## Legal Notice

### Copyright ©1999 Lucent Technologies, Inc. All Rights Reserved.

This electronic information product (IP) is protected by the copyright and trade secret laws of the United States and other countries. The complete document may not be reproduced, distributed, or altered in any fashion. Selected sections may be copied or printed with the utilities provided by the viewer software as set forth in the contract between the copyright owner and the licensee to facilitate use by the licensee, but further distribution of the data is prohibited.

For permission to reproduce or distribute, call:

1-888-LTINFO6 (1-888-584-6366) (From inside the continental United States)

1-317-322-6848 (From outside the continental United States).

### Notice

Every effort was made to ensure that the information in this IP was complete and accurate at the time of publication. However, information is subject to change.

This IP describes certain hardware, software, features, and capabilities of Lucent Technologies products. This IP is for information purposes; therefore, caution is advised that this IP may differ from any configuration currently installed.

Lucent Technologies is the successor to the business and assets of AT&T Network Systems business unit.

### Mandatory Customer Information

***Interference Information: Part 15 of FCC Rules*** - Refer to the *5ESS*®-2000 Switch Product Specification IP.

### Trademarks

4ESS is a registered trademark of Lucent Technologies.
5ESS is a registered trademark of Lucent Technologies.
ALLIANCE is a registered trademark of AT&T Corp.
ANSI is a registered trademark of American National Standards Institute.
AUTOPLEX is a registered trademark of Lucent Technologies.
COMMON LANGUAGE is a registered trademark and CLEI, CLLI, CLCI, and CLFI are trademarks of Bell Communications Research, Inc.
DEC is a trademark of Digital Equipment Corporation.
DynaText is a registered trademark of Electronic Book Technologies, Inc.
EKTS is a trademark of Lucent Technologies.
ESS is a trademark of Lucent Technologies.
ETHERNET is a registered trademark of Xerox Corporation
IBM is a registered trademark of International Business Machines Corp.
MC68020 is a trademark of Motorola, Inc.
MC68040 is a trademark of Motorola, Inc.
MC68060 is a trademark of Motorola, Inc.
MEGACOM is registered trademark of AT&T Corp.
MOTOROLA is a registered trademark of Motorola, Inc.
MULTIQUEST is a registered trademark of AT&T Corp.
PINNACLE is a registered trademark of Lucent Technologies.
SLC is a registered trademark of Lucent Technologies.

TELETYPE is a registered trademark of AT&T Corp.
VOICEMARK is a registered trademark of AT&T Corp.
UNIX is a registered trademark in the United States and other countries, licensed exclusively through X/Open Company Ltd.

## Warranty

Warranty information applicable to the *5ESS*®-2000 switch may be obtained from the Lucent Technologies Account Management organization. Customer-modified hardware and/or software is not covered by this warranty.

## Ordering Information

This IP is distributed by the Lucent Technologies Customer Information Center in Indianapolis, Indiana.

The order number for this IP is 235-600-113. To order, call:

1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568 (From inside the continental United States)

1-317-322-6848 or fax to 1-317-322-6699 (From outside the continental United States).

## Support Telephone Numbers

***Information Product Support Telephone Number:*** To report errors or ask nontechnical questions about this or other IPs produced by Lucent Technologies, call 1-888-LTINFO6 (1-888-584-6366).

***Technical Support Telephone Numbers:*** For initial technical assistance, call the North American Regional Technical Assistance Center (NARTAC) at 1-800-225-RTAC (1-800-225-7822). For further assistance, call the Customer Technical Assistance Management (CTAM) Center:

1-800-225-4672 (From inside the continental United States)

1-630-224-4672 (From outside the continental United States).

The CTAM center is staffed 24 hours a day, 7 days a week.

# 1. INTRODUCTION

## 1.1 PURPOSE

This Translations Data Manual describes the protected relations, virtual relations, and global parameters of the Lucent Technologies *5ESS*®-2000 switch database. It serves as a reference guide for personnel who maintain the *5ESS*®-2000 switch. This document may be used in conjunction with the following Lucent Technologies documents:

- *5ESS®-2000 Switch Population Rules Language (PRL) Data Manual* (235-600-123)
- *5ESS®-2000 Switch Dynamic Data Manua*l (235-600-234 )
- *5ESS®-2000 Switch Translations and Dynamic Data Reference Manual* (235-600-225)
- *5ESS®-2000 Switch Translations and Dynamic Data Domain Description Manual* (235-600-245)

If you will be using this document to troubleshoot automatic static office-dependent data (SODD) audits, be sure to read the *5ESS®-2000 Switch Routine Operations and Maintenance Procedure* (235-105-210) and "Overview" section of this document.

## 1.2 UPDATE INFORMATION

### 1.2.1 GENERAL

This manual is being updated to include changes to the 5E14 translation data protected relations, virtual relations and global parameters. This document is available only in electronic media. Software updates cause changes in translation data, and when these changes occur, this manual will be updated to reflect the new and/or changed information.

Due to the nature of the data contained within this manual, interactive references and linking are not available. To easily find specific relations, please use the *DynaText*®search feature.

### 1.2.2 NOMENCLATURE CHANGES

As of March 18, 1999, Bellcore officially changed its name to Telcordia Technologies. In this document, the Bellcore name is used only to identify items that were produced under the Bellcore name. Exceptions may exist in software-influenced elements such as input/output messages, master control center screens, and recent change/verify screens. Where these elements are shown, there may be references to the Bellcore name until such time as they are changed in the software code.

As a result of the World Telecommunications Standardization Conference held March 1-12, 1993, the International Telegraph and Telephone Consultative Committee (CCITT), no longer exists as an organization under the International Telecommunication Union (ITU). According to the ITU, the CCITT is now referred to as the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS).

For new and revised Recommendations issued by the ITU-TS, the term "CCITT Recommendation X.xxx" will be replaced by the "ITU-T Recommendation X.xxx" designation. For a transition period from 1993 to 1997, if the Recommendation had a previous CCITT designation, the new name will include "(formerly CCITT Recommendation X.xxx)". Names of existing CCITT Recommendations will not change unless revised.

National ISDN is an evolving platform in which new features will continue to be introduced for new revenue opportunities, improved operational efficiencies, and for support of specific applications. NI 1, NI 2, and NI 3

Copyright © 1999 Lucent Technologies 

represent specific features as documented in Bellcore SRs 1937, 2120, and 2457. The industry is migrating to an additional terminology to more specifically denote the availability of National ISDN features: NI 95, NI 96, etc. A feature is included in a specific version (such as, NI 96) if it is available by the switch vendors by the first quarter of the year.

## 1.3 ORGANIZATION

This document is organized into four parts.

- Part 1, Introduction, Section 1 , presents an overview of this document and the protected database of the *5ESS*®-2000 switch. An index in Part 1 lists the protected relations, virtual relations, and global parameters of the database that are described in this issue.

- Part 2, Relations, Section 2 , presents the protected relations and virtual relations of the *5ESS*®-2000 switch database. Protected relations are the relations that are stored either on disk (`DBDISK`) or in Database Random Access Memory (`DBPRAM`). Virtual relations are the relations that are not stored in memory ( `DBNOTODD`). Each relation in Part 2 of this document contains a brief relation description, data dictionary values section, field layout section, and population rules section. For each virtual relation in Part 2 there is a tree diagram that depicts the decomposition scheme of the relation.

- Part 3, Global Parameters, Section 3 , describes the global parameters of the *5ESS*®-2000 switch database. Each global relation in this section contains a brief relation description, the initial value section, a rules section, and the population rules.

- Part 4, Relation Name to Recent Change/Verify View Cross-Reference, Section 4 , lists the Recent Change and Verify (RC/V) view numbers and the associated *5ESS*®-2000 switch static data base global parameters and base relations.

- Part 5, Recent Change/Verify View Cross-Reference to Relation Name, Section 5 , lists the Recent Change and Verify (RC/V) view numbers and the associated *5ESS*®-2000 switch static data base global parameters and base relations.

All relations and global parameters are listed alphabetically, with numbers and underscores preceding letters.

## 1.4 CONVENTIONS USED IN THIS DOCUMENT

In this document, population rule language version 5.0 (PRL 5.0). statements, expressions, and attributes appear in `constant-width type`. Variable names in PRL 5.0 statements appear in *`constant-width italic type`*.

## 1.5 OVERVIEW

### 1.5.1 GENERAL

The *5ESS*®-2000 switch uses a relational database called office-dependent data (ODD). The ODD database resides in computer memory and consists of the relations and global parameters that are required to support a specific *5ESS*®-2000 switch. *Relations* are two-dimensional tables with rows that are called *tuples*. Tuples consist of several fields, and columns of fields are called *attributes*. A *field layout* graphically depicts one tuple of a relation, including the placement of the attributes. The set of possible values for an attribute constitutes that attribute's *domain*. To uniquely identify a tuple in a relation, one or more attributes are designated as the *key*, and a key with more than one attribute is called a *compound key*.

A *parameter* is a *5ESS*®-2000 switch variable that is stored in a single memory location (as opposed to a relation, which is always treated as an array). A *global parameter* is known to the entire *5ESS*®-2000 switch (not to only one

Copyright © 1999 Lucent Technologies 

or more switching modules (SMs) but to all SMs in the switch). There are approximately 1500 global parameters. Each parameter is assigned a value that is specific to that office configuration.

The ODD is populated with data that is electronically entered on office data administration (ODA) input forms via the ODA process. The rules that govern the populating of the ODD are specific to each software release. Data is changed by means of the RC/V program or the office data base editor (ODBE).

### 1.5.2 PRL 5.0 AUTOMATED STATIC ODD AUDIT CHECKS

The Automated Static ODD Audit (99-5E-1334) will identify most types of ODD database errors. To ensure the accuracy and completeness of the error detection, the Automated Static ODD Audit feature uses the source files of PRL 5.0.

When the Automated Static ODD Audit is executed, it will create a detailed log of all error conditions detected in the *5ESS*®-2000 switch database. In most instances, the log will contain the line number from the relation `checks` section of the PRL 5.0 source code files where the error was detected. The decoded log also contains an excerpt of the source code associated with the failing line number.

To resolve the SODD errors in the error log file, one must refer to the relation `checks` section in the latest version of the PRL 5.0 source code files. The latest version of the PRL 5.0 files resides in the Electronic Media Networked Services on-line *5ESS*®-2000 switch source code listings. These files are updated on a regular basis.

Note that the PRL 5.0 source code files contained in this *Translations Data Manual* are issued only once, at the introduction of a new Software Release (SR). Subsequent changes to the relation `checks` section of the PRL 5.0 source code files will cause the information in the *Translations Data Manual* to become outdated. To avoid confusion, use only the on-line version of this document to analyze SODD audit errors.

**NOTE:** For instructions on how to use the on-line listing service, see the *5ESS*®*-2000 Switch Software Analysis Guide* (235-600-510).

## 1.6 USER FEEDBACK

The producers of this document are constantly striving to improve quality and usability. Please use the enclosed user feedback form for your comments and to advise us of any errors. If the form is missing or your comments will not fit, please write to:

Lucent Technologies
Documentation Services
2400 Reynolda Road
Winston-Salem, NC 27106

Please include the issue number, publication date of the document, your complete mailing address, and telephone number. We will answer all correspondence within 30 days, informing you of the disposition of your comments.

You may also call our documentation HOT LINE if you need immediate help.

**The HOT LINE number is 1-888-LTINFO6 (1-888-584-6366).**

The HOT LINE is available from 7:30 a.m. to 6:00 p.m. Eastern Standard time. Outside of those hours, you can leave a message on the answering machine and someone will return your call the following business day. This HOT LINE is not intended to eliminate the use of the comment cards, but rather to enhance the comment process.

Document users who have access to electronic mail facilities may send comments via electronic mail. The electronic address is **hotline5@wrddo.lucent.com**. Please make sure that the document title, number, and issue

Copyright © 1999 Lucent Technologies 

number are included in the mail along with the sender's name, phone number, and address.

## 1.7 DISTRIBUTION

This document is distributed by the Lucent Technologies Customer Information Center in Indianapolis, Indiana. Most operating telephone companies should place orders through their documentation coordinator. Some companies may allow customers to order directly from the Customer Information Center; however, the majority do not. Companies that use documentation coordinators to manage their orders receive a significant discount. If you do not know the name/number of the documentation coordinator for your company, you may call 1-888-582-3688 to obtain their name and telephone number.

Customers not represented by a documentation coordinator and Lucent Technologies employees can order the documentation for the *5ESS*®-2000 switch directly from the Lucent Technologies Customer Information Center. Proper billing information must be provided. These orders should be mailed to:

Lucent Technologies Customer Information Center
Order Entry
2855 N. Franklin Road
Indianapolis, IN 46219

Orders may also be called in on 1-888-LUCENT-8 (1-888-582-3688) within the continental United States and +1-317-322-6416 from outside the continental United States or faxed in on 1-317-322-6484.

## 1.8 TECHNICAL ASSISTANCE

Technical assistance for the *5ESS*®-2000 switch can be obtained by calling the North American Regional Technical Assistance Center (NARTAC).
**The NARTAC LINE NUMBER IS 1-800-225-RTAC**
This telephone number is monitored 24 hours a day, 7 days a week. During regular business hours, your call will be answered by your local NARTAC. Outside of normal business hours, all calls will be answered at a centralized technical assistance center where service-affecting problems will be dispatched immediately to your local NARTAC. All other problems will be referred to your local NARTAC on the next regular business day.

## 1.9 REFERENCES

### 1.9.1 TRANSLATION DATA DOCUMENTS

The Lucent Technologies documents referenced in this manual are:

- 235-600-234, *Dynamic Data Manual*
- 235-600-123, *Population Rules Language (PRL) Data Manual*
- 235-600-245, *Translations and Dynamic Data Domain Description Manual*
- 235-600-225, *Translations and Dynamic Data Reference Manual*

### 1.9.2 VCDX DOCUMENTS

This document also contains information concerning the Compact Digital Exchange (CDX) and the Very Compact Digital Exchange (VCDX), which are switching systems based on the *5ESS*®-2000 switch. This document is a standard *5ESS*® switch/*5ESS*®-2000 switch document that is also applicable to the CDX and VCDX switching systems. Information applicable only to CDX or VCDX may be found in the following manuals:

Copyright © 1999 Lucent Technologies 

- 235-120-010, *Compact Digital Exchange (CDX) Reference Guide (5E13)*
- 235-120-020, *Compact Digital Exchange (CDX) User's Guide (5E13)*
- 235-120-120, *Very Compact Digital Exchange (VCDX) User's Guide*

### 1.9.3 RELEASE SPECIFIC DOCUMENTS

An "x" or "x"s in the last three positions of a release specific document number indicate the digits that change from release to release. Refer to 235-001-001, *Documentation Description and Ordering Guide* for the document number associated with each software release.

## 1.10 PROTECTED AND VIRTUAL RELATIONS

### 1.10.1 DEFINITIONS

The following diagram defines commonly used data dictionary terms that appear in the descriptions of protected and virtual relations in the *5ESS*®-2000 switch database. Values that are not explicitly specified use the default value.

| Engineering Information | Definition |
|---|---|
| Access Type | Access types for protected relations are linear (sequential search), compacted/indexed, hashed, dynamic hashed, and dictionary. Access types for virtual relations are generated key and virtual. Default: None; this is a required field. |
| Application | The term used for relations whose distribution type includes logical partitioned (LP) distribution. The processor (AM or CMP) on which the tuples reside is determined by which functionality owns the relation. Default: Null. |
| CORCable | Can the relation be changed via customer-originated recent changes (CORCs)? Default: DBNO. |
| Cluster | The number of sequentially keyed tuples which are always populated as a set. Default: 1 Range: 1 to 4096 |
| Data Page Size | The size (in bytes) required for each data page. Default: 0. |
| Density | The percentage of key values present in the key range populated. For example if the keys in a relation are between 100 and 300 and 80 of those are typically present, the density is 80/(300-100) or 40 percent. 100 means all tuples present are sequentially keyed. Default: 0 (The program internally chooses a default based on the access method.) Range: 0 to 100 |
| Distribution | Tuples reside in the switching module (SM), administrative module (AM), communication module processor (CMP), or a combination of those elements of the *5ESS*®-2000 switch. Default: None; this is a required field. |
| Expected Tuples in Relation | The expected number of tuples to be populated in the typical SM relation. It is the size around which memory usage is optimized. This is generally set to the average field value for non-SM-2000s. Default: 0. |
| Foldtype | The folding algorithm that is used on the key of a hashed relation. Foldtypes are DBDEFAULT (DBGC16) and DBGC31. Default: DBDEFAULT. |
| Head Table Size | The size (in bytes) of the head table for the relation. Default: 0. |
| I2 Index | For three-level indexing, the number of key attribute bits that are used to index into the intermediate data page. Zero (0) signifies not indexed or index-by-divide method used. Default: 0. |
| Identical | Indicates the name of an identical relation with both relations having identical structures. Default: Null. |
| Ignore | This field serves two purposes. For CIND relations, if sub-keys are used, any bits not selected by the sub-keys must be accounted for in the ignore option. For DYNAMIC relations, this field can only specify one range. This range is the high bits that are always zero, in other words those that are not used. Default: 0 |
| Index Length | The number of key attribute bits that is required to index into the head table. Zero (0) |

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | signifies not indexed or index-by-divide method used. Default: 0. |
| Intermediate Page Size | For three-level indexing; the size (in bytes) of each intermediate page for the relation. Default: 0. |
| Key Shift | Not applicable for protected or virtual relations. Default: 0. |
| Key Store | Indicates whether the key attributes are stored. Default: DBYES. |
| Length/Position of Subkeys | The aggregate key of a compacted indexed access relation may be broken up and rearranged into as many as six subkeys. The length (in bits) of each subkey and its position (bit offset from the beginning of the tuple) are specified. Default: 0. |
| Manual | If DBYES is specified, the relation will have to be checked and possibly reengineered each time the relation changes. Default: DBNO. |
| Maximum Tuples in Relation | The logical maximum number of tuples in the relation by design. The actual number of tuples should not exceed this number. Memory usage may degrade if the number of tuples populated for a given relation is greater than this number. This number may not be an absolute maximum if the combination of the keys of the relation allows for more tuples. Default: 0. |
| Memory Type | Protected relations reside in Database Protected Random Access Memory (DBPRAM) or database disk (DBDISK) memory. Virtual relations (DBNOTODD) are not stored in memory. Default: DBNOTODD. Unprotected relations reside in Database Unprotected Random Access Memory (DBURAM) and are documented only in the *5ESS*®-2000 Switch Dynamic Data Manual. |
| Padding Indicator | Padding is not used for protected data; padding indicator is set to unpadded. |
| Page Level | The level of indexing for the relation: 0 signifies indexed access not used, 1 signifies single-level indexing, 2 signifies two-level indexing, and 3 signifies three-level indexing. Default: 0. |
| Permutation Type | Attributes are rearranged for optimal memory usage or performance (perm) or not (unperm). |
| Pseudo Index | Not applicable for protected or virtual relations. Default: 0. |
| Pseudo Page | Not applicable for protected or virtual relations. Default: 0. |
| Relation Type | Protected relations have a relation type of either DBSTATIC or DBSTORAGE. Virtual relations have a relation type of DBSTATIC, DBNOUPDT, or DBNOSEQU. Default: DBSTATIC. |
| Spare | This option is used to force a minimum amount of free space in a tuple structure for future use. Default: 0 |
| Trigger Function | The name of the invoked trigger function. Default: Null. |
| Insert Trigger | Is trigger invoked on insertions? Default: DBNO. |
| Update Trigger | Is trigger invoked on updates? Default: DBNO. |
| Delete Trigger | Is trigger invoked on deletions? Default: DBNO. |
| End of Transaction Trigger | Is trigger invoked at the end of a transaction? Default: DBNO. |
| Tsbal | This value determines the basis for engineering the relation. It indicates whether time or space is more important. Default: DBNORMAL |

### 1.10.2 ACCESS TYPE

Different methods are necessary to provide efficient access to data in relations of various sizes. The following methods are used to access information in protected database relations:

| | |
|---|---|
| Linear Access | `DBACC_LIN`. Tuples are stored one after another. This method requires tuples to be searched sequentially until a particular tuple is found by matching the key. This method is slow and is used only when a few tuples are stored in the relation. Its advantage is that it requires the least amount of memory. |
| Compacted Indexed Access | `DBACC_CIND`. This access method is fast but may require more memory than the other access methods. A pointer in an access dictionary points to the data page (for single-level indexed access, the entire relation is contained on one data page) or to the head table (for two- or three-level indexing). After the data page or head table is selected, the relation key and the information from the index dictionary are used in an arithmetic operation to produce an index that identifies the correct data page and offset into the data page where the tuple is located. |

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | There are three types of indexing:<br><br>(1) In *single-level indexing,* the entire relation key (usually a simple key) is used as an index. The index is used with the tuple size specified in the index dictionary to find a tuple on the data page.<br><br>(2) In *two-level indexing,* the relation key is divided to produce two indexes. The first index is used to find an offset into the head table, which provides the block ID number of (pointer to) the correct data page. The second index is used with the tuple size to find the offset into the data page where the tuple is stored.<br><br>(3) *Three-level indexing* requires three accesses: the head page, an intermediate page, and a data page. The tuple resides on the data page. |
| Hashed Access | `DBACC_HASH`. This access method uses the relation key in the fold-type algorithm to produce the address where the tuple resides. |
| Dictionary Access | `DBACC_DD`. This access method is similar to single-level indexing except that relations with this access method are dictionaries for the database manager. |
| GK Relation Access | `DBACC_GK`. This access method utilizes both indexing and hashing techniques. As tuples are needed in GK relations, the database manager generates keys. The tuples are inserted sequentially, resulting in efficient memory utilization. |
| Virtual Relation Access | `DBACC_OPV`. This access method indicates that the relation is a logical structure. |

### 1.10.3 MEMORY TYPE

`DBPRAM` relations are stored in protected random access memory (RAM), where they are used. Protected RAM data can be changed by means of the RC/V program.

Since the `DBDISK` relations are used very infrequently, those relations are copied into RAM only when they are needed. Disk relations data can be changed via the RC/V program.

`DBNOTODD` relations are virtual relations. They are not stored but are built from physical relations or storage relations that reside in protected RAM or on disk.

### 1.10.4 DISTRIBUTION TYPE

The term *distribution type* describes how a relation is distributed throughout the processors. A relation may be stored in the AM, SM, CMP, or a combination of those elements of the *5ESS*®-2000 switch. The term *SM* encompasses host SMs, remote SMs, optically remote SMs, and local SMs. The basic distribution types are the following:

| | |
|---|---|
| Fixed Partitioned (FP) | The relation exists in all SMs, but the data is different from one SM to another. |
| Fixed Redundant (FR) | The relation exists in all SMs, and the data is identical from one SM to another. |
| Fixed Group of Tuples (FG) | The relation is partitioned into a group of tuples, and each group is populated on one or more SMs. The mapping between the group of tuples and the set of SMs may vary from group to group. |
| Logical Partitioned (LP) | The relation exists in either the AM or the CMP, depending on the application. |
| Logical Redundant (LR) | The relation exists in both the AM and the CMP. |
| Disk Only (DO) | The relation resides on disk. |
| Control ODD (CO) | The relation exists in all processors. This distribution type is used only for data dictionaries. |

The FP, FR, FG, LP, and LR distribution types can be combined to form more complex distribution types. For

Copyright © 1999 Lucent Technologies 

example, LPFG indicates that each group of tuples may reside not only on one or more SMs (the FG rule) but may also reside on the LP processor (AM or CMP, as determined by the relation's application). Similarly, LRFG indicates that in addition to residing on one or more SMs, a group of tuples may reside on the LR processor (that is, be redundantly populated on the AM and CMP).

LPFP indicates that each tuple is stored on one of the SMs (the FP rule) and also on the LP processor (AM or CMP, as determined by the relation's application). Thus the LP processor contains all tuples in the relation for an LPFP relation. An LPFG relation, on the other hand, may or may not contain all tuples in the relation.

### 1.10.5 APPLICATION

As stated earlier, the term *application* refers only to relations whose distribution type includes LP. The processor on which the tuples reside (AM or CMP) is determined by which application owns the relation. Each LP relation includes an application specification in its data dictionary section, depending on the functionality that the relation is associated with. A global parameter contains the ID of the processor on which each application resides. For example, Global parameter `Glprcmap` contains the processor ID of the CMP since the Recent Change mapping code, application `RCMAP`, resides on the CMP.

### 1.10.6 RELATION TYPE

The OpViews feature provides users with more ways to view and access the database. It also allows data to be stored more efficiently and saves memory space.

Before the OpViews facility was available, there was only one way to access and view the database. With few exceptions, the user tuple buffers contained copies of the data exactly as it was stored. Since the user tuple and the stored tuple were usually identical, memory was wasted.

With the OpViews facility, however, the logical view of the data (user tuple) need not be the same as the stored data (stored tuple). In other words, the data in a logical view (virtual relation) can be stored in one or more physical storage relations. The application user does not need to know how the data is stored. Data storage is mostly independent of what the database users see, and data storage can be rearranged without affecting users. Thus data can be designed to ensure efficient memory usage.

The separation of the data storage format from the user's conceptual view of the data has resulted in several new relation types. The main categories of relations are

- physical relations
- virtual relations
- storage relations

These relation types are described more fully in the following subsections.

### 1.10.7 General

#### 1.10.7.1 Physical Relations

Physical relations are relations that the user views exactly as they are stored in the ODD database. Users can access these relations directly. Physical relations have a corresponding set of population rules.

Relation type: `DBSTATIC` if tuple-level access (TLA) primitives are used, or `DBDYNAMIC` if dynamic access (DA) primitives are used.

Copyright © 1999 Lucent Technologies 

### 1.10.7.2 Virtual Relations

Virtual relations are constructed from data that is stored in more than one physical relation. A virtual relation has a logical structure that is not found in the underlying stored structure. Each virtual relation includes a tree diagram that depicts its stored structure: a dashed box denotes the virtual relation itself, solid boxes denote root storage relations, and ellipses denote GK storage relations.

There are three types of virtual relations:

- virtual update relations
- virtual read-only relations
- virtual batch review-inhibit relations

All three types of virtual relations share several characteristics. They are all mapped into physical storage relations, and they all have a virtual relation file, one or more root storage relations, and optional child storage (or GK) relations.

Users see no difference between virtual and physical relations. From the database manager's perspective, a virtual relation is a tree structure in which every node represents a storage relation.

### 1.10.7.3 General

#### 1.10.7.3.1 Virtual Update Relations

Virtual update relations allow both transaction and nontransaction primitives for the following operations:

- read
- sequential read (that is, batch review, read-first/next, and step-first/next)
- insert
- delete
- update

A virtual update relation can have only one root, and its root can have only GK storage relations as child nodes.

Virtual update relations have a corresponding set of population rules.

Relation type: `DBSTATIC`.

#### 1.10.7.3.2 Virtual Read-Only Relations

Virtual read-only relations allow only nontransaction read and sequential read primitives. A virtual read-only relation can only have one root, but that root relation can have other root relations, physical relations, or GK relations as child nodes.

Relation type: `DBNOUPDT`.

#### 1.10.7.3.3 Virtual Batch Review-Inhibit Relations

Virtual batch review-inhibit (BRI) relations have the same characteristics as virtual read-only relations but do not

Copyright © 1999 Lucent Technologies 

allow sequential read access. A virtual BRI relation can have more than one root, which results in more than one tree of storage relations. The root relation can have other roots, physical relations, or GK relations as its child nodes.

Relation type: `DBNOSEQU`.

#### 1.10.7.4 Storage Relations

Like physical relations, storage relations are stored in the ODD. Storage relations are accessible only by the database manager code in support of virtual relations. There are two types of storage relations: root storage relations and child storage (GK) relations.

Storage relations have no corresponding population rules; population rules reside at the virtual update relation level.

#### 1.10.7.5 General

##### 1.10.7.5.1 Root Storage Relations

A root storage relation has the same key as its corresponding virtual update or virtual read-only relation. It does not have parent nodes. It contains the key information (that is, a generated key) that is needed to access its child storage relations. The root storage relation generally contains attributes that are unique to the relation keys and are not stored in GK relations. All decomposed relations must contain at least one root storage relation that is accessed with the key that is specified in the corresponding virtual relation.

Relation type: `DBSTORAGE`.

##### 1.10.7.5.2 Child Storage (GK) Relations

Child storage relations are accessed by either a generated key or, in the case of virtual read-only and virtual batch review-inhibit relations, a foreign key.

A foreign key is an attribute or set of attributes that is stored in one or more parent storage relations. It uniquely defines the primary key of a child storage relation tuple. The term "foreign" indicates that the key is located in a separate storage relation. Foreign keys differ from generated keys in two ways:

- They are user-defined (not system-generated) values.
- They are allowed only in virtual read-only and virtual BRI relations.

A generated key is an atomic attribute that is generated by the DBM access method to facilitate efficient storage of that storage relation's tuples. The generated key for a GK child storage relation is stored in its required parent relation's tuple. (A GK relation can have multiple parent storage relations whose tuples may point to or share the same GK child tuple.) A child storage relation that is defined by a generated key cannot be a root relation because a root relation must have the same key as its virtual relation. It can, however, store the generated keys of GK storage relations as its children.

Most decomposed relations use GK storage relations to store attributes that are not often populated or sets of attributes that, as a set, do not often change in value. The keys to the GK relation are not stored with the relation.

Relation type: `DBSTORAGE`.

### 1.10.8 RELATION POPULATION RULES

The relation population rules in this document are written in Release 5.0 of a formal language called Population

Copyright © 1999 Lucent Technologies 

Rule Language (PRL 5.0). PRL 5.0 represents the structure and data dependencies of static relations in a precise, unambiguous format. This language presents population rules with a set of logic constructs and some procedural constructs. This section of this document describes the features and capabilities of PRL 5.0. This section also provides reference information for personnel who use *5ESS*®-2000 switch relation population rules.

PRL 5.0 is used to describe the valid set of values in the ODD database of a *5ESS*®-2000 switch. The ODA uses these rules to validate how the database is built. The RC/V program also uses these rules to validate updates to the database. The SODD Audit feature uses these rules in checking the validity of the data in a particular *5ESS*®-2000 switch. The SODD Audit is generated directly from the PRL 5.0 population rule source files to ensure the completeness and accuracy of the checks.

### 1.10.9 POPULATION RULE FILES

The relation population rules are organized by relation. There is a separate population rule file for each static relation in the database. Each population rule file is documented both in this Translations Data Manual and through the Electronic Media Networked Services on-line *5ESS*®-2000 switch source code listings.

A population rule file contains data description sections and a `checks` section. The data description sections describe the data and, except for the `distribution-rules` and `default-rules` sections, are written in English text. The `checks` section contains the actual population rules and is written in the PRL 5.0 language.

The on-line listings contain all of the sections that are found in the population rule file. This Translations Data Manual contains all of the sections except the `retrofit-rules` section. In a population rules file, each section is marked by one of the following keywords, starting in the first column:

| | | | |
|---|---|---|---|
| attribute: | definitions: | fullname: | relation: |
| checks: | description: | parameter: | retrofit-rules: |
| default-rules: | distribution-rules: | rc-oda-rules: | import: |

Each of those sections of a population rules file is discussed in greater detail in the following sections of this document.

### 1.10.10 ORGANIZATION OF POPULATION RULE FILES

Files for the *5ESS*®-2000 switch are organized as either relations, parameters, or definitions. The following shows the organization of each file type and its sections. These sections are described more fully later in this "Introduction" to this document.

*Organization of Relation Files*

```
PRL Version: 5.0;
 relation:
fullname:
 description:
rc-oda-rules:
retrofit-rules:
default-rules:
distribution-rules:
attribute:
fullname:
description:
import:
checks:
```

Copyright © 1999 Lucent Technologies 

*Organization of Parameter Files*

```
 PRL Version: 5.0;
 parameter:
 fullname:
 description:
 rc-oda-rules:
 retrofit-rules:
 default-rules:
 distribution-rules:
 import:
 checks:
```

*Organization of Definition Files*

```
 PRL Version: 5.0;
 import:
 definitions:
```

The `Version` clause identifies version of PRL that is used in the population rules files.

The `definitions` format is used to define publicly available `func-defn`s and `let-statement`s that can be used by all relations. PRL 5.0 files are also used to define global abbreviations and functions, as described in the following text of this "Introduction."

The `attribute` section is included when the programmer defines attributes of relations and structure parameters. The `attribute` section is not included when defining scalar parameters because scalar parameters have no attributes.

### 1.10.11 SECTIONS OF THE POPULATION RULES FILE

The sections that describe each relation or parameter of the database are described here.

### 1.10.12 General

#### 1.10.12.1 Relation/Parameter

Each relation of the database is introduced by the following statement:

```
  relation:
    name of relation
```

Each parameter of the database is introduced by the following statement:

```
  parameter:
    name of parameter
```

A sample `relation` section is shown in Exhibit 1-1 .

#### 1.10.12.2 The 'fullname' Section

The `fullname` section conveys the meaning of the relation name on one line. It is introduced by the following statement:

```
 fullname:
  text
```

A sample `fullname` section is shown in Exhibit 1-1 .

#### 1.10.12.3 The 'description' Section

The `description` section describes the purpose of a single relation or parameter.

```
 description:
  text
```

A sample `description` section is shown in Exhibit 1-1 .

```
relation:
    RLch_excd

fullname:
    Charging Exception Day Relation

description:
    This relation identifies the type of charging
    used for each special day (such as a holiday).
```

**Exhibit 1-1 Relation/Parameter**

### 1.10.12.4 The 'rc-oda-rules' Section

The `rc-oda-rules` section documents additional requirements for RC/V and ODA. These rules, which are written in English, define the entry, update, and deletion of information in the relation by ODA and RC/V. Often, the information in the `rc-oda-rules` section actually represents one or more data dependencies. If there are no special rules regarding ODA and RC/V, the words `not applicable` are entered in this section. The `rc-oda-rules` section has the following format:

```
 rc-oda-rules:
  text
```

The `rc-oda-rules` section contains rules that affect the interfaces of RC/V and ODA. For example:

- If a relation is to be supported only by ODA, then a comment in this section would state that the relation cannot be modified by RC.
- If there are trigger-function constraints on the sequence in which RC should populate relations for the assignment of lines, trunks, equipment, etc., comments in this section would specify the required sequence.

  Sample `rc-oda-rules` sections are shown in Exhibit 1-2

```
rc-oda-rules:
 The attribute ref_cnt must have a zero value
 before a delete of a tuple in this relation
 is allowed.

rc-oda-rules:
 The attributes rtpd[*].strtime must be
 presented to the user in HHMM format,
 even though they are stored in seconds.

rc-oda-rules:
 The status attribute cannot go from OOS
 to ACTIVE, but must be changed from OOS
 to GROW, then in a separate operation
  from GROW to ACTIVE.
```

**Exhibit 1-2 rc-oda-rules**

Copyright © 1999 Lucent Technologies 

### 1.10.12.5 The 'retrofit rules' Section

The `retrofit-rules` section explains how to transform data from a previous *5ESS*®-2000 switch software release to the current release. It is introduced by the following statement:

```
retrofit-rules:
  text
```

The `retrofit-rules` section describes how the relation is to be populated when the *5ESS*®-2000 switch database is moved from one software release to another. These rules should be used for that purpose only. If the data does not change from one software release to another, the word `None` or `preserve over the retrofit`appears in the `retrofit-rules` section. The data may change due to

- moving data from one relation to another
- a change in interpretation of data values
- removing data

### 1.10.12.6 The 'default rules' Section

The `default-rules` section contains code that assigns values to each attribute that requires a default value. The imperative/functional dialect of PRL 5.0 is used, which is described at the end of the PRL 5.0 description.

When no information is provided for a specific data item during an insert operation, both RC/V and ODA use the `default` variable. The `default-rules` section is introduced by the following statement:

```
default-rules:
  statements
```

The `default-rules` section has access to the `default` variable to provide default values.

The assignments in the `default-rules` section are used to initialize the RC/V and ODA views. If necessary, the RC/V or ODA user can override these values. If no default is given for a nonkey attribute, that attribute defaults to the smallest legal nonnegative value.

If there are no default rules, the comment `/* none */` is used in this section. A sample `default-rules` section is shown in Exhibit 1-3 .

```
default-rules:
    default.ref_cnt = 0;
    for i in { 0 thru $MAX_RTPD - 1 }
    begin
 default.rtpd[i].strtime = 86400;
 default.rtpd[i].clrt = 0;
   end
```

**Exhibit 1-3 default rules**

### 1.10.12.7 The 'distribution rules' Section

The `distribution-rules` section contains coded rules that define the processors for which a specific tuple in the current relation exists. This code is used for reference only; it is never executed. It is introduced by the following statement:

```
distribution-rules:
  statements
```

Copyright © 1999 Lucent Technologies 

Sample distribution-rules sections are shown in Exhibit 1-4 .

```
distribution-rules:
 /* standard */

distribution-rules:
 pcrlist [tuple.im] =
 true;

distribution-rules:
 /*
  * populate this relation only on SM's
  * that support RISLU's
  */
 for loceq in RLrc_loceq on am
 where (loceq.unittype is_in {SMRISLU, SMRISLU2})
  pcrlist [loceq.im] = true;
```

**Exhibit 1-4 distribution-rules**

The code in the distribution-rules section refers to the boolean array pcrlist and the variable tuple to describe the distribution of data across processors.

If pcrlist[i] is true, then the tuple must be found on processor<i>. If pcrlist[i] is false, then that tuple must not be found on processor<i>. The pcrlist array is initialized to all false. (For a sample pcrlist, see Section "Built-in Functions.")

For some relations, such as RLcktdata, the pcrlist cannot be computed from the tuple. For those relations, the distribution-rules section is empty, and the rc-oda-rules section contains details, such as processor supplied by RC/ODA user.

### 1.10.12.8 The 'attribute' Section

Every attribute that is defined in the relation must be described by an attribute section.

Population rules that cover parameters do not have an attribute section because parameters typically do not have attributes. An attribute section appears in the following format:

```
attribute:
 name of attribute

fullname:
 full name of attribute

description:
 descriptive text
```

Sample attribute sections are shown in Exhibit 1-5 .

```
attribute:
    dispx
fullname:
    display index
description:
    OSPS BST display index for the given
```

```
    call factors.

attribute:
    rtpd[*].strtime
fullname:
    Start Time
description:
    Gives the start time for this rate
    period in seconds past midnight.
```

**Exhibit 1-5 attribute**

The operator `[*]` is used for pseudoarrays of like attributes (see Subsection "Pseudoarrays").

### 1.10.12.9 The 'import' Section

The import section contains a list of files which define symbols used in the poprule file. An example of this section can be found in RLfc_line.R.

### 1.10.12.10 The 'checks' Section

The `checks` section contains the true population rules and is the main part of a relation's population rules specification. The `checks` section contains the assertions and dependency rules about a database that evaluate to true or false based on the contents of that database at a given time. Assertions are used to assert that one or more specified conditions must be true. For the contents of a database to be correct, all PRL 5.0 assertions about that database must evaluate to true. Relation dependency rules are dependencies between the relation that is being specified and some other relation, and/or dependencies that are not associated with a particular attribute. Each dependency rule is written using a combination of the dependency statements that are described in Section "Statements for Specifying Dependencies with Declarative PRL." If no assertions or dependencies are associated with the relation as a whole, the relation `checks` section contains the comment `/* not applicable */`. The relation `checks` section may also be used to list attribute-specific dependencies.

The `checks` section is introduced by the following statement:

```
checks:
 PRL 5.0 statements
```

## 1.10.13 DEFINITIONS IN PRL

### 1.10.13.1 Data in PRL

A numeric constant can be written in the following bases:

- Decimal numbers are a sequence of one or more digits from *0* to *9*. They should not start with a *0* unless there is only one digit.
- Octal numbers start with a *0* and continue with one or more digits from *0* to *7*.
- Hexadecimal numbers start with *0x* or *0X* and continue with one or more digits from *0* to *9* and *a* to *f* or *A* to *F*.
- Binary numbers start with *0b* or *0B* and continue with one or more *0*s and *1*s.

A *string constant* is a sequence of characters between a set of enclosing double quotation (" ") marks that is not immediately preceded by a backslash. Within a string constant, a backslash double quotation mark (*"*) means a

double quote, a backslash backslash (\) means a single backslash, and a backslash zero (*0*) means the null character.

An *identifier* begins with a letter and continues with zero or more letters, digits, or underscores. All characters are significant, and their case (lower case or upper case) is also significant. An identifier that is preceded by a `$` refers to a value that has been defined in a *.h* file. An identifier may optionally be preceded by a backslash (\) so that a keyword can be used as an ordinary identifier.

### 1.10.13.2 Pseudoarrays

A *pseudoarray* is a special interface that PRL 5.0 supports for a set of like-named attributes. If a set of attributes has embedded sequential numbers that start with either *0* or *1*, then that set of attributes can be accessed using a pseudoarray. For example, if a tuple has attributes *a01, a02, a03, ... a25*, then the PRL 5.0 program can regard these attributes as a pseudoarray *a* that can be indexed by values from 1 to 25. (It would be an error to use index *0* on this pseudoarray.) Some external attribute name series have two numbers embedded in them, such as *s1b1, s2b1, s1b2, ... s2b10*. These can be regarded as arrays of arrays. In this example, *s[*]b[*]* is an array of arrays; *s[1]b[*]* is an array, and *s[1]b[2]* is a single element. Note that pseudoarray subscripts can be in the middle of an identifier.

If there is a set of attributes that have skipped numbers, these attributes cannot be accessed using the pseudoarray interface. For example, the attributes *attr01, attr02, attr11*, and *attr12* cannot be accessed using the pseudoarray interface because the embedded numbers are not sequentially increasing.

The following diagram shows examples of pseudoarrays:

**Examples of Pseudoarrays:**

| RD [a] | PRL [b] |
|---|---|
| attr1<br>attr2...<br>attr42<br>abc1def.ghi<br>abc2def.ghi<br>att01...<br>att09 | attr[1] attr[*]<br>attr[2]<br>attr[42]<br>abc[1]def.ghi abc[*]def.ghi<br>abc[2]def.ghi<br>att[*] |
| ***Notes:***<br>a. Relation Definition Language<br><br>b. Population Rules Language | |

### 1.10.14 STATEMENTS FOR SPECIFYING DEPENDENCIES WITH DECLARATIVE PRL

The following dependency statements are used to specify the database integrity constraints:

- the `for` statement
- the `if` statement
- `assertion` statements
- the `combinations_of` statement
- the `find` statement
- the `select` statement
- the `let` statement

Copyright © 1999 Lucent Technologies 

## 1.10.15 General

### 1.10.15.1 The 'for' Statement

The `for` statement is used as a looping construct. It has several slightly different forms, but each of its forms has the same purpose: to execute a statement or block of statements repetitively. Note that a `for` statement always contains `begin` and `end` keywords.

The different forms of a `for` statement are illustrated in the following subsections of this text.

### 1.10.15.2 General

#### 1.10.15.2.1 Accessing the Tuples in a Relation

The `for` statement is used to access a number of tuples within a relations. The simplest and most common form of the `for` statement is as follows:

```
for tuple in RLabcdef
begin
        .
        .
        .
        statement-list
        .
        .
        .
end
```

In this form of the `for` statement, the statement list between the `begin` and `end` keywords is executed once for every tuple that is found in the referenced relation `RLabcdef`. This form of the `for` statement is illustrated in Exhibit 1-6 .

```
for rc_lcc in RLrc_lcc
begin
        if (rc_lcc.servclass == FC_ISDN) then
        begin
                rc_lcc.termclass == RTTC_INDIVID;
        end
end
```

**Exhibit 1-6 for statement**

#### 1.10.15.2.2 Processor Specification

We have seen that the `for` statement can loop through all of the tuples in a referenced relation. The `for` statement also allows one or more qualifying processors to be specified that specify the tuples that are looped through, as shown in Exhibit 1-7 .

```
for fcline in RLfc_line on re_oeinfo.portmod
begin
        .
        .
        .
```

Copyright © 1999 Lucent Technologies 

```
        statement-list
      .
      .
      .
end
```

**Exhibit 1-7 for Statement Processor Specification**

In the `for` statement in Exhibit 1-7 , the referenced relation `RLfc_line` has a qualifying processor, on `rc_oeinfo.portmod`. The statement-list between the begin and end keywords is executed once for every tuple in that part of the referenced relation that resides on the `rc_oeinfo.portmod`. This use of the for statement is further illustrated in Exhibits 1-8 through 1-10 .

```
for ctinfo in RLctinfo on sm (12)
begin
        ctinfo.cw_on > ctinfo.cw_off;
end
```

**Exhibit 1-8 for Statement Example**

```
for ctinfo in RLctinfo on SM (sm_number)
begin
        ctinfo.cw_on > ctinfo.cw_off;
end
```

**Exhibit 1-9 for Statement Example**

```
for ctinfo in RLctinfo on xzy.port.module
begin
        ctinfo.cw_on > ctinfo.cw_off;
end
```

**Exhibit 1-10 for Statement Example**

Exhibits 1-7 through 1-10 shown previously, illustrate the most general form of processor specification; any valid expression can follow the `on` keyword (see Subsection, "Expressions in Dependency Statements"). Other possibilities for specifying qualifying processors in the for statement are the keywords `on all` and on `sm_all`.

Note that, without a processor specification, tuples from a partitioned relation are selected from the current processor, and tuples from a nonpartitioned relation (central or redundant) are selected from an appropriate processor.

### 1.10.15.2.3 Tuple Variables

A tuple variable provides a means to reference successive tuples of a relation. In this form of the `for` statement, the statement list between the `begin` and `end` keywords is executed once for every tuple in the referenced relation `RLabcdef`. In turn, the tuple pointer `abcdef` points to each tuple that the `for` statement ranges over. This tuple pointer may be used from within the begin-end block to reference tuples that might otherwise be ambiguous. Exhibit 1-11 illustrates a nest form of the `for` statement. Notice the different tuple variables.

```
for ctinfo in RLctinfo
where (ctinfo.rcall_type != 0)
begin
            for tctinfo in RLctinfo
            where (tctinfo.call_type == ctinfo.rcall_type
```

Copyright © 1999 Lucent Technologies 

```
                    begin
                                tctinfo.ct_adctype == DBYES;
                    end
     end
```

**Exhibit 1-11 Nest Form for Statement**

### 1.10.15.2.4 Stepping through a Range of Variables

In addition to ranging over a set of tuples, a for statement may be used to range over a set of listed values, as shown in Exhibit 1-12

```
for idx in { 1 thru 6, 10 }
begin
       .
       .
       .
        statement-list
       .
       .
       .
end
```

**Exhibit 1-12 Ranging**

In the `for` statement in Exhibit 1-12 , the statement list between the `begin` and `end` keywords is executed once for each value in the set that is specified in the braces ( { } ), in this case, seven times. In turn, the variable `idx` assumes each of these values. The set that is specified in the braces may be a factor or list of factors (see Subsection, "Factors"). This form of the `for` statement is illustrated in Exhibit 1-13

```
for bix in { 0 thru 31 }
begin
         let i = (aix / 32) + bix;
         let aix = 2 * bix;
         if (i != 0) then
         begin
                   find >= 1 group_port in RLgroup_port
                   where (group_port.grpnum == i);
         end
end
```

**Exhibit 1-13 Factors**

Exhibit 1-14 shows some other possible ways of using a `for` statement in this manner.

```
for idx in { 1 thru var1 }
begin
       .
       .
       .
end
for i in { j thru k }
begin
        .
        .
```

Copyright © 1999 Lucent Technologies 

```
        .
end
for i in { 1 thru 6, j thru k, 15 }
begin
        .
        .
        .
end
```

**Exhibit 1-14 Factors**

### 1.10.15.2.5 The 'where' Clause

The `for` statement also provides a `where` clause, which is used to select certain tuples that limit the range of the for statement. A `where` clause may be used with all forms of the `for` statement that step through tuples. A sample where clause is shown in Exhibit 1-15 .

```
for abcdef in RLabcdef
where (abcdef.attr1 == DBYES)
begin
            .
            .
            .
            statement-list
            .
            .
            .
end
```

**Exhibit 1-15 Where Clause**

In this form of the `for` statement, the statement list between the `begin` and `end` keywords is executed once for each tuple in the referenced relation whose value for `attr1` is `DBYES`. This form of the for statement is illustrated in Exhibit 1-16

```
for group_port in RLgroup_port
where (group_port.portgrp.grptype == TM_LINE)
begin
        find == 1 rt_lgmem in RLrt_lgmem
        where (rt_lgmem.grpnum == group_port.grpnum);
end
```

**Exhibit 1-16 Where Clause - for Statement**

### 1.10.15.3 The 'if' Statement

The `if` statement in PRL is much like `if` statements in other languages. A specified condition is tested for its truth value. If the condition is true, a statement or block of statements is executed. Optionally, an `else` clause allows a different statement or block of statements to be executed if the specified condition is false. The condition that is being tested may be any logical expression and must be enclosed in parentheses (see Subsection, "Expressions in Dependency Statements").

An `if` statement appears in the following format:

```
if ( condition ) then
begin
```

```
                .
                .
                .
                statement-list
                .
                .
                .
        end
        else
        begin
                .
                .
                .
                statement-list
                .
                .
                .
        end
```

Sample `if` statements are shown in Exhibits 1-17 , 1-18 , and 1-19 .

```
        if (rc_lcc.servclass == FC_PROCALL) then
        begin
                 rc_lcc.termclass == RTTC_INDIVID;
        end
        else
        begin
                 rc_lcc.termclass is_in { RI, AGING, TINWATS };
        end
```

**Exhibit 1-17 if Statement**

```
        if (ctinfo.ct_optype == OSPSDA &&
                ctinfo.notify != ctinfo.coin_recall) then
        begin
                ctinfo.ct_adctype == DBYES;
        end
```

**Exhibit 1-18 if Statement**

```
        begin
                let found = find == 1 a in RLa where (a.x == FC_PBX);
                if (found) then
                begin
                            find == 1 a in RLa where (ax == FC_PBX)
                            when_found
                                      a.y == GLdef on sm(pcr_num);
                end
        end
```

**Exhibit 1-19 if Statement**

Exhibit 1-17 consists of an `if-then` clause and an `else` clause, whereas Exhibits 1-18 and 1-19 consist of only an `if-then` clause.

Copyright © 1999 Lucent Technologies 

Note that the `begin` and `end` keywords are always present in both the `if-then` and `else` clauses of an `if` statement.

### 1.10.15.4 Assertion Statements

*Assertion statements* are statements that are used to assert that one or more specified conditions must be true. Assertion statements provide a powerful means of expressing data dependencies at a conceptual level. There are three types of assertion statements:

- simple assertion
- valid combination assertion
- find assertion

In all three types of assertions, if an assertion fails (that is not true), an error condition is identified.

### 1.10.15.5 General

#### 1.10.15.5.1 Simple Assertion Statements

Simple assertion statements are quite common. A simple assertion usually consists of a factor (see Subsection "Factors"), followed by an assertion operator, followed by a factor or factor list. In general, however, expressions can appear on either the left or right side of the assertion operator (see Subsection, "Expressions in Dependency Statements"). Simple assertions may be linked to a form a *compound assertion* (see Subsection, "Compound Assertions") or a logical expression by using the logical operators and (&&) and or (||). To force precedence of simple assertions in a compound assertion or logical expression, parentheses are used.

The simple assertion operators are as follows:

**Relational operators:**
== (equals)
!= (not equal)
> (greater than)
< (less than)
>= (greater than or equal)
<= (less than or equal)
**Bitwise operators:**
& (bitwise and)
| (bitwise or)
^ (bitwise eclusive)
<< (left shift)
>> (right shift)
**Boolean operators:**
&& (logical and)
|| (logical or)
! (logical not)
**Set operators:**
*is_in*
*subset_of*
*set_equals*
*union*
*intersection*
*minus*
**Pattern-matching operators:**
~== (is matched by)
~!= (is not matched by)

#### 1.10.15.5.2 General

##### 1.10.15.5.2.1 Arithmetic Operators

The five arithmetic operators (+, -, *, /, and %) are used to assert that some arithmetic relationship between the factors on the left and right sides of a simple assertion statement must be true.

The statement in Exhibit 1-20 states that two attributes must be equal to each other.

```
for ctinfo in RLctinfo
begin
     find == 1 stinfo in RLstinfo
     where (ctinfo.serv_tm == stinfo.serv_tm)
     when_found
     begin
          ctinfo.ct_optype == stinfo.st_optype;
     end
end
```

**Exhibit 1-20 Two Attributes**

Exhibit 1-21 shows other sample statements that contain the == and != operators.

```
A global parameter must be equal to the value of a variable, as in
     Glospsid == reroute;

An  attribute must not be equal to a constant, as in
     ctinfo.cw_on != 15;

Two tuples must be  equal (attribute by attribute) to each other, as in
     /* the am must replicate all sm RLctinfo tuples */
     for ctinfo in RLctinfo
     begin
          find == 1 tctinfo in RLctinfo
          where (tctinfo == ctinfo);
     end
```

**Exhibit 1-21 Arithmetic Samples**

The statement in Exhibit 1-22 states that the value of one attribute must be greater than the value of another attribute.

```
for ctinfo in RLctinfo
begin
     ctinfo.cw_on > ctinfo.cw_off;
end
```

**Exhibit 1-22 Attribute Value**

Exhibit 1-23 shows other sample statements that contain the > (greater than) and < (less than) operators.

An attribute must be greater than or equal to a constant value, as in

```
ctinfo.rcall_type >= 27;
```

**Exhibit 1-23 Attribute Constant Value**

The value of a global parameter must be less than or equal to the value of an attribute within a particular tuple, as in

Copyright © 1999 Lucent Technologies 

```
Glint_flow <= ctinfo.cw_on;
```

In Exhibit 1-24 , a single element of an array attribute, that is, `stinfo.ctmask[arr_idx]` , must be equal to a constant.

```
if (maskidx == 1) then
begin
     stinfo.ctmask[arr_idx] == 1;
end
```

**Exhibit 1-24 Single Element Attribute**

The array index inside the brackets ( [ ] ) may be any valid numeric expression (see Subsection "Expressions in Dependency Statements"). Exhibit 1-25 shows other sample statements that contain == and != operators involving arrays.

A single element of an array attribute must not be equal to an element of an array variable, as in Exhibit 1-25 .

```
stinfo.ctmask[arr_idx] != new_array[arr_idx];
```

**Exhibit 1-25 Single Element Array**

Element 2 of an array variable must not be equal to a constant, as in

```
new_array[2] != 14;
```

Exhibit 1-26 illustrates bit slicing in simple assertion statements. Bit slicing allows individual bits within an attribute, variable, or parameter to be referenced. The assertion in Exhibit 1-26 illustrates the use of such a bit-index. The attribute `memnum` is an array, and the `[aix]` notation is used to indicate which element of the array is being referenced. In addition, the `{bix}` notation is used to indicate which bits of the referenced element are being referenced.

```
let bix = 5;
let aix = 7;
if (group_port.member is_in { 1 thru 2015 }) then
begin
     rt_lgmem.memnum[aix]{bix} == 0B1;
end
```

**Exhibit 1-26 Bit Slicing**

The right side of the statement is expressed as a binary constant, `0B1`, but a statement of the form

```
rt_lgmem.memnum[aix]{bix} == 1;
```

is also valid. The bit index that is contained in the braces ( { } ) may be any valid numeric expression, or it may be a range of expressions separated by a colon (see Subsection "Expressions in Dependency Statements").

Exhibit 1-27 shows other sample statements that contain == and != operators involving bit slicing.

A string of bits of a single element of an array attribute must be equal to a constant, as in

```
rt_lgmem.memnum[aix]{9:11} == 0B101;
```

**Exhibit 1-27 Bit Single Element**

A string of bits of an attribute cannot all be set to 1, as in

```
ctinfo.ctname{9:12} != 0B1111;
```

Exhibit 1-28 illustrates the use of a *pseudoarray attribute* in a simple assertion statement. A pseudoarray attribute is a sequence of systematically named attributes, which can be referenced in checks statements. The assertion in

Copyright © 1999 Lucent Technologies 

Exhibit 1-28 illustrates the use of one element of a pseudoarray. The attribute `sup_tm` is not really an array but rather a group of eight identically defined attributes. The `[idx]` notation is used to indicate which attribute in the attribute group is being referenced. The pseudoarray index inside the parentheses may be any valid numeric expression (see Subsection "Expressions in Dependency Statements").

```
ctinfo.serv_tm != ctinfo.sup_tm[idx];
```

**Exhibit 1-28 Pseudoarry Attribute**

The statement in Exhibit 1-28 indicates that the `serv_tm` attribute must not be equal to the `idx`'th `sup_tm` attribute.

Exhibit 1-29 shows other sample statements that contain arithmetic operators involving pseudoarray attributes.

The attribute `dotflw2` must be greater than or equal to the attribute `dotflw1`, the attribute `dotflw3` must be greater than or equal to the attribute *dotflw2*, and so forth, as in

```
for x in { 2 thru 8 }
 begin
      ctinfo.dotflw[x] >= ctinfo.dotflw[x-1];
 end
```

**Exhibit 1-29 dotflw2 Attribute**

If any attribute in the attribute group `sup_tm1` through `sup_tm8` is not equal to zero, then all of the previous attributes in the group must not be equal to zero. For example, if `sup_tm2` is not zero, then `sup_tm1` must not be zero; if `sup_tm3` is not zero, then `sup_tm1` and `sup_tm2` must not be zero, and so forth, as in

```
for x in { 2 thru 8 }
 begin
      if (ctinfo.sup_tm[x] != 0) then
      begin
           ctinfo.sup_tm[x-1] != 0;
      end
 end
```

Exhibit 1-30 illustrates the use of a synonym of the *let* operator. First, a `find` assertion statement is assigned to *x* with a `let` statement (see Section "The 'let' Statement"). The name *x* is then used in a simple assertion statement.

```
let x = find >= 1 rt_lgmem in RLrt_lgmem
          where (rt_lgmem.grpnum == rt_mhg.grpnum);
     .
     .
     .
if (maskidx == 1) then
begin
     x == true;
end
```

**Exhibit 1-30 Synonym - Simple Assertion Statement**

### 1.10.15.5.2.2 Set Membership Operators

Three set-membership operators are available in PRL 5.0:

- *is_in*

- *subset_of*
- *set_equals*

The *is_in* operator is used to assert that a factor (see Subsection "Factors") is a member of a set. The *subset_of* operator is used to assert that one set is contained in another set. The *set_equals* operator is used to assert that two sets are the same. Each of these operators evaluates to either true or false. In general, a set is delimited by enclosing its members between braces ( { } ).

The statement in Exhibit 1-31 indicates that the value of an attribute must be in the set of integers between 1 and 250, inclusive.

```
if (rt_scrning.route_type == RTE_ATDN) then
begin
     rt_scrning.route_x is_in { 1 thru 250 };
end
```

**Exhibit 1-31 Set Value of Attribute**

Exhibit 1-32 shows other sample statements that contain the *is_in* operator.

```
The value of an attribute must be one of a set of enumerated values,  as in
     fc_porttyp.protocol is_in { PCDOLH3, PCDILH3 };

A variable must not be one of a set of values, as in
     ! (start_signal is_in { 1 thru 25, 50, 75 thru 80, 100 });
```

**Exhibit 1-32 is_in Operator**

The value of an attribute must not be in the set of values of a pseudoarray attribute; the array index inside the parentheses may be any range of expressions separated by a colon rather than just constants as shown here (see Subsection "Expressions in Dependency Statements").

```
     ! (ctinfo.serv_tm is_in { ctinfo.sup_tm[1:8] });
```

The simple assertion statement in Exhibit 1-33 says that one set of values must contain another set of values. The set on the left side of the operator is the set of values for the `RLrt_scrning.prefix` attribute that is formed by using the grouping construct in the `for` statement. Therefore, the `group` keyword is used, which obviates the need to express this set in braces ( { } ). The set on the right side of the operator represents a set of enumerated

```
/* Every group of tuples with equivalent screen_x and dest_x
      * must contain one tuple for at least the 3 emulated
      * values of prefix.
      */
     for grt_scrning in RLrt_scrning
     grouped_by {screen_x, dest_x}
     begin
          {FCPEX_0, FCPFX_1, FCPEX_NONE} subset_of grt_scrning.prefix;
     end
```

**Exhibit 1-33 Set of Values**

Whenever the `subset_of` assertion operators are used in a simple assertion, both of the operands must represent sets of values. Exhibit 1-34 presents other sample statements that contain `subset_of` operators.

Copyright © 1999 Lucent Technologies 

The set of values represented by the list of factors on the left side of the statement must contain (that is, must be a subset of) the set of integer values on the right side of the statement, as in Exhibit 1-34 .

```
 { abc.attr1, count, Glint_flow, index, abc.attr2 } subset_of { 12,
14, 23, 56, 63, 88, 96 };
```

**Exhibit 1-34 subset_of Statement**

The set of values represented by the list of factors on the left side must not contain (that is, must not be a subset of) the set of integer values on the right side. This means that at least one member of the set on the right side of the statement is not found in the set on the left side, as in

```
! ({ 12, 14, 96 } subset_of { abc.attr1, count, Glint_flow, index,
abc.attr2 });
```

An assertion can also be written to state that two sets must contain the exact same set of members, as in

```
     { 12, 14, 96 } set_equals { abc.attr1, count, abc.attr2 };
```

### 1.10.15.5.2.3 Pattern-Matching Operators

The two pattern-matching operators are used to assert that a string does or does not match a *regular expression*. A regular expression is specified by describing the regular expression as used in the *UNIX*® operating system. The regular expression is enclosed in double quotation marks (`" "`).

In Exhibit 1-35 , a variable must match a regular expression.

```
     string  == "[0-9]+";
```

**Exhibit 1-35 Variable Match**

In Exhibit 1-36 , an attribute must not match the regular expressions.

```
     risite.text  !=  "[0-9]+";
```

**Exhibit 1-36 No Variable Match**

### 1.10.15.5.2.4 Compound Assertions

The next two examples illustrate how simple assertions can be linked logically and how precedence can be forced by using parentheses.

Exhibit 1-37 is an assertion statement that is composed of two simple assertion statements that are linked by the logical *or* (`||`) operator.

```
     for rc_lcc in RLrc_lcc
     begin
          rc_lcc.termclass == FC_ISDN ||
               rc_lcc.servclass != FC_PROCALL;
     end
```

**Exhibit 1-37 Assertion Statement**

The assertion statement in Exhibit 1-38 consists of two other assertion statements that are linked by the logical *and* (`&&`) operator. The first of these assertions is itself a compound assertion statement that is linked by the logical *or* (`||`) operator. In this example, the parentheses are used to force the first assertion to be evaluated before the second assertion. Without the parentheses, the order of evaluation of the entire assertion statement would be reversed because the *and* operator has a higher precedence than the *or* operator.

Copyright © 1999 Lucent Technologies 

```
    for rc_lcc in RL_lcc
     begin
          if (current_pcr == ATDN) then
          begin
               (rc_lcc.termclass == FC_ISDN ||
                    rc_lcc.servclass != FC_PROCALL) &&
                    rc_lcc.termclass == RTTC_INDIVID;
          end
     end

     /* which is equivalent to */
     for rc_lcc in RL_lcc
     begin
          if (current_pcr == ATDN) then
          begin
               rc_lcc.termclass == RTTC_INDIVID;
               rc_lcc.termclass == FC_ISDN ||
               rc_lcc.servclass != FC_PROCALL;
          end
     end
```

**Exhibit 1-38 Logical Operator**

### 1.10.15.6 The Valid Combinations Statement

A *valid combinations statement* is used to specify valid combinations of values for a group of items. Valid combinations statements are illustrated in Exhibits 1-39 and 1-40 .

```
for fc_porttyp in RLfc_porttyp
begin
     combinations_of ( fc_porttyp.servclass, fc_porttyp.protocol )
     begin
          { FCLOHK, FCNAHK_TRUNK }, { PCDOLH3, PCDILH3 };
          FCLOMET_TRUNK, { PCDILM3, PCDOLM3 };
          FC_BSYVFY, PCIOPER3;
          FC_SPSOPER, PCDOLH3;
          FC_TRK_EMERG, PCAEMER3;
          TM_TSTK, PCALTT3;
     end
end
```

**Exhibit 1-39 Valid Combinations Statement**

```
if ! (fc_porttyp.serv_class is_in { FCLOHK, FCLOMET_TRUNK,
     FCNAHK_TRUNK, FC_BSYVFY, FC_SPSOPER }) then
begin
     combinations_of
     (
          fc_porttype.protocol,
          fc_trunk.in_sigtyp,
          fc_trunk.instartsig,
          fc_trunk.out_sigtype,
```

Copyright © 1999 Lucent Technologies 

```
          fc_trunk.out_startsig
     )
     begin
          { PCIEMHP2, PCIEMMP2 },
          DBDP,
          FCIMMED,
          DBNOSIG,
          FCSSNULL;
          { PCOEMHP2, PCOEMMP2 },
          *,
          FCSSNULL,
          DBDP,
          FCIMMED;
          {
               PCAILH1,
               PCAILH2,
               PCAILM2,
               PCDILH1,
               PCIEMH1,
               PCIEMHM2,
               PCIEMMM2
          },
          { DBMFC_V1, DBMFC_V2, DBMFC_V3, DBMFC_V4 },
          FCSTARTNA,
          DBNOSIG,
          FCSSNULL;
```

**Exhibit 1-40 Valid Combinations Statement**

```
          { PCDILH2, PCDILM2 },
          { DBMFC_V1, DBMFC_V2, DBMFC_V3, DBMFC_V4 },
          FCSTARTNA,
          DBNOSIG,
          FCSSNULL;
     end
end
```

Each group of values in a valid combinations assertion specifies a single combination of values that is legal for the set of valid combinations that is listed at the top of the table. In most cases, the list of valid combinations items at the top of the table is a list of attributes, global parameters, and/or variables, as shown in Exhibits 1-39 and 1-40 . In general, however, each valid combinations item can be any arbitrary expression (see Subsection "Expressions in Dependency Statements").

In Exhibit 1-39 , the valid combinations items are the attributes `fc_porttyp.servclass` and `fc_porttyp.protocol`. The table itself consists of five groups of valid values for these two combination table items. The first group of values consists of `{ FCLOHK, FCNAHK_TRUNK }`, and `{ PCDOLH3, PCDILH3 }`. This means that when the `servclass` attribute in relation `RLfc_porttyp` equals either `FCLOHK` or `FCNAHK_TRUNK` , then the `protocol` attribute in relation `RLfc_porttyp` must be either `PCDOLH3` or `PCDILH3` , and so forth for all other groups of values in the table. This information could be specified in other ways, but the valid combinations assertion is much more compact and less verbose than the other, more verbose constructs.

In any particular group of values, each value except the last value is followed by a comma, and each group of values is terminated with a semicolon. When more than a single value must be entered for a given item in a group, the set of values is enclosed in braces ( { } ). All of the groups of values combined represent all of the different legal combinations for the combination table items at the top of the table. If a group of values for the listed combination

table items does not match any of the combinations in the table, the assertion fails and an error condition is raised. For the valid combinations assertion to be valid, at least one of the combination table items must have all of its legal values specified in the table.

An asterisk (`*`) can be used to specify that any value is legal. An exclamation point (`!`) that is followed by a value or group of values can be used to specify that any value except those specified values is legal.

As shown in the Exhibits 1-39 and 1-40 , a combinations statement always contains the `begin` and `end` keywords.

### 1.10.15.7 The 'find' Statement

A `find` statement allows a programmer to count the elements in a set and simultaneously make an assertion about each element. The relation in which tuples are being looked for may be restricted to the AM, CMP, or to a particular SM or with a `where` clause in a manner similar to `for` statement operations.

### 1.10.15.8 General

#### 1.10.15.8.1 Key Words

The key words in `find` statements are `find`, `in`, `where`, and `when_found`. A sample `find` statement is shown in Exhibit 1-41 .

```
if (Glsub_sigtyp == RCNO_SUB) then
begin
     find == 0 rc_lcc in RLrc_lcc;
end
```

**Exhibit 1-41 find Statement Key Words**

Exhibit 1-41 illustrates the `find` statement in its simplest form, which is

```
find <relational operator> <tuple count> <tuple variable>
in <relation>;
```

If any tuples are found in the relation, the `find` assertion fails and an error condition is raised.

Exhibit 1-42 illustrates another `find` statement.

```
if (Glsub_sigtyp == RCNO_SUB) then
begin
     find == 1 rc_lcc in RLrc_lcc;
end
```

**Exhibit 1-42 find Statement**

The `find` statement in Exhibit 1-42 indicates that exactly one tuple must be present in the relation `RLrc_lcc`. If no tuples are in that relation, or if more than one tuple is found, then the `find` assertion fails and an error condition is raised.

Exhibit 1-43 illustrates another `find` statement.

```
if (Glsub_sigtyp == RCNO_SUB) then
begin
     find <= (rt_scrning.dest_x) rc_lcc in RLrc_lcc;
end
```

**Exhibit 1-43 Another find Statement**

Copyright © 1999 Lucent Technologies 

The `find` statement in Exhibit 1-43 indicates that there must be no more than `rt_scrning.dest_x` tuples in the relation `RLrc_lcc`; that is, the number of tuples is the value that is contained in the attribute `rt_scrning.dest_x`. If the number of tuples in that relation is greater than the value of `rt_scrning.dest_x`, then the `find` assertion fails and an error condition is raised.

### 1.10.15.8.2 Tuple List/Processor Specification

The following examples show how a qualifying processor is specified in a `find` statement. This statement is similar to the `for` statement. The qualifying processor specifies the tuples that the `find` statement searches.

```
for ctinfo in RLctinfo
 begin
      find >= 1 stinfo in RLstinfo
         where (ctinfo.sup_tm1 == stinfo.serv_tm);
 end
```

**Exhibit 1-44 find Statement Searches**

```
for ctinfo in RLctinfo
begin
     find >= 1 stinfo in RLstinfo on sm (12)
     where (ctinfo.sup_tm1 == stinfo.serv_tm);
end
```

**Exhibit 1-45 find Statement Searches**

```
for ctinfo in RLctinfo
begin
     find >= 1 stinfo in RLstinfo on xyz.port.module
     where (ctinfo.sup_tm1 == stinfo.serv_tm);
end
```

**Exhibit 1-46 find Processor Specification**

Exhibits 1-44 and 1-45 illustrate the use of the `on` clause for processor specification. Exhibit 1-46 illustrates the most general form of processor specification.

### 1.10.15.8.3 Tuple Variables

As shown in Exhibit 1-47 , a `find` assertion statement allows a *tuple* variable to be used to ensure that a relation reference is not ambiguous.

```
for ctinfo in RLctinfo
 begin
      find == 1 tctinfo in RLctinfo
      where (tctinfo.call_type == ctinfo.rcall_type)
      when_found
      begin
           tctinfo.ct_optype == ctinfo.ct_optype;
      end
 end
```

**Exhibit 1-47 Tuple Variable**

Copyright © 1999 Lucent Technologies 

The statement in Exhibit 1-47 asserts that for each tuple in the relation RLctinfo, there must be exactly one other tuple in which the rcall_type attribute of one tuple is the same as the call_type of the other tuple. The ct_optype attribute of the tuples must also match.

### 1.10.15.8.4 Finding Values

A find statement allows a variable to range over a list of values. The list of values may be attributes, global parameters, and/or variables. In Exhibit 1-48 , *value_id* is expected to be of the same underlying domain as the attributes in the list. This statement asserts that exactly two attributes have a nonzero value in the set of values that is listed between the braces. It also asserts that each of the two attributes found must have a value of less than 100.

```
for a in RLa
begin
     find == 2 value_id in { a.a1, a.a2, a.a3 }
     where (value_id != 0)
     when_found
     begin
          value_id < 100;
     end
end
```

**Exhibit 1-48 Find Statement Variable**

### 1.10.15.8.5 The 'where' Clause

The find statement provides a where clause that is used to specify a condition that must be true for the find statement to be true. Exhibit 1-49 illustrates the use of the where clause in a find statement.

```
for rc_lcc in RLrc_lcc
 begin
      find >= 1 rc_oeinfo in RLrc_oeinfo
      where (rc_oeinfo.lcc == rc_lcc.lcc &&
           rc_oeinfo.rax == rc_lcc.rax);
 end
```

**Exhibit 1-49 Where Clause in Find Statement**

This find statement asserts that for every tuple in relation RLrc_lcc at least one tuple must exist in relation RLrc_oeinfo in which the lcc and rax values of both relation tuples match. If no matching tuple is found in relation RLrc_oeinfo, the find assertion fails and an error condition is raised.

### 1.10.15.8.6 The 'when_found' Clause

In addition to the required items and where clause, the find statement also provides a when_found clause. The when_found clause is executed for each element of the array regardless of whether the count assertion is true. Exhibit 1-50 illustrates the use of the when_found clause in a find statement.

```
for rc_cninf in RLrc_cninf
begin
     find == 1 rc_lcc in RLrc_lcc
     where (rc_lcc.lcc == rc_cninf.lcc &&
          rc_lcc.rax == rc_cninf.rax)
```

Copyright © 1999 Lucent Technologies 

```
          when_found
          begin
               rc_lcc.servclass == FC_ISDN;
          end
     end
```

**Exhibit 1-50 When_Found Clause**

The `find` statement in Exhibit 1-50 illustrates the use of the `where` clause and the `when_found` clause together. A `when_found` clause may, however, be specified without a `where` clause. Any number of statements may be placed in the `when_found` block.

The `find` statement in Exhibit 1-50 indicates that exactly one tuple must exist in relation `RLrc_lcc` whose `lcc` and `rax` values match the corresponding `lcc` and `rax` values in some tuple in relation `RLrc_cninf`. When this matching tuple is found, the `servclass` attribute in relation `RLrc_lcc` must be `FC_ISDN`.

Two possible error conditions could arise as a result of this statement. The first error condition would occur if exactly one matching tuple in relation `RLrc_lcc` is not found (that is, zero matches are found) or if two or more matching tuples are found. If this occurs, the `when_found` clause is not executed and the entire `find` assertion fails.

If exactly one matching tuple is found in relation `RLrc_lcc`, another error condition could arise if the `servclass` attribute on the matching tuple does not equal `FC_ISDN`.

This double error condition can occur whenever a `when_found` clause is used in a `find` statement. The tuple existence assertion can fail, in which case the entire statement fails. Or, if the tuple existence is true, the assertions inside the `when_found` clause can fail.

Secondly, at first glance, the statement

```
find == 1 rc_lcc in RLrc_lcc
where (rc_lcc.lcc == rc_cninf.lcc &&
     rc_lcc.rax == rc_cninf.rax &&
     rc_lcc.servclass == FC_ISDN);
```

may appear to mean the same thing as the `find` statement in Exhibit 1-50 , but it does not. Suppose that two or more matching tuples can be on the `lcc` and `rax` attributes, but only one of the matching tuples has the correct value for `servclass`. In that case, the assertion in the previous exhibit would pass, whereas the `find` assertion in Exhibit 1-50 would fail.

### 1.10.15.8.7 Nested 'find' Statement

As shown in Exhibit 1-51 , a `find` statement may be nested inside the `when_found` clause of some other `find` assertion.

```
for rt_dntran in RLrt_dntran
begin
     find >= 1 rc_cninf in RLrc_cninf
     where (rc_cninf.module == rt_dntran.port.module &&
          rc_cninf.ph_number == rt_dntran.ph_number &&
          rc_cninf.ph_cn == rt_dntran.ph_cn)
     when_found
     begin
          find == 1 rc_lcc in RLrc_lcc
          where (rc_lcc.lcc == rc_cninf.lcc &&
               rc_lcc.rax == rc_cninf.rax)
```

```
                when_found
                begin
                     rc_lcc.termclass == rt_dntran.termclass;
                     rc_lcc.termclass == rt_dntran.pstermcl;
                end
           end
     end
```

**Exhibit 1-51 Nested Find Statement**

In Exhibit 1-51 , the second `find` statement is nested inside the `when_found` clause of the first `find` statement. Inside the `when_found` clause of the second `find` statement are two simple assertion statements. For every tuple in the relation `RLrt_dntran`, at least one matching tuple must be found in relation `RLrc_cninf`. When this matching tuple is found, the `lcc` and `rax` attribute values in that tuple are used to find a matching tuple between relations `RLrc_lcc` and `RLrc_cninf`. When this matching tuple is found, two simple assertions between the `RLrt_dntran` tuple and the `RLrc_lcc` tuple must be true.

### 1.10.15.9 The 'select' Statement

A `select` statement is used to perform alternate checks that are dependent on the value of some expression. An expression is selected, and this expression is compared for equality with expressions that are contained in one or more `when` clauses. When the first `when` clause expression that is equal to the `select` expression is found, the statement or block of statements that are associated with the matching `when` clause is executed. Only the statements that are associated with the first matching `when` clause are executed. If there are no matching `when` expressions, the statements that are associated with an optional `else` clause are executed.

Sample `select` statements are shown in Exhibits 1-52 and 1-53 .

```
for rt_scrning in RLrt_scrning
begin
     select (rt_scrning.route_type)
     begin
          when (RTE_ATDN):
          begin
               rt_scrning.route_x == 0;
          end
          when (RTE_DNTRAN):
          begin
               rt_scrning.route_x is_in { 1 thru 250 };
          end
          when (RTE_HUNT):
          begin
               rt_scrning.route_x is_in { 1 thru 3617 };
          end
          when (RTE_PRIME):
          begin
               rt_scrning.route_x == 0;
          end
          else
          begin
               false;
          end
     end
```

```
end

Note: "false" in the previous else part indicates that any other values are error
      conditions.
```

**Exhibit 1-52 Select Statements**

```
     select (cktdata.type, cktdata.cli)
     begin
          when ( PCMSMA, * ):
          begin
               . . .
          end
          when ( PCMSDST, 0 ):
          begin
               . . .
          end
          when ( PCMSALIT, {0, 1, 2} ):
          begin
               . . .
          end
    end
```

**Exhibit 1-53 Select Statements**

Exhibit 1-53 of the `select` statement illustrates the use of a list of expressions in `select when` clauses. When a `select` statement is used as shown in Exhibit 1-53 , a list of expressions rather than a single expression may be selected. If a list of expressions is selected, each `when` clause must have the same number of expressions that the `select` statement has.

If each `when` expression is equal to each corresponding `select` expression, the statement or block of statements that is associated with the matching `when` clause is executed.

As shown in Exhibits 1-52 and 1-53 , the `select` statement, `when` clauses, and `else` clause always contain `begin` and `end` keywords

### 1.10.15.10 The 'let' Statement

A `let` statement assigns expressions or statements to an identifier or set of identifiers. The `let` statements in PRL are similar to the macros that are available in other programming environments. The `let` statement should not be confused with an assignment to a variable, which it resembles.

A `let` statement can have parameters and can assign either a statement or an expression to an identifier name. A `let` statement can also assign a list of identifiers to an expression, if the expression returns a set of values. The `let` statement can have the following formats:

```
                                let identifier = expression;
               let identifier ( parameters) = expression;
               let identifier = statement ;
               let identifier ( parameters) = statement;
               let { identifier list } = expression;
```

This last `let` statement format is used for multiple simultaneous assignment; the `expression` must be of type array, and the array must have the same number of elements as the `identifier list`. This statement causes each subsequent use of the `i`*th* identifier in the list to mean "evaluate `(expression) [i]` and use that value." This construct is encountered only when a function must return multiple values, as in

let {a, b} = f(x, y, z)

Think of using a `let` statement in PRL 5.0 as defining a macro. Using a `let` statement differs from making variable assignments in several ways. A given identifier may not be assigned to be something else before the end of its scope. The scope of a `let` statement covers the smallest `begin` to `end` block in which it is contained.

If the compound statement is part of a looping construct (such as, a `for` statement), the value of the variable will not remain from one iteration to the next. Nor will it be available after the end of the loop. Unlike typical macros, however, names that are defined with `let` statements are treated as expressions, and they evaluate as though the body were contained in outer parentheses.

Sample `let` statements are shown in Exhibits 1-54 and 1-55 .

```
let SPD1 = 86400; /* secs per day */
let featid = 0x7400 | at_cf.fid;
let IntBitCnt(x) =
    count { i in { 0 thru 31 }
         where (x{i} == 1) };
let base(n) = n / 32;
let offset(n) = n % 32;
let ArrayBitCnt(a) =
    count { i in { 0 thru 32*(count a) - 1 }
     where (a[base(i)]{offset(i)} == 1) };
let IsAnOper =
    find >= 1 t in RLologinid
    where (t.serv_tm == servteam.serv_tm &&
     t.extdl_per == OA_RES);
```

**Exhibit 1-54 Let Statements**

Exhibit 1-55 shows how the nesting of `begin` to `end` blocks affects `let` statements.

```
/*
 * SCOPING EXAMPLE
 */
begin
     let x(n) = n / 16;
     /* x is available here */
     begin
          let y(n) = n % 16;
          /* x is available here */
          /* y is available here */
     end
     /* x is available here */
     /* y is NOT available */
end
```

**Exhibit 1-55 Nesting Blocks - Let Statements**

### 1.10.15.11 Expressions in Dependency Statements

Four types of expressions are used in dependency statements:

- factors

- sets
- binary expressions
- unary expressions

Each of these types of expressions are discussed in the following subsections of this document.

### 1.10.15.12 General

#### 1.10.15.12.1 Factors

A *factor* is the simplest type of expression and may be one of the following:

- an attribute (or subattribute or pseudoarray attribute)
- a global parameter
- a variable
- a function reference
- a macro reference
- a constant
  - a simple constant
  - a `count` clause
  - a `find` clause

The following are examples of factors:

```
! (ctinfo.serv_tm is_in { ctinfo.sup_tm(x:x+4) });
find <= ( rt_scrning.dest_x ) trc_lcc in RLrc_lcc;
select ( abcdef.attr1 )  ...
ctinfo.sup_tm[x-1] != 0;
if (ctinfo.ctname{x:x+5} != 0B111111) then ...
stinfo.ctmask[arr_idx / 2] != new_array[arr_idx / 2];
combinations_of
{
     abc.att1,
     abc.att2{9:11}
}  ...
ctinfo.cw_on <= Gl_intraflow;
ctinfo.cw_on <= Gl_intraflow on sm (pcrnum);
if !( start_signal is_in { 1 thru 25, 50 } ) then  ...
stinfo.ctmask[arr_idx / 2] != new_array[arr_idx / 2];
let string_val = itoa ( number ** 2 / x + 4 );
if ( length (risite.text) > 0 ) then ...
if (ctinfo.ctname{x:x+5} != 0B111111) then ...
rt_scrning.route_x == $ZERO;
```

```
for abc in RLabc on $CMP ...
 rt_scrning.route_x is_in { 1 thru $MAXHUNT };
for i in { 1 thru $SZCHKLST } ...
 let num_tuples = count {a in RLa where (RLa.x == 7)};
```

### 1.10.15.12.2 Sets

A *set* is an array of values without duplicates. The following are examples of typical set usage:

```
if !( start_signal is_in { 1 thru 25, 50 } ) then  ...
!( ctinfo.serv_tm is_in { ctinfo.sup_tm[x thru x+4] });
select  (rt_scrning.route_x)
begin
     when ({ 1 thru 250, 300, 400 thru 450 }): ...
end
if (rt_scrning.route_type is_in { RTE_HUNT, RTE_ATDN }) then ...
```

### 1.10.15.12.3 Binary Expressions

Most expressions are binary expressions, which are expressions in the following form:

*<left side> <binary-operator> <right side>*

In its simplest form, both the left and right sides of an expression, that is, the *operands* of the expression, are factors (see Subsection "Factors."). The operands of a binary expression may also be sets (see Subsection "Sets"). In addition, both the left and right sides of a binary expression may be expressions in themselves. This allows arbitrary nesting of binary expressions. By using the logical binary operators *and* (&&) and *or* (||), binary expressions can be linked to form more complex binary expressions. Binary expressions are evaluated in their order of precedence, but the precedence may be forced anywhere in a logical expression by using parentheses.

Binary expressions have the following operators:

| | |
|---|---|
| == | (equals) |
| != | (not equal) |
| < | (less than) |
| <= | (less than or equal) |
| > | (greater than) |
| >= | (greater than or equal) |
| + | (add) |
| - | (subtract) |
| * | (multiply) |
| / | (divide) |
| % | (modulo) |
| ** | (exponent) |
| && | (logical and) |
| \|\| | (logical or) |

Copyright © 1999 Lucent Technologies 

& (bitwise and)

| (bitwise or)

^ (bitwise exclusive or)

<< (left shift)

>> (right shift)

The following are set membership operators:

*is_in*

*subset_of*

*union*

*intersection*

*set_equals*

*minus*

The following are pattern-matching operators:

== (is matched by)

!= (is not matched by)

Precedence and associativity are summarized in the following diagram. Operators on the same row have the same precedence, and the rows are in order of decreasing precedence.

| Operator | Associativity |
|---|---|
| . | right to left |
| [ ] { } ( ) | left to right |
| ** | right to left |
| ! - | right to left |
| * / % | left to right |
| + - | left to right |
| << >> | left to right |
| on | right to left |
| intersection | left to right |
| union, minus | left to right |
| count, min, max, sum | NA [a] |
| thru, by | NA |
| < <= > >= | NA |
| == != == != | left to right |
| grouped_by, grouped_by_unordered | NA |
| in | NA |
| is_in, subset_of, set_equals | NA |
| & | left to right |
| ^ | left to right |
| \| | left to right |
| && | left to right |
| \|\| | left to right |
| ?: | right to left |
| = | NA |
| , | NA |

***Notes:***

a. Not applicable; the operators on a line do not have precedence over the other operators on the line.

**Copyright © 1999 Lucent Technologies** 

The following are examples of binary expressions:

```
if ( abc.att1 == y ** 2 ) then  ...
for group_port in RLgroup_port
 where ( group_port.portgrp.grptype == TM_LINE )  ...
 let truthval = rc_lcc.termclass == FC_ISDN ||
           rc_lcc.servclass != FC_PROCALL;
 find >= 1 rc_oeinfo in RLrc_oeinfo
 where ( rc_oeinfo.lcc == rc_lcc.lcc &&
      rc_oeinfo.rax == rc_lcc.rax );
 find <= ( rt_scrning.dest_x + 1) rc_lcc in RLrc_lcc;
 if ! ( start_signal is_in { 1 thru 25, 50 } ) then  ...
 if ( RLrt_scrning.prefix set_equals { FCPFX_0, FCPFX_1 } ) then ...
 ...  where ( risite.text  == "[0-9]+" )  ...
 if ( ctinfo.ct_optype == OSPSDA &&

      ctinfo.notify != ctinfo.coin_recall ) then  ...
 let string_val = itoa ( number ** 2 / x + 4 );
 select ( abcdef.attr1 % 10 )  ...
 if ( (abcdef.attr2 % 10) == 1 ) then ...
 combinations_of () begin
 {
      grpnum / 2,
      RLabcdef.attr1{9:11}
 }  ...
 let truth_val = (aidx < idx) && (bidx >= idx);
 Gl_intraflow * 2 <= ctinfo.cw_on;
 stinfo.ctmask[arr_idx / 2] != new_array[arr_idx / 2];
 new_array[arr_idx / 2] is_in { stinfo.ctmask[x:x+5] };
 if ( new_array[arr_idx / 2] is_in { stinfo.ctmask[x:x+5] } &&
      sm_num != 1 ) then  ...
 ctinfo.ctname{x * x+5 / y**2} == 0B1;
 ctinfo.ctname{x:x+5} != 0B111111;
 if ( ctinfo.sup_tm(x) != 0 ) then  ...
 ctinfo.sup_tm(x-1) != 0;
 ! (ctinfo.serv_tm is_in { ctinfo.sup_tm(x:x+4) });
```

### 1.10.15.12.4 Unary Expressions

Unary expressions are of the form

*<unary-operator>  <operand>*

In its simplest form, the operand is a factor (see Subsection "Factors"). The operand of a unary expression may also be a set (see Subsection "Sets"). The "operand" of a unary expression may itself be any arbitrary expression.

The unary expression operators are the following:

| | |
|---|---|
| ! | (not) |
| - | (bitwise not) |
| + | (plus) |
| - | (minus) |

The most common unary operators are *not* and *bitwise not*.

The following are examples of unary expressions:

```
!  (sig == DBNOSIG)
!  var_x || var_y
! (var1 >= var2) || (var1 <= var3)
!  (aidx < idx) && (bidx >= idx)
   ( ( ( x >> 8 ) * 2 ) & ( y & z ) )
```

### 1.10.15.12.5 Conditional Expressions

A *conditional expression* uses the C ternary operator (that is, ?:). Conditional expressions have the following format:

```
<expression> ? <expression> :<expression>
```

The first expression must be Boolean type, and the other two expressions must have the same type. If the first expression is true, a conditional expression evaluates to the value of the second expression. If the first expression is false, a conditional expression evaluates to the third expression.

The following are examples of conditional expressions:

```
(lnkgrp.network == CCNATL) ?
    Glnatl7sm : Glintl7sm
(Glintl7sm == Glpcr_id) ? {0 thru 40}
    : (Glnatl7sm == Glpcr_id) ? {1 thru 29} : {0}
```

Note that in the previous second example, the conditional expressions are nested. The third expression itself is a conditional expression.

### 1.10.15.12.6 Grouping Expressions

#### 1.10.15.12.6.1 Overview

A *grouping expression* partitions an array of tuples into a set of sets. The grouping is performed by the `grouped_by` expression. Each subset has identical values of a specified set of attributes. This construct is useful for treating related items as a group.

The following is an example of a group expression:

```
group-expression
     expression grouped_by { attribute-list }
     expression grouped_by_unordered { attribute-list}
```

#### 1.10.15.12.6.2 Semantics

These grouping expressions produce of array of tuples.

The initial expression must be a relation expression; each of its tuples will be in exactly one subset, and each subset will have values that are identical to the attributes that are specified in the attribute-list.

The `grouped_by_unordered` keyword is rarely used. When it is used, tuples in the same subset will have the same multiset of values for the given attributes, but which value comes from which attribute does not matter.

To see how a `grouped_by` expression works, suppose a relation `RLa` with two attributes `a, b` contains the following tuples:

```
    Relation RLa =
    { <x,2>, <y,1>, <y,3>, <z,2> }
```

Copyright © 1999 Lucent Technologies 

Grouping by the first attribute results in

```
    RLa grouped_by { a }:
    { {<x,2>}, {<y,1>, <y,3>}, {<z,2>} }
```

Grouping by the second attribute results in

```
    RLa grouped_by { b }:
    { {<x,2>, <z,2>}, {<y,1>}, {<y,3>} }
```

The following are examples:

```
RLch_clnm grouped_by { clnm }
{ x in RLch_clnm where (x.clnm != "") }
    grouped_by { clnm }
RLls_lnk on Gl_pcrid grouped_by {lsnum}
```

### 1.10.15.12.7 Bit Ordering and Array References

By convention, bits are ordered from low order to high order, or, equivalently, from right to left. The low-order bit of an attribute (or a parameter or variable) is always the right-most bit and is called Bit 0. The high-order bit is always the left-most bit. A *bit slice* is a contiguous ordered set of bits. For example, Bits 3 through 10 out of a 16-bit word would be a bit slice. The bits that are referenced in a bit slice are referenced from low order to high order. For example, the bit slice `ctname{9:12}` refers to the 10th bit from the right through the 13th bit from the right of the attribute `ctname`.

On the other hand, both arrays and pseudoarrays (that is, groups of identical attributes) are conventionally ordered from left to right and are numbered starting with zero. As a result, the array reference `ctname[4:6]` refers to the fifth byte from the left through the seventh byte from the left of the attribute `ctname` . Pseudoarrays, which are not really arrays but groups of identical attributes, are referenced similarly except that the numbering may begin at any number. Thus the pseudoarray reference `ctname[5 thru 7]` refers to attributes `ctname5` , `ctname6`, and `ctname7`.

### 1.10.15.12.8 Labels

Each statement in PRL 5.0 can have a statement label attached to it as a unique identifier. The statement label is placed before the statement, usually on the same line but possibly on the preceding line. The label consists of a string that ends with a colon. The label must be unique within a population rule file but may not necessarily be unique across all files. A statement in PRL 5.0 can be uniquely identified by a relation and label together. A label can be applied at various nesting levels so that one label may refer to an entire `for-loop`, whereas another label can identify some assertion within the same `for-loop`. In Exhibit 1-56 , `o23vb:` and `go134:` are labels.

```
PRL Version: 5.0;
description:
checks:
o23vb:    for argp in RLargp
          where (argp.thresh_frl != 31)
          begin
go134:            argp.thresh_frl <= argp.pq_frl;
                  argp.pq_frl != 31;
          end
```

**Exhibit 1-56 Label**

### 1.10.16 PRL 5.0 Functions

PRL 5.0 provides the ability to write functions. The programming style in functions is different than in a declarative specification of dependencies. Within functions, a more conventional programming style is allowed. This more conventional programming style is called "procedural PRL" or "functional" PRL. Whereas "declarative PRL 5.0" is

used to specify rules on the data, functional PRL 5.0 is generally used to calculate values or perform operations that cannot be written in declarative PRL. Functions are not intended to check data, but the `assert` statement is provided in such a way that a rule (assertion) can be placed inside a function if there is no alternative.

The function header includes the function name, parameters, and the type of data that is to be returned, as in the Exhibits 1-57 and 1-58 .

```
function atoi(string str) returning int
begin
    n = 0;
    i = 0;
    char = substr(str, i, 1);
    while (char  == "[0-9]")
    begin
        n = n*10 + index("0123456789", char);
        i = i + 1;
        char = substr(str, i, 1);
    end
    return n;
end
```

**Exhibit 1-57 Function Header**

The parameter and return-value types must be specified. A few simple types are built in, including

- Boolean, int, uint, and string.
- Many types that are implicitly defined as part of the *5ESS*®-2000 database definition (such as, enumerations, domains, and tuples).
- Type operators that are used to create new types from existing types (such as, T* designates an array with elements of type T).

```
function hunt_sm (DMGRPNUM mlhg) returning int
begin
        find == 1 rt_mhg in RLrt_mhg
        where (rt_mhg.grpnum == mlhg)
        when_found
                return rt_mhg.module;
        /* shouldn't get here */
        return am;
end
```

**Exhibit 1-58 Parameter and Return-Value**

### 1.10.17 General

#### 1.10.17.1 The Assignment Statement

Like the assignment statement in any other language, the assignment statement in PRL is the = (equal) symbol. The type of the left side of an assignment statement must agree with the type of the right side.

#### 1.10.17.2 General

#### 1.10.17.2.1 Assignment to Simple Variables

Exhibits 1-59 through 1-67 illustrate assignments to simple variables. In Exhibit 1-59 , the variable `idx` is assigned the value of the attribute `group_port.member`.

```
idx = group_port.member;
```

**Exhibit 1-59 idx Variable**

In Exhibit 1-60 , the variable `aidx` is subtracted from the variable `idx`. The result is shifted right by 5 bits, and the final result is assigned to the variable `bidx`.

```
bidx = (idx - aidx) >> 5;
```

**Exhibit 1-60 bidx Variable**

In Exhibit 1-61 , the Boolean variable `var` is assigned the truth value of a simple assertion statement.

```
var = group_port.member == 100;
```

**Exhibit 1-61 var Variable - simple Statement**

In Exhibit 1-62 , the Boolean variable `var` is assigned the truth value of a `find` statement.

```
var = find >= 1 rt_lgmem in RLrt_lgmem
          where (rt_lgmem.grpnum == rt_mhg.grpnum);
```

**Exhibit 1-62 var Variable - find Statement**

In Exhibit 1-63 , the Boolean variable `var` is assigned the truth value of a logical expression (see Subsection "Expressions in Dependency Statements").

```
var = (aidx < idx) && (bidx >= idx);
```

**Exhibit 1-63 var Variable - Logical Expression**

Exhibit 1-64 indicates how the result of a function call is assigned to a variable. The integer variable `varx2` is assigned the value that is returned from the call to the built-in function length.

```
fum = "some string";
varx2 = length (fum);
```

**Exhibit 1-64 varx2 Variable**

Exhibit 1-65 also indicates how the result of a function call is assigned. In Exhibit 1-65 , however, the assignment is made to a list of variables rather than to a single variable. This form of assignment statement is used whenever the function that is being referenced in the function call returns more than a single value. The variables `var1`, `var2`, and `var3` are assigned the values that are returned from the call to the function `compute_indexes` .

```
{var1, var2, var3} = compute_indexes (RLabc.member);
```

**Exhibit 1-65 List of Variables**

Exhibit 1-66 illustrates the assignment of a count expression (see Section "Expressions in Dependency Statements") to a variable. The variable `num_tuples` is assigned the value of the number of counted tuples.

Copyright © 1999 Lucent Technologies 

```
num_tuples = count { abc in RLabc
            where (RLabc.x == 7) };
```

**Exhibit 1-66 Count Expression**

Exhibit 1-67 illustrates *bit slicing*. In the assignment statement in Exhibit 1-67 , a string of bits is assigned in sequence to bit positions 9 through 11 of the integer variable `varx1`. The right side of the statement is expressed as a binary constant, but a statement in the following form is also valid:

```
varx1{9:11} = 5;
```

```
int     varx1;
     .
     .
     .
varx1{9:11} = 0B101;
```

**Exhibit 1-67 varx1 Variable**

The bit slice may be of length 1; that is,

```
varx1{9} = 0B1;
```

The elements inside the braces ( { } ) may be any valid numeric expression or a range of expressions separated by a colon (see Subsection "Expressions in Dependency Statements").

### 1.10.17.2.2 Assignment to Array Variables

Exhibits 1-68 through 1-74 illustrate how assignments to array variables are made.

In Exhibit 1-68 , the four factors inside the braces ( { } ) are assigned in sequence to the four elements of the integer array `arr`, that is,

```
     arr[0] = RLctinfo.cw_on;
arr[1] = RLctinfo.cw_off;
arr[2] = total;
arr[3] = index;
```

```
{arr[0 thru 3]} = { ctinfo.cw_on, ctinfo.cw_off, total, index };
```

**Exhibit 1-68 arr Array**

The array slice may be of length 1; that is,

```
arr[1] = RLctinfo.cw_off;
```

The elements inside the brackets ( [ ] ) may be any valid numeric expression or a range of expressions separated by a colon (see Subsection "Expressions in Dependency Statements").

Exhibit 1-69 has the same effect as Exhibit 1-68 ; the * notation is shorthand for 0:3.

```
arr[ * ] = { ctinfo.cw_on, ctinfo.cw_off, total, index };
```

**Exhibit 1-69 arr Array**

Exhibit 1-70 illustrates the notion of *array slicing*. The two factors inside the braces ( { } ) are assigned in sequence to an array slice. The array slice is Elements 1 and 2 of the integer array `arr`; that is,

```
arr[1] = RLctinfo.cw_off;
arr[2] = total;
```

Elements 0 and 3 of the array are unchanged.

Copyright © 1999 Lucent Technologies 

```
{arr[1 thru 2]} = { ctinfo.cw_off, total };
```

**Exhibit 1-70 Array Slicing**

The array elements inside the brackets ( [ ] ) may be any range of expressions separated by a colon (see Subsection "Expressions in Dependency Statements").

In Exhibit 1-71 , the variable `index` is assigned to the last array element of the integer array `arr`; that is,
*arr[3] = index;*
The `$` notation is shorthand for the last element.

```
arr[ $ ] = index;
```

**Exhibit 1-71 Shorthand**

Exhibit 1-72 illustrates *bit slicing*. In this assignment statement, a string of bits is assigned in sequence to Bit Positions 12 through 14 of Element 2 of the integer array `arr`. The right side of the statement is expressed as a binary constant, but a statement in the following form is also valid:

```
arr[2]{12:14} = 6;
```

```
arr[2]{12:14} = 0B110;
```

**Exhibit 1-72 Bit Slicing**

The bit slice may be of length 1; that is,

```
arr[2]{12} = 0B1;
```

The elements inside the braces ( { } ) may be any valid numeric expression or a range of expressions separated by a colon (see Subsection "Expressions in Dependency Statements").

Exhibit 1-73 illustrates both array slicing and bit slicing. In this assignment statement, two strings of bits are assigned in sequence to Bit Positions 12 through 14 of Elements 1 and 2 of the integer array `arr`.

```
{arr[1 thru 2]{12:14}} = { 0B110, 0B111 };
```

**Exhibit 1-73 Array and Bit Slicing**

The elements inside the brackets ( [ ] ) and the elements inside the braces ( { } ) may both be any range of expressions separated by a colon (see Subsection "Expressions in Dependency Statements").

### 1.10.17.3 Different Constructs in Functions

Most of the same PRL 5.0 constructs that were described in earlier sections of this documents are also used in functions. Some additional constructs are used in functions, however, and some of the constructs that are used in other types of statements perform somewhat differently when they are used in functions.

A `while` statement is a general looping construct and is legal only in functions. The expression must be Boolean-typed. If the expression evaluates to true, the statement is executed. This action is repeated until the expression evaluates to false. Execution then continues after the `while` statement.

A while statement has the following format:

```
while (expression) ...;
```

The `break` and `return` statements are also legal only in functions. A `break` terminates the smallest enclosing `while`, `for`, or `find` statement. For more information on break statements, see Subsection "The 'break' Statement."

A `return` statement causes the function to return immediately, giving the value of the expression as the function

Copyright © 1999 Lucent Technologies 

call expression value. The type of the expression must match the type that is defined in the function header.

The following statements from declarative PRL 5.0 are used in functions, with slight changes to the semantics:

- In an `if` statement, either the statement following the `then` is executed or the statement following the `else` is executed (if one is present), depending on whether the expression is true or false.
- In a `compound-statement`, the statements are executed in the order in which they appear. Neither `let` statements nor function definitions are allowed within functions.
- In a `for` statement, the statement is executed several times. Each time that the statement is executed, the identifier before the `in` clause is assigned to the next element from the array after the `in` clause. The identifier's value is undefined on normal termination of a `for` statement.
- The `select` statement executes a selected statement from a list of `when` clauses. The selected statement is chosen in the same way as with declarative PRL.

Other declarative statements make no sense in a function and are therefore prohibited. For example, `combinations_of` and `find` statements are meaningless as function statements.

### 1.10.17.4 The Assert Function

Functions in PRL 5.0 were not intended to perform checks, but a check can be performed with an `assert` statement. Using the `assert` built-in function causes the expression that is enclosed in parentheses to be evaluated as a Boolean function, evaluating to either true or false. Of course, the expression within the parentheses must evaluate to either true or false. An assert function is used only within functions.

Exhibit 1-74 is a sample `assert` statement:

```
function func2() returning boolean
begin
     for  acsr_usr in RLacsr_usr
    begin
        find == 1 dslequip in RLdslequip on sm(acsr_usr.own_mod)
        where (dslequip.dsl == port)
        when_found
        assert(dslequip.acsr_gpid == acsr_usr.acsr_gpid);
    end
    return true;
end
```

**Exhibit 1-74 assert Statement**

### 1.10.17.5 The 'break' Statement

A `break` statement forces the termination of an enclosing `while`, `for`, or `find` assertion statement before its natural termination. Exhibit 1-75 is a sample `break` statement:

```
for abc in RLabc
begin
        find == 1 def in RLdef
        where  ( . . . )
        when_found
```

```
        begin
                find >= 1 xyz in RLxyz
                where  ( . . . )
                when_found
                begin
                        if ( xyz.a == 1 ) then
                        begin
                                . . .
                                break;
                        end
                end
        end
end
```

**Exhibit 1-75 break Statement**

The `break` statement exits out of the innermost `find` statement.

### 1.10.17.6 The 'return' Statement

A `return` statement is used to exit the function and return its values. A function can return multiple values only as an array.

A `return` statement has the following format:

*`return expression;`*

### 1.10.17.7 Built-in Functions and Let Statements

The following built-in functions are defined to simplify specification of the population rules.

| Function | Meaning |
|---|---|
| am | the processor number of the AM |
| sm_all | the array of all legal SM numbers |
| all | am union sm_all |
| cmp | the processor number of the CMP |
| current_pcr | current processor number |
| sm(x) | the processor number for SMx |
| is_uniq(x) | number of unique x |
| uniq(x) | array of all elements in x, with duplicates removed |
| itoa(x) | string value of integer x |
| atoi(s) | integer value of string s |
| length(s) | integer length of string s |
| concat(s1,s2) | string resulting from appending s2 to the end of s1. |
| strlen(s) | integer length of strings (synonym of length(s)) |
| strcat(s1,s2) | string resulting from appending s2 to end of s1 (synonym of concat(s1,s2)) |
| substr(s,i,n) | substring of strings, starting with the ith character and containing n characters |
| get_gpd_pcrlist(gt,gi) | return a pcrlist value to be used for group partitioned relations |
| getenv(env) | return the value for the environment variable env |
| gpd_pcr(gt,gi) | return a particular processor p, where get_gpd_pcrlist(gt, gi) [p] == true |

| | |
|---|---|
| new(t,x) | create new variable of type t and length x |
| OnBitsInArray(a) | number of bits that are set to 1 in the array of integer-valued elements, a. |
| OnBitsInInt(x) | number of bits that are set to 1 in the integer-valued argument x |
| enum2int(v) | coerces an enum value into an int |
| int2enum(t,v) | coerces an integer value into a specified enum value [v = value, t = type] |

The functions that do not appear in the preceding table but are commonly used are located in the applications files.

## 1.11 GLOBAL PARAMETERS

Each switching office has a set of global parameters that define office constants. These constants are accessible to any processor and vary from office to office, depending on the function (that is, local, toll) and the provided features. Global parameters that begin with `Gl` are global office parameters; those that begin with `DB` are database-related parameters that are not touched by RC/V and ODA.

This document presents the domain distribution type, default value, distribution rules, and population rules of each global parameter. The domains (sets of possible values) for global parameters are the same as the domains for the attributes of relations. "Processor" refers to the module in which the global parameter resides, that is, the AM, SM, CMP, or a combination of those elements of the *5ESS* ®-2000 switch.

Global parameters may have the following basic distribution types:

| | |
|---|---|
| FP (Fixed Partitioned) | The global parameter exists in all SMs, but its value differs from one SM to another. |
| FR (Fixed Redundant) | The global parameter exists in all SMs, and its value is the same from one SM to another. |
| LP (Logical Partitioned) | The global parameter is populated differently in the AM and the CMP. |
| LR (Logical Redundant) | The global parameter exists in both the AM and the CMP, and its value is the same in both processors. |

These basic distribution types can be combined to form more complex distribution types.

**Relation Description**

LASS Automatic Callback Constructed Feature

This relation gives LASS Automatic Callback constructed feature information used in the SM. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description:** BRCS constructed feature id consists of a modular feature type and a unique identifier. For a LASS Automatic Callback constructed feature, the modular feature type is MFAC which is an enumeration of type DMmftype. The feature id must have a class of FACBRCS and a subclass of SCL_FEAT. If the feature is offered on a generally available basis, the feature id must also have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: actvn**

**Fullname:** activation

**Attribute Description:** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate via a dialed code or feature button) for 5E5 so that actvn always has the value ACTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: dctvn**

**Fullname:** Deactivation

**Attribute Description:** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate via a dialed code or feature button) for 5E5 so that dctvn always has the value DCTNONE. Future generics may allow this feature to be deactivated via dialed codes or feature buttons.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description:** Type of billing to be performed. This is an enumeration of type DMbool. This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the customer decides it will bill if the feature is universally available. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis whereas if it is set to DBNO, the billing will be done on a flat rate basis.

**Attribute: filtr_op**

**Fullname:** filter options

**Attribute Description:** This is a boolean value which will be used to indicate whether or not this feature is restricted to intra-terminal group only. This attribute should be initially populated with DBNO. If this attribute is set to DBYES, then the feature will be restricted to intra-terminal group only.

### Relation Description

Copyright © 1999 Lucent Technologies

Automatic Call Distribution Call Queue Determination

Expanded Call Queue (Type) Determination relation for OSPS TA and DA/NON-ISP calls. The RLac_cqdet, RLac_tgrp, RLac_destx, and RLexpacd relations are read to obtain the ACD call type. RLac_cqdet will always be read first.

If switch personnel have defined data to utilyze the Extended CallType Determination (ECTD) capability, relations RLac_tgrp and/or RLac_destx will be read second or third.
The primary relation, RLac_cqdet, is read and additionally as indicated by the 'usenext' attributes, RLac_tgrp and or RLac_destx. These additional relations allow for more specific screening of call characteristics to determine the call type. Each of the three relations contains a 'usenext' field of type DMUSENEXT, which indicates the next relation to be read. One, two or three relations may be read to determine the proper call type. Tuples in the three relations are 'linked' to each other via the 'ta_pcid' field in each relation. In addition to the key of trunk group number, the RLac_tgrp relation is read with the key of 'ta_pcid' obtained from the read of the RLac_cqdet relation. In addition to the key of destination index, the RLac_destx relation is read with the key of 'ta_pcid' obtained from the read of the RLac_cqdet relation.

If switch personnel have defined data to utilyze the Expanded Call Type Determination capability introduced by the OSPS ACD Expansion feature (98-5E-4668), relation RLexpacd will be read following the initial read of relation RLac_cqdet. Relation RLexpacd allows the ACD process to apply additional call screening properties to the selection of a call type. The read of relation RLexpacd is performed if the 'expacd' attribute of relation RLac_cqdet is populated with one or more call screening property values. The 'expacd' attribute defines a set of call screening properties that will be used to select a call type. Tuples in the RLac_cqdet and RLexpacd relations are linked to each other via the 'ta_pcid' attribute of each relation. Relation RLexpacd is read using the 'ta_pcid' value and the first call screening property value obtained from relation RLac_cqdet.

Switch personnel will have the following options available for the call type selection process:

1. Use only relation RLac_cqdet. For this case, the 'ta_pcid' attribute must be '0', the 'usenext' attribute must be set to 'TANONE', and the 'expacd' attribute must be NULL.
2. Use relation RLac_cqdet as well as relations RLac_tgrp and/or RLac_destx. For this case, the 'ta_pcid' attribute must not be '0', the 'usenext' attribute must be set to either 'TATGRP' or 'TADESTX', and the 'expacd' attribute must be NULL.
3. Use relation RLac_cqdet as well as relation RLexpacd. For this case, the 'ta_pcid' attribute must not be '0', the 'usenext' attribute must be set to 'TANONE', and the 'expacd' attribute must not be NULL.

Not to be populated for export applications.
This relation is only to be populated for domestic applications having OSPS Toll and Assistance.

The following are suggested tuples to be populated for this relation:

| ta_type | prefix | coin | carrier |
|---|---|---|---|
| OATORIG_ISP | FCPFX_0MINUS | DBYES | OAIC_CARR |
| | | | OALEC_CARR |
| | | | OAUNKWN_CARR |
| | | DBNO | OAIC_CARR |
| | | | OALEC_CARR |
| | | | OAUNKWN_CARR |
| | FCPFX_0 | DBYES | OAIC_CARR |
| | | | OALEC_CARR |
| | | | OAUNKWN_CARR |
| | | DBNO | OAIC_CARR |
| | | | OALEC_CARR |
| | | | OAUNKWN_CARR |
| | FCPFX_1 | DBYES | OAIC_CARR |
| | | | OALEC_CARR |
| | | | OAUNKWN_CARR |
| | | DBNO | OAIC_CARR |
| | | | OALEC_CARR |
| | | | OAUNKWN_CARR |
| OATXFER_CAMA | NULLPREF | | OADC_CARR |
| OATSYS_CAMA | | | |
| OATINWARD | | | |
| OATOPER_INIT | | | |
| OATNIT | | | |
| OATDA2VDT | | | |
| OASOSTR | | | |

**Attribute:**
ta_type
**Fullname:**
Key: Toll & Assistance call type
**Attribute Description:**
Used to identify how call arrived at the switch.

**Attribute:**
prefix
**Fullname:**
Key: Dialed digits prefix indicator
**Attribute Description:**
This field denotes how the call was dialed (0+, 1+, etc.)

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

coin

**Fullname:**

Key: Coin call flag

**Attribute Description:**

Indicates whether or not the incoming call is coin

**Attribute:**

ospsid

**Fullname:**

Key: OSPS Switch ID

**Attribute Description:**

The OSPS Switch ID (alphanumeric 1-9999) from where the call originated. This field is used for performing call type determination on the OSPS switch from where an interflow call originated. Therefore, non-interflow switches would populate this field with 0.

**Attribute:**

carrier

**Fullname:**

Key: call carrier type

**Attribute Description:**

Denotes the type of carrier for the call

**Attribute:**

callq

**Fullname:**

Call queue

**Attribute Description:**

Call queue to be used for routing a call to the proper serving team & call queue.
For some types of Listing Services calls, this can be a service ID instead of a call queue.
For intercept services provided with an IBM External Information System (EIS), the call type determined using this relation is also passed to the EIS. Because this is the only way that the IBM system has of distinguishing calls arriving over ANI trunks and ONI trunks, the office data should be defined so that the call type associated with calls arriving with ANI is different from those arriving as ONI/ANIF.

**Attribute:**

ap_callq

**Fullname:**

Automated Position call queue

**Attribute Description:**

Call Type to be used for routing a call to the proper Automated Position (AP) serving team and call queue.

**Copyright © 1999 Lucent Technologies** 

Unless the secure feature 415 for Rap is active,
APs cannot handle Listing Services, Automatic Intercept or
Specialized Handling for 700 Services traffic,
therefore the ap_callq is not applicable and is not
entered (zero) for these services.
The AP call queue cannot be a Listing Services call queue
unless the RaP feature is active.

Zero is not allowed on the RC/ODA form. It is equivalent to
unknown.

**Attribute:**
dispx
**Fullname:**
DA to VDT and Non-ISP calls VDT display index
**Attribute Description:**
The key to RLoaodisp to determine the
VDT display to be used for this call.

**Attribute:**
ta_pcid
**Fullname:**
Toll & Assistance Pre-call ID
**Attribute Description:**
Used to logically link this tuple with a RLac_tgrp and/or
RLac_destx tuple for a specific call's characteristic.
See the description at the beginning of this file for
more information on how this attribute is used

**Attribute:**
usenext
**Fullname:**
Use next (relation)
**Attribute Description:**
Indicates the relation to be read next, for additional call
type determination. Either RLac_tgrp or RLac_destx can be read
next.

**Attribute:**
expacd
**Fullname:**
Expanded ACD call property parameters
**Attribute Description:**
Identifies the set of call property parameters that will be
used to read relation RLexpacd for the selection of a call
type.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

ospsff

**Fullname:**

reserved field for OSPS fast features.

**Attribute Description:**

This field will be defined for future OSPS fast features.

## 4. Population Rules for RLac_destx

### Relation Description

Automatic call distribution on destination index. Expanded call queue determination table for destination index This relation is used in conjunction with the RLac_cqdet and RLac_tgrp relations. A complete description of the interaction between these relations is found in the description of the RLac_cqdet relation.

Not to be populated for export applications. This relation is only to be populated for domestic applications having OSPS Toll and Assistance.

**Attribute: ta_pcid**

**Fullname:** Toll & Assistance Pre-call ID

**Attribute Description:** Used to logically link this tuple with a RLac_cqdet tuple for a specific call's

Copyright © 1999 Lucent Technologies

characteristic

**Attribute: destx**

**Fullname:** Destination Index

**Attribute Description:** Indicates the destination index (output from digit analysis) of the incoming call

**Attribute: callq**

**Fullname:** Call Queue (type)

**Attribute Description:** Call queue to be used for routing a call to the proper serving team & call queue. For some types of Listing Services calls, this can be a service ID instead of a call queue. For intercept services provided with an *IBM*® external information system (EIS), the call type determined using this relation is also passed to the EIS. Because this is the only way that the *IBM*® system has of distinguishing calls arriving over ANI trunks and ONI trunks, the office data should be defined so that the call type associated with calls arriving with ANI is different from those arriving as ONI/ANIF.

**Attribute: ap_callq**

**Fullname:** Automated Position call queue

**Attribute Description:** Call type to be used for routing a call to the proper Automated position (AP) serving team and call queue. Unless the secure feature 415 for Rap is active, APs cannot handle listing services, automatic intercept or specialized handling for 700 Services traffic, therefore the ap_callq is not applicable and is not entered (zero) for these services. The AP call queue cannot be a Listing Services call queue unless the RaP feature is active. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: dispx**

**Fullname:** DA and Non-ISP calls VDT display index

**Attribute Description:** The key to RLoaodisp to determine the VDT display to be used for this call.

**Attribute: usenext**

**Fullname:** Use Next (relation)

**Attribute Description:** Indicates the relation to be read next, for additional call type determination. If usenext is equal to TGRP, then the ta_pcid key of this relation is used as a partial key to read the RLac_tgrp relation.

**Attribute: ospsff**

**Fullname:** osps fast feature

**Attribute Description:** Used for OSPS fast feature, if necessary.

## 4. Population Rules for RLac_opts

Copyright © 1999 Lucent Technologies

**Relation Description**

This relation gives LASS automatic callback constructed feature option information used in the AM. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description:** A BRCS constructed feature ID consists of a modular feature type and a unique identifier. For a LASS automatic callback constructed feature, the modular feature type is MFAC which is an enumeration of type DMmftype. The feature ID must have a class of FACBRCS and a subclass of SCL_FEAT. If the feature is offered on a generally available basis, the feature ID must also have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: actvn**

**Fullname:** activation

**Attribute Description:** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate using a dialed code or feature button) for 5E5 so that actvn always has the value ACTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: dctvn**

**Fullname:** deactivation

**Attribute Description:** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate using a dialed code or feature button) for 5E5 so that dctvn always has the value DCTNONE. Future generics may allow this feature to be deactivated via dialed codes or feature buttons.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description:** Type of billing to be performed. This is an enumeration of type DMbool. This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the customer decides it will bill if the feature is universally available. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis whereas if it is set to DBNO, the billing will be done on a flat rate basis.

**Attribute: ring_typ**

**Fullname:** Call-back ringing type

**Attribute Description:** Select from one of the cadences available to the automatic callback feature user. This attribute should be initially populated with ringing cadence DR_C.

**Attribute: filtr_op**

**Fullname:** filter options

**Attribute Description:** This is a boolean value which will be used to indicate whether or not this feature is restricted to intra-terminal group only. This attribute should be initially populated with DBNO. If this attribute is set to DBYES, then the feature will be restricted to intra-terminal group only.

LASS Automatic Callback Constructed Feature Line Parameters

This relation gives LASS Automatic Callback constructed feature line parameters that are pseudo group partitioned. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: lport**

**Fullname:** logical port

**Attribute Description:** This attribute defines the logical port and is a sequential key administered per SM. Analog lines would also be assigned lports, although the ISDN and analog lport values will be tracked and assigned separately to conserve memory as is currently done with logical termination indexes.

**Attribute: lpt_type**

**Fullname:** lport type

**Attribute Description:** This attribute indicates the type of lport that the tuple belongs to.

**Attribute: ring_typ**

**Fullname:** Call-back ringing type

**Attribute Description:** Select from one of the cadences available to the LASS Automatic Callback feature user. This attribute should be initially populated with ringing cadence DR_C.

## 4. Population Rules for RLac_tgrp

**Relation Description**

Automatic call distribution for trunk groups. Expanded Call Queue (Type) determination table for trunk groups This relation is used in conjunction with the RLac_cqdet and RLac_destx relations. A complete description of the interaction between these relations is found in the description of the RLac_cqdet relation. This relation is not to be populated for export applications, it is only to be populated for domestic applications having OSPS Toll and Assistance.

**Attribute: ta_pcid**

**Fullname:** Toll & Assistance Pre-call ID

**Attribute Description:** Used to logically link this tuple with a RLac_cqdet tuple for a specific call's characteristic.

**Attribute: tgroup**

Copyright © 1999 Lucent Technologies

**Fullname:** Trunk Group

**Attribute Description:** Indicates the incoming trunk group number of the incoming call.

**Attribute: callq**

**Fullname:** Call Queue (type)

**Attribute Description:** Call queue (type) to be used for routing a call to the proper serving team & call queue. For some types of Listing Services calls, this can be a service ID instead of a call queue. For intercept services provided with an *IBM*® external information system (EIS), the call type determined using this relation is also passed to the EIS. Because this is the only way that the *IBM*® system has of distinguishing calls arriving over ANI trunks and ONI trunks, the office data should be defined so that the call type associated with calls arriving with ANI is different from those arriving as ONI/ANIF.

**Attribute: ap_callq**

**Fullname:** Automated Position call queue

**Attribute Description:** Call Type to be used for routing a call to the proper automated position (AP) serving team and call queue. Unless the secure feature 415 for Rap is active, APs cannot handle Listing Services, Automatic Intercept or Specialized Handling for 700 Services traffic, therefore the ap_callq is not applicable and is not entered (zero) for these services. The AP call queue cannot be a Listing Services call queue unless the RaP feature is active. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: dispx**

**Fullname:** DA to VDT and Non-ISP calls VDT display index

**Attribute Description:** The key to RLoaodisp to determine the VDT display to be used for this call.

**Attribute: usenext**

**Fullname:** Use next (relation)

**Attribute Description:** Indicates the relation to be read next, for additional call queue determination. If usenext is equal to DESTX, then the ta_pcid key of this relation is used as a partial key to read the RLac_destx relation

**Attribute: ospsff**

**Fullname:** fast feature spare

**Attribute Description:** Spare for fast feature

```

## 4. Population Rules for RLac_tkct

### Relation Description

Automatic call distribution trunk to call type-operator services position system (OSPS) call type and display index determination for trunks.

This relation is part of call type determination for OSPS directory assistance (DA) and commercial-automatic call distributor (C-ACD) calls. The 'oppcid' key is obtained either from a tuple in RLop_id or from a tuple in RLop_iddn.

### Attribute: oppcid

Copyright © 1999 Lucent Technologies

**Fullname:** Operator pre-call identifier

**Attribute Description:** This key is obtained either from a tuple in RLop_id or from one in RLop_iddn.

**Attribute: tgroup**

**Fullname:** Trunk group number

**Attribute Description:** This key must either be a valid trunk group number or 9999. Except for the wild card value 9999, there must be a tuple in RLrt_trkg whose key (that is attribute 'grpnum') matches 'tgroup'.

**Attribute: call_type**

**Fullname:** Call type

**Attribute Description:** This identifies the call type for the given call factors. Each call type uniquely corresponds to an automatic call distribution (ACD) call queue.

**Attribute: dispx**

**Fullname:** Display index

**Attribute Description:** This attribute identifies the display index for the given call factors. There must be a tuple with key 'dispx' in the RLoaodisp relation.

**Attribute: vec_asgnd**

**Fullname:** Vector assigned indicator **Attribute Description:** This attribute is DBYES only if a vector has been assigned to handle calls with a given 'oppcid'/'tgroup' key. When this attribute is DBYES, the 'vec_num' attribute must contain a valid vector number minus one (that this, the corresponding tuple in RLcv_vectr must exist and define the desired call treatment).

**Attribute: cndasgnd**

**Fullname:** Calling number delivery (CND) feature assigned

**Attribute Description:** This attribute is DBYES only when the CND feature has been assigned to the trunk group/dialed digits combinations associated with this tuple.

**Attribute: cnbrmis**

**Fullname:** Enable calling number delivery to management information system (MIS)

**Attribute Description:** This attribute is DBYES only when the calling party number should be sent to the MIS for a C-ACD call. This attribute can be DBYES only if the CND feature has been assigned (that is, 'cndasgnd' must be set to DBYES).

**Attribute: cnbrdisp**

**Fullname:** Enable calling number display at agent terminals

**Attribute Description:** This attribute is DBYES only when calling party numbers (CPNs) should be sent to the position terminal process (PTP) for a C-ACD call for possible display on the agent terminals (determined by display index definition). This attribute can be DBYES only if the CND feature has been assigned (that is, 'cndasgnd' must be set to DBYES).

**Attribute: vec_num**

**Fullname:** Vector number assigned minus 1

**Attribute Description:** This identifies the RLcv_vectr tuple to provide call handling while waiting for a C-ACD agent. When the 'vec_asgnd' attribute is DBYES, 'vec_num' must contain a valid vector

Copyright © 1999 Lucent Technologies 

number minus 1. There should be an existing tuple in RLcv_vectr that defines the desired call treatment. When 'vec_asgnd' is DBNO, 'vec_num' can contain any value, valid or otherwise.

**Attribute: ospsff**

**Fullname:** OSPS fast feature item

**Attribute Description:** Usage: Use bit 0 for free terminating C-ACD calls where 0=N and 1=Y. This is only used for *PINNACLE*® ACD calls over non-common channel signaling (CCS) trunks. When this field is set to 'N', answer supervision will be returned for all calls to this CALL TYPE\ID. When this field is set to 'Y', answer supervision will not be returned for any call to this CALL TYPE ID. This field should be set to 'N' if calls to this CALL TYPE ID come from an IC network or are not free. This field should be set to 'Y' if all calls to this CALL TYPE ID are free local calls. Bits 1-5 are left for future OSPS special feature development.

**Attribute: daa_ind**

**Fullname:** Direct agent access (DAA) indicator

**Attribute Description:** This attribute is DBYES only if DAA is assigned to this call type. DAA can only be assigned to C-ACD call types. If attribute 'daa_ind' is set to DBYES, then a call arriving on this call type should be routed directly to a specific agent instead of the ACD routing the call to an available agent.

## 4. Population Rules for RLacb_cf

### Relation Description

Auto-call-back constructed feature.

### Attribute: feat_id

Copyright © 1999 Lucent Technologies

**Fullname:** Identifies the MCC constructed feature ID.

**Attribute Description:**

```
Permissible Domain: 1 - 65535 (0x0001 - 0xffff).
ACBC Admissible Domain: 0x3401 - 0x34c0.
```

***NOTE:*** ACBC has only one enabled binary feature option, and two parameter fields with 5, and 6 combinations respectively. The maximum number of possible preconstructed/constructed ACBC features (and hence feature tuples) is 60. The REL_DICT TMAX was set to 64. That is why the range of admissible values is not equal to the permissible range.

Default Value: No default.

Dependencies: Verify that RLfacname has a tuple such that feat_id = RLfacname.facid, and RLfacname.class = FACFEAT for that tuple.

**Attribute: bill_typ**

**Fullname:** Boolean structure indicating the combination of severals types of billing.

**Attribute Description:** MCC feature billing (charge) type. It is a structure of Boolean. In each case DBYES indicates that type of billing is applicable and DBNO indicates it is not. See DMmc_bill.h for a description of each sub-attribute.

Range: DBYES, DBNO for each sub-attribute.

Dependencies: If flat == DBYES all other sub-attributes == DBNO. If flat == DBNO, either usefreq1 or usefreq2 == DBYES, but not both. The sub-attributes usefreq3, usefreq4, actchrg, dactchrg, duration, and change will always equal DBNO for this feature.

Defaults: DBYES for flat, DBNO for all other sub-attributes.

**Attribute: bill_typ.flat**

**Fullname:** flat rate - no usage sensitive.

**Attribute Description:**

```
If flag = DBYES then all other sub-attributes = DBNO.
If flag = DBNO then either usefreq1 or usefreq2 = DBYES
```

but not both.

**Attribute: bill_typ.usefreq1**

**Fullname:** usage frequency charge - for use of event 1.

**Attribute Description:** See bill_typ.flat.

**Attribute: bill_typ.usefreq2**

**Fullname:** usage frequency charge - for use of enent 2.

**Attribute Description:** See bill_typ.flat.

**Attribute: bill_typ.usefreq3**

**Fullname:** useage frequency charge - for use of event 3.

**Attribute Description:** See bill_typ.flat.

Copyright © 1999 Lucent Technologies 

**Attribute: bill_typ.usefreq4**

**Fullname:** usage frequency charge - for use of event 4.

**Attribute Description:** See bill_typ.flat.

**Attribute: bill_typ.actchrg**

**Fullname:** usage charge for activation.

**Attribute Description:** See bill_typ.flat.

**Attribute: bill_typ.dactchrg**

**Fullname:** usage charge for deactivation.

**Attribute Description:** See bill_typ.flat.

**Attribute: bill_typ.duration**

**Fullname:** usage for duration of use.

**Attribute Description:** See bill_typ.flat.

**Attribute: bill_typ.change**

**Fullname:** usage charge for change of parameter.

**Attribute Description:** See bill_typ.flat.

**Attribute: filtr_op**

**Fullname:** Line to line acb campon filter option.

**Attribute Description:** Line to line ACB CAMPON filter option: select either intra-office or intra-terminal group campon restriction.

Range: Boolean value of DBNO and DBYES.

DBNO: restricted to intra-office.

DBYES: restricted to intra-terminal group.

**Attribute: ffcf[*]**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description:** See fullname description.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLacb_port

### Relation Description

Automatic call back parameters assigned to a BRCS User.

Automatic call back parameters assigned to a BRCS user. A user is defined to be an analog terminal, a trunk, or an ISDN user). For ACBC, trunk users are not valid. The following is a list of valid service classes for ports associated with users assigned this feature: FC_INDVL, FC_4WIRE_INDV, RC_PBX, and FC_ISDN. Special entry for group parameter associated with the BRCS feature grouping (BFG), capability G268, is intended to improve recent change (RC) response time and provide for SM memory reduction. It permits the creation of groups of BRCS features and parameters, and the utilization of these groups by call processing. BFG group parameter relations will not be created, but will be populated in existing lport keyed relations. Identifying bfg group parameters will be accomplished via use of an lpt_type key field set to lpt_bfg and use of the lport key field to contain the bfg group id. This concept is used to avoid creation of new database relations. Distribution: group partitioned (if lpt_type=lpt_bfg) or sm partitioned. This relation now has two types of tuples.

Copyright © 1999 Lucent Technologies 

(1) The first type is the existing tuples which are SM-PARTITIONED and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

(2) The second type is the BFG GROUP PARTITIONED TUPLE associated with features in a BRCS feature group (BFG), having lpt_type=LPT_BFG, and the bfgid populated in the lport field.

For BFG purposes, RLacb_port is a Group type. Therefore, only BFG Pseudo port tuple is permitted for the port assigned to a BFG. Individual post tuples may not be created for BFG assigned ports (when the feature is in the BFG).

***NOTE:*** There is a limit of 30 BRCS features for each bfgid.

**Attribute: lport**

***NOTE:*** There is a limit of 30 BRCS features for each bfgid

**Fullname:** Logical port of the User being assigned the BRCS features.

**Attribute Description** If lpt_type != LPT_BFG, RLacb_port.lport must equal RLfc_line.lport.

The keys for RLfc_line are:

```
RLfc_line.port = RLlpt_pt(RLacb_port.lport).port
RLfc_line.party = RLlpt_pt(RLacb_port.lport).party
If lpt_type = LPT_BFG, then RLacb_port.lport contains a BFG group
 ID.
```

Dependencies: If lpt_type != LPT_BFG, there must be a tuple in RLfc_porttyp keyed by the RLlpt_pt(lport,lpt_type).port such that RLfc_porttyp.servclass = FC_INDVDL, FC_ISDN, or FC_4WIRE_INDV. If lpt_type = LPT_BFG, the must be a tuple in RLbfgmatch keyed by the bfgid contained in RLacb_port.lport.

**Attribute: lpt_type**

**Fullname:** Logical port type of the User.

**Attribute Description:** Range: LPT_ISDN (for ISDN Users), LPT_BFG (for BFG tuples), or LPT_OTHER (for analog BRCS lines) Dependencies: RLacb_port.lpt_type must be identical to RLfc_line.lpt_type if the User is for an analog or ISDN terminal. The keys for RLfc_line are:

```
RLfc_line.port = RLlpt_pt(RLacb_port.lport).port
RLfc_line.party = RLlpt_pt(RLacb_port.lport).party
```

If lpt_type=LPT_BFG, then there must be a tuple in RLbfgmatch keyed by the bfgid contained in RLacb_port.lport. If RLfc_line.lpt_type=LPT_OTHER then RLfc_line.party must be FCP_INDI.

**Attribute: feat_id**

**Fullname:** Identifies the MCC constructed feature id

.**Attribute Description:**

***NOTE:*** ACBC has only one enabled binary feature option, and two parameter fields with 5, and 6 combinations respectively. The maximum number of possible preconstructed/constructed ACBC features (and hence feature tuples) is 60. That is why the range of admissible values is not equal to the permissible range. Dependencies:

Copyright © 1999 Lucent Technologies 

(1) Verify that RLfacname has a tuple such that feat_id = RLfacname.facid, and RLfacname.class = FACBRCS for that tuple.

(2) Verify existence of tuple in RLtrmfeats with this lport as key. This RLtrmfeats tuple must have an attribute such that feat_id = RLtrmfeats.ftent[n].fid

(3) Verify existence of tuple in RLacb_cf with this feat_id as key value.

**Attribute: ring_typ**

**Fullname:** Identifies type of call-back ringing cadence optioned.

**Attribute Description:** The ring_typ must be assigned DR_E or DR_F if and only if the port has RLfc_porttyp.servclass = FC_4WIRE_INDV.

**Attribute: ring_max**

**Fullname:** Call-back duration maximum.

**Attribute Description:** Specifies the maximum number of seconds the feature will attempt to recall the feature initiator.

## 4. Population Rules for RLacc_dpcs

### Relation Description

Copyright © 1999 Lucent Technologies

SCCP DPC Accounting Data

This relation will tie the SCCP DPC Accounting information together. The relation will provide the GT Digit String index, the DPC of GT and the Subsystem number to account. If the GTT has a Digit string equaling that of the GTT Index, the DPC from the GTT Translation matches the OPC and the SSN of the MSU equals one of the SSN Index numbers set in this tuple the MSU is accounted for by SCCP DPC Accounting.

**Attribute: gttindx**

**Fullname:** Global Title Index

**Attribute Description:** This attribute contains the Global Title Index of the digit string under SCCP DPC Accounting.

**Attribute: acct_bdpc**

**Fullname:** SCCP Accounting SSNs for the Backup DPC

**Attribute Description:** This attribute contains a bitmap of the possible SSN Index numbers being used by the Backup DPC of this GTT Digit String.

**Attribute: acct_pdpc**

**Fullname:** SCCP Accounting SSNs for the Primary DPC

**Attribute Description:** This attribute contains a bitmap of the possible SSN Index numbers being used by the Primary DPC of this GTT Digit String.

## 4. Population Rules for RLacc_mtp

### Relation Description

MTP Accounting Data

This relation will be used on the AM for the Traffic Measurement Hash Table in the MTP Accounting feature. The relation will contain all linksets, DPCs, GSMs, SI values used under the MTP Accounting in the GSMs. The AM must keep consistent with the SMs when updates are made to the MTP Accounting Data. If the AM undergoes an init, this relation will provide a recovery mechanism for the MTP Accounting Data in the AM.

### Attribute: dpc

**Fullname:** Destination Point Code

Copyright © 1999 Lucent Technologies

**Attribute Description:** This attribute will contain the DPC that is being accounted for on the Linkset in this tuple. This attribute could contain the OPC of the GSM associated with this tuple. This will allow the customer to account for messages generated by or destined for this office.

**Attribute: gsm**

**Fullname:** Global Switching Module

**Attribute Description:** This attribute contains the GSM that is performing MTP Accounting

**Attribute: in_out**

**Fullname:** Incoming or Outgoing

**Attribute Description:** This attribute will indicate whether the accounted linkset is being accounted for as an incoming or an outgoing linkset. If the attribute is set to 0 (DBNO), it will indicate an outgoing linkset. If the attribute is set to 1 (DBYES), then the linkset is incoming.

**Attribute: lsnum**

**Fullname:** Linkset Number

**Attribute Description:** This attribute will contain a linkset that is being accounted for by the MTP Accounting feature.

**Attribute: si1**

**Fullname:** Service Indicator One

**Attribute Description:** This attribute will contain the first Service Indicator that is being accounted for on a linkset, destined for the point code in this tuple.

**Attribute: si2**

**Fullname:** Service Indicator Two

**Attribute Description:** This attribute will contain the second Service Indicator that is being accounted for on a linkset, destined for the point code in this tuple.

Copyright © 1999 Lucent Technologies 

# ACC_OPCS

## 1. Description

This relation will contain the SCCP Accounting Global Title Index and the OPC Index as the key. The tuple returned will contain as a data item a bitmap of the Subsystem number indexes associated with the GTT and OPC.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 5000 |

### Relation Description

Copyright © 1999 Lucent Technologies

SCCP OPC Accounting Data

The relation will tie the SCCP OPC Accounting Information together. This relation will provide the GT Digit String Index, the OPC from the MSU and the Subsystem Numbers to account.

**Attribute: gtpcindx**

**Fullname:** SCCP Point Code Index

**Attribute Description:** The Index of the SCCP Point Code being accounted by the SCCP OPC Accounting feature.

**Attribute: gttindx**

**Fullname:** Index of the GT Digit String

**Attribute Description:** The Index of the GT Digit String being accounted for by the SCCP OPC Accounting feature.

**Attribute: acct_ssn**

**Fullname:** Bitmap of SSNs

**Attribute Description:** Bitmap of the Accounted SSNs for this GT Digit String and Point Code.

Copyright © 1999 Lucent Technologies

# ACC_SI

## 1. Description

This relation will contain the information necessary for the verification and accumulation of combinations of Linkset, DPCs and SI values for the MTP Accounting feature. The Indices of the Linkset and DPCs will be used for relational compaction. The keys in to the relation are the linkset index and a boolean bit indicating the direction of the linkset (incoming or out-going) An array is used to hold all possible SI values, with the DPC index used as the array element.

## 2. Data Dictionary Values

## 4. Population Rules for RLacc_si

**Relation Description**

MTP Accounting Service Indicator

The relation will contain the information necessary for the verification and accumulation of combinations of Linksets DPCs and SI values for the MTP Accounting feature. The Indices of the parameters, linkset, and DPC will be used for compaction. The keys into the relation are the Linkset Index and a boolean indicating whether the Linkset is being accounted for as an incoming linkset or and outgoing linkset. An array is used to hold all possible SI values, with the ACCPCINDX used as an array element.

**Attribute: acclsindx**

**Fullname:** MTP Accounted Linkset Index

**Attribute Description:** Linkset Index of an MTP Accounted Linkset

**Attribute: in_out**

**Fullname:** Incoming or Outgoing

**Attribute Description:** This attribute will be used to indicate whether the linkset DPC, and SI values are accounted as an incoming linkset or an outgoing linkset. If the attribute is set to 0 (DBNO) it will indicate an Outgoing Linkset. If the attribute is set to 1 (DBYES) then the linkset is incoming.

**Attribute: acc[*]**

**Fullname:** Accounting SIs Array

**Attribute Description:** This array will contain two Service Indicator Values. The values will be stored in the short in the following manner:

```
------------------
|  SI 1  |  SI 2  |
------------------
```

The alternate structure will be defined to allow the user to access the array as an array.

# ACCGTTID

## 1. Description

This relation will be used by the SCCP Accounting feature to define a GT Digit string to be used for Accounting. The GT Strings must be defined as an SCCP digit string before being placed on accounting. The translation group will be used to indicate the number of fixed, primary and secondary digits used in the GT string. Each GT digit string will be given an index for faster access and compaction.

## 2. Data Dictionary Values

## 4. Population Rules for RLaccgttid

### Relation Description

SCCP Accounting GT Digit String to Index relation

Copyright © 1999 Lucent Technologies

This relation will be used by the SCCP Accounting feature to define a GT Digit Strings to be used for accounting. The GT Digit String must be defined as an SCCP Digit string before being placed on accounting. The translation group will be used to indicate the number of Fixed, Primary and Secondary digits used in the GT Strings. Each GT Digit String will be given an index for faster access and relational compaction.

**Attribute: digit[*]**

**Fullname:** Digits of the GT Digit String

**Attribute Description:** Digits of a Digit String used in the SCCP Accounting feature. There can be up to 8 digits defined for SCCP Accounting.

**Attribute: tran_gp**

**Fullname:** Translation Group

**Attribute Description:** Translation Group used in the SCCP Accounting.

**Attribute: gttindx**

**Fullname:** GT Digit String Index

**Attribute Description:** Global Title Digit String Index for the SCCP Accounting feature.

**Attribute: num_digit**

**Fullname:** Number of digits

**Attribute Description:** Number of Digits used for the Global Title Translation.

**Attribute: num_opcs**

**Fullname:** Number of OPCs

**Attribute Description:** Number of OPCs being accounted for on this GT Digit string.

# ACCI_DPC

## 1. Description

This relation will contain the MTP Accounting DPC data. The Accounted DPC index will be used as the key with the DPC value and the number of Linksets this DPC is being accounted on as data items in the relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 250 |
| expected number of tuples | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCtrigfail |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| ks key store | DBNO |

## 3. Field Layout

```
ACCI_DPC    relid = 2392  DBSTATIC   DBACC_CIND  DBPRAM    FP      NULL
     accpcindx   DMUNS8       (ushort: 8)     <--- key, not stored
     dpc         DMDPC        (ulong: 24)
     num_ls      DMUNS8       (ushort: 8)

## 4. Population Rules for RLacci_dpc

### Relation Description

MTP Accounting Index to DPC

Copyright © 1999 Lucent Technologies

The relation will be used to provide the reverse mapping needed for the MTP Accounting features. The relation will be required for the population of a Dynamic table found in the SMP and used when sending reports up to the AM.

**Attribute: accpcindx**

**Fullname:** MTP Accounting Point Code Index

**Attribute Description:** This attribute will contain the index used to indicate a Point Code which is being used in the MTP Accounting feature.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description:** This attribute, dpc, defines a Point Code to which we have a signaling connection to via a signaling link. The dpc/opc is being Accounted for by the MTP Accounting feature.

**Attribute: num_ls**

**Fullname:** Number of Linksets

**Attribute Description:** Number of Linksets on which this dpc is being Accounted for under the MTP Accounting feature.

Copyright © 1999 Lucent Technologies 

# ACCI_LS

## 1. Description

This relation will contain the MTP Accounting Linkset information. The key will be the Linkset index, returning the linkset number and the number of DPCs being accounted on the linkset.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 100 |
| expected number of tuples | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCtrigfail |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 4. Population Rules for RLacci_ls

### Relation Description

MTP Accounting Linkset Index to Linkset Number

This relation will be used to provide the reverse mapping between the Accounting Linkset Index and the Linkset Value for the MTP Accounting feature.

**Attribute: acclsindx**

**Fullname:** MTP Accounting Linkset Index

**Attribute Description:** Index of a linkset on MTP Accounting.

**Attribute: in_dpcnt**

**Fullname:** Count of the Incoming DPCs

**Attribute Description:** Number of DPCs being accounted on the Incoming Linkset.

**Attribute: lsnum**

Copyright © 1999 Lucent Technologies

**Fullname:** Accounting Linkset Value

**Attribute Description:** The linkset values that are being accounted under the MTP Accounting feature.

**Attribute: out_dpcnt**

**Fullname:** Count of the Outgoing DPCs

**Attribute Description:** Number of DPCS being accounted on the Outgoing Linkset.

## 4. Population Rules for RLacct_cf

### Relation Description

Any constructed ACCT feature can be assigned to a line/trunk as active or inactive, independent of the activation/deactivation type, but only one ACCT feature can be assigned to any line/trunk.

Copyright © 1999 Lucent Technologies

Measurements for the ACCT feature are reflected in MS_CFT as constructed feature measurements.

Any constructed ACCT feature can be assigned to a line/trunk as

```
-----------------------------------
/ACCTETS - ETS Account Code Feature

actvn       ACTNONE
dctvn       DCTNONE
amac        FLAT
ama_field   DIG8
cd_as_alw   DBNO
parm_actvn  ACTNONE

/ACCTDLX - Account Code Deluxe Feature

actvn       ACTCD
dctvn       DCTCD
amac        FLAT
ama_field   CHAR15
cd_as_alw   DBYES
parm_actvn  ACTCD

WILDCARD FEATURE NAME
---------------------
NAME: /AC
```

**Attribute: feat_id**

**Fullname:** Account Code constructed feature ID

**Attribute Description:** Constructed feature identification. Range: 4001 (hex) to 43ff (hex).

**Attribute: ama_field**

**Fullname:** 8-digit or 15-character account code field in the AMA record

**Attribute Description:** Indicates whether the feature produces an AMA record with an 8-digit ACCT field or a 15-character account code field.

**Attribute: actvn**

**Fullname:** Feature activation type

**Attribute Description:** Method of activating a constructed feature. This is permanent activation. One call activation is not provided. dependencies:

```
ACTNONE - RLacct_cf.dctvn = DCTNONE
          RLacct_cf.amac.flat = DBYES
ACTCD -   RLacct_cf.dctvn = DCTCD
          *** ODA ONLY WARNING ***
          *** (NOT SUPPORTED BY RC) ***
```

To activate the feature via a dialed code, verify that RLdaprlfnl and/or RLidp_dtre have a tuple for a given dialed code with action = ACN_ACTACCT.

**Attribute: dctvn**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Feature deactivation type

**Attribute Description:** Method of deactivating a constructed feature. This is permanent deactivation. One call deactivation is not provided.

```
DCTNONE - RLacct_cf.actvn = ACTNONE
          RLacct_cf.amac.flat = DBYES
DCTCD -   RLacct_cf.actvn = ACTCD
          *** ODA ONLY WARNING ***
          *** (NOT SUPPORTED BY RC) ***
```

To deactivate the feature using a dialed code, verify that RLdaprlfnl and/or RLidp_dtre have a tuple for a given dialed code with action = ACN_DCTACCT.

**Attribute: cd_as_alw**

**Fullname:** Preset code association allowed

**Attribute Description:** Indicates whether preset code associations are allowed. This sequence can be any complete dialable sequence of digits up to 10 digits: a DN, a feature group D carrier access code, feature code, routing information, and so forth.

**Attribute: parm_actvn**

**Fullname:** Parameter set activation type

**Attribute Description:** Method of activating an ACCT parameter set. The activation of the parameter set is permanent. One call activation of *** ODA ONLY WARNING *** *** (NOT SUPPORTED BY RC) *** To activate the feature parameter set using a dialed code, verify that RLdaprlfnl and/or RLidp_dtre have a tuple for a given dialed code with action = ACN_MAINACT and another tuple with ACN_ALTACT. The ACCT group effected is the ACCT group assigned to the originating port. All ports assigned to that group are also effected.

**Attribute: amac**

**Fullname:** AMA charging

**Attribute Description:** Boolean structure indicating the combination of ama charging. In each case a DBYES indicates the type of billing is applicable and DBNO indicates it is not. See domain DMmc_bill for a description of each sub-attribute.

**Attribute: amac.flat**

**Fullname:** Flat rate - no usage sensitive charge

**Attribute Description:** Indicates flat rate - no other types of billing found in this structure apply.

If flat == DBYES, all other subattributes = DBNO.

If flat == DBNO, one or more subattributes = DBYES

**Attribute: amac.usefreq1**

**Fullname:** Usage frequency charge - for use of event 1

**Attribute Description:** Indicates billing applies for frequency charge of usage of event 1.

**Attribute: amac.usefreq2**

**Fullname:** Usage frequency charge - for use of event 2

**Attribute Description:** Usage frequency charge - for use of event 2.

Copyright © 1999 Lucent Technologies 

**Attribute: amac.usefreq3**
**Fullname:** Usage frequency charge - for use of event 3

**Attribute Description:** Usage frequency charge - for use of event 3.

**Attribute: amac.usefreq4**
**Fullname:** Usage frequency charge - for use of event 4

**Attribute Description:** Usage frequency charge - for use of event 4.

**Attribute: amac.actchrg**
**Fullname:** Usage charge for activation

**Attribute Description:** Indicates usage charge for activation applies.

**Attribute: amac.dactchrg**
**Fullname:** Usage charge for deactivation

**Attribute Description:** Indicates usage charge for deactivation applies.

**Attribute: amac.duration**
**Fullname:** Usage charge for duration of use

**Attribute Description:** Indicates usage charge for duration of use applies.

**Attribute: amac.change**
**Fullname:** Usage charge for change of parameter

**Attribute Description:** Indicates usage charge for change of parameter applies.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLacct_gp

**Relation Description**

Account code (ACCT) group parameters.

Account code group parameters.

IMPORTANT: If there is a change to the key(s) of this relation, YOU MUST NOTIFY the owner of the logging module, db/DBrclog. A coordinated change MUST be made to the logging code or your data will NOT be recovered.

Since the key for this relation is assigned sequentially, the engineering assumes only 7 bits of the key are used. This allows for 128 maximum tuples in the relation without reengineering.

**Attribute: gpid**

**Fullname:** Account group identification

**Attribute Description:** This attribute contains the account code group identification.

**Attribute: main_parms**

**Fullname:** Main parameter set

**Attribute Description:** Structure indicating the set of main ACCT parameters. See DMacct_prm for a description, range of values and default of each sub-attribute.

**Attribute: main_parms.annc_ind**

**Fullname:** Announcement index for restriction treatment

**Attribute Description:** Announcement index for restriction treatment. Specifies an announcement index to be used if the call is blocked because an ACCT was not dialed and restriction treatment is ER_ANNC.

**Attribute: main_parms.ama_rec**

**Fullname:** Dialed account code included in automatic message accounting (AMA) records

**Attribute Description:** Indicates whether an AMA record is required when an ACCT is dialed. If AMA required is set to DBYES then prompt treatment must not be null.

**Attribute: main_parms.mdr_rec**

**Fullname:** Dialed account code included in message detail recording (MDR) records.

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Indicates whether the dialed ACCT is included in MDR records.

**Attribute: main_parms.ama_req**
**Fullname:** AMA recording required for account code dialed calls

**Attribute Description:** Indicates whether an AMA record is required when an ACCT is dialed.

**Attribute: main_parms.mdr_req**
**Fullname:** MDR recording required for account code dialed calls

**Attribute Description:** Indicates whether an MDR record is required when an ACCT is dialed.

**Attribute: main_parms.ama_rstrct**
**Fullname:** Restrict AMA recorded calls dialed without an account code

**Attribute Description:** Indicates whether AMA recorded calls are restricted without an ACCT.

**Attribute: main_parms.mdr_rstrct**
**Fullname:** Restrict MDR recorded calls dialed without an account code

**Attribute Description:** Indicates whether MDR recorded calls are restricted without an ACCT.

**Attribute: main_parms.rstrct_trt**
**Fullname:** Restriction treatment for blocked calls dialed without an account code

**Attribute Description:** Prompt for restricted calls.

**Attribute: main_parms.prmpt_trt**
**Fullname:** Prompt treatment for dialing the account code

**Attribute Description:** Prompt for customer to dial an ACCT.

**Attribute: alt_parms**
**Fullname:** Alternate parameter set

**Attribute Description:** Structure indicating the set of alternate ACCT parameters. See DMacct_prm for details on sub-attributes.

**Attribute: alt_parms.annc_ind**
**Fullname:** Announcement index for restriction treatment

**Attribute Description:** Announcement index for restriction treatment. Specifies an announcement index to be used if the call is blocked because an ACCT was not dialed and restriction treatment is ER_ANNC.

**Attribute: alt_parms.ama_rec**
**Fullname:** Dialed account code included in AMA records

**Attribute Description:** Indicates whether an AMA record is required when an ACCT is dialed. If AMA required is set to DBYES then prompt treatment must not be null.

**Attribute: alt_parms.mdr_rec**
**Fullname:** Dialed account code included in MDR records

**Attribute Description:** Indicates whether the dialed ACCT is included in MDR records.

Copyright © 1999 Lucent Technologies 

**Attribute: alt_parms.ama_req**

**Fullname:** AMA recording required for account code dialed calls

**Attribute Description:** Indicates whether an AMA record is required when an ACCT is dialed.

**Attribute: alt_parms.mdr_req**

**Fullname:** MDR recording required for account code dialed calls

**Attribute Description:** Indicates whether an MDR record is required when an ACCT is dialed.

**Attribute: alt_parms.ama_rstrct**

**Fullname:** Restrict AMA recorded calls dialed without an account code

**Attribute Description:** Indicates whether AMA recorded calls are restricted without an ACCT.

**Attribute: alt_parms.mdr_rstrct**

**Fullname:** Restrict MDR recorded calls dialed without an account code.

**Attribute Description** Indicates whether MDR recorded calls are restricted without an ACCT.

**Attribute: alt_parms.rstrct_trt**

**Fullname:** Restriction treatment for blocked calls dialed without an account code.

**Attribute Description:** Prompt for restricted calls.

**Attribute: alt_parms.prmpt_trt**

**Fullname:** Prompt treatment for dialing the account code.

**Attribute Description:** Prompt for customer to dial an ACCT.

**Attribute: act_parms**

**Fullname:** Active account code parameter set.

**Attribute Description:** Active set of ACCT parameters. This attribute indicates which ACCT parameter set is active. This parameter can be changed via dialed code, if RLacct_cf.parm_actvn = ACTCD. Switching between MAIN_PARMS and ALT_PARMS or vice versa provides the customer the ability to change between the values of the attributes in the MAIN_PARMS parameter set and the values of those same attributes in the ALT_PARMS parameter set. Some or all of the values of attributes in the MAIN_PARMS parameter set, may be the same as the values of those attributes in the ALT_PARMS parameter.

**Attribute: acct_l**

**Fullname:** Length of the account code

**Attribute Description:** Length of the ACCT for lines using this group definition.

**Attribute: tod_inh**

**Fullname:** Time-of-day (TOD) inhibit flag

**Attribute Description:** Specifies whether time-of-day changes to ACCT group data are inhibited. This field is intended to be used by end customers through the facilities management feature, allowing a customer to temporarily deactivate TOD scheduled changes. This field only inhibits TOD originated recent changes (TORC)s, not customer oriented recent changes (CORC)s.

**Attribute: toll_si**

**Fullname:** TOLL Screening Index

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Hold screening index to override toll diversion to an attendant.

**Attribute: dpat_ovrd**

**Fullname:** DPAT override flag

**Attribute Description:** Indicates if DPAT restrictions can be overridden when making an associated ACCT call.

**Attribute: ffcf1**

**Fullname:** Boolean reserved for future Field Feature use.

**Attribute Description:** See fullname description.

**Attribute: ffcf2**

**Fullname:** Unsigned short reserved for future field feature use.

**Attribute Description:** See fullname description.

# ACCT_PRT

## 1. Description

Account Code (ACCT) feature port parameters

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 65531 |
| expected number of tuples | 75 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| density | 16 |
| l1 length of subkey 1 | 2 |
| p1 position of subkey 1 | 16 |
| l2 length of subkey 2 | 16 |
| p2 position of subkey 2 | 0 |
| ks key store | AUTO |
| spare space | 16s |

## 3. Field Layout

```

Account code (ACCT) feature parameters. ACCT feature parameters assigned to a BRCS User (a User is defined to be an analog terminal, a trunk, or an ISDN User). Special entry for group parameter associated with BFG. BRCS feature grouping (BFG), capability G268, is intended to improve recent change (RC) response time and provide for sm memory reduction. it permits the creation of groups of brcs features and parameters, and the utilization of these groups by call processing. BFG group parameter relations will not be created, but will be populated in existing LPORT keyed relations. Identifying bfg group parameters will be accomplished via use of an LPT_TYPE key field set to LPT_BFG and use of the LPORT key field to contain the bfg group ID. this concept is used to avoid creation of new database relations. This relation now has two types of tuples.

(1) The first type is the existing tuples which are SM-PARTITIONED and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

(2) The second type is the BFG group partitioned tuple associated with features in a BRCS feature group (BFG), having lpt_type=LPT_BFG, and the bfgid populated in the lport field.

For BFG purposes, RLacct_prt is a group type. Therefore, only BFG lport tuple is permitted for the lport assigned to a BFG. Individual lport tuples may not be created for BFG assigned lports (when the feature is in the BFG).

***NOTE:*** There is a limit of 30 BRCS features for each bfgid."

**Attribute: lport**

**Fullname:** lport type

**Attribute Description:** Logical port of the User being assigned the BRCS features. If lpt_type != LPT_BFG, RLacct_prt.lport must equal RLfc_line.lport (if a line) or RLfc_trunk.lport (if a trunk). The keys for RLfc_line & RLfc_trunk are: RLfc_line.port = RLlpt_pt(RLacct_prt.lport,RLacct_prt.lpt_type).port RLfc_line.party = RLlpt_pt(RLacct_prt.lport,RLacct_prt.lpt_type).party RLfc_trunk.port = RLlpt_pt(RLacct_prt.lport,RLacct_prt.lpt_type).port If lpt_type = LPT_BFG, then RLacct_prt.lport contains a BFG group ID. Dependencies: If lpt_type != LPT_BFG, there must be a tuple in RLfc_porttyp keyed by the RLlpt_pt(lport).port. If lpt_type = LPT_BFG, the must be a tuple in RLbfgmatch keyed by the bfgid contained in RLacct_prt.lport. The only line classes allowed the ACCT feature are:

```
FC_INDVDL       individual
FC_PBX          PBX
FC_ATTENDANT    attendant
FC_4WIRE_INDV   individual 4-wire line
FC_ISDN         ISDN
FC_ISATND       ISDN Attendant
```

The D-channel port is the port specified for the class of service: FC_ISDN and FC_ISATND. The only trunk classes allowed the ACCT feature are:

```
FC_PF           private facility without flash repeating
FC_PFLASH       private facility with flash repeating
```

Only one ACCT Feature can be assigned to a user at any time. Dependency: Verify existence of tuple in RLtrmfeats, RLfc_line or RLfc_trunk, and RLfc_porttype.

```
/* The following dependency is enforced in RLacct_cf.p. */
```

**Copyright © 1999 Lucent Technologies** 

```
 Gldsnopt = DBYES, then the following must be true:
1) If RLacct_cf.ama_field = DIG8, then
   RLacct_gp.acct_l must be <=7.
2) If RLacct_cf.ama_field = CHAR15, then
   RLacct_gp.acct_l must be <=14.
```

**Attribute: lpt_type**

**Fullname:** logical port

**Attribute Description:** Range: LPT_ISDN (for ISDN Users), LPT_BFG (for BFG tuples), or LPT_OTHER (for analog BRCS lines and trunks) Dependencies: RLacct_prt.lpt_type must be identical to RLfc_line.lpt_type if the User is for an analog or ISDN terminal. The keys for RLfc_line are: RLfc_line.port = RLlpt_pt(RLacct_prt.lport).port RLfc_line.party = RLlpt_pt(RLacct_prt.lport).party If the User is a BRCS trunk, then lpt_type=LPT_OTHER. If lpt_type=LPT_BFG, then there must be a tuple in RLbfgmatch keyed by the bfgid contained in RLacct_prt.lport.

**Attribute: gpid**

**Fullname:** account code group identifier

**Attribute Description:** Verify that RLacct_gp has a tuple where RLacct_gp.gpid = RLacct_prt.gpid. An ACCT user must be assigned to an ACCT group.

**Attribute: cdtblid**

**Fullname:** code association table identifier

**Attribute Description:** If cdtblid > 0, verify that RLacct_rtg has a tuple where RLacct_rtg.cdtblid = RLacct_prt.cdtblid. An ACCT user does not have to be assigned to an ACCT code association table. RLacct_cf.cd_as_alw and cdtblid=0 are independent of each other. An ACCT associated code table can be assigned to a user regardless of whether RLacct_cf.cd_as_alw is = DBYES or DBNO. If RLacct_cf.cd_as_alw = DBNO and an associated code table is assigned to the user, the associated code table will never be accessed.

***NOTE:*** If an ACCT associated code table is assigned to a user and the ACCT feature assigned to that user does not allow code associations, ODA cross checks will produce a warning.

## 4. Population Rules for RLacct_rtg

**Relation Description**

Account code (ACCT) code association table

**Attribute: cdtblid**

**Fullname:** Code association table identification

**Attribute Description:** Code association table identification.

**Attribute: use_cd[*]**

**Fullname:** ACCT use codes

**Attribute Description:** List of 10 ACCT use codes with associated dialing sequence For use_cd1 through use_cd10, the associated dialing sequence is cd_sq1 through cd_sq10 respectively. Range: 0 to 7 characters, if fewer than 7 characters, pad on the right with NULL. The use code must be a code with action = ACN_ACCTUSE. If use_cd1 is not NULL, then cd_sq1 must not be NULL; likewise for the 9 remaining entries. All use codes in this tuple must be unique and defined in an ODP and/or the IDP used by the port(s) that uses this tuple.

**Attribute: use_cd[*].digcnt**

**Fullname:** Digit count

**Attribute Description:** The number of digits in use_cd.code.

**Attribute: use_cd[*].code**

**Fullname:** Code

Copyright © 1999 Lucent Technologies 

**Attribute Description:** The ACCT use code.

**Attribute: cd_sq1**

**Fullname:** Code sequence

**Attribute Description:** List of 10 dialing sequences, each associated with an ACCT use code. The sequence of digits must be a complete dialable sequence of no more than 10 characters. The sequence can be a DN, Feature Group D Carrier Access Code, feature code, routing information, etc. Multiple sequences can be stored within the 10 characters, if the sequences are complete. An ARS use code followed by a 7-digit DN is allowed, but an ARS use code followed by only 3 digits of a 7-digit DN is not allowed. Range: 0 to 10 characters, if fewer than 10 characters, pad on the right with NULL. The associated code(s) must be defined in an ODP and/or IDP and/or PNDP used by the port(s) that uses this tuple. If cd_sq1 is not NULL, then use_cd1 must not be NULL; likewise for the 9 remaining entries.

**Attribute: cd_sq1.digcnt**

**Fullname:** Digit count

**Attribute Description:** The number of digits in cd_sq.code.

**Attribute: cd_sq1.code**

**Fullname:** Code sequence

**Attribute Description:** Dialing sequence associated with use_cd.

**Attribute: cd_sq[*]**

**Fullname:** Code sequence

**Attribute Description:** List of 10 dialing sequences, each associated with an ACCT use code. The sequence of digits must be a complete dialable sequence of no more than 10 characters. The sequence can be a DN, a Feature Group D Carrier Access Code, feature code, routing information, etc. Multiple sequences can be stored within the 10 characters, if the sequences are complete. An ARS use code followed by a 7-digit DN is allowed, but an ARS use code followed by only 3 digits of a 7-digit DN is not allowed. Range: 0 to 10 characters, if fewer than 10 characters, pad on the right with NULL. The associated code(s) must be defined in an ODP and/or IDP and/or PNDP used by the port(s) that uses this tuple. If cd_sq1 is not NULL, then use_cd1 must not be NULL; likewise for the 9 remaining entries.

**Attribute: cd_sq[*].digcnt**

**Fullname:** Digit count

**Attribute Description:** The number of digits in cd_sq.

**Attribute: cd_sq[*].code**

**Fullname:** Code sequence

**Attribute Description:** Dialing sequence associated with use_cd.

## 4. Population Rules for RLacct_tm

**Relation Description**

Account Code Template

Account code constructed feature template: options and default parameters on feature definition recent change/verify (RC/V) view.

**Attribute: feat_id**

**Fullname:** Constructed feature identification

**Attribute Description:** This attribute contains the constructed feature identifier.

**Attribute: ama_field**

**Fullname:** AMA field length indicator

**Attribute Description:** This attribute indicates whether the feature produces an AMA record with an 8-digit ACCT field or a 15-character account code field.

**Attribute: actvn**

**Fullname:** Activation method

**Attribute Description:** This attribute indicates the method of activating a constructed feature. This is permanent activation: one call activation is not provided.

**Attribute: dctvn**

**Fullname:** De-activation method

**Attribute Description:** This attribute indicates the method of deactivating a constructed feature. This is permanent deactivation: one call deactivation is not provided.

**Attribute: cd_as_alw**

**Fullname:** Code Association Allowed

**Attribute Description:** This attribute indicates whether preset code associations are allowed. This sequence can be any complete dialable sequence of digits up to 10 digits: a DN, a Feature Group D Carrier Access Code, feature code, routing information, etc.

**Attribute: parm_actvn**

**Fullname:** Parameter Activation

**Attribute Description:** This attribute indicates the method of activating an ACCT parameter set.

**Copyright © 1999 Lucent Technologies** 

The activation of the parameter set is permanent: one call activation of either parameter is not provided.

**Attribute: gpname**

**Fullname:** Group Name

**Attribute Description:** This attribute contains the account code group name. If this attribute is not NULL, a check must be made when the feature is assigned to a line such that:

RLacct_gp has a tuple where RLacct_gp.gpid = RLacct_prt.gpid for the lport and lport_type receiving this feature.

**Attribute: cdtblname**

**Fullname:** Code Association Table Name

**Attribute Description:** This attribute contains the code association table name. If this attribute is not NULL, a check must be made when the feature is assigned to a line such that:

RLacct_rtg has a tuple where RLacct_rtg.cdtblid = RLacct_prt.cdtblid for the lport and lport_type receiving this feature.

**Attribute: amac**

**Fullname:** AMA Charging

**Attribute Description:** This attribute is a boolean structure indicating the combination of AMA charging. In each case a DBYES indicates the type of billing is applicable and DBNO indicates it is not.

**Attribute: amac.flat**

**Fullname:** flat rate

**Attribute Description:** This sub-attribute indicates whether or not billing is done on a flat rate: that is, a flat rate means that there are not usage sensitive charges.

**Attribute: amac.usefreq[*]**

**Fullname:** usage frequency charge for use of event 1

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 1.

**Attribute: amac.actchrg**

**Fullname:** usage frequency charge for use of event 1

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 1.

**Attribute: amac.dactchrg**

**Fullname:** usage frequency charge for use of event 1

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 1.

**Attribute: amac.duration**

**Fullname:** usage frequency charge for use of event 1

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage

Copyright © 1999 Lucent Technologies 

frequency charges for use of event 1.

**Attribute: amac.change**

**Fullname:** usage frequency charge for use of event 1

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 1.

## 4. Population Rules for RLacctcode

### Relation Description

Account code table. This relation holds account codes per ANI for 1+ subaccount billing. The feature is not committed, so this is spare data created just in case.

**Attribute: anitbl**

**Fullname:** automatic number identification table index

**Attribute Description:** Obtained from the RLanimod relation.

**Copyright © 1999 Lucent Technologies** 

**Attribute: spare1**

**Fullname:** spare 1

**Attribute Description:** Spare field.

**Attribute: locdigs**

**Fullname:** local line number of ANI

**Attribute Description:** The local line number; the last four digits of the ANI.

**Attribute: spare2**

**Fullname:** spare 2

**Attribute Description:** Spare field.

**Attribute: tupnum**

**Fullname:** tuple number

**Attribute Description:** Provides a unique key to allow multiple tuples per ANI.

**Attribute: spare3**

**Fullname:** spare 3

**Attribute Description:** Spare field.

**Attribute: spare4**

**Fullname:** spare 4

**Attribute Description:** Spare field.

**Attribute: acct_cd0**

**Fullname:** account code 0

**Attribute Description:** One of up to five account codes allowed for this ANI; one to eight digits are stored in BCD in this field.

**Attribute: acct_cd1**

**Fullname:** account code 1

**Attribute Description:** One of up to five account codes allowed for this ANI; one to eight digits are stored in BCD in this field.

**Attribute: acct_cd2**

**Fullname:** account code 2

**Attribute Description:** One of up to five account codes allowed for this ANI; one to eight digits are stored in BCD in this field.

**Attribute: acct_cd3**

**Fullname:** account code 3

**Attribute Description:** One of up to five account codes allowed for this ANI; one to eight digits are stored in BCD in this field.

**Attribute: acct_cd4**

**Fullname:** account code 4

Copyright © 1999 Lucent Technologies

**Attribute Description:** One of up to five account codes allowed for this ANI; one to eight digits are stored in BCD in this field.

## 4. Population rules for RLacctown

### Relation Description

Relation containing information for Originating Line Number Screening Account Owner Table.

**Attribute:**

acctown

Copyright © 1999 Lucent Technologies

**Fullname:**
account owner
**Attribute Description:**
Specify four alphanumeric characters or "----" for default.

**Attribute:**
phraseid
**Fullname:**
phrase identification
**Attribute Description:**
Branding announcement unique to the account owner.

**Attribute:**
disptext
**Fullname:**
display text
**Attribute Description:**
Up to 12 alphnumeric characters to be displayed at the position to identify the account owner to the operator

**Attribute:**
scrindex
**Fullname:**
screen index
**Attribute Description:**
An screen index is used to route calls from the operator system defined by account owner.

## 4. Population rules for RLacd_dn

### Relation Description

automatic call distributor directory number

This relation contains Automatic Call Distributor (ACD) DN information for ACD DNs that are not being interflowed. For ACD DN information on ACD DNs that are being interflowed, see RLDAA_DN.

**Attribute:**

dn

**Fullname:**

directory number

**Attribute Description:**

This attribute consists of a NOC (normalized office code) and four directory number digits. For ACD DNs, there must be a tuple in RLRTDNMOD with noc+d4d3. Also, on the corresponding routing SM there must be a tuple in RLRT_DNTRAN with noc+d4d3d2d1. There must not be a tuple in RLDAA_DN for this same DN. There must not be a tuple with a scmdn equal to an ACD DN in RLdn_pscm.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

dn.noc

**Fullname:**

normalized office code

**Attribute Description:**

see dn

**Attribute:**

dn.digits

**Fullname:**

four directory number digits

**Attribute Description:**

see dn

**Attribute:**

call_que

**Fullname:**

call queue

**Attribute Description:**

This attribute identifies the default call queue that handles calls for this ACD DN. If the call queue is not equal to zero, there must be a tuple with a non zero tgid value in RLCQPARM for this call queue.

**Attribute:**

vec_asgnd

**Fullname:**

vector assigned

**Attribute Description:**

This attribute is DBYES only if a vector has been assigned to handle calls to this ACD DN. When this attribute is DBYES, the vec_num attribute must contain a valid attribute vector number minus 1.

**Attribute:**

vec_num

**Fullname:**

vector number minus 1

**Attribute Description:**

This attribute identifies the RLQVVECTOR tuple that provides call handling while waiting for an ACD agent. When the vec_asgnd attribute is DBYES, vec_num must contain a valid vector number minus 1. There should be an existing tuple in RLQVVECTOR that defines the desired call treatment. When vec_asgnd is DBNO, vec_num should be 0.

**Attribute:**

carrier

**Fullname:**

Copyright © 1999 Lucent Technologies 

carrier

**Attribute Description:**

This attribute indicates the presubscribed carrier for an ACD DN. It is used for ACD call redirection. There must be a tuple in RLFC_CARR for this carrier.

**Attribute:**

pic2

**Fullname:**

presubscribed intra-LATA-toll carrier

**Attribute Description:**

This attribute indicates the presubscribed (preferred) intra-LATA-toll carrier for an ACD DN. It is used for intra-LATA ACD call redirection.

This attribute must be $NULL_BCARID (default) if the ICLATA SF (SFID 149) is not active. When pic2 is not equal to $NULL_BCARID, there must be a tuple in RLFC_CARR for this intra-LATA-toll carrier.

The value of this attribute is independent of the mass presubscribed intra-LATA-toll carrier, Glpic2.

**Attribute:**

plc

**Fullname:**

presubscribed intra-LATA local carrier ID

**Attribute Description:**

This attribute contains the presubscribed intra-LATA local carrier ID for an alternate LSP.

**Attribute:**

cnbrdisp

**Fullname:**

calling number to agent's display

**Attribute Description:**

When this attribute is DBYES, calling numbers (if available) are displayed on the agent's terminal. When it is DBNO, calling numbers are not displayed on the agent's terminal.

**Attribute:**

cnbrmis

**Fullname:**

calling number to management information system

**Attribute Description:**

When this attribute is DBYES, calling numbers (if available) for calls to this ACD DN are sent to the MIS. When it is DBNO, calling numbers for

Copyright © 1999 Lucent Technologies 

calls to this ACD DN are not sent to the MIS.

**Attribute:**
digtree
**Fullname:**
starting digit analysis tree
**Attribute Description:**
This attribute identifies the digit analysis table to start with when analyzing digits for ACD call redirection. There must be a tuple in RLDA_DIGSTRT for this digtree.

**Attribute:**
dispx
**Fullname:**
display index
**Attribute Description:**
This attribute identifies the display index for calls to this ACD DN. If this attribute is non-zero, there must be a tuple in RLACDDISP for this dispx.

**Attribute:**
freeterm
**Fullname:**
free termination
**Attribute Description:**
When this attribute is DBYES, calls to this ACD DN are not billed. When this attribute is DBNO, calls to this ACD DN get standard billing treatment (and therefore if chargeable, get billed).

**Attribute:**
line_screen
**Fullname:**
line screen
**Attribute Description:**
When this attribute is DBYES, this ACD DN is associated with toll/code restriction/diversion or WATS band screening. This attribute is used for ACD call redirection.

**Attribute:**
miscallcls
**Fullname:**
management information system call class
**Attribute Description:**
This attribute is used by the Management Information System (MIS) to track ACD calls.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
screen_x
**Fullname:**
screening index
**Attribute Description:**
This attribute is used for routing and charging redirected ACD calls. There must be a tuple in RLrt_scrning for this screen_x.

**Attribute:**
psap
**Fullname:**
e911 public safety answering point
**Attribute Description:**
This attribute is used for the ACD E911 Public Safety Answering Point Special Feature to indicate if this ACD DN is an ACD E911 PSAP. The ACD E911 PSAP special feature is a secured feature (SFID 143). This attribute must not be set to DBYES unless the special feature has been purchased.

**Attribute:**
unbundled
**Fullname:**
Network/LEC indicator, for calls to complete to an alternate LSP platform.
**Attribute Description:**
When unbundled = DBYES, (None/1)+ 7/10 digit intra-LATA local calls route using presubscribed local carrier (PLC) information. If PLC routing information is not populated, route via the LEC. When unbundled = DBNO, (None/1)+ 7/10 digit intra-LATA local calls always route via the LEC.

**Attribute:**
acdsp1
**Fullname:**
ACD/BRCS spare 1
**Attribute Description:**

## 4. Population Rules for RLacd_pos

**Relation Description**

This relation contains ACD/BRCS position number to port mapping information. It is used by RC and ODA when administering position numbers. Also, it is used by office records when reporting on position number assignments and audits for maintaining dynamic RLSRVQDB data.

**Attribute: posnum**

**Fullname:** position number

**Attribute Description:** This attribute uniquely identifies an ACD/BRCS position.

**Attribute: module**

**Fullname:** switching module

**Attribute Description:** This attribute identifies the switching module where this ACD/BRCS position

Copyright © 1999 Lucent Technologies 

is located.

**Attribute: port**

**Fullname:** local port name

**Attribute Description:** This attribute identifies the local d-port to which this ACD/BRCS position is assigned.

**Attribute: party**

**Fullname:** party

**Attribute Description:** This attribute indicates the user to which this ACD/BRCS position is assigned.

**Attribute: pos_dn**

**Fullname:** position directory number

**Attribute Description:** This attribute identifies the primary directory number of this ACD/BRCS position.

**Attribute: pos_dn.noc**

**Fullname:** normalized office code

**Attribute Description:** See pos_dn.

**Attribute: pos_dn.digits**

**Fullname:** four directory number digits

**Attribute Description:** See pos_dn.

**Attribute: ltm_idxi**

**Fullname:** logical termination index

**Attribute Description:** This attribute is the sequential number assigned to correspond with the primary DN of this ACD/BRCS position.

**Attribute: acdsp1**

**Fullname:** ACD/BRCS spare 1

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp2**

**Fullname:** ACD/BRCS spare 2

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp3**

**Fullname:** ACD/BRCS spare 3

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp4**

**Fullname:** ACD/BRCS spare 4

**Attribute Description:** Spare ACD/BRCS attribute.

Copyright © 1999 Lucent Technologies

**Attribute: acdsp5**

**Fullname:** ACD/BRCS spare 5

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp6**

**Fullname:** ACD/BRCS spare 6

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp7**

**Fullname:** ACD/BRCS spare 7

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp8**

**Fullname:** ACD/BRCS spare 8

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp9**

**Fullname:** ACD/BRCS spare 9

**Attribute Description:** Spare ACD/BRCS attribute.

**Attribute: acdsp10**

**Fullname:** ACD/BRCS spare 10

**Attribute Description:** Spare ACD/BRCS attribute.

## 4. Population Rules for RLacddisp

**Relation Description**

ACD/BRCS call seizure display.

ACD/BRCS display index to character display mapping.

**Attribute: dispx**

**Fullname:** Display index

**Attribute Description:** This key attribute is an index used to identify displays on ACD/BRCS positions for incoming calls delivered through the queue.

**Attribute: display**

**Fullname:** display

**Attribute Description:** Displayed upon terminating to an ACD/BRCS agent. Filled with up to SZACDDISP characters 'A'-'Z','a'-'z', '0'-'9', '-','/', and ' '(blank).

**Attribute: dnstart**

**Fullname:** display number start

**Attribute Description:** This numerical value is the "n"th digit in the calling/called number to start displaying. It is used to point to the first digit of a number.

**Attribute: dnlen**

**Fullname:** display number length

**Attribute Description:** calling/called number display length This attribute is used to specify how many digits are displayed beginning at the "dnstart" digit.

**Attribute: disp_clg**

**Fullname:** display calling

**Attribute Description:** display of the calling directory number This attribute indicates that the calling DN is to be displayed at the agent's terminal.

**Attribute: disp_cld**

**Fullname:** display called

**Attribute Description:** display of the called directory number This attribute indicates that the called DN is to be displayed at the agent's terminal.

## 4. Population Rules for RLacoftran

### Relation Description

ACOF button translation

Maps the control port and party for a particular ACOF restriction.

Information concerning this section is not available at this time.

**Attribute: config**

**Fullname:** configuration group

**Attribute Description:** This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

Copyright © 1999 Lucent Technologies

**Attribute: cpe_comp**

**Fullname:** CPE component

**Attribute Description:** This cpe_comp must be the same as RLbnfeat.cpe_comp which has an action of ACN_IACOF and the same config as this relation.

**Attribute: button**

**Fullname:** ISDN station set button number

**Attribute Description:** This button number must be the same as RLbnfeat.button which has an action of ACN_IACOF and the same config as this relation.

**Attribute: lport**

**Fullname:** control lport of an IDP group for an ACOF restriction

**Attribute Description:** Verify existence of tuple in RLfc_line where RLfc_line.lport = RLacoftran.lport AND RLfc_line.lpt_type = RLacoftran.lpt_type. The keys for RLfc_line are:

```
RLfc_line.port = RLlpt_pt(RLacoftran.lport,RLacoftran.lpt_type)
       .port.member
RLfc_line.party = RLlpt_pt(RLacoftran.lport,RLacoftran.lpt_type
).party
        Also, verify existence of tuple in RLtrmfeats
        for this control lport and lpt_type that has the IDP
        modular feature type assigned.
```

**Attribute: lpt_type**

**Fullname:** lport type

**Attribute Description:** Information concerning this section is not available at this time.

**Attribute: lport_mod**

**Fullname:** module control lport is located on

**Attribute Description:** Information concerning this section is not available at this time.

**Attribute: afidx**

**Fullname:** ACOF button index for this button

**Attribute Description:** This index is assigned in RLisatlmt in attribute afbitmap. See RLisatlmt.P for information on how the index is generated.

```
Dependencies:
The bit which corresponds to this index
number in rlISATLMT.afbitmap must be set to '1'.

Verify the existence of a tuple in RLisafidx
such that
rlISAFIDX.config = rlACOFTRAN.config

rlISAFIDX.afidx  = rlACOFTRAN.afidx
```

## 4. Population Rules for RLacpfx

### Relation Description

LASS automatic callback office prefix exception list. Upon invoking LASS AC, the DN in the ILHB must be translated to a valid number that will allow the user to call back the last incoming calling DN (LICDN). A global office parameter, Glinpa, will first be checked to see if the area code corresponding to the LICDN is the NPA most often implied by a call received in the office. If the implied NPA for the LICDN is the same as what is in Glinpa, then the LICDN is allowed to be translated on less than 3 digits. If this is not the case, relation RLnmimpdgt is read to reconstruct the full destination code for the LICDN. If the call is still not routable because it must be determined if a 1+ needs to be prefixed or not, this relation which is an exception list, is read to determine what special office codes are an exception to the office standard ( either 1+ is the norm or none+ is ) specified in the relation via the ofc_pfx field.

Copyright © 1999 Lucent Technologies 

**Attribute: dummy_key**

**Fullname:** dummy key

**Attribute Description:** This relation does not need a key, but one is required. A dummy key is used for this relation.

**Attribute: ofc_pfx**

**Fullname:** office prefix standard

**Attribute Description:** This attribute specifies whether or not the office standard is that of accepting DNs dialed with or without a 1+ dialed to a particular NPA or NPA-NXX or whether the office will not accept termination to a DN with a particular NPA or NPA-NXX if a 1+ is dialed. The office standard is to accept either 1+ or no 1+ dialing. If the ofc_pfx is set to DBYES, then 1 + NPA and/or 1 + NPA-NXX is defined in the office dialing plan and will route to the DN. If it is set to DBNO, then none + NPA and/or none + NPA-NXX is defined in the office dialing plan and will route to the DN.

**Attribute: ids_in_use**

**Fullname:** number of exception structures in use

**Attribute Description:** This attribute specifies the current number of exception entries populated. The exception structures must be populated in a sequential order, excpid1 first, then excpid2 second, etc.

**Attribute: inpa_sp1**

**Fullname:** INPA feature spare bit 1

**Attribute Description:** Spare place holder for use by the INPA feature

**Attribute: inpa_sp2**

**Fullname:** INPA Feature spare bit 2

**Attribute Description:** Spare place holder for use by the INPA feature.

**Attribute: excpid[*]**

**Fullname:** exception list - entries 1..10

**Attribute Description:** There are 10 exception list entries. Each is composed of the exception list count and the exception list digits (in ASCII).

**Attribute: excpid[*].pfxid**

**Fullname:** exception list entry id

**Attribute Description:** Exception List entry ID. This field specifies the exception list digits in ascii. The exception list digits in each entry specify either an NPA, or an NPA-NXX combination. Office codes within that office that are exceptions to what the office standard is are contained in the exception list. LASS Automatic Callback invocation will cause this relation to be read to see if the number that is being called back is an exception to what the office standard is. The maximum number of entries on the list is 10, each of which may be 3 or 6 digits in length. Office codes which just consist of an NPA must be populated first in this list and those which consist of NPA-NXX must be populated last in the list.

**Attribute: excpid[*].pfxcnt**

**Fullname:** exception list count

Copyright © 1999 Lucent Technologies 

**Attribute Description:** There are 10 of these counters that keep track of how many digits have been populated in a corresponding exception list entry. An exception list entry will contain at a minimum the NPA.

## 4. Population Rules for RLacsr_grp

### Relation Description

Automatic customer station rearrangement group parameter. This relation provides the automatic customer station rearrangement (ACSR) group parameter data.

The application processor (AP) will automatically receive update information whenever an ACSR move occurs. The application processor identification (APID) has an associated business customer BCID specified.

**Attribute: acsr_gpid**

**Fullname:** ACSR group ID

**Attribute Description:** The ACSR group ID is an identifier resulting from the conversion from an 8 character ACSR group name. The ACSR group name is an identifier with a class of FACACSR and a subclass of SCL_NULL.

**Attribute: apid**

**Fullname:** Application processor ID (APID)

**Attribute Description:** Applications processor ID specifies the destination AP (or external processor) that messages are sent regarding ACSR moves from users associated with this ACSR group. A value of zero implies no AP for this ACSR group.

**Attribute: bcid**

**Fullname:** Business customer ID (BCID)

**Attribute Description:** Business customer ID for this ACSR group as it relates to the APID. A value of zero implies that this ACSR group is not associated with an AP.

Messages sent to an external processor (that is, applications processor) concerning ACSR moves will include this number for identifying the user (or business customer) on that external processor.

**Attribute: ring_typ**

**Fullname:** ACSR ring back cadence selector

**Attribute Description:** Ringback cadence selector specifies the type of ringing to be applied for the ACSR ringback call. ACSR attempts to ring back the customer after the RC is completed. This field specifies the ring type and duration of ring. It will ring when the customer invokes it.

**Attribute: ring_max**

**Fullname:** ACSR ring back interval

**Attribute Description:** The ringback interval specifies the number of seconds to allow ringing to occur during an ACSR ringback call.

**Attribute: grp_active**

**Fullname:** ACSR group active

**Attribute Description:** ACSR group status indicates if the ACSR group is active or inactive. A user with the appropriate ACSR feature (RLacsr_usr.grp_cntrl is DBYES) can utilize dialed codes (or CORCs) to modify the ACSR group status.

## 4. Population Rules for RLacsr_ldm

### Relation Description

Automatic Customer Station Rearrangement Large Data Movement Control Relation

This relation provides control information for the distribution of the Automatic Route Selection (ARS) and Individualized Dialing Plan (IDP) Group Partitioned Data (GPD). The relation is used by Recent Change to prevent setting up configurations where IDP and ARS group data needs to be moved during an ACSR end-user originated line move. The tuples in this relation documents the number of interactions between ARS and ACSR, and IDP and ACSR so Recent Change will know what bit maps in RLdb_amgpd to check to verify the distribution of the ARS or IDP group data. An interaction is created whenever a particular user has both IDP and ACSR, or ARS and ACSR. The relation is used in the following cases:

- an ACSR group is assigned/removed from a DSL,
- an ACSR group is assigned/removed from an ISDN user who also has either IDP or ARS,

Copyright © 1999 Lucent Technologies

- an IDP group is assigned/removed from an ISDN user who also has ACSR, and
- an ARS group is assigned/removed from an ISDN user who also has ACSR.

See also: RLdb_amgpd.P, RLid_port.P, RLarport.P, RLdslequip.P.

**Attribute: acsr_gpid**

**Fullname:** Automatic Customer Station Rearrangement Group Identification number

**Attribute Description:** The ACSR Group ID identifies an ACSR Group associated with a DSL on a particular SM. This ACSR Group is also assigned to a User who is a member of an ARS group or an IDP group.

**Attribute: ldm_gpid**

**Fullname:** Large Data Movement Group Identification Number

**Attribute Description:** The Large Data Movement Group ID identifies an ARS or IDP Group associated with a particular User who is also a member of an ACSR group.

**Attribute: ldm_type**

**Fullname:** Large Data Movement Group Type (ARS or IDP)

**Attribute Description:** The Large Data Movement Group Type identifies the type (ARS or IDP) of the Large Data Movement Group.

**Attribute: use_count**

**Fullname:** Use Count

**Attribute Description:** The Use Count attribute specifies the number of Users who are members of both this ACSR group and this LDM group.

## 4. Population Rules for RLacsr_opt

### Relation Description

Automatic customer station rearrangement constructed feature options. This relation provides the automatic customer station rearrangement (ACSR) feature option and default parameter information used in the AM.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description:** A BRCS constructed feature ID consists of a modular feature type and a unique identifier. Only the unique portion of the BRCS feature ID is stored in this attribute. For an automatic customer station rearrangement (ACSR) feature, the modular feature type is MFACSR which is an enumeration of DMMFTYPE. The feature ID must have a class of FACBRCS and a

Copyright © 1999 Lucent Technologies 

subclass of SCL_FEAT.

**Attribute: ama_rec**

**Fullname:** AMA Recording

**Attribute Description:** This attribute indicates if an AMA billing record should be generated for this ACSR feature. The generation of an AMA record for ACSR feature use provides usage sensitive billing. By not generating an AMA record, flat rate billing applies. It can take a value DBYES or DBNO

```
DBYES   /* generate AMA record */
DBNO    /* do not generate AMA record */
```

**Attribute: grp_control**

**Fullname:** group control

**Attribute Description:** This attribute indicates if a user with this ACSR feature is allowed to modify the ACSR group status via a dialed code (CORC). acsr_grp.grp_active defines the group status. It can take a value DBYES or DBNO

```
DBYES   /* group control allowed */
DBNO    /* group control NOT allowed */
```

**Attribute: acsr_group**

**Fullname:** ACSR group name

**Attribute Description:** The ACSR group name default parameter is used to specify the initial ACSR group that a user is associated with when assigned this ACSR feature. The ACSR User relation is populated with the ACSR group ID corresponding to the ACSR group name: RLacsr_usr.group_id. The ACSR group association specified by this default parameter can always be overridden.

**Attribute: pin_req**

**Fullname:** Personal Identification Number Required

**Attribute Description:** The PIN required default parameter is used to specify the initial setting for this field in the ACSR user relation when a user is assigned this ACSR feature. Specifically, the field populated is RLacsr_usr.pin_req. The value specified by this default parameter can always be overridden.

## 4. Population Rules for RLacsr_usr

### Relation Description

**Copyright © 1999 Lucent Technologies** 

Automatic customer station rearrangement (ACSR) user relation

This relation provides the ACSR user parameter values. The ACSR feature may be part of a business and residential customer service (BRCS) feature group (BFG).

**Attribute: locdn**

**Fullname:** Local directory number

**Attribute Description:** This attribute consists of the Normalized Office Code (NOC) and four directory number digits.

**Attribute: locdn.noc**

**Fullname:** Normalized office code

**Attribute Description:** Normalized office code

**Attribute: locdn.digits**

**Fullname:** Digits

**Attribute Description:** The last 4 digits of the local directory number

**Attribute: feat_id**

**Fullname:** Feature identification number

**Attribute Description:** A BRCS constructed feature ID consists of a modular feature type and a unique identifier. For an ACSR feature, the modular feature type equals MFACSR which is an enumeration of DMMFTYPE. The feature ID must have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: acsr_gpid**

**Fullname:** ACSR group ID

**Attribute Description:** The ACSR group ID associates a user with an ACSR feature to an ACSR group.

**Attribute: pin_req**

**Fullname:** Personal identification number (PIN) required

**Attribute Description:** The PIN required attribute specifies whether the user is required to enter a PIN upon invocation of the ACSR feature. It can take a value DBYES or DBNO:

DBYES - - PIN equals required.

DBNO - - PIN equals not required.

**Attribute: acsr_inh**

**Fullname:** ACSR inhibition per LOCDN

**Attribute Description:** This indicates whether ACSR is inhibited for this user.

**Attribute: ama_rec**

**Fullname:** Automatic Message Accounting (AMA) billing recorded indicator

**Attribute Description:** This attribute indicates if an AMA billing record should be generated for each successful ACSR move invoked by this user. The generation of an AMA record for an ACSR

Copyright © 1999 Lucent Technologies 

user provides usage sensitive billing. By not generating an AMA record, flat rate billing applies.

**Attribute: grp_cntrl**

**Fullname:** Group control

**Attribute Description:** This attribute indicates if this ACSR user is allowed to modify the ACSR group status via a dialed code (Customer Oriented Recent Change (CORC)). The acsr_grp.grp_active attribute defines the group status.

**Attribute: bill_dn**

**Fullname:** Billing Directory Number (DN)

**Attribute Description:** This attribute indicates the billing DN to be billed for usage sensitive ACSR moves.

**Attribute: bill_dn.digcnt**

**Fullname:** Billing directory number digit count

**Attribute Description:** Keeps the count of digits used by the billing DN.

**Attribute: bill_dn.dn**

**Fullname:** Billing directory number DN

**Attribute Description:** This attribute indicates the digitstring of the billing DN.

# ACT_SPR

## 1. Description

This relation is used to store active sparing info for (R)ISLU line cards (max of 2 spares/ISLU) and (R)ISLU2 line circuits (max of 4 which can consist of a mixture of local and remote line group spares).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 8 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | SMrcspare |
| insert trigger | DBNO |
| update trigger | DBYES |
| delete trigger | DBNO |
| end of transaction trigger | DBYES |
| padding indicator | unpadded |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population rules for RLact_spr

### Relation Description

Relation used to store sparing information for active spare line cards for (R)ISLU, and line circuits for ISLU2.

This relation defines the connection from a faulty integrated services line unit (ISLU) or remote ISLU (RISLU) line card, to a spare ISLU or RISLU line card, respectively.

This relation also defines the connection from a faulty integrated services line unit 2 (ISLU2) line circuit, to a spare ISLU2 line circuit.

The relation is filled in by a switch initiated recent change operation which is part of the spare activation. At office-dependent database (ODD) population time there are no active spare connections. Therefore, there should be one tuple per ISLU(2) or RISLU with all of the attributes set to null values as follows:

**Attribute:**
luno
**Fullname:**
Line unit number
**Attribute Description:**
This is the key to the relation and is set to the unit number of the ISLU(2) or RISLU. There should be one tuple per ISLU(2) or RISLU.

**Attribute:**
sprrec[*]
**Fullname:**
Structure contains sparing information
**Attribute Description:**
This is a structure domain DMspr_rec. The fields of the domain are set as follow:

```
sport = 0               null port
stype = PCNULLCKT       null ckttype
fport = 0               null port
ftype = PCNULLCKT       null ckttype
```

Copyright © 1999 Lucent Technologies 

**Attribute:**
sprrec[*].sport
**Fullname:**
Sport
**Attribute Description:**
Store sparing information.

**Attribute:**
sprrec[*].stype
**Fullname:**
stype
**Attribute Description:**
Store sparing information.

**Attribute:**
sprrec[*].fport
**Fullname:**
fport
**Attribute Description:**
Store sparing information.

**Attribute:**
sprrec[*].ftype
**Fullname:**
ftype
**Attribute Description:**
Store sparing information.

## 4. Population Rules for RLactbfg

**Relation Description**

ACTive BFG. rlACTBFG controls the design limit that only one BFG update or one BFG Administration view instance can be running/active at one time.

This relation is only used for BFG Update and BFG Administration control. Before modifications, consult the owner of the BFG Administration (RBFGADMIN) or BFG Construction (RBFGCONS) view.

**Attribute: actbfgid**

**Fullname:** BFG ID of the ACTIVE BFG - 'ACTBFG' BFG

**Attribute Description:** This value is zero, unless an unresolved update of BFG exists. During BFG update or administration this value represents the BFG being processed - the BFG ID of 'ACTBFG' which can be found in rlFACNAME. If the update was initiated from RBFGCONS then (actbfgid == srcbfgid). Otherwise, the update was initiated from RBFGADMIN and (actbfgid != srcbfgid).

**Attribute: srcbfgid**

**Fullname:** BFG ID of the Source BFG

**Attribute Description:** This value represents the BFG ID of the BFG being updated the BFG being administered to some other BFG, from the RBFGADMIN view. When the Source BFG key on the RBFGADMIN view is 'SETUP', this 'srcbfgid' is set to 0. When (srcbfgid equals actbfgid), then the update was initiated from the BFG Construction view (RBFGCONS), otherwise the BFG update was initiated from the BFG Administration view (RBFGADMIN).

**Attribute: dstbfg[*]**

**Fullname:** Destination BFG ID(s) (1 thru 9)

**Attribute Description:** This array contains the list of BFG IDs that are involved in the update. For entry 1, it may be a Selected, Base or Residential BFG. When entry 1 is the only Destination BFG, then it must exist. Entries 2 thru 9 (inclusive), may be either a Selected or Residential BFG. Entries 10 thru 16 must be only Residential BFGs. For entries 2 thru 16, the BFG may not necessarily exist

Copyright © 1999 Lucent Technologies 

due to a deletion from RBFGCONS during the RBFGADMIN update process. For both 'SETUP' and the BFG Removal operation Destination BFG IDs 1 thru 16 are 0. For the BFG Removal operation, 'NULL' is entered as the TARGET BFG from view RBFGADMIN - 12.8. In the BFG Removal case, the SOURCE BFG is being unassigned and it's associated features are being removed along with it if the ALLOW SERVICE CHNG field is set to 'Y' on view 12.8. If the ALLOW SERVICE CHNG field is set to 'N', then the features in the SOURCE BFG will be stripped out and assigned to the line (but the SOURCE BFG is still removed).

**Attribute: dstbfg[*]**

**Fullname:** Destination BFG IDs (10 thru 16)

**Attribute Description:** This array contains the list of BFG IDs (10 - 16) that are involved in the update. Entries 10 thru 16 must be only Residential BFGs. Entries 2 thru 16 need not exist due to a deletion from RBFGCONS during the RBFGADMIN update process.

**Attribute: chgserv**

**Fullname:** Change Of Service, Yes or No

**Attribute Description:** Change Of Service is always YES when the BFG Update is taking place from RBFGCONS, otherwise it may be YES or NO.

**Attribute: chgcnt**

**Fullname:** Change Count

**Attribute Description:** This count is used during an update or administration processing to assure no other BFG is being updated or administered.

## 4. Population Rules for RLad1b_idp

### Relation Description

Individualized dialing plan one-digit abbreviated dial list basic relation, stores up to 14 digits per tuple.

**Attribute: ad1_list_id**

**Fullname:** 1-digit ad list ID

**Attribute Description:** One-digit unshared abbreviated dial list ID.

Dependencies: Assigned from the class and subclass master tuple in RLsmfacids. Generally this will be the last-used attribute in the master tuple unless there are tuples on the reclaim list (indicated by a non-zero value in the reclaimed field in the master tuple).

**Attribute: adcode**

**Fullname:** 1-digit AD code

**Attribute Description:** A one-digit AD code for the given list; it is an extended digit (0-9, *, and #).

**Attribute: storedseq**

**Fullname:** Stored digits

**Attribute Description:** Stored extended digit sequence.

**Attribute: storedseq.digcnt**

**Fullname:** Digit count

**Attribute Description:** The number of digits stored in this tuple as well as a flag to indicate that an extended tuple was necessary to accommodate all digits. If the value is between 0 and 14 this means the digcnt refects the total number of digits associated with the abbreviated dial code. A digcnt which equals 15 acts as a flag to indicate the following:

(1) There are more than 14 digits associated with this tuple.
(2) Ten digits are stored in this tuple and are located in the first ten digit positions.
(3) No value is stored in the eleventh digit position.
(4) The digits in the positions 12-15 are an encoded key to the tuple in RLad1e_idp which contain the rest of the digits associated with this ad list and ad code. The key is encoded in the following way: If the key to the RLad1e_idp tuple equals 0x1234 then the digits in the 12-15 position would be

```
|digit 12 |  digit 13 | digit 14 | digit 15|
|---------|-----------|----------|---------|
|         |           |          |         |
|   '1'   |    '2'    |   '3'    |   '4'   |
|         |           |          |         |
|---------|-----------|----------|---------|
```

Where '1' represents the character 1 (0x31). The 12th digit represents the 4 high order bits of the key. The 13th digit represents the next 4 bits of the key, the 14th digit represents the next 4 bits of the key and the 15th digit represents the 4 low order bits of the key. When hex digits 0xa, 0xb, 0xc, 0xd, 0xe or 0xf are part of the key a special encoding is done in the associated digit position as follows.

```
0xa is represented by '*'
0xb is represented by '#'
```

Copyright © 1999 Lucent Technologies 

```
0xc is represented by 'F'
0xd is represented by 'O'
0xe is represented by 'I'
0xf is represented by 'P'
```

Using this encoding, if the key to RLad1e_idp equals 0xa9be then the values in the 12-15 digit positions would be:

```
|digit 12 |  digit 13 | digit 14 | digit 15|
|---------|-----------|----------|---------|
|         |           |          |         |
|   '*'   |    '9'    |   '#'    |   'I'   |
|         |           |          |         |
|---------|-----------|----------|---------|
```

**Attribute: storedseq.dn**

**Fullname:** Directory number

**Attribute Description:** The stored sequence invoked by the AD code. Range of values: digits: an array of up to 15 extended digits ['0'-'9','#','*', and the following ASCII characters: O(0x4f), F(0x46), I(0x49), and P(0x50)]. Default value: 0 (null); Dependencies: If the digit count is 0-14 there are no dependencies. If the digit count is 15 then the digits in the 12-15 positions represent a key to a tuple in RLad1e_idp which is sequentially derived from the lastused or reclaimid field in the 1-digit extended master class tuple in relation RLsmfacids.

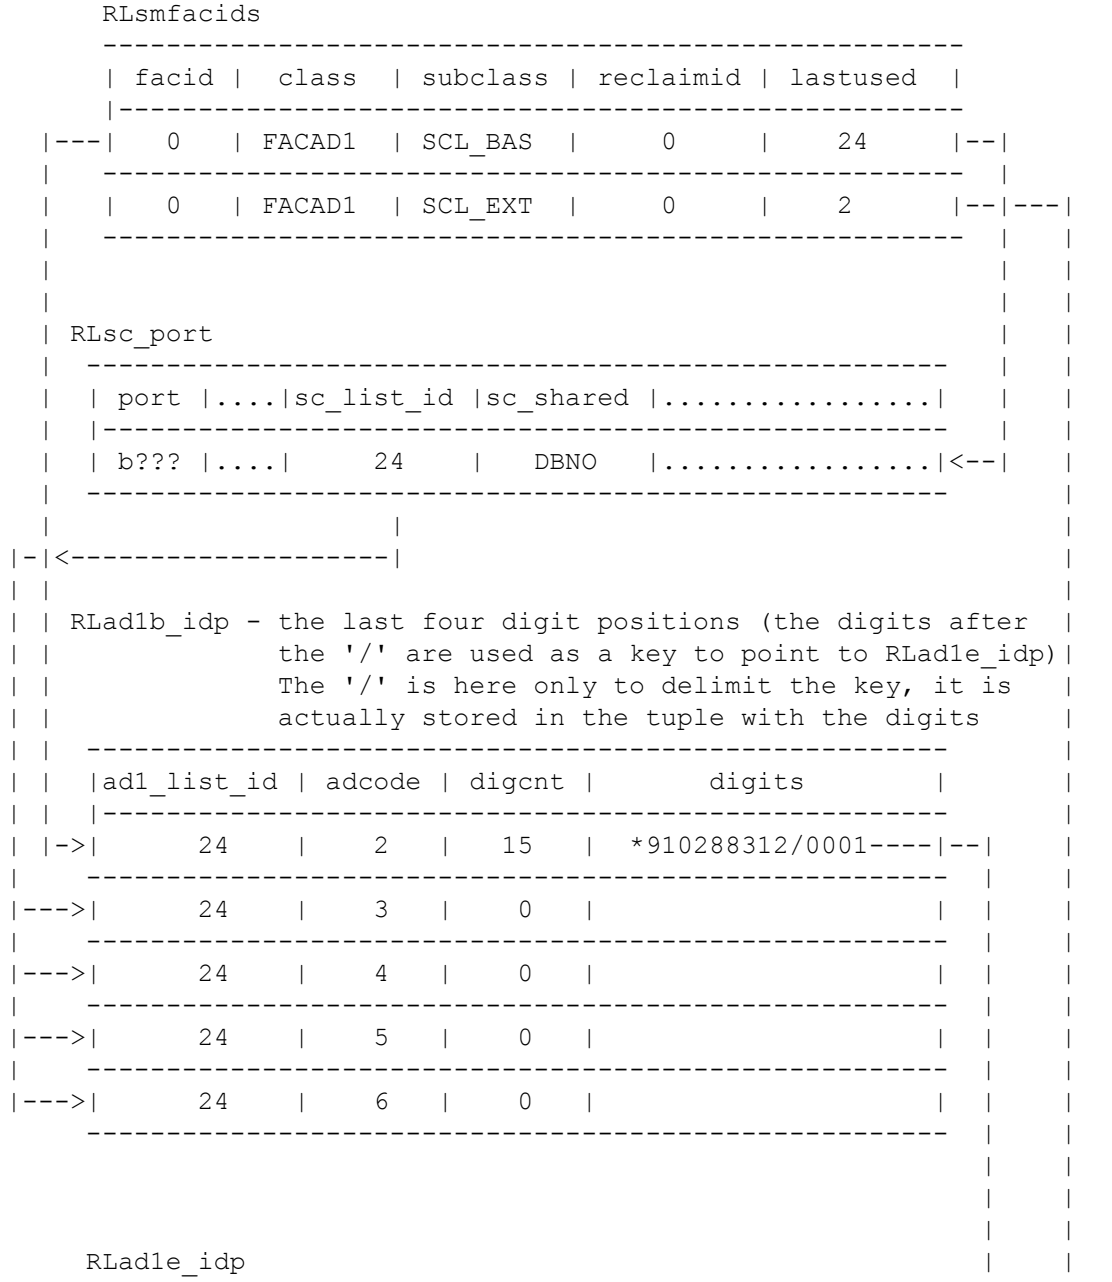
## 4. Population Rules for RLad1e_idp

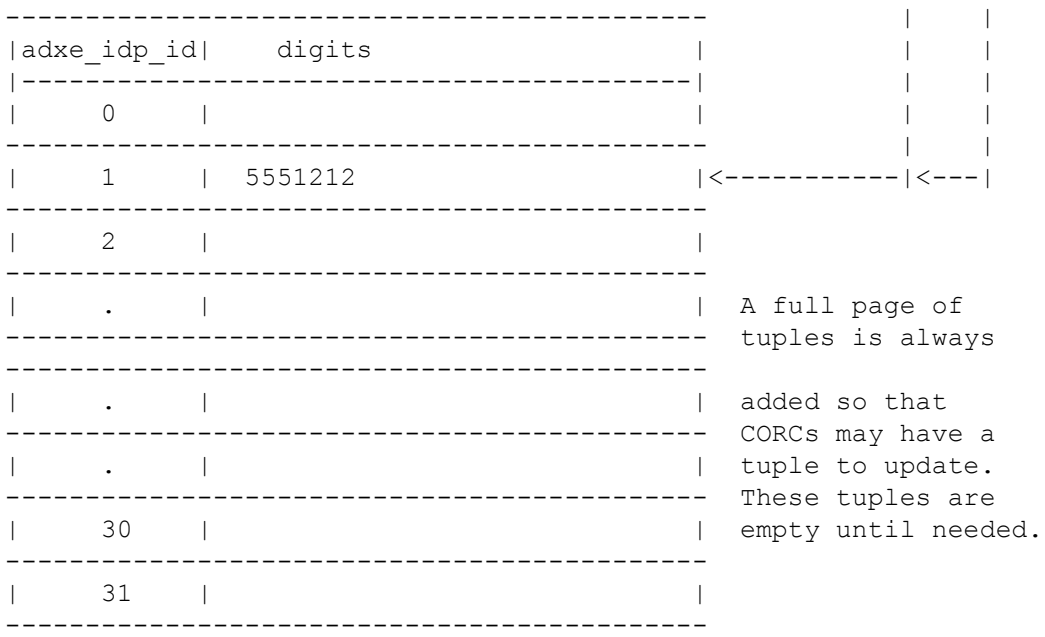
### Relation Description

One-digit speed calling extended digit relation.

Graphical dependency linkage of data for RLad1e_idp.



Copyright © 1999 Lucent Technologies 



**Attribute: adxe_idp_id**

**Fullname:** extended digit abbreviated dial list ID

**Attribute Description:** This key is stored in a tuple in RLad1b_idp. See poprules for RLad1b_idp for details. Even though the key 0 is populated it is never used.

Dependencies: Assigned sequentially from the class master extended tuple in RLsmfacids (key => facid=0, class=FACAD1, subclass=SCL_EXT).

**Attribute: digits**

**Fullname:** stored digits

**Attribute Description:** This attribute indicates the stored digits.

Range of values: an array of up to 22 extended digits('0'-'9','#','*', and the following ASCII characters: O(0x4f), F(0x46), I(0x49), and P(0x50)).

These digits will be populated with the BCD I/O type. This I/O type has been name TTBCD.

ODA: The length of a structure of this I/O type does not imply the number of digits that can be stored in it. The correct number of storable digits IS INDEED 22.

RECENT CHANGE: The algorithm used to determine the number of digits storable in the structure can be found in hdr/db/DBbcdmacs.h

**Attribute: digits.adig22**

**Fullname:** digits

**Attribute Description:** An array of 22 BCD digits followed by the digit count.

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLad1s_idp

**Relation Description:** Individualized dialing plan 1-digit shared abbreviated dial list.

This relation gives shared individualized dialing plan information associated with a (name, class, subclass) combination. The relation RLname2id identifies the (name, class, subclass) with which the (ad1_list_id, adcode) information is associated. The class is FACAD1 and the subclass is SCL_SHR. Each adcode, or 1-digit abbreviated dial code, is associated with a string of digits. This ad1_list_id may be assigned to one or more lines.

This relation is for a shared 1-digit Speed Calling lists. A shared speed call list can be assigned to more that one line. Given the speed call list id and the speed call code the stored sequence for that speed call code can be found.

**Attribute: ad1_list_id**

**Fullname:** 1-digit ad list id

**Attribute Description:** shared 1-digit speed call list id

**Attribute: adcode**

**Fullname:** 1-digit AD code

**Attribute Description:** A 1-digit AD code for the given list; it is an extended digit (0-9, *, and #).

**Copyright © 1999 Lucent Technologies** 

Default Abbreviated Dialing Lists (AD1): If an AD1 list is assigned to the line and if the AD codes are not specified by the customer, default abbreviated dialing lists will be built by ODA as follows:

(1) If a dialing plan (IDP) is assigned to the line, populate digits 2 - 7.

(2) If a dialing plan is not assigned to the line (POTS abbreviated dialing), then populate digits 2 - 9.

**Attribute: storedseq**

**Fullname:** stored extended digit sequence

**Attribute Description:** The stored sequence invoked by the AD code. Each attribute is a structure consisting of three members:

```
edn32:   a 32-digit string;
tgsr_ov: terminal group station restriction override;
digcnt:  the number of digits in the string;
Range of values:  edn32: an array of up to 32 extended digits('0'-'9','#'
,'*',
         and the following ASCII characters:  O(0x4f), F(0x46), I(0x49),
         and P(0x50).);
tgsr_ov: all enumeration values(DBNO,DBYES);
digcnt:  0-32.
Default value: edn32: 0 (null); tgsr_ov: DBNO;
digcnt:  0.
```

**Attribute: storedseq.dcnt32**

**Fullname:** count for up to 32 digits

**Attribute Description:** number of digits in the stored sequence

**Attribute: storedseq.tgsr_ov**

**Fullname:** terminal group station restriction override

**Attribute Description:** ability to override terminal group station restrictions and dialing plan access treatment restrictions via speed calling

**Attribute: storedseq.edn32**

**Fullname:** array of 32 of extended digits

**Attribute Description:** Digit string of up to 32 extended digits making up the stored sequence.

## 4. Population Rules for RLad2b_idp

**Relation Description**

Individualized dialing plan 2-digit abbreviated dial list basic tuple, can hold up to 14 digits. If more are needed they will be in ad2e_idp.

**Attribute: ad2_list_id**

**Fullname:** 2-digit abbreviated dial list ID

**Attribute Description:** Sequentially assigned from the class and subclass master tuple in RLsmfacids. The ID is generally assigned from the lastused attribute in the master tuple. If there are

**Copyright © 1999 Lucent Technologies** 

reclaimed tuples then it is assigned from the reclaimid field in the master tuple. This is indicated by a non-zero value in the reclaimid field.

**Attribute: dig_tens**

**Fullname:** digit dialed in tens position

**Attribute Description:** This attribute indicates the digit dialed in the tens position. Range of values: extended digits '0' - '9', *, #, ".

**Attribute: dig_ones**

**Fullname:** digit dialed in ones position

**Attribute Description:** This attribute indicates the digit dialed in the ones position. Range of values: extended digits 0-9.

**Attribute: storedseq**

**Fullname:** stored digits

**Attribute Description:** Stored digits; string of 15 digits and digit count.

**Attribute: storedseq.digcnt**

**Fullname:** digit count

**Attribute Description:** The number of digits stored in this tuple as well as a flag to indicate that an extended tuple was necessary to accommodate all digits. If the value is between 0 and 14 this means the digcnt refects the total number of digits associated with the abbreviated dial code. A digcnt which equals 15 acts as a flag to indicate the following:

(1) There are more than 14 digits associated this tuple.
(2) Ten digits are stored in this tuple and are located in the first ten digit positions.
(3) No value is stored in the eleventh digit position.
(4) The digits in the positions 12-15 are an encoded key to the tuple in RLad2e_idp which contain the rest of the digits associated with this ad list and ad code. The key is encoded in the following way: If the key to the RLad2e_idp tuple equals 0x1234 then the digits in the 12-15 position would be

```
|digit 12 |  digit 13 | digit 14 | digit 15|
|---------|-----------|----------|---------|
|         |           |          |         |
|   '1'   |    '2'    |   '3'    |   '4'   |
|         |           |          |         |
|---------|-----------|----------|---------|
```

Where '1' represents the character 1 (0x31).

The 12th digit represents the 4 high order bits of the key. The 13th digit represents the next 4 bits of the key, the 14th digit represents the next 4 bits of the key and the 15th digit represents the 4 low order bits of the key.

When hex digits 0xa, 0xb, 0xc, 0xd, 0xe or 0xf are part of the key a special encoding is done in the associated digit position as follows.

```
0xa is represented by '*'
0xb is represented by '#'
0xc is represented by 'F'
0xd is represented by 'O'
```

Copyright © 1999 Lucent Technologies 

```
0xe is represented by 'I'
0xf is represented by 'P'
```

Using this encoding, if the key to RLad2e_idp equals 0xa9be then the values in the 12-15 digit positions would be:

```
|digit 12 |  digit 13 | digit 14 | digit 15|
|---------|-----------|----------|---------|
|         |           |          |         |
|   '*'   |    '9'    |   '#'    |   'I'   |
|         |           |          |         |
|---------|-----------|----------|---------|
```

Dependencies: If there are more than 14 digits associated with this list and adcode then the digcnt = 15.

**Attribute: storedseq.dn**

**Fullname:** Directory Number

**Attribute Description:** The stored sequence invoked by the AD code. Range of values: digits: an array of up to 15 extended digits ['0'-'9','#','*', and the following ASCII characters: O(0x4f), F(0x46), I(0x49), and P(0x50)].

Dependencies: If the digit count is 0-14 there are no dependencies. If the digit count is 15 then the digits in the 12-15 positions represent a key to a tuple in RLad2e_idp which is sequentially derived from the lastused or reclaimid field in the 2-digit extended master class tuple in relation RLsmfacids.

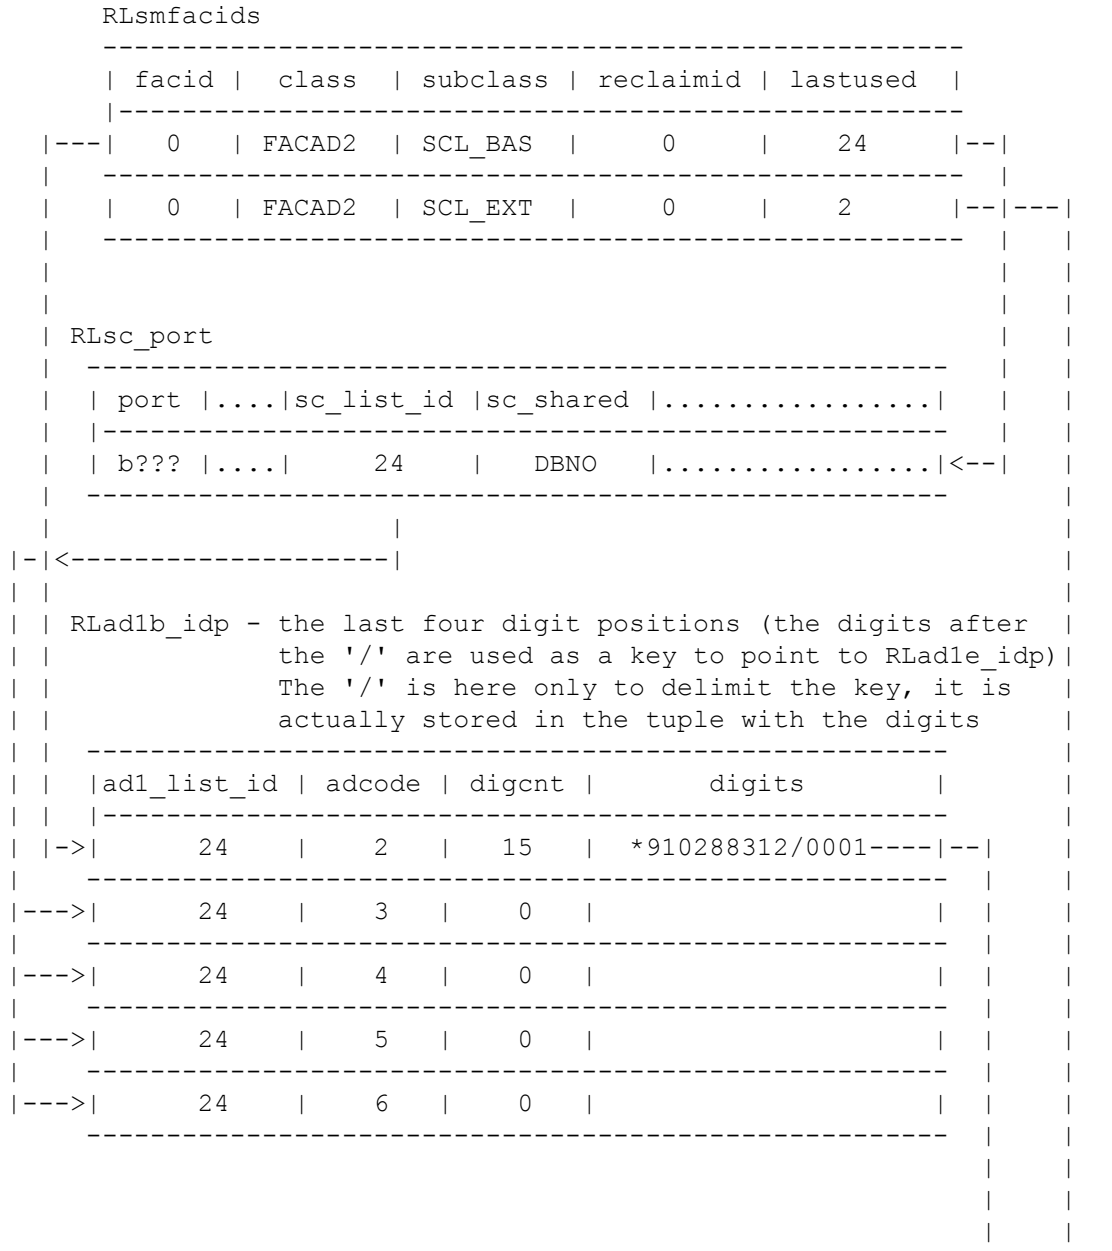
## 4. Population Rules for RLad2e_idp

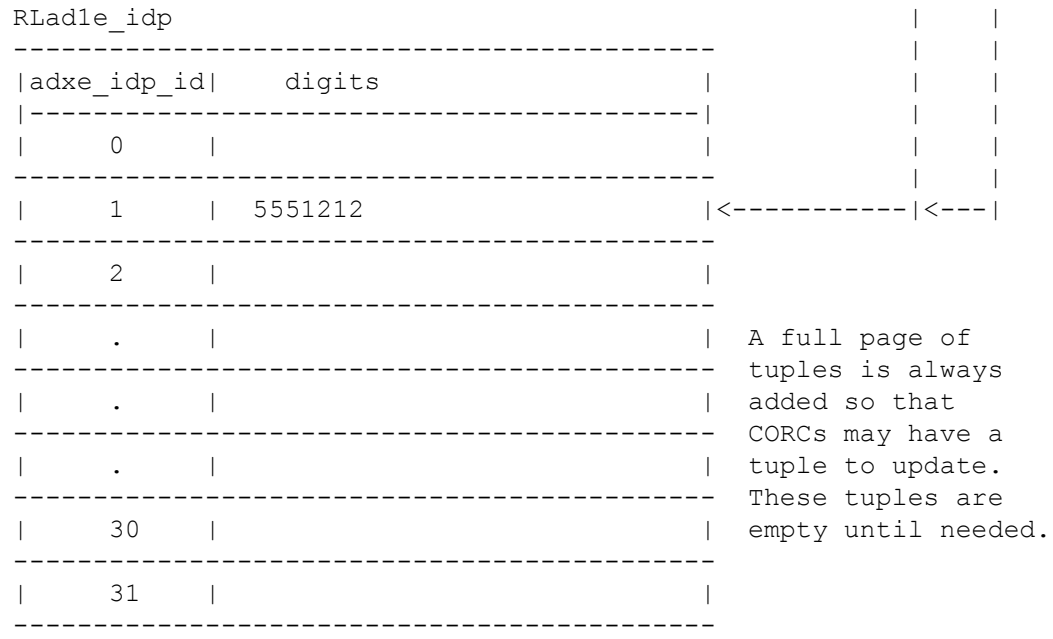
### Relation Description

Two-digit speed calling extended digit relation.

Graphical dependency linkage of data for RLad1e_idp



Copyright © 1999 Lucent Technologies 



**Attribute: adxe_idp_id**

**Fullname:** extended digit abbreviated dial list ID

**Attribute Description:** This key is stored in a tuple in RLad1b_idp. See poprules for RLad1b_idp for details. Even though the key 0 is populated it is never used. Dependencies: Assigned sequentially from the class master extended tuple in RLsmfacids (key => facid=0, class=FACAD2, subclass=SCL_EXT).

**Attribute: digits**

**Fullname:** stored digits

**Attribute Description:** This attribute indicates the stored digits. Range of values: an array of up to 22 extended digits ['0'-'9','#','*', and the following ASCII characters: O(0x4f), F(0x46), I(0x49), and P(0x50)]. These digits will be populated with the BCD I/O type. This I/O type has been name TTBCD.

ODA: The length of a structure of this I/O type does not imply the number of digits that can be stored in it. The correct number of storable digits is indeed 22.

RECENT CHANGE: The algorithm used to determine the number of digits storable in the structure can be found in hdr/db/DBbcdmacs.h *

**Attribute: digits.adig22**

**Fullname:** digits

**Attribute Description:** An array of 22 BCD digits followed by the digit count.

## 4. Population Rules for RLad2s_idp

**Relation Description:** Individualized dialing plan 2-digit shared abbreviated dial list

This relation gives shared individualized dialing plan information associated with a (name, class, subclass) combination. The relation RLname2id identifies the (name, class, subclass) with which the (ad2_list_id, dig_tens, dig_ones) information is associated. The class is FACAD2 and the subclass is SCL_SHR. Each (ad2_list_id, dig_tens) combination is associated with all valid dig_ones values (0 through 9). Each (ad2_list_id, dig_tens, dig_ones) combination is associated with a string of digits. This ad2_list_id may be assigned to one or more lines.

This relation is for a shared 2-digit Speed Calling list. A shared speed call list can be assigned to more than one line. Given the speed call list id and the speed call code the stored sequence for that speed call code can be found.

**Attribute: ad2_list_id**

**Fullname:** 2-digit ad list id

**Attribute Description:** shared 2-digit speed call list id

**Attribute: dig_tens**

**Fullname:** digit dialed in tens position

**Attribute Description:** This attribute indicates the digit dialed in the tens position. Range of values: extended digits '0' - '9', *, #, ''.

**Attribute: dig_ones**

**Fullname:** digit dialed in ones position

**Attribute Description:** This attribute indicates the digit dialed in the ones position. Range of values: extended digits 0-9.

**Attribute: storedseq**

**Fullname:** stored digits

**Attribute Description:** This attribute indicates the stored digits. This is a structure consisting of three members:

```
edn32:   a 32-digit string;
tgsr_ov: terminal group station restriction override;
```

Copyright © 1999 Lucent Technologies 

```
digcnt:  the number of digits in the string.
Range of values:  edn32: an array of up to 32 extended digits('0'-'9','#'
,'*',
         and the following ASCII characters:  O(0x4f), F(0x46), I(0x49),
         and P(0x50).);
tgsr_ov: all enumeration values(DBNO,DBYES);
digcnt:  0-32.
Default value: edn32: 0 (null); tgsr_ov: DBN0;
digcnt:  0.
```

**Attribute: storedseq.dcnt32**

**Fullname:** count for up to 32 digits

**Attribute Description:** Number of digits in the stored sequence.

**Attribute: storedseq.tgsr_ov**

**Fullname:** terminal group station restriction override

**Attribute Description:** The ability to override terminal group station restrictions and dialing plan access treatment restrictions via speed calling.

**Attribute: storedseq.edn32**

**Fullname:** array of 32 of extended digits

**Attribute Description:** Digit string of up to 32 extended digits making up the stored sequence.

# ADB_G

## 1. Description

Individualized dialing plan 2-digit abbrev dial list basic tuple, can hold up to 14 digits. If more are needed they will be in ad2e_idp. This is a storage relation shared by both RLad1b_idp and RLad2b_idp.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLaddon

**Relation Description**

Add on *Alliance*® Teleconferencing. This relation contains those NPAs for which part or all of the NXXs can be restricted from using add-on *Alliance*® Teleconferencing.

There are a maximum of 16 NPAs per OSPS office. This relation has permutation type un_perm to guarantee that the alternate relation definition has the same alignment as the relation.

**Attribute: npa**

**Fullname:** Numbering Plan Area

**Attribute Description:** This is an NPA served by this OSPS for which some NXXs are restricted from originating add-on *Alliance*® Teleconferencing calls.

**Attribute: allrest**

**Fullname:** All NXXs are restricted or just some

**Attribute Description:** This is a boolean flag which indicates if all NXXs are restricted (DBYES) or just some (or none) (DBNO).

**Attribute: bits[*]**

**Fullname:** NXX restriction flags

**Attribute Description:** These are 800 boolean flags stored in 25 32-bit words, with a bit being a flag for each NXX within the NPA to indicate whether the NXX is restricted (1) or not (0). The low order bits are populated with boolean bits24 status of lower NXXs in ascending order. Thus NXXs 200 to 231 will correspond to bit 0 to bit 31 within the attribute bits00.

**Relation Description**

*Autoplex*® facility identifiers

This relation maps *Autoplex*® facility identifiers, assigned by the office, to the facility circuit name.

**Attribute: afac_id**

**Fullname:** *Autoplex*® facility identifier

**Attribute Description:** Key attribute identifying a facility used for *Autoplex*® traffic. This ID is assigned by the technician. It is used in communicating maintenance information to the *Autoplex*® complex.

**Attribute: sm**

**Fullname:** Switching module (SM)

**Attribute Description:** Indicates the SM on which the facility resides.

**Attribute: circuit**

**Fullname:** Circuit name

**Attribute Description:** Indicates the circuit name of the facility. This is the key to the circuit's RLcktdata tuple on the given SM.

## 4. Population Rules for RLagentid

**Relation Description**

ACD/BRCS agent login id relation

This relation defines the valid login IDs and serving team assignments for ACD/BRCS agents.

**Attribute: agent_id**

**Fullname:** ACD/BRCS agent identifier

**Attribute Description:** This is the agent ID.

**Attribute: serv_tm**

**Fullname:** Serving Team number

**Attribute Description:** Serving team number this agent ID is assigned to.

**Attribute: pswd**

**Fullname:** Agent's password

**Attribute Description:** The password is a string of SZAGPSWD characters composed only of numeric characters '0'-'9'. Note that the password must be exactly SZAGPSWD characters OR the null string.

**Attribute: mon_perm**

**Fullname:** Agent's monitoring (service observing) permission flag

**Attribute Description:** This attribute indicates whether an agent is allowed to monitor (service observe).

# AI_ESP

## 1. Description

Access Interface Unit Essential Service Protection Masks  Explanation for TMAX value:

Each tuple in this relation holds information for 8 lines on both an SM and SM-2000. Tuples can be created for all possible lines, so for an SM with eight possible AIU's at 640 lines/AIU (20 AP's per AIU, 32 lines per AIU), 5120 lines are configurable, although such a configuration may be illegal.

The maximum number of tuples for RLai_esp was based on 80 tuples for each AIU. ODA will only create tuples for lines within that group that have been assigned the ESP feature on a port basis. If there are no ESP assigned lines in the tuple, that tuple will not be created. For each possible AIU, a maximum of 80 tuples/AIU will be created since an AIU contains a greater number of groups. Tuhs for SM2000, the tmax is 43 (max AIU's) * 80 (max tuples) = 3440 tuples per SM-2000.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10080 |
| expected number of tuples | 17 |
| access type | DBACC_HASH |
| memory type | DBPRAM |

## 4. Population rules for RLai_esp

### Relation Description

Access Interface Unit Essential Service Protection Masks.

**Attribute:**

unit_nbr

**Fullname:**

Copyright © 1999 Lucent Technologies 

Access Interface Unit number

**Attribute Description:**

'unit_nbr' is the first key to this relation.
The following check section tells how the key is generated.

**Attribute:**

ap_nbr

**Fullname:**

Application Pack number

**Attribute Description:**

'ap_nbr' identifies an Application Pack in an (*)AIU unit.
It is the second key to this relation.
The following check section tells how the key is generated.

**Attribute:**

group

**Fullname:**

Group Identification

**Attribute Description:**

'group' identifies an 8-line group in an Application Pack.
'group' is the third key to this relation.
The following check section tells how the key is generated.

**Attribute:**

espmask

**Fullname:**

1 byte per group (bit value of 1 means the Essential Service
Protection (ESP) is enabled for this port).

**Attribute Description:**

The espmask attribute contains 8 one-bit masks,
one for each line in the group. Bit 0 contains
the mask for Line 0 of the group.... and bit 7

**Copyright © 1999 Lucent Technologies** 

```
contains the mask for Line 7 of the group.
Bit 0 is the low order bit.

'espmask' will logically be a projection of the
RLrc_oeinfo 'esl' attribute.  'espmask' indicates
which lines have ESP (Essential Services Protection).
ESP lines receive priority originating treatment
during severe peak traffic conditions IF the
switch personnel has enabled ESP.
Each line in a group will have a different bit
for it in 'espmask'.  Which bit a line uses is
dependent on its relative position in the group.
```

## 4. Population Rules for RLailsdt

**Relation Description**

RLailsdt

RLailsdt is for the automated inward line screening (AILS) data

**Attribute: npa**

**Fullname:** NPA.

**Attribute Description:** Office Code utilizing this feature.

**Attribute: unique**

**Fullname:** Uniqueness key.

**Attribute Description:** A non-displayed key which is related to the DPC, allowing multiple 800-bit maps for each NPA.

**Attribute: oaff1**

**Fullname:** 3 bit spare.

**Attribute Description:** Unused.

**Attribute: pointcode**

**Fullname:** Destination Point Code.

**Attribute Description:** Destination point code of the office code utilizing this feature.

**Attribute: oaff2**

**Fullname:** 5 bit spare.

**Attribute Description:** Unused.

**Attribute: oaff3**

**Fullname:** 3 bit spare.

**Attribute Description:** Unused.

**Attribute: nxx200**

**Fullname:** NXXs 200 - 231.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

Copyright © 1999 Lucent Technologies 

**Attribute: nxx232**

**Fullname:** NXXs 232 - 263.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx264**

**Fullname:** NXXs 264 - 295.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx296**

**Fullname:** NXXs 296 - 327.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx328**

**Fullname:** NXXs 328 - 359.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx360**

**Fullname:** NXXs 360 - 391.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx392**

**Fullname:** NXXs 392 - 423.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx424**

**Fullname:** NXXs 424 - 455.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx456**

**Fullname:** NXXs 456 - 487.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx488**

**Fullname:** NXXs 488 - 519.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx520**

**Fullname:** NXXs 520 - 551.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx552**

**Fullname:** NXXs 552 - 583.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx584**

Copyright © 1999 Lucent Technologies

**Fullname:** NXXs 584 - 615.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx616**

**Fullname:** NXXs 616 - 647.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx648**

**Fullname:** NXXs 648 - 679.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx680**

**Fullname:** NXXs 680 - 711.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx712**

**Fullname:** NXXs 712 - 743.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx744**

**Fullname:** NXXs 744 - 775.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx776**

**Fullname:** NXXs 776 - 807.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx808**

**Fullname:** NXXs 808 - 839.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx840**

**Fullname:** NXXs 840 - 871.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx872**

**Fullname:** NXXs 872 - 903.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx904**

**Fullname:** NXXs 904 - 935.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx936**

**Fullname:** NXXs 936 - 967.

Copyright © 1999 Lucent Technologies

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

**Attribute: nxx968**

**Fullname:** NXXs 968 - 999.

**Attribute Description:** Bitmap indicating which NXXs are served by this point code.

# AISCLS

## 1. Description

Destination indexes related to automatic number identification.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 16 |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| access type | DBACC_LIN |
| head table size | 256 |
| data page size | 256 |

```

## 4. Population Rules for RLaiscls

### Relation Description

Automatic intercept system class.

This relation is keyed by the intercept class. For each class, the relation contains two destination indexes; one used if ANI is available, the other if ANI is not available. If populated, these indexes are used in expanded call type determination. All intercept calls receive treatment based on the data entered in this relation, and the data for intercept entered in RLac_cqdet. If there is no data for the call in this relation, or if the destination index for the call is blank, then the intercept data in RLac_cqdet is used with no destination index.

The maximum number of tuples is 16.

**Attribute: aiscls**

**Fullname:** Intercept class.

**Attribute Description:** Class of intercept.

**Attribute: aisanidi**

**Fullname:** Destination index with ANI.

**Attribute Description:** Destination index for expanded call type determination, which is used if ANI is available. This cannot be zero if ais_nanidi is zero. Zero is not allowed on the RC/ODA form. It is

Copyright © 1999 Lucent Technologies 

equivalent to unknown.

**Attribute: ais_nanidi**

**Fullname:** Destination index without ANI.

**Attribute Description:** Destination index for expanded call type determination, which is used if ANI is not available (ANI fail or ONI). This cannot be zero if aisanidi is zero. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

## 4. Population rules for RLaiu2ap

### Relation Description

(*)AIU APPLICATION PACK Information

This relation is used for information related to AIU application packs (APs). 600MM shelf AIU has maximum 20 APs and the 500MM shelf AIU AIU has a maximum of 14 APs that may be Line Packs (LPs) and Ring Generators (RGs) or a Test Pack (Test AP)..
Line Packs can be equipped from AP 0 - 19 in a 600MM shelf and AP 0 - 14 in a 500MM shelf.
When RGs are equipped in the 600MM, they are always resided on the APs 17 and 19; and the AP 16 and 18 have to be null.
When RGs are equipped in the 500MM, they are always resided on the APs 11 and 13; and the AP 10 and 12 have to be null.

**Attribute:**
aiuno

**Fullname:**
Access Interface Unit Number

**Attribute Description:**
Unit number of a Access Interface Unit.

**Attribute:**
name[*]

**Fullname:**
Application Pack Circuit name in position N. (note: N = * )

**Attribute Description:**
For the 20 possible positions for the application packs.
This attribute holds the application pack circuit name
either an LP name, RG, or Test AP name.

**Attribute:**
comdac_config

**Fullname:**
Comdac equipage of (*)AIU.

**Attribute Description:**
The attribute holds comdac equipage of (*)AIU.

**Attribute:**
shelf_size

**Fullname:**
(*)AIU Comdac shelf size.

**Attribute Description:**
The attribute holds shelf size of (*)AIU.

**Attribute:**
eref0_eqp

**Fullname:**
External clk reference 0

**Attribute Description:**
The attribute holds status of external clk reference 0.

Copyright © 1999 Lucent Technologies 

**Attribute:**
eref1_eqp

**Fullname:**
External clk reference 1

**Attribute Description:**
The attribute holds status of external clk reference 1.

**Attribute:**
ext_rg0

**Fullname:**
External Ring Generator 0.

**Attribute Description:**
Circuit name of external ring generator number 0.

**Attribute:**
ext_rg1

**Fullname:**
External Ring Generator 1.

**Attribute Description:**
Circuit name of external ring generator number 1.

**Attribute:**
risitid

**Fullname:**
Remote peripheral site id.

**Attribute Description:**
The attribute holds site id of site where RAIU is remoted.

**Attribute:**
cable_series

**Fullname:**
Cable series type name

**Attribute Description:**
type of backplane cable used

**Attribute:**
distance

**Fullname:**

Copyright © 1999 Lucent Technologies 

distance

**Attribute Description:**
cable distance

**Attribute:**
sealcmap

**Fullname:**
Application Pack Circuit sealing current map.

**Attribute Description:**
This attribute holds the sealing current option for every application pack in the AIU. This is a 20-bit bit map to represent the option to turn ON/OFF the sealing current of an AP. If the bit is 1, the sealing current will be turned ON for AP pack that corresponds to the position of the bit map.

**Attribute:**
dpidb[*]mask

**Fullname:**
Mask for available AIU PCM timeslots

**Attribute Description:**
The attribute dpidb[*]mask is a 32 bit mask that specifies the PCM timeslots on an AP that are reserved for DPIDB permanent connections to the PSU.

The low order bit represents PCM/AP timeslot 0, the high order bit represents PCM/AP timeslot 31. A bit set to '0' indicates a timeslot used for DPIDB connection.

The default value is 0xffffffff, representing no dpidb timeslots are used. This will be true for any AP on a RAIU, since DPIDBs are not allowed for RAIU, and for any with NO operational or assigned digital (U or T) line circuits.

The actual timeslots chosen for DPIDB connection can be found in the relations RLdpidb_pt and RLdslequip.

When allocating timeslots for D-channels, up to 4 quarter timeslots from the same AP may share a PCM timeslot. This is called piggybacking timeslots. A piggy-backed timeslot is preferred over using a previously empty timeslot.

The following diagram shows which DPIDB's and timeslots may be used to connect D-channels from an AP to the PSU:

```

| Application pack | Time slot assignment | |
|---|---|---|
| 0, 4, 8, 12, 16 | 0, 4, 8, 12, 16, 20, 24, 28 | <= x |
| 1, 5, 9, 13, 17 | 1, 5, 9, 13, 17, 21, 25, 29 | <= y |
| 2, 6, 10, 14, 18 | 2, 6, 10, 14, 18, 22, 26, 30 | <= z |
| 3, 7, 11, 15, 19 | 3, 7, 11, 15, 19, 23, 27, 31 | <= t |

x: time slot group (0, 4, 8, 12, 16, 20, 24, 28)
y: time slot group (1, 5, 9, 13, 17, 21, 25, 29)
z: time slot group (2, 6, 10, 14, 18, 22, 26, 30)
t: time slot group (3, 7, 11, 15, 19, 23, 27, 31)

Time slot groups are independent of DPIDBs.

A selected time slot on a DPIDB for an AP pack will meet the previous criteria if the following equation is satisfied:

```
ts % 4 == ap_no % 4
```

**Attribute:**
shelf

**Fullname:**
XAIU shelf relative to PDXU

**Attribute Description:**
This attribute will describe the XAIU shelf relative to PDXU. This shelf position will determine the TSGRP <-> FPIDB mapping between the XAIU and PDXU.

## 4. Population rules for RLaiu2rg

### Relation Description

```
        Access Interface Unit ((*)AIU) to Ring Generator (RG)

        This relation, when given an (*)AIU number, tells which RG
        services that particular (*)AIU.  It also gives RG physical
        mate and if these 2 RGs are hosted by this (*)AIU.
```

**Attribute:**

## 4. Population rules for RLaiupidb

**Relation Description**

Access Interface Unit ((*)AIU) Peripheral Interface Data Bus (PIDB) connections

This relation describes the type and the connections of PIDBs associated with a (*)AIU service group.

**Attribute:**

picb

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Peripheral Interface Control Bus

**Attribute Description:**

The PICB of the service group.
A corresponding tuple is required in RLpicb,
with unittype of SMAIU, SMRAIU, SMXAIU for AIU

**Attribute:**

dchan

**Fullname:**

D-Channel Type

**Attribute Description:**

Valid values are PCDCUT for cut-through and PCDIRCON for directly connected. For local AIU, if there is no ISDN pack in the unit, then dchan must be set to PCNODCHAN. If dchan value is PCDCUT, there must not be any PIDB's of type PCDPIDB.

All D-channels on an AIU must be on DPIDB's, terminating at the PSU. All D-channels on a RAIU must be on PCAIU PIDB's.
The cut-through type of D-channel is not supported for AIU's (it is support on RAIU's) when DSL's are present.

**Attribute:**

pidb[*]

**Fullname:**

PIDB

**Attribute Description:**

The 'x'th connection on the COMDAC.
This attribute is a structure of the following form:

| | |
|---|---|
| name | The circuit name of the PIDB in rlCKTDATA, and is of type DMCIRCUIT. |
| type | The PIDB type of the PIDB, and is of type DMPIDBTYPE. |
| assoc | The circuit to which the PIDB is attached, and is of type DMCIRCUIT. |
| assoc_dp | The position on the PSIU shelf of a directly connected PIDB. |

**Attribute:**

pidb[*].name

**Fullname:**

Circuit Name

**Attribute Description:**

The circuit name of the PIDB. The PIDB must be represented in RLcktdata and vice versa.

If the pidb is not present in CKTDATA, then the name should be set to 0.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
pidb[*].type
**Fullname:**
PIDB Type
**Attribute Description:**
PIDB type from DMpidbtype.

PCAIUPIDB : the PIDB in the AIU provides a path to the TSIU. This type is only valid on an AIU. PIDBs of this type must terminate on a TSIU. When on a RAIU it is extended via a facility.

PIDBs of type PCAIUPIDB always have a 'mate' PIDB on the other AIU service group. This reflects the fact that these PIDBs are grown in pairs. This is not true for a RAIU since a RAIU can have a SIMPLEX configuration.

'Mate' AIU PIDBs that connect to the TSIU (such as PCAIUPIDB) must connect to the same TSIU DI at paired DI connections (0,1), (2,3), (4,5),(6,7),(8,9),(10,11),(12,13) or (14,15) ... (22,23). The 'mate' PIDB from AIU service group 0 must go to lower member of the pair and must be even. Therefore, the mate PIDB from AIU service group 1 must connect to the higher member of the pair.

The 'pidb' attribute in RLcktdata for each PIDB of type PCAIUPIDB must reflect the correct DI connection for that PIDB.

A PIDB of this type has an entry in RLpidb. A PTSB is allocated in dynamic data for each of the 32 time slots on the PIDB. For each PCAIUPIDB, there must be a PCAIUPIDB with the same PIDB number on the other COMDAC(that is, the PCAIUPIDBs must be equipped in pairs.)

PCDPIDB : the PIDB is one of a pair of PIDBs running in the AIU. PIDBs of type PCDPIDB must terminate at the PSIU. It is not allowed to connect any AIU PIDB of type PCDPIDB to a PSU shelf of circuit data type PCSHLFPSIU, with a cli of DGDFMP.

**Copyright © 1999 Lucent Technologies** 

Note: If the PIDB is not present in CKTDATA,
then the type field should be set to
PCNULLPIDB as a default value.

**Attribute:**
pidb[*].assoc
**Fullname:**
Associated Circuit
**Attribute Description:**
The circuit the PIDB is associated with:

If PIDB 'type' is PCAIUPIDB,
populate 'assoc_ckt' with 0xffff.

If PIDB 'type' is PCDPIDB,
populate 'assoc_ckt' with the side 0 PSIU shelf
circuit name to which the PIDB is attached.
The RLpsiupidb relation tuple keyed with this
shelf name should contain this PIDB name in
one of the attributes dpidb00 through dpidb10.

Note: If the PIDB is not present in CKTDATA,
then the assoc_ckt field
should be set to NULL ( 0xffff)
as a default value.

**Attribute:**
pidb[*].assoc_dp
**Fullname:**
Packet Switch Interface Unit (PSIU) position of a directly
connected PIDB.
**Attribute Description:**
The position of the PIDB connection on the PSIU shelf for a
directly connected PIDB. The PIDB in position XX should be
the same as the PIDB named in the dpidbXX attribute in the
RLpsiupidb relation.
This attribute should be 0 if the PIDB 'type' is not PCDPIDB.

**Defines:**
"db/DMclidef.h"

## 4. Population Rules for RLalgtmrs

**Relation Description**

Level 2 MTP alignment timers

This relation determines the values of level 2 MTP alignment timers given the data rate of the signaling link as input.

**Attribute: dslrate**

**Fullname:** data signaling rate

**Attribute Description:** The rate of the data link in Kbps. This is the key of the relation.

**Attribute: nalghigh_tm**

**Fullname:** Not Aligned Timer (high timer)

**Attribute Description:** The high timer (T2high) which is used during the Not Aligned state of Initial Alignment Control only when Automatic Allocation of Signaling Data Links is being used.

**Attribute: nalglow_tm**

**Fullname:** Not Aligned Timer (low timer)

**Attribute Description:** The low timer (T2low) which is used during the Not Aligned state of Initial Alignment Control only when Automatic Allocation of Signaling Data Links is being used.

**Attribute: l2T5_tm**

**Fullname:** Status Indication Busy Timer

**Attribute Description:** This is T5 timer used when a receiving end of a signaling link detecting a congestion situation. The receiving end periodically returns a link status signal unit containing a status indication "B" (for busy) to the remote transmitting end of the link at interval T5.

**Attribute: nprov_tm**

**Fullname:** Normal Proving Timer

**Attribute Description:** This is T4n timer used during the Proving state when there is no emergency condition. This is the normal proving period.

**Attribute: delack_tm**

**Fullname:** Excessive delay of acknowledgement Timer

**Attribute Description:** The timer ( T7 ) specifies the maximum time to wait for the acknowledgment of a transmitted MSU.

**Attribute: alg_tm**

**Fullname:** Aligned Ready Timer

Copyright © 1999 Lucent Technologies 

**Attribute Description:** This is T3 timer used during the Aligned state of Initial Alignment Control.

**Attribute: remcng_tm**

**Fullname:** Remote Congestion Timer

**Attribute Description:** The timer ( T6 ) specifies the maximum time to wait for remote congestion to clear.

**Attribute: nalg_tm**

**Fullname:** Not Aligned Timer.

**Attribute Description:** This is T2 timer used during the Not Aligned state of Initial Alignment Control.

**Attribute: algrd_tm**

**Fullname:** Alignment Ready Timer

**Attribute Description:** This is T1 timer used after we are aligned. This is the amount of time we will wait for the other side to align.

**Attribute: eprov_tm**

**Fullname:** Emergency Proving Timer

**Attribute Description:** This is T4e timer used during the Proving state when an emergency proving period is required.

## 4. Population Rules for RLaliaspc

### Relation Description

Alias Point Codes

This relation stores the ALIASPC for NI LATA routing feature in ATT-NSD network and is used for crosscheck purpose. The Alias Point Codes in this relation are identical to the CNI data structure cDalspc[ ].

**Attribute: alias_pc**

**Fullname:** Alias Point Code

**Attribute Description:** The Alias Point Codes in the toll switch are the point codes assigned to the switch in addition to its true office point code. They are used for Network Interconnect messages only. This will be a string of 9 decimal digits. The resultant number will be built as a hex value. The following format applies:

```
(Bits)  23             16 15      11 10     8 7               0
        +----------------+----------+--------+----------------+
        |    Network     |  Region  | Cluster|     Member     |
        |   Identifier   |          | ID     |                |
        +----------------+----------+--------+----------------+
The 9 digit externally defined POINT CODE is converted as:
(network identifier *2 ^16) +
```

## 4. Population Rules for RLalt_dig

**Relation Description:** Alternate announcement digit inflection scheme.

```
**********************************************************************
POPULATION RULES FOR <<<< RLalt_dig >>>>

This relation is not to be populated for export applications.

      Attribute
      ---------
 key  appl         DESCR: application
                   RANGE: One of the enum values defined in db/DMannc_apl.G
                   DEFAULT: None

 key  infl_id      DESCR: inflection id (scheme)
                   RANGE: 1-255
                   This inflection ID is specified by software,
                   so the inflection IDs assigned must correspond
                   to software defined values.
                   DEFAULT: None

 key  alt_ann      DESCR: 11 bits
                   RANGE: 1-1000
                   DEFAULT: None

      dur          DESCR: expected duration of digit string (rounded up
                   to nearest second)
                   RANGE: 1-255 (in seconds)
                   DEFAULT: None

      spare1       DESCR: field used only for alignment of tuple (24 bits)
                   RANGE: 0
                   DEFAULT: 0
```

Copyright © 1999 Lucent Technologies 

```
      infltc01    DESCR: inflection command or phrase
         .        RANGE: 0-16383, 16600-65535
         .
         .        At least one non-zero entry must be specified.
         .        The end of the inflection commands/phrases is denoted
         .        by the 0 entry which MUST be present in each
         .        tuple. No non-zero entries can exist after this entry.

      inflct50
                  DEFAULT: 0
*********************************************************************
DESCRIPTION:

Defines the digit inflection scheme to be used for Automated Calling Card
Service (ACCS).

QUANTITY OF TUPLES:

2 tuples are required as listed here.

TUPLE SEMANTICS for FCOSPS_TA:

appl         - FCOSPS_TA

*************************************************************************/
```

**Attribute: appl**

**Fullname:** application

**Attribute Description:** application

**Attribute: infl_id**

**Fullname:** inflection id

**Attribute Description:** This inflection ID is calculated by software so the inflection IDs assigned must correspond to software defined values.

**Attribute: alt_ann**

**Fullname:** alternate announcement set

Copyright © 1999 Lucent Technologies 

**Attribute Description:** The alternate announcement set assigned need not be contiguous.

The alt_ann value is a range of 1-1000.

**Attribute: dur**

**Fullname:** expected duration of digit string.

**Attribute Description:** Expected duration of digit string (rounded up to nearest second).

**Attribute: spare1**

**Fullname:** spare1

**Attribute Description:** Spare 24 bit field used only for alignment of tuple.

**Attribute: inflct[*]**

**Fullname:** inflection command or phrase

**Attribute Description:** At least one non-zero entry must be specified. The end of the inflection commands/phrases is denoted by the 0 entry which MUST be present in each tuple. No non-zero entries can exist after this entry. inflct50

# ALT_HDR

## 1. Description

This relation contains the alternate announcement header phrase list.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 5000 |
| expected number of tuples | 3000 |
| density | 94 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| tsbal | DBSPEED |
| permutation type | un_perm |

## 3. Field Layout

 ************************************************************************/

/************************************************************************
Population for OSPS Automated Calling Card Service
Announcements (ACCS)

Note:
If the Thank You [branding phrase] announcement is to
be given, the global parameter GLin_thnku must equal DBYES,
otherwise no announcement is given for the ACCS Initial call.

There are two Thank You announcements which can be given,
announcement #5 or #16 listed in the following:

Announcement #5 (hdr_id = 5) should contain only the
Thank You phrase.
TUPLE SEMANTICS:
appl     - FCOSPS_TA
hdr_id   - 5
alt_ann  - 1-1022
dur      - (as calculated by Recent Change)
phrase1  - 52 (Thank You phrase ID)

Announcement #16 (hdr_id = 16) should contain the
Thank you for using phrase plus the branding phrase,
```

Copyright © 1999 Lucent Technologies 

```
which is one of the following:
AT&T
Northwestern Bell
Ohio Bell
New Jersey Bell
Wisconsin Telephone
C&P
Your Local Telephone Company
United Telephone
New York Telephone
New England Telephone
S.N.E.T
Cincinnati Bell
U.S. West Communications
Pacific Bell
Nevada Bell
Whidbey Telephone Company
Roseville Telephone
Illinois Bell
Michigan Bell
Southwestern Bell
Rochester Telephone

TUPLE SEMANTICS:
appl     - FCOSPS_TA
hdr_id   - 16
alt_ann  - 1-1022
dur      - (as calculated by Recent Change)
phrase1  - (Thank you for using phrase ID)
phrase2  - (correct branding phrase ID)

The wording and the IDs of all the phrases are contained in
the RLphrases relation in the AM.

The conditions that determine which Thank You announcement
are explained in the following. These checks are performed
in the OA call processing code and are not to be enforced
in ODA or RC code.

announcement #5 given when:
GLin_thnku = DBYES and GLbranding = DBNO
or GLin_thnku = DBYES and GLbranding = DBYES and

GLoftyp = DBYES and carrier id of call does not equal AT&T
                or
GLoftyp = DBNO and carrier id of call equals AT&T

or GLin_thnku = DBYES and GLbranding = DBYES and
GLoftyp = DBYES and carrier id of call equals AT&T
                or
 GLoftyp = DBNO and carrier id of call equals LEC
                and
the call is a Directory Assistance call and
GLdabrand = DBNO
```

Copyright © 1999 Lucent Technologies 

```
announcement #16 given when:
GLin_thnku = DBYES and GLbranding = DBYES and

 GLoftyp = DBYES and carrier id of call equals AT&T
        or
 GLoftyp = DBNO and carrier id of call equals LEC
         and
the call is not a Directory Assistance call
or GLin_thnku = DBYES and GLbranding = DBYES and

 GLoftyp = DBYES and carrier id of call equals AT&T
        or
 GLoftyp = DBNO and carrier id of call equals LEC
        and
 GLoftyp = carrier ID of call and

the call is a Directory Assistance call and
GLdabrand = DBYES

If the Thank You announcement is to be given for ACCS
Sequence calls, the global parameter GLseq_thnku must equal
DBYES, otherwise no announcement is given.  When the parameter
is set (GLseq_thnku = DBYES), only announcement #5 is given.
Tuple semantics same as the previous for hdr_id=5.

Note:
The announcement headers #39 and #40 should only be populated
if the Front-End Branding Secured Feature has been purchased.
If it has been purchased, the Audible Logo phrase ID is determined
at the time the Customized TN1054 ASC packs are made, and is used
in announcement headers #39 and #40.

The announcement header #149 should only be populated if the PLBQ
Business/Residential Promotional Card Secure Feature has been
purchased.  If the feature has been purchased, the Time Balance
Quotation phrase ID(s) is/are determined at the time that the
customized packs are made and are used in announcement header
149.

The conditions that determine which prompt announcement is
given are explained in the following. These checks are performed
in the OA call processing code and are not to be enforced in
ODA or RC code.

announcement #1 is given when:
        prompt treatment is tone plus prompt
                and
        Secure Feature #15 (Front-End Branding) is not activated
                or
        Glbranding = DBNO
                or
        Glofcar != carrier of call
```

Copyright © 1999 Lucent Technologies 

```
                or
        carrier of call is not AT&T or LEC

announcement #26 is given when:
        prompt treatment is tone only
                and
        Secure Feature #15 (Front-End Branding) is not activated
                or
        Glbranding = DBNO
                or
        Glofcar != carrier of call
                or
        carrier of call is not AT&T or LEC

announcement #39 is given when:
        Secure Feature #15 (Front-End Branding) is activated
                and
        Glbranding = DBYES
                and
        Glofcar = carrier of call
                and
        carrier of call is AT&T or LEC
                and
        prompt treatment is tone only

        Announcement #39 (hdr_id = 39) should contain the 'bong'
        and 'Audible Logo' phrase.
        'Audible Logo' and prompt phrase.
        TUPLE SEMANTICS:
            appl     - FCOSPS_TA
            hdr_id   - 40
            alt_ann  - 1-1022
            dur      - (as calculated by Recent Change)
            phrase1  - 79 ('bong' phrase ID)
            phrase2  - ?? ('Audible Logo' phrase ID determined when
                           the customized announcement is made)
            phrase3  - 28 ('pause' phrase ID)
            phrase4  - 47 ('Please dial your card number' phrase ID)
            phrase5  - 48 ('or zero for an operator now' phrase ID)

        Announcement Header IDs 241 through 300 are to be used
        as customized announcements for the PLBQ Business/Residential
        Card feature.  IDs 241 through 270 will be used by the
        customer to create announcements that will be used as part
        of or instead of the balance quotation.  Ids 271 through 300
        will be used to create announcements that will be used
        instead of the standard disconnect warning announcements.

**Attribute:**

appl

**Fullname:**

Application

**Attribute Description:**
Announcement application

**Attribute:**
hdr_id
**Fullname:**
header id
**Attribute Description:**
The header IDs assigned need not be contiguous.
A phraseX value in the range 1-16383, 16600-MAXPHRASEID must exist as a key in the relation RLphrases along with the corresponding appl value.

**Attribute:**
alt_ann
**Fullname:**
alternate announcement set
**Attribute Description:**
The alternate code assigned need not be contiguous.
The alt_ann value is a range of 1-1022.

**Attribute:**
dur
**Fullname:**
duration
**Attribute Description:**
Dur is the expected duration of the digit string.
The value of dur is calculated by mapping code on an insert transaction. Its value is found by looping through the phrase entries until a 0 is encountered as follows:
- for each phrase entry which specifies a Phrase ID (1-16383, 16600-MAXPHRASE ID)
  the value of 'dur' in the RLphrases entry corresponding to the Phrase ID and appl specified is added into the running total
- for the values 0, 16385, 16386, 16387, 16388, 16389, 16500 - 16599
  the running total is unaffected.

**Attribute:**
spare1
**Fullname:**
spare1
**Attribute Description:**
Field used for spare and for alignment of tuple.

**Attribute:**

phrase1

**Fullname:**

phrase or command

**Attribute Description:**

At least one non-zero entry must be specified. The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |
| 47-16383 | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |
| 16387 | Command - date of last incoming call |
| 16388 | Command - time of last incoming call |
| 16389 | Command - number of dollars and cents |
| 16500-16599 | Application-Specific Commands These are defined by applications to have certain meanings. All of these are treated EXACTLY as is 16385. |
| 16600-MAXPHRASEID | Application Defined Phrase IDs |

NOTE: (MAXPHRASEID+1)-65535 are NOT used for phrase IDs but for subsystem specific purposes.

**Attribute:**

phrase[*]

**Fullname:**

phrase or command

**Attribute Description:**

At least one non-zero entry must be specified. The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |
| 47-16383, | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |

## 4. Population rules for RLalt_plng

**Relation Description**

English Phrase to Alternate Phrase Table.

This table maps English phrases, to alternate language/usage phrases.

**Attribute:**

eng_phr

**Fullname:**

English phrase ID.

**Attribute Description:**

This is the English phrase ID to be mapped to an alternate phrase ID.

Copyright © 1999 Lucent Technologies

**Attribute:**
appl
**Fullname:**
Announcement Application Type.

**Attribute Description:**
Announcement application type of the alternate phrase to which to map eng_phr. Not used at this time.

**Attribute:**
alt_ann
**Fullname:**
alternate announcement set
**Attribute Description:**
The alternate announcement assigned need not be contiguous. The alt_ann value is a range of 1-1022.

**Attribute:**
alt_phr
**Fullname:**
Alternate Phrase ID.

**Attribute Description:**
This is the alternate phrase corresponding to eng_phr for this appl.

**Attribute:**
spare1
**Fullname:**
Spare 1
**Attribute Description:**
A spare field.

        ************************************************************************/
```

**Attribute:**
appl
**Fullname:**
Application
**Attribute Description:**
Announcement application

**Attribute:**
trl_id
**Fullname:**
trailer id
**Attribute Description:**
trailer ID

Copyright © 1999 Lucent Technologies 

**Attribute:**
alt_ann
**Fullname:**
alternate announcement
**Attribute Description:**
The alternate announcement assigned need not be contiguous.
The alt_ann value is a range of 1-1022.

**Attribute:**
dur
**Fullname:**
duration
**Attribute Description:**
Expected duration of digit string.
The value of dur is calculated by mapping code on an insert transaction. Its value is found by looping through the phrase entries until a 0 is encountered as follows:
- for each phrase entry which specifies a Phrase ID (1-16383, 16600-MAX

  PHRASEID) the value of 'dur' in the RLphrases entry corresponding to the Phrase ID and appl specified is added into the running total
- for the values 0, 16385, 16386, 16387, 16388, 16389, 16500-16599 the running total is unaffected

**Attribute:**
spare1
**Fullname:**
spare1
**Attribute Description:**
Field used for spare and for alignment of tuple.

**Attribute:**
phrase1
**Fullname:**
phrase or command
**Attribute Description:**
At least one non-zero entry must be specified.
The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |

**Copyright © 1999 Lucent Technologies** 

| | |
|---|---|
| 47-16383, | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |
| 16387 | Command - date of last incoming call |
| 16388 | Command - time of last incoming call |
| 16389 | Command - number of dollars and cents |
| 16500-16599 | Application-Specific Commands These are defined by applications to have certain meanings. All of these are treated EXACTLY as is 16385. |
| 16600-MAXPHRASEID | Application Defined Phrase IDs |

NOTE: (MAXPHRASEID+1)-65535 are NOT used for vphrase IDs but for subsystem specific purposes.

**Attribute:**

phrase[*]

**Fullname:**

phrase or command

**Attribute Description:**

At least one non-zero entry must be specified. The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |
| 47-16383, | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |
| 16387 | Command - date of last incoming call |
| 16388 | Command - time of last incoming call |
| 16389 | Command - number of dollars and cents |

# AMCALL

## 1. Description

This relation contains the billing call type information.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 128 |
| expected number of tuples | 62 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| ks key store | AUTO |

## 3. Field Layout

```
AMCALL      relid = 133   DBSTATIC   DBACC_CIND  DBPRAM    FR      NULL

## 4. Population rules for RLamcall

### Relation Description

Billing call type information

N/A

The maximum number of tuples should be equal to the number of enumeration values in the DMamcall domain.

**Attribute:**

amacalltype

**Fullname:**

Administrative module (AM) call type

**Attribute Description:**

Unless explicitly noted, detailed, xmbi_wats, trcr_type, data_type, and special fields listed with each 'amacalltype' are the default suggested values only. The TG-5 should be consulted when deviating from these values.

AMFGAOLATA - Automatic messages accounting (AMA) call code 131 for feature group A (FGA) originating local access and transport area (LATA) calls. Normal values are:

| | |
|---|---|
| detailed | - DBN0 |
| xmbi_wats | - DBNO |
| trcr_type | - AMINLATA |
| data_type | - AMLOCALDATA |
| special | - DBNO |
| custid | - DBNO |

Detailed, xmbi_wats, trcr_type, and data_type cannot be changed from the default values.

AMFGATLATA - AMA call code 132 for FGA terminating LATA calls.
Dependencies on other attributes are:

| | |
|---|---|
| detailed | - DBNO |
| xmbi_wats | - DBNO |
| trcr_type | - AMINLATA |
| data_type | - AMLOCALDATA |
| special | - DBNO |
| custid | - DBNO |

Detailed, xmbi_wats, trcr_type, and data_type cannot be changed from the default values.

AMFGDOLATA - AMA call code 110 for feature group D (FGD) originating LATA calls. Dependencies on other attributes are:

Copyright © 1999 Lucent Technologies

```
                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMINLATA
                data_type       - AMINTERLATA
                special         - DBNO
                custid          - DBNO

AMFGDTLATA      - AMA call code 119 for FGD terminating LATA calls.
                  Dependencies on other attributes are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMINLATA
                data_type       - AMINTERLATA
                special         - DBNO
                custid          - DBNO

AMFGDWATS       - AMA call code 114 for FGD outward wide area telephone
                  service (OUTWATS) originating LATA calls.  Dependencies
                  on other attributes are:

                detailed        - DBNO
                xmbi_wats       - DBYES
                trcr_type       - AMINLATA
                data_type       - AMINTERLATA
                special         - DBNO
                custid          - DBNO

AMFGBOLATA      - AMA call code 134 for feature group B (FGB)
                  originating LATA calls.  Dependencies on
                  other attributes are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMINLATA
                data_type       - AMLOCALDATA
                special         - DBNO
                custid          - DBNO

AMFGBTLATA      - AMA call code 135 for FGB terminating LATA
                  calls. Dependencies on other attributes are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMINLATA
                data_type       - AMLOCALDATA
                special         - DBNO
                custid          - DBNO

AMSBWATS        - AMA call code 7 for wide area telephone
                  service (WATS), station billing number.
                  Normal attribute values are:
```

Copyright © 1999 Lucent Technologies 

```
                detailed        - DBYES
                xmbi_wats       - DBNO
                trcr_type       - AMSPECIAL
                data_type       - AMTOLLDATA
                special         - DBNO
                custid          - DBNO

AMFX            - AMA call code 11 for foreign exchange (FX).
                Normal attribute values are:

                detailed        - DBYES
                xmbi_wats       - DBNO
                trcr_type       - AMOTHER
                data_type       - AMOTHER
                special         - DBNO
                custid          - DBNO

AMTANTTRK       - AMA call code 32 for tandem tie trunk (TTT).
                Normal attribute values are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMOTHER
                data_type       - AMOTHER
                special         - DBNO
                custid          - DBNO

AMCFPFNOANS     - AMA call code 32 for TTT.  (Same as AMTANTTRK
                except call processing does not generate
                simulated answer.) Normal attribute values
                are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMOTHER
                data_type       - AMOTHER
                special         - DBNO
                custid          - DBNO

AMSBILWATS      - AMA call code 111 for WATS, station billing
                inter-LATA.
                Normal attribute values are:

                detailed        - DBYES
                xmbi_wats       - DBYES
                trcr_type       - AMINTERLATA
                data_type       - AMINTERLATA
                special         - DBNO
                custid          - DBNO

AMATTSTPD       - AMA call code 060 for station paid call.
                Normal attribute values are:

                detailed        - DBYES
```

Copyright © 1999 Lucent Technologies 

```
                xmbi_wats       - DBNO
                trcr_type       - AMTOLL
                data_type       - AMTOLLDATA
                special         - DBNO
                custid          - DBNO

AMATTCMC        - AMA call code 306 for cellular mobile carrier
                  (CMC).
                  Normal attribute values are:

                  detailed      - DBYES
                  xmbi_wats     - DBNO
                  trcr_type     - AMSPECIAL
                  data_type     - AMTOLLDATA
                  special       - DBNO
                  custid        - DBNO

AMACCT          - AMA call code 124 for account code dialed calls not
                  normally recorded.  Normal attribute values are:

                  detailed      - DBNO
                  xmbi_wats     - DBNO not normally recorded call.
                  trcr_type     - AMOTHER
                  data_type     - AMOTHER
                  special       - DBNO
                  custid        - DBNO

AMACCTCTX       - AMA call code 83 for account code dialed calls
                  extended by an attendant to a centralized telephone
                  communications exchange service (CENTREX) station not
                  normally recorded.  Normal attribute values are:

                  detailed      - DBNO
                  xmbi_wats     - DBNO not normally recorded call.
                  trcr_type     - AMOTHER
                  data_type     - AMOTHER
                  special       - DBNO
                  custid        - DBNO

AMACCTTIE       - AMA call code 84 for account code dialed calls
                  extended by an attendant to a CENTREX station not
                  normally recorded.  Normal attribute values are:

                  detailed      - DBNO
                  xmbi_wats     - DBNO not normally recorded call.
                  trcr_type     - AMOTHER
                  data_type     - AMOTHER
                  special       - DBNO
                  custid        - DBNO

AMCCSASAMP      - AMA call code 21 for common channel signaling
                  availability (CCSA) sampling.  Normal attribute
                  values are:
```

Copyright © 1999 Lucent Technologies 

```
                detailed        - DBYES
                xmbi_wats       - DBNO
                trcr_type       - AMOTHER
                data_type       - AMOTHER
                special         - DBNO
                custid          - DBNO

AMETSMDR      - AMA call code 85 for electronic tandem switching
                (ETS)-message detail recording (MDR) revenue
                accounting office (RAO).  Normal attribute values
                are:

                detailed        - DBYES
                xmbi_wats       - DBNO
                trcr_type       - AMOTHER
                data_type       - AMOTHER
                special         - DBNO
                custid          - DBNO

AMETSCCSA     - AMA call code 99 for ETS-MDR and CCSA route.
                Normal attribute values are:

                detailed        - DBYES
                xmbi_wats       - DBNO
                trcr_type       - AMOTHER
                data_type       - AMOTHER
                special         - DBNO
                custid          - DBNO

AMISDNDATA    - AMA call code 72 for integrated services digital
                network (ISDN) data intra-LATA (uses CSDC call
                type 72).
                Normal attribute values are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMSPECIAL
                data_type       - AMLOCDATA
                special         - DBNO
                custid          - DBNO

AMISDNOLATA   - AMA call code 117 for ISDN originating inter-LATA
                (uses CSDC call type 117).  Normal attribute values
                are:

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMINLATA
                data_type       - AMINTERLATA
                special         - DBNO
                custid          - DBNO

AMISDNTLATA   - AMA call code 121 for ISDN terminating inter-LATA
                (uses CSDC call type 121).  Normal attribute values
```

Copyright © 1999 Lucent Technologies 

are:

detailed - DBNO
xmbi_wats - DBNO
trcr_type - AMINLATA
data_type - AMINTERLATA
special - DBNO
custid - DBNO

AMSPOHOSPS - AMA call code 010 for station paid, operator handled toll and assistance (T&A) Operator Services Position System (OSPS) calls. Normal attribute values are:

detailed - DBNO
xmbi_wats - DBNO
trcr_type - AMOPER
data_type - AMOPRASSIST
special - DBNO
custid - DBNO

AMSCOLOSPS - AMA call code 014 for station collect T&A OSPS calls. Normal attribute values are:

detailed - DBNO
xmbi_wats - DBNO
trcr_type - AMOPER
data_type - AMOPRASSIST
special - DBNO
custid - DBNO

AMSSCGOSPS - AMA call code 015 for station special calling T&A OSPS calls. Normal attribute values are:

detailed - DBNO
xmbi_wats - DBNO
trcr_type - AMOPER
data_type - AMOPRASSIST
special - DBNO
custid - DBNO

AMPEPDOSPS - AMA call code 016 for person paid T&A OSPS calls.

detailed - DBNO
xmbi_wats - DBNO
trcr_type - AMOPER
data_type - AMOPRASSIST
special - DBNO
custid - DBNO

AMPECOOSPS - AMA call code 017 for person collect T&A OSPS calls.

detailed - DBNO
xmbi_wats - DBNO

Copyright © 1999 Lucent Technologies 

```
                trcr_type       - AMOPER
                data_type       - AMOPRASSIST
                special         - DBNO
                custid          - DBNO

AMPSCGOSPS    - AMA call code 018 for person special calling T&A
                OSPS calls.

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMOPER
                data_type       - AMOPRASSIST
                special         - DBNO
                custid          - DBNO

AMAUTOOSPS    - AMA call code 019 for automatic collect T&A OSPS
                calls.

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMOPER
                data_type       - AMOPRASSIST
                special         - DBNO
                custid          - DBNO

AMSSCDOSPS    - AMA call code 022 for station special called
                T&A OSPS calls.

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMOPER
                data_type       - AMOPRASSIST
                special         - DBNO
                custid          - DBNO

AMPSCDOSPS    - AMA call code 023 for person special called T&A
                OSPS calls.

                detailed        - DBNO
                xmbi_wats       - DBNO
                trcr_type       - AMOPER

**Attribute:**
detailed
**Fullname:**
Flag to send called member
**Attribute Description:**
Indicates whether terminating directory number (DN) is included in AMA record for this type of call (also see amacalltype).

**Attribute:**
xmbi_wats
**Fullname:**
Flag to send mbi_wats hand
**Attribute Description:**
Indicates whether this is a message billing index (MBI) or WATS call type (also see amacalltype).

**Attribute:**
trcr_type
**Fullname:**
Type of answer entry for tracer count
**Attribute Description:**
Grouping of counts for tracer records. Determines the appropriate count that a call should peg in the call assembly tracer record.

**Copyright © 1999 Lucent Technologies** 

Valid values are:

```
AMLOCAL       - Local call, pegs records output local
                answered or not recorded local answered.
AMTOLL        - Toll call, pegs records output toll
                answered or not recorded toll answered.
AMSPECIAL     - Special services, pegs records output
                special answered or not recorded special.
AMOTHER       - Not toll or local, pegs records output other
                answered or not recorded other answered.
AMINLATA      - Inter-LATA call, pegs records output
                inter-LATA for answered and unanswered
                calls or not recorded inter-LATA for
                answered and unanswered inter-LATA calls.
```

**Attribute:**
data_type
**Fullname:**
Type of data associated with call type
**Attribute Description:**
Indicates the type of call for network completion study purposes. This forces the trunk network number (TNN) to be included in the AMA record produced for the particular data_type under study. These studies are controlled by the global supervision options, Gllocsupv, Gltolsupv, and Glicsupv, and used with the data_types of AMLOCDATA, AMTOLLDATA, and AMINTERLATA respectively.

Valid values are:

```
AMLOCDATA       - Local data.
AMTOLLDATA      - Toll data.
AMOTHDATA       - Other data (not local or toll).
AMINTERLATA     - Inter-LATA data.
```

**Attribute:**
special
**Fullname:**
Special set of calls
**Attribute Description:**
Indicates whether this call type is part of a special set of calls forshort term study. Forces a record to be produced on an abandon for those AMA call types with special set to DBYES when the GLspecabn global option is turned on. The service providers have the capability of defining its own set based on AMA calltype.

```
DBYES   - Included in special study.
DBNO    - Not included in special study.
```

**Attribute:**
custid

**Copyright © 1999 Lucent Technologies** 

**Fullname:**

Customer identification

**Attribute Description:**

DBYES - Customer identification is required for this call type, except in the case where the call type is:

1 - Detailed message rate, timed, with MBI.
6 - Station paid.
110 - Inter-LATA station paid.
134 - FGB originating.

In this case, the customer identification will be included in the AMA record if there is a terminal group number associated with the originator (the terminal group number is the 'custid'). Otherwise, no 'custid' will be recorded.

DBNO - Customer identification will not be included in the AMA record for this call type.

The only call types that may have 'custid' set to DBYES or DBNO are:

1 - AMDTLTMBI.
6 - AMSTPAID.
7 - AMSBWATS
11 - AMFX.
21 - AMCCSASAMP.
32 - AMTANTTRK or AMCFPFNOANS.
68 - AMBNWATS.
72 - AMISDNDATA.
85 - AMETSMDR.
99 - AMETSCCSA.
110 - AMFGDOLATA.
111 - AMSBILWATS.
117 - AMISDNOLATA.
124 - AMBACCT.
134 - AMFGBOLATA.
144 - AMFGDWATS.

All other call types must have 'custid' set to DBNO.

### Relation Description

Call code to structure code family

Call Code to structure code family: saved in call record from the Transaction Capability Application Part (TCAP) message sent from a remote database.

Copyright © 1999 Lucent Technologies

"This relation must be populated for Service Switching Point (SSP) offices (when Glssp=DBYES) or for Software Defined Networks at an Action Point (ACP) (when Glapsdn=DBYES. An office can be either an SSP office or an ACP office but never both concurrently. This check resides in the CCS Office Parameters View."

**Attribute: call_code**

**Fullname:** call code

**Attribute Description:** Call code is an integer representation of the digits received in the TCAP response message for a number services call.

**Attribute: sc_family**

**Fullname:** structure code family

**Attribute Description:**

```
AMIC_SC - Interexchange Carrier structure code
          family to be used if the call code returned
          from the SCP is to be billed for IC.  This
          structure code family is only valid for SSP
          offices when Glssp=DBYES.
AMTELCO_SC - Local Telephone Company structure code
          family to be used if the call code returned
          from the SCP is to be billed for the Local
          Service Provider.  This structure code family
          is only valid for SSP offices when Glssp=DBYES.
AMAPSDN - Software Defined Network (SDN) structure code
          family to be used if the call code returned from
          the database is to be billed as an SDN call at
          an Action Point (ACP).  This structure code
          family is only valid for SDN ACP offices when
          Glapsdn=DBYES.
AMPVNEBAF - Private Virtual Network Extended Bellcore
          Automatic Message Accounting Format structure
          code family to be used.  This structure code
          family is only valid for PVNSSP offices.
          Glpvn_ofc must_be DBPVN_SSP.
AMLNACP - Leased Network (LN) structure code family to be
          used if the call code returned from the database
          is to be billed as a LN call at an Action Point (ACP).
          This structure code family is only valid for LN ACP
          offices when Glacpln=DBYES.
```

## 4. Population rules for RLamcmcid

**Relation Description**

AM Cellular Mobile Carrier ID number.

10 digit billing number for a Cellular Mobile Carrier.

**Attribute:**
cmc_id
**Fullname:**
Cellular Mobile Carrier id number.
**Attribute Description:**
Every cmcid found in amtkgp relation must be defined in this relation.

**Attribute:**
cmc_ani
**Fullname:**
Cellular Mobile Carrier Auto Number ID.
**Attribute Description:**
String of 10 ASCII digits (each digit in the range 0-9). This 10 digit number is used for billing the Cellular Mobile Carrier.

**Attribute:**
cmc_ani.digcnt
**Fullname:**
Digit Count.
**Attribute Description:**
Digit Count.

**Attribute:**
cmc_ani.dn
**Fullname:**
Directory Number.
**Attribute Description:**
Directory Number.

## 4. Population Rules for RLamfca_st

**Relation Description**

Flexible call accounting stream manager.

Flexible call accounting stream manager. This is being added by feature 99-5E-3784 Real Time Call Details.

**Attribute: sidx**

**Fullname:** Stream index

**Attribute Description:** This is the integer number associated with the stream.

**Attribute: server**

**Fullname:** Server

**Attribute Description:** OSDS identifier for the process that receives the MGCARECS message from the SM.

**Attribute: server.procno**

**Fullname:** Process number

**Attribute Description:** OSDS process number for AMSD process.

**Attribute: server.pcrid**

**Fullname:** Processor number

**Attribute Description:** OSDS processor id for AMSD process.

**Attribute: server.uniq**

Copyright © 1999 Lucent Technologies 

**Fullname:** Uniqueness

**Attribute Description:** OSDS uniqueness id for AMSD process.

**Attribute: timer**

**Fullname:** Timer

**Attribute Description:** SM flushing message buffer timer, incremented in 4 second intervals.

**Attribute: ofi**

**Fullname:** Optional feature indicator

**Attribute Description:** 32 DMBOOL flags used to indicate the presence or absence of optional features for AMSD.

**Attribute: ofi.opt0**

**Fullname:** Option 0

**Attribute Description:** Spare option to be used for future field feature use.

**Attribute: ofi.opt1**

# AMGPD_R

## 1. Description

Root storage relation for DB_AMGPD.

The purpose of this relation is to identify which processors a group resides on. The keys and pointers to RLpcr1_g/RLpcr2_g are stored in this relation. RLpcr1_g/RLpcr2_g contain the processor bit maps.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 2200 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTORAGE |
| head page size | 512 |
| data page size | 256 |
| permutation type | perm |

## 3. Field Layout

## 4. Population Rules for RLampci7gr

**Relation Description:** Relation for creating CCS group messages.

This relation is read to determine which circuit identifier codes (CICs) are populated in a given range of 24 CICs. This relation is used to create group blocking messages for CCS trunks, when an SM is initialized or isolated from the network.

***NOTE:*** The reason for two different relations, ampci7gr and pci7gr, is due to the large difference in maximum number of tuples between the AM and SM module. The module identifies which SM the PCI and CIC offset are populated on.

```
pci          Point code index.  This identifies the index which
```

Copyright © 1999 Lucent Technologies 

```
             translate to an origination point code and a
             destination point code pair.
cic_offset   Circuit code (cic) offset.  This identifies the
             starting CIC of 24 CICs indicated in the cic_map.
             This will always be a multiple of 24 starting at 0.
cic_map      This bitmap represents which circuit codes (CIC) for a
             give PCI are populated on this SM. A bit of 1 indicates
             that the CIC (cic_offset + bit number) is populated on
             this SM and is not CADN.  Bit 0 is the left most bit and
             23 is the right most bit.

             00000000001111111112222
             01234567890123456789012
             -----------------------
             ABCDEFGHIJKLMNOPQRSTUVWX

             Assuming cic_offset is 72
             A represents cic 72
             B represents cic 73
                     .
                     .
                     .
             X represents cic 95
```

**Attribute: module**

**Fullname:** module number

**Attribute Description:** This attribute identifies which SM this pci and cic_offset is populated for.

**Attribute: pci**

**Fullname:** Point code index

**Attribute Description:** This identifies the index which translate to an origination point code and a destination point code pair.

**Attribute: cic_offset**

**Fullname:** Starting CIC

**Attribute Description:** Circuit code (cic) offset. This identifies the starting CIC of 24 CICs indicated in the cic_map. This will always be a multiple of 24 starting at 0 (0, 24, 48, 72, 96, and so forth).

**Attribute: cic_map**

**Fullname:** CIC bitmap

**Attribute Description:** This bitmap represents which circuit codes (CIC) for a give PCI are populated on this SM. A bit of 1 indicates that the CIC (cic_offset + bit number) is populated on this SM and is not CADN. Bit 0 is the left most bit and 23 is the right most bit.

## 4. Population Rules for RLamsd_str

**Relation Description:** Stream data manager stream protocol.

Stream data manager stream protocol. This is being added by feature 99-5E-3784 Real Time Call Details.

**Attribute: sidx**

**Fullname:** Stream Index

**Attribute Description:** This is the integer number associated with a stream.

**Attribute: appl**

**Fullname:** Application

**Attribute Description:** This is the name of the application.

**Attribute: dlg**

**Fullname:** Dialog

**Attribute Description:** Unique integers identifying streams per each application.

**Attribute: file**

**Fullname:** File prefix

**Attribute Description:** This is the prefix to be attached to the files produced by this dialog.

**Attribute: blkperss**

**Fullname:** Number of blocks per subsegment

**Attribute Description:** This is the number of blocks per subsegment.

**Attribute: blksz**

Copyright © 1999 Lucent Technologies 

**Fullname:** Block size

**Attribute Description:** block size in bytes

**Attribute: irpt**

**Fullname:** Integrity reporting

**Attribute Description:** This indicates whether sanity errors must be reported to AIM or the ROP.

**Attribute: rsmax**

**Fullname:** Record sequence maximum

**Attribute Description:** Maximum record sequence number available to this stream.

**Attribute: rsmin**

**Fullname:** Record sequence minimum

**Attribute Description:** Minimum record sequence number available to this stream.

**Attribute: tpfill**

**Fullname:** Tape filler

**Attribute Description:** number of bytes of filler on the disk reserved for expansion after formatting on the tape. This enables 1 to 1 correspondence between disk and tape blocks.

**Attribute: tcb0**

**Fullname:** Timer Control Block0

**Attribute Description:** AMSD error recovery timer.

**Attribute: tcb0.time**

**Fullname:** Timer Control Block0 Time

**Attribute Description:** Duration of the timer in milliseconds hexadecimal.

**Attribute: tcb0.tid**

**Fullname:** Timer Control Block0 Timer id

**Attribute Description:** OSDS identifier for the timer returned by the OSDS primitive used to acquire the timer.

**Attribute: tcb0.opt**

**Fullname:** Timer Control Block0 Optional Feature Indicator

**Attribute Description:** Bit to indicate the selection of an optional feature

**Attribute: tcb0.offset**

**Fullname:** Timer Control Block0 Offset

**Attribute Description:** Millisecond offset (in hex) from the hour at which the timer will expire.

**Attribute: tcb1**

**Fullname:** Timer Control Block1

**Attribute Description:** AMSD error recovery timer.

Copyright © 1999 Lucent Technologies 

**Attribute: tcb1.time**

**Fullname:** Timer Control Block1 Time

**Attribute Description:** Duration of the timer in milliseconds hexadecimal.

**Attribute: tcb1.tid**

**Fullname:** Timer Control Block1 Timer id

**Attribute Description:** OSDS identifier for the timer returned by the OSDS primitive used to acquire the timer.

**Attribute: tcb1.opt**

**Fullname:** Timer Control Block1 Optional Feature Indicator

**Attribute Description:** Bit to indicate the selection of an optional feature.

**Attribute: tcb1.offset**

**Fullname:** Timer Control Block1 Offset

**Attribute Description:** Millisecond offset (in hex) from the hour at which the timer will expire.

**Attribute: tcb2**

**Fullname:** Timer Control Block 2

**Attribute Description:** AMSD timer for MGGFSTATUS or MGGFSINIT timing.

**Attribute: tcb2.time**

**Fullname:** Timer Control Block2 Time

**Attribute Description:** Duration of the timer.

**Attribute: tcb2.tid**

**Fullname:** Timer Control Block2 Timer id

**Attribute Description:** OSDS identifier for the timer returned by the OSDS primitive used to acquire the timer.

**Attribute: tcb2.opt**

**Fullname:** Timer Control Block2 Optional Feature Indicator

**Attribute Description:** Bit to indicate the selection of an optional feature

**Attribute: tcb2.offset**

**Fullname:** Timer Control Block2 Offset

**Attribute Description:** Millisecond offset (in hex) from the hour at which the timer will expire.

**Attribute: tcb3**

**Fullname:** Timer control block 3

**Attribute Description:** Write retries and end messages timer.

**Attribute: tcb3.time**

**Fullname:** Timer Control Block3 Time

**Attribute Description:** Duration of the timer in milliseconds hex.

Copyright © 1999 Lucent Technologies 

**Attribute: tcb3.tid**

**Fullname:** Timer Control Block3 Timer id

**Attribute Description:** OSDS identifier for the timer returned by the OSDS primitive used to acquire the timer.

**Attribute: tcb3.opt**

**Fullname:** Timer Control Block3 Optional Feature Indicator

**Attribute Description:** Bit to indicate the selection of an optional feature.

**Attribute: tcb3.offset**

**Fullname:** Timer Control Block3 Offset

**Attribute Description:** Millisecond offset (in hex) from the hour at which the timer will expire.

**Attribute: tcb4**

**Fullname:** Timer control block 4

**Attribute Description:** Spare for field features.

**Attribute: tcb4.time**

**Fullname:** Timer Control Block4 Time

**Attribute Description:** Duration of the timer in hex.

**Attribute: tcb4.tid**

**Fullname:** Timer Control Block4 Timer id

**Attribute Description:** OSDS identifier for the timer returned by the OSDS primitive used to acquire the timer.

**Attribute: tcb4.opt**

**Fullname:** Timer Control Block4 Optional Feature Indicator

**Attribute Description:** Bit to indicate the selection of an optional feature

**Attribute: tcb4.offset**

**Fullname:** Timer Control Block4 Offset

**Attribute Description:** Millisecond offset (in hex) from the hour at which the timer will expire.

**Attribute: ctb0**

**Fullname:** Count/Threshold 0

**Attribute Description:** Count/Threshold for MGGFSINIT attempts.

**Attribute: ctb0.cnt**

**Fullname:** Count/Threshold0 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb0.thresh**

**Fullname:** Count/Threshold0 Threshold

**Attribute Description:** Threshold that triggers action.

Copyright © 1999 Lucent Technologies 

**Attribute: ctb0.opt**
**Fullname:** Count/Threshold0 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb1**
**Fullname:** Count/Threshold 1

**Attribute Description:** Count/Threshold for invalid syntax.

**Attribute: ctb1.cnt**
**Fullname:** Count/Threshold1 Count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb1.thresh**
**Fullname:** Count/threshold1 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb1.opt**
**Fullname:** Count/Threshold1 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb2**
**Fullname:** Count/threshold 2

**Attribute Description:** Count/threshold for bad write.

**Attribute: ctb2.cnt**
**Fullname:** Count/Threshold2 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb2.thresh**
**Fullname:** Count/Threshold2 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb2.opt**
**Fullname:** Count/Threshold2 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb3**
**Fullname:** Count/threshold 3

**Attribute Description:** Spare for field features.

**Attribute: ctb3.cnt**
**Fullname:** Count/Threshold3 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb3.thresh**

Copyright © 1999 Lucent Technologies

**Fullname:** Count/Threshold3 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb3.opt**

**Fullname:** Count/Threshold3 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb4**

**Fullname:** Count/threshold 4

**Attribute Description:** Count/threshold for OSSENDMSG failure

**Attribute: ctb4.cnt**

**Fullname:** Count/Threshold4 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb4.thresh**

**Fullname:** Count/Threshold4 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb4.opt**

**Fullname:** Count/Threshold4 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb5**

**Fullname:** Count/threshold 5

**Attribute Description:** Count/threshold for retries of timed transfer to disk.

**Attribute: ctb5.cnt**

**Fullname:** Count/Threshold5 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb5.thresh**

**Fullname:** Count/Threshold5 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb5.opt**

**Fullname:** Count/Threshold5 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb6**

**Fullname:** Count/threshold 6

**Attribute Description:** Spare for field features.

**Attribute: ctb6.cnt**

**Fullname:** Count/Threshold6 count

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb6.thresh**
**Fullname:** Count/Threshold6 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb6.opt**
**Fullname:** Count/Threshold6 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb7**
**Fullname:** Count/threshold 7

**Attribute Description:** Spare for field features.

**Attribute: ctb7.cnt**
**Fullname:** Count/Threshold7 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb7.thresh**
**Fullname:** Count/Threshold7 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb7.opt**
**Fullname:** Count/Threshold7 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb8**
**Fullname:** Count/threshold 8

**Attribute Description:** Spare for field features.

**Attribute: ctb8.cnt**
**Fullname:** Count/Threshold8 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb8.thresh**
**Fullname:** Count/Threshold8 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb8.opt**
**Fullname:** Count/Threshold8 Option

**Attribute Description:** Spare for field features.

**Attribute: ctb9**
**Fullname:** Count/threshold 9

**Attribute Description:** Spare for field features.

Copyright © 1999 Lucent Technologies 

**Attribute: ctb9.cnt**

**Fullname:** Count/Threshold9 count

**Attribute Description:** Number of times the event has occurred.

**Attribute: ctb9.thresh**

**Fullname:** Count/Threshold9 Threshold

**Attribute Description:** Threshold that triggers action.

**Attribute: ctb9.opt**

**Fullname:** Count/Threshold9 Option

**Attribute Description:** Spare for field features.

**Attribute: ofi**

**Fullname:** Optional flag indicator

**Attribute Description:** 32 DMBOOL flags used to indicate the presence or absence of optional features for AMSD.

**Attribute: ofi.opt0**

**Fullname:** Option 0

**Attribute Description:** Routine Integrity Checks

**Attribute: ofi.opt1**

**Fullname:** Option 1

**Attribute Description:** Enable incrementing the leaky bucket counter for late responses to MGGFSWRITE requests.

**Attribute: ofi.opt2**

**Fullname:** Option 2

**Attribute Description:** Send MGGFSEND after the next MGGFSEND response.

**Attribute: ofi.opt3**

**Fullname:** Option 3

**Attribute Description:** Do MGGFSWRITE retries if unsuccessful during timed transfer to disk.

**Attribute: ofi.opt4**

**Fullname:** Option 4

**Attribute Description:** Update the block headers right before sending MGGFSWRITE data to disk.

**Attribute: ofi.opt5**

**Fullname:** Option 5

**Attribute Description:** Do a write request even if the 'write sent' flag is DBYES

**Attribute: ofi.opt6**

**Fullname:** Option 6

**Attribute Description:** Should never be set to DBYES in the field.

Copyright © 1999 Lucent Technologies 

**Attribute: ofi.opt7**
**Fullname:** Option 7

**Attribute Description:** Indicate that subscriber charge register information should be included in the call accounting record.

**Attribute: ofi.opt8**
**Fullname:** Option 8

**Attribute Description:** Spare for field features.

**Attribute: ofi.opt9**
**Fullname:** Option 9

**Attribute Description:** Spare for field features.

**Attribute: ofi.opt10**
**Fullname:** Option 10

**Attribute Description:** Spare for field features.

## 4. Population Rules for RLamtkgp

**Relation Description:** AM Trunk Groups.

Trunk group billing information (Toll switch).

**Attribute: grpnum**

**Fullname:** Trunk group number.

**Attribute Description:** Every trunk grp with service class FC_LATA_CONN and FC_TTOLL_CONN defined in rt_trkg must be in this relation.

Trunk groups with service class FC_PF used as a Type 1 Cellular Access interface must also be in this relation (that is, tuples are defined in this relation for FC_PF trunk groups only if cmc is DBYES).

**Attribute: cmc**

**Fullname:** Cellular Mobile Carrier.

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Trunk group connects to a Cellular Mobile Carrier.

**Attribute: blknoani**

**Fullname:** block EAS call if no ani received.

**Attribute Description:** Block EAS calls received on LATA connect trunks without ANI.

**Attribute: billtrk**

**Fullname:** create ama record on EAS calls.

**Attribute Description:** AMA records should be created on LATA-connect trunks.

**Attribute: cmcid**

**Fullname:** Cellular Mobile Carrier ID number.

**Attribute Description:** If this trunk group is to a LATA-connect trunk (cmc is DBYES) then this field contains the cmc identifier (range of 1-60), which must also be found in the amacmcid relation. If cmc is DBNO then cmcid should be 0.

**Attribute: cmc_obill**

**Fullname:** Billing type for originating CMC calls.

**Attribute Description:** RLamtkgp.cmc_obill can only be set to CMC_T2ABILL if the Type 2A Cellular Interconnections Special Feature has been purchased (SFID128) and RLamtkgp.cmc_obill can only be set to CMC_T2BBILL if the Type 2A/2B CMC via CCS Special Feature has been purchased (SFID160). When the cmc_obill is set, the RLamtkgp.cmc must be DBYES, the trunk service class must be FC_TTOLL_CONN, and the trunk group type must be RTOUTGO or RTTWOWAY. In addition, the outgoing signaling type must be DBMF when SFID 128 has been purchased and the outgoing signaling type must be DBMF or DBISUP7 when SFID 160 has been purchased.

RLamtkgp.cmc_obill can only be set to CMC_T1BILL if the AMA Capabilities for Type 1 Cellular Access Special Feature has been purchased (SFID167). When cmc_obill is set, then cmc must be DBYES, the service class must be FC_PF, the group type must be RTOUTGO or RTTWOWAY, and the signaling type must be DBMF.

**Attribute: cmc_tbill**

**Fullname:** Billing type for terminating CMC calls.

**Attribute Description:** RLamtkgp.cmc_tbill can only be set to CMC_T2ABILL if the Type 2A Cellular Interconnections Special Feature has been purchased (SFID128) and RLamtkgp.cmc_tbill can only be set to CMC_T2BBILL if the Type 2A/2B CMC via CCS Special Feature has been purchased (SFID160). When the cmc_tbill is set, the RLamtkgp.cmc must be DBYES, the trunk service class must be FC_TTOLL_CONN, and the trunk group type must be RTINCOM or RTTWOWAY. In addition, the incoming signaling type must be DBMF when SFID 128 has been purchased and the incoming signaling type must be DBMF or DBISUP7 when SFID 160 has been purchased.

RLamtkgp.cmc_tbill can only be set to CMC_T1BILL if the AMA Capabilities for Type 1 Cellular Access Special Feature has been purchased (SFID167). When cmc_tbill is set, then cmc must be DBYES, the service class must be FC_PF, the group type must be RTINCOM or RTTWOWAY, and the signaling type must be DBMF.

## 4. Population rules for RLanidx003

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

## 4. Population rules for RLanidx009

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

## 4. Population rules for RLanidx022

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

## 4. Population rules for RLanidx035

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

## 4. Population rules for RLanidx041

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

## 4. Population rules for RLanidx047

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

### Relation Description

```
        Automatic Number Identification table

        This relation consist of the Long Distance Platform (LDP) Automatic
        Number Identification (ANI) Table.

        Provides ANI Table processing for Toll Digital Exchange
        (TDX) Calls based on options set in this relation.

        The relations RLanidflt, RLanitbl, RLanidx[XXX], and RLtdxcartb
        are used together to determine how LDP calls are processed.

        Note:  Terminology was changed from "Toll Digital Exchange (TDX)"
        to "Long Distance Platform (LDP)".  The database still contains
        names with "tdx" whereas the customers will see "ldp" on ODA forms
        and RC views.

### Relation Description

ANII II Carrier Group Table

This relation provides information as to whether an OLNS query should be sent given the ANI Group ID from the incoming trunk group and the ANI II digits received on the call.

**Attribute:**
iigrpid
**Fullname:**
ANI II Group ID.
**Attribute Description:**
This field specifies ANI II group identification number.

**Attribute:**
action
**Fullname:**
Send II Digits.
**Attribute Description:**
This field specifies if the ANI II digits in the list need to be sent or not.

**Attribute:**
entries
**Fullname:**
entries
**Attribute Description:**
Number of entries in the iidig array.

**Attribute:**

iidig[*]

**Fullname:**

ANI II digit list.

**Attribute Description:**

array of permitted ANI II digit list.

# ANIIITBL

## 1. Description

This relation contains the OSPS Automatic Number Identification (ANI) II Digits for Automatic Message Accounting (AMA) Recording . This relation will have a distribution of Fixed Group (FG) with grp_type of GPD_OPRT and a grp_id of 1.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1024 |
| expected number of tuples | 3 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |

## 3. Field Layout

## 4. Population rules for RLanimod

**Relation Description**

Automatic Number Identification to Switching Module

Copyright © 1999 Lucent Technologies

Translates ANI (NPANXX) to SM number and index.
This relation determines which SM contains further Outbound Services data for the given ANI.

**Attribute:**
npanxx
**Fullname:**
numbering plan area - office code
**Attribute Description:**
This corresponds to the first six digits of the ANI. The first three digits make up the numbering plan area followed by the three digits of office code.

**Attribute:**
p_animod
**Fullname:**
primary ANI table switching module
**Attribute Description:**
The primary copy of the outbound services ANI table (RLldpindx/RLanidx[XXX]) for the given npa-nxx resides on this switching module.

**Attribute:**
s_animod
**Fullname:**
secondary ANI table switching module
**Attribute Description:**
For future use.
The secondary copy of the outbound services ANI table (RLldpindx/RLanidx[XXX]) for the given npa-nxx resides on this switching module. This copy is read if unable to access the primary copy. The secondary switching module must be different from the primary switching module

**Attribute:**
anitbl
**Fullname:**
automatic number identification table index
**Attribute Description:**
Used as one of the indexes into the outbound services ANI table (RLldpindx/RLanidx[XXX]).

## 4. Population rules for RLannc_apl

### Relation Description

announcement application

```
/*****************************************************************
 *
 *      POPULATION RULES FOR <<<< RLannc_apl >>>>
 *
 *      This relation specifies the SMs which are populated with RAF/SAS
 *      Automated Announcement data for a given application and SM.
 *      The announcement relations (RLannc_hdr, RLannc_trl,
 *      RLannc_dig, RLssp_ann, and RLras_idp ) may or may not have tuples
 *      corresponding to a particular application and SM according
 *      to the following rules. For every SM listed in RLannc_apl
 *      for a given application, the announcement data should be
 *      redundantly populated (except in a Growth scenario).
 *      For any SM which is not listed for a given application, population
 *      of the previous relations is not allowed on that SM until the
 *      SM is added to the application tuple in this relation.
 *
 *      This relation is used for cross checking by recent change and ODA.
 *
 *
 *      Attribute
 *      ---------
 * key  appl            DESCR: application
 *                      RANGE: One of the enum values defined in db/DMannc_ap
l.G
 *                      DEFAULT: None
 *

```

DESCRIPTION:

Defines the digit inflection scheme to be applied to OSPS Directory Assistance (DA) listing numbers played to the customer.
In general, the inflection ID is equal to the number of digits in the telephone
listing (with one exception).
Announcements are stored in firmware.

QUANTITY OF TUPLES:

One tuple is required for each digit string of a given length and one additional for N00-NXX-XXXX numbers (Toll Free, etc).

TUPLE SEMANTICS for FCOSPS_DA:

| appl | infl_id | dur | dummy | inflct01 - inflct50 |
|---|---|---|---|---|
| FCOSPS_DA | 3 | 3 | 0 | FC_OH FC_FLAT FC_FLAT FC_FALLING FC_END |
| FCOSPS_DA | 4 | 4 | 0 | FC_OH FC_FLAT FC_FLAT FC_FLAT FC_FALLING FC_HUND_THOUS FC_END |
| FCOSPS_DA | 7 | 8 | 0 | FC_OH RC_FLAT FC_FLAT FC_FALLING FC_HALF_SEC FC_FLAT FC_FLAT FC_FLAT FC_FALLING FC_HUND_THOUS FC_END |

Population for Remote Access Services (RAS)

DESCRIPTION:

Defines the digit inflection scheme to be applied to collected digit strings and directory numbers played to the customer. In general, the inflection ID is equal to the number of digits collected by RAS (with one exception).

QUANTITY OF TUPLES:

One tuple is required for each digit string of a given length,

```
one tuple for N00-NXX-XXXX numbers (Toll Free, etc), one tuple
is required for 10-XXX-XXX-XXX-XXXX (CI calls) and one tuple
is required for 1-N00-NXX-XXXX (Toll Free calls).

TUPLE SEMANTICS for FCBRCS_RAS:

special inflection scheme for N00-NXX-XXXX numbers (such as Toll Free):

appl            - FCBRCS_RAS
infl_id         - 100
dur             - (as calculated in the rc-oda rules section)
inflct01        - listing inflection scheme
   .              (specified by office or see the following)
inflct50

special inflection scheme for 10-XXX-XXX-XXX-XXXX numbers (CI calls):

appl            - FCBRCS_RAS
infl_id         - 101
dur             - (as calculated in the rc-oda rules section)
inflct01        - listing inflection scheme
   .              (specified by office or see the following)
inflct50

special inflection scheme for 1-N00-NXX-XXXX numbers (such as Toll Free):

appl            - FCBRCS_RAS
infl_id         - 102
dur             - (as calculated in the rc-oda rules section)
inflct01        - listing inflection scheme
.                 (specified by office or see the following)
inflct50

-------------------------------------------------------------------------
appl          infl_id  dur    dummy             inflct01 - inflct50

/*************************************************************************

Population for Two-Level Activation of Customer Originated Trace (COT)
        and Automatic Callback (AC).

DESCRIPTION:

Defines the digit inflection scheme to be applied to collected
digit strings and directory numbers played to the customer.
In general, the inflection ID is equal to the number of digits
collected.

QUANTITY OF TUPLES:

One tuple is required for each digit string of a given length.

TUPLE SEMANTICS for FCLS_2LEVEL:

   appl       infl_id  dur    dummy             inflct01 - inflct50
-------------------------------------------------------------------------

FCLS_2LEVEL       1     1       0       FC_OH, FC_FALLING, FC_END

FCLS_2LEVEL       2     2       0       FC_OH, FC_FLAT, FC_FALLING,
                                        FC_END

FCLS_2LEVEL       3     3       0       FC_OH, FC_FLAT, FC_FLAT,
                                        FC_FALLING, FC_END

FCLS_2LEVEL       4     4       0       FC_OH, FC_FLAT, FC_FLAT,
                                        FC_FLAT, FC_FALLING,

**Attribute: appl**

**Fullname:** application

**Attribute Description:** application

**Attribute: infl_id**

**Fullname:** inflection id

**Attribute Description:** This inflection ID is calculated by software so the inflection IDs assigned must correspond to software defined values.

**Attribute: dur**

**Fullname:** expected duration of digit string.

**Attribute Description:** expected duration of digit string (rounded up to nearest second).

**Attribute: dummy**

**Fullname:** dummy

**Attribute Description:** dummy field used only for alignment of tuple.

**Attribute: inflct[*]**

**Fullname:** inflection command or phrase

**Attribute Description:** At least one non-zero entry must be specified. The end of the inflection commands/phrases is denoted by the FC_END (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry. inflct50

# ANNC_HDR

## 1. Description

This relation contains the announcement header phrase list.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 64000 |
| expected number of tuples | 1000 |
| density | 94 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| tsbal | DBSPEED |
| permutation type | un_perm |

DESCRIPTION:

Population for OSPS Directory Assistance (DA)

Defines the information portion of a Directory Assistance (DA) listing announcement. One header must be defined for each Announcement Type specified by the Directory Assistance System/ Computer (DAS/C).

NOTE: For DA announcements, the following application-specific commands are recognized:

```
 16385          Command - Insert a digit string here

 16386          Command - Repeat the previous digit
                          string here
```

QUANTITY OF TUPLES:

                          (MC5D144A1) or SAS circuit packs.
phrase68

*************************************************************************/

/*************************************************************************
Population for OSPS Automated Calling Card Service
Announcements (ACCS)

Note:
If the Thank You [branding phrase] announcement is to
be given, the global parameter GLin_thnku must equal DBYES,
otherwise no announcement is given for the ACCS Initial call.

There are two Thank You announcements which can be given,
announcement #5 or #16 listed in the following:

Announcement #5 (hdr_id = 5) should contain only the
Thank You phrase.
TUPLE SEMANTICS:
appl     - FCOSPS_TA
hdr_id   - 5
dur      - (as calculated by Recent Change)
phrase1  - 52 (Thank You phrase ID)

Announcement #16 (hdr_id = 16) should contain the
Thank you for using phrase plus the branding phrase,
which is one of the following:
AT&T
Northwestern Bell
Ohio Bell
New Jersey Bell
Wisconsin Telephone
C&P
Your Local Telephone Company
United Telephone
New York Telephone
```

Copyright © 1999 Lucent Technologies 

```
New England Telephone
S.N.E.T
Cincinnati Bell
U.S. West Communications
Pacific Bell
Nevada Bell
Whidbey Telephone Company
Roseville Telephone
Illinois Bell
Michigan Bell
Southwestern Bell
Rochester Telephone

TUPLE SEMANTICS:
appl     - FCOSPS_TA
hdr_id   - 16
dur      - (as calculated by Recent Change)
phrase1  - (Thank you for using phrase ID)
phrase2  - (correct branding phrase ID)

The wording and the IDs of all the phrases are contained in
the RLphrases relation in the AM.

The conditions that determine which Thank You announcement
are explained in the following. These checks are performed
in the OA call processing code and are not to be enforced in
ODA or RC code.

announcement #5 given when:
GLin_thnku = DBYES and GLbranding = DBNO
or GLin_thnku = DBYES and GLbranding = DBYES and

GLoftyp = DBYES and carrier id of call does not equal AT&T
                or
GLoftyp = DBNO and carrier id of call equals AT&T

or GLin_thnku = DBYES and GLbranding = DBYES and
GLoftyp = DBYES and carrier id of call equals AT&T
                or
 GLoftyp = DBNO and carrier id of call equals LEC
                and
the call is a Directory Assistance call and
GLdabrand = DBNO

announcement #16 given when:
GLin_thnku = DBYES and GLbranding = DBYES and

 GLoftyp = DBYES and carrier id of call equals AT&T
        or
 GLoftyp = DBNO and carrier id of call equals LEC
         and
the call is not a Directory Assistance call
or GLin_thnku = DBYES and GLbranding = DBYES and
```

Copyright © 1999 Lucent Technologies 

```
 GLoftyp = DBYES and carrier id of call equals AT&T
        or
 GLoftyp = DBNO and carrier id of call equals LEC
        and
 GLoftyp = carrier ID of call and

the call is a Directory Assistance call and
GLdabrand = DBYES

If the Thank You announcement is to be given for ACCS
Sequence calls, the global parameter GLseq_thnku must equal
DBYES, otherwise no announcement is given.  When the parameter
is set (GLseq_thnku = DBYES), only announcement #5 is given.
Tuple semantics same as the previous for hdr_id=5.

Note:
The announcement headers #39 and #40 should only be populated
if the Front-End Branding Secured Feature has been purchased.
If it has been purchased, the Audible Logo phrase ID is determined
at the time the Customized TN1054 ASC packs are made, and is used
in announcement headers #39 and #40.

The announcement header #149 should only be populated if the PLBQ
Business/Residential Promotional Card Secure Feature has been
purchased.  If the feature has been purchased, the Time Balance
Quotation phrase ID(s) is/are determined at the time that the
customized packs are made and are used in announcement header
149.

The conditions that determine which prompt announcement is
given are explained in the followint. These checks are performed
in the OA call processing code and are not to be enforced in
ODA or RC code.

announcement #1 is given when:
        prompt treatment is tone plus prompt
                and
        Secure Feature #15 (Front-End Branding) is not activated
                or
        Glbranding = DBNO
                or
        Glofcar != carrier of call
                or
        carrier of call is not AT&T or LEC

announcement #26 is given when:
        prompt treatment is tone only
                and
        Secure Feature #15 (Front-End Branding) is not activated
                or
        Glbranding = DBNO
                or
        Glofcar != carrier of call
```

Copyright © 1999 Lucent Technologies 

```
                or
        carrier of call is not AT&T or LEC

announcement #39 is given when:
        Secure Feature #15 (Front-End Branding) is activated
                and
        Glbranding = DBYES
                and
        Glofcar = carrier of call
                and
        carrier of call is AT&T or LEC
                and
        prompt treatment is tone only

        Announcement #39 (hdr_id = 39) should contain the 'bong'
        and 'Audible Logo' phrase.
        'Audible Logo' and prompt phrase.
        TUPLE SEMANTICS:
            appl     - FCOSPS_TA
            hdr_id   - 40
            dur      - (as calculated by Recent Change)
            phrase1  - 79 ('bong' phrase ID)
            phrase2  - ?? ('Audible Logo' phrase ID determined when
                           the customized announcement is made)
            phrase3  - 28 ('pause' phrase ID)
            phrase4  - 47 ('Please dial your card number' phrase ID)
            phrase5  - 48 ('or zero for an operator now' phrase ID)

        Announcement Header IDs 241 through 300 are to be used
        as customized announcements for the PLBQ Business/Residential
        Card feature.  IDs 241 through 270 will be used by the
        customer to create announcements that will be used as part
        of or instead of the balance quotation.  Ids 271 through 300
        will be used to create announcements that will be used
        instead of the standard disconnect warning announcements.

/*************************************************************************

Population for OSPS Toll and Assistance (OSPSTA)

NOTE:   For OSPSTA announcements, the following application-specific
commands are recognized:

 16500          Command - Insert a CREDIT digit
                          string
 16501          Command - Insert a CHARGE DUE digit
                          string
 16502          Command - Insert a CALL DURATION digit
                          string
 16503          Command - Insert an AMOUNT digit
                          string
 16504          Command - Insert a CARRIER Branding phrase

Population Rules for Remote Access Services (RAS)

DESCRIPTION:

Defines the header portion of a Remote Access Services (RAS)
announcement. Some announcement headers may be concatenated
together depending upon options selected. The actual hdr_id's
listed here are derived from DMras_id. Call processing will
```

```
use this domain and cast the value to a short before accessing
a tuple in this relation. The enumeration name was listed here
because it is more descriptive than the corresponding  number.

QUANTITY OF TUPLES:

22 tuples per SM.

TUPLE SEMANTICS for FCBRCS_RAS:

        Population for Automatic Customer Station Rearrangement (ACSR)

        DESCRIPTION:

        Defines the header portion of a Automatic Customer Station
        Rearrangement (ACSR) announcement. Some announcement headers
        may be concatenated together depending upon options selected.
```

```
QUANTITY OF TUPLES:

One tuple is required for each specified Announcement Type
with the Header ID equal to the Announcement Type value.

27 tuples per SM

TUPLE SEMANTICS for FCISDN_ACSR:

        phrase68

*************************************************************************/
```

**Attribute:**
appl
**Fullname:**
Application
**Attribute Description:**
Announcement application

**Attribute:**
hdr_id
**Fullname:**
header id
**Attribute Description:**
The header IDs assigned need not be contiguous.
A phraseX value in the range 1-16383, 16600-MAXPHRASEID must exist as a key in the relation RLphrases along with the corresponding appl value.

**Attribute:**
spare1
**Fullname:**
spare1
**Attribute Description:**
Field used for spare.

**Attribute:**
dur
**Fullname:**
duration
**Attribute Description:**
Dur is the expected duration of the digit string.
The value of dur is calculated by mapping code on an insert transaction. Its value is found by looping through the phrase entries until a 0 is encountered as follows:
- for each phrase entry which specifies a Phrase ID (1-16383, 16600-MAXPHRASEID)
  the value of 'dur' in the RLphrases entry corresponding to the Phrase ID and appl specified is added into the running total
- for the values 0, 16385, 16386, 16387, 16388, 16389, 16500 - 16599
  the running total is unaffected.

**Attribute:**

spare2

**Fullname:**

spare2

**Attribute Description:**

Field used for spare and for alignment of tuple.

**Attribute:**

phrase1

**Fullname:**

phrase or command

**Attribute Description:**

At least one non-zero entry must be specified. The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |
| 47-16383 | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |
| 16387 | Command - date of last incoming call |
| 16388 | Command - time of last incoming call |
| 16389 | Command - number of dollars and cents |
| 16500-16599 | Application-Specific Commands These are defined by applications to have certain meanings. All of these are treated EXACTLY as is 16385. |
| 16600-MAXPHRASEID | Application Defined Phrase IDs |

NOTE: (MAXPHRASEID+1)-65535 are NOT used for phrase IDs but for subsystem specific purposes.

**Attribute:**

phrase[*]

**Fullname:**

phrase or command

**Attribute Description:**

At least one non-zero entry must be specified. The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|

| | |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |
| 47-16383, | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |
| 16387 | Command - date of last incoming call |
| 16388 | Command - time of last incoming call |
| 16389 | Command - number of dollars and cents |
| 16500-16599 | Application-Specific Commands These are defined by applications to have certain meanings. All of these are treated EXACTLY as is 16385. |
| 16600-MAXPHRASEID | Application Defined Phrase IDs |

NOTE: (MAXPHRASEID+1)-65535 are NOT used for phrase IDs but for subsystem specific purposes.

```

DESCRIPTION:

RLannc_trl (for OSPS Directory Assistance Announcements)

Defines the announcement trailers to be concatenated to each Directory Assistance announcement. Two trailers are required: one for the case where the customer is allowed recall, the other for when recall is not allowed.

NOTE:

(1) These trailer IDs must be defined for the FCOSPS_DA application in every SM which is equipped with RAFs/SASs providing OSPS Directory Assistance announcements.

QUANTITY OF TUPLES:

2 tuples per SM.

TUPLE SEMANTICS for FCOSPS_DA:

OSPS DIRECTORY ASSISTANCE
MESSAGE TRAILERS

```
appl            - FCOSPS_DA
trl_id          - 1

/**********************************************************************

Population Rules for Remote Access Services (RAS) Announcements

DESCRIPTION:

Defines the announcement trailers to be concatenated to each
Remote Access Services announcement. The actual trl_id's
listed here are derived from DMras_id. Call processing will
use this domain and cast the value to a short before accessing
a tuple in this relation. The enumeration name was listed here
because it is more descriptive than the corresponding number.

NOTE: These trailer IDs must be defined for the FCBRCS_RAS
application in every SM which is equipped with RAFs/SASs
providing Remote Access Services announcements.

QUANTITY OF TUPLES:

3 tuples per SM.

TUPLE SEMANTICS for FCBRCS_RAS:

**Fullname:**
trailer id
**Attribute Description:**
trailer ID

**Attribute:**
spare1
**Fullname:**
spare1
**Attribute Description:**
Field used for spare.

**Attribute:**
dur
**Fullname:**
duration
**Attribute Description:**
Expected duration of digit string.
The value of dur is calculated by mapping code on an insert transaction. Its value is found by looping through the phrase entries until a 0 is encountered as follows:
- for each phrase entry which specifies a Phrase ID (1-16383, 16600-MAXPHRASEID) the value of 'dur' in the RLphrases entry corresponding to the Phrase ID and appl specified is added into the running total
- for the values 0, 16385, 16386, 16387, 16388, 16389, 16500-16599 the running total is unaffected

spare2
**Attribute Description:**
Field used for spare and for alignment of tuple.

**Attribute:**
phrase1
**Fullname:**
phrase or command
**Attribute Description:**
At least one non-zero entry must be specified.
The end of the phrases is denoted by a zero (0)
entry which MUST be present in each tuple. No
non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|
| 0 | Defines logical end of Phrase list |
| 1-46 | Digit-string related Phrase IDs (see RLPHRASES Pop Rules) |
| 47-16383, | Application Defined Phrase IDs |
| 16385 | Command - Insert a digit string here |
| 16386 | Command - Repeat the previous digit string here |
| 16387 | Command - date of last incoming call |
| 16388 | Command - time of last incoming call |
| 16389 | Command - number of dollars and cents |
| 16500-16599 | Application-Specific Commands These are defined by applications to have certain meanings. All of these are treated EXACTLY as is 16385. |
| 16600-MAXPHRASEID | Application Defined Phrase IDs |

NOTE: (MAXPHRASEID+1)-65535 are NOT used for vphrase IDs but for subsystem specific purposes.

**Attribute:**

The end of the phrases is denoted by a zero (0)
entry which MUST be present in each tuple. No
non-zero entries can exist after this entry.

These values are defined as follows:

| PHRASEX | DESCRIPTION |
|---|---|

```
  0            Defines logical end of Phrase list
1-46           Digit-string related Phrase IDs
               (see RLPHRASES Pop Rules)
47-16383,      Application Defined Phrase IDs
16385          Command - Insert a digit string here
16386          Command - Repeat the previous digit
                         string here
16387          Command - date of last incoming call
16388          Command - time of last incoming call
16389          Command - number of dollars and cents
16500-16599    Application-Specific Commands
               These are defined by applications to
               have certain meanings. All of these
               are treated EXACTLY as is 16385.
16600-MAXPHRASEID  Application Defined Phrase IDs

NOTE: (MAXPHRASEID+1)-65535 are NOT used for
phrase IDs but for subsystem specific purposes.
```

**Attribute:**

phrase50

**Fullname:**

phrase or command

**Attribute Description:**

At least one non-zero entry must be specified. The end of the phrases is denoted by a zero (0) entry which MUST be present in each tuple. No non-zero entries can exist after this entry.

These values are defined as follows:

```
PHRASEX         DESCRIPTION
-------         -----------
  0             Defines logical end of Phrase list
1-46            Digit-string related Phrase IDs
                (see RLPHRASES Pop Rules)
47-16383,       Application Defined Phrase IDs
16385           Command - Insert a digit string here
16386           Command - Repeat the previous digit
                          string here
16387           Command - Date of last incoming call
16388           Command - Time of last incoming call
16389           Command - number of dollars and cents
16500-16599     Application-Specific Commands
                These are defined by applications to
                have certain meanings. All of these
                are treated EXACTLY as is 16385.
16600-MAXPHRASEID  Application Defined Phrase IDs

NOTE: (MAXPHRASEID+1)-65535 are NOT used for
phrase IDs but for subsystem specific purposes.

### Relation Description

```
        Adjacent point code information

        This relation provides detailed information about an adjacent
        point code and assigned signaling link codes.

        This relation is used by both the National and International
        versions of Standardization Sector (SS7) (formerly CCITT7).
        The global SMs (GSMs) for these two versions
        must be separate, and any partitioned relations, like this one,
        must be populated independently on each GSM. This includes any
        index values retrieved from the RLindx relation that are used to
        populate this relation. RLindx is also GSM partitioned, so the
        proper partitioned data must be used from RLindx when populating
        any attributes in this relation.
```

## 4. Population rules for RLapci_apc

### Relation Description

National Standardization Sector (SS7) (formerly CCITT7) or International SS7 adjacent point code index to assigned adjacent signaling point translation relation

Translate the adjacent destination point code index to the assigned adjacent destination point code.

This relation resides in the National SS7 Global SM (as defined by the Glnatl7sm office parameter) and/or in the International SS7 Global SM (as defined by the Glintl7sm office parameter).

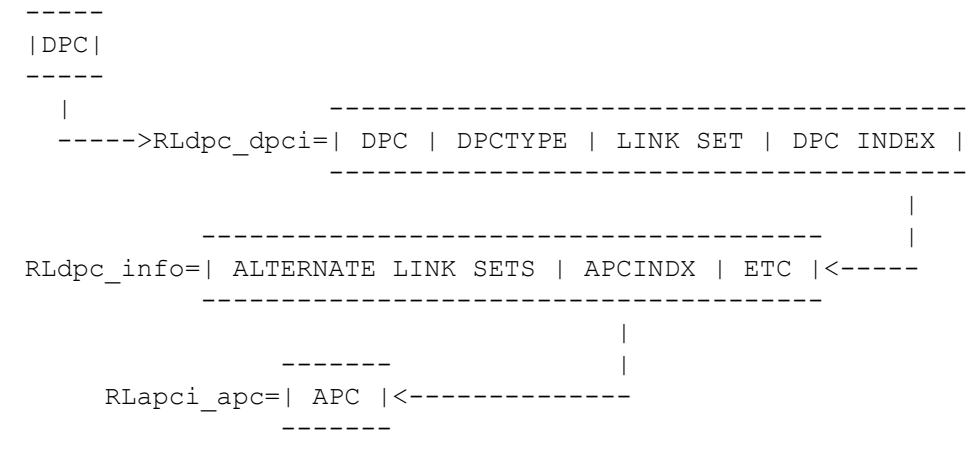
Copyright © 1999 Lucent Technologies

NOTE:

This relation is used by both the National and International versions of Standardization Sector (SS7) (formerly CCITT7). The global SMs (GSMs) for these two versions must be separate, and any partitioned relations, like this one, must be populated independently on each GSM. This includes any index values retrieved from the RLindx relation that are used to populate this relation. RLindx is also GSM partitioned, so the proper partitioned data must be used from RLindx when populating any attributes in this relation.

When a tuple is created for RLdpc_info and the field 'apcindx' (adjacent point code index) is assigned a non-zero value then this relation is populated as follows:

```
        find or create a tuple with a key equal to 'apcindx'
        when_found
                rlapci_apc.apc == RLdpc_dpci.dpc
```



Then the contents of apc holds the original DPC.

**Attribute:**
apci
**Fullname:**
Adjacent Point Code Index
**Attribute Description:**
The index assigned to an adjacent point code.

**Attribute:**
apc
**Fullname:**
Adjacent Point Code
**Attribute Description:**
This attribute corresponds to the Adjacent Point Code associated with the APC Index.

# APCONF

## 1. Description

This relation indicates whether certain features or hardware units are permitted for a given office configuration and SM configuration. The relation contains a tuple for each combination of SM configuration and feature; the relation also contains tuples containing the appropriate mask for an office type. The process of and-ing the office type mask with the tuple for a feature/hardware unit will yield either a true (nonzero) or false (zero) indication of whether the feature/hardware is permitted. This relation is pre-populated by a tool during load building and distributed to ODA. In cannot be permuted; it must remain as "un_perm" permutation. It has a distribution of disk only since ODA is the only current user of the relation.

## 2. Data Dictionary Values

| | |

## 4. Population rules for RLappfgrp

### Relation Description

Private feature/facility groups with Application Processor (AP) interactions

This relation specifies the private feature or facility groups a given business customer owns with respect to AP features.

Copyright © 1999 Lucent Technologies

For 5E3(1), three AP features use this relation: Facilities Management (FM), Traffic Data (TD) and Automatic Circuit Assurance (ACA).

For a given gcsrid/apid pair, the tuples in this are made up of the union of:

(1) All groups whose data may be manipulated by business customer=gcsrid via the FM feature running on AP=apid.

(2) All groups which may have traffic measurements taken and forwarded to AP=apid for business customer=gcsrid.

(3) All trunk groups which may have ACA performed on them, and the output sent to AP=apid for business customer=gcsrid.

**Attribute: gcsrid**

**Fullname:** Business customer ID

**Attribute Description:** See relation general info.

**Attribute: apid**

**Fullname:** Applications processor ID (APID)

**Attribute Description:** Must be tuple in RLcmapdata with RLcmapdata.site_id = apid.

**Attribute: grptype**

**Fullname:** Type of private feature/facility

**Attribute Description:** Dependencies:

(1) If grptype = MSARSG, there must be tuple in RLargp with RLargp.ar_gpid = grpnum

(2) If grptype = MSIDPG, there must be tuple in RLidp_gp with RLidp_gp.idp_gpid = grpnum

(3) If grptype = MSTERMG, there must be tuple in RLdb_amgpd such that RLdb_amgpd.grp_type = GPDTG, RLdb_amgpd.grp_id = grpnum

(4) If grptype = MSMDRG, there must be a tuple in RLmdr_gp such that RLmdr_gp.gcsrid = gcsrid, RLmdr_gp.ap_id = apid, RLmdr_gp.mdr_gpid = grpnum

(5) If grptype = MSACCTG, there must be a tuple in RLacct_gp such that RLacct_gp.gpid = grpnum

(6) If grptype = MSAUTHG, there must be a tuple in RLath_grp such that RLath_grp.athgpid = grpnum

(7) If grptype = MSTODG, there must be a tuple in RLtd_sched such that RLtd_sched.td_id = grpnum

(8) If grptype = MSSFG, there must be a tuple in Rlrt_sfg such that RLrt_sfg.grpnum = grpnum

(9) If grptype = MSTRKG, there must be a tuple in Rlrt_trkg such that RLrt_trkg.grpnum = grpnum

(10) If grptype = MSMLHG, there must be a tuple in Rlrt_mhg such that RLrt_mhg.grpnum = grpnum

Copyright © 1999 Lucent Technologies 

(11) If grptype = MSMQSF, there must be a tuple in Rlrt_sfg such that RLrt_sfg.grpnum = grpnum, RLrt_sfg.q_alwd = DBYES

(12) If grptype = MSMQT, there must be a tuple in Rlrt_trkg such that RLrt_trkg.grpnum = grpnum, RLrt_trkg.q_alwd = DBYES

(13) If grptype = MSMQHG, there must be a tuple in Rlrt_mhg such that RLrt_mhg.grpnum = grpnum, RLrt_mhg.q_ing = DBYES

(14) If grptype = MSATTG, there must be a tuple in RLgroup_port such that RLgroup_port.grptype = TM_LINE RLgroup_port.grpnum = grpnum RLgroup_port.member = 1 and there must be a tuple in RLfc_porttyp such that RLfc_porttyp.port = RLgroup_port.port RLfc_porttyp.servclass = FC_ATTENDANT or FC_ISATND

(15) If grptype = MSARSPAT, there must be a tuple in RLarscrn such that RLarscrn.mc_ri1|RLarscrn.mc_ri2|RLarscrn.mc_ri3| RLarscrn.mc_ri4|RLarscrn.mc_ri5|RLarscrn.mc_ri6 = grpnum

(16) If grptype = MSMLHGQC there must be a tuple in RLrt_mhg such that RLrt_mhg.grpnum = grpnum, RLrt_mhg.isat_idx != 0.

(17) If grptype = MSMLHGAC there must be a tuple in RLrt_mhg such that RLrt_mhg.grpnum = grpnum, RLrt_mhg.isat_idx != 0.

**Attribute: grpnum**

**Fullname:** Group number

**Attribute Description:** Identifies the group number of the private feature/facility group within the switch. range:

```
1-65535, if grptype= MSARSG|MSIDPG|MSTERMG|MSAUTHG|
                     MSACCTG|MSTODG|MSMDRG:
1-AVRIMAX(), if grptype=MSARSPAT
1-AVMLHGRPS(), if grptype = MSMLHG|MSMQHG|MSATTG|
                            MSMLHGQC|MSMLHGAC
1-AVSFGGRPS(), if grptype = MSSFG|MSMQSF
1-AVTRKGRPS(), if grptype = MSTRKG|MSMQT

Dependencies:
1) If grptype= MSARSG|MSIDPG|MSAUTHG|MSACCTG|
               MSTODG|MSMDRG:
   grpnum corresponds to the internal group number
   as specified in RLfacname
2) also see dependencies for grptype field
```

**Attribute: fmuse**

**Fullname:** Tuple vaild for facilities management use

**Attribute Description:** Dependencies:

If fmuse=DBYES, then there must be a tuple in RLfmassign such that RLfmassign.gcsrid = gcsrid and RLfmassign.apid = apid.

**Attribute: tduse**

**Fullname:** Tuple valid for traffic data to customer location feature

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Dependencies:

(1) If tduse = DBYES, then there must be a tuple in RLtdassign such that RLtdassign.gcsrid = gcsrid and RLtdassign.apid = apid.

(2) tduse cannot be DBYES if grptype=MSAUTHG| MSACCTG|MSTODG|MSMDRG|MSARSG

**Attribute: acause**

**Fullname:** Tuple valid for automatic circuit assurance

**Attribute Description:** Dependencies:

(1) If acause = DBYES, then there must be a tuple in RLtdassign such that RLtdassign.gcsrid = gcsrid and RLtdassign.apid = apid.

(2) acause can be DBYES only if grptype = MSTRKG.

(3) If acause=DBYES, then there must be a tuple in RLrctgrprk such that RLrctgrprk.portgrp.grpnum = grpnum and RLrctgrprk.servclass != FC_RAFANNC or FC_RAFDTA or FC_RAFCTR

**Attribute: msactive**

**Fullname:** Measurements active flag

**Attribute Description:** Indicates whether or not traffic measurements for this group are being sent to the AP.

Dependencies:

(1) msactive can be DBYES only if tduse=DBYES

(2) If msactive = DBYES and grptype = MSATTG, grpnum must be listed in RLms_att

(3) If msactive = DBYES and grptype = MSIDPG, grpnum must be listed in RLms_idp

(4) If msactive = DBYES and grptype = MSMLHG, grpnum must be listed in RLms_mlhg

(5) If msactive = DBYES and grptype = MSTERMG, grpnum must be listed in RLms_tgsr

(6) If msactive = DBYES and grptype = MSSFG, grpnum must be listed in RLms_pfa

(7) If msactive = DBYES and grptype = MSMQHG, grpnum must be listed in RLms_qu in a tuple with gptyp = TM_QLINE

(8) If msactive = DBYES and grptype = MSMQSF, grpnum must be listed in RLms_qu in a tuple with gptyp = TM_QSFG

(9) If msactive = DBYES and grptype = MSMQT, grpnum must be listed in RLms_qu in a tuple with gptyp = TM_QTRK

(10) If msactive = DBYES, there must be a tuple in RLtdassign with RLtdassign.gcsrid = gcsrid, RLtdassign.apid = apid and RLtdassign.tdactive = DBYES

(11) No dependencies for other grptypes

Copyright © 1999 Lucent Technologies 

**Attribute: nlactive**

**Fullname:** Nonusage trunk scan (NUTS)/locked-up trunk scan (LUTS) active flag

**Attribute Description:** Indicates whether or not NUTS/LUTS scanning is active.

Dependencies:

(1) nlactive can be DBYES only if grptype = MSTRKG and acause = DBYES

(2) If grptype = MSTRKG, there must be a tuple in RLrt_trkg with RLrt_trkg.grpnum = grpnum RLrt_trkg.nlactive = nlactive

(3) If nlactive = DBYES, there must be a tuple in RLtdassign with RLtdassign.gcsrid = gcsrid RLtdassign.apid = apid RLtdassign.acaactive = DBYES

**Attribute: shtactive**

**Fullname:** Short holding time (SHT) active flag

**Attribute Description:** Indicates whether or not SHT monitoring is active.

Dependencies:

(1) shtactive can be DBYES only if grptype = MSTRKG and acause = DBYES

(2) If shtactive = DBYES, there must be a tuple in RLrt_trkg with RLrt_trkg.grpnum = grpnum RLrt_trkg.sht_thres > 0

(3) If shtactive = DBYES, there must be a tuple in RLtdassign with RLtdassign.gcsrid = gcsrid RLtdassign.apid = apid RLtdassign.acaactive = DBYES

(4) If grptype = MSTRKG and shtactive = DBNO, there must be a tuple in RLrt_trkg with RLrt_trkg.grpnum = grpnum RLrt_trkg.sht_thres = 0

**Attribute: lhtactive**

**Fullname:** Long holding time (LHT) active flag

**Attribute Description:** Indicates whether or not LHT monitoring is active.

Dependencies:

(1) lhtactive can be DBYES only if grptype = MSTRKG and acause = DBYES

(2) If lhtactive = DBYES, there must be a tuple in RLrt_trkg with RLrt_trkg.grpnum = grpnum RLrt_trkg.lht_thres > 0

(3) If lhtactive = DBYES, there must be a tuple in RLtdassign with RLtdassign.gcsrid = gcsrid RLtdassign.apid = apid RLtdassign.acaactive = DBYES

(4) If grptype = MSTRKG and lhtactive = DBNO, there must be a tuple in RLrt_trkg with RLrt_trkg.grpnum = grpnum RLrt_trkg.lht_thres = 0

**Attribute: mdruse**

**Fullname:** Message detail recording (MDR) use

Copyright © 1999 Lucent Technologies 

**Attribute Description:** 'mdruse' must be set to DBYES in order for MDR records of the trunk group to be generated in the AP.

If any member in the trunk group has MDR assigned then 'mdruse' must be set to DBYES using Recent Change so MDR information will be sent to AP via FM/boot switch redundant data process.

If 'mdruse' is set to DBYES then grptype must be MSTRKG

**Defines:** "db/DMnxx.h",
"db/DMnpanxx.h",
"db/DMlocdig.h",
"db/DMnpa.h"

## 4. Population Rules for RLappl_plat

**Relation Description:** TCAP Application to CCS signaling platform.

This relation defines the CCS signaling platform used by each TCAP application. If PSU based signaling is used, the relation identifies the GSM number and the GSM point code. If CNI based signaling is used, the relation identifies the CNI point code.

**Attribute: appl**

**Fullname:** TCAP Application

**Attribute Description:** This attribute contains the TCAP application name.

**Attribute: sm**

**Fullname:** Switching Module

**Attribute Description:** This attribute contains the switching module number.

Copyright © 1999 Lucent Technologies

**Attribute: psu_mod**

**Fullname:** PSU Module

**Attribute Description:** The psu_mod attribute defines whether the CCS platform is the CNI or PSU. If the CNI is used for CCS signaling, psu_mod is set to zero; if PSU-based signaling is used, psu_mod is set to the GSM number.

**Attribute: pc**

**Fullname:** Point Code

**Attribute Description:** The point code of the GSM or the CNI.

## 4. Population Rules for RLapsite

**Relation Description:** Site id to application processor (AP) index.

This relation provides a translation from the site_id to the apindex. Starting in Generic 5E3, ISDN SM can host Application Processors with 'site_id's from 1 to 255. The maximum number of APs per SM is 10. The maximum number of APs per SM-2000 is 30. For each AP on a SM or SM-2000, this relation has one tuple which associates the site_id and apindex.

**Attribute: site_id**

**Fullname:** Site id

Copyright © 1999 Lucent Technologies

**Attribute Description:** Site identification number of the AP. The site identification number can be any number from 1 to 255 and must uniquely identify the AP to the *5ESS*®-2000 switch. Each tuple in this relation must have a corresponding tuple in RLcmapdata. For either the AM or a given SM, the site_id field will be populated from the RLcmapdata.site_id value.

**Attribute: apindex**

**Fullname:** AP index

**Attribute Description:** AP index for *5ESS*®-2000 switch use. The AP index is an integer between 1 and AVOFAPMAX (99), and is used by the AP communication package to refer to the AP. This number must be unique to each site identifier. For either the AM or a given SM, the apindex field will be populated from the RLcmapdata.apindex value. APs hosted by AM IOP data links are no longer supported. APs hosted by ISDN SMs or SM-2000s will have apindex values from 4 to AVOFAPMAX (99).

## 4. Population Rules for RLaqte_dap

**Relation Description:** Autoquote Digital to Analog Port.

Static relation used by OSPS to map the digital subscriber line (DSL) port to its autoquote analog-mate line port. This relation depends on the values in the relation RLfc_porttyp which contains all the ports in the office. If a port is deleted from RLfc_porttyp and that same port exists in this relation then it should be deleted from this relation also. Also the relation RLaqte_adp must be updated with the attributes reversed from this relation at the time of update. This relation has no intra relation dependencies.

**Attribute: dig_port**

**Fullname:** digital port

**Attribute Description:** This attribute is the local port number of the autoquote DSL port.

**Attribute: anl_port**

**Fullname:** Analog port

**Attribute Description:** This attribute is the local port number of the autoquote analog-mate line port.

Copyright © 1999 Lucent Technologies

# AR_CF

## 1. Description

LASS Automatic Recall feature constructed feature options - used in SM. These constructed features can be assigned to analog and ISDN terminals for voice calls. Use of AR with CSD calls can only be assigned for use with ISDN terminals on Standard BRIs.

## 2. Data Dictionary Values

| | |

## 4. Population Rules for RLar_cf

**Relation Description:** LASS Automatic Recall Constructed Feature.

This relation gives LASS Automatic Recall constructed feature information used in the SM. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description:** A BRCS constructed feature id consists of a modular feature type and a unique identifier. For an Automatic Recall constructed feature, the modular feature type is MFAR which is an enumeration of type DMmftype. The feature id must have a class of FACBRCS and a subclass of SCL_FEAT. If the feature is offered on a generally available basis, the feature id must also have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: actvn**

**Fullname:** activation

**Attribute Description:** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate via a dialed code or feature button) for 5E5 so that actvn always has the value ACTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: dctvn**

**Fullname:** deactivation

**Attribute Description:** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate via a dialed code or feature button) for 5E5 so that dctvn always has the value DCTNONE. Future generics may allow this feature to be deactivated via dialed codes or feature buttons.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description:** Type of billing to be performed. This is an enumeration of type DMbool. This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the service provider decides it will bill if the feature is universally available. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis whereas if it is set to DBNO, the billing will be done on a flat rate basis. ama_rec applies equally to whatever call types this AR feature applies to (voice, CSD, or both) as indicated by voice_alw and data_alw.

**Attribute: filtr_op**

**Fullname:** filter options

**Attribute Description:** This is a boolean value which will be used to indicate whether or not this feature is restricted to intra-terminal group only. This attribute should be initially populated with DBNO. If this attribute is set to DBYES, then the feature will be restricted to intra-terminal group only.

**Attribute: voice_alw**

**Fullname:** voice allow

Copyright © 1999 Lucent Technologies 

**Attribute Description:** This is a boolean value which indicates whether this feature applies to voice calls.

**Attribute: data_alw**

**Fullname:** data allow

**Attribute Description:** This is a boolean value which indicates whether this feature applies to CSD data calls. It may only be assigned to terminals on a Standard BRI.

Copyright © 1999 Lucent Technologies

# AR_LNSI

## 1. Description

This relation is used for routing the calls in the automatic route selection (ARS) feature for the leased network (LN) action control point (ACP) capability. This assigns screening index for the data/voice calls based upon the switch type (access/via).

## 2. Data Dictionary Values

| | |

## 4. Population Rules for RLar_lnsi

**Relation Description:** LN switch type to ARS screening index relation.

This relation is used for routing the calls in the automatic route selection (ARS) feature for the leased network (LN) action control point (ACP) capability. This assigns screening index for the data/voice calls based upon the switch type (access/via). The fc subsystem is the main user of this relation. This relation is required only in Leased Network

Copyright © 1999 Lucent Technologies

offices.

**Attribute: ln_node**

**Fullname:** Leased Network switch type

**Attribute Description:** This attribute specifies the per call switch type (access or via). It is access if the call is originated at this switch, otherwise it is via.

**Attribute: data_call**

**Fullname:** Data call indicator

**Attribute Description:** This attribute specifies the type of call. DBYES indicates that the call is a data call, DBNO indicates a voice call.

**Attribute: ars_si**

**Fullname:** Automatic route selection screening index

**Attribute Description:** ARS screening index used to read RLarscrn. This screening index is used for Leased Network calls instead of using an ARS screening index normally obtained from the RLarport relation. For each value of RLar_lnsi.ars_si, a tuple must exist in RLarscrn with this as a key value. The RLarscrn.ar_gpid will be obtained from RLgpid_net.argp and the RLarscrn.ars_idx is obtained from either the LDIT ODP routing index or the PNDP ARS index.

## 4. Population Rules for RLar_opts

**Relation Description:** LASS Automatic Recall Constructed Feature Options.

This relation gives LASS Automatic Recall constructed feature option information used in the AM. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description:** A BRCS constructed feature id consists of a modular feature type and a unique identifier. For an Automatic Recall constructed feature, the modular feature type is MFAR which is an enumeration of type DMmftype. The feature id must have a class of FACBRCS and a subclass of SCL_FEAT. If the feature is offered on a generally available basis, the feature id must also have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: actvn**

**Fullname:** activation

**Attribute Description:** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate via a dialed code or feature button) for 5E5 so that actvn always has the value ACTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: dctvn**

**Fullname:** deactivation

**Attribute Description:** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate via a dialed code or feature button) for 5E5 so that dctvn always has the value DCTNONE. Future generics may allow this feature to be deactivated via dialed codes or feature buttons.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description:** Type of billing to be performed. This is an enumeration of type DMbool. This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the customer decides it will bill if the feature is universally available. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis whereas if it is set to DBNO, the billing will be done on a flat rate basis. ama_rec applies equally to whatever call type (voice or data) that this AR feature supports.

**Attribute: ring_typ**

**Fullname:** Call-back ringing type

**Attribute Description:** Select from one of the cadences available to the Automatic Recall feature user. This attribute should be initially populated with ringing cadence DR_C.

**Attribute: filtr_op**

**Fullname:** filter options

**Attribute Description:** This is a boolean value which will be used to indicate whether or not this feature is restricted intra-terminal group only. This attribute should be initially populated with DBNO.

Copyright © 1999 Lucent Technologies 

If this attribute is set to DBYES, then the feature will be restricted intra-terminal group only.

**Attribute: voice_alw**

**Fullname:** voice allow

**Attribute Description:** This is a boolean value which indicates whether this feature applies to voice calls.

**Attribute: data_alw**

**Fullname:** data allow

**Attribute Description:** This is a boolean value which indicates whether this feature applies to CSD data calls. It may only be assigned to terminals on a Standard BRI.

## 4. Population Rules for RLar_port

**Relation Description:** LASS Automatic Recall Constructed Feature Line Parameters.

Copyright © 1999 Lucent Technologies

This relation gives LASS Automatic Recall constructed feature line parameters that are pseudo group partitioned. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: lport**

**Fullname:** logical port

**Attribute Description:** This attribute defines the logical port and is a sequential key administered per SM. Analog lines would also be assigned lports, although the ISDN and analog lport values will be tracked and assigned separately to conserve memory as is currently done with logical termination indexes.

**Attribute: lpt_type**

**Fullname:** lport type

**Attribute Description:** This attribute indicates the type of lport that the tuple belongs to.

**Attribute: ring_typ**

**Fullname:** Recall ringing type

**Attribute Description:** Select from one of the cadences available to the LASS Automatic Recall feature user. This attribute should be initially populated with ringing cadence DR_C.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLaraltfrl

**Relation Description:** Alternate frl table for ARS Phase II.

This relation contains an alternate frl for each frl allowed. The alternate frl from the relation will be used when the alternate FRL feature is allowed and active (RLargp.alw_alt_frl, RLargp.alt_frl and RLarport.use_alt_frl are set to DBYES)

**Attribute: ar_gpid**

**Fullname:** auto route selection group id

**Attribute Description:** This tuple should not be deleted when it is in use for this group.

**Attribute: altfrl[*]**

**Fullname:** alternate frl for each given frl

**Attribute Description:** In order to fill in the alternate frl, the alw_alt_frl bit in the RLargp relation needs to be set to DBYES

## 4. Population Rules for RLarcf

**Relation Description:** Automatic Route Constructed Feature.

Automatic route selection constructed feature (options only) used in SM. The following is a list of valid service classes for ports assigned this feature:

```
LINES
-----
FC_INDVDL, FC_ATTENDANT, FC_PBX, FC_4WIRE_INDV,
FC_MODEM,  FC_ISDN,  FC_ISATND,  RC_UNASSIG, RC_PORTUNA
```

**Copyright © 1999 Lucent Technologies** 

```
TRUNKS
------
FC_PF,      FC_PFLASH, FC_PFITT, FC_LATA_CONN
FC_CA_ANI, FCEDSL,    FCEDSLHM, FC_TTOLL_CONN,
```

**Attribute: feat_id**

**Fullname:** feature identification.

**Attribute Description:** Auto Route Selection (ARS) constructed feature id.

**Attribute: entry_pt**

**Fullname:** Entry point

**Attribute Description:** Indicates which entry methods are accepted by the given constructed auto route selection feature.

**Attribute: fltrerr**

**Fullname:** error treatment for inappropriate numbers.

**Attribute Description:** Error treatment given when it is determined that the dialed code (N11, 011, 10XX, 800, 0+, 0-) is inappropriate for auto route selection.

**Attribute: frl_err**

**Fullname:** error treatment for insufficient facility restriction Level (FRL).

**Attribute Description:** Error treatment given when it is determined that a line has insufficient FRL to use a given facility.

**Attribute: frl_typ**

**Fullname:** Facility Restriction Level (FRL) type.

**Attribute Description:** The calling privileges associated with a line.

**Attribute: actvn**

**Fullname:** activation type.

**Attribute Description:** Specifies the type of constructed feature activation allowed for this feature.

```
For line de-activation for 1 call:
If actvn = ACTNONE  and  dctvn = DCTCD
    then   entry_pt = ARE_AUTO.
For line always activate:
If actvn = ACTNONE  then dctvn = DCTNONE.
```

**Attribute: dctvn**

**Fullname:** deactivating type.

**Attribute Description:** Specifies the types of deactivation allowed for this feature.

```
If dctvn = DCTNONE  or  DCTCD  then actvn = ACTNONE.
*** ODA ONLY WARNING ***
*** (NOT SUPPORTED BY RC) ***
```

To deactivate the feature via a dialed code, verify that RLdaprlfnl and/or RLidp_dtre have a tuple for a given dialed code with action = ACN_ARSDCT.

Copyright © 1999 Lucent Technologies

**Attribute: gactvn**

**Fullname:** group activating type.

**Attribute Description:** specifies the type of group activation for this feature.

```
If gactvn = ACTNONE  then gdctvn = DCTNONE.
If gactvn = ACTCD    then gdctvn = DCTCD.
*** ODA ONLY WARNING ***
*** (NOT SUPPORTED BY RC) ***
```

To activate the feature via a dialed code, verify that RLdaprlfnl and/or RLidp_dtre have a tuple for a given dialed code with action = ACN_GPACT.

**Attribute: gdctvn**

**Fullname:** group deactivating type.

**Attribute Description:** Specifies the type of group deactivation for this feature.

```
If gdctvn = DCTNONE  then gactvn = ACTNONE.
If gdctvn = DCTCD    then gactvn = ACTCD.
*** ODA ONLY WARNING ***
*** (NOT SUPPORTED BY RC) ***
```

To deactivate the feature via a dialed code, verify that RLdaprlfnl and/or RLidp_dtre have a tuple for a given dialed code with action = ACN_GPDCT.

**Attribute: chgapg**

**Fullname:** change active pattern group.

**Attribute Description:** Tells whether the active pattern group number (act_pg in RLargp) changes are permitted by time of day (TOD) or diald code.

**Attribute: chgerwt**

**Fullname:** change expensive route warning tone.

**Attribute Description:** Indicates whether expensive warning tone change are permitted by customer through dial_code.

**Attribute: chgaltfrl**

**Fullname:** Change the status of the alternate FRL table.

**Attribute Description:** Indicates whether activation/deactivation of alternate FRL table (alw_alt_frl in RLargp) is permitted by the customer through a dialed code or time of day. Glsabac D

**Attribute: tcmopt**

**Fullname:** traveling class mark (TCM) option.

**Attribute Description:** Indicates whether or not the private switch network customer wants traveling class marks (indication of a station's facility restriction level) passed between private network nodes.

**Attribute: ccsa**

**Fullname:** Common control switching arrangement (CCSA).

**Attribute Description:** Indicates whether CCSA limit apply to this feature. If CCSA limits apply, they will only be used on calls using dialing plan 1.

**Copyright © 1999 Lucent Technologies** 

**Attribute: ars_bill**

**Fullname:** type of billing for ARS.

**Attribute Description:** Boolean structure indicating the combination several types of billing. In each case a DBYES indicates that type of billing is applicable and DBNO indicates it is not. See domain DMmc_bill for a description of each sub-attribute. Range of Values: DBYES, DBNO for each sub-attribute Default Value: DBYES for flat, DBNO for all other subattribute.

**Attribute: ars_bill.flat**

**Fullname:** flat rate.

**Attribute Description:** Flat rate, no usage sensitive charge.

**Attribute: ars_bill.usefreq1**

**Fullname:** usage frequency 1.

**Attribute Description:** Usage frequency charge, for use of event 1.

**Attribute: ars_bill.usefreq2**

**Fullname:** usage frequency 2.

**Attribute Description:** Usage frequency charge, for use of event 1.

**Attribute: ars_bill.usefreq3**

**Fullname:** usage frequency 3.

**Attribute Description:** Usage frequency charge, for use of event 3.

**Attribute: ars_bill.usefreq4**

**Fullname:** usage frequency 4.

**Attribute Description:** Usage frequency charge, for use of event 4.

**Attribute: ars_bill.actchrg**

**Fullname:** activation charge.

**Attribute Description:** Usage charge for activation.

**Attribute: ars_bill.dactchrg**

**Fullname:** deactivation charge.

**Attribute Description:** Usage charge for deactivation.

**Attribute: ars_bill.duration**

**Fullname:** duration charge.

**Attribute Description:** Usage charge for duration of use.

**Attribute: ars_bill.change**

**Fullname:** parameter change.

**Attribute Description:** Usage charge for change of parameter.

## 4. Population Rules for RLargp

**Relation Description:** Automatic Route Selection (ARS) group data.

This relation contains ARS group data for each group.

**Attribute: ar_gpid**

**Fullname:** ARS group id

Copyright © 1999 Lucent Technologies

**Attribute Description:** Auto Route Selection group id.

**Attribute: ars_act_sts**

**Fullname:** ARS active status

**Attribute Description:** Active status indicator for ARS group.

**Attribute: pg_alw**

**Fullname:** Pattern groups allowed

**Attribute Description:** The number of pattern groups that a customer may have.

**Attribute: act_pg**

**Fullname:** Active pattern group

**Attribute Description:** The pattern group that is active.

**Attribute: annc_ri**

**Fullname:** Announcement route index

**Attribute Description:** The announcement for inappropriate ARS number; it is a route index that points to an announcement.

**Attribute: tod_inh**

**Fullname:** Time of day changes inhibited

**Attribute Description:** Specifies whether time of day changes to ARS group data are inhibited. This field is intended to be used by end customers through the Facilities Management feature, allowing a customer to temporarily deactivate TOD scheduled changes. If the value is DBYES, then TOD changes will be blocked for this ARS group.

**Attribute: alw_alt_frl**

**Fullname:** Allow alternate FRL

**Attribute Description:** Boolean indicating whether the customer is allowed the alternate FRL feature or not.

If this attribute is DBYES do not delete the RLaraltfrl tuple for this ARS group. If alw_alt_frl is DBYES, the actions ACN_FRLALT and ACN_FRLMAIN are valid actions recognized by Time Of Day (TOD). ODA ONLY: If alw_alt_frl is DBYES, verify the existence of a tuple in RLaraltfrl keyed by ar_gpid.

**Attribute: alt_frl**

**Fullname:** Alternate FRL indicator

**Attribute Description:** Boolean indicating whether the alternate FRL feature is active or inactive.

**Attribute: pq_frl**

**Fullname:** Post-queue FRL

**Attribute Description:** Post-queue routing FRL used in the case of queue timeout when queuing is permitted on the outgoing trunk. If post queue FRL upgrade is not to occur, pq_frl will have a value of 31 (ARFRL_NONUSE). If it is being used, pq_frl will have a value from 0-16.

**Attribute: thresh_frl**

Copyright © 1999 Lucent Technologies 

**Fullname:** Threshold FRL

**Attribute Description:** If pq_frl indicates that post queue FRL upgrade is being used (it has a value from 0-16), the following conditions must be met before the upgrade can take place. 1. Terminal FRL >= thresh_frl and terminal FRL not 31 (ARFRL_NONUSE) OR thresh_frl = 31 2. pq_frl > terminal frl or terminal frl = 31.

**Attribute: argptyp**

**Fullname:** ARS group type

**Attribute Description:** Indicates if the ARS group is a circuit-switched voice or circuit-switched data group.

**Attribute: shc**

**Fullname:** Satellite Hop Count

**Attribute Description:** The maximum Satellite Hop Count allowed for each call in each ARS group. If Satellite Hop Count exceeded this value then attribute 'shcopt' should be checked to determine the options of action.

**Attribute: shcopt**

**Fullname:** Option of Satellite Hop Count

**Attribute Description:** If Satellite Hop Count exceeded the maximum value allowed that specified in attribute 'shc' then 'shcopt' should be checked to determine the options of action. The options are:

0|SHCDONTCARE) 'DON'T CARE', use either terrestrial or satellite facilities to route call.

1|SHCPREFER) 'PREFERRED', once the SHC limit has been reached, try to route terrestrially if available: otherwise route via satellite facilities.

2|SHCSTRICT) 'STRICT', once the SHC limit has been reached, route terrestrially if available: otherwise clear call.

**Copyright © 1999 Lucent Technologies** 

# ARPORT

## 1. Description

This relation contains the automatic route selection feature parameters on a port. Automatic route selection parameters are assigned to a business and residential customer services (BRCS) user. A user is defined to be an analog terminal, a trunk, or an integrated services digital network [ISDN] User.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLarport

**Relation Description:** Auto Route selection feature parameters on a port.

Automatic route selection parameters assigned to a business and residential customer services (BRCS) user (a user is defined to be an analog terminal, a trunk, or an integrated services digital network [ISDN] User).

```
Special Entry for Group Parameter Associated with BFG
------------------------------------------------------
```

For BRCS Feature Group (BFG) purposes, this Automatic Route Selection (ARS) is an either type. Therefore, BFG lport tuple will be created for the Switching Module (SM) where any BFG lport members reside. Individual lport tuples may or may not be created for BFG assigned lports. BFG, capability G268, is intended to improve recent change response time and provide for SM memory reduction. It permits the creation of groups of BRCS features and parameters, and the utilization of these groups by call processing. BFG group parameter relations will not be created, but will be populated in existing lport keyed relations. Identifying BFG group parameters will be accomplished via use of an lpt_type key field set to LPT_BFG and use of the lport key field to contain the BFG group ID. This concept is used to avoid creation of new database relations. Distribution: Group partitioned (if lpt_type=LPT_BFG) or SM partitioned This relation now has two types of tuples.

(1) The first type is the existing tuples which are sm-partitioned and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

(2) The second type is the BFG group partitioned tuple associated with features in a BFG, having

Copyright © 1999 Lucent Technologies 

lpt_type=LPT_BFG, and the bfgid populated in the lport field.

***NOTE:*** There is a limit of 30 BRCS features for each bfgid.

**Attribute: lport**

**Fullname:** Logical port identifier

**Attribute Description:** Logical port of the user being assigned the BRCS features.

If lpt_type != LPT_BFG, RLarport.lport must equal RLfc_line.lport (if a line) or RLfc_trunk.lport (if a trunk).

The keys for RLfc_line & RLfc_trunk are:

RLfc_line.port = RLlpt_pt(RLarport.lport,RLarport.lpt_type).port RLfc_line.party = RLlpt_pt(RLarport.lport,RLarport.lpt_type).party RLfc_trunk.port = RLlpt_pt(RLarport.lport,RLarport.lpt_type).port

If lpt_type = LPT_BFG, then RLarport.lport contains a BFG group ID.

If lpt_type != LPT_BFG, there must be a tuple in RLfc_porttyp keyed by the RLlpt_pt(lport,lpt_type).port.

If lpt_type = LPT_BFG, there must be a tuple in RLbfgmatch keyed by the bfgid contained in RLarport.lport.

For lines: Verify existence of tuple in RLfc_line and a tuple in RLfc_porttyp for this lport (the port is derived from RLlpt_pt(lpt_type,lport).port) with a service class FC_INDVDL, FC_ATTENDENT, FC_PBX, FC_4WIRE_INDV, FC_MODEM, FC_ISDN, FC_ISATND, RC_UNASSIG, or RC_PORTUNA.

The D_channel port is the port specified for the classes of service: FC_ISDN and FC_ISATND.

If RLfc_porttyp.servclass is RC_UNASSIG or RC_PORTUNA then the line is on intercept. Also for these lines, RLrc_lcc.servclass will equal FC_INDVDL, FCATTENDENT, FC_PBX, FC_4WIRE_INDV, FC_MODEM, FC_ISDN, or FC_ISATND.

If RLfc_porttyp.servclass is FC_MODEM showing the ARS feature is associated with a modem pool group, then the port and the associated modem pool must be assigned to a private modem pool group; RLrt_mpg.pooltype must be MPPVTBILL or MPPVTNOBILL.

OR for trunks: Verify existence of tuple in RLfc_trunk and a tuple in RLfc_porttyp keyed by RLlpt_pt.port for trunks with service class FC_PF, FC_PFITT, or FC_PFLASH.

**Attribute: lpt_type**

**Fullname:** lport type

**Attribute Description:** Logical port type of the user. Range: LPT_ISDN (for ISDN Users), LPT_BFG (for BFG tuples), or LPT_OTHER (for analog BRCS lines and trunks)

RLarport.lpt_type must be identical to RLfc_line.lpt_type if the user is for an analog or ISDN terminal.

The keys for RLfc_line are: RLfc_line.port = RLlpt_pt(RLarport.lport,RLarport.lpt_type).port RLfc_line.party = RLlpt_pt(RLarport.lport,RLarport.lpt_type).party

Copyright © 1999 Lucent Technologies 

If the User is a BRCS trunk, then lpt_type=LPT_OTHER.

If lpt_type=LPT_BFG, then there must be a tuple in RLbfgmatch keyed by the bfgid contained in RLarport.lport.

**Attribute: ar_gpid**

**Fullname:** ARS voice group ID

**Attribute Description:** ARS group ID Range of Values: 0 to 65535. The zero is used only by Recent Change temporarily from the special insert, if the default on the feature selection definition was 0.

(1) Verify ar_gpid exists in RLargp, if ar_gpid > 0.

(2) If RLundpinfo.undp_ert = UNATDN then RLdn_feats.tgid must be > 0 and a tuple exists in RLrt_tg for that terminal group.

When an ARS group is added to a user who also subscribes to automatic customer station rearrangement (ACSR) a tuple in RLacsr_ldm will be either updated or inserted, or the addition of the ARS group to this user will fail. The check is made by comparing the RLdb_amgpd.pcr_map[1..7] fields indicated by RLarport.argp and by RLacsr_usr.acsr_gpid. See RLacsr_ldm.P for the details.

When an ARS group is deleted from a user who also subscribes to ACSR, the use_count field in one tuple of RLacsr_ldm will be decremented by one. See RLacsr_ldm.P for the details.

**Attribute: priv_dn**

**Fullname:** Private directory number

**Attribute Description:** Private directory billing number (1 thru $SZDNUM digits) for this user for MDR (Customer Location (CL) or revenue accounting office (RAO)).

**Attribute: priv_dn.digcnt**

**Fullname:** Private directory number digit count

**Attribute Description:** Used for private directory billing number digit count.

**Attribute: priv_dn.dn**

**Fullname:** Private directory number code

**Attribute Description:** Used for private directory billing number code.

**Attribute: ardtgpid**

**Fullname:** Auto route data group ID

**Attribute Description:** Identifies an ARS data group. If a non-zero ardtgpid is specified, a tuple must exist in RLargp with ar_gpid as the key, and the group type in that tuple must be BR_CSD (circuit-switched data)

**Attribute: frl_line**

**Fullname:** ARS facility restriction level port

**Attribute Description:** ARS facility restriction level for line or trunk; this value is used to compare the frl_grp in RLrt_mcrt. This field is meaningless for trunks that use incoming TCMs.

Copyright © 1999 Lucent Technologies 

frl_line range 0-16 are 'real' frls, and ARFRL_NONUSE (31) indicates the frl is not used. If RLarcf.frl_typ = ARL_FXDFRL, then RLarport.frl_line = 16.

**Attribute: ars_tone**

**Fullname:** ARS tone type

**Attribute Description:** Tone type for expensive route warning tone to be chosen by the customer.

**Attribute: alw_mdr**

**Fullname:** MDR indicator for a line

**Attribute Description:** Indicates if this user requires MDR to revenue accounting office, for call types AMCCSASAMP, AMETSMDR, and AMETSCCSA only.

If RLfc_porttyp.servclass=FC_MODEM, set alw_mdr=DBNO for modem members in a modem pool group.

**Attribute: use_alt_frl**

**Fullname:** Alternate Facility Restriction Level (FRL) table treatment indicator.

**Attribute Description:** Indicates if this user requires alternate FRL table treatment.

If RLargp.alw_alt_frl = DBNO, use_alt_frl must be DBNO.

**Attribute: tcmin**

**Fullname:** Traveling class mark (TCM) indicator for incoming trunks

**Attribute Description:** Indicates whether or not an incoming private network trunk is expecting to receive a TCM. Zero means no TCM is expected. Values of one or two indicate the number of digits in the TCM. When an incoming TCM is expected, the TCM will be used as the FRL, and frl_line is not used. This attribute is only used for trunks.

If the trunk indicated as the key port is an incoming trunk or a two-way trunk, all values are valid, except for leased network, the value can only be zero or one. If the value equals one, it must have a service class of PF and the in_signaling type must be TT, MF, or DP. For all other cases, only 0 is valid. If the value is one or two, RLartcm will not be populated for leased network, for other cases RLartcm must be populated and keyed in by ar_gpid. If attribute tcmopt in RLarcf equals DBNO, the value must be zero. If the trunk indicated as the key port is cut-through (RLfc_trunk.cut_thru=DBYES) then the value must be zero.

If tcmin = 1 or 2, then frl_line must be ARFRL_NONUSE (31) and RLarcf.frl_type = ARL_VARFRL.

**Attribute: tcmout**

**Fullname:** TCM indicator for outgoing trunks.

**Attribute Description:** Indicates whether or not an outgoing private network trunk is expecting to send a TCM. If the value is zero, no TCM will be sent. Values of one or two indicate the number of TCM digits to be outpulsed. This attribute is only used for trunks.

If the trunk indicated as the key port is an outgoing trunk or a two-way trunk, all values are valid. For all other cases, only zero is valid. If the value is one or two, RLartcm must be populated and keyed in by ar_gpid. For leased network, if the value is one or two, the service class must be PF and the out_signaling type must be TT, MF or DP. If attribute tcmopt in RLarcf equals DBNO, the value must be zero. If the trunk indicated as the key port is cut-through (RLfc_trunk.cut_thru=DBYES) or an FX trunk (RLfc_trunk.out_startsig or RLfc_trunk.in_startsig is FCFXLOOP or FCFXGRND), then the value must be 0.

Copyright © 1999 Lucent Technologies 

```
If deftcm = 0 through 7, then tcmout = 1 or 2.
If deftcm = 8 through 16, then tcmout = 2.
If deftcm = 31, then tcmout = 0.
```

**Attribute: ars_si**

**Fullname:** Auto route selection screening index for port

**Attribute Description:** ARS screening index used to read RLarscrn.

Use the default value for retrofit. Verify that a tuple with this ars_si and ar_gpid exists in RLarscrn.

**Attribute: q_alwd**

**Fullname:** Queuing allowed for this port

**Attribute Description:** Is modular queuing for outgoing private facilities allowed?

```
IF q_alwd is DBYES then:
If RLfc_porttyp.porttype is TM_TRK then
        RLfc_porttyp.servclass must be FC_PF, FC_PFITT, or
        FC_PFLASH
or
If RLfc_porttyp.porttype is TM_LINE
        RLfc_porttyp.servclass must be FC_INDVDL,
        FC_ATTENDANT, FC_PBX, FC_ISDN, FC_ISATND, FC_4WIRE_INDV.
        If RLfc_porttyp.servclass == FC_4WIRE_INDV and
        if FC_4wire.conf_bridge == DBYES, then q_alwd
        must equal DBNO.
        If RLfc_porttyp.servclass=FC_MODEM, set q_alwd =
        DBNO for modem members in a modem pool group.
```

**Attribute: qpriority**

**Fullname:** Priority port

**Attribute Description:** Is this a priority line for modular queuing for private facility?

```
if qpriority is DBYES,
        then q_alwd must be DBYES.
if q_alwd is DBYES and RLfc_porttyp.porttype is
        TM_TRK, then qpriority must be DBYES.
If q_alwd is DBYES and RLfcporttyp.porttype is
        TM_LINE and RLfc_porttyp.servclass is FC_ATTENDANT
or RLfc_porttyp.servclass is FC_ISATND
        then qpriority must be DBYES.
```

**Attribute: un_dpln**

**Fullname:** Uniform numbering dialing plan number

**Attribute Description:** Uniform numbering dialing plan number. Each user which is given auto ars treatment must specify the Private Number Dialing Plan (PNDP) or the Office Dialing Plan (ODP).

(1) If the entry condition of the ARS feature assigned is AUTO then RLarport.un_dpln must not equal DPNULL. To verify this the ARS feature ID taken from RLtrmfeats for this user is used as the key to RLartm, and if RLartm.entry_pt equals ARE_AUTO then RLarport.un_dpln must equal either DP1, DP2 or DPODP.

Copyright © 1999 Lucent Technologies 

(2) If this attribute is DP1 or DP2, then there must exist a tuple in RLundpinfo for the same ar_gpid with RLundpinfo.un_dpln=RLarport.un_dpln.

For Retrofit purposes from 5E2, un_dpln = DPODP when RLartm.entry_pt = ARE_AUTO and un_dpln = DPNULL when RLartm.entry_pt = ARE_ACC_CD.

**Attribute: deftcm**

**Fullname:** Default TCM for outgoing or 2-way trunks

**Attribute Description:** Default TCM to be used for calls that require a TCM be outpulsed, but the FRL was not received in the trunk termination message.

```
1) If tcmout = 0, then deftcm = 31.
   If tcmout = 1, then deftcm = 0 through 7.
   If tcmout = 2, then deftcm = 0 through 16.
```

**Attribute: rlt_frlind**

**Fullname:** Use originator caller's FRL indicator.

**Attribute Description:** Release link trunk facility restriction level indicator. This parameter must be set to DBYES if the original caller's FRL is to be used in place of the attendant's FRL in routing the call and in the MDR record. If RLarport.rlt_frlind = DBYES, RLrt_trkg.rlt_type must not = RLT_NONE.

**Attribute: rlt_amaind**

**Fullname:** Use original caller's automatic message accounting data indicator.

**Attribute Description:** Release link trunk automatic message accounting (AMA)indicator. This parameter must be set to DBYES if the original caller's data is to be used in place of the attendant's data in the MDR record. If RLarport.rlt_amaind = DBYES, RLrt_trkg.rlt_type must not = RLT_NONE.

**Attribute: voice_ete**

**Fullname:** Options of end to end Q.931 connectivity for voice calls

**Attribute Description:** End to end voice call Q.931 connectivity options:

ETEDONTCARE: Don't care if there is a PRI trunk available or not. ETEREQUIRE: PRI trunk is required to route a call. If no PRI trunk exists, clearing procedure will be initiated.

ETEPREFER: PRI trunk is preferred to route a call. If there is no PRI trunk available routing will use whatever trunk available.

**Attribute: data_ete**

**Fullname:** options of end to end Q.931 connectivity for data call.

**Attribute Description:** End to end data call Q.931 connectivity options:

ETEDONTCARE: Don't care if there is a PRI trunk available or not.

ETEREQUIRE: PRI trunk is required to route the call: If no PRI trunk exists, clearing procedure will be initiated.

ETEPREFER: PRI trunk is preferred to route the call. If there is no PRI trunk available routing will use whatever trunk available.

## 4. Population Rules for RLarscrn

**Relation Description:** ARS route index data for each group.

**Attribute: ar_gpid**

**Fullname:** auto route selection group id

**Attribute Description:** Auto Route Selection group id.

**Attribute: ars_idx**

**Fullname:** index generated by digit analysis

**Attribute Description:** Index generated by digit analysis routine.

**Attribute: ars_si**

**Fullname:** ARS screening index

**Attribute Description:** ARS screening index.

**Attribute: charge_x**

**Fullname:** private charge index for calls with RTE_MCTRAN rte_typ

**Attribute Description:** Charge index for RTE_MCTRAN calls Used when no rte_typ(N) values are RTE_MCTRAN The charge_x must be 1-2047 if any of the rte_typ(N) values are RTE_MCTRAN If the charge index is non-zero, then there must be a tuple of RLchrgidxexp with a matching key.

**Attribute: rte_typ[*]**

**Fullname:** route type override for the corresponding mc_ri

**Attribute Description:** This route type is used to override an RTE_MC or RTE_MCTRAN route type returned by private digit analysis. The default value(RTE_NULL) is used to specify the route type for a pattern group that's not used for this customer. Retrofit Rule:

```
rte_typ(N) should be RTE_MC
for the pattern groups that are used.
and the default value for the remaining
pattern groups.
```

Route types are numerically paired with the corresponding mc_ri(N). Dependencies are described in mc_ri(N) description. (N) ranges from 1 to 6 and refers to each rte_typ(N) or mc_ri(N).

**Attribute: mc_ri[*]**

**Fullname:** the BRCS route index for ARS group

**Attribute Description:** Route index or noc used in MFC routing

```
Range:  0 - AVRIMAX() (ri)
        0 - AVNOCMAX() (noc)
```

The default value is used to specify the index for a pattern group that's not active.

Copyright © 1999 Lucent Technologies 

Verify that RLargp has a tuple with this ar_gpid as key where rlARGP.pg_alw equals the maximum number of known mc_ri's (such as, if rlARGP.pg_alw = 3 then mc_ri1 - rmc_ri3 may be known and mc_ri4-6 must be 0).

```
If rte_typ(N) = RTE_ANNCE, RTE_ATDN, or RTE_REORDER,
then mc_ri(N) = 0.
```

If rte_typ(N) = RTE_ATDN, check is done by ODA only per 'Special Checks for ARS', 3) in RLarport.

If rte_typ(N) = RTE_ANNCE, verify that RLargp.annc_ri > 0.

If rte_typ(N) = RTE_MC, verify that a tuple exists in RLrt_mcrt with a rte_typ = RTE_MC or RTE_SFG or RTE_PVN with the corresponding mc_ri(N) as key. In this case, mc_ri(N) must be from 1 - AVRIMAX().

If rte_typ(N) = RTE_MCTRAN, interpret the corresponding mc_ri(N) as a noc. The range of mc_ri(N) must be from 1 - AVNOCMAX(). If the noc is non-zero, verify that a tuple exists in RLnoccode with this noc as key.

# ARSEGSIG

## 1. Description

This relation contains the pause position and length for use in ARS segmented signaling. This information is required only for the MC route indices of ARS cut-through routes to PBXs. Tuples are required for all mc_ri's that have the segsig bit in RLrt_mcrt set to DBYES.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 128 |
| expected tuples in relation | 1 |

## 4. Population Rules for RLarsegsig

**Relation Description:** ARS segmented signaling.

Relation containing pause position and length for use in ARS segmented signaling. This information is required only for MC route indices of ARS cut-through routes to PBXs. Tuples are required for all mc_ri's that have the segsig bit in RLrt_mcrt set to DBYES.

**Attribute: mc_ri**

**Fullname:** route index for MFC routing

**Attribute Description:** Requires a tuple in RLrt_mcrt with this mc_ri as a key and RLrt_mcrt.segsig = DBYES.

**Attribute: ar_gpid**

**Fullname:** ARS group id

**Attribute Description:** ARS group id.

**Attribute: pause[*]**

**Fullname:** pause length in seconds between digits in digit string specified by position

**Attribute Description:** At least one pause length > 0 seconds must be specified. There can be up to four pauses in a digit string. Each pause must have a corresponding position. If the corresponding position value is 0, then the pause length specified must also be 0. Pause lengths of 0, the default value, mean there is no pause.

**Attribute: positn[*]**

**Fullname:** position of pause within digit string.

**Attribute Description:** At least one position must be specified. There can be up to four positions in the digit string before which a pause may be placed. For each position there must be a corresponding pause specified. The position values must be unique and entered in ascending order, except for 0 which can be used in positn1 through positn4. If the postion value is 0, the corresponding pause length must also be 0. A position value of 0 means there are no more pauses in the digit string.

## 4. Population Rules for RLartcm

Copyright © 1999 Lucent Technologies

**Relation Description:** Auto Route Selection Traveling Class Mark (TCM).

Conversion table for TCMs

**Attribute: ar_gpid**

**Fullname:** Auto Route Selection group ID

**Attribute Description:** Auto Route Selection group ID

**Attribute: tcmone[*]**

**Fullname:** One-digit Traveling Class Mark (TCM)

**Attribute Description:** 1-digit TCMs converted from 2-digit TCMs. tcmone0 contains the value of the 1-digit TCM corresponding to the 2 digit *5ESS*®-2000 switch TCM of 00..... tcmone16 contains the value of the 1 digit TCM corresponding to the 2 digit *5ESS*®-2000 switch TCM of 16. tcmone0 <= tcmone1 <= ... tcmone15 <= tcmone16. A 2-digit TCM of 0 will always be converted to a 1-digit TCM of 0. This is due to the fact that tcmtwo0 contains the value of the largest 2-digit TCM corresponding to the 1-digit TCM of 0.

```
If tcmtwo0 = 0, then tcmone0 = 0 and tcmone1 > 0.
If tcmtwo0 = 1, then tcmone0 = 0, tcmone1 = 0 and tcmone2 > 0.
By definition tcmone0 will always have a value of 0.
```

**Attribute: tcmtwo[*]**

**Fullname:** Two-digit TCM

**Attribute Description:** 2-digit TCMs converted from 1-digit TCMs tcmtwo0 contains the value of the largest 2-digit TCM which should correspond to the 1-digit TCM of 0. tcmtwo7 contains the value of the largest 2-digit TCM which should correspond to the 1-digit TCM of 7. These values will be ascending and unique.

For Example:

```
                    5ESS-2000 SWITCH
          TRAVELING CLASS MARKS (CONVERSION FROM 1-DIGIT)

          *1. ARGPNAME  ________      2. MBDN no display

          LIST OF 2-DIGIT CONVERTED VALUES (TCMLIST)

                 ROW      TCM              TCM
                  1  TCM0  5          TCM4  10
                  2  TCM1  6          TCM5  11
                  3  TCM2  8          TCM6  12
                  4  TCM3  9          TCM7  16_
```

```
The TCMs populated on this view must be ascending and unique.
The relation, RLartcm, would be populated as shown here:

1-digit converted to 2-digit   2-digit converted to 1-digit
                                          tcmone0 = 0;
        tcmtwo0 = 5;                      tcmone1 =  0;
        tcmtwo1 = 6;                      tcmone2 =  0;
        tcmtwo2 = 8;                      tcmone3 =  0;
```

**Copyright © 1999 Lucent Technologies** 

```
tcmtwo3 = 9;
tcmtwo4 = 10;
tcmtwo5 = 11;
tcmtwo6 = 12;
tcmtwo7 = 16.
```

```
tcmone4 =  0;
tcmone5 =  0;
tcmone6 =  1;
tcmone7 =  2;
tcmone8 =  2;
tcmone9 =  3;
tcmone10 = 4;
tcmone11 = 5;
tcmone12 = 6;
tcmone13 = 7;
tcmone14 = 7;
tcmone15 = 7;
tcmone16 = 7.
```

The conversion from 1-digit TCMs to 2-digit TCMs will be done internally (that is no screen exists to populate the values for this conversion).

## 4. Population Rules for RLartm

**Relation Description:** Automatic Route selection Template.

This relation is the template for Automatic Route Selection (ARS) constructed features.

ARS Preconstructed Feature Definitions

| attrib. | /AR* | /ARCD | /ARGD | /ARC | /ARA | /ARAD | /ARADTCM | /ARADCCS |
|---|---|---|---|---|---|---|---|---|

/ARADTCM     Use Code Deluxe ARS with TCM
/ARADCCS     Use Code Deluxe ARS with CCSA Limit"
```

**Attribute: feat_id**

**Fullname:** Feature Identifier

**Attribute Description:** This attribute is the key to this relation, and is the ARS feature identifier.

**Attribute: entry_pt**

**Fullname:** Entry Points

**Attribute Description:** This attribute identifies which entry methods are accepted by the given ARS constructed feature.

**Attribute: fltrerr**

**Fullname:** Filter Error

**Attribute Description:** This attribute indicates the error treatment to be given when it is determined that the dialed code is inappropriate for ARS.

**Attribute: frl_err**

**Fullname:** Facility Restriction Level Error

**Attribute Description:** This attribute indicates the error treatment given when it is determined that a line has insufficient FRL to use a given facility.

**Attribute: frl_typ**

**Fullname:** Facility Restriction Level Type

**Attribute Description:** This attribute indicates the calling privileges associated with a line.

**Attribute: actvn**

**Fullname:** Activation

**Attribute Description:** This attribute specifies the types of constructed feature activation allowed for this feature.

**Attribute: dctvn**

**Fullname:** Deactivation

**Attribute Description:** This attribute specifies the types of deactivation allowed for this feature.

**Attribute: gactvn**

**Fullname:** Group Activation

**Attribute Description:** This attribute specifies the type of group activation for this feature.

**Attribute: gdctvn**

**Fullname:** Group Deactivation

**Attribute Description:** This attribute specifies the type of group deactivation for this feature.

Copyright © 1999 Lucent Technologies 

**Attribute: chgapg**

**Fullname:** Change Active Pattern Group

**Attribute Description:** This attribute indicates whether or not the active pattern group number changes are permitted by customer via dial-code.

**Attribute: chgerwt**

**Fullname:** Change Expense Warning Tone

**Attribute Description:** This attribute indicates whether or not expense warning tone changes are permitted by customer via dial-code.

**Attribute: chgaltfrl**

**Fullname:** Change Alternate FRL

**Attribute Description:** This attribute indicates whether or not activation/deactivation of the alternate FRL table is permitted by customer via dialed-code or time-of-day.

**Attribute: tcmin**

**Fullname:** Traveling Class Marks In

**Attribute Description:** This attribute indicates whether or not an incoming PRSN trunk is expecting to receive a 1- or 2-digit TCM. This attribute is used only for trunks.

**Attribute: tcmout**

**Fullname:** Traveling Class Marks Out

**Attribute Description:** This attribute indicates whether or not an outgoing PRSN trunk is expecting to send a 1- or 2-digit TCM. This attribute is used only for trunks.

```
If deftcm = 0 thru 7, then tcmout = 1 or 2.
If deftcm = 8 thru 16, then tcmout = 2.
If deftcm = 31, then tcmout = 0.
```

**Attribute: alw_mdr**

**Fullname:** Allow MDR

**Attribute Description:** This attribute indicates if this port requires MDR to revenue accounting office. For call types AMCCSASAMP, AMETSMDR, and AMETSCCSA only.

**Attribute: ars_tone**

**Fullname:** ARS Tone

**Attribute Description:** This attribute indicates the tone type chosen by the customer.

TN_NONE = 900ms. TNBEEP1 = 440HZ tone.

**Attribute: frl_line**

**Fullname:** Facility Restriction Level for Line

**Attribute Description:** This attribute indicates the FRL for line: this value is used to compare the frl_grp in RLrt_mcrt. The valid range of frl is 0 - 16, ARFRL_NONUSE(31) is used as an internal default to indicate the FRL was not populated

**Attribute: tcmopt**

**Fullname:** Traveling Class Marks On Private

Copyright © 1999 Lucent Technologies 

**Attribute Description:** This attributer indicates whether or not the private switching network customer wants traveling class marks (indication of a station's facility restriction level) passed between private network nodes.

**Attribute: ccsa**

**Fullname:** CCSA

**Attribute Description:** This attribute indicates whether CCSA limits apply to this constructed feature. If CCSA limits apply, they will only be used on calls using dialing plan 1.

**Attribute: ars_si**

**Fullname:** ARS Screening Index

**Attribute Description:** This attribute contains the ARS screening index.

**Attribute: use_alt_frl**

**Fullname:** Use Alternate FRL

**Attribute Description:** This attribute indicates if this port requires alternate FRL table treatment.

**Attribute: q_alwd**

**Fullname:** Queueing Allowed

**Attribute Description:** This attribute indicates whether or not modular queueing for outgoing private facilities is allowed.

**Attribute: qpriority**

**Fullname:** Queueing Priority

**Attribute Description:** This attribute indicates whether or not this line is a priority line for modular queueing for private facilities.

**Attribute: ars_bill**

**Fullname:** ARS Billing

**Attribute Description:** This attribute is a Boolean structure indicating the combination of several types of billing.

**Attribute: ars_bill.flat**

**Fullname:** Flat Rate Billing

**Attribute Description:** This sub-attribute indicates whether or not billing is done on a flat rate: that is, a flat rate means that there are no usage sensitive charges.

**Attribute: ars_bill.usefreq1**

**Fullname:** Usage Frequency charge for use of event 1

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 1.

**Attribute: ars_bill.usefreq2**

**Fullname:** Usage Frequency charge for use of event 2

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 2.

Copyright © 1999 Lucent Technologies 

**Attribute: ars_bill.usefreq3**

**Fullname:** Usage Frequency charge for use of event 3

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 3.

**Attribute: ars_bill.usefreq4**

**Fullname:** Usage Frequency charge for use of event 4

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage frequency charges for use of event 4.

**Attribute: ars_bill.actchrg**

**Fullname:** Activation Charge

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage charges for activation.

**Attribute: ars_bill.dactchrg**

**Fullname:** Deactivation Charge

**Attribute Description:** This sub-attribute indicates whether or not billing is to include usage charges for deactivation.

**Attribute: ars_bill.duration**

**Fullname:** Duration Charge

**Attribute Description:** This sub-attribute indicates whether or not billing is to include duration charges.

**Attribute: ars_bill.change**

**Fullname:** Change Charge

**Attribute Description:** This sub-attribute indicates whether or not billing is to include charges for change.

**Attribute: ar_gpname**

**Fullname:** Auto Route Selection Group Name

**Attribute Description:** This attribute contains the ARS group name for voice.

**Attribute: ar_dtgpname**

**Fullname:** Auto Route Selection Data Group Name

**Attribute Description:** This attribute contains the ARS group name for data. An ar_dtgpname cannot exist unless an ar_gpname currently exists. Data ARS groups cannot be created without the existence of voice ARS groups.

**Attribute: priv_dn**

**Fullname:** Private Billing Number

**Attribute Description:** This attribute is a structure containing the private billing number for this port for MDR (customer location or revenue accounting office).

**Attribute: priv_dn.digcnt**

**Fullname:** Digit Count

Copyright © 1999 Lucent Technologies 

**Attribute Description:** This sub-attribute contains the count of digits in the private billing number.

**Attribute: priv_dn.dn**
**Fullname:** DN for Private Billing

**Attribute Description:** This sub-attribute contains the dn for the private billing number.

**Attribute: un_dpln**
**Fullname:** Uniform Numbering Dialing Plan

**Attribute Description:** This attribute indicates the UN dialing plan number. Each port which is given auto ARS treatment must specify the PNDP to be used.

**Attribute: deftcm**
**Fullname:** Default Traveling Class Mark

**Attribute Description:** This attribute indicates the default traveling class mark to be used for calls that require a TCM to be outpulsed and therefore need an FRL for conversion into a TCM, but that do not receive an FRL in the trunk termination message returned from the AM. The valid two digit TCM is 0 - 16, ARFRL_NONUSE(31) is used as an internal default to indicate the FRL is not populated.

**Attribute: rlt_frlind**
**Fullname:** Release Link Trunk Facility Restriction Level Indicator

**Attribute Description:** This attribute indicates if the original caller's FRL is to be used in place of the attendant's FRL in routing the call and in the MDR record.

**Attribute: rlt_amaind**
**Fullname:** Release Link Trunk Automatic Message Accounting Indicator

**Attribute Description:** This attribute indicates whether the original caller's data is to be used in place of the attendant's data in the AMA record.

**Attribute: voice_ete**
**Fullname:** Options of End to End Q.931 Connectivity for Voice Call

**Attribute Description:** End to end voice call Q.931 connectivity options:

ETEDONTCARE Don't care if there us a ORI trunk available or not.

ETEPREFER PRI trunk is preferred to route a call. If there is no PRI trunk available, routing will use whatever trunk available.

ETEREQUIRE PRI trunk is required to route a call. If no PRI trunk exists, clearing procedure will be initiated.

**Attribute: data_ete**
**Fullname:** Options of End to End Q.931 Connectivity for Data Call

**Attribute Description:** End to end data call Q.931 connectivity options:

ETEDONTCARE Don't care if there us a ORI trunk available or not.

ETEPREFER PRI trunk is preferred to route a call. If there is no PRI trunk available, routing will

Copyright © 1999 Lucent Technologies 

use whatever trunk available.

ETEREQUIRE PRI trunk is required to route a call. If no PRI trunk exists, clearing procedure will be initiated.

Advanced Service Interface Constructed Feature

Construct the Advanced Service Interface (ASI) feature. The following is a list of valid service class for ports assigned this feature:

```
LINES
-----
FC_INDVDL
```

ASI cannot be assigned to trunks.

**Attribute: feat_id**

**Fullname:** Feature ID

**Attribute Description:** Advanced Service Interface feature identification This feature ID must be used with modular feature type MFASI Every feature ID should have a tuple in RLasi_opts with the same values in im_asgn and ex_asgn.

**Attribute: im_asgn**

**Fullname:** Implicit Mode Assigned

**Attribute Description:** Indicate if ASI feature includes the implicit mode.

**Attribute: ex_asgn**

**Fullname:** Explicit Mode Assigned

**Attribute Description:** Indicate if ASI feature includes the explicit mode.

**Attribute: spare1**

**Fullname:** Spare1

**Attribute Description:** Reserved for future use. Legal value set to the default.

**Attribute: spare2**

**Fullname:** Spare2

**Attribute Description:** Reserved for future use. Legal value set to the default.

## 4. Population Rules for RLasi_gp

**Relation Description:** Advanced Service Interface Access Group.

Associates an Advanced Service Interface group to its trunk and signaling characteristics.

**Attribute: grp_id**

**Fullname:** Advanced Service Interface Group ID

**Attribute Description:** Advanced Service Interface Group to which this line belongs.

**Attribute: dial_code**

**Fullname:** Dialed Access Code Digits

**Attribute Description:** Dialed access code digits - a string of up to 5 digits.

**Attribute: sig_t**

**Fullname:** Signal Timing

**Attribute Description:** Signal conversion release timing.

**Attribute: acc_dn**

**Fullname:** Access Directory Number

**Attribute Description:** Access directory number to the intelligent peripheral (IP).

**Attribute: acc_dn.digcnt**

**Fullname:** Access Directory Number digit count

**Attribute Description:** Count of digits in the access directory number. Legal value has been set to the default for unused attributes.

**Attribute: acc_dn.dn**

**Fullname:** Access Directory Number

**Attribute Description:** Actual digits of a access directory number. Legal value has been set to the

Copyright © 1999 Lucent Technologies 

default for unused attributes.

**Attribute: dest_x**

**Fullname:** Destination index

**Attribute Description:** Spare destination index. Legal value has been set to the default for unused attributes.

**Attribute: route_x**

**Fullname:** Route Index

**Attribute Description:** Route index used to route the call.

**Attribute: usecnt**

**Fullname:** Usage count

**Attribute Description:** This is a count of the number of RLasi_port tuples that are using the same ASI group id and service code. It is needed so that RC can determine when an ASI group is in use by lines or BFGs. (ASI groups are created and deleted on RC/V 4.61). RLasi_gp tuples cannot be deleted if there are lines or BFGs assigned to the ASI group. This count is only incremented for the lines (RLasi_port) with a valid service code.

**Attribute: charge_x**

**Fullname:** Charge Index

**Attribute Description:** Charge index. Legal value has been set to the default for unused attributes.

**Attribute: dest2_x**

**Fullname:** Second Destination Index

**Attribute Description:** Spare destination index. Legal value has been set to the default for unused attributes.

**Attribute: route2_x**

**Fullname:** Second Route Index

**Attribute Description:** Spare Route index used to route the call. Legal value has been set to the default for unused attributes.

**Attribute: charge2_x**

**Fullname:** Second Charge Index

**Attribute Description:** Spare Charge index. Legal value has been set to the default for unused attributes.

**Attribute: sig_conv**

**Fullname:** Signal Conversion

**Attribute Description:** Signal conversion may be needed on this route.

**Attribute: mea**

**Fullname:** Modified Explicit Access

**Attribute Description:** Indicates whether signal conversion on an extended leg by an IP or user dialed call is allowed.

Copyright © 1999 Lucent Technologies 

**Attribute: spare1**

**Fullname:** Spare1

**Attribute Description:** Reserved for future use. Legal value has been set to the default for unused attributes.

**Attribute: spare2**

**Fullname:** Spare2

**Attribute Description:** Reserved for future use. Legal value has been set to the default for unused attributes.

## 4. Population Rules for RLasi_opts

**Relation Description:** Advanced service interface (ASI) options.

ASI feature definition's options and defaults. The following population rules apply to each of the attributes using DMbcd5_6 domain:

```
      serv_code, ra_code, remr_code,
      spare1_code, and spare2._code
ODA:
      The length of an attribute of this
      I/O type does not imply the number
      of digits that can be stored in it.
RECENT CHANGE:
      The algorithm used to determine the
      number of digits storable in the attribute
      can be found in hdr/db/DBbcdmacs.h.
```

The domain DMbcd5_6 supports up to six binary coded decimal (BCD) digits plus a count of the actual number of digits stored. The ASI feature uses codes where the number of digits is between one and five. Number of digits = "\0" means no code exists. The digits are stored in BCD format, two per character (byte). The domain has three characters to represent up to six digits plus one character for the number of digits (the number of digits character is required by the I/O type). If the number of digits is < 6, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The 'number of digits' character always contains the number of digits. The digits are stored in the attribute starting with D1.

```
Layout follows:
| byte 0  | byte 1  | byte 2  | byte 3  |
-----------------------------------------
|    |    |    |    |    |    |         |
| D1 | D2 | D3 | D4 | D5 | D6 | no. dig |
|    |    |    |    |    |    |         |
-----------------------------------------
```

**Attribute: feat_id**

**Attribute Description:** Implicit mode service code digits.

**Attribute: remr_code**

**Fullname:** Remote access reconnect code

**Attribute Description:** Remote access reconnect code digits.

**Attribute: ra_code**

**Fullname:** Remote access code

**Attribute Description:** Remote access code digits.

**Attribute: spare1_code**

**Fullname:** Spare1 access code

**Attribute Description:** Spare access code digits for future use. Legal value set to the default.

**Attribute: spare2_code**

**Fullname:** Spare2 access code

**Attribute Description:** Spare access code digits for future use. Legal value set to the default.

**Attribute: sid**

**Fullname:** ASI subscriber identification

**Attribute Description:** Identify subscriber to intelligent peripheral (IP). The subscriber ID is a number of one to ten digits If the number of digits equals zero, then no ID has been associated with the feature. The digits are stored in BCD, two per character (byte). The domain has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is less than ten, the null character (which becomes same as digit '0' in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

| byte 0 | byte 1 | byte 2 | byte 3 | byte 4 | byte 5 |
|---|---|---|---|---|---|
| D1 | D2 | D3 | D4 | D5 | D6 | D7 | D8 | D9 | D10 | no. dig |

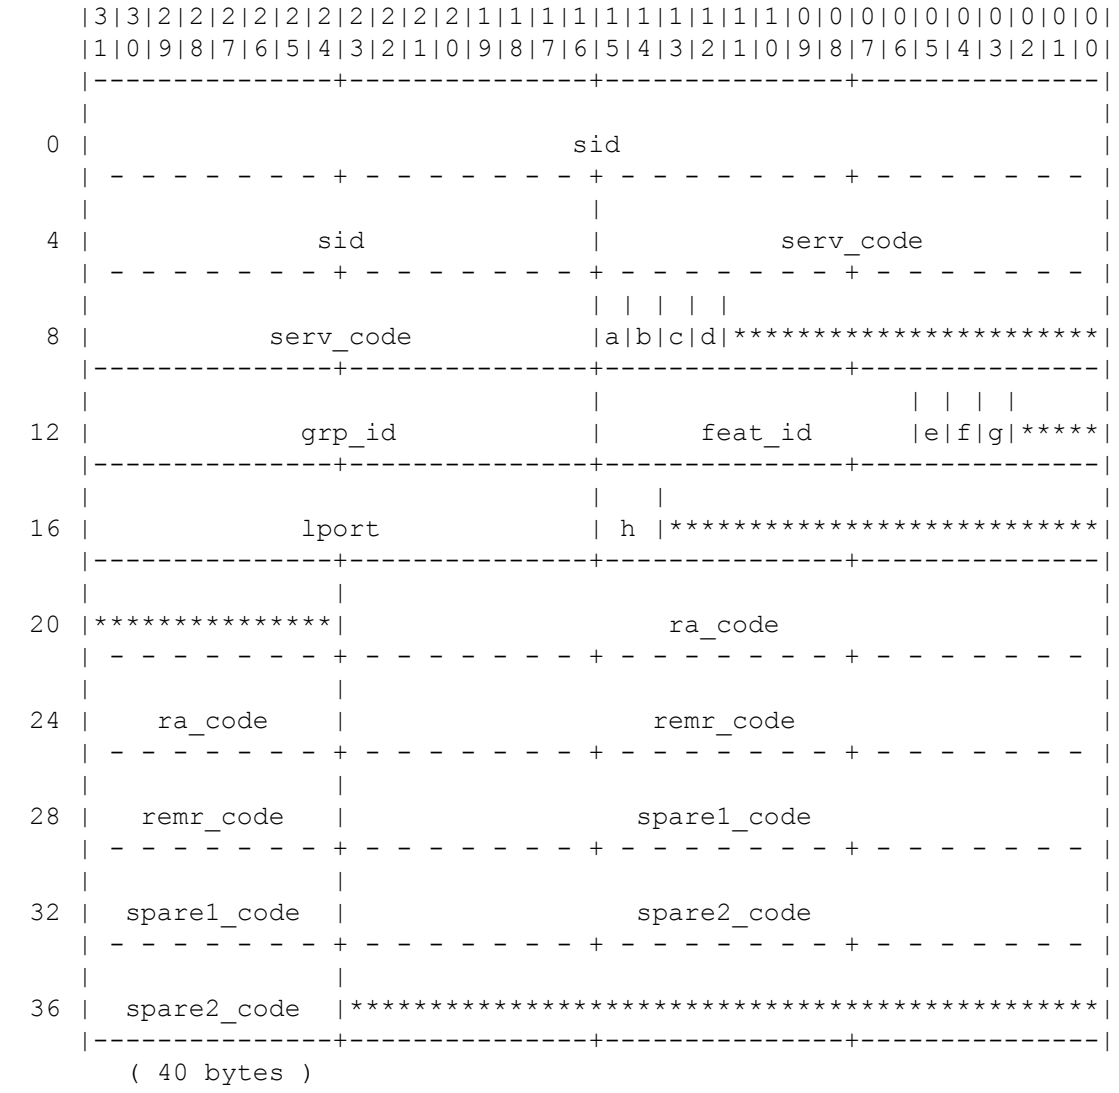
User, Compacted and Stored Tuple Layout ASI_PORT



( 40 bytes )

## 4. Population Rules for RLasi_port

### Relation Description

Advanced service interface (ASI) - proxy per port data.

ASI - proxy feature per-port data. This relation exists only for lines.

```
DISTRIBUTION:  group partitioned (if lpt_type = LPT_BFG) or
               switching module (SM) partitioned
```

This relation has two types of tuples.

(1) The first type is the existing tuples which are SM partitioned and remain unchanged. They are keyed by

lpt_type == LPT_OTHER and lport.

(2) The second type is the business and residential customer service (BRCS) feature group (BFG) group partitioned tuple, commonly referred to as a 'pseudo port' tuple, associated with features in a BFG. The lpt_type = LPT_BFG, and the bfgid populated in the lport field.

RLasi_port is an 'EITHER' type; therefore, both types of tuples may exist in this relation.

The following population rules applies to each of the attributes using DMbcd5_6 domain:

serv_code, ra_code, remr_code, spare1_code, and spare2._code

Office data administration (ODA):

The length of a structure of this I/O type does not imply the number of digits that can be stored in it.

Recent change:

The algorithm used to determine the number of digits storable in the structure can be found in hdr/db/DBbcdmacs.h

The domain DMbcd5_6 supports up to six BCD digits plus a count of the actual number of digits stored. The ASI feature uses a codes with a maximum of five digits ( 1 <= no. digits <= 5)). Number of digits = "\0" means no code exists.

The digits are stored in BCD format, two per character (byte). The domain has three characters to represent up to six digits plus one character for the number of digits (the number of digits character is required by the I/O type). If the number of digits is < 6, the null character (which becomes the same as digit 0 in BCD) is used to fill the remaining digits. The 'number of digits' character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

```
| byte 0  | byte 1  | byte 2  | byte 3  |
-----------------------------------------
|    |    |    |    |    |    |         |
| D1 | D2 | D3 | D4 | D5 | D6 | no. dig |
|    |    |    |    |    |    |         |
-----------------------------------------
```

**Attribute: lport**

**Fullname:** Logical port

**Attribute Description:** Logical port of the user being assigned the BRCS features.

```
If lpt_type == LPT_OTHER, RLasi_port.lport must equal
RLfc_line.lport.  The keys for RLfc_line are:
RLfc_line.port = RLlpt_pt(RLasi_port.lport,RLasi_port.lpt_type).port
RLfc_line.party =
                RLlpt_pt(RLasi_port.lport,RLasi_port.lpt_type).party

If lpt_type = LPT_BFG, then
RLasi_port.lport contains a BFG group ID.
```

If lpt_type == LPT_OTHER, there must be a tuple in RLfc_porttyp keyed by the RLlpt_pt(lport,lpt_type).port. If lpt_type = LPT_BFG, there must be a tuple in RLbfgmatch keyed by

**Copyright © 1999 Lucent Technologies** 

the bfgid contained in RLasi_port.lport. Verify the existence of a tuple in RLfc_line and a tuple in RLfc_porttyp for the RLlpt_pt(lport,lpt_type).port, and a tuple in RLtrmfeats keyed by the lport.

**Attribute: lpt_type**

**Fullname:** Logical port type

**Attribute Description:** Logical port type of the user.

**Attribute: feat_id**

**Fullname:** Feature ID

**Attribute Description:** Advanced service interface feature ID.

**Attribute: grp_id**

**Fullname:** Advanced service interface group ID.

**Attribute Description:** Advanced service interface group to which this line belongs.

**Attribute: serv_code**

**Fullname:** Service code

**Attribute Description:** Implicit mode service code digits.

**Attribute: remr_code**

**Fullname:** Remote access reconnect code

**Attribute Description:** Remote access reconnect code digits.

**Attribute: ra_code**

**Fullname:** Remote access code

**Attribute Description:** Remote access code digits.

**Attribute: spare1_code**

**Fullname:** Spare1 access code

**Attribute Description:** Spare access code digits for future use.

**Attribute: spare2_code**

**Fullname:** Spare2 access code

**Attribute Description:** Spare access code digits for future use.

**Attribute: sid**

**Fullname:** Advanced service interface subscriber identification

**Attribute Description:** Identify subscriber to intelligent peripheral (IP). If the sid attribute was not entered from recent change (RC), then the sid attribute digits will be set to null and the number of digits to zero. The sid attribute is a number of up to 10 digits where the number of digits = ( 1 <= no. digits <= 10). If the number of digits = 0, this means the subscriber ID is not present. The digits are stored in BCD, two per character (byte). The domain used for the sid attribute has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is less than 10, the null character (which becomes the same as digit 0 in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

```
byte 0  | byte 1  | byte 2  | byte 3  | byte 4  | byte 5  |
-------------------------------------------------------------
   |     |     |     |     |     |     |     |     |         |
D1 | D2  | D3  | D4  | D5  | D6  | D7  | D8  | D9  |D10  | no. dig.|
   |     |     |     |     |     |     |     |     |         |
-------------------------------------------------------------
```

**Attribute: ra**

**Fullname:** ASI remote access billing option

**Attribute Description:** Permit AMA billing for calls to the IP which went through the remote access front end process.

**Attribute: ip_dial_bill**

**Fullname:** IP dialed billing option

**Attribute Description:** Permit all IP dialed calls to generate an automatic message accounting (AMA) billing record

**Attribute: ex_bill**

**Fullname:** Explicit billing

**Attribute Description:** Permit AMA billing for explicit access to the IP

**Attribute: spare1**

**Fullname:** Spare1

**Attribute Description:** Reserved for future use. Legal value has been set to the default.

**Attribute: spare2**

**Fullname:** Spare2

**Attribute Description:** Reserved for future use. Legal value has been set to the default.

**Attribute: spare3**

**Fullname:** Spare3

**Attribute Description:** Reserved for future use. Legal value has been set to the default.

**Attribute: spare4**

**Fullname:** Spare4

**Attribute Description:** Reserved for future use. Legal value has been set to the default.

## 4. Population rules for RLasp_ltm

### Relation Description

Advanced Services Platform logical termination ports.

This relation is used for logical termination ports which subscribe to Advanced Services Platform (ASP) terminating feature(s).

Copyright © 1999 Lucent Technologies

This is a corcable relation.

**Attribute:**
lead_module
**Fullname:**
Lead module
**Attribute Description:**
Lead module

**Attribute:**
ltm_type
**Fullname:**
Logical termination type
**Attribute Description:**
Logical termination index type

**Attribute:**
ltm_idx
**Fullname:**
Logical termination index
**Attribute Description:**
Logical termination index

**Attribute:**
feat_id
**Fullname:**
Feature ID
**Attribute Description:**
Advanced Services Platform feature ID.

**Attribute:**
tat_act
**Fullname:**
Terminating Attempt Trigger Activation
**Attribute Description:**
Trigger activation status for TAT. This is a corcable attribute.

**Attribute:**
tat_trig
**Fullname:**
Terminating Attempt Trigger
**Attribute Description:**
Trigger number for TAT.

**Attribute:**
tat_rout

Copyright © 1999 Lucent Technologies 

**Fullname:**
Terminating Attempt Trigger (TAT) Default Routing Flag
**Attribute Description:**
Specifies whether or not the call should be default routed to the TAT DN in case of a failure.

Only if an error occurs while communicating with the Service Control Point (SCP), not after the transaction is closed, and this attribute is set to DBYES, call processing will route the call to the port on which the TAT is assigned.

If Default Routing is not in effect (DBNO), the standard error treatment of reorder or announcement will be given when an error condition is encountered.

This attribute is used by the ASP Default Routing for TATs Special Feature (SFID 136). It cannot be equal to DBYES unless the feature has been purchased (SFID 136 is set) for the office.

**Attribute:**
ia_sim_act
**Fullname:**
Intra-office simultaneous active
**Attribute Description:**
Intra-office maximum number of simultaneously active forwarded calls.

**Attribute:**
ir_sim_act
**Fullname:**
Inter-office simultaneous active
**Attribute Description:**
Inter-office maximum number of simultaneously active forwarded calls.

**Attribute:**
ffcf1
**Fullname:**
Unsigned 8 reserved for future special features
**Attribute Description:**
Not assigned yet

**Attribute:**
ffcf2
**Fullname:**
Boolean reserved for future special features
**Attribute Description:**

**Attribute:**
t_bltrig_act
**Fullname:**
Terminating Busy Line Trigger Activation
**Attribute Description:**
Trigger activation status for Terminating Busy Line Trigger.
This is a corcable attribute.

**Attribute:**
t_bltrig
**Fullname:**
Terminating Busy Line Trigger
**Attribute Description:**
Trigger number for Terminating Busy Line trigger.

**Attribute:**
t_natrig_act
**Fullname:**
Terminating No Answer Trigger Activation
**Attribute Description:**
Trigger activation status for Terminating No Answer Trigger.
This is a corcable attribute.

**Attribute:**
t_natrig
**Fullname:**
Terminating No Answer Trigger
**Attribute Description:**
Trigger number for Terminating No Answer trigger.

Copyright © 1999 Lucent Technologies 

**Attribute:**
t_natrig_timer
**Fullname:**
Terminating No Answer Trigger Timer
**Attribute Description:**
This attribute specifies the value for the Terminating No Answer trigger timer.

**Defines:**
"db/DMservalw.h"

### Relation Description

Advanced services platform options

Advanced service platform originating feature.

**Attribute:**
feat_id
**Fullname:**
Feature ID
**Attribute Description:**
Advanced services platform feature ID.

**Attribute:**
ohi_act
**Fullname:**
Off hook immediate (OHI) activation
**Attribute Description:**
Trigger activation status for OHI.

**Attribute:**
ohi_trig
**Fullname:**
Off hook immediate trigger
**Attribute Description:**
Trigger number for OHI.

**Attribute:**
ohd_act
**Fullname:**
Off hook delay (OHD) activation
**Attribute Description:**
Trigger activation status for OHD

**Attribute:**
ohd_trig
**Fullname:**
Off hook delay trigger
**Attribute Description:**
Trigger number for OHD.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ohd_dflt_rte
**Fullname:**
Off Hook Delay Default Routing Indicator
**Attribute Description:**
Default routing indicator for OHD trigger.

**Attribute:**
fcd_act
**Fullname:**
Feature code dialing plan activation
**Attribute Description:**
Trigger activation status for public office dialing plan feature code (POPD FC).

**Attribute:**
fcd_alw
**Fullname:**
Feature code dialing plan allow
**Attribute Description:**
Permission flag for POPD FC.

**Attribute:**
cdp_act
**Fullname:**
Customized dialing plan (CDP) activation
**Attribute Description:**
Trigger activation status for CDP.

**Attribute:**
cdp_alw
**Fullname:**
Customized dialing plan allow
**Attribute Description:**
Permission flag for CPD.

**Attribute:**
fai_act
**Fullname:**
Feature activation indicator (FAI) activation
**Attribute Description:**
Trigger activation status for FAI.

**Attribute:**
fai_alw
**Fullname:**
Feature activation indicator allowed

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Permission flag for FAI.

**Attribute:**
o_bltrig_act
**Fullname:**
Originating Busy Line Trigger Activation
**Attribute Description:**
Activation status for Originating Busy Line Trigger.

**Attribute:**
o_bltrig
**Fullname:**
Originating Busy Line Trigger
**Attribute Description:**
Trigger number used for Originating Busy Line.

**Attribute:**
o_natrig_act
**Fullname:**
Originating No Answer Trigger Activation
**Attribute Description:**
Activation status for Originating No Answer Trigger.

**Attribute:**
o_natrig
**Fullname:**
Originating No Answer Trigger
**Attribute Description:**
Trigger number used for Origination No Answer.

**Attribute:**
o_natrig_timer
**Fullname:**
Originating No Answer Trigger Timer
**Attribute Description:**
Timer used for an Originating No Answer Trigger.

**Attribute:**
ffcf1

### Relation Description

Advanced Services Platform Options

This relation is used to define the Advanced Services Platform (ASP) terminating feature(s).

**Attribute:**
feat_id
**Fullname:**
Feature ID
**Attribute Description:**
Advanced Services Platform feature ID.

**Attribute:**
tat_act
**Fullname:**
Terminating Attempt Trigger Activation
**Attribute Description:**
Trigger activation status for TAT.

**Attribute:**
tat_trig
**Fullname:**
Terminating Attempt Trigger
**Attribute Description:**
Trigger number for TAT.

**Attribute:**
tat_rout
**Fullname:**
Terminating Attempt Trigger (TAT) Default Routing Flag
**Attribute Description:**
Specifies whether or not the call should be default routed to the TAT DN in case of a failure.

Only if an error occurs while communicating with the Service Control Point (SCP), not after the transaction is closed, and this attribute is set to DBYES, call processing will route the call to the port on which the TAT is assigned.

If Default Routing is not in effect (DBNO), the standard error treatment of reorder or announcement will be given when an error condition is encountered.

This attribute is used by the ASP Default Routing for TATs Special Feature (SFID 136). It cannot be equal to DBYES unless the feature has been purchased (SFID 136 is

set) for the office.

**Attribute:**
ia_sim_act
**Fullname:**
Intra-office simultaneous active
**Attribute Description:**
Intra-office maximum number of simultaneously active forwarded calls.

**Attribute:**
ir_sim_act
**Fullname:**
Inter-office simultaneous active
**Attribute Description:**
Inter-office maximum number of simultaneously active forwarded calls.

**Attribute:**
t_bltrig_act
**Fullname:**
Terminating Busy Line Trigger Activation
**Attribute Description:**
Trigger activation status for T_Busy trigger.
This is a corcable attribute.

**Attribute:**
t_bltrig
**Fullname:**
Trigger number for T_Busy trigger
**Attribute Description:**
Trigger number for Terminating Busy Trigger

**Attribute:**
t_natrig_act
**Fullname:**
Terminating No Answer Trigger Activation
**Attribute Description:**
Trigger activation status for Terminating No Answer Trigger.
This is a corcable attribute.

**Attribute:**
t_natrig
**Fullname:**
Trigger Number for T_NoAnswer trigger
**Attribute Description:**
Trigger number for Terminating No Answer Trigger

Copyright © 1999 Lucent Technologies 

**Attribute:**
t_natrig_timer
**Fullname:**
Terminating No Answer trigger Timer
**Attribute Description:**
This attribute specifies the value for the Terminating No Answer trigger timer.
**Attribute:**
ffcf1

## 4. Population Rules for RLat_cf

Copyright © 1999 Lucent Technologies

**Relation Description:** Attendant control constructed features.

Defines the attendant control constructed feature relation The following is a list of valid service classes for ports assigned this feature:

```
LINES
-----
FC_INDVDL
FC_ISDN
FC_ISATND
FC_4WIRE_INDV
```

**Attribute: fid**

**Fullname:** feature ID - for modular feature type MFACTR

**Attribute Description:** This fid must be used with modular feature type MFACTR to obtain a 16 bit feature ID.

Verify that RLfacname has a tuple such that modular feature type MFACTR + fid = RLfacname.facid and

RLfacname.class = FACBRCS and

RLfacname.subclass = SCL_FEAT for that tuple.

**Attribute: controller**

**Fullname:** feature user - orig/term

**Attribute Description:** This attribute is DM_AT_ORIG only if the service class is FC_ISATND. DM_AT_TERM is never assigned to service class FC_ISATND.

**Attribute: actvn**

**Fullname:** activaton type

**Attribute Description:** Indicates method of activating MCC features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. The allowed options are as shown in the following layout:

```
Combination Act/Deact      Activation  Deactivation
1. Always active           ACTNONE     DCTNONE
2. Customer selected       ACTCD       DCTCD
   activation/deactivation
3. Customer selected       ACTCD       DCTAUTO
   activation/deactivation
   for one call only

Range of values: enumerated types ACTCD and ACTNONE
   Default: ACTNONE.
   Dependencies:
   Enum. value        Dependency
           *** ODA ONLY WARNING ***
           *** (NOT SUPPORTED BY RC) ***
   ACTCD       1) Verify the existence of a tuple in
   (activation    relation RLdaprlfnl or RLidp_dtre
   by dial code)  with 'action' set to ACN_FTACT and
```

**Copyright © 1999 Lucent Technologies** 

```
                        RLdaprlfnl.feat_id or RLidp_dtre.feat_id
                        has modular feature type MFACTR
                    2) RLat_cf.dctvn = DCTCD or DCTAUTO
    ACTNONE         1) RLat_cf.dctvn = DCTNONE
```

**Attribute: dctvn**

**Fullname:** de-activation type

**Attribute Description:** Indicates method of activating MCC features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. The allowed options are as shown in the following layout:

```
Combination Act/Deact       Activation  Deactivation
    1. Always active        ACTNONE     DCTNONE
    2. Customer selected    ACTCD       DCTCD
activation/deactivation
    3. Customer selected    ACTCD       DCTAUTO
activation/deactivation
for one call only

Range of values: enumerated types DCTAUTO, DCTCD
                 and DCTNONE
Default: DCTNONE.
                  Dependencies:
Enum. value       Dependency
        *** ODA ONLY WARNING ***
        *** (NOT SUPPORTED BY RC) ***
DCTAUTO      1) Verify the existence of a tuple in
(activation     relation RLdaprlfnl or RLidp_dtre
by dial code    with 'action' set to ACN_FTDCT
for 1 call)  2) RLat_cf.actvn = ACTCD
       *** ODA ONLY WARNING ***
       *** (NOT SUPPORTED BY RC) ***
  DCTCD      1) Verify the existence of a tuple in
(activation     relation RLdaprlfnl or RLidp_dtre
by dial code)   with 'action' set to ACN_FTDCT and
                RLdaprlfnl.feat_id or RLidp_dtre.feat_id
                has modular feature type MFACTR
             2) RLat_cf.actvn = ACTCD
DCTNONE      1) RLat_cf.actvn = ACTNONE
```

**Attribute: amac**

**Fullname:** AMA type

**Attribute Description:** AMA billing option always DBNO indicating flat rate billing.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLat_grp

**Relation Description**

Attendant Control Group

Defines the per group data associated with the Attendant Control Constructed Feature Relation

**Attribute: acvt_gpid**

**Fullname:** ACVT group ID for this ISAT group and restriction group

**Attribute Description:**

```
Verify that RLfacname has a tuple  such that
       acvt_gpid = RLfacname.facid
       RLfacname.class = FACACTR
       RLfacname.subclass = SCL_NULL
Each 'acvt_gpid' must have a unique 'isat_idx'
       and 'res_grp' combination.
```

**Attribute: isat_idx**

**Fullname:** ISDN attendant index

**Attribute Description:** There must be a tuple in RLRT_MHG with 'hunttype' RTH_ISAT such that the isat_idx attribute of that tuple equals this isat_idx.

**Attribute: res_grp**

**Fullname:** ACVT restriction group

**Attribute Description:** A number indicating which group the restricted DN belongs in.

**Attribute: acvt_res**

**Fullname:** ACVT restriction

**Attribute Description:** Condition under which calls are restricted ACVT Groups are not allowed to use the Direct Connect Restriction Levels, ODCTRES and ODCTNRES.

**Attribute: active**

**Fullname:** Active status

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Active status for an ACUT group.

**Attribute: err_treat**

**Fullname:** error treatment

**Attribute Description:** Type of error treatment to be applied when restriction is active.

**Attribute: err_r_idx**

**Fullname:** error announcement route index

**Attribute Description:** If 'err_r_idx' > 0, then there must be a tuple in RLrt_routing keyed with this err_r_idx and RLrt_routing.route_type = RTE_HUNT. If 'err_r_idx' is not 0, then the digit count for 'err_dn' must be 0.

**Attribute: err_dn**

**Fullname:** DN where station is sent if an error occurs

**Attribute Description:** The error DN is a number of up to 10 digits ( no. digits = (1 <= no. digits <= 10)). Number of digits = 0 means no error DN is present. The digits are stored in BCD, two per character (byte). The domain used for err_dn has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is < 10, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

```
byte 0  | byte 1  | byte 2  | byte 3  | byte 4  | byte 5 |
-------------------------------------------------------
   |     |     |     |     |     |     |     |     |     |
D1 | D2  | D3  | D4  | D5  | D6  | D7  | D8  | D9  |D10  |no. dig.|
   |     |     |     |     |     |     |     |     |     |
-------------------------------------------------------
Dependencies: If the no.dig. for 'err_dn' is not 0,
              then 'err_r_idx' must be 0.
```

## 4. Population Rules for RLat_id

Copyright © 1999 Lucent Technologies

**Relation Description**

Contains the Integrated Services Digital Network Attendant (ISAT) index

Contains the ISAT index and restriction group associated with a given FAC ID for the Attendant Control of Voice Terminals Constructed Feature. Distribution is GRP_PART with group type = GPDACVT. end relation;

**Attribute: isat_idx**

**Fullname:** Integrated Services Digital Network attendant index.

**Attribute Description:** Integrated services Digital Network attendant index. There must be a tuple in RLRT_MHG with hunttype RTH_ISAT such that the isat_idx.

**Attribute: res_grp**

**Fullname:** ACVT restriction group that station resides in.

**Attribute Description:** ACVT restriction group. A number indicating which group the restricted DN belongs in.

**Attribute: acvt_gpid**

**Fullname:** ACVT group ID for this ISAT group and restriction group.

**Attribute Description:** ACVT group ID for this ISAT group and restriction group.

## 4. Population Rules for RLat_opts

**Relation Description:** Attendant control constructed feature options.

Defines the feature options for the attendant control constructed feature. The following is a list of valid service classes for ports assigned this feature:

```
LINES
-----
FC_INDVDL
FC_ISDN
FC_ISATND
FC_4WIRE_INDV
PRE-CONSTRUCTED FEATURES
/ACVTO  - Attendant Control of Voice Terminals Originating
/ACVTT  - Attendant Control of Voice Terminals Terminating
/AT*    - Attendant Control Wildcard
-------------------------------------------------------
|  ATTRIBUTE    |            PRECONSTRUCTED             |
```

**Copyright © 1999 Lucent Technologies** 

| FIELD | FEATURES | | |
|---|---|---|---|
| 1. FEATURE | /ACVTO | /ACVTT | /AT* |
| 2. REMARKS | ACVT ORIGINATING feature. | ACVT TERMINATING feature. | Attendant Control Wildcard |
| | FEATURE OPTIONS | | |
| 3. CONTROL | ORIG | TERM | TERM |
| 4. AMAC | FLAT | FLAT | FLAT |
| 5. ACTYP | NONE | NONE | NONE |
| 6. DACTYP | NONE | NONE | NONE |
| DEFAULT PARAMETERS | | | |
| 7. ACVT GRP | BLANK | BLANK | BLANK |
| 8. RESTRICT | NONE | NONE | NONE |
| 9. ERR TYPE | TONE | TONE | TONE |
| 10. RTE IDX | BLANK | BLANK | BLANK |
| 11. ERR TN | BLANK | BLANK | BLANK |
| 12. ROW (1-63) | N | N | N |

The AMAC attribute is locked to DBNO, all other attributes are open.

**Attribute: fid**

**Fullname:** Feature ID

**Attribute Description:** Attendant Control constructed feature ID.

**Attribute: actvn**

**Fullname:** Activation Type

**Attribute Description:** Indicates method of activating MCC features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. The allowed options are as shown in the following layout:

| Combination Act/Deact | Activation | Deactivation |
|---|---|---|
| 1. Always active | ACTNONE | DCTNONE |
| 2. Customer selected activation/deactivation | ACTCD | DCTCD |
| 3. Customer selected activation/deactivation | ACTCD | DCTAUTO |

Copyright © 1999 Lucent Technologies 

```
   for one call only
The combination of activation=ACTCD and deactivation=
DCTAUTO is never assigned to a line with class of
service = FC_ISATND or FC_ISDN.
```

**Attribute: dctvn**

**Fullname:** De-activation Type

**Attribute Description:** Indicates method of activating MCC features. The two attributes (actions), activation and deactivation, together determine the customer options for the feature. The allowed options are as shown in the following layout:

```
Combination Act/Deact       Activation  Deactivation
 1. Always active            ACTNONE     DCTNONE
 2. Customer selected        ACTCD       DCTCD
    activation/deactivation
 3. Customer selected        ACTCD       DCTAUTO
    activation/deactivation
    for one call only
```

The combination of activation=ACTCD and deactivation= DCTAUTO is never assigned to a line with class of service = FC_ISATND or FC_ISDN

**Attribute: acvt_res**

**Fullname:** Attendant Control of Voice Terminal Restriction

**Attribute Description:** Condition under which calls are restricted. If a Direct Connect restriction level is being used, (ODCTRES or ODCTNRES) make sure the Secured Feature SFID012 has been purchased, the error type is RERTE and an Error DN is populated.

**Attribute: amac**

**Fullname:** AMA Billing Type

**Attribute Description:** AMA billing option.

**Attribute: controller**

**Fullname:** Controller of Restriction Feature

**Attribute Description:** Feature user - orig/term.

**Attribute: err_treat**

**Fullname:** Error Treatment Type

**Attribute Description:** Type of error treatment to be applied to restricted calls.

**Attribute: err_r_idx**

**Fullname:** Error Announcement Route Index

**Attribute Description:** Route Index to route restricted calls to. This is populated only if err_treat is ER_ANNC.

**Attribute: err_dn**

**Fullname:** Error DN

**Attribute Description:** DN to route restricted calls to (Can be up to 10 digits). This is populated only if err_treat is ER_RERTE. Default: No error DN, then 'no. dig.' = 0, and the digits will be set to

Copyright © 1999 Lucent Technologies 

null and the number of digits to zero. The error DN is a number of up to 10 digits ( no. digits = (1 <= no. digits <= 10)). Number of digits = 0 means no error DN is present. The digits are stored in BCD, two per character (byte). The domain used for err_dn has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is < 10, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

```
| byte 0  | byte 1  | byte 2  | byte 3  | byte 4  | byte 5 |
-----------------------------------------------------------
|    |    |    |    |    |    |    |    |    |    |        |
| D1 | D2 | D3 | D4 | D5 | D6 | D7 | D8 | D9 |D10 |no. dig.|
|    |    |    |    |    |    |    |    |    |    |        |
-----------------------------------------------------------
```

**Attribute: acvt_gpid**

**Fullname:** ACVT Group ID

**Attribute Description:** ACVT group ID for this ISAT group and restriction group.

**Attribute: grp00**

**Fullname:** ACVT GROUP

**Attribute Description:** grp00 Always DBNO. Used for ease of coding.

**Attribute: grp[*]**

**Fullname:** ACVT GROUP

**Attribute Description:**

```
grp01   Boolean indicating whether this ISDN attendant
thru    can control ACVT group XX.
grp63   XX ranges from 01 through 63.
```

## 4. Population Rules for RLat_port

**Relation Description:** Attendant control feature port.

Defines the per port data associated with the Attendant Control Constructed Feature Relation The following is a list of valid service classes for ports assigned this feature:

```
LINES
-----
FC_INDVDL
FC_ISDN
FC_4WIRE_INDV
SPECIAL ENTRY FOR BFG
---------------------
```

For BFG purposes, 'ACTR' feature parameter type is 'LINE'. Therefore, BFG lport tuples will not be created for the lport assigned to a BFG. Only individual lport tuples are created for BFG assigned lports.

**Attribute: lport**

**Fullname:** logical port of the user

**Attribute Description:**

```
Verify existence of tuple in RLfc_line
where RLfc_line.lport = RLat_port.lport AND
   RLfc_line.lpt_type = RLat_port.lpt_type.
The keys for RLfc_line are:
   RLfc_line.port = RLlpt_pt
                    (RLat_port.lport,RLat_port.lpt_type).port.member
   RLfc_line.party =
                   RLlpt_pt(RLt_port.lport,RLat_port.lpt_type).party
Also
   RLfc_porttyp(RLlpt_pt(lport, lpt_type).port).servclass
   must equal FC_INDVDL OR FC_ISDN OR FC_4WIRE_INDV.
```

Also, verify existence of tuple in RLtrmfeats where RLtrmfeats is keyed by lport and lpt_type and there is an ftent attribute that has a fid with a modular feature type of MFACTR.

**Attribute: lpt_type**

**Fullname:** logical port type of the user

Copyright © 1999 Lucent Technologies 

**Attribute Description:** This attribute indicates the type of lport that the tuple belongs to

**Attribute: acvt_res**

**Fullname:** condition under which calls are restricted

**Attribute Description:** If acvt_gpid != 0, then acvt_res must be DM_NO_ACVT. If the acvt_res is a Direct Connect restriction level (ODCTRES, ODCTNRES), make sure that the Secured Feature ID 12 (SFID012) has been purchased, the line is non-shared analog, and that it has err_treat set to ER_RERTE and an Error DN specified.

**Attribute: err_treat**

**Fullname:** error treatment type

**Attribute Description:** The type of treatment to be applied to restricted calls.

**Attribute: acvt_gpid**

**Fullname:** ACVT group ID for this ISAT group and restriction group

**Attribute Description:**

```
If 'acvt_gpid' > 0,
    then verify that RLfacname has a tuple such that
acvt_gpid = RLfacname.facid
RLfacname.class = FACACTR
RLfacname.subclass = SCL_NULL
```

**Attribute: err_r_idx**

**Fullname:** route index to route restricted calls to

**Attribute Description:**

```
If 'err_r_idx' > 0, then there must be a tuple in RLrt_routing
keyed with this err_r_idx and RLrt_routing.route_type = RTE_HUNT.
If 'err_r_idx' is not 0, then the digit count for 'err_dn' must be 0.
```

**Attribute: err_dn**

**Fullname:** DN to route restricted calls to

**Attribute Description:** This is populated only if err_treat is ER_RERTE. No error DN, then 'no. dig.' = 0, and the digits will be set to null and the number of digits to zero. The error DN is a number of up to 10 digits ( no. digits = (1 <= no. digits <= 10)). Number of digits = 0 means no error DN is present. The digits are stored in BCD, two per character (byte). The domain used for err_dn has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is < 10, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

```
byte 0  | byte 1  | byte 2  | byte 3  | byte 4  | byte 5 |
-------------------------------------------------------
|    |    |    |    |    |    |    |    |    |        |
D1 | D2 | D3 | D4 | D5 | D6 | D7 | D8 | D9 |D10 |no. dig.|
|    |    |    |    |    |    |    |    |    |        |
-------------------------------------------------------
```

**Copyright © 1999 Lucent Technologies** 

If the no.dig. for 'err_dn' is not 0, then 'err_r_idx' must be 0.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLat_prtgp

**Relation Description:** ISDN attendant port groups.

Defines whether a given attendant can change the group restrictions for a given group Attendant Control Constructed Feature Relation. The following is a list of valid service classes for ports assigned this feature:

```
LINES
-----
FC_ISATND
```

**Attribute: latidx**

**Fullname:** logical ISDN attendant terminal index

**Attribute Description:** Logical ISDN attendant terminal index. Sequentially assigned number used to cause a dense packing of ISDN attendant keyed relations. The next available latidx is in the relation RLrc_lahol if there are unused latidx or in RLrc_qidx for the next available if there are no holes.

Copyright © 1999 Lucent Technologies 

**Attribute: grp00**

**Fullname:** group number

**Attribute Description:** grp00 is always DBNO used for ease of coding, not a group.

**Attribute: grp[*]**

**Fullname:** group number

**Attribute Description:** Boolean indicating whether this ISDN attendant can control ACVT group XX. XX ranges from 01 through 63.

# ATCNTMSK

## 1. Description

Attendant Control mask (ATCNTMSK).

This mask is used to mask out the DNs that should not be verified by the Attendant group. This mask is used by the busy verify, emergency override and attendant control of voice terminals features. This relation replaces RLbv_mask.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 2048 |
| expected tuples in relation | 50 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| permutation type | un_perm |
| storage type | DBORIGLEN |
| foldtype | DBDEFAULT |

## 3. Field Layout

## 4. Population Rules for RLatcntmsk

**Relation Description**

Attendant Control Mask

There will be one tuple in this relation for each 100s group that needs to be controlled by an attendant group. The mask is used to mask out DNs within this 100s group that should not be controlled by the designated attendant group. This verification is for the following Attendant features:

(1) Busy Lamp Field (For ISDN Attendants)

(2) Busy Verify

(3) Emergency Override

(4) Attendant Control of Voice Terminals (ACVT)

(5) Attendant Call Forwarding features

**Copyright © 1999 Lucent Technologies** 

**Attribute: hgid**

**Fullname:** Hundreds Group Identifier

**Attribute Description:** Contains the noc, thousand weighted digit, and hundred weighted digit. Used as a key to find the correct RLtree_blf tuple. hundred group identifier (hgid) has three sub-fields:

```
noc     Normalized Office Code
        Range: 1 - AVNOCMAX()
        Default: none
d4      Thousand weighted digit
        Range: 0 - 9
        Default: none
d3      Hundred weighted digit
        Range: 0 - 9
        Default: none
```

***NOTE:*** The following example explains how the 'hgid' value is derived.

```
For the DN# 220-4321:
Read RLnoccode to convert nxx to noc;
For RLnoccode.nxx equal to 220 (Office Code)
RLnoccode.noc equals 118 (Normalized Office Code)
        118 = noc
          4 = digit4 (d4)
          3 = digit3 (d3)
          2 = digit2 (d2)
          1 = digit1 (d1)
The 'noc', 'd4', and 'd3' will be used to determine
the 'hgid' value.
        noc = 118(0x76)
        shift 2 left          = 0x7600
        d4 = 4  (0x04)
        shift 1 left          = 0x0040
        d3 = 3  (0x03)          = 0x0003
        hgid = 0x7600 + 0x0040 + 0x0003
                                = 0x7643
```

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description:** Contains the group number of the attendant Multi-Line Hunt Group.

**Attribute: dnmsk[*]**

**Fullname:** Mask of DNs

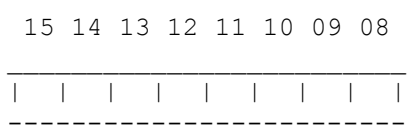
**Attribute Description:** Mask of 100 bits which is used to determine which DNs can be controlled by an attendant group.

dnmsk1 first byte (8 bits) of 100s group mask each bit that equals '0' denotes DN not associated with attendant MLHG, and each bit that equals '1' denotes DN is associated with an attendant MLHG.

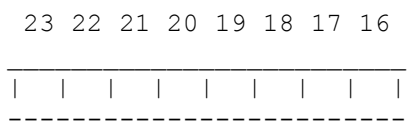
```
Hundred digit number 1st byte
 07 06 05 04 03 02 01 00
```

**Copyright © 1999 Lucent Technologies** 

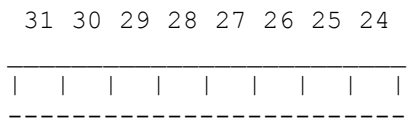
dnmsk2 Hundred digit number 2nd byte



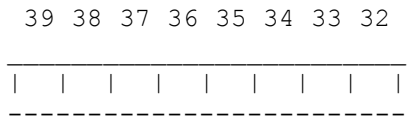
dnmsk3 Hundred digit number 3rd byte



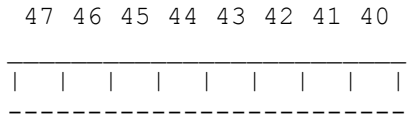
dnmsk4 Hundred digit number 4th byte



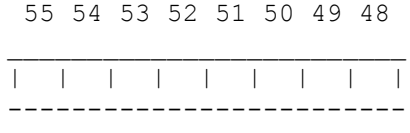
dnmsk5 Hundred digit number 5th byte



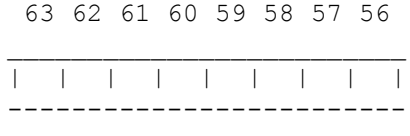
dnmsk6 Hundred digit number 6th byte



dnmsk7 Hundred digit number 7th byte

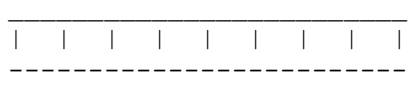


dnmsk8 Hundred digit number 8th byte

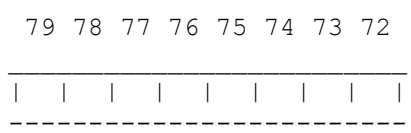


dnmsk9 Hundred digit number 9th byte

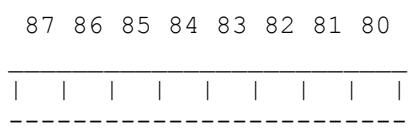
Copyright © 1999 Lucent Technologies



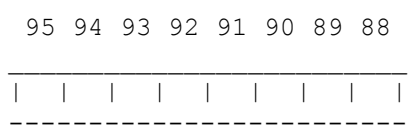
dnmsk10 Hundred digit number 10th byte



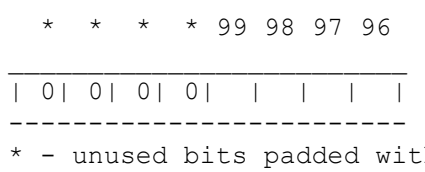
dnmsk11 Hundred digit number 11th byte



dnmsk12 Hundred digit number 12th byte



dnmsk13 Hundred digit number 13th byte



Each bit with '0' indicates that the DN is NOT a member of the set of DNs that this given attendant group (based on this group's number) can control. Each bit with '1' indicates that the DN is a member of the set of DNs that this given attendant group (based on this group's number) can control.

## 4. Population Rules for RLath_cf

**Relation Description:** Authorization codes constructed feature parameters.

Copyright © 1999 Lucent Technologies

Authorization (ATH) code constructed feature parameters. The key to this relation is a 16 bit key. The range of the key is from 4801 (hex) to 4bff (hex) and will be assigned sequentially. The leftmost bit will not be used. Therefore, this relation is engineered for a 15 bit key.

**Attribute: ath_fid**

**Fullname:** ATH constructed feature identifier

**Attribute Description:** Authorization code constructed feature identifier.

**Attribute: amac**

**Fullname:** AMA charging

**Attribute Description:** Boolean structure indicating the combination of AMA charging. In each case a DBYES indicates the type of billing that is applicable and DBNO indicates it is not.

**Attribute: amac.flat**

**Fullname:** flat rate

**Attribute Description:** flat rate - no usage sensitive charge.

**Attribute: amac.usefreq1**

**Fullname:** usage frequency charge 1

**Attribute Description:** Usage frequency charge - for use of 'event' 1.

**Attribute: amac.usefreq2**

**Fullname:** usage frequency charge 2

**Attribute Description:** Usage frequency charge - for use of 'event' 2.

**Attribute: amac.usefreq3**

**Fullname:** usage frequency charge 3

**Attribute Description:** Usage frequency charge - for use of 'event' 3.

**Attribute: amac.usefreq4**

**Fullname:** usage frequency charge 4

**Attribute Description:** Usage frequency charge - for use of 'event' 4.

**Attribute: amac.actchrg**

**Fullname:** activation charge

**Attribute Description:** Usage charge for activation.

**Attribute: amac.dactchrg**

**Fullname:** deactivation charge

**Attribute Description:** Usage charge for deactivation.

**Attribute: amac.duration**

**Fullname:** duration charge

**Attribute Description:** Usage charge for duration of use.

**Attribute: amac.change**

Copyright © 1999 Lucent Technologies 

**Fullname:** change charge

**Attribute Description:** Usage charge for change of parameter.

**Attribute: ath_prompt**

**Fullname:** ATH prompt

**Attribute Description:** Type of prompt given to the user indicating the authorization code should be entered.

**Attribute: actvn**

**Fullname:** feature activation

**Attribute Description:** Method of activating a constructed feature.

**Attribute: dctvn**

**Fullname:** feature deactivation

**Attribute Description:** Method of deactivating a constructed feature.

**Attribute: ama_override**

**Fullname:** AMA override

**Attribute Description:** Indicate if the account code field in the AMA record can be overridden by the authorization code.

**Attribute: ama_field**

**Fullname:** AMA field

**Attribute Description:** Indicates whether the feature produces an AMA record with an 8-digit authorization code field or a 15-character authorization code field.

**Attribute: chg_ma**

**Fullname:** change ma_toggle

**Attribute Description:** Indicate if the customer can change the ma_toggle field in the RLath_grp relation via dialed code.

**Attribute: chg_acf**

**Fullname:** change ath_first

**Attribute Description:** Indicate if the customer can change the ath_first field in the RLath_grp relation via dialed code.

## 4. Population Rules for RLath_code

**Relation Description:** Authorization code (ATH).

Copyright © 1999 Lucent Technologies

Relation for authorization code(s) for a given authorization code group.

***NOTE:*** RLath_code.G will not be able to support both FTS2000 and custom network offices (CNO) at the current 113,000 TMAX.

ODA SUPPORT RULES:

In order to meet the needs of the 12 offices listed here, office data administration (ODA) will engineer the TMAX of RLath_code.G to 250,000.

| BASE & OFFICE NAME | CONTROL |
|---|---|
| Atlanta, GA | 3585d0 |
| Dallas, TX | 8363d0 |
| New York, NY | 9084d0 |
| Washington 3, DC | OR40d0 |
| Chicago, IL | 4E25d0 |
| Los Angeles, CA | 4X81d0 |
| Philadelphia, PA | 1R73d1 |
| Rochester, NY | 4J55d0 |
| Oakland, CA | 4X52d0 |
| St Paul, MN | AAA7d0 |
| Pittsburgh, PA | 1R45d0 |
| White Plains, NY | 8987d0 |

RC SUPPORT RULES:

Recent change/verify (RCV) will check the number of 'athcodes' in an office. This will be done by checking the incremental/decremental counter in relation against the value of global parameter Glathct.

**Attribute: ath_code**

**Fullname:** Authorization code

**Attribute Description:** A 15 digit authorization code.

**Attribute: athgpid**

**Fullname:** ATH group identifier

**Attribute Description:** Authorization code group identifier.

**Attribute: mfcos**

**Fullname:** Main feature class of service

**Attribute Description:** Main feature class of service for this authorization code.

**Attribute: afcos**

**Fullname:** Alternate feature class of service

**Attribute Description:** Alternate feature class of service for this authorization.

**Copyright © 1999 Lucent Technologies** 

# ATH_FCOS

## 1. Description

Authorization code feature class of service (FCOS).

## 2. Data Dictionary Values

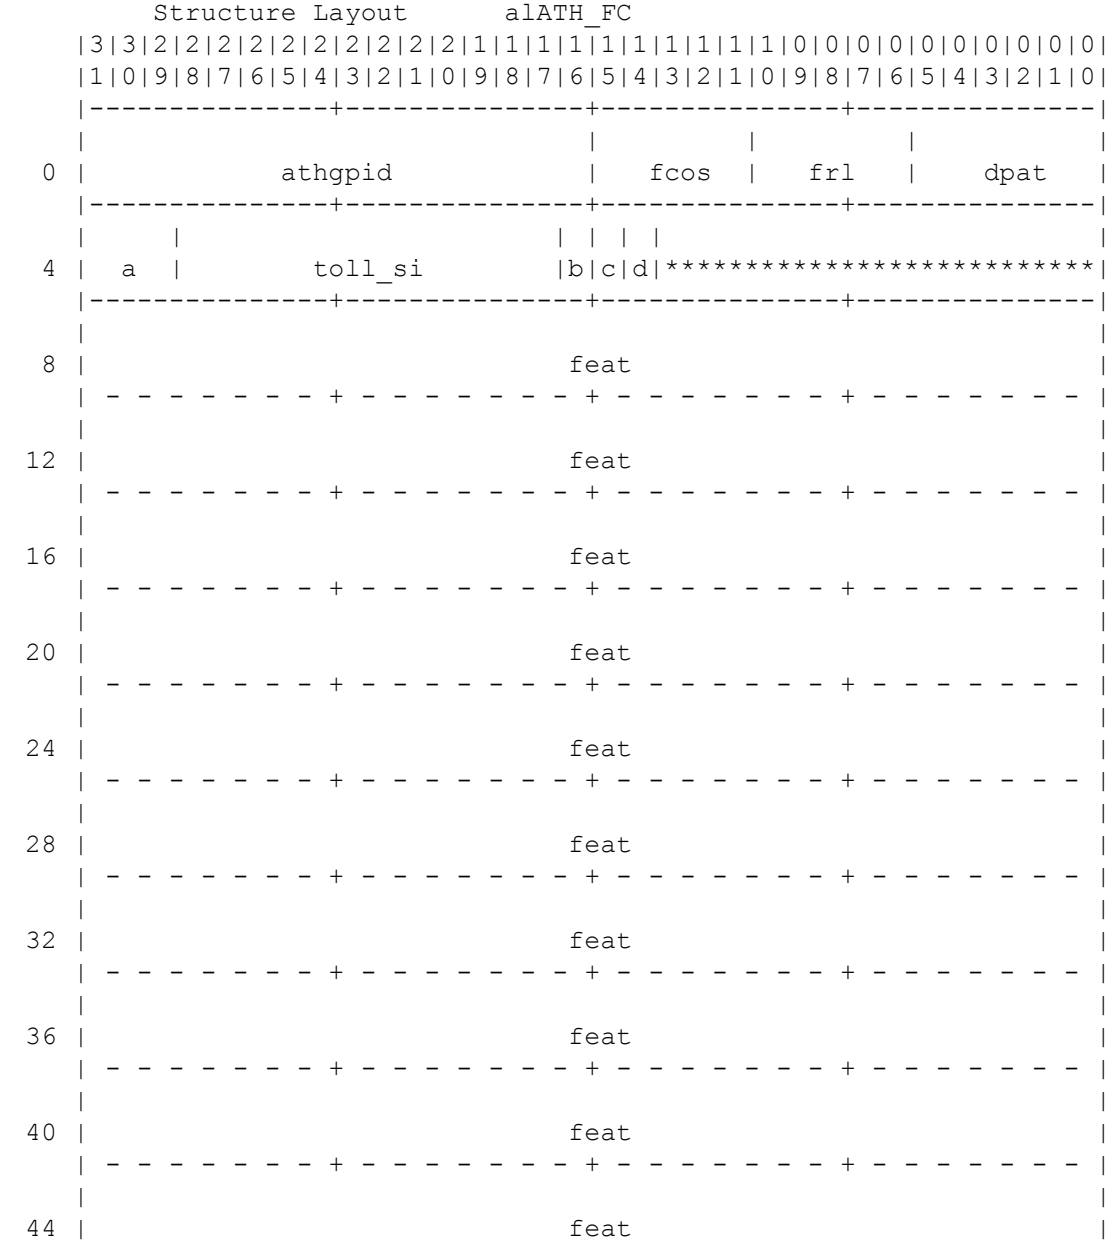
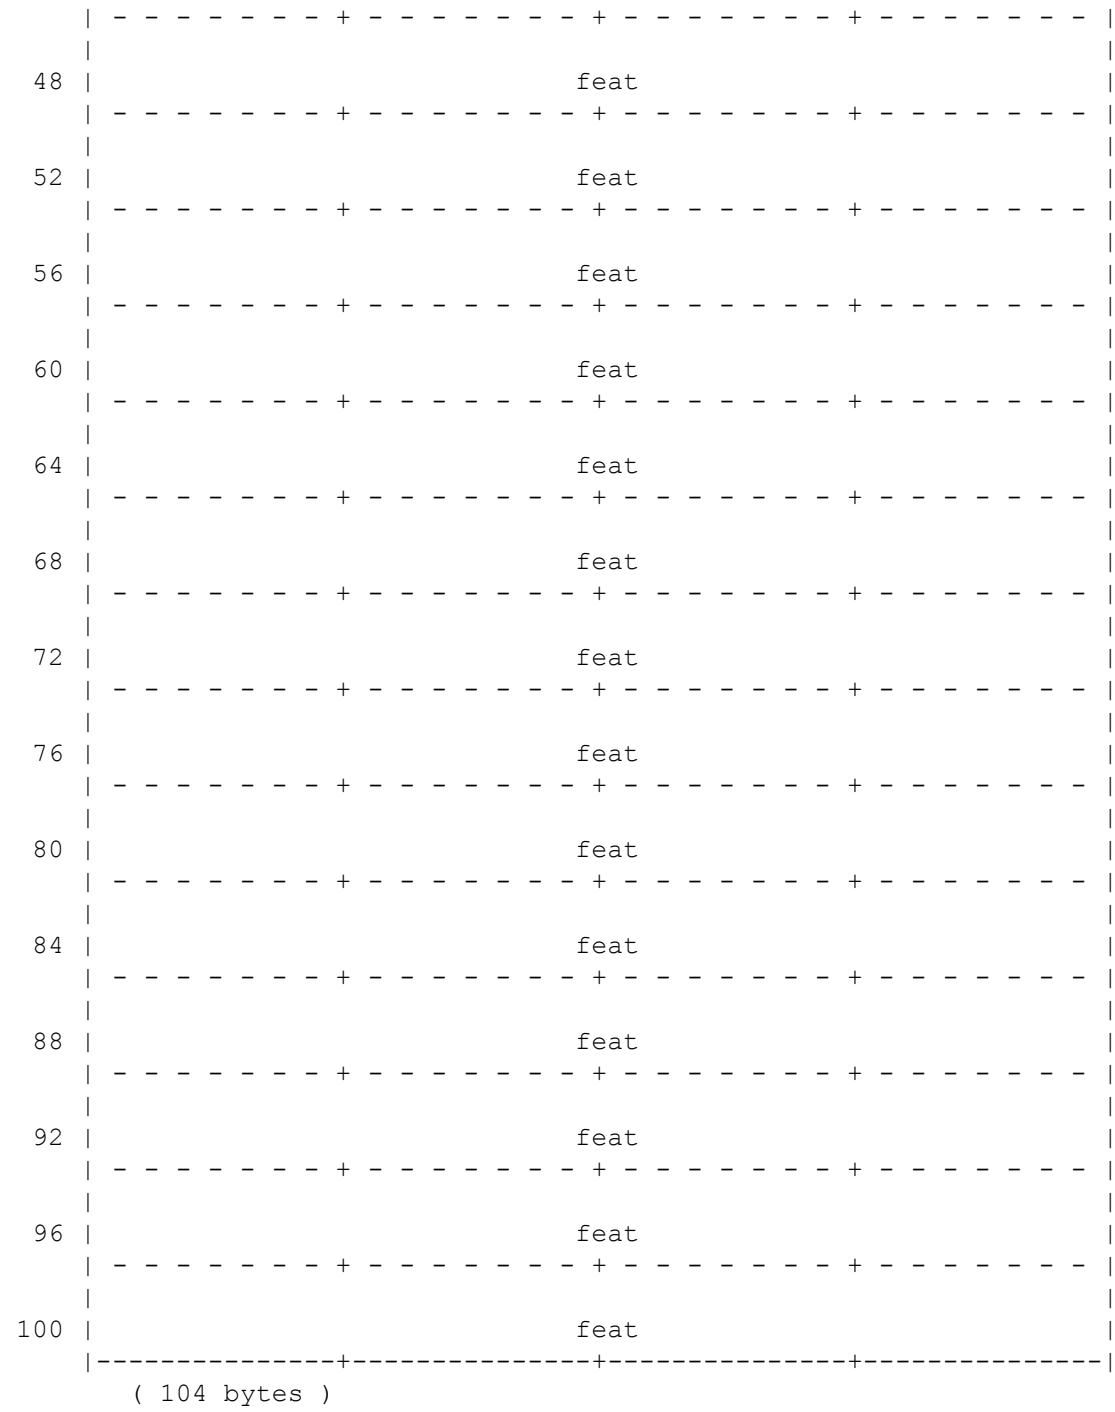
Structure Layout alATH_FC





## 4. Population Rules for RLath_fcos

**Relation Description:** authorization code feature class of service.

Feature class of service for authorization codes.

RLath_fcos and RLath_prt have an interaction with the ama and mdr features. On the RLath_prt relation, the ath_ama and ath_mdr fields are used to indicate if ama/mdr calls made on the port should be restricted unless a valid authorization code has been entered. When an ama/mdr call is made, the RLath_prt relation is read to

determine if an authorization code is required to allow the call. If an authorization code is required but has not been entered, the customer is given error treatment and the call terminates. If an authorization code is required and one has been entered, the RLath_fcos relation is read to determine if the ama/mdr fields indicate the call can proceed. While both RLath_prt and RLath_fcos are needed to determine the treatment of ama/mdr recorded calls during call processing, there is no dependency for population of the ODD.

**Attribute: athgpid**

**Fullname:** authorization code group identifier

**Attribute Description:** A tuple must exist in RLath_grp keyed by the athgpid.

**Attribute: fcos**

**Fullname:** the feature class of service to be associated with this group

**Attribute Description:** If the nestfcos field for this group is set to DBYES in RLath_grp, then there must exist a tuple in RLath_fcos for the maximum mfcos or afcos value defined in RLath_code for this group and for each fcos less than the maximum.

**Attribute: frl**

**Fullname:** facility restriction level

**Attribute Description:** Facility Restriction Level value to be used to override the existing frl value whenever an authorization code is entered. The valid frl range is 0-16, ARFRL_NONUSE(31) is used as a an internal default for non-populated frl.

**Attribute: dpat**

**Fullname:** dial plan access treatment

**Attribute Description:** Dialing plan access treatment value to be used to override the existing dpat value whenever an authorization code is entered.

**Attribute: st_rstrct**

**Fullname:** type of station restriction

**Attribute Description:** Type of station restriction that can be overridden.

**Attribute: toll_si**

**Fullname:** toll diversion screen index

**Attribute Description:** Screen index to be used to override the screen index associated with a toll diverted terminal.

**Attribute: dpat_override**

**Fullname:** override dpat restriction

**Attribute Description:** If this value is DBYES, then a dpat value must be specified for the 'dpat' field. A dpat value is not applicable and is defaulted to zero when this field is DBNO.

**Attribute: ama**

**Fullname:** automatic message accounting

**Attribute Description:** Indicate if AMA recorded calls can proceed with the fcos specified.

**Attribute: mdr**

**Fullname:** message detail recording

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Indicate if MDR recoreded calls can proceed with fcos specified.

**Attribute: feat[*]**

**Fullname:** feature list

**Attribute Description:** There must be a tuple in RLfacname with a facid equal to this fid. The class must be FACBRCS and subclass SCL_FEAT. Subclass cannot be SCL_CLUST. Feature name in RLfacname for the specified fid cannot be a wild card feature (/xx*) where xx are any alpha characters.

## 4. Population Rules for RLath_grp

**Relation Description:** Authorization code group.

Authorization code group parameters.

CRITICAL INFORMATION:

If there is a change to the key(s) of this relation, YOU MUST NOTIFY the owner of the logging module, db/DBrclog. A coordinated change MUST be made to the logging code or your data will NOT be recovered.

```
Distribution Rules  - group partioned relation by ATHGPID
                      GROUP TYPE = GPDATH
```

This relation will be populated on the AM when the group is first defined. The first time a group is associated with an Authorization Code feature the group data will be deleted from the AM and moved to the SM associated with the line or trunk the Authorization Code feature is assigned to. This can happen in two ways:

(1) An Authorization Code feature is defined with an ath_gpname specified as a default parameter. RLath_tm.ath_gpname is not null. The first time that Authorization Code feature is assigned to a line or a trunk the AM tuple for that authorization code group in RLath_grp will be deleted and moved to the SM RLath_grp relation associated with the line or trunk.

(2) An Authorization Code feature is defined with no authorization code group specified as a default parameter. RLath_tm.ath_grp is null. The Authorization Code feature is assigned to a line or trunk. The Authorization Code line parameters are updated to add an authorization group, RLath_prt.athgpid, to the Authorization Code feature. The authorization code group data in RLath_grp for that athgpid will be deleted from the AM and inserted on the SM associated with the line or trunk the Authorization Code feature is assigned to.

Once a group is deleted from the AM and inserted on an SM the tuples will be copied from one SM to another as the AC feature or features using the group are assigned to different SM's.

There are no unusual requirements for handling the distribution of RLath_grp, the normal GPD rules all apply. For detail on the specifics of handling Group Partioned Data refer to RLdb_amgpd, RLdb_imgpd and RLdb_gpdus.

Engineering Note: This relation is engineered for 1023 tuples.

**Attribute: athgpid**

**Fullname:** Authorization code group indentifier.

**Attribute Description:** This attribute is used as authorization code group identifier.

**Attribute: annc_ri**

**Fullname:** Announcement route index.

**Attribute Description:** Specifies an announcement index to be used if the call is blocked because an ATH was not dialed and restrictions treatment is ER_ANNC.

**Attribute: err_trtmt**

**Fullname:** Error treatment.

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Identifies the error treatment to be given when a call fails with an authorization code that belongs to this authorization code group (athgpid).

**Attribute: length**

**Fullname:** Length for all authorization codes for a group.

**Attribute Description:** Used as length of all authorization codes for a group.

**Attribute: nestfcos**

**Fullname:** Nested feature class of service.

**Attribute Description:** Indicate if the FCOSs have a nested structure.

**Attribute: ath_alt**

**Fullname:** Alternate set of authorization codes.

**Attribute Description:** Indicates if there is an alternate set of authorization codes and their associated privilege sets for the authorization code group.

**Attribute: ma_toggle**

**Fullname:** Activity of main or alternate FCOS

**Attribute Description:** Indicates if the main of alternate FCOS is active.

**Attribute: failmode**

**Fullname:** Failure mode.

**Attribute Description:** Indicates if calls that require an authorization code for use will be allowed or disallowed during a communication failure.

**Attribute: tod_inh**

**Fullname:** Time of day inhibit flag.

**Attribute Description:** Specifies whether time of day changes to Authorization Code group data are inhibited. This field is intended to be used by the end customer through the Facility Management feature, allowing a customer to temporary deactivate the time of day scheduled changes.

## 4. Population Rules for RLath_prt

**Relation Description:** Authorization code line/trunk parameters.

Authorization Code parameters assigned to a BRCS User (a User is defined to be an analog terminal, a trunk, or an ISDN User).

```
CRITICAL INFORMATION
--------------------
```

If there is a change to the key(s) of this relation, YOU MUST NOTIFY the owner of the logging module, db/DBrclog.

Copyright © 1999 Lucent Technologies

A coordinated change MUST be made to the logging code or your data will NOT be recovered.

```
SPECIAL ENTRY FOR GROUP PARAMETER ASSOCIATED WITH BFG
-----------------------------------------------------
```

BRCS FEATURE GROUPING (BFG), CAPABILITY G268, IS INTENDED TO IMPROVE RECENT CHANGE RESPONSE TIME AND PROVIDE FOR SM MEMORY REDUCTION. IT PERMITS THE CREATION OF GROUPS OF BRCS FEATURES AND PARAMETERS, AND THE UTILIZATION OF THESE GROUPS BY CALL PROCESSING. BFG GROUP PARAMETER RELATIONS WILL NOT BE CREATED, BUT WILL BE POPULATED IN EXISTING LPORT KEYED RELATIONS.

IDENTIFYING BFG GROUP PARAMETERS WILL BE ACCOMPLISHED VIA USE OF AN LPT_TYPE KEY FIELD SET TO LPT_BFG AND USE OF THE LPORT KEY FIELD TO CONTAIN THE BFG GROUP ID. THIS CONCEPT IS USED TO AVOID CREATION OF NEW DATA BASE RELATIONS.

DISTRIBUTION: GROUP PARTITIONED (IF LPT_TYPE=LPT_BFG) OR SM PARTITIONED

THIS RELATION NOW HAS TWO TYPES OF TUPLES.

(1) THE FIRST TYPE is the existing tuples which are SM-PARTITIONED and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

(2) THE SECOND TYPE is the BFG GROUP PARTITIONED TUPLE associated with features in a BRCS Feature Group (BFG), having lpt_type=LPT_BFG, and the bfgid populated in the lport field.

For BFG purposes, RLath_prt is a Group type. Therefore, only BFG lport tuple is permitted for the lport assigned to a BFG. Individual lport tuples may not be created for BFG assigned lports (when the feature is in the BFG).

***NOTE:*** There is a limit of 30 BRCS features for each bfgid. "

**Attribute: lport**

**Fullname:** Logical port

**Attribute Description:** Used as logical port of the User being assigned the BRCS features.

**Attribute: lpt_type**

**Fullname:** lport type

**Attribute Description:** Used as Logical port type of the User.

**Attribute: athgpid**

**Fullname:** Authorization code group identifier.

**Attribute Description:** Used as authorization code group identifier.

**Attribute: athdtgpid**

**Fullname:** Authorization data group id.

**Attribute Description:** Identifies the ATH data group. If a non-zero athdtgpid is specified, a tuple must exist in RLath_grp keyed by athgpid.

**Attribute: ath_first**

**Fullname:** Indicator of authorization code required first.

**Attribute Description:** Indicates if the authorization code is required first.

**Copyright © 1999 Lucent Technologies** 

**Attribute: ath_ama**

**Fullname:** Authorization code is required before allowing AMA recorded calls to proceed.

**Attribute Description:** Indicates if an authorization code is required before allowing any AMA recorded calls to proceed.

**Attribute: ath_mdr**

**Fullname:** Authorization code indicator required before allowing message detail recording to proceed.

**Attribute Description:** Indicates of an authorization code is required before allowing message detail recording to proceed.

## 4. Population Rules for RLath_tm

**Relation Description:** Authorization Codes Template.

ath_tm - This relation describes the default parameters and options associated with an Authorization Code feature defined within an office.

Each authorization code feature defined within an office will have a tuple describing the feature in this relation.

**Attribute: ath_fid**

**Fullname:** Authorization Code Constructed Feature Identifier

**Attribute Description:** feature identifier

**Attribute: amac**

**Fullname:** AMA Charging

**Attribute Description:** Boolean structure indicating the combination of AMA charging. In each case a DBYES indicates the type of billing that is applicable and DBNO indicates it is not. See the RDL domain DMmc_bill for a description of each sub-attribute.

**Attribute: amac.flat**

**Fullname:** AMA Flat Rate Charging

**Attribute Description:** AMA charging based on a flat rate, no usage sensitive charging.

**Attribute: amac.usefreq1**

**Fullname:** AMA Charging Usage Frequency Event One

**Attribute Description:** AMA charging based on usage frequency event one.

**Attribute: amac.usefreq2**

**Fullname:** AMA Charging Usage Frequency Event Two

**Attribute Description:** AMA charging based on usage frequency event two.

**Attribute: amac.usefreq3**

**Fullname:** AMA Charging Usage Frequency Event Three

**Attribute Description:** AMA charging based on usage frequency event three.

**Attribute: amac.usefreq4**

Copyright © 1999 Lucent Technologies 

**Fullname:** AMA Charging Usage Frequency Event Four

**Attribute Description:** AMA charging based on usage frequency event four.

**Attribute: amac.actchrg**

**Fullname:** AMA Activation Charge

**Attribute Description:** AMA charging for activation.

**Attribute: amac.dactchrg**

**Fullname:** AMA Deactivation Charge

**Attribute Description:** AMA charging for deactivation.

**Attribute: amac.duration**

**Fullname:** AMA Use Duration Charge

**Attribute Description:** AMA charging for duration of use.

**Attribute: amac.change**

**Fullname:** AMA Parameter Change Charge

**Attribute Description:** AMA charging for changing of parameters.

**Attribute: ath_gpname**

**Fullname:** Authorization Code Voice Group Name

**Attribute Description:** Authorization Code voice group associated with this feature.

**Attribute: ath_dtgpname**

**Fullname:** Authorization Code Data Group Name

**Attribute Description:** Authorization Code data group associated with this feature. Data Authorization Code groups can only exist on a feature assigned a voice group.

**Attribute: ath_prompt**

**Fullname:** Authorization Code Prompt

**Attribute Description:** The type of prompt that will be given to the user indicating the authorization code should be entered.

**Attribute: ama_field**

**Fullname:** AMA Record Field Type

**Attribute Description:** Indicates whether the feature produces an AMA record with an 8-digit authorization code field or a 15-character authorization code field.

**Attribute: actvn**

**Fullname:** Feature Activation Method

**Attribute Description:** Method of Activating a Constructed Feature.

**Attribute: dctvn**

**Fullname:** Feature Deactivation Method

**Attribute Description:** Method of Deactivating a Constructed Feature.

Copyright © 1999 Lucent Technologies 

**Attribute: ama_override**

**Fullname:** AMA Account Code Override

**Attribute Description:** Indicates if the account code field in the AMA record can be overridden by the authorization code.

**Attribute: chg_ma**

**Fullname:** Customer Changable Feature Class of Service Allowed

**Attribute Description:** Indicates if the customer can change the ma_toggle field in the RLath_grp relation via a dialed code.

**Attribute: chg_acf**

**Fullname:** Customer Changable Authorization Order Allowed

**Attribute Description:** Indicate if the customer can change the ath_first field in the RLath_prt relation via dialed code.

**Attribute: ath_ama**

**Fullname:** AMA Authorization Requirement

**Attribute Description:** Indicate if an authorization code is required before allowing any AMA recorded calls to proceed.

**Attribute: ath_mdr**

**Fullname:** MDR Authorization Requirement

**Attribute Description:** Indicate if an authorization code is required before allowing message detail recorded calls to proceed.

**Attribute: ath_first**

**Fullname:** Authorization Code Required First

**Attribute Description:** Indicate if the authorization code is required first with entry of an authorization code use code.

## 4. Population Rules for RLatsdata

Copyright © 1999 Lucent Technologies

**Relation Description:** Automatic trunk test scheduler (ATTS) test session definition table.

Each tuple in this relation parametrically defines a test session in a certain test schedule to be invoked by ATTS for the purpose of performing automated trunk testing over a specified range of equipped members of a specified trunk group. This relation supports multiple individual test schedules, each spanning up to an eight-week period. The ATTS schedules are maintained by office personnel by modifying the population of this relation's tuples via Recent Change transactions. While the individual tuples themselves may be populated in any order, ATTS treats the tuples as a representation of a time-ordered sequence of test sessions on a per-schedule basis. Within a given ATTS schedule these individual test sessions may not overlap, but individual test sessions defined in one ATTS schedule may overlap with those in another schedule.

The test session time parameters are specified in terms of hours and minutes with respect to Greenwich Mean Time (GMT). The Global Office Parameter Gltimezone will be used by the ATTS software to convert the scheduled time values read from this relation into local office time values.

While this relation and the associated ATTS software supports multiple schedules, it is possible to populate all tuples in such a way that they relate to a single schedule. As such, this relation may be considered as providing a pool of test session tuples to be allocated among the various schedules as per the intent of office personnel. The maximum number of schedules supported is largely a software determination. Yet the number of tuples in the relation is also constrained, for resource management considerations, to a pre-determined maximum quantity. The Global Office Parameter Glats_tcnt will be used by Recent Change to track the actual number of tuples populated in the relation at any given time, thereby allowing enforcement of the maximum tuple quantity constraint.

**Attribute: sched**

**Fullname:** An ATTS schedule number

**Attribute Description:** Specifies the individual ATTS schedule for which this test session is defined.

**Attribute: week**

**Fullname:** Week within schedule that session begins.

**Attribute Description:** Specifies the week within the individual ATTS schedule that the test session is to begin executing.

**Attribute: day**

**Fullname:** Day session begins

**Attribute Description:** Specifies the day within the given 'week' that the test session is to begin executing.

**Attribute: stt_hr**

**Fullname:** Hour session begins

**Attribute Description:** Specifies the hour within the given 'day' during which the test session is to begin executing.

***NOTE:*** The value 0 corresponds to the midnight hour with respect to UTC.

**Attribute: stt_min**

**Fullname:** Minute session begins

**Attribute Description:** Specifies the minute within the given 'stt_hr' during which the test session is to begin executing.

**Attribute: stp_hr**

Copyright © 1999 Lucent Technologies 

**Fullname:** Hour session ends

**Attribute Description:** Specifies the hour during which the test session is to stop executing.

**Attribute: stp_min**

**Fullname:** Minute session ends

**Attribute Description:** Specifies the minute within the given 'stp_hr' that the test session is to stop executing.

**Attribute: skip**

**Fullname:** Ignore this test session entry? (y/n)

**Attribute Description:** Indicates whether or not the given test session should be skipped when its scheduled starting time arrives.

***NOTE:*** If the value indicates DBYES, then ATTS will skip the current session and proceed with the next. The time at which the next session will be started will depend on whether or not that next session is defined as part of a chain of test sessions (refer to the notes given for the population of the 'link' attribute). If the next test session is not defined as part of a chain, then it will begin executing at the time specified by the contents of its tuple (provided that the value of 'skip' in that tuple indicates DBNO). Otherwise it will begin executing immediately (again provided that the value of 'skip' in that tuple indicates DBNO), as if the skipped session had been allocated zero time to execute. This flag may be used to temporarily prevent a test session from executing without requiring the need to delete its entry from the schedule.

**Attribute: link**

**Fullname:** Link this test session to the previous session? (y/n)

**Attribute Description:** Indicates whether or not this test session should begin executing immediately if and when the previous session completes its execution early.

**Attribute: grpnum**

**Fullname:** Trunk group whose members are to be tested

**Attribute Description:** Identifies the individual trunk group to be tested during this test session.

**Attribute: mem_lo**

**Fullname:** Lower limit of group members to be tested.

**Attribute Description:** Specifies the first member (lower bound) in a range of members of the specified trunk group to be tested during this session.

**Attribute: mem_hi**

**Fullname:** Upper limit of group members to test.

**Attribute Description:** Specifies the last member (upper bound) in a range of members of the specified trunk group to be tested during this session.

**Attribute: order**

**Fullname:** Sequence in which trunk group members will be tested.

**Attribute Description:** Indicates the sequence in which the trunk group members will be tested either low-to-high (ascending - DBNO) or high-to-low (descending - DBYES).

**Copyright © 1999 Lucent Technologies** 

**Attribute: tran**

**Fullname:** Type of ATME transmission test.

**Attribute Description:** Specifies the type of ATME transmission test to perform on all equipped members of the given trunk group during this test session. Currently this attribute is not used.

**Attribute: sig**

**Fullname:** Type of ATME signaling test.

**Attribute Description:** Specifies the type of ATME signaling test(s) to perform on all equipped members of the given trunk group during this test session. Currently this attribute is not used.

Copyright © 1999 Lucent Technologies

# ATSFTBTN

## 1. Description

This static relation is group partitioned and will reside on every GPDCONFIG partitioned SM and also the CMP. On SMs, it contains one tuple per configuration group that is assigned to at least one standard, circuit switched terminal on that SM. On the CMP, it contains all standard configuration groups defined on the switch (assigned to terminals or not).

The relation stores a 256 bit array where a set bit (1) indicates the corresponding National ISDN-2 feature button (button 1 thru 254) is configured. The most significant bit (MSB) of each attribute corresponds to the highest number of the given range (except for the assign7 attribute where the MSB is reserved / not used). The least significant bit (LSB) of each attribute corresponds to the lowest number of the given range (except for the assign0 attribute where the LSB is reserved / not used).

The key for this relation is the configuration group number and is 12 bits in length.

## 2. Data Dictionary Values

## 4. Population Rules for RLatsftbtn

**Relation Description:** Automatic Terminal Setup Feature Button Configuration Group Assignment.

This relation contains one tuple for every Standard Terminal Configuration group defined by group type GPDCONFIG. The relation will exist on the CMP and in SMs as defined by the GPDCONFIG assignment partitioning. Each tuple of the relation is composed of the configuration group number and 8 bitmap fields. A Standard Terminal may have up to 254 feature buttons.

These buttons are grouped in 8 bitmaps (6 complete sets of 32 bits and 2 incomplete sets of 32 bits) as follows:

```
attribute assign0 stores buttons 31 - 1 (button 0 unused)
attribute assign1 stores buttons 63 - 32
attribute assign2 stores buttons 95 - 64
attribute assign3 stores buttons 127 - 96
attribute assign4 stores buttons 159 - 128
attribute assign5 stores buttons 191 - 160
attribute assign6 stores buttons 223 - 192
attribute assign7 stores buttons 254 - 224 (button 255 reserved)
```

If a bit in any bitmap is set, this indicates the corresponding feature button is configured with a feature action. As depicted in the previous bit ranges, the MSB of each attribute corresponds to the highest number of the given range (except for the assign7 attribute where the MSB is not used and equal 0 (no button 255)). The LSB thus refers to the lowest button in the attribute range except for assign0 where the LSB is always 0 (no button 0). This attribute design allows for direct indexing into the alternate structure by the operational software. There must always exist a tuple in RLrc_cfgbm keyed by RLatsftbtn.config where RLrc_cfgbm.fword[0-7] equal RLatsftbtn.assign[0-7].

**Attribute: config**

**Fullname:** Standard Terminal Configuration Group Number

**Attribute Description:** When populated on an SM, this attribute should contain all Standard Terminal Configuration Groups assigned to standard terminals on this SM. On the CMP, this attribute will contain all of the Standard Configuration Groups defined on the switch (assigned or not).

**Attribute: assign0**

**Fullname:** Bitmap 0 indicating feature buttons 31-1 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a

Copyright © 1999 Lucent Technologies 

Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 31 thru 1. Bit position 0 (rightmost LSB) must always be set to zero. See the relation description for more information.

**Attribute: assign1**

**Fullname:** Bitmap 1 indicating feature buttons 63 - 32 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 63 thru 32. See the relation description for more information.

**Attribute: assign2**

**Fullname:** Bitmap 2 indicating feature buttons 95 - 64 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 95 thru 64. See the relation description for more information.

**Attribute: assign3**

**Fullname:** Bitmap 3 indicating feature buttons 127 - 96 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 127 thru 96. See the relation description for more information.

**Attribute: assign4**

**Fullname:** Bitmap 4 indicating feature buttons 159 - 128 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 159 thru 128. See the relation description for more information.

**Attribute: assign5**

**Fullname:** Bitmap 5 indicating feature buttons 191 - 160 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 191 thru 160. See the relation description for more information.

**Attribute: assign6**

**Fullname:** Bitmap 6 indicating feature buttons 223 - 192 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 223 thru 192. See the relation description for more information.

**Attribute: assign7**

**Fullname:** Bitmap 7 indicating feature buttons 254 - 224 assigned

**Attribute Description:** This attribute is a bitmap that indicates whether a feature button on a Standard Configuration group is assigned to a feature action. This bitmap stores bits corresponding to feature buttons 254 thru 224 (bit 32, the leftmost bit (MSB) must always be zero). See the relation description for more information.

## 4. Population Rules for RLatsopts

### Relation Description

RLatsopts - automatic trunk test scheduler (ATTS) test schedule options table.

This relation is an extension of RLatsparam.G, and defines additional options which are used to control an ATTS test session on a per-schedule basis.

**Attribute: sched**

**Fullname:** An ATTS schedule number.

**Attribute Description:** Each tuple in this relation will be an extension of a tuple in the RLatsdata relation with the same ATTS schedule number.

Copyright © 1999 Lucent Technologies

**Attribute: max_calls**

**Fullname:** Maximum number of total call attempts per test session.

**Attribute Description:** Specifies the maximum number of call attempts per test session. Used as a threshold which, when exceeded, causes the test session to terminate. A value of 0 indicates no maximum.

**Attribute: max_errors**

**Fullname:** Maximum number of total errors detected per test session

**Attribute Description:** Specifies the maximum number of errors per test session. Used as a threshold which, when exceeded, causes the test session to terminate. A value of 0 indicates no maximum.

**Attribute: xshort**

**Fullname:** Spare attribute.

**Attribute Description:** Spare attribute provided for future use.

**Attribute: xuns8**

**Fullname:** Spare attribute.

**Attribute Description:** Spare attribute provided for future use.

**Attribute: cycle**

**Fullname:** Cyclic restart indicator.

**Attribute Description:** This attribute indicates if the entire test cycle should be repeated continuously. DBYES value for cycle indicates that after all trunk members of the specified trunk group and of the 'retry list' have been tested, the user may optionally choose to repeat the entire test cycle until the timer expires, the user chooses to not repeat the test cycle, or some other stop criteria is met (such as maximum call attempts). DBNO value for cycle indicates that only one iteration of the test session is to be performed.

**Attribute: xbool1**

**Fullname:** Spare attribute.

**Attribute Description:** Spare attribute provided for future use.

**Attribute: xbool2**

**Fullname:** Spare attribute.

**Attribute Description:** Spare attribute provided for future use.

## 4. Population Rules for RLatsparam

### Relation Description

Automatic Trunk Test Scheduler (ATTS) test schedule parameters table

This relation defines a table of parameters which are used to control an ATTS test session on a per-schedule basis.

**Attribute: sched**

**Fullname:** An ATTS schedule number.

Copyright © 1999 Lucent Technologies

**Attribute Description:** The key to this relation table is provided by the value of the 'sched' attribute in the RLatsdata relation.

**Attribute: tst_type**

**Fullname:** Type of test.

**Attribute Description:** Specifies the type of test to be performed during test sessions associated with ATTS schedule 'sched'.

**Attribute: max_fail**

**Fullname:** Maximum number of successive aborted test attempts per test session.

**Attribute Description:** Specifies the maximum number of consecutive aborted trunk test attempts allowed per test session. Used as a threshold which, when reached, causes a test session to terminate.

**Attribute: ctbsyabt**

**Fullname:** Count busy-trunk aborted tests with miscellaneous aborts?

**Attribute Description:** Specifies whether or not tests which abort because the trunk is busy should be included in the counter associated with the threshold for miscellaneous aborted tests (RLatsparam.max_fail).

**Attribute: max_loop**

**Fullname:** Maximum number of loops through a session's retry list.

**Attribute Description:** Specifies the maximum number of passes which should be performed per test session through a list of trunks associated with aborted tests for which another test attempt should be made , time permitting. Used as a threshold which causes a test session to terminate when trunks remain on the list after the specified maximum number of passes through the list have been made. The value of 0 will allow the retry list to be turned off.

**Attribute: max_cong**

**Fullname:** Maximum number of successive tests per session which result in detection of congestion.

**Attribute Description:** Specifies the maximum number of consecutive trunk test attempts per test session which are allowed to result in detection of congestion. Used as a threshold which, when exceeded, causes a test session to terminate.

**Attribute: max_ansto**

**Fullname:** Maximum number of successive tests per session which result in the director timing out while waiting for an Answer (or equivalent) signal.

**Attribute Description** Specifies the maximum number of consecutive trunk test attempts per test session which are allowed to result in the director timing out while waiting for an Answer (or equivalent) signal from the far end. Used as a threshold which, when exceeded, causes a test session to terminate.

**Attribute: max_dirto**

**Fullname:** Maximum number of successive tests per session which result in the director timing out while waiting for an event other than receipt of an Answer (or equivalent) signal.

**Attribute Description:** Specifies the maximum number of consecutive trunk test attempts per test session which are allowed to result in the director timing out while waiting for an event other than receipt of an answer (or equivalent) signal from the far end. Used as a threshold which, when

Copyright © 1999 Lucent Technologies 

exceeded, causes a test session to terminate.

**Attribute: print**

**Fullname:** Test session immediate print control flag.

**Attribute Description:** Specifies how to output, in real time, the result of each test.

The following layout defines the use of various automatic transmission measuring equipment (ATME) report print formats currently not supported by US.

| type of results printed | C0 | C1 | C2 | C3 | C4 | C5 | C6 |
|---|---|---|---|---|---|---|---|
| clean test passe | | | | x | | | x |
| outside service limits | | x | | x | x | | x |
| outside maint limits | | | x | x | | x | x |
| fails signaling test | x | x | x | x | x | x | x |
| invalid trunk | x | | | | x | x | x |
| trunk unavailable | x | | | | x | x | x |
| responder busy | x | | | | x | x | x |

**Attribute: ref_cnt**

**Fullname:** Count of the number of references.

**Attribute Description:** A counter which tracks the number of tuples in the static AM relation RLatsdata which have a value in their 'sched' attribute which equals the value of this tuple's key.

**Attribute: retry**

**Fullname:** Maximum number of loops through a session's retry list.

**Attribute Description:** Specifies the maximum number of passes which should be performed per test session through a list of trunks associated with aborted tests for which another test attempt should be made , time permitting. Used as a threshold which causes a test session to terminate when trunks remain on the list after the specified maximum number of passes through the list have been made. The value of 0 will allow the retry list to be turned off.

**Attribute: retest**

**Fullname:** Repeat a failed test

**Attribute Description:** Specifies whether or not an immediate attempt to repeat a failed test should be made.

## 4. Population Rules for RLaut_rec

**Relation Description:** Automatic Reconfiguration

Static relation defining patterns used as input for Automatic Reconfiguration.

**Attribute: pat_id**

**Fullname:** Pattern ID

**Attribute Description:** Integer pattern ID.

**Attribute: pat_name**

**Fullname:** Pattern Name

**Attribute Description:** Pattern Name.

**Attribute: pat_fdow**

**Fullname:** Pattern Forcing Day of Week

**Attribute Description:** Pattern 'forcing' day of week. Day zero represents Sunday.

**Attribute: pat_hofd**

**Fullname:** Pattern hour of day

**Attribute Description:** Pattern hour of day.

Copyright © 1999 Lucent Technologies 

**Attribute: pat_mofh**

**Fullname:** pattern minute of hour

**Attribute Description:** pattern minute of hour.

**Attribute: cqop_done**

**Fullname:** call Queue/Operator pattern data activated?

**Attribute Description:** Call Queue/Operator pattern data activated? DBYES if pattern has been activated, DBNO otherwise.

**Attribute: act_done**

**Fullname:** Interflow Activation pattern data activated?

**Attribute Description:** Interflow Activation pattern data activated? DBYES if pattern has been activated, DBNO otherwise.

**Attribute: deac_done**

**Fullname:** Interflow Deactivation pattern data activated

**Attribute Description:** Interflow Deactivation pattern data activated? DBYES if pattern has been activated, DBNO otherwise.

**Attribute: act_data**

**Fullname:** Interflow activation data?

**Attribute Description:** DBYES if interflow activation data is in the pattern. DBNO otherwise.

**Attribute: deac_data**

**Fullname:** Interflow deactivation data?

**Attribute Description:** DBYES if interflow deactivation data in the pattern. DBNO otherwise.

**Attribute: cqst_data**

**Fullname:** Call Queue/Serving Team data

**Attribute Description:** DBYES if there is call queue to serving team reconfiguration data in the pattern. DBNO otherwise.

**Attribute: opst_data**

**Fullname:** Operator/Serving Team data?

**Attribute Description:** DBYES if there is operator to serving team reconfiguration data in the pattern, DBNO otherwise.

**Attribute: dummy_var**

**Fullname:** Dummy Variable

**Attribute Description:** Dummy variable used to reserve 3 bits.

**Attribute: pat[*]ctst**

**Fullname:** Pattern call type to serving team

**Attribute Description:** Pattern's call type to serving team mapping.

## 2.3 RELATIONS: B

Copyright © 1999 Lucent Technologies

# B900NB

## 1. Description

This relation indicates whether a 900 call can be charged to a LEC card. This is based on NPA-NXX of the LEC calling card number.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 800 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| head table size | 512 |
| data page size | 512 |
| page level | 2 |
| ks key store | DBNO |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLb900nb

**Relation Description** Blocking 900 calls for LEC cards NPA based body table. This relation indicates whether 900 calls are blocked for LEC card charges. This is based on NPA-NXX of the LEC card.

This relation is populated for domestic generics only.

**Attribute: npa**

**Fullname:** Numbering Plan Area

**Attribute Description:** This is an NPA for which some NXXs have 900 calls blocked for LEC card charges as indicated in the head table RLb900nh.

**Attribute: oamap[*]**

**Fullname:** OA Map Word xx

**Attribute Description:** Each OA map word xx gives block state for 32 NXXs.

## 4. Population Rules for RLb900nh

**Relation Description** Blocking 900 calls for LEC cards NPA based head table. This relation indicates whether 900 calls are blocked for LEC card charges. This is based on NPA or NPA-NXX of the LEC card.

This relation is populated for domestic generic only.

**Attribute: blkdummy**

**Fullname:** Block 900 Calls Dummy Key

**Attribute Description:** This is a dummy key set to 1.

**Attribute: oaff1**

**Fullname:** Spare Field 1

**Attribute Description:** Spare field for fast features.

**Attribute: oaff2**

**Fullname:** Spare Field 2

**Attribute Description:** Spare field for fast features.

**Attribute: oamap[*]**

**Fullname:** OA Map Word xx

**Attribute Description:** Each OA map word xx gives 900 calls blocking state for 16 NPAs. The allowed values for xx are:

```
OAALW  = 00
OABLK  = 01
OAPBLK = 10
```

(see domain DMBLKSTAT for details).

## 4. Population Rules for RLb900rh

**Relation Description:** Blocking 900 calls for LEC cards RAO based head table. This relation indicates whether 900 calls are blocked for LEC card charges. This is based on RAO of the LEC card.

Since this table is based on the RAO of the LEC card, no body table is required with this relation. The restrictions are made on a RAO basis, and all [0/1]XX of that RAO are inclusive in the restriction.

This relation is populated for domestic generics only.

**Attribute: blkdummy**

**Fullname:** Block 900 Calls Dummy Key

**Attribute Description:** This is a dummy key set to 1.

**Attribute: oaff1**

**Fullname:** Spare Field 1

**Attribute Description:** Spare field for fast features.

**Attribute: oaff2**

**Fullname:** Spare Field 2

**Attribute Description:** Spare field for fast features.

**Attribute: oamap[*]**

**Fullname:** OA Map Word xx

**Attribute Description:** Each OA map word xx gives block state for 32 RAOs.

## 4. Population Rules for RLbcl_cf

**Relation Description** Bulk calling line identification constructed feature. This relation gives LASS bulk calling line identification (BCLID) constructed feature information used in the SM. This information is used by call processing only. BCLID is a local area signaling service (LASS) that allows private branch exchange (PBX) with or without

Copyright © 1999 Lucent Technologies 

direct inward dialing (DID), multiline hunt group (MLHG), and BRCS/Centrex groups and/or lines to receive call-related information on calls received from outside the PBX, MLHG, or BRCS/Centrex group. Information on intragroup calls can optionally be provided to BCLID subscribers. The BCLID information includes:

(1) The calling directory number (DN) - set to 'P' if LASS privacy indicator is set, and set to 'O', if unavailable.

(2) The calling line multistatus - set to 'M' (for multi), if the true calling DN cannot be identified (such as, multiparty, PBX, etc.), otherwise set to 'T' for true DN. This multistatus indicator will be set to 'B' if Billing number is provided instead of calling number.

(3) Date (Day and Month) - provided as an option.

(4) The time the call was received - hours, minutes, and seconds.

(5) The called DN - replaced by port/terminal number, and group identifier of called party, if multiline hunt group.

(6) Busy/idle status of called DN - if it cannot be determined that the called DN is busy (such as, PBX), the status is always set to idle.

For interoffice calls, BCLID will require use of common channel signaling (CCS) so that the calling party information can be provided by the originating switch. The data is transmitted from the terminating switch to the user's customer premise equipment (CPE) shortly after each call is received. Such CPE may include computer terminals, minicomputers, magnetic tape devices or related equipment, that will process and provide display or storage of the transmitted BCLID data. The data is transmitted to the CPE over a dedicated data channel (application processor interface (API)) using 3A-Translator or directly to an Application Processor. The transmission does not affect completion of any calls.

This is the initial offering of BCLID. The BCLID software was introduced in the 5E8 generic and resides in the LASS loadable package.

**Attribute: feat_id**

**Fullname:** Feature ID

**Attribute Description:** A BRCS feature ID consists of a unique identifier. For LASS Bulk Calling Line IDentification feature, the modular feature type is MFBCL which is an enumeration type in DMmftype.

**Attribute: ama_rec**

**Fullname:** Billing Type

**Attribute Description:** Type of billing to be performed. This billing can be done on flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the service provider decides it will bill if the feature is universally available. If ama_rec is set to DBYES, then the billing will be done on a usage sensitive basis whereas if it is set to DBNO, the billing will be done on a flat rate basis.

**Attribute: incl_date**

**Fullname:** Include Date Option

**Attribute Description:** This is an enumeration of DMbool which is used to indicate whether the date will be included in the BCLID message. If this attribute is set to DBYES, then the date will be included in the BCLID message.

**Attribute: filtr_op**

**Fullname:** Filter Option

Copyright © 1999 Lucent Technologies 

**Attribute Description:** This is an enumeration of DMbool which is used to indicate whether this feature generates a message for intra-terminal group calls. If this attribute is set to DBYES, then the BCLID messages are sent for calls originated outside of the terminal group and no BCLID messages will be generated for call originated inside the same terminal group of the BCLID termination. Otherwise, if the filter option is set to DBNO then BCLID will generate a message for every incoming call (from inside or outside the terminal group) to this terminal group.

**Attribute: spare1**

**Fullname:** Spare Field Attribute

**Attribute Description:** Spare attribute.

**Attribute: spare2**

**Fullname:** Spare Field Attribute

**Attribute Description:** Spare attribute.

**Attribute: spare3**

**Fullname:** Spare Field Attribute

**Attribute Description:** Spare attribute.

## 4. Population Rules for RLbcl_grp

**Relation Description**

```
Bulk calling line identification group relation
```

This relation provides the bulk Calling Line Identification (BCLID) group parameter data.

The Application Processor (AP) will automatically receive information whenever a call terminates to any member of this group. A Business Customer ID (BCID) must exists in order to assign BCLID.

**Attribute: bcgpid**

**Fullname:** Bulk calling line identification group ID

**Attribute Description:** The BCLID group ID is an identifier resulting from the conversion from an 8

Copyright © 1999 Lucent Technologies

character BCLID group name. The BCLID group name is an identifier with a class of FACBCL and a subclass of SCL_NULL.

**Attribute: apid**

**Fullname:** Application processor ID (APID)

**Attribute Description:** Applications processor ID specifies the destination AP that messages are sent regarding incoming calls as to the members associated with this BCLID group.

**Attribute: alt_apid**

**Fullname:** Alternate application processor ID

**Attribute Description:** Alternate application processor ID specifies the alternate destination AP that messages are sent when the primary AP is unavailable to receive messages with regard to incoming calls to the members associated with this BCLID group. A value of zero implies no alternate AP is assigned to this BCLID group.

**Attribute: bcid**

**Fullname:** Business customer ID

**Attribute Description:** Business customer ID for this BCLID group. Messages sent concerning BCLID calls will include this number to identify the user (or business customer) on that AP or alternate APID.

**Attribute: grpactive**

**Fullname:** Group active flag

**Attribute Description:** BCLID group active flag indicates if the BCLID group is active (DBYES) or inactive (DBNO). Active means that all incoming calls to this group will be recorded normally by BCLID. Inactive means that BCLID will not record any of the incoming calls to this group.

**Attribute: bcldn10**

**Fullname:** BCLID 10-digit called party directory number flag

**Attribute Description:** The 10-digit directory number flag indicates if the called party number sent over the AP link must be 10-digits (DBYES), or if the called party number can be both 7 and 10-digits when sent over the AP link (DBNO).

**Attribute: spare1**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute.

**Attribute: spare2**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute.

## 4. Population Rules for RLbcl_ltm

**Relation Description**

Bulk Calling Line IDentification Logical Termination Ports

This relation maps the terminating port into the group relation and the counts for this port. The mechanism used to link the information is the same used in ICLID. By the use of an extra field bcl_idx we can link the usage sensitive count relation for the terminating port, also using bcgpid as a key, we can link the information contents into

Copyright © 1999 Lucent Technologies 

RLbcl_grp relation and this relation will tell us the APID, BCID, alternate APID for this customer.

**Attribute: ltm_idx**

**Fullname:** Logical Termination Index

**Attribute Description:** Attribute ltm_idx has a domain range that starts with 0. The range in this relation starts with 1. As discussed in RLrc_smidx, the existence of an index implies the value 1 or greater. If no index is defined, RLrc_smidx would contain an ltm_idx value of 0 and no tuple would exist in this relation. Therefore, ltm_idx must be greater than 0 in this relation.

**Attribute: ltm_type**

**Fullname:** Logical Termination Type

**Attribute Description:** This is a logical termination index type.

**Attribute: lead_module**

**Fullname:** Lead Switching Module

**Attribute Description:** Identifies the lead module for this termination.

**Attribute: bcgpid**

**Fullname:** BCLID Group ID

**Attribute Description:** The BCLID group id is an identifier resulting from the conversion from an 8 character BCLID group name. The BCLID group name is an identifier with a class of FACBCL and a subclass of SCL_NULL.

**Attribute: bcl_idx**

**Fullname:** BCLID Index

**Attribute Description:** This is an index used by BCLID to keep track of usage sensitive counts for billing. It will be used to index into the dynamic relation RLbcl_lcnt which will contain the usage sensitive counts for individual DNs. This index is assigned sequentially by RC. RLbcllth relation holds all the indices deleted from this relation to allow the re-use of the indices.

**Attribute: ama_rec**

**Fullname:** Billing Type (usage sensitive or flat rate)

**Attribute Description:** This is a boolean attribute that describes the type of billing for this group. This value is populated from RLbcl_opts for the feature assigned to this group.

**Attribute: spare1**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute

**Attribute: spare2**

## 4. Population Rules for RLbcl_mhtg

### Relation Description

Copyright © 1999 Lucent Technologies

Bulk Calling Line IDentification MLHG and Trunk Group Relation

This relation has the information about Multi-Line Hunt Group and Trunk Group. It is SM and CMP redundant.

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description:** This attribute has the group number information for a given Multi-Line Hunt Group or Trunk Group.

**Attribute: grptype**

**Fullname:** Group Type

**Attribute Description:** This attribute specifies whether the group is a Multi-Line Hunt Group or if the group is a Trunk Group. This attribute only can accept two 'enum' values, and those values are DBBCLMLHG for Multi-Line Hunt Groups and DBBCLTRKG for Trunk Groups.

**Attribute: bcgpid**

**Fullname:** Bulk Calling Line IDentification Group ID

**Attribute Description:** This number is used as a key to RLbcl_grp relation to get the customer information.

**Attribute: mlhgid**

**Fullname:** Multi-Line Hunt Group ID

**Attribute Description:** This is a 2 character attribute that is used to store the two digits that identify the MLHG in the BCLID message that is sent to the CPE. The values for this attribute range from 00 to 99, or default to a NULL character. This is not an unique value among the BCLID users. This attribute is used to identify the MLHG that generates the BCLID message if two or more of these termination types terminates to the same AP. No automatic assignment is required for this attribute. This attribute exists also in RLrc_pgrprmk relation.

BCLID requires this attribute because this feature exist already in the 1A Switch. This attribute only provide extra information in the BCLID message that is sent to the AP. The user of BCLID may or may not want to assign a value to this attribute.

**Attribute: ama_rec**

**Fullname:** Billing Type (usage sensitive or flat rate)

**Attribute Description**: This is a boolean attribute that describes the type of billing for this group. This value is populated from RLbcl_opts for the feature assigned to this group.

**Attribute: bcl_fid**

**Fullname:** Bulk Calling Line IDentification Feature ID

**Attribute Description:** This attribute is a 10 bit long field that describes the feature ID assigned to this group. It will be used as a key for map other information in RLbcl_cf relation to this group.

**Attribute: billdn**

**Fullname:** Billing DN

**Attribute Description:** This attribute stores the Billing DN number for this group. The number is stored in BCD (Binary Code Decimal) format using 6 bytes. The following diagram shows the layout of the bytes.

```
+---------+---------+---------+---------+---------+-------+
```

**Copyright © 1999 Lucent Technologies** 

```
|     |     |     |     |     |     |     |     |     |     |        |
| D1  | D2  | D3  | D4  | D5  | D6  | D7  | D8  | D9  | D10 |  CNT   |
|     |     |     |     |     |     |     |     |     |     |        |
+---------+---------+---------+---------+---------+---------+-------+
```

The following is an example of how the data is stored in this field:

DN: (708)-979-3333

```
+-------+-------+-------+-------+-------+-------+-------+
|   |   |   |   |   |   |   |   |   |   |   |       |
| 7 | 0 | 8 | 9 | 7 | 9 | 3 | 3 | 3 | 3 |  10   |
|   |   |   |   |   |   |   |   |   |   |   |       |
+-------+-------+-------+-------+-------+-------+-------+
```

The billing DN is populated based on the following rules:

(1) If the group is a MLHG then the billing DN is equal to the grp_loc and grp_noc attributes in RLrt_mhg relation. This attribute holds the LISTED TN for all cases except when the hunt type is RTH_MUPH or RTH_ISAT. If the hunt type is RTH_MUPH or RTH_ISAT then grp_loc and grp_noc holds SUBTN1.

(2) If the group is a trunk group then the billing DN is taken from RLrctgrprk.billingdn attribute. If the attribute is empty then billing DN must be specified.

**Attribute: spare1**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute

**Attribute: spare2**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute

**Attribute: spare3**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute

**Attribute: spare4**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute

**Attribute: spare5**

**Fullname:** Spare field attribute.

**Attribute Description:** Spare Attribute

```

## 4. Population Rules for RLbcl_opts

**Relation Description** This relation gives LASS bulk calling line identification constructed feature options information used in the CMP for RC/V only.

**Attribute: feat_id**

**Fullname:** Feature ID

**Attribute Description**: A BRCS feature ID consists of a unique identifier. For LASS bulk calling line identification feature, the modular feature type is MFBCL which is an enumeration type in DMmftype.

Copyright © 1999 Lucent Technologies

**Attribute: ama_rec**

**Fullname:** Billing Type

**Attribute Description:** Type of billing to be performed. This billing can be done on flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the service provider decides it will bill if the feature is universally available. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis whereas if it is set to DBNO, the billing will be done on a flat rate basis.

**Attribute: incl_date**

**Fullname:** Include Date Option

**Attribute Description:** This is an enumeration of DMbool which is used to indicate whether the date will be included in the BCLID message. If this attribute is set to DBYES, then the date will be included in the BCLID message.

**Attribute: filtr_op**

**Fullname:** Filter Option

**Attribute Description:** This is an enumeration of DMbool which is used to indicate whether this feature generates a message for intra-terminal group calls. If this attribute is set to DBYES, then the BCLID messages are sent for calls originated outside of the terminal group and no BCLID messages will be generated for call originated inside the same terminal group of the BCLID termination. Otherwise, if the filter option is set to DBNO then BCLID will generate a message for every incoming call (from inside or outside the terminal group) to this terminal group.

**Attribute: bclgpname**

**Fullname:** Bulk Calling Line IDentification Group ID

**Attribute Description**: The BCLID group name is an character string of 8 characters that holds the default group assigned to each BCLID feature. This group may not exists at the time that this field is populated, but it must be defined at the time that the feature is assigned to any termination. This attribute is only used by RC.

**Attribute: spare1**

**Fullname:** Spare Field Attribute

**Attribute Description:** Spare attribute.

**Attribute: spare2**

**Fullname:** Spare Field Attribute

**Attribute Description:** Spare attribute.

**Attribute: spare3**

**Fullname:** Spare Field Attribute

**Attribute Description:** Spare attribute.

## 4. Population Rules for RLbcllth

**Relation Description** Bulk calling line identification last bcl_idx hole. This relation is used to store the BCLID bcl_idx index holes for BCLID billing counts in a dual-link list.

The bcl_idx index holes are distributed between four queues. This strategy supports concurrency of four users by allowing up to four users to retrieve indices simultaneously. Each index is stored in the appropriate queue defined by the queue identifier attribute value. The appropriate queue is determined by dividing the index value by four. The remainder of this division represents the appropriate queue identifier value.

For a new office, four tuples will be initialized. Each tuple will contain the highest used index value corresponding to

Copyright © 1999 Lucent Technologies 

a queue. A tuple will be initialized for each queue, queue zero, one, two, and three. The succ and pred attribute values are zero when there are no index holes in the given queue.

**Attribute: module**

**Fullname:** Lead Switching Module

**Attribute Description:** Recent Change keeps separate bcl_idx link lists for each SM. The head cell for each link list is the module number and bcl_idx = 0. RC adds a member to a link list when it is no longer needed. This may be due to a customer no longer subscribing to the BCLID feature. When an bcl_idx is required to be assigned to an ltm_idx on a SM, RC uses the members from the link list.

**Attribute: bcl_idx**

**Fullname:** BCLID Index

**Attribute Description:** This is a sequentially assigned index used by BCLID to keep track of the counts for billing. It will be used to index into the dynamic relation RLbcllcnt which will contain the BCLID counts for ports.

**Attribute: qid**

**Fullname:** Queue Identifier

**Attribute Description:** Queue identifier references one of the four index queues.

**Attribute: pred**

**Fullname:** Predecessor

**Attribute Description:** The predecessor bcl_idx that is the key to the next less significant member of the link list or 0 to indicate no member or last member of the list.

**Attribute: succ**

**Fullname:** Successor

**Attribute Description:** The successor bcl_idx that is the key to the more significant member of the link list or 0 to indicate no member or last member of the list.

**Copyright © 1999 Lucent Technologies** 

# BFGMATCH

## 1. Description

This relation contains a list of BRCS constructed features (fid only) assigned to a BFG, used in BFG selection during the assignment of a BFG to a line/DN/ MLHG Line.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 3840 |
| expected number of tuples | 50 |
| density | 84 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |
| ks key store | DBNO |
| corcable relation | DBYES |
| permutation type | un_perm |

## 3. Field Layout

### 3.1 BFGMATCH Field Layout continued.
