**Attribute: feat_id**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** feature identification

**Attribute Description** This is the constructed feature ID.
The value is computed accordingly: top 6 bits (10 - 15): MFQU (14 [0xe]) (see DMmftyp.G), bottom ten bits (0 - 9): 1 - 1023 (0x1 - 0x3ff)

**Attribute: grptype**

**Fullname:** group type

**Attribute Description** This is the type of group to queue for. Since this relation is used only for multiline hunt group queuing constructed features grptyp is always TM_QLINE.

**Attribute: qtype**

**Fullname:** queue type

**Attribute Description** This is the type of queuing. Q_MLHG is queuing for voice multiline hunt groups. Q_CSD is queuing for circuit switched data multiline hunt groups.

**Attribute: cwl**

**Fullname:** call waiting lamps allowed

**Attribute Description** If this is DBYES then the queue has call waiting lamps.
If this is DBNO then the queue does not have call waiting lamps.

**Attribute: spl_dlytreat**

**Fullname:** special in-band delay treatment allowed

**Attribute Description** If spl_dlytreat is DBYES then the queue has in-band delay treatment.
If spl_dlytreat is DBNO then the queue does not have in-band delay treatment. In-band delay treatment consists of announcements.

**Attribute: lmptyp**

**Fullname:** call waiting lamp type

**Attribute Description** If lmptyp is IS_FB then the call waiting lamps are feature button lamps on an ISDN terminal.
If lmptyp is IS_DP then the call waiting lamps are distribution point lamps.
If lmptyp is IS_LTNULL then there are no call waiting lamps for this queue.
ISAT groups must use feature button call waiting lamps.

**Attribute: threstyp**

**Fullname:** call waiting threshold type

**Attribute Description** If threstyp is IS_N then the call waiting lamp should be lit when the NUMBER of calls in the queue exceeds the call waiting threshold. The threstyp IS_N is used for ISAT multiline hunt groups.
If threstyp is IS_T then the call waiting lamp should be lit when the TIME of the longest call in the queue exceeds the call waiting threshold.
If threstyp is IS_THNULL then the MLHG does not have call waiting lamps.

Copyright © 1999 Lucent Technologies 

**Attribute: qinterfl**

**Fullname:** queue interflow allowed

**Attribute Description** If quinterfl is DBYES then queue interflow is allowed.
If quinterfl is DBNO then queue interflow is not allowed.

**Attribute: sada**

**Fullname:** service after delay announcement

**Attribute Description** If sada is DBYES then the service after delay feature is active for the multiline hunt group.
If sada is DBNO then the service after delay feature is not active for the multiline hunt group.

**Attribute: ann_bill**

**Fullname:** announcement billing

**Attribute Description** If ann_bill is DBYES then billing begins when a queued call is connected to announcement.
If ann_bill is DBNO then billing begins when a queued call is connected to a multiline hunt group member.

**Attribute: q_bill**

**Fullname:** type of billing for queuing

**Attribute Description** q_bill is a boolean structure indicating the combination of several types of billing that apply to the queuing feature. Only flat rate billing is supported for queuing features.

**Attribute: q_bill.flat**

**Fullname:** flat rate billing for queuing

**Attribute Description** If q_bill.flat is DBYES then flat rate billing is used for this queuing feature.
If q_bill.flat is DBNO then usage sensitive billing is used for this queuing feature.

**Attribute: q_bill.usefreq1**

**Fullname:** user frequency charge for use of event 1

**Attribute Description** If q_bill.usefreq1 is DBYES then billing for event 1 applies to this feature.
If q_bill.usefreq1 is DBNO then billing for event 1 does not apply to this feature.

**Attribute: q_bill.usefreq2**

**Fullname:** user frequency charge for use of event 2

**Attribute Description** If q_bill.usefreq2 is DBYES then billing for event 2 applies to this feature.
If q_bill.usefreq2 is DBNO then billing for event 2 does not apply to this feature.

**Attribute: q_bill.usefreq3**

**Fullname:** user frequency charge for use of event 3

**Attribute Description** If q_bill.usefreq3 is DBYES then billing for event 3 applies to this feature.

Copyright © 1999 Lucent Technologies 

If q_bill.usefreq3 is DBNO then billing for event 3 does not apply to this feature.

**Attribute: q_bill.usefreq4**

**Fullname:** user frequency charge for use of event 4

**Attribute Description** If q_bill.usefreq4 is DBYES then billing for event 4 applies to this feature.
If q_bill.usefreq4 is DBNO then billing for event 4 does not apply to this feature.

**Attribute: q_bill.actchrg**

**Fullname:** user charge for activation

**Attribute Description** If q_bill.actchrg is DBYES then billing for activation applies to this feature.
If q_bill.actchrg is DBNO then billing for activation does not apply to this feature.

**Attribute: q_bill.dactchrg**

**Fullname:** user charge for deactivation

**Attribute Description** If q_bill.dactchrg is DBYES then billing for deactivation applies to this feature.
If q_bill.dactchrg is DBNO then billing for deactivation does not apply to this feature.

**Attribute: q_bill.duration**

**Fullname:** user charge for duration of use

**Attribute Description** If q_bill.duration is DBYES then billing for feature usage applies to this feature.
If q_bill.duration is DBNO then billing for feature usage does not apply to this feature.

**Attribute: q_bill.change**

**Fullname:** user charge for change of parameter

**Attribute Description** If q_bill.change is DBYES then billing for changing a parameter applies to this feature.
If q_bill.change is DBNO then billing for changing a parameter does not apply to this feature.

**Attribute: qbsize**

**Fullname:** queue basic size

**Attribute Description** qbsize is the default value for the queue basic size.
The actual queue basic size is stored in RLqu_os.G when the feature is assigned. The queue basic size is how many calls are allowed in the basic portion of the queue.

**Attribute: qexsize**

**Fullname:** queue extended size

**Attribute Description** qesize is the default value for the queue extended size.
The actual queue extended size is stored in RLqu_os.G when the feature is assigned. The queue extended size is how many calls are allowed in the extended portion of the queue. The extended portion of the queue is reserved for Foreign Exchange (FX) calls.

Copyright © 1999 Lucent Technologies 

**Attribute: qmodule**

**Fullname:** queuing module

**Attribute Description** qmodule is the default parameter for the queuing module. To better use the resources of the switch it is recommended that the queuing module is the same as the hunting module for the MLHG (RLrt_mhg.module). This is accomplished by setting qmodule equal to RLrt_mhg.module for the MLHG which this queuing feature will be assigned to.

If the qmodule field is non-zero then it must specify an SM which exists in the office.

**Attribute: numcwl**

**Fullname:** number of call waiting lamps assigned

**Attribute Description** numcwl specifies the number of call waiting lamps thresholds that are defined for this queuing feature. For non-ISAT call waiting lamps (threstyp = IS_T) there may be up to 3 call waiting lamp thresholds. For ISAT call waiting lamps (threstyp = IS_N) there can be at most one call waiting lamp threshold.

All call waiting lamps for non-ISAT MLHGs are based on a call waiting lamp threshold. Therefore, for non-ISAT MLHGs numcwl is the number of call waiting lamps assigned to the queue.

ISAT MLHGs can have one call waiting lamp based on a call waiting lamp threshold and another call waiting lamp that turns on if at least one call is queued. The ISAT call waiting lamp that turns on if at least one call is queued does not use a threshold. Therefore, for ISAT queuing features numcwl is not necessarily the number of call waiting lamps available to the MLHG. For ISAT queuing features numcwl is 0 if cwth1 is 0. For ISAT queuing features numcwl is 1 if cwth1 is non-zero.

**Attribute: cwth1**

**Fullname:** call waiting lamp threshold 1

**Attribute Description** cwth1 is the threshold size for call waiting lamp 1. The threshold size refers to the number of calls in the queue if threstyp is IS_N. Threstyp IS_N is used only for ISAT MLHGs. ISAT MLHGs only use cwth1. Therefore, cwth2 and cwth3 can never be used to refer to the number of calls in the queue.

The threshold size refers to the length of time (in seconds) of the oldest call in the queue if threstyp is IS_T. If the threshold refers to time the maximum value is 31.

**Attribute: cwth2**

**Fullname:** call waiting lamp threshold 2

**Attribute Description** cwth2 is the threshold size for call waiting lamp 2. The threshold size refers to the length of time (in seconds) of the oldest call in the queue.

**Attribute: cwth3**

**Fullname:** call waiting lamp threshold 3

**Attribute Description** cwth3 is the threshold size for call waiting lamp 3. The threshold size refers to the length of time (in seconds) of the oldest call in the queue.

Copyright © 1999 Lucent Technologies 

**Attribute: cwl_sd1**

**Fullname:** call waiting lamp signal distribution point 1

**Attribute Description** cwl_sd1 is the signal distribution point for call waiting lamp 1.

**Attribute: cwl_sd1.member**

**Fullname:** call waiting lamp 1 port

**Attribute Description** cwl_sd1.member is the signal distribution point port for call waiting lamp 1.

**Attribute: cwl_sd1.module**

**Fullname:** call waiting lamp 1 module

**Attribute Description** cwl_sd1.module is the signal distribution point module for call waiting lamp 1.

**Attribute: cwl_sd2**

**Fullname:** call waiting lamp 2 signal distribution point

**Attribute Description** cwl_sd2 is the signal distribution point for call waiting lamp 2.

**Attribute: cwl_sd2.member**

**Fullname:** call waiting lamp 2 port

**Attribute Description** cwl_sd2.member is the signal distribution point port for call waiting lamp 2.

**Attribute: cwl_sd2.module**

**Fullname:** call waiting lamp 2 module

**Attribute Description** cwl_sd2.module is the signal distribution point module for call waiting lamp 2.

**Attribute: cwl_sd3**

**Fullname:** call waiting lamp 3 signal distribution point

**Attribute Description** cwl_sd3 is the signal distribution point for call waiting lamp 3.

**Attribute: cwl_sd3.member**

**Fullname:** call waiting lamp 3 port

**Attribute Description** cwl_sd3.member is the signal distribution point port for call waiting lamp 3.

**Attribute: cwl_sd3.module**

**Fullname:** call waiting lamp 3 module

**Attribute Description** cwl_sd3.module is the signal distribution point module for call waiting lamp 3.

Copyright © 1999 Lucent Technologies 

**Attribute: numann**

**Fullname:** number of announcements assigned (excluding flexible first)

**Attribute Description** numann is the number of announcements that are used as in-band delay treatment when calls are queued.

**Attribute: pre_anntone**

**Fullname:** pre-announcement tone

**Attribute Description** pre_anntone is PCTAUD if audible ringing is to be used before the first announcement.
pre_anntone is PCTIDLE if silence is to be used before the first announcement.

**Attribute: pre_ann_dly**

**Fullname:** pre-announcement delay

**Attribute Description** pre_ann_dly is the tone interval before the first announcement. Each interval represents a six second duration.

**Attribute: int_anntone**

**Fullname:** inter-announcement tone

**Attribute Description** int_anntone is PCTAUD if an audible ringing is to be used between announcements.
int_anntone is PCTIDLE if silence is to be used between announcements.
int_anntone is PCMUSIC if music tone is to be used between announcements.

**Attribute: int_ann_dly**

**Fullname:** inter announcement delay

**Attribute Description** int_ann_dly is the tone interval between announcements. Each interval represents a six second duration.

**Attribute: post_anntone**

**Fullname:** post-announcement tone

**Attribute Description** post_anntone is PCTAUD if an audible ringing is to be used after the last announcement.
post_anntone is PCTIDLE if silence is to be used after the last announcement.
post_anntone is PCMUSIC if music tone is to be used after the last announcement.

**Attribute: ann1typ**

**Fullname:** announcement 1 type (barge-in or nonbarge-in)

**Attribute Description** If ann1type is QU_BARGE then announcement 1 is a barge-in announcement.
If ann1type is QU_NBARGE then announcement 1 is a nonbarge-in announcement.

**Attribute: ann2typ**

Copyright © 1999 Lucent Technologies 

**Fullname:** announcement 2 type (barge-in or nonbarge-in)

**Attribute Description** If ann2type is QU_BARGE then announcement 2 is a barge-in announcement.
If ann2type is QU_NBARGE then announcement 2 is a nonbarge-in announcement.

**Attribute: ann3typ**

**Fullname:** announcement 3 type (barge-in or nonbarge-in)

**Attribute Description** If ann3type is QU_BARGE then announcement 3 is a barge-in announcement.
If ann3type is QU_NBARGE then announcement 3 is a nonbarge-in announcement.

**Attribute: ann4typ**

**Fullname:** announcement 4 type (barge-in or nonbarge-in)

**Attribute Description** If ann4type is QU_BARGE then announcement 4 is a barge-in announcement.
If ann4type is QU_NBARGE then announcement 4 is a nonbarge-in announcement.

**Attribute: ann5typ**

**Fullname:** announcement 5 type (barge-in or nonbarge-in)

**Attribute Description** If ann5type is QU_BARGE then announcement 5 is a barge-in announcement.
If ann5type is QU_NBARGE then announcement 5 is a nonbarge-in announcement.

**Attribute: ann1cycl**

**Fullname:** number of cycles for announcement 1

**Attribute Description** ann1cycle is the number of repetitions (cycles) for announcement 1.
If announcement 1 is the last announcement then the number of number of cycles can be zero to indicate continuous play.

**Attribute: ann2cycl**

**Fullname:** number of cycles for announcement 2

**Attribute Description** ann2cycle is the number of repetitions (cycles) for announcement 2.
If announcement 2 is the last announcement then the number of number of cycles can be zero to indicate continuous play.

**Attribute: ann3cycl**

**Fullname:** number of cycles for announcement 3

**Attribute Description** ann3cycle is the number of repetitions (cycles) for announcement 3.
If announcement 3 is the last announcement then the number of number of cycles can be zero to indicate continuous play.

**Attribute: ann4cycl**

Copyright © 1999 Lucent Technologies 

**Fullname:** number of cycles for announcement 4

**Attribute Description** ann4cycle is the number of repetitions (cycles) for announcement 4. If announcement 4 is the last announcement then the number of number of cycles can be zero to indicate continuous play.

**Attribute: ann5cycl**

**Fullname:** number of cycles for the flexible first announcement

**Attribute Description** ann5cycle is the number of repetitions (cycles) for announcement 5. The number of cycles can be zero to indicate continuous play.

**Attribute: ann1port**

**Fullname:** port for announcement 1

**Attribute Description** ann1port is the port for announcement 1.

**Attribute: ann1port.member**

**Fullname:** announcement 1 port

**Attribute Description** ann1port.member is the port name of the announcement trunk for announcement 1.

**Attribute: ann1port.module**

**Fullname:** announcement 1 module

**Attribute Description** ann1port.module is the switching module of the announcement trunk for announcement 1.

**Attribute: ann2port**

**Fullname:** port for announcement 2

**Attribute Description** ann2port is the port for announcement 2.

**Attribute: ann2port.member**

**Fullname:** announcement 2 port

**Attribute Description** ann2port.member is the port name of the announcement trunk for announcement 2.

**Attribute: ann2port.module**

**Fullname:** announcement 2 module

**Attribute Description** ann2port.module is the switching module of the announcement trunk for announcement 2.

**Attribute: ann3port**

**Fullname:** port for announcement 3

Copyright © 1999 Lucent Technologies 

**Attribute Description** ann3port is the port for announcement 3.

**Attribute: ann3port.member**

**Fullname:** announcement 3 port

**Attribute Description** ann3port.member is the port name of the announcement trunk for announcement 3.

**Attribute: ann3port.module**

**Fullname:** announcement 3 module

**Attribute Description** ann3port.module is the switching module of the announcement trunk for announcement 3.

**Attribute: ann4port**

**Fullname:** port for announcement 4

**Attribute Description** ann4port is the port for announcement 4.

**Attribute: ann4port.member**

**Fullname:** announcement 4 port

**Attribute Description** ann4port.member is the port name of the announcement trunk for announcement 4.

**Attribute: ann4port.module**

**Fullname:** announcement 4 module

**Attribute Description** ann4port.module is the switching module of the announcement trunk for announcement 4.

**Attribute: ann5port**

**Fullname:** port for announcement 5

**Attribute Description** ann5port is the port for announcement 5.
Announcement 5 is the flexible first announcement. The flexible first announcement is played in place of announcement one if the age of the oldest call on the queue is greater than the threshold specified in RLqu_cfdfl.flex_first.

**Attribute: ann5port.member**

**Fullname:** announcement 5 port

**Attribute Description** ann5port.member is the port name of the announcement trunk for announcement 5.

**Attribute: ann5port.module**

**Fullname:** announcement 5 module

**Attribute Description** ann5port.module is the switching module of the announcement trunk for

announcement 5.

**Attribute: music_port**

**Fullname:** music port.

**Attribute Description** The music_port is the port for the music delay treatment. The structure members are:

(1) member(DMport): Port name of the music port

(2) module(DMmodule): The SM number that this port terminates on

**Attribute: music_port.member**

**Fullname:** music port member.

**Attribute Description** music_port.member is the trunk port to be used to provide music.

**Attribute: music_port.module**

**Fullname:** music port module.

**Attribute Description** music_port.module is the switching module of the trunk for the music port.

**Attribute: flex_first**

**Fullname:** flexible first - threshold value (in six-second intervals) for the alternate first announcement

**Attribute Description** flex_first is the threshold value for the alternate first announcement. Ann5port is the alternate first announcement. The flex_first threshold is in six second intervals. If the oldest call on the queue has been queued longer than flex_first six second intervals than the flexible first announcement (announcement 5) is played instead of the first announcement when subsequent calls are queued.

**Attribute: warn_thresh**

**Fullname:** Threshold size for queue threshold warning lamps on queue monitor consoles that monitor the queue

**Attribute Description** Warn_thresh is used for multiline hunt group queues which are monitored by queue monitor consoles. When the number of calls in the queue exceeds warn_thresh the queue threshold warning lamps on all queue monitor consoles monitoring the MLHG queue are lit. When the number of calls in the queue is equal to or less than warn_thresh the queue threshold warning lamps are turned off.

**Attribute: isat_thresh**

**Fullname:** ISAT threshold value for QWARN lamp

**Attribute Description** isat_thresh is used for ISAT MLHGs that have a QWARN lamp. When the number of calls in the basic portion of the queue (excluding those residing in reserved emergency slots) exceeds the isat_thresh value, the QWARN lamp is lit on all consoles that have one. When this number falls below isat_thresh, the QWARN lamp is extinguished.

Copyright © 1999 Lucent Technologies 

**Attribute: qbusy_dpn**

**Fullname:** Queue Busy Distribution Point

**Attribute Description** Used for an ISAT MLHG to alert when the queue is full.

**Attribute: qbusy_dpn.member**

**Fullname:** Queue Busy Distribution Point Port

**Attribute Description** qbusy_dpn.member is the physical port that the distribution point is located on.

**Attribute: qbusy_dpn.module**

**Fullname:** Queue Busy Distribution Point Module

**Attribute Description** qbusy_dpn.module is the module that the distribution point is associated with.

## 4. Population Rules for RLqu_cwl

**Relation Description**
calls waiting lamps parameter data

This relation contains multiline hunt group (MLHG) call waiting lamp information. Call waiting lamps are used to indicate how long calls have been queued for a MLHG. As many as three different call waiting lamps can be provided per MLHG. This relations defines the call waiting lamp distribution points and the call waiting lamp threshold values. When a call is queued longer than a call waiting lamp threshold the call waiting lamp is turned on. The RLqu_cwl tuple is populated on the MLHG queuing module. This relation defines analog distribution point call waiting lamps. A separate relation (RLisqu_cwl) is used to define ISDN feature button call waiting lamps.

**Attribute: portgrp**

**Fullname:** modular queuing port group

**Attribute Description** This is the key to owner relation. if TM_QLINE is specified, then there must be a RLrt_mhg tuple keyed by RLqu_cwl.portgrp.grpnum

In that RLrt_mhg tuple RLrt_mhg.qfid must be non-NULL. There must be a RLqu_cfdfl tuple keyed by RLrt_mhg.qfid. In that RLqu_cfdfl tuple RLqu_cfdfl.cwl must be DBYES and RLqu_cfdfl.lmptyp must be IS_DP (distribution point) and RLqu_cfdfl.threshtyp must be IS_T (call waiting lamp threshold based on time).

**Copyright © 1999 Lucent Technologies** 

**Attribute: portgrp.grpnum**

**Fullname:** multiline hunt group number

**Attribute Description** decimal number assigned to a multiline hunt group.

**Attribute: portgrp.grptype**

**Fullname:** group type

**Attribute Description** This attribute must be TM_QLINE since call waiting lamps are only provided for multiline hunt group queues. Trunk and Simulated Facility Group (SFG) queues do not provide call waiting lamps.

**Attribute: numcwl**

**Fullname:** number of calls waiting lamps allowed

**Attribute Description** This is the number of call waiting lamps provided for the multiline hunt group

**Attribute: cwth[*]**

**Fullname:** call waiting lamp threshold value

**Attribute Description** These are the call waiting lamp threshold values. The call waiting lamp thresholds are in six second intervals. When the age of the oldest call on the queue reaches cwth1 the first call waiting lamp (cwl_sd1) is turned on. If more than on call waiting lamp is provided then when the age of the oldest queued call reaches cwth2 the first call waiting lamp (cwl_sd1) is turned off and the second lamp (cwl_sd2) is turned on.
If 3 call waiting lamps are provided then call waiting lamp 2 is turned off and call waiting lamp 3 is turned on when the age of the oldest queued call reaches cwth3. cwth1 < cwth2 < cwth3

**Attribute: cwl_sd[*]**

**Fullname:** calls waiting lamp signal distribution point

**Attribute Description**

```
If cwth1 is non 0 then cwl_sd1 must not be 0.
If cwl_sd1 is non 0 then cwth1 must not be 0.
If cwth2 is non 0 then cwl_sd2 must not be 0.
If cwl_sd2 is non 0 then cwth2 must not be 0.
If cwth3 is non 0 then cwl_sd3 must not be 0.
If cwl_sd3 is non 0 then cwth3 must not be 0.
There must be a tuple in RLfc_porttyp keyed by each non 0 cwl_sd, and
RLfc_porttyp.servclass must = PF_LAMP.
Non-zero call waiting lamp signal distribute points must be unique.
If cwl_sd1 is non 0 then
        cwl_sd1 must not equal cwl_sd2.
        cwl_sd1 must not equal cwl_sd3.
        cwl_sd1 must not equal cwl_sd1, cwl_sd2 or cwl_sd3
        in any other RLqu_cwl tuple.
If cwl_sd2 is non 0 then
        cwl_sd2 must not equal cwl_sd1.
        cwl_sd2 must not equal cwl_sd3.
        cwl_sd2 must not equal cwl_sd1, cwl_sd2 or cwl_sd3
```

Copyright © 1999 Lucent Technologies 

```
        in any other RLqu_cwl tuple.
If cwl_sd3 is non 0 then
        cwl_sd3 must not equal cwl_sd1.
        cwl_sd3 must not equal cwl_sd2.
        cwl_sd3 must not equal cwl_sd1, cwl_sd2 or cwl_sd3
        in any other RLqu_cwl tuple.
```

**Attribute: cwl_sd[*].member**

**Fullname:** port name

**Attribute Description** port name of a port

**Attribute: cwl_sd[*].module**

**Fullname:** the SM number

**Attribute Description** This is the SM number that this port terminates on.

## 4. Population rules for RLqu_dly

### Relation Description

Queuing delay.

Relation that contains delay announcement parameters for queuing.

**Attribute:**

portgrp

**Fullname:**

Port group.

**Attribute Description:**

This attribute is the key for this relation
and is divided into subattributes portgrp.grpnum
and portgrp.grptype. The structure members are:

1. Portgrp.grpnum: decimal number assigned
   to a multiline hunt group, a Simulated
   Facility Group (SFG) or a trunk group.
2. Portgrp.grptype: enumerated field indicating
   the group type

NOTE: This relation should only be populated if one of the
following is satisfied:

```
portgrp.grptype == TM_QLINE and
RLqu_cfdfl.spl_dlytreat == DBYES
where RLqu_cfdfl is keyed by RLrt_mhg.qfid
and RLrt_mhg is keyed by portgrp.grpnum.
or
portgrp.grptype == TM_QTRK and
(RLqu_tcfdf.spl_dlytreat == DBYES or
RLqu_tcfdf.pri_spl_dly == DBYES) for OFFHOOK queuing or
RLqu_tcfdf.pri_spl_dly == DBYES for RGBK queuing
where RLqu_tcfdf is keyed by RLrt_trkg.qfid
where RLrt_trkg is keyed by portgrp.grpnum.
or
portgrp.grptype == TM_QSFG and
RLqu_tcfdf.spl_dlytreat == DBYES or
RLqu_tcfdf.pri_spl_dly == DBYES
```

Copyright © 1999 Lucent Technologies 

```
            where RLqu_tcfdf is keyed by RLrt_sfg.qfid
            where RLrt_sfg is keyed by portgrp.grpnum.
```

**Attribute:**
portgrp.grpnum
**Fullname:**
group number
**Attribute Description:**
group number

**Attribute:**
portgrp.grptype
**Fullname:**
group type
**Attribute Description:**
group type.

**Attribute:**
numann
**Fullname:**
number of announcement.
**Attribute Description:**
Number of announcements (excluding flexible first)

**Attribute:**
ann[*]typ
**Fullname:**
announcement type.
**Attribute Description:**
Announcement type (barge-in or nonbarge-in) .
Ann5type is used ONLY for flexible first announcement

if ann[x]port is not assigned, ann[x]type must be QU_NBARGE.

**Attribute:**
ann[*]cycl
**Fullname:**
announcement cycle.
**Attribute Description:**
Announcement cycles: for up to 5 announcements.
From 0 to 4 cycles per announcement.
Ann5cycle is used ONLY for the flexible first
announcement.

General Purpose Assignment:
if ann[x]cycl!=0 and ann[x]port is assigned
then x <= numann.

**Copyright © 1999 Lucent Technologies** 

Special Assignment:
(where the last an/or the Flexible First
Announcement is to be used as a Continuous
(music) Announcement): if ann[x]cycl=0 and
ann[x]port is assigned then x=numann (last)
or x=5 (flexible first).

**Attribute:**
ann[*]port
**Fullname:**
announcement port.
**Attribute Description:**
Announcement ports for up to five announcements.
Member is the port name of a trunk that should
be assigned as an announcement trunk in relation
RLfc_trunk. Module refers to the Interface Module
in which this trunk is located.
Ann5port is for the flexible first announcement.
This attribute is divided into subattributes
ann[x]port.member and ann[x]port.module. The
structure members are:
1. member(DMport): Port name of a port

2. module(DMmodule): The SM number that this port
terminates on

if ann[x]port
is non-zero, x <= numann.
if ann[x]port is non-zero then:
if portgrp.grptype is TM_QLINE:
ann[x]port.module must
equal RLrt_mhg.qmodule where RLrt_mhg is
keyed by portgrp.grpnum.
if portgrp.grptype is TM_QTRK:
ann[x]port.module must
equal RLrt_trkg.qmodule where RLrt_trkg is
keyed by portgrp.grpnum.
if portgrp.grptype is TM_QSFG:
ann[x]port.module must
equal RLrt_sfg.qmodule where RLrt_sfg is
keyed by portgrp.grpnum.
Ann5port must be 0 if numann = 0

**Attribute:**
ann[*]port.member
**Fullname:**
port member.
**Attribute Description:**
port member.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ann[*]port.module
**Fullname:**
port module.
**Attribute Description:**
port module

**Attribute:**
music_port
**Fullname:**
Music (tone) port.
**Attribute Description:**
Trunk port to provide music as tone.
This attribute is divided into subattributes member and module.

The structure members are:
1. member(DMport): Port name of a port

2. module(DModule): The SM number that this port terminates on

**Attribute:**
music_port.member
**Fullname:**
Port member name.
**Attribute Description:**
Port member name.

**Attribute:**
music_port.module
**Fullname:**
Module number.
**Attribute Description:**
Module number.

**Attribute:**
pre_anntone
**Fullname:**
pre announcement tone.
**Attribute Description:**
Pre-announcement tone.

**Attribute:**
int_anntone

Copyright © 1999 Lucent Technologies 

**Fullname:**
inter announcement.
**Attribute Description:**
Pre_announcement tone.

**Attribute:**
post_anntone
**Fullname:**
Post announcement.
**Attribute Description:**
Post_announcement tone,

**Attribute:**
pre_ann_dly
**Fullname:**
Pre announcement delay.
**Attribute Description:**
Tone interval before first announcement.
Each interval represents a six-second duration.

If portgrp.grptype = TM_QLINE and numann = 0 then
the pre-announcement delay must be = 0.

For portgrp.grptype != TM_QLINE:
if (numann > 0 && rou_q != Q_HPCOHQ) or
an RLqu_pri tuple (keyed on portgrp.grpnum) exists
and RLqu_pri.numann_p > 0.
then
the pre-announcement delay must be > 0.
else
the pre-announcement delay must be = 0.

**Attribute:**
int_ann_dly
**Fullname:**
inter announcement delay
**Attribute Description:**
Tone interval between announcements
Each interval represents a six-second duration.

If portgrp.grptype = TM_QLINE and numann < 2 then
the inter-announcement delay must be = 0.

For portgrp.grptype != TM_QLINE:
if numann > 1 or
an RLqu_pri tuple (keyed on portgrp.grpnum) exists
and RLqu_pri.numann_p > 1
then
the inter-announcement delay must be > 0.

Copyright © 1999 Lucent Technologies 

```
        else
            the inter-announcement delay must be = 0.
```

**Attribute:**
        flex_first
**Fullname:**
        Flexible first.
**Attribute Description:**
        Flexible first - threshold value (in six-second
        intervals) for the alternate first announcement.

        flex_first must be populated if
        flexible first announcement (ann5port) is defined:
        else, flex_first must be 0.

**Attribute:**
        sada
**Fullname:**
        Service After Delay Announcement.
**Attribute Description:**
        Indicates if the Service After Delay Announcement
        feature is active for the hunt group.

        If numann == 0 the sada must be DBNO
        and if grptyp != TM_QLINE then sada must be DBNO.
        If sada = DBYES then ann1type must_be QU_NBARGE.
        If sada = DBYES and ann5port.member > 0 then
        ann5type must_be QU_NBARGE.

**Attribute:**
        ann_bill
**Fullname:**
        Announcement bill.
**Attribute Description:**
        Indicates if billing is to begin with the announcement
        (DBYES) or when the call is connected to the hunt
        group member (DBNO).

**Attribute:**
        freeterm
**Fullname:**
        Free termination.
**Attribute Description:**
        Indicates if the mlhg is marked as a free termination.

        The value of this bit must follow the

**Copyright © 1999 Lucent Technologies** 

freeterm bit in the relation RLfc_line for the first member of the mlhg, if one exists.

**Attribute:**
ffcf1
**Fullname:**
Future feature.
**Attribute Description:**
NONE

## 4. Population Rules for RLqu_ogtos

**Relation Description**
Owner static relation for outgoing queue initialization

Information concerning this section is not available at this time.

**Attribute: ogt_key**

**Fullname:** key to owner relation

**Attribute Description** This attribute is the key to the relation. It is a short which is found by taking the portgrp.grpnum and adding AVMXTRKGRPS if the portgrp.grptype is TM_QSFG, or else if portgrp.grptype is TM_QTRK, then the key is equal to portgrp.grpnum. The total of rqsize and pqsize for all tuples in this relation is kept in a global parameter Gltkqcells

**Attribute: portgrp**

**Fullname:** group type and number

**Attribute Description** This attribute is divided into subattributes portgrp.grpnum and portgrp.grptype and should be unique. The structure members are:

(1) Portgrp.grpnum: decimal number assigned to an SFG or a trunk group.

(2) Portgrp.grptype: enumerated field indicating the group type.

Dependencies: for TM_QTRK there must be a RLrt_trkg tuple with q_alwd equal to DBYES which is keyed by portgrp.grpnum, for TM_QSFG there must be a RLrt_sfg tuple with q_alwd equal to DBYES which is keyed by portgrp.grpnum.

**Attribute: portgrp.grpnum**

**Fullname:** group number

**Attribute Description** Information concerning this section is not available at this time.

**Attribute: portgrp.grptype**

**Fullname:** group type

**Attribute Description** Information concerning this section is not available at this time.

**Attribute: rou_q**

**Fullname:** type of routine queue

**Attribute Description** There is no priority queuing associated with Q_BLV

**Attribute: pri_q**

**Fullname:** is there a priority queue

**Attribute Description** Information concerning this section is not available at this time.

Copyright © 1999 Lucent Technologies 

**Attribute: rqsize**

**Fullname:** routine queue size

**Attribute Description** When trunk queuing is assigned to a trunk to queue on a particular SM, the rqsize and pqsize assigned to this trunk must be <= 255. The combined total of (rqsize + pqsize + qu_os.qbsize + qu_os.qexsize) for all tuples on this SM must be <= 255 on an SM or <= 4000 on SM-2000.
This is checked in poprules for Glnq_cells.

**Attribute: pqsize**

**Fullname:** priority queue size

**Attribute Description**If pri_q is DBYES, then pqsize must be > 0.
If pri_q is DBNO, then pqsize must be 0.

**Attribute: rq_timeout**

**Fullname:** routine queue timeout limit in seconds

**Attribute Description** If rou_q is Q_RGBK then rq_timeout must be <= 1770

***NOTE:*** The timeout value specified is the approximate time which timeout will occur within thirty seconds.

**Attribute: pq_timeout**

**Fullname:** priority queue timeout limit in seconds

**Attribute Description**The timeout value specified is the approximate time which timeout will occur within thirty seconds.

**Attribute: retry_time**

**Fullname:** retry timeout limit in seconds

**Attribute Description** If retry_time > 0 then rou_q must be Q_RGBK.

***NOTE:*** The timeout value specified is the approximate time which timeout will occur within thirty seconds. 0 means no retry

**Attribute: sp_time**

**Fullname:** service protection time delay in seconds

**Attribute Description** if sp_time > 0 then pri_q must be DBYES.

***NOTE:*** 0 means no service protection

**Attribute: post_q_treat**

**Fullname:** post queue treatment

**Attribute Description** When a call is removed from a queue and not given the facility queued for, the call will be re-routed only if the call is an ARS-D call and QR_ALTR is specified else the call is given reorder tone and disconnected When portgrp.grptype is TM_QTRK or TM_QSFG, QR_NULL

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLqu_os

**Relation Description**
owner static relation for queue initialization

This relation is for queue initialization for owner tuple for Multi-line Hunt Group (MLHG). This relation contains information about the size of the queue (basic and extended), a queue monitor console threshold value, the number of queue monitor consoles, and information about each queue monitor consoles for the MLHG.

A queue monitor console is an ISDN DSL which can be used to display status information about a MLHG. A queue monitor console does not have any special equipment beyond normal ISDN feature buttons and an ISDN CPE display. A feature button on the queue monitor console which is mapped to a MLHG is called a queue status feature button. When the queue status feature button is pressed information about the MLHG queue is displayed on the queue monitor console. When the number of calls queued for the MLHG exceeds the warning threshold (warn_thresh) the queue status feature button lamp on the queue monitor console is lit.

Glnq_cells contains the total qbsize and qexsize for all of the queuing tuples on the SM. RC uses this to enforce the restriction that the total queue size for all MLHG and trunk queues on a given SM be no greater than 255 for an SM and no greater than 4000 for SM-2000.

**Attribute: grpnum**

**Fullname:** group number

**Attribute Description** The grpnum is the multi-line hunt group number.

**Attribute: qbsize**

**Fullname:** queue basic size

**Attribute Description** A queue associated with multiline hunt group has a queue basic size. The number of calls in the queue for the terminating lines for a given MLHG can not be more than the defined value set by the customer (max 255). The following rule is enforced in population rules for Glnq_cells. The combined total of (qbsize + qexsize + qu_ogtos.rqsize + qu_ogtos.pqsize) for all tuples on this SM must be no greater than 255 for an SM or 4000 for SM-2000.

**Attribute: qexsize**

**Fullname:** queue extended size.

**Attribute Description** A queue associated with the multi-line hunt group has a value set for queue extended size. A qexsize is set for the calls coming on foreign exchange trunks.

The combined total of (qbsize + qexsize + qu_ogtos.rqsize + qu_ogtos.pqsize) for all tuples on this

Copyright © 1999 Lucent Technologies 

SM must be no greater than 255 for an SM or 4000 for SM-2000.

**Attribute: warn_thresh**

**Fullname:** warning threshold size for queue threshold warning lamps

**Attribute Description** The field warn_thresh is used for MLHG queues which are monitored by one or more queue monitor consoles. If the number of calls in the queue is greater than warn_thresh then queue threshold warning lamps on the queue monitor consoles are lit.

**Attribute: num_qmon**

**Fullname:** number of queue monitor consoles

**Attribute Description** A MLHG can be monitored by at most three queue monitor consoles. This num_qmon tells how many queue monitor consoles are monitoring a MLHG.

**Attribute: qmon1**

**Fullname:** queue monitor console one

**Attribute Description** qmon1 is the 1st queue monitor console monitoring a circuit switched data multi-lint hunt group.

**Attribute: qmon1.module**

**Fullname:** queue monitor console one's module

**Attribute Description** qmon1.module is the module identification number for 1st queue monitor console monitoring the MLHG. Each queue monitor console monitoring the MLHG is connected with different processor or switching module. For call processing we need to know which processor the queue monitor console is attached with.

**Attribute: qmon1.lport**

**Fullname:** queue monitor console one's logical port

**Attribute Description** The qmon1.lport is the logical port number for the queue monitor console one monitoring the multi-line hunt group.

**Attribute: qmon1.termno**

**Fullname:** queue monitor console one's terminal number

**Attribute Description** The qmon1.termno is queue monitor console one's terminal number

**Attribute: qmon1.cpecomp**

**Fullname:** queue monitor console one's CPE component

**Attribute Description** MLHG queue monitor one uses a Queue Status Feature Button (QSFB) to monitor this MLHG queue. qmon1.cpecomp identifies the CPE component on the queue monitor console where the QSFB is located.

**Attribute: qmon1.button**

**Fullname:** queue monitor console one's queue status feature button

Copyright © 1999 Lucent Technologies 

**Attribute Description** MLHG queue monitor one uses a Queue Status Feature Button (QSFB) to monitor this MLHG queue. qmon1.button identifies the QSFB on the queue monitor console.

**Attribute: qmon1.config**

**Fullname:** queue monitor console one's configuration

**Attribute Description** The qmon1.config is the queue monitor console's configuration for queue monitor console one.

**Attribute: qmon2**

**Fullname:** queue monitor console two

**Attribute Description** qmon2 is the 2nd queue monitor console monitoring a circuit switched data multi-lint hunt group.

**Attribute: qmon2.module**

**Fullname:** queue monitor console two's module

**Attribute Description** The qmon2.module is the queue monitor console two's module number.

**Attribute: qmon2.lport**

**Fullname:** queue monitor console two's logical port

**Attribute Description** The qmon2.termno is the queue monitor console's terminal number for the 2nd queue monitor console monitoring a multi-line hunt group.

**Attribute: qmon2.termno**

**Fullname:** queue monitor console two' terminal number

**Attribute Description** The qmon2.termno is the queue monitor console's terminal number for the 2nd queue monitor console monitoring a multi-line hunt group.

**Attribute: qmon2.cpecomp**

**Fullname:** queue monitor console two's CPE component

**Attribute Description** MLHG queue monitor two uses a Queue Status Feature Button (QSFB) to monitor this MLHG queue. qmon2.cpecomp identifies the CPE component on the queue monitor console where the QSFB is located.

**Attribute: qmon2.button**

**Fullname:** queue monitor console two's queue status feature button

**Attribute Description** MLHG queue monitor two uses a Queue Status Feature Button (QSFB) to monitor this MLHG queue. qmon2.button identifies the QSFB on the queue monitor console.

**Attribute: qmon2.config**

**Fullname:** queue monitor console two's configuration

Copyright © 1999 Lucent Technologies 

**Attribute Description** The qmon2.config is the queue monitor console's configuration for the 2nd queue monitor console monitoring a multi-line hunt group.

**Attribute: qmon3**

**Fullname:** queue monitor console three

**Attribute Description** qmon3 is the 3rd queue monitor console monitoring a circuit switched data multi-lint hunt group.

**Attribute: qmon3.module**

**Fullname:** queue monitor console three's module

**Attribute Description** The qmon3.module is the module number for the 3rd queue monitor console monitoring the MLHG.

**Attribute: qmon3.lport**

**Fullname:** queue monitor console three's logical port

**Attribute Description** The qmon3.lport is the logical port number for the 3rd queue monitor console monitoring the multi-line hunt group.

**Attribute: qmon3.termno**

**Fullname:** queue monitor console three's terminal number

**Attribute Description** The qmon3.termno is the terminal number for the 3rd queue monitor console monitoring the multi-line hunt group.

**Attribute: qmon3.cpecomp**

**Fullname:** queue monitor console three's CPE component

**Attribute Description** MLHG queue monitor three uses a Queue Status Feature Button (QSFB) to monitor this MLHG queue. qmon3.cpecomp identifies the CPE component on the queue monitor console where the QSFB is located.

**Attribute: qmon3.button**

**Fullname:** queue monitor console three's queue status feature button

**Attribute Description** MLHG queue monitor three uses a Queue Status Feature Button (QSFB) to monitor this MLHG queue. qmon3.button identifies the QSFB on the queue monitor console.

**Attribute: qmon3.config**

**Fullname:** queue monitor console three's configuration

**Attribute Description** The qmon3.config is the configuration for the 3rd queue monitor console monitoring a multi-line hunt group.

## 4. Population Rules for RLqu_pri

**Relation Description**
Queuing Priority

Relation that contains delay announcement and service protection parameters for priority offhook queuing.
Attributes pann1typ thru pann3typ are redefined as an array of types.
Attributes pann1cycl thru pann3cycl are redefined as an array of cycles.
Attributes pann1port thru pann3port are redefined as an array of ports.
Allows features to treat the set of above attributes as arrays of attributes.

**Attribute: portgrp**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Key to owner relation

**Attribute Description** This attribute is the key for this relation and is divided into subattributes portgrp.grpnum and portgrp.grptype. The structure members are:

(1) Portgrp.grpnum: decimal number assigned to a Simulated Facility Group (SFG) or a trunk group.

(2) Portgrp.grptype: enumerated field indicating the group type

***NOTE 1:*** This relation should only be populated if one of the following is satisfied:

portgrp.grptype == TM_QSFG and RLqu_tcfdf.pri_spl_dly == DBYES where RLqu_tcfdf is keyed by RLrt_sfg.qfid and RLrt_sfg is keyed by portgrp.grpnum.

portgrp.grptype == TM_QTRK and RLqu_tcfdf.pri_spl_dly == DBYES where RLqu_tcfdf is keyed by RLrt_trkg.qfid and RLrt_trkg is kdyed by portgrp.grpnum.

***NOTE 2:*** This relation is for Priority queues only!

```
if portgrp.grptype is TM_QSFG
      RLrt_sfg.priority must be DBYES
if portgrp.grptype is TM_QTRK
      RLrt_trkg.priority must be DBYES
```

**Attribute: portgrp.grpnum**

**Fullname:** Group number

**Attribute Description** group number

**Attribute: portgrp.grptype**

**Fullname:** Group type

**Attribute Description** group type

**Attribute: numann_p**

**Fullname:** Number of priority announcement allowed

**Attribute Description** number of priority announcements allowed

**Attribute: pann1type**

**Fullname:** priority announcement type

**Attribute Description** for pann1type if pann1type is QU_NBARGE then 1 <= numann_p

**Attribute: pann2type**

**Fullname:** priority announcement group

**Attribute Description** for pann2type, if pann2type is QU_NBARGE, then 2 <= numann_p

**Attribute: pann3type**

Copyright © 1999 Lucent Technologies 

**Fullname:** priority announcement type

**Attribute Description** for pann3type, if pann3type is QU_NBARGE, then 3 <= numann_p

**Attribute: pann1cycl**

**Fullname:** priority announcement cycles

**Attribute Description** if pann1cycl is > 0, then 1 <=numann_p . Also if pann1cycl equals 0 , then 1 must be > numann_p

**Attribute: pann2cycl**

**Fullname:** priority announcement cycles

**Attribute Description** for pann2cycl, if pann2cycl is > 0 then 2 <= numann_p also, if pann2cycl equals 0 , then 2 must be > numann_p

**Attribute: pann3cycl**

**Fullname:** priority announcement cycles

**Attribute Description** for pann3cycl, if pann3cycl is > 0, then 3 <= numann_p also, if pann3cycl equals 0, then 3 must be > numann_p

**Attribute: pann1port**

**Fullname:** priority announcement port

**Attribute Description** Priority announcement ports for up to three announcements. Member is the port name of a trunk that should be assigned as an announcement trunk in relation RLfc_trunk. Module refers to the Switching Module in which this trunk is located. This attribute is divided into subattributes

**Attribute: pann1port.member**

**Fullname:** port name of a port

**Attribute Description** for pann1port, if pann1port is non-zero, 1 <= numann_p.
if pann1port is non-zero, pann1port.module must equal RLrt_sfg.qmodule where RLrt_sfg is keyed by portgrp.grpnum (if portgrp.grptype = TM_QSFG), or else pann1port.module must equal RLrt_trkg.qmodule where RLrt_trkg is keyed by portgrp.grpnum (if portgrp.grptype = TM_QTRK).

**Attribute: pann1port.module**

**Fullname:** The SM number that this port terminates on

**Attribute Description** port module

**Attribute: pann2port**

**Fullname:** priority announcement port

**Attribute Description** Member is the port name of a trunk that should be assigned as an announcement trunk in relation RLfc_trunk. Module refers to the Switching Module in which this trunk is located. This attribute is divided into subattributes

Copyright © 1999 Lucent Technologies 

**Attribute: pann2port.member**

**Fullname:** priority announcement port

**Attribute Description** for pann2port, if pann2port is non-zero, 2 <= numann_p. if pann2port is non-zero, pann2port.module must equal RLrt_sfg.qmodule where RLrt_sfg is keyed by portgrp.grpnum (if portgrp.grptype = TM_QSFG), or else pann2port.module must equal RLrt_trkg.qmodule where RLrt_trkg is keyed by portgrp.grpnum (if portgrp.grptype = TM_QTRK).

**Attribute: pann2port.module**

**Fullname:** The SM number that this port terminates on

**Attribute Description** port module

**Attribute: pann3port**

**Fullname:** prority announcement port

**Attribute Description** Member is the port name of a trunk that should be assigned as an announcement trunk in relation RLfc_trunk. Module refers to the Switching Module in which this trunk is located. This attribute is divided into subattributes

**Attribute: pann3port.member**

**Fullname:** priority announcement port

**Attribute Description** for pann3port, if pann3port is non-zero, 3 <= numann_p. if pann3port is non-zero, pann3port.module must equal RLrt_sfg.qmodule where RLrt_sfg is keyed by portgrp.grpnum (if portgrp.grptype = TM_QSFG), or else pann3port.module must equal RLrt_trkg.qmodule where RLrt_trkg is keyed by portgrp.grpnum (if portgrp.grptype = TM_QTRK).

**Attribute: pann3port.module**

**Fullname:** The SM number that this port terminates on

**Attribute Description** port module

## 4. Population Rules for RLqu_rgbk

**Relation Description**
relation that contains ringback parameters

This relation is for Ringback queues only! Therefore RLqu_tcfdf.rou_q must be Q_RGBK where RLqu_tcfdf is keyed by qfid where:

if portgrp.grptype is TM_QSFG qfid is found in RLrt_sfg.qfid, which is keyed by portgrp.grpnum, or

if portgrp.grptype is TM_QTRK qfid is found in RLrt_trkg.qfid, which is keyed by portgrp.grpnum.

**Attribute: portgrp**

**Fullname:** port group

**Attribute Description** key to owner relation

**Attribute: portgrp.grpnum**

Copyright © 1999 Lucent Technologies

**Fullname:** group number

**Attribute Description** The decimal number assigned to an SFG or a trunk group.

**Attribute: portgrp.grptype**

**Fullname:** group type

**Attribute Description** if TM_QTRK is specified, then there must be a RLrt_trkg tuple with q_alwd equal to DBYES which is keyed by portgrp.grpnum.

If TM_QSFG is specified, then there must be a RLrt_sfg tuple with q_alwd equal to DBYES which is keyed by portgrp.grpnum.

**Attribute: rgbk_typ**

**Fullname:** ringback type

**Attribute Description** Distinctive ringback ringing. If rou_q in corresponding RLqu_tcfdf tuple is Q_RGBK, DR_NULL is not allowed

(1) ODA should NEVER populate a NULL value in this attribute, this pertains to RC ONLY !!

(2) Distinctive Ringing pattern DR_G is not used in generics 5e5_1u and beyond.

The distinctive ringing patterns are described here:

DR_A (Normal Ringing): 2 seconds on, 4 seconds off.

DR_B (Distinctive Ringing): 800ms on, 400ms off, 800ms on, 4 seconds off.

DR_C (Distinctive Ringing): 400ms on, 200ms off, 400ms on, 200 ms off, 800ms on, 4 seconds off.

DR_D (Distinctive Ringing): 1 second on, 1 second off, 1 second on, 3 seconds off.

DR_P (Distinctive Ringing): 1640ms on, 360ms off.

**Attribute: rgbk_intrvl**

**Fullname:** ringback interval

**Attribute Description** Time limit for ringback. If rou_q in corresponding RLqu_tcfdf tuple is Q_RGBK, QSEC_NULL is not allowed

***NOTE:*** ODA should NEVER populate a NULL value in this attribute, this is for RC ONLY !!

## 4. Population Rules for RLqu_sm

**Relation Description**
queues on switching modules

The count of all queues for MLHG, SFG, and Trunk Groups by switching module is identified in each tuple of this relation. If there are no queues at all for a given SM, then there is no tuple in the relation.

**Attribute: module**

**Fullname:** switching module number

Copyright © 1999 Lucent Technologies

**Attribute Description** this identifies the specific SM which has either MLHG, SFG, or Trunk Group queues

**Attribute: amount**

**Fullname:** amount of queues

**Attribute Description** amount of MLHG and SFG queues on this SM

**Attribute: ogtq_amnt**

**Fullname:** outgoing trunk queue

**Attribute Description** identifies the count of trunk group queues for this SM

## 4. Population rules for RLqu_tcfdf

**Relation Description**

Queuing contructed feature with default parameters

This is the constructed feature relation for the trunks queuing features. These features are assigned to trunks in order to provide queuing for calls terminating to trunks where all trunks are busy.

**Attribute:**

feat_id

**Fullname:**

Queuing constructed feature identifier

**Attribute Description:**

Value is computed accordingly:
top 6 bits (10 - 15): MFQU (14 [0xe]) (see DMmftyp.G),
bottom ten bits (0 - 9): 1 - 1023 (0x1 - 0x3ff).

Copyright © 1999 Lucent Technologies 

**Attribute:**
grptype
**Fullname:**
Type of group to queue for
**Attribute Description:**
The values for this attributes must be TM_QTRK or TM_QSFG.

**Attribute:**
rou_q
**Fullname:**
Type of queuing
**Attribute Description:**
The values for the type of queuing must be Q_RGBK, Q_OFFHK, Q_DSU, or Q_BLV.

**Attribute:**
pri_q
**Fullname:**
Is there a priority queue?
**Attribute Description:**
Values must be DBYES or DBNO.

**Attribute:**
spl_dlytreat
**Fullname:**
Special delay treatment allowed
**Attribute Description:**
Values must be DBYES or DBNO.

**Attribute:**
pri_spl_dly
**Fullname:**
Priority special delay treatment allowed
**Attribute Description:**
Valuse must be DBYES or DBNO.

**Attribute:**
rqsize
**Fullname:**
Routine queuing size - default parameter
**Attribute Description:**
Values for this attribute must be between 1 - 255.

Copyright © 1999 Lucent Technologies 

rqsize + pqsize must be <= 255.
NOTE: after the feature is assigned to a group the total of the qu_ogtos.rqsize + qu_ogtos.pqsize + qu_os.qbsize + qu_os.qexsize attributes assigned to this SM must be <= 255 (SM) or <= 4000 (SM-2000).
Note: These checks are enforced in QU_OS and QU_OGTOS.

**Attribute:**
pqsize
**Fullname:**
Priority Queue size - default parameter
**Attribute Description:**
See rules under rqsize attribute.
If pri_q = DBNO, then pqsize must be 0.
if pri_q = DBYES, then pqsize must be > 0

**Attribute:**
qmodule
**Fullname:**
Queuing module - default parameter
**Attribute Description:**
The values for this attribute must be between 1 - 192.

If no value is specified when the feature is defined, the qmodule is defaulted to 1. When the feature is assigned to a trunk or SFG, RC checks RLmodatt to make sure it is an operational SM.

**Attribute:**
numann
**Fullname:**
Number of announcements
**Attribute Description:**
The number of announcements allowed must be between 0 - 4.
It must be 0 if spl_dlytreat is DBNO.

**Attribute:**
pre_anntone
**Fullname:**
Pre-announcement tone
**Attribute Description:**
The pre-announcement tone must be PCTAUD or PCTIDLE.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

pre_ann_dly

**Fullname:**

Tone interval before first announcement

**Attribute Description:**

The tone intervals before first anouncement represent a six-second duration, between 0 - 20. It must be > 0 if numann is >= 2 or if numannp is >= 1. GETS HPC queueing (rou_q = Q_HPCOHQ) is an exception to this rule; pre_ann_dly can be set to 0 even when there are annoucements provisioned.

**Attribute:**

int_anntone

**Fullname:**

Inter-announcement tone

**Attribute Description:**

The values for the inter-announcement tone must be PCTAUD or PCIDLE.

**Attribute:**

int_ann_dly

**Fullname:**

Tone interval between annoucements

**Attribute Description:**

The values for the tone intervals between announcements represent a six-second duration, it must be between 0 - 20. Ii must be > 0 if numann is >= 2 or if numannp is >= 2.

**Attribute:**

post_anntone

**Fullname:**

Post-announcement tone

**Attribute Description:**

The values for the post-announcement tone must be PCTAUD or PCTIDLE.

**Attribute:**

ann[*]typ

**Fullname:**

Priority1 anouncement type

**Attribute Description:**

The announcement type must be for barge-in or nonbarge-in. QU_BARGE or QU_NBARGE. Ann5type is for the flexible first announcement.

**Attribute:**

ann[*]cycl

**Fullname:**

Announcement1 cycles

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
The announcement cycle is for up to 5 announcements. From 1 to 4 cycle per announcement. Ann5cycle is for the flexible first announcement.

**Attribute:**
ann3cycl
**Fullname:**
Anouncement3 cycles
**Attribute Description:**
The announcement cycle is for up to 5 announcements. From 1 to 4 cycles per announcement. Ann5cycle is for the flexible first announcement.

**Attribute:**
ann4cycl
**Fullname:**
Announcement4 cycles
**Attribute Description:**
The anouncement cycle is for up to 5 announcements. From 1 to 4 cycles per announcement. Ann5cycle is for the flexible first announcement.

**Attribute:**
ann5cycl
**Fullname:**

Annoucement5 cycles
**Attribute Description:**
The announcement cycle is for up to 5 announcements. From 1 to 4 cycles per announcements. Ann5cycle is for the flexible first announcement.

**Attribute:**
ann[*]port
**Fullname:**
Announcement1 port
**Attribute Description:**
The announcement port attribute is divided into subattributes ann1port.member and ann1port.module. Member is the port name of a trunk that should be assigned as an announcement trunk in relation RLfc_trunk. Module refers to the switching module in which this trunk is located. Ann5port is for the flexible first aanouncement.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ann[*]port.member
**Fullname:**
Port name of a port
**Attribute Description:**
The port name of a port. Range of values is from 1 to 65535.

**Attribute:**
ann[*]port.module
**Fullname:**
SM number this port terminates on
**Attribute Description:**
The SM number that this port terminates on. Range of values 1 - 192.

**Attribute:**
flex_first
**Fullname:**
Flexible first - threshold value
**Attribute Description:**
Flexible first - threshold value (in six-second interval) for the alternate first announcement.

**Attribute:**
sp_time
**Fullname:**
Service protection time limit
**Attribute Description:**
Service protection time - decimal number indicating service protection delay in seconds.

**Attribute:**
numann_p
**Fullname:**
Number of priority announcements
**Attribute Description:**
Number of priority announcements allowed.

**Attribute:**
pann[*]type
**Fullname:**
Priority1 anouncement type
**Attribute Description:**
The announcement type must be for barge-in or nonbarge-in. QU_BARGE or QU_NBARGE. Ann5type is for the flexible first

**Copyright © 1999 Lucent Technologies** 

announcement.

**Attribute:**
pann[*]cycl
**Fullname:**
Announcement1 cycles
**Attribute Description:**
The announcement cycle is for up to 5 announcements. From 1 to 4 cycle per announcement. Ann5cycle is for the flexible first announcement.

**Attribute:**
pann[*]port
**Fullname:**
Announcement1 port
**Attribute Description:**
The announcement port attribute is divided into subattributes ann1port.member and ann1port.module. Member is the port name of a trunk that should be assigned as an announcement trunk in relation RLfc_trunk. Module refers to the switching module in which this trunk is located. Ann5port is for the flexible first aanouncement.

**Attribute:**
pann[*]port.member
**Fullname:**
Port name of a port
**Attribute Description:**
The port name of a port. Range of values is from 1 to 65535.

**Attribute:**
pann[*]port.module
**Fullname:**
SM number this port terminates on
**Attribute Description:**
The SM number that this port terminates on. Range of values 1 - 192.

**Attribute:**
rgbk_typ
**Fullname:**
Distintive riging pattern for ringback
**Attribute Description:**
Distinctive ringback ring.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
rgbk_intrvl
**Fullname:**
Time limit for ringback
**Attribute Description:**
Time limit for ringback.

**Attribute:**
retry_time
**Fullname:**
Retry timeout limit
**Attribute Description:**
Retry time limit for ringback.

**Attribute:**
pq_timeout
**Fullname:**
Priority queue timeout limit
**Attribute Description:**
Priority queue timeout limit in seconds.

**Attribute:**
rq_timeout
**Fullname:**
Routine queue timeout limit
**Attribute Description:**
Routine queue timeout limit in seconds.

**Attribute:**
post_q_treat
**Fullname:**
Queue timeout/overflow post routing
**Attribute Description:**
Queue timeout treatment (reorder or alternate route for ARS-D).

# QVDSTDN

## 1. Description

This relation contains the Queuing and Vectoring call vector destination number.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 2048 |
| expected number of tuples | 100 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| ks key store | AUTO |

## 3. Field Layout

## 4. Population Rules for RLqvdstdn

**Relation Description**
Queuing and vectoring destination number to directory number (DN) mapping table.

This relation defines where a call will be routed when a given destination number is specified in a call vectoring route step.

**Attribute: destnmbr**

**Fullname:** Destination number

**Attribute Description** Destination numbers are used in call vectoring route steps (RLqvvector) to send calls to other destinations. An entered destination number must be decremented by one in order to form the key for the corresponding tuple of the RLqvdstdn relation.

**Attribute: dn**

**Fullname:** directory number

**Attribute Description** This attribute contains a structure for a directory number of up to 15 digits and a count of the number of digits that are valid.

**Attribute: dn.dn0**

**Fullname:** digit number 0

**Attribute Description** This sub-attribute contains the 1st digit of the directory number.

**Attribute: dn.dn1**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** digit number 1

**Attribute Description** This sub-attribute contains the 2nd digit of the directory number.

**Attribute: dn.dn2**

**Fullname:** digit number 2

**Attribute Description** This sub-attribute contains the 3rd digit of the directory number.

**Attribute: dn.dn3**

**Fullname:** digit number 3

**Attribute Description** This sub-attribute contains the 4th digit of the directory number.

**Attribute: dn.dn4**

**Fullname:** digit number 4

**Attribute Description** This sub-attribute contains the 5th digit of the directory number.

**Attribute: dn.dn5**

**Fullname:** digit number 5

**Attribute Description** This sub-attribute contains the 6th digit of the directory number.

**Attribute: dn.dn6**

**Fullname:** digit number 6

**Attribute Description** This sub-attribute contains the 7th digit of the directory number.

**Attribute: dn.dn7**

**Fullname:** digit number 7

**Attribute Description** This sub-attribute contains the 8th digit of the directory number.

**Attribute: dn.dn8**

**Fullname:** digit number 8

**Attribute Description** This sub-attribute contains the 9th digit of the directory number.

**Attribute: dn.dn9**

**Fullname:** digit number 9

**Attribute Description** This sub-attribute contains the 10th digit of the directory number.

**Attribute: dn.dn10**

**Fullname:** digit number 10

**Attribute Description** This sub-attribute contains the 11th digit of the directory number.

**Copyright © 1999 Lucent Technologies** 

**Attribute: dn.dn11**

**Fullname:** digit number 11

**Attribute Description** This sub-attribute contains the 12th digit of the directory number.

**Attribute: dn.dn12**

**Fullname:** digit number 12

**Attribute Description** This sub-attribute contains the 13th digit of the directory number.

**Attribute: dn.dn13**

**Fullname:** digit number 13

**Attribute Description** This sub-attribute contains the 14th digit of the directory number.

**Attribute: dn.dn14**

**Fullname:** digit number 14

**Attribute Description** This sub-attribute contains the 15th digit of the directory number.

**Attribute: dn.digcnt**

**Fullname:** digit count

**Attribute Description** This attribute contains a count of the number of valid digits to use from the dn.dn structure.

**Copyright © 1999 Lucent Technologies** 

# QVVECTOR

## 1. Description

This relation contains the queuing and Vectoring Call Vector.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 2048 |
| expected number of tuples | 200 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population rules for RLqvvector

### Relation Description

Queuing and Vectoring Call Vector definitions

Each tuple of this relation contains 15 steps defining how a call is to be treated while waiting for an ACD/BRCS agent. As such it forms a sort of program defined in a 'language' specialized for call handling. This 'language' contains such functions as queuing a call, playing announcements, connection to a music source for a specified period and conditional or unconditional branching, to name just a few. Conditional and unconditional GOTOs branching between tuples of RLqvvector can be used to produce larger programs.

When a step's cmdcode subattribute is FINOOP, there are no constraints on the other subattributes. This provides a way to temporarily disable a vector step without having to reenter the parameters when the step is later reenabled.

**Attribute:**

vectnmbr

**Fullname:**
vector number
**Attribute Description:**
A vector number can be referenced by conditional and unconditional GOTO steps within any of the 2048 vector tuples allowed. Vectors are numbered from 1 to 2048. Thus the key value is actually the vector number minus 1 (0 to 2047).

**Attribute:**
vredirect
**Fullname:**
Vector to which calls are to be redirected
**Attribute Description:**
When the 'redirect' attribute is set to DBYES, the 'vredirect' attribute specifies the vector to which calls should be redirected (the value is the vector number minus 1). Note that this redirection is NOT recursive. The 'redirect' attribute in the vector to which calls are redirected are ignored. Moreover, the redirection attributes are NOT examined when vector processing branches to another vector using a conditional or unconditional GOTO step.

**Attribute:**
active
**Fullname:**
Vector Activated
**Attribute Description:**
This attributes allows a vector to be deactivated.
While this attribute is DBNO, all calls to an ACD DN that are assigned this vector will instead receive standard treatment (calls are placed into a queue according to call type determined, receives one of three announcements depending on the expected delay, and then hears audible ring until an agent answers). This allows the vector to be 'quarantined' while being edited.

**Attribute:**
redirect
**Fullname:**
Redirection of vector assignment enabling attribute
**Attribute Description:**
This attribute allows the redirection to another vector. If set to DBYES, new calls that ordinarily would have begun vector processing on this vector will instead be redirected to the vector specified in the 'vredirect' attribute.

**Attribute:**
step1
**Fullname:**
Step 1 of vector 'program'
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute defines the first step in this 15-step vector.

**Attribute:**
step1.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**
This subattribute defines the function to be performed by this vector step (such as GOTO, NOOP, RING, ...).

**Attribute:**
step1.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
This subattribute records 1 of two arguments needed by the various vector step command codes (cmdcode). Its permissible range of values and its meaning is determined by the contents of the cmdcode subattribute.

**Attribute:**
step1.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
This subattribute records 1 of two arguments needed by the various vector step command codes (cmdcode). Its permissible range of values and its meaning is determined by the contents of the cmdcode subattribute.

**Attribute:**
step1.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Certain vector commands are subject to failure due to a number of reasons (For example, MUSIC can fail to route to a music source port because it is already connected to the maximum number of calls it can support). When such failures occur, vector processing can be diverted to an error treatment by specifying the first vector step of the error treatment in this subattribute.

**Attribute:**
step1.carg1
**Fullname:**
Conditional GOTO argument 1
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This subattribute records 1 of two arguments needed by the various conditional GOTO commands that can be placed in the cmdcode attribute. Its permissible range of values and its meaning is determined by which conditional GOTO command is in the cmdcode subattribute.

**Attribute:**
step1.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
This subattribute records 1 of two arguments needed by the various conditional GOTO commands that can be placed in the cmdcode attribute. Its permissible range of values and its meaning is determined by which conditional GOTO command is in the cmdcode subattribute.

This subattribute is also used with the PROMPT, ANNOUNC, and DISC commands when the route index (step1.arg1) is associated with an immediate start announcement trunk group. This argument will contain an announcement index for the immediate start announcement (17A announcement machine).

**Attribute:**
step1.cond
**Fullname:**
Conditional test
**Attribute Description:**
This subattribute is used to specify the condition of a conditional GOTO step. For example, if this subattribute contains a value of FI_LE, the branch will occur if the parameter being tested (such as number of calls in a queue) is less than or equal to the threshold specified in carg1 and/or carg2.

**Attribute:**
step2
**Fullname:**
Step 2 of vector 'program'
**Attribute Description:**
This attribute defines the second vector step

**Attribute:**
step2.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**
Usage is same as for step1.cmdcode subattribute

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
step2.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
Usage is same as for step1.arg2 subattribute

**Attribute:**
step2.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step2.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Usage is same as for step1.errstp subattribute

**Attribute:**
step2.carg1
**Fullname:**
Conditional GOTO argument 1
**Attribute Description:**
Usage is same as for step1.carg1 subattribute

**Attribute:**
step2.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

**Attribute:**
step2.cond
**Fullname:**
Conditional test
**Attribute Description:**
Usage is same as for step1.cond subattribute

**Attribute:**
step3
**Fullname:**
Step 3 of vector 'program'

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
This attribute defines the third vector step

**Attribute:**
step3.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**
Usage is same as for step1.cmdcode subattribute

**Attribute:**
step3.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
Usage is same as for step1.arg2 subattribute

**Attribute:**
step3.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step3.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Usage is same as for step1.errstp subattribute

**Attribute:**
step3.carg1
**Fullname:**
Conditional GOTO argument 1
**Attribute Description:**
Usage is same as for step1.carg1 subattribute

**Attribute:**
step3.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

**Attribute:**

Copyright © 1999 Lucent Technologies 

step3.cond

**Fullname:**

Conditional test

**Attribute Description:**

Usage is same as for step1.cond subattribute

**Attribute:**

step4

**Fullname:**

Step 4 of vector 'program'

**Attribute Description:**

This attribute defines the fourth vector step

**Attribute:**

step4.cmdcode

**Fullname:**

command code of vector step

**Attribute Description:**

Usage is same as for step1.cmdcode subattribute

**Attribute:**

step4.arg2

**Fullname:**

vector step's second command argument

**Attribute Description:**

Usage is same as for step1.arg2 subattribute

**Attribute:**

step4.arg1

**Fullname:**

vector step's first command argument

**Attribute Description:**

Usage is same as for step1.arg1 subattribute

**Attribute:**

step4.errstp

**Fullname:**

Error Treatment Step number

**Attribute Description:**

Usage is same as for step1.errstp subattribute

**Attribute:**

step4.carg1

**Fullname:**

Conditional GOTO argument 1

**Attribute Description:**

Usage is same as for step1.carg1 subattribute

Copyright © 1999 Lucent Technologies 

**Attribute:**
step4.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

**Attribute:**
step4.cond
**Fullname:**
Conditional test
**Attribute Description:**
Usage is same as for step1.cond subattribute

**Attribute:**
step5
**Fullname:**
Step 5 of vector 'program'
**Attribute Description:**
This attribute defines the fifth vector step

**Attribute:**
step5.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**
Usage is same as for step1.cmdcode subattribute

**Attribute:**
step5.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
Usage is same as for step1.arg2 subattribute

**Attribute:**
step5.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step5.errstp
**Fullname:**

Copyright © 1999 Lucent Technologies 

Error Treatment Step number

**Attribute Description:**

Usage is same as for step1.errstp subattribute

**Attribute:**

step5.carg1

**Fullname:**

Conditional GOTO argument 1

**Attribute Description:**

Usage is same as for step1.carg1 subattribute

**Attribute:**

step5.carg2

**Fullname:**

Conditional GOTO argument 2

**Attribute Description:**

Usage is same as for step1.carg2 subattribute

**Attribute:**

step5.cond

**Fullname:**

Conditional test

**Attribute Description:**

Usage is same as for step1.cond subattribute

**Attribute:**

step6

**Fullname:**

Step 6 of vector 'program'

**Attribute Description:**

This attribute defines the sixth vector step

**Attribute:**

step6.cmdcode

**Fullname:**

command code of vector step

**Attribute Description:**

Usage is same as for step1.cmdcode subattribute

**Attribute:**

step6.arg2

**Fullname:**

vector step's second command argument

**Attribute Description:**

Usage is same as for step1.arg2 subattribute

Copyright © 1999 Lucent Technologies 

**Attribute:**
step6.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step6.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Usage is same as for step1.errstp subattribute

**Attribute:**
step6.carg1
**Fullname:**
Conditional GOTO argument 1
**Attribute Description:**
Usage is same as for step1.carg1 subattribute

**Attribute:**
step6.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

**Attribute:**
step6.cond
**Fullname:**
Conditional test
**Attribute Description:**
Usage is same as for step1.cond subattribute

**Attribute:**
step7
**Fullname:**
Step 7 of vector 'program'
**Attribute Description:**
This attribute defines the seventh vector step

**Attribute:**
step7.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Usage is same as for step1.cmdcode subattribute

**Attribute:**
step7.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
Usage is same as for step1.arg2 subattribute

**Attribute:**
step7.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step7.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Usage is same as for step1.errstp subattribute

**Attribute:**
step7.carg1
**Fullname:**
Conditional GOTO argument 1
**Attribute Description:**
Usage is same as for step1.carg1 subattribute

**Attribute:**
step7.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

**Attribute:**
step7.cond
**Fullname:**
Conditional test
**Attribute Description:**
Usage is same as for step1.cond subattribute

**Attribute:**
step8

Copyright © 1999 Lucent Technologies 

**Fullname:**
Step 8 of vector 'program'
**Attribute Description:**
This attribute defines the eighth vector step

**Attribute:**
step8.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**
Usage is same as for step1.cmdcode subattribute

**Attribute:**
step8.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
Usage is same as for step1.arg2 subattribute

**Attribute:**
step8.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step8.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Usage is same as for step1.errstp subattribute

**Attribute:**
step8.carg1
**Fullname:**
Conditional GOTO argument 1
**Attribute Description:**
Usage is same as for step1.carg1 subattribute

**Attribute:**
step8.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

Copyright © 1999 Lucent Technologies 

**Attribute:**
step8.cond
**Fullname:**
Conditional test
**Attribute Description:**
Usage is same as for step1.cond subattribute

**Attribute:**
step9
**Fullname:**
Step 9 of vector 'program'
**Attribute Description:**
This attribute defines the ninth vector step

**Attribute:**
step9.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**
Usage is same as for step1.cmdcode subattribute

**Attribute:**
step9.arg2
**Fullname:**
vector step's second command argument
**Attribute Description:**
Usage is same as for step1.arg2 subattribute

**Attribute:**
step9.arg1
**Fullname:**
vector step's first command argument
**Attribute Description:**
Usage is same as for step1.arg1 subattribute

**Attribute:**
step9.errstp
**Fullname:**
Error Treatment Step number
**Attribute Description:**
Usage is same as for step1.errstp subattribute

**Attribute:**
step9.carg1
**Fullname:**
Conditional GOTO argument 1

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Usage is same as for step1.carg1 subattribute

**Attribute:**
step9.carg2
**Fullname:**
Conditional GOTO argument 2
**Attribute Description:**
Usage is same as for step1.carg2 subattribute

**Attribute:**
step9.cond
**Fullname:**
Conditional test
**Attribute Description:**
Usage is same as for step1.cond subattribute

**Attribute:**
step10
**Fullname:**
Step 10 of vector 'program'
**Attribute Description:**
This attribute defines the tenth vector step

**Attribute:**
step10.cmdcode
**Fullname:**
command code of vector step
**Attribute Description:**

## 2.18 RELATIONS: R

Copyright © 1999 Lucent Technologies

# R_HOLEQ

## 1. Description

RMS-D3 static relation that stores unused rqkeys deleted from RLr_holeq indirectly via RC/V.

Capabilities: *5ESS* ®-2000 toll switch RMS-D3

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 72 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application | RCMAP |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 256 |
| page level | 0 |

## 3. Field Layout

```
R_HOLEQ     relid = 848   DBSTATIC   DBACC_HASH  DBPRAM    LP      RCMAP
     rqkey       DMUNS16      (ushort)  <--- key
  (a) rdummy1     DMUNS1       (ushort: 1)
         User, Compacted and Stored Tuple Layout    R_HOLEQ
    |3|3|2|2|2|2|2|2|2|2|2|1|1|1|1|1|1|1|1|1|0|0|0|0|0|0|0|0|0|0|

    |---------------+---------------+---------------+---------------|
       ( 4 bytes )
```

## 4. Population Rules for RLr_holeq

**Relation Description**
Hole queue.

Whenever an RMS-D3 r_qkeypt relation tuple is deleted a new tuple should be added to this relation using the r_qkeypt tuple key rqkey as its key. When a new RMS-D3 r_qkeypt tuple is to be inserted, the key rqkey will be found in this relation by searching for the first defined tuple and the key to that tuple will be the key to the new RMS-D3 r_qkeypt tuple. The tuple in this relation will be deleted in this case. If there are no tuples in this relation then the r_qkeypt tuple key will be the number found in RLrc_idx.rmsidx.

Whenever an RMS-D3 r_qkeypt relation tuple is deleted a new tuple should be added to this relation using the r_qkeypt tuple key rqkey as its key.

**Attribute: rqkey**

**Fullname:** hole queue

**Attribute Description** Whenever an RMS-D3 r_qkeypt relation tuple is deleted a new tuple should be added to this relation using the r_qkeypt tuple key rqkey as its key.

When a new RMS-D3 r_qkeypt tuple is to be inserted, the key rqkey will be found in this relation by searching for the first defined tuple and the key to that tuple will be the key to the new RMS-D3

Copyright © 1999 Lucent Technologies 

r_qkeypt tuple. The tuple in this relation will be deleted in this case.

**Attribute: rdummy1**

**Fullname:** dummy, not used

**Attribute Description** Dummy attribute, it is not used.

  4 |     module     |**********************************************|
    |---------------+---------------+---------------+---------------|
       ( 8 bytes )
```

## 4. Population Rules for RLr_qkeypt

**Relation Description**
Gport number to random mapping number relation.

This relation maps from a remote measurement system (RMS-D3) gport number to a random number, 0-71, used as a key into the dynamic RMS-D3 relation.
A qkey is required for each RMS-D3 port. The RLr_holeq relations holds any unused rqkeys in a sequence. The RLrc_idx holds the counter attribute, rmsidx, used to get the next rqkey number in the event none exist in RLr_holeq.

**Attribute: module**

**Fullname:** RMS-D3 SM module number

**Attribute Description** This attribute indicates the SM number of the TAT.

Copyright © 1999 Lucent Technologies

**Attribute: port**

**Fullname:** RMS-D3 port (member) number

**Attribute Description** This attribute contains the port number of the TAT.

**Attribute: rqkey**

**Fullname:** Random number

**Attribute Description** This attribute is a random number serving as a mapping from gport. It is a singular value assigned by an office, ODA or RCV.

## 4. Population Rules for RLraf_mbd

**Relation Description**
RAF and SAS memory board data per unit.

Stores the application and memory board micro-codes for an RAF. Stores the application for a SAS.

**Attribute: raf_picb**

**Fullname:** peripheral interface control bus

**Attribute Description** peripheral interface control bus for a DSU2-RAF or SAS

**Attribute: raf_app**

**Fullname:** application for the RAF or SAS memory boards

**Attribute Description** 8 chars of text denoting application of the DSU2-RAF (no default value), currently used BUT NOT RESTRICTED TO:

```
OSPS-DA  -  OSPS Directory Assistance
OSPS-TA  -  OSPS Toll and Assist
OSPS-CTR -  OSPS Coin Tone Receiver
800-DA   -  OSPS 1-800 Directory Assistance
BRCS-RAS -  BRCS Remote Access Service
ISDN-ACS -  BRCS Automatic Customer Station
            Rearrangement
ASP      -  Advanced Services Platform
BRCS-SLE -  BRCS Screen List Editing
```

BRCS-2LV - BRCS 2-Level Activation of Customer Originated Trace and Automatic Callback

Or, for SAS, this attribute will contain the NULL string if no memory flash cards have been defined for the SAS unit. Else it will contain the SAS application type, currently used BUT NOT RESTRICTED TO:

```
  TACCT    -  Toll Digital Exchange (TDX) account codes
```

**Attribute: mbd1_mc**

**Fullname:** micro code for memory board 1

**Attribute Description** 12 chars of text containing the micro-code of the first DSU2-RAF memory board (no default value).
OR
This attribute will always contain the null string for SAS memory boards, since microcodes are not

**Copyright © 1999 Lucent Technologies** 

used for SASs

Only first 8 characters of the microcode are significant. The last four characters are not used by the switch and thus should be defaulted to 0001 by both RC and ODA.

CHARACTER RANGE: 'A-Z', '0-9'

The following layout shows the valid microcodes for each memory board for available RAF applications ( J-drawing J5D003EA-1 ):

| RAF APPLICATION | MEMORY BOARDS | | |
|---|---|---|---|
| | mbd1_mc / LIST# | mbd2_mc / LIST# | mbd3_mc / LIST# |
| OSPS-DA | 5D087A10 L4 | null entry | null entry |
| OSPS-TA | 5D114A40 L10 | 5D172A10 * 5D172A20 * 5D172A30 * L24 | null entry null entry null entry |
| OSPS-CTR | 5D114A10 L10 | null entry | null entry |
| 800-DA | 5D144A10 L11 | null entry | null entry |

|---|---|---|---|

SERVICE DESCRIPTIONS:

The RAF supports three different types of services. The types of services and a short description of each service follows:

(1) ANN Announcement service provides announcements without any tone decoding capability. Tone signals or coin information is ignored by the RAF and SAS. (For RAF and SAS - maximum 32 PC_ANN channels, that is, PIDB timeslots)

(2) DTA Dial Through Announcement service provides announcements while also collecting tone information which may be used to control the announcement being played.
(For RAFs - maximum 20 PCDTA channels, that is, PIDB timeslots)
(For SASs - maximum 32 PCDTA channels, that is, PIDB timeslots)

(3) COIN Dial through announcement with coin detection (CTR) provides announcements while also collecting coin information which may be used to control the announcement being played.
(For RAFs - maximum 20 PCCTR channels, that is, PIDB timeslots)
(For SASs - maximum 32 PCDTA channels, that is, PIDB timeslots)

APPLICATION DEPENDENCIES

Generally, each application that uses the RAF requires specific services to be available on the RAF. The current applications that are available and the services that they require are listed here:

(1) OSPS-DA OSPS Directory Assistance requires ANN services.

(2) OSPS-TA OSPS Toll and Assistance requires DTA services.
*Memory board 5D172A10[L24] is an optional board containing additional OSPS-TA announcement phrases for 5E7SU and 5E8. For 5E8SU and later software releases Memory board 5D172A20[L24] is the optional board containing additional OSPS-TA announcement phrases. This optional board must appear as the second board, with 5D114A40[L10] as the first board. For 5E9 and later software releases Memory board 5D172A30[L24] is the optional board containing additional OSPS-TA announcement phrases. This optional board must appear as the second board, with 5D114A40[L10] as the first board.
**When used with memory board 5D155A10[L15], the two may be equipped in any order in the second and third positions.

(3) OSPS-CTR OSPS Coin Tone Receiver requires COIN services.

(4) 800-DA 800 Service Directory Assistance requires ANN services.

(5) BRCS-RAS Remote Access to Call Forwarding requires DTA services.

(6) ISDN-ACS ISDN Automatic Customer Station Rearrangement requires DTA services. It also contains announcements for BRCS-RAS.

(7) ASP Advanced Services Platform requires DTA services.

(8) BRCS-SLE LASS Screen List Editing requires DTA services. It also contains announcements for BRCS-RAS and the ISDN-ACS using the first 5E7 microcodes[L12,L23] set and BRCS-RAS, ISDN-ACS and BRCS-2LV using the second 5E7 microcodes set

**Attribute: mbd2_mc**

**Fullname:** micro code for memory board 2

**Attribute Description** same format as mbd1_mc for second memory board except value defaults to NULL string if board is not equipped or this is a SAS memory board.
See the layout under 'attribute mbd1_mc usage' section for possible microcodes for this attribute and their corresponding list numbers.

**Attribute: mbd3_mc**

**Fullname:** micro code for memory board 3

**Attribute Description** same format as mbd1_mc for third memory board except value defaults to NULL string if board is not equipped OR this is a SAS memory board.
See the layout under 'attribute mbd1_mc usage' section for possible microcodes for this attribute and their corresponding list numbers.

## 4. Population Rules for RLras_idp

**Relation Description**
Remote Access Service (RAS) Announcement Route Index (RI) to Individual Dialing Plan (IDP) relational Information.

This relation is used to store the information about the IDP that corresponds to a particular announcement RI used by RAS

Copyright © 1999 Lucent Technologies 

**Attribute: annc_ri**

**Fullname:** RAS Announcement Route Index

**Attribute Description** This is the announcement route index which RTA uses to route a Remote Access Directory Number (RADN) to a DSU2-RAF-DTA. Note that RCV cannot determine if this is a valid route index for RAS but only that it is a valid announcement index :

**Attribute: annc_idp**

**Fullname:** Announcement Route Index Individualized Dialing Plan

**Attribute Description** This attribute maps a DSU2-RAF-DTA RI to a particular IDP. A value of 0 indicates there is no idp group.

**Attribute: idp_rstr**

**Fullname:** Individualized Dialing Plan Restriction

**Attribute Description** This attribute indicates whether or not an originating port must be in the IDP group as specified by annc_idp. It can take both DBYES and DBNO values

```
DBYES       /* Must be in the same IDP */
DBNO        /* Can be in a different IDP */
```

**Attribute: digtree**

**Fullname:** Digit Analysis Digit Tree Selector

**Attribute Description** This attribute is used to store the digit analysis table identifier which is used in call processing to tell what table to start in for analyzing the numbers dialed

```

## 4. Population Rules for RLrateperd

**Relation Description**
Rate period.

This relation defines one of 4 rate periods for billing purposes. The rate period is found based on the hour of the day and the day of the week.

There should be 24 (hours) X 8 (days) = 192 tuples in this relation for each ISDN Packet Switching SM.

Copyright © 1999 Lucent Technologies

Table of initialized values (based on the current 1PSS setup):

| Hour of day | Day of week | Rate period |
|---|---|---|
| 00:00 - 07:59 | MONDAY - HOLIDAY | 1 |
| 08:00 - 16:59 | MONDAY - HOLIDAY | 2 |
| 17:00 - 22:59 | MONDAY - HOLIDAY | 3 |
| 23:00 - 23:59 | MONDAY - HOLIDAY | 4 |

**Attribute: hrofday**

**Fullname:** Hour of day

**Attribute Description** Hour of the day (key1), ranges from 0 to 23:

```
0 :    0:00 to 0:59
1 :    1:00 to 1:59
  etc.
23 :   23:00 to 23:59
```

For efficient memory use, it should be assigned sequentially.

**Attribute: dayofwk**

**Fullname:** Day of week

**Attribute Description** Day of the week (key2), enum values are:

```
MONDAY, TUESDAY,  WEDNESDAY,  THURSDAY,
FRIDAY, SATURDAY, SUNDAY, and HOLIDAY.
```

**Attribute: rateprd**

**Fullname:** Rate period

**Attribute Description** The rate period in which to bill the customer.

**Copyright © 1999 Lucent Technologies** 

# RBP_SC

## 1. Description

Relation that maps logical point number to an office assigned name, normal state, alarm level, and port for Multimodule RSM alarm input and output option scan and distribute points terminating on the MMSU. This relation is used by the Remote Alarm Process (HMrmap). The information pertaining to the alarm input option is displayed on the MCC and contained in craft output messages. Information pertaining to the alarm output option is not displayed.

Client Process: HMrmap

## 2. Data Dictionary Values

## 4. Population Rules for RLrbp_sc

**Relation Description**
remote alarm scan point assignments.

This relation maps logical point number to an office assigned name, normal state, alarm level, and port for Multimodule RSM alarm input and output option scan and distribute points terminating on the MMSU. This relation should only be populated for the Master RSM at an RSM site or the Master ORM/TRM in a colocated cluster.

This relation will also be populated in the single SM of VCDX and WNC (Wireless Centrex) offices.

This relation is used by the Remote Alarm Process (HMrmap). The information pertaining to the alarm input option is displayed on the MCC and contained in craft output messages. Information pertaining to the alarm output option is not displayed. Client Process: HMrmap

**Attribute: ptnum**

**Fullname:** logical point number as known by HMrmap

**Attribute Description** These logical point numbers should also be in the relation RLfc_porttyp under attribute sleevld.circuit with a servclass of HM_REM_ALM when the port attribute is specified in this relation. Range is 0-113, whereby 55-99 are not used. Tuples with ptnum values 0, 1, 32-54 are required scan points. Tuples with ptnum values 100-113 are required distribute points. These tuples are initialized according to TABLE-1 & 2 (in Attention ODA & RC Section). Tuples with ptnum values 2-31 are office assignable scan points.

**Attribute: inuse**

**Fullname:** indicates if point is in use or not

**Attribute Description** DBYES means the alarm is operational, which requires that the port attribute be specified. DBNO means that no alarms will be reported. Initialize according to TABLE-1 & 2 (in Attention ODA & RC Section)

**Attribute: mccname**

**Fullname:** office assigned label to be displayed on the MCC for the name of the point

**Attribute Description** Office assignable label of 9 ASCII characters to be displayed on the MCC for the name of the point. If less than 9 characters are supplied the remaining characters should be null. Initialize according to TABLE-1 & 2 (in Attention ODA & RC Section). Default is blank.

**Attribute: ttyname**

**Fullname:** office assigned label that appears in craft output messages concerning the alarm scan

**Copyright © 1999 Lucent Technologies** 

point

**Attribute Description** Office assignable label of 20 ASCII characters to be included in craft output messages concerning this alarm scan point. If less than 20 characters are supplied the remaining characters in the field should be null. The domain is 21 characters long, the 21st character position must be null. Initialize according to TABLE-1 (in Attention ODA & RC Section). Default is blank.

**Attribute: normst**

**Fullname:** indicates the normal state of alarm scan point

**Attribute Description** Normal state of point is either DBOPEN or DBCLOSED. The alarm state is the opposite of normal. This is determined by the type of sensor attached to the scan point in the office. Initialize according to TABLE-1 & 2 (in Attention ODA & RC Section)

**Attribute: alm_lvl**

**Fullname:** alarm level (CR, MJ, MN, ACT, INFO) generated when this point goes off normal

**Attribute Description** Alarm level sounded when scan point goes off-normal. This is office assigned based on the relative importance of the device being monitored. Initialize as shown in TABLE-1 & 2 (in Attention ODA & RC Section)

**Attribute: port**

**Fullname:** local port name

**Attribute Description** Hexadecimal local port name for the point. Since there are two ports (duplex, mirror image) associated with each point, one for service group 0 and the other for service group 1, only the local port name for service group 0 appears in this attribute. Note for ports associated with a CSU MMSU (rc_eqloc.com_shelf == DBYES), only one service group exists (service group 0). Therefore, duplex ports will not exist for CSU MMSU ports and only the service group 0 ports can be specified. If prot_rc is 1 or 2 these are voltage sensing MMSU scan points. If prot_rc is 3 these are MMSU distribute points. If prot_rc is 0 these maybe either voltage or current sensing MMSU scan points. When ever this attribute is modified, then the corres- ding new and old port information in the relation RLfc_porttyp must be updated such that the old port servclass is changed to RC_UNASSIG and the new port servclass is changed from RC_UNASSIG to HM_REM_ALM. But if the old port is 0, then the old port does not exit in relation RLfc_porttyp. Follow the population in RLfc_porttyp. Initialize according to TABLE-1 & 2 (in Attention ODA & RC Section)

**Attribute: prot_rc**

**Fullname:** protect tuple by limiting recent change activity to certain attributes only

**Attribute Description** When prot_rc is 0, the entire tuple can be deleted or updated. When prot_rc is 1, only attributes normst, and port can be updated. When prot_rc is 2, only attributes inuse, normst, alm_lvl, and port can be updated by recent change. When prot_rc is 3, only attribute port can be updated by recent change. All other attributes are not recent changeable except as stated. This attribute is not to be entered from any recent change view. This attribute is set to zero for tuples where ptnum is 2-31. There is no default value. Initialize as shown in TABLE-1 and TABLE-2 (in Attention ODA & RC Section)

## 4. Population Rules for RLrc_admgp

**Relation Description**
Recent Change Administration Groups.

This relation is used by Recent Change to perform validity checking on the other 3 conversion relations.

**Attribute: gsm**

**Fullname:** Global SM Number

**Attribute Description** This attribute specifies either a standardization sector (SS7) or CCSNA7 SCCP Global SM number.

**Attribute: adm_grp**

**Fullname:** SCCP Conversion Administration Group

**Attribute Description** This attribute represents a group of Destination Point Codes which will be converted in the same manner.

Copyright © 1999 Lucent Technologies

**Attribute: num_mbr**

**Fullname:** Number of Members of an Administration Group

**Attribute Description** This attribute specifies a count of the number of members for this administration group.

**Attribute: grp_type**

**Fullname:** Administration Group Signaling Type

**Attribute Description** This attribute specifies the signaling type of all the point codes that are members of this administration group.

## 4. Population Rules for RLrc_alpho

**Relation Description**
Recent Change Analog Lport Holes.

ISDN relation that stores the logical port holes for LPT_TYPE=LPT_OTHER. The LPT_ISDN holes are kept in RLrc_lphol. Two separate relations are used to lessen RC concurrency problems.

Recent Change administers four separate LPT_OTHER lport link list for each SM. Reference population rules for RLrc_qidx for a strategic overview of how four linked list are maintained. RC adds a member to a link list when it is no longer needed. When an lport is required to be assigned to an analog line port or BRCS trunk on a SM, RC uses the members from the link list. If the link list is empty then the next index is taken from RLrc_qidx.

NOTE - only member tuples are kept in this relation. The starting point for a link list is located in the RLrc_qidx relation (RLrc_qidx.succ attribute)

For new offices, ODA will sequentially assign LPT_OTHER lports starting with 1 for each SM and populate RLrc_qidx with the next lport to use for each SM.

Empty queue: Read module x, qtyp=LPT_OTHER, and qid=y in RLrc_qidx. If RLrc_qidx.succ is zero, then queue y is empty.

Copyright © 1999 Lucent Technologies 

Members on list: Read module x, qtyp=LPORT, and qid y in RLrc_qidx. The RLrc_qidx.succ attribute points to the first member on the link list in RLrc_alpho. Read tuple in RLrc_alpho with mod=x and lport=RCrc_qidx.succ to obtain the first member. The first member has succ = 0 if it is the only member, otherwise it points to the next member in the link list. A succ attribute of 0 indicates the end of the link list. The attribute index in the relation RLrc_qidx defines the next available lport index value if all four queues are empty.

For existing offices, ODA will preserve all logical port assignments and holes across all offline ODA processes.

**Attribute: module**

**Fullname:** Switching Module

**Attribute Description** Module for which this lport hole list is being kept. Each module has a separate lport hole list

**Attribute: alport**

**Fullname:** analog logical port

**Attribute Description** Sequentially assigned number used to cause a dense packing of port keyed ISDN BRC relations. Key value is the head cell of the link list for each SM.

**Attribute: succ**

**Fullname:** Successor lport

**Attribute Description** Key pointer to next member of the link list or 0 to indicate no or last member on the list

## 4. Population Rules for RLrc_athct

**Relation Description**
Authorization code count.

rc_athct Count of authorization codes for rc only.

This relation contains the count of the number of authorization codes defined for each authorization code group defined in the office. This relation is used by recent change only. Tuple 0 is the global office count and is the sum of the counts for the other tuples. It does not correspond to a real auth code group.

This relation keeps track of the number of authorization codes defined for a particular authorization code group.

Copyright © 1999 Lucent Technologies

The relation is keyed by the group id. The tuple for group ID 0 never represents a real authorization code group, so this tuple is used to save the office-wide authorization code count (that is, the sum of the counts for the individual groups).

The sum of rc_athct for all athgpid's cannot exceed the maximum stored in Glathct. In general, this maximum is 100,000. For a few offices (FTS2000), the maximum is allowed to go 250,000. In any case, check the maximum against the global parameter.

**Attribute: athgpid**

**Fullname:** authorization code group identifier

**Attribute Description** If athgpid is 0, the tuple contains a count with the total number of authorization codes defined in the office. If athgpid is greater than 0, it represents a real authorization code group. The group should have a tuple in RLfacname and RLfid2name to translate the group ID back to the group name used on the ODA and RC screens.

**Attribute: athdef**

**Fullname:** authorization codes defined

**Attribute Description** Number of authorization codes defined for this group. The office total is defined in Glathct and can be up to 250,000.

**Copyright © 1999 Lucent Technologies** 

# RC_CDRMK

## 1. Description

Remarks for RC carrier ID.

This is a virtual update relation. The root storage relation is RLcdrmk_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RC_CDRMK

## 4. Population Rules for RLrc_cdrmk

**Relation Description**
Recent change (RC) carrier destination remarks.

RC relation to store switch personnel remarks for all destination indices used for feature group B and feature group D carriers.

**Attribute: dest_x**

**Fullname:** Destination index.

**Attribute Description** Consists of the 0ZZ/1NX destination indices. These indices are the destination indices assigned in RLdaprmfnl, RLda_conflict, and RLdaprlfnl when the attribute type_ci_call, assumes the values FCAVT or FCINC. The destination index can not be zero.

**Attribute: carrid**

**Fullname:** Feature Group Carrier identifier.

**Attribute Description** The carrier identifier can be a four-digit character string. Each character can assume the values '0' through '9'.

**Attribute: featgrp**

**Fullname:** Feature Group Carrier Type

**Attribute Description** Identifies carrier identifier as feature group B (FGB) or feature group D (FGD). Set the attribute to either FGB_CARR or FGD_CARR.

**Attribute: rmk**

**Fullname:** Remarks.

**Attribute Description** Remarks field, used by the switch personnel. It is originally populated with a null string - where NULL is defined by \0.

## 4. Population rules for RLrc_cfgbm

**Relation Description**

Bit map to keep track of button features in configuration group
There is a tuple in this relation for each configuration group and

its component. A tuple is composed of a key (configuration group and component) and 8 bitmap fields.

A terminal component may have up to 254 buttons. The buttons are grouped into 6 ranges of 32 ( 32 to 63, 64 to 95 , ... , 192 to 223 ) and two incomplete ranges ( 1 to 31 and 224 to 254 ).
These 8 ranges are represented by 8 bitmap fields fword# (here, # varies from 0 to 7),
so that a bit within a bitmap field has a corresponding unique button on the terminal component. If the button is assigned a BRCS feature, then the bit is set to 1. Otherwise, it is set to 0.
If the bit is set to 1, then there must exist a tuple in RLbnfeat keyed by the RLrc_cfgbm.cpe_comp, RLrc_cfgbm.config, and the button number. Otherwise, if it is set to 0, such a tuple should not exist in RLbnfeat. The bitmap fields fword0 and fword7 represent 31 buttons each. The field fword0 has its low order bit (rightmost bit) always set to 0, since the button number 0 does not exist. The field7 has its high order bit always set to 0, since a terminal component may have 254 buttons at the most.

The rest of the bitmap fields (fword1, fword2, fword3, fword4, fword5, and fword6) represent 32 buttons each.

**Attribute:**
cpe_comp
**Fullname:**
Customer premises equipment component
**Attribute Description:**
Customer Premises Equipment component is derived from the Q.931 ISDN message. There it is referred to as module. There may be up to 8 components per DSL (Digital Subscriber Line). Each of them has 254 buttons.

**Attribute:**
config
**Fullname:**
ISDN configuration identifier
**Attribute Description:**
If a configuration identifier exists in RLrc_cfgbm, then it must exist in RLfid2name and RLfacname. The inverse is also true.
If a configuration identifier exists either in RLis_term or RLbnfeat, then it must exist in RLrc_cfgbm. Inverse is not necessarily true since a configuration group must first be defined in RLrc_cfgbm before it may be inserted into either RLis_term or RLbnfeat.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

std_dsl

**Fullname:**

Standard DSL Configuration Group Indicator

**Attribute Description:**

This field indicates whether this configuration group
is populated for the standard DSL (which adhere to the
Bellcore ISDN protocol standards.
DBYES - This configuration is only allowed to be assigned
to the Bellcore standard DSL.
DBNO - This configuration is only allowed to be assigned
to the Custom Lucent Technologies(TM) DSL.

**Attribute:**

fword0

**Fullname:**

First fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent
the CPE component buttons 1 thru 31.
The low order bit is always set to 0.

**Attribute:**

fword1

**Fullname:**

Second fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent
the CPE component buttons 32 thru 63.

**Attribute:**

fword2

**Fullname:**

Third fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent
the CPE component buttons 64 thru 95.

**Attribute:**

fword3

**Fullname:**

Fourth fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent
the CPE component buttons 96 thru 127.

**Attribute:**

fword4

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Fifth fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent the CPE component buttons 128 thru 159.

**Attribute:**

fword5

**Fullname:**

Sixth fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent the CPE component buttons 160 thru 191.

**Attribute:**

fword6

**Fullname:**

Seventh fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent the CPE component buttons 192 thru 223.

**Attribute:**

fword7

**Fullname:**

Eighth fullword bitmap field

**Attribute Description:**

Field of type long unsigned. The bits represent the CPE component buttons 224 thru 254. The high order bit is always set to 0.

## 4. Population Rules for RLrc_cgidx

**Relation Description**
Charge index remarks.

This relation associates a remark, which contains up to 16 characters, with a charge index.
There is a tuple in this relation for every charge index in RLchrgidxexp (that is, RLchrgidxexp.charge_x ).

**Attribute: charge_x**

**Fullname:** Charge Index

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the charge index to which the remark (that is, RLrc_cgidx.rem ) relates.

**Attribute: rem**

**Fullname:** Remark

**Attribute Description** The remark for the charge index is stored as an array of up to 16 ASCII characters. If no remark was specified for the charge index then the array is set to NULL ('\0').

## 4. Population Rules for RLrc_cirmk

### Relation Description

Copyright © 1999 Lucent Technologies

Store remarks for RLfc_carr and RLfc_fgbcarr.

Stores remarks for feature group B (FGB) and feature group D (FGD) carriers. Provides a measurement collection option.

**Attribute: carrid**

**Fullname:** Feature Group Carrier id

**Attribute Description** Indicates the carrier identifier. It must be entered as a 4 digit character string where each of the digits can be '0' through '9'. The carr_id value must be an existing one in the RLfc_carr or RLfc_fgbcarr relation.

**Attribute: featgrp**

**Fullname:** Feature Group Carrier Type

**Attribute Description** Identifies carrier ID as either feature group B (FGB) or feature group D (FGD). Set the attribute to FGB_CARR for FGB and FGD_CARR for FGD.

**Attribute: measure**

**Fullname:** Carrier Measurement collection option.

**Attribute Description** Attribute indicates whether measurements should be done for the carrier. It should be noted that all measurements will be done for a carrier, and only 500 can be measured at a time regardless if a carrier is FGB or FGD.

Note: RC/V and ODA will enforce measurable carriers to be at limit of Gl_mx_carr, which is defined as a constant value of 500. See Gl_cars.p poprules.

**Attribute: rmk**

**Fullname:** Remarks field

**Attribute Description** used by the switch personnel. It is originally populated with a Null string where Null is defined as '\0'.

## 4. Population Rules for RLrc_clei

**Relation Description**
Recent change (RC) CLEI code.

This relation provides the CLEI code values for all trunk type units. It is treated as a remarks relation from the switch viewpoint and serves only to retain the CLEI code values for printing on the office records.

This is a new relation for the CMP in generic 5E6. The CLEI code attributes were removed from the RC_EQLOC relation to save memory because they are only needed for trunk units, not for all units.

**Attribute: im**

**Fullname:** Switching Module number

**Attribute Description** key.

**Attribute: unittype**

**Fullname:** unit type

**Attribute Description** key.

**Attribute: unit_no**

**Fullname:** unit number

# RC_CNINF

## 1. Description

Administrative information for protocol handler channels.

This is a virtual update relation. The root storage relation is RLcninf_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RC_CNINF.

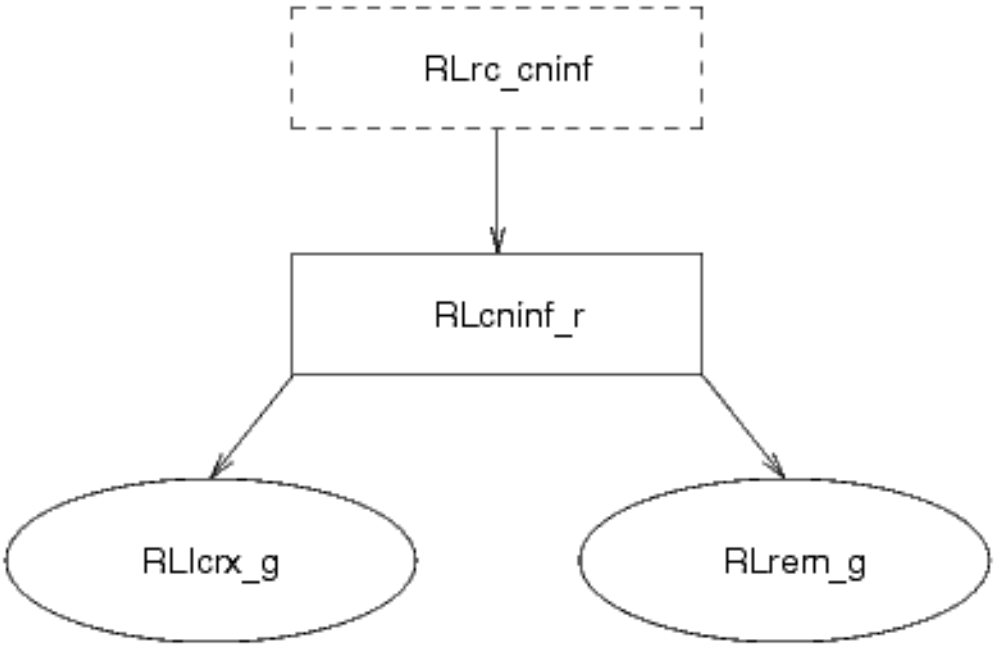

**Figure 1 Virtual Relation RC_CNINF**

## 4. Population Rules for RLrc_cninf

**Relation Description**
Whenever there is a tuple in RLpsx25ln relation,
```
there must be a tuple in RLrc_cninf relation such that
rlRC_CNINF.ph_number = rlPSX25LN.ph_number, and
rlRC_CNINF.ph_cn = rlPSX25LN.ph_cn ,        and
rlRC_CNINF.party = rlPSX25LN.party.
For a given lcc and rax,
there must be a tuple in rc_lcc relation such that
rlRC_CNINF.lcc = rlRC_LCC.lcc, and
rlRC_CNINF.rax = rlRC_LCC.rax.
```
This is a Recent Change only relation.

**Attribute: module**

**Fullname:** module

**Attribute Description** The module where a tuple of the PSX25LN relation resides such that rlRC_CNINF.ph_number = rlPSX25LN.ph_number, and rlRC_CNINF.ph_cn = rlPSX25LN.ph_cn.

**Attribute: ph_number**

**Fullname:** Protocol Handler number

**Attribute Description** Protocol handler (PH) number: 0 - 95.

**Attribute: ph_cn**

**Fullname:** Protocol Handler channel number

**Attribute Description** PH channel number: 0 - 127.

**Attribute: party**

**Fullname:** party

**Attribute Description**
```
party (KEY) - Specific packet user within an ISDN DSL
              D-channel.
'ISDN DSL D-channel packet user' is defined by:
FC_PORTTYP.servclass = FC_ISDN    and
DSLEQUIP.dserv       = PSSX/PSXMP and
SPID.ppd_lport       > 0
```
Permanent packet B-channels are populated with FCP_BCHAN.

**Attribute: lcc**

**Fullname:** Line class code

**Attribute Description** Line class code assigned by an office.

**Attribute: rax**

Copyright © 1999 Lucent Technologies 

**Fullname:** Rate center

**Attribute Description** Rate center for the packet switching assigned by the office.

**Attribute: rem**

**Fullname:** DSLs remarks

**Attribute Description** DSLs remarks if no CKT Switching on DSL.

## 4. Population rules for RLrc_con

**Relation Description**

RECENT CHANGE DA_CONFLCT DATA RELATION
RECENT CHANGE ONLY RELATION: RLrc_con will have to be updated with the table numbers obtained from RLda_conflct. The corresponding LDIT of which this table is a part of, or 0 if this table belongs to an RDIT, will be the entry for the attribute RLrc_con.ldit.
Manual determination of data is a tedious job and has to be done after finding which table is a part of which LDIT/RDIT tree for the existing digit analysis data. New data should be appropriately

Copyright © 1999 Lucent Technologies

populated by RC-ODA.

**Attribute:**
table
**Fullname:**
TABLE
**Attribute Description:**
This attribute corresponds to the attribute RLda_conflct.table:

**Attribute:**
ldit
**Fullname:**
LDIT
**Attribute Description:**
This attribute is the LDIT number in relation RLrc_ldit or 0 if it represents an RDIT and it indicates that the table number is a part of this LDIT or is part of an RDIT when 0.:

## 4. Population Rules for RLrc_ctur

**Relation Description**
Cut-through Time slot to User ratio for ODB ISCN assignment.

This relation is used by Recent Change when selecting an ODB ISCN. RC will read the relation for the cut-through time slot to user information. After looking at all the shelves in the tuple, RC will select the shelf with the highest time slot/user ratio. This way all the users are load balanced across the shelves. After selecting the shelf, RC will use it to search RLrc_odb for a match. If none is found, RC will pick the next highest ratio shelf in RLrc_ctur and search RLrc_odb again. This will continue until a tuple is found in RLrc_odb or there are no more available shelves in RLrc_ctur.

This is a Recent Change relation. ;

end relation;

**Attribute: module**

**Fullname:** SM module number

**Attribute Description** Identifies a specific SM on which the On Demand B-channel service resides.

**Attribute: psu**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** PSU number

**Attribute Description** Packet Switch Unit number. Set to 0.

**Attribute: sh0_odbts**

**Fullname:** Minimum number of time slots reserved for ODB on shelf 0.

**Attribute Description** This attribute is the reserved time slot for ODB on shelf 0 for peripherals coming from the TSIU.

**Attribute: sh0_odbusr**

**Fullname:** ODB users on shelf 0

**Attribute Description** Indicates number of users assigned to ODB on shelf 0.

**Attribute: sh1_odbts**

**Fullname:** Minimum number of time slots reserved for ODB on shelf 1.

**Attribute Description** This attribute is the reserved time slot for ODB on shelf 1 for peripherals coming from the TSIU.

**Attribute: sh1_odbusr**

**Fullname:** ODB users on shelf 1

**Attribute Description** Indicates number of users assigned to ODB on shelf 1.

**Attribute: sh2_odbts**

**Fullname:** Minimum number of time slots reserved for ODB on shelf 2.

**Attribute Description** This attribute is the reserved time slot for ODB on shelf 2 for peripherals coming from the TSIU.

**Attribute: sh2_odbusr**

**Fullname:** ODB users on shelf 2

**Attribute Description** Indicates number of users assigned to ODB on shelf 2.

**Attribute: sh3_odbts**

**Fullname:** Minimum number of time slots reserved for ODB on shelf 3.

**Attribute Description** This attribute is the reserved time slot for ODB on shelf 3 for peripherals coming from the TSIU.

**Attribute: sh3_odbusr**

**Fullname:** ODB users on shelf 3

**Attribute Description** Indicates number of users assigned to ODB on shelf 3.

**Attribute: sh4_odbts**

Copyright © 1999 Lucent Technologies 

**Fullname:** Minimum number of time slots reserved for ODB on shelf 4.

**Attribute Description** This attribute is the reserved time slot for ODB on shelf 4 for peripherals coming from the TSIU.

**Attribute: sh4_odbusr**

**Fullname:** ODB users on shelf 4

**Attribute Description** Indicates number of users assigned to ODB on shelf 4.

## 4. Population rules for RLrc_dgt

**Relation Description**

```
        Recent change (RC) digit data relation
        RC only relation:  RLrc_dgt will be updated with the table
        numbers obtained from RLdaprmdgt.  The corresponding local digit
        interpreter table (LDIT) from RLrc_ldit of which this table is a
        part of, or zero if belonging to a remaining digit interpreter
        table (RDIT) will be the entry for the attribute RLrc_dgt.ldit.
        For existing data, this relation is constructed by
        traversing the digit tree for each LDIT/RDIT beginning with
        the starting table number.  Each time a new table number
```

Copyright © 1999 Lucent Technologies

is encountered during tree traversal, an entry is made in this relation with the LDIT number being traversed as this attribute or zero if belonging to an RDIT.

**Attribute:**
table
**Fullname:**
Table
**Attribute Description:**
This attribute corresponds to the attribute RLdaprmdgt.previous.

**Attribute:**
ldit
**Fullname:**
LDIT
**Attribute Description:**
This attribute corresponds to the attribute RLrc_ldit.ldit or is set to zero when the table belongs to an RDIT.

switching module number

**Attribute Description:**

This attribute contains the SM number as part of the key for this relation.

**Attribute:**

picb

**Fullname:**

Peripheral Interface Control Bus

**Attribute Description:**

This attribute contains the PICB number which is one of the keys for this relation.

**Attribute:**

unitno

**Fullname:**

DLTU unit number

**Attribute Description:**

This attribute contains the DLTU unit number.

**Attribute:**

dfino

**Fullname:**

DFI number

**Attribute Description:**

This attribute contains the DFI board number.

## 4. Population Rules for RLrc_dninfo

**Relation Description**
Recent Change Directory Number Information.

This relation is used for directory number administration for DN's that do not have an origination equipment number.

This relation should be populated for the following: DNs on regular intercept without ports, test lines, lines with RI (route index) or a DN is a secondary-only DN and has either a remark (rem) or ATT MLHG (att_grp) to be saved. The att_grp attribute is being used to store the attendant multiline hunt group or the incoming ISDN Attendant (ISAT) Busy Verify Trunk (BVT) group number as of 5E7 for secondary-only Directory Numbers (DNs).

**Attribute: psflag**

**Fullname:** Packet Directory Number Flag

**Attribute Description** Packet DN indicator (DBYES/DBNO). IF RLrc_dninf.psflag equals DBNO, THEN this DN is considered a circuit DN. IF RLrc_dninf.psflag equals DBYES, THEN this DN is considered a packet DN.

**Attribute: dn**

**Fullname:** Directory number

**Attribute Description** The directory number is used to determine the routing of a subscribers called. This directory number should also be present in RLrt_dntran for analog and circuit switched calls.

**Attribute: dn.noc**

**Fullname:** Directory Number Normalized Office Code

**Attribute Description** The noc code for directory number is taken from the NOCCODE relation. It is used in combination with the digits as the internal representation of the directory number on the *5ESS*®-2000 switch.

**Attribute: dn.digits**

**Fullname:** Directory Number Digits

**Attribute Description** The digits represent the last four digits of the directory number. It is used in combination with the noc as the internal representation of the directory number on the *5ESS*®-2000 switch.

**Attribute: lcc**

**Fullname:** Line Class Code

**Attribute Description** An example of the codes in the Translation Guide. This code is usually determined by the telephone company. RE: Multiparty - the values should be 4SS, 4FS & 8SS. This information is used for populating RLrc_oeinfo.lcc and RLrc_dninfo.lcc. For packet switching, this information is used in populating RLrc_cninf.lcc.

**Attribute: rax**

**Fullname:** Rate Center

**Attribute Description** The rax is obtained from line input or from the line TN's RLnoccode entry.

**Attribute: rem**

**Fullname:** Remarks

Copyright © 1999 Lucent Technologies 

**Attribute Description** This field used as a character string for remarks.

**Attribute: mbs**

**Fullname:** May Be Shared

**Attribute Description** This attribute is used for sharing. The mbs attribute is set to DBYES or DBNO depending if this directory number may be used for sharing.

**Attribute: rbv**

**Fullname:** ISDN Attendant (ISAT) Remote Busy Verification (RBV) Indication Flag

**Attribute Description** The rbv flag will indicate that this secondary-only DN is remote busy verifiable. If rbv=DBYES then the value in the att_grp attribute will represent the ISAT remote busy verify trunk (RBVT) group number associated with the secondary-only DN.

**Attribute: att_grp**

**Fullname:** Attendant Multiline Hunt Group Number

**Attribute Description** This attribute will indicate either the attendant multiline hunt group or the incoming ISDN Attendant (ISAT) busy verify trunk (BVT) group number that a secondary-only directory number (DN) is associated with.

## 4. Population Rules for RLrc_eisnm

**Relation Description**
External information system name.

This relation is used to enter an Identification Number for each EIS. The number will be required in other relations for given EIS. To facilitate the entries, a designated name is entered in this relation which will be used for entry of the Identification Number in other relations.

**Attribute: eis_id**

**Fullname:** External Information System Identification Number

**Attribute Description** This attribute contains an Identification Number assigned to the external information system.

Copyright © 1999 Lucent Technologies 

**Attribute: eis_name**

**Fullname:** External Information System Name

**Attribute Description** This attribute is used to enter a designated name for an EIS ID so that in other relations the name can be used instead of entering the EIS ID itself. All printable ascii characters are allowed, except for lower case letters. All letters should be converted to upper case.

Copyright © 1999 Lucent Technologies

# RC_EQLOC

## 1. Description

This relation contains the locations bay, vertical position EQLS, of IM equipment units. .P This is a virtual update relation. The root storage relation is RLeqloc_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RC_EQLOC.

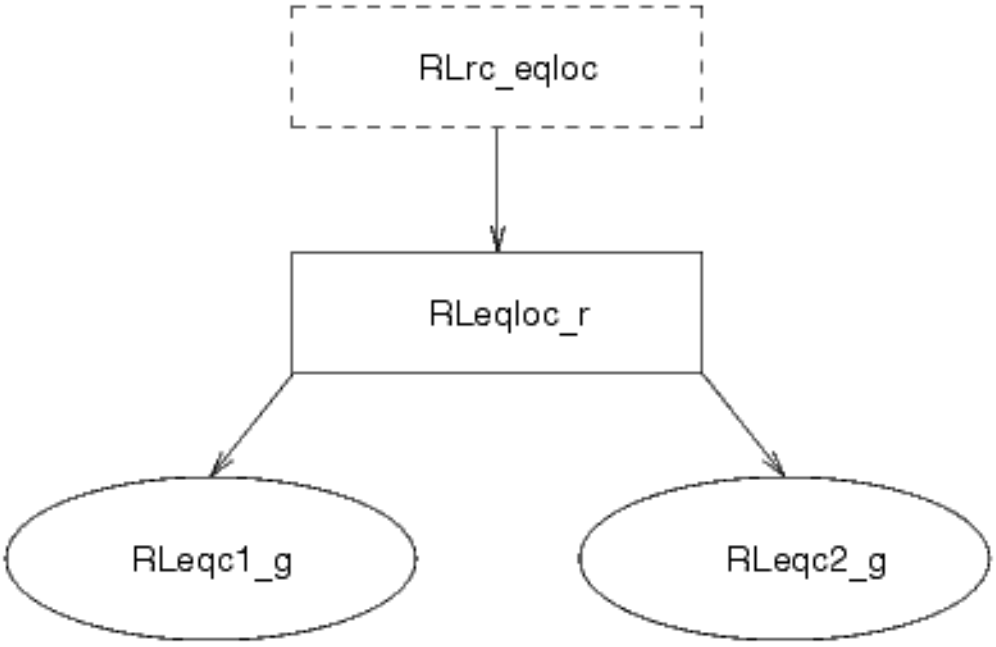

**Figure 1 Virtual Relation RC_EQLOC**

## 4. Population Rules for RLrc_eqloc

**Relation Description**
Equipment location.

Locations bay vertical position EQLS of IM equipment units.

**Attribute: im**

**Fullname:** IM number

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** For each Alarm and Status Circuit (215A CM) or Remote Alarm Unit (RAU/OAU)

**Attribute: unittype**

**Fullname:** unit type.

**Attribute Description** Unit type taken from CKTDATA relation. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'unittype' should be set to SMASU. For each RAU/OAU in an RSM, ORM, or TRM 'unittype' should be set to SMOAU. For population restrictions, see poprules for RLclidat rm_alm_out attribute.

**Attribute: unit_no**

**Fullname:** Unit number

**Attribute Description** For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM or TRM 'unit_no' should be set to zero.

**Attribute: service_group**

**Fullname:** Service group number

**Attribute Description** For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM 'service_group' should be set to zero.

***NOTE:*** For units of type SMDLTU or SMDLTU2, this field is actually the DFI/DFI-2 BOARD number (1-10), not the service group number.

***NOTE:*** If a DLTU or DLTU2 unit is present, but no boards have been grown in, a dummy tuple with service group of zero must be populated, and removed when a DFI board is actually grown in.

***NOTE:*** For the DNU-S, the service_group attribute is really the data group. The data group refers to one half of the DNU-S excluding the CCs. Data group 0 is required, but data group 1 is optional.

**Attribute: bay**

**Fullname:** Bay

**Attribute Description** Bay in which unit is located. For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'bay' should be set to the switching module controller cabinet number in which the alarm and status circuit is located.

```
Bay for an SM is 0 to 4.
Bay for an SM-2000 is from 0 to 14, 100 to 104, or 200 to 208
        (DNU-S can also use the range 90 to 99).
```

**Attribute: vertpos**

**Fullname:** Vertical position

**Attribute Description** Vertical position of the unit. For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'vertpos' should be set to the vertical height of the Alarm Status Unit (ASU) in the switching module controller cabinet containing that alarm and status circuit.

**Copyright © 1999 Lucent Technologies** 

For each module controller and Time-Slot Interchanger (TSI) unit (MCTU) and Local Digital Service Unit model 2 (LDSU2), if 'unittype' for the MCTU in the Switching Module (SM) is SMSMP20 or SMMCTU3 and if this unit is the second SM in the cabinet then 'vertpos' must be set to 41.

**Attribute: aisle**

**Fullname:** Aisle

**Attribute Description** Aisle number where unit is located. For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'aisle' should be set to the four-character designation for the aisle containing the switching module controller cabinet in which the alarm and status circuit is located.

**Attribute: com_shelf**

**Fullname:** Compact shelf indicator

**Attribute Description** Indicates if the unit is located in the compacted shelf. The compact shelf can support the MMSU, RAF, SMSAS, GDSF, and DLTU2 units.

**Attribute: cab_ref**

**Fullname:** Cabinet reference

**Attribute Description** Describes the physical placement of a hardware unit with respect to a 5ess cabinet. Specifically, an AIU may be placed in the front or the rear of a cabinet.

**Attribute: picb**

**Fullname:** Peripheral interface control bus (PICB)

**Attribute Description** PICB number plus one of unit. Some units have hard-coded PICB numbers (or pseudo-PICB numbers) for the value of this 'picb' attribute:

For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'picb' should be set to 0x40 (pseudo-PICB).

For facility interface unit (FIU) side 0 in an RSM, 'picb' should be set to 0x35.

For FIU side 1 in an RSM, 'picb' should be set to 0x36.

**Attribute: sndpicb**

**Fullname:** Second PICB

**Attribute Description** Zero (there is no 'sndpicp' for LU2).

**Attribute: pidb**

**Fullname:** Peripheral interface data bus (PIDB)

**Attribute Description** PIDB number of the unit. The DFIs connected to the FIU are connected via Facilities Interface Data Buses (FIDBs). In this case the 'pidb' field refers to the FIDB. For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'pidb' should be set to zero.

Copyright © 1999 Lucent Technologies 

**Attribute: sndpidb**

**Fullname:** Second PIDB

**Attribute Description** Second PIDB number of DFI-2 board, if equipped. DFI-2s can be connected to the Facilities Interface Unit (FIU) via FIDBs. In this case, the 'sndpidb' field refers to the second FIDB corresponding to relative facility 1. The default value for 'sndpidb' is 0x7F.

**Attribute: mtb0**

**Fullname:** Metallic test bus0

**Attribute Description** Metallic test bus0.

**Attribute: mtb0.circuit**

**Fullname:** Circuit

**Attribute Description** Metallic test bus zero, for analog unit. For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'mtb0.circuit' should be (0,0). RSM, ORM, or TRM, mtb0.circuit should be #GLNULCKT.

**Attribute: mtb0.module**

**Fullname:** Module

**Attribute Description** IM number. For each alarm and status circuit (215A CM) or RAU/OAU in an RSM, ORM, or TRM, 'mtb0.module' should be (0,0). Alarm Unit (RAU/OAU) in an RSM, ORM or TRM, mtb0.module should be 0.

**Attribute: mtb1**

**Fullname:** Metallic test bus1

**Attribute Description** Metallic test bus1.

**Attribute: mtb1.circuit**

**Fullname:** circuit.

**Attribute Description** Metallic test bus one, for analog unit. For each Alarm and RSM, ORM or TRM, mtb1.circuit should be #GLNULCKT.

**Attribute: mtb1.module**

**Fullname:** Module

**Attribute Description** Metallic test bus one, for analog unit. For each Alarm and RSM, ORM, or TRM, mtb1.module should be 0.

**Attribute: mtb[*]_idx**

**Fullname:** Metallic Test Bus 0/1 circuit InDeX

**Attribute Description** This is the Metallic Test Bus 0 or 1 circuit index. For each Alarm and Status Circuit (215A CM) or Remote Alarm Unit (RAU/OAU) in an RSM, ORM, or TRM, mtb(0:1)_idx should be #GLNULCX.

Copyright © 1999 Lucent Technologies 

**Attribute: mtb[*]_msu**

**Fullname:** Metallic Test Bus 0/1 Metallic Service Unit unit number

**Attribute Description** This is the unit number of the Metallic Service Unit to which the Metallic Test Bus (MTB) 0 or 1 terminates. For each Alarm and Status Circuit (215A CM) or Remote Alarm Unit (RAU/OAU) in an RSM, ORM, or TRM, mtb(0:1)_msu should be 0.

**Attribute: risite**

**Fullname:** remote peripheral site identification.

**Attribute Description** This is the remote peripheral site id of the remote site that hosts this unit.
**Defines:** "db/DMcircuit.h", "db/DMcktindx.h", "db/DMpidb.h"

## 4. Population rules for RLrc_fnl

### Relation Description

RECENT CHANGE DIGIT ANALYSIS FINAL DATA RELATION
RECENT CHANGE ONLY RELATION: RLrc_fnl will be updated with the table numbers obtained from RLdaprmfnl. The corresponding LDIT of which this table is a part of, or 0 if the table belongs to an RDIT will be the entry for RLrc_fnl.ldit.
For existing data, the relation is constructed by traversing the tree for each LDIT/RDIT and finding the associated table number. An entry is made here with that table number and the

Copyright © 1999 Lucent Technologies

LDIT or 0 if an RDIT.

**Attribute:**
table
**Fullname:**
table
**Attribute Description:**
This attribute corresponds to the attribute RLdaprmfnl.previous.

**Attribute:**
ldit
**Fullname:**
ldit
**Attribute Description:**
This attribute is the LDIT number for which the table number in RLdaprmfnl belongs to or is set to 0 if the table number is part of an RDIT.

## 4. Population rules for RLrc_hole

### Relation Description

```
        Recent Change index Holes

        RLrc_hole is a general relation for storing holes formed by
        deleting indices allocated using RLrc_qidx.  Some queue types
        have their own dedicated hole relations instead of using this
        relation.

        Each queue type has up to four tuples in RLrc_qidx per SM,
        depending on how many queues that queue type uses.  For the
        queue types that use RLrc_hole, each tuple of RLrc_qidx gives
        the next index that has never yet been allocated, the number
        of holes (tuples that were once allocated but were later
        released), and the number of the first hole.  The number of
```

Copyright © 1999 Lucent Technologies

holes equals the number of corresponding tuples in RLrc_hole. RLrc_hole consists of linked lists of holes, where the headcells are RLrc_qidx tuples. When allocating an index, Recent Change uses a hole in preference to using the next never-yet-allocated index.

The keys to RLrc_hole identify a index that has been released and can be reused. The non-key attribute, succ, is the link to the next hole (tuple of RLrc_hole), or 0 if there are no more.

**Attribute:**
module
**Fullname:**
Switching module
**Attribute Description:**
There is a linked list of RLrc_hole tuples for each SM, queue type, and queue ID combination in RLrc_qidx, for those queue types that use RLrc_hole. A linked list may be empty.

**Attribute:**
qtyp
**Fullname:**
Queue type
**Attribute Description:**
There is a linked list of RLrc_hole tuples for each SM, queue type, and queue ID combination in RLrc_qidx, for those queue types that use RLrc_hole. A linked list may be empty. Not all queue types use RLrc_hole; some use other relations.

**Attribute:**
index
**Fullname:**
Index value
**Attribute Description:**
Index is the value of an index that had once been allocated but was later released. The number (index % no_of_queues) is usually equal to the queue ID in the RLrc_qidx headcell of this queue, but may be different. This is because Recent Change usually releases indices to the matching list to balance the number of holes in each list, but if that queue is busy, it releases them to a different queue.

**Attribute:**
succ
**Fullname:**
Successor
**Attribute Description:**
Successor is the link to the next RLrc_hole tuple. If this is the last tuple in the linked list, successor will be 0.

## 4. Population Rules for RLrc_hotel

**Relation Description**
Recent change only - hotel identification numbers.

This relation holds the available unique autoquote hotel ID values during the deletion of hotels from the relations RLfc_hotel. As tuples are added to the RLrc_hotel relation this relation should be looked at first to determine if there are any free hotel ID values that can be reused. It is used by RC.

The contents of each attribute of each tuple must be unique. The contents of each attribute of each tuple must be less than the value stored in the global called Glrchotel.

**Attribute: tupnumb**

> **Fullname:** tuple number
>
> **Attribute Description** This attribute is nothing more than a sequential number from 1 to 410. RC reads each tuple in order until an empty tuple or incomplete tuple is found. Once RC finds an incomplete tuple or no tuple at all, it uses the last successful tupnumb as the key to retrieve the latest unique hotel identifier to use in assigning aqhid in the relation RLFC_HOTEL.

**Attribute: hotel1_id**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** This is the hotel ID for the first freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel2_id**

**Fullname:** This is the hotel ID for the second freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel3_id**

**Fullname:** This is the hotel id for the third freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel4_id**

**Fullname:** This is the hotel ID for the fourth freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel5_id**

**Fullname:** This is the hotel ID for the fifth freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel6_id**

**Fullname:** This is the hotel ID for the sixth freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value

Copyright © 1999 Lucent Technologies 

is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel7_id**

**Fullname:** This is the hotel ID for the seventh freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel8_id**

**Fullname:** This is the hotel ID for the eighth freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel9_id**

**Fullname:** This is the hotel ID for the ninth freed unique hotel ID which was removed from a deleted tuple in the relation RLfc_hotel.

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

**Attribute: hotel10_id**

**Fullname:** This is the hotel ID for the tenth freed unique hotel ID which was removed from a deleted tuple in the relation RLrc_hotel.a

**Attribute Description** The attributes hotel1_id through hotel10_id contain the unique hotel IDs that were used and then freed by the relation, RLfc_hotel, as attribute aqhid. When the attribute value is greater than 4095, this signifies that the aqhid for that attribute is empty - so the previous hotel#_id should be used as the next available aqhid for RLfc_hotel.

## 4. Population Rules for RLrc_icitg

**Relation Description**
ISDN call identifier / trunk group.

This relation associates an ISDN call identifier (ICI) for a hunt group number to a trunk group number. A tuple exists in this relation for each isat_idx/enumici combination that is associated with the set of ISAT multiline hunt groups in the office.

**Attribute: enumici**

Copyright © 1999 Lucent Technologies

**Fullname:** Real Enumerated ISDN call identifier

**Attribute Description** This attribute holds the value of an ICI that has been subscribed to by this ISAT hunt group.

**Attribute: isat_idx**

**Fullname:** ISAT Index of ISAT hunt group

**Attribute Description** This is an abstract form of a multiline hunt group number.

**Attribute: tkgrpnum**

**Fullname:** Trunk Group Number

**Attribute Description** This attribute holds the trunk group number which corresponds to this enumici.

## 4. Population Rules for RLrc_icrtn

**Relation Description**
Intercom calling restriction (ICR) ISDN attendant data.

Recent change relation for ICR ISDN attendant data. Tuple exists only when at least one sfg_acn is not equal to 0.

**Attribute: dport**

**Fullname:** ISDN D - channel port to which attendant console is connected

**Attribute Description** Dport and sm together must be a valid attendant DN, with service class of FC_ISATND. Cpetype field in the relation RLis_term has to be set of IS_TYPATT.

**Attribute: sm**

**Fullname:** Switching module on which attendant console is connected to.

**Attribute Description** Dport and sm together must be a valid attendant DN, with service class of FC_ISATND.

**Attribute: config**

**Fullname:** Configuration id of ISDN attendant console.

**Attribute Description** Config id is calculated by converting dport to lport and then using lport to read RLis_term.

**Attribute: sfg_acn1**

**Fullname:** Indicates if the action ACN_ICR1 is assinged to an ICR SFG

**Attribute Description** If sfg_acn[1] is not equal to 0 then a tuple must exist in RLicr such that:

```
key rlICR.sfg_num = rlRC_ICRTN.sfg_acn[1]
    rlICR.bl_type = ISDNBL
```

Copyright © 1999 Lucent Technologies 

```
        rlICR.action  = ACN_ICR1
```

**Attribute: sfg_acn2**

**Fullname:** Indicates if the action ACN_ICR2 is assigned to an ICR SFG

**Attribute Description** If sfg_acn[2] is not equal to 0 then a tuple must exist in RLicr such that:

```
key rlICR.sfg_num = rlRC_ICRTN.sfg_acn[2]
    rlICR.bl_type = ISDNBL
    rlICR.action  = ACN_ICR2
```

**Attribute: sfg_acn3**

**Fullname:** Indicates if the action ACN_ICR3 is assigned to an ICR SFG

**Attribute Description** If sfg_acn[3] is not equal to 0 then a tuple must exist in RLicr such that:

```
key rlICR.sfg_num = rlRC_ICRTN.sfg_acn[3]
    rlICR.bl_type = ISDNBL
    rlICR.action  = ACN_ICR3
```

**Attribute: sfg_acn4**

**Fullname:** Indicates if the action ACN_ICR4 is assigned to an ICR SFG

**Attribute Description** If sfg_acn[4] is not equal to 0 then a tuple must exist in RLicr such that:

```
key rlICR.sfg_num = rlRC_ICRTN.sfg_acn[4]
    rlICR.bl_type = ISDNBL
    rlICR.action  = ACN_ICR4
```

**Attribute: sfg_acn5**

**Fullname:** Indicates if the action ACN_ICR5 is assigned to an ICR SFG

**Attribute Description** If sfg_acn[5] is not equal to 0 then a tuple must exist in RLicr such that:

```
key rlICR.sfg_num = rlRC_ICRTN.sfg_acn[5]
    rlICR.bl_type = ISDNBL
    rlICR.action  = ACN_ICR5
```

**Attribute: sfg_acn6**

**Fullname:** Indicates if the action ACN_ICR6 is assigned to an ICR SFG

**Attribute Description** If sfg_acn[6] is not equal to 0 then a tuple must exist in RLicr such that:

```
key rlICR.sfg_num = rlRC_ICRTN.sfg_acn[6]
    rlICR.bl_type = ISDNBL
    rlICR.action  = ACN_ICR6
```

**Relation Description**

Remarks for international direct distance dialing (IDDD)

**Copyright © 1999 Lucent Technologies** 

recent change/verify (RC/V) view

This relation records the remarks entered for the IDDD view.

There is a tuple for each prefix and country access code.

**Attribute:**
ldit
**Fullname:**
Local digit (LDIT)
**Attribute Description:**
LDIT - see general information.

**Attribute:**
prfix
**Fullname:**
Prefix
**Attribute Description:**
The IDDD prefix.

**Attribute:**
rcdigs
**Fullname:**
RC digits
**Attribute Description:**
This is part of the key, and corresponds with ldit
to one tuple in the relation RLrc_ldit.

**Attribute:**
city_digs
**Fullname:**
City digits
**Attribute Description:**
City access code.

**Attribute:**
rem
**Fullname:**
Remark, about rc_iddd tuple
**Attribute Description:**
Used to record a remark about a tuple in relation rc_iddd.

## 4. Population Rules for RLrc_ididx

**Relation Description**
Recent change IDP table index relation.

Recent change relation used to track the highest used table identifiers for the conflict, digit, and reverse digit tables.

**Attribute: idp_gpid**

**Fullname:** Individualized Dialing Plan group identifier.

**Attribute Description** IDP group identifier for which the table indices are being maintained.

**Attribute: hi_cnfltbl**

**Fullname:** highest conflict table identifier

**Attribute Description** Indicates the last identifier used as a conflict table identifier.

Copyright © 1999 Lucent Technologies

**Attribute: hi_digtbl**

**Fullname:** highest digit table identifier

**Attribute Description** Indicates the last identifier used as a digit table identifier.

**Attribute: hi_revtbl1**

**Fullname:** highest reverse digit analysis table identifier

**Attribute Description** Indicates the last identifier used as a reverse digit analysis table identifier.

## 4. Population Rules for RLrc_idrmk

**Relation Description**
Indit remarks.

Every tuple in this relation exists as a comment, in correspondence with a tuple existing in the relation RC_INDIT and a terminal digit in relation DAPRLDGT.
Populated if the RMK field on RC/V view 9.5 or the ODA INDIT form contains text.

**Attribute: indit**

**Fullname:** Incoming trunk digit interpreter table

**Attribute Description** indit - This is part of the key and corresponds to a tuple in relation RC_INDIT.

**Attribute: rcdigs**

**Fullname:** rc digits

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** rcdigs - this is part of the key, and corresponds to a specific path in the Incoming Trunk Digit Interpreter Table.

**Attribute: rem**

**Fullname:** remark, about rc_indit tuple

**Attribute Description** rem - used to record a remark about a specific path in the Incoming Trunk Digit Interpreter Table.

## 4. Population rules for RLrc_idx

### Relation Description

Recent Change / Verify Indexes
This relation maintains the largest used keys for several other relations which are keyed via a count (that is, a number meaningful only because it is a key). When an insertion is to be made to one of those relations, this relation is used to obtain and record the next key value.

**Attribute:**
param
**Fullname:**
Symbolic constant parameter
**Attribute Description:**
A value of 1 is used to access the relation.

**Attribute:**
sc[*]idx
**Fullname:**
Speed Call Indexes
**Attribute Description:**
Indexes used in Speed Call relations

**Attribute:**
prel_idx
**Fullname:**
daprldgt index
**Attribute Description:**
Highest table number used in RLdaprldgt.

**Attribute:**
prim_idx
**Fullname:**
daprmdgt index

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Highest table number used in RLdaprmdgt.

**Attribute:**
prlfnl_idx
**Fullname:**
daprlfnl index
**Attribute Description:**
Highest table number used in RLdaprlfnl.

**Attribute:**
prmfnl_idx
**Fullname:**
daprmfnl index
**Attribute Description:**
Highest table number used in RLdaprmfnl.

**Attribute:**
ambig_idx
**Fullname:**
da_ambig index
**Attribute Description:**
Highest table number used in RLda_ambig.

**Attribute:**
conflidx
**Fullname:**
da_conflct index
**Attribute Description:**
Highest table number used in RLda_conflct.
NOTE: this attribute is no longer used.
RLda_conflict table numbers are now allocated
from RLrc_qidx and RLrc_hole relations.

**Attribute:**
hntkidx
**Fullname:**
tmblist index
**Attribute Description:**
Highest index number used in RLtmblist.

**Attribute:**
qkeyidx
**Fullname:**
qkeyport index
**Attribute Description:**
Highest qkey number used in RLqkeyport.

## 4. Population Rules for RLrc_ilth

**Relation Description**
Logical ISDN termination index holes.

This relation stores the ltm_idx holes for ISDN and shared analog lines where ltm_type = LTM_ISDN. This relation is used by recent change (RC) only.

The module number is always non-zero. RC keeps four separate ltm_idx link lists for each SM. Reference population rules for RLrc_qidx for a strategic overview of how four linked list are maintained. RC adds a member to a link list when it is no longer needed. This may be due to a primary LT port being deleted or lead terminal

Copyright © 1999 Lucent Technologies 

movement from an SM to another. When an ltm_idx is required to be assigned an LT port on a SM, RC uses the members from the link list. If the link list is empty then the next index is taken from RLrc_qidx.

NOTE:
Only member tuples are kept in this relation. The starting point for a link list is located in the RLrc_qidx relation (RLrc_qidx.succ attribute).

For new offices, ODA will sequentially assign ltm_indices starting with 1 for each SM and populate RLrc_qidx with the next ltm_idx to use for each SM. Empty queue: Read module x, qtyp=LTM_IDXI, and qid y in RLrc_qidx. If RLrc_qidx.succ is zero, then queue y is empty.

Members on list:
Read module x, qtyp=LTM_IDXI, and qid y in RLrc_qidx. The RLrc_qidx.succ attribute points to the first member on the link list in RLrc_ilth. Read tuple in RLrc_ilth with mod=x and ltm_idxi=RCrc_qidx.succ to obtain the first member. The first member has succ = 0 if it is the only member, otherwise it points to the next member in the link list. A succ attribute of 0 indicates the end of the link list. The attribute index in the relation RLrc_qidx defines the next available ltm_idxi index value if all four queues are empty.

**Attribute: module**

**Fullname:** Each module has four separate ltm_idx link lists.

**Attribute Description** Switching modules used as key.

**Attribute: ltm_idxi**

**Fullname:** Logical ISDN termination hole index

**Attribute Description** This attribute is the key to the RLltmstat dynamic relation and is one of the keys to the RLIS_LINE static relation. It is sequentially assigned by RC via hole reuse. The key value 1-8191 (standard SM-2000) or 1-65535 (SM-2000) is used to link idle holes.

**Attribute: succ**

**Fullname:** Successor ltm_idxi

**Attribute Description** Successor ltm_idxi, key to next member of link list or 0 to indicate no or last member on the list.

Copyright © 1999 Lucent Technologies 

# RC_INDIT

## 1. Description

This relation contains the incoming digit analysis number to start table mapping. This relation maintains a list of the RLdaprldgt entry points for each and every indit value used.

## 4. Population Rules for RLrc_lahol

**Relation Description**
Logical ISDN attendant index holes.

This ISDN relation stores the logical ISDN attendant index holes.
Recent change (RC) keeps four separate latidx link lists for each SM. Reference population rules for RLrc_qidx for a strategic overview of how four linked list are maintained. RC adds a member to a link list when it is no longer needed. When a latidx is required to be assigned to an ISDN attendant port on a SM, RC uses the members from the link list. If the link list is empty then the next index is taken from RLrc_qidx.

NOTE:

Copyright © 1999 Lucent Technologies 

Only member tuples are kept in this relation. The starting point for a link list is located in the RLrc_qidx relation (RLrc_qidx.succ attribute). For new offices, ODA will sequentially assign latidx from 1 to 31 for each SM and populate RLrc_qidx with the next latidx to use for each SM.

Empty queue:
Read module x, qtyp=LATIDX, and qid y in RLrc_qidx. If RLrc_qidx.succ is zero, then queue y is empty.

Members on list:
Read module x, qtyp=LATIDX, and qid y in RLrc_qidx. The RLrc_qidx.succ attribute points to the first member on the link list in RLrc_lahol. Read tuple in RLrc_lahol with mod=x and latidx=RCrc_qidx.succ to obtain the first member. The first member has succ = 0 if it is the only member, otherwise it points to the next member in the link list. A succ attribute of 0 indicates the end of the link list. The attribute index in the relation RLrc_qidx defines the next available latidx index value if all four queues are empty.

Notice that rc_lahol is a LIFO and no checking is done to assure that the lahol queue order is sequential. Also, these are actual holes. When lahol is empty, a new (not previously used) latidx is assigned from RLrc_qidx.index. For existing offices, ODA will preserve all logical ISDN attendant index assignments and holes across all offline ODA processes.

**Attribute: module**

**Fullname:** Switching Number

**Attribute Description** RC supports separate index queues for each SM. The index corresponds to the SM defined by this attribute value.

**Attribute: latidx**

**Fullname:** Logical ISDN Attendant Terminal Index

**Attribute Description** Attribute latidx is used to cause a dense packing of ISDN attendant keyed relations. Key value is the head cell of the link list for each SM. As used in this relation, latidx contains an index to an available hole in the sequentially assigned latidx numbers in RLlat_lpt.

**Attribute: succ**

**Fullname:** Successor latidx

**Attribute Description** Used as key pointer to the next member of the link list. If this value is 0, this indicates no members, or the last member on the list.

Copyright © 1999 Lucent Technologies 

# RC_LCC

## 4. Population Rules for RLrc_lcc

**Relation Description**
Recent Change Line Class Code.

This relation gives line class specific information. The relation RLrc_oeinfo identifies the (port, party) the (lcc, rax) information is associated with while the relation RLrc_dninfo identifies the (tn) information when no (port, party) information is present, such as a line on intercept these lines may not have (port, party) information.

This relation is static. This relation is used for both domestic an export applications.

When this relation exists with a the attribute servclass populated with PSX25_T1, then a corresponding DAtimer relation will not exist. This may be true for other user of the RLrc_lcc relation, but this comment is only intended to be applied to PSX25_T1 (XAT port) specifically.

**Attribute: lcc**

**Fullname:** Line Class Code

**Attribute Description** An example of the codes in the Translation Guide. This code is usually determined by the telephone company. For example, multiparty - the values should be 4SS, 4FS & 8SS. This information is used for populating RLrc_oeinfo.lcc and RLrc_dninfo.lcc. For packet switching, this information is used in populating RLrc_cninf.lcc. For Default Service, this information is used in populating RLbfgmatch.lcc.

**Attribute: rax**

**Fullname:** Rate Center

**Attribute Description** Used to populate RLrc_oeinfo.rax. for packet switching, this information is used in populating RLrc_cninf.rax.

**Attribute: lcc_cnt**

**Fullname:** Line Class Code Count

**Attribute Description** This attribute is used to keep track of the number of lines assigned to the LCC.

**Attribute: termclass**

**Fullname:** Terminating Class of Service

**Attribute Description** This attribute is used to populate RLrt_dntran.termclass.

**Attribute: servclass**

Copyright © 1999 Lucent Technologies 

**Fullname:** Originating Class of Service

**Attribute Description** This attribute allows the specification of different types of lines and trunks. A line with multi-frequency ringing must be assigned FC_INDVDL, FC_5PTY, FC_10PTY or FC_2PTY values. Originating class of service. This attribute is used to show all the special lines. Such as 2-party or multi-party, coin or pbx, charge-a-call or individual.

For X.25 access on a T1 (XAT) service populate with servclass PSX25_T1.

**Attribute: screen_x**

**Fullname:** Screening Index

**Attribute Description** This information is used to populate RLfc_line.screen_x.

For XAT ports, the value of screen_x is used in relation RLpsx25ln. The RLfc_line relation is not populated (does not exist) for XAT ports.

**Attribute: line_screen**

**Fullname:** Line Screen

**Attribute Description** Indicates whether or not a line has any associated toll/code restriction/diversion or WATS band screening. set to DBYES if the screening index in the tuple is one that is used for toll/code restriction/diversion or WATS band screening.
Note that all lines assigned a given line class code should have line_screen bits in their associated RLfc_line tuples that agree with this bit. The only exception to the rule is XAT ports which do not populate the RLfc_line relation.
For packet switching set line_screen to DBNO.

**Attribute: digtree**

**Fullname:** Digit Analysis Table Identifier

**Attribute Description** This information is used to populate RLfc_line.digtree.
The only exception to the rule is XAT ports which do not populate the RLfc_line relation.
For DSL lines and XAT ports, the value of digtree is used in relation RLpsx25ln.

**Attribute: insep**

**Fullname:** Incoming/Originating Separations Class

**Attribute Description** Used by Division of Revenue (domestic) and by Traffic Dispersion (export). Do not populate the RLfc_line relation for XAT ports.

**Attribute: desep**

**Fullname:** Destination Separation Class

**Attribute Description** Used by Division of Revenue (domestic) and by Traffic Dispersion (export). Do not populate the RLfc_line relation for XAT ports.

**Attribute: lata**

**Fullname:** Local Access Transport Area

Copyright © 1999 Lucent Technologies 

**Attribute Description** This information is used to populate RLfc_line.lata.
Used by the TCAP (Transaction Capabilities Application Part) improvements for a switch spanning multiple LATAs feature. A group of lines, based on line class code (LCC), may reside in a different lata than the office lata.

**Attribute: rem**

**Fullname:** Remarks

**Attribute Description** Character string for remarks.

```

## 4. Population rules for RLrc_ldit

### Relation Description

LDIT entry point into RLdaprmdgt.
This relation maintains a list of the RLdaprmdgt entry points for each and every ldit value used.
LDITs are distributed using group partitioning.
The group type is GPD_DA and the group ID is the value of the DAS to which the LDIT is assigned.

**Attribute:**
ldit
**Fullname:**
Preliminary Digit Interpretation Table
**Attribute Description:**
Used to select a particular digit interpretation table.

Copyright © 1999 Lucent Technologies

**Attribute:**
primtable
**Fullname:**
The entry point into RLdaprmdgt.
**Attribute Description:**
This value is used as the initial value of RLdaprmdgt.previous.

**Attribute:**
psflag
**Fullname:**
Packet Switching Flag
**Attribute Description:**
Indicates that RLdaprmdgt contains only packet switching tuples.

**Attribute:**
fat
**Fullname:**
Foreign Area Translator
**Attribute Description:**
Redirect further digit translations to a common digit tree?

**Attribute:**
acdcnt
**Fullname:**
Count of ACD/DAA DNs using this particular LDIT
**Attribute Description:**
The acdcnt attribute contains the combined count of Automatic Call Distributor (ACD) DNs and Direct Agent Access (DAA) DNs using a particular LDIT. The count is needed to ensure that LDITs used by ACD/DAA DNs are distributed to all operational SMs in the office. If acdcnt is greater than 0, the LDIT is being used by ACD/DAA DNs and must be distributed to all operational SMs in the office. If the count is 0, the LDIT is not being used by any ACD/DAA DN and can be removed from SMs that no longer need it. The acdcnt count is maintained by RC and ODA and is incremented when new ACD/DAA DNs are inserted, and decremented when existing ACD/DAA DNs are deleted.

## 4. Population Rules for RLrc_ldrmk

**Relation Description**
Ldit remarks.

Every tuple in this relation exists as a comment, in correspondence with a tuple existing in the relation RC_LDIT and a terminal digit in relation DAPRMDGT.
Populated if the RMK field on RC/V view 9.3 or the ODA LDIT form contain text.

**Attribute: ldit**

**Fullname:** Local Digit Interpreter Table

**Attribute Description** ldit - This is part of the key and corresponds to a tuple in relation RC_LDIT.

**Attribute: rcdigs**

**Fullname:** rc digits

**Attribute Description** rcdigs - This is part of the key. It corresponds to a specific path in the Local

Copyright © 1999 Lucent Technologies 

Digit Interpreter Table.

**Attribute: rem**

**Fullname:** remark

**Attribute Description** rmk - Used to record a remark about a specific path in the Local Digit Interpreter Table.

## 4. Population Rules for RLrc_loceq

**Relation Description**
Location equipment.

Logical name information associated with circuits.

> ***NOTE 1:*** For all units this relation is not always a subset of the RLrc_eqloc relation. Therefore there should not always be a correspondence of tuples and their associated values.

***NOTE 2:*** Unless otherwise specified, TRCU refers to TRCU or TRCU2 located at the host office. TRCU2 refers to the TRCU2 located at the ORM.

***NOTE 3:*** Unless otherwise specified, ORM will refer to both ORM and ORM2000.

***NOTE 4:*** CM1 supports ORM only. CM2 can support ORM or ORM2000.

**Attribute: im**

> **Fullname:** The SM the circuit resides on
>
> **Attribute Description** For each message switch (MSGS) and for each MSGS PC community, im should be zero. For each remote alarm unit (RAU) in an RSM, optically remote module (ORM), or two-mile optically remote module (TRM), im should be set to the module number.
>
> In communication module, model 1 (CM1) and communication module, model 2 CM2:
> For each transmission rate converter unit (TRCU) associated with an ORM, 'im' should be set to zero.
>
> For each TRCU2 (located at the ORM), 'im' should be set to the module number.
>
> In CM2:
> For each communication module control unit (CMCU) and time multiplexed switch unit (TMSU), 'im'

Copyright © 1999 Lucent Technologies 

should be zero. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'im' should be set to the module number.

**Attribute: picb**

**Fullname:** Peripheral interface control bus (PICB) number plus 1

**Attribute Description** For each MSGS, 0 or 1, 'picb' should be set to '20*(MSGS side). For each MSGS PC community, 'picb' should be set to X'20*(MSGS side) + (PC community number) + 1. For each RAU in an RSM, ORM, or TRM, 'picb' should be set to 0x40.

In CM1 and CM2:
For each host TRCU (located at the host office), 'picb' should be set to 0x80 + TRCU number (0x1,0x2,...,0x60). The TRCU number corresponds to the rlTRCUPATH.host_number attribute. Note that a TRCU number can support TWO ORMs, but it can not support ORM and ORM2000 on the same TRCU.

As of 5e12(1), for each remote TRCU, RLrc_loceq is no longer used so those 'picb' numbers may be used for different unit types. The range being freed is in 0x80 thru 0xE0.

In CM2:
For each CMCU, 'picb' should be set to 0x40 + (0x00 for CMCU side 0, 0x20 for CMCU side 1). For each TMSU, 'picb' should be set to 0x40 + (0x00 for TMSU side 0, 0x20 for TMSU side 1) + the TMSU number (0,1,2,...11) + 1. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'picb' should be set to 0x40.

For facility interface unit (FIU) side 0 in an RSM, 'picb' should be set to 0x35.

For FIU side 1 in an RSM, 'picb' should be set to 0x36.

**Attribute: unittype**

**Fullname:** unit type.

**Attribute Description** In CM1:
For each MSGS, 'unittype' should be set to SMMSWU. For each MSGS PC community, 'unittype' should be set to SMMPU. For each RAU in an RSM, ORM, or TRM, 'unittype' should be set to SMOAU. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'unittype' should be set to SMASU.

For each TRCU, 'unittype' should be set to SMTRCU (TRCU-E version 1) or SMTRCU2 (TRCU-O version 2).

In CM2:
For each MSGS and PC community number 1, the 'unittype' should be set to SMMSCU2. For other communities, the 'unittype' should be set to SMMSPU3. For each communication module control unit (CMCU), the 'unittype' should be set to SMCMCU. For CM2C, the communication module control 'unittype' should be set to SMCMU.

For each TMSU, model 2, the 'unittype' should be set to SMTMSU2.

For each TMSU, model 3, the 'unittype' should be set to SMTMSU3.

For each RAU in an RSM, ORM, or TRM, 'unittype' should be set to SMOAU. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'unittype' should be set to SMASU.

Copyright © 1999 Lucent Technologies 

For each TRCU, 'unittype' should be set to SMTRCU (TRCU-E version 1) or SMTRCU2 (TRCU-O version 2).

In CM1 and CM2:
For each TRCU2 'unittype' should be set to SMTRCU2. CM2 can only support ORM2000.

**Attribute: unitnumber**

**Fullname:** Unit number

**Attribute Description** In CM1:
For each MSGS, 'unitnumber' should be set to the MSGS side. For each PC community, 'unitnumber' should be set to 8*(MSGS side) + (PC community number). The valid 'unitnumbers' for PC communities are: 1, 2-5, 9, 10-13.

For each RAU in an RSM, ORM, or TRM, 'unitnumber' should be set to zero.
For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'unitnumber' should be set to zero.

For each TRCU, 'unitnumber' should be set 0x1,0x2,..,0x60. The TRCU 'unitnumber' corresponds to the rlSLNKTMS.trcu_num attribute.

For each TRCU2, 'unitnumber' should be set 0x1,0x2,..,0x60. CM1 will not support ORM2000, only ORM.

In CM2:
For each MSGS and community number 1, the 'unitnumber' should be set to (MSGS side). For other PC communities, 'unitnumber' should be set to 32*(MSGS side) + (PC community number). The valid 'unitnumbers' are: 1, 2-8, 10-15, 33, 34-40, 42-47. For each CMCU, 'unitnumber' should be set to the CMCU side, 0 or 1. For each TMSU, 'unitnumber' should be set to switch unit number (0,1,...,10,11) for the given side. For each RAU in an RSM, ORM, or TRM, 'unitnumber' should be set to zero. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'unitnumber' should be set to zero.

For each TRCU, 'unitnumber' should be set 0x1,0x2,..,0x60. The TRCU 'unitnumber' corresponds to the rlSLNKTMS.trcu_num attribute.

For each TRCU2, 'unitnumber' should be set 0x1,0x2,..,0x60.

**Attribute: service_group**

**Fullname:** Service group

**Attribute Description** In CM1:
For each MSGS, 'service_group' should be set to zero. For each MSGS PC community, 'service_group' should be set to zero. For each RAU in an RSM, ORM, or TRM, 'service_group' should be set to zero. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'service_group' should be set to zero.

For each TRCU or TRCU2, 'service_group' should be set to zero.

In CM2:
For each MSGS, 'service_group' should be set to zero. For each PC community, 'service_group' should be set to 1 if picb equals 4, 6, 8, 11, 13, 15, 35, 37, 39, 44, 46, or 48; otherwise, 'service_group' should be set to zero. For each CMCU and TMSU, 'service_group' should be set to zero. For each RAU in an RSM, ORM, or TRM, 'service_group' should be set to zero. For each

Copyright © 1999 Lucent Technologies 

alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'service_group' should be set to zero.

For each TRCU or TRCU2, 'service_group' should be set to zero.

***NOTE 1:*** For units of type SMDLTU or SMDLTU2, this field is actually the digital facility interface (DFI)/DFI-2 board number (1-10), not the service group number.

***NOTE 2:*** If a digital line and trunk unit (DLTU) or DLTU2 unit is present, but no boards have been grown in, a dummy tuple with a service group of zero must be populated and removed when a DFI board is actually grown in.

**Attribute: bay**

**Fullname:** Bay

**Attribute Description** For each MSGS, 'bay' should be set to the MSGS bay number containing that MSGS. For each MSGS PC community, 'bay' should be set to the MSGS 'bay' number containing that community. For CM1, the valid 'bay' number is 0-7. For CM2, the valid 'bay' number is 0-11. For CM2C, the valid 'bay' number is 1-4, and all core units should all be in the same 'bay'.

For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'bay' should be set to the switching module controller cabinet number in which the alarm and status circuit is located. For each RAU in an RSM, ORM or TRM, 'bay' should be set to the miscellaneous frame number in which the RAU is located.

For each TRCU or TRCU2, 'bay' should be set to the miscellaneous frame number in which the TRCU is located.

**Attribute: vertpos**

**Fullname:** Vertical position

**Attribute Description** For each MSGS, 'vertpos' should be set to the vertical height of the MSCU shelf in that MSGS. For each MSGS PC community, 'vertpos' should be set to the vertical height of the shelf of the Message Switch Peripheral Unit (MSPU) containing that community.

In CM1 and CM2:
For each TRCU or TRCU2 the 'vertpos' should be set to the vertical height (vertical position of lowest shelf to floor in inches) of the TRCU in the miscellaneous frame containing that TRCU.

In CM2:
For each CMCU and TMSU, 'vertpos' should be set to the height of that respective shelf.

For each RAU in an RSM, ORM, or TRM, 'vertpos' should be set to the vertical height of the Office Alarm Unit (OAU) in the miscellaneous frame containing that RAU. For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'vertpos' should be set to the veritcal height of the Alarm Status Unit (ASU) in the switching module controller cabinet containing that Alarm and Status Circuit (ASC).

**Attribute: aisle**

**Fullname:** Aisle

**Attribute Description** For each MSGS, 'aisle' should be set to the character string containing the two-character floor number followed by the two-character aisle number where the associated

Copyright © 1999 Lucent Technologies 

MSCU is located. For each MSGS PC community, 'aisle' should similarly define the floor and aisle numbers for the MSPU containing that community.

In CM1 and CM2:
For each TRCU or TRCU2, 'aisle' should be set to the four character designation for the aisle containing the miscellaneous frame in which the TRCU is located.

In CM2:
For each CMCU and TMSU, 'aisle' should be set to the character containing the two-character floor number where each respective unit is located. For each alarm and status circuit (215A CM) in an RSM, 'aisle' should be set to the four-character designation for the aisle containing the switching module controller cabinet in which the alarm and status circuit is located. For each RAU in an RSM, ORM, or TRM, 'aisle' should be set to the four-character designation for the aisle containing the miscellaneous frame in which the RAU is located.

**Attribute: com_shelf**

**Fullname:** Compact shelf indicator

**Attribute Description** Indicates if the unit is located in the compact shelf. The compact shelf can support the MMSU, RAF, GDSF, and DLTU2 units.

**Attribute: cab_ref**

**Fullname:** Cabinet reference

**Attribute Description** Describes the physical placement of a hardware unit with respect to a *5ESS*®-2000 switch cabinet. Specifically, an AIU may be placed in the front or the rear of a cabinet.

**Attribute: pidb**

**Fullname:** Peripheral interface data bus (PIDB)

**Attribute Description** For each MSGS, 'pidb' should be set to zero. For each MSGS PC community, 'pidb' should be set to zero.

In CM1 and CM2:
For each TRCU or TRCU2, 'pidb' should be set to zero.

In CM2:
For each CMCU and TMSU, 'pidb' should be set to zero.
For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'pidb' should be set to zero. For each RAU in an RSM, ORM, or TRM, 'pidb' should be set to zero. The DFIs connected to the FIU are connected via facilities interface data buses (FIDBs). In this case the 'pidb' field refers to the FIDB.

**Attribute: sndpidb**

**Fullname:** Second PIDB

**Attribute Description** Contains the second PIDB (relative facility 1) terminating to a DFI-2 board. DFI-2s can be connected to the FIU via FIDBs. In this case, the 'sndpidb' field refers to FAC 1's FIDB. The default value for 'sndpidb' is 0x7F.

**Attribute: mtb0**

Copyright © 1999 Lucent Technologies 

**Fullname:** Metallic Test Bus _ mtb0.

**Attribute Description** This attribute is divided into sub-attributes mtb0.module and mtb0.circuit. For each MSGS, 'mtb0' should be (0,0). For each MSGS PC community, 'mtb0' should be set to (0,0).

In CM1 and CM2:
For each TRCU or TRCU2, 'mtb0' should be set to (0,#GLNULCKT).

In CM2:
For each CMCU and TMSU, 'mtb0' should be set to zero.
For each alarm and status circuit (215A CM) in an RSM, ORM, or TRM, 'mtb0' should be (0,0). For each RAU in an RSM, ORM, or TRM, 'mtb0' should be (0,0). and mtb0.circuit. For each MSGS, mtb0 should be (0,#GLNULCKT).
For each MSGS PC community, mtb0 should be set to (0,#GLNULCKT). mtb0 should be set to (0, #GLNULCKT). ORM, or TRM, mtb0 should be (0,#GLNULCKT). mtb0 should be (0,#GLNULCKT).

**Attribute: mtb0.circuit**

**Fullname:** circuit.

**Attribute Description** Circuit.

**Attribute: mtb0.module**

**Fullname:** Module

**Attribute Description** Module.

**Attribute: mtb1**

**Fullname:** Metallic Test Bus _ mtb1.

**Attribute Description** This attribute is divided into sub-attributes mtb1.module and mtb1.circuit. For each MSGS, mtb1 should be (0,#GLNULCKT).
For each MSGS PC community, mtb1 should be set to (0,#GLNULCKT).
mtb1 should be set to (0,#GLNULCKT).
ORM, or TRM, mtb1 should be (0,#GLNULCKT).
mtb1 should be (0,#GLNULCKT).

In CM1 and CM2:
For each TRCU or TRCU2, 'mtb1' should be set to (0,#GLNULCKT).

**Attribute: mtb1.circuit**

**Fullname:** circuit.

**Attribute Description** Circuit.

**Attribute: mtb1.module**

**Fullname:** Module

**Attribute Description** Module.

**Attribute: mtb[*]_idx**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Metallic Test Bus 0/1 circuit InDeX

**Attribute Description** This is the Metallic Test Bus 0 or 1 circuit index. For each Alarm and Status Circuit (215A CM) or Remote Alarm Unit (RAU/OAU) in an RSM, ORM, or TRM, mtb(0:1)_idx should be #GLNULCX.

**Attribute: mtb[*]_msu**

**Fullname:** Metallic Test Bus 0/1/Metallic Service Unit unit number

**Attribute Description** This the unit number of the Metallic Service Unit (MSU) to which the Metallic Test Bus (MTB) 0 or 1 terminates. For each Alarm and Status Circuit (215A CM) or Remote Alarm Unit (RAU/OAU) in a RSM, ORM, or TRM, mtb(0:1)_msu should be 0.

**Defines:**
"db/DMcircuit.h",
"db/DMcktindx.h",
"db/DMclidef.h"

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLrc_lphol

**Relation Description**
ISDN logical port holes for lportI.

Copyright © 1999 Lucent Technologies

SDN relation that stores the logical port holes for the ISDN lports (LPT_TYPE=LPT_ISDN, LPT_PKT, and LPT_BFG). These three types of lports are used for circuit SOPs, packet SOPs, and default service BFGs, respectively. Holes for the analog lports (LPT_TYPE=LPT_OTHER) are kept in relation RLrc_alpho.

Recent Change administers four separate link lists for each LPT_TYPE on each SM. For each LPT_TYPE, indices are distributed over these four link lists or queues. Reference population rules for RLrc_qidx for a strategic overview of how four linked list are maintained. RC adds a member to a link list when it is no longer needed. When an index is required, RC retrieves members from the link lists. If the link lists are empty then the next index is taken from RLrc_qidx.index.

NOTE - only member tuples are kept in this relation. The starting point for a link list is located in the RLrc_qidx relation (RLrc_qidx.succ attribute)

For new offices, ODA will sequentially assign lports from 1 to 8191 for each SM and populate RLrc_qidx.lport with the next lport to use for each SM. RLrc_qidx.qtyp will differentiate tuples for different types of lports.

Empty queue: Read module x, qtyp=LPORT, PKT_LPORT, or DFLT_LPORT, and qid y in RLrc_qidx. If RLrc_qidx.succ is zero, then queue y is empty.

Members on list: Read module x, qtyp=LPORT, PKT_LPORT, or DFLT_LPORT and qid y in RLrc_qidx. The RLrc_qidx.succ attribute points to the first member on the link list in RLrc_lphol. Read tuple in RLrc_lphol with mod=x, lpt_type=LPT_ISDN, LPT_PKT, or LPT_BFG (corresponding to RLrc_qidx.qtyp) and lport=RCrc_qidx.succ to obtain the first member. The first member has succ = 0 if it is the only member, otherwise it points to the next member in the link list. A succ attribute of 0 indicates the end of the link list. The attribute index in the relation RLrc_qidx defines the highest used lport index value if all four queues are empty (add 1 for the next available index).

**Attribute: module**

**Fullname:** Switching module

**Attribute Description** On each module four separate link lists exist for each LPT_TYPE.

**Attribute: lpt_type**

**Fullname:** Logical port type

**Attribute Description** There is a separate set of four queues for ISDN circuit lports, packet lports, and default service BFG lports.

**Attribute: lport**

**Fullname:** Logical port number

**Attribute Description** Sequentially assigned number used to cause a dense packing of lport keyed ISDN relations. Key value is the head cell of the link list for each SM. See RLfc_line.lport & RLgroup_port.lport (circuit lports), RLodpsop (packet lports), RLdslequip.dflt_lport (default service BFG lports), and RLrc_qidx for more information.

**Attribute: succ**

**Fullname:** Successor lport

**Attribute Description** Key pointer to next member of the link list or 0 to indicate no or last member on the list.

## 4. Population Rules for RLrc_mminf

**Relation Description**
Recent change (RC) multi-line hunt group information.

This relation contains the RC information for a multiple line hunt group (MLHG).

Copyright © 1999 Lucent Technologies

There will be a tuple for each MLHG which has an attendant MLHG associated with it (that is, this MLHG itself is controlled by an ATT MLHG or an ATT Remote Busy Verify trunk). The key, mem will always be 0 (represent the whole group). The attribute, mbs will always be DBNO.

**Attribute: mlhg**

**Fullname:** Multiple Line Hunt Group number

**Attribute Description** This key specifies the multiple line hunt group number which hunt type is RTH_CIRCULAR, RTH_LGCIR, RTH_REGULAR, RTH_LGREG, RTH_UCD, RTH_LGUCD, RTH_PPSMHG, or RTH_PPLMHG and is controlled by the attendant multiple line hunt group.

**Attribute: mem**

**Fullname:** Multiple Line Hunt Group member number

**Attribute Description** This key specifies the member number of this MLHG. It will always be 0 because this relation is used to represent the whole MLHG.

**Attribute: mbs**

**Fullname:** may be shared flag

**Attribute Description** This attribute indicates that this is a shared DN or not, it will always be DBNO.

**Attribute: rbv**

**Fullname:** Remote Busy Verify indication flag

**Attribute Description** The rbv attribute will indicate that the multiline hunt group DN is Remote Busy Verifiable. IF rbv=DBYES then the value in the att_grp attribute will represent the remote busy verify trunk (RBVT) group number associated with the multiline hunt group.

**Attribute: att_grp**

**Fullname:** Attendant Multiple Line Hunt Group number

**Attribute Description** When the rbv attribute is set to DBNO, this attribute contains the attendant MLHG number which is associated with the MLHG found in the 'mlhg' attribute. Otherwise, If rbv=DBYES then this attribute contains the ISAT busy verify trunk (BVT) group number.

## 4. Population Rules for RLrc_msusr

**Relation Description**
Message Service Groups List.

This relation joins RLmdc_grp.G and RLmds_grp.G to support a verify only RC/V view 4.36.

Note that the OCDN COUNT is derived by subtracting RLrc_msusr.rdn_cnt from RLrc_msusr.cdn_cnt. This count (ocdn) is displayed on RC view 4.36 along with the value of RLrc_msusr.rdn_cnt.

**Attribute: mdc_no**

**Fullname:** Message Desk Center Number

**Attribute Description** This attribute points to a valid Message Desk Center in the relation RLmdc_grp.

**Attribute: cdn_cnt**

**Fullname:** Dependent DNs with a non-null value for client TN type.

**Attribute Description** This attribute serves as a counter for the number of dependent DNs with a non-null value for RLrt_dntran.client_typ. This counter is 4 bits and allows a maximum of 15 group dependent DNs. Whenever cdn_cnt is greater than 0, changing an MSC to non-MSC MLHG service is not allowed.

**Attribute: rdn_cnt**

**Fullname:** Dependent DNs with client TN type set to MSS_RDN.

**Attribute Description** This attribute serves as a counter to indicate the number of dependent DNs with RLrt_dntran.client_typ set to MSS_RDN.

This counter is designed for RC/V to provide a mechanism for RC/V to prevent users from changing MSC type from 'Deluxe' to 'Basic', provided that rdn_cnt is greater than 0. In other words, if rdn_cnt is greater than 0, the associated RLmdc_grp.ap_id must not equal 0.

**Attribute: dummy**

**Fullname:** dummy (not used)

Copyright © 1999 Lucent Technologies 

**Attribute Description** dummy (not used)

**Attribute: mds_id00 through mds_id17**

**Fullname:** Message Service Group I.D.

**Attribute Description** This attribute points to a valid Message Desk Service group number in the relation RLmds_grp.

**Attribute: nxbcid00 through nxbcid17**

**Fullname:** Index of BCID (business customer ID) in RLmdc_grp

**Attribute Description** Used as an index to gcsrid(0-5) in RLmdc_grp.

**Attribute: deluxe00 through deluxe17**

**Fullname:** Deluxe service flag

**Attribute Description** Indicates whether group has deluxe service or not. If this value is DBYES, then RLmds_grp.ap_id must have a non-zero value; if DBNO, then RLmds_grp.ap_id must be zero.

**Attribute: servid00 through servid17**

**Fullname:** Service Identifier

**Attribute Description** Identifies the MSS that is providing message service for an MSS group when more than one MSS group resides on an Applications Processor (AP).

# RC_MULTIDN

## 1. Description

This relation keeps track of all the Directory Numbers associated with a port. The port must belong to a member of a multiline hunt group. This relation is only populated for ports that have more than one DN. It is keyed by the noc and last four digits of the DN.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 15000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application | RCDATA |
| relation type | DBSTATIC |
| head table size | 2048 |
| data page size | 512 |
| page level | 0 |
| foldtype | DBGC31 |

## 3. Field Layout

## 4. Population Rules for RLrc_multidn

Copyright © 1999 Lucent Technologies

**Relation Description**
RLrc_multidn.

This relation keeps track of all the Directory Numbers associated with:
1. A member of a multiline hunt group or the subgroup of a MUPH or ISAT group that has multiple directory numbers. If the multiline hunt group is for Modem Pooling, then multiple dns are not allowed.
2. An individual analog line that has the Multiple Directory Numbers Per Line with Distinctive Ringing feature.
3. It is keyed by the noc and last four digits of the DN.

This relation is a series of linked lists where the initial tuple in the list represents the base/master TN for the line. The master tuple points to another tuple in the list which may point to another tuple. The linked list ends when the next TN is set to 0. There is no limit (other than relation size) on the length of the list, but this list should have at least 2 members (or it wouldn't be a multiple DN line).

**Attribute: locdn**

**Fullname:** Local Directory Number

**Attribute Description** This attribute consists of noc (Normalized Office Code) and the last four digits of a directory number. This gets populated when more than one dn is assigned to a member of a multiline hunt group, to a subgroup of a MUPH group or to an individual analog line.

**Attribute: locdn.noc**

**Fullname:** Normalized Office Code

**Attribute Description** It represents the NOC associated with the DN.

**Attribute: locdn.digits**

**Fullname:** Last 4 digits of the Directory Number

**Attribute Description** It represents the last 4 digits of the DN.

**Attribute: port**

**Fullname:** port

**Attribute Description** Indicates the port associated with this DN.

**Attribute: party**

**Fullname:** Party Value

**Attribute Description** Indicates the party value associated with this DN.

**Attribute: module**

**Fullname:** Switching Module

**Attribute Description** The module that the port is on.

**Attribute: nextlocdn**

Copyright © 1999 Lucent Technologies 

**Fullname:** Next Local Directory Number

**Attribute Description** It is the pointer to the next tuple (dn) that also belongs to the same MLHG member, subgroup of the MUPH group or pots line. If there is no next multiple dn value, the attribute is null. If this attribute is not null, then there must also be a tuple in this relation keyed by this noc and digits.

**Attribute: nextlocdn.noc**

**Fullname:** Normalized Office Code

**Attribute Description** It represents the Normalized Office Code.

**Attribute: nextlocdn.digits**

**Fullname:** Last 4 digits of Next Local Directory Number

**Attribute Description** It represents the last 4 digits if the next local directory number.

## 4. Population Rules for RLrc_odb

**Relation Description**
Recent change assignable PH+CNs.

This relation is used by Recent Change to select an available PH and Channel for the 'On Demand B Packet' (ODB) feature. If a PH and Channel were entered via RC then RC will look for that PH and Channel in this relation. If no match is found it is an error. If a tuple is found that matches, RC will remove it. On the other hand if no PH and Channel were entered on the Recent Change, when adding ODB, then RC will search RLrc_tur for the least loaded PH shelf. RC will then search this relation for a match on that shelf. If none is found RC returns to RLrc_tur for the

Copyright © 1999 Lucent Technologies 

next least loaded PH shelf. When there is a match in this relation, RC will remove that tuple and use the PH and Channel it found to populate the Packet Switching relations (such as RLpsx25ln).

***NOTE:*** When ODB users are to be added to the switch, office personnel should first select the PH/PH-channels that will be used for this purpose, because once selected for ODB use they cannot be used for any other purpose or even shared for any other purpose until this is undone. All arrangement for load balancing can be used whereby, for example, one heavy user, a few moderate users, or several light users would be put on the same PH. These PH/PH-channels would then be reserved for ODB use by creating tuples in the relation RLrc_odb. When the ODB feature is assigned to a user, a PH/PH-channel is chosen (via switch personnel selection or by an algorithm executed by the switch) and the corresponding tuple is then removed for RLrc_odb. The band value is stored in a new tuple in RLodpsop created for this user, and the attribute odb_usr in the appropriate RLrc_tur is incremented. When the ODB feature is taken away from this user, the odb_usr attribute is decremented, a tuple of RLrc_odb is created, and a tuple of RLodpsop is deleted.

As of 5E9, X.25 Packet Switching will no longer be supported by the PH2 Access Image. X.25 ports will only be supported on PH3's. Since the ODB feature will now only be supported on PH3's, PH/PH-channels may only be reserved on PH3's.

Note: This relation is populated only for the first PH channel of an ODB ISCN; here are the characteristics of an ODB ISCN:

- An ODB ISCN is identified by the first PH channel used.
- An ODB ISCN represents four consecutive PH channels.
- The first ODB channel must have a number evenly divisible by four (such as 0, 4, 8, etc.).

**Attribute: module**

**Fullname:** SM module number

**Attribute Description** Identifies a specific SM for an ISLU

**Attribute: shelf**

**Fullname:** PSU Shelf number

**Attribute Description** This is the shelf component of 'ph_number'. It is used to indicate the PSU shelf a PH and Channel are on. It is related to the shelf field in RLrc_tur.

**Attribute: lph**

**Fullname:** Logical PH number

**Attribute Description** Logical PH number component of a 'ph_number'. (shelf << 4) + lph = ph_number

**Attribute: ph_cn**

**Fullname:** Ph channel number

**Attribute Description** PH channel number available for assignment to the ODB feature user.

**Attribute: band**

Copyright © 1999 Lucent Technologies 

**Fullname:** Usage classes

**Attribute Description** For Service Provide to engineer Users among PH's. This field is used to restrict usage of PHs to select users. When ODB is assigned to a DSL user, the Service Provider also can enter a band value. When RC finds a tuple in this relation it can use it and will compare the tuples 'band' with the entered 'band' and select the tuple if they match. If they don't RC will select another tuple until one is found that matches. This field is copied to RLodpsop when this relation tuple is deleted and copied back when RLodpsop is deleted.

***NOTE:*** The domain used following (DMuchar) was chose for execution efficiency. Reason being: only 4 bits needed.

## 4. Population Rules for RLrc_oeinfo

**Relation Description**
Recent change origination equipment information.

This relation contains administrative information for line ports.

This relation is used for Recent Change. The relation contain origination information per line.

**Attribute: port**

**Fullname:** Global port name (SM number not included).

**Attribute Description** This is the logical port name of the line being assigned.

**Attribute: portmod**

**Fullname:** Module number on which the global port is defined.

**Attribute Description** This attribute is SM on which the logical port is assigned.

**Attribute: party**

**Fullname:** Party Identifier

**Attribute Description** This attribute indicates the user number for this port. The range on this value may be from 0 thru 9 depending on the type of service class and ringing allowed. For mutli-party service this attribute indicates the type of ringing that can be done per that user.

**Attribute: lcc**

**Fullname:** Line Class Code

**Attribute Description** The lcc and rax is used to determine the class of service that is assigned to this logical port. For further details see the population rules for RLrc_lcc.p.

**Attribute: rax**

**Fullname:** Rate center

**Attribute Description** The lcc and rax is used to determine the class of service that is assigned to this logical port. For further details see the population rules for RLrc_lcc.p.

**Attribute: rem**

Copyright © 1999 Lucent Technologies 

**Fullname:** Remarks

**Attribute Description** This attribute is used for a character string for remarks.

**Attribute: esl**

**Fullname:** Essential Service Line

**Attribute Description** This attribute is used to indicate if this port has essential service protection.

**Attribute: portgrp**

**Fullname:** Multi-line hunt group number (group type not included).

**Attribute Description** For mutlti-line hunt group members this attribute is used for the group number for the member assigned to that port.

**Attribute: porttyp**

**Fullname:** Port Type

**Attribute Description** Type of port for multi-line hunted group members.

**Attribute: member**

**Fullname:** MLH Member Number

**Attribute Description** For multi-line hunt group members this attribute is used for the member number assigned to the port.

**Attribute: mkbusy**

**Fullname:** Make Busy Key

**Attribute Description** This attribute is used for the port of the make busy key. The SM number is not included in the attribute.

**Attribute: mkbsymod**

**Fullname:** Make busy module.

**Attribute Description** This attribute is used for the module of the make busy scan point.

**Attribute: rmkbusy**

**Fullname:** Random Make Busy Key

**Attribute Description** Port (scan point) of the Random Make Busy Key associated with this line.

**Attribute: rmkbsymod**

**Fullname:** Module of Random Make Busy port (scan point)

**Attribute Description** Number of the module on which the Random Make Busy key is physically located.

**Attribute: sphtkey**

Copyright © 1999 Lucent Technologies 

**Fullname:** Stop Hunt Key

**Attribute Description** This attribute is used for the port of the stop hunt key. The module number is not included in the attribute.

**Attribute: sphkymod**

**Fullname:** Stop Hunt Key Module

**Attribute Description** This attribute is used for the module of the stop hunt key scan point.

**Attribute: att_grp**

**Fullname:** Attendant Group

**Attribute Description** When the rbv attribute is set to DBNO and att_grp is greater than 0, then this attribute has the value of an attendant multiline hunt group number associated with the primary DN. Otherwise, if rbv=DBYES and att_grp is greater than 0, then this attribute contains the incoming ISAT Busy Verify Trunk (BVT) group number. If att_grp equals 0 then this primary DN is not associated with any ISAT multiline hunt group or ISAT busy verify trunk.

```
Note: The check for a bit set in RLtgcntmsk
      as the relation of the DN corresponding to this port
      in RLrc_oeinfo will be done from RLtgcntmsk.
```

**Attribute: acof_cnt**

**Fullname:** Attendant Control of Facilities Count

**Attribute Description** Number of attendant control of facilities buttons associated with this port.

**Attribute: lsf_cnt**

**Fullname:** LASS Selective Feature Count

**Attribute Description** This field is used to keep track of the total subscription count for all DNs including secondary only DNs which subscribe to any of 5E6 LASS features. If this field is zero, the lsf_sub field in FC_LINE must be DBNO. If non-zero, the lsf_sub field must be set to DBYES.

For those lines which have a corresponding tuple in RLltsbport, the lsf_cnt attribute is only be maintained on the main(lead) port of 1-TN Line Time Slot Bridging lines (LTSB). The value of this attribute on an associated non-lead port is a `don't care'.

**Attribute: nohuntcnt**

**Fullname:** Number of No-hunt DNs

**Attribute Description** This field is used to keep track of the total count for all no-hunt DNs for this port which is a member of a MLHG where the multi-dn (fc_line.locdn) is the primary DN.

**Attribute: rbv**

**Fullname:** Remote Busy Verify Indication Flag

**Attribute Description** The rbv attribute will indicate that this DN is Remote Busy Verifiable. If rbv=DBYES then the value in the att_grp attribute will represent the incoming ISDN Attendant

Copyright © 1999 Lucent Technologies 

(ISAT) Busy Verify Trunk (BVT) group number associated with the primary DN. If rbv=DBNO then the DN is not Remote Busy Verifiable.

## 4. Population Rules for RLrc_olth

**Relation Description**
Logical termination index holes for unshared analog and trunks.

Relation that stores the ltm_idx holes for unshared analog and trunks where ltm_type - LTM_OTHER. This relation is used by recent change (RC) only.

The module number is always non-zero. RC keeps four separate ltm_idx link lists for each SM. Reference population rules for RLrc_qidx for a strategic overview of how four linked list are maintained. RC adds a member to a link list when it is no longer needed. This may be due to a unshared analog or trunk being deleted. When an ltm_idx is required to be assigned port on a SM, RC uses the members from the link list. If the link list is empty then the next index is taken from RLrc_qidx.
NOTE - only member tuples are kept in this relation. The starting point for a link list is located in the RLrc_qidx relation (RLrc_qidx.succ attribute).
For new offices, ODA will sequentially assign ltm_idices from 1 to 8191 for each SM and populate RLrc_qidx with the next ltm_idx to use for each SM.
Empty queue: Read module x, qtyp=LTM_IDXO, and qid y in RLrc_qidx.If RLrc_qidx.succ is zero, then queue y is empty.
Members on list: Read module x, qtyp=LTM_IDXO, and qid y in RLrc_qidx. The RLrc_qidx.succ attribute points to

Copyright © 1999 Lucent Technologies 

the first member on the link list in RLrc_ilth. Read tuple in RLrc_ilth with mod=x and ltm_idxo=RCrc_qidx.succ to obtain the first member. The first member has succ = 0 if it is the only member, otherwise it points to the next member in the link list. A succ attribute of 0 indicates the end of the link list. The attribute index in the relation RLrc_qidx defines the next available ltm_idxo index value if all four queues are empty.

**Attribute: module**

**Fullname:** Switching module

**Attribute Description** For each module there are separate LTM_IDX link lists.

**Attribute: ltm_idxo**

**Fullname:** LTM_OTHER hole index

**Attribute Description** It is assigned sequential hole reuse implemented using this relation by RC. Key value 1-8191 used to link idle holes.

**Attribute: succ**

**Fullname:** Successor ltm_idxo

**Attribute Description** Key to next member of link list or 0 to indicate no or last member on the list.

## 4. Population Rules for RLrc_pdrmk

**Relation Description**
Pdit remarks.

There is a tuple in this relation for every tuple in RC_PDIT and corresponding terminal digit in DAPRLDGT. Populated if there is a tuple in relation RC_PDIT and corresponding terminal digit in DAPRLDGT.

**Attribute: pdit**

**Fullname:** Preliminary digit

**Attribute Description** pdit - This is part of the key and corresponds to one tuple in relation RC_PDIT.

**Attribute: rcdigs**

**Fullname:** rc digits

**Attribute Description** rcdigs - This is part of the key, and corresponds with pdit to one terminal digit in relation DAPRLDGT.

**Attribute: calltype**

**Fullname:** The type of call this is.

**Attribute Description** The value of call type is determine from RLdaprlfnl.desttype (see checks section for this relation in the 235-600-123 Populations Rules Language (PRL) Data manual).

**Attribute: rem**

**Fullname:** remark, about rc_pdit tuple

**Attribute Description** rmk - Used to record a remark about a specific path in the Incoming Trunk Digit Interpreter Table.

## 4. Population Rules for RLrc_pgmu

**Relation Description**
Call pick-up group, module users.

This relation contains the number of terminating call appearances for users of a terminating predesignated queue, call pick up group, for each switching module containing users of the group. If there are no users of a group on a switching module, then there is no tuple in this relation.

**Attribute: pugroup**

**Fullname:** Pick Up Group

**Attribute Description** The call pick up group identifies directory numbers and multiline hunt group members whose calls are queued together for possible answering by another station.

**Attribute: module**

**Fullname:** Switching Module number

**Attribute Description** Module is the specific switching module serving directory numbers or

Copyright © 1999 Lucent Technologies 

multiline hunt group members whose calls may be queued together for call pick up.

**Attribute: users**

**Fullname:** Number of terminating call appearances using the pick up group.

**Attribute Description** Indicates the number of terminating call appearances of users of the call pick up group on the switching module.

# RC_PGRPRMK

## 1. Description

Remarks associate with MLH group views.

This is a virtual update relation. The root storage relation is RLpgrp_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RC_PGRPRMK.

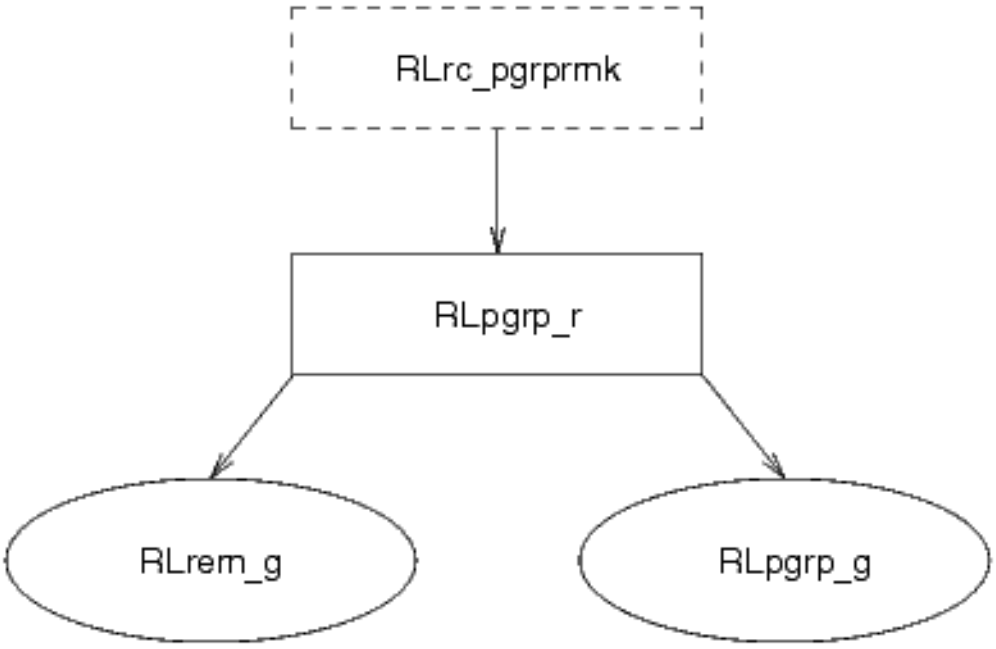

**Figure 1 Virtual Relation RC_PGRPRMK**

## 4. Population Rules for RLrc_pgrprmk

**Relation Description**
Remarks associate with multiline hunt group views.

This relation contains remarks associate with multiline hunt groups.

**Attribute: portgrp**

**Fullname:** Logical Port Group Identifier

**Attribute Description** This attribute consists of the grpnum (multiline hunt group number) and grptype (which will always be TM_LINE).

**Attribute: portgrp.grpnum**

**Fullname:** Multiline Hunt Group Number

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Decimal number assigned to multiline hunt group.

**Attribute: portgrp.grptype**

**Fullname:** The group type of multiline hunt group.

**Attribute Description** In this case the grptype will always be TM_LINE.

**Attribute: rem**

**Fullname:** Character String for Remarks

**Attribute Description** Remarks to describe the multiline hunt group.

**Attribute: tn**

**Fullname:** Multiline Hunt Group Directory Number

**Attribute Description** This attribute consists of the noc (normalized office code) and four directory number digits.
If RLrt_mhg.htype in RLrt_mhg tuple keyed by RLrc_pgrprmk.portgrp.grpnum is :

(A) RTH_ISAT or RTH_MUPH -
The tn must be null (noc = 0, digits[0] = '0'), there must be a tuple in RLrtdn_mhg with RLrtdn_mhg.grpnum = RLrc_pgrprmk.portgrp .grpnum and a tuple in RLrt_dntran keyed by RLrtdn_mhg.locdn with RLrt_dntran.ucd_muph = DBYES.

(B) RTH_UCD or RTH_LGUCD -
If there exists an RLrtdn_mhg tuple keyed by RLrc_pgrprmk.portgrp .grpnum, then there must be a tuple in RLrtdnmpg and RLpr_dntran keyed by RLrc_pgrprmk.tn, else this group has no modem pooling on it and there must be a tuple in RLrtdn_mhg keyed by RLrc_pgrprmk.tn and also a tuple in RLrt_dntran keyed by RLrc_pgrprmk.tn, with RLrt_dntran.ucd_muph = DBYES.

(C) RTH_PSUCD or RTH_PSLGUCD -
There must be a tuple in RLpr_dntran keyed by RLrc_pgrprmk.tn or a tuple must exist in RLrtdnmod keyed by RLrc_pgrprmk.tn.noc and RLrc_pgrprmk.tn.digits[0:1].

(D) other hunt types -
If there exists an RLgroup_port tuple keyed by RLrc_pgrprmk.portgrp and RLgroup_port.member = 1, then there must exist a tuple in RLrt_dntran keyed by RLrc_pgrprmk.tn with RLrt_dntran.portname = RLgroup_port.port, else this group has no members and there must not exist a tuple in RLrt_dntran keyed by RLrc_pgrprmk.tn.

**Attribute: tn.noc**

**Fullname:** Normalized Office Code

**Attribute Description** Noc code assigned to phone number of group if a phone number is assigned.

**Attribute: tn.digits**

**Fullname:** Directory digits

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Last four digits assigned to phone number of group if a phone number is assigned.

**Attribute: rax**

**Fullname:** Rate Center for Group

**Attribute Description** Rate center is derived from relation RLrc_oeinfo.

**Attribute: cf**

**Fullname:** Call Forwarding Variable Feature

**Attribute Description** Does multiline hunt group have call forwarding variable allowed? An enumeration of DBNO says it doesn't. Dependency: Derived from mhg_opts attribute of same name keyed by feat_id from this tuple.

**Attribute: cfbusy**

**Fullname:** Call forwarding busy line feature

**Attribute Description** Does multiline hunt group have call forwarding busy line allowed? An enumeration of DBNO says it doesn't. Dependency: Derived from mhg_opts attribute of same name keyed by feat_id from this tuple.

**Attribute: grpcfbl**

**Fullname:** MLHG Call Forwarding Busy Line Assigned

**Attribute Description** This attribute indicates whether the MLHG has call forwarding busy line assigned. In addition, if a call forwarding busy line feature is assigned, this attribute indicates whether the call forwarding busy line feature has either the CFBL inhibit make busy or inhibit line busy parameter assigned or not. CFBL_NULL indicates the MLHG does not have a CFBL feature assigned. CFBL_ASGN indicates the MLHG has a CFBL feature assigned but which does not have the CFBL inhibit make busy or inhibit line busy parameter assigned. CFBL_IMLB indicates the MLHG has a CFBL feature which also has either the CFBL inhibit make busy or inhibit line busy parameter assigned.

**Attribute: std_bri_cnt**

**Fullname:** Count of Circuit MLHG Members on a Standard BRI

**Attribute Description** The attribute will be used as a counter to keep track of the number of circuit MLHG (Multi-Line Hunt Group) members that are on a standard BRI.

**Attribute: feat_id**

**Fullname:** Feature Identification of Associated Multiline Hunt Group

**Attribute Description** The values of feat_id will be:

```
high order byte = MFMLHG from DMmftype
low  order byte = any value
```

Dependency: The feat_id must be found as a key in RLfacftdsc.

**Attribute: grpdn_mbrs**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Number of Members Using the Group or Subgroup DN

**Attribute Description** This field indicates the number of MLHG members which send the group/listed DN or the subgroup 1 DN (ISAT) in the routing message upon originating. Such a member does not have either an individual DN or a no-hunt DN, that is, the locdn for ltm_type LTM_OTHER in FC_LINE (or the noc, loc in IS_LINE if ltm_type is LTM_ISDN) must be zero. The exception is for regular, circular and ISAT hunt types, where member 1's DN or an ISAT member DN is also the group/listed or subgroup DN. In this case, the member is counted in grpdn_mbrs as a user of the group/listed or subgroup DN.

When such a member is added to a MLHG (as defined as seen here), this field should be incremented by one. When such a member is removed from the MLHG, this field should be decremented by one.

When the hunt type of an existent MLHG is changed (via RC update), this field should be administered accordingly. For example, When a regular or circular hunt type MLHG is changed to a UCD hunt type, if member 1 DN is retained as the group/listed DN, then it will be deleted as the member 1 DN. In this case, since member 1 was already include in count of group DN users, (even though it becomes a 'no DN' member, that is, FC_LINE/IS_LINE locdn = 0), this field is not incremented by one. When a UCD hunt type MLHG is changed to a regular or circular hunt type, if member 1 already has a DN, then the group DN would be added to member 1 (multidn case) and therefore this field is increment by one (since member one could send the group/listed DN on originating). However, if in the UCD to regular or circular change case the member 1 did not previously have a DN associated with it, the member 1 would be assigned the group/listed DN and this field is not decremented by one (since member 1 will still send the group/listed DN on originating).

When this field changes from zero to non-zero, the grpdn_flag in RLrt_mhg must be set to DBYES. Likewise, when this field changes from non-zero to zero, the grpdn_flag in RLrt_mhg must be set to DBNO.

**Attribute: mlhgid**

**Fullname:** BCLID Multi-Line Hunt Group ID

**Attribute Description** This is a two character attribute that is used to store the two digits that identify the MLHG in the BCLID message that is sent to the CPE. The values for this attribute range from 00 to 99, or default to a NULL character. This is not an unique value among the BCLID users. This attribute is used to identify the MLHG that generates the BCLID message if two or more MLHG terminates to the same AP. No automatic assignment is required for this attribute. This attribute is maintained in this relation and also in RLbcl_mhtg.mlhgid.
BCLID requires this attribute because this feature exist already in the 1A Switch. This attribute only provide extra information in the BCLID message that is sent to the AP. The user of BCLID may or may not want to assign a value to this attribute.

# RC_PGTC

## 1. Description

This relation is used by RCV to associate the Pair Gain Test Controller (PGTC) identification with the Metallic Service Unit (MSU) Metallic Test Bus (MTB) and MSU Distribute (DIST) pack distribute point that is wired to the PGTC test circuit. This relation is closely associated with the SM relation RLpctc.h which also stores the MTB and distribute point information for operational use. This relation should only be populated in offices that have Universal *SLC*® 96 systems and PGTCs that have the integrated Mechanized Loop Testing (MLT-2) capability.

## 2. Data Dictionary Values

## 4. Population Rules for RLrc_pgtc

**Relation Description**
Pair gain test controller.

This relation is used by RCV to associate the PGTC identification with the MSU, MTB and MSU distribute (DIST) pack distribute point that is wired to the PGTC test circuit.

This relation is closely associated with the SM relation RLpgtc which also stores the MTB and distribute point information for operational use. This relation should only be populated in offices that have Universal *SLC*® 96 systems and PGTCs that have the MLT-2 capability.

**Attribute: pgtc_frame**

**Fullname:** PGTC frame number

**Attribute Description** With the exception of PGTC frames that may exist at a RSM, there is only one PGTC that exists at the host office. The host PGTC frame will always be identified with one (1). RSM PGTC frame numbers will begin with the module number associated with the RSM. In the case of clustered RSMs, only the one PGTC frame would service the cluster and the frame number chosen should correspond to the lowest numbered module in the cluster. This field is also populated as an attribute in the appropriate SM relation RLpgtc.

**Attribute: pgtc_member**

**Fullname:** PGTC trunk member

**Attribute Description** PGTC trunk members and are labeled 1 to 255, although no one PGTC frame should ever have this many trunks based on the engineering rules required that there can exist no more than one PGTC test trunk per MSU shelf in a service group. The PGTC trunk members will always be a part of the PGTC frame at a site. Members cannot be mixed between frames. This field is also populated as an attribute in the appropriate SM relation RLpgtc.

**Attribute: im**

**Fullname:** Module number

**Attribute Description** Module number which contains the MSU with the MA pack and DIST associated with the particular PGTC test circuit pack. This field indicates the appropriate SM where the relation RLpgtc is populated with associated information.

**Attribute: msu**

**Fullname:** PGTC Metallic Test Unit

**Attribute Description** 1 bit - MSU unit number - 0 or 1. This attribute identifies the MSU that terminates the PGTC test circuit. This attribute is the part of the key to the SM partitioned relation RLpgtc in the SM indicated by the im attribute number.

**Attribute: sg**

**Fullname:** PGTC - Service Group

**Attribute Description** 1 bit - MSU service group number - 0 or 1. This attribute identifies the MSU

Copyright © 1999 Lucent Technologies 

service group that terminates the PGTC test circuit. This attribute is part of the key to the SM partitioned relation RLpgtc in the SM indicated by the previous im attribute.

**Attribute: shelf**

**Fullname:** PGTC shelf

**Attribute Description** 2 bits - MSU shelf number - 0 to 3 (if using old MSU default shelf number is 0). This attribute identifies the MSU shelf that terminates the PGTC test circuit. This attribute is part of the key to the SM partitioned relation RLpgtc in the SM indicated by the previous im attribute number.

# RC_QEND

## 1. Description

This relation is used by Recent Change to determine the next available QLPS qendpoint address for a CCS QPH in the QLPS Network. The attributes will be used as a bit map for QLPS qendpoint addresses between 197 and 255 (valid range of CCS QPH Qendpoint Addresses).

## 4. Population Rules for RLrc_qidx

**Relation Description**
Recent Change Queue Index.

This relation stores the first index hole and the next available index value for the ltm_idxo, ltm_idxi, alport, lport, latidx, pkt_lport, dflt_lport, iclid, facid, circuit, port, and GSDB index types. Recent Change maintains separate queues or linked lists of index holes for each SM. The queues are maintained in the relations RLrc_olth, RLrc_ilth, RLrc_lahol, RLrc_alpho, RLrc_lphol, RLic_lth, and RLrc_hole. RLrc_lphol contains holes for lports with lpt_type=LPT_ISDN, LPT_PKT, & LPT_BFG, which correspond to qtypes of lport, pkt_lport & dflt_lport. RLrc_hole is a general hole relation. It is used by circuit, port, and GSDB and should be also by used by any new indices in the future instead of defining a new relation.

This relation contains from one to four tuples for each index type on each SM, depending on the type. The RLrc_qidx.succ attribute points to the first member on the link list of index holes in the respective relation (that is, the RLrc_qidx.succ attribute represents the starting point for the link list located in the hole relations). The

Copyright © 1999 Lucent Technologies 

RLrc_qidx.numholes attribute tells how many holes there are in the list for the queue types that use RLrc_hole, but is 0 for the other queue types. The RLrc_qidx.index attribute contains the next available index value.

Index retrieval: Determine the queue to be used to retrieve the index. Read the tuple with module x, qtyp=<type of index to be retrieved>, and qid=<queue identifier> within the relation RLrc_qidx. The RLrc_qidx.succ points to the first index hole withing the queue. read the tuple within the corresponding hole relation to obtain the index hole. If the value of RLrc_qidx.succ is zero, the RLrc_qidx.index attribute value represents the next available index (0 if there are none left)

For new offices, four tuples will be initialized for each queue type, for each SM, except just one for circuit and GSDB. The value of successor will be zero if no index holes exist for the specified queue type and queue identifier in the corresponding hole relation. Numholes tells how many holes are present for the queue types that use RLrc_hole; it is 0 for the queue types the use relations other than RLrc_hole (see list in first paragraph). For each queue type, the tuple with the queue identifier of zero will contain an index value which generates a remainder of zero when the index value is divided by the number of queues for that queue type. Similarly, tuples with the queue identifier value of X will contain index hole values which generate remainders of X respectively when divided by the number of queues. The next available index value represents the highest index value which has not been used. The exception is that if all the indices have been allocated from a given queue, the index value is set to 0 regardless of the queue ID. For new offices in which the indices have not been used to populate other relations, the next available index attribute will be initialized to N, 1, 2, . . ., N-1 in queues 0, 1, 2, . . ., N-1, respectively, where N is the number of queues for this queue type. In offices where indices have been used, the index attribute must be set to the first legal unallocated value (0 if there are none), excluding values for which there are holes. To see if a particular value has been allocated, you must check different relations, depending on index type (see poprules for each hole relation).

**Attribute: module**

**Fullname:** Switching Module

**Attribute Description** Recent Change and ODA support separate index queues for each SM. The index corresponds to the SM defined by this attribute value.

**Attribute: qtyp**

**Fullname:** Queue Type

**Attribute Description** Queue type defines the index type.

**Attribute: qid**

**Fullname:** Queue Identifier

**Attribute Description** Queue identifier defines separate link lists for each index type. The range of qid is zero through the number of queues for this qtyp minus 1. Thus this attribute defines up to four queues or link lists. For each queue type this relation contains a tuple for each queue identifier value. The index value is divided by the number of queues to determine which queue the index belongs to. The remainder of this division is the appropriate queue number. For example, if this qtyp uses four queues, the queue identifier attribute value for tuple with an index attribute value of five is one.

**Attribute: index**

**Fullname:** Next Available Index

**Attribute Description** This attribute defines the next available index value for the given index type and queue identifier of the tuple. If all the indices are used up, index is set to zero. The next

Copyright © 1999 Lucent Technologies 

available index value is retrieved if there are no index holes in the queue (value of successor is zero). Indices are distributed between the queues. The appropriate queue is determined by dividing the index value by the number of queues. The remainder of this division represents the appropriate queue number.

**Attribute: succ**

**Fullname:** Successor

**Attribute Description** The successor attribute points to the first index hole member within the corresponding index hole relation. If there are no index holes for the specified queue type and queue identifier, the successor attribute has a value of zero.

**Attribute: numholes**

**Fullname:** Number of Holes

**Attribute Description** Numholes is used only by the queue types that use RLrc_hole. It tells how many hole tuples there are in RLrc_hole corresponding to this tuple of RLrc_qidx. It is used to help Recent Change determine which queue to select.

## 4. Population Rules for RLrc_qkey

**Relation Description**
Unused RLqkeyport keys deleted via RC/V.

Whenever a qkeyport relation tuple is deleted, a new tuple should be added to this relation using the qkeyport tuple key, qkey, as its key.
When a new qkeyport tuple is to be inserted, the key, qkey, will be found in this relation by searching for the first defined tuple and the key to that tuple will be the key to the new qkeyport tuple. The tuple in this relation will be deleted in this case. If there are no tuples in this relation, them the qkeyport tuple key will be the number found in RLrc_idx.qkeyidx.

**Attribute: qkey**

**Fullname:** Arbitrary key used by RC nad RTA to represent hunted trunk ports

**Attribute Description** Whenever a qkeyport relation tuple is deleted, a new tuple should be added to this relation using the qkeyport tuple key qkey as its key.

**Attribute: dummy1**

**Fullname:** dummy - unused attribute

**Attribute Description** This is a dummy attribute - it is unused

# RC_QTMS

## 1. Description

This relation defines the HDLC channels and timeslots that have been assigned to QLPS pipes on this QTMSLNK. This relation is used by RC/V when a new QLPS pipe is assigned. See RLqlps for a definition of QLPS hardware that is used in the 5ESS(R)-2000 switch for hign bandwidth message transport and RLtmspipe for more information on QLPS pipes.

## 4. Population rules for RLrc_qtms

### Relation Description

Quad-Link Packet Switch TMS links for RC/V

This relation defines resources that have been allocated to a QTMSLNK. A QTMSLNK is a TMS link used by the QLPS (Quad-Link Packet Switch) Hardware. QLPS is part of SN-2000 and is an overlay network to provide high bandwidth message transport between SM-2000's and between SM-2000's and existing processors. Each QLPS hardware board takes 4 ports (TMS links) on the ONTC.

RC/V will use this relation when new QLPS pipes are assigned in the office to see what resources are available on the QTMSLNK that can be used for a new pipe.

**Attribute:**

qtmslnk

**Fullname:**

QLPS TMS link (QTMSLNK)

**Attribute Description:**

This attribute identifies a QTMSLNK that has QLPS pipes assigned to it.

**Attribute:**

qnetwork

Copyright © 1999 Lucent Technologies 

**Fullname:**
QLPS Network
**Attribute Description:**
This attribute is the QLPS network, which can only be 0 or 1 for release 1 of Service Net-2000.

**Attribute:**
num_hdlc
**Fullname:**
Number of Assigned QLPS HDLC Channels
**Attribute Description:**
This attribute is the TOTAL number of QLPS HDLC channels that have been assigned to QLPS pipes on this QTMSLNK. There are 32 HDLC channels on a QTMSLNK, but channel 0 is reserved for use by the hardware and channel 31 is reserved for a side port, leaving 30 channels on a QTMSLNK that can be assigned to pipes. (Therefore the default is set to 2, indicating that 2 of the 32 are already accounted for and cannot be used for new pipes. This attribute is used by RC/V to determine how many HDLC channels are remaining on this QTMSLNK that can be assigned to pipes.

**Attribute:**
hdlcs
**Fullname:**
QLPS HDLC Channel Assignment
**Attribute Description:**
This attribute is a bit map that identifies WHICH of the 30 HDLC channels on this QTMSLNK have been assigned to pipes. This attribute consists of 32 bits, 0-31 low order to high order, with a bit set for each HDLC channel assigned. Bits 0 and 31 are set by default since they are never available for new QLPS pipes.

high order.....low order
31, 30, 29.....2, 1, 0

**Attribute:**
num_slots
**Fullname:**
Number of Allocated QTMSLNK timeslots
**Attribute Description:**
This attribute is the TOTAL number of timeslots on this QTMSLNK that have been allocated. There are 256 timeslots per QTMSLNK, but 32 are allocated by default for the QGP side port, leaving 224 to be assigned to pipes. This attribute will be used by RC/V to know how many timeslots are left to be assigned to pipes.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
num_mhpipes
**Fullname:**
Total number of Message Handler pipes assigned on this QTMSLNK.
**Attribute Description:**
This attribute contains the TOTAL number of Message Handler (MH) pipes that have been assigned on this QTMSLNK. It is used by RC/V for balancing among QTMSLNKs when a new MH pipe is assigned to a QLPS network.

**Attribute:**
num_qphpipes
**Fullname:**
Total number of QPH pipes assigned on this QTMSLNK and network.
**Attribute Description:**
This attribute contains the total number of QPH pipes that have been assigned on this QTMSLNK and network.

**Attribute:**
slots0
**Fullname:**
Timeslot Assignment Map (bits 0 through 31)
**Attribute Description:**
This attribute holds bits 0 through 31, low order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

bit for timeslot 31.....bit for timeslot 0

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 1, 9, 17, and 25 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes.

**Attribute:**
slots1
**Fullname:**
Timeslot Assignment Map (bits 32 through 63)
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute holds bits 32 through 63, low order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                 bit for
timeslot                                timeslot
63.....................................32
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 33, 41, 49, and 57 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes.

**Attribute:**

slots2

**Fullname:**

Timeslot Assignment Map (bits 64 through 95)

**Attribute Description:**

This attribute holds bits 64 through 95, low order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                 bit for
timeslot                                timeslot
95.....................................64
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 65, 73, 81, and 89 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes.

**Attribute:**

slots3

**Fullname:**

Timeslot Assignment Map (bits 96 through 127)

**Attribute Description:**

This attribute holds bits 96 through 127, low

**Copyright © 1999 Lucent Technologies** 

order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                 bit for
timeslot                                timeslot
127.....................................96
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 97, 105, 113, and 121 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes.

**Attribute:**
slots4
**Fullname:**
Timeslots Assignment Map (bits 128 through 159)
**Attribute Description:**
This attribute holds bits 128 through 159, low order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                 bit for
timeslot                                timeslot
159.....................................128
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 129, 137, 145, and 153 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes

**Attribute:**
slots5
**Fullname:**
Timeslot Assignment Map (bits 160 through 191)
**Attribute Description:**
This attribute holds bits 160 through 191, low order to high order, for the timeslot assignment

**Copyright © 1999 Lucent Technologies** 

bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                  bit for
timeslot                                 timeslot
191.....................................160
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 161, 169, 177, and 185 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes

**Attribute:**
slots6
**Fullname:**
Timeslot Assignment Map (bits 192 through 223)

**Attribute Description:**
This attribute holds bits 192 through 223, low order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                  bit for
timeslot                                 timeslot
223.....................................192
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 193 201, 209, and 217 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes.

**Attribute:**
slots7
**Fullname:**
Timeslot Assignment Map (bits 224 through 255)
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute holds bits 224 through 255, low order to high order, for the timeslot assignment bit map. RC/V uses this attribute when assigning timeslots to a new pipe.

```
bit for                                 bit for
timeslot                                timeslot
255.....................................224
```

If a bit is set, it means that the timeslot of that number has been assigned to a pipe in RLtmspipe. If it is not set, the timeslot is still available to be assigned to a pipe.

Note that the bits 225, 233, 241, and 249 are set by default since these are part of the 32 reserved timeslots for HDLC channel 31 going to the side port for the QGP and are not available to be assigned to pipes.

## 4. Population rules for RLrc_rdit

### Relation Description

Remaining Digit Interpreter Table entry point into RLdaprmdgt. RDIT performs translation on the digits that are not analyzed by the primary translator to determine whether a selective dialing request is intended. This relation maintains a list of the RLdaprmdgt entry points for each and every rdit value used. It also contains the ldit and previous digit linkages to rdit values. This relation is only used by recent change and oda in administering the RDIT digit trees.
RDITs are distributed using group partitioning.
The group type is GPD_DA and the group ID is 65000.

## 4. Population Rules for RLrc_scrn

**Relation Description**
Screening Index Remarks.

This relation associates a remark, which contains up to 16 characters, with unique screening index--destination index combinations in RLrt_scrning.
There is a tuple in this relation for every unique combination of screening index and destination index in RLrt_scrning (that is, RLrt_scrning.dest_x and RLrt_scrning.screen_x ). The uniqueness of the combination of these two attribute values is stressed since as many as three tuples in RLrt_scrning can have the same dest_x and screen_x. This is due to the fact that RLrt_scrning.prefix is a key attribute, along with screen_x and dest_x, and assumes one of three values.

**Attribute: dest_x**

**Fullname:** Destination Index

**Attribute Description** This is the destination index taken from RLrt_scrning.dest_x.

**Attribute: screen_x**

**Fullname:** Screen Index

**Attribute Description** This is the screening index taken from RLrt_scrning.screen_x.

**Attribute: rem**

**Fullname:** Remark

**Attribute Description** The remark for the screen index, destination index combination is stored as an array of up to 16 ASCII characters. If no remark is associated with the keys, then the array is set to NULL ('\0').

## 4. Population Rules for RLrc_servm

**Relation Description**
rc_servm is for message registers in two applications, see main description.

Each rc_servm tuple is created exclusively for only one of the following two reasons:

(1) If an overflow message register is assigned to a multi-line hunt group, then the rt_mhg relation attribute rt_mhg.reg_port is the key to rc_servm
(see the following port). If rt_mhg.reg_port is NULL then no rc_servm tuple should exist. There should be at the most one rc_servm tuple per rt_mhg relation tuple.

(2) If a message register is assigned to one or more hotel/motel lines, then the fchotmot relation attribute fchotmot.mregister is the key to rc_servm (see the following port). There should be at most one rc_servm tuple for every identical value of the fchotmot.mregister attribute in the entire fchotmot relation.

Both types rc_servm tuples can be expected within this relation.

Copyright © 1999 Lucent Technologies

The main description contains all relevant information.

**Attribute: port**

**Fullname:** Physical address of Message Register Circuit

**Attribute Description** This key attribute is divided into sub-attribute port.member and port.module. Member is the port name of a message register circuit. Module refers to the Switching Module in which this message register circuit is located.

**Attribute: port.member**

**Fullname:** Message Register Circuit

**Attribute Description** Identifies a message register circuit on a switching module.

**Attribute: port.module**

**Fullname:** Switching Module

**Attribute Description** Identifies which switching module the message register circuit is located on.

**Attribute: usrcount**

**Fullname:** User Count

**Attribute Description** This attribute should be zero if the 'sermsg' attribute is set to FC_MSGREG. This attribute must be non-zero if the 'sermsg' attribute is set to FC_HOTMOTL. For the non-zero case the count should be the number of FCHOTMOT relation tuples that are assigned the same.

**Attribute: sermsg**

**Fullname:** Message Register Usage

**Attribute Description** This attribute must be set to one of the following values so that recent change can tell which exclusive use the message register is intended for.
FC_HOTMOTL, if the message register is assigned to hotel/motel lines.
FC_MSGREG, if the message register is assigned as a multi-line hunt overflow message register.

## 4. Population Rules for RLrc_sgpdn

**Relation Description**
This relation is used to store tn.noc and digits for a MUPH or ISAT multi-line hunt group.

For MUPH a subtn's from 1 to 6 may be assigned while for ISAT subtn's 1 to 8 may be used.
This relation is used only for ISAT and MUPH multi-line hunt groups.

**Attribute: portgrp**

**Fullname:** Multi-line hunt group number and type.

**Attribute Description** The multi-line hunt group number is used to link all members of a given type

Copyright © 1999 Lucent Technologies 

of hunting. The group type indicates what type of group will be used for the given hunt type. These groups may be for trunks or lines, for this relation only the group type for lines may be used.

**Attribute: portgrp.grpnum**

**Fullname:** Multi-line Hunt group number.

**Attribute Description** The multiline hunt group number is a decimal number from 1 to AVMLHGRPS() and it used to identify the specific hunting group to which members may be assigned.

**Attribute: portgrp.grptype**

**Fullname:** Multiline hunt group type.

**Attribute Description** The group type indicates what type of hunting is being used for this group number. The group type indicates if the group is to be used for trunks or lines, only the group type of TM_LINE may be used.

**Attribute: subgrp**

**Fullname:** MUPH/ISAT multi-line hunt sub group.

**Attribute Description** The MUPH multi-line hunt sub group may be assign a decimal number from 1 to 6 to indicate what sub group the directory number is assigned. The ISAT multi-line hunt sub group has 2 additional sub groups so it may assign a number from 1 to 8.

**Attribute: tn**

**Fullname:** Subgroup Directory Number

**Attribute Description** A directory number is used for each of the subgroups that may be used for the ISAT or MUPH hunt type. These directory numbers are used when a member is assigned to the group. Depending on the member number being assigned a different subgroup directory number is then used. A block or group of member numbers are valid for a given subgroup.

**Attribute: tn.noc**

**Fullname:** Normalized Office Code assigned to this subgroup

**Attribute Description** The normalized office code is one of the attributes which is used on the *5ESS*®-2000 switch to determine the directory number.

**Attribute: tn.digits**

**Fullname:** Last four digits assigned to this subgroup

**Attribute Description** The last four digits is one of the attributes which is used on the *5ESS*®-2000 switch to determine the directory number.

## 4. Population Rules for RLrc_spid

**Relation Description**
Recent Change service profile identifier.

This relation contains a list of USPIDs on the switch.

This relation, which is used for Recent Change, contains all USPIDs assigned on the switch as well as a mapping of USPID to SM. For custom ISDN interface the USPID can be anywhere from 1 thru 10 digits. For standard ISDN interface the USPID can be anywhere from 1 thru 18 digits. No duplicate USPIDs are allowed in the *5ESS* ®-2000 switch database.

**Attribute: uspid**

**Fullname:** User Service Profile Identifier.

**Attribute Description** The USPID indicates the Service Provider assigned User Service Profile IDentifier.

For custom ISDN interface the USPID can be anywhere from 1 thru 10 digits. For standard ISDN interface the USPID can be anywhere from 1 thru 18 digits. No duplicate USPID allowed in the *5ESS*®-2000 switch database.

(The uspid digit count is generated, not specifically input).

New USPID = uspid.digcnt,uspid.dig1, uspid.dig2,...uspid.dig18.

Digits will be right justified when less than 18 are specified, that is, least significant digit stored in uspid.dig18. Unused digits = 0. Digits will be stored in BCD.

**Attribute: uspid.digcnt**

**Fullname:** The USPID digit count

**Attribute Description** Gives the digit count for the specified USPID digits

**Attribute: uspid.dig[*]**

**Fullname:** Digit 1, Digit 2, .. Digit 17, Digit 18

Copyright © 1999 Lucent Technologies 

**Attribute Description** Digits 1 thru 18 of USPID

**Attribute: module**

**Fullname:** Module number on which the user specified by USPID is located and where RLspid is located.

**Attribute Description** This attribute is the SM on which the user is assigned.

**Attribute: fipmap**

**Fullname:** Fully Initializing Protocol bit map

**Attribute Description** This attribute is used by RC to indicate that the User Service Order Profile (USOP) can only be accessed by terminals that support FIPs. If the alternate (count) is greater than zero, then RLspid.fip_req is set to DBYES, which means that the USOP can only be accessed by terminals that support FIPs.

The following capabilities imply the USOP will require a FIP terminal:

```
Feature                                          BRI Type
-------                                          --------
1)  Feature Buttons (cfg_grp).                   Custom & Standard
2)  Terminal Management (tmf).                   Custom
3)  Terminal Key System (tks)                    Custom & Standard
4)  Message Desk Service (mds).                  Custom & Standard
5)  Electronic Directory Service (eds).          Custom
6)  X.25 Permanent Virtual Circuit         Custom & Standard Service with
out fixed TEI (pvcs).
7)  Membership in a circuit MLHG (ckt_mlhg)   Custom & Standard
8)  Membership in a packet MLHG without an individual DN (pkt_mlhg).   Cu
stom & Standard
9)  Shared (shared).                             Custom & Standard
10) Electronic Key Telephone Service (ekts).  Standard
11) Network Element Service Signaling (ness). Standard
12) Personal Communications Access on a C-Interface (pasc).       Standar
d
13) Service Control Point Allowed (scp_alw).  Standard
```

**Attribute: fipmap.cfg_grp**

**Fullname:** Configuration Group assignment (Feature Buttons)

**Attribute Description** This attribute is used to indicate if any feature buttons are assigned to this USOP. Feature button assignment is indicted by the presence of a configuration group assignment in RLis_term.config.

**Attribute: fipmap.shared**

**Fullname:** Shared

**Attribute Description** This attribute is used to indicate if this USOP's primary DN is shared. It's setting is determined from RLis_line.shared.

**Attribute: fipmap.tks**

**Fullname:** Terminal Key Systems Capabilities

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This attribute is used to indicate if this USOP has terminal key system capabilities assigned - aka multiple DNs. Multiple DNs in this context means more than one DN where each DN has it's own appearance on the terminal, as opposed to multidn where more than one DN is assigned to a single appearance on the terminal. It's setting is determined from RLis_term.ltport_cnt.

**Attribute: fipmap.eds**

**Fullname:** Electronic Directory Service

**Attribute Description** This attribute is used to indicate if the electronic directory service (EDS) is assigned to this USOP. EDS can be assigned to the line or through a BFG. The attribute is set if the EDS feature is assigned to the line or BFG RLdn_feats tuples for this USOP.

**Attribute: fipmap.mds**

**Fullname:** Message Desk Service

**Attribute Description** This attribute is used to indicate if message desk service (MDS) is assigned to this USOP. MDS can be assigned to the line or through a BFG. The attribute is set if the MDS feature is assigned to the line or BFG RLdn_feats tuple for this USOP.

**Attribute: fipmap.ckt_mlhg**

**Fullname:** Circuit MLHG without an individual DN

**Attribute Description** This attribute is used to indicate if this USOP is assigned as a member of a circuit multiline hunt group. MLHG membership is determined by population of RLpggpmap for this USOP's port and party.

**Attribute: fipmap.pkt_mlhg**

**Fullname:** Packet MLHG without an individual DN

**Attribute Description** This attribute is used to indicate if this USOP is assigned as a Permanent packet D or On-Demand B packet member of a packet multiline hunt group and does not have an individual DN, thus, requiring a FIP terminal. Packet multiline hunt group members with individual DNs do not require a FIP terminal.

**Attribute: fipmap.tmf**

**Fullname:** Terminal Management Feature

**Attribute Description** This attribute is used to indicate if terminal management (TM) features are assigned to this USOP. Terminal management features are indicated by the type of terminal indicated in RLis_term.cpetype. Terminal types B, D and Attendant are TM types.

**Attribute: fipmap.pvcs**

**Fullname:** X.25 Permanent Virtual Circuit Service

**Attribute Description** This attribute is used to indicate if permanent virtual circuits (PVCs) assigned to this USOP require a FIP terminal. If a fixed TEI is provisioned with the PVCs, use of the USOP does not require a FIP terminal. For a USOP with PVCs and no fixed TEI provisioned, a FIP terminal is required. The population of fipmap.pvcs is based on RLpsx25ln.pvc_h_lcn for this

Copyright © 1999 Lucent Technologies 

USOP's ph_number, ph_cn and party.

**Attribute: fipmap.ekts**

**Fullname:** Electronic Key Telephone Service

**Attribute Description** This attribute is used to indicate if this USOP is used by an EKTS terminal. It is set based on RLis_term.ekts. The attribute exists as a separate item from fipmap.tks and fipmap.shared because it is possible to assign EKTS without any of the typical key system features (such as, shared DN, multiple DNs).

**Attribute: fipmap.ness**

**Fullname:** Network Element Services Signaling

**Attribute Description** This attribute is used to indicate if network element services signaling (NESS) is assigned to this USOP. NESS assignment is determined by the presence of a tuple in RLaspnport for this USOP (keyed by circuit lport of primary DN). NESS is an ASPN BRCS module feature.

**Attribute: fipmap.pasc**

**Fullname:** Personal Communications Access Service on a C-Interface

**Attribute Description** This attribute is used to indicate if this USOP has either personal communication service (PCS) or wireless centrex (WCTX) access on a C-Interface. In RLis_term.pasc, the value PASC_PCSI indicates that this USOP has PCS service, and the value PASC_WCTX indicates that this USOP has wireless centrex assigned.

**Attribute: fipmap.scp_alw**

**Fullname:** Service Control Point

**Attribute Description** This attribute is used to indicate if this USOP has service control point (SCP) capability. Setting of the attribute is from RLrt_dntran.scp_alw for the primary DN.

**Attribute: fipmap.spare2**

**Fullname:** RC_SPID/(fipmap) spare 2

**Attribute Description** Spare fip_map domain attribute.

**Attribute: fipmap.spare3**

**Fullname:** RC_SPID/(fipmap) spare 3

**Attribute Description** Spare fip_map domain attribute.

**Attribute: fipmap.spare4**

**Fullname:** RC_SPID/(fipmap) spare 4

**Attribute Description** Spare fip_map domain attribute.

**Defines:** "db/DMparty.h"

## 4. Population Rules for RLrc_tktxc

**Relation Description**
RC storage of trunk transmission level information.

The values for fetyp, netlp, trnktyp and fetlcls should be determined by customer (operating company) engineers. These population rules are provided to aid the customer engineer in setting the values of these parameters to obtain the desired digital loss insertion characteristics for each trunk transmission class. Specific values for each of these parameters are suggested for an application with no special transmission requirements.

See GI_cpe for related loss information.
RLrc_tktxc is no longer used by international and should not be populated for generic 5EE4(1) or later. It will be deleted in 5EE4(2).

**Attribute: tranclass**

**Fullname:** trunk transmission class.

Copyright © 1999 Lucent Technologies

**Attribute Description** See Relation RLrc_trk.p (attribute: transclass) for population rules.

**Attribute: fetyp**

**Fullname:** Far end type.

**Attribute Description** The far end type gives the transmission level point of the far-end office. This is used in domestic applications to determine the digital loss to be inserted toward the line on trunk-line connections. An exception to this is that ISDN lines, including OSPS attendants, never receive digital loss except for conference connections.
The following layout shows the loss value given as a function of fetyp.

```
-------------------------------------------------------------| fety
p
             |TLPN3|TLPN2|TLPN1|TLP0 |TLP1 |TLP2 |TLP3 |TLP4 |TLP5 |
+------------+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| loss       |6 dB |5 dB |4 dB |3 dB |2 dB |1 dB |0 dB |7 dB |8 dB |
-------------------------------------------------------------------
The recommended values for fetyp are:
trunks:
TLP0  - far-end is local or tandem
TLPN2 - far-end is analog toll
TLPN3 - far-end is digital toll
For analog trunks:
TLP3  - all far-end connections.
```

**Attribute: netlp**

**Fullname:** Near end transmission level point (TLP).

**Attribute Description** The near end TLP is used to determine loss only on trunk-trunk connections. The valid values of netlp are TLP0 and TLPN3. If both trunks have a netlp of TLPN3, no digital loss is inserted in either direction. If either trunk in the connection has netlp set to TLP0, loss may be inserted when connecting a digital trunk to an analog trunk. The amount of loss is a function of trnktyp and fetlcls. See fetlcls for details. The suggested value for netlp is TLP0 for all trunks in a local *5ESS*®-2000 switch and for trunks that carry only local traffic in a local/toll *5ESS*®-2000 switch. It is suggested that netlp be set to TLPN3 for all trunks in a toll *5ESS*®-2000 switch and for trunks that carry at least some toll traffic in a local/toll *5ESS*®-2000 switch.

**Attribute: trnktyp**

**Fullname:** Trunk Type.

**Attribute Description** Trunk type is used in conjunction with fetlcls in determining loss on trunk-trunk connections when either trunk has a netlp equal to TLP0. See fetlcls for details.Trunk type has two valid values: DIGITAL and ANALOG.
It is recommended that trunks that use digital facilities throughout be set to DIGITAL and trunks that use analog facilities be set to ANALOG.

**Attribute: fetlcls**

**Fullname:** Far end toll class.

**Attribute Description** Far end toll class is used in conjunction with trnktyp to determine loss only on trunk-trunk connections when either trunk has its netlp set to TLP0. Far end toll class is a numerical value, 0-5, that identifies toll class of the far end office.

**Copyright © 1999 Lucent Technologies** 

```
5       - denotes local or tandem. This should also be used for
          tie trunks when the 5ESS-2000 switch is being used as a PBX.
          1,2,3,4 - denotes toll office. The following layout gives the
          digital loss that is inserted in trunk-trunk connections when
          either trunk has a 'netlp' other than TLPN3.
```

| FROM \ TO | local (fetlcls == 5) | | toll (fetlcls < 5) | |
|---|---|---|---|---|
| | analog | digital | analog | digital |
| local analog | 0 | 0 | 0 | 0 |
| local dig | 3 | 0 | 3 | 0 |
| toll analog | 0 | 0 | 0 | 0 |
| toll dig | 6 | 0 | 0 | 0 |

**Attribute: trkclcnt**

**Fullname:** Trunk class count.

**Attribute Description** The trunk class count contains a count of the number of trunks with this trunk transmission class.

**Copyright © 1999 Lucent Technologies** 

# RC_TNMLH

## 1. Description

Main TN of multiline hunt group. This relation is use to indicate when the TN is associated to a PKT or CKT MLHG, when the MLHG is global or local and the MLHG group number the main TN is associated with.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 2000 |
| expected number of tuples | 300 |
| access type | DBACC_HASH |
| memory type | DBPRAM |

## 4. Population Rules for RLrc_tnmlh

**Relation Description**
Main TN of multi-line hunt group to multiline hunt group number.

**Attribute: tn.noc**

**Fullname:** Normalized office code

**Attribute Description** NOC code assigned to phone number of multi-line hunt group.

**Attribute: tn.digits**

**Fullname:** Directory digits

**Attribute Description** Last four digits assigned to phone number of group.

**Attribute: gblgrp**

**Fullname:** global or local group

**Attribute Description** Indicates if the MLHG is a global group (DBYES) or local group (DBNO). If gblgrp is DBYES, then the MLHG is a global group (member ports can be spread across the SMs), else the group is a local group (members ports are consolidated on one SM).

```
When RLrt_mhg.gblgrp == DBNO then,
   for all tuples in GROUP_PORT where:
     GROUP_PORT.portgrp.grpnum = RT_MHG.grpnum
     GROUP_PORT.port.module = X
        where 'X' must be a single switching module number.
```

for all tuples in PSGP_PRT where: PSGP_PRT.grpnum = RT_MHG.grpnum

Copyright © 1999 Lucent Technologies 

PSGP_PRT.module = X where 'X' must be a single switching module number.

**Attribute: psflag**

**Fullname:** Packet switching MLHG indicator

**Attribute Description** Packet switching MLHG indicator.

**Attribute: grpnum**

**Fullname:** Multi-line hunt group number

**Attribute Description** Multi-line hunt group number.

## 4. Population Rules for RLrc_trk

**Relation Description**
Recent Change remarks and CLCI code.

Remarks and CLCI's associated with trunk view.

RLrc_trk (Internal Protocal - PSPKT_TRK Port Group Members)

DESCRIPTION:

This relation must be populated to define PSPKT_TRK Packet Port Group member information required by the Recent Change/Verify (RC/V) subsystem.

This relation is the Recent Change version of the RLpsgp_prt relation. There should be a one-to-one correspondence between tuples in this relation and those in RLpsgp_prt (and RLpsprt_gp).

QUANTITY OF TUPLES:

One tuple per PSPKT_TRK Port Group Member in RLpsgp_prt.

TUPLE SEMANTICS:
```
portgrp.grpnum  - PSPKT_TRK Port Group number (from RCTGRPRK)
                  There must be a corresponding entry in
```

**Copyright © 1999 Lucent Technologies** 

```
                  RCTGRPRK.
portgrp.grptype - TM_TRK
member          - PSPKT_TRK Port Group member (from PSGP_PRT)
clcitrk         - Allowed values are 0-16382 and NULL
transclass      - Values are 1-99 and must correspond with a
                  digital transmission class.
```

RLrc_trk (X.75/X.75'- PSX75_TK/PSX75P_TK Port Group Members) DESCRIPTION:

This relation must be populated to define PSX75_TK and PSX75P_TK Packet Port Group member information required by the Recent Change/Verify (RC/V) subsystem.

This relation is the Recent Change version of the RLpsgp_prt relation. There should be a one-to-one correspondence between tuples in this relation and those in RLpsgp_prt (and RLpsprt_gp).

QUANTITY OF TUPLES:

One tuple per PSX75_TK or PSX75P_TK Port Group Member in RLpsgp_prt.

TUPLE SEMANTICS:

- portgrp.grpnum - PSX75_TK or PSX75P_TK Port Group number (from RCTGRPRK). There must be a corresponding entry in RCTGRPRK for either type.
- portgrp.grptype - TM_TRK
- member - PSX75_TK or PSX75P_TK Port Group member (from PSGP_PRT)
- clcitrk - Allowed values are 0-16382 and NULL
- transclass - Values are 1-99 and must correspond with a digital transmission class.

RLrc_trk (Local Test Desk Test Trunks - LTD)

DESCRIPTION:

LTD test trunks provide the interface to external testing systems (LTD, MLT, Fortel, etc.) for metallic loop testing of lines. These trunks may be configured as incoming trunks (LTD to line tests) or outgoing trunks (line to LTD tests).

A separate OUTGOING LTD trunk group is required for each 'metallic community.' Thus, each remote module (RSM, ORM, TRM, MMRSM cluster, etc.) which is not metallically linked to the host office must have its own OUTGOING LTD trunk group to provide LTD access from the lines within that module/cluster.

Corresponding tuples must appear in the following relations:

```
RLrt_trkg    - keyed on trunk group
RLrctgrprk   - keyed on trunk group
RLgroup_port - keyed on trunk group and member
RLpggpmap    - keyed on trunk port
RLfc_porttyp - keyed on trunk port (servclass = TMTSTK)
RLfc_trunk   - keyed on trunk  port
RLmtbtst     - keyed on trunk port
```

QUANTITY OF TUPLES:

A tuple is required in RLrc_trk for each LTD test trunk (incoming or outgoing) in the SM.

**Copyright © 1999 Lucent Technologies** 

TUPLE SEMANTICS:

```
portgrp.grpnum (KEY)  - Incoming or Outgoing LTD trunk group number
portgrp.grptype (KEY) - TM_TRK
member (KEY)          - trunk group member number
clcitrk               - not applicable
transclass            - Default value, not applicable
```

RLrc_trk (DCTU trunk groups members)

DESCRIPTION:

Population rules regarding DCTU trunk groups members are presented.

NOTE:

(1) DCTU trunk group members are, in reality, logical test ports and as such do not have real TRUNK hardware associated with them. DCTU trunk group members are associated with physical DCTU port circuits. There does not exist associated trunk data as contained in these attributes defined for physical DCTU port circuits. Therefore, the values used for attributes clcitrk and transclass should be the default values.

A much better solution is for this relation NOT to be populated if the trunk group is a DCTU trunk group. This change would probably require changes in RCV and ODA.

(2) For each separate DCTU trunk group number (portgrp.grpnum) the DCTU trunk group MUST be defined in the relations RLRT_TRKG and RLRCTGRPRK. See the population rules for RLrt_trkg and RLrctgrprk.

(3) For each DCTU trunk group number, there MUST be a minimum of four (4) members. The maximum number can only be determined from the number of DCTUs that are part of any DCTU trunk group. The number of members in any DCTU trunk group should always be divisible by four.

(4) A DCTU trunk group CAN have members from any number of DCTUs in a HOST *5ESS*®-2000 switch processing entity. For each HOST DCTU trunk group member within a HOST DCTU trunk group, there MUST be a corresponding entry in RLFC_PORTTYP in the particular SM where the physical DCTUPORT circuit is defined. See the population rules for RLfc_porttyp and RLcktdata.

(5) For each RSM DCTU trunk group member within a RSM DCTU trunk group, there MUST be a corresponding entry in RLFC_PORTTYP in the SAME RSM where the physical DCTUPORT circuit is defined. See the population rules for RLcktdata and RLfc_porttyp.

(a) The same restrictions that apply to RSM stated previously also apply to ORM/TRM.

(6) For each DCTU trunk group member, there MUST be a corresponding entry in RLQKEYPORT. This rule includes DCTUs in both the HOST *5ESS*®-2000 switch processing entity and RSMs See the population rules for RLqkeyport.

(7) For each DCTU trunk group member, there MUST be a corresponding entry in RLPGGPMAP. This rule includes DCTUs in both the HOST *5ESS*®-2000 switch processing entity and RSMs. See the population rules for RLpggpmap.

(8) There can be one fully equipped DCTU per SM that contains 12 DCTUPORTs. There is one DCTUPORT LTP defined for each DCTUPORT. There is one DCTU trunk group member per DCTUPORT LTP. There can be 192 DCTUs in an office. Therefore, the theoretical maximum number of tuples in this relation owing to DCTU trunk group members is:

( 1 DCTU/SM) x ( 192 SMs/office) x ( 12 DCTUPORTs/DCTU) x

**Copyright © 1999 Lucent Technologies** 

= 2,304 members/office owing to the DCTU

QUANTITY OF TUPLES:

One (1) tuple per DCTU trunk group member in an office.

TUPLE SEMANTICS:

```
portgrp.grpnum (KEY)  - DCTU trunk group number
Must be entry in RLrt_trkg and RLrctgrprk
portgrp.grptype (KEY) - TM_TRK
member (KEY)          - DCTU trunk group member number
clcitrk               - Default value, not applicable
transclass            - Default value, not applicable
```

RLrc_trk (ISTF trunk groups members)

DESCRIPTION:

Integrated Services TEst Function (ISTF) trunk group members are really Logical Test Ports (LTP) and do not have hardware dedicated to them. These members are instead associated with the channels serving the ISTF. There is no associated RLfc_trunk data for these LTPs and therefore, the values used for attributes clcitrk and transclass should be the default values.

This relation is the Recent Change version of the RLrt_trkg relation.

QUANTITY OF TUPLES:

One (1) tuple per ISTF trunk group member in an office.

TUPLE SEMANTICS:

```
portgrp.grpnum (KEY)  - ISTF trunk group number.  There is only one group
                        number per ISTF LTP type. There must be a
                        corresponding entry in RLrt_trkg and RLrctgrprk
portgrp.grptype (KEY) - TM_TRK
member (KEY)          - ISTF trunk group member number.  The relation RListf
                        has a count field for each LTP type.  These attributes
                        identify how many RLrc_trk.member exist per ISTF
                        board.  There must be a corresponding entry in
                        RLpggpmap and RLgroup_port.
```

clcitrk - Default value, not applicable

transclass - Default value, not applicable

RLrc_trk (for DSU2-RAF/SAS Port Group Members)
DESCRIPTION:

This relation must be populated to define DSU2-RAF/SAS Port Group member information required by the Recent Change/Verify (RC/V) subsystem. There is no associated RLfc_trunk data for these circuits and therefore, the values used for attributes clcitrk and transclass should be the default values.

This relation is the Recent Change version of the RLgroup_port relation. There should be a one-to-one correspondence between tuples in this relation and those in RLgroup_port (and RLpggpmap).

QUANTITY OF TUPLES:

**Copyright © 1999 Lucent Technologies** 

One tuple per RAF/SAS Port Group member.

TUPLE SEMANTICS:

```
portgrp.grpnum  - RAF/SAS Port Group number (from RT_TRKG)
                  There must be a corresponding entry in
                  RT_TRKG and RCTGRPRK.
portgrp.grptype - TM_TRK
member          - RAF/SAS Port Group member number (from GROUP_PORT)
clcitrk         - not applicable, set to NULL string
transclass      - not applicable, set to zero (0)
```

RLrc_trk (for TM_TOPAS Port Group Members)
DESCRIPTION:

This relation must be populated to define TM_TOPAS Port Group member information required by the Recent Change/Verify (RC/V) subsystem.

This relation is the Recent Change version of the RLgroup_port relation. There should be a one-to-one correspondence between tuples in this relation and those in RLgroup_port (and RLpggpmap).

QUANTITY OF TUPLES:

One tuple per TM_TOPAS Port Group member.

TUPLE SEMANTICS:

```
portgrp.grpnum  - TM_TOPAS Port Group number (from RT_TRKG)
                  There must be a corresponding entry in
                  RT_TRKG and RCTGRPRK.
portgrp.grptype - TM_TRK
member          - TM_TOPAS Port Group member number (from GROUP_PORT)
clcitrk         - as defined by office
transclass:     - DIGITAL
                  RLrc_trk (for TM_RMSD3 Port Group Members)
```

DESCRIPTION:

This relation must be populated to define TM_RMSD3 Port Group member information required by the Recent Change/Verify (RC/V) subsystem.

relation. There should be a one-to-one correspondence between tuples in this relation and those in RLgroup_port (and RLpggpmap).

QUANTITY OF TUPLES:

One tuple per TM_RMSD3 Port Group member.

TUPLE SEMANTICS:

```
portgrp.grpnum  - TM_RMSD3 Port Group number (from RT_TRKG)
                  There must be a corresponding entry in
                  RT_TRKG and RCTGRPRK.
portgrp.grptype - TM_TRK
member          - TM_RMSD3 Port Group member number (from GROUP_PORT)
clcitrk         - as defined by office
transclass:     - DIGITAL"
```

**Attribute: member**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Member Number.

**Attribute Description** Trunk group member number. Same as relation GROUP_PORT or relation PSGP_PRT for packet switching trunk group members.

**Attribute: portgrp**

**Fullname:** Port Group.

**Attribute Description** This attribute is divided into two attributes: (grpnum, grptype).

**Attribute: portgrp.grpnum**

**Fullname:** Group number.

**Attribute Description** Trunk group identifier. Use all trunk group members assigned in relation GROUP_PORT or in relation PSGP_PRT for packet switching trunk groups.

**Attribute: portgrp.grptype**

**Fullname:** Group type.

**Attribute Description** Same as relation GROUP_PORT or relation PSGP_PRT for packet switching trunk groups.

**Attribute: clcitrk**

**Fullname:** Trunk CLCI.

**Attribute Description** Common language circuit identifier. Arbitary number (0 - 16382) optionally assigned to each member of trunk groups. This field will be set to NULL for all unassigned members.
For CCS trunks (that is RT_TRKG.in_sigtype = DBCCIS6, DBTUP7, DBISUP7, or RT_TRKG.out_sigtype = DBCCIS6, DBTUP7, DBISUP7), this field is mandatory.

All CCIS trunks (RT_TRKG.in_sigtype = DBCCIS6 or RT_TRKG.out_sigtype = DBCCIS6) in the set of trunk groups that have the same pair of values for RCTGRPRK.ne_clli and RCTGRPRK.fe_clli must have unique values for RC_TRK.clcitrk.

All CCS7 trunks (RT_TRKG.in_sigtype = DBTUP7 or DBISUP7 OR RT_TRKG.out_sigtype = DBTUP7 or DBISUP7) in the set of trunk groups that have the same values for RT_TRKG.pci (that is, the set of trunk groups that have the same pair of values for RT_TRKG.opc and RT_TRKG.dpc) must have unique values for RC_TRK.clcitrk.

For domestic ISUP7 trunks (RLRT_TRKG.in_sigtype = DBISUP7 or RLRT_TRKG.out_sigtype = DBISUP7), the clcitrk attribute is an equivalent value to RLlab7prt.cic and has a range of 0 - 16382.

For wideband (NxDS0) ISUP7 trunks, the clcitrk attribute must equal the CIC of the first member of the wideband trunk block plus the modulus of the member number and 24. This ensures that the CICs are assigned in sequential order for groups of 24 trunks. A trunk block is a group of 24 sequential members within the same wideband trunk group starting with member 0 or any multiple of 24.

**Attribute: transclass**

**Fullname:** Transmission class.

Copyright © 1999 Lucent Technologies 

**Attribute Description** Trunk transmission class. If trunk group member is of type

```
RAF(RAFEN) with service class fc_rafdta,fc_rafannc,fc_rafctr:
ACJACK     with service class tm_acjack:
LTD        with serviceclass tm_tstk:
LTP        with service class dgltpttf, dgppmltp, dn_els_ttf,
                              tmdftacltp, tmltpdctu, tm_alit,
                              tm_callbk, tm_dcjack, tm_ictc,
                              tm_msu, tm_ogtc, tm_otottf, tm_rotl,
                              tm_s96ctttf, tm_wsttf, tm_tone,
                              tm_istflb, tm_istfxmit, tmdstpgtc
```

then transclass has a value of zero. Otherwise, transclass has a value of 1-99.

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLrc_tur

**Relation Description**
Time slot to User ratio for ODB ISCN assignment.

This relation is used by Recent Change when selecting an ODB ISCN. RC, given a LCEN, will take the LCENs ISLU or IDCU, or LCKEN for ISLU2, or AIUEN for AIU, and search the relation for all tuples that match the ISLU(2), IDCU, or AIU. After looking at all the tuples, RC will select the tuple with the highest time slot/user ratio. This way

Copyright © 1999 Lucent Technologies 

all the users are load balanced across the ISLU, IDCU, or AIU. After selecting the tuple, RC will use the shelf to search RLrc_odb for a match on its shelf. If none is found, RC will pick the next highest ratio RLrc_tur tuple that has a different shelf and search RLrc_odb again. This will continue until a tuple is found in RLrc_odb or there are no more tuples in RLrc_tur to look at.

This is a Recent Change relation.

**Attribute: module**

**Fullname:** SM module number

**Attribute Description** Identifies a specific SM for an ISLU(2), IDCU, or AIU.

**Attribute: shelf**

**Fullname:** PSU shelf number

**Attribute Description** This is the PSU shelf the ISLU(2), IDCU, or AIU is connected to via a pidb.

**Attribute: unitno**

**Fullname:** Intergrated services Line Unit or Integrated Digital Carrier Unit Number, or Access Interface Unit.

**Attribute Description** Identifies a specific line unit on an SM.

**Attribute: unittype**

**Fullname:** Type of unit (ISLU(2), AIU, IDCU).

**Attribute Description** Identifies unit type on an SM.

**Attribute: odb_ts**

**Fullname:** Time slots reserved for ODB.

**Attribute Description** This attribute is the sum of the odb_min attribute values in the RLdpidb_pt relation for all DPIDBs that go to the ISLU(2)/IDCU/AIU, SHELF pair (keys to this relation).

**Attribute: odb_usr**

**Fullname:** ODB users

**Attribute Description** Indicates number of users assigned to ODB for this ISLU(2)/IDCU/AIU SHELF. **Defines:** "db/DMunitno.h"

**Copyright © 1999 Lucent Technologies** 

# RC_UNIDX

## 1. Description

Recent change (RC) only relation used to track highest ID used for conflict table and digit table identifiers in UN, in order to assign new tables a unique identifier. The identifiers of those attributes will be initialized by ODA for new offices and retrofit offices and then modified by RC.

```

## 4. Population Rules for RLrc_unidx

**Relation Description**
RC uniform numbering (UN) identifier index.

This relation is used to track the highest identifier used for UN relations, in order to assign new tables a unique identifier.

There are private dialing relations whose attribute values are INTERNALLY generated keys into related relation tuples. In order to correctly allocate subsequent keys, RC/V must have this relation initially populated by ODA. The rules for index generation are presented in the usage section for the corresponding index attribute.

Copyright © 1999 Lucent Technologies

For each ars customer with private dialing, the current highest key values generated for conflict table, digit table, selective destination screening table, on-to-off conversions table, and network service codes table are maintained.

**Attribute: ar_gpid**

**Fullname:** Automatic Route Service group identifier

**Attribute Description** This attribute indicates the ARS group identifier.

**Attribute: hi_cnfltbl**

**Fullname:** highest conflict table identifier

**Attribute Description** This attribute indicates the last id used as a conflict table identifier. Each time a conflict situation exists for a set of digit strings in RLundtre associated with a particular ar_gpid-un_dpln pair, a value RLundtre.next = RLuncnflct.table must be generated and inserted into those relation tuples.

The set if generated conflict index values must be contiguous and start with the value one (1). The highest generated value must be stored in RLrc_unidx.hi_cnfltbl. If no conflict table indices have been generated for an ar_gpid, then RLrc_unidx.hi_cnfltbl will be zero (0) and there will be no tuples in RLuncnflct keyed by that ar_gpid. This is highly unlikely, but the check should be made for consistency.

**Attribute: hi_digtbl**

**Fullname:** highest digit table identifier

**Attribute Description** This attribute indicates the last ID used as a digit table identifier. When RLundpinfo.da_strt is NULL when keyed by ar_gpid and un_dpln, that indicates that there is no RLundtre table entry for that ars group using that dialing plan for digit strings of any length. This case requires that an index value be generated so that RLundpinfo.da_strt = RLundtre.previous.

If RLundpinfo.da_strt is not NULL, then a table index exists for this ar_gpid and un_dpln and supplies RLundpinfo.previous as a key into RLundtre.

The first digit position requires up to 12 RLundtre tuples, and each successive digit position requires up to 10 tuples.

Each digit position defines a RLundtre table for a given ar_gpid-un_dpln pair. If during population of a given digit string, an empty table (no populated tuples) is found, a new index value is generated such that RLundtre.next = RLundtre.previous between two tuples associated by consecutive digits in a digit string.

The set of generated digit table index values must be contiguous and start with the value one (1). The highest generated value must be stored in RLrc_unidx.hi_digtbl. If no digit table indices have been generated for an ar_gpid, then RLrc_unidx.hi_digtbl will be zero (0) and there will be no tuples in RLundpinfo or RLundtre keyed by that ar_gpid. This case is highly unlikely, but should be made for consistency.

**Attribute: hi_sds**

**Fullname:** highest selective destination table identifier

**Attribute Description** This attribute indicates the last id used as a digit table identifier for selective destination screening.

Copyright © 1999 Lucent Technologies 

When selective destination screening is indicated for a particular ar_gpid-un_dpln-digit string combination, an index value is generated such that RLundtre.conv_indx = RLunsds.previous. The set of generated sds table index values must be contiguous and start with the value one (1). The highest value generated must be stored in RLrc_unidx.hi_sds. If no sds table indices have been generated for an ar_gpid, RLrc_unidx.hi_sds will be zero (0) and there will be no tuples in RLunsds keyed by that ar_gpid.

**Attribute: hi_onoff**

**Fullname:** highest on to off conversion table identifier

**Attribute Description** This attribute indicates the last id used as a digit table identifier for on to off conversions.

When an on to off network number conversion for a given ar_gpid requires more than the RNX to determine the conversion tuple, an index value must be generated and assigned to an RLunonoff.table entry and corresponding RLunon_di.previous entry.

If there is already an RLunonoff tuple associated with this ar_gpid and rnx, then no index will be generated.
Note that the dialing plan is not considered since RLundtre is not accessed.

Each digit position (5 through 7) in the on-to-off digit string could require a table of up to 10 tuples in RLunon_di. If the next digit position is to be analyzed in a given string AND there is no tuple in RLunon_di for that table, THEN generate a new index value that will be assigned to an RLunon_di.next entry and corresponding RLunon_di.previous entry.

The set of generated on to off table index values must be contiguous and start with the value one (1). The highest value generated (for both RLunonoff and RLunon_di) must be stored in RLrc_unidx.hi_onoff. If there have not been any on to off table indices generated for an ar_gpid, then RLrc_unidx.hi_onoff will be zero (0) and there will be no tuples in RLunonoff keyed by that ar_gpid.

**Attribute: hi_nsc**

**Fullname:** highest network service code conversion table identifier

**Attribute Description** This attribute indicates the last id used as a digit table identifier for network service code conversion.
When a network service code conversion is indicated by a tuple in RLundtre, an index is generated for the ar_gpid-un_dpln pair associated with the conversion such that RLundtre.conv_indx = RLunnsc.conv_indx.

The set of generated nsc conversion table index values must be contiguous and start with the value one (1). The highest value generated must be stored in RLrc_unidx.hi_nsc. If there have not been any indices to the nsc conversion table generated for an ar_gpid, then RLrc_unidx.hi_nsc will be zero (0) and there will be no tuple in RLunnsc keyed by that ar_gpid.

Copyright © 1999 Lucent Technologies 

# RC_UNRMK

## 1. Description

Remark assoc. with private network digit interpreter view.

This is a virtual update relation. The root storage relation is RLunrmk_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RC_UNRMK.

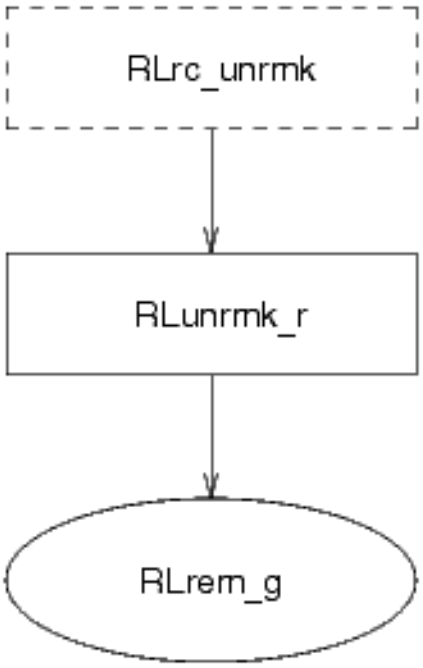

**Figure 1 Virtual Relation RC_UNRMK**

## 4. Population Rules for RLrc_unrmk

**Relation Description**
Uniform Numbering remarks.

This relation provides access to descriptive remarks associated with an ars group, private dialing plan number, and digit string combination.

If the remark field is NULL, do not create a RLrc_unrmk tuple.
If the remark field is not NULL, then for each RLundtre tuple populated, there must be a correspondingly keyed RLrc_unrmk tuple populated.

**Attribute: ar_gpid**

**Fullname:** Automatic Route Selection group identifier

**Attribute Description** This attribute is the ARS group identifier: part one of the key to this relation from RLundtre.

**Attribute: un_dpln**

**Fullname:** Private Network Dialing Plan number

**Attribute Description** This attribute is the Private Network Dialing Plan number: part two of the key to this relation from RLundtre.

**Attribute: inc_digs**

**Fullname:** incoming digits string

**Attribute Description** This attributes is the incoming digits: part three of the key to this relation from RLundtre. The maximum value is 18 if the IDDD15 secured feature (SFID223) has been purchased and turned on, otherwise is 15.

**Attribute: rem**

**Fullname:** remark

**Attribute Description** This attribute contains the remark associated with the RLundtre tuple that keys into this relation.

## 4. Population Rules for RLrcacsr_q

**Relation Description**
Automatic Customer Station Rearrangement (ACSR) queue.

This relation provides the pending ACSR requests for service (to move to new location).

**Attribute: req_number**

**Fullname:** request number

**Attribute Description** This number is used to service each ACSR request in the order it is received. At the time of entry of an ACSR request, the next sequential number will be assigned to this request by the RCasrsp process within the ranges specified in the following. When all the available numbers are all used, the RCasrsp process, reassigns the request numbers from the first number within the specified range.

**Attribute: locdn**

**Fullname:** Local directory number

**Attribute Description** This attribute consists of the NOC (normalized office code) and four directory number digits.

**Attribute: locdn.noc**

**Fullname:** Normalized office code

**Attribute Description** Normalized office code

**Attribute: locdn.digits**

**Fullname:** Digits

**Attribute Description** The local dn minus the office code.

**Attribute: port**

**Fullname:** port for the D-channel

**Attribute Description** The port identifies the target DSL on the module derived from the next attribute, targ_mod.

**Attribute: targ_mod**

**Fullname:** target module number

Copyright © 1999 Lucent Technologies 

**Attribute Description** module of target DSL for the ACSR move

**Attribute: src_mod**

**Fullname:** source module number

**Attribute Description** module of source DSL for the ACSR move

**Attribute: time_entry**

**Fullname:** time of entry of the ACSR request

**Attribute Description** RCasrsp process will put time of entry of the ACSR request

**Attribute: status**

**Fullname:** status of ACSR request (normal/inprog/purged/cancelled)

**Attribute Description** This indicates whether the ACSR request in the queue is normal, in progress, purged by the switch personnel using the craft command, or cancelled by the end user or the RCasrsp process in response to a 'cancel' message from FITA. The ACSR OKP process indicates 'normal' status when an ACSR request is first enqueued.

**Attribute: non_epid**

**Fullname:** Indicates whether terminal is non-epid type

**Attribute Description** Used by ACSR *UNIX*® system process while calling the RC/V view 23.2 for line move. This is required to pass to the RC/V view 23.2

**Attribute: ama_rec**

**Fullname:** AMA Recording

**Attribute Description** This attribute indicates if an AMA billing record should be generated for using this ACSR feature. **Defines:** "db/DMport.h"

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLrcapdata

**Relation Description**
Application processor (AP) data.

This relation contains the site ID of an AP and uses this as key to determine the remark attribute describing the owner of the AP.
Starting in the 5E4 Generic, each AP can be given an 8 character remark which provides a descriptive name to correspond to the AP site_id. This remark field will be included in the office records to facilitate the switch personnel in correlating an AP and site_id.
This relation will be used by recent change (RC) to produce the office records for APs.
A tuple in this relation is created for each tuple defined in RLcmapdata, independent of whether or not a remark, 'rmk', is known or submitted.

**Attribute: site_id**

**Fullname:** Site identification number of the AP

**Attribute Description** The site identification number can be any number from 1 to 255 and must uniquely identify the AP to the switch. This number is used by AP capabilities to indicate where messages should be routed. The assignment of this number must be consistent with their usage.

**Attribute: rmk**

**Fullname:** Remark

**Attribute Description** Remark provides a character description for the AP site. This value will be included in the Office Records. SZTEXT = 8.

# RCB_HCB

## 1. Description

For RDFI, this table translates from RDFI to HDFI. For RDFI2s, this table translates from T1FAC to HFAC. This relation is also used to show which RDFI/T1FACs may be used as alternate references for the remote clock (RCLK) and the translation of this RDFI (or T1FAC) name to the RCLK reference number.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 20 |
| expected tuples in relation | 8 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population rules for RLrcb_hcb

### Relation Description

```
        T1FAC circuit name to HFAC circuit name Translation
        This table translates from T1FAC to HFAC for both RDFI
        and RDFI2.  This relation is also used to show the
        translation of the RDFI (or T1FAC) name to the RCLK
        reference number.
```

**Attribute:**

```
        rfac_id
```

**Fullname:**

```
        internal name of the PCT1FAC facility circuit
```

**Attribute Description:**

```
        This attribute is the key to its RLCKTDATA tuple
```

**Attribute:**

```
        hfac_id
```

Copyright © 1999 Lucent Technologies

**Fullname:**
internal circuit name of the host facility circuit
**Attribute Description:**
this circuit is connected to the other end of this PCT1FAC

**Attribute:**
rcrefunit
**Fullname:**
the remote clock reference number
**Attribute Description:**
The RCLK reference number that is associated with the PCT1FAC specified by the key (rfac_id) to this relation (RLRCB_HCB).
This attribute must contain a valid, operational RCLK reference as specified in the relation RLSRCREF, whose key is this attribute (rcrefunit) and whose (ext_ref) attribute in RLSRCREF relation is set to DBNO.
If the PCT1FAC associated with the key (rfac_id) is not a RCLK reference, this value must be SMNOTREF.

**Attribute:**
rfac_id1
**Fullname:**
name of the alternate PCT1FAC that may be used as an RCLK reference
**Attribute Description:**
Name of the alternate PCT1FAC that may be used as an RCLK reference. This attribute must contain the name of a valid operational PCT1FAC facility circuit (with a CKTDATA tuple 'eqstat' attribute of SMOPER) in this RSM, provided that this RSM is equipped with an RCLK and the key (rpicb) is designated to be used as an RCLK reference.

A PCT1FAC is designated to be used as an RCLK reference by having an entry in the relation RLSRCREF, whose key is the attribute 'rcrefunit' and with 'ext_ref' attribute of RLSRCREF set to DBNO.
In addition, there must be a tuple in this relation (RLRCB_HCB) whose key is the same as this attribute.
The minimum number of RCLK references is two. For 5E2_2, there will be only two reference for the RCLK.

**Defines:**

## 4. Population Rules for RLrcfacids

**Relation Description**
Recent Change FAC IDs.

This relation maintains the list of available FAC IDs for SM partitioned data.

**Attribute: facid**

**Fullname:** FAC id

**Attribute Description** This attribute indicates FAC ID number.

**Attribute: class**

**Fullname:** Class of Facid

**Attribute Description** This attribute identifies the class of facid. The enum value FACPSNIDX has range from 0 to 4095 and FACFDSIDX has range from 0 to 100.

**Attribute: subclass**

Copyright © 1999 Lucent Technologies

**Fullname:** Subclass of Facids

**Attribute Description** This attribute identifies the subclass of facids on a particular global sm.

**Attribute: gsm**

**Fullname:** Global SM

**Attribute Description** This attribute indicates the Global SM number.

**Attribute: reclaimid**

**Fullname:** Next FAC ID to be reclaimed.

**Attribute Description** This attribute indicates the next FAC ID to be reclaimed.

**Attribute: lastused**

**Fullname:** Last FAC ID used.

**Attribute Description** This attribute indicates the last FAC ID to be used.

## 4. Population Rules for RLrcftrkey

**Relation Description**
RC Feature Key.

A feature key is used to activate / deactivate / change parameters for an MCC feature. This relation associates a set of feature keys to a particular lport.
The relation is keyed by a port (module, lport, lport type) plus a sequence number. The sequence numbers, assigned in order starting with 1, allow multiple feature keys to be associated with a particular port.

**Attribute: lport_mod**

Copyright © 1999 Lucent Technologies

**Fullname:** Switching module of the lport

**Attribute Description** The SM on which the control line terminates.

**Attribute: lport**

**Fullname:** Logical port of the user which is the control line for the key.

**Attribute Description** With lpt_type and lport_mod, this attribute specifies the line to be associated with the feature keys.

**Attribute: lpt_type**

**Fullname:** Logical port type of the user.

**Attribute Description** This attribute will be LPT_ISDN for ISDN users or LPT_OTHER for analog lines.

**Attribute: sqnum**

**Fullname:** Feature Key sequence number

**Attribute Description** This attribute is sequential in nature starting with 1 (That is if a tuple with this attribute equal to 2 exists, there must also be a tuple with sequence number 1.) The sequence numbers provide a means for associating multiple feature keys with a particular lport. Each feature key gets its own tuple and the tuple keys are made unique by the sequence numbers.

**Attribute: scan_port**

**Fullname:** Scan point port

**Attribute Description** This attribute identifies the scan point that is physically wired to the feature key on the controlling terminal.

**Attribute: scan_port.member**

**Fullname:** Scan point port number

**Attribute Description** Port for the user which is the control line for the key.

**Attribute: scan_port.module**

**Fullname:** Scan point port module number

**Attribute Description** Specifies which SM the scan point terminates on.

**Attribute: feat_id**

**Fullname:** Feature ID.

**Attribute Description** Identifies the feature to be activated or deactivated when the scan point changes state.

**Defines:**"db/DMport.h"

Copyright © 1999 Lucent Technologies 

# RCLK_SC

## 1. Description

Relation that maps a RSM Remote Clock logical scan or distribute point name to its (duplexed) MSU port numbers.

The information is used for Remote Network Clock alarm scan or distribute point processing

Client Process: SMrclkfr

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLrclk_sc

**Relation Description**
Remote clock scan (RCLK_SC).

Each RCLK scan (distribute) point is duplicated which means that each side of the RCLK has scan (distribute) point assigned to a port on MSU service group 0 as well as a corresponding duplicate port on MSU service group 1.
side0, side0dup - a scan (distribute) point and its duplicate for RCLK side 0
side1, side1dup - a scan (distribute) point and its duplicate for RCLK side 1

**Attribute: type**

**Fullname:** type of scan or distribute point

**Attribute Description** Identifies the type of scan point or distribute point used by the RCLK. The RCLK scan point type can be either RCLK_WPWR, RCLK_YPWR, RCLK_MOR,RCLK_ROS, RCOSC_XPWR, or RCOSC_YPWR. The RCLK distribute point type can be RCLK_OOSD, RCLK_RQIPD, or RCOSC_OOSD.

**Attribute: side0**

**Fullname:** hexadecimal port number of primary scan or distribution port on side 0

**Attribute Description** Identifies the port number of the primary scan (or distribute) point on side 0.

**Attribute: side0dup**

**Fullname:** hexadecimal port number of duplex scan or distribution point on side 0

**Attribute Description** Identifies the port number of the duplex scan (or distribute) point on side 0. This duplex port number is not assigned for CSU/MSU, since CSU/MSU does not have service group 1.

**Attribute: side1**

**Fullname:** hexadecimal port number of primary scan or distribution point on side 1

**Attribute Description** Identifies the port number of the primary scan (or distribute) point on side 1.

**Attribute: side1dup**

**Fullname:** hexadecimal port number of duplex scan or distribution point on side 1

**Attribute Description** Identifies the port number of the duplex scan (or distribute) point on side 1. This duplex port number is not assigned for CSU/MSU, since CSU/MSU does not have service group 1.

**Defines:**"db/DMport.h"

## 4. Population Rules for RLrclkdef

**Relation Description**
Remote clock description.

This relation provides a composite description of the RCLK. There are only two tuples in this relation, one for each RCLK side.

**Attribute: side**

**Fullname:** RCLK side

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute determines which RCLK a tuple describes. It is used as the key to this relation.
The domain of this attribute is BFSIDE, or 1 bit. The enumeration (DMSIDE) values that can be assumed by this relation are SM5SIDE0 if the tuple describes the RCLK on side 0, or SM5SIDE1 if the tuple describes the RCLK on side 1. This attribute should be populated to indicate the appropriate RCLK side described by a tuple.

**Attribute: nc_type**

**Fullname:** type of RCLK

**Attribute Description** This attribute specifies the type of RCLK with which the RSM is equipped. If the RSM is equipped with a RCLK, the nc_type is set to one of the following:

```
SM24NC2 - DS1 24-channel clock
SM30NC2 - DS1 30-channel clock
SMSANC2 - Stand alone version of network clock 2 (NCLK2).
```

The RLCK hardware consists of the same hardware as the NCLK2. This attribute should be populated to appropriately indicate the type of the RCLK in the RCLK side described by each tuple in this relation.

**Attribute: sync_type**

**Fullname:** synchronization type

**Attribute Description** If the RSM is equipped with a RCLK, then populate this attribute. The value is:

```
HIERARCH - Master/Slave synchronization.
           All 5e2(2) offices will be HIERARCH.
           U.S. offices will be HIERARCH.
SING_MUT - Single-ended mutual synchronization.
           Some future offices outside the U.S.
           will be SING_MUT.
```

**Attribute: osc_type**

**Fullname:** oscillator type

**Attribute Description** If the RSM is equipped with a RCLK, populate this attribute. The value for a Domestic office is:

```
SMDOM_MED - Medium Stability Oscillator
Stratum 3 offices (Local)
5e2(2)    - ckt.pack TN1286
```

The value for an Export office is:

```
SMEXP_HI  - High Stability Oscillator
Gateway and Toll applications
5e2(2)    - ckt. pack TN1283
SMEXP_MED - Medium stability oscillator
5e2(2)    - ckt. pack TN1285
```

## 4. Population Rules for RLrcmbgnm

**Relation Description**
The relation stores the multi-switch business group (MBG) name for each multi-switch business group identifier known by the switch.

QUANTITY OF TUPLES:
A tuple is required in RLrcmbgnm for each mgb_id value that is stored in RLmbg2tg where name is specified.

**Attribute: mbg_id**

**Fullname:** MBG identifier (MBG_ID)

**Attribute Description** mbg_id is an identifier used to describe a MBG that has multi-switch business group elements (MBGE) in 1 or more switches. This is a unique number in the network with a range of {2-65535}. The value 1 is "Reserved for Public Network Identifier" (such as, non-MBG identification.)

```
/* RULE about RLrcmbgnm.mbg_id */
/* This relation should not exist unless the */
/* CENTREX Network (CN) CN_SFID #181 is on */
```

Copyright © 1999 Lucent Technologies

**Attribute: mbg_name**

**Fullname:** Multiswitch Business Group NAME

**Attribute Description** mbg_name is an 8 character identifier associated with the MBG identifier. This is used to identify the MBG customer, and associated switch data, with the customer's CENTREX Network.

## 4. Population Rules for RLrcnetgrp

**Relation Description**
Leased network group name and ARS group IDs.

This relation contains a list of all the ARS group IDs that are associated with a given leased network group name, NETGRP. This relation is used by Recent Change to copy all appropriate ARS group data down to all SMs for the associated trunk group member ports with this NETGRP (see RLrctgrprk.netgrp).

**Attribute: netgrp**

**Fullname:** Leased Network Group Name

**Attribute Description** Leased network group name used to define a grouping of ARS groups which share a trunk group, in particular, a leased network CCS7 intermachine trunk group. See RLrctgrprk.netgrp.

Copyright © 1999 Lucent Technologies

**Attribute: argp**

**Fullname:** Automatic Route Selection Group ID

**Attribute Description** Internal ARS group ID assigned to the associated ARS group name shared within a leased network group assigned to a trunk group.

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLrcnsfmap

### Relation Description

```
        Extendent Digital Subscriber Line (EDSL) pre_routing index.

        associates Extended Digital Subscriber Line (EDSL) pre-routing index
        with call by call service type

      " This relation is populated when RLnsfmap is populated.  RLnsfmap
        maps attributes to an index (nsftype, band, carrid, fac_num,
```

Copyright © 1999 Lucent Technologies

bearcap and scocsid mapped to
eprtidx2). RLrcnsfmap maps the index (eprtidx2) to the attributes (nsftype, band, carrid, fac_num, bearcap and scocsid) and to the number of users (nusers).
RLnsfmap is used for call processing. RLrcnsfmap is initialized by ODA and used by Recent Change for insert, delete, and update."

**Attribute:**
eprtidx2
**Fullname:**
Extended Digital Subscriber Line (EDSL) pre-routing index.
**Attribute Description:**
EDSL pre-routing index for call by call type.

**Attribute:**
nsftype
**Fullname:**
call by call service type.
**Attribute Description:**
EDSL call by call service types.
Valid types:
FC_OPOTS - originating POTS
FC_OWBAND - OUTWATS with band
FC_MAXOWATS - maximal OUTWATS
FC_TPOTS - terminating POTS
FC_M800 - originating and terminating Megacom(R) 800
FC_SDN - originating and terminating SDN
FC_OFX - originating from PRI & terminating to FX
FC_TFX - originating from FX & terminating to PRI
FC_OTIE - originating from PRI & terminating to TIE
FC_TTIE - originating from Tie & terminating to PRI
FC_HM - Hotel/Motel service.
FC_SCOCS - Selective Class of Call Screening service.
FC_MEGACOM - originating MEGACOM(R)
FC_I800 - terminating International 800 service
FC_MULTIQUEST - terminating MULTIQUEST(R)
(DIAL-IT NOVA) service
(Note: Terminating TINWATS is also a call
by call service type but is not assigned here.
MCRI/SFGs are assigned in RLrt_mcrt).

**Attribute:**
band
**Fullname:**
band number.
**Attribute Description:**
OUTWATS band number.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

fac_num

**Fullname:**

Facility Number.

**Attribute Description:**

This attribute is used to indicate the facility number of the incoming or outgoing FX or Tie trunk

**Attribute:**

carrid

**Fullname:**

Carrier id.

**Attribute Description:**

Interexchange carrier id. A tuple in RLfc_carr such that RLfc_carr.carrid equals RLrcnsfmap.carrid, for all values except NULL_BCARID.

Allowable Range: 0-FGDMAXBCAR
A NULL carrier is defined as NULL_BCARID.
A non-existing or invalid carrier is defined as INVBCARID.

Default: NULL_BCARID

**Attribute:**

bearcap

**Fullname:**

Bearer Capability

**Attribute Description:**

Type of bearer capability associated with the call-by-call service type.

**Attribute:**

scocsid

**Fullname:**

Selected Class of Call Screening Service Id.

**Attribute Description:**

The service id associated with the SCOCS service.

**Attribute:**

nusers

**Fullname:**

number of users.

**Attribute Description:**

Number of users of this eprtidx2. The number of users is the number of trunk groups referencing this eprtidx2 (number of tuples in RLedslgprt with an eprtidx2 (key) = RLrcnsfmap. eprtidx2). Note that a RLedslgprt tuple for a

Copyright © 1999 Lucent Technologies 

```
        given grpnum and eprtidx2 may be populated on more
        than one SM but is counted as one user here.
```

**Defines:**

```
        "db/DMcarr_val.h"
```

## 4. Population Rules for RLrcpfakey

**Relation Description**
Recent Change keys for private facilities access parameter tuples.

Stores data for keying into the RLpf_parm relation.

This relation is used by Recent Change to quickly locate a tuple in RLpf_parm with attributes that match the keys to this relation.

See RLpf_parm for a full description of the key attributes to this relation.

**Attribute: digcoll**

**Fullname:** digit collection type

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates the type of digit collection.

**Attribute: save_acd**

**Fullname:** save access dialcode

**Attribute Description** Save access dialcode indicator.

**Attribute: dial_tn2**

**Fullname:** second dial tone indicator

**Attribute Description** Indicator to provide second dial tone.

**Attribute: ovlp_opls**

**Fullname:** overlap outpulsing

**Attribute Description** Overlap outpulsing indicator.

**Attribute: sig_conv**

**Fullname:** signal conversion

**Attribute Description** Signal conversion indicator.

**Attribute: seqnum**

**Fullname:** sequence number

**Attribute Description** This is a sequential based key.

If this value is greater than 0, there must be tuples in RLrcpfakey with every seqnum from 0 through this value. For example, if this attribute is 1 there must be a 0 in another tuple in the RLrcpfakey relation with matching values for the other 5 keys. The sequence numbers must begin with 0 and then be sequentially incremented.

**Attribute: parm_id**

**Fullname:** parameter identifier

**Attribute Description** There must be a tuple in the RLpf_parm relation for each of the parm_id's in this relation such that:

```
RLpf_parm.dcol_typ = RLrcpfakey.digcoll
RLpf_parm.save_acd = RLrcpfakey.save_acd
RLpf_parm.dial_tn2 = RLrcpfakey.dial_tn2
RLpf_parm.ovlp_opls = RLrcpfakey.ovlp_opls
RLpf_parm.sig_conv = RLrcpfakey.sig_conv
RLpf_parm.parm_id = RLrcpfakey.parm_id
```

**Attribute: usr_cnt**

**Fullname:** user count

**Attribute Description** This is the number of PFA group parameter tuples using this parm_id.

## 4. Population rules for RLrcrtirmk

### Relation Description

```
        Route Index Remarks
        This relation associates a remark, which contains up to 16 characters,
        with a route index.
        There is a tuple in this relation for every route index populated
        in RLrt_routing (that is, RLrt_routing.route_x).
```

**Attribute:**

```
        rti
```

**Fullname:**

Copyright © 1999 Lucent Technologies

Route Index

**Attribute Description:**

This is the route index to which the remark (that is, RLrcrtirmk.rem) refers.

**Attribute:**

count

**Fullname:**

RTI counter

**Attribute Description:**

This attribute contains the number of references to RLrcrtirmk.rti found in RLrtlist.ri[0 thru 15] (all tuples). This counter enables RC to block deletions on RC View 10.2, if a specific RTI is referenced (RLrcrtirmk.count != 0) on any LDP Route List (RC View 10.40). The tuple can, however, be deleted, even though the RTI may be referenced from other relations such as, RLfc_carr, RLrt_dtrtx, RLrt_fixedri, RLrt_scrning, RLrt_wbrtx, and RLsrv_dest.

**Attribute:**

rem

**Fullname:**

Remark

**Attribute Description:**

The remark for the route index is stored as an array of up to 16 ASCII characters. If no remark was specified for the route index then the array is set to NULL ('\0').

## 4. Population Rules for RLrcrtmod

**Relation Description**
Recent change routing module relation.

Number of hundreds groups routed by SM.

(1) 1) Each tuple contains the number of Hundreds Groups routed by this module.

Copyright © 1999 Lucent Technologies

(2) 2) The definition of an eligible switching module is defined in the population rules for rlRTDNMOD.

(3) 3) One tuple exists in this relation for each eligible switching module.

A tuple is populated even if there are zero rlRTDNMOD.rtg_mod attributes specifing this rlRCRTMOD.sm."

**Attribute: sm**

**Fullname:** Switching Module

**Attribute Description** Switching Module (1-192).

**Attribute: workload**

**Fullname:** The number of rlRTDNMOD tuples that specify this switching module in RLrtdnmod.rtg_mod.

**Attribute Description** The number of rlRTDNMOD tuples that specify this switching module in rlRTDNMOD.rtg_mod.
Zero(0) is a legal value for rlRCRTMOD.workload if there are no rlRTDNMOD.rtg_mod attributes that reference this rlRCRTMOD.sm. Notice that RC mapping code for Hundreds Group Assignment (vhgrpas) handles this zero case as an exception to its rule concerning automatic assignment of routing modules. This zero case is given special handling to accommodate SM growth. It prevents new SMs from being the target of automatic assignment until the SM is fully operational.

If the switch personnel leaves the SM attribute blank on this view, the RC code finds the rlRCRTMOD tuple with the lowest non-zero rlRCRTMOD.workload attribute and populates rlRTDNMOD.rtg_mod with that particular rlRCRTMOD.sm. For this default case, one hundreds group on a (modatt.unittype=SMSMP20) is equivalent to five (5) hundreds group on an SM-2000 SM (modatt.unittype=SMSM2000 or SMSM2005). In other words, except for the zero case, if the user does not specify an SM, then the RC code automatically assigns the new hundreds group to the SM with the lowest workload.

**Attribute: psworkload**

**Fullname:** The number of rlRTDNMOD tuples that specify this switching module in rlRTDNMOD.psrtg_mod.

**Attribute Description** The number of rlRTDNMOD tuples that specify this switching module in rlRTDNMOD.psrtg_mod.
Zero(0) is a legal value for rlRCRTMOD.psworkload if there are no rlRTDNMOD.psrtg_mod attributes that reference this rlRCRTMOD.sm. Notice that RC mapping code for Hundreds Group Assignment (vhgrpas) handles this zero case as an exception to its rule concerning automatic assignment of packet routing modules. If the switch personnel leaves the SM attribute blank on this view, the RC code finds the rlRCRTMOD tuple with the lowest non-zero rlRCRTMOD.psworkload attribute and populates rlRTDNMOD.psrtg_mod with that particular rlRCRTMOD.sm. In other words, except for the zero case, if the user does not specify an SM: then the RC code automatically assigns the new hundreds group to the SM which is an ISDN SM with the fewest packet hundreds groups.

This zero case is given special handling to accommodate SM growth. It prevents new SMs from being the target of automatic assignment until the SM is fully operational.

## 4. Population Rules for RLrcsdl_lg

**Relation Description**
Signaling Data Link port to Link Group Member Mapping.

This relation is used for Automatic Allocation of Signaling Data Links. It provides a mapping between a Link Group and Member and a Signaling Data Link port.

**Attribute: sdl_sm**

**Fullname:** Signaling Data Link Module

**Attribute Description** Switching Module where the Signaling Data Link (SDL) resides.

**Attribute: sdl_port**

Copyright © 1999 Lucent Technologies

**Fullname:** Signaling Data Link Port

**Attribute Description** The Signaling Data Link port number.

**Attribute: lnkgrpmem**

**Fullname:** Link Group Member Number

**Attribute Description** The member of the link group which contains the port keyed by this relation.

**Attribute: lnkgrp**

**Fullname:** Link Group Number

**Attribute Description** The link group which contains the port keyed by this relation.

## 4. Population Rules for RLrctgfeat

**Relation Description**
List of BRCS constructed features to be assigned to each trunk group member as the member is inserted.

There is a tuple in this relation for each trunk group that wants BRCS features assigned to members automatically as each member is inserted. BRCS features may be assigned to members without a tuple in this relation.

The tuple is keyed by trunk group number and consists of up to 48 trunk group (tg) entries. Each tg entry contains the data needed to assign a BRCS feature to a trunk member.

Null tg entries contain the following values:

```
id   = 0
act  = DBNO
parm = APNO
ac   = DBNO
rasalwd = DBNO
```

Non-null entries must precede null tg entries in the tg list. For example, null tg entries cannot be interspersed among non-null tg entries.

**Attribute: tgn**

**Fullname:** Trunk Group Number

**Attribute Description** Indicates the trunk group that will use this relation to store the feature and cluster ID's. A tuple in relation RLrt_trkg must exist and be keyed by this tgn.

**Attribute: tgent1**

**Fullname:** Trunk Group Entry 1 Structure

**Attribute Description** Trunk group entry structure 1 - 48.

**Attribute: tgent1.fid**

**Fullname:** Feature ID

**Attribute Description** Indicates the constructed feature ID. There must be a tuple in RLfacname with a facid equal to this id with class = FACBRCS and subclass = SCL_FEAT. Clusters are not supported.

**Attribute: tgent1.initactv**

Copyright © 1999 Lucent Technologies 

**Fullname:** Initial Activation

**Attribute Description** Indicates the initial activation status for each ID. DBNO indicates the ID is inactive: DBYES indicates the ID is active.

**Attribute: tgent1.autoparm**

**Fullname:** Automatic Parameter

**Attribute Description** Unused attribute - not to be populated.

**Attribute: tgent1.ac**

**Fullname:** Authorization Code

**Attribute Description** Indicates that an authorization code is needed to access the feature defined by the ID attribute from any trunk in this group.
(For ODA only, if ac = DBYES then the feature defined by the id attribute must be in the RLath_fcos relation. The range of values is DBYES and DBNO with DBNO as the default. DBYES indicates an authorization code is needed for all members of the trunk group, however, a corresponding field (ath) in TRMFEATS overrides this value for individual trunks.)

**Attribute: tgent1.rasalwd**

**Fullname:** Remote Access Service (RAS)

**Attribute Description** This bit determines if Remote Access Service (RAS) is supported for this ID. For the 5E5 generic, this bit is not used and should always be set to DBNO.

**Attribute: tgent[*]**

**Fullname:** Trunk Group Entry 1 Structure

**Attribute Description** Trunk group entry structure 1 - 48.

**Attribute: tgent[*].fid**

**Fullname:** Feature ID

**Attribute Description** Indicates the constructed feature ID. There must be a tuple in RLfacname with a facid equal to this ID with class = FACBRCS and subclass = SCL_FEAT. Clusters are not supported.

**Attribute: tgent[*].initactv**

**Fullname:** Initial Activation

**Attribute Description** Indicates the initial activation status for each ID. DBNO indicates the id is inactive: DBYES indicates the ID is active.

**Attribute: tgent[*].autoparm**

**Fullname:** Automatic Parameter

**Attribute Description** Unused attribute - not to be populated.

**Attribute: tgent[*].ac**

Copyright © 1999 Lucent Technologies 

**Fullname:** Authorization code

**Attribute Description** Indicates that an authorization code is needed to access the feature defined by the id attribute from any trunk in this group. For ODA only, if ac = DBYES then the feature defined by the id attribute must be in the RLath_fcos relation. The range of values is DBYES and DBNO with DBNO as the default. DBYES indicates an authorization code is needed for all members of the trunk group, however, a corresponding field (ath) in BRCFEATS overrides this value for individual trunks.

**Attribute: tgent[*].rasalwd**

**Fullname:** Remote Access Service (RAS)

**Attribute Description** This bit determines if Remote Access Service (RAS) is supported for this ID. For the 5E5 generic, this bit is not used and should always be set to DBNO.

# RCTGRPRK

## 1. Description

This relation contains the trunk group recent change remarks data.

This is a virtual relation. The Root Storage Relation is RLtgrprk_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RCTGRPRK.

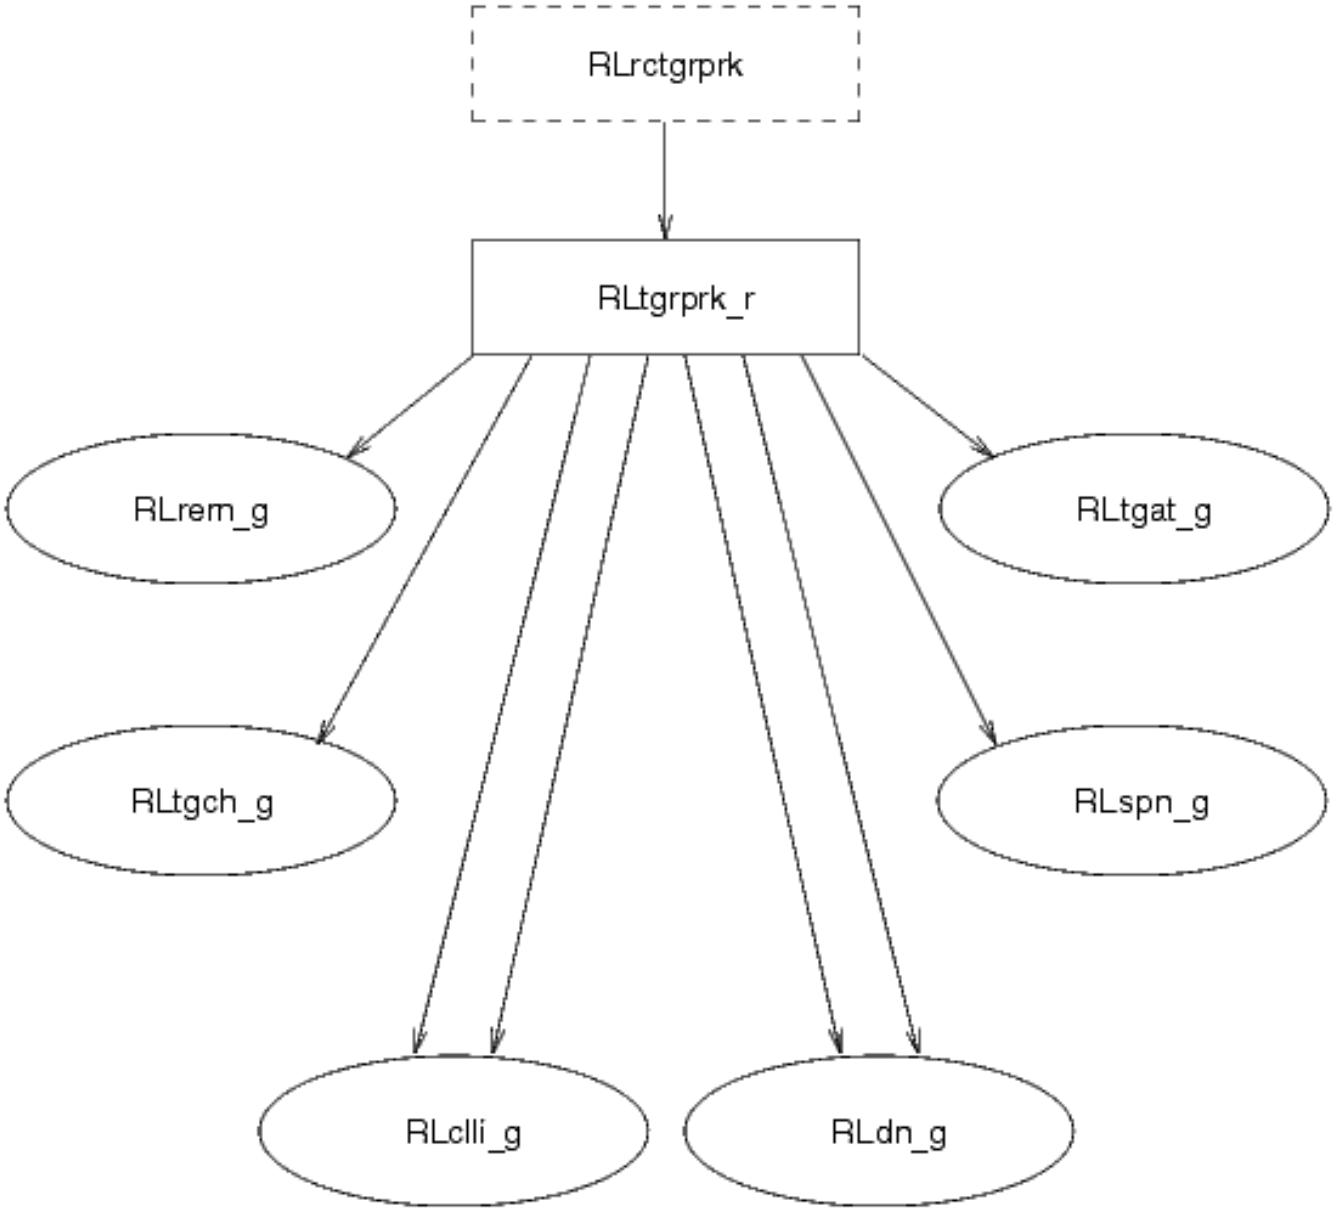

**Figure 1 Virtual Relation RCTGRPRK**

## 4. Population rules for RLrctgrprk

### Relation Description

Recent change trunk group remarks

Trunk group recent change remarks data.

This rule is to be followed when populating trunk and routing information for originating access tandem and originating toll offices. For all incoming integrated services digital network (ISDN) user part 7 (ISUP7) trunks at an originating access tandem office and all incoming ISUP7 trunks at an originating toll office that handles international traffic, the circuit code must be populated in RLcktcddig.ckt_code. This is not an recent change (RC)/office data administration (ODA) enforceable rule.

When installing Common Channel Signaling System, Version 7 (CCS7) trunks which connect two networks, for example a local exchange carrier (LEC) and a long distance carrier, the following rules apply:

Note: These rules cannot be enforced by RC or ODA.

CCS7 trunks are trunks which have either RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equal to DBISUP7.

The toll office (TO) end must have a servclass of FC_LATA_CONN. A toll office switch is any switch within an inter-LATA carrier (IC) or international carrier (INC) network.

FC_LATA_CONN trunks can connect to LEC switches which are either end offices (EO) or access tandem (AT) switches. AT switches allow calls to be distributed to or concentrated from appropriate end offices.

The EO or AT end must have a servclass of FC_IEC. An EO or AT is any switch that is within the LEC network.

FC_IEC trunks can connect to far switches which may be any one of the following carrier types:

Inter-LATA carrier

Copyright © 1999 Lucent Technologies 

```
        International carrier
        Consolidated carrier

Use of these TRK CLASS ('servclass') values, for trunks that
cross the network boundary, is necessary to utilize the
integrated services digital network (ISDN) user part (UP)
protocol for internetwork operations.

SPECIAL TRUNK GROUPS

RLrctgrprk (remote digital test access extended digital
    subscriber line [EDSL] primary rate interface [PRI]
    trunks - remote digital test access [RDTA])

DESCRIPTION:

The RDTA capability is fully explained in the relation RLdn_rdta.
The capability uses EDSL PRI trunk group members to connect RDTA
sessions to a remote CSC.  The following tuple semantics, define
the correct population of RDTA trunk groups in this relation.
The rdta_grp attribute must be DBYES, 'billingdn' must be null
for outgoing EDSL trunk groups and populated for two-way EDSL
trunk groups and the brc attribute must be DBNO.  The group
members must be used exclusively for RDTA.

Corresponding tuples must appear in the following relations:

     RLgroup_port    - keyed on trunk group and member
     RLpggpmap       - keyed on trunk port
     RLfc_porttyp    - keyed on trunk port (servclass = FCEDSL)
     RLedsltrkg      - keyed on trunk group with bill_dn null

QUANTITY OF TUPLES:

A tuple is required in RLrctgrprk for each RDTA test trunk
GROUP (outgoing or two-way) in the office.

TUPLE SEMANTICS:

RLrctgrprk attributes should be populated as shown in the
following.  Any attributes not specified should be populated
with the default value.

OUTGOING EDSL TRUNK GROUPS
--------------------------
portgrp.grpnum (KEY)  - Outgoing RDTA trunk group number.
portgrp.grptype (KEY) - TM_TRK.
rem                   - RDTA test trunk group (specify outgoing).
servclass             - FCEDSL.
module                - Zero.
digtree               - Zero (default).
insep                 - Zero (default).
screen_x              - Zero (default).
```

Copyright © 1999 Lucent Technologies 

```
glare_action          - GLR_NULL.
privacy               - DBNO.
ln_virt_on            - DBNO.
outpuls               - DBNO.
audring               - DBNO.
annc_apl              - SVCNO_ANNC.
intsig                - FCNO_SIG.
brc                   - DBNO.
billingdn             - 'digcnt' equals zero and 'dn' equals '\0').
datarate              - DBDATA_56K, DBDATA_R64K, DBDATA_64K.
vpa_type              - CCNONCCS.
npsn                  - Zero.
rdta_grp              - DBYES.

TWO WAY EDSL TRUNK GROUPS
-------------------------
portgrp.grpnum (KEY)  - Two-way RDTA trunk group number.
portgrp.grptype (KEY) - TM_TRK.
rem                   - RDTA test trunk group (specify two-way).
servclass             - FCEDSL.
module                - Zero.
digtree               - Is greater than zero (must be valid 'digtree'
                        for office EDSL trunks).
insep                 - Zero (default).
screen_x              - Is greater than zero(must be valid 'screen_x'
                        for office EDSL trunks)
glare_action          - ALLCTRL or NONECTRL.
privacy               - DBNO.
ln_virt_on            - DBNO.
outpuls               - DBNO.
audring               - DBNO.
annc_apl              - SVCNO_ANNC.
intsig                - FCNO_SIG.
brc                   - DBNO.
billingdn             - 'digcnt' is greater than or equal to seven
                        and 'dn' is seven or more digits.
datarate              - DBDATA_56K, DBDATA_R64K, DBDATA_64K.
vpa_type              - CCNONCCS.
npsn                  - Zero.
rdta_grp              - DBYES.
```

RLrctgrprk (local test desk test trunks - LTD)

DESCRIPTION:

LTD test trunks provide the interface to external testing systems (LTD, mechanized loop testing [MLT], Fortel, etc.) for metallic loop testing of lines. These trunks may be configured as incoming trunks (LTD to line tests) or outgoing trunks (line to LTD tests).

A separate outgoing LTD trunk group is required for each 'metallic community'. Thus, each remote module (remote switching

Copyright © 1999 Lucent Technologies 

module [RSM], optically remote switching module [ORM], two-mile ORM [TRM], multi-module RSM [MMRSM] cluster, etc.) which is not metallically linked to the host office must have its own outgoing LTD trunk group to provide LTD access from the lines within that module/cluster. Each remote module must have its own incoming LTD test trunk CIRCUIT(S), but this circuit(s) may be included in the same trunk group as the non-remote module incoming test trunks.

Corresponding tuples must appear in the following relations:

```
RLrc_trk      - keyed on trunk group and member
RLrt_trkg     - keyed on trunk group
RLgroup_port  - keyed on trunk group and member
RLpggpmap     - keyed on trunk port
RLfc_porttyp  - keyed on trunk port (servclass = TM_TSTK)
RLfc_trunk    - keyed on trunk port
RLmtbtst      - keyed on trunk port
```

QUANTITY OF TUPLES:

A tuple is required in RLrctgrprk for each LTD test trunk GROUP (incoming or outgoing) in the office.

TUPLE SEMANTICS:

RLrctgrprk attributes should be populated as shown in the following. Any attributes not specified should be populated with the default value.

```
portgrp.grpnum (KEY)  - Incoming or outgoing LTD trunk group
                        number.
portgrp.grptype (KEY) - TM_TRK.
rem                   - LTD test trunk group (specify incomeing
                        or outgoing).
servclass             - TM_TSTK.
module                - Zero.
digtree               - For incoming LTD group, use table
                        identifier for DAPRLDGT; for outgoing
                        LTD group, use zero.
```

Engineering rules for trunk group number for International Business Machines (IBM) Digit Analysis Selector (DAS)

The following is not enforceable by ODA and RC, but must be followed by the customer when entering trunk groups with RLrctgrprk.servclass equal FC_EIS_TRK which are attached to an IBM DAS.

Every trunk group attached to the same IBM DAS must have a trunk group number which produces a unique remainder when divided by eight. For example, one IBM DAS(R) could not be connected to trunk group numbers 33 and 65, because both have a remainder of one when divided by eight. It is recommended that trunk groups numbers be consecutive, with the first number being a multiple of

Copyright © 1999 Lucent Technologies 

eight. For example, 64, 65, 66, 67, 68, 69, 70, 71.

**Attribute:**
portgrp
**Fullname:**
Port group
**Attribute Description:**
Port group.

**Attribute:**
portgrp.grpnum
**Fullname:**
Group number
**Attribute Description:**
Trunk group number.

**Attribute:**
portgrp.grptype
**Fullname:**
Group type
**Attribute Description:**
Group type, use enumeration TM_TRK.

**Attribute:**
rem
**Fullname:**
Remarks
**Attribute Description:**
Character string for remarks.

**Attribute:**
servclass
**Fullname:**
Service class
**Attribute Description:**
Trunk class of service. The value inserted here must also be a valid 'servclass' used in FC_PORTTYP. If RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equals DBCCIS6, DBTUP7, or DBISUP7, then 'servclass' must be FC_LTOLL_CONN, FC_TTOLL_CONN, FC_PRI_INTOLL, FC_SEC_INTOLL, FC_BV_INTOLL, FC_BV_TOLLCMP, FC_LATA_CONN (as declared in population rules for RLFC_PORTTYP).

If 'servclass' equals TM_TSTK: designates incoming and outgoing local test desk (LTD) test trunks used for metallic loop testing of lines. Applicable for U.S. and international. Refer to LTD population rules section.

Copyright © 1999 Lucent Technologies 

If 'servclass' equals OA_IFOPER, a tuple can exist in IST_PARM with RList_parm.tgn_d equal to RLrctgrprk.portgrp.grpnum (indicating an outgoing interflowed D-channel trunk group is in use) or RList_parm.tgn_b equal to RLrctgrprk.portgrp.grpnum (indicating an outgoing interflowed B-channel trunk group is in use).

Before deleting a tuple in RCTGRPRK (with servclass equal to OA_IFOPER), ensure a tuple does not exist in IST_PARM with that trunk group number.

If 'servclass' equals OA_IFTERM, a tuple can exist in OSPS_INT with RLosps_int.inc_dtrkg equal to RLrctgrprk.portgrp.grpnum (indicating an incoming interflowed D-channel trunk group is in use) or RLosps_int.inc_btrkg equal to RLrctgrprk.portgrp.grpnum (indicating an incoming interflowed B-channel trunk group is in use).

Before deleting a tuple in RCTGRPRK (with servclass equal to OA_IFTERM), ensure a tuple does not exist in OSPS_INT with that trunk group number.

If 'servclass' equals TMOGTC, TM_ROTL, TM_CALLBK, or TMDFTACLTP, a local digital interpreter table (LDIT) needs to be populated to every switching module (SM) where the logical test port (LTP) resides; that is for every SM where the LTP resides, the SM should be subscribed to an LDIT. The DAS associated with that LDIT is defined in RLRC_DAS. Note that RC and ODA do not support the previous check.

## Special Access Trunk Groups

Trunk groups that are assigned special access service classes of RLrctgrprk.servclass equal to FC_SPAWATS, FC_SPAMEG, FC_SPAB800 or FC_SPAM800, cannot be changed to a non-special access service class. The reverse is also true. Trunk groups that are assigned non-special access service classes cannot be changed to a special access service class. Growth and de-growth procedures must be followed. The following are the rules for changing class of service for trunk groups that are assigned special access service classes:

| From | ==> | To |
|---|---|---|
| FC_SPAWATS | ==> | FC_SPAMEG |
| FC_SPAMEG | ==> | FC_SPAWATS |
| FC_SPAB800 | ==> | FC_SPAM800 |
| FC_SPAM800 | ==> | FC_SPAB800 |

The following 'servclass', 'sigtype', and signal combinations are valid for special access:

| servclass | sigtype | signal |
|---|---|---|
| FC_SPAWATS | DBDP,DBMF, DBTT | FCWINK, FCIMMED, |

Copyright © 1999 Lucent Technologies 

| | | |
|---|---|---|
| | | FCDIALTONE |
| FC_SPAMEG | DBDP,DBMF, DBTT | FCWINK, FCIMMED, FCDIALTONE |
| FC_SPAB800 | DBDP,DBMF, DBTT | FCWINK, FCIMMED, FCDELAYDIAL |
| FC_SPAM800 | DBDP,DBMF, DBTT | FCWINK, FCIMMED, FCDELAYDIAL |

Special access trunks that are assigned a service class of FC_SPAWATS (special access wide area telephone service [WATS]) or FC_SPAMEG (MEGACOM(R) [special access]) must have the relations RLspabilldn, RLspabndscrn and RLspaenxx populated and distributed to the appropriate SMs where the trunks are located.

Special access trunks that are assigned a service class of FC_SPAB800 (special access basic 800) or FC_SPAM800 (MEGACOM(R) 800 [special access]) do not require that the relations RLspabilldn, RLspabndscrn and RLspaenxx be populated and distributed to the appropriate SMs where the trunks are located.

For more information about population and distribution of RLspabilldn, RLspabndscrn and RLspaenxx, refer to their respective poprules.

**Attribute:**

module

**Fullname:**

Module

**Attribute Description:**

The SM number where the packet switching trunks reside. Packet switching trunks have their 'servclass' set to PSPKT_TRK X.75/X.75'. For non packet switching trunks ('servclass' other than PSPKT_TRK X.75/X.75') the module should be set to zero.

For PSPKT_TRK, if module does not equal zero then all members of group must be on same SM and the module attribute is set equal to this SM number.

For X.75/X.75' trunks, module equal zero if the trunk group is split across non-remoted SMs. If an X.75/X.75' trunk group contains members on a remoted SM such as an ORM or RSM, then all members of the group must be on that remoted SM and the module attribute is set equal to this SM number.

Copyright © 1999 Lucent Technologies 

**Attribute:**
digtree
**Fullname:**
Digit tree
**Attribute Description:**
Digit analysis table identifier.

Range of value: 0-99.

Default value: No default. If 'servclass' is equal to OA_TAOPER, 'digtree' must be non-zero. If 'servclass' does not equal zero, verify existence of tuple in RLrc_das where RLrc_das.digtree equals 'digtree'.

When Glapsdn is set to DBYES (this is an action point (ACP) in the software defined network), then a 'digtree' of 88 is not allowed to be assigned to any trunk ('digtree' must not be 88). The reason for this is, at an ACP, there must be some trunks that have their 'sdnded' attribute set to DBYES. When a call arrives at an ACP using one of these trunks ('sdnded' equals DBYES), the reserved digtree of 88 will be used by call processing to enter digit analysis to determine if a query is to be sent to a remote database for routing instruction for the associated call. Only in the case where routing instruction from the remote database instructs the ACP to route the associated call via POTS domain, the original 'digtree' assigned to this trunk (does not equal 88) will be used.

RC/V Constraint/Crosscheck
---

A digit analysis table identifier can only be assigned to a member if (1) it is a valid DAS, and (2) if the DAS is currently assigned (that is, the LDIT for the DAS is populated) to the SM that owns the trunk group member. To determine if the DAS is assigned to the SM that owns the trunk member, check RLDB_AMGPD with grp_type equal to GPD_DA and grp_id equal to 'digtree'.

The attributes 'pcr_map1' through 'pcr_map7' represent a processor bit map. The bit position corresponding to the SM number that owns the port (that is, 'port.module') should be set to a '1'. If a DAS is not assigned to a SM, that DAS cannot be assigned to any trunk group member in that SM.

**Attribute:**
insep
**Fullname:**
Incoming separation class
**Attribute Description:**
Incoming/originating separations class. The insep attribute is used for division of revenue (U.S.) and for traffic dispersion (international). DMINSEP is 0-254. NULL value is zero. The 'insep' is based on trunk group.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
screen_x
**Fullname:**
Screen index
**Attribute Description:**
Should match the screen_x attribute in FC_TRUNK.

**Attribute:**
glare_action
**Fullname:**
Glare action
**Attribute Description:**
This parameter indicates the method to be used on a trunk group when dual seizure occurs. Possible values are:

ALLCTRL - All the trunks in this trunk group will have control over glare and the far end office will yield to glare condition.

NONECTRL - All the trunks in this trunk group will not have control in a glare situation and will yield to the trunks in the far end office.

ODDEVEN - All the trunks in this trunk group will use an algorithm to compute glare based on a numeric comparison of originating point code/destination point code (OPC/DPC) in the context of circuit identification code (CIC) being odd or even.

GLR_NULL- When the input field is left blank this attribute is populated with the enum NULL. The reverse relationship also applies. When glare_action is NULL this field on the screen is left blank.

See RLfc_trunk.glare for more information.

For packet switching trunk groups (IP, X.75 or X.75') the glare_action attribute is not used. Glare conditions on two-way packet switching trunks do not occur because of the assignment of logical channel numbers (up to 128 per trunk member). Both the near end and far end logical channel numbers are provisioned by the user and eliminate 'Glare' conditions from occurring. This attribute should always be populated as ALLCTRL for these three trunk group types for consistency and to conform with rules for other types of two-way trunk groups.

NOTE: For ISUP7 two-way trunks, check the capabilities of the far switch before setting this attribute to ALLCTRL or

**Copyright © 1999 Lucent Technologies** 

NONECTRL. The connecting office must be a 5E6(1) or later release or have equivalent glare capability before a value of ALLCTRL or NONECTRL can be chosen.

**Attribute:**
privacy
**Fullname:**
Private number
**Attribute Description:**
This attribute is used for equal access multi-frequency (EAMF), centralized automatic message accounting (CAMA), PRI, EDSL, and EDSL trunk for hotel/motel for Traffic Services Position System (TSPS) service (EDSLHM) trunk groups to indicate whether the directory number (DN) received is a private number or not. This attribute corresponds to, and should have the same value as, RLfc_trunk.privacy.

DBYES - Indicates a private number.
DBNO - Indicates not a private number.

Note: The determination of the type of trunk group, EAMF, CAMA, PRI, EDSL, or EDSLHM, is not RC enforceable but is a recommendation for ODA population of an office. For trunk group types other than those listed previously this attribute should be set to DBNO.

**Attribute:**
cpn_rstrct
**Fullname:**
Calling party number (CPN) restriction
**Attribute Description:**
This attribute is used to determine if the CPN parameter should be passed in an ISUP7 initial address message (IAM) to the next office. This attribute corresponds to, and should have the same value as, RLfc_trunk.cpn_rstrct.

DBNO - Indicates the parameter should be passed to the next office (not restricted).
DBYES - Indicates the parameter will not be passed to the next office and the CPN parameter will not be populated in the outgoing IAM message.

**Attribute:**
chg_rstrct
**Fullname:**
Charge number (CHG) restriction
**Attribute Description:**
This attribute is used to determine if the CHG parameter should be passed in an ISUP7 IAM to the next office. This attribute corresponds to, and should have the same value as

**Copyright © 1999 Lucent Technologies** 

RLfc_trunk.chg_rstrct.

DBNO - Indicates the parameter should be passed to the next office (not restricted).
DBYES - Indicates the parameter will not be passed to the next office and the CHG parameter will not be populated in the outgoing IAM message.

**Attribute:**
ln_virt_on
**Fullname:**
FTS2000 leased network virtual on-net trunk group
**Attribute Description:**
This attribute is used to indicate whether this is a FTS2000 leased network virtual on-net trunk group. This attribute corresponds to, and should have the same value as, RLfc_trunk.ln_virt_on.

DBYES - Indicates a FTS2000 leased network virtual on-net trunk group.
DBNO - Otherwise.

**Attribute:**
uuiic_rstrct
**Fullname:**
User-to-user information (UUI) parameter inter-exchange carrier (IXC) boundary restriction indicator.
**Attribute Description:**
UUI signaling transfer allows ISDN customers to exchange user data transparently through the network, in the UUI of an ISUP message, during call setup and call clearing.

The user to user information parameter IXC boundary restriction indicator is checked at network boundaries by the operational software to determine if the UUI parameter should be passed/accepted in an ISUP message to/from the far switch. (The UUI parameter may be included in any of the following ISUP messages: IAM, address complete message [ACM], answer message [ANM], call progress message [CPG], release message [REL].)

For LATA_CONN trunks:

DBNO: Indicates the UUI parameter should be accepted in forward messages or passed in backward messages by IXC switches at the access point.

Indicates that the UUI parameter should be passed in forward messages or accepted in backward messages by IXC switches at the egress point. (not restricted)

DBYES: Indicates the UUI parameter should not be accepted in forward messages or passed in backward messages by IXC switches at the

Copyright © 1999 Lucent Technologies 

access point.

Indicates that the UUI parameter should not be passed in forward messages or accepted in backward messages by IXC switches at the egress point. (restricted)

For IEC trunks:

DBNO: Indicates the UUI parameter should be accepted in backward messages by local exchange carrier (LEC) switches at the access point.

Indicates that the UUI parameter should be accepted in forward messages by LEC switches at the egress point. (not restricted)

DBYES: Indicates the UUI parameter should not be accepted in backward messages by LEC switches at the access point.

Indicates that the UUI parameter should not be accepted in forward messages by LEC switches at the egress point. (not restricted)

The following guidelines should be followed when populating the rctkgrprk.uuiic_rstrct attribute for ISUP trunks.

This attribute is used by the operational software only at network boundaries. Therefore, for trunks with service class of FCLATA_CONN or FC_IEC, this indicator should be optioned by the customer.

This attribute is ignored by the operational software for all other service class values.

This attribute corresponds to, and should have the same value as fc_trunk.uuiic_rstrct. For additional details, see the poprules for RLfc_trunk.

**Attribute:**

atpic_rstrct

**Fullname:**

Access transport parameter IXC boundary restriction indicator

**Attribute Description:**

Q.931 information element transfer facilitates the transport of specific Q.931 information elements in the ISUP access transport parameter (ATP) transparently between exchanges in the network.

The access transport parameter IXC boundary restriction indicator is checked at network boundaries by the operational software to determine if the ATP parameter should be passed/accepted in an ISUP message to/from the far switch. (The ATP parameter may be included in any of the following ISUP messages: IAM, ACM, ANM, CPG, REL.)

Copyright © 1999 Lucent Technologies 

For LATA_CONN trunks:

DBNO: Indicates the ATP parameter should be accepted in forward messages or passed in backward messages by IXC switches at the access point.

Indicates that the ATP parameter should be passed in forward messages or accepted in backward messages by IXC switches at the egress point. (not restricted)

DBYES: Indicates the ATP parameter should not be accepted in forward messages or passed in backward messages by IXC switches at the access point.

Indicates that the ATP parameter should not be passed in forward messages or accepted in backward messages by IXC switches at the egress point. (restricted)

For IEC trunks:

DBNO: Indicates the ATP parameter should be accepted in backward messages by LEC switches at the access point.

Indicates that the ATP parameter should be accepted in forward messages by LEC switches at the egress point. (not restricted)

DBYES: Indicates the ATP parameter should not be accepted in backward messages by LEC switches at the access point.

Indicates that the ATP parameter should not be accepted in forward messages by LEC switches at the egress point. (not restricted)

The following guidelines should be followed when populating the rctgrprk.atpic_rstrct attribute for ISUP trunks.

This attribute is used by the operational software only at network boundaries. Therefore, for trunks with service class of FCLATA_CONN or FC_IEC, this indicator should be optioned by the customer.

This attribute is ignored by the operational software for all other service class values.

This attribute corresponds to, and should have the same value as RLfc_trunk.atpic_rstrct. For additional details, see the poprules for RLfc_trunk.

**Attribute:**
cfn_rstrct
**Fullname:**
Confusion message (CFN) restriction indicator
**Attribute Description:**
In order to identify that unrecognized signaling information

Copyright © 1999 Lucent Technologies 

has been received at an exchange, a CFN may be sent in either the forward or backward direction to an adjacent switch.

The confusion message restriction indicator is used by the incoming operational software when an incoming message is not understood. This attribute is checked to determine whether a confusion message should be generated and sent to an adjacent office.

This attribute corresponds to, and should have the same value as RLrctgrprk.cfn_rstrct.

DBNO: Indicates that the message should be generated or sent to the adjunct office (not restricted).

DBYES: Indicates that the message should be generated or sent to the adjunct office (restricted).

(The default setting of this attribute is 'not restricted'.)

The following guidelines should be followed when populating the RLfc_trunk.cfn_rstrct indicator for ISUP trunks.

1. The CFN should be generated only at LEC switches. Therefore, this attribute should be optioned by the customer at LEC offices where ccs7_type equals Regional Bell Operating Company (RBOC).

2. The CFN should not be generated at AT&T toll offices. Therefore, this attribute does not apply at toll exchanges where ccs7_type equals TOLL. Also for CCS7 LATA_CONN trunks at an originating toll exchange where 'ccs7_type' equals RBOC, the value of this attribute does not apply.

For additional details, see the poprules for RLfc_trunk.

**Attribute:**

ccs7_typ

**Fullname:**

CCS7 protocol type

**Attribute Description:**

This attribute is used by call processing software to trigger network specific handling of certain ISUP7 messages and parameters. A value of DBTOLL indicates that routing information indicator (RII) and dialed directory number (DLDN) should be sent if known. It also means to handle the CPN parameter as billing number, provided that the network is operating in 'old' mode.

After toll network transition to 'new' mode the CPN parameter will contain calling party number. It also means to respond to the following events in call processing as has been specified by AT&T-NSD.

1. Send a facility (FAC) reject (REJ) message when certain events

Copyright © 1999 Lucent Technologies 

happen to the UUI parameter.
2. Send a second start dial message under certain circumstances respond to the side identification (SID) automatic number identification (ANI) increment message.
3. Process a CRANK BACK message.
4. Do not respond with a CFN message when an unknown message is received.

A value of DBRBOC means that ISUP7 messages and parameters are to be handled as specified by Telcordia Technologies. For example, the CPN and CHG parameters should be sent when known. Also, the originating line identity (OLI) parameter can be sent when known with a value showing the service ID of the call. It also means that the FAC REJ message is not sent when MA-UUI is dropped. RBOC network specific handling of parameters occurs when ccs7_typ is set to DBRBOC.

Generally, all trunk groups that are in a local exchange carrier environment are populated with a value of DBRBOC. Conversely, all trunk groups that are in the AT&T-NOG environment are populated with a value of DBTOLL except LATA_CONN trunks which have a value of DBRBOC.

**Attribute:**
rcd_3pt1_itc
**Fullname:**
Recode '3.1kHz audio' bearer capability
**Attribute Description:**
This attribute is used in the local network to determine if calls with a bearer capability (IAM.USI.tr_cap) of '3.1kHz audio' should have their bearer capability values recoded to 'speech'.

This attribute is ONLY applicable under the following conditions.

1. The bearer capability of the outgoing call is '3.1kHz audio',
2. This is a local tandem which received the call via an incoming inband signaling speech trunk or an originating end office, and
3. An outgoing ISUP trunk was selected.

All members of a trunk group must have the same value for rcd_3pt1_itc.

The following diagram provides the value for 'rcd_3pt1_itc' and the action that will be taken.

| Value: | Action: |
|---|---|
| DBNULLITC | No value has been defined, use the global office parameter Glrcd_3pt1 to determine the bearer capability value to be sent out. |

**Copyright © 1999 Lucent Technologies** 

```
   DBSPEECH     Recode IAM.USI.tr_cap to 'speech'
   DB3PT1KHZ    Send out the IAM.USI as is, (that is,
                '3.1kHz audio')
```

The rcd_3pt1_itc attribute should not be set to DB3PT1KHZ until the following are true:

1. The far switch has implemented the rule that the value of the USI parameter is either controlled by the trunk group parameter (if not set to DBNULLITC or the switch parameter).
2. The transmission facilities to the far switch are capable of handling calls with a bearer capability of '3.1kHz audio'.
3. The software at the far switch is capable of handling calls with a bearer capability of '3.1kHz audio'.

These three items listed previously cannot be checked by the software. It is therefore up to the user to make these checks manually before changing the field rcd_3pt1_itc to DB3PT1KHZ.

This attribute must have the same value as the rcd_3pt1_itc attribute defined in the RLrctgrprk tuple for the trunk group indicated in RLfc_trunk.tgroup.

**Attribute:**
tg_char
**Fullname:**
Trunk group characteristics
**Attribute Description:**
Portion of the common language identifier which represents the trunk group characteristics.

See the following 'fe_clli' for a description of when the field is required. Any non-blank, alphanumeric or dash character is valid. Default is a null value.

**Attribute:**
fe_clli
**Fullname:**
Common language ID
**Attribute Description:**
Portion of the common language identifier for the trunk group. This attribute represents the far end common language office code.

The remote network management center automatically queries the 5ESS(R)-2000 switch for this attribute and uses it to determine trunk group far-end locations in order to perform network traffic management activities. Therefore, it is important that this

Copyright © 1999 Lucent Technologies 

attribute be populated accurately for all trunk groups.

If RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equals DBISUP7, then 'fe_clli' when populated, must be 11 characters (any non blank, alphanumeric or dash character is valid).

**Attribute:**
outpuls
**Fullname:**
Outpulsing
**Attribute Description:**
Indicates whether outpulsing is required.

**Attribute:**
audring
**Fullname:**
Audible ring
**Attribute Description:**
Indicates whether audible ring is applied.

**Attribute:**
annc_apl
**Fullname:**
Announcement application
**Attribute Description:**
This attribute identifies the application using the port, if the port is of the following lp_type in FC_PORTTYP:

PCRAFANN - for announcement ports
PCRAFDTA - for dial-through announcement ports
PCRAFCTR - for coin tone receiver

If the port is not one of the previously mentioned types, then this attribute should be set to SVCNO_ANNC indicating that no announcements have been assigned to this port.

If this attribute is set to SVC_DA, then 'servclass' must be FC_RAFANNC. If this attribute is set to SVC_ACCS, then 'servclass' must be FC_RAFDTA or FC_RAFCTR. If this attribute is set to SVC_COIN, then 'servclass' must be FC_RAFCTR. If this attribute is set to SVC_RAS, then 'servclass' must be FC_RAFDTA. If this attribute is set to SVC_ACSR, then 'servclass' must be FC_RAFDTA. If this attribute is set to SVC_PVN, then 'servclass' must be FC_RAFDTA. If this attribute is set to SVC_AOC, then 'servclass' must be FC_RAFANNC.

**Fullname:**
Directory number
**Attribute Description:**
Directory number.

**Attribute:**
carrid
**Fullname:**
Carrier identifier
**Attribute Description:**
Indicates the carrier identifier. It is a four character string, where each of the characters can be '0' through '9'.

- The default is the NULL string and is defined by "\0".

- Must match attribute CARRID in IMTGRPS.

- The carrid attribute must be specified when servclass is FC_IEC.

- The carrid attribute may be specified when servclass is FC_TSPS. This is allowed for the TAISP special feature.

- The carrid attribute may be specified when servclass is TM_CALLBK, TMDFTACLTP, or TM_ROTL. If the carrier ID is specified for these servclasses, then the BILLINGDN attribute must also be filled in. This information is used to provide ANI information on certain types of inter-LATA TM test calls and inter-LATA Operating System (OS) callback, security callback, and connection appraisal calls. This includes itrunk and line work station (TLWS), centralized trunk test unit (CTTU), integrated mechanized loop testing (IMLT), IMLT main distributing frame (MDF), and remote office test line (ROTL).

  If GLospsta is set to yes, then the 'carrid' can be specified on trunks that handle incoming inward traffic. Trunks with servclasses of FC_TTOL_CONN, FC_PRI_INTOLL, FC_SEC_INTOLL, and FC_LTOLL_CONN can handle incoming inward traffic.

- The carrid attribute may be specified when servclass is FC_LATA_CONN, for toll digital exchange (TDX) trunks.

**Attribute:**
featgrp

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Feature group carrier type
**Attribute Description:**
Flags carrier ID as feature group B (FGB_CARR) or feature group D (FGD_CARR). Set the attribute to FGB_CARR,FGD_CARR or FG_NULL.

**Attribute:**
fgdcicsz
**Fullname:**
FGD carrier identification code size
**Attribute Description:**
The purpose of this field is to indicate the allowed CIC size for access via tandem (AVT) and international carrier (INC) call types on incoming or two way trunks. These call types are only possible on FC_TTOLL_CONN, FC_LTOLL_CONN, and FC_LATA_CONN service class trunks. The default value is FGDCIC3 which is always used for trunks which don't support AVT and INC call types.

**Attribute:**
free_ans
**Fullname:**
Free answer
**Attribute Description:**
Indicates whether answer supervision will be returned on the trunk group for calls to a free line. It must be set to DBYES for trunk groups directly connected to a carrier, and for trunk groups which handle carrier traffic and serve offices with free line service. Must match attribute free_ans in IMTGRPS.

**Attribute:**
brc
**Fullname:**
Business and residential customer service (BRCS) assigned
**Attribute Description:**
Indicates whether business and residential customer service (BRCS) features will automatically be assigned to each trunk group member as that member is inserted. BRCS features do not apply to CCS trunks. For CCS trunks, that is, DBCCIS6 or DBTUP7 this field will be set to DBNO.

For trunk groups with RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equal to DBISUP7, if RLrctgrprk.servclass is not equal to FC_LTOLL_CONN, then this field will be set to DBNO.

For remote digital test access trunk groups brc must be DBNO.

Copyright © 1999 Lucent Technologies 

**Attribute:**
mkbusykey
**Fullname:**
Make busy key (MBK)
**Attribute Description:**
Indicates the make busy key associated with this trunk group.

**Attribute:**
cut_thru
**Fullname:**
Cut through
**Attribute Description:**
This attribute will be used to populate the relation FC_TRUNK attribute cut_thru. This attribute must be the same for all members of the same group.

**Attribute:**
billingdn
**Fullname:**
Billing directory number
**Attribute Description:**
This attribute will be used to populate the relation PF_TKDN attribute dn. This attribute must be the same for all members of the same group.

This attribute will allow the digit string 11X-XXX-XXXX. The '1' in the first position will be used to designate that this billing number is being used in a private leased network. Form checks should not require that a valid NPA be the first three digits of a ten digit string.

For EDSL trunk groups (trunk groups with trunks that have 'servclass' equal to FCEDSL or FCEDSLHM, and lp_type equal to PCTBCHAN in RLfc_porttyp), this attribute contains the same billing DN information as RLedsltrkg.bill_dn (in different format since domains are different).

Only special access trunk groups that have a class of service equal to FC_SPAWATS for special access WATS and FC_SPAMEG for MEGACOM(R) will require a billing DN. The billing DN for special access WATS and MEGACOM(R) trunk groups will not be stored in this relation, but will be stored in the RLspabilldn relation (dn_bill attribute). The length of the billing DN must be ten. The billing DN may also be stored in RLrctgrprk.billingdn, but it will not be used by any special access code. Only the billing DN in RLspabilldn.dn_bill will be used by special access call processing and AMA billing code.

When the 'servclass' is any of TM_CALLBK, TM_ROTL, or TMDFTACLTP,

Copyright © 1999 Lucent Technologies 

this attribute is not used to populate the relation PF_TKDN. In these cases, this attribute provides a billing directory number for certain TLWS and OS test and callback calls. For these 'servclasses': This attribute must be populated when the CARRID attribute is populated and this attribute must be NULL when CARRID is NULL.

When the rdta_grp attribute is DBYES this attribute must be null if the trunk group is outgoing. If the trunk group is two-way the attribute must have 7-15 digits.

**Attribute:**
billingdn.digcnt
**Fullname:**
dig count
**Attribute Description:**
Digit count.

**Attribute:**
billingdn.dn
**Fullname:**
Directory number
**Attribute Description:**
Directory number.

**Attribute:**
inc_tndwnk
**Fullname:**
International carrier tandem wink
**Attribute Description:**
Indicates whether the first wink received from the INC carrier at an access tandem will be relayed to the end office.

**Attribute:**
trk_qry
**Fullname:**
Trunk query
**Attribute Description:**
Indicates whether trunk query interoffice audit should be run on this trunk group. DBYES is valid only if RLrt_trkg.in_sigtype equals DBCCIS6 or DBISUP7, or RLrt_trkg.out_sigtype equals DBCCIS6 or DBISUP7. This is an updatable attribute for CCS trunks.

**Attribute:**
xlt_tst
**Fullname:**
Translation test

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

Indicates whether translation test interoffice audit should be run on this trunk group. DBYES is valid only if RLrt_trkg.in_sigtype equals DBCCIS6 or DBISUP7, or RLrt_trkg.out_sigtype equals DBCCIS6 or DBISUP7. This is an updatable attribute for CCS trunk.

**Attribute:**

ne_clli

**Fullname:**

Near-end common language location identifier

**Attribute Description:**

Near-end common language location identifier associated with this trunk group. Default: null value. Any non blank, alphanumeric character or dash is valid. There is no requirement that the characters be divided into subfields.

Must be populated with non-blanks if xlt_tst equals DBYES or if out_sigtype or in_sigtype equals DBCCIS6. Non-blanks are valid only for U.S. offices. For CCIS6 trunks, 'ne_clli' is not updatable.

If RLrt_trkg.in_sigtype or RLrt_trkg.out_sigtype equals DBISUP7, then 'ne_clli' when populated, must be 11 characters (any non blank, alphanumeric or dash character is valid).

**Attribute:**

vpa_type

**Fullname:**

Voice path assurance (VPA) type

**Attribute Description:**

This attribute controls the way the software runs the voice path assurance test for CCS trunks.

The default value for VPA TYPE on the recent change screen is zero. The default value for VPA TYPE on the ODA form is NOVPA.

For all non-CCS trunks, 'vpa_type' should be populated as CCNONCCS.

The following diagram is a guide for populating VPA TYPE on the RC screen or the ODA form. The appropriate value to choose depends on the near office type and the far office type to determine tone frequencies to be used in running the vpa test. In addition, it involves consideration for the type of facility used and the planned inserted connection loss (ICL) loss value for that facility. This information is used to control the VPA receiver operate and release levels. The loss on the trunk affects the power level of the tone that is detected by the VPA receiver. Note that the last character of the symbol put on the recent change screen is the hardware loss threshold level. See the following digram for the meaning of each hardware loss threshold level.

near end*** far end trunk trunk CCS

| office type | office type | facility | ICL | VPA TYPE |
|---|---|---|---|---|
| 4 wire | 4 wire | 4 wire | 0 dB | 4W4WL0 |
| 4 wire | 4 wire | 4 wire | 0.1 - 0.8 dB | 4W4WL1 |
| 4 wire | 4 wire | 4 wire | 0.9 - 1.7 dB | 4W4WL2 |
| 4 wire | 4 wire | 4 wire | 1.8 - 2.9 dB | 4W4WL3 |
| 4 wire | 2 wire | 2 wire | 0.0 - 4.0 dB | 4W2WL3 |
| 4 wire | 2 wire | 2 wire | 4.1 - 5.5 dB | 4W2WL4 |

| 2 wire | 4 wire | 4 wire | 0 dB | 2W4WL0 |
| 2 wire | 4 wire | 4 wire | 0.1 - 0.8 dB | 2W4WL1 |
| 2 wire | 4 wire | 4 wire | 0.9 - 1.7 dB | 2W4WL2 |
| 2 wire | 4 wire | 4 wire | 1.8 - 2.9 dB | 2W4WL3 |
| 2 wire | 2 wire | 2 wire | 0.0 - 4.0 dB | 2W2WL3 |
| 2 wire | 2 wire | 2 wire | 4.1 - 5.5 dB | 2W2WL4 |
| 2 wire | 2 wire | 2 wire | 4.1 - 5.5 dB HI LOSS | 2W2WL5 |

*** Used for frequency specifications only. The
5ESS(R)-2000 switch is always a four wire switch
with respect to its transmission characteristics.

| hdwe level | Operate threshold* | Release threshold** |
|---|---|---|
| 0 | -20 dBm +-2dBm | -27 dBm |
| 1 | -21.5 dBm +-2dBm | -28.5 dBm |
| 2 | -23.2 dBm +-2dBm | -30.2 dBm |
| 3 | -25.6 dBm +-2dBm | -32.6 dBm |
| 4 | -27 dBm +-2dBm | -34 dBm |
| 5 | -31 dBm +-2dBm | -38 dBm |

* tone is detected if power level is >= value shown.
** tone stops being detected (released) if power level
is greater than or equal to the value shown.

For four wire continuity check (four wire switch at each end and
four wire facility between switches)

Bell System

| Inserted Connection Loss | Operate Range | Release Range |
|---|---|---|
| 0 dB | -18 <= N <= -6 + n dBm | N <= -27 + n dBm |
| .1 - .8 dB | -19.5 <= N <= -7.5 + n dBm | N <= -28.5 + n dBm |
| .9 - 1.7 dB | -21.2 <= N <= -9.2 + n dBm | N <= -30.2 + n dBm |
| 1.8 - 2.9 dB | -23.6 <= N <= -11.6 + n dBm | N <= -32.6 + n dBm |

For two wire continuity check (two wire switch at one or both ends
no dependence on type of facility)

Bell System

Copyright © 1999 Lucent Technologies 

| Inserted Connection Loss | Operate Range | Release Range |
|---|---|---|
| 0 - 4.0 dB | -23 <= N <= -11 dBm | N<=-32 |
| 4.1 - 5.5 dB | -25 <= N <= -13 dBm | N<=-34 |
| 4.1 - 5.5 dB HI LOSS | -29 <= N <= -17 dBm | N<=-38 |
| 4.1 - 8.6 dB 2 wire | -27.6 <= N <= -15.6 dBm | N<=-36.6 |
| 4.1 - 8.6 dB 2 wire HI LOSS | -29 <= N <= -17 dBm | N<=-38 |

'N' is the absolute power level of the check tone and 'n' is the relative power at the input of the receiver with respect to the zero transmission level point.

ICL is the 1004 HZ transducer loss of the trunk referenced to the nominal impedance of the offices (600 or 900 ohms) which the trunk interconnects. It reflects all of the gains or loses from the originating outgoing switch appearance through the trunk to the outgoing appearance of the terminating switch with the trunk terminated in the nominal office impedance.

**Attribute:**

datarate

**Fullname:**

Data rate

**Attribute Description:**

This attribute holds the value to be stored in the RLFC_TRUNK.datarate for members of this trunk group. It is used to identify the data rate that this trunk is capable to handle for an inter switch ISDN data call. Data trunks are interoffice digital trunks designated to transmit data to/from an ISDN customer premise equipment (CPE) at 56kb/s, restricted 64kb/s or 64kb/s.

For EDSL D trunks (servclass equals FCEDSL and lp_type equals PCTDCHAN in RLfc_porttyp), 'type' attribute of the RLfc_trunk relation must be RTISDNLK for all trunks in the group. Datarate of DBDATA_NULL is not valid for EDSL D trunk groups.

For OSPS EDSL D trunks (servclass equals OA_IFOPER or OA_IFTERM and lp_type equals PCTDCHAN in RLfc_porttyp), 'type' attribute of the RLfc_trunk relation must be RTISDNLK for all trunks in the group. Datarate of DBDATA_NULL is not valid for OSPS EDSL D trunk groups.

For packet switching IP trunks with 'servclass' equal to PSPKT_TRK ( = PACKET ), the datarate should be set to DBDATA_NULL. For multiple internal protocol (IP) trunk groups, datarate could be DBDATA_56K or DBDATA_64K. RC/V will internally shift to PSDSL56KB or PSDSL64KB for RLdslequip.dslrate.

For X.75' or X.75 packet switching trunk groups set datarate only to DBDATA_56K.

Range of values:

```
DBDATA_NULL   - for voice trunk.
DBDATA_56K    - for any trunk (segregated or not) able to
                carry 56 kb/s data calls.
DBDATA_R64K   - for any trunk (segregated or not) able
```

Copyright © 1999 Lucent Technologies 

to carry restricted 64 kb/s data calls.
DBDATA_64K - for any trunk (segregated or not) able to carry 64 kb/s data calls.

Dependencies: When 'datarate' is not DBDATA_NULL then 'servclass' for this trunk group, defined in RLfc_porttyp, can be FC_LTOLL_CONN, FC_TTOLL_CONN, FC_PRI_INTOLL, FCEDSL, FCEDSLHM, OA_IFOPER, OA_IFTERM, FC_SEC_INTOLL, FC_IEC, FC_LATA_CONN, FC_PF, FC_PFITT or FC_PFLASH.

Trunk groups with all other 'servclass' values must have datarate equal to DBDATA_NULL.

Also when datarate is not DBDATA_NULL the 'type' attribute of the RLfc_trunk relation must be RTINCOM, RTOUTGO, or RTTWOWAY for all trunks in the trunk group.

If the trunk has a 'servclass' of FC_PF, FC_PFITT or FC_PFLASH and the signaling is not ISUP7, the 'datarate' must be DBDATA_56K or DBDATA_NULL.

**Attribute:**
npsn
**Fullname:**
Next packet switch number
**Attribute Description:**
Contains the packet switch number of a packet switch that has a direct IP trunk group connection with the present switch.

**Attribute:**
lnpsnid
**Fullname:**
lpsnid
**Attribute Description:**
Unused.

**Attribute:**
sdnded
**Fullname:**
SDN assigned
**Attribute Description:**
Indicates if the trunk is assigned to SDN service access (DBYES) or not (DBNO). Only the ACP offices will be allowed to have these trunks. BRCS features are not allowed for this attribute. RLrctgrprk.brcs will be set to 'no'. This attribute also appears in RLfc_trunk.sdnded. If 'sdnded' is DBYES, then Glapsdn must be DBYES which indicates this switch is an action point in the software defined network.

Copyright © 1999 Lucent Technologies 

**Attribute:**
sgd
**Fullname:**
Station group designer
**Attribute Description:**
Station group designator (SGD) is a digit at the end of a dialed digit string indicating the group to which a station belongs. This attribute indicates if a SGD is expected to be forwarded from the originating private branch exchange (PBX) to the ACP in the SDN.

This attribute may be set to DBYES only if this trunk is a SDN direct access trunk from a PBX to an ACP. This attribute also appears in RLfc_trunk.sgd.

**Attribute:**
unres_ea
**Fullname:**
Unrestricted equal access
**Attribute Description:**
This attribute allows trunks to originate PVN calls using equal access signaling.

**Attribute:**
pvnterm
**Fullname:**
PVN terminating indicator
**Attribute Description:**
This attribute allows all calls originating on the trunk to be marked as ASP terminal group originators. This allows termination to terminal groups with ASPF and ASPS restriction types.

**Attribute:**
retry
**Fullname:**
Allow retry on failure
**Attribute Description:**
This attribute is used to determine whether additional attempts to connect to announcement should occur if the first attempt fails (such as because 'maxcalls' limit has been reached). This attribute corresponds to, and should have the same value as, RLfc_anounce.retry.

DBNO - Indicates that no retry should be attempted.
DBYES - Indicates that a retry is desired.

This attribute is used by mapping code to store the value of the view buffer's 'retry' attribute for a trunk group. In the event of updates, inserts, etc., the value of 'retry' in this

Copyright © 1999 Lucent Technologies 

relation will be used to update the 'retry' attribute in the RLfc_anounce relation, as opposed to copying the value from the view buffer.

**Attribute:**
lsdel_ans
**Fullname:**
OSPS listing services delay answer supervision
**Attribute Description:**
This attribute is used by OSPS on listing services calls to determine when answer supervision should be relayed to the originating office. When set to DBYES, answer supervision is relayed upon receipt of a billing indicator from an external vendor system. When set to its default value DBNO, answer supervision is relayed upon operator position seizure.

DBYES - answer supervision after external vendor stimulus.
DBNO - answer supervision after operator position seizure.

**Attribute:**
ln_type
**Fullname:**
Leased network (LN) type
**Attribute Description:**
Attribute which marks the trunk as one of the following:

LN_NULL - Trunks are not leased network.
LN_QRY - Leased network call with query to database.
LN_NOQRY - Leased network with no query to database.
LN_IMT - Leased network intermachine trunks.

**Attribute:**
netgrp
**Fullname:**
Leased network group name
**Attribute Description:**
Leased network group name used to define a grouping of automatic route selection (ARS) groups which share a trunk group, in particular, a leased network CCS7 intermachine trunk group.

**Attribute:**
e911type
**Fullname:**
Enhanced 911 type
**Attribute Description:**
The e911type attribute specifies the type of trunk to which enhanced 911 calls are being routed over.

Copyright © 1999 Lucent Technologies 

**Attribute:**
esco
**Fullname:**
Emergency service central office number (ESCO)
**Attribute Description:**
The ESCO number identifies the originating office of an E911 caller. It is used in call processing to retrieve an emergency service number (ESN) which is used for call routing and call transfer.

**Attribute:**
rdta_grp
**Fullname:**
Remote digital test access trunk group
**Attribute Description:**
This attribute is used to identify the trunk group as a remote digital test access trunk group. See the previously general section rules for tuple semantics and RLdn_rdta for more information regarding the RDTA capability. When this attribute is DBYES the trunk group must be an EDSL PRI trunk group and all of its assigned members must be used only for RDTA monitor sessions. If a trunk member has been assigned a RDTA TN and has a tuple populated in RLdn_rdta then there must be a corresponding RLfc_trunk tuple with the rdta_port attribute equal DBYES. There may not be any route indexes populated in RLrt_routing or RLrt_mcrt that point to a trunk group with this attribute equal DBYES and lport equal 0. The trunk will appear as an EDSL trunk with the previously noted exceptions.

**Attribute:**
ani6
**Fullname:**
Automatic number identification 6
**Attribute Description:**
This attribute indicates to the operator system that the call may require special screening. Traditionally used for HOTEL/MOTEL type services.

If RLrctgrprk.ani6 is DBYES, then RLrctgrprk.ani7 must be set to DBNO.
For trunks with servclasses of FC_PF, FC_PFLASH or FC_PFITT and type of RTTWOWAY or RTINCOM RLrctgrprk.ani6 may be set to DBYES or DBNO as specified by the customer.
All other servclass values must set RLfc_trunk.ani6 to DBNO.
The ani6 bit may not be DBYES on data trunks.
RLrctgrprk.ani6 corresponds to
and should have the same value as RLfc_trunk.ani6.
For all members of a given trunk group, the ani6 bit should be set to the same value.

Copyright © 1999 Lucent Technologies 

RLrctgrprk.ani6 will be defaulted to DBNO.

**Attribute:**
ani7
**Fullname:**
Automatic number identification 7
**Attribute Description:**
This attribute indicates to the operator system
that the call may require special screening.
Traditionally used for coin call type services.

If RLrctgrprk.ani7 is DBYES, then RLrctgrprk.ani6
must be set to DBNO.
For trunks with servclasses of FC_PF, FC_PFLASH or
FC_PFITT and type of RTTWOWAY or RTINCOM RLrctgrprk.ani7
may be set to DBYES or DBNO as specified by the customer.
All other servclass values must set RLfc_trunk.ani7 to DBNO.
The ani7 bit may not be DBYES on data trunks.
RLrctgrprk.ani7 corresponds to
and should have the same value as RLfc_trunk.ani7.
For all members of a given trunk group, the ani7 bit
should be set to the same value.

RLrctgrprk.ani7 will be defaulted to DBNO.

**Attribute:**
ani_type
**Fullname:**
Automatic number identification type
**Attribute Description:**
Used to differentiate between various direct access and
switched access ANIs for outbound services. A value of
zero indicates that the outbound services ANI table
(RLldpindx/RLanidx[XXX]) will not be accessed for call
processing data.

**Attribute:**
asi_use
**Fullname:**
Advanced service interface use
**Attribute Description:**
Indicates that trunk may be used for advanced service interface.

**Attribute:**
trignum
**Fullname:**
Trigger number
**Attribute Description:**
Trigger number for network services applications for shared

interoffice trunks.

**Attribute:**
fac_num
**Fullname:**
Facility number
**Attribute Description:**
The fac_num field indicates the facility number of the originating foreign exchange (FX) or tie trunk.

**Attribute:**
std_fxtie
**Fullname:**
Standard FX or tie trunk
**Attribute Description:**
Identifies if this is a FX or tie trunk.

**Attribute:**
cont_test
**Fullname:**
Continuity test indicator
**Attribute Description:**
For Autoplex(R) series immediate call setup (ICS) trunks, indicates whether or not continuity test should be run.

**Attribute:**
spbool1
**Fullname:**
Spare boolean 1
**Attribute Description:**
Reserved for future use.

**Attribute:**
spbool2
**Fullname:**
Spare boolean 2
**Attribute Description:**
Reserved for future use.

**Attribute:**
mltislcopt
**Fullname:**
Signaling option between MLT and integrated subscriber loop carrier (ISLC)
**Attribute Description:**
Used by improved digital loop carrier (DLC) operational status indications special feature. The 'mltislcopt' field will be

Copyright © 1999 Lucent Technologies 

used to indicate whether enhanced MLT signaling is provided (DBYES) or the conventional signaling is provided (DBNO).

**Attribute:**
mai
**Fullname:**
Mode of access indicator
**Attribute Description:**
The mode of access field identifies an Access Provider Identifier (API) code for an incoming FGD trunk to an OSPS.

**Attribute:**
apicode
**Fullname:**
Access provider identifier code
**Attribute Description:**
Used by OSPS Feature Group D Incoming Signaling for Special Applications - Release 2 feature. The apicode field will be used to indicate whether the mode of access if "direct" or "switched". Default is "switched".

**Attribute:**
utt
**Fullname:**
Utility Telemetry Trunk Indicator.
**Attribute Description:**
This boolean is used for the Suppressed Ringing Special Feature. This attribute is used to mark a trunk group as a Utility Telemetry Trunk Group.

**Attribute:**
asptoll
**Fullname:**
Advanced Services Platform Toll Indicator
**Attribute Description:**
The asptoll field indicates if all calls over this trunk group will generate an SCP query. When this field is set to DBYES all incoming calls will generate a query to the SCP The query will contain the ANI and dialed number. The SCP will send back a reply with either the carrier or trunk group that should be used for routing. The 5E will also make an AMA record based on the SCP reply message.

**Attribute:**
asp_carrtrig
**Fullname:**
ASP Carrier Trigger detection
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute, if set to YES, indicates that if the carrier identified to use on this call has a trigger number provisioned, an ASP INFO_COLLECTED query to the SCP will be generated.

**Attribute:**
far_e911
**Fullname:**
Far E911 indicator
**Attribute Description:**
The far_e911 attribute indicates if the Digital Cellular Switch (DCS) trunk group is dedicated to E911 traffic at the far end. A value of DBYES indicates that the far end of the DCS trunk group is designated as being dedicated for E911 traffic. A value of DBNO indicates that the trunk group is not a DCS trunk or the far end of a DCS trunk group is not designated as being dedicated for E911 traffic.

**Attribute:**
ffcf1
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description.

**Attribute:**
ffcf2
**Fullname:**
DSL Inverted
**Attribute Description:**
Used by the Packet Pipe Enhancement Feature to indicate if this packet pipe uses inverted data, on a trunk group basis. This data is sent to the PH4 on initialization of packet pipes.

**Attribute:**
ffcf3
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
This attribute is a spare

**Attribute:**
ffcf4
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

Copyright © 1999 Lucent Technologies 

**Attribute:**
ffcf5
**Fullname:**
ICOS trunk group detection
**Attribute Description:**
This attribute if set to 1, indicates a ICOS trunk group for servclass FCAPXIDCS. A corresponding spare bit, ffcf7, in relation fc_trunk must be set to DBYES when this bit is set to 1.

This spare attribute will be used in generic 5E11 and 5E12. In 5E13, this attribute will be replaced with new attribute called icos_trkg. The attribute ffcf5 will be released for use as a spare attribute.

**Attribute:**
ffcf6
**Fullname:**
Reserved for future field feature.
**Attribute Description:**
Reserved for future field feature.

**Attribute:**
tdx_trk
**Fullname:**
Toll Digital Exchange Trunk
**Attribute Description:**
This attribute is used to indicate that the trunk is part of the Toll Digital Exchange (TDX) network. Only trunks having a service class of FC_LATA_CONN, FC_TTOLL_CONN, and FC_IEC may be part of this network. The TDX network can be used when feature SFID165 has been purchased.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute.

**Attribute:**
term_bill
**Fullname:**
Terminating Billing Indicator
**Attribute Description:**
This attribute indicates whether a call that egresses a Toll Digital Exchange (TDX) network should have an associated AMA billing record produced at the terminating TDX office. This attribute only applies to TDX trunks.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ani_proc
**Fullname:**
TDX Automatic Numbering Identification (ANI) Table Processing indicator
**Attribute Description:**
This attribute indicates whether a call on a Toll Digital Exchange (TDX) trunk may have ANI Table Processing. TDX ANI Table Processing is a secured feature numbered SFID235. Both SFID165 and SFID235 must be active before the ani_proc attribute may be set to DBYES. Valid combinations of the TDX and ANI secured features are represented in the following diagram.

| SFID165 TDX | SFID235 ANI | Comments |
|---|---|---|
| Y | N | TDX Basic Call Processing (CP) only |
| Y | Y | TDX Basic CP and ANI Table Processing |
| N | N | neither feature |
| N | Y | invalid setting (if this condition is found during a retrofit, then SFID235 should be turned off and all the ani_proc attributes should be reset to N) |

In addition, this TDX ANI table processing indicator may only be set on trunks having an FC_LATA_CONN servclass.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute.

## 6. RCTGRPRK Population rules continued.

**Attribute:**
isupmld
**Fullname:**
ISUP Message Loop Detection
**Attribute Description:**
ISUP message loop detection attribute. This attribute can only be set for SS7 trunk on per trunk group basis, which have RLrt_trkg.out_sigtype equal to DBISUP7.

If SFID163 is ON, then
if isupmld == Y then
hop count value is decremented by one as the call is sent on to the next switch.
if isupmld == N then
hop count value, if received, is passed on unchanged.

**Attribute:**
maxhopcnt

Copyright © 1999 Lucent Technologies 

**Fullname:**
Maximum Hop Counter Value
**Attribute Description:**
Maximum Hop Counter value, assignable on a per SS7 trunk group basis. Max Hop Counter value specifies the maximum number of contiguous SS7 inter-exchange circuits that are allowed per ISUP call. The initial value must be greater than the maximum number of exchanges that would normally be used to complete the call. The range for hop counter value is from 0 to 20. 0 should only be used for non-ISUP trunk groups.

**Attribute:**
lrn_das
**Fullname:**
Location routing number digit analysis tree selector
**Attribute Description:**
This attribute contains the digit analysis tree selector to be used for analyzing a location routing number (LRN) that has been received in an IAM message associated with an ISUP trunk origination.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute.

**Attribute:**
mlppstage
**Fullname:**
Multi-Level Precedence and Preemption stage
**Attribute Description:**
Multi-Level Precedence and Preemption protocol stage on SS7 trunk group. STAGE1 protocol sends/receives PP Level in Calling Party Category. STAGE2 protocol sends/receives PP Level in MLPP Precedence Parameter. Only SS7 trunks having service class of FC_LTOLL_CONN, FC_TTOLL_CONN, or FC_PRI_INTOLL along with a PP trunk hunt-type may have this attribute set to either CCSPPST1 or CCSPPST2.

This attribute exists in both the RLfc_trunk and RLrctgrprk relations. Corresponding tuples should have the same value for this attribute.

**Attribute:**
ported
**Fullname:**
ported indicator
**Attribute Description:**
This attribute indicates if the line associated with this tuple is individually ported by the Number Portability feature. However, if the line is in either a Multiline Hunt Group (MLHG) or a Terminal Group (TG), then the group ported indicator

Copyright © 1999 Lucent Technologies 

takes precedence over the individual ported indicator. The indicator that will be used (either the individual or the group ported indicator) will be the one that is displayed by Recent Change for the ported field on the line assignment views. See rc-oda-rules for more information.

**Attribute:**
vpn_access
**Fullname:**
VPN Trigger Detection
**Attribute Description:**
This attribute, if set to DBYES, indicates a Virtual Private Network (VPN) trunk group.

**Attribute:**
mbg_trans
**Fullname:**
MBG Transport
**Attribute Description:**
This attribute indicates whether the trunk supports receiving/sending MBG information on incoming/outgoing trunks between EO/localside and VPN switch. SFID270 must be unlocked via RC View 8.22 before mbg_trans may be set to DBYES.

**Attribute:**
mint_sig
**Fullname:**
MINT signaling type.
**Attribute Description:**
This attribute is used to denote MINT signaling type

**Attribute:**
queue_inh
**Fullname:**
Queue inhibit indicator
**Attribute Description:**
This attribute is used to indicate that reroute queuing is inhibited on this trunk group.

**Attribute:**
net_indicator
**Fullname:**
Network Indicator
**Attribute Description:**
Indicates if the call is entering or exiting an office from within (ON) or outside (OFF) of the network.

Copyright © 1999 Lucent Technologies 

**Attribute:**
dal_egress
**Fullname:**
DAL (Direct Access Link) egress indicator
**Attribute Description:**
Indicates an outgoing or 2-way DAL trunk.

**Attribute:**
spc_pbx
**Fullname:**
Special PBX protocol indicator
**Attribute Description:**
This attribute identifies whether or not to send the new Dialed Number Identification Service (DNIS) protocols to the PBX. This is to distinguish PBXs that can only accept the standard protocol, versus the new protocol. If this bit is set to DBYES on RC View 5.1, the following protocols are sent, dependent upon the type of signaling used.

* DTMF - *ANI*DN* or **DN* or *ANI** or ***, depending on the information available
* MF - DN, without KP + ST

SFID271 must be unlocked via RC View 8.22 before spc_pbx may be set to DBYES.

**Attribute:**
dal_access
**Fullname:**
Direct Access Links (DAL) indicator
**Attribute Description:**
This attribute, if set to DBYES on RC View 5.1, indicates that the DAL feature is allowed for this trunk group.

SFID126 and SFID272 must be unlocked via RC View 8.22 before dal_access may be set to DBYES.

**Attribute:**
ct_trig
**Fullname:**
Cutthrough trigger
**Attribute Description:**
Trigger number to allow for triggering on feature group D (FGD) cutthrough calls

**Attribute:**
passani
**Fullname:**
Pass Automatic Number Identification (ANI) indicator

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

When this indicator is set to DBYES, then 2-stage Equal Access Multi-Frequency (EAMF) signaling will be used, that is, the ANI, if available, will be sent, on calls egressing the Long Distance Platform (LDP) network on a Local Area Transport Area (LATA) MF trunk to a Local Exchange Carrier (LEC) or a Private Branch Exchange (PBX).

When this indicator is set to DBNO, then the ANI may not be sent to the LEC or PBX (or the situation does not apply). Note that the ANI is normally sent to an Inter-Exchange Carrier (IC).

**Attribute:**

pref_npa

**Fullname:**

prefix NPA

**Attribute Description:**

This field is used to determine which NPA (if any) will be prefixed to a seven-digit destination number incoming to the switch on a LATA trunk.

**Attribute:**

dnis_user

**Fullname:**

Dialed Number Identification Service II (DNIS II) end user

**Attribute Description:**

This attribute, if set to DBYES, identifies a DNIS subscribed trunk for the Transport of Original Dialed Number feature. The original dialed number shall be sent out to the PBX as follows:

PRI: At the terminating switch for PRI, in the Called Party Number Information Element of the Q.931 message.

MF: At the terminating switch for MF, in the Called Party Number signaling.

SFID498 must be unlocked before dnis_user may be set to DBYES. SFID498 is temporary and will only be supported in 5E13 BMI. Beginning in 5E13 SU, SFID498 will be replaced with SFID271.

**Attribute:**

acctprompt

**Fullname:**

Long Distance Platform (LDP) account code feature prompt

**Attribute Description:**

This attribute provides the LDP Account Code prompt type for incoming or two-way trunk groups where the LDP Account Code feature is active for the 400Hz Carrier Tone feature.

Copyright © 1999 Lucent Technologies 

The following prompt types can be provided:

BEEP2: account code prompt of two audible beeps
ANNC: SAS announcement
CARRIER: 400Hz carrier tone
GLOBAL: prompt type assigned value of Glactprmpt

SFID498 must be unlocked before acctprompt may be assigned any value other than GLOBAL. SFID498 is temporary and will only be supported in 5E13 BMI. Beginning in 5E13 SU, SFID498 will be replaced with SFID165.

**Attribute:**
ct_for_dt
**Fullname:**
400Hz carrier tone for dial tone
**Attribute Description:**
Activation status for carrier tone to be applied instead of dial tone for an incoming or a 2-way trunk group.

**Attribute:**
ctxid
**Fullname:**
Context Identifier
**Attribute Description:**
This attribute indicates if the trunk associated with this tuple is unbundled or resold. A trunk is unbundled if ctxid = CTXID_UNBNLD; it is resold if ctxid = CTXID_RESOLD.

**Attribute:**
eonbill_dn
**Fullname:**
End Office Nodal (EON) Billing Number
**Attribute Description:**
The EON billing number is a ten digit DN which will be used to populate the ChargeNumber parameter of the TCAP Info_Collect message. When populated, eon_plan must also be populated. The format is NPA-XXX-XXXX.

SFID 515, must first be unlocked in order to assign this field a value.

**Attribute:**
eon_plan
**Fullname:**
End Office Nodal (EON) Numbering Plan
**Attribute Description:**
Numbering plan for the EON billing number. It identifies the numbering plan as ISDN or Action Point Number (APN). When

Copyright © 1999 Lucent Technologies 

populated, eonbill_dn must also be populated.

SFID 515, must first be unlocked in order to assign this field a value.

**Attribute:**
eonpriv_ind
**Fullname:**
End Office Nodal (EON) Privacy Indicator
**Attribute Description:**
Privacy indicator for the EON billing number. When set to DBYES it identifies the number as private.

**Attribute:**
eonpref_ind
**Fullname:**
End Office Nodal (EON) Prefix Indicator
**Attribute Description:**
When this indicator is set to DBYES, the FAR END NPA will be prefixed to a seven-digit dialed number incoming to the 5ESS(R)-2000 switch on an EOLN2 trunk.

SFID 515 must first be unlocked in order to assign a value to this field.

**Attribute:**
rel_link_init
**Fullname:**
Release Link Indicator
**Attribute Description:**
This attribute indicates whether this incoming trunk group is eligible for Release Link processing.

Copyright © 1999 Lucent Technologies 

# RCTRK_R

## 1. Description

This relation contains the remarks and CLCI's associated with trunk view. This is a root storage relation.

# RDFI_CON

## 1. Description

Relation that gives the connection of DFI's between an RSM and its associated HIM. There is one tuple for every RSM/HIM connecting link in the *5ESS*®-2000 switch complex. This relation is used for RDFI/HDFI pairs in DLTUs (RSMs on T1 facilities) and RDFI2/HDFI or RDFI2/HDFI2 pairs in DLTU2s (T1 facilities), or DLTU_Es (RSMs on ITU-TS/CEPT facilities).

## 4. Population Rules for RLrdfi_con

**Relation Description**
Remote digital facility interface connections.

Relation that gives the connection of DFI's between an RSM and its associated HIM. There is one tuple for every link connecting a HIM and an RSM in the *5ESS*®-2000 switch complex.
This relation is used for RDFI/HDFI pairs in DLTUs (RSMs on T1 facilities) and RDFI2/HDFI or RDFI2/HDFI2 pairs in DLTU2s (T1 facilities), or DLTU_Es (RSMs on ITU_TS/CEPT facilities). The relation RLRDFI_CON and the relation RLHDFI_CON contain similar data: RLHDFI_CON keys from the HIM and RLRDFI_CON keys from the RSM. A change in one of these relations requires the corresponding change in the other relation.

**Attribute: rsm**

**Fullname:** Remote Switching Module

**Attribute Description** SM number of RSM (1-192).

**Attribute: rdltu**

**Fullname:** Remote Digital Line and Trunk Unit

**Attribute Description** DLTU, DLUT2, or DLTU_E number at RSM end (0-5).

**Attribute: rdfi**

**Fullname:** Remote Digital Facility Interface

**Attribute Description** RDFI/RDFI2 number at RSM end (1-10 for DLTU/DLTU2, stored as 0-9, and 1-16 for DLTU_E, stored as 0-15).

**Attribute: rfac**

**Fullname:** Remote Facility

**Attribute Description** Relative facility number on a RSM end RDFI (0) or RDFI2 (0-1).

**Attribute: him**

**Fullname:** Host Switching Module

**Attribute Description** SM number of HIM (1-192).

**Attribute: hdltu**

**Fullname:** Host Digital Line & Trunk Unit

**Attribute Description** DLTU, DLTU2, or DLTU_E number at HIM end (0-5).

**Attribute: hdfi**

**Fullname:** Host Digital Facility Interface

**Attribute Description** HDFI/HDFI2 number at HIM end (1-10 for DLTU/.DLTU2, stored as 0-9, and 1-16 for DLTU_E, stored as 0-15.).

Copyright © 1999 Lucent Technologies 

**Attribute: hfac**

**Fullname:** Host Facility

**Attribute Description** Relative facility number on a Host SM end Host DFI (0) or HDFI2 (0-1).

Copyright © 1999 Lucent Technologies

# RDT2UNIT

## 1. Description

This relation maps the circuit name of TR-303 RDT (PCRDT303) to the unit number of TR-303 RDT. It is the inverse mapping of RLunit2rdt.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 240 |
| expected tuples in relation | 20 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | DBrdt2unit_trg |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 3. Field Layout

```
RDT2UNIT    relid = 2737  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population Rules for RLrdt2unit

**Relation Description**
Maps Remote Digital Terminal to an internal RT unit number.

This relation maps the RT circuit name to an internal RT unit number( a sequential number of each TR303 in an SM).

**Attribute: rdt_unit**

**Fullname:** Remote Digital Terminal unit number

**Attribute Description** This is an internal RT unit number which is a sequential number assigned to each TR-303 RDT in an SM.

**Attribute: rtname**

**Fullname:** RT circuit name

**Attribute Description** This is an internal circuit name of the RT.

**Defines:** /* NONE */

## 4. Population Rules for RLregdata

**Relation Description**
Registration Area Data.

This relation is needed by the Air Extension(SM).This relation contains registration area data.

**Attribute: reg**

**Fullname:** Registration Area Identifier

**Attribute Description** It uniquely identifies for each registration area.

**Attribute: rpcu_id**

**Fullname:** RPCU Identifier

**Attribute Description** It uniquely identifies each RPCU interfaced with a WNC.

**Attribute: area_type**

Copyright © 1999 Lucent Technologies

**Fullname:** Registration Area Type Identifier

**Attribute Description** Identifies the type of the registration area.

**Attribute: tntgrpid**

**Fullname:** Tenant Group Identifier

**Attribute Description** Identifies the tenant group which this registration area belongs.

## 4. Population Rules for RLrembv_ri

**Relation Description**
Remote Busy Verification Route Index.

This relation contains the Remote Routing Index, for a given ISAT index & digit analysis route index combination, needed to perform a Remote Busy Verification call.

**Attribute: isat_idx**

**Fullname:** ISDN attendant index

**Attribute Description** This is an abstract representation of an ISDN Attendant (ISAT) Multiline Hunt Group (MLHG) number. This index is obtained from the relation RLrt_mhg keyed by the MLHG group number.

**Attribute: rti**

**Fullname:** Route Index

**Attribute Description** This attribute represents the resulting route index from digit analysis. Note:

Copyright © 1999 Lucent Technologies 

No restrictions are being implemented limiting the class of service of the route indices that RLrembv_ri.rti can have. Currently the only route indices that should be populated are those that allow voice calls and are not routing across an ISAT Busy Verify Trunk group.

**Attribute: rrti**

**Fullname:** Remote Route Index

**Attribute Description** This attribute identifies a ISDN Attendant (ISAT) Busy Verify Trunk (BVT) that the ISAT will terminate to in order to attempt a Remote Busy Verification on a DN on a remote *5ESS*®-2000 switch.

## 4. Population Rules for RLresxdl

**Relation Description**
Restricted external dialing (RESXDL) table.

Restricted external dialing table for operator. This table contains the dialing numbers restricted to operators in a serving team. This relation has only a dummy non-key attribute since it is used only to verify the existence of a tuple.

**Attribute: resxdl_idx**

**Fullname:** restricted external dialing index

**Attribute Description** Identifies the restricted external dialing table.

**Attribute: dial_dig**

**Fullname:** Dial digits

**Attribute Description** Operator entered digits.

**Attribute: dummy**

**Fullname:** dummy

**Attribute Description** Dummy, not used.

## 4. Population Rules for RLretrochk

**Relation Description**
RLretrochk.R

This relation is a placeholder relation for retrofit critical checks. The checks performed in the 'checks:' section are related exclusively to the BREV retrofit capability. This relation contains the Target release checks that are SU'ed to the previous release to ensure that checks critical to a BREV retrofit are executed by the SODD Audit prior to the retrofit to the Target release.

**Attribute: dumkey**

**Fullname:** Dummy Key: DBYES,DBNO

Copyright © 1999 Lucent Technologies

**Attribute Description** Dummy key needed to access the relation

**Attribute: dumattr**

**Fullname:** Dummy Attribute

**Attribute Description** Dummy attribute to satisfy a legal relation.

## 4. Population rules for RLrg2aiu

### Relation Description

```
        Ring Generator (RG) to Access Interface Unit (AIU)

        This relation tells which AIU a RG services.
```

**Attribute:**

Copyright © 1999 Lucent Technologies

rgname

**Fullname:**

Ring Generator Name

**Attribute Description:**

The key to this relation.

**Attribute:**

rgmate

**Fullname:**

Ring Generator Mate

**Attribute Description:**

The mate to rgname

**Attribute:**

aiunit[*]

**Fullname:**

Access Interface Unit

**Attribute Description:**

The AIUs this RG services. aiunit0 is the unit that hosts (physically contains) rgname.

**Attribute:**

external_rg

**Fullname:**

External Ring Generator

**Attribute Description:**

A Ring Generator that is external to (*)AIU. An external RG would not be located in any one of the slots on (*)AIU.

## 4. Population Rules for RLri_dgrp

**Relation Description**
Remote integrated services line units (RISLU, RAIU) D-channel port to piggy-back group assignment.

This relation assigns a RISLU/RAIU D-channel port to a piggy-back group. There are 32 piggy-back groups which are associated with the 32 PSIUPIDB time slots. There is no direct relationship between the piggy-back groups and the PSIUPIDB time slots ( that is, the piggy-back groups are logical time slots).

Copyright © 1999 Lucent Technologies 

**Attribute: dport**

**Fullname:** D-channel port name

**Attribute Description** Populate with the RISLU/RAIU D-channel port name.

**Attribute: pgybkgrp**

**Fullname:** Piggy-back group number

**Attribute Description** Piggy-back group number of the RISLU/RAIU D-channel.

**Attribute: log_pidb**

**Fullname:** Logical PIDB number on a PSU shelf.

**Attribute Description** This is just a logical PIDB number ranging 0-3, on a PSU shelf.

**Defines:**"db/DMport.h"

## 4. Population Rules for RLribm_sc

**Relation Description**
remote building/miscellaneous alarm SCan points.

Relation containing information about remote peripherals. Remote Alarm Section (RAS) building/miscellaneous alarm scan points. One RISLU at each RISLU site may be (optionally) equipped with a RAS that provides building/miscellaneous alarm scanning.

REQUIRED (INITIALIZED) POPULATION FOR RLRIBM_SC. An SM may host from zero to eight RASs, each RAS

**Copyright © 1999 Lucent Technologies** 

corresponding to a unique RISLU site id (risitid). RLRIBM_SC in a particular SM is initialized with two tuples for each RAS hosted by the SM (maximum of 16 tuples per SM at initialization). These two tuples each have risitid set to the RAS's associated RISLU site id; the remaining attributes are specified by the following layout.

```
_____________________________________________________________________
ptnum  mccname   ttyname                alm_lvl        prot_rc   inuse
---------------------------------------------------------------------
  0    (blank)   FIRE                   HMSC_CRIT          1      DBYES
  1    (blank)   FIRE ALARM TROUBLE     HMSC_MAJ           1      DBYES

---------------------------------------------------------------------
INITIALIZATION  EXAMPLE: Given that SM 24 will host an RAS located at RISLU
  site 512 and a second RAS located at RISLU site 520, then RLRIBM_SC in SM
  24 will be initialized with four tuples as follows:

risitid   ptnum    ( ... remaining RLRIBM_SC attributes ...)
512         0                  see the previous layout
512         1                  see the previous layout
520         0                  see the previous layout
520         1                  see the previous layout
```

Each tuple in this relation represents a single alarm scan point on the (optional) remote peripheral Remote Alarm Section. A remote site can have at most one RAS. An SM can host up to eight RASs, since an SM can host up to eight remote peripherals and the remote peripherals could all be at unique remote sites. An SM will have in its relation the tuples for all alarm scan points on each RAS-equipped RISLU hosted by the SM.

Since the RAS has 32 scan points and an SM can host up to eight RAS-equipped RISLUs, an SM can have up to 256 tuples."

**Attribute: risitid**

**Fullname:** RLrisite ID

**Attribute Description** This is the identification number of the remote site where the RAS providing this alarm scan point resides. This attribute corresponds to the key attribute of RLRPSITE.

**Attribute: ptnum**

**Fullname:** Point number

**Attribute Description** RAS alarm scan point number (0-31). Tuples with ptnum values 0 and 1 are required. Tuples with ptnum values 2-31 are office assignable.

**Attribute: mccname**

**Fullname:** MCC name

**Attribute Description** Office-assignable label of 9 ASCII characters to be displayed on the MCC for the name of the point. If less than 9 characters are supplied the remaining characters should be null.

**Attribute: ttyname**

**Fullname:** ttyname

**Attribute Description** Office-assignable label of 20 ASCII characters to be included in switch personnel output messages concerning this alarm scan point. If less than 20 characters are

**Copyright © 1999 Lucent Technologies** 

supplied the remaining characters in the field should be null. The domain is 21 characters long. The 21st character position must be null.

**Attribute: alm_lvl**

**Fullname:** Alarm level

**Attribute Description** Alarm level sounded when scan point goes off-normal. This is office assigned based on the relative importance of the device being monitored.

**Attribute: prot_rc**

**Fullname:** Protect recent change

**Attribute Description** Protects tuple by denying recent change activity. When prot_rc is 0, the tuple can be deleted or updated. When prot_rc is 1 the tuple may not be deleted or updated. This attribute is not to be entered from any recent change view. This attribute is set to zero for tuples where ptnum is 2-31.

**Attribute: inuse**

**Fullname:** inuse

**Attribute Description** DBYES - the alarm is operational.
DBNO - that no alarms will be reported.

## 4. Population Rules for RLrisite

**Relation Description**
Configuration information about each RISLU site.

Relation containing configuration information about each RISLU site. This relation is modeled after the RSM RLCLIDAT relation. (see db/DMarrisite.G and db/DMrisite.G for accessing RLRISITE tuple attributes as array elements).

**Copyright © 1999 Lucent Technologies** 

Each tuple in this relation represents a single RISLU site. A RISLU site can have up to eight RISLUs. A RISLU site may be hosted by several switching modules: also a switching module may host several RISLU sites.

In general, a tuple will exist in this relation only if there exists at least one equipped RISLU (that is equipage state =SMOPER.) (During Growth, a new tuple may be added with no RISLUs, but this should be only a transitional state.) RISLUs in unequipped states will not appear.

**Attribute: risitid**

**Fullname:** RISLU site number

**Attribute Description** This is the identification number of the set of RISLUs which comprise the RISLU site. RISLU site numbers may range from 500 through 999. This range (see DMRISITID) is defined so as not to conflict with RSM site numbers (the latter are currently restricted to the range 1-174).

**Attribute: text**

**Fullname:** Title Of The Site

**Attribute Description** It is a text identification of the RISLU site (for example, name of town) and is used to title MCC display pages. If there are less than 15 characters the string should be padded with binary zeros.

**Attribute: ri_cnt**

**Fullname:** Number Of RISLUs At The Site

**Attribute Description** This attribute holds the number of RISLUs at the site, and must be less than or equal to MAXRISITESZ (8).

**Attribute: sm_alm**

**Fullname:** Number of SM Hosting RISLU With Building/Power Alarms

**Attribute Description** This attribute holds the module number (1-192) of the module that hosts the RISLU responsible for building and power alarms at the RISLU site. The following attribute (ri_alm) identifies the RISLU by unit number (0-7).

Although every RISLU scans its own fan and fuse alarms, one RISLU per RISLU site must be selected to scan power and battery alarms for the RISLU site. This same RISLU will also be used to scan building and miscellaneous (office defined) alarms if the RISLU site is equipped with the optional link adapter unit (LAU) remote alarm section (RAS).

During growth, if there are no RISLUs at this site, this should be populated with 0.

**Attribute: ri_alm**

**Fullname:** Unit Number Of The RISLU Responsible For Building/Power Alarms

**Attribute Description** This attribute holds the RISLU unit number relative to switching module sm_alm of the RISLU responsible for building and power alarms at the RISLU site (see previous description of sm_alm).
During growth, if there are not RISLUs at this site, this should be populated with 0.

**Attribute: ras_eqp**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Is RISLU site equipped with a remote alarm section (RAS) ?

**Attribute Description** This attribute is set to DBYES or DBNO according to whether the RISLU site is equipped with an RAS. If equipped, the RAS will be hosted by the RISLU indicated by the pair of attributes sm_alm and ri_alm.

**Attribute: ras_dplx**

**Fullname:** Is Site Equipped with (optional) RAS containing duplex ACCs

**Attribute Description** This attribute is set to DBYES if the RISLU site is equipped with a RAS containing duplex alarm conversion circuits (ACC)s. This attribute is set to DBNO if the RAS contains only a simplex ACC or if the RAS is unequipped at the RISLU site (see ras_eqp).

**Attribute: smrislu[*]**

**Fullname:** SM/RISLU Numbers Of The Nth RISLU At The Site

**Attribute Description** These remote member attributes are populated so as to identify the RISLUs at the RISLU site, in terms of the hosting SM number (1-192) and the RISLU unit number (0-7). Attributes that are not assigned should have the sm and rislu attributes (see DMSMRISLU) set to zero. The smrislu[0-7] attributes may be listed in any order (no correlation with any physical property is implied). Whenever possible assigned attribute pairs should be consecutive starting with smrislu0. If holes develop through degrowth, they should be filled when growing the next RISLU.

**Attribute: smrislu[*].sm**

**Fullname:** The Number Of The SM Hosting The Nth RISLU At The Site

**Attribute Description** Set to 0 if no RISLU in this slot.

**Attribute: smrislu[*].rislu**

**Fullname:** The RISLU Number Of The Nth RISLU At The Site

**Attribute Description** Set to 0 if no RISLU in this slot.

## 4. Population Rules for RLrisludfi

**Relation Description**
describes the RISLU DFIs and their relationships to other components.

This relation describes the various attributes associated with the RISLU DFI-H1/R1 and DFI-H2/R2 pairs in an SM. Each DFI pair has one tuple in this relation.

This relation describes the various attributes associated with the RISLU DFI-H1/R1 and DFI-H2/R2 pairs in an SM. Each DFI pair has one tuple in this relation.

Note that DFI-R1s and DFI-R2s are not explicitly represented in RLCKTDATA. The existence of a DFI-H1 or DFI-H2 tuple implies the existence of its DFI-R1 or DFI-R2 at the remote site.

Copyright © 1999 Lucent Technologies 

Key Format: See RLPICB population rules for RISLU DFI-H1s and DFI-H2s.

**Attribute: dfi_picb**

**Fullname:** picb number of RISLU DFI

**Attribute Description** The picb number that controls the DFI-H1 or DFI-H2. If a RISLU DFI has an tuple in RLCKTDATA, it must also have a tuple in this relation.

**Attribute: pidb0**

**Fullname:** ckt name of RISLU PIDB that connects the remote DFI to CD svc group 0

**Attribute Description** The internal circuit name of the RISLU PIDB that connects the remote DFI with CD service group 0 in the RISLU. The PIDB must also have a tuple in CKTDATA.

**Attribute: pidb1**

**Fullname:** ckt name of RISLU PIDB that connects the remote DFI to CD svc group 1

**Attribute Description** The internal circuit name of the RISLU PIDB that connects the remote DFI with CD service group 1 in the RISLU. The PIDB must also have a tuple in CKTDATA.

**Attribute: lu**

**Fullname:** RISLU line unit number

**Attribute Description** The line unit number of the RISLU that this DFI is connected to.

**Attribute: site**

**Fullname:** RISLU site number

**Attribute Description** The site number of the RISLU that this DFI is connected to. The site must be defined in RLrpsite.

**Attribute: hdfinum**

**Fullname:** host DFI number in host DFTU (DLTU-RH)

**Attribute Description** The DFI number in the DLTU-RH. If the DFI is a DFI-H1, the number must be in the range 1-4. If it is a DFI-H2, the number must be in the range 5-16.

**Attribute: rdfinum**

**Fullname:** remote DFI number in remote DLTU (DLTU-RR)

**Attribute Description** The DFI number in the DLTU-RR. If the DFI is a DFI-R1, the number must be in the range 1-2. If it is a DFI-R2, the number must be in the range 3-12.

**Attribute: ncts**

**Fullname:** number of control time slots on this facility

**Attribute Description** The number of time slots on this DFI that will be used for control information. This should be populated with 0 if the DFI is a DFI-H2. It should be populated with 1 if

Copyright © 1999 Lucent Technologies 

the DFI is a DFI-H1.

## 4. Population Rules for RLrmblist

**Relation Description**
This relation is the random make busy list.

It contains the members of a mlhg that are associated with a particular scan point such that when the scan point is activated or deactivated these members are made busy or made idle, respectively. Analog subgrps are implicitly defined by using the same scan point definition for several analog multiline hunt groups members. When a RMB button is depressed then all members assigned to the scan point take this action. A particular tuple must be replicated to the Hunting SM of the group found by using RLhuntkeys.portgrp.grpnum to read RLrt_mhg where

RLrt_mhg.module is the module designated as HUNTING MODULE. The RMB members are shown in the bitmap representation in this relation.

The distribution type of this relation is GRP_PART with a grp_type of GPDSM_PART. The population of the RLrmblist tuple is for every tuple in the relation RLhuntkeys, where the attribute huntkey_type is FCRMKBUSY. The RLrmblist tuple is keyed by the RLhuntkeys.scndindex. The distribution of this tuple is populated on the HUNTING SM of the group which owns the FCRMKBUSY key, this is found by using RLhuntkeys. portgrp.grpnum to read RLrt_mhg where RLrt_mhg.module is the module designated as the HUNTING MODULE. A RLrmblist tuple must also be populated on a RSM/ORM if any member indicated in RLrmblist.member1 thru member63 port resides on a RSM/ORM. Also if the RSM is part of a MMRSM cluster a RLrmblist tuple must reside on each module in the cluster.

**Attribute: scndindex**

**Fullname:** scanpoint secondary index

**Attribute Description** Key to relation obtained from RLhuntkeys.

**Attribute: length**

**Fullname:** Length (size of) this random make busy group.

**Attribute Description** Number of members under control of the random make busy key (number of active members in the tuple).

**Attribute: grpnum**

**Fullname:** Group number of the hunt group.

**Attribute Description** Group number of the multi-line hunt group that the random make busy subset is a part of.

**Attribute: bsytrt**

**Fullname:** Busy Treatment

**Attribute Description** Busy treatment associated with the random make busy list.

**Attribute: member1**

**Fullname:** set of 32 bits.

**Attribute Description** Used as a bit map of 32 members. Each 32 bit field represents 32 multiline hunt group members. (A bit map of 2016 -- members 0 through 2015) If the member is a part of the RMB group then the bit is ON ( 1 -- DBYES) else the bit is 0.
bit 0 of member1 is unused. MLHG members are assigned in ascending order going from the least significant bit to the most significant bit.

```
examples:
member1 --> 31 - 0
member2 --> 63 - 32
member3 --> 95 - 64
member4 --> 127 - 96 (that is, member(1:63))
```

**Attribute: member[*]**

**Fullname:** set of 32 bits.

## 4. Population Rules for RLrnd_opts

**Relation Description**
Redirecting number delivery (RND) Feature Options.

This relation gives Redirecting Number Delivery constructed feature option information. These constructed features can be assigned to standard ISDN terminals and analog terminal shared with standard BRI. The RND feature cannot be assigned to trunk groups or trunk members.

Only one RND feature can be assigned per DN/Multiline Hunt Group Member.

**Attribute: fid**

**Fullname:** feature identification

**Attribute Description** A BRCS constructed feature id consists of a unique identifier. For a Redirecting Number Delivery constructed feature, the feature id must have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: act_type**

Copyright © 1999 Lucent Technologies

**Fullname:** activation type

**Attribute Description** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate via a dialed code or feature button) for 5E8 so that act_type always has the value ACTNONE. Future software releases may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: deact_type**

**Fullname:** deactivation type

**Attribute Description** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate via a dialed code or feature button) for 5E8 so that deact_type always has the value DCTNONE. Future software releases may allow this feature to be deactivated via dialed codes or feature buttons.

**Attribute: ffcf1**

**Fullname:** bit reserved for future special feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf2**

**Fullname:** bit reserved for future special feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf3**

**Fullname:** bit reserved for future special feature use

**Attribute Description** Not assigned yet.

**Attribute: ffcf4**

**Fullname:** unsigned 8 reserved for future special feature use

**Attribute Description** Not assigned yet.

## 4. Population Rules for RLrotl_cb

**Relation Description**
Remote office test line - call back (ROTL_CB).

Remote office test line - contains a key which is used to lookup call back number. The RC and VER views affected are RC_ROTL and VER_ROTL.

**Attribute: carot_code**

**Fullname:** ROTL - CAROT code

**Attribute Description** Call back code passed in by CAROT, to get call back number.

**Attribute: call_back_num**

**Fullname:** Structure for call back total digits and DN

**Attribute Description** Total number of digits in directory number and DN structure.

**Attribute: call_back_num.digcnt**

**Fullname:** call back digits in DN

**Attribute Description** Total number of digits in directory number.

**Attribute: call_back_num.dn**

**Fullname:** Call back directory number.

**Attribute Description** ROTL - call back directory number.

**Attribute: carrid**

**Fullname:** Carrier id.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Indicates the carrier through which a call back to a CAROT will be routed if the DN is outside the LATA. It must be a 4 digit character string where each of the characters can be '0' through '9'. The carrier ID value must be an existing one in the RLfc_carr relation.

**Attribute: mode**

**Fullname:** Mode type.

**Attribute Description** ROTL - mode type.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLrpcu2ndn

**Relation Description**
RPCU to NESS Interface DNs.

This WIRELESS Centrex (WCTX) relation contains the radio port control unit (RPCU) to NESS interface Directory Number translation.

**Attribute: rpcu_id**

**Fullname:** Radio Port Control Unit Identifier

**Attribute Description** Identifies the radio equipment.

**Attribute: rpcu_idx**

**Fullname:** Index into the RPCU Data

**Attribute Description** Index used by TM to maintain a RPCU OOS list.

**Attribute: rpcu_grpid**

**Fullname:** RPCU Group Identifier

**Attribute Description** Identifies a group of RPCUs in a registration area.

**Attribute: mwibtn**

**Fullname:** Message waiting indicator feature button number.

**Attribute Description** Used to provision a logical button location on the user's handset for

Copyright © 1999 Lucent Technologies 

indicating to the user the presence of a waiting message on their message service system.

**Attribute: ndn1,ndn2,ndn3,ndn4,ndn5**

**Fullname:** 10 Digit NESS Interface DNs

**Attribute Description** The NESS interface DNs are those PCS Interfaces DNs that have the NESS BRCS feature.

## 4. Population Rules for RLrpcu2reg

**Relation Description**
RPCU to the registration area.

This Air Extension(SM) relation contains the RPCU to the registration area mapping.

**Attribute: rpcu_id**

**Fullname:** RPCU Identifier

**Attribute Description** It uniquely identifies the RPCU.

**Attribute: wspid**

**Fullname:** Air Extension(SM) Service Provider ID

**Attribute Description** Air Extension(SM) service provider identifier

**Attribute: regcod[*]**

**Fullname:** Registration Area Code

**Attribute Description** It uniquely identifies the registration area code within a service provider.

## 4. Population Rules for RLrpcu2sm

**Relation Description**
RPCU TO SM.

This WCTX relation contains the radio port control unit (RPCU) to the Switching Module (SM) number data.

**Attribute: rpcu_id**

**Fullname:** Radio Port Control Unit Identifier

**Attribute Description** Identifies the radio equipment.

**Attribute: sm**

**Fullname:** The switch module number.

**Attribute Description** This is the switching module number the VLR data will be mapped to.

# RPMA

## 1. Description

This SM relation contains information defining remote site. Given a unit number, unittype, scan point, RLrpma, relation will provide details of scan point. This relation replaces RLrpma as per Remote Access Interface Unit doc.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 756 |
| expected tuples in relation | 250 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | HMrpma_trg |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBNO |
| permutation type | perm |

## 3. Field Layout

## 4. Population Rules for RLrpma

**Relation Description**
Remote Peripheral (RP) Miscellaneous Alarm Data.

Each tuple in this relation identifies "miscellaneous" scan points (or "alarms") supported on RP such as RAIU. Scan points on remote peripherals are typically connected in duplex fashion. but simplex operation is also supported. Regardless of mode of operation (duplex or simplex), number of scan point supported do not change.

Note that RAIU unit is allowed on SM-2000 only.

**Attribute: unitnum**

**Fullname:** Unit number of Remote Peripheral

**Attribute Description** This is a key attribute. This identifies a Remote Peripheral (RP) unit equipped capable of providing miscellaneous scan points.

**Attribute: unittype**

**Fullname:** Unit type of Remote Peripheral (eg. RAIU etc.).

**Attribute Description** This is a key attribute. This identifies unit type of the RP providing miscellaneous scan points.

**Attribute: point**

**Fullname:** Scan point number

**Attribute Description** This is a key attribute. This identifies one of the miscellaneous scan points. For RAIU case range of this key is {0 through 5}. On RAIU {6 through 7} are reserved for Fan and Fuse scan points.

**Attribute: in_use**

**Fullname:** Scan point operation

**Attribute Description** This attribute indicates whether or not the specified scan point is operational. DBYES indicates that the scan point is operational; DBNO indicates that the scan point is not operational.

**Attribute: nrm_stat**

**Fullname:** Scan point normal state

**Attribute Description** This attribute indicates the normal state of the scan point. DBOPEN indicates that the scan point is connected to a device having electro-mechanical contacts which are in the open-circuit state while the specific alarm condition is not present. DBCLOSED indicates that the scan point is connected to a device having contacts which are in the closed-circuit state while the specific alarm condition is not present.

Copyright © 1999 Lucent Technologies 

**Attribute: mcc_name**

**Fullname:** Scan point label for MCC display use

**Attribute Description** This attribute contains an office-assignable label consisting of 8 ASCII characters, which are to be displayed on an MCC screen (such as, the 1640 page). If the user inputs less than 8 characters, the remaining ones should be automatically populated by Recent Change as null characters. It shall be permissible for the user to define a "null" (blank) label by choosing to enter no characters through RC/V.

**Attribute: tty_name**

**Fullname:** Scan point label for ROP output report use

**Attribute Description** This attribute contains an office-assignable label consisting of 20 ASCII characters, which are to appear in scan point status output reports. If the user inputs less than 20 characters, the remaining ones should be automatically populated by Recent Change as null characters. It shall be permissible for the user to define a "null" (blank) label by choosing to enter no characters through RC/V.

**Attribute: alm_lvl**

**Fullname:** Scan point alarm level

**Attribute Description** This attribute defines the severity level of the alarm to be issued when the scan point enters the "alarming" state.

**Defines:**

## 4. Population Rules for RLrpsite

**Relation Description**
Configuration Information about Remote Peripherals (RP) at remote site.

Poprules in this relation apply to RP such as RISLU and RAIU.

This relation is modeled after the RSM RLclidat relation. Each tuple in this relation represents a single remote site. A remote site can have up to eight RPs. A remote site may be hosted by several switching modules; also a switching module may host several remote sites.

**Attribute: risitid**

**Fullname:** RP site number

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the identification number of the set of RPs which comprise the RP site. RP site numbers may range from 500 through 999. This range (see DMRISITID) is defined so as not to conflict with RSM site numbers (the latter are currently restricted to the range 1-174).

**Attribute: text**

**Fullname:** Title Of The Site

**Attribute Description** This attribute holds a string of up to 15 characters. It is a text identification of the RP site (such as, name of town) and is used to title MCC display pages. If there are less than 15 characters the string should be padded with binary zeros.

**Attribute: rp_cnt**

**Fullname:** Number Of RPs At The Site

**Attribute Description** This attribute holds the number of RPs at the site, and must be less than or equal to MAXRISITESZ.

**Attribute: sm_alm**

**Fullname:** Number of SM Hosting RP With Building/Power Alarms

**Attribute Description** This attribute holds the module number (1-192) of the module that hosts the remote peripheral responsible for building and power alarms at the RP site. The following attribute (rp_alm) identifies the RP by unit number. Although every RP scans its own fan and fuse alarms, one RP per RP site must be selected to scan power and battery alarms for the RP site. This same RP will also be used to scan building and miscellaneous (office defined) alarms if the RP site is equipped with the optional Link Adapter Unit (LAU) Remote Alarm Section (RAS). This is only valid for RISLU's and RAIU's.

**Attribute: rp_alm**

**Fullname:** Unit Number Of The RP Responsible For Building/Power Alarms

**Attribute Description** This attribute holds the RP unit number relative to switching module sm_alm of the RP responsible for building and power alarms at the RP site (see the previous description of sm_alm).

The RP responsible for Building/Power alarm must be of RISLU type. RAIU unit does not have dedicated Building/Power scan points hence it can not report Building/Power alarms.

**Attribute: ras_eqp**

**Fullname:** Is RP Site Equipped With A Remote Alarm Section (RAS)?

**Attribute Description** This attribute is set to DBYES or DBNO according to whether the RP site is equipped with an RAS. If equipped, the RAS will be hosted by the RP indicated by the pair of attributes sm_alm and rp_alm.

**Attribute: ras_dplx**

**Fullname:** IS Site Equipped with (optional) RAS with 2 links or ATA cards connected to host SM?

**Attribute Description** This attribute is set to DBYES if the RP site is equipped with 2 links or ATA cards connected back to the HOST SM. This attribute is set to DBNO if there is only 1 link or ATA

Copyright © 1999 Lucent Technologies 

card attached to the HOST SM. This attribute is also set to DBNO if the RAS is unequipped at the RP site (see "ras_eqp").

**Attribute: slim_ri**

**Fullname:** SLIM routing index for Test Application Pack

**Attribute Description** For a logical remote which has a Test AP circuit assigned, this unique SLIM route index should be populated. Each of these indices are associated with a unique Port Group. The valid range for SLIM ROUTE INDICES is from 0 to 8191. The route indices can be numbered randomly. For every unique slim_ri, the route index must exist in the relation RT_ROUTING. The group number and type found in RT_ROUTING must exist in the relations GROUP_PORT and PORT_GROUP. In GROUP_PORT and PORT_GROUP, a logical test port must exist for every SLIM circuit marked equipped and operational. The group type in GROUP_PORT and PORT_GROUP must be TM_TRK. For every logical test port, information must be found in the SM relation FC_PORTTYP. The key to the information is the member of GROUP_PORT and PORT_GROUP. The service class, hunt, and lp_type fields in FC_PORTTYP must equal TM_SLIM, DBYES, and PCSLIM respectively. The SLIM ROUTE INDEX must be zero if the site does not contain a metallic Test Application pack.

**Attribute: rp[*]**

**Fullname:** SM/RP Numbers Of The Nth RP At The Site

**Attribute Description** These remote member attributes are populated so as to identify the RPs at the RP site, in terms of the hosting SM number (1-192) and the RISLU unit number.

The rp[0-7] attributes may be listed in any order (no correlation with any physical property is implied). Whenever possible, assigned attribute pairs should be consecutive starting with rp0. If holes develop through degrowth, they should be filled when growing the next RISLU. The rp[0-7] attributes can be filled in with any combination of RPs.

## 4. Population Rules for RLrptrnscv

**Relation Description**
Revertive Pulsing Transceiver circuit names.

This relation contains one tuple for each equipped revertive pulse circuit (PC_RVPT) found in the cktdata relation for the IM. The key field, circuit, is constructed in the same manner as is done for the cktdata tuple.

**Attribute: circuit**

**Fullname:** Circuit name

**Attribute Description** Circuit name of equipped Revertive Pulsing circuit

**Attribute: dummy**

**Fullname:** Dummy field

**Attribute Description** Always zero

**Relation Description**
Reroute Destination.

Table for selecting a new destination index for rerouted calls based on the incoming destination index, internal destination ID, and the incoming trunk group.

**Attribute: dest_x**

**Fullname:** Destination Index

**Attribute Description** Destination index which comes from digit analysis or from intercept.

**Attribute: int_destid**

**Fullname:** Internal reroute Destination ID number

**Attribute Description** Indicates the destination ID of the switch that the call is being rerouted to.

**Attribute: tgroup**

Copyright © 1999 Lucent Technologies

**Fullname:** Trunk Group

**Attribute Description** The incoming call's incoming trunk group number which is gotten from RLrt_trkg.

**Attribute: rr_dest**

**Fullname:** Reroute Destination index

**Attribute Description** Destination index for the switch that DA or Non-ISP calls to a VDT will be rerouted to.

# RSM2HTU

## 1. Description

This relation maps the RSM number to the unit number of Host Transport Unit (HTU) of the HSM. It is the inverse of RLhtu2rsm. In addition, the relation contains the four control circuit names used for communication to the RSM.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 30 |
| expected tuples in relation | 5 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | unperm |

## 3. Field Layout

```

## 4. Population rules for RLrsm2htu

### Relation Description

Remote Switching Module to Host Transport Unit.
Maps the RSM module to the Host Transport Unit that it is connected to.
This relation is the inverse of RLhtu2rsm.

**Attribute:**
rsm_num
**Fullname:**
Remote Switching Module number.
**Attribute Description:**
This is the module number of a Remote Switching Module (RSM).

**Attribute:**
htu_num
**Fullname:**
Host Transport unit number.
**Attribute Description:**
This is the unit number of the Host Transport UNIT (HTU). An HTU is an "abstract" unit defined to host all the umbilicals going to a RSM. The value will be identical to the RSM offset defined in MODATT for an RSM.

**Attribute:**
cts1_ckt
**Fullname:**
Control Time Slot circuit for umbilical 1.
**Attribute Description:**
This is the control time slot circuit name carried on the host transport. There can be four of these circuits, 1 each carried on the first four umbilicals. They will all be located in this relation and are named:

- cts1_ckt -> Carried on umbilical 1
- cts2_ckt -> Carried on umbilical 2
- cts3_ckt -> Carried on umbilical 3
- cts4_ckt -> Carried on umbilical 4

They have all been placed in the relation for fast clink management (1 read will get all the control circuit names). With the control circuit names also used as keys in RLhmrsmcl, one more read will get the chdb for the control circuit.

**Attribute:**
cts2_ckt
**Fullname:**
Control Time Slot circuit for umbilical 2.

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
See attribute "cts_ckt1".

**Attribute:**
cts3_ckt
**Fullname:**
Control Time Slot circuit for umbilical 3.
**Attribute Description:**
See attribute "cts_ckt1".

**Attribute:**
cts4_ckt
**Fullname:**
Control Time Slot circuit for umbilical 4.
**Attribute Description:**
See attribute "cts_ckt1".

**Defines:**

## 4. Population rules for RLrsmchan

### Relation Description

```
        RSM communication link
        Provides information for the RSM communication link.
        see main description.
        ;
end relation;
```

Copyright © 1999 Lucent Technologies

**Attribute:**
chdb_num
**Fullname:**
Channel Data Block Number (Peripheral Side Time Slot) for the RSM communication link.
**Attribute Description:**
There is a one-to-one correspondence between tuples in this (RLRSMCHAN) relation, and tuples in RLHMRSMCL with a .comm_link attribute of DBYES and a circuit type not equal to PCHUMB_CTS. There are 2 attributes which link the corresponding tuples between relations:
- 'chdbnum' is a non-key attribute in RLHMRSMCL, and is used here as the key to RLRSMCHAN.
- 'hfac_id' is a non-key attribute in RLRSMCHAN (see separate attribute description here), and is used as the key to RLHMRSMCL.

So, one tuple must be equipped in this relation for each tuple in RLHMRSMCL with a .comm_link attribute of DBYES and a circuit type not equal to PCHUMB_CTS. Furthermore, this attribute must match the chdb_num attribute for each RLHMRSMCL tuple.

**Attribute:**
hfac_id
**Fullname:**
Circuit name of HSM DFI facility.
**Attribute Description:**
This attribute is of type DMCIRCUIT and must contain the name of a facility circuit, as determined from examining the associated RLHMRSMCL relation. As mentioned here in the 'chdb_num' attribute description, there is a one-to-one correspondence between tuples in this (RLRSMCHAN) relation, and tuples in RLHMRSMCL with a .comm_link attribute of DBYES and circuit type not equal to PCHUMB_CTS. 'hfac_id' is 1 of 2 attributes which link the corresponding tuples between relations.
'hfac_id' is a non-key attribute here in RLRSMCHAN used as the key to RLHMRSMCL. This tuple's hfac_id attribute must match the ckt_id attribute used as the key to the RLHMRSMCL tuple associated with this tuple's chdb_num.

**Attribute:**
tsdb_num
**Fullname:**
Time Slot Data Block Number (Network Side Time Slot) for the RSM communication link.
**Attribute Description:**
The field tsdb_num is of type DMCTS9 and will take a value from 0 to 511. The field tsdb_num

**Copyright © 1999 Lucent Technologies** 

should be two times the value of cts_even that is populated in RLMODATT for the RSM that is connected to TMS link 0 by the facility name in hfac_id. TMS link 0 is assigned to the hdfi_id connected to RSM DLTU unit 0, RSM facility 0, RDFI numbers 1 and 3. The field tsdb_num should be one more than two times the value of cts_odd that is populated in RLMODATT for the RSM that is connected to TMS link 1 by the facility name in hfac_id. TMS link 1 is assigned to the hfac_id connected to RSM DLTU unit 0, RSM facility 0, RDFI numbers 2 and 4.

```

## 4. Population rules for RLrsmfac_con

**Relation Description**

Remote Switching Module facility connection.
Maps the near end to the far end for facilities used in an RSM complex.
Facilities can connect HSMs to RSMs and RSMs to RSMs. There will be
one tuple in this relation for each near end termination of a facility.
Given a tuple A, it's far end information should match a tuple in the
far end SM whose far end information matches tuple A's near end
information.

**Attribute:**

utype

**Fullname:**

Copyright © 1999 Lucent Technologies

Unit type of near end.

**Attribute Description:**

This is the unit type as defined in cktdata of the facility connected to the near end.

**Attribute:**

unit

**Fullname:**

Unit number of near end.

**Attribute Description:**

This is the unit number as defined in cktdata of the facility connected to the near end.

**Attribute:**

ckt_indx

**Fullname:**

Circuit index of near end.

**Attribute Description:**

This is the circuit index as defined in cktdata of the facility connected to the near end.

**Attribute:**

fe_module

**Fullname:**

Far end module.

**Attribute Description:**

This is the module that is connected to the far end facility.

**Attribute:**

fe_utype

**Fullname:**

Far end unit type.

**Attribute Description:**

This is the unit type that is connected to the far end facility.

**Attribute:**

fe_unit

**Fullname:**

Far end unit number.

**Attribute Description:**

This is the unit number that is connected to the far end facility.

**Attribute:**

fe_ckt_indx

**Fullname:**

Far end circuit index.

**Attribute Description:**

## 4. Population Rules for RLrsmnts

**Relation Description**
RSM network time slot (RSMNTS).

Provides RSM communication link network control and timing (NCT) time slot information for every HDFI used for the RSM CTS.

**Attribute: tsdb_num**

**Fullname:** Time slot data block number (network side time slot) for the RSM communication link.

Copyright © 1999 Lucent Technologies

**Attribute Description** There will be two entries in this relation for every RSM connected to the HSM. These 'tsdb_num' values correspond to the cts_even and cts_odd attributes in the RSM's RLmodatt tuple and are calculated by the following algorithm: Multiply RLmodatt.cts_even by 2 for one entry, multiply RLmodatt.cts_odd by 2 and add 1 for the other.

For example, if RSM 4 were subtending to an HSM, then for SM 4 in RLmodatt you might have the following: cts_even = 26 and cts_odd = 27. The RLrsmnts tuples populated for RSM 4 in the HSM would have tsdb_num (key) values of 52 (26 * 2) and 55 (27 * 2 + 1).

**Attribute: comm_link**

**Fullname:** RSM communication link NCT time slot indication

**Attribute Description** This field is DBYES if the 'tsdb_num' is used for an RSM communication link, DBNO otherwise.

Copyright © 1999 Lucent Technologies 

# RT_DNTRAN

## 1. Description

This relation contains the DN terminating translations.

## 2. Data Dictionary Values

|__________________________________________________________________________|
*****************************************************************
*
* Application specific poprules for:
*   Automatic Call Distributor (ACD) and Direct Agent Access (DAA) DNs
*
* The ACD/BRCS Interworking feature allows for the definition of
* ACD and DAA DNs.  The RLrt_dntran tuples for ACD or DAA DNs are
* associated with RLacd_dn or RLdaa_dn tuples, not RLfc_line tuples.
* There also are no tuples in RLrc_oeinfo, RLrc_dninfo or RLpr_dntran
* for either ACD or DAA DNs.
*
* TUPLE SEMANTICS
* ---------------
* The following RLrt_dntran attributes are applicable for ACD and DAA
* DNs.  All attributes not listed shall use their default values.
*
* dn            defined in RLacd_dn or RLdaa_dn
* termclass     RTTC_ACD or RTTC_IWACD
* term_name     FCP_NULL
* calltrc       DBYES or DBNO
* deny_term     DBNO
* denybv        DBYES
* portname      0
* lpt_type      LPT_OTHER
* ltm_type      LTM_OTHER
* ltm_idx       0
* pin[1..4]     '#'
*

*****************************************************************
*
* Application Specific poprules for Remote Digital Test Access
*    (RDTA) ports
*
```

```
* The 5e7 RPA capability allows for RDTA ports to be equipped
* either on an Access Switch or a Remote Switch using either a
* Pseudo BRI port or an EDSL PRI port.  Refer to the poprules
* in RLdn_rdta for more details.
*
* NOTE:  THERE IS NO RLrc_oeinfo OR RLrc_lcc TUPLE FOR EITHER
* -----    TYPE OF RDTA PORT!!!!!!!  SEE SPECIAL RULES IN
*          RLfc_line for determining PORT SERVICE CLASSES!!!
*    ALSO: RLfc_line tuples ONLY exist for RPA Pseudo-BRI ports.
*          The EDSL PRI ports are populated in RLfc_trunk.
*
* TUPLE SEMANTICS
* ---------------
* The following RLrt_dntran attributes are applicable for RPA EDSL
* PRI B-Channel and Pseudo BRI use (RPA does not use EDSL D-Channel).
* Both types will have the rdta_port attribute equal DBYES signaling
* TM routing to take the call.  All the attributes not listed shall
* use their default values.  RDTA does not allow port intercept.
*
* dn    NOC and Digits defined in RLdn_rdta
* termclass     RTTC_TMTST
* term_name     FCP_INDI
* denybv        DBNO
* deny_term     DBNO
* portname      RPA gport populated in RLdn_rdta, RLgroup_port, RLpggpmap
* lpt_type      LPT_ISDN (for Pseudo BRI) or LPT_OTHER (for EDSL PRI)
* ltm_type      LTM_OTHER
* lport Pseudo BRI RDTA lport defined in RLlpt_pt or
*            0 for EDSL PRI ports
* ltm_idx       0
* rdta_port     DBYES
*
*************************************************************************"
```

**Attribute:**

dn

**Fullname:**

terminating directory number

**Attribute Description:**

This attribute consists on the NOC (normalized office code) and four directory number digits.
This dn represents only the Circuit Switching DN.

For any directory number, if the noc+d4d3 has a tuple in relation RLRTDNMOD with a non-zero route index a tuple also may exist in RLRT_DNTRAN. For these cases the tuple in RLRT_DNTRAN will take precedence insofar as call routing is concerned. This is true regardless of the type of SM (RSM/LSM/HSM/ORM) from which the call originates. An example where this is useful is the case of a DN hundreds group where most DNs all route to the same PBX trunk group but there are a few DNs in that hundreds group which do not. In this case the route

Copyright © 1999 Lucent Technologies 

index in RLRTDNMOD is used to route the majority of calls to the hundreds group whereas those few which route differently do so via the existence of RLRT_DNTRAN tuples.

Automatic Call Distributor (ACD) DNs that are not being interflowed have a corresponding tuple in RLacd_dn. Direct Agent Access (DAA) DNs and ACD DNs that are being interflowed have a corresponding tuple in RLdaa_dn.

A DN, used for Integrated Service Digital network,
may have:
(1) circuit switching only, or
(2) packet switching only, or
(3) both circuit and packet switching.

This dn attribute is only associated with the circuit switching dn. If the dn is a packet switching dn, then the relation RLpr_dntran will be populated instead.

SPECIAL UNIQUENESS CHECK FOR CIRCUIT/PACKET DNs:

The DN represented by this tuple must be unique to this user. This means that if a corresponding tuple exists in RLpr_dntran (that is not on intercept with module equal to zero), then that tuple must be associated with the same user as this RLrt_dntran tuple. Further, only intercepted DNs, individual DNs, and some types of MLHG DNs can have any RLpr_dntran tuple.

This check ensures that if a tuple exists in both RLrt_dntran and RLpr_dntran with the same DN, that both DNs belong to the same user and the Service Order Profiles (SOPs) are:
RLrt_dntran: CKT
RLpr_dntran: PPD, ODB, PPB1, PPB2

**Attribute:**

termclass

**Fullname:**

termination class of service

**Attribute Description:**

For ISDN DSLs (servclass=FC_ISDN) the termclass should be populated with RTTC_INDIVID unless it is in a multiline hunt group.

ACD and DAA DNs have either a RTTC_ACD or RTTC_IWACD termclass. If an ACD or DAA DN is assigned INWATS treatment, it will have the RTTC_IWACD termclass. Otherwise, it will have the RTTC_ACD termclass. DNs with a termclass of either RTTC_ACD or RTTC_IWACD will have: term_name set to FCP_NULL, deny_term set to DBNO, denybv set to DBYES, portname set to 0, lpt_type set to LPT_OTHER, ltm_type set to LTM_OTHER, ltm_idx set to 0, and pin[1..4] set to '#'.

The termclass can be RTTC_PORTGRP or RTTC_INWATS for ISDN Attendant DSL's ( servclass = FC_ISATND )

for circuit switched voice multiline hunt groups [RLrt_mhg(grpnum).beartyp = BR_VOICE; where RLpggpmap(module, D port).grpnum is the key to RLrt_mhg]. It must be RTTC_INWATS or RTTC_PORTGRP for ISDN circuit switched data hunt groups (RLrt_mhg.beartyp = BR_CSD). If termclass = RTTC_INWATS and the port value is non-zero, you must find a matching RLfc_line tuple with INWATS=DBYES. If termclass = RTTC_INWATS and the port value is zero, you must find a matching dn in RLrt_dnmhg tuple for grpnum that maps into rlRT_MHG where INWATS=DBYES.

When a DN is assigned for the mixed local/inwats mlhg access feature, the RT_DNTRAN tuple created for inwats access acts as an alternate entry point to an existing mlhg. This alternate entry point is a special case of multiple DNs for a mlhg member.
A tuple for the inwats mixed access may exist for
1) A UCD group
2) A MUPH sub-group
3) A member of a mlhg with a hunt type of RTH_REGULAR, RTH_CIRCULAR, RTH_LGREG, or RTH_LGCIR

Hunt group dns normally have a termclass of RTTC_PORTGRP or RTTC_INWATS. The RTTC_INDIVID termclass may be intermixed with the other two.
Multiple dns for a multiline hunt group can have any of the following termclass: RTTC_INDIVID, RTTC_PORTGRP, RTTC_AGING, or RTTC_INWATS.
In the local/inwats mixed mlhg access case of multiple DNs the termclass is always RTTC_INWATS.

**Copyright © 1999 Lucent Technologies** 

A termclass of RTTC_INWATS can now be assigned to non-MLHG lines. When a non-MLHG line has a termclass of RTTC_INWATS, the ind_inwats attribute must be set to DBYES.

When the DN is assigned for trunk INWATS (TINWATS), termclass = RTTC_TINWATS, RLrt_dntran.portname.module = 0, and RLrt_dntran.portname.member = #GLNULPORT. The RTTC_TINWATS termclass is the same type as the RTTC_RI termclass. RTTC_TINWATS may only be assigned to DNs that route via an RI to a trunk group.

When a DN is assigned as the Remote Access Directory Number (RADN) for the Remote Access to Advanced Service Interface (RASI) special feature, termclass=RTTC_ASI_RA, RLrt_dntran.portname.module = 0, and RLrt_dntran.portname.member = 0.

5E5_1U SERVICE ORDER PROCESSING FOR INTERCEPT
(that is, RLrt_dntran.termclass set to RTTC_AGING)

1. There are two types of intercept possible. The first involves putting a DN on intercept and leaving the port data intact. The second involves putting the DN on intercept and removing the association of the DN with its physical and logical data.

   a. Intercept CAN be assigned to an MLHG individual member DN or a member, including cases where the individual member DN is the same as the MLHG group DN (such as, member 1's DN for regular, circular or PPMHG hunt groups.)

      (a typical DN that is not placed on intercept is:

      RLrt_dntran.termclass equals RTTC_PORTGPR
      RLrt_dntran.port.module equals 0
      RLrt_dntran.port.member equals 0).

   b. When the port data is left intact:
      RLrt_dntran.portname.module is_not_equal 0.
      RLrt_dntran.portname.member is_not_equal #GLNULPORT.
      All intercept bits must be set (refer to #2).
      All port data remains intact (refer also to #3).
      A tuple exists in RLrc_oeinfo.

   c. When the port data is disassociated with the DN:
      RLrt_dntran.portname.module equals 0.
      RLrt_dntran.portname.member equals #GLNULPORT.
      RLrt_dntran.ltm_type equals LTM_OTHER.
      RLrt_dntran.ltm_idx equals 0.
      RLrt_dntran.lpt_type equals LPT_OTHER.
      RLrt_dntran.lport equals 0.
      All port data is removed or unassigned.
      A tuple exists in RLrc_dninfo.

Copyright © 1999 Lucent Technologies 

2. For the previous case (1b), the following must be done:

   a. Verify the RLfc_line tuple has its intercept bit set to prevent originations (and some terminations). Note that for ISDN shared DNs, RLfc_line will only be set if the DN is a primary DN. Also, ports that have multidn capabilities will only have their RLfc_line.intercept bit toggled if the locdn field matches the DN in RLrt_dntran.

```
for all tuples in RLrt_dntran
where ( ( RLrt_dntran.termclass equals RTTC_AGING ) and
      ( RLrt_dntran.portname.module is_not_equal 0 ) and
      ( RLrt_dntran.portname.member is_not_equal #GLNULPORT ) )
when found
    find exactly 1 tuple in RLfc_line
                on SM RLrt_dntran.portname.module
    where ( ( RLfc_line.port.module equals
                 RLrt_dntran.portname.module ) and
        ( RLfc_line.port.member equals
                 RLrt_dntran.portname.member ) and
        ( RLfc_line.party equals RLrt_dntran.term_name ) )
    when found
          if ( ( RLrt_dntran.ltm_idx equals RLfc_line.ltm_idx ) and
               ( RLfc_line.multidn equals DBNO ) )
          then RLfc_line.intercept equals DBYES;
          else if ( ( RLrt_dntran.dn equals RLfc_line.locdn ) and
                   ( RLfc_line.multidn equals DBYES ) )
          then RLfc_line.intercept equals DBYES;
```

   b. If this user is an ISDN user, RLis_line must be placed on intercept as well. Further, if the ISDN user is the part of a shared DN group, then ALL RLis_line tuples in that shared DN group must be placed on intercept.

```
short module;
for all tuples in RLrt_dntran

                                      ( RLshterm.ltm_idxi equals
                                         RLis_line.ltm_idxi ) and
                                      ( RLshterm.range is_in { 0..7 } ) )
                              when found
                                   for module in RLshterm.shared[ 0..3 ].module
                                   find exactly 1 tuple in RLis_line on SM module
                                   where ( ( RLis_line.lead_module equals
                                                RLshterm.lead_module ) and
                                             ( RLis_line.ltm_idxi equals
                                                RLshterm.ltm_idxi ) )
                                   when found
                                        RLis_line.intercept equals DBYES;
          end
```

3) For lines that are not multiparty, FC_ISDN, or FC_ISATND, the RLfc_porttyp.servclass will typically be set to RC_PORTUNA or RC_UNASSIG. Refer to RLfc_porttyp for more details. For lines that are members of MLHGs, refer to the population rules for RLfc_line, RLrt_mem, and RLrt_lgmem for additional dependencies.

4) Refer also to the population rules for:
   - RLfc_porttyp.P (servclass attribute and retrofit)
   - RLfc_line.P (Analog and ISDN primary DNs)
   - RLis_line.P (ISDN and shared DN lines)
   - RLrc_multidn.P (lines that have multiple DNs allowed)
   - RLrc_dninf.P (does not exists when DN is associated with its port data)
   - RLrc_oeinfo.P (exists where intercept equals DBYES and port data remains)
   - RLrt_lgmem.P (large MLHG groups)
   - RLrt_mem.P (small MLHG groups)

**Attribute:**
vlr_sm
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

DN to VLR SM translation

**Attribute Description:**

This field is used only for Wireless Centex feature(WCTX).
It indicates which SM contains VLR (Visitor Location Register)
data. For Non-WCTX, it must be set to the default value 0x0.

**Attribute:**

deny_term

**Fullname:**

denied termination

**Attribute Description:**

Deny termination. Line should not be allowed to receive calls.

If the terminating class is a multiline hunt group
(that is if termclass = RTTC_PORTGRP or RTTC_INWATS)
then 'deny_term' must be populated as DBNO.

If the line has circuit switching, default is DBNO;
otherwise, default is DBYES.
For ISDN lines, see the table for ISDN applications
in General Section.

**Attribute:**

portname

**Fullname:**

global port name

**Attribute Description:**

If ltm_type is LTM_ISDN, the portname is that of ISDN
lead port or the shared analog portname.
Note: The range of values for D-Channel port members
is (#GLMNPORT to #GLMXPORT).

Dependencies:
1) IF ucd_muph == DBYES
( rlRT_DNTRAN.portname.module = 0
rlRT_DNTRAN.portname.member = #GLNULPORT )
2) IF portname.member > #GLNULPORT,
verify existence of tuple in RLfc_line AND
a tuple in RLfc_porttyp for this key port;
ELSE
No dependency for ucd_muph. If portname.member
is #GLNULPORT and portname.module is 0
and termclass is not RTTC_AGING then the tuple is
distributed to the routing module, to all RSMs, and all
other modules with the stand alone option installed using
the GPDSA_PART group type using the routing module number
as the grp_id.
These cases are:
1) ucd_muph DN
2) special ri DN where the ri is not specified in RLrtdnmod
(For ODA: if the ri is specified in RLrtdnmod and a tuple exists

Copyright © 1999 Lucent Technologies 

in RLrt_specri for this DN, then the appropriate warning
or error message is given. See poprule 2 for the 'dn' attribute.
For RC: if the ri is specified in RLrtdnmod and a tuple exists in
RLrt_specri for this DN with the same or different ri specified,
this can be a valid but temporary ri change transition state. See
poprule 2 for the 'dn' attribute for further information.)

3) For every tuple in RLRT_DNTRAN except for MUPH or UCD,
if portname.member = #GLNULPORT and portname.module = 0
a corresponding tuple must exist in RLRC_DNINFO.
For every tuple in RLRT_DNTRAN with portname.module > 0
and portname.member > #GLNULPORT, no corresponding tuple
in RLRC_DNINFO should exist.

If tuple is being created as a multiple dn for a multiline hunt
group member, this port must already exist in the relation
RLgroup_port keyed by the designated group, TM_LINE, and member.
For servclass FC_ISATND, FC_ISDN the portname
should be the D-port.

4) If RLrt_dntra.ltsb_pt equals DBYES then RLrt_dntra.portname
is a LTSB port (1-TN and 2-TN).

**Attribute:**
portname.member
**Fullname:**
port name of a port
**Attribute Description:**
see portname

**Attribute:**
portname.module
**Fullname:**
the SM number that this port terminates on
**Attribute Description:**
see portname

**Attribute:**
term_name
**Fullname:**
termination name
**Attribute Description:**
Must have the value FCP_INDI if the port is a member of
a LINE SIDE Stand-Alone Announcement MLH group on a module
that has the stand alone call processing option, that is
the port points to a MLH group which is local to the
module and the parameter GLsalgrp contains that MLH group
number.

For servclass FC_ISDN, populate as follows:
if ( RLdslequip(portname).briclass == BRI_MP ) or
( RLdslequip(portname).briclass == BRI_PP ) or

Copyright © 1999 Lucent Technologies 

```
     RLdslequip(portname).briclass == BRI_STD )
then term_name is in {0 thru 7}

For servclass FC_ISATND and cpetype IS_TYPATT,
this is populated with FCP_INDI.

If the dn is a multiple dn for a member of a multiline hunt
group, the term_name must be the same as for the base dn for
the multiline hunt group member that defined in RLfc_line.
```

**Attribute:**
calltrc
**Fullname:**
is calll tracing in effect?
**Attribute Description:**
Indicates if calls to thes dn should be traced.
This attribute should always be initialized to
DBNO, since traces require considerable resources.
The field may be updated by recent change on request.
If the tuple is for a multiple dn of a multiline hunt
group, this attribute is defaulted to DBNO. This field
may be updated by recent change on request for both the base
dn or the multiple dn.

**Attribute:**
denybv
**Fullname:**
are busy verify capabilities denied?
**Attribute Description:**
Tells if the line has the busy verify service denied.
If the dn is a multiple dn for a member of a multiline
hunt group, the value of denybv is the same as that of
the base dn. While the base dn of a multiline hunt group
has multiple dns associated with it, the denybv field is
not updatable by recent change.

**Attribute:**
ucd_muph
**Fullname:**
indicates if this is a main DN for a UCD, MUPH, ISAT hunt
group/subgroup, or access TN for Modem Pooling
**Attribute Description:**
Indicates if this is either a UCD group DN, OR a MUPH
subgroup DN (DBYES) or ISAT subgroup DN (DBYES) or
modem access DN(DBYES) or none of these (DBNO).

Dependency:
1) IF rlRT_DNTRAN.ucd_muph == DBYES and
   rlRT_DNTRAN.termclass == RTTTC_PORTGRP then verify that
   rlRTDN_MHG has a tuple with key rlRTDN_MHG.locdn =

Copyright © 1999 Lucent Technologies 

```
   rlRT_DNTRAN.dn.
   ELSE IF rlRT_DNTRAN.ucd_muph == DBYES and
   rlRT_DNTRAN.termclass == RTTTC_MODEM then verify that
   rlRTDNMPG has a tuple with key rlRTDNMPG.locdn =
   rlRT_DNTRAN.dn.
2) IF rlRT_DNTRAN.ucd_muph == DBYES then verify that
   this rlRT_DNTRAN tuple exists in the routing module,
   all RSMs, and all other modules with the stand alone
   call processing option installed (that is Glsacp = DBYES).
3) IF ucd_muph == DBYES then
   portname = 0.
4) If rlRT_DNTRAN.ucd_muph == DBYES then
   rlRT_DNTRAN.termclass must be either
   RTTC_PORTGRP (MLHG) or RTTC_INWATS or
   RTTC_MODEM(modem access DN).
5) If rlRT_DNTRAN.ucd_muph == DBYES then
   rlRT_DNTRAN.denybf must be DBNO.
```

**Attribute:**

mctran

**Fullname:**

indicates if there is an associated entry in RLrt_mctr for this DN

**Attribute Description:**

The mctran attribute indicates if there is an associated entry in the relation RLrt_mctr for this DN. A value of DBYES in mctran indicates one of the following SFGs must be associated with this DN: originating SFG, terminating SFG, INWATS SFG or SDN SFG.

If the DN has EON, INWATS or SDN SFG assigned, the mctran is always DBYES.

The mctran attribute is also used by the trunk INWATS feature (RLrt_dntran.termclass = RTTC_TINWATS) to indicate if there is an associated entry in the relation RLrt_mctr for this DN. It is set to DBYES if RLrt_dntran.termclass = RTTC_TINWATS and a tuple exists for this DN in RLrt_mctr (RLrt_mctr.locdn) with RLrt_mctr.inwats_mcri > 0.

Once it is determined that the DN has EON, INWATS or SDN SFG, the value of mctran is set to DBYES, the following tgid check will not change the value of mctran for this particular DN.

If the DN belongs to a terminal group(tgid)
then if RLrt_tgid(tgid) tuple exists
     then if RLrt_ tgid.term_sfg and RLrt_ tgid.orig_sfg are both DBNO
          then the attribute mctran is DBNO
          else the attribute mctran is DBYES.
     else the attribute mctran is DBNO.
else the attribute mctran is DBNO.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ltsb_pt
**Fullname:**
indicates whether or not this is an LTSB port
**Attribute Description:**
Indicates whether or not this is an LTSB port. If this bit is set to DBNO, TM only has to read RLrtdnmod and this relation to get the corresponding port and module and line testing would proceed as if it were a normal non-LTSB line. If this bit is set to DBYES, then this port is an LTSB port and a read must be done of RLrc_oeinfo to check service class code information for LTSB.

**Attribute:**
lpt_type
**Fullname:**
the type of logical port
**Attribute Description:**
lpt_type Indicates the LPORT type to which the lport value associated with this DN belongs. The lpt_type is LPT_ISDN for ISDN BRCS, ISDN PODS, or shared analog lines:

RLrt_dntran.lpt_type is LPT_ISDN if:
RLfc_porttyp.servclass == FC_ISDN or
RLfc_porttyp.servclass == FC_ISATND or
RLfc_porttyp.sh_analog == DBYES.

Otherwise:
RLrt_dntran.lpt_type == LPT_OTHER.

If this is an ISDN BRCS, ISDN PODS or ISDN-analog line, then RLrt_dntran.lpt_type must be LPT_ISDN and the portname is that of ISDN lead port or shared analog portname.

**Attribute:**
ltm_type
**Fullname:**
the type of logical termination index
**Attribute Description:**
Indicates the LTM_IDX type to which the ltm_idx value associated with this DN belongs.

RLrt_dntran.ltm_type is LTM_ISDN if
1) this is a primary DN on a DSL
(RLis_line.primary is DBYES and
RLis_term.cprtyp is IS_TYPEA, IS_TYPEB, IS_TYPEC,
IS_TYPED, IS_TYPEE, or IS_TYPATT) , or
2) this is the primary DN of a shared analog line

**Copyright © 1999 Lucent Technologies** 

```
   (RLfc_porttyp.sh_analog is DBYES) or
3) it is a secondary-only DN (RLis_line.primary is DBNO).

If this is an ISDN DSL or a shared analog line,
or a secondary-only DN
then RLrt_dntran.ltm_type must be LTM_ISDN and
the portname is that of ISDN lead DSL port or
the shared analog portname.

Otherwise RLrt_dntran.ltm_type must be LTM_OTHER.

If set to LTM_ISDN, RLis_line will be populated with key
RLrt_dntran.portname.module and RLrt_dntran.ltm_idx

For the following case,
ltm_type = LTM_OTHER and ltm_idx = 0

1) rt_dntran.ucd_muph is DBYES, this indicates a UCD,
   MUPH, or ISAT subgroup DN, or a MP access DN.
2) rt_dntran.termname is RTTC_AGING, this indicates
   a CKT TN is on intercept without a port.
3) rt_dntran.servclass is FC_ISDN and RLis_term.cpetyp
   is not IS_TYPEA, IS_TYPEB, IS_TYPEC, IS_TYPED, IS_TYPEE
   or IS_TYPATT.
```

**Attribute:**

lport

**Fullname:**

logical port

**Attribute Description:**

```
Logical port which is a sequential number of physical
ports when they are assigned. The lport is preserved
during office growth or office ODD reprocessing.

if ( RLrt_dntran.portname.member > #GLNULPORT )
then RLrt_dntran.lport = RLfc_line.lport
else RLrt_dntran.lport = 0

If RLrt_dntra.ltsb_pt equals DBYES then RLrt_dntra.portname
is a LTSB port (1-TN and 2-TN).

The range in this relation depends upon the portname.module
SM type.  For an SM related DNs, the lport ranges from
0 to 8191.  For SM-2000 related DNs, the lport depends on the
lpt_type.  For LPT_OTHER, SM-2000 lports range from 0 to 65531.
For other lpt_types, SM-2000 lports range from 0 to 8191.
```

**Attribute:**

ltm_idx

**Fullname:**

logical termination index

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

A RC/ODA assigned ltm_idx value. The
name.module, ltm_type, and ltm_idx values are used as
key values lead_module, ltm_type, and ltm_idx,
respectively to access RLdn_feats. If ltm_type
is LTM_ISDN, name.module and ltm_idx are also used
as key values lead_module and ltm_idxi respectively to
access relations such as RLis_line, RLshterm,
etc. Refer to text under ltm_type poprules
to determine when to use an LTM_ISDN ltm_idx value.
See RLrc_qidx for rules for assigning
the value. When ltm_type is LTM_ISDN then
RLis_line requires a tuple keyed by
lead_module and ltm_idx.
An ltm_type of LTM_OTHER and a non-zero value
is required when 1) the ltm_type is not LTM_ISDN
and 2) it is not one of the zero cases as described
in the text under ltm_type.

This index is a sequential
number assigned to correspond to the DN of this
relation. The ltm_idx is preserved during office growth
or offline ODD reprocessing.

If ltm_type is LTM_ISDN,
new DNs will be assigned values from the lowest
available RLrc_qidx(portname.module).ltm_idxi attribute
or holes from deleted ltm_idx entries. See
RLrc_qidx.index and RLrc_qidx.succ. ltm_idx will exist
as the key in RLis_line with RLis_line.lead_module =
portname.module and RLis_line.ltm_idx = ltm_idx.
If RLis_line.primary = DBYES, then
a RLfc_line tuple exists where RLfc_line.ltm_idx =
RLrt_dntran.ltm_idx and RLfc_line.ltm_type = LTM_ISDN.
The keys to the RLfc_line tuple are port =
RLrt_dntran.portname and party = RLrt_dntran.term_name

If ltm_type is LTM_OTHER and requires a non-zero ltm_idx
(refer to ltm_type poprules for the zero cases), then
new DNs will be assigned values from the lowest
available RLrc_qidx(portname.module,LTM_IDXO).ltm_idxo attribute
or holes from deleted ltm_idx entries. See
RLrc_qidx(module, LTM_IDXO, qid).index and RLrc_qidx.succ
Also, a RLfc_line tuple exists where RLfc_line.ltm_idx =
RLrt_dntran.ltm_idx and RLfc_line.ltm_type = LTM_OTHER.
The keys to the RLfc_line tuple are port =
RLrt_dntran.portname and party = RLrt_dntran.term_name

NOTE: the ltm_idx is also assigned to MLHG members
and trunk members. If a MLHG or trunk member,
ltm_idx = RLgroup_port(portgrp,member).ltm_idx.
See RLgroup_port population rules under attribute ltm_idx.

NOTE: the ltm_idx is also associated with CA-ICOM CAs.

Copyright © 1999 Lucent Technologies 

Each CA-ICOM CA will have a tuple in is_line keyed
by the ltm_idx & lead port. A CA-ICOM CA does not
have a associated DN, so there will not be a DNtran tuple
for it. However there is a entry in the icm_term relation
that links the lports. See is_line & icm_term checks.

NOTE: when the DN is a multiple DN that terminates to
the same port (one found in relation RLrc_multidn and
is not RLfc_line.locdn), then the ltm_type and ltm_idx
values are the same those found in
RLrt_dntran.(RLfc_line.locdn).

Note: Attribute ltm_idx has a domain range of 0-8191
for an SM and 0-65531 for SM-2000. The range in this
relation depends upon the portname.module SM type. For
an SM related DNs, ltm_idx range is 0-8191. For
SM-2000 related DNs, ltm_idx range is 0-65531.
As discussed in RLrc_qidx, the existence of an
index implies the value 1 or greater.

Note: If RLrt_dntra.ltsb_pt equals DBYES then RLrt_dntra.portname
is a LTSB port (1-TN and 2-TN).

**Attribute:**
no_hunt
**Fullname:**
indicates if this is a no_hunt DN entry to a hunt group member
**Attribute Description:**
If DBYES then calls to this DN should only terminate to
the equivalent hunt group member, not hunt to other hunt
group members.

Dependency: If nohunt is DBYES, then termclass must be
RTTC_PORTGRP, RTTC_INWATS, RTTC_INDIVID, or RTTC_AGING.
The group DN of a multiline hunt group must always
have nohunt set to DBNO. For RTH_UCD, RTH_LGUCD,
RTH_ISAT, if nohunt = DBYES then
ucd_muph should be set to DBNO (that is when ucd_muph
is DBYES, this is the group DN).
For members of a multiline hunt group to
have a nonhunt dn, the hunt group must have a hunt
type of either RTH_CIRCULAR, RTH_REGULAR, RT_UCD, RTH_LGCIR,
RT_LGUCD, RTH_ISAT, or RTH_LGREG in RLrt_mhg.

**Attribute:**
mdn_depend
**Fullname:**
indicates if this is a dependent DN of a multiple DN
**Attribute Description:**
indicates a dependent DN for Multiple DNs.
Multiple DNs may exist on ISDN MLHG or Analog MLHG or individual

**Attribute:**

rdta_port

**Fullname:**

Implies tuple is an RPA RDTA TN and should route via TM routing.

**Attribute Description:**

The attribute is used to determine if the digits are associated with either a EDSL PRI or Pseudo-BRI RPA Remote Digital Test Access port that is defined in RLdn_rdta. If this attribute is DBYES then there must also be a tuple in RLdn_rdta for this noc and digits (noc must be converted into its corresponding nxx). The attribute is used by TM routing to route the call as a test line code to an RPA session. Both types of RPA ports will be populated ONLY on their designated routing module. See the previous distribution rules. Only option #1 applies to RPA ports.

## 5. RT_DNTRAN Population rules continued.

**Attribute:**

ind_inwats

**Fullname:**

indicates that a line is an individual INWATS line and is not part of a MLHG

**Attribute Description:**

If this line has a termclass of RTTC_INWATS and is not part of a MLHG, then the ind_inwats bit must be set to DBYES

**Attribute:**

client_typ

**Fullname:**

client TN type sent to message service center

**Attribute Description:**

Indicates the client TN type sent to the voice message system. With the introduction of ISVM in 5E7, message service center (MSC) can be categorized into eight types as follows:

| Basic/Deluxe | Screening | No-Screening |
|---|---|---|
| OCDN Option | 1B/1D | 3B/3D |

Copyright © 1999 Lucent Technologies

RDN Option 2B/2D 4B/4D
---

Note that B indicates 'Basic' and D indicates 'Deluxe'. 'Deluxe' means there is an AP or VM associated with the MSC. MSC types 1B and 1D are existing pre-5E7 MSCs. MSC types 2B, 3B, and 4B should be blocked because they will not be supported in 5E7.

If RLrt_dntran.client_typ is set to MSS_OCDN or MSS_RDN, then RLrt_dntran.no_hunt must be DBNO. In other words, if client TN type is specified, the DN must be hunted.

If RLrt_dntran.client_typ is set to MSS_OCDN or MSS_RDN, then must find the associated tuple in RLrt_mhg and make sure that RLrt_mhg.mdc is DBYES.

If RLrt_dntran.client_typ = MSS_RDN, then must find the associated tuple in RLmdc_grp and make sure that RLmdc_grp.ap_id must not equal 0. This is to block 2B or 4B type of MSCs.

If RLrt_dntran.client_typ = MSS_OCDN, then must find the associated tuple in RLmdc_grp and verify that RLmdc_grp.ap_id must not equal 0, provided that RLmdc_grp.msc_scrn equals DBNO. This is to block 3B type of MSC.

**Attribute:**
scp_alw
**Fullname:**
Service Control Point Messaging Allowed
**Attribute Description:**

## 4. Population Rules for RLrt_dtrtx

**Relation Description**
ISDN Data Route Index.

This relation is used to obtain the route index for ISDN circuit-switched data calls or speech calls. RTA normally gets the route index at the RT_SCRNING state from either the RT_SCRNING relation or from Digit Analysis and sends it to the RT_RTING state. However, in an ISDN data call or a speech call, the RT_SCRNING state will check the originating tcm.bear_cap for voice, data, or speech. If data or speech, the RT_DTRTING state will be called. RT_DTRTING will combine the original route index with the originating datarate (DBDATA_NULL for speech) to form the key to read this relation to get a 'new' route index. RT_DTRTING will then pass the 'new' route index to the RT_RTING state.

'Normal' route index leading to announcement trunk or OSPS trunk is not allowed to be populated in this relation.

The following paragraphs do not apply when the datarate is DBDATA_NULL. These checks and descriptions are only relevant to actual data datarates, not speech.

If a trunk group handling data at the rate requested does not exist, then no tuple for this rate will be populated in this relation causing a reorder on the call.

The following are guidelines for the toll network pertaining to the DAS (that is, the Digit Analysis dig_tree in the DA_DIGSTRT) and data rate relationship. These cannot be enforced by recent change or by ODA checks:

Copyright © 1999 Lucent Technologies 

All route indexes derived by a DAS of 82, 90, and 98 must have a DBDATA_56K tuple present in this relation. All route indexes derived by a DAS of 90, 92, and 98 must have a DBDATA_R64K tuple present in this relation. All route indexes derived by a DAS of 90, 91, and 98 must have a DBDATA_64K tuple present in this relation.

This relation will also be used for routing data calls to EDSL B channel trunks. This description applies to EDSL with the following exceptions: The route index for accessing the EDSL B trunk group is obtained from directory number relations (RLRTDNMOD in the RT_PREDNTRAN state, or RLRT_SPECRI in the RT_POST_DNTRAN state), or screening, or digit analysis. In this state(s) RTA will combine the datarate with the original route index and go to the RT_DTRTING state. This data routing state will then pass the 'new' data route index to the RT_RTING state.

The trunk group associated with this new route index is the group designated to handle data calls at the rate requested. That is, except for CCS and EDSL B trunks the 'datarate' attribute of each trunk member of that trunk group should be the same as the rate requested. These data trunks must be segregated from voice trunks. There may exist up to three tuples in this relation per 'normal' route index. These three tuples are for 56kb/s, restricted 64kb/s and 64kb/s trunk groups.

Trunks connecting *5ESS*®-2000 switch offices and using CCS signaling or EDSL need not be segregated data trunks but can carry voice or data. In this case, the 'normal' route index will be the same as the 'new' data route index. Furthermore, such trunks with CCS signaling can handle traffic at subrates. If the datarate attribute of the trunk members of the trunk group pointed to by this 'new' data route index is 64k, then these trunks can also handle restricted 64k and 56k traffic. In addition, we can have up to three tuples, one for 56k, another for restricted 64k and the third one for 64k traffic. The trunk group pointed to by these tuples can have a higher datarate than that requested. All these three tuples will have the 'normal' route index the same as the 'new' data route index.

**Attribute: route_x**

**Fullname:** Route Index

**Attribute Description** This attribute represents the existing route index chosen based upon the screening and destination indexes or obtained from the Digit Analysis relations.

For EDSL B trunks, it represents the route index obtained from the directory number relations (RLrtdnmod, RLrt_specri), screening or Digit Analysis.

The chosen route index is restricted to those indexes whose trunk groups are interoffice trunks or EDSL B trunks.

**Attribute: datarate**

**Fullname:** Datarate

**Attribute Description** The data rate requested on a data call. It can be:

DATA_56K - for any trunk (segregated or not) able to carry 56 kb/s data calls.

DATA_R64K - for any trunk (segregated or not) able to carry restricted 64 kb/s data calls.

DATA_64K - for any trunk (segregated or not) able to carry 64 kb/s data calls.

DATA_NULL - for any trunk capable of carrying speech calls.

Refer to checks section of the data_rtx attribute for enforcement of correct datarate.

**Attribute: data_rtx**

Copyright © 1999 Lucent Technologies 

**Fullname:** New Data Route Index

**Attribute Description** This attribute indicates the new route index for data or speech calls at the specified rate.

A tuple with this attribute as key must exist in RLRT_ROUTING and the 'route_type' field in this tuple must be set to RTE_HUNT.

This tuple will also have its 'portgrp.grpnum' field designating the trunk group that will support the data or speech call at the specified data rate.

If the trunk is segregated for data and the datarate is not DATA_NULL, then the data route index, 'data_rtx', should not appear in any of the following:

RLrt_scrning, the Digit Analysis relations (RLdaprlfnl or RLdaprmfnl) or in the directory number relations (RLrtdnmod or RLrt_specri). If the trunk is using CCS signaling (if the out_sigtype is DBISUP7 or DBCCIS6 ) or if it is an EDSL B trunk group using both voice and data then the data route index 'data_rtx' may appear in any of the previous relations.

## 4. Population rules for RLrt_edn

### Relation Description

Alternate emergency DN terminating translations

Alternate emergency DN terminating translations.

**Attribute:**
dn
**Fullname:**
Terminating directory number
**Attribute Description:**
This attribute consists of the NOC (normalized office code) and four directory number digits.

**Attribute:**
dn.noc
**Fullname:**
Normalized office code
**Attribute Description:**
Normalized office code

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

dn.digits

**Fullname:**

Digits

**Attribute Description:**

The local dn minus the office code.

**Attribute:**

termclass

**Fullname:**

Termination class

**Attribute Description:**

The terminating class of service. Only the following termination classes are valid:

RTTC_INDIVID - individual line
RTTC_PARTY - party line

For Export, must be RTTC_INDIVID only.

**Attribute:**

deny_term

**Fullname:**

Denied termination

**Attribute Description:**

Deny termination. Line should not be allowed to receive calls.

If the line has circuit switching, default is DBNO; otherwise, default is DBYES.

**Attribute:**

portname

**Fullname:**

Portname

**Attribute Description:**

Defines the port. Divided into sub-attributes portname.member and portname.module. In each module, tuples exist only for directory numbers with line equipment numbers (LEN's) that physically exist on the module being considered. If the current module = X, then RLRT_EDN.portname.module = X (X can not identify a RSM or a module with the stand alone call processing option). If ltm_type is equal to LTM_ISDN, then the portname is that of ISDN lead port or the shared analog portname.

**Attribute:**

portname.member

**Fullname:**

Member

**Attribute Description:**

Port name of a port.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
portname.module
**Fullname:**
Module
**Attribute Description:**
The module number that terminates this port.

**Attribute:**
term_name
**Fullname:**
Terminating name
**Attribute Description:**
Must have the value FCP_INDI if the port is a member of a LINE SIDE Stand-Alone Announcement MLH group on a module that has the stand alone call processing option, that is the port points to a MLH group which is local to the module and the parameter GLsalgrp contains that MLH group number.

For servclass FC_ISDN, populate as follows:

```
if ( RLdslequip(portname).briclass == BRI_MP or
     RLdslequip(portname).briclass == BRI_STD)
then term_name is in {0 thru 7}
else term_name is FCP_INDI
```

For servclass TM_XDB, this is populated with FCP_INDI
For servclass FC_ISATND and cpetype IS_TYPATT,
this is populated with FCP_INDI.

If the dn is a multiple dn for a member of a multiline hunt group, the term_name must be the same as for the base dn for the multiline hunt group member that defined in RLfc_line.

**Attribute:**
calltrc
**Fullname:**
Call tracing indicator
**Attribute Description:**
Indicates if calls to thes dn should be traced.
This attribute should always be initialized to
DBNO, since traces require considerable resources.
The field may be updated by recent change on request.
If the tuple is for a multiple dn of a multiline hunt group, this attribute is defaulted to DBNO. This field may be updated by recent change on request for both the base dn or the multiple dn.

**Attribute:**
denybv
**Fullname:**

Deny busy verify capabilities indicator

**Attribute Description:**

Tells if the line has the busy verify service denied. If the dn is a multiple dn for a member of a multiline hunt group, the value of denybv is the same as that of the base dn. While the base dn of a multiline hunt group has multiple dns associated with it, the denybv field is not updatable by recent change.

**Attribute:**

ucd_muph

**Fullname:**

Uniform call distribution hunt group or multiposition hunt subgroup indicator

**Attribute Description:**

Indicates if this is either a UCD group DN, OR a MUPH subgroup DN (DBYES) or none of these (DBNO).
The attribute ucd_muph must always have the value DBNO.

**Attribute:**

mctran

**Fullname:**

Access RLrt_mctra indicator

**Attribute Description:**

Indicates if RLrt_mctr is to be accessed subsequent to reading this relation for private facilities feature (DBYES).
If mctran is DBYES, relation RLrt_mctr is to be read to get terminating sfg.
The attribute mctran must always have the value DBNO.

**Attribute:**

ltsb_pt

**Fullname:**

Line Time Slot Bridging port indicator

**Attribute Description:**

This attribute indicates whether or not this is an LTSB port.
Always set to DBNO in this relation (only used in RLrt_dntran).

**Attribute:**

lpt_type

**Fullname:**

Logical port type

**Attribute Description:**

Indicates the LPORT type to which the lport value associated with this DN belongs. The lpt_type is LPT_ISDN for ISDN BRCS, ISDN PODS, or shared analog lines:

**Copyright © 1999 Lucent Technologies** 

```
        lpt_type is LPT_ISDN if:
                RLfc_porttyp.servclass == FC_ISDN or
                RLfc_porttyp.servclass == FC_ISATND or
                RLfc_porttyp.sh_analog == DBYES.

        Otherwise:
                lpt_type == LPT_OTHER.

        If this is an ISDN BRCS, ISDN PODS or ISDN-analog
        line, then lpt_type must be LPT_ISDN and
        the portname is that of ISDN lead port or shared
        analog portname.
```

**Attribute:**
ltm_type
**Fullname:**
Logical termination index type
**Attribute Description:**

```
        Indicates the LTM_IDX type to which the ltm_idx value
        associated with this DN belongs.

        ltm_type is LTM_ISDN if
        1) this is a primary DN on a DSL
           (RLis_line.primary is DBYES and
           RLis_term.cprtyp is IS_TYPEA, IS_TYPEB, IS_TYPEC,
           IS_TYPED, IS_TYPEE, or IS_TYPATT) , or
        2) this is the primary DN of a shared analog line
           (RLfc_porttyp.sh_analog is DBYES) or
        3) it is a secondary-only DN (RLis_line.primary is DBNO).

        If this is an ISDN DSL or a shared analog line,
        or a secondary-only DN
        then ltm_type must be LTM_ISDN and
        the portname is that of ISDN lead DSL port or
        the shared analog portname.

        Otherwise ltm_type must be LTM_OTHER.

        For the following case,
        ltm_type = LTM_OTHER and ltm_idx = 0

        1) RLrt_dntran.portname.module = 0 and
           RLrt_dntran.portname.member = 0.
        2) RLfc_porttyp.servclass is FC_ISDN and RLis_term.cpetype
           is not IS_TYPEA, IS_TYPEB, IS_TYPEC, IS_TYPED, IS_TYPEE
           or IS_TYPATT.
```

**Attribute:**
lport
**Fullname:**
Logical port

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Logical port which is a sequential number of physical ports when they are assigned. The lport is preserved during office growth or office ODD reprocessing.

**Attribute:**
ltm_idx
**Fullname:**
Logical termination index
**Attribute Description:**
A RC/ODA assigned ltm_idx value. This index is a sequential number assigned to correspond to the DN of this relation. The ltm_idx is preserved during office growth or offline ODD reprocessing.

See RLrt_dntran.ltm_idx for more information.

**Attribute:**
no_hunt
**Fullname:**
No-hunt indicator
**Attribute Description:**
If DBYES then calls to this DN should only terminate to the equivalent hunt group member, not hunt to other hunt group members.

If nohunt is DBYES, then termclass must be RTTC_PORTGRP or RTTC_INWATS. The group DN of a multiline hunt group must always have nohunt set to DBNO. For RTH_UCD, RTH_LGUCD, RTH_ISAT, if nohunt = DBYES then ucd_muph should be set to DBNO (that is when ucd_muph is DBYES, this is the group DN). For members of a multiline hunt group to have a nonhunt dn, the hunt group must have a hunt type of RTH_CIRCULAR, RTH_REGULAR, RT_UCD, RTH_LGCIR, RT_LGUCD, RTH_ISAT, or RTH_LGREG in RLrt_mhg.

**Attribute:**
mdn_depend
**Fullname:**
Multiple DN dependent
**Attribute Description:**
Indicates a dependent DN for Multiple DNs with distinctive ringing. Always DBNO for ISDN lines.

**Attribute:**
mdn_rngpat
**Fullname:**
Multiple DN ringing pattern
**Attribute Description:**
Identifies type of Distinctive Ringing pattern associated with a

**Copyright © 1999 Lucent Technologies** 

master or dependent DN of a Multiple DN line.
MDN_DR_A is standard ringing (2 sec. on 4 sec. off).

**Attribute:**
pin4
**Fullname:**
Personal identification number digit
**Attribute Description:**
This is the most significant digit of a Binary Coded Decimal (BCD) Personal Identification Number (PIN). It is service order changeable only. The intent of the PIN is to provide each line in the office with a security code for services such as Remote Access Service (RAS) and Automatic Customer Station Rearrangement (ACSR).

Note: if any pin[] is specified, all pins[] must be specified by RC and ODA.
The default value '#' (11) indicates no PIN specified.

**Attribute:**
pin3
**Fullname:**
Personal identification number digit
**Attribute Description:**
This is one digit of a BCD PIN. It is service order changeable only. The intent of the PIN is to provide each line in the office with a security code for services such as RAS and ACSR. Note: if any pin[] is specified, all pins[] must be specified by RC and ODA.

**Attribute:**
pin2
**Fullname:**
Personal identification number digit
**Attribute Description:**
This is one digit of a BCD PIN. It is service order changeable only. The intent of the PIN is to provide each line in the office with a security code for services such as RAS and ACSR. Note: if any pin[] is specified, all pins[] must be specified by RC and ODA.

**Attribute:**
pin1
**Fullname:**
Personal identification number digit
**Attribute Description:**
This is one digit of a BCD PIN. It is service order changeable only. The intent of the PIN is to provide

**Copyright © 1999 Lucent Technologies** 

each line in the office with a security code for services such as RAS and ACSR. Note: if any pin[] is specified, all pins[] must be specified by RC and ODA.

**Attribute:**
rdta_port
**Fullname:**
Implies tuple is an RDTA TN.
**Attribute Description:**
This attribute is not used in RLrt_edn. It is only used in RLrt_dntran for the Remote Digital Test Access capability. This attribute should always be DBNO in this relation.

**Attribute:**
ind_inwats
**Fullname:**
indicates that this line is an individual INWATS line and is not part of a MLHG
**Attribute Description:**
If this line has a termclass of RTTC_INWATS and is not part of a MLHG then the ind_inwats bit must be set to DBYES

**Attribute:**
client_typ
**Fullname:**
Client TN type sent to message center.
**Attribute Description:**
Indicates the client TN type sent to the voice message system. This attribute is added to this relation just for keeping the data structure identical to that of RLrt_dntran. It always has a default value, since it will never be populated because it only applies to MLHGs & dependent DNs.

**Attribute:**
scp_alw
**Fullname:**
Service Control Point Messaging Allowed
**Attribute Description:**
This attribute will be used to indicate whether or not messages from Service Control Point may be received.

**Attribute:**
ncdt
**Fullname:**
NP - Non-Conditional 10-Digit Trigger for LRN
**Attribute Description:**
This attribute will be used to indicate whether or not the NP - Non-Conditional 10-Digit Trigger for LRN has been enabled

**Copyright © 1999 Lucent Technologies** 

for this DN.

**Attribute:**
ffcf1
**Fullname:**
boolean reserved for future field feature
**Attribute Description:**
boolean reserved for future field feature

**Attribute:**
ffcf2
**Fullname:**
Future field feature
**Attribute Description:**
Boolean reserved for future field feature.

**Attribute:**
ffcf3
**Fullname:**
boolean reserved for future field feature
**Attribute Description:**
boolean reserved for future field feature

**Attribute:**
vlr_sm
**Fullname:**
VLR SM for Wireless Centrex
**Attribute Description:**
This field is used only for the Wireless Centrex (WCTX) feature.
For non-WCTX, it must be set to the default value 0x0.

**Attribute:**
lrn_idx
**Fullname:**
Location routing number index
**Attribute Description:**
This attribute is a key into the RLlrntbl relation. It is used to
find the location routing number associated with this ported DN.

**Attribute:**
caseindex
**Fullname:**
Case Index
**Attribute Description:**
Index into the CALEA cases

Copyright © 1999 Lucent Technologies 

# RT_EMRNM

## 1. Description

Emergency directory number to local alternate.
This attribute corresponds to the dialed number for an emergency call.

## 4. Population Rules for RLrt_emrnm

**Relation Description**
Emergency Number.

This relation is used for emergency number dialing.

**Attribute: dmdn**

**Fullname:** Dialed Emergency Directory Number (DN)

**Attribute Description** This attribute corresponds to the dialed number for an emergency call. The attribute is either a specific directory number, or a range of directory numbers that need to have the same alternate routing destination during SM stand-alone operation. The alternate routing destination can be either a DN (attribute locdn), or a route index (attribute ri).

The dialed emergency directory number does not need to be a DN assigned in the local office.

Ranges of DNs are specified by entering the wild card digit '*' in the appropriate DN digit positions. The wild card digit will match any dialed digit at that position. A typical case where a range of DNs is used is when a group of inter-module trunk (IMTs) is being used as a backup alternate route

Copyright © 1999 Lucent Technologies 

during stand-alone operation. All or some set of dialed DNs may be rerouted to the group of IMTs by specifying the appropriate DN range with a route index (attribute ri) that points to the IMTs. It is important to note that IMTs can be exhausted quickly when standalone operation occurs.

Only the following digit expressions are valid for this dmdn attribute:

```
0                   Reroute calls destined for operator.
XXX                 Reroute three digit dialed calls
                    destined for a specific three digit
                    number (such as, 911, 411).
XXX-XXXX            Reroute seven digit dialed calls
                    destined for a specific DN.
XXX-XXX-XXXX        Reroute ten digit dialed calls
                    destined for a specific DN.
XXXXX-XXX-XXX-XXXX  Reroute fifteen digit dialed calls
                    destined for a specific DN.
XXX-XX**            Reroute seven digit dialed calls
                    destined for a specific hundreds group.
XXX-XXX-XX**        Reroute ten digit dialed calls
                    destined for a specific hundreds group.
XXX-****            Reroute seven digit dialed calls
                    destined for a specific office code.
XXX-XXX-****        Reroute ten digit dialed calls
                    destined for a specific office code.
***-****            Reroute seven digit dialed calls
                    destined for the home area code.
XXX-***-****        Reroute ten digit dialed calls
                    destined for a specific area code.
*-****-***-***-**** Reroute all calls destined for any
                    hundreds group, office code, and area code.
```

The actual digit 'X' and matching wild card digit '*' must be specified in the exact position, quantity, and sequence indicated here. In the event two or more entries match the dialed DN, precedence will be given according to the order of this list. The call will be rerouted to the alternate routing destination specified by the digit expression closest to the top of the list. When an exact match fails, partial matches (additional DB reads) are attempted to find a match with an entry containing wild card digits - first in the hundreds group, then in the office code, then in an area code, and lastly for all calls (15 wild card digits).

The following rule applies only to local SMs (not RSMs, ORMs, and TRMs) which do not have the stand-alone call processing option installed:

```
1. Routing to emergency directory numbers that terminate to
   lines on this module requires that these DNs be populated in
RLRT_EDN.
The maximum number of dialed emergency directory numbers
in the CMP is 500.  An SM with the stand alone
call processing option (Glsacp = DBYES) can have a
maximum of 500 emergency DNs. A non-SM-2000 SM without
the stand alone option can only have up to 10 emergency DNs.
An SM-2000 without the standalone option can have
up to 500 tuples.
```

**Attribute: dmdn.digcnt**

**Fullname:** Digit Count

Copyright © 1999 Lucent Technologies 

**Attribute Description** Used to count the number of digits dialed in an emergency call.

**Attribute: dmdn.dn**

**Fullname:** Dialed number

**Attribute Description** Dialed emergency number.

**Attribute: prefix**

**Fullname:** Prefix

**Attribute Description** The prefix attribute is the other key attribute. It represents the dialed prefix (0+, etc.) to the previous number.

**Attribute: type**

**Fullname:** Type

**Attribute Description** The type attribute identifies the type of port that terminates the emergency route. For a non-remoted module that does not have the stand-alone call processing option, the type attribute always indicates a line (TM_LINE). For the CMP, and all SMs, the type attribute indicates a line (TM_LINE) or a trunk (TM_TRK). If the rerouting is to a line, then the locdn attribute is retrieved. If the rerouting is to a trunk, then the routing index and outdmdn attributes are retrieved.

**Attribute: locdn**

**Fullname:** Local DN

**Attribute Description** The locdn attribute corresponds to a directory number for circuit switched voice and data services which the emergency call is rerouted to. The locdn attribute is only retrieved if the type attribute indicates 'line'. This attribute is populated only if the type attribute indicated 'line'.

The following rule applies only to the CMP:

(1) The DN specified by 'locdn' terminates to a line or trunk on any SM (local, or remote). It is recommended (but not required) that this SM not be the same SM that terminates the emergency DN specified in the key attribute 'dmdn'. In addition, it is recommended (but not required) that the routing module associated with 'locdn' not be the same routing module associated with the key attribute 'dmdn'.

The following rule applies only to RSMs:

(1) The DN specified by 'locdn' terminates to a line or trunk on this RSM or any other RSM in the same multi-module cluster.

The following rule applies only to non-RSMs which have the stand-alone call processing option:

(1) The DN specified by 'locdn' terminates to a line or trunk on this module.

The following rules apply only to non-RSMs which do not have the stand-alone call processing option:

Copyright © 1999 Lucent Technologies 

(1) The DN specified by 'locdn' terminates to a line on this SM. The characteristics of this line are defined in the population rules for the relation RLRT_EDN.

(2) For each RLRT_EMRNM tuple, the relation RLRT_EDN must contain a corresponding tuple with the key RLRT_EMRNM.locdn.

(3) The DN specified by 'locdn' may be the same as the emergency DN specified in key attribute 'dmdn'. This situation will occur if the emergency DN (that is, dmdn) terminates to a line on this SM and this line is of the type defined in the population rules for RLRT_EDN.

**Attribute: locdn.noc**

**Fullname:** Normalized Office Code (NOC)

**Attribute Description** NOC for the 'locdn'.

**Attribute: locdn.digits**

**Fullname:** Digits

**Attribute Description** 'locdn' digits.

**Attribute: ri**

**Fullname:** Route Index

**Attribute Description** The ri attribute corresponds to a routing index, used to reroute the emergency call over a trunk. This attribute is retrieved in conjunction with the outdmdn attribute only when the type attribute indicates 'trunk'.

**Attribute: outdmdn**

**Fullname:** Outpulsed Dialed Emergency Number

**Attribute Description** The outdmdn attribute corresponds to a main directory which is actually outpulsed over the trunk selected for the emergency call reroute. This attribute is retrieved in conjunction with the ri attribute only when the type attribute indicates 'trunk'. This attribute is populated only if the type attribute indicates 'trunk'.

If this attribute is not populated and the type attribute indicates 'trunk', the originally dialed DN (attribute dmdn) will be outpulsed over the trunk. An example is the case where an IMT is being used as the alternate route for a range of DNs (see description of attribute dmdn) and the dialed DN should be outpulsed over the IMT.

**Attribute: outdmdn.digcnt**

**Fullname:** Digit count

**Attribute Description** Outpulsed digit count.

**Attribute: outdmdn.dn**

**Fullname:** Dialed number

**Attribute Description** Outpulsed dialed number.

## 4. Population rules for RLrt_fixedri

**Relation Description**

Fixed route indices and associated charge indices
Defines fixed route indices for each call treatment type. These indices point to trunk groups which provide reorder/announcements, etc.

**Attribute:**

noc

**Fullname:**

Normalized office code (NOC)

**Attribute Description:**

Populated as zero except for automatic intercept system (AIS) operator calls, including 'ritypes' of RT_REGICPT, RT_DENIED, and RT_OOS. RT_BLANK can also have a zero NOC, but should also have entries in this relation, one per NOC, as populated in NOCCODE.

**Attribute:**

Copyright © 1999 Lucent Technologies

ritype

**Fullname:**

Call treatment type

**Attribute Description:**

For all 'ritypes' in RLtatype which are populated as DBNO for the attribute 'toneind', insert an entry into RLrt_fixedri, using 'ritype' and 'noc' as keys. As well, list terminal maintenance test enumerations that have been assigned route indices.

| RITYPE | Description |
|---|---|
| RT_SCD | Provides routing to a tone or announcement for calls blocked by selective carrier denial (SCD) screening which is a function of the selective carrier denial feature. |
| CC_CGC | Provides routing to a tone or announcement when a circuit group congestion (CGC) backward fail message is received on a common channel signaling (CCS) trunk. Required if the office has any RLFC_TRUNK tuple with 'in_sigtype' or 'out_sigtype' of DBTUP7 or DBISUP7. |
| CC_NNC | Provides routing to a tone or announcement when a national network (trunk) congestion message is received on a CCS trunk. Required if the office has any RLFC_TRUNK tuple with 'in_sigtype' or 'out_sigtype' of DBCCIS6, DBTUP7, or DBISUP7. |
| CC_SEC | Provides routing to a tone or announcement when a switching equipment congestion (SEC) backward fail message is received on a CCS trunk. Required if the office has any RLFC_TRUNK tuple with 'in_sigtype' or 'out_sigtype' of DBCCIS6, DBTUP7, or DBISUP7. |
| CC_SSI | Provides routing to a tone or announcement when a send special information tone (SIT) backward fail message is received on a CCS trunk. Required if the office has any RLFC_TRUNK tuple with 'in_sigtype' or 'out_sigtype' of DBTUP7 or DBISUP7. |
| DG_RESP | Provides routing to a transmission test facility (TTF) responder trunk group of logical test ports (LTPs) with a class of service of DGLTPTTF. This trunk group must be a different trunk group than that used for the DG_TGEN fixed route type. Required in all offices. |
| DG_TGEN | Provides routing to a TTF tone generator trunk group of LTPs with a class of service of DGLTPTTF. This trunk group must be a different trunk group than that used for the DG_RESP fixed route type. Required in all offices. |
| DN_RESP | Provides routing to a TTF responder trunk group of LTPs with a class of service of DN_ELS_TTF. This trunk group is used by the electronic loop segregation (ELS) testing. Required in all offices with RLCKTDATA |

**Copyright © 1999 Lucent Technologies** 

| | |
|---|---|
| | tuples with a type attribute equal to PCLCCOMDAC (equipped with a 4AC line unit). |
| FC_ANSTO | Provides routing to a tone or announcement for timeout waiting for answer on feature group B (FGB) or FGD-incoming (INC) calls. Required before carrier interconnect is activated in an office. |
| FC_DC_OFHK | Provides routing to a tone or announcement when no second start dial wink (SSD) has been received on a direct trunk from an inter-LATA carrier. Required before carrier interconnect is activated in an office. |
| FC_IEC_FAIL | Provides routing to a tone or announcement when a termination failure occurred during signaling. Required before carrier inter-connect is activated in an office. |
| FC_IV_NO_DIG | Provides routing to a tone or announcement for cases when an invalid number of digits has been received from an inter-LATA carrier. Required if the office has any RLFC_PORTTYP tuple with a class of service of FC_IEC. |
| FC_NO_ACK | Provides routing to a tone or announcement when no acknowledgement wink has been received from a carrier. Required before carrier interconnect is activated in an office. |
| FC_NO_SSD | Provides routing to a tone or announcement when no second start dial wink has been received from an international carrier. Required before carrier interconnect is activated in an office. |
| FC_NO_START | Provides routing to a tone or announcement when no start signal has been received from a carrier. Required before carrier interconnect is activated in an office. |
| FC_OS_ANI_TO | Provides routing to a tone or announcement when timeout waiting for automatic number identification (ANI) request from an operator facility. Required before carrier interconnect is activated in an office. |
| FC_SSD_OFHK | Provides routing to a tone or announcement when an offhook instead of a second start dial wink is received from a carrier. Required before carrier interconnect is activated in an office. |
| NM_EA1 | Provides routing to emergency announcement 1 for network management. Required if the office has an Engineering and Administrative Data Acquisition System (EADAS) LINK. |
| NM_EA2 | Provides routing to emergency announcement 2 for network management. Required if the office has an EADAS LINK. |
| NM_NCA | Provides routing to the national congestion announcement for network management. |

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | Required if the office has an EADAS LINK. |
| NM_DSNICA | Provides routing to the defense switched network (DSN) isolated codes announcement for network management. Required in all DSN offices (that is, when Gldsnopt equals DBYES). |
| RT_ACT_PROCERR | Provides routing to an announcement when the unidentified call rejection (UCR) activation code is dialed. |
| RT_BADDATA | Provides routing to tone or announcement. Used when routing could not be completed since bad (invalid data--static or dynamic) has been encountered by the routing software. Required in all offices. |
| RT_BLANK | Provides routing to tone or announcement for attempting to terminate to a vacant number. Populated one tuple per office NOC (when the NOC is non-zero). This is required in all offices. If the office has any RLfc_trunk.in_sigtype or out_sigtype of DBISUP7 a tuple is also required with a NOC of zero. |
| RT_CAC | Provides routing to a tone or announcement for invalid calls from charge-a-call line. Required in all offices. |
| RT_CMONI | Provides routing to a centralized automatic message accounting (CAMA) operator keying trunk group. Required if there is a service class of FC_CP_KEYING in RLFC_PORTTYP. |
| RT_DEAC_PROCER | Provides routing to an announcement when the UCR deactivation code is dialed. |
| RT_DENIED | Provides routing for attempted calls to lines denied termination. This termination may be to AIS or announcement. Required if a 'deny_term' attribute in RT_DNTRAN is DBYES. |
| RT_DENY_ORIG | Provides routing for attempted calls to lines which have the UCR feature assigned. UCR rejects calls originating which specify the call as private. Required for offices which purchase the UCR secured feature. This termination must be an announcement. |
| RT_HNPA | Provides routing for calls where the home numbering plan area (NPA) was dialed but is not allowed. Required when 'desttype' attribute is set to FCHNPA in RLDAPRMDGT. |
| RT_HOSTSA | A tuple in RT_FIXEDRI for RT_HOSTSA will route calls switched through the host 5ESS(R)-2000 switch to a stand-alone announcement (via a 13A announcement machine or equivalent) if a switching module (SM) or remote SM (RSM) required to route or terminate the call should happen to be in stand-alone. The tuple for RT_HOSTSA will point to a route index which in turn points to a trunk group containing the trunk port(s) of these host stand-alone announcements. |

For international, population with this 'ritype' will affect the system in the following way. A trunk group will be

Copyright © 1999 Lucent Technologies 

needed for the stand-alone announcement(s). This must be reflected in the following relations: RLfc_trunk, RLgroup_port, RLimtgrps, RLport_group, RLrctgrprk RLrc_trk, RLrt_routing, and RT_trkg. This trunk group will need a route index, which must be reflected in this relation (RLrt_fixedri), the RLrcrtirmk, and the RLrt_routing relations. Finally, a port member(s) will be needed. This must be reflected in the RLfc_anounce, RLfc_porttyp, RLfc_trunk, RLgroup_port RLport_group, and RLqkeyport relations, (RLqkeyport, since announcement trunks are rotate hunted).

The 'ritype' of 'RT_HOSTSA' is selected when the following conditions occur. When the host 5ESS(R)-2000 switch office has been engineered for a host stand-alone announcement, a call (either originated in the office or entering the office via trunk) desiring routing or termination on a module that is isolated from the rest of the host 5ESS(R)-2000 switch, will receive the fixed route type of 'RT_HOSTSA'.
The 'ritype' of 'RT_RSMSA' is selected when the following conditions occur. If a module with the stand-alone call processing option has been engineered for the stand-alone announcement, the following events will occur:

1. A call, originated in the module, and destined for termination outside of the module, will be checked for stand-alone emergency number treatment.
2. If the dialed number is not located in the RLrt_emrnm relation, it will be checked for stand-alone multi-line hunt group (MLHG) treatment.
3. If the dialed number is not located in the RLrtgrpdn relation, it will receive the fixed route type of 'RT_RSMSA'.

RT_INSID — Provides routing for coin calls where an insufficient initial coin deposit was made. Required for all offices equipped with a line unit or digital carrier line unit (DCLU).

RT_INV10XX — Provides routing for the following 10XXX dialing errors:
- An inter-exchange carrier ID was dialed on an international call.
- An international carrier ID was dialed on a U.S. call.

Required when RLDAPRLDGT contains any tuple with attribute row equal to FC_CARRIER.

RT_INVPIC — Provides routing to a tone or announcement when a presubscribed inter-exchange carrier (PIC) cannot be used to handle the type of call dialed. Required before carrier interconnect is activated in an office.

RT_INVDIG — Provides tone or announcement treatment

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | when invalid digits are dialed. The fixed route type is set to RT_INVDIG when an invalid digit string (containing a '#' or '') is received during digit reception on a line or trunk. Required in all offices. |
| RT_LCOP | Provides routing to a local coin overtime prompt. Required in all offices having either a line unit or DCLU. |
| RT_NO10XX | Provides routing to a tone or announcement when a call cannot be dialed with the 10XXX prefix. Required before carrier interconnect is activated in an office. |
| RT_NO911 | Provides tone or announcement for offices not having the 911 feature. Not currently used. |
| RT_NODLTN | Provides routing to a local overload/no resources available announcement. Indicates that no dial tone could be applied to an originating customer. Required in all offices. |
| RT_XMTR | Provides routing for calls when no transmitter (universal tone generator [UTG]) is available for outpulsing. Required in all offices. |
| RT_NWBLK | Provides routing for calls between two SMs when the path through the time multiplexed switch (TMS) is blocked. Required in all offices. When this relation is populated for an RSM and RITYPE is equal to RT_NWBLK, (all RSM-host time slots are busy), then route index (RI) should point to a trunk group, for an announcement or reorder on that RSM. |
| RT_OLSPD | Provides routing to a tone or announcement for 1+ calls from stations denied sent paid (direct distance dialing [DDD]) billing. Required for all Operator Services Position System (OSPS) offices. |
| RT_OOS | Provides routing to tone or announcement for calls terminating to out-of-service (OOS) lines, including those that are high-and-wet, disabled or family of equipment. It is recommended that this have an RI that has the 'route-type' populated in RLRT_ROUTING as RTE_BUSY. Populated one tuple per office NOC. Required in all offices. |
| RT_OVLD | Provides routing for calls denied due to overload conditions. Required in all offices. |
| RT_PDIAL | Provides partial dial tone or announcement routing. Required in all offices. |
| RT_PPBPC | Provides routing to an announcement when a precedence call with equal or higher precedence prevents (or blocks) a call from being completed. At least one tuple is required with this announcement type in all offices utilizing the automatic voice network (AUTOVON) interface capability. |
| RT_PPBPR | Provides routing to an announcement when a non-preemptable call prevents the completion of a precedence call. At least one tuple is required |

Copyright © 1999 Lucent Technologies 

| | |
|---|---|
| | with this announcement type in all offices utilizing the AUTOVON interface capability. |
| RT_PPNAV | Provides routing to an announcement when a call involving a non-AUTOVON user has been preempted so that a priority government call can be completed. At least one tuple is required with this announcement type in all offices utilizing the AUTOVON interface capability. |
| RT_PPUAP | Provides routing to an announcement when the caller is attempting to make a call with an unauthorized precedence level. At least one tuple is required with this announcement type in all offices utilizing the AUTOVON interface capability. |
| RT_PPVAC | Provides routing to an announcement when a call cannot be completed as dialed. At least one tuple is required with this announcement type in all offices utilizing the AUTOVON interface capability. |
| RT_PPPAL | Provides routing to an announcement when a call is blocked due to precedence access threshold limit exceeded. Required in AUTOVON interface or digital switched network (DSN) office using position acknowledgement timeout (PAT). |
| RT_PRMSIG | Provides permanent signal tone or announcement routing. Required in all offices. |
| RT_PFXERROR | Provides tone or announcement routing when the calling party dials a prefix when it should be omitted. Not currently used. |
| RT_MISRLRN | Provides tone or announcement routing when an ISUP Release Cause Code of 26 "Misrouted Call to a Portable Number" is received. If this fixed route type is not provisioned, RT_REORDER is used. |
| RT_REGICPT | Provides routing to tone or announcement for calls that should have regular intercept treatment applied. Populated one tuple per office NOC. Required in all offices having 'AGING' lines. |
| RT_REORDER | Provides routing to reorder. Required in all offices. |
| RT_REQ10XX | Provides routing to a tone or announcement when 10XXX has not been dialed but is required. Required before carrier interconnect is activated in an office. |
| RT_REVRBANN | Provides routing to a tone or announcement when an originating multi-party line is going to be rung back due to multi-party revertive ringing. This is available as part of the REA revertive announcement feature. |
| RT_REVOHANN | Provides routing to a tone or announcement when a terminating multi-party line goes offhook after being rung back due to multi-party revertive ringing. This is available as part of the REA revertive announcement feature. |
| RT_RSMSA | Population of this tuple is optional. A tuple in RT_FIXEDRI for RT_RSMSA |

Copyright © 1999 Lucent Technologies 

is required if the office contains any modules which are equipped with a stand-alone announcement provided by a 13A announcement machine. The tuple for RT_RSMSA will point to a route index which in turn points to a trunk group containing the trunk port(s) for this stand-alone announcement.
A tuple for RT_RSMSA is not required if no module in the office provides a 13A stand-alone announcement and, in particular, is not required if all the modules in the office which are supplying a stand-alone announcement are doing so via a line-side announcement machine.

For international, population with this 'ritype' will affect the system in the following way. A trunk group will be needed for the stand-alone announcement(s). This must be reflected in the following relations: RLfc_trunk, RLgroup_port, RLimtgrps, RLport_group, RLrctgrprk RLrc_trk, RLrt_routing, and RT_trkg. This trunk group will need a route index, which must be reflected in this relation (RLrt_fixedri), the RLrcrtirmk, and the RLrt_routing relations. Finally, a port member(s) will be needed. This must be reflected in the RLfc_anounce, RLfc_porttyp, RLfc_trunk, RLgroup_port, RLport_group, and RLqkeyport relations (RLqkeyport, since announcement trunks are rotate hunted).

The 'ritype' of 'RT_HOSTSA' is selected when the following conditions occur. When the host 5ESS(R)-2000 switch office has been engineered for a host stand-alone announcement, a call (either originated in the office or entering the office via trunk) desiring routing or termination on a module that is isolated from the rest of the host 5ESS(R)-2000 switch, will receive the fixed route type of 'RT_HOSTSA'.

The 'ritype' of 'RT_RSMSA' is selected when the following conditions occur. If a module with the stand-alone call processing option has been engineered for the stand-alone announcement, the following events will occur:

1. A call, originated in the module, and destined for termination outside of the module, will be checked for stand-alone emergency number treatment.
2. If the dialed number is not located in the RLrt_emrnm relation, it will be checked for stand-alone MLHG treatment.
3. If the dialed number is not located in the RLrtgrpdn relation, it will receive the fixed route type of 'RT_RSMSA'.

RT_RTGTRBL Provides routing to reorder or routing trouble announcement. Indicates that an

Copyright © 1999 Lucent Technologies 

internal software failure has occurred and the cause of the failure is indeterminate. In most instances, attempting the call later should result in a successful termination. Required in all offices.

RT_SSEA — Provides routing to tone or announcement for calls in which a special services access code was dialed and should not been dialed. Required in all offices.

RT_VACANT — Provides tone or announcement routing for vacant code calls. Required if RLDAPRMDGT has any tuple with a 'desttype' of FCVACANT.

RT_WATS_DENIED — Provides routing to tone or announcement for calls that are denied wide area telephone service (WATS) usage. Not currently used.

RT_OEAS_ERR — Provides routing to a tone or announcement when a call is routed to an OSPS using equal access signaling, but the carrier specified through the signaling cannot handle the call. Required if the office is an AT&T toll and assistance (T&A) OSPS office.

RT_DFLT_FAIL — Provides routing to reorder or announcements (error treatment) for denied calls (invalid digits dialed) made by the 'default' user in the multpoint-DSL and point-to-point DSL environment.

DESCRIPTION:
Defines the fixed route index type RT_DFLT_FAIL which specifies the fixed route index which points to the trunk group that provides error treatment of reorder/announcement cetera to the 'default' user in the multipoint digital subscriber line (MDSL) and point-to-point DSL environment.
If there exists a tuple in RLbfgmatch where RLbfgmatch.def_svc is DBYES, there must exist one tuple in RLrt_fixedri where RLrt_fixedri.ritype is RT_DFLT_FAIL. (This check is implemented in RLbfgmatch.)
QUANTITY OF TUPLES:
One tuple of type RT_DLFT_FAIL.
TUPLE SEMANTICS:
ritype - RT_DFLT_FAIL
ri - Assigned by office. This route index will point to a trunk group that provides the reorder or the announcement (could be a general/customized announcement) trunk group.
ci - Assigned by office.
noc - Zero.

RT_CWDBUSY — Provides routing for the Call Waiting Deluxe (CWD) Special Feature using CWD BUSY Announcement given by 13A or 14A. This will route to an idle port from a trunk group defined in the RLrt_trkg relation.

Copyright © 1999 Lucent Technologies 

```
RT_CWDHOLD      Provides routing for the Call Waiting Deluxe (CWD)
                Special Feature using CWD HOLD Announcement given by
                13A or 14A. This will route to an idle port from a
                trunk group defined in the RLrt_trkg relation.
RT_CWDREMDR     Provides routing for the Call Waiting Deluxe
                (CWD) Special Feature using CWD REMINDER
                Announcement given by 13A or 14A.  This will
                route to an idle port from a trunk group
                defined in the RLrt_trkg relation.
RT_CWDDFANC     Provides routing for the Call Waiting Deluxe
                (CWD) Special Feature using CWD DEFAULT
                Announcement given by 13A or 14A.  This will
                route to an idle port from a trunk group
                defined in the RLrt_trkg relation.

Valid Fixed Route Types, for LTD and TLWS Terminal Maintenance
---------------------------------------------------------------
ritype          Usage and Requirements
------          ----------------------
TM_BTBK         Provides routing to a TTF tone decoder
                during office-to-office testing of
                lines being transferred from a crossbar or
                ESS(TM) office to the 5ESS(R)-2000 switch office.
                The tone decoder is used to detect traffic busy or test
                blockage conditions on the line under test.
                Not required if the office has no lines or if
                the office being replaced is a step-by-step.
                switch; otherwise it is required.
TMTSTTK         Provides routing to first available member
                of a first in/first out (FIFO) hunted trunk
                group containing outgoing local test desk (LTD)
                test trunk circuits.  Used for line originated
                LTD call.  Refer to LTD population rules section.
        RLrt_fixedri (outgoing local test desk - OG LTD)
                fixed route TYPE = TMTSTTK
        DESCRIPTION:
        This relation specifies the route index which
        points to the trunk group for outgoing LTD
        connections.  Outgoing LTD trunks provide access
        to external test systems (LTD, mechanized loop
        testing [MLT], Fortel, etc.) for test calls
        initiated at the subscriber line.  This route
        index is applicable only for the OG LTD
        trunk group containing trunks within host
        office (non-remote) modules.
        Routing for OG LTD test calls are handled
        differently for remote modules (RSM, optically remote
        SM [ORM], two-mile ORM [TRM], multi-module RSM [MMRSM]
        cluster, etc.) than they are for modules within the host
        office.  This difference in handling is dictated by the
        lack of metallic linkage to the host office.  The three-digit
        or seven-digit OG LTD test code may be the same for the
        entire office, including remote the modules.  This test
        code will point to a fixed route type of TMTSTTK.  The
```

Copyright © 1999 Lucent Technologies 

route index associated with type TMTSTTK, however, will be applicable only to modules in the host office, and will point to the trunk group containing all OG LTD test trunks in the host office.
Each remote module/cluster which is not metallically linked to the host office must have its own outgoing LTD trunk group (containing one or more trunk members). The route index assigned to that trunk group must be unique from that associated with TMTSTTK. This route index must be populated in the parameter Glltdri for the remote module. When an OG LTD call is made using the access code, a check is made on the type of module from which the call originated. If it is a host office module, routing is done via rixed route type TMTSTTK. If it is a remote module, the code routes to the trunk group in the module via the route index contained in Glltdri.
Note that incoming LTD test trunks are not hunted and do not use route indices. Therefore this relation is not applicable for incoming LTD test trunk groups.
QUANTITY OF TUPLES:
One tuple is required in RLrt_fixedri for fixed route type TMTSTTK specifying the route index associated with the host office OG LTD trunk group.
TUPLE SEMANTICS:
RLrt_fixedri attributes should be populated as shown here. Any attribute not specified should be populated with the default value.

| | |
|---|---|
| noc | - Zero. |
| ritype (KEY) | - TMTSTTK. |
| ri | - Route index of host office OG LTD trunk group. |

| | |
|---|---|
| TM_CSTL | Provides routing to first available member of trunk group containing outgoing LTD test trunk circuits wired to the coin station test line (CSTL). Used for CSTL test calls originated from coin lines. Required in all offices having CSTL equipment. |
| TM_ICSRTT | Provides routing to the TTF touch tone test line circuit during operation test of subscriber touch tone pad. The touch tone test is used by two 5ESS(R)-2000 switch features, LTD and station ringer touch tone test. Required in all offices. |
| TM_CBAK | Provides routing to a callback trunk group of logical test ports with a service class of TM_CALLBACK. Required in all offices with integrated mechanized loop testing (IMLT)-2 and trunk and line work station (TLWS).<br>DESCRIPTION:<br>Defines the fixed route index type TM_CBAK which specifies the fixed route index which points to the callback trunk group of logical test ports with servclass TM_CALLBACK. This is required for IMLT-2 and TLWS callback connections. |

Copyright © 1999 Lucent Technologies 

QUANTITY OF TUPLES:
One tuple of type TM_CBAK.
TUPLE SEMANTICS:
ritype - TM_CBAK.
ri - Assigned by office. This route index must point to a trunk group of logical test ports that have a service class of TM_CALLBACK.
ci - Assigned by office.
noc - Zero.

TMAPT — Provides routing for outgoing operational test calls initiated from TLWS or by automatic progression testing (APT). Must route to a group of logical test ports in an SM containing a TTF. Required if the office wishes to run automatic progression tests on its trunks.

TMXMITRIISTF — Provides routing to a transmission test service of the integrated services test function (ISTF). Must route to a group of logical test ports in an SM containing a corresponding entry in RLrt_routing for this RI. The logical test port (LTP) tuples (RLfc_porttyp) must have the attribute servclass set to TM_ISTFXMIT. The 'ritype' TMXMITRIISTF is required if any ISTF transmit (XMIT) LTPs exist.

TMLBRIISTF — Provides routing to a test line service of the ISTF. Must route to a group of logical test ports in an SM containing a corresponding entry in RLrt_routing for this RI. The LTP tuples (RLfc_porttyp) must have the attribute servclass set to TM_ISTFLB. Unlike the XMIT LTPs, the line busy (LB) LTPs can be routed to via dialed digits or fixed RI routing. This 'ritype' is required if any ISTF LB LTPs exist.

TMINTIF — Provides routing for TLWS manual transmission connections. Required in offices with TLWS where TTF is standard equipment.

TMOGTRANS — Provides routing for outgoing transmission test calls initiated from the TLWS. Similar to TMAPT, and can use same RI.

TMICTC — Provides routing for incoming transmission test calls for common channel signaling (CCS) trunks. This fixed routing index should point to a trunk group of TM_ICTC LTPs (that is, RLrctgrprk.servclass equals TM_ICTC). The trunk group of LTPs used for incoming transmission test calls can be used for CCS and non-CCS calls.
The route type of the route index pointed to be this fixed route index in the RT_ROUTING relation should be RTE_HUNT. The route index is strictly used only for CCS calls.
This fixed routing index needs only to be populated for offices with CCS trunks.

TMS96CTST — Provides routing for TTF control port for SLC(R) 96 channel unit testing.

End of LTD and TLWS Fixed Routes

---

| | |
|---|---|
| CC_UIA | The unauthorized inward WATS (INWATS) announcement provides routing to a tone or announcement for an 800 service call at an originating screening office (OSO) for INWATS. It must point to reorder or to an announcement trunk group. The customer is connected to this announcement when the owner of the 800 number being called has not authorized toll free calls from the area code in which the call is being originated. This fixed route type will be required in all toll OSO offices for which destination type FCOSOIWTS is populated in DAPRMDGT. It is also required in the relation TATYPE. |
| CC_NCD | Provides routing to a tone or an announcement for network call denial (NCD). A customer is routed to this announcement when a database query discloses that the calling number is associated with a delinquent AT&T communications (AT&T-C) customer. It must point to an announcement trunk group. The relation TATYPE must include this fixed route type. This must be populated in all point of presence (POP) toll offices. |
| FC_EASMRT | Provides routing to a tone or an announcement for equal access signaling calls misrouted to a toll or AT&T-C switch from an end office or access tandem (calls with unexpected information digits and customer interactive dialing calls). It must point to an announcement trunk group. The relation TATYPE must include this fixed route type. This must be populated in all POP toll offices. |
| RT_ATCANIF | Provides routing to a tone or announcement for ALLIANCE(R) teleconferencing capability for calls experiencing ANI failure. The Telephone Company Administration (TCA) may choose to send it to an announcement or reorder tone on 13A announcement unit. The tuple for RT_ATCANIF will point to a route index which in turn will point to a trunk group containing the trunk port. Required when 'desttype' attribute is set to FCADDON or FCMEETME in RLDAPRMDGT. |
| RT_ATCINT | Provides routing to an intercept announcement for ALLIANCE(R) teleconferencing capability. The exact treatment will be provided by the TCA, but it is expected that they would be routed to an announcement provided by the 13A announcement unit. The tuple for RT_ATCINT will point to a route index which in turn will point to trunk group containing the trunk port. Required when 'desttype' attribute is set to FCADDON or FCMEETME in RLDAPRMDGT. |
| RT_DFLTRT | Provides routing to announcement for |

Copyright © 1999 Lucent Technologies 

Special Feature ASP Default Routing for
3/6/10-Digit Triggers.
The exact treatment will be provided by the
TCA, but it is expected that they would be
routed to an announcement provided by the 13A
announcement unit. The tuple for RT_DFLTRT will
point to a route index which in turn will point
to trunk group containing the trunk port. Required
when 'dfltrt' attribute is set to DFLT_ANNC
in RLDAPRMFNL or RLDAPRLFNL.

Valid Fixed Route Types, for DSU2-RAF/SAS

| ritype | Usage and Requirements |
|---|---|
| RT_EISOSPS | Population of this tuple is optional. Provides routing to OSPS listing services announcements given by the digital service unit model 2 (DSU2)-recorded announcement function (RAF) or SAS. This will route via trunk hunt mechanisms to an idle RAF/SAS port from a group defined in RT_TRKG. This trunk group must be defined as an RAF/SAS announcement group. This fixed route index is mapped to a unique route index for this RAF/SAS application. The route index is mapped to a unique trunk group for this RAF/SAS application. The fixed route index, route index, and trunk group are unique for the application and cannot be used by other applications. However, the FC_RAFANNC service class may be used by more than one application. Each application must have its own trunk group defined, along with a way to route to it. Application check is enforced in RLrt_routing. |
| RT_OSPSDA | Population of this tuple is optional. Provides routing to OSPS directory assistance announcements given by the DSU2-RAF/SAS. This will route via trunk hunt mechanisms to an idle RAF/SAS port from a group defined in RT_TRKG. This trunk group must be defined as an RAF/SAS announcement group. This fixed route index is mapped to a unique route index for this RAF/SAS application. The route index is mapped to a unique trunk group for this RAF/SAS application. The fixed route index, route index, and trunk group are unique for the application and cannot be used by other applications. However, the FC_RAFANNC service class may be used by more than one application. Each application must have its own trunk group defined, along with a way to route to it. Application check is enforced in RLrt_routing. |
| RT_OSPSCOIN | Provides routing to OSPS coin announcements given by the DSU2-RAF/SAS with coin tone receivers (DSU2-RAF-COIN). This will route via trunk hunt mechanisms to an idle RAF/SAS port from a group |

| | |
|---|---|
| | defined in RT_TRKG. This trunk group must be defined as a RAF/SAS announcement group. Required in all OSPS offices having DSU2-RAFs/SASs with coin tone receivers with Glospsta equal to DBYES and Glacts equal to DBYES. This fixed route index is mapped to a unique route index for this RAF/SAS application. The route index is mapped to a unique trunk group for this RAF/SAS application. The fixed route index, route index, and trunk group are unique for the application and cannot be used by other applications. However, the FC_RAFCTR service class may be used by more than one application. Each application must have its own trunk group defined, along with a way to route to it.<br>Application check is enforced in RLrt_routing. |
| RT_OSPSAOC | Provides routing to OSPS more efficient call handling (MECH) announcements given by DSU2-RAF-COIN and DSU2-RAF-DTA RAFs/SASs. This will route via trunk hunt mechanisms to an idle RAF/SAS port from a group defined in RT_TRKG. This trunk group must be defined as a RAF/SAS announcement group. Required in all OSPS offices having DSU2-RAFs/SASs with coin tone receivers or tone decoders with Glospsta equal to DBYES and Glmecfw greater than zero.<br>No application check is enforced in RLrt_routing. |
| RT_OSPS_ACCS | Provides routing to OSPS automated calling card service announcements given by the DSU2-RAF/SAS with the dial-through-announcement capability. Required in all OSPS offices (if office parameter Glospsta is equal to DBYES). This trunk group must be defined as a DSU2-RAF dial through announcement (DTA) or SAS group. This fixed route index is mapped to a unique route index for this RAF/SAS application. The route index is mapped to a unique trunk group for this RAF/SAS application. The fixed route index, route index, and trunk group are unique for the application and cannot be used by other applications. However, the FC_RAFDTA service class may be used by more than one application. Each application must have its own trunk group defined, along with a way to route to it.<br>Application check is enforced in RLrt_routing. |
| RT_NSANNC | Provides routing to network services - PVN announcements given by the DSU2-RAF-DTA or SAS. This will route to an idle RAF/SAS port from a trunk group defined in the RLrt_trkg relation. This trunk group must be defined as DSU2-RAF-DTA or SAS. |
| RT_ACSR | Provides routing to automatic customer station rearrangement announcements given by the |

Copyright © 1999 Lucent Technologies 

```
                DSU2-RAF-DTA or SAS.  This trunk group must be defined
                as a DSU2-RAF/SAS group.  That is, RLrt_trkg.type
                must equal RTRAF for this trunk group.
                Application check is enforced in RLrt_routing.
                DESCRIPTION:
                Defines the fixed route index type RT_ACSR
                which specifies the fixed route index which
                points to the trunk group that provides ACSR
                announcements given by the DSU2-RAF/SAS. This group
                must be a DSU-RAF/SAS trunk group. That is
                RLrt_trkg.type must equal RTRAF for this trunk
                group.
                QUANTITY OF TUPLES:
                One tuple of type RT_ACSR.
                TUPLE SEMANTICS:
                ritype  - RT_ACSR.
                ri      - Assigned by office.  This route index will
                          point to a trunk group that provides ACSR
                          announcements given by the DSU2-RAF/SAS.
                ci      - Assigned by office.
                noc     - Assigned by office.
RT_SLE          Provides routing to local area signaling service
                (LASS) screen list editing (SLE) announcements given
                by the DSU2-RAF-DTA or SAS.  This trunk group must be
                defined as a DSU2-RAF/SAS group.  The RLrt_trkg.type
                must be equal to RTRAF for this trunk group.
                DESCRIPTION:
                Defines the fixed route index type RT_SLE which
                specifies the fixed route index which points to
                the trunk group that provides SLE announcements
                given by the DSU2-RAF/SAS.  This group must be a
                DSU-RAF/SAS trunk group.  That is RLrt_trkg.type
                must equal RTRAF for this trunk group.
                QUANTITY OF TUPLES:
                One tuple of type RT_SLE.
                TUPLE SEMANTICS:
                ritype  - RT_SLE.
                ri      - Assigned by office.  This route index will
                          point to a trunk group that provides SLE
                          announcements given by the DSU2-RAF/SAS.
                ci      - Assigned by office.
                noc     - Assigned by office.
RT_ALSLE        Provides routing to LASS Screen List
                Editing announcements given by the
                DSU2-RAF DTA. This trunk group must be
                defined as a DSU2-RAF group.
                The RLrctgrprk.servclass must be equal to
                FC_RAFDTA for this trunk group.
                 DESCRIPTION:
                        Defines the fixed route index type RT_ALSLE
                        which specifies the fixed route index which
                        points to the trunk group that provides SLE
                        announcements in an alternate language given
                        by the DSU2-RAF . This group must be a DSU2-RAF
```

```
                    trunk group. That is RLrctgrprk.servclass must
                    be equal to FC_RAFDTA for this trunk group.
                 QUANTITY OF TUPLES:
                    1 tuple of type RT_ALSLE
                 TUPLE SEMANTICS:
                    ritype - RT_ALSLE
                    ri - assigned by office. This route index will
                         point to a trunk group that provides SLE
                         announcements given by the DSU2-RAF.
                    ci - assigned by office
                    noc - assigned by office
RT_2LEVEL        Provides routing to 2-Level automatic callback
                 (AC)/customer originated trace (COT) announcements
                 given by the DSU2-RAF-DTA or SAS.  This trunk group
                 must be defined as a DSU2-RAF/SAS group.  The RLrt_trkg.
                 type must be equal to RTRAF for this trunk group.
                 DESCRIPTION:
                 Defines the fixed route index type RT_2LEVEL which
                 specifies the fixed route index which points to the
                 trunk group that provides 2LEVEL announcements given
                 by the DSU2-RAF/SAS.  This group must be a DSU-RAF/SAS
                 trunk group.  That is RLrt_trkg.type must equal RTRAF
                 for this trunk group.
                 QUANTITY OF TUPLES:
                 One tuple of type RT_2LEVEL.
                 TUPLE SEMANTICS:
                 ritype  - RT_2LEVEL.
                 ri      - Assigned by office.  This route index will
                           point to a trunk group that provides 2LEVEL
                           announcements given by the DSU2-RAF/SAS.
                 ci      - Assigned by office.
                 noc     - Zero.
RT_AL2LVL        Provides routing to 2-Level AC/COT
                 announcements given by the DSU2_RAF DTA.
                 This trunk group must be defined as a
                 DSU2-RAF group. The RLrctgrprk.servclass must be
                 equal to FC_RAFDTA for this trunk group.
                  DESCRIPTION:
                 Defines the fixed route index type RT_AL2LVL which
                 specifies the fixed route index which points to the
                 trunk group that provides 2LEVEL announcements in an
                 alternate language given by the DSU2-RAF. This group
                 must be a DSU2-RAF trunk group.
                 That is the RLrctgrprk.servclass must be equal to
                 FC_RAFDTA for this trunk group.
                  QUANTITY OF TUPLES:
                    1 tuple of type RT_AL2LVL
                  TUPLE SEMANTICS:
                    ritype - RT_AL2LVL
                    ri - assigned by office. This route index will
                         point to a trunk group that provides
                         2LEVEL announcements given by the
                         DSU2-RAF.
                    ci - assigned by office
```

                        noc - 0
RT_TOLL_ACCT    Provides routing to a 5E Toll Account Code SAS
                dial-through-announcement (NOTE: Not DSU2-RAF).
                This will route to an idle SAS port from a trunk
                group defined in the RLrt_trkg relation. The
                RLrt_trkg.type must equal RT_RAF for SAS.
                 QUANTITY OF TUPLES:
                        1 tuple of type RT_TOLL_ACCT
                 TUPLE SEMANTICS:
                        ritype - RT_TOLL_ACCT
                        ri - assigned by office. This route
                             index will point to a trunk group
                             that provides Account Code announcement
                             given by SAS. (Route Index)
                        noc- 0
-------------------------------------------------------------------
End of DSU2-RAF/SAS Fixed Routes
-------------------------------------------------------------------
RT_RASI         Provides routing for the Remotes Access to
                Advanced Service Interface (RASI) feature
                using existing announcements given by the
                DSU2-RAF-DTA.
                This will route to an idle RAF port from a
                trunk group defined in the RLrt_trkg relation.
                This trunk group must be defined as a DSU2-RAF
                DTA.
                NOTE: Routing to an announcement is also provided
                with this type.  This will be used when routing
                to the DSU2-RAF needs to be disabled in order
                to disable RASI.
```

**Attribute:**

ri

**Fullname:**

Route index

**Attribute Description:**

Populate attribute based upon treatment type and trunk group number providing the specified treatment. Route index to trunk group translation can be found in relation RT_ROUTING.

When the ri attribute is non-zero, the route index must be assigned in the routing relation. In addition, if the route index is for one of the intercept treatment types (RT_BLANK, RT_DENIED, RT_OOS, or RT_REGICPT) and has a trunk group assigned to it, then the trunk group must be consistent with that treatment type. This means that the trunk group can not be one of the following types: RTMLHG, RTINCOM, RTISDNLK, RTTMGRP. Usually, these intercept treatment types are assigned to RIs that translate to announcement trunks.

When the NOC is nonzero, the RI(s) specified for AIS are normally translated in relation RT_ROUTING with prefix digits of 0, 1, 3 respectively for ritypes of RT_BLANK, RT_OOS, and RT_REGICPT. This is an option

**Copyright © 1999 Lucent Technologies** 

and should not be enforced, however, this information may be used for documentation purposes.

**Attribute:**
ci
**Fullname:**
Charge index
**Attribute Description:**
Populate as specified in CHRGIDXEXP.

**Defines:**
"db/DMtreat.h"

## 4. Population Rules for RLrt_gpsf

**Relation Description**
This relation associates a trunk group with its simulated facility group through a routing index.

This relation associates a trunk group with its Simulated Facility Group (SFG) through a routing index. Tuples of this relation are populated when an incoming CCSA, ESSX SFG, or EON SFG is needed to terminate to members of this trunk group.

**Attribute: grpnum**

**Fullname:** the group number of this trunk group

**Attribute Description**
Verify existence of tuple in RLrt_trkg such that

Copyright © 1999 Lucent Technologies

```
key rlRT_TRKG.grpnum   = grpnum
rlRT_TRKG.term_sfg = term_sfg.
```

**Attribute: mc_ri**

**Fullname:** SFG route index

**Attribute Description** Route index. This route index leads to the incoming ESSX simulated facility group. If rlRT_GPSF.mc_ri > 0, verify existence of tuple in RLrt_mcrt such that: key rlRT_MCRT.mc_ri = mc_ri and rlRT_MCRT.route_type = RTE_SFG. Also verify existence of tuple in RLrt_tgid such that: key rlRT_TGID.tgid = tgid and rlRT_TGID.term_mcri = mc_ri.

**Attribute: tgid**

**Fullname:** terminal group id

**Attribute Description** If tgid is greater than zero, then verify that rlRT_GPSF.term_sfg = DBYES, and there is at least one tuple in RLdn_feats such that RLdn_feats.tgid = RLrt_gpsf.tgid.

**Attribute: term_sfg**

**Fullname:** terminal Simulated Facility Group (SFG)

**Attribute Description** Indicates if a simulated facility is needed to enter the terminal group using this (key) trunk group. If this tuple is populated then term_sfg must be DBYES. An SFG is needed when term_sfg = DBYES. If DBYES then mc_ri and/or ccsa_termri > 0.

**Attribute: ccsa_termri**

**Fullname:** the CCSA MFC route index

**Attribute Description** MFC feature route index for CCSA. If ccss_termri > 0, verify that a RLrt_mcrt exists such that: key rlRT_MCRT.mc_ri = rlRT_GPSF.ccsa_termri, and rlRT_MCRT.route_type == RTE_SFG.

**Attribute: count**

**Fullname:** count

**Attribute Description** Indicates the number of trunk group members that have terminal group features assigned for this trunk group and terminal group ID equal to tgid.

**Attribute: eon_mcri**

**Fullname:** the EOLN base MFC route index

**Attribute Description** This attribute contains a base MFC route index that leads to an EON SFG when it is added with an EOLN service index from the other relation. SFID218 must be active before this attribute is populated with a non default value.

# RT_LAPD

## 1. Description

This relation contains the lapd parameters and timer values for layer 2 data links for TR303 RTs. It Also contains leaky bucket timers and thresholds for EOC/TMC path switching, and provisioning masks.

## 2. Data Dictionary Values

## 4. Population Rules for RLrt_lapd

**Relation Description**
Layer 2 LAPD parameters and EOC/TMC path switching leaky bucket timers and thresholds.

This relation defines the layer 2 LAPD parameters that are used for both the EOC and TMC on TR303 remote terminals (RTs). The leaky bucket timers and thresholds for EOC/TMC path switching are also included.

**Attribute: rtname**

**Fullname:** TR303 Remote Terminal Circuit Name

**Attribute Description** This is the internal circuit name for a TR303 RT.

**Attribute: t200**

**Fullname:** Layer 2 Acknowledgement Timer

**Attribute Description** This is the layer 2 acknowledgement timer.

**Attribute: n200**

**Fullname:** Layer 2 Retransmission Threshold

**Attribute Description** This is the layer 2 retransmission threshold

**Attribute: k**

**Fullname:** Layer 2 Window Size

**Attribute Description** This is the layer 2 window size.

**Attribute: sap0n201**

**Fullname:** SAPI0 Maximum I-field Size

**Attribute Description** This is the maximum I-field size for SAPI0.

**Attribute: sap1n201**

**Fullname:** SAPI1 Maximum I-field Size

**Attribute Description** This is the maximum I-field size for SAPI1.

**Attribute: t203**

Copyright © 1999 Lucent Technologies 

**Fullname:** Link Assurance Timer

**Attribute Description** This is the link assurance timer.

**Attribute: dmres_thr**

**Fullname:** Disconnected Mode (DM) Response Threshold

**Attribute Description** This is the leaky bucket threshold for the DM response error type.

**Attribute: dmres_time**

**Fullname:** Disconnected Mode (DM) Response Timer

**Attribute Description** This is the leaky bucket timer for the DM response error type.

**Attribute: dlres_thr**

**Fullname:** Data Link (DL) Resets Threshold

**Attribute Description** This is the leaky bucket threshold for the DL resets error type.

**Attribute: dlres_time**

**Fullname:** Data Link (DL) Resets Timer

**Attribute Description** This is the leaky bucket timer for the DL resets error type.

**Attribute: infra_thr**

**Fullname:** Invalid Frame Threshold

**Attribute Description** This is the leaky bucket threshold for the invalid frame error type.

**Attribute: infra_time**

**Fullname:** Invalid Frame Timer

**Attribute Description** This is the leaky bucket timer for the invalid frame error type.

**Attribute: pvmask1**

**Fullname:** Provisioning Mask, First 1024 Ports

**Attribute Description** This mask is used by the TR303 RT provisioning process to determine if a port needs to be provisioned on the RT. The masks pvmask1 and pvmask2 represent the 2048 ports that the RT might use for analog or D-channel ports. The mask pvmask1 represents the first group of 1024 ports associated with the RT, with each bit in the mask representing a group of 32 ports, that is, bit 0 is for physical channel unit (CU) positions 1 to 32, bit 1 is for CU positions 33 to 64, etc. and bit 31 is for CU positions 993 to 1024. For TR303 RTs, recent change sets the masks to 0 during RT growth. During line assignment, port conditioning will set the proper bit in the mask corresponding to the group of 32 ports containing the line, if a line cannot be provisioned. ODA for new offices (not retrofitting offices) will set bits in this mask based on the ports in RLfc_porttyp that have the prov attribute set.

This mask will survive retrofit.

Copyright © 1999 Lucent Technologies 

**Attribute: pvmask2**

**Fullname:** Provisioning Mask, Second Group of 1024 Ports

**Attribute Description** This mask is used by the TR303 RT provisioning process to determine if a port needs to be provisioned on the RT. The masks pvmask1 and pvmask2 represent the 2048 ports that the RT might use for analog or D-channel ports. The mask pvmask2 represents the second group of 1024 ports associated with the RT, with each bit in the mask representing a group of 32 ports, that is, bit 0 is for physical channel unit (CU) positions 1025 to 1056, bit 1 is for CU positions 1057 to 1088, etc., and bit 31 is for CU positions 2017 to 2048. For TR303 RTs, recent change sets the masks to 0 during RT growth. During line assignment, port conditioning will set the proper bit in the mask corresponding to the group of 32 ports containing the line, if a line cannot be provisioned. ODA for new offices (not retrofitting offices) will set bits in this mask based on the ports in RLfc_porttyp that have the prov attribute set.

This mask will survive retrofit.

**Attribute: prov_flag**

**Fullname:** Provisioning Flag

**Attribute Description** A value of DBYES for this attribute indicates that the switch should provision the RT. A value of DBNO indicates that the switch should not provision the RT.

This value is recent changeable.

## 4. Population Rules for RLrt_lgmem

**Relation Description**
Large multi-line hunt group (MLHG) active member map.

An array from 0 - 2016 which contains by group the members, of a large MLHG. The array is split into 63 words (32 bits) named memnum1 - memnum63. The right most bit is the low order for each word. However, for memnum1 the low order bit 0 is not used since a MLHG can't have a 0 member. The remaining 62 bit maps utilize all 32 bits. Below each memnum will indicate the range of members which it can represent. This tuple is populated on the HUNTING MODULE for the group, this is indicated where rlrt_lgmem.grpnum is equal to rlrt_mhg.grpnum, and rlrt_mhg.module is the HUNTING MODULE.

**Attribute: grpnum**

**Fullname:** MLHG group number

**Attribute Description** Key is the groups number

**Attribute: memnum[*]**

**Fullname:** A bit map representing members 31 -1 of a large MLHG

**Attribute Description** A bit map from [ 31 - 0 ] with the right most bit being the low order bit. This bit map represents members 31 - 1, and each bit should be set to 0 if the member is not active, else to 1 if the member is active. Bit 0 is always set to 0.

# RT_MCRT

## 1. Description

This relation contains the routing data expansion which is used by the modular Feature Customization Capability (MFC) features. This relation is used for routing calls in the automatic route selection (ARS), Private Facilities (PF), and Precedence and Preemption (PP) features.

## 2. Data Dictionary Values

## 4. Population rules for RLrt_mcrt

### Relation Description

The MC routing static relation

Routing data expansion used by modular feature customization capability (MFC) features. This relation is used for routing calls in the automatic route selection (ARS), private facilities (PF), and precedence and preemption (PP) features.

"The MC routing static relation is used by call processing

Copyright © 1999 Lucent Technologies

```
        for ARS routing and certain types of PFA routing. "

Attribute:
        mc_ri
Fullname:
        route index used in MFC routing
Attribute Description:
        route index for MFC routing.

Attribute:
        route_type
Fullname:
        type of route
Attribute Description:
        For PF feature:  RTE_REORDER, RTE_SFG, RTE_MC, RTE_DNTRAN
        For ARS feature: RTE_REORDER, RTE_BUSY, RTE_SFG, RTE_MC,
                         RTE_PVN, RTE_DNTRAN
        For PP feature:  RTE_REORDER,  RTE_MC, RTE_SFG
        For EDSL feature: RTE_REORDER, RTE_SFG

                RTE_SFG:     sfg_grp > 0.
                RTE_MC :     sfg_grp = 0.
                RTE_REORDER, RTE_BUSY: grpnum = 0, sfg_grp = 0,
                                       nbr_del = 0, nbr_pref = 0.

        An mc_ri with route_type = RTE_SFG can be used by EDSL.
        For Trunk INWATS (TINWATS), RLrt_sfg.sfg_type = SFGINWATS.
        For OUTWATS, RLrt_sfg.sfg_type = SFGOUTWATS.
        For basic service (POTS originating, POTS terminating),
                                        RLrt_sfg.sfg_type = SFGEDSL.
        For Megacom(R), RLrt_sfg.sfg_type = SFGMEGACOM.
        For Megacom(R) 800, RLrt_sfg.sfg_type = SFGM800.
        For SDN, RLrt_sfg.sfg_type = SFGSDN.
        For FX & Tie, RLrt_sfg.sfg_type = SFGINFX, SFGINTIE, SFGOUTTIE,
                                          SFGOUTFX, SFG2WFX, SFG2WTIE.
        For HM, RLrt_sfg.sft_type = SFGHM.
        For SCOCS, RLrt_sfg.sft_type = SFGSCOCS.

        For CENTREX Network Overflow SFG, RLrt_sfg.sfg_type = SFGCNSOVFL.
        For International 800, RLrt_sfg.sfg_type = SFGI800.
        For MultiQuest (DIAL-IT NOVA), RLrt_sfg.sfg_type = SFGMULTIQUEST.

        An mc_ri populated for use by EDSL must have grpnum = 0.
        Attributes nbr_del, nbr_pref, pref,
        sec_rt_ri, sig_pro, ani_ind, ovlap_ind, segsig, frl_grp,
        erwt_ind, and preempt_ind should be set to their default.
        These cannot be enforced by Recent Change since it cannot
        determine the user of the mc_ri.

        Secondary routes for inter-module trunks may use the route
        type RTE_DNTRAN.  If this route type is encountered, the DN
```

Copyright © 1999 Lucent Technologies 

```
        will be considered an intra-switch line terminating call (that is
        the call will revert back to the DN translation state for
        line terminating calls) and will be completed across the NCT
        links if the DN terminates on the same host Switch.
        The sec_rt_ri of the tuple must be a valid noc for this office
        when the route type is RTE_DNTRAN.
        If there exist a RLrt_mcrt tuple with the sec_rt_ri
        as the key then that tuple does not pertain to this route.
        If this secondary route type is encountered and the DN does
        not terminate on the same host Switch, the call will fail.

        The route_type RTE_PVN can only exist if the office
        parameter Glofc_pvn != DBNON_PVN.  (RTE_PVN is recognized
        by RTA only when ARS is active.)
```

**Attribute:**

```
        grpnum
```

**Fullname:**

```
        port group number
```

**Attribute Description:**

```
        indicates port group number for trunk.

        If carr_id != null value then,
                grpnum=0.
        If grpnum != 0 then,
                existence of tuple in RLrt_trkg with
                rlRT_TRKG.grpnum = grpnum,
                rlRT_TRKG.type must not be RTINCOM.

        If route_type = RTE_PVN and the office parameter,
        Glpvn_ofc = DBPVN_SSP, then grpnum = 0.
```

**Attribute:**

```
        sfg_grp
```

**Fullname:**

```
        simulated facility group id
```

**Attribute Description:**

```
        Indicates Simulated Facility Group (SFG)

        If route_type = RTE_SFG then sfg_grp > 0
           else sfg_grp = 0.

        If sfg_grp > 0
           then verify existence of a tuple in RLrt_sfg
           such that:
                RLrt_sfg.grpnum == RLrt_mcrt.sfg_grp.
                If RLrt_sfg.sfg_type == SFGOUTWATS or SFGEDSL or
                                        SFGMEGACOM or SFGM800 or
                                        SFGSDN or SFGI800 or
                                        SFGMULTIQUEST or
                                        SFGHM or SFGSCOCS or
```

Copyright © 1999 Lucent Technologies 

```
                                SFGOUTESSX or SFG2WESSX.
            then
                 RLrt_mcrt.grpnum = 0

          If RLrt_sfg.sfg_type == SFGINFX, SFGOUTFX, SFGINTIE,
                                  SFGOUTTIE,
                                  SFGHM, SFGSCOCS,
                                  SFG2WTIE, SFG2WFX.
          then
                  RLrt_mcrt.sec_rt_ri must be set to 0

          The following change is not enforced by
          Recent Change or ODA but is necessary
          for an origination with an RTrt_sfg.sfg_type
          of SFGSDN.

          If RLrt_sfg.sfg_type == SFGSDN then

                  RTrt_mcrt.grpnum > 0

     If sfg_grp >0 && carr_id != null value
        then verify existence of tuple in RLrt_sfg such that:
          RLrt_sfg.grpnum == RLrt_mcrt.sfg_grp;
          RLrt_sfg.sfg_type == SFGOUTWATS or SFGEDSL or
                               SFGM800 or SFGMEGACOM or SFGSDN or
                               SFGI800 or SFGMULTIQUEST or
                               SFGHM or SFGSCOCS or
                               SFGOUTESSX or SFG2WESSX.

     If route_type = RTE_PVN and the office parameter
       Glpvn_ofc != DBNON_PVN, then sfg_grp = 0.

     Enhanced 911 SFGs cannot be assigned via this relation.
     Their group numbers are accessed via their global parameters
     instead and then used to read RLrt_sfg.
```

**Attribute:**
nbr_del
**Fullname:**
number of digits to delete
**Attribute Description:**

```
 If route_type = RTE_REORDER or RTE_BUSY then nbr_del = 0.

 If route_type = RTE_PVN and the office parameter
 Glpvn_ofc = DBPVN_SSP, then nbr_del = 0.
```

**Attribute:**
pref
**Fullname:**
prefix digits

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
The characters input in pref must equal to value of nbr_pref.

**Attribute:**
nbr_pref
**Fullname:**
number of digits to prefix
**Attribute Description:**
If route_type = RTE_REORDER or RTE_BUSY then nbr_pref = 0.

If route_type = RTE_PVN and the office parameter
Glpvn_ofc = DBPVN_SSP, then nbr_pref = 0.

**Attribute:**
sec_rt_ri
**Fullname:**
secondary routing index - normal RTA routing
**Attribute Description:**
If sec_rt_ri != 0 and sfg_grp !=0, and the tuple in
relation RLrt_sfg with grpnum == sfg_grp
has sfg_type == SFGNETPAT,
then verify existence of a tuple in RLrt_poly with this
ri as the key.
Else, if sec_rt_ri != 0 and sfg_grp !=0, and the tuple
in relation RLrt_sfg with grpnum == sfg_grp has
sfg_type == SFGEOPAT,
then verify existence of a tuple in RLrt_mcrt with this ri
as the key.
Else,
verify existence of tuple in RLrt_routing with this ri as
key, unless 0 (no secondary route).
*
In an inter-module trunk call, the sec_rt_ri of the
secondary route index must be the noc if the secondary
route type is RTE_DNTRAN.
*
If route_type = RTE_PVN and the office parameter
Glpvn_ofc = DBPVN_SSP, then sec_rt_ri = 0.
For FX & Tie calls over PRI on a call by call basis
this field is not used for routing purposes, RLrt_sfg.sfg_rti
is used instead. See checks for sfg_grp, for setting sec_rt_ri
to 0 when the sfg types are SFGINFX, SFGOUTFX, SFGINTIE,
SFGOUTTIE, SFG2WFX, SFG2WTIE, SFGHM, or SFGSCOCS.

**Attribute:**
sec_mc_ri
**Fullname:**
secondary routing index - mc routing
**Attribute Description:**
Verify existence of tuple in RLrt_mcrt with this ri as

**Copyright © 1999 Lucent Technologies** 

key, unless 0 (no secondary route).
If route_type = RTE_PVN and the office parameter
Glpvn_ofc = DBPVN_SSP, then sec_mc_ri = 0.

**Attribute:**
sig_pro
**Fullname:**
Used to specify the signaling protocol
**Attribute Description:**
1) TRAD for traditional type of signaling,
2) EA for exchange access (EA) signaling,
3) INC for international type of signaling.
4) FGB for signaling to feature group B carriers.
This value is only valid for route_types
of RTE_MC and RTE_SFG.
5) MEA for Modified EA signaling for the TAISP feature.
6) INCM for international MEA signaling for TAISP.
7) PNANI for ANI Over PF Secured Feature.

Dependency: if grpnum = 0, sig_pro not required and
defaults to TRAD.

The combination of rt_descript = RT_OTHER, sig_pro = PNANI,
and ani_ind = DBYES is used only by the ANI over PF Secured
Feature, which requires that Secured Feature ID 005 be set.

**Attribute:**
ffcf1
**Fullname:**

**Attribute Description:**
future field feature use

**Attribute:**
ffcf2

**Fullname:**
future field
**Attribute Description:**
future field feature use

**Attribute:**
ffcf3

**Fullname:**
future field
**Attribute Description:**
future field feature use

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ffcf4

**Fullname:**
future field
**Attribute Description:**
future field feature use

**Attribute:**
ani_ind
**Fullname:**
automatic number identification indicator
**Attribute Description:**
Range of value:
DBYES--ANI information should be outpulsed;
DBNO--ANI information should not be outpulsed.
Dependency: if grpnum = 0, then DBNO
else no dependencies on any other field.

The combination of rt_descript = RT_OTHER, sig_pro = PNANI, and ani_ind = DBYES is used only by the ANI over PF Secured Feature, which requires that Secured Feature ID 005 be set.

**Attribute:**
ovlap_ind
**Fullname:**
overlap outpulsing indicator
**Attribute Description:**
Range of value:
DBYES if overlap outpulsing is allowed,
DBNO, otherwise.
Dependency: if grpnum = 0, then DBNO
else no dependencies on any other field.

**Attribute:**
segsig
**Fullname:**
indicator for a cut-through route requiring segmented signaling ARS
**Attribute Description:**
Cut-through route indicator for ARS segmented signaling.
DBYES if segmented signaling is allowed,
DBNO, otherwise.

If RLrt_mcrt.segsig = DBYES, verify that a RLfc_trunk tuple exists for grpnum with RLfc_trunk.cut_thru = DBYES.
ODA only:
1) If RLrt_mcrt.segsig = DBYES, the trunk group

Copyright © 1999 Lucent Technologies 

specified by RLrt_mcrt.grpnum must be assigned an ARS feature. Verify there is an RLarport tuple keyed by RLrt_mcrt.grpnum.

2) If RLrt_mcrt.segsig = DBYES, there must also be a tuple of RLarsegsig keyed by this mc_ri and RLarport.ar_gpid defined previously.
3) RLrt_mcrt.route_type must be RTE_MC

**Attribute:**
rt_descript
**Fullname:**
route destination type
**Attribute Description:**
Chosen to indicate what type of route this tuple in RLrt_mcrt represents. If more than 1 value applies to the attribute, rt_descript, then the tuple should be duplicated, with a different RI for the key, with 1 tuple per relevant value of the rt_descript attribute. For example, if overflow on direct trunk groups to carriers, shared trunk groups to access tandems (ATs), and Service Provider only trunk groups are all routing to the same announcement/tone, it is necessary to have a separate tuple for each case in order for measurements to work correctly. If grpnum = 0, rt_descript not required and defaults to RT_OTHER.

**Attribute:**
frl_grp
**Fullname:**
group facility restriction level
**Attribute Description:**
this value is used to compare with value of RLarport.frl_line.
Default Value: 31 (ARFRL_NONUSE) - Indicates FRL not used.
Dependencies: This attribute is used exclusively in ARS route lists.

**Attribute:**
erwt_ind
**Fullname:**
expensive warning tone indicator
**Attribute Description:**
This attribute is used exclusively in ARS route lists.
If route_type equals RTE_PVN then erwt_ind must_be DBNO.

**Attribute:**
charge_x
**Fullname:**
charging index
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

```
A non-zero charge index should be entered when physical
facilities (trunks) are specified.

R/C will implement the following warning message on view
10.4 for 5E7_1J:

Begin
If (grpnum != 0) && (charge_x == 0) then
        print_message('A non-zero charge index IS required
                        to prevent AMA Irregularities')
End
```

**Attribute:**
carr_id
**Fullname:**
identifies carrier id
**Attribute Description:**
If not null then verify existence of tuple in
RLfc_carr with this id.
If (route_type == RTE_MC) && (grpnum == 0) then carr_id != 0.
If route_type = RTE_PVN and the office parameter
Glpvn_ofc != DBNON_PVN, then carr_id = 0.

**Attribute:**
preempt_ind
**Fullname:**
indicates whether to perform an idle or preempt hunt
**Attribute Description:**
This attribute is only valid for PP features.
Range of value:DBNO - perform idle hunt
DBYES - perform preempt hunt
Dependency: If route_type is != RTE_MC then preempt_ind
must = DBNO.

**Attribute:**
crankback
**Fullname:**
crankback message indicator
**Attribute Description:**
DMBOOL indicating if a crankback message can be sent back
to the previous switch for rerouting. DBYES indicates that
no more routing is available in this routing list and a
crankback message can be sent to the previous switch in
case a satisfactory route cannot be obtained. DBNO indicates
that the crankback message shouldn't be sent.
Also crankback can not be applied to a terminating facility.
To prove that this is an intermachine trunk we look at
RLrctgrprk and check that the LN-TYPE is LN_IMT.
Crankback should not be applied to a SFG.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ani_ii_digs
**Fullname:**
identifies ANI II pairs
**Attribute Description:**
Two digit information indicator associated with the MC Route Index of an outgoing call using Equal Access signaling (EAMF or EA-ISUP7). The MC Route Index will identify the service provided to the originator such as PFA/OUTWATS or SDN/OUTWATS call.

The ani information indicator is defined and administered by Telcordia Technologies.

The ani_ii_digs associated with a call can be obtained from various places in the system. If it is obtained from RLrt_mcrt relation, it is associated with a service such as PFA/OUTWATS or SDN OUTWATS. If it is obtained from the RLflex_ani relation, it is associated with the Class of Service of the originating party. If it is obtained from the RLscridxpa relation, it is associated with a screening index of the originating party (The Flexible ANI Enhancement Secured Feature must be purchased and enabled, and the carrier must be allowed to send ANI II Digits). If it is obtained from the RLrt_routing relation it identifies the carrier through its association with the Route Index.

The ani_ii_digs attribute associated with the MCRI (RLrt_mcrt) has the highest precedence, followed by RI (RLrt_routing), SCRIDX (RLscridxpa) and the COS (RLflex_ani).
The following diagram illustrates the precedence and the ani_ii_digs attribute to be outpulsed with the call:

| RLrt_mcrt | RLrt_routing | RLscridxpa | RLflex_ani |
|---|---|---|---|
| ani_ii_digs | ani_ii_digs | ani_ii_digits | ani_ii_digs |
| defined | N/A | N/A | N/A |
| null | defined | N/A | N/A |
| null | null | defined | N/A |
| null | null | null | defined |

If the value of RLrt_mcrt.ani_ii_digs is FC_ANI_NULL, RLrt_routing.ani_ii_digs is FC_ANI_NULL, and RLscridxpa does not exist, then the ani_ii_digs will be derived from RLflex_ani and the value will be based on the COS of the originating party. Flexible ANI II feature is a secured feature and must be purchased to use. Flexible ANI Enhancements secured feature is depended on the Flexible ANI II secured feature.

**Attribute:**
ani6
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

automatic number identification 6

**Attribute Description:**

This attribute indicates to the operator system that the call may require special screening. If DBYES--ANI digit 6 should be outpulsed. If DBNO--ANI digit 6 should not be outpulsed. If RLrt_mcrt.ani6 is DBYES, then RLrt_mcrt.ani7 must be DBNO, RLrt_mcrt.route_type must equal SFG, RLrt_mcrt.ani_ind must be DBYES, RLrt_mcrt.ani_ii_digs must_be 100,

and RLrt_sfg.sfg_type must be SFGOUTWATS or SFGHM.

**Attribute:**

ani7

**Fullname:**

automatic number identification 7

**Attribute Description:**

This attribute indicates to the operator system that the call may require special screening. If DBYES--ANI digit 7 should be outpulsed. If DBNO--ANI digit 7 should not be outpulsed. If RLrt_mcrt.ani7 is DBYES, then RLrt_mcrt.ani6 must be DBNO, RLrt_mcrt.route_type must equal SFG, RLrt_mcrt.ani_ind must be DBYES, RLrt_mcrt.ani_ii_digs must_be 100,

and RLrt_sfg.sfg_type must be SFGOUTWATS or SFGSCOCS.

**Attribute:**

exp_cic

**Fullname:**

Feature Group D Expanded Carrier Identification Code (CIC)

**Attribute Description:**

Used to indicate on Equal Access trunks whether the expanded (4-digit) Carrier Identification Code (CIC) should be used (DBYES). A value of DBNO on relevant trunks indicates that the 3-digit CIC should be used. Trunks other than Equal Access have this attribute set to DBNO.

**Attribute:**

rtecat

**Fullname:**

routing category

**Attribute Description:**

DMnpt used by the FTS-2000 INPA feature to specify the routing category/numbering plan that will be used by the call. RTECAT can only be populated in Leased Network offices, where the Leased Network DAS, Gllndas,

**Copyright © 1999 Lucent Technologies** 

is populated on view 8.15.

| rtecat | routing category |
|---|---|
| CC_NPTNULL | No change (default setting) |
| CC_NANP | change to use NANP (North American Dialing Plan) |
| CC_APN | change to use APN (Action Point Numbering Plan) |
| CC_INTL | change to use INTL (International Numbering Plan) |

**Attribute:**
rte_srchlmt
**Fullname:**
Route search limit value
**Attribute Description:**
This attribute is used to denote the route search limit. The route search limit determines how far along the route chain to search.

**Attribute:**
tnsc
**Fullname:**
Terminating Network Selection Code
**Attribute Description:**
This attribute is used to denote the Terminating Network Selection Code value.

## 4. Population rules for RLrt_mctr

**Relation Description**

MFC route index for DN terminating translations

This relation is for DN terminating translations.
A tuple must be populated when an incoming SFG
is required to terminate to the line described by
the locdn. This relation provides a modular feature
route index for the inwats, sdn, essx, ccsa, or tinwats
SFG.

"SPECIAL CHECK FOR RLRT_MCTR

The mc_ri's specified in this relation are mutually exclusive.
Therefore, if any of the 4 attributes mc_ri, inwats_mcri,
ccsa_termri, or sdn_mcri is > 0, then the other 3 must be 0.
The exceptions to this are mc_ri (for ESSX) and ccsa_termri
(for CCSA), which can both be > 0. If this is the case,
the characteristics of the originator will determine if the
ccsa_termri or mc_ri should be used for a given call.
The other exception to this is mc_ri (for ESSX) and sdn_mcri
(for SDN), which can both be > 0. The characteristics of the
originator will determine if sdn_mcri or mc_ri should be used
for a given call

The previous poprule does not apply to EON SFG.

The following population rules apply to multiple dns of a multi-
line hunt group:
If the multiple dn is pointing to a base dn that is a member of a
REG, CIRC, UCD, or ISAT hunt group, then there is a RT_MCTR tuple on
the AM.

If the multiple dn is pointing to a base dn that is a MUPH or ISAT
subtn or a UCD group dn, then there is a tuple on the AM."

**Attribute:**
locdn
**Fullname:**
Local directory number
**Attribute Description:**
Terminating local directory number

**Attribute:**
locdn.noc

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Normalized office code
**Attribute Description:**
Normalized office code

**Attribute:**
locdn.digits
**Fullname:**
digit string
**Attribute Description:**
Digit string; an array of up to 4 extended digits

**Attribute:**
tgid
**Fullname:**
terminal group id
**Attribute Description:**
Terminal group id of this terminating line.

**Attribute:**
mc_ri
**Fullname:**
route index
**Attribute Description:**
MFC feature route index for an incoming ESSX SFG.

**Attribute:**
term_sfg
**Fullname:**
SFG terminal group
**Attribute Description:**
Tell if an ESSX or CCSA SFG is needed to terminate to this terminal group. DBYES means an SFG is needed.

**Attribute:**
inwats_mcri
**Fullname:**
MFC route index for INWATS
**Attribute Description:**
MFC feature route index for INWATS or TINWATS.

**Attribute:**
ccsa_termri
**Fullname:**
route index for CCSA
**Attribute Description:**
MFC feature route index for incoming CCSA SFG.

Copyright © 1999 Lucent Technologies 

**Attribute:**
sdn_mcri
**Fullname:**
route index for SDN
**Attribute Description:**
MFC feature route index for SDN.

**Attribute:**
eon_mcri
**Fullname:**
the EOLN base MFC route index
**Attribute Description:**
This attribute contains a base MFC route index that leads to an EON SFG when it is added with an EOLN service index from relation either RLdaprlfnl or RLdaprmfnl. SFID218 must be active before this attribute is populated with a non default value.

## 4. Population Rules for RLrt_mem

**Relation Description**
Small Multiline Hunt Group active member map.

This relation is intended to be a bit map for small MLHGs with each bit representing a member of the small group. The bit map is 2 words long (64 bits), with the left most bit being the low order bit. The low order bit (0) is not used since there can be no 0 member. Members for a small group range from 1 - 63. The bit map is set up to reference the whole bit map at once, or by a word at a time. If the bit map is referenced a word at a time the memnum2 field represents the second word, this words left most bit is the low order bit (0), and is used to reference the 32nd member of the group. Memmap1 contains members 1 - 31, while memnum2 contains members 32 - 63. This relation is populated by RC/V on the hunting module for the group. The hunting module for the group is determined where rlrt_mem.grpnum is equal to rlrt_mhg.grpnum, and the hunting module is equal to rlrt_mhg.module.

**Attribute: grpnum**

**Fullname:** MLHG Group Number

**Attribute Description** Key is the groups number

**Attribute: memnum1**

**Fullname:** Member bit map 1 (1 - 31) of a small MLHG

**Attribute Description** This attribute is a word (32 bits) which represents members 1 - 31 of a small MLHG. The low order bit is the left most bit, and in this case is 0, and is not used due to MLHGs not having a member 0. When a member is populated for a MLHG the corresponding bit must be set to 1 to indicate the member is active. If the member is not active due to being on intercept or having been deactivated then the bit must be 0.

**Attribute: memnum2**

**Fullname:** Member bit map 2 (32 - 63) of a small MLHG

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This attribute is a word (32 bits) which represents members 32 - 63 of a small MLHG. The low order bit is the left most bit, and in this case is 0, this bit represents member 32 of the MLHG. When a member is populated for a MLHG the corresponding bit must be set to 1 to indicate the member is active. If the member is not active due to being on intercept or having been deactivated then the bit must be 0 .

## 4. Population rules for RLrt_mhg

Copyright © 1999 Lucent Technologies

**Relation Description**

```
        multiline hunt group information

        This relation provides information about
        multiline hunt groups (MLHG).

       "*****************************************************************

        NOTE:   For OSPS external database applications (such as AMLB),
                the following packet switching application population
                rules apply for populating OSPS tuples.

        *****************************************************************

                RLrt_mhg (packet switching application)

        As of 5E9, X.25 Packet Switching will no longer be supported
        by the PH2 Access Image.  X.25 packet will only be supported
        by PH3's.

        As of 5E10, X.25 Packet Switching is also supported by PH4's.

        For packet switching application, a DSL is not marked busy
        when it is in use unless all the logical channels of the DSL
        packet switching channel are in use. Therefore, two
        special hunt types, namely RTH_PSUCD and RTH_PSLGUCD are
        introduced to meet the special requirements for hunting a DSL
        in a multi-line group. RTH_PSUCD is used for a group with member
        number less than 64 ; otherwise, RTH_PSLGUCD is used.

         TUPLE SEMANTICS:

         grpnum  a valid group number (key), range from 0 to AVMLHGRPS().

         module  Indicates the module where the dynamic data is
                 populated for this MLHG.

         gblgrp  Indicates if the MLHG is a global group (DBYES)
                 or a local group (DBNO). If gblgrp is DBYES, then
                 the MLHG is a global group ( member ports are spread
                 across the SMs ), else the group is a local group
                 (members ports are consolidated on one SM).
                 Default: DBYES
                 Dependencies :
                 When RLrt_mhg.gblgrp == DBNO then,
               for all tuples in PSGP_PRT where:
                 PSGP_PRT.grpnum = RT_MHG.grpnum
                 PSGP_PRT.module = X
                   where 'X' must be a single switching module number

         grpmkbusy  DBNO (Group Make Busy does not apply to packet switching)

         size    If htype == RTH_PSUCD or RTH_PSUCD,
```

Copyright © 1999 Lucent Technologies 

```
        the MLHG is used for packet switching.
        The range is from 0 to 63 for RTH_PSUCD,
        range from 64 to 2015 for RTH_PSLGUCD. No default value.
asg_size  rlRT_MHG.asg_size equals count of tuples in rlPSGP_PRT
        where rlPSGP_PRT.grpnum = rlRT_MHG.grpnum,
        rlPSGP_PRT.grptype = TM_LINE.
        Note: rlRT_MHG.asg_size <= rlRT_MHG.size.

htype   RTH_PSUCD, or RTH_PSLGUCD
grpcfv  DBNO
monitor DBNO (default)
dummy   DBNO
first_preempt 0
q_ing   DBNO
qmodule  0
qbsize   0
qexsize  0
qfid     0
beartyp  BR_PACK
isat_idx 0
rlt_type RLT_NONE
rlt_flash DBNO
psbgrp packet business group (0-100)
ldn_cnt   Indicates the number of linear entry point DNs
          assigned to the members of a packet MLHG.

*************************************************************************

               RLrt_mhg (Modem Pool Group Application)

       A modem pool group will function as a regular analog multi_line
       hunt group with the hunt type equal to RTH_UCD or RTH_LGUCD
       depending on the size of the group.
       A modem and its associated terminal adapter (TA) in
       a modem pool group must be assigned together as one
       member in that group. With the same keys of group number
       (grpnum) and member number, the relation RLgroup_port will
       map the port of the modem while the RLpsgp_prt will map the
       port of the TA. When an idle member is selected for routing
       it is marked busy regardless the calling party is from DSL
       line or from analog line.

TUPLE SEMANTICS:

grpnum  a valid group number (key), range from 1 to AVMLHGRPS().

module       Indicates the module where the dynamic data is
             populated for this MLHG.

gblgrp       Indicates if the MLHG is a global group (DBYES)
             or a local group (DBNO). If gblgrp is DBYES, then
             the MLHG is a global group ( member ports are spread
             across the SMs ), else the group is a local group
```

```
                    ( members ports are consolidated on one SM).
                    Default: DBYES
                    Dependencies :
                                When RLrt_mhg.gblgrp == DBNO then,
                                  for all tuples in GROUP_PORT where:
                                    GROUP_PORT.portgrp.grpnum = RT_MHG.grpnum
                                    GROUP_PORT.port.module = X
                                     where 'X' must be a single switching module nu
mber.

                                  for all tuples in PSGP_PRT where:
                                    PSGP_PRT.grpnum = RT_MHG.grpnum
                                    PSGP_PRT.module = X
                                     where 'X' must be a single switching module nu
mber.

        size
                    For modem pool group,the range is from 0 or 2 to 64 for
                    RTH_UCD, range from 65 to 2016 for RTH_LGUCD.
                    Default is zero.

        asg_size
                    rlRT_MHG.asg_size equals count of tuples in rlGROUP_PORT
                    where rlGROUP_PORT.portgrp.grpnum = rlRT_MHG.grpnum,
                    rlGROUP_PORT.portgrp.grptype = TM_LINE.
                    Note: rlRT_MHG.asg_size <= rlRT_MHG.size.

      ************************************************************************

                    RLrt_mhg (ISDN Circuit Switched Data Application)

              A multi line hunt group for data Circuit Switching
              (beartyp = BR_CSD) must have a hunt type of regular,
              circular, or uniform call distribution.  The hunt group
              can use either scan points or functional keys on a terminal
```

which is a member of the group for Group Make Busy and Stop Hunt functions. A member of the CSD hunt group must be an ISDN terminal of type IS_TYPEA, IS_TYPEB, ISTYPEC, IS_TYPED, or IS_TYPEE. IS_TYPATT cannot be a member of a CSD hunt group.

A member of a CSD hunt group is the D-channel of the DSL on which the terminal resides. The member is considered to be 'busy' if all the B-channels on that DSL that have a bearer service of data (RLdslequip.b1serv and/or RLdslequip.b2serv equal to RTDMD_SRV) are busy. The DSL may have none, one, or two B-channels with a bearer service of RTDMD_SRV.

TUPLE SEMANTICS:

grpnum a valid group number (key), range from 1 to AVMLHGRPS().

module Indicates the module where the dynamic data is populated for this MLHG.

gblgrp Indicates if the MLHG is a global group (DBYES) or a local group (DBNO). If gblgrp is DBYES, then the MLHG is a global group ( member ports are spread across the SMs ), else the group is a local group ( members ports are consolidated on one SM).
Default: DBYES
Dependencies :
When RLrt_mhg.gblgrp == DBNO then,
for all tuples in GROUP_PORT where:
GROUP_PORT.portgrp.grpnum = RT_MHG.grpnum
GROUP_PORT.port.module = X
where 'X' must be a single switching module number.

for all tuples in PSGP_PRT where:
PSGP_PRT.grpnum = RT_MHG.grpnum
PSGP_PRT.module = X
where 'X' must be a single switching module number.

reg Indicates if a multi-line hunt group has an overflow peg count register (DBYES) or not (DBNO). If rlRT_MHG.reg = DBYES, the reg_port attribute must be entered with a non-null value.

reg_port If rlRT_MHG.reg = DBYES, rlRT_MHG.reg_port.member must be a valid MSU signal distributor point.

inwats Indicates if a multi_line hunt group is INWATS (DBYES) or not (DBNO).
Default: DBNO

Copyright © 1999 Lucent Technologies 

```
grpmkbusy Indicates if group make busy is provided for this
          multi-line hunt group (DBYES) or not (DBNO).
          Default: DBNO
          If DBYES, the miscellaneous equipment number must
          be entered.
          Dependencies: If DBYES, verify if tuple exists
          such that
                rlFC_PORTTYP.servclass = FC_HUNTKEY
                rlHUNTKEYS.huntkey_type = FCGRPMKBUSY

size      For a regular MLHG the size can range from 0 or 2 to 64.
          For a large MLHG, the size can be from 65 to 2016.
          The Default value is zero.

asg_size  rlRT_MHG.asg_size equals count of tuples in
          rlGROUP_PORT where
          rlGROUP_PORT.portgrp.grpnum = rlRT_MHG.grpnum,
          rlGROUP_PORT.portgrp.grptype = TM_LINE.
          Note: rlRT_MHG.asg_size <= rlRT_MHG.size.

htype     RTH_REGULAR, RTH_LGREG, RTH_CIRCULAR, RTH_LGCIR,
          RTH_UCD, OR RTH_LGUCD.

grpcfv    DBNO

monitor   DBNO (default)

dummy     DBNO

first_preempt 0

q_ing     queuing active on this group?
          Range of values: DBYES or DBNO
          Default value: DBNO
          Dependencies: If q_ing is DBYES, then qfid must
             contain a valid queuing feature with modular
             feature type MFQU, and a tuple in RLfacname
             with RLfacname.facid = qfid and
             RLfacname.subclass = SCL_FEAT.
             The htype must be RTH_CIRCULAR, RTH_LGCIR,
             RTH_UCD, or RTH_LGUCD if q_ing is DBYES.

             Note: If q_ing is DBNO, then qmodule, qbsize,
             and qfid dependencies need not be checked. If
             q_ing is DBYES, these values must be valid
             (not 0). This note is intended for check tools.

  qmodule module on which this group's queue resides
          Range of values: 0 - 192
          Default value: 0
          Dependencies: qmodule must = RLmodatt.module

          ------------------------------------------------
```

```
                | NOTE:                                              |
                | To better utilize office resources for both        |
                | local and global MLHG groups, it is recommended    |
                | that when rlRT_MHG.q_ing is DBYES, then            |
                | rlRT_MHG.qmodule be equal to rlRT_MHG.module.      |
                ------------------------------------------------

          qbsize  default parameter queue basic size
                  Range of values: 0 - 255
                  Default value: 0
                  Dependencies: qbsize + qexsize must be <= (255 -
                  (all (qbsize + qexsize + qu_ogtos.rqsize + qu_ogtos.pqsize)
                  already assigned to this particular SM))

          qexsize 0 (CSD on FX facilities is not supported)

          qfid    queuing feature id
                  Range of values: 0, or
                  top 6 bits (10 - 15): MFQU (14 [0xe]) (see DMmftyp.G),
                  bottom ten bits (0 - 9): 1 - 1023 (0x1 - 0x3ff)
                  Default value: 0
                  Dependencies: a tuple in RLfacname with
                  RLfacname.facid = qfid and RLfacname.subclass = SCL_FEAT.
                  Also if qfid is not zero then a tuple must be found in
                  relation RLqu_cfdfl keyed by qfid, and the grptype must
                  be TM_QLINE in the tuple in RLqu_cfdfl keyed by qfid.
                  The tuple in RLqu_cfdfl must have qtype = Q_CSD.
                  The htype must be RTH_CIRCULAR, RTH_LGCIR, RTH_UCD,
                  or RTH_LGUCD if qfid is non zero.

         beartyp   BR_CSD
         isat_idx  0
         rlt_type  RLT_NONE
         rlt_flash DBNO
         psbgrp    0
         ldn_cnt   0

        ************************************************************************/"
```

**Attribute:**

grpnum

**Fullname:**

multiline hunt group number

**Attribute Description:**

For Packet Switching Modem call procesiing (PSMCP) (termclass = RTTC_MODEM), the key with attribute of RLrtdnmpg.grpnum must have valid entry in this relation RLrt_mhg that is rlRTDNMPG.grpnum = rlRT_MHG.grpnum

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
module
**Fullname:**
hunting module for the multiline hunt group
**Attribute Description:**
GLOBAL GROUPS
---

For Global Groups, the RLrt_mhg.gblgrp must be DBYES.
The RLrt_mhg.module attribute must be populated with the routing module of the DN stored in RLrt_mhg.grp_noc and RLrt_mhg.grp_loc. This is accomplished by using RLrt_mhg.grp_noc and d4 and d3 of RLrt_mhg.grp_loc (where RLrt_mhg.grp_loc is abxx, and a=d4, b=d3) as keys read RLrtdnmod. Set the RLrt_mhg.module as follows:

For PSUCD and PSLGUCD set it equal to RLrtdnmod.psrtg_mod.

For a Global UCD or LGUCD Multiline Hunt Group that is also a Modem Pool Group, ODA and Recent Change will set the attribute module based on the packet routing module assigned for the hundreds group of the Listed TN of the Modem Pool Group. This is accomplished by using the attribute psrtg_mod in relation RLrtdnmod for the hundreds group of the Modem Pool Group's Listed TN. This method applies only for global Modem Pool Groups.

For all other hunt types set it equal to RLrtdnmod.rtg_mod. The previous condition applies when a multiline hunt group is created.

The following checks applies only to ISAT multiline hunt groups when the first member is assigned to the group; Using RLrtdnmod.rtg_mod as key, read RLsmconf. If lpconf.package == GLISDNBASE then RLrt_mhg.module must be updated after the first member of the group is inserted, as follows:
Read RLgroup_port using the keys of RLrt_mhg.grpnum, grptype of TM_LINE, and a member of 1.
Set RLrt_mhg.module == RLgroup_port.port.module

LOCAL GROUPS
---
This is the case whenever ALL members associated with the group physically terminate on a single switching module and RLrt_mhg.gblgrp == DBNO.

For all hunt types except PSUCD and PSLGUCD:
  for all tuples in GROUP_PORT where:
    GROUP_PORT.portgrp.grpnum = RT_MHG.grpnum
  the group is local if and only if:
    GROUP_PORT.port.module = X and RT_MHG.gblgrp == DBNO
  where 'X' is a single switching module number. In this case, set RT_MHG.module = X.

**Copyright © 1999 Lucent Technologies** 

```
        For hunt types PSUCD and PSLGUCD:
          for all tuples in PSGP_PRT where:
            PSGP_PRT.grpnum = RT_MHG.grpnum
          the group is local if and only if:
            PSGP_PRT.module = X && RT_MHG.gblgrp == DBNO
          where 'X' is a single switching module number.  In
          this case, set RT_MHG.module = X.

        For a local group, the dynamic relation
        tuples for all the members of the group
        must be in the same module.  The following diagram
        defines the correspondence between hunt group types
        (see attribute 'htype') and the dynamic relations for
        each group:

        Hunt Type                           Dynamic Relations
        -------------------------------     -----------------
        CIRCULAR,REGULAR,GUCD,UCD,PSUCD     RLLNSTAT
        LGCIR,LGGUCD,LGREG,LGUCD,PSLGUCD    RLLGLNSTAT
        PPSMHG                              RLLNSTAT,RLPPLNST
        PPLMHG                              RLLGLNSTAT,RLPPLLNST
        MUPH                                RLRTMUPHST
        ISAT                                RLLNSTAT,RLISATUCD

        RC Update Rule
        --------------
        For an existing MLH group, RLrt_mhg.module may not
        be changed from zero to non-zero, nor may it be
        changed from one non-zero value to another. Therefore
        to move a local MLH group to a different module,
        members of the current group must be deleted and a
        new group created with the appropriate module number.
```

**Attribute:**

gblgrp

**Fullname:**

global or local group

**Attribute Description:**

```
        Indicates if the MLHG is a global group (DBYES)
        or a local group (DBNO). If gblgrp is DBYES, then
        the MLHG is a global group ( member ports are spread
        across the SMs ), else the group is a local group
        (members ports are consolidated on one SM).

        When RLrt_mhg.gblgrp == DBNO then,
          for all tuples in GROUP_PORT where:
            GROUP_PORT.portgrp.grpnum = RT_MHG.grpnum
            GROUP_PORT.port.module = X
              where 'X' must be a single switching module number.

          for all tuples in PSGP_PRT where:
            PSGP_PRT.grpnum = RT_MHG.grpnum
```

Copyright © 1999 Lucent Technologies

```
        PSGP_PRT.module = X
          where 'X' must be a single switching module number.
```

**Attribute:**
ffcf8
**Fullname:**
unsigned 8 reserved for future field feature use
**Attribute Description:**
Not assigned yet

**Attribute:**
size
**Fullname:**
highest member number plus 1
**Attribute Description:**
Highest member number plus 1 if one or more members are present, otherwise 0.
When OUTDIAL members are present they are not included in the size. Therefore size is the highest hunted member plus 1 if one or more hunted members are present; otherwise 0.

Range:
The size for a regular MLHG can range from 0 or 2 to 64 (regular groups may have members 0-63).
Where as the size for a large MLHG can range from 65 to 2016 (large groups may have members 64-2015).

Dependencies:
If for this tuple, htype == RTH_REGULAR or RTH_PPSMHG,
 then size = 0, or 2 <= size <= 64.

If htype == RTH_LGREG, or RTH_PPLMHG,
 then 65 <= size <= 2016.

If htype == RTH_PSUCD or RTH_PSLGUCD, the MHLG is used for packet switching and the range is from 0 or 2 to 64 for RTH_PSUCD, and from 65 to 2016 for RTH_PSLGUCD.

See htype for dependency between htype and size for ISAT groups. If isat_idx is non-zero (indicating this is an ISDN attendant multiline hunt group), then size can be no more than 64. A maximum of 63 members is allowed for ISDN attendant groups.

**Attribute:**
asg_size
**Fullname:**
number of currently assigned members to this group
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

rlRT_MHG.asg_size equals count of tuples in rlGROUP_PORT
where rlGROUP_PORT.portgrp.grpnum = rlRT_MHG.grpnum,
rlGROUP_PORT.portgrp.grptype = TM_LINE.

Note:
rlRT_MHG.asg_size as close as possible to rlRT_MHG.size.
To conserve memory, it is recommended that member numbers
in rlGROUP_PORT and rlPGGPMAP be numbered consecutively,
beginning with the number 1. This does not apply when
htype == RTH_MUPH. Tuples in rlGROUP_PORT that are OUTDIAL
members will not be reflected in asg_size.

If htype = RTH_PSUCD or RTH_PSLGUCD, the MLHG is used for
packet switching. rlRT_MHG.asg_size equals count of tuples
in rlPSGP_PRT where rlPSGP_PRT.grpnum = rlRT_MHG.grpnum,
rlPSGP_PRT.ptype = TM_LINE.

Note:
rlRT_MHG.asg_size <= rlRT_MHG.size.

**Attribute:**
htype
**Fullname:**
hunting type
**Attribute Description:**
Indicates the type of hunting for this group. A large group
is one which may contain more than 63 members.
The following enumerations are valid:

```
RTH_CIRCULAR,   Circular hunt
RTH_REGULAR,    Regular hunt (mlhg)
RTH_LGCIR,      Circular hunt on large groups
RTH_GUCD,       Uniform call distribution
RTH_LGGUCD,     Large group uniform call distribution
RTH_LGREG,      Regular hunt on large groups
RTH_UCD,        Uniform call distribution
RTH_ISAT,       ISDN Attendant Hunt
RTH_MUPH,       Multi position hunt group
RTH_LGUCD,      Large group uniform call distribution
RTH_PSUCD,      acket swtch uniform call distribution
RTH_PSLGUCD,    acket swtch UCD for linear large MLHG
RTH_PPSMHG,     idle/preempt search on small MLHG
RTH_PPLMHG,     idle/preempt search on large MLHG
```

If set to RTH_PPSMHG or RTH_PPLMHG, then every line in this
MLHG must have a tuple in the relation rlPP_LINE.
This can be verified by doing the following:
Find the tuple in rlGROUP_PORT such that:
key rlGROUP_PORT.portgrp.grpnum == grpnum
rlGROUP_PORT.portgrp.grptype == TM_LINE
key rlGROUP_PORT.member == range of valid member numbers
Then for this tuple in rlGROUP_PORT :
rlGROUP_PORT.port == key rlPP_LINE.port.

Copyright © 1999 Lucent Technologies 

A value of RTH_ISAT indicates that the group is an ISAT
( ISdn Attendant Terminal) group.

A multi-line hunt group for packet switching must have a htype
equal to RTH_PSUCD or RTH_PSLGUCD. A packet MLHG can consist of
a mixture of members with the following types of services:
D channel packet, On-Demand B channel packet, PPB, or XAT.

For a given grpnum, there must be a set of tuples in
rtdn_mhg, psmhgdnr, psgp_prt, and psgp_prt relation
such that:

1. rlRT_MHG.grpnum = rlRTDN_MHG.grpnum = rlPSMHGDNR.grpnum
   = rlPSGP_PRT.grpnum = rlPSPRT_GP.grpnum
2. rlPSGP_PRT.ptype = rlPSPRT_GP.ptype = TM_LINE.

There are no matching tuples in group_port or
pggpmap relations.

For PSMCP, htype for modem pool group is RTH_UCD or RTH_LGUCD;
a modem and its associated terminal adapter (TA) in a modem
pool group must be assigned together as one member in that
group. With the same keys of group number (grpnum) and member
number, the relation RLgroup_port will map the port of the
modem while the RLpsgp_prt will map the port of the TA. Hence,
for a given grpnum, there must be a set of tuple in relations
RLgroup_port and RLpsgp_prt such that:

rlRT_MHG.grpnum = rlRTDNMPG.grpnum,
rlGROUP_PORT.grpnum = rlPSGP_PRT.grpnum = grpnum and
rlGROUP_PORT.grptype = rlPSGP_PRT.ptype = TM_LINE.

**Attribute:**

reg

**Fullname:**

group register indicator

**Attribute Description:**

Indicates if a multi-line hunt group has an overflow peg count
register (DBYES) or not (DBNO).
If rlRT_MHG.reg = DBYES, the reg_port attribute must be entered
with a non-null value and a tuple must exist in RLmhg_opts with
RLmhg_opts.ofvreg = DBYES for the MLHG feature assigned to this
multi-line hunt group.

**Attribute:**

reg_port

**Fullname:**

portname of register

**Attribute Description:**

If rlRT_MHG.reg = DBYES, rlRT_MHG.reg_port.member
must be a valid MSU signal distributor point.

Copyright © 1999 Lucent Technologies

**Attribute:**
reg_port.member
**Fullname:**
member
**Attribute Description:**
See reg_port

**Attribute:**
reg_port.module
**Fullname:**
module number
**Attribute Description:**
See reg_port

**Attribute:**
grpcfv
**Fullname:**
group call forwarding variable
**Attribute Description:**
Indicates if a call forwarding variable feature is assigned to the lead member of the multiline hunt group. DBYES indicates that the CFV feature has an activation type of one of the following: ACTCD_DN, ACTCDDNC, ACTCDNCA, or ACTCDN1A.

**Attribute:**
grpmkbusy
**Fullname:**
group make busy
**Attribute Description:**
Indicates if group make busy is provided for this multi-line hunt group (DBYES) or not (DBNO). For packet switching, grpmkbusy must equal DBNO. Group make busy can be provided either by means of a miscellaneous equipment number (that is scan point) or via a feature button on an ISDN terminal. Only one of these can be assigned for any multiline group.

If DBYES, then:
(1) the miscellaneous equipment number could be entered.
Dependencies: If DBYES, verify if tuple exists such that
rlFC_PORTTYP.servclass = FC_HUNTKEY
rlHUNTKEYS.huntkey_type = FCGRPMKBUSY
rlBIKYPM.e_grpmkbsy == DBNO
or
(2) the feature button could be entered.
Dependencies:
If DBYES, verify that this feature button does

```
not exist for ISAT groups such that
            RLrt_mhg.isat_idx = 0 and
            RLrt_mhg.htype != RTH_ISAT
The group make busy feature button can exist on
all ISDN members of the hunt groups but is only usable
on member 1 (if member 1 is ISDN) of the hunt group
(usability is checked in the ISDN hunt keys software).
The feature button exists if there is a tuple in
RLbnfeat (for the configuration listed in RLis_term for
the lport of member 1) such that RLbnfeat.action =
ACN_BYGP.  Also there must be a tuple in RLbikypm keyed
by this grpnum and member 1 such that RLbikypm.e_grpmkbsy
is DBYES.  Also verify that RLhuntkeys does not
have a tuple such that RLhuntkeys.huntkey_type =
FCGRPMKBUSY for RLhuntkeys.portgrp.grpnum
= RLrt_mhg.grpnum.
```

**Attribute:**

```
inwats
```

**Fullname:**

```
INWATS group indicator
```

**Attribute Description:**

```
Indicates if a multi_line hunt group is INWATS (DBYES)
or not (DBNO).
Dependencies:
Each DN that points to this group must have
rlRT_DNTRAN.termclass = RTTC_INWATS.  For each port
associated with this group, verify if tuples exist such
that:
rlFC_LINE.inwats = DBYES and the class of service is one
of the following: rl_FC_PORTTYP.servclass =
        FCINDVDL
        FC_PBX
        FC_HOTMOTL
        FC_ATTENDANT
        PBXHOTMOT
        FC_ISDN
        FC_ISATND
```

**Attribute:**

```
dummy
```

**Fullname:**

```
dummy field
```

**Attribute Description:**

```
this field was called cfb_ind, removed for 5E5.
```

**Attribute:**

```
first_preempt
```

**Fullname:**

```
first preemptable line in this multiline hunt group
```

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

Indicates the first preemptable line in this Multiline hunt group when the Precedence and Preemption (PP) feature is activated. (A preemptive search is only allowed when htype is set to RTH_PPSMHG, or RTH_PPLMHG.) Therefore, if first_preempt > 0, then htype must be set to either RTH_PPSMHG or RTH_PPLMHG.

Dependency:
The following rules should be applied if htype == RTH_PPSMHG, or RTH_PPLMHG.

1) First_preempt line must be marked preemptable.
   Find the tuple in rlGROUP_PORT such that:
   key rlGROUP_PORT.portgrp.grpnum == grpnum
       rlGROUP_PORT.portgrp.grptype == TM_LINE
   key rlGROUP_PORT.member == first_preempt
   Then for this tuple in rlGROUP_PORT
   rlGROUP_PORT.port == key rlPP_LINE.port.
   For this identified tuple in rlPP_LINE:
   rlPP_LINE.preemptable must equal DBYES.

2) All lines preceding this first_preempt line must be marked non-preemptable and all lines after this first_preempt line must be marked preemptable. This will be checked at the precedence and preemption assignment stage.

**Attribute:**

q_ing

**Fullname:**

queuing indicator

**Attribute Description:**

queuing active on this group?

Dependencies:
If q_ing is DBYES, then qfid must contain a valid queuing feature with modular feature type MFQU (see attribute qfid).
If q_ing is DBYES, the htype must be one of:

- RTH_CIRCULAR,
- RTH_LGCIR,
- RTH_UCD,
- RTH_LGUCD,
- RTH_ISAT,
- RTH_PPSMHG,
- RTH_PPLMHG,
- RTH_MUPH,

For PSMCP q_ing = DBNO

If q_ing is DBNO, then qihtns must be DBNO

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
monitor
**Fullname:**
monitor
**Attribute Description:**
Indicates that the DN for this MLHG can be monitored on an ISDN attendant BLF/DSS console. DBYES indicates that the DN of this multiline hunt group is monitored by the attendant consoles in the ISDN attendant group keyed by isat_idx.

If RLrt_mhg.monitor == DBYES, then RLrt_mhg.htype must be one of the following:
RTH_CIRCULAR
RTH_LGCIR
RTH_REGULAR
RTH_LGREG
RTH_UCD
RTH_LGUCD
RTH_PPSMHG
RTH_PPLMHG

and a tuple must exist in RLrc_mminf where
(key)RLrc_mminf.mlhg = RLrt_mhg.grpnum
(key)RLrc_mminf.member = 0

Using the RLrc_mminf.att_grp value, retrieve the corresponding attendant tuple from RLrt_mhg where
(key)RLrt_mhg.grpnum = RLrc_mminf.att_grp

The htype of this MLHG must be RTH_ISAT, that is RLrt_mhg.htype = RTH_ISAT.

**Attribute:**
qihtns
**Fullname:**
queuing allowed for individual hunted TN calls indicator
**Attribute Description:**
Indicates if queuing is allowed for individual hunted TN calls.
DBYES - queuing is allowed for individual hunted TN calls
DBNO - queuing is not allowed for individual hunted TN calls

If qihtns is DBYES, then RLrt_mhg.q_ing must be DBYES.

If htype is RTH_ISAT and qihtns = DBYES then
the group must subscribe to the ICI_QUE ici in the RLicx_ici relation keyed by RLrt_mhg.isat_idx.

If qihtns is DBYES then RLrt_mhg.beartyp must be BR_VOICE.

If qihtns is DBYES then RLrt_mhg.htype must not be RTH_MUPH.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
qmodule
**Fullname:**
queue module
**Attribute Description:**
qmodule is the switching module on which this group's queue resides.
Dependencies: qmodule must = RLmodatt.module

NOTE:
To better utilize office resources for MLHG groups, it is recommended that when rlRT_MHG.qfid is non-zero, then rlRT_MHG.qmodule be equal to rlRT_MHG.module. This suggestion should be tempered with the requirement found in RLqu_dly indicating that if RLqu_dly.portgrp.grptype equals TM_QLINE then RLqu_dly.ann[x]port.module must equal RLrt_mhg.qmodule where RLrt_mhg is keyed by RLqu_dly.portgrp.grpnum.

If qmodule changes from one SM to another, then tuple changes may be needed in RLms_qan.sm_id and .gp_id if measurements are enabled for the RLrt_mhg.grpnum.

**Attribute:**
qbsize
**Fullname:**
basic queue size
**Attribute Description:**
default parameter queue basic size
Dependencies:
All (qu_os.qbsize + qu_os.qexsize + qu_ogtos.rqsize + qu_ogtos.pqsize) attributes in tuples already assigned to this particular SM must be <= 255 (SM) or <= 4000 on SM-2000

Note: This check is implemented in RLqu_os and RLqu_ogtos.

**Attribute:**
qexsize
**Fullname:**
extended queue size
**Attribute Description:**
default parameter queue extended size
Dependencies:
Same dependencies as for qbsize.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
qfid
**Fullname:**
queuing feature id
**Attribute Description:**
Range of values: 0, or
top 6 bits (10 - 15): MFQU (14 [0xe]) (see DMmftyp.G),
bottom ten bits (0 - 9): 1 - 1023 (0x1 - 0x3ff)

Dependencies:
There must be a tuple in RLfacname with RLfacname.facid = qfid
and RLfacname.subclass = SCL_FEAT.

If qfid is non zero, the htype must be one of:
RTH_CIRCULAR,
RTH_LGCIR,
RTH_UCD,
RTH_LGUCD,
RTH_ISAT,
RTH_PPSMHG,
RTH_PPLMHG,
RTH_MUPH,

If qfid is not zero, then a tuple must be found in
relation RLqu_cfdfl, keyed by qfid, with grptype of TM_QLINE.

If RLqu_cfdfl.cwl is DBNO then queuing call waiting
lamps are not provided and tuple must be not be
populated in RLqu_cwl nor in RLisqu_cwl.

If RLqu_cfdfl.cwl is DBYES then queuing call waiting lamps
are provided and a tuple must be populated in RLqu_cwl, RLisqu_cwl
or RLisatmbr (but only one of these, as described in the following).

If RLqu_cfdfl.lmptyp is DP then distribution point
call waiting lamps are provided and there must be a
tuple in RLqu_cwl keyed by RLrt_mhg.grpnum on the
queuing SM (RLrt_mhg.qmodule).

If RLqu_cfdfl.lmptyp is FB and this is not an ISAT group
(RLrt_mhg.htype != RTH_ISAT) then ISDN feature button
call waiting lamps are provided and there must be a
tuple in RLisqu_cwl keyed by RLrt_mhg.grpnum on the
queuing SM (RLrt_mhg.qmodule).

If RLqu_cfdfl.lmptyp is FB and this is an ISAT group
(RLrt_mhg.htype == RTH_ISAT) then there must be a tuple
in RLisatmbr keyed by RLrt_mhg.isat_idx on the
queuing SM (RLrt_mhg.qmodule).

**Attribute:**
mdc

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
message desk center flag
**Attribute Description:**
Message Desk Center indicator. If mdc is equal to DBYES, this MLHG will serve a Message Desk Center. The mdc must not equal DBYES if the MLHG is used for Modem Pooling, since Modem Pooling is not supported by Message Desk Center.

**Attribute:**
beartyp
**Fullname:**
bearer type
**Attribute Description:**
beartyp can be associated with a predefined feature which is in turn associated with a multiline hunt group. Its value is an indication of the type of calls that can be routed to the multiline hunt group.

dependency:
If hunt type is RTH_ISAT, beartyp must be BR_VOICE.

**Attribute:**
isat_idx
**Fullname:**
isat index
**Attribute Description:**
An abstract version of the multiline hunt group number. The RLfacids relation with class= FAC_ISAT is used to generate unique values of isat_idx, one unique isat_idx for each grpnum with htype of RTH_ISAT.
RLfacids.subclass = SCL_NULL for the RLfacids.class = FAC_ISAT.

When an ISAT multiline hunt group is deleted, a tuple in RLfacids is used to store the unused isat_idx value which can be later allocated to a new ISAT multiline hunt group.

Dependency:
If htype!= RTH_ISAT then set to 0.
If htype = RTH_ISAT then populate tuples in RLicx_ici, RLisatgrp, RLisatmbr, RLisatmod, RLrticitk, and RLrtisatmp.

If RLicx_ici.ici1 - ici16 is populated with FX1 - FX8, TIE1 - TIE8, or CNET ici values then RLrticitk relation must be populated where appropriate. RLicx_ici must always exist with at least LDN1 ici populated for the ISAT to function. This is enforced in RLicx_ici.

Place the RLisatmod tuple in the processor which is designated as the queuing module RLrt_mhg.qmodule.
For RLicx_ici tuples, isat_idx becomes the key and RLicx_ici.grpnum = RLrt_mhg.grpnum.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
grp_noc
**Fullname:**
normalized office code of the group's DN
**Attribute Description:**
The normalized office code for the following hunt types:

UCD, LGUCD, PSUCD and PSLGUCD hunt types is the group's noc.
grp_noc = RLrc_pgrprmk.tn.noc for this Hunt Group number.
For PSUCD and PSLGUCD this corresponds to the lower DN in
the range specified.

REGULAR,LGREG,CIRCULAR,LGCIR,PPLHMG and PPSMHG hunt
types is the group's (Member 1's) noc.
grp_noc = RLrc_pgrprmk.tn.noc for this Hunt Group number.

MUPH and ISAT hunt types is the Subgroup 1's noc.
grp_noc = RLrc_sgpdn.tn.noc for this Hunt Group number
and a subgroup of 1.

## 5. RT_MHG Population rules continued.

**Attribute:**
grp_loc
**Fullname:**
locdn of the group's dn in binary
**Attribute Description:**
The last 4 digits, in BINARY, of the Directory Number
for the following hunt types:
UCD, LGUCD, PSUCD and PSLGUCD hunt types is the group's locdn.
grp_loc = RLrc_pgrprmk.tn.digits for this Hunt Group number.
For PSUCD and PSLGUCD this corresponds to the lower DN in
the range specified.

REGULAR,LGREG,CIRCULAR,LGCIR,PPLHMG and PPSMHG hunt
types is the group's (Member 1's) locdn.
grp_loc = RLrc_pgrprmk.tn.digits for this Hunt Group number.

MUPH and ISAT hunt types is the Subgroup 1's locdn.
grp_loc = RLrc_sgpdn.tn.digits for this Hunt Group number
and a subgroup of 1.

NOTE:
EX: FOR Hunt Types like UCD and REGULAR, the grp_loc attribute
is indentical to RLrc_pgrprmk.tn.digits except grp_loc
is not in ASCII. The ASCII character string (tn.digits) is converted
to an integer(grp_loc).

**Attribute:**
grpdn_flag

Copyright © 1999 Lucent Technologies 

**Fullname:**
group/subgroup DN use flag
**Attribute Description:**
DBYES in this field indicates that there is at least one member in the MLHG which sends the group/listed DN or the subgroup DN (ISAT) in the routing message upon originating.

The number of such members is stored in the grpdn_mbrs field of the relation, RC_PGRPRMK.

This field should be set to DBYES only when the grpdn_mbrs counter in RLrc_pgrprmk is non-zero. Conversely, this field should be reset to DBNO only when the grpdn_mbrs counter in RLrc_pgrprmk is zero.

NOTE:
This field is required by call processing software for the UCD and ISAT MLHG hunt types only. However, in order to simplify the administration code and maintain acceptable RC response time performance during hunt type changes, this flag applies to all MLHG hunt types (regular, circular, UCD and ISAT).

**Attribute:**
rlt_type
**Fullname:**
type of Release Link Trunks on this multiline hunt group
**Attribute Description:**
This attribute indicates if the multiline hunt group contains Release Link Trunks (RLTs), and if so, whether the type of hold is permanent or temporary.

Dependencies:
This attribute must be set to RLT_NONE unless the group is a non-ISDN foreign exchange line in a multiline hunt group. The line servclass must be FC_PBX at the branch. This implies:

****** AT THE MAIN ******

1 ) RLfc_porttyp.servclass = FC_PFLASH
2 ) RLrctgrprk.brc = DBYES
3 ) RLrt_trkg.type = RTINCOM
4 ) RLrt_trkg.in_sigtype = DBNOSIG
5 ) RLrt_trkg.out_sigtype = DBNOSIG
6 ) RLfc_trunk.in_startsig = FCDIRCON
7 ) RLfc_trunk.out_startsig = FCSSNULL
8 ) RLfc_trunk.cut_thru = DBNO
9 ) RLfc_porttyp.lp_type = PCFXGRND

***** AT THE BRANCH *****

**Copyright © 1999 Lucent Technologies** 

```
        1 ) RLfc_line.brc           = DBYES
        2 ) RLfc_line.lpt_type      = LPT_OTHER
        3 ) RLfc_line.signal        = DBTT
        4 ) RLfc_porttyp.lp_type    = PCPBX
        5 ) RLfc_porttyp.servclass  = FC_PBX
        6 ) RLfc_porttyp.slcpbx     = DBYES
```

**Attribute:**
rlt_flash
**Fullname:**
Release Link Trunk flash flag
**Attribute Description:**
This attribute indicates whether or not the branch location can send a flash to the main switch over the RLT during added party disconnect.

Dependencies:
This attribute cannot be DBYES unless rlt_type is RLT_PERM.

**Attribute:**
stats24
**Fullname:**
ISAT load statistics reinitializing period
**Attribute Description:**
Boolean to indicate initialization period. If set to DBYES, period is 24 hrs. THIS ONLY APPLIES TO ISAT MLHGs. If set to DBNO, reinitializing period is 30 minutes for ISAT. For ALL non-ISAT MLHGs, stats24 will always be DBNO.

**Attribute:**
ffcf1

**Attribute:**
psap
**Fullname:**
E911 Public Safety Answering Point indicator
**Attribute Description:**
This is a boolean used to indicate if the MLHG is an ISDN public safety answering point (PSAP).

Since this feature is secured, this feature must have been previously purchased before the E911 PSAP field can be set to "Y" on RC/V view 3.5.

When E911 PSAP is set to DBYES, the following conditions apply.

This feature does not allow modular queuing, modem pool members, and message service center features.

Copyright © 1999 Lucent Technologies 

The hunt type for this MLHG must be one of the following:
RTH_CIRCULAR
RTH_LGCIR
RTH_REGULAR
RTH_LGREG
RTH_UCD
RTH_LGUCD

The bearer for this feature must be voice.

All members assigned to this MLHG must be ISDN.

**Attribute:**
mon_mode
**Fullname:**
monitoring mode
**Attribute Description:**
This bit is reserved as a place holder for future ISDN Attendant Busy Lamp Field (BLF) development. This bit will be used to select the mode for monitoring the busy/idle status of DNs.

**Attribute:**
sada
**Fullname:**
service after delay announcement
**Attribute Description:**
Indicates if the Service After Delay Announcement feature is active for the hunt group.

Dependencies:
If sada = DBYES then a tuple must exists in the relation QU_DLY where its keys are
QU_DLY.portgrp.grpnum = RT_MHG.grpnum and
QU_DLY.portgrp.grptype = TM_QLINE
and the following is true: QU_DLY.sada = DBYES.

**Attribute:**
psbgrp
**Fullname:**
group number for packet switching data business group service
**Attribute Description:**
Used by packet switching data business group service feature. This feature provides a means of setting up and administering packet switched data business groups, for the purpose of distinguishing between intra-group and other virtual calls on AMA (billing) records.

In 5E5, the primary purpose is to distinguish between intra-

Copyright © 1999 Lucent Technologies 

group and non-intra-grp PVC/VC calls on AMA (billing) records. In 5E8, the PBG purpose has been expanded to allow a common means of abbreviated dialing for members of a PBG, abbreviated calling number delivery for intra-PBG calls, and perhaps most important, the ability to provision a Simulated Facility Group (SFG) for the PBG. An SFG can place a limit on the resources consumed by all the members of the PBG. These resource limits (independently provisioned) are Aggregate Logical Channel Numbers (LCNs) and Throughput Class Negotiation (TPC). When the limit is exceeded by active calls, future calls may either be blocked or charged at a premium rate.

This attribute contains the packet switching data business group number, or 0 (zero) if this multiline hunt group is not a member of any packet business group.

Dependency:
All members of a packet business group must be on the same 5ESS(R)-2000 switch.

A MLHG is in at most one packet switching business group.

The psbgrp attribute is only valid for packet MLHG and modem pool MLHG.

```
If ((htype is_not_equal RTH_PSUCD) and
    (htype is_not_equal RTH_PSLGUCD) and
    (htype is_not_equal RTH_UCD) and
    (htype is_not_equal RTH_LGUCD))
{ psbgrp := 0;}
```

If this attribute does not equal 0, then the Packet Business Group Must be assigned and therefore a tuple of RLpbg_sfg and RLpbg_info must exist.

**Attribute:**
ldn_cnt
**Fullname:**
Linear DNs Count
**Attribute Description:**
For packet switching Multi-Line Hunt Groups, the ldn_cnt attribute specifies the number of linear entry point DNs that are assigned.

The ldn_cnt does not apply to MLHGs that don't have a packet hunt type.

The ldn_cnt must be equal the number of linear entry point DNs found in RLpsgp_ldn where the packet MLHG number is the same.

Copyright © 1999 Lucent Technologies 

**Attribute:**
freeterm
**Fullname:**
Free Termination
**Attribute Description:**
Reflects the value of freeterm of member 1 of the MLHG.

**Attribute:**
fga
**Fullname:**
Feature Group A
**Attribute Description:**
Reflects the fga value of member 1 of the MLHG.

**Attribute:**
bcl_assign
**Fullname:**
BCLID Assign
**Attribute Description:**
This boolean attribute specifies whether BCLID is assigned to this MLHG.

**Attribute:**
ported
**Fullname:**
ported indicator
**Attribute Description:**
This attribute indicates if the hunt group associated with this tuple is ported by the Number Portability feature. The group ported indicator takes precedence over the individual ported indicator found in RLfc_line or RLis_line. The indicator that will be used (either the individual or the group ported indicator) will be determined by call processing.

**Attribute:**
ctxid
**Fullname:**
Context Identifier
**Attribute Description:**
This attribute indicates if the MLHG associated with this tuple is unbundled or resold. A MLHG is unbundled if ctxid = CTXID_UNBNLD; it is resold if ctxid = CTXID_RESOLD.

## 4. Population Rules for RLrt_misc

**Relation Description**

Miscellaneous Remote Terminal Data.

This relation maps the remote terminal (RT) circuit name to miscellaneous per-RT data.

**Attribute: rtname**

**Fullname:** Remote Terminal Circuit Name

**Attribute Description** This is the internal circuit name of the RT.

**Attribute: rtint**

**Fullname:** RT Interface

**Attribute Description** This is the RT interface (TR8 or TR303).

**Attribute: hi_line**

**Fullname:** Number of Lines Terminated

**Attribute Description** For TR8 RTs, the value of this attribute is the highest equipped external line number, which is between 0 and 96 inclusive. For TR303 RTs, the value of this attribute is equal to the number of RLfc_porttyp tuples that currently exist for ports on this RT.

**Attribute: mtbcrkt**

**Fullname:** Metallic Test Bus Global Circuit Name

**Attribute Description** When the MTB is used for circuit testing, this is the MTB global circuit name. When a different circuit testing method is used, both components of this structure will be 0.

**Attribute: mtbcrkt.circuit**

**Fullname:** Circuit Name in MTB Global Circuit Name

**Attribute Description** This is the internal circuit name component of the MTB global circuit name.

Copyright © 1999 Lucent Technologies 

**Attribute: mtbcrkt.module**

**Fullname:** Switching Module Number in MTB Global Circuit Name

**Attribute Description** This is the switching module number component of the MTB global circuit name.

**Attribute: sid**

**Fullname:** RT Site Identifier

**Attribute Description** This is the RT site identifier (SID), which uniquely identifies an RT within an office.

**Attribute: ckttest**

**Fullname:** Circuit Testing Method

**Attribute Description** This is the circuit testing method (RTU, MTB-short, MTB-diode, or none).

**Attribute: pow_alarm**

**Fullname:** Power Alarm Classification

**Attribute Description** This is the power alarm classification (major or minor for TR8; critical, major, or minor for TR303).

**Attribute: ber_thres**

**Fullname:** Bit Error Rate Threshold for Protection Line Switch

**Attribute Description** This is a representation of the bit error rate threshold for protection line switch. The actual bit error ratio is ten raised to a power equal to the negative of the value of this attribute, that is 10^(- ber_thres).

When the bit error rate threshold is exceeded on a particular DS1, a protection line switch is attempted assuming that a protection line is available.

**Attribute: vendor**

**Fullname:** RT Vendor Name

**Attribute Description** This is the name of the RT vendor.

**Attribute: num_dsl**

**Fullname:** Number of Digital Subscriber Lines

**Attribute Description** This is the number of digital subscriber lines (DSL)s assigned to this RT.

**Attribute: inhdslmaint**

**Fullname:** Inhibit DSL Maintenance

**Attribute Description** This allows the ability to inhibit DSL maintenance for all DSLs whose interface type is TR303.

## 4. Population Rules for RLrt_mpg

**Relation Description** Modem pool hunt group information.

Information concerning this section is not available at this time.

**Attribute: grpnum**

**Fullname:** modem pool hunt group number

**Attribute Description** Existence of tuple in RLrt_mhg with key value:
key RLrt_mhg.grpnum = RLrt_mpg.grpnum.
Group must be an uniform call distribution (UCD) hunt type.

**Attribute: dialseq**

Copyright © 1999 Lucent Technologies

**Fullname:** dialing sequence for modem

**Attribute Description** This array contains the modem prefix dialing code, a string of characters that tells the modem that it is to begin dialing. The dialing sequence consists of any printable characters. The dialing code is determined solely by the modem manufacturer, which means that a modem pool group can contain only one brand of modem. Modems that require non-printable characters (such as combination of CTRL and another character) cannot be used in a Modem Pool Group. This field is left justified. The range is 1-5 characters with null padding on the right.

**Attribute: maint**

**Fullname:** group maintenance indicator

**Attribute Description** If this modem pool is public, then this field must be BYES. If the modem pool is private and the operating company has a contract to maintain it, this field must be DBYES. If the modem pool is private and the operating company does not have contract to maintain it, this field must be DBNO.

**Attribute: monitor**

**Fullname:** Tells that the DN associated with this MLHG is busy monitorable or not.

**Attribute Description** This field tells the DN associated with this MLHG in RLrtdnmpg the 'dsldn' field) is monitorable using the ISDN attendant console BLF light.

**Attribute: idp**

**Fullname:** Whether 4-digit dialing is supported to reach any modem pool member in the group.

**Attribute Description** This field tells whether the office where the group resides supports 4-digit dialing to any modem pool member in this modem pool group. If so, the field should be set to DBYES. Otherwise, set to DBNO.

**Attribute: pooltype**

**Fullname:** pool type of MLHG

**Attribute Description** This field tells the pool type of this MLHG. Possibilities are public or private. A private pool must be either billed or not billed. If a private pool is billed, pooltype is set to MPPVTBILL. If a private pool is not billed, pooltype is set to MPPVTNOBILL. If the pool is public, only the speed is given. The possible speeds are MP300BPS-MP9600BPS. This is a mandatory field. This field must not be set to MPNULL.

## 4. Population Rules for RLrt_poly

### Relation Description

Polygrid routing.

Relation that contains route patterns consisting of a direct route, three triples and the RCD digits. Used for doing polygrid routing. Alternate Declaration for RLrt_poly Attributes dr_ri, f1_ri, f2_ri, f3_ri, s1_ri, s2_ri, s3_ri, t1_ri, t2_ri, and t3_ri are grouped together in an array called ris. This array has ris [0] containing dr_ri, ris [1] = f1_ri ..... The RCDs associated with these ri's are also grouped in an array called rcds. This array has four 2-bit rcds (that is, 1 character) for each ri. In this case, rcds [0] contains dr_rcd0 in bits 0-1, dr_rcd1 in bits 2-3, dr_rcd2 in bits 4-5, and dr_rcd3 in bits 6-7.

The following section is taken directly from RLrt_poly.P to provide overview of route indexes attributes :

```
dr_rcd0  route control digits for direct route
through
dr_rcd3 Range: PPRCD0, PPRCD1, PPRCD2, or PPRCD3
        Default: No default values
        Dependency: if dr_ri == 0, then all four dr_rcds
        (0-3) must equal PPRCD0
f1_ri   route indexes for first triple
through
f3_ri   Range: 0 - route does not exist
               1 - AVRIMAX() - valid route index
        Default: No default values
        Dependency: f1_ri != f2_ri != f3_ri and verify
        existence in RLrt_routing with these ri's as the
        key for each ri != 0.
f1_rcd0  rcds associated with first triple first route
through
f1_rcd3 Range: PPRCD0, PPRCD1, PPRCD2, or PPRCD3
        Default: No default values
        Dependency: if the associated f1_ri = 0, then
        all four f1_rcd (0-3) must be PPRCD0
f2_rcd0 rcds associated with first triple second route
through
f2_rcd3 Range: PPRCD0, PPRCD1, PPRCD2, or PPRCD3
        Default: No default values
        Dependency: if the associated f2_ri = 0, then
        all four f2_rcd (0-3) must be PPRCD0
f3_rcd0 rcds associated with first triple third route
through
f3_rcd3 Range: PPRCD0, PPRCD1, PPRCD2, or PPRCD3
        Default: No default values
        Dependency: if the associated f3_ri = 0, then
        all four f3_rcd (0-3) must be PPRCD0
s1_ri   see f1_ri thru f3_ri and substitute first triple
through
s3_ri   with second triple and f1-f3 with s1-s3
s1_rcd0 - s1_rcd3  see f1_rcd0 through f1_rcd3
s2_rcd0 - s2_rcd3  see f2_rcd0 through f2_rcd3
s3_rcd0 - s3_rcd3  see f3_rcd0 through f3_rcd3
t1_ri thru  see f1_ri thru f3_ri and substitute first triple
t3_ri       with third triple and f1-f3 with t1-t3
t1_rcd0 - t1_rcd3  see f1_rcd0 through f1_rcd3
t2_rcd0 - t2_rcd3  see f2_rcd0 through f2_rcd3
t3_rcd0 - t3_rcd3  see f3_rcd0 through f3_rcd3"
```

**Copyright © 1999 Lucent Technologies** 

**Attribute: pattern**

**Fullname:** Route Pattern

**Attribute Description** Route pattern (route index from other relations).

**Attribute: grid**

**Fullname:** Home Grid Routing

**Attribute Description** Interior or exterior home grid routing provides the ability to assign one interior pattern and up to 3 exterior patterns where the interior pattern contains routes within the home grid.

**Attribute: rotate**

**Fullname:** Rotate

**Attribute Description** Rotation within triples allowed on precedence call.
DBYES for rotate,
DBNO for no rotate

**Attribute: immed_pr**

**Fullname:** Immediate Preemption

**Attribute Description** Immediate preemption on this route (NORAD/SAGE ROUTE).
DBYES do immediate preempt search
DBNO do not do immediate prempt search.

**Attribute: dr_ri**

**Fullname:** Direct Route Index

**Attribute Description** Direct route index:
0 - No direct route in this pattern
1 - AVRIMAX() valid route index.

**Attribute: f[*]_ri**

**Fullname:** First Triple

**Attribute Description** Route indexes for first triple:
0 - Route does not exist.
1 - AVRIMAX() - valid route index.
Dependency: f1_ri != f2_ri != f3_ri and verify existence in RLrt_routing with these ri's as the key for each ri != 0.

**Attribute: s[*]_ri**

**Fullname:** Route Indexes for Second Triple

**Attribute Description** Route indexes for second triple.
See f1_ri thru f3_ri and substitute first triple with second triple and f1-f3 with s1-s3.

**Attribute: t[*]_ri**

Copyright © 1999 Lucent Technologies 

**Fullname:** Route Indexes for Third Triple

**Attribute Description** Route indexes for third triple.
See f1_ri thru f3_ri and substitute first triple with third triple and f1-f3 with t1-t3.

**Attribute: pad**

**Fullname:** Pad

**Attribute Description** Used as filler attribute.

**Attribute: dr_rcd[*]**

**Fullname:** Route Control Digits for Direct Route

**Attribute Description** Route control digits for direct route.
Dependency: if dr_ri == 0, then all four dr_rcds (0-3) must equal PPRCD0.

**Attribute: f1_rcd[*]**

**Fullname:** Route Control Digits (rcds) First Triple First Route

**Attribute Description** Rcds associated with first triple first route.
Dependency: if the associated f1_ri = 0, then all four f1_rcd (0-3) must be PPRCD0.

**Attribute: f2_rcd[*]**

**Fullname:** Route Control Digits (rcds) First Triple Second Route

**Attribute Description** Rcds associated with first triple second route
Dependency: if the associated f2_ri = 0, then all four f2_rcd (0-3) must be PPRCD0.

**Attribute: f3_rcd[*]**

**Fullname:** Route Control Digits (rcds) First Triple Third Route

**Attribute Description** Rcds associated with first triple third route
Dependency: if the associated f3_ri = 0, then all four f3_rcd (0-3) must be PPRCD0.

**Attribute: s1_rcd[*]**

**Fullname:** Route Control Digits (rcds) Second Triple First Route

**Attribute Description** Rcds associated with second triple first route. See f1_rcd0 through f1_rcd3.

**Attribute: s2_rcd[*]**

**Fullname:** Route Control Digits (rcds) Second Triple Second Route

**Attribute Description** Rcds associated with second triple second route. See f2_rcd0 through f2_rcd3

**Attribute: s3_rcd[*]**

**Fullname:** Route Control Digits (rcds) Second Triple Third Route

**Attribute Description** Rcds associated with second triple third route. See f3_rcd0 through f3_rcd3.

**Copyright © 1999 Lucent Technologies** 

**Attribute: t1_rcd[*]**

**Fullname:** Route Control Digits (rcds) Third Triple First Route

**Attribute Description** Rcds associated with third triple first route. See f1_rcd0 through f1_rcd3.

**Attribute: t2_rcd[*]**

**Fullname:** Route Control Digits (rcds) Third Triple Second Route

**Attribute Description** Rcds associated with third triple second route. See f2_rcd0 through f2_rcd3.

**Attribute: t3_rcd[*]**

**Fullname:** Route Control Digits (rcds) Third Triple Third Route

**Attribute Description** Rcds associated with third triple third route. See f3_rcd0 through f3_rcd3.

## 4. Population rules for RLrt_routing

### Relation Description

Routing

Routing data expansion.

RLrt_routing (outgoing local test desk - OG LTD)
Fixed Route Index = TM_TSTTK

DESCRIPTION:

This relation specifies the route index which points to the trunk group for outgoing (OG) local test desk (LTD) connections. Outgoing LTD trunks provide access to external test systems (LTD, mechanized loop testing [MLT], Fortel, etc.) for test calls initiated at the subscriber line.

Routing for OG LTD test calls are handled differently for remote modules (remote switching module [RSM], optically remote switching module [ORM], two mile ORM [TRM], multi-module remote switching module [MMRSM] cluster, etc.) than they are for modules within the host office. This difference in handling is dictated by the lack of metallic linkage to the host office. The three-digit or seven-digit OG LTD test code

**Copyright © 1999 Lucent Technologies** 

may be the same for the entire office, including remote modules. This test code will point to a fixed route type of TM_TSTTK. The route index associated with type TM_TSTTK, however, will be applicable only to modules in the host office, and will point to the trunk group containing all OG LTD test trunks in the host office.

Each remote module/cluster which is not metallically linked to the host office must have its own outgoing LTD trunk group (containing one or more trunk members). The route index assigned to that trunk group must be unique from that associated with TM_TSTTK. This route index must be populated in the parameter Glltdri for the remote module. When an OG LTD call is made using the access code, a check is made on the type of module from which the call originated. If it is a host office module, routing is done via rixed route type TM_TSTTK. If it is a remote module, the code routes to the trunk group in the module via the route index contained in Glltdri.

Note that incoming LTD test trunks are not hunted and do not use route indices. Therefore this relation is not applicable for incoming LTD test trunk groups.

QUANTITY OF TUPLES:

One tuple is required in RLrt_routing for each route index associated with an outgoing LTD test trunk group.

TUPLE SEMANTICS:

RLrt_routing attributes should be populated as shown in the following lines. Any attribute not specified should be populated with the default value.

```
route_x (KEY)   - Route index associate with OG LTD trunk
                  group.
route_type      - RTE_HUNT.
portgrp.grpnum  - Outgoing LTD trunk group number.
portgrp.grptype - TM_TRK.
sec_rte_x       - Route index for reorder.
sig_pro         - Traditional (TRAD).
```

RLrt_routing (for fixed route index TM_CBAK)

DESCRIPTION:

This relation must be populated for the route index associated with the fixed route type of TM_CBAK. Population rules are specified in RLrt_fixedri for this case. This route index must point to the trunk group associated with the callback logical test ports of

Copyright © 1999 Lucent Technologies 

servclass TM_CALLBACK.

QUANTITY OF TUPLES:

One tuple for the fixed route associated with TM_CBAK fixed type.

TUPLE SEMANTICS:

```
route_x         - Assigned by office.
route_type      - RTE_HUNT.
portgrp.grpnum  - Assigned by office.
portgrp.type    - TM_TRK.
sec_rte_x       - Assigned by office (reorder is suggested).
```

It is recommended that the following attributes be set
to their default values:

```
        nbr_del                 pref
        nbr_pref.digcnt         sig_pro (TRAD)
        ani_ind                 ovlap_ind
        two_stage
```

These values are not checked by ODA or RC/V, but
this will avoid executing operational routing code
that is unnecessary for the Callback test call.

## RLrt_routing (for DCTU route index)

DESCRIPTION:

This relation must be populated for the route index associated with each singular directly connected test unit (DCTU) trunk group assigned. This route index must point to the DCTU trunk group associated with the DCTUPORT logical test ports (LTPs) of servclass TMLTPDCTU.

Note:

1. It is possible to have any number of route indices associated with the same trunk group number. It is recommended that there be one singular DCTU route index for each DCTU trunk group of servclass TMLTPDCTU. It is valid to have more than one DCTU route index assigned to a singular DCTU trunk group number. Each DCTU trunk group must be defined in relation RLRT_TRKG and RLRCTGRPRK.
   See the population rules for RLrt_trkg and RLrctgrprk.

2. It is recommended that there be a singular DCTU trunk group number for each DCTU equipped in a host 5ESS(R)-2000 switch processing entity. However, it is valid for a DCTU trunk group to include all DCTU trunk members from any number of DCTUs residing in the host 5ESS(R)-2000 switch processing entity. There would still be only one DCTU route index associated with this DCTU trunk group.

Copyright © 1999 Lucent Technologies 

3. There must be a singular RSM DCTU route index for each singular RSM DCTU trunk group. All the members of an RSM DCTU trunk group must be defined in that RSM.

4. When only one DCTU serves a host 5ESS(R)-2000 switch entity, the value for the secondary route index (sec_rte_x) associated with this DCTU route index must be either the null value zero or the office value for REORDER. The route_type for REORDER is 'RTE_REORDER.' (There is a separate entry in this relation for route_type of 'RTE_REORDER'.) See also the population rules for RLmodatt.

5. When a host DCTU trunk group is made up of any number of DCTU residing in the host switch, the DCTU route index associated with this trunk group effectively serves the entire host switch. (Each DCTU indirectly services any line in the host.) Here, the value for the secondary route index (sec_rte_x) associated with this DCTU route index must be assigned the null value zero or the office value for REORDER. See also the population rules for RLmodatt.

6. When a DCTU serves a RSM, the value for the secondary route index (sec_rte_x) associated with this RSM DCTU route index must be assigned the null value zero or the office value for REORDER.

7. The following is the recommended rule when there are two DCTUs serving a host 5ESS(R)-2000 switch entity. Here, each DCTU explicitly services half the testing load. There is a singular DCTU trunk group assigned to each DCTU. There is a singular DCTU route index (route_x) assigned to each DCTU trunk group. (More details on this scenario are provided in the population rules for RLmodatt.) The secondary route index (sec_rte_x) for each of the two singular DCTU route indices (route_x) points to the other DCTU route index. This assignment allows RTA to route automatically to the other DCTU (DCTU route index) if the first choice is busy.

   This scenario can be carried through to its logical conclusion if there are more than two DCTUs, each with its own singular DCTU route index, serving the HOST processing entity.

8. There must be a corresponding entry in the relation RLRCRTIRMK. See the population rules for RLrcrtirmk. There are no changes needed to the population rules for this relation.

9. The same restrictions that apply to RSM also apply to ORM/TRM.

QUANTITY OF TUPLES:

Copyright © 1999 Lucent Technologies 

One tuple for each DCTU route index associated with a singular DCTU trunk group defined by 'portgrp.grpnum.'

TUPLE SEMANTICS:

```
route_x          - Value assigned by office.
route_type       - RTE_HUNT.
portgrp.grpnum   - DCTU trunk group number.  Corresponds to
                   entry in RLRT_TRKG and RLRCTGRPRK.
portgrp.type     - TM_TRK.
nbr_del          - Zero (default).
pref             - Zero (default).
nbr_pref.digcnt  - Zero (default).
sig_pro          - TRAD.
ani_ind          - DBNO.
ovlap_ind        - DBNO.
rt_descript      - RT_OTHER.
sec_rte_x        - See the previous items 4, 5, 6 and 7.
                   The most common value will be either zero
                   or the route_x corresponding to a route_type of
                   'RTE_REORDER'.
```

RLrt_routing (For ISTF Route Index)

DESCRIPTION:

This relation must be populated for the route index associated with each integrated services test function (ISTF) trunk group assigned. This route index must point to the ISTF trunk group associated with each ISTF LTP type.

QUANTITY OF TUPLES:

One tuple for each ISTF LTP type.

TUPLE SEMANTICS:

```
route_x          - Value assigned by office.
route_type       - RTE_HUNT, RTE_TM
portgrp.grpnum   - ISTF trunk group number.  There has to be a
                   corresponding entry in RLRT_TRKG and RLRCTGRPRK.
portgrp.type     - TM_TRK.
nbr_del          - Zero (default).
pref             - Zero (default).
nbr_pref.digcnt  - Zero (default).
sig_pro          - TRAD.
ani_ind          - DBNO.
ovlap_ind        - DBNO.
rt_descript      - RT_OTHER.
sec_rte_x        - RTE_REORDER.
```

Copyright © 1999 Lucent Technologies 

RLrt_routing (for DSU2-RAF/SAS Port Groups)

DESCRIPTION:

This relation must be populated for every digital service unit model 2 with recorded announcement function (DSU2-RAF) and/or Service Announcement System (SAS) port group route index as defined in RT_FIXEDRI and other. Each port group uses existing trunk group hunt mechanisms to route to an idle RAF/SAS port through which an appropriate announcement will be given.
For every tuple populated in this relation, a corresponding tuple should be populated in the RCRTIRMK relation for recent change purposes.

QUANTITY OF TUPLES:

One tuple for each DSU2-RAF/SAS port group.

TUPLE SEMANTICS:

| | |
|---|---|
| route_x | - Value assigned by office. |
| route_type | - RTE_HUNT. |
| portgrp.grpnum | - RAF/SAS port group number as defined in RT_TRKG and RCTGRPRK. |
| portgrp.type | - TM_TRK. |
| nbr_del | - Zero (default). |
| pref | - Not applicable - use `\0`. |
| nbr_pref | - Zero (default). |
| sec_rte_x | - Zero (no secondary routing, except for FC_RAFANNC. FC_RAFANNC must have secondary routing to either RTE_HUNT or RTE_REORDER). |
| sig_pro | - TRAD. |
| ani_ind | - DBNO. |
| ovlap_ind | - DBNO. |
| two_stage | - DBNO. |
| rt_descript | - Not applicable. |

RECENT CHANGE/ODA RULES
DSU2-RAF (non-dial through announcement [DTA]) and SAS port groups:
For each DSU2-RAF/SAS port group not having the dial-through announcement capability, there may exist a tuple with a key value of 'grpnum' in this relation that corresponds to an RLfc_porttyp tuple with an annc_apl of SVC_DA and an RLrt_fixedri tuple of ritype RT_OSPSDA.

DSU2-RAF-DTA, DSU2-RAF-COIN, and SAS port groups:
For each DSU2-RAF/SAS port group having the dial-through announcement capability, there may exist a tuple with a key value of 'grpnum' in this relation that corresponds to an RLfc_porttyp tuple with an annc_apl of SVC_ACCS and an RLrt_fixedri tuple of ritype

Copyright © 1999 Lucent Technologies 

RT_OSPS_ACCS. Also for each DSU2-RAF/SAS port group having the dial-through announcement capability, there may exist a tuple with a key value of 'grpnum' in this relation that corresponds to an RLfc_porttyp tuple with an annc_apl of SVC_ACSR and an RLrt_fixedri tuple of ritype RT_ACSR. If the corresponding RLfc_porttyp tuple has an annc_apl of SVC_COIN, there will exist an RLrt_fixedri tuple of RT_OSPSCOIN for the coin announcement capability. If the corresponding RLfc_porttyp tuple has an annc_apl of SVC_RAS for the dial-through announcement capability and there is a tuple in RLannc_apl with appl equal to SVC_RAS then there must exist a tuple in RLras_idp with a corresponding annc_ri and there is a tuple in RLannc_apl with appl equal to SVC_ACSR then there must exist a tuple in RLrt_fixedri with a ritype of RT_ACSR.

## RLrt_routing (for CCS transmission test call routing)

DESCRIPTION:

This relation must be populated with a route index associated with incoming transmission test calls on common channel signaling (CCS) trunks. This routing index corresponds to the fixed routing index TMICTC. This routing index is used to route the incoming CCS test call to the trunk group of logical test ports (TM_ICTC). The trunk group pointed to by this routing index should be the same trunk group used for incoming non-CCS trunk transmission test calls.

QUANTITY OF TUPLES:

One tuple per 5ESS(R)-2000 switch office equipped with CCS trunks.

TUPLE SEMANTICS:

```
route_x          - Value assigned by office.
route_type       - RTE_HUNT, RTE_TM
portgrp.grpnum   - Incoming transmission test call trunk group
                   (trunk group of logical test ports with
                   service class of TM_ICTC ).
portgrp.type     - TM_TRK.
nbr_del          - Zero.
pref             - Zero.
nbr_pref         - Zero.
sec_rte_x        - Zero.
sig_pro          - TRAD.
ani_ind          - DBNO.
ovlap_ind        - DBNO.
two_stage        - DBNO.
rt_descript      - RT_OTHER.
```

Copyright © 1999 Lucent Technologies 

RLrt_routing (For packet switching route index)

DESCRIPTION:

This relation must be populated for the route index associated with a packet switching trunk group assigned.

For the route index assigned to the internal protocol (IP) trunk group:

For a given route index, there must be a tuple in RLrt_routing, and RLpsri_psn such that, RLrt_routing.route_x = RLpsri_psn.route_x.

In addition, if the route index is associated with a registered private operating company (RPOA) (inter-exchange carrier) data network identification code (DNIC) then there should also be a tuple in the RLpsdnicri such that, RLrt_routing.route_x = RLpsri_psn.route_x = RLpsdnicri.route_x.

For the route index assigned to the X.75/X.75' trunk group:

For a given route index, there must be a tuple in RLrt_routing.

In addition, if the route index is associated with an RPOA (inter-exchange carrier) DNIC then there should also be a tuple in the RLpsdnicri such that, RLrt_routing.route_x = RLpsdnicri.route_x.

For a secondary route index assigned to a X.75/X.75' trunk group:

For a given secondary route index (sec_rte_x), there must be a tuple in RLrt_routing.

In addition, if the secondary route index is associated with an RPOA (inter-exchange carrier) DNIC then there should also be a tuple in the RLPSDNICRI relation such that, RLrt_routing.sec_rte_x = RLpsdnicri.route_x.

Multiple X.75' trunk groups per 5ESS(R)-2000 switch, including X.75' to X.75', can tandem trunk through a 5ESS(R)-2000 switch (with or without going through the IP subnetwork). This feature allows each 5ESS(R)-2000 switch to have multiple X.75' trunk groups to another sub-network (integrated services digital network [ISDN] or public packet switch network [PPSN]) within the local access and transport area (LATA) by configuring routing tables. PVCs can be provisioned on X.75' trunk members and alternate route indexes can be provisioned for both X.75 and X.75' trunk groups. The user must carefully provision PVCs on X.75 or X.75' trunk members with alternate routes because the PVCs will not alternate route. The 5ESS(R)-2000 switch

Copyright © 1999 Lucent Technologies 

will also be able to have multiple X.75 trunk groups connected to an inter-exchange carrier (IEC)/value added network (VAN) if the routing tables are correctly defined.

The user must provision the routing tables properly so that trunks with the previous Telcordia Technologies TR-301 Issue 2 and TR448 features do not route to another 5ESS(R)-2000 switch that is not operating on the 5E8 software release or to another vendor's ISDN switch which is not compatible with the previous TRs.

Call looping among the sub-networks in a Bell operating company (BOC) LATA is a situation that could arise either due to mis-provisioning of routing tables, or due to a combination of alternate routing and transit switching. It is the responsibility of the BOC to set up the routing tables in a way that minimizes the potential for looping.

QUANTITY OF TUPLES:

One tuple for each packet switching route index.

TUPLE SEMANTICS:

route_x - value assigned by office

route_type - RTE_HUNT. The members in the trunk group must be hunted to find the next available one. The hunt type = RTH_PSUCD must exist in RLrt_trkg. Since X.75/X.75' trunk groups are limited to 24 members and IP trunk groups are limited to 32 members, RLrt_trkg.htype must never equal RTH_PSLGUCD.

portgrp.grpnum - Trunk group number. There has to be a corresponding entry in RLRT_TRKG, RLPSTRUNKS and RLRCTGRPRK.

portgrp.type - TM_TRK.

nbr_del - Zero (default).

pref - Zero (default).

nbr_pref.digcnt - Zero (default).

sig_pro - TRAD.

ani_ind - DBNO.

ovlap_ind - DBNO.

rt_descript - RT_OTHER.

sec_rte_x - The secondary route index provides for an alternate path to the terminating switch.

For X.75/X.75' trunk groups (RLPSTRUNKS.trk_type equals X75 or X75P); sec_rte_x may be the value of a valid alternate route index pointing to either an IP, X.75 or X.75' trunk group. Refer to the usage section for the sec_rte_x attribute for more information.

For IP trunk groups (RLpstrunks.trk_type equals PCISXIP) the following rules apply:

1. In a given tuple, sec_rte_x does not equal route_x.

Copyright © 1999 Lucent Technologies 

2. sec_rte_x equals zero indicates no secondary route. This is the default value.
3. If sec_rte_x does not equal zero, then there exists another tuple in RLrt_routing with the key sec_rte_x.

**Attribute:**
route_x
**Fullname:**
Route index
**Attribute Description:**
Make up routing numbers to be associated with outgoing trunk group numbers.

**Attribute:**
route_type
**Fullname:**
Type of route
**Attribute Description:**
All trunks use enumeration RTE_HUNT.

Secondary routes for inter-module trunks may use the route type RTE_DNTRAN. If this route type is encountered, the directory number (DN) will be considered an intra-switch line terminating call (that is, the call will revert back to the DN translation state for line terminating calls) and will be completed across the Network Control and Timing (NCT) links if the DN terminates on the same host switch. The sec_rte_x of the tuple must be a valid noc for this office when the route type is RTE_DNTRAN. If there exist a RLrt_routi.p tuple with the sec_rte_x as the key then that tuple does not pertain to this route. If this secondary route type is encountered and the

DN does not terminate on the same host switch, the call will fail.

**Attribute:**
portgrp
**Fullname:**
Port group identifier
**Attribute Description:**
Port group identifier.

**Attribute:**
portgrp.grpnum
**Fullname:**
Outgoing trunk group number
**Attribute Description:**
The portgrp.grpnum attribute is a key to the RLrt_trkg relation.

**Copyright © 1999 Lucent Technologies** 

If the tuple from RLrt_trkg indicates that the trunk group is of 'type' = announcement, then the 'module' attribute in RLrt_trkg must be zero (that is, a globally controlled announcement). 'When the grpnum=0, no corresponding tuple is needed in the relation RLrt_trkg'. An extended digital subscriber line (EDSL) D-channel trunk group must not be assigned to a route index.

**Attribute:**
portgrp.grptype
**Fullname:**
Group type
**Attribute Description:**
Group port type.

**Attribute:**
nbr_del
**Fullname:**
Number of digits to delete
**Attribute Description:**
Once the call is routed to the appropriate trunk some digits (example: area code or office code) can be deleted. Allowing only information essentially needed for routing in destination office.

**Attribute:**
pref
**Fullname:**
Prefix digits
**Attribute Description:**
Prefix digits. Prefix the digits needed to route the call in distant office. For routes to an inter-LATA inter-exchange or international carrier, this field contains the 0ZZ/1NX code to be outpulsed to the access tandem. The 'pref' field may also contain 2ZZ (rt_routing.pref = 2ZZ where Z is 0-9) to indicate called number will be outpulsed as dialed to the access tandem when the secured special feature, optional seven digit outpulsing, is active on shared trunk groups (rt_routing.rt_descript = RT_STG) with exchange access (EA) signaling (rt_routing.sig_pro = EA). The 2ZZ will be converted to 0ZZ via software before it is outpulsed on the trunk. This field is not used for packet switch calls. For packet switch calls, the implied numbering plan area (NPA) is obtained either from the RLnmimpdgts relation or the office parameter GLpsinpa.

Route index set up to point to a revertive pulsing trunk group must have a 'pref' specified (zero for terminations to low-five side of office, or five for terminations to high-five side).

One of the many uses of this attribute is to store digit strings for equal access signaling. (e.g. 0ZZ, 1NX, or 1N'X). 0ZZ, 1NX, and 1N'X values are standardized across switches in the network.

Copyright © 1999 Lucent Technologies 

International operator traffic, characterized by a 1N'X value of 'pref', must not be routed on ISDN user part 7 (ISUP7) trunks but should be routed on EA multi-frequency (MF) trunks.

U.S. transport traffic, characterized in the end office switch by 1NX and a carrier ID other than 288, must be routed to an AT&T toll office switch on EA/MF trunks.

Equal access calls, using the international dialing sequence, and arriving at a toll office switch on an ISUP7 must be fully code addressed and routed on through the toll network using ISUP7 signaling.

**Attribute:**
nbr_pref
**Fullname:**
Number of digits prefixed
**Attribute Description:**
Number of digits prefixed.

**Attribute:**
sec_rte_x
**Fullname:**
Secondary route index
**Attribute Description:**
When routing index can be used to route the call to an empty trunk with similar destination. For announcement trunk groups, (where RLrt_trkg.type is equal to RTANNCMNT), the sec_rte_x must point to a tuple in RLrt_routing with a route type of RTE_ORDER.

The proportionate bidding (PB) feature adds a restriction to the secondary route index range. The PB feature is a secured feature. Its security feature identification number (SFID) is 34. The following rule for PB is valid only if that SFID is active:

> For all RLrt_routing tuples, the secondary route index attribute (sec_rte_x) cannot have a value in the range of the PB route index (1001 to 1032).

For general information regarding the PB feature rules, refer to rlPROPBID.p.

In an inter-module trunk call, the sec_rte_ri of the secondary route index must be the normalized office code (NOC) if the secondary route type is RTE_DNTRAN.

For special access trunk groups with a service class of FC_SPAB800 or FC_SPAM800, the sec_rte_x must be set to zero (reorder). For X.75/X.75' packet switching trunk groups this attribute may be used to provide an alternate route for destinations requiring X.75 or X.75' connections. The alternate route may be on the same

Copyright © 1999 Lucent Technologies 

5ESS(R)-2000 switch or another 5ESS(R)-2000 switch connected via an IP trunk group within the sub-network. For X.75 and X.75' trunk groups the value zero means 'no secondary route index assigned' and does not indicate reorder. Also, only one alternate route will be used by packet switching software (route index forms may appear to cascade from one route index to another but, as previously stated, the trunk hunting stops with this sec_rte_x route index value).

When the primary route is X.75', it must be possible to designate, on the routing tables, an alternate route which is either an X.75 trunk group, another X.75' trunk group or an IP trunk group.

Note: Although the routing tables may indicate that the alternate route for an X.75' trunk group primary route is an IP trunk group, it will not be possible operationally to alternate route a virtual call request received over an IP trunk and destined for that X.75' trunk group to the alternate IP trunk group.

When the primary route is X.75, it must be possible to designate, on the routing tables, an alternate route which is either an X.75' trunk group, another X.75 trunk group or an IP trunk group.

Note: Although the routing tables may indicate that the alternate route for an X.75 trunk group primary route is an IP trunk group, it will not be possible operationally to alternate route a virtual call request received over an IP trunk and destined for that X.75 trunk group to the alternate IP trunk group.

There is no switch requirement to match the operational/provisionable characteristics of the primary/alternate trunk groups. It is up to the service provider to decide which characteristics, if any, need to be the same between primary/alternate routes and designate them appropriately.

Note: Alternate routing on X.75 and X.75' trunk groups does not apply to PVCs. There are no rules enforcing this restriction. It is the responsibility of the user to correctly provision routing tables and associated PVC assignments.

**Attribute:**

sig_pro

**Fullname:**

Signaling protocol

**Attribute Description:**

The possible values are as follows:

TRAD - Traditional type of signaling.
EA - Exchange access signaling.
INC - International type of signaling.
FGB - Signaling to feature group B carriers. This value is

**Copyright © 1999 Lucent Technologies** 

only valid for route_type equal to RTE_HUNT.
MEA - Modified EA signaling for TAISP,
Exchange Access Operator Services System (EAOSS) signaling for EAOSS Special Feature when the lec_os is set to DBYES, or
Exchange Operator Services System (EOSS) signaling for EAOSS Special Feature when the lec_os is set to DBYES and no carrier is specified.
INCM - International MEA signaling for TAISP, or
Exchange Access Operator Services System (EAOSS) signaling for EAOSS Special Feature when the lec_os is set to DBYES.
PNANI - Automatic number identification (ANI) over PF secured feature.

Note: No internal data other than the `sig_pro` attribute is available to indicate if the far end Traffic Service Position System (TSPS) office is expecting TRAD or EA signaling. This must be verified with the TSPS office prior to definition of the signaling protocol for these trunks.

For traffic to a TSPS office which has not converted to the new OS signaling, use sig_pro equals TRAD. For traffic to a TSPS office which has converted to the new OS signaling, use sig_pro equals EA. Do not use INC or FGB for signaling to a TSPS office. The only exception is when the prefix is 4NX for TAISP signaling, then INC can be used to signal to the TSPS office.

If the sig_pro is MEA or INCM then the rt_descript must be RT_DTG or RT_STG and the servclass of the trunk must be FC_TSPS. Also, GLexinbnd must be DBYES to allow expanded inband signaling for sig_pro MEA and INCM.

If the sig_pro is MEA or INCM and the SFID 011 is activated, rctgrprk.intsig must be FCINBAND or FCEXINBND. This is the EAOSS Special Feature requirement.

If the sig_pro is MEA or INCM and the SFID 011 is not activated, rctgrprk.intsig must be FCEXINBND. This is the TAISP Feature requirement.

Note: The following supplemental information is not RC/ODA enforceable.

InterSM trunks cannot be used for equal access signaling. In other words, if sig_pro is not TRAD then the trunk served by this route index cannot be an interSM trunk.

When a sig_pro value of EA or INC is used to process an outgoing call, the digit analysis tables on the incoming side of the switch must have a consistent type_ci_call value. This value cannot be FCNONCI or FCCI_NULL (see RLdaprmfnl.type_ci_call and RLdaprlfnl.type_ci_call). Calls that violate this rule are killed by call processing.

Copyright © 1999 Lucent Technologies 

When sig_pro is EA, delete digits are ignored by the switch software and therefore should be set to zero to avoid confusion.

The combination of rt_descript equals RT_OTHER, sig_pro equals PNANI, and ani_ind equals DBYES is used only by the ANI over PF secured feature, which requires that secured feature ID 005 be set.

**Attribute:**
ckt_code
**Fullname:**
Circuit code
**Attribute Description:**
This attribute, contained in the network identification field of the transit network selection (TNS) parameter, maps an OZZ or a 1N/N'X to a four bit circuit code.

It is not recommended that a ckt_code value of zero be used when this route index is used on an ISUP7 trunk with a sig_pro value that is not TRAD.

For all cases when the tuple in RLrt_trkg, indexed by RLrt_routing.portgrp.grpnum, has out_sigtype equal to DBISUP7 and sig_pro is not TRAD, then the following consideration applies:

A four-bit value of 0000, in the circuit code bit subfield of the TNS parameter, is defined in the ISUP7 protocol specification to have a meaning of `unspecified'. Since all CCS7 parameter bit subfields have a default value of zero unless otherwise assigned, it is not recommended to use a four-bit 0000 code point as a meaningful value for ckt_code.

A 'ckt_code' value of 0001 must be used when 'pref' contains the 1NX (international call, no operator requested) standardized string.

A 'ckt_code' value of 0010 must be used when 'pref' contains the 1N'X (international call, operator requested) standardized string.'

**Attribute:**
ani_ind
**Fullname:**
ANI indicator
**Attribute Description:**
DBYES, if the ANI information should be outpulsed; DBNO, if the ANI information should not be outpulsed.

The combination of rt_descript = RT_OTHER, sig_pro = PNANI, and ani_ind = DBYES is used only by the ANI over PF secured feature, which requires that secured feature ID 005 be set.

The combination of lec_os = DBYES, sig_pro = MEA or INCM, rt_descript = RT_STG, and ani_ind = DBYES is required by EAOSS

**Copyright © 1999 Lucent Technologies** 

Special Feaure to provide EAOSS signaling, which requires that SFID 011 be activated.

**Attribute:**
ovlap_ind
**Fullname:**
Overlap indicator
**Attribute Description:**
DBYES if overlap outpulsing is allowed, DBNO, otherwise. This should be DBNO for revertive pulsing trunks.

This must be DBNO when the attribute portgrp.grpnum in this relation has a TSPS class of service (FC_TSPS) as indicated in RLrctgrprk.servclass, unless RLrt_routing.sig_pro is MEA or INCM.

This must be DBNO when the attribute portgrp.grpnum in this relation has a primary rate interface (PRI) class of service (FCEDSL, FCEDSLHM) as indicated in RLrctgrprk.servclass.

Overlap outpulsing is not allowed on ISUP7 or Common Channel Signaling System 6 (CCIS6) trunks. In other words, for all cases when the tuple in RLrt_trkg, indexed by a valid RLrt_routing.portgrp.grpnum (grpnum does not equal zero) has out_sigtype equal to DBISUP7 or DBCCIS6 then the following consideration applies:

RLrt_routing.ovlap_ind must be DBNO.

**Attribute:**
two_stage
**Fullname:**
Two-stage outpulsing flag
**Attribute Description:**
Not used by U.S. -- default to DBNO.

**Attribute:**
cpnsubsc
**Fullname:**
Calling party number subscription
**Attribute Description:**
This attribute indicates whether or not the inter-LATA/international carrier (IC/INC) subscribes to calling party number (CPN) parameter.

DBYES - The CPN parameter can be sent in the outgoing initial address message (IAM)
DBNO - Indicates it will not be sent in the IAM.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

rt_descript

**Fullname:**

Type of route

**Attribute Description:**

Chosen to indicate what type of route this tuple in RLrt_routing represents. If more than one value applies to the attribute, rt_descript, then the tuple should be duplicated, with a different RI for the key, with one tuple per relevant value of the rt_descript attribute. For example, if overflow on direct trunk groups to carriers, shared (tandem) trunk groups to access tandems (ATs), and BOC only trunk groups are all routing to the same announcement/tone, it is necessary to have a separate tuple for each case in order for measurements to work correctly. Note that the enumeration value RT_GEN_ANN should be used for routes to announcement or tone for which no more specific value applies.

**Attribute:**

ani_ii_digs

**Fullname:**

ANI II pairs

**Attribute Description:**

Two-digit information indicator associated with the route index of an outgoing call using EA signaling (EAMF or EA-ISUP7), EAOSS signaling, EOSS signaling, and MEA signaling. The route Index will identify the carrier used for the call.

The ANI information indicator is defined and administered by Telcordia Technologies.

The 'ani_ii_digs' associated with a call can be obtained from various places in the system. If it is obtained from RLrt_mcrt relation, it is associated with a service e.g., private facility access (PFA)/outward wide area telephone service (OUTWATS) or shared directory number (SDN) OUTWATS. If it is obtained from the RLflex_ani relation, it is associated with the class of service (COS) of the originating party. If it is obtained from the RLscridxpa relation, it is associated with a screening index of the originating party (The Flexible ANI Enhancement Secured Feature must be purchased and enabled, and the carrier must be allowed to send ANI II Digits).
If it is obtained from the RLrt_routing relation it identifies the carrier through its association with the route index.

The ani_ii_digs attribute associated with the MCRI (RLrt_mcrt) has the highest precedence, followed by RI (RLrt_routing), SCRIDX (RLscridxpa) and the COS (RLflex_ani).
The following diagram illustrates the precedence and the ani_ii_digs attribute to be outpulsed with the call:

| RLrt_mcrt | RLrt_routing | RLscridxpa | RLflex_ani |
|---|---|---|---|
| ani_ii_digs | ani_ii_digs | ani_ii_digits | ani_ii_digs |
| defined | N/A | N/A | N/A |

**Copyright © 1999 Lucent Technologies** 

| | | | |
|---|---|---|---|
| null | defined | N/A | N/A |
| null | null | defined | N/A |
| null | null | null | defined |

If the value of RLrt_mcrt.ani_ii_digs is FC_ANI_NULL, RLrt_routing.ani_ii_digs is FC_ANI_NULL, and RLscridxpa does not exist, then the ani_ii_digs will be derived from RLflex_ani and the value will be based on the COS of the originating party. Flexible ANI II feature is a secured feature and must be purchased to use. Flexible ANI Enhancements secured feature is depended on the Flexible ANI II secured feature.

**Attribute:**

csi_subsc

**Fullname:**

Carrier selection information (CSI) parameter subscription indicator

**Attribute Description:**

If the originating end office (OEO) determines that an inter-LATA exchange carrier (IXC) is required to complete the call, and if circuit selection results in the selection of a Common Channel Signaling System 7 (CCS7) outgoing circuit either directly to the IXC office or to an AT office, the OEO marks the circuit busy and formulates an IAM.

Prior to the originating end office sending an IAM, the carrier selection information subscription indicator will be read by the operational software to determine whether the CSI parameter should be transported to the IXC in the IAM message.

This attribute only applies when the associated outgoing trunk group uses ISUP7 signaling.

csi_subsc should be optioned to one of the values listed in the following on a per carrier route basis.

DBYES: Indicates that the CSI parameter should be passed to the IXC (subscribed).

DBNO: Indicates that the CSI parameter should not be passed to the IXC (not subscribed).

**Attribute:**

uui_subsc

**Fullname:**

User to user information (UUI) parameter subscription indicator

**Attribute Description:**

User to user information signaling transfer allows ISDN customers to exchange user data transparently through the network, in the UUI parameter of an ISUP message, during call setup and call clearing.

Copyright © 1999 Lucent Technologies 

Prior to sending an IAM message from an originating end office, the UUI parameter subscription indicator is checked by the operational software to determine if the UUI parameter should be passed to the far switch.

This attribute only applies when the associated outgoing trunk group uses ISUP7 signaling. The uui_subsc attribute should be optioned to one of the following values.

DBYES: Indicates that the UUI parameter should be included in the outgoing IAM (subscribed).

DBNO: Indicates that the UUI parameter should not be included in the outgoing IAM (not subscribed).

**Attribute:**
atp_subsc
**Fullname:**
Access transport parameter (ATP) subscription indicator
**Attribute Description:**
Q.931 information element transfer facilitates the transport of specific Q.931 information elements in the ISUP ATP transparently between exchanges in the network.

Prior to sending an IAM message from an originating end office, ATP subscription indicator will be checked by the operational software to determine whether the ATP parameter passed to the far switch.

This attribute only applies when the associated outgoing trunk group uses ISUP7 signaling.

The atp_subsc attribute should be optioned to one of the following values.

DBYES: Indicates that the ATP parameter should be included in the outgoing IAM (subscribed).

DBNO: Indicates that the ATP parameter should not be included in the outgoing IAM (not subscribed).

**Attribute:**
ffcf1
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**

ffcf4
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**
exp_cic
**Fullname:**
Expanded carrier identification code (CIC)
**Attribute Description:**
Used to indicate on EA trunks whether the expanded (four-digit) CIC should be used (DBYES). A value of DBNO on relevant trunks indicates that the three-digit CIC should be used. Trunks other than EA have this attribute set to DBNO.

**Attribute:**
lec_os
**Fullname:**
Operator services provided by LEC (LEC OS)
**Attribute Description:**
Used to indicate the operator services are provided by LEC (DBYES). A value of DBNO indicates the operator services are provided by IC. The following rules apply to this field:

1. The SFID 011 must be activated before setting this field to DBYES.
2. When the field is set to DBYES,
   a.) the signaling protocol must be MEA or INCM,
   b.) the route description type must be RT_STG,
   c.) the ANI indicator must be DBYES,
   d.) the servclass of the trunk must be FC_TSPS,
   e.) the out signal type must be DBMF.

When the SFID 011 is activated, the following signalings will be provided:

Copyright © 1999 Lucent Technologies 

| lec_os | sig_pro | rt_descript | SIGNALING PROVIDED |
|---|---|---|---|
| DBYES | INCM | STG | EAOSS |
| DBYES | MEA | STG | EAOSS |
| DBYES | MEA | STG | EOSS (no carrier specified) |
| DBNO | INCM | STG | MEA |
| DBNO | INCM | DTG | MEA |
| DBNO | MEA | STG | MEA |
| DBNO | MEA | DTG | MEA |

When the SFID 011 is not activated, only the following signalings will be provided:

| lec_os | sig_pro | rt_descript | SIGNALING PROVIDED |
|---|---|---|---|
| DBNO | INCM | STG | MEA |
| DBNO | INCM | DTG | MEA |
| DBNO | MEA | STG | MEA |
| DBNO | MEA | DTG | MEA |

EAOSS - Exchange Access Operator Services System Signaling
EOSS - Exchange Operator Services System Signaling
MEA - Modified EA signaling (AT&T terminology)

**Attribute:**
cicp_subsc
**Fullname:**
Carrier Identification Code Parameter (CICP) Subscription
**Attribute Description:**
Used to indicate on CCS7 trunks whether to send CICP parameter to IXC (Inter Exchange Carrier). A value of DBYES indicates that CICP should be allowed. DBNO indicates no CICP parameter should be sent.

1. The SFID 009 must be activated before setting this field to DBYES.
2. When the field is set to DBYES,
   a.) and signaling protocol is INC, then servclass must not be FC_IEC (IC).
   b.) and signaling protocol is not INC, then signaling protocol must be EA or MEA,
   c.) the out signal type must be DBISUP7.

**Attribute:**
rte_srchlmt
**Fullname:**
Route search limit
**Attribute Description:**
This attribute is Route search limit.
The route search limit determines how far along the route chain to search.

Copyright © 1999 Lucent Technologies 

**Attribute:**
tnsc
**Fullname:**
Terminating Network Selection Code
**Attribute Description:**
This attribute is Terminating Network Selection Code

**Attribute:**
tdr
**Fullname:**
Time Dependent Routing
**Attribute Description:**
This attribute denotes if Time Dependent Routing pertains to this route index. Even though tdr is set to DBYES, Time Dependent Routing (TDR) is not active unless SFID 251 is also turned on. The TDR SFID 251 is controlled by call processing, not by data.

**Attribute:**
trignum
**Fullname:**
final route trigger number
**Attribute Description:**
This attribute is a trigger number that causes an SCP query to be initiated on the final route in the list. Although, several RI triggers may be encountered during the call, only one SCP query will be invoked, and only on the final route in either RLrt_routing, or in RLrtlist. The trigger number can be set on RC View 10.2, or on RC View 10.25, after it is defined on RC View 9.35 with protocol R0D1 (ASP0.1 on RC View), and application ASP, and SFID 290 (Final Route Trigger) is unlocked on RC View 8.22.

```
/*********************************************************/
/* The trignum attribute is reserved for future use by the */

/*********************************************************/
```

**Attribute:**
rtlist_key
**Fullname:**
route list key indicator
**Attribute Description:**
This attribute indicates if a corresponding route list tuple is populated in the RLrtlist relation. For the rtlist_key attribute to be set to DBYES, a corresponding tuple with the same RI must be populated in the RLrtlist relation, and SFID289 (LDP Route List) must be unlocked.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
rel_link_type
**Fullname:**
release link type
**Attribute Description:**
Indicates which protocol will be used for Release Link processing.

**Attribute:**
eon_sup_cn
**Fullname:**
End Office Nodal ISUP Charge Number Suppression Indicator
**Attribute Description:**
This attribute, when assigned a value of DBYES, indicates that the Charge_Number will be suppressed and that the office originating line information (OLI), Glofc_oli, will be used to populate the OLI in the outgoing IAM message for ISUP calls which have been identified as EOLN2 calls.

SFID 515 must be unlocked before assigning a value of DBYES to eon_sup_cn. SFID 515 is dependent upon SFID 126.

## 4. Population Rules for RLrt_scrning

**Relation Description**
Screening Data Table

This relation associates the key values of screen index, dialed prefix (0+, 1+ or NONE), and the destination index (also known as code index) to what is known as rate and route data.

The screen index comes from line or trunk data, 'who you are' and the prefix and destination indices come from digit analysis, 'what you dialed'. These three sub-keys together yield (rate and route) or 'where you go' and 'what you pay' information. That is, knowing who you are and what you dialed, the central office can set up this relation to determine how you pay (rate or charge index) and where you terminate (route index [RI]). This relation also yields other rerouting information. For example, if a long distance call is dialed without a 1+ prefix, the following announcement may be heard, "Please dial 1 then the area code..." This is due to the screening relation. With the occurrence of the screen index and the digits dialed, a NONE prefix (is issued?) (which?) yields a route index leading to the pre-set announcement.

This relation is populated by recent change/verify (RC/V) view 10.10

**Attribute: screen_x**

**Fullname:** Screening index

**Attribute Description** Screening index associated with the line or trunk which originated this call. This is one of the three sub-keys to the relation.

The global parameter GL_OSO is set to 'DBYES' indicates that the *5ESS*®-2000 switch office is a toll office. For each trunk group handling incoming originating screening office OSO-inward wide area telephone service (INWATS) calls (which require inter-LATA database (IDB) query, the screening index allocated to this trunk should be duplicated to a screening index with a value equal to the initial screening index plus 100. Screening index of '100+ initial screening index' is used after digit analysis of the plain old telephone service (POTS) number returned from IDB. This will differentiate a POTS OSO call from a non OSO POTS call, and will preserve the identity of the incoming OSO call.

Example: - An 800 call originating in screening index 3 (home local access and transport area [LATA]) is sent to an IDB and then returned to the *5ESS* ®-2000 switch in

**Copyright © 1999 Lucent Technologies** 

screening index 103. It is now known where the call originated (3) and, if the call terminates in the same LATA it is routed to the local exchange carrier (LEC) haul back trunk group. If the POTS number returned from the IDB is for a served LATA it is routed to the AT&T access group.

**Attribute: prefix**

**Fullname:** Prefix digits dialed - 1+, 0+ or NONE

**Attribute Description** The term 'prefix' indicates the digits '1', '0' (or none) that may be dialed in front of the directory number. Prefix is one of the three sub-keys to the relation. For each combination of screen index and destination index values populated in this relation, there can be one to three values of prefixes. These indicate how the call should be processed in case each of those dialed prefixes: 0+, 1+ or no prefix. The prefix dialed is determined by digit analysis.

**Attribute: dest_x**

**Fullname:** Screening Destination Index (DI) or Code Index (CDI)

**Attribute Description** This is one of the three sub-keys to the relation. Destination index, which is termed 'CODE INDEX' or 'CDI' in the recent change/verify (RC/V) views, indicates the TYPE or CLASSIFICATION of the digit string dialed. A central office can have several types of digit strings - (such as, all strings that start with 979, digits for inter office calls, digits for intra office calls etc.).

These sets of strings are to be grouped to be given same or similar route treatment. Such grouping is accomplished by giving the same destination index to a set of all such strings. A destination index is supplied by digit analysis for each set of dialed digits.

By setting up the digit analysis tables appropriately, different destination indices can be assigned for various sets of digits.

This gives the central office the ability to identify a set of dialed digits no matter who dialed those digits, or where they originated. This information is used in this relation, in combination with other sub-keys to yield 'rate' and 'route' information.

**Attribute: route_type**

**Fullname:** Screening Route Type

**Attribute Description** Indicates the type of route used to process this call. One of the route types listed is associated with this compound key value (SI+CDI+PREFIX). Each allowed route type and its meaning are shown:

```
RTE_HUNT:   Route this call to a hunted trunk.
RTE_DNTRAN: Route this call to a line after directory number
            (DN) translation.
RTE_ATDN:   Route this call to the attendant of the (BRCS)
            terminal group.
RTE_PRIME:  Route this call using the route index or NOC
            (Normalized Office Code) obtained from
            digit analysis
RTE_MC:     This is a private facility (PF) or automatic
            route selection (ARS) call.  Route
            the call using RLRT_MCRT.
```

**Attribute: route_x**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Route Index or Normalized Office Code (NOC) Value

**Attribute Description** The value in this attribute is either the route index or an NOC. IF the value is a route index, the call is routed to an appropriate trunk populated in RLRT_ROUTING. If the value is a NOC, it is routed to a line. The value of attribute route_x is interpreted depending on the value of the route_type attribute. The allowed values and the meaning of route_x attribute depending on the route_type are as follows:

| route_type | route index value |
|---|---|
| RTE_ATDN | Zero (use RI from digit analysis). |
| RTE_DNTRAN | This is a NOC, range: 1-AVNOCMAX(). |
| RTE_HUNT | This is a route index, range: 1-AVRIMAX(). |
| RTE_PRIME | Zero (use RI from digit analysis). |
| RTE_MC | This is an modular feature customization (MC) route index, range: 1-AVRIMAX(). |

**Attribute: cst**

**Fullname:** Screening Class of Service Tone

**Attribute Description** Class of service tone. This is the tone returned to the originator when a call is to be failed due to screening.

**Attribute: rev_bat**

**Fullname:** Screening Reverse Battery Indicator

**Attribute Description** Reverse battery indicator. Use DBYES for private branch exchange (PBX) toll diversion trunk and DBNO for all others.

**Attribute: charge_x**

**Fullname:** RT Screening Charge Index

**Attribute Description** Charge index. Type of charging applied to call. Taken from CHRGIDXEXP relation, attribute 'charge_x'. The valid range of this attribute is 0 - 2047.

**Attribute: carr_block**

**Fullname:** Screening Carrier Block

**Attribute Description** Set to DBYES if when doing carrier-independent screening on calls to inter-LATA carriers, the calls should be routed/blocked according to this screening tuple (assuming it was reached while doing carrier-independent screening - that is, screening with the digit analysis DI rather than the carrier DI) and access a new one using the carrier-specific DI.

--------Should be set to DBYES on all screening tuples used to implement blocking due to:

- toll/code restriction/diversion
- WATS band screening
- 1+ required announcement
- '0+7D not allowed' announcement
- etc.

Should be set to DBNO on screening tuples that are just used to pick a normal RI or NOC that will result in successful routing.

**Copyright © 1999 Lucent Technologies** 

**Attribute: inter_restrict**

**Fullname:** RT Screening Inter-restrict

**Attribute Description** If DBYES, indicates the originating line is restricted from making sent-paid calls to the selected carrier. The default is DBNO.

**Attribute: conf_type**

**Fullname:** Conflict Type

**Attribute Description** The TYPE CI CALL selected for conflict resolution for all conflict cases between intra-LATA local, intra-LATA toll, and inter-LATA calls.

**Attribute: ffcf1**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description** See fullname description.

**Attribute: ffcf2**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description** See fullname description.

**Attribute: ffcf3**

**Fullname:** Boolean reserved for future field feature.

**Attribute Description** See fullname description.

**Attribute: ffcf4**

## 4. Population rules for RLrt_sfg

### Relation Description

```
        Simulated Facility Group routing

         Simulated facility group information
```

**Attribute:**

```
        grpnum
```

**Fullname:**

```
        Group number.
```

**Attribute Description:**

```
        Indicates the group number of this sfg.

        If size is in the range of 97-1984,
        then the grpnum must be 1-500 and
        the hunt_type must be RTH_LGSFG.

        If size is in the range of 1-96 or is 9999,
```

Copyright © 1999 Lucent Technologies

then the grpnum may be 1-AVSFGRPS() and
the hunt_type must be RTH_SFG.

The sfg_num (grpnum) must not be duplicated from the
number used in RLicr. that is,
RLicr.sfg_num != RLrt_sfg.grpnum

**Attribute:**
size
**Fullname:**
Size.
**Attribute Description:**
If the size is less than or equal to 1984,
then the size is the maximum number of calls
which may use this SFG simultaneously.

If the size is equal to 9999, then there is
no limit on the number of simultaneous calls
which may use this SFG.

**Attribute:**
owbillnum
**Fullname:**
Wats billing number.
**Attribute Description:**
OUTWATS, INWATS, TINWATS, HM, SCOCS, EON, MEGACOM(R) or private
CCSA network billing number.
Used for accounting purposes.
IF swab == DBNO
rlRT_SFG.owbillbum = NULL
ELSE
rlRT_SFG.owbillnum cannot be NULL

**Attribute:**
owbillnum.digcnt
**Fullname:**
digit count.
**Attribute Description:**
Digit count.

**Attribute:**
owbillnum.dn
**Fullname:**
Directory number.
**Attribute Description:**
Directory number.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

warnthresh

**Fullname:**

Threshold warning lamp.

**Attribute Description:**

The customer-selected ISDN Attendant Simulated Facility Group (SFG) Warning Lamp Threshold.

When, and only when, the number of idle Simulated Facilities of an SFG is less than or equal to this value, the warning lamp will be lit. This is true even if warnthresh equals or exceeds the size of the group.

**Attribute:**

sfg_si

**Fullname:**

Simulated Facility Group (SFG) screening index.

**Attribute Description:**

Screening index to be used in OESSX (sfg_type = SFGOUTESSX), 2WESSX (sfg_type = SFG2WESSX), OUTWATS (sfg_type = SFGOUTWATS), Hotel/Motel (sfg_type=SFGHM), Selective Class of Call Screening service (sfg_type = SFGSCOCS), EOLN (sfg_type = SFGEON), SDN (sfg_type = SFGSDN), MEGACOM(R) (sfg_type = SFGMEGACOM) and originating EDSL POTS (sfg_type = SFGEDSL, used for OPOTS service, see RLedslgprt.P). This si is passed in the MGrt_fail message back to the originating terminal process and is placed in the route request sent back to RTA.

If = 0 then sfg_type cannot equal SFGOUTWATS, SFGHM, SFGSCOCS, SFGM800, SFGMEGACOM.
If !=0 then sfg_type must equal SFGOUTWATS, SFGOUTWATS, or SFGOUTESSX, or SFG2WESSX or SFGEDSL SFGHM, SFGSCOCS, SFGEON, SFGEDSL, SFGSDN, SFGM800, or SFGMEGACOM and a tuple must exist in RLrt_scrning with sfg_si as one of the keys.

**Attribute:**

hunt_type

**Fullname:**

Hunt type

**Attribute Description:**

Indicates the type of hunting

**Attribute:**

sfg_type

**Fullname:**

SFG type

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

Indicates the type of sfg.

An SFG (grpnum) may be used by EDSL. For Trunk INWATS (TINWATS), sfg_type = SFGINWATS. For OUTWATS, sfg_type = SFGOUTWATS. For basic service (POTS originating, POTS terminating), sfg_type = SFGEDSL.
For Software Defined Network, sfg_type = SFGSDN.
For MEGACOM(R) 800 service, sfg_type = SFGM800.
For MEGACOM(R) service, sfg_type = SFGMEGACOM.
For Enhanced 911 line originations sfg_type = SFGE911LNE and for Enhanced 911 trunk originations sfg_type = SFGE911TRK.
For nsftypes OFX & OTIE the corresponding SFG type is SFGOUTFX & SFGOUTTIE
For nsftypes TFX & TTIE the corresponding SFG type is SFGINFX & SFGINTIE
The SFG types SFG2WFX & SFG2WTIE can be used by all 4 nsftypes.
For CENTREX Network Overflow SFG, sfg_type = SFGCNSOVFL.
For Hotel/Motel service sfg_type = SFGHM.
For Selective Class of Call Screening service sfg_type = SFGSCOCS.
For EOLN sfg_type = SFGEON.
For International 800 service, sfg_type = SFGI800.
For MultiQuest (DIAL-IT NOVA) service, sfg_type = SFGMULTIQUEST.

**Attribute:**

sfgbl

**Fullname:**

SFG busy lamp.

**Attribute Description:**

Indicates if an sfg busy lamp is associated with this sfg (DBYES) or not (DBNO).

IF DBYES verify existence of tuple in RLrt_tgbl such that
key rlRT_TGBL.grpnum = rlRT_SFG.grpnum
rlRT_TGBL.pftype = PFSFG

**Attribute:**

sfgmkby

**Fullname:**

SFG make busy.

**Attribute Description:**

Indicates if sfg make busy (a private facility feature capability) is provided for this sfg (DBYES) or not (DBNO).

If DBYES verify if tuple exists such that:
key rlHUNTKEYS.port = any valid port,
rlHUNTKEYS.huntkey_type = FCSFGMKBUSY,
rlHUNTKEYS.portgrp.grpnum = rlRT_SFG.grpnum
or
a tuple exists in rlISSCCOF such that

**Copyright © 1999 Lucent Technologies** 

```
        rlISSCCOF.pftype = PFSFG,
        rlISSCCOF.grpnum = rlRT_TRKG.grpnum
```

**Attribute:**
        isdntgbwl
**Fullname:**
        ISDN trunk group busy lamp.
**Attribute Description:**
        Indicates if an ISDN trunk group busy lamp and a
        possible a trunk group warning lamp is associated
        with this sfg (DBYES) or not (DBNO).

        IF DBYES verify existence of tuple in RLtgtoatt
        such that
        key rlTGTOATT.grpnum = rlRT_SFG.grpnum
        rlTGTOATT.pftype = PFSFG
        Note: the SFG might have nothing to do with ISDN
        but it can be monitored via the ISDN
        attendant console lamps. In fact it could
        also be monitored by an analog TGBL as previously
        seen.

**Attribute:**
        swab
**Fullname:**
        Standard WATS billing.
**Attribute Description:**
        Standard WATS or private billing indicator. Set to DBYES
        when calls are to be billed to a standard
        billing number, otherwise DBNO.

        If rlRT_SFG.owbillnum == NULL
        swab = DBNO
        ELSE
        swab = DBYES.

**Attribute:**
        q_alwd
**Fullname:**
        Queuing allowed.
**Attribute Description:**
        queuing allowed on this group?

        If q_alwd id DBYES, then qfid must contain
        a valid queuing feature with modular feature type MFQU,
        and a tuple in RLfacname with RLfacname.facid = qfid
        and RLfacname.subclass = SCL_FEAT. Also if
        q_alwd is DBYES then sfg_type must be SFGOUTWATS.
        If pri_spl_dly sets to DBYES, then RLqu_pri tuple
        must exist in queuing sm where RLrt_sfg.grpnum equals

Copyright © 1999 Lucent Technologies 

RLqu_pri.portgrp.grpnum and RLqu_pri.portgrp.grptype
euqals TM_QSFG.
If it is OFFHOOK queue and spl_dlytreat or pri_spl_dly
set to DBYES, then RLqu_dly tuple must exist in queuing sm
where RLrt_sfg.grpnum equals RLqu_dly.portgrp.grpnum and
RLqu_dly.portgrp.grptype equals TM_QSFG.
If it is RGBK queue and pri_spl_dly set to DBYES, then
RLqu_dly tuple must exit where RLrt_sfg.grpnum equals
RLqu_dly.portgrp.grpnum and RLqu_dly.portgrp.grptype
equals TM_QSFG.

**Attribute:**
qmodule
**Fullname:**
Queuing module
**Attribute Description:**
module on which this group's queue resides

verify qmodule exists in RLmodatt.mod
If q_alwd is DBYES then qmodule must be > 0.

If qmodule changes from one SM to another, then tuple changes
may be needed in RLms_qan.sm_id and .gp_id if measurements are
enabled for the RLrt_sfg.grpnum.

**Attribute:**
rqsize
**Fullname:**
Routine queue size.
**Attribute Description:**
default parameter routine queue size

Dependencies:
All (qu_ogtos.rqsize + qu_ogtos.pqsize +qu_os.qbsize +
qu_os.qexsize) attributes in tuples already assigned to
this particular SM must be <= 255 (SM) or <= 4000
(SM-2000).

Note: This check is being implemented in RLqu_os
and RLqu_ogtos.

**Attribute:**
pqsize
**Fullname:**
Priority queue size.
**Attribute Description:**
default parameter priority queue size

See rules for rqsize.
Note: this check is being implemented in RLqu_os

**Copyright © 1999 Lucent Technologies** 

and RLqu_ogtos

**Attribute:**
rou_q
**Fullname:**
Routine section
**Attribute Description:**
Routine section type.

**Attribute:**
pri_q
**Fullname:**
Priority section.
**Attribute Description:**
does this queue have a priority section

If pri_q is DBYES then pqsize must be >0
and q_alwd must be DBYES.

**Attribute:**
enq_act
**Fullname:**
Enqueuing active.
**Attribute Description:**
enqueuing active
(Note: this attribute is for
an interface to the Facilities Management Capability)

**Attribute:**
ffcf1
**Fullname:**
Future feature entry.
**Attribute Description:**
Future feature entry.

**Attribute:**
ffcf2
**Fullname:**
Future feature entry.
**Attribute Description:**
Future feature entry.

**Attribute:**
ffcf3
**Fullname:**
Future feature entry.
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Future feature entry.

**Attribute:**
ffcf4
**Fullname:**
Future feature entry.
**Attribute Description:**
Future feature entry.

**Attribute:**
ffcf5
**Fullname:**
Future feature entry.
**Attribute Description:**
Future feature entry.

**Attribute:**
line_das
**Fullname:**
Line Digit Analysis Selector.
**Attribute Description:**
New line das
Range of values: 0 - 99

Dependencies: if RLrt_sfg.line_das > 0
then RLda_digstrt.digtree must be defined and
RLrt_sfg.sfg_type must be SFGOUTWATS or SFGEON.

**Attribute:**
trk_das
**Fullname:**
Trunk Digit Analysis Selector.
**Attribute Description:**
New trunk das
Range of values: 0 - 99

Dependencies: if RLrt_sfg.trk_das > 0
then RLda_digstrt.digtree must be defined and
RLrt_sfg.sfg_type must be SFGOUTWATS or SFGEON.

**Attribute:**
post_q_treat
**Fullname:**
post queue treatment.
**Attribute Description:**
post queue treatment (ARS-D,MQII)
When a call overflows a Modular Queue and is not queued
for given the facility, the call will be re-routed only

Copyright © 1999 Lucent Technologies 

if the call is an ARS-D call and QR_ALTR is specified, or
else the call is given reorder tone and disconnected.

When qfid > 0 QR_NULL is not allowed

**Attribute:**
qfid
**Fullname:**
Queuing feature Id.
**Attribute Description:**
queuing feature id
Range of values: 0, or top 6 bits = MFQU,
bottom 10 bits must be 1 - 1023

a tuple in RLfacname with
RLfacname.facid = qfid and RLfacname.subclass = SCL_FEAT
If qfid > 0 then q_alwd must be DBYES. If qfid > 0 then
RLqu_tcfdf.grptyp must be TM_QSFG where RLQU_TCFDF is
keyed by qfid.

**Attribute:**
mdr_grp
**Fullname:**
Message Detail Recording Group
**Attribute Description:**
Indicates the MDR group associated with this SFG.
The type of SFG allowed is OUTWATS.
If populated, the MDR group must be defined in RLmdr_gp.
A PFA/ARS call that using OUTWATS SFG produces MDR
record that specified in the MDR_GP.

**Attribute:**
mdract
**Fullname:**
Message Detail Recording Activation Indicator
**Attribute Description:**
Indicates if MDR is active for this SFG.
If active the mdr_grp attribute must also
populated

**Attribute:**
sfg_rti
**Fullname:**
The routing index associated with a SFG group
**Attribute Description:**
This route index is associated with a SFG group,
and will be used to route calls from a PRI trunk
to FX or Tie Trunk, in this case the route index
must be greater than zero for all other cases the

Copyright © 1999 Lucent Technologies 

route index should be zero.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLrt_specri

**Relation Description**
DNs associated with route indices for terminal maintenance testing.

DNs associated with route indices for terminal maintenance testing.

RLrt_specri (Loopback Test Type Routing)DESCRIPTION:

Trunks use dialed digits to attempt to connect to an Integrated Services Test Function (ISTF) transmission test which provides a near end loopback. The type of loopback (inverted or non-inverted) which they request is identified in the RLrt_specri.tstcode attribute. From there the associated route index is used to get a trunk group and eventually hunt through the members to find the next available ISTF loopback Logical Test Port (LTP). The tstcode attribute is passed along in the routing, therefore separate route indexes are not required for different tstcodes. This means that one route index can serve the LTP type loopback even though there are 2 flavors of loopback. The route index is associated with a trunk group which has a servclass of TM_ISTFLB.

BRIs use dialed digits to perform a non-inverting loop-back which is performed locally at the TSI instead of the ISTF. The test code for BRI access is TCICNINVISTF. For BRI access the RI is ignored. If a dialed code is intended only for BRI access, the RI is allowed to be 0. If a dialed code is intended for both BRI and trunk access then the RI must be non-zero (to identify the ISTF for trunk access).

As a point of clarification, BELLCORE has specified that the term 'non-inverting loopback' and '108 Test Line' are equivalent and may be used interchangeably.

There exists a corresponding tuple to the RLrt_specri tuple in RLrt_dntran relation which uses the same noc and digits.

If RI is populated before the tuple can be inserted, the ICP must be set to 'N'.

QUANTITY OF TUPLES: One tuple for each ISTF loopback tstcode, but the ri should be the same for all tuples. Exception: for TCICNINVISTF tstcode the ri may be zero (if non-zero, ri should be the same for all tuples).

TUPLE SEMANTICS:

dn.noc - - normalized office code for directory number

Copyright © 1999 Lucent Technologies 

dn.digits - - last four digits of terminal maintenance directory number

ri - - route index used to access trunk group. This should be the same for all ISTF loopback tstcodes unless an ri of 0 is populated. 0 may be populated when a dial code is only intended for BRI access to the 108 test line.

ci - - 0 (default)

tstcode - - test code which identifies the type of loopback requested (inverted=TCICINVISTF or non-inverted=TCICNINVISTF).

**Attribute: dn**

**Fullname:** directory number

**Attribute Description** Directory number.

**Attribute: dn.noc**

**Fullname:** DN's normalize office code

**Attribute Description** Normalized office code for directory number.

**Attribute: dn.digits**

**Fullname:** DN's last 4 digits

**Attribute Description** Last four digits of terminal maintenance directory number.

**Attribute: ri**

**Fullname:** route index

**Attribute Description** Route index used to access trunk group. This should be the same for all ISTF loopback tstcodes.

**Attribute: ci**

**Fullname:** charge index

**Attribute Description** Charge index.

**Attribute: tstcode**

**Fullname:** test code

**Attribute Description** Type of testing associated with directory number.

A tstcode of TCIC106 is only allowed if the global office parameter Gldsnopt = DBYES.

TCBRITL - - basic rate interface dial up test line.

TCBBRITL - - billed basic rate interface dial up test line. For tstcode equal to TCBRITL or TCBBRITL, ri must equal 0.

## 4. Population rules for RLrt_tg

### Relation Description

Routing and terminal group relation

Associates a modular feature customization (MFC) capability terminal group with its associated data in the administrative module (AM) and in each switching module (SM).

A tuple in this relation should only exist if at least one of the non-key attributes is not required to be defaulted.

**Attribute:**

tgid

**Fullname:**

Identification of this modular feature customization terminal group

**Attribute Description:**

Terminal group ID of the lines (not the attendant's TGID) that get toll diverted or have manual line service or get re-routed to the attendant directory number (DN).

**Attribute:**

src_bill

**Fullname:**

Source billing

**Attribute Description:**

Flag to indicate if the source billing for attendant handled calls (SBAC) feature is activated for this terminal group.

If the attendant and the originating party are members of the same terminal group and src_bill is set to DBYES, then the attendant's billing DN will be replaced by the originating party's DN on all calls extended by the attendant that result in billing records.

Four types of source parties are allowed: centrex lines, centrex satellite tie trunks, foreign exchange (FX) trunks and regular tie trunks.

This condition is enforced by call processing and not by recent change/verify (RC/V) or ODA.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
mbg_id
**Fullname:**
Multiswitch Business Group (MBG) IDentifier.
**Attribute Description:**
mbg_id is an identifier used to describe a Multiswitch Business Group (MBG) that has Multiswitch Business Group Elements (MBGE) in 1 or more switches.
This is a unique number in the network with a range of {0,2-65535}. The value 1 is "Reserved for Public Network Identifier" (such as, non-MBG identification.

```
/* RULE about RLrt_tg.mbg_id */
/* rt_tg.mbg_id should be 0 unless the */
/* CENTREX Network (CN) CN_SFID #181 is on */
```

**Attribute:**
cns
**Fullname:**
CENTREX Network government Secure
**Attribute Description:**
cns is an indicator showing subscription to the CENTREX Network government Secure Feature.

```
/* RULE about RLrt_tg.cns */
/* RLrt_tg.cns must be DBNO unless the */
/* CENTREX Network for Government Secure (CNS)
/* CNS_SFID #183 is on */
```

**Attribute:**
pp_display
**Fullname:**
precedence preemption only display
**Attribute Description:**
pp_display designates if the PP display is to be used for all calls that terminate to any ISAT terminals that are members of this terminal group and have the PP feature assigned.

The value of pp_display only has effect if the PP feature is assigned to the ISAT terminal.
If pp_display = DBYES, then all calls terminating to ISAT are displayed with PP format.

1) All non-PP calls are displayed with "1=N" in the precedence subfield of the display.
2) NO Terminal Group restrictions are shown.

If pp_display = DBNO, then only PP calls terminating to ISAT are displayed using the PP ISAT display format.

1) PP calls do NOT show Terminal Group restrictions.
2) All PP calls are off-net. There can not be an on-net PP call. PP calls cannot be MBG calls.

**Copyright © 1999 Lucent Technologies** 

3) MBG calls will show Group restrictions and be displayed as if no PP feature had been assigned to the ISAT terminal.
4) non-PP off-net calls will NOT show Terminal Group restrictions.

This can be summarized in the following diagram:

| PP call | pp_ disply | t grp restr shown | fmt DSN |
|---|---|---|---|
| Note 1 | Y | N | Y |
| Y | N | N | Y |
| N | N | Note 2 | N |

Note 1: For pp_display=Y, the format is determined independent of the type of call being handled.

Note 2: Terminal group restrictions are shown for MBG calls. For non-MBG calls, no terminal group restrictions will be shown, but the rest of the TGSR format will be used.

**Attribute:**

sdndas

**Fullname:**

Software defined network (SDN) digit analysis selector.

**Attribute Description:**

This attribute specifies the digit analysis selector (DAS) that will be used for SDN originations from analog or basic rate interface (BRI) lines. The SDN DAS is used in call processing to define the digit analysis tables that will be used to analyze the digits for an SDN dialing plan. This attribute is used for SDN originations of the format (SDN dial code or SDN feature button) + (SDN directory number), where the dial code or feature button is defined with an action of ACN_SDNUSE. The SDN directory number is interpreted by this attribute. This attribute is not used to route SDN calls via automatic route selection (ARS).

SDN calls are routed with the code index and route index from standard digit analysis (such as local digital interpreter [LDIT], table rate and route [RAR], international direct distance dialing [IDDD]) and are not overwritten by the code index and route index obtained from the carrier (such as inter=LATA carrier form [ICF], carrier destination mapping form [CDIM]). For example, the code index is obtained from RLDAPRMFNL.dest and the route index is obtained from RLDAPRMFNL.route_x or RLRT_SCRNING.route_x. The carrier is identified in the same manner as basic interexchange carrier calls, such as obtaining the carrier via the presubscribed interexchange carrier (PIC) parameter assigned to the directory number. When defining digits to interpret in LDIT, the call type (such as RLDAPRMFNL.desttype) must be FCNORMAL and cannot be FCSDNACCESS.

CDIM - Carrier destination mapping form.

**Copyright © 1999 Lucent Technologies** 

ICF - Inter-LATA carrier feature form.
IDDD - International direct distance dialing form.
LDIT - Local digit interpreter table form.
RAR - Rate and route form, screening.

Dependencies:
1. If sdndas is not zero, then there must be a tuple in RLrc_das with the sdndas value.
2. The LDIT of this DAS must exist on all SMs where the terminal group exists. The distribution of the LDIT will be verfied when the terminal group is assigned to the directory number (DN) and this attribute (sdndas) is not zero for the terminal group that is being assigned. The distribution of the LDIT can not be checked when assigning this attribute (sdndas).
3. The RLrc_ldit packet switching flag (psflag) must be set to DBNO.

**Attribute:**
moh_src
**Fullname:**
Music on hold music source
**Attribute Description:**
This is the local or global music source trunk port for use with music on hold.

The music source trunk port cannot be specified unless the music on hold special feature (SFID 064 is set) has been purchased by the office.

**Attribute:**
moh_src.member
**Fullname:**
Trunk port name used for music source
**Attribute Description:**
Attribute moh_src.member is the trunk port name of the music port for music on hold.

If moh_src.member is not equal to GLNULPORT, then the Music On Hold special feature ID must indicate that the feature has been purchased for the office.

**Attribute:**
moh_src.module
**Fullname:**
Music on hold source switching module
**Attribute Description:**
Attribute moh_src.module is the SM of the trunk of the music source for music on hold.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
parktime
**Fullname:**
Call park time
**Attribute Description:**
Call park timer, defines how long to hold a parked call before attempting ringback. Can be from 0 to 360 seconds in 30 second increments. The default for the field is zero seconds. A value of zero indicates no ringback timing is to be applied.

**Attribute:**
attpktime
**Fullname:**
Attendant call park time
**Attribute Description:**
Call park timer, defines how long to hold a call parked against an attendant before attempting ringback. Can be from 0 to 360 seconds in 30 second increments. The default for the field is zero seconds. A value of zero indicates no ringback timing is to be applied.

**Attribute:**
ffcf1
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
Boolean reserved for future field feature

**Attribute:**
ffcf2
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
Boolean reserved for future field feature

**Attribute:**
ffcf3
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
Boolean reserved for future field feature

**Attribute:**
ffcf4
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
nosofthold
**Fullname:**
Prohibit music on hold for soft hold
**Attribute Description:**
Prohibit music on hold for soft hold indicates whether music on hold is prohibited for a custom ISDN user during a soft hold request. A default of DBNO indicates music should be provided to the soft held party.

Prohibit music on hold for soft hold cannot be DBYES unless the Music On Hold Special Feature (SFID 064 is set) has been purchased by the office.

**Attribute:**
cnigi
**Fullname:**
Calling number identification service delivery option. Intra-Group Only.
**Attribute Description:**
The cnigi field indicates whether members of the terminal group have restrictions on delivery of calling party number and forwarding number information, as provided by the CNIS, CPN/BND, RN Delivery, CgPS Delivery and ICLID features. Based on the cnigi field, these may be restricted to intra-group calls only. CNIGI is NOT a separate assignable feature. The CNIGI field may be overridden on a per line or per trunk basis, by setting the CNIGI field to a value other than NULL.

The possible settings of Intra-group CNIS option are:

FCNULLCNIGI- Default. Consult the Glcnigi Office Parameter.

FCNRSTCNIGI- No Restrictions apply to Display/deliver CPN or RN information on all calls.

FCIGOCNIGI - Display/deliver CPN or RN information only on intra-group calls.

**Attribute:**
atnd_dn
**Fullname:**
DN of attendant.
**Attribute Description:**
zero indicates no attendant DN exists.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

atnd_dn.noc

**Fullname:**

Normalized office code (NOC)

**Attribute Description:**

zero indicates no attendant DN exist

**Attribute:**

atnd_dn.digits

**Fullname:**

Digit string

**Attribute Description:**

An array of four extended digits.
NULL indicates no attendant DN for this group

**Attribute:**

atnd_dntr

**Fullname:**

unused attribute

**Attribute Description:**

unused attribute - defaulted to zero

**Attribute:**

ported

**Fullname:**

ported indicator

**Attribute Description:**

This attribute indicates if the terminal group associated with this tuple is ported by the Number Portability feature. The group ported indicator takes precedence over the individual ported indicator. The indicator that will be used (either the individual or the group ported indicator) will be determined by call processing.

**Attribute:**

ovr_dny_xfer

**Fullname:**

Override Deny Transfer

**Attribute Description:**

This attribute indicates that any transfer denials provisioned by the Deny Transfer of Digit Screened Calls feature will be overridden and thus allow the transfer for all lines in this terminal group. If this attribute is set to DBYES, all transfers on lines in this terminal group are allowed regardless of whether the digit strings are marked as "denied" or not.

**Attribute:**

ctxid

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Context Identifier

**Attribute Description:**

This attribute indicates if the terminal group associated with this tuple is unbundled or resold. A terminal group is unbundled if ctxid = CTXID_UNBNLD; it is resold if ctxid = CTXID_RESOLD.

**Defines:**

"db/DMport.h"

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLrt_tgbl

**Relation Description**

associates a simulated facility or a trunk group with its metallic service unit port of the busy lamp (tgbl)

N/A

**Attribute:**

grpnum

**Fullname:**

trunk group id

**Attribute Description:**

Indicates the group number of this sfg or physical trunk group.

Copyright © 1999 Lucent Technologies

```
        IF pftype = PFSFG Verify existence of tuple in
        RLrt_sfg such that:
        key rlRT_SFG.grpnum = rlRT_TGBL.grpnum
        rlRT_SFG.sfgbl   = DBYES.

        IF pftype = PFPHYS Verify existence of tuple in
        RLrt_trkg such that:
        key rlRT_TRKG.grpnum = rlRT_TGBL.grpnum
        rlRT_TRKG.tgbl   = DBYES.
```

**Attribute:**
pftype
**Fullname:**
indicates if this facility is a simulated facility group or a physical trunk group
**Attribute Description:**
Indicates if this facility is a simulated facility groupF (PFSFG) or a physical trunk group (PFPHYS).

**Attribute:**
tgbl_port
**Fullname:**
id of metallic service unit port of the tgbl
**Attribute Description:**

```
        Verify existence of tuple in RLfc_porttyp
        such that:
        key rlFC_PORTTYP.port      = tgbl_port
        rlFC_PORTTYP.servclass = FC_PFLAMP

        Verify that tgbl_port.member is not equal
        to the RLicr.port AND tgbl_port.module is
        not equal to the RLicr.sm in any of the
        RLicr tuples.
```

**Attribute:**
tgbl_port.member
**Fullname:**
port name of a port
**Attribute Description:**
indicates the port name

**Attribute:**
tgbl_port.module
**Fullname:**
SM number
**Attribute Description:**
The IM number that this port terminates on

**Relation Description**

Terminal group Id.

Associates a modular feature customization capability (MFC) terminal group with its associated data in the AM.

**Attribute:**
tgid
**Fullname:**
Terminal group Id.
**Attribute Description:**
ID of this MFC terminal group.

**Attribute:**
orig_sfg
**Fullname:**
Originating simulated facility group
**Attribute Description:**
Indicates if a simulated facility is needed to escape this CCSA/ESSX terminal group (DBYES) or not (DBNO).

Dependency:
If DBYES then
rlRT_TGID.mc_ri and/or rlRT_TGID.ccsa_origri > 0.

**Attribute:**
mc_ri
**Fullname:**
MFC route index
**Attribute Description:**
Used by private facilities and automatic route selection feature routing.

Dependency:
If > 0 then
1) verify that a tuple exists in RLrt_mcrt such that:
   key rlRT_MCRT.mcri = rlRT_TGID.mc_ri,
   rlRT_MCRT.route_type = RTE_SFG.
2) verify that a tuple exists in RLrt_sfg such that:
   rlRT_SFG.grpnum = rlRT_MCRT.sfg_grp,
   rlRT_SFG.sfg_type is SFGOUTESSX or SFG2WESSX.

**Attribute:**
term_sfg
**Fullname:**
terminating simulated facility group
**Attribute Description:**
Indicates if a simulated facility is needed to enter this CCSA/ESSX terminal group (DBYES) or not (DBNO).
Range: DBYES/DBNO. Default: DBNO.

Copyright © 1999 Lucent Technologies

If DBYES then
rlRT_TGID.term_mcri and/or rlRT_TGID.ccsa_termri > 0.

**Attribute:**
term_mcri
**Fullname:**
MFC route index associated with the terminating sfg
**Attribute Description:**
MFC route index associated with the terminating sfg needed to enter this terminal group. Used by private facilities and automatic route selection feature routing.

Dependency:
If > 0 then
1) verify that a tuple exists in Rlrt_mcrt such that:
key rlRT_MCRT.mcri = rlRT_TGID.term_mcri,
rlRT_MCRT.route_type = RTE_SFG.
2) verify that a tuple exists in RLrt_sfg such that:
rlRT_SFG.grpnum = rlRT_MCRT.sfg_grp,
rlRT_SFG.sfg_type is SFGINESSX or SFG2WESSX.

**Attribute:**
ffcf1
**Fullname:**
future field feature
**Attribute Description:**
These are spares reserved for future transparency and special feature use.

boolean reserved for future field feature use.

**Attribute:**
ffcf2
**Fullname:**
future field feature
**Attribute Description:**
These are spares reserved for future transparency and special feature use.

boolean reserved for future field feature use.

**Attribute:**
ffcf3
**Fullname:**
future field feature
**Attribute Description:**
These are spares reserved for future transparency and special feature use.

**Copyright © 1999 Lucent Technologies** 

boolean reserved for future field feature use.

**Attribute:**
sfg_6port
**Fullname:**
group number of sfg 6 port.
**Attribute Description:**
Group number of sixport sfg.

Dependency:
If > 0 verify existence of tuple in RLrt_sfg such that
key rlRT_SFG.grpnum = rlRT_TGID.sfg_6port,
rlRT_SFG.sfg_type = SFG6PORT.

**Attribute:**
ccsa_termri
**Fullname:**
Terminating CCSA MFC route index
**Attribute Description:**
MFC feature route index associated with the CCSA sfg needed to enter this terminal group. Used by ARS CCSA routing.

Dependency:
If > 0 then
1) verify that a tuple exists in RLrt_mcrt such that:
key rlRT_MCRT.mcri = rlRT_TGID.ccsa_termri,
rlRT_MCRT.route_type = RTE_SFG.
2) verify that a tuple exists in RLrt_sfg such that:
rlRT_SFG.grpnum = rlRT_MCRT.sfg_grp,
rlRT_SFG.sfg_type is SFGINCCSA or SFG2WCCSA.

**Attribute:**
ccsa_origri
**Fullname:**
Originating CCSA MFC route index
**Attribute Description:**
MFC feature route index associated with the CCSA sfg needed for recent change only.

Dependency:
If > 0 then
1) verify that a tuple exists in RLrt_mcrt such that:
key rlRT_MCRT.mcri = rlRT_TGID.ccsa_origri,
rlRT_MCRT.route_type = RTE_SFG.
2) verify that a tuple exists in RLrt_sfg such that:
rlRT_SFG.grpnum = rlRT_MCRT.sfg_grp,
rlRT_SFG.sfg_type is SFGOUTCCSA or SFG2WCCSA.

Copyright © 1999 Lucent Technologies 

**Attribute:**
sdn_mcri
**Fullname:**
SDN MFC route index for software defined networks.
**Attribute Description:**
MFC route index for software defined network which associates an SDN SFG with a terminal group. Used by network access point feature.

Dependency:
If > 0 then
1) verify that a tuple exists in RLrt_mcrt such that:
key rlRT_MCRT.mcri = rlRT_TGID.sdn_mcri,
rlRT_MCRT.route_type = RTE_SFG.
2) verify that a tuple exists in RLrt_sfg such that:
rlRT_SFG.grpnum = rlRT_MCRT.sfg_grp,
rlRT_SFG.sfg_type is SFGSDN.

**Attribute:**
eon_mcri
**Fullname:**
the EOLN base MFC route index
**Attribute Description:**
This attribute contains a base MFC route index that leads to an EON SFG when it is added with an EOLN service index from the other relation.
SFID218 must be active before this attribute is populated with a non default value.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLrt_tm

**Relation Description**
Private facilities access (PFA) feature default parameter information.

Associates a private facility feature identifier with its default PFA groups and modular queueing parameters.

Copyright © 1999 Lucent Technologies

**Attribute: feat_id**

**Fullname:** PFA feature identifier

**Attribute Description** An assignable PFA feature identifier.

**Attribute: pf_gpid**

**Fullname:** PFA group name

**Attribute Description** Identifies the default PFA circuit switch voice (CSV) group name defining the access codes and associated info for the PFA feature.

**Attribute: pf_dtgpname**

**Fullname:** Private Facilities data group name

**Attribute Description** Identifies the default PFA circuit switch data (CSD) group name defining the access codes and associated info for the PFA feature.

**Attribute: q_alwd**

**Fullname:** queuing allowed

**Attribute Description** Indicates if modular queueing for outgoing private facilities is allowed.

**Attribute: qpriority**

**Fullname:** priority queuing

**Attribute Description** Indicates if this is a priority line for modular queueing for private facilities.

## 4. Population rules for RLrt_trkg

### Relation Description

Trunk group information

Logical trunk group information.

```
"*************************************************************************
Special trunk groups
*************************************************************************

    RLrt_trkg (local test desk [LTD] test trunks)

DESCRIPTION:

LTD test trunks provide the interface to external testing
systems (LTD, mechanized loop testing [MLT], Fortel, etc.)
for metallic loop testing of lines.  These trunks may be
configured as incoming trunks (LTD to lines tests) or outgoing
trunks (line to LTD tests).

A separate outgoing LTD trunk group is required for each
metallic community.  Thus, each remote module (remote switching
module [RSM], optically remote switching module [ORM], two-mile
optically remote switching module [TRM], multi-module remote
switching module [MMRSM] cluster, etc.) which is not metallically
linked to the host office must have its own outgoing LTD trunk
GROUP to provide LTD access from the lines within that module/cluster.
Each remote module must have its own incoming LTD test trunk
CIRCUIT(S), but this circuit(s) may be included in the same
trunk group as the non-remote module incoming test trunks.

Corresponding tuples must appear in the following relations:

        RLrc_trk        - keyed on trunk group and member
        RLrctgrprk      - keyed on trunk group
        RLgroup_port    - keyed on trunk group and member
        RLpggpmap       - keyed on trunk port
        RLfc_porttyp    - keyed on trunk port (servclass = TMTSTK)
        RLfc_trunk      - keyed on trunk port
```

**Copyright © 1999 Lucent Technologies** 

RLmtbtst - keyed on trunk port

QUANTITY OF TUPLES:

A tuple is required in RLrt_trkg for each LTD trunk group (incoming or outgoing) in the office.

TUPLE SEMANTICS:

RLrt_trkg attributes should be populated as shown in the following. Any attribute not specified should be populated with the default value.

```
grpnum (KEY)    - Incoming or outgoing LTD trunk group number.
type            - RTINCOM for incoming LTD trunk group.
                - RTOUTGO for outgoing LTD trunk group.
htype           - RTH_NONE for incoming LTD trunk group.
                - RTH_FIFO for outgoing LTD trunk group.
size            - Number of members in LTD trunk group.
atttn           - Zero.
apt_inh         - DBYES.
out_sigtype     - DBNOSIG.
in_sigtype      - DBMF for incoming LTD trunk group.
                - DBNOSIG for outgoing LTD trunk group.
```

**********

**********

RLrt_trkg (for DCTU trunk groups)

DESCRIPTION:

This section provides population rules for directly connected test units (DCTU) trunk groups.

1. DCTU trunk groups are trunk groups of logical test ports (LTPs). These LTPs have a servclass of TMLTPDCTU and must be defined in RLfc_porttyp, RLgroup_port, and RLpggpmap. The DCTU trunk groups have a servclass of TMLTPDCTU and must be appropriately populated in the relation RLRCTGRPRK. See the corresponding population rules in RLrctgrprk.

2. The type for DCTU trunk groups is RTTMGRP.

3. The hunt type (htype) for DCTU trunk groups in this relation must be set to RTH_FIFO. The operational use of the DCTU is not possible without this hunt type.

4. It is recommended that there be a singular DCTU trunk group number assigned for every DCTU in the office. However, it is valid for all DCTUs in a host 5ESS(R)-2000 switch processing entity to have all its associated DCTU trunk group members

Copyright © 1999 Lucent Technologies 

defined as part of one singular DCTU trunk group.

5. There must be a singular DCTU trunk group number assigned for every DCTU in the office that resides in a RSM. There must be a singular DCTU route index associated with this RSM DCTU trunk group. See the population rules for RLrt_routing and RLmodatt.

6. For each DCTU trunk group, there must a minimum of four DCTU trunk group members. The maximum number can only be determined from the number of DCTUs that are part of any DCTU trunk group.

7. For each RSM DCTU trunk group, there must a minimum of four DCTU trunk group members and a maximum of twelve DCTU trunk group members. See the population rules for RLfc_porttype, RLcktdata, RLpggpmap, and RLgroup_port.

8. For each DCTU trunk group defined here, there must be a singular DCTU route index assigned. The numerical value of the DCTU trunk group does not have to have the same numerical value for the DCTU route index. See the population rules for RLrt_routing and RLrcrtirmk.

9. For each RSM DCTU trunk group defined here, there must be a singular RSM DCTU route index assigned. The numerical value of the DCTU trunk group does not have to have the same numerical value for the DCTU route index. See the population rules for RLrt_routing and RLrcrtirmk.

10. DCTU trunk groups do not leave the office. Therefore, the value populated for fenpa is not used anywhere and is not applicable.

11. The same restrictions that apply to RSM also apply to ORM/TRM.

TUPLE SEMANTICS:

```
grpnum (KEY) - DCTU trunk group number.
type         - RTTMGRP.
module       - Zero (always zero).
cluster      - Zero.
ncd_scrn     - NO_SCRN (default).
orig_lata    - Zero (default).
htype        - RTH_FIFO.
size         - Highest member number plus 1.
atttn        - Zero.
tpnum        - 100 (Not applicable for DCTU).
apt_inh      - DBYES.
act_size     - Number of members in trunk group.
out_sigtype  - DBNOSIG.
in_sigtype   - DBNOSIG.
satellite    - DBNO.
fenpa        - Not applicable, use default.
fenxx        - Not applicable, use default (199).
lata_num     - Zero (default).
```

```
coin          - DBNO (default).
camaque       - DBNO.
tgbl          - DBNO.
isdntgbwl     - DBNO.
warnthresh    - Zero (default).
tkgpmkby      - DBNO.
term_sfg      - DBNO.
imt           - DBNO.
rlt_type      - RLT_NONE.
rlt_flash     - DBNO.

*************************************************************************

                RLrt_trkg (for ISTF trunk groups)

DESCRIPTION:

Integrated services test function (ISTF) trunk groups
exist one per ISTF logical test port (LTP) type.  Currently
there are two ISTF LTP types (servclass=TM_ISTFLB,
servclass=TM_ISTFXMIT).  A route index exists per ISTF LTP
type and points to each ISTF trunk group.  Each member of
the trunk group corresponds to a LTP.

Each ISTF can have 31 loopback LTPs and three transmission
test LTPs.  Each switching module (SM) can have up to four
ISTF boards.  The contributions to the two trunk groups per
SM would be a maximum of 124 loopback members for the one
trunk group and 12 transmission test members for the other
trunk group.

Since these trunk groups are test trunks, the automatic
progression test (APT) should not be executed for it.  This
is stopped by having atttn attribute set to zero and apt_inh
to DBYES which says to inhibit APT.

QUANTITY OF TUPLES:
One tuple per ISTF LTP type.

TUPLE SEMANTICS:

grpnum (KEY) - ISTF trunk group number.  There is a number
               for each different type of ISTF LTP.
type         - RTTMGRP
module       - Zero (always zero).
cluster      - Zero.
ncd_scrn     - NO_SCRN (default).
orig_lata    - Zero (default).
htype        - RTH_FIFO.
size         - Highest member number plus 1.
atttn        - Zero.
tpnum        - 100 (Not applicable for ISTF).
apt_inh      - DBYES.  Test trunks do not get tested by APT.
```

```
out_sigtype  - DBNOSIG.
in_sigtype   - DBNOSIG.
satellite    - DBNO.
fenpa        - Not applicable, use default.
fenxx        - Not applicable, use default (199).
lata_num     - Zero (default).
coin         - DBNO (default).
camaque      - DBNO.
tgbl         - DBNO.
isdntgbwl    - DBNO.
warnthresh   - Zero (default).
tkgpmkby     - DBNO.
term_sfg     - DBNO.
imt          - DBNO.
rlt_type     - RLT_NONE.
rlt_flash    - DBNO.

**********************************************************************
```

## RLrt_trkg (for digital service unit model 2-recorded announcement function [DSU2-RAF] and Service Announcement System [SAS] port groups)

DESCRIPTION:

This relation must be populated for every RAF/SAS port group routed to either through fixed route index (see RT_FIXEDRI and RT_ROUTING) or other.

NOTE:

1. A DSU2-RAF/SAS port group does not correspond to a specific announcement, only a set of possible announcements. The announcement is selected later and is transmitted in an instruction to the DSU2-RAF/SAS by the terminal process associated with the port.

2. It is recommended that all DSU2-RAFs/SASs containing ports belonging to a particular port group should be equipped with the same set of announcements or at least a common subset thereof.

3. The RAF/SAS port group defined can be distributed over any number of SMs depending on the application. Routing to individual SMs (as opposed to any SM on the switch) can be accomplished using a number of route indices, each mapping to RAF/SAS ports on different SMs.

4. To complete specification of the RAF/SAS port group, population is required in the following relations: GROUP_PORT, PGGPMAP, QKEYPORT, FC_PORTTYP, RCTRGPRK, RC_TRK, IMTGRPS. If the group is to be routed to using fixed route index, population should also appear in the

Copyright © 1999 Lucent Technologies 

relations RT_FIXEDRI, RT_ROUTING, and RCRTIRMK.

5. Those applications using the FCreq_annc() primitive (see fc/FCrafctrl) must ensure that the ANNC_HDR, ANNC_TRL and ANNC_DIG relations are populated on all SMs equipped with RAF/SAS ports in the port group defined here.

6. RAF/SAS port groups can have one of three announcement capabilities:
   a. An announcement capability which is responsible for playing announcements without the dial-through capability.
   b. An announcement capability in which digits can be dialed while an announcement is being played; this is referred to as the dial-through announcement capability. The announcement is terminated when the first digit is detected.
   c. An announcement capability in which coin tones can be received while an announcement is being played; this is referred to as the DSU2-RAF-COIN capability. The announcement is terminated when the first digit is detected. These port groups are routed to using fixed route index.

7. The remote announcement service (RAS) remote access to call forwarding (RACF) and automatic customer station rearrangement (ACSR) features are allowed to share the DSU2-RAF/SAS port group. When this is done the route index for each may terminate to the same group number.

   NOTE: Currently office engineering engineers for a shared resource for RAS and ACSR.

NUMBER OF TUPLES:

One tuple for each DSU2-RAF/SAS port group

TUPLE SEMANTICS:

```
grpnum      - Unique value chosen by office    - must correspond
              to grpnum specified in RT_ROUTING for the
              route index used in routing to this group.
type        - RTRAF (DSU2   -RAF/SAS group).
module      - Zero for distributed RAFs/SASs, SM number for local
              RAF/SAS groups (any module type).
pbx_id      - Zero (Default).
cluster     - See rules under general population rules for
              RLrt_trkg.cluster.
ncd_scrn    - NO_SCRN (Default).
orig_lata   - Zero (Default).
htype       - RTH_FIFO.
size        - Highest member number plus 1.
atttn       - Zero.
amlpcnt     - 101.
alm_lvl     - TMMAJALM (Major AML alarm)
```

Copyright © 1999 Lucent Technologies 

```
tpnum       - 100 (Not applicable for RAF/SAS).
apt_inh     - DBYES.
act_size    - Number of assigned ports in RAF/SAS group.
out_sigtype - DBNOSIG.
in_sigtype  - DBNOSIG.
satellite   - DBNO.
fenpa       - Not applicable    - use '\0'.
fenxx       - Not applicable, use default (199).
lata_num    - Zero (default).
coin        - DBNO (default).
camaque     - DBNO.
tgbl        - DBNO (Default).
isdntgbwl   - DBNO (Default).
warnthresh  - Zero (default).
tkgpmkby    - DBNO (Default).
term_sfg    - DBNO (Default).
nlactive    - DBNO (Default).
sht_thres   - Zero (Default).
shtcallcnt  - Zero (Default).
lht_thres   - Zero (Default).
vpa_rate    - CCPCT0.
dig_trunk   - DBNO.
dpc         - Zero.
opc         - Zero.
pci         - Zero (Default).
q_alwd      - DBNO (Default) for announcement port groups and
              coin announcement port groups; DBYES for automatic
              calling card service (ACCS) dial-through announcement
              port groups.
qmodule     - Zero (Default) for announcement port groups,
              module on which this group's queue resides
              for ACCS dial-through announcement port group,
              Zero (Default) for coin announcement port groups.
rqsize      - Zero (Default) for announcement and coin
              announcement port groups.  For ACCS dial-through
              announcement port groups, rqsize must be set
              to the desired number of calls to be allowed
              to queue for ACCS dial-through announcement ports.
              For ACCS dial-through announcement port groups,
              the following rules apply:

              Range of values:  0 - 255.
              Default value:  Zero.
              Dependencies: rqsize must be less than or equal to
                            (255 - (all (rqsize + qu_os.qbsize +
                            qu_os.qexsize) already assigned to this
                            particular SM))

              If q_alwd is DBYES then rqsize must be greater than
              zero.

pqsize      - Zero (Default).
rou_q       - Q_DSU for ACCS dial-through announcement port
              groups, Q_OFFHK for announcement and coin
```

Copyright © 1999 Lucent Technologies 

```
                announcement port groups.
pri_q       - DBNO (Default).
post_q_treat- QR_NULL.
                for announcement and coin announcement port
                groups.  QR_REORDER for ACCS dial-through
                announcement port groups.
                Dependencies:  When qfid is greater than zero, then
                QR_NULL is not allowed.  Therefore, for ACCS
                dial-through announcement port groups, post_q_treat
                must be set to QR_REORDER.
enq_act     - DBNO (Default).
qfid        - Queuing feature ID.  Zero for announcement and coin
                announcement port groups.  Must be greater than zero
                for ACCS dial-through announcement port groups.
                There is a constructed feature defined for
                ACCS dial-through announcement port groups
                called QTACCS.

                Range of values:  Zero, or top six bits = MFQU,
                bottom 10 bits must be 1 - 1023

                Default value:  Zero.

                Dependencies:  If qfid is greater than zero, a tuple in
                RLfacname with RLfacname.facid = qfid and
                RLfacname.subclass = SCL_FEAT
dsnarc_id   - Zero.
shuttle_check - DBNO.
calbycal    - DBNO.
tera_action - TMTNULL.
imt         - DBNO (Default).
rlt_type    - RLT_NONE.
rlt_flash   - DBNO.
raf_mbrs      Number of members in the trunk group that are
                from RAFs, as opposed to from SASs.

                DSU2-RAF/SAS (non dial through announcement [DTA]) port
                groups:  For each DSU2-RAF/SAS port group not having the
                dial-through announcement capability, there may exist
                a tuple with a key value of 'grpnum' in this relation
                that corresponds to an RLfc_porttyp tuple with an
                annc_apl of SVC_DA and an RLrt_fixedri tuple of ritype
                RT_OSPSDA or RT_EISOSPS.

                DSU2-RAF-DTA, DSU2-RAF-COIN, SAS-DTA, or SAS-COIN port groups:
                For each DSU2-RAF/SAS port group having the dial-through
                announcement capability, there may exist a tuple
                with a key value of 'grpnum' in this relation that
                corresponds to an RLfc_porttyp tuple with an annc_apl
                of SVC_ACCS and an RLrt_fixedri tuple of ritype
                RT_OSPS_ACCS.  Also for each DSU2-RAF/SAS port group
                having the dial-through announcement capability,
                there may exist a tuple with a key value of 'grpnum'
                in this relation that corresponds to an RLfc_porttyp
```

tuple with an annc_apl of SVC_ACSR and an RLrt_fixedri tuple of ritype RT_ACSR. If the corresponding RLfc_porttyp tuple has an annc_apl of SVC_COIN, there will exist an RLrt_fixedri tuple of RT_OSPSCOIN for the coin announcement capability. If the corresponding RLfc_porttyp tuple has an annc_apl of SVC_RAS for the dial-through announcement capability and there is a tuple in RLannc_apl with appl equal to SVC_RAS then there must exist a tuple in RLras_idp with a corresponding annc_ri and there is a tuple in RLannc_apl with appl equal to SVC_ACSR then there must exist a tuple in RLrt_fixedri with a ritype of RT_ACSR.
where (RLannc_apl.appl = SVC_ACSR)

**********
*

RLrt_trkg (for extended digital subscriber lines [EDSL] trunk groups)

DESCRIPTION:

EDSL B-channels and D-channels are defined as trunks and assigned in a trunk group. EDSL B-trunks are assigned in RLfc_porttyp with servclass FCEDSL or FCEDSLHM and with lp_type equal to PCTBCHAN. EDSL D-trunks have servclass equal to FCEDSL and lp_type equal to PCTDCHAN. FCEDSLHM is used for EDSL trunks with hotel/motel to TSPS service, FCEDSL is used for all other EDSL trunks.

B-trunks must be in a separate trunk group from D-trunks. For B-trunks and D-trunk groups, all group members must have the same servclass.

D-trunks for a given EDSL customer can be in individual trunk groups or all in one group (all in one is recommended). However, all trunks in a group must have the same datarate.

An EDSL customer may have B-trunks and D-trunks on more than one digital facility interface (DFI) (see EDSL description in RLfc_porttyp for channel description). B-trunk assignments to trunk groups is independent of DFI assignment, that is, trunks on one DFI can be in one or more trunk group, and trunks from one or more DFI can be in a trunk group, including trunks from more than one SM.

B-trunk groups in this relation with servclass FCEDSL or FCEDSLHM also have an entry in RLedsltrkg.

QUANTITY OF TUPLES:

One per B-trunk group and one per D-trunk group.

TUPLE SEMANTICS:

grpnum - Trunk group number.

type - Specify incoming, outgoing, or two-way for B-channel trunk groups. Specify ISDN link (RTISDNLK) for

Copyright © 1999 Lucent Technologies 

D-channel trunk groups. Cannot be outgoing if servclass equals FCEDSLHM (Enforced in RLfc_trunk.R). See also RLfc_porttyp.R servclass for rules specific to FCEDSL and FCEDSLHM.

module - Use zero for globally controlled group, module number for a local group.

pbx_id - Private branch exchange (PBX) identifier.

irr - Not applicable for domestic, use default zero.

deny_term - Not applicable for U.S., use default DBNO.

cluster - See rules under general population rules for RLrt_trkg.cluster.

ncd_scrn - Not applicable for EDSL, use default NO_SCRN.

orig_lata - Not applicable for EDSL, use default zero.

htype - See the explanation under the htype attribute. Note that not all the rules for htype for EDSL or EDSLHM trunk groups are enforced from this relation.

size - Highest member number of this trunk group plus one.

atttn - Use zero for EDSL D-channel trunk group or one-way incoming EDSL B-channel trunk groups. For outgoing or two-way EDSL B-channel trunk groups (servclass = FCEDSL or FCEDSLHM), an atttn can be assigned.

amlpcnt - Must be set to 100 for outgoing, 2-way, announcement incoming with dedicated E911 services and B-channel trunk groups. Set to 101 for incoming B-channel groups and D-channel trunk groups.

alm_lvl - Must be set to MAJOR alarm for all trunks. If the feature is purchased, the customer may recent change the alm_lvl to MINOR or CRITICAL.

apt_inh - Must be DBYES if atttn equals zero.

out_sigtype - Use DBDCHAN for outgoing and two way B-channel trunk groups and for ISDN link D-channel trunk groups. Use DBNOSIG for incoming B-channel trunk groups.

in_sigtype - Use DBDCHAN for incoming and two-way B-channel trunk groups and for ISDN link D-channel trunk

Copyright © 1999 Lucent Technologies 

```
                groups.  Use DBNOSIG for outgoing B-channel trunk
                groups.

satellite    - DBYES if trunk via satellite, otherwise DBNO.

fenpa        - See general pop rules for RLrt_trkg.fenpa.

fenxx        - Not applicable for EDSL, use default, 199.

lata_num     - Not applicable for EDSL, use default, zero.

coin         - Not applicable for EDSL, use default, DBNO.

camaque      - Not applicable for EDSL, use DBNO.

tgbl         - Not applicable for EDSL, use default DBNO.

isdntgbwl    - Not applicable for EDSL, use default DBNO.

warnthresh   - Not applicable for EDSL, use default zero.

tera_action - See general pop rules for RLrt_trkg.tera_action.

term_sfg     - See general pop rules for RLrt_trkg.term_sfg.

nlactive     - See general pop rules for RLrt_trkg.nlactive.

sht_thres    - See general pop rules for RLrt_trkg.sht_thres.

shtcallcnt   - See general pop rules for RLrt_trkg.shcallcnt.

lht_thres    - See general pop rules for RLrt_trkg.lht_thres.

vpa_rate     - Not applicable for EDSL, use default CCPCTO.

dig_trunk    - See general pop rules for RLrt_trkg.dig_trunk.

dpc          - Not applicable for EDSL, use zero.

opc          - Not applicable for EDSL, use zero.

pci          - Not applicable for EDSL, use default zero.

q_alwd       - See general pop rules for RLrt_trkg.q_alwd.

qmodule      - See general pop rules for RLrt_trkg.qmodule.

rqsize       - See general pop rules for RLrt_trkg.rqsize.

pqsize       - See general pop rules for RLrt_trkg.pqsize.

rou_q        - See general pop rules for RLrt_trkg.rou_q.

pri_q        - See general pop rules for RLrt_trkg.pri_q.
```

Copyright © 1999 Lucent Technologies 

```
enq_act     - See general pop rules for RLrt_trkg.enq_act.

post_q_treat - See general pop rules for RLrt_trkg.post_q_treat.

qfid        - See general pop rules for RLrt_trkg.qfid.

dsnarc_id   - Not applicable for EDSL, use default zero.

stre_ip     - Used by STOR feature to determine this is an
              IP trunk.

stre_measure - Used by STOR feature to determine when measurements
               are to occur.

shuttle_check - This item is set to DBYES when an office wishes to
              verify that the trunk group being terminated to is
              not the same as the one being originated on.  This
              is used in DSN switches on trunk groups between
              switches that support dual homed PBXs or end offices.
              It is allowed for use in the public network.

              Range:  DBYES, DBNO. Default is DBNO.

              Dependencies:  If shuttle_check equals DBYES, then
              htype must be one of the following: RTH_FWDLIN,
              RTH_BWDLIN, RTH_LGFWD, or RTH_LGBWD.

tpnum       - Not applicable for EDSL, use 100.  If trunk is not
              a one-way incoming or two-way, must use 100.

calbycal    - Use DBYES if this is an EDSL call by call trunk
              group, else use default DBNO.  If grpnum exists
              in RLedsltrkg, then RLedsltrkg.calbycal must have
              same value as RLrt_trkg.calbycal.  If
              RLrt_trkg.calbycal equals DBYES, a tuple must exist
              for RLedsltrkg.grpnum.  For definition of call by
              call see population rules in RLedsltrkg.

imt         - Use DBYES if this is an inter-module trunk group.
              otherwise, use DBNO (default).

rlt_type    - RLT_NONE.

rlt_flash   - DBNO.

*********************************************************************

               RLrt_trkg (for packet switching trunk group)

DESCRIPTION:

        A trunk group for packet switching is identified
        by hunt type  equal to RTH_PSUCD.  For packet switching,
```

the translation from group to port and from port to group is stored in PSGP_PRT and PSPRT_GP relations respectively. PSGP_PRT and PSPRT_GP are the replacement of GROUP_PORT and PGGPMAP respectively when htype is equal to RTH_PSUCD. Since X.75/X.75' packet trunk groups are limited to 24 members and IP packet trunk groups are limited to 32 members, the hunt type RTH_PSLGUCD must never be used.

For each packet switching trunk group, there should be a corresponding tuple in RLpstrunks. Also, if the trunk group type is X75 or X75', there should also be a corresponding tuple in RLpsl3trkg. RLpstrunks and RLpl3trkg have the same key (trunk group) as RLrt_trkg.

Service class of the trunk group for packet switching must be PSPKT_TRK for internal protocol (IP) trunks, PSX75P_TK for X.75' trunks and PSX75_TK for X.75 trunks in RLfc_porttyp relation. The trunk group is two-way type of the T1 or DS1 digital trunks.

All the members in a packet trunk group must be of DEN or NEN type.

Trunk group configuration for packet switching:

The following rules apply for IP trunks:

1. Service class of the IP trunk group must be PSPKT_TRK in fc_porttyp relation.
2. There will be a maximum of 16 IP trunk groups for each 5ESS(R)-2000 switch.
3. Each IP trunk group will have a maximum of 32 trunk members.
4. All IP trunks in a trunk group will terminate on the same SM.
5. Only one trunk member will terminate on a protocol handler 2 (PH2).
6. From one to six trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are IP trunk members.
7. The trunk group is two-way.

The following rules apply for X.75' trunks:

1. There can be 255 X.75' trunk groups (per office) with a maximum of 24 trunk members per group.
2. There is a limit of 25 X.75' trunk groups on a given SM.
3. The trunk group is a two-way T1 or DS1 facility.
4. Only one trunk member will terminate on a PH2.
5. From one to six trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75' trunk members and all trunk member ports terminate in the same SM. It is recommended that only four trunk members are put on a given PH3 or PH4.
6. The service class of each member in fc_porttyp is

Copyright © 1999 Lucent Technologies 

PSX75P_TK.
7. X.75' trunk members can reside on different SMs.
8. All the trunk members in a X.75' trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75' trunk members it must contain the whole group.

The following rules apply for X.75 trunks:
1. There can be 255 X.75 trunk groups (per office) with a maximum of 24 trunk members each.
2. There is a limit of 25 X.75 trunk groups on a given SM.
3. The trunk group is a two-way T1 or DS1 facility.
4. Only one trunk member will terminate on a PH2.
5. From one to six trunk members may terminate on a PH3 or PH4 as long as all of the trunk members are X.75 trunk members and all trunk member ports terminate in the same SM. It is recommended that only four trunk members are put on a given PH3 or PH4.
6. The service class of each member in fc_porttyp is PSX75_TK.
7. All the trunk members in a X.75 trunk group can be split among non-remoted SMs and can not be split between RSMs, ORMs or TRMs, that is, if any RSM, ORM or TRM contains X.75 trunk members it must contain the whole group.

The total combined number of packet trunks (IP, X.75, X.75') on any given ISDN SM is 25. This may consist of any number of types following the previous limits for the three types.

NUMBER OF TUPLES:

One tuple for each packet switching trunk group

TUPLE SEMANTICS:

grpnum - Unique value chosen by office - must correspond to grpnum specified in RT_ROUTING for the route index used in routing to this group.
type - RTTWOWAY.
module - Range from 0 to 192.
pbx_id - Zero (Default).
irr - DBNO (Default).
deny_term - DBNO (Default).
cluster - If all tuples in PSGP_PRT where PSGP_PRT.grpnum equal RT_TRKG.grpnum have PSGP_PRT.port.module as a module with the same MODATT.clid, then RT_TRKG.cluster equals MODATT.clid. Otherwise, RT_TRKG.cluster equals zero.
ncd_scrn - NO_SCRN (Default).
orig_lata - Zero (Default).
htype - RTH_PSUCD.
size - Highest member number plus one if one or more

Copyright © 1999 Lucent Technologies 

```
                members are present, otherwise, zero.
atttn         - Zero.
amlpcnt       - Range from 0 to 101.
alm_lvl       - TMMAJALM.
tpnum         - 100.
apt_inh       - DBYES.
out_sigtype   - DBNOSIG.
in_sigtype    - DBNOSIG.
satellite     - DBNO.
fenpa         - Not applicable - use '\0'.
fenxx         - Not applicable, use default, 199.
lata_num      - Zero (default).
coin          - DBNO (default).
camaque       - DBNO.
tgbl          - DBNO (Default).
isdntgbwl     - DBNO (Default).
warnthresh    - Zero (Default).
tkgpmkby      - DBNO (Default).
term_sfg      - DBNO (Default).
nlactive      - DBNO (Default).
sht_thres     - Zero (Default).
shtcallcnt    - Zero (Default).
lht_thres     - Zero (Default).
vpa_rate      - CCPCT0.
dig_trunk     - DBYES.
dpc           - Zero.
opc           - Zero.
pci           - Zero (Default).
q_alwd        - DBNO (Default).
qmodule       - Zero (Default).
rqsize        - Zero (Default).
pqsize        - Zero (Default).
rou_q         - Q_OFFHK.
pri_q         - DBNO (Default).
enq_act       - DBNO (Default)
qfid          - Zero (default).
dsnarc_id     - Zero.
shuttle_check - DBNO.
imt           - Use DBYES if it is an inter-module trunk
                group.  Otherwise, use DBNO (default).
rlt_type      - RLT_NONE.
rlt_flash     - DBNO.

*********************************************************************

        RLrt_trkg (for TM_RMSD3 and TM_TOPAS trunk groups)

DESCRIPTION:

The TM_RMSD3 trunk groups are connected from a
5ESS(R)-2000 switch to a RMS-D3 over a T1.

QUANTITY OF TUPLES:
```

One per RMSD3 trunk group and one per TOPAS trunk group.

NOTES ON TRUNK USAGE: 7/26/87

1.** Note: The FE_NPAs should not be cross-checked on a one-way incoming trunk if the COS equals TM_TOPAS or TM_RMSD3.
2. All trunks in a trunk group are COS=TM_RMSD3 or all are not.
3. All RMS-D3 trunks on a DTU are in the same trunk group.
4. All RMS-D3 DTUs (24 trunks) are in a separate trunk group.
5. There are no restrictions on the SM(s) to which to connect the TM_RMSD3 or TM_TOPAS trunks.
6. The TPNUM field must be 100 for all trunks that are not two-way or one-way incoming. For two-way or incoming, TPNUM will be 0-99; zero is the default.
7. The value that should be changed via recent change/verify (RC/V) into this relation for TPNUM must be identified by the TOPAS engineer at office turn-up.

TUPLE SEMANTICS:

grpnum - Trunk group number.
type - RTINCOM.
module - Zero.
pbx_id - Zero.
irr - DBNO.
deny_term - DBNO.
cluster - Zero.
ncd_scrn - NO_SCRN.
orig_lata - Zero.
htype - RTH_NONE.
size - Highest member number of this trunk group plus one.
atttn - Zero.
amlpcnt - 101.
alm_lvl - TMMAJALM (Default).
apt_inh - DBYES.
out_sigtype - DBNOSIG.
in_sigtype - DBMF.
satellite - DBNO.
fenpa - Not applicable, use default.
--> NO CROSS-CHECK SHOULD BE DONE ON ONE-WAY INCOMING

fenxx - Not applicable, use default, 199.
lata_num - Zero (default).
coin - DBNO (default).
camaque - DBNO.
tgbl - DBNO.
isdntgbwl - DBNO.
warnthresh - Zero (default).
tkgpmkby - DBNO.

rlt_flash    - DBNO.

*********************************************************************

        Rlrt_trkg (for busy line verification (BLV) trunk groups)

Description:

        BLV trunks should be populated as an outgoing trunk
        with a service class of FC_BV_TOLLCMP or FC_BV_INTOLL.

        BLV trunk queuing should not be used when the
        5ESS(R)-2000 switch is performing as a tandem office
        and only passing the BLV call through the network.
        Queuing should not be used when the Operator Services
        Position System (OSPS) originates BLV calls and is on
        a node in the BLV network.

        BLV queuing should only be used when there are a
        minimal number of BLV trunks providing access to the
        BLV network for one OSPS office.  It should also be
        when the OSPS is not on a BLV network node.

        Since most OSPS offices will probably be on a node
        in the BLV network, BLV queuing should seldomly be
        used.

        The ability to queue BLV trunk requests, when all
        members of a selected trunk group are busy, can be
        accomplished by additionally assigning the following
        attributes.

        attribute       value   comments
```

*********************************************************************

        RLrt_trkg (for OSPS EDSL trunk groups for interflow
        also known as OSPS primary rate interface [PRI])

DESCRIPTION:

OSPS PRI B-channels and D-channels are defined as trunks and assigned
in a trunk group.  OSPS PRI trunks are assigned in RLfc_porttyp
with servclass OA_IFOPER for pseudo operators at a sending
OSPS.  OSPS PRI trunks are assigned in RLfc_porttyp
with servclass OA_IFTERM for interflow originating terminal
processes at a receiving OSPS.

OSPS PRI D-trunks have lp_type = PCTDCHAN.
OSPS PRI B-trunks have lp_type = PCTBCHAN.

B trunks must be in a separate trunk group from D
trunks.  For B and D trunk groups, all group members
must have the same servclass.

All D trunks for a given OSPS destination should be in
the same trunk group. All trunks in a group must have the
same datarate.

All B-trunks for a given OSPS destination should be in the same
trunk group, even if across more than one PRI.  All trunks in a
group must have the same datarate.

An OSPS PRI destination may have B-trunks and D-trunks on more than
one DFI (See OSPS PRI description in RLfc_porttyp for channel
description).  B-trunk assignments to trunk groups is independent of
DFI assignment, that is, trunks on one DFI can be in one or more trunk
group, and trunks from one or more DFI can be in a trunk group,
including trunks from more than one SM.
```

## 5. RT_TRKG Population rules continued.

Copyright © 1999 Lucent Technologies 

QUANTITY OF TUPLES:

One per B-trunk group and one per D-trunk group.

TUPLE SEMANTICS:

grpnum - Trunk group number.

type - Specify incoming, or outgoing for B-channel trunk groups. Specify ISDN link (RTISDNLK) for D-channel trunk groups. Outgoing, if servclass equals OA_IFOPER. Incoming, if servclass equals OA_IFTERM.

module - Use zero for globally controlled group, module number for RSM local group.

pbx_id - Use default zero.

irr - Not applicable for domestic, use default DBNO.

deny_term - Not applicable for U.S., use default DBNO.

cluster - See rules under general population rules for RLrt_trkg.cluster.

ncd_scrn - Not applicable for OSPS PRI, use default NO_SCRN.

orig_lata - Not applicable for OSPS PRI, use default zero.

htype - Use RTH_NONE for OSPS PRI.

size - Highest member number of this trunk group plus one.

atttn - Use zero for OSPS PRI D-channel trunk group or one-way incoming OSPS PRI B-channel trunk groups. For outgoing OSPS PRI B channel trunk groups (servclass equals OA_IFOPER), an atttn can be assigned.

amlpcnt - Must be set to 101.

alm_lvl - Must be set to TMMAJALM.

apt_inh - Must be DBYES if atttn equals zero.

out_sigtype - Use DBDCHAN for outgoing B-channel trunk groups and for ISDN link D-channel trunk groups. Use DBNOSIG for incoming B-channel trunk groups.

in_sigtype - Use DBDCHAN for incoming B-channel trunk groups and for ISDN link D-channel trunk groups. Use DBNOSIG for outgoing B-channel trunk groups.

Copyright © 1999 Lucent Technologies 

```
satellite    - DBYES if trunk via satellite, otherwise DBNO.

fenpa        - Allowed for incoming OSPS PRI B-channel trunk groups.
               See general pop rules for RLrt_trkg.fenpa.

fenxx        - Not applicable for OSPS PRI, use default, 199.

lata_num     - Not applicable for OSPS PRI, use default, zero.

coin         - Not applicable for OSPS PRI, use default, DBNO.

camaque      - Not applicable for OSPS PRI, use DBNO.

tgbl         - Not applicable for OSPS PRI, use default DBNO.

isdntgbwl    - Not applicable for OSPS PRI, use default DBNO.

warnthresh   - Not applicable for OSPS PRI, use default zero.

tera_action  - See general pop rules for RLrt_trkg.tera_action.

tkgpmkby     - Not applicable for OSPS PRI, use default DBNO.

term_sfg     - Not used by OSPS PRI, use DBNO.

nlactive     - Not applicable for OSPS PRI, use default DBNO.

sht_thres    - Not applicable for OSPS PRI, use default zero.

shtcallcnt   - Not applicable for OSPS PRI, use default zero.

lht_thres    - Not applicable for OSPS PRI, use default zero.

vpa_rate     - Not applicable for OSPS PRI, use default CCPCTO.

dig_trunk    - See general pop rules for RLrt_trkg.dig_trunk.

dpc          - Not applicable for OSPS PRI, use zero.

opc          - Not applicable for OSPS PRI, use zero.

pci          - Not applicable for OSPS PRI, use default zero.

q_alwd       - Not applicable for OSPS PRI, use default DBNO.

qmodule      - Not applicable for OSPS PRI, use default zero.

rqsize       - Not applicable for OSPS PRI, use default zero.

pqsize       - Not applicable for OSPS PRI, use default zero.

rou_q        - Not applicable for OSPS PRI, use default Q_OFFHK.
```

Copyright © 1999 Lucent Technologies 

```
        pri_q        - Not applicable for OSPS PRI, use default DBNO.

        enq_act      - Not applicable for OSPS PRI, use default DBNO.

        post_q_treat - Not applicable for OSPS PRI, use default QR_REORDER.

        qfid         - Not applicable for OSPS PRI, use default zero.

        dsnarc_id    - Not applicable for OSPS PRI, use default zero.

        shuttle_check - Not applicable for OSPS PRI, use default DBNO.

        tpnum        - 100.

        calbycal     - Not applicable for OSPS PRI, use default DBNO.

        imt          - DBNO .

        rlt_type     - RLT_NONE.

        rlt_flash    - DBNO.

        ************************************************************/"
```

**Attribute:**
grpnum
**Fullname:**
Group number
**Attribute Description:**
Trunk group number.

**Attribute:**
type
**Fullname:**
Trunk type
**Attribute Description:**
Group type. If the group 'type' indicates an announcement group, RTANNCMNT, and the 'module' attribute is non-zero (that is, the group is a local announcement group) the RLrtanngrp relation for that module must have a tuple with its 'anngrp' attribute value equal to the 'grpnum' value.
This restriction does not apply to VCDX offices, however.

Common Channel Signaling System 6 (CCIS6) trunks must be

two-way. Telephon user part 7 (TUP7) trunks must be two-way.

ISDN user part 7 (ISUP7) trunks may be one-way or two-way.

If the trunk class of service is FC_SPAWATS or FC_SPAMEG, then the 'type' must be either two-way or one-way incoming.

Copyright © 1999 Lucent Technologies 

If the trunk class of service is FC_SPAB800 or FC_SPAM800, then the 'type' must be either two-way or one-way outgoing.

**Attribute:**
module
**Fullname:**
Module
**Attribute Description:**
Module number identifier. A zero value indicates that the group is a globally controlled group. This is normally the case when the ports associated with a group are spread across more than one module. The dynamic hunt data for all ports will be in the administrative module (AM).

A non-zero value indicates the module number for a module local group. This is normally the case when the ports of a group are all physically located on the same module. The dynamic hunt data for all ports in the group will be located in that module.

If attribute servclass as found in relation RLrctgrprk for this trunk group number (key attribute grpnum) has the value FC_CP_TALKING or FC_CP_KEYING then module must be zero.

In a VCDX office, the general rule is for the module number to be non-zero or local. Exceptions include TM test trunks and RDTA trunks when the service class is FCEDSL.

If the 'out_sigtype' attribute is DBCCIS6, DBTUP7, or DBISUP7, then module must be set to zero. This means that common channel signaling (CCS) trunk groups will always be global groups.

CCS trunks can be connected to any module. However, if the module goes into standalone, the CCS trunks will not be used. Further, if a CCS trunk is in use and the module goes into standalone, and the caller (or called party) hang up, the trunk will remain active until the module is reconnected to the AM.

**Attribute:**
pbx_id
**Fullname:**
PBX/CPE ID
**Attribute Description:**
If the trunk group belongs to a PBX this field contains the PBX identifier. For non-PBX groups this will have the value zero. The full domain subrange is valid and the default value is zero. If non-zero, this is the key to the IRLfc_pbx relation containing information relating to the whole PBX. The IRLfc_pbx relation is only used by international and not by U.S.

For each trunk group connected to the same far PBX, this attribute must be populated with the same value. When this attribute is

**Copyright © 1999 Lucent Technologies** 

populated, the attribute RLfc_trunk.pbx_id must be populated with the same value for each member in the trunk group. RLrt_trkg.pbx_id can be populated with zero if screening of user-provided calling party numbers (CPNs) from the PBX is not going to be done. See the poprules for RLedsltrkg.cpn_scrn. If screening of user-provided CPNs is going to be done, at least one tuple in RLsc_range keyed by this PBX/CPE id must be created. Since internal name pbx_id remains same and this field pbx_id now being called PBX/CPE ID on the screen, but the internally the attribute name stays same. See population rules for RLsc_range in RLsc_range.p.

**Attribute:**
cluster
**Fullname:**
Cluster
**Attribute Description:**
This attribute is used to determine whether to apply AM alternate emergency routing to calls originating outside of an RSM in standalone. If this attribute is non-zero and the RSM is in standalone, it will be tried. If RT_TRKG.type is RTINCOM or RTTMGRP, cluster equals zero. Otherwise, for non-packet-switched trunk groups (htype does not equal RTH_PSUCD), if all tuples in GROUP_PORT where PGGPMAP.grpnum equals RT_TRKG.grpnum have PGGPMAP.port.module as a module with the same MODATT.clid, then RT_TRKG.cluster equals MODATT.clid. Otherwise, RT_TRKG.cluster equals zero. For packet-switched trunk groups (htype equals RTH_PSUCD), if all tuples in PSGP_PRT where PSGP_PRT.grpnum equals RT_TRKG.grpnum have PSGP_PRT.module as a module with the same MODATT.clid, then RT_TRKG.cluster equals MODATT.clid. Otherwise, RT_TRKG.cluster equals zero.

**Attribute:**
ncd_scrn
**Fullname:**
Network call denial (NCD) screening
**Attribute Description:**
NCD screening type for toll application. Must be set to one of the following values:

NO_SCRN - If calls are not to be screened for NCD. This is a default value. For incoming trunk groups with class of service (COS) of FC_ISPOPR or FC_OPR_DIOR, the ncd_scrn value should be set to NO_SCRN.
SC_W_LMAP - Screen calls for NCD requiring LATA mapping. This value is valid when the type attribute is equal to RTINCOM and the service class (from servclass attribute in RLrctgrprk) is equal to FC_CA_ANI.
SC_WO_LMAP - Screen calls for NCD without LATA mapping. This value is valid when

Copyright © 1999 Lucent Technologies 

type is equal to RTINCOM or RTTWOWAY and the
service class is equal to FC_LATA_CONN.

**Attribute:**
orig_lata
**Fullname:**
Originating local access and transport area (LATA)
**Attribute Description:**
Will take on values from 2 to 15 to indicate the originating LATA identity of the trunk group for toll and NCD application. Must be known if ncd_scrn is equal to SC_W_LMAP, otherwise the default value is zero (null value).

**Attribute:**
lata_num
**Fullname:**
LATA number
**Attribute Description:**
This is the LATA number of the office on the other end of this trunk. It is required if this is a service switching point office:

Glssp = DBYES

and the office serves more than one LATA and the type attribute equals

RTINCOM (incoming) or
RTOUTGO (outgoing) or
RTISDNLK (EDSL) or
RTTWOWAY (two-way)

This check is not enforceable by RC or ODA since there is no way to know if the office serves more than one LATA.

**Attribute:**
trkgmbgid
**Fullname:**
TRunk Group Multiswitch Business Group (MBG) IDentifier
**Attribute Description:**
trkgmbgid is an identifier used to describe a Multiswitch Business Group (MBG), for which the following indicated actions apply.

This is a unique number in the network with a range of {0,2-65535}. The value 1 is reserved.

A value of 0 denotes a null value; this null value means that the trunk group contains public trunks, the trunk group is not associated with any single MBG identifier. Trunks in this trunk group can be used to signal only public MBG related information.

Copyright © 1999 Lucent Technologies 

```
        A non-zero value indicates a single Multiswitch Business Group
        (MBG) IDentifier value for which MBG calls are allowed to
        send the Generic Digits Parameter (GDP) with the type of trunk
        encoded in the parameter.

        The GDP parameter may be populated and sent provided:
            (1) the call is a MBG call
            (2) The outgoing trunk's trkgmbgid matches the
                MBG identifier that is dynamically associated
                with the outgoing MBG call.

        For details on how an mbgid is associated with
        a call and dynamically matched to trkgmbgid, refer to:

        1) 235-190-110 "National ISDN Feature Descriptions"
        2) 235-190-120 "Common Channel Signaling Service Features"

        /* RULE about RLrt_trkg.trkgmbgid */

        /* RLrt_trkg.trkgmbgid must be 0 unless */
        /* CENTREX Network for government Secure (CNS) */

        /* CNS_SFID #183 is on or VPN Expansion Package 2
         * (SFID 270) is on. */
```

**Attribute:**

```
        ovfl_rti
```

**Fullname:**

```
        Overflow route index
```

**Attribute Description:**

```
        ovfl_rti is a Modular Constructed (MC) route index used to
        select an SFG and control overflow traffic from a trunk group
        marked CNS (trkgmbgid != 0) to a public trunk (trkgmbgid = 0).

        ovfl_rti may only be populated with a non-zero value for
        trunk groups that are marked CN-S (trkgmbgid != 0)
        ovfl_rti is only used for calls that have a non-zero terminal group
        and have been routed over a trunk group where RLrt_trkg.trkgmbgid
        matches with the value of business group identifier that is
        used by the call.
```

**Attribute:**

```
        trk_ici
```

**Fullname:**

```
        Trunk group incoming call identifier
```

**Attribute Description:**

```
        trk_ici is used to display to an ISAT called party the type
        of trunk that originated an MBG call.
        This value is loaded into the ISUP7 GDP parameter at the
        originating end office and passed to the far switch.
```

Copyright © 1999 Lucent Technologies 

If the call terminates to an ISAT terminal, this value is then displayed for the attendant.

**Attribute:**
htype
**Fullname:**
Hunt type
**Attribute Description:**
Hunt type.

Range: All values except the following:
RTH_MUPH, RTH_SFG, RTH_LGSFG.

Note: Not all the rules for htype are enforced in this relation. There htype rules in FC_PORTTYPE and in FC_TRUNK as well as relations that exist for specific trunk class of service such as EDSLTRKG.

RTH_FIFO is a valid hunt type for a servclass of TM_CALLBK as found in relation RLrctgrprk for IMLT-2 callback logical test ports.

RTH_FIFO is the valid hunt type for a servclass of TMDFTACLTP as found in relation RLrctgrprk for IMLT-2 DFTAC logical test ports.

RTH_FIFO is the only valid hunt type for a servclass of DGPPMLTP as found in relation RLrctgrprk. DGPPMLTP is only used in EXPORT.

If htype is set to the precedence and preemption hunt types RTH_PRFLIN, RTH_PRBLIN, RTH_PLFLIN, RTH_PLBLIN, RTH_PRFIFO, or RTH_PLFIFO, the following dependency exists:
All members of this trunk group must be assigned a precedence and preemption modular feature. Therefore, a tuple keyed on the port number for every trunk in this trunk group must exist in the relation RLpp_trunk. To verify this, for every tuple in RLfc_trunk where RLfc_trunk.tgroup equals grpnum for this tuple, there must be a tuple in RLpp_trunk such that:
RLpp_trunk.port == RLfc_trunk.port.

For one-way outgoing CCS ISUP7 trunks, (out_sigtype equals DBISUP7 and in_sigtype equals DBNOSIGNAL) set the htype to RTH_FIFO or RTH_ROTATE.

For one-way incoming CCS ISUP7 trunks, (in_sigtype equals DBISUP7 and out_sigtype equals DBNOSIGNAL) set the htype to RTH_NONE (no hunting on incoming trunks).

For SES trunk groups (servclass FC_SES), the htype must be RTH_NONE.

If htype equals one of the following:

Copyright © 1999 Lucent Technologies 

```
RTH_FIFO
RTH_ROTATE
RTH_NONE
RTH_PRFIFO
RTH_PLFIFO
then shuttle_check must equal DBNO.

A trunk group for packet switching is identified
by hunt type  equal to RTH_PSUCD.  For packet switching,
the translation from group to port and from port to group
is stored in PSGP_PRT and PSPRT_GP relations respectively.
PSGP_PRT and PSPRT_GP are the replacement of GROUP_PORT
and PGGPMAP respectively when htype is equal to
RTH_PSUCD.  The enumeration RTH_PSLGUCD must never be
assigned to packet trunk groups.

For each packet switching trunk group, there should be a tuple
in both the RLpstrunks and RLpsl3trkg relation.  RLrt_trkg,
RLpstrunks and RLpsl3trkg have trunk group number as the key.

Service class of the trunk group for packet switching must
be PSPKT_TRK for IP trunks, PSX75P_TK for X.75' trunks and
PSX75_TK for X.75 trunks in RL fc_porttyp relation.  The trunk
group is 2_way type of the T1 or DS1 digital trunks.

All the members in a packet trunk group must be of DEN or NEN type.

For trunk groups with a service class of EDSL or EDSLHM the
following htype rules apply:
        For D channel trunk groups htype must be RTH_NONE
        (this is enforced in relation EDSLTRKG),
        (note also that type is RTISDNLK).

        For B channel trunk groups:
              if type is RTINCOM htype must be RTH_NONE.
              (this is enforced in relation FC_PORTTYP).

              if type is RTOUTGO htype must be RTH_FIFO
              (note also, that EDSLHM can not be RTOUTGO,
               enforced in relation FC_TRUNK).

              if type is RTTWOWAY htype must be:
               if service class is EDSL
                      RTH_FWDLIN, RTH_LGFWD,
                      RTH_BWDLIN, RTH_LGBWD,
                      RTH_UCD, RTH_LGUCD,
                      RTH_GUCD, RTH_LGGUCD,
                      RTH_BGUCD, RTH_LGBGUCD,
                      RTH_PRFLIN, RTH_PLFLN,
                      RTH_PRBLIN, RTH_PLBLIN

               if service class is EDSLHM
                      RTH_FWDLIN, RTH_LGFWD,
                      RTH_BWDLIN, RTH_LGBWD,
```

RTH_UCD, RTH_LGUCD,
RTH_GUCD, RTH_LGGUCD,
RTH_BGUCD, RTH_LGBGUCD

**Attribute:**
size
**Fullname:**
Group size
**Attribute Description:**
Highest member number plus one.

If 'htype' is RTH_UCD, RTH_FWDLIN, RTH_BWDLIN, RTH_PRFLIN, RTH_PRBLIN or RTH_PRFIFO, then 'size' must be in the range 0-192.

If 'htype' is RTH_LGUCD, RTH_LGFWD, RTH_LGBWD, RTH_PLFLIN, RTH_PLBLIN or RTH_PLFIFO, then 'size' must be in the range 193-1952.

If 'htype' is any other valid value, then 'size' must be in the range 0-1952.

If no members are assigned then size equals zero.

**Attribute:**
atttn
**Fullname:**
Automatic trunk test table number (ATTTN)
**Attribute Description:**
Automatic trunk test table number. An ATTTN can be assigned to any outgoing or two way trunk with a service class of:

FC_SEC_INTOLL,
FC_LTOLL_CONN,
FC_PDID, FC_IEC,
FC_PF,
FC_PFLASH,
FC_PFITT,
OA_IFOPER,
FCEDSL,
FCEDSLHM,
FC_OPRISP,
FC_OPRTSP,
FC_LATA_CONN,
FC_PRI_INTOLL,
FC_TTOLL_CONN,
FC_TSPS,
FC_CAMA.

ATTTNs should not be assigned to any other trunks.

Copyright © 1999 Lucent Technologies 

**Attribute:**
amlpcnt
**Fullname:**
Automatic maintenance limit (AML) percentage
**Attribute Description:**
Automatic maintenance limit percentage. The default value will be 101 for all trunk groups, and that is the only value a trunk group can have unless two-way, outgoing, announcement or incoming with dedicated E911 services. Two-way, outgoing, announcement and incoming with dedicated E911 services can have any integer value from 0 to 101 (default is still 101 when non-DCS). A value of 101 indicates to ignore the field and figure AML at runtime. A value of 0 to 100 is the percentage of trunks in that trunk group that can be taken out of service automatically (non-manually) by the 5ESS(R)-2000 switch.

Note: The RC/ODA screen containing this field does not use 101, instead it uses a NULL string. A NULL string is saved internally as 101, and a value of 101 is displayed as a NULL string.

**Attribute:**
alm_lvl
**Fullname:**
Automatic maintenance limit (AML) alarm level
**Attribute Description:**
Automatic maintenance limit alarm level. This variable determines the type of alarm that is generated once the number of trunk members in an AML-able trunk group has been removed from service and reaches it's AML limit. The default value for this alarm will be major (TMMAJALM) for all trunk groups. Since the E911 Trunk group failure feature is a secured feature, the alm_lvl field will not be recent changeable unless purchased. Once purchased for the office, the alm_lvl field will be recent changeable by the switch personnel for any AML alarm level of TMMINALM, TMMAJALM or TMCRITALM.

**Attribute:**
tpnum
**Fullname:**
Testing Operations, Provisioning and Administrative System (TOPAS) number
**Attribute Description:**
TOPAS test position number. This is used to determine the TOPAS test position to terminate a test call of type 101RMS. The value must be 100 for all trunk groups that do not have TM_RMSD3 service class. If trunk group service class is TM_RMSD3, then tpnum must have a value from 0 to 99 (default zero) which indicates the assigned TOPAS test position. The office will be initially populated with the default value (zero) for trunk groups with TM_RMSD3 class

Copyright © 1999 Lucent Technologies 

of service trunk and with the value 100 for all other type of trunks.

Note: The TPNUM attribute is only meaningful for trunk groups that are to be processed by the remote measurement system-digital 3 (RMS-D3). RMS-D3 does their own trunk hunting for test call termination and test call queuing. The tpnum attribute is the TOPAS test position from which the internal hunting should begin. The trunk groups with class of service TM_RMSD3 should have a value of 00-99 for the tpnum attribute. All other trunk groups should set to 100.

Population of this attribute will be done by TOPAS. If this position is unavailable, all the other TOPAS test positions are hunted. If no TOPAS test position is available, the call is routed to the TLWS. The test call type is found in the relation RLtm_tsc.

Note: The RC screen containing this field does not use 100, instead it uses a NULL string. A NULL string is saved internally as 100, and a value of 100 is displayed as a NULL string.

**Attribute:**
apt_inh
**Fullname:**
Inhibit automatic progression testing
**Attribute Description:**
Inhibit automatic progression testing. If ATTTN equals zero, then this attribute must be DBYES.

**Attribute:**
callmon_inh
**Fullname:**
Inhibit call monitor testing
**Attribute Description:**
Inhibit call monitor testing. If callmon_inh is set to DBYES, then call monitor testing is inhibited. If callmon_inh is set to DBNO, then call monitor testing is allowed.

The callmon_inh field must be set to DBYES when the apt_inh field is set to DBYES.

**Attribute:**
act_size
**Fullname:**
Actual size
**Attribute Description:**
The number of trunks in the trunk group.

**Attribute:**

Copyright © 1999 Lucent Technologies 

warnthresh

**Fullname:**

Threshold warning

**Attribute Description:**

The customer-selected ISAT trunk group warning lamp threshold.

When, and only when, the number of idle trunk member of a trunk group is less than or equal to this value, will the warning lamp be lit. This is true even if warnthresh equals or exceeds the size of the group.

**Attribute:**

out_sigtype

**Fullname:**

Out signal type

**Attribute Description:**

Address signaling type. A trunk group cannot be inserted with out_sigtype equal to DBTUP7, DBISUP7, or DBCCIS6 unless the global parameter, Glccs is not equal to CC_NOPLATFORM. When Glccs is not equal to CC_NOPLATFORM, then the switch is equipped with either a common network interface (CNI) ring or SS7 PSU signaling.

A trunk group cannot be inserted with the out_sigtype equal to DBCCIS6 if the SM global parameter, Glconfigname, is equal to D_BASIC. In international, a different, but similar dependency exists for the existence of the CCS transport mechanism hardware. An SES trunk group (servclass FC_SES) must have out_sigtype equal DBNOSIG. See RLfc_trunk relation for description on DBRP_TO under the attribute out_sigtype.

**Attribute:**

in_sigtype

**Fullname:**

In signal type

**Attribute Description:**

Address signaling type. A trunk group cannot be inserted with in_sigtype equal to DBTUP7, DBISUP7, or DBCCIS6 unless the global parameter, Glccs is not equal to CC_NOPLATFORM. When Glccs is not equal to CC_NOPLATFORM, then the switch is equipped with either a common network interface (CNI) ring or SS7 PSU signaling.

A trunk group cannot be inserted with the in_sigtype equal to DBCCIS6 if the SM global parameter, Glconfigname, is equal

to D_BASIC. In international, a different, but similar dependency exists for the existence of the CCS transport mechanism hardware.

**Attribute:**

satellite

**Fullname:**

Copyright © 1999 Lucent Technologies 

Satellite

**Attribute Description:**

Any trunk via satellite.

**Attribute:**

fenpa

**Fullname:**

Far end numbering plan area (NPA)

**Attribute Description:**

In general, the use of FENPA is dependent on the service class of the Trunk Group (See the FENPA attribute rules section for the specific trunk service classes for FENPA assignment). However the following general rules can be stated:

If the trunk TYPE is incoming and the office is a toll office assigned as an Originating Screening Office (OSO) or an Inward Wide Area Telephone Service (INWATS) office (that is Gl_oso = yes) or if the office is a Service Switching Point (SSP) office ,in general, FENPA must be assigned. Incoming Maintenance and other special trunk groups must not have FENPA assigned.

In general, for trunk TYPE of outgoing or two-way used for toll services, FENPA must be assigned.

In general, for other trunk TYPEs, FENPA is an optional attribute and should be set to the default value ("\0") to avoid executing unnecessary operational code on the switch.

**Attribute:**

fenxx

**Fullname:**

Far end office code (NXX)

**Attribute Description:**

Far end NXX. The fenxx attribute is the integer value of the NXX where the trunk originates and is optionally populated.

It is currently used when the office is a service switching point(SSP) for the query to the external service control point (SCP) database. The far end NXX is used for the calling party's number when the full ten digit automatic number identification (ANI) is not known (that is, traditional signaling or centralized automatic message accounting [CAMA] ANI failure). The far end NXX should only be populated when the NXX is representative of all incoming calls for this trunk group. If the far end NXX is the default value, then the query to the SCP database may contain only the calling party's NPA.

**Attribute:**

coin

**Fullname:**

Copyright © 1999 Lucent Technologies 

Coin station

**Attribute Description:**

This attribute indicates that all number services calls (service switching point feature) received over this trunk group are assumed to be from coin stations.

**Attribute:**

camaque

**Fullname:**

Centralized automatic message accounting

**Attribute Description:**

Trunk in CAMA (operator) keying trunk. This is the new addition to the already existing relation. This attribute should be populated with DBYES for CAMA operator keying trunk and with DBNO for other trunk type. This field must be set to DBNO for all CCS trunk types.

**Attribute:**

tgbl

**Fullname:**

Trunk group busy lamp

**Attribute Description:**

Indicates if a trunk group busy lamp is associated with this trunk group (DBYES) or not (DBNO).

If DBYES, verify the existence of the tuple in RLrt_tgbl such that key rlRT_TGBL.grp_num equals rlRT_TRKG.grpnum and rlRT_TGBL.pftype equals PFPHYS.

If htype is packet switched where rlRT_TRKG.htype equals RTH_PSUCD, then 'tgbl' must be DBNO.

**Attribute:**

tkgpmkby

**Fullname:**

Trunk group make busy

**Attribute Description:**

Indicates if trunk group make busy for private facility (SCCOF) is provided for this trunk group (DBYES) or not (DBNO).

If DBYES, verify if tuple exists such that:

```
key rlHUNTKEYS.port       = a valid port,
rlHUNTKEYS.hunt_type      = FCTRKGPMKBY,
rlHUNTKEYS.portgrp.grpnum = rlRT_TRKG.grpnum
```

or a tuple in rlISSCCOF exists such that:

```
rlISSCCOF.pftype          = PFPHYS,
rlISSCCOF.grpnum          = rlRT_TRKG.grpnum
```

Copyright © 1999 Lucent Technologies 

**Attribute:**
isdntgbwl
**Fullname:**
ISDN trunk group warning lamp
**Attribute Description:**
Indicates that this trunk group has one or more trunk group warning lamps on ISDN attendant consoles associated with it.

If DBYES, verify existence of tuple in RLtgtoatt such that key rlTGTOATT.grpnum equals rlRT_TRKG.grpnum and rlTGTOATT.pftype equals PFPHYS

**Attribute:**
term_sfg
**Fullname:**
Terminating simulated facility group
**Attribute Description:**
Indicates if this key grpnum is terminating to a simulated facility group (sfg) (DBYES) or not (DBNO).

If term_sfg is equal to DBYES, verify existence of a tuple in RLrt_gpsf with this key grpnum as the key.

**Attribute:**
nlactive
**Fullname:**
Nonusate trunk scan (NUTS)/locked-up trunk scan (LUTS) activated
**Attribute Description:**
NUTS/LUTS active flag. Should be populated with DBYES if this trunk group is to be scanned for NUTS/LUTS. Otherwise, should be DBNO (default). If nlactive equals DBYES, there must be a tuple in RLappfgrp with RLrt_trkg.grpnum equal to RLappfgrp.grpnum, RLappfgrp.pftype equal to MSTRKG, and RLappfgrp.nlactive equal to DBYES.

**Attribute:**
sht_thres
**Fullname:**
Short holding time (SHT) threshold
**Attribute Description:**
SHT threshold. Valid SHT threshold values are 0 to 160 seconds by increments of two seconds. A value of zero (default) indicates SHT monitoring is not active on this trunk group.

Dependencies: If sht_thres is greater than zero, there must be a tuple in RLappfgrp with RLrt_trkg.grpnum equal to RLappfgrp.grpnum, RLappfgrp.pftype equal to MSTRKG, and RLappfgrp.shtactive equal to DBYES

Copyright © 1999 Lucent Technologies 

**Attribute:**
shtcallcnt
**Fullname:**
Short holding time call count
**Attribute Description:**
SHT call count threshold. Valid values are 2 to 30 calls by increments of two calls when the value of the sht_thres field is greater than zero. If the sht_thres field is zero, then this field should also be zero (default).

**Attribute:**
lht_thres
**Fullname:**
Long holding time (LHT) threshold
**Attribute Description:**
LHT threshold. Valid LHT threshold values are zero to ten hours by increments of one hour. A value of zero (default) indicates LHT monitoring is not active on this trunk group. If lht_thres is greater than zero, there must be a tuple in RLappfgrp with RLrt_trkg.grpnum equal to RLappfgrp.grpnum, RLappfgrp.pftype equal to MSTRKG, and RLappfgrp.lhtactive equal to DBYES.

**Attribute:**
vpa_rate
**Fullname:**
Voice path assurance (VPA) rate
**Attribute Description:**
Set to CCPCT0 if this CCS trunk group will never do the VPA test. Set to CCPCT12_5 if the VPA test is done 12.5% of the time. Set to CCPCT50 if the VPA test is done 50% of the time. Set to CCPCT100 if the VPA test is done 100% of the time. Must be CCPCT0 for non-CCS trunk groups.

Note: If vpa_rate does not equal CCPCT0, then the SMs containing trunks from this trunk group must have DSU2-LDSUF service groups equipped with tone transceivers (RLcktdata.type equal to PCT_XCVR). This is an updateable field for CCS trunks.

**Attribute:**
dig_trunk
**Fullname:**
Digital trunk
**Attribute Description:**
This attribute is set to DBNO when the datarate attribute of RLrctgrprk is DBDATA_NULL. It is set to DBYES for all other trunk groups.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

dpc

**Fullname:**

Destination point code (DPC)

**Attribute Description:**

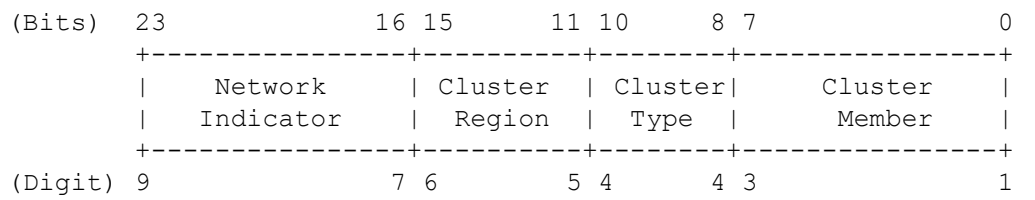
Destination point code. The DPC indicates the signaling point for the far end office, except for inter-module trunks (IMT) which set the DPC equal to a 'pseudo' point code value that indicates the SM numbers on which the inter-module trunk terminates (that is, near end SM and far end SM). This attribute is used only for CCS trunk groups.

There are three point code formats that are supported:

1. AT&T format,
2. non-AT&T format,
3. inter-module trunk (IMT)
4. Single SM Loop Around Trunk (Single SM IMT)

These are distinguished as described in the following.

For the AT&T Communications network, a point code will be assigned by the CCIS network administration center (CNAC) for each switch. This will be a string of nine decimal digits (the external format). The resultant number will be built as a hex value. The following format applies:

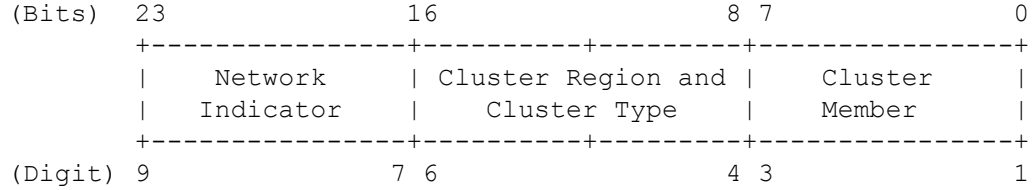


The nine digit externally defined point code (whether DPC or OPC) is converted as:

(network indicator 2 ^16) +
(cluster region 2^11) +
(cluster type 2^8) +
cluster member

The network indicator (NID) is always 254 (decimal) for the AT&T Communications network and 236 for the UNITEL network.

For other networks using the T1 CCS standards for system 7 (that is RBOCS, et. al.) the following format applies:



**Copyright © 1999 Lucent Technologies** 

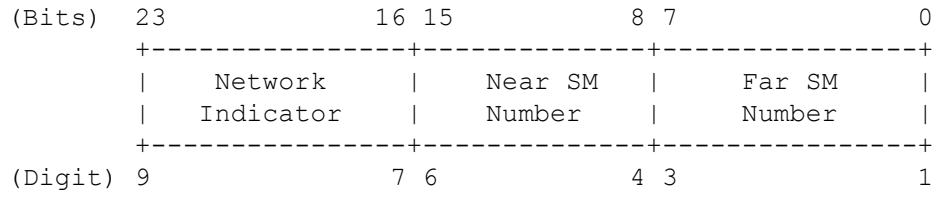
The cluster region and type can be anything but zero.

The nine digit externally defined point codE (whether DPC or OPC) is converted as:

(network indicator 2 ^16) +
(cluster region and type 2^8) +
(cluster member)

The network indicator will never be 254 for non-AT&T Communications offices, however, non-AT&T offices need to provision trunks to AT&T offices which requires that the dpc begin with 254 and be interpreted in ANSI(R) format, and an NID of 236 will never be used for a non-UNITEL switch. Also '000' may only be assigned when the trunk is an inter-module trunk (see the following IMT layout).

The format of the DPC for an inter-module trunk (IMT) is different than the format used for inter-office CCS trunks, and is defined as follows:



where:
Network indicator = 000
Near SM number = SM number which terminates the near end of the inter-module trunk (that is, the value of the attribute gport.module).

Range: One is less than or equal to the SM number which is less than or equal to 192.

Far SM number = SM number which terminates the far end of the intermodule trunk connected to the 'near SM', and which has the same circuit identification code (attribute 'cic').

Range: One is less than or equal to the SM number which is less than or equal to 192.

The following restrictions apply:

The near SM number cannot equal the far SM number.

The nine digit externally defined point code is converted as follows:

(Near SM number 2^8) + (Far SM number)

Copyright © 1999 Lucent Technologies 

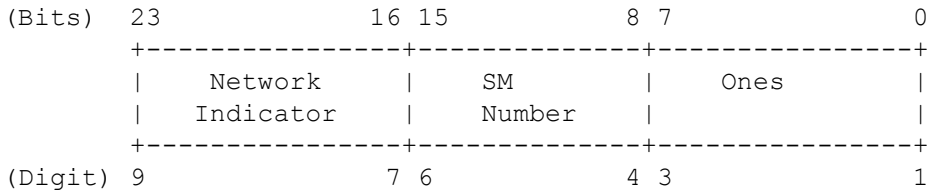
Example: The nine digit externally defined DPCs for an intermodule trunk with CIC = 'X' between SMs 50 and 99 on a switch with OPC = 'A' would be populated as follows:

| DPC | OPC | CIC | GPORT |
|---|---|---|---|
| 000050099 | A | X | SM 50, Port Y |
| 000099050 | A | X | SM 99, Port Z |

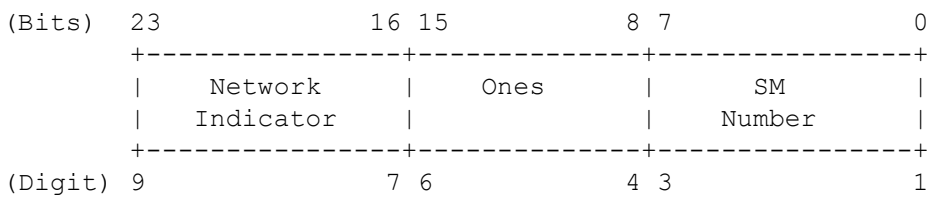
where:
port Y - The port number of the trunk group member on SM 50
port Z - The port number of the trunk group member on SM 99.

Populate DPC with 0 for non-CCS7 trunk groups (that is, trunk groups that do not have in_sigtype equal to DBISUP7 or out_sigtype equal to DBISUP7).

The format of the DPC for a Single SM loop around trunk (Single SM IMT) is as follows:



OR



where:
Network indicator = 000
SM number = SM number which terminates the ends of the inter-module trunk (that is, the value of the attribute gport.module).

Ones = 0xff = 255 decimal (An indication that the loop around trunk is on a single SM)

The following restrictions apply:

The nine digit externally defined point code is converted as follows:

(SM number 2^8) + (255)
OR

**Copyright © 1999 Lucent Technologies** 

```
(255 2^8) + (SM number)

Example:  The nine digit externally defined DPCs for a single SM
loop around intermodule trunk with CIC = 'X' on SM 50 on a
switch with OPC = 'A' would be populated as follows:

DPC         OPC CIC   GPORT
---------   --- ---   ---------
000050255    A   X    SM 50, Port Y
000255050    A   X    SM 50, Port Z

where:
port Y  - The port number of one end of the Single SM IMT
              trunk group member on SM 50.
port Z  - The port number of the opposite end of the Single SM IMT
              trunk group member on SM 50.

The format used for entry of the DPC on the recent change and
ODA forms depends on whether the switch is in the AT&T
network or not and may further depend on the DPC value itself.
Determination of the switch being present in the AT&T network
may be done by examining the value stored in GLopc for a CNI
signaled trunk group or the value stored in RLgsm_opc.opc
for a PSU signaled trunk group.  The high order 8 bits of
the 24 bit point code (GLopc or RLgsm_opc.opc)
are examined and if this value does not equal 254 or 236 then
the format used for entry of DPC is the T1 CCS standard format
shown previously.  Otherwise, further examination of the DPC
itself as entered on the screen is needed.

If the NID of the DPC is 254 or 236, the AT&T format must
be used for the DPC being entered only if it matches the
NID of the office OPC (Glopc) or RLgsm_opc.opc.

Otherwise, the format used for entry of DPC is the T1 CCS standard
format shown previously.
```

## 6. RT_TRKG Population rules continued.

**Attribute:**

opc

**Fullname:**

Originating point code

**Attribute Description:**

This attribute is used only for CCS trunk groups The originating point code assigned to this office for this trunk group. The format and assignment rules are the same as for DPC.

The format used for entry of the OPC on the RC and ODA forms depends on whether the switch has on OPC in the AT&T network or not. This is determined by examination of the high order 8 bits of 24 bit point code stored in Glopc for a CNI signaled trunk group or the high order 8 bits of 24 bit RLgsm_opc.opc for a PSU signaled

Copyright © 1999 Lucent Technologies 

trunk group. If this value is 254 or 236 (from high order 8 bits of a 24 bit Glopc or 8 bits of RLgsm_opc.opc), the format used for entry of OPC is the AT&T format shown previously.

For any other value of the high order 8 bits of a 24 bit Point Code, the T1 CCS standard format should be used for entry of OPC from the Recent Change and ODA forms.

For network interconnect (NI) LATA routing feature, if the office is equipped with CNI in the AT&T Network Services Division (ATT-NSD) network, the OPC for all the CCS7 trunk should match either the true office point codes or one of the alias point codes when the feature is used (that is, alias point codes are populated).

If the OPC and DPC are nonzero values, then they cannot be equal to each other.

**Attribute:**
pci
**Fullname:**
Point code index
**Attribute Description:**
This attribute is used only for CCS trunk groups. This field contains the unique value stored in RLLAB7_PCI for the DPC and OPC associated with this trunk group.

**Attribute:**
q_alwd
**Fullname:**
Queuing allowed
**Attribute Description:**
Indicates whether queuing is allowed on this group.

If q_alwd is DBYES, then qfid must contain a valid queuing feature with modular features type MFQU, and a tuple in RLfacname with RLfacname.facid equal to qfid and RLfacname.subclass equal to SCL_FEAT. Also type must be RTTWOWAY or RTOUTGO. Also if q_alwd is DBYES the servclass found in relation RLrctgrprk must be FC_PF, FC_PFITT, FCEDSL, FC_RAFDTA or FC_PFLASH. If RLrctgrprk.servclass is equal to FCEDSL then RLfc_trunk.ln_type must not be LN_NULL. If q_alwd is DBYES and module does not equal zero, then the qmodule and module must be equal. If pri_spl_dly sets to DBYES, there must exist a RLqu_pri tuple in queuing SM where RLqu_pri.portgrp.grpnum equals RLrt_trkg.grpnum and RLqu_pri.portgrp.grptype equals TM_QTRK. If it is OFFHOOK queue and spl_dlytreat or pri_spl_dly set to DBYES, there must exist a RLqu_dly tuple in queuing SM where RLqu_dly.portgrp.grpnum equals RLrt_trkg.grpnum and RLqu_dly.portgrp.grptype equals TM_QTRK. If it is RGBK queue and pri_spl_dly set to DBYES, there must exit a RLqu_dly tuple in queuing SM where RLqu_dly.portgrp.grpnum equals RLrt_trkg.grpnum

Copyright © 1999 Lucent Technologies 

and RLqu_dly.portgrp.grptype equals TM_QTRK.

**Attribute:**
qmodule
**Fullname:**
Queuing module
**Attribute Description:**
Module on which this group's queue resides.

Verify qmodule exists in RLmodatt.mod. If q_alwd is DBYES then qmodule must be greater than zero.

If qmodule changes from one SM to another, then tuple changes may be needed in RLms_qan.sm_id and .gp_id if measurements are enabled for the RLrt_trkg.grpnum.

**Attribute:**
rqsize
**Fullname:**
Routine queue size
**Attribute Description:**
Default parameter routine queue size.

The rqsize + pqsize attributes must be <= 255. All (qu_ogtos.rqsize + qu_ogtos.pqsize + qu_os.qbsize + qu_os.qexsize) attributes tuples already assigned to this particular SM must be <= 255 (SM) or <=4000 (SM-2000).

NOTE: This check is being implemented in RLqu_os and RLqu_ogtos.

If q_alwd is DBYES, then rqsize must be greater than 0.

**Attribute:**
pqsize
**Fullname:**
Priority queue size
**Attribute Description:**
Default parameter routine queue size.

See rules for rqsize

**Attribute:**
rou_q
**Fullname:**
Routine type
**Attribute Description:**
Routine section type.

If rou_q is Q_RGBK then type must be RTOUTGO.

Copyright © 1999 Lucent Technologies 

**Attribute:**
pri_q
**Fullname:**
Priority queue
**Attribute Description:**
Indicates if this queue has a priority section.

If pri_q equals DBYES, then pqsize must be greater than zero and q_alwd must be DBYES.

**Attribute:**
post_q_treat
**Fullname:**
Post queue treatment
**Attribute Description:**
Post queue treatment (automatic route selection-D [ARS-D],MQII). When a call overflows a modular queue and is not queued for given the facility, the call will be re-routed only if the call is an ARS-D call and QR_ALTR is specified, or else the call is given reorder tone and disconnected.

When qfid is greater than zero, then QR_NULL is not allowed.

**Attribute:**
enq_act
**Fullname:**
Enqueuing active
**Attribute Description:**
Enqueuing active. (Note: This attribute is for the interface to the facilities management capability.)

**Attribute:**
qfid
**Fullname:**
Queue feature ID
**Attribute Description:**
Queuing feature ID. A tuple in RLfacname with RLfacname.facid equal to qfid and RLfacname.subclass equal to SCL_FEAT. If qfid is greater than zero, then q_alwd must be DBYES. If qfid is greater than zero then RLqu_tcfdf.grptyp must be TM_QTRK where RLQU_TCFDF is keyed by qfid.

**Attribute:**
dsnarc_id
**Fullname:**
Alternate route cancellation (ARC) ID
**Attribute Description:**
ID of the ARC control table entry (that is, relation RLnmdsnarc)

**Copyright © 1999 Lucent Technologies** 

associated with this trunk group. The ARC ID of this trunk group is the ARC ID of the office to which this trunk group terminates.

If dsnarc_id does not equal zero, then verify the existence of a tuple in RLnmdcofc containing this value. If Gldsnopt is equal to DBNO, then dsnarc_id must equal zero.

**Attribute:**
shuttle_check
**Fullname:**
Shuttle check
**Attribute Description:**
This item is set to DBYES when an office wishes to verify that the trunk group being terminated to is not the same as the one being originated on. This is used in DSN switches on trunk groups between switches that support dual homed PBXs or end offices. It is allowed for use in the public network.

If shuttle_check equals DBYES, then htype must be one of the following:

RTH_FWDLIN,
RTH_BWDLIN,
RTH_LGFWD,
RTH_LGBWD,
RTH_PRFLIN,
RTH_PRBLIN,
RTH_PLFLIN,
RTH_PLBLIN.

**Attribute:**
calbycal
**Fullname:**
Call by call
**Attribute Description:**
Use DBYES if this is an EDSL call by call trunk group, otherwise use default DBNO. If grpnum exists in RLedsltrkg, then RLedsltrkg.calbycal must have same value as RLrt_trkg.calbycal. If RLrt_trkg.calbycal = DBYES, a tuple must exist for RLedsltrkg.grpnum. For definition of call by call and description of EDSL trunk groups, see population rules in RLedsltrkg. Also see RLrt_trkg section for EDSL trunk groups.

**Attribute:**
tera_action
**Fullname:**
Trunk error analysis (TERA) action
**Attribute Description:**
TERA recovery action. This attribute identifies the action to be taken by TERA when a trunk reaches any of its error thresholds. There are two error thresholds: the quick check threshold, which is recent changeable, and the peer group

Copyright © 1999 Lucent Technologies 

threshold which is a function of the number of members in a trunk group. Refer to the RC view line and trunk test, trunk error analysis. This field must be set to one of the following:

TMTNULL - Allowed if atttn is zero or greater than zero but only if specified (never the default). This value indicates that the trunk implicated when a threshold is reached may have no action taken; no report, no test and no removal.

TMTREPT - Allowed if ATTTN is zero or greater than zero. This is the default if ATTTN is zero and tera_action was not specified (NS). It indicates that no recovery action beyond reporting that a trunk has received an excessive number of machine detected inter-office irregularities (MDIIs) will take place.

TMTTEST - Allowed only if ATTTN is greater than zero. This is the default if ATTTN is greater than zero and tera_action was NS. This value indicates that an operational test may be performed when a trunk reaches a threshold of MDIIs.

TMTRMV - allowed if ATTTN is zero or greater than zero but only if specified (never the default). This value indicates that the trunk implicated when a threshold is reached may be removed without performing an operational test.

The following summerizes the population rules state previously:

```
-----------------------------------------------------------------
if atttn = 0 & tera_action = NS    then tera_action = TMTREPT
if atttn = 0 & tera_action = TMTREPT then tera_action = TMTREPT
if atttn = 0 & tera_action = TMTRMV  then tera_action = TMTRMV
if atttn = 0 & tera_action = TMTNULL then tera_action = TMTNULL
-----------------------------------------------------------------
if atttn > 0 & tera_action = NS    then tera_action = TMTTEST
if atttn > 0 & tera_action = TMTTEST then tera_action = TMTTEST
if atttn > 0 & tera_action = TMTREPT then tera_action = TMTREPT
if atttn > 0 & tera_action = TMTRMV  then tera_action = TMTRMV
if atttn > 0 & tera_action = TMTNULL then tera_action = TMTNULL
-----------------------------------------------------------------
```

**Attribute:**
imt
**Fullname:**
Inter-module trunk group
**Attribute Description:**
If this trunk group is an inter-module trunk group, then 'imt' is DBYES, otherwise, 'imt' is DBNO.

**Attribute:**
rlt_type
**Fullname:**
Release link trunk (RLT) type
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute indicates if the trunk group contains RLTs, and if so, whether the type of hold is permanent or temporary.

This attribute must be set to RLT_NONE unless the trunk group is:

1. A non-ISDN senderized tie trunk incoming to the main and two-way from the branch with a service class of flash repeating:

   **** AT THE MAIN *****

   a ) RLfc_porttyp.servclass = FC_PFLASH
   b ) RLrctgrprk.brc = DBYES
   c ) RLrt_trkg.type = RTINCOM
   d ) RLrt_trkg.out_sigtype = DBNOSIG
   e ) RLfc_trunk.out_startsig = FCSSNULL
   f ) RLfc_trunk.cut_thru = DBNO

   *** AT THE BRANCH *****

   a ) RLfc_porttyp.servclass = FC_PFLASH
   b ) RLrctgrprk.brc = DBYES
   c ) RLrt_trkg.type = RTTWOWAY
   d ) RLrt_trkg.in_sigtype = DBTT
   e ) RLfc_trunk.in_startsig = FCDIALTONE
   f ) RLfc_trunk.cut_thru = DBNO

2. A non-ISDN senderized foreign exchange multi-line hunt trunk incoming to the main and outgoing from the branch:

   **** AT THE MAIN - FX TRUNK APPEARANCE *****

   a ) RLfc_porttyp.servclass = FC_PFLASH
   b ) RLrctgrprk.brc = DBYES
   c ) RLrt_trkg.type = RTINCOM
   d ) RLrt_trkg.in_sigtype = DBNOSIG
   e ) RLrt_trkg.out_sigtype = DBNOSIG
   f ) RLfc_trunk.in_startsig = FCDIRCON
   g ) RLfc_trunk.out_startsig = FCSSNULL
   h ) RLfc_trunk.cut_thru = DBNO
   i ) RLfc_porttyp.lp_type = PCFXGRND

   *** AT THE BRANCH -- FX LINE APPEARANCE ****

Refer to the population rules for RLrt_mhg.G.

**Attribute:**
rlt_flash
**Fullname:**
Release link trunk flash

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

This attribute indicates whether or not the branch location can send a flash to the main switch over the RLT during added party disconnect.

This attribute cannot be DBYES unless rlt_type is RLT_PERM.

**Attribute:**

pri_bchan

**Fullname:**

PRI B-channel

**Attribute Description:**

Indicator used to identify a PRI B-channel trunk group.

DBYES: PRI B-channel trunk group
DBNO: Non PRI B-channel trunk group

**Attribute:**

enq_ln

**Fullname:**

Leased network critical queuing indicator

**Attribute Description:**

Leased network critical queuing indicator. Indicates whether or not an outgoing trunk group will support critical user queuing. This is used in call processing only when the incoming trunk is defined as a leased network trunk.

- DBYES indicates that a leased network incoming trunk may queue for this trunk only if the incoming trunk is defined as a leased network critical user (that is, facility restriction level [FRL] = 14) and RLrt_trkg.q_alwd and RLrt_trkg.enq_act are both equal to DBYES.

- DBNO indicates that all leased network incoming trunks may queue for this trunk if RTrt_trkg.q_alwd and RLrt_trkg.enq_act are both equal to DBYES.

**Attribute:**

ni_annc

**Fullname:**

Network interconnect non-interworking announcement indicator

**Attribute Description:**

The ni_annc attribuite is used for control if tone/announcement is applied to a call after the vacant code announcement (VCA) MDII is printed on an ISUP7 trunk with service class of FC_IEC. A terminating access tandem or a terminating end office which is directly connected to an inter-exchange carrier (IXC) will perform called number screening, NPA and/or NPA-NXX analysis) to determine if the call can be routed to a valid

**Copyright © 1999 Lucent Technologies** 

destination.

If the previously mentioned screening fails, a VCA MDII is printed and the office must either
1. Return a release message with cause=3 no route to destination or,
2. Provide an appropriate tone or announcement.

The ni_annc attribute is checked after the previously mentioned screening fails only if the IAM forward call indicator shows that ISUP7 trunks were used all the way. The ni_annc attribute does not apply if the call route consists of a combination of ISUP protocol trunks interworked to other signal protocol trunks (that is, multi-frequency [MF]).

The value of this parameter should be optioned by the customer to one of the following values.

DBYES: A tone/announcement should be provided to the preceding exchange.

DBNO: A release message should be sent to the preceding exchange.

**Attribute:**
niiw_annc
**Fullname:**
Network interconnect interworking announcement indicator
**Attribute Description:**
The niiw_annc attribute is used to control if tone/announcement is applied to a call after the VCA MDII is printed on an ISUP7 trunk with service class of FC_IEC. A terminating access tandem or a terminating end office which is directly connected to an inter-exchage carrier (IXC) will perform called number screening, NPA and/or NPA-NXX analysis to determine if the call can be routed to a valid destination.

If the previously mentioned screening fails, a VCA MDII is printed and the office must either
1. Return a release message with cause=3 no route to destination or,
2. Provide an appropriate tone or announcement.

The niiw_annc attribute is checked after the previously mentioned screening fails only if the forward call indicator shows that the call route consists of a combination of ISUP protocol trunks interworked to other signal protocol trunks (that is, MF). [NI 2.0 SSD]

The value of this parameter should be optioned by the customer to one of the following values.

DBYES: A release message should be sent to the preceding exchange.

Copyright © 1999 Lucent Technologies 

DBNO: A tone/announcement should be provided to the preceding exchange.

**Attribute:**

ctrl_type

**Fullname:**

Control type (transfer prohibit action)

**Attribute Description:**

The ctrl_type attribute is used when an outgoing ISUP trunk is selected to route out of an office but the associated Signaling System 7 (SS7) dynamic routing to the far point code is marked transfer prohibited (TFP). Before attempting to re-route on the next route, ctrl_type will be checked to determine whether the current trunk should be skipped or if the call should be canceled.

For trunks which use ISUP7 as their outgoing signaling type, ctrl_type must be set to either 'skip' (DBSKIP) or 'cancel' (DBCANCEL). For trunks which do not use ISUP7 as their outgoing signaling, ctrl_type must be left blank, (DBNULLCTRL).

The setting for ctrl_type should be based on the network topology. The ultimate decision for setting ctrl_type is up to the data administrator. Several possible scenarios are described here and can be used as guidelines when determining how ctrl_type should be set.

Scenario #1:
---
If the far office connected to a trunk group only uses ISUP trunks but the office is currently not accessible using ISUP trunks, (due to a failure), there is no reason to reroute calls since the far switch cannot accept incoming calls. Rerouting such calls could possibly cause congestion on the indirect routes. Under these circumstances, the ctrl_type field should be set to DBCANCEL.

Scenario #2:
---
If there are alternate routes available which do not use ISUP signaling, then ctrl_type should be set to DBSKIP. Although the far office is not accessible using ISUP trunks, non-ISUP trunks may be able to reach the far office and complete the call.

Scenario #3:
---
If there are dual tandems connected to a far office, ctrl_type should be set to DBSKIP. Although the first tandem may not be able to reach the far office via ISUP, the second office may be able to. Or, the second office may have non-ISUP signaling which is capable of routing the traffic.

Copyright © 1999 Lucent Technologies 

The value of ctrl_type must be set to one of the three values listed in the following.

| | |
|---|---|
| DBNULLCTRL | This must be used for all trunks which do not use ISUP7 as their outgoing signaling type. These trunks will not check this field since it only applies to ISUP outgoing trunks. |
| DBSKIP | Skip this trunk and attempt a re-route on the alternate route. |
| DBCANCEL | Do not attempt any reroutes. Cancel the call. |

**Attribute:**
cama_psap
**Fullname:**
Centralized automatic message accounting - public safety answering point

**Attribute Description:**
The cama_psap attribute is a bool used to specify if a trunk group is a CAMA PSAP trunk group.

**Attribute:**
bcl_assign
**Fullname:**
Bulk calling line identification (BCLID) assign
**Attribute Description:**
This boolean attribute specifies whether BCLID feature is assigned to this trunk group.

**Attribute:**
npt
**Fullname:**
Numbering plan type
**Attribute Description:**
This identifies the numbering plan type (NPT) for the direct connect DN, if the direct connect DN field is populated. The NPT is used to identify the numbering plan as a private numbering plan (APN), as the North American Numbering plan (NANP), or as an international numbering plan (INTL). This field will be used by the public and private switched networks to identify the type of translation to apply to the address digits.

**Attribute:**
speech
**Fullname:**

Speech

**Attribute Description:**

This attribute is used to indicate if speech treatments have been assigned to the trunk. ISDN routing and digit analysis, requires 'speech' and '3.1kHz audio' bearer capability calls be routed differently. '3.1kHz audio' calls equates roughly to voiceband data (facsimile, modems, etc.), where it is important to maintain the absolute integrity of the bit stream. No speech treatments, such as time assignment speech interpolation (TASI) and low bit rate voice (LBRV) encoding, should be applied to a '3.1kHz audio' call. This field should be set to DBYES by the switch personnel when the trunk group has speech treatments assigned so that '3.1 kHz audio' calls will not be routed over the speech trunk group. No checks can be made to verify that the trunk group actually has speech treatments when this field is set to DBYES by the switch personnel, but setting the field to DBYES will restrict the trunk group to only carrying 'speech' calls.

**Attribute:**

wb_rate

**Fullname:**

Wideband rate for NxDS0 trunk group

**Attribute Description:**

The wb_rate attribute is used to identify the wideband rate supported by the trunk group. The wb_rate is used to identify wideband capable trunk groups. The attribute wb_rate is included in this relation because wideband trunk groups are globally hunted. The valid enumerations of wb_rate are:

WB_NULL for trunk groups that cannot support wideband calls,
WB_384K for trunk groups that can only support 384 kb/s wideband calls or DS0 calls,
WB384_1536K for trunk groups that can only support 384 kb/s, 1536 kb/s, or DS0 calls,
WB_1536K for trunk groups that can only support 1536 kb/s wideband calls or DS0 calls,
WB_MR for trunk groups that can only support multi-rate wideband calls or DS0 calls.

The wb_rate attribute is also stored in RLfc_trunk. The values of RLfc_trunk.wb_rate and RLrt_trkg.wb_rate must be equal for the same trunk groups. Cross-checks to enforce this condition can be found in RLfc_trunk.p

**Attribute:**

wbtsa_type

**Fullname:**

Wideband time-slot allocation type

**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

The attribute wbtsa_type is used to identify the type of time-slot assignment used by wideband trunk groups. A list of the valid enumerations and their meanings follows.

| | |
|---|---|
| RTWBNULL | If the trunk group is wideband, this value means the fixed assignment scheme is used. If the trunk group is not wideband, the attribute does not apply. |
| RTWBFLOAT | The floating assignment scheme is used by a trunk groups which have this wbtsa_type value. |
| RTWBFLEX | The flexible assignment scheme is used by trunk groups which have this wbtsa_type value. |

This field is also stored in the RLfc_trunk.wbtsa_type field. Corresponding tuples in RLfc_trunk and RLrt_trkg must have the same value for wbtsa_type. The attribute wbtsa_type is included in RLrt_trkg because wideband trunks are hunted globally by the CMP.

For wideband calls, fixed time-slot assignment requires wideband calls start on a specific channel: 1, 7, 13, or 19 for N = 6 calls. N = 24 calls must start with time-slot 1 and use all 24 members within a trunk block. N must be 6 or 24 for fixed wideband time-slot assignment, any other value will result in the call being killed. In addition to starting on certain channels, fixed time-slot assignment requires wideband calls use contiguous channels, within the same SM, within the same trunk group, within the same DFI and within the same trunk block.

Floating time-slot assignment allows calls to start on any channel as long as all of the channels assigned to the call are contiguous, within the same SM, within the same trunk group, within the same DFI and within the same trunk block.

Flexible time-slot assignment allows the channels associated with a call to be non-contiguous. The channels must still, however, be within the same SM, within the same trunk group, within the same DFI and within the same trunk block.

**Attribute:**
dcs_retry
**Fullname:**
Autoplex(R) retry indicator
**Attribute Description:**
For Autoplex(R) two-way trunks, indicates whether or not a retry should be attempted.

**Attribute:**
dcs_trk

Copyright © 1999 Lucent Technologies 

**Fullname:**
Autoplex(R) trunk indicator
**Attribute Description:**
Indicates whether or not a trunk is Autoplex(R), including public switched telephone network (PSTN) trunks.

**Attribute:**
dcs_digcnt
**Fullname:**
Autoplex(R) incoming digit count
**Attribute Description:**
For Autoplex(R) dual tone mulit-frequency (DTMF) trunks, indicates the number of incoming digits.

**Attribute:**
apx_notify
**Fullname:**
Executive control processor (ECP) authorization indicator
**Attribute Description:**
Indicates whether or not authorization from the ECP is required.

**Attribute:**
servtype
**Fullname:**
Service Type for a Speech Handler Trunk Group
**Attribute Description:**
Indicates the service type associated with a Speech Handler trunk group

**Attribute:**
raf_mbrs
**Fullname:**
Number of members in the trunk group that are from RAFs.
**Attribute Description:**
Announcement trunk groups may be composed of both RAF and SAS members. This attribute is used to keep count of the number of RAF members in the trunk group.

**Attribute:**
staggered
**Fullname:**
Cascading announcement.
**Attribute Description:**
Indicate whether this trunk group is for 15A cascading announcement. For this attribute to be set to DBYES, SFID118 must be DBYES.

Copyright © 1999 Lucent Technologies 

**Attribute:**
stre_ip
**Fullname:**
STOR Intelligent Peripheral Trunk Group.
**Attribute Description:**
Indicates whether the Trunk Group is connected to an Intelligent Peripheral. Used by ASP feature AIN 0.2 SSP Send To Outside Resource (STOR). SFID229 must be turned on before this attribute can be set to DBYES.

**Attribute:**
stre_measure
**Fullname:**
STOR Intelligent Peripheral Trunk Group Measurement Indicator.
**Attribute Description:**
Indicates whether to do measurements on the Trunk Group Used by ASP feature AIN 0.2 SSP Send To Outside Resource (STOR). The duration of the STOR 5ESS(R)-2000 switch to IP connection is measured. SFID229 must be turned on, stre_ip must be DBYES and the number of IP trunks marked for measurement must be less than 25 before this attribute can be set to DBYES. The count of IP trunks marked for measurement is maintained in Glipcnt.

**Attribute:**
ffcf1
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description.

**Attribute:**
ffcf2
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description.

**Attribute:**
ffcf3
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description.

**Attribute:**
ffcf4
**Fullname:**

Boolean reserved for future field feature

**Attribute Description:**

See fullname description.

**Attribute:**

inh_jip

**Fullname:**

Inhibit jurisdiction information parameter signaling indicator

**Attribute Description:**

For local number portability, when set to DBYES, this attribute indicates that the jurisdiction information parameter may not be signaled. This attribute only has meaning for an ISUP trunk.

**Attribute:**

sig_pnum

**Fullname:**

Signal ported number indicator

**Attribute Description:**

For local number portability, when set to DBYES, this attribute indicates that the dialed number, instead of the location routing number, will be signaled in the called party number. This attribute only has meaning for an ISUP trunk.

**Attribute:**

isg

**Fullname:**

Information Service Gateway

**Attribute Description:**

For Information Service Gateway, when set to DBYES, this attribute indicates that this is ISG trunk.

**Attribute:**

cnaopt

**Fullname:**

Connecting Network AMA Option

**Attribute Description:**

This attribute will be used to contain the connecting network access(CNA) AMA option. The option can be set to not generate CNA AMA records, always generate CNA AMA records, or generate a CNA AMA record when a LNP query is made.

**Attribute:**

psu_mod

**Fullname:**

PSU Module

**Attribute Description:**

This attribute defines whether the CCS signaling platform is CNI or PSU. If CNI is used for CCS

Copyright © 1999 Lucent Technologies 

signaling, psu_mod is set to zero; if PSU-based CCS signaling is used, psu_mod is set to the GSM number.

**Attribute:**
mint_act
**Fullname:**
MINT active
**Attribute Description:**
Used to flag if MINT signaling is active

**Attribute:**
outage_rpt
**Fullname:**
outage report
**Attribute Description:**
Indicates that when the trunk group is 100% out-of-service the outage should be reported by the Enhanced Automatic Maintenance Limit capability.

**Attribute:**
imm_start_ann
**Fullname:**
immediate start announcement
**Attribute Description:**
Indicates that this trunk group uses Immediate Start Announcements (17A announcement machine).

**Attribute:**
linebusy
**Fullname:**
Line Busy indicator
**Attribute Description:**
Indicates whether or not Line Busy treatment should be given to the call regardless of the treatment defined at the end of the route list that leads to this trunk group. If this switch has a PBX connected by a PRI/PF trunk that has the "linebusy" indicator set and RTA cannot find an idle trunk to the PBX, it will change the MGRT_FAIL reason sent to the OTP from REORDER to LINEBUSY. This will prevent the OTP from releasing to the upstream switch with data that would cause the upstream switch to Reroute On Release.

**Attribute:**
rtcd_req
**Fullname:**
Real Time Call Details Required

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
This attribute defines whether RTCD Records will be generated for this trunk group.

**Attribute:**
enh_psap_sig
**Fullname:**
Enhanced Public Safety Answering Point
**Attribute Description:**
This attribute is used to indicate that a trunk designated as a CAMA PSAP is using enhanced CAMA signaling. The cama_psap attribute must also be DBYES if this attribute is DBYES. This attribute can only be set to DBYES when the secured feature FGD Interface to E911 has been purchased ( SFID 299 is active ). SFID 299 is dependent on SFID 61.

**Attribute:**
tendigonly
**Fullname:**
E911 CAMA PSAP outpulse 10 digit only indicator
**Attribute Description:**
This attribute contains the E911 CAMA PSAP outpulse 10 digit only indicator. The enh_psap_sig attribute must be DBYES if this attribute is DBYES. When the tendigonly attribute is DBYES, only 10 digits will be outpulsed to the PSAP. If the tendigonly attribute is DBNO and enh_psap_sig attribute is DBYES, 20 digits will be outpulsed to the PSAP.

**Attribute:**
calea
**Fullname:**
Communications Assistance For Law Enforcement Act.
**Attribute Description:**
Indicates that the trunk group has been reserved for the CALEA feature.

## 4. Population Rules for RLrt_wbrtx

**Relation Description**
Wideband (NxDS0) alternate route index.

This relation is used to obtain the route index for wideband calls. RTA normally gets the route index in the RT_SCRNING state from either the RLrt_scrning relation or Digit Analysis. The route index is then used in the RT_RTING state.

For wideband calls, however, the RT_SCRNING state will check the originating tcm.bear_cap. If the call is wideband, the RT_WBRTING state will be called. RT_WBRTING will combine the original route index with the incoming wideband rate to form a key to read RLrt_wbrtx. The new route index (wb_rtx) is then used in the RT_RTING state to route the call.

***NOTE:*** Note: This relation was modeled after the RLrt_dtrtx relation which is used to route circuit-switched DS0 data calls. A chart which graphically shows how the RLrt_wbrtx relation is used is show here:

```
perform digit analysis
on dialed digits---------->screening------->normal route index
x
RLrt_dtrtx
route_x rate data_rtx
x      null    aa
x      56R     a

   P means primary trunk group (facilities)
   S means secondary trunk group (facilities)
```

**Attribute: route_x**

**Fullname:** Route Index

**Attribute Description** This attribute represents the existing route index chosen based upon the screening and destination indices or obtained from the Digit Analysis relations.

**Attribute: wb_rate**

**Fullname:** Wideband (NxDS0) rate of the trunk group

**Attribute Description** The wideband rate requested by an incoming NxDS0 call can be:

```
WB_384K to request a trunk that can only carry 384 kb/s
        wideband calls or DS0 calls,
WB_1536K to request a trunk that can only carry 1536 kb/s
         wideband calls or DS0 calls,
WB_MR to request a trunk that can only carry calls
         requiring from 128 kb/s --> 1536 kb/s depending
         upon the number of members within the wideband
         trunk group or DS0 calls.
```

Refer to the checks section of the wb_rtx attribute for the rules which ensure the correct wideband rate (wb_rate).

**Attribute: wb_rtx**

**Fullname:** Wideband Route Index

**Attribute Description** This attribute provides the new route index for wideband calls that request the matching wb_rate value specified in the key field (wb_rate).

A tuple with this attribute as key must exist in RLrt_routing and the 'route_type' field must be RTE_HUNT. The trunk group which is designated to carry the traffic is contained in the field 'portgrp.grpnum' of the corresponding RLrt_routing tuple.

## 4. Population Rules for RLrt2ds1

**Relation Description**
Mapping From Remote Terminal (RT) to 5ESS-2000 switch peripheral Unit Facilities.

**Copyright © 1999 Lucent Technologies** 

This relation is used to determine which peripheral unit's facilities (DS1s) are associated with a given TR8 or TR303 remote terminal (RT). A tuple includes 28 locations that represent the 28 possible DS1 terminations on an RT. Each location contains the DS1 circuit name of the DS1 that terminates in that position on the RT, that is, location 1 represents the DS1 relative to the RT,..., location 28 represents the 28th DS1 relative to the RT.

**Attribute: rtname**

**Fullname:** RT Circuit Name

**Attribute Description** This is the internal RT circuit name.

**Attribute: unit_no**

**Fullname:** UNIT Number

**Attribute Description** This is the unit number.

**Attribute: rt_no**

**Fullname:** Remote Terminal Number

**Attribute Description** This is the Remote Terminal (RT) number.

**Attribute: rtint**

**Fullname:** RT Interface

**Attribute Description** This is the RT interface (TR8 or TR303).

**Attribute: rtds1_1**

**Fullname:** Transport facility circuit name associated with RT's 1st DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the first DS1 termination on the RT. A DS1 must always be assigned in this position.

**Attribute: rtds1_2**

**Fullname:** Transport facility circuit name associated with RT's 2nd DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the second DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_3**

**Fullname:** Transport facility circuit name associated with RT's 3rd DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the third DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_4**

**Fullname:** Transport facility circuit name associated with RT's 4th DS1

Copyright © 1999 Lucent Technologies 

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 4th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_5**

**Fullname:** Transport facility circuit name associated with RT's 5th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the fifth DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_6**

**Fullname:** Transport facility circuit name associated with RT's 6th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the sixth DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_7**

**Fullname:** Transport facility circuit name associated with RT's 7th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the seventh DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_8**

**Fullname:** Transport facility circuit name associated with RT's 8th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 8th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_9**

**Fullname:** Transport facility circuit name associated with RT's 9th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 9th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_10**

**Fullname:** Transport facility circuit name associated with RT's 10th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 10th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_11**

**Fullname:** Transport facility circuit name associated with RT's 11th DS1

Copyright © 1999 Lucent Technologies 

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 11th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_12**

**Fullname:** Transport facility circuit name associated with RT's 12th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 12th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_13**

**Fullname:** Transport facility circuit name associated with RT's 13th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 13th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_14**

**Fullname:** Transport facility circuit name associated with RT's 14th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 14th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_15**

**Fullname:** Transport facility circuit name associated with RT's 15th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 15th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_16**

**Fullname:** Transport facility circuit name associated with RT's 16th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 16th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_17**

**Fullname:** Transport facility circuit name associated with RT's 17th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 17th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_18**

**Fullname:** Transport facility circuit name associated with RT's 18th DS1

Copyright © 1999 Lucent Technologies 

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 18th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_19**

**Fullname:** Transport facility circuit name associated with RT's 19th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 19th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_20**

**Fullname:** Transport facility circuit name associated with RT's 20th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 20th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_21**

**Fullname:** Transport facility circuit name associated with RT's 21st DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 21st DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_22**

**Fullname:** Transport facility circuit name associated with RT's 22nd DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 22nd DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_23**

**Fullname:** Transport facility circuit name associated with RT's 23rd DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 23rd DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_24**

**Fullname:** Transport facility circuit name associated with RT's 24th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 24th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_25**

**Fullname:** Transport facility circuit name associated with RT's 25th DS1

Copyright © 1999 Lucent Technologies

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 25th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_26**

**Fullname:** Transport facility circuit name associated with RT's 26th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 26th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_27**

**Fullname:** Transport facility circuit name associated with RT's 27th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 27th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: rtds1_28**

**Fullname:** Transport facility circuit name associated with RT's 28th DS1

**Attribute Description** The value of this attribute is the transport facility (DS1) circuit name associated with the 28th DS1 termination on the RT. If there is no DS1 in this position, then the value of this attribute is 0x0 (GLNULCKT).

**Attribute: ds1_mask**

**Fullname:** Bit Mask for Assigned DS1s

**Attribute Description** This is a 28-bit mask that is used to determine which DS1s are assigned on this RT. For each of the 28 possible DS1 terminations on the RT, the corresponding bit in ds1_mask is set if a DS1 is assigned in that position, and cleared otherwise. The least significant bit, that is, bit 0, corresponds to DS1 number 1 relative to the RT.

**Attribute: prot_ds1**

**Fullname:** Protection Line DS1

**Attribute Description** This is the DS1 number (relative to the RT) of the protection line DS1. A value of 0 indicates that there is no protection line DS1.

**Attribute: bu_link**

**Fullname:** Backup EOC/TMC Link

**Attribute Description** This is the DS1 number (relative to the RT) of the backup EOC/TMC link. This attribute is meaningful only for TR303 RTs and has a value of 0 for TR8 RTs.

**Defines:**"db/DMcircuit.h"

# RTANNGRP

## 1. Description

This relation contains the local announcement group relation for switching modules.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 400 |
| expected tuples in relation | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| ks key store | DBNO |
| l1 length of subkey1 | 13 |
| p1 position of subkey1 | 3 |
| ignore key bits | 0-2 |

## 3. Field Layout

```

## 4. Population Rules for RLrtanngrp

**Relation Description**
Routing Announcement Group

Local announcement group relation for switching modules.

**Attribute: grpnum**

**Fullname:** Group Number

**Attribute Description** Trunk Group Number must correspond to a globally controlled trunk group

Copyright © 1999 Lucent Technologies 

and be an announcement trunk group type. This means that the grpnum value must have tuple in the RLrt_trkg relation with the 'type' attribute equal to announcement and 'module' attribute = Zero(0) (that is, the trunk group is globally controlled).

**Attribute: anngrp**

**Fullname:** Announcement Group

**Attribute Description** Trunk Group Number for a local module announcement trunk. The RLrt_trkg must have a tuple with type attribute = announcement and module = Nonzero (that is, the trunk group is a local trunk group). The module number in the RLrt_trkg tuple indicates where the RLrtanngrp tuple is located.

## 4. Population Rules for RLrtcase

**Relation Description**
Routing Case Relation.

This relation defines the routing cases. The routing case, as a concept, is formed out of a routing case index, and up to four linksets/combined linksets, called respectively the normal routing and the three alternate routings. It also contains a bitmap array that indicates which DPCIs, and therefore DPCs, are using this routing case.

**Attribute: rtcase**

**Fullname:** Routing Case Index.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** ---

**Attribute: lnk_set**

**Fullname:** Linkset/Combined Linkset.

**Attribute Description** This attribute represents the linkset or the combined linkset which is the first component of the routing case.

**Attribute: altls1**

**Fullname:** First Alternate Linkset/Combined Linkset.

**Attribute Description** This attribute is the second routing case element.

**Attribute: altls2**

**Fullname:** Second Alternate Linkset/Combined Linkset.

**Attribute Description** This attribute is the third routing case element.

**Attribute: altls3**

**Fullname:** Third Alternate Linkset/Combined Linkset.

**Attribute Description** This attribute is the fourth routing case element.

**Attribute: dpci[*]**

**Fullname:** Array of bits used to indicate which dpci's are served by this routing case.

**Attribute Description** Attributes dpci0 thru dpci62 comprise the array of bits which are used to indicate which dpci's are served by this routing case. The layout of the dpci bit array is shown here.

```
high                                                    low

|  I   I   I   I   I   I    ...   I   I   I   I   I   I  |
| 2015 -------------------  ...  --------------------1984|
|-------------------------  ...  ------------------------|
```

When a routing case is assigned to serve a dpc,an entry is made in the dpci bit map array as follows:

**Copyright © 1999 Lucent Technologies** 

(1) Divide the dpci being served by 32 to obtain the segment in the array to be modified (such as, for dpci == 0..31, modify dpci0: for dpci == 32..63, modify dpci1, etc.)

(2) In the segment found in step 1, locate the (dpci & 0x1f)-th bit.

(3) Set the bit position to 1.

If the first bit of dpci0 equals 0, it means that there is at least 1 DPCI using the routing case, else, it means that there is no DPCI using the routing case.

When a destination point code is added to the network, if the Glrmrte equals DBYES, and if there is a need for a new routing case, then a new tuple will be populated in this relation. When the Gl_rmrte equals DBNO then this relation will not be populated.

## 4. Population Rules for RLrtdn_mhg

**Relation Description**
Associates a local DN with its multiline / multiposition hunt group number.

Use this relation to obtain the MLHG group number for types UCD, PSUCD, MUPH, or ISAT.

**Attribute: locdn**

**Fullname:** local directory number

**Attribute Description** This attribute is a structure consisting of the normalized office code (NOC) and four directory number digits (digits). For packet switching multi-line hunt groups (MLHG)s the locdn will always be a PSUCD DN. The linear DNs associated with packet MLHG members are stored in RLpsldn_gp.

**Attribute: locdn.noc**

**Fullname:** normalized office code

**Attribute Description** Noc code assigned to phone number of group if a phone number is assigned.

**Attribute: locdn.digits**

Copyright © 1999 Lucent Technologies 

**Fullname:** directory digits

**Attribute Description** The last four digits assigned to phone number of group if a phone number is assigned.

**Attribute: psflag**

**Fullname:** packet switching MLHG indicator

**Attribute Description** Packet switching MLHG dn indicator

If RLrtdn_mhg.psflag == DBNO then:

(1) Verify the existence of a tuple in RLrt_dntran (on the same module) with key RLrt_dntran.dn == RLrtdn_mhg.locdn.

(2) The RLrt_dntran tuple must have RLrt_dntran.ucd_muph = DBYES.

If RLrtdn_mhg.psflag == DBYES, then verify the existence of a tuple in RLpr_dntran (on the same module) with key RLpr_dntran.dn == RLrtdn_mhg.locdn.

**Attribute: grpnum**

**Fullname:** multiline / multiposition hunt group number

**Attribute Description**

```
ID of this multiline/ multiposition hunt group.
IF ( RLrtdn_mhg.psflag == DBNO )
   IF there are members assigned to the MLHG THEN
   Verify existence of tuple in RLgroup_port with key values:
      RLgroup_port.portgrp.grpnum = RLrt_mhg.grpnum,
      RLgroup_port.portgrp.grptyp = TM_LINE,
      RLgroup_port.member = 1.
ELSE
IF there are members assigned to the MLHG THEN
   Verify existence of tuple in RLpsgp_prt with key values:
      RLpsgp_prt.grpnum = RLrt_mhg.grpnum,
      RLpsgp_prt.ptype  = TM_LINE,
      RLpsgp_prt.member = 1.
```

**Attribute: ucd_hunt**

**Fullname:** UCD hunt group indicator

**Attribute Description**

```
Indicates if this key DN is for a UCD type hunt group
(DBYES) or not (DBNO)
Dependency:
Only one of ucd_hunt, muph_hunt, or isat_hunt can be DBYES,
the other 2 must be DBNO.
IF ( RLrtdn_mhg.psflag == DBYES )
THEN RLrtdn_mhg.ucd_hunt = DBYES
```

**Attribute: muph_hunt**

Copyright © 1999 Lucent Technologies 

**Fullname:** MUPH hunt group indicator

**Attribute Description**

```
Indicates if this key DN is for a MUPH type hunt group
(DBYES) or not (DBNO)
Dependency:
Only one of ucd_hunt, muph_hunt, isat_hunt can be DBYES,
the other 2 must be DBNO.
IF ( RLrtdn_mhg.psflag == DBYES )
THEN RLrtdn_mhg.muph_hunt = DBNO
```

**Attribute: isat_hunt**

**Fullname:** ISAT hunt group indicator

**Attribute Description**

```
Indicates if this key DN is for an  isdn attendant (ISAT) type hunt group
.
Only one of ucd_hunt, muph_hunt, or isat_hunt can be DBYES,
the other 2 must be DBNO.
IF ( RLrtdn_mhg.psflag == DBYES )
THEN RLrtdn_mhg.isat_hunt = DBNO
```

**Attribute: sub_grp**

**Fullname:** subgroup number

**Attribute Description**

```
Multiposition hunt group (MUPH) subgroup number or
ISDN Attendant (ISAT) subgroup number.
IF ( RLrtdn_mhg.muph_hunt == DBYES),
    this attribute indicates subgroup number of the muph,
ELSE IF (RLrtdn_mhg.isat_hunt == DBYES),
    this attribute indicates subgroup number of the ISAT group.
    Up to 8 subgroup members are available for ISAT groups
    but for MUPH groups only 6 are allowed.
ELSE
    it takes the default value.
IF ( RLrtdn_mhg.muph_hunt == DBYES ), 0 < subgrp <= 6.
IF ( RLrtdn_mhg isat_hunt == DBYES ), 0 <= subgrp <= 7.
ELSE subgrp = 0.
```

If RLrtdn_mhg.isat_hunt = DBYES, the subgrp number represents either a LDN1-8 or WAT1-5 ICI. See RLicx_ici for dependency rules.

# RTDNMOD

## 1. Description

Translates DN group to module number or route index.

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation RTDNMOD.

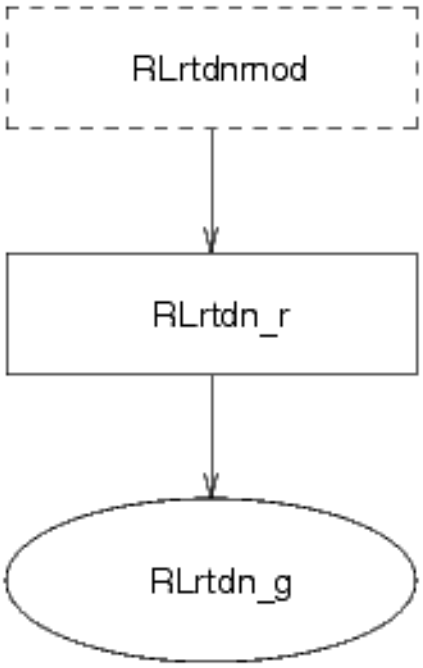

**Figure 1 Virtual Relation RTDNMOD**

## 4. Population Rules for RLrtdnmod

**Relation Description**
Translates DN group to module number or route index.

**Attribute: dngroup**

**Fullname:** directory number group - a group of 100 directory numbers

**Attribute Description** Defines a group of 100 directory numbers.

A tuple exists if

(a) there is at least one line with a directory number that matches on rlRTDNMOD.dngroup or

(b) a route index is to be assigned to this block of 100 directory numbers

**Attribute: dngroup.noc**

**Fullname:** normalized office code

**Attribute Description** see RLrtdnmod.dngroup

**Attribute: dngroup.d4d3**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** directory number thousands digit (d4), and hundreds digit (d3)

**Attribute Description** see RLrtdnmod.dngroup

**Attribute: rtg_mod**

**Fullname:** routing module

**Attribute Description** Identifies the switching module that performs routing for the group of directory numbers identified by dngroup. Any RLRT_DNTRAN tuples that exist for the specified dngroup reside on this SM.

Also see the previous RC/ODA rules.

**Attribute: psrtg_mod**

**Fullname:** packet routing module

**Attribute Description** Identifies the switching module that performs packet routing for the group of directory numbers identified by dngroup. Any RLPR_DNTRAN tuples that exist for the specified dngroup reside on this SM. psrtg_mod indicates a packet routing SM. The packet routing SM must be an ISDN module.

Also see the previous RC/ODA rules.

**Attribute: ri**

**Fullname:** Routing Index

**Attribute Description** If non-zero then there must exist a corresponding tuple in RLRT_ROUTING. Identifies the route index over which to route all calls to DNs within this 100s group. As explained in the population rules for relation RLRT_DNTRAN for attribute dn, if the noc+d4d3 has a tuple in relation RLRTDNMOD with a non-zero route index a tuple also may exist in RLRT_DNTRAN. For these cases the tuple in RLRT_DNTRAN will take precedence insofar as call routing is concerned.

Existing tuples with non-zero rtg_mod where ri is being changed from zero to non-zero should leave rtg_mod with the same value.

**Attribute: psgrpnum**

**Fullname:** Packet Switching Multi-Line Hunt Group Number.

**Attribute Description** If non-zero, then all 100 directory numbers for the 'dngroup' are listed TNs of the MLHG indicated by 'psgrpnum'. This means that for all 100 DN's a tuple must not be found for RLpr_dntran and RLrtdn_mhg for each DN in the 'dngroup'. Therefore, when routing a packet switch call, routing will read RLrtdnmod and if 'psgrpnum' is a value other than zero, then routing will read RLrt_mhg using the 'psgrpnum' found in RLrtdnmod.

If zero, then for each of the directory numbers in the 'dngroup' that is a listed TN of a MLHG, a RLpr_dntran and RLrtdn_mhg tuple will be populated for that individual directory number.

## 4. Population Rules for RLrtdnmpg

**Relation Description**
Terminating local DN for modem pool group (MPG) number.

Associates a local DN and billing DN for DSL with its modem pool group number.

**Attribute: locdn**

**Fullname:** local directory number.

**Attribute Description** locdn (KEY) This is a seven (7) digit local directory number (DN) locdn is used for two types of DNs: (see the following pop rules for dsldn for how to distinguish which of these types apply for a given tuple)

(1) It is a terminating directory number of a DSL subscriber to the modem pool; this locdn will be used by any analog customer wishing to place a call to the DSL using the modem pool.

Verify the existence of a tuple in RLrt_dntran (on the same module) with RLrt_dntran.dn= RLrtdnmpg.locdn and RLrt_dntran.termclass= RTTC_MODEM.

(2) It is a terminating DN assigned to the modem pool to be used by DSL subscribers who wish to dial a modem pool member to place a digital to analog call.

Verify the existence of a tuple in RLpr_dntran (on the same module) with RLpr_dntran.dn= RLrtdnmpg.locdn and RLpr_dntran.pstermcl= RTTC_MODEM.

**Attribute: locdn.noc**

**Fullname:** Normalized office code.

**Attribute Description** The normalized office code

**Attribute: locdn.digits**

**Fullname:** digits.

**Attribute Description** Digit string of 4 digits

**Attribute: grpnum**

**Fullname:** group number.

**Attribute Description** ID of the multi-line hunt group for modem pool group.

**Copyright © 1999 Lucent Technologies** 

The same value of RLrtdnmpg.grpnum must be populated to RLrt_mhg.grpnum and RLrt_mpg.grpnum.

**Attribute: dsldn**

**Fullname:** DSL directory number.

**Attribute Description** For each dsldn there is a tuple in OFFICECODE and PR_DNTRA relation such that:

(1) The first three digits in dsldn.noc = RLofficecode.noc

(2) RLpr_dntra.dn.noc = RLofficecode.noc The last four digits in dsldn.digits = RLpr_dntra.dn.digits

(3) The RLpr_dntra.pstermcl = RTTC_INDIVID or RTTC_PORTGRP.

Or, if dsldn is a listed TN of a packet MLHG and if this packet MLHG has the entire hundreds group as its listed TN's Then there should be a tuple in RLrtdnmod where the RLrtdnmpg.dsldn.noc = RLrtdnmod.dngroup.noc and the thousand and hundred digits = RLrtdnmod.dngroup.d4d3 and where RLrtdnmod.psgrpnum is not equal to 0.

If the key 'locdn' of this tuple is a terminating DN assigned to a modem pool group, the dsldn.noc = 0 and dsldn.digit = value of 0.

**Attribute: dsldn.noc**

**Fullname:** Normalized office code.

**Attribute Description** The normalized office code

**Attribute: dsldn.digits**

**Fullname:** digits.

**Attribute Description** Digit string of 4 digits

**Attribute: billdsldn**

**Fullname:** billing DSL directory number.

**Attribute Description** The billing DN associated with the dsldn in the same tuple.

(1) When the locdn of this tuple represents the terminating DN for a modem pool call, this billdsldn is the billing DN for the call. If the dsldn is a MLHG listed TN of a packet MLHG then the billdsldn will be the dsldn with npa added. Otherwise look at RLpr_dntran to get ph, ph channel, and party. Use these to access RLpsx25ln. If the RLpsx25ln.billdn_flg is equal to yes, then use the ph, ph channel, and party to look up the RLpsbilldn.bill_dn. When a tuple in PSX25LN relation exists such that

```
RLpsx25ln.dd_number = RLrtdnmpg.dsldn    and
RLpsx25ln.billdn_flg = DBYES,
then RLrtdnmpg.billdsldn = RLpsbilldn.bill_dn:
if RLpsx25ln.billdn_flg = DBNO, then
RLrtdnmpg.billdsldn = NPA + RLrtdnmpg.dsldn where
NPA is the area code (attribute npa) from the
```

Copyright © 1999 Lucent Technologies 

```
RLnoccode tuple corresponding to the office code
(attribute nxx in RLnoccode) of the dsldn.
```

When a change is made in RLpsx25ln or RLpsbilldn with a match that RLpsx25ln.dd_number = RLrtdnmpg.dsldn, the corresponding tuple in RLrtdnmpg needs to be updated accordingly.

(2) If the key locdn of this tuple is a terminating DN assigned to a modem pool group, the billdsldn = 0.

**Attribute: billdsldn.digcnt**

**Fullname:** digit count.

**Attribute Description** digit count.

**Attribute: billdsldn.dn**

**Fullname:** directory number.

**Attribute Description** Directory number.

## 4. Population Rules for RLrtenvalm

**Relation Description**
Environmental Alarms and Conditions for TR303 Remote Terminals.

This relation maps the TR303 Remote Terminal (RT) name to the environmental alarm classifications and conditions for the RT.

**Attribute: rtname**

**Fullname:** TR303 RT Circuit Name

**Attribute Description** This is the circuit name for a TR303 RT.

**Attribute: classif1**

**Fullname:** First Environmental Alarm Classification

**Attribute Description** This is the first environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond1**

**Fullname:** First Environmental Alarm Condition

**Attribute Description** This is the first environmental alarm condition for this RT.

**Attribute: classif2**

**Fullname:** Second Environmental Alarm Classification

**Attribute Description** This is the second environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond2**

**Fullname:** Second Environmental Alarm Condition

**Attribute Description** This is the second environmental alarm condition for this RT.

**Attribute: classif3**

**Fullname:** Third Environmental Alarm Classification

**Attribute Description** This is the third environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond3**

**Fullname:** Third Environmental Alarm Condition

**Attribute Description** This is the third environmental alarm condition for this RT.

Copyright © 1999 Lucent Technologies 

**Attribute: classif4**

**Fullname:** Fourth Environmental Alarm Classification

**Attribute Description** This is the fourth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond4**

**Fullname:** Fourth Environmental Alarm Condition

**Attribute Description** This is the fourth environmental alarm condition for this RT.

**Attribute: classif5**

**Fullname:** Fifth Environmental Alarm Classification

**Attribute Description** This is the fifth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond5**

**Fullname:** Fifth Environmental Alarm Condition

**Attribute Description** This is the fifth environmental alarm condition for this RT.

**Attribute: classif6**

**Fullname:** Sixth Environmental Alarm Classification

**Attribute Description** This is the sixth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond6**

**Fullname:** Sixth Environmental Alarm Condition

**Attribute Description** This is the sixth environmental alarm condition for this RT.

**Attribute: classif7**

**Fullname:** Seventh Environmental Alarm Classification

**Attribute Description** This is the seventh environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond7**

**Fullname:** Seventh Environmental Alarm Condition

**Attribute Description** This is the seventh environmental alarm condition for this RT.

**Attribute: classif8**

**Fullname:** Eighth Environmental Alarm Classification

**Attribute Description** This is the eighth environmental alarm classification (minor, major, critical,

Copyright © 1999 Lucent Technologies 

or automatic) for this RT.

**Attribute: cond8**

**Fullname:** Eighth Environmental Alarm Condition

**Attribute Description** This is the eighth environmental alarm condition for this RT.

**Attribute: classif9**

**Fullname:** Ninth Environmental Alarm Classification

**Attribute Description** This is the ninth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond9**

**Fullname:** Ninth Environmental Alarm Condition

**Attribute Description** This is the ninth environmental alarm condition for this RT.

**Attribute: classif10**

**Fullname:** Tenth Environmental Alarm Classification

**Attribute Description** This is the tenth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond10**

**Fullname:** Tenth Environmental Alarm Condition

**Attribute Description** This is the tenth environmental alarm condition for this RT.

**Attribute: classif11**

**Fullname:** Eleventh Environmental Alarm Classification

**Attribute Description** This is the eleventh environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond11**

**Fullname:** Eleventh Environmental Alarm Condition

**Attribute Description** This is the eleventh environmental alarm condition for this RT.

**Attribute: classif12**

**Fullname:** Twelfth Environmental Alarm Classification

**Attribute Description** This is the twelfth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond12**

**Fullname:** Twelfth Environmental Alarm Condition

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the twelfth environmental alarm condition for this RT.

**Attribute: classif13**

**Fullname:** Thirteenth Environmental Alarm Classification

**Attribute Description** This is the thirteenth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond13**

**Fullname:** Thirteenth Environmental Alarm Condition

**Attribute Description** This is the thirteenth environmental alarm condition for this RT.

**Attribute: classif14**

**Fullname:** Fourteenth Environmental Alarm Classification

**Attribute Description** This is the fourteenth environmental alarm classification (minor, major, critical, or automatic) for this RT.

**Attribute: cond14**

**Fullname:** Fourteenth Environmental Alarm Condition

**Attribute Description** This is the fourteenth environmental alarm condition for this RT. **Defines:** "db/DMcircuit.h"

# RTFTRKEY

## 1. Description

A customer's feature key is used to activate/deactivate/change parameter for a maintenance control center (MCC) feature.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 4096 |
| expected number of tuples | 3 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

```
RTFTRKEY    relid = 520   DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population Rules for RLrtftrkey

**Relation Description**
Customer's feature key.

Copyright © 1999 Lucent Technologies

A customer's feature key is used to activate/deactivate/change parameter for an MCC feature.

**Attribute: scan_port**

**Fullname:** Scanpoint port.

**Attribute Description** This attribute indicates a scanpoint port and is the key for this relation. It is divided into sub-attributes scan_port.member and scan_port.module.

Verify existence of tuple in RLfc_line AND a tuple in RLfc_porttyp for this key port. In RLfc_porttyp the class of service should be FC_FEATUREKEY.

**Attribute: scan_port.member**

**Fullname:** Port name of a port.

**Attribute Description**Port name of a port.

**Attribute: scan_port.module**

**Fullname:** IM number.

**Attribute Description**The IM number that this port terminates on.

**Attribute: lport**

**Fullname:** Logical port.

**Attribute Description** This attribute indicates the logical port of the user which is the control lport for the key. The MCC features assigned to this lport will be activated/deactivated or individualized dial plan (IDP) alternate code treatment set number changed.

```
Dependencies: Verify existence of tuple in fc_line where
RLfc_line(RLlpt_pt(lport,lpt_type).port, party)
.lport = RLrtftrkey.lport AND where
RLfc_line(RLlpt_pt(lport, lpt_type).port, party)
.lpt_type = RLrtftrkey.lpt_type.
```

**Attribute: lpt_type**

**Fullname:** Logical port type.

**Attribute Description**Logical port type of the user.

**Attribute: lport_mod**

**Fullname:** Logical port module.

**Attribute Description**The switching module on which the lport is located.

**Attribute: feat_id**

**Fullname:** Feature id.

**Attribute Description**MCC feature id that is assigned to the control line, and is invoked by operating the console key corresponding to RLrtftrkey.scan_port.

Copyright © 1999 Lucent Technologies 

```
If RLrtftrkey.feat_id corresponds to a terminal feature like ACOF,
verify existence of tuple in RLtrmfeats with cntl port as key.
This RLtrmfeats tuple must have an attribute such that
RLtrmfeats.ftent[n].fid = feat_id.
If RLrtftrkey.feat_id corresponds to a DN feature like Night Service,
verify existence of tuple in RLdn_feats for the primary DN
of this control port. This RLdn_feats tuple must have an attribute
such that RLdn_feats.ftent[n].fid = feat_id.
```

**Attribute: on_actset**

**Fullname:** Alternate code treatment set number.

**Attribute Description** Individualized dialing plan (IDP) alternate code treatment set number to be used for ACN_ACT_ON and ACN_ACTOFF actions.

Verify existence of tuple in RLtrmfeats with control port as key. This RLtrmfeats tuple must have an attribute assigning an IDP feature with rlIDP_CF.act_alwd = DBYES.

**Attribute: of_actset**

**Fullname:** Alternate code treatment set number.

**Attribute Description** IDP alternate code treatment set number to be used for ACN_ACT_ON and ACN_ACTOFF actions.

Verify existence of tuple in RLtrmfeats with cntl port as key. This RLtrmfeats tuple must have an attribute assigning an IDP feature with rlIDP_CF.act_alwd = DBYES.

**Attribute: ofhk_actn**

**Fullname:** Action to be taken on onhook.

**Attribute Description** MCC action to be taken on offhook when this key is depressed.

IF != ACN_NONE, the corresponding MCC action should be listed in RLfacftdsc.action[n] for this feat_id key.

**Attribute: onhk_actn**

**Fullname:** Action to be taken on onhook.

**Attribute Description** MCC action to be taken on onhook when this key is released.

IF != ACN_NONE, the corresponding MCC action should be listed in RLfacftdsc.action[n] for this feat_id key.

**Copyright © 1999 Lucent Technologies** 

# RTGRPDN

## 1. Description

Main DN and optional additional DNs for global multiline hunt groups accessed during stand alone. This relation is used only during stand alone operation to translate a dialed MLHG DN located on another module to the group number. Another local member of that same group can then be hunted during stand alone.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 200 |

## 4. Population Rules for RLrtgrpdn

**Relation Description**
DNs in Global MLHGs for SM Stand-alone.

Main DN and optional additional DNs for global multiline hunt groups accessed during stand alone. This relation is used only during stand alone operation to translate a dialed MLHG DN located on another module to the group number. Another local member of that same group can then be hunted during stand alone.

**Copyright © 1999 Lucent Technologies** 

**Attribute: grpdn**

**Fullname:** global multiline hunt group DN

**Attribute Description** This is group DN or member DN associated with a global MLHG. The list of DNs to be populated in RLrtgrpdn is determined as follows:

(1) Make a list of all DNs where: RLrt_dntran.termclass = RTTC_PORTGRP or RTTC_INWATS and RLrt_dntran.ucd_muph = DBNO.

(2) For each DN in this list of DNs, delete all MLHG DNs associated with local groups:

(a) Get the port associated with the MLHG DN: X = RLrt_dntran.portname where the key is - RLrt_dntran.dn = grpdn

(b) Get the group number associated with the port: Y = RLpggpmap.portgrp.grpnum where the key is - RLpggpmap.port = X

(c) Determine if it is a global group: Z = RLrt_mhg.gblgrp where the key is - RLrt_mhg.grpnum = Y if Z = DBNO, delete the DN from the list.

The resulting list of DNs that are not on RSMs or SMs with the Stand Alone option and which are part of a group with at least one member being on an RSM or SM with the Stand Alone option should be populated in RLrtgrpdn.

**Attribute: grpdn.noc**

**Fullname:** Normalized office code

**Attribute Description** Normalized office code

**Attribute: grpdn.digits**

**Fullname:** local dn minus the office code

**Attribute Description** local dn minus the office code

**Attribute: grp**

**Fullname:** multiline hunt group number and type

**Attribute Description** Group number and group type associated with the group DN. This is obtained by reading RLrt_dntran with 'grpdn' as the key. The value of RLrt_dntran.portname is then used as the key to RLpggpmap. This attribute is then set equal to RLpggpmap.portgrp.

**Attribute: grp.grpnum**

**Fullname:** group number

**Attribute Description** group number

**Attribute: grp.grptype**

**Fullname:** group type

Copyright © 1999 Lucent Technologies 

**Attribute Description** group type

**Attribute: member**

**Fullname:** member number of this DN

**Attribute Description** This is obtained by reading RLrt_dntran with 'grpdn' as the key. The value of RLrt_dntran.portname is then used as the key to RLpggpmap. This attribute is then set equal to RLpggpmap.member.

**Attribute: term_name**

**Fullname:** terminating port name

**Attribute Description** This is obtained by reading RLrt_dntran with 'grpdn' as the key. This attribute is then set equal to RLrt_dntran.term_name.

Copyright © 1999 Lucent Technologies 

# RTICITK

## 1. Description

Associates an ISAT group or individual type group and trunk type and tgn with subgrp, member map and ici index. Either this relation or RLrtisatmap is used during ISAT hunting to acquire member map and ici index.

## 2. Data Dictionary Values

| | |

## 4. Population Rules for RLrticitk

**Relation Description**
Associates an ISAT group or individual type group and trunk type and tgn with subgrp, member map and ici index.

Either this relation or RLrtisatmp is used during ISAT hunting to acquire member map and ici index.

**Attribute: grptyp**

**Fullname:** Group Type

**Attribute Description** If grptype is IC_MLHG, a hunt group in RLrt_mhg must exist such that the RLrt_mhg.htype of RTH_ISAT and the RLrt_mhg.isat_idx of that tuple must correspond to RLrticitk.icigrp.

**Attribute: orig_tgn**

**Fullname:** Trunk Group Number

**Attribute Description** Trunk group number that this icigrp can receive calls from. There must be a tuple in RLrt_trkg keyed by this orig_tgn.

**Attribute: icigrp**

**Fullname:** Incoming Call Identification Group

**Attribute Description** isat_idx of group of lines which share designations of tie trunk groups (TK_TIE), fx trunk groups (TK_FX), or CNET trunk groups (TK_CNET), FTS trunk groups (TK_FTS) or terminal group number.

This tuple is only populated for icigrp's where the corresponding ici is any one listed. The corresponding RLrticitk.subgrp is also shown.

**Copyright © 1999 Lucent Technologies** 

```
ici     subgrp    ici      subgrp ici      subgrp
ICI_FX1    0      ICI_TIE1   0    ICI_CNET   0
ICI_FX2    1      ICI_TIE2   1    ICI_FTS    0
ICI_FX3    2      ICI_TIE3   2
ICI_FX4    3      ICI_TIE4   3
ICI_FX5    4      ICI_TIE5   4
ICI_FX6    5      ICI_TIE6   5
ICI_FX7    6      ICI_TIE7   6
ICI_FX8    7      ICI_TIE8   7
```

When RLicx_ici.ici1-16 is populated with at least one of the ici values then a tuple is needed in RLrticitk.

If grptype is IC_MLHG, a hunt group in RLrt_mhg must exist such that the RLrt_mhg.htype of RTH_ISAT and the RLrt_mhg.isat_idx of that tuple must correspond to this icigrp.

**Attribute: trktype**

**Fullname:** trunk type

**Attribute Description** The value chosen depends on the corresponding ici and the servclass of trunks in the group.

```
Use FX for ici = ICI_FX1-8.
Use TIE for ici = ICI_TIE1-8.
Use CNET for ici = ICI_CNET.
Use FTS for ici = ICI_FTS.
For members in the trunk group
if RLfc_porttyp.servclass = FC_PF or FC_FPLASH
   & RLfc_porttyp.lp_type = FXGRND or FXLOOP then
    use TK_FX
else
    use TK_TIE or TK_CNET
```

**Attribute: subgrp**

**Fullname:** The Subgroup Within the ISAT Group

**Attribute Description** The subgroup within the ISAT group which is designated to serve calls from orig_tgn. If trktype = FX or TIE, then subgrp range 0-7. If trktype = CNET, then subgrp must be 0. If trktype = FTS, then subgrp must be 0. (See RLrticitk.icigrp description).

```
NOTE:  This subgrp value is NOT related to
       the sub_grp value defined in RLrtdn_mhg
       for LDN1-8 or WAT1-5.
```

**Attribute: ici_idx**

**Fullname:** Index of the ICI in the group.

**Attribute Description** Index of the ICI in the group. (Irrelevant for individual groups because only for hunting.) Values: 0-15. Used as index to UCD vari<ables in dynamic relation rlISATUCD, and for ICI subqueues.

**Attribute: memb0map**

**Fullname:** A bit map of the members of an ISAT hunt group.

Copyright © 1999 Lucent Technologies 

**Attribute Description** A bit map of the members of an ISAT hunt group, according to whether they handle the ICI represented by trktype and the subgrp.

Each of 8 attributes contains 8 bits (64 bits). Each bit corresponds to a member of a multiline hunt group. The least significant bit of each element represents member 1,9,17,25,33,41,49,57 respectively. The most significant bit of each element represents member 8,16,24,32,40,48,56, 63 respectively (64 is not used).

A value of 1 means that the member handles this ICI. A value of 0 means that it does not.

```
Dependencies:
At least 1 bit must be set to 1.
If there does not exist a tuple in RLgroup_port with key
value:
    key   RLgroup_port.portgrp.grpnum  = RLrt_mhg.grpnum,
    key   RLgroup_port.portgrp.grptype = TM_LINE,
    key   RLgroup_port.member          = bit position,
then membNmap of the corresponding bit position must
be 0.
```

Obtain RLrt_mhg.grpnum by finding an RLrt_mhg tuple with RLrt_mhg.htype = RTH_ISAT and isat_idx = icigrp.

**Attribute: memb[*]map**

**Fullname:** A bit map of the members of an IAST hunt group.

**Attribute Description** A bit map of the members of an ISAT hunt group, according to whether they handle the ICI represented by trktype and the subgrp.

Each of 8 attributes contains 8 bits (64 bits). Each bit corresponds to a member of a multiline hunt group. The least significant bit of each element represents member 1,9,17,25,33,41,49,57 respectively. The most significant bit of each element represents member 8,16,24,32,40,48,56, 63 respectively (64 is not used).

A value of 1 means that the member handles this ici. A value of 0 means that it does not.

Dependencies: At least 1 bit must be set to 1.

```
If there does not exist a tuple in RLgroup_port with key
value:
    key   RLgroup_port.portgrp.grpnum = RLrt_mhg.grpnum,
    key   RLgroup_port.portgrp.grptyp = TM_LINE,
    key   RLgroup_port.member         = bit position,
then membNmap of the corresponding bit position must
be 0.
```

Obtain RLrt_mhg.grpnum by finding an RLrt_mhg tuple with RLrt_mhg.htype = RTH_ISAT and isat_idx = icigrp.

Copyright © 1999 Lucent Technologies 

# RTISATMP

## 1. Description

Associates an ISAT group and ICI with member map, priority and ici index.

Maximum tuples derived from multiplying the maximum number of ISAT groups by 16 ICI's per ISAT group. The expected tuple and density data was extracted from a study of field equipment.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples - 63 ISAT grps x 16 ICI's per grp | 1008 |

## 4. Population Rules for RLrtisatmp

**Relation Description**
ISAT member map.

Associates an ISAT group and ICI with member map, priority and ici index.

A tuple must exist for each ici/isat_idx combination where the tuple in RLrt_mhg corresponding to isat_idx has RLrt_mhg.isat_idx != 0 and the following conditions of ici values are met:
Possible values for RLrtisatmp.ici are:

```
ICI_LDN1-8
ICI_WAT1-5
ICI_CFBL
ICI_CFDA
ICI_CFV
ICI_CFOH
ICI_ICPT
ICI_DCL
ICI_PPFOVR
ICI_PPFLSH
ICI_PPIMMD
ICI_PPPRIO
ICI_PPEXEC
ICI_PPROUT
ICI_EMER
ICI_RLT
ICI_QUE
ICI_FXICN
ICI_TIEICN
ICI_FTSICN
```

All other ICI's are excluded from this relation.

The following ICI values correspond to (RLrtdn_mhg.subgrp) in the ISAT group.

| ici | subgrp | ici | subgrp |
|---|---|---|---|
| ICI_LDN1 | 0 | ICI_WAT1 | 0 |
| ICI_LDN2 | 1 | ICI_WAT2 | 1 |
| ICI_LDN3 | 2 | ICI_WAT3 | 2 |
| ICI_LDN4 | 3 | ICI_WAT4 | 3 |
| ICI_LDN5 | 4 | ICI_WAT5 | 4 |
| ICI_LDN6 | 5 | | |
| ICI_LDN7 | 6 | | |

**Copyright © 1999 Lucent Technologies** 

ICI_LDN8 7

**Attribute: ici**

**Fullname:** Incoming call id.

**Attribute Description** Incoming call identification - an enumerated value ISDN Call Identification (ICI's listed previously)

**Attribute: isat_idx**

**Fullname:** ISAT index.

**Attribute Description** ISAT index corresponding to hunt group.

**Attribute: ici_idx**

**Fullname:** Index of the ICI in the group.

**Attribute Description** Used as index to UCD start hunt variables and for queuing and dequeuing calls in dynamic relation RLisatucd.

Allocated sequentially as listed in RLicx_ici. There cannot be two tuples in RLrtisatmp such that the isat_idx is the same and ici_idx is also the same.

**Attribute: memb[*]map**

**Fullname:** A bit map of the member.

**Attribute Description** A bit map of the members of an ISAT hunt group, according to whether they handle these ICI's.

Each of the 8 attributes contain 8 bits (64 bits). Each bit corresponds to a member of a multiline hunt group. The least significant bit of each element represents member 1,9,17,25,33,41,49,57 respectively. The most significant bit of each element represents member 8,16, 24,32,40,48,56, 63 respectively (64 is not used). A value of 1 means that the member handles this ici. A value of 0 means that it does not.

At least 1 bit must be set to 1. (not enforced by RC/V)

If there does not exist a tuple in RLgroup_port with key value:

```
key   RLgroup_port.portgrp.grpnum = RLrtdn_mhg.grpnum,
key   RLgroup_port.portgrp.grptyp = TM_LINE,
key   RLgroup_port.member         = bit position,
then membNmap of the corresponding bit position must be 0.
```

**Copyright © 1999 Lucent Technologies**

# RTLIST

## 1. Description

This relation contains the LDP route list.

This is a virtual relation. The Root Storage Relation is RLrtlist_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation RTLIST.

## 4. Population rules for RLrtlist

### Relation Description

Route List for LDP Routing Enhancements Feature
This relation defines the route list for LDP routing.
SFID289 must be unlocked on RC View 8.22, before
an LDP route list can be defined on RC View 10.40.
The number of RIs specified on the RC View determine the
count (1 to 16), and the number of RIs in the route list.
When additional RIs are inserted, or deleted, from the list,
the count is incremented, or decremented, to reflect the
correct number of RIs assigned in the list.
The key (prim_ri) is also the first RI (ri[0])

**Copyright © 1999 Lucent Technologies** 

```
        assigned in the list:
                RLrtlist.ri[0] == RLrtlist.prim_ri;
```

**Attribute:**
        prim_ri
**Fullname:**
        primary route index
**Attribute Description:**
        primary route index number

**Attribute:**
        count
**Fullname:**
        RI count
**Attribute Description:**
        The number of non-zero RIs assigned in the list.

**Attribute:**
        ri[*]
**Fullname:**
        route list
**Attribute Description:**
        Up to 16 unique RIs can be specified in the route list.

```

## 4. Population Rules for RLrtppscrn

**Relation Description**
Precedence and preemption screening relation.

The following rules are for documentation only and are not enforceable by recent change (RC). They should be included in the TG5 to document how to minimize the number of tuples in rtppscrn.

(1) When the PP feature is assigned to a line or trunk, the following two tuples should exist in RTPPSCRN for the SI and DI assigned with the RTE_CODE equal to 0. A tuple should exist with the PREC_LEVEL equal to

Copyright © 1999 Lucent Technologies 

P for precedence calls and a tuple should exist with the PREC_LEVEL equal to R for routine calls.

(2) Data should be explicitly populated for a RTE_CODE at a desired PREC_LEVEL when:

(a) The desired route differs from the route chosen for RTE_CODE 0 PREC_LEVEL P for precedence calls or RTE_CODE PREC_LEVEL R for routine calls. Precedence calls for any RTE_CODE at any PREC_LEVEL use the data associated with RTE_CODE 0 PREC_LEVEL P if data for that RTE_CODE and PREC_LEVEL is not explicitly populated. Routine calls for any RTE_CODE use the data associated with RTE_CODE 0 PREC_LEVEL R when data for that RTE_CODE is not explicitly populated.

(b) A tuple already exist for that RTE_CODE but at a lower PREC_LEVEL above ROUTINE than the desired PREC_LEVEL and the desired route differs from the route chosen by the existing tuple. In other words, precedence calls at precedence levels higher than ROUTINE can use data associated with a lower PREC_LEVEL but higher than ROUTINE if data for the desired PREC_LEVEL is not explicitly populated.

(1) Example: This example will illustrate the previous rules. The following layout contains existing tuples. The RTI indicates the chosen route. For this example the SI and DI are the same for all tuples. (A tuple should exist in RTPPSCRN for all combinations of SI and DI)

| RTE_CODE | PREC_LEVEL | RTI |
|---|---|---|
| 0 | R | A |
| 0 | P | B |
| 0 | F | C |
| 2 | I | D |

The following layout contains additional tuples. The needed column indicates whether or not the tuple should be added to RTPPSCRN.

| | RTE_CODE | PREC_LEVEL | RTI | NEEDED |
|---|---|---|---|---|
| 1. | 1 | F | B | NO |
| 2. | 1 | I | D | YES |
| 3. | 3 | R | E | YES |
| 4. | 2 | F | D | NO |

Tuple (1) doesn't need to be populated because the RTI does not differ from the RTI for RTE_CODE 0 PREC_LEVEL P.

Tuple (2) needs to be populated because the RTI differs from the RTI for RTE_CODE 0 PREC_LEVEL P and because a tuple does not exist at a lower PREC_LEVEL but higher than ROUTINE for RTE_CODE 1 with the same RTI.

Tuple (3) needs to be populated because the RTI differs from the RTI for RTE_CODE 0 PREC_LEVEL R.

Tuple (4) doesn't need to be populated because a tuple exists at a lower PREC_LEVEL but higher than ROUTINE for RTE_CODE 2 with the same RTI."

**Attribute: si**

**Fullname:** screening index

**Attribute Description** Screening index associated with a line.

**Attribute: di**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** destination index

**Attribute Description** Dependencies: none.

**Attribute: rte_code**

**Fullname:** dialed route code

**Attribute Description** Indicates the valid route codes that can be analyzed.

**Attribute: prec_level**

**Fullname:** precedence level

**Attribute Description** Indicates the precedence level of the call in progress. Dependencies: If rtype == RTE_MC, RTE_HUNT or RTE_POLYGRID then prec_level != PP_EXECUTIVE.

**Attribute: ri**

**Fullname:** route index

**Attribute Description** Indicates route index used to route calls to the appropriate trunks.

**Attribute: rtype**

**Fullname:** route type

**Attribute Description** Dependencies:

(1) If rtype = RTE_ATDN, then ri cannot be 0 and must be a valid noc. Also digits must not be null.

(2) If rtype = RTE_MC, then digits should be null, ri should be non-zero, and prec_level != PP_EXECUTIVE. Also verify a tuple exists in RLrt_mcrt with the key mc_ri == ri.

(3) If rtype = RTE_HUNT, then verify the existence of a tuple in RLrt_routing with key route_x = ri, and ri > 0. Also digits should be null and prec_level != PP_EXECUTIVE.

(4) If rtype = RTE_REORDER, then ri should be set to 0, and digits should be null.

(5) If rtype = RTE_DNTRAN, then ri should be zero. Also digits should be null.

(6) If rtype = RTE_PRIME, then ri should be zero and digits should be null.

(7) If rtype = RTE_POLYGRID, then verify the existence of a tuple in RLrt_poly with key pattern = ri, and ri > 0. Digits should be null and prec_level != PP_EXECUTIVE.

**Attribute: digits**

**Fullname:** line number associated with a given attendant noc

**Attribute Description** These are the 4 line number digits associated with an attendant noc. This digits array attribute is only valid when rtype == RTE_ATDN. All other cases are don't care. Range of each digit: 0 .. 9.

**Attribute: charge_x**

Copyright © 1999 Lucent Technologies 

**Fullname:** charge index

**Attribute Description**

(1) NOTE: The charge index contained in rtppscrn is not overwritten by the charge index from RLrt_mcrt. The charge index should be fully populated here if the office uses the PP feature.

**Attribute: code_control**

**Fullname:** code control flag

**Attribute Description** Indicates whether DSN code controls can or cannot be applied to the route indicated by this tuple.

```
Dependencies:
If the global parameter Gldsnopt == DBNO
   the code_control must = DBNO.
If code controls can be applied, then
   code_control must = DBYES.
```

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLrts_hcn

### Relation Description

```
translation table from RSM NCT time slot number to
HIM DFI channel circuit name
POPULATION PROCEDURES WHEN ADDING A T1 UMBILICAL
These rules are to be used to populate the RTS_HCN and
HCN_RTS relations when a new T1 umbilical is added
between an RSM and its host SM (HSM).  The starting
point for populating RTS_HCN is the FIDB number of the
RDFI or RDFI2 T1FAC to which the T1 line is connected.
(1) Assume that the RDFI/RDFI2 is added first.  Once it
is installed, the FIDB_SGN relation should be populated:
this gives the mapping from an RSM FIDB to the (PICB+1)
number of the associated RDFI/RDFI2 channel circuit
(service group, service group is the DFI channel number
(1-10) on the DLTU). The domain of FIDB is (0x00 - 0x09)
and (0x10 - 0x19).

(2) The next step is to connect the RDFI/RDFI2 to the
HDFI/HDFI2 via the T1 line.  Once the T1 line is wired
to the HDFI/HDFI2, the RCB_HCB relation should be
```

Copyright © 1999 Lucent Technologies

populated. This relation gives the mapping from the RDFI/RDFI2 channel circuit to the HDFI/HDFI2 channel circuit name.

(3) Once the HFAC circuit name is known the TSP2APP relation is read and the PCH_UMB circuit (RSM umbilical circuit) is determined. The subtending PCHUMB_TS circuits are determined and populated in the RTS_HCN relation as the (himcktname).

The 22(23) entries in RTS_HCN will be populated as follows: The 'himcktname' attribute is will have a circuit index constructed by using the Umbilical number plus one (umbil + 1) in the upper byte, and the channel circuit number in the lower byte. The channel circuit numbers are taken from the range of (0-22, resulting in 23 tuple entries) if the umbilical does not carry a Control Time Slot (CTS), and (1-22, resulting in 22 tuple entries) if the umbilical uses a channel as a CTS. The constructed circuit index value should be the circuit index for the circuit name attribute 'himcktname'.
The RTS_HCN and HCN_RTS relations are not populated for Control Time Slots. A Control Time Slot is always connected to RSM NCT time slots 0, 1, 2, or 3.

The following diagram give the RSM NCT time slot (nctts) values for each of the 20 possible FIDB values. The first diagram corresponds to FIDB values 0-9 and the second diagram to FIDB values 10-19.

**Attribute:**
nctts
**Fullname:**
RSM NCT time slot number
**Attribute Description:**
The nctts attribute corresponds to an NCT time slot in the RSM which is associated with a T1 transmission line.

**Attribute:**
himcktname
**Fullname:**
HIM DFI channel circuit name
**Attribute Description:**
The himcktname attribute indicates the associated umbilical channel circuit name. The circuit name will be the circuit that has a circuit index derived from umbilical number plus one (umbil + 1) in the upper byte and the channel number in the lower byte.

## 4. Population Rules for RLrts_rts

**Relation Description**
Local end to far end time slots.

Relation containing far end network side time slot numbers corresponding to local network side time slots

Copyright © 1999 Lucent Technologies

connected by a given ICL channel (time slot).

Intra-RSM communication links (ICLs) will initially be T1 spans. These facilities carry 23 active channels (the 24th being used for multiplexed signaling information.) When an ICL is attached to an RM, an association is made between the ICL channel number (0-23) and a TSI network side time slot number (0-511). There are 20 of these possible associations, depending upon the FIDB which is associated with the termination.

An association between ICL channel and network side time slot can also be made at the other end of the ICL. However, the two time slots associated with a given channel may be different because the FIDBs used at each end may be different. (In fact, it can be proven that they can NEVER all be the same in a fully assigned cluster.)

This relation specifies the correspondence between local end (ts_near) and far end (ts_far) time slots which terminate a given ICL channel. The attribute 'othrrm' specifies the ID of the mate RM which terminates the ICL channel specified by 'ts_near'. For example, if ts_near=18 in module 2 terminates in ts_far=23 of module 4, then the tuple in module 2 will have: ts_near=18;othrrm=4;ts_far=23. The corresponding tuple in module 4 will have:ts_near=23;othrrm=2;ts_far=18.

Note: that growth/degrowth of an ICL implies changes in pairs to 23 tuples (22 if either CDFI of the ICL connects to PIDBs 01 or 11) in each of the terminating modules. For each ts[i]-->ts[j] in one module there will be a corresponding ts[j]-->ts[i] in the other module.

**Attribute: ts_near**

**Fullname:** near end time slot

**Attribute Description** A local network side time slot which terminates an ICL.

**Attribute: othrrm**

**Fullname:** other RM

**Attribute Description** The module ID of the mate RM to which 'ts_near' connects.

**Attribute: ts_far**

**Fullname:** far end time slot

**Attribute Description** The corresponding network side time slot on the other end of the ICL.

## 4. Population Rules for RLrtsatln

**Relation Description**
Stand Alone Test Line.

A tuple exists in this relation for each port in RLfc_porttyp with a servclass of FC_SATSTLN.

**Attribute: port**

**Fullname:** Global port id

**Attribute Description** This attribute is the key for this relation and is divided into sub-attributes; port.member and port.module. Member is the port name of a line or trunk. Module is the Switch Module on which this port is located.

**Attribute: port.member**

**Fullname:** Port Member

**Attribute Description** Member is the port name of a line or trunk.

Copyright © 1999 Lucent Technologies 

**Attribute: port.module**

**Fullname:** Port Module

**Attribute Description** Module is the Switch Module on which this port is located.

**Attribute: screen_x**

**Fullname:** Screening index

**Attribute Description** Indicates the screening index to be substituted for 0 when doing standalone routing tests. It is obtained by using the lcc and rax attributes from the port's RLrc_oeinfo tuple as keys to an appropriate RLrc_lcc tuple.

**Attribute: am_emrnm**

**Fullname:** AM Emergency Number Routing

**Attribute Description** Indicates if the port is to be used for testing standalone emergency routing for the AM or for the SM on which the port is located. This attribute can have the following values:

```
DBYES - AM emergency routing
DBNO  - SM emergency routing
```

The default value is DBNO.

## 4. Population Rules for RLrxschd

**Relation Description**
Routine exercise schedule.

This data relation contains the Routine Exercise (REX) schedule information. In particular it contains the REX starting time in hours, minutes, and the duration of the tests. There is one tuple in RLrxschd for each SM processor number.

ODA CHECKS BOTH: 1) That each RLrxschd must have a corresponding RLmodatt tuple; 2) Every RLmodatt tuple

Copyright © 1999 Lucent Technologies 

for each operational SM must have a corresponding RLrxschd tuple.

RC DOES NOT CHECK that ALL RLrxschd tuples have a corresponding tuple in RLmodatt. RC checks whether the SM is operational and has a corresponding RLrxschd tuple (that is, same as 2 in ODA check described previously).

The processor number (rxschd.procno) for the CM is represented by the number '0' in RLrxschd. If there is no CM equipped in the office, the processor number should not be '0'.

**Attribute: procno**

**Fullname:** REX module number

**Attribute Description** This attribute will contain the module number for the REX schedulers.
*** ODA ONLY CHECK ***
***(NOT SUPPORTED BY RC)***
Verify each RLrxschd have an associated RLmodatt tuple.

***ODA AND RC CHECK ***
Verify each operational SM have an associated RLrxschd tuple.

**Attribute: rxtsttyp**

**Fullname:** route exercise test type

**Attribute Description** This attribute is also a key for this relation. It will contain one of three test type that REX can schedule.
DGNTST is for a full diagnostic test or a conditional restoral on all uni
ts.
ELSTST is for the Electronic Loop Segregation test which tests customer l
ines.
FABTST is for the Fabric Exercise which test crosspoints in the Line Unit
.

**Attribute: rxhtod**

## 4. Population Rules for RLs96absig

**Relation Description**
SLC 96/SLC 5 Channel Unit Signaling.

This relation defines the A/B signaling bit patterns for each type of RT Channel Unit.

QUANTITY OF TUPLES:

15 tuples

The following rules show how the values contained in the RLs96absig relation are converted by the DFI (on the DCLU) units into T1 A,B bit patterns.
DCLU and IDCU TR8 CONVERSION RULE :

$T_{A = 0}$

if A=0 and C=0 $T_{A = 1}$

if (A=1 and C=0) or (A=1 and C=1) $T_{A = 1/0}$

if A=0 and C=1 $T_{B = 0}$

if B=0 and D=0 $T_{B = 1}$

if (B=1 and D=0) or (B=1 and D=1) $T_{B = 1/0}$

if B=0 and D=1

ABCD signaling is used for TR303 RTs on IDCU. Signals are sent as shown in the table.

The following values give the hard-coded constants used for the appropriate chanutyps for the DCLU (that is, a common set of values has been chosen that will work with DCLU according to the conversion rules stated previously)

255 is considered to be an invalid value. However, the switch software uses the lower 4 bits of the value in the table whether the value is invalid or not, if the state of the call and other parameters associated with the port, indicate that a signal should be sent/is to be received from the channel unit.

**Attribute: chanutyp**

**Fullname:** channel unit type

**Attribute Description** The key to this relation is the channel unit type (DMchanutyp) which contains values for DCLU channel unit types. The following diagram gives the entries which represent the channel unit type on the DCLU for switched service and non-switched special services (nailup):

```
PC1PARTY,    PCMLTYPARTY,  PCCOIN,    PCSPOTS,    PCFXS,
PCFXSL,      PCDFXS,       PCFSR,     PCDID,      PCDIDDPT
```

The following channel unit types are only supported for non-switched special services (nailup) through a DCLU. These are generic channel unit types designed to allow any channel unit to be plugged in at the RT until it is nailed up, without new switch software to support them. These channel unit types only provide idle code towards the RT (hence, the last 2 characters of the name represent the AB-bit pattern sent to the channel for idle code). No other signals should be sent towards the channel unit and are populated with the `invalid' value of 255 (such as, the ringing, channel test, ground start and coin signals). However, the switch software does NOT treat the signals populated in the table with 255 as invalid but may send one of these signals in some cases. The value sent is determined from the lower 4 bits of 255 which is decimal 15 or binary 1111. Based on the following conversion rules given, the AB-bit pattern sent to the channel unit is binary 11 which corresponds to either idle, disconnect or invalid for the channel unit at the RT. All the receive signals are populated with the invalid value of 255. This means any channel unit sending a signal to the switch must send an `ridle' code AB-bit pattern of 11. This will mean the switch will treat this port as in-service and idle. If the switch receives anything other than the AB-bit pattern of 11, the switch interprets the signal as off hook. However, since the `ofhk' signal is also populated as AB-bit pattern 11, the switch sees an invalid off hook signal and will place the port out-of-service, high-and-wet. Both cases are acceptable to the nailup software.
PCSSV00, PCSSV10

The following channel unit types are not currently supported for switched service by the switch software (recent change, call processing, terminal maintenance, or ODA) through a DCLU or an IDCU. However, for non-switched special services, these channel units may be physically installed in the RT and specified on the RT growth views using one of the generic nailup channel unit types listed previously.
PCFXO, PCCFESPOTS

The following channel unit type is used to describe the signaling states associated with terminations on TR303 RTs:

PCTR303

**Attribute: idle**

**Fullname:** Idle code - -48R, TG.

**Attribute Description** Reception of this pattern at the RT causes the channel unit to apply normal battery feed to the customer loop. This pattern is used for the loop start of a SPOTS channel unit.

**Copyright © 1999 Lucent Technologies** 

For the DID channel unit at the RT, this pattern causes the loop closure relay to be in the non-operation state. For the FXS channel unit this pattern signifies dial tone on the channel unit, no ringing.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: chtst**

**Fullname:** Channel test code.

**Attribute Description** Reception of the pattern at the RT starts the tests to check for the proper operation of the RT channel unit.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: fwdis**

**Fullname:** Forward disconnect code.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to short the tip and ring together. For the FXS channel unit, this pattern signifies tip open, -48 volts ring.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: mrrng**

**Fullname:** Negative Ring Ringing.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to apply -R ringing to the loop, negative DC. For DID, the channel unit at the RT operates its loop closure relay to provide a tip and ring termination at the PBX. For FXO, the channel unit at the RT operates its loop closure relay, no ring ground. For FSR, the channel unit at the RT applies 16 2/3 Hz for Harmonic, 20 Hz for Synchromonic ringing to the customers line.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: prrng**

**Fullname:** Positive Ring Ringing.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to apply +R ringing to the loop, positive DC. For FSR, the channel unit at the RT applies 25 Hz for Harmonic, 30 Hz for Decimonic or 30 Hz for Synchromonic ringing to the customers line.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: mtrng**

Copyright © 1999 Lucent Technologies 

**Fullname:** Negative Tip Ringing.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to apply -T ringing to the loop, negative DC. For the ESPOSTS channel unit, this pattern means loop closure for loop start and tip ground ringing for ground start. For FSR, the channel unit at the RT applies 33 1/3 Hz for Harmonic, 40 Hz for Decimonic or 42 Hz for Synchromonic ringing to the customers line.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: ptrng**

**Fullname:** Positive Ring Ringing.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to apply +T ringing to the loop, positive DC. For FSR, the channel unit at the RT applies 50 Hz for Harmonic, 50 Hz for Decimonic or 54 Hz for Synchromonic ringing to the customers line.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: neglm**

**Fullname:** Negative Loop Mode - -48R TG.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place negative battery, ring with respect to tip, on the loop.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: poslm**

**Fullname:** Positive Loop Mode- 48R TG.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place positive battery, floating feed, on the loop.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: gndst**

**Fullname:** Ground Start- -48 NTG.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place negative battery on ring with tip open. For the FXO channel unit this pattern means ring ground with no loop closure for ground start.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

Copyright © 1999 Lucent Technologies 

**Attribute: ani**

**Fullname:** Tip party test code.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to initiate a tip party ground test.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: pcchk**

**Fullname:** Positive Coin Check.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place positive voltage on tip with ring open.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: mcchk**

**Fullname:** Negative Coin Check.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place negative voltage on tip and open ring.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: ccoll**

**Fullname:** Coin collect.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place positive coin collect voltage to tip with ring open.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: cret**

**Fullname:** Coin return.

**Attribute Description** Reception of the pattern at the RT causes the channel unit to place negative coin return voltage to tip with ring open.

Signal Direction is from the switch to the RT (DCLU->RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: ranig**

Copyright © 1999 Lucent Technologies 

**Fullname:** Receive Tip ground code.

**Attribute Description** Reception of this pattern at the *5ESS* ®-2000 switch from the channel unit at the RT signals that a ground current greater than a preset threshold has been detected.

Signal Direction is from the RT to the switch (DCLU<-RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: ranir**

**Fullname:** Receive Tip relay code.

**Attribute Description** The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: rgrnd**

**Fullname:** Receive ground code.

**Attribute Description** Reception of this pattern at the *5ESS* ®-2000 switch from the channel unit at the RT signifies that the ground current is greater than a certain threshold and one of the following five signaling bit patterns is being sent to the RT; ground start, positive coin check, negative coin check, coin return, or coin collect. For the ESPOTSSCF channel units this pattern means ring ground for ground start.

Signal Direction is from the RT to the switch (DCLU<-RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: rordr**

**Fullname:** Receive reorder code.

**Attribute Description** The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: ridle**

**Fullname:** Receive idle code.

**Attribute Description** Reception of this pattern at the *5ESS* ®-2000 switch from the channel unit at the RT signifies an 'on-hook' condition, when the loop or ground
current is under a preset threshold value. For the FXO channel unit, this pattern means loop start idle, tip ground. For the DID channel unit this pattern means normal battery code transmission towards the *5ESS*®-2000 switch.

Signal Direction is from the RT to the switch (DCLU<-RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: ofhk**

**Fullname:** Receive off-hook code.

**Attribute Description** Reception of this pattern at the *5ESS* ®-2000 switch from the channel unit at the RT signals an 'off-hook' condition, when the loop current exceed a preset threshold value. For the FXO channel unit, this pattern means ringing applied to the tip and ring. For the DID channel

Copyright © 1999 Lucent Technologies 

unit this pattern means that the channel unit has detected a reverse battery from the PBX and transmits a reverse battery code to the *5ESS*®-2000 switch.

Signal Direction is from the RT to the switch (DCLU<-RT).

The DFI/LIU unit converts this value into T1 A,B bit patterns.

**Attribute: cgrnd**

**Fullname:** Coin ground signaling

**Attribute Description** The cgrnd attribute is for coin ground (RT to IDCU) signaling. For TR8 RTs, the coin ground is always the same pattern as ring ground. Under TR303, they have different patterns and thus a new attribute is required. The default value for this attribute is 255.

**Attribute: fsr5**

**Fullname:** Frequency Selective Ringing Pattern #5

**Attribute Description** The fsr5 attribute is for Frequence selective ringing (pattern #5) signaling (IDCU to RT) signaling.

## 4. Population Rules for RLs96diode

**Relation Description**
Returns the test bus control unit (TBCU) scan and distribute points assigned to the given MTB.

Assigns the scan and distribute points needed to operate the TBCU. The scan and distribute points should be on the same MSU service group as the MTB. This data resides in the IM with the MSU providing the scan and distribute points.

**Attribute: mtbckt**

Copyright © 1999 Lucent Technologies

**Fullname:** circuit name of metallic test bus.

**Attribute Description** Circuit name of the metallic test bus, see RLcktdata for lay out of the circuit.

**Attribute: tbcuscan**

**Fullname:** TBCU scan point.

**Attribute Description** One scan point for each MTB that serves *SLC*® 96 or *SLC*® 5 RT's.

**Attribute: d1_rmcut**

**Fullname:** First distribute point of TBCU.

**Attribute Description** One for each MTB the serves *SLC*® 96 or *SLC*® 5 RT's.

**Attribute: d2_sigcut**

**Fullname:** Second distribute point of TBCU.

**Attribute Description** One for each MTB the serves *SLC*® 96 or *SLC*® 5 RT's.

**Attribute: d3_chres**

**Fullname:** Third distribute point of TBCU.

**Attribute Description** One for each MTB the serves *SLC*® 96 or *SLC*® 5 RT's.

**Attribute: d4_chres**

**Fullname:** Fourth distribute point of TBCU.

**Attribute Description** One for each MTB the serves *SLC*® 96 or *SLC*® 5 RT's.

**Attribute: d5_chres**

**Fullname:** Fifth distribute point of TBCU.

**Attribute Description** One for each MTB the serves *SLC*® 96 or *SLC*® 5 RT's.

## 4. Population Rules for RLs96equip

**Relation Description**
Subscriber Loop Carrier (SLC 96) Equipage *SLC*® 96 System Hardware Equipage for *SLC*® 96s interfacing with DCLU.

This relation defines the *SLC*® 96 RT (mode, serving SDFI, serving MTB and SID).

**Attribute: s96rtname**

**Fullname:** RT name. This attribute replaces the previous attribute s96nam.

**Attribute Description** The RT name is identical to the A shelf (Mode 1) circuit name in RLcktdata. The RT name is identical to the bank 0 (Mode 2) circuit name in RLcktdata.

**Attribute: bank0mode**

**Fullname:** Bank 0 mode

**Attribute Description**

```
Mode of shelves A and B (PCMODE1 or PCMODE2).
bank0mode = PCMODE1 if SLC 96 bank0 is nonconcentrated.
bank0mode = PCMODE2 if SLC 96 bank0 is concentrated.
(bank 0 must be equipped).
```

**Attribute: bank1mode**

**Fullname:** Bank 1 mode

**Attribute Description**

```
Mode of shelves C and D (PCUNEQ, PCMODE1, or PCMODE2).
bank1mode = PCUNEQ, if unequipped.
bank1mode = PCMODE1, if nonconcentrated.
bank1mode = PCMODE2, if concentrated.
```

**Attribute: dfia**

**Fullname:** Digital Facility Interface A

**Attribute Description** A line SDFI circuit name from RLcktdata. A valide value must be ASSIGNED.

**Attribute: dfib**

**Fullname:** Digital Facility Interface B

**Attribute Description** B line SDFI circuit name from RLcktdata. 0 if UNASSIGNED.

**Attribute: dfic**

**Fullname:** Digital Facility Interface C

**Attribute Description** C line SDFI circuit name from RLcktdata. 0 if UNASSIGNED.

Copyright © 1999 Lucent Technologies 

**Attribute: dfid**

**Fullname:** Digital Facility Interface D

**Attribute Description** D line circuit name from RLcktdata. 0 if UNASSIGNED.

**Attribute: pdfi**

**Fullname:** P Digital Facility Interface

**Attribute Description**
P line circuit name from RLcktdata.
0 if bank1mode = PCMODE2 or UNASSIGNED.

**Attribute: mtbcrkt**

**Fullname:** Metallic test bus (MTB) circuit. This attribute replaces the previous attribute mtbid.

**Attribute Description** MTB assignment is optional -- see subattributes: mtbcrkt.circuit and mtbcrkt.module.

**Attribute: mtbcrkt.circuit**

**Fullname:** MTB circuit name

**Attribute Description** MTB circuit name from RLcktdata.

**Attribute: mtbcrkt.module**

**Fullname:** MTB circuit module

**Attribute Description** IM number containing MSU serving this MTB.

**Attribute: sid**

**Fullname:** *SLC*® 96 RT identification number.

**Attribute Description** One RLs96equip tuple per remote terminal. Each has a distinct (unique) sid (SLC96id). Therefore each RLs96equip tuple should be assigned a unique sid number in the range 1 ~ 9999 (decimal) starting with 1.

**Attribute: pmisc_mj**

**Fullname:** PWR/MISC alarm - major.

**Attribute Description**
If pmisc_mj = DBYES, then PWR/MISC alarm is major.
If pmisc_mj = DBNO, then PWR/MISC alarm is minor.
pmisc_mj is updatable, and it should be set to DBYES if PWR/MISC alarm for this RT is caused by a loss of commercial power. The default value is DBNO (that is, minor). For Universal *SLC*® 96 this attribute should be DBNO.

**Attribute: mtpproto**

**Fullname:** MTP protocol.

Copyright © 1999 Lucent Technologies 

**Attribute Description** If mtpproto = DBYES, then diode protocol is to be executed on the MTP between the RT and the TBCU. If mtpproto = DBNO, then diode protocol is not to be executed on this path.

## 4. Population Rules for RLs96smtb

**Relation Description**
MTB to SLC 96 or SLC 5 RT Relationship

This relation returns global name of RTs which are connected to a given MTB.

This relations associated up to 20 RTs with a MTB.

**Attribute: mtbgckt**

**Fullname:** Global circuit name of metallic test bus.

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the circuit name of the MTB that is serving the specified *SLC*® RT.

**Attribute: mtbgckt.circuit**

**Fullname:** MTB circuit name.

**Attribute Description** MTB circuit name.

**Attribute: mtbgckt.module**

**Fullname:** SM number containing this MTB.

**Attribute Description** Specify the SM number containing this MTB.

**Attribute: index**

**Fullname:** Nth RT on this MTB.

**Attribute Description** This is a number from 1 to 20 (Nth RT on this MTB).

**Attribute: s96grt**

**Fullname:** name of s96rt connected to the given MTB

**Attribute Description** Contains RT name and SM number serving this RT.

**Attribute: s96grt.circuit**

**Fullname:** RT name (from RLs96equip).

**Attribute Description** For RTs on DCLU, the RT name comes from RLs96equip. For RTs other than DCLU, the RT name comes from RLrt_misc.

**Attribute: s96grt.module**

**Fullname:** SM number serving this RT.

**Attribute Description** Specify the SM number serving this RT.

## 4. Population Rules for RLsa_rmvtk

**Relation Description**
Incoming trunks in the SM that have to be removed.

Identifies the incoming trunks in the SM that have to be removed from service and busied back during module stand-alone operation.
This relation is only populated for SMs with the stand alone call processing option (Glsacp = DBYES), and is not populated for export.

**Attribute: port**

**Fullname:** The local port name.

**Attribute Description** This attribute is the local port name of a trunk without the Switching Module number.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLsasfmcrd

**Relation Description**
SAS memory flash cards.

Stores information on memory flash cards assigned to a SAS memory board.
QUANTITY OF TUPLES: 32 tuples, maximum, per SAS

**Attribute: ckt_indx**

**Fullname:** circuit index

**Attribute Description** circuit index for this SAS

**Attribute: unitnum**

**Fullname:** unit number

**Attribute Description** Unit number of SAS

**Attribute: brdnum**

**Fullname:** board number

**Attribute Description** Number of the SAS memory board. This attribute contains the value of RC/V RC_EQSASP field PACK NUMBER minus 1

**Attribute: crds_equip**

**Fullname:** cards equipped

**Attribute Description** Number of memory cards equipped for this board

**Attribute: mcrd0_size**

**Fullname:** memory card zero size

**Attribute Description** Card density of memory card zero

**Attribute: mcrd1_size**

**Fullname:** memory card one size

**Attribute Description** Card density of memory card one

**Attribute: mcrd2_size**

**Fullname:** memory card two size

**Attribute Description** Card density of memory card two

**Attribute: mcrd3_size**

**Fullname:** memory card three size

**Attribute Description** Card density of memory card three

**Attribute: mcrd4_size**

Copyright © 1999 Lucent Technologies 

**Fullname:** memory card four size

**Attribute Description** Card density of memory card four

**Attribute: mcrd5_size**

**Fullname:** memory card five size

**Attribute Description** Card density of memory card five

**Attribute: mcrd6_size**

**Fullname:** memory card six size

**Attribute Description** Card density of memory card six

**Attribute: mcrd7_size**

**Fullname:** memory card seven size

**Attribute Description** Card density of memory card seven

**Attribute: mcrd0_code**

**Fullname:** memory card zero code

**Attribute Description** Card version number of memory card zero

**Attribute: mcrd1_code**

**Fullname:** memory card one code

**Attribute Description** Card version number of memory card one

**Attribute: mcrd2_code**

**Fullname:** memory card two code

**Attribute Description** Card version number of memory card two

**Attribute: mcrd3_code**

**Fullname:** memory card three code

**Attribute Description** Card version number of memory card three

**Attribute: mcrd4_code**

**Fullname:** memory card four code

**Attribute Description** Card version number of memory card four

**Attribute: mcrd5_code**

**Fullname:** memory card five code

**Attribute Description** Card version number of memory card five

Copyright © 1999 Lucent Technologies

**Attribute: mcrd6_code**

**Fullname:** memory card six code

**Attribute Description** Card version number of memory card six

**Attribute: mcrd7_code**

**Fullname:** memory card seven code

**Attribute Description** Card version number of memory card seven

## 4. Population Rules for RLsc_cf

**Relation Description**
Construct the speed call feature.

Set the basic definition of the feature. Possibilities include one or two digit speed call, changeable or non-changeable speed call lists, and DN screening options.

**Attribute: feat_id**

**Fullname:** Feature identification

**Attribute Description** Identifies the constructed feature ID.

**Attribute: dnfltr**

**Fullname:** DN filter for restriction of customer originated RC

**Attribute Description** DN filtering is used to restrict what can be entered into a speed call list through customer originated recent change. Office originated recent change does not use DN filtering.

If dnfltr.all_pass == DBYES, then DN filtering will not be done. This is the equivalent of setting all DN filter options to DBYES. However, it allows the DN to pass the filtering process without examination of each bit in the structure.

A pass or DBYES means the DN in question will be processed normally. A fail or DBNO is considered a disallowed action and can not be entered into the speed call list.

If dnfltr.all_pass == DBNO, the other structure bits will be examined for their values. Each of the structure bits optn_a through optn_q is set to DBYES if the DN in question is to pass through that criterion and DBNO if it is to fail.

Additional usage information about DN screening options can be found in the domain, DMmcdnfltr.

Other structure bits, optn_19 through optn_31 are not used at this time.

Copyright © 1999 Lucent Technologies 

**Attribute: dnfltr.all_pass**

**Fullname:** All DNs pass

**Attribute Description** All DNs pass through the DN filter.

**Attribute: dnfltr.optn_a**

**Fullname:** Option A

**Attribute Description** DNs with option A filtering pass through the filter.

**Attribute: dnfltr.optn_b**

**Fullname:** Option B

**Attribute Description** DNs with option B filtering pass through the filter.

**Attribute: dnfltr.optn_c**

**Fullname:** Option C

**Attribute Description** DNs with option C filtering pass through the filter.

**Attribute: dnfltr.optn_d**

**Fullname:** Option D

**Attribute Description** DNs with option D filtering pass through the filter.

**Attribute: dnfltr.optn_e**

**Fullname:** Option E

**Attribute Description** DNs with option E filtering pass through the filter.

**Attribute: dnfltr.optn_f**

**Fullname:** Option F

**Attribute Description** DNs with option F filtering pass through the filter.

**Attribute: dnfltr.optn_g**

**Fullname:** Option G

**Attribute Description** DNs with option G filtering pass through the filter.

**Attribute: dnfltr.optn_h**

**Fullname:** Option H

**Attribute Description** DNs with option H filtering pass through the filter.

**Attribute: dnfltr.optn_i**

**Fullname:** Option I

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** DNs with option I filtering pass through the filter.

**Attribute: dnfltr.optn_j**

**Fullname:** Option J

**Attribute Description** DNs with option J filtering pass through the filter.
When the system recognizes an IDP speed call code as the dialed number, the stored number is retrieved, and checked to see if it satisfies the other screening options selected. The retrieved number can not be another speed call number. If the screening is passes then the system utilizes the resulting number. For example, the storage of a call forward number.

**Attribute: dnfltr.optn_k**

**Fullname:** Option K

**Attribute Description** DNs with option K filtering pass through the filter.

**Attribute: dnfltr.optn_l**

**Fullname:** Option L

**Attribute Description** DNs with option L filtering pass through the filter.

**Attribute: dnfltr.optn_m**

**Fullname:** Option M

**Attribute Description** DNs with option M filtering pass through the filter.

**Attribute: dnfltr.optn_n**

**Fullname:** Option N

**Attribute Description** DNs with option N filtering pass through the filter.

**Attribute: dnfltr.optn_o**

**Fullname:** Option O

**Attribute Description** DNs with option O filtering pass through the filter.

**Attribute: dnfltr.optn_p**

**Fullname:** Option P

**Attribute Description** DNs with option P filtering pass through the filter.
Option P is a PP precedence code. This code is used for storing customer changeable SC numbers. When set to DBYES, this option allows a PP precedence code followed by a telephone number to be stored in the SC list.

This option also allows a PP route code to be stored in the SC number.

**Attribute: dnfltr.optn_q**

**Fullname:** Option Q

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** DNs with option Q filtering pass through the filter.

A PP AUTOVON CF number. This option is used with customer changeable call forwarding features. If set to DBYES, then the forward-to-DN number must be to a port that can receive Autovon calls. Also optn_a must be set to DBYES.

**Attribute: dnfltr.optn_18**

**Fullname:** Option 18

**Attribute Description** Unused at this time.

**Attribute: dnfltr.optn_19**

## 4. Population Rules for RLsc_opts

**Relation Description**
Speed Calling Feature Definition Options and Defaults

This relation defines the feature definition options and defaults for a speed calling feature.

**Attribute: feat_id**

**Fullname:** Feature identification

**Attribute Description** Speed Calling Constructed Feature Identification.

**Attribute: sc**

**Fullname:** Speed Calling

**Attribute Description** Is one digit or two digit speed calling allowed?

**Attribute: ch_sc**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Changeable speed calling

**Attribute Description** Is speed calling customer changeable?
DBNO == not changeable, DBYES == changeable.

**Attribute: dnfltr**

**Fullname:** DN Filtering

**Attribute Description** DN filtering is used to restrict what can be entered into a Speed Call List through customer originated Recent Change. Office originated RC does not use DN filtering.

If dnfltr.all_pass == DBYES, then DN filtering will not be done. This is the equivalent of setting all DN filter options to DBYES. However, it allows the DN to pass the filtering process without examination of each bit in the structure.

A pass of DBYES means the DN in question will be processed normally. A fail or DBNO is considered a disallowed action and can not be entered into the Speed Call list.

If dnfltr.all_pass == DBNO, the other structure bits will be examined for their values. Each of the structure bits optn_a through optn_q is set to DBYES if the DN in question is to pass through that criterion and DBNO if it is to fail.

Additional usage information on the DN filtering options can be found in the domain, DMmcdnfltr.

Other structure bits, optn_19 through optn_31 are not used at this time.

**Attribute: dnfltr.all_pass**

**Fullname:** All DNs Pass

**Attribute Description** When all_pass == DBYES, DN filtering is not done. This is the same a setting all the bits to DBYES: however, it allows the DN to pass the filtering process without actually examining each bit in the structure.

**Attribute: dnfltr.optn_a**

**Fullname:** DN Filtering Option A

**Attribute Description** Select DN Filtering Option A.

**Attribute: dnfltr.optn_b**

**Fullname:** DN Filtering Option B

**Attribute Description** Select DN Filtering Option B.

**Attribute: dnfltr.optn_c**

**Fullname:** DN Filtering Option C

**Attribute Description** Select DN Filtering Option C.

**Attribute: dnfltr.optn_d**

**Fullname:** DN Filtering Option D

Copyright © 1999 Lucent Technologies 

**Attribute Description** Select DN Filtering Option D.

**Attribute: dnfltr.optn_e**

**Fullname:** DN Filtering Option E

**Attribute Description** Select DN Filtering Option E.

**Attribute: dnfltr.optn_f**

**Fullname:** DN Filtering Option F

**Attribute Description** Select DN Filtering Option F.

**Attribute: dnfltr.optn_g**

**Fullname:** DN Filtering Option G

**Attribute Description** Select DN Filtering Option G.

**Attribute: dnfltr.optn_h**

**Fullname:** DN Filtering Option H

**Attribute Description** Select DN Filtering Option H.

**Attribute: dnfltr.optn_i**

**Fullname:** DN Filtering Option I

**Attribute Description** Select DN Filtering Option I.

**Attribute: dnfltr.optn_j**

**Fullname:** DN Filtering Option J

**Attribute Description** Select DN Filtering Option J.

When the system recognizes an IDP speed call code as the dialed number, the stored number is retrieved, and checked to see if it satisfies the other screening options selected. The retrieved number can not be another speed call number. If the screening is passes then the system utilizes the resulting number. For example, the storage of a call forward number.

**Attribute: dnfltr.optn_k**

**Fullname:** DN Filtering Option K

**Attribute Description** Select DN Filtering Option K.

**Attribute: dnfltr.optn_l**

**Fullname:** DN Filtering Option L

**Attribute Description** Select DN Filtering Option L.

**Attribute: dnfltr.optn_m**

Copyright © 1999 Lucent Technologies 

**Fullname:** DN Filtering Option M

**Attribute Description** Select DN Filtering Option M.

**Attribute: dnfltr.optn_n**

**Fullname:** DN Filtering Option N

**Attribute Description** Select DN Filtering Option N.

**Attribute: dnfltr.optn_o**

**Fullname:** DN Filtering Option O

**Attribute Description** Select DN Filtering Option O.

**Attribute: dnfltr.optn_p**

**Fullname:** DN Filtering Option P

**Attribute Description** Select DN Filtering Option P.

Option P is a PP precedence code. This code is used for storing customer changeable SC numbers. When set to DBYES, this option allows a PP precedence code followed by a telephone number to be stored in the SC list.

This option also allows a PP route code to be stored in the SC number.

**Attribute: dnfltr.optn_q**

**Fullname:** DN Filtering Option Q

**Attribute Description** Select DN Filtering Option Q.

A PP Autovon CF number. This option is used with customer changeable call forwarding features. If set to DBYES, then the forward-to-dn number must be to a port that can receive Autovon calls. Also optn_a must be set to DBYES.

**Attribute: dnfltr.optn_18**

**Fullname:** Option 18

**Attribute Description** Not used at this time.

**Fullname:** Option 31

**Attribute Description** Not used at this time.

**Attribute: sc_name**

**Fullname:** Default Speed Calling Name

**Attribute Description** Default Speed Calling List Name.

If the SC list is a unshared list, the name need not be known. A name will automatically be assigned with the proper format.

For analog lines and DSLs (such has TNs, OEs, and MLHG members which have telephone numbers) the format will be Axxxxxxxxxx where xxxxxxxxxx corresponds to the TN.

For TGNs, the format will be yyyyzzzz where yyyy is the TGN and zzzz is the MEMB. Both yyyy and zzzz will be filled with leading zeroes if necessary.

If the SC list is shared, the name must be specified and it cannot be of the form Axxxxxxxxxx or yyyyzzzz.

**Attribute: sc_shared**

**Fullname:** Default Speed Calling Shared List

**Attribute Description** Is the speed calling list shared with another list? DBNO == unshared list, DBYES == shared list.

## 4. Population Rules for RLsc_port

**Relation Description**
Assignment of BRCS speed calling features to logical port.

Two speed call features will be allowed per port, however, there are limits on the assignment. Valid assignments include a one-digit speed calling feature, and/or a two-digit speed calling feature. It invalid to assign more than one type of one-digit or two-digit speed calling to the same port.

**Attribute: lport**

**Fullname:** Logical Port

Copyright © 1999 Lucent Technologies

**Attribute Description** Logical port of the user being assigned the BRCS features.

See the CHECK section in the *5ESS®-2000 Switch Population Rules Language Data Manual* (235-600-123) for the rules relating to this attribute.

**Attribute: lpt_type**

**Fullname:** Logical Port Type

**Attribute Description** Logical port of the user being assigned the BRCS features. There are 4 allowed values for this attribute:

```
LPT_ISDN    for ISDN and shared analog users,
LPT_BFG     for BFG tuples,
LPT_PACKET  for ODB and PPD packet services,
LPT_OTHER   for unshared analog lines and BRCS trunks.
```

See the CHECK section in the *5ESS®-2000 Switch Population Rules Language Data Manual* (235-600-123) for the rules relating to this attribute.

**Attribute: feat_id**

**Fullname:** Feature Identification

**Attribute Description** Identifies the constructed feature ID.

**Attribute: sc_list_id**

**Fullname:** Speed Calling List Identification

**Attribute Description** Indicates the speed calling list ID assigned to this user.

**Attribute: sc_shared**

**Fullname:** Speed Calling Shared List

**Attribute Description** Indicates whether the speed calling list is shared (DBYES) or not shared (DBNO) with other lines.

**Attribute: sc**

**Fullname:** Speed Calling type indicator

**Attribute Description** The value is used to indicate the type of speed calling which is assigned to the port. One-digit and two-digit speed calling are the allowed values. The value of SC_BOTH is not allowed in RLsc_port because the wild card feature should never be assigned to a port.

**Attribute: ffcf1**

**Fullname:** Future field 1.

**Attribute Description** Future field feature use.

**Attribute: ffcf2**

## 4. Population rules for RLsc_range

### Relation Description

PBX Screening Range Relation

RLsc_range can contain up to 20 ranges of DNs per PBX that are to be screened. Calling Party Numbers (CPN) provided over a Primary Rate Interface (PRI) will be screened against the ranges of numbers for the PBX connected to the PRI, if the RLedsltrkg.cpn_scrn attribute is set to DBYES. (RLedsltrkg.grpnum = RLrt_trkg.grpnum and RLrt_trkg.pbx_id = RLsc_range.pbx_id.) If the user-provided CPN is in one of the ranges, then it passes screening. If it is not in one of the ranges, it fails screening. CPNs that fail screening may be discarded and replaced with a network provided CPN. The RLedsltrkg.cpn_disc attribute indicates whether the CPN should be discarded. If it is set to DBYES, then the user-provided CPN is discarded and replaced with the RLedsltrkg.main_dn if it is populated. If the RLedsltrkg.main_dn is not populated then no CPN will be provided This relation will be keyed by pbx_id (identifier of the PBX) and tuple_idx. The pbx_id attribute is defined in RLrt_trkg and RLfc_trunk for those trunk groups connected to a PBX. Other attributes of this relation are 'num_range' (number of ranges), 'range1' thru 'range5' (DN ranges 1 thru 5). Note that only 5 ranges can be specified per tuple. This means that if a PBX can have up to 20 ranges specified, a maximum of 4 tuples can be populated in this relation for each PBX.

**Attribute:**

Copyright © 1999 Lucent Technologies 

pbx_id

**Fullname:**

PBX/CPE ID Identifier

**Attribute Description:**

This attribute identifies the PBX or other customer premise equipment that the screening ranges are associated with. The pbx_id and tuple_idx are used as keys to this relation. Range of values for this attribute is 1 thru 4095.

**Attribute:**

tuple_idx

**Fullname:**

Screening Range Tuple Index

**Attribute Description:**

This attribute is populated with values 0 thru 3 based on the number of screening ranges. Each RLsc_range tuple can contain from 1 to 5 screening ranges. Each PBX can have up to 20 ranges specified. This means each PBX could have a maximum of four RLsc_range tuples populated The tuple_idx attribute indicates which tuple for the PBX this is, and thereby indicates which ranges are populated in this tuple. Tuple_idx would be populated for a PBX that has 20 ranges as follows:

| Screening Ranges | tuple_idx Value |
|---|---|
| 1 thru 5 | 0 |
| 6 thru 10 | 1 |
| 11 thru 15 | 2 |
| 16 thru 20 | 3 |

When tuple_idx = 0, RLsc_range.num_range gives the number of screening ranges for this PBX. Else, if tuple_idx is non-zero, RLsc_range.num_range must be 0.

**Attribute:**

num_range

**Fullname:**

Number of Screening Ranges for a PBX

**Attribute Description:**

This attribute contains the number (1 thru 20) of screening ranges associated with this PBX.

Dependency: if more than one tuple exists for this PBX, num_range will be populated on the first tuple (that tuple where tuple_idx = 0). In all other tuples associated with a PBX, this attribute must = 0. This attribute must be updated when ranges are added to or deleted from this PBX.

**Attribute:**

range1

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Screening Range 1

**Attribute Description:**

This attribute is the first range of DNs to be screened for this PBX. Since a PBX can have up to four tuples populated, this attribute would actually represent range 1 in tuple 1, range 6 in tuple 2, range 11 in tuple 3 and range 16 in tuple 4. A range consists of a 10 digit number for the lowest number in the range and a 10 digit number for the highest number in the range. The 10 digit numbers must have the same NPA and NXX. The range is stored as the NPA, the NXX, the low 4 digits of the lowest number, and the low 4 digits of the highest number. The upper bound of the range must be greater than or equal to the lower bound of the range. There must not be any overlap of this range with any of the other ranges for this pbx_id. The changes have been made for screen name pbx_id to PBX/CPE ID, the class 2 equipment. The range is stored in BCD (see usage for npa and nxx. Given a number (312)971-4837, its internal representation should be as folllows:

npa

| 0 | 3 | 1 | 2 |
|---|---|---|---|

nxx

| 0 | 9 | 7 | 1 |
|---|---|---|---|

xxxx

| 4 | 8 | 3 | 7 |
|---|---|---|---|

**Attribute:**

range1.npa

**Fullname:**

Numbering Plan Area

**Attribute Description:**

This attribute identifies the Numbering Plan Area of this PBX. The NPA is stored in a 4 digit BCD number. The first digit (leftmost) of this BCD number is always 0. The NPA is stored in the next three digits. The first digit of the NPA must be 2 - 9; the second digit must be 0 - 9, and the third digit must be 0 - 9. If this range is not populated, then the range1.npa must be set to 0.

The internal data representation of range1.npa could be described by the following picture.

|D1 |D2 |D3 |D4 |

**Copyright © 1999 Lucent Technologies** 

```
        +---+---+---+---+
```

where: D1 is always 0
D2 is any number from 2 through 9
D3 is any number from 0 through 9
D4 is any number from 0 through 9
Note: each cell consists of 4 bits.

**Attribute:**
range1.nxx
**Fullname:**
Office Code of PBX
**Attribute Description:**
This attribute contains the Office Code of the PBX. The NXX is stored in a 4 digit BCD number. The first digit (leftmost) of this BCD number is always 0. The NXX is stored in the next three digits. The first digit of the NXX must be 2 - 9; the second digit must be 0 - 9, and the third digit must be 0 - 9. If this range is not populated, then range1.nxx must be 0.

The internal data representation of range1.nxx could be described by the following picture.

```
        +---+---+---+---+
        |D1 |D2 |D3 |D4 |
        +---+---+---+---+
```

Where: D1 is always 0
D2 is any number from 2 through 9
D3 and D4 are any numbers 0 through 9
Note: each cell consists of 4 bits.

**Attribute:**
range1.low_dig_limit
**Fullname:**
Lower Limit Four Digits
**Attribute Description:**
This attribute identifies the lower four digits for the lower bound of the DN range. When a CPN is received from a PBX, it is in the form NPA-NXX-XXXX. It is these last four digits that are checked against the lower and higher limit values for each range. If a user-provided CPN IS found to be within one of the ranges for this PBX, it is marked as screened and passed. If the user-provided CPN does not fall within a range, it may be discarded and replaced with a network-provided CPN. See the population rules for RLedsltrkg.cpn_disc. These lower 4 digits are stored in BCD with the last digit stored in the rightmost position. If this range is not populated, then range1.low_dig_limit must be set to 0.
The internal data representation of range1.xxxx could be described by the following picture.

**Copyright © 1999 Lucent Technologies** 

```
+---+---+---+---+
|D1 |D2 |D3 |D4 |
+---+---+---+---+
```

Where: D1, D2, D3 and D4 are any numbers 0 through 9
Note: each cell consists of 4 bits.

**Attribute:**
range1.high_dig_limit
**Fullname:**
Higher limit 4 digits
**Attribute Description:**
This attribute identifies the lower four digits for the upper bound of the DN range. When a CPN is received from a PBX, it is in the form NPA-NXX-XXXX. It is these last four digits that are checked against the lower and higher limit values for each range. If a user-provided CPN IS found to be within one of the ranges for this PBX, it is marked as screened and passed. If the user-provided CPN does not fall within a range, it may be discarded and replaced with a network-provided CPN. See the population rules for RLedsltrkg.cpn_disc. These lower 4 digits are stored in BCD with the last digit stored in the rightmost position. If this range is not populated, then range1.low_dig_limit must be set to 0.

The internal data representation of range1.xxxx could be described by the following picture.

```
+---+---+---+---+
|D1 |D2 |D3 |D4 |
+---+---+---+---+
```

Where: D1, D2, D3 and D4 are any numbers 0 through 9
Note: each cell consists of 4 bits.

**Attribute:**
range2
**Fullname:**
Screening Range 2
**Attribute Description:**
This attribute is the second range of DNs to be screened for this PBX. Since a PBX can have up to four tuples populated, this attribute would actually represent range 2 in tuple 1, range 7 in tuple 2, range 12 in tuple 3 and range 17 in tuple 4. A range consists of a 10 digit number for the lowest number in the range and a 10 digit number for the highest number in the range. The 10 digit numbers must have the same NPA and NXX. The range is stored as the NPA, the NXX, the low 4 digits of the lowest number, and the low 4 digits of the highest number. The upper bound of the range must be greater than or equal to the lower

**Copyright © 1999 Lucent Technologies** 

bound of the range. There must not be any overlap of this range with any of the other ranges for this pbx_id. The changes have been made for screen name pbx_id to PBX/CPE ID, the class 2 equipment.

**Attribute:**
range2.npa
**Fullname:**
Numbering Plan Area
**Attribute Description:**
See poprules for range1.npa

**Attribute:**
range2.nxx
**Fullname:**
Office Code of PBX
**Attribute Description:**
See poprules for range1.nxx

**Attribute:**
range2.low_dig_limit
**Fullname:**
Lower limit 4 digits
**Attribute Description:**
See poprules for range1.low_dig_limit

**Attribute:**
range2.high_dig_limit
**Fullname:**
Higher limit 4 digits
**Attribute Description:**
See poprules for range1.high_dig_limit

**Attribute:**
range3
**Fullname:**
Screening Range 3
**Attribute Description:**
This attribute is the third range of DNs to be screened by this PBX. Since a PBX can have up to four tuples populated, this attribute would actually represent range 3 in tuple 1, range 8 in tuple 2, range 13 in tuple 3 and range 18 in tuple 4. A range consists of a 10 digit number for the lowest number in the range and a 10 digit number for the highest number in the range. The 10 digit numbers must have the same NPA and NXX. The range is stored as the NPA, the NXX, the low 4 digits of the lowest number, and the low 4 digits of the highest number. The upper bound of the range must be greater than or equal to the lower bound of the range. There must not be any overlap of this

**Attribute Description:**
See poprules for range1.high_dig_limit

**Attribute:**
range4
**Fullname:**
Screening Range 4
**Attribute Description:**
This attribute is the fourth range of DNs to be screened by this PBX. Since a PBX can have up to four tuples populated, this attribute would actually represent range 4 in tuple 1, range 9 in tuple 2, range 14 in tuple 3 and range 19 in tuple 4. A range consists of a 10 digit number for the lowest number in the range and a 10 digit number for the highest number in the range. The 10 digit numbers must have the same NPA and NXX. The range is stored as the NPA, the NXX, the low 4 digits of the lowest number, and the low 4 digits of the highest number. The upper bound of the range must be greater than or equal to the lower bound of the range. There must not be any overlap of this range with any of the other ranges for this pbx_id. The changes have

## 4. Population Rules for RLsca_ltm

**Relation Description**
Local Area Signaling Services Selective Call Acceptance.

This relation holds the index to the SCA screen list. It also contains Non-acceptance treatment, forward-to-dn, and base station ringing (ping-ring) option and a SCA/CAR indicator.

General Availability access to the LASS Selective Features is denied for the secondary only DNs and all the multi-line hunt group DNs. The 5E6 LASS selective features will not be allowed on Part IV terminals (ISDN PODS) defined in the 5E4 BRI specification. 5E6 LASS SCA feature will be offered only to the following service classes:

FC_INDVDL, FC_ISDN, FC_4WIRE_INDV, FC_PBX
For those lines which have a corresponding tuple in RLltsbport, this LSF data will only exist on the main(lead) port of 1-TN line time slot bridging (LTSB) lines.

**Attribute: ltm_type**

**Fullname:** Logical Termination index type

**Attribute Description** This is the logical termination type defined same as RLfc_line or RLis_line.

**Attribute: ltm_idx**

**Fullname:** Logical termination Index

**Attribute Description** This is the logical termination index defined same as RLfc_line or RLis_line relation.

**Attribute: gen_avail**

**Fullname:** General Availability

**Attribute Description** The gen_avail indicates the reason of the creation of this tuple. If the gen_avail is DBYES, this tuple is created through the general availability which is an office parameter, Glscaac. If this tuple is created through subscription, this field should be set to DBNO.

**Attribute: sca_idx**

**Fullname:** Selective Call Acceptance screen list index

**Attribute Description** The sca_idx is the index to SCA screen list tuples. (LSFSCA if gen_avail = DBNO; GENSCA if gen_avail = DBYES) The SCA screen list tuples associated with this ltm_idx

Copyright © 1999 Lucent Technologies 

can be accessed with the sca_idx and a range from 0 through 10. The sca_idx is allocated/deallocated through SMSEQIDX relation.

**Attribute: sca_nat**

**Fullname:** Selective Call Acceptance Non-Acceptance Treatment

**Attribute Description** This field indicates what type of non-acceptance treatment the calling party will receive if the call is screened by the Selective Call Acceptance feature. This field should defined as

```
NAT_NULL,   if the NAT is unspecified.
NAT_FWRD,   if the call will be forwarded.
NAT_RCRD   if an announcement will be given.
```

**Attribute: car**

**Fullname:** Computer Access Restriction

**Attribute Description** This field indicates whether this tuple is used for Computer Access Restriction feature. Set this field to DBYES for CAR. Otherwise set to DBNO.

**Attribute: bs_rg_ind**

**Fullname:** Base Station Reminder Ringing indicator

**Attribute Description** This field indicates whether a base station reminder ringing (ping ring) will be given when the call is forwarded. This field must be set to DBNO.

**Attribute: fwd_dn**

**Fullname:** Forward-to-DN

**Attribute Description** This field is used to store a forward-to-dn (RTN).

**Attribute: fwd_dn.dcnt32**

**Fullname:** Number of digits in the forward-to-dn

**Attribute Description** The dcnt32 is the number of digits in the forward-to-dn.

**Attribute: fwd_dn.edn32**

**Fullname:** Extended Directory Number

**Attribute Description** This field contains a DN in a BCD representation.

## 4. Population Rules for RLsccp_dpc

**Relation Description**
SCCP DPC Accounting Data.

This relation will be used by the AM traffic measurement group to populate the AM hash accounting table. This table will be used to hold the counts of the SCCP accounting feature. The relation will contain a tuple for every GTT digit string/ DPC/ and GSM combination used in the SCCP accounting feature.

**Attribute: digit[*]**

**Fullname:** Digit String

**Attribute Description** This attribute contains the digits used in the definition of the GTT Digit String used in SCCP Accounting

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This attribute contain the Destination Point Code used by the SCCP Accounting feature for this GTT Digit String.

**Attribute: gsm**

**Fullname:** Global Switching Module Number

**Attribute Description** This attribute contain the GSM Number performing ACCP Accounting.

**Attribute: tran_gp**

**Fullname:** Translation Group

**Attribute Description** The attribute contains the translation group defining the number of Fixed, Primary and Secondary digits used in the GTT Digit String.

**Attribute: ssn[*]**

**Fullname:** Subsystem Number

**Attribute Description** These 10 attributes will contain the subsystem numbers being accounted for on the GSM/GTT Digit String/DPC combination defined in this tuples. The number 1 will be used to indicate "no SSN defined" or default.

## 4. Population Rules for RLsccp_opc

**Relation Description**
SCCP OPC Accounting Data.

This relation will be used by the AM Traffic Measurement Group to populate the AM Hash Accounting table. This table will be used to hold the counts of the SCCP Accounting Feature. The relation will contain a tuple for every GTT Digit String/ OPC/ and GSM combination used in the SCCP Accounting Feature.

**Attribute: digit[*]**

**Fullname:** GTT Digit String

**Attribute Description** The attributes contain the primary and secondary digits used in the GTT Digit String.

**Attribute: gsm**

**Fullname:** Global Switching Module

**Attribute Description** The attribute will contain the GSM performing SCCP Accounting.

**Attribute: opc**

**Fullname:** Origination Point Code

**Attribute Description** The Origination Point Code being accounted for using SCCP OPC Accounting

**Attribute: tran_gp**

**Fullname:** Translation Group

**Attribute Description** The attribute contains the translation group defining the number of fixed, primary and secondary digits used by the GTT String.

**Attribute: ssn[*]**

**Fullname:** Subsystem Number

**Attribute Description** These attributes will contain the SSN values for the GTT String/ OPC and GSM defined by this tuple. There can be up to 10 valid SSNs defined.

Copyright © 1999 Lucent Technologies 

# SCCP_PC

## 1. Description

This relation is needed to keep track of DPCs entered on the DPC/SSN view. Use of this relation, along with its dynamic counterpart RLsccpstat, replaces usage of the attributes "con_pc" of RLdpc_dpci and "sccp_con" of RLdpc_stat in 5e13 and earlier releases, neither of which would be able to accommodate cluster and network routed DPCs.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 2000 |
| expected number of tuples | 256 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| relation type | DBSTATIC |
| distribution | FP |
| trigger function | CCsccp_pc |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population rules for RLsccp_pc

### Relation Description

```
        SCCP concerned DPCs relation

        The relation is needed to keep track of DPCs entered on the
        DPC/SSN view. The relation replaces the attribute con_pc of
        RLdpc_dpci relation that existed in 5e13 and earlier releases,
        which would not be able to accommodate cluster and network
        routed DPCs.
```

Copyright © 1999 Lucent Technologies

**Attribute:**
sccp_pc
**Fullname:**
DPC of SCCP concern
**Attribute Description:**
Destination Point Code which is provisioned as either a primary or backup destination for some application.

**Attribute:**
sccpci
**Fullname:**
SCCP Point Code Index
**Attribute Description:**
SCCP Point Code Index, key to dynamic relation RLsccpstat.

**Attribute:**
con_pc
**Fullname:**
SCCP concerned flag
**Attribute Description:**
The attribute indicates whether the Point Code is of SCCP concern to other GSMs in the office, for applications which use SCCP conversion (such as, between C7INTL and C7NATL GSMs).

**Defines:**
"ccs/CCc7_param.h",
"db/RLsccpstat.h"

# SCCPSCR

## 1. Description

This relation provides a screening capability on incoming SCCP messages. The relation maps Called Party Address Global Title Translation Type to Calling Party Address Global Title Translation Type and Originating Point Code.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 1416 |
| expected number of tuples | 1 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | CCtrigfail |
| insert trigger | DBYES |
| update trigger | DBNO |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 3. Field Layout

```
SCCPSCR     relid = 2532  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population Rules for RLsccpscr

**Relation Description**
SCCP screening.

This relation provides a screening capability on incoming SCCP messages. This relation maps Called Party Address Global Title Translation Type to Calling Party Address Global Title Translation Type and Originating Point Code

**Attribute: ttcd**

**Fullname:** Called Party Address Global Title Translation Type.

**Attribute Description** This attribute specifies the Called party Address Global Title Translation Type for SCCP messages.

**Attribute: ttcg**

Copyright © 1999 Lucent Technologies

**Fullname:** Calling Party Address Global Title Translation Type.

**Attribute Description** This attribute specifies the Calling Party Address Global Title Translation Type for SCCP messages.

**Attribute: pc**

**Fullname:** Point Code

**Attribute Description** This attribute provides Calling Party Address Point Code.

```

## 4. Population Rules for RLscd_sac

**Relation Description:** SCD screening of SAC.

This relation is consulted to determine whether a SAC should be screened for SCD. For each SAC which requires SCD screening, a tuple will exist in this relation.

**Attribute: sac**

**Fullname:** Service Access Code

**Attribute Description** Indicates the SAC being screened.

Copyright © 1999 Lucent Technologies

# SCD_SCRN

## 1. Description

Selective carrier denial screening (SCD_SCRN) relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 500 |
| access type | DBACC_CIND |
| memory type | DBPRAM |

## 4. Population Rules for RLscd_scrn

**Relation Description:** Selective carrier denial (SCD) screening.

This relation is consulted to determine if a port should be denied access to a particular carrier. For each port which is denied access to a carrier, this relation, RLscd_scrn, contains a bit map of all carriers to which that port is denied access.

**Attribute: port**

**Fullname:** Port

**Attribute Description** The physical port. This is a structure with subattributes port.member and port.module.

**Attribute: port.member**

**Fullname:** Member

**Attribute Description** Indicates the local port name.

**Attribute: port.module**

**Fullname:** Module

**Attribute Description** Indicates the module on which the port resides.

**Attribute: carr_map**

**Fullname:** Carrier map

**Attribute Description** This bitmap indicates whether access to any particular carrier should be denied.

## 4. Population Rules for RLscf_ltm

**Relation Description**
Local Area Signaling Services Selective Call Forwarding.

This relation holds the index to the SCF screen list. It also contains forward-to-dn, and base station ringing (ping-ring) option.

General availability access to the LASS Selective Features is denied for the secondary only DNs and all the multi-line hunt group DNs. The 5E6 LASS selective features will not be allowed on Part IV terminals (ISDN PODS) defined in the 5E4 BRI specification. 5E6 LASS SCF feature will be offered only to the following service classes:

FC_INDVDL, FC_ISDN, FC_4WIRE_INDV, FC_PBX
For those lines which have a corresponding tuple in RLltsbport, this LSF data will only exist on the main(lead) port of 1-TN Line Time Slot Bridging lines (LTSB).

**Attribute: ltm_type**

**Fullname:** Logical Termination index type

**Attribute Description** This is the logical termination type defined same as RLfc_line or RLis_line.

**Attribute: ltm_idx**

**Fullname:** Logical termination Index

**Attribute Description** This is the logical termination index defined same as RLfc_line or RLis_line relation.

**Attribute: gen_avail**

**Fullname:** General Availability

**Attribute Description** The gen_avail indicates the reason of the creation of this tuple. If the gen_avail is DBYES, this tuple is created through the general availability which is an office parameter, Glscfac. If this tuple is created through subscription, this field should be set to DBNO.

**Attribute: bs_rg_ind**

**Fullname:** Base Station Reminder Ringing indicator

**Attribute Description** This field indicates whether a base station reminder ringing (ping ring) will be given when the call is forwarded. Set this field to DBYES for ping ring.

**Attribute: scf_idx**

Copyright © 1999 Lucent Technologies 

**Fullname:** Selective Call Forwarding screen list index

**Attribute Description** The scf_idx is the index to SCF screen list tuples. (LSFSCF if gen_avail = DBNO; GENSCF if gen_avail = DBYES) The SCF screen list tuples associated with this ltm_idx can be accessed with the scf_idx and a range from 0 through 10. The scf_idx is allocated/deallocated through SMSEQIDX relation.

**Attribute: fwd_dn**

**Fullname:** Forward-to-DN

**Attribute Description** This field is used to store a forward-to-dn (RTN).

**Attribute: fwd_dn.dcnt32**

**Fullname:** Number of digits in the forward-to-dn

**Attribute Description** The dcnt32 is the number of digits in the forward-to-dn.

**Attribute: fwd_dn.edn32 Fullname:** Extended Directory Number

**Attribute Description** This field contains a DN in a BCD representation.

Copyright © 1999 Lucent Technologies 

# SCM_NSCM

## 1. Description

This relation contains information about the member that has the Series Completion (SC) feature active. It also contains information about the member that it series completes to, that is, the next member in the series completion linked list.

This is an example diagram of the SC linked list information:

```
   SC      SC
A------>B------>C
```

For this SC linked list, there will be 2 tuples in RLscm_nscm with the attribute values as indicated in the following diagram. Each tuple indicates one link in this SC linked list.

```
l* attributes    n* attributes
--------------  ------------------
A's values       B's values
B's values       C's values
The first tuple indicates that A Series Completes to B
The second tuple indicates that B series completes to C
```

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLscm_nscm

**Relation Description**
Series Completion (SC) Member (SCM) and the Next Series Completion Member (NSCM) in the series completion linked list.

Information regarding one member in a series completion linked list. This relation contains information on the member that has the series completion feature active, and the member that it series completes to, that is, the next member in the series completion linked list.

**Attribute: ltm_idx**

**Fullname:** Logical termination index of a member of a series completion linked list

**Attribute Description** The logical termination index of a member of a series completion linked list. This attribute, along with the ltm_type attribute uniquely identifies a member of a series completion linked list. This member series completes to the series completion member indicated by the nltm_idx, nltm_type, nlead_module and ndn attributes.

**Attribute: ltm_type**

**Fullname:** Logical termination type of a member of a series completion linked list

**Attribute Description** The logical termination type of a member of a series completion linked list. This attribute along with the ltm_idx uniquely identifies a member of a series completion linked list. This member series completes to the series completion member indicated by the nltm_idx, nltm_type, nlead_module and ndn attributes.

**Attribute: nltm_idx**

**Fullname:** Logical termination index of the next member in a series completion linked list

**Attribute Description** If nonzero, this attribute along with the nltm_type and the nlead_module uniquely identifies the member of a series completion linked list that the ltm_idx and ltm_type attributes series complete to. If an LTSB port, or a member of a multi-line hunt group is series completed to, then nltm_idx is set to zero to indicate to call processing that the DN stored in the RLscm_nscm.ndn attribute should be analyzed, hunted if necessary, and the call routed. If nltm_idx is greater than zero, then call processing will route the call directly, and not analyze the DN stored in the ndn attribute.

**Attribute: nltm_type**

**Fullname:** Logical termination type of the next member in a series completion linked list

**Attribute Description** This attribute, along with the nltm_idx (if nonzero) and nlead_module uniquely identifies the next member of a series completion linked list.

Copyright © 1999 Lucent Technologies 

**Attribute: nlead_module**

**Fullname:** Lead module of the next member in a series completion linked list

**Attribute Description** This attribute, along with the nltm_idx (if non zero), nltm_type and ndn uniquely identifies the next member of a series completion linked list.

**Attribute: ntrc**

**Fullname:** Nuisance call trace activation bit for next member of a series completion linked list

**Attribute Description** Indicates whether or not the nuisance call trace feature is active on the next member of a series completion group determined by the nltm_idx and nltm_type attributes.

**Attribute: ndn**

**Fullname:** Local number of the next member of a series completion linked list

**Attribute Description** Noc and digits making up a directory local number which correspond to the nltm_idx (if non zero), nltm_type and nlead_module attributes.

**Attribute: ndn.noc**

**Fullname:** Normalized office code(NOC) of the directory number

**Attribute Description** The NOC of the directory number corresponding to the next member in the series completion linked list.

**Attribute: ndn.digits**

**Fullname:** last 4 digits of the directory number

**Attribute Description** Last 4 digits of the DN corresponding to the next member in the series completion linked list. The directory number must be part of the office dialing plan.

**Attribute: ndn_dntr**

**Fullname:** unused attribute

**Attribute Description** unused attribute - defaulted to zero

# SCMSGPRI

## 1. Description

This relation defines the priority for the following SCCP messages:

```
     CR         Connection Request
     CC         Connection Confirm
     CREF       Connection Refusal
     DT1        Data Form 1
     ERR        Error
     IT         Inactivity Test
     RLC        Release Complete
     RLSD       Released
     SSA        Subsystem Allowed
     SSP        Subsystem Prohibited
     SST        Subsystem Test
     SNR        Subsystem Normal Routing
     SBR        Subsystem Backup Routing
     UDT        Unit Data
     UDTS       Unit Data Service
     XUDT       Extended Unit Data
     XUDTS      Extended Unit Data Service
```

## 2. Data Dictionary Values

## 4. Population Rules for RLscmsgpri

**Relation Description**
SCCP message priority table.

This relation defines the priority for SCCP messages.

**Attribute: dummy_key**

**Fullname:** Dummy Key

**Attribute Description** This attribute serves as the key. It should always be 0.

**Attribute: cr**

**Fullname:** Priority for CR Message

**Attribute Description** This attribute defines the priority assigned for CR message. 0 is lowest priority and 3 is the highest priority.

**Attribute: cc**

**Fullname:** Priority for CC Message

**Attribute Description** This attribute defines the priority assigned for CC message. 0 is lowest priority and 3 is the highest priority.

**Attribute: cref**

**Fullname:** Priority for CREF Message

**Attribute Description** This attribute defines the priority assigned for CREF message. 0 is lowest priority and 3 is the highest priority.

**Attribute: dt1**

**Fullname:** Priority for DT1 Message

**Attribute Description** This attribute defines the priority assigned for DT1 message. 0 is lowest priority and 3 is the highest priority.

**Attribute: err**

Copyright © 1999 Lucent Technologies 

**Fullname:** Priority for ERR Message

**Attribute Description** This attribute defines the priority assigned for ERR message. 0 is lowest priority and 3 is the highest priority.

**Attribute: it**

**Fullname:** Priority for IT Message

**Attribute Description** This attribute defines the priority assigned for IT message. 0 is lowest priority and 3 is the highest priority.

**Attribute: rlc**

**Fullname:** Priority for RLC Message

**Attribute Description** This attribute defines the priority assigned for RLC message. 0 is lowest priority and 3 is the highest priority.

**Attribute: rlsd**

**Fullname:** Priority for RLSD Message

**Attribute Description** This attribute defines the priority assigned for RLSD message. 0 is lowest priority and 3 is the highest priority.

**Attribute: ssa**

**Fullname:** Priority for SSA Message

**Attribute Description** This attribute defines the priority assigned for SSA message. 0 is lowest priority and 3 is the highest priority.

**Attribute: ssp**

**Fullname:** Priority for SSP Message

**Attribute Description** This attribute defines the priority assigned for SSP message. 0 is lowest priority and 3 is the highest priority.

**Attribute: sst**

**Fullname:** Priority for SST Message

**Attribute Description** This attribute defines the priority assigned for SST message. 0 is lowest priority and 3 is the highest priority.

**Attribute: snr**

**Fullname:** Priority for SNR Message

**Attribute Description** This attribute defines the priority assigned for SNR message. 0 is lowest priority and 3 is the highest priority.

**Attribute: sbr**

**Fullname:** Priority for SBR Message

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute defines the priority assigned for SBR message. 0 is lowest priority and 3 is the highest priority.

**Attribute: udt**

**Fullname:** Priority for UDT Message

**Attribute Description** This attribute defines the priority assigned for UDT message 0 is lowest priority and 3 is the highest priority.

**Attribute: udts**

**Fullname:** Priority for UDTS Message

**Attribute Description** This attribute defines the priority assigned for UDTS message 0 is lowest priority and 3 is the highest priority.

**Attribute: xudt**

**Fullname:** Priority for XUDT Message

**Attribute Description** This attribute defines the priority assigned for XUDT message. 0 is lowest priority and 3 is the highest priority.

**Attribute: xudts**

**Fullname:** Priority for XUDTS Message

**Attribute Description** This attribute defines the priority assigned for XUDTS message 0 is lowest priority and 3 is the highest priority.

## 4. Population Rules for RLscore

**Relation Description**
Network clock (NCLK) units.

This relation provides a composite description of the office network and timing complex (ONTC) subunits, for example, the NCLK, the time-multiplexed switch (TMS), the message interface (MI), and the link interface (LI). The LI exists for communication module, model 1 (CM1)-vintage ONTC only. There are only two tuples in this relation, one for each ONTC system side.

**Attribute: side**

**Fullname:** Side

**Attribute Description** This attribute determines which ONTC a tuple describes. This attribute is used as the key to this relation.

The domain of this attribute is BFSIDE, or one bit. The enumeration (DMSIDE) values that can be assumed by this relation are SM5SIDE0 if the tuple describes the ONTC on system side 0, or SM5SIDE1 if the tuple describes the ONTC on system side 1.

This attribute should be populated to indicate the appropriate system side described by a tuple.

**Attribute: nc_type**

**Fullname:** Network clock type

**Attribute Description** This attribute specifies the type of NCLK with which the office is equipped.

The domain of this attribute is BFSMNCTYPE, or a bit field that three bits wide. The enumeration (DMSMNCTYPE) values that this attribute can assume for a NCLK1 equipped office are:

SM5DS1 - - Digital signal level 1 (DS1) 24-channel clock

SM5STDALNE - - Stand-alone clock, that is, it does not use external references

SM530CHAN - - DS1 30-channel network clock

If the office is equipped with a network clock 2 (NCLK2), the nc_type is set to one of the following:

SM24NC2 - - DS1 24-channel clock

SM30NC2 - - DS1 30-channel clock

SMSANC2 - - Stand-alone version of NCLK2

This attribute should be populated to appropriately indicate the type of the NCLK in the ONTC side described by each tuple in this relation.

**Attribute: tmstype**

**Fullname:** Time-multiplexed switch (TMS) type

Copyright © 1999 Lucent Technologies 

**Attribute Description** The tmstype specifies where the TMS on a system side is a single-fabric, dual-fabric or double-dual-fabric TMS.

For a CM1 office, this attribute should always be populated with SMDUALFAB since CM1 offices are always equipped with dual fabric TMS. For a communications module, model 2 (CM2) office, this variable should be populated to indicate the appropriate TMS type.

For a communications module, model 2 compact (CM2C) office, this variable should always be populated with SMSNGLFAB since CM2C offices are only single-fabric TMS.

**Attribute: iia_normal**

**Fullname:** Intrupts normal state

**Attribute Description** This attribute describes the normal state of interrupts for the ONTC.

The domain of this attribute is BFSTATUS, or one bit. The enumeration (DMSTATUS) value that this attribute can assume is SMALLOW if the interrupts are to be allowed if the ONTC is operating normally, or SMINHIBIT if the interrupts are to be inhibited even if the ONTC is operating normally.

This attribute should be populated with SMALLOW.

**Attribute: eqstat**

**Fullname:** Equipage status

**Attribute Description** This attribute describes the equipage state of the ONTC system side described by a tuple.

The domain of this attribute is BFEQSTAT, or three bits. This attribute can only assume the value SMOPER which indicates that the ONTC system side described by this tuple is equipped.

This attribute should be populated with SMOPER.

**Attribute: mi_cli**

**Fullname:** Message interface unit

**Attribute Description** This attribute indicates the hardware version of the MI unit.

```
0x00    DGVNULL                 [J5D006AA, L1 and L2]
0x400   DGAPRCM2        5e10    SN516B C/D with APR (Auto Power
                                Recovery).  CLI for CM2(C) only.
                                APR only available in CM2(C).
                                Backwards compatible with SN516.
                                [J5D020A-1, L46B, L50, L51]
                                [J5D020A-2, L1H]
```

***NOTE:*** When an office has APR (Auto Power Recovery), all CM2(C) unit/circuit CLI's "have" to have the APR bit(s) set. This includes the MI, NC2, and TMS cli's, and all PC cli's (see RLspc).

**Attribute: li_cli**

**Fullname:** Link interface unit

**Attribute Description** This attribute indicates the hardware version of the LI unit and is applicable

Copyright © 1999 Lucent Technologies 

only to an ONTC of CM1 vintage and should be set to 0x00. [J5D006AB-1, L1 or L2 or L3 or L4 or L5 or L6]

**Attribute: nc_cli**

**Fullname:** Network clock unit

**Attribute Description** This attribute indicates the hardware version of the NCLK unit.

```
Note1:  The CLI for the following unit/circuit must be derived by
        OR'ing the CLIs corresponding to the hardware/capability
        equipped in the switch.
EXAMPLE:
BOARD
         CLI
         MC5D215A2
         0x80 TN1285B
         0x50 TN1274B
         0x00 SN516B
         0x102
         nc_cli     =  0x1D2

Note2:  The TLP (Trouble Location Procedure) board list is
        only required to print the minimum acceptable issue
        of a given circuit pack. Therefore, it is acceptable,
        for example, to print TN1286 on the TLP when there is
        a TN1286B actually equipped.
        The CEPT feature actually applies to Export (non-US)
        ONLY. Therefore, for Domestic (US) applications, the
        Change Level Indicators (CLI's) associated with CEPT
        compliant circuit packs should not be used, even if a
        CEPT compliant pack is actually equipped. Therefore,
        a CEPT compliant circuit pack should use the same CLI
        as a non-compliant circuit pack, in US only. Note that
        the factory is no longer manufacturing TN1286's
        (non-compliant); they are only making TN1286B's (CEPT
        compliant).
EXAMPLE:
```

A US office has a TN1286, which needs to be replaced. When the replacement (spare) is ordered from the factory, the office will receive a TN1286B (using the same board code [TN1286] with a suffix denotes backwards compatibility). The CLI for the TN1286 is 0x00, which the office should currently have in their ODD. The CLI for a TN1286B is 0x40 WHEN USED IN A CEPT COMPLIANT OFFICE (Export ONLY). US offices don't comply with CEPT; therefore, when the TN1286B is installed in the office, the CLI should remain 0x00, and NOT be updated to 0x40.

                                    [J5D020A-2, L1H]
```

**Attribute: sync_type**

**Fullname:** Synchronization Type

**Attribute Description**If the office is equipped with an NCLK2, then populate this attribute. The value is:

SMHIERARCH - - Master/slave synchronization. U.S. offices will be SMHIERARCH.

SMSING_MUT - - Single-ended mutual synchronization. Some future offices outside the U.S. will be SMSING_MUT.

Default value (in an NCLK1 office) is SMHIERARCH.

**Attribute: osc_type**

**Fullname:** Oscillator type

**Attribute Description**

```
If the office is equipped with an NCLK2, populate this attribute.
The value for a U.S. office is:
SMDOM_HI        - High stability oscillator
                  stratum 2 offices (Toll)
                  5E2(2) - circuit pack TN1284
SMDOM_MED       - Medium stability oscillator
                  stratum 3 offices (Local)
                  5E2(2) - circuit pack TN1286
The value for an international office is:
SMEXP_HI        - High stability oscillator
                  gateway and toll applications
                  5E2(2) - circuit pack TN1283
                  SMEXP_MED - Medium stability oscillator
5E2(2) - circuit pack TN1285
Default value (in an NCLK1 office) is SMDOM_MED.
```

# SCP_SCRN

## 1. Description

This relation provides the static data used to store the called DN/calling DN group information for the Network Element Services Signaling (NESS) special feature.

The key of this relation is group id and called DN for quick access in call processing. Each group may have up to 128 called DN associated.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 500 |
| expected tuples | 200 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| spare | 32l |

## 3. Field Layout

## 4. Population Rules for RLscr_ltm

**Relation Description**
Local Area Signaling Services Selective Call Rejection.

This relation holds the index to the SCR screen list. It also contains a harsh indicator.

General availability access to the LASS Selective Features is denied for the secondary only DNs and all the multi-line hunt group DNs. The 5E6 LASS selective features will not be allowed on Part IV terminals (ISDN PODS) defined in the 5E4 BRI specification. 5E6 LASS SCR feature will be offered only to the following service classes:

FC_INDVDL, FC_ISDN, FC_4WIRE_INDV, FC_PBX

For those lines which have a corresponding tuple in RLltsbport, this LSF data will only exist on the main(lead) port of 1-TN Line Time Slot Bridging lines (LTSB).

**Attribute: ltm_type**

**Fullname:** Logical Termination index type

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the logical termination type defined same as RLfc_line or RLis_line.

**Attribute: ltm_idx**

**Fullname:** Logical termination Index

**Attribute Description** This is the logical termination index defined same as RLfc_line or RLis_line relation.

**Attribute: gen_avail**

**Fullname:** General Availability

**Attribute Description** The gen_avail indicates the reason of the creation of this tuple. If the gen_avail is DBYES, this tuple is created through the general availability which is an office parameter, Glscrac. If this tuple is created through subscription, this field should be set to DBNO.

**Attribute: harsh**

**Fullname:** Harsh

**Attribute Description** This field indicates whether a harsh announcement will be given to the calling party as a rejection treatment of 5E6 LASS SCR feature. DBNO in this field indicates that a gentle announcement should be given.

**Attribute: scr_idx**

**Fullname:** Selective Call Rejection screen list index

**Attribute Description** The scr_idx is the index to SCR screen list tuples (LSFSCR if gen_avail = DBNO; GENSCR if gen_avail = DBYES) The SCR screen list tuples associated with this ltm_idx can be accessed with the scr_idx and a range from 0 through 10. The scr_idx is allocated/deallocated through SMSEQIDX relation.

### Relation Description

```
        Screening Index Parameter Assignment

        This relation allows the assignment of parameters (features,
         indicators, etc..) on a per screening index basis.

        "This relation was created for the Calling Party Number Presentation
```

Copyright © 1999 Lucent Technologies

(CPNP) Special Feature and can be used by other features that need to assign parameters to a line (or trunk) on a per screening index basis. This relation is not required to have a tuple for every screening index. If a tuple for a specific screening index does not exist, defaults are assumed."

**Attribute:**
screen_x
**Fullname:**
Screening Index
**Attribute Description:**
Screening Index associated with the line or trunk which originated the call.

**Attribute:**
acp_ind
**Fullname:**
All Call Privacy Indicator
**Attribute Description:**
Indicates the presentation status of all lines or trunks using this screening index. If SFID50 is not set, then acp_ind must equal PUBLIC.

**Attribute:**
pcp_ind
**Fullname:**
Per Call Privacy Indicator
**Attribute Description:**
Indicates whether or not Per Call Privacy is allowed for this screening index. If SFID50 is not set, then pcp_ind must equal DBNO.

**Attribute:**
ani_ii_digits
**Fullname:**
ANI II pairs
**Attribute Description:**
Two-digit information indicator associated with the screening index.

**Attribute:**
o_bltrig_inh
**Fullname:**
Originating Busy Line Trigger Inhibit
**Attribute Description:**
This attribute will be used to indicate whether or not to inhibit the office Originating Busy Line Trigger. Default for this attribute is DBNO. When set to DBYES, no screening of the dialed

Copyright © 1999 Lucent Technologies 

digit will be performed. This attribute is secured by SFID #212. This functionality was provided by the attribute ffcf1 in 5e11.

**Attribute:**
o_natrig_inh
**Fullname:**
Originating No Answer Trigger Inhibit
**Attribute Description:**
This attribute will be used to indicate whether or not to inhibit the office Originating No Answer Trigger. Default for this attribute is DBNO. When set to DBYES no screening of the dialed digit will be performed. This attribute is secured by SFID #212. This functionality was provided by the attribute ffcf2 in 5e11.

**Attribute:**
ffcf1
**Fullname:**
Boolean reserved for future field feature.
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
ffcf2
**Fullname:**
Boolean reserved for future field feature.
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
ffcf3
**Fullname:**
Boolean reserved for future field feature.
**Attribute Description:**
Future field feature, default to DBNO.

**Attribute:**
ffcf4
**Fullname:**
Boolean reserved for future field feature.
**Attribute Description:**
Future field feature, default is DBNO.

**Attribute:**
ffcf5
**Fullname:**
Boolean reserved for future field feature.
**Attribute Description:**

## 4. Population Rules for RLscroar

**Relation Description**
OLS - Alternate Routing (OAR) Table.

Copyright © 1999 Lucent Technologies

This relation associates an OLS scrncode to a screening index.

Therefore, call processing may use the scrncode to determine an alternate screening index, resulting in an alternate routing treatment.

**Attribute: scrncode**

**Fullname:** OLS - Scrncode

**Attribute Description** Contains OLS scrncode values.
Any value from 1-999.

**Attribute: screen_x**

**Fullname:** Screening Index

**Attribute Description** Indicates the screening index to be substituted when alternate routing is determined for the screening code which originated this call. Any value from 0 to 4095 inclusive is valid, with 0 mapping to a blank internally.

**Attribute: num_ext_rtg**

**Fullname:** External Routing Number

**Attribute Description** This attribute is used to specify what number the external routing number is.

**Attribute: elig_ext_rtg**

**Fullname:** External Routing Eligibility

**Attribute Description** This attribute is used to specify whether or not this call is eligible for external routing.

**Attribute: destidx**

**Fullname:** Destination Index

**Attribute Description** This attribute is used to specify what the destination index is for the external routing number.

## 4. Population Rules for RLsda_ltm

**Relation Description**
Local Area Signaling Services Selective Distinctive Alert.

This relation holds the index to the SDA screen list. General availability access to the LASS selective features is denied for the secondary only DNs and all the multi-line hunt group DNs. The 5E6 LASS selective features will not be allowed on Part IV terminals (ISDN PODS) defined in the 5E4 BRI specification. 5E6 LASS SDA feature will be offered only to the following service classes:

Copyright © 1999 Lucent Technologies

FC_INDVDL, FC_ISDN, FC_PBX
For those lines which have a corresponding tuple in RLltsbport, this LSF data will only exist on the main(lead) port of 1-TN line time slot bridging (LTSB) lines.

**Attribute: ltm_type**

**Fullname:** Logical Termination index type

**Attribute Description** This is the logical termination type defined same as RLfc_line or RLis_line.

**Attribute: ltm_idx**

**Fullname:** Logical termination Index

**Attribute Description** This is the logical termination index defined same as RLfc_line or RLis_line relation.

**Attribute: gen_avail**

**Fullname:** General Availability

**Attribute Description** The gen_avail indicates the reason of the creation of this tuple. If the gen_avail is DBYES, this tuple is created through the general availability which is an office parameter, Glsdaac. If this tuple is created through subscription, this field should be set to DBNO.

**Attribute: sda_idx**

**Fullname:** Selective Distinctive Alert screen list index

**Attribute Description** The sda_idx is the index to SDA screen list tuples (LSFSDA if gen_avail = DBNO; GENSDA if gen_avail = DBYES) The SDA screen list tuples associated with this ltm_idx can be accessed with the sda_idx and a range from 0 through 10. The sda_idx is allocated/deallocated through SMSEQIDX relation.

## 4. Population rules for RLsec_dna

### Relation Description

Secondary DN EKTS(TM)_BASIC Terminal Call Appearance Default Bearer Capability
This relation stores information about the default bearer capability assigned to a secondary TN of a EKTS_BASIC standard terminal. There should never be any tuples in this relation for EKTS_CACH, BASIC CALL, Standard ACO or Custom-BRI terminals.
The default bearer channel information is used during the Automatic Terminal Setup (ATS) terminal download. The only type of default bearer capability service allowed for secondary TNs is Circuit Switched Voice as either speech (lo_spch / hi_spch) or 3.1 KHz audio (lo_audio / hi_audio).
This relation contains one tuple for every secondary TN that is assigned to a primary CKTTN of an EKTS_BASIC terminal. The four lo* / hi* attribute values may not be provisioned into the ranges for any of the primary CKTTN, ODBTN or DPKTTN default bearer capabilities defined in RLprim_dna. The four lo* and hi* attributes may contain values from 1 thru 254.

**Attribute:**
lport
**Fullname:**
Logical Port Number
**Attribute Description:**
This attribute contains the circuit switched logical port number of the EKTS_BASIC Primary TN standard terminal that has this secondary TN assigned.
This lport value must also exist in RLspid.ckt_lport and RLlpt_spid.lport on this SM.

**Attribute:**
lead_mod
**Fullname:**
Lead Module of the Secondary TN
**Attribute Description:**
This attribute contains the lead module of the Secondary TN. This value can range from 1 to 192.

**Attribute:**
ltm_idxi
**Fullname:**
Logical Termination Index of Secondary TN
**Attribute Description:**
This attribute contains the logical termination index of the secondary TN. This value is assigned on the lead module SM.

Copyright © 1999 Lucent Technologies

**Attribute:**
lo_spch
**Fullname:**
Lowest Speech Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID (DNA) that is the lowest Speech CSV DNA of this secondary TN for the default bearer capability of Speech CSV for an EKTS_BASIC terminals primary TN.

For every tuple in RLsec_dna, this attributes value may only appear once for both bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLsec_dna tuple). There is also a coupling with this relation and RLprim_dna for any primary DN Appearance IDs. For every tuple in RLsec_dna that has a RLlpt_spid.uspid value equal to RLprim_dna.uspid, all RLprim_dna.lo* and hi* attribute values cannot appear in any bearer capability lo - hi attribute ranges of this relation (that is, this number cannot be included in the ranges of any bearer capabilities for the corresponding RLprim_dna tuple).

**Attribute:**
hi_spch
**Fullname:**
Highest Speech Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID (DNA) that is the highest Speech CSV DNA of this secondary TN for the default bearer capability of Speech CSV for an EKTS_BASIC terminals primary TN.

For every tuple in RLsec_dna, this attributes value may only appear once for both bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLsec_dna tuple). There is also a coupling with this relation and RLprim_dna for any primary DN Appearance IDs. For every tuple in RLsec_dna that has a RLlpt_spid.uspid value equal to RLprim_dna.uspid, all RLprim_dna.lo* and hi* attribute values cannot appear in any bearer capability lo - hi attribute ranges of this relation (that is, this number cannot be included in the ranges of any bearer capabilities for the corresponding RLprim_dna tuple).

**Attribute:**
lo_audio
**Fullname:**
Lowest 3.1 KHz Audio Bearer Capability DN Appearance ID
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute contains the DN Appearance ID (DNA) that is the lowest 3.1 KHz Audio CSV DNA of this secondary TN for the default bearer capability of 3.1 KHz Audio CSV for an EKTS_BASIC terminals primary TN.

For every tuple in RLsec_dna, this attributes value may only appear once for both bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLsec_dna tuple).
There is also a coupling with this relation and RLprim_dna for any primary DN Appearance IDs. For every tuple in RLsec_dna that has a RLlpt_spid.uspid value equal to RLprim_dna.uspid, all RLprim_dna.lo* and hi* attribute values cannot appear in any bearer capability lo - hi attribute ranges of this relation (that is, this number cannot be included in the ranges of any bearer capabilities for the corresponding RLprim_dna tuple).

**Attribute:**
hi_audio
**Fullname:**
Highest 3.1 KHz Audio Bearer Capability DN Appearance ID
**Attribute Description:**
This attribute contains the DN Appearance ID (DNA) that is the highest 3.1 KHz Audio CSV DNA of this secondary TN for the default bearer capability of 3.1 KHz Audio CSV for an EKTS_BASIC terminals primary TN.

For every tuple in RLsec_dna, this attributes value may only appear once for both bearer capability lo - hi attributes (that is, this number cannot be included in the ranges of any other bearer capabilities for this RLsec_dna tuple).
There is also a coupling with this relation and RLprim_dna for any primary TN Appearance IDs. For every tuple in RLsec_dna that has a RLlpt_spid.uspid value equal to RLprim_dna.uspid, all RLprim_dna.lo* and hi* attribute values cannot appear in any bearer capability lo - hi attribute ranges of this relation (that is, this number cannot be included in the ranges of any bearer capabilities for the corresponding RLprim_dna tuple).

This attribute holds a string of up to 11 characters. It is a text identification of the cluster and may contain any comment. However, it is expected to be used to title display pages and the like and was intended to carry a title for the cluster (such as; Brokenburg, MCI POP, etc.) If there are less than 11 characters in the string, it should be padded with binary zeros.

## 4. Population Rules for RLsel_coll

**Relation Description** Select collect table. This relation holds automatic number identification (ANIs) from which collect billing is allowed to the ANI of the key. The feature is not committed, so this is spare data created just in case.

**Attribute: anitbl**

**Fullname:** Automatic number identification table index

**Attribute Description** Obtained from the RLanimod relation.

**Attribute: spare1**

**Fullname:** Spare 1

**Attribute Description** Spare field.

**Attribute: locdigs**

**Fullname:** Local line number of ANI

**Attribute Description** The local line number; the last four digits of the ANI.

**Attribute: spare2**

**Fullname:** Spare 2

**Attribute Description** Spare field.

Copyright © 1999 Lucent Technologies 

**Attribute: tupnum**

**Fullname:** Tuple number

**Attribute Description** Provides a unique key to allow multiple tuples per ANI.

**Attribute: spare3**

**Fullname:** Spare 3

**Attribute Description** Spare field.

**Attribute: spare4**

**Fullname:** Spare 4

**Attribute Description** Spare field.

**Attribute: sc_ani[*]**

**Fullname:** Select collect ANI 0 - 4

**Attribute Description** One of up to five ANIs allowed to make collect calls to this ANI; ten digits are stored in binary coded decimal (BCD) in this field.

**Attribute: sc_ani[*].dn0**

**Fullname:** Select collect ANI digit 0

**Attribute Description** BCD digit 0 of ANI.

**Attribute: sc_ani[*].dn1**

**Fullname:** Select collect ANI digit 1

**Attribute Description** BCD digit 1 of ANI.

**Attribute: sc_ani[*].dn2**

**Fullname:** Select collect ANI digit 2

**Attribute Description** BCD digit 2 of ANI.

**Attribute: sc_ani[*].dn3**

**Fullname:** Select collect ANI digit 3

**Attribute Description** BCD digit 3 of ANI.

**Attribute: sc_ani[*].dn4**

**Fullname:** Select collect ANI digit 4

**Attribute Description** BCD digit 4 of ANI.

**Attribute: sc_ani[*].dn5**

Copyright © 1999 Lucent Technologies 

**Fullname:** Select collect ANI digit 5

**Attribute Description** BCD digit 5 of ANI.

**Attribute: sc_ani[*].dn6**

**Fullname:** Select collect ANI digit 6

**Attribute Description** BCD digit 6 of ANI.

**Attribute: sc_ani[*].dn7**

**Fullname:** Select collect ANI digit 7

**Attribute Description** BCD digit 7 of ANI.

**Attribute: sc_ani[*].dn8**

**Fullname:** Select collect ANI digit 8

**Attribute Description** BCD digit 8 of ANI.

**Attribute: sc_ani[*].dn9**

**Fullname:** Select collect ANI digit 9

**Attribute Description** BCD digit 9 of ANI.

**Attribute: sc_ani[*].digcnt**

**Fullname:** Select collect ANI digit count

**Attribute Description** Digit count of ANI stored in this structure.

## 4. Population Rules for RLseqrest

**Relation Description**
Sequence number restriction.

Specifies which telephone numbers can not be dialed as sequence calls in automated calling card services (ACCS).

**Attribute: cld_rest**

Copyright © 1999 Lucent Technologies 

**Fullname:** Called number restriction

**Attribute Description** A three, seven or ten digit directory number (DN) for a called party that cannot be dialed as an ACCS sequence call. The only numbers which are allowed in this relation are:

```
411         (restrict 411 number)
611         (restrict 611 number)
911         (restrict 911 number)
500         (restrict all 500-XXX-XXXX numbers)
700         (restrict all 700-XXX-XXXX numbers)
800         (restrict all 800-XXX-XXXX numbers)
900         (restrict all 900-XXX-XXXX numbers)
5551212     (restrict 5551212 numbers)
0005551212 (restrict all 5551212 numbers
             where any numbering plan area [NPA] was dialed)
```

The 0005551212 number represents all NPA5551212 numbers and will be restricted if the relation contains this tuple. OR any number found in inwnpa of RLinwnpas, these are INWATTS NPAs and can be restricted. This relation may contain any combination of the previous numbers. However, these numbers are the only numbers acceptable in this relation.

**Attribute: cld_rest.digcnt**

**Fullname:** Digit count

**Attribute Description** Digit count for called number restriction.

**Attribute: cld_rest.dn**

**Fullname:** DN for restricted called number

**Attribute Description** DN for restricted called number.

**Attribute: accs**

**Fullname:** Automated calling card service

**Attribute Description**

```
DBYES  -  can be forward number for ACCS
DBNO   -  cannot be forward number for ACCS
```

**Attribute: sab**

**Fullname:** Subaccount billing

**Attribute Description**

```
DBYES - this DN can be a forward number for a subaccount
        billing service call.
```

## 4. Population Rules for RLservdata

**Relation Description**
Service Data.

This relation provides customer service parameters as defined by the *5ESS*®-2000 switch owner. To determine the treatment each call is to receive and to provide a flexible way of assigning the destination ID provided by the vendor, a service ID is associated with each call queue and specified in RLctinfo. Any destination ID provided by an EIS vendor can be mapped into current and future destination route types. This is in place of having specific ranges assigned for particular destination route types (internal announcement vs. external announcement, etc.).

Maximum number of tuples is 128 (based on 128 call queues). Expected average number of tuples is 30.

**Attribute: serv_id**

**Fullname:** Service Identification

**Attribute Description** Service ID for this particular EIS service.

**Attribute: init_action**

**Fullname:** Initial Action

**Attribute Description** Used by call processing at call origination to determine the initial treatment to be given to the call.

**Attribute: init_eis_id**

**Fullname:** Initial EIS ID

**Attribute Description** EIS ID of the pre-operator EIS. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: serv_dest**

**Fullname:** Service Destination

**Attribute Description** Key to RLsrv_dest which provides the initial routing destination for the initial action of a service. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: annc_type**

**Fullname:** Announcement Type

Copyright © 1999 Lucent Technologies 

**Attribute Description** Specifies the announcement to be supplied by the *5ESS*®-2000 switch DSU2 RAF when this internal announcement source is selected as the initial service destination. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: serv_code**

**Fullname:** Service Code

**Attribute Description** Indicates the internal call events which are applicable to this service.

**Attribute: eis_app_code**

**Fullname:** EIS Application Code

**Attribute Description** Informs the vendor of the service application required for this call. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: num_recalls**

**Fullname:** Number of Recalls

**Attribute Description** Default number of recalls when a value is not provided by an EIS, or when a service is provided without EIS support.

**Attribute: recall_dly**

**Fullname:** Recall Delay

**Attribute Description** Default recall delay (in tenths of seconds) when a value is not provided by an EIS, or when a service is provided without EIS support. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: lsccdigtim**

**Fullname:** LSCC Prompting Digit Timing

**Attribute Description** Determines the amount of digit timing, in 50 millisecond intervals, for Listing Services call completion prompting when an internal ARU is used. Zero is not allowed on the RC/ODA form. It is equivalent to unknown. This attribute must be zero prior to 5E6(2).

**Attribute: cc_on**

**Fullname:** Is call completion allowed?

**Attribute Description** This turns call completion on and off for each service provided by EIS.

**Attribute: turnbk_rtidx**

**Fullname:** Turn Back Route Index

**Attribute Description** This specifies the route index to be used for a Listing Services call completion turnback (cannot complete call) announcement.
Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: call_progrtidx**

Copyright © 1999 Lucent Technologies 

**Fullname:** Call Progress Route Index

**Attribute Description** This specifies the route index to be used for an LSCC call progress announcement before an operator is attached. If it is zero, then no call progress announcement will be made.
Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: ics_billno**

**Fullname:** ICS Billing Number

**Attribute Description** This attribute is used to specify the ICS 10-digit billing number.

**Attribute: oaff1**

**Fullname:** Spare 1

**Attribute Description** For possible future use.

**Attribute: oaff2**

**Fullname:** Spare 2

**Attribute Description** For possible future use.

**Attribute: oaff3**

**Fullname:** Spare 3

**Attribute Description** For possible future use.

**Attribute: oaff4**

**Fullname:** Spare 4

**Attribute Description** For possible future use.

**Attribute: oaff5**

**Fullname:** Spare 5

**Attribute Description** For possible future use.

**Attribute: oaff6**

**Fullname:** Spare 6

**Attribute Description** For possible future use.

## 4. Population rules for RLservdes

### Relation Description

Service designation table
Relation is used to determine which is the expected service type for 1+800 calls arriving on alternate access services (AATOS) and software defined network (SDN)/network remote access (NRA) multifrequency (MF) trunks, or as alternate access to language specific operators (AATLSOS) or Federal Telecommunications Systems network remote access (FTS NRA) calls.
This relation is also used for the SU feature which determines if the entered number is really a SSCWXY or a 1+800 number for Access using Feature Group D Signaling.
This relation should be populated for domestic generics only.

Copyright © 1999 Lucent Technologies 

**Attribute:**
sscwxy
**Fullname:**
SSCWXY code
**Attribute Description:**
This is the SSCWXY as signaled in the forward number field of a 1+800 dialed AATOS or SDN/NRA call.
Also, this can be the first six digits of an AATLSOS call or an FTS NRA call.

SSCWXY can be any combination of digits, each [0-9].
If the is800bit attribute is DBYES, then this field will hold the first 6 digits of the 1+800 Access with FDG Signaling telephone number, otherwise this field will hold the entered SSCWXY number.

**Attribute:**
z
**Fullname:**
Z digit
**Attribute Description:**
This is the Z digit signaled in the forward number of the call.
If the is800bit attribute is DBYES, then this field will hold the 7th digit of the 1+800 Access with FGD Signaling telephone number, else it will contain the Z digit associated with the SSCWXY number.

**Attribute:**
inwnpa
**Fullname:**
INWATTS NPA.
**Attribute Description:**
NPA of the INWATTS/toll free number utilizing this feature.

**Attribute:**
servind
**Fullname:**
Service indicator
**Attribute Description:**
This is an indicator for whether the call is AATOS, SDN/NRA, or AATLSOS.

**Attribute:**
destidx
**Fullname:**
Destination index
**Attribute Description:**
Destination index used to route the call to a language-specific operator.

Copyright © 1999 Lucent Technologies 

**Attribute:**
fts
**Fullname:**
Federal Telecommunications Systems
**Attribute Description:**
Whether this SSCWXY,Z is an FTS NRA call.

**Attribute:**
label
**Fullname:**
Label
**Attribute Description:**
Label displayed at the operator position to indicate the call information. All values are valid, including blanks, special characters, and spaces.

**Attribute:**
measidx
**Fullname:**
Measurements index
**Attribute Description:**
Index into measurements data.

**Attribute:**
spare
**Fullname:**
Spare
**Attribute Description:**
Spare field for future use.

**Attribute:**
acqs
**Fullname:**
acqs
**Attribute Description:**
Indicates if hotel room number class of charge is allowed for AATLSOS calls.

**Attribute:**
paid
**Fullname:**
paid
**Attribute Description:**
Indicates if PAID or DDD class of charge is allowed for AATLSOS calls.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
is800bit
**Fullname:**
Is 800 bit
**Attribute Description:**
Indicates if the key is an 800 number.

**Attribute:**
quietheartrmt
**Fullname:**
Quiet Hear Treatment
**Attribute Description:**
This field is used for the Quiet Hear treatment eligibility parameter used to control the application of Quiet Hear based on the 800 Access Call Routing Number or 800 Access Number as defined in the OSPS Service Designation table.

**Attribute:**
audiologobrand
**Fullname:**
Audio Logo Branding
**Attribute Description:**
Quiet Hear treatment eligibility parameter used to control the application of Quiet Hear Audio Logo Branding based on the 800 Access Call Routing Number or 800 Access Number as defined in the OSPS Service Designation table.

**Attribute:**
tcsonpa
**Fullname:**
terminating code screening originating NPA
**Attribute Description:**
The Terminating Code Screening Originating NPA field is used as the originating NPA during TCS checks.
The TCS ONPA is specified per service type and has the following meanings:
blank - use the signaled originating NPA as the originating NPA during TCS checks
0 - no TCS checks apply
1-999 - use the specified TCS NPA as the originating NPA during TCS checks

**Attribute:**
autotrmt
**Fullname:**
Autotrmt
**Attribute Description:**
This boolean field indicates whether Automated Access

**Copyright © 1999 Lucent Technologies** 

treatment should be given to 1800 CALL ATT calls arriving from the 4ESS(TM).

**Attribute:**
autocdsu
**Fullname:**
Autocdsu
**Attribute Description:**
This boolean field indicates whether 1-800-CALLATT CDSU automated treatment should be given.

**Attribute:**
num_ext_rtg
**Fullname:**
External routing number
**Attribute Description:**
This attribute is used to specify what number the external routing number is.

**Attribute:**
elig_ext_rtg
**Fullname:**
External Routing Eligibility
**Attribute Description:**
This attribute is used to specify whether or not this call is eligible for external routing.

**Attribute:**
asaptreatment
**Fullname:**
Automated Service Access Prompting treatment indicator
**Attribute Description:**
This attribute is used to specify whether or not this call is eligible for Automated Service Access Prompting treatment

**Attribute:**
lang_code
**Fullname:**
language code
**Attribute Description:**
This attribute is used to indicate what language is being prompted by an associated number.

**Attribute:**
lc_alw
**Fullname:**
LAC/LMC Change Allowed

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
This attribute is used to specify whether or not a calling customer is eligible to change the language

**Attribute:**
po_cc_id
**Fullname:**
Peel Out Calling Card ID
**Attribute Description:**
800 Peel Out Calling Card Identification. The null value is stored as a 0 in the relation.

**Attribute:**
oaff4
**Fullname:**
Spare4
**Attribute Description:**
Spare field for future use.

**Attribute:**

## 4. Population Rules for RLsf3_ltm

**Relation Description**
Special feature placeholder relation 3_LTM.

This relation is a dummy placeholder relation. It is not to be used without permission from the special features spare resource administrator.

Multiple features may use this relation at one time. The subrelation ID key (ksubrid) must be used to distinguish tuples used by different features or tuples that mimic different regular relations.

The following features use this relation as follows:

```
ksubrid         feature/purpose
-------         ---------------
The following is a brief description of each feature:

FEATURE NAME
------------
(Description of feature)
.      .       .
.      .       .
.      .       .
FEATURE NAME

## 4. Population Rules for RLsf12

**Relation Description**
Special feature placeholder relation 12.

This relation is a dummy placeholder relation. It is not to be used without permission from the 5EX Special Features project.

This relation's primary purpose is to provide additional storage when all storage has been used in an existing base relation with the same key set. For example, this relation could be used to store information that one would normally expect to find in RLmwcf, RLcf_cf, RLfc_coinchg, RLarcf, or RLdaprlfnl. Multiple features may use this relation at one time. The subrelation ID key, ksubrid, may be used to distinguish tuples used by different features or tuples that mimic different regular relations.

For this relation, the following standard is currently being used:

```
ksubrid         purpose
-------         ------
```

## 4. Population rules for RLsf14

### Relation Description

Special Feature Placeholder Relation 14
This relation is a dummy placeholder relation. It is not to be used without permission from the Special Features Department--Dept. 55663. Multiple features may use this relation at one time. The subrelation ID key (ksubrid) must be used to distinguish tuples used by different features or tuples that mimic different regular relations. This relation is currently only used by the PIDB Growth Control Special Feature (ksubrid = 0).

The following features use this relation as follows:

| ksubrid | feature/purpose |
|---|---|
| 0 | PIDB Growth Control Special Feature. The as1 field is used to indicate the maximum number of PIDBs that the IDCU can have. The ks field is used to indicate the IDCU unit number. |

The following is a brief description of each feature:

PIDB GROWTH CONTROL
---

The PIDB Growth Control Special Feature provides a mechanism to enforce a pricing restructure for the IDCU. This feature will limit the number of PIDBs that an IDCU can have based upon how many PIDBs have been purchased.

**Attribute:**
ks
**Fullname:**
Arbitrary Unsigned Short Key
**Attribute Description:**
Arbitrary unsigned short key
When ksubrid = 0, this relation is being used to support the PIDB Growth Control Special Feature. The ks attribute in this relation is the IDCU number.

**Attribute:**
ksubrid
**Fullname:**
Subrelation Identifier Key
**Attribute Description:**
Subrelation identifier key
For ksubrid = 0: PIDB Growth Control Special Feature.
See the relation description section for details.

## 4. Population Rules for RLsf24

**Relation Description**
Special feature placeholder relation 24.

This relation is a dummy placeholder relation. It is not to be used without permission from the special features spare resource administrator.

Multiple features may use this relation at one time. The subrelation ID key (ksubrid) must be used to distinguish tuples used by different features or tuples that mimic different regular relations.

The following features use this relation as follows:

```
ksubrid         feature/purpose
-------         ---------------
The following is a brief description of each feature:

FEATURE NAME
------------
(Description of feature)
.     .      .
.     .      .
.     .      .
FEATURE NAME

## 4. Population Rules for RLsf43

**Relation Description**
Special Feature Placeholder Relation 43.

This relation is a dummy placeholder relation. It is not to be used without permission from the Special Features Department--Dept. 55663. Multiple features may use this relation at one time. The subrelation ID key (ksubrid) must be used to distinguish tuples used by different features or tuples that mimic different regular relations.

The following features use this relation as follows:

| ksubrid | feature/purpose |
|---|---|

The following is a brief description of each feature:

```
FEATURE NAME
------------
(Description of feature)
.     .      .
.     .      .
.     .      .
FEATURE NAME
------------
(Description of feature)
```

**Relation Description**
Special feature placeholder relation 44.

This relation is a dummy placeholder relation. It is not to be used without permission from the special features spare resource administrator.

Multiple features may use this relation at one time. The subrelation ID key (ksubrid) must be used to distinguish tuples used by different features or tuples that mimic different regular relations.

The following features use this relation as follows:

```
ksubrid         feature/purpose
-------         ---------------
```

The following is a brief description of each feature:

```
FEATURE NAME
------------
(Description of feature)
.      .       .
.      .       .
.      .       .
FEATURE NAME
------------
(Description of feature)
```

## 4. Population Rules for RLsfg_asfc

**Relation Description**
Alternate service feature code.

This relation provides a mapping from sfg number to asfc for the Enhanced INWATS Type AMA (EITA) special feature. Customers who purchase EITA can choose a number between 800 and 999 to be placed on the AMA record for INWATS type calls instead of the current value of 08. Each tuple in this relation must match up with an already existing INWATS SFG.

"The range of asfc is 800-999. If there is no alternate service feature code specified for a particular sfg then there should be no tuple for that sfg in this relation. The max number of tuples is 150, the expected number is 50 to 100."

**Attribute: grpnum**

**Fullname:** SF Group Number

**Attribute Description** The INWATS SFG number that has an alternate service feature code associated with it.

Copyright © 1999 Lucent Technologies 

**Attribute: alt_sfc**

**Fullname:** Alternate Service Feature Code

**Attribute Description** The alternate service feature code to be used in place of the default value of 08 for INWATS when this feature is purchased.

**Attribute: spbit1**

**Fullname:** spare bit 1

**Attribute Description** This names the spare bits in this relation to ease future use of this relation.

**Attribute: spbit2**

**Fullname:** spare bit 2

**Attribute Description** This names the spare bits in this relation to ease future use of this relation.

**Attribute: spbit3**

**Fullname:** spare bit 3

**Attribute Description** This names the spare bits in this relation to ease future use of this relation.

**Attribute: spbit4**

**Fullname:** spare bit 4

**Attribute Description** This names the spare bits in this relation to ease future use of this relation.

**Attribute: spbit5**

**Fullname:** spare bit 5

**Attribute Description** This names the spare bits in this relation to ease future use of this relation.

**Attribute: spbit6**

**Fullname:** spare bit 6

**Attribute Description** This names the spare bits in this relation to ease future use of this relation.

# SHRD_G

## 1. Description

The storage relation for RLshterm. This relation contains four shared terminals.

This is a child storage relation

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10000 |
| expected tuples in relation | 500 |
| access type | DBACC_GK |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTORAGE |
| head table size | 256 |
| intermediate page size | 256 |
| data page size | 256 |
| page level | 3 |
| index length | 0 |
| i2 index into intermediate page | 0 |
| ks key store | DBNO |
| foldtype | DBGC31 |
| permutation type | perm |
| gkidxrel - generated key index relation | rlSHRD_I |

# SHTERM

## 1. Description

This relation contains the associated terminal information for a shared DN plus the lead port information. The lead port is the primary terminal where the DN is located.

This is a virtual relation. The tree diagram Figure 1 depicts the stored structure of virtual relation SHTERM.

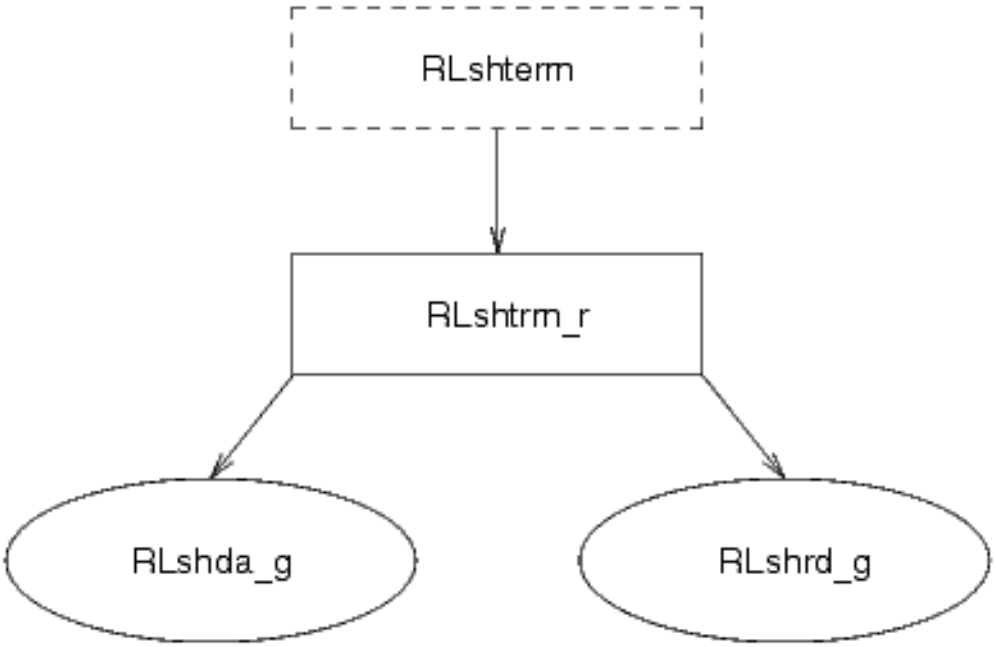

**Figure 1 Virtual Relation SHTERM**

## 2. Data Dictionary Values

## 4. Population rules for RLshterm

### Relation Description

Shared terminal.
Provides the lead terminal for this directory number followed by a list of associated terminals that share this ltm_idxi (DN or MLHG member).

**Attribute:**
lead_module
**Fullname:**
lead module.
**Attribute Description:**
lead switching module for the DN or member represented by the ltm_idxi

**Attribute:**
range
**Fullname:**
Range.

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

Denotes the range for groups of 4 shared
terminals. There can be at most 32 shared terminals.
1 lead terminal and 31 associated terminals.
0 denotes 1 shterm tuple ... 1 denotes 2 tuples.
2 denotes 3 shterm tuple ... 3 denotes 4 tuples.
4 denotes 5 shterm tuple ... 5 denotes 6 tuples.
6 denotes 7 shterm tuple ... 7 denotes 8 tuples.
There is always range 0 for RLis_line(lead_module,ltm_idxi).shared
set to DBYES, and range 1 will exist when shtm_cnt > 3.
range 2 will exist when shtm_cnt > 7.
range 3 will exist when shtm_cnt > 11.
range 4 will exist when shtm_cnt > 15.
range 5 will exist when shtm_cnt > 19.
range 6 will exist when shtm_cnt > 23.
range 7 will exist when shtm_cnt > 27.

**Attribute:**

ltm_idxi

**Fullname:**

logical termination index.

**Attribute Description:**

logical termination index.

**Attribute:**

eponum

**Fullname:**

enhanced professional office position number

**Attribute Description:**

This attribute contains the Enhanced Professional Office (EPO)
position number. It consists of the EPO position number assigned
to one of the terminals sharing this DN or MLHG member.
If this attribute is greater than zero, there must be a tuple
in RLshterm for this DN or MLHG member where the first entry of
the lowest range keyed tuple (starting from range 0 to range 7)
has a RLshterm.shared[] structure where the shared[*].is_epos is DBYES,
the shared[*].epo_on is DBYES (that is, the DN is being tracked), and
the shared[*].subaddr_cnt has a value that is greater or equal to
all other shared[] entries that have shared[*].is_epos and
shared[*].epo_on set to DBYES.
If there are no DNs being tracked, any entry in RLshterm.shared[]
of any range keyed tuple where the shared[*].is_epos is DBYES can
be used. The "eponum" attribute in the associated RLis_term tuple
for the selected entry must match this attribute.

**Attribute:**

ffcf[*]

**Fullname:**

Future feature field.

**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

boolean reserved for future field feature use.

**Attribute:**
std_grp
**Fullname:**
Standard Group.
**Attribute Description:**
Indicates whether or not the group is Bellcore Standard BRI.

**Attribute:**
shtm_cnt
**Fullname:**
terminals sharing count.
**Attribute Description:**
For range equal 0 indicates the total number minus 1 of terminals sharing this DN and valid shtm_cnt values are 1 to 31. For range greater than 0, shtm_cnt must be 0.

**Attribute:**
ad_time
**Fullname:**
Abbreviated/Delayed ringing time.
**Attribute Description:**
Abbreviated/Delayed ringing time in seconds. A key system group may have at most one time value where ringing is delayed and/or abbreviated. If any shared*.ad_pat is ADDELAY, ADDELRID or ADABBREV, then ad_time must be non-zero in tuple (range=0), otherwise if none of shared*.ad_pat is ADDELAY, ADDELRID or ADABBREV, then ad_time must be 0 in tuple (range=0).
Must be 0 in (range > 0) tuple.
Default: 12 sec (two ring cycles)
when shared[].ad_pat is_in { ADDELAY,ADDELRID,ADABBREV }

**Attribute:**
todid
**Fullname:**
time of day identifier.
**Attribute Description:**
When a TOD feature is assigned or deleted from the primary DN, 'todid' in RLshterm need to be updated. This field has default value for secondary only DN's.
On the primary DN,
shterm.todid = trmfeats.todid
If RLis_line(ltm_idxi, lead_module).primary is DBYES and RLtrmfeats(RLlpt_pt(lport,lpt_type=LPT_ISDN).port).todid is non-zero, then this todid must be the same as RLtrmfeats.todid.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

shared[*]

**Fullname:**

shared.

**Attribute Description:**

Each tuple can denote the sharing of up to 4 terminals. shared1 thru shared4 must be filled sequentially without gaps. These attributes provide the key for the RLtermkydn relation on the module where the port is. The lead port is populated in shared1 in RLshterm.range = 0. The rest of the sharedX entries are for the associated terminals.

**Attribute:**

shared[*].lport

**Fullname:**

logical port.

**Attribute Description:**

logical port number of the port associated with the DSL or shared analog port. Also see previous module. For DSL ports must have an entry in RLis_term using this attribute as the key along with termno. Must have a tuple in RLtermkydn or RLcgpn_ltm keyed by this attribute.

Note: For shared analog lports there are no related RLis_term or RLtermkydn tuples.

Note: For BASIC EKTS(TM) tuples, there are no related RLtermkydn tuples. See RLis_line poprules for crosschecks

**Attribute:**

shared[*].subaddr_cnt

**Fullname:**

subaddresses count.

**Attribute Description:**

Indicates the number of subaddresses minus 1 associated with this terminal for this ltm_idxi.

**Attribute:**

shared[*].module

**Fullname:**

module.

**Attribute Description:**

Corresponding Switching Module of the lport for which this ltm_idxi is shared. The following restriction should be exercised only if TFOS (Transparency Feature Option) number 038 is not set. This option allows the customers to have Shared DN groups across SM/RSM clusters.

For 5E8, RC and ODA must sort the terminal information both by module and dsl_group. The lead_port must still remain

**Copyright © 1999 Lucent Technologies** 

to be the first entry in the shared data. All terminals residing on the same module will be grouped with the lead_port. Also, terminals on the same PH will be immediately after the first terminal. Subsequent entries on the lead module will be sorted in ascending order by the dsl_group. After no more entries are found on the lead_module the lowest module number will appear next. The terminals will be first sorted in ascending order by SM then by the PH number. Also, inside each module grouping the terminals will be sorted in ascending order by PH.

```
EXAMPLE:TERM # SM      PH
         1     3       16      lead port
         2     3       1
         3     1       5
         4     12      1
         5     3       16
         6     1       1
         7     2       12
         8     10      2

SORTED Version of previous:
         1     3       16      lead port does not move
         2     3       16      was TERM 5
         3     3       1       was TERM 2
         4     1       1       was TERM 6
         5     1       5       was TERM 3
         6     2       12      was TERM 7
         7     10      2       was TERM 8
         8     12      1       was TERM 4
```

The sorted data should be sorted both by RC and ODA. The actual PRL checks will be put in for the next load. Must rewrite pseudocode and convert to PRL.

Restriction: If any terminal in the shared DN group resides on a RSM, then all members of the shared DN group must reside on the same MMRSM cluster (that is, if RLmodatt[module].imtype equals 'SM5RSM' for any terminal in the group, then RLmodatt[module].clid must be equal for all terminals in the group - range 0 shared1 through shared4 and range 1 shared1 through shared4).

**Attribute:**

shared[*].epo_on

**Fullname:**

enhanced professional office indicator

**Attribute Description:**

This attribute indicates if the DN (secondary, secondary only, or shared secondary) or MLHG member that's assigned to the terminal for this shared[] entry is being tracked by the MIS as an Enhanced Professional Office (EPO) DN or member.

**Copyright © 1999 Lucent Technologies** 

If this attribute is set to DBYES, the terminal associated with this entry must not be a standard ISDN terminal or an ACD/BRCS position.
If this shared[] entry is for the lead port terminal (that is, range == 0, shared1), this attribute must be equal to the "epo_on" attribute in the associated RLis_line tuple for this DN or member.

**Attribute:**
shared[*].is_epos
**Fullname:**
enhanced professional office position indicator
**Attribute Description:**
This attribute indicates if the terminal associated with this shared[] entry is an Enhanced Professional Office (EPO) position.
If this attribute is set to DBYES for non-analog terminals, the associated RLis_term tuple must have "eponum" attribute that is greater than zero. If this attribute is set to DBNO, the RLis_term.eponum must be zero.

**Attribute:**
shared[*].frst_ca
**Fullname:**
first call appearance number.
**Attribute Description:**
Specifies the first the call appearance number on this terminal associated with the DN or MLHG Member. The call appearances on the lead terminal are on this RLshterm.shared[].module associated with the DN or Member is given by the call appearance number = frst_ca + offset, where offset = {0...subaddr_cnt}.
This applies to RLis_term.cpetype =
{ IS_TYPEC and IS_TYPED },
but not an attendant.
frst_ca =0,
if RLfc_porttyp(RLlpt_pt(lport,lpt_type=LPT_ISDN).port).sh_analog=DBYES
Sum of first_ca and sub_addr_cnt must be less than or equal to 254.

**Attribute:**
shared[*].termno
**Fullname:**
terminal number.
**Attribute Description:**
the terminal number for this directory number or multiline hunt line in 5E4 always 0.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

shared[*].callexcl

**Fullname:**

Bridged Call Exclusion.

**Attribute Description:**

Indicates whether Bridged Call Exclusion is not allowed (CE_NONE), or it is allowed but it has to be activated manually by pressing a feature button or by dialing a code (CE_MAN), or the feature is automatically activated upon originations or terminations on this logical port (CE_AUTO). Automatic Call Exclusion can be disabled by pressing a feature button or by dialing a code.

**Attribute:**

shared[*].ad_pat

**Fullname:**

abbreviated/delay pattern.

**Attribute Description:**

Ringing/display type for each terminal:

ADNORMAL = 0, normal ringing/immediate display
ADDELAY = 1, delayed ringing/delayed display
ADABBREV = 2, abbreviated ringing/immediate display
AD_NONE = 3, no ringing/immediate display
ADDELRID = 4, delayed ringing/immediate display
ADNORNOD = 5, no ringing/no display

Dependency:

If ADDELAY, ADDELRID, or ADABBREV, ad_time must be non-zero in range 0 tuple.

**Attribute:**

shared[*].dsl_group

**Fullname:**

PH number that this terminal is assigned to

**Attribute Description:**

Populate with the DSL Group Number (0 to 95) to which the port has been assigned. This value is to be gotten from the RLdslequip relation. For analog SHDN make the dsl_group zero.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLsid_ds1

**Relation Description**
Remote Terminal Site Identifier to DS1 Name.

This relation maps the Remote Terminal (RT) SID and DS1 number to the DS1 external name.

**Attribute: sid**

**Fullname:** RT Site Identifier

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the RT site identifier, which uniquely identifies an RT within an office.

**Attribute: rt_ds1**

**Fullname:** DS1 Number on RT

**Attribute Description** This is the DS1 number on the RT side. This attribute is represented as a character so that the key of this relation is identical to the key of RL96sidlrt, which is the DCLU equivalent of RLsid_ds1.

**Attribute: sm**

**Fullname:** Switching Module (SM) Number

**Attribute Description** This is the number of the SM.

**Attribute: unitno**

**Fullname:** Unit Number

**Attribute Description** This is the unit number on which the DS1 terminates.

**Attribute: utype**

**Fullname:** Unit Type

**Attribute Description** This is the unit type on which the DS1 terminates.

**Attribute: rtnum**

**Fullname:** RT Number

**Attribute Description** This is the RT number.

**Attribute: ds1_num**

**Fullname:** Facility (DS1) Number

**Attribute Description** This is the DS1 Number relative to the RT. The attributes sm, unitno, and ds1_num comprise the DS1 external name. For IDCU transport facility, this number is from 0 -39. For DNU-S transport facility, this number is from 0 - 335 which is a combination of the STS/VT physical numbers.

**Attribute: rdt_unit**

**Fullname:** TR-303 RDT unit number.

**Attribute Description** This is an internal RT unit number which is a sequential number assigned to each TR-303 RDT in a SM.

**Attribute: is_prot**

**Fullname:** Protection Line

**Attribute Description** This is a boolean that indicates whether this is the protection line DS1.

**Attribute: rtint**

Copyright © 1999 Lucent Technologies 

**Fullname:** RT Interface

**Attribute Description** This is the RT interface (TR8 or TR303).

Copyright © 1999 Lucent Technologies 

# SIMSUPRT

## 4. Population Rules for RLsl_lentl

**Relation Description**
List of LEN's.

List of LEN's to be tested by SLIM routine testing.

**Attribute: entry**

**Fullname:** Identity of an entry in LEN list

**Attribute Description** This attribute represent an entry of line equipment number in the list.

**Attribute: list_id**

**Fullname:** Identity of LEN list

**Attribute Description** This attribute represent the list id in the LEN's list.

**Attribute: len_rng.entype**

**Fullname:** Range of LEN's, line equipment entry type

**Attribute Description** Range of line equipment number of entry type.

**Attribute: len_rng.low_sm**

**Fullname:** Range of LEN's, lower SM value.

**Attribute Description** Lower range of the SM value.

**Attribute: len_rng.low_conc**

**Fullname:** Range of LEN's, lower concentrator value

**Attribute Description** Lower range of the concentrator value.

**Attribute: len_rng.low_swgrp**

**Fullname:** Range of LEN's, lower service group value

**Attribute Description** Lower range of the upper service group.

**Attribute: len_rng.low_level**

**Fullname:** Range of LEN's, lower level value.

**Attribute Description** Lower range of the level value.

**Attribute: len_rng.low_rt**

**Fullname:** Range of LEN's, lower remote terminal (RT) value

Copyright © 1999 Lucent Technologies 

**Attribute Description** Lower range of the RT value.

**Attribute: len_rng.low_line**

**Fullname:** Range of LEN's, lower Remote Terminal line value

**Attribute Description** Lower range of the RT line value.

**Attribute: len_rng.up_sm**

**Fullname:** Range of LEN's, upper SM value.

**Attribute Description** Upper range of the SM value.

**Attribute: len_rng.up_conc**

**Fullname:** Range of LEN's, upper concentrator value

**Attribute Description** Upper range of the concentrator value.

**Attribute: len_rng.up_swgrp**

**Fullname:** Range of LEN's, upper service group value

**Attribute Description** Upper range of the upper service group.

**Attribute: len_rng.up_level**

**Fullname:** Range of LEN's, upper level value.

**Attribute Description** Upper range of the level value.

**Attribute: len_rng.up_rt**

**Fullname:** Range of LEN's, upper remote terminal (RT) value

**Attribute Description** Upper range of the RT value.

**Attribute: len_rng.up_line**

**Fullname:** Range of LEN's, upper Remote Terminal line value

**Attribute Description** Upper range of the RT line value.

POPRULES FOR ISLU

This relation's representation looks just like LEN whether the actual equipment is LEN, LCEN, or LCKEN. Recent Change receives input in the form of LCEN for ISLU. The following rules apply for "populating" this relation. These poprules actually provide conversion rules to convert from the external LCEN representation passed by RC to the internal LEN representation used by this relation.

On input, conversion of ISLU and ISLU-Z LCEN with SM, LU, LGC, and LC is needed to LEN structure with SM, LU, CONC, SWGRP, SW and LEVEL. The following lines detail how the conversion works. For the "high*" part of the relation, the same conversion rules apply.

```
Conversion from view/form equipment number to relation:
-------------------------------------------------------
```

**Copyright © 1999 Lucent Technologies** 

```
     Note: low_xxx and up_xxx attributes are mapped from the
     START OE" and "END OE", form/view fields, respectively.
     lenrng.low_sm = sm
     lenrng.low_unit = lu
     lenrng.low_conc = lgc / 2
     lenrng.low_swgrp = lgc % 2
     lenrng.low_sw = lc / 4
     lenrng.low_     level = lc % 4
     lenrng.low_rt = 0
     lenrng.low_line = 0
     lenrng.up_sm = sm
     lenrng.up_unit = lu
     lenrng.up_conc = lgc / 2
     lenrng.up_swgrp = lgc % 2
     lenrng.up_sw = lc / 4
     lenrng.up_level = lc % 4
     lenrng.up_rt = 0
     lenrng.up_line = 0
```

To go the other direction, from relation to view/form equipment number

```
     sm = lenrng.low_sm
     lu = lenrng.low_unit
     lgc = ((lenrng.low_conc % 8) << 1) + (lenrng.low_swgrp)
     lc = (lenrng.sw << 2) + lenrng.level
```

LEN "L":

POPRULES FOR AIU

This relation's representation looks just like a LEN whether the actual equipment is LEN or AIUEN. Recent Change receives input in the form of AIUEN for AIU. The following rules apply for "populating" this relation. These poprules actually provide conversion rules to convert from the external AIUEN representation passed by RC to the internal LEN representation used by this relation.

On input, conversion of AIUEN with SM, AIU, LP, and LC is needed to LEN structure with SM, LU/UNIT, CONC, SWGRP, SW and LEVEL. The following lines detail how the conversion works. For the "high*" part of the relation, the same conversion rules apply.

```
     lenrng.low_sm    = sm
```

**Copyright © 1999 Lucent Technologies** 

```
     lenrng.low_unit  = aiu
     lenrng.low_conc  = lp / 2
     lenrng.low_swgrp = lp % 2
     lenrng.low_sw    = lc / 4
     lenrng.low_level = lc % 4
```

To go the other direction:

```
     sm  = lenrng.low_sm
     aiu = lenrng.low_lu
     lp  = (lenrng.low_conc << 1) + (lenrng.low_swgrp)
     lc  = (lenrng.low_sw << 2) + (lenrng.low_level)
```

## 4. Population Rules for RLsl_sessn

**Relation Description**
SLIM routine mode test session definition.

This relation will define the test session start, stop, period, and the test job id for SLIM tests.

**Attribute: tsess_id**

**Fullname:** Identity of the test session

**Attribute Description** This attribute represent the test id for certain test session.

**Attribute: tjob[*]_id**

**Fullname:** Identities of the test jobs

**Attribute Description** This attribute represent the test job id to be run.

**Attribute: start_date.year,start_date.month,start_date.day Fullname:** Start date of the test session

**Attribute Description** This attribute represent the start date of the test session.

**Attribute: start_time.hr,start_date**

**Fullname:** Start time of the test session

**Attribute Description** This attribute represent the start and time of the test session.

**Attribute: periodicity**

**Fullname:** The period of repetition

**Attribute Description** This attribute represent the period of time when the test should be rerun.

**Attribute: stop_time.hr,stop_time.min**

**Fullname:** Stop time of the test session

**Attribute Description** This attribute shows the stop time (hour and minutes), of the test session.

## 4. Population Rules for RLsl_thrsh

**Relation Description**
Slim tests and threshold.This relation holds the list of threshold values for SLIM tests.

**Attribute: threshlst_id**

**Fullname:** Identity of threshold list

**Attribute Description** This attribute contains the list id number which is going to be used by the SLIM test.

**Attribute: onhk00_test.high,onhk00_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 00

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for AC voltage, tip-to-ground.

**Attribute: onhk01_test.high,onhk01_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 01

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for AC voltage, ring-to-ground.

**Attribute: onhk02_test.high,onhk02_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 02

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for AC voltage, tip-to-ring.

**Attribute: onhk03_test.high,onhk03_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 03

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for DC voltage, tip-to-ground.

**Attribute: onhk04_test.high,onhk04_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 04

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for DC voltage, ring-ground.

Copyright © 1999 Lucent Technologies 

**Attribute: onhk05_test.high,onhk05_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 05

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for DC voltage, tip-to-ring.

**Attribute: onhk06_test.high,onhk06_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 06

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for resistance, tip-to-ground.

**Attribute: onhk07_test.high,onhk07_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 07

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for resistance ring-to-ground.

**Attribute: onhk08_test.high,onhk08_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 08

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test which is not currently used in domestic switching.

**Attribute: onhk09_test.high,onhk09_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 09

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test resistance tip-to-ring.

**Attribute: onhk10_test.high,onhk10_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 10

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test which is not currently used in domestic switching.

**Attribute: onhk11_test.high,onhk11_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 11

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test which is not currently used in domestic switching.

**Attribute: onhk12_test.high,onhk12_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 12

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test which is not currently used in domestic switching.

Copyright © 1999 Lucent Technologies 

**Attribute: onhk13_test.high,onhk13_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 13

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for capacitance, tip-to-ground.

**Attribute: onhk14_test.high,onhk14_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 14

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for capacitance, ring-to-ground.

**Attribute: onhk15_test.high,onhk15_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 15

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test for capacitance, tip-to-ring.

**Attribute: onhk16_test.high,onhk16_test.low**

**Fullname:** Threshold values (high and low) for SLIM on-hook test 16

**Attribute Description** This attribute contains the threshold values for on-hook SLIM test monitor for short.

**Attribute: offhk00_test.high,offhk00_test.low**

**Fullname:** Threshold values (high and low) for SLIM off-hook test 00

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test loop resistance.

**Attribute: offhk01_test.high,offhk01_test.low**

**Fullname:** Threshold values (high and low) for SLIM off-hook test 01

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test dial speed.

**Attribute: offhk02_test.high,offhk02_test.low**

**Fullname:** Threshold values (high and low) for SLIM off-hook test 02

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test dial pulse.

**Attribute: offhk03_test.high,offhk03_test.low**

**Fullname:** Threshold values (high and low) for SLIM off-hook test 03

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test keytone level.

**Attribute: offhk04_test.high,offhk04_test.low**

Copyright © 1999 Lucent Technologies 

**Fullname:** Threshold values (high and low) for SLIM off-hook test 04

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test keytone difference.

**Attribute: offhk05_test.high,offhk05_test.low**

**Fullname:** Threshold values (high and low) for SLIM off-hook test 05

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test keytone frequency.

**Attribute: offhk06_test.high,offhk06_test.low**

**Fullname:** Threshold values (high and low) for SLIM off-hook test 06

**Attribute Description** This attribute contains the threshold values for off-hook SLIM test flash hook.

# SL_TJOB

## 1. Description

SLIM routine testjob that relates testsets, threshold lists, LEN's to be tested and the types of lines to be allowed to be tested.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 240 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application type | TLWS |
| relation type | DBSTATIC |

## 3. Field Layout

## 4. Population Rules for RLsl_tjob

**Relation Description**
Slim routine test job.

SLIM routine test job that relates testsets, threshold list's, LEN's to be tested and the types of lines to be allowed to be tested.

**Attribute: tjob_id**

**Fullname:** Identity of the test job

**Attribute Description** This attribute is the representation of the testjob ID.

**Attribute: tset_id**

**Fullname:** Identity of the testset

**Attribute Description** Identity of the testset to be used.

**Attribute: len_rng.low_sm**

**Fullname:** Range of LEN's, lower SM value.

**Attribute Description** Lower range of the SM value.

**Attribute: len_rng.low_unit**

**Fullname:** Range of LEN's, lower Unit value.

**Attribute Description** Lower range of the Unit value.

**Attribute: len_rng.low_conc**

**Fullname:** Range of LEN's, lower concentrator value

**Attribute Description** Lower range of the concentrator value.

**Attribute: len_rng.low_swgrp**

**Fullname:** Range of LEN's, lower service group value

**Attribute Description** Lower range of the upper service group.

**Attribute: len_rng.low_level**

**Fullname:** Range of LEN's, lower level value.

Copyright © 1999 Lucent Technologies 

**Attribute Description** Lower range of the level value.

**Attribute: len_rng.low_rt**

**Fullname:** Range of LEN's, lower remote terminal (RT) value

**Attribute Description** Lower range of the RT value.

**Attribute: len_rng.low_line**

**Fullname:** Range of LEN's, lower Remote Terminal line value

**Attribute Description** Lower range of the RT line value.

**Attribute: len_rng.up_sm**

**Fullname:** Range of LEN's, upper SM value.

**Attribute Description** Upper range of the SM value.

**Attribute: len_rng.up_unit**

**Fullname:** Range of LEN's, upper Unit value.

**Attribute Description** Upper range of the Unit value.

**Attribute: len_rng.up_conc**

**Fullname:** Range of LEN's, upper concentrator value

**Attribute Description** Upper range of the concentrator value.

**Attribute: len_rng.up_swgrp**

**Fullname:** Range of LEN's, upper service group value

**Attribute Description** Upper range of the upper service group.

**Attribute: len_rng.up_level**

**Fullname:** Range of LEN's, upper level value.

**Attribute Description** Upper range of the level value.

**Attribute: len_rng.up_rt**

**Fullname:** Range of LEN's, upper remote terminal (RT) value

**Attribute Description** Upper range of the RT value.

**Attribute: len_rng.up_line**

**Fullname:** Range of LEN's, upper Remote Terminal line value

**Attribute Description** Upper range of the RT line value.

**Attribute: lenlst_id**

Copyright © 1999 Lucent Technologies 

**Fullname:** Identity of len list of LEN's

**Attribute Description** Identity of len list of LEN's to be tested.

**Attribute: thrshlst_id**

**Fullname:** Identity of the threshold value list

**Attribute Description** Identity of the threshold value list to be used.

**Attribute: pbx_allowed**

**Fullname:** Indicator of pbx_allowed lines

**Attribute Description** Indicator whether the pbx lines to be allowed for testing or not.

**Attribute: oos_allowed**

**Fullname:** Indicator of OOS lines

**Attribute Description** This attribute is an indicator for whether the OOS lines to be tested or not.

POPRULES FOR ISLU

This relation's representation looks just like an LEN whether the actual equipment is an LEN, LCEN, or LCKEN. Recent Change receives input in the form of an LCEN for ISLU. The following rules apply for "populating" this relation. These poprules actually provide conversion rules to convert from the external LCEN representation passed by RC to the internal LEN representation used by this relation.

On input, conversion of an LCEN with SM, LU, LGC, and LC is needed to LEN structure with SM, LU, CONC, SWGRP, SW and LEVEL. The following lines detail how the conversion works.

```
     Note: low_xxx and up_xxx attributes are mapped from the
     "START OE" and "END OE", form/view fields, respectively.

     lenrng.low_sm = sm
     lenrng.low_unit = lu
     lenrng.low_conc = lgc / 2
     lenrng.low_swgrp = lgc % 2
     lenrng.low_sw = lc / 4
     lenrng.low_level = lc % 4
     lenrng.up_sm = sm
     lenrng.up_unit = lu
     lenrng.up_conc = lgc / 2
     lenrng.up_swgrp = lgc % 2
     lenrng.up_sw = lc / 4
     lenrng.up_level = lc % 4

To go the other direction, (from relation to view/form)
     sm = lenrng.low_sm
     lu = lenrng.low_unit
     lgc = ((lenrng.low_conc % 8) << 1) + (lenrng.low_swgrp)
     lc = (lenrng.sw << 2) + lenrng.level

LEN "L":
```

    POPRULES FOR AIU
```

This relation's representation looks just like a LEN whether the actual equipment is LEN or AIUEN. Recent Change receives input in the form of AIUEN for AIU. The following rules apply for "populating" this relation. These poprules actually provide conversion rules to convert from the external AIUEN representation passed by RC to the internal LEN representation used by this relation.

On input, conversion of AIUEN with SM, AIU, LP, and LC is needed to LEN structure with SM, LU/UNIT, CONC, SWGRP, SW and LEVEL. The following lines detail how the conversion works. For the "high*" part of the relation, the same conversion rules apply.

```
    lenrng.low_sm    = sm
    lenrng.low_unit  = aiu
    lenrng.low_conc  = lp / 2
    lenrng.low_swgrp = lp % 2
    lenrng.low_sw    = lc / 4
    lenrng.low_level = lc % 4
```

To go the other direction:

```
    sm  = lenrng.low_sm
    aiu = lenrng.low_lu
    lp  = (lenrng.low_conc << 1) + (lenrng.low_swgrp)
    lc  = (lenrng.low_sw << 2) + (lenrng.low_level)
Pictorial representation of LEN and AIUEN "entype":

LEN "L":

   _____________________________
   | ' ' ' ' ' | ' ' ' | | ' ' | ' |
   |           |  conc | | sw  |lev|
   |           |      swgrp    |-el|
   |___________|_______|_|_____|___|
AIUEN "E":

   _____________________________
   | ' ' ' ' ' | ' ' ' | | ' ' | ' |
   |           |   lp    |   lc    |
   |___________|_________|_________|
```

# SL_TSET

## 1. Description

Sets of SLIM on-hook tests to used in SLIM routine mode.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 15 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LP |
| application type | TLWS |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population Rules for RLsl_tset

**Relation Description**
SLIM TestSet.

This relation provides the sets of SLIM on-hook tests to be used in SLIM routine mode.

**Attribute: tset_id**

**Fullname:** Testset identifier

**Attribute Description** This attribute is used to identify the testset.

Copyright © 1999 Lucent Technologies

**Attribute: tst[*]_selctd**

**Fullname:** Testset selected from 1 through 16

**Attribute Description** These are the possible SLIM on-hook tests selected.

DBYES - Test selected,
DBNO - test not selected
