# Gldi0_5ptss

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldi0_5ptss | FP | DMulong |

### 1.1 Gldi0_5ptss

Global Office Parameter Gldi0_5ptss

### 1.2 Description

These parameters are the PSU time slot set bit masks. These parameters are used to reserve TSIU time slots for use by PSU nail up connections on DI 0. Each bit that is set will reserve a TSIU channel time slot via a tuple in RLcktdata of type PCPSU_TS (see poprules for RLcktdata for more details). At least as many bits must be set as the number of TSIU channel time slots required for nail ups on the PSU PIDBs connecting to DI 0 for the following port types: ISM, RISLU, IP trunks, X.75'/X.75 trunks, XAT, ESDL/OSPS trunks, PSU Pipe (PP), and Speech Handler (SH) trunks (see Gldi0tscnt). If the SM is not an ISDN SM, these parameters should not be populated. It is recommended that no more than a SM total of 128 time slots be used for nail ups if inter SM call processing takes place on this SM.

The following cross-check will verify the integrity of these parameters: for all nonzero values, in descending order, of RLpsiupidb.shts_di0, the bits set in these parameters must satisfy the conditions:

(1) Each set bit can only represent one value (that is, a bit can not be used by more than one shelf).

(2) The set bits must follow the algorithm shown here for each shelf:

```
count   <-- RLpsiupidb.shts_di0

#pidb0s <-- count of non-zero pidb_*a where

            corresponding di_pidb == 0

timeslots_available <-- 0

slot_counted[] <-- 0 (array of 32 which indicates how many

                      times a given timeslot has been

                      counted for a shelf)

for (ptss=0; ptss < 8; ptss+)

{

    for (timeslot=0; timeslot < 32; timeslot++)

    {

        if (bit on in ptss bit map and
```

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldi0tscnt | FP | DMuchar |

### 1.1 Gldi0tscnt

Global Office Parameter Gldi0tscnt

### 1.2 Description

This parameter records the number of TSIU channel time slots on DI 0 used by the following PSU PIDB nailed up connections: ISM, RISLU, IP trunks, X.75'/X.75, PSU Pipe (PP) trunks, SS7 Signaling Data Links, AT and EDSL trunks. This count should be incremented/decremented whenever the RLpsiupidb.shts_di0 attribute is incremented/decremented. Rules for incrementing/decrementing the RLpsiupidb.shts_di0 is described under attribute description of shts_di[*] in RLpsiupidb poprules file.

This parameter is not used for SM-2000.

At least as many bits must be set as the number of TSIU channel time slots required for nail ups on the PSU PIDBs connecting to DI 1 for the following port types: ISM, RISLU, IP trunks, X.75'/X.75 trunks, XAT, EDSL/OSPS trunks, PSU Pipe (PP), and Speech Handler (SH) trunks (see Gldi1tscnt). If the SM is not an ISDN SM, these parameters should not be populated. It is recommended that no more than a SM total of 128 time slots be used for nail ups if inter SM call processing takes place on this SM.

The following cross-check will verify the integrity of these parameters: for all nonzero values, in descending order, of RLpsiupidb.shts_di1, the bits set in these parameters must satisfy the conditions:

(1) Each set bit can only represent one value (that is, a bit can not be used by more than one shelf).

(2) The set bits must follow the algorithm shown here for each shelf:

```
count <-- RLpsiupidb.shts_di1

#pidb1s <-- count of non-zero pidb_*b where

            corresponding di_pidb == 1

timeslots_available <-- 0

slot_counted[] <-- 0 (array of 32 which indicates how many

                      times a given timeslot has been

                      counted for a shelf)

for (ptss=0; ptss < 8; ptss+)

{

    for (timeslot=0; timeslot < 32; timeslot++)

    {

        if (bit on in ptss bit map and
```

Copyright © 1999 Lucent Technologies 

```
                slot_counted[timeslot] <= #PIDB1s)

            {

                timeslots_available++;

                slot_counted[timeslot]++;

            }

        }

    }

    assert (count <= timeslots_available)
```

This parameter is unused by SM-2000. The parameter will initially be populated with default (0).

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldi1tscnt | FP | DMuchar |

### 1.1 Gldi1tscnt

Global Office Parameter Gldi1tscnt

### 1.2 Description

This parameter records the number of TSIU channel time slots on DI 1 used by the following PSU PIDB nailed up connections: ISM, RISLU, IP trunks, X.75'/X.75 trunks, XAT, PP PSU Pipe (PP), SS7 Signaling Data Links and EDSL trunks. This count should be incremented/decremented whenever the RLpsiupidb.shts_di1 attribute is incremented/decremented. Rules for incrementing/decrementing the RLpsiupidb.shts_di1 is described under attribute description of shts_di[*] in RLpsiupidb poprules file.

This parameter is not used for SM-2000.

# Gldiorscr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldiorscr | FP | DMchar3 |

### 1.1 Gldiorscr

Global Office Parameter Gldiorscr

### 1.2 Description

This global holds the DIOR Speed Dialing access code, which is the digit sequence keyed by the customer to indicate that the call should receive DIOR Speed Dialing treatment. It is made recent changeable because there is a possibility that it could change during development of the feature; but once the access code has been agreed upon by all carriers, its value should not change as this will be a nationally-used customer interface. The default value listed is the current planned access code. It is group partitioned,
`grp_type = GPD_OSPS and grp_id = 4 (see RLdb_gpdus.P).`

# Gldispdb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldispdb | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Gldispdb

### 1.2 Description:

The Gldispdb global parameter contains an SM's current rlDISPDB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCdispcnt.c which is the init code for Gldispdb. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as display features are assigned and DNs are shared. It will never be decreased.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;

# Gldn_priv

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldn_priv | FR | DMbool |

### 1.1 Gldn_priv

Global Office Parameter Gldn_priv

### 1.2 Description

This parameter is used to indicate whether Directory Number (DN) privacy is on for the office. Two different precedence lists are used to determine All Call privacy. The activation status of special feature Calling Party Number Presentation (CPNP) determines which precedence list is used. In either case, a Per-Call Privacy dialed code (if allowed) will toggle the ACP result.

CPNP not active

If the CPNP feature is not active and Gldn_priv is set to DBNO, DN privacy is not turned on for the office but is turned on individually for each terminal (analog or ISDN), if DN privacy is assigned to the terminal. Calling DNs can be displayed at those ISDN terminals that have the Calling Number Delivery feature. If this parameter is set to DBYES, the calling DN will not be displayed even if the terminal has the Calling Number Delivery feature. This parameter should be used when the office does not have all-call DN privacy assigned properly to the terminals in the office. In this way the calling DNs will not be displayed until the data in the office has been set up correctly.
CPNP active

If the CPNP feature is active, the following precedence list is used.

```
Q.931   |*Line  |**Screen | Gldn_priv | Result

# Gldscbk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldscbk | LR | DMbool |

### 1.1 Gldscbk

Global Office Parameter Gldscbk

### 1.2 Description

This parameter is used to indicate if the office receives error messages when deleting a Directory Number that is a member of a Series Completion linked list(that is, when BCKLNK is DBYES).

If set to DBYES, no error message will be shown, and the series completion backlinks will be removed automatically when such a DN is deleted. If set to DBNO, an error message will be given when deleting a DN that is a member of a Series Completion linked list, and the user will need to enter the update mode, set BCK LNK field on RC/V view to DBNO (which will remove the backlinks) and then do the deletion of the DN.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** 0

***AM Initial Value:*** DBYES

***CMP Initial Value:*** DBYES

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** ODA should preserve the existing value in Retrofit.

***Default Rules:***

```
default = DBYES;
```

The default value for this parameter is DBYES, which means Series Completion backlinks, if they exist, will be removed automatically (no error message given) before any DN is deleted.

***Distribution Rules:*** standard

***Checks:***

```
/* RULE about Gldscbk.values: */

# Gldsk_sze

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldsk_sze | LR | DMshort |

### 1.1 Gldsk_sze

Global Office Parameter Gldsk_sze

### 1.2 Description

Gives amount of disk space available for the disk-resident ODD in kilobytes. This is an ODA supported parameter. Its value must be a multiple of 16K and may vary depending on the disk configuration. There are two disk configurations. The values for Gldsk_sze are as follows:

```
Disk Configuration    Gldsk_sze

     63,66              8992K
```

The determination of which configuration an office should use is based on formulas found in 5 DOPS or the Switch Administration Guidelines. These formulas are based on total SM ODD, Disk ODD, and AMA storage requirements.

RLsmconf.oddpart has an additional section describing in detail the 63 and 66 disk configurations.

# Gldsnopt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldsnopt | LRFR | DMbool |

### 1.1 Gldsnopt

Global Office Parameter Gldsnopt

### 1.2 Description

The Defense Switched Network (DSN) is the command, control, and administrative network for the Department of Defense. The DSN will evolve from the present analog AUTOmatic VOice Network (AUTOVON), which is a private military telecommunications network that provides its subscribers services similar to the public network, as well as some unique features specific to military applications. A DSN switch is a dedicated facility that is either owned by or leased to the Department of Defense.

Switches in the DSN are of 3 types:

- A DSN END Office Switch performs the functions of a military Dial Central Office or PABX, and functions as a terminating office in the DSN.
- A stand alone Nodal Switch functions primarily as a tandem in the DSN.
- A Multifunction Nodal Switch has the combined functions of a DSN tandem node and a DSN END office switch.

An AUTOVON Interface Switch has the capability of accessing the present AUTOVON network, but can also be part of a public network switch.

Parameter Gldsnopt specifies whether or not this office is a DSN switch. If this office is a DSN switch, this parameter is set to DBYES. If this office is a non-DSN switch, this parameter is set to DBNO. For AUTOVON interface switches, Gldsnopt is set to DBNO. For DSN Nodal or Multifunction switches, this parameter is set to DBYES. For any other switches not in a DSN, this parameter is set to DBNO.

# Gldto_o

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gldto_o | LR | DMlong |

### 1.1 Gldto_o

Global Office Parameter Gldto_o

### 1.2 Description

This parameter provides the calibration adjustment for the TLWS distance-to-open test. This is the amount (in feet) that the distance-to-open return value is adjusted to take out the office-to-office variance in the distance from the DCTU to the MDF.

ODA should populate the default value for this parameter. When the switch is installed, switch personnel will determine the correct value for this parameter by creating an artificial open on a line at a known distance from the MDF. This parameter will be modified until the returned results from the DTO test and the artificial open agree. Gldto_o is specified in feet.

***Type:*** DBLONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** When retrofitting to the 5E5(1) generic, the value of this parameter needs to be taken from the global parameter Glcp7dummy. The value of Gldto_o should be preserved for generic retrofits after 5E5.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:*** standard

***Checks:***

```
/* RULE about Gldto_o.values: */

Gldto_o is_in {-65535 thru 65535};
```

# Glecdaud

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glecdaud | LR | DMlong |

### 1.1 Glecdaud

Global Office Parameter Glecdaud

### 1.2 Description

This AM only global parameter is used by the On-Switch ECD Audit software code for 5E10(1) and later software releases. It serves as a status bitmap to record the completion of the On-Switch ECD Audit. The bit mask is defined in a DBCR local header to be used by the On-Switch ECD Audit and the Database Retrofit check function. The purpose of having a status bitmap is to ensure that the audit has been run with no errors prior to final data base dump for retrofitting offices.

# Glecp_pc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glecp_pc | LRFR | DMpt_code |

### 1.1 Glecp_pc

Executive Cellular Processor Point Code

### 1.2 Description

The parameter represents the Point Code of the *Autoplex*® executive cellular processor (ECP).

***Type:*** DBLONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:***

```
if (SFID130 == DBYES) then begin Glecp_pc != 0;

end else begin Glecp_pc == 0; end
```

The Executive Cellular Processor Point Code is a string of 9 decimal digits (the external format). Its internal hex value is determined based on the following format:

```
(Bits)  23             16                   8 7               0
        +----------------+----------+--------+----------------+
        |    Network     | Cluster Region and|     Cluster    |
        |   Indicator    |    Cluster Type   |      Member    |
        +----------------+----------+--------+----------------+
(Digit) 9               7 6                  4 3               1

        The 9 digit externally defined Point Code is converted as:

        ( network indicator *2 ^16 )      +
        ( cluster region and type *2 ^8 ) +
          cluster member
```

Example: 230005003 -> 0xe60503

# Glecutod

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glecutod | FP | DMbool |

### 1.1 Glecutod

Enhanced cut through to operator (ECUT) Operator Default Option parameter.

### 1.2 Description

This parameter shall be used to activate/deactivate the ECUT Operator Default Option. If a caller's second attempt to enter a calling card number results in an ECUT card recognition failure, this global parameter determines if an operator request is automatically generated (DBYES), or the call is idled with a disconnect announcement (DBNO).

# Gleds_port

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gleds_port | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Electronic Directory Service Count

### 1.2 Description:

The Gleds_port global parameter contains a per SM's count of ports assigned an Electronic Directory Service (EDS) feature with the Directory Query Display (DQD) option allowed. It is used in calculating the number of Processor Control Blocks (PCBs), etc. needed for EDS (see Glospcb.R).

Its value is maintained over all initializations and updated via RC when an EDS feature with the DQD option allowed is assigned or removed. Each SM will have its' own value of this count.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***TRIGGER:*** OSincpcb,

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** The value of this parameter is established by ODA and will be updated by RC when an EDS feature with the DQD option allowed is assigned or removed. Its value can increase and decrease.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***

# Gleisdl

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gleisdl | FP | DMuns5 |

### 1.1 Gleisdl

Global Office Parameter Gleisdl

### 1.2 Description

Gleisdl keeps count of the number of External Information system (EIS) Call Processing Data Links (CPDLs) are equipped on the SM. As EIS CPDLs are added or removed from the SM, this global is incremented or decremented accordingly.

The Gleisdl global must always equal the number of bits set to a 1 in the global Gleiseq.

If the value of Gleisdl is 0, then the value of the global Gleiseq must also be 0 and there must be no tuples in RLeis_sm for the SM.

# Gleiseq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gleiseq | FP | DMushort |

### 1.1 Gleiseq

Global Office Parameter Gleiseq

### 1.2 Description

Gleiseq is a bit map used to keeps track of the currently assigned External Information System (EIS) Call Processing Data Links (CPDLs) relative link numbers on the SM. This global is used by RC to assign the next available relative number on the SM when a new EIS link is requested by the customer. When ODA and RC assign relative link numbers to newly added EIS CPDLs, then the smallest available relative link number is to be used. The links on the SM do not have to be assigned consecutively. Each bit (0-15) represents a relative link number on the SM. If the bit is 0, then the relative link number is not currently not assigned to an EIS CPDL.

# Glentry7

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glentry7 | LPFP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glentry7 - total number of rlENTRY7 tuples

### 1.2 Description:

The Glentry7 global parameter contains an AM or SM's count of rlENTRY7 tuples. Its value is maintained over all initializations and updated as rlENTRY7 tuples are inserted.

The following algorithm is used to calculate

```
Glentry7:
in an AM:
       Glentry7 must be between 0 and 1500
       Glentry7 must be 0 if Glpci7gr is 0
       Glentry7 must be 96 or greater**
             if Glientry7 + ((5 * Glpci7gr) / 4)
                    is >= 0 and < 96
       Glentry7 must be 1500 if Glientry7 +
                    ((5 * Glpci7gr) / 4 ) is > 1500
       otherwise
       Glentry7 is Glientry7 + ((5 * Glpci7gr) / 4 )
end AM
in SM-2000:
       Glentry7 must be between 0 and 2500
       Glentry7 must be 0 if Glpci7gr is 0
       Glentry7 must be 96 or greater**
                if Glientry7 + ((5 * Glpci7gr) / 2) is >= 0 and
                   < 96
       Glentry7 must be 2500 if Glientry7 +
                  ((5 * Glpci7gr) / 2 ) is > 2500
       otherwise
       Glentry7 is Glientry7 + ((5 * Glpci7gr) / 2 ) end
SM-2000
in an SM:
       Glentry7 must be between 0 and 250
       Glentry7 must be 0 if Glpci7gr is 0
       Glentry7 must be 64 or greater**
                if Glientry7 + ((5 * Glpci7gr) / 2) is >= 0 and < 64
       Glentry7 must be 250 if Glientry7 +
                ((5 * Glpci7gr) / 2 ) is > 250
       otherwise
       Glentry7 is Glientry7 + ((5 * Glpci7gr) / 2 )
end SM
```

***NOTE:*** This indicates a scenario where degrowth has occurred for some CCS7 trunks which caused the value to be higher than the calculated minimum. Since these are SRE parameters and there is no way to recover the Dynamic Data pages these values are never decreased. This also saves effort during degrowth of one

# Gleocratfl

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gleocratfl | FP | DMcratfl |

### 1.1 Gleocratfl

Global Office Parameter Gleocratfl

### 1.2 Description

POPULATION: GROUP_PARTITIONED

This parameter is group partitioned with grp_type=GPD_OPRT and grp_id=3. That is, it exists on all SMs with operator traffic trunks, and all loaded SMs. An SM that carries operator traffic trunks is one in which one or more tuples in rlFC_PORTTYPE have the attribute servclass set to FC_ISPOPR. DESCRIPTION: This parameter indicates the option to be used when a CFR/RTRS ( Centralized Flexible Rating/Real-Time Rating System) rating failure has occurred during the end-of-call contact period of an Automated Coin Toll Service (ACTS) call. The value OA_ACTSOPR means that the call will be routed to an operator position. The value OA_ACTSFREE means that the call should not be charged for the previous period.

# Glesa_time

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glesa_time | LR | DMshort |

### 1.1 Glesa_time

Global Office Parameter Glesa_time

### 1.2 Description

This global parameter is for the Dual ESA for E911 Enhancements Special feature and will be used to store the hour of the day that the active and inactive ESAs should be switched. If Glesa_time is 0, this indicates that no time based switching of active and inactive ESAs is to be done for this switch. A value of 1 to 24, is the hour of the day that the switch is to be done; 1 - 23 is the military time hour and 24 is midnight.

***Type:*** DBSHORTPAR

# Glespnorm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glespnorm | LR | DMbool |

### 1.1 Glespnorm

Global Office Parameter Glespnorm

### 1.2 Description

This parameter is used to define how the off-normal condition for Essential Service Protection (ESP) will be displayed on the MCC. A value of DBNO indicates that the off-normal condition for ESP is allowed and the normal condition is inhibited. A value of DBYES indicates that the off-normal condition for ESP is inhibited and the normal condition is allowed. In 5E8(1), the Glcp13dummy parameter is used to define the off-normal condition for ESP.
**AM Initial Value:** DBNO

**CMP Initial Value:** DBNO

# Glexdet

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glexdet | FP | DMbool |

### 1.1 Fullname:

Global Office Parameter Glexdet

### 1.2 Description:

Specifies whether this OSPS or ISP office performs exception area determination for privileged and compete inter-LATA calls. Privileged and compete areas (exception areas) exist where the originating and terminating office codes (NPA-NXX) reside in different LATA's but both these offices are owned by the same service provider and are allowed to connect calls between these offices with there own local exchange carrier (LEC). Under normal situations only interconnect carriers (IC) are allowed to make these inter-LATA connections. Thus the term 'exception area'. These are areas which Local Exchange Carriers (LEC) are allowed to carry inter-LATA calls. This parameter should be set to DBNO when the office does not have exception areas within its serving area. A value of DBYES will be used when the office does have exception areas within its serving area. The parameter must be present in all PSM's and SM's which have ISPOPR trunks. Group type = GPD_OPRT Group id = 2

# Glexinbnd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glexinbnd | FR | DMbool |

### 1.1 Glexinbnd

Global Office Parameter Glexinbnd

### 1.2 Description

Glexinbnd indicates whether or not Expanded Inband Signaling (EIS) is used in the office and provides a means of flash cutting TSPS trunks to EIS. It is also used to provide control of red box fraud protection for dial-tone-first coin lines. When Glexinbnd is set to DBNO, red box fraud control is not provided and trunk group data are used to determine signaling for TSPS trunks.

When Glexinbnd is set to DBYES, this provides for control of red box fraud on dial-tone-first coin lines by providing forward line battery polarity on 0-plus calls and 0-minus calls routed over TSPS trunks. In addition ALL TSPS trunks in the office are defaulted to use EIS irrespective of trunk group data of FCWINKONLY.(RLrctgrprk.intsig) It is possible to overrid this default for a given trunk member by setting a bit in relation RLfc_trunk to DBYES. The signal (RLrctgrprk.intsig) will remain as specified in the trunk group data.

If EIS is used in a given office for operator services traffic, then EIS should be used for ALL operator services traffic. Mixing expanded inband signaling and other signaling (RLrctgrprk.intsig) protocols such as INBAND and FCWINKONLY for operator services traffic could result in MF tones being played in a customers' ear.

The RLfc_trunk.ffcf2 bit override is provided for customers using EIS for operator services traffic and using TSPS trunks for non-operator services traffic which does not use expanded inband signaling.

# Glexmdt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glexmdt | FR | DMshort |

### 1.1 Glexmdt

Global Office Parameter Glexmdt

### 1.2 Description

This timer is set by the Originating Access tandem (OAT) after it sends the Initial Address Message (IAM) to the Originating Toll Office (OTO). The OAT uses Glexmdtimer to provide a delay to ensure that glare, blocking etc, is not encountered on the outgoing circuit to an OTO. When the timer expires, the OAT sends an Exit Message (EXM) to the End Office (EO). The range for this timer is 100 - 1200 milliseconds with 100 ms. intervals.

# Glfc_t1

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glfc_t1 | FR | DMlong |

### 1.1 Glfc_t1

Global Office Parameter Glfc_t1, Flexible Calling T1 Timer

### 1.2 Description

When a HOLD message is sent to a Standard CPE, this timer is set, and the switch will wait for a HOLD ACKNOWLEDGE message to be returned from the CPE. If a HOLD ACKNOWLEDGE is received while the timer is running, the timer is cancelled, the B-channel is released, and the call is put on hold. If a HOLD REJECT message is received, nothing is done. If the timer expires and then the HOLD ACKNOWLEDGE is received, the call is dropped. The range of this timer is one to ten seconds with one second increments and a default value of four seconds. For software efficiency the internal value is stored in milliseconds rather than in seconds. This parameter is used for only for Standard BRIs

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glfclass | FP | DMfclass |

### 1.1 Glfclass

Global Office Parameter Glfclass

### 1.2 Description

Glfclass has 4 possible values: HARM, DECI, SYNCH, FCNOMFR. If there are any MFR lines, Glfclass must not be FCNOMFR.

The values and the definitions are:

```
HARM    - represents that multifrequency ringing is

          from the harmonic frequency series,

DECI    - decimonic series,

SYNCH   - synchromonic series,

FCNOMFR - no multifrequency ringing.

          Special restrictions:

          If the SM is equipped with one or more LU1

          (RLrc_eqloc.unittype = SMLU) then Glfclass MUST

          be set to FCNOMFR.

# Glffall0

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffall0 | LP | DMhex32 |

### 1.1 Fullname:

Global Office Parameter Glffall0

### 1.2 Description:

This parameter, in conjunction with Glffall1 to Glffall7 in the CMP, is used by Optioned Feature System (OFS) for 5E9 and later Software Releases. Along with Glffany0 to Glffany7, these parameters represent the 'office' setting of the feature options (also known as TFOS bits) and are populated from Glffos0 to Glffos7 in each SM.

Each bit in this parameter represents a feature option. Bit 0 represents feature option 500, bit 1 represents feature option 501, etc. Thus, this parameter provides 32 feature options, options 500 through 531. The bit will be set to on (1) if the corresponding bit of Glffos0 in all the operational SMs are on (1); the bit will be set to off (0) if any of the corresponding bit of Glffos0 in the SMs is off (0).

This parameter is populated by Recent Change. Glffos0.

***Type:*** DBLONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** In a retrofit from 5E8 to 5E9, whenever a tuple exists in the relation RLsf12 keyed by ks=0 and ksubrid=0, this parameter must preserve the value of RLsf12.al2. If the tuple does not exist, this parameter should be built per description above. In a retrofit from 5E9 to 5E10 or later, ODA should carry the value forward.

# Glffall10

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffall10 | LP | DMhex32 |

### 1.1 Fullname:

Global Office Parameter Glffall10

### 1.2 Description:

This global parameter, in conjunction with Glffall0 through Glffall20 in the CMP, is used by Feature Optioning System (FOS). Along with Glffany0 through Glffany20, these parameters represent the 'office' setting of the feature options (also known as TFOS bits) and are populated from Glffos0 to Glffos20 in each SM.

Each bit in this parameter represents a feature option. Bit 0 represents feature option 820, bit 1 represents feature option 821, etc. Thus, this parameter provides 32 feature options, options 820 through 851.

The bit will be set to on (1) if the corresponding bit of Glffos10 in all the operational SMs are on (1); the bit will be set to off (0) if any of the corresponding bit of Glffos10 in the SMs is off (0).

This parameter is populated by Recent Change view 8.31.

# Glffany0

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffany0 | LP | DMhex32 |

### 1.1 Glffany0

Global Office Parameter Glffany0

### 1.2 Description

This parameter, in conjunction with Glffany1 to Glffany7 in the CMP, is used by Optioned Feature System (OFS) for 5E9 and later software releases. Along with Glffall0 to Glffall7, these parameters represent the 'office' setting of the feature options (also known as, TFOS bits) and are populated from Glffos0 to Glffos7 in each SM.

Each bit in this parameter represents a feature option. Bit 0 represents feature option 500, bit 1 represents feature option 501, etc. Thus, this parameter provides 32 feature options, options 500 through 531. The bit will be set to on (1) if any of the corresponding bit of Glffos0 in the SMs is on (1); the bit will be set to off (0) if the corresponding bit of Glffos0 in all the SMs are off (0).

This parameter is populated by Recent Change. Glffos0

# Glffany1

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffany1 | LP | DMhex32 |

### 1.1 Glffany1

Global Office Parameter Glffany1

### 1.2 Description

This parameter, in conjunction with Glffany0, Glffany2 to Glffany7 in the CMP, is used by Optioned Feature System (OFS) for 5E9 and later software releases. Along with Glffall0 to Glffall7, these parameters represent the 'office' setting of the feature options (also known as, TFOS bits) and are populated from Glffos0 to Glffos7 in each SM.

Each bit in this parameter represents a feature option. Bit 0 represents feature option 532, bit 1 represents feature option 533, etc. Thus, this parameter provides 32 feature options, options 532 through 563. The bit will be set to on (1) if any of the corresponding bit of Glffos1 in the SMs is on (1); the bit will be set to off (0) if the corresponding bit of Glffos1 in all the SMs are off (0).

This parameter is populated by Recent Change.

***Type:*** DBLONGPAR

# Glffany12

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffany12 | LP | DMhex32 |

### 1.1 Fullname:

Global Office Parameter Glffany12

### 1.2 Description:

This global parameter, in conjunction with Glffany0 through Glffany20 in the CMP, is used by Feature Optioning System (FOS). Along with Glffall0 through Glffall20, these parameters represent the 'office' setting of the feature options (also known as TFOS bits) and are populated from Glffos0 to Glffos20 in each SM.

Each bit in this parameter represents a feature option. Bit 0 represents feature option 884, bit 1 represents feature option 885, etc. Thus, this parameter provides 32 feature options, options 884 through 915.

The bit will be set to on (1) if any of the corresponding bit of Glffos12 in the SMs is on (1); the bit will be set to off (0) if the corresponding bit of Glffos12 in all the SMs are off (0).

This parameter is populated by Recent Change view 8.31.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffos0 | FP | DMhex32 |

### 1.1 Glffos0

Global Office Parameter Glffos0

### 1.2 Description

This parameter, in conjunction with Glffos1, Glffos2, and Glffos3, is used by the optioned feature system (OFS) for 5E6 and later software releases. This parameter is not SM redundant, and is used to set or reset the feature options in an individual SM. Each bit in this parameter represents a feature option. Bit 0 represents feature option 500, bit 1 represents feature option 501, etc. Thus, this parameter provides 32 feature options, options 500 through 531. The feature option is on when the bit is set (1), and the option is off when the bit is reset (0).

In a retrofit from 5E5 to 5E6, this parameter must preserve the value from Glim6dummy. In other generic retrofits, ODA must recover this parameter. This parameter is populated by recent change (RC). ODA should initialize this parameter to 0.

# Glffos1

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffos1 | FP | DMhex32 |

### 1.1 Fullname:

Global Office Parameter Glffos1

### 1.2 Description:

This parameter, in conjunction with Glffos0, Glffos2, and Glffos3, is used by the Optioned Feature System (OFS) for 5E6 and later Software Releases. This parameter is not SM redundant, and is used to set or reset the feature options in an individual SM. Each bit in this parameter represents a feature option. Bit 0 represents feature option 532, bit 1 represents feature option 533, etc. Thus, this parameter provides 32 feature options, options 532 through 563. The feature option is on when the bit is set (1), and the option is off when the bit is reset (0).

OFS allows the ability for a given feature option to be set to different values on each SM (that is, not SM redundant). For example, 532 could be on (1) in one SM and off (0) in another SM. However, some feature options must be set to the same value for the entire office (that is, SM redundant). These feature options are:

- 541 (Bit 9) - 550 (Bit 18)
- 553 (Bit 21) - 557 (Bit 25)

ODA must recover this parameter on a retrofit. This parameter is populated by Recent Change. ODA should initialize this parameter to 0.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffos3 | FP | DMhex32 |

### 1.1 Glffos3

Global Office Parameter Glffos3

### 1.2 Description

This parameter, in conjunction with Glffos0, Glffos1, and Glffos2, is used by the optioned feature system (OFS) for 5E6 and later software releases. This parameter is not SM redundant and is used to set or reset the feature options in an individual SM. Each bit in this parameter represents a feature option. Bit 0 represents feature option 596, bit 1 represents feature option 597, etc. Thus, this parameter provides 32 feature options, options 596 through 627. The feature option is on when the bit is set (1), and the option is off when the bit is reset (0).

ODA must recover this parameter on a retrofit. This parameter is populated by recent change (RC). ODA should initialize this parameter to 0.

# Glffos19

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glffos19 | LRFR | DMhex32 |

### 1.1 Fullname:

Global Office Parameter Glffos19

### 1.2 Description:

This parameter is used by the Optioned Feature System (OFS) for 5E13 and later Software Releases. This parameter is used to set or reset the feature options on all the processors. This parameter is SM redundant and must be set to the same value for all SMs in the office. Each bit in this parameter represents a feature option. Bit 0 represents feature option 1108, bit 1 represents feature option 1109, etc. Thus, this parameter provides 32 feature options, options 1108 through 1139. The feature option is on when the bit is set (1), and the option is off when the bit is reset (0).

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glfgdph | FR | DMfgdph |

### 1.1 Glfgdph

Global Office Parameter Glfgdph - Feature Group D phase of the office

### 1.2 Description

The Feature Group D phase of the office can be set to: Pre-permissive phase - refers to the period of time during which ordinary subscribers are allowed to dial only the 10XXX access code. This phase does not impact dialing of 950 calls or any others features.

Permissive phase - the period of time during which ordinary subscribers are allowed to dial either the 10XXX and the 101XXXX access code on a call by call basis. This phase does not impact dialing of 950 calls or any other features.

Post-permissive phase - refers to the period of time during which ordinary subscribers are allowed to dial only the 101XXXX access code. This phase does not impact dialing of 950 calls or any others features.

# Glgbrsnd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgbrsnd | LRFR | DMshort |

### 1.1 Glgbrsnd

Global Office Parameter Glgbrsnd

### 1.2 Description

Glgbrsnd is the time interval to wait before resending a CCS maintenance/hardware group blocking message (TUP/ISUP protocols) when failing to receive the appropriate acknowledgement in response to the initial CCS maintenance/hardware group blocking message sent. This parameter is used in the AM only. ODA should populate with during retrofits and growths. This parameter is used only when the office contains CCS7 trunks as shown when one or more tuples of RLrt_trkg have in_sigtype or out_sigtype set to DBISUP7 or DBTUP7. Glgbrsnd is specified in seconds.

***Type:*** DBSHORTPAR

# Glgenid

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgenid | LRFR | DMchar |

### 1.1 Glgenid

Global Office Parameter Glgenid

### 1.2 Description

Following are the description and population rules for the elements of this parameter, Glgenid[0] through Glgenid[4]. Contains the software generic, issue and release numbers. It is sent to EADAS as part of the traffic and Division of Revenue reports. The parameter consists of four characters. Each character is assigned a number as follows:

```
element 1 - Glgenid[0]

  This element always represents the

  software generic, that is, must be set

  to a 1 for 5E1, 2 for 5E2, 3 for 5E3, etc.

  See examples below.

element 2 - Glgenid[1]

  This element represents the issue of

  the specified generic. The first issue

  of a generic always starts at 1, issue

  is never 0. See examples below.

element 3 - Glgenid[2]

  This element represents the release
```

Copyright © 1999 Lucent Technologies

of the specified issue of a generic. The first release of a generic issue starts at 1, the release of an issue is never 0. See examples below.

element 4 - Glgenid[3]

This element is unused, set it to 0.

Examples:

5E1(2)3 which is generic 1, issue 2, release 3 is specified as 1230.

5E2(2) which represents generic 2, issue 2, ( release 1 is implied ) is specified as 2210.

5E3 which represents generic 3, ( where issue 1, release 1 is implied ) is specified as 3110.

# Glgets_fw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgets_fw | FR | DMhex32 |

### 1.1 Glgets_fw

Global Office Parameter Glgets_fw

### 1.2 Description

This global is used to activate the Government Emergency Telecommunications System (GETS) feature processing. Glgets_fw has the following meaning: if 0, GETS processing is off; if 1, GETS is processing on and all calls become eligible for GETS treatment; if > 1, GETS processing is in the test mode. When Glgets_fw is greater than 1, the value is cast to the domain DMGPORT which is the port number and the module number (SM) of a test trunk for the GETS feature. Only calls on this test trunk are eligible for GETS treatment. Note ODA only supports the 0 and 1 values. RC supports the 0 and 1 values plus the values for test trunks specification.

# Glgets_rec

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgets_rec | FP | DMdn |

### 1.1 Glgets_rec

Global Office Parameter Glgets_rec

### 1.2 Description

This parameter is used as the preselect (default) directory number for Gets calls requesting automated processing. The value for this parameter is a 10 digit [0-9] number (not restricted to directory number format) or 0 if no external conferencing or ANI digits for feature group D signalling are used. Since this is a DMdn, both fields of it must be set. The array dn of this DMdn should be set to the desired digits, while the digcnt field of the DMdn should be set to the number of digits in the dn field. The digcnt should be 10 for a 10 digit number or 0 for no number.

***Type:*** DBDN_PAR

# Glglobalsm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glglobalsm | FP | DMmodule |

### 1.1 Glglobalsm

Global Office Parameter Glglobalsm

### 1.2 Description:

This parameter is indicates if a processor contains the direct interface with common channel signaling PSU transport hardware.

If Glglobalsm is not equal to 0, then the given processor is know as a Global SM.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** Certain transactions against Glglobalsm must be allowed or denied.

Transaction: Change Glglobalsm from zero to x.

Cross checks during this transaction must verify that Gllds_opt is not the null value, Glofftype is not the null value, and that Gloffpc is not greater than 16383 or 0x3fff. If those requirements are satisfied, then the SM labeled 'x' must not be an RSM if Global Office Parameter Glc7_rsm is set to DBNO. The relation MODATT can be used to find if SM 'x' is an RSM, and if the attribute 'imtype' for 'x' is set to SM5RSM then this transaction must be aborted. Neither SS7 MTP nor SS7 PSU signaled voice trunks can be assigned to an RSM, if Glc7_rsm is set to DBNO.

If the above requirements are satisfied, then the SM labeled 'x' must contain an CCS PH perf image. The next check involves verifying that SM 'x' is equipped with a PSU. If at least one tuple exists in the relation RLpsiupidb in SM 'x' then Glglobalsm can be set in SM x. 'RLindx' must be initialized with all SS7 related keys and tuples with max_idx values set to zero.

Transaction: Change Glglobalsm from x to 0

This transaction request simply completes the SS7 degrowth procedure. Before Glglobalsm can be set to zero a couple of cross checks must be made against relations in the current global SM.

First, all SS7 tuples in the relation RLINDX must have index values set to zero. If not stop this request. Second, the relation RLLS_GRP should have no tuples indicating that all link sets have been removed. If not, stop this request.

Copyright © 1999 Lucent Technologies 

When the above SS7 checks succeed, then remove all tuples in the relation RLINDX in SM x, remove the tuple in the RLOFF_PAR relation in SM x and remove all tuples from the RLC7L3TMRS relation in SM x.

Also, there must be no tuple in RLgsm_net where (RLgsm_net.gsm == Glglobalsm) and (RLgsm_net.sccp_type == CC_CCITT).

Finally set Glglobalsm to zero on the specified SM.

***Retrofit Rules:*** On retrofit to 5E11, Glglobalsm will only be valid on the SMs. Therefore, Glglobalsm should always equal 0 on the AM/CMP.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
        for i in {1 thru 192}
        begin
                if (Glintl7sm on sm(i) != 0) then
                        pcrlist[Glintl7sm on sm(i)] = true;
                if (Glnatl7sm on sm(i) != 0) then
                        pcrlist[Glnatl7sm on sm(i)] = true;
        end
```

# Glgslknum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgslknum | FP | DMushort |

### 1.1 Glgslknum

Number of gslk tuples populated in SM.

### 1.2 Description

The Glgslknum parameter is used to store the number of tuples needed for the dynamic relation RLgslk. This value is set by SM initialization code and administered via PC trigger functions to represent the total number of RLgslk tuples that have been inserted. One Rlgslk tuple is required for each tuple in RLgsdb and RLai_gsdb.

Since GSDBs and AI_GSDBs represent groups of eight lines, each group of eight lines gets one GSLK.

# Glgsmtype

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgsmtype | FP | DMgsmtype |

### 1.1 Fullname:

Global Office Parameter Glgsmtype

### 1.2 Description:

This global parameter specifies the type of SM in terms of the type of CCS messaging supported on the SM. Glgsmtype has on of the following values:

1. CCNOTAGSM - This SM is not a global SM.
2. CCISLANDGSM - The SM is a GSM that supports CCS messaging for trunks and TCAP services on the SM but has not been provisioned to support such messaging for trunks and TCAP services on other non-global SM's.
3. CCHOSTGSM - The SM is a GSM which supports sending and receiving of CCS messages for non-global SM's.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** CCNOTAGSM

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** When an SM is provisioned as a GSM via Recent Change view 16.1 or ODA form CCGSM then the value of Glgsmtype should be updated to CCISLANDGSM. If an GSM is deleted via Recent Change view 16.1 or ODA form CCGSM Glgsmtype should be updated to CCNOTAGSM.
If a GSM is provisioned as a Host GSM via Recent Change view 16.16 or ODA form CMTMH, Glgsmtype should be updated to CCHOSTGSM. If a GSM is deleted via Recent Change view 16.16 or ODA form CMTMH so that it no longer serves as a host for any non-global SM's then Glgsmtype should be updated to CCISLANDGSM.

***Retrofit Rules:*** The value should be preserved over the retrofit.

***Default Rules:***

```
default = CCNOTAGSM;
```

***Distribution Rules:***

### 1.1 Glgtt_ent

SCCP Count of Maximum Global Title Translation Entries

### 1.2 Description

This parameter is referenced by SCCP. It is populated in SM's indicated by Glgsm_net when Glgsm_net is not empty. Glgtt_ent indicates the maximum number of entries allowed in the RLgtt_dpc relation per GSM.

# Glgursnd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glgursnd | LRFR | DMshort |

### 1.1 Glgursnd

Global Office Parameter Glgursnd

### 1.2 Description

Glgursnd is the time interval to wait before resending a CCS maintenance/hardware group unblocking message (TUP/ISUP protocols) when failing to receive the appropriate acknowledgement in response to the initial CCS maintenance/hardware group unblocking message sent. This parameter is used in the AM only. ODA should populate with default value for new office but preserve value from data base during retrofits and growths. This parameter is used only when the office contains CCS7 trunks as shown when one or more tuples of RLrt_trkg have in_sigtype or out_sigtype set to DBISUP7 or DBTUP7.

# Gliamcrmpr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gliamcrmpr | LRFR | DMuns2 |

### 1.1 Fullname:

Global Office Parameter Gliamcrmpr - Initial Address Message (IAM)/Circuit Reservation Message (CRM) Priority

### 1.2 Description:

This per office parameter is used as an indicator for SS7 ISUP to mark the priority for IAMs and CRMs messages. When set to 1, all outgoing IAMs and CRMs (regardless of type of call) are set to the standard priority of 1. If set to 0 (zero), all GETS and MLPP non-routine IAMs and CRMs have outgoing priority = 1; all other types of calls (including routine MLPP calls) have their priority LOWERED to 0. This in effect RAISES the relative priority of GETS and MLPP call's IAM and CRMs.

# Glibusy

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glibusy | FR | DMbool |

### 1.1 Glibus

ISUP Busy Play Announcement Indicator (Glibusy)

### 1.2 Description

A terminating exchange will determine whether the called party interface is busy prior to performing circuit allocation. If the called party interface is busy, the office must either (1) return a 2release message (REL) with a cause of user busy (17), or (2) provide busy tone.

The ISUP busy play announcement indicator (Glibusy) will be checked by the operational software during call failures in which the called party is busy, and the call route consists of ISUP protocol trunks interworked to other signal protocol trunks.

The values of the parameter may be optioned by the customer to one of the values shown below:

DBYES: A busy tone should be provided to the originating exchange.

DBNO: A Release Message should be sent to the originating exchange.

# Glical_inf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glical_inf | FP | DMshort |

### 1.1 Fullname:

Incremental value for the number of CALEA Information tuples.

### 1.2 Description:

The Glical_inf global parameter contains an SM's incremental RLCAL_INFO tuple count. It is established by ODA and is changeable via Recent Change. The switch personnel can add tuples by increasing this value. A trigger function inserts the additional tuples and links them to the idle list.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***TRIGGER:*** FCtrical_inf,

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** A RC view (v8.40) and ODA form per-SM field is required.
RC ONLY: This value can not be changed by more than 50 during each update. This global parameter needs special support for the Large Terminal Growth (LTG) process. As per requirements ODA is not supporting an equivalent ODA form.
Whenever adding or deleting a population rule for CALEA that has LTG impact, you must contact the ODA Support Group for LTG to modify the CALEA #include file.

***Retrofit Rules:*** This value should be preserved over a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```

# Gliccsstpd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gliccsstpd | FP | DMushort |

### 1.1 Gliccsstpd

Incremental value for number of CCSSeTuP data block tuples

### 1.2 Description

The Gliccsstpd global parameter contains an SM's incremental rlCCSSTPDB tuple count. It is established by ODA and is changeable via recent change. The craft can add tuples by increasing this value. A trigger function inserts the additional tuples and links them to the idle list.

This parameter indicates the incremental number of RLccsstpdb tuples that should be added on to the standard allocation amount for this processor. Gliccsstpdb is provisionable by the craft. When Gliccsstpdb is updated, a trigger function will create the added RLccsstpdb tuples and link them to the idle list.

When special features exist in certain processors, more RLccsstpdb tuples may be needed. If this need arises, the value of Gliccsstpdb should be set to a non-zero value that will add onto the standard allocation and provide enough tuples to satisfy the need.

# Gliclidfeatid

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gliclidfeatid | FR | DMfid |

### 1.1 Gliclidfeatid

Global Office Parameter Gliclidfeatid

### 1.2 Description

This global parameter contains a LASS ICLID feature id for GENERALLY AVAILABLE feature access. This will be used by call processing to determine which tuple to read in the _cf and _opts relations for GENERALLY AVAILABLE features. Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the GENERALLY AVAILABLE feature name, /DIGA, as the key.

# Glictmc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glictmc | LP | DMuns13 |

### 1.1 Glictmc

Global Office Parameter Glictmc

### 1.2 Description

The Logical Processor to populate according to the following rules is identified by Glpacdq. Other Logical Processors should be populated with the value zero.

This global parameter (Interposition Conference and Transfer Maximum Calls) specifies the maximum number of calls that may be queued for 'claimed' positions. It is the maximum number of conference and transfer requests within the OSPS ACD to specific positions (that is, requested by operator login id or position number) that can be queued because the 'claimed' positions are busy.

This parameter appears on the ODA OSPS Office Options form. It also appears on the RC/V OSPS Office Parameters view 8.9 in the field 'CLAIM CQDB' in the 'CALL QUEUE SLOTS' section.

The RLCTINFO trigger function will respond to increases to Glictmc on RC/V view 8.9 by inserting additional tuples into RLCQDB such that the number of tuples (reflected in Glcqdbx) is not less than the sum (Glctmcs + Glictmc).

The sum (Glctmcs + Glictmc) is displayed (read only) on the OSPS Office Parameters view 8.9 in the field named 'REQUIRED CQDB' in the 'CALL QUEUE SLOTS' section. Recent Change and ODA are both required to disallow the sum (Glctmcs + Glictmc) from exceeding 5000.

***Type:*** DBSHORTPAR

# Glidlech

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glidlech | FP | DMshort |

### 1.1 Glidlech

Global Office Parameter Glidlech

### 1.2 Description:

This global parameter contains the numbers of the peripheral channels which currently source idle code to the network. At power-up initialization, this variable should contain the value zero. There is no way for maintenance to update this value, only the *5ESS*®-2000 switch software can do it. This value should remain intact during a Generic Retrofit.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** RC and ODA will always set Glidlech = 0 for SM-2000. ODA will not preserve values over a retrofit for SM-2000.

***Retrofit Rules:*** not applicable

***Default Rules:*** None

***Distribution Rules:***

```

# Glidpdesep

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glidpdesep | FR | DMdesep |

### 1.1 Glidpdesep

Global Office Parameter Glidpdesep

### 1.2 Description

This global parameter will store the desep value for IDP dial codes. When IDP digit analysis identifies that an IDP dial code has been dialed, the value of Glidpdesep will be assigned to the desep in the route request message. The desep in the route request message will make its way into the Call Record. All IDP dial codes will be given this desep, regardless of what IDP group the dial codes are defined in.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** For retrofit from 5E7(1) to 5E8(1), the new 5E8(1) global parameter Glidpdesep will be assigned the value of Glim8dummy. In 5E8(1), Glim8dummy is replaced by Glidpdesep, so Glim8dummy will be available for use. Once Glidpdesep is given the value of Glim8dummy, Glim8dummy should be set to zero.

# Glignscrn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glignscrn | FR | DMbool |

### 1.1 Glignscrn

Ignore Screening on 0+ Calls

### 1.2 Description

This global parameter will be used to determine whether pre-query screening will occur on 0+ calls when an Off-Hook Delay (OHD) feature is assigned to the originating party. If the parameter is set to DBYES, screening will be ignored on 0+ calls from an originator with an OHD feature, and an Info_Collected Trigger will be launched. If the parameter is set to DBNO, screening will occur on 0+ calls from an originator with an OHD feature. In the second case, an Info_Collected Trigger may or may not be launched, depending on the results of screening. This parameter can be set to DBYES only if the Pre-Query Screening for OHD Trigger feature is active in the office (SFID178 is on).

# Gliic_cnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gliic_cnt | LP | DMpsiic_cn |

### 1.1 Fullname:

Global Office Parameter Gliic_cnt, International Interlock Code counter for Closed User Groups.

### 1.2 Description:

This global office parameter is used to keep a count of the number of Closed User Group International Interlock Codes (IICs) defined in the entire switch. The count is maintained so that RC can quickly determine if it should allow a new tuple to be populated in the relation RLpscug_iic. A maximum of 1600 IIC's are allowed per *5ESS*® switch for all X.75 trunk groups. This global is an internal RC / ODA populated parameter and is not displayed on any view. The global may only be updated using ODBE (to fix corruption).

***Type:*** DBSHORTPAR

# Glilec

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glilec | FR | DMbool |

### 1.1 Glilec

ISUP Non-Interworking LEC Announcement Indicator (Glilec)

### 1.2 Description

Glilec is used to control if tone/announcement is applied to a call with bearer capability of `3.1kHz audio' or `speech' after certain failure events occur on an ISUP7 trunk in the LEC network. This only applies to non-ISDN access calls which have used ISUP7 trunks all the way (IAM.FCI.isdn_access=0 & IAM.FCI.isup=1).

It does not apply to the following failure events:

```
unallocated number (1)
user busy (17)
no user responding (18)
call rejected (21)
number changed (22)
destination out of order (27)
bearer capability not implemented (65)
```

If a failure event other than what is listed above occurs, the switch software must determine whether to

```
(1) send a Release Message or
(2) provide an appropriate tone or announcement.
```

The value of this parameter should be optioned by the customer to one of the values below.

```
DBYES: A tone/announcement should be provided to
       the preceding exchange.
DBNO:  A Release Message should be sent to
       the preceding exchange.

# Glim5dummy

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glim5dummy | FP | DMlong |

### 1.1 Glim5dummy

Global Office Parameter Glim5dummy

### 1.2 Description

This global parameter is used to allow or disallow a user to transfer a picked up leg. The 1A does not allow a picked up leg to be transferred. Some offices consider the ability to transfer a pickup call and for the value of Glim5dummy (global SM parameter) to decide if the call should be blocked. If the parameter is 0, the call will be blocked as it is in the 1A. If the parameter is set to 1, the transfer will not be blocked. On retrofits from 5E4(2) to 5E5(1) or to 5E6(1) preserve existing value. This parameter will be replaced in 5E7(1) by Glmwcpu.

# Glim6dummy

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glim6dummy | FP | DMlong |

### 1.1 Glim6dummy

Global Office Parameter Glim6dummy

### 1.2 Description

This global parameter is used by the field feature optioning system (FFOS) for 5E4(2) and 5E5 generics. This parameter is not SM redundant, and is used to set or reset the feature options in an individual SM. Each bit in this parameter represents a feature option, except for the sign bit (bit 31). Bit 0 represents feature option 0, bit 1 represents feature option 1, etc. Bit 31 should not be used because it is a sign bit. Thus, this parameter provides 31 feature options, options 0 through 30. The feature option is on when the bit is set (1), and the option is off when the bit is reset (0).

In a retrofit from 5E4(2) to 5E5, ODA must recover this parameter. This parameter will be replaced by Glffos0 in 5E6. This parameter is populated by Recent Change. ODA should initialize this parameter to 0.

# Glim10dummy

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glim10dummy | FP | DMlong |

### 1.1 Glim10dummy

Global Office Parameter Glim10dummy

### 1.2 Description

This global parameter is used by field feature 2.1 (NOANI) for the 5e4(2) and 5e5 generics. This parameter will enable craft to print or suppress a message to the read only printer (ROP), by turning it on/off through ODBE. The messages will indicate that an incoming call to the 5ESS(R)-2000 switch over an equal access (LATA_CONNECT) Trunk contains no ANI information or contains a KP+ST sequence (that is no ANI digits). The feature option is on when it is set to 1 and off when it is set to 0. This bit is not preserved from 5e4(2) to 5e5 and therefore has to be reset in 5e5. In the 5e6 design, this bit will no longer be used since craft will be allowed to turn the feature on and off through input commands.

# Glindets

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glindets | FR | DMulong |

### 1.1 Glindets

Global Office Parameter Glindets

### 1.2 Description

This parameter is currently used to store 3 values for the OSPS Special Feature 'LIDB - Change Handling of Indeterminate Reply Codes'. The OSPS SF LCHOIRC is using bits 0-5 for 3 parameters. Bits 0-1 represent the status for LIDB Unavailable Network Resource and Nonparticipating Group query replies, bits 2-3 represent LIDB Timeout query replies, and bits 4-5 represent all other LIDB indeterminate query replies. Bits 6-31 are currently unused and are reserved for future LIDB query replies. RC and ODA are to show the values as E (existing treatment), A (allow) and D (deny) (domain DMindetst).

***Type:*** DBULONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** RC and ODA must display all three fields with either an E, A or D (domain DMindetst). Bits 0-1 represent LIDB Unavailable Network Resource and Nonparticipating Group query replies, bits 2-3 represent LIDB Timeout query replies, and bits 4-5 represent all other LIDB indeterminate query replies. The RC/ODA values for each 2 bit field are E, A or D (domain DMindetst). Bits 6-31 are currently unused.

***Retrofit Rules:*** Bits 20-25 of Gloff1 in 5E8 must be copied to bits 0-5 of this global parameter in 5E9. All the other bits (6-31) are not used currently by this feature and thus need not be copied (but can be defaulted to zeros).

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glinh_snpa | FR | DMbool |

### 1.1 Glinh_snpa

Global Office Parameter Glinh_snpa Inhibit SCP NPA Deletion

### 1.2 Description

This global parameter is used for advanced services platform (ASP) and service switching point (SSP) 800 calls to indicate deletion of the NPA should be inhibited for the routing DN returned from the service control point (SCP) data base. At a SSP office a query is made to an external SCP data base to obtain routing information necessary to complete the call. The NPA deletion functionality is done before invoking digit analysis on the returned routing DN. The default value of DBNO is used to indicate do not inhibit NPA deletion and DBYES indicates inhibit NPA deletion on the routing DN before invoking digit analysis.

```

# Glinic

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glinic | FP | DMpsdnic |

### 1.1 Glinic

Global Office Parameter Glinic

### 1.2 Description

Glinic is a string of 4 BCD digits. This global parameter specifies the INIC (ISDN Network Identification Code) of the ISDN network where this switch resides. The Glinic value is to be used for the clearing network identification code (CNIC) in the PH.

For any SMs with the GLISDNBASE software loadable package, this parameter must be in the range 0x0001 through 0x9999. For any SMs without the GLISDNBASE software loadable package, this parameter must be 0.

It should be noted that the INIC of an ISDN has no association with data network identification codes (DNICs) because DNICs do not identify ISDNs. This parameter should be populated only in all the ISDN SMs.

# Glinpa

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glinpa | FR | DMchr8 |

### 1.1 Fullname:

Global Office Parameter Glinpa

### 1.2 Description:

Implied NPA (area code) of the office. The area code (NPA) chosen to be Glinpa should be the NPA most often implied by 7-digit calls received in this office. It is a legal area code, each digit being between '0' and '9' inclusive. It must be filled in. Glinpa is related to the RLnmimpdgts relation. In order to limit the number of tuples in the RLnmimpdgts relation, RLnmimpdgts is generally not populated with tuples for 7-digit calls whose implied NPA is the same as the Glinpa. Be aware that choosing a Glinpa which is not the most often implied npa for 7-digit calls will result in more tuples being populated in the RLnmimpdgts relation.

Occasionally customers may find a need to populate the RLnmimpdgts with the same implied NPA as the Glinpa. Again this results in more tuples being populated in the RLnmimpdgts relation.

# Glintacmtr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glintacmtr | FR | DMuns13 |

### 1.1 Glintacmtr

Global Office Parameter Glintacmtr

### 1.2 Description

This global parameter specifies the time delay interval, in increments of milleseconds, between requesting that an address complete message (ACM) be sent, and the initial request to connect to an announcement circuit, automated position, or operator position. This timer is used for incoming SS7 signaled international calls to the OSPS.

***Type:*** DBSHORTPAR

# Glintl7sm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glintl7sm | FP | DMmodule |

### 1.1 Glintl7sm

Global Office Parameter Glintl7sm

### 1.2 Description

This global parameter indicates if this processor contains a direct interface with the international CCITT7 (Signaling system No. 7) transport hardware.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** If there is international CCITT7 in the office the value of this parameter depends on the transport hardware:
Glintl7sm must be set to indicate the SMs containing PSUs used for international CCITT7 transport. Glintl7sm is set to the SM number on any SM which contains a PSU that handles international CCITT7 transport. On these SMs, Glnatl7sm must be zero (0) since national and international CCITT7 signaling cannot exist on the same SM.

Certain transactions against Glintl7sm must be allowed or denied:

```
'Transaction: Change Glintl7sm from zero to x'
```

If all the requirements for changing the parameter Glglobalsm in SM 'x' from zero to 'x' are satisfied, then set Glintl7sm to 'x' on 'x'.

```
'Transaction: Change Glintl7sm from x to y'
```

This transaction applies when both 'x' and 'y' are non-zero. This request must be denied unconditionally.

```
'Transaction: Change Glintl7sm from x to zero'
```

If all the requirements for changing the parameter Glglobalsm in SM 'x' from 'x' to zero are satisfied, then set Glintl7sm to '0' on SM 'x'. Glintl7sm cannot be set to a non-zero value on SM 'x' if SM 'x' is an RSM (that is of type SM5RSM) unless the global parameter Glc7_rsm is set to DBYES. The type of SM 'x' can be read from RLmodatt.imtype. If Glc7_rsm is set to DBNO then if SM 'x' is of type SM5RSM, Glintl7sm can never be set to a non-zero value.

***Retrofit Rules:*** None.

# Glintopcnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glintopcnt | LR | DMshort |

### 1.1 Glintopcnt

Global Office Parameter Glintopcnt

### 1.2 Description

This global parameter stores the current internal operator id count for OSPS. It has the following relationship with the two relations INTOPID and OLOGINID:

#tuples (OLOGINID) + #tuples (INTOPID) = Glintopcnt

This parameter is incremented by RC when tuples are inserted into OLOGINID or INTOPID. It does not appear on a Recent Change view.

When the number of tuples in OLOGINID = 0, the tuples in INTOPID should be cleared and this parameter set equal to 0.

For new offices, this parameter should be equal to the number of tuples in OLONGID. For existing offices populated via off-line ODA process, this parameter should be equal to the sum of the tuples in relation OLONGID and the relation INTOPID.

This parameter must be zero unless there is at least one loaded SM in the office.

# Glipuentry

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glipuentry | FP | DMshort |

### 1.1 Glipuentry

Global Office Parameter Glipuentry - incremental pick up entry

### 1.2 Description

GLipuentry is the global parameter that is changeable via recent change (RC). The craft can add tuples by changing this value.

POPULATION: ODA will initialize to default value.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** A new RC and ODA per-sm field are required. For RC, the value cannot be increased by more than 50 during each update. A trigger function will create the added RLpu_entry tuples and link them to the idle list.

***Retrofit Rules:*** The value is preserved over a retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
for modatt in RLmodatt
pcrlist[modatt.module] = true;
```

***Checks:***

# Glircar

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glircar | FP | DMbcarid |

### 1.1 Glircar

Global Office Parameter Glircar defines: "db/DMcarr_val.h"

### 1.2 Description

Specifies the OSPS emergency default carrier identification number in binary format. Glircar is the carrier identifier for operator services dialing on emergency calls. This carrier is required for Inter-LATA OSPS emergency calls from dedicated Intra-LATA trunk groups. This carrier id must appear in the RLfc_carr relation which defines the routing information for this carrier. This parameter along with the information in RLfc_carr controls the routing used for emergency operator services dialing for toll and assistance operators on this OSPS switch. Glospsta

Please look in db/DMcarr_val.G for #defines used in this file.

# Glisdam

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glisdam | FR | DMbool |

### 1.1 Glisdam

Global Office Parameter Glisdam

### 1.2 Description

This global parameter specifies office option for AMA recording for ISDN circuit switched data (CSD) calls. DBYES, a standard data module with data for bearer capabilities, network interworking, release cause indicator, and/or signaling/supplementary services must be appended to a regular AMA record.

Set to DBNO, if existing 5E3 implementation of AMA call codes and structure codes for CSD calls will be used. Set to DBYES, if existing voice call codes and structure codes will be used for the CSD call. In either case, an EBAF data module must be appended to the structure code to be used. The data module is AAA if a signaling/supplementary service is used in the call; otherwise, it is module BBB.

# Glislu2cap

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glislu2cap | FR | DMbool |

### 1.1 Glislu2cap

ISLU2/AIU capacitor usage

### 1.2 Description

This global parameter is used to indicate whether the ISLU2/AIU MTB capacitor should be included in the line test path. The capacitor may be included in the path for compatibility with non-integrated Mechanized Loop Test Systems. Including the capacitor degrades the measurement accuracy of other test systems. DBYES indicates the capacitor should be included in the measurements, DBNO indicates the capacitor should not be included in the line test path.

# Glisuptk_cnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glisuptk_cnt | FP | DMushort |

### 1.1 Glisuptk_cnt

Global parameter for ISUP7 ports

### 1.2 Description:

Glisuptk_cnt contains the number of RLfc_trunk tuples where RLfc_trunk.in_sigtype equals DBISUP7. This value is used to determine the appropriate number of RLccsstpdb tuples to allocate in each SM. The relationship between the value of Glisuptk_cnt and the number of RLccsstpdb tuples is built into software. A summary of this logic follows:

RLccsstpdb tuples are only used for some incoming ISUP7 calls, so none are needed for 1-way outgoing ISUP7 trunks.

When no ISUP7 trunks exist in an SM, no RLccsstpdb tuples are allocated. For Glisuptk_cnt with a value between 1 and 32, 10 RLccsstpdb tuples are allocated. For Glisuptk_cnt larger than 32, 1 RLccsstpdb tuple is allocated for every 3 trunks beyond 32. This is summarized in the following chart.

```
RLccsstpdb

Glisuptk_cnt    tuples

-------------   ----------

1 - 32          10

33-35           11

36-38           12

etc
```

***Type:*** DBSHORTPAR

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** not applicable

Copyright © 1999 Lucent Technologies

***Retrofit Rules:*** For retrofit from an earlier release to 5E9, Glisuptk_cnt must be populated with the number of incoming ISUP7 (that is, trunks where RLfc_trunk.in_sigtype = DBISUP7) trunks in the SM. The algorithm for doing this is shown in the checks section of this population rule file.

For retrofit from 5E9 to a later release, the value of Glisuptk_cnt can be discarded and recomputed using the algorithm shown in the checks section of this population rule file.

# Glitnfw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glitnfw | FR | DMhex32 |

### 1.1 Glitnfw

Global Office Parameter Glitnfw

### 1.2 Description

This global is used to activate the improved third number acceptance (ITNA) feature processing. Glitnfw has the following meaning: if 0, ITNA processing is off; if 1, ITNA processing is on and all calls become eligible for ITNA treatment; if greater than one, ITNA processing is in the test mode. When Glitnfw is greater than one, the value is cast to the domain DMGPORT, which is the port number and the module number (SM) of a test trunk for the ITNA feature. Only calls on this test trunk are eligible for ITNA treatment. Note ODA only supports the zero and one values. RC supports the zero (0) and one (1) values plus the values for test trunks specification.

# Glitxn_inf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glitxn_inf | FP | DMushort |

### 1.1 Fullname:

Incremental value for number of rlTXN_INFO tuples

### 1.2 Description:

This global parameter records the incremental count of rlTXN_INFO tuples on an SM. It is established by ODA and is changeable via recent change. The switch personnel can add tuples by increasing this value. A trigger function inserts the additional tuples and links them to the idle list.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***TRIGGER:*** FCtritxnif,

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** This global parameter is fully supported by RC via view 8.40. The initial value of this parameter is established by ODA. If SFID 507 is not active, Glitxn_inf must equal 0.
RC ONLY: This value cannot be changed by more than 50 during each update.

***Retrofit Rules:*** This value should be preserved over a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;

# Gliwlec

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gliwlec | FR | DMbool |

### 1.1 Gliwlec

ISUP Interworking LEC Announcement Indicator (Gliwlec)

### 1.2 Description

Gliwlec is used to control if tone/announcement is applied to a call with bearer capability of `3.1kHz audio' or `speech' after certain failure events occur on an ISUP7 trunk in the LEC network. This only applies to non-ISDN access calls which have not used ISUP7 trunks all the way (IAM.FCI.isdn_access=0 & IAM.FCI.isup=0).

It does not apply to the following failure events:

```
unallocated number (1)
user busy (17)
no user responding (18)
call rejected (21)
number changed (22)
destination out of order (27)
bearer capability not implemented (65)
```

If a failure event other than what is listed above occurs, the switch software must determine whether to

```
(1) send a Release Message or
(2) provide an appropriate tone or announcement.
```

The value of this parameter should be optioned by the customer to one of the values below.

```
DBYES:  A Release Message should be sent to the preceding exchange.
DBNO:   A tone/announcement should be provided to the preceding exchange.
```

# Gllatiablf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllatiablf | FP | DMuns8 |

### 1.1 Gllatiablf

Global Office Parameter Gllatiablf

### 1.2 Description

This parameter is used to count how many RLIS_TERM tuples have RLIS_TERM.latidx assigned some non_zero values in each SM.

For ODA, count all RLIS_TERM tuples with a non_zero value of RLIS_TERM.latidx per SM. If no tuples are found, set to default value of 0.

For RC and ODBE, if a RLIS_TERM tuple with a non_zero value of RLIS_TERM.latidx assigned is added or a RLIS_TERM tuple with zero value of RLIS_TERM.latidx changed to a non_zero value of RLIS_TERM, this Gllatiablf will be incremented by one. Each time a RLIS_TERM tuple with a non_zero value of RLIS_TERM.latidx assigned is deleted or its RLIS_TERM.latidx value gets changed to zero, this Gllatiablf will be decremented by one.

# Gllidbtime

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllidbtime | LRFR | DMuns4 |

### 1.1 Gllidbtime

Global Office Parameter Gllidbtime

### 1.2 Description

LIDB query time out parameter. Time allowed for LIDB query (BNS or Calling card) to respond. Range is specified in seconds. This parameter indicates the longest period of time that call processing will wait for a reply from the database. A timeout for a BNS query will result in the operators following local practices to obtain verification. A timeout for a calling card query will result in call processing continuing the call as indicated by the Glbllng_blck parameter. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value.

Global Office Parameter Gllndas

### 1.2 Description

This global parameter will be defined as the DAS to specify the digit tree to use for the vacant code screening for the Leased Network (LN) Action Point (ACP) calls. If this global parameter is populated (not equal to zero), then there should exactly exist one tuple in the relation RLrc_das with RLrc_das.digtree = Gllndas.

# Gllnp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllnp | FR | DMbool |

### 1.1 Gllnp

Local Number Portability (LNP) indicator

### 1.2 Description

When set to DBYES, this parameter indicates that the LNP feature SFID174 is unlocked and at least one ASP LNP trigger number has been populated in an RLdaprmfnl tuple.

The purpose of this parameter is to trigger the recalculation of the number of ASP dynamic base relation tuples in RLnsdb, RLns_bill, RLns_idx, and RLtn_info, and the allocation of new tuples for these relations due to the use of ASP queries for the LNP feature.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***TRIGGER:*** FCtriaspbase

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** This is an internal parameter not supported by an RC view. It can be established by ODA. RC mapping code will update this parameter from DBNO to DBYES, when RC finds that the first ASP LNP trigger number has been populated in RLdaprmfnl. An ASP LNP trigger number may only be populated if SFID174 has been unlocked, so this parameter may only be set to DBYES if SFID174 has been unlocked.

***Retrofit Rules:*** This parameter should be recalculated during a retrofit. If SFID174 is unlocked and there is at least one tuple in RLdaprmfnl with the lnp_trignum attribute set to a non-zero value, then this parameter should be set to DBYES. Otherwise it should be DBNO.

The Glaspbase parameter should be calculated AFTER this parameter has been calculated.

***Default Rules:***

```
default = DBNO;
```

***Distribution Rules:***

```
        /* standard */
```

***Checks:***

# Gllnpama

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllnpama | FR | DMbool |

### 1.1 Fullname:

Local Number Portability (LNP) Automatic Message Accounting (AMA) indicator

### 1.2 Description:

When set to DBYES, this parameter indicates that the Number Portability feature, NP-AMA Access Billing, SFID199 is unlocked. When set to DBNO, this parameter indicates that SFID199 is locked. After SFID199 has been updated, this parameter will be updated from DBNO to DBYES or from DBNO to DBYES by functions triggering off of RLfc_line, RLis_line, or RLfc_trunk being updated, inserted, or deleted.

***Type:*** DBENUMPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***TRIGGER:*** *

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** This parameter is updated by trigger functions and is not supported by RC mapping code. The value of this parameter is initialized by ODA. If SFID199 is unlocked, ODA will set this value to DBYES. If SFID199 is locked, ODA will then set this value to DBNO.

***Retrofit Rules:*** In 5E11 and 5E12, this data was previously stored in the ab2 attribute of a RLsf14 tuple with ks equal to the SM number and ksubrid equal to 1. During a retrofit from 5E12 to 5E13, the data from sf14.ab2 must be carried over and stored in this parameter. In later retrofits, the value of this parameter should be preserved (by EVL code or ODA).

***Default Rules:***

```
default = DBNO;
```

***Distribution Rules:***

```
        /* standard */
```

***Checks:***

```
/* RULE about Gllnpama */

# GllnprecaI

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| GllnprecaI | FP | DMbool |

### 1.1 Fullname:

Local Number Portability Recalculation indicator

### 1.2 Description:

When set to DBYES, this parameter indicates that the Number Portability feature, NP - AMA Access Billing, SFID199 is unlocked and the number of ASP dynamic base relation tuples in RLnsidx, RLnsdb, and RLns_bill has been recalculated. When set to DBNO, this parameter indicates that SFID199 is locked and the number of tuples in RLnsidx, RLnsdb, and RLns_bill has not been recalculated. This parameter will be updated after SFID199 has been updated and as soon as either RLfc_line, RLis_line, or RLfc_trunk is updated, inserted, or deleted.

The parameter was created as part of a "work around" that tries to deal with not being able to trigger directly off of changes to SFIDs. The recalculation is instead triggered by the first RLfc_line, RLis_line, or RLfc_trunk tuple that is updated, inserted, or deleted after SFID199 has been unlocked. When set to DBYES, this parameter indicates that the initial recalculation has taken place and that from this point on, the recalculation should only be triggered if the number of ported lines or trunks changes.

***Type:*** DBENUMPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** This parameter is updated by trigger functions and is not supported by RC mapping code. The value of this parameter is established by ODA. ODA will always set the value to DBNO.

***Retrofit Rules:*** In 5E11 and 5E12, this data was previously stored in the ab1 attribute of a RLsf14 tuple with ks equal to the SM number and ksubrid equal to 1. During a retrofit by EVL from 5E12 to 5E13, the data from sf14.ab1 must be carried over and stored in this parameter.

In later retrofits by EVL, the value of this parameter should be preserved.

In retrofits by ODA, this value will always be set to DBNO.

# Glloc_loss

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glloc_loss | FP | DMtsi_loss |

### 1.1 Glloc_loss

Global Office Parameter Glloc_loss

### 1.2 Description

This parameter is used to define the amount of decibel (dB) loss applied to local calls by the Time Slot Interchanger (TSI). It applys to all calls that do not traverse an umbilical link. Intermodule calls on an ORM are treated as umbilical calls; therefore, local loss will not be applied to these calls.

This parameter is set in 0.5 dB increments. Range of values: min. LSS0_0 (0.0 dB) to max. LSS15_0 (15.0 dB).

```
LSS0_0 (0.0 dB)

LSS0_5 (0.5 dB)

LSS1_0 (1.0 dB)

LSS1_5 (1.5 dB)

LSS2_0 (2.0 dB)

        .

        .

        .

LSS15_0 (15.0 dB)
```

In order to set the parameter to a value greater than 0.0, the Far Access Remote (FAR) special feature (SFID 184) must be purchased and must be turned on (SFID 184 is set) for the office.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllocalcoin | FR | DMbool |

### 1.1 Gllocalcoin

Global Office Parameter Gllocalcoin

### 1.2 Description

This parameter is used by the special feature, Coin Line Automatic Message Accounting (CLAMA) in 5E8(1). This parameter is SM redundant. It is used to obtain on a per office basis, AMA records for local coin sent-paid calls. This parameter can be set to DBYES only if the security bit (SFID070) indicates that the CLAMA feature has been purchased by the office.

The value of this parameter can be:

```
DBNO  = do not generate AMA records

DBYES = generate AMA records
```

ODA should initialize this parameter to DBNO in a new office.

# Glloop

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glloop | FP | DMushort |

### 1.1 Glloop

Global Office Parameter Glloop

### 1.2 Description

This parameter is initialized by the RLLOOPDB initialization function to equal the actual number of tuples in RLLOOPDB. If the RLLOOPDB initialization succeeds then Glloop will be set to the lesser of the values Glnbst and DBQNLOOPDB. In case of initialization failure, Glloop will reflect the actual number of RLLOOPDB tuples successfully initialized.

This parameter does not appear on any ODA form and ODA is not required to initialize its value. This parameter does not appear on any Recent Change (RC) view.

The RLPOS_LPRT trigger function will increase the value of Glloop as additional RLLOOPDB tuples are inserted in response to increases to Glnbst, resulting from RC to view 21.32 (RC_PPMAP). The RLPOS_LPRT trigger function will insert RLLOOPDB tuples and correspondingly increase Glloop such that Glloop is not less than the lesser of the values Glnbst and DBQNLOOPDB. The range is specified in decimal.

# Gllportcnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllportcnt | FP | DMulong |

### 1.1 Fullname:

Global Office Parameter Count of Analog Lines and ISDN Digital

Subscriber Line Logical Terminations that are ported

### 1.2 Description:

The Gllportcnt global parameter contains an SM's count of analog lines (that do not have shared DNs) and PODS (Plain Old Digital Service) lines that are ported by a Number Portability feature plus an SM's count of shared analog and ISDN tuples where the terminal has been ported by a Number Portability feature. Its value is maintained over all initializations and updated via trigger functions as analog and PODS lines are inserted, deleted, or updated and as shared analog and ISDN lines are inserted, deleted, or updated.

This count does not include terminals ported via Multi-Line Hunt Groups or Terminal Groups. This parameter c

# Gllscmdb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllscmdb | FP | DMshort |

### 1.1 Fullname:

Global Office Parameter Gllscmdb, number of LSCMDBs allocated per SM

### 1.2 Description:

The Gllscmdb global parameter contains an SM's current rlLSCMDB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FClscmcnt.c which is the init code for Gllscmdb. So if the algorithm in this file changes verify that it is consistent with the init code algorithm. ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

# Gllsdnnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllsdnnum | FP | DMushort |

### 1.1 Gllsdnnum

Large SHDN Number

### 1.2 Description:

Number of Large SHDN groups appearing on this SM. The group must have at least 9 members and each SM the group appears on must increment the counter.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter should be populated based on the number of large SHDN groups per SM. When groups are updated via Recent Change this number can change based on whether a new large group was created or whether a large group was modified to become a small group. Also actions such as swaps, moves, etc. via Recent Change must update the Global if needed. Global must also be updated when large groups are changed to small groups. Also, when small groups are changed to large groups and when large groups are changed.

If there are no Large SHDN groups on the SM the value should default to zero.

***Retrofit Rules:*** This number must be populated at retrofit to be the number of large SHDN groups (more than eight terminals in the group) per SM.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***

# Gllsfw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gllsfw | FP | DMhex32 |

### 1.1 Gllsfw

Global Office Parameter Gllsfw

### 1.2 Description

Listing Services call completion feature word.

This global is used to activate the LS Call Completion (LSCC) feature. Gllsfw has the following meaning: if 0, LSCC feature is off; if 1, LSCC feature is activated. When Gllsfw is greater than 1, the value is cast to the domain DMGPORT, which is the port number and the Module Number (SM) of a test trunk for the LSCC feature. Only calls on this test trunk are eligible for LSCC treatment. When Gllsfw is greater than one (test trunk), a tuple must exist in RLport_group where RLport_group.port equals Gllsfw and RLport_group.party equals FCP_TRUNK. A tuple must exist in RLfc_oprtk where RLfc_oprtk.tgroup equals RLport_group.portgrp.grpnum. In this tuple, RLfc_oprtk.lstraf must be DBYES.

Prior to 5E6(2), this global must always equal the default.

# Glltdri

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glltdri | FP | DMsysid |

### 1.1 Glltdri

Global Office Parameter Glltdri

### 1.2 Description

TM Outgoing Local Test Desk (OG LTD) calls. This parameter is used only in routing OG LTD calls originated from Remote Switching Modules (RSMs), Optically Remote Switching Modules (ORMs), two-mile optically Remote Switching Modules (TRMs), and clusters of remote modules (MMRSMs). Modules that are non-RSM/non-ORM/non-TRM/non-MMRSM route OG LTD calls using fixed routing (TSTTRK treatment type), and therefore the value of this parameter must be set to the default value of zero (0). The route index value populated in the parameter Glltdri for RSM/ORM/TRM/MMRSM points to a trunk group of one or more outgoing SN107 circuits, all of which must reside within the remote module or cluster.

Each remote module or cluster for which OG LTD testing is to be supported must contain its own metallic facilities, including outgoing SN107 LTD trunk group(s), MMSU and MTBs.

Each module within a cluster must contain a non-zero value for the parameter Glltdri (if OG LTD is supported from that module). This value must point to a trunk group within the module or cluster. Failure to populate Glltdri to a non-zero value will result in metallic routing failures during OG LTD calls originated from that remote module. Population of Glltdri to a route index value pointing to a trunk group outside of the remote module or cluster will also result in metallic routing failures.

# Glltsbnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glltsbnum | FP | DMltsbdb |

### 1.1 Glltsbnum

Global Office Parameter Glltsbnum

### 1.2 Description

This parameter keeps track of the number of ltsb groups on an SM. Upon insertion of a new group, increase the shared number and run through a function that takes the number in this parameter and multiplies it by a fraction to get the number of DLTSBDBs that should be allocated. If the current number of DLTSBDBs is too little as indicated by Glltsbdb, then allocate the needed number that should fit on a page. Then increase the value of parameter Glltsbdb. This parameter is increased upon insertion or update of an ltsb group in relation RLdltsbdb. This parameter is updated as tuples are added via trigger functions.

# Glmalloc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmalloc | FP | DMushort |

### 1.1 Fullname:

Count of rlMALLOC tuples present in SM

### 1.2 Description:

This global parameter contains the count of rlMALLOC tuples which are present in a given SM. This is done to allow engineering and auditing of rlMALLOC.

For an SM loaded with the ID303APP (IDCU) or ISDNBASE (ATS) loadable packages:

```
   The number of rlMALLOC tuples is nominally based on the
   number of TR303 RTs present in the SM, the number of
   concurrent TR303 processes, a fixed value, 80, for the
   Automatic Terminal Setup (ATS) software, and the
   incremental global parameter (Glimalloc).

   If there are no TR303 RTs in the SM then Glmalloc is 80
   (12 per ATS terminal process with up to 6 concurrent
   processes and 8 extra tuples) + Glimalloc.  This is the
   default number of tuples required for ATS.

   Note that the nomenclature xxx:yyy means the value for both
   the SM (xxx) and SM-2000 (yyy).
   If there are TR303 RTs in the SM, then Glmalloc is equal to:

      4 (A) * max number of TR303 processes (B) + 4 (C) +
      80 (D) + Glimalloc up to a value of 880:1472 which
      is then rounded up to the next power of 2 less 1 (2047).

      Where:
         A = Number of TR303 rlMALLOC tuples per TR303 TP
         B = Max number of TPs statistically possible for 1 RT:
             1 (a) + 34:66 (b) - 11 (c) + 2 (d) - 4 (A) = 22:54
               a = Maximum TR303 rlRTLB tuples set aside
                   for recovery
               b = Maximum number of TR303 TPs per SM possible
               c = The maximum number of concurrent TR303 manual
                   processes is not realistic, so take them away
               d = Realistic maximum number of TR303 manual jobs
                   to a given RT
         C = Maximum TR303 rlMALLOC tuples set aside for recovery
         D = Number of ATS rlMALLOC tuples

For an SM not loaded with the ID303APP (IDCU) and ISDNBASE (ATS)
loadable packages:

     The number of rlMALLOC tuples is 0.
```

Copyright © 1999 Lucent Technologies 

```
Note that the count of operational/grow TR303 RTs in the SM
is available in the Glrt303cnt global parameter.

Note that the customer can increase the value of this global
parameter by increasing the incremental global parameter
(Glimalloc).

The fixed value of 80 tuples is to provide ATS with up to 12 MALLOC
tuples for each ATS_DCOLL terminal process (with a maximum of 6
ATS_DCOLL processes active at one time).

# Glmate_pc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmate_pc | FP | DMdpc |

### 1.1 Fullname:

Global Office Parameter Glmate_pc

### 1.2 Description:

This Global Parameter is used to hold the Point Code value of the Mate office to this standardization sector (SS7) (formerly CCITT7) National or International GSM if the GSM can be an STP; otherwise it will contain the GSM's origination point code.

***Type:*** DBLONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** On a GSM, the initial value of Glmate_pc should be the point code of the GSM; on an SM the initial value of Glmate_pc should be zero. If an SM—2000 is defined as a GSM via the insert operation on Recent Change view 16.1 (CCGSM) or ODA form CCGSM, the value of Glmate_pc on that SM—2000 should be updated to contain the GSM's point code. If an GSM is deleted via the delete operation on Recent Change view 16.1 (CCGSM) or ODA form CCGSM, the value of Glmate_pc on that SM should be updated to zero.

***Retrofit Rules:*** The value of Glmate_pc should be preserved over retrofit.

***Default Rules:***

```
/*
* This Global Parameter is used only on a  standardization sector (SS7)
* (fromerly CCITT7) National or International Global SM-2000.  All
* Non-Global SMs must have the parameter set to 0.
*/

# Glmax_fm_rc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmax_fm_rc | LR | DMuchar |

### 1.1 Glmax_fm_rc

Global Office Parameter Glmax_fm_rc

### 1.2 Description

This parameter indicates the total number of facilities management (FM) originated recent change (RC) sessions that can be running on the 5ESS(R)-2000 switch. This parameter is added in generic 5E3(1) so that switch switch personnel can control FM RC/V sessions which are initiated externally from a 3B20S Applications Processor. The initial value should be set to 4 (decimal). Afterwards this parameter will be recent changeable and can be set from 0 - 10 (decimal).

# Glmdbnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmdbnum | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glmdbnum

### 1.2 Description:

The Glmdbnum global parameter contains an SM's current rlMDB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCmdbcnt.c which is the init code for Glmdbnum. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as analog, coin or ISDN lines are assigned, DNs are shared, or line time slot bridging is assigned. It will never be decreased.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** The value is calculated as the number of D-Channel tuples in RLdslequip where RLdslequip.bri_class is BRI_MP or BRI_STD on this SM. If there are no D-Channel RLdslequip tuples where RLdslequip.bri_class is BRI_MP or BRI_STD, Glmdslcnt should be zero.

```
- ODA population:
  Glmdslcnt := 0;
  for all tuples in RLdslequip
  begin

     must find exactly 1 tuple in RLfc_porttyp
     where ( RLfc_porttyp.port.member equals RLdslequip.dsl and
             RLfc_porttyp.port.module equals Gl_pcrid )
     when found
     begin
        if ( RLfc_porttyp.port_indx {0:1} equals #GLDCH ) then
           if RLdslequip.bri_class equals BRI_MP or BRI_STD
              Glmdslcnt := Glmdslcnt + 1;

        - RC/V insert of RLdslequip tuple:
```

Copyright © 1999 Lucent Technologies 

```
        if ( RLfc_porttyp.port_indx {0:1} equals #GLDCH ) then
           if RLdslequip.bri_class equals BRI_MP or BRI_STD
              Glmdslcnt := Glmdslcnt + 1;

        - RC/V update of RLdslequip tuple:
        if ( RLfc_porttyp.port_indx {0:1} equals #GLDCH ) then
           if OLD.bri_class is not equal to BRI_MP or BRI_STD
                 AND
           NEW.bri_class equals BRI_MP or BRI_STD
                 Glmdslcnt := Glmdslcnt + 1;
        OR
        if ( RLfc_porttyp.port_indx {0:1} equals #GLDCH ) then
           if OLD.bri_class equals BRI_MP or BRI_STD
                 AND
           NEW.bri_class is not equal to BRI_MP or BRI_STD
                 Glmdslcnt := Glmdslcnt - 1;

        - RC/V deletion of RLdslequip tuple:

        if ( RLfc_porttyp.port_indx {0:1} equals #GLDCH ) then
           if RLdslequip.bri_class equals BRI_MP or BRI_STD
                 Glmdslcnt := Glmdslcnt - 1;
     end

end

# Glmecfw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmecfw | FR | DMhex32 |

### 1.1 Glmecfw

Global Office Parameter Glmecfw

### 1.2 Description

This global is used to activate the more efficient call handling (MECH) feature processing. Glmecfw has the following meaning: if 0, MECH is off; if 1, MECH is on; if > 1, Glmecfw is taken to be the port module and member of the test trunk and member for MECH calls. To access the port module and member number Glmechfw must be cast to DMgport. ODA only supports the values 0 and 1. A test trunk can only be entered via Recent Change (RC).

# Glmem_sze

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmem_sze | LR | DMshort |

### 1.1 Fullname:

Global Office Parameter Glmem_sze

### 1.2 Description:

Contains the amount of memory requested for the AM ODD in kilobytes or Kb (1024 bytes = 1 Kilobyte). This number should be on an 8Kb boundary. The values 1024, 2048, 3072, 3200, 3328, 3456, 3584, 3712, 3840, 3968, 4096, 4224, 4352, 4480, 4608, 5120, 5632, 6144, 6656, 7168, 7680, 8192, 8704, 9216, 9728, and 10240 are possible.

The 1024 and 2048 values should be used only for system labs or private building. The values 3712, 3840, 3968, 4096, 4224, 4352, 4480, 4608, 5120, 5632, 6144, 6656, 7168, 7680, 8192, 8704, 9216, 9728, and 10240 are allowed only if an AM ODD requires more than 3584 Kilo bytes. DBGEN needs to support these values and DBM needs to allow them to be valid as a safety measure.

# Glminquery

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glminquery | LR | DMuns7 |

### 1.1 Fullname:

AILS minimum number of query attempts

### 1.2 Description:

The Glminquery global parameter holds the AILS minimum query attempts parameter which specifies the minimum number of AILS CCS7 TCAP query attempts required within a quarter hour. The range is 1 to 64, and the default is 40.

# Glmnrcsw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmnrcsw | FP | DMbool |

### 1.1 Glmnrcsw

Global Office Parameter Glmnrcsw

### 1.2 Description

POPULATION: This parameter is group partitioned. The grp_type=GPD_OSPS with grp_id = 1. This means that the parameter should be populated only on operator services position system (OSPS) SMs. In rlMODATT, if the attribute osps_sm equals DBYES, that SM is an OSPS SM.

This parameter indicates whether (DBYES) or not (DBNO) the Basic Services Terminal (BST) or Visual Display Terminal (VDT) monitoring port should be automatically deactivated as having monitoring privileges upon manager log-off. DBYES indicates that the automatic deactivation should occur. DBNO indicates that the automatic deactivation should NOT occur. ODA should initialize this parameter to DBNO.

# Glmodh_blf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmodh_blf | FP | DMuns8 |

### 1.1 Glmodh_blf

Global Office Parameter Glmodh_blf

### 1.2 Description

This parameter tells how many RLMODH_BLF dynamic tuples should be allocated in each SM.

```
If gltreeablf <= 42 then

   glmodh_blf = gltreeablf

else

   glmodh_blf = 42 + (gltreeablf - 42) div 2
```

ODA, RC and ODBE are required to calculate this parameter according to the previous formula, after either all RLTREE_BLF tuples are allocated and gltreeablf is generated in ODA case, or after a RC/ODBE work is done on RLTREE_BLF relation that the gltreeablf value gets changed.

For RC only, if a new calculated global parameter value is smaller than the current value, but not equal to zero, do not update it. Otherwise do update it.

***Type:*** DBSHORTPAR

# Glmodm_blf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmodm_blf | FP | DMuns8 |

### 1.1 Glmodm_blf

Global Office Parameter Glmodm_blf

### 1.2 Description

This parameter tells how many RLMODM_BLF dynamic tuples should be allocated in each SM.

```
If gltreeablf <= 42 then

   glmodm_blf = 3 x gltreeablf

else

   glmodm_blf = 126 + (gltreeablf - 42)
```

ODA, RC and ODBE are required to calculate this parameter according to the previous formula, after either all RLTREE_BLF tuples are allocated and gltreeablf is generated in ODA case, or after a RC/ODBE work is done on RLTREE_BLF relation that the gltreeablf value gets changed.

For RC only, if a new calculated global parameter value is smaller than the current value, but not equal to zero, do not update it. Otherwise do update it.

# Glmoni1x

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmoni1x | FP | DMlong |

### 1.1 Glmoni1x

Global Office Parameter Glmoni1x

### 1.2 Description

These parameters contain 32 bits each, for a combined total BIT MAP of 256 bits.

In each SM: For each unique number assigned to the index in RLMONI_BLF, the corresponding bit in the global parameter GLMONI1X - GLMONI8X should be set to '1'. Index range: 1 - 255

The lowest order bit of Glmoni1x indicates assignment of index '0'. Since index '0' is not used, this bit should never be set to '1'. The next bit (bit position 1) is used to indicate equipage of index '1', etc.

The lowest order bit of Glmoni2x indicates assignment of index '32', etc.

The global parameter GLMONIABLF is the number of equipped indices (the number of tuples in the SM relation RLMONI_BLF. It also represents the number of bits that should be set to '1' in Glmoni1x - Glmoni8x.

```
           31  30  29            2   1   0

          -------------       -------------

Glmoni1x |   |   |   |  ...  |   |   |   |

          -------------       -------------

           63  62  61           34  33  32

          -------------       -------------

Glmoni2x |   |   |   |  ...  |   |   |   |

          -------------       -------------

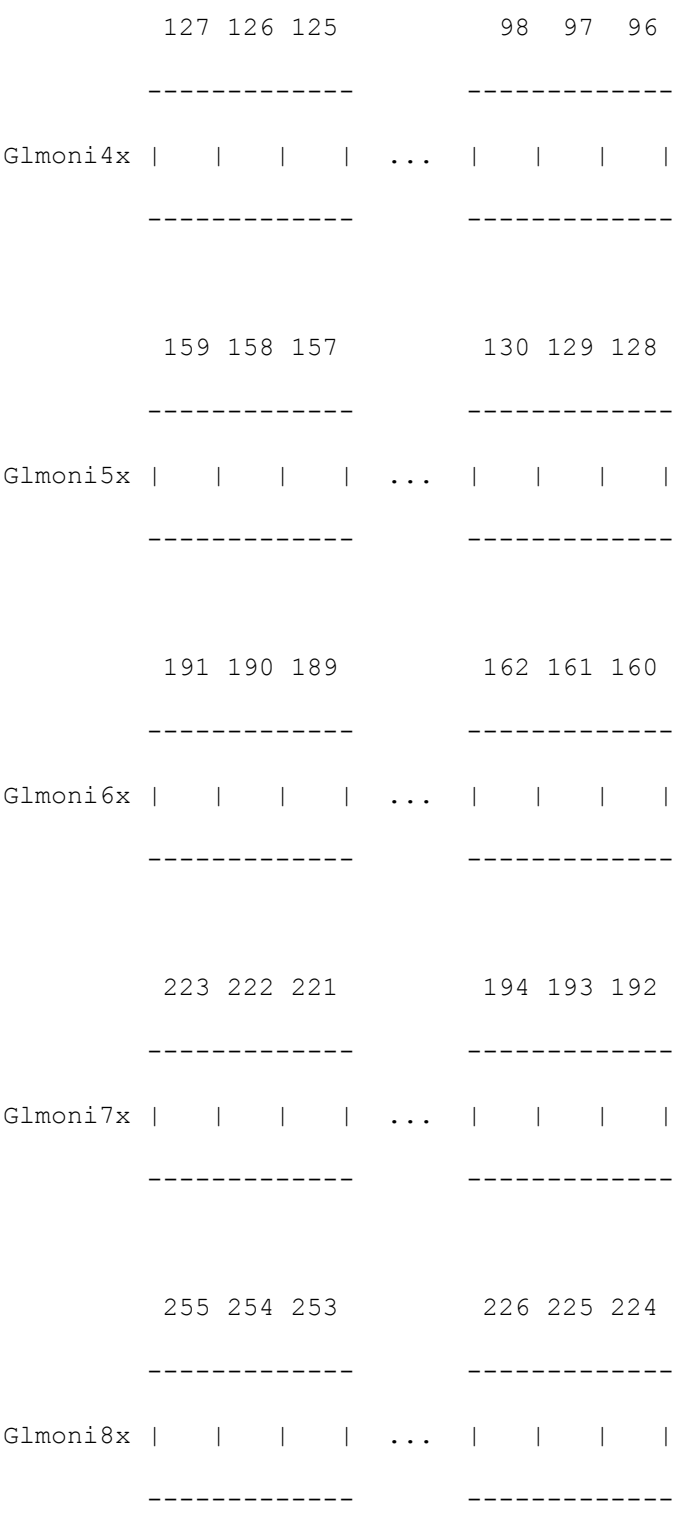
           95  94  93           66  65  64

          -------------       -------------

Glmoni3x |   |   |   |  ...  |   |   |   |

          -------------       -------------
```

Copyright © 1999 Lucent Technologies



For ODA in each SM:

Every time a new RLMONI_BLF tuple is created, the RLMONI_BLF.index should be assigned the next unassigned positive integer value from 1 - 255, and the corresponding bit in Glmoni1x - Glmoni8x should be set to '1'.

For example: If ODA is used to assign four MLHG or individual DNs from different Hundreds Groups for monitoring

**Copyright © 1999 Lucent Technologies** 

on this SM, ODA will sequentially assign indices 1, 2, 3, and 4 to the four RLMONI_BLF tuples as they are inserted. The global GLMONIABLF will be set to 4 (indicating that RLMONI_BLF contains four tuples), and bits 1, 2, 3, and 4 in Glmoni1x will be set to '1'. Bits 5 through 31 will remain set to '0'.

```
Glmoni1x =

0000001E (hex)

30        (dec) value

                entered
```

Another example: If ODA is used to assign thirty-three MLHG or individual DNs from different Hundreds Groups for monitoring on this SM, ODA will sequentially assign indices 1 through 33 to the thirty-three RLMONI_BLF tuples as they are inserted. The global GLMONIABLF will be set to 33 (indicating that RLMONI_BLF contains thirty-three tuples), bits 1 through 31 in Glmoni1x will be set to '1', and bits 0 and 1 in Glmoni2x will be set to '1' with bits 2 through 31 remaining set to '0'.

```
Glmoni1x =

FFFFFFFE (hex)

-2        (dec) value

                entered

Glmoni2x =

00000003 (hex)

3         (dec) value

                entered
```

For RC and ODBE in each SM:

When a new RLMONI_BLF tuple is created, the RLMONI_BLF.index should be assigned the first unassigned positive integer value from 1 - 255, and the corresponding bit in Glmoni1x - Glmoni8x should be set to '1'.

For example: If ODA inserted four MLHG or individual DNs from different Hundreds Groups for monitoring in this SM, then indices 1, 2, 3, and 4 have been assigned to the four tuples in RLMONI_BLF, and Glmoni1x bits 1, 2, 3, and 4 will be set to '1'.

**Copyright © 1999 Lucent Technologies** 

If RC is used to add another MLHG or individual DN from a different Hundreds Group, the index will be assigned the value of 5, GLMONIABLF will be updated to 5 (indicating that RLMONI_BLF contains five tuples), and bit 5 in Glmoni1x will be set to '1'.

```
Glmoni1x =

0000003E (hex)

62        (dec) value

                entered
```

When a RLMONI_BLF tuple is deleted, the RLMONI_BLF.index should be used to reset the corresponding bit in Glmoni1x - Glmoni8x to '0'.

For example: If ODA inserted four MLHG or individual DNs from different Hundreds Groups for monitoring in this SM, then indices 1, 2, 3, and 4 have been assigned to the four tuples in RLMONI_BLF, and Glmoni1x bits 1, 2, 3, and 4 will be set to '1'.

If RC is used to delete a tuple in RLMONI_BLF and the corresponding index is 2, GLMONIABLF will be updated to 3 (indicating that RLMONI_BLF contains three tuples), and bit 2 in Glmoni1x will be reset to '0'. Bits 1, 3, and 4 will remain set to '1'.

```
Glmoni1x =

0000001A (hex)

26        (dec) value

                entered
```

          -------------       -------------

           63  62  61           34  33  32

          -------------       -------------

Glmoni2x |   |   |   |  ...  |   |   |   |

          -------------       -------------

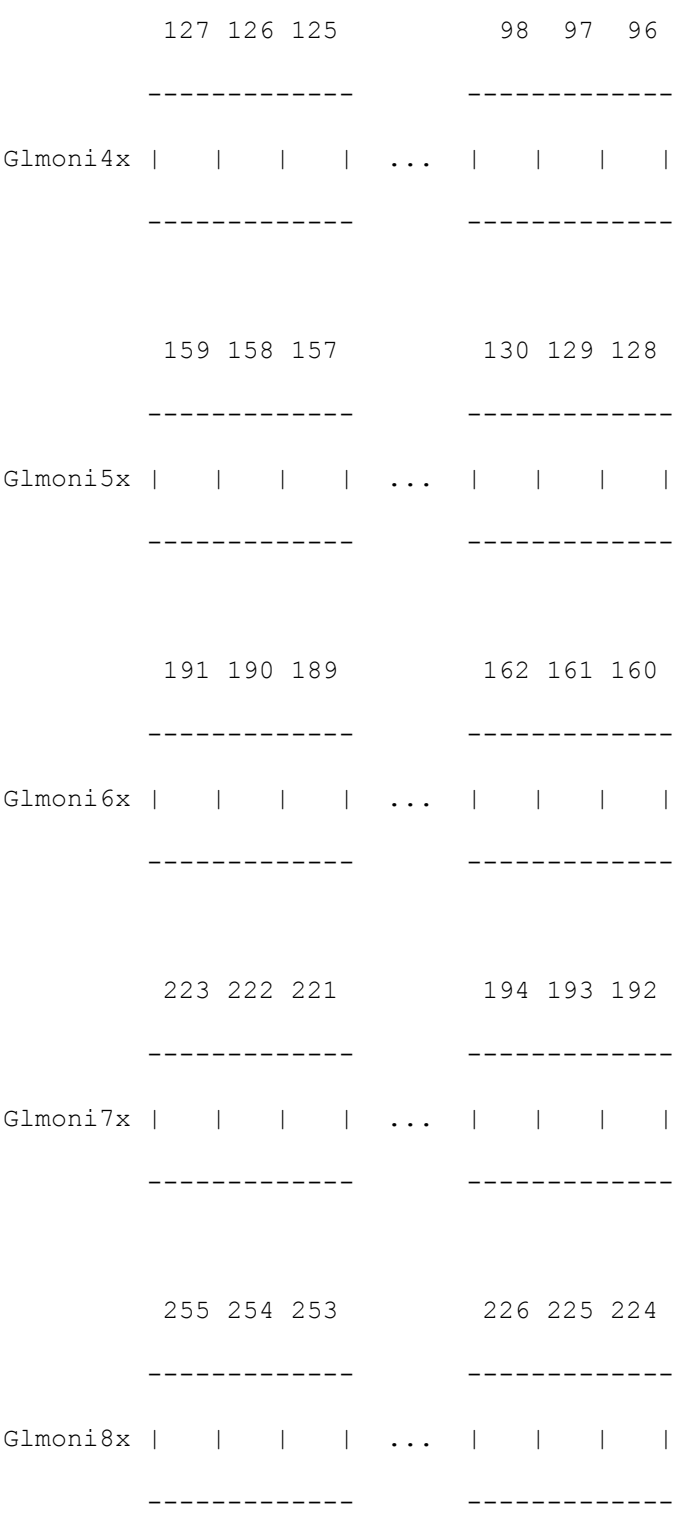
           95  94  93           66  65  64

          -------------       -------------

Glmoni3x |   |   |   |  ...  |   |   |   |

          -------------       -------------
```

Copyright © 1999 Lucent Technologies



For ODA in each SM:

Every time a new RLMONI_BLF tuple is created, the RLMONI_BLF.index should be assigned the next unassigned positive integer value from 1 - 255, and the corresponding bit in Glmoni1x - Glmoni8x should be set to '1'.

**Copyright © 1999 Lucent Technologies** 

For example: If ODA is used to assign four MLHG or individual DNs from different Hundreds Groups for monitoring on this SM, ODA will sequentially assign indices 1, 2, 3, and 4 to the four RLMONI_BLF tuples as they are inserted. The global GLMONIABLF will be set to 4 (indicating that RLMONI_BLF contains four tuples), and bits 1, 2, 3, and 4 in Glmoni1x will be set to '1'. Bits 5 through 31 will remain set to '0'.

```
Glmoni1x =

0000001E (hex)

30        (dec) value

                entered
```

Another example: If ODA is used to assign thirty-three MLHG or individual DNs from different Hundreds Groups for monitoring on this SM, ODA will sequentially assign indices 1 through 33 to the thirty-three RLMONI_BLF tuples as they are inserted. The global GLMONIABLF will be set to 33 (indicating that RLMONI_BLF contains thirty-three tuples), bits 1 through 31 in Glmoni1x will be set to '1', and bits 0 and 1 in Glmoni2x will be set to '1' with bits 2 through 31 remaining set to '0'.

```
Glmoni1x =

FFFFFFFE (hex)

-2        (dec) value

                entered

Glmoni2x =

00000003 (hex)

3         (dec) value

                entered
```

For RC and ODBE in each SM:

When a new RLMONI_BLF tuple is created, the RLMONI_BLF.index should be assigned the first unassigned positive integer value from 1 - 255, and the corresponding bit in Glmoni1x - Glmoni8x should be set to '1'.

For example: If ODA inserted four MLHG or individual DNs from different Hundreds Groups for monitoring in this SM, then indices 1, 2, 3, and 4 have been assigned to the four tuples in RLMONI_BLF, and Glmoni1x bits 1, 2, 3, and 4 will be set to '1'.

**Copyright © 1999 Lucent Technologies** 

If RC is used to add another MLHG or individual DN from a different Hundreds Group, the index will be assigned the value of 5, GLMONIABLF will be updated to 5 (indicating that RLMONI_BLF contains five tuples), and bit 5 in Glmoni1x will be set to '1'.

```
Glmoni1x =

0000003E (hex)

62       (dec) value

               entered
```

When a RLMONI_BLF tuple is deleted, the RLMONI_BLF.index should be used to reset the corresponding bit in Glmoni1x - Glmoni8x to '0'.

For example: If ODA inserted four MLHG or individual DNs from different Hundreds Groups for monitoring in this SM, then indices 1, 2, 3, and 4 have been assigned to the four tuples in RLMONI_BLF, and Glmoni1x bits 1, 2, 3, and 4 will be set to '1'.

If RC is used to delete a tuple in RLMONI_BLF and the corresponding index is 2, GLMONIABLF will be updated to 3 (indicating that RLMONI_BLF contains three tuples), and bit 2 in Glmoni1x will be reset to '0'. Bits 1, 3, and 4 will remain set to '1'.

```
Glmoni1x =

0000001A (hex)

26       (dec) value

entered
```

# Glmoni4x

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmoni4x | FP | DMlong |

### 1.1 Glmoni4x

Global Office Parameter Glmoni4x

### 1.2 Description

These parameters contain 32 bits each, for a combined total BIT MAP of 256 bits.

In each SM:

For each unique number assigned to the index in RLMONI_BLF, the corresponding bit in the global parameter GLMONI1X - GLMONI8X should be set to '1'. Index range: 1 - 255

The lowest order bit of Glmoni1x indicates assignment of index '0'. Since index '0' is not used, this bit should never be set to '1'. The next bit (bit position 1) is used to indicate equipage of index '1', etc.

The lowest order bit of Glmoni2x indicates assignment of index '32', etc.

The global parameter GLMONIABLF is the number of equipped indices (the number of tuples in the SM relation RLMONI_BLF. It also represents the number of bits that should be set to '1' in Glmoni1x - Glmoni8x.

```

For ODA in each SM:

Every time a new RLMONI_BLF tuple is created, the RLMONI_BLF.index should be assigned the next unassigned positive integer value from 1 - 255, and the corresponding bit in Glmoni1x - Glmoni8x should be set to '1'.

For example: If ODA is used to assign four MLHG or individual DNs from different Hundreds Groups for monitoring on this SM, ODA will sequentially assign indices 1, 2, 3, and 4 to the four RLMONI_BLF tuples as they are inserted. The global GLMONIABLF will be set to 4 (indicating that RLMONI_BLF contains four tuples), and bits 1, 2, 3, and 4 in Glmoni1x will be set to '1'. Bits 5 through 31 will remain set to '0'.

```
Glmoni1x =

0000001E (hex)

30       (dec) value

               entered
```

Another example: If ODA is used to assign thirty-three MLHG or individual DNs from different Hundreds Groups for monitoring on this SM, ODA will sequentially assign indices 1 through 33 to the thirty-three RLMONI_BLF tuples as they are inserted. The global GLMONIABLF will be set to 33 (indicating that RLMONI_BLF contains thirty-three tuples), bits 1 through 31 in Glmoni1x will be set to '1', and bits 0 and 1 in Glmoni2x will be set to '1' with bits 2 through 31 remaining set to '0'.

```
Glmoni1x =

FFFFFFFE (hex)

-2       (dec) value

               entered

Glmoni2x =
```

```
00000003 (hex)

3         (dec) value

                entered
```

For RC and ODBE in each SM:

When a new RLMONI_BLF tuple is created, the RLMONI_BLF.index should be assigned the first unassigned positive integer value from 1 - 255, and the corresponding bit in Glmoni1x - Glmoni8x should be set to '1'.

For example: If ODA inserted four MLHG or individual DNs from different Hundreds Groups for monitoring in this SM, then indices 1, 2, 3, and 4 have been assigned to the four tuples in RLMONI_BLF, and Glmoni1x bits 1, 2, 3, and 4 will be set to '1'.

If RC is used to add another MLHG or individual DN from a different Hundreds Group, the index will be assigned the value of 5, GLMONIABLF will be updated to 5 (indicating that RLMONI_BLF contains five tuples), and bit 5 in Glmoni1x will be set to '1'.

```
Glmoni1x =

0000003E (hex)

62        (dec) value

                entered
```

When a RLMONI_BLF tuple is deleted, the RLMONI_BLF.index should be used to reset the corresponding bit in Glmoni1x - Glmoni8x to '0'.

For example: If ODA inserted four MLHG or individual DNs from different Hundreds Groups for monitoring in this SM, then indices 1, 2, 3, and 4 have been assigned to the four tuples in RLMONI_BLF, and Glmoni1x bits 1, 2, 3, and 4 will be set to '1'.

If RC is used to delete a tuple in RLMONI_BLF and the corresponding index is 2, GLMONIABLF will be updated to 3 (indicating that RLMONI_BLF contains three tuples), and bit 2 in Glmoni1x will be reset to '0'. Bits 1, 3, and 4 will remain set to '1'.

```
Glmoni1x =

0000001A (hex)

26        (dec) value

                entered
```

# Glmoni8x

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmoni8x | FP | DMlong |

### 1.1 Glmoni8x

Global Office Parameter Glmoni8x

### 1.2 Description

These parameters contain 32 bits each, for a combined total BIT MAP of 256 bits.

In each SM:

For each unique number assigned to the index in RLMONI_BLF, the corresponding bit in the global parameter GLMONI1X - GLMONI8X should be set to '1'. Index range: 1 - 255

The lowest order bit of Glmoni1x indicates assignment of index '0'. Since index '0' is not used, this bit should never be set to '1'. The next bit (bit position 1) is used to indicate equipage of index '1', etc.

The lowest order bit of Glmoni2x indicates assignment of index '32', etc.

The global parameter GLMONIABLF is the number of equipped indices (the number of tuples in the SM relation RLMONI_BLF. It also represents the number of bits that should be set to '1' in Glmoni1x - Glmoni8x.

```
            31  30  29            2   1   0

          -------------       -------------

Glmoni1x |   |   |   |  ...  |   |   |   |

          -------------       -------------

            63  62  61          34  33  32

          -------------       -------------

Glmoni2x |   |   |   |  ...  |   |   |   |

          -------------       -------------

            95  94  93          66  65  64

          -------------       -------------

# Glmoniablf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmoniablf | FP | DMuns8 |

### 1.1 Glmoniablf

Global Office Parameter Glmoniablf

### 1.2 Description

In each SM, this parameter is used to count how many RLMONI_BLF tuples are assigned. For ODA, count how many RLMONI_BLF tuples per SM. If no tuples are found, set to default value of 0. For RC and ODBE, if a RLMONI_BLF tuple is added to a SM, the Glmoniablf in the SM should be incremented by one. Each time a RLMONI_BLF tuple is deleted, this Glmoniablf will be decremented by one.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glmsdls | FP | DMuns2 |

### 1.1 Glmsdls

Global Office Parameter Glmsdls

### 1.2 Description

This parameter specifies the quantity of Management Information System (MIS) data link DSLs that are connected to the SM. This parameter is populated by ODA and RC but does not appear on any view. Each SM's parameter is set to the number of RLDLDSL tuples in that SM with the servclass attribute set to OA_MIS_LNK.

# Glnatl7sm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnatl7sm | FP | DMmodule |

### 1.1 Glnatl7sm

Global Office Parameter Glnatl7sm.

### 1.2 Description

This parameter indicates if this processor contains a direct interface with the national version of SS7 (formerly CCITT7) (Signaling system No. 7) transport hardware.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** Glnatl7sm and Glintl7sm cannot both have a non-zero value on the same SM.

If there is a national version of SS7 (formerly CCITT7) in the office the value of this parameter depends on the transport hardware:

Glnatl7sm must be set to indicate the SMs containing PSUs used for national SS7 transport. Glnatl7sm is set to the SM's own number on any SM which contains a PSU that handles national SS7 transport. On these SMs, Glintl7sm must be zero (0) since international and national SS7 signaling cannot exist on the same SM. On these SMs, Glglobalsm and Glnatl7sm have the same value.

Certain transactions against Glnatl7sm must be allowed or denied:

'Transaction: Change Glnatl7sm from zero to x'

If all the requirements for changing the parameter Glglobalsm in SM 'x' from zero to 'x' are satisfied, then set Glnatl7sm to 'x' on 'x'.

'Transaction: Change Glnatl7sm from x to y'

This transaction applies when both 'x' and 'y' are non-zero. This request must be denied unconditionally.

'Transaction: Change Glnatl7sm from x to zero'

Copyright © 1999 Lucent Technologies 

If all the requirements for changing the parameter Glglobalsm in SM 'x' from 'x' to zero are satisfied, then set Glnatl7sm to '0' on 'x'.

Glnatl7sm cannot be set to a non-zero value on SM 'x' if SM 'x' is an RSM (that is of type SM5RSM) unless the global parameter Glc7_rsm is set to DBYES. The type of SM 'x' can be read from RLmodatt.imtype. If Glc7_rsm is set to DBNO then if SM 'x' is of type SM5RSM, Glnatl7sm can never be set to a non-zero value.

***Retrofit Rules:*** None.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
for i in {1 thru 192}
begin
      if (Glnatl7sm on sm(i) != 0) then
             pcrlist[Glnatl7sm on sm(i)] = true;
end
```

***Checks:***

```
if (current_pcr is_in sm_all) then
begin
      /* An SM can't have both SS7 international signaling and SS7
       * national signaling.
       */
      if(Glnatl7sm != 0) then
      begin
              Glintl7sm == 0;

              /* Verify that this national GSM is in RLgsm_opc. */
              find == 1 gsm_opc in RLgsm_opc
              where (gsm_opc.gsm == Glnatl7sm);
      end
end
```

# Glnbst2

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnbst2 | FP | DMushort |

### 1.1 Glnbst2

Global Office Parameter Glnbst2

### 1.2 Description

This parameter is initialized by the RLTAPOSDB initialization function to equal the number of RLLPRT_POS tuples for which RLLPRT_POS.pos_typ equals OA_BST2.

This parameter does not appear on any ODA form and ODA is not required to initialize its value. This parameter does not appear on any recent change (RC) view.

The RC mapping code for view 21.32 (RC_PPMAP) will maintain the value of Glnbst2 as RLLPRT_POS tuples are inserted, updated, and deleted.

Refer to population rules for Gltloop for interdependencies.

Range is specified in decimal.

# Glncdtime

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glncdtime | LRFR | DMuns4 |

### 1.1 Glncdtime

Global Office Parameter Glncdtime

### 1.2 Description

Time allowed for an NCD query to respond. Range is from 1 to 8 seconds. Default is 2 seconds. This parameter indicates the longest period of time that call processing will wait for a NCD reply from the database. A timeout will result in the operators following local practices to obtain verification. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default values. Range is specified in seconds.

# Glnclk2as

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnclk2as | LR | DMbool |

### 1.1 Fullname:

Network Clock 2 - automatic synchronization

**Defines:** db/DMclidef.h

### 1.2 Description:

This boolean field denotes the on/off state of the automatic synchronization capability of the *5ESS*® switch Network Clock - Model 2.

When on, that is, Glnclk2as == DBYES, the system will automatically restore, without the currently required manual intervention, equipped temporarily OOS references when they become available again, and attempt to stay synchronized to the highest priority reference available. It will not automatically restore manually removed references.

New enhanced firmware is necessary for this capability. The field 'nc_cli' in RLSCORE contains network clock change level indicators. Bit 7 of 'nc_cli' in RLSCORE has been assigned to denote the presence or absence of the firmware enhancements to support this capability (#define'd as DGNC2AS in the file DMclidef.G). This capability is supported when bit 7 of 'nc_cli' of RLSCORE is set.

When off, that is, Glnclk2as == DBNO, the switch will operate in it's normal mode. It will not automatically bring back on-line any temporarily out-of-service references that are available again.

Glnclk2as should be DBNO, and not be allowed to be changed to DBYES, if the field 'nc_cli' of relation RLSCORE does not have bit 7 set, that is, if ((RLSCORE.nc_cli & $DGNC2AS) == 0), this capability is not supported.

# Glnetmask

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnetmask | LRFR | DMtcpaddr |

### 1.1 Fullname:

Global Office Parameter Glnxtpr

### 1.2 Description:

IP Net Mask identifies the network mask and is used to create unique IP addresses and determine the routing between the SM's, the AM and the OAPs.

```
There are IP Network Address  consists of three parts
    1) Network Class
    2) Netid
    3) Host id.
and the  Net mask contains the first two.
These parts are of variable length and are as follows:
(The high order bits are the Network Class)
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
  |0 1 2 3 4 5 6 7|0 1 2 3 4 5 6 7|0 1 2 3 4 5 6 7|0 1 2 3 4 5 6 7| Class
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
  |0|   NETID     |             HOSTID                            | A
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
  |1 0|        NETID              |            HOSTID             | B
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
  |1 1 0|                 NETID                   |    HOSTID     | C
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
  |1 1 1 0|             MULTICAST ADDRESS                         | D
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
  |1 1 1 1 0|           Reserved for future use                   | E
  |-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|-+-+-+-+-+-+-+-|
```

Class D and E address are not supported.

The bitpos (0  thru  7) should not be 0.

The bitpos (24 thru 31) should be be  0.

# Glnetrel

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnetrel | LRFR | DMlineno |

### 1.1 Glnetrel

Network Release

### 1.2 Description

Network Software Release. This is the oldest software release currently being run on any switch which is networked with this switch. There are certain features which require that every switch that communicates with this switch be on the same or later software release. These features look at this parameter to determine when they can be active on the network (and therefore on this switch). These features cannot be active on this switch until this parameter indicates that all switches on the network are operating at the minimum software release level needed to support the feature. This minimum software release level is referred to as the 'Activation Level.' As long as this global is greater than or equal to the feature's 'Activation Level,' the feature can safely be active on the network. Some optional features may still have a 'Feature Activation Bit' in addition to an 'Activation Level'. The 'Feature Activation Bit' does not apply until after the 'Activation Level' has been satisfied. If coordination is necessary, all switches on the network may update this global at the same time during periods of low call traffic.

The last two digits of this parameter indicate the software update level within the current software release. This is an arbitrary designation and does not necessarily correspond to the actual number of software updates distributed to the field. The first (or first two) digit(s) indicate the software release. The first software release of 5E9 is represented by 901. Later software updates in 5E9 which require network coordination would be represented by 902, 903, etc. There is no need to update this parameter for each software release unless it is required by a certain feature within that release.

The following layout lists all features which use this global to determine when they are allowed to be active in the network. The activation level is the minimum software release level the network must be on before the feature can be active.

```
Network         Feature     Activation Level
-------         -------     ----------------
FTS2000         INPA              901
```

# Glnint

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnint | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glnint

### 1.2 Description:

This parameter is a count of the number of RLLPRT_POS tuples for which RLLPRT_POS.pos_typ equals OA_INT.

This parameter is initialized by ODA before SM initialization because it is needed to initialize Glptrdb and Glqrydb.

During SM initialization, it is recalculated by the RLTAPOSDB initialization function to equal the number of RLLPRT_POS tuples for which RLLPRT_POS.pos_typ equals OA_INT.

This parameter does not appear on any Recent Change view.

The Recent Change mapping code for view 21.32 (RC_PPMAP) will maintain the value of Glnint as RLLPRT_POS tuples are inserted, updated, and deleted.

Refer to population rules for Gltloop for interdependencies.

Range specified in decimal.

# Glnmmon

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnmmon | LP | DMuns8 |

### 1.1 Glnmmon

Global Office Parameter Glnmmon

### 1.2 Description

This parameter is used to keep count of the number of Multiline Hunt Group (MLHG) queue monitor consoles in an office. A queue monitor console is an ISDN terminal which can display MLHG queue status data. Glnmmon is equal to the number of tuples in RLmontoq. Recent change should increment Glnmmon when a terminal becomes a queue monitor console (tuple in RLmontoq created for the terminal). Recent change should decrement Glnmmon when a terminal is changed from a queue monitor console to a regular terminal (tuple in RLmontoq deleted for the terminal). Glnmmon can never be greater than Glmxmon. The valid value for Glnmmon should be maintained on the CMP and the AM value of Glnmmon should be 0. The range of this parameter is 0-255.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

# Glnocmax

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnocmax | LRFR | DMnocmax |

### 1.1 Glnocmax:

Global Office Parameter Glnocmax - maximum number of NOCs allowed per office

### 1.2 Description:

This parameter is internal to the switch and contains the maximum number of allowed Normalized Office Codes (NOCs) that can be assigned on the switch. The value of this parameter is always set to 250, unless the office is provisioned with the Number Portability - NPA-NXX Growth Feature (SFID198). In this case, the parameter will be set internally to 8190 when the feature is active and a NOC greater than 250 is assigned on RC View 8.2. (See RLofficecode.R).

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 250

***AM Initial Value:*** 250

***CMP Initial Value:*** 250

***RC/ODA Rules:*** This parameter is supported by RC and ODA. The value of this parameter is populated by ODA and updated via RC View 8.2 according to the following rule:

```
if ((SFID198 == DBYES) &&
    (there exists an RLofficecode tuple with a noc that is in {251 thru 8190}))
{
  Glnocmax == 8190;
} else
{
         Glnocmax == 250;
}
```

The value is always set to 250, unless the Number Portability - NPA-NXX Growth Feature (SFID198) is active is active and a NOC greater than 250 is assigned on RC View 8.2.
The dummy tuple, 8191, for RLofficecode should not be included in the range of Glnocmax values.

***Retrofit Rules:*** None

# Glnpasle

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnpasle | FR | DMbool |

### 1.1 Glnpasle

Global Office Parameter Glnpasle

### 1.2 Description

If set to YES, when checking the screening list during the SLE add or delete processing, the NPA split table (RLnpasplit) must be checked.

For the add option:

If the NPA of the dialed DN is found in the table, the screening list must be checked for NPA or it's associated NPA. If either of these DNs, the DN with either the NPA or it's associated NPA from the NPA split table, is in the screening list, the dialed DN will be substituted into the list. If neither of these DNs is in the screening list, the SLE add session may continue.

For the delete option:

If the NPA of the dialed DN is found in the table, the screening list must be checked for NPA or it's associated NPA. If either of these DNs, the DN with either the NPA or it's associated NPA from the NPA split table, is in the screening list, the DN must be deleted. If neither of these DNs is in the screening list, the DN cannot be deleted.

Global Office Parameter Glnpatcap

### 1.2 Description

If set to yes, provide validation of TCAP queries for AC/AR and SLE on 7 digits if the TCAP NPA is found in the NPA split table (RLnpasplit). If the NPA is not found in the NPA split table, 10 digit validation is done. When set to yes, do not assert on failure.

# Glnpsn_index

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnpsn_index | LR | DMulong |

### 1.1 Glnpsn_index

Global Office Parameter Glnpsn_index

### 1.2 Description

This parameter is next_psn index bit masks and use to indicate the usage of next_psn index. Npsn_index permits the RLpsiptst data to be stored in a memory by efficient manner in the global PH data arrays. When insert the relation RLpsiptst, first find the lowest available position ; then set the bit. On the other hand, when delete the relation RLpsiptst, the position of this bit should be unset.

```
31             16  15             0 <---- bit position
|               |  |              |
v               v  v              v
----------------  ----------------
0000000000000000  0000000000000000
```

**Where:**

bit position = RLpsiptst.npsn_index = If there exists a tuple of RLpsiptst which npsn_index = 0, the 0th bit should be set.

# Glnq_cells

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnq_cells | FP | DMushort |

### 1.1 Glnq_cells

Total MLHG Queue Cells on SM

### 1.2 Description

This parameter is used to keep the total number of MLHG queue cells on an SM. This global parameter, along with the Gltkqcells global parameter is used to determine when the maximum allowed queue cells per SM has been reached on a particular SM. This number will reflect the total qbsize + qexsize attributes of all the tuples in RLqu_os.

# Glnraf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnraf | FP | DMushort |

### 1.1 Fullname:

Count of RAF ports in use

### 1.2 Description:

This parameter is a count of the number of RLLPRTACCS tuples.

This parameter is initialized by ODA before SM initialization because it is needed to initialize Glptrdb and Glqrydb.

During SM initialization, it is recalculated by the OALPRTACC initialization function to equal the number of RLLPRTACCS tuples.

This parameter does not appear on any Recent Change view.

The Recent Change mapping code for view 20.22 (RC_EQRAS) will maintain the value of Glnraf as RLLPRTACCS tuples are inserted, updated, and deleted.

# Glnrgsln

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnrgsln | FR | DMshort |

### 1.1 Glnrgsln

Global Office Parameter Glnrgsln

### 1.2 Description

This parameter is used by Generalized Ringing while allocating the ISLU-Z resource. The parameter should be set to the average number of ringers per subscriber's line. By setting the parameter too high, blocking may occur on the RG (Ring Generator) resource unnecessarily. By setting this value too low, there is a danger of causing the RG to go into an overload condition. If this information is not readily available, use the default value of 5.

### 1.1 Glnumrcv

Global Office Parameter Glnumrcv

### 1.2 Description

The number of OSPS offices that this office receives interflowed traffic from; that is, number of incoming offices. The value populated is equal to the number of tuples in RLosps_int. Glnumrcv is required by the measurements sub-system. The value of Glnumrcv is can not changed by recent change (RC) through any view attribute but is controlled by the appropriate RC function of inserting or deleting tuples in RLosps_int.

```

# Glnumrr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnumrr | LRFR | DMuns5 |

### 1.1 Glnumrr

Global Office Parameter Glnumrr

### 1.2 Description

The number of offices that this switch can interflow to for non T&A calls; This is equal to the count of all non-zero entries for attribute int_destid of RLdstid_rr. Glnumrr is required by the measurement sub-system. The value of Glnumrr is not recent changeable through any view attribute directly but is controlled by the appropriate recent change (RC) view that allows adding and removing Non-T&A Interflow destinations, which are represented by the attribute int_destid in relation RLdstid_rr.

# Glnvdt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnvdt | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glnvdt

### 1.2 Description:

This parameter is a count of the number of RLLPRT_POS tuples for which RLLPRT_POS.pos_typ equals OA_VDT.

This parameter is initialized by ODA before SM initialization because it is needed to initialize Glptrdb and Glqrydb.

During SM initialization, it is recalculated by the RLTAPOSDB initialization function to equal the number of RLLPRT_POS tuples for which RLLPRT_POS.pos_typ equals OA_VDT.

This parameter does not appear on any Recent Change view.

The Recent Change mapping code for view 21.32 (RC_PPMAP) will maintain the value of Glnvdt as RLLPRT_POS tuples are inserted, updated, and deleted.

Refer to population rules for Gltloop for interdependencies.

# Glnxasw_time

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnxasw_time | FP | DMmillis |

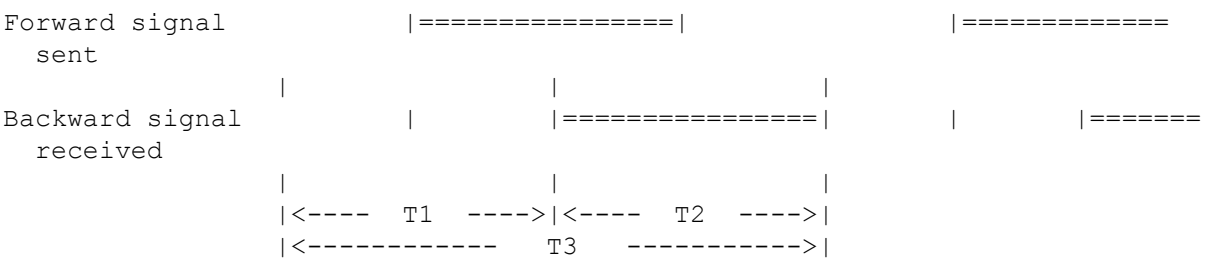
### 1.1 Glnxasw_time

Global Office Parameter Glnxasw_time

### 1.2 Description

This parameter specifies the reanswer timing for national (non local) calls. This timing is done in the supervision point of a connection at reception of 'clear back' on the outgoing trunk. The outgoing trunk has service class FCNAHK_TRUNK in this case. The range is 2000 - 120,000. The RCV support is none. Used by Export. The following diagram refers to the population of the parameters Glomfc_tmr, Gltmr1_omfc and Gltmr2_omfc. Also refer to the 5EE1(2) MFC Signaling Design DS: DS5DE 5.08.01.01.00.

Outgoing MFC Signaling Timing Intervals



```
T1 = duration of forward signal (forward tone-on to forward tone-off)
T2 = duration of silent interval (forward tone-off to forward tone-on)
T3 = duration of entire cycle (forward tone-on to forward tone-on)
```

# Glnxtpr

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glnxtpr | LR | DMlong |

### 1.1 Fullname:

Global Office Parameter Glnxtpr

### 1.2 Description:

This parameter is used to hold the linkage between the third and fourth digits when a three to six digit conversion is in progress. When office personnel are converting 3 digit data trees to 6 digit trees, they want to maintain routing on the 3 digit tree until all the 6 digit data is intact and verified. The 6 digit tree is built independent of the current 3 digit tree. During the conversion, the DAPRMDGT linkage between the 2 trees is contained in this parameter. When the conversion is complete, the value stored in this parameter is placed into the DAPRMDGT data on the last digit in the 3 digit tree. This links the 2 trees together.

(ex. A conversion is taking place on digits 312. Routing will continue on the 312 string while the 312xxx digit tree is being populated (xxx being 000 - 999). When all the needed 312xxx digit strings are populated ;nd verified then the conversion is completed by placing the Glnxtpr value into the DAPRMDGT data for the 2. This changes all the routing to use the 6 digit string.)

# GlobInalin

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| GlobInalin | FP | DMushort |

### 1.1 GlobInalin

Lines with Advanced Services Platform originating busy line or no answer features

### 1.2 Description

The GlobInalin global parameter contains an SM's count of ASP originating busy line or no answer features assigned to lines and active in RLasp_port. Its value is maintained over all initializations and updated via trigger functions as busy line or no answer features are inserted or deleted.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC.

The value of this parameter is established by ODA and will be updated by trigger functions as busy line or no answer features are inserted or deleted. Its value can increase and decrease.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***

```
default = 0;
```

# Gloctlopen

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gloctlopen | FR | DMuns7 |

### 1.1 Gloctlopen

Global Office Parameter Gloctlopen

### 1.2 Description

Controls the open circuit. The value gives the open circuit duration in seconds. The recommeded default value is 30 or 30 seconds. Must be given the same value in every IM. During an update, the change to a new value has no synchronization requirement.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

# Gloctltone

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gloctltone | FR | DMuns7 |

### 1.1 Gloctltone

Global Office Parameter Gloctltone

### 1.2 Description

Controls the tone returned to the caller. If the operating company does not want the tone returned, Gloctltone should be given a value zero. Dividing the value by ten gives the tone duration in seconds. The recommended default value is 50 or a 5-second tone duration. Must be given the same value in every IM. During an update, the change to a new value has no synchronization requirement.

# Glodbama

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glodbama | FP | DMbool |

### 1.1 Fullname:

Global Office Parameter Glodbama

### 1.2 Description:

The Enhanced B-Channel Packet Switching (EBPS) feature allows the user to dynamically use the DSL for circuit or packet switching. To use the DSL for packet switching when the DSL is in circuit switching mode, the user must set up the B-channel for packet switching via Q.931 signaling.

The Glodbama parameter indicates whether the office desires to generate AMA Billing Entries for the time period during which the B-channel is set up for packet switching.

These billing entries are separate from and in addition to the billing entries produced for the individual X.25 calls made during the time the B-Channel is set up for packet switching.

A value of DBYES implies that each On-Demand Packet Switching setup will generate a billing entry that will be handled by the AMATPS system. A value of DBNO implies that no such records will be produced. Only ISDN SMs can have a DBNO value.

# Glor_resId

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glor_resId | FR | DMbool |

### 1.1 Fullname:

Special Feature Global Parameter

### 1.2 Description:

This global parameter contains a settable office option to control AMA recording via RC/V view 8.1. When it is set to DBYES, additional EBAF modules will be appended to the AMA recored for resold line origination. Its default value is DBNO. This global will replace the second bit of Glsf8dummy used in 5e12SU and 5e13SU.

***Type:*** DBENUMPAR

# Glospsraf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glospsraf | FP | DMbool |

### 1.1 Fullname:

Global Office Parameter Glospsraf

### 1.2 Description:

This parameter indicates whether the announcement facilities provided by the DSU2-RAF units within an OSPS office should be utilized to provide automated announcements.

A value of DBYES implies that OSPS has the facility of using the DSU2-RAFs to provide automated announcements to the customer. A value of DBNO implies that OSPS cannot use the DSU2-RAFs to provide automated announcements to the customer. This parameter does not imply the existence of DAS/C vendor links to the switch.

This parameter must be DBNO unless there is at least one loaded SM in the office.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glp1silc | LRFR | DMgapamt |

### 1.1 Glp1silc

Global Office Parameter Glp1silc

### 1.2 Description

Used by the network management automatic controls SILC feature. Gives rate (percentage from 0 to 100% in increments of 12.5) that calls will be blocked. Used during machine congestion level 1. Should be initialized to NMPCT0=16. Afterwards the parameter will be recent changeable and can be set to the following amounts:
`NMPCT0=16, NMPCT12_5=32, NMPCT25_0=48, NMPCT37_5=64, NMPCT50_0=80, NMPCT62_5=96, NMPCT75_0=112, NMPCT87_5=128, NMPCT100=144.`

This parameter is not dependent on other parameters.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glp101tl | LRFR | DMmodule |

### 1.1 Glp101tl

Global Office Parameter Glp101tl

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is TM 101 Test Line (Metallic Testing).

# Glpatdn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpatdn | LP | DMbool |

### 1.1 Glpatdn

Global Office Parameter Glpatdn

### 1.2 Description

This parameter is used by the OSPS auto-reconfiguration process to determine if pattern tuples in RLaut_rec are to be marked as having been processed. When set to DBYES, pattern tuples with time-of-day values equal to and prior to the current time will have their pattern done attributes set to DBYES by the auto-reconfiguration process which will also set the parameter back to DBNO. ODA always populates this parameter with the default value. This parameter is not populated from any ODA form.

Recent Change default: N/A

# Glpc_dnpriv

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpc_dnpriv | LRFP | DMaccess |

### 1.1 Glpc_dnpriv

Global Office Parameter Glpc_dnpriv

### 1.2 Description

This parameter is used to indicate ICLID per call DN privacy feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the PCP feature, whether the feature is generally available or whether the feature is temporarily unavailable for use. ODA must set its value to SUBSCRIPTION when retrofitting from the 5E4(2) generic. ODA must retain its value across retrofits to post 5E5 generics. The AM parameter is changed by RC only when the 'ALL' value is used for the SM key on the LASS Feature Access View. The AM parameter reflects the office standard value and is typically used to set the SM parameter after SM growth.

### 1.1 Glpcbodb

PCB tuples On Demand B-Channel Global Parameter

### 1.2 Description

This global parameter contains an SM's count of PCB tuples needed due to On Demand B-Channel (ODB) packet.

Its value is maintained over all initializations and updated via trigger functions as ODB features are assigned.

***Type :*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:***
This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions when an ODB packet feature is assigned. Its value can increase and decrease.

***Retrofit-ODA Rules:***
Not applicable.

***Retrofit Rules:***
This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;
```

# Glpccc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpccc | LRFR | DMmodule |

### 1.1 Glpccc

Global Office Parameter Glpccc

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is global critical craft control.

# Glpctfree

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpctfree | LPFP | DMlong |

### 1.1 Glpctfree

Global Office Parameter Glpctfree

### 1.2 Description

Gives the percent of free space desired in the SM static ODD (memory equippage permitting). This parameter is used in conjunction with Glmaxodd. If 100/(100 - Glpctfree) times the data space required by DBGEN exceeds Glmaxodd, the ODD size is set to Glmaxodd and an appropriate warning message is printed. Adds freespace to the end of the SM/CMP ODD. With different configurations possible and widely varying ODD sizes within the same office, it is important that the customer be allowed to specify this parameter per SM, CMP or RSM. It should also be possible for the customer to easily choose one value for all SMs or ranges of SM numbers.

The valid range is 1 - 99. For ODD data space exceeding 2 Megabytes, 20% free space may be excessive. SM/CMP ODD backup space on disk should be checked by consulting tables in 5EDOPS or in Switch Administration Guidelines.

The free space is used for RC transactions, hash re-organization and data growth. RC transactions need an average 256 K. Hash re-organization of large hash relation needs around 100K and the remaining free space is for future data growth.

It is guaranteed that an ODD Generated by the DBGEN tools will have a minimum of 256K of freespace. Therefore, if the calculated amount of freespace < 256K, DBGEN will set the freespace to 256K.

Freespace is calculated as a percentage of the entire (including freespace) ODD. Freespace is added to the amount of populated data (DBactblks - DBunblocks) resulting in the final size of the ODD (DBphysblks). NOTE that DBunblocks, the amount of unprotected (dynamic) data is subtracted out since the unprotected ODD is not part of the non-redundant SM/CMP ODD and, therefore, should not be used when calculating the amount of freespace.

For example, if an ODD has populated data (DBactblks - DBunblocks) of 700 and the GLPCTFREE parameter was set to 30, then DBGEN would calculate freespace to be 300 and set the size of the ODD (DBphysblks) to 1000.

***NOTE:*** Since Glpctfree is defined but not used by the AM, it should contain zero for the AM case.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpdnic | FP | DMpsdnic |

### 1.1 Glpdnic

Global Office Parameter Glpdnic

### 1.2 Description

This global parameter specifies the Data Network Identification Code (DNIC) of the local BOC PPSN. The Glpdnic will be used in the PH to determine whether or not a packet call has crossed an X.75 trunk gateway.

For any SMs with the GLISDNBASE software loadable package, this parameter must be in the range 0x0001 through 0x9999. For any SMs without the GLISDNBASE software loadable package, this parameter must be 0.

# Glphdbnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glphdbnum | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glphdbnum - path data block number

### 1.2 Description:

This parameter contains a count of the number of peripheral time slots in an SM. For SMs, this parameter will always be populated with 512. For SM-2000 this parameter will be set to a default value of 512.

This value should remain intact during a Generic Retrofit.Glrhg_cnt.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 512

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** The value of this parameter should only be increased, and never decreased, by RC. It is increased, if necessary, when an (E)NLI pair is grown in. Its is *not* decreased when an (E)NLI pair is degrown. So, in the case of an (E)NLI pair degrowth followed by an (E)NLI pair growth, it wouldn't be necessary to increase the value of the parameter. SM-2000 requires a default value to support off-line pump and for test purposes.

***Retrofit Rules:*** This value should remain intact over a generic retrofit.

***Default Rules:***
```
default = 512;
```

***Distribution Rules:***
```
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;
```

***Import:***
```
env.R
```

***Checks:***

# Glpi_oper

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpi_oper | FP | DMbool |

### 1.1 Glpi_oper

Global Office Parameter Glpi_oper

### 1.2 Description:

This parameter indicates if both PIs (Packet Interfaces) are operational in CKTDATA. DBYES means that they are both operational and DBNO means that they are NOT both operational.

The population rules are as follows:

| PI0 eqstat | PI1 eqstat | Glpi_oper |
|---|---|---|
| SMOPER | SMOPER | DBYES |
| SMUNEQ | X | DBNO |
| SMGROW | X | DBNO |
| X | SMUNEQ | DBNO |
| X | SMGROW | DBNO |
| no PIs in CKTDATA (ie no ISDN) | | DBNO |

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** Notice that if the SM does not have ISDN, Glpi_oper is DBNO. However, the value for a fully operational ISDN SM should be DBYES.

RC/V will be responsible for changing Glpi_oper to DBYES during PI growth (once both PIs are SMOPER), but maintenance will not be able to change Glpi_oper via RC/V. Maintenance may change it with ODBE, if necessary.

rc/v PI conversion rules:

When converting from a PI1 to PI2 or vice a versa, special rules apply to the setting of this parameter. When converting, the case of EQSTAT is changing from OPER to GROW and the PI TYPE is changing, Glpi_oper must retain the value of DBYES. The value must remain at DBYES to allow the other PI to remain working. Setting it to DBNO shuts down the PSU activity. Any other condition, the rules below apply.

***Retrofit Rules:*** not applicable

# Glpispm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpispm | LRFR | DMmodule |

### 1.1 Glpispm

Global Office Parameter Glpispm

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is Inter-SM Packet Data Base Manager.

# Glpktds

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpktds | FP | DMlong |

### 1.1 Glpktds

Global Office Parameter Glpktds

### 1.2 Description

This global parameter is used to enable/disable the reporting mechanism for discarded PI and PH packets. The craft will be able to selectively allow the asserts PSPIDISCARD and PSPHDISCARD by setting the global parameter according to the table shown below.

Recent Change/Verify (RC/V) default: N/A

| Office Parameter Value | Office Parameter Bit Fields | Conditions for allowing the assert |
|---|---|---|
| 0 | 0000 | Always disallowed |
| 1 | 0001 | Always disallowed |
| 2 | 0010 | Always disallowed |
| 3 | 0011 | Always disallowed |
| 4 | 0100 | PH discarded frames when not in timer recovery or peer busy |
| 5 | 0101 | PH discarded frames including timer recovery |
| 6 | 0110 | PH discarded frames including peer busy |
| 7 | 0111 | all PH discarded frames |
| 8 | 1000 | PI discarded frames when not in timer recovery or peer busy |
| 9 | 1001 | PI discarded frames including timer recovery |
| 10 | 1010 | PI discarded frames including peer busy |
| 11 | 1011 | all PI discarded frames |
| 12 | 1100 | PH or PI discarded frames |

# Glpmem_sze

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpmem_sze | LPFP | DMlong |

### 1.1 Glpmem_sze

Global Office Parameter Glpmem_sze

**Defines:**
db/DMclidef.h

### 1.2 Description:

For the CMP and the SM-2000 (SMP2000), the highest addressable memory. For other SMs (SMP12, SMP20, MCTU3, SMP23), the amount of physical memory. Glpmem_sze is stated in units of 1K bytes (that is 1024 bytes). Note that megabytes (MB) are used in the following discussion, where 1 MB is 1024 K bytes.

For the CMP with Glconfigname=CNFG002 the Glpmem_sze is fixed to 868,352 KB. The actual memory size is 20 MB. For VCDX switches where there is no CMP hardware but a process, CMPKP, the Glpmem_sze is fixed to 1904 KB, the size of the ODD for the "CMP".

For the AM this parameter is defined but not used and therefore Glpmem_sze=0 for this case. The ECD contains the AM memory equipage information.

5E10(1) & LATER SM PROCESSOR EQUIPAGE

| SM PROCESSOR | MOTOROLA PROCESSOR (Note 1) | MEMORY BOARD (Note 2) | MAX.SLOTS | MAX EQUIPAGE [MEGABYTES] (Note 3) |

```
 ======================================================================
NOTES:
1. Processor addressability limits are defined by the microprocessor used
   and the SMP architecture.  For the 68012 the maximum addressability is
   32MB which can be reached using an MEU.  For the rest of the shown
   processors the addressability is limited by memory on the core board
   (if supported), and the number and size of external memory boards which
   can be supported on the specific architecture.
2. TN56=2MB, TN2012=4MB, TN1374=4MB, TN1376=8MB, TN1661=16MB, TN1685=32MB
   and TN1806=64MB.  TN1374, TN1376, and TN1661 boards may be mixed in the
   same MCTU2.  The SM-2000 also supports memory board mixing, but pack type
   usage is limited to the associated unit (as shown in the processor equipage
   chart).  The SMP23CDM and SMP23CDMX provide 32 megabytes of on-board
   memory; the SMP23CDM does not support external memory boards, the SMP23CDMX
   supports zero to five TN2012 external memory boards.
3. Maximum equipage (*) requires use of the Memory Expansion Unit (MEU). The
   SM-2000 equipped with a CORE60 (68060 processor) comes with 64MB of
   on-board memory.  Two memory configurations are available with CORE60MM,
   64MB or 128MB of on-board memory; the 128MB version is limited to use with
   SM2005 unit type.

        The following algorithms can be used to determine the value of this
        parameter.

        If the unittype = SMPU4, SMSM2000(for SM-2000), and SMSM2005(for
        SM2005) then set up 2 counts SIDE0 and SIDE1.

        Note that SM-2000 defines a class of SMs, which is comprised of
        SM-2000(SMSM2000) and SM2005(SMSM2005).

        The SMxxxx without a "dash" is an "altval" used by RCV and ODA.

        The (SMSMxxxx) defines the SM's unittype.

        Also note that the use of the SM-2000 and SM2000 names throughout
        the prl files has not been used consistently, and therefore may be
        used in such a way that does not
        ------------------------------------------------------------------------
        1. Set SIDE0 and SIDE1 to 0.

        for every tuple in RLcktdata

        begin
        if ((RLcktdata.eqstat == SMOPER) &&
            (RLcktdata.type == PC_MP) &&

| Glpmint | LRFR | DMuchar |

### 1.1 Glpmint

Global Office Parameter Glpmint

### 1.2 Description

This office parameter is used to specify the interval at which layer 1 performance monitoring reports are automatically generated. This control is to be on the entire office basis. Its initial (default) value is to be 1 hour and is to be recent change updatable on an office basis. This parameter should be populated with the same value in the AM and in all SMs.

# Glpmlog

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpmlog | LRFR | DMmodule |

### 1.1 Glpmlog

Global Office Parameter Glpmlog

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is Global Output Message Logging.

# Glpmmax

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpmmax | LR | DMushort |

### 1.1 Glpmmax

Global Office Parameter Glpmmax

### 1.2 Description

This office parameter is used to limit the number of Layer 1 Performance Monitoring threshold groups. The maximum number of groups is 65535 but for time and ODD space reasons this parameter will limit the number of PM threshold groups. If the allowed number of groups is exhausted this parameter can be increased to allow for more groups. The penalty for increasing the number of groups is that more ODD memory is needed and it will take PM refresh longer to update each ISLU/IDCU with PM thresholds.

This parameter is only to be set by ODA if the parameter is not previously defined. If previously defined ODA is not to change the value.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpmrat | FR | DMuchar |

### 1.1 Glpmrat

Global Office Parameter Glpmrat

### 1.2 Description

This global office parameter specifies the number of cyclic redundancy code (CRC) errors, also known as block errors, that are allowed before a severely errored second (SES) is incremented in an ANSI(R) Standard U-card. This value is to be initially set to 3 and is to be recent change updatable. It is defaulted to 3 because the current BRITE CUs are set at 3 and would require a hardware change to alter the value. This office parameter is to be populated in all SMs. The value in all SMs should always be the same.

# Glpmsgd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpmsgd | LRFR | DMmodule |

### 1.1 Glpmsgd

Global Office Parameter Glpmsgd

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is Global Message Distribution .

# Glpmtim

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpmtim | LRFR | DMuchar |

### 1.1 Glpmtim

Global Office Parameter Glpmtim

### 1.2 Description

This office parameter is used to specify the hour at which ALE and performance monitoring reports will be generated daily. This control is to be on the entire office basis. Its initial (default) value is to be 0 (zero) and is to be recent change updatable on an office basis. The number indicates at which hour of the day the daily reports are to be generated. A 0 (zero) indicates 12 midnite and 23 indicates 11 pm. On ODD updates the value should not be altered. For DFI, IDCU, and DNU-S, This field specifies the start hour for the 24-hour collection interval. This parameter should be populated with the same value in the AM and in all SMs.

# Glposmn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glposmn | FP | DMushort |

### 1.1 Glposmn

Global Office Parameter Glposmn

### 1.2 Description

Lowest (minimum) operator position number served by the IBM(R) DAS.

The OSPS Port to IBM(R) position ID mapping allows the OSPS owner to obtain IBM(R) position ID's for each of the OSPS operator ports (positions) associated with the IBM(R) Directory Assistance System(s) (DAS) working in conjunction with an OSPS.

This parameter and Glposrn are specified to produce the required mapping. Glposmn assigns the minimum OSPS position number and Glposrn assigns the range of sequential positions from the minimum position, that may interface with the IBM(R) DAS.

For example, when OSPS position numbers in the range of 500 to 1499 are planned to interface with an IBM(R) DAS (RLpos_port.posnum is in {500, 1499}), Glposmn is set to 500 and Glposrn is set to 1000. Not all the positions within this range are required to interface with the IBM(R) DAS. Only OSPS operator position ID's where RLpos_port.pos_typ equals OA_VDT are converted to IBM(R) position ID's. However, all current and future positions which provide services via the IBM(R) DAS must fall within these bounds. If the Glposmn number or Glposrn is later changed, all IBM(R) position ID's associated with ARU ports will need to be reassigned in the IBM(R) DAS; therefore, room for operator position growth should be considered when assigning these values.

If the OSPS owner wishes to start the sequence at OSPS position number 1, this value can be set to zero to make the OSPS position number and IBM(R) position ID equal; this only wastes the first IBM(R) position ID (ID = 0), as OSPS has no position number zero. Alternately, this parameter can be set to one, which makes the IBM(R) position ID one less than the corresponding OSPS position number.

The IBM(R) position ID = RLpos_port.posnum - Glposmn.

Glposmn + Glposrn must be less than 4097.

If Glposrn is zero (no value entered by the customer), then Glposmn must be zero.

Prior to 5E6(2), this global must always equal the default.

# Glposrn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glposrn | FP | DMushort |

### 1.1 Glposrn

Global Office Parameter Glposrn

### 1.2 Description

Number of operator position numbers set aside to serve the IBM(R) DAS.

See comments for global Glposmn.

The sum of all the RANGES for positions and trunk groups may not exceed 9000. This is an IBM(R) system limit. Note that the 9000 range must be potentially shared with other switching systems that use a given IBM(R) DAS. Therefore, ODA (not RC) should give a warning when the sum of all ranges exceeds 4500, indicating that over half the available array in the IBM(R) DAS has been allocated for this office alone, and reassessment may be required if other offices share an IBM(R) DAS. This warning should also appear in the RC documentation.

Zero is not allowed on the RC/ODA form. It is used when there is no customer entered data for this global.

Glposmn + Glposrn must be less than 4097.

Glposrn + Gltg0rn + Gltg1rn + Gltg2rn + Gltg3rn + Gltg4rn + Gltg5rn + Gltg6rn + Gltg7rn must be less than 9001.

Glposrn + Gltg0rn + Gltg1rn + Gltg2rn + Gltg3rn + Gltg4rn + Gltg5rn + Gltg6rn + Gltg7rn SHOULD be less than 4501, else ODA warning.

RC and ODA must also enforce the poprules for Glposrn given in RLeisdsl. Poprules for when Glposrn cannot be zero are given in RLeisdsl so that there is an order of growth defined for RC.

If Glposrn is not zero, then Gltg0rn + Gltg1rn + Gltg2rn + Gltg3rn + Gltg4rn + Gltg5rn + Gltg6rn + Gltg7rn must be greater than zero (at least one of these global parameters must not be zero).

Prior to 5E6(2), this global must always equal the default.

# Glpridest

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpridest | FP | DMbool |

### 1.1 Glpridest

Global Office Parameter Glpridest

### 1.2 Description

This parameter determines whether the priority destination feature (30-01-0213) is active in the office. It is a country dependency and the parameter will be set according to the country in which the office is installed. It must not be recent changeable. The RCV support is none. Used by Export.

# Glprmsd3

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glprmsd3 | LRFR | DMmodule |

### 1.1 Glprmsd3

Global Office Parameter Glprmsd3

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is Remote Measurement System.

# Glpsinpa

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpsinpa | FP | DMchr8 |

### 1.1 Fullname:

Global Office Parameter Glpsinpa

### 1.2 Description:

Implied NPA (numbering plan area, or area code) of the office for ISDN packet switching. This NPA allows a telephone company to assign an implied NPA for packet switching which may be different from that for circuit switching (such as, voice call). Therefore, Glpsinpa may or may not be the same as Glinpa. The area code (NPA) chosen to be Glpsinpa should be the NPA most often implied by 7-digit packet switching calls originating from or incoming to this office. Even though 8 characters are used for defining the parameter, for domestic application, Glpsinpa will normally be 3 digits in the format of NXX where:

```
N = any digit from 2 through 9, inclusive
X = any digit from 0 through 9, inclusive
X = any digit from 0 through 9, inclusive
```

Glpsinpa is related to the RLnmimpdgts relation. In order to limit the number of tuples in the RLnmimpdgts relation, RLnmimpdgts is generally not populated with tuples for 7-digit calls whose implied NPA is the same as the Glinpa. Be aware that choosing a Glinpa which is not the most often implied npa for 7-digit calls will result in more tuples being populated in the RLnmimpdgts relation.

Occasionally customers may find a need to populate the RLnmimpdgts with the same implied NPA as the Glinpa. Again this results in more tuples being populated in the RLnmimpdgts relation.

This parameter should be populated only in all the ISDN SMs. Therefore, for the SMs with the GLISDNBASE software loadable package, Glpsinpa must be set to an appropriate value. For the SMs without the GLISDNBASE software loadable package, Glpsinpa is set to '\0'.

# Glpsmlhgs

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpsmlhgs | LR | DMshort |

### 1.1 Glpsmlhgs

Global Office Parameter Glpsmlhgs

### 1.2 Description

This parameter indicates the number of Packet Switching Multi-Line Hunt Groups and Modem Pool Groups in the office. It must be updated by RC when the number of Packet Switching Multi-Line Hunt Groups and Modem Pool Groups is grown or de-grown. A Packet Switching MLHG has hunt type RTH_PSUCD or RTH_PSLGUCD in relation RLrt_mhg. A Modem Pool Group has a tuple in relation RLrt_mpg. Therefore, the value of this parameter should be the sum of all tuples in RLrt_mhg with the above hunt types plus the number of tuples in RLrt_mpg. Range from 0 to AVMLHGRPS(). Default is 0. This parameter is populated by ODA and supported by RC and ODBE.

# Glpsubase

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpsubase | FP | DMctrladrs |

### 1.1 Glpsubase

Global Office Parameter Glpsubase

### 1.2 Description

This parameter stores the base address of the Side 0 PSU (formerly PSIU) controller (PSUCOM) circuit. This parameter is only needed in ISDN SMs. This parameter will be populated as follows: The Side 0 PSUCOM will be associated with the even numbered Peripheral Interface Control Bus (PICB) for the SMPSIU peripheral unit. The base address is a 16 bit value having the even numbered (HEX) PICB number for PSUCOM 0 in the upper 8 bits and zero in the lower 8 bits. DBGEN initializes Glpsubase to 0xe000, followed by ODA initialization if a PSIU is equipped. The value 0xe000 maps to Control Interface (CI) 7 which is not used thus safeguarding against improper use. This was picked instead of zero because improper use would result in LDSU peripheral detected bad addresses. Glpsubase is alterable by recent change (that is, PSIU growth).

# Glpswmtc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpswmtc | LRFR | DMmodule |

### 1.1 Glpswmtc

Global Office Parameter Glpswmtc

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is Global Switch Maintenance .

# Glpts_sps

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpts_sps | FP | DMulong |

### 1.1 Fullname:

Global Office Parameter Glpts_sps

### 1.2 Description:

This parameter contains a bit-map of equipped and in-use Signal Processors in an SM which process signaling bits on peripheral time slots. In this context, in-use means that at least one of the two TSI links served by an SP FIFO has a board connected to it and the eq_stat of at least one or both of the entries in rlCKTDATA is SMOPER for both MCTSI service groups. The following can be connected to the TSI link and are reflected in this bit-map:

```
a DX board
a Peripheral Control and Timing (PCT) Link
```

For SMs, this parameter will always be populated with 1, since there is exactly one SP in SMs.
This value should remain intact during a Generic Retrofit.Glnts_sps.

***Type:*** DBLONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

# Glptsdbnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glptsdbnum | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glptsdbnum - peripheral time slot data block number

### 1.2 Description:

The global parameter Glptsdbnum contains a current count of the number of rlTSDB tuples required for peripheral to peripheral connections in an SM. The value of this parameter is incremented, when a PIDB or PCT link (as in the case of PSU) is grown, and is decremented when a PIDB/PCT link is de-grown. This Global Parameter corresponds to the H-Value GP needed by SRE.

Global Office Parameter Glpu_entry - call pickup entries.

### 1.2 Description:

Glpu_entry is the global parameter that is the current size of the RLpu_entry tuples that exist.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCpuentsz.c which is the init code for Glpu_entry. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

POPULATION:
The following algorithm should be used.
mu = (0.5 * 4 calls/hr/line * Glpu_usrs * 20 sec) / 3600 sec.
sigma = the square root of mu
tupcnt = mu + (5 * sigma) + Glipuentry

### 1.1 Glpu_usrs

Global Office Parameter Glpu_usrs - pickup users

### 1.2 Description

Glpu_usrs represents the numbers of users that have the Call Pick terminating feature and have the potential of being queued on a SM (queuing SM). It is the sum of all members of every pickup group that will be queued on a SM.

# Glpupd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpupd | LRFR | DMmodule |

### 1.1 Glpupd

Global Office Parameter Glpupd

### 1.2 Description

A new set of global parameters is needed in all processors (AM, SM, CMP) which maps logical applications to the processor on which they are provided. This parameter is used by OSDS when sending messages and by DB in determining on which processor an application associated relation is located. This parameter will only change when an application is moved to a different physical processor. In 5E6 there is no provision for allowing this to occur other than at retrofit. When multiple CMPs are supported these will change when applications are moved from one CMP to another CMP or to an SM in the case of the CCS link.

Functionality type is Global Program Update.

# Glpvn_das

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glpvn_das | FR | DMda_tree |

### 1.1 Glpvn_das

Global Office Parameter Glpvn_das

### 1.2 Description

Analysis Selector (DAS) for the ASP dialing plan. Note, that the term Private Virtual Network (PVN) was later changed to ASP, but the internal parameter names and values have not changed. This parameter points to RLda_digstrt to obtain the starting location of digit analysis within the Office Dialing Plan (ODP). This parameter is used as digtree for dedicated lines (offhook-delay/offhook-immediate triggers) and dedicated trunks (trunk seizure/PRI channel triggers). This parameter is also used after an origination is identified as ASP by an access code trigger, BRI feature button trigger and a shared interoffice trunk trigger.

If the office is not an ASP office, this parameter must only be assigned its default value.

```
checks
if ( Glpvn_das != 0 ) then
do;
     Glpvn_das != Glscpl_das and
     Glpvn_das != Glscpt_das and
     Glpvn_ofc != DBNON_PVN
end;

# Glqgpoper

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqgpoper | LP | DMshort |

### 1.1 Glqgpoper

Global Office Parameter Glqgpoper (Quad link Gateway Processor)

### 1.2 Description:

This parameter indicates the of operational Quad link Gateway Processor (QGP) configuration in the office. For 5ESS®-2000 release 1, there can be a 0, 2, or 4 QGP configuration in the office.

This parameter is used by QLPS message routing and by Switch Maintenance to determine the given operational QGP configuration for the office.

This parameter is used by measurements to size reports.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** ---

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** Glqgpoper is populated in the AM only.

Glqgpoper is incremented by 2 whenever one QGP from a pair of QGPs (one on each side of the MSGS) is made operational.

Glqqpoper is set to 2 when one or both QGPs (QGP x-0) is in the operational state.

Glqqpoper is set to 4 when one or both QGPs (QGP x-1) are operational and both QGPs (QGP x-0) in the operational state.

Glqgpoper is decremented by 2 whenever both QGPs from a pair of QGPs (one on each side of the MSGS) is no longer operational.

***Retrofit Rules:*** ODA must recalculate this parameter during a retrofit.

# Glqlpseq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqlpseq | LRFP | DMbool |

### 1.1 Fullname:

Global Office Parameter Glqlpseq

### 1.2 Description:

This parameter indicates whether the primary QLPS (Quad-Link Packet Switch) networks 0 and 1 are operational or in growth in the office or not.

(Note that this parameter is for QLPS networks 0 and 1 only. Other networks in the future must define new parameters.)

The default indicates that QLPS networks 0 and 1 are both NOT operational or in growth.

Glqlpseq will be used by Switch Maintenance code to know whether to traverse QLPS legs of code or not and as a defense check in maintenance code.

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** Glqlpseq is redundant in the AM, CMP, and SM-2000's.
Glqlpseq is re-set to DBNO whenever 1 or more of the 4 QLPSs in networks 0 or 1 are removed.
Glqlpseq is set to DBYES when BOTH QLPS boards (one on each side of the ONTC) are at least in the growth state for BOTH QLPS networks 0 and 1. Glqlpseq must always be populated with the default value in SM's since access to QLPS will only be through Message Handler's (MHs) on SM-2000s, not SMs.

***Retrofit Rules:*** ODA must recalculate this parameter during a retrofit.

***Default Rules:***
```
default = DBNO;

# Glqntwk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqntwk | LP | DMshort |

### 1.1 Fullname:

Global Office Parameter Glqntwk

### 1.2 Description:

Indicates the number of QLPS (Quad-Link Packet Switch) networks that are operational or in growth in the office. (For 5E-2000 release 1, there will only be 2 networks - 0 and 1. In the future there may be up to 4 networks.)

This global parameter will be used by measurements to size reports about QLPS and by the ONTC SSP and QLFR.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** ---

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** Glqntwk is populated in the AM only. This parameter is initially set to 0 indicating no QLPS networks in the office. It is incremented by 1 when both QLPS boards for a network are grown in. It is decremented by 1 when 1 of the QLPS boards for a network is removed.

***Retrofit Rules:*** ODA must recalculate this parameter during a retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
        /* Standard */
        ;
```

***Checks:***
```
/* A growth or operational QLPS network has a growth or
 * operational QLPS on side 0 and side 1 on the same network.
 * Glqntwk must equal the count of such networks.
 */

let net0 = find == 2 qlps in RLqlps
           where ((qlps.side == SM5SIDE0 || qlps.side == SM5SIDE1) &&

# Glqrbns

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqrbns | FR | DMuns10 |

### 1.1 Glqrbns

Global Office Parameter Glqrbns

### 1.2 Description

LIDB query destination parameter for BNS calls, taking into account the carrier of the calls as well as the type of the calls: inter-LATA or intra-LATA. It is SM redundant.

Glqrbns has the following format:

| bit 9 | bit 8 | bit 7 | bit 6 | bit 5 | bit 4 | bit 3 | bit 2 | bit 1 | bit 0 |
|---|---|---|---|---|---|---|---|---|---|

The bits of Glqrbns have the following significance:

| BIT Positions | Call Carrier | Call Type | Bit Value (binary) | Query Destination |
|---|---|---|---|---|
| 1 \| 0 | AT&T | INTER | 00 | AT&T's BVA |
| 1 \| 0 | AT&T | INTER | 01 | LIDB |
| 1 \| 0 | AT&T | INTER | 10 | See RLnpa_head |
| 1 \| 0 | AT&T | INTER | 11 | Use default value |
| 3 \| 2 | AT&T | INTRA | 00 | AT&T's BVA |
| 3 \| 2 | AT&T | INTRA | 01 | LIDB |
| 3 \| 2 | AT&T | INTRA | 10 | See RLnpa_head |
| 3 \| 2 | AT&T | INTRA | 11 | Use default value |
| 5 \| 4 | BOC | INTER | 00 | AT&T's BVA |
| 5 \| 4 | BOC | INTER | 01 | LIDB |
| 5 \| 4 | BOC | INTER | 10 | See RLnpa_head |
| 5 \| 4 | BOC | INTER | 11 | Use default value |
| 7 \| 6 | BOC | INTRA | 00 | AT&T's BVA |
| 7 \| 6 | BOC | INTRA | 01 | LIDB |
| 7 \| 6 | BOC | INTRA | 10 | See RLnpa_head |
| 7 \| 6 | BOC | INTRA | 11 | Use default value |
| 9 \| 8 | DEFAULT | SEE BELOW | *0 | AT&T's BVA |
| 9 \| 8 | DEFAULT | SEE BELOW | *1 | LIDB |

* Bit 9 is a don't-care bit. The default destination is determined only by the bit 8.

The query destination for any given switch is determined by the following variables:

(1)The type of the operator service call: CCD or BNS;
(2)The carrier of the call;
(3)The type of the call: inter-LATA or intra-LATA.

Copyright © 1999 Lucent Technologies

These variables are taken into account in the above table. For example, for a BNS call, if the Call Carrier is AT&T and the Call Type is inter-LATA, bits 0 and 1 of Glqrbns would be examined. A value of 00 means send the query to AT&T's BVA, a value of 01 means send the query to LIDB, a value of 10 (binary) means the bit map must be accessed to determine the query destination, a value of 11 (binary) means use the default destination as specified by the bit 8. Bit map refers to the data comprised of the tuples of Relation RLnpa_head or Relations RLnpa_head and RLnpa_nxx. Bit 8 is used to direct the query destination when the associated q2bit in RLnpa_head equals 3 (11 in binary), or when the associated tuple of RLnpa_head itself is absent, or when the associated bits in Glqrbns equals 3 (11 in binary).

The bit 8 of Glqrbns must equal the bit 8 of Glqrccd.

The I/O form of this global parameter is in hex.

# Glqv_state

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqv_state | FP | DMushort |

### 1.1 Glqv_state

Per SM count of the total number of initialized ACD/BRCS Queuing and Vectoring State (rlQV_STATE) tuples.

### 1.2 Description

The Glqv_state global parameter contains an SM's current rlQV_STATE tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***Type:*** DBUSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions when the ACD/BRCS feature is enabled on the switch. It is also updated by trigger functions as lines and trunks are assigned and when rlCLLQDB tuples are inserted. It will never be decreased.

# Glqvaga

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqvaga | FR | DMuns8 |

### 1.1 Glqvaga

For ACD/BRCS queuing and vectoring this parameter specifies the per call absolute limit on the number of ACD status queries and Third Party Call Control (TPCC) host queries.

### 1.2 Description

For ACD/BRCS calls receiving call vectoring treatment, this parameter specifies the maximum number of: GOTOAGE, GOTOQUE, GOTOSTA, GOTOAVL, and REQRTE steps that can be processed for a given call. When this limit is reached for a given call, vector processing is stopped. If the call has been previously placed into a queue, the call remains in that queue and any currently active delay treatment (MUSIC/RING/QUIET) continues. If the call has NOT been previously queued, the call is given reorder.

When the global parameter contains 0, no limit is enforced.

# Glqvanq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqvanq | FR | DMuns8 |

### 1.1 Glqvanq

For ACD/BRCS queuing and vectoring this parameter specifies the absolute limit on the duration of an announcement (in seconds) when a call is set-up to an announcement and the call has not been previously placed into an ACD/BRCS queue.

### 1.2 Description

For ACD/BRCS calls receiving call vectoring treatment, this parameter specifies the maximum number of seconds an announcement can last when a call is set-up to an announcement and the call has not been previously placed into an ACD/BRCS queue. The purpose of this limit is to detect when a Route Index to a Music Source has been mistakenly used instead of a Route Index to an Announcement. The result would be that any ANNOUNCE step using this RI will never end. If a call has been previously queued, this is of little concern. However, when the call has NOT been queued, an error of this sort can tie up all vectoring resources (such as, rlQV_STATE tuples).

When the global parameter contains 0, no limit is enforced.

# Glqvrga

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqvrga | FR | DMuns8 |

### 1.1 Glqvrga

For ACD/BRCS queuing and vectoring this parameter specifies the per call resettable limit on the number of ACD status queries and Third Party Call Control (TPCC) host queries.

### 1.2 Description

For ACD/BRCS calls receiving call vectoring treatment, this parameter specifies the maximum number of: GOTOAGE, GOTOQUE, GOTOAVL, GOTOSTA, and REQRTE steps that can be processed without pausing. The counter used to count the steps is reset whenever an ANNOUNCE, MUSIC, RING or QUIET step is successfully processed. If the counter reaches the limit specified by this global, vector processing is paused for the number of seconds specified by Glqvpau and all resettable limit counters are cleared. If the call has been previously placed into a queue, the pause will end early if an agent becomes available during the pause. Any currently active delay treatment (MUSIC/RING/QUIET) continues during the pause. If no delay treatment is active, the caller will hear silence during the pause.

When the global parameter contains 0, no limit is enforced.

# Glqvtmn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glqvtmn | FR | DMuns8 |

### 1.1 Glqvtmn

For ACD/BRCS queueing and vectoring this parameter specifies the absolute limit on the number of seconds a call can be vectored without being placed on a queue.

### 1.2 Description

For ACD/BRCS calls receiving call vectoring treatment, this parameter specifies a time limit (in seconds) on the total time a call can be vectored without being placed on a queue. The purpose of this parameter is to guarantee that a call cannot be given vectoring treatment (such as, connected to announcements and music) indefinitely if it has not been placed into a queue. It is needed in ACD applications where callers expect to wait for a long period of time (hours) to prevent a vectoring error from tying up global vectoring resources (such as, rlQV_STATE tuples) with unproductive calls (without this limit, these calls may only be cleared from the switch by initializing the SMs).

When the global parameter contains 0, no limit is enforced.

Global Office Parameter Glralmmod

### 1.2 Description:

This global parameter indicates if the Alarm Output Option is present, and if so, on which SM. This parameter is populated in all SMs.

The Alarm Output Option indicates the ability to report audible and visual alarms and status at an SM via either an RAU (Remote Alarm Unit) or ASU (Alarm and Status Unit). The following SM configurations either require or optionally support the Alarm Output Option:

- Single RSM or ORM/TRM. If the Alarm Output Option is on, Glralmmod will be set to the number of the SM. Otherwise it is zero.

- MMRSM cluster. If the Alarm Output Option is on, all SMs in the cluster will have Glralmmod set to the number of the SM hosting the alarm panel. Otherwise, it will be zero in all SMs in the cluster.

- ORM/TRM colocated group. If SMs in the group are sharing the alarm panel, they will have Glralmmod set to the number of the SM hosting the alarm panel. Otherwise, it will be zero in all SMs in the group.

- VCDX SM. The Alarm Output Option is required, so Glralmmod must be equal to the SM number.

- DRM. If the Alarm Output Option is on, Glralmmod will be set to the number of the SM. Otherwise, it is zero.

In all other modules, Glralmmod is set to zero.

# Glratetime

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glratetime | LRFR | DMuns4 |

### 1.1 Glratetime

Global Office Parameter Glratetime

### 1.2 Description

Rating query time out parameter which is specified in seconds. This parameter indicates the longest period of time that call processing will wait for a rating reply from the data base. A timeout will result in a rating failure. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value.

# Glrcd_3pt1

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrcd_3pt1 | FR | DMrcd_3pt1 |

### 1.1 Glrcd_3pt1

Global Office Parameter Glrcd_3pt1

### 1.2 Description

Glrcd_3pt1 is used to determine the bearer capability (IAM.USI.tr_cap value) under the following conditions.

(1) The call has a bearer capability of '3.1kHz audio'.

(2) The call is about to be routed out over an ISUP trunk.

(3) The office processing the call is either a local tandem which received the call via an incoming inband signaling speech trunk or an originating end office.

(4) The per trunk group indicator stored in RLfc_trunk, (rcd_3pt1_itc), was null.

The following table shows the value for Glrcd_3pt1 and the action that will be taken.

| Value: | Action: |
|---|---|
| DBSPEECH | Recode IAM.USI.tr_cap to 'speech' |
| DB3PT1KHZ | Send out IAM.USI as '3.1kHz audio' without modification |

Glrcd_3pt1 should not be set to DB3PT1KHZ until the following are true:

(1) All far switches have implemented the rule that the value of the USI parameter is either controlled by the trunk group parameter (if not set to 'null' or the switch parameter).

(2) The transmission facilities to all far switches are capable of handling calls with a bearer capability of '3.1kHz audio'.

(3) The software at all far switches is capable of handling calls with a bearer capability of '3.1kHz audio'.

These checks cannot be made by the software. It is therefore up to the craft personnel to make these checks before changing the global office parameter Glrcd_3pt1 to DB3PT1KHZ.
Gloftyp

***Type:*** DBENUMPAR

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

Copyright © 1999 Lucent Technologies 

***SM Initial Value:*** DBSPEECH

***AM Initial Value:*** DBSPEECH

***CMP Initial Value:*** DBSPEECH

***RC/ODA Rules:*** Glrcd_3pt1 must not be set to DBSPEECH at a toll office.

***Retrofit Rules:*** In a newly retrofitted office, all trunk groups will have RLrctgrprk.rcd_3pt1_itc set to DBNULLITC. This means that Glrcd_3pt1 will control the outgoing USI value for all ISUP trunks in a newly retrofitted office.

For a newly retrofitted Local Exchange Carrier (LEC) owned switch, Glrcd_3pt1 should be set to its default value of DBSPEECH. This will assure that the sending out of '3.1kHz audio' bearer capability values will not begin until all conditions shown above are true.

For a newly retrofitted toll switch, Glrcd_3pt1 should be set to DB3PT1KHZ. This will assure that AT&T toll switches will continue to send 3.1kHz audio calls out without recoding.

When retrofitting from a 5E8 release to a 5E9 or later software release, the value of Glrcd_3pt1 should be carried forward as is.

***Default Rules:*** default = DBSPEECH;

# Glrcvbs

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrcvbs | LR | DMbool |

### 1.1 Glrcvbs

Recent Change verbose option

### 1.2 Description

This global parameter Indicates the default option for printing one line summary of Recent Change inserts, updates, deletions and failures to the Receive-Only Printer (ROP) after a Recent Change transaction has completed. If this option is set to DBYES, all Recent Changes will be logged to the ROP unless the user specifically selects the verbose option as 'N' in menu RC or 'NVERBOSE' in APPTEXT. This replaced Glrcosl in 5E7(1).

# Glrdtadas

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrdtadas | FR | DMda_tree |

### 1.1 Glrdtadas

Global Office Parameter Glrdtadas, RDTA digit analysis selector

### 1.2 Description

This global office parameter defines the Digit Analysis Selector (DAS) to be used to translate the output facility DNs specified in the EXC:RDTA TTY input message for the Remote Digital Test Access (RDTA) capability. The DAS specified will translate the DN for a 64 Kbps (Clear or Restricted) or 56 Kbps data call. If this parameter is populated (not equal to zero), then there should be exactly one tuple in the relation RLrc_das with RLrc_das.digtree equal to Glrdtadas and Glrdtasrnx must not equal zero. The parameter is populated on every SM in the office (SM redundant).

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ODA should enforce that the LDIT pointed to by the DAS entered for this Global Parameter is populated on all loaded SMs in the office and any standard SMs containing CCS7 trunk ports. RC will not enforce the check.

***Retrofit Rules:*** not applicable

# Glrdtapic

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrdtapic | FR | DMcarrid |

### 1.1 Fullname:

Global Office Parameter Glrdtapic

### 1.2 Description:

This parameter is used to store the preferred Inter-LATA Carrier ID for routing output data from a Remote Digital Terminal Access (RDTA) session in one LATA, over an Inter-LATA CCS7 (ISUP) trunk, to a Customer Service Center (CSC) in another LATA.

If the Inter-LATA Carrier ID is entered as 1, 2 or 3 characters, then the unspecified characters are '0'. As an example, if the user enters 12 as the Inter-LATA Carrier ID, then the 0 and 1st numbered elements are '0'.

```
Glcarrid[0] = '0'
Glcarrid[1] = '0'
Glcarrid[2] = '1'
Glcarrid[3] = '2'
```

This parameter replaces Glsf9dummy in 5e11.1, which was used for this purpose in the 5e9.1, 5e9.2, and 5e10.1 generics.

***Type:*** DB4STRPAR

***ODBE Access:*** DBDISPLAY

# Glregrecall

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glregrecall | FP | DMbool |

### 1.1 Glregrecall

Global Office Parameter Glregrecall

### 1.2 Description

If true the office is equipped with the indirect (register recall) version of capability j121, Feature Access during Speech. This version enables a subscriber to access an associated feature while engaged in a call by signaling a request for permission of dialing facilities and then dialing a digit string defined by the administration to access the feature. The only feature accessed for this generic is MCT. The value of parameter Glmct1 may be DBYES. Glregrecall is country dependent. It should have the value DBYES only if the administration has bought register recall. The only such administration at time of writing this is Saudi Arabia. Used by Export.

# Glrem_loss

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrem_loss | FP | DMtsi_loss |

### 1.1 Glrem_loss

Global Office Parameter Glrem_loss

### 1.2 Description

This parameter is used to define the amount of decibel (dB) loss applied to remote calls by the time slot interchanger (TSI). It applys to all calls that traverse an umbilical link. This includes Inter-module calls on an ORM. If an RSM has an intra-RSM cluster call that gets backhauled over the T1 umbilical link, then the remote loss will apply to this call. This parameter is set in 0.5 dB increments. Range of values:

```
 min. LSS0_0 (0.0dB) to max. LSS15_0 (15.0 dB).
          LSS0_0 (0.0 dB)
          LSS0_5 (0.5 dB)
          LSS1_0 (1.0 dB)
          LSS1_5 (1.5 dB)
          LSS2_0 (2.0 dB)
                .
                .
                .
          LSS15_0 (15.0 dB)
```

In order to set the parameter to a value greater than 0.0, the far access remote (FAR) special feature (SFID 184) must be purchased and must be turned on (SFID 184 is set) for the office.

***Type:*** DBENUMPAR

# Glreplyblf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glreplyblf | FP | DMuns8 |

### 1.1 Glreplyblf

Global Office Parameter Glreplyblf

### 1.2 Description

This parameter tells how many RLREPLYBLF dynamic tuples should be allocated in each SM.

```
If (gltreeablf + glmoniablf) <= 42 then

     glreplyblf = gltreeablf + glmoniablf

else

     glreplyblf = 42 + (gltreeablf+ glmoniablf - 42) div 2
```

ODA, RC and ODBE are required to calculatethis parameter according to the formula above, after either all RLTREE_BLFand RLMONI_BLF tuples are allocated, gltreeablf and glmoniablf are generatedin ODA case, or after a RC/ODBE work is done on RLTREE_BLF/RLMONI_BLF relation to affect the gltreeablf/glmoniablf value. For RC only, ifa new calculated global parameter value is smaller than the current value,but not equal to zero, do not update it. Otherwise do update it.

# Glretrochk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glretrochk | LR | DMlong |

### 1.1 Glretrochk

Global Office Parameter Glretrochk

### 1.2 Description

This AM only global parameter is used by Database Retrofit software code for 5E9(2) and later software releases. It serves as a status bitmap to record the completion of all required Database Retrofit steps. Each bit represents a required step. The bit mask is defined in a DB local header to be used by a Database Retrofit check function. The purpose of having a status bitmap is to ensure all required Database Retrofit steps to be performed in the proper order.

# Glretry

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glretry | LRFR | DMshort |

### 1.1 Glretry

Global Office Parameter Glretry

### 1.2 Description

This global parameter is used to turn the diagnostic retry on and off and to turn the retry output message on and off. The 3 values available will be the following:

```
  0 : which is retry off (RETRYOFF)

      (output message will also be off),

  1 : retry on, output message off (RETRYON_NM)

      (retry on no message)

  2 : retry on, output message on (RETRYON_V)

      (retry on verbose)
```

This parameter will only be changed by odbe and will be read by dg to determine if the retry should be done. It will be used by both the SM and CM diagnostics which are SM and AM processes. On retrofit, preserve existing value.

# Glretsm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glretsm | FP | DMlong |

### 1.1 Glretsm

Global Office Parameter Glretsm

### 1.2 Description:

Glretsm is used by ODA to determine if a SM will retrofit to a software configuration other than the pre-retrofit software configuration of the SM. The allowable values and their meaning are:

| pre-retrofit Glconfigname | Glretsm value | post-retrofit Glconfigname |
|---|---|---|
| CNFG000 | 0 | CNFG000 |
| CNFG000 | 1 | CNFG001 |
| CNFG000 | 2 | CNFG002 |
| CNFG000 | 3 | CNFG003 |
| CNFG001 | 0 | CNFG001 |
| CNFG001 | 1 | CNFG000 |
| CNFG001 | 2 | CNFG002 |
| CNFG001 | 3 | CNFG003 |
| CNFG002 | 0 | CNFG002 |
| CNFG002 | 1 | CNFG000 |
| CNFG002 | 2 | CNFG001 |
| CNFG002 | 3 | CNFG003 |
| CNFG003 | 0 | CNFG003 |
| CNFG003 | 1 | CNFG000 |
| CNFG003 | 2 | CNFG001 |
| CNFG003 | 3 | CNFG002 |
| CNFG2K00 | 0 | CNFG2K00 |

The value of DMsmconfig, for each SM tuple in the AM relation RLsmconf, must be set to correspond to the SM parameter, Glconfigname, of each SM.

# Glrgtrip

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrgtrip | FR | DMrgtrip |

### 1.1 Glrgtrip

Global Office Parameter Glrgtrip

### 1.2 Description

This global parameter is used by Generalized Ringing to indicate the Ringing Trip Threshold required to be set at the ISLU-Z line card. There are four valid values. Ring trip is detected when frequency being monitored differs in the amount that it is above and below the frequency threshold.

DMRTRIPO means ring trip is detected when the difference is 14 counts

DMRTRIP1 means 16 counts; DMRTRIP2 means 18 counts

DMRTRIP3 means 20 counts. The domestic value is DMRTRIP3

# Glrhg_cnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrhg_cnt | FP | DMushort |

### 1.1 Glrhg_cnt

Global Office Parameter Glrhg_cnt

**Defines:**
db/DMtmslnk.h

### 1.2 Description:

Contains the number of Relative Hunt Groups for an SM. For SMs, this parameter should always contain the value 1. For an SM-2000, it contains the number of NLI2s equipped on the SM divided by 2. Or, it contains the number of ENLIs/NLI1s equipped on the SM divided by 2. For SM-2000s, this value will be 0 for VCDX offices. For SMs, this value will be 1 for VCDX offices.

This value should remain intact during a Generic Retrofit.

# Glringtot

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glringtot | FR | DMshort |

### 1.1 Glringtot

Global Office Parameter Glringtot

### 1.2 Description

This global parameter indicates how long ringing should continue if no answer, abandon or overload occurs.

For Example:

Glringtot = 5 means ring for 5 minutes (if answer, abandon, or overload does not occur) then time out unconditionally. The default of zero means 'continue ringing forever,' that is, not timeout. The maximum value of the parameter is 32,767 (because it is a short). The value of the parameter always indicates number of minutes before timeout. '1' is not valid - two minutes is the shortest ringing time allowed.

***Type:*** DBSHORTPAR

# Glrlnoc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrlnoc | FP | DMlnoc |

### 1.1 Glrlnoc

Global Office Parameter Glrlnoc

### 1.2 Description

This parameter gives the next available lnoc to be used when adding a tuple to RLfcnpamap. For initialization and retrofit, Glrlnoc will equal the highest assigned lnoc that appears in RLfcnpamap (excluding 12,799) plus 1. In RLfcnpamap, an lnoc of 12,799 indicates a terminating NPA-NXX only; when Glrlnoc is set to 12,799, no more lnocs may be assigned. Glrlnoc is Group Partitioned, restricted to OSPS SMs and PSMs only; that is, SMs with grp_type = GPD_OPRT and grp_id = 2 (see RLdb_gpdus.P).

# Glrrosps

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrrosps | LRFR | DMuns8 |

### 1.1 Glrrosps

Global Office Parameter Glrrosps

### 1.2 Description

This global parameter indicates if rerouting is in progress in this office. It is used internally by OSPS Rerouting call processing code. It contains the total number of serving teams in this office that have their call traffic rerouted. This parameter is kept up-to-date by the OSPS auto-reconfiguration process (AUautrec) and Immediate Interflow Activation and Deactivation RC by setting it to the value of the sum of all the num_on attributes in the static relation RLdistid_rr whenever Rerouting is activated or deactivated.

# Glrsclong

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrsclong | FR | DMshort |

### 1.1 Glrsclong

Global Office Parameter Glrsclong

### 1.2 Description

Glrsclong is the time interval to wait before resending a CCS reset-circuit signal (CCIS6/TUP/ISUP protocols) when failing to receive an acknowledgement in response to the initial CCS reset circuit signals sent at intervals defined by Glrscshort. If an acknowledgement for the signal is not received within the Glrsclong time interval, the sending of the reset circuit signal will continue at the Glrsclong time interval until maintenance intervention occurs. This parameter is used only when the SM contains CCS trunks as shown when one or more tuples of RLfc_trunk have in_sigtype or out_sigtype set to DBISUP7, DBTUP7 or DBCCIS6.

# Glrsmtype

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrsmtype | LRFP | DMrsmtype |

### 1.1 Glrsmtype

Global Office Parameter Glrsmtype

### 1.2 Description

This global parameter indicates which type of MMRSM is located in the office. For the AM, it will contain one of two types which may be remoted (SM24CHT1 or SM30CCITT). The copy of Glrsmtype in the AM is not changeable by recent change. For an LSM, it will be set to indicate that there is no associated MMRSM (SMNOTRSM). For an HSM or an RSM it will be identical to the copy that exists in the AM. This value is closely linked to the global parameter Glimtype. When Glimtype is set to indicate a regular SM, Glrsmtype must be set to SMNOTRSM. When Glimtype is set or changed to RSM or HSM, Glrsmtype must be set first to SM24CHT1 or SM30CCITT based upon the value of Glrsmtype in the AM. Currently, there are no requirements which state that more than one type of MMRSM can exist in the same office and such requirements are not likely.

# Glrt303cnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrt303cnt | FP | DMushort |

### 1.1 Fullname:

The count of TR303 RTs with an eqstat of SMOPER or SMGROW on this Switch Module (SM).

### 1.2 Description:

This global parameter is the count of operation or grow TR303 Remote Terminals on an IDCU on this SM. This number is determined by counting the RLcktdata tuples in this SM of the tuples which have a circuit type of PCRDT303 and an equippage state of SMOPER or SMGROW.

This count is used by recent change in properly maintaining and updating the Glrtlb, Glrtmsgbuf, and Glrteila global parameters (whose values are based entirely on the number of operational/grow TR303 RTs in the SM.

# Glrteila

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrteila | FP | DMushort |

### 1.1 Fullname:

Count of rlRTEILA tuples present in SM

### 1.2 Description:

This global parameter contains the number of rlRTEILA tuples that should be present in a given SM. This is done to allow engineering and auditing of rlRTEILA.

The number of rlRTEILA tuples is nominally based on the number of TR303 RTs present in the SM.

If there are no TR303 RTs in the SM, then Glrteila is 0.

Otherwise, Glrteila

```
((AVTR303RTMAX * 4) + 2)
```

to a maximum value of 642 for SM and 972 for SM-2000. This limits the number of TR303 RTs to 160 for SM and 240 for SM-2000.

Note that the count of operational/grow TR303 RTs in the SM is available in the Glrt303cnt global parameter.

Note that the maximum number of TR303 RTs on an SM or SM-2000 is AVTR303RTMAX.

# Glrtgmd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrtgmd | LR | DMbool |

### 1.1 Glrtgmd

Global Office Parameter Glrtgmd

### 1.2 Description

This global parameter controls routing module assignment in an office. The default value (DBYES) causes restrictive routing module assignments. Assignment of a hundreds group to an remote site module (RSM/ORM/TRM) as the routing module will only be allowed in the restrictive case if all the DNs in the hundreds group are physically located on the same remote site (same cluster/site ID). The non-restrictive value of this parameter (DBNO) will allow a RSM/ORM/TRM to be the routing module for any hundreds group, regardless of where the DNs in the hundreds group are located in the office. See population rules for RTDNMOD for further description.

# Glrtlb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrtlb | FP | DMushort |

### 1.1 Fullname:

Count of rlRTLB tuples present in SM

### 1.2 Description:

This global parameter contains the count of rlRTLB tuples which are present in a given SM. This is done to allow engineering and auditing of rlRTLB.

For an SM loaded with the ID303APP (IDCU) or ISDNBASE (ATS) loadable packages:

```
    The number of rlRTLB tuples is nominally based on the number
    of TR303 RTs present in the SM, a fixed value, 12, for
    Automatic Terminal Setup software (ATS), and the incremental
    global parameter (Glirtlb).

    If there are no TR303 RTs in the SM then Glrtlb is 12 + Glirtlb.
    This is the default number of tuples required for ATS.

    Note that the nomenclature xxx:yyy means the value for both
    the SM (xxx) and SMSM-2000ndash;2000 (yyy). The total number
    of rlRTLB tuples when TR303 RTs are present is determined by:
        4 (A) * Glrt303cnt (B) + 22:54 (C) + 12 (D) + Glirtlb up
        to the maximum of 211:359 (limit of rlRTLB tuples in SM)
        which is then rounded up to the next power of (511).

        Where:
           A = Number of TR303 TPs per each additional RT
           B = Number of TR303 RTs (Glrt303cnt)
           C = Maximum number of TPs statistically possible for
               1 RT: 1 (a) + 34:66 (b) - 11 (c) + 2 (d) - 4
              (e) = 22:54
                 a = Maximum TR303 rlRTLB tuples set aside for
                     recovery
                 b = Maximum number of TR303 TPs per SM possible
                 c = The maximum number of concurrent TR303 manual
                     processes is not realistic, so take them away
                 d = Realistic maximum number of TR303 manual jobs
                     to a given RT
                 e = Number of TR303 TPs per each additional RT
           D = Number of ATS rlRTLB tuples

For an SM not loaded with the ID303APP (IDCU) and ISDNBASE (ATS)
loadable packages:

           The number of rlRTLB tuples is 0.
```

Note that the number of operational/grow TR303 RTs in the SM is available in the Glrt303cnt global parameter.

Copyright © 1999 Lucent Technologies 

Note that the customer can increase the value of this global parameter by increasing the incremental global parameter (Glirtlb).

The fixed value of 12 tuples is to provide ATS with 12 RTLB tuples (two for each ATS_DCOLL terminal process with six maximum processes).

# Glrtmsgbuf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrtmsgbuf | FP | DMushort |

### 1.1 Fullname:

Count of rlRTMSGBUF tuples present in SM

### 1.2 Description:

This global parameter contains the count of rlRTMSGBUF tuples which are present in a given SM. This is done to allow engineering and auditing of rlRTMSGBUF.

For an SM loaded with the ID303APP (IDCU) or ISDNBASE (ATS) loadable packages:

```
The number of rlRTMSGBUF tuples is nominally based on the number
of TR303 RTs present in the SM, a fixed value, 360, for Automatic
Terminal Setup (ATS) software, and the incremental global
parameter (Glirtmsgbuf).

If there are no TR303 RTs in the SM then Glrtmsgbuf is 360 for the
ATS software which provides ATS with 180 rlRTMSGBUF tuples for
each ATS_DCOLL terminal process + Glirtmsgbuf. This is the default
number of tuples required for ATS.

If there are TR303 RTs in the SM, the TR303 component for
calculating the number of rlRTMSGBUFs is dependent on the number
of TR303 rlAPDU and TR303 rlRTLB tuples in the SM. Note that the
nomenclature xxx:yyy means the value for both the SM (xxx) and
SMSM-2000ndash;2000 (yyy).

The total number of rlRTMSGBUF tuples when TR303 RTs are present
is determined by:
  1.5 (A) * (B) + 360 (F) + Glirtmsgbuf
  up to the max of 809:1031 (limit of rlRTMSGBUF tuples in SM)
  which is then rounded up to the next power of 2 less 1 (2047).

  Where:
    A = Average number of rlRTMSGBUF tuples per rlAPDU tuple
    B = Number of TR303 rlAPDU tuples: (C) + 96 (D) + 4 (E)
        Where:
          C = The number of TR303 rlRTLB tuples is derived
              as 4 (G) * num of TR303 RTs (Glrt303cnt) + 22:54(C')
          C'= Maximum number of TPs statistically possible
              for1 RT:
              1 (a) + 34:66 (b) - 11 (c) + 2 (d) - 4 (G) =22:54
                   a = Maximum TR303 rlRTLB tuples set aside for
                       recovery
                   b = Maximum number of TR303 TPs per SM possible
                   c = The maximum number of concurrent TR303
                       manual processes is not realistic, so take
                       them away
```

Copyright © 1999 Lucent Technologies

```
                    d = Realistic maximum number of TR303 manual
                        jobs to a given RT
            D = Maximum number of messages allowed to be queued to
                any single TR303 application TP (PCAPP_PDU_MAX)
            E = Maximum TR303 rlAPDU tuples set aside for recovery
      F = Maximum number of ATS rlRTMSGBUF tuples
      G = Number of TR303 TPs per each additional RT
   For an SM not loaded with the ID303APP (IDCU) and ISDNBASE
  (ATS) loadable packages:

           The number of rlRTMSGBUF tuples is 0.
```

Note that the count of operational/grow TR303 RTs in the SM is available in the Glrt303cnt global parameter.

Note that the customer can increase the value of this global parameter by increasing the incremental global parameter (Glirtmsgbuf).

# Glrtrto

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrtrto | FP | DMuns5 |

### 1.1 Glrtrto

Ready to receive timeout limit.

### 1.2 Description

The VMSI capability makes a request for the sending of data containing billing information to the Enhanced service provider (ESP). When the ESP is ready to receive the data, it will send a 'ready to receive' signal. This parameter is used by the VMSI capability to indicate the length of time, measured in seconds, it will wait for the 'ready to receive' signal from the ESP.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 20

***AM Initial Value:*** 20

***CMP Initial Value:*** 20

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** On a retrofit from a 5E6(1) Office, which has the Voice Messaging Service Interface (VMSI), Issue 1, feature activated, to a 5E7(1) Software Release version of VMSI (Issue 2), the parameter Glrtrto must be set to '12', which is the hard-coded value used in 5E6. The zero bit of the global parameter Gloff2 is used as a feature activation bit for VMSI Issue 1. If the bit is non-zero, the feature is activated in 5E6, and this parameter Glrtrto must be set to '12'. If the 5E6(1) Office does not have VMSI Issue 1, the default value should be used.

# Glrvqthrsh

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glrvqthrsh | FR | DMuchar |

### 1.1 Glrvqthrsh

CDMA reverse voice quality threshold.

### 1.2 Description

This parameter is for the CDMA reverse voice quality threshold. This threshold is used to determine when to peg the Speech Handler (SH) measurements associated with Low Quality Reverse Voice Call Intervals. Specifically, when the voice quality value of the reverse voice frame fed to the vocoder for the call interval is below the threshold, the appropriate measurement is pegged. This threshold is NOT used for SH reverse voice frame selection.

# Glsabac

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsabac | FP | DMchr2 |

### 1.1 Glsabac

Global Office Parameter Glsabac

### 1.2 Description

This global holds the Subaccount Billing access code, which is the digit sequence keyed by the customer at the ACCS bong tone to indicate that the call should receive subaccount billing treatment. It is made recent changeable because there is a possibility that it could change during development of the feature; but once the access code has been agreed upon by all carriers, its value should not change as this will be a nationally-used customer interface. The default value listed is the current planned access code. It is group partitioned, restricted to PSMs and SMs with servclass of FC_RAFDTA in RLfc_porttype; that is, SMs with grp_type = GPD_OSPS and grp_id = 3 (see RLdb_gpdus.R).

# Glsabill

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsabill | FP | DMbool |

### 1.1 Glsabill

Global office parameter Glsabill.

### 1.2 Description

Indicates whether the stand-alone billing feature has been purchased for a specific module. All SMs will initially have a value of DBNO. When the stand-alone billing option is purchased, Glsabill will be changed to DBYES.

***NOTE:*** Parameter will vary from SM to SM within an office.

If the stand alone billing option is not purchased, a default amount of memory is allocated to buffer billing information only during tracer reporting and is not available for use during stand alone operation. When the stand alone billing option is purchased, the billing memory buffer size is increased to use all the spare memory between the end of the SM ODD and the start of peripheral images which are packed into high memory. This billing buffer size is therefore dependent on the amount of physical memory equipped and the size of the SM ODD.

***Type:*** DBENUMPAR

# Glsablec

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsablec | FP | DMbool |

### 1.1 Glsablec

Global Office Parameter Glsablec

### 1.2 Description

This global indicates whether Subaccount Billing service is offered by the Local Exchange Carrier serving this switch (DBYES) or not (DBNO). This flag is only checked if the switch is owned by an Interexchange Carrier; otherwise, this flag is ignored. The value of this flag depends on the value of Glsab_fb. Glsablec can only be set to DBYES if Glsab_fb is also set to DBYES. If Glsab_fb is set to DBNO, Glsablec must also be set to DBNO.

It is group partitioned, restricted to PSMs and SMs with servclass of FC_RAFDTA in RLfc_porttype; that is, SMs with grp_type = GPD_OSPS and grp_id = 3 (see RLdb_gpdus.P).

# Glsacmp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsacmp | FR | DMbool |

### 1.1 Glsacmp

LS AMA Enhancements Record CSAME/CDIFF Call Completion Billing Parameter

### 1.2 Description

This global is used to make an enhanced AMA record for listing service (LS) calls upon call completion based on the determination of SAME/DIFF billing methods. It has the following meaning: if 0, no enhanced AMA record will be generated for CSAME/CDIFF billing upon call completion; if 1, an enhanced AMA record will be generated upon completion for CSAME/CDIFF billing. DBNO=0 DBYES=1.

# Glsacral

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsacral | LR | DMbool |

### 1.1 Fullname:

Global Office Parameter Glsacral

### 1.2 Description:

Glsacral is used to shut off the generation of 15 minute critical alarm reports for isolated SMs (such as, for factory testing and/or site installation). The default value is DBYES (alarm reports generated). A level 2 or greater 3B initialization (manual or automatic) will always reset the parameter to DBYES, to guarantee that the alarm reports are always generated after cutover. These alarm reports are a feature of the switch, and must be guaranteed to generate. Therefore, the usage of this parameter should be restricted to Bell Laboratories and Network Systems factory and site personnel. Should customer personnel alter the value of this parameter, Network Systems should be waived of responsibility for these alarm reports not generating.

ODA must set this parameter to DBYES for new offices and all offline retrofits and growths.

# Glsalgrp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsalgrp | FP | DMshort |

### 1.1 Glsalgrp

Global Office Parameter Glsalgrp

### 1.2 Description

This global parameter allows an SM to be equipped with a line side announcement machine in order to provide the stand-alone announcement. Its values are zero (0), or a multiline hunt group number. If zero, routing to the S.A. announcement via fixed RI RT_RSMSA is done as currently. If nonzero, routing to the multiline hunt group specified by the parameter is done. The lines of the group terminate on an external announcement machine provided by the Service Provider. The lines of the group should have 'Freeterm' marked as DBNO in FC_LINE so that customers are not charged for listening to this line side Service Provider provided announcement.

# Glsastacct

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsastacct | FR | DMbool |

### 1.1 Glsastacct

Announcement for TDX toll account code using SAS.

### 1.2 Description

Service provider office option parameter to turn on or off toll account code dial-through-announcement given by SAS circuit. If a TDX customer subscribes to the account code feature and Glsastacct is set to DBYES the caller hears the account code announcement. At any time after the account code announcement begins, the caller enters the digits. Onces the caller begins entering digits the SAS circuit stops playing the announcement. A fixed route of TACCT must exist on view 10.1 in order for a caller to hear the announcement. When set to DBNO the caller hears the account code prompt (2 beeps) and enters digits.

# Glscaac

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscaac | LPFP | DMaccess |

### 1.1 Glscaac

Global Office Parameter Glscaac

### 1.2 Description

This parameter is used to indicate 5E6 LASS Selective Call Acceptance (SCA) feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the SCA feature, whether the feature is generally available or whether the feature is temporarily unavailable for use. It should initially be populated with UNAVAILABLE. The AM value for this parameter is defaulted to UNAVAILABLE. The AM parameter is changed by RC only when the 'ALL' value is used for the SM key on the LASS Feature Access View. The AM parameter reflects the office standard value and is typically used to set the SM parameters after SM growth.

Routing indices Glscart and Glcarrt must be defined (should not be 0) to set this parameter to either GEN_AVAIL or SUBSCRIPTION.

```
RANGE: (0 - 4)
Values:   0 = LASSNULL,
          1 = UNAVAILABLE,
          2 = GEN_AVAIL,
          3 = SUBSCRIPTION,
          4 = TEMP_UNAVAIL
```

# Glscafd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscafd | FR | DMfid |

### 1.1 Glscafd

Global Office Parameter Glscafd

### 1.2 Description

This global parameter contains the 5E6 LASS SCA feat_id available when the access parameter, Glscaac is set to GEN_AVAIL. This will be used by call processing to determine which tuple to read in the _cf relation for GENERALLY AVAILABLE features. Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the GENERALLY AVAILABLE feature name, /SCAGA, as the key.

# Glscamaq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscamaq | LR | DMuns8 |

### 1.1 Glscamaq

Global Office Parameter Glscamaq

### 1.2 Description

Glscamaq global parameter identifies a unique OSPS ACD call queue reserved for system CAMA calls. This excludes interflowed system CAMA calls that are being received and directed to a different call queue via the ospsid attribute in RLac_cqdet. It includes interflowed system CAMA calls that aren't directed to a different call queue via the ospsid attribute. The range is 0 - 128. This parameter is used to generate system CAMA call queue measurements. When a call queue is reserved solely for system CAMA calls, Glscamaq should be set to the value of the callq attribute in the RLac_cqdet tuple having the key attributes set to:

```
Attribute       Value
---------       -----
ta_type         SYS_CAMA
prefix          NULLPREF
coin            OASTNONCOIN
ospsid          0
carrier         OADC_CARR
```

If another tuple is found in RLac_cqdet having the callq attribute equal to the callq attribute of the system CAMA tuple described previously, then a call queue is not reserved solely for system CAMA calls, and in this case Glscamaq should be set to 0. If a tuple exists in RLac_destx or RLac_tgrp having its callq attribute equal to the callq attribute of the system CAMA tuple in RLac_cqdet described previously, then a call queue is not reserved solely for system CAMA calls, and in this case Glscamaq should be set to 0.

If the usenext attribute of the system CAMA tuple in RLac_cqdet described previously, is equal to TATGRP and a tuple exists in RLac_tgrp where RLac_tgrp.ta_pcid equals RLac_cqdet.ta_pcid, then it is assumed that a call queue is not reserved solely for system CAMA calls, and in this case Glscamaq should be set to 0.

If the usenext attribute of the system CAMA tuple in RLac_cqdet described previously, is equal to TADESTX and a tuple exists in RLac_destx where RLac_destx.ta_pcid equals RLac_cqdet.ta_pcid, then it is assumed that a call queue is not reserved solely for system CAMA calls, and in this case Glscamaq should be set to 0.

These two assumptions are based on the fact that it is not logical for a customer to request a second level of call type determination without the intention of specifying a call queue different than the call queue defined at the first level.

# Glscfac

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscfac | LPFP | DMaccess |

### 1.1 Glscfac

Global Office Parameter Glscfac

### 1.2 Description

This global parameter is used to indicate 5E6 LASS Selective Call Forwarding (SCF) feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the SCF feature, whether the feature is generally available or whether the feature is temporarily unavailable for use. It should initially be populated with UNAVAILABLE. The AM value for this parameter is defaulted to UNAVAILABLE. The AM parameter is changed by RC only when the 'ALL' value is used for the SM key on the LASS Feature Access View. The AM parameter reflects the office standard value and is typically used to set the SM parameters after SM growth.

```
RANGE: (0 - 4)
Values:   0 = LASSNULL,
          1 = UNAVAILABLE,
          2 = GEN_AVAIL,
          3 = SUBSCRIPTION,
          4 = TEMP_UNAVAIL
```

# Glscffd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscffd | FR | DMfid |

### 1.1 Glscffd

Global Office Parameter Glscffd

### 1.2 Description

This global parameter contains the 5E6 LASS SCF feat_id available when the access parameter, Glscfac, is set to GEN_AVAIL. This will be used by call processing to determine which tuple to read in the _cf relation for GENERALLY AVAILABLE features. Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the GENERALLY AVAILABLE feature name, /SCFGA, as the key.

# Glscmdb

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscmdb | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter Glscmdb

### 1.2 Description:

The Glscmdb global parameter contains an SM's current rlSCMDB tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/FCscmcnt.c which is the init code for Glscmdb. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This global parameter is not supported by RC. The value of this parameter is established by ODA and will be updated by trigger functions as DNs are shared. It will never be decreased.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;

# Glscrac

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscrac | LPFP | DMaccess |

### 1.1 Glscrac

Global Office Parameter Glscrac

### 1.2 Description

This global parameter is used to indicate 5E6 LASS Selective Call Rejection (SCR) feature access. It indicates whether the feature is unavailable for use, whether subscription is required to access the SCR feature, whether the feature is generally available or whether the feature is temporarily unavailable for use. It should initially be populated with UNAVAILABLE. The AM value for this parameter is defaulted to UNAVAILABLE. The AM parameter is changed by RC only when the 'ALL' value is used for the SM key on the LASS Feature Access View. The AM parameter reflects the office standard value and is typically used to set the SM parameters after SM growth.

Routing indices Glscr_h and Glscr_g must be defined (should not be 0) to set this parameter to either GEN_AVAIL or SUBSCRIPTION.

```
RANGE: (0 - 4)
Values:   0 = LASSNULL,
          1 = UNAVAILABLE,
          2 = GEN_AVAIL,
          3 = SUBSCRIPTION,
          4 = TEMP_UNAVAIL
```

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** UNAVAILABLE

***AM Initial Value:*** LASSNULL

***CMP Initial Value:*** LASSNULL

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** ODA must retain its value across retrofits to post 5E6 genrics.

***Default Rules:***

```
default = UNAVAILABLE;
```

***Distribution Rules:***

```
        /* Populate on all SMs */
        for modatt in RLmodatt

# Glscrfd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glscrfd | FR | DMfid |

### 1.1 Glscrfd

Global Office Parameter Glscrfd

### 1.2 Description

This global parameter contains the 5E6 LASS SCR feat_id available when the access parameter, Glscrac is set to GEN_AVAIL. This will be used by call processing to determine which tuple to read in the _cf relation for GENERALLY AVAILABLE features. Even though this parameter has a default of null specified for the generally available feature id, ODA should populate this parameter as a result of the ODA process which converts feature names to feature ids. This parameter is populated with the last 10 bits of RLfacname.facid which is accessed by using the GENERALLY AVAILABLE feature name, /SCRGA, as the key.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsdap_idx | FR | DMdestidx |

### 1.1 Glsdap_idx

Global Office Parameter Glsdap_idx

### 1.2 Description

Routing index for the SDAP calls

This global variable indicates the serving team that has APSs capable of handling Speed Dial Auto Provisioning calls. This parameter is initailly set to 0, but must be updated to a valid index, as determined by the service provider, before the Auto Provisioning feature can be activated. When set to a non-zero value, this routing index is used to determine the APS serving team for the call.

This global is redundant on all SMs, is displayed on RC/V view 8.9, and is recent changeable.

```
When Glsdap_idx is not zero:
     must find at least 1 tuple in Rlac_destx
     where (RLac_destx.destx equals Glsdap_idx)
     when found
     begin
          must find at least 1 tuple in RLac_cqdet
          where (RLac_cqdet.ta_pcid equals Rlac_destx.ta_pcid and
               RLac_cqdet.ta_type equals OATO_AP);
     end
```

# Glsdap_pbn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsdap_pbn | FR | DMdn |

### 1.1 Glsdap_pbn

Global Office Parameter Glsdap_pbn

### 1.2 Description

This parameter is used as the "Pseudo Called Number" for billable Speed Dial Auto Provisioning (SDAP) calls (such as DIOR and Wireless). This number is recorded in the AMA record for such calls.

The value for this parameter is a 10 digit [0-9] number (not restricted to directory number format). The value of blank will initially be populated, but must be updated to a valid 10 digit number, as determined by the service provider, in order for the Auto Provisioning feature to be activated.

Since this is a DMdn, both fields of it must be set. The array dn of this DMdn should be set to the desired digits, while the digcnt field of the DMdn should be set to the number of digits in the dn field. The digcnt should be 10 for a 10 digit number or 0 for no number. A number of less than 10 digits is not valid.

***Type:*** DBDN_PAR

# Glsdnfw

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsdnfw | FP | DMhex32 |

### 1.1 Glsdnfw

Feature activation word for AATOS/SDN NRA.

***Defines:*** db/DMparty.h

### 1.2 Description

This global is used to activate processing AATOS and SDN/NRA calls. It has the following meaning: if 0, AATOS and SDN/NRA processing is off; if 1, AATOS and SDN/NRA processing is on; and if > 1, then only AATOS and SDN/NRA calls arriving on a designated trunk receive AATOS and SDN/NRA treatment. When Glsdnfw is greater than 1, the value is cast to the domain DMGPORT, which is the port number and module of a test trunk over which calls should receive AATOS and SDN/NRA treatment. Glsdnfw is used as the key into the relation RLgroup_port to retrieve the trunk group and member number of the designated trunk.Glsdnds, Glsdncr

***Type:*** DBLONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ODA only supports the values 0(N) and 1(Y). RC supports all possible values, the default is 0(N).

If Glsdnfw is greater than 0, then Glsdnds must have a valid value populated (1-99) and Glsdncr must have a valid value populated (0-999).

This check is supported by RC only:

When Glsdnfw is greater than 1, then the tgn portion of the hex word Glsdnfw must be found as the key to exactly one tuple in RLfc_oprtk.

***Retrofit Rules:*** On retrofit, if the value is neither 0 nor 1, reset to 0.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```

# Glsdnnum

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsdnnum | FP | DMushort |

### 1.1 Glsdnnum

Global Office Parameter Glsdnnum

### 1.2 Description

Glsdnnum is the number of small shared directory numbers with a presence on this module. This is determined from the RLshterm relation. Glsdnnum is the count of all RLshterm tuples on this module where ((RLshterm.range == 0) and (RLshterm.shtm_cnt <= 7)). This parameter should exist on all SMs. If there are no RLshterm tuples on this SM, the value of Glsdnnum should be zero. This number will change in various scenarios: Group changed from small to large, number will decrease on SMs the group is present. Change from large to small group, number will increase on SMs the group is found. Small group modified, number will either decrease or increase on some SMs depending on if terminals were added or deleted.

# Glsdntrm

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsdntrm | FP | DMushort |

### 1.1 Glsdntrm

Global Office Parameter Glsdntrm

### 1.2 Description

This is the number of terminals with shared directory numbers which reside on this module. It is based on the RLshterm relation. It is the count of each time RLshterm shows a local terminal.

For each RLshterm tuple the count is incremented for each of the following statements when they are true.

```
RLshterm.shared1.module == current module
RLshterm.shared2.module == current module
RLshterm.shared3.module == current module
RLshterm.shared4.module == current module
```

For a maximum of four and a minimum of 0 per tuple.

# Glsdpcmvint

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsdpcmvint | LR | DMcmvint |

### 1.1 Glsdpcmvint

Global Office Parameter Glsdpcmvint

### 1.2 Description

Communication module vintage for scan and distribute points. The domain can assume the following enumeration (DMCMVINT) values:

```
SMCM1VINT - the CM hardware is Model 1 (CM1)
SMCM2VINT - the CM hardware is Model 2 (CM2)
```

Glsdpcmvint must be populated to indicate the vintage of the CM hardware, that is, Model 1 or Model 2. It must be set to SMCM1VINT if both system sides are CM1 or to SMCM2VINT if both system sides are CM2. If an office is being converted from CM1 to CM2 via Recent Change, it must only be updated after conversion is completed (Glcmconv=DBNO) and both system sides are of the same vintage.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsecptr | LR | DMoapsecpr |

### 1.1 Glsecptr

Global Office Parameter Glsecptr

### 1.2 Description

This global parameter uses unsigned 7 bits for specifying the Operator Service Center (OSC) and Force Management Center (FMC) location for the security printer.

It is recent-changeable only via the security terminal.

It is used by NM subsystem and AS subsystem to forward All Pins Fail (APF) and All Cards Fail (ACF) messages to the right OSPS Administrative Processor (OAP).

# Glshanal

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glshanal | FP | DMushort |

### 1.1 Glshanal

Global Office Parameter Glshanal

### 1.2 Description

Glshanal is the number of shared analog terminals on this module. This is determined from the RLfc_porttyp relation. It is the total count of all the tuples in RLfc_porttyp where (RLfc_porttyp.sh_analog == DBYES) If there are no RLfc_porttyp tuples which match the above criteria, Glshanal should be set to 0.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

# Glsle_mode

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsle_mode | FR | DMbool |

### 1.1 Fullname:

Global Office Parameter Glsle_mode

### 1.2 Description:

This parameter specifies the mode that LASS SLE would operate when invoked. When set to DBNO SLE will operate its 5E6 version, when set to DBYES it will perform its 5E7 (Bellcore standards) version. Sets of announcements phrases needed by both versions during an SLE session are on the same DSU2-RAF board set:

| mbd1_mc / LIST# | mbd2_mc / LIST# | mbd3_mc / LIST# |
|---|---|---|
| 5D142A20 L22 | 5D143A30 L23 | null entry |

# Glsmqlmh

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsmqlmh | FP | DMshort |

### 1.1 Glsmqlmh

Global Office Parameter Glsmqlmh

### 1.2 Description:

Indicates the number of Message Handler's (MH's) in a given SM-2000 processor in the office that has connectivity to a QLPS via 1 or more MH pipes. For release 1, there is only 1 MH (that is, MH0) that terminates pipes in an SM-2000, so the number of MHs that have connectivity to a QLPS in a given SM-2000 will be either 0 (no pipes) or 1 (MH0 has pipes).

It should also be noted that, in release 1, a MH may have:

```
1) no pipes,

2) 1 pipe or

3) 2 pipes to a QLPS.
```

This parameter DOES NOT indicate the number of pipes. It merely indicates the number of MH's in an SM-2000 that has connectivity, that is any pipes, to a QLPS.

Glsmqlmh is used by measurements to size reports and by diagnostics to derive a source of packets for diagnosing the QLPS.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** Glsmqlmh is populated in the SM only. It is always 0 in the SM and is only incremented in SM-2000's. It is initially set to 0 indicating no MHs in this SM-2000 has access to QLPS via MH pipes. It is incremented by 1 when the first MH pipe is assigned to that SM-2000. It is not incremented when additional pipes are assigned to that SM-2000, only the first one. It is decremented by 1 when all pipes to that SM-2000 are

Copyright © 1999 Lucent Technologies 

removed.

***Retrofit Rules:*** ODA must preserve this parameter during a retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***

# Glsmtks

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsmtks | FP | DMgrupnm |

### 1.1 Glsmtks

Global office parameter Glsmtks.

### 1.2 Description

This parameter contains the number of trunk groups on an SM.

This parameter contains the number of tuples present in RLimtgrps.G on a partecular SM. There is a tuple present in this relation for every trunk group that has a member assigned to the particular SM. In SM, measurement data is collected for the first 120 trunk greoups. In SM-2000, the measurement data is collected for all the trunk groups that have one or more members on this SM. RC will be the only user of this parameter.

# Glsnapon

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsnapon | LRFR | DMbool |

### 1.1 Glsnapon

Global Office Parameter Glsnapon

### 1.2 Description

This global parameter is used to indicate whether this office is the regular 5E (DBNO) or based on SNAP architecture (DBYES).

If this parameter is set to DBYES, 5E does not perform any call processing but behaves as a switching fabric.

This parameter should be allowed to change only through ODA (not RC/V) to prevent from setting the value to DBYES inadvertently for the normal 5E office.

The value of this parameter must be consistent throughout AM, CM and all SMs.

***RANGE: (0 - 1) Values:*** 0 = DBNO; 1 = DBYES;

***Type:*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** This global parameter should not be visible to RC/V and should not be allowed to alter its value through RC/V.

ODA is the only process to change this parameter. ODBE is also allowed for lab testing purpose.

***Retrofit Rules:*** A SNAP office must be a new office and Retrofit from a 5E office to an SNAP office is not allowed.

***Default Rules:*** default = DBNO;

***Distribution Rules:***

# Glsp2feat

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsp2feat | LRFR | DMhex32 |

### 1.1 Fullname:

OSPS Special feature activation bits

### 1.2 Description:

This global reserves 32 bits to be used by OSPS for feature activation bits for future features. As features are assigned, the 'Special Feature x' (see the following) must be replaced with the actual feature name. A pseudo global name must be assigned to each feature, along with the corresponding hex value indicating which bit is reserved for this feature. Code using this feature activation bit can use a local #define instead of the customary 'global' #define.

```
For example:
GLEXAMPLE (0x400, bit 10) -
     Great and wonderful example feature.
Local header file for code would have '#define GLEXAMPLE 0x400'
LAYOUT:
GLDISPAUTO (0x1, bit 0) -
        Display Auto Collect portion of 800 Toll-Free Services
        NPA Expansion Special Feature.
GLENFAUTO (0x2, bit 1) -
        Enforce Auto Collect portion of 800 Toll-Free Services
        NPA Expansion Special Feature.
GLVMSACC (0x4, bit 2) -
        Activation indicator for the VMS Access Dialing Changes
        feature.
GLLNPSNGLNBRQRY (0x8, bit 3) - Activation parameter for the Local
        Number Portability (LNP) Single Number Query feature.
GLXXXXXX (0x10,bit 4) -
        Special Feature x.
GLXXXXXX (0x20, bit 5) -
        Special Feature x.
GLATTLNP (0x40, bit 6) -
        Activation indicator for ATT for the Local Number
        Portability (LNP) Using Location Routing Number (LRN)
        Special Feature.
GLLECLNP (0x80,bit 7) -
        Activation indicator for LEC for the LNP Using LRN Special
        feature.
GLCIIDIOR (0x100, bit 8) -
        Activation indicator for CAS International Intercept for
        DIOR originations
GLCIINDIOR (0x200, bit 9) -
        Activation indicator for CAS International Intercept for
        non-DIOR originations
GLCRDRSTR (0x400, bit 10) -
        Activation indicator for quotation of card restriction
        type in ATCO announcements and operator displays.
```

Copyright © 1999 Lucent Technologies 

```
GLICSCNALW (0x800, bit 11) -
        Activation indicator for Allow Coin Handling for Inmate
        Calling Services (ICS) originations
GLIMPLTRNS (0x1000, bit 12) -
        Activation indicator for the VMS Implicit Transfer feature.
GLCICADAR3 (0x2000, bit 13) -
        Activation indicator for the Completion of Inter-LATA Calls
        to Directory Assistance (CICADA) - Release 3 Feature.
GLAMARSRCTYP (0x4000, bit 14) -
        AMA Recording for Listing Services Search Types feature.
GLANIIIREL2 (0x8000, bit 15) -
        Activation indicator for the AMA - Record ANI II Digits
        Release 2 feature.
GLDIALECT (0x10000, bit 16) -
        Activation parameter for the Direct Integrated Access
        to Language Enhanced Capabilities (DIALECT). Special
        Feature x.
GLOLNS (0x20000, bit 17) -
        Activation parameter for the Originating Line Number
        Screening (OLNS) feature.
GLTAACT (0x40000, bit 18) -
        Activation indicator for the Toll and Assist portion of
        LSCC with SS7 Redirection feature
GLLSACT (0x80000, bit 19) -
        Activation indicator for the Listing Services portion of
        LSCC with SS7 Redirection feature
GLRTRSDAQRY (0x100000, bit 20) -
        Activation indicator for the RTRS Query portion of LSCC
        with SS7 Redirection feature
GLLECPINPROMPT (0x200000, bit 21) -
        Activation indicator for the LEC PIN Promt portion of the
        ACCS Special 10 Digit Calling Card Handling feature
GLTENDIGTCCC (0x400000, bit 22) -
        Activation indicator for the Ten Digit True Choice Calling
        Card portion of the ACCS Special 10 Digit Calling Card
        Handling feature
GLRECANIII (0x800000, bit 23) -
        Activation parameter for the long-term phase of the OSPS
        AMA - Record ANI II Digits feature
GLDIORCCC (0x1000000, bit 24) -
        Activation parameter for the DIOR with CCC Capability
        feature.
GLPEELOUTFEATACT (0x2000000, bit 25) -
        Activation parameter for the OSPS 800 Peel Out for Calling
        Card feature.
GLOVERCIID (0x4000000, bit 26) -
        Parameter for overriding CIID cards for ASCQ feature.
GLPHASE1WCIND (0x8000000, bit 27) -
        Activation parameter for Phase 1 of the CCS7 Incoming
        Signaling Wireless Call Indicator feature.
GLPHASE2WCIND (0x10000000, bit 28) -
        Activation parameter for Phase 2 of the CCS7 Incoming
        Signaling Wireless Call Indicator feature.
GLIBNSACT (0x20000000, bit 29) -
```

**Copyright © 1999 Lucent Technologies** 

```
        Activation parameter for IBNS Call Blocking Feature.
GLTANTLDA (0x40000000, bit 30) -
        Activation parameter for TA NATL DA 00- Access LSCC
        with SS7 Redirection Feature.
GLLSNATLDA (0x80000000, bit 31) -
        Activation parameter for LS NATL DA 00- Access LSCC
        with SS7 Redirection Feature.
```

***RC/ODA Rules:*** RC and ODA are to preserve all bits in this global, whether they have been assigned or not. RC and ODA are to maintain the bit assignments specified in the LAYOUT part of the description section. When a feature is activated on the view (Y), set the corresponding bit to 1, otherwise set the bit to 0. GLAMARSRCTYP cannot be 1 when both secure feature bits SFID288 and SFID422 are off OR when SFID369 is off. GLAMARSRCTYP.rc-oda.10.1

```
GLATTLNP cannot be activated (1) when secure feature bit
SFID288 is off and secure feature bit SFID419 is off.

GLLECLNP cannot be activated (1) when secure feature bit
SFID417 is off. GLDIALECT cannot be activated (1) when secure
feature bit SFID425 is off.

GLOLNS cannot be activated (1) when secure feature bit SFID452
is off, OR when the default value of 1023 has not been entered
for OLNS default table, OR when the default value of "----" has
not been entered for Account Owner table.

GLTAACT cannot be activated (1) when secure feature bit SFID288
is off, OR when BOTH secure feature bit SFID424 and SFID429 are
off.

GLLSACT cannot be activated (1) when secure feature bit SFID288
is off, OR when BOTH secure feature bit SFID422 and SFID429 are
off.

GLLECPINPROMPT cannot be activated (1) when secure feature bits
SFID288, SFID432 and SFID433 are all off. At least one of these
must be on.

GLTENDIGTCCC cannot be activated (1) when secure feature bit
SFID023 is off. SFID023 and either, or both SFID288 and/or
```

**Copyright © 1999 Lucent Technologies** 

```
SFID433 must be on.

GLRECANIII cannot be activated (1) when both secure feature bit
SFID288 and SFID434 are off OR when option feature bit OFID676
is on.

GLDIORCCC cannot be activated (1) when secure feature bit SFID288 is
off, OR when BOTH  secure feature bit SFID388 and SFID435 are off.

GLPEELOUTFEATACT cannot be activated (1) when secure feature bit
SFID436 is off, OR AATOS feature activation bit GLSDNFW != 1, OR
when either secure feature bit SFID112 or option feature bit
OFID567 is off.

GLIBNSCBACT can only be activated when secure feature parameter
SFID288 is on or SFID445 is on, and when option feature parameter
OFID620 is on.

GLPHASE1WCIND can only be activated (1) when secure feature bit
SFID442 is on AND when option feature bit OFID661 is on.

GLPHASE2WCIND can only be activated (1) when GLPHASE1WCIND is
active (1).

GLTANATLDA can only be activated (1) when either secure feature
bit SFID288 or SFID443 is on (1) and GLTAACT is on (1).

GLLSNATLDA can only be activated (1) when either secure feature
bit SFID288 or SFID443 is on (1) and GLLSACT is on (1).

GLANIIIREL2 can only be activated (1) when either secure feature
bit SFID288 or SFID448 is on (1) and GLRECANIII is on (1).

GLLNPSNGLNBRQRY can only be activated (1) when either secure
feature bit SFID288 or secure feature bit SFID454 is on (1),
and GLATTLNP is on (1).

# Glsp3feat

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsp3feat | LRFR | DMhex32 |

### 1.1 Fullname:

OSPS Special feature activation bits

### 1.2 Description:

This global reserves 32 bits to be used by OSPS for feature activation bits for future features. As features are assigned, the 'Special Feature x' (see below) must be replaced with the actual feature name. A pseudo global name must be assigned to each feature, along with the corresponding hex value indicating which bit is reserved for this feature. Code using this feature activation bit can use a local #define instead of the customary 'global' #define.

```
For example:
GLEXAMPLE (0x400, bit 10) - Great and wonderful example feature.
Local header file for code would have '#define GLEXAMPLE 0x400'

LAYOUT:
GLFLEXACDACT (0x1, bit 0) - Activation parameter for the OSPS ACD Expansion
         feature (98-5E-4668).
GLXXXXXX (0x2, bit 1) - Special Feature x.
GLXXXXXX (0x4, bit 2) - Special Feature x.
GLXXXXXX (0x8, bit 3) - Special Feature x.
GLXXXXXX (0x10, bit 4) - Special Feature x.
GLXXXXXX (0x20, bit 5) - Special Feature x.
GLXXXXXX (0x40, bit 6) - Special Feature x.
GLXXXXXX (0x80, bit 7) - Special Feature x.
GLXXXXXX (0x100, bit 8) - Special Feature x.
GLXXXXXX (0x200, bit 9) - Special Feature x.
GLXXXXXX (0x400, bit 10) - Special Feature x.
GLXXXXXX (0x800, bit 11) - Special Feature x.
GLXXXXXX (0x1000, bit 12) - Special Feature x.
GLXXXXXX (0x2000, bit 13) - Special Feature x.
GLXXXXXX (0x4000, bit 14) - Special Feature x.
GLXXXXXX (0x8000, bit 15) - Special Feature x.
GLXXXXXX (0x10000, bit 16) - Special Feature x.
GLXXXXXX (0x20000, bit 17) - Special Feature x.
GLXXXXXX (0x40000, bit 18) - Special Feature x.
GLXXXXXX (0x80000, bit 19) - Special Feature x.
GLXXXXXX (0x100000, bit 20) - Special Feature x.
GLXXXXXX (0x200000, bit 21) - Special Feature x.
GLXXXXXX (0x400000, bit 22) - Special Feature x.
GLXXXXXX (0x800000, bit 23) - Special Feature x.
GLXXXXXX (0x1000000, bit 24) - Special Feature x.
GLXXXXXX (0x2000000, bit 25) - Special Feature x.
GLXXXXXX (0x4000000, bit 26) - Special Feature x.
GLXXXXXX (0x8000000, bit 27) - Special Feature x.
GLXXXXXX (0x10000000, bit 28) - Special Feature x.
GLXXXXXX (0x20000000, bit 29) - Special Feature x.
GLXXXXXX (0x40000000, bit 30) - Special Feature x.

# Glspcl

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glspcl | FR | DMbool |

### 1.1 Glspcl

Global Office Parameter Glspcl

### 1.2 Description

Global allows the TCS to specify whether Special Area Checks are 'on' or 'off' (DBYES or DBNO respectfully) for Improved Third Number Acceptance (ITNA) Treatment. If the parameter is off, then no special area checks using the special area table (RLitnaspec) will be performed.

# Glspeech

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glspeech | FR | DMushort |

### 1.1 Glspeech

Number of trunk groups with speech treatments.

### 1.2 Description

This global parameter specifies the number of trunk groups which have speech treatments applied to them. Speech treatments include such things as time assignment speech interpolation (TASI) and low bit rate voice (LBRV) encoding. This value should equal the number of trunks in RLrt_trkg which have the value of 'speech' set to DBYES.

GLEXAMPLE (0x400, bit 10) -
        Great and wonderful example feature.
Local header file for code would have '#define GLEXAMPLE 0x400'

LAYOUT:
GLCDNR   (0x1, bit 0) -
         Called and Calling Number Restrictions.
GLXXXXXX (0x2, bit 1) -
         Unavailable for 5e9 use. It is in use in the 5e8 generic.
GLINPAOSPS (0x4, bit 2) -
         5E9 OSPS INPA Expansion feature.
GLCLI (0x8, bit 3) -
         TRAN-0-SEND over FGD Trunks Special feature.
GLWLAMA (0x10, bit 4) -
         AMA Recording from Wireless Service Provider Special Feature.
GLIIW_INDT (0x20, bit 5) -
         5E8 OSPS International Inward Billed Number Screening.
GLINTRAAIBNS (0x40, bit 6) -
         5E8 OSPS Automated Inward BNS Intra LATA Allow.
GLINDETAIBNS (0x80, bit 7) -
         5E8 OSPS Automated Inward BNS Indeterminate Treatment.
GLALW809 (0x100, bit 8) -
         5E8 OSPS CICADA 2 - Block/Unblock 809 Special Feature.
GLITOI (0x200, bit 9) -
         Intraflow to Interflow Call Handling w/ Interflow Call Queues.
GLPLBQON   (0x400, bit 10) -
         5E9 Purchase Limits Balance Quotation feature.
GLCBSD1 (0x800, bit 11) -
         Card Based Speed Dialing Feature.
GLPROMOCARD (0x1000, bit 12) -
         PLBQ Business/Residential Card.
GLMECHPC (0x2000, bit 13) -
         5E9 OSPS MECH PERSON COLLECT.
GLRTD (0x4000, bit 14) -
         5e9 Screening for Real-Time Call Details Feature.
```

Copyright © 1999 Lucent Technologies

```
GLPLBQ2ON (0x8000, bit 15) -
         5E9 Purchase Limits Balance Quotation - Release 2 feature.
GLAMAGDM (0x10000, bit 16) -
         5E9 AMA Generic Data Module feature.
GLCBSDAP (0x20000, bit 17) -
         Card Based Speed Dial Auto Provisioning feature.
GLDIORTF800 (0x40000, bit 18) -
         DIOR Toll Free 800 feature.
GLAILS (0x80000, bit 19) -
         Automated Inward Line Screening feature.
GLCSB (0x100000, bit 20) -
         Branding on routing parameter for the Carrier Specific Branding
         feature.
GLDIORCPSR2 (0x200000, bit 21) -
         DIOR Country Pair Screening Release 2 Feature.
GLTYBT (0x400000, bit 22) -
         ACCS Thank You Branding Timer feature.
GLASAPRTRS (0x800000, bit 23) -
         Automated Service Access Prompting - Rls 2 feature.
GLASAPAMA (0x1000000, bit 24) -
         Automated Service Access Prompting - Rls 2 feature.
GLACCSCCC (0x2000000, bit 25) -
         Feature activation bit for ACCS for CCC feature.
GLIBNSCTI (0x4000000, bit 26) -
         International Billed Number Screening - Rls 2 feature.
GLICS (0x8000000, bit 27) -
         Inmate Calling Services (ICS) feature.
GLDIORNRA (0x10000000, bit 28) -
         DIOR Network Remote Access feature.
GLDIORAICR3 (0x20000000, bit 29) -
         DIOR Automated Initial Calls Release 3 feature.
GLINCCS7SIG (0x40000000, bit 30) -
         CCS7 Incoming Signaling for OSPS feature.
GLFULLCARD (0x80000000, bit 31) -
          Full card entry for CAS Rate Quote.
GLcas3
GLmecpb
GLsdap_idx
GLsdap_pbn

***RC/ODA Rules:*** RC and ODA are to preserve all bits in this global, whether they have been assigned or not. RC and ODA are to maintain the bit assignments specified in the LAYOUT part of the description section. When a feature is activated on the view (Y), set the corresponding bit to 1, otherwise set the bit to 0.

There are 3 known exceptions to this rule. Due to changes in the CDNR feature's announcements, bit 0 must be initialized to 0 for all generics from 5e9_1w and beyond, regardless of whether bit 0 is on or off in 5e8_1e.

Bit 1 should be initialized to 0 in 5e9_1w and beyond due to the fact that the bit is being used for a feature in 5e8 but is not used in 5e9.

Bit 12 should be initialized to 0 in 5e9_2m due to the fact that the bit is being used for a feature in 5e9(1) and is being used by a different feature in 5e9(2). Bit 11 will be the sole activation bit for the entire Speed Dialing feature, and its value will be carried forward from 5e9(1).

An additional exception is that for all releases after 5e9.1, bit 14 should be set to zero regardless of what value it contains in previous releases.

```
GLWLAMA cannot be 1 when secured feature bit SFID104 is off
   (GLWLAMA.rc-oda.8.1).
GLALW809 cannot be 1 when secured feature bit SFID110 is off
   (GLALW809.rc-oda.8.1).
GLITOI cannot be 1 when secured feature bit SFID113 is off
   (GLITOI.rc-oda.8.1).
The check with SFID365 is modified for 5e9.2, with GLCBSD1 replacing
   GLCBSD2, which is not being used in 5e9.2.
GLCBSD1 cannot be 1 when secured feature bit SFID365 is off
   (GLCBSD1.rc-oda.9.2).
GLRTD cannot be activated when secure feature bit SFID366 is off.

GLRTD cannot be activated when option feature bit OFID595 is off.

GLAILS cannot be 1 when secured feature bit SFID370 is off
   (GLAILS.rc-oda.9.1).
GLCBSDAP cannot be 1 when secured feature bit SFID367 is off
   (GLCBSDAP.rc-oda.9.2).
GLCSB cannot be activated when secure feature bit SFID378 is off.

GLASAPRTRS cannot be activated when both secure feature bits SFID384
   and SFID288 are off.
(GLASAPRTRS.rc-oda.9.1)

GLASAPAMA cannot be activated when both secure feature bits SFID384
   and SFID288 are off.
(GLASAPAMA.rc-oda.9.1)

GLTYBT cannot be 1 when both secure feature bits SFID390 and SFID288
    are off.
(GLTYBT.rc-oda.9.1)

GLACCSCCC cannot be 1 when both secure feature bits SFID288 and SFID388
    are off.
GLICS cannot be 1 when both secure feature bits SFID288 and SFID385 are off.

GLPROMOCARD cannot be activated when secure feature bit SFID400 is off or
```

**Copyright © 1999 Lucent Technologies** 

```
   when secure feature bit SFID400 is on and GLPLBQ2ON is off.
GLFULLCARD cannot be activated when GLPLBQ2ON is off.

GLINCCS7SIG cannot be 1 when both secure feature bits SFID288 and SFID395
   are off.
(GLINCCS7SIG.rc-oda.10.1)
```

***Retrofit Rules:***

```
Copy entire word (all bits) from one software release to the next.

The exceptions to this rule are bit 0 which must be initialized to
     0 for this generic (5e9_1w) and all following generics, due to
     a change in the CDNR feature's announcement treatments, and Bit 1,
     which is not being used in the 5e9_1w generic but is used in 5e8.
     This bit should be initialized to 0 and not be populated according
     to it's 5e8 value.

In addition, bit 12 should be initialized to 0 in 5e9_2m due to the fact
     that the bit is being used for a feature in 5e9(1) and is being used
     by a different feature in 5e9(2). Bit 11 will be the sole activation
     bit for the entire Speed Dialing feature, and its value will be
     carried forward from 5e9(1).

# Glsplofc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsplofc | FR | DMbool |

### 1.1 Glsplofc

Global Office Parameter Glsplofc

### 1.2 Description

This global parameter indicates if 7 digit dialing may be used to reach a different NPA than the originating NPA. DBYES means the office is serving more than one NPA or that 7 digit dialing can an be used to reach a different NPA. DBNO means all 7 digit numbers will have the same NPA.

# Glsptwcac

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glsptwcac | FR | DMspacce |

### 1.1 Glsptwcac

Global Office Parameter Glsptwcac

### 1.2 Description

This parameter is used by the Spontaneous Usage Sensitive Three Way Calling (USTWC) Special Feature.

It is used to store the type of access available for the feature. There are three access types:

```
1. SP_UNAVAIL
   This is the default value.
   The feature cannot be accessed for use by any line, no exceptions.

2. SP_GENAVAIL
   The feature is accessible by all lines, except those lines disabled
   for use on RC/View 1.6.

3. SP_SUBSCR
   The feature is not accessible by any line, except those lines enabled
   for use on RC/View 1.6.
```

The default value cannot be changed unless the Spontaneous Usage Sensitive 3-Way Calling Special Feature (SFID 156) has been purchased.

This parameter replaces Glsf8dummy which was used in 5e9.1 and 5e9.2 to provide this information.

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glss7wrls | FR | DMbool |

### 1.1 Glss7wrls

SS7 Wireless Global Parameter

### 1.2 Description

This parameter is used by the CCS7 Incoming Signaling from 4ESS(TM) For Wireless Service Providers feature. It is used to determine whether an AP call type can be assigned to SS7 Signaled Wireless calls that must be routed to a position for handling. If the value is DBNO, then OSPS will not select the AP call type when performing Call Type Determination. If the value is DBYES, then OSPS may select the AP call type.

# Glssdap

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glssdap | FP | DMshort |

### 1.1 Glssdap

Minimum number of RLsdap_sdl tuples to create at retrofit.

### 1.2 Description

Glssdap contains the number of RLsdap_sdl tuples to create at retrofit, that is, the start number. It should be set based on the volume of speed dial auto provisioning (SDAP) calls the office is expected to handle. The standard value is 8.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** ODA: This value should be set to 8 on OSPS SMs in new offices. RC: This value cannot be changed or viewed by RC.

***Retrofit Rules:*** This value should remain intact over a generic retrofit.

***Default Rules:*** default = 0;

| Glssp | LRFR | DMbool |

### 1.1 Glssp

Global Office Parameter Glssp

### 1.2 Description:

This parameter is used to indicate that this service Switching Point (SSP) office and can process Number Services calls. This parameter must be set ( to DBYES) before several other relations can be populated for SSP offices.

This parameter has a dependency on the global parameter Glccs, which must indicate that CCS transport is available, before Glssp can be set to DBYES.

This parameter also has a dependency on the global parameter Gllata_num, which must be populated before Glssp can be set to DBYES.

Gllata_num must be set to a valid number 100-999 before the parameter Glssp may be set to DBYES.

This parameter (Glssp) has a dependency on the global parameter, Gl_oso. Glssp may not be set to DBYES if Gl_oso is DBYES.

# Glt303

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glt303 | FR | DMshort |

### 1.1 Glt303

T303 - Q.931 SETUP response timer

### 1.2 Description

This parameter is used as the Q.931 SETUP response timer value for BRI (T303). This timer is initiated when a Q.931 SETUP message is sent to CPE on a BRI. The timer is cancel when further call progress messages are received (that is, ALERTing, CONNect, DISConnect). If the timer expires, then excessive call delay procedures apply; a second SETUP is sent and T303 is re-started if no CALL_PROCeeding message is received. If no response is received before the second T303 expires, then the terminating BRI is cleared.

         * Compute the number of tuples needed for Provisioned
         * Busy and No Answer Terminating trigger calls.
         * (Refer to fc/FCtrigint/MCdbqasltm.c for details).
         */
        let tblna_trig = (Gltbllines > 0 || Gltnalines > 0 ||
        Gltatlines > 0) ?
                        ((Gltbllines + 2879) / 2880)  +
                        ((Gltnalines + 79) / 80)  +
                        ((Gltatlines + 719) / 720)    : 0;

        /* Compute the number of RLtatdb tuples needed by ASP
         * on the terminating  side of the call.
         * Multiply the call rate (2.5) by the fraction of calls
         * that use ASP by the average holding time. The fraction
         * of calls that use ASP is equal to the number of lines
         * with Terminating attempt triggers assigned multiplied
         * by the approximate percent of times a query will be
         * sent to the SCP. Calls to DNs with TATs assigned
         * will query 100% of the time, and 5% of the DNs returned
         * by the SCP will be DNTs which will cause another query,
         * so the total is 105%.
         *
         * Add a factor into the algorithm for Busy Line No Answer
         * calls which also use RLtatdb tuples. Approx 10% of all
         * originating trigger ASP calls will have a NEL in the
         * ANALYZE ROUTE message, that is, a BLNA call.  Tats can
         * have NELs returned also, but the RLtatdb tuple is
         * reused so no additional tuples are allocated.
         *
         * Since prl does not support floating point math, and to
         * prevent division by 0, the following formula has been
         * simplified to the result used in the following
         * calculation.
         *
         * mu = (crpl  * Gltatlines* f.tatquery * hold.time)
         *      + (Glaspbase * f.blna)
         *    = (2.5 * Gltatlines * 1.05 * (210/3600)) +
         *(Glaspbase * 1/10);
        /*
         * Compute the number of tuples needed for Busy Line No
```

```
 * Answer Originating trigger calls using both the office
 * wide trigger and those provisioned on lines.
 * The penetration of BLNA Originating triggers is 40%
 * which is the weighted average of busy or unanswered
 * calls.
 *
 * Because the SFID lock cannot be checked in the PRL
 * code, the global parameters Glorgbltrg and Glorgnatrg,
 * which contain the trigger numbers, are used to indicate
 * that BLNA office originating trigger feature is active.
 * The global parameter Globlnalin stores the count of
 * lines which have either the busy line or no answer
 * trigger assigned and active on lines.
 * The holding time is 210/3600 seconds, which is the
 * weighted average of busy, no answer and answer.
 *
 * let ofcblnatrig= ((Glorgbltrg > 0 ||
 * Glorgnatrg  > 0 ) ? ZZZ : 0);
 *      where ZZZ is defined similarly to ssp_base as
 *      follows:
 *

# Gltd2disp

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltd2disp | FR | DMushort |

### 1.1 Gltd2disp

Global Office Parameter Gltd2disp

### 1.2 Description

This parameter is the TD-2 Display Timer in seconds. The value specifies the length of time that selected displays should appear on a BRI CPE. For example, a Q.931 Display Text IE contains non-blank information and is sent during call clearing. A timer is started and set for the number of seconds specified in this parameter. When the timer expires, a Display Text IE to clear the display will be sent in a Q.931 information message to the CPE. This parameter represents the TD-2 Timer specified by Bellcore in TR-NWT-000865 Generic Requirements for ISDN Display for Call Control and Selected Services.

# Gltg0rn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltg0rn | FP | DMushort |

### 1.1 Gltg0rn

Global office parameter Gltg0rn.

### 1.2 Description

Number of member numbers set aside for the first trunk group served by the IBM(R) DAS.

The OSPS Port to IBM(R) position ID mapping allows the OSPS owner to obtain IBM(R) position ID's for each of the ARU trunk group ports (members) associated with the IBM(R) directory assistance system(s) (DAS) working in conjunction with an OSPS.

Ten parameters are specified within ODA and RC/V to produce the required mapping. Glposmn assigns the minimum OSPS position number and Glposrn assigns the range of sequential positions, from the minimum position, that may interface with the IBM(R) DAS. The range parameters (Gltg[0-7]rn) for ARU trunk groups indicate the maximum member range for each of up to eight ARU trunk groups which may interface with a Directory Assistance System(s).

Each of the parameters for the ARU trunk groups (Gltg[0-7]rn) apply to both internal OSPS DSU2-RAF trunk groups as well as external ARU trunk groups which connect to IBM(R) DAS ARU's. The remainder from the division of the trunk group number divided by eight is referred to as the `IBM(R) trunk group index.' Each ARU trunk group associated with a particular IBM(R) DAS must have a unique IBM(R) trunk group index. The first trunk group RANGE parameter specifies the range of the largest trunk group with a Trunk Group Number (TGN) that is a multiple of eight (IBM(R) Trunk Group Index of zero) and interfaces with an IBM(R) DAS. The second RANGE parameter applies to any IBM(R) DAS-associated trunk group with an IBM(R) trunk group index of 1, etc.

Assume an office requires two DAS Systems, DAS1 and DAS2; a trunk group to DAS1 (TGN 256) needs 200 members and a trunk group to DAS2 (TGN 504) requires 350 members. The first trunk group RANGE parameter is set to 350. The RANGEs specified must include room for growth. If any RANGE parameter is later modified, it will affect all the Position ID's of ARU members in groups with a larger IBM(R) trunk group index, and will require reassignment in the IBM(R) DAS.

If Glposrn is zero, then Gltg0rn must be zero and must appear as unknown on the RC and ODA screens.

The sum of all the RANGES for positions and trunk groups may not exceed 9000. This is an IBM(R) system limit. Note that the 9000 range must be potentially shared with other switching systems that use a given IBM(R) DAS. Therefore, ODA (not RC) should give a warning when the sum of all ranges exceeds 4500, indicating that over half the available array in the IBM(R) DAS has been allocated for this office alone, and reassessment may be required if other offices share an IBM(R) DAS. This warning should also appear in the RC documentation.

Glposrn + Gltg0rn + Gltg1rn + Gltg2rn + Gltg3rn + Gltg4rn + Gltg5rn + Gltg6rn + Gltg7rn must be less than 9001.

Glposrn + Gltg0rn + Gltg1rn + Gltg2rn + Gltg3rn + Gltg4rn + Gltg5rn + Gltg6rn + Gltg7rn SHOULD be less than 4501, else ODA warning.

If Glposrn is not zero, then Gltg0rn + Gltg1rn + Gltg2rn + Gltg3rn + Gltg4rn + Gltg5rn + Gltg6rn + Gltg7rn must be greater than zero (at least one of these global parameters must not be zero).

Prior to 5E6(2), this global must always equal the default.

# Gltg7rn

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltg7rn | FP | DMushort |

### 1.1 Gltg7rn

Global office parameter Gltg7rn.

### 1.2 Description

Number of member numbers set aside for the eighth trunk group served by the IBM(R) DAS.

See comments for global Gltg0rn.

Prior to 5E6(2), this global must always equal the default.

# Glthdsk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glthdsk | LR | DMlong |

### 1.1 Fullname:

Global Office Parameter Glthdsk

### 1.2 Description:

This parameter is used to control access to the disk. When a disk access results in a failure this parameter is set with the current timestamp. Future disk accesses are only allowed when the current timestamp is two minutes past the timestamp value contained in this parameter.

This parameter is set at system process initialization by the DB function DBdiskinit(), in response to a message MDSI_DBDSK received from AIM, or at routine intervals if the disk becomes inaccessible (DDSDSDP OFFNORMAL). During retrofit, ODA should set the parameter to zero.

This parameter is replacing the old dummy parameter, Glcp1dummy.

# Glti_t1

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glti_t1 | FR | DMlong |

### 1.1 Glti_t1

Global Office Parameter Glti_t1, Terminal

Initialization T1 Timer

### 1.2 Description

This global office parameter is used to define the no. of seconds the switch should wait for an initializing terminal to send the switch an initialization request. This time interval starts when Layer two (2) initialization results in TEI assignment, or when SABME is received in the case of FIXED TEI, or whenever the switch requests terminal initialization from the terminal. For software efficiency, valid values are expressed in milliseconds in increments of 1000 msec (1 sec).

# Gltl1mnths

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltl1mnths | FR | DMuchar |

### 1.1 Fullname:

Minimum threshold value of DSL layer 1 errors

### 1.2 Description:

This office parameter is used to indicate the minimum (troubled) threshold for service-affecting Level 1 errors on TCPIP B1 channel DSLs for the entire switch. When this threshold is reached, an entry for this DSL protocol channel (DSL group and member) will be placed in a table that tracks DSLs experiencing errors and the entry is timestamped. If the maximum (remove) threshold (Gltl1mxths) is reached, the current time and the timestamp of the table entry are compared. If the time difference is less than a pre-defined time, the DSL is taken out-of-service. If the time difference is greater than the pre-defined time, then the error count is decremented by a pre-defined amount.

# Gltloop

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltloop | FP | DMushort |

### 1.1 Gltloop

Global Office Parameter Gltloop

### 1.2 Description

This parameter is initialized by the RLTALOOPDB initialization function to equal the actual number of tuples in RLTALOOPDB. If the RLLOOPDB initialization succeeds then Gltloop will be set to the lesser of the values (Glnbst2 + Glnint + 3*Glnvdt) and DBQNTALOOP. In case of initialization failure, Gltloop will reflect the actual number of RLTALOOPDB tuples successfully initialized.

This parameter does not appear on any ODA form and ODA is not required to initialize its value. This parameter does not appear on any recent change/verivy (RC/V) view.

The RLPOS_LPRT trigger function will increase the value of Gltloop as additional RLTALOOPDB tuples are inserted in response to increases to Glnbst2, Glnint, or Glnvdt, resulting from RC to view 21.32 (RC_PPMAP). The RLPOS_LPRT trigger function will insert RLTALOOPDB tuples and correspondingly increase Gltloop such that Gltloop is not less than the lesser of the values (Glnbst2 + Glnint + 3*Glnvdt) and DBQNTALOOP.

# Gltm_rt101

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltm_rt101 | LR | DMtm_rt101 |

### 1.1 Gltm_rt101

Global Office Parameter Gltm_rt101

### 1.2 Description

Priority routing order for 101 test line calls. This relation is populated based on the RLTLWSR and Gltm_rt101 relations. For each TLWS defined in the RLTLWSR, this relation should also have an entry. Also if the CTTU is defined in the Gltm_rt101, the last tuple in this relations should be set to:

```
number = 9     devid = 0     type_tws =TM_CTTU
```

Priority routing order for 101 test line calls terminating to Trunk/Line Work Station (TLWS or CTTU).

This parameter is used when the `general` 101 Test Line has been dialed. The call will terminate at different locations depending how this parameter has been populated. The choices are LOCAL, REMOTE, CTTU, NULL:

LOCAL — The T&M phone is served by the 5ESS(R)-2000 switch office (that is, has a line appearance on the switch). The DN of the TLWS T&M phone can either be an individual line or a member of a multi-line hunt group.

REMOTE — The T&M phone is not directly connected via a line to the 5ESS(R)-2000 switch (that is, it has a trunk appearance).

***NOTE:*** The TLWS may be physically located in the office, but the T&M phone for the TLWS has a trunk appearance. In most cases a REMOTE T&M phone will also have a Remoted TLWS (such at, the TLWS at the SCC or a TLWS at an RSM).

CTTU — The T&M phone is associated with CTTU testing. Incoming calls would be sent to CTTU for testing instead of the TLWS if the global office parameter has the CTTU in the priority ranking.

NULL — Used if not LOCAL, REMOTE or CTTU.

Rank the order as 1st, 2nd, and 3rd. NULL value is used as a terminator if all 3 choices are not in the priority list (such as, LOCAL, REMOTE, NULL). When an incoming 101 test call is received, the first route type is retrieved from Gltm_rt101. The position busy array is searched for all TLWS's of the same type. The position busy array is populated from the rlTM_ws101 relation which in turn was populated from rlTLWSR (except for CTTU). The tm_type field of rlTM_WS101 determines whether a TLWS is a local or remote TLWS. If the global parameter Glcttu is set to DBYES, then an additional tuple will be added to the position busy table with a type of cttu.

If there are no TLWS' in the position busy table of the correct type, or all TLWS of the correct type are marked busy (OP:PB), the next type in the routing order is checked. Finally, when a non-busy TLWS match is made, the incoming call is terminated to the DN associated with that TLWS. NULL implies that LOCAL, REMOTE, and/or CTTU are not valid for this rank order. The call will be sent to busy tone when this value is found in the priority ranking. This is the case when no TLWS wants to terminate 101 test calls.

See I/O Manual for details on Position Busy for 101, SET:PB, CLR:PB, and OP:PB.

# Gltm_unbld

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltm_unbld | FR | DMbool |

### 1.1 Fullname:

Special Feature Global Parameter

### 1.2 Description:

This global relation contains a settable office option to control AMA recording via RC/V view 8.1. When it is set to DBYES, additional EBAF modules will be appended to the AMA record for the unbundled line termination. Its default value is DBNO. This global will replace the third bit of Glsf8dummy used in 5e12SU and 5e13SU.

# Gltmda_inx

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltmda_inx | FR | DMtmda_inx |

### 1.1 Gltmda_inx

Global Office Parameter Gltmda_inx

### 1.2 Description

Contains digit analysis screening index and digit tree entry for ROTL, CTTU, IMLT2 and remote TLWS connection appraisal calls.

screen_x — Screening index used by ROTL, CTTU, IMLT2, and remote TLWS connection appraisal calls. Should be chosen to be identical to that used for standard POTS routing from a line (in RLFC_LINE).

digtree — Digit analysis digit tree starting point. Should be chosen to be identical to that used for standard POTS routing from a line.

# Gltms_evenlnk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltms_evenlnk | FP | DMuns9 |

### 1.1 Gltms_evenlnk

Global Office Parameter Gltms_evenlnk

### 1.2 Description

This parameter specifies the even NCT link between LSM/HSM/ORM/TRM described by this module and the TMS. If the SM having this parameter populated is an RSM, this parameter will contain the even NCT link number of its HSM.

See the lnknum attribute of the RLslnktms for a description of the rangeof this parameter.

This parameter must be populated with the number that uniquely identifies the even TMS NCT link that is connected to this SM.

The value populated in this parameter should be the same as the value found in the tmsevennct attribute in the relation RLmodatt.

***NOTE:*** This will result in the parameter having a 0 value in the skeleton data bases used for module growth. Upon growth of a module, the ODDCREAT process will have to populate this parameter. The ODD- CREATE process will read the RLmodatt tuple from the AM for the growth module. ODDCREAT will set Gltms_evenlnk parameter equal to the value in the tmsevennct attribute found in the modatt tuple for the growth module.

# Gltms_oddlnk

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltms_oddlnk | FP | DMuns9 |

### 1.1 Gltms_oddlnk

Global Office Parameter Gltms_oddlnk

### 1.2 Description

This parameter specifies the odd NCT link between LSM/HSM/ORM/TRM described by this module and the TMS. If the SM having this parameter populated is an RSM, this parameter will contain the odd NCT link number of its HSM.

See the lnknum attribute of the RLslnktms for a description of the range of this parameter.

This parameter must be populated with the number that uniquely identifies the odd TMS NCT link that is connected to this SM.

The value populated in this parameter should be the same as the value found in the tmsoddnct attribute in the relation RLmodatt.

***NOTE:*** The default value for this parameter will be 0. This will result in the parameter having a 0 value in the skeleton data bases used for module growth. Upon growth of a module, the ODDCREAT process will have to populate this parameter. The ODD- CREATE process will read the RLmodatt tuple from the AM for the growth module. ODDCREAT will set Gltms_oddlnk parameter equal to the value in the tmsoddnct attribute found in the modatt tuple for the growth module.

recent change (RC) default: N/A

ODA default: ODA should not default this parameter.

# Gltmttopts

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltmttopts | LP | DMlong |

### 1.1 Gltmttopts

Terminal Maintenance Trunk Testing Options

### 1.2 Description

This global parameter will be used to turn on and off portions of the Automatic Trunk test Scheduler. Each of the thirty-two bits of this parameter will correspond to a given portion of the feature. A '1' indicates that the sub-feature is turned on, while a '0' indicates that the sub-feature is turned off. The individual bits will take on the following meanings:

```
(The bits are numbered 31 30 29 ... 9 8 7 6 5 4 3 2 1 0)
bit 0 - Not used in US (Reserved for Spain, Int'l)
bit 1 - Responder busy actions (immediate retry and 10-in-15 threshold).
bit 2 - Maximum call attempts stop mechanism.
bit 3 - Maximum call errors stop mechanism.
bit 4 - Cyclic restart.
bit 5 - Put unavailable trunks on retry list.
bit 6 - On if ATSPRM view maps to RLatsopts relation.  This bit should
        not be changed, even if features are turned off for testing.
bit 7 - Maximum answer time out stop mechanism.
bit 8 - DUMP-ATPRM command to dump data associated with ATSPRM screen
bit 9 - Automatic end-of-session real-time report.
bit 10 - Print additional summary counters.
bit 11 - Not used in US (Reserved for Spain, Int'l)
bit 12 - Not used in US (Reserved for Spain, Int'l)
bit 13 - Not used in US (Reserved for Spain, Int'l)
bit 14 - Not used in US (Reserved for Spain, Int'l)
bit 15 - Not used in US (Reserved for Spain, Int'l)
bit 16 - If '1', use local time; if '0', use UTC.  Default = '1'.
bit 17 - If '1', put busy trunks on the retry list. Default = '1'.
bit 18 - Unused.
bit 19 - Unused.
bit 20 - Unused.
bit 21 - Unused.
bit 22 - Unused.

# Gltn_info

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltn_info | FP | DMushort |

### 1.1 Fullname:

Termination Notification Information Data Blocks

### 1.2 Description:

The Gltn_info global parameter contains an SM's current rlTN_INFO tuple count. It is verified during full initializations and updated as tuples are inserted via trigger functions.

***NOTE:*** The algorithm in this file must be the same as the algorithm in fc/FCtrigint/MCdbqtn_inf.c which is the init code for Gltn_info. So if the algorithm in this file changes verify that it is consistent with the init code algorithm.

ODA has agreed to make the calculation changes in 5e10 even though the changes were made to this file in 5e11.

***Type:*** DBSHORTPAR

# Gltnalines

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltnalines | FP | DMushort |

### 1.1 Fullname:

Global Office Parameter count of terminating no answer triggers assigned to lines

### 1.2 Description:

This global parameter records the number of subscribed Terminating No Answer triggers provisioned on the lines on an SM. It is calculated during retrofit and incremented/decremented when T_No_Answer triggers are added or deleted. Its value is maintained over all initializations and updated via RC as Terminating No Answer triggers are inserted or deleted.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** The value of this parameter is established by ODA and will be updated by RC as terminating no answer triggers are inserted or deleted.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit. The formula as described in the population rules will be incorporated into Glparams.V.

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

```
        /* Populate on all SMs */
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;
```

# Gltodcrc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltodcrc | FP | DMushort |

### 1.1 Gltodcrc

Global Office Parameter Gltodcrc

### 1.2 Description

This parameter dictates how many Time of Day CORCs are allowed to be logged in the CORC log buffer before a flush is started. This parameter will be used by both an SM and an SM-2000.

For an SM, the default for Gltodcrc is 1. For an SM-2000 SM, the default for Gltodcrc is 5.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 1

***AM Initial Value:*** ---

***CMP Initial Value:*** ---

***RC/ODA Rules:*** A RC view (8.27) and ODA form (5510) per-SM field is required.

***Retrofit Rules:*** The value should remain intact over a retrofit.

***Default Rules:***
```
default = 1;
```

# Gltosys_cama

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltosys_cama | FR | DMbool |

### 1.1 Gltosys_cama

Global Office Parameter Gltosys_cama

### 1.2 Description

Specifies whether to send 1+ system CAMA ONI-ANIF traffic to a CAMA transfer office or to handle it with an OSPS operator. DBYES means send it to a CAMA transfer office. While OSPS-TA is being grown in an office this parameter should be set to DBYES so that CAMA ONI/ANIF traffic is sent to an external operator system as CAMA transfer traffic. After OSPS-TA is cutover it is assumed that the OSPS will handle the CAMA ONI/ANIF traffic internally, so this parameter should be set to DBNO. Therefore the ODA default is DBYES (pre-cut) and the RC/V default is DBNO (post-cut).

***Type:*** DBENUMPAR

# Gltpcs_alt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltpcs_alt | FR | DMshort |

### 1.1 Gltpcs_alt

PCS Automatic Link Transfer Disconnect Timer

### 1.2 Description

This parameter defines the value, in milliseconds, of the timer. When the switch recognizes an ALT request, the old RPCU is sent a FACILITY message requesting permission to perform ALT bridging and the timer is started. The switch expects a FACILITY message indicating that ALT bridging has been completed before the timer expires. If the timer expires, the ALT has failed and the call cleared.

# Gltportcnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltportcnt | FP | DMulong |

### 1.1 Fullname:

Global parameter for Ported non-ISUP7 trunks.

### 1.2 Description:

Gltportcnt contains the number of RLfc_trunk tuples where RLfc_trunk.in_sigtype is not DBISUP7 which are ported by a Number Portability feature.

It will be updated by trigger functions as rlFC_TRUNK tuples are inserted, updated, or deleted.

This count does not include trunks ported via Terminal Groups.

***Type:*** DBULONGPAR

***ODBE Access:*** DBNOCHANGE

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is updated by trigger functions and is not supported by RC mapping code. These functions are triggered off of RLfc_trunk being updated, inserted, or deleted. The values of this parameter is established by ODA. ODA will set its value to the number of non-ISUP7 that are marked ported.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit (by ODA or EVL code).

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
        for modatt in RLmodatt
        pcrlist[modatt.module] = true;
```

***Checks:***
```

# Gltreeablf

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltreeablf | FP | DMuns8 |

### 1.1 Gltreeablf

Global Office Parameter Gltreeablf

### 1.2 Description

This parameter is used to count how many RLTREE_BLF tuples are assigned in each SM.

For ODA, count how many RLTREE_BLF tuples per SM. If no tuples are found, set to default value of 0.

For RC and ODBE, if a RLTREE_BLF tuple is added to a SM, the Gltreeable in the SM will be incremented by one. Each time a RLTREE_BLF tuple is deleted, this Gltreeablf will be decremented by one.

# Gltrkcnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltrkcnt | FP | DMushort |

### 1.1 Gltrkcnt

Trunk Count Global Parameter

### 1.2 Description

Contains an SM's count of trunks. Its value is maintained over all initializations and updated as trunks are inserted or deleted.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This parameter is supported by RC and ODA. Its value can increase and decrease.

retrofit-oda-rules: Not applicable.

***Retrofit Rules:*** This value should be recalculated during a generic retrofit.

***Default Rules:***
```
default = 0;
```

***Distribution Rules:***
```
/* Populate on all SMs */
for modatt in RLmodatt
pcrlist[modatt.module] = true;
```

***Checks:***
```
/* RULE about Gltrkcnt.values: */
if (current_pcr is_in sm_all) then
begin
        Gltrkcnt is_in {0 thru 24192};

/* RULE about GLtrkcnt: */
        Gltrkcnt == count {fc_trunk in RLfc_trunk};
end
```

# Gltrnk_off

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltrnk_off | FP | DMbool |

### 1.1 Gltrnk_off

Trunk Offering Feature Active Indicator

### 1.2 Description

This parameter indicates if the Operator Break In or Trunk Offering feature is active. If one of these features must be active this parameter must be populated to DBYES, otherwise it must be populated to DBNO.

***Type :*** DBENUMPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** DBNO

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** recent change (RC) Impact: Gltrnk_off is a static parameter and is not recent changeable by the craft. Gltrnk_off is changeable by the ODBE Office Data Base Editor.

ODA should populate with the default values for new offices.

***Retrofit Rules:*** ODA should populate with the default values during retrofit and growth.

***Default Rules:***

```
default = DBNO;
```

***Distribution Rules:***

```
/* Populate on all SMs */
for modatt in RLmodatt
pcrlist[modatt.module] = true;
```

***Checks:***

```
        /* no check */
```

# Gltrssrv

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltrssrv | FR | DMulong |

### 1.1 Fullname:

Telephone Relay Service Parameter

### 1.2 Description:

This parameter is used for the Telephone Relay Service (TRS) feature.

***Type:*** DBULONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0x00666760

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** The Telephone Relay Service (TRS) Special Feature is assigned use of bit 0 to bit 23 in global parameter Gltrssrv. Bit 0 through bit 23 will be used to represent the TRS type and be divided into three fields of eight bits each:

Bits 0 to 7 is used for unrestricted TRS calls;
Bits 8 to 15 is used for restricted TRS calls;
Bits 16 to 23 is used for TRS hotel calls;

Each 8 bit field will be used to represent a two-digit BCD number, to be updated through recent change view 8.9. The values assigned by Bellcore are 60, 67, and 66, respectively, for the three fields above. ODA and RC must use these as the default values:

TRS UNRESTRICTED 60
TRS RESTRICTED 67
TRS HOTEL 66

Thus, the default value must be 0x00666760.

***Retrofit Rules:*** Bits 0-23 of Gloff4 in 5E9(1) must be copied to bits 0-23 of this global. All the other bits (24-31) are not used and should be defaulted to zeros.

***Default Rules:***

```
default = 0x00666760;
```

***Distribution Rules:*** None

# Gltsiopt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltsiopt | FP | DMuns16 |

### 1.1 Gltsiopt

Global Office Parameter Gltsiopt

### 1.2 Description

Contains an image of the TSIU command register 3 (CMD3). This parameter should be initially set to 65535 (0xffff). Any changes to this default value will be performed by Peripheral Control software. The craft can update this value through ODBE, but this is discouraged. This value should remain intact during a Generic Retrofit.

For SM-2000s, this value must always be the default value (0xffff).

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 65535

# Gltsm_cnt

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltsm_cnt | FP | DMcount |

### 1.1 Gltsm_cnt

Telephone Status Monitor and Select (TSM) User Count

### 1.2 Description

This parameter contains a count of the number of TSM monitoring terminals on a SM.

***Type:*** DBSHORTPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** EQUIPMENT

***IOTYPE:*** DBDECIMAL

***SM Initial Value:*** 0

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** This count must be incremented whenever an ISDN user on this SM assigns TSM (by adding their first monitored terminal on view 23.24). It must be decremented whenever a TSM monitoring terminal removes the last terminal from their monitored list (view 23.24).

***Retrofit-ODA Rules:*** Value should be calculated as in the following PRL check.

***Retrofit Rules:*** None

***Default Rules:***

```
default = 0;
```

***Distribution Rules:***

# Gltxaru

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Gltxaru | FR | DMbool |

### 1.1 Gltxaru

Global Office Parameter Gltxaru

### 1.2 Description

This parameter is used in OSPS offices to indicate whether or not directory assistance (DA) announcements are provided by vendor supplied audio response units connected to incoming DA trunks. This arrangement is known as 'Trunk-Side' External ARU.

This parameter must be set to DBYES if DA announcements are provided by the arrangement described above. Otherwise the parameter should be set to DBNO. The parameter should also be set to DBNO in offices which are not OSPS offices and in OSPS offices which do not handle DA traffic.

# Glublrsnd

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glublrsnd | LRFR | DMshort |

### 1.1 Fullname

Global office parameter Glublrsnd.

### 1.2 Description

Glublrsnd is the time interval to wait before resending a CCS unblocking signal (TUP/ISUP protocols) when failing to receive the acknowledgement in response to the initial CCS unblocking signal sent.

This parameter is used in the AM only. ODA should populate with default value for new office but preserve value from data base during retrofits and growths. This parameter is used only when the office contains CCS7 trunks as shown when one or more tuples of RLrt_trkg have in_sigtype or out_sigtype set to DBISUP7 or DBTUP7. Glublrsnd is specified in seconds.

***Type:*** DBSHORTPAR

# Glunsize

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glunsize | LPFP | DMlong |

### 1.1 Fullname:

Global Office Parameter Glunsize

### 1.2 Description:

Giving a positive value to Glunsize overrides the default value of the size of the SM/CMP Unprotected ODD. When the default size of the Unprotected ODD is to be used, Glunsize must be zero. Leaving Glunsize at its default of zero tells DBGEN code to read the Critical Information file to get the default size of the SM Unprotected ODD. For the CMP case, leaving Glunsize at its default value of zero tells DBGEN code to read the MTCMP.out (empty ODD) file to get the defauot size of the CMP Unprotected ODD.

The Glunsize value for CMP is 2097152 (2M). In VCDX offices, Glunsize value for CMP is 2097152.

If a different size is wanted for the Unprotected ODD, Glunsize should be set to the desired number of bytes of Unprotected ODD. This size however must be a multiple of 16384, since the Unprotected and Protected ODDs must both start and end on 16 Kb boundaries.

Starting with 5E9_2M, the UODD size will not be a constant value based on the configuration type for the SMs. For the SMs the UODD size will be engineered now. The rules to engineer the size of the UODD for SMs will be stored in the prl/EVLuoddsz directory in the form of RL*.V (EVL) files. There will be one RL*.V file for each dynamic relation. The RL*.V file will have the sizing rules that dictate the initialization of the dynamic relation on the SM at the initialization time. ODA should populate Glunsize for SMs according to the sizing rules documented under prl/EVLuoddsz/RL*.V files. The Glunsize value on the SMs will be the result of concatenating all the sizing rules (RL*.V) files for the dynamic relations stored under the prl/EVLuoddsz directory.

***NOTE:*** Since Glunsize is defined for the AM but not used, its value should always be zero.

***Type:*** DBLONGPAR

# Glusrsts

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glusrsts | FR | DMshort |

### 1.1 Fullname

Global office parameter Glusrsts.

### 1.2 Description

This parameter is used by Generalized Ringing while allocating the ISLU-Z RG resource. This parameter shows the number of users assigned per ringing time slot on the RG. The formula to use when calculating this parameter is:

```
Glusrsts = (24) / Glnrgrsln
```

This parameter is not recent change (RC) able, but is affected by a RCV change to Glnrgrsln.

# Glustwcama

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glustwcama | FR | DMbool |

### 1.1 Fullname

Global office parameter Glustwcama.

### 1.2 Description

This parameter is used by Usage Sensitive Three Way Calling (USTWC) Special Feature. It will be used to store the YES/NO indication for the generation of USTWC AMA activation records. The default value will be NO. The default value cannot be changed unless the usage sensitive three way calling special feature (SFID 106) or the spontaneous usage sensitive three way calling(SFID 156 ) has been purchased. This parameter replaces Glsf2dummy which was used in 5e8 to provide this information.

***Type:*** DBENUMPAR

# Glustwcfid

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glustwcfid | FR | DMmcc_fid |

### 1.1 Fullname

Global office parameter Glustwcfid.

### 1.2 Description

This global parameter is being used for the usage sensitive three way calling (USTWC) special feature. It will be used to store the feature identifier for USTWC. This feature identifier will consist of two components: a modular feature type (top 6 bits, bits 15 to 10) and a unique identifier (bottom 10 bits, bits 9 to 0). It will only be stored if the feature has been unlocked and if stored will indicate that the feature is available in the office. The default value will be 0. The default cannot be changed unless the USTWC feature has been unlocked.

***Type:*** DBSHORTPAR

# Glvdigtmg

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glvdigtmg | FR | DMulong |

### 1.1 Fullname:

Vector Digit Timing

### 1.2 Description:

This parameter is being used to store two Call Vector prompt values for CACD. The lower 16 bits (0-15) are used to store the values of the first digit prompt timeout value (in milliseconds). The range is 0 - 64000. RC and ODA are to show the value in seconds (0 - 64) and convert back and forth to the value of milliseconds stored in the database. The upper 16 bits (16-31) are used to store the timeout value (in milliseconds) for the remaining digits in a multidigit prompt step. The RC/ODA range is again 0 - 64 seconds.

***Type:*** DBULONGPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBHEX

***SM Initial Value:*** 0x13881f40

***AM Initial Value:*** 0

***CMP Initial Value:*** 0

***RC/ODA Rules:*** ODA and RC must display the two values in seconds on the view, but must store the values in milliseconds in the global. The first vector digit timing value is stored in the lower 16 bits and the other vector digit timing value is stored in the upper 16 bits. The RC/ODA range for both timing values is 0 - 64 seconds.

***Retrofit Rules:*** This value is being carried forward from Gloff2 in 5E8. Reverse and forward mapping in 5E9 must switch from Gloff2 to this parameter. The method of storage is unchanged, just the name of the parameter is changing (from Gloff2 to Glvdigtmg).

***Default Rules:***

```
default = 0x13881F40;
```

***Distribution Rules:***

```
        /* standard */
```

***Checks:***

# Glvmssc

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glvmssc | FP | DMchar3 |

### 1.1 Fullname:

VMSI Service Code

### 1.2 Description:

This global office parameter is provided to specify the VMSI service code of the Enhanced Service Provider (ESP). The format of the service code shall be '1Z', or '19Z', to indicate to the switch that a request to transfer to an ESP is being made. 'Z' is a digit from 1 to 8 and shall designated by the TCA. Gl_pcrid, Glsabac .

***Type:*** DB4STRPAR

***ODBE Access:*** DBDISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** - -

***AM Initial Value:*** - -

***CMP Initial Value:*** - -

***RC/ODA Rules:*** not applicable

***Retrofit Rules:*** On a retrofit from a 5E6 Office, which has the Voice Messaging Service Interface (VMSI), Issue 1, feature activated, to a 5E7 Software Release version of VMSI (Issue 2), the parameter Glvmssc must be set to '12', which is the hard-coded value used in 5E6. The Global parameter used in 5E6 to indicate the feature is activated is the zero bit of Gloff2. If the bit is nonzero, the feature is activated in 5E6 and this parameter Glvmssc must be set to '12'. When the VMSI feature is not active in 5e6, the parameter must be set to the default value.

***Default Rules:***

```
default = "12";
```

***Distribution Rules:***

# Glxcamaq

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glxcamaq | LR | DMuns8 |

### 1.1 Glxcamaq

Global Office Parameter Glxcamaq

### 1.2 Description

Glxcamaq global parameter identifies a unique OSPS ACD call queue reserved for transfer CAMA calls. This excludes interflowed transfer CAMA calls that are being received and directed to a different call queue via the ospsid attribute in RLac_cqdet. It includes interflowed transfer CAMA calls that aren't directed to a different call queue via the ospsid attribute. The range is 0 - 128. This parameter is used to generate transfer CAMA call queue measurements. When a call queue is reserved solely for transfer CAMA calls, Glxcamaq should be set to the value of the callq attribute in the RLac_cqdet tuple having the key attributes set to:

```
Attribute       Value
---------       -----
ta_type         XFER_CAMA
prefix          NULLPREF
coin            OASTNONCOIN
ospsid          0
carrier         OADC_CARR
```

If another tuple is found in RLac_cqdet having the callq attribute equal to the callq attribute of the transfer CAMA tuple described above, then a call queue is not reserved solely for transfer CAMA calls, and in this case Glxcamaq should be set to 0. If a tuple exists in RLac_destx or RLac_tgrp having its callq attribute equal to the callq attribute of the transfer CAMA tuple in RLac_cqdet described above, then a call queue is not reserved solely for transfer CAMA calls, and in this case Glxcamaq should be set to 0. If the usenext attribute of the transfer CAMA tuple in RLac_cqdet described above is equal to TATGRP and a tuple exists in RLac_tgrp where RLac_tgrp.ta_pcid equals RLac_cqdet.ta_pcid, then it is assumed that a call queue is not reserved solely for transfer CAMA calls, and in this case Glxcamaq should be set to 0. This assumption is based on the fact that it is not logical for a customer to request a second level of call type determination without the intention of specifying a call queue different than the call queue defined at the first level.

# Glxnopcdfl

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glxnopcdfl | LP | DMbool |

### 1.1 Glxnopcdflag.

Global Office Parameter Glxnopcdflag.

### 1.2 Description

This parameter is the indicator for Traffic Measurements used to indicate when a STP/OPC Policed Destination has been deleted. Recent Change will set this flag to a DBYES, when it deletes a Point Code from the STP/OPC feature on any SS7 (formerly CCITT7) National Global SM.

***Type :*** DBENUMPAR

***ODBE Access:*** DBNODISPLAY

***DBGEN:*** DBYES

***Classification:*** OPTION

***IOTYPE:*** DBALPHA

***SM Initial Value:*** ---

***AM Initial Value:*** DBNO

***CMP Initial Value:*** DBNO

***RC/ODA Rules:*** ***NOTE:*** The STP/OPC Policing feature isn't supported, therefore Glxnopcdfl should be populated with DBNO.

# Glzmiclata

## 1. Description

| Parameter | Distribution | Domain |
|---|---|---|
| Glzmiclata | FR | DMbool |

### 1.1 Fullname:

Zero Minus ICLATA Glzmiclata

### 1.2 Description:

This parameter is used to provide the options between ICLATA 0- calls and Selective Carrier Denial (SCD) feature. When set to DBNO, the LEC will carry ICLATA 0- calls in which no carrier was dialed by the user that would otherwise be blocked by SCD. When set to DBYES, the 0- calls will be blocked by SCD and receive SCD treatment. The SFID 149 (ICLATA) and SFID 013 (SCD) must be activated, or the Alternate Local Service Provider feature (SFID 269) and SFID 013 (SCD) must be activated, before DBYES can be assigned.

## 4. RC/VIEW TO BASE RELATION CROSS-REFERENCE

This section contains a listing of the *5ESS*®-2000 switch static data base global parameters and base relations. The associated Base Relations are listed for each Recent Change and Verify (RC/V) view number. The Global Parameters are prefixed with a "GL" and the Base Relations are prefix with an "RL".

A corresponding cross-reference of Recent Change View to Base Relation for each Recent Change View can be found in the 235-118-255 Recent Change Reference 5e14 Software Release.

## 5. BASE RELATION TO RC/VIEW CROSS-REFERENCE

This section contains a listing of the *5ESS*®-2000 switch static data base global parameters and base relations. The associated Recent Change and Verify (RC/V) view numbers are listed for each relation. Global Parameters are listed in alphabetical order with the prefix of "GL" followed by the Base Relations with a prefix of "RL".

A corresponding cross-reference of Recent Change View to Base Relation can be found in the 235-118-255 Recent Change Reference 5E14 Software Release.
