group and Line Group Controller Measurements. This relation is updated when the RLms_lusdy relation is populated with identifiers (Switching Module (SM), Line Unit and Study Group) via RC or ODA.

This relation identifies all the measurements study groups assigned for each Line Unit (LU) or (Remote) Integrated Services Line Unit ((R)ISLU) in this SM. Since a LU and ISLU can be part of multiple study groups, each bit in the luXstudy_grp attribute represents the corresponding study group.'

**Attribute: lu_type**

**Fullname:** Line Unit Type

**Attribute Description** This field indicates the type of line unit (LU or ISLU).

**Attribute: lu[*]study_grp**

**Fullname:** Line Unit (Remote) Integrated Services Line Unit (0-42) Study Group

**Attribute Description** Line Unit Study Group for Line Unit X (where X is 0-42).

**Attribute: lu[*]study_grp.lustudy_grp**

**Fullname:** Line Unit Study Group

**Attribute Description** Bit map which indicates all study groups assigned for specified Line Unit ((R)ISLU). There are 5 possible study groups; each corresponding bit in luXstudy_grp is set if the line unit is part of that study group. Here is a chart which illustrates the luXstudy_grp value when the LU (ISLU) is a member of the indicated study groups.

| luXstudy_grp value | study group(s) |
|---|---|
| 2 | 1 |
| 4 | 2 |
| 6 | 1, 2 |
| 8 | 3 |
| 10 | 1, 3 |
| 12 | 2, 3 |
| 14 | 1, 2, 3 |
| 16 | 4 |
| 18 | 1, 4 |
| 20 | 2, 4 |
| 22 | 1, 2, 4 |
| 24 | 3, 4 |
| 26 | 1, 3, 4 |
| 28 | 2, 3, 4 |

## 4. Population Rules for RLms_tgsr

**Relation Description:** measurements for assigned terminal groups.

Measurements for assigned terminal groups.

**Attribute: im_id**

**Fullname:** interface module identifier

**Attribute Description** module 0 only applies

**Attribute: gps_in_use**

**Fullname:** number of groups in use for all switch modules

**Attribute Description** Indicates the number of groups currently identified within the 0 tuple.

**Attribute: gp_id[*]**

Copyright © 1999 Lucent Technologies 

**Fullname:** group identification number

**Attribute Description** Indicates a specified group identification number which is being measured. All gp_id fields must be populated with either 0 (the default) or a valid terminal groupid. The groupid must be unique, i.e., it may appear in at most one gp_id{1-200} field.

Dependencies: None.

## 4. Population Rules for RLmsaphss

Copyright © 1999 Lucent Technologies

**Relation Description** Trunk and multi-line hunt group that has the 100 Second Scan.

This relation must be populated with a tuple for each trunk group and multiline hunt group that is assigned the 100 second scan (HSS) feature.

This relation is GROUP partitioned. The AM version of this relation is NEVER populated. The SM versions are populated with tuples for trunk groups and LOCAL multiline hunt groups (assigned the HSS feature) contained in those SMs.

TRUNK example:

If the HSS feature is assigned to a trunk group that has its members located on SMs 1, 3, and 5, then a tuple for this trunk group must be placed in RLmsaphss in SMs 1, 3, and 5 only.

MLHG example:

If the HSS feature is assigned to a local MLHG, a tuple must only be placed in the SM where the members reside for that local MLHG. (NOTE: Because the MLHG must be local, ALL of the members WILL reside on a single SM.)

When members of an existing trunk group or local MLHG (assigned the HSS feature) are added to an SM that previously did not contain members of that trunk group or local MLHG , then a tuple must be placed in RLmsaphss on that SM.

When the last member of an trunk group or LOCAL multiline hunt group (assigned the HSS feature) is deleted from an SM then a tuple must be deleted from RLmsaphss on that SM for that trunk group or LOCAL multiline hunt group.

The GPD 'group type' used for this relation is GPDTRKG or GPDHSS_MLHG, and the GPD 'group id' is the trunk group or multiline hunt group number.

**Attribute: grptype**

**Fullname:** Private feature/facility group type

**Attribute Description** The type of private feature/facility group. Valid group types are:
MSHSSTRKG - Trunk Group
MSHSSMLHG - Multi-line Hunt Group.

**Attribute: grpnum**

**Fullname:** Group number

**Attribute Description** Identifies the group number of the private feature/facility group within the switch.

For group type of MSHSSTRKG grpnum must be a valid trunk group.
A tuple must exist in RLrt_trkg keyed by RLmsaphss.grpnum.

For group type of MSHSSMLHG grpnum must be a valid LOCAL multiline hunt group. A tuple must exist in RLrt_mhg keyed by RLmsaphss.grpnum. If the tuple exists, the gblgrp attribute must be DBNO.

**Attribute: bcid**

**Fullname:** Business customer ID

**Attribute Description** Business Customer ID.

Copyright © 1999 Lucent Technologies 

Must be a tuple in RLtdassign and RLhssasgn for the given 'bcid' and 'apid'.

**Attribute: apid**

**Fullname:** Applications Processor (AP) ID

**Attribute Description** Applications Processor (AP) Identification.

```
must be a tuple in RLcmapdata with:
      RLcmapdata.site_id == apid
      and
      RLcmapdata.module != 0
```

**Attribute: hssactive**

**Fullname:** HSS active flag

**Attribute Description** This attribute indicates whether the HSS feature has been activated on this group.

Copyright © 1999 Lucent Technologies 

# MSDSLGDT

## 1. Description

This relation is populated with the channel group of PS_PPCG and the member_cnt which defines the number of packet pipes associated with this channel group in a SM. This information is used by the Measurements subsystem to verify the channel group is valid when the switch personnel performs an inhibit or an allow of measurements for a FRPH. Measurements also uses this relation to size the EADAS buffer based upon the member_cnt.

## 2. Data Dictionary Values

## 4. Population Rules for RLmsdslgdt

**Relation Description** Defines the Packet Pipe channel group data on a SM.

This relation resides in AM for providing the information on Packet Pipe channel group data for measurements.

**Attribute: ch_group**

**Fullname:** (key) Channel group

**Attribute Description** Channel group.

**Attribute: sm**

**Fullname:** (key) The SM number

**Attribute Description** The SM number which this logical PH is associated.

**Attribute: member_cnt**

Copyright © 1999 Lucent Technologies

**Fullname:** Member count in this channel group

**Attribute Description** The number of packet pipes associated with this channel group for a FRPH (Frame Relay PH).

## 4. Population rules for RLmsprtlst

### Relation Description

Traffic Measurement Printing List relation.

The relation, RLmsprtlst, will be used to identify the measurements components for which the measurements report will be printed on the ROP. Each measurement component within this relation must also be found in the relation RLmssellst that is, RLmssellst contains the components which have been selected for measurements collection. A measurements report can only be printed on the ROP for those components which have been selected for collection.

**Attribute:**
index
**Fullname:**
Index
**Attribute Description:**
The Index number of the tuple for a particular section. This value will be a second key into this relation. Its value will vary depending on the number of tuples currently in use. For example, for a section requiring 2 tuples to hold its component list. One tuple will have an index of 0, with 31 components populated. The second tuple will have an index of 1 with between 1 and 31 components populated.

**Attribute:**
secname
**Fullname:**
Section Name
**Attribute Description:**
The Section Name of the EADAS Buffer Section from the domain DMmssec

**Attribute:**
numcomp
**Fullname:**
Number of components
**Attribute Description:**
Indicates the number of components that are being stored per tuple for the associated section.

**Attribute:**

Copyright © 1999 Lucent Technologies 

comp[*]

**Fullname:**

Component X

**Attribute Description:**

This attribute will contain a component number that will be selected for collection. A group of 31 of these attributes with domain DMhex32 will exist for each tuple. A section may have several tuples associated with it. The range of these attributes will be a 32 bit word, but the values stored will be dependent on the range of the component associated with the corresponding section.

## 4. Population rules for RLmssellst

### Relation Description

Traffic Measurement Selectivity List relation.

The relation, RLmssellst, will be used to obtain the components of a particular section of the EADAS Buffer.

**Attribute:**
index
**Fullname:**
Index
**Attribute Description:**
The Index number of the tuple for a particular section. This value will be a second key into this relation. Its value will vary depending on the number of tuples currently in use. For example, for a section requiring 2 tuples to hold its component list. One tuple will have an index of 0, with 31 components populated. The second tuple will have an index of 1 with between 1 and 31 components populated.

**Attribute:**
secname
**Fullname:**
Section Name
**Attribute Description:**
The Section Name of the EADAS Buffer Section from the domain DMmssec

**Attribute:**
numcomp
**Fullname:**
Number of components
**Attribute Description:**
Indicates the number of components that are being stored per tuple for the associated section.

**Attribute:**
comp[*]
**Fullname:**
Component X
**Attribute Description:**
This attribute will contain a component number that will be selected for collection. A group of 31 of these attributes with domain DMhex32 will exist for each tuple. A section may have several tuples associated with it. The range of these attributes will be a 32 bit word, but the values stored will be dependent on the range of the component associated with the corresponding section. RC/V will

Copyright © 1999 Lucent Technologies 

insert and delete tuples as needed, and will bunch components together. It will make sure there are no empty spots between compX attributes by rearranging the components, and if a tuple does not have any components set, that is, numcomp=0, that tuple will be removed. RC/V will insert a new tuple
if the last tuple for a section is full, and the maximum number of tuples are not in use. This list of attributes will contain the components selected for collection. These components will be stored contiguously by RC/V, and thus when any new component has to be inserted, it will go on the end. If not all the components in a tuple are used, the unused attributes which will be at the end of the tuple will be set to 0xffffffff.

## 4. Population rules for RLmtb_comp

### Relation Description

Metallic testing compensation values for line units

This relation holds the metallic testing compensation values for lines. This is used during SLIM(2)/Test AP testing to remove (compensate) resistance and capacitance due to the metallic connections and line unit so as to leave a true measurement of the subscribers line and instrument.

**Attribute:**
unittype

**Fullname:**
Line unit type

**Attribute Description:**
This attribute uniquely identifies a unit type

**Attribute:**
loopres

**Fullname:**
Loop resistance in Ohms

**Attribute Description:**
This attribute is the loop resistance compensation used in calculations by SLIM(2)/Test AP to measure a subscribers line and instrument.

**Attribute:**
ab2ecap

# MTBDCTU

## 1. Description

Specifies the Metallic Test Busses (MTB)s that are associated with (connected to) a given DCTU port circuit.

When a PGTC port is wired on the MTB between the DCTU and the MMSU, the 'lodist_pt' field contains the port name of the distribute point which is connected to the HIGH valued resistors controlling the low sleeve current toward the PGTC. Otherwise the 'lodist_pt' is set to GLNULPORT.

## 4. Population Rules for RLmtbdctu

**Relation Description** MTB associated with DCTU

Specifies the metallic test busses (MTBs) that are associated with (connected to) a given DCTU port circuit.

Copyright © 1999 Lucent Technologies 

This relation specifies the directly connected test unit (DCTU) port circuit (DCTUPORT) that is physically connected to a MTB in a metallic service unit (MSU). The MTBs connect to the DCTU base pack, SN423, which then uses the EAN (equal access network) to connect to the PMU packs, SM248. MTBs are physical tip and ring pairs that are part of the metallic access (MA) circuit pack, TN138, in a modular MSU (MMSU). Besides DCTUPORTs, MTBs connect to analog line units, analog trunk units, Pair Gain Test Controller circuits, and Test Bus Controller Units.

This data is used by Terminal Maintenance operational software when making a DCTU metallic connection. This relation resides currently in the AM. The DCTU and the MSU(s) that it connects to may or may not be in the same SM. Additional information pertaining to DCTUPORTs or MTBs may be found in population rules for RLcktdata.

In general, the DCTUPORTs should be distributed across MSU service groups in the office. There are no other engineering rules in this regard and no internal cross checks required to support this requirement.

DCTUPORTs must be grown in groups of 4, which correspond to the number of PORTs per PMU.

The maximum tuple size for this relation (currently 64 tuples) should be enough to handle two fully equipped DCTUs in a *5ESS*®-2000 switch HOST processing entity of up to 120,000 lines (24 DCTUPORTs) and up to ten (10) RSMs (ORMs or TRMs) each connecting a minimally equipped DCTU (4 DCTUPORTs). More DCTUs in RSMs (ORMs or TRMs) can be supported either by increasing maximum tuple size or decreasing the number of DCTUPORTs supporting the HOST *5ESS*®-2000 switch. Since a *5ESS*®-2000 switch can support 192 SMs with one DCTU in each SM, the theoretical maximum number of tuples could be:

```
      ( 12 DCTUPORTs/DCTU ) x (1 DCTU/SM) x (192 SM/office)
                              = 2,304 DCTUPORTs/office
```

OPTIONAL EQUIPMENT:

When a DCTU is used to test a line connected to a Universal-SLC system, a Pair Gain Test Controller (PGTC) is required to achieve metallic bypass.

There are 3 configurations for the PGTC:

(1) The PGTC is direct wired on a specific No Test Trunk (located between the testing center and the NTT). The PGTC is controlled via sleeve lead control provided from the testing center over the No Test Trunk sleeve and ground leads.

No ODD is required to support this configuration and the switch software is not even aware of the existence and use of the PGTC in this manner. It is described here for completeness in documenting PGTC configurations.

(2) The PGTC is connected to a pair of MTBs (the first MTB provides the connection toward the DCTU, the second toward the line under test). The PGTC is switched into the connection only when required and is a shared resource used whenever a DCTU connects to a Universal-SLC system.

Distribute points under *5ESS*®-2000 switch software control, regulate sleeve lead current to control the PGTC (~12 ma for low current and ~28 ma for high). These distribute points must be equipped sequentially on the same distribute pack (which must be in the same SM as the Metallic Access pack which terminates the MTB of the PGTC).

Since the PGTC is not directly associated with any specific RLMTBDCTU tuple, the 'lodist_pt' field is populated in the relation 'RLPGTC'. Again, this description is only included for completeness of configurations.

(3) The PGTC is direct wired to the DCTU MTB between the DCTU and the MMSU. The PGTC is only activated for DCTU connections to Universal-SLC system lines.

**Copyright © 1999 Lucent Technologies** 

Distribute points control the PGTC and have the same assignment restrictions (sequential points and location relative to MTB) as the previous configuration 2.

In this configuration, the PGTC is associated with one (and only one) DCTU MTB therefore there is no need for an RLPGTC tuple. Instead, the RLMTBDCTU tuple for that MTB will contain the port name of the low distribute point in the attribute 'lodist_pt'. The value of 'lodist_pt' should never be GLNULPORT in this case. The high distribute point port name is derived from the low distribute point port name using the following algorithm: Locate the RLFC_PORTTYP tuple for the low distribute point port. Increment the value of the 'port_indx' attribute of that tuple to give the port index of the 'cktname' attribute from RLFC_PORTTYP (which is the circuit name of the DIST pack) and the calculated port index of the high distribute point. The 'port' attribute of the RLCKT_PORT relation is the port name of the high distribute point.

All 3 configurations can exist in the same office simultaneously.

**Attribute: dctuid**

**Fullname:** global circuit name of DCTU port circuit

**Attribute Description** global circuit name of DCTU port circuit.

**Attribute: dctuid.circuit**

**Fullname:** DCTUPORT circuit name

**Attribute Description** DCTUPORT circuit name.

**Attribute: dctuid.module**

**Fullname:** SM where DCTUPORT circuit is connected

**Attribute Description** SM where DCTUPORT circuit is connected

**Attribute: dctumtb**

**Fullname:** global MTB circuit name from DCTU port to MSU

**Attribute Description** MTB that connects DCTU.

**Attribute: dctumtb.circuit**

**Fullname:** MTB circuit name

**Attribute Description** MTB circuit name.

**Attribute: dctumtb.module**

**Fullname:** SM where MTB resides

**Attribute Description** SM where MTB resides.

**Attribute: dctu_idx**

**Fullname:** circuit index of DCTU's MTB

**Attribute Description** Circuit index of the MTB used by the DCTU

Copyright © 1999 Lucent Technologies 

**Attribute: lodist_pt**

**Fullname:** MSU distribute point wired to HIGH resistor value for PGTC

**Attribute Description** The Distribute (DIST) pack that terminates this distribute point must exist in the same MMSU as the MA pack that terminates the DCTU MTB. PC software will construct the portname for the associated 'hidist_pt' based on the requirement that the distribute points are assigned sequentially and are on the same DIST pack.

The high distribute port name is obtained by incrementing the circuit index for 'lodist_pt' found in RLfc_porttyp and then reading RLckt_port using the incremented port index and the 'lodist_pt' circuit name found in RLfc_porttyp.

This field will have an entry in rlFC_PORTTYP with 'servclass' set to TMDSTPGTC.

If there is no PGTC wired to the DCTU MTB, then the value for 'lodist_pt' must be GLNULPORT.

**Attribute: msu_no**

**Fullname:** MSU unit number of DCTU MTB

**Attribute Description** Unit number of the MSU from which the DCTU's MTB originates

**defines:**
"db/DMport.h"

RLmtbfe (MTB Far End Equipment For ISLU/RISLU line units)

DESCRIPTION:

Defines the Integrated Services Line Unit (ISLU) or Remote ISLU (RISLU) Metallic Access Network (MAN) Board connected at the far end of the MTB.

This data resides in the SM containing the MSU serving this MTB but not necessarily the SM serving the ISLU/RISLU. The ISLU/RISLU and the MSU that it connects to may or may not be in the same SM. Note that MTBs to ISLU/RISLUs are optional, and a tuple in this relation will only exist for an ISLU/RISLU if and only if there exists an MTB to the ISLU/RISLU.

Note that the ISLU/RISLU configuration is somewhat unique in that each MTB can connect to one or two ISLU/RISLU MAN boards, one board in each service group of this ISLU/RISLU if there are Z-cards or one board in SG 0 if there are only U-cards. There are NO MAN boards required in SG 1 if there are only U-cards. (There can be a maximum of 4 MAN boards per ISLU/RISLU, 2 in each service group. ) The MAN Board listed in this relation is an equipped board in the ISLU/RISLU which is connected to the MTB.

PICB # - the PICB (relative to the SM) connected to the ISLU/RISLU. This PICB is for the service group of the ISLU/RISLU which contains the MAN PACK connected to the MTB. For the case where two MAN boards are connected to the MTB, chose the MAN board/SG using the following diagram.

B (Board) - 'B' is 0 or 1 and should be an equipped MAN board in the service group of the ISLU/RISLU.

This table indicates which Man Board is populated for each for the MTBs (MTB0 and MTB1).

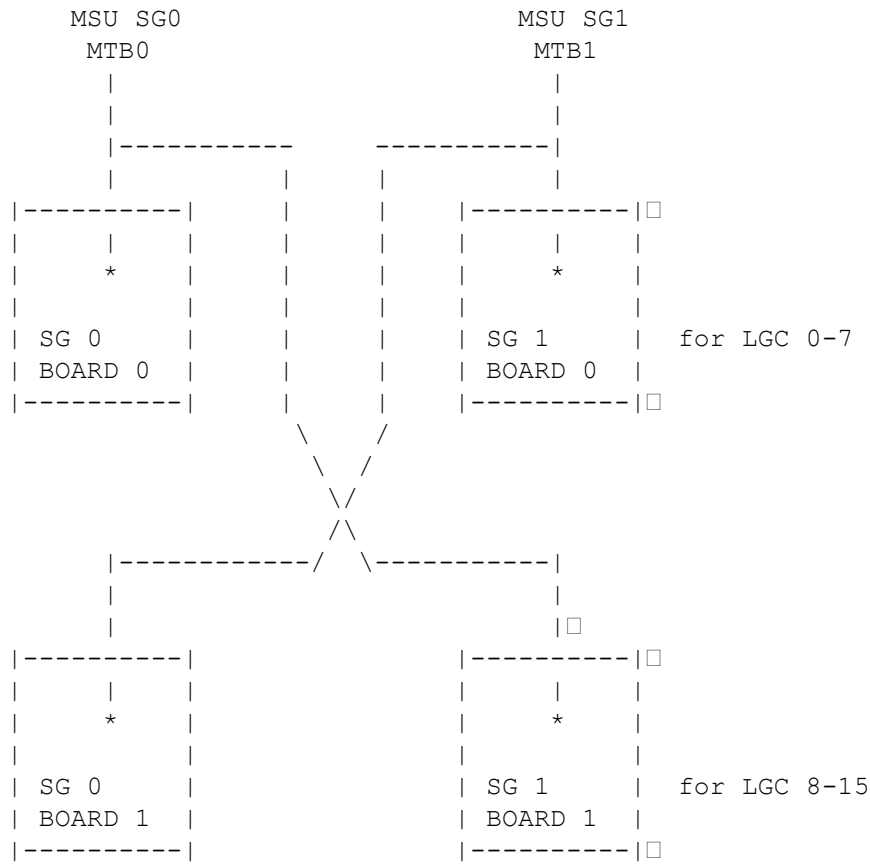
Equippage of MAN for MTB0

| SG Board 0 0 | SG Board 1 1 | MAN Board to use in MTBFE |
|---|---|---|
| X | | MAN00 |
| | X | MAN11 |

Copyright © 1999 Lucent Technologies 

```
   X              X            MAN00

  Equippage of MAN for MTB1
  SG Board       SG Board       MAN Board
   1 0            0 1           to use in MTBFE
  -----          -----          ------
   X                            MAN10
                  X             MAN01
   X              X             MAN10
```



QUANTITY OF TUPLES:

1 tuple per MTB connected to an ISLU/RISLU. ISLU/RISLUs without Metallic access networks (or with them but without MTBs connected to them) will have no tuples (since they have no MTB).

TUPLE SEMANTICS:

```
mtbcktname (KEY)  - MTB circuit name
fetype            - PCISLU
fecktname.circuit - MAN Board connected to MTB as
                    indicated in the previous diagram.
fecktname.module  - SM where the ISLU/RISLU resides.
fenumber          - 0 (This only applies to TLWS
```

related MTBs)
"

**Attribute:**
mtbcktname
**Fullname:**
MTB circuit name.
**Attribute Description:**
This attribute should contain the same data as whats in the key name field in the Rlcktdata relation.

**Attribute:**
fetype
**Fullname:**
Far end type.
**Attribute Description:**
Far end type. The far end type can be the following depending on what the particular MTB is hooked up to:

```
PCUNASGND - if the MTB is shorted.
PCLU      - if the MTB is connected to a line unit.
PCLTDTST  - if the MTB is connected to a local test desk
PCTLWSDCJ - if the MTB is connected to a trunk line
            work station.
DBPCS96   - if the MTB is connected to a SLC(R) 96,
            SLC(R) 5 or just to a TBCU, with no RT yet
            assigned.
PCDCTU    - if the MTB is connected to a DCTU.
PCDRPAIR  - must be this type if the ckt_indx ends
            in 0xf (RLcktdata.ckt_indx{0:3} = 0xf): that
            is, bus 15 on every metallic access pack
            is a dedicated diode/resister pair for
            diagnostic use.
PCPGTCIN  - if the MTB is connected to the input
            of the Pair Gain Test Controller
            (PGTC) circuit.
PCPGTCOUT - if the MTB is connected to the output
            of the Pair Gain Test Controller
            (PGTC) circuit.
PCAIU     - if the MTB is connected to an Access
            Interface Unit ((*)AIU).
```

**Attribute:**
fecktname
**Fullname:**
Far end circuit name.
**Attribute Description:**
This attribute represents the far end circuit name with the following exceptions:

**Copyright © 1999 Lucent Technologies** 

If fetype is PCUNASGND then this field is 0.
If fetype is PCDRPAIR then this field is 0.
if fetype is PCPGTCIN then this field is 0.
if fetype is PCPGTCOUT then this field is 0.
if fetype is PCISLU then (see the diagram in
the general section).
if fetype is DBPCS96 and MTB is connected only to
the TBCU with no RT yet assigned to this MTB, then
fecktname is (GLNULCKT,0).

If fetype is PCAIU then this field is set to the circuit
name of the (*)AIU COMDAC circuit that this MTB is
connected to.

**Attribute:**
fecktname.circuit
**Fullname:**
circuit.
**Attribute Description:**
circuit.

**Attribute:**
fecktname.module
**Fullname:**
module.
**Attribute Description:**
This attribute is the IM number which contains the
far end circuit, except when PCUNASGND = 0.
If fetype is PCPGTCIN or PCPGTCOUT, this attribute
is 0.

See the previous exception for DBPCS96.

FOR MMRSM:
1) The far end circuit IM specified should only be a RSM
which is a member of the same MMRSM site (clid) as this IM
which contains the MSU serving this MTB.

2) The far end circuit IM specified can only be different
from this IM which contains the MSU serving this MTB if
this IM is specified as the Common Resource RSM for
this MMRSM site, that is, the attribute rm_mtb is equal
to [this IM] in relation RLclidat for this MMRSM site
(clid).

3) If the far end circuit IM specified is different from
this IM which contains the MSU serving this MTB, and,
rm_mtb is equal to 0 in RLclidat for this MMRSM site,
THEN,
if in relation RLclidat rm_alm_in=0, rm_alm_out=0, rm_clk=0

Copyright © 1999 Lucent Technologies 

and rm_cnt >1, the attribute rm_mtb in RLclidat is set
to [this IM](containing the MSU serving this MTB) which
will define this IM as the Common Resource RSM and so
allowing a different far end circuit IM to be specified
for this attribute (fecktname.module).
ELSE,
if any of rm_alm_in, rm_alm_out or rm_clk in RLclidat are
not equal to 0 but are equal to this IM (containing the
MSU serving this MTB) and rm_cnt >1, then this is the
defined Common Resource RSM for this MMRSM site and the
attribute rm_mtb in RLclidat for this MMRSM site is
set to [this IM](which contains the MSU serving this MTB)
and so allowing a different far end circuit IM to be
specified for this attribute (fecktname.module).

See RLclidat population rules for further clarification on
MMRSM site related option restrictions.

FOR ORM/TRM co-located site:
The far end circuit IM specified should only be
ORM/TRM which is a member of the same site as this IM
which contains the MSU serving this MTB.
COMMENT: This will not be enforced by RC and ODA.

**Attribute:**
fenumber
**Fullname:**
Far end TLWS number.
**Attribute Description:**
Far end TLWS number, otherwise = 0:

**Defines:**

## 4. Population Rules for RLmtbtst

Copyright © 1999 Lucent Technologies

**Relation Description** Metallic test bussed for the local test desk test trunk.

This relation specifies the two metallic test bus (MTB) circuits which connect each local test desk (LTD) test trunk (incoming or outgoing) to the metallic service unit (MSU) or modular MSU (MMSU). LTD test trunks provide the interface to external testing systems (LTD, mechanized loop testing [MLT], Fortel, etc.) for metallic loop testing of lines.

**Attribute: tstid**

**Fullname:** Port name of the test trunk.

**Attribute Description** Tuples must appear in the following relations:

```
if RLfc_porttyp.servclass = TM_TSTK
        RLrc_trk     -   keyed on trunk group and member
        RLrt_trkg    -   keyed on trunk group
        RLrctgrprk   -   keyed on trunk group
        RLgroup_port -   keyed on trunk group and member
        RLpggpmap    -   keyed on trunk port
        RLfc_porttyp -   keyed on trunk port (servclass = TM_TSTK)
        RLfc_trunk   -   keyed on trunk port
```

**Attribute: tstid.member**

**Fullname:** Member

**Attribute Description** None.

**Attribute: tstid.module**

**Fullname:** Module

**Attribute Description** None.

**Attribute: mtb0tec**

**Fullname:** MTB0 from the test equipment

**Attribute Description** For each tuple in this relation, two corresponding tuples must appear in the SM relation RLmtbfe, keyed on the names of the LTD trunk MTB circuits.

**Attribute: mtb0tec.circuit**

**Fullname:** Circuit name

**Attribute Description** None.

**Attribute: mtb0tec.module**

**Fullname:** Module

**Attribute Description** None.

**Attribute: mtb1tec**

**Fullname:** MTB1 from the test equipment.

Copyright © 1999 Lucent Technologies 

**Attribute Description** None.

**Attribute: mtb1tec.circuit**

**Fullname:** Circuit name

**Attribute Description** None.

**Attribute: mtb1tec.module**

**Fullname:** Module name

**Attribute Description** None.

**Attribute: mtb0_idx**

**Fullname:** Circuit index of MTB zero.

**Attribute Description** Circuit index of the MTB on service group zero.

**Attribute: mtb1_idx**

**Fullname:** circuit index of MTB one.

**Attribute Description** Circuit index of the MTB on service group one.

**Attribute: mtb0_msu**

**Fullname:** MSU unit number of MTB zero.

**Attribute Description** The unit number of the MSU from which MTB zero originates.

**Attribute: mtb1_msu**

**Fullname:** MSU unit number of MTB one.

**Attribute Description** The unit number of the MSU from which MTB one originates.

## 4. Population Rules for RLmultifac

**Relation Description** Multi-facility child map

This relation maps a single high-level circuit (multi-facility) to a group of subtending low-level (child) facilities.

**Attribute: multifac**

**Fullname:** Multi-facility circuit name

**Attribute Description** For each transport unit terminating more than a single low-level facility (T1/E1), a single higher level circuit within the unit is chosen to represent all the subtending facilities.

**Attribute: lowfac[*]**

**Fullname:** Low-level facility circuit names

**Attribute Description** These attributes (lowfac00 - lowfac31) are the low-level facility names in this multifac set.

## 4. Population Rules for RLmumtib

**Relation Description** Holds Metallic Test Interconnect Bus access info per Switching Module

This relation contains metallic test interconnect bus (MTIB) information for different SMs. Each SM may contain up to 2 regular MSUs, or a single compact shelf MSU. The relation describes the MTIB route between MSU service groups and indicates which MSU shelves have metallic access.

The key for this relation is the SM number. A given SM will have a tuple in this relation only if there are one or more MTIB access packs equipped in the SM. No tuple should be present for any MSU on a remoted SM (RSM, ORM, or TRM), even if the MSU is equipped with MTIB access packs.

A compact shelf MSU is a single service group MSU intended to support small office configurations. The compact shelf is required to be MSU unit number zero which contains only service group 0.
While MTIB's may not be needed for an office equipped with a single compact MSU, an MTIB access pack is required in a compact shelf MSU to provide access to the protocol test circuit on the MSU common board.

The non-key part of the tuple can be thought of as four co-tuples that represent the four MSU service groups (in the 2 MSU's) that may reside in this SM. A co-tuple will be populated only if the service group it represents has metallic

**Copyright © 1999 Lucent Technologies** 

access. An unpopulated co-tuple has all of its attributes set to the default values.

The attributes that comprise a co-tuple all have the same digit (0, 1, 2, or 3) as part of the variable name. These attributes map to MSU service groups as follows:

```
0 refers to MSU 0, service group 1
1 refers to MSU 0, service group 0
2 refers to MSU 1, service group 1
3 refers to MSU 1, service group 0
```

For example, the co-tuple representing MSU 0, service group 1 is comprised of the following attributes: msu0_sgid, msu0_sh[0 thru 3], next0_mod, nextmsu0_sg, prev0_mod, prevmsu0_sg.

A word of caution. To avoid confusion about this naming scheme, remember that the attribute 'msu0_sgid' refers to service group 1 (MSU 0), while 'msu1_sgid' refers to service group 0 (MSU 0). The names of MSU 1 attributes are similar, and must also be considered carefully.

**Attribute: module**

**Fullname:** SM Number

**Attribute Description** The number of an SM that is equipped with one or more MTIB access packs.

**Attribute: msu0_sgid**

**Fullname:** MSU Service Group Identifier

**Attribute Description** This is the service group identifier (PICB + 1) of an MSU that has metallic access. It is the key of the co-tuple containing the following attributes: msu0_sgid, msu0_sh(0:3), next0_mod, nextmsu0_sg, prev0_mod, prevmsu0_sg. This co-tuple always maps to service group 1 of MSU 0.

**Attribute: msu0_sh[*]**

**Fullname:** MSU Shelf Metallic Access Information

**Attribute Description** One attribute exists for each shelf in the MSU service group. The attribute's value is DBYES if the shelf has metallic access and DBNO otherwise.

**Attribute: next0_mod**

**Fullname:** SM Number of the Next Populated Co-tuple

**Attribute Description** This is the SM number of the next MSU service group in the MTIB span. The pair (next0_mod, nextmsu0_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of next0_mod is 0.

**Attribute: nextmsu0_sg**

**Fullname:** Service group ID of the next populated co-tuple

**Attribute Description** This is the service group identifier (PICB + 1) of the next MSU service group in the MTIB span. The pair (next0_mod, nextmsu0_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of nextmsu0_sg is 0.

Copyright © 1999 Lucent Technologies 

**Attribute: prev0_mod**

**Fullname:** SM number of the previous populated co-tuple.

**Attribute Description** This is the SM number of the previous MSU service group in the MTIB span. The pair (prev0_mod, prevmsu0_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prev0_mod is 0.

**Attribute: prevmsu0_sg**

**Fullname:** Service group ID of the previous populated co-tuple.

**Attribute Description** This is the service group identifier (PICB + 1) of the previous MSU service group in the MTIB span. The pair (prev0_mod, prevmsu0_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prevmsu0_sg is 0.

**Attribute: msu1_sgid**

**Fullname:** MSU Service Group Number

**Attribute Description** This is the service group identifier (PICB + 1) of an MSU that has metallic access. It is the key of the co-tuple containing the following attributes: msu1_sgid, msu1_sh(0:3), next1_mod, nextmsu1_sg, prev1_mod, prevmsu1_sg. This co-tuple always maps to service group 0 of MSU 0.

**Attribute: msu1_sh[*]**

**Fullname:** MSU Shelf Metallic Access Information

**Attribute Description** One attribute exists for each shelf in the MSU service group. The attribute's value is DBYES if the shelf has metallic access and DBNO otherwise.

**Attribute: next1_mod**

**Fullname:** SM number of the next populated co-tuple.

**Attribute Description** This is the SM number of the next MSU service group in the MTIB span. The pair (next1_mod, nextmsu1_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of next1_mod is 0.

**Attribute: nextmsu1_sg**

**Fullname:** Service group ID of the next populated co-tuple.

**Attribute Description** This is the service group identifier (PICB + 1) of the next MSU service group in the MTIB span. The pair (next1_mod, nextmsu1_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of nextmsu1_sg is 0.

**Attribute: prev1_mod**

**Fullname:** SM number of the previous populated co-tuple.

**Attribute Description** This is the SM number of the previous MSU service group in the MTIB span. The pair (prev1_mod, prevmsu1_sg) can be thought of as a 'previous' link in the list of MSU

Copyright © 1999 Lucent Technologies 

service groups. If this is the first service group in the MTIB span, the value of prev1_mod is 0.

**Attribute: prevmsu1_sg**

**Fullname:** Service group ID of the previous populated co-tuple.

**Attribute Description** This is the service group identifier (PICB + 1) of the previous MSU service group in the MTIB span. The pair (prev1_mod, prevmsu1_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prevmsu1_sg is 0.

**Attribute: msu2_sgid**

**Fullname:** MSU Service Group Number

**Attribute Description** This is the service group identifier (PICB + 1) of an MSU that has metallic access. It is the key of the co-tuple containing the following attributes: msu2_sgid, msu2_sh(0:3), next2_mod, nextmsu2_sg, prev2_mod, prevmsu2_sg. This co-tuple always maps to service group 1 of MSU 1.

**Attribute: msu2_sh[*]**

**Fullname:** MSU shelf metallic access information.

**Attribute Description** One attribute exists for each shelf in the MSU service group. The attribute's value is DBYES if the shelf has metallic access and DBNO otherwise.

**Attribute: next2_mod**

**Fullname:** SM number of the next populated co-tuple.

**Attribute Description** This is the SM number of the next MSU service group in the MTIB span. The pair (next2_mod, nextmsu2_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of next2_mod is 0.

**Attribute: nextmsu2_sg**

**Fullname:** Service group ID of the next populated co-tuple.

**Attribute Description** This is the service group identifier (PICB + 1) of the next MSU service group in the MTIB span. The pair (next2_mod, nextmsu2_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of nextmsu2_sg is 0.

**Attribute: prev2_mod**

**Fullname:** SM number of the previous populated co-tuple.

**Attribute Description** This is the SM number of the previous MSU service group in the MTIB span. The pair (prev2_mod, prevmsu2_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prev2_mod is 0.

**Attribute: prevmsu2_sg**

**Fullname:** Service group ID of the previous populated co-tuple.

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the service group identifier (PICB + 1) of the previous MSU service group in the MTIB span. The pair (prev2_mod, prevmsu2_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prevmsu2_sg is 0.

**Attribute: msu3_sgid**

**Fullname:** MSU Service Group Number

**Attribute Description** This is the service group identifier (PICB + 1) of an MSU that has metallic access. It is the key of the co-tuple containing the following attributes: msu3_sgid, msu3_sh(0:3), next3_mod, nextmsu3_sg, prev3_mod, prevmsu3_sg. This co-tuple always maps to service group 0 of MSU 1.

**Attribute: msu3_sh[*]**

**Fullname:** MSU shelf metallic access information.

**Attribute Description** One attribute exists for each shelf in the MSU service group. The attribute's value is DBYES if the shelf has metallic access and DBNO otherwise.

**Attribute: next3_mod**

**Fullname:** SM number of the next populated co-tuple.

**Attribute Description** This is the SM number of the next MSU service group in the MTIB span. The pair (next3_mod, nextmsu3_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of next3_mod is 0.

**Attribute: nextmsu3_sg**

**Fullname:** Service group ID of the next populated co-tuple.

**Attribute Description** This is the service group identifier (PICB + 1) of the next MSU service group in the MTIB span. The pair (next3_mod, nextmsu3_sg) can be thought of as a 'next' link in the list of MSU service groups. If this is the last service group in the MTIB span, the value of nextmsu3_sg is 0.

**Attribute: prev3_mod**

**Fullname:** SM number of the previous populated co-tuple.

**Attribute Description** This is the SM number of the previous MSU service group in the MTIB span. The pair (prev3_mod, prevmsu3_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prev3_mod is 0.

**Attribute: prevmsu3_sg**

**Fullname:** Service group ID of the previous populated co-tuple.

**Attribute Description** This is the service group identifier (PICB + 1) of the previous MSU service group in the MTIB span. The pair (prev3_mod, prevmsu3_sg) can be thought of as a 'previous' link in the list of MSU service groups. If this is the first service group in the MTIB span, the value of prevmsu3_sg is 0.

## 4. Population Rules for RLmwcf

**Copyright © 1999 Lucent Technologies** 

**Relation Description** Multiway constructed feature.

The following is a list of valid service classes for ports assigned this feature:

| LINES | TRUNKS |
|---|---|
| FC_INDVDL | FC_PFLASH |
| FC_PBX | FC_PFITT |
| FC_ATTENDANT | FC_PF |
| FC_SATSTLN | |
| FC_4WIRE_INDV | |
| FC_ISDN | |
| FC_ISATND | |

**Attribute: feat_id**

**Fullname:** feature id.

**Attribute Description** Multiway constructed feature id.

The RLtrmfeats tuple must have an attribute such that (mftype of MFMWY + RLmwcf.feat_id = RLtrmfeats.ftent[n].fid. See the following NOTE. NOTE: MFMWY is defined in db/DMmftype.G. Adding mftype to feat_id before reading RLtrmfeats is necessary because the feat_id in this relation is the unique 10 bits of the FID, it does not include the mftype. Whereas, RLtrmfeats stores the entire FID (mftype + 10 unique bits).

Verify that RLfacname has a tuple such that feat_id = RLfacname.facid, and RLfacname.class = FACBRCS and RLfacname.subclass = SCL_FEAT for that tuple.

```
NOTE: One of the following Entry Point options:
      (For non-ISDN epflash, epin_mid, epoff_hk, epfr_cw, epfr_pu)
      (For ISDN epis_button, epis_dialcd, epis_fr_pu)
      (For ISDN Attendant episa_dialcd)
      must be chosen (that is, equal to DBYES).
      Note that for ISDN Attendant (that is, servclass of FC_ISATND)
      call processing fl_bfr_ans is not being used. The fl_bfr_ans
      attribute is being set with the  default value of DBYES for servcla
ss
      of FC_ISATND.
      if RLfc_porttyp.servclass = FC_ISDN then
         RLmwcf.epflash = DBNO
         RLmwcf.epin_mid = DBNO
         RLmwcf.epoff_hk = DBNO
         RLmwcf.epfr_cw = DBNO
         RLmwcf.epfr_pu = DBNO
      if RLfc_porttyp.servclass = FC_ISATND then
         RLmwcf.epflash = DBNO
         RLmwcf.epin_mid = DBNO
         RLmwcf.epoff_hk = DBNO
         RLmwcf.epfr_cw = DBNO
         RLmwcf.epfr_pu = DBNO
         RLmwcf.epis_button = DBNO
         RLmwcf.epis_dialcd = DBNO
         RLmwcf.epis_fr_pu = DBNO
```

**Attribute: epflash**

Copyright © 1999 Lucent Technologies 

**Fullname:** Entry point from flash.

**Attribute Description**

```
Entry to multiway calling from flash.
If RLmwcf.epflash = DBYES  then
        RLmwcf.epin_mid = DBNO
        RLmwcf.epoff_hk = DBNO
        RLmwcf.epfr_cw = DBNO
        RLmwcf.epfr_pu = DBNO.
if epflash=DBYES, actvn=ACTNONE and dctvn=DCTNONE for a multiway feature
on
        a terminal then no other multiway feature with epflash=DBYES may
be
        assigned to that terminal.
if epflash=DBYES and dctvn=DCTCD for a multiway feature on a terminal the
n
        no other multiway feature with dctvn=DCTCD or dctvn=DCTAUTO may b
e
        assigned to that terminal.
```

**Attribute: epin_mid**

**Fullname:** entry point by code

**Attribute Description**

```
Entry to multiway calling by dialed code (start
in the middle of Multiway).
If RLmwcf.epin_mid = DBYES  then
        RLmwcf.ept.fr_cw = DBNO
        RLmwcf.epfr_pu = DBNO
        RLmwcf.cntrl cannot = DIR_CONN, CODE_3WAY
```

**Attribute: epoff_hk**

**Fullname:** Entry point by code start off hook

**Attribute Description** Entry to multiway calling by dialed code (start off hook).

```
If RLmwcf.epoff_hk = DBYES  then
        RLmwcf.epfr_cw = DBNO
        RLmwcf.epfr_pu = DBNO
        RLmwcf.cntrl cannot = DIR_CONN, CODE_3WAY
```

**Attribute: epfr_cw**

**Fullname:** Entry point from call waiting

**Attribute Description** Entry to multiway calling from call waiting.

**Attribute: epfr_pu**

**Fullname:** Entry point from call pick up

**Attribute Description** Entry to multiway calling from Call Pick Up

Copyright © 1999 Lucent Technologies 

***NOTE:*** Recent Change is not enforcing the checks on RLis_term and RLis_line because Recent Change can not force the order in which views are accessed. These checks would require that the terminal assignment view had been accessed prior to accessing this view. However, ISDN Multiway will only work on a CPE which has at least 2 Call Appearances.

**Attribute: epis_button**

**Fullname:** Entry point for ISDN by functional button (CONF or TRAN)

**Attribute Description** Entry to ISDN multiway calling from ISDN functional button, CONF or TRAN.

```

# MWCFDFL

## 1. Description

This relation contains the multiway constructed feature and defaults. This is used in IM.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1024 |
| expected number of tuples | 59 |
| density | 90 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population rules for RLmwcfdfl

### Relation Description

Multiway (MW) constructed feature

This relation is for multiway constructed features in modular feature customization (MFC) capability. The relation defines options and the default parameters for the MW features. There is another relation RLmwcf that

contains only the options. These two relations are interdependent in the sense that whenever an MW feature is constructed, the options in these two relations are populated with exactly the same values. In other words, if a tuple is found with a given feature ID in RLmwcfdl, In other words, if a tuple is found with a given feature id in RLmwcfdfl, there must be a tuple in RLmwcf with the same feature ID, and consequently, all attributes related to the options must be the same.

The inter-relationship between RLmwcf and RLmwcfdfl has been described in the description section. The checks for the option attributes have been described in populations rules language (PRL) for RLmwcf. The check for RLmwcfdfl.feat_id attribute will ensure that these relations are correctly populated by office data administration (ODA).

**Attribute:**
feat_id
**Fullname:**
Feature identifier
**Attribute Description:**
This identifies which business and residential customer service (BRCS) modular feature is identified via this data. A BRCS feature consists of modular feature type defined in db/DMmfttype.G (top six bits, 10 through 15) and a unique identifier (bottom ten bits, 0 through 9). The 'mftype', an enumeration, is MFMWY for multiway feature.

**Attribute:**
epflash
**Fullname:**
Entry from flash
**Attribute Description:**
Entry to multiway calling from flash.

**Attribute:**
epin_mid
**Fullname:**
Entry in the middle
**Attribute Description:**
Entry to multiway calling by dialed code (start in the middle of multiway).

**Attribute:**
epoff_hk
**Fullname:**
Entry at off hook
**Attribute Description:**
Entry to multiway calling by dialed code (start off hook).

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
epfr_cw
**Fullname:**
Entry from call waiting
**Attribute Description:**
Entry to multiway calling from call waiting.

**Attribute:**
epfr_pu
**Fullname:**
Entry from call pickup
**Attribute Description:**
Entry to multiway from call pick up.

**Attribute:**
epis_button
**Fullname:**
Entry from integrated services digital network (ISDN) functional button
**Attribute Description:**
Entry to ISDN multiway calling from ISDN functional button (conference [CONF] or transfer [TRAN]).

**Attribute:**
epis_dialcd
**Fullname:**
Entry to ISDN by dialed code
**Attribute Description:**
Entry to ISDN multiway calling by dialed code or feature button.

**Attribute:**
epis_fr_pu
**Fullname:**
Entry to ISDN from call pick up
**Attribute Description:**
Entry to ISDN multiway calling from call pick up.

**Attribute:**
episa_dialcd
**Fullname:**
Entry to ISDN attendant (ISAT) by dialed code
**Attribute Description:**
Entry to ISAT multiway by dialed code feature button.

**Attribute:**
cntrl

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Control
**Attribute Description:**
Indicates which call processing function will be performed by the feature.

**Attribute:**
fl_bfr_ans
**Fullname:**
Flash before answer
**Attribute Description:**
Determines whether a customer flash will be recognized by the switching system before answer.

**Attribute:**
xfer
**Fullname:**
Transfer
**Attribute Description:**
Indicates how the controlling terminal's on hook will effect each of the multiway calling modular (MWC) control component options.

**Attribute:**
pty_dep_tn
**Fullname:**
Party departure tone
**Attribute Description:**
Determines if (and which) special tone is given if a held or non-controlling terminal disconnects.

**Attribute:**
splt_last_pty
**Fullname:**
Split last party
**Attribute Description:**
Allows the controlling terminal to flash any time after forming the initial N-way call with no terminals held and dial a split last party code to remove the last terminal added to the conference.

**Attribute:**
sigc_3way
**Fullname:**
Signal controller for three-way connection
**Attribute Description:**
Signal controller open interval is sent on a three-way connection.

**Attribute:**

Copyright © 1999 Lucent Technologies 

ps_pd

**Fullname:**

Permanent signal (PS)/partial dial (PD) timing

**Attribute Description:**

Signal controller open interval is sent on a hold connection.

**Attribute:**

sigc_hold

**Fullname:**

Signal controller - hold connection

**Attribute Description:**

Signal controller open interval is sent on a hold connection.

**Attribute:**

three_way_ind

**Fullname:**

Three-way indicator

**Attribute Description:**

Determines if an indication is given to the non-controlling parties when entering three-way speech.

**Attribute:**

actvn

**Fullname:**

Activation

**Attribute Description:**

Specifies the types of activation allowed for this feature.

**Attribute:**

dctvn

**Fullname:**

Deactivation

**Attribute Description:**

Specifies the types of deactivation allowed for this feature.

**Attribute:**

ot_hldfl

**Fullname:**

Hold originating/terminating filtering

**Attribute Description:**

Hold original party terminal group filtering.

**Attribute:**

oh_tg_fl

**Fullname:**

Hold original party terminal group filtering

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Hold original party terminal group filtering.

**Attribute:**
oh_interfl

Bill usage frequency charge for use of event 4
**Attribute Description:**
Bill usage frequency charge for use of event 4.

**Attribute:**
bill_actchrg
**Fullname:**
Bill usage charge for activation
**Attribute Description:**
Bill usage charge for activation.

**Attribute:**
bill_dactchrg
**Fullname:**
Bill usage charge for deactivation
**Attribute Description:**
Bill usage charge for deactivation.

**Attribute:**
bill_duration
**Fullname:**
Bill usage charge for duration of use
**Attribute Description:**
Bill usage charge for duration of use.

**Attribute:**
bill_change
**Fullname:**
Bill usage charge for change of parameter
**Attribute Description:**
Bill usage charge for change of parameter.

**Attribute:**
n_way
**Fullname:**
Number of terminal in multiway
**Attribute Description:**
Indicates maximum number of terminals that may be involved in an N-way call.

**Attribute:**
px_attfl
**Fullname:**
Transfer parties present attendant filtering

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Transfer parties present attendant filtering.

**Attribute:**
nw_tg_fl
**Fullname:**
N-way terminal group filtering
**Attribute Description:**
N-way terminal group filtering.

**Attribute:**
nw_interfl
**Fullname:**
N-way transfer parties present inter-office filtering
**Attribute Description:**
N-way transfer parties present inter-office filtering.

**Attribute:**
nw_intrafl
**Fullname:**
N-way transfer parties present intra-office filtering
**Attribute Description:**
N-way transfer parties present intra-office filtering.

**Attribute:**
tone_durn
**Fullname:**
Tone duration
**Attribute Description:**
Indicates party departure tone duration in milliseconds.

**Attribute:**
nw_pf_fl
**Fullname:**
N-way transfer parties present private facilities filtering
**Attribute Description:**
N-way transfer parties present private facilities filtering.

**Attribute:**
nw_attfl
**Fullname:**

dir_conn_dn

**Fullname:**

Direct connect directory number (DN)

**Attribute Description:**

Indicates direct connect prestored extended digit string.

Range of values: 15 digits.
Default value: No default or NULL.

If dir_conn_dn.digcnt is greater than zero then RLmwcfdfl.cntrl is equal to DIR_CONN.

**Attribute:**

dir_conn_dn.digcnt

**Fullname:**

Direct connect digit count

**Attribute Description:**

Indicates the number of prestores digit count.

**Attribute:**

dir_conn_dn.dn

**Fullname:**

Direct connect directory number

**Attribute Description:**

Direct connect directory number.

## 4. Population rules for RLmwport

**Relation Description**

Multiway calling port.

multiway feature parameters assigned to a BRCS User (a User is defined to be an analog terminal, a trunk, or an ISDN User).

"The following is a list of valid service classes for ports assigned this feature:

| LINES | TRUNKS |
|---|---|
| FC_INDVDL | FC_PFLASH |
| FC_PBX | FC_PFITT |
| FC_ATTENDANT | FC_PF |
| FC_ISDN | |
| FC_ISATND | |
| FC_SATSTLN | |
| FC_4WIRE_INDV | |

NOTE: This special dependency is enforced to save SM ODD memory. A tuple should exist in this relation only when in the constructed feature relation (RLmwcfdfl), keyed by this feat_id, has:
RLmwcfdfl.cntrl = DIR_CONN or
RLmwcfdfl.cntrl = N_WAY or
RLmwcfdfl.pty_dep_tn = TNBEEP1."

**Attribute:**

lport

**Fullname:**

logical port.

**Attribute Description:**

Logical port type of the user being assigned the BRCS features.

Copyright © 1999 Lucent Technologies 

**Attribute:**
lpt_type
**Fullname:**
logical port type.
**Attribute Description:**
Logical port type of the user.

**Attribute:**
feat_id
**Fullname:**
multiway constructed feature id.
**Attribute Description:**
Multiway constructed feature id.

**Attribute:**
dir_conn_dn
**Fullname:**
direct connect prestored extended-digits string.
**Attribute Description:**
direct connect prestored extended-digits string.
Range of Values: 15 digits
Default Value: No default or NULL.
Dependencies:
If dir_conn_dn.digcnt > 0 then RLmwcf.cntrl = DIR_CONN.

**Attribute:**
dir_conn_dn.digcnt
**Fullname:**
digit count.
**Attribute Description:**
digit count.

**Attribute:**
dir_conn_dn.dn
**Fullname:**
directory number.
**Attribute Description:**
directory number.

**Attribute:**
n_way
**Fullname:**
maximum terminals in a n_way call.
**Attribute Description:**
Maximum number of terminals that may be involved in
an N-way call.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
tone_durn
**Fullname:**
tone duration.
**Attribute Description:**
party departure tone duration Y milliseconds.

## 4. Population Rules for RLna7clsls

**Relation Description**
NA7 Combined Link Set Component Relation

This relation provides the information for the North American CCS7 (NA7) combined link set (CLS). For every NA7 CLS, it provides the link set1, link set2, and the associated CLS index.

**Attribute: cls**

**Fullname:** Combined Link Set.

**Attribute Description** This attribute defines the combine link set.

**Attribute: ls1**

**Fullname:** First Component Link Set.

**Attribute Description** This attribute defines the first component link set of the combined link set.

**Attribute: ls2**

Copyright © 1999 Lucent Technologies

**Fullname:** Second Component Link Set.

**Attribute Description** This attribute is the second component link set of the combined link set.

**Attribute: clsindx**

**Fullname:** Combined Link Set Index.

**Attribute Description** The combined link set index is obtained from the next available combined link set index in the RLindx relation. Read the RLindx relation with the CCNACLSIDX key. Increment the max_idx attribute by one, and assign the value to the clsindx. Finally update the RLindx tuple. This attribute is defined by the data population process.

# NA7CLUST

## 1. Description

This relation contains the North American CCS7 (NA7) cluster data. The purpose of this relation is to identify which members of cluster are populated. Each tuple contains one bit per member of the network/cluster.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 255 |
| expected number of tuples | 1 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCtrigfail |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| padding indicator | unpadded |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population rules for RLna7clust

### Relation Description

This relation contains NA7 cluster data for the STPI
This relation contains NA7 cluster data for the STPI. The purpose of this relation is to identify which members of cluster are populated. Each tuple contains one bit per member of the network/cluster.

**Attribute:**
network
**Fullname:**
Specifies the carrier.
**Attribute Description:**
This attributes specifies the network type for the cluster management. It is defined by the switch administration.

**Attribute:**
cluster
**Fullname:**
A subset of network
**Attribute Description:**
This attributes defines the cluster of DPCs within a network. This is defined by the switch administration.

**Attribute:**
clust_ind
**Fullname:**
Cluster Index
**Attribute Description:**
The cluster index is defined by the data population process

Copyright © 1999 Lucent Technologies 

**Attribute:**
mbr_map1
**Fullname:**
The Destination Point Code Indexes (0-31) served by this cluster.
**Attribute Description:**
This bit field defines the DPCs served by this cluster. Each bit of this attribute represents a DPC index (0-31).
If the link set is not serving any DPCs, populate with the default value. When set to the default value of 1 (bit 0 set), this attribute represents DPC index 0 which is invalid. This condition is used only to indicate that the cluster has not yet been assigned to any DPC index.
This is defined by the data population process.
The format of the bit field follows (bit 0 is the low order bit):

```
|-31-30-29-28- ..... -4--3--2--1--0-| bits
|-----------------------------------|
| D  D  D  D          D  D  D  D  D |
| P  P  P  P  ....... P  P  P  P  P |
| C  C  C  C          C  C  C  C  C | mbr_map1
| I  I  I  I  ....... I  I  I  I  I |
| 31 30 29 28 ....... 4  3  2  1  0 |
|-----------------------------------|
```

**Attribute:**
mbr_map2
**Fullname:**
The Destination Point Code Indexes (32-63) served by this cluster
**Attribute Description:**
This bit field defines the DPCs (32-63) served by this cluster.
Each bit of this attribute represents a DPC index.
The format of the bit field follows (bit 0 is the low order bit):

```
|-31 -30- 29- 28-.... -4 - 3 - 2 - 1 - 0-| bits
|----------------------------------------|
| D   D   D   D .......D   D   D   D   D |

|----------------------------------------|
```

**Attribute:**
lsmap1
**Fullname:**
The link set numbers (0-31) serving this cluster
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This bit field defines the LSs serving this cluster.
Each bit of this attribute represents a LS number (0-31).
If no link set is serving this cluster, then populate with
the default value. When set to the default value of 1 (bit
0 set), this attribute represents LS number 0 which is
invalid. This condition is used only to indicate that no
link set is serving this cluster.

This is defined by the data population process.

The format of the bit field follows (bit 0 is the low order bit):

```
|-31-30-29-28- ..... -4--3--2--1--0-| bits
|-----------------------------------|
| L  L  L  L          L  L  L  L  L |

## 4. Population Rules for RLnaapcinf

**Relation Description**
North American CCS7 (NACCS7) adjacent point code information.

This relation provides detailed information about a NACCS7 adjacent point code and assigned signaling link codes.

**Attribute: apcindx**

**Fullname:** Adjacent point code (APC) index.

**Attribute Description** This attribute is the index assigned to the APC in RLnapc_inf. It is defined by the data population process.

**Attribute: slc**

**Fullname:** Signaling link code.

**Attribute Description** This attribute is the signaling link code *(SLC®)* that identifies a link to the APC. It is defined by switch administration.

Copyright © 1999 Lucent Technologies

**Attribute: lnkindx**

**Fullname:** Link index

**Attribute Description** This attribute is the link index assigned to this signaling link. If the *SLC*® does not define a link serving the APC, populate with the default value. The link index is obtained from the next value in the CCNALNKIDX tuple of the RLindx relation. In other words, obtain the max_idx attribute of the CCNALNKIDX tuple of the RLindx relation. Increment max_idx by one and assign that value to lnkindx. Then update the CCNALNKIDX tuple.

**Attribute: lsnum**

**Fullname:** Link Set number.

**Attribute Description** The link set number containing the link which is assigned this *SLC*®. It is defined by switch administration. If the *SLC*® does not define a signaling link, populate with the default value.

**Attribute: member**

**Fullname:** Link Set member number.

**Attribute Description** The member number assigned to the signaling link associated with the *SLC*®. This is defined by switch administration. If the *SLC*® does not define a signaling link, populate with the default value.

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLnailup

### Relation Description

List of nailed-up ports
Basic nail-up provides the ability to establish a permanent connection between two ports. Connections between the following types of ports are supported:

DEN - Digital Equipment Number,
ILEN - IDCU Line Equipment Number,
NEN - Networking Equipment Number,
INEN - IDLC Network Equipment Number,
SLEN - SLC(R) Equipment Number,
TEN - Trunk Equipment Number

Any of the above port types can be connected in basic nail-up. This also includes ports on RSMs.
SLEN (SLC(R) Equipment Number) nail-up connections are also supported for DCLU. This ability was added by SLC(R) Nail-up (g138) in 5E4(2). Besides DCLU lines, any type of trunk and those lines that terminate on a D-bank coming into DLTU are supported. Each nail-up port must have a corresponding tuple in FC_PORTTYP an if it is a trunk then in FC_TRUNK also.

ILEN (IDCU Line Equipment Numbers which are represented on the RC and ODA forms as the M and G EN types) nail-up and hair-pin connections are supported for IDCU. Hair-pin connections are a subset of nail-ups in which both ends of the connection are on the same IDCU and in which no TSI resources are used in making the connection.

Digital Data Service (DDS) single path nailups and dual path hairpins are supported. Dual Path DDS has many restrictions:

1) only supported on IDCU as a hair-pin
2) for TR008 RTs and PUB43801 facilities, the two Office Equipment (OE) identifiers associated with one end of the hair-pin must be sequential, for TR303 RTs, only one OE is associated with the TR303 RT end of the hair-pin
3) for TR008 RTs, the two OEs must be on the same channel unit, which means that the OE which is represented as the port1 attribute must be ODD and the OE which is represented as the port3_member attribute must be EVEN (NOTE, OE as in ILEN not internal port name !!!)
4) the two paths must be on the same DS1, this is due to

Copyright © 1999 Lucent Technologies 

hardware restrictions of the IDCU TSI
5) the path 1 timeslot must be a lower then the path 2 timeslot
6) the path 1 timeslot and the path 2 timeslot must both be less than or equal to 18 to ensure frame integrity in the IDCU hair-pin TSI
7) for TR008 Mode I RTs, the OE which is represented as the port1 attribute must NOT be 11, 21, 23, 35, 45, 47, 59, 69, 71, 83, 93, 95

INEN (IDLC Network Equipment Numbers which are represented on the RC and ODA forms as the A type) nail-up connections are supported for DNU-S.
Regular single path nailup, Single path DDS nailup, and dual path DDS nailup are supported. Dual Path DDS restrictions:

1) The two paths must be on the same DS1.
2) The path 1 timeslot must be a lower than the path 2 timeslot

**Attribute:**
port1
**Fullname:**
Port being nailed-up on this SM.
**Attribute Description:**
Identifies nailed-up port on this SM.

**Attribute:**
port2_member
**Fullname:**
Far end nailed-up port with port1.
**Attribute Description:**
Identifies far end (port2_member) nailed-up port with port1.

**Attribute:**
port2_sm
**Fullname:**
Switching module associated with far end nailed-up port (port2_member).
**Attribute Description:**
Identifies the switching module on which port2_member resides.

**Attribute:**
nuloss
**Fullname:**
Loss in dB for nailed-up port1.
**Attribute Description:**
Attenuation value associated with port1's outgoing side from TSI (from network side to peripheral side). Since each nail-up is custom designed by the customer service engineer, there is no 'normal' value.

**Copyright © 1999 Lucent Technologies** 

Loss is an optional value.

**Attribute:**
sigmode
**Fullname:**
Signaling modes.
**Attribute Description:**
Tells the switch if any signaling (robbed-bit) is to be passed through the switch or not. If yes then the value of this attribute specifies how much signaling to pass through the connection.

**Attribute:**
control
**Fullname:**
Controlling port.
**Attribute Description:**
Whichever port has a control is set to DBYES. Note that control is exclusive: one tuple must have control set to DBYES while its mate tuple has it set to DBNO.

**Attribute:**
tc_initsig
**Fullname:**
Type of signaling bit pattern for the first 2.5 seconds of the carrier failure.
**Attribute Description:**
This attribute contains the conditioning bit pattern required by the other end of the nailup. The conditioning bit patterns associated with RLnailup.port1 are stored in the RLnailup tuple keyed by portname stored in port2_member.

The initial conditioning is applied to nailup circuits during the initial 2.5 seconds of carrier failure. If the sigmode attribute is set to SMINHSIG, then this circuit conditioning does not occur.

For any port2_member which is a Trunk Unit Port (or TEN), this attribute must be set to SIG00.

**Attribute:**
tc_finisig
**Fullname:**
Signaling bits applied after 2.5 seconds of the carrier failure until the failure conditions ceases.
**Attribute Description:**
This attribute contains the conditioning bit pattern required by the other end of the nailup. The conditioning bit patterns associated with RLnailup.port1 are stored in the RLnailup tuple keyed by portname stored in port2_member.

Copyright © 1999 Lucent Technologies 

The final conditioning is applied to nailup circuits after the first 2.5 seconds of carrier failure has elapsed until the carrier failure quits. If the sigmode attribute is set to SMINHSIG, then this circuit conditioning does not occur. For any port2_member which is a Trunk Unit Port (or TEN), this attribute must be set to SIG11.

**Attribute:**
trwrd
**Fullname:**
Trouble word.
**Attribute Description:**
This attribute contains the trouble word pattern required by the other end of the nailup. The trouble word pattern associated with RLnailup.port1 is stored in the RLnailup tuple keyed by portname stored in port2_member.

When a circuit involved in a nail-up connection fails, this attribute specifies the trouble word to be sent during carrier failure. The trouble word is sent over a T1 channel, along with the signaling defined in attributes tc_initsig and tc_finisig. If the port2_member of this nail-up tuple contains a Trunk Unit Port ( or TEN), this field must contain TMUAC.

**Attribute:**
dds1
**Fullname:**
Digital Data Service, first path
**Attribute Description:**
This attribute specifies that the nailed-up or hair-pinned connection is a Digital Data Service type connection. If the port is a DDS port, then the signaling mode must be set to SMINHSIG.

If the DDS port is on a TR303 RT, then the lp_type must be PC303NAIL.

**Attribute:**
dds2
**Fullname:**
Digital Data Service, second path
**Attribute Description:**
This attribute specifies that this hairpin connection is Digital Data Service and consists of two paths.

Note that Dual Path Digital Data Service is only allowed for hairpin.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
zcs_on
**Fullname:**
Zero Code Suppression allowed on nailuped or hairpinned connection.
**Attribute Description:**
The zcs-on attribute is used for indicating the zero code suppression is to be enabled or disabled on the timeslots indicated by the path1_ds0 and path2_ds0 (if valid) attributes. This is only valid for signaling types of SMINHSIG. On a DS1 that does not use the ZCS format, this attribute is ignored. DBYES means Zero Code Suppression is allowed on the paths associated with this nailup/hairpin.

DBNO means Zero Code Suppression is disabled on the paths associated with this nailup/hairpin.

NOTE: ZCS can only be disabled on IDCU hardware. It is not allowed to be set to DBNO on other hardware types.

**Attribute:**
hairpin
**Fullname:**
Hairpinned instead of nailed up path(s)
**Attribute Description:**
If the data path(s) is to be looped around in the Time Slot Interchanger of the IDCU (instead of the SM TSI for nailups), the hairpin attribute is set to DBYES. For connection which go through the SM TSI, this attribute is set to DBNO.

**Attribute:**
path1_ds0
**Fullname:**
IDCU or TR303-DNU Facility and DS0 carrying path 1 of nailup/IDCU hairpin
**Attribute Description:**
This attribute gives the internal circuit name of the IDCU or TR303-DNU facility and the DS0 on that facility which is carrying path1 of this nailup or IDCU hairpin (for this end).

**Attribute:**
path1_ds0.ds1name
**Fullname:**
IDCU or TR303-DNU Facility Internal Circuit name
**Attribute Description:**
IDCU or TR303-DNU Facility which connects IDCU or TR303-DNU to RT containing port1_member and port3_member (assuming it is non-zero).

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
path1_ds0.ds1_ts
**Fullname:**
DS0 Number on IDCU or TR303-DNU Facility
**Attribute Description:**
This is the DS0 number on the IDCU or TR303-DNU facility which is carrying the nailup or IDCU hairpin connection between the IDCU or TR303-DNU and the RT on which port1_member resides.

**Attribute:**
path2_ds0
**Fullname:**
IDCU or TR303-DNU Facility and DS0 carrying path 1 of nailup/IDCU hairpin
**Attribute Description:**
This attribute gives the internal circuit name of the IDCU or TR303-DNU facility and the DS0 on that facility which is carrying path2 of this nailup or IDCU hairpin (for this end).

**Attribute:**
path2_ds0.ds1name
**Fullname:**
IDCU or TR303-DNU Facility Internal Circuit name
**Attribute Description:**
IDCU or TR303-DNU Facility which connects IDCU or TR303-DNU to RT containing port1_member and port3_member (assuming it is non-zero).

**Attribute:**
path2_ds0.ds1_ts
**Fullname:**
DS0 Number on IDCU or TR303-DNU Facility
**Attribute Description:**
This is the DS0 number on the IDCU or TR303-DNU facility which is carrying the nailup or IDCU hairpin connection between the IDCU or TR303-DNU and the RT on which port1_member or port3_member resides (assuming it is non-zero).

**Attribute:**
port3_member
**Fullname:**
Second port on this end for Dual Path Digital Data Service
**Attribute Description:**
This is the second port on this end of a Dual Path Digital Data Service (DDS) connection.
The port index for this port equals the port 1 index plus 1 and is only valid for Dual Path DDS terminating on TR8 RTs or on PUB43801 facilities.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
dscnum
**Fullname:**
Dedicated Switch Connection number.
**Attribute Description:**
The value of this attribute will be 0 for regular nailup or will have the DSC (Dedicated Switch Connection) number when the nailup is used as a dedicated switch connection associated with Autoplex(R).

**Defines:**
"db/DMport.h"

## 4. Population Rules for RLnalkp_ls

**Relation Description**
North American CCS7 (NACCS7) Link Information

This relation consists of information on a particular NACCS7 signaling link.

**Attribute: dltnum**

**Fullname:** Data Link Terminal (DLT) number

Copyright © 1999 Lucent Technologies

**Attribute Description** The DLT number is the Signaling Terminating port name assigned to this link.

**Attribute: lsnum**

**Fullname:** Link set number.

**Attribute Description** The number of the link set that the link belongs to. This is defined by switch administration.

**Attribute: member**

**Fullname:** Link set member number

**Attribute Description** The member number assigned to this link. This is defined by switch administration.

**Attribute: slc**

**Fullname:** Signaling link code

**Attribute Description** The Signaling Link Code (SLC) assigned to this link. The SLC uniquely identifies a signaling link between two offices. The two end offices must assign the same SLC to any one signaling link. This is defined by switch administration.

**Attribute: norm_sls**

**Fullname:** Normal signaling link selection values

**Attribute Description** A mask of 32 bits that indicates the Signaling Link Selection codes assigned to this link for load sharing under normal conditions. This is defined by the data population process.

For each SLS code which is normally assigned to this link, the corresponding bit in norm_sls is set to 1. Therefore, if the link is assigned SLS codes of 0, 13, and 26, the 0, 13, and 26 bits are set to 1.

The value for norm_sls is obtained from the RLnalsh_sz relation using the following link's load sharing number and the following loadsharing size of the link set as keys.

The load sharing number of a link can be derived as follows: All priority 1 links in the link set are ordered from the smallest to the largest member, and each ordered link is assigned a consecutive number from 1 to X. This number equals the load sharing number of the link.

The load sharing size of a link set is equal to the number of priority 1 links in the link set. This number is stored in the RLnalsgrp relation in attribute llnks. Whenever a priority 1 link is added or deleted from a link set, the norm_sls attribute for all other links in the link set must be updated.

**Attribute: cls_sls**

**Fullname:** Combined link set signaling link selection values

**Attribute Description** A mask of 32 bits indicating the Signaling Link Selection codes assigned to this link, as part of a combined link set, for load sharing under normal conditions. If the link is a priority 2 or 3, or is not part of a combined link set (nalsgrp.clsindx = 0), populate with the default value. This is defined by the data population process.

For each SLS code which is normally assigned to this link (as part of a combined link set), the

Copyright © 1999 Lucent Technologies 

corresponding bit in cls_sls is set to 1. Therefore if the link is assigned SLS codes of 0, 12, and 24, the 0, 12, and 24 bits are set to 1.

The procedure to assign SLS values is as follows:

First determine which is link set1 and link set2 which make up this combined link set (see the RLnalsgrp static relation). The link set with the larger link set number is referred as LS1 and the other as LS2. Next determine all priority 1 links for each link set. Order these links from the smallest to the largest link member number within each link set. Then each ordered link is assigned a consecutive number from 1 to X. This number equals the loadsharing number of this link.

Assign even SLS values to the links in LS1 and odd SLS values to the links in LS2 sequentially in the order of their load sharing number.

Whenever a priority 1 link is added or deleted from a link set of a combined link set, the cls_sls attribute for all links in the link set must be updated.

**Attribute: priority**

**Fullname:** Priority

**Attribute Description** The signaling link's assigned priority.

| value | meaning |
|---|---|
| 1 | link should be active and loaded |
| 2 | link should be active but not loaded |
| 3 | link is standby and not active or loaded |

This is defined by switch administration.

## 4. Population Rules for RLnalsdpc

**Relation Description**
North American CCS7 (NACCS7) link set to affected Destination Point Code (DPC) index

Based on a given link set, the DPC indexes served by the link set and the DPC indexes served by the link set as

Copyright © 1999 Lucent Technologies 

part of a combined link set can be obtained. The DPC to DPC index mapping is performed by the RLnapcndx relation.

**Attribute: ls**

**Fullname:** Link Set number

**Attribute Description** This attribute defines the link set that serves the DPC. It is defined by switch administration.

**Attribute: dpci_srv**

**Fullname:** The destination Point Code indexes (0-31) served by this link set

**Attribute Description** This bit field defines the DPCs (0-31) served by the link set. The link set may serve the DPC as a normal link set or an alternate link set. Each bit of this attribute represents a DPC index. The DPC to DPC index mapping is performed by the RLnapcndx relation.

If the link set is not serving any DPCs, populate with the default value. When set to the default value of 1 (bit 0 set), this attribute represents DPC index 0 which is invalid. This condition is used only to indicate that the link set has not yet been assigned to any DPC index.

This is defined by the data population process.

The format of the bit field follows (bit 0 is the low order bit):

```
|-31-30-29-28- ..... -4--3--2--1--0-| bits
|-----------------------------------|
| D  D  D  D          D  D  D  D  D |
| P  P  P  P  ....... P  P  P  P  P |
| C  C  C  C          C  C  C  C  C | dpci_srv
| I  I  I  I  ....... I  I  I  I  I |
| 31 30 29 28 ....... 4  3  2  1  0 |
|-----------------------------------|
```

**Attribute: dpci1_srv**

**Fullname:** The Destination Point Code Indexes (32-63) served by this Link Set

**Attribute Description** This bit field defines the DPCs (32-63) served by this link set. The link set may serve the DPC (32-63) as a normal link set or an alternate link set. Each bit of this attribute represents a DPC index. The DPC to DPC index mapping is performed by the RLnapcndx relation.

The format of the bit field follows (bit 0 is the low order bit):

```
|-31 -30- 29- 28-.... -4 - 3 - 2 - 1 - 0-| bits
|----------------------------------------|
| D   D   D   D .......D   D   D   D   D |
| P   P   P   P .......P   P   P   P   P | dpci1_srv
| C   C   C   C .......C   C   C   C   C |
| I   I   I   I  ......I   I   I   I   I |
|63  62  61  60.......36  35   34  33  32|
|----------------------------------------|
```

**Attribute: dpci2_srv**

**Fullname:** The Destination point Code Indexes (64-95) served by this Link Set

Copyright © 1999 Lucent Technologies 

**Attribute Description** This bit field defines the DPCs (64-95)) served by this link set. The link set may serve the DPC (64-95) as a normal link set or an alternate link set. Each bit of this attribute represents a DPC index. The DPC to DPC index mapping is performed by the RLnapcndx relation.

The format of the bit field follows (bit 0 is the low order bit):

```
|-31 -30- 29- 28-.... -4 - 3 - 2 - 1 - 0-| bits
|----------------------------------------|

|----------------------------------------|
```

**Attribute: dpci4_cls**

**Fullname:** Destination Point Code Index (128-159) served by this Link Set as part of a Combined Link Set

**Attribute Description** This bit field defines the DPCs (128-159)) served by this link set as part of a combined link set. The combined link set may only serve the DPC (128-159) as a normal route. Each bit of this attribute represents a DPC index (128-159). The DPC to DPC index mapping is performed by the RLnapcndx relation.

The format of the bit field follows (bit 0 is the low order bit):

```
|-31 -30- 29- 28-.... -4 - 3 - 2 - 1 - 0-| bits
|----------------------------------------|
| D   D   D   D .......D   D   D   D   D |
| P   P   P   P .......P   P   P   P   P | dpci4_cls
| C   C   C   C .......C   C   C   C   C |
| I   I   I   I  ......I   I   I   I   I |
|159 158 157 156......132 131 130 129 128|
|----------------------------------------|
```

**Attribute: dpci5_cls**

**Fullname:** Destination point Code Index (160-191) srved by this Link Set as part of a Combined Link Set

**Attribute Description** This bit field defines the DPCs (160-191)) served by this link set as part of a combined link set. The combined link set may only serve the DPC (160-191) as a normal route. Each bit of this attribute represents a DPC index (160-191). The DPC to DPC index mapping is performed by the RLnapcndx relation.

## 4. Population rules for RLnalsgrp

### Relation Description

North American CCS7 (CCSNA7) link set information
This relation consists of information on a particular CCSNA7 link set: the number of links in each link set, the number of active links in each link set, the number of loaded links in each link set,inhibit protocol and information as to whether the link set is part of a combined link set.

**Attribute:**

lsnum

Copyright © 1999 Lucent Technologies

**Fullname:**
Link set number
**Attribute Description:**
The link set number is defined by switch administration.

**Attribute:**
apci
**Fullname:**
Adjacent Point Code index
**Attribute Description:**
The index associated with the APC to which this link set has a direct connection.

**Attribute:**
lsnum2
**Fullname:**
Link set number of the second link set in a combined link set
**Attribute Description:**
If this link set (the key value) is part of a combined link set, lsnum2 is the value of the other link set number. If this link set is not part of a combined link set, populate with the default value. This attribute is defined by switch administration.

**Attribute:**
nlnks
**Fullname:**
Number of physical links
**Attribute Description:**
This attribute is defined by the data population process based upon the number of physical signaling links defined by switch administration.

**Attribute:**
alnks
**Fullname:**
Number of active links
**Attribute Description:**
The number of normally active members (links) in this link set. This is the number of priority 1 and priority 2 links in the link set. This attribute is defined by data population process based upon the number of active signaling links defined by switch administration.

**Attribute:**
llnks
**Fullname:**
Number of load sharing links
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

The number of load sharing members (links) in this link set. This is the number of priority 1 links in the link set. This attribute is defined by the data population process based upon the number of priority 1 signaling links defined by switch administration.

**Attribute:**
clsindx
**Fullname:**
The combined link set index.
**Attribute Description:**
If this link set (the key value) is part of a combined link set, populate with the combined link set index. If this link set is not part of a combined link set, populate with the default value. It is defined by the data population process.

**Attribute:**
inh_protocol
**Fullname:**
Management Inhibition Protocol Specifier
**Attribute Description:**
This specifies Management Inhibition Protocol usage.

## 4. Population Rules for RLnalsh_sz

**Relation Description**
North American CCS7 (NACCS7) office loadsharing definition.

This relation defines the NACCS7 office load sharing applicable for link sets.

**Attribute: num_ldsh**

**Fullname:** Number of load sharing links within a link set or combined link set

**Attribute Description** The number of load sharing links in a link set is determined by the number of priority 1 links which have been assigned to the link set.

**Attribute: slslk0**

**Fullname:** Signaling Link Selection Link number

**Attribute Description** These attributes are selected by the Signaling Link Selection (SLS) (0-31) value. The contents of each array element is the logical load sharing link number (1-16). A logical load sharing link is a link in a link set or combined link set which has been assigned a priority of 1. Thus the first member of a link set with priority 1 is the logical load sharing link 1. The second member of a link set with priority 1 is logical load sharing link 2. And so on .....

The following diagrams show how to populate each attribute of a tuple. The value of a particular attribute is determined by using the tuples key (num_ldsh) and the attribute (slslk00 through slslk31) to read into the following diagram. It is defined by the data population process.

```
num_ldsh    ----------slslk00 through slslk15-----------
            0  1  2  3  4  5  6  7  8  9 10 11 12 13 14 15
            ------------------------------------------------
  1         1  1  1  1  1  1  1  1  1  1  1  1  1  1  1  1
```

## 4. Population Rules for RLnalslnk

**Relation Description**
North American CCS7 (NACCS7) link information.

This relation consists of information on a each link in a link set. Each link is referenced by a link set number and a member number.

**Attribute: lsnum**

**Fullname:** The link set number.

**Attribute Description** The number of the link set that the link belongs to. This is defined by switch administration.

Copyright © 1999 Lucent Technologies

**Attribute: member**

**Fullname:** Member number

**Attribute Description** The member number of the link in the link set. It is defined by switch administration.

**Attribute: st_dlt**

**Fullname:** Signaling terminal's data link terminating (DLT) number.

**Attribute Description** The DLT number assigned to the signaling terminal (ST) port of this link. This is defined by switch administration.

**Attribute: sdl_sm**

**Fullname:** The SM of the Signaling Data Link.

**Attribute Description** The SM where the Signaling Data Link is found. It is defined by switch administration.

**Attribute: sdl_port**

**Fullname:** Signaling Data Link local port number.

**Attribute Description** The Signaling Data Link port number for this signaling link. It is defined by switch administration.

**Attribute: unittyp**

**Fullname:** Hardware Unit type of the SDL port

**Attribute Description** This attribute defines the hardware unit type(analog or digital) of the SDL port.

**Attribute: unitnum**

**Fullname:** Hardware unit number.

**Attribute Description** This attribute defines the hardware unit number. If the unittyp is PCDIGITAL, then unum range is 0 thru 5 and if the unittyp is PCANALOG, then the unum range is 0 thru 7.

**Attribute: cktnum**

**Fullname:** DFI number or Service group number based on unit type.

**Attribute Description** This attribute defines the DFI number (1 thru 16) if the unittyp is PCDIGITAL, or the service group number (0 thru 1) if the unittyp is PCANALOG.

       ( 24 bytes )
```

## 4. Population Rules for RLname2id

**Relation Description**
Construction name to ID translation

This relation translates an 16-character ASCII name (known to the switch personnel) to a 16-bit internal name. There is a separate name space for each class of names, which is the other key.

Copyright © 1999 Lucent Technologies

There is a tuple in this relation for every tuple in RLid2name.

**Attribute: name**

**Fullname:** 16-character ASCII name

**Attribute Description** This is the externally known ASCII name. It can be from 1 to 16 characters long. If it is less than 16 characters long, the field is padded with binary zeros ('\0'). Names must be unique within a class. Names from different classes need not be uniq.

construction class

**Attribute: class**

**Fullname:** assignment and construction class

**Attribute Description** Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space.

**Attribute: subclass**

**Fullname:** assignment and construction subclass

**Attribute Description** Each class of names is divided into one or more subclasses. The subclasses of a given class all share the same name space, since subclass is not a key to RLname2id.

**Attribute: id**

**Fullname:** assignment and construction identification

**Attribute Description** This is the internal identifier associated with the external name. This is a short with a range from 0 to 65535. For most names, this is treated as a simple number.

**Attribute: usecnt**

**Fullname:** Usage count

**Attribute Description** This is a count of the number of references of the id in other base relations.

**Defines:** "db/DMmftype.h",
"db/DMdnum.h",
"db/DMfid.h"

## 4. Population rules for RLnamintf

### Relation Description

Interface Protocol (IP) Interface Index Relation

This relation converts an IP interface name to an IP interface index.
It is the inverse relation of RLintfnam.

**Attribute:**
indx_name
**Fullname:**
Index for interface name
**Attribute Description:**
Unique index associated with the IP interface.

**Attribute:**
intf_name
**Fullname:**
IP interface name
**Attribute Description:**
This attribute is the character name given to the IP interface on the switch.

## 4. Population Rules for RLnapc_inf

**Relation Description**
North American CCS7 (NACCS7) Destination Point Code Information

This relation provides more detailed information about a NACCS7 Destination Point Code.

**Attribute: dpcindx**

**Fullname:** Destination Point Code index.

**Attribute Description** The DPC index is defined by the data population process.

**Attribute: altls1**

**Fullname:** First alternate link set

**Attribute Description** The link set number which is the first alternate link set used to carry signaling traffic to the DPC. It is defined by switch administration.
If no alternate link set is to be defined, populate with the default value. If the DPC is served by a Combined Link Set, altls1 must be filled with the default value.

**Attribute: altls2**

**Fullname:** Second alternate link set

**Attribute Description** The link set number which is the second alternate link set used to carry signaling traffic to the DPC. It is defined by switch administration.
If no alternate link set is to be defined, populate with the default value. If the DPC is served by a Combined Link Set, altls2 must be filled with the default value.

**Attribute: altls3**

**Fullname:** Third alternate link set

**Attribute Description** The link set number which is the third alternate link set used to carry signaling traffic to the DPC. It is defined by switch administration.
If no alternate link set is to be defined, populate with the default value. If the DPC is served by a Combined Link Set, altls3 must be filled with the default value.

**Attribute: altls4**

**Fullname:** Fourth alternate link set

**Attribute Description** The link set number which is the fourth alternate link set used to carry signaling traffic to the DPC. It is defined by switch administration.
If no alternate link set is to be defined, populate with the default value. If the DPC is served by a Combined Link Set, altls4 must be filled with the default value.

**Attribute: apcindx**

**Fullname:** Adjacent Point Code (APC) index

**Attribute Description** If the DPC corresponding to dpcindx has been determined, by Switch Administration, to be an Adjacent Point Code assign the next APC index. A DPC is considered

Copyright © 1999 Lucent Technologies 

adjacent if this office has signaling links which are directly connected to the DPC. If the DPC is not adjacent, populate with the default value. It is defined by the data population process.
Populate with the next available APC index value available from the RLindx relation. Read the RLindx relation with CCNAAPCIDX as the key. Increment the max_idx attribute by one and assign this value to apcindx. Then update the RLindx tuple.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLnapcndx

**Relation Description**
North American CCS7 (NACCS7) destination point code (DPC) index.

This relation provides basic information for NACCS7 DPCs with an index to be used with the RLnapc_inf relation for further information.

**Attribute: dpc**

**Fullname:** Destination Point Code

Copyright © 1999 Lucent Technologies

**Attribute Description** The Destination Point Code (DPC) identifies the signaling point for a far end office. It is defined by switch administration.

The DPC is externally defined as a string of 9 decimal digits. The internal format is a hex value based upon the following format (where bit 0 is the low order bit):

```
(Bits) 23          16 15           8 7            0
        +------------+-------------+------------+
        |  Network   |   Network   |   Cluster  |
        | Indicator  |   Cluster   |   Member   |
        +------------+-------------+------------+
(Digit) 9            7 6            4 3            1
```

The 9 digit externally defined DPC is converted as follows:

(network indicator 2^16) + (cluster type 2^8) + cluster member

Range: 0x0 - 0xFFFFFF (0 - 16777215) subject to the following:
Network Indicator: 0 - 255
Network Cluster: 0 - 255
Cluster Member: 0 - 255

**Attribute: no_func**

**Fullname:** Digital Derived Services Node function.

**Attribute Description** This attribute defines whether the DPC is an Action Point, Network Control Point, or Network Services Complex. If the DPC is none of the previous, populate with the default value. It is defined by switch administration.

**Attribute: dpc_type**

**Fullname:** Destination type

**Attribute Description** This attribute defines whether the DPC acts as a Signaling End Point, Signaling Transfer Point, or both. If the DPC acts as none of the previous, populate with the default value. It is defined by switch administration.

**Attribute: lnk_set1**

**Fullname:** Link set which normally serves this DPC.

**Attribute Description** The number of the link set that is normally used for reaching this DPC. It is defined by switch administration.

**Attribute: lnk_set2**

**Fullname:** Second link set of a combined link set.

**Attribute Description** If the DPC is served by a combined link set, populate with the smaller link set number. If the destination is not served by a combined link set, populate with the default value. It is defined by switch administration.

**Attribute: clsindx**

**Fullname:** Combined link set index

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** If the DPC is served by a combined link set, populate with a combined link set index. If the DPC is not served by a combined link set, populate with the default value. If the DPC is adjacent, populate clsindx with the default value. If clsindx is greater than 0, then the lnk_set2 attribute of this tuple must be greater than 0. This attribute is defined by the data population process.

**Attribute: dpcindx**

**Fullname:** Destination point code index

**Attribute Description** Populate with the next available DPC index value. It is defined by the data population process. The index is obtained from the next dpc index in the RLindx relation. Read the RLindx relation with the CCNADPCIDX key. Increment the max_idx attribute by one, and assign this value to the dpcindx. Finally update the RLindx tuple.

**Attribute: con_pc**

**Fullname:** SCCP Concerned Point Code

**Attribute Description** This attribute specifies whether this point code should be sent SCCP network management messages that are sent only to concerned point codes.

**Attribute: adjacent**

**Fullname:** Adjacent Point Code Indicator

**Attribute Description** This attribute indicates whether the DPC is an Adjacent Point Code
DBYES will indicate that the DPC is adjacent.
DBNO will indicate that the DPC is non-adjacent.

## 4. Population Rules for RLnet_gpid

**Relation Description**
Leased network ARSID to automatic route selection group ID.

This relation maps the leased network ARSID received by the LN ACP from the LN NCP, or received by a LN Via office in a CCS7 ISUP IAM, into internal ARS voice and data Group IDs.
This relation is the inverse of RLgpid_net.

Copyright © 1999 Lucent Technologies

**Attribute: net_arsid**

**Fullname:** Leased Network ARSID

**Attribute Description** Leased network ARSID received by the LN ACP from the LN NCP, or received by a LN Via office in a CCS7 ISUP IAM.

**Attribute: ars_gpid**

**Fullname:** Automatic Route Selection Voice Group ID

**Attribute Description** Internal ARS voice group ID assigned to the associated ARS group name. This attribute must be populated (non-zero) for every tuple in this relation.

**Attribute: ardtgpid**

**Fullname:** Automatic Route Selection Data Group ID

**Attribute Description** Internal ARS data group ID assigned to the associated ARS group name. A zero value indicates that there is no ARS data group ID assigned.

## 4. Population Rules for RLnet_gsm

**Relation Description**
SCCP Network Definition

This relation specifies information about SCCP Networks served by this switch. This relation is keyed by Network Number and is compatible with RLgsm_net.

**Attribute: net_num**

Copyright © 1999 Lucent Technologies

**Fullname:** SCCP Network Number

**Attribute Description** This attribute specifies the Network Number of a SCCP Global SM.

**Attribute: gsm**

**Fullname:** Global SM

**Attribute Description** This attribute specifies Global SM's which use SCCP.

**Attribute: sig_type**

**Fullname:** Message Transfer Part (MTP) Signaling Type

**Attribute Description** This attribute specifies the MTP Signaling Type under which SCCP is running.

**Attribute: sccp_type**

**Fullname:** Signaling Connection Control Part Type

**Attribute Description** This attribute tells which specifications that SCCP is following.

## 4. Population rules for RLnet_info

### Relation Description

Network routeset relation

This relation contains the network routeset for provisioned networks.

**Attribute:**
netid
**Fullname:**
Network Identifier
**Attribute Description:**
Network Identifier, top 8 bits of 24-bit point code for NAR.

**Attribute:**
norm_rte
**Fullname:**
Normal Route
**Attribute Description:**
Normal Route, linkset (key to RLls_grp and RLls_netid) or combined linkset (key to RLcls_ls).

**Attribute:**
alt_rte1
**Fullname:**
Alternate Route 1
**Attribute Description:**
Alternate route, linkset (key to RLls_grp and RLls_netid) or combined linkset (key to RLcls_ls).

**Attribute:**
alt_rte2
**Fullname:**
Alternate Route 2
**Attribute Description:**
Alternate route, linkset (key to RLls_grp and RLls_netid) or combined linkset (key to RLcls_ls).

**Defines:**
"ccs/CCc7_param.h",
"db/DBls_stat.h"

## 4. Population rules for RLnli_lnk

### Relation Description

Network Link Interface Relation.

NOTE: Unless otherwise specified, NLI will refer to NLI, NLI1 and ENLI.

This relation correlates NLIs with TMS links. It is the dual of the RLslnktms relation. Each entry in RLnli_lnk MUST have four entries in RLslnktms. The opposite is not true. RLnli_lnk ONLY lists link data for SM-2000 SMs, not for Non-SM-2000 SMs. So, for every four tuples in RLslnktms, there will be a tuple here for an SM-2000, but not for an SM.
There must be one entry in RLmodatt for each unique SM listed in this relation.
There must be four entries in RLslnktms for SMs.
There will be (4 * RLmodatt.eq_lis) for each SM-2000
There are no TMSLNKs associated with an RSM, so they will not need entries in this relation.
NLI1s used for CDX office (CM2C - 32 Mb) will have two entries in this relation.

Copyright © 1999 Lucent Technologies 

See discussion on relation dependencies
in the Population Rules section in RLmodatt.

**Attribute:**
sm
**Fullname:**
module number
**Attribute Description:**
This attribute uniquely identifies each module with which
the office is equipped.
The domain (DMMODULE) of this attribute is unsigned 8 bits,
therefore the maximum range is 0 to 255. However, actual
range is smaller than that. For a CM1 office this relation
should have no tuples, as SM-2000s are not supported on a CM1.
For a CM2 office (Glcm0vint=SMCM2VINT), the maximum number
of SMs is 192, so the valid range is 1 to 192.
For a CDX office the maximum number of SMs is two, only one of
which can be a SM-2000. CDX offices supports a maximum of 6 RSMs,
and the range of SM values 1 to 192 is still valid.

**Attribute:**
nli
**Fullname:**
NLI, NLI1, ENLI
**Attribute Description:**
This attribute identifies the NLI for which the non-key
attribute values describe. The current NLI range is 0 through 23.
For ENLI, the current range is 0 through 23.
The NLI1 range used in CM2C offices is only 0 through 1.
Note that NLIs MUST be grown in sets (2 per side) and the
sets MUST have identical link assignments on both sides
(thus no need for a 'side' attribute).
The number of NLIs on a specified SM is given in the
'eq_lis' attribute in the RLmodatt relation.
[Note that the 'eq_lis' starts count on 1, while NLIs are
numbered starting at 0; thus the eq_lis values will always
be larger than any NLI value.]

**Attribute:**
eqstat
**Fullname:**
equipage status
**Attribute Description:**
This attribute will show the equipage state of the NLI in question.

**Attribute:**
nlnk2spr
**Fullname:**
Spare attribute # 2

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Currently unused.

**Attribute:**
nlnk3spr
**Fullname:**
Spare attribute # 3
**Attribute Description:**
Currently unused.

**Attribute:**
tsi_link
**Fullname:**
TSI link number.
**Attribute Description:**
This attribute identifies the TSI link associated with the specified NLI.

**Attribute:**
tmslnk_0
**Fullname:**
TMS link numbers.
**Attribute Description:**
These attributes identify the TMS links associated with the specified NLI. tmslnk_1 is algorithmically determined based on the CM2 fabric type (single or dual) and the value of tmslnk_0.
NOTE: For NLI1 and ENLI, only tmslnk_0 is valid. The value for tmslnk_1 should be set to PCNULLTMS.
Due to FLI and Single Fabric considerations, the lowest numbered TMS link that an NLI can have is 6 (Dual fabric) and 8 (single fabric). The minimum value for an NLI link is restricted for both single and dual fabric CMs. If a single fabric CM, then the set of valid link numbers is very restricted. The relation RLslnktms has a complete set of poprule checks to enforce link assignments for single and dual fabric CMs.

**Attribute:**
tmslnk_1
**Fullname:**
TMS link numbers.
**Attribute Description:**
See tmslnk_0 attribute.
For ENLI tmslnk_1 is always set to $PCNULLTMS.
For CDX office tmslnk_1 is always set to $PCNULLTMS.

**Attribute:**
nli_0_cli
**Fullname:**

Copyright © 1999 Lucent Technologies 

NLI CLI value for ONTC 0.

**Attribute Description:**

This attribute identifies the NLI CLI values for the NLI in ONTC 0. There is no assumption being made concerning NLIs replacement, so provisions are made in this relation for NLI pairs to have unique CLI values.

NLI will have a CLI value of 0x0 (DGVNULL).
ENLI will have a CLI value of 0x1 (DGVENLI).
A new cli value of 0x02 is defined for NLI1 For CDX offices.

**Attribute:**

nli_1_cli

**Fullname:**

NLI CLI value for ONTC 1.

**Attribute Description:**

This attribute identifies the NLI CLI values for the NLI in ONTC 1. There is no assumption being made concerning NLIs replacement, so provisions are made in this relation for NLI pairs to have unique CLI values.

NLI will have a CLI value of 0x0 (DGVNULL).
ENLI will have a CLI value of 0x1 (DGVENLI).
A new cli value of 0x02 is defined for NLI1 For CDX offices.

**Attribute:**

trcu0_pi, trcu1_pi

**Fullname:**

TRCU path index for side 0 and side 1 of this NLI.

**Attribute Description:**

TRCU model 1 and model 2 have a different TRCU path attached to side 0 and side 1 of this NLI. This makes these attributes necessary to look up TRCU information in RLtrcupath.

**Defines:**

"db/DMtmslnk.h",
"db/DMclidef.h"

## 4. Population rules for RLnm2prid

### Relation Description

Name to profile index mapping

This relation is the parent of the RLLAESPROF relation. This relation allows the use of a name of up to 30 characters to be used in the CMP by Recent Change.

**Attribute:**
nameofprof
**Fullname:**
Name of Profile Name
**Attribute Description:**
Character string containing Lawfully Authorized Electronic Surveillance (LAES) profile name.

**Attribute:**
lprofidx
**Fullname:**
Lawfully Authorized Electronic Surveillance (LAES) profile index
**Attribute Description:**
Lawfully Authorized Electronic Surveillance (LAES) profile index.

**Attribute:**
count
**Fullname:**
Count
**Attribute Description:**
Count of number of cases using the associated RLlaesprof tuple.

## 4. Population Rules for RLnmdcofc

**Relation Description**
Names and IDs of directly connected DSN switches subject to ARC control.

Information concerning this section is not available at this time.

**Attribute: dsnofc**

**Fullname:** office name

**Attribute Description** This attribute is the DSN switch name and always contains 3 letters (A-Z). These are the offices that have direct routes with this switch and can be ARC controlled.

**Attribute: dsnarc_id**

**Fullname:** ARC id

**Attribute Description** The dsnarc_id must be unique within this relation.

## 4. Population rules for RLnmimpdgt

### Relation Description

```
Network Management Implied Digits Table
This relation is used by Network Management (NM), by packet switching
(PS), and by LASS Automatic Recall (LASSAR), to derive the called
party's NPA for 7-digit line originating calls where the NPA does not
equal the Glinpa (global implied NPA) or Glpsinpa (global packet switch
implied NPA).
```

Copyright © 1999 Lucent Technologies

It is used by NM to derive the NPANXX for incoming trunk abbreviated signaling calls (4-6 digits) and to derive the NPA for 7-digit incoming trunk calls.

It is used by LASS Automatic Callback (LASSAC), Seven Digit Entry of Forward-to-DNs for IDP, and SSP 800 services (SSP800) to derive, from the 10-digit public DN (NPANXXXXXX where NPA does not equal Glinpa), the dialable DN for the terminal originating the LASSAC or SSP800 call based on the starting digit analysis table for that terminal (that is, should this public DN be run through digit analysis as a 7-digit call or a 10-digit call and, if 7-digits, does it need a 1 prefixed or not). This relation is also used by LASS Screen List Editing (SLE) to get the NPA for a 7-digit number that is to be entered as a 10-digit DN on the SLE screening list where the NPA is not the Glinpa. The number to be prefixed is entered by the SLE user to be put on the user's SLE screening list and then no routing is performed on the digits dialed by the user.

There should be no tuples corresponding to calls whose Carrier Interconnect types (CITYPES) are AVT, INC, or EMRR in relations RLda_conflct.type_ci_call, RLdaprlfnl.type_ci_call, and RLdaprmfnl.type_ci_call.

**Attribute:**

prefix

**Fullname:**

Prefix index dialed for a call

**Attribute Description:**

This is the prefix index dialed for a call. It is one of the keys to determine the implied digits for a call because some 7-digit calls have a different implied NPA depending on the prefix dialed (FCPFX_NONE, FCPFX_0, or FCPFX_1).

Note that LASSAC and SSP800 must have either an FCPFX_NONE or an FCPFX_1 tuple populated to derive a 7-digit dialable DN since neither feature will prefix a 0. That is, if the public DN can only be dialed as 0+NXXXXXX for the given starting digit table, LASSAC and SSP800 will use all ten digits. If all ten digits are to be used, LASSAC uses the relation RLACPFX to determine whether a 1 should be prefixed or not. This relation is needed for LASSAC because LASSAC uses normal office screening (relation RT_SCRNING) unlike SSP800 which uses special screening.

Note that NM, LASSAR and LASS SLE read this relation with the prefix field from digit analysis which is based on how the customer dialed the call. That is, if the customer dialed NXXXXXX, the prefix value used will be FCPFX_NONE: if 1+NXXXXXX, FCPFX_1: and if 0+NXXXXXX, FCPFX_0 (NM only for 0+ calls).

Therefore, the implied NPA prefix field on the LDIT form should be filled out with the prefix value that the customer would use to dial the 7-digit DN based on the starting digit analysis table of the customer (see trntbl attribute here).

Copyright © 1999 Lucent Technologies 

For abbreviated signaling calls (4-6 digits) the prefix value assigned during digit analysis is always FCPFX_NONE since prefixes are not applicable for such calls. Therefore, the prefix field value for tuples containing implied digits for such calls must be FCPFX_NONE also.

The prefix field value for tuples containing implied digits for 7-digits line originating calls should be FCPFX_NONE, FCPFX_1, or FCPFX_0. For incoming trunk 7-digits calls, it should be FCPFX_NONE. The prefix field should never be FCPFX_0MINUS or NULLPREF.

**Attribute:**
trntbl
**Fullname:**
Last used translation table and starting point
**Attribute Description:**
This is a structure consisting of two attributes: tbltype and starttbl. This is a key because it makes a difference in determining a call's implied digits. For instance, two different incoming trunks may use the same steering digits and have the same FCPFX_NONE prefix index, but because the trunks have different digtrees, and therefore completely different translation tables, the calls may have completely different implied digits.

**Attribute:**
trntbl.tbltype
**Fullname:**
Translation table type
**Attribute Description:**
This attribute contains the translation table type, preliminary or primary (corresponding to RLdaprldgt and RLdaprmdgt). For 7-digit line origination calls (tuples populated from the LDIT forms/screens), the value of tbltype will be DB_PRMRY. For trunk originating calls (tuples populated from the INDIT forms/screens), the value of tbltype will be PRELIMINARY.

**Attribute:**
trntbl.starttbl
**Fullname:**
Starting point in table
**Attribute Description:**
This attribute tells the starting point used in the RLdaprldgt or RLdaprmdgt relation for the call (RLdaprmdgt for line originations and RLdaprldgt for trunk originations). This is the same value as found in either RLrc_indit or RLrc_ldit based on the terminal's digit tree index (digtree).
If trntbl.tbltype has the value PRELIMINARY, a legal value for trntbl.starttbl is one of the values used in the RLrc_indit relation's preltable field.
If trntbl.tbltype has the value DB_PRMRY, a legal value for

Copyright © 1999 Lucent Technologies 

trntbl.starttbl is one of the values used in the RLrc_ldit relation's primtable field.

**Attribute:**
steering
**Fullname:**
Steering digits
**Attribute Description:**
These are the non-last-four digits of 4-7 input digit string as described in the following paragraphs.
For 7-digit calls (NXX-XXXX), the non-last four digits are the NXX digits.

For 6-digits abbreviated signaling calls, these are the first two digits, padded on the RIGHT with all nulls.
For 5-digits abbreviated signaling calls, this is the first digit, padded on the RIGHT with all nulls.
For 4-digits abbreviated signaling calls, this field is ALL nulls.
A null is the character \0.

If a 5 or 6 digit abbreviated signaling call does not translate on 1 or 2 digits, respectively, no tuple is populated for that call. The composite key for this relation is prefix, trntbl, and steering digits. The steering field is at most 3 digits. Therefore, if a 7-digit call translates on more than 3 digits, only the first 3 are used for the steering field. This means that, for calls where the first 3 digits, the prefix, and the trntbl are the same the implied npa derived from this relation will be the same.
A 7 digit call is allowed to translate on less than 3 digits only when the implied npa for the call is the same as Glinpa: when the implied npa for the call is not the same as Glinpa, using less than 3 digits for translation is prohibited.

**Attribute:**
npa
**Fullname:**
Implied Numbering Plan Area
**Attribute Description:**
This is the implied npa for 4-7 digit domestic calls.
Typically, there are no tuples for 7 digit calls whose implied npa equals the Office Parameter Implied NPA (Glinpa).

Occasionally customers may find a need to populate the RLnmimpdgts with the same implied NPA as the Glinpa for 7 digit calls. This results in more tuples being populated in the RLnmimpdgts relation. This field may also equal Glinpa when the tuple corresponds to a 4-6 digit abbreviated signaling call, since such a digit pattern must always have a corresponding tuple because of the implied NXX, regardless of whether the implied NPA of the call is the same as GLinpa. Therefore, for tuples corresponding to 4-6 digit abbreviated signaling calls:

**Copyright © 1999 Lucent Technologies** 

1) the npa field must be filled in when the implied npa of the call is not the same as Glinpa.
2) the npa field may be filled in with only nulls or a valid npa when the implied npa of the call is the same as Glinpa.

For tuples corresponding to 7-digit calls, this field may be null (\0) ONLY when you want to specify that the implied npa for a 7-digit line originating call is the same as the NPA of the line originating the call. If this is the case, the implied NPA field on the LDIT form/screen should be AMB. The NPA of the originating party is determined from the terminal's rlfc_line LOCDN to derive the NOC which is then used to read rlofficecode to get the NPA.

Note that nulls in this field mean two things depending on the steering digits. If abbreviated signaling call, nulls mean use the Glinpa as the npa: if a 7-digit call, nulls mean use the npa of the calling terminal as the npa

.

When the field is not null, all 3 characters must make up a legal npa. A null npa field is three '\0's.

**Attribute:**

nxx

**Fullname:**

Implied Central Office Code

**Attribute Description:**

This is the implied nxx for 4-6 digit domestic abbreviated signaling calls. For tuples corresponding to such calls this field may never be nulls.

For tuples corresponding to 4-6 digit abbreviated signaling calls which terminate to lines in this office, the nxx must correspond to the NOC contained in the route_x attribute of the rldaprldgt relation tuple which provides digit analysis treatment for the call. The nxx to NOC correspondence is provided by the RLnoccode relation.
For tuples corresponding to 7-digit calls, however, this field must be nulls -- it is not needed since the NXX is already known.
All three characters of the field must contain a character between '0' and '9', inclusive, or be all nulls ('\0').

## 4. Population rules for RLno_picb

### Relation Description

Equipment location for units without a PICB

This relation contains equipment location information for SM units which are not PICB controlled. This relation is similar to RLrc_loceq for units that are controlled via a PICB. Similar to RLrc_loceq, the information in RLno_picb is a subset of the RLrc_eqloc relation.

**Attribute:**

unittype

Copyright © 1999 Lucent Technologies

**Fullname:**
Unit type
**Attribute Description:**
The type of peripheral unit.

**Attribute:**
unitnumber
**Fullname:**
Unit number
**Attribute Description:**
The number that identifies the selected peripheral unit.

**Attribute:**
aisle
**Fullname:**
Aisle number
**Attribute Description:**
Aisle number where unit is located.

**Attribute:**
bay
**Fullname:**
Bay number
**Attribute Description:**
Bay in which unit is located.

**Attribute:**
cab_ref
**Fullname:**
Cabinet reference
**Attribute Description:**
Describes the physical placement of a hardware unit with respect to a 5ESS(R)-2000 switch cabinet. Specifically, a PDXU unit is placed in the rear of a cabinet.

**Attribute:**
vertpos
**Fullname:**
Vertical position.
**Attribute Description:**
Vertical position of the unit.

## 4. Population Rules for RLnoccode

**Relation Description**
Noc code

Digits to noc

**Attribute: nxx**

**Fullname:** office code, or area code and office code

**Attribute Description** Office code, or area code concatenated with the office code (left justified string). Traditionally, office codes are of the form NXX. For 5E3, the 0XX and 1XX Routing feature allows office codes of 0XX and 1XX, provided for special uses to preserve standard office code ranges. These are typically used for INWATS lines. Since 0XX and 1XX are being excluded from the LDIT, these lines can only be terminated to from an incoming trunk. This is a 1AESS Transparency feature.

**Attribute: noc**

**Fullname:** normalized office code

**Attribute Description** Normalized office code.

**Attribute: npa**

**Fullname:** area code

**Attribute Description** Area code.

**Attribute: basenpa**

**Fullname:** base npa indicator

**Attribute Description** Base npa indicator. The basenpa indicator is set to DBYES when the npa is associated with the first unique 3-digit nxx value assigned in the office, else basenpa is set to DBNO.

From a customer perspective, the basenpa is not provisionable via RC. When inserting a group of noc views (8.2) having the same nxx on different npa's via Recent Change, the basenpa indicator is set to DBYES automatically for the first nxx inserted.

Copyright © 1999 Lucent Technologies 

For ODA, the situation is different. Because ODA does not sequence the input forms, there is no concept of "first" nxx. Therefore the basenpa indicator must be provisioned by a required attribute on the ODA noc form. ODA requires that within a set of noc forms defining the same nxx, exactly one of them must have the BASENPA indicator set to Y.

**Attribute: usecnt**

**Fullname:** use count

**Attribute Description** This attribute applies only to tuples containing a 3-digit nxx. It is a count of all other RLnoccode tuples containing a 6-digit nxx (NPA + nxx) whose last 3 digits (nxx) match this 3-digit nxx. In other words, it is a count of NPAs having that nxx. The usecnt attribute is set to zero on all tuples with a 6-digit nxx.

**Attribute: rax**

**Fullname:** default rate area

**Attribute Description** Rate center. Used in RLrc_dninfo and in RLrc_oeinfo. Default value is 0. When a line is inserted or updated and no rax is provided, then the rax stored in this relation will be used.

**Attribute: ffcf1**

**Fullname:** spare

**Attribute Description** spare attribute for future use

**Attribute: ffcf2**

**Fullname:** spare

**Attribute Description** spare attribute for future use

**Defines:** "db/DMnxx.h",
"db/DMnpanxx.h",
"db/DMnpa.h"

```

## 4. Population Rules for RLnon_usa

**Relation Description**
Non-U.S. NPA-NXXs

An entry in this table indicates that a call to this NPA-NXX will terminate outside of the United States.

An entry in this table indicates that a call to this NPA-NXX will terminate outside of the United States. If the NPA-NXX of the forward number is not found in this table, it is assumed to be a domestic (within the U.S.) call. For non-domestic calls, the home_country is a three-character identifier used to determine whether a card call is to the country of the card issuer or to a third country (non-U.S. and non-home country) by comparing it to the home_country attribute entered on the Card Issuer form (TCCID) or view (27.55).

**Attribute: npanxx**

**Fullname:** npanxx is the NPA-NXX of a non-U.S. forward number.

**Attribute Description** If a tuple with NPA000 or NPA-NXX of the forward number is found, it is assumed that the call terminates outside the U.S.

**Attribute: home_country**

Copyright © 1999 Lucent Technologies

**Fullname:** Home country identifier for the NPA-NXX.

**Attribute Description** For a card call with an International Credit Card Validation (ICCV) card issuer, if the forward number is in North American Numbering Plan (NPA-NXX) format, that NPA-NXX is used to search this table. If found, and the home_country matches that of the card issuer, the call is a home country call; otherwise, it is a third country call. If the NPA-NXX is not found in this table the call is a domestic (within the U.S.) call.

**Attribute: member**

**Fullname:** member

**Attribute Description** This field specifies whether the country identified by the NPANXX is a member of the group of countries which allow DIOR calls to terminate to other group members.

**Attribute: oaff1**

**Fullname:** Spare Field 1

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: oaff2**

**Fullname:** Spare Field 2

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

Copyright © 1999 Lucent Technologies 

# NPA_HEAD

## 1. Description

This relation, keyed by the NPA, contains query information about an NPA subgroup, which is defined as the group of 100 consecutive NXX's or (0/1)XX of a given NPA/RAO. An NPA/RAO consists of the following subgroups: RAO-0XX, RAO-1XX, NPA-2XX, NPA-3XX, NPA-4XX, NPA-5XX, NPA-6XX, NPA-7XX, NPA-8XX, NPA-9XX.

## 2. Data Dictionary Values

## 4. Population Rules for RLnpa_head

**Relation Description**
NPA header.

This relation contains query information about the ten NPA subgroups within an NPA. An NPA subgroup is defined as the group of 100 consecutive NXX's or (0/1)XX's of a given NPA/RAO. An NPA/RAO consists of the following subgroups: RAO-0XX, RAO-1XX, NPA-2XX, NPA-3XX, NPA-4XX, NPA-5XX, NPA-6XX, NPA-7XX, NPA-8XX, NPA-9XX. These are designated NPA subgroups NPA0, NPA1, NPA2, NPA3, NPA4, NPA5, NPA6, NPA7, NPA8, NPA9, respectively. There are ten 2-bit long attributes, called q2bit0 through q2bit9, containing query information for NPA subgroups NPA0 through NPA9, respectively.

The q2bit provides the following query information for the corresponding NPA subgroup:

## 4. Population rules for RLnpa_nxx

### Relation Description

NPA-NXX

This relation contains query information about a given NPA subgroup within an NPA. An NPA subgroup is defined as the group of 100 consecutive NXX's or (0/1)XX of a given NPA/RAO. An NPA/RAO consists of the following subgroups: RAO-0XX, RAO-1XX, NPA-2XX, NPA-3XX, NPA-4XX, NPA-5XX, NPA-6XX, NPA-7XX, NPA-8XX, NPA-9XX. These are designated NPA subgroups NPA0, NPA1, NPA2, NPA3, NPA4, NPA5, NPA6, NPA7, NPA8, NPA9, respectively. The member of an NPA subgroup is generally denoted as NPA-YXX, with 'Y' constrained to a decimal digit. There are 12 attributes of 8 bits each plus an attribute of 4 bit long, comprising 100 bits of data. Each bit corresponds to each of the 100 YXX's of the NPA subgroup. The YXX is arranged in ascending order in increments of one starting with the lowest bit of q8bit0 to the highest bit of q8bit11 through the highest order bit of q4bit. A '1' and '0' indicates the LIDB and BVA is populated with the billing data for this RAO/NPA-NXX, respectively.

See Main Description
end relation;

## 4. Population rules for RLnpa2npd

**Relation Description**

Numbering Plan Area (NPA) to Numbering Plan Digit (NPD) Translation Table for E911 (emergency) Calls

RLnpa2npd provides a mapping of a 3 digit NPA to a single digit NPD. This enables full use of Signaling System 7 (SS7) which can carry multiple area codes to interface to 8-Digit Centralized Automatic Message Accounting (CAMA) Public Safety Answering Points (PSAP).

This relation is originally used for feature 99-5E-7124, NPA to NPD Translation Table for E911 Calls.

**Attribute:**

npa

**Fullname:**

numbering plan area

**Attribute Description:**

This key attribute is the NPA associated with an SS7 E911 call.

# NPASPLIT

## 1. Description

Each tuple contains an original Numbering Plan Area (NPA) and a new NPA associated with a NPA split. A NPA split refers to the interval during which 1 NPA is being divided into 2 NPAs, with the original being one of them. For any NPA split, two tuples will be populated in this relation. The "new_npa" attribute indicates which is the new NPA.

## 2. Data Dictionary Values

## 4. Population rules for RLnpasplit

### Relation Description

```
        Local Area Signaling Services (LASS) Numbering Plan

        Area (NPA) Split Resolution
```

Copyright © 1999 Lucent Technologies

This relation will be populated for offices experiencing a Numbering Plan Area (NPA) split. A NPA split refers to the interval during which 1 NPA is being divided into 2 or more NPAs, with the original being one of them.
Each tuple contains an original NPA and a new NPA associated with a NPA split. For any NPA split, two tuples will be populated in this relation. The new_npa attribute indicates which is the new NPA.

**Attribute:**
npa
**Fullname:**
Numbering Plan Area
**Attribute Description:**
Numbering Plan Area (NPA) received for calling or called number.

**Attribute:**
splitno
**Fullname:**
NPA split number
**Attribute Description:**
Associated key used to identify when one new NPA is being split from multiple existing NPAs or when multiple new NPAs are being split from one existing NPA. Ex. sections of old NPA values 312, 708, and 815 are being split into one new NPA 416, the relation would be populated accordingly:

| | | | | | | |
|---|---|---|---|---|---|---|
| npa | 312 | 708 | 815 | 416 | 416 | 416 |
| splitno | 0 | 0 | 0 | 0 | 1 | 2 |
| assoc_npa | 416 | 416 | 416 | 312 | 708 | 815 |
| new_npa | DBNO | DBNO | DBNO | DBYES | DBYES | DBYES |

The splitno key allows multiple splits to occur.

**Attribute:**
assoc_npa
**Fullname:**
Associate Numbering Plan Area
**Attribute Description:**
Associated NPA related to a NPA split.

**Attribute:**
char_fill
**Fullname:**
Char relation filler
**Attribute Description:**
Used in RC for the update and delete cases.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
interval
**Fullname:**
This field is not used in the 5e8 software release.
**Attribute Description:**
None.

**Attribute:**
new_npa
**Fullname:**
New NPA indicator
**Attribute Description:**
Indicates old or new NPA. If set to DBYES, the npa value stored is the new NPA value. If set to DBNO, the npa value stored is the old NPA value.

**Attribute:**
tcapscrn
**Fullname:**
TCAP screening option
**Attribute Description:**
If set to yes, provide validation of TCAP queries for AC/AR and SLE on 7 digits if the TCAP NPA is found in the NPA split table (RLnpasplit). If the NPA is not found in the NPA split table, 10 digit validation is done.

**Attribute:**
digscrn
**Fullname:**
Digit screening option
**Attribute Description:**
If set to yes, provide 7 digit screening for those calling DNs whose NPA is in the NPA split table (RLnpasplit). If the 7-digit DN is in the screening list, make sure the screening list NPA is related to the same NPA split as the calling DNs NPA. For cases not included above, provide 10 digit screening. For any calls that fail validation or screening, use current error treatment.

**Attribute:**
sleadd
**Fullname:**
SLE Add screening option
**Attribute Description:**
If set to YES, when checking the screening list during the SLE add processing, the NPA split table (RLnpasplit) must be checked.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
sledel
**Fullname:**
SLE Delete screening option
**Attribute Description:**
If set to YES, when checking the screening list during the SLE delete processing, the NPA split table (RLnpasplit) must be checked.

**Attribute:**
bool4_fill
**Fullname:**
Bool4 relation filler
**Attribute Description:**
Used for future expansion

## 4. Population rules for RLnpatg

### Relation Description

RLnpatg will be used in 5E13 by the NPA Handling By Trunk Group feature.
RLnpatg is being used by NPA Handling By Trunk Group Feature

**Attribute:**
tgn
**Fullname:**
TGN Key.
**Attribute Description:**
This is the Trunk Group Number for the NPA Handling By Trunk Group feature. The allowable values on this field is between 1 - 4000.

Copyright © 1999 Lucent Technologies

**Attribute:**
oaff1
**Fullname:**
first unsigned short attribute
**Attribute Description:**
Unknown.

**Attribute:**
nxx
**Fullname:**
NXX Key.
**Attribute Description:**
This is the NXX for the NPA Handling By Trunk Group feature.
The allowable values are between 200 - 999.

**Attribute:**
oaff2
**Fullname:**
second unsigned short attribute
**Attribute Description:**
Unknown.

**Attribute:**
true_npa
**Fullname:**
True Number Planning Area (NPA).
**Attribute Description:**
This the TRUE NPA for the NPA Handling By Trunk Group feature.
The allowable values are between 200 - 999.

**Attribute:**
oaff3
**Fullname:**
second unsigned short attribute
**Attribute Description:**
Unknown.

**Attribute:**
oaff4
**Fullname:**
fourth unsigned short attribute.
**Attribute Description:**
Unknown.

## 4. Population rules for RLns_trig

### Relation Description

Network Services Trigger Table

This tuple supplies query formulation data for network features

**Attribute:**
trignum
**Fullname:**
Trigger Number
**Attribute Description:**
Specifies the unique Network Services Trigger

**Attribute:**
protocol
**Fullname:**
Protocol
**Attribute Description:**
Specifies the TCAP protocol

**Attribute:**
tran_typ
**Fullname:**
Translation Type
**Attribute Description:**
This field identifies the translation type used by Network Services. In range values are 0 to 255, 256 is an out of range value.

Copyright © 1999 Lucent Technologies 

**Attribute:**
active
**Fullname:**
Active Status
**Attribute Description:**
Activation status of an ASP Trigger.

**Attribute:**
title
**Fullname:**
Alternate Global Title
**Attribute Description:**
Alternate Global title is used by the STP to select an SCP when call processing can not construct a valid Global Title.

**Attribute:**
title.digcnt
**Fullname:**
Digit Count.
**Attribute Description:**
Directory number digits.

**Attribute:**
title.dn
**Fullname:**
Directory Number.
**Attribute Description:**
Directory Number code

**Attribute:**
serv_key
**Fullname:**
Service Key
**Attribute Description:**
Indicates whether the originator's number(ANI) or the called party's number(dialed number) will be used for service key query formulation.
FCSKNULL - Null value.
FCSKANI - Indicates ANI should be used in query formulation.
FCSKCDPN - Indicates CalleD Party Number should be used in query formulation
.

**Attribute:**
app_typ
**Fullname:**
Application type
**Attribute Description:**
Identifies which network service is active.

**Copyright © 1999 Lucent Technologies** 

FCAPNULL - services not known at this timeT(Call Processing only).
FCAPASP - indicates ASP services are requested.
FCSEAOFC - indicates shared inter-office Equal Access to DNTs.
FCAPE911 - indicates Enhanced 911 query.
FCAP800 - indicates a Number Services 800 query is required.

**Attribute:**
postqry_si
**Fullname:**
Post query screen index
**Attribute Description:**
The post query screen index identifies the screen index to use after an Advanced Services Platform (ASP) query. This screen index will be used for post query routing and charging.

**Attribute:**
spare_1
**Fullname:**
spare bit
**Attribute Description:**
Not currently used

**Attribute:**
spare_2
**Fullname:**
spare bit
**Attribute Description:**
Not currently used

**Attribute:**
spare_3
**Fullname:**
spare unsigned 12
**Attribute Description:**
Not currently used

**Attribute:**
spare_4
**Fullname:**
spare bit
**Attribute Description:**
Not currently used

**Attribute:**
spare_5

Copyright © 1999 Lucent Technologies 

**Fullname:**
spare bit
**Attribute Description:**
Not currently used

**Attribute:**
spare_6
**Fullname:**
spare char
**Attribute Description:**
Not currently used

**Attribute:**
servalw
**Fullname:**
Service Allowed
**Attribute Description:**
Specifies originating service types that will be allowed to encounter the ASP trigger defined using the trignum referencing this RLns_trig tuple.

FCSA_VOICE - Voice
FCSA_CSD - Circuit Switched Data (CSD)
FCSA_BOTH - Both Voice and CSD

**Attribute:**
tollfree
**Fullname:**
Toll-free Indicator
**Attribute Description:**
Indicates whether the ASP 3/6/10 digit trigger defined using the trignum referencing this RLns_trig tuple should be treated as an ASP Toll-free trigger

**Attribute:**
postq_das
**Fullname:**
Post query digit analysis tree selector
**Attribute Description:**
This attribute contains the digit analysis tree selector to be used for analyzing digits after a response to an ASP query has been received.

**Attribute:**
vpntrig
**Fullname:**
VPN trigger detection
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute, if set to DBYES, indicates a Virtual Private Network (VPN) trigger exist.

**Attribute:**
qortrig
**Fullname:**
Query on Release trigger
**Attribute Description:**
This attribute, if set to DBYES, indicates this trigger is a (Local) Number Portability Query on Release for Location Routing Number (NP - QOR for LRN) trigger.

**Attribute:**
use_curr_das
**Fullname:**
Use Current DAS
**Attribute Description:**
Indicates whether the current digit analysis selector (DAS) in effect on the call pre-query should be used for digit analysis post query. This attribute will only apply when the trigger is a DNT.

**Attribute:**
dnistrig
**Fullname:**
Dialed Number Identification Service (DNIS) trigger
**Attribute Description:**
This attribute, if set to DBYES, identifies this trigger as a DNIS trigger for the Transport of Original Dialed Number (DNIS II) Feature.

SFID498 must be unlocked before dnistrig can be set to DBYES. SFID498 is temporary and will only be supported in 5E13 BMI. Beginning in 5E13 SU, SFID498 will be replaced with SFID271, which is the SFID for DNIS, Phase I.

**Attribute:**
eontrig
**Fullname:**
End Office Nodal (EON) trigger
**Attribute Description:**
This attribute, if set to DBYES, identifies this trigger as an EON trigger for the AT&T Digital Link Phase 5 (ADL5) Feature.

SFID515 must be unlocked before eontrig can be set to DBYES.

**Defines:**

    |---------------+---------------+---------------+---------------|
       ( 8 bytes )
```

## 4. Population Rules for RLnsc_dpc

**Relation Description**
Network Service Complex to Destination Point Code.

This is an embedded CCIS6 (ECIS6) interworking relation for mapping a network services complex (NSC) index to its North American CCS7 (CCSNA7) destination point code (DPC) and link set number.

**Attribute: nsc_ind**

**Fullname:** Network Services Complex index

**Attribute Description** This attribute will identify an NSC that is attached to the ACP in the network.

The tuple for an NSC in this relation cannot be deleted (that is, the NSC de-grown from the office) if there are any voice trunks to that NSC still populated for the office. If there are voice trunks still populated, then there will be a tuple in the RLlab6_pci relation with the nsc_ind from this relation in the sl_group field. Before a tuple is deleted from this relation, make sure the RLlab6_pci tuple that has this nsc_ind in the sl_group field has been deleted.

Copyright © 1999 Lucent Technologies 

It is critical that the number assigned for the NSC index of an NSC be the same number that is assigned to the sl_group attribute in the RLlab6prt relation for that NSC. This will ensure that the signaling messages are sent to the same NSC (point code) as the voice trunks going to that NSC.

**Attribute: linkset**

**Fullname:** Link set number

**Attribute Description** This identifies the CCSNA7 link set that goes to the indicated NSC.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This identifies the CCSNA7 Destination Point Code (DPC) of this NSC.

Copyright © 1999 Lucent Technologies 

# NSFMAP

## 1. Description

This relation contains the associates EDSL call by call service type with pre-routing index.

## 2. Data Dictionary Values

## 4. Population rules for RLnsfmap

### Relation Description

```
        EDSL call by call service type

         Associates EDSL call by call
         service type with pre-routing index.

       " This relation along with RLedsltrkg and RLedslgprt provide
         data for the EDSL call by call service selection feature.  In
         addition RLrcnsfmap is used by RC to support administration of
         RLnsfmap (See population rules for RLedsltrkg, RLedslgprt and
```

Copyright © 1999 Lucent Technologies

RLrcnsfmap).

Call by call service selection allows multiple services to be assigned to a trunk group. On a per call basis, the service being used is indicated in the Network Specific Facilities (NSF) element of a Q.931 message. Call by call services that may have SFGs are:

OUTWATS specifying a specific band number
Maximal OUTWATS (means use maximum band trunk group
is subscribed to)
Basic originating (POTS)
Basic terminating (POTS) including DID
Terminating trunk INWATS (TINWATS)
Megacom(R) 800 originating (M800)
Software Defined Network originating (SDN)
Originating from PRI & Terminating to FX (OFX)
Terminating to PRI & originating from FX (TFX)

Originating from PRI & terminating to TIE (OTIE)
Terminating to PRI & originating from TIE (TTIE)
Hotel/Motel Service (HM)
Selective Class of Call Screening Service (SCOCS)
MEGACOM(R) originating (MEGACOM)
International 800 service (I800)
MultiQuest(R) (DIAL-IT NOVA) service (MULTIQUEST)

OUTWATS, Maximal OUTWATS, SDN, M800, OFX, OTIE, POTS, HM, SCOCS, and MEGACOM(R) are the originating services supported, TINWATS, TFX, TTIE, SDN, M800, I800, MULTIQUEST(R) and POTS are the terminating services. Note for M800 and SDN both originating and terminating services are available.

Note that POTS is the NSF default and is indicated by the absence of an NSF on a call.

OUTWATS has a WATS band number associated with it. OUTWATS, Maximal OUTWATS, SDN, M800, and originating POTS may or may not have an associated interexchange carrier. Because the number of combinations of service types, bands, and carriers is very large and the number of combinations provided by a given office is very small, this relation provides for associating an RC/ODA assigned index (relatively small number) with each combination provided. Note that two carriers each providing OUTWATS service for the same WATS band would require two tuples.

The NSF service type,fac_num, band number, carrier ID, bearer capability and selective class of call screening id are used as keys to this relation. The specification of this data (for a trunk group) results in the generation of an eprtidx2 index used as one of two keys for RLedslgprt. An eprtidx2 index may be used by more than one trunk group."

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
band
**Fullname:**
OUTWATS band number
**Attribute Description:**
OUTWATS band number.

**Attribute:**
carrid
**Fullname:**
carrier id
**Attribute Description:**
Interexchange carrier ID.

Allowable Range: 0-FGDMAXBCAR
A NULL carrier is defined as NULL_BCARID.
A non-existing or invalid carrier is defined
as INVBCARID.

Dependencies: A tuple must exist in RLfc_carr
such that RLfc_carr.carrid = RLnsfmap.carrid
for all valid carrid values except NULL_BCARID.

**Attribute:**
nsftype
**Fullname:**
call by call service type
**Attribute Description:**
EDSL call by call service types.
Valid types:
FC_OPOTS - originating POTS
FC_OWBAND - OUTWATS with band
FC_MAXOWATS - maximal OUTWATS
FC_TPOTS - terminating POTS
FC_M800 - originating and terminating Megacom(R) 800
FC_SDN - originating and terminating SDN
FC_OFX - originating from PRI & terminating to FX
FC_TFX - originating from FX and terminating to PRI.
FC_OTIE - originating from PRI & terminating to Tie.
FC_TTIE - originating from Tie & terminating to PRI.
FC_HM - originating Hotel/Motel Service
FC_SCOCS - originating Selective Class of Call Screening.
FC_MEGACOM - originating MEGACOM(R) service
FC_I800 - terminating International 800 service
FC_MULTIQUEST - terminating MultiQuest(R) (DIAL-IT NOVA)
service
(Note: Terminating trunk INWATS (TINWATS) is also
a call by call service type but is not assigned here.
MCRI/SFGs are assigned in RLrt_mctr).

Copyright © 1999 Lucent Technologies 

The following check is only described here but is actually placed in RLrcnsfmap poprules to avoid redundancy.
For FC_OPOTS, band must = 0 (interpreted as null band for this nsftype).

For FC_OWBAND, band must = valid OUTWATS band (0-255).

For FC_MAXOWATS, band must = 0 (interpreted as null band for this nsftype).

For FC_TPOTS, band must = 0 (interpreted as null band for this nsftype), carrid must = null carrier.

For FC_M800, band must = 0 (interpreted as null band for this nsftype).

For FC_SDN, band must = 0 (interpreted as null band for this nsftype).

For FC_OFX,FC_TFX,FC_OTIE,FC_TTIE, band must = 0 (interpreted as null band for this nsftype).

For FC_MEGACOM, band must = 0 (interpreted as null band for this nsftype).

For FC_I800, band must = 0 (interpreted as null band for this nsftype).

For FC_MULTIQUEST, band must = 0 (interpreted as null band for this nsftype).

**Attribute:**
fac_num
**Fullname:**
Facility Number.
**Attribute Description:**
This attribute is used to indicate the facility number of the originating from/terminating to FX or Tie trunk.

**Attribute:**
bearcap
**Fullname:**
Bearer Capability
**Attribute Description:**
Type of Bearer Capability associated with the call-by-call service type.

Copyright © 1999 Lucent Technologies 

**Attribute:**
scocsid
**Fullname:**
Selected Class of Call Screening Service Id.
**Attribute Description:**
The service id associated with the SCOCS service type.

**Attribute:**
eprtidx2
**Fullname:**
pre-routing index
**Attribute Description:**
EDSL pre-routing index for call by call service type.

Note: The value for eprtidx2 is generated by RC/ODA for each unique combination of nsftype, band, and carrid. Administration of assigned/ unassigned values is controlled via the RLfacids relation. RLfacids.class for eprtidx2 is FACEDSL. See RLfacids population rules.
Also see RLrcnsfmap population rules.

**Defines:**
"db/DMcarr_val.h"

## 4. Population Rules for RLntstype

**Relation Description**
Network Time Slot Type

This relation will hold the type of Logical Link associated with the Time Slot (key).

**Attribute: tsnum**

**Fullname:** Time Slot Number

**Attribute Description** The number of the Single Timeslot (key). The tsnum number is derived from the Relative Hunt Group, the TMS timeslot number and the last bit of the tmslnk (even or odd tmslnk).

```
-------------------------------------------------
|0|0| Relative Hunt Group | TMS Link TS |tmslnk{0}|
-------------------------------------------------
 1 1 1                   0 0           0         0
 5 4 3                   9 8           1         0
```

**Attribute: netwk**

# NW_RTIDX

## 1. Description

This relation will only be used for CCS calls whose chosen route does not meet per call restrictions identified in the CCS IAM message. Given the current route index, and the type(s) of restrictions, a new route index will be returned as an attribute. The new route index will be used to pick the trunk group to route the CCS call. In an office that does not have CCS, this relation is not populated.

## 2. Data Dictionary Values

## 4. Population Rules for RLnw_rtidx

**Relation Description**
New routing index relation

This relation will only be used for CCS calls whose chosen route does not meet per call restrictions identified in the CCS IAM message. Given the current route index, and the type(s) of restrictions, a new route index will be returned as an attribute. The new route index will be used to pick the trunk group to route the CCS call. The rta subsystem is the main user of this relation.

Copyright © 1999 Lucent Technologies 

In general, there may be multiple occurrences of the same route index value (route_x) with different restrictions: thus giving a different new route index value (newrtx_x).

***NOTE:*** The following are guidelines pertaining to data rates, DAS, and a new route index. These cannot be enforced by recent change or ODA checks. For all route indexes derived by a DAS of 97 or 98, a tuple must exist in this relation without signaling type set to ISUP. For all route indexes derived by a DAS of 81, a tuple must exist in this relation with satellite set to yes. Note that additional restrictions (that is, satellite) may also exist on each of these types of route indexes.

Engineers Note:
Common Channel Signaling per call restrictions are contained in the Initial Address Message (IAM). The IAM contains both the dialed digits, and any per call routing restriction(s) known as Traveling Class Marks (TCMs).

If the original route index selected is incompatible with the routing restriction(s) associated with the particular call, the routing state will be set to RTCCS_REST. During this state, the relation RLnw_rtidx will be read. This relation produces a route index which is then used to translate to a trunk group number, which will be a key into the RLrt_trkg relation. By this means, a new route index (newrtx_x) will be computed, designed to meet the per call restriction(s).

The restrix attribute in RLnw_rtidx is really the anding of three individual attributes, those corresponding to out_signaling type, satellite, and digital path. The new route index must meet any and all per call restriction(s) contained in the IAM.

The values of NS (null signaling type) for signaling type: SN (satellite no) for the satellite indicator: and PN (digital path no) are the default values. They should be treated as don't care fields. If office engineering personnel are only concerned with the call routing over ISUP signaling (for example), the only field to be examined in the RLrt_trkg relation would be out_sigtype, which would have to be set to DBISUP7. If office engineering personnel are only concerned that a call not have a satellite connection, AND that a digital path be required, the only fields that need be examined in RLrt_trkg are satellite (which m

ust be set to DBNO), and digital path (which must be set to DBYES).

Listed here are some examples of how RLnw_rtidx would be used. (This is not an all inclusive list).

(1) The per call restriction as given in the IAM indicates that the call requires a digital path. This means that IAM.USI was coded 56KPS, 64KPS Res, or 64KPS. The original route index is 5, which points to trunk group 10. A read of RLrt_trkg, with trunk group 10 as the key, has digital path set to DBNO, which is incompatible with the TCM restriction.

So, RLnw_rtidx is read using route_x=5 restrix=NSSNPY, producing a route index of 15, which gives trunk group number 20. A read of RLrt_trkg, with trunk group 20 as the key, has digital path set to DBYES. Thus the route meets the per call restriction. The value of restrix for digital path (that is, PY for digital required, PN for no digital path required), must be PY. The other two possible restrictions (signaling type and satellite) are don't care's.

(2) The per call restrictions as given in the IAM indicate that the call requires both no more satellite connections, and a digital path. This means that IAM.USI was coded 56KPS, 64KPS Res, or 64KPS and Nat_of_conn.sat_ind was > 0 indicating that at least one satellite connection was already in the call path. The original route index is 25, which points to trunk group 30. A read of RLrt_trkg, with trunk group 30 as the key has either satellite set to DBYES, or digital path set to DBNO (or both). This is incompatible with the TCM restrictions.

So, RLnw_rtidx is read with route_x=25 restrix=NSSYPY, producing a route index of 35, which gives trunk group 40. A read of RLrt_trkg, with trunk group 35 as the key, has BOTH satellite set to DBNO AND digital path set to DBYES. Thus the route meets the per call restrictions. The value of restrix for satellite (that is, SY

**Copyright © 1999 Lucent Technologies** 

for satellite yes, SN for satellite no) must be SY, and the restrix value for digital path must be PY. The signaling type is treated as a don't care field.

(3) The per call restrictions as given in the IAM indicate that the call requires an ISUP7 connection, no more satellite connections, and a digital path. This means that IAM.USI was coded 56KPS, 64KPS Res, or 64KPS and Nat_of_conn.sat_ind was > 0 indicating that at least one satellite connection was already in the call path; also the IAM.FCI.ISUPpref was set to 'ISUP7 required'. The original route index is 45, which points to trunk group 50. A read of RLrt_trkg, with trunk group 50 as the key, has out_signaling type set to DBMF, and/or satellite set to DBYES, and/or digital path set

to DBNO. This is incompatible with the per call restrictions.

So, RLnw_rtidx is read with route_x=25 restrix=I7SYPY, which produces a new route index of 55, which points to trunk group 60. A read of RLrt_trkg, with trunk group 60 as the key has signaling type set to DBISUP7 AND satellite set to DBNO AND digital path set to DBYES. Thus the route meets the per call restrictions. The value of restrix for signaling type (that is, NS for null signaling type and I7 for ISDN-UP signaling type) must be I7, the restrix value for satellite must be SY, and the restrix value for digital path must be PY.

***NOTE:*** The following attribute section makes it appear that restrix is the primary key for rlNW_RTIDX, and route_x is the secondary key. This is not the case. The keys were listed in this order to satisfy the desires of memory engineering personnel. In reality, route_x can be thought of as the primary key."

**Attribute: restrix**

**Fullname:** CCS routing restrictions

**Attribute Description** This attribute indicates the status of the following Common Channel Signaling routing restrictions:

(1) out signaling type

(2) satellite

(3) dig_path.

(1) There are two possible variations for out_sigtype, which indicates the signaling type that the call should use, and hence the trunk group signaling type (out_sigtype in the RLrt_trkg relation):

NS, which indicates null signaling type (no specific signaling type is required).

I7, which indicates ISUP7 (Integrated Services Digital Network(R) User Part, or ISDN-UP 7) signaling type.

(2) There are two possible variations for satellite, which indicates whether or not the call has been routed via satellite:

SN, which is analogous to satellite equals DBNO, meaning that the call has not been routed via satellite: and thus, there will be no satellite restrictions on the returned newrtx_x attribute. The default value will be SN (DBNO).

SY, which is analogous to satellite equals DBYES, meaning that the call has been routed via satellite, and must not use another satellite route. In this case, the returned newrtx_x attribute must point to satellite = DBNO in the RLrt_trkg relation.

Copyright © 1999 Lucent Technologies 

***NOTE:*** When SY is set in restrix, either the call has been routed via satellite OR the call is an incoming international call.

(3) There are two possible variations for dig_path, which indicates whether or not a digital path is required for the call.

PN, which is analogous to dig_path equals DBNO, meaning that a digital path is not required. Thus, there will be no digital restriction on the returned newrtx_x attribute. The default value will be PN (DBNO).

PY, which is analogous to dig_path equals DBYES, meaning that a digital path is required to complete the call. In this case, the returned newrtx_x attribute must point to dig_trunk = DBYES in the RLrt_trkg relation.

**Attribute: route_x**

**Fullname:** Existing route index chosen

**Attribute Description** This attribute represents the existing route index chosen based on the screening, prefix, and destination indexes. The chosen index is restricted to only those indexes derived from incoming CCS trunks. There are no particular constraints on the route index.

**Attribute: newrtx_x**

**Fullname:** New route index

**Attribute Description** This attribute indicates the new route populated to meet the previously mentioned criteria restrictions (sigtype, satellite, and dig_path).

## 4. Population rules for RLnxxrange

### Relation Description

RLnxxrange is allocated to store NPA NXX data

This relation is used by views 27.12R and 27.12V to store the NPA NXX data for the OSPS NPA Code Expansion for BLV (98-5E-4281) feature beginning in 5e14_1b.

Examples:

1) If NPA (312), ROUTECODE (15) and both BEGNXX and ENDNXX are null as input, the data will be stored as shown in the following column (1). A range of 0 to 1000 will be stored to represent the entire NPA.

2) If NPA (312), ROUTECODE (15), BEGNXX (979) and ENDNXX is null are input, the data will be stored as shown in the following column (2).

3) If NPA (312), ROUTECODE (15), BEGNXX (979) and ENDNXX (989) are input, the data will be stored as shown in the following column 3.

4) If there are multiple entries input for an NPA, the

**Copyright © 1999 Lucent Technologies** 

data will be sorted and stored as shown in the following columns (4), (5), and (6). There is room in each data structure for 3 ranges. Each tuple will be numbered from 0 up to the maximum number of relations needed -1 in increments of 1. Unused data ranges will be blank. All of the NXX range pairs must be non-overlapping, unique ranges for each NPA. As additional entries are input, the pair will be inserted/deleted in order. If 7 NXX ranges are input, 3 tuples will be used. Tuple number 0 data is seen in column (4). Tuple number 1 is seen in column (5) and tuple number 2 in column (6).

| | (1) | (2) | (3) | (4) | (5) | (6) |

first key
**Attribute Description:**
Used to store the numbering plan area (NPA) or the local routing number (LRN). The range is 200-999.

**Attribute:**
tupnum
**Fullname:**
second key
**Attribute Description:**
Used to store TUPNUM which is a sequential number of tuples associated with each unique NPA.

**Attribute:**
routecode
**Fullname:**
route code
**Attribute Description:**
Used for the ROUTECODE which is associated with each verifiable NPA. The range is 000-999. The ROUTECODE must be

**Copyright © 1999 Lucent Technologies** 

unique for each NPA and cannot be shared with another NPA.

**Attribute:**
begnxx[*]
**Fullname:**
begin nxx in the range
**Attribute Description:**
Field used to store the beginning NXX values in a range of NXX that is specified. The value of NXX is 000-999. If NXX is not specified, then it will be stored as 0 in the data.

**Attribute:**
endnxx[*]
**Fullname:**
ending nxx in the range
**Attribute Description:**
Field used to store the ending NXX values in a range of NXX that is specified. The value of endnxx0 is 000-1000. The value of endnxx1 and endnxx2 is 000-999. If END NXX is not specified then it will either equal 1000 in the data if the entire NPA is included or it will equal BEGNXX for a single NXX range.

**Attribute:**
entries
**Fullname:**
number of entries
**Attribute Description:**
Used to store the total number of ranges specified for this NPA.

## 4. Population Rules for RLoaexmap

**Relation Description**
This relation defines the exception areas for OSPS offices.

The existence of a tuple in this relation defines an exception area call. Define exception areas for office codes (or groups of office codes) which are considered as either privileged or compete areas. An exception area may represent a single NPA-NXX or a group of NPA-NXX which is contained in a single LATA. All office codes represented by the exception area index will receive the same exception area treatment by the OSPS.

(1) Each exception area should eventually be populated in at least one tuple of RLoaexmap. However there is no dependency required to enforce this.

(2) An exception area may be defined as a one way or two way calling area. A one way would require a single entry with the eai being defined as either the originating or terminating area. A two way area would be defined

Copyright © 1999 Lucent Technologies 

by having two entries, the second with the indexes reversed.

(3) The originating and terminating exception area may not be in the same LATA.

(4) The originating and terminating eai may not be the same in a single tuple entry.

(5) An office code is not allowed to be defined in more than one exception area and is enforced by the RLfcnpamap poprules.

(6) Deletion of the last tuple using a given exception area index (oeai or teai) in this relation is not allowed unless the RLfcnpamap tuple which defines this exception area index is removed.

**Attribute: oeai**

**Fullname:** Originating exception area index

**Attribute Description** Originating exception area index of the originating NPA-NXX as obtained from RLfcnpamap.

**Attribute: teai**

**Fullname:** Terminating exception area index

**Attribute Description** Terminating exception area index obtained from RLfcnpamap based on terminating NPA-NXX.

## 4. Population Rules for RLoaodisp

**Relation Description**
OSPS display index to character display mapping.

This relation is not to be populated for international applications. Populate only in offices intended to serve OSPS.

**Attribute: dispx**

**Fullname:** Display index

**Attribute Description** Identifies the display index for the given call factors.

**Attribute: display**

**Fullname:** Display

**Attribute Description** Displayed upon position seizure. Filled with up to SZDISPLAY characters 'A'-'Z', 'a'-'z', '0'-'9', '-','/', and ' '(blank). This field is left justified. The intercept feature is intended to replace the existing automatic intercept system (AIS). AIS has the capability to display at the intercept operator position, a 'class' indicator which could map into the various type/class of intercept calls. For OSPS intercept, the customer could define the display to the 'intercept' operator via this attribute to accomplish the same functionality. The following strings are appropriate with respect to the different intercept classes:

```
INTERCEPT CLASS        'AIS EQUIVALENT DISPLAY'
---------------  --------------------------------
ANIBLNK, ONIBLNK  'VACANT', 'BLANK' or 'UNASSIGNED'
ANITRBL, ONITRBL  'TROUBLE'
ANIREG, ONIREG    'CHANGED'
ANIFAIL, CONC     'UNKNOWN'
```

**Attribute: dnstart**

**Fullname:** Display number star

**Attribute Description** Display for calling/called number.

**Attribute: dnlen**

**Fullname:** Display number length

**Attribute Description** Calling/called number display length.

```

## 4. Population Rules for RLocntwk

**Relation Description**
Static relation containing the carrier to use to route to the NPA, TTC, and operator special dialed code combination as part of a LEC intracompany network.

The non-key attribute for the valid carrier is included as part of the tuple.

**Attribute: oanpa**

**Fullname:** oa npa

**Attribute Description** The operator entered NPA.

**Attribute: oattc**

**Fullname:** oa TTC

**Attribute Description** The operator entered term toll center (TTC) code.

Copyright © 1999 Lucent Technologies

**Attribute: oaosdc**

**Fullname:** OA OSDC

**Attribute Description** Operator special dialed codes for the NPA, NXX combinations.

Range from 0000-2100 internally. Using ODA and RC the range should be 000-999, 1100-1199 11000-11999 on the input forms.

OSDC dialing can be of the form:

```
1. XXX
2. 11XX
3. 11XXX    X = [0-9].
```

Therefore, there are 2100 possible OSDCs, and the mapping of all possible OSDCs into 0000-2100 range can be accomplished as followed:

```
if 000 =< dial.osdc =< 999
        then oaosdc = dial.osdc
if 1100 =< dial.osdc =< 1199
        then oaosdc = 1000 + ( dial.osdc - 1100 )
if 11000 =< dial.osdc =< 11999
        then oaosdc = 1100 + ( dial.osdc - 11000 )
```

Application programs must translate this attribute back to its normal form before attempting to make any meaning out of it, as followed.

```
if 000 =< oaosdc =< 999
        then read.osdc = oaosdc
if 1000 =< oaosdc =< 1099
        then read.osdc = oaosdc - 1000 + 1100
if 1100 =< ososdc < 2100
        then read.osdc = oaosdc -1100 + 11000
```

The mapping is as follows:

```
RLocntwk    OSDC (As on input forms)
oaosdc
--------   -------------------------
000-999     000-999
1000-1099   1100 - 1199
1100-2099   11000 - 11999
```

**Attribute: oacarr**

**Fullname:** oa carrier

**Attribute Description** Carrier for the call.

**Defines:** "db/DMcarr_val.h"

Copyright © 1999 Lucent Technologies

# ODPSOP

## 1. Description

User data for the on demand packet (ODP) feature. In the 5E5 generic, this offering will be limited to on demand packet B (ODB) and will be provided by the enhanced B packet switching (EBPS) capability.

## 2. Data Dictionary Values

## 4. Population Rules for RLodpsop

**Relation Description**
User data for EBPS feature.

This relation maps a User ID number to the PH, PH - channel and band. It also includes level 2 and level 3 parameters used when setting up the ODB call. For each user, a tuple resides only on the SM where the BRI is located. RLodpsop is a fixed partitioned (FP) relation.

A User can subscribe to either zero, one, or two On-Demand B-Channels. If a User does not subscribes to any On-Demand B-Channels, then a tuple of RLodpsop does not exist. If a User subscribes to either one or two On-Demand B-Channels, then the information on the On-Demand B-Channel(s) is stored in one tuple of RLodpsop.

As of 5E9, all lines with X.25 Packet Switching features are no longer being supported on the PH2 Access Image. X.25 Packet Switching is only being supported on PH3's. In 5e10, X.25 Packet Switching is supported on both PH3's and PH4's.

**Attribute: port**

**Fullname:** D port name

**Attribute Description** The port defines the PH port of the D-Channel of the DSL

**Attribute: party**

**Fullname:** ODB User

**Attribute Description** Identifies ODB User on the DSL

**Attribute: t3xx**

**Fullname:** Network initiated clearing timer

**Attribute Description** Time to wait (in minutes) after last X.25 call terminates before tearing down the nailed-up connection. A value of zero means that the timer is not to be used, that is, the call is not to be torn down.

If the On-Demand B-Channel has conditional notification, then the timer T320 should be used instead of timer T3XX.

If the ODB channel has conditional notification, then the value for t3xx must be 0 minutes.

**Attribute: band**

**Fullname:** Performance class

**Attribute Description** For service provider to engineer Users among PH's.

**Attribute: ph_number**

**Fullname:** PH number.

**Attribute Description** Logical PH number of the given ODB user.

As of 5E9, all lines with X.25 Packet Switching features are no longer being supported on the PH2 Access Image. X.25 Packet Switching is only being supported on PH3's. In 5e10, X.25 Packet Switching is supported on both PH3's and PH4's.

Copyright © 1999 Lucent Technologies 

**Attribute: b_num**

**Fullname:** Number of On-Demand B-Channels

**Attribute Description** This attribute specifies the number of On-Demand B-Channels subscribed. The values for this attribute are 1 or 2.

The number of On-Demand B-Channels must equal the odb_bchan attribute in RLlpt_pt. If two On-Demand B-Channels are subscribed to, then the channels must have a Common DN.

**Attribute: ph_cn**

**Fullname:** PH channel number.

**Attribute Description** When the DSL Group (PH128) is assigned to On Demand B-Channel Packet Switching, then only ph channel (member) numbers that are multiples of 4. (such as member 0,4,8,12,...124) shall be allowed assignment in the DSL Group.

**Attribute: ph_cn2**

**Fullname:** Second PH Channel Number

**Attribute Description** PH Channel Number of the second ODB.

When the DSL Group (PH128) is assigned to On Demand B-Channel Packet Switching, then only ph channel (member) numbers that are multiples of 4 (such as member 0,4,8,12,...124) shall be allowed assignment in the DSL Group.

If only one On-Demand B-Channel is assigned, then the value for this attribute is 0.

**Attribute: lapbt1**

**Fullname:** T1 timer

**Attribute Description** Timeout value for frame retransmissions. This value is given tenths of a second, such as a value of 36 means 3.6 (three and six tenths) seconds. Range is 20 to 200 (2 to 20 seconds) in increments of 2 (0.2 seconds) that is [20, 22, 24,26...200].

**Attribute: lapbt3**

**Fullname:** T3 Timer

**Attribute Description** Timeout value for idle channel state. This value is given in seconds. Range is 3 to 30.

**Attribute: lapbn2**

**Fullname:** Frame transmission counter

**Attribute Description** The value of N2 shall indicate the maximum number of attempts made by the data computer equipment (DCE) or data terminal equipment (DTE) to complete the successful transmission of a frame to the DTE or DCE respectively.

**Attribute: lapbk**

**Fullname:** Layer 2 window size

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Maximum number of outstanding I (information) frames. I frames carry actual user data, as opposed to S (supervisory) frames, which are for layer 2 control only. The value of K shall indicate the maximum number of sequentially numbered I frames that the DTE or DCE may have outstanding (that is, unacknowledged) at any given time. The value of K shall never exceed seven.

**Attribute: dslrate**

**Fullname:** Data rate for B1 or B2-channel

**Attribute Description** Select speed to be used on b-channel nailed up to PH and PH channel for ODB user.

**Attribute: orig**

**Fullname:** ODB origination allowed

**Attribute Description** To allow ODB service to selected customers.

**Attribute: l2prof**

**Fullname:** Level 2 profile

**Attribute Description** Select level 2 protocol for ODB user.

**Attribute: intercept**

**Fullname:** DN placed on intercept

**Attribute Description** Indicates that the DN associated with this user has been placed on intercept.

**Attribute: use_t320**

**Fullname:** Use T320 Timer

**Attribute Description** This attribute specifies whether timer T320 or T3XX is to be used. The Timer T3XX is used if the ODB channel does not have Conditional Notification and Timer T320 is used if the ODB Channel does have Conditional Notification.

**Defines:** "db/DMparty.h"

# OFF_PAR

## 1. Description

This relation contains the Standardization Sector (SS7) (formerly CCITT7) (national and international versions) office parameters that are needed in the PH and are recent changeable. This relation is needed as it is not possible to have trigger functions for office parameters.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 1 |
| expected number of tuples | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCoff_par |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population rules for RLoff_par

### Relation Description

Office parameters.
This relation contains the National and International Standardization Sector (SS7) (formerly CCITT7) office parameters that are needed in the PH.

**Attribute:**
index
**Fullname:**
Index.
**Attribute Description:**
Index to the relation.

**Attribute:**
olo_gw
**Fullname:**
Other licensed operator.
**Attribute Description:**
DBYES if the office is a gateway to an Other Licensed Operator (OLO).

**Attribute:**
stpinh_nod
**Fullname:**
STP inhibited nodally.
**Attribute Description:**
DBYES if reporting for STP policed MSUs is inhibited nodally in the office.

**Attribute:**
stpinh_og
**Fullname:**
STP inhibited - outgoing.
**Attribute Description:**
DBYES if reporting for the outgoing STP policed MSUs is inhibited

Copyright © 1999 Lucent Technologies 

in the office.

**Attribute:**
stpinh_ic
**Fullname:**
STP inhibited - incoming.
**Attribute Description:**
DBYES if reporting for incoming STP policed MSUs is inhibited in the office.

**Attribute:**
mgtinh_nod
**Fullname:**
Management inhibited nodally.
**Attribute Description:**
DBYES if reporting for management policed MSUs is inhibited nodally in the office.

**Attribute:**
mgtinh_og
**Fullname:**
Management inhibited - outgoing.
**Attribute Description:**
DBYES if reporting for outgoing management policed MSUs is inhibited in the office.

**Attribute:**
mgtinh_ic
**Fullname:**
Management inhibited - incoming.
**Attribute Description:**
DBYES if reporting for incoming management policed MSUs is inhibited in the office.

**Attribute:**
upinh_nod
**Fullname:**
UP inhibited nodally.
**Attribute Description:**
DBYES if reporting for MTP User Part (UP) policed MSUs is inhibited nodally in the office.

**Attribute:**
upinh_og
**Fullname:**
UP inhibited - outgoing.
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

DBYES if reporting for outgoing MTP UP policed MSUs is inhibited in the office.

**Attribute:**
upinh_ic
**Fullname:**
UP inhibited - incoming.
**Attribute Description:**
DBYES if reporting for incoming MTP UP policed MSUs is inhibited in the office.

**Attribute:**
stpalt_rte
**Fullname:**
STP alternate route.
**Attribute Description:**
The stpalt_rte flag is used to implement the Circular Routing algorithm or the RED BOOK version of Signaling Route Management. CCS subsystem makes run time decisions that determine which of the above implementations will be executed. If Glcountry is UK, protocol is C7NATL and stpalt_rte is DBYES, algorithm for Circular Route Control works. If Glcountry is not UK and not NATL, and if stpalt_rte is DBYES then RED BOOK code gets active. If stpalt_rte is DBNO then the version before CRC or RED BOOK is active.

**Attribute:**
olomask
**Fullname:**
Other licensed operator mask.
**Attribute Description:**
The office which is being engineered may be identified by the OLO networks as having different point codes. This means that an office can have multiple point codes depending on the number of OLO's which signal to it. There must be a point code to each OLO that signals to the office.

**Attribute:**
olo1_pc
**Fullname:**
Other licensed operator 1 point code.
**Attribute Description:**
Contains the point code assigned by OLO one.

**Attribute:**
olo2_pc
**Fullname:**
Other licensed operator 2 point code.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Contains the point code assigned by OLO two.

**Attribute:**
olo3_pc
**Fullname:**
Other licensed operator 3 point code.
**Attribute Description:**
Contains the point code assigned by OLO three.

**Attribute:**
olo4_pc
**Fullname:**
Other licensed operator 4 point code
**Attribute Description:**
Contains the point code assigned by OLO four.

**Attribute:**
pol_allow
**Fullname:**
STP OPC Policing MSU default treatment.
**Attribute Description:**
Indicates the default MSU treatment is to allow/prohibit the STP function for the OPC/DPC pair

**Attribute:**
pol_active
**Fullname:**
STP OPC Policing feature active.
**Attribute Description:**
Indicates that the STP OPC Policing feature is active or in-active.

**Attribute:**
pol_thrshld
**Fullname:**
The threshold value for discarded STP MSU.
**Attribute Description:**
The threshold value for discarded STP MSU. When the number of MSUs discarded exceeds this value an output report will be generated.

**Attribute:**
actilsdpol
**Fullname:**
ILS/DPC Policing Active
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute will be used to indicate whether the ILS/DPC Policing feature is active or in-active on this GSM.

**Attribute:**
thrilsdpol
**Fullname:**
ILS/DPC Policing Threshold
**Attribute Description:**
This attribute will contain the threshold value for the discarded STP MSUs. When the number of MSUs discarded exceeds this value an output report will be generated.

**Attribute:**
defilsdpol
**Fullname:**
ILS/DPC Policing Default
**Attribute Description:**
This attribute will be used to indicate the default MSU treatment which will allow or prohibit the STP function for the ILS/DPC Pair.

**Attribute:**
falselnkcong
**Fullname:**
false link congestion
**Attribute Description:**
This attribute represents whether the customer has turned on monitoring of links in link congestion level 1 or level 2 for false link congestion. The default value is monitoring congestion level 2.

**Attribute:**
imprvd_slt
**Fullname:**
improved signaling link test
**Attribute Description:**
This attribute indicates whether improved signaling link test procedures have been selected for use on the global switching module for the SS7 PSU platform. If improved signaling link test procedures are to be used, imprvd_slt has a value of "DBYES".

## 4. Population Rules for RLofficecode

**Relation Description**
NOC to digits

**Attribute: noc**

**Fullname:** normalized office code

**Attribute Description** Normalized office code.

**Attribute: npa**

**Fullname:** area code

**Attribute Description** area code

**Attribute: nxx**

**Fullname:** office code

**Attribute Description** Traditionally, office codes are of the form NXX. For 5E3, the 0XX and 1XX Routing feature allows office codes of 0XX and 1XX, provided for special uses to preserve standard office code ranges. These are typically used for INWATS lines. Since 0XX and 1XX are being excluded from the LDIT, these lines can only be terminated to from an incoming trunk. This is a 1AESS Transparency feature.

Packet Switching TNs are of the form NXXXXXX. Office codes of the form 0XX and 1XX are not valid for packet TNs.

**Attribute: ffcf1**

**Fullname:** spare

**Attribute Description** spare attribute for future use

# OLNP_HEAD

## 1. Description

This relation, keyed by the NPA, contains query information about an NPA subgroup, which is defined as the group of 100 consecutive NXX's or (0/1)XX of a given NPA/RAO. An NPA/RAO consists of the following subgroups: RAO-0XX, RAO-1XX, NPA-2XX, NPA-3XX, NPA-4XX, NPA-5XX, NPA-6XX, NPA-7XX, NPA-8XX, NPA-9XX.

## 4. Population Rules for RLolnp_head

**Relation Description**
OLNP Header.

This relation contains query information about the ten NPA subgroups within an NPA. An NPA subgroup is defined as the group of 100 consecutive NXX's or (0/1)XX's of a given NPA/RAO. An NPA/RAO consists of the following subgroups: RAO-0XX, RAO-1XX, NPA-2XX, NPA-3XX, NPA-4XX, NPA-5XX, NPA-6XX, NPA-7XX, NPA-8XX, NPA-9XX. These are designated NPA subgroups NPA0, NPA1, NPA2, NPA3, NPA4, NPA5, NPA6, NPA7, NPA8, NPA9, respectively. There are ten 2-bit long attributes, called q2bit0 through q2bit9, containing query information for NPA subgroups NPA0 through NPA9, respectively.

The q2bit provides the following query information for the corresponding NPA subgroup:

## 4. Population rules for RLolnp_nxx

### Relation Description

OLNP-NXX

This relation contains query information about a given NPA subgroup within an NPA. An NPA subgroup is defined as the group of 100 consecutive NXX's or (0/1)XX of a given NPA/RAO. An NPA/RAO consists of the following subgroups: RAO-0XX, RAO-1XX, NPA-2XX, NPA-3XX, NPA-4XX, NPA-5XX, NPA-6XX, NPA-7XX, NPA-8XX, NPA-9XX. These are designated NPA subgroups NPA0, NPA1, NPA2, NPA3, NPA4, NPA5, NPA6, NPA7, NPA8, NPA9, respectively.
The member of an NPA subgroup is generally denoted as NPA-YXX, with 'Y' constrained to a decimal digit. There are 12 attributes of 8 bits each plus an attribute of 4 bit long, comprising 100 bits of data. Each bit corresponds to each of the 100 YXX's of the NPA subgroup. The YXX is arranged in ascending order in increments of one starting with the lowest bit of q8bit0 to the highest bit of q8bit11 through the highest order bit of q4bit. A '1' and '0' indicates the NXX is open to portability or not open portability, respectively.
See Main Description
end relation;

**Attribute:**

npa_grp

**Fullname:**

NPA Group

**Attribute Description:**

## 4. Population Rules for RLologinid

Copyright © 1999 Lucent Technologies

**Relation Description**
OSPS operator external login id relation.

This relation contains the external login ids and serving teams for OSPS operators, including commercial automatic call distributor (C-ACD) agents.

This relation is not to be populated for export applications. This relation is not to be populated for offices having no PSMs.

**Attribute: op_id**

**Fullname:** relative external operator identifier

**Attribute Description** This is the operator ID. The op_id must be left justified. Note that ONLY the OTRs (operator trouble reports) generated by operators with a op_id that consist of only numeric characters '0'-'9' are considered for reporting to an external OTR analysis system. Note that login 0001 is different than login 1. The ids from 9000 to 9999 are NOT ALLOWED. op_id can be from 1-4 alphanumeric characters.

**Attribute: dasc_opid**

**Fullname:** Directory Assistance System Computer (DAS/C) Operator Identifier

**Attribute Description** If login_optype = OSPSTA, then switch personnel should not be allowed to update this attribute. In this case, this dasc_opid attribute should have a value of 0.

If login_optype = OSPSDA, then the DAS/C Operator ID is a number, represented as 4 BCD digits packed into a short, whose range is 1-9999. It can take on any value in the previous range but must be different for every tuple. Each set of 4 bits must represent a number in the range 0-9.

**Attribute: intopid**

**Fullname:** Internal Operator Identifier

**Attribute Description** Internal operator id. This is a integer between 1-16383. It must have a different value for every tuple. It must always be between 1 and the current value of the global parameter Glintopcnt.

ODA RULES:
For a new office, intopid must be assigned sequentially starting with 1, and Glintopcnt must be equal to the number of tuples in this relation.
For existing offices being populated via off-line ODA process, intopid must be preserved for Retrofit, and Glintopcnt must be equal to the sum of the tuples in this relation and relation RLintopid.
For example (new offices), if 3 tuples have been inserted, the first tuple would have intopid = 1, the second would have intopid = 2, and the third would have intopid = 3. Glintopcnt would be 3.
For existing offices, intopid is preserved for Retrofit, and Glintopcnt must be equal to the number of tuples in this relation and relation RLintopid.

**Attribute: serv_tm**

**Fullname:** Serving Team number

**Attribute Description** Serving team number this operator id is assigned to. There must be a tuple in RLstinfo which is keyed by this serv_tm, and that RLstinfo tuple must have the attribute st_optype with the same value as this tuple's login_optype attribute.

Copyright © 1999 Lucent Technologies 

**Attribute: extdl_per**

**Fullname:** External Dialing Permissions

**Attribute Description** The rules and restrictions for this attribute (extdl_per), which are listed in the following paragraphs, apply only if login_optype = OSPSDA, or if login_optype = OSPSTA and the operator is on a Listing Services type call. If login_optype = OSPSTA and the operator is on any other T&A type call (0-, 0+, coin, etc.), the operator will be unrestricted, independent of how this attribute is set.

**Attribute: hand_off**

**Fullname:** Handoff allowed flag

**Attribute Description** DBYES if the operator is allowed to handoff.
DBNO if the operator is denied handoff.

**Attribute: transfer**

**Fullname:** Transfer allowed flag

**Attribute Description** DBYES if the operator is allowed to transfer to call queue.
DBNO if the operator is denied transfer to call queue.

**Attribute: con_tran_idv**

**Fullname:** Conference or transfer to individual operator allowed flag

**Attribute Description** DBYES if the operator is allowed to conference with or transfer to an individual operator or position.
DBNO if the operator is denied ability to conference with or transfer to an individual operator or position.

**Attribute: pswd**

**Fullname:** Operator's password

**Attribute Description**

The password used for monitoring, which is a string of SZPSWDID characters composed only of alphanumeric characters 'A'-'Z', 'a'-'z' and '0'-'9'. Note that the password must be exactly SZPSWDID (6) characters OR the null string.

For Toll and Assistance login ids (login_optype=OSPSTA) the password must contain at least one alphabetic character and one numeric character. In other words, all six characters can not be alphabetic and all six characters can not be numeric. Default: Null string.

**Attribute: mon_perm**

**Fullname:** Operator's monitoring permission flag

**Attribute Description** DBYES if the operator is allowed to monitor.
DBNO if the operator is not allowed to monitor.

**Attribute: login_optype**

Copyright © 1999 Lucent Technologies

**Fullname:** Type of operator for this login identifier

**Attribute Description** Type of operator login. login_optype for this operator must be the same optype as the attribute st_optype in the tuple keyed by the value of attribute serv_tm in relation RLstinfo. Only DA operators may be assigned to DA serving teams and TA operators assigned to TA serving teams. Either OSPSDA or OSPSTA.

RESTRICTIONS/DEPENDENCIES:

The login_optype attribute may not be updated by RC/V - it may only be specified during an insertion.

**Attribute: ospsff**

**Fullname:** OSPS fast feature item

**Attribute Description** The item is to be used for future OSPS fast feature development.

## 4. Population Rules for RLoloid

**Relation Description**
Other licensed operator index.

This relation takes the 'other licensed operator index' found in RLdpc_info, and returns the corresponding name of the 'other licensed operator'.

Copyright © 1999 Lucent Technologies

**Attribute: oloid**

**Fullname:** Other licensed operator index.

**Attribute Description** An index found in RLdpc_info that is used as a key into this relation.

**Attribute: oloname**

**Fullname:** Name of other licensed operator.

**Attribute Description** A character array that provides the name of the other licensed operator.

### Relation Description

Originating Line Screening (OLS) Restrictions Table

Relation is used by Originating Line Screening (OLS) to associate Class-Of-Charge (COC) restrictions with a screen code value.

**Attribute:**
scrncode
**Fullname:**
Screen code
**Attribute Description:**
0 for this key means not screened. 999 is reserved for testing.

**Attribute:**
restrictions
**Fullname:**
restrictions - Consists of 11 bit flags indicating which classes of charge are/are not allowed.
**Attribute Description:**
Consists of 11 bit flags indicating which classes of charge are/are not allowed. The attribute is retrieved as a binary string: abcdefghijk: the flags are:
(a is the high-order bit in the string)

a - whether paid or DDD billing is allowed (DBYES) or not (DBNO).
Default = DBYES.

b - whether collect billing is allowed (DBYES) or not (DBNO).
Default = DBYES.

c - whether autocollect is allowed (DBYES) or not (DBNO).
Default = DBYES.

d - whether back card# billing is allowed (DBYES) or not (DBNO).
Default = DBYES.

e - whether back third# billing is allowed (DBYES) or not (DBNO).
Default = DBYES.

Copyright © 1999 Lucent Technologies 

f - whether forward card# billing is allowed (DBYES) or not (DBNO).
Default = DBYES.

g - whether forward third# billing is allowed (DBYES) or not (DBNO).
Default = DBYES.

h - whether sent paid billing is allowed (DBYES) or not (DBNO)
for DA Call Completion calls. Default = DBYES.

i - whether alternate billing is allowed (DBYES) or not (DBNO)
for DA Call Completion calls. Default = DBYES.

j - whether DA Call Completion is allowed (DBYES) or not (DBNO).
Default = DBYES.

k - not currently used: should be set to DBNO.

**Attribute:**
scrct
**Fullname:**
screen code count
**Attribute Description:**
Number of times a screen code is used in a tuple in RLfcscrlne
or RLfcscrrng.

**Attribute:**
hdr_id
**Fullname:**
announcement header id
**Attribute Description:**
The announcement header ID is used in providing a branding
announcement for 0+ calls for the Customized Market
Announcements feature. The header ID is part of a branding
announcement given the customer to provide information on
automated calls. This header ID identifies the particular
market segment which will receive the customized announcement.
Header IDs 67 through 86 have been set aside for use by
the Customized Market Announcements feature.
Zero is not allowed on the RC/ODA form.
It is equivalent to unknown.

**Attribute:**
phr_id
**Fullname:**
announcement phrase id
**Attribute Description:**
This attribute identifies the phrase id of a
given announcement. The phrase ID is used in providing a branding
announcement for 0+ calls for the Customized Market

Copyright © 1999 Lucent Technologies 

Announcements feature. The phrase ID is part of a branding announcement given the customer to provide information on automated calls. This phrase ID identifies the particular market segment provider which will be presented in the branding announcement to the customer.
Zero is not allowed on the RC/ODA form.
It is equivalent to unknown.

**Attribute:**
acdtrknbr
**Fullname:**
ACD trunk number
**Attribute Description:**
This attribute is used by the SS7 Incoming Signaling to the OSPS from the 4ESS(TM) Switch feature to specify the "pseudo" trunk group number for ACD calls. The range of this field is 1 - 2000, or blank. This trunk group number does not have to be previously defined on view 5.1 (RLrt_trkg).

**Attribute:**
icstreat
**Fullname:**
ICS treatment
**Attribute Description:**
This attribute is used to specify whether or not an originating location (that is, back number) is eligible for ICS treatment.

**Attribute:**
icsintl
**Fullname:**
ICS international
**Attribute Description:**
This attribute is used to specify whether or not calls to international numbers from the associated originating location (that is, back number) is eligible for ICS treatment.

**Attribute:**
num_ext_rtg
**Fullname:**
External Routing Number
**Attribute Description:**
This attribute is used to specify what number the external routing number is.

**Attribute:**
elig_ext_rtg
**Fullname:**
External Routing Eligibility

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
This attribute is used to specify whether or not this call is eligible for external routing.

**Attribute:**
destidx
**Fullname:**
Destination Index
**Attribute Description:**
This attribute is used to specify what the destination index is for the external routing number.

**Attribute:**
ans_treatmnt
**Fullname:**
Answer Treatment
**Attribute Description:**
This attribute is used to specify whether immediate answer or billiable answer should be returned on a SS7 Signaled PBX Access call.

**Attribute:**
blk_tollfree
**Fullname:**
Block Toll Free
**Attribute Description:**
This attribute is used to specify whether the OLS Screen Code is assigned to originating line numbers considered ineligible for CICADA call completion.

**Attribute:**
rateofr_inlg
**Fullname:**
Rate Offer Ineligible
**Attribute Description:**
This attribute is used for the OLS screen code to specify whether or not a rate offer should be made on calls from lines for which that OLS code applies.

**Attribute:**
oaff1
**Fullname:**
Spare Field 1
**Attribute Description:**
Spare field for fast features.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

oaff2

**Fullname:**

Spare Field 2

**Attribute Description:**

Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population Rules for RLop_id

**Relation Description**
This relation is part of the call type determination used for OSPS DA and C-ACD calls.

**Attribute: dest_x**

**Fullname:** Destination index from digit analysis

**Attribute Description** Usually populate at least three of same destination index for all screening indices.

**Attribute: screen_x**

**Fullname:** Screening index

**Attribute Description** Screening index associated with the incoming port.

**Attribute: prefix**

Copyright © 1999 Lucent Technologies

**Fullname:** Dialing prefix from the dialed digit sequence

**Attribute Description** Must be a value in any tuple in the RLdaprlfnl relation.

**Attribute: opnoc**

**Fullname:** Operator normalized code

**Attribute Description** This is the operator normalized code for look-up with local digits. This attribute must contain 0 if oppcid is non-zero. If opnoc is non-zero, there must be a tuple with opnoc as its key value in RLop_iddn.

**Attribute: ospsff**

**Fullname:** OSPS fast feature item

**Attribute Description** The item is to be used for future OSPS fast feature development.

**Attribute: oppcid**

**Fullname:** Operator pre-call identifier used in call types

**Attribute Description** This attribute must be 0 if opnoc is non-zero. If non-zero, there must be a tuple with oppcid as its key value in RLac_tkct.

## 4. Population Rules for RLop_iddn

**Relation Description**
This relation is part of the OSPS call type determination for DA and C-ACD applications.

It should be used when it is desired to identify calls based on the called number's address digits (last four).

There can be multiple tuples with the same opnoc value in this relation. When a tuple is deleted and if it's the only (last) tuple with a given opnoc, then a check must be made to verify that there is no tuple in the RLop_id relation with this opnoc value.

This relation should be used when it is desired to identify operator calls based on the called number's address digits (last four).

**Attribute: opnoc**

**Fullname:** Operator Normalize Code

**Attribute Description** This key is obtained by reading the opnoc attribute of a RLop_id relation tuple. Note that zero is not a valid key value since when the RLop_id opnoc attribute is zero, the non-zero RLop_id oppcid attribute will be used to index RLac_tkct directly.

Copyright © 1999 Lucent Technologies 

**Attribute: locdn**

**Fullname:** Local digits dialed

**Attribute Description** Local digits to be identified. Must always be four characters '0'-'9' and never blank.

**Attribute: ospsff**

**Fullname:** OSPS fast feature item

**Attribute Description** The item is to be used for future OSPS fast feature development.

**Attribute: oppcid**

**Fullname:** Operator Pre-Call IDentifier

**Attribute Description** This is the operator pre-call identifier used to determine the call type by serving as one of the two keys into RLac_tkct.

## 4. Population Rules for RLopdbparm

**Relation Description**
Database parameters which allow an operator to access an external database.

**Copyright © 1999 Lucent Technologies** 

This relation defines the parameters of the databases which can be assigned to the database keys on the operator's terminal.

To allow the addition of new vendors/emulations during the life of the generic without requiring relational definition language (RDL) changes, the following local defines must be used by code on the switch for db_termtype, RLpos_port.cstfeat and RLpos_lprt.cstfeat:

```
#define OA_TRAINER  5
#define OA_CSTNULL  0
#define OA_TEMPLATE 1
#define OA_BASIC    2
#define OA_IBMEM    3
#define OA_VLTDEM   4
```

**Attribute: db_type**

**Fullname:** Database number

**Attribute Description** This is a unique number assigned to the database on this switch.

**Attribute: db_name**

**Fullname:** Database name

**Attribute Description** The name of the database. This name will be used to refer to this database in other recent change (RC)/ODA views, and it will be used to label the database key to which it has been assigned on the operator terminal display.

**Attribute: wd1size**

**Fullname:** Word 1 size

**Attribute Description** This is the number of characters in the attribute srchwd1.

**Attribute: srchwd1**

**Fullname:** Search word 1

**Attribute Description** This is the first string sent out by the database during a login sequence.

**Attribute: wd2size**

**Fullname:** Search word 2 size

**Attribute Description** This is the number of characters in the attribute srchwd2.

**Attribute: srchwd2**

**Fullname:** Search word 2

**Attribute Description** This is the second string sent out by the database during a login sequence.

**Attribute: db_adr**

**Fullname:** Database address

**Attribute Description** This is the first integrated services digital network (ISDN) destination packet

**Copyright © 1999 Lucent Technologies** 

telephone number of the database.

**Attribute: db_adr.dn0**

**Fullname:** Digit number 0

**Attribute Description** This is the first binary coded decimal (BCD) digit of the ISDN packet telephone number.

**Attribute: db_adr.dn1**

**Fullname:** Digit number 1

**Attribute Description** This is the second BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn2**

**Fullname:** Digit number 2

**Attribute Description** This is the third BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn3**

**Fullname:** Digit number 3

**Attribute Description** This is the fourth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn4**

**Fullname:** Digit number 4

**Attribute Description** This is the fifth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn5**

**Fullname:** Digit number 5

**Attribute Description** This is the sixth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn6**

**Fullname:** Digit number 6

**Attribute Description** This is the seventh BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn7**

**Fullname:** Digit number 7

**Attribute Description** This is the eighth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn8**

**Fullname:** Digit number 8

**Attribute Description** This is the ninth BCD digit of the ISDN packet telephone number.

Copyright © 1999 Lucent Technologies 

**Attribute: db_adr.dn9**

**Fullname:** Digit number 9

**Attribute Description** This is the tenth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.dn10**

**Fullname:** Digit number 10

**Attribute Description** This is the eleventh BCD digit of the ISDN packet telephone number.

**Attribute: db_adr.digcnt**

**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the packet telephone number.

**Attribute: db_adr2**

**Fullname:** Database address 2

**Attribute Description** This is the second ISDN destination packet telephone number of the database. This is only used for databases which support TEMPLATE terminal emulation.

**Attribute: db_adr2.dn0**

**Fullname:** Digit number 0

**Attribute Description** This is the first BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn1**

**Fullname:** Digit number 1

**Attribute Description** This is the second BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn2**

**Fullname:** Digit number 2

**Attribute Description** This is the third BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn3**

**Fullname:** Digit number 3

**Attribute Description** This is the fourth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn4**

**Fullname:** Digit number 4

**Attribute Description** This is the fifth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn5**

Copyright © 1999 Lucent Technologies 

**Fullname:** Digit number 5

**Attribute Description** This is the sixth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn6**

**Fullname:** Digit number 6

**Attribute Description** This is the seventh BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn7**

**Fullname:** Digit number 7

**Attribute Description** This is the eighth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn8**

**Fullname:** Digit number 8

**Attribute Description** This is the ninth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn9**

**Fullname:** Digit number 9

**Attribute Description** This is the tenth BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.dn10**

**Fullname:** Digit number 10

**Attribute Description** This is the eleventh BCD digit of the ISDN packet telephone number.

**Attribute: db_adr2.digcnt**

**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the second packet telephone number.

**Attribute: cust_cugx**

**Fullname:** Customer closed user group index

**Attribute Description** This closed user group index is sent to the video display terminal (VDT). The VDT will use this number to form an X.25 call request packet with a closed user group facility equal to this value.

**Attribute: s_wsize**

**Fullname:** Send window size

**Attribute Description** The X.25 send window size.

**Attribute: s_psize**

Copyright © 1999 Lucent Technologies 

**Fullname:** Send packet size

**Attribute Description** The X.25 send packet size. Nonzero values must be powers of 2 and could theoretically range from 16 to 4096 (that is, 16, 32, 64, ...4096) but in the *5ESS*®-2000 switch the actual value is restricted to less than this.

**Attribute: r_wsize**

**Fullname:** Receive window size

**Attribute Description** The X.25 receive window size.

**Attribute: r_psize**

**Fullname:** Receive packet size

**Attribute Description** The X.25 receive packet size. Nonzero values must be powers of 2 and could theoretically range from 16 to 4096 (that is, 16, 32, 64, ... 4096) but in the *5ESS*®-2000 switch the value is restricted to less than this.

**Attribute: t20**

**Fullname:** Restart request response timer (seconds)

**Attribute Description** The X.25 level 3 timer used to time the response to the sending of RESTART REQUEST packet from the data terminal equipment (DTE) to the data communication equipment (DCE). The timer is started when a RESTART REQUEST packet is sent out and stopped when a RESTART CONFIRMATION or a RESTART REQUEST is received by the DTE. Upon expiring, R20 is decremented and another RESTART REQUEST is sent out with T20 being restarted.

**Attribute: t25**

**Fullname:** Data packet acknowledgement timer (seconds)

**Attribute Description** The X.25 level timer used to time the acknowledgement of DATA packets. This timer is started whenever a DATA packet is sent from the DTE. It is also started whenever a DATA, receiver ready (RR), or receiver not ready (RNR) packet is received with a P(R) that rotates the level 3 window. Upon expiring, the level 3 reset procedure is invoked with a RESET REQUEST packet being sent out from the DTE.

**Attribute: r20**

**Fullname:** Restart request retransmission count

**Attribute Description** The X.25 level 3 counter associated with T20. R20 is decremented upon T20 expiring. When T20 expires R20 times, level 3 communication is declared as broken with the application being informed of this event.

**Attribute: db_termtype**

**Fullname:** Terminal interface to the database

**Attribute Description** This defines the type of emulation used by the terminal when interfacing with the database.

## 4. Population Rules for RLopeisdb

**Relation Description**
Operator's EIS and Terminal Data Base Key.

This relation associates the EIS ID and the database key from the operator terminal with a particular serving team and service ID. This allows the proper database display and EIS service to be provided to an operator when a call is routed to their position, based on their serving team ID and service ID of the call.

Maximum number of tuples is 800 (based on 50 serving teams and 16 service IDs). Expected average number is 300.

**Attribute: serv_tm**

**Fullname:** External Information Serving Team Number

**Attribute Description** Number of the serving team to be associated with a particular service ID.

**Attribute: serv_id**

**Fullname:** External Information Service Identification Number

**Attribute Description** This attribute is for entering a service identification number associated with a

Copyright © 1999 Lucent Technologies 

particular type of service.

**Attribute: eis_id**

**Fullname:** External Information System Identification Number

**Attribute Description** This attribute is for entering an EIS number.

**Attribute: db_key**

**Fullname:** Data Base Key Number

**Attribute Description** This attribute is for entering database key number from the operator terminal to be associated with a particular serving team and service ID.

**Attribute: oaff1**

**Fullname:** spare 1

**Attribute Description** Fast Feature Spare.

**Attribute: oaff2**

**Fullname:** spare 2

**Attribute Description** Fast Feature Spare.

## 4. Population Rules for RLopextdb

Copyright © 1999 Lucent Technologies

**Relation Description**
External database which is accessible by an operator serving team.

MEMORY ENGINEERING INFORMATION:
The maximum number of tuples is determined from the following algorithm: #db_num x # of ofc_num x # of serv_tm.

In Release 5E4(2) the maximum value of db_num is 1, the maximum value of ofc_num is 32, and the maximum value of serv_tm is 129. Therefore: the maximum number of tuples is 1 x 32 x 129 = 4128

In 5E6, the previous is still valid, since all office/serv team combinations must have the same db_key. Assuming no setup would ever have more than 20 offices, the maximum number of tuples is more likely to be 2580.

**Attribute: db_key**

**Fullname:** Database key on the operator console

**Attribute Description** This corresponds to a database softkey on the operator terminal. For this serving team and office ID, this database key is assigned to have the database given in the database name field.

**Attribute: ofc_num**

**Fullname:** Operator service center number

**Attribute Description** Operator service center (OSC) number.

**Attribute: serv_tm**

**Fullname:** Serving team number

**Attribute Description** Serving team number.

**Attribute: db_type**

**Fullname:** Database number from RLopdbparm

**Attribute Description** This defines which database on the switch is assigned to this tuple. Possible databases are defined in RLopdbparm.

**Attribute: sz_loginid**

**Fullname:** SZ login ID

**Attribute Description** Number of non-NULL characters in loginid. Restricted to 0 through SZDBLOGID.

**Attribute: loginid**

**Fullname:** Login ID

**Attribute Description** User login ID used for the external database login. This is a string of SZDBLOGID characters.

**Attribute: term_loginid**

**Fullname:** Termination Login ID

Copyright © 1999 Lucent Technologies 

**Attribute Description** Termination character for the loginid string.

**Attribute: sz_passwd**

**Fullname:** Size of Password

**Attribute Description** Number of non_NULL characters in password. Range is in 0 through SZDBPSWD.

**Attribute: passwd**

**Fullname:** Password

**Attribute Description** Password used for the external database login. This is a string of SZDBPSWD characters.

**Attribute: term_passwd**

**Fullname:** Termination password

**Attribute Description** Termination character for the passwd string.

**Attribute: autologin**

**Fullname:** Autologin Indicator

**Attribute Description** Should the VDT execute the auto login procedure whenever a session is established with this database?

**Attribute: autosession**

**Fullname:** Auto session indicator

**Attribute Description** Should session with this database be established automatically whenever the operator logs in to OSPS?

**Attribute: ospslogin**

**Fullname:** OSPS login indicator

**Attribute Description** Should the OSPS login be used as the login to this database?

**Attribute: rvchg_ind**

**Fullname:** Reverse charging indicator

**Attribute Description** Should the database DSLs be charged for calls to this database? If this is yes, then the database DSL must be engineered to accept reversed charge calls.

## 4. Population Rules for RLosdc

**Relation Description**
This relation contains the valid operator special dialed codes which can be used for residual calls.

**Attribute: osdc**

**Fullname:** Operator special dialed code

**Attribute Description** This is a valid OSDC for making residual calls.

All residual OSDC's for an office are either 4 digits of the form 11xx or 5 digits of the form 11xxx. Therefore a given RLosdc relation can have both 4 and 5 digit codes. If it is expected that the same residual OSDC will be dialed with both a 4 and 5 digit code to different destinations, then both the 4 and 5 digit code should be populated in this relation. For example, if calls to a marine operator are dialed as NPA-TTC-1153 to one destination and dialed as NPA-11531 to another destination, both codes (1153 and 11531) should be populated in this relation.

**Attribute: ospsff**

**Fullname:** OSPS fast feature

**Attribute Description** OSPS fast feature item - the item is to be used for future OSPS fast feature development.

## 4. Population Rules for RLosps_int

**Relation Description**
Incoming OSPS ID to internal ID.

Relation for mapping a four digit OSPS ID number to an internal ID number from 1 to 100 and its associated B and D channel trunk group number.

**Attribute: in_osps**

**Fullname:** Incoming OSPS ID

**Attribute Description** ID of the switch that is interflowing calls to this switch

**Attribute: int_id**

**Fullname:** Internal ID number

Copyright © 1999 Lucent Technologies

**Attribute Description** Indicates the internal ID number of the switch that the call is being received from.

**Attribute: sw_name**

**Fullname:** Name of the OSPS switch associated with the incoming OSPS ID

**Attribute Description** Indicates the name of the OSPS switch that is Interflowing calls to this switch.

**Attribute: inc_dtrkg**

**Fullname:** Incoming D-channel trunk group number

**Attribute Description** Indicates the trunk group number of the D-channels for incoming interflow traffic with class of service = OA_IFTERM and trunk direction = RTISDNLK

**Attribute: inc_btrkg**

**Fullname:** Incoming B-channel trunk group number

**Attribute Description** Indicates the trunk group number of the B-channels for incoming interflow traffic with class of service = OA_IFTERM and trunk direction = RTINCOM.

Copyright © 1999 Lucent Technologies

# OSPSPARM

## 1. Description

This static relation contains the OSPS Admin office parameters. This relation is used to determine the following:

(1) The OSPS Administrative office ID ( FMC or OSC and an ID number).

(2) The physical location (PSM, d-channel port number) of a given FMC/OSC.

(3) Whether the administrative port is connected to an OAP or is just an external data port (no input).

(4) Permission/screening information for OSPS report/display distribution.

(5) List of serving teams in the OSC (if the office is an OSC)

(6) Operator "made busy" threshold for position status display.

## 2. Data Dictionary Values

## 4. Population Rules for RLospsparm

**Relation Description**

OSPS is a feature available on a *5ESS*®-2000 switch.

One switch can support only one OSPS. Each individual OSPS can support a max of 8 force management centers (FMC)s and 32 Operator Service Centers. Each FMC and OSC within a given OSPS has a unique ID satisfying the following rules. However, there is no uniqueness requirement on FMC/OSC IDs in different OSPS sites, that is, 2 different OSPS sites can have identical OSC and FMC IDs.

The relation is used to determine the following:

(1) the OSPS Administrative office ID (FMC or OSC and an ID number).

**Copyright © 1999 Lucent Technologies** 

(2) the physical location (PSM, d-channel port number) of a given FMC/OSC.

(3) whether the administrative port is connected to an OAP or to a commercial ACD management information system (MIS).

(4) permission/screening information for OSPS report/display distribution.

(5) list of serving teams to appear in part 3 of 15 minute report.

(6) operator 'made busy' threshold for position status display.

(7) whether operators receive indicator when they are being monitored.

(8) type of data link used for office (ATA/STA).

(9) whether or not an OSC's event reports are forwarded to the owning FMC.

**Attribute: ofc_type**

**Fullname:** Office type

**Attribute Description** Office type, 'F' for FMC or 'O' for OSC.

**Attribute: ofc_num**

**Fullname:** Office number

**Attribute Description** Office number.
1-8 inclusive if ofc_type='F'.
1-32 inclusive if ofc_type='O'.

**Attribute: gdport**

**Fullname:** Global D-channel port

**Attribute Description** D-channel global port number for office.

The servclass attribute of this port in RLfc_porttyp must be AS_OAP.

For OSPS commercial ACD use, this attribute may be set for the port that has the servclass of OA_MIS_LNK. This would be used only for an OSC that is defined for the commercial ACD feature.

```
If the servclass is
OA_MIS_LNK the following must also be set to DBNO ofc_oap,
ofc_pm1 to ofc_pm3, ofc_pmop, ofc_dcq, ofc_dst, ofc_dpos, ofc_dop,
ofc_prf1 to ofc_prf3
and also the following must be set to 0:
ofc_msk1 to ofc_msk5, ofc_fmc, ofc_dlink.
```

**Attribute: gdport.member**

**Fullname:** Member

**Attribute Description** Member for D-channel global port.

**Attribute: gdport.module**

Copyright © 1999 Lucent Technologies 

**Fullname:** Module

**Attribute Description** Module for D-channel global port.

**Attribute: ofc_oap**

**Fullname:** Office OAP

**Attribute Description** Does the office have an OAP?

**Attribute: ofc_pm[*]**

**Fullname:** Office permission bit1-bit3

**Attribute Description** Can office get parts 1-3 of OSPS 15 minute report?

These permission bits only pertain to parts 1-3 of the 15 minute report when they are being printed at this office. If this office's 15 minute reports are being printed at another office these permission bits have no effect. Set to DBNO if the servclass of gdport in RLfc_porttyp equals OA_MIS_LNK.

**Attribute: ofc_pmop**

**Fullname:** Office permission operator report

**Attribute Description** Can office get the OSPS 24 hour operator report?

**Attribute: ofc_dcq**

**Fullname:** Office permission display queue

**Attribute Description** Can office request the call queue display?

**Attribute: ofc_dst**

**Fullname:** Office permission display serving team

**Attribute Description** Can office request the serving team display?

**Attribute: ofc_dpos**

**Fullname:** Office permission display Posn Status

**Attribute Description** Can office request the posn status display

**Attribute: ofc_dop**

**Fullname:** Office permission display Op Perf

**Attribute Description** Can office request the op perf display

**Attribute: ofc_prf[*]**

**Fullname:** Office preference bit1-bit3

**Attribute Description** Does office want parts 1-3 of OSPS 15 minute report?

These preference bits only pertain to parts 1-3 of the 15 minute report when they are being printed

Copyright © 1999 Lucent Technologies 

at this office. If this office's 15 minute reports are being printed at another office these preference bits have no effect. DBNO if the servclass of gdport in RLfc_porttyp equals OA_MIS_LNK.

**Attribute: ofc_prfop**

**Fullname:** Send scheduled 24 hour operator report?

**Attribute Description** Does the office want the 24 hour operator report sent automatically? When the office type is 'F', this field must be 'N', unless no other offices of any type on the same PSM have it set to 'Y'. Multiple OSC offices on the same PSM may have it set to 'Y' as long as there is no FMC office on that PSM with it set to 'Y'. The FMC version of the report uses many more OSDS messages than the OFC version, and this restriction helps prevent message control block overload on a PSM.

**Attribute: ofc_msk1**

**Fullname:** Office mask1

**Attribute Description** The following 5 attributes define a bit mask which indicates whether the office (ofc_num) will receive report/display data about other offices. If the bit is 'on' (DBYES), then the corresponding office's data is available at the office (ofc_type). Of course, a bit cannot be 'on' (=1) unless the office in question exists in this relation. If an OSC is receiving data for an FMC it will print the data for the OSCs indicated in that FMC's ofc_msk2 -> ofc_msk5.

Only sections 1 & 3 are printed for another office as section 2 is on a switch-wide basis and therefore, are the same for all offices.

IN ALL MASK ATTRIBUTES, BIT 0 IS THE LOW ORDER BIT!

For ofc_msk1, bits 0-7 are for FMCs 1-8.

```
If ofc_type = F this mask has no effect as an FMC can't receive
another FMC's reports.
If ofc_type = O this mask in effect says that this OSC will receive
the indicated FMC's reports.
```

**Attribute: ofc_msk[*]**

**Fullname:** Office mask2-5

**Attribute Description** For ofc_msk2 through ofc_msk5, this mask in effect says that this office is collecting data on the indicated OSCs.

```
For ofc_msk2, bits 0-7 are for OSCs 1-8.
For ofc_msk3, bits 0-7 are for OSCs 9-16.
For ofc_msk4, bits 0-7 are for OSCs 17-24.
For ofc_msk5, bits 0-7 are for OSCs 25-32
```

**Attribute: ofc_fmc**

**Fullname:** Office FMC

**Attribute Description** An FMC which can also receive an OSC's force records and (optionally) tickets.

If ofc_type='O', then ofc_fmc can equal 0-8.

- 0 implies: no FMC gets the OSC data
- 1-8 implies the corresponding FMC

Copyright © 1999 Lucent Technologies 

```
    receives the data.  The FMC must be defined to exist in
    this relation.
If ofc_type='F', then ofc_fmc must equal 0
```

**Attribute: ofc_st1**

**Fullname:** Office serving team

**Attribute Description** The following 4 attributes define bit maps of the serving teams which exist in (OSCs) or are 'owned by' (FMCs) this office. IN ALL MAP ATTRIBUTES, BIT 0 IS THE LOW ORDER BIT!

For both ofc_type='O' and ofc_type='F', the bit(s) corresponding to the serving team IDs represented in or owned by this office must equal 1. (A bit cannot be 'on' (=1) unless the corresponding serving team is defined in the relation RLstinfo.) 0 if the servclass of gdport in RLfc_porttyp equals OA_MIS_LNK.

For ofc_st1, a bit map of serving teams 1-32. Serving team 1 is the low order bit.

**Attribute: ofc_st[*]**

**Fullname:** Office serving team2-4

**Attribute Description** Bit map of serving teams 33-128.

```
ofc_st2 serving team 33-64
ofc_st3 serving team 64-96
ofc_st4 serving team 97-128
```

**Attribute: ofc_thresh**

**Fullname:** Office threshold

**Attribute Description** Number of times (0<=N<=6) within a one minute interval that an operator is allowed to be detected as 'made busy' by the position status display process before they are 'tagged' as being 'delinquent'.

**Attribute: mon_ndcator**

**Fullname:** Monitoring indicator

**Attribute Description** Monitoring indicator given?

```
DBYES - if the operators in this office are informed
        when being monitored.
DBNO  - if the operators in this office are not informed
        when being monitored.
```

**Attribute: ofc_dlink**

**Fullname:** Office data link

**Attribute Description** Type of data link and type of FMC forwarding.

```
       0 - interface using an ATA without ticket
           forwarding to the owning FMC
       1 - interface using an STA without ticket
           forwarding to the owning FMC
       2 - interface using an ATA with ticket
```

Copyright © 1999 Lucent Technologies 

```
    forwarding to the owning FMC
3 - interface using an STA with ticket
    forwarding to the owning FMC
```

If (ofc_type == F) or (ofc_fmc == 0) only values 0 or 1 are allowed. 0 if the servclass of gdport in RLfc_porttyp equals OA_MIS_LNK.

**Attribute: spare1**

**Fullname:** Spare Field 1

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

**Attribute: spare2**

**Fullname:** Spare Field 2

**Attribute Description** Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population Rules for RLotr_vld

**Relation Description**
Static relation containing valid operator trouble report (OTR) codes OSPS office destination for the OTR and MCC ROP printing information.

The relation is used to validate OTRs entered by the operator and then is used to determine the correct destination for the OTR.

**Attribute: otr_id**

**Fullname:** Operator Trouble Report Identifier

**Attribute Description** Numeric otr_ids consisting of 2 or 3 digits that is, '001'-'999' or '01'-'99' can be used. Single digit otr_ids cannot be used. If two digit otr_ids are entered they must be padded with a leading 0 (zero).

Copyright © 1999 Lucent Technologies

Alphanumeric otr_ids must consist of 2 or 3 characters. Alphanumeric otr_ids consisting of 2 alphanumeric characters will be left justified. Single character alphanumeric otr_ids cannot be used.

Note: only numeric T&A otr_ids will be considered for transmission to an external OTR analysis system.

**Attribute: otr_def**

**Fullname:** otr_def

**Attribute Description** OTR validity indicator.

**Attribute: ofc_type**

**Fullname:** Office Type

**Attribute Description** Destination admin office type.

**Attribute: ofc_num**

**Fullname:** Office Number

**Attribute Description** Destination admin office number.

**Attribute: otr_mcc**

**Fullname:** OTR MCC

**Attribute Description** Does this OTR code get printed at the MCC ROP?

**Attribute: otr_otrp**

**Fullname:** OTR OTR printer

**Attribute Description** This attribute is controlling the printing of the OTRs at the OAP OTR printer.

The attribute is set to a default value of DBYES for all OTR IDs. For OTRs with ID 010 through 099 (only), otr_otrp attribute can be reset to a value of DBNO.

```
DBYES - indicates that the OTR is to be printed at the OAP
        OTR printer.
DBNO  - inhibits the printing of the OTR. All other OTR IDs
        cannot be changed to DBNO.
```

## 4. Population Rules for RLpbg_info

**Relation Description**
This relation contains information needed on the SM for an ISDN simulated facilities group (SFG) for packet mode calls on a packet business group (PBG) basis. The billing directory number for the PBG is stored in this relation. Information required of routing calls associated with a packet business group is stored in this relation including abbreviated dialing length, and whether aggregate LCN and throughput counts are active on this PBG.
The following tuple semantics detail the allowed values for packet business group.

```
TUPLE SEMANTICS for a Packet Business Group
-------------------------------------------------------------------
psbgrp            Packet Business Group Number
bill_dn.digcnt    {0,10} (Number of digits in Billing DN
bill_dn.dn        Billing Directory Number
abbr_len          0-6  (Abbreviated Dialing Length)
abbr_del          {DBYES,DBNO} (Abbreviated Number Delivery)
tpc_act           {DBYES,DBNO} (Aggregate Throughput counts Active)
lcn_act           {DBYES,DBNO} (Aggregate LCN counts Active)
pbg_ama           {DBYES,DBNO}
```

**Attribute: psbgrp**

**Fullname:** Packet Business Group number.

**Attribute Description** The packet business group number is used to identify the packet business group. The packet business group number is assigned to lines and multi-line hunt groups to indicate membership in the packet business group. The values for this attribute are 1 to 100.

**Attribute: bill_dn**

**Fullname:** Billing Directory Number.

**Attribute Description** This attribute specifies the billing directory number for the packet business group.

**Attribute: bill_dn.digcnt**

Copyright © 1999 Lucent Technologies 

**Fullname:** Billing Directory Number digit count

**Attribute Description** This attribute contains the digit count for the billing directory number. The billing DN is stored in attribute bill_dn. The values for this attribute are 0 and 10. A value of 0 denotes that no billing DN has been subscribed.
If the global office parameter GLpbgmod is DBYES, then a billing DN must be provisioned for all PBGs.

**Attribute: bill_dn.dn**

**Fullname:** Billing Directory Number digits

**Attribute Description** This attribute specifies the digits of the billing directory number for the packet business group.

**Attribute: abbr_len**

**Fullname:** Abbreviated Dialing Length.

**Attribute Description** This attribute specifies the abbreviated dialing length for the packet business group. The abbreviated dialing feature allows the incoming X.25 call request packet to contain called DN of 1-6 digits. The called DN is then filled out to 11 digits using the originator's DN.

The values of this attribute range from 0 to 6. A value of 0 denotes that abbreviated dialing is not subscribed to.

**Attribute: abbr_del**

**Fullname:** Abbreviated Number Delivery.

**Attribute Description** This attribute specifies whether the packet business group has subscribed to the abbreviated number delivery feature. The value of DBNO for this attribute denotes that abbreviated number delivery is not subscribed to.
The abbreviated number delivery feature can not be subscribed to without also subscribing to an abbreviated dialing feature.

**Attribute: lcn_act**

**Fullname:** Aggregate Logical Channel Number counts active.

**Attribute Description** This attribute specifies whether the aggregate logical channel number count should be kept for the packet business group.

If the aggregate throughput limit is greater than 0 and the overflow treatment is blocking or charge premium, then the aggregate throughput count is active; otherwise, it is inactive.

**Attribute: tpc_act**

**Fullname:** Aggregate Throughput Class count Active.

**Attribute Description** This attribute specifies whether the aggregate throughput class count should be kept for the packet business group.

If the aggregate throughput limit is greater than 0 and the overflow treatment is blocking or charge

premium, then the aggregate throughput count is active; otherwise, it is inactive.

**Attribute: pbg_ama**

**Fullname:** Packet Business Group Automatic Message Accounting flag.

**Attribute Description** The packet business group automatic message accounting (AMA) flag specifies whether AMA records should be created for calls within the packet business group.

Copyright © 1999 Lucent Technologies 

# PBG_SFG

## 1. Description

This relation contains one entry for each Packet Business Group (PBG) defined.

## 2. Data Dictionary Values

       ( 12 bytes )
```

## 4. Population Rules for RLpbg_sfg

**Relation Description**
This relation contains parameters for an ISDN simulated facilities group (SFG) for packet mode calls on a packet business group (PBG) basis.

An aggregate count of logical channel numbers and throughput used by all members of the packet business group is kept and compared against the limits contained in this relation. When these limits are reached, the overflow treatment contained in this relation is applied to the packet business group.

```
TUPLE SEMANTICS for a Packet Business Group
-------------------------------------------------------------------
psbgrp     Packet Business Group Number
aggr_lcn   0-65536 (Aggregate LCN Limit)
aggr_tpc   0-536,870,912 by 1024 (Aggregate Throughput Limit)
ovfl_trt   {PSOF_NONE,PSOF_BLOCK,PSOF_PREMIUM}
num_mem    Number of Members
```

Copyright © 1999 Lucent Technologies

Packet business groups can only be assigned to members on PH3's.

**Attribute: psbgrp**

**Fullname:** Packet Business Group Number.

**Attribute Description** The packet business group number is used to identify the packet business group. The packet business group number is assigned to lines and multi-line hunt groups to indicate membership in the packet business group. The values for this attribute are 1 to 100.

**Attribute: aggr_lcn**

**Fullname:** Aggregate Logical Channel Number subscription parameter

**Attribute Description** The aggregate logical channel number subscription parameter defines the limit on logical channel numbers that can be active on a PBG before the PBG enters an overflow condition.

The values for this attribute range from 0 to 65536.

**Attribute: aggr_tpc**

**Fullname:** Aggregate Throughput Class subscription parameter.

**Attribute Description** The aggregate throughput class subscription parameter defines the limit on throughput class that can be active on a PBG before the PBG enters an overflow condition.

The value for the aggregate throughput class is provisioned in Kilo-bits-per-second (Kbps), but it is stored in bits-per-second (BPS). The value for the aggregate throughput class ranges from 0 to 524288 in increments of 1 Kbps. The value for this attribute ranges from 0 to 536870912 in increments of 1024 bps.

**Attribute: ovfl_trt**

**Fullname:** Overflow Treatment.

**Attribute Description** The overflow treatment attribute specifies the type of treatment to provide to all calls set up pertaining to the packet business group, when the packet business group is in an overflow condition.

If both the aggregate LCN and throughput limit equal 0, then the overflow treatment must be PSOF_NONE (no treatment).

**Attribute: num_mem**

**Fullname:** Number of Members.

**Attribute Description** The num_mem attribute is a count of the number of members in the packet business group. A member can be a line or a multi-line hunt group. This attribute is used by recent change to determine if a packet business group can be deleted.

The number of members is the count of all RLpsx25ln tuples with psbgrp equal to RLpbg_sfg.psbgrp added to the count of all RLrt_mhg tuples with psbgrp equal to RLpbg_sfg.psbgrp.

## 4. Population Rules for RLpc_msusg

**Relation Description**
This relation maps a MSU service group number to its picb number.

Only 2 MSUs are allowed per SM. Each MSU is allowed 2 service groups. Quantity of Tuples: 1 tuple for each MSU service group end relation;

**Attribute: msusg**

**Fullname:** MSU service group number

**Attribute Description** Metallic service unit number times 2 plus service group number. Only 2 MSUs are allowed per SM. Each non-compact shelf SU has 2 service groups. Each compact shelf MSU has 1 service group. RLrc_loceq.com_shelf is set to DBYES if a compact shelf.

**Attribute: picb**

**Fullname:** picb number

**Attribute Description** Picb number (key of RLpicb - picb number of MSU service group) plus one.

# PCI6_LAB

## 1. Description

This relation translates a Point Code Index (PCI) and a primary link indicator to a CCIS6 link pair. Two tuples are inserted for insertion of a tuple in RLlab6_pci. (One with primary attribute = DBNO and one with primary attribute = DBYES.) Conversely, two tuples are deleted for each deletion in RLlab6_pci.

## 2. Data Dictionary Values

| | |

## 4. Population rules for RLpci6_lab

**Relation Description**

```
Point code index to CCIS6 routing label relation
This relation translates a point code index (pci) and a primary link
indicator to a CCIS6 link pair.  There is a one-to-one correspondence
```

Copyright © 1999 Lucent Technologies

between this relation and RLlab6_pci. However, you must specify whether it is the primary link or not.

**Attribute:**
pci
**Fullname:**
Point code index
**Attribute Description:**
Point code index provides a unique internal representation of a CCIS6 link pair. See RLlab6_pci for more details.

**Attribute:**
primary
**Fullname:**
Primary link of CCIS6 link pair flag
**Attribute Description:**
Primary is a BOOLEAN which indicates whether this CCIS6 link pair is a primary or mate link as defined on the Trunk Group and Member form. Primary = DBNO indicates a mate link as assigned by the CCIS Network Administration Center(CNAC), and by the RBOCs for the local service provider. Primary = DBYES indicates a primary link as assigned by CNAC or RBOC.

**Attribute:**
sl_group
**Fullname:**
Signaling link group
**Attribute Description:**
This refers to the group of the CNI signaling link associated with this trunk. See RLlab6prt for more details.

**Attribute:**
sl_mem
**Fullname:**
Signaling link member
**Attribute Description:**
Signaling link member within a signaling link group. Supplied by CNAC (RBOC). See RLlab6prt for more details.

**Attribute:**
sl_vlink
**Fullname:**
Signaling link virtual link
**Attribute Description:**
When embedded CCIS is used (that is, CCIS6 messages passing over a 56 Kbs link), the physical link is divided into eight virtual links. This attribute specifies the virtual link. This is supplied by CNAC (RBOC).

## 4. Population Rules for RLpci7_lab

**Relation Description**
Point code index to CCS7 routing label relation

This relation translates a Point Code Index (PCI) to a destination/origination point (DPC/OPC) code and network combination for CCS7 trunks. The ccs subsystem is the main user of this relation.

PCIs are arbitrary indexes used to save AM memory. Each trunk in the switch having a DBISUP7 (domestic only) or DBTUP7 (export only) signaling type must have a relation in the AM to translate the system 7 routing label to a global port. Since a particular OPC/DPC/network combination (49 bits) appears many times in an office, it is converted to a PCI (10 bits) to save space. PCIs are also used by CCIS6 trunks as described in the RLlab6_pci relation. Tuples in this relation are inserted, deleted, or updated based on information contained on the Trunk Group form. Any transaction on this relation should result in a corresponding transaction on the mirror relation, RLlab7_pci.

**Attribute: pci**

**Fullname:** Point code index

**Attribute Description** PCIs provide a unique internal representation of a system 7 OPC/DPC/network combination. PCIs are also shared with CCIS6 trunks. That is, system 7 PCIs are generated from the same pool as system 6 PCIs - see RLlab6_pci. See RLlab7_pci for more information.

**Attribute: dpc**

**Fullname:** Destination point code

**Attribute Description** DPC indicates the signaling point for the far-end office, except for inter-module trunks which set the DPC equal to a pseudo point code value that indicates the SM numbers on which the inter-module trunk terminates (that is, near-end SM and far-end SM). See RLlab7prt for more information.

**Attribute: opc**

**Fullname:** Origination point code

**Attribute Description** The OPC indicates the signaling point which is assigned to this office. It has the same layout as the DPC and will be assigned in the same manner. See RLlab7prt for more information.

**Attribute: network**

**Fullname:** SS7 Network to which the PCI belongs.

**Attribute Description** Network to which the PCI refers. See RLlab7prt.

**Attribute: psu_mod**

**Fullname:** PSU Module

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute identifies whether the CNI or a GSM is used for CCS signaling. The value of psu_mod is set to zero if the CNI is to be used for CCS signaling; otherwise psu_mod contains the GSM number for PSU based CCS signaling.

# PCI7GR

## 1. Description

This relation creates the CCS maintenance group messages. This relation is used to determine which Circuit Identifier Codes (CICs) are populated in a given offset of 24 CICs. This relations is used to create CCS7 Group messages for CCS Trunks.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 24192 |
| expected number of tuples | 10 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | TMpci7gr |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| corcable | DBYES |

## 4. Population Rules for RLpci7gr

**Relation Description** Relation for creating CCS group messages. This relation is read to determine which circuit identifier codes (CICs) are populated in a given range of 24 CICs. This relation is used to create group blocking messages for CCS trunks, when an SM is initialized or isolated from the network.

***NOTE:*** The reason for two different relations, ampci7gr and pci7gr, is due to the large difference in maximum number of tuples between the AM and SM.

```
pci        - Point code index.  This identifies the index
             which translate to an origination point code
             and a destination point code pair.
cic_offset - Circuit code (cic) offset.  This identifies the
             starting CIC of 24 CICs indicated in the cic_map.
             This will always be a multiple of 24 starting at 0.
cic_map    - This bitmap represents which circuit codes (CIC)
             for a given PCI are populated on this SM.  A bit of
```

Copyright © 1999 Lucent Technologies

```
             1 indicates that the CIC (cic_offset + bit number)
             is populated on this SM and is not CADN.  Bit 0 is
             the left most bit and 23 is the right most bit.

B represents cic 73
        .
        .
        .
X represents cic 95
```

**Attribute: pci**

**Fullname:** Point code index

**Attribute Description** This identifies the index which translate to an origination point code, destination point code and network combination.

**Attribute: cic_offset**

**Fullname:** Starting CIC

**Attribute Description** Circuit code (CIC) offset. This identifies the starting CIC of 24 CICs indicated in the cic_map. This will always be a multiple of 24 starting at 0 (0, 24, 48, 72, 96, and so forth).

**Attribute: cic_map**

**Fullname:** CIC bitmap

**Attribute Description** This bitmap represents which circuit codes (CIC) for a give PCI are populated on this SM. A bit of 1 indicates that the CIC (cic_offset + bit number) is populated on this SM and is not CADN. Bit 0 is the left most bit and 23 is the right most bit.

## 4. Population rules for RLpcrtoip

### Relation Description

Processor To IP Assignment Relation

This relation is used to hold from 1 to 5 IP addreses for a specific 5ESS(R)-2000 switch processor. The processor may be a physical or logical processor. One IP address is assigned to each SM for any 5ESS(R)-2000 switch performing IP processing.

**Attribute:**

pcr_name

**Fullname:**

Processor Name

**Attribute Description:**

Processor identification number and its associated qualifiers based on processor ID.

**Attribute:**

Copyright © 1999 Lucent Technologies

indx_addr[*]

**Fullname:**

IP Address Index

**Attribute Description:**

Index for the IP address[*] assigned to the processor.

**Attribute:**

subnet_mask[*]

**Fullname:**

Subnetwork Mask

**Attribute Description:**

The subnetwork mask associated with the IP address[*].

## 4. Population Rules for RLpcs_hlr

**Relation Description**
This WCTX relation contains Home Location Register (HLR) subscriber data.

This relation contains subscriber data common to the Home Location Register (HLR). This relation has corcable fields relating to status of the handset, message waiting indicator calling count and Shared Secret Data (SSD).

**Attribute: pcs_idx**

**Fullname:** Index into the hlr data

**Attribute Description** This is the key for the relation. Index into the HLR.

**Attribute: handset_st**

**Fullname:** Handset state

**Attribute Description** It indicates the state of the handset (pcsactive/pcsinactive).

**Attribute: vlr_id**

**Fullname:** Visitor Location Registration IDentifier

**Attribute Description** This is the VLR ISDN Number that identify the VLR where a subscriber is registered.

**Attribute: alert_id**

**Fullname:** Alert Identifier

**Attribute Description** Alert Identifier specifies alert phase and alert value.

**Attribute: mwi**

**Fullname:** Message waiting indicator

**Attribute Description** Message waiting indicator is a lamp on the handset that is illuminated when subscriber has a message.

**Attribute: count**

**Fullname:** Call history counter

**Attribute Description** This attribute is a modulo-64 count held in the SU. It is corced upon receipt of COUNT_UPDATE_REQ.

**Attribute: pcsssda**

Copyright © 1999 Lucent Technologies 

**Fullname:** Shared Secret Data - subset A.

**Attribute Description** This is the first part of SSD and is derived from the A-key for uss in authenticating the subscriber in both home and roaming environments.

**Attribute: pcsssdb**

**Fullname:** Shared Secret Data - subset B.

**Attribute Description** This is the second part of SSD and is derived from the A-key for uss in authenticating the subscriber in both home and roaming environments.

## 4. Population Rules for RLpctrktxc

**Relation Description**
Trunk transmission parameters.

**Attribute: portname**

Copyright © 1999 Lucent Technologies

**Fullname:** Trunk circuit name

**Attribute Description** 16-bit trunk circuit name. This identifies the trunk to which these attributes apply.

**Attribute: fetyp**

**Fullname:** Far end type

**Attribute Description** The far end type gives the transmission level point of the far-end office. This is used in domestic applications to determine the digital loss to be inserted toward the line on trunk-line connections. An exception to this is that ISDN lines, including OSPS attendants, never receive digital loss except for conference connections.

The following layout shows the loss value given as a function of fetyp.

| fetyp | TLPN3 | TLPN2 | TLPN1 | TLP0 | TLP1 | TLP2 | TLP3 | TLP4 | TLP5 |
|---|---|---|---|---|---|---|---|---|---|
| loss | 6 dB | 5 dB | 4 dB | 3 dB | 2 dB | 1 dB | 0 dB | 7 dB | 8 dB |

```
The recommended values for fetyp are:
trunks:
TLP0  - far-end is local or tandem
TLPN2 - far-end is analog toll
TLPN3 - far-end is digital toll
For analog trunks:
TLP3  - all far-end connections.
```

**Attribute: netlp**

**Fullname:** Near end transmission level point (TLP)

**Attribute Description** The near end TLP is used to determine loss only on trunk-trunk connections. The valid values of netlp are TLP0 and TLPN3. If both trunks have a netlp of TLPN3, no digital loss is inserted in either direction. If either trunk in the connection has netlp set to TLP0, loss may be inserted when connecting a digital trunk to an analog trunk. The amount of loss is a function of trnktyp and fetlcls. See fetlcls for details. The suggested value for netlp is TLP0 for all trunks in a local *5ESS*®-2000 switch and for trunks that carry only local traffic in a local/toll *5ESS*®-2000 switch. It is suggested that netlp be set to TLPN3 for all trunks in a toll *5ESS*®-2000 switch and for trunks that carry at least some toll traffic in a local/toll *5ESS*®-2000 switch.

**Attribute: fetlcls**

**Fullname:** far end toll class

**Attribute Description** end toll class is used in conjunction with trnktyp to determine loss only on trunk-trunk connections when either trunk has its netlp set to TLP0. Far end toll class is a numerical value, 0-5, that identifies toll class of the far end office.

```
5       - Denotes local or tandem.
          This should also be used for tie trunks
          when the 5ESS(R)-2000 switch is being used as a PBX.
1,2,3,4 - Denotes toll office.
          The following layout gives the digital loss that
          is inserted in trunk-trunk connections when
```

Copyright © 1999 Lucent Technologies 

either trunk has a 'netlp' other than TLPN3.

| FROM \ TO | local (fetlcls == 5) | | toll (fetlcls < 5) | |
|---|---|---|---|---|
| | analog | digital | analog | digital |
| local analog | 0 | 0 | 0 | 0 |
| local dig | 3 | 0 | 3 | 0 |
| toll analog | 0 | 0 | 0 | 0 |
| toll dig | 6 | 0 | 0 | 0 |

**Attribute: trnktyp**

**Fullname:** trunk type

**Attribute Description** Trunk type is used in conjunction with fetlcls in determining loss on trunk-trunk connections when either trunk has a netlp equal to TLP0. See fetlcls for details. Trunk type has two valid values: DIGITAL and ANALOG. It is recommended that trunks that use digital facilities throughout be set to DIGITAL and trunks that use analog facilities be set to ANALOG.

## 4. Population rules for RLpeelcc

### Relation Description

RLpeelcc will be used in 5E13 by the OSPS 800 Peel Out for Calling Card feature.
RLpeelcc is designated for OSPS fast feature group.

**Attribute:**
po_cc_id
**Fullname:**
key: peel out cc id
**Attribute Description:**
This attribute is used to determine 800 peel out for calling card characteristics.

**Attribute:**
propr_indet_al
**Fullname:**
indeterm handling
**Attribute Description:**
This attribute specifies the default value for an indeterminate card validation reply. A value of DBNO means deny "D" and a value of DBYES means allow "A". When a null value is entered, it will be stored as DBYES in the relation.

**Attribute:**
multi_cards
**Fullname:**
multiple cards
**Attribute Description:**
This attribute specifies whether or not cards other than 14 digits may be used.

**Attribute:**
propr_14dig

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
14 digit card treatment
**Attribute Description:**
This attribute specifies whether or not card queries for 14-digit cards are sent to designated propriety database only. DBYES indicates that the treatment is "P" (proprietary), and DBNO indicates that the treatment is "C" (CardTable).

**Attribute:**
seq_call_msg
**Fullname:**
seq call messages
**Attribute Description:**
This attribute specifies the maximum number of completed sequence calls allowed.

**Attribute:**
seq_call_att
**Fullname:**
seq call attempts
**Attribute Description:**
This attribute specifies the maximum number of incomplete automated sequence calls allowed.

**Attribute:**
propr_carr_grp
**Fullname:**
carrier group ID
**Attribute Description:**
This attribute references to a list of carriers that accept the proprietary card associated with access number. The null value is stored as a 0 in the relation.

**Attribute:**
propr_qry_to
**Fullname:**
query timeout
**Attribute Description:**
This attribute indicates the length of time to wait for receipt of a proprietary card response. The null value is stored as a 0 in the relation.

**Attribute:**
propr_trans_ty
**Fullname:**
translation type
**Attribute Description:**
This attribute specifies that translation type is used in the

**Copyright © 1999 Lucent Technologies** 

LIDB format query or an indication to use existing card table.
For CardTable a value of 999 is stored in the relation.

**Attribute:**
star_dlmtr
**Fullname:**
star character
**Attribute Description:**
This attribute value determines whether a caller-entered "*" erases the dialed digits, or marks the end of digit collection. DBYES indicates that the value is entered as "E" (ERASE), and DBNO indicates that the value is entered as "D" (DELIMITER).

**Attribute:**
pnd_dlmtr
**Fullname:**
pound character
**Attribute Description:**
This attribute value determines whether a caller-entered "#" erases the dialed digits, or marks the end of digit collection. DBYES indicates that the value is entered as "E" (ERASE), and DBNO indicates that the value is entered as "D" (DELIMITER).

**Attribute:**
retries_count
**Fullname:**
allow retries counter
**Attribute Description:**
This attribute specifies the number of retries allowed for entering either the forward number or a card number, excluding the first try.

**Attribute:**
timing_type
**Fullname:**
timing scheme
**Attribute Description:**
This attribute specifies the scheme for the initial digit and interdigit timing. DBYES indicates that the timing type is standard ACCS "A", and DBNO indicates that the timing type is uniform interdigit "U".

**Attribute:**
eras_dly_to
**Fullname:**
erase reprompt delay
**Attribute Description:**
This attribute specifies the delay time between receiving the erasure character and playing a reprompt. The null value is stored as

Copyright © 1999 Lucent Technologies 

255 in the relation.

**Attribute:**
interdig_to
**Fullname:**
interdigit timeout
**Attribute Description:**
This attribute specifies the time for setting an interdigit timer. The null value will be stored as 0 in the relation.

**Attribute:**
nodial_to
**Fullname:**
nodial timeout
**Attribute Description:**
This attribute specifies the time for setting a bailout timer. The null value will be stored as 0 in the relation.

**Attribute:**
oaff1
**Fullname:**
unsigned short attribute.
**Attribute Description:**
This attribute is not used by the OSPS 800 Peel Out for Calling Card feature and thus will always be zero (0).

**Attribute:**
po_annc_set
**Fullname:**
announcement set
**Attribute Description:**
This attribute specifies the alternate announcement code. The null value will be stored as 1023 in the relation.

**Attribute:**
oaff2
**Fullname:**
unsigned short attribute.
**Attribute Description:**
This attribute is not used by the OSPS 800 Peel Out for Calling Card feature and thus will always be zero (0).

**Attribute:**
label
**Fullname:**
proprietary card label
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute specifies the proprietary card label for the OSPS 800 Peel Out for Calling Card feature.

**Attribute:**
oaff3
**Fullname:**
unsigned short attribute.
**Attribute Description:**
This attribute is not used by the OSPS 800 Peel Out for Calling Card feature and thus will always be zero (0).

**Attribute:**
oaff4
**Fullname:**
unsigned short attribute.
**Attribute Description:**
This attribute is not used by the OSPS 800 Peel Out for Calling Card feature and thus will always be zero (0).

**Attribute:**
oaff5
**Fullname:**
unsigned short attribute.
**Attribute Description:**
This attribute is not used by the OSPS 800 Peel Out for Calling Card feature and thus will always be zero (0).

## 4. Population Rules for RLpf_cpsl

### Relation Description

Premises equipment port with a sleeve port.

Associates a customer premises equipment port with a sleeve port.

### Attribute: cpe_port

**Fullname:** global port id of customer premises equipment port used in PF feature

**Attribute Description** Global port id of customer premises equipment port used in PF feature. This attribute is divided into subattributes port.mrmber and port.module. The structure members are:

1. member (DMport): Port name of a trunk.
2. module (DMmodule): The IM number that this port terminates on.

Range of values:

Copyright © 1999 Lucent Technologies 

```
1.  member:  unsigned short (1 to 65535)
2.  module:  unsigned short (1 to 255)
    Default value: No default value.

    Dependency:
    1) Verify existence of tuple in RLfc_trunk for this key port.
    2) Verify existence of tuple in RLfc_porttyp for
       this key port with following attribute values:
            rlFC_PORTTYP.servclass = FC_PFCPE
            rlFC_PORTTYP.lptyp     = PCCPEOTRK
            rlFC_PORTTYP.porttype  = TM_TRK
            rlFC_PORTTYP.testpont  = DBNO
            rlFC_PORTTYP.els_loss  = DBNO.
```

**Attribute: cpe_port.member**

**Fullname:** port member

**Attribute Description** Customer premises equipment port member.

**Attribute: cpe_port.module**

**Fullname:** port module

**Attribute Description** Customer premises equipment port module.

**Attribute: slv_port**

**Fullname:** global port id of PFA sleeve port

**Attribute Description** Global port id of PFA sleeve port. This attribute is divided into subattributes port.member and port.module. The structure members are:

```
1.  member (DMport):  Port name of a trunk.
2.  module (DMmodule):  The IM number that this port terminates on.

Range of values:
1.  member:  unsigned short (1 to 65535)
2.  module:  unsigned short (1 to 255)
    Default value: No default value.

    Dependency:
    1) Verify existence of tuple in RLfc_trunk.
    2) Verify existence of tuple in RLfc_porttyp for
       this key port with the following attribute values:
            rlFC_PORTTYP.servclass = FC_PFSLV
            rlFC_PORTTYP.porttype  = TM_TRK
            rlFC_PORTTYP.testport  = DBNO
            rlFC_PORTTYP.els_loss  = DBNO.
```

**Attribute: slv_port.member**

**Fullname:** port member

**Attribute Description** pfa sleeve port member.

Copyright © 1999 Lucent Technologies 

**Attribute: slv_port.module**

**Fullname:** port module

**Attribute Description** pfa sleeve port module.

## 4. Population Rules for RLpf_gp

**Relation Description**
Associates a private facility access group to its trunk and signaling characteristics.

**Attribute: pf_gpid**

**Fullname:** Private Facility group id.

**Attribute Description** Dialed access code digits a string of up to 5 digits.
There must be one and only one Master tuple per pf_gpid. If there is a tuple with RLpf_gp.dial_code = other than M, there must be a tuple such that RLpf_gp.dialcode = M for that pf_gpid. The parm_id is 0 and there is not a tuple in RLpf_parm associated with the master tuple. The rout_typ is equal to RTE_NULL and the other attributes in RLpf_gp are set to 0. The master tuple is only used for the delete case to delete the pf_gpid. When the master dialcode is specified all the tuples associated with the specified pf_gpid will be deleted. If the entire group is not to be deleted only the pf group and the desired dial_code need to be entered.

**Attribute: dial_code**

**Fullname:** dialed access code digits

**Attribute Description** Dialed access code digits.

**Attribute: dial_code.dcnt5**

**Fullname:** Digit count.

**Attribute Description** Digit count.

**Attribute: dial_code.digits**

**Fullname:** Digits.

**Attribute Description** Digits or M for master tuple.

**Attribute: dest_x**

**Fullname:** Destination index.

**Attribute Description** Destination index.

```
If = 0 then,
        verify existence of tuple in RLpf_parm with
        key rlPF_PFPARM.parm_id  = rlPF_GP.parm_id,
        rlPF_GP.rout_typ = RTE_MC
Else,
        verify existence of tuple in RLpf_parm with
        key rlPF_PFPARM.parm_id  =  rlPF_GP.parm_id,
        rlPF_PFPARM.dcol_typ != PDC_POTS.
```

Copyright © 1999 Lucent Technologies 

**Attribute: parm_id**

**Fullname:** Parameters Id.

**Attribute Description** Indicates the ID of the set of parameters applicable for this pf_gpid and dialed code. This is the key to RLpf_parm relation which defines the parameters.
Verify that a tuple exists in RLpf_parm such that: key rlPF_PARM.parm_id = rlPF_GP.parm_id.

**Attribute: ri**

**Fullname:** Route index.

**Attribute Description** Route index used to route the call.

```
IF rout_typ = RTE_MC, then verify existence of
tuple for this key route index in RLrt_mcrt.
ELSE verify existence of tuple for this key route
index in RLrt_routing.
```

**Attribute: rout_typ**

**Fullname:** Route Type.

**Attribute Description** Indicates the type of route index attribute ri is.

```
The rout_typ must be equal to RTE_MC,
        if the corresponding RLpf_parm.dcol_typ
        is equal to PDC_POTS.
```

**Attribute: watsop_ri**

**Fullname:** Watsop ri

**Attribute Description** To be deleted.

**Attribute: q_req**

**Fullname:** Queuing request.

**Attribute Description** Modular queuing for outgoing facilities request.
If q_req is DBYES then RLPF_PARM.dcol_type must be PDC_FIXED, PDC_VAR, PDC_POTS or PDC_XY and ovlp_opls must be DBNO, where RLPF_PARM is keyed by parm_id.

**Attribute: ets_trk**

**Fullname:** Electronic tandem switch (ETS) trunk.

**Attribute Description** This flag indicates whether or not this is an electronic tandem switch (ETS) trunk for the call forwarding over private facilities (CFPF) CFPF/ETS forwarding case.
If ets_trk = DBYES then:

```
a) RLpf_parm.dcol_typ using parm_id as key must be PDC_0.
b) the trunk group to which ri routes must be a cut-through trunk.
   (that is, for rout_type = RTE_MC (RTE_HUNT),
   use ri as key for RLrt_mcrt(RLrt_routing) and retrieve grpnum
   (portgrp.grpnum): use grpnum as key for RLgroup_port and for
   each member in RLgroup_port with grpnum (portgrp.grpnum) as key
   having portgrp.grptype = TM_TRK, retrieve port.member and
```

Copyright © 1999 Lucent Technologies 

```
port.module: for each retrieved port.member and port.module as
keys for RLfc_trunk, cut_thru must be DBYES)
```

Note: If ets_trk is DBYES, this implies that auto-ARS is on the destination end of the trunk.

**Attribute: ath_alwd**

**Fullname:** Authorization allowed.

**Attribute Description** Indicates whether or not the destination end of the trunk is expecting an authorization (ATH) code to be dialed.

```
1) If ath_alwd is DBYES then
a) ets_trk must be DBYES
b) ath_len must be > 0
c) ath_prompt must not be TN_NONE
```

***NOTE:*** If ath_alwd = DBYES, this implies the ATH code feature is assigned to the destination end of the trunk.

**Attribute: ath_len**

**Fullname:** Authorization length.

**Attribute Description** This is the length of the authorization code to be collected and saved for future CFPF outpulsing.

The length must be greater than zero if ath_alwd is set to DBYES, otherwise it must be zero.

**Attribute: ath_prompt**

**Fullname:** Authorization prompt.

**Attribute Description** This indicates the type of tone that should be applied to prompt the user for the ATH code.

If this is not set to the default, then ath_alwd must be set to DBYES.

**Attribute: acct_len**

**Fullname:** Account length.

**Attribute Description** This attribute indicates the length of the lead_digs[] + account (ACCT) code digit sequence.

```
1) If acct_len > 0, ets_trk must be DBYES
2) acct_len must be greater than or equal to lead_dcnt.
```

Note: If acct_len is greater than zero, this implies that the ACCT code feature is assigned on the destination end of the trunk.

**Attribute: lead_dcnt**

**Fullname:** Lead digit count.

**Attribute Description** This attribute indicates the length of the lead ACCT code digit sequence.

```
1) lead_dcnt must always be less than or equal to acct_len
2) there must be lead_dcnt non-null digits specified in lead_digs[]
```

**Copyright © 1999 Lucent Technologies** 

**Attribute: pfgptyp**

**Fullname:** Private Facilities group type.

**Attribute Description** Indicates if the PFA group is circuit-switched voice or circuit-switched data.

**Attribute: lead_digs**

**Fullname:** Lead digits.

**Attribute Description** This array is used to store the lead account code digit sequence.

```
There must be a non-null entry for each
digit allowed by lead_dcnt.  Digits are left
justified, padded with nulls on the right.
      If lead_dcnt = 0
         lead_digs[0-2] must be \0
      If lead_dcnt > 0
         lead_digs[0] must in { '#', '*', '0' - '9' }
         lead_digs[1-2] must in { NULL, '0' - '9' }
```

## 4. Population rules for RLpf_parm

### Relation Description

private facility parameters.
Associates a private facility access
parameter id to set of parameters.
The following is a list of valid service classes
for port assigned this feature:

```
LINES
-----
FC_INDVDL
FC_ATTENDANT
FC_4WIRE_INDV
FC_PBX
FC_ISDN
FC_ISATND

TRUNKS
------
FC_PF
FC_PFLASH
FC_PFITT
FC_PFCPE
```

**Attribute:**
parm_id
**Fullname:**
parameter identification.
**Attribute Description:**
ID that associates a private facility access parameter id to set of parameter (key).

**Attribute:**
n1_dgt
**Fullname:**
first value of N'th digit.
**Attribute Description:**
First value of N'th digit.

**Attribute:**
n2_dgt
**Fullname:**
second value of N'th digit.
**Attribute Description:**
Second value of N'th digit.

Copyright © 1999 Lucent Technologies 

**Attribute:**
n3_dgt
**Fullname:**
Third value of Nth digit
**Attribute Description:**
Third value of Nth digit

**Attribute:**
n4_dgt
**Fullname:**
Fourth value of N'th digit
**Attribute Description:**
Fourth value of N'th digit

**Attribute:**
dcol_typ
**Fullname:**
digit collection type.
**Attribute Description:**
Depending on the value of this attribute, other attributes must set to valid specified values.

**Attribute:**
save_acd
**Fullname:**
save access code.
**Attribute Description:**
Indicates if the access code is to be saved.

**Attribute:**
dial_tn2
**Fullname:**
second dial tone.
**Attribute Description:**
indicates if second dial tone is to be given.

**Attribute:**
num_dgt
**Fullname:**
number of digits to collect.
**Attribute Description:**
Number of digits to collect including access code.
The allowed maximum value is 18 if the IDDD15 secured feature (SFID223) has been purchased and turned on, otherwise is 15.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ovlp_opls
**Fullname:**
overlap outpulsing.
**Attribute Description:**
Indicates if overlap outpulsing should be attempted.

**Attribute:**
dcol_ovlp
**Fullname:**
digits to collect before overlap.
**Attribute Description:**
Number of digits to collect before attempting overlap sending.
The allowed maximum value is 18 if the IDDD15 secured feature (SFID223)
has been purchased and turned on, otherwise is 15.

**Attribute:**
sig_conv
**Fullname:**
signal conversion.
**Attribute Description:**
Signal conversion may be needed on this route.
IF DBYES, dcol_typ = PDC_0
If sig_conv = DBYES, and PF_GP.pfgptyp = CSD, then
sig_t must not equal 0.
This is reserved for Recorded Telephone Dictation and
is not supported by CSD.
The following dependency poprule is recommended but not required.
If sig_conv=DBYES and sig_t=0 then the trunk group(s) pointed
to must have a FC_PFCPE servclass.

```
for every tuple in RLpf_parm
where (RLpf_parm.sig_conv equals DBYES and
        RLpf_parm.sig_t equals 0)
begin
        must find all tuples in RLpf_gp on all
        where (RLpf_gp.parm_id equals RLpf_parm.parm_id)
        when found
        begin
                RLpf_gp.rout_typ must equal RTE_HUNT
                must find at least 1 tuple in RLrt_routing
                where (RLpf_gp.ri equals RLrt_routing.route_x)
                when found
                begin
                        must find at least 1 tuple in RLrctgrprk
                        where (RLrctgrprk.portgrp.grpnum equals
                                RLrt_routing.portgrp.grpnum)
                        begin
                              RLrctgrprk.servclass must equal FC_PFCPE
                        end
                end
        end
```

**Copyright © 1999 Lucent Technologies** 

```
        end
```

**Attribute:**
```
        sig_t
```
**Fullname:**
```
        signal timing.
```
**Attribute Description:**
```
        Signal conversion release timing.
        If sig_t = 0 and PF_GP.pfgptyp = CSD, then sig_conv
        must not equal DBYES.
```

**Attribute:**
```
        max_dgt
```
**Fullname:**
```
        maximum digits.
```
**Attribute Description:**
```
        Maximum number of digits including access code, to collect.
        The allowed maximum value is 18 if the IDDD15 secured feature (SFID223)
        has been purchased and turned on, otherwise is 15.
```

**Attribute:**
```
        min_dgt
```
**Fullname:**
```
        minimum digit.
```
**Attribute Description:**
```
        Minimum number of digits including access code, to collect.
        The allowed maximum value is 18 if the IDDD15 secured feature (SFID223)
        has been purchased and turned on, otherwise is 15.
```

**Attribute:**
```
        nth_dgt
```
**Fullname:**
```
        N'th digit.
```
**Attribute Description:**
```
        Position of N'th digit.
        The allowed maximum value is 18 if the IDDD15 secured feature (SFID223)
        has been purchased and turned on, otherwise is 15.
```

**Attribute:**
```
        xnum_dgt
```
**Fullname:**
```
        X - number of digits.
```
**Attribute Description:**
```
        X- number of digits to collect based on N'th digit.
        The allowed maximum value is 18 if the IDDD15 secured feature (SFID223)
        has been purchased and turned on, otherwise is 15.
```

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ynum_dgt
**Fullname:**
Y - number of digits.
**Attribute Description:**
Y- number of digits to collect based on N'th digit.
The allowed maximum value is 18 if the IDDD15 secured feature (SFID223) has been purchased and turned on, otherwise is 15.

**Attribute:**
intdig_t
**Fullname:**
inter digit.
**Attribute Description:**
Inter digit collection timing.

**Attribute:**
pause1
**Fullname:**
initial pause.
**Attribute Description:**
This is a digit pause used to delay digit outpulsing for a variable length of time until the termination side of call forwarding over private facilities (CFPF) electronic tandem switching (ETS) trunk is ready to collect digits.

**Attribute:**
pause2
**Fullname:**
1st intermediate pause.
**Attribute Description:**
This is the first intermediate pause required for CFPF/ETS segmented signaling. IT is used to cause a delay between the account code and DN digit sequence for the non-collocated invocation of CFPF.

**Attribute:**
pause3
**Fullname:**
second intermediate pause.
**Attribute Description:**
This is the second intermediate pause required for CFPF/ETS segmented signaling. Itis used to cause a delay between the DN and authorization code digit sequence for the non-collocated invocation of CFPF.

**Attribute:**
tt_acd
**Fullname:**
Tandem Tie Access Code.

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

Indicates if the access code and the Trunk Network Number are to be recorded in the AMA record for Tie Trunk calls.

Copyright © 1999 Lucent Technologies

# PF_PORT

## 1. Description

Private facilities access feature per-port data. This relation is common for lines and trunks.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLpf_port

**Relation Description**
Private facilities access feature per-port data.

This relation is common for lines and trunks.
SPECIAL ENTRY FOR GROUP PARAMETER ASSOCIATED WITH BFG
---
Business and residential customer service (BRCS) feature grouping, capability G268, is intended to improve recent change response time and provide for switching module (SM) memory reduction. It permits the creation of groups of BRCS features and parameters, and the utilization of these groups by call processing. BRCS feature group (BFG) group parameter relations will not be created, but will be populated in existing lport keyed relations.

Identifying BFG group parameters will be accomplished via use of an lpt_type key field set to LPT_BFG and use of the lport key field to contain the BFG group ID. This concept is used to avoid creation of new database relations.

Distribution: Group partitioned (if lpt_type=LPT_BFG) or SM partitioned

Copyright © 1999 Lucent Technologies 

This relation now has two types of tuples.

1. The first type is the existing tuples which are SM partitioned and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

2. The second type is the BFG group partitioned tuple associated with features in a BFG, having lpt_type=LPT_BFG, and the bfgid populated in the lport field.

For BFG purposes, RLpf_port is a group type. Therefore, only BFG lport tuple is permitted for the lport assigned to a BFG. Individual lport tuples may not be created for BFG assigned lports (when the feature is in the BFG).
Note: There is a limit of 30 BRCS features for each bfgid.

**Attribute: lport**

**Fullname:** Logical port

**Attribute Description** Logical port of the user being assigned the BRCS features. If lpt_type != LPT_BFG, RLpf_port.lport must equal RLfc_line.lport (if a line) or RLfc_trunk.lport (if a trunk). The keys for RLfc_line & RLfc_trunk are:

```
RLfc_line.port = RLlpt_pt(RLpf_port.lport,RLpf_port.lpt_type).port
RLfc_line.party = RLlpt_pt(RLpf_port.lport,RLpf_port.lpt_type).party
RLfc_trunk.port = RLlpt_pt(RLpf_port.lport,RLpf_port.lpt_type).port
If lpt_type = LPT_BFG, then
RLpf_port.lport contains a BFG group ID.
If lpt_type != LPT_BFG, there must be a tuple
in RLfc_porttyp keyed by the RLlpt_pt(lport,lpt_type).port.  If
lpt_type = LPT_BFG, there must be a tuple in RLbfgmatch
keyed by the bfgid contained in RLpf_port.lport.
Verify the existence of tuple in RLfc_line AND a tuple
in RLfc_porttyp for the RLlpt_pt(lport,lpt_type).port, and a
tuple in RLtrmfeats keyed by the lport.
```

**Attribute: lpt_type**

**Fullname:** Logical port type

**Attribute Description** Logical port type of the user.
RLpf_port.lpt_type must be identical to RLfc_line.lpt_type if the user is for an analog or integrated services digital network (ISDN) terminal. The keys for RLfc_line are:

```
RLfc_line.port = RLlpt_pt(RLpf_port.lport,RLpf_port.lpt_type).port
RLfc_line.party = RLlpt_pt(RLpf_port.lport,RLpf_port.lpt_type).party
If the user is a BRCS trunk, then
lpt_type=LPT_OTHER.  If lpt_type=LPT_BFG, then there
must be a tuple in RLbfgmatch keyed by the bfgid
contained in RLpf_port.lport.
```

**Attribute: pf_gpid**

**Fullname:** Private facilities group ID

**Attribute Description** Private facility group to which this line/trunk belongs.
A zero indicates that this port has no private facility group associated.
If pf_gpid > 0 verify that a tuple exists in RLpf_gp with this ID as the key value.

**Attribute: pfdtgpid**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Private facilities data group ID

**Attribute Description** Identifies the private facilities data group. If a non-zero pfdtgpid is specified, a tuple must exist in RLpf_gp with pfgid as the key, and the group type in that tuple must be BR_CSD (circuit-switched data).
A zero indicates that this port has no private facility group associated.
Data groups cannot be assigned to ports without at least one B channel being marked as data.

**Attribute: q_alwd**

**Fullname:** Queuing allowed

**Attribute Description** Indicates whether modular queuing for outgoing private facilities is allowed.

```
IF q_alwd id DBYES then:
If RLfc_porttyp.porttype is TM_TRK then
   RLfc_porttyp.servclass must be FC_PF,
   or FC_PFLASH or PFITT
or If RLfc_porttyp.porttype is TM_LINE
   RLfc_porttyp.servclass must be FC_INDIVIDUAL,
   FC_ISDN, FC_ISATND,
   FC_ATTENDANT, FC_PBX, or FC_4WIRE_INDV.
If RLfc_porttyp.servclass == FC_4WIRE_INDV
   and if RLfc_4wire.conf_bridge == DBYES,
   then q_alwd must equal DBNO.
```

**Attribute: qpriority**

**Fullname:** Queuing priority

**Attribute Description** Indicates whether this is a priority line for modular queuing for private facility.
If 'qpriority' is DBYES, then 'q_alwd' must be DBYES. If 'q_alwd' is DBYES and RLfc_porttyp.porttype is TM_TRK, then 'qpriority' must be DBYES.
If 'q_alwd' is DBYES and RLfc_porttyp.portype is TM_LINE and RLfc_porttyp.servclass is FC_ATTENDANT or RLfc_porttyp.servclass is FC_ISATND then 'qpriority' must be DBYES.

## 4. Population Rules for RLpf_tkdn

**Relation Description**
Private facility and trunk directory number. Associates a trunk with its billing directory number for the used in private facility feature.

**Attribute: gport**

**Fullname:** Global port id.

Copyright © 1999 Lucent Technologies

**Attribute Description** Global port id. This attribute divided into sub_attributes port.member and port.module.

**Attribute: gport.member**

**Fullname:** Port name.

**Attribute Description** Port name of a port.

**Attribute: gport.module**

**Fullname:** Interface module (IM) number.

**Attribute Description**The interface module (IM) number that this port terminates on.

**Attribute: dn**

**Fullname:** Directory Number.

**Attribute Description** Billing directory number for this trunk.

**Attribute: dn.digcnt**

**Fullname:** Digit Count.

**Attribute Description** Directory number digits.

**Attribute: dn.dn**

**Fullname:** Directory Number.

**Attribute Description** Directory number code.

# PFIXTEI

## 1. Description

This relation is used to provide information for assigning up to 8 fixed terminal endpoint identifiers (TEIs) per BRI. It's keyed by port, and each tuple will contain the TEIs and lports for 8 users per port. The array is indexed by the user's party.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 3840 |
| expected tuple | 50 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function for TM | TMpfixtei |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLpfixtei

**Relation Description**
Fixed terminal endpoint identifier (TEI).

This is used to provide information for assigning up to 8 fixed TEIs per BRI. It's keyed by port, and each tuple will contain the TEIs and lports for 8 USOPs per port. The arrays are indexed by the USOP's party.

**Attribute: port**

**Fullname:** Port

**Attribute Description** This attribute is the key, and each tuple will contain the TEIs and lports for 8 users per port.

**Attribute: teidata[*]**

**Fullname:** TEI Data Array

**Attribute Description** This is an array of TEI data for all users on a BRI. It is indexed by the party value of the user. teidata is a structure containing the 3 attributes lport, tei, and tei_pop.

**Attribute: teidata[*].lport**

**Fullname:** Logical Port

**Attribute Description** This attribute contains a Permanent packet D lport for this user.

**Attribute: teidata[*].tei**

**Fullname:** Terminal Endpoint Identifier

**Attribute Description** This attribute contains the provisioned tei.

**Attribute: teidata[*].tei_pop**

**Fullname:** Terminal Endpoint Identifier Populated

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute indicates if TEI is assigned for party.

# PGGP_R

## 1. Description

Port to group and member. This is a physical storage relation introduced by Opview data capability. It is a modified version of the current base relation port_group except some redundant attributes that can be retrieved from group_port are not stored in this relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 65531 |

# PGGPMAP

## 1. Description

This relation contains the group and member number to a port. This is a virtual update relation designed specifically for the need of Recent Change. It is a replacement for the current base relation port_group because Opview data capability changed port_group into a read-only relation to reduce ODD memory space.

The tree diagram Figure 1 depicts the stored structure of virtual relation PGGPMAP.

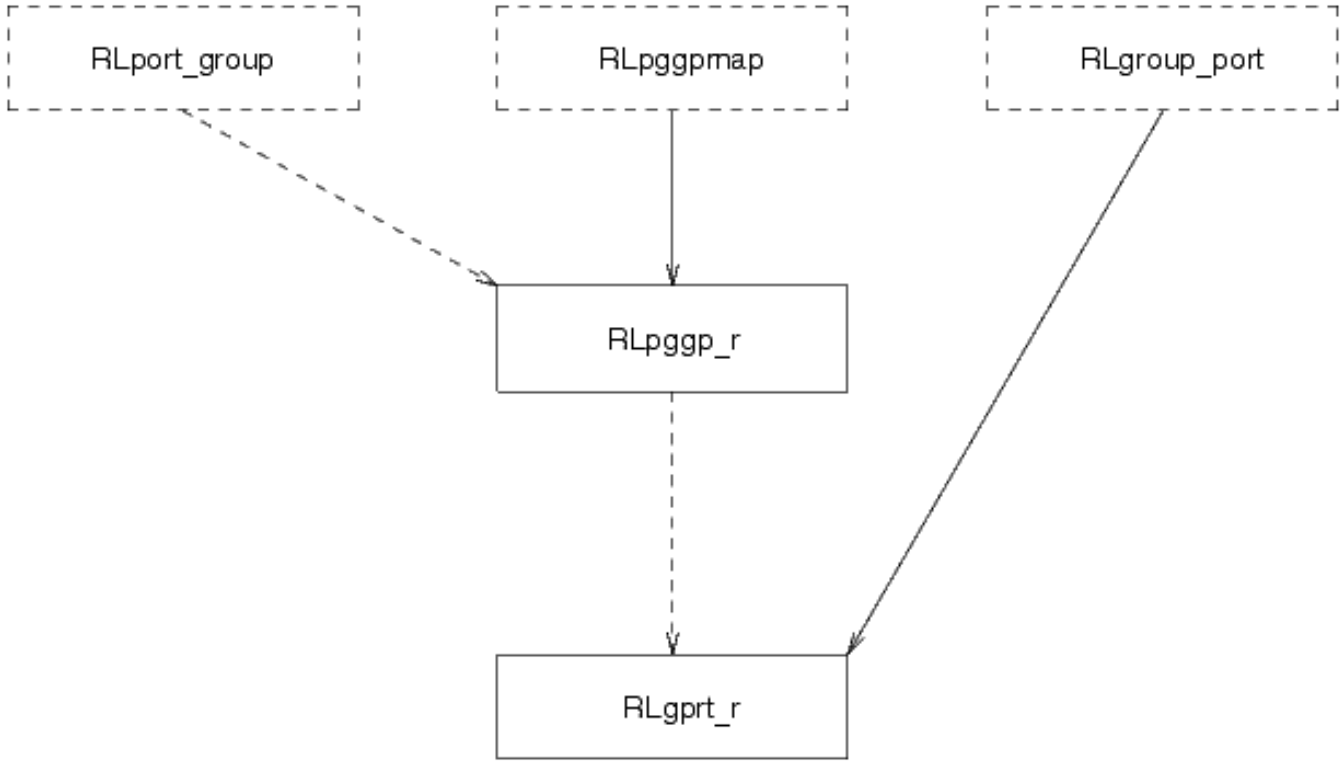

**Figure 1 Virtual Relation PGGPMAP**

## 4. Population rules for RLpggpmap

### Relation Description

Port_Group to Group_Port MAP(ping)

A new virtual update relation RLpggpmap is created for
the specific needs of Recent Change.
It contains all the attributes that are in RLgroup_port.
However, the following attributes are USERATT attributes:
tsi_link, vpidb,
qkey, lport, lpt_type, ltm_type, ltm_idx
The USERATT attributes are dummy variables ignored
by DBM, they are needed for creating a buffer space that has
the same size as the buffer used for RLgroup_port during update.
This allows RC to use the samebuffer space to update both
relations RLgroup_port and RLpggpmap

**Attribute:**

port

**Fullname:**

Global port name.

**Attribute Description:**

Global port name.

**Attribute:**

port.member
**Fullname:**
Port member
**Attribute Description:**
Port member.

**Attribute:**
port.module
**Fullname:**
port module.
**Attribute Description:**
SM where member is defined.

**Attribute:**
party
**Fullname:**
Party value
**Attribute Description:**
User number on this physical port.

**Attribute:**
portgrp
**Fullname:**
port group id.
**Attribute Description:**
Trunk group or multiline hunt group.

**Attribute:**
portgrp.grpnum
**Fullname:**
Group number.
**Attribute Description:**
group number for trunk or multiline hunt group.

**Attribute:**
portgrp.grptype
**Fullname:**
group type.
**Attribute Description:**
Group type.

TM_LINE for MLHG
TM_TRK for trunk

**Attribute:**
member

member.
**Attribute Description:**
Trunk group member or MLHG member number.

**Attribute:**
tsi_link
**Fullname:**
Time Slot Interchanger (TSI) link number
**Attribute Description:**
USERATT attribute - not stored in the database

**Attribute:**
vpidb
**Fullname:**
Virtual Peripheral Interface Data Bus (VPIDB)
**Attribute Description:**
USERATT attribute - not stored in the database

**Attribute:**
qkey
**Fullname:**
Arbitrary key.
**Attribute Description:**
USERATT attribute - not stored in the database

**Attribute:**
lport
**Fullname:**
Logical port.
**Attribute Description:**
USERATT attribute - not stored in the database

**Attribute:**
lpt_type
**Fullname:**
Logical port type.
**Attribute Description:**
USERATT attribute - not stored in the database

**Attribute:**
ltm_type
**Fullname:**
logical termination index type.
**Attribute Description:**
USERATT attribute - not stored in the database

# PGTC

## 1. Description

Associate the Metallic Test Busses (MTBs) and distribute points connected to a Pair Gain Test Controller (PGTC) test circuit. A PGTC is an external facility used for the testing of Universal SLC(R) 96 lines. In order to operationally use the PGTC it is necessary to wire two MTBs to the PGTC test circuit : one MTB to the input and one MTB to the output of the PGTC. In addition, two distribute points are wired through the 5ESS(R)-2000 switch resistor panel out to the sleeve control input of the PGTC test circuit. This allows the 5ESS(R)-2000 switch to manipulate the various functions of the PGTC for metallic testing of lines that terminate on a USLC-96 system. This relation reflects the MTB wired to the input port of the PGTC test circuit and the distribute point wired to the high valued resister on the resistor panel. Based on the following rules, PC software will construct the names of the other MTB and distribute point internally. This relation is an SM partitioned relation in every SM that has an MSU. The following requirements pertain to population and engineering assignments :

```
(1) Every MSU shelf will terminate no more than one
    PGTC test port. This requirement is dictated by
    the software design.

(2) The two MTB's must be sequentially assigned and on
    the same MA pack. Both MTBs must be operational and
    in service for the PGTC test feature to work.
    Requiring that both MTBs be on the same pack insures
    that they are both in service at the same time
    since all MTBs on a MA pack are in or out of service
    depending on the state of the MA pack. Requiring that
    the MTBs be assigned sequentially simplifies the
    office assignment algorithms and installation
    and will aid in debugging.

(3) The MSU MA pack that terminates the PGTC mtb in and
    out pair must be on the same shelf as a MSU MA that
    terminates at least one DCTU MTB. It is not required
    that the DCTU MTBs and PGTC MTBs be on the same MSU
    MA pack. This requirement is dictated by the software
    design.

(4) The two distribute points must be sequentially
    assigned and on the same MSU DIST pack. Both
    distribute points need to be operational and in
    service for the PGTC test feature to work.
    Requiring that both distribute points exist on the
    same DIST pack insures that they are both
    in service at the same time. Requiring that the
    distribute points be assigned sequentially simplifies
    the office assignment algorithms and installation
    and will aid in debugging.
```

PC software will construct the MTB out portname and the high distribute point portname from the requirement that the MTBs and distribute points are assigned sequentially and on the same pack. Operationally, the value of mtbout = mtbin + 1 and hidist_pt = lodist_pt+1.

For every tuple that is populated in this relation, a corresponding tuple should also be populated in the AM relation rlRC_PGTC. However the rlRC_PGTC relation does not contain the MTB and distribute point name information.

### Relation Description

Pair Gain Test Controller (PGTC)

Associate the Metallic Test Busses (MTBs) and distribute points connected to a Pair Gain Test Controller (PGTC) test circuit.

PC software will construct the MTB out portname and the high distribute point portname from the requirement that the MTBs and distribute points are assigned sequentially and on the same pack. Operationally, the value of mtbout is equal to the circuit name for the next sequential circuit index from the circuit index for the mtbin circuit."

**Attribute:**

msu

**Fullname:**

MSU unit number

Copyright © 1999 Lucent Technologies

**Attribute Description:**
1 bit - MSU unit number - 0 or 1

**Attribute:**
sg
**Fullname:**
MSU service group number
**Attribute Description:**
1 bit - MSU service group number - 0 or 1

**Attribute:**
shelf
**Fullname:**
MSU shelf number
**Attribute Description:**
2 bits -MSU shelf number - 0 to 3

**Attribute:**
mtbin
**Fullname:**
circuit name for MTB into PGTC
**Attribute Description:**
This MTB must be populated and have an eqstat of SMOPER in RLCKTDATA in this SM. This MTB must also be populated in RLMTBFE in this SM with fetype of PCPGTCIN. The Metallic Access (MA) pack that terminates this MTB must exist on the same MSU MA that terminates the MTB assigned to mtbout. PC software will construct the portname for the associated mtbout from the requirement that the MTBs are assigned sequentially and on the same MA pack. For each PGTC MTB, there must be populated an DCTU MTB on the same shelf as the PGTC MTB.

The out MTB (mtbout) circuit name is obtained by incrementing the circuit index for mtbin found in RLcktdata and then reading RLunit_ckt using the incremented circuit index and the unit and utype from RLcktdata.

**Attribute:**
lodist_pt
**Fullname:**
MSU dist. point wired to high resistor value for PGTC
**Attribute Description:**
The Distribute (DIST) pack that terminates this distribute point must exist in the same SM as the MA(s) that terminate the mtbin and mtbout. PC software will construct the portname for the associated hidist_pt from the requirement that the distribute points are

**Copyright © 1999 Lucent Technologies** 

assigned sequentially and are on the same DIST pack.

The high distribute (hidist_pt) port name is obtained by incrementing the port index for lodist_pt found in RLfc_porttyp.port_indx and then reading RLckt_port using the incremented port index and the lodist_pt's pack circuit name found in RLfc_porttyp.cktname.

This field will have an entry in rlFC_PORTTYP with servclass set to TMDSTPGTC.

**Attribute:**
pgtc_frame
**Fullname:**
PGTC frame number
**Attribute Description:**
With the exception of PGTC frames that may exist at an RSM, there is only one PGTC that exists at the host office. The host PGTC frame will always be identified one (1). RSM PGTC frame numbers will begin with the module number associated with the RSM. In the case of clustered RSMs, only one PGTC frame will service the cluster.

This field is also populated as the key in the AM relation rlRC_PGTC.

**Attribute:**
pgtc_member
**Fullname:**
PGTC trunk member number
**Attribute Description:**
PGTC trunk members and are labeled from 1 to 255, although no one PGTC frame should ever have this many trunks based on the engineering rules required that there can exist no more than one PGTC test trunk per MSU shelf in a service group. The PGTC trunk members will always be a part of the PGTC frame at a site. Members cannot be mixed between frames. This field is also populated as the key in the AM relation rlRC_PGTC.

## 4. Population Rules for RLphchstat

**Relation Description**
PH Channel Status

Provides the allocation/reservation status of PH channels for logical PHs that can support automatic channel allocation.

**Attribute: lph**

**Fullname:** Logical PH number

**Attribute Description** The logical PH number (relative to PSU); the PSU shelf number is stored in bits 4-6, and the logical PH number (relative to shelf) is stored in bits 0-3.

**Attribute: chmap_0**

**Fullname:** channel status map 0

**Attribute Description** 32 bit map used to indicate which channels in PH channel cluster 0 (channels 0 - 31) have been allocated or reserved (0 = not allocated/reserved, 1 = allocated/reserved)

**Attribute: chmap_1**

**Fullname:** channel status map 1

**Attribute Description** 32 bit map used to indicate which channels in PH channel cluster 1 (channels 32 - 63) have been allocated or reserved (0 = not allocated/reserved, 1 = allocated/reserved)

**Attribute: chmap_2**

**Fullname:** channel status map 2

**Attribute Description** 32 bit map used to indicate which channels in PH channel cluster 2 (channels 64 - 95) have been allocated or reserved (0 = not allocated/reserved, 1 = allocated/reserved)

**Attribute: chmap_3**

**Fullname:** channel status map 3

Copyright © 1999 Lucent Technologies 

**Attribute Description** 32 bit map used to indicate which channels in PH channel cluster 3 (channels 96 - 127) have been allocated or reserved (0 = not allocated/reserved, 1 = allocated/reserved)

**Defines:**
/* NONE */

## 4. Population Rules for RLphr_lang

**Relation Description**
This table maps English phrases, such as those use for customized market announcements (CMA) and independent company announcement branding (ICAB), to corresponding non-English language phrases.

An entry in this table maps an English language phrase to a corresponding non-English language phrase.

**Attribute: eng_phr**

**Fullname:** English phrase ID.

**Attribute Description** This is the English phrase ID to be mapped to a non-English language phrase ID.

**Attribute: appl**

**Fullname:** Announcement Application Type.

**Attribute Description** Announcement application type of the non-English language phrase to which to map eng_phr.

Copyright © 1999 Lucent Technologies 

**Attribute: noneng_phr**

**Fullname:** Non-English Phrase ID.**Attribute Description** This is the non-English phrase corresponding to eng_phr for this application.

**Attribute: spare1**

**Fullname:** Spare 1

**Attribute Description** A spare field.

**Attribute: spare2**

**Fullname:** Spare 2

**Attribute Description** A spare field.

## 4. Population rules for RLphrases

### Relation Description

phrases of announcements

```
/*************************************************************************
 *
 *      POPULATION RULES for RLPHRASES:
 *
 *      Attribute
 *      ---------
 * key  ph_id     DESCR: Phrase ID
 *                Range: 1-16383, 16600-MAXPHRASEID
 *                These phrase IDs correspond to the phrase IDs
 *                specified on the DSU2-RAF Announcement Storage
 *                Circuit (ASC) packs and on the SAS
 *                circuit packs. As phrase IDs are changed
 *                in the RAFs/SASs, they must be changed
 *                in this relation.
 *                DEFAULT: None
 *
 *                Microcode numbers for the phrase IDs are listed for
 *                each application in RLraf_mbd.
 *
 *
 * key  appl      DESCR: application
 *                Range: One of the enum values listed in
 *                       db/DMannc_apl.G
 *                DEFAULT: None
 *
 *      dur       Range: 1-7200
 *                This gives the duration of the phrase, rounded up
 *                to the nearest second, when played by the RAF/SAS.
 *                7200 seconds.
 *                DEFAULT: None
 *
 *      phtext65  Range:  All ASCII characters
 *                This is an array of up to 65 characters used to
 *                store the written text equivalent of what will be
 *                spoken to the subscriber during announcement play.
 *                No special character is required to terminate the
 *                text string, however the text should be padded on
 *                the right with blanks to fill out the array of 65.
 *                Since the RC/V screen can only accommodate 65
 *                characters, only 65 characters of any phrase can
 *                be given here. Additional text in the phrase is
 *                simply left off or can be abbreviated.
 *
 *
 *                DEFAULT: ASCII BLANK (' ')
 *
 *************************************************************************/
```

# PHRTCONG

## 1. Description

This relation defines the congestion onset and abatement thresholds for the transmission and retransmission buffers used by an Telecommunicaton Standarization Sector (ITU-TS) Signaling Terminal Protocol Handler (ST-PH). It also defines the transmission rate of Message Signal Units (MSUs) over an Signaling Data Link (SDL), connect to that ST-PH. This relation is used for either a single congestion level or for multiple congestion levels (that is, Levels 1 through 3). In the case of multiple levels, Level 3 is the highest level of congestion. In the case of a single level, the Level 3 attributes hold the threshold values while the attributes for Levels 1 and 2 are unused.

## 4. Population Rules for RLphrtcong

**Relation Description**
Protocol Handler Retransmission/Transmission Congestion.

This relation defines the congestion onset, abatement and discard thresholds for the retransmission and transmission buffers used by Signaling Data Links (SDL) for Telecommunicaton Standarization Sector (ITU-TS). This relation allows for the limitation of the Message Signal Units (MSU) that are transmitted every 20 msec. A default of zero being defined as no limitation to the number of transmitted MSU and no timing constrictions. This relation is used for either a single congestion level, for multiple congestion levels, or Multiple Congestion Levels with Priorities (that is, Levels 1 through 3). All threshold values are in terms of the percent fill of the buffer space. In the case of a single level, the Level 3 attributes hold the threshold values while the attributes for Levels 1 and 2 are unused. In the case of multiple congestion levels, Level 1 is the lowest, and Level 3 is the highest. At the onset of congestion, when the buffer occupancy is increasing, the signaling link (SL) congestion status is determined by the highest congestion onset threshold exceeded by the buffer occupancy. That is, if congestion onset threshold n is the highest congestion onset threshold exceeded by the current buffer occupancy, the current SL congestion status is assigned the value n. At the abatement of congestion, when the buffer occupancy is decreasing, the SL congestion status is determined by the lowest congestion abatement threshold under which the buffer occupancy has dropped. That is, if congestion abatement threshold n is the lowest congestion abatement threshold under which the current buffer occupancy has dropped, the current SL congestion status is assigned the value n - 1.' The maximum value for the transmission rate of MSUs has been restricted to 8. It is envisaged however that in future generics this value maybe too low. To allow for this the RDL domain used for the attribute trate is larger than currently required. So if at some point in the future a larger value is needed only a population rule change will be required to accomplish this. (A potential maximum value of 15 is foreseen to be more than enough for all future requirements). The value zero for the transmission rate of the MSU's is defined to be the lifting of all limitations concerning the rate of transmission and all timing constrictions.

**Attribute: portname**

**Fullname:** Signaling Terminal Port Name.

**Attribute Description** This attribute is used to identify a SDL which terminates on a ST DLT port on a Global SM.

**Attribute: lvl3rtonset**

**Fullname:** Level 3 congestion onset threshold for retransmission buffer.

**Attribute Description** For single level congestion, this attribute indicates the percent fill of the

Copyright © 1999 Lucent Technologies 

re-transmission buffer before congestion occurs (that is, lvl3rtonset - 1). When this threshold is reached the buffer is marked as congested, and a message is sent to the Signaling Traffic Route Management (STRM) process in the SM where this relation is located. This tells STRM the current congestion level of the SDL as indicated by attribute 'portname'. For Multiple Congestion Levels, when the retransmission buffer occupancy exceeds the value of this threshold, Level 3 congestion treatment is in effect.

**Attribute: lvl3rtabate**

**Fullname:** Level 3 congestion abatement threshold for retransmission buffer.

**Attribute Description** For single level congestion, this attribute indicates the percent of fill this buffer must obtain for congestion to abate once it has occurred. When this threshold is reached the buffer is marked as uncongested (if it was previously marked as congested), and a message is sent to the Signaling Traffic and Route Management (STRM) process in the SM where this relation is located. This tells STRM the current congestion level of the SDL. For Multiple Congestion Levels, when the retransmission buffer occupancy decreases under the value of this threshold, Level 2 congestion treatment is in effect.

**Attribute: lvl3rtdisc**

**Fullname:** Level 3 congestion discard threshold for re-transmission buffer.

**Attribute Description** For Multiple Congestion Levels, when the percentage fill of the re-transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

**Attribute: lvl3tonset**

**Fullname:** Level 3 congestion onset threshold for transmission buffer.

**Attribute Description** For single level congestion this defines the percent fill of of the transmission buffer before congestion occurs (lvl3tonset - 1). When congestion does occur STRM is informed the current congestion level of the SDL. For Multiple Congestion Levels, when the transmission buffer occupancy exceeds the value of this threshold, Level 3 congestion treatment is in effect.

**Attribute: lvl3tabate**

**Fullname:** Level 3 congestion abatement threshold for transmission buffer.

**Attribute Description** For single level congestion, this defines the percentage fill of the transmission buffer that must be reached for congestion to abate once it has occurred. When this happens STRM is informed the current congestion level of the SDL. For Multiple Congestion Levels, when the transmission buffer occupancy decreases under the value of this threshold, Level 2 congestion treatment is in effect.

**Attribute: lvl3tdisc**

**Fullname:** Level 3 congestion discard threshold for transmission buffer.

**Attribute Description** For Multiple Congestion Levels, when the percentage fill of the transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

**Attribute: lvl2rtonset**

Copyright © 1999 Lucent Technologies 

**Fullname:** Level 2 congestion onset threshold for retransmission buffer.

**Attribute Description** Defines the percent fill, which when exceeded by the retransmission buffer occupancy will trigger the beginning of Level 2 congestion treatment.

**Attribute: lvl2rtabate**

**Fullname:** Level 2 congestion abatement threshold for retransmission buffer.

**Attribute Description** Defines the percent fill, which the retransmission buffer occupancy must drop under for Level 2 congestion to abate and or Level 1 congestion treatment to be in effect.

**Attribute: lvl2rtdisc**

**Fullname:** Level 2 congestion discard threshold for re-transmission buffer.

**Attribute Description** For Multiple Congestion Levels, when the percentage fill of the re-transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

**Attribute: lvl2tonset**

**Fullname:** Level 2 congestion onset threshold for transmission buffer.

**Attribute Description** Defines the percent fill, which when exceeded by the transmission buffer occupancy will trigger the beginning of Level 2 congestion treatment.

**Attribute: lvl2tabate**

**Fullname:** Level 2 congestion abatement threshold for transmission buffer.

**Attribute Description** Defines the percent fill, which the transmission buffer occupancy must drop under for Level 2 congestion to abate and for Level 1 congestion treatment to be in effect.

**Attribute: lvl2tdisc**

**Fullname:** Level 2 congestion discard threshold for transmission buffer.

**Attribute Description** For Multiple Congestion Levels, when the percentage fill of the transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

**Attribute: lvl1rtonset**

**Fullname:**

**Attribute Description** Defines the percent fill, which when exceeded by the retransmission buffer occupancy will trigger the beginning of Level 1 congestion treatment.

**Attribute: lvl1rtabate**

**Fullname:** Level 1 congestion abatement threshold for retransmission buffer.

**Attribute Description** Defines the percentage fill of the following re-transmission buffer which Level 1 congestion will abate.

**Attribute: lvl1rtdisc**

Copyright © 1999 Lucent Technologies 

**Fullname:** Level 1 congestion discard threshold for re-transmission buffer.

**Attribute Description** For Multiple Congestion Levels, when the percentage fill of the re-transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

**Attribute: lvl1tonset**

**Fullname:** Level 1 congestion onset threshold for transmission buffer.

**Attribute Description** Defines the percent fill, which when exceeded by the transmission buffer occupancy will trigger the beginning of Level 1 congestion treatment.

**Attribute: lvl1tabate**

**Fullname:** Level 1 congestion abatement threshold for transmission buffer.

**Attribute Description** Defines the percentage fill of the following transmission buffer which Level 1 congestion will abate.

**Attribute: lvl1tdisc**

**Fullname:** Level 1 congestion discard threshold for transmission buffer.

**Attribute Description** For Multiple Congestion Levels, when the percentage fill of the transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

**Attribute: trate**

**Fullname:** Rate of MSU transmission per 20 millisec cycle.

**Attribute Description** The DEFAULT value (0) is defined to be the unlimited transmission of MSU's with no time limitation to constrict the flow of messages. The values 1 - 8 defines how many MSU's may be transmitted every 20 millisecs.

## 4. Population rules for RLpicb

### Relation Description

Peripheral Interface Control Bus

Peripheral interface control bus. List all picb numbers that appear in CKTDATA relation for all units

RLpicb (SLC(R) 96 CC PICB)

DESCRIPTION:

Assigns SDFI Common Control (CC) PICBs to a DCLU. One CC PICB is assigned to each DCLU service group.

KEY FORMAT:

```
   ---------------------------------
   |            CC PICB            |
   |-------------------------------|
   |           |                   |
   |   CI NO.  |   CI PICB NO.     |
   |           |                   |
   |---|---|---|---|---|---|---|---|
     7   6   5   4   3   2   1   0
```

CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 tuple per DCLU service group

even numbered PICB to service group 0
odd numbered PICB to service group 1

TUPLE SEMANTICS:

name (KEY) - CC PICB
pidb - PIDB A
pidb2 - 0x7F (Default value)

Copyright © 1999 Lucent Technologies 

```
       sg - service_group (0 through 1)
       esraddr - CC PICB shifted left 1 byte
       unitnum - DCLU unit number (0 through 7)
       esrsize - 8
       dmsgpicb - CC PICB on opposite service group
       dsgcpicb - DC PICB on same service group
       unittype - SMDCLU
       brd0type - PCSLCC
       brd1type through brd31type - PCNOBRD

                RLpicb (SLC(R) 96 DC PICB)

DESCRIPTION:

       Assigns SDFI Control (DC) PICBs to a DCLU. One
       DC PICB is assigned to each DCLU service group.

KEY FORMAT:

    ---------------------------------
    |             DC PICB           |
    |-------------------------------|
    |           |                   |
    |   CI NO.  |   CI PICB NO.     |
    |           |                   |
    |---|---|---|---|---|---|---|---|
      7   6   5   4   3   2   1   0

    CI NO. - Control Interface 0 or 1
    CI PICB NO. - PICB number relative to a CI (0 to 22)
                  (PICB 0 and 1 on CI 0 reserved for the LDSU)
                   (PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

       1 tuple per DCLU service group

               even numbered PICB to service group 0
               odd numbered PICB to service group 1

TUPLE SEMANTICS:

       name (KEY) - DC PICB
       pidb - 0
       pidb2 - 0x7F (Default value)
       sg - service_group (0 through 1)
       esraddr - DC PICB shifted left 1 byte
       unitnum - DCLU unit number (0 through 7)
       esrsize - 8
       dmsgpicb - DC PICB on opposite service group
```

Copyright © 1999 Lucent Technologies 

```
      dsgcpicb - CC PICB on same service group
      unittype - SMDCLU
      brd0type - PCSLDC
      brd1type through brd31type - PCNOBRD

              RLpicb (MSU DFTAC circuit)

 DESCRIPTION:

      Assigns correct base address and brdtype for MSU
      Distributing Frame Test Access Circuit (DFTAC) TN1040
      circuit.

 QUANTITY OF TUPLES:

      1 tuple for each MSU service group. The DFTAC is
      a subtending circuit.

              even numbered PICB to service group 0
              odd numbered PICB to service group 1

TUPLE SEMANTICS:

      name (KEY) - picb number of MSU service group
      pidb - 0
      pidb2 - 0x7F (Default value)
      sg      - service_group (0 through 1)
      esraddr - picb shifted left 1 byte
      unitnum - MSU unit number
      esrsize - 16
      dmsgpicb - d7
      dsgcpicb - d7
      unittype - SMMODMSU
      brd0type - brd31type if the DFTAC is placed in a
                 particular board position 0-31 the value
                 should be PCDFTACBRD

              RLpicb (PSIU CC PICB)

 DESCRIPTION:

      Assigns a Common Control PICB to a PSIU. There is
      one CC PICB assigned to each PSIU Common Controller
      side.

 KEY FORMAT:

   ---------------------------------
   |            CC PICB            |
   |--------------------------------
```

Copyright © 1999 Lucent Technologies 

```
   |           |                   |
   |   CI NO.  |   CI PICB NO.     |
   |           |                   |
   |---|---|---|---|---|---|---|---|
     7   6   5   4   3   2   1   0
```

CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 tuple per PSIU Common Controller Side

The PICBs must be assigned consecutively as follows:
Even PICB to PSIU Common Controller Side-0
Odd PICB to PSIU Common Controller Side-1

TUPLE SEMANTICS:

name (KEY) - CC PICB
pidb - System PIDB# assigned to Shelf-0, DF-0, Connection-0 on the Common Controller associated with this PICB
In the case where PCT link is used in shelf 0 this attribute will be set to 0x7f (SMNULPIDB).
This attribute is independent from the connection type used in shelf 1 thru 4.
pidb2 - 0x7F (Default value)
sg - service_group (0 through 1)
esraddr - CC PICB shifted left 1 byte
unitnum - 0 (The PSIU is only a single unit)
esrsize - 16
dmsgpicb - CC PICB assigned to the mate PSIU Common Controller
dsgcpicb - 0xd7 (Default value as there is no companion PICB)
unittype - SMPSIU
brd0type - PCNOBRD
brd1type through brd31type - PCNOBRD

## RLpicb (ISLU(2) CC PICB)

DESCRIPTION:

Assigns a Common Control PICB to an ISLU(2). There is one CC PICB assigned to each ISLU(2) Common Controller side.

KEY FORMAT:

```
   ---------------------------------
   |            CC PICB            |
   |--------------------------------
```

Copyright © 1999 Lucent Technologies 

```
|           |                   |
|   CI NO.  |   CI PICB NO.     |
|           |                   |
|---|---|---|---|---|---|---|---|
  7   6   5   4   3   2   1   0
```

CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 Tuple per ISLU(2) Common Controller Side

The PICBs must be assigned consecutively as follows:
Even PICB to ISLU(2) Common Controller Side-0
Odd PICB to ISLU(2) Common Controller Side-1

TUPLE SEMANTICS:

name (KEY) - CC PICB
pidb - System PIDB# assigned to CD-0 Connection-0
pidb2 - 0x7F (Default value)
sg - service_group (0 through 1)
esraddr - CC PICB shifted left 1 byte
unitnum - Line Unit Number
(0-7) for SMs
(0-42) for SM-2000 SMs, ISLU2 only
esrsize - 16
dmsgpicb - CC PICB assigned to the mate Common Controller
dsgcpicb - 0xd7 ( Default value as there is no companion PICB)
unittype - SMISLU or SMISLU2
brd0type through brd31type - PCNOBRD

RLpicb ((*)AIU CC PICB)

DESCRIPTION:

Assigns a Common Control PICB to an (*)AIU. There is one
CC PICB assigned to each (*)AIU COMDAC.

KEY FORMAT:

(SEE DMpicb.G for additional help picture of PICB relation)

CI NO. - Control Interface 0 or 1
- Control Interface 0 to 3 for SM-2000 SMs
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)

Copyright © 1999 Lucent Technologies 

(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 Tuple per (*)AIU COMDAC

The PICBs must be assigned consecutively as follows for AIU:
Even PICB to AIU COMDAC 0
Odd PICB to AIU COMDAC 1

The PICBs must be assigned as follows for (*)AIU
Even PICB to AIU COMDAC 0
Odd PICB to AIU COMDAC 1

Note that (*)AIU PICBs for COMDAC0 and COMDAC1 don't have to be consecutive but they have to be odd and even

TUPLE SEMANTICS:

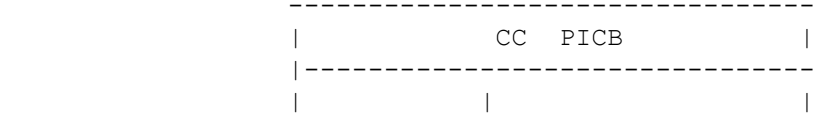
name (KEY) - CC PICB
pidb - System PIDB# assigned to COMDAC 0 Connection-0
pidb2 - 0x7F (Default value)
sg - service_group (0 through 1)
esraddr - CC PICB shifted left 1 byte
unitnum - Access Interface Unit Number
(0-14) for SMs
(0-42) for SM-2000 SMs
esrsize - 16
dmsgpicb - CC PICB assigned to the mate Common Controller
dsgcpicb - 0xd7 ( Default value as there is no companion PICB)
unittype - {SMAIU,SMRAIU,SMXAIU}
brd0type through brd31type - PCNOBRD

RLpicb (RISLU CC PICB)

DESCRIPTION:

Assigns a Common Control PICB to a RISLU. There is one CC PICB assigned to each RISLU Common Controller side. The PICB is connected to a DFI-H1 pack, which extends the PICB to the CC in the remoted ISLU.

KEY FORMAT:



Copyright © 1999 Lucent Technologies 

```
|   CI NO.  |   CI PICB NO.     |
|           |                   |
|---|---|---|---|---|---|---|---|
  7   6   5   4   3   2   1   0
```

CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 Tuple per RISLU Common Controller Side

The PICBs must be assigned consecutively as follows:
Even PICB to RISLU Common Controller Side-0
Odd PICB to RISLU Common Controller Side-1

TUPLE SEMANTICS:

name (KEY) - CC PICB
pidb - System PIDB# assigned to CD-0 Connection-0
pidb2 - 0x7F (Default value)
sg - service_group (0 through 1)
esraddr - CC PICB shifted left 1 byte
unitnum - Line Unit Number (0-7)
esrsize - 16
dmsgpicb - CC PICB assigned to the mate Common Controller
dsgcpicb - PICB # assigned to the PICB that controls
the DFI-H1 that is used to remote the CC PICB
unittype - SMRISLU
brd0type through brd31type - PCNOBRD

RLpicb (RISLU DFI-H1 PICB)

DESCRIPTION:

Assigns a PICB to a RISLU DFI-H1 pack. There is one PICB assigned to each DFI-H1 pack. There are two DFI-H1 packs for each RISLU.

KEY FORMAT:

```
---------------------------------
|         DFI-H1  PICB          |
|-------------------------------|
|           |                   |
|   CI NO.  |   CI PICB NO.     |
|           |                   |
|---|---|---|---|---|---|---|---|
  7   6   5   4   3   2   1   0
```

**Copyright © 1999 Lucent Technologies** 

CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 Tuple per RISLU DFI-H1 pack

TUPLE SEMANTICS:

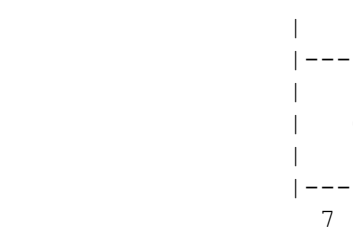
name (KEY) - DFI-H1 PICB
pidb - System PIDB# assigned to PIDB that is being
remoted through this DFI-H1
pidb2 - 0x7F (Default value)
sg - service_group (DFI number in DLTU-RH, 1-10)
esraddr - DFI-H1 PICB shifted left 1 byte
unitnum - DLTU-RH number
esrsize - 8
dmsgpicb - DFI-H1 PICB # assigned to the mate DFI-H1
dsgcpicb - PICB # assigned to the PICB that is being
extended to the remoted ISLU CC through
this DFI-H1
unittype - SMDLTURH
brd0type through brd31type - PCNOBRD

## RLpicb (RISLU DFI-H2 PICB)

DESCRIPTION:

Assigns a PICB to a RISLU DFI-H2 pack. There is one PICB assigned to each DFI-H2 pack.

KEY FORMAT:



CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

```
       1 Tuple per RISLU DFI-H2 pack

TUPLE SEMANTICS:

       name (KEY) - DFI-H2 PICB
       pidb - System PIDB# assigned to PIDB that is being
              remoted through this DFI-H2
       pidb2 - 0x7F (Default value)
       sg      - service_group (DFI number in DLTU-RH,  1-10)
       esraddr - DFI-H2 PICB shifted left 1 byte
       unitnum - DLTU-RH number
       esrsize - 8
       dmsgpicb - 0xd7 (The default value as there is no
                  mate PICB)
       dsgcpicb - PICB # of the PICB controlling CC 0 for
                  this RISLU
       unittype - SMDLTURH
       brd0type through brd31type - PCNOBRD

                        RLpicb (RCLK)

DESCRIPTION:
       Assigns the RCLK PICBs to the RCLKU. There is one PICB
       assigned to an RCLK side.

QUANTITY OF TUPLES:

       2 tuples, one tuple for each RCLK side.

TUPLE SEMANTICS:

       picb (KEY)  - PICB number of the RCLK.
                     This is the upper byte of the RCLK
                     baseadd attribute in RLcktdata for
                     the circuit name.
       pidb        - 0
       pidb2       - 0x7F (Default value)
       sg          - service_group (0 through 1)
       esraddr     - The base address for the error source
                     register.
                       upper byte  = the picb attribute of
                                     this relation.
                       lower byte  = always 0x0
       unitnum     - 0
       esrsize     - 16
       dmsgpicb    - 0
       dsgcpicb    - 0
       unittype    - SMRCLKU
       brd0type through brd31type - PCNOBRD

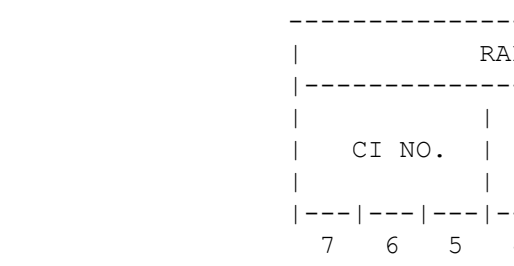
               RLpicb (RAF common board)
```

Copyright © 1999 Lucent Technologies 

DESCRIPTION:

Assigns a PICB to an RAF. One PICB is assigned to each RAF.

KEY FORMAT:



CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 tuple per RAF

TUPLE SEMANTICS:

picb (KEY) - RAF PICB
pidb - RAF PIDB
pidb2 - 0x7F (Default value)
sg - service_group (0 through 16)
esraddr - PICB (high order 8 bits) + 0
(low order 8 bits)
unitnum - 0-7 (RAF unit number)
esrsize - 16
dmsgpicb - 0xd7
dsgcpicb - 0xd7
unittype - SMRAF
brd0type through brd6type - PCANN, PCDTA, PCTDEC, PCCTR and PCNOBRD
PCANN indicates that a DSP is providing announcements.
PCDTA indicates that a DSP is providing dial-through announcements.
PCTDEC indicates that a DSP is providing tone decoding.
PCCTR indicates that a DSP is providing coin tone reception.
PCNOBRD indicates that a DSP is not assigned a service type.
These attributes refer to the types of services provided by the DSP's (0-6) found on the common board and correspond to the types of channels assigned to the common board in CKTDATA. Only one type of channel is allowed per common board. Therefore all channels

Copyright © 1999 Lucent Technologies 

```
            will either be ckttype PC_ANN or PC_DTA.
            If channel ckttype is PC_ANN then
                  assign brd0type through brd3type to PCNOBRD.
                  assign brd4type through brd6type to PCANN.
            If channel ckttype is PC_DTA and the
            digit decoder capability
            is to be provided,
                  assign brd0type through brd3type to PCTDEC.
                  assign brd4type through brd6type to PCDTA.
            If channel ckttype is PC_DTA and the
            coin tone receiver capability
            is to be provided,
                  assign brd0type through brd4type to PCCTR.
                  assign brd5type through brd6type to PCDTA.
      brd7type through brd31type - PCNOBRD

DEPENDENCIES:

      RLpidb - 1 tuple whose key is same as PIDB attribute.
      RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
      RLrc_eqloc - 1 tuple whose keys are SM number, Unit
              number, Service Group number, and Unit type.
      RLcktdata - tuples defining the channels associated with the
              common control for the RAF.

              RLpicb (SAS common board)

DESCRIPTION:

      Assigns a PICB to a SAS. One PICB is assigned to
      each SAS unit.

KEY FORMAT:

   ---------------------------------
   |           SAS PICB            |
   |-------------------------------|
   |           |                   |
   |   CI NO.  |   CI PICB NO.     |
   |           |                   |
   |---|---|---|---|---|---|---|---|
     7   6   5   4   3   2   1   0

   CI NO. - Control Interface 0 or 1
          - Control Interface 0 to 3 for SM-2000 SMs
   CI PICB NO. - PICB number relative to a CI (0 to 22)
                 (PICB 0 and 1 on CI 0 reserved for the LDSU)
                  (PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:
```

Copyright © 1999 Lucent Technologies 

```
        1 tuple per SAS

TUPLE SEMANTICS:

        picb (KEY) - SAS PICB
        pidb - SAS PIDB
        pidb2 - 0x7F (Default value)
        sg      - service_group (0 through 16)
        esraddr - PICB (high order 8 bits) + 0 (low order 8 bits)
        unitnum - 0-7 (SAS unit number)
        esrsize - 16
        dmsgpicb - 0xd7
        dsgcpicb - 0xd7
        unittype - SMSAS
        brd0type through brd7type - PCANN, PCDTA, PCTOPLAY,
                PCDTAM4, PCM4TOPLAY, and PCNOBRD.

                PCANN indicates that a DSP is providing announcements.

                PCDTA and PCDTAM4 indicates that a DSP is providing
                dial-through announcements.

                PCTOPLAY and PCM4TOPLAY that a DSP works in
                conjunction with the PCANN DSPs to provide
                playback of announcements.

                PCNOBRD indicates that a DSP is not assigned a service
                type.

                These attributes refer to the types of services provided
                by the DSP's (0-7) found on the common board and
                correspond to the types of channels assigned to the
                common board in CKTDATA.  Unlike the DSU2-RAF, multiple

                channels are allowed per common board.  However,
                if the coin tone reception or tone decoder capability
                is to be provided, the DSP type will be PCDTA.

                PCANN, PCDTAM4, and PCM4TOPLAY can only be assigned
                to brd0type through brd3type.  PCDTA and PCTOPLAY
                can only be assigned to brd4type through brd7type.
                DSPs should be assigned based on the following
                priority:

                  1. Assign all ANN DSPs needed to brd0-3type
                  2. Assign all DTA DSPs needed to brd4-7type
                  3. If not able to assign needed DTA DSPs
                     to brd4-7type, check available brd0-3type
                     and assign DTAM4 DSPs
                     (that is, if either brd0type, brd1type, brd2type,
                      or brd3type is PCNOBRD, assign PCDTAM4)
                  4. Assign all PCTOPLAY DSPs needed to brd4-7type
                  5. If not able to assign needed TOPLAY DSPs
```

Copyright © 1999 Lucent Technologies 

```
                    to brd4-7type, check available brd0-3type
                    and assign M4TOPLAY DSPs
                    (that is, if either brd0type, brd1type, brd2type,
                     or brd3type is PCNOBRD, assign PCM4TOPLAY)
      brd8type through brd31type - PCNOBRD

NOTE:
      1 PCANN DSP provides a maximum of 8 announcement playback
      1 PCDTAM4 DSP provides a maximum of 8  dial-through announcements
      1 PCDTA DSP provides a maximum of 16 dial-through announcements
      1 PCTOPLAY DSP provides a maximum of 32 outpulsing/playback
      1 PCM4TOPLAY DSP provides a maximum of 32 outpulsing/playback

      Fields DTA CNT, ANN CNT, and TDEC CNT on recent change view
      RC_EQRAS should be used to determine the number of DSPs
      that needs to be assigned to brd0-7types as follows:

      (DTA CNT + ANN CNT)/8  = total of PCANN DSPs
      (DTA CNT + TDEC CNT)/8 = total of PCDTAM4 DSPs
      (DTA CNT + TDEC CNT)/16 = total of PCDTA DSPs
      (DTA CNT + ANN CNT)/32  = total of PCTOPLAY or PCM4TOPLAY DSPs
      (all totals should be rounded to the nearest integer)

      The sum of fields DTA CNT, ANN CNT, and TDEC CNT cannot
      exceed thirty-two (32).

DEPENDENCIES:

      RLpidb - 1 tuple whose key is same as PIDB attribute.
      RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
      RLrc_eqloc - 1 tuple whose keys are SM number, Unit
              number, Service Group number, and Unit type.
      RLcktdata - tuples defining the channels associated with the
              common control for the SAS.

              RLpicb (DCTU PICB)

DESCRIPTION:

      Assigns PICB to a Directly Connected Test Unit (DCTU).
      One PICB is assigned to each DCTU service group. There
      can only be one DCTU (or service group) in any Switch
      Module (SM). The DCTU service group is always zero (0).
      The DCTU unit number is always zero (0).  There must be
      a corresponding entry in the relations RLRC_EQLOC and

      RLRC_LOCEQ. The DCTU components must be defined in
      the relation RLCKTDATA in the SAME SM as RLPICB is
      defined. See the population rules for RLrc_eqloc,
      RLrc_loceq, and RLcktdata.
```

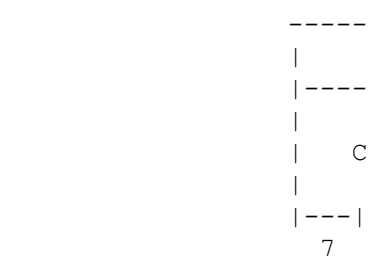
KEY FORMAT:



CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

1 tuple per DCTU. There can be no more than one DCTU tuple per SM.

TUPLE SEMANTICS:

name (KEY) - PICB
pidb - 0 (zero)
pidb2 - 0x7F (Default value)
sg - 0 (service_group number 0)
esraddr - PICB shifted left 1 byte
unitnum - 0 (DCTU unit number 0)
esrsize - 8
dmsgpicb - d7 (default)
dsgcpicb - d7 (default)
unittype - SMDCTU
brd0type through brd31type - PCNOBRD

## RLpicb (Service types on an LDSU2 service group)

DESCRIPTION:

Assigns PICBs to an LDSU2. One PICB is assigned to each LDSU2 service group.

KEY FORMAT:

Copyright © 1999 Lucent Technologies 

```
   |---|---|---|---|---|---|---|---|
     7   6   5   4   3   2   1   0

   CI NO. - Control Interface 0 or 1
   CI PICB NO. - PICB number relative to a CI (0 or 1)

 QUANTITY OF TUPLES:

       1 tuple per LDSU2 service group

               PICB 0 to service group 0
               PICB 1 to service group 1

TUPLE SEMANTICS:

       name (KEY) - LDSU2 PICB
       pidb - 0
       pidb2 - 0x7F (Default value)
       sg      - service_group (0 through 1)
       esraddr - PICB (high order 8 bits) + 0
                 (low order 8 bits)
       unitnum - 0 (LDSU2 unit number)
       esrsize - 16
       dmsgpicb - LDSU2 PICB on opposite service group
       dsgcpicb - 0xd7
       unittype - SMDSU2
       brd0type through brd6type - PCTDEC, PCTGEN, PCNOBRD,
               PCTXCVR, or PCCTDEC.
               Unlike DSU1 and MSU, these attributes
               refer to the type of service provided by
               DSPs 0 - 6 found on an LDSU2 board.  (that
               is, brd0type refers to DSP0; brd1type refers
               to DSP1; . . .; brd6type refers to
               DSP6)  PCTDEC indicates that a DSP is
               providing Tone Decoding.  PCTGEN indicates
               that a DSP is providing Tone Generation.
               PCNOBRD indicates that a DSP is not assigned
               a service type. PCTXCVR indicates that a DSP
               is providing Tone Transceiver and VBS
               Generator functions. PCCTDEC indicates that
               a DSP is providing CAMA transfer call
               identity tone decoding.
       brd7type through brd31type - PCNOBRD

 NOTE:
       1 DSP provides a maximum of 31 Tone Generators (PCTGEN).
       1 DSP provides a maximum of 5 Tone Decoders (PCTDEC).
       1 DSP provides a maximum of 5 Tone Transceivers (PCTXCVR).
       1 DSP provides a maximum of 10 CAMA Transfer call
       identity tone Decoders (PCCTDEC)1
       These ratios, RLcktdata tuples, along with the
       RLcktdata population rules, should be used in
       determining the number of DSPs to assign for
```

Copyright © 1999 Lucent Technologies 

tone generation and tone decoding. DSPs assigned to tone decoding should be filled to it's maximum before allocating another DSP to do tone decoding. DSPs assigned to tone transceiver functions should be filled to it's maximum before allocating another DSP to provide tone transceiver circuits.
DSPs assigned to CAMA transfer call identity tone decoding should be filled to its maximum before allocating another DSP to do CAMA transfer call identity tone decoding.

Example:
```
        21 RLcktdata Tone Generator tuples &
        18 RLcktdata Tone Decoding tuples &
         3 RLcktdata Tone Transceiver tuples
           result in RLpicb being built as follows.

   brd0type brd1type brd2type brd3type brd4type
   brd5type brd6type

    PCTGEN   PCTDEC   PCTDEC   PCTDEC   PCTDEC
    PCTXCVR  PCNOBRD

          Recent Change can grow in 2 more tone
          decoding services before assigning brd6type
          to PCTDEC (OR Recent Change could grow in 2
          more Tone Transceiver services before
          assigning brd6type to PCTXCVR).  Degrowing
          the number of tone decoders under 16 would
          result in brd4type getting updated to PCNOBRD.
```
Example:
```
        31 RLcktdata Tone Generator tuples
        13 RLcktdata Tone Decoding tuples
         3 RLcktdata Tone Transceiver tuples &
         7 RLcktdata CAMA Transfer cal identity Tone
           decoding tuples would result in RLpicb
           being built as follows.

   brd0type brd1type brd2type brd3type brd4type
   brd5type brd6type

    PCTGEN   PCTDEC   PCTDEC   PCTDEC   PCTXCVR
    PCCTDEC  PCNOBRD

          Recent Change can grow in 2 more tone
          decoding services before assigning brd6type
          to PCTDEC (OR Recent Change could grow in 3
          more CAMA Transfer call identity
          tone decoding services before assigning
          brd6type to PCCTDEC).  Degrowing the number
          of tone decoders under 11 would result in
          brd4type getting updated to PCNOBRD.
```

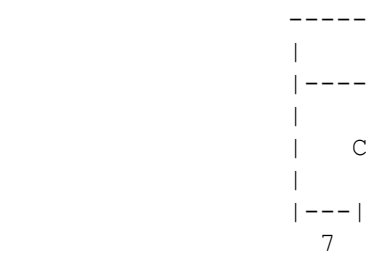
Copyright © 1999 Lucent Technologies 

RLpicb (Service types on an LDSF3 )

DESCRIPTION:

Assigns PICBs to an LDSF3. One PICB is assigned to each LDSF3 circuit.

KEY FORMAT:



CI NO. - Control Interface 0 - 3
CI PICB NO. - PICB number relative to a CI (0 - 22)

QUANTITY OF TUPLES:

1 tuple per LDSF3 circuit

TUPLE SEMANTICS:

name (KEY) - LDSF3 PICB
pidb - 1st PIDB connected to DSC3 Board (PIDB0 of Board)
pidb2 - 0x7F (Default value)
sg - service group number is the physical position of board in the unit (0 through 17)
esraddr - PICB (high order 8 bits) + 0 (low order 8 bits)
unitnum - 0 - 5 (LDSF3 unit number)
esrsize - 16
dmsgpicb - 0xd7
dsgcpicb - 0xd7
unittype - SMLDSF3
brd0type through brd9type - PCTDEC, PCTGEN, PCNOBRD, PCTXCVR, PCVBSXCVR.
Unlike DSU1 and MSU, these attributes refer to the type of service provided by DSPs 0 - 9 found on an LDSF. (that is, brd0type refers to DSP0; brd1type refers to DSP1; . . .; brd6type refers to DSP6)
PCTDEC indicates that a DSP is providing Tone Decoding. PCTGEN indicates that a DSP is providing Tone Generation. PCNOBRD indicates that a DSP is not assigned a service type. PCTXCVR indicates that a DSP

Copyright © 1999 Lucent Technologies 

```
                is providing Tone Transceiver functions.
                PCVBSXCVR indicates that a DSP is providing
                voice Band services generator functions.

        brd10type through brd31type - PCNOBRD

NOTE:
        1 DSP provides a maximum of 64 Tone Generators (PCTGEN).
        1 DSP provides a maximum of 16 Tone Decoders (PCTDEC).
        1 DSP provides a maximum of 16 Tone Transceivers (PCTXCVR).
        1 PCVBSXCVR provides a maximum of 8 VBS generators.

        These ratios, RLcktdata tuples, along with the
        RLcktdata population rules, should be used in
        determining the number of DSPs to assign for
        tone generation and tone decoding.  DSPs assigned
        to tone decoding should be filled to it's maximum
        before allocating another DSP to do tone decoding.
        DSPs assigned to tone transceiver functions should be
        filled to it's maximum before allocating another DSP
        to provide tone transceiver circuits.

DEPENDENCIES:

       RLdsc3pidb - 1 tuple whose key equals Rlpicb.picb
       RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
       RLrc_eqloc - 1 tuple whose keys are SM number, Unit
                    number, Service Group number, and Unit type

                  RLpicb ( Service types on a GDSF )
```

## 5. PICB Population rules continued.

```
DESCRIPTION:

        Assigns PICBs to a GDSF. One PICB
        is assigned to each GDSF circuit.

KEY FORMAT:

     ---------------------------------
     |          GDSF PICB            |
     |-------------------------------|

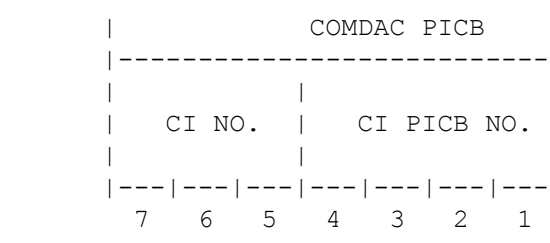
esraddr - COMDAC PICB shifted left 1 byte ORed
with 0xf0
unitnum - Line Unit Number (0-7)
esrsize - 8
dmsgpicb - 0xd7 (Default values, unused in LU )
dsgcpicb - 0xd7 ( Default value as there is no
companion PICB)
unittype - SMLU3
brd0type through brd31type - PCNOBRD

RLpicb (LU 4 COMDAC PICB)

DESCRIPTION:

Assigns a COMDAC PICB to a LU4. There is one COMDAC PICB
assigned to each COMDAC side.

KEY FORMAT:



CI NO. - Control Interface 0 or 1 (SM) 0 - 3 (SM-2000)
CI PICB NO. - PICB number relative to a CI (0 to 22)
(PICB 0 and 1 on CI 0 reserved for the LDSU on an SM
only)
(PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

Copyright © 1999 Lucent Technologies 

```
1 Tuple per service group

Each service group requires duplicated PICB.
The PICBs must be assigned consecutively to the same
CI NO. as follows:
Even PICB to service group 0
Odd PICB to service group 1

TUPLE SEMANTICS:

name (KEY) - CC PICB
pidb     - System PIDB# assigned to this COMDAC
pidb2    - 0x7F (Default value)
sg       - service_group (0 through 1)
esraddr  - COMDAC PICB shifted left 1 byte ORed
           with 0xf0
unitnum  - Line Unit Number ( 0 - 7 for an SM,
                              0 - 42 for SM-2000 )
esrsize  - 8
dmsgpicb - 0xd7 (Default values, unused in LU )
dsgcpicb - 0xd7 ( Default value as there is no
           companion PICB)
unittype - SMLU4
brd0type through brd31type - PCNOBRD

                RLpicb (ISTF common board)

  DESCRIPTION:

        Assigns a PICB to an Integrated Services
        Test Function (ISTF) unit. One PICB is
        assigned to each RLISTF board and there
        can be up to 4 boards per SM.  The PICB
        must be assigned in the same SM as the
        RLISTF tuple.

        The brdXtype attribute in the RLPICB relation
        is used to identify how the Digital Signal
        Processors (DSP) internal to the ISTF board
        are serving it.  These correspond to the
        service types described as logical test
        ports in RLFC_PORTTYP.

  KEY FORMAT:

     ---------------------------------
     |          ISTF PICB            |
     |-------------------------------|
     |           |                   |
     |   CI NO.  |   CI PICB NO.     |
     |           |                   |
     |---|---|---|---|---|---|---|---|
```

```
      7   6   5   4   3   2   1   0

   CI NO. - Control Interface 0 or 1
   CI PICB NO. - PICB number relative to a CI (0 to 22)
                 (PICB 0 and 1 on CI 0 reserved for the LDSU)
                  (PICBs 23 reserved for maintenance)

 QUANTITY OF TUPLES:

       1 tuple per ISTF

TUPLE SEMANTICS:

       picb (KEY) - ISTF PICB
       pidb - ISTF PIDB
       pidb2 - 0x7F (Default value)
       sg      - service_group, valid combinations of service
                 group and unit number are:
                       sg    unitnum
                       --------------
                        4      0
                        8      2
                        13     1
                        17     3
       esraddr - PICB (high order 8 bits) + 0
                  (low order 8 bits)
       unitnum - 0-3 (ISTF unit number)
       esrsize - 16
       dmsgpicb - 0xd7
       dsgcpicb - 0xd7
       unittype - SMISTF
       brd0type through brd6type - PCISTF_LB and
               PCISTF_XMIT These attributes refer
               to the types of services provided
               by the DSP's (0-6) found on the
               common board.  A single DSP can
               provide 31 loopback services
               (PCISTF_LB).  However, it takes 2
               DSP's for each transmission
               service (PCISTF_XMIT) and these
               board numbers must be contiguous
               starting with an odd number
               (such as, brd1type and brd2type
               make up an xmit pair).  The RListf
               relation contains the number of
               services being provided by the ISTF.
               These values are in the attributes
               lb_cnt and xmit_cnt of that relation.
       brd7type through brd31type - PCNOBRD

 DEPENDENCIES:

       RLpidb     - 1 tuple whose key is same as PIDB
```

```
                attribute.
     RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
     RLrc_eqloc - 1 tuple whose keys are SM number, Unit
                  number, Service Group number, and Unit
                  type.
     RListf     - 1 tuple defining the number of services
                  provided
     RLcktdata  - 1 tuple defining the common control for
                  the ISTF

             RLpicb (TU CDI PICB)

DESCRIPTION:

     Assigns a PICB to an Analog Trunk Unit (TU) Control
     and Data Interface (CDI) common board. One PICB is
     assigned to each TU service group.

KEY FORMAT:

   ---------------------------------
   |           TU CDI PICB         |
   |-------------------------------|
   |   CI NO.  |   CI PICB NO.     |
   |---|---|---|---|---|---|---|---|
     7   6   5   4   3   2   1   0

CI NO. - Control Interface 0 or 1 (SM), 0 - 3 (SM-2000)
CI PICB NO. - PICB number relative to a CI (0 to 22)
     (PICB 0 and 1 on CI 0 reserved for the LDSU on an SM only)
     (PICBs 23 reserved for maintenance)

QUANTITY OF TUPLES:

     1 Tuple per TU CDI board tuple present in CKTDATA.

TUPLE SEMANTICS:

     name (KEY) - TU CDI  CI/PICB
     pidb -       System DI/PIDB# assigned to the CDI
                  common board.
     pidb2 -      0x7F (Default value).
     sg      -    service_group (0 through 1)
     esraddr -    TU CDI  CI/PICB shifted left 1
                  byte + 0xC0.
     unitnum -    Analog Trunk Unit (TU) Number (0-7)
     esrsize -    8
     dmsgpicb -   0xd7 (Default value, unused in TUs)
     dsgcpicb -   0xd7 (Default value as there is no
                  companion PICB)
     unittype -   SMTU
     brd0type through brd31type - PCNOBRD
```

Copyright © 1999 Lucent Technologies 

DEPENDENCIES:

RLcktdata - 1 tuple defining the common board for this TU, The tuple can be accessed by keying into RLunit_ckt with the ckt_indx (sg + 1), unitnum (0-7), and unittype (SMTU). This will give you a circuit name to access RLcktdata. Also, tuples for all associated subtending circuit boards and channels, as specified in RLCKTDATA population rules.

RLpidb - 1 tuple for the corresponding DI/PIDB, whose key is the same as the pidb attribute.

RLrc_eqloc - 1 tuple whose keys are SM number, Unit number, Service Group number, and Unit type.

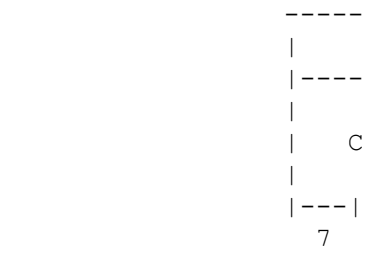
RLrc_loceq - 1 tuple keyed by SM number and CI/PICB +1.

RLpicb (ECSU)

DESCRIPTION:

Assigns the EC5 picbs in the ECSU.
Each EC5 is associated with a DFI (24 channels) facility.
There is one picb per EC5.

KEY FORMAT:



QUANTITY OF TUPLES

One tuple per EC5 assigned to a DFI Facility.

TUPLE SEMANTICS:

picb (KEY) - PICB number of the EC5.

pidb - System PIDB#/FIDB# assigned to DFI Facility associated with the EC5.

pidb2 - 0x7F (Default value).

esraddr - the base address for the error source register,
upper byte = picb attribute of this relation,

Copyright © 1999 Lucent Technologies 

```
                lower byte = 0x00.
     unitnum    - Unit number of the ECSU which contains
                  the EC5(0-5).
     esrsize    - 8
     dmsgpicb   - 0xd7 (Default value, unused)
     dsgcpicb   - Companion picb number of the
                  associated DFI.
     unittype   - SMECSU
     sg         - EC5 number (1-20).
     brd0type through
     brd31type       - PCNOBRD
             RLpicb (DFI PICB)

DESCRIPTION:

     Assigns a CI/PICB to a DFI board. The DFI terminates a
     single T1 facility, and has a corresponding PIDB (or FIDB).

KEY FORMAT:

   ---------------------------------
   |             DFI PICB          |

DEPENDENCIES:

RLcktdata - 1 tuple defining the common board for this DFI, The tuple can be accessed by keying into RLunit_ckt with the ckt_indx (dfi + 1), unitnum (0-5), and unittype (SMTU). This will give you a circuit name to access RLcktdata. Also, tuples for all associated subtending channels, as specified in the RLCKTDATA population rules.

RLfidb_sgn - 1 tuple for the FIDB, whose key is same as the pidb attribute (associated with a PCT1FAC or PCCFAC only).

RLpidb - 1 tuple for the DI/PIDB, whose key is same as the pidb attribute (associated with a PCTFAC or PCHFAC only).

RLrc_eqloc - 1 tuple whose keys are SM number, Unit number, DFI Board Number ('Service Group'), and Unit type.

RLrc_loceq - 1 tuple keyed by SM number and CI/PICB +1.

## RLpicb (DFI-2 PICB)

DESCRIPTION:

Assigns a PICB to a DFI-2 board. The DFI-2 may terminate one or two T1 facilities (physically designated as FAC 0 and FAC 1), and thus may have one or two corresponding PIDBs (or FIDBs). Either or both of these PIDBs/FIDBs may be equipped. The PIDB/FIDB which physically connects to facility 0 must be populated in the '.pidb' attribute of the rlPICB tuple, and the PIDB/FIDB which physically connects to facility 1 must be populated

in the '.pidb2' attribute of the rlPICB tuple.

KEY FORMAT:

CI NO. - Control Interface 0 or 1

CI PICB NO. - PICB number relative to the CI
PICBs numbered (2 - 22) are available on CI 0
PICBs numbered (0 - 22) are available on CI 1

QUANTITY OF TUPLES:

Copyright © 1999 Lucent Technologies 

```
            1 Tuple per DFI-2 board tuple present in CKTDATA.

         TUPLE SEMANTICS:

            name (KEY) - DFI-2 PICB
            pidb -       System PIDB#/FIDB# assigned to DFI-2 facility 0
            pidb2 -      System PIDB#/FIDB# assigned to DFI-2 facility 1
                         0x7F (Default value).
            sg      -    service_group (DFI number, 1-10)
            esraddr -    DFI-2 CI/PICB shifted left 1 byte.
            unitnum -    Digital Line Trunk Unit 2 (DLTU2) Number (0-5)
            esrsize -    16
            dmsgpicb -   picb number of associated EC5 (echo
                         canceling board) connected to DFI2
                         facility 1 (FAC 1). If there is no EC5
                         associated with FAC 1 then set to
                         default (0xd7).
            dsgcpicb -   picb number of associated EC5 (echo
                         canceling board) connected to DFI2
                         facility 0 (FAC 0).  If there is no EC5
                         associated with FAC 0 then set to
                         default (0xd7).
            unittype -   SMDLTU2
            brd0type through brd1type - PCEECU or PCNOBRD
            brd2type through brd31type - PCNOBRD

          DEPENDENCIES:

            RLcktdata -  1 tuple defining the common board for
                         this DFI-2, the tuple can be accessed
                         by keying into RLunit_ckt with the
                         ckt_indx (dfi + 1), unitnum (0-5), and
                         unittype (SMTU). This will give you a
                         circuit name to access RLcktdata. Also,
                         tuples for all associated subtending
                         channels, as specified in the RLCKTDATA
                         population rules.
            RLfidb_sgn - 1 tuple for each equipped FIDB, whose key
                         is the same as each non-0x7F pidb/pidb2
                         attribute associated with a PCT1FAC or PCCFAC.
            RLpidb -     1 tuple for each equipped DI/PIDB, whose
                         key is same as each non-0x7F pidb/pidb2
                         attribute associated with a PCTFAC or PCHFAC.
            RLrc_eqloc - 1 tuple whose keys are SM number, Unit number,
                         DFI-2 Board Number ('Service Group'), and
                         Unit type.
            RLrc_loceq - 1 tuple keyed by SM number and CI/PICB +1.

**********************************************************************

                        RLpicb (IDCU PICB)

        DESCRIPTION:
```

Assigns a PICB to an IDCU service group. IDCU service groups are always in pairs (both service groups must be present). An IDCU may have one or more PIDB/DPIDBs; however, the first PIDB position on the IDCU is always a PIDB (not a DPIDB) as is populated in the '.pidb' attribute of rlPICB.

Note that the PICB for service group 0 of the IDCU must be even and the PICB for service group 1 must be equal to (service group 0 picb + 1).

KEY FORMAT:

CI NO. - Control Interface 0 or 1
CI PICB NO. - PICB number relative to the CI
PICBs numbered (2 - 22) are available on CI 0
PICBs numbered (0 - 22) are available on CI 1

QUANTITY OF TUPLES:

1 Tuple per IDCU service group (2 per IDCU)

TUPLE SEMANTICS:

name (KEY) - IDCU PICB
pidb - PIDB number relative to the SM of the PIDB assigned to position 0 on the IDCU 0 on the IDCU
pidb2 - 0x7F (Default value).
sg - service_group (0 through 1)
esraddr - IDCU CI/PICB shifted left 1 byte.
unitnum - Integrated Digital Carrier Unit (IDCU) Number (0-7 for an SM and 0-42 for an SM-2000)
esrsize - 16
dmsgpicb - 0xd7 (Default value, unused in IDCUs)
dsgcpicb - 0xd7 (Ditto)
unittype - SMIDCU
brd0type through brd31type - PCNOBRD

DEPENDENCIES:

RLcktdata - 1 tuple defining the common board for this IDCU service group which can be uniquely identified with a circuit index of (RLpicb.sg + 1), unit number of RLpicb.unitnum and a unit type of SMIDCU.

Copyright © 1999 Lucent Technologies 

```
                        0-2 tuples associated with each equipped IDCU
                        Facility.
                        0-1 tuples associated with an ELI defined
                        under the name space for this IDCU.
                        1-23 tuples associated with the PIDB/DPIDBs
                        assigned to this IDCU service group.
              RLislupidb - 1 tuple keyed by the CI/PICB number.
              RLpidb -    1 tuple for each equipped DI/PIDB.
              RLrc_eqloc - 1 tuple whose keys are SM number, Unit number,
                           IDCU Number ('Service Group'), and Unit type.
              RLrc_loceq - 1 tuple keyed by SM number and CI/PICB +1.

       "
```

**Attribute:**
picb
**Fullname:**
Peripheral Interface Control Bus
**Attribute Description:**
Peripheral interface control bus. List all picb numbers that appear in CKTDATA relation for all units, include both service group zero and one in each unit.

**Attribute:**
pidb
**Fullname:**
Peripheral Interface Data Bus
**Attribute Description:**
Number of the Peripheral Interface Data Bus (PIDB) cable connecting to this service group. DFIs in an RSM are connected to the FIU via FIDBs, so in this case, the pidb field refers to the FIDB number. DFI-2s may have up to two PIDBs/FIDBs, so in this case, the pidb field refers to the first relative PIDB/FIDB on a board (for facility 0).

**Attribute:**
pidb2
**Fullname:**
Peripheral Interface Data Bus 2.
**Attribute Description:**
Number of the second PIDB cable to a DFI-2. For DFI-2s, the pidb2 field refers to the second relative PIDB/FIDB on the board (for facility 1). This field should default to 0x7f for non-DFI-2s, or if a DFI-2 has relative PIDB/FIDB 1 unequipped.

**Attribute:**
esraddr

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Base address needed for esr (error source register)
**Attribute Description:**
Base address needed for error source register.
This is a two byte hex field.
The high order byte is equal to the CI/PICB number.
The low order byte is one of the following values
depending on the value of the attribute unittype:
F8, F0, C0, 00 ( most typical ).
See the previous general section or the following
check section for the Specific values for each
unittype enumeration.

**Attribute:**
unitnum
**Fullname:**
Service group number relative to IM (SM)
**Attribute Description:**
Unit number relative to the SM.

**Attribute:**
esrsize
**Fullname:**
Size of error source register on service group
**Attribute Description:**
Size of error source register on service group.
Set units to the following decimal values depending
on the value of attribute unittype: 8, 16.
See the previous general application section or the
following checks section for the specific values for
each unittype enumeration.

**Attribute:**
dmsgpicb
**Fullname:**
Mate Service Group PICB
**Attribute Description:**
Mate Service Group PICB

**Attribute:**
dsgcpicb
**Fullname:**
service group companion PICB
**Attribute Description:**
service group companion PICB.

**Attribute:**
sg

Copyright © 1999 Lucent Technologies 

**Fullname:**
service group
**Attribute Description:**
Service group number. This attribute is cross checked against service_group in RLrc_loceq.

**Attribute:**
unittype
**Fullname:**
Unit type of service group
**Attribute Description:**
Unit type of service group. Taken from CKTDATA relation attribute 'utype'.

**Attribute:**
brd[*]type
**Fullname:**
Board type slot 0 (DSU and MSU)
**Attribute Description:**
This is the valid non-defaulted board type enum An enumeration other than PCNOBRD. Local DSU mark UTD= Universal tone detector and UTG=Universal tone generator Use enumeration PCUTR for UTD and PCUTG for UTG. Break the 'ckt_indx' attribute of CKTDATA relation's first circuit of two circuits down into binary then starting from the right divide first five, which represents board location. These three tell which board type 0 through 15 to place enumeration in. For global DSU break the 'name' attribute in CKTDATA down the same way for TTF conference, responder, tone generator, interface and processor boards. For the MSU break the 'ckt_indx' attribute in CKTDATA down into binary and use bit positions 0 through 3 as the board positions for the metallic access, scanner, distributor, GDX compensator, SLIM2, and ALIT boards. The previous steps must be done for both service groups in each DSU and MSU unit.

For the Local DSU with a Revertive Pulsing Transceiver, the attribute brdNtype (where N=pack position in the service group: N=0-7) must be populated with the value PCRVPTBRD.

## 4. Population Rules for RLpidb

**Relation Description**
Control bus associated with a data bus.

Control bus associated with a data bus. This relation is based on the pidb attribute in RLcktdata.

```
**********************************************************************
POPULATION RULES FOR RLPIDB:

**********************************************************************
RLpidb    (SLC 96 PIDB A)
DESCRIPTION:
        PIDB A is the first PIDB on each DCLU service group. PIDB A
        is always required.
QUANTITY OF TUPLES:
        One tuple per DCLU service group
        any available PIDB is acceptable (same DI in both SGs).
TUPLE SEMANTICS:
        name (KEY) - PIDB A
        picb - CC PICB for this service group
        dmsgpidb - PIDB A on opposite service group
        dsgcpidb - PIDB B on this service group
                  (0x7f if UNASSIGNED: 9:1 DCLU)
        rpidb1 - 0x7F
        rpidb2 - 0x7F
**********************************************************************
                RLpidb (SLC 96 PIDB B)
DESCRIPTION:
        PIDB B is the second PIDB on each DCLU service group.
        This PIDB is not assigned for 9:1 concentration DCLUs.
QUANTITY OF TUPLES:
        One tuple per DCLU service group
        any available PIDB is acceptable (same DI for both SGs).
TUPLE SEMANTICS:
        name (KEY) - PIDB B
        picb - CC PICB for this service group
        dmsgpidb - PIDB B on opposite service group
        dsgcpidb - PIDB A on this service group
        rpidb1 - 0x7F
        rpidb2 - 0x7F
**********************************************************************
RLpidb    (PSIU TSI PIDB)
DESCRIPTION:
```

**Copyright © 1999 Lucent Technologies** 

This relation defines the TSI PIDBs that terminate on the PSU Data Fanout boards. There can be up to 48 PIDBs (24 per side) terminating in a PSU. A minimum of 2 PIDBs (1 per side) are always required if a PSU is equipped. Corresponding PIDBs on each PSU side must be connected to the same DI/DX.

QUANTITY OF TUPLES:

One tuple per assigned PIDB. Any available PIDB is acceptable.

TUPLE SEMANTICS:

pidb (KEY) - PIDB number.
picb - PSUCOM PICB for this service group.
dmsgpidb - PIDB # of same DF connection on opposite psu shelf side.
dsgcpidb - 0x7f (Not used for PSU).
rpidb1 - Relative PIDB# (0-47). See Table for assignment.
rpidb2 - 0x7f (Not used for PSU)

RPIDB1 TABLE: (Used to determine the relative PSIU PIDB#)

This table is summarized by:

rpidb1 = (8 * Shelf) + (2 * connection) + (PSU Side)

| rpidb1 | PSU Side | Shelf | Connection | DF# |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 |

RLpidb (ISLU(2) TSI PIDBs)

DESCRIPTION:

This relation defines the TSI PIDBs that can terminate on the ISLU(2) Common Data boards. There can be up to 24 PIDBs (12 per ISLU(2) side). A minimum of 2 PIDBs (1 per side) are always required. Only PIDBs of circuit type PCPIDBISLU which are listed in RLcktdata should be included in this relation.

QUANTITY OF TUPLES:

One tuple per assigned PIDB (maximum of 12 per side) any available PIDB is acceptable (same DI in both sides) (same DX on both sides for SM-2000).

TUPLE SEMANTICS:

name (KEY) - System PIDB circuit name
picb - CC PICB for this service group
dmsgpidb - PIDB# on the same CD connection on mate controller
dsgcpidb - 0x7f (Not used for ISLU(2))
rpidb1 - Relative PIDB# (0-23) See Table for assignment
rpidb2 - 0x7f (Not used for ISLU(2))

RPIDB1 TABLE: (Used to determine the relative ISLU(2) PIDB#)

This table is summarized by

rpidb1 = (12 CD Brd# ) + (2 *Connection) + (ISLU(2) Side)

| rpidb1 | ISLU(2) Side | CD Brd # | Connection |
|---|---|---|---|
| 0 | 0 | 0 | 0 |
| 1 | 1 | 0 | 0 |
| 2 | 0 | 0 | 1 |
| 3 | 1 | 0 | 1 |

RLpidb (AIU TSI PIDBs)

DESCRIPTION:

This relation defines the TSI PIDBs that can terminate on the AIU COMDAC. There can be up to 12 PIDBs (6 per COMDAC). A minimum of 2 PIDBs are always required. Only PIDBs of circuit type PCAI_PIDB which are listed in RLcktdata should be included in this relation.

QUANTITY OF TUPLES:

One tuple per assigned PIDB (maximum of 6 per side) any available PIDB is acceptable (same DI in both sides) (same DX on both sides for SM-2000).

TUPLE SEMANTICS:

name (KEY) - System PIDB circuit name
picb - CC PICB for this service group
dmsgpidb - PIDB# on the same COMDAC connection on mate controller
dsgcpidb - 0x7f (Not used for AIU))
rpidb1 - Relative PIDB# (0-11) See Table for assignment
rpidb2 - 0x7f (Not used for AIU)

RPIDB1 TABLE: (Used to determine the relative AIU PIDB#)

This table is summarized by

rpidb1 = (COMDAC # ) + (2 * Connection)

| rpidb1 | COMDAC # | Connection |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 1 | 0 |

RLpidb (LU 1 TSI PIDBs)

DESCRIPTION:

This relation defines the TSI PIDBs that can terminate on the LU 1 Common Data boards. There can be up to 2 PIDBs (1 per LU 1 service group).

QUANTITY OF TUPLES:

One tuple per assigned PIDB.

**Copyright © 1999 Lucent Technologies** 

```
        Each service group requires duplicated PIDB.
        Any available PIDB is acceptable, the PIDBs must be
        assigned consecutively to the same DI NO.
TUPLE SEMANTICS:
        name (KEY) - System PIDB circuit name
        picb - COMDAC PICB for this service group
        dmsgpidb - 0x7f (Not used for LU 1)
        dsgcpidb - 0x7f (Not used for LU 1)
        rpidb1 - 0x7f (Not used for LU 1)
        rpidb2 - 0x7f (Not used for LU 1)
**********************************************************************
RLpidb    (LU 2 TSI PIDBs)
DESCRIPTION:
    This relation defines the TSI PIDBs that can terminate on the LU 2
    Common Data boards.  There can be up to 2 PIDBs (1 per LU 2
    service group).
QUANTITY OF TUPLES:
    One tuple per assigned PIDB.
    Each service group requires duplicated PIDB.
    Any available PIDB is acceptable, the PIDBs must be
    assigned consecutively to the same DI NO.
TUPLE SEMANTICS:
    name (KEY) - System PIDB circuit name
    picb - COMDAC PICB for this service group
    dmsgpidb - 0x7f (Not used for LU 2)
    dsgcpidb - 0x7f (Not used for LU 2)
    rpidb1 - 0x7f (Not used for LU 2)
    rpidb2 - 0x7f (Not used for LU 2)
**********************************************************************
RLpidb    (LU 3 TSI PIDBs)
DESCRIPTION:
    This relation defines the TSI PIDBs that can terminate on the LU 3
    Common Data boards.  There can be up to 2 PIDBs (1 per LU 3
    service group).
QUANTITY OF TUPLES:
    One tuple per assigned PIDB.
    Each service group requires duplicated PIDB.
    Any available PIDB is acceptable, the PIDBs must be
    assigned consecutively to the same DI NO.
    (for SM-2000, the PIDBs must be assigned consecutively
    on the same DX NO.)
TUPLE SEMANTICS:
        name (KEY) - System PIDB circuit name
        picb - COMDAC PICB for this service group
        dmsgpidb - 0x7f (Not used for LU 3)
        dsgcpidb - 0x7f (Not used for LU 3)
        rpidb1 - 0x7f (Not used for LU 3)
        rpidb2 - 0x7f (Not used for LU 3)
**********************************************************************
RLpidb    (RISLU TSI PIDBs)
DESCRIPTION:
        This relation defines the TSI PIDBs that can terminate on the
        RISLU DFI-H1 or DFI-H2 boards. There can be up to 12 PIDBs
        for each
```

Copyright © 1999 Lucent Technologies 

```
RISLU. A minimum of 2 PIDBs are always required.
        One PIDB is assigned for each DFI-H1 or DFI-H2 board in a
        RISLU. Each TSI PIDB is remoted over digital carrier facilities
        to a DFI-R1 or DFI-R2 board. Each remote DFI is connected to
        the CD service groups by two PIDBs, one to each service group.
        One of these PIDBs is used as active, the other as standby.
        This configuration is referred to as remote PIDB fan out, and
        is used on all RISLUs.
QUANTITY OF TUPLES:
        One tuple per assigned PIDB (maximum of 12 per RISLU)
        any available PIDB is acceptable.
TUPLE SEMANTICS:
        name (KEY) - System PIDB circuit name
        picb - PICB that controls the RISLU DFI that is remoting this PIDB
        dmsgpidb - 0x7f (Not used for RISLU)
        dsgcpidb - 0x7f (Not used for RISLU)
        rpidb1 - Relative PIDB# of the pidb which is fanned out
                to CD service group 0 (see the following NOTE)
        rpidb2 - Relative PIDB# of the pidb which is fanned out
                to CD service group 1 (see the following NOTE).
 NOTE:
        Each RISLU TSI PIDB has two tuples in RLCKTDATA of type
        PCPIDBRISLU associated with it.  These tuples represent
        the two PIDBs that connect the RISLU remote DFI with the
        RISLU CD service groups.  The lower byte of the circuit
        index for these two tuples is identical ( See RLCKTDATA
        population rules).
        -rpidb1 should be populated with the lower byte of the
         associated PCPIDBRISLU circuit index multiplied by two.
        -rpidb2 should be populated with rpidb1 + 1
        EXAMPLE:
                Circuit names of associated PCPIDBRISLU tuples:
                        0x0105
                        0x0205
                rpidb1:         10 (decimal)
                rpidb2:         11 (decimal)
**********************************************************************
**********************************************************************
                RLpidb (RAF common board)
DESCRIPTION:
        Assigns a PIDB to an RAF. One PIDB is assigned to each RAF.
QUANTITY OF TUPLES:
        One tuple per RAF.
TUPLE SEMANTICS:
        name (KEY) - PIDB (assigned to RAF)
        picb - PICB for this RAF
        dmsgpidb - 0x7f
        dsgcpidb - 0x7f
        rpidb1 - 0x7f (Not used for RAF)
        rpidb2 - 0x7f (Not used for RAF)
 DEPENDENCIES:
        RLpicb - 1 tuple whose key is same as PICB attribute.
        RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
        RLrc_eqloc - 1 tuple whose keys are SM number, Unit
```

**Copyright © 1999 Lucent Technologies** 

```
                number, Service Group number, and Unit type.
        RLcktdata - 1 tuple defining the common control for the RAF.
*********************************************************************
                RLpidb (SAS common board)
DESCRIPTION:
        Assigns a PIDB to a SAS. One PIDB is assigned to each
        SAS unit.
QUANTITY OF TUPLES:
        One tuple per SAS.
TUPLE SEMANTICS:
        name (KEY) - PIDB (assigned to SAS)
        picb - PICB for this SAS
        dmsgpidb - 0x7f
        dsgcpidb - 0x7f
        rpidb1 - 0x7f (Not used for SAS)
        rpidb2 - 0x7f (Not used for SAS)
 DEPENDENCIES:
        RLpicb - 1 tuple whose key is same as PICB attribute.
        RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
        RLrc_eqloc - 1 tuple whose keys are SM number, Unit
                number, Service Group number, and Unit type.
        RLcktdata - 1 tuple defining the common control for the SAS.
*********************************************************************
                RLpidb (ISTF common board)
DESCRIPTION:
        Assigns a PIDB to an Integrated Services Test Function (ISTF).
        One PIDB is assigned to each ISTF common board.
        The PIDB provides the digital data being tested corresponding
        to the PICB assigned to the ISTF.  The PICB, PIDB, and ISTF must
        all be defined on the same SM.
QUANTITY OF TUPLES:
        One tuple per ISTF.
TUPLE SEMANTICS:
        name (KEY) - PIDB (assigned to ISTF)
        picb - PICB for this ISTF
        dmsgpidb - 0x7f (default)
        dsgcpidb - 0x7f (default)
        rpidb1 - 0x7f (not used for ISTF)
        rpidb2 - 0x7f (not used for ISTF)
 DEPENDENCIES:
        RLpicb - 1 tuple whose key is same as PICB attribute.
        RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
        RLrc_eqloc - 1 tuple whose keys are SM number, Unit
                number, Service Group number, and Unit type.
        RLcktdata - 1 tuple defining the common control for the ISTF.
*********************************************************************
                  POPULATION RULES FOR RLPIDB:
 RLpidb (Analog Trunk Unit common board)
 DESCRIPTION:
        Defines the PIDB tuple required to represent the Peripheral
        Interface Data Bus (PIDB) associated with Analog Trunk Unit (TU)
        Control and Data Interface (CDI) common board. For each equipped
        ('eqstat' attribute is not SMUNEQ) tuple in RLCKTDATA with 'type'
        attribute of PCCDI, equip one PIDB tuple keyed by its PIDB number,
```

Copyright © 1999 Lucent Technologies 

```
        which is found in the CKTDATA tuple's 'pidb' attribute.
 QUANTITY OF TUPLES:
        One PIDB tuple per equipped PCCDI tuple in CKTDATA.
        An equipped tuple is one with an 'eqstat' attribute equal to
        SMOPER or SMGROW (that is, not equal to SMUNEQ).
 TUPLE SEMANTICS:
        name (KEY) - DI/PIDB # from PCCDI cktdata.pidb attribute
        picb           - CI/PICB + 1 for this PCCDI circuit,
                       obtained from lower byte of CKTDATA name - 1.
        dmsgpidb   - 0x7F
        dsgcpidb   - 0x7F
        rpidb1     - 0x7F
        rpidb2     - 0x7F
**********************************************************************
                  POPULATION RULES FOR RLPIDB:
RLpidb (PCTFAC or PCHFAC)
DESCRIPTION:
        Defines the PIDB tuple required to represent the Peripheral
        Interface Data Bus (PIDB) associated with PCTFAC and PCHFAC
        facility circuits. For each populated tuple in RLCKTDATA
        with 'type' attribute of PCTFAC or PCHFAC, populate
        one PIDB tuple keyed by its PIDB number, which is found in the
        CKTDATA tuple's 'pidb' attribute.
        DFI-1 circuit boards only terminate a single facility, while the newer
        DFI-2 circuit boards terminate up to two. Regardless of DFI type,
        facilities are numbered according to their relative position on the
        board. Facilities terminating on a DFI-1 can only be relative facility
        0, while facilities terminating on a DFI-2 may be either relative
        facility 0 or 1, depending on the physical connection on the T1 side
        if the DFI-2. Relative facility is determined directly from the lower
        bit of the CKTDATA 'ckt_indx' attribute.
QUANTITY OF TUPLES:
        One PIDB tuple per populated PCTFAC or PCHFAC tuple in CKTDATA.
TUPLE SEMANTICS:
        name (KEY) - DI/PIDB # from PCTFAC or PCHFAC cktdata.pidb attribute
                       or        DX/PIDB        # from cktdata.pidb, for SM-2000.
        picb     - CI/PICB for this PCTFAC or PCHFAC circuit,
                       obtained from upper byte of CKTDATA name - 1.
        dmsgpidb - 0x7F
        dsgcpidb - 0x7F
        rpidb1   - RLcktdata.R checks the 'name' to rpidb1
                   if ( this PCTFAC/PCHFAC is relative facility 0 )
                         populate this field the same as the 'name' attribute
                   else ( this PCTFAC/PCHFAC is relative facility 1 )
                         therefore, a tuple must exist in CKTDATA representing
                         relative facility 0 on the same CI/PICB + 1.
                         populate this field with the pidb attribute of that
                         CKTDATA tuple
        rpidb2   - RLcktdata.R checks the 'name' to rpidb2
                   if ( this PCTFAC/PCHFAC is relative facility 1 )
                         populate this field the same as the 'name' attribute
                   else ( this PCTFAC/PCHFAC is relative facility 0 )
                         see if there is a tuple in CKTDATA representing
                         relative facility 1 on the same CI/PICB + 1.
```

**Copyright © 1999 Lucent Technologies** 

```
                        if ( relative facility tuple 1 exists )
                             populate this field with the pidb attribute of
                             that CKTDATA tuple
                          else
                             populate this field with 0x7f (unequipped PIDB)
*************************************************************************
RLpidb    (IDCU TSI PIDBs)
DESCRIPTION:
        This relation defines the TSI PIDBs that can terminate on the
        IDCU.  There can be up to 16 PIDBs per IDCU service group.
        There are restrictions between the assignment of PIDBs and
        DPIDBs on an IDCU.  If certain DPIDBs are assigned to an
        IDCU, then that service group could be restricted to less
        then 16 PIDBs.  See the IDCU population rules in RLislupidb.
        Only PIDBs of circuit type PCPIDBIDCU and pidbtype of
        PCDUALPIDB which are listed in  RLcktdata should be included
        in this relation.
QUANTITY OF TUPLES:
        One tuple per assigned PIDB (maximum of 16 per side)
        only dual pidbs are allowed which requires PIDB pairs
        be assigned to the IDCU.
TUPLE SEMANTICS:
        name (KEY) - System PIDB circuit name
        picb - CC PICB for this service group
        dmsgpidb - PIDB# on the same CD connection on mate controller
        dsgcpidb - 0x7f (Not used for IDCU)
        rpidb1 - Relative PIDB# (0-31)
        rpidb2 - 0x7f (Not used for IDCU)
        rpidb1 = (pidb_number_relative_to_IDCU_SG << 1) + IDCU_side
                pidb_number_relative_to_IDCU_SG = 0 to 15 (PIDBs only)
                IDCU_side = 0 or 1 (service group number)
*********************************************************************
              RLpidb (LDSF common board)
DESCRIPTION:
      Assign a PIDB to a Local Digital Services Function (LDSF).
      Four PIDBs are assigned to each LDSF common board.  All
      four PIDBs must be connected to the same DX.
QUANTITY OF TUPLES:
      4 tuples per LDSF
TUPLE SEMANTICS:
      pidb (KEY) - PIDB (assigned to LDSF)
      picb - PICB for this LDSF
      dmsgpidb - 0x7f (default)
      dsgcpidb - 0x7f (default)
      rpidb1 - 0x7f (not used for
 LDSF)
      rpidb2 - 0x7f (not used for LDSF)
 DEPENDENCIES:
      RLdsc3pidb - 1 tuple whose key is picb.
      RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
      RLrc_eqloc - 1 tuple whose keys are SM number, Unit
              number, Service Group number, and Unit type.
      RLcktdata - 1 tuple defining the common control for the LDSF.
*********************************************************************
```

```
              RLpidb (GDSF common board)
DESCRIPTION:
      Four PIDBs are assigned to each GDSF common board for SM-2000 and
      one PIDB or two PIDB for SM.
      All PIDBs must be connected to the same DX/DI.
QUANTITY OF TUPLES:
      4 tuples per GDSF for SM-2000
      1 or 2 tuples per GDSF for SM
TUPLE SEMANTICS:
      pidb (KEY) - PIDB (assigned to GDSF)
      picb - PICB for this GDSF
      dmsgpidb - 0x7f (default)
      dsgcpidb - 0x7f (default)
      rpidb1 - 0x7f (not used for GDSF)
      rpidb2 - 0x7f (not used for GDSF)
 DEPENDENCIES:
      RLdsc3pidb - 1 tuple whose key is picb.
      RLrc_loceq - 1 tuple keyed by SM number and PICB (+1).
      RLrc_eqloc - 1 tuple whose keys are SM number, Unit
              number, Service Group number, and Unit type.
      RLcktdata - 1 tuple defining the common control for the GDSF.
*************************************************************************/
```

**Attribute: pidb**

**Fullname:** peripheral interface data bus

**Attribute Description** Number of the peripheral interface data bus (PIDB) cable connecting to this service group. DFIs in an RSM are connected to the FIU via FIDBs, so in this case, the pidb field refers to the FIDB number. DFI-2s may have up to two PIDBs/FIDBs, so in this case, the pidb field refers to the first relative PIDB/FIDB on a board (for facility 0).

**Attribute: picb**

**Fullname:** peripheral interface control bus

**Attribute Description** Peripheral interface control bus. List all picb numbers that appear in CKTDATA relation for all units, include both service group zero and one in each unit. The peripheral interface control bus is cross checked against the upper byte of the attribute 'baseadd' in RLcktdata.

**Attribute: dmsgpidb**

**Fullname:** Mate service group PIDB.

**Attribute Description** Mate service group PIDB.

**Attribute: dsgcpidb**

**Fullname:** Service group companion PIDB.

**Attribute Description** Service group companion PIDB.

**Attribute: rpidb1**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Relative PIDB Number (Only used for PSIU/ISLU(2)/RISLU)

**Attribute Description** Relative PIDB Number (Only used for PSIU/ISLU(2)/RISLU/AIU) (Default value of 0x7F if unassigned)

**Attribute: rpidb2**

**Fullname:** Relative PIDB Number

**Attribute Description** Relative PIDB Number (Only used for RISLU) (Default value of 0x7F if unassigned)

```

## 4. Population Rules for RLpidblimit

**Relation Description**
PIDB Growth Control Special Feature relation.

```
PIDB GROWTH CONTROL
-------------------
```

The PIDB Growth Control special feature provides a mechanism to enforce a pricing restructure for the IDCU. This feature will limit the number of PIDBs that an IDCU can have based upon how many PIDBs have been purchased.

**Attribute: idcu**

**Fullname:** Integrated Digital Carrier Unit

**Attribute Description** This attribute is the key to this relation and represents the IDCU that the PIDB limit applies to.

**Attribute: pidblimit**

**Fullname:** PIDB limit

**Attribute Description** This attribute represents the maximum number of PIDBs that the IDCU is allowed to have.

## 4. Population rules for RLpli_lnk

**Relation Description**

```
        Peripheral Link to TSI Link mapping

        This relation maps from the physical link position
        (with respect to the TSI) to the Peripheral Unit
        end of the Peripheral Control and Timing (PCT) link.
        It is the reverse mapping of the RLlnk_pli relation.
        For each entry in RLpli_lnk there must be an associated
        entry in RLlnk_pli.
```

**Attribute:**

Copyright © 1999 Lucent Technologies

tsi_link

**Fullname:**

TSI link number

**Attribute Description:**

This attribute identifies the TSI link associated with the specified PCT link.

**Attribute:**

unittype

**Fullname:**

Peripheral Unit Type

**Attribute Description:**

The type of peripheral unit.

**Attribute:**

unitnumber

**Fullname:**

unit number

**Attribute Description:**

The number that identifies the selected peripheral unit.

**Attribute:**

pct_link

**Fullname:**

peripheral control and timing unit link number

**Attribute Description:**

This attribute identifies the relative PCT link number for the peripheral. The range depends on the type of peripheral unit:

SMPSIU : Range is the same as the lower 5 bits of PCPCTLNK circuit index. It represents the PSU shelf number and the PCT connection which is always 0.

SMDNU_S: Range is 0 through 11 with links 0 through 5 being in data group 0 and links 6 through 11 in data group 1. There is only one tuple in this relation for each duplex PCT link connected to the CDs.

**Attribute:**

cktname[*]

**Fullname:**

circuit name

**Attribute Description:**

circuit name for either side 0 or side 1 to which the PCT link connects. For example, when PCT link is used in PSU, the circuit name is the name of PSU shelf PCSHLFPSIU. This field is populated only if the PCT link is connected to a PSU.

Copyright © 1999 Lucent Technologies

**Attribute:**
is_ts_inv
**Fullname:**
Is Time Slot Inversion used?
**Attribute Description:**
This attribute will indicate if Time Slot Inversion is being used by the TSI link.

**Defines:**

### Relation Description

```
Mapping from Facility to Performance Monitoring Group
This relation describes which performance monitoring group
a facility is assigned to. The facilities that are supported
are indicated in the ckttype attribute.
```

**Attribute:**

Copyright © 1999 Lucent Technologies

facname

**Fullname:**

Circuit Name

**Attribute Description:**

This is the circuit name of the facility in the PM group.

**Attribute:**

ckttype

**Fullname:**

Type of Facility

**Attribute Description:**

This identifies the type of facility, and must be set to PCIFAC for integrated digital carrier unit (IDCU) facilities, and PCDF2FAC for digital facility interface model 2 (DFI-2) facilities.

It is set to: PCOC3FAC, PCSTEFAC, PCVT1FAC, or PCDS1SFAC for facilities associated with the Digital Networking Unit - SONET (DNU-S).

**Attribute:**

pmgrp

**Fullname:**

Performance Monitoring Group

**Attribute Description:**

This is the group ID of the performance monitoring group.

**Copyright © 1999 Lucent Technologies** 

# PMGRPDSL

## 1. Description

Associates a DSL performance monitoring group with the DSLs in the group.

## 2. Data Dictionary Values

## 4. Population Rules for RLpmgrpdsl

**Relation Description**
This relation describes which digital subscriber lines (DSLs) are assigned to each performance monitoring group.

The key is comprised of the switching module (SM) number, the group ID of the performance monitoring group, and a DSL D-channel port name. For every DSL performance monitoring group defined in RLpmthresh, there is one tuple in this relation for each DSL in that group.

**Attribute: module**

**Fullname:** SM Number

**Attribute Description** This is the number of the SM on which the DSL resides.

**Attribute: pmgrp**

**Fullname:** Performance Monitoring Group

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the group ID of the performance monitoring group that includes the DSL.

**Attribute: portname**

**Fullname:** DSL Port Name

**Attribute Description** This is the port name of the D-channel on a DSL.

**Attribute: type**

**Fullname:** Circuit Type

**Attribute Description** This is the circuit type of the parent circuit of the DSL D-channel.

## 4. Population Rules for RLpmgrpfac

**Relation Description**
This relation describes which facilities are assigned to each performance monitoring group.

The key is comprised of the switching module (SM) number, the group ID of the performance monitoring group, and facility circuit name. There is one tuple in RLpmgrpfac for every performance monitoring group defined in RLfacthrsh.

**Attribute: module**

**Fullname:** SM Number

**Attribute Description** This is the number of the SM on where the facility is assigned.

**Attribute: pmgrp**

**Fullname:** Performance Monitoring Group

**Attribute Description** This is the group ID of the performance monitoring group that includes the facility.

Copyright © 1999 Lucent Technologies

**Attribute: facname**

**Fullname:** Facility Circuit Name

**Attribute Description** This is the circuit name of the facility.

**Attribute: ckttype**

**Fullname:** Type of Facility

**Attribute Description** This identifies the type of facility in the PM group. Performance monitoring is supported for the following units:

```
Integrated digital carrier unit (IDCU)
- Digital signal level 1 (DS1)
Digital facility interface - 2 (DFI-2)
- Digital signal level 1 (DS1)
Digital networking unit-synchronous optical network (SONET) (DNU-S)
- SONET termination equipment (STE)
- Virtual tributary 1.5 (VT1.5)
- Digital signal level 1 (DS1)
```

# PMTHRESH

## 1. Description

This relation defines the threshold values to be used by layer 1 performance monitoring for a particular ISDN interface. Each tuple represents a set of thresholds to be used by an individual BRI or group of BRIs. In the 5E6(1) generic the only circuits that will have variable performance monitoring thresholds are *ANSI*® Standard U-DSLs.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 3840 |

## 4. Population Rules for RLpmthresh

**Relation Description**
Layer 1 DSL Performance Monitoring Thresholds.

This relation defines the threshold values to be used by layer 1 DSL performance monitoring for a particular ISDN interface. Each tuple represents a set of thresholds to be used by an individual BRI or group of BRIs. In the 5E6(1) generic the only circuits that will have variable performance monitoring thresholds are *ANSI*® and AMI U-DSLs. One tuple per Performance Monitoring Group (PMGRP). A PMGRP can be inserted at any time, but must exist before referenced by RLpmdslgrp or RLpmgrpdsl. The RLPMTHRESH relation will always be populated with at least one tuple (/PMGDEF) with the following values:

```
pmgrp   =  /PMGDEF
ach_es  =  40
ach_ses =  10
acd_es  =  100
acd_ses =  25
rci_es  =  20
rci_ses =  5
rcd_es  =  50
rcd_ses =  15
ach_inh =  DBNO
acd_inh =  DBNO
rci_inh =  DBNO
rcd_inh =  DBNO
inh_pm  =  DBNO
```

**Copyright © 1999 Lucent Technologies** 

The /PMGDEF group is the generic office default. This tuple is populated for each office and is not recent changeable. If the generic office default is specified the tuple is to be populated with the PMGRP name of PMDEF. The value of the other attributes is to be set to the generic office defaults unless otherwise specified. Any new PM group other than /PMGDEF or PMDEF will require a new tuple. The default for any attribute in the new group is to be the corresponding attribute from the /PMGDEF tuple unless there is a PMDEF tuple populated. In which case the attribute values from the PMDEF tuple is to be used. This relation is to be populated in an SM for each threshold group tuple that is referred by a circuit in that SM. This reference is provided by the RLpmdslgrp and RLpmgrpdsl relations. When a group is inserted it is to be populated in only one processor (AM) until it is referenced by a circuit. Then it is populated in the SM where the circuit is located. The /PMGDEF tuple is populated only in the AM. The RLpmthresh tuple on the SM cannot be deleted until the group is no longer referenced (in RLpmdslgrp) on the SM. The RLpmthresh tuple on the AM/CMP cannot be deleted until the group is no longer referenced on any SM. For AMI U-cards the following fields are used. The others are not used but must be specified or defaulted.

```
acd_es
rcd_es
acd_inh
rcd_inh
inh_pm
```

**Attribute: pmgrp**

**Fullname:** Performance Monitoring Group Name

**Attribute Description**Key to the relation which identifies which group of thresholds are to be used by a specific ISLU U-card or IDCU DSL.

**Attribute: ach_es**

**Fullname:** Alert Threshold for Current Hour Errored Seconds

**Attribute Description**Specifies the number of errored seconds that are allowed before the current hour alert count is considered to have too many errors.

**Attribute: ach_ses**

**Fullname:** Alert Threshold for Current Hour Severely Errored Seconds

**Attribute Description**Specifies the number of severely errored seconds that are allowed before the current hour alert count is considered to have too many errors.

**Attribute: acd_es**

**Fullname:** Alert Threshold for Current Day Errored Seconds

**Attribute Description** Specifies the number of errored seconds that are allowed before the current day alert count is considered to have too many errors.

**Attribute: acd_ses**

**Fullname:** Alert Threshold for Current Day Severely Errored Seconds

**Attribute Description** Specifies the number of severely errored seconds that are allowed before the current day alert count is considered to have too many errors.

**Attribute: rci_es**

Copyright © 1999 Lucent Technologies 

**Fullname:** Report Threshold for Current Interval Errored Seconds

**Attribute Description** Specifies the number of errored seconds that are allowed before the current interval report count is considered to have too many errors.

**Attribute: rci_ses**

**Fullname:** Report Threshold for Current Interval Severely Errored Seconds

**Attribute Description** Specifies the number of severely errored seconds that are allowed before the current interval report count is considered to have too many errors.

**Attribute: rcd_es**

**Fullname:** Report Threshold for Current Day Errored Seconds

**Attribute Description** Specifies the number of errored seconds that are allowed before the current day report count is considered to have too many errors.

**Attribute: rcd_ses**

**Fullname:** Report Threshold for Current Day Severely Errored Seconds

**Attribute Description** Specifies the number of severely errored seconds that are allowed before the current day report count is considered to have too many errors.

**Attribute: ach_inh**

**Fullname:** Inhibit the Performance Monitoring Current Hour Alert

**Attribute Description** Inhibits the generation of performance monitoring current hour reports for all circuits pointing to this tuple.

**Attribute: acd_inh**

**Fullname:** Inhibit the Performance Monitoring Current Day Alert

**Attribute Description** Inhibits the generation of performance monitoring current day reports for all circuits pointing to this tuple.

**Attribute: rci_inh**

**Fullname:** Inhibit the Performance Monitoring Current Interval Report

**Attribute Description** Inhibits the generation of performance monitoring current interval reports for all circuits pointing to this tuple.

**Attribute: rcd_inh**

**Fullname:** Inhibit the Performance Monitoring Current Day Report

**Attribute Description** Inhibits the generation of performance monitoring current day reports for all circuits pointing to this tuple.

**Attribute: inh_pm**

**Fullname:** Inhibit Performance Monitoring

Copyright © 1999 Lucent Technologies 

**Attribute Description** Inhibits all performance monitoring for all circuits pointing to this tuple.

## 4. Population Rules for RLpol_mtx

**Relation Description**
STP OPC Policing Matrix.

This relation defines whether the STP function is allowed or prohibited between each OPC and DPC pair. 'mtxindx' will represent the index entry for the OPC. 'pol_pc' is an array that contains that status bits for every DPC. To read the status of a particular OPC/DPC pair, one must have two indicators: 'mtxindx' to get the OPC tuple and the index to reach the bit corresponding to the DPC in pol_pc(s). Each bit in 'pol_pc' list status of an OPC/DPC pair.

**Attribute: mtxindx**

**Fullname:** Policing Matrix Index.

**Attribute Description** This is used as key into the RLpol_mtx table and represents an Originating Point Code.

**Attribute: spare**

**Fullname:** Spare

**Attribute Description** This is a spare field that is used to hold checksum values in the alternate structure.

**Attribute: pol_pc[*]**

**Fullname:** Policed destination point codes.

**Attribute Description** This is an array of 16 16-bit elements. Each bit indicates the STP function status (allow or prohibit) for each OPC/DPC pair. The index position of each bit in the tuple represents the mtxindx for the Destination Point Code.

## 4. Population Rules for RLpolicing

**Relation Description**
Standardization sector (SS7) Message Transfer Part (MTP) policing information.

This relation contains the expanded information required for all MTP policing functions and exists only if policing is provided based on the attribute olo_gw being set to DBYES in the relation RLoff_par. Signaling Transfer Point, Signaling Network Management policing as well as the User Part policing information is contained in this relation for the message transfer part of National SS7 common channel signaling.

**Attribute: polindx**

**Fullname:** policing index from RLdpc_info or RLls_grp

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** polindx is the key to this relation.

**Attribute: snm_rep**

**Fullname:** Boolean for software reporting of policed SNM messages.

**Attribute Description** Indicates whether or not software reporting of policed SNM messages is required.

**Attribute: linkset**

**Fullname:** Link set

**Attribute Description** The link set number if the owner is a link set.

**Attribute: stp_pol**

**Fullname:** Boolean for Signal Transfer Point (STP) policing.

**Attribute Description** Indicates if the destination or link set requires the STP policing function. That is, if an incoming message is detected for another point code (that is, not the current office ) on a link set which has STP policing the message must be stopped. Similarly, if an outgoing message is detected for a DPC which has STP policing it also must be stopped.

**Attribute: opc_siw**

**Fullname:** This attribute contains the set of Service Indicator codes defining the User Parts which are being policed from certain originating point codes.

**Attribute Description** Contains the set of service indicator codes which are policed from the dpc. This feature examines the Service Indicator of User Part messages and certain ones are thrown away. The service indicator is a 4 bit value allowing for up to 16 service indicator codes which can be policied. This field is used to store these service indicator codes in the opc_siw attribute when incoming messages are to be screened in the following way: The value of the service indicator is used to locate a bit position in opc_siw. This bit is set to "1" when the corresponding service indicator value is being policed. The least significant bit of opc_siw is used to indicate if the service indicator code of zero is policed and the most significant bit of opc_siw is used to indicate if the service indicator code of 15 is policed.

**Attribute: pol_own**

**Fullname:** The owner of this policing attribute ( DPC or Link Set )

**Attribute Description** Indicates whether the policing is for a Linkset or a Destination Point Code.

**Attribute: dpc_siw**

**Fullname:** Service Indicator codes defining the User Parts which are being policed to certain destination point codes.

NOTE: - A single point code may have both incoming (opc_siw) and outgoing (dpc_siw) policing active simultaneously but in different modes. Thus the need for both fields.

**Attribute Description** Is populated with the set of service indicator codes which are policed to the dpc. This field is defaulted to zero for tuples which are defined with link set owners. Also if this field

Copyright © 1999 Lucent Technologies 

is set to zero for dpc owners this indicates that no outgoing UP policing is required which is based upon the DPC of the message and the service indicator. This feature examines the Service Indicator of User Part messages and certain ones are thrown away. The service indicator is a 4 bit value allowing for up to 16 service indicator codes which can be policied. This field is used to store these service indicator codes in the dpc_siw attribute when incoming messages are to be screened in the following way: The value of the service indicator is used to locate a bit position in dpc_siw. This bit is set to "1" when the corresponding service indicator value is being policed. The least significant bit of dpc_siw is used to indicate if the service indicator code of zero is policed and the most significant bit of dpc_siw is used to indicate if the service indicator code of 15 is policed.

**Attribute: opc_rep**

**Fullname:** Boolean for incoming user part policed messages.

**Attribute Description** This boolean attribute allows incoming user part policed messages to generate fault reports or not.

**Attribute: dpc_rep**

**Fullname:** Boolean for incoming user part policed messages.

**Attribute Description** This boolean attribute allows outgoing user part policed messages to generate fault reports or not.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** The destination point code if the owner is a destination.

**Attribute: stp_rep**

**Fullname:** Boolean for software reporting of policed STP messages

**Attribute Description** Indicates whether or not software reporting of policed STP messages is required.

**Attribute: snm_pol**

**Fullname:** Boolean for Signaling Network Management (SNM) policing

**Attribute Description** Indicates whether or not the destination or link set requires the SNM policing function. That is if an incoming message is detected to be of a certain type (defined in h0h1) on a link set which has SNM policing the message must be stopped. Similarly, if an outgoing message is detected of a certain type for a DPC which has SNM policing the message must again be stopped.

**Attribute: h0h1[*]**

**Fullname:** Signaling Network Management Heading Codes

**Attribute Description** These attributes contain the set of h0/h1 Signaling Network Management heading codes which are being policed.

h0h1 - Is an array of unsigned 16 bit shorts which contains the set of ho/h1 Signaling Network Management heading codes which are being policed.

Copyright © 1999 Lucent Technologies 

h0h1_00 through h0h1_15 fields can only be populated if the snm_pol field is DBYES. The SNM policing feature examines network management messages and certain ones are thrown away. The messages which are thrown away are identified by what is called "H0" and "H1" heading codes. This relation is used to store these heading codes in the h0h1_00 through h0h1_15 attributes in the following way: The value of h0 is used to indicate which h0h1# attribute to use. (that is, h0 = 0 -> h0h1_00, h0 = 1 -> h0h1_01, etc.) The value of h1 is used to locate the bit position in the array element. This bit position is set to "1" if the corresponding h0 and h1 combination is being policied. The least significant bit of h0h1_<h0> is used to indicate if h1 of zero is policed and the most significant bit of h0h1_<h0> is used to indicate if h1 of 15 is policed.

## 4. Population Rules for RLport_pos

**Relation Description**
Port to Position

Port to position mapping This relation must be kept consistent with the relations RLpos_port, RLlprt_pos and RLpos_lprt. Consistency means that corresponding tuples in each of these four relations must exist and certain attributes in these tuples must have the same value. These attributes are listed in the POPULATION RULES of RLpos_lprt.

**Attribute: gbport**

**Fullname:** B-channel global port

Copyright © 1999 Lucent Technologies

**Attribute Description** The B-channel global port to which this position is assigned. Can not be recent changed while the port is in service. This is indicated by the bsc_state attribute in RLPORTLA as keyed by the same port.

**Attribute: gbport.member**

**Fullname:** global b-channel port member

**Attribute Description** Member for B-channel global port.

**Attribute: gbport.module**

**Fullname:** Module for B-channel global port

**Attribute Description** module for B-channel global port

**Attribute: posnum**

**Fullname:** position number

**Attribute Description** Position number. Can not be recent changed if the position is logged in. A position is not logged in when it is linked to the unoccupied serving team head cell in RLhcservtm.

**Defines:** "db/DMport.h"

## 4. Population Rules for RLport2vsm

**Relation Description**
Maps analog port to VLR module number.

This relation was created for the WIRELESS Centrex (WCTX) feature. It maps the analog port to the Visitor Location Register (VLR) SM where the VLR data is stored.

Copyright © 1999 Lucent Technologies

**Attribute: port**

**Fullname:** The local port name.

**Attribute Description** The local port name of the analog port.

**Attribute: vsm**

**Fullname:** The VLR switch module number.

**Attribute Description** This is the switching module number the VLR data will be mapped to.

**Attribute: privacy**

**Fullname:** The privacy indicator.

**Attribute Description** The privacy indicator.
The value DBNO indicates that the wired phone is allowed to bridge to the pcs handset.
The value DBYES indicates that the wired phone is NOT allowed to bridge to the pcs handset.

## 4. Population rules for RLportipad

### Relation Description

```
BRI port to local address mapping
This relation is used when mapping an BRA port to its local address.
This is used for routing purposes.  Only OSPF and ICMP use this address.
```

**Attribute:**
port
**Fullname:**
Port number
**Attribute Description:**
The port of the DSL for the x.25 link.

**Attribute:**
module
**Fullname:**
Module number

Copyright © 1999 Lucent Technologies

**Attribute Description:**
This attribute along with the port number
is used to identify a specific TCPIP port.

**Attribute:**
appl_type
**Fullname:**
Application type
**Attribute Description:**
Contains the application type, that is, TCPIP, OAP, etc..

**Attribute:**
port_ipaddr
**Fullname:**
Port IP address
**Attribute Description:**
Contains the IP address of this port. Used for routing.

## 4. Population Rules for RLpos_lprt

**Relation Description**
position to local B-channel port mapping

This relation should be consistent with the static AM relations RLpos_port and RLport_pos, and with the static PSM relation RLlprt_pos. Consistency means that the corresponding tuples in all 4 of these relations must exist and certain attributes must have the same values. RLpos_lprt data is in the PSMs only. Tuples are divided across

Copyright © 1999 Lucent Technologies

PSMs based on the global port. There should be only one instance of any unique tuple across processors. This relation is not to be populated for export applications. It should be populated only in offices intended to serve OSPS. Local defines which must be used by code on the switch for cstfeat are defined in RLopdbparm.

**Attribute: posnum**

**Fullname:** position number

**Attribute Description** The position number.

**Attribute: iserv_tm**

**Fullname:** interflow serving team for interflow positions

**Attribute Description** If pos_typ is set to OA_INT, then iserv_tm must be in range (129-144) and a tuple must exist (with this key) in relation RList_parm. Else if pos_type is not set to OA_INT, then iserv_tm must be set to 0.

**Attribute: ofc_num**

**Fullname:** operator services center id

**Attribute Description** This equals RLpos_port.ofc_num.

**Attribute: lbport**

**Fullname:** B-channel local port to which this position is connected

**Attribute Description** Can only be changed when the port is out of service which is indicated by the bsc_state attribute in RLportla as keyed by port number.

**Attribute: mon_pos**

**Fullname:** monitor the position?

**Attribute Description** Indicates whether or not the operator is allowed to monitor calls.

**Attribute: posdb_key**

**Fullname:** key of RLposdb or RLtaposdb

**Attribute Description** is used as the key for RLposdb and RLtaposdb: must have a different value for every tuple in these relations.

**Attribute: pos_typ**

**Fullname:** position type

**Attribute Description** This attribute, an enum, signifies whether the position is a BST, VDT, or INTERFLOW position.

**Attribute: cstfeat**

**Fullname:** Combined Services Terminal feature

**Attribute Description** Vendor or feature being used as the basis of the software for the second port on the Combined Services Terminal.

## 4. Population Rules for RLpp_cf

**Relation Description**

The following is a list of valid service classes for LTports assigned this feature:

```
LINES          TRUNKS
```

Copyright © 1999 Lucent Technologies

```
-------------  -------------
FC_INDVDL      FC_PDID
FC_PBX         FC_LTOLL_CONN
FC_ATTENDANT   FC_TTOLL_CONN
FC_4WIRE_INDV  FC_PRI_INTOLL
               FC_PFLASH
               FC_PF
               FC_PFITT
FC_ISDN
FC_ISATND
```

**Attribute: feat_id**

**Fullname:** Precedence and preemption constructed feature ID

**Attribute Description** Verify that RLfacname has a tuple such that feat_id = RLfacname.facid, and RLfacname.class = FACBRCS for that tuple.

**Attribute: actvn**

**Fullname:** type of activation

**Attribute Description** Indicates method of activating MFC features. Range of values: must always be ACTNONE.

**Attribute: dctvn**

**Fullname:** feature deactivation for precedence and preemption

**Attribute Description** Indicates method of deactivating MFC feature. Range of values: must always be DCTNONE.

**Attribute: pseudo_level**

**Fullname:** precedence level for non-autovon calls to or from this port

**Attribute Description** Indicates the precedence level of calls involving a non-AUTOVON LTport. This value is assigned by the customer.

**Attribute: satfwd_time**

**Fullname:** number of seconds before forward from satellite-PID

**Attribute Description** Indicates the number of seconds before a precedence call on a trunk from the end office to a satellite PBX, is forwarded to an attendant. Range of values: 0 - 60 seconds.

**Attribute: attdnt_di**

**Fullname:** attendant destination index for satellite forwarding

**Attribute Description** Indicates the destination index for calls forwarded from a satellite trunk to an attendant. Dependencies: Verify the existence of a tuple in RLrtppscrn with the destination index (di) equal to attdnt_di and with rtype == RTE_ATDN.

**Attribute: area[*]_di**

Copyright © 1999 Lucent Technologies 

**Fullname:** destination index for area N (where N equals 1 through 5)

**Attribute Description** Indicates the destination index for calls made to calling area N. Dependencies: If non-zero, verify the existence of a tuple in RLrtppscrn with the destination index (di) equal to areaN_di.

**Attribute: crossover**

**Fullname:** crossover traffic

**Attribute Description** Indicates whether LTports without AUTOVON/DSN network privileges can be connected, without the attendant's assistance, to AUTOVON/DSN trunks. Dependencies: If the global office parameter Gldsnopt is set to DBYES, then crossover must also be set to DBYES.

## 4. Population Rules for RLpp_ltm

**Relation Description**
Precedence and preemption logical termination. Precedence and preemption feature parameters on this line.
SPECIAL ENTRY FOR GROUP PARAMETER ASSOCIATED WITH BFG
---
BRCS feature grouping (BFG), capability G268, is intended to improve recent change response time and provide for SM memory reduction. It permits the creation of groups of BRCS features and parameters, and the utilization of these groups by call processing. BFG group parameter relations will not be created. This relation now has two types of tuples.

(1) The first type is the tuples existing prior to BFG which remain unchanged.

(2) The second type is the BFG group parameter TUPLE associated with PP feature in a BRCS feature group (BFG).

For BFG purposes, RLpp_ltm is a Group type. Therefore, only BFG Pseudo port tuple is permitted for the port assigned to a BFG. Individual post tuples may not be created for BFG assigned ports (when the feature is in the BFG). As new BRCS features are added to *5ESS*®-2000 switch a plan to add to the current list of BFG-able features will be evaluated. ISDN BRCS is included in BFG. NOTE: There is a limit of 30 BRCS features for each bfgid. The following is a list of valid service classes for ports assigned this feature:
FC_INDVDL
FC_PBX
FC_ATTENDANT
FC_4WIRE_INDV
FC_ISDN
FC_ISATND
NOTE: The PRL check corresponds to the valid set of service classes is within the check section for the attribute ltm_idx. Since different servclasses are allowed only for certain dependencies, refer to attribute ltm_idx usage section.

**Attribute: lead_module**

**Fullname:** Lead module.

**Attribute Description** lead module NOTE: When lead_module = zero then ltm_type = must equal LTM_ISDN (for BFG case) else lead_module range is 1-192.
NOTE: The lead_module cannot equal an SM number that has the SM Global Parameter, Glconfigname, set to D_BASIC. Default: none

**Copyright © 1999 Lucent Technologies** 

**Attribute: ltm_type**

**Fullname:** Logical Termination type.

**Attribute Description** Logical termination index type

**Attribute: ltm_idx**

**Fullname:** Logical termination Index.

**Attribute Description** Logical termination index Note: Attribute ltm_idx has a domain range of 0-8191. The range in this relation specifies 1-8191. As discussed in RLrc_qidx, the existence of an index implies the value 1 or greater. If no index is defined, RLrc_qidx(ltm_typ) would contain an index value of 0 and NO TUPLE WOULD EXIST IN THIS RELATION. Therefore, ltm_idx must be greater than 0 in this relation. Range: 1-8191 EXCEPT IF lead_module = zero If lead_module is zero, then range is 256-8191. NOTE 1: When a RLpp_ltm tuple exists with lead_module = zero, there exists a tuple or tuples in RLltm_bfg with this key:

```
ltm_bfg.module   = 1-192
ltm_bfg.type_ltm = LTM_ISDN or LTM_OTHER
ltm_bfg.ltm_idx  = any valid assigned ltm index
ltm_bfg.bfgid    = pp_ltm.ltm_idx
```

The set of tuples in RLltm_bfg is link listed and represents all DNs on all SMs which are associated with the single tuple in RLpp_ltm. NOTE 2: The following dependencies apply ONLY to ltm_type equal to LTM_ISDN or LTM_OTHER, when lead_module is NOT equal to zero.

(1)

```
Verify existence of a tuple in RLfc_line
such that RLfc_line.party == FCP_INDI
where the port in RLfc_line is
RLltm_port(ltm_idx).port
if RLpp_ltm.ltm_type == LTM_OTHER,
or
RLis_line(ltm_idx, lead_module).lead_port
if RLpp_ltm.ltm_type == LTM_ISDN.
```

(2)

```
 For unshared analog,
RLpp_ltm.ltm_type == LTM_OTHER and
RLfc_porttyp.servclass is:
FC_INDVDL, FC_PBX, FC_ATTENDANT,
or FC_4WIRE_INDV,
with RLfc_porttyp.sh_analog == DBNO,
where the key to RLfc_porttyp is:
RLltm_port(ltm_idx).port
For primary ISDN or shared analog,
RLpp_ltm.ltm_type == LTM_ISDN,
RLis_line(lead_module,ltm_idx).primary == DBYES
and RLfc_porttyp.servclass is:
FC_ISDN or FC_ISATND,
with RLfc_porttyp.sh_analog == DBYES,
where the key to RLfc_porttyp is:
RLis_line(ltm_idx, lead_module).lead_port
For secondary-only ISDN,
RLpp_ltm.ltm_type == LTM_ISDN,
RLis_line(lead_module,ltm_idx).primary == DBNO
```

**Copyright © 1999 Lucent Technologies** 

```
and no tuple exists in RLfc_porttyp
but the servclass is FC_ISDN.
```

**Attribute: prec_noncoi**

**Fullname:** Precedence non community of interest (COI).

**Attribute Description** Indicates the highest authorized precedence level of a call originating on this line to a non-COI destination. For hotline calls, this precedence level is used provided a precedence level is not stored as part of attribute dn in relation RLfc_dircon.

**Attribute: prec_coi**

**Fullname:** Precedence of community of interest (COI).

**Attribute Description** Indicates the highest authorized precedence of a call originating on this line to an ltm_idx in the same Community Of Interest group. If set to PP_NONE then coi_gpid = 0.

**Attribute: coi_gpid**

**Fullname:** Community of interest group id.

**Attribute Description** Indicates the Community Of Interest group id.

```
If set to 0 then
prec_coi = PP_NONE.  If > 0 then
prec_coi != PP_NONE.
```

**Attribute: preemptable**

**Fullname:** Preemtable.

**Attribute Description** Indicates whether this line can be preempted or not.

```
Verify the following for lines in a
MLHG with a hnttype of RTH_PPSMHG or RTH_PPLMHG:
For the tuple in RLpggpmap where the port is:
if RLpp_ltm.ltm_type == LTM_OTHER
use RLltm_port(ltm_idx).port
or
if RLpp_ltm.ltm_type == LTM_ISDN,
use RLis_line(ltm_idx, lead_module).lead_lport
to read RLlpt_pt(lead_lport,lpt_type=LPT_ISDN)
to get the port.
if there exists a tuple in RLrt_mhg such that:
key RLrt_mhg.grpnum == RLpggpmap.portgrp.grpnum,
Then the following must be true:
If RLpggpmap.member >= RLrt_mhg.first_preempt,
then RLpp_ltm.preemptable must be set to DBYES.
Otherwise,
if RLpggpmap.member < RLrt_mhg.first_preempt,
then RLpp_ltm.preemptable must be set to DBNO.
```

**Attribute: impreempt**

**Fullname:** Immediate preemption

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates whether immediate preemption is turned on or off on this ltm_idx.
attribute must be set to DBNO.

**Attribute: prec_pkup**

**Fullname:** Precedence pick up.

**Attribute Description** Indicates whether precedence calls to this ltm_idx can be picked up using the Call Pickup terminating feature. If set to DBYES, then verify existence of a tuple in RLpu_ltm such that:
key RLpu_ltm.ltm_idx == ltm_idx
key RLpu_ltm.ltm_type == ltm_type
key RLpu_ltm.lead_module == lead_module
for any RLpu_ltm.feat_id since all tuples are for pickup terminating.

**Attribute: forwd_prec**

**Fullname:** Forwarding precedence.

**Attribute Description** Indicates whether the forward intragroup precedence option is on or off. If set to DBYES then verify that a PP call forwarding feature has been assigned to this ltm_idx. This can be done by finding the tuple in relation RLdn_feats with the same keys as RLpp_ltm plus any RLdn_feats.range. For this tuple, there must be at least one entry in the ftent array such that:
ftent[i].selcrit is equal to CF_PPBUSY or
ftent[i].selcrit is equal to CF_PPIDLE.

**Attribute: avn_rec**

**Fullname:** AUTOVON receiver.

**Attribute Description** Indicates whether this ltm_idx can receive calls from the AUTOVON network. If the global office parameter Gldsnopt is set to DBYES, then both avn_rec and avn_orig can not be DBNO.

**Attribute: dir_stn**

**Fullname:** Direct station.

**Attribute Description** Indicates whether this ltm_idx has been assigned the direct station select feature. If set to DBYES, then a one-digit speed calling list must exist for this line.
If dir_stn == DBYES, then verify a SC feature where
RLlpt_pt((RLsc_port.lport,lpt_type).port.member == RLltm_port(ltm_idx).port on
RLpp_ltm.lead_module such that
RLsc_port.sc_list_id is greater than 0 and
RLsc_port.sc is equal to SC1_DIG.

**Attribute: avn_orig**

**Fullname:** AUTOVON originating.

**Attribute Description** Indicates whether calls to the AUTOVON network can be made from this line. If the global office parameter Gldsnopt is set to DBYES, then both avn_rec and avn_orig can not be DBNO.

**Attribute: hotline**

Copyright © 1999 Lucent Technologies 

**Fullname:** Hot line.

**Attribute Description** This attribute indicates whether this port is a hotline or not.

```
If set to MSTR_VOICE, MSTR_DATA,
SLV_VOICE, SLV_DATA, NOT_MS_VOICE, or NOT_MS_DATA,
then
if lead_module !=0
then
     ltm_type == LTM_OTHER,
     RLfc_line.nodial == FCND_DIRCON,
     RLfc_porttyp.servclass == FC_4WIRE_INDV or FC_INDVDL and
     RLfc_porttyp.hunt == DBNO.
else
     ltm_type == LTM_ISDN,
     if RLfc_line.bfgid == RLpp_ltm.ltm_idx
     then
          RLfc_porttyp.servclass == FC_4WIRE_INDV or
                                    FC_INDVDL and
          RLfc_porttyp.hunt == DBNO.
```

# PP_MEM

## 1. Description

This relation maps a Packet Pipe (PP) trunk port to its subtending PP member trunk ports.

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation PP_MEM.

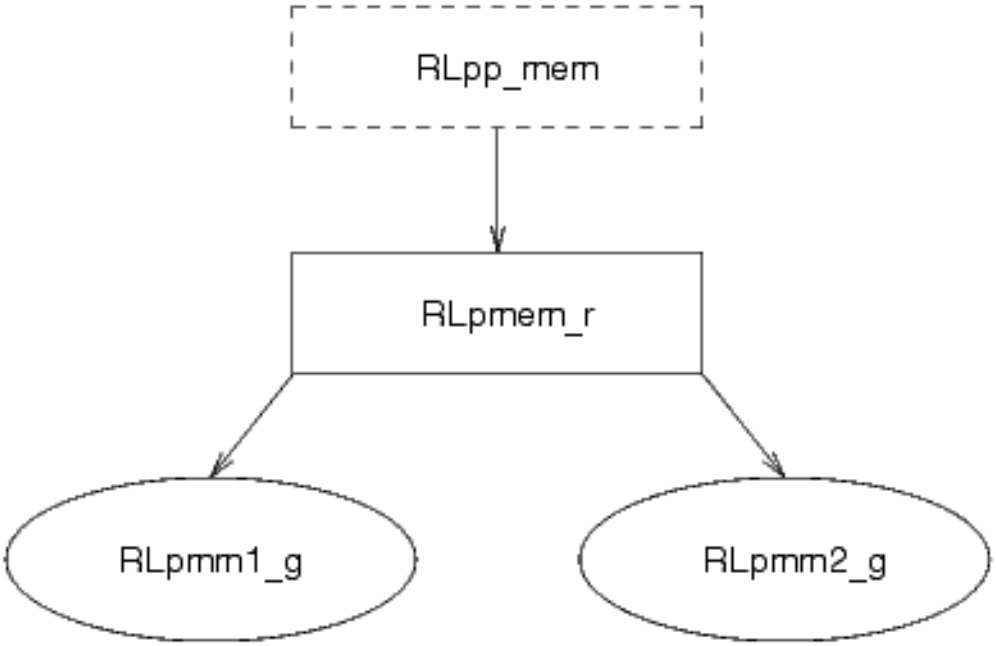

**Figure 1 Virtual Relation PP_MEM**

## 2. Data Dictionary Values

## 4. Population rules for RLpp_mem

### Relation Description

This relation maps the PP or FRBC to its members.
This relation maps a PP (Packet Pipe) trunk
port to its subtending PP member trunk ports.
This relation also maps a FRBC (Frame Relay
Bearer Channel) to its subtending BCM trunks ports.

**Attribute:**
gport
**Fullname:**
Global port number of the PP or FRBC trunk port (key)
**Attribute Description:**
This attribute has the global port number for the PP or FRBC trunk port

**Attribute:**
pptgnum
**Fullname:**
Trunk group number of the PP or FRBC trunk port
**Attribute Description:**
This attribute has the trunk group number of the PP or FRBC trunk port

**Attribute:**
pptgmember
**Fullname:**
Trunk group member number of the pipe trunk port
**Attribute Description:**
This attribute has the trunk group member number of the pipe trunk port

**Attribute:**
num_mem
**Fullname:**
Number of members associated with this pipe.
**Attribute Description:**
This attribute gives the number of the members
associated with a given pipe.

**Attribute:**
memmod
**Fullname:**
Module number on which the Members are defined
**Attribute Description:**
This attribute identifies the module number where

Copyright © 1999 Lucent Technologies 

the members reside. All the members have to be on the same DFI or DNU_S facility.

**Attribute:**
mport[*]
**Fullname:**
Port name for each member.
**Attribute Description:**
This attribute gives the port name for each member.

**Attribute:**
farpsu_ca
**Fullname:**
Far packet switching unit community address number
**Attribute Description:**
This attribute indicates the far packet switching community number. This attribute is only used when the packet pipe is being used as an inter-SM nailup between two SM for the purpose of a soft hand-off.

**Defines:**
"db/DMport.h",
"db/DMcircuit.h",
"db/DMunitno.h"

## 4. Population rules for RLpp_opts

### Relation Description

```
Precedence and Preemption options.
 Precedence and Preemption features and definition.
General Population Rules:
The following diagram indicates which attributes are
associated with;
        feature definition (RLpp_cf),
        lines  (RLpp_ltm), and
        trunks (RLpp_trunk).
```

| Attribute | Feature | Lines | Trunks |
|---|---|---|---|
| feat_id | X | X | X |
| actvn | X | | |
| dctvn | X | | |
| pseudo_level | X | | |

**Attribute:**
feat_id
**Fullname:**
feature id.
**Attribute Description:**
Indicates the Precedence and Preemption (PP) constructed feature id.

**Attribute:**
actvn
**Fullname:**
activating.
**Attribute Description:**
Indicate method of activating MFC features.

**Attribute:**
dctvn
**Fullname:**
deactivation.
**Attribute Description:**
Indicate method of deactivating MFC feature.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
pseudo_level
**Fullname:**
peusdo level.
**Attribute Description:**
Indicates the precedence level of calls involving a non Autovon port. This value is assigned by the customer.

**Attribute:**
satfwd_time
**Fullname:**
satellite forward time.
**Attribute Description:**
Indicates the number of seconds before a precedence call on a trunk from the end office to a satellite PBX, is forwarded to an attendant.

**Attribute:**
attdnt_di
**Fullname:**
attendant destination.
**Attribute Description:**
Indicates the destination index for calls forwarded from a satellite trunk to an attendant.

**Attribute:**
area1_di
**Fullname:**
area1 destination.
**Attribute Description:**
Indicates the destination index for calls made to calling area1.

**Attribute:**
area2_di
**Fullname:**
area2 destination.
**Attribute Description:**
Indicates the destination index for calls made to calling area2.

**Attribute:**
area3_di
**Fullname:**
area3 destination.
**Attribute Description:**
Indicates the destination index for calls made to calling area3.

**Attribute:**
area4_di
**Fullname:**
area4 destination.
**Attribute Description:**
Indicates the destination index for calls made to calling area4.

**Attribute:**
area5_di
**Fullname:**
area5 destination.
**Attribute Description:**
Indicates the destination index for calls made to calling area5.

**Attribute:**
crossover
**Fullname:**
crossover indicator.
**Attribute Description:**
Indicates whether ports without AUTOVON/DSN Network privileges can be connected, without the attendant's assistance, to AUTOVON/DSN trunks.

**Attribute:**
prec_noncoi
**Fullname:**
Precedence level of calls to NON Community Of Interest (COI) users.
**Attribute Description:**
Indicates the HIGHEST authorized precedence level of a call originating on a line to a non_coi destination. For hotline calls, this precedence level is used if precedence level is not stored as part of attribute dn in relation RLfc_dircon.

**Attribute:**
coi_gpid
**Fullname:**
Community Of Interest (COI) group id.
**Attribute Description:**
Indicates the Community Of Interest group id.

**Attribute:**
prec_coi
**Fullname:**
Precedence level of calls to Community Of Interest (COI) users.
**Attribute Description:**
Indicates the HIGHEST authorized precedence of a call originating on this line to a port in the same community of interest group.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
preemptable
**Fullname:**
Preemtable boolean.
**Attribute Description:**
Indicates whether a line can be preempted or not.

**Attribute:**
impreempt
**Fullname:**
Immediate Preemption boolean.
**Attribute Description:**
Indicates whether immediate preemption is turned on or off for a specific port.

**Attribute:**
prec_pkup
**Fullname:**
Call Pickup Precedence.
**Attribute Description:**
Indicates whether precedence calls to a port can be picked up using the call pickup feature.

**Attribute:**
forwd_prec
**Fullname:**
Forward Intragroup Precedence Calls.
**Attribute Description:**
Indicates whether the forward intragroup precedence option is on or off.

**Attribute:**
avn_rec
**Fullname:**
Autovon receive.
**Attribute Description:**
Indicates whether a port can receive calls from the AUTOVON Network.

**Attribute:**
dir_stn
**Fullname:**
Direct Station Select (DSS).
**Attribute Description:**
Indicates whether a port has been assigned the direct station select feature.

Copyright © 1999 Lucent Technologies 

**Attribute:**
avn_orig
**Fullname:**
Autovon originator.
**Attribute Description:**
Indicates whether calls to the AUTOVON Network can be made from a line.

**Attribute:**
trk_type
**Fullname:**
satellite trunk type.
**Attribute Description:**
Indicates the type of trunk. The trunk can either be between the end office and a satellite PBX, or it can connect the end office to an AUTOVON tandem switch. For a NODAL or Multi-Function DSN switch, trunks can be between the Nodal/MF switch and

1) EO switch
2) AI switch
3) Non AUTOVON/DSN switch
4) another Nodal/MF switch
5) Satellite PBX

In addition, the trunk can be assigned the following features:

| | | |
|---|---|---|
| Precedence | Network In-Dialing | (PNID) |
| Immediate | Network In-Dialing | (INID) |
| Routine | Network In-Dialing | (RNID) |
| Priority | In-Dialing | (PID) |

Range of values: The following enumeration types:
SAT_INID, SAT_PID, TAN_RNID, TAN_PNID,
EOAI_PNID, EOAI_RNID, EOAI_INID, OFFNET,
IST_RCD, IST_NONRCD, TIE_RNID, TIE_PNID
MLPPDQO, MLPPDQI, MLPPPQ and MLPPCQ.
Default: None.

The following dependencies exist in the relation rlPP_TRUNK and are stated here only for completeness sake.
1)The following dependency cannot be enforced by recent change.
Dependency: A PP trunk group is a trunk group that has a hunt type equal to one of the following:

RTH_PRFLIN, RTH_PRBLIN, RTH_PLFLIN,
RTH_PLBLIN, RTH_PRFIFO, or RTH_PLFIFO.
An MLPP trunk group has a servclass of FCEDSL and has a hunt type equal to one of the following:
RTH_PRFLIN, RTH_PRBLIN, RTH_PLFLIN or RTH_PLBLIN.
For a given PP trunk group, all trunk group members must be assigned a PP feature and must have the same trk_type. Therefore when setting

Copyright © 1999 Lucent Technologies 

trk_type the following steps should be taken.

a) Identify the trunk group number associated with this tuple in rlPP_TRUNK by finding the tuple in rlPGGPMAP such that:
key rlPGGPMAP.port == port.
Then rlPGGPMAP.portgrp.grpnum contains the trunk group number.
b) The information about each member in this trunk group can be found in rlGROUP_PORT such that:

```
key rlGROUP_PORT.portgrp.grpnum  == rlPGGPMAP.portgrp.grpnum
key rlGROUP_PORT.portgrp.grptype == rlPGGPMAP.portgrp.grptype
key rlGROUP_PORT.member          == a given member number.
```

c) If this port in rlPP_TRUNK is the only member in this trunk group then trk_type can be set to any of the valid enumeration types.
d) Otherwise, if another member exists in rlGROUP_PORT then verify that this member has been assigned a PP feature by identifying the tuple in rlPP_TRUNK such that:
key rlPP_TRUNK.port == rlGROUP_PORT.port.
Then set trk_type == rlPP_TRUNK.trk_type.
This will insure that all subsequent members added to this trunk group will have the same trk_type.

2) If trk_type is set to SAT_INID or SAT_PID then the hunt type of the trunk group that this trunk belongs to must NOT be one of the following: RTH_PRFLIN, RTH_PRBLIN, RTH_PLFLIN, RTH_PLBLIN, RTH_PRFIFO, or RTH_PLFIFO. (For verification rules see poprules for the attribute, port.)
3) The table below lists the required values for the servclass attribute in the relation RLfc_porttyp for each value of trk_type. For example, if trk_type is set to TAN_RNID then servclass in the tuple of RLfc_porttyp where: key RLfc_porttyp.port == port must be set to FC_LTOLL_CONN, FC_PF, FC_PFLASH or FC_PFITT.

| trk_type | servclass |
|---|---|
| TAN_RNID | FC_LTOLL_CONN |
| TAN_RNID | FC_PF, FC_PFLASH, FC_PFITT |
| TAN_PNID | FC_LTOLL_CONN |
| SAT_PID | FC_PDID |
| SAT_INID | FC_PDID |
| TIE_RNID | FC_LTOLL_CONN |
| TIE_PNID | FC_LTOLL_CONN |
| OFFNET | FC_LTOLL_CONN |
| EOAI_RNID | FC_TTOLL_CONN |
| EOAI_PNID | FC_TTOLL_CONN |
| EOAI_INID | FC_TTOLL_CONN |
| IST_RCD | FC_PRI_INTOLL |
| IST_NONRCD | FC_PRI_INTOLL |

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| MLPPDQO | FCEDSL |
| MLPPDQI | FCEDSL |
| MLPPPQ | FCEDSL |
| MLPPCQ | FCEDSL |

**Attribute:**
hotline
**Fullname:**
Hotline.
**Attribute Description:**
This attribute indicates whether this port is a hotline or not.

**Attribute:**
prec_limit
**Fullname:**
precedence limit for trunks with this PP feature.
**Attribute Description:**
Authorized precedence level limitation for trunks.
This indicates the HIGHEST authorized precedence level
call originated on a trunk.

**Attribute:**
esp
**Fullname:**
Essential Service Protection.
**Attribute Description:**
Indicates whether a trunk with this PP feature is
essential service protected.

**Attribute:**
dsn103
**Fullname:**
type of 103 test for trunks.
**Attribute Description:**
Indicates which 103 test to run, the DSN 103 or the public 103.
The DSN 103 test is run only on trunks populated in RLpp_trunk
with dsn103 == DBYES.

**Attribute:**
priority_ring
**Fullname:**
priority ring type.
**Attribute Description:**
Indicates the type of priority ringing, used for PP trunks.

## 4. Population Rules for RLpp_trunk

**Relation Description**
Precedence and preemption feature parameters on trunks.

The relation should not be populated on SMs that have the Global parameter, Glconfigname = D_BASIC. The D_BASIC SM does not contain the loadable package DSNCOMON, which supports the precedence and preemption feature.

**Attribute: port**

**Fullname:** port

**Attribute Description**

(1) Verify existence of tuple in rlFC_TRUNK such that: key rlFC_TRUNK.port = port

(2) Verify existence of tuple in rlFC_PORTTYP with this port as the key. Also for this tuple in rlFC_PORTTYP, rlFC_PORTTYP.servclass can only be one of the following:

FC_PDID, FC_LTOLL_CONN, FC_TTOLL_CONN,
FC_PRI_INTOLL, FC_PF, FC_PFLASH, FC_PFITT, or FCEDSL.

(3) If this is a two-way or out-going trunk that has a trk_type other than SAT_INID, SAT_PID, TAN_RNID, EOAI_RNID, or TIE_RNID, then the following condition must be true: The hunt type of the trunk group that this trunk belongs to must be one of the following:

RTH_PRFLIN, RTH_PRBLIN, RTH_PLFLIN,
RTH_PLBLIN, RTH_PRFIFO, or RTH_PLFIFO. An MLPP trunk group has a servclass of FCEDSL and has a hunt type equal to one of the following: RTH_PRFLIN, RTH_PRBLIN, RTH_PLFLIN or RTH_PLBLIN. This can be verified as follows: Find the tuple in rlPGGPMAP such that: key rlPGGPMAP.port == port, and for this tuple in rlPGGPMAP rlPGGPMAP.portgrp.grpnum == key rlRT_TRKG.grpnum Then for this tuple in rlRT_TRKG rlRT_TRKG.htype == one of the previously mentioned values.

Copyright © 1999 Lucent Technologies 

(4) NOTE: The port.module cannot equal an SM number that has the SM Global Parameter, Glconfigname, set to D_BASIC.

**Attribute: port.member**

**Fullname:** port name of a port

**Attribute Description** See usage of port.

**Attribute: port.module**

**Fullname:** the IM number that this port terminates on

**Attribute Description** See usage of port.

**Attribute: feat_id**

**Fullname:** precedence and preemption constructed feature id

**Attribute Description**

(1) Verify existence of tuple in RLdn_feats with the following keys:

```
lead_module: Gl_pcrid
ltm_type:    LTM_OTHER
ltm_idx:     rlFC_TRUNK.ltm_idxo
range:       any
```

This RLdn_feats tuple must have an attribute such that feat_id = RLdn_feats.ftent[n].fid

(2) Verify existence of tuple RLpp_cf for this key feat_id.

**Attribute: trk_type**

**Fullname:** type of trunk

**Attribute Description** The trunk can either be between the end office and a satellite PBX, or it can connect the end office to an AUTOVON tandem switch. For a nodal or Multi-Function DSN switch, trunks can be between the Nodal/MF switch and

(1) EO switch

(2) AI switch

(3) Non AUTOVON/DSN switch

(4) another Nodal/MF switch

(5) Satellite PBX

In addition the trunk can be assigned the following features:

```
Precedence network in-dialing (PNID)
Immediate network in-dialing (INID)
Routine network in-dialing (RNID)
Priority in-dialing (PID)
```

Dependencies:

Copyright © 1999 Lucent Technologies 

(1) The following dependency cannot be enforced by recent change. For a given trunk group, either all or none of the members must be assigned a PP feature. Also once a PP feature has been assigned, each member in the group must have the same trk_type. Therefore when setting trk_type the following steps should be taken:

(a) Identify the trunk group number associated with this tuple in rlPP_TRUNK by finding the tuple in rlPGGPMAP such that:
```
key rlPGGPMAP.port == port.
Then rlPGGPMAP.portgrp.grpnum contains the
trunk group number.
```

(b) The information about each member in this trunk group can be found in rlGROUP_PORT such that:
```
rlGROUP_PORT.portgrp.grpnum == rlPGGPMAP.portgrp.grpnum
rlGROUP_PORT.portgrp.grptype == rlPGGPMAP.portgrp.grptype
rlGROUP_PORT.member == a given member number.
```

(c) If this port in rlPP_TRUNK is the only member in this trunk group then trk_type can be set to any of the valid enumeration types.

(d) Otherwise, if another member exists in rlGROUP_PORT then verify that this member has been assigned a PP feature by identifying the tuple in rlPP_TRUNK such that: key rlPP_TRUNK.port == rlGROUP_PORT.port. Then set trk_type == rlPP_TRUNK.trk_type. This will insure that all subsequent members added to this trunk group will have the same trk_type.

(2) If trk_type is set to SAT_INID, SAT_PID, TAN_RNID, EOAI_RNID, or TIE_RNID, then the hunt type of the trunk group that this trunk belongs to must NOT be one of the following: RTH_PRFLIN, RTH_PRBLIN RTH_PLFLIN, RTH_PLBLIN, RTH_PRFIFO, or RTH_PLFIFO. (For verification rules see pop. rules for the attribute, port.) The following layout lists the required values for the servclass attribute in the relation RLfc_porttyp for each value of trk_type. For example, if trk_type is set to TAN_RNID then servclass in the tuple of RLfc_porttyp, where key RLfc_porttyp.port == port, must be set to FC_LTOLL_CONN, FC_PF, FC_PFLASH or FC_PFITT.

| trk_type | servclass |
|---|---|
| TAN_RNID | FC_LTOLL_CONN |
| TAN_RNID | FC_PF, FC_PFLASH, FC_PFITT |
| TAN_PNID | FC_LTOLL_CONN |
| SAT_PID | FC_PDID |
| SAT_INID | FC_PDID |
| TIE_RNID | FC_LTOLL_CONN |
| TIE_PNID | FC_LTOLL_CONN |
| OFFNET | FC_LTOLL_CONN |
| EOAI_RNID | FC_TTOLL_CONN |
| EOAI_PNID | FC_TTOLL_CONN |
| EOAI_INID | FC_TTOLL_CONN |
| IST_RCD | FC_PRI_INTOLL |
| IST_NONRCD | FC_PRI_INTOLL |
| MLPPDQO | FCEDSL |
| MLPPDQI | FCEDSL |
| MLPPPQ | FCEDSL |
| MLPPCQ | FCEDSL |

Copyright © 1999 Lucent Technologies 

**Attribute: prec_limit**

**Fullname:** authorized precedence level limitation

**Attribute Description** Dependencies: Each trk_type can have only the following values for prec_limit:

| trk_type | prec_limit |
|---|---|
| SAT_INID | PP_FLOVERRIDE |
| SAT_PID | PP_FLOVERRIDE |
| TAN_RNID | PP_ROUTINE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_FLOVERRIDE |
| TAN_PNID | PP_FLOVERRIDE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_ROUTINE |
| EOAI_PNID | PP_FLOVERRIDE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_ROUTINE |
| EOAI_RNID | PP_FLOVERRIDE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_ROUTINE |
| EOAI_INID | PP_FLOVERRIDE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_ROUTINE |
| OFFNET | PP_FLOVERRIDE |
| IST_RCD | PP_FLOVERRIDE |
| IST_NONRCD | PP_FLOVERRIDE |
| TIE_RNID | PP_ROUTINE, PP_FLOVERRIDE, PP_IMMEDIATE, PP_FLASH, PP_PRIORITY |
| TIE_PNID | PP_FLOVERRIDE, PP_ROUTINE, PP_IMMEDIATE, PP_FLASH, PP_PRIORITY |
| MLPPDQO | PP_FLOVERRIDE, PP_ROUTINE, PP_IMMEDIATE, PP_FLASH, PP_PRIORITY |
| MLPPDQI | PP_FLOVERRIDE, PP_ROUTINE, PP_IMMEDIATE, PP_FLASH, PP_PRIORITY |
| MLPPPQ | PP_FLOVERRIDE, PP_ROUTINE, PP_IMMEDIATE, PP_FLASH, PP_PRIORITY |
| MLPPCQ | PP_FLOVERRIDE, PP_ROUTINE, PP_IMMEDIATE, PP_FLASH, PP_PRIORITY |

**Attribute: esp**

**Fullname:** essential service protection

**Attribute Description** Indicates whether this trunk is essential service protected. Dependencies: esp must be set to DBNO for trk_type values of SAT_INID, SAT_PID, TAN_RNID, TAN_PNID,

Copyright © 1999 Lucent Technologies 

OFFNET, IST_RCD, IST_NONRCD, TIE_RNID, TIE_PNID, MLPPDQO, MLPPDQI, MLPPPQ and MLPPCQ.

**Attribute: dsn103**

**Fullname:** DSN 103 test

**Attribute Description** Indicates which 103 test to run when a 103 test is requested. If dsn103 == DBYES, run the DSN 103 test, and if dsn103 == DBNO, run the public 103 test. The DSN 103 test is in the same family as the public 103 test but contains additional tests (such as a preemption wink). The DSN 103 test takes the place of the public 103 test and the DSN 103 test is run only on trunks that have a tuple populated in RLpp_trunk and have dsn103 == DBYES.

**Attribute: priority_ring**

**Fullname:** type of priority ringing

**Attribute Description** Indicates type of priority ringing. Dependencies: If trk_type is set to EOAI_INID, then priority_ring is a required field and must be set to LP4WOFF, LP4W350, or LP4W1650.

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLppscrmks

**Relation Description**
This is a relation that is needed to implement the precedence and preemption (PP) modular feature.

This relation can remain empty, meaning no tuples populated, until subscribers requesting the PP feature have been identified.

**Attribute: si**

**Fullname:** Screening Index

**Attribute Description** Screening index associated with a line.

**Attribute: di**

**Fullname:** Destination Index

**Attribute Description** Destination index.

**Attribute: rte_code**

**Fullname:** Route Code

**Attribute Description** Indicates the valid route codes that can be analyzed.

**Attribute: prec_level**

**Fullname:** Precedence Level

**Attribute Description** Indicates the precedence level of the call in progress.

**Attribute: remarks**

**Fullname:** Remarks

**Attribute Description** Remarks associated with RLrtppscrn relation tuples.

**Relation Description**

```
Packet Switching Directory Number Translation

This relation translates packet DN into packet user's

"The following tuple semantics detail the allowed values for
the possible types of Packet Directory Numbers.

TUPLE SEMANTICS for a DN with Individual Termination Class
-----------------------------------------------------------
dn              Directory Number
module          Switching Module Number
ph_number       Protocol Handler Number
ph_cn           Protocol Handler Channel Number
party           Party
pstermcl        RTTC_INDIVID (Individual Termination Class)
psdenytm        {DBYES,DBNO}
chan_sel        {DBYES,DBNO}
psucd           DBNO
psbgrp          0-100 (Packet Business Group Number)

TUPLE SEMANTICS for a MLHG Uniform Call Distribution DN
-------------------------------------------------------
dn              Directory Number
module          0 (Switching Module Number)
ph_number       0 (Protocol Handler Number)
ph_cn           0 (Protocol Handler Channel Number)
party           0 (Party)
pstermcl        RTTC_PORTGRP (Multi-Line Hunt Group)
psdenytm        DBNO
chan_sel        DBNO
psucd           DBYES (Uniform Call Distribution DN)
psbgrp          0 (Packet Business Group Number)

TUPLE SEMANTICS for a MLHG Linear Entry Point DN
------------------------------------------------
dn              Directory Number
module          0 (Switching Module Number)
ph_number       0 (Protocol Handler Number)
ph_cn           0 (Protocol Handler Channel Number)
party           0 (Party)
pstermcl        RTTC_PORTGRP (Multi-Line Hunt Group)
psdenytm        DBNO
chan_sel        DBNO
psucd           DBNO (Linear Entry Point DN)
psbgrp          0 (Packet Business Group Number)

TUPLE SEMANTICS for a Modem Pool Group DN
-----------------------------------------
dn              Directory Number
module          0 (Switching Module Number)
ph_number       0 (Protocol Handler Number)
```

```
        ph_cn           0 (Protocol Handler Channel Number)
        party           0 (Party)
        pstermcl        RTTC_MODEM (Multi-Line Hunt Group)
        psdenytm        DBNO
        chan_sel        DBNO
        psucd           DBNO (default)
        psbgrp          0 (Packet Business Group Number)"
```

**Attribute:**
dn
**Fullname:**
packet switching directory number
**Attribute Description:**
usage: This attribute consists on the NOC (normalized office code) and four directory number digits.

For any directory number, if the noc+d4d3 has a tuple in relation RLRTDNMOD with a non-zero route index a tuple also may exist in RLPR_DNTRAN. For these cases the tuple in RLPR_DNTRAN will take precedence insofar as call routing is concerned. This is true regardless of the type of SM (RSM/LSM/HSM/ORM) from which the call originates. An example where this is useful is the case of a DN hundreds group where most DNs all route to the same PBX trunk group but there are a few DNs in that hundreds group which do not. In this case the route index in RLRTDNMOD is used to route the majority of calls to the hundreds group whereas those few which route differently do so via the existence of RLPR_DNTRAN tuples.

**Attribute:**
dn.noc
**Fullname:**
Normalized office code
**Attribute Description:**
See attribute dn

**Attribute:**
dn.digits
**Fullname:**
Directory Digits
**Attribute Description:**
Local directory number minus the office code.

**Attribute:**
module
**Fullname:**
SM number
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

SM number where the DSL or packet user associated to the DN is located.

**Attribute:**
ph_number
**Fullname:**
PH number
**Attribute Description:**
PH number of the terminating packet switching user of a DSL is connected to.

**Attribute:**
ph_cn
**Fullname:**
PH channel number
**Attribute Description:**
Channel number of the PH the terminating packet switching user is connected to.

**Attribute:**
party
**Fullname:**
Party
**Attribute Description:**
Specific user within an ISDN DSL D-channel.

**Attribute:**
pstermcl
**Fullname:**
Terminating class of the packet switching user.
**Attribute Description:**
To indicate the packet switching user termination class.

**Attribute:**
psdenytm
**Fullname:**
Deny termination on the packet switching user.
**Attribute Description:**
Deny termination on the packet switching user.

**Attribute:**
chan_sel
**Fullname:**
Active Channel Selection
**Attribute Description:**
The active channel selection attribute specifies that the dn is a Common DN that is shared by at least two channels.

Copyright © 1999 Lucent Technologies

Since the DN is a Common DN, there must exist a tuple of RLcdnchan for the DN. Only one of the channels of the Common DN can be RLpr_dntran. If the D-Channel is assigned, then the D-Channel is put in RLpr_dntran. If the D-Channel is not assigned, then first B-Channel in RLcdnchan is put in RLpr_dntran.

**Attribute:**
psucd
**Fullname:**
Packet Switching Uniform Call Distribution
**Attribute Description:**
The psucd attribute specifies whether the dn is a packet Uniform Call Distribution DN or a Linear entry point DN when the pstermcl = RTTC_PORTGRP.

If pstermcl = RTTC_PORTGRP and psucd = DBNO the DN must have a tuple populated in RLpsldn_gp, otherwise if psucd equals DBYES, then the DN must have a tuple populated in RLrtdn_mhg.

For packet UCD or linear DNs, there is no port information in this relation.

The psucd attribute is equal to DBNO for any term class other than RTTC_PORTGRP.

**Attribute:**
psbgrp
**Fullname:**
Packet Business Group number
**Attribute Description:**
This attribute specifies the Packet Business Group (PBG) number that is associated with the dn.

If termclass is RTTC_INDIVID, then the psbgrp attribute is the PBG that provisioned for the line. The value of 0 is used, if the line does not subscribe to a PBG. If termclass is not RTTC_INDIVID, then the psbgrp attribute has the value of 0.

If termclass is RTTC_PORTGRP, then the Packet Business Group number that is associated with the Multi-Line Hunt Group is in RLrt_mhg. If the psbgrp attribute is not equal to 0, then RLpbg_sfg and RLpbg_info must exist keyed by psbgrp.

## 4. Population rules for RLpri_sm

**Relation Description**

Primary Rate Interface to SM mapping
This relation defines on what SM the Primary Rate Interface (PRI) groups have been defined. Each group consists of 1 D-channel and up to 479 B-channels in up to 20 facilities (providing Non-Facility Associated Signaling) or 2 D-channels and up to 478 B-channels in up to 20 facilities (providing Non-facility Associated Signaling with D-channel Backup).

**Attribute:**

prigrp

**Fullname:**

primary rate interface group name

**Attribute Description:**

Copyright © 1999 Lucent Technologies

This is a unique number assigned to each PRI group in the office.

**Attribute:**
sm
**Fullname:**
Switching Module
**Attribute Description:**
This specifies the SM where the PRI Group is defined.

**Attribute:**
dprim_port
**Fullname:**
Primary D-channel port
**Attribute Description:**
Port name of PRI primary D-channel

**Attribute:**
dsec_port
**Fullname:**
Secondary D-channel port
**Attribute Description:**
Port name of PRI secondary D-channel

## 4. Population rules for RLprifacs

**Relation Description**

Primary Rate Interface Facilities
This relation defines the facilities (that is, T1's)
that have been assigned to a Primary Rate Interface Group.
A PRI group consists of 1 D-channel and up to 479 B-channels in
up to MAXDCHANS (20 for 5E9(1)) facilities (providing Non-Facility
Associated Signaling) or 2 D-channels and up to 478 B-channels
in up to 20 facilities (providing Non-facility Associated
Signaling with D-channel Backup).

**Attribute:**

prigrp

**Fullname:**

primary rate interface group name

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This is a unique number assigned to each PRI group in the office.

**Attribute:**
interf_id
**Fullname:**
Interface ID
**Attribute Description:**
This specifies the interface ID number that has been assigned to this facility in the given PRI group.

**Attribute:**
num_bchans
**Fullname:**
Number of B-channels
**Attribute Description:**
This specifies the number of B-channels that have been assigned on the facility identified by the given interface ID on the given PRI group.

**Attribute:**
bchan[*]
**Fullname:**
B-channel ports
**Attribute Description:**
This specifies up to 24 B-channel ports that have been assigned on this facility for this PRI group.

PRI group number

**Attribute Description:**

This is a unique number assigned to each PRI group in the office.

**Attribute:**

max_act_tbct

**Fullname:**

Maximum Active Two B-channel Transfers.

**Attribute Description:**

Maximum number of active transfers.

**Attribute:**

max_reqs_tbct

**Fullname:**

Maximum Two B-channel Transfer Requests.

**Attribute Description:**

Maximum number of valid transfer requests accepted per 10 seconds.

**Attribute:**

tbctsrvgrp

**Fullname:**

Two B-channel Transfer Serving Group.

**Attribute Description:**

The TBCT PRI serving group number for this PRI group.

**Attribute:**

tbct_active

**Fullname:**

Two B-channel Transfer Active.

**Attribute Description:**

Indicates whether the service type TBCT is active for this PRI group.

## 4. Population rules for RLprigrp

**Relation Description**

Primary rate interface (PRI) group
This relation defines on a per switching module (SM) basis, the PRI groups. Each group consists of one D-channel and up to 479 B-channels in up to 20 (MAXFACS) facilities (providing non-facility associated signaling) or two D-channels and up to 478 B-channels in up to 20 (MAXFACS) facilities (providing non-facility associated signaling with D-channel backup). In 5E9(1), the maximum number of facilities allowed is 20 and the parameter MAXFACS will indicate this.

**Attribute:**
prigrp
**Fullname:**
PRI group name
**Attribute Description:**
This is a unique number assigned to each PRI group in the office.

**Attribute:**
pri_type
**Fullname:**
PRI group type
**Attribute Description:**
This specifies whether this is an Custom PRI or a Bellcore Standard PRI.

**Attribute:**
bchan_serv
**Fullname:**
B Channel Service
**Attribute Description:**
SERVICE msg can be sent on B-channel for National PRI.

**Attribute:**
std_nsf_ie
**Fullname:**
Standard Network Specific Facility IE interpretation type
**Attribute Description:**
This boolean attribute, if set to MC_YES or MC_NULL, allows for National PRIs to have their network specific facility information element interpreted according to the Bellcore standards. For CUSTOM PRIs the only valid values for this attribute are MC_NO or MC_NULL, both of which mean a non-standard interpretation of this information element.

**Attribute:**
dprim_port
**Fullname:**

Copyright © 1999 Lucent Technologies 

D-channel PRIMARY port

**Attribute Description:**

This is the global port name of the PRIMARY D-channel in the PRI group.

**Attribute:**

dsec_port

**Fullname:**

D-channel SECONDARY port

**Attribute Description:**

This is the global port name of the SECONDARY D-channel in the PRI group.

**Attribute:**

num_bchans

**Fullname:**

Number of B-channels

**Attribute Description:**

This is the number of B-channels in this PRI group.

**Attribute:**

num_facs

**Fullname:**

Number of facilities

**Attribute Description:**

This is the number of facilities in this PRI group.

**Attribute:**

fac[*].interf_id

**Fullname:**

Interface ID for a facility

**Attribute Description:**

This is an array of up to MAXFACS interface ID's assigned to the facilities in this PRI group. They will be populated sequentially and there will be no holes in the array.

**Attribute:**

fac[*].fac_name

**Fullname:**

Facility name

**Attribute Description:**

This is an array of up to MAXFACS circuit names of the facilities assigned to this PRI group.

**Attribute:**

fac[*].fac_mod

**Fullname:**

Copyright © 1999 Lucent Technologies 

SM of a facility

**Attribute Description:**

This is an array of up to MAXFACS SMs of the assigned facilities in this PRI group. All SM values for a PRI group will be the same, since only intra-SM is supported.

**Attribute:**

fac[*].b_flag

**Fullname:**

B-channel indicator per facility

**Attribute Description:**

This is an array of up to MAXFACS B-channel flags, one per facility in this PRI group. The flag indicates whether the facility has B-channels assigned to the PRI group or not.

# PRIM_DNA

## 1. Description

This static relation is populated in ISDN SMs containing any type of standard ISDN terminal. The relation stores the default bearer capability DN Appearance ID ranges for the standard terminals primary TNs (CKTTN, ODBTN, or DPKTTN).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 16382 |

## 4. Population rules for RLprim_dna

### Relation Description

Primary DN Standard ISDN Terminal Default DN Appearances
This relation description must first begin with a definition of 'primary DN' as it is used in the context of this relation and the Automatic Terminal Setup (ATS) operational capability. A primary DN (or TN) can be a Circuit Switched TN (CKTTN), a On-Demand B-Channel Packet Switched TN (ODBTN) or a D-Channel Packet Switched TN (DPKTTN). Also, a primary DN could be the listed TN of a Multi-Line Hunt Group (MLHG) if the MLHG member does not have an individual TN defined.

This relation stores information about the default bearer capability assigned to the primary DNs of standard ISDN terminals. This information is stored in the twelve lo_* and hi_* attributes. This relation must not contain tuples for Custom-BRI terminals.

Copyright © 1999 Lucent Technologies 

The default bearer channel information is used during the Automatic Terminal Setup (ATS) terminal download. The six possible default bearer capabilities for Primary DNs are grouped into Circuit Switched Voice (CSV), Circuit Switched Data (CSD) or Packet Mode Data (PMD) as follows:

CSV SPEECH (lo_spch / hi_spch) - NOT VALID FOR EKTS_CACH,
CSV 3.1 Khz AUDIO (lo_audio / hi_audio) - NOT VALID FOR EKTS_CACH,
CSD 64Kbps on B-Channel (lo_64kbc / hi_64kbc),
CSD 56Kbps on B-Channel (lo_56kbc / hi_56kbc),
ODB B-Channel X.25 PMD (lo_odb / hi_odb),
DPKT D-Channel X.25 PMD (lo_dpkt / hi_dpkt)

For each type of bearer capability, there is a range of terminal DN Appearance IDs (up to 16 each for speech / 3.1 KHz audio CSV and 56K bps / 64K bps CSD, and up to four each for ODB PMD / DPKT PMD) that may be assigned (depending on the specific type of standard terminal). Each terminal DN Appearance ID in this range will have that default bearer capability assigned.
The following descriptions detail how different types of standard terminals may be provisioned in this relation and give a maximum number of DN Appearance IDs for that terminal type:
Standard Additional Call Offering (ACO) Terminals:

0 thru 16 speech CSV DN Appearance IDs (up to RLis_line.csv_climit)
0 thru 16 audio CSV DN Appearance IDs (up to RLis_line.csv_climit)
0 thru 16 56k CSD DN Appearance IDs (up to RLis_line.csd_climit)
0 thru 16 64k CSD DN Appearance IDs (up to RLis_line.csd_climit)
0 thru 4 ODB PMD DN Appearance IDs (see attributes for TN limitations)
0 thru 4 DPKT PMD DN Appearance IDs (see attributes for TN limitations)

No Secondary DN Appearance IDs
Maximum number of ACO DN Appearance IDs =
(16 + 16 + 16 + 16 + 4 + 4 + 0) = 72

Standard BASIC CALL Terminals:
0 thru 16 speech CSV DN Appearance IDs (up to RLis_line.csv_climit)
0 thru 16 audio CSV DN Appearance IDs (up to RLis_line.csv_climit)
0 thru 16 56k CSD DN Appearance IDs (up to RLis_line.csd_climit)
0 thru 16 64k CSD DN Appearance IDs (up to RLis_line.csd_climit)
0 thru 4 ODB PMD DN Appearance IDs (see attributes for TN limitations)
0 thru 4 DPKT PMD DN Appearance IDs (see attributes for TN limitations)

No Secondary DN Appearance IDs
Maximum number of BASIC CALL DN Appearance IDs =
(16 + 16 + 16 + 16 + 4 + 4 + 0) = 72

Standard EKTS_BASIC Terminals:
0 or 1 speech CSV DN Appearance IDs
0 or 1 audio CSV DN Appearance IDs
0 or 1 56k CSD DN Appearance IDs
0 or 1 64k CSD DN Appearance IDs

Copyright © 1999 Lucent Technologies 

```
 0 thru 4 ODB PMD DN Appearance IDs (see attributes for TN limitations)
 0 thru 4 DPKT PMD DN Appearance IDs (see attributes for TN limitations)
 0 thru 63 Secondary Speech DN Appearance IDs (in RLsec_dna)
 0 thru 63 Secondary 3.1 Khz Audio DN Appearance IDs (in RLsec_dna)
                Maximum number of EKTS_BASIC DN Appearance IDs =
                        (1 + 1 + 1 + 1 + 4 + 4 + 63 + 63) = 138
Standard EKTS_CACH Terminals:
 0 CSV (no speech or audio) DN Appearance IDs
 0 or 1 56k CSD DN Appearance IDs
 0 or 1 64k CSD DN Appearance IDs
 0 thru 4 ODB PMD DN Appearance IDs (see attributes for TN
                                     limitations)
 0 thru 4 DPKT PMD DN Appearance IDs (see attributes for TN
                                      limitations)
        No Secondary DN Appearance IDs
                Maximum number of EKTS_CACH DN Appearance IDs =
                        (0 + 0 + 1 + 1 + 4 + 4 ) = 10
        NOTE: All circuit switched call appearances are in RLtermkydn!
```

**Attribute:**
uspid
**Fullname:**
Standard DSL uspid
**Attribute Description:**
This attribute contains the standard USPID value of the Primary DNs for these default bearer capabilities. There must be a tuple in RLspid with the RLspid.uspid attribute matching this attribute. This key will allow one tuple to exist for every standard terminal port/party provisioned on this SM.

**Attribute:**
uspid.digcnt
**Fullname:**
uspid digit count
**Attribute Description:**
Contains the digit count for sub-attributes dig1 thru dig18.

**Attribute:**
uspid.dig1
**Fullname:**
First digit of uspid
**Attribute Description:**
This attribute contains the first digit of the uspid.

**Attribute:**
uspid.dig2
**Fullname:**
Second digit of uspid
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute contains the Second digit of the uspid.

**Attribute:**
uspid.dig3
**Fullname:**
Third digit of uspid
**Attribute Description:**
This attribute contains the Third digit of the uspid.

**Attribute:**
uspid.dig4
**Fullname:**
Fourth digit of uspid
**Attribute Description:**
This attribute contains the Fourth digit of the uspid.

**Attribute:**
uspid.dig5
**Fullname:**
Fifth digit of uspid
**Attribute Description:**
This attribute contains the Fifth digit of the uspid.

**Attribute:**
uspid.dig6
**Fullname:**
Sixth digit of uspid
**Attribute Description:**
This attribute contains the Sixth digit of the uspid.

**Attribute:**
uspid.dig7
**Fullname:**
Seventh digit of uspid
**Attribute Description:**
This attribute contains the Seventh digit of the uspid.

**Attribute:**
uspid.dig8
**Fullname:**
Eighth digit of uspid
**Attribute Description:**
This attribute contains the Eighth digit of the uspid.

**Attribute:**
uspid.dig9

lo_spch
**Fullname:**
Lowest Speech Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID number (DNA) that is the lowest Speech CSV DNA of this primary DN for the default bearer capability of Speech Circuit Switched Voice. The attribute may be populated only for BASIC CALL, ACO or EKTS_BASIC terminals. This attribute must always be populated with zero for EKTS_CACH terminals.

For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. For BASIC CALL and ACO terminals, the number of DN Appearance IDs that can span the lo_spch to hi_spch range is limited by the value of RLis_line.csv_climit and have a maximum range of 16 DN Appearance IDs.

For EKTS_BASIC terminals, the number of DN Appearance IDs that can span the lo_spch to hi_spch range is 1 (that is, lo_spch must

**Copyright © 1999 Lucent Technologies** 

equal hi_spch).

**Attribute:**
hi_spch
**Fullname:**
Highest Speech Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID number (DNA) that is the highest Speech CSV DNA of this primary DN for the default bearer capability of Speech Circuit Switched Voice. The attribute may be populated only for BASIC CALL, ACO or EKTS_BASIC terminals. This attribute must always be populated with zero for EKTS_CACH terminals.

For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. For BASIC CALL and ACO terminals, the number of DN Appearance IDs that can span the lo_spch to hi_spch range is limited by the value of RLis_line.csv_climit and have a maximum range of 16 DN Appearance IDs.

For EKTS_BASIC terminals, the number of DN Appearance IDs that can span the lo_spch to hi_spch range is 1 (that is, lo_spch must equal hi_spch).

**Attribute:**
lo_audio
**Fullname:**
Lowest Audio Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID number (DNA) that is the lowest Audio CSV DNA of this primary DN for the default bearer capability of 3.1 Khz Audio Circuit Switched Voice. The attribute may be populated only for BASIC CALL, ACO or EKTS_BASIC terminals. This attribute must always be populated with zero for EKTS_CACH terminals.

For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to

**Copyright © 1999 Lucent Technologies** 

RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. For BASIC CALL and ACO terminals, the number of DN Appearance IDs that can span the lo_audio to hi_audio range is limited by the value of RLis_line.csv_climit and have a maximum range of 16 DN Appearance IDs.
For EKTS_BASIC terminals, the number of DN Appearance IDs that can span the lo_audio to hi_audio range is 1 (that is, lo_audio must equal hi_audio).

**Attribute:**
hi_audio
**Fullname:**
Highest Audio Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID number (DNA) that is the highest Audio CSV DNA of this primary DN for the default bearer capability of 3.1 Khz Audio Circuit Switched Voice. The attribute may be populated only for BASIC CALL, ACO or EKTS_BASIC terminals. This attribute must always be populated with zero for EKTS_CACH terminals.

For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. For BASIC CALL and ACO terminals, the number of DN Appearance IDs that can span the lo_audio to hi_audio range is limited by the value of RLis_line.csv_climit and have a maximum range of 16 DN Appearance IDs.

For EKTS_BASIC terminals, the number of DN Appearance IDs that can span the lo_audio to hi_audio range is 1 (that is, lo_audio must equal hi_audio).

**Attribute:**
lo_64kbc
**Fullname:**
Lowest 64K bps Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID number (DNA) that is the lowest 64K CSD DNA of this primary DN for the default bearer capability of 64K bps Circuit Switched Data. The attribute may be populated for all types of standard terminals. For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes

attribute may be populated for all types of standard terminals. For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. For BASIC CALL and ACO terminals, the number of DN Appearance IDs that can span the lo_56kbc to hi_56kbc range is limited by the value of RLis_line.csd_climit and have a maximum range of 16 DN Appearance IDs.

For EKTS_BASIC and EKTS_CACH terminals, the number of DN Appearance IDs that can span the lo_56kbc to hi_56kbc range is 1 (that is, lo_56kbc must equal hi_56kbc).

**Attribute:**
hi_56kbc
**Fullname:**
Highest 56K bps Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID number (DNA) that is the highest 56K CSD DNA of this primary DN for the default bearer capability of 56K bps Circuit Switched Data. The attribute may be populated for all types of standard terminals. For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. For BASIC CALL and ACO terminals, the number of DN Appearance IDs that can span the lo_56kbc to hi_56kbc range is limited by the value of RLis_line.csd_climit and have a maximum range of 16 DN Appearance IDs.

For EKTS_BASIC and EKTS_CACH terminals, the number of DN Appearance IDs that can span the lo_56kbc to hi_56kbc range is 1 (that is, lo_56kbc must equal hi_56kbc).

**Attribute:**
lo_odb
**Fullname:**
Lowest ODB PKT Bearer Capability DN Appearance ID
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute contains the DN Appearance ID number (DNA) that is the lowest On-Demand B-Channel packet (ODB) DNA of this ODB TN or the listed TN of the MLHG if the individual TN does not exist. The DNA is for the default bearer capability type ODB Packet Mode Data. The attribute may be populated for all types of standard terminals.

For every tuple in RLprim_dna, this attributes value may only appear once for all bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLprim_dna tuple). EKTS_BASIC terminals also have a coupling with this relation and RLsec_dna for any secondary DN Appearance IDs. For every tuple in RLsec_dna that has its lport value equal to RLspid.ckt_lport, any RLsec_dna.lo*/hi* value cannot appear in any bearer capability lo - hi attribute ranges of this relation. The maximum number of DN Appearance IDs that can span the lo_odb to hi_odb range is 4. There is a coupling with these two attributes and the lo_dpkt / hi_dpkt attributes as follows:

If only individual ODB TN assigned (no individual DPKT TN assigned), range = 0 thru 4 for ODB attributes ((hi_odb - lo_odb) < 4).
If only individual DPKT TN assigned (no individual ODB TN assigned), range = 0 thru 4 for DPKT attributes ((hi_dpkt - lo_dpkt) < 4 ).
If individual DPKT TN and individual ODB TN assigned with same TN, range = 0 thru 4 for all four attributes: ( (hi_odb - lo_odb) + (hi_dpkt - lo_dpkt) < 4 ).
If individual DPKT TN and individual ODB TN assigned with different TNs, range = 0 thru 4 for each type {that is, ( (hi_odb - lo_odb) < 3 ) and ( (hi_dpkt - lo_dpkt) < 3 ) }.
If DPKT user and ODB user are members of the same MLHG and no DPKT or ODB individual TN is assigned, then range = 0 thru 4 for all four attributes ( (hi_odb - lo_odb) + (hi_dpkt - lo_dpkt) < 4 ).

**Attribute:**
hi_odb
**Fullname:**
Highest ODB PKT Bearer Capability DN Appearance ID

# PRISG_G

## 1. Description

This is a child storage relation for OPVIEW RLprisrvgp.G . This relation can store 5 groups of 20 Primary Rate Interface (PRI) groups and their associated active status bits.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 4000 |
| expected number of tuples | 200 |
| access type | DBACC_GK |
| memory type | DBPRAM |
| distribution | LP |
| application type | RCMAP |
| relation type | DBSTORAGE |
| ks key store | DBNO |
| foldtype | DBGC31 |
| gkidxrel reverse index | rlPRISG_I |

## 3. Field Layout

## 4. Population rules for RLprisg_g

### Relation Description

# PRISG_R

## 1. Description

The Primary Rate Interface (PRI) Serving Group root relation is for OPVIEW RLprisrvgp.G. This root storage relations provides PRI serving group information and pointers to the child relation (RLprisg_g).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 4095 |
| expected tuples in relation | 200 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application type | RCMAP |
| relation type | DBSTORAGE |

## 3. Field Layout

```
PRISG_R     relid = 2909  DBSTORAGE  DBACC_HASH  DBPRAM    LP      RCMAP

# PRISRVGP

## 1. Description

The Primary Rate Interface (PRI) Serving Group OPVIEW relation defines the PRI Serving Group. The serving group can store up to 100 unique PRI groups and their active status bits. Also see RLprisg_r.G and RLprisg_g.G

The tree diagram Figure 1 depicts the stored structure of virtual relation PRISRVGP.

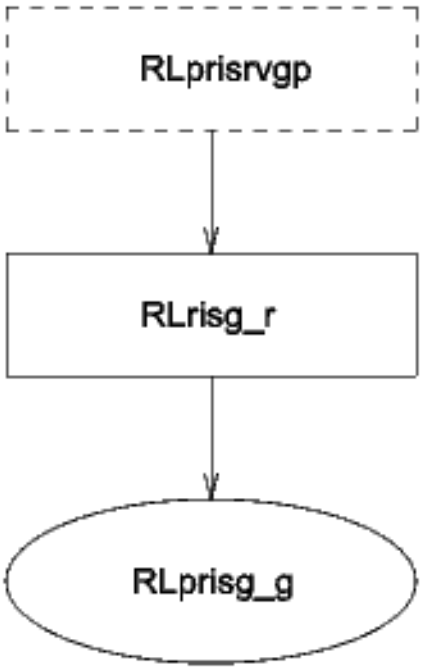

**Figure 1 Virtual Relation PRISRVGP**

## 2. Data Dictionary Values

| | |
|---|---|
| access type | DBACC_OPV |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |
| permutation | un_perm |

## 3. Field Layout

```

## 4. Population rules for RLprisrvgp

**Relation Description**

Serving Group for (PRI) Primary Rate Interface
This relation defines on a per switching module (SM) basis, the serving group associated with the PRI group.
/* MAXPRIACT is defined in RLprisrvgp.G */

**Attribute:**
prisrvgrp
**Fullname:**
PRI serving group
**Attribute Description:**
PRI serving group number.

**Attribute:**
srvtyp
**Fullname:**
PRI serving group type
**Attribute Description:**
Indicate what type of serving group, for example a type of TBCT.

**Attribute:**
count
**Fullname:**
PRI group count
**Attribute Description:**
The current number of PRI groups in this PRI serving group.

**Attribute:**
priact[*]
**Fullname:**
Structure containing PRI group number and active information.
**Attribute Description:**
This is a structure domain DMpriact. It is an array of up to $MAXPRIACT unique PRI group numbers which are members of the same PRI serving group and their associated active status.(that is prigrp[5] corresponds with active[5])

**Attribute:**
priact[*].prigrp
**Fullname:**
PRI group number.
**Attribute Description:**
Up to $MAXPRIACT PRI group numbers which are members of the same PRI serving group.

**Attribute:**

Copyright © 1999 Lucent Technologies 

priact[*].active

**Fullname:**

PRI group active

**Attribute Description:**

Indicate whether the serving type on the PRI group is active.

## 4. Population Rules for RLpropbid

**Relation Description**
Domestic Static Proportionate Bidding.

The Domestic Static Proportionate Bidding relation is used to hold the routing data for the range of route indices to which the Proportionate Bidding Special Feature may apply. These route indices are referred to as the Proportionate Bidding (PB) route indices. The PB route index is the key to this relation. Since there can be up to 32

**Copyright © 1999 Lucent Technologies** 

PB route indices, this relation can have up to 32 tuples. Information in each tuple may identify up to 4 more route indices (referred to as carrier-specific route indices) to which calls may be directed based on Operating Company assigned proportions. In addition, each tuple can have up to 4 carrier designations (no relation to carrier ID as used elsewhere on the *5ESS*®-2000 switch), and up to 4 proportions, where each proportion indicates the percentage of calls that the associated carrier will handle. Each tuple also has an indicator stating whether the proportionate bidding feature is active for this PB route index. In summary, for each PB route index, there can be up to 4 carriers, 4 proportions, and 4 carrier-specific route indices. Each carrier has a corresponding proportion and route index. Calls to the PB route index (key attribute) will be apportioned for routing between the carrier-specific route indices (propidx) according to the corresponding proportion (proppor) values. The attributes 'propcar[1-4]' represent the possible carrier designations. The attributes 'proppor[1-4]' represent the possible proportion values, and the attributes 'propidx[1-4]' represent the possible carrier-specific route indices. The proportion value for each carrier-specific route index must be greater than or equal to zero. All the proportion values must sum up to 100, and must be in non-increasing order. The technician will not be forced to enter the proportions in this order with RC/V since the mapping code will reorder them in the appropriate order when necessary.

**Attribute: rte_idx**

**Fullname:** Initial Route Index for the destination.

**Attribute Description** This attribute is the key of the propbid relation.

**Attribute: spare1**

**Fullname:** Spare byte for possible future use.

**Attribute Description** For future use.

**Attribute: spare2**

**Fullname:** Spare Nibble for possible future use.

**Attribute Description** For future use.

**Attribute: spare3a**

**Fullname:** Spare boolean for possible future use.

**Attribute Description** For future use.

**Attribute: spare3b**

**Fullname:** Spare boolean for possible future use.

**Attribute Description** For future use.

**Attribute: spare3c**

**Fullname:** Spare boolean for possible future use.

**Attribute Description** For future use.

**Attribute: propstate**

**Fullname:** Proportionate Bidding State Flag.

**Attribute Description** This field indicates whether proportionate bidding is enabled or disabled for

Copyright © 1999 Lucent Technologies 

the route index that is the key to this tuple.

**Attribute: propcar1**

**Fullname:** Carrier 1 Number.

**Attribute Description** This field is the carrier number associated with the route index. Since this tuple exists, there must be at least one valid carrier associated with the route index. The other carriers can be set to zero corresponding to an entry not in use.

**Attribute: propcar2**

**Fullname:** Carrier 2 Number.

**Attribute Description** This field is the carrier number associated with the route index. This carrier number is the same type as the propcar attribute.

**Attribute: propcar3**

**Fullname:** Carrier 3 Number.

**Attribute Description** This field is the carrier number associated with the route index. This carrier number is the same type as the propcar attribute.

**Attribute: propcar4**

**Fullname:** Carrier 4 Number.

**Attribute Description** This field is the carrier number associated with the route index. This carrier number is the same type as the propcar attribute.

**Attribute: proppor1**

**Fullname:** Proportion of calls to go to carrier 1.

**Attribute Description** This field contains the desired percentage of calls that should be routed to carrier 1. A percentage of 1 to 100 is allowed.

**Attribute: proppor2**

**Fullname:** Proportion of calls to go to carrier 2.

**Attribute Description** This field contains the desired percentage of calls that should be routed to carrier 2. A percentage of 0 to 100 is allowed.

**Attribute: proppor3**

**Fullname:** Proportion of calls to go to carrier 3.

**Attribute Description** This field contains the desired percentage of calls that should be routed to carrier 3. A percentage of 0 to 100 is allowed.

**Attribute: proppor4**

**Fullname:** Proportion of calls to go to carrier 4.

**Attribute Description** This field contains the desired percentage of calls that should be routed to

Copyright © 1999 Lucent Technologies 

carrier 4. A percentage of 0 to 100 is allowed.

**Attribute: propidx1**

**Fullname:** Carrier 1's carrier-specific route index.

**Attribute Description** This field is the carrier-specific route index that is used to route calls to the chosen carrier. This route index is the same type as the PB route index but must have a different value. Since this tuple exists, there must be at least one valid carrier-specific route index. The other carrier-specific route indices can be set to zero.

**Attribute: propidx2**

**Fullname:** Carrier 2's carrier-specific route index.

**Attribute Description** This field is the carrier-specific route index that is used to route calls to the chosen carrier. This route index is the same type as the PB route index but must have a different value.

**Attribute: propidx3**

**Fullname:** Carrier 3's carrier-specific route index.

**Attribute Description** This field is the carrier-specific route index that is used to route calls to the chosen carrier. This route index is the same type as the PB route index but must have a different value.

**Attribute: propidx4**

**Fullname:** Carrier 4's carrier-specific route index.

**Attribute Description** This field is the carrier-specific route index that is used to route calls to the chosen carrier. This route index is the same type as the PB route index but must have a different value.

### Relation Description

Protocol Parameter Values Relation

This relation defines the TCP, IP, and UDP Parameter Values.

**Attribute:**
pcr_name.pcr_id
**Fullname:**
Processor name identification number
**Attribute Description:**
This attribute is the processor identification number

**Attribute:**
tcpmss_def
**Fullname:**
TCP maximum segment size default
**Attribute Description:**
This attribute is the default maximum segment size value.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
tephport_start
**Fullname:**
TCP Ephemeral port start number
**Attribute Description:**
This attribute is the starting TCP ephemeral port number.

**Attribute:**
tcpttl_def
**Fullname:**
TCP TTL default value
**Attribute Description:**
The default TCP TTL value from 1-255.

**Attribute:**
ipreassem_timr
**Fullname:**
IP reassembly timer
**Attribute Description:**
This attribute is the IP reassembly timer (in seconds) used when the IP must reassemble fragmented messages.

**Attribute:**
icmperr_cnt
**Fullname:**
ICMP error count
**Attribute Description:**
The count of the number of octets to be returned in ICMP error messages.

**Attribute:**
ipmtu_discov
**Fullname:**
IP maximum transmission unit discovery
**Attribute Description:**
The interval in seconds in which IP attempts to increase the path MTU through the path MTU discovery procedures.

**Attribute:**
enable_mtudis
**Fullname:**
IP path maximum transmission unit enabled
**Attribute Description:**
This attribute turns on or off the path MTU discovery procedures.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
chksum_enable
**Fullname:**
Check sum enabled
**Attribute Description:**
This attribute turns on and off the generation and checking of the UDP checksum.

**Attribute:**
uephport_start
**Fullname:**
UDP Ephemeral port start number
**Attribute Description:**
This attribute is the starting UDP ephemeral port number.

**Attribute:**
udpttl_def
**Fullname:**
UDP TTL default value
**Attribute Description:**
The default UDP TTL value from 1-255.

## 4. Population rules for RLprt_pci

**Relation Description**

Module and port to point code index and circuit code relation

This relation translates a module and port number into a point code index and a circuit code for CCS7 trunks. The ccs subsytem is the main user of this relation.

**Attribute:**

module

**Fullname:**

Switching module

**Attribute Description:**

This is a key attribute which is the switching module associated with this trunk.

Copyright © 1999 Lucent Technologies

**Attribute:**
port
**Fullname:**
Port number
**Attribute Description:**
The port Digital Equipment Number (DEN), Trunk Equipment Number (TEN), or Networking Equipment Number (NEN) associated with this trunk.

**Attribute:**
circuit_code
**Fullname:**
Circuit identifier code
**Attribute Description:**
The circuit identifier for the CCS trunk.

For CCS7 trunks, (that is, DBTUP7 and DBISUP7), this 14-bit field is the circuit identification code assigned by the customer.

**Attribute:**
pci
**Fullname:**
Point code index
**Attribute Description:**
The point code index is derived as part of the population rules for the RLlab7_pci relation.

**Attribute:**
protocol
**Fullname:**
CCS protocol
**Attribute Description:**
The CCS protocol used on this trunk.

## 4. Population Rules for RLprt2rpcu

**Relation Description**
Port to radio port control unit.

This relation maps ISDN port to the radio port control unit. This relation was added by the WIRELESS Centrex (WCTX) feature.

**Attribute: port**

**Fullname:** port name

**Attribute Description** The port name of the D-channel port.

**Attribute: rpcu_id**

**Fullname:** RPCU Identifier.

**Attribute Description** Identifies the radio equipment.

# PRT6LAB

## 1. Description

This relation translates the internal representation of the CCS6 port, that is, module and member, to an external representation of routing label. Tuples are inserted or deleted for each insertion or deletion to the RLlab6prt relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 512 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| head table size | 256 |
| intermediate page size | 256 |
| data page size | 256 |
| page level | 3 |
| ks key store option | DBNO |

## 3. Field Layout

```

### Relation Description

Port to CCIS6 routing label relation

This relation is obsolete, and removed in 5e14.

**Attribute:**
gport
**Fullname:**
Global port
**Attribute Description:**
The global port is divided into sub-attributes member and module. This is the same attribute as RLfc_trunk.port.

**Attribute:**
gport.member
**Fullname:**
Member associated with the port
**Attribute Description:**
Member is assigned a unique number starting with zero.

**Attribute:**
gport.module
**Fullname:**
Switching module number
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

The module number is the same as RLfc_trunk.port.module. It indicates the SM number.

**Attribute:**
band
**Fullname:**
Band
**Attribute Description:**

**Attribute:**
bmem_num
**Fullname:**
Band member number
**Attribute Description:**

**Attribute:**
sl_group
**Fullname:**
Signaling link group
**Attribute Description:**

**Attribute:**
sl_mem
**Fullname:**
Signaling link member
**Attribute Description:**

**Attribute:**
sl_vlink
**Fullname:**
Signaling link virtual link
**Attribute Description:**

# PRT7LAB

## 1. Description

This relation translates the internal representation of the CCS7 port (that is, module and member) to an external representation or routing label (destination point code (dpc) and circuit identification code (CIC)) and signaling selection value (SLS). Tuples are inserted or deleted for each insertion or deletion in RLlab7prt.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 24192 |
| expected number of tuples | 140 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| ks key store | DBNO |

## 3. Field Layout

## 4. Population Rules for RLprt7lab

**Relation Description**
Global port to CCS7 routing label relation

This relation translates the internal representation of the CCS7 port (that is, module and member) to an external representation or routing label (destination point code (DPC) and circuit identification code (CIC)).

**Attribute: gport**

**Fullname:** Global port

**Attribute Description** A *5ESS*®-2000 switch global port in an office. It consists of the SM number and the member. This attribute has the same definition as RLfc_trunk.port.

**Attribute: gport.member**

Copyright © 1999 Lucent Technologies 

**Fullname:** Port member

**Attribute Description** The member number of the trunk on an SM.

**Attribute: gport.module**

**Fullname:** SM module number

**Attribute Description** Switching module that the trunk is associated with.

**Attribute: dpc**

**Fullname:** Destination point code

**Attribute Description** The DPC indicates the signaling point for the far-end office.
See RLlab7prt for more details.

**Attribute: opc**

**Fullname:** Origination point code

**Attribute Description** The OPC indicates the signaling point which is assigned to this office.
See RLlab7prt for more information.

**Attribute: network**

**Fullname:** Network.

**Attribute Description** This attribute is used to indicate the network to which the standardization sector (SS7) routing label refers.
See RLlab7prt for more information.

**Attribute: pci**

**Fullname:** Point Code Index

**Attribute Description** This attribute represents the point code index assigned to this DPC/OPC/network combination.
See RLlab7prt for more information.

**Attribute: cic**

**Fullname:** Circuit identification code

**Attribute Description** The CIC identifies the circuit (trunk) among those directly interconnecting the DPC and OPC.
See RLlab7prt for more information.

**Attribute: sls**

**Fullname:** Signaling link selection

**Attribute Description** The SLS value identifies the path link for all signaling messages for each trunk on a single T1 facility.
See RLlab7prt for more information.

## 4. Population Rules for RLprtc

**Relation Description**
Protocol circuit description for a metallic service unit

**Attribute: prtcktname**

**Fullname:** circuit name

**Attribute Description** Circuit name of the protocol circuit. Use CKTDATA relation, 'name' attribute associated with 'type' attribute enumeration PCMSPRTC. The circuit index for this circuit name should be ((sg+1) << 8 ) + 0x30.

**Attribute: prtcscanpt**

**Fullname:** scan point number

**Attribute Description** For modular MSU, it is not used and should be set to GLNULPORT.

**Attribute: prtcdistpt**

**Fullname:** starting distribute point number

Copyright © 1999 Lucent Technologies

**Attribute Description** For modular MSU, it not used and should be set to GLNULPORT.

**Attribute: prtcmtb**

**Fullname:** metallic test bus number

**Attribute Description** For modular MSU, it not used and should be set to zero(0).

**Defines:**"db/DMport.h"

## 4. Population Rules for RLpsbilldn

**Relation Description**
Packet switching billing directory number

This relation defines a Packet Switching (PS) billing directory number which is different from the local directory number specified in the psx25ln relation.

**Attribute: ph_number**

**Fullname:** Protocol Handler (PH) number

**Attribute Description** Protocol Handler (PH) number (key1), range from 0 to 95. For efficient memory utilization, it should be assigned sequentially. The Protocol Handler number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered via RCV/ODA.

**Attribute: ph_cn**

**Fullname:** Protocol Handler (PH) channel number

**Attribute Description** Protocol Handler (PH) channel number (key2), also called DSL group member. Its range is from 0 to 127. For efficient memory utilization, it should be assigned sequentially. The Protocol Handler number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered via RCV/ODA.

**Attribute: party**

**Fullname:** Packet user within a ISDN DSL D-channel

**Attribute Description** Specific packet user within an ISDN DSL D-channel. There can be up to 8 packet user Service Order Profiles (SOPs) defined on an ISDN DSL D-channel. Permanent Packet B-channels (PPB) and On-Demand Packet B-channels (ODB) are populated with FCP_BCHAN. This attribute is not used by X.25 Access on a T1 (XAT) port, populate with FCP_INDI for XAT ports. Packet trunks are populated with FCP_PKTTRK.

**Attribute: bill_dn**

**Fullname:** Billing directory number

**Attribute Description** billing directory number which is different from the local directory number in

**Copyright © 1999 Lucent Technologies** 

psx25ln relation. If the billdn_flg attribute in psx25ln relation is DBYES, there must be a tuple in psbilldn relation. Otherwise, there is no need for a tuple in psbilldn relation since billing DN is the same as local DN. bill_dn is a 10 digit number, excluding * and #. It is in the format of npa-office code-4 digit local number for both E.164 and X.121 numbering plan.

**Attribute: bill_dn.digcnt**

**Fullname:** Digit count

**Attribute Description** The number of digits in RLpsbilldn.bill_dn.dn. For XAT ports which have fcltyp of PSX25, the digcnt member of rmt_dn will always be equal to 10 digits.

**Attribute: bill_dn.dn**

**Fullname:** Local number

**Attribute Description** A 10 digit number, excluding * and #. It is in the format of npa-office code-4 digit local number for both E.164 and X.121 numbering plan. For XAT ports the dn member of bill_dn must have 10 digits in the form of: npa (3 digits) + office code (3 digits) + station number ( 4 digits). This satisfies both the E.164 and X.121 numbering plans.

**Defines:** "db/DMnpanxx.h", "db/DMparty.h"

## 4. Population Rules for RLpscsi_id

**Relation Description**
This relation stores the value of the clearing sub-network identifier (CSI) for the entire switch.

The CSI value was intended to be a global parameter but this data is needed in the PH and currently no mechanism exists for transporting a global parameter value to the PH. By placing the CSI value in this relation we are able to use static data transport to update the PH global data PScsi_id using trigger RTrccsi_id. The CSI value is inserted into the clearing subnetwork identification utility by the subnetwork when a virtual call is cleared from either an active or in progress state. The CSI value identifies the subnetwork that cleared the call. The valid range of the ID is 0000-9999. The relation exists in every ISDN loaded SM (FG with group type = GPDISDN).

Copyright © 1999 Lucent Technologies 

This relation is only used by X.75' trunks.

**Attribute: ofc_id**

**Fullname:** Office Identification Number

**Attribute Description** This attribute should always be populated with the value 0.

**Attribute: csi_id**

**Fullname:** Clearing Sub-Network Identifier

**Attribute Description** The attribute is used to define the clearing sub-network identifier for the switch. The valid range of values is 0-9999. Each digit is in packed BCD form.

## 4. Population Rules for RLpscstcug

**Relation Description**

This relation defines an index of a closed user group associated with a packet TN or packet MLHG member:

- ISDN DSL D channel user
- ISDN DSL ODB channel user
- ISDN DSL PPB channel user

The relation is the inverse relation of RLpscugcst.

As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. Members of Closed User Groups must reside on PH3's. In 5e10, members of Closed User Groups are supported on both PH3's and PH4's.

This relation associates an ISDN packet user TN or packet MLHG member with a closed user group (CUG) interlock code. A packet user may subscribe to any combination of ODB, PPB, B channel or D channel packet switching services each with its own unique packet TN or packet MLHG member.

The CUG index is uniquely assigned on a per packet TN or packet MLHG member basis. Below are examples of valid and invalid assignments of CUG indexes to CUG interlock codes (DNIC and ICN):

Valid CUG assignments

| Packet TN ** | CUG IDX | DNIC | ICN |
|---|---|---|---|
| DSL1, ODB PKT USER | 1 | 3105 | 6 |
| | 2 | 3103 | 1 |
| DSL1, PPB PKT USER | NONE | | |
| DSL1, D PKT USER | 1 | 3108 | 2 |
| | 2 | 3105 | 6 |
| DSL1, B PKT USER | NONE | | |
| DSL2, D PKT USER | 2 | 3105 | 6 |
| DSL2, B PKT USER | 2 | 3108 | 4 |
| DSL2, PPB PKT USER | 2 | 3105 | 9 |

** Each PKT User has a unique PKT TN

Invalid CUG assignments

| Packet User | CUG IDX | DNIC | ICN |
|---|---|---|---|
| DSL1, ODB PKT USER | 1 | 3104 | 3 |
| | 2 | 3104 | 3 |

**Attribute: cust_cugx**

**Fullname:** Customer Closed User Group index.

**Attribute Description** Two (2) HEX digits A through F are not allowed. Any value within the range can be populated (0x00 through 0x99).

Initially, there is no CUG assigned to the DSL, rlPSX25LN.cug_hindx is set to FF. When the first CUG (not necessary that cust_cugx is equal to 1) is assigned, rlPSX25LN.cug_hindx must be set to cust_cugx. For the subsequent CUG assignments, if the new cust_cugx > current value of rlPSX25LN.cug_hindx, then rlPSX25LN.cug_hindx must set to the new cust_cugx: otherwise, rlPSX25LN.cug_hindx remains the same.

cust_cugx is provisioned on a per DSL packet TN or packet MLHG member basis and each cust_cugx assigned to a specific packet TN or packet MLHG member must be unique. Refer to the

Copyright © 1999 Lucent Technologies 

general section for examples of correct and incorrect cust_cugx assignments.

The checks for this attribute in relation to CUG CODE are located at the beginning of the check section for the entire relation.

**Attribute: ph_number**

**Fullname:** PH number.

**Attribute Description** PH number, also called DSL group number.
The protocol handler number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered using RCV/ODA.

As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. Members of Closed User Groups must reside on PH3's. In 5e10, members of Closed User Groups are supported on both PH3's and PH4's.

**Attribute: ph_cn**

**Fullname:** Protocol Handler channel number of the DSL group member number

**Attribute Description** PH channel number, also called DSL group member. Its range is from 0 to 127.

The protocol handler channel number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH channel number entered on the (T1 packet switching channel assignment) view.

**Attribute: party**

**Fullname:** DSL D-channel multipoint party

**Attribute Description** Specific packet user within an ISDN DSL D-channel. There can be up to 8 packet user service order profiles (SOP)s defined on an ISDN DSL D-channel.

Permanent packet B-channels (PPB) and on-demand packet B-channels (ODB) are populated with FCP_BCHAN(0). Packet trunks are populated with FCP_PKTTRK(0).
This attribute is not used by X.25 access on a T1 (XAT) port, populate with FCP_INDI(0) for XAT ports.

**Attribute: cug_code**

**Fullname:** Closed User Group Interlock Code

**Attribute Description** All DSL packet TNs or packet MLHG members that belong to the same closed user group (CUG) must have the same cug_code. The relationship of the CUG interlock code with the CUG index is described in the general section.
The checks for this attribute in relation to CUG IDX are located at the beginning of the CHECK section in the *5ESS®-2000 Switch Population Rules Language Data Manual* (235-600-123) for the entire relation.

**Attribute: cug_code.dnic**

**Fullname:** Data network ID code.

**Attribute Description** Data network identification code (DNIC) of the network of the coordinating

Copyright © 1999 Lucent Technologies 

administration or recognized private operating agency (RPOA) 4 BCD digits, range is 0001-9999. No default value. Hex digits A through F are not allowed. If all the members of a closed user group are within the same network, the DNIC is that of the home network. Otherwise, One of the networks involved will be designated as the coordinating administration upon a mutual agreement.

**Attribute: cug_code.icn**

**Fullname:** International Closed User Group.

**Attribute Description** A 16 bit binary number assigned by the CUG coordinating administration or RPOA. This value is unique for each CUG belonging to the same network.
No default value.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLpscug_iic

**Relation Description**
Closed User Group International Interlock Codes

This relation stores X.75 trunk group Closed User Group (CUG) International Interlock Code (IIC) lists. The lists are identified by a unique CUG List ID number. Each List ID number may have up to 100 unique IIC's provisioned. There is a maximum of 1600 IIC's for the entire switch which can be spread across all provisioned X.75 trunk groups. The global parameter Gliic_cnt is used by recent change to check if the relation is full (contains 1600 IIC's). The relation is populated on the CMP and all Loaded ISDN SMs. This relation is only used for X.75 trunk groups.

**Attribute: cuglist_id**

**Fullname:** Closed User Group International Interlock Code List ID Number

**Attribute Description** This attribute is used to define the Closed User Group (CUG) List ID Number associated with a list of CUG International Interlock Codes (IICs). The CUG List ID is assigned to X.75 trunk groups in the relation RLpsl3trkg and may have up to 100 tuples with the same CUG List ID number. The value 0 may not be used. The valid range of values for tuple is 1

Copyright © 1999 Lucent Technologies 

thru 1600.

**Attribute: iic_code**

**Fullname:** International Interlock Code

**Attribute Description** Attribute is used to store an International Interlock Code (IIC) which consists of a Data Network Identification Code (DNIC) and an International Closed User Group Number (ICN). The IIC is linked to an X.75 trunk group via the Closed User Group ID number. Both the DNIC and ICN values must be unique for every unique value of the cuglist_id attribute. This restriction is enforced by all attributes being keys of the relation and thus no PRL checks are necessary.

**Attribute: iic_code.dnic**

**Fullname:** Closed User Group Data Network Identification Code

**Attribute Description** DNIC (Data Network Identification Code) of the network of the coordinating administrator or RPOA (Recognized Private Operating Agency). The values are BCD digits and range from 0001-9999. Hex digits A through F are not allowed. The value must be unique for every RLpscug_iic.cuglist_id. If all the members of a closed user group are within the same network, the DNIC is that of the home network. Otherwise, one of the networks involved will be designated as the coordinating administrator upon a mutual agreement.

**Attribute: iic_code.icn**

**Fullname:** International Closed User Group number

**Attribute Description** A 16 bit binary number assigned by the CUG coordinating administrator or RPOA. This value is unique for each CUG belonging to the same network and must also be unique per RLpscug_iic.cuglist_id. There is no default value.

Copyright © 1999 Lucent Technologies 

# PSCUGCST

## 1. Description

This relation defines an index of a closed user group associated with a x.25 line:
- ISDN DSL D-channel user
- ISDN B-channel

It is the inverse relation of RLpscstcug.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1500 |

## 4. Population Rules for RLpscugcst

**Relation Description**

This relation defines a closed user group associated with a packet TN or packet MLHG member:
- ISDN DSL D channel user
- ISDN DSL ODB channel user
- ISDN DSL PPB channel user

The relation is the inverse relation of RLpscstcug.
X.25 packet switching will no longer be supported by the PH2 access image. Members of closed user groups must reside on PH3's.

This relation associates an ISDN packet user TN or packet MLHG member with a closed user group (CUG) interlock code. A packet user may subscribe to any combination of ODB, PPB, B channel or D channel packet switching services each with its own unique packet TN or packet MLHG member.

Copyright © 1999 Lucent Technologies

The CUG index is uniquely assigned on a per packet TN or packet MLHG member basis. Below are examples of valid and invalid assignments of CUG indexes to CUG interlock codes (DNIC and ICN):

Valid CUG assignments

| Packet TN ** | CUG IDX | DNIC | ICN |
|---|---|---|---|
| DSL1, ODB PKT USER | 1 | 3105 | 6 |
| | 2 | 3103 | 1 |
| DSL1, PPB PKT USER | NONE | | |
| DSL1, D PKT USER | 1 | 3108 | 2 |
| | 2 | 3105 | 6 |
| DSL1, B PKT USER | NONE | | |
| DSL2, D PKT USER | 2 | 3105 | 6 |
| DSL2, B PKT USER | 2 | 3108 | 4 |
| DSL2, PPB PKT USER | 2 | 3105 | 9 |

** Each PKT User has a unique PKT TN

Invalid CUG assignments

| Packet User | CUG IDX | DNIC | ICN |
|---|---|---|---|
| DSL1, ODB PKT USER | 1 | 3104 | 3 |
| | 2 | 3104 | 3 |

**Attribute: cug_code**

**Fullname:** Closed User Group Interlock Code

**Attribute Description** All the DSL packet TNs or packet MLHG members that belong to the same closed user group (CUG) must have the same cug_code. The relationship of the CUG interlock code with the CUG index is described in the general section.

The checks for this attribute in relation to CUG IDX are located at the beginning of the check section for the entire relation.

**Attribute: cug_code.dnic**

**Fullname:** data network identification code

**Attribute Description** Data network identification code (DNIC) of the network of the coordinating administration or recognized private operating agency (RPOA) 4 BCD digits, range from 0001-9999. Hex digits A through F are not allowed. If all the members of a closed user group are within the same network, the DNIC is that of the home network. Otherwise, One of the networks involved will be designated as the coordinating administration upon a mutual agreement.

**Attribute: cug_code.icn**

**Fullname:** International Closed User Group

**Attribute Description** A 16 bit binary number assigned by the CUG coordinating administration or RPOA. This value is unique for each CUG belonging to the same network.

No default value.

**Attribute: ph_number**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** PH number

**Attribute Description** PH number, also called DSL group number.
The protocol handler number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered via RCV/ODA.

X.25 packet switching will no longer be supported by the PH2 access image. Members of closed user groups must reside on PH3's.

**Attribute: ph_cn**

**Fullname:** Protocol handler channel number of DSL group member number

**Attribute Description** The protocol handler channel number that an X.25 access on a T1 (XAT) port is assigned.

**Attribute: party**

**Fullname:** DSL D channel multipoint party

**Attribute Description** Specific user within an ISDN D-channel.

**Attribute: cust_cugx**

**Fullname:** Customers closed user group index

**Attribute Description** Two HEX digits, range from 00 to 99. HEX digits A through F are not allowed.

Initially, when there is no CUG assigned to a PH channel, the attribute cug_hindx in the RLpsx25ln relation is set to 0xFF. When the first CUG (not necessary that cust_cugx is equal to 1) is assigned, the attribute cug_hindx in the RLpsx25ln relation must be assigned the value of this attribute cust_cugx.

For the subsequent CUG assignments, if the new of cust_cugx is greater than the current value of the attribute cug_hindx in the RLpsx25ln relation, then the value of the attribute cug_hindx in the RLpsx25ln relation must be assigned the new value of this attribute cust_cugx. Otherwise, the value of the attribute cug_hindx in the RLpsx25ln relation will remain the same.
cust_cugx is provisioned on a per DSL packet TN or packet MLHG member basis and each cust_cugx assigned to a specific packet TN or packet MLHG member must be unique. Refer to the general section for examples of correct and incorrect cust_cugx assignments.

The checks for this attribute in relation to CUG CODE are located at the beginning of the check section for the entire relation in the *Populations Rules Language Data Manual* (235-600-123).

## 4. Population Rules for RLpsdnicri

**Relation Description**
This relation defines the route index for a data network to route an internetwork call via X.75, X.75', or an IP facility.

Three types of inter-network packet call setup need to access this relation:

(1) The far end of a PVC (permanent virtual circuit) is in another packet network which dnic is in RLpspvcinf.rmt_dnic. To determine the trunk to route this type of call, there must be a matching tuple in psdnicri relation such that RLpspvcinf.rmt_dnic = dnic.

(2) An internetwork virtual call is requested without recognized private operating agency (RPOA) service. The preselected inter-exchange carrier is determined from RLpsx25ln.iecp_dnic. Therefore, there must be matching tuples in this relation such that RLpsx25ln.iecp_dnic = dnic. This relation is populated before the RLpsx25ln relation for recent change/verify (RC/V).

(3) An internetwork call is requested with RPOA service. The customer must specify the DNIC of the RPOA. Therefore, the DNIC selected by the customer on a per call basis must have a matching tuple in this relation.

**Attribute: dnic**

Copyright © 1999 Lucent Technologies 

**Fullname:** Data network identification code.

**Attribute Description** A 4-digit BCD code that identifies a data network. The range of valid values for this attribute is 0x0001 through 0x9999. The hex digits A through F are not allowed. The hex digit restriction is enforced in the attribute check section.

**Attribute: route_x**

**Fullname:** Route Index

**Attribute Description** The route index of the trunk group that routes an internetwork call via an X.75, X.75', or IP trunk.

**Attribute: iecp_cnt**

**Fullname:** IECP Usage Count

**Attribute Description** The iecp_cnt attribute specifies the number of RLpsx25ln tuples having an inter-exchange carrier preselect DNIC (iecp_dnic) equal to the DNIC of a RLpsdnicri tuple.

## 4. Population Rules for RLpsgp_ldn

**Relation Description**
Packet Switching Multi-Line Hunt Group To Linear DN Information

This relation is used for the calling address (that is, directory number) verification. When the calling address is specified in an X.25 Call Request packet for origination, packet routing must verify its validity. The calling address can be the linear DN associated with the originating packet MLHG member. For each member of a packet MLHG, that has a linear entry point DN assigned, there will be a tuple populated in this relation. This relation is used in the screening of the X.25 Call Request packet for a packet MLHG member. If a linear entry point DN is assigned to a packet MLHG member, then the member can use its linear DN as the calling address. For example: grpnum = 30 member = 10 has the linear entry point DN 979-2000. When the X.25 Call Request is received from the port associated with packet MLHG 30 member 10, a valid calling address could be 979-2000.

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description** This attribute specifies the group number for a packet switching Multi-Line Hunt Group (MLHG) that has a linear hunting algorithm associated with it. There must be a corresponding tuple in RLpsldn_gp and the hunt type in RLrt_mhg must be PSUCD or PSLGUCD. The noc for the group linear entry point DN in RLpsmhgdnr must not equal 0. This check is done in RLpsldn_gp. For member 1, the linear DN in this relation must match the group's linear entry point DN in RLpsmhgdnr. This check is done in RLpsldn_gp.

**Attribute: member**

**Fullname:** Member Number

**Attribute Description** This attribute specifies the MLHG member number

Copyright © 1999 Lucent Technologies 

**Attribute: dn**

**Fullname:** Directory Number

**Attribute Description** This attribute consists of the Normalized Office Code (NOC) and the four directory number digits.

**Attribute: dn.noc**

**Fullname:** Normalized Office Code

**Attribute Description** This is the normalized office code for the linear entry point DN

**Attribute: dn.digits**

**Fullname:** Directory Digits

**Attribute Description** These are the local directory digits for the linear entry point DN.

## 4. Population Rules for RLpsgp_prt

**Relation Description**
Packet Switching Group number to Port.

This relation contains information used to map a packet switching Multi-Line Hunt Group or Trunk Group and member number to a packet switching port name. The provisionable deactive/active status, for hunted calls only, is also stored in this relation. If rlRT_MHG.htype = RTH_PSUCD or RTH_PSLGUCD, there must be tuples with number equal to rl_RT_MHG.size in the PSGP_PRT relation such that rlPSGP_PRT.grpnum = rlRT_MHG.grpnum. If rlRT_TRKG.htype = RTH_PSUCD, there must be tuples with number equal to rl_RT_TRKG.act_size in the PSGP_PRT relation such that rlPSGP_PRT.grpnum = rlRT_TRKG.grpnum. All the groups in the rt_mpg or rtdnmpg relation must be in this relation

```
Servclass in fc_porttyp relation:
        If ptype is TM_LINE,
           service class of the DSL must be FC_ISDN or TM_XDB.
        If ptype is TM_TRK,
           service class of the trunk group must be
           PSPKT_TRK or PSX75P_TK in the fc_porttyp relation.
           The trunk group is of the 2-way T1 facility type.
```

Line configuration for packet switching: As of 5E9, all Packet Line MLHG Members must reside on PH3's since they will no longer be supported on the PH2 Access Image.

```

```

Trunk group configuration for packet switching: The following rules apply for Internal Protocol (IP) trunks:

(1) Service class of the IP trunk group must be PSPKT_TRK in fc_porttyp relation.

(2) There will be a maximum of 16 IP trunk groups for each *5ESS*®-2000 switch.

(3) Each IP trunk group will have a maximum of 32 trunk members.

(4) All IP trunks in a trunk group will terminate on the same SM.

(5) Only one trunk member will terminate on a PH2.

(6) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are IP trunk members.

(7) The trunk group is 2_way.

The following rules apply for X.75' trunks:

(1) There can be 255 X.75' trunk groups (per office) with a maximum of 24 trunk members per group.

(2) There is a limit of 25 X.75' trunk groups on a given SM.

(3) The trunk group is a 2-way T1 facility.

(4) Only one trunk member will terminate on a PH2.

(5) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75' trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk members are put on a given PH3 or PH4.

(6) The service class of each member in fc_porttyp is PSX75P_TK.

(7) X.75' trunk members can reside on different SMs.

(8) All the trunk members in a X.75' trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group.

The following rules apply for X.75 trunks:

(1) There can be 255 X.75 trunk groups (per office) with a maximum of 24 trunk members each.

(2) There is a limit of 25 X.75 trunk groups on a given SM.

(3) The trunk group is a 2-way T1 facility.

(4) Only one trunk member will terminate on a PH2.

(5) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75 trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk members are put on a given PH3.

(6) The service class of each member in fc_porttyp is PSX75_TK.

**Copyright © 1999 Lucent Technologies** 

(7) All the trunk members in a X.75 trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group.

The total combined number of Packet Trunks (IP, X.75, X.75') on any given Loaded SM is 25. This may consist of any number of types following the previous limits for the three types.

```
TUPLE SEMANTICS for a Packet Trunk Member
-----------------------------------------
grpnum          Group Number
ptype           TM_TRK
member          Member Number
module          Switching Module Number
ph_number       Protocol Handler Number
ph_cn           Protocol Handler Channel Number
party           Party
qkey            Arbitrary Key
chan_sel        Channel Selection (DBNO)
deactive        Deactivation (DBNO)"
```

**Attribute: grpnum**

**Fullname:** Group Number.

**Attribute Description** Group number of a packet trunk group, modem pool group or packet Multi-Line Hunt Group (MLHG). For an X.75 trunk group, all trunk group member entries in RLfc_porttyp must have servclass=PSX75_TK. There can be 255 X.75 trunk groups per office and there may be 25 X.75 trunk groups per SM with a maximum of 24 trunk members per trunk group; however, all the trunk members in a X.75 trunk group can only be split among non-remoted SMs and cannot be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group. For an X.75' trunk group, all trunk group member entries in RLfc_porttyp must have servclass=PSX75P_TK. There can be 255 X.75' trunk groups per office and there may be 25 X.75' trunk groups per SM with a maximum of 24 trunk members per trunk group; however, all the trunk members in a X.75' trunk group can only be split among non-remoted SMs and cannot be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group. For an IP trunk group, all trunk group member entries in RLfc_porttyp must have servclass=PSPKT_TRK. Packet trunk groups may have up to 25 tuples consisting of up to 16 IP trunk groups, up to 25 X.75' trunk group or up to 25 X.75 trunk groups. This is enforced by both RC/V and ODA.

**Attribute: ptype**

**Fullname:** Port Type for the group.

**Attribute Description** Indicates whether this group member supports trunk or line types of service. For X.25 access on a T1 (XAT) ports, populate this attribute with TM_LINE. For X.75, X.75' and IP trunks, populate this attribute with TM_TRK.

**Attribute: member**

**Fullname:** Member number.

**Attribute Description** Group member number.

```
1 - 2015 for ps multiline group or modem pool group,
```

Copyright © 1999 Lucent Technologies 

```
0 -   31 for IP trunk groups,
0 -   23 for X.75' trunk groups,
0 -   23 for X.75 trunk groups,
```

**Attribute: module**

**Fullname:** Switching Module number.

**Attribute Description** Switching Module where the port is located.

**Attribute: ph_number**

**Fullname:** Protocol Handler number.

**Attribute Description** The Protocol Handler (PH) number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered on the (T1 PACKET SWITCHING CHANNEL ASSIGNMENT) view. As of 5E9, all Packet Line MLHG Members must reside on PH3's since they will no longer be supported on the PH2 Access Image.

**Attribute: ph_cn**

**Fullname:** Protocol Handler Channel number.

**Attribute Description** The Protocol Handler channel number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH channel number entered on the (T1 PACKET SWITCHING CHANNEL ASSIGNMENT) view. Channel number range is 0 - 127. If the port is an X.75, X.75' or IP trunk then ph_cn must be 0 if the PH is of type PH2. If the port is an X.75, X.75' or IP trunk and the PH is of type PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.
HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'member' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute: party**

**Fullname:** Party.

**Attribute Description** The specific packet user within an ISDN DSL D-channel. There can be up to 8 packet user Service Order Profiles (SOPs) defined. The following symbolic use of numeric party value is defined:

```
FCP_INDI        0       individual lines
FCP_TRUNK       0       trunks
FCP_BCHAN       0       B-channel packet-switching
FCP_DFLTSRV     0       Default Service
FCP_PKTTRK      0       Packet trunks
FCTP_RNG        1       ring side of two party line
FCTP_TIP        2       tip side of two party line
```

Permanent Packet B-Channels (PPB) are populated with FCP_BCHAN. Packet trunks are populated with FCP_PKTRK. This attribute is not used by X.25 access on a T1 (XAT) port, populate with FCP_INDI for XAT ports.

**Attribute: tsi_link**

Copyright © 1999 Lucent Technologies 

**Fullname:** Time Slot Interchanger (TSI) link associated with the port

**Attribute Description** This attribute is the TSI link associated with the port. It is used to support fast port inhibit. This attribute is only used for trunks assigned to the following trunk units: SMDNU_S, and SMDLTU2.

**Attribute: vpidb**

**Fullname:** Virtual Peripheral Interface Data Bus

**Attribute Description** This attribute identifies the channel on a Peripheral Control and Timing (PCT) link associated with the port. This attribute identifies the PIDB on a DX. The PIDB is associated with a Digital Line Trunk Unit-2 (DLTU2) facility. This attribute is only used for facilities assigned to the following trunk units: SMDNU_S, and SMDLTU2.

**Attribute: qkey**

**Fullname:** Arbitrary key.

**Attribute Description** If ptype is TM_LINE, set qkey equal to 0, else set qkey equal to the index value from RLqkeyport. For X.25 access on a T1 (XAT) ports, the attribute ptype will be TM_LINE. Therefore, populate qkey with 0 for XAT ports.

**Attribute: chan_sel**

**Fullname:** Channel selection

**Attribute Description** Specifies whether channel selection applies. Channel selection means that there are two or more channels with X.25 packet services that together make up one packet MLHG member. The port in this relation will be the equal the port for the first assigned channel in RLcdnchan. There is no longer a one to one mapping between RLpsgp_prt and RLpsprt_gp. When channel selection applies there will only one port in RLpsgp_prt associated with this group and member. That port will be the same as the first assigned channel in RLcdnchan. Channel selection is only valid for a packet MLHG member with a port type of TM_LINE

**Attribute: deactive**

**Fullname:** Deactive/Active Packet Multi-LIne Hunt Group Indicator

**Attribute Description** Indicates the deactive/active hunt status of a packet Multi-Line Hunt Group member. If DBYES, then the member will be marked busy for hunted calls. This means that a deactivated packet MLHG member will always be considered busy for calls made to the group PSUCD DN or a linear entry point DN. The deactivation/activation status has no effect on non-hunted calls, which are calls made to a MLHG member using its individual DN. Deactivation only applies for a packet MLHG member with a port type of TM_LINE. Deactivation is not valid for a packet modem pool member. When deactivation is yes, then the status for the member in RLrt_mem or RLrt_lgmem must equal 0. Deactivation in this relation must be the same as deactivation in RLpsprt_gp. If channel selection equals DBYES, then deactivation must be same for all the associated channels in RLpsprt_gp.

## 4. Population Rules for RLpshfinfo

**Relation Description**
PSU Shelf Information

Provides information associated with the logical PHs on a PSU shelf that can support automatic channel (that is, ISCN) allocation.

**Attribute: shelf**

**Fullname:** PSU shelf number

**Attribute Description** The PSU shelf number (key).

**Attribute: phalw**

**Fullname:** PH-allow map

**Attribute Description** 16 bit map used to indicate if channels can be automatically allocated for the shelf's PHs; bit n represents logical PH n, where 1 = allowed, 0 = not allowed.

**Copyright © 1999 Lucent Technologies** 

**Attribute: chcnt[*]**

**Fullname:** channel count

**Attribute Description** The number of channels that have been allocated or reserved on logical PH XX (XX = 00-15).

**Attribute: phapp[*]**

**Fullname:** PH application type

**Attribute Description** Logical PH XX application type (XX = 00-15).

**Attribute: hwtyp[*]**

**Fullname:** PH hardware type

**Attribute Description** Logical PH XX hardware type (XX = 00-15).

**Attribute: pad1[*]**

**Fullname:** manual padding #1

**Attribute Description** Manual padding used to force "phapp_XX" variable to be aligned in the least significant bits of the byte it resides in (XX = 00-15).

**Attribute: pad2[*]**

**Fullname:** manual padding #2

**Attribute Description** Manual padding used to force "hwtyp_XX" variable to be aligned in the least significant bits of the byte it resides in (XX = 00-15).

**Defines:**
/* None */

## 4. Population Rules for RLpsiptst

**Relation Description**
Packet Switching Internal Protocol Trunk Selection Table

RLpsiptst provides the data contained in PH global data arrays which is used to identify the IP trunk PH and PH channel and the Inter-SM Link PH and PH channel to which an individual packet is to be sent. RLpsiptst associates a Next Packet Switch (ie. a packet switch which has a direct Internal Protocol (IP) trunk group connection to the present switch) with (1) the number of trunks in the IP trunk group, (2) the identity of the switching module where the trunks physically exist, and (3) a normalized Next PSN value called the Next PSN Index.

**Attribute: npsn**

**Fullname:** Next Packet Switch Number

**Attribute Description** npsn contains the packet switch number of a packet switch that has a direct IP trunk group connection with the present switch.

Copyright © 1999 Lucent Technologies 

**Attribute: module**

**Fullname:** Module

**Attribute Description** Identifies the switching module where the IP trunks physically exist. All trunks within an IP trunk group must reside on one switching module.

**Attribute: grpnum**

**Fullname:** Group number

**Attribute Description** Identifies the IP trunk group number

**Attribute: size**

**Fullname:** Trunk group size

**Attribute Description** Identifies the number of trunks in the IP trunk group. The maximum number of trunks in an IP trunk group is 32. If there are no trunks assigned, then size has the value 0.

**Attribute: npsn_index**

**Fullname:** Next packet switch number index

**Attribute Description** The value for npsn_index is automatically assigned by Recent Change or ODA. npsn_index permits the RLpsiptst data to be stored in a memory efficient manner in the global PH data arrays. npsn_index normalizes the range of npsn values (1 - 255) to the values between 0 and 15, inclusive. This is possible because a switch can have a maximum of 16 IP trunk groups and thus a maximum of 16 adjacent packet switches (npsn's).

## 4. Population rules for RLpsiupidb

### Relation Description

Packet Switching Interconnect Unit Peripheral Interface Data Bus
This relation contains additional information on the TSI PIDBs and Direct PIDBs that terminate to a given PSU shelf.

**Attribute:**
psiu_shelf
**Fullname:**
Packet Switching Interconnect Unit Shelf
**Attribute Description:**
16 Bit PSIU Shelf name for Shelf Side-0. Must be populated in RLcktdata as PCSHLFPSIU.

**Attribute:**
pidb[*]a
**Fullname:**
Peripheral Interface Data Bus on PSIUCOM side 0
**Attribute Description:**
The circuit name of an even PIDB connecting the TSIU to connection-i (where i is from 0 to 3) of the DF on this shelf associated with PSIUCOM-0.
This PIDB must be populated in RLpidb and in RLcktdata (ckttype is PCPIDBPSIU).

pidb_1a can only be configured if pidb_0a exists.
pidb_2a can only be configured if pidb_1a exists.
pidb_3a can only be configured if pidb_2a exists.
The pidb_1a, pidb_2a, and pidb_3a are populated on a shelf with DF-MP circuit only. They must be defaulted to $GLNULCKT if they are not equipped.
pidb_[0-3]a for a given PSU shelf must all terminate to the same TSIU DI. This is to eliminate data loss during PSUCOM and MCTSI switches. Refer to assignment rules for more information:
Drawing: SD 5D007-01 Sheet: 74 (Packet Switch Unit)

**Attribute:**
pidb[*]b
**Fullname:**

Copyright © 1999 Lucent Technologies 

Peripheral Interface Data Bus on PSIUCOM side 1

**Attribute Description:**

The circuit name of an odd PIDB connecting the TSIU to connection-i (where i is from 0 to 3) of the DF on this shelf associated with PSIUCOM-1. This PIDB must be populated in RLpidb and in RLcktdata (ckttype is PCPIDBPSIU). This PIDB must be paired with the PIDB assigned to 'pidb_[*]a' and must be '1' greater on the same TSIU DI board.

pidb_1b can only be configured if pidb_0b exists.
pidb_2b can only be configured if pidb_1b exists.
pidb_3b can only be configured if pidb_2b exists.
The pidb_1b, pidb_2b, and pidb_3b are populated on a shelf with the cli equals to 0x3 for DF-MP circuit only. They must be set to zero when PCSHLFPSIU cli is 0 or if they are not equipped.

**Attribute:**

dpidb[*]

**Fullname:**

Direct peripheral interface data bus.

**Attribute Description:**

Circuit name of the PIDB connecting position x of the DF to service group 0 of the ISLU(2) or IDCU. or to the COMDAC0 of the AIU. (NOTE: Each direct PIDB position on the DF connects to 2 ISLU(2) or IDCU PIDBs, one on each of the two ISLU(2)/IDCU service groups, or one on each of the two COMDACs of an AIU.) This pidb must be populated in RLcktdata (PCPIDBISLU or PCPIDBIDCU or PCAI_PIDB) as pidbtype PCDPIDB, but not in RLpidb. For more information on the population rules for DPIDBs, see CKTDATA population rules for ISLU(2) and IDCU or AIU Equipped PIDBs - PCPIDBISLU/PCPIDBIDCU/PCAI_PIDB. The eqstat of this shelf in CKTDATA cannot be changed to a state lower than that of any of the DPIDBs assigned to it. For more information and population rules regarding PSIU Shelves relative to DPIDBs, see the CKTDATA population rules for the PSIU Shelf Unit - PCSHLFPSIU.

For additional information and population rules relating to the ISLU(2)/IDCU/AIU connection for this PIDB, see relation 'RLislupidb' and 'RLaiupidb' under section 'PCDPIDB'. This pidb must also be populated in RLislupidb and in RLaiupidb. Its location in RLislupidb/RLaiupidb is derivable from the picb value in RLrc_eqloc.

Where, picb is the key in RLislupidb for ISLU(2) service group 0, or the key in RLaiupidb for AIU COMDAC 0.
dpidb0-5 - associated with DPIDB position n on the DF.
dpidb6-10 - associated with DPIDB position n on the DF.

Copyright © 1999 Lucent Technologies 

(This pidb is currently not populated)
This attribute is not used by X.25 access on a T1 (XAT) port.

**Attribute:**
config[*]
**Fullname:**
Protocol Handler (PH) Packet Switch Unit shelf information.
**Attribute Description:**
This attribute contains sub-attributes which indicate the number of operational PH(*), the number of channel groups of hardware type PH(*), the number of assigned channel groups of hardware type PH(*), and the minimum spare PH(*) on the shelf.

**Attribute:**
config[*].num_ph
**Fullname:**
Number of operational PH(*) on each shelf.
**Attribute Description:**
Each element follows similar population procedures.
This attribute is the number of operational PHs of hardware type x on this shelf.
A PH is operational when the attribute 'eqstat' in RLcktdata is 'SMOPER' (PH ckttype is PCPHPSIU).
This number should be updated whenever the attribute 'eqstat' in RLcktdata is changed from or to 'SMOPER' for any of the x type PHs on this shelf.
See also the rules for the PH in RLcktdata and the rule for 'configx.min_spr' below.

config1.num_ph - associated with PH1s
config2.num_ph - associated with PH2s
config3.num_ph - associated with PH3s
config4.num_ph - associated with PH4s
configv1.num_ph - associated with PHV1s
configv2.num_ph - associated with PHV2s
configv3.num_ph - associated with PHV3s
configv4.num_ph - associated with PHV4s
configa1.num_ph - associated with PHA1s
If no configx.num_ph exist on the shelf the default value should be set to zero.
XAT ports are not supported on PH1.

**Attribute:**
config[*].num_grp
**Fullname:**
Number of operational PH(*) assigned a DSL group on each shelf.
**Attribute Description:**
This is the number of non-empty channel groups for this shelf for PH hardware type SMPH(*).
That is, it should be the number of

**Copyright © 1999 Lucent Technologies** 

```
groups on that shelf that are assigned
(attribute 'assigned' = 'DBYES' in RLdslgdata):
    config(*).num_grp = 0;
    for (i=0; i<16; i++) {
    if (RLdslgdata.assigned of channel group i
        on this shelf == DBYES
    AND
        RLdslgdata.hw_type of channel group i
        on this shelf == SMPH(*)
    config(*).num_grp++;
    }
This number should be updated in either of the following
cases:
    1) when attribute 'assigned' in RLdslgdata is changed
       from 'DBYES' to 'DBNO' or from 'DBNO' to 'DBYES' for any of the
       groups on this shelf whose attribute 'hw_type' in RLdslgdata
       is 'SMPH(*)', or
    2) when attribute 'hw_type' in RLdslgdata is changed
       from or to 'SMPH(*)' for any of the groups on this shelf whose
       attribute 'assigned' in RLdslgdata is 'DBYES'.
See also the rule for attribute 'assigned' in
RLdslgdata and the rule for 'configx.num_hw' below.
If no SMPH(*) groups exist on the shelf the default value for
config1.num_grp should be set to zero.
```

**Attribute:**

```
config[*].num_hw
```

**Fullname:**

```
number of channel groups reserved a SMPH(*) hardware type.
```

**Attribute Description:**

```
This is the number of channel groups for this shelf of PH hardware
type 'SMPH(*)'.
That is, it should be the number of groups on this shelf that
are assigned a hardware type of 'SMPH(*)'
(attribute 'hw_type' = 'SMPH(*)'
in RLdslgdata):
                config(*).num_hw = 0:
                for (i=0: i<16: i++) {
                        if (RLdslgdata.hw_type of channel group i
                                on this shelf == SMPH(*)
                                config(*).num_hw++:
                        }
When a channel group has been assigned a hardware type
of 'SMPH(*)', the channel group may only use PH(*) hardware.
Config(*).num_hw should be updated whenever the attribute 'hw_type'
in RLdslgdata is changed from or to 'SMPH(*)'.
The following 2 constraints should always be observed:
config(*).num_ph >= config(*).num_hw >= config(*).num_grp
config(*).num_ph - config(*).num_hw >= config(*).min_spr
where    'config(*).num_ph' is the total
number of operational PHs on the shelf
for PH hardware type 'SMPH(*)'
(see 'config(1-4).num_ph' definition above)
```

**Copyright © 1999 Lucent Technologies** 

'config(*).num_grp' is the total
number of channel groups on
the shelf of PH hardware type 'SMPH(*)'
and with assigned channels
(see 'config(*).num_grp' definition above).
'config(*).min_spr' is the minimum number
of spare PHs on the shelf of PH hardware
type 'SMPH(*)' (see 'config(*).min_spr' definition
below).

See also the rule for attribute 'assigned' in
RLdslgdata, the rule for the attribute 'config(*).num_grp
, and the rule for 'config(*).min_spr' below.
If no channel groups for this shelf are of the SMPH(*)
hardware type, the attribute config(*).num_hw and should
be defaulted to zero.

NOTE: In domestic (USA) generics, PH1s are for internal
testing only. PH1s do not appear in domestic field offices
and are not supported by RC/V. However, PH1s may appear in
domestic test labs.

**Attribute:**

config[*].min_spr

**Fullname:**

Number of minimum spare PH(*) on each shelf.

**Attribute Description:**

This is the required minimum number of spare PHs for this
shelf for PH hardware type SMPH(*).
This subattribute insures that a minimum number of spare
PHs will always be available on the shelf for backup of
active PHs.

The total number of spare PHs of hardware type SMPH(*)
on the shelf is equal to
config(*).num_ph - config(*).num_hw
where 'config(*).num_ph ' is the total
number of operational PHs on the shelf
for PH hardware type 'SMPH(*)'
(see 'config(*).num_ph' definition above)
'config(*).num_hw' is the total
number of channel groups on
the shelf of PH hardware type 'SMPH(*)'
(see 'config(*).num_hw' definition above).
The total number of spare PHs MUST NOT be less
than the required minimum number of spares.
(Any number of spare PHs over the minimum number
is valid.)

Thus, the following must always be true:
config(*).num_ph - config(*).num_hw >= config(*).min_spr
unless 'config(*).num_hw' is equal to zero, in

Copyright © 1999 Lucent Technologies 

which case this rule no longer need be true.

**Attribute:**
shts_di[*]
**Fullname:**
PSU shelf to TSIU nailed up timeslot connections count per di.
**Attribute Description:**
For an SM:
---
This attribute reflects the number of PSU PIDB time slots that have nailed up connections through the TSIU on this shelf per di.

Following checks should be used to increment shts_di0:
When one of the "shlf" attributes is incremented in RLtscount for this shelf then shts_di0 should be incremented when either of the following conditions is true:
1- All "di_pidb" values are 0 for this shelf.
2- At least one "di_pidb" value is 0 and there is "available" TSIU time slots reserved on DI0. To have "available" TSIU requires the following three criteria to be met:
- The count of TSIU time slots being used on DI0 (Gldi0tscnt) is less than TSIU time slots reserved on DI0 (sum of bits set in Gldi0_*ptss) and the shts_di0 value has not exceeded oper_pidb * 32 on DI0.
- No actual TSIU timeslot is used on a shelf more than the number of PIDBs on DI0. For example, if 3 PIDBs exist on DI0 and the bit for timeslot 14 is set in 5 bit maps, the timeslot can only be used 3 times by that shelf.
- Every application on every shelf can be assigned to a bit in one of the Gldi0_*ptss bit maps following the above rule.

Following checks should be used to decrement shts_di0:
This value should be decremented when a "shlf" value is decremented in RLtscount when either of the following conditions is true:

1- All "di_pidb" values are 0 for this shelf.
2- At least one "di_pidb" value is 0, the count of TSIU time slots used on di0 (Gldi0tscnt) is greater than zero, and the count of TSIU time slots used on di1 (Gldi1tscnt) is zero.

Following checks should be used to increment shts_di1:
When one of the "shlf" attributes is incremented in RLtscount for this shelf then shts_di1 should be incremented when either of the following conditions is true:

1- All "di_pidb" values are 1 for this shelf.
2- At least one "di_pidb" value is 1, condition 2 for shts_di0 could not be met and there is "available" TSIU time slots reserved on DI1. To have enough TSIU requires the following three criteria to be met:

Copyright © 1999 Lucent Technologies 

- The count of TSIU time slots being used on DI1 (Gldi1tscnt) is less than TSIU time slots reserved on DI1 (sum of bits set in Gldi1_*ptss) and the shts_di1 value has not exceeded oper_pidb * 32 on DI1.
- No actual TSIU timeslot is used on a shelf more than the number of PIDBs on DI1. For example, if 3 PIDBs exist on DI1 and the bit for timeslot 14 is set in 5 bit maps, the timeslot can only be used 3 times by that shelf.
- Every application on every shelf can be assigned to a bit in one of the Gldi1_*ptss bit maps following the above rule.

Following checks should be used to decrement shts_di1:
This value should be decremented when a "shlf" value is decremented in RLtscount when either of the following conditions is true:
1- All "di_pidb" values are 1 for this shelf.
2- At least one "di_pidb" value is 1 and the count of TSIU time slots used on di1 (Gldi1tscnt) is greater than 0.

For an SM-2000:
---
This attribute reflects the total number of PSU PIDB time slots that have nailed up connections through the TSIU on this shelf.

**Attribute:**
di_pidb[*]
**Fullname:**
PSU shelf DI to PIDB connection.
**Attribute Description:**
This attribute indicates what DI the PIDB on this shelf is connected to for connection-i (where i is from 0 to 3) of the DF.

If a PIDB is not being used/not connected the DI value should default to 6.

**Attribute:**
oper_pidb
**Fullname:**
Operational PIDBs on the shelf.
**Attribute Description:**
This attribute holds the counter for the operational PIDBs per shelf.

**Attribute:**
rpa_ts
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Remote Protocol Access reserved Timeslots

**Attribute Description:**

This attribute is used to keep track of the timeslots reserved for the Remote Protocol Access feature BRI monitor session ports. There is a direct one to one correlation with RLtscount.rpa_0pidb thru rpa_4pidb attributes. Timeslots are reserved on a PSU shelf basis. The PSU PIDB timeslots used by RPA are reserved from the available PIDB timeslots on a given PH shelf and are not part of the PSU nail-up timeslots. For SM-2000 one time slot is reserved for diagnostics.

For SM: the sum of
RLpsiupidb.shts_di0 + RLpsiupidb.shts_di1 +
RLpsiupidb.rpa_ts + RLpsiupidb.odb_min for each
PSU shelf must be <= oper_pidb * 32.

For SM-2000: the sum of
RLpsiupidb.shts_di0 + RLpsiupidb.shts_di1 +
RLpsiupidb.rpa_ts + RLpsiupidb.odb_min for each
PSU shelf must be <= oper_pidb * 31.
Or the sum of rpa_ts and odb_min for each shelf
must be <= number of PCT link * 767 if the shelf
is connected via PCT link.

**Attribute:**

odb_min

**Fullname:**

Minimum time slots for on demand packet-B (ODB)

**Attribute Description:**

Minimum time slots reserved for on demand packet-B (ODB) on a per shelf basis.

**Attribute:**

pct0_sg[*]

**Fullname:**

PCT link 0 circuit for service group 0 and 1.

**Attribute Description:**

This is the circuit name for the first PCT link connected to a PSU shelf. Current design supports only one PCT link per shelf. The PCT link is a duplex link connects to both service group 0 and service group 1

**Defines:**

## 4. Population Rules for RLpsl2thrs

**Relation Description** Level 2 IP, X.75', X.75, and PP trunk group thresholds

This relation contains threshold values used by level 2 error handling for X.75', X.75, IP and packet pipes (PP) trunk groups.

Copyright © 1999 Lucent Technologies

**Attribute: grpnum**

**Fullname:** Trunk Group Number

**Attribute Description** Group number of the X.75', X.75, IP or PP trunk group

**Attribute: badfcs**

**Fullname:** Bad Frame Check Sequence

**Attribute Description** This attribute gives the threshold value for the ratio of frames received with a bad frame check sequence (FCS) to the total number of frames received. badfcs= 'i' signifies threshold is 1 out of 'i' frames received with a bad FCS.

**Attribute: sabm_num**

**Fullname:** Number of SABMs received in 30 seconds

**Attribute Description** This attribute gives the threshold value for the maximum number of set asynchronous balanced mode (SABM) frames received in a 30 second period.

**Attribute: l2err**

**Fullname:** Level 2 protocol errors

**Attribute Description** This attribute gives the threshold value for the maximum number of level 2 protocol violations detected in a 30 second period

## 4. Population Rules for RLpsl3trkg

**Relation Description**
This Relation defines the OSI Level 3 parameters applicable for packet switching trunk groups of type X.75 or X.75'.

This relation does not apply for IP or other PRI trunk group types. Not all attributes in this relation apply to both types of packet trunks. Please refer to the general section tuple semantics and each attributes usage section to

Copyright © 1999 Lucent Technologies 

determine what type(s) of packet trunks the attribute is applicable for. The relation is set up for RC READ-FIRST-READ-NEXT access on the iiclist_id attribute.

The following tuple semantics detail the allowed values for both X.75 and X.75' trunk groups.

```
TUPLE SEMANTICS for X.75 Trunk Groups
-------------------------------------
grpnum       X.75 Trunk Group Number (1 thru AVTRKGRPS())
num_plan     X.75 Mode of Operation (PSX121 or PSE164)
ilc_scrn     {ILCON,ILCOFFTR,ILCOFFDN}
nuiin_unv    {NUICLEAR,NUIPASS} (default = NUICLEAR)
nuiout_unv   {NUICLEAR,NUIPASS} (default = NUICLEAR)
nuiin_vfy    {NUICLEAR,NUIPASS,NUIDELETE} (default = NUIPASS)
nuiout_vfy   {NUICLEAR,NUIPASS,NUIDELETE} (default = NUIPASS)
cugscrn_alw  {DBYES,DBNO}
iiclist_id   0-1600
remote_dnic  1-9999
seg_size     {TSEGSZ16,TSEGSZ64,TSEGSZ128,TSEGSZ256} (default
             = TSEGSZ64)

TUPLE SEMANTICS for X.75' Trunk Groups
--------------------------------------
grpnum       X.75' Trunk Group Number (1 thru AVTRKGRPS())
num_plan     X.75' Mode of Operation (PSX121 or PSE164)
ilc_scrn     ILCNONE (ilc_scrn only for X.75 trunks)
nuiin_unv    NUINONE (nui_in_unv only for X.75 trunks)
nuiout_unv   NUINONE (nui_out_unv only for X.75 trunks)
nuiin_vfy    NUINONE (nui_in_vfy only for X.75 trunks)
nuiout_vfy   NUINONE (nui_out_vfy only for X.75 trunks)
cugscrn_alw  DBNO (cugscrn_alw only for X.75 trunks)
iiclist_id   0    (iiclist_id only for X.75 trunks)
remote_dnic  0    (remote_dnic only for X.75 trunks)
seg_size     TNOSEGSZ (seg_size only for X.75 trunks)
```

**Attribute: grpnum**

**Fullname:** X.75 or X.75' Trunk Group Number

**Attribute Description** Enter the X.75 or X.75' Trunk Group number (1-AVTRKGRPS()) as defined in RLpsx75trk, RLrctgrprk and RLrt_trkg.

**Attribute: num_plan**

**Fullname:** X.75 or X.75' packet switching mode of operation

**Attribute Description** The num_plan attribute is used to define the numbering plan that is 'native' to the trunk group. The only valid mode of interworking between numbering plans is escape code. The pseudo DNIC mode of interworking is no longer supported as of the 5E8 software release. See the retrofit section of this relation for details on the elimination of the pseudo DNIC mode of interworking.

The attribute is valid for both X.75 and X.75' trunk group types. The attribute is necessary to properly interpret addresses and escape codes for calls arriving on the trunk.

The valid numbering plans are E.164 (PSE164) and X.121 (PSX121).

**Copyright © 1999 Lucent Technologies** 

The enumeration PSXNONE is not valid in the relation. This enumeration is for RC and ODA use only and will appear as 'NONE' on the view. The enumeration is for use with non-X.75/non-X.75' trunk groups which share the trunk group view (this field is a required field on the view so an entry for every trunk group is necessary).

**Attribute: ilc_scrn**

**Fullname:** Intra Lata Competition Screening at X.75 Interface

**Attribute Description** The intra lata competition (ILC) screening attribute is a routing parameter for X.75 trunks. If the parameter is set to ILCON the packet trunk call arriving at the X.75 interface should be screened for intra lata competition. The attribute is not used for X.75' trunk groups and should be defaulted to ILCNONE for them. The ILCNONE enumeration is not valid for X.75 trunk groups.

If this trunk group parameter is set to ILCON, and if the RPOA utility is provisioned in the RLpsx75trk.prov_flag attribute, the switch will discard the ICPI utility if present and check the value of the Glilc global office parameter. Depending on the value of Glilc, packet routing will either route the call based on RPOA without DA, route the call based on RPOA, route the call to the intra-lata carrier (IC) indicated by the RPOA or clear the call with two possible error messages.

If this trunk group parameter is set to ILCOFFTR, and if the RPOA utility is provisioned in the RLpsx75trk.prov_flag attribute, the switch will discard the ICPI utility if present and route the call based on RPOA.

If this trunk group parameter is set to ILCOFFDN, the RPOA utility is not present in the call request packet and the called address indicates an IC is not needed to complete the call then the call will be routed based on the directory number (DN) in the call request packet (called address). If the RPOA utility is not present, the called address indicates an IC is needed to complete the call and the ICPI utility is present then the ICPI will be replaced with RPOA (with the DNIC/INIC mapped from ICPI to RPOA) and the call routed to the preselected IC; however, if the ICPI utility is not present the call will be cleared. This enumeration will treat the call as the packet switching software did in pre-5e8 software releases.

**Attribute: nuiin_unv**

**Fullname:** X.75 Trunk Interface NUI incoming unverified (NUIHANDI(0))

**Attribute Description** The attribute is used to define the type of network user identification (NUI) treatment for incoming unverified calls on the X.75 trunk interface. The attribute does not apply to X.75' trunks and should be set to NUINONE for them. The default value for X.75 trunks is NUICLEAR.

NUI provides supplementary network user identification for charging of virtual call usage. The NUI utility and the transit network identification (TNI) Utility must be provisioned for all trunk members of this trunk group in the RLpsx75trk.prov_flag attribute for this attribute to be used.

When this attribute is set to 'PASS' the switch should transmit the call request packet (CRP) as it is. When this attribute is set to 'CLEAR' the switch should clear the CRP containing the NUI utility. The enumeration 'DELETE' does not apply to this attribute. The Bellcore TA/TR name for this attribute is NUIHANDI(0).

**Attribute: nuiout_unv**

**Fullname:** X.75 Trunk Interface NUI outgoing unverified (NUIHANDO(0))

Copyright © 1999 Lucent Technologies 

**Attribute Description** The attribute is used to define the type of network user identification (NUI) treatment for outgoing unverified calls on the X.75 trunk interface. The attribute does not apply to X.75' trunks and should be set to NUINONE for them. The default value for X.75 trunks is NUICLEAR.

NUI provides supplementary network user identification for charging of virtual call usage. The NUI utility and the transit network identification (TNI) Utility must be provisioned for all trunk members of this trunk group in the RLpsx75trk.prov_flag attribute for this attribute to be used.

When this attribute is set to 'PASS' the switch should transmit the call request packet (CRP) as it is. When this attribute is set to 'CLEAR' the switch should clear the CRP containing the NUI utility. The enumeration 'DELETE' does not apply to this attribute. The Bellcore TA/TR name for this attribute is NUIHANDO(0).

**Attribute: nuiin_ver**

**Fullname:** X.75 Trunk Interface NUI incoming verified (NUIHANDI(1))

**Attribute Description** The attribute is used to define the type of network user identification (NUI) treatment for incoming verified calls on the X.75 trunk interface. The attribute does not apply to X.75' trunks and should be set to NUINONE for them. The default value for X.75 trunks is NUIPASS.

NUI provides supplementary network user identification for charging of virtual call usage. The NUI utility and the transit network identification (TNI) Utility must be provisioned for all trunk members of this trunk group in the RLpsx75trk.prov_flag attribute for this attribute to be used.

When this attribute is set to 'PASS' the switch should transmit the call request packet (CRP) as it is. When this attribute is set to 'CLEAR' the switch should clear the CRP containing the NUI utility. When this attribute is set to 'DELETE' the switch should remove the NUI utility from the CRP before delivering the call set up packet. The Bellcore TA/TR name for this attribute is NUIHANDI(1).

**Attribute: nuiout_ver**

**Fullname:** X.75 Trunk Interface NUI outgoing verified (NUIHANDO(1))

**Attribute Description** The attribute is used to define the type of network user identification (NUI) treatment for outgoing verified calls on the X.75 trunk interface. The attribute does not apply to X.75' trunks and should be set to NUINONE for them. The default value for X.75 trunks is NUIPASS.

NUI provides supplementary network user identification for charging of virtual call usage. The NUI utility and the transit network identification (TNI) Utility must be provisioned for all trunk members of this trunk group in the RLpsx75trk.prov_flag attribute for this attribute to be used.

When this attribute is set to 'PASS' the switch should transmit the call request packet (CRP) as it is. When this attribute is set to 'CLEAR' the switch should clear the CRP containing the NUI utility. When this attribute is set to 'DELETE' the switch should remove the NUI utility from the CRP before delivering the call set up packet. The Bellcore TA/TR name for this attribute is NUIHANDO(1).

**Attribute: cugscrn_alw**

**Fullname:** X.75 Trunk Interface Closed User Group Screening

**Attribute Description** The attribute is used to enable (DBYES) or disable (DBNO) closed user group screening on X.75 trunk groups. The attribute is not used by X.75' trunk groups and should

Copyright © 1999 Lucent Technologies 

be set to DBNO for them. If this attribute is DBYES, there must be a valid CUG List ID entered in the iiclist_id attribute.

If this attribute is DBYES, then every trunk member of the trunk group must also subscribe to either the CUG indication utility or the CUG/OA Utility via the RLpsx75trk.prov_flag attribute. Whenever a new trunk member is added to a trunk group with CUG screening enabled, the new member must have one of the two previous utilities enabled. If the attribute is DBNO then no screening is performed on call request packets at the X.75 trunk interface.

This attribute is also populated in RLpsx75trk for packet routing efficiency. The value in RLpsx75trk for every member of a given trunk group must be exactly the same as the value for the group in this relation.

**Attribute: iiclist_id**

**Fullname:** X.75 Trunk Interface Closed User Group Screening List ID Number

**Attribute Description** The attribute is used to assign a closed user group (CUG) list ID number to the trunk group. The CUG List ID must be a valid ID number defined in RLpscug_iic and may be shared with other trunk groups. The attribute is not used by X.75' trunk groups and should be set to 0 for them. The valid range for X.75 trunk groups is 0-1600.

If this attribute is 0 then no screening is allowed (cugscrn_alw attribute must be set to DBNO (zero indicates no list assigned)). If the attribute value is 1-1600 then a list is assigned but the cugscrn_alw attribute may be either DBYES or DBNO (allows for an on-off toggle).

This attribute is also populated in RLpsx75trk for packet routing efficiency. The value in RLpsx75trk for every member of a given trunk group must be exactly the same value entered for the group in this relation.

**Attribute: remote_dnic**

**Fullname:** X.75 Trunk Remote DNIC

**Attribute Description** This attribute contains the remote DNIC assigned to the remote end of the X.75 trunk group. The remote_dnic attribute is not used for X.75' trunk groups. The range of values to be entered by operating company personnel for X.75 trunk groups is from 0001 - 9999. Hex digits A through F are not allowed. The default value 0000 should be populated for X.75' trunk groups.

**Attribute: seg_size**

**Fullname:** X.75 Trunk Group Internetwork Segment Size

**Attribute Description** This attribute is used for recording the X.75 trunk group segment size in the AMA record for internetwork virtual circuits. The valid segment sizes are 16, 64, 128 or 256 octets represented by the enumerations TSEGSZ16, TSEGSZ64, TSEGSZ128 and TSEGSZ258. This attribute is applicable for X.75 trunk groups only and is defaulted to TSEGSZ64 for them. The attribute is not used for X.75' trunk groups and should be defaulted to TNOSEGSZ for them. This attribute is similar to the SM global parameter Glsegsz which is used for intranetwork X.75 call segment size provisioning and X.25 intranetwork/internetwork call segment size provisioning. Refer to the retrofit section for more information pertaining to retrofit.

## 4. Population Rules for RLpsldn_gp

**Relation Description**
This relation is used to determine the starting packet MLHG member for a linear hunt.

When the called address is a linear entry point DN, this relation is read to determine the start hunt member. For each linear entry point DN that is assigned to a unique packet MLHG and member a tuple will exist in this relation. A linear entry point DN, when called, is used to determine the member of the packet MLHG to start the hunt with. Hunting starts at a determined member and continues until an idle member is found or until the end of the member list is reached.

For example:
DN = 979-2000 is assigned to grpnum = 30 member = 10.
If 979-2000 is dialed, then linear hunting will start with packet MLHG 30, member 10.

**Attribute: dn**

**Fullname:** Packet Switching Directory Number

**Attribute Description** For packet switching multi-line hunt groups with linear hunting this is a linear entry point DN. The attribute consists of the normalized office code (NOC) and four directory number digits.

Packet routing will read this relation with the linear DN to find the group and member number to start hunting with.

There must be a corresponding tuple in RLpsgp_ldn and the hunt type in RLrt_mhg must be PSUCD or PSLGUCD.

The NOC for the group linear entry point DN in RLpsmhgdnr must not equal 0.

For member 1, the linear DN in this relation must match the group's linear entry point DN in RLpsmhgdnr.

**Attribute: dn.noc**

**Fullname:** Normalized office code

**Attribute Description** This is the normalized office code for the linear entry point DN.

**Attribute: dn.digits**

Copyright © 1999 Lucent Technologies 

**Fullname:** Directory Digits

**Attribute Description** These are the local directory digits for the linear entry point DN.

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description** Group number of a packet switching multi-line hunt group (MLHG) that has a linear hunting algorithm associated with it.

**Attribute: member**

**Fullname:** Member Number

**Attribute Description** Member number of packet switching multi-line hunt group.

## 4. Population Rules for RLpslinkpt

**Relation Description**
Gateway link IDs for X.75/X.75' Trunk PVCs

This relation maps the gateway link ID used by an IP PVC into the SM, PH and channel number of the destination X.75/X.75' trunk.

**Attribute: linkid**

**Fullname:** Gateway Link ID

**Attribute Description** Gateway Link ID used by Routing for PVCs on a given X.75/X.75' trunk

**Attribute: module**

**Fullname:** Switching Module

**Attribute Description** Switching Module (SM) number of the given X.75/X.75' trunk

**Attribute: ph_number**

**Fullname:** PH number

**Attribute Description** PH number of the given X.75/X.75' trunk

Copyright © 1999 Lucent Technologies

**Attribute: ph_cn**

**Fullname:** PH channel number

**Attribute Description** PH channel number of the given X.75/X.75' trunk If the port is an X.75 or X.75' trunk and the PH is of type PH2 then ph_cn must be 0 If the port is an X.75 or X.75' trunk and the PH is of type PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4. HARDWARE CONVERSION NOTE: If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

## 4. Population Rules for RLpsmappvc

**Relation Description**
Permanent virtual circuit (PVC) bit map.

This relation defines a PVC bit map associated with a given D/B channel of a DSL, X.75 or X.75' trunk or a X.25 access on a T1 (XAT) port. On-demand B-channel (ODB) DSL ports and IP Trunk group members may not have PVC's assigned to them and thus should not have tuples in this relation. As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. Instead X.25 Packet Switching will only be supported by PH3's.

**Attribute: ph_number**

**Fullname:** Protocol Handler number.

**Attribute Description** Ph_number is also called DSL group number. For efficient memory utilization, ph_number should be assigned sequentially. The Protocol Handler number that an X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered on the (T1 PACKET SWITCHING CHANNEL ASSIGNMENT) view. As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. Instead X.25 Packet Switching will only be supported by PH3 or PH4.

**Attribute: ph_cn**

**Fullname:** Protocol Handler channel number.

**Attribute Description** Ph_cn is also called DSL group member. For efficient memory utilization, ph_cn should be assigned sequentially. The Protocol Handler channel number that an X.25 access on a T1 (XAT) port is assigned is determined by the PH channel number entered on the (T1 packet switching channel assignment) view. If the port is an X.75 or X.75' trunk and the PH is of type PH2 then ph_cn must be 0. If the port is an X.75 or X.75' trunk and the PH is of type PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.

HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4

Copyright © 1999 Lucent Technologies 

and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute: party**

**Fullname:** DSL D channel multipoint.

**Attribute Description** Specific packet user within an ISDN DSL D-channel. There can be up to 8 packet user Service Order Profiles (SOPs) defined on an ISDN DSL D-channel. This attribute is not used by X.25 access on a T1 (XAT) port.

**Attribute: mappvc[*]**

**Fullname:** PVC bit map.

**Attribute Description** The four attributes, mappvc1 thru mappvc4 are the 16 byte PVC bit map. Each four byte attribute is made up of 32 bits, one bit used to represent each logical channel number (LCN), 0-31, that are designated for PVC usage. A bit set to 1 indicates that channel is assigned to a PVC, zero means not assigned. For each bit on the map that is set to 1, there must be a tuple in RLpspvcinf. local_lcn in RLpspvcinf indicates assigned PVC. For example, the content of mappvc described as 000.....1010 indicates that logical channel number 1 and 3 have PVC's assigned. The highest bit assigned must be less than or equal to the value of pvc_h_lcn in RLpsx25ln/RLpsx75trk.

```
mappvc1   First 4 bytes of PVC map.
mappvc2   Second 4 bytes of the PVC map.
mappvc3   Third 4 bytes of the PVC map.
mappvc4   Last 4 bytes of the PVC map.
127     96 95     64 63     32 31      0  <-- logical channel no.
```

## 4. Population Rules for RLpsmhgdnr

**Relation Description**
This relation is used for calling address (that is, directory number) verification.

When the calling address is specified in a call setup packet for origination, packet switching routing must verify its validity. First, the calling address is checked against rlPSX25LN.dd_number of the DSL. If it matches, the verification is completed: otherwise, if the calling address is not one of the group directory numbers of a packet switching MLHG group, then it is checked against the group's listed linear entry point DN. If no match is found in this relation, then RLpsgp_ldn will be read to retrieve the member's linear entry point DN.

This relation contains the range of PSUCD directory numbers that are used for a packet multi-line hunt group. The linear entry point DN assigned to member 1 of the packet MLHG is also considered the linear listed DN for the group and will be stored in this relation.

**Attribute: grpnum**

**Fullname:** Group number

**Attribute Description** Group number of modem pool group or normal ps multiline hunt group. The group number of the MHG group is determined from rlPSPRT_GP.grpnum of the tuple in the PSPRT_GP relation such that rlPSX25LN.ph_number = rlPSPRT_GP.ph_number, rlPSX25LN.ph_cn = rlPSPRT_GP.ph_cn. Thereafter, a tuple in PSMHGDNR relation such that rlPSMHGDNR.grpnum = rlPSPRT_GP.grpnum is retrieved. The calling address is valid if and only if rlPSMHGDNR.from_dn <= calling address <= rlPSMHGDNR.to_dn

Copyright © 1999 Lucent Technologies 

```
If rlRT_MHG.htype = RTH_PSUCD or RTH_PSLGUCD, there must be a tuple
in the PSMHGDNR relation such that rlPSMHGDNR.grpnum = rlRT_MHG.grpnum.
```

**Attribute: from_dn**

**Fullname:** from directory number

**Attribute Description** Starting group directory number of the group. It is a structure with 2 members, NOC and digits.

**Attribute: from_dn.noc**

**Fullname:** Normalized office code

**Attribute Description** Normalized office code. No default value.

**Attribute: from_dn.digits**

**Fullname:** digits

**Attribute Description** Four digit local number, excluding * and #. No default value.

**Attribute: to_dn**

**Fullname:** to directory number

**Attribute Description** Ending group directory number of the group. It is a structure with 2 members, NOC and digits.

**Attribute: to_dn.noc**

**Fullname:** Normalized office code

**Attribute Description** Normalized office code. No default value.

**Attribute: to_dn.digits**

**Fullname:** digits

**Attribute Description** Four digit local number, excluding * and #. No default value.

**Attribute: ln_dn**

**Fullname:** Linear listed DN

**Attribute Description** The linear group DN is the linear entry point DN that is assigned to member 1 of the packet MLHG.

A linear entry point DN is assigned to a packet MLHG and member number. When a linear entry point DN is called it is used to map into the member for which hunting for an idle member should start.

The ln_dn attribute must be assigned to member 1 which is located in RLpsldn_gp on the packet routing SM determined by RLrtdnmod.

**Attribute: ln_dn.noc**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Normalized office code

**Attribute Description** This is the normalized office code for the packet MLHG's linear entry point DN.

**Attribute: ln_dn.digits**

**Fullname:** Directory digits

**Attribute Description** This is the local directory number minus the office code for the packet MLHG's linear entry point DN.

## 4. Population Rules for RLpsprt_gp

**Relation Description**
Packet Switching Port to Group number.

This relation contains information used to map a packet switching port name to a packet switching multi-line hunt group (MLHG) or trunk group (TG) and member number. The provisionable deactive/active status, for hunted calls

Copyright © 1999 Lucent Technologies 

only, is also stored in this relation. If rlRT_TRKG.htype = RTH_PSUCD, there must be tuples with number equal to rl_RT_TRKG.act_size in the PSPRT_GP relation such that rlPSPRT_GP.grpnum = rlRT_TRKG.grpnum. All the groups in the rt_mpg or rtdnmpg relation must be in this relation. Servclass in fc_porttyp relation:

If ptype is TM_LINE, service class of the DSL must be FC_ISDN or TM_XDB.
If ptype is TM_TRK, service class of the trunk group must be PSPKT_TRK or PSX75P_TK in the fc_porttyp relation. The trunk group is of the 2-way T1 facility type.

Line configuration for packet switching:
As of 5E9, all Packet Line MLHG Members must reside on PH3's since they will no longer be supported on PH2 Access Image.

As of 5E10, Packet Line MLHG Members can reside either on PH3's or PH4's.

```
TUPLE SEMANTICS for a Packet Line MLHG Member
---------------------------------------------
grpnum                  Group Number
ptype                   TM_LINE
member                  Member Number
module                  Switching Module Number
ph_number               Protocol Handler Number
ph_cn                   Protocol Handler Channel Number
party                   Party
qkey                    Arbitrary Key (0)
chan_sel                Channel Selection
deactive                Deactivation
```

Trunk group configuration for packet switching:
The following rules apply for internal protocol (IP) trunks:

(1) Service class of the IP trunk group must be PSPKT_TRK in fc_porttyp relation.

(2) There will be a maximum of 16 IP trunk groups for each *5ESS*®-2000 switch.

(3) Each IP trunk group will have a maximum of 32 trunk members.

(4) All IP trunks in a trunk group will terminate on the same SM.

(5) Only one trunk member will terminate on a PH2.

(6) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are IP trunk members.

(7) The trunk group is 2_way.

The following rules apply for X.75' trunks:

(1) There can be 255 X.75' trunk groups (per office) with a maximum of 24 trunk members per group.

(2) There is a limit of 25 X.75' trunk groups on a given SM.

(3) The trunk group is a 2-way T1 facility.

(4) Only one trunk member will terminate on a PH2.

(5) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75' trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk

**Copyright © 1999 Lucent Technologies** 

members are put on a given PH3 or PH4.

(6) The service class of each member in fc_porttyp is PSX75P_TK.

(7) X.75' trunk members can reside on different SMs.

(8) All the trunk members in a X.75' trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group.

The following rules apply for X.75 trunks:

(1) There can be 255 X.75 trunk groups (per office) with a maximum of 24 trunk members each.

(2) There is a limit of 25 X.75 trunk groups on a given SM.

(3) The trunk group is a 2-way T1 facility.

(4) Only one trunk member will terminate on a PH2.

(5) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75 trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk members are put on a given PH3 or PH4.

(6) The service class of each member in fc_porttyp is PSX75_TK.

(7) All the trunk members in a X.75 trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group.

The total combined number of Packet Trunks (IP, X.75, X.75') on any given Loaded SM is 25. This may consist of any number of types following the previous limits for the three types.

```
TUPLE SEMANTICS for a Packet Trunk Member
-----------------------------------------
grpnum                  Group Number
ptype                   TM_TRK
member                  Member Number
module                  Switching Module Number
ph_number               Protocol Handler Number
ph_cn                   Protocol Handler Channel Number
party                   Party
qkey                    Arbitrary Key
chan_sel                Channel Selection (DBNO)
deactive                Deactivation (DBNO)
```

**Attribute: module**

**Fullname:** Switching Module number.

**Attribute Description** Switching Module where the port is located.

**Attribute: ph_number**

**Fullname:** Protocol Handler number.

Copyright © 1999 Lucent Technologies 

**Attribute Description** The Protocol Handler number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH number entered on the (T1 packet switching channel assignment) view. As of 5E9, all Packet Line MLHG Members must reside on PH3's since they will no longer be supported on PH2 Access Image. Starting in 5E10, Packet Line MLHG Members are also supported on PH4's.

**Attribute: ph_cn**

**Fullname:** Protocol Handler Channel number.

**Attribute Description** The Protocol Handler channel number that a X.25 access on a T1 (XAT) port is assigned is determined by the PH channel number entered on the (T1 PACKET SWITCHING CHANNEL ASSIGNMENT) view. If the port is an IP, X.75 or X.75' trunk and the PH is of type PH2 then the ph_cn must be 0 If the port is an IP, X.75 or X.75' trunk and the PH is of type PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.
HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute: party**

**Fullname:** Party.

**Attribute Description** The specific packet user within an ISDN DSL D-channel. There can be up to 8 packet user service order profiles (SOP)s defined. The following symbolic use of numeric party value is defined:

```
FCP_INDI        0       individual lines
FCP_TRUNK       0       trunks
FCP_BCHAN       0       B-channel packet-switching
FCP_DFLTSRV     0       Default Service
FCP_PKTTRK      0       Packet trunks
FCTP_RNG        1       ring side of two party line
FCTP_TIP        2       tip side of two party line
```

Permanent packet B-channels (PPB) are populated with FCP_BCHAN. Packet trunks are populated with FCP_PKTRK. This attribute is not used by X.25 access on a T1 (XAT) port, populate with FCP_INDI for XAT ports.

**Attribute: tsi_link**

**Fullname:** Time slot interchanger (TSI) link associated with the port

**Attribute Description** This attribute is the TSI link associated with the port. It is used to support fast port inhibit. This attribute is only used for trunks assigned to the following trunk units: SMDNU_S SMDLTU2

**Attribute: vpidb**

**Fullname:** Virtual Peripheral Interface Data Bus

**Attribute Description** This attribute identifies the channel on a peripheral control and timing (PCT) link associated with the port. This attribute identifies the PIDB on a DX. The PIDB is associated with a digital line trunk unit-2 (DLTU2) facility. This attribute is only used for facilities assigned to

Copyright © 1999 Lucent Technologies 

the following trunk units: SMDNU_S SMDLTU2

**Attribute: grpnum**

**Fullname:** Group Number.

**Attribute Description** Group number of a packet trunk group, modem pool group or packet MLHG. For an X.75 trunk group, all trunk group member entries in RLfc_porttyp must have servclass=PSX75_TK. There can be 255 X.75 trunk groups per office and there may be 25 X.75 trunk groups per SM with a maximum of 24 trunk members per trunk group; however, all the trunk members in a X.75 trunk group can only be split among non-remoted SMs and cannot be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group. For an X.75' trunk group, all trunk group member entries in RLfc_porttyp must have servclass=PSX75P_TK. There can be 255 X.75' trunk groups per office and there may be 25 X.75' trunk groups per SM with a maximum of 24 trunk members per trunk group; however, all the trunk members in a X.75' trunk group can only be split among non-remoted SMs and cannot be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group. For an IP trunk group, all trunk group member entries in RLfc_porttyp must have servclass=PSPKT_TRK. Packet trunk groups may have up to 25 tuples consisting of up to 16 IP trunk groups, up to 25 X.75' trunk group or up to 25 X.75 trunk groups. This is enforced by both RC/V and ODA.

**Attribute: grptype**

**Fullname:** Group Type.

**Attribute Description** Indicates whether this group member supports trunk or line types of service. For X.25 access on a T1 (XAT) ports, populate this attribute with TM_LINE.

**Attribute: member**

**Fullname:** Member number.

**Attribute Description** Group member number.

**Attribute: qkey**

**Fullname:** Arbitrary Key.

**Attribute Description** Zero or an arbitrary number starting with 1. If ptype is TM_LINE, set qkey equal to 0, else set qkey equal to the index value from RLqkeyport. For X.25 access on a T1 (XAT) ports, the attribute ptype will be TM_LINE. Therefore, populate qkey with 0 for XAT ports.

**Attribute: htgmod**

**Fullname:** Hunting Module for a MLHG.

**Attribute Description** Switching module which is designated the hunting module for a packet switching MLHG.

**Attribute: gblgrp**

**Fullname:** Global Group.

**Attribute Description** Indicator as to whether the packet switching MLHG is a Global or Local

Copyright © 1999 Lucent Technologies 

group. DBYES indicates a Global group. DBNO indicates a Local group.

**Attribute: chan_sel**

**Fullname:** Channel Selection

**Attribute Description** Specifies whether channel selection applies. Channel selection means that there are two or more channels with X.25 packet services that together make up one packet MLHG member. There is no longer a one to one mapping between RLpsprt_gp and RLpsgp_prt. When channel selection applies there will only be one port in RLpsgp_prt associated with this group and member. That port will be the same as the first assigned channel in RLcdnchan.

**Attribute: deactive**

**Fullname:** Deactive/Active Packet MLHG Indicator

**Attribute Description** Indicates the deactive/active hunt status of a packet MLHG member. If DBYES, then the member will be marked busy for hunted calls. This means that a deactivated packet MLHG member will always be considered busy for calls made to the group PSUCD DN or a linear entry point DN. The deactivation/activation status has no effect on non-hunted calls, which are calls made to a MLHG member using its individual DN. Deactivation only applies for a packet MLHG member with a port type of TM_LINE. Deactivation is not valid for a packet modem pool MLHG member. This check is done in RLpsgp_prt. When deactivation is yes, then the status for the member in RLrt_mem or RLrt_lgmem must equal 0. This check is done in RLpsgp_prt. Deactivation in this relation must be the same as deactivation in RLpsgp_prt. If channel selection equals DBYES, then deactivation must be same for all the associated channels in RLpsprt_gp. These checks are done in RLpsgp_prt.

## 4. Population Rules for RLpspsn_ri

**Relation Description**
The relation RLpspsn_ri associates a destination packet switch number with a route index.

This relation is used to route a packet switch call to a trunk at a tandem switch.

**Attribute: psn**

**Fullname:** Packet Switch Number

**Attribute Description** The destination packet switch is a switch that resides in the same IP

Copyright © 1999 Lucent Technologies

subnetwork as this switch. An IP subnetwork is a set of switches connected by IP trunk groups. The destination packet switch provides the IP subnetwork interface with either the customer termination or with another packet switching network (via a gateway trunk group).

**Attribute: route_x**

**Fullname:** Route Index

**Attribute Description** RLpspsn_ri.route_x is used by tandem packet switch routing to determine the outgoing IP trunk group associated with a destination PSN. RLpspsn_ri.route_x provides the key for a tuple in RLrt_routing. RLrt_routing.portgrp.grpum identifies the outgoing IP trunk group number.

Copyright © 1999 Lucent Technologies 

# PSPVCINF

## 1. Description

This relation defines permanent virtual circuit data. pspvcinf is populated for PH, channel number, and party used for both DSL and X.75/X.75' trunk PVCs. psx25ln (for DSLs) or psx75trk (for X.75/X.75' trunks) as well as psmappvc relations must be populated before pspvcinf relation.

## 2. Data Dictionary Values

## 4. Population rules for RLpspvcinf

### Relation Description

Packet Switching Permanent Virtual Circuit information.

This relation defines Permanent Virtual Circuit (PVC) information. RLpspvcinf is populated for Protocol Handler channels which are

Copyright © 1999 Lucent Technologies 

defined as either a PPB DSL, or a XAT, X.75' or X.75 trunk member port and make use of PVC's. PVCs may exist on single and multi-point DSL D channels; however, the multipoint DSL D channel user must be a 'First Initializing Terminal (FIT)'.

PVC's cannot be assigned to On-Demand B (ODB) DSL ports or to IP Trunk channels.

"As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. All X.25 Packet Switching will only be supported by PH3's.

This relation defines permanent virtual circuit data. On-Demand B-Channel Packet Switching (ODB) will not have a tuple in this relation because PVCs are not allowed on B-Channels used for ODB.

A PVC may be assigned to a packet switching channel of a DSL, an XAT port or an X.75 / X.75' trunk member. RLpsx25ln (for DSLs and XAT ports) or RLpsx75trk (for X.75 / X.75' trunk members) as well as RLpsmappvc relations must be populated before the RLpspvcinf relation. A tuple is populated when a PVC is assigned to a packet switching channel of a DSL, an XAT port or X.75 / X.75' trunk member.

A PVC may not exist between two X.75 trunk members or between a X.75 to X.75' connection.

Beginning with the 5E8 software release the ability to provide alternate routing for X.75 and X.75' trunk groups was allowed. The 5E8 software release has also introduced the ability to provide X.75' tandem trunks thru the 5ESS(R)-2000 switch and the ability to directly connect ISDN Switches via X.75' trunk groups. Refer to the fcltype, remote_lcn, psn and lnkid_g1p attributes for more information.
WARNING: X.75 and X.75' trunks with PVCs and alternate routing must be provisioned very carefully. PVCs will NOT alternate route on these trunks.

Beginning with the 5E14 software release a new fcltype of PNINET (Internet Protocol Interface) was added. If the interface for PNINET is an X.75/X.75' trunk then it will be supported only on a PH3 or PH4.

NOTE: general checks about (PSX25,PSX75) are located at the general (RULE about RLpspvcinf:)"

**Attribute:**
ph_number
**Fullname:**
Protocol Handler number.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

Also called DSL group number.

For efficient memory utilization, the PH number should be assigned sequentially.

The Protocol Handler number that a X.25 access on a T1 (XAT) port, a Packet DSL port or a X.75 / X.75' trunk member port is assigned is determined by the PH number entered via RCV/ODA.

As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. All X.25 Packet Switching will only be supported by PH3's.

**Attribute:**

ph_cn

**Fullname:**

Protocol Handler channel number.

**Attribute Description:**

PH channel number (key2), also called DSL group member. The range is from 0 to 127. For efficient memory utilization, the PH channel number should be assigned sequentially.

For a given ph_number and ph_cn, there must be a matching tuple in dslequip and equipdsl relations such that ph_number = rlDSLEQUIP.dsl_group = rlEQUIPDSL.dsl_group, ph_cn = rlDSLEQUIP.member = rlEQUIPDSL.member

The Protocol Handler channel number that a X.25 access on a T1 (XAT) port, a packet DSL port or a X.75 / X.75' trunk member port is assigned is determined by the PH channel number entered via RCV/ODA.

If the port is an X.75 or X.75' trunk and the PH is of type PH2 then the ph_cn must be 0.

If the port is an X.75 or X.75' trunk and the PH is of type PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.
HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute:**

party

**Fullname:**

DSL D channel multipoint.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

specific packet user (key3) within an ISDN DSL D-channel. There can be up to 8 packet user Service Order Profiles (SOPs) defined.

Permanent Packet B-channels (PPB) are populated with FCP_BCHAN (0). Packet trunks (X.75 / X.75') are populated with FCP_PKTTRK (0). If the party != 0, then for a given ph_number, ph_cn, and party, there must be a matching tuple in psx25ln relation.

This attribute is not used by X.25 access on a T1 (XAT) port, populate with FCP_INDI (0) for XAT ports.

**Attribute:**

local_lcn

**Fullname:**

Permanent Virtual Circuit local Logical Channel Number.

**Attribute Description:**

The local_lcn is the Logical Channel Number (LCN) of the PVC from an X.25 to X.25 PVC link, an X.25 to X.75 PVC link, an X.25 to X.75' PVC link or an X.75' to X.75' PVC link. The local_lcn is the LCN of the 'near end' side of the link and is provisioned as the 'far or remote' end on the other side of the PVC link. Each side of the PVC link must provision a local_lcn and remote_lcn value (these values are the inverse of each other for 'near end' and 'far end' provisioning.

The values for local_lcn are in the range 1 - 127.

For X.25 access on a T1 (XAT) ports and X.25 DTE packet users populate with the port / user PVC LCN (near end).

For X.75 / X.75' trunk PVCs, this is the LCN of the X.75 / X.75' trunk PVC (near end).

**Attribute:**

send_pktsz

**Fullname:**

Packet size for sending.

**Attribute Description:**

Packet size for sending, either in PKTSZ128 or in PKTSZ256 enumeration type.

For X.25 access on a T1 (XAT) ports, packet DSL ports or X.75 / X.75' trunk members populate with outgoing (send) packet size entered via RCV/ODA.

For fcltype of PNINET the recommended send packet size is 256.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
send_wndwsz
**Fullname:**
Window size for sending.
**Attribute Description:**
Packet Level 3 Window size for sending direction.

For X.25 access on a T1(XAT) ports, packet DSL ports or X.75/X.75' trunk member ports populate with outgoing(snd) window size entered via RCV/ODA. The allowed values for the window size are 1-7. The value of null is not allowed.

For an fcltype of PNINET the recommended send window size is 7.

**Attribute:**
rcv_pktsz
**Fullname:**
Packet size for receiving.
**Attribute Description:**
Packet size for receiving, in PKTSZ128 or in PKTSZ256.

For X.25 access on a T1 (XAT) ports, packet DSL ports or X.75 / X.75' trunk member ports populate with incoming (receive) packet size entered via RCV/ODA.

For an fcltype of PNINET the recommended receive packet size is 256.

**Attribute:**
rcv_wndwsz
**Fullname:**
Window size for receiving.
**Attribute Description:**
Packet Level 3 Window size for receiving direction.

For X.25 access on a T1(XAT) ports, packet DSL ports or X.75/X.75' trunk member ports populate with incoming(rcv) window size entered via RCV/ODA. The allowed values for the window size are 1-7. The value of null is not allowed.

For an fcltype of PNINET the recommended receive window size is 7.

**Attribute:**
remote_lcn
**Fullname:**
Remote Logical Channel Number.
**Attribute Description:**
This attribute populates the remote logical channel number for a Permanent Virtual Circuit (PVC) link from an X.25 to

**Copyright © 1999 Lucent Technologies** 

X.25 PVC link, an X.25 to X.75 PVC link, an X.25 to X.75' PVC link or an X.75' to X.75' PVC link. The remote_lcn is the LCN of the 'far end' side of the link and is provisioned as the 'near' end on the other side of the PVC link. Each side of the PVC link must provision a remote_lcn and local_lcn value (these values are the inverse of each other for 'far end' and 'near end' provisioning.

The values 1 to 4095 will be populated to accommodate other public packet switching networks; however, for the remote_lcn of a DTE on the 5ESS(R)-2000 switch, the values 1 to 127 will be populated for a B channel and 1 to 15 for a D channel.

For X.25 access on a T1 (XAT) ports and X.25 DTE packet users populate with the remote PVC (X.75 or X.75') LCN (far end). The fcltype attribute could be PSX25, PSX75 or PSX75P.

For X.75 trunk PVCs, this is the LCN of the X.25 DTE PVC LCN (far end access port). The fcltype must always equal PSX25 for X.75 trunk PVCs.

For X.75' trunk PVCs, this is either the LCN of the X.25 DTE PVC LCN or of the tandem X.75' trunk PVC LCN (far end access port). In this case the fcltype attribute will either equal PSX25 or PSX75P respectfully.

Otherwise, remote_lcn is the lcn of the gateway link (1PSS). See attributes rmt_dnic and lnkid_g1p.

For X.75/X.75' trunk PVCs with fcltype of PNINET, the remote_lcn is blocked since a remote dn does not exist. The remote_lcn for the PVC will be internally generated.

**Attribute:**

rmt_dn

**Fullname:**

Remote Directory Number.

**Attribute Description:**

Directory number of the other end of the PVC.
The rmt_dn is a structure of two decimal members: digcnt (digit count) and dn. The digcnt ranges between numerals 0 and 10 and the dn ranges from 0 to 10 digits.

If RLpspvcinf.fcltype (remote end facility type) is PSX25, PSX75, PSX75P or PNINET, rmt_dn may or may not be specified using the following criteria:

- If the RLpspvcinf.fcltype is PSX25 and the PVC is also PSX25 then the rmt_dn must be specified.

- If the RLpspvcinf.fcltype is PSX25 and the PVC is PSX75 then the rmt_dn must be specified.

**Copyright © 1999 Lucent Technologies** 

If the RLpspvcinf.fcltype is PSX25 and the PVC is PSX75P
then the rmt_dn must be specified.

If the RLpspvcinf.fcltype is PSX75P and the PVC is PSX25
then the rmt_dn must be specified.

If the RLpspvcinf.fcltype is PSX75P and the PVC is PSX75P
then the rmt_dn must NOT be specified.

If the RLpspvcinf.fcltype is PSX75 and the PVC is PSX25
then the rmt_dn must NOT be specified.

If the RLpspvcinf.fcltype is PNINET and the PVC is PSX25
then the rmt_dn must NOT be specified.

If the RLpspvcinf.fcltype is PNINET and the PVC is PSX75
then the rmt_dn must NOT be specified.

If the RLpspvcinf.fcltype is PNINET and the PVC is PSX75P
then the rmt_dn must NOT be specified.

PSX25 uses the rmt_dn to determine the route to the destination
and to generate billing records.

For fcltyp of PSX25 the dn member of rmt_dn must have
10 digits in the form of: npa (3 digits) + office code
(3 digits) + station number ( 4 digits).

For X.75 / X.75' trunk PVCs rmt_dn should be populated with
the access port address (directory number).

A PSX75 fcltype or a PSX75P to PSX75P tandem PVC does not use
this field since the packet switching gateway takes care of both
routing to the destination and generating billing records.
Therefore, the digit count of rmt_dn must be set to 0, and the
digits must be set to a null string.

Although the rmt_dn is not used locally for routing a
PVC if the fcltype == PSX75P or PSX75 the rmt_dn must be
populated for billing purposes on the other end of the
PVC. It must have a variable lenth to accommodate the
dialing plans  outside of this network. In this case,
the lenth of the dn member of rmt_dn can vary from 1
to 10 digits.

**Attribute:**

rmt_dn.digcnt

**Fullname:**

Count of digits.

**Attribute Description:**

For XAT ports which have fcltyp of PSX25, the digcnt

Copyright © 1999 Lucent Technologies 

member of rmt_dn will always be equal to 10 digits.

**Attribute:**
rmt_dn.dn
**Fullname:**
Directory Number.
**Attribute Description:**
Directory number of the other end of the PVC.
For XAT ports which have fcltyp of PSX25, the dn member of rmt_dn must have 10 digits in the form of: npa (3 digits) + office code (3 digits) + station number ( 4 digits).

**Attribute:**
call_indc
**Fullname:**
Calling or called indicator.
**Attribute Description:**
Calling or called indicator (PSCALLING or PSCALLED), a value must be specified, there is no default.
If this end of the PVC has a call_indc == PSCALLING, then the call_indc of the other end of the PVC must equal PSCALLED. Similarly, if this end of the of the PVC has a call_indc == PSCALLED then the call_indc of the other end rmt_dn must == PSCALLING.
This attribute must be populated as previously outlined for XAT ports packet DSL ports and X.75 / X.75' trunk member ports.

**Attribute:**
billable
**Fullname:**
Billable or nonbillable indicator.
**Attribute Description:**
billable (DBYES) or nonbillable (DBNO) indicator.
(if tuple is for X.75' trunk PVC billable=DBNO, otherwise, default is DBYES)

For X.75 trunk tuples, if billable equals DBYES, this indicates that the far end of the PVC (remote STE) is the billable user; billable equals DBNO indicates that the local end is the billable user.

**Attribute:**
fcltype
**Fullname:**
Destination Facility Type.
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

Destination PVC Facility Type (PSX25/PSX75/PSX75P/PNINET). If the destination facility type is PSX75 or PSX75P and the tuple is for an X.25 DTE user or X.25 access on a T1 port then rmt_dnic and lnkid_g1p must be nonzero.

For an X.25 DTE user or X.25 access on a T1 (XAT) port populate this attribute with PSX25, PSX75 or PSX75P.

For an X.75 trunk member port PVC populate this attribute with PSX25.

For an X.75' trunk member port PVC populate this attribute with either PSX25 or PSX75P. If the value entered is PSX75P then the remote_lcn, lnkid_g1p and psn attributes must be non-zero.

Value must be specified, no default.

**Attribute:**
rmt_dnic
**Fullname:**
Remote Data Network Identification Code.
**Attribute Description:**
data network identification code of the network to which the gateways X.75 and X.75' links.

Range for remote dnic is 0001-9999 when entered by operating company personnel. Hex digits A through F are not allowed. If nothing is entered, the field should be populated with 0000.

If and only if fcltype is PSX25 or PNINET, rmt_dnic is not to be populated by operating company--the value must be 0000. Although the rmt_dnic is not used for routing, if the fcltype of the PVC is PSX75P or PSX75 the rmt_dnic may be required at the other end of the PVC for billing purposes.

**Attribute:**
lnkid_g1p
**Fullname:**
Gateway Link Identification.
**Attribute Description:**
Gateway Link ID is the link_id associated with the remote end of the PVC when the PVC terminates on an X.75 or X.75' packet trunk.

PVCs between X.75' and X.75 trunk groups are NOT permitted. PVCs between X.75' and X.75' trunk groups are permitted (X.75' tandem trunks).

The attribute must equal 0 if the fcltype is PSX25 or PNINET.

**Copyright © 1999 Lucent Technologies** 

The valid range is from 0 to 255.

**Attribute:**
psn
**Fullname:**
Packet Switch Number.
**Attribute Description:**
The destination packet switch is a switch that resides in the same IP subnetwork as this switch. An IP subnetwork is a set of switches connected by IP trunk groups.

If the RLpspvcinf.fcltype is PSX75 or PSX75P, then the RLpspvcinf.psn identifies the destination packet switch that provides the IP subnetwork interface with another packet switching network (via a gateway trunk group).

In the 5e8 software release the ability to directly connect X.75' trunk groups from the 5ESS(R)-2000 switch to another ISDN Switch was introduced (if the other switch is a 5ESS(R)-2000 switch it must be operating on the 5e8 or later software release and if the other switch is another vendors switch it must be compliant with Telcordia Technologies TR-301, Issue 2). In this application the fcltype will be PSX75 or PSX75P and the psn may or may not be the psn number for this switch (if the psn equals Glpsn then this is a tandem from this 5ESS(R)-2000 switch and IP trunks are not used; however, if the psn is not equal to Glpsn then this is a tandem to another 5ESS(R)-2000 switch in the IP network as previously described.

If RLpspvcinf.fcltype == PSX25 , then RLpspvcinf.psn = 0.

If RLpspvcinf.fcltype == PNINET, then RLpspvcinf.psn = 0.

If RLpspvcinf.psn != Glpsn && RLpspvcinf.psn != 0, then a tuple must exist in RLpspsn_ri such that RLpspsn_ri.psn == RLpspvcinf.psn.

PVCs between X.75' and X.75 trunk groups are NOT permitted.

**Attribute:**
intra_grp
**Fullname:**
Packet switching data business group service.
**Attribute Description:**
Used by packet switching data business group service feature. This feature provides a means of setting up and administering packet switched data business groups, for the purpose of distinguishing between intra-group and other (non intra-group) PVCs on AMA (billing) records.

Copyright © 1999 Lucent Technologies 

If the pvc is to be considered intra-group for billing purposes, then populate with DBYES.
If the pvc is to be considered otherwise for billing purposes, then populate with DBNO.

If billable = DBNO, then intra_grp should be DBNO.
If intra_grp = DBYES, then each X.25/XAT user should be members of the same packet switch business group.

Attribute is not to be used by X.75 / X.75' trunk member ports.

**Attribute:**
in_thrupt
**Fullname:**
Incoming throughput class.
**Attribute Description:**
access port incoming throughput class
(used for X.75 / X.75' tuples only)

This attribute is not used by X.25 access on a T1 (XAT) port or packet DSL ports. Populate with PSTHNULL for XAT and packet DSL ports.

**Attribute:**
out_thrupt
**Fullname:**
Outgoing throughput class.
**Attribute Description:**
access port outgoing throughput class
(used for X.75 / X.75' tuples only)

This attribute is not used by X.25 access on a T1 (XAT) ports or packet DSL ports. Populate with PSTHNULL for XAT and packet DSL ports.

**Attribute:**
pvc_id_num
**Fullname:**
PVC Identification number.
**Attribute Description:**
This attribute contains a number assigned to an X.75 PVC to be used for AMA internetwork billing records.
If the tuple is for a PVC which is not an X.75 PVC, pvc_id_num should be zero.

**Defines:**
"db/DMportindx.h"

## 4. Population Rules for RLpsri_psn

**Relation Description**
Route index to packet switch number

This relation associates a route index with the destination packet switch and the next packet switch within an Internal Protocol (IP) subnetwork.

**Attribute: route_x**

**Fullname:** Route index

**Attribute Description** Route index for IP trunk groups.

**Attribute: psn**

**Fullname:** Destination packet switch number

**Attribute Description** The destination packet switch is a switch that resides in the same IP subnetwork as this switch. An IP subnetwork is a set of switches connected by IP trunk groups. The destination packet switch provides the IP subnetwork interface with either the customer termination or with another packet switching network (via a gateway trunk group).

**Attribute: npsn**

**Fullname:** Next packet switch number

Copyright © 1999 Lucent Technologies

**Attribute Description** The packet switch identified by npsn is the next switch in the path between the originating switch and the destination switch. The next switch is an adjacent switch that is directly connected to this switch by the Internal Protocol (IP) trunk group identified by RLrt_routing.portgrp.grpnum (where RLrt_routing.route_x == RLpsri_psn.route_x).

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLpstni_id

**Relation Description**
The relation is used to provision a list of up to 20 shared ISDN network identification codes/data network identification codes (INICs/DNICs), hereby referred to as transit network identifiers (TNIs), for the entire switch.

The number of entries in the inic1_dnic - inic20_dnic attributes may vary from 0 to 20. In other words, the list can be empty (0 entries where i_d_count and all 20 inicX_dnic attributes are equal to zero), or the list may contain TNI entries (the i_d_count attribute value will be from 1-20 and shared TNI values will be entered in the inicX_dnic attributes up to the value of i_d_count).

The entries in the inic1_dnic - inic20_dnic attributes must be unique. The relation has no direct coupling with the tni_state attribute in RLpsx75trk. Refer to the RLpsx75trk.tni_state usage section for more information on the use of this relation.

The relation is populated the same on all ISDN SMs to allow static data transport to update the PH global data PSshrddnic whenever one of the 20 TNIs is changed through service provisioning (group partitioned data type is GPDISDN).

**Attribute: ofc_id**

**Fullname:** Office Identification Number

**Attribute Description** This attribute should always be populated with the value 0.

**Attribute: i_d_count**

**Fullname:** Unique TNI Attribute ID Counter

**Attribute Description** This attribute is used to store a count of the number of unique TNI ID values entered in the attributes inic1_dnic through inic20_dnic. If the value equals zero then all 20 of the inicX_dnic attributes must be populated with 0x0000.
When this attribute contains a value K greater than zero then the first K inicX_dnic attributes must contain a value in the range 0x0001 through 0x9999.

**Attribute: inic1_dnic**

Copyright © 1999 Lucent Technologies 

**Fullname:** Shared transit network identifier (TNI) 1

**Attribute Description** Attribute used to store the first transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic2_dnic**

**Fullname:** Shared transit network identifier (TNI) 2

**Attribute Description** Attribute used to store the second transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic3_dnic**

**Fullname:** Shared transit network identifier (TNI) 3

**Attribute Description** Attribute used to store the third transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic4_dnic**

**Fullname:** Shared transit network identifier (TNI) 4

**Attribute Description** Attribute used to store the fourth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic5_dnic**

**Fullname:** Shared transit network identifier (TNI) 5

**Attribute Description** Attribute used to store the fifth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic6_dnic**

**Fullname:** Shared transit network identifier (TNI) 6

**Attribute Description** Attribute used to store the sixth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic7_dnic**

**Fullname:** Shared transit network identifier (TNI) 7

**Attribute Description** Attribute used to store the seventh transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic8_dnic**

Copyright © 1999 Lucent Technologies 

**Fullname:** Shared transit network identifier (TNI) 8

**Attribute Description** Attribute used to store the eighth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic9_dnic**

**Fullname:** Shared transit network identifier (TNI) 9

**Attribute Description** Attribute used to store the ninth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic10_dnic**

**Fullname:** Shared transit network identifier (TNI) 10

**Attribute Description** Attribute used to store the tenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic11_dnic**

**Fullname:** Shared transit network identifier (TNI) 11

**Attribute Description** Attribute used to store the eleventh transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic12_dnic Fullname:** Shared transit network identifier (TNI) 12
**Attribute Description** Attribute used to store the twelfth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic13_dnic**
**Fullname:** Shared transit network identifier (TNI) 13
**Attribute Description** Attribute used to store the thirteenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic14_dnic Fullname:** Shared transit network identifier (TNI) 14
**Attribute Description** Attribute used to store the fourteenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic15_dnic Fullname:** Shared transit network identifier (TNI) 15
**Attribute Description** Attribute used to store the fifteenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic16_dnic Fullname:** Shared transit network identifier (TNI) 16
**Attribute Description** Attribute used to store the sixteenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

Copyright © 1999 Lucent Technologies 

**Attribute: inic17_dnic Fullname:** Shared transit network identifier (TNI) 17

**Attribute Description** Attribute used to store the seventeenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic18_dnic**

**Fullname:** Shared transit network identifier (TNI) 18

**Attribute Description** Attribute used to store the eighteenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic19_dnic Fullname:** Shared transit network identifier (TNI) 19

**Attribute Description** Attribute used to store the nineteenth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

**Attribute: inic20_dnic Fullname:** Shared transit network identifier (TNI) 20

**Attribute Description** Attribute used to store the twentieth transit network identifier in the shared list. This number must be unique among all 20 possible TNI values in the relation. The value 0x0000 represents no TNI entered. Valid TNI values are 0x0001 through 0x9999.

## 4. Population Rules for RLpstrk_l2

**Relation Description**
Level 2 and Loop-back

Testing parameters for Packet Switching trunks (X.75, X.75', IP) and T1 or DS1 facility (XAT) ports. This relation contains parameters used by level 2 and terminal maintenance for X.75', X.75, and internal protocol (IP) trunks, and X.25 packet switching on a T1 or DS1 facility (XAT) ports.

**Attribute: port**

**Fullname:** Port name

**Attribute Description** DLTU or DNU-S port name (channel circuit name) of the X.75' trunk, X.75 trunk, IP trunk, or XAT port.

**Attribute: lapbA**

**Fullname:** A/B link address

**Attribute Description** A/B link address value used by level 2 for a given X.75', X.75, or IP trunk member. This attribute not used by XAT ports. DBYES if link address = A, DBNO if link address = B.

**Attribute: linkid**

**Fullname:** Gateway Link ID

**Attribute Description** Gateway link ID used for X.75'/X.75 PVCs

**Attribute: lapbk**

**Fullname:** LAPB Window Size (k)

**Attribute Description** Number of unacknowledged frames allowed by LAPB level 2 protocol. For X.25 access on a T1 or DS1 (XAT) port, populate with window value entered on the (X.25 packet switching channel assignment) view. Range of values:

```
2 to 7 for IP, X.75, and X.75' trunks
1 to 7 for XAT ports
```

**Attribute: lapbn2**

**Fullname:** LAPB number of retransmissions allowed (n2)

**Attribute Description** Number of retransmissions allowed of a given frame For X.25 access on a T1 or DS1 (XAT) port, populate with N2 value entered on the (X.25 packet switching channel

**Copyright © 1999 Lucent Technologies** 

assignment) view.

**Attribute: lapbt1**

**Fullname:** LAPB time allowed for acknowledgements

**Attribute Description** Time allowed to receive acknowledgement for a given frame (in TENTHS of a SECOND). Even values only are permitted. For X.25 access on a T1 or DS1 (XAT) ports, populate with T1 value entered on the (X.25 packet switching channel assignment) view.

**Attribute: lapbt3**

**Fullname:** LAPB Idle line time

**Attribute Description** Time allowed until next valid (flag) frame is received (IN SECONDS). For X.25 access on a T1 or DS1 (XAT) port, populate with T3 value entered via RC/ODA.

**Attribute: ocu_test**

**Fullname:** OCU loopback testing allowed flag

**Attribute Description** Office channel unit (OCU) digital loopback testing allowed for the X.75' trunk, X.75 trunk, IP trunk, or XAT port. For XAT ports, populate with OCU LOOPBACK value entered via RCV/ODA.

**Attribute: csu_test**

**Fullname:** CSU loopback testing allowed flag

**Attribute Description** Channel service unit (CSU) digital loopback testing allowed for this X.75' trunk, X.75 trunk, IP trunk, or XAT port. For X.25 access on a T1 or DS1 (XAT) port, populate with CSU LOOPBACK value entered via RCV/ODA.

## 4. Population Rules for RLpstrunks

**Relation Description**
Packet switching trunk group information.

This relation provides information about packet switching trunk groups. This relation should be populated only for the packet switching trunks. The htype attribute in the RLrt_trkg tuple is set to RTH_PSUCD for the packet switching trunk group. If the number of trunk members in a trunk group is less than the maximum, then the trunk

members should be populated without leaving any HOLES between any two consecutive trunk members. In other words, all the trunk members should be populated contiguously. The trunk group must be defined in the loaded ISDN SM which has the PSU hardware. The relation also defines how many members are assigned and it further defines the protocol handler (PH) number and the Channel number for each member. An office can have a maximum of 16 internal protocol (IP) trunk groups. Each IP trunk group can have a maximum of 32 trunk members. An IP trunk group cannot be split across the SMs. All the trunk members in an IP trunk group must physically exist on the same SM. An office can have a maximum of 255 X.75' trunk groups. A given SM may have up to 25 X.75' trunk groups with each X.75' trunk group having a maximum of 24 trunk members. X.75' trunk group members may reside on different SMs (for example, there could be 24 SMs each with a single X.75' trunk); however, all the trunk members in a X.75' trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group. An office can have a maximum of 255 X.75 trunk groups. A given SM may have up to 25 X.75 trunk groups with each X.75 trunk group having a maximum of 24 trunk members. Members may reside on different SMs as stated for X.75' previously. The combined number of Packet trunk groups allowed on a given Loaded SM is 25. These groups may consist of any valid combination of Packet trunk groups (IP, X.75' and X.75) as described previously. For example, an SM could have 7 IP, 1 X.75' and 17 X.75 groups or an SM could have 16 IP and 9 X.75, etc. The following rules apply for internal protocol (IP) trunks:

(1) Service class of the IP trunk group must be PSPKT_TRK in fc_porttyp relation.

(2) There will be a maximum of 16 IP trunk groups for each *5ESS*®-2000 switch.

(3) Each IP trunk group will have a maximum of 32 trunk members.

(4) All IP trunks in a trunk group will terminate on the same SM.

(5) Only one trunk member will terminate on a PH2.

(6) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are IP trunk members.

(7) The trunk group is 2_way.

The following rules apply for X.75' trunks:

(1) There can be 255 X.75' trunk groups (per office) with a maximum of 24 trunk members per group.

(2) There is a limit of 25 X.75' trunk groups on a given SM.

(3) The trunk group is a 2-way T1 facility.

(4) Only one trunk member will terminate on a PH2.

(5) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75' trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk members are put on a given PH3 or PH4.

(6) The service class of each member in fc_porttyp is PSX75P_TK.

(7) X.75' trunk members can reside on different SMs.

(8) All the trunk members in a X.75' trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group.

Copyright © 1999 Lucent Technologies 

The following rules apply for X.75 trunks:

(1) There can be 255 X.75 trunk groups (per office) with a maximum of 24 trunk members each.

(2) There is a limit of 25 X.75 trunk groups on a given SM.

(3) The trunk group is 2_way.

(4) Only one trunk member will terminate on a PH2.

(5) From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75 trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk members are put on a given PH3 or PH4.

(6) The service class of each member in fc_porttyp is PSX75_TK.

(7) All the trunk members in a X.75 trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group.

The total combined number of packet trunks (IP, X.75, X.75') on any given Loaded SM is 25. This may consist of any number of types following the previous limits for the three types.

**Attribute: grpnum**

**Fullname:** Trunk group number

**Attribute Description** Packet switching trunk group number. The key for this relation is the same as that of RLrt_trkg. There should be a tuple in this relation only if the htype attribute in the RLrt_trkg tuple is set to RTH_PSUCD. Since X.75/X.75' packet trunk groups are limited to 24 members and IP trunk groups are limited to 32 members, RLrt_trkg.htype must never equal RTH_PSLGUCD.

**Attribute: tkg_type**

**Fullname:** Trunk group type

**Attribute Description** Indicates which type of trunk group this is:

```
tkg_type = X75P for an X.75' trunk group
tkg_type = IP for an IP trunk group
tkg_type = X75 for X.75 trunks.
```

**Attribute: npsn**

**Fullname:** Next packet switch number.

**Attribute Description** Next Packet Switch Number. 'npsn' contains the packet switch number of the packet switch that is connected to the present packet switch by the IP trunk group identified in the key attribute 'grpnum'. The following rules apply:

(1) If RLpstrunks.tkg_type equals IP then RLpstrunks.npsn must_not equal Glpsn and RLpstrunks.npsn and Glpsn must_not equal 0.

(2) If RLpstrunks.tkg_type equals X75 or X75P then RLpstrunks.npsn must_equal 0.

(3) If RLpstrunks.npsn > 0 then exactly one tuple exists in the relation RLpsiptst such that

Copyright © 1999 Lucent Technologies 

RLpsiptst.npsn == RLpstrunks.npsn

**Attribute: size**

**Fullname:** Number of trunks in a trunk group.

**Attribute Description** Total number of trunks assigned to this trunk group that physically reside on the present SM. If there are no trunks assigned to a trunk group, then an RLpstrunks tuple does not exist.

```
The range of values for IP trunk group members is 1 - 32.
The range of values for X.75' trunk group members is 1 - 24.
The range of values for X.75 trunk group members is 1-24.
For IP trunk groups (tkg_type == IP) the following rules apply:
There exists a tuple in RLpsiptst such that:
1. RLpsiptst.npsn == RLpstrunks.npsn and
2. RLpsiptst.size == RLpstrunks.size
There exists a tuple in RLrt_trkg such that:
1. RLrt_trkg.grpnum == RLpstrunks.grpnum
2. RLrt_trkg.act_size == RLpstrunks.size
```

**Attribute: pair[*]**

**Fullname:** Nth Pair of trunk members in the group.

**Attribute Description** This is a structure consisting of two members: member number 1 and member number 2. For X.75 trunk groups, the 'pair' attributes are only populated for those trunk members residing on that SM.

**Attribute: pair[*].assign1**

**Fullname:** Assignment of first member of the pair.

**Attribute Description** Indicates whether the first member of the pair is assigned or not.

**Attribute: pair[*].ph1**

**Fullname:** PH number of the first member in the pair.

**Attribute Description** PH number of the first member in the pair.

**Attribute: pair[*].chan1**

**Fullname:** Channel number of the first member in the pair.

**Attribute Description** Channel number of the first member in the pair. If the port is an IP, X.75 or X.75' trunk and the PH is of type PH2 then the channel number must be 0 If the port is an IP, X.75 or X.75' trunk and the PH is of type PH3 or PH4 then channel number may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.

HARDWARE CONVERSION NOTE:
If the PH3 ior PH4 s to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

Copyright © 1999 Lucent Technologies 

**Attribute: pair[*].assign2**

**Fullname:** Second member in the pair assignment.

**Attribute Description** Indicates whether the second member in the pair is assigned or not.

**Attribute: pair[*].ph2**

**Fullname:** PH number of the second member in the pair.

**Attribute Description** PH number of the second member in the pair.

**Attribute: pair[*].chan2**

**Fullname:** Channel number of the second member in the pair.
If the port is an IP, X.75 or X.75' trunk and the PH is of type PH2 then the channel number must be 0.

If the port is an IP, X.75 or X.75' trunk and the PH is of type PH3 or PH4 then channel number may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.

HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute Description** Channel number of the second member in the pair.

## 4. Population Rules for RLpstsnc_cnt

**Relation Description**
Transit Sub-Network Count

This relation stores the X.75' Trunk Transit Sub-Network Count value (TSNC). The valid values for the count are 0-14. The relation is used instead of a global parameter to allow Static Data Transport to update the PH Global Data PStsnc_cnt whenever the count in this relation changes. The relation is only applicable for X.75' packet trunks. See the attribute usage sections for more information.

**Attribute: ofc_id**

Copyright © 1999 Lucent Technologies

**Fullname:** Office Identification Number

**Attribute Description** The Office ID Number should always be populated with the value 0.

**Attribute: tsnc_cnt**

**Fullname:** Transit Sub-Network Count number

**Attribute Description** This attribute may be populated with any value in the range of 0-14. This is the threshold value of the Transit Sub- Network Count for the entire switch and is used to detect invalid looping among the subnetworks within the LATA. The relation is populated in all ISDN SMs to allow for Static Data Transport to update the PH global data PStsnc_cnt whenever the provisioned value is changed via RC/V view 8.1. The default value is zero.

***NOTE:*** It is the service provider's responsibility to ensure that the same value is provisioned for this attribute / parameter across the subnetwork.

Copyright © 1999 Lucent Technologies

# PSU_TRKG

## 1. Description

This relation provides the mapping from PSU Community Address (CA) to a list of Speech Handler (SH) trunk groups along with its servtype.

## 2. Data Dictionary Values

## 4. Population Rules for RLpsu_trkg

**Relation Description**
Maps PSU Community Address to Speech Handler (SH) and Autoplex Data (ADT) trunk groups.

This relation provides the mapping from the PSU Community Address (CA) to a list of SH or ADT trunk groups along with their service type (speech, data, video, fax). Each tuple in this relation consists of an array of SH and ADT trunks for that PSU community address. This relation is engineered with array size of SH and ADT trunks, equal to 10, due to real time constraint imposed by RTA hunting.

**Attribute: psu_ca**

**Fullname:** PSU Community Address (key)

**Attribute Description** PSU Community Address, and this is used as an index in this relation.

**Attribute: servtype**

**Fullname:** Service Type of Trunk Group (key)

**Attribute Description** Service Tyupe of Trunk Group is used as a key to manage the increase number of service types.

**Attribute: sh_trkg[*].grpnum**

**Fullname:** SH and ADT trunk group

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This contains a SH or ADT trunk group number.

**Attribute: sh_trkg[*].servtype**

**Fullname:** Service type

**Attribute Description** This indicates the service type (voice, data, video, fax) associated with a SH or ADT trunk group.

# PSULNK

## 1. Description

This relation defines a link between near PSU Community Address (CA) and far PSU CA to support point-to-point and ATM network configurations. A link constitutes two channels, and this relation provides the information on the circuit name and channel group for both the channels (active, and standby).

## 2. Data Dictionary Values

### Relation Description

Copyright © 1999 Lucent Technologies

PSU Link Definition Relation

This defines a link between near PSU community address and a far end PSU Community Address to support point-to-point configurations. A link constitutes two channels, and this relation provides the information on the circuit-name and channel group for both the channels (active, and standby).

**Attribute: link**

**Fullname:** Link Number

**Attribute Description** PHA link number. In simplex mode, it will have only one channel, while in duplex mode, a link will have two channels. Key attribute.

**Attribute: nearpsu_ca**

**Fullname:** Near End PSU Community Address

**Attribute Description** PSU community address of the originating PSU. Key attribute.

**Attribute: chgrp0**

**Fullname:** PHA channel Group for channel 0

**Attribute Description** Defines the PHA channel group for the channel 0 of PHA link.

**Attribute: chgrp1**

**Fullname:** PHA channel Group for channel 1.

**Attribute Description** Defines the PHA channel group for the channel 1 of PHA link.

**Attribute: cktname0**

**Fullname:** PHA Circuit Name for channel 0.

**Attribute Description** Defines the PHA Circuit Name for the channel 0 of PHA link.

**Attribute: cktname1**

**Fullname:** PHA Circuit Name for channel 1.

**Attribute Description** Defines the PHA Circuit Name for the channel 1 of PHA link.

**Attribute: farpsu_ca**

**Fullname:** Far end PSU Community Address

**Attribute Description** PSU community address of the destination PSU.

**Attribute: far_type**

**Fullname:** Far end type of a link.

**Attribute Description** This represents the far end of a link. Whether the far end is in this office or another office.

**Attribute: aps_type**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Automatic Protection Switch (APS) type.

**Attribute Description** This represents the automatic protection switch type on a per link basis.

**Attribute: con0_type**

**Fullname:** Connection type of link 0

**Attribute Description** This represents the connection type of PHA link 0.

**Attribute: con1_type**

**Fullname:** Connection type of link 1

**Attribute Description** This represents the connection type of PHA link 1.

**Attribute: sd_thresh**

**Fullname:** Signal Degrade (SD) threshold.

**Attribute Description** This represents the "Signal Degrade" bit-error-rate threshold.

**Attribute: sf_thresh**

**Fullname:** Signal Fail (SF) threshold

**Attribute Description** This represents the "Signal Fail" bit-error-rate threshold.

**Defines:**
"db/DMcircuit.h",
"db/DMfartype.h",
"db/DMapstype.h",
"db/DMsd_thres.h",
"db/DMphnbr.h"

## 4. Population Rules for RLpsusm

**Relation Description**
PSU Community Address to PSU and SM

This maps PSU CA to a switching module (SM) number and a PSU number. This is an inverse relation to RLsmpsu.

**Attribute: psu_ca**

**Fullname:** PSU Community Address.

Copyright © 1999 Lucent Technologies

**Attribute Description** PSU Community Address of a PSU.

**Attribute: psu**

**Fullname:** Peripheral Switching Unit.

**Attribute Description** Peripheral Switching Unit defined in a SM.

**Attribute: sm**

**Fullname:** Switching Module number.

**Attribute Description** Indicates the SM number on which this PSU CA is defined.

## 4. Population rules for RLpsx25ln

### Relation Description

Packet switching X.25 line

This relation defines the X.25 level 3 data for a packet switching (PS) digital subscriber line (DSL) D- or B- channel or an X.25 access on a T1 (XAT) port. This relation must be populated before the RLpspvcinf and RLpsmappvc relations.

Packet switching X.25 line.

**Attribute:**

ph_number

**Fullname:**

Protocol handler (PH) number

**Attribute Description:**

The PH number that a XAT port is assigned. For efficient memory utilization, it should be assigned sequentially.

As of 5E9(1), all X.25 packet will no longer be supported on the PH2 access image. X.25 packet will only be supported on PH3s.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ph_cn
**Fullname:**
Protocol handler channel number
**Attribute Description:**
The PH channel number that a XAT port is assigned.
The range is from 0 to 127.

For efficient memory utilization, it should be
assigned sequentially.

**Attribute:**
party
**Fullname:**
DSL D channel multipoint
**Attribute Description:**
Specific packet user (Key3) within an ISDN DSL D-channel.
There can be up to eight packet user service order profiles
(SOPs) defined. Permanent packet B-channels (PPB) and
on-demand packet B-channels (ODB) are populated with FCP_BCHAN.
This attribute is not used by XAT port, populate with FCP_INDI
for XAT ports.

ODBs do not appear in rlDSLEQUIP or rlEQUIPDSL. For each tuple
in this relation that is populated for a DSL associated with an
individual directory number (DN) (not a group DN) that is not a
common DN, there must be a matching tuple in dslequip, equipdsl,
and pr_dntran relation. For each non-ODB tuple in this relation
that is populated for a DSL associated with an individual DN (not
a group DN) that is a common DN, there must be a matching tuple
in dslequip, equipdsl, and pr_dntran relation; however, the
ph_number, ph_cn, and party attributes are only populated with
one channel of the common DN (see RLpr_dntra.p poprules for how
these attributes are populated).

Without Channel Selection
---
rlPSX25LN.ph_number = rlDSLEQUIP.dsl_group
= rlEQUIPDSL.dsl_group = rlPR_DNTRAN.ph_number,
rlPSX25LN.ph_cn = rlDSLEQUIP.member.
= rlEQUIPDSL.member = rlPR_DNTRAN.ph_cn.
rlPSX25LN.dd_number = rlPR_DNTRAN.dn.
With Channel Selection
---
rlPSX25LN.ph_number = rlDSLEQUIP.dsl_group
= rlEQUIPDSL.dsl_group
rlPSX25LN.ph_cn = rlDSLEQUIP.member.
= rlEQUIPDSL.member
rlPSX25LN.dd_number = rlPR_DNTRAN.dn.

Copyright © 1999 Lucent Technologies 

```
        For each tuple in this relation that is populated for a DSL
        associated only with a multi-line hunt group (MLHG) DN (that is,
        the DSL has no individual DN assigned to it) there must be a
        matching tuple in dslequip, equipdsl, and pr_dntran relation
        such that:

        rlPSX25LN.ph_number = rlDSLEQUIP.dsl_group =
                rlDSLEQUIP.dsl_group = rlEQUIPDSL.dsl_group and
                rlPR_DNTRAN.ph_number = 0 (default)
        rlPSX25LN.ph_cn = rlDSLEQUIP.member =
                rlDSLEQUIP.member = rlEQUIPDSL.member and
                rlPR_DNTRAN.ph_cn = 0 (default)
        rlPSX25LN.dd_number = rlPR_DNTRAN.dn.

        For each tuple in this relation that is populated for a DSL
        associated with BOTH an individual AND an MLHG DN, the
        attributes populated are those only associated with the
        corresponding individual DN such that:

        Without Channel Selection
        -------------------------
        PSX25LN.ph_number = rlDSLEQUIP.dsl_group
                = rlEQUIPDSL.dsl_group = rlPR_DNTRAN.ph_number,
        rlPSX25LN.ph_cn = rlDSLEQUIP.member
                = rlEQUIPDSL.member = rlPR_DNTRAN.ph_cn, and
        rlPSX25LN.dd_number = rlPR_DNTRAN.dn.
        With Channel Selection
        ----------------------
        PSX25LN.ph_number = rlDSLEQUIP.dsl_group
                = rlEQUIPDSL.dsl_group
        rlPSX25LN.ph_cn = rlDSLEQUIP.member
                = rlEQUIPDSL.member
        rlPSX25LN.dd_number = rlPR_DNTRAN.dn.

        In this case the dsl_group ph_number, member, ph_cn,
        dd_number, and dn must be those associated with the
        individual DN.
```

**Attribute:**

dd_number

**Fullname:**

Directory number

**Attribute Description:**

```
        Structure of local directory number for packet switching.

        NOC     - Normalized office code, range from 1 to AVNOCMAX().
        digits  - Four digit local number, excluding * and #.

        If mhgflg is DBNO, dd_number is the individual directory
        number.  Else, if mhgflg is DBYES and if pvc_h_lcn greater
        than zero, dd_number must

        be an individual directory number, so that a permanent
```

Copyright © 1999 Lucent Technologies 

virtual circuit (PVC) that belongs to this packet switching port can be setup without being hunted by using the individual directory number.

If mlhg = DBYES and the dd_number is not equal to RLrc_pgrprmk.tn keyed by RLpsprt_gp (Gl_pcrid,ph_number,ph_cn,party).grpnum, the dd_number must be the individual directory number; otherwise, dd_number must be a directory number of the MLHG group the packet switching port belongs to.

When PS DSL line subscribes to receive modem pool access from an analog line, there must be a matching tuple in rtdnmpg and rt_dntran relations such that rlPSX25LN.dd_number = rlRT_DNTRAN.dn = rlRTDNMPG.dsldn.

Also if rlPSX25LN.billdn_flg = DBNO, rlRTDNMPG.billdsldn will be derived from rlPSX25LN.dd_number and RLofficecode relation.

Otherwise, rlPSBILLDN.bill_dn = rlRTDNMPG.billdsldn

**Attribute:**
dd_number.noc
**Fullname:**
Normalized office code
**Attribute Description:**
Normalized office code.

**Attribute:**
dd_number.digits
**Fullname:**
Count of digits
**Attribute Description:**
For XAT ports the digcnt member of dd_number will always be equal to 10 digits.

**Attribute:**
cug_pi_idx
**Fullname:**
Closed user group (CUG) preferential customer index
**Attribute Description:**
The preferential customer CUG index is a two digit HEX code, range from 00 to 99, and FF. Default is FF which means that the customer does not have the preferential CUG.

If the DSL subscribes to CUGs (that is, cug_hindx is not equal to FF), the value of cug_pi_idx depends upon cug_oaflg and cug_iaflg.

**Copyright © 1999 Lucent Technologies** 

If cug_oaflg = DBNO and cug_iaflg = DBNO, cug_pi_idx must be specified, and must not be FF. If the DSL has only one CUG, then that CUG must be the preferential CUG such that:

1. RLpsx25ln.ph_number = RLpscstcug.ph_number, RLpsx25ln.ph_cn = RLpscstcug.ph_cn and RLpsx25ln.party = RLpscstcug.party.

2. RLpsx25ln.cug_pi_idx = RLpsx25ln.cug_hindx = RLpscstcug.cust_cugx.

If cug_oaflg = DBNO and cug_iaflg = DBNO, and the DSL has more than one CUGs, one of the CUGs must be designated as the preferential CUG.

If cug_oaflg = DBYES, or cug_iaflg = DBYES, the DSL can optionally have the preferential CUG. If cug_pi_idx is set to FF, then the DSL does not have the preferential CUG. Otherwise, 00 <= cug_pi_idx <= cug_hindx.

If the DSL does not subscribe to any CUGs (that is, cug_hindx is equal to FF), set the following:

cug_pi_idx = FF, cug_oaflg = DBNO and cug_iaflg = DBNO

**Attribute:**
cug_hindx
**Fullname:**
Closed user group customer highest index
**Attribute Description:**
The highest index to customer CUG index array is a two digit hex code, range from 0 to 99, and FF. Where 0xFF means that the customer does not subscribe any CUGs.

The cughindx is equal to highest rlPSCSTCUG.cust_cugx with the same ph_number and ph_cn.

If cug_hindx is not equal to 0xFF, there must be a tuple with ph_number, ph_cn, and cug_hindx as keys in the pscstcug relation.

Initially, there is no CUG assigned to the DSL; cug_hindx is set to 0xFF. When the first CUG (it is not necessary that rlPSCSTCUG.cust_cugx is equal to one) is assigned, cug_hindx must be set to rlPSCSTCUG.cust_cugx. For the subsequent CUG assignments, if the new rlPSCSTCUG.cust_cugx is greater than the current value of cug_hindx, then cug_hind must set to the new rlPSCSTCUG.cust_cugx. Otherwise, cug_hindx remains the same.

For PS DSL customers who subscribe to a modem pool, access must be assigned to a preferential customer CUG or a regular CUG on the

Copyright © 1999 Lucent Technologies 

RLpscstcug relation. All the PS DSL users who subscribe to a particular modem pool, together with the modem pool terminal adapters (MPTAs) of that modem pool group must be assigned to the same CUG group. All the MPTAs in any CUG groups must be assigned to preferential CUG, that is, the cug_pi_idx is not used in dialing for origination from MPTA. Because of this restriction, an MPTA can only be assigned to one CUG group.

**Attribute:**
cug_oaflg
**Fullname:**
Closed user group outgoing access flag
**Attribute Description:**
CUG outgoing access indicator.

**Attribute:**
cug_iaflg
**Fullname:**
Closed user group incoming access flag
**Attribute Description:**
CUG incoming access indicator.

**Attribute:**
pvc_h_lcn
**Fullname:**
PVC highest logical channel number
**Attribute Description:**
The highest logical channel number (LCN) that can be assigned to a PVC. The lowest LCN for a PVC is always one. The range is from 0 to 127. A zero implies no PVCs. If pvc_h_lcn is greater than zero, a tuple in the RLpsmappvc relation must be populated with all the bits on all the four bitmap attributes set to zero as initial values. If no PVCs all the bits are also set to zero.

For MPTA of packet switch modem call processing (PSMCP), set pvc_h_lcn equal to zero. The value of pvc_h_lcn (as zero or nonzero) impacts the value of the RLspid.fip_req attribute. See the RLspid poprules for further details.

**Attribute:**
l_lcn_in
**Fullname:**
Lowest-one way incoming logical channel number
**Attribute Description:**
The lowest one-way incoming LCN. Range must immediately follow that of PVC such that: pvc_h_lcn + 1 <= l_lcn_in <= h_lcn_in.

For MPTA of PSMCP, set l_lcn_in equal to zero.

Copyright © 1999 Lucent Technologies 

**Attribute:**
h_lcn_in
**Fullname:**
Highest one-way incoming logical channel number
**Attribute Description:**
The highest one-way incoming LCN. Range must immediately follow that of PVC such that: pvc_h_lcn + 1 <= l_lcn_in <= h_lcn_in.

For MPTA of PSMCP, set h_lcn_in equal to zero.

**Attribute:**
l_lcn_2w
**Fullname:**
Lowest two-way logical channel number
**Attribute Description:**
The lowest-two way LCN. Range must immediately follow that of one-way incoming such that: h_lcn_in + 1 <= l_lcn_2w <= h_lcn_2w.

For MPTA of PSMCP, set l_lcn_2w equal to one.
Note: only logical channel 'one' in a D channel is assigned to that DSL line connected to MPTA; this is accomplished by setting l_lcn_2w = 1 and h_lcn_2w =1.

**Attribute:**
h_lcn_2w
**Fullname:**
Highest two-way logical channel number
**Attribute Description:**
The highest-two way LCN. Range must immediately follow that of one-way incoming such that: h_lcn_in + 1 <= l_lcn_2w <= h_lcn_2w.

For MPTA of PSMCP, set h_lcn_2w equal to one.

**Attribute:**
l_lcn_out
**Fullname:**
Lowest one-way outgoing logical channel number
**Attribute Description:**
The lowest-one way outgoing LCN. Range must immediately follow that of two-way LCNs such that: h_lcn_2w + 1 <= l_lcn_out <= h_lcn_out.

**Attribute:**
h_lcn_out
**Fullname:**
Highest one-way outgoing logical channel number
**Attribute Description:**
The highest one-way outgoing LCN. Range must immediately follow that of two-way LCNs such that: h_lcn_2w + 1 <= l_lcn_out <= h_lcn_out.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
mhgflg
**Fullname:**
Multi-line hunt group flag
**Attribute Description:**
Multi-line hunt group indicator. If DBYES and if chan_sel is DBNO, then there must be a matching tuple in psprt_gp, psgp_prt, rt_mhg relations such that: ph_number = rlPSPRT_GP.ph_number = rlPSGP_PRT.ph_number, ph_cn = rlPSPRT_GP.ph_cn = rlPSGP_PRT.ph_cn, rlPSPRT_GP.grpnum = rlPSGP_PRT.grpnum = rlRT_MHG.grpnum, rlPSPRT_GP.member = rlPSGP_PRT.member.

If DBYES and chan_sel is DBYES, then there must be a matching tuple in psprt_gp and rt_mhg relations such that: ph_number = rlPSPRT_GP.ph_number, ph_cn = rlPSPRT_GP.ph_cn

Also, if DBYES and chan_sel is DBNO, then l_lcn_in, h_lcn_in, l_lcn_2w, and h_lcn_2w cannot be all zeros. If mhgflg equals DBYES and chan_sel equals DBYES, then only h_lcn_in and h_lcn_2w for one of the assigned channels must be non-zero. This check is done under the busy_lim attribute. This means that a member of an MLHG must have a valid logical channel range assigned for two-way and/or one-way incoming communication. In this case, the mlhg_cnt attribute of the tuple in the relation RLdslgdata whose dsl_group is the same as this tuple's ph_number must be incremented. If this condition is not satisfied, then the mlhg_cnt attribute in that tuple should not be incremented, with the following exception. For a terminal adaptor of a modem pool group, mhgflg is set to DBYES, but the mlhg_cnt is not incremented.

If a recent change operation modifies this tuple so that the previous condition becomes no longer true, then mlhg_cnt in RLdslgdata should also be decremented as part of the RC operation.

**Attribute:**
flow_cntl
**Fullname:**
Flow control parameter negotiation indicator
**Attribute Description:**
If flow_cntl is DBNO, then send_pktsz and rcv_pktsz must be equal to the lowest value which is PKTSZ128.

**Attribute:**
throughput
**Fullname:**
Throughput class negotiation indicator for a virtual circuit
**Attribute Description:**
Throughput class negotiation indicator (DBYES/DBNO).

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
send_thruputcl

**Attribute Description:**
Fast select acceptance indicator.

**Attribute:**
rvrs_chrg
**Fullname:**
Reverse charge acceptance indicator
**Attribute Description:**
Reverse charge acceptance indicator.

**Attribute:**
oc_barred
**Fullname:**
Outgoing call barred
**Attribute Description:**
If DBYES, outgoing packet call origination is denied. This is done to prevent outgoing virtual calls from being originated from the data terminating equipment (DTE). The restriction is established by service provisioning and applies to all outgoing virtual calls at the DTE/data circuit equipment (DCE) interface. The facility is independent of the logical channel assignments for one-way outgoing or two-way channels.

Any existing data for the logical channel assignments should be left intact when the outgoing-calls-barred facility is set to DBYES, allowing outgoing and two-way LCN assignments to be re-activated by setting the outgoing-calls-barred facility to DBNO.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ic_barred
**Fullname:**
Incoming call barred
**Attribute Description:**
If DBYES, incoming packet call termination is denied. This is done to prevent incoming virtual calls from being presented to the DTE. The restriction is established by service provisioning and applies to all incoming virtual calls at the DTE/DCE interface. The facility is independent of the logical channel assignments for one-way incoming or two-way channels.

Any existing data for the logical channel assignments should be left intact when the incoming-calls-barred facility is set to DBYES, allowing incoming and two-way LCN assignments to be re-activated by setting the incoming-calls-barred facility to DBNO.

**Attribute:**
lport
**Fullname:**
Logical port type associated with this tuple
**Attribute Description:**
The logical port associated with this tuple. The valid values include the full range for ODB and PPD users. For PPB users, this attribute is always set to zero.

Refer to the population rules in RLrc_lphol.P and RLrc_qidx.P for more details on lport assignment.

```
Domain:         DMLPORT
ODB Range:      1 - 8191        (on demand B LPORT)
PPD Range:      1 - 8191        (permanent packet D LPORT)
PPB Range:      0               (permanent packet B LPORT)
Default:        1) not applicable for ODB or PPD.
                2) must be zero for all other applications.
Dependencies:
```

The only check for this tuple will be against the lport contained in RLspid. Refer to the checks sections of RLspid.P for further cross checks.

```
if (RLpsx25ln.lport is_not_equal 0) then
    find exactly 1 tuple in RLlpt_spid
    where ((RLlpt_spid.lport equals RLpsx25ln.lport) and
            (RLlpt_spid.lpt_type equals RLpsx25ln.lpt_type))
    when found
        find exactly 1 tuple in RLspid
        where ( RLspid.uspid   equals RLlpt_spid.uspid)

**Attribute:**
lpt_type
**Fullname:**
Logical port type of this tuple
**Attribute Description:**
The logical port type of this tuple.

**Attribute:**
psbgrp
**Fullname:**
Group number
**Attribute Description:**
Used by packet switching data business group service feature. This feature provides a means of setting up and administering packet switched data business groups, for several purposes.

The primary purpose of packet business group (PBG) was to distinguish between intra-group and non-intra-grp PVC/VC calls on automatic message accounting (AMA) (billing) records. The PBG purpose has been expanded to allow a common means of abbreviated dialing for members of a PBG, abbreviated calling number delivery for intra-PBG calls, and perhaps most important, the ability to provision a simulated facility group (SFG) for the PBG. An SFG can place a limit on the resources consumed by all the members of the PBG. These resource limits (independently provisioned) are aggregate logical channel numbers (LCNs) and throughput class negotiation (TPC). When the limit is exceeded by active calls, future calls may either be blocked or charged at a premium rate.

This attribute contains the packet switching data business group number, or zero if this B or D-channel packet switching customer is not a member of a packet business group.

The members of a PBG can be individual packet users as well as an entire packet MLHG. Each individual packet user has one tuple in RLpsx25ln. Each packet MLHG has one tuple in RLrt_mhg.

The members are put into a packet business group because the operating company wishes to bill the customers in a special way for virtual calls within the group or to administer the SFG.

The directory number associated with the party (originating or terminating) in a virtual call determines whether the packet business group number in RLpsx25ln or in RLrt_mhg is used: If the DN is individual, then RLpsx25ln is used, if the DN is hunted, then the packet business group in RLrt_mhg is used.

All members of a packet switching business group must be on the same 5ESS(R)-2000 switch.

Copyright © 1999 Lucent Technologies 

**Attribute:**
intercept
**Fullname:**
DN intercept flag
**Attribute Description:**
Indicates that the DN associated with this tuple been placed on intercept. Note that the packet switch MLHG group DN cannot be put on intercept (see attribute dd_number section), but an MLHG member or member DN can be intercept.

```
1: when ( RLpsx25ln.intercept == DBYES )
   and there exists a tuple in RLpr_dntran, such that:
        RLpr_dntran.dn = RLpsx25ln.dd_number
        RLpr_dntran.ph_number = RLpsx25ln.ph_number
        RLpr_dntran.ph_cn = RLpsx25ln.ph_cn
        RLpr_dntran.party = RLpsx25ln.party,
   then RLpr_dntran.pstermcl = RTTC_AGING.

2: when ( RLpsx25ln.intercept == DBYES )
   and there exists a tuple in RLpsprt_gp, such that:
        RLpsprt_gp.module = the sm number which owns the
        RLpsx25ln tuple
        RLpsprt_gp.ph_number = RLpsx25ln.ph_number
        RLpsprt_gp.ph_cn = RLpsx25ln.ph_cn
        RLpsprt_gp.party = RLpsx25ln.party,
   then there should exist a RLrt_lgmem or RLrt_mem tuple on
        RLpsprt_gp.htgmod module such that:
        RLrt_lgmem.grpnum = RLpsprt_gp.grpnum or
        RLrt_mem.grpnum = RLpsprt_gp.grpnum.

        case 1: There exists a RLrt_lgmem tuple such that
                RLrt_lgmem.grpnum = RLpsprt_gp.grpnum.
                Then the bit associated to RLpsprt_gp.member
                in the RLrt_lgmem tuple should set to not
                active (not zero).
        case 2: There exists a RLrt_mem tuple such that
                RLrt_mem.grpnum = RLpsprt_gp.grpnum.
                Then the bit associated to RLpsprt_gp.member
                in the RLrt_mem tuple should set to not active
                (not zero).
```

**Attribute:**
iecp_dnic
**Fullname:**
Inter-exchange carrier preselect for data network identification code (DNIC)
**Attribute Description:**
This is the four digit (in binary coded decimal [BCD]) DNIC for inter-exchange carrier preselect, range from 0001 to 9999. Hex

**Copyright © 1999 Lucent Technologies** 

digits 'A' through 'F' are not allowed. There must be a matching tuple in the psdnicri relation such that:
rlPSDNICRI.dnic = iecp_dnic.

**Attribute:**
billdn_flg
**Fullname:**
Billing directory number flag
**Attribute Description:**
Is billing directory number different from dd_number?
If billdn_flg is DBYES, then the billing directory number is different from dd_number and there must be a tuple in the psbilldn relation with ph_number and ph_cn as keys.

**Attribute:**
screen_x
**Fullname:**
Screening index
**Attribute Description:**
Screening index for a packet switching DSL. This index ranges from 1 to 4095. A unique screen_x must be assigned to packet switching DSL channels. There must be a tuple in rt_scrning relation.

There must be a tuple in the rc_lcc relation with the same value of screen_x. To find the tuple of the rc_lcc relation, there must be a tuple in rc_cninf relation such that:

On the switching module (SM) where the DSL resides,
ph_number = rlDSLEQUIP.dsl_group = rlRC_CNINF.ph_number,
ph_cn = rlDSLEQUIP.member = rlRC_CNINF.ph_cn and
rlRC_CNINF.lcc = rlRC_LCC.lcc, and rlRC_CNINF.rax = rlRC_LCC.rax.

Both digtree and screen_x must be independent of the corresponding values used for circuit switched calls.

**Attribute:**
digtree
**Fullname:**
Digit analysis table identifier
**Attribute Description:**
Digit analysis table identifier. There must be a tuple in da_digstrt relation.

There must be a tuple in the rc_lcc relation with the same value of digtree. To find the tuple of the rc_lcc relation, there must be a tuple in rc_cninf relation such that:

On the SM where the DSL resides, ph_number = rlDSLEQUIP.dsl_group = rlRC_CNINF.ph_number, ph_cn = rlDSLEQUIP.member = rlRC_CNINF.ph_cn and rlRC_CNINF.lcc = rlRC_LCC.lcc, and rlRC_CNINF.rax = rlRC_LCC.rax.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ccitt_ver
**Fullname:**
International telegraph and telephone consultative committee (Telecommunication Standardization Sector (ITU-TS) (formerly CCITT)) version
**Attribute Description:**
Specifies the version of ITU-TS protocol (such as 1980, 1984) that is supported for this DTE.

**Attribute:**
call_tn
**Fullname:**
Calling telephone number (TN) in AMA record
**Attribute Description:**
Specifies whether the calling TN received in a call request packet should be used as the billing TN in the AMA record for this DTE.

**Attribute:**
call_id
**Fullname:**
Calling ID enabled
**Attribute Description:**
Specifies whether the calling ID should be allowed to be received from the DTE. If enabled (DBYES), the call ID received in the call request packet should be used as the call ID for the call. If disabled (DBNO), the 5ESS(R)-2000 switch will generate a call ID for the call.

**Attribute:**
dis_scr
**Fullname:**
Disable DN screening
**Attribute Description:**
Specifies whether to disable the screening of the calling TN received in a call request packet for incorrect format. If screening is disabled (DBYES), the calling TN in the call request packet will not be screened. If screening is not disabled (DBNO), the calling TN in the call request packet will be screened normally.

**Attribute:**
pmdr_grp
**Fullname:**
Packet switching message detail recording (MDR) group
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute indicates the MDR group associated with the packet TN of any packet DSL service or T1 (XAT) port. The MDR group must be a valid MDR group defined in RLmdr_gp.p with the pkt_mdr attribute set to DBYES. One thousand MDR groups may be assigned on each loaded SM.

Packet MDR groups may be assigned to any packet DSL service or T1 (XAT) packet service and the packet MDR activation status of each packet service is completely independent of the other packet services of the DSL.

Packet MDR groups may not be assigned to modem pool members. The RLmdr_gp.modem_pool attribute generates a special modem pool MDR record if a packet service the group is assigned to uses a modem pool.

**Attribute:**
pmdr_act
**Fullname:**
Packet switching MDR activation
**Attribute Description:**
This attribute indicates if packet MDR is active for a packet DSL service or T1 (XAT) port. If this attribute is DBYES then a valid MDR group must be populated in the pmdr_grp attribute. This attribute may be set differently for each MDR group assigned to any given DSL packet service.

**Attribute:**
l_chg_prev
**Fullname:**
X.25 DTE local charging prevention
**Attribute Description:**
Specifies whether or not to allow the local charge prevention feature for an X.25 DTE or XAT port. X.25 packet users/XAT ports may NOT subcribe to local charge prevention (LCP) and reverse charging acceptance (RCA) simultaneously since they are mutually exclusive. The following types of tuples in RLpsx25ln may NOT be provisioned with LCP: X.25 users or XAT ports with modem pool members or tuples in RLpsx25ln that are not X.25 users/XAT ports. It is possible for an X.25 user or XAT port to subscribe to LCP and the following types of services: packet MDR, MLHG members with or without an individual DN, trusted DTE, 1980 Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) version DTE, a modem pool access DN user and ACSR features.

**Attribute:**
notif_cls
**Fullname:**
Notification class of service

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

A DSL packet service can subscribe to either no notification (PSNO_NOTIFY) or conditional notification (PSCOND_NOTIFY) for a notification class of service. If a call is routed to a channel with conditional notification when the layer 1 is up on the channel, but layer 2 is down for the channel, then the channel will be notified of the incoming call. The channel is notified by sending Q.931 messages on the D-channel. If the user accepts the call by responding to the Q.931 messages, then the switch will initiate layer 2 setup procedures on the channel and offer the call. Conditional notification only applies to permanent packet D-channels and on-demand B-channels, however a permanent packet B-channel with channel selection may have conditional notification, but it has no meaning.

If DSL packet service has conditional notification, then it cannot have permanent virtual circuits (PVCs) or incoming calls barred. Only on-demand B-channels, permanent packet B-channels, and permanent packet D-channels can have conditional notification. A permanent packet B-channel cannot have conditional notification unless it also has channel selection. If a DSL packet service has conditional notification without channel selection, then it must have a two-way or incoming LCN.

If the channel is on a PH2, then the only allowed value in no notification. An MLHG member may not have conditional notification.

ODA requires that the value for notif_cls be entered. For Recent Change, the notif_cls attribute has a calculated value instead of a default value. If a valid value for notif_cls is not entered, then the calculated value for notif_cls is derived as follows:

If the channel is not a permanent packet D-channel, a permanent packet B-channel, or an on-demand B-channel, then the value for notif_cls is no notification.

For channels not subscribing to channel selection:

If the channel is on a PH2, then the value for notif_cls is no notification.

If the channel has incoming calls barred, no incoming or two-way LCNs, or the h_pvc_lcn attribute is non-zero, then the value for notif_cls is no notification.

If the channel is a member of a packet multi-line hunt group, then the value for notif_cls is no notification.

If the channel is a permanent packet B-channel, then the value for notif_cls is no notification.

If none of the previous cases apply then:

If the channel is a D-channel, then the value for

Copyright © 1999 Lucent Technologies 

notif_cls is conditional notification.

If the channel is a on-demand B-channel and has a t3xx value of zero minutes, then the value for notif_cls is conditional notification.
If the channel is an on-demand B-channel and has a t3xx value that is not equal to zero minutes, then the value for notif_cls is no notification.

If the channel is an on-demand B-channel and has an unknown value for t3xx, then the value for notif_cls is conditional notification.

For channels subscribing to channel selection:

Since the channel subscribes to channel selection, the channel must be on a PH3 or PH4, cannot have incoming calls barred, and can not have a non-zero value for the h_pvc_lcn attribute.

If the channel is a member of a packet multi-line hunt group, then the value for notif_cls is no notification.

If any other channel of the channel selection group has a known value for notif_cls, then the channel's value for notif_cls must match.

If the channel is a permanent packet B-channel and is part of a channel selection group including only permanent packet B-channels, then the value for notif_cls is no notification.

If none of the previous cases apply then:

If the channel is part of a channel selection group that includes a D-channel but does not include an on-demand B-Channel, then the value for notif_cls is conditional notification.

If the channel is part of a channel selection group that includes an on-demand B-channel that has a t3xx value of zero minutes, then the value for notif_cls is conditional notification.

If the channel is part of a channel selection group that includes an on-demand B-channel that has a t3xx value that is not equal to zero minutes, then the value for notif_cls is no notification.

If the channel is part of a channel selection group that includes an on-demand B-channel and has an unknown value for t3xx, then the value for notif_cls is conditional notification.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

chan_sel

**Fullname:**

Active channel selection

**Attribute Description:**

If a DSL packet service has active channel selection, then it shares a common DN with one or two other packet services on the DSL. When a call is terminated to the common DN, an active channel selection algorithm is performed to determine which channel the call should be offered on.

If a channel has active channel selection, then the channel must be included in a tuple of RLcdnchan. Only on-demand B-channels, Permanent packet B-channels, and permanent packet D-channel can subscribe to active channel selection. If an MLHG member subscribes to channel selection, then it must have an individual DN.

**Attribute:**

snd_mct

**Fullname:**

Maximum combined throughput for the sending direction

**Attribute Description:**

This attribute provides a limit on throughput for the sending direction. When the sum of the sending throughput of virtual calls exceeds the maximum combined throughput, the user is considered busy. A value of zero means that no maximum combined throughput limit for the sending direction has been subscribed.

The value for this is provisioned and stored in kilo-bits-per-second. For B-channels, this attribute has a range of 0 and 64 to 128 in increments of 8. For D-channels, this attribute has a range of 0 and 16 to 32 in increments of 2. The default value for this attribute is 0.

Only on-demand B-channels, permanent packet B-channels, permanent packet D-channels, and X.25 access on a T1 channel can have a non-zero value for this attribute. If the channel is on a PH2, then the value of this attribute must be zero.

**Attribute:**

rcv_mct

**Fullname:**

Maximum combined throughput for the receiving direction

**Attribute Description:**

This attribute provides a limit on throughput for the receiving direction. When the sum of the receiving throughput of virtual calls exceeds the maximum combined throughput, the user is considered busy. A value of zero means that no maximum combined throughput limit for the receiving direction has been subscribed.

The value for this is provisioned and stored in kilo-bits-per-second. For B-channels, this attribute has a range of 0 and 64 to 128 in

**Copyright © 1999 Lucent Technologies** 

increments of 8. For D-Channels, this attribute has a range of 0 and 16 to 32 in increments of 2. The default value for this attribute is zero.

Only on-demand B-channels, permanent packet B-channels, permanent packet D-channels, and X.25 access on a T1 channel can have a non-zero value for this attribute. If the channel is on a PH2, then the value of this attribute must be zero.

**Attribute:**
hnt_nfy
**Fullname:**
Hunting notification
**Attribute Description:**
Hunting notification specifies the type of called line address modification (CLAMN) procedures that is subscribed.

The following types of hnt_nfy are valid: PSCLAMN (old), PSNFY_YES (yes), PSNFY_NO (no), and PSNFY_NULL (blank).

Any X.25 service, that is not a packet MLHG member, must have a hnt_nfy value of PSNFY_NULL (blank).

Packet modem pool members can't provision hunting notification, they must have a hnt_nfy value of PSNFY_NULL (blank).

If packet MLHG member has an individual DN, then they can subscribe to a hnt_nfy value of PSNFY_YES, PSNFY_NO, or PSCLAMN, otherwise the only valid values are PSNFY_NO and PSCLAMN.

The hunting notification procedure for an OSPS packet MLHG member must be PSCLAMN.

**Attribute:**
busy_lim
**Fullname:**
Busy limit indicator for packet MLHG members
**Attribute Description:**
This attribute specifies the maximum number of LCNs that are available for hunted packet calls.

When the sum of incoming call LCNs exceeds the busy limit the multi-line hunt group is marked busy for hunted calls.

The busy limit is not a valid parameter for a packet service that is not a member of a packet MLHG. The busy_lim must equal zero.

Copyright © 1999 Lucent Technologies 

The busy_lim value for a packet MLHG member, without channel selection, can be in the range of one to the total of incoming and two-way LCNs.

The busy_lim value for a packet MLHG member, with channel selection, can be in the range of one to the total of incoming and two-way LCNs for all the associated channels found in RLcdnchan since there must be at least one incoming or two-way LCN for the common packet MLHG member.

The busy_lim value for an OSPS packet MLHG member must be equal to the total of incoming and two-way LCNS for the packet service.

**Attribute:**
ddn
**Fullname:**
Default Directory Number
**Attribute Description:**
This attribute indicates if user is an packet DDN user.

**Attribute:**
caseindex
**Fullname:**
Case Index
**Attribute Description:**

## 4. Population Rules for RLpsx75trk

**Relation Description**
This relation defines the X.75/X.75' level 3 data on a trunk member basis.

Important tuple links to tuples in RLpsx75trk are:

```
RLpsx75trk    <---RLpstrunks    via (grpnum)
RLpsx75trk    <---RLpsl3trkg    via (grpnum)
```

Beginning with the 5E8 software release the *5ESS*®-2000 switch may have up to 255 X.75' packet switching trunk groups. This will allow for direct X.75' connection to another ISDN switch (either a *5ESS*®-2000 switch or another vendor's ISDN switch) without tandeming through the PPSN. The multiple X.75' trunk group capability will also allow X.75' to X.75' transit sub-network switching. The tandem trunk groups will require the other switch to either be a *5ESS*®-2000 switch with the 5E8 software release or anther vendors switch that is compliant with Bellcore TR-301, Issue 2. This feature will also allow each *5ESS*®-2000 switch to have multiple X.75' trunk groups to another sub-network (PPSN or ISDN) within the LATA using proper routing tables.

The 5E8 software release also adds the ability for each *5ESS*®-2000 switch to have multiple X.75 trunk groups to an IEC/VAN using proper routing tables.
Note: The user must be aware that with the ability to provision 255 X.75 and 255 X.75' trunk groups, the limit of X.75'/X.75 trunks which can have PVCs provisioned (255) may be easily reached. The 255 PVC limit is a result of the limit on the gateway link ID.

**Attribute: ph_number**

**Fullname:** PH number

**Attribute Description** PH number for X.75/X.75' trunk.

**Copyright © 1999 Lucent Technologies** 

**Attribute: ph_cn**

**Fullname:** PH channel number

**Attribute Description** PH channel number of the given X.75/X.75' trunk.

If the port is an X.75 or X.75' trunk and the PH is of type PH2 then ph_cn must be 0.
If the port is an X.75 or X.75' trunk and the PH is of type PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3 or PH4.

HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute: pvc_h_lcn**

**Fullname:** PVC high logical channel number

**Attribute Description** This attribute contains the highest logical channel number (LCN) assignable to PVCs. A value of 0 implies no PVCs.

**Attribute: l_lcn_in**

**Fullname:** Lowest LCN number assignable to one-way incoming call requests

**Attribute Description** This attribute signifies the lowest logical channel number (LCN) that can be assigned only to call requests INCOMING to the switch from the remote STE on an X.75 or X.75' trunk.

**Attribute: h_lcn_in**

**Fullname:** Highest LCN number assignable to one-way incoming call requests

**Attribute Description** This attribute signifies the highest logical channel number (LCN) that can be assigned only to call requests INCOMING to the switch from the remote STE on an X.75 or X.75' trunk.

**Attribute: l_lcn_out**

**Fullname:** Lowest LCN number assignable to one-way outgoing call requests

**Attribute Description** This attribute signifies the lowest logical channel number (LCN) that can be assigned only to call requests OUTGOING from the switch to the remote STE on an X.75 or X.75' trunk.

**Attribute: h_lcn_out**

**Fullname:** Highest LCN number assignable to one-way outgoing call requests

**Attribute Description** This attribute signifies the highest logical channel number (LCN) that can be assigned only to call requests OUTGOING from the switch to the remote STE on an X.75 or X.75' trunk.

**Attribute: l_lcn_2w**

Copyright © 1999 Lucent Technologies 

**Fullname:** Lowest LCN number assignable to two way call requests

**Attribute Description** This attribute signifies the lowest logical channel number (LCN) that can be assigned to call requests INCOMING or OUTGOING on an X.75/X.75' trunk.

**Attribute: h_lcn_2w**

**Fullname:** Highest LCN number assignable to two way call requests

**Attribute Description** This attribute signifies the highest logical channel number (LCN) that can be assigned to call requests INCOMING or OUTGOING on an X.75/X.75' trunk.

**Attribute: h_to_l**

**Fullname:** high to low indicator

**Attribute Description** Indicates whether the LCN assignment is made from high to low (DBYES) or low to high (DBNO).
For X.75 and X.75' trunks there is no dependency of this attribute on the RLpstrk_l2.lapbA attribute; they are independent of each other.

**Attribute: in_thrucl**

**Fullname:** Incoming default throughput class

**Attribute Description** Default throughput class to be used for incoming X.75 and X.75' call requests. The value of PSTHNULL is not allowed. The default value is PS9600BPS. If the throughput class utility (0x00000002) in the prov_flags attribute is disabled this default value is the only value allowed.

**Attribute: out_thrucl**

**Fullname:** Outgoing throughput default class

**Attribute Description** Default throughput class to be used for outgoing X.75 and X.75' call requests. The value of PSTHNULL is not allowed. The default value is PS9600BPS. If the throughput class utility (0x00000002) in the prov_flags attribute is disabled this default value is the only value allowed.

**Attribute: in_wndsz**

**Fullname:** Incoming window size

**Attribute Description** Default window size to be used for incoming X.75 and X.75' call requests. The value of WDWNULL is not allowed. The default value is WDWSZ2. If the window size utility (0x00000004) in the prov_flags attribute is disabled this default value is the only value allowed.

**Attribute: out_wndsz**

**Fullname:** Outgoing window size

**Attribute Description** Default window size to be used for outgoing X.75 and X.75' call requests. The value of WDWNULL is not allowed. The default value is WDWSZ2. If the window size utility (0x00000004) in the prov_flags attribute is disabled this default value is the only value allowed.

**Attribute: in_pktsz**

Copyright © 1999 Lucent Technologies 

**Fullname:** Incoming packet size

**Attribute Description** Default packet size to be used for incoming X.75' and X.75 call requests. The valid values are PKTSZ128 and PKTSZ256. The default value is PKTSZ128. If the packet size utility (0x00000008) in the prov_flags attribute is disabled this default value is the only value allowed.

**Attribute: out_pktsz**

**Fullname:** Outgoing packet size

**Attribute Description** Default packet size to be used for outgoing X.75' and X.75 call requests. The valid values are PKTSZ128 and PKTSZ256. The default value is PKTSZ128. If the packet size utility (0x00000008) in the prov_flags attribute is disabled this default value is the only value allowed.

**Attribute: util_faclen**

**Fullname:** X.75 / X.75' Trunk Utility Facility Field Length

**Attribute Description** This attribute is used to provision the length of the X.75 or X.75' utility/Facility field. The valid enumerations for this attribute are BASIC and EXTENDED with the default value being BASIC.

If the value of the attribute is BASIC then the length of the utility field may not exceed 63 octets and the length of the facility field may not exceed 109 octets in the call request packet.

If the value of the attribute is EXTENDED then the length of the utility field could exceed 63 octets and/or the length of the facility field could exceed 109 octets in the call request packet provided that the length of the combined facility and utility fields does not exceed 172 octets. If the length exceeds 172 octets the call will be cleared.

The domain enumeration NONE is used only for RC and ODA and will be represented on their view as blank (null) for non X.75/X.75' trunk group members. This enumeration is not valid in the relation.

**Attribute: x75id[*]**

**Fullname:** X.75 Trunk Interface Identification Number

**Attribute Description** This attribute is used to define the X.75 trunk member interface identifier. The 12 digit BCD number is used to populate the X.75 trunk identifier utility which is provisioned by enabling the prov_flag attributes X75ID utility flag. The first 11 digits are assigned by the user to uniquely identify the X.75 trunk member used in a call.

There are no provisioning restrictions or checks for the value entered in this attribute (except that the low order four bits of the attribute x75id6 for X.75 trunk members must be 0000 (that is, the 12th BCD digit which is not part of the 11 digit ID). The valid X.75 trunk member entries for the digits are 0-9 (hex a-f not allowed)). The attribute is defined with an alternate value in the RLpsx75trk.G file to allow PS code to access these 12 BCD digits in a six element array (x75id[6]) where the 12th digit is 0 (seen previously).

The interface identification number will be used to determine appropriate billing for certain packet calls in certain network configurations in which the called address is not sufficient to indicate the interexchange carrier or other X.75 connected entity to be billed.

Copyright © 1999 Lucent Technologies 

A default value of 000000000000 is used for X.75 trunk member tuples to arbitrarily distinguish between an interface which was used in the call and the recording of 'no interface used'.

These attributes are not valid for X.75' trunks and should be populated as fffffffffffff for them. The RC and ODA views will display 'blank' instead of fffffffffffff.

**Attribute: rpoa_senddel**

**Fullname:** X.75 Trunk Interface RPOA Delete Before Sending

**Attribute Description** The attribute is used to specify if the X.75 RPOA selection utility defined in a call request packet (CRP) at the X.75 interface should be deleted before the CRP is transmitted to the remote X.75 signaling terminal (STE) over the X.75 trunk.

If the attribute is provisioned to DBYES then the outgoing RPOA selection utility must be provisioned either before or after the utility marker.

When the attribute is DBYES, the RPOA selection utility will be deleted before the X.75 CRP is transmitted. When the attribute is DBNO (do not delete), then the switch passes the RPOA Selection utility or the sequence of RPOA selection utilities in the transmitted X.75 CRP.

The default value for X.75 trunks is DBYES and DBNO for X.75' trunks (not valid for X.75' trunks).

**Attribute: rpoa_rcvdel**

**Fullname:** X.75 Trunk Interface RPOA Delete when Received

**Attribute Description** The attribute is used to specify if the X.75 RPOA selection utility is to be deleted when received in an X.75 call request packet (CRP) from the remote X.75 signaling terminal (STE) over an X.75 trunk.

If the attribute is provisioned to DBYES then the incoming RPOA selection utility must be provisioned either before or after the utility marker.

When the attribute is DBYES, then the switch X.75 STE discards the RPOA selection Utility, or the first RPOA selection utility in case of a sequence of RPOA selection utilities, when received in an X.75 CRP if the contents of the RPOA parameter field identifies the network of the *5ESS* ®-2000 switch ISDN subnetwork. When the attribute is DBNO (do not delete), then the switch X.75 STE clears the X.75 virtual CRP received from the remote X.75 STE.

The default value for X.75 trunks is DBYES and DBNO for X.75' trunks (not valid for X.75' trunks).

**Attribute: tni_state**

**Fullname:** X.75 Trunk Transit Network Identification Unique / Shared

**Attribute Description** The attribute is used to provision the X.75 transit network identification (TNI) mode as either unique or shared. The TNI mode values are used to detect looping within the network.

Each X.75 trunk member may have a TNI mode of unique (TNIUNIQ), shared (TNISHARD) or no TNI mode (TNINONE). The TNI mode is used when the switch receives an IP Call Request Packet that contains the ATNIC facility or a sequence of ATNIC facilities.

The enumerations TNIUNIQ and TNISHARD designate if the TNI is to be used in either a 'unique' mode or in a 'shared' mode as described in the following paragraphs:

Copyright © 1999 Lucent Technologies 

If the trunk member is in unique mode and a call request packet (CRP) is received from IP which does not contain an instance of an ATNIC facility with the parameter field value matching a TNI value provisioned in the RLpstni_id relation, the *5ESS*®-2000 switch must insert the TNIC utility into the X.75 CRP to be sent. However, if the CRP received from IP has a ATNIC facility that does match a TNI value provisioned as above the call will be cleared.

If the trunk member is in shared mode and a (CRP) is received from IP which does not contain an instance of an ATNIC facility with the parameter field value matching a TNI value provisioned in the RLpstni_id relation, the *5ESS*®-2000 switch must insert the TNIC utility into the X.75 CRP. However, if the CRP received from IP has an ATNIC facility that does match a TNI value provisioned as above the *5ESS*®-2000 switch must not insert an additional instance of the TNIC utility into the X.75 CRP to be sent.

The relation RLpstni_id contains a list of 0 to 20 shared TNIs that are valid for this switch (the list always exists and when empty it is considered a null list). This list is not coupled with the provisioning of this attribute and is used when processing an incoming IP CRP as mentioned previously.

When the X.75 trunk member has no TNI (TNINONE) then existing pre-5E8 software release call processing applies (if there are any duplicate TNIs in the call request packet (CRP), the call is cleared). Up to seven unique TNIs may be present in the CRP.

The default value for both X.75 and X.75' trunks is TNINONE. The default gives pre 5E8 treatment for X.75 trunks and not valid for X.75' trunks.

**Attribute: cugscrn_alw**

**Fullname:** X.75 Trunk Interface Closed User Group Screening

**Attribute Description** The attribute is used to enable (DBYES) or disable (DBNO) closed user group screening on X.75 trunk members. The attribute is not used by X.75' trunk members and should be set to DBNO for them. If this attribute is DBYES, there must be a valid CUG list ID entered in the iiclist_id attribute.
If this attribute is DBYES, then every member of this trunk group must also subscribe to either the CUG indication utility or the CUG/OA utility using the prov_flag attribute. Whenever a new trunk member is added to a trunk group with CUG screening enabled, the new member must have one of the two previous utilities enabled. If the attribute is DBNO then no screening is performed on call request packets at the X.75 trunk interface.

This attribute is also populated in RLpsl3trkg. The value in this attribute for every member of a given trunk group must be exactly the same as the value for the group in RLpsl3trkg.

**Attribute: iiclist_id**

**Fullname:** X.75 Trunk Interface Closed User Group Screening List ID Number

**Attribute Description** The attribute is used to assign a closed user group (CUG) list ID number to the trunk group. The CUG List ID must be a valid ID number defined in RLpscug_iic and may be shared with other trunk groups. The attribute is not used by X.75' trunk groups and should be set to 0 for them. The valid range for X.75 trunk groups is 0-1600.

If this attribute is 0 then no screening is allowed (cugscrn_alw attribute must be set to DBNO (zero indicates no list assigned). If the attribute value is 1-1600 then a list is assigned but the cugscrn_alw attribute may be either DBYES or DBNO (allows for an on-off toggle).

Copyright © 1999 Lucent Technologies 

This attribute is also populated in RLpsl3trkg. The value in this attribute for every member of a given trunk group must be exactly the same as the value for the group in RLpsl3trkg.

**Attribute: prov_flags**

**Fullname:** X.75/X.75' utility provisioning flags.

**Attribute Description** This attribute is an unsigned long bit map which contains a '1' bit set if the corresponding utility is supported on the trunk as follows:
Note: As of the 5E8 Software Release the default value for all X.75' Utilities is on (enabled). Also, the utilities that have Before and After flags default to Before.

```
UTILITIES:
----------
```

(1) Call identifier (0x00000001L)
(2) Throughput class indicator (0x0000002L)
(3) Window size indicator (0x00000004L)
(4) Packet size indicator (0x00000008L)
(5) Fast select indicator (0x00000010L)
(6) Reverse charge indicator (0x00000020L)
(7) CUG indicator (0x00000040L)
(8) CUG with outgoing access indicator (0x00000080L)
(9) Called line address modified indicator (0x00000100L)
(10) Clearing network (CNIC) indicator (0x00000200L)
(11) Transit network (TNIC) indicator (0x00000400L)
(12) Utility marker (0x00000800L)
(13) TDI supported before utility marker (0x00001000L) (default)
(14) TDI supported after utility marker (0x00002000L) - (not allowed for X.75')
(15) TDS indicator supported before utility marker (0x00004000L) (default)
(16) TDS indicator supported After utility marker (0x00008000L) - (not allowed for X.75')
(17) Tariff indicator supported before utility marker (0x00010000L) (default)
(18) Tariff indicator supported after utility marker (0x00020000L) - (not allowed for X.75')
(19) Incoming RPOA indicator supported before utility marker (0x00040000L) (default)
(20) Incoming RPOA indicator supported after utility marker (0x00080000L) - (not allowed for X.75')
(21) Outgoing RPOA indicator supported before utility marker (0x00100000L) (default)
(22) Outgoing RPOA indicator supported after utility marker (0x00200000L) - (not allowed for X.75')
(23) Access characteristics indicator (0x00400000L) - (not allowed for X.75)
(24) Transit sub-network count utility indicator (0x00800000L) - (not allowed for X.75)
(25) X.75 trunk identification (X75ID) utility indicator (0x01000000L) - (not allowed for X.75)
(26) Clearing sub-network ID utility indicator (0x02000000L) - (not allowed for X.75)
(27) Protocol conversion permissions utility indicator (0x04000000L) - (not allowed for X.75)
(28) Network user identification (NUI) supported before utility marker (default) (0x08000000L)
(29) Network user identification (NUI) supported after utility marker (0x10000000L)
(30) Interexchange carrier pre-select utility indicator (0x20000000L) -

Note: For the 6 utilities which can be provisioned on an X.75 trunk either before or after the utility marker (that is, TDI, TDS, tariff, incoming RPOA, outgoing RPOA and NUI), these individual utilities cannot be supported both before and after. For example, we cannot provision TDI both before and after the utility marker. Also, by provisioning one of the two you are also activating the utility (provisioning it 'ON'). If neither before or after are provisioned (provisioned is defined here as the switch personnel physically entering 'N' for both fields on the view) then the utility is inactive (provisioned to 'OFF').

```
LCN RANGE CHECKS FOR X.75 and X.75' Trunks:
-------------------------------------------
For X.75 trunks:
If RLpsx75trk.h_to_l = DBYES then
  { if  ( l_lcn_in = h_lcn_in = l_lcn_out = h_lcn_out=
      l_lcn_2w =h_lcn_2w =0 ) then
         1 <= pvc_h_lcn <= 127
    else
      pvc_h_lcn <  l_lcn_in
      l_lcn_in  <= h_lcn_in
      h_lcn_in  <  l_lcn_2w
      l_lcn_2w  <= h_lcn_2w
      h_lcn_2w  <  l_lcn_out
      l_lcn_out <= h_lcn_out <= 127
```

with the understanding that if any category of channels (incoming, 2-way or outgoing) does not have any channels (low=high=0) then the starting (low) and ending (high) numbers must be zero and should be left out of the preceding inequality rule.

}

Else (RLpsx75trk.h_to_l = DBNO) then

```
  { if  ( l_lcn_in = h_lcn_in = l_lcn_out = h_lcn_out=
      l_lcn_2w =h_lcn_2w =0 ) then
         1 <= pvc_h_lcn <= 127
    else
      pvc_h_lcn <  l_lcn_out
      l_lcn_out <= h_lcn_out
      h_lcn_out <  l_lcn_2w
      l_lcn_2w  <= h_lcn_2w
      h_lcn_2w  <  l_lcn_in
      l_lcn_in  <= h_lcn_in <= 127
```

with the understanding that if any category of channels (incoming, 2-way or outgoing) does not have any channels (low=high=0) then the starting (low) and ending (high) numbers must be zero and should be left out of the previous inequality rule.

## 4. Population Rules for RLpu_ltm

**Relation Description**
This relation is for logical termination ports which have the PU_terminating feature(s).

```
SPECIAL ENTRY FOR EITHER PARAMETER ASSOCIATED WITH BFG
------------------------------------------------------
```

For BFG purposes, this put is an either type. Therefore, BFG pseudo port tuple will be created for the SM where any BFG port members reside. Individual port tuples may or may not be created for BFG assigned ports.

BFG, capability G268, is intended to improve recent change response time and provide for SM memory reduction. It permits the creation of groups of BRCS features and parameters, and utilization of these groups by call processing. New group parameter relations will not be created, but will be populated in the existing relations. The group parameters will be identified by lead_module = zero (see lead_module for details).

This relation has now two types of tuples distinguished primarily by ltm_type.

1. The first type is the existing RLpu_ltm tuples which are group partitioned and remain unchanged (ltm_type = LTM_ISDN or LTM_OTHER).

Copyright © 1999 Lucent Technologies 

2. The second type is the BFG group parameter tuple and is also group partitioned. This tuple is accessed by keys lead_module(equal to zero), ltm_index and ltm_type = LTM_ISDN. The BFG group parameter tuples were put in this relation to avoid creation of a new relation and minimize changes in the existing relation.

The following is a list of valid service classes for LTports (DNs) assigned this feature:

```
LINES
-----
FC_INDVDL
FC_ATTENDANT
FC_4WIRE_INDV
FC_PBX
FC_ISDN
FC_ISATND
```

**Attribute: ltm_type**

**Fullname:** Logical termination type.

**Attribute Description** Logical termination index type.
If LTM_ISDN, verify existence of tuple in RLis_line with this lead_module and ltm_idx.
Note: If RLpu_ltm.lead_module is equal to zero and RLpu_ltm.ltm_type is equal to LTM_ISDN the tuple in the relation refers to BRCS feature grouping (BFG) group parameter tuples. See special entry for group parameter associated with BFG.

**Attribute: lead_module**

**Fullname:** Lead module.

**Attribute Description** Lead module.

**Attribute: ltm_idx**

**Fullname:** logical termination index.

**Attribute Description** Logical termination index.
Note: Attribute ltm_idx has a domain range that starts with 0. In this relation, the ltm_idx range starts with 1. As discussed in RLrc_qidx, the existence of an index implies the value 1 or greater. If no index is defined, RLrc_qidx(ltm_type) would contain an index value of 0 and no tuple would exist in this relation. Therefore, ltm_idx must be greater than 0 in this relation.

```
If lead_module is zero, the ltm_idx range starts with 256.
If RLpu_ltm.lead_module is equal to zero then
a tuple must exist in RLis_line relation such
that :
if fc_porttyp.servclass = FC_ISDN (or FC_ISATND),
RLpu_ltm.ltm_idx = RLis_line.bfgid
if fn_porttyp.sevcclass = FC_INDVDL, then
RLpu_ltm.ltm_idx = RLfc_line.bfgid
```

**Attribute: feat_id**

**Fullname:** Feature ID.

**Attribute Description** Pickup terminating constructed feature ID.

(1) Verify existence of tuple in RLdn_feats with same key (lead_module, ltm_type, ltm_idx). The

Copyright © 1999 Lucent Technologies 

RLdn_feats tuple must have an attribute, fid such that (mftype of MFPUT + RLpu_ltm.feat_id) = RLdn_feats.ftent[n].fid. See explanation following 3).

(2) Verify existence of tuple in RLput_cf with mftype of MFPUT + RLpu_ltm.feat_id as key value. See explanation following 3).

(3) Call pickup terminating features including directed call pickup with/without barge-in may be assigned to multi-line hunt group members.

Note: MFPUT is defined in db/DMmftype.G. Adding mftype to feat_id before reading RLdn_feats or RLput_cf is necessary because the feat_id in this relation is the unique 10 bits of the FID, it does not include the mftype. Whereas, RLdn_feats and RLput_cf store the entire FID (mftype + 10 unique bits).

**Attribute: t_pred_q**

**Fullname:** Terminating predesignated queue.

**Attribute Description** Terminating predesignated queue.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLpu_port

**Relation Description**
Pick Up features port.

```
SPECIAL ENTRY FOR GROUP PARAMETER ASSOCIATED WITH BFG
-----------------------------------------------------
```

For BFG purposes, this puo is an either type. Therefore, BFG lport tuple will be created for the sm where any BFG lport members reside. Individual lport tuples may or may not be created for BFG assigned lports. BRCS Feature Grouping (BFG), capability G268, is intended to improve recent change response time and provide for sm memory reduction. it permits the creation of groups of brcs features and parameters, and the utilization of these groups by call processing. BFG group parameter relations will not be created, but will be populated in existing lport keyed relations. Identifying BFG group parameters will be accomplished via use of an lpt_type key field set to LPT_BFG and use of the LPORT key field to contain the BFG group ID. This concept is used to avoid creation of new database relations. Distribution: group partitioned (if LPT_TYPE=LPT_BFG) or sm partitioned This relation now has two types of tuples.

(1) THE FIRST TYPE is the existing tuples which are SM-PARTITIONED and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

(2) THE SECOND TYPE is the BFG GROUP PARTITIONED TUPLE associated with features in a BRCS Feature Group (BFG), having lpt_type=LPT_BFG, and the bfgid populated in the lport field.

***NOTE:*** There is a limit of 30 BRCS features for each bfgid.

**Attribute: lport**

**Fullname:** Logical port.

**Attribute Description** Logical port of the User being assigned the BRCS features. If lpt_type != LPT_BFG, RLpu_port.lport must equal RLfc_line.lport. The keys to RLfc_line are: RLfc_line.port = RLlpt_pt(RLpu_port.lport,RLpu_port.lpt_type).port RLfc_line.party = RLlpt_pt(RLpu_port.lport,RLpu_port.lpt_type).party If lpt_type = LPT_BFG, then RLpu_port.lport contains a BFG group ID. If lpt_type != LPT_BFG, there must be a tuple in RLfc_porttyp keyed by the RLlpt_pt(lport,lpt_type).port. If lpt_type = LPT_BFG, the must be a tuple in RLbfgmatch keyed by the bfgid contained in RLpu_port.lport. Verify existence of tuple in RLfc_line and RLfc_porttyp keyed by RLlpt_pt(lport,lpt_type). RLfc_porttyp..servclass must be FC_INDVDL, FC_4WIRE_INDV, FC_ATTENDANT, FC_ISDN or FC_ISATND

**Attribute: lpt_type**

**Fullname:** Logical port type.

**Attribute Description** Logical port type of the User. RLpu_port.lpt_type must be identical to RLfc_line.lpt_type if the User is for an analog or ISDN terminal. The keys for RLfc_line are: RLfc_line.port = RLlpt_pt(RLpu_port.lport,RLpu_port.lpt_type).port RLfc_line.party =

Copyright © 1999 Lucent Technologies 

RLlpt_pt(RLpu_port.lport,RLpu_port.lpt_type).party If lpt_type=LPT_BFG, then there must be a tuple in RLbfgmatch keyed by the bfgid contained in RLpu_port.lport.

**Attribute: feat_id**

**Fullname:** PU feature id.

**Attribute Description** Pickup originating constructed feature id.

(1) Verify existence of tuple in RLtrmfeats with same key. The RLtrmfeats tuple must have an attribute, fid such that (mftype of MFPUO + RLpu_port.feat_id) = RLtrmfeats.ftent[n].fid. See the following NOTE.

(2) Verify existence of tuple in RLpuo_cf with mftype of MFPUO + RLpu_port.feat_id as key value. See the following NOTE.

***NOTE:*** MFPUO is defined in db/DMmftype.G. Adding mftype to feat_id before reading RLtrmfeats or RLpuo_cf is necessary because the feat_id in this relation is the unique 10 bits of the FID, it does not include the mftype. Whereas, RLtrmfeats and RLpuo_cf store the entire FID (mftype + 10 unique bits).

(3) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = CD_CAL assigned to each user.

(4) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = LDSPK_PG assigned to each user.

(5) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = PUIPRDQ assigned to each user.

(6) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = BPARK assigned to each user.

(7) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = DPARK assigned to each user.

(8) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = ANS_BACK assigned to each user.

(9) Verify only one MFPUO + RLpu_port.feat_id can have RLpuo_cf.initiate = RTRV assigned to each user.

**Attribute: dir_pu_dn**

**Fullname:** Direct Pick Up local directory number.

**Attribute Description** Direct Pickup local DN that can be accessed by code. If dir_pu_dn.noc != 0, then RLpuo_cf assigned to this user shall have RLpuo_cf.initiate = PUIPREDN. The directed call pickup originator and terminator must be in the same terminal group.

**Attribute: dir_pu_dn.noc**

**Fullname:** Normalized office code(NOC) of the directory number

**Attribute Description** The NOC of the directory number corresponding to the directed call pick up DN.

**Copyright © 1999 Lucent Technologies** 

**Attribute: dir_pu_dn.digits**

**Fullname:** last 4 digits of the directory number

**Attribute Description** Last 4 digits of the DN corresponding to the directed call pick up DN.

**Attribute: dpd_dntr**

**Fullname:** unused attribute

**Attribute Description** unused attribute - defaulted to zero

**Attribute: pusel_q1**

**Fullname:** PU queu.

**Attribute Description** The queue (group) that the customer can originate to pick up. If pusel_q1 >=2 and <= 65534 then

(1) RLpuo_cf.pu_selq != PUQNONE

**Attribute: pusel_q2**

**Fullname:** PU queu.

**Attribute Description** The queue (group) that the customer can originate to pick up. If pusel_q2 >= 2 and <= 65534 then

(1) RLpuo_cf.pu_selq != PUQNONE or PU1QS

(2) RLpu_port.pusel_q1 >= 2 and <= 65534

**Attribute: pusel_q3**

**Fullname:** PU queu.

**Attribute Description** The queue (group) that the customer can originate to pick up. If pusel_q3 >= 2 and <= 65534 then

(1) RLpuo_cf.pu_selq = PU3QS or PU4QS

(2) RLpu_port.pu_selq1 >= 2 and <= 65534

(3) RLpu_port.pu_selq2 >= 2 and <= 65534

**Attribute: pusel_q4**

**Fullname:** PU queu.

**Attribute Description** The queue (group) that the customer can originate to pick up. If pusel_q4 >= 2 and <= 65534 then

(1) RLpuo_cf.pu_selq = PU4QS

Copyright © 1999 Lucent Technologies 

(2) RLpu_port.pu_selq1 >= 2 and <= 65534

(3) RLpu_port.pu_selq2 >= 2 and <= 65534

(4) RLpu_port.pu_selq3 >= 2 and <= 65534

## 4. Population Rules for RLpuo_cf

**Relation Description**
This relation is not to be populated by international.

**Attribute: feat_id**

**Fullname:** Call pickup originating constructed feature ID

**Attribute Description** Identifies mcc constructed feature ID.

**Attribute: initiate**

**Fullname:** Call Pickup initiate component

**Attribute Description** Is used in the construction process to determine which option of PUO feature is being selected.

**Attribute: allow_barg_in**

**Fullname:** Barge-in component

**Attribute Description** Allow or disallow bridge onto existing call. 3-way, or n-way connection.

**Attribute: allow_chg_dp_d**

**Fullname:** Change directed pickup telephone number

**Attribute Description** Allow customer control to change the predesignated specified TELNO if PUO was constructed with PUIPREDN of initiate component.

**Attribute: cal_sel**

**Fullname:** Pickup call selection component

**Attribute Description** Used to indicate the type(s) of calls this party can remove from the pickup queue call pickup (CPU), or can pickup by means of directed pickup nonbarge-in (DPN), or directed pickup with barge-in (DPU), or can busy verify by means of busy verify or can be overridden by means of emergency override.

**Attribute: cal_sel.intratg**

**Fullname:** Intra-terminal group

**Attribute Description** Intra-terminal group.

**Attribute: cal_sel.intraoff**

**Fullname:** Intra-office

**Attribute Description** Intra-office.

**Attribute: cal_sel.interoff**

Copyright © 1999 Lucent Technologies 

**Fullname:** Inter-office **Attribute Description** Inter-office.

**Attribute: cal_sel.pf**

**Fullname:** Private facility

**Attribute Description** Private facility.

**Attribute: cal_sel.attndnt**

**Fullname:** Attendant

**Attribute Description** Attendant.

**Attribute: pu_selq**

**Fullname:** Pickup queue selection component

**Attribute Description** Customer can indicate number of queue (group) he would like to be able to pickup from.

**Attribute: actvn**

**Fullname:** Activation method type

**Attribute Description** Indicates the method of activating modular communications capability features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. Note: any additions or deletions of enumerations from this base domain must be reported to the administrator of function RCbfg_act which is located in the 'rc' subsystem, module RCutil.

**Attribute: dctvn**

**Fullname:** Deactivation method type

**Attribute Description** Indicates the method of deactivating modular communications capability features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. Note: any additions or deletions of enumerations from this base domain must be reported to the administrator of function RCbfg_act which is located in the 'rc' subsystem, module RCutil.

**Attribute: bill_typ**

**Fullname:** Charging type

**Attribute Description** Boolean structure indicating the combination of several types of billing. In each case a DBYES indicates that type of billing is applicable and DBNO indicates it is not.

**Attribute: bill_typ.flat**

**Fullname:** Flat rate - no usage sensitive charge

**Attribute Description** Flat rate.

**Attribute: bill_typ.usefreq1**

Copyright © 1999 Lucent Technologies 

**Fullname:** Usage frequency charge - for use of event 1

**Attribute Description** Usage frequency charge.

**Attribute: bill_typ.usefreq2**

**Fullname:** Usage frequency charge - for use of event 2

**Attribute Description** Usage frequency charge.

**Attribute: bill_typ.usefreq3**

**Fullname:** Usage frequency charge - for use of event 3

**Attribute Description** Usage frequency charge.

**Attribute: bill_typ.usefreq4**

**Fullname:** Usage frequency charge - for use of event 4

**Attribute Description** Usage frequency charge.

**Attribute: bill_typ.actchrg**

**Fullname:** Usage charge for activation

**Attribute Description** Usage charge for activation.

**Attribute: bill_typ.dactchrg**

**Fullname:** Usage charge for deactivation

**Attribute Description** Usage charge for deactivation.

**Attribute: bill_typ.duration**

**Fullname:** Usage charge for duration of use

**Attribute Description** Usage charge for duration of use.

**Attribute: bill_typ.change**

**Fullname:** Usage charge for change of parameter

**Attribute Description** Usage charge for change of parameter.

## 4. Population Rules for RLpuo_rout

**Relation Description**
This relation associates a origination port and action with a pick up port.

**Attribute: lport**

**Fullname:** logical port of the user

**Attribute Description** Logical port of the User being assigned the BRCS features.
RLpuo_rout.lport must equal
RLfc_line.lport (if a line) or RLfc_trunk.lport (if a trunk).
The keys for RLfc_line & Rlfc_trunk are:
RLfc_line.port = RLlpt_pt(RLpuo_rout.lport,RLpuo_rout.lpt_type).port
RLfc_line.party = RLlpt_pt(RLpuo_rout.lport,RLpuo_rout.lpt_type).party
RLfc_trunk.port = RLlpt_pt(RLpuo_rout.lport,RLpuo_rout.lpt_type).port
There must be a tuple in RLfc_porttyp keyed by the RLlpt_pt(lport,lpt_type).port. Verify existence of tuple in RLfc_line and RLfc_porttyp keyed by RLlpt_pt(lport,lpt_type).port. RLfc_porttyp.servclass

Copyright © 1999 Lucent Technologies 

must be FC_INDVDL, FC_4WIRE_INDV, FC_ISDN, FC_ISATND, or FC_ATTENDANT.

**Attribute: lpt_type**

**Fullname:** logical port type of the user assigned CPUO

**Attribute Description** Logical port type of the User assigned CPUO.

```
Range: LPT_ISDN (for ISDN Users)
or LPT_OTHER (for analog BRCS lines and trunks)
RLpuo_rout.lpt_type must be identical to RLfc_line.lpt_type
if the User is for an analog or ISDN terminal.
The keys for RLfc_line are:
RLfc_line.port = RLlpt_pt(RLpuo_rout.lport,RLpuo_rout.lpt_type).port
RLfc_line.party = RLlpt_pt(RLpuo_rout.lport,RLpuo_rout.lpt_type).party
If the User is a BRCS trunk, then lpt_type=LPT_OTHER.
```

**Attribute: pu_act**

**Fullname:** pick up action

**Attribute Description** Identifies action to be taken.

```
Range of values:
    ACN_LSP (loudspeaker paging)
    ACN_CCL (code calling)
Dependencies:
Enum. Value      Dependency
ACN_LSP          RLpuo_cf.initiate = LDSPK_PG
ACN_CCL          RLpuo_cf.initiate = CD_CAL
```

**Attribute: port_ls_cc**

**Fullname:** port id of loudspeaker speaker (LSP) of code calling (CCL) trunk that is to be accessed

**Attribute Description** Port ID of (LSP) or (CCL) trunk that is to be accessed. Dependencies:

(1) Verify that a tuple exists in
`RLfc_porttyp.servclass = FC_PFCPE, when`
`pu_act =ACN_LSP (Loud Speaker Paging), or`
`pu_act =ACN_CCL (Code Call)`

(2) for SERVCLASS to be appropriate the trunk must be in the right type trunk group.

**Attribute: port_ls_cc.member**

**Fullname:** port name of a port

**Attribute Description** Port name of a port

**Attribute: port_ls_cc.module**

**Fullname:** the sm number that this port terminates on

**Attribute Description** The SM number that this port terminates on.

Copyright © 1999 Lucent Technologies

**Attribute:**
feat_id
**Fullname:**
call pickup originating constructed feature id
**Attribute Description:**
Identifies the MCC constructed feature id.

**Attribute:**
initiate
**Fullname:**
call pickup initiate component
**Attribute Description:**
used in the construction process to determine which option of PUO feature is being selected.

**Attribute:**
allow_barg_in
**Fullname:**
barge in component
**Attribute Description:**
Allow or disallow bridge onto existing call.
3-way, or n-way connection.
Range of value: DBYES (allow to barge in)
DBNO (disallow to barge in)
Dependencies:
If DBYES then RLpuo_tm.initiate = IDPUDL, IPREDN,
BSYVFY or EMEROVR

**Attribute:**
allow_chg_dp_d
**Fullname:**
change directed pickup TELNO
**Attribute Description:**
Allow customer control to change the predesignated
specified TELNO if PUO was constructed with PUIPREDN
of initiate component.
Range of value: DBYES (allow change)
DBNO (do not allow change)
Dependencies:
if DBYES then RLpuo_tm.initiate = PUIPREDN
NOTE: for issue 5E2(1) only DBNO allowed

**Attribute:**
cal_sel
**Fullname:**
pickup call selection component
**Attribute Description:**
Used to indicate the type(s) of calls this party
can remove from the pickup queue Call Pickup (CPU),
or can pickup by means of Directed Pickup Nonbarge-In
(DPN), or Directed Pickup with Barge-In (DPU), or can
busy verify by means of Busy Verify or can be
overridden by means of Emergency Override.
Dependencies: At least one value must be DBYES.

**Attribute:**
cal_sel.intratg
**Fullname:**
intra-terminal group
**Attribute Description:**
for intra-terminal group

Copyright © 1999 Lucent Technologies 

**Attribute:**
cal_sel.intraoff
**Fullname:**
intra-office
**Attribute Description:**
for intra-office

**Attribute:**
cal_sel.interoff
**Fullname:**
interoffice
**Attribute Description:**
for interoffice

**Attribute:**
cal_sel.pf
**Fullname:**
private facilities
**Attribute Description:**
for private facilities

**Attribute:**
cal_sel.attndnt
**Fullname:**
attendant
**Attribute Description:**
for attendant

**Attribute:**
pu_selq
**Fullname:**
pickup queue selection component
**Attribute Description:**
Customer can indicate number of queue (group) they would like to be able to pickup from.

```

**Attribute:**
port_ls_cc
**Fullname:**
trunk that is to be accessed
**Attribute Description:**

```
        Port ID of Loudspeaker Paging (LSP) or Code Calling
        (CCL) trunk that is to be accessed.  This attribute
        is divided into sub-attributes port.member and
        port.module.  The structure members are:
                1. member (DMport):  Port name of a port
                2. module (DMmodule):  The SM number that
                           this port terminates on
        Range of Values: 0 (zero), or
                1. member: unsigned short (0-65535)
                2. module: unsigned short (1-255)
        Dependencies:
        1) Verify that a tuple exists in
           RLfc_porttyp.servclass = FC_PFCPE,  when
           pu_act = ACN_LSP (Loudspeaker paging) or
           pu_act = ACN_CCL (Code Calling).
        Note: for SERVCLASS to be appropriate the trunk must
        be in the right type trunk group.
```

**Attribute:**
port_ls_cc.member
**Fullname:**
port name of a port
**Attribute Description:**
see port_ls_cc description

**Attribute:**
port_ls_cc.module
**Fullname:**
SM number
**Attribute Description:**
The SM number that this port terminates on

## 4. Population Rules for RLput_cf

**Relation Description**
Pick Up Termination constructed feature.

Call pick up terminating constructed feature.

**Attribute: feat_id**

**Fullname:** Pick Up Termination feature Id.

**Attribute Description** MCC Feature ID for Call Pickup constructed feature ID.

**Attribute: mw_brgfid**

**Fullname:** Multiway bridge feature id.

**Attribute Description** Constructed feature id of multiway feature to which this call pick up terminating feature can bridge. If mw_brgfid > 0, verify existence of the tuple in RLmwcf with the rightmost 10 bits of this attribute as the key value. This is necessary because RLmwcf only stores the unique field of a MW FID, whereas this relation has mftype of MFMWY + 10 bit unique field of MW FID stored.

```
and
if RLfc_porttyp.servclass = FC_ISDN or
                    FC_ISATND then
RLmwcf.epis_fr_pu = DBYES else
RLmwcf.epfr_pu = DBYES,
and
RLmwcf.o3_tg_fl = RLmwcf.o3_interfl = DBYES
RLmwcf.o3_intrafl = RLmwcf.o3_pf_fl = DBYES
RLmwcf.o3_attfl = DBYES
and
RLmwcf.a3_attfl   = RLput_cf.ptyflt.attndnt
RLmwcf.a3_tg_fl   = RLput_cf.ptyflt.intratg
RLmwcf.a3_intrafl = RLput_cf.ptyflt.intraoff
RLmwcf.a3_interfl = RLput_cf.ptyflt.interoff
RLmwcf.a3_pf_fl   = RLput_cf.ptyflt.pf
```

**Attribute: fea_fun**

**Fullname:** feature function.

**Attribute Description** To select the pickup terminating option desired.

```
        CAL_PU (call pickup)
        DIR_PU (directed pickup non-Barg-In )
        DIR_PU_BRG (with barge-in option selected)
        HDIR_PU_BRG (with barge-in on held call
        option selected)
        TBSYVFY (busy verify)
        TEMEROVR (emergency override)
     Enum.value   Dependency
     ----------   ----------
     CAL_PU       1) RLput_cf.org_trm_fl = PUFL_NONE
                  2) RLput_cf.bg_in_tone = TN_NONE
                  3) RLpu_ltm.t_pred_q >=2  and  <= 65534

## 4. Population Rules for RLput_tm

**Relation Description**
Call pick up terminating constructed feature.

PRECONSTRUCTED DPUT FEATURES FOR ISDN DNs ONLY! NOTE: These preconstructed features must ONLY be assigned to ISDN DNs which are primary. These are the only preconstructed features in this poprule with this restriction.

**Attribute: feat_id**

**Fullname:** feature id

**Attribute Description** MCC Feature ID for Call Pickup constructed feature ID.

**Attribute: mw_brgfid**

**Fullname:** feature id of multiway feature

**Attribute Description** Constructed feature id of multiway feature to which this call pick up terminating feature can bridge.

```
Dependencies:
If mw_brgfid > 0, verify existence of the tuple in
RLmwcf with this key feat_id value
and
if RLfc_porttyp.servclass = FC_ISDN or
                            FC_ISATND then
RLmwcf.epis_fr_pu = DBYES else
RLmwcf.epfr_pu = DBYES,
and
RLmwcf.o3_tg_fl = RLmwcf.o3_interfl = DBYES
RLmwcf.o3_intrafl = RLmwcf.o3_pf_fl = DBYES
RLmwcf.o3_attfl = DBYES
and
RLmwcf.a3_attfl   = RLput_tm.pty_flt.attndnt
RLmwcf.a3_tg_fl   = RLput_tm.pty_flt.intratg
RLmwcf.a3_intrafl = RLput_tm.pty_flt.intraoff
RLmwcf.a3_interfl = RLput_tm.pty_flt.interoff
RLmwcf.a3_pf_fl   = RLput_tm.pty_flt.pf
```

**Attribute: fea_fun**

Copyright © 1999 Lucent Technologies 

**Fullname:** feature function component

**Attribute Description** To select the pickup terminating option desired.

```
Dependencies:
Enum.value      Dependency
----------      ----------
CAL_PU          1) RLput_tm.org_trm_fl = PUFL_NONE
                2) RLput_tm.bg_in_tone = TN_NONE
                3) RLpu_ltm.t_pred_q >=2  and  <= 65534

                3) RLput_tm.bg_in_tone = TNBEEP1
```

**Attribute: pty_flt**

**Fullname:** party filtering component

**Attribute Description** Filters to determine if a call can be picked up or answered.

```
Range of value: DBYES or DBNO for all structure members.
Members:        ATTNDNT (attendant),
                INTRATG (intra-terminal group)
                INTRAOFF (intra-office)
                INTEROFF (interoffice)
                PF (private facilities)
```

Default value: DBYES for all members (Results in no filtering).

**Attribute: pty_flt.intratg**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** intra-terminal group

**Attribute Description** filter for intra-terminal group

**Attribute: pty_flt.intraoff**

**Fullname:** intra-office

**Attribute Description** filter for intra-office

**Attribute: pty_flt.interoff**

**Fullname:** interoffice

**Attribute Description** filter for interoffice

**Attribute: pty_flt.pf**

**Fullname:** private facilities

**Attribute Description** filter for private facilities

**Attribute: pty_flt.attndnt**

**Fullname:** attendant

**Attribute Description** filter for attendant

**Attribute: org_trm_fl**

**Fullname:** originating and terminating filter component

**Attribute Description** Used by directed pickup with barge-in (DPU) and busy verify and emergency override. Stable calls would be the call on which barge-in is being attempted.

```
Dependencies:
Enum. Value     Dependency
-----------     ----------
PUFL_NONE       1) RLput_tm.fea_fun = CAL_PU or DIR_PU
                2) RLput_tm.bg_in_tone = TN_NONE

A_CAL_NFLT      1) RLput_tm.fea_fun = DIR_PU_BRG or
                   HDIR_PU_BRG or TBSYVFY or TEMEROVR
                2) RLmwcf.ot_3wyfl =  ALL
```

**Attribute: bg_in_tone**

**Fullname:** barge in tome indicator

**Attribute Description** Dependencies:

(1) If tone indicator is TNBEEP1, then tone duration Y ms = 900 in RLpu_ltm.tone_durn and

**Copyright © 1999 Lucent Technologies** 

tone repetition interval X = 0 RLpu_ltm.tone_intvl.

(2) If tone indicator is TNBEEP1, then RLput_tm.FEAFUN=DIRPUBRG or TBSYVFY or TEMEROVR or HDIRPUBRG

**Attribute: bill_typ**

**Fullname:** MCC feature billing (charge) type

**Attribute Description** Range of value: FLAT (no usage sensitive charge)
Default value: FLAT
Dependencies: none

**Attribute: bill_typ.flat**

**Fullname:** flat rate

**Attribute Description** no usage sensitive charge

**Attribute: bill_typ.usefreq1**

**Fullname:** usage frequency charge

**Attribute Description** for use of 'event' 1

**Attribute: bill_typ.usefreq2**

**Fullname:** usage frequency charge

**Attribute Description** for use of 'event' 2

**Attribute: bill_typ.usefreq3**

**Fullname:** usage frequency charge

**Attribute Description** for use of 'event' 3

**Attribute: bill_typ.usefreq4**

**Fullname:** usage frequency charge

**Attribute Description** for use of 'event' 4

**Attribute: bill_typ.actchrg**

**Fullname:** usage charge for activation

**Attribute Description** usage charge for activation

**Attribute: bill_typ.dactchrg**

**Fullname:** usage charge for deactivation

**Attribute Description** usage charge for deactivation

**Attribute: bill_typ.duration**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** usage charge for duration of use

**Attribute Description** usage charge for duration of use

**Attribute: bill_typ.change**

**Fullname:** usage charge for change of parameter

**Attribute Description** usage charge for change of parameter

**Attribute: actvn**

**Fullname:** activating MCC feature

**Attribute Description** Indicates method of activating MCC features Dependencies:

```
Enum. value    Dependency
ACTNONE        1) RLput_tm.dctvn = DCTNONE
               2) RLput_tm.bill_typ.flat = DBYES
ACTCD          1) RLput_tm.dctvn = DCTCD
```

**Attribute: dctvn**

**Fullname:** deactivating MCC feature

**Attribute Description** Indicates method of deactivating MCC feature. Dependencies:

```
Enum. value    Dependency
DCTNONE        1) RLput_tm.actvn = ACTNONE
               2) RLput_tm.bill_typ.flat = DBYES
DCTCD          1) RLput_tm.actvn = ACTCD
```

**Attribute: t_pred_q**

**Fullname:** terminating predesignated queue

**Attribute Description** Dependencies:

```
If  t_pred_q  >=2  and  <= 65534 then
RLput_tm.fea_fun = CAL_PU.
```

Copyright © 1999 Lucent Technologies

# QENDPTS

## 1. Description

This relation defines interconnectivity of QLPS endpoints. See Rlqlps.G for a description of QLPS hardware that is used in the *5ESS*®-2000 switch for high bandwidth message transport.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 60 |
| expected tuples in relation | 32 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LRFG |
| relation type | DBSTATIC |
| trigger | SMendpttrig |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLqendpts

**Relation Description**
QLPS Endpoint Connectivity.

**Copyright © 1999 Lucent Technologies** 

This relation defines the connectivity of quad-link packet switch (QLPS) endpoints for a given QLPS service.

**Attribute: qnetwork**

**Fullname:** QLPS Network

**Attribute Description** This attribute identifies the QLPS network for which the endpoint connectivity is given. In release 1 of Service Net-2000, only networks 0 and 1 are allowed. Networks 2 and 3 may be supported in the future.

**Attribute: qservice**

**Fullname:** QLPS Service

**Attribute Description** This attribute is one of the services provided by the network. For this service, an endpoint connectivity map will be given in this tuple.

**Attribute: qserv_num**

**Fullname:** QLPS Service Sub-Number

**Attribute Description** This attribute will be used to further specify the QLPS service given in the qservice attribute. This attribute is always 0 when the qservice is OSDS.

**Attribute: qends[*]**

**Fullname:** QLPS Endpoints 1 through 255. (There are 8 elements in the array.)

**Attribute Description** Array positions that identify a 256 bit map of endpoint addresses for the given service

NOTE: Bit position 0 of array element 0 is never set.

If bit 1 is set in this attribute, for example, it means a QLL (QLPS logical link) can be established to QLPS endpoint 1.

| endpoint type | bit positions |
|---|---|
| MH | 1 - 192 |
| QGP | 193 - 194 |
| QGP side ports | 195 - 196 |

## 4. Population rules for RLqkeyport

### Relation Description

```
        Static mapping from arbitrary hunted port key to gport.
        This relation is used for static mapping from arbitrary
        hunted port key to gport.
                Specific Application section:
                        RLqkeyport (DCTU trunk groups members)
          DESCRIPTION:
                Population rules regarding DCTU trunk groups members. All rules
                pertain to DCTUs that reside in a HOST 5ESS(R)-2000 Switch
                Processing entity and DCTUs that reside in RSMs/ORMs/TRMs.
                NOTE:
```

Copyright © 1999 Lucent Technologies

```
      (1) A singular qkey is required for each DCTU trunk group
          member since they are FIFO hunted. DCTU trunk groups have
          a hunt type of 'RTH_FIFO.' See the population rules for
          RLrt_trkg and RLrctgrprk.
      (2) For each DCTU trunk group member within a DCTU trunk group,
          there must be a corresponding entry in RLFC_PORTTYP in the
          particular SM where the physical DCTUPORT circuit is
          defined.  See the population rules for RLfc_porttype and
          RLcktdata.
      (3) For each DCTU trunk group member, there must be a
          corresponding  entry in RLGROUP_PORT and RLPGGPMAP. See
          the population rules for RLgroup_port and RLpggpmap.
      (4) There can be one fully equipped DCTU per SM that contains
          12 DCTUPORTs. There is one DCTUPORT LTP defined for each
          DCTUPORT. There can be 192 DCTUs in an office. Therefore,
          the theoretical maximum number of tuples in this relation
          owing to DCTU trunk group members is:
          ( 1 DCTU/SM) x ( 192 SMs/office) x ( 12 DCTUPORTs/DCTU) x
          ( 1 (DCTUPORT LTP)/DCTUPORT ) x ( 1 qkey/(DCTUPORT LTP) )
                              = 2,304 qkeys/office owing to the DCTU

QUANTITY OF TUPLES:
      One (1) tuple for each DCTUPORT LTP (DCTU trunk group member)
      in an office.

TUPLE SEMANTICS:
      qkey (KEY)    - singular value assigned by office, ODA, or RCV
                      Must be entry in RLGROUP_PORT
     gport.member   - DCTUPORT LTP name
                      Must be entry in RLPGGPMAP and RLGROUP_PORT
      gport.module - SM where DCTUPORT LTP is defined
                      entry MUST be defined in RLFC_PORTTYP
                      Must be entry in RLPGGPMAP and RLGROUP_PORT
      ps_flg       - DBNO
      ph_number    - 0
      ph_cn        - 0
RLqkeyport (ISTF trunk groups members)

DESCRIPTION:
      A qkey is required for each Integrated Services Test
      Function (ISTF) trunk group member since they are hunted FIFO.

QUANTITY OF TUPLES:
      One (1) tuple for each ISTF LTP (ISTF trunk group member)

TUPLE SEMANTICS:
      qkey (KEY)     - singular value assigned by office, ODA, or RCV
                       Must be entry in RLGROUP_PORT
     gport.member    - ISTF LTP name
                       Must be entry in RLPGGPMAP and RLGROUP_PORT
      gport.module   - SM where ISTF LTP is defined
                       entry must be defined in RLFC_PORTTYP
                       Must be entry in RLPGGPMAP and RLGROUP_PORT
      ps_flg         - DBNO
```

Copyright © 1999 Lucent Technologies 

```
        ph_number     - 0
        ph_cn         - 0
RLqkeyport (for DSU2-RAF/SAS Port Group members)

  DESCRIPTION:
        This relation provides the mapping from arbitrary hunted port
        keys to their RAF/SAS Global Port name equivalents.
        NOTE:
        (1) Each RAF/SAS port must be associated with a unique qkey for
            hunting since RAF/SAS ports are FIFO hunted (see RT_TRKG
            and RCTGRPRK).
        (2) For every port specified in this relation, a corresponding
            tuple must be populated in the GROUP_PORT, PGGPMAP,
            FC_PORTTYP and RC_TRK relations.
        (3) In addition, for every RAF/SAS port specified here,
            population must exist in the relation RLckt_port and
            RLcktdata for each port circuit. Here, we only check
            against RLckt_port since RLckt_port checked against
            RLcktdata already.

  QUANTITY OF TUPLES:
        One tuple per hunted RAF/SAS Port Group member

  TUPLE SEMANTICS:
        qkey        - unique value assigned by ODA and/or Recent Change
                      value must correspond to value in GROUP_PORT
                      relations for the gport given below
        gport.module - SM on which RAF/SAS port resides
        gport.member - RAF/SAS Port as defined above
        ps_flg       - DBNO
        ph_number    - 0
        ph_cn        - 0
  RLqkeyport (packet switching trunk groups members)

  DESCRIPTION:
        A qkey is required for each packet switching
        trunk group member since they are hunted ROTATE.
        An entry must be defined in RLFC_PORTTYP, FC_TRUNK
        RLDSLEQUIP, and RLEQUIPDSL relations
        such that
        1. rlQKEYPORT.gport.module = rlFC_PORTTYP.port.module
           rlFC_TRUNK.port.module
        2. rlQKEYPORT.gport.member = rlFC_PORTTYP.port.member
           rlFC_TRUNK.port.member = rlDSLEQUIP.dsl = rlEQUIPDSL.dsl
        3. rlFC_PORTTYP.servclass = PSPKT_TRK and
           rlFC_PORTTYP.lp_type = PCISWIP
        4. rlFC_PORTTYP.servclass = PSX75_TK and
           rlFC_PORTTYP.lp_type = PCX75TK
        5. rlFC_PORTTYP.servclass = PSX75P_TK and
           rlFC_PORTTYP.lp_type = PCX75PTK

  QUANTITY OF TUPLES:
        One (1) tuple for each packet switching trunk group member
```

Copyright © 1999 Lucent Technologies 

```
TUPLE SEMANTICS:
     qkey (KEY)    - singular value assigned by office, ODA, or RCV
                     Must be entry in RLPSPRT_GP and RLPSGP_PRT,
                     no entries in RLGROUP_PORT.
     gport.module  - SM where the packet switching trunk goup is
                     defined
     gport.member  - Port name of the trunk group member
     ps_flg        - must be DBYES for a packet switching trunk;
                     otherwise, it must be DBNO.
     ph_number     - Protocol handler number, also called DSL
                     group number. Range from 0 to 95. It
                     must be zero if ps_flg is DBNO.
     ph_cn         - PH channel number, also called DSL group member.
                     The range is from 0 to 127;
                     It must be zero if ps_flg is DBNO.

The following rules apply to the attributes in relations
RLqkeyport, RLpsgp_prt, RLpsprt_gp, and RLrt_trkg:
      1. rlQKEYPORT.qkey = rlPSGP_PRT.qkey = rlPSPRT_GP.qkey.
         The value of qkey is allocated from base address in RC_IDX
         or RC_QKEY relation.
      2. rlQKEYPORT.ph_number = rlPSGP_PRT.ph_number =
         rlPSPRT_GP.ph_number
         rlQKEYPORT.ph_cn = rlPSGP_PRT.ph_cn = rlPSPRT_GP.ph_cn
      3. rlRT_TRKG.grpnum = rlPSGP_PRT.grpnum = rlPSPRT_GP.grpnum
      4. rlPSGP_PRT.ptype = rlPSPRT_GP.ptype = TM_TRK, and
         rlRT_TRKG.htype = RTH_PSUCD.  Since X.75/X.75' packet
         trunk groups are limited to 24 members and IP packet
         trunk groups are limited to 32 members, RLrt_trkg.htype
         must never equal RTH_PSLGUCD.
      Trunk group configuration for packet switching:
      The following rules apply for Internal Protocol (IP) trunks:
       1. Service class of the IP trunk group must be
          PSPKT_TRK in fc_porttyp relation.
       2. There will be a maximum of 16 IP trunk groups for
          each 5ESS(R)-2000 switch.
       3. Each IP trunk group will have a maximum of 32 trunk
          members.
       4. All IP trunks in a trunk group will
          terminate on the same SM.
       5. Only one trunk member will terminate on a PH2.
       6. From 1 to 6 trunk members may terminate on a PH3 or PH4 as
          long as all of the trunk members are IP trunk members.
       7. The trunk group is 2_way.

      The following rules apply for X.75' trunks:
       1. There can be 255 X.75' trunk groups (per office)
          each with a maximum of 24 trunk members per group.
       2. There is a limit of 25 X.75' trunk groups on a given SM.
       3. The trunk group is a 2-way T1 facility.
       4. Only one trunk member will terminate on a PH2.
       5. From 1 to 6 trunk members may terminate on a PH3 or PH4 as
          long as all of the trunk members are X.75' trunk members
          and all trunk member ports terminate in the same SM.
```

Copyright © 1999 Lucent Technologies 

It is recommended that only 4 trunk members are put on a given PH3.

6. The service class of each member in fc_porttyp is PSX75P_TK.
7. X.75' trunk members can reside on different SMs.
8. All the trunk members in a X.75' trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs, and TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group.

The following rules apply for X.75 trunks:

1. There can be 255 X.75 trunk groups (per office) with a maximum of 24 trunk members each.
2. There is a limit of 25 X.75 trunk groups on a given SM.
3. The trunk group is a 2-way T1 facility.
4. Only one trunk member will terminate on a PH2.
5. From 1 to 6 trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75 trunk members and all trunk member ports terminate in the same SM. It is recommended that only 4 trunk members are put on a given PH3 or PH4.
6. The service class of each member in fc_porttyp is PSX75_TK.
7. All the trunk members in a X.75 trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs, and TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group. The total combined number of Packet Trunks (IP, X.75, X.75') on any given Loaded SM is 25. This may consist of any number of types following the above limits for the three types.

**Attribute:**
qkey
**Fullname:**
Arbitrary key used by RC & RTA to represent hunted trunk ports.
**Attribute Description:**
Arbitrary key used by RC & RTA to represent hunted trunk ports.

**Attribute:**
gport
**Fullname:**
Structure of a global port.
**Attribute Description:**
Used as a structure of a global port.

**Attribute:**
gport.member
**Fullname:**
Port name

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Used as a port name.
For X.75 trunk ports, there must be an entry in RLfc_porttyp
with RLfc_porttyp.servclass=PSX75_TK
For X.75' trunk ports, there must be an entry in RLfc_porttyp
with RLfc_porttyp.servclass=PSX75P_TK
For IP trunk ports, there must be an entry in RLfc_porttyp
with RLfc_porttyp.servclass=PSPKT_TRK

**Attribute:**
gport.module
**Fullname:**
Module number.
**Attribute Description:**
Used as module number.

**Attribute:**
ps_flg
**Fullname:**
Packet switching trunk group
**Attribute Description:**
Indicates if the trunk group is used for packet switching.

**Attribute:**
ph_number
**Fullname:**
Protocol handler number.
Also called DSL group number.
**Attribute Description:**
Used as protocol handler number, also called DSL group number.

**Attribute:**
ph_cn
**Fullname:**
Protocol handler channel number
**Attribute Description:**
Used as protocol handler channel number.
The range is from 0 to 127.
If the port is an IP, X.75 or X.75' trunk and the PH is of
type PH2 then ph_cn must be 0.
If the port is an IP, X.75 or X.75' trunk and the PH is of type
PH3 or PH4 then ph_cn may be (0,4,8...20) in even multiples of four
as long as all members on a given PH3 or PH4 are of the same trunk
level 2 profile and all of the ports are equipped on the same
SM. It is recommended that a maximum of 4 X.75' or X.75 trunk
members be assigned to a given PH3 o PH4.
HARDWARE CONVERSION NOTE:
If the PH3 or PH4 is to be converted to a PH2 only 1 member may be
assigned to the PH3 or PH4 and the 'ph_cn' attribute must equal 0

**Copyright © 1999 Lucent Technologies** 

otherwise the conversion will be blocked!

**Attribute:**
fast_inh
**Fullname:**
Fast Port Termination Inhibit Flag
**Attribute Description:**
This flag indicates whether this trunk port
supports the fast port termination inhibit feature.
Fast Port Termination Inhibit enables RTA to avoid rehunting
while the out of service status for a large number of trunks
is being updated in the CMP from the SM. This can occur
due to a carrier group alarm or manual remove operation
of certain facilities (such as, an STE or an STS-1).
This feature is supported by the following trunk units:
DNU-S (Digital Networking Unit-SONET)
DLTU2 (Digital Line Trunk Unit-2

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLqlps

**Relation Description**
Quad-Link Packet Switch Hardware

This relation defines the quad-link packet switch (QLPS) Hardware. QLPS is part of SM-2000 and is an overlay network to provide high bandwidth message transport between SM-2000's and between SM-2000's and existing processors. A QLPS network consists of 2 QLPS boards, one installed on each side of the ONTC. One side is always the ACTIVE QLPS and the other the STANDBY QLPS for the network during normal operation.

**Attribute: qnetwork**

**Fullname:** QLPS Network

**Attribute Description** This attribute identifies the QLPS network, which can only be 0 or 1 in release 1 of the *5ESS*®-2000 switch. Future releases may have networks 2 and 3, which must be allowed for.

**Attribute: side**

**Fullname:** ONTC side

**Attribute Description** This attribute is used to identify which ONTC side the QLPS hardware for the given network is being installed on. (ONTC side is also called TMS side.)

**Copyright © 1999 Lucent Technologies** 

**Attribute: qservice**

**Fullname:** QLPS Service (what type(s) of messages are routed by this QLPS)

**Attribute Description** This attribute is used to define what types of services are provided by the given QLPS network. Type of service essentially means what type of messages will be routed by this QLPS. For release 1 of *5ESS*®-2000 switch, the allowable QLPS networks will route OSDS messages. The default is set with bit 0 set to indicate that the supported service for release 1 is OSDS. In the future, as other services are added, the description of this attribute may be expanded to indicate different services per network.

**Attribute: qtmslnk[*]**

**Fullname:** QLPS TMS links (QTMSLNKs)

**Attribute Description** For the four TMS links associated with the given QLPS network on the given ONTC side:

```
qtmslnk0: stores the first TMS link
qtmslnk1: stores the second TMS link
qtmslnk2: stores the third TMS link
qtmslnk3: stores the fourth TMS link
```

Each QLPS board on an ONTC side occupies 4 TMS links.

**Attribute: eqstat**

**Fullname:** QLPS Equippage Status

**Attribute Description** This attribute is used to store the equippage status of the given QLPS network on the given ONTC side.

**Attribute: cli**

**Fullname:** QLPS Hardware Vintage

**Attribute Description** This attribute identifies the version of the QLPS hardware. (In *5ESS*®-2000 switch release 1, there is only 1 version of QLPS hardware.)

**defines:**
"db/DMclidef.h"

# QOR_OPT

## 1. Description

The purpose of this relation is to identify which coding standard and cause value combinations are designated for Query on Response processing. The relation is indexed by the coding standard. Currently, only the ITU-TS and *ANSI*® standards are used. The tuples contain one bit per cause value.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 4 |
| expected number of tuples | 2 |
| access type | DBACC_LIN |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLqor_opt

**Relation Description:** Query on Release for Location Routing Number options.

This relation is an optional relation used for the Number Portability (NP) - Query on Release (QOR) for Location Routing Number (LRN) feature.

This feature uses the Query on Release (QOR) trigger along with the basic NP - LRN feature to provide number portability. The QOR trigger is a new type of Local Number Portability (LNP) trigger, where the database query to the Service Control Point (SCP) is not launched until receipt of an SS7 release message with a cause value of 27, "NP QOR - Number not Found" ( and possibly other provisioned cause values). This relation indicates which combinations of coding standard and cause values are provisioned.

Note the cause values are defined in the CCS7 ISUP Messages and Parameters Specification Document.

**Attribute: cdstd**

**Fullname:** Coding Standard

**Attribute Description** This key attribute indicates the coding standard used in the release message. A value of 0 indicates ITU-TS; a value of 2 indicates *ANSI*®. No other values are allowed.

**Attribute: cv_map1**

**Fullname:** Cause value bitmap word 1

**Attribute Description** This attribute is used as a bitmap for cause values 0 through 31. When a given bit is set to 1, the corresponding cause value is provisioned for NP - QOR for LRN processing.

**Attribute: cv_map2**

**Fullname:** Cause value bitmap word 2

**Attribute Description** This attribute is used as a bitmap for cause values 32 through 63. When a given bit is set to 1, the corresponding cause value is provisioned for NP - QOR for LRN processing.

**Attribute: cv_map3**

**Fullname:** Cause value bitmap word 3

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute is used as a bitmap for cause values 64 through 95. When a given bit is set to 1, the corresponding cause value is provisioned for NP - QOR for LRN processing.

**Attribute: cv_map4**

**Fullname:** Cause value bitmap word 4

**Attribute Description** This attribute is used as a bitmap for cause values 96 through 127. When a given bit is set to 1, the corresponding cause value is provisioned for NP - QOR for LRN processing.

## 4. Population rules for RLqph

### Relation Description

QPH

This relation provides the basic relationship between the QLPS endpoint addresses, the Logical PH numbers and the QPH index.

**Attribute:**

qphindx

Copyright © 1999 Lucent Technologies

**Fullname:**
QPH index
**Attribute Description:**
The QPH index is the sequential index of the Quad Link PH

**Attribute:**
qendpt
**Fullname:**
QLPS endpoint
**Attribute Description:**
The QLPS endpoint address of the QPH.

**Attribute:**
dsl_group
**Fullname:**
Digital Subscriber Line group
**Attribute Description:**
This attribute is the DSL group number to which a port has been assigned. The attribute is the logical PH number.

**Attribute:**
netwk0
**Fullname:**
QLPS Network 0
**Attribute Description:**
Indicates whether the QLPS Network 0 is linked to this QPH through a QPH pipe.

**Attribute:**
netwk1
**Fullname:**
QLPS Network 1
**Attribute Description:**
Indicates whether the QLPS Network 1 is linked to this QPH through a QPH pipe.

## 4. Population rules for RLqphpipe

### Relation Description

QPH pipe

This relation provides the basic description of the SM side of the QLPS pipe connecting the QPH to the QLPS Network

**Attribute:**
qendpt
**Fullname:**
QLPS endpoint
**Attribute Description:**
The QLPS endpoint address of the QPH.

**Attribute:**
qnetwork
**Fullname:**
QLPS Network
**Attribute Description:**
The QLPS Network Number. For release one, there will be two networks defined; 0 and 1.

**Attribute:**
qport
**Fullname:**
Logical Port Number
**Attribute Description:**
The logical port number associated with this QPH pipe.

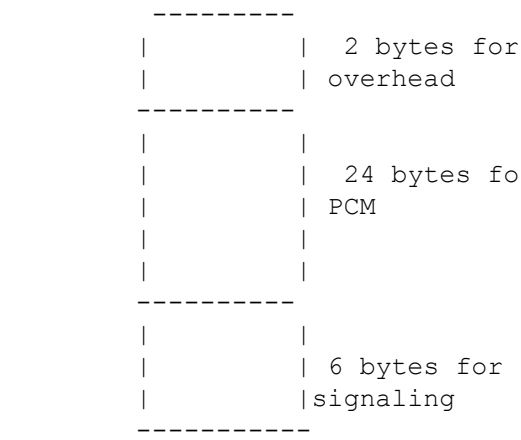
Copyright © 1999 Lucent Technologies 

**Attribute:**
num_slots
**Fullname:**
Number of Pipe Timeslots
**Attribute Description:**
The number of timeslots in the QPH pipe being defined. This number for release 1, will be fixed at 4 timeslots per QPH pipe.

**Attribute:**
qlnkpos
**Fullname:**
QTMSLNK (QLPS TMS Link) Position
**Attribute Description:**
The position within the QLPS of the QTMSLNK that terminates this QPH pipe at the QLPS.

**Attribute:**
net[*]
**Fullname:**
QPH pipe Network Side Timeslot Map
**Attribute Description:**
These attributes are 24 words of 32 bits each that for a 768 bit map of timeslots that define a pipe from the QLPS to the QPH in this GSM. The network side timeslots (through the TMS) have been defined in the AM relation RLtmspipe. (See RLtmspipe.r for more information.) For this pipe (from a given QLPS to QPH in this GSM), the network side timeslots need to be copied from RLtmspipe.slot{0-7} and converted to a PC numbering scheme used for network side timeslots used by PC in an GSM. The mapping scheme is:

Each frame on a TSI link has 1024 bytes, 32 blocks which contain 32 bytes each.
In each block, the 32 bytes are assigned as follows:



**Copyright © 1999 Lucent Technologies** 

The PCM bytes are where the QLPS pipe data is carried. The 24 bytes for PCM are divided into 3 chunks of 8 each. Only the first and third chunk of 8 out of every 24 are transmitted on the NCT2 links for a total of 16 transmitted timeslots in each block. Given 32 blocks, there is a total of 16 * 32 = 512 transmitted (usable) timeslots.

**Attribute:**

nli

**Fullname:**

NLI/DLI for Network Timeslots

**Attribute Description:**

This attribute identifies the NLI that the network side timeslots terminates on the Global SM-2000. For release 1, all QLPS pipes use the primary NLI's on SM-2000. On Global SMs the DLT's will be used and populated in this attribute.

# QPORT

## 1. Description

Describes the relationship between the port of the QLPS Network and the CCS QPH.

The tree diagram Figure 1 depicts the stored structure of virtual relation QPORT.

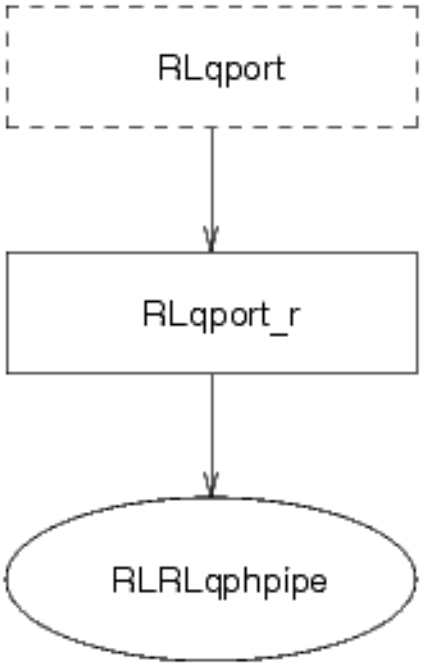

**Figure 1 Virtual Relation QPORT**

# QTYPES

## 1. Description

This relation defines the type of all QLPS (Quad-Link Packet Switch) endpoints. QLPS is used in the 5ESS-2000 switch for high bandwidth message transport.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 496 |
| expected tuples in relation | 68 |
| access type | DBACC_HASH |
| memory type | DBPRAM |

## 4. Population rules for RLqtypes

**Relation Description**

QLPS Endpoint Types

This relation will have a tuple for every endpoint in a Quad-Link Packet Switch (QLPS) network. QLPS is an optional high bandwidth message transport being developed as part of Service Net 2000 release 1. The tuples in this relation will specify the endpoint id number, the endpoint type, and what SM-2000 the endpoint resides in.

**Attribute:**

qnetwork

**Fullname:**

QLPS Network

**Attribute Description:**

This attribute identifies the QLPS network, which can only be 0 or 1 in release 1 of 5E-2000. Future releases may have

Copyright © 1999 Lucent Technologies

networks 2 and 3, which must be allowed for.

**Attribute:**
qendpt
**Fullname:**
QLPS Endpoint
**Attribute Description:**
This attribute is the id number (1-196) of a QLPS endpoint for the given QLPS network.

**Attribute:**
type
**Fullname:**
QLPS Endpoint Type
**Attribute Description:**
This attribute specifies the type of the indicated QLPS endpoint. For release 1, the possible type of endpoints are MH and QGP.

| type | endpoint addresses |
|---|---|
| MH | 1 - 192 |
| QGP | 193 - 194 |
| Side Ports for QGPs | 195 - 196 |

**Attribute:**
sm_num
**Fullname:**
SM Where Endpoint Resides
**Attribute Description:**
This attribute specifies the SM where this endpoint resides. For the MH, it is the same number as the endpoint address. For the QGP, this attribute is zero since the QGP endpoint is not in an SM.

**Attribute:**
dsl_group
**Fullname:**
DSL group number
**Attribute Description:**
DSL group number to which the QLPS endpoint (specifically a QPH) is assigned. A dsl_group is also defined as the logical PH.

## 4. Population Rules for RLqu_cfdfl

**Relation Description:** Queuing constructed feature defaults.

This is the constructed feature relation for multiline hunt group queuing features. These features are assigned to multiline hunt groups in order to provide queuing for calls terminating to the multiline hunt group when all members of the multiline hunt group are busy.
