## 4. Population rules for RLbfgmatch

**Relation Description**

Business and residential customer service (BRCS) featuring grouping matching

List of BRCS constructed features (feature ID [FID] only) assigned to a BRCS feature group (BFG), used in BFG selection during the assignment of a BFG to a line/directory number (DN)/multi-line hunt group (MLHG) line.
in BFG selection during the assignment of a BFG to a line/DN/MLHG line.

| rel_name | relation description |
|---|---|
| bfgmatch | list of BRCS constructed features assigned to a BFG bfgid |

DISTRIBUTION: This relation is on the administrative module (AM) disk.

Copyright © 1999 Lucent Technologies 

Population Rules for RLbfgmatch:

Each insertion, update, or delete to/from RLtrmfeats and/or RLdn_feats will result in an insertion, possible update, or delete to/from RLbfgmatch. The bfgid attribute will be identical in both of these relations.

Remarks about BFG selection:
RLbfgmatch exists to avoid Recent Change (RC) performance response delays when the automatic BFG selection function is called. Most BRCS feature statuses, all group IDs and other important parameters of BFG are stored and maintained in this relation. Selection reads the AM disk (rather than the Switching Module (SM) where the BFG is already assigned) to determine during feature assignment whether the view buffer features and parameter data are compatible with the BFG. Since more than one BFG may be read in this way, selection retains which BFG has the most features and parameters matching the view buffer data. This best fit BFG is selected to be assigned to the line involved in this feature assignment process. If the result of best fit is a tie, the first BFG examined is assigned. If none of the BFG match, a BFG with subclass SCL_BFGB is assigned to the line. The inclusion of Line Class Code (LCC) in RLbfgmatch is used to minimize cross checks during terminal assignment and on BFG updates.

Multiple multiway calling (MW) features inside a BFG has an impact on selection since only one set of MW parameter is stored in RLbfgmatch. The first MW feature parameters encountered during BFG construction are stored in RLbfgmatch. All other MW features, in the BFG, must use the default parameters from the MW feature assigned.

Multiple Distinctive Ring (DR) features are not allowed in a BFG. This is blocked from occurring in BFG construction by the parameter mapping code for the DR modular feature. Such attempt to insert or add more than one DR feature to a BFG results in an error message.

One authorization code feature and auth group is allowed inside a BFG. During BRCS feature assignment, when the feature's dn_feats.ath = bfgmatch.ath, this feature is eligible to pass selection successfully.

Remote Access Service (RAS):
During BRCS feature assignment, when the feature's dn_feats.ras equals bfgmatch.ras, this feature is eligible to pass selection successfully.

Feature activation:
During BRCS feature assignment, when the feature's dn_feats.active=DBYES this feature is eligible to pass selection successfully. When the feature's dn_feats.active = DBNO, then the feature is eligible to pass selection successfully ONLY if bfgmatch.act = DBNO.

Speed Calling (SC) feature, shared and unshared SC lists,

Copyright © 1999 Lucent Technologies 

and selection:
The corresponding BFG RLsc_port tuples will have a full set of parameters (from the feature's default parameters if none were specified when the BFG was constructed) carried as a part of the BFG with the exception of unshared speed calling. Unshared speed calling will have SC_SHARED = DBNO (or null) and the SC LIST NAME will be null. This permits an unshared SC feature to reside inside the BFG and be eligible for selection.

During BFG selection, when an SC feature is to be assigned to the line, if the SC_SHARED attribute is DBNO (null), the line must have it's own RLsc_port tuple populated to retain the unshared speed call list. If the line's SC_SHARED is DBYES and SC LIST NAME is not null, the SC feature is permitted to be selected inside the BFG. The line will have its own RLsc_port tuple populated only if the SC_LIST NAME inside the BFG does not match the SC LIST NAME to be assigned to that line.

Constructed feature activation/deactivation option restrictions:
The following BRCS modular feature types require checks on their activation/deactivation options against all DMmc_actyp values that allow customer selected activation (end subscriber dialing codes which permanently alter the static office-dependent data [SODD]). Any such constructed or pre-constructed BRCS feature is not allowed to be assigned in a BFG. This check is to be maintained therefore on the basis of what is valid/invalid in DMmc_actyp, rather than what is valid/invalid on a modular feature by modular feature basis. The same check can therefore be called for ALL the following modular features identified:

Dependencies:

Any feature that satisfies any one of the following conditions should not be defined in bfgmatch:

1. If FEATURE = at_opts.fid, at_opts.actvn = ACTCD and at_opts.dctvn = DCTCD.

2. If FEATURE = acct_cf.feat_id, acct_cf.actvn = ACTCD and acct_cf.dctvn = DCTCD.

3. If FEATURE = ath_cf.ath_fid, ath_cf.actvn = ACTCD and ath_cf.dctvn = DCTCD.

4. If FEATURE = dr_opts.feat_id, dr_opts.actvn = ACTCD and dr_opts.dctvn = DCTCD.

5. If FEATURE = id_opts.feat_id, id_opts.actvn = ACTCD and id_opts.dctvn = DCTCD.

6. If FEATURE = mdr_opts.feat_id, mdr_opts.actvn = ACTCD and mdr_opts.dctvn = DCTCD.

Copyright © 1999 Lucent Technologies 

7. If FEATURE = mwcfdfl.feat_id, mwcfdfl.actvn = ACTCD and mwcfdfl.dctvn = DCTCD.

8. If FEATURE = tg_cf.feat_id, tg_cf.actvn = ACTCD and tg_cf.dctvn = DCTCD.

9. If FEATURE = puo_cf.feat_id, puo_cf.actvn = ACTCD and puo_cf.dctvn = DCTCD.

10. If FEATURE = put_cf.feat_id, put_cf.actvn = ACTCD and put_cf.dctvn = DCTCD.

Secondary only DNs may be assigned a BFG directly or via selection. If there are both terminal and DN type BRCS features inside the BFG, this does not invalidate the BFG from being selected for that secondary only DN. Call processing will permit the secondary DN to use only the DN features of that BFG.

Digital subscriber lines (DSLs) may only be assigned a default service BFG directly (not via selection). A default service BFG is indicated by a def_svc attribute set to DBYES: DSLs may only be assigned default service BFGs, and default service BFGs are assignable only to DSLs (such as, not DNs).

Application specific Population Rules - default service BFG

DESCRIPTION:

Each default service BFG requires a tuple in RLbfgmatch. Default service allows unknown customer premise equipment (CPE) on a basic rate interface (BRI) (subscribing to default service) to allow originations. No terminations are allowed to a CPE utilizing default service.

QUANTITY OF TUPLES:

Each default service BFG ID must have one tuple in RLbfgmatch.

TUPLE SEMANTICS:

Currently a default service BFG is only allowed a small subset of the features allowed for a normal BFG. A default service BFG is identified by attribute def_svc set to DBYES.

| Attribute | Value |
|---|---|
| bfgid | - The default service BFG ID. |
| def_svc | - DBYES |
| feat_cnt | - Zero |
| dnft_cnt | - Zero |
| act | - All bits set to zero. |
| ath | - All bits set to zero. |

The following population rules apply to each of the advanced
service interface (ASI) attributes using DMbcd5_6 domain:

        ra_code, remr_code, spare1_code and spare2_code

Office data administration (ODA):
The length of an attribute of this input/output (I/O) type does
not imply the number of digits that can be stored in it.

Recent change (RC):
The algorithm used to determine the number of digits storable in
the attribute can be found in hdr/db/DBbcdmacs.h.

The domain DMbcd5_6 supports up to six BCD digits plus a count of
the actual number of digits stored.  The ASI feature uses codes
of one to five digits, inclusive (1 <= number of digits <= 5).
Number of digits = "\0" means no code exists.

The digits are stored in BCD format, two per character (byte).
The domain has three characters to represent up to six digits plus
one character for the number of digits (the number of digits
character is required by the I/O type).  If the number of digits is
greater than six, the null character (which becomes same as digit 0 in
BCD) is used to fill the remaining digits.  The 'number of digits'
character always contains the number of digits.  The digits are stored
in the attribute starting with D1.

Layout follows:

| byte 0  | byte 1  | byte 2  | byte 3  |
-----------------------------------------
|    |    |    |    |    |    |         |
| D1 | D2 | D3 | D4 | D5 | D6 | no. dig |
|    |    |    |    |    |    |         |
-----------------------------------------

*****************************************************************/
```

Copyright © 1999 Lucent Technologies 

**Attribute:**
bfgid
**Fullname:**
Identifier for the BRCS feature group
**Attribute Description:**
Note: In this relation a tuple is only populated when a BFG has been created or updated. In other poprules the range of bfgid is noted as 0-4095. In this poprule the tuple is created/updated only if a bfgid has been assigned in the range previously stated. Values 0-255 are invalid since they represent no BFG (0), and null BFG (base=1-255).

**Attribute:**
act
**Fullname:**
Activation
**Attribute Description:**
Bit array identifying the activation/deactivation status of features within BFG. This 30 bit array contains one bit per BFG feature (a maximum of 30 BRCS features are allowed within one BFG.)

**Attribute:**
ath
**Fullname:**
Authorization code
**Attribute Description:**
Bit array identifying the authorization code status of features within the BFG. This 30 bit array contains one bit per BFG feature (a maximum of 30 BRCS features are allowed within one BFG).

**Attribute:**
ras
**Fullname:**
Remote access service
**Attribute Description:**
Bit array identifying the remote access service status of features within the BFG. This 30 bit array contains one bit per BFG feature (a maximum of 30 BRCS features are allowed within one BFG).

**Attribute:**
ftent[*]
**Fullname:**
Constructed feature ID
**Attribute Description:**
Each entry is a constructed feature ID. There must be a tuple in RLfacname and RLfid2name with a feature assignment and

Copyright © 1999 Lucent Technologies 

construction identification (FACID) equal to this value.
The class associated with the FACID must be equal to FACBRCS.

Some BRCS feature parameter relations use DMFID as the domain for the feature ID key, others use DMMCC_FID. DMFID is a 10 bit domain, and requires using the low-order 10 bits {0:9}. DMMCC_FID is a 16 bit domain. BRCS feature SC and ID are examples of features using the DMMCC_FID, but which are really only using bits {0:9} - for the constructed feature relation and the feature options relation. Sub-key generation is being used to strip off the six bits passed from RC - it's removing the modular feature type (MFT). This is being done since the MFT is not needed, as because it saves space.

Note: In this relation terminal features should appear before DN features. Certain features are restricted from being used by standard (STD) BRIs. Other features are for STD BRIs only. BFGs are not allowed to be constructed which contain features from both these two incompatible sets.

```
DN
Features restricted
from STD BRI or
analog shared with STD
----------------------
MFEDS (unless SFID225 is purchased)
MFPP

DN
Features allowed
only on STD BRI
------------------
MFRND
MFAR for CSD

Terminal features restricted
from STD BRI or
analog shared with STD
----------------------------
MFACB
MFACSR
MFCWT

Terminal
Features allowed
only on STD BRI
-----------------
there are none
```

In addition to the restrictions listed previously which are based on modular feature type, the following restrictions on feature options apply to STD BRI and analog shared with STD BRI.

1. The call forwarding (CFW) over private

Copyright © 1999 Lucent Technologies 

facilities option
2. The message desk service (MDS) leave word calling feature option
3. The MDS message retrieval display feature option
4. The MDS print on demand feature option
5. The MDS auto call setup feature option
8. The display time and date feature option
9. Any calling party number (CPN)/billing number (BN) feature option values other than CPN_PREF or CPN_ONLY
10. The MW entrypoint is dialcode option
11. The automatic call distribution (ACD)/BRCS CFW return to queue option

**Attribute:**
tgid
**Fullname:**
Terminal group ID
**Attribute Description:**
Range of values: 1 - 65535.

Default: None or zero. If there is a terminal group (TG) feature, the default is none. Otherwise, the default is zero.

Dependency: None

**Attribute:**
idp_gpid
**Fullname:**
Individualized dialing plan (IDP) group ID
**Attribute Description:**
Range of values: 0 - 65535.

Default: None or zero. If there is an IDP feature, the default is none. Otherwise, the default is zero.

Dependencies:

| Attribute value | Dependency |
|---|---|
| zero | 1. If and only if this port has no IDP group data.<br>2. RLbfgmatch.dpat_caty equals zero. |
| greater than zero | 1. Verify existence of tuple in RLidp_gp for this key. |

**Attribute:**
ad1_list_id
**Fullname:**
One-digit abbreviated dial list

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

Range of values: 0-65535.

Default: Zero.

Dependencies:

| Attribute value | Dependency |
|---|---|
| zero | Indicates the one-digit abbreviated dial list is not assigned to this port. |
| greater than zero | Verify existence of tuple in RLad1s_idp: RLsc_cf.sc = SC1_DIG. |

**Attribute:**

ad2_list_id

**Fullname:**

Two-digits abbreviated dial list

**Attribute Description:**

Indicates the two-digit abbreviated dial list assigned to this port.

Range of values: 0-65535.

Default: Zero.

Dependencies:

| Attribute value | Dependency |
|---|---|
| zero | Indicates the two-digit abbreviated dial list is not assigned to this port. |
| greater than zero | Verify existence of tuple in RLad2s_idp: RLsc_cf.sc equals SC2_DIG. |

**Attribute:**

icrsfg

**Fullname:**

Intercome calling restriction (ICR) simulated facilities group number

**Attribute Description:**

Range of values: 0 - AVSFGRPS().

Default: Zero (no ICR).
Dependancy: 'sfg_num' must have been assigned in RLicr.

**Attribute:**

feat_cnt

**Fullname:**

Feature counts

**Attribute Description:**

Indicates the number of features assigned within this bfgid

Range of values: 0-30.
Default: Zero.

**Attribute:**

ar_gpid

**Fullname:**

Constructed feature ID

**Attribute Description:**

Each entry is a constructed feature ID. There must be a tuple in RLfacname and RLfid2name with a FACID equal to this value. The class associated with the FACID must be equal to FACBRCS.

Note: In this relation terminal features should appear before DN features.

**Attribute:**

ardtgpid

**Fullname:**

Constructed feature ID

**Attribute Description:**

Each entry is a constructed feature ID. There must be a tuple in RLfacname and RLfid2name with a FACID equal to this value. The class associated with the FACID must be equal to FACBRCS.

Note: In this relation terminal features should appear before DN features.

**Attribute:**

pf_gpid

**Fullname:**

Private facility group

**Attribute Description:**

Range of values: 0 - 65535.

Default: Zero. Indicates that this port has no private facility group associated.

**Attribute:**

pfdtgpid

**Fullname:**

Private facility access (PFA) data group ID

**Attribute Description:**

PFA data group ID.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
dir_pu_dn
**Fullname:**
Direct pickup local telephone number
**Attribute Description:**
Direct pickup local telephone number that can be accessed by code.

Range of values: if populated, a telephone number serviced by this office, (full directory number).

Default value: No default or zero. If there is a call pickup originating (PUO) feature, the default is none. Otherwise, the default is zero.

Dependencies: If not null (\0) then RLpuo_cf assigned to this port shall have RLpuo_cf.initiate equal to PUIPREDN. The directed call pickup originator and terminator must be in the same terminal group.

**Attribute:**
dir_pu_dn.noc
**Fullname:**
Normalized office code(NOC) of the directory number
**Attribute Description:**
The NOC of the directory number corresponding to the directed call pick up DN.

**Attribute:**
dir_pu_dn.digits
**Fullname:**
last 4 digits of the local directory number
**Attribute Description:**
Last 4 digits of the DN corresponding to the directed call pick up DN.

**Attribute:**
dpd_dntr
**Fullname:**
unused attributes
**Attribute Description:**
unused attribute - default to zero

**Attribute:**
pusel_q1
**Fullname:**
Queue group
**Attribute Description:**
The queue (group) that the customer can originate to pick up.

Copyright © 1999 Lucent Technologies 

Range of values: 0, or 2 to 65534. Values 2 through 65534 are valid when constructing RLpuo_cf only.

Default: No default or zero. If there is a PUO feature, the default is none. Otherwise, the default is zero.

Dependency: If pusel_q1 greater than or equal to two and if RLpuo_cf.initiate equals PUIPRDQ then RLpuo_cf.pu_selq does not equal PUQNONE. If pusel_q1 equals zero then, RLpuo_cf.pu_selq equals PUQNONE.

**Attribute:**
pusel_q2
**Fullname:**
Queue group
**Attribute Description:**
The queue (group) that the customer can originate to pick up.

Range of values: 0, or 2 to 65534. Values 2 through 65534 are valid when constructing RLpuo_cf only.

Default: No default or zero. If there is a PUO feature, the default is none. Otherwise, the default is zero.

Dependency: If pusel_q2 greater than or equal to two and if RLpuo_cf.initiate equals PUIPRDQ then RLpuo_cf.pu_selq is not equal to PUQNONE or PU1QS and RLpu_port.pusel_q1 is greater than or equal to two.

**Attribute:**
pusel_q3
**Fullname:**
Queue group
**Attribute Description:**
The queue (group) that the customer can originate to pick up.

Range of values: 0, or 2 to 65534. Values 2 through 65534 are valid when constructing RLpuo_cf only.

Default: No default or zero. If there is a PUO feature, the default is none. Otherwise, the default is zero.

Dependency: If pusel_q3 is greater than or equal to two and if RLpuo_cf.initiate equals PUIPRDQ then:
1. RLpuo_cf.pu_selq equals PU3QS or PU4QS.
2. RLpu_port.pu_selq1 and RLpu_port.pu_selq2 are greater than or equal to two.

**Attribute:**
pusel_q4

**Copyright © 1999 Lucent Technologies** 

**Fullname:**

Queue group

**Attribute Description:**

The queue (group) that the customer can originate to pick up.

Range of values: 0, or 2 to 65534. Values 2 through 65534 are valid when constructing RLpuo_cf only.

Default value: No default or zero. If there is a PUO feature, the default is none. Otherwise, the default is zero.

Dependencies: If pusel_q4 is greater than or equal to two and if RLpuo_cf.initiate equals PUIPRDQ then, RLpuo_cf.pu_selq equals PU4QS and RLpu_port.pu_selq1, RLpu_port.pu_selq2, and RLpu_port.pu_selq3 are greater than or equal to two.

**Attribute:**

csv_bchan

**Fullname:**

Number of B-channels for circuit switched voice (CSV) calls

**Attribute Description:**

Number of B-channels a user is allowed for CSV calls.

Range: Zero to one.

Default: Zero.

Dependency: If RLbfgmatch.csv_bchan is_not zero then RLbfgmatch.def_svc is DBYES. See also the def_svc dependency section.

**Attribute:**

csd_bchan

**Fullname:**

Number of B-channels for circuit switched data (CSD) calls

**Attribute Description:**

Number of B channels a user is allowed for CSD calls.

Range: Zero (greater than zero currently not allowed).

Default: Zero.

Dependency: RLbfgmatch.csd_bchan is zero. See also the def_svc dependency section.

**Attribute:**

port_ls_cc

**Fullname:**

Port ID of loud speaker paging (LSP) or code calling (CCL) trunk

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

Port ID of LSP or CCL trunk that is to be accessed. This attribute is divided into sub-attributes port.members and port.module. The structure members are:

1. member (DMport): Port name of a port.
2. module (DMmodule): The SM number that this port terminates on.

Range of values: 1. member: unsigned short (0-65535).
2. module: unsigned short (1-255).

Default: No default or zero. If there is a PUO feature, the default is none. Otherwise, the default is zero.

Dependencies: The CPUO feature with LSP or CCL is not allowed inside a BFG.

**Attribute:**

port_ls_cc.member

**Fullname:**

Port

**Attribute Description:**

Same as seen previously..

**Attribute:**

port_ls_cc.module

**Fullname:**

Module

**Attribute Description:**

Same as seen previously..

**Attribute:**

t_pred_q

**Fullname:**

Terminating predesignated queue

**Attribute Description:**

Terminating predesignated queue.

Range of values: 0, or 2 to 65534. Values 2 through 65534 are valid when constructing RLput_cf only.

Default: No default or zero. If there is a PUT feature and RLput_cf.fea_fun is 'CAL_PU', the default is none. Otherwise, the default is zero.

Dependencies: If RLput_cf.fea_fun equals CAL_PU then t_pred_q is greater than or equal to two.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

athgpid

**Fullname:**

Authorization code group identifier

**Attribute Description:**

Authorization code group identifier.

Range of values: 0 to 65535.

Default: Zero is not a valid athgpid, used to indicate there is not an athgpid associated with this ath_fid.

Dependencies: If a non-zero athgpid is specified a tuple must exist in RLath_gp keyed by the athgpid.

**Attribute:**

athdtgpid

**Fullname:**

Authorization data group ID

**Attribute Description:**

Authorization data group ID.

**Attribute:**

acctgpid

**Fullname:**

Account code data group ID.

**Attribute Description:**

Account data group ID

**Attribute:**

cdtblid

**Fullname:**

Code association table identifier

**Attribute Description:**

Code association table identifier.

Range of values: 0 to 65535.

Default: Zero.

Dependencies: If cdtblid is greater than zero, verify that RLacct_rtg has a tuple where RLacct_rtg.cdtblid equals RLacct_prt.cdtblid. An account code (ACCT) port does not have to be assigned to an ACCT code association table.

**Attribute:**

mdr_gpid

**Fullname:**

Message detail recording (MDR) group ID

**Attribute Description:**

MDR group ID.

Range of values: 1 to 1000.

Default: None or zero. If there is a MDR feature, the default is none. Otherwise, the default is zero.

Dependencies: The port must be assigned to an existing MDR group with a non-zero MDR group ID.

For each non-zero MDR group ID, a tuple must exist in RLmdr_gp such that: RLmdr_gp.mdr_gpid = mdr_gpid.

If there is a group ID entered in this attribute the group must not be packet MDR only (RLmdr_gp must be populated for this group ID with at least one of the following attributes: {orig_priv, in_priv, public} set to DBYES as well as the attribute pkt_mdr set to DBYES or DBNO). The group ID is invalid if the pkt_mdr attribute equals DBYES and the previous other three attributes equal DBNO. The restriction applies only to packet MDR.

**Attribute:**
lcc
**Fullname:**
Line class code
**Attribute Description:**
Refer to the Translations Guide (TG-5) for LCC examples. The LCC is assigned by the switch owner. This attribute stores the LCC used to build the bfgid.

Default: None (but 'lcc' is required input to create a BFG).

Dependency: When RLrc_lcc.lcc is equal to RLbfgmatch.lcc and RLrc_lcc.rax is equal to RLbfgmatch.rax, check the value of def_svc. If def_svc is not DBYES then, when the bfgid is built, the required BRCS feature cross checks are performed. If the value in RLrc_oeinfo.lcc is equal to bfgmatch.lcc, it is not necessary to rerun cross checks during a feature or BFG update. If def_svc is DBYES then, RLrc_lcc.line_screen must be DBNO, RLrc_lcc.servclass must be FC_ISDN, and RLrc_lcc.termclass must be RTTC_INDIV.

**Attribute:**
eds_grpid
**Fullname:**
Electronic directory service (EDS) group ID
**Attribute Description:**
EDS group ID (ten bits, bits zero through nine), is an identifier resulting from the conversion from an eight character EDS group name using RLfacname. The eds_grpid is arranged sequentially starting at one. When an eds_grpid is freed-up, that position will

be re-claimed before adding one more to the end of the list.

Range of values: 1 to 1023.

Default: None or zero. If there is an EDS feature, the default is none. Otherwise, the default is zero.

Dependencies: None.

**Attribute:**
csv_hunt
**Fullname:**
Circuit switched voice multi-line hunt group
**Attribute Description:**
Flag to indicate that this user is a member of a CSV MLHG.

Range of values: DBNO (DBYES is currently not allowed).

Default: DBNO.

Dependency: RLbfgmatch.csv_hunt is DBNO. See also the def_svc dependency section.

**Attribute:**
csd_hunt
**Fullname:**
Circuit switched data multi-line hunt group
**Attribute Description:**
Flag to indicate that this user is a member of a CSD MHLG.

Range of values: DBNO (DBYES is currently not allowed).

Default: DBNO.

Dependency: RLbfgmatch.csd_hunt is DBNO. See also the def_svc dependency section.

**Attribute:**
csv_fixed
**Fullname:**
Specific B-channel used for CSV calls
**Attribute Description:**
Used to specify a specific B-channel used for CSV calls.

Range of values: FCNO_BCHAN, FCANY_CHAN.

Default: FCNO_BCHAN.

Dependency: If RLbfgmatch.csv_fixed is_not FCNO_BCHAN then RLbfgmatch.def_svc is DBYES. See also the def_svc dependency section.

Copyright © 1999 Lucent Technologies 

**Attribute:**
csd_fixed
**Fullname:**
Specific B-channel used for CSD calls
**Attribute Description:**
Used to specify a specific B-channel used for CSD calls.

Range of values: FCNO_BCHAN, FCANY_CHAN.

Default: FCNO_BCHAN.

Dependency: If RLbfgmatch.csd_fixed is_not FCNO_BCHAN then RLbfgmatch.def_svc is DBYES. See also the def_svc dependency section.

**Attribute:**
rax
**Fullname:**
Rate center
**Attribute Description:**
Rate center (used with LCC).

Default: One (rax attribute is required input to create a BFG).

Dependency: See the previous lcc attribute dependencies.

**Attribute:**
frl_line
**Fullname:**
Automatic route selection (ARS) restriction level
**Attribute Description:**
ARS facility restriction level (FRL) for this BFG. This value is used to compare the frl_grp in RLrt_mcrt. This field is meaningless for trunks that use incoming Traveling Class Marks (TCMs).

Range of values: 0 to 16 and 31.

Default: 16 or 31. If there is an ARS feature, the default is 16. Otherwise, the default is 31 (ARFRL_NONUSE).

Dependency: If RLarcf.frl_typ equals ARL_FXDFRL, then RLarport.frl_line = 16.

**Attribute:**
alw_mdr
**Fullname:**
Allow MDR

**Attribute Description:**
Indicates if this port requires MDR to revenue accounting office, for call types AMCCSASAMP, AMETSMDR, and AMETSCCSA only.

Range of values: DBYES, DBNO.

Default: DBNO.

Dependencies: If RLfc_porttyp.servclass equals FC_MODEM, set alw_mdr=DBNO for modem members in a modem pool group.

## 5. BFGMATCH Population rules continued.

**Attribute:**
use_alt_frl
**Fullname:**
Alternate FRL table treatment
**Attribute Description:**
Indicates if this port requires alternate FRL table treatment.

Range of values: DBYES, DBNO.

Default: DBNO.

Dependencies: If RLargp.alw_alt_frl = DBNO, use_alt_frl must be DBNO.

**Attribute:**
ars_si
**Fullname:**
ARS screening index
**Attribute Description:**
ARS screening index used to read RLarscrn.

Range of values: 1-16.

Default: One (equal to one when no ARS feature exists inside the BFG.) For retrofit, use the default value.

Dependency: A tuple with this ars_si and ar_gpid should be populated in RLarscrn in order for ARS to work. However, RC does not enforce this due to the magnitude of the cross-check.

**Attribute:**
q_alwd
**Fullname:**
Queue allowed
**Attribute Description:**
Indicates if modular queuing for outgoing private facilities is allowed.

Range of values: DBYES or DBNO.

Copyright © 1999 Lucent Technologies 

Default: DBNO.

Dependencies: None.

**Attribute:**
qpriority
**Fullname:**

Queue priority
**Attribute Description:**
Indicates if this is a priority line for modular queuing for private facility.

Range of values: DBYES or DBNO.

Default: DBNO.

Dependencies: If qpriority is DBYES, then q_alwd must be DBYES.

**Attribute:**
un_dpln
**Fullname:**
Uniform numbering dialing plan number
**Attribute Description:**
Uniform numbering dialing plan number. Each port which is given auto ARS treatment must specify the private network dialing plan (PNDP) or the office dialing plan (ODP).

Range of values: DPNULL,DP1,DP2,DPODP.
Default: DPNULL.

Dependencies:
1. If RLarport.un_dpln is not DPNULL then the ARS feature assigned must have an entry condition of AUTO. To verify this the ARS feature ID from RLtrmfeats for this port is used as the key to RLartm and RLartm.entry_pt must equal ARE_AUTO.

2. If this attribute is DP1 or DP2, then there must exist a tuple in RLundpinfo for the same ar_gpid with RLundpinfo.un_dpln equal to RLarport.un_dpln.

   For Retrofit purposes, un_dpln equals DPODP when RLartm.entry_pt equals ARE_AUTO and un_dpln equals DPNULL when RLartm.entry_pt = ARE_ACC_CD.

3. If RLarport.un_dpln equals DPODP, then RLarport.tcmin must equal zero.

Copyright © 1999 Lucent Technologies 

**Attribute:**
n_way
**Fullname:**
N-way
**Attribute Description:**
Maximum number of terminals that may be involved in an N-way call, for the first MW feature found in RLbfgmatch.ftent1 through ftent30.

Range of values: N_EQ_0, N_EQ_3, N_EQ_4, N_EQ_5, N_EQ_6.

Default: N_EQ_0 where the modular feature is constructed such that no MWPORT would be populated in the ODD. If the BFG's first MW feature populates a MWPORT tuple, then MWPORT poprules apply for the default value. Otherwise, the default is N_EQ_0.

Dependencies: None.

Note: The default value of N_EQ_0 does not impact RLmwport population rules, as it applys only when no tuple is populated in that relation.

**Attribute:**
dpat_caty
**Fullname:**
Dialing plan access treatment
**Attribute Description:**
Indicates category assigned to this BFG to dial plan access treatment (DPAT). Used along with DPAT array in dial tree to determine a treatment.

Range of values: 0 - 32.

Default: Zero.

Dependencies: A zero indicates there is no DPAT. A zero should be assigned if IDP group for this port has RLidp_gp.dpat_alwd = DBNO.

**Attribute:**
ad1_shared
**Fullname:**
One-digit abbreviated dialing (AD) list shared
**Attribute Description:**
Indicates whether one-digit AD list is shared (DBYES) or not shared (DBNO) with other lines.

Range of values: DBYES, DBNO.

Default: DBNO.

Copyright © 1999 Lucent Technologies 

Dependencies: None.

**Attribute:**
ad2_shared
**Fullname:**
Two-digit AD list shared
**Attribute Description:**
Indicates whether two-digit ad list is shared (DBYES) or not shared (DBNO) with other lines.

Range of values: DBYES, DBNO.

Default: DBNO.

Dependencies: None.

**Attribute:**
pfq_alwd
**Fullname:**
Modular queue for outgoing private facility allowed
**Attribute Description:**
Indicates if modular queuing for outgoing private facilities is allowed.

Range of values: DBYES or DBNO.

Default: DBNO.

Dependencies: If q_alwd ID DBYES then:
1. RLrc_lcc.servclass must be FC_INDIVIDUAL, FC_ISDN, FC_ISATND, FC_ATTENDANT, FC_PBX, or FC_4WIRE_INDV.

2. If RLrc_lcc.servclass equals FC_4WIRE_INDV and if RLfc_4wire.conf_bridge equals DBYES, then q_alwd must equal DBNO.

**Attribute:**
pfqpriority
**Fullname:**
PFA q priority
**Attribute Description:**
Indicates if this is a priority line for modular queuing for private facility.

Range of values: DBYES or DBNO.

Default: DBNO.

Dependencies: If qpriority is DBYES, then q_alwd must be DBYES. If q_alwd is DBYES and RLrc_lcc.servclass is FC_ATTENDANT

Copyright © 1999 Lucent Technologies 

or RLrc_lcc.servclass is FC_ISATND then qpriority must be DBYES.

**Attribute:**
moh_act
**Fullname:**
Music on hold active
**Attribute Description:**
Indicates if the music is on hold active for this BFG.

Range of values: DBYES or DBNO.

Default: DBNO.

moh_act = DBYES: Music on hold is active.
moh_act = DBNO: Music on hold is not active.

**Attribute:**
disp_rstrct
**Fullname:**
Customer Defined DISPlayed ReSTRiCTion: RC/V 12.9
**Attribute Description:**

Centrex Network "disp_rstrct"

disp_rstrct contains a value that indicates
to a called ISAT attendant, a customer defined
restriction for the calling party.
This value is used only for display to an ISAT
attendant and is not enforced by switch software.
A value of DBTOLL_RST means, to the ISAT attendant,
the caller is restricted from making toll calls.
A value of DBNULL_RST means, to the ISAT attendant,
the caller has no customer defined restrictions.

**Attribute:**
dring
**Fullname:**
Distinctive ringing pattern
**Attribute Description:**
Identifies the type of distinctive ringing pattern.

Range of values: DR_A, DR_B, DR_C, DR_D, DR_E, DR_F, DR_P.

Default: DR_A.

Dependencies: The dring attribute can have the values
DR_E or DR_F if and only if RLfc_porttyp.servclass for
this port equals FC_4WIRE_INDV.

SPECIAL CHECK FOR MLHG:

Copyright © 1999 Lucent Technologies 

An MLHG line that is an Multi-Line Position Hunt (MUPH) line (RLrt_mhg.htype equals RTH_MUPH) cannot have distinctive ringing.

**Attribute:**
ring_typ
**Fullname:**
Call-back ringing cadence optioned
**Attribute Description:**
Identifies type of call-back ringing cadence optioned.

Range of values: DR_A, DR_B, DR_C, DR_D, DR_E, DR_F, DR_P.

Default: DR_C or DR_A. If there is an ACBC feature, the default is DR_C. Otherwise, the default is DR_A.

Dependencies: The ring_typ must be assigned DR_E or DR_F only if the port has RLfc_porttyp. The servclass attribute if and equals FC_4WIRE_INDV.

**Attribute:**
ring_max
**Fullname:**
Call-back duration maximum
**Attribute Description:**
Specifies the maximum number of seconds the feature will attempt to recall the feature initiator.

Range of values: SEC_24, SEC_30, SEC_36, SEC_42, SEC_48.

Default: SEC_24.

Dependencies: None.

**Attribute:**
ath_first
**Fullname:**
Authorization code first
**Attribute Description:**
Indicates if the authorization code is required first.

Range of values: DBYES (authorization code is required first). DBNO (authorization code is not required first).

Default: DBNO.
Dependencies: None.

**Attribute:**
ath_ama

**Fullname:**
Authorization automatic message accounting (AMA)
**Attribute Description:**
Indicates if an authorization code is required before allowing anyAMA recorded calls to proceed.

Range of values: DBYES (authorization code is required). DBNO (authorization code is not required).

Default: DBNO.
Dependencies: None.

**Attribute:**
ath_mdr
**Fullname:**
Authorization MDR
**Attribute Description:**
Indicates if an authorization code is required before allowing MDR to proceed.

Range of values: DBYES (authorization code is required). DBNO (authorization code is not required).

Default: DBNO.
Dependencies: None.

**Attribute:**
prec_noncoi
**Fullname:**
Precedence of non-community of interest (COI)
**Attribute Description:**
Indicates the highest authorized precedence level of a call originating on this line to a non-COI destination. For hotline calls, this precedence level is used provided a precedence level is not stored as part of attribute dn in relation RLfc_dircon.

Range of values: PP_FLOVERRIDE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_ROUTINE, PP_EXECUTIVE.

Default: PP_ROUTINE or PP_FLOVERRIDE. If there is a precedence and preemption (PP) feature, the default is PP_ROUTINE. Otherwise, the default is PP_FLOVERRIDE.

Dependencies: None.

**Attribute:**
prec_coi
**Fullname:**
Precedence of COI
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Indicates the highest authorized precedence of a call originating on this line to an ltm_idx in the same COI group.

Range of values: PP_FLOVERRIDE, PP_FLASH, PP_IMMEDIATE, PP_PRIORITY, PP_ROUTINE, PP_EXECUTIVE, PP_NONE.

Default: PP_NONE or PP_FLOVERRIDE. If there is a PP feature, the default is PP_NONE. Otherwise, the default is PP_FLOVERRIDE.

Dependencies: If set to PP_NONE then coi_gpid == 0.

**Attribute:**
preemptable
**Fullname:**
Preemtable
**Attribute Description:**
Indicates whether this line can be preempted or not.

Range of values: DBYES, DBNO.

Default: DBYES or DBNO. If there is a PP feature, the default is DBYES. Otherwise, the default is DBNO.

Dependencies: Verify the following for lines in an MLHG with an hnttype of RTH_PPSMHG or RTH_PPLMHG for the tuple in RLport_group where the port is RLltm_port(ltm_idx).port.

1. If RLpp_ltm.ltm_type equals LTM_OTHER or if RLpp_ltm.ltm_type equals LTM_ISDN, then RLis_line(ltm_idx, lead_module).lead_lport is used to read lpt_pt(lead_lport) to get the port.

   If there exists a tuple in RLrt_mhg such that, key RLrt_mhg.grpnum equals RLport_group.portgrp.grpnum, then the following must be true:

1. If RLport_group.member is greater than or equal to RLrt_mhg.first_preempt, then RLpp_ltm.preemptable must be set to DBYES.

2. Otherwise, if RLport_group.member is less than RLrt_mhg.first_preempt, then RLpp_ltm.preemptable must be set to DBNO.

**Attribute:**
impreempt
**Fullname:**
Immediate preemption
**Attribute Description:**
Indicates whether immediate preemption is turned on or off on this ltm_idx.

Range of values: DBYES, DBNO.

Copyright © 1999 Lucent Technologies 

Default: DBYES or DBNO. If there is a PP feature, the default is DBYES. Otherwise, the default is DBNO.

Dependencies: If preemptable is set to DBNO then this attribute must be set to DBNO.

**Attribute:**
coi_gpid
**Fullname:**
COI group ID
**Attribute Description:**
Indicates the COI group ID.

Range of values: 0 - 20.

Default: Zero.

Dependencies: If set to zero then prec_coi equals PP_NONE. If it is greater than zero, then prec_coi does not equal PP_NONE.

**Attribute:**
prec_pkup
**Fullname:**
Precedence calls pick up
**Attribute Description:**
Indicates whether precedence calls to this ltm_idx can be picked up using the call pickup feature.

Range of values: DBYES, DBNO.

Default: DBNO.

Dependencies: If set to DBYES, then verify existence of a tuple in RLpu_ltm such that:
1. key RLpu_ltm.ltm_idx equals ltm_idx
2. key RLpu_ltm.ltm_type equals ltm_type
3. key RLpu_ltm.lead_module equals lead_module
4. key RLpu_ltm.feat_id equals a pickup terminating constructed feature ID.

**Attribute:**
forwd_prec
**Fullname:**
Forward intragroup precedence option
**Attribute Description:**
Indicates whether the forward intragroup precedence option is on or off.

Range of values: DBYES, DBNO.

Copyright © 1999 Lucent Technologies 

Default: DBNO.

Dependencies: If set to DBYES then verify that a PP call forwarding feature has been assigned to this ltm_idx. This can be done by finding the tuple in relation RLdn_feats with the same keys as RLpp_ltm plus any RLdn_feats.range. For this tuple, there must be at least one entry in the ftent array such that:

1. ftent[i].selcrit is equal to CF_PPBUSY or
2. ftent[i].selcrit is equal to CF_PPIDLE.

**Attribute:**
avn_rec
**Fullname:**
Automatic voice network (AUTOVON) network receive
**Attribute Description:**
Indicates whether this ltm_idx can receive calls from the AUTOVON network.

Range of values: DBYES, DBNO.

Default: DBYES or DBNO. If there is a PP feature, the default is DBYES. Otherwise, the default is DBNO.

Dependencies: If the global office parameter, Gldsnopt, is set to DBYES, then avn_rec must also be set to DBYES.

**Attribute:**
dir_stn
**Fullname:**
Direct station select feature
**Attribute Description:**
Indicates whether this ltm_idx has been assigned the direct station select feature.

Range of values: DBYES, DBNO.

Default: DBNO.

Dependencies: If set to DBYES, then a one-digit speed calling list must exist for this line. Therefore, verify that for the port

```
RLltm_port(ltm_idx).port
if RLpp_ltm.ltm_type == LTM_OTHER,
or
RLis_line(ltm_idx, lead_module).lead_port
if RLpp_ltm.ltm_type == LTM_ISDN.
```

**Attribute:**

Copyright © 1999 Lucent Technologies 

avn_orig

**Fullname:**

AUTOVON originate

**Attribute Description:**

Indicates whether calls to the AUTOVON network can be made from this line.

Range of values: DBYES, DBNO.

Default: DBNO.

Dependencies: If the global office parameter, Gldsonpt, is set to DBYES, then avn_orig must also be set to DBYES.

**Attribute:**

dnft_cnt

**Fullname:**

DN features counts

**Attribute Description:**

Indicates the number of DN features assigned within this bfgid.

Range of values: 0-30.

Default: Zero.

**Attribute:**

def_svc

**Fullname:**

Default service

**Attribute Description:**

Flag to indicate this tuple is used to provide default service for a DSL.

Range of values: DBYES or DBNO.

Default: DBNO.

Dependency:

```
If RLbfgmatch.def_svc is DBYES then,
then begin
        find exactly 1 tuple per GPD SM in RLfc_line
        where (RLfc_line.port is (BFGID_MASK | RLbfgmatch.bfgid)
           and (RLfc_line.party is FCP_DFLTSVC)
        when found
        begin
             RLbfgmatch.bill_dn is RLfc_line.bill_dn :
        end:
             find at least 1 tuple in RLckt_port on all
             where (RLckt_port.cktname equals GLBFGHCKT and
                    RLckt_port.port_indx equals RLbfgmatch.bfgid)
             when found
```

```
                  begin
                        must find exactly 1 tuple per GPD SM in RLfc_line
                        where (RLfc_line.port.member is RLckt_port.port
                           and RLfc_line.port.module is 0
                           and RLfc_line.party is FCP_DFLTSVC)
                        when found
                        begin
                            RLbfgmatch.bill_dn is RLfc_line.bill_dn :
                        end
                   end
```

When RLbfgmatch.def_svc is DBNO then the BFG is not assignable for default service. If RLbfgmatch.def_svc is DBYES then this BFG is only assignable for default service (that is, not assignable as a normal BFG ).

There is a limit to the number of default service tuples that may exist in 5E5. This limit is set by two global office parameters: Gldfltcnt and Gldfltmax. Refer also to uhdr/data/GLpoprules.G for more information about those parameters. For 5E5, the maximum number of default service BFGs is 255.

Global parameters exist to establish the maximum (Gldfltmax) and current (Gldfltcnt) number of default service BFGs that can exist in an office. ODA initially populates the Gldfltcnt value by counting the number of tuples in the relation with def_svc set to DBYES. RC must administer the Gldfltcnt on inserts and deletes.

**Attribute:**
acrngbktyp
**Fullname:**
LASS automatic callback distinctive ringback pattern
**Attribute Description:**
Type of LASS automatic callback distinctive ringback pattern. This attribute should be initially populated with ringing cadence DR_C.

Range of values: DR_A, DR_B, DR_C, DR_D.

Default: DR_C.

Dependency: None.

**Attribute:**
arrngbktyp
**Fullname:**
LASS automatic recall distinctive ringback pattern
**Attribute Description:**
Type of LASS automatic recall distinctive ringback pattern. This attribute should be initially populated with ringing cadence DR_C.

**Copyright © 1999 Lucent Technologies** 

Range of values: DR_A, DR_B, DR_C, DR_D.

Default: DR_C.

Dependency: None.

**Attribute:**
max_bchan
**Fullname:**
Maximum B-channels
**Attribute Description:**
Maximum number of B-channels that may be used simultaneously by this user.

Range of values: Zero - one.

Default: Zero.

Dependency: If RLbfgmatch.max_bchan is not zero then RLbfgmatch.def_svc is DBYES. See also the def_svc dependencies section.

**Attribute:**
hotline
**Fullname:**
Hotline
**Attribute Description:**
This attribute indicates whether this port is a hotline or not.

Range of values: NOT_HL, MSTR_VOICE, MSTR_DATA, SLV_VOICE, SLV_DATA, NOT_MS_VOICE or NOT_MS_DATA.

Default: NOT_HL.

Dependencies: If set to MSTR_VOICE, MSTR_DATA, SLV_VOICE, SLV_DATA, NOT_MS_VOICE, or NOT_MS_DATA, then ltm_type equals LTM_OTHER, RLfc_line.nodial equals FCND_DIRCON, and the servclass in RLfc_porttyp must equal FC_4WIRE_INDV or FC_INDVDL. If the port in RLfc_porttyp is assigned as a member of an MLHG, then hotline must equal NOT_HL.

**Attribute:**
ldst_cw
**Fullname:**
Distinctive CW tone for long distance calls
**Attribute Description:**
This attribute can not be changed from the default unless the special feature ID SFID091 is turned on.

Copyright © 1999 Lucent Technologies 

**Attribute:**
alert_type
**Fullname:**
Alert type
**Attribute Description:**
The alert_type field is for use by the Call Waiting Deluxe (CWD) Special feature (SFID 145) in the 5E10.1 SR. If alert_type is set to OFC_ALERT, then the actual value which call processing uses is stored in the Glcwalert global office parameter.

**Attribute:**
cwd_dflt
**Fullname:**
Call waiting deluxe default option
**Attribute Description:**
The cwd_dflt field is for use by the Call Waiting Deluxe (CWD) Special feature (SFID 145) in the 5E10.1 SR. This field stores the default option (ringing, forward, announcement) taken when the CWD subscriber gets call waited and no action is taken by the subscriber. If cwd_dflt is set to OFC_DFLTOPT, then the actual value which call processing uses is stored in the Glcwdefopt global office parameter.

**Attribute:**
cwd_usgsens
**Fullname:**
Call waiting deluxe usage sensitive for conferencing
**Attribute Description:**
The cwd_usgsens field is for use by the Call Waiting Deluxe (CWD) Special feature (SFID 145) in the 5E10.1 SR. This field is set to DBYES when usage sensitive billing for conferencing after being call waited is required. If cwd_usgsens is set to OFC_CONF, then the actual value which call processing uses is stored in the Glcwconf global office parameter.

**Attribute:**
asi_gpid
**Fullname:**
Advanced service interface (ASI) group ID.
**Attribute Description:**
ASI group to which this line belongs.

Dependencies: The port must be assigned to an existing ASI group with a non-zero ASI group ID.

For each non-zero ASI group ID, a tuple must exist in RLasi_gp such that:

RLasi_gp.grp_id equals asi_gpid

Copyright © 1999 Lucent Technologies 

**Attribute:**
serv_code
**Fullname:**
Service code
**Attribute Description:**
Implicit mode service code digits.

The domain DMbcd5_6 supports up to six BCD digits plus a count of the actual number of digits stored. The service code may contain one to five digits, inclusive (1 <= number of digits <= 5). Number of digits = "\0" means no service code exists.

The digits are stored in BCD format, two per character (byte). The domain has three characters to represent up to six digits plus one character for the number of digits (the number of digits character is required by the I/O type). If the number of digits is less than six, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The 'number of digits' character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

| byte 0 | byte 1 | byte 2 | byte 3 |
|---|---|---|---|
| D1 \| D2 | D3 \| D4 | D5 \| D6 | no. dig |

**Attribute:**
ra_code
**Fullname:**
Remote access code
**Attribute Description:**
Remote access code digits.

**Attribute:**
remr_code
**Fullname:**
Remote access reconnect code
**Attribute Description:**
Remote access reconnect code digits.

**Attribute:**
asi1_code

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Advanced service interface spare1 code
**Attribute Description:**
Spare access code digits for future ASI use.

Currently not in use therefore the only legal value is the default value. See the general section for a description of the attributes layout.

**Attribute:**
asi2_code
**Fullname:**
Advanced service interface spare2 code
**Attribute Description:**
Spare access code digits for future ASI use.

Currently not in use therefore the only legal value is the default value. See the general section for a description of the attributes layout.

**Attribute:**
asi_sid
**Fullname:**
ASI subscriber identification
**Attribute Description:**
Identify subscriber to intelligent peripheral (IP).

The subscriber ID is a number of one to ten digits, inclusive (1 <= number of digits <= 10). Number of digits = "\0" means no ID has been associated with the feature.

The digits are stored in BCD, two per character (byte). The domain has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is less than ten, the null character (which becomes same as digit 0 in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. The digits are stored in the attribute starting with D1.

Layout follows:

| byte 0 | byte 1 | byte 2 | byte 3 | byte 4 | byte 5 |
|---|---|---|---|---|---|
| D1 \| D2 | D3 \| D4 | D5 \| D6 | D7 \| D8 | D9 \| D10 | no. dig |

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
asi_ra
**Fullname:**
ASI remote access billing option
**Attribute Description:**
Permit AMA billing for calls to the IP which went through the remote access front end process.

**Attribute:**
ip_dial_bill
**Fullname:**
IP dialed billing option
**Attribute Description:**
Permit all IP dialed calls to generate an AMA billing record.

**Attribute:**
ex_bill
**Fullname:**
Explicit billing
**Attribute Description:**
Permit AMA billing for explicit access to the IP.

**Attribute:**
ffcf1
**Fullname:**
Future field 1
**Attribute Description:**
future field feature use.

**Attribute:**
ffcf2
**Fullname:**
Future field 2
**Attribute Description:**
future field feature use.

Future field 4

**Attribute Description:**

future field feature use.

**Attribute:**

priv_dn

**Fullname:**

Private directory billing number

**Attribute Description:**

Private directory billing number (0 to $SZDNUM digits) for this port for MDR (customer location [CL] or revenue accounting office [RAO]).

Default: priv_dn.digcnt equals zero and priv_dn.dn[] = "\0".

Dependencies: None.

**Attribute:**

priv_dn.digcnt

**Fullname:**

Digit counts

**Attribute Description:**

Number of digits in the Private directory billing number (0 to $SZDNUM digits) for this port for MDR (CL or RAO).

Default: priv_dn.digcnt equals zero and priv_dn.dn = "\0".

Dependencies: None.

**Attribute:**

priv_dn.dn

**Fullname:**

Private DN

**Attribute Description:**

Private directory billing number (0 to $SZDNUM digits) for this port for MDR (CL or RAO).

Default: priv_dn.digcnt equals zero and priv_dn.dn = "\0".

Dependencies: None.

**Attribute:**

bill_dn

**Fullname:**

Billing DN

**Attribute Description:**

Billing directory number (BDN).

Copyright © 1999 Lucent Technologies 

Range of values: 15 digit DN.

Default: 'digcnt' equals zero.

Dependency: If RLbfgmatch.bill_dn.digcnt is not zero then RLbfgmatch.def_svc is DBYES. See also the def_svc dependency section.

**Attribute:**
bill_dn.digcnt
**Fullname:**
Billing directory number count
**Attribute Description:**
Same as seen previously..

**Attribute:**
bill_dn.dn
**Fullname:**
Billing directory number
**Attribute Description:**
Same as seen previously..

## 6. BFGMATCH Population rules continued.

**Attribute:**
dir_conn_dn
**Fullname:**
Direct connect prestored extended-digits string
**Attribute Description:**
Direct connect prestored extended-digits string

Range of values: 15 digits.

Default: No default or NULL. If there is a MW feature, the default is none. Otherwise, the default is NULL.

Dependencies: If dir_conn_dn is greater than zero, then RLmwcf.cntrl equals DIR_CONN.

**Attribute:**
dir_conn_dn.digcnt
**Fullname:**
Digits counts
**Attribute Description:**
Same as seen previously..

**Attribute:**
dir_conn_dn.dn
**Fullname:**
Direct connect DN

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Same as seen previously..

**Attribute:**
cnigi
**Fullname:**
Calling number identification service delivery option.
Intra-Group Only.
**Attribute Description:**
The cnigi field indicates whether members of the terminal group have restrictions on delivery of calling party number and forwarding number information, as provided by the CNIS, CPN/BND, RN Delivery, CgPS Delivery and ICLID features. Based on the cnigi field, these may be restricted to intra-group calls only. CNIGI is NOT a separate assignable feature. This per-line cnigi field, if not set to FCNULLCNIGI overwrites per-terminal-group and per-office field.

The possible settings of Intra-group CNIS option are:

FCNULLCNIGI- Default. Consult the RLrt_tg.cnigi, or if the tuple does not exist, consult Glcnigi Office Parameter.

FCNRSTCNIGI- No Restrictions apply to Display/deliver CPN or RN information on all calls.

FCIGOCNIGI - Display/deliver CPN or RN information only on intra-group calls.

**Attribute:**
tcw
**Fullname:**
talking call waiting
**Attribute Description:**

tcw contains a value that indicates that the customer not only has a terminating call waiting feature but a value of DBYES means that the customer has the talking call waiting feature which announces the name of the party trying to call.

This attribute can not be changed from the default unless the special feature ID SFID331 is turned on.

**Defines:**
"db/DMparty.h",
"db/DMdnum.h",
"db/DMnpa.h"

## 4. Population Rules for RLbikypm

**Relation Description**

Associates key status of hunt keys with hunt group and number.

**Attribute: grpnum**

**Fullname:** Multiline hunt group number

**Attribute Description** The following rules apply based on the value of RLrt_mhg.isat_idx:

```
For this grpnum, if RLrt_mhg(grpnum).isat_idx ! = 0 then
    subgrp = 0
    e_mbmkbsy = DBNO
    mbmkbsy = DBNO
    e_stphnt = DBNO
    stphnt = DBNO
    e-grpmkbsy = DBNO
    grpmkbsy = DBNO
For this grpnum, if RLrt_mhg(grpnum).isat_idx = 0 then
    e_posmkbsy = DBNO
    posmkbsy = DBNO
```

**Attribute: member**

**Fullname:** Hunt group number

**Attribute Description:** Multiline hunt group member that the huntkeys are assigned to.

**Attribute: subgrp**

**Fullname:** Member Make Busy(MMB) Subgroup number

**Attribute Description:** Used to store the member make busy group. If this value is non-zero then

Copyright © 1999 Lucent Technologies 

there must be a tuple in ISTMBLST where ISTMBLST.subgrp = BIKYPM.subgrp. Up to 32 different MLHG members can be assigned to the same MMB subgroup, and RLISTMBLST contains a list of all MLHG members that are assigned to the same subgroup. Any member of a MMB subgroup that has a MMB key assigned may activate or deactivate the MMB feature for the entire subgroup. A MLHG member may be part of a MMB subgroup and not have a MMB key assigned - yet this member will still be activated/deactivated by other subgroup members activating/deactivating their MMB keys. When a subgroup member activates its MMB key, the MMB lamps for all members that have MMB keys assigned will be lighted, and the dynamic hunting data for all MMB subgroup members will be busied, and all subgroup members will not be available to accept hunted calls to the Multiline Hunt Group.

**Attribute: e_mbmkbsy**

**Fullname:** Does a member make busy feature button exist for this member?

**Attribute Description:** DBYES if the member make busy feature button exists. (The button exists if there is a tuple in RLbnfeat with RLbnfeat.action = ACN_BYMB.)

**Attribute: mbmkbsy**

**Fullname:** Is member make busy key on?

**Attribute Description:** This is a CORCable only field that is ONLY set to DBYES when the member make busy feature button is activated, (and subsequently set to DBNO when the member make busy feature button is deactivated). When initializing this tuple and e_mbmkbsy = DBYES, then set mbmkbsy = DBNO. Dependencies: If e_mbmkbsy is DBNO, mbmkbsy should be DBNO.

**Attribute: e_stphnt**

**Fullname:** Does a stop hunt feature button exist for this member?

**Attribute Description:** DBYES if the stop hunt feature button exists. (The button ixists if there is a tuple in RLbnfeat with RLbnfeat.action = ACN_STPH.)

**Attribute: stphnt**

**Fullname:** Is the stop hunt feature button on?

**Attribute Description:** This a CORCable only field that is ONLY set to DBYES when the stop hunt feature button is activated, (and subsequently set to DBNO when the stop hunt feature button is deactivated). When initializing this tuple and e_stphnt = DBYES then set stphnt = DBNO. Dependencies: If e_stphnt is DBNO, stphnt should be DBNO.

**Attribute: e_grpmkbsy**

**Fullname:** Does a group make busy feature button exist for this member?

**Attribute Description:** DBYES if the group make busy feature button exists. (The button exists if there is a tuple in RLbnfeat with RLbnfeat.action = ACN_BYGP.) If DBYES, there must be a tuple in RLrt_mhg keyed by this grpnum such that RLrt_mhg.grpmkbusy = DBYES.

**Attribute: grpmkbsy**

**Fullname:** Is group make busy feature button on?

**Attribute Description:** This is a CORCable only field that is ONLY set to DBYES when the group make busy feature button is activated, (and subsequently set to DBNO when the group make busy feature button is deactivated). Only Member 1 of a Hunt group can activate/deactivate a Group MAke busy key. When initializing this tuple and e_grpmkbsy = DBYES, then set grpmkbsy = DBNO. Dependencies: If e_grpmkbsy is DBNO, grpmkbsy should be DBNO.

Copyright © 1999 Lucent Technologies 

**Attribute: e_posmkbsy**

**Fullname:** Does a position make busy feature button exist for this member?

**Attribute Description:** DBYES if the position make busy feature button exists. (The button exists if there is a tuple in RLbnfeat with RLbnfeat.action = ACN_BYPO.)

**Attribute: posmkbsy**

**Fullname:** Is position make busy feature button on?

**Attribute Description:** This is a CORCable only field that is ONLY set to DBYES when the position make busy feature button is activated, (and subsequently set to DBNO when the position make busy feature button is deactivated). When initializing this tuple and e_posmkbsy = DBYES, then set posmkbsy = DBNO. Dependencies: If e_posmkbsy is DBNO, posmkbsy should be DBNO.

**Attribute: e_rmkbsy**

**Fullname:** Does a random make busy feature button exist?

**Attribute Description:** DBYES if the random make busy feature button exists. (The button exists is there is a tuple in RLbnfeat with RLbnfeat.action = ACN_BYRB)

**Attribute: rmkbsy**

**Fullname:** Random Make Busy Active?

**Attribute Description:** This is a CORCable only field that is ONLY set to DBYES when the random make busy feature button is activated (and set to DBNO when the random make busy feature is deactivated.)

**Attribute: rmbgrp**

**Fullname:** Random Make Busy Subgroup

**Attribute Description:** Used to store the Random Make Busy Group. If this value is non-zero then there must be a tuple in ISRMBLST where ISRMBLST.rmbgrp = BIKYPM.rmbgrp. A Random Make Busy subgroup can contain from 1 to 2015 members(unlike Member Make busy subgroup which has a maximum of 32 members). All Random Make Busy Subgroup members are found in the mbr_list attribute of RLisrmblst(this relation is keyed by MLHG group and rmbgrp). Only the Random Make Busy Subgroup Owner(specified in RLisrmblst.fbown) is allowed to activate and deactivate the feature for the entire subgroup. When the Random Make Busy Subgroup owner activates its Random Make Busy key, the Random Make Busy Lamp is lighted for the owner, and the dynamic hunting data for the entire rmbgrp is busied - and all rmbgrp members cannot receive hunted calls to the MLHG.

**Attribute: mbsytrt**

**Fullname:** Call termination busy treatment assigned to a Member Make Busy key

**Attribute Description:** Call termination busy treatment assigned to a Member/position Make Busy key. When the Member Make Busy key is activated, the individual member(subgrp is zero) or each member of the subgroup (subgrp > 0) is busied for the different call termination types depending on the call termination busy treatment assigned. Types of call termination busy treatment:

RMBBOTH: - Member Make Busy key makes the member(s) unavailable(busy) for terminations by either hunted/nohunt calls

RMBHUNT: - Member Make Busy key makes the member(s) unavailable(busy) for terminations by hunted calls only

Copyright © 1999 Lucent Technologies 

RMBNOHUNT: - Member Make Busy key makes the member(s) unavailable(busy) for terminations by nohunted calls only

When this member is part of a non-ISAT MLHG (RLrt_mhg.htype != RTH_ISAT), this specifies the call termination type for a member make busy button on an individual member that does not belong to a member make busy subgroup.

When this member is part of a ISAT MLHG, (RLrt_mhg.htype = RTH_ISAT), this specifies the call termination type for a position make busy button for this member.

**Attribute: rbsytrt**

**Fullname:** Call termination busy treatment for assigned to a Random Make Busy key.

**Attribute Description:** Call termination busy treatment for assigned to a Random Make Busy key. When the Random Make Busy key is activated, the individual member(rmbgrp is zero) or each member of the subgroup (rmbgrp > 0) is busied for the different call termination types depending on the call termination busy treatment assigned. Types of call termination busy treatment:

RMBBOTH: - Random Make Busy key makes the member(s) unavailable(busy) for terminations by either hunted/nohunt calls

RMBHUNT: - Random Make Busy key makes the member(s) unavailable(busy) for terminations by hunted calls only

RMBNOHUNT: - Random Make Busy key makes the member(s) unavailable(busy) for terminations by nohunted calls only

This specifies the call termination type for a random make busy button on an individual member that does not belong to a random make busy subgroup.

## 4. Population Rules for RLbillplbl

**Relation Description** Bill print label table. This relation holds labels for printing on bills per subaccount billing account code or concentrated calling feature override code per automatic number identification (ANI). The feature is not committed, so this is spare data created just in case.

**Attribute: anitbl**

**Fullname:** Automatic Number Identification Table Index

**Attribute Description**: Obtained from the RLanimod relation.

Copyright © 1999 Lucent Technologies

**Attribute: spare1**

**Fullname:** Spare 1

**Attribute Description:** Spare field.

**Attribute: locdigs**

**Fullname:** Local Line Number of ANI

**Attribute Description**: The local line number; the last four digits of the ANI.

**Attribute: codetype**

**Fullname:** Code Type

**Attribute Description:** Type of code stored in code.

**Attribute: code**

**Fullname:** Code

## 4. Population rules for RLblvexcl

### Relation Description

BLV exclusion

This relation contains a tuple for each NPA-NXX code in relation RLblvscrn marked as having lines excluded from verification by the OSPS operator. NXXs are identified as having line exclusions through a value of either OAVER_EXCL (the NXX is verifiable but some line numbers are not verifiable) or OANVER_EXCL (NXX is not verifiable for non-ported numbers but has some exclusions for ported numbers). Up to 96 bands of lines may be excluded from verification per NPA-NXX. There are a maximum of 6 bands per

Copyright © 1999 Lucent Technologies 

tuple and a maximum of 16 tuples per NPA-NXX.
RLblvexcl contains from 1 to 16 tuples for each NPA-NXX that has lines excluded from verification as indicated in relation RLblvscrn. There are a maximum of 200 tuples per OSPS office. The average number of tuples is 1. This data is located in the PSMs only.
The permutation type is un_perm to guarantee that the alternate relation definition has the same alignment as the relation.

**Attribute:**
exclky
**Fullname:**
EXCLuded KeY
**Attribute Description:**
This is the primary key.It is a number (0-15) retrieved from RLblvscrn when an NPA has some line numbers excluded from verification. It is a denser way to indicate the NPA

**Attribute:**
bnxx
**Fullname:**
binary NXX
**Attribute Description:**
This is the NXX in binary form and is the secondary key.

**Attribute:**
tupnum
**Fullname:**
tuple number
**Attribute Description:**
This key is a sequential number from 0 to 15 and always starts at 0 for each unique exclkey/bnxx. Each tuple can handle 6 ranges. If there are 7-12 ranges the second tuple will have a tuple number of 1, for 13-18 ranges, the third tuple will have tuple number of 2, and so forth.

**Attribute:**
entries
**Fullname:**
entries
**Attribute Description:**
This value represents the number of ranges specified for each unique exclky/bnxx. For example, if there are 15 ranges specified for a exclky/bnxx, the entries attribute will be 15 for all 3 tuples for this exclky/bnxx. entries can range from 1 to 96.
**Attribute:**
lnnums0
**Fullname:**
line number
**Attribute Description:**
There are 12 lnnum fields grouped in 6 pairs, each presenting a range. lnnums0 is the lower bound of a contiguous group of line numbers excluded from operator verification. lnnume0 is the upper bound for

Copyright © 1999 Lucent Technologies 

this group of line numbers. Up to 96 bands may be specified per NPA-NXX. The ranges should be populated in ascending order; that is, lnnums0 < lnnums1, etc. whenever a range is deleted, the ranges should be compressed so there are no empty ranges between used There should not be any overlap in the ranges. If a single line is to be excluded from verification, the lnnumsx and lnnumex (where x is 0 to 5) should be the same value.

**Attribute:**
lnnums[*]
**Fullname:**
line number
**Attribute Description:**
There are 12 lnnum fields grouped in 6 pairs, each presenting a range. lnnums0 is the lower bound of a contiguous group of line numbers excluded from operator verification. lnnume0 is the upper bound for this group of line numbers. Up to 96 bands may be specified per NPA-NXX. The ranges should be populated in ascending order; that is, lnnums0 < lnnums1, etc. whenever a range is deleted, the ranges should be compressed so there are no empty ranges between used There should not be any overlap in the ranges. single line is to be excluded from verification, the lnnumsx and lnnumex (where x is 0 to 5) should be the same value.

# BLVSCRN

## 1. Description

This relation contains the NPAs that can be verified using the busy line verification feature. There is also a 2 bit field for each of the 800 possible NXX codes in the NPA. This field indicates if (0) the entire NXX is verifiable, (1) some line numbers in the NXX are excluded from verification and (2) the NXX is not valid or cannot be verified at this OSPS. This relation also contains a 3 digit routing code for each NPA.

## 4. Population rules for RLblvscrn

**Relation Description**

busy line verification screen
This relation contains the NPAs that are verifiable from this OSPS office and a status for each NXX within the NPA. It also contains a routing code when busy line verification is performed by the operator.
The following summarizes all the data required for implementing the Busy Line Verification feature. This is an attempt to place all data needed by the BLV capability in one place. No attempt is made in the following to provide all the poprules for all BLV data. Also no attempt is made to specifically identify all relations and attributes for BLV.
Verifiable NPAs, verifiable NXXs, line number exclusions and BLV routing codes are described in relations - Rlblvscrn and RLblvexcl
Global data parameters that need to be specified are -

- Glblv_act - BLV feature activation bit
- Glblv_digst - BLV digit analysis starting index
- Glblvsx - BLV screening index
- Glei_limit - Indicates length of time an operator may interrupt a call before a message is printed on the security printer.
- Gleithres_ind - indicates if the above message should be printed.

Trunks (see below) used by the operator can be queued for when all members of the group are busy. The assignment rules for BLV queuing is described in the poprules for RLrt_trkg and RLqu_ogtos.
The above data represents data unique to BLV. The following represents existing data structures that BLV related data is added to.
A new digit analysis tree must be added to translate the

Copyright © 1999 Lucent Technologies 

BLV routing codes specified in RLblvscrn. This digit analysis tree is built to select the proper BLV trunks on BLV attempts. The digit start index is placed in Glblv_digst. Data for a new screening index must be created for BLV. The screening index is placed in Glblvsx. New outgoing trunk groups must be defined for BLV. They must have a service class of FC_BV_INTOLL or FC_BV_TOLLCMP.

**Attribute:**
blvnpa
**Fullname:**
busy line verification NPA
**Attribute Description:**
This field represents the NPAs that are verifiable by this OSPS office. The NPAs range from 200-999.

**Attribute:**
blvrtcde
**Fullname:**
busy line verification routing code
**Attribute Description:**
For each verifiable NPA, a unique routing code must be assigned. The range of values is 0 to 199. This code may replace the NPA of the called number when the operator attempts a busy line verification. The code can be used to properly route the call in the verification network. There are no default values.

**Attribute:**
exclky
**Fullname:**
excluded key
**Attribute Description:**
This is a 4-bit field used as the primary key into RLblvexcl. The field values are assigned from 0-15. Because there is a maximum of 16 NPAs served by an OSPS office, the served NPAs are mapped to exclky to provide a more dense key for RLblvexcl. Each tuple must have a unique exclky whether or not exclusions exist for this NPA.

**Attribute:**
vfbits[*]
**Fullname:**
verifiable bits
**Attribute Description:**
This is a 1600-bit bitmap stored in 50 32-bit words. There is a 2-bit field for each possible NXX in the NPA. Each vfbits contains 16 of these 2-bit enumerations. Thus, NXXs 200 to 215 will correspond to bits 0,1 to bits 30,31 within the attribute vfbits00.
A value of OAVERIFIABLE indicates that the entire NXX can be verified. A value of OAVER_EXCL indicates that some line numbers in the NXX are excluded from verification. A value of OANON_VER indicates that the NXX is not valid or

**Copyright © 1999 Lucent Technologies** 

is not verifiable by this OSPS. A value of OANVER_EXCL indicates that the NXX is not verifiable for non-ported numbers but has some exclusions for ported numbers. The default value for this item is OAVERIFIABLE.

## 4. Population Rules for RLbnfeat

**Relation Description**

ISDN button to feature.

Provides relationship between ISDN configuration group and button function.

Copyright © 1999 Lucent Technologies

**Attribute: cpe_comp**

**Fullname:** Customer Premises Equipment (CPE) component.

**Attribute Description:** A unit of buttons on the terminal (also known as, module in the BRI spec).

**Attribute: config**

**Fullname:** ISDN configuration identifier.

**Attribute Description:** ISDN configuration identifier. The same as in RLrc_cfgbm.config. Initially, this number must be assigned sequentially. Hole-reuse is also implemented. Must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config.

**Attribute: button**

**Fullname:** ISDN station set button number.

**Attribute Description:** ISDN station set button number on a component.

**Attribute: fid**

**Fullname:** feature id.

**Attribute Description:** Feature id associated with particular button. Indicates the constructed feature id. There must be a tuple in RLfacname with a facid equal to this fid including fid equal 0. Entering a fid of 0 indicates the NULL feature. The class associated with the facid in RLfacname must be equal to FACBRCS. Valid fids and actions are listed here in the following layout.

**Attribute: action**

**Fullname:** Action enumeration.

**Attribute Description:** This is the action table taken when the button is depressed.

Action Table ----------

As features add actions to this table, consideration should be given to the relation RLfeatbn.

A 'Y' in the param column indicates that digcnt may be non-zero and that a stored parameter may be entered. Any action that has a 'Y' in the param column must also add a description of that parameter and how it is obtained in the following poprules.

Button Only indicates that there is not a dialed code for this action. This is for information purposes only.

Wildcard - A 'Y' indicates that the Wildcard fid must be used for this action. A 'N' indicates that the Wildcard must not be used. An 'O' indicates that the Wildcard fid is optional and that a regular fid may be used. If a choice can be made, the Wildcard should be used. The config, MFT, and action must be unique. For Call Forwarding, the config, fid, and action must be unique.

It should be noted that the NULL feature can not have a Wildcard fid. This is indicated with an asterisk in the Wildcard column.

| Action | MF type | Target | Button Only | Param | Wildcard |
|---|---|---|---|---|---|
| ACN_ACBFBP | ACB | 1 | Y | N | O |
| ACN_ACCTUSE | ACCT | 6 | N | Y | O |
| ACN_ACCFB | AC | 1 | N | N | O |
| ACN_ACUFB | AC | 1 | N | N | O |
| ACN_AD1CH | SC | 7 | N | N | O |
| ACN_AD1USE | SC | 8 | N | Y | O |

**Attribute: target**

**Fullname:** target.

**Attribute Description**: Contains the target value derived from the feature id and action combination. Recent Change will provide the mapping based on the following list.

All of the targets are valid for both TMF (cpetype in RLis_term equal to IS_TYPEB, IS_TYPED or IS_TYPATT) and non-TMF (cpetype in RLis_term equal to IS_TYPEA, IS_TYPEC, or IS_TYPEE) terminals. target 0 Unassigned.

**Copyright © 1999 Lucent Technologies** 

```
target 1:  Route to the feature terminal process. Create one if it does
           not exist. This is used for buttons which do not interact
           immediately with the active call. It is used for
           features which do not affect the active call.
target 2:  Route to the display terminal process. Create one if it does
           not exist. This is for the first button of a display session.
target 3:  Route to the display terminal process.  If one does not exist,
           drop the message and peg a count. If there is no display termi
nal
           process, no error treatment will be given to the terminal.
target 4:  For a non-TMF terminal, route to the terminal process with a
           matching call reference. If one does not exist, drop the messa
ge
           and peg a count. If there is no matching call reference, no er
ror
           treatment will be given to the terminal.
```

For a TMF terminal, route to the terminal process of the selected call appearance. If one does not exist, drop the message and peg a count. If there is no selected call appearance process, no error treatment will be given to the terminal.

```
target 5:  For a non-TMF terminal route to the terminal process with a
           matching call reference if it exists, otherwise give immediate
           error treatment. This will route to the terminal process if it
           exists regardless of the state it is in.
```

For a TMF terminal, route to the terminal process of the selected call appearance if it exists, otherwise give immediate error treatment. This will route to the terminal process if it exists regardless of the state it is in.

```
target 6:  For a non-TMF terminal route to the terminal process with a
           matching call reference if it exists and is in the dialtone
           state otherwise route to the feature terminal process.
           Create one if it does not exist. This will route the message
           to the terminal process only when it is receiving dialtone.
           (In state N1, Dial Tone Sending, as defined in the Basic Rate
            Interface specification)
```

For a TMF terminal if the terminal is ON HOOK, route to a feature terminal process Create one if it does not exist. The feature terminal process will reply to the terminal to activate its speaker phone. If the terminal is OFF HOOK, route to the terminal process for the selected call appearance if it exists and is in the dialtone state otherwise route to a feature terminal process. Create one if it does not exist. This will route the message to the terminal process only when it is receiving dial tone. (In state N1, Dial Tone Sending, as defined in the Basic Rate Interface Specification)

```
target 7:  For a non-TMF terminal route to the terminal process with a
           matching call reference if it exists and is connected to dial
           tone, otherwise route to a feature terminal process. Create on
e
           if it does not exist. This will route the message to the termi
nal
           process only when it is receiving dial tone.  (In state N1, Di
al
           Tone Sending, as defined in the Basic  Rate Interface specific
ation)
```

For a TMF terminal route to the terminal process for the selected call appearance if it exists and is connected to dial tone, otherwise route to a feature terminal process. Create one if it does not exist. This will route the message to the terminal process only when it is receiving dial tone. (In state N1, Dial Tone Sending, as defined in the Basic Rate Interface specification)

```
target 8:  For a NON-TMF terminal route to the terminal process with a
```

matching call reference if it exists, otherwise route to a feature terminal process. Create one if it does not exist. This will route to the TP if it exists regardless of the state it is in.

For a TMF terminal if the terminal is ON HOOK, route to a feature terminal process. Create one if it does not exist. The feature terminal process will reply to the terminal to activate its speaker phone. If the terminal is OFF HOOK, route to the terminal process for the selected call appearance if it exists, otherwise route to a feature terminal process. Create one if it does not exist. This will route the message to the TP regardless of the state it is in.

Note: A target value of 15 is used internally by call processing and should not be assigned.

**Attribute: digcnt Fullname:** digit count.

**Attribute Description** provides the number of valid digits stored in the stored parameters, digit1 thru digit4.

**Attribute: str_param Fullname:** stored parameter.

**Attribute Description** stored parameter. If digcnt equals 1-4 then this field will contain the designated number of alphanumeric characters up to 4 stored in BCD. Valid digits #, *, 0, 1...9, F, I, O, P. If digcnt is equal to 0, then this field must be all zero.

See the previous target list table for actions that require either digit or store parameter for this attribute.

The mapping is as follows:

| character | binary (as stored in BNFEAT) |
|---|---|
| 0 | 0000 |
| 1 | 0001 |
| 2 | 0010 |
| 3 | 0011 |
| 4 | 0100 |
| 5 | 0101 |
| 6 | 0110 |
| 7 | 0111 |
| 8 | 1000 |
| 9 | 1001 |
| * | 1010 |
| # | 1011 |
| F | 1100 |
| O | 1101 |
| I | 1110 |
| P | 1111 |

The last four are AUTOVON digits. The digits will be left justified in the 16-bit field and if there are less than four, the empty positions on the right will be filled with all zeros. The digit count will always be the number of digits entered by the switch personnel, 0 to 4, regardless of the way call processing plans to interpret them.

The following are the population rules for the ISDN attendant actions that contain a str_param and state the minimum/maximum values of digcnt:

| action | digcnt | str_param | description |
|---|---|---|---|

```
ACN_IACOF    2          two digits indicating the alternate code treatmen
t
                        number in the dialing plan for a valid IDP.
       The data layout in the str_param for the ACN_IACOF action is:
-15-14-13-12-11-10-09-08-07-06-05-04-03-02-01-00-
-------------------------------------------------
|   0-3     |    0-9    |     0     |     0     |
|  in BCD   |   in BCD  | not used  | not used  |
-------------------------------------------------
Range : 01-32.
        NOTE: The number one should be entered as 01, two as 02, three
              as 03...., etc..
```

Default: none

```
         The digcnt must have a value of 2 when the action is ACN_IACOF.
         Also the following relations must have a tuple populated:
              Relation    Keys
              RLacoftran  config cpe_comp button
              RLisacof    config idp_gpid actsetnum
                          (determined from this str_param)
              RLisatlmt   config
              RLisafidx   config afidx
```

Refer to the poprules of the previous relations for more information.

              3            02
              .            .
              .            .
              .            .
              99           98
             100           99
        The data layout in the str_param for the ACN_IDSS action is:
-15-14-13-12-11-10-09-08-07-06-05-04-03-02-01-00-
-------------------------------------------------
|   0-9     |    0-9    |     0     |     0     |
|  in BCD   |   in BCD  | not used  | not used  |
-------------------------------------------------
        The digcnt must have a value of 2 when the action is ACN_IDSS.
        All 100 of these tuples must exists if there is at least
        one tuple in RLbnfeat with the action ACN_IEHGS or ACN_IHGS.
        If there is no RLbnfeat tuple with an action ACN_IHGS or
        ACN_IEHGS, all 100 of these ACN_IDSS tuples must not exists.
**********************************************************************
action       digcnt     str_param description
ACN_IDTGS    1-4        upto four digit dial access code for the private
                        facility.
        The digcnt must be a value (1-4, where 1 is the minimum value and
 4
        is the maximum value) when the action is ACN_IDTGS.
        An example of the data layout in the str_param for the ACN_IDTGS
```

```
        action with the two digit access code 95 is:
                  (in this example the digcnt will be 2)
-15-14-13-12-11-10-09-08-07-06-05-04-03-02-01-00-
-------------------------------------------------
|     9     |     5     |     0     |     0     |
|  in BCD   |   in BCD  | not used  | not used  |
-------------------------------------------------
        An example of the data layout in the str_param for the
        ACN_IDTGS action with the three digit access code *56 is:
             (in this ex. the digcnt will be 3)
             NOTE: that * translates to the hex digit A.
-15-14-13-12-11-10-09-08-07-06-05-04-03-02-01-00-
-------------------------------------------------
|    A      |     5     |    6      |     0     |
|  in HEX   |   in BCD  |  in BCD   | not used  |
-------------------------------------------------
        Also the following relations must have a tuple populated:
            Relation        Key(s)
            RLdtgstran      config dial_code (determined from this str_pa
ram)
            RLisdtgs        config pftype grpnum
            RLisatlmt       config
            RListgidx       config tgidx
        Refer to the poprules of the previous relations for more informat
ion.
**********************************************************************
action       digcnt     str_param description
ACN_IEHGS       4       4 digits indicating the normalized office code.
                        The data in the str_param for the ACN_IEHGS actio
n is:
-15-14-13-12-11-10-09-08-07-06-05-04-03-02-01-00-
-------------------------------------------------
|not    |      NOC                              |
|used   |      in HEX                           |
-------------------------------------------------
                        NOC is the normalized office code in HEX.
        NOTE: Whenever a tuple with the action ACN_IEHGS is added, the
              following tuples with the keys of:
              config            = config of ACN_IEHGS
              cpe_comp          = cpe_comp of ACN_IEHGS
              button numbers    = 1 to 100
              must be populated with the action ACN_IDSS. If they are not
              present,  then the tuples must added as shown here:
config    cpe_comp   bn   action   fid  digcnt str_param

            Relation    Key(s)
            RLfeatbn    config fid action
     Refer to the poprules of the previous relation for more information.
**********************************************************************
**********************************************************************
     Dependency: If RLbnfeat.action == ACN_BNTOG,
```

```
                then RLbnfeat.fid must be of MF
                type CFW such that for that fid:
                1) RLcf_cf.actvn(bnfeat.fid) == ACTCD
                2) RLcf_cf.dctvn(bnfeat.fid) == DCTCD.
**********************************************************************
**********************************************************************
These are the criteria that must be met to associate a multiway feature
with a feature button.
     Dependency: If RLbnfeat.action == ACN_MWITD,
                then RLbnfeat.fid must be of MF type MWY
                such that for RLbnfeat.fid:
                1) RLmwcf.epis_dialcd(bnfeat.fid) == DBYES
**********************************************************************
The following population rules are for the ISDN Account Code use
action (ACN_ACCTUSE) that contain a str_param (stored parameter).
The stored parameter is a substitute for a dialed code (that is, use code
)
since a feature button does not inherently produce a dialed code.
The stored parameter is used only to match against the contents of
RLacct_rtg, no digit analysis is done.
     digcnt    - range: 0-4
                 default: 0
     str_param - 0 to 4 digits
                 default: 0
This same digit count (when not 0) and stored parameter must also be
populated in the RLacct_rtg relation as use_cdX.digcnt and use_cdX.code
in the appropriate Code
Association Table identification tuple with the appropriate dialing seque
nce.
The X may be any of the possible values allowed which is 1 thru 10. The
appropriate tuple in the Code Association table will be keyed with the
cdtblid attribute found in the RLacct_prt relation for the port or ports
that
it is desired to have an associated code sequence for an Associated Code
Feature Button use.

# BTBPG

## 1. Description

Four distribute points and four scan points assigned to one OTO trunk for Office to Office testing. The first two distribute points are used for sleeve lead control of the old office test trunk. The third and fourth distribute points are used for OTO testing of Integrated *SLC*®-96 lines to provide 117V DC signature required to setup the necessary connections and initiate the channel test over the existing office line appearance. The channel test generates the stimulus detected in the *5ESS*®-2000 switch office to verify wiring continuity and line translations.

The four scan point attributes are NOT currently used. (It is expected that they will be used in a future release of Integrated *SLC*®-96 Office to Office to read channel test results from the old office over the tip and ring.)

## 4. Population Rules for RLbtbpg

**Relation Description**

Board to Board Testing

Four distribute points and four scan points assigned to one OTO trunk for Office to Office testing. The first two distribute points are used for sleeve lead control of the old office test trunk. The third and fourth distribute points are used for OTO testing of Integrated *SLC*®-96 lines to provide 117V DC signature required to setup the necessary connections and initiate the channel test over the existing office line appearance. The channel test generates the stimulus detected in the *5ESS*®-2000 switch office to verify wiring continuity and line translations.

The four scan point attributes are NOT currently used. (It is expected that they will be used in a future release of Integrated *SLC*®-96 Office to Office to read channel test results from the old office over the tip and ring.)

The key for this relation is the global port name of the Office to Office trunk.For each OTO trunk in this relation a tuple must also appear in FC_porttyp with servclass of TM_OTOTK.

OTO trunks to be used for testing only *non_SLC*® lines require only dist1 and dist2, for sleeve lead control of the old office test trunk.OTO trunks to be used for testing Integrated *SLC*® lines require all four distribute points - dist1, dist2, s96d1sig, and s96d2sig - to be assigned and populated. The scan point fields are not used at this time and should be set to zero.

NOTE: OTO trunks used for testing SLC lines can also be
used to test non-SLC lines -- the additional distribute

**Copyright © 1999 Lucent Technologies** 

```
points for 117V signature and ring ground will not
interfere. In other words, all OTO trunks in the 5ESS-2000 switch
office may be configured with all four distribute points
and be used both for testing SLC lines and for testing
non_SLC lines.
```

The current limit on the number of simultaneously active OTO tasks, whether *SLC*® or *non_SLC*®, is set at four.An office may have more than four OTO trunks configured, but only four will be in use at any given time. As such, the number of members in an OTO trunk group should be limited to four.

```
NOTE:  Each OTO trunk requires a tuple in this relation.
       The number of tuples allowed in this relation is absolutely
       restricted to 20.
```

The distribute points assigned to a particular OTO trunk MUST be in the same Switching Module.It is recommended that they also be in the same MSU, Service Group, and distribute pack. It is also recommended that the OTO trunk be in the same SM, if possible, as the distribute points assigned to it.

A tuple must appear in FC_porttype for each distribute point populated in BTBPG.Dist1 and dist2 should have servclass field of RC_SLVLEAD.S96d1sig and s96d2sig should have servclass field of TM_S96OTOSD.

STRMANSI25
**Fullname:**
Waiting for traffic restart allowed timer
**Attribute Description:**
Traffic restart allowed timer (in milliseconds).

**Attribute:**
STRMANSI28
**Fullname:**
Waiting for traffic restart waiting timer
**Attribute Description:**
Traffic restart waiting timer (in milliseconds).

**Attribute:**
STRMANSI29
**Fullname:**
TRA sent timer
**Attribute Description:**
Timer started when a TRA is sent in response to an unexpected TRA or TRW message. (in milliseconds).

## 4. Population Rules for RLcaddef

**Relation Description** Definition of ringing cadences. RLcaddef is an existing relation for export. The ISLU-Z development requires that this relation now be populated for domestic as well. The existing method of population for export will be used for RLcaddef. Also see rc-oda rules.

**Attribute: cadtype**

**Fullname:** Cadence Identifier, up to two cadences allowed
**Attribute Description:** See attribute description.

**Attribute: sp_ring**

**Fullname:** Special Ringing Indicator, for English ringing cadence
**Attribute Description:** See attribute description.

**Attribute: ring_int**

**Fullname:** Length of first ringing interval in 50 ms. terms
**Attribute Description:** See attribute description.

Copyright © 1999 Lucent Technologies

**Attribute: sil_int**

**Fullname:** Length of first silent interval in 50ms. terms
**Attribute Description:** See attribute description.

**Attribute: ring2_int**

**Fullname:** Length of second ringing interval in 50 ms. terms
**Attribute Description:** See attribute description.

**Attribute: sil2_int**

**Fullname:** Length of second silent interval in 50 ms. terms
**Attribute Description:** See attribute description.

## 4. Population rules for RLcal_bann

### Relation Description

CALEA advisory warning banner

SAS advisory warning banner in response to a successful login. This banner explicitly states the possible consequences of an unauthorized entry. This banner is changeable by the security administrator (by MML commands) to meet local requirements and state law.

**Attribute:**
line_no
**Fullname:**
Line number of banner
**Attribute Description:**
Line number of the CALEA warning banner (1-10).

**Attribute:**
line_rmk
**Fullname:**
Remark field for banner
**Attribute Description:**
Eighty characters of text allowed on each line (1-80). The remark field is a null terminated character string. The switch personnel can enter 74 characters per line.

## 4. Population rules for RLcal_logn

### Relation Description

CALEA security login

Holds the data to be added to the CALEA security login.

**Attribute:**
user_id
**Fullname:**
User login ID
**Attribute Description:**
User login ID. Maximum 8 characters, minimum of 3.

**Attribute:**
password
**Fullname:**
User encrypted password
**Attribute Description:**
User encrypted password. Maximum 12 characters, minimum of 6.

**Attribute:**
pswd_length
**Fullname:**
Length of password
**Attribute Description:**
Number of characters in password before encryption.

Copyright © 1999 Lucent Technologies 

**Attribute:**
admin_type
**Fullname:**
Administration type
**Attribute Description:**
Administration type, security or surveillance.

**Attribute:**
login_date
**Fullname:**
Login date
**Attribute Description:**
User login date and time.

**Attribute:**
pswd_date
**Fullname:**
Password date
**Attribute Description:**
Date this password was last changed.

**Attribute:**
invld_attmps
**Fullname:**
Invalid attempts
**Attribute Description:**
Invalid number of login attempts since the last successful login.

## 4. Population Rules for RLcardgrp

### Relation Description

RLcardgrp

RLcardgrp is a spare relation for OSPS Special Feature use.

**Attribute: cardgroup**

**Fullname:** Card group number.

**Attribute Description:** Number identifying a specific card group.

**Attribute: oaff1**

**Fullname:** uns4 spare.

Copyright © 1999 Lucent Technologies

**Attribute Description:** Unused.

**Attribute: oaff2**

**Fullname:** boolean spare.

**Attribute Description:** Unused.

**Attribute: oaff3**

**Fullname:** boolean spare.

**Attribute Description:** Unused.

**Attribute: oaff4**

**Fullname:** boolean spare.

**Attribute Description:** Unused.

**Attribute: oaff5**

**Fullname:** boolean spare.

**Attribute Description:** Unused.

**Attribute: oaff6**

**Fullname:** ushort spare.

**Attribute Description:** Unused.

**Attribute: type0031**

**Fullname:** Card types 0 thru 31.

**Attribute Description:** bits for including card types 00 thru 31 in this card group.

**Attribute: type3263**

**Fullname:** Card types 32 thru 63.

**Attribute Description:** bits for including card types 32 thru 63 in this card group.

# CARRGRP

## 1. Description

This relation stores groups of carriers and associates a carrier group ID with each group. Thus, it is possible to determine that a carrier accepts a specific card for billing by assigning a carrier group ID for a group including that carrier to the specified card in the appropriate card recognition table.
This relation is to have a distribution of FG (fixed group), with a grp_type of GPD_OSPS, and a grp_id of 3.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1000 |
| expected number of tuples | 10 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```
CARRGRP     relid = 2128  DBSTATIC   DBACC_HASH  DBPRAM    FG      NULL
     carrgrp     DMUNS8       (ushort: 8)     <--- key

## 4. Population Rules for RLcarrgrp

**Relation Description**

Carrier Group

Relation containing the carrier group information to determine permissions or restrictions based upon the card type.

**Attribute: carrgrp**

**Fullname:** Carrier Group Number.

**Attribute Description:** Identifies a group of carriers that are exceptable for a given type of calling card.

**Attribute: entries**

**Fullname:** entries

**Attribute Description:** Number of entries in the carrid array.

**Attribute: ospsff1**

**Fullname:** ospsff1

**Attribute Description:** Spare for relation.

**Attribute: ospsff2**

**Fullname:** ospsff2

**Attribute Description:** Spare for relation.

## 4. Population rules for RLcascntrt

### Relation Description

CAS Contract
This relation contains those NPAs for which part or all of the NXXs can have a contract between the LEC owner and the owner of a card that uses CAS signaling.
This relation should be populated for domestic generics only.
end relation;

**Attribute:**
npa
**Fullname:**
Originating NPA that has at least one NXX
**Attribute Description:**
This is the key for the relation. It indicates those originating NPAs that have at least one NXX whose LEC owner has a contract with the owner of a card that uses CAS signaling for calling card calls.

**Attribute:**
allnxxs
**Fullname:**
All NXXs belong to LECs that have contracts with the owner of a card that uses CAS signaling for calling card calls.
**Attribute Description:**
This flag indicates that all NXXs for this NPA belong to LECs that have contracts with the owners of a card that uses CAS signaling for calling card calls.

**Attribute:**
bits00
**Fullname:**
Bitfield indicating which NXXs have a contract between the owner of a card that uses CAS signaling for calling cards calls.
**Attribute Description:**
There are 800 1-bit elements in this and the following items. Each bit indicates if the NXX it stands for has a contract between the owner of a card that uses CAS signaling and the LEC which owns it for calling card calls.
The 800 bits represent NXX values 200 - 999.

**Attribute:**
bits01
**Fullname:**
Bitfield indicating which NXXs have a contract between the owner of a card that uses CAS signaling and the LEC which owns the NXX for calling card calls.
**Attribute Description:**
See bits00

**Attribute:**

## 4. Population rules for RLcc_00x

**Relation Description**

INWATS 00X code (pseudo npa).
INWATS 00X code (pseudo npa). This relation is the inverse of the RLcc_onpa relation whereas there exist a one to one correspondence of tuples between this relation and RLcc_onpa.

**Attribute:**
o_npa
**Fullname:**
Originating Numbering Plan Area.
**Attribute Description:**
Range of ONPA digits: [2-9][0-9][0-9]
This field corresponds to the 'orig_npa' field of the relation RLcc_onpa.

**Attribute:**
p_npa
**Fullname:**

Copyright © 1999 Lucent Technologies

Pseudo Numbering Plan Area.

**Attribute Description:**

00X code takes on an integer value from 0 to 9.
This field corresponds to the 'pseudo_npa' field of RLcc_onpa.
Integer value of the digits '00X' used as the area code field for outpulsing on non-toll INWATS (800 Service) calls which are routed to a BOC Access Tandem office.

# CC_NAME

## 1. Description

Country code and corresponding country name information.

This relation is to have a distribution of fixed group (FG), with a grp_type of GPD_OPRT, and a grp_id of two. The maximum number of tuples for this relation is 256; However, the average number of tuples will be 200.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 256 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |

## 3. Field Layout

## 4. Population Rules for RLcc_name

**Relation Description** Country Code to Country Name Map.
This relation is used to map a numeric country code to a 15 character country name. This information is used for displaying the country name on the OSPS VDT on a direct international originations (DIOR) call.

**Attribute: cc**

**Fullname:** Country Code

**Attribute Description:** Key to mapping a country code to a country name - left justified

**Attribute: name**

**Fullname:** Country Name

**Attribute Description:** Country name associated with the key attribute cc_name.cc - left justified

**Attribute: dior_autoseq**

**Fullname:** DIOR Automated Initial and Sequence Calling

**Attribute Description:** Whether calls originated from the country named by the key attribute cc_name.cc are allowed to attempt automated calling card initial and sequence calls.

**Attribute: oaff1**

**Fullname:** OA fast feature spare 1

**Attribute Description:** Spare.

**Attribute: oaff2**

**Fullname:** OA fast feature spare 2

**Attribute Description:** Spare.

**Attribute: idddcac**

**Fullname:** IDDD CAC

**Attribute Description:** International Direct Distance Dialing Country Access Code as opposed to a DIOR country code.

**Attribute: is809nxx**

**Fullname:** Is really an 809 NXX

**Attribute Description:** Is the previous idddcac actually an NXX for 809 (Caribbean)?

**Attribute: apqueue**

**Fullname:** Automated Position queue usage allowed

**Attribute Description:** Is automated position queue usage allowed on DIOR automated initial

Copyright © 1999 Lucent Technologies 

calls?

**Attribute: nracc**

**Fullname:** Network Remote Access Country Code

**Attribute Description:** Network Remote Access Country Code as opposed to the IDDD CAC or a DIOR country code.

**Attribute: prepdcard**

**Fullname:** Pre-paid card usage allowed indicator

**Attribute Description:** Are Pre-paid cards allowed to be used on calls from this DIOR country?

**Attribute: indettrmt**

**Fullname:** Indeterminate reply treatment

**Attribute Description:** Treatment to be given when an indeterminate reply is received on a card query.

**Attribute: annclang**

**Fullname:** Announcement language

**Attribute Description:** Language in which announcements are to be given if not English.

**Attribute: oaff3**

**Fullname:** OA fast feature spare 3

**Attribute Description:** Spare.

**Attribute: oaff4 Fullname:** OA fast feature spare 4

**Attribute Description** Spare.

## 4. Population Rules for RLcc_onpa

**Relation Description** Originating NPA of caller on 800 call relation. Originating NPA of caller on an 800 call - determined from 00Y digits of 00Y-NXX-XXXX number. This relation is mainly used by the CCS subsystem.

**Attribute: pseudo_npa**

**Fullname:** Pseudo NPA

**Attribute Description:** 00Y code takes on an integer value from 0 to 9. When the sequence 00Y-NXX-XXXX is received over a trunk and the service is identified as FCOSOIWATS or FCNS800 (by digit analysis) then this relation is accessed with the X from the 00X to obtain any of the following information:

- originating NPA
- originating LATA
- coin line origination indicator.

**Attribute: orig_npa**

**Fullname:** Originating NPA

**Attribute Description**: Originating NPA consists of 3 ASCII digits representing the area code of

Copyright © 1999 Lucent Technologies 

the calling party.

**Attribute: orig_lata**

**Fullname:** Originating LATA
**Attribute Description:** Originating LATA indicating the calling party's LATA.

**Attribute: coin**

**Fullname:** Coin Line Origination Indicator
**Attribute Description:** DMBOOL indicates if this origination is from a coin line. The coin attribute indicates that this is a coin origination in the originating office. Relates to the pseudo_npa sent from the local office.

```
DBYES - indicates that this was an origination from a coin phone
DBNO  - not a coin origination.
```

## 4. Population Rules for RLcc_pcc

**Relation Description**

country code paired country code

This relation maps the 1-3 digit country code to a 3 digit paired country code.

Maps country code to paired country code.

**Attribute: cc**

**Fullname:** country code

**Attribute Description:** This is the country code portion of the forward number converted to binary.

**Attribute: pcc**

**Fullname:** Paired Country Code

**Attribute Description:** This is the paired country code in binary.

# CCF

## 1. Description

Concentrated calling feature (CCF) table. CCF allows customers to specify outgoing calls that are permitted or not permitted from their ANIs. Data are stored in this relation as follows: each of word[*] contains two NPAs, an NPA-NXX, or two country codes (CCs). The field wordtype indicates what is stored in each word. Words containing NPAs are stored first, followed by words containing NPANXXs, and lastly words containing CCs. Two fields, nxx_tup and cc_tup indicate which tupnum to read for the first word containing NPANXXs or CCs, respectively.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 25000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 4. Population Rules for RLccf

**Relation Description** Concentrated call feature (CCF) permission/denial table.
This relation holds numbering plan areas (NPAs)/NPANXXs/country codes (CCs) with allow/deny treatment for ANIs with the CCF. The feature is not committed, so this is spare data created just in case.

**Attribute: anitbl**
**Fullname:** Automatic number identification table index

**Attribute Description:** Obtained from the RLanimod relation.

**Attribute: spare1**
**Fullname:** Spare 1

**Attribute Description** Spare field.

**Attribute: locdigs Fullname:** Local line number of ANI

**Attribute Description:** The local line number; the last four digits of the ANI.

**Attribute: spare2**
**Fullname:** Spare 2

**Attribute Description**: Spare field.

**Attribute: tupnum**
**Fullname:** Tuple number

**Attribute Description:** Provides a unique key to allow multiple tuples per ANI.

**Attribute: def_treat**
**Fullname:** Default treatment

**Attribute Description:** Default treatment for calls from this ANI.

**Attribute: dom_treat**
**Fullname:** Domestic treatment

**Attribute Description**: Treatment for all calls to U.S. destinations from this ANI.

**Attribute: spare3**
**Fullname:** Spare 3

**Attribute Description:** Spare field.

**Attribute: intl_treat**
**Fullname:** International treatment

**Attribute Description**: Treatment for all calls to international destinations from this ANI.

**Attribute: spare4**

Copyright © 1999 Lucent Technologies 

**Fullname:** Spare 4

**Attribute Description:** Spare field.

**Attribute: nxx_tup**
**Fullname:** NXX tuple

**Attribute Description:** Which tupnum to read for the first word containing an NPANXX.

**Attribute: cc_tup**
**Fullname:** Country code tuple

**Attribute Description:** Which tupnum to read for the first word containing CCs.

**Attribute: spare5**
**Fullname:** Spare 5

**Attribute Description**: Spare field.

**Attribute: word[*]**
**Fullname:** Word 00 - 13

**Attribute Description:** Word with NPA/NPANXX/CC data for this ANI.

**Attribute: word[*].npacc**
**Fullname:** NPA/CC

**Attribute Description:** This field contains either an NPA or a CC depending on wordtype.

**Attribute: word[*].allow1**
**Fullname:** Allow 1

**Attribute Description:** Whether to allow calls to this NPA/CC.

**Attribute: word[*].wordtype**
**Fullname:** Word type

**Attribute Description:** Type of data stored in this word, that is 2 NPAs, NPANXX, or 2 CCs.

**Attribute: word[*].spare1**
**Fullname:** Spare 1

**Attribute Description:** Spare field.

**Attribute: word[*].npanxxcc**
**Fullname:** NPA/NPANXX/CC

**Attribute Description:** This field contains an NPA, an NXX, or a CC depending on wordtype.

**Attribute: word[*].allow2**
**Fullname:** Allow 2

**Attribute Description:** Whether to allow calls to this NPA/NXX/CC.

**Attribute: word[*].spare2**
**Fullname:** Spare 2

Copyright © 1999 Lucent Technologies 

**Attribute Description:** Spare field.

## 4. Population Rules for RLccfovrd

**Relation Description** Concentrated calling feature (CCF) override code table. This relation holds override codes per automatic number identification (ANI) for CCF. The feature is not committed, so this is spare data created just in case.

**Attribute: anitbl**

**Fullname:** Automatic Number Identification Table Index
**Attribute Description**: Obtained from the RLanimod relation.

**Attribute: spare1**

**Fullname:** Spare 1
**Attribute Description** Spare field.

**Attribute: locdigs**

**Fullname:** Local Line Number of ANI
**Attribute Description:** The local line number; the last four digits of the ANI.

**Attribute: spare2**

**Fullname:** Spare 2
**Attribute Description**: Spare field.

**Attribute: ovrd_cd[*]**

**Fullname:** Override Code
**Attribute Description:** One of up to ten override codes allowed for this ANI; one to eight digits are stored in binary coded decimal (BCD) in this field.

## 4. Population Rules for RLccsfeats

**Relation Description** Common Channel Signaling features relation.
This relation indicates the status of CCS features. The indicators in this relation are used to specify if specific features are active or inactive on the switch.

**Attribute: feats_key**

**Fullname:** Dummy key to the relation,

**Attribute Description:** This is the key to this relation. The key value will always be DBNO.

**Attribute: exp_sls**

**Fullname:** Expanded Signaling Link Set

**Attribute Description:** The value of the Signaling Link Selection (SLS) code determines the specific links and STPs used to route a message. Setting the exp_sls field to Y allows for the expansion of the SLS code to its full 8 bits. Such expansion allows the maximum size of a B or D

Copyright © 1999 Lucent Technologies 

link set to be 16 links compared to the previous value of 8 (Expansion to a number greater than 16 is not currently possible since the signaling link code field, which is used in several network management messages, has only 4 bits.) The expansion also allows a more even traffic distribution on links in a (combined) link set, especially after link failures. For example, with a 5-bit SLS code, traffic load between links in a link set could differ in some cases by a factor of 2. With the 8-bit SLS code, traffic will differ by less than 25% in all cases.

**Attribute: imp_slt**

**Fullname:** Improved Signaling Link Test

**Attribute Description:** The imp_slt field indicates if the Improved SLT feature is active in this office. The Improved SLT feature adds two additional requirements to the existing Signaling Link Test (SLT) procedure. The first requirement clarifies that the test pattern sent in the second signaling link test message should be the same as that seen in the first signaling link test message. This allows the response to the first test message to be accepted as a response to the second test message, in effect allowing twice the time for a response to the first signaling link test message. The second requirement clarifies that when the option to test available (that is, in-service) links periodically is on, the test should be performed even on links which are experiencing transmit or received congestion.

**Attribute: mtp_node**

**Fullname:** Message Transport Protocol Node Restart

**Attribute Description:** The mtp_node field indicates if the MTP Node Restart feature is active in this office. The MTP Restart procedure enables the Message Transfer Part (MTP) at a signaling point that has just become available to bring sufficient signaling links into the available state to handle the expected traffic and to stabilize its routing before user traffic is restarted to the point. This procedure uses the Traffic Restart Allowed (TRA) and Traffic Restart Waiting (TRW) messages. The TRW message is an indication to the receiving signaling point that user signaling traffic (that is, traffic from the users of the MTP, such as ISUP) should not be sent to the originator of the TRW until a TRA message is received from the same signaling point. A TRA is an indication to the receiving signaling point that user signaling traffic may be resumed to the originator of the message. The MTP Restart procedures may not only be performed at a restarting signaling point, but also at signaling points adjacent to the signaling point which is restarting.

**Attribute: spare1**

**Fullname:** spare 1

**Attribute Description:** Boolean spare for future use.

**Attribute: spare2**

**Fullname:** spare 2

**Attribute Description:** Boolean spare for future use.

**Attribute: spare3**

**Fullname:** spare 3

**Attribute Description:** Boolean spare for future use.

**Attribute: spare4**

**Fullname:** spare 4

**Attribute Description:** Boolean spare for future use.

## 4. Population Rules for RLcdfi_con

Copyright © 1999 Lucent Technologies

**Relation Description** Connections of communications digital facility interfaces over Inter-SM communication links between an RSM and a mate RSM at a site. This relation directly reflects the office-engineered connection between DFI/DFI-2s at an RSM and DFI/DFI-2s at a mate RSM. A mate RSM is another RSM in the same MMRSM site (cluster) connected by means of ICLs. Only tuples for equipped CDFIs should be in the relation. The relations RLCDFI_CON and RLRDFI_CON together describe how all equipped DFIs at an RSM are connected. A particular equipped DFI at an RSM may appear in one and only one of these relations.

**Attribute: rsm**

**Fullname:** Remote Switching Module Number
**Attribute Description** SM number of RSM (from 1 to 192).

**Attribute: cdltu**

**Fullname:** Communications Digital Line to Trunk Unit
**Attribute Description** DLTU number at RSM end (0-5), or DLTU_E number at RSM end (0-5).

**Attribute: cdfi**

**Fullname:** Communications Digital Facility Interface
**Attribute Description** For T1 facilities, CDFI or CDFI2 number at RSM end (1-10, stored as 0-9). For ITU-TS/CEPT facilities, CDFI or CDFI2 number at RSM end (1-16, stored as ^0-15).

**Attribute: cfac**

**Fullname:** Communications Digital Facility Interface Relative Facility Number
**Attribute Description** Relative Facility number on CDFI (0) and CDFI2 (0-1).

**Attribute: rsm_mate**

**Fullname:** SM Number of Mate RSM
**Attribute Description** SM number of mate RSM (1-192).

**Attribute: cdltu_mate**

**Fullname:** Communications Digital Line Trunk Unit at Mate RSM
**Attribute Description** DLTU number at mate RSM end (0-5) or DLTU_E number at mate RSM end (0-5).

**Attribute: cdfi_mate**

**Fullname:** Communications Digital Facility Interface at RSM Mate
**Attribute Description** For T1 facilities, CDFI or CDFI2 number at mate RSM end (1-10, stored as 0-9). For ITU-TS/CEPT facilities, CDFI or CDFI2 number at mate RSM end (1-16, stored as (0-15).

**Attribute: cfac_mate**

**Fullname:** Mate Cluster Digital Facility Interface Relative Facility Number
**Attribute Description** Relative facility number on mate CDFI (0) and CDFI2 (0-1).

Copyright © 1999 Lucent Technologies

# CDFI_MAP

## 1. Description

This SM relation gives the end-to-end CDFI connection information for the Inter-RSM Communication Links (ICL)s in a multimodule RSM. Also, this SM relation gives the CDFIs that may be used as timing ICLs.

## 4. Population rules for RLcdfi_map

### Relation Description

```
CDFI maps
This SM relation gives the end-to-end CDFI
connection information for the ICLs (Inter-RSM
Communication Links) in a multimodule RSM.
Also, this SM relation gives the CDFIs that
may be used as timing ICLs.
```

Copyright © 1999 Lucent Technologies

This relation should have a tuple for each operational circuit of type PCCFAC populated in this RSM's RLCKTDATA relation. A PCCFAC is a circuit which terminates the (ICL) facility running between two RSMs in a multi-module RSM. The key to this relation is the internal circuit name of the PCCFAC, which is also the key to the RLCKTDATA relation. The non-key attributes of this relation give the far end connection for a given PCCFAC in terms of the far-end RSM number and the internal circuit name of the PCCFAC at the far end.
This relation (RLCDFI_MAP) must be consistent with the corresponding tuples in the RLRSMFAC_CON relation, which also contains end-to-end connections for CFACs (except using external circuit names). Further, tuples in RLCDFI_MAP for a given RSM must be consistent with the corresponding tuples in each far-end RSM's RLCDFI_MAP relation.

**Attribute:**
near_cdfi
**Fullname:**
near end of cdfi
**Attribute Description:**
The internal circuit name for the Communication Facility (PCCFAC) terminating the near end of an ICL, that is, it resides in the same RSM where this relation is populated. This must be a valid, operational (SMOPER) Communication Facility, as populated in this RSM's RLCKTDATA relation, with name (key) equal to this attribute, type of PCCFAC, and eqstat of SMGROW or SMOPER.

**Attribute:**
far_rsm
**Fullname:**
far end of RSM
**Attribute Description:**
The SM number for the RSM at the far end that the T1 junctor associated with the near_cdfi terminates on. This must be a valid, equipped RSM, as shown by a tuple in the AM relation RLMODATT whose key is the same as this attribute. In addition, it must be an RSM in the same multimodule RSM, as shown by (1) a tuple in the SM relation RLMATATT whose key is the same as this attribute, by (2) equal 'clid' attributes in the AM relation RLMODATT for the tuples with keys equal to this attribute and the SM number of the RSM this relation is populated on, and by (3) an entry equal to this attribute in one of the attributes rm01 - rm10 in the AM relation RLCLIDAT for the tuple corresponding to this cluster. The key to the CLIDAT tuple is the same as the 'clid' attribute of the AM relation RLMODATT discussed above.

**Attribute:**

Copyright © 1999 Lucent Technologies 

far_cdfi

**Fullname:**

far end of communication digital facility interface

**Attribute Description:**

The internal circuit name for the far end of the Communication Digital Facility Interface (PCCDFI/PCCDFI2) which terminates to a 24-channel T1 facility (called an ICL) whose time-slots are used to carry traffic and control information between RSMs in a MMRSM cluster.

**Attribute:**

far_cfac

**Fullname:**

far end of communication facility

**Attribute Description:**

The internal circuit name for the Communication Facility (PCCFAC) terminating the far end of an ICL, that is, it resides in an RSM at the other end of a T1 cable which also terminates in the current RSM (where this relation is populated). Specifically, it terminates to the PCCFAC circuit specified in the 'near_cdfi' attribute above.
This must be a valid, operational Comm. Facility, as populated in the RLCKTDATA relation resident on the RSM designated by 'far_rsm', with key name equal to this attribute, type of PCCFAC, and eqstat of SMGROW or SMOPER.

**Attribute:**

far_oefac

**Fullname:**

other end of the communication facility

**Attribute Description:**

The internal pseudo-circuit name on an RSM representing the half of the ICL time-slots owned by the RSM at the other end of an ICL.

**Attribute:**

far_rcl

**Fullname:**

far end of remote communication link

**Attribute Description:**

The internal circuit name which is the Derived Data Link (DDL) communication channel associated with an ICL. As populated in the RLCKTDATA relation resident on the far RSM, there is one RCL tuple associated with each CFAC tuple.

**Attribute:**

far_picb

**Fullname:**

far end peripheral interface control bus

**Attribute Description:**

The Peripheral Interface Control Bus (PICB) number terminating to the far end CDFI-1 or CDFI-2 board.

**Copyright © 1999 Lucent Technologies** 

This attribute is populated with the picb number directly, without a 'plus 1' augmentation.

**Attribute:**
alt_cdfi
**Fullname:**
the alternate cdfi
**Attribute Description:**
The internal circuit name for the alternate PCCFAC that is associated with the 'near_cdfi' PCCFAC to be used as an ICL timing source. If this tuple's key (near_cdfi) is not to be used as an ICL timing source, then this attribute will be zero.
This must be a valid Comm. Facility, as populated in this RSM's RLCKTDATA relation, with key name equal to this attribute, type of PCCFAC, and eqstat of SMGROW or SMOPER.
In addition, this attribute (alt_cdfi) will have a tuple in this RSM's RLCDFI_MAP relation with the key being equal to this attribute and the 'alt_cdfi' attribute equal to THIS tuple's 'near_cdfi' (that is, there is an associated tuple with the two attributes reversed).

## 4. Population Rules for RLcdnchan

**Relation Description** Common Directory Number Channel Information

This relation defines the information stored on all channels belonging to a Common Directory Number. A user may subscribe to a single 'Common' Directory Number for all of the user packet service types (that is, Permanent Packet on the D-Channel, Permanent Packet on the B-Channel, and On-Demand B-Channel). When a call is terminated to the Common DN, a channel is selected to offer the call based on the information stored in this relation.

The RLcdnchan is setup READ-FIRST-READ-NEXT access on both the mlhg_flag and ph_number attributes.

**Copyright © 1999 Lucent Technologies** 

If two B-Channels belong to a Common DN then they must be listed in RLcdnchan according to the following precedence.

1) Permanent Packet on the B1-Channel
2) Permanent Packet on the B2-Channel
3) First On-Demand B-Channel assigned
4) Second On-Demand B-Channel assigned

The following tuple semantics detail the allowed values for the possible combinations of channels with a Common DN.

```
TUPLE SEMANTICS for a D-Channel and two PPBs
-------------------------------------------
dn                Common Directory Number

**Attribute: dn**

**Fullname:** Directory Number.

**Attribute Description** This attribute contains the Common Directory Number for channels contained in the relation. A corresponding tuple of RLpr_dntran must exist for the Common DN.

**Attribute: dn.noc**

**Fullname:** Normalized Office Code.

**Attribute Description** This attribute contains the normalized office code for the Common Directory Number. The range for this attribute is from 1 to AVNOCMAX().

**Attribute: dn.digits**

**Fullname:** Digits.

**Attribute Description** This attribute contains the digits for the Common Directory Number.

**Attribute: ph_number**

**Fullname:** Protocol Handler Number.

**Attribute Description** This attribute specifies the Protocol Handler Number or DSL Group number that all of the channels of the Common DN are on.

**Attribute: party**

**Fullname:** D-Channel Party.

**Attribute Description** If an On-Demand B-Channel or Permanent Packet D-Channel is part of the Common DN, then this attribute contains the value of the party that is associated the user subscribing to the Common DN. If only Permanent Packet B-Channels are part of the Common DN, then the party is #FCP_BCHAN.

**Attribute: dchan**

**Fullname:** D-Channel.

**Attribute Description** This attribute contains the routing information about the D-Channel of the Common DN.

Copyright © 1999 Lucent Technologies 

**Attribute: dchan.phcn**

**Fullname:** D-Channel Protocol Handler Channel.

**Attribute Description** This sub-attribute contains the Protocol Handler channel number of the D-Channel. If the D-Channel is not assigned, then this attribute has a value of 0.

**Attribute: dchan.cctype**

**Fullname:** D-Channel Common Channel Type

**Attribute Description** This sub-attribute contains the common channel type for the D-Channel. The Common Channel Type specifies the type of channel assigned to the Common DN. The allowed values for this sub-attribute are PSCCDCHN (D-Channel) and PSCCNULL (Null Value).

If the D-Channel is assigned to the Common DN, then this subattribute has a value of PSCCDCHN. The value PSCCNULL is used when the D-Channel is not assigned to the Common DN.

**Attribute: dchan.assigned**

**Fullname:** Is the D-Channel assigned?

**Attribute Description** This sub-attribute specifies whether the D-Channel has been assigned to the Common DN.

**Attribute: dchan.routable**

**Fullname:** Is the D-Channel routable?

**Attribute Description** This sub-attribute specifies whether the D-Channel is routable for incoming calls. The D-Channel is routable for incoming calls if it has incoming or two-way LCNs and does not have incoming calls barred. If the D-Channel is not assigned, then the value of this sub-attribute is DBNO.

**Attribute: bchan1**

**Fullname:** First B-Channel.

**Attribute Description** This attribute contains the routing information about the B-Channel 1 of the Common DN. The term 'B-Channel 1' does not imply that the channel is associated with the B1 Channel. The term 'B-Channel 1' is the associated with the PH Channel that is the first preference for routing B-Channel calls.

The B-Channel 1 attribute is the first channel on the following list that has been provisioned.

(1) Permanent Packet on the B1-Channel

(2) Permanent Packet on the B2-Channel

(3) First On-Demand B-Channel Packet assigned

**Attribute: bchan1.phcn**

**Fullname:** B-Channel1 Protocol Handler Channel.

**Attribute Description** This sub-attribute contains the Protocol Handler channel number of the B-Channel 1.

**Attribute: bchan1.cctype**

Copyright © 1999 Lucent Technologies 

**Fullname:** B-Channel 1 Common Channel Type

**Attribute Description** This sub-attribute contains the common channel type for the B-Channel 1. The Common Channel Type specifies the type of channel assigned to the Common DN. The allowed values for this sub-attribute are PSCCPPB (Permanent Packet B-Channel) and PSCCODB (On-Demand B-Channel).

If the Common Channel Type is PSCCODB, then B-Channel 1 must be an On-Demand B-Channel. If the Common Channel Type is PSCCPPB, then the B-Channel 1 must be a Permanent Packet B-Channel.

**Attribute: bchan1.assigned**

**Fullname:** Is the B-Channel1 assigned?

**Attribute Description** This sub-attribute specifies whether the B-Channel1 has been assigned to the Common DN.

For a DN to be a Common DN, at least two channels must share the Common DN; therefore, at least the first B-Channel must be assigned.

**Attribute: bchan1.routable**

**Fullname:** Is the B-Channel1 routable?

**Attribute Description** This sub-attribute specifies whether the B-Channel1 is routable for incoming calls. The B-Channel1 is routable for incoming calls if it has incoming or two-way LCNs and does not have incoming calls barred.

**Attribute: bchan2**

**Fullname:** Second B-Channel.

**Attribute Description** This attribute contains the routing information about the B-Channel 2 of the Common DN. The term 'B-Channel 2' does not imply that the channel is associated with the B2 Channel. The term 'B-Channel 2' is associated with the PH channel that is the second preference for routing B-Channel calls.

The B-Channel 2 attribute is the first channel on the following list that has been provisioned.

```
1) Permanent Packet on the B2-Channel (only if bchan1 = PPB1)
2) First On-Demand B-Channel Packet assigned (only if bchan1 = PPB)
3) Second On-Demand B-Channel Packet assigned
```

**Attribute: bchan2.phcn**

**Fullname:** B-Channel2 Protocol Handler Channel.

**Attribute Description** This sub-attribute contains the Protocol Handler channel number of the B-Channel 2. If the B-Channel 2 is not assigned, then the value of this attribute is 0.

**Attribute: bchan2.cctype**

**Fullname:** B-Channel 2 Common Channel Type

**Attribute Description** This sub-attribute contains the common channel type for the B-Channel 2. The Common Channel Type specifies the type of channel assigned to the Common DN. The allowed values for this sub-attribute are PSCCPPB (Permanent Packet B-Channel), PSCCODB (On-Demand B-Channel), and PSCCNULL (Null Value).

If the B-Channel 2 is assigned to the Common DN, then this subattribute has a value of PSCCODB or PSCCPPB. The value PSCCNULL is used when the B-Channel 2 is not assigned to the

Copyright © 1999 Lucent Technologies 

Common DN.

If the Common Channel Type is PSCCODB, then B-Channel 2 must be an On-Demand B-Channel. If the Common Channel Type is PSCCPPB, then the B-Channel 2 must be a Permanent Packet B-Channel.

**Attribute: bchan2.assigned**

**Fullname:** Is the B-Channel2 assigned?

**Attribute Description** This sub-attribute specifies whether the B-Channel2 has been assigned to the Common DN.

**Attribute: bchan2.routable**

**Fullname:** Is the B-Channel2 routable?

**Attribute Description** This sub-attribute specifies whether the B-Channel2 is routable for incoming calls. The B-Channel2 is routable for incoming calls if it has incoming or two-way LCNs and does not have incoming calls barred.

**Attribute: tcid**

**Fullname:** Throughput Class Indicator on the D-Channel.

**Attribute Description** This attribute contains the Throughput Class Indicator on the D-Channel. All incoming calls to the Common DN with a throughput class less than the Throughput Class Indicator are routed to the D-Channel. If the D-Channel is not assigned, then the attribute has a value of PSTHNULL. If the D-Channel is assigned, then the tcid attribute may have any of the following values: {PSTHNULL, PS75BPS, PS150BPS, PS300BPS, PS600BPS, PS1200BPS, PS2400BPS, PS4800BPS, PS9600BPS}.

The tcid attribute has a calculated value instead of a default value. If a D-Channel is not part of the Common DN and the value for tcid is unknown, then the calculated value for the tcid attribute is PSTHNULL. If a D-Channel is part of the Common DN and the value for tcid is unknown, then the calculated value for the tcid attribute is PS9600BPS.

**Attribute: mlhg_flag**

**Fullname:** Packet MLHG member

**Attribute Description** The channels assigned to the common individual DN make up a common packet MLHG member.

Each channel assigned must have a tuple in RLpsprt_gp where the group and member numbers are the same.

**Attribute: dport**

**Fullname:** D channel port number

**Attribute Description** Specifies the D port that the channels assigned use.

The D port if used or not will always be populated for the assigned channels. Two PPB's don't need a D channel but the D port associated with their DSL will still be used.

**Defines:**

"db/DMparty.h"

# CDRMK_R

## 1. Description

Root storage relation for RC_CDRMK.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1100 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | LP |
| application | RCDATA |
| relation type | DBSTORAGE |
| head table size | 256 |
| data page size | 512 |

## 3. Field Layout

```
CDRMK_R     relid = 1672  DBSTORAGE  DBACC_HASH  DBPRAM    LP      RCDATA
     carrid      DMCIC4       (array [ 4 ] of char )     <--- key
     remarks     DMGK16       (ulong: 16)

Private facility.
**Attribute Description:**
Private facility.

**Attribute:**
call_fltr.attndnt
**Fullname:**
Attendant.
**Attribute Description:**
Attendant.

**Attribute:**
cfpf_alwd
**Fullname:**
Call Forwarding over Private Facilities (CFPF).
**Attribute Description:**
This is the call forwarding over private facilities (CFPF) indicator that designates if the forwarded call can be over private facilities.

**Attribute:**
actvn
**Fullname:**
Method of activating.
**Attribute Description:**
Indicates method of activating MFC features

If the attribute fwd_cndtn for this tuple is set to CFN_PPBUSY, CFN_PPIDLE, or CFN_ACDQIDL, then this value must be set to ACTNONE.

If the attribute fwd_cndtn for this tuple is set to CFN_DBUSY,CFN_DIDLE,or CFN_DBSYIDL, then this value must be set to ACTNONE, ACTCD, or ACTCD_DN.

| Enum. value | Dependency |
|---|---|
| ACTNONE | 1) RLcf_cf.dctvn = DCTNONE or DCTCD<br>2) At feature assignment time, fwd_dn must be assigned and not null. |
| ACTCD | 1) RLcf_cf.dctvn = DCTCD or DCTAUTO<br>*** ODA ONLY WARNING ***<br>*** (NOT SUPPORTED BY RC) ***<br>2) Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTACT or attribute = ACN_DBDACT |

**Copyright © 1999 Lucent Technologies** 

```
                    or attribute = ACN_CFVACT
                    for the dial code.
                    3) At feature assignment time, if no
                    fwd_dn is given, chg_fwdn must be
                    DBYES.
        ACTCD_DN    1) RLcf_cf.dctvn = DCTCD or DCTAUTO
                              *** ODA ONLY WARNING ***
                              *** (NOT SUPPORTED BY RC) ***
                    2) Verify tuple exists in dial tree
                       RLdaprlfnl or RLidp_dtre with
                       'action' attribute = ACN_FTACT
                       or attribute = ACN_DBDACT
                       or attribute = ACN_CFVACT
                       for the dial code.
        ACTCDDNC    1) RLcf_cf.dctvn = DCTCD
                              *** ODA ONLY WARNING ***
                              *** (NOT SUPPORTED BY RC) ***
        ACTCDNCA    2) Verify tuple exists in dial tree
        or              RLdaprlfnl or RLidp_dtre with
        ACTCDN1A        'action' attribute = ACN_FTACT
                        or attribute = ACN_CFVACT
                        for the dial code.
        ACTSCAN     1) RLcf_cf.dctvn = DCTSCAN
                    2) At feature assignment time, the
                        fwd_dn must be assigned and not null.
                    3) Using the feat_id from this relation
                        as the key into RLfacftdsc verify that
                        RLfacftdsc.selcrit = CF_NS
```

**Attribute:**

dnfltr

**Fullname:**

DN filter (screening) for call forwarding activation.

**Attribute Description:**

32_boolean structure, each bit representing a certain filtering criterion for adding/changing numbers in the forward to DN numbers.

**Attribute:**

dnfltr.all_pass

**Fullname:**

All pass.

**Attribute Description:**

if all_pass=DBYES then all other group members equal DBYES,
if all_pass=DBNO  then one or more member equal DBNO.

**Attribute:**

dnfltr.optn_a

**Fullname:**

option a.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Call between members of the same terminal group.

**Attribute:**
dnfltr.optn_b
**Fullname:**
option b.
**Attribute Description:**
An intraoffice call that is not an intragroup.

**Attribute:**
dnfltr.optn_c
**Fullname:**
option c.
**Attribute Description:**
An intradistrict call that is not an intragroup or interoffice call. This option basically allows interoffice 7 and 10 digit calls which may or may not have a 1+ prefix.

**Attribute:**
dnfltr.optn_d
**Fullname:**
option d.
**Attribute Description:**
An interdistrict call, that is, one which requires the dialing of a Feature Group D Carrier Access Code or one which uses presubscribed carrier.

**Attribute:**
dnfltr.optn_e
**Fullname:**
option e.
**Attribute Description:**
An international call, that is, one which requires the dialing of an international prefix (011+) followed by country code and telephone number.

**Attribute:**
dnfltr.optn_f
**Fullname:**
option f.
**Attribute Description:**
An X11 type of call for example 411, 911 etc.

**Attribute:**
dnfltr.optn_g

Copyright © 1999 Lucent Technologies 

**Fullname:**
option g.
**Attribute Description:**
A call to the POTS (Plain Old Telephone Service) operator 0 or in combination with option d a 0+7/10 digit intradistrict call, or in combination with option e an internatiol operator (010) or a international operator assisted call 01+.

**Attribute:**
dnfltr.optn_h
**Fullname:**
option h.
**Attribute Description:**
A POTS (Plain Old Telephone Service) feature code (*XX or *XXX) with or without subsequent parameters. When the feature code requires parameters , the system will perform no screening on the subsequent parameters.

**Attribute:**
dnfltr.optn_i
**Fullname:**
option i.
**Attribute Description:**
An IDP intercom nuber. When the system recognize that an IDP intercom number is involved the system should perform the digit deletion an d prefixing functions associated with the intercom function and then determine if that resulting number satisfies some other option selected in the same capability.

**Attribute:**
dnfltr.optn_j
**Fullname:**
option j.
**Attribute Description:**
An IDP Abbreviated Dial Code. When the system recognize an IDP abbreviated dial code the dialed number, the stored number is retrieved, and that retrieved number is checked to see if it satisfies some other option that has been selected in this screening capability.

**Attribute:**
dnfltr.optn_k
**Fullname:**
option k.
**Attribute Description:**
This option is checked by Time Of Day (TOD) during the entry of a speed call list entry and during the activation of call forwarding over Private Facilities (CFPF) and if yes, it allows the user to dial a private facility access code for a

**Copyright © 1999 Lucent Technologies** 

non-senderized (cut-through) facility.

**Attribute:**
dnfltr.optn_l
**Fullname:**
option l.
**Attribute Description:**
This option is checked by TOD during the entry of a speed call list entry and during the activation of call forwarding over private facility access code (CFPF) and if yes, it allows the user to dial a private access code for senderized facility.

**Attribute:**
dnfltr.optn_m
**Fullname:**
option m.
**Attribute Description:**
An IDP POTS access code. This opyion allow an IDP POTS access code followed by digits that will be screened by other opyions of this capability ( excluding options i, j, k, l, n, o, p, or q).

**Attribute:**
dnfltr.optn_n
**Fullname:**
option n.
**Attribute Description:**
An IDP Feature Group D Carrier Access Code. This code requires a parameter that must conform to the selected screening options.

**Attribute:**
dnfltr.optn_o
**Fullname:**
option o.
**Attribute Description:**
This option is checked by TOD during the entry of a speed call list entry and during activation of call forwarding over private facility and if yes allows the user to dial an Automatic Route Selection (ARS) access code.

**Attribute:**
dnfltr.optn_p
**Fullname:**
option p.
**Attribute Description:**
A PP prcedence code. This code is used for storing customer changeable abbreviated dialing numbers.

Copyright © 1999 Lucent Technologies 

**Attribute:**
dnfltr.optn_q
**Fullname:**
option q.
**Attribute Description:**
A PP AUTOVON cf number. This opyion is used with customer changeable call forwarding features. if set to DBYES then the forward-to-dn number must be to a port that can recieve AUTOVON calls. Also option_a must be set to DBYES.

**Attribute:**
dnfltr.optn_18
**Fullname:**
option 18.
**Attribute Description:**
Option 18-31 are don't care set to DBYES.

**Attribute:**
dnfltr.optn_19
**Fullname:**
option 19.
**Attribute Description:**
option 19, set to DBYES.

**Attribute:**
dnfltr.optn_20
**Fullname:**
option 20.
**Attribute Description:**
option 20, set to DBYES.

**Attribute:**
dnfltr.optn_21
**Fullname:**
option 21.
**Attribute Description:**
option 21, set to DBYES.

**Attribute:**
dnfltr.optn_22
**Fullname:**
option 22.
**Attribute Description:**
option 22, set to DBYES.

**Attribute:**
dnfltr.optn_23

Copyright © 1999 Lucent Technologies 

**Fullname:**
option 23.
**Attribute Description:**
option 23, set to DBYES.

**Attribute:**
dnfltr.optn_24
**Fullname:**
option 24.
**Attribute Description:**
option 24, set to DBYES.

**Attribute:**
dnfltr.optn_25
**Fullname:**
option 25.
**Attribute Description:**
option 25, set to DBYES.

**Attribute:**
dnfltr.optn_26
**Fullname:**
option 26.
**Attribute Description:**
option 26, set to DBYES.

**Attribute:**
dnfltr.optn_27
**Fullname:**
option 27.
**Attribute Description:**
option 27, set to DBYES.

**Attribute:**
dnfltr.optn_28
**Fullname:**
option 28.
**Attribute Description:**
option 28, set to DBYES.

**Attribute:**
dnfltr.optn_29
**Fullname:**
option 29.
**Attribute Description:**
option 29, set to DBYES.

Copyright © 1999 Lucent Technologies 

**Attribute:**
dnfltr.optn_30
**Fullname:**
option 30.
**Attribute Description:**
option 30, set to DBYES.

**Attribute:**
dnfltr.optn_31
**Fullname:**
option 31.
**Attribute Description:**
option 31, set to DBYES.

**Attribute:**
dctvn
**Fullname:**
Deactivate.
**Attribute Description:**
Indicates method of deactivating MFC feature.

If the attribute fwd_cndtn for this tuple is set to CFN_PPBUSY, CFN_PPIDLE, or CFN_ACDQIDL, then this value must be set to DCTNONE.

| Enum. value | Dependency |
|---|---|
| DCTNONE | 1) RLcf_cf.actvn = ACTNONE |
| DCTAUTO | 1) RLcf_cf.actvn = ACTCD or ACTCD_DN |
| DCTCD | 1) RLcf_cf.actvn = ACTCD,ACTCD_DN, ACTCDNC,ACTCDDNCA,ACTNONE or |
| ACTCDN1A | *** ODA ONLY WARNING *** *** (NOT SUPPORTED BY RC) *** 1) Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTDCT or attribute = ACN_CFVDCT for 'action' attribute = ACN_DBDDCT for the given dial code. |
| DCTSCAN | 1) RLcf_cf.actvn = ACTSCAN 2) Using the feat_id from this relation as the key into RLfacftdsc verify that RLfacftdsc.selcrit = CF_NS |

**Attribute:**
chg_datim
**Fullname:**
change for don't answer timing allowed.
**Attribute Description:**
Indicates if customer can change don't answer time.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
chg_fwdn
**Fullname:**
Change forward number .
**Attribute Description:**
Indicates if customer can change the forward to directory number.

**Attribute:**
cs_alwd
**Fullname:**
Call Screening Allowed.
**Attribute Description:**
Indicates if Call Screening is allowed.

**Attribute:**
ffcf1
**Fullname:**
Future field feature.
**Attribute Description:**
Boolean reserved for future field feature.

**Attribute:**
cfdarc
**Fullname:**
Call Forward Don't Answer - Ring Control
**Attribute Description:**
When this attribute is set to DBYES, this [pre]constructed feature has CFDA-RC option active. In order for this attribute be DBYES secured feature 335 has to be active.

**Attribute:**
ffcf2
**Fullname:**
Future field feature 2.

# CF_LDN

## 1. Description

Contains call forwarding information for listed directory numbers (LDN)s of a multiline hunt group (MLHG).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 4000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| head table size | 1024 |
| data page size | 512 |
| page level | 0 |
| storage type | DBORIGLEN |
| corcable | DBYES |
| foldtype | DBDEFAULT |

## 3. Field Layout

## 4. Population Rules for RLcf_ldn

**Relation Description** Call forwarding for listed directory numbers. This relation contains information needed for call forwarding of listed directory numbers of a multi position hunt group or ISDN attendant hunt group. This is a corcable relation.

**Attribute: grpnum**

**Fullname:** Multiline Hunt Group Number
**Attribute Description** Contains the number of the MLHG that this LDN belongs to.

**Attribute: sub_grp**

**Fullname:** MLHG Subgroup Number
**Attribute Description** Contains the subgroup number of an LDN in a MLHG. In multiple position hunt groups this number may be 1 - 6, in ISDN Attendant groups this number may be 0 - 7. Database population clarification: if the sub_grp attribute is 0 for ISAT hunt groups or 1 for MUPH hunt groups and a CFV feature is assigned and the cf_active attribute is DBYES, then this sub_grp's CFV feature is in effect for the entire group. This can be overridden by each individual sub_grp forwarding to their own unique destination.

**Attribute: cf_active**

**Fullname:** Call Forwarding Active Bit
**Attribute Description** Used to see if call forwarding is active for this LDN. Database population clarification: If the sub_grp attribute is 0 for ISAT hunt groups or 1 for MUPH hunt groups and a CFV feature is assigned and the cf_active attribute is DBYES, then this sub_grp's CFV feature is in effect for the entire group. This can be overridden by each individual sub_grp forwarding to their own unique destination. This is a corcable attribute.

**Attribute: fwd_dn**

**Fullname:** Forward to Directory Number
**Attribute Description** Used to store forward to DN for this LDN. This is a corcable attribute.

**Attribute: fwd_dn.dcnt32**

**Fullname:** Digit Count of the Forwarding Number
**Attribute Description** Store the count of the forwarding number.

**Copyright © 1999 Lucent Technologies** 

**Attribute: fwd_dn.edn32**

**Fullname:** Forwarding Telephone Number
**Attribute Description** Store the forwarding telephone number.

**Attribute: lead_module**

**Fullname:** Lead Module of the Main Member of the MLHG
**Attribute Description** Used to store the number of the module of the lead member of the MLHG.

**Attribute: ir_sim_act**

**Fullname:** Interoffice Simultaneously Active Forwards
**Attribute Description** Used to store the maximum number of simultaneously active inter-office call forwards between base station and forward-to DN.

**Attribute: ia_sim_act**

**Fullname:** Intraoffice Simultaneously Active Forwards
**Attribute Description** Used to store maximum number of simultaneously active intra-office call forwards between base station and forward-to DN

**Attribute: seq_act**

**Fullname:** Sequentially Active Call Forwards
**Attribute Description** Used to store the maximum number of call forwarding legs allowed to be call forwarded.

**Attribute: ffcf1**

**Fullname:** Future Field 1
**Attribute Description** Future field feature use.

**Attribute: ffcf2**

**Fullname:** Future Field 2
**Attribute Description** Future field feature use.

**Attribute: ffcf3**

**Fullname:** Future Field 3
**Attribute Description** Future field feature use.

**Attribute: ffcf4**

**Fullname:** Future Field 4
**Attribute Description** Future field feature use.

# CF_LTM

## 1. Description

This relation contains the call forward feature parameters on this logical termination port.

This is a virtual relation. The tree diagram Figure 1 depicts the stored structure of virtual relation CF_LTM.

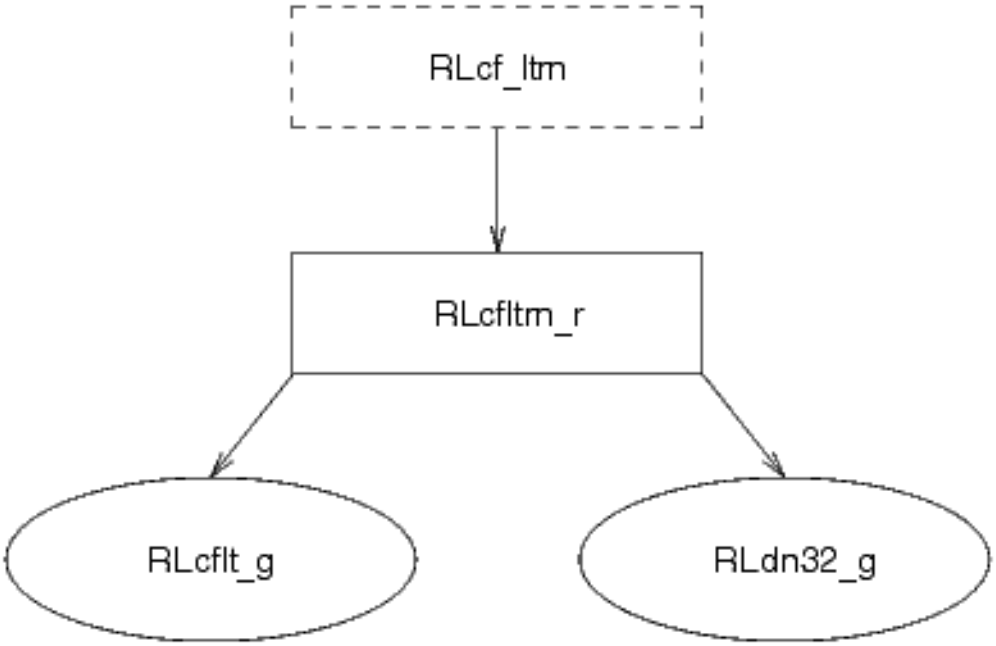

**Figure 1 Virtual Relation CF_LTM**

## 2. Data Dictionary Values

| | |
|---|---|
| access type | DBACC_OPV |
| distribution | FG |
| relation type | DBSTATIC |
| corcable | DBYES |
| trigger function | FCtrcfltm |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 3. Field Layout

## 4. Population rules for RLcf_ltm

**Relation Description**

call forwarding logical termination port.

call forward feature line parameters on this logical

**Copyright © 1999 Lucent Technologies** 

termination port

"The following is a list of valid service classes
for ports assigned this feature:

| LINES |
|---|
| FC_INDVDL |
| FC_ATTENDANT |
| FC_SATSTLN |
| FC_4WIRE_INDV |
| FC_PBX |
| FC_ISDN |
| FC_ISATND |

SPECIAL ENTRY FOR BFG
---

For BFG purposes, CFW feature parameter type is LINE.
Therefore, BFG Pseudo port tuples will not be created for
the port assigned to a BFG. Only individual port tuples
are created for BFG assigned ports.

SPECIAL CHECK FOR CIRCUIT SWITCHED DATA(CSD)
...

CSD Call Forwarding features can only be assigned to lines
with servclass=FC_ISDN.

To distinguish between CSV and CSD Call Forwarding features
refer to RLcf_opts and RLcf_cf for detail presconstructed
Call Forwarding features.

SPECIAL CHECK FOR ACD/BRCS
...

The Call Forwarding Don't Answer Return to Queue feature
can only be assigned to ACD/BRCS position primary DNs."

**Attribute:**
lead_module
**Fullname:**
lead module.
**Attribute Description:**
lead_module.

**Attribute:**
ltm_type
**Fullname:**
Logical Termination index type.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
Logical Termination index type.

**Attribute:**
ltm_idx
**Fullname:**
Logical Termination Index.
**Attribute Description:**
Logical Termination index.

**Attribute:**
feat_id
**Fullname:**
feature id.
**Attribute Description:**
Call Forwarding constructed feature id.

1) Verify existence of tuple in RLdn_feats with same key (lead_module, ltm_type, ltm_idx). The RLdn_feats tuple must have an attribute, fid such that (mftype of MFCFW + RLcf_ltm.feat_id) = RLdn_feats.ftent[n].fid. See explanation following 2).

2) Verify existence of tuple in RLcf_cf with mftype of MFCFW + RLcf_ltm.feat_id as key value. See explanation following 2).

   NOTE: MFCFW is defined in db/DMmftype.G. Adding mftype to feat_id before reading RLdn_feats or RLcf_cf is necessary because the feat_id in this relation is the unique 10 bits of the FID, it does not include the mftype. Whereas, RLdn_feats and RLcf_cf store the entire FID (mftype + 10 unique bits).

**Attribute:**
fwd_dn
**Fullname:**
forward directory number.
**Attribute Description:**
stored dn to forward incoming calls to (32 digits max). Range of values: All valid DN's.
For CFPF, the DN may include PFA or ARS, ACCT and ATH use codes. For non-collocated case, the fwd_dn may also contain ATH and/or ACCT codes, but for collocated case, ATH and/or ACCT codes are stored in RLcfpf_ltm.

Warning: It is suggested that the fwd_dn not contain a dn which will be toll diverted. The calling party will not know why the

**Copyright © 1999 Lucent Technologies** 

toll diversion has occurred, and if the attendant is the recipient of the toll diverted call, the attendant may not know how the call could have been routed there.

For call forwarding features with CFN_ACDQIDL forwarding conditions, fwd_dn must be null.

**Attribute:**
fwd_dn.dcnt32
**Fullname:**
digit count.
**Attribute Description:**
digit count.

**Attribute:**
fwd_dn.edn32
**Fullname:**
forward-to DN digits.
**Attribute Description:**
forward-to DN digits.

**Attribute:**
ia_sim_act
**Fullname:**
simultaneously active intra-office calls.
**Attribute Description:**
Maximum number of simultaneously active intra-office calls allowed between base station and forward to DN.

Call forwarding features with the CFN_ACDQIDL forwarding condition can have only 1 simultaneously active intra-office call, based on the Automatic Call Distribution algorithm. Therefore, this attribute will be restricted to the value 1.

**Attribute:**
ir_sim_act
**Fullname:**
simultaneously active inter-office calls.
**Attribute Description:**
Maximum number of simultaneously active inter-office calls allowed between base station and forward to DN.

This attribute does not apply to calls forwarded because of a CFN_ACDQIDL forwarding condition.
Therefore, this attribute will be restricted to the value 1.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

seq_act

**Fullname:**

sequential forwarding.

**Attribute Description:**

Maximum number of call forwarding legs allowed to be sequentially forwarded.

Calls forwarded because of a CFN_ACDQIDL forwarding condition are not subject to the restriction specified by this attribute. Therefore, this attribute will be restricted to the value 1.

**Attribute:**

dont_ans_t

**Fullname:**

Do not answer time.

**Attribute Description:**

Don't answer time (in seconds) before a call should be forwarded.

If cf_opts.fwd_cndtn is CFN_IDLE, CFN_DIDLE, CFN_PPIDLE, CFN_PRCI or CFN_ACDQIDL then the range of valid values are from 4 to 60. If CFDA-Ring Control SFID is active (SFID 335), and CFDA-RC is active on this line (either OFID 737 or Line Option is active), then dont_ans_t can also be value of 0.

If cf_opts.fwd_cndtn is CFN_IDLE, CFN_DIDLE, CFN_PPIDLE or CFN_PRCI then dont_ans_t default value should be 30.
If cf_opts.fwd_cndtn
is CFN_ACDQIDL, the dont_ans_t default value should be 18.

Dependencies: If cf_opts.fwd_cndtn is CFN_BUSY, CFN_DBUSY, CFN_PPBUSY, CFN_PRCB, CFN_BSYIDL, CFN_DBSYIDL or CFN_PRCV, then dont_ans_t should be zero.

**Attribute:**

bs_rg_ind

**Fullname:**

base station ringing indicator.

**Attribute Description:**

Base station ringing indicator. DBYES ring reminder is given; DBNO no ring reminder.

For call forwarding features with the CFN_ACDQIDL forwarding condition, the base station ring indicator must be DBNO.

**Attribute:**

cfpf_digs

**Fullname:**

Call Forwarding over Private Facilities (CFPF) digits.

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

this attribute indicates whether or not the digits stored in the forward to dn buffer (fwd_dn) may invoke ARS, PFA, ACCT, or ATH for Call Forwarding over Private Facilities (CFPF).

DBYES ( the digits may contain an ARS, PFA, ACCT, or ATH use code )
DBNO ( the digits do not contain an ARS, PFA, ACCT, or ATH use code )

If DBYES, this implies that a tuple exists in RLcf_cf with:
1 ) RLcf_cf.feat_id equal ((DMmftype.MFCFW << 10) + feat_id)
2 ) RLcf_cf.cfpf_alwd equal DBYES

When a CF feature is assigned to a line, RLcf_ltm.cfpf_digs must be initialized with the contents of RLcf_opts.cfpf_alwd.

If RLcf_ltm.fwd_dn is changed during an update, RLcf_ltm.cfpf_digs must be updated with the contents of cfpf_alwd.

**Attribute:**

ffcf[*]

**Fullname:**

future field.

**Attribute Description:**

Future field feature use.

**Attribute:**

cfpf_codes

**Fullname:**

Call Forwarding over Private Facilities codes.

**Attribute Description:**

This attribute indicates whether or not a corresponding tuple in RLcfpf_ltm contains an authorization and/or account code.

DBYES ( RLcfpf_ltm is populated with an ATH and/or ACCT code. )
DBNO ( RLcfpf_ltm is not populated with an ATH and/or ACCT code. )

if DBYES, this implies:
1) cfpf_digs is DBYES
2) tuple(s) with the same keys exists in cfpf_ltm (that is, group partitioned)
3) If RLcfpf_ltm.auth_code.digcnt is

**Copyright © 1999 Lucent Technologies** 

```
           greater than zero then an AUTH feature
           must be assigned to this line in
           RLtrmfeats or the BFG RLtrmfeats
           assigned to this line.
        4) If RLcfpf_ltm.acct_code.digcnt is
           greater than zero then an ACCT feature
           must be assigned to this line in
           RLtrmfeats or the BFG RLtrmfeats
           assigned to this line.

        When a CF feature is assigned to a line,
        if the value for acct_code or auth_code
        in RLcf_opts is > 0, cfpf_codes must be
        DBYES.

        When RLcfpf_ltm.acct_code or RLcfpf_ltm.
        auth_code is updated to a length greater
        than 0, RLcf_ltm.cfpf_codes must be DBYES.
```

**Attribute:**

annc_ri

**Fullname:**

Announcement route index.

**Attribute Description:**

Indicates the announcement route index for CFPF. The CFPF announcement is applied to the base station when a call is forwarded due to theCFPF feature.
NOTE: the ability to use announcements has not been implemented yet. Therefore, the value of this attribute must be locked to 0.

**Attribute:**

mdnl_enhan

**Fullname:**

MDNL enhanced.

**Attribute Description:**

This attribute indicates which MDNL package (basic or enhanced), if any, the customer has.

DBYES (Master DN has enhanced MDNL)
DBNO (Master DN either has basic MDNL or has no MDNL)

Dependencies:

```
if (mdnl_enhan=DBNO) then
    ((mdnl_rcf = mdnl_opt) &&
        mdnl_rcf != DEPEND_ONLY &&
        mdnl_opt != DEPEND_ONLY );
if (mdnl_enhan=DBNO && mdnl_opt=MASTER_ONLY) then
        RLcf_opts.fwd_cndtn must be equal CFN_BSYIDL;

if (mdnl_enhan=DBYES) then
    ltm_type must be LTM_OTHER;
```

Copyright © 1999 Lucent Technologies 

```
            must find a tuple in RLcf_opts
            where (RLcf_opts.feat_id = RLcf_ltm.feat_id)
            when found
                RLcf_opts.fwd_cndtn must be equal CFN_BSYIDL;
                must not find tuple in RLport_group
                where ((RLport_group.port=RLfc_line.port) and
                (RLport_group.party=RLfc_line.party));

        NOTE: if mdnl_enhan = DBYES && mdnl_opt=DEPEND_ONLY
        && fc_line.multidn = DBNO then no DN will be forwarded.
```

**Attribute:**
mdnl_opt
**Fullname:**
Master, Dependant or all (MDNL) option.
**Attribute Description:**
this attribute indicates which DN (Master,Dependent or all) will be forwarded and this option is CORCable.

**Attribute:**
mdnl_rcf
**Fullname:**
MDNL remotely activated.
**Attribute Description:**
this attribute indicates which DN (Master,Dependent or all) will be forwarded when forwarding is activated remotely. This field is changed thru service only.

**Attribute:**
mdnl_emsi
**Fullname:**
MDNL Enhanced Message Service Indication.
**Attribute Description:**
This attribute indicates which DN (Master or Called) will be sent when a call is forwarded. When set to DBYES the Master DN will be provided as the forwarding party. When set to DBNO the DN that was called will be provided as the forwarding party. The forwarding party DN is provided over the API link as well as in the ICLID data. NOTE: This attribute is NOT CORCable.

CHECKS: In order to provide more flexibility during CF Feature Administration there are no cross-checks restricting assignment of MDNL EMSI. However, the Call Processing code will provide the Called party for MLHG calls and ISDN calls, even if mdnl_emsi is set to DBYES. For call forwarding features with the CFN_ACDQIDL forwarding condition, MDNL Enhanced Message Service Indication must be DBNO.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
cfda_cw
**Fullname:**
activate CFDA/CW special feature indicator.
**Attribute Description:**
The indicator provides the ability to override the office option on a per line basis and is used when the office option for CFDA/CW special feature (SFID062) is set to YES on RC/V Secured Feature Upgrade view.

If the line has CFDA feature (with RLcf_opts.fwd_cndtn equals CFN_IDLE), this bit will indicate whether CFDA after CW feature is activated on the line (YES) or not activated (NO).

If SFID062 is not set (NO), then the cfda_cw must contain the default value of DBYES for CFDA features assigned to unshared analog lines; and must contain the default value of DBNO for ISDN lines, Shared Analog lines, and lines has non-CFDA features (with RLcf_opts.fwd_cndtn != CFN_IDLE).

This indicator is always set to DBNO for ISDN lines, Shared Analog lines (the check on RLcf_ltm.ltm_type - 'LTM_ISDN' will cover both cases), and lines that have non-CFDA features.

**Attribute:**
cfimb
**Fullname:**
Call Forwarding Busy Line Inhibit Make Busy
**Attribute Description:**
This attribute indicates whether call forwarding busy line is inhibited if a make busy key or make busy feature button is active

**Attribute:**
cfilb
**Fullname:**
Call Forwarding Busy Line Inhibit Line Busy
**Attribute Description:**
This attribute indicates whether call forwarding busy line is inhibited if a line is busy and the make busy key or make busy feature button is inactive

**Attribute:**
ovfcfi
**Fullname:**
Overflow tone for Call Forwarding Busy Line Inhibit

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
This attribute indicates whether overflow tone should be given instead of busy tone when call forwarding busy line is inhibited

**Attribute:**
cfdarc
**Fullname:**
Call Forwarding Don't Answer - Ring Control
**Attribute Description:**
When this attribute is set to DBYES, this subscriber has CFDA-RC option active. In order for this attribute be DBYES secured feature 335 has to be active. This attribute cannot be updated from DBYES to DBNO when OFID 737 is active.

**Attribute:**
cs_alwd
**Fullname:**
Call Screening allowed.
**Attribute Description:**
This attribute Indicates whether Call Screening is allowed.

## 4. Population rules for RLcf_opts

### Relation Description

Call forwarding options.

Call Forwarding Feature Definition's Options & Defaults:

**Attribute:**
feat_id
**Fullname:**
feature id.
**Attribute Description:**
call forwarding constructed feature id.
verify that RLfacname has a tuple such that
feat_id = RLfacname.facid, and RLfacname.class =
FACBRCS for that tuple.

**Attribute:**
fwd_cndtn
**Fullname:**
conditions for forwarding.
**Attribute Description:**
condition for forwarding call. Range: CFN_BUSY,
CFN_IDLE, CFN_BSYIDL, CFN_PRCB, CFN_PRCI, CFN_PRCV,
CFN_DBUSY, CFN_DIDLE, CFN_DBSYIDL, CFN_PPBUSY,
CFN_PPIDLE, or CFN_ACDQIDL.

If set to CFN_PPBUSY, or CFN_PPIDLE,
then for this same tuple the attribute actvn must
be set to ACTNONE, the attribute dctvn must
be set to DCTNONE, and call_fltr.attndnt = DBNO.
If set to CFN_ACDQIDL, the actvn attribute must

Copyright © 1999 Lucent Technologies 

be set to ACTNONE and the dctvn attribute must be set to DCTNONE.

If fwd_cndtn set to CFN_DBUSY, CFN_DIDLE, or CFN_DBSYIDL, then call_fltr.attndnt = DBNO.

CSV CF and CSD CF can exist in the same BFG with the following three restrictions.

1. There can be either CFN_BUSY or CFN_DBUSY in the same BFG, but not both.
2. There can be at most one of the following call forwarding idle features in a BFG: CFN_IDLE, CFN_DIDLE or CFN_ACDQIDL.
3. There can be either CFN_BSYIDL or CFN_DBSYIDL in the same BFG, but not both.

The PRL for these three restrictions are found in the r elation RLdn_feats under Selection Criteria checks.

If condition for forwarding call is CFN_BUSY, CFN_IDLE, CFN_BSYIDL, CFN_DBUSY, CFN_DIDLE, CFN_DBSYIDL,
a forwarding DN is required.

In order to supply data needed for call processing, the forwarding DN must be either in the database or given by the user at activation time. The forward-to DN is defined in RLcf_port for 5e3_1l and in RLcf_ltm for 5e4_2q and later generics.

For the CFN_ACDQIDL forwarding condition, no forwarding DN is allowed.

**Attribute:**
call_fltr
**Fullname:**
incoming call filter.
**Attribute Description:**
Incoming call screening filter. Range: DBYES, DBNO for all five enumerated values.

For call forwarding features with the CFN_ACDQIDL forwarding condition, all five call screening filter values should be DBYES.

**Attribute:**
call_fltr.intratg
**Fullname:**
Intra-terminal group.
**Attribute Description:**
Intra-terminal group.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
call_fltr.intraoff
**Fullname:**
Intra-office.
**Attribute Description:**
Intra-office.

**Attribute:**
call_fltr.interoff
**Fullname:**
Inter-office.
**Attribute Description:**
Inter-office.

**Attribute:**
call_fltr.pf
**Fullname:**
Private facility.
**Attribute Description:**
Private facility.

**Attribute:**
call_fltr.attndnt
**Fullname:**
Attendant.
**Attribute Description:**
Attendant.

**Attribute:**
bs_rg_ind
**Fullname:**
Base station ring indicator.
**Attribute Description:**
Indicate if ring reminder provided for base station.

For call forwarding features with the CFN_ACDQIDL forwarding condition, the base station ring indicator must be DBNO.

**Attribute:**
ffcf[*]
**Fullname:**
future field feature.
**Attribute Description:**
Spare bit reserved for future field feature.

Copyright © 1999 Lucent Technologies 

**Attribute:**
cfdarc
**Fullname:**
Call Forward Don't Answer - Ring Control
**Attribute Description:**
When this attribute is set to DBYES, this [pre]constructed feature has CFDA-RC option active. In order for this attribute be DBYES secured feature 335 has to be active.

**Attribute:**
actvn
**Fullname:**
Activation.
**Attribute Description:**
Indicates method of activating MFC features
Range of values: all enumerated values.

If the attribute fwd_cndtn for this tuple is set to CFN_PPBUSY, or CFN_PPIDLE, then this value must be set to ACTNONE.

If the attribute fwd_cndtn for this tuple is set to CFN_DBUSY, CFN_DIDLE, or CFN_DBSYIDL, then this value must be set to ACTCD, ACTCD_DN, or ACTNONE.

If the attribute fwd_cndtn for this tuple is set to CFN_ACDQIDL, then this value must be set to ACTNONE.

| Enum. value | Dependency |
|---|---|
| ACTNONE | 1) RLcf_opts.dctvn = DCTNONE or DCTCD<br>2) At feature assignment time, fwd_dn must be assigned and not null unless fwd_cndtn equals CFN_ACDQIDL. For CFN_ACDQIDL, the fwd_dn must be null. |
| ACTCD | 1) RLcf_opts.dctvn = DCTCD or DCTAUTO<br>*** ODA ONLY WARNING ***<br>*** (NOT SUPPORTED BY RC) ***<br>2) Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTACT or attribute = ACN_DBDACT or where attribute = ACN_CFVACT for the dial code.<br>3) At feature assignment time, if no fwd_dn is given, chg_fwdn must be DBYES. |
| ACTCD_DN | 1) RLcf_opts.dctvn = DCTCD or DCTAUTO<br>*** ODA ONLY WARNING ***<br>*** (NOT SUPPORTED BY RC) ***<br>2) Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTACT |

**Copyright © 1999 Lucent Technologies** 

```
                or where attribute = ACN_CFVACT
                or attribute = ACN_DBDACT
                for the dial code.
        ACTCDDNC  1) RLcf_opts.dctvn = DCTCD
                     *** ODA ONLY WARNING ***
                     *** (NOT SUPPORTED BY RC) ***
        ACTCDNCA  2) Verify tuple exists in dial tree
        or           RLdaprlfnl or RLidp_dtre with
        ACTCDN1A           'action' attribute = ACN_FTACT
        or          where attribute = ACN_CFVACT
                    for the dial code.
        ACTSCAN   1) RLcf_opts.dctvn = DCTSCAN
                  2) At feature assignment time, the
                     fwd_dn must be assigned and not null.
                  3) Using the feat_id from this relation
                     as the key into RLfacftdsc verify that
                     RLfacftdsc.selcrit = CF_NS
```

**Attribute:**

dnfltr

**Fullname:**

DN filter.

**Attribute Description:**

32-boolean structure, each bit representing a certain filtering criterion for adding/changing numbers in the forward to dn numbers. Range of values for each structure member: DBYES to pass: DBNO to fail. First member set to DBYES results in no filtering being done and allows the dn to pass the filtering process without examining each bit in the structure. Pass indicates dn in question will be processed normally: Fail indicates disallowed action, and corrective or alternate action will be provided. See domain description for meaning of individual members.

If all_pass == DBYES then each of the other members = DBYES.
If one or more member of optn_x (any member with optn) = DBNO then all_pass = DBNO.

Call forwarding features with the CFN_ACDQIDL forwarding condition must have all DN filters set to DBYES.

**Attribute:**

dnfltr.all_pass

**Fullname:**

All pass.

**Attribute Description:**

if all_pass=DBYES then all other group members equal DBYES,

**Copyright © 1999 Lucent Technologies** 

if all_pass=DBNO then one or more member equal DBNO.

**Attribute:**
dnfltr.optn_a
**Fullname:**
option a.
**Attribute Description:**
Call between members of the same terminal group.

**Attribute:**
dnfltr.optn_b
**Fullname:**
option b.
**Attribute Description:**
An intraoffice call that is not an intragroup.

**Attribute:**
dnfltr.optn_c
**Fullname:**
option c.
**Attribute Description:**
An intradistrict call that is not an intragroup or interoffice call. This option basically allows interoffice 7 and 10 digit calls which may or may not have a 1+ prefix.

**Attribute:**
dnfltr.optn_d
**Fullname:**
option d.
**Attribute Description:**
An interdistrict call, that is, one which requires the dialing of a Feature Group D Carrier Access Code or one which uses presubscribed carrier.

**Attribute:**
dnfltr.optn_e
**Fullname:**
option e.
**Attribute Description:**
An international call, that is, one which requires the dialing of an international prefix (011+) followed by country code and telephone number.

**Attribute:**
dnfltr.optn_f
**Fullname:**
option f.

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
An X11 type of call for example 411, 911 etc.

**Attribute:**
dnfltr.optn_g
**Fullname:**
option g.
**Attribute Description:**
A call to the POTS (Plain Old Telephone Service) operator 0 or in combination with option d a 0+7/10 digit intradistrict call, or in combination with option e an internatiol operator (010) or a international operator assisted call 01+.

**Attribute:**
dnfltr.optn_h
**Fullname:**
option h.
**Attribute Description:**
A POTS (Plain Old Telephone Service) feature code (*XX or *XXX) with or without subsequent parameters. When the feature code requires parameters , the system will perform no screening on the subsequent parameters.

**Attribute:**
dnfltr.optn_i
**Fullname:**
option i.
**Attribute Description:**
An IDP intercom nuber. When the system recognize that an IDP intercom number is involved the system should perform the digit deletion an d prefixing functions associated with the intercom function and then determine if that resulting number satisfies some other option selected in the same capability.

**Attribute:**
dnfltr.optn_j
**Fullname:**
option j.
**Attribute Description:**
An IDP Abbreviated Dial Code. When the system recognize an IDP abbreviated dial code the dialed number, the stored number is retrieved, and that retrieved number is checked to see if it satisfies some other option that has been selected in this screening capability.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

dnfltr.optn_k

**Fullname:**

option k.

**Attribute Description:**

This option is checked by Time Of Day (TOD) during the entry of a speed call list entry and during the activation of call forwarding over Private Facilities (CFPF) and if yes, it allows the user to dial a private facility access code for a non-senderized (cut-through) facility.

**Attribute:**

dnfltr.optn_l

**Fullname:**

option l.

**Attribute Description:**

This option is checked by TOD during the entry of a speed call list entry and during the activation of call forwarding over private facility access code (CFPF) and if yes, it allows the user to dial a private access code for senderized facility.

**Attribute:**

dnfltr.optn_m

**Fullname:**

option m.

**Attribute Description:**

An IDP POTS access code. This opyion allow an IDP POTS access code followed by digits that will be screened by other opyionsof this capability ( excluding options i, j, k, l, n, o, p, or q).

**Attribute:**

dnfltr.optn_n

**Fullname:**

option n.

**Attribute Description:**

An IDP Feature Group D Carrier Access Code. This code requires a parameter that must conform to the selected screening options.

**Attribute:**

dnfltr.optn_o

**Fullname:**

option o.

**Attribute Description:**

This option is checked by TOD during the entry of a speed call list entry and during activation of call forwarding over private facility and if yes allows the user to dial an Automatic Route Selection (ARS) access code.

Copyright © 1999 Lucent Technologies 

**Attribute:**
dnfltr.optn_p
**Fullname:**
option p.
**Attribute Description:**
A PP prcedence code. This code is used for storing customer changeable abbreviated dialing numbers.

**Attribute:**
dnfltr.optn_q
**Fullname:**
option q.
**Attribute Description:**
A PP AUTOVON cf number. This opyion is used with customer changeable call forwarding features. if set to DBYES then the forward-to-dn number must be to a port that can recieve AUTOVON calls. Also option_a must be set to DBYES.

**Attribute:**
dnfltr.optn_18
**Fullname:**
option 18.
**Attribute Description:**
Option 18-31 are don't care set to DBYES.

**Attribute:**
dnfltr.optn_19
**Fullname:**
option 19.
**Attribute Description:**
option 19, set to DBYES.

**Attribute:**
dnfltr.optn_20
**Fullname:**
option 20.
**Attribute Description:**
option 20, set to DBYES.

**Attribute:**
dnfltr.optn_21
**Fullname:**
option 21.
**Attribute Description:**
option 21, set to DBYES.

option 28, set to DBYES.

**Attribute:**
dnfltr.optn_29
**Fullname:**
option 29.
**Attribute Description:**
option 29, set to DBYES.

**Attribute:**
dnfltr.optn_30
**Fullname:**
option 30.
**Attribute Description:**
option 30, set to DBYES.

**Attribute:**
dnfltr.optn_31
**Fullname:**
option 31.
**Attribute Description:**
option 31, set to DBYES.

**Attribute:**
dctvn
**Fullname:**
Deactivation.
**Attribute Description:**
Indicates method of deactivating MFC feature.

If the attribute fwd_cndtn for this tuple is set to CFN_PPBUSY, CFN_PPIDLE, or CFN_ACDQIDL, then this value must be set to DCTNONE.

| Enum. value | Dependency |
|---|---|
| DCTNONE | 1) RLcf_opts.actvn = ACTNONE |
| DCTAUTO | 1) RLcf_opts.actvn = ACTCD or ACTCD_DN |
| DCTCD | 1) RLcf_opts.actvn = ACTCD,ACTCD_DN, ACTCDDNC,ACTCDNCA,ACTNONE or ACTCDN1A<br>*** ODA ONLY WARNING ***<br>*** (NOT SUPPORTED BY RC) *** |
| | 2) Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTDCT or where attribute = ACN_CFVDCT for 'action' attribute = ACN_DBDDCT for the given dial code. |
| DCTSCAN | 1) RLcf_opts.actvn = ACTSCAN |

Copyright © 1999 Lucent Technologies 

2) Using the feat_id from this relation
as the key into RLfacftdsc verify that
RLfacftdsc.selcrit = CF_NS.

**Attribute:**
chg_datim
**Fullname:**
change dor don't answer rime.
**Attribute Description:**
Indicates if customer change the don't answer time.
*** ODA ONLY WARNING ***
*** (NOT SUPPORTED BY RC) ***
Verify tuple exists in dial tree
RLdaprlfnl or RLidp_dtre with
'action' attribute = ACN_CFDATCH for
the given dial code.

**Attribute:**
chg_fwdn
**Fullname:**
change for forward telephone number.
**Attribute Description:**
Indicates if customer can change the forward to directory number.

Call forwarding features with the CFN_ACDQIDL forwarding condition are not allowed to change their forward-to-DN.

*** ODA ONLY WARNING ***
*** (NOT SUPPORTED BY RC) ***
Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_CFDNCH for the given dial code.

**Attribute:**
cfpf_alwd
**Fullname:**
Call Forward over Private Facilities allowed.
**Attribute Description:**
This is the Call Forwarding over Private Facilities (CFPF) indicator that indicates if the forwarded call can be over a private facility.

If a feature with cfpf_alwd set to DBYES is assigned to a standard DSL, the Secured Feature ID (SFID) 225 must be on.

Dependencies:

1) If cfpf_alwd is DBYES:

a) RLcf_opts.actvn cannot be ACTCDNCA or ACTCDN1A.

**Copyright © 1999 Lucent Technologies** 

b) RLcf_opts.fwd_cndtn cannot be CFN_PRCI.
c) RLcf_opts.fwd_cndtn cannot be CFN_IDLE unless SFID 155 is set.

2) If dnfltr.all_pass is DBNO, (DN SCREENING is allowed) and cfpf_alwd is DBYES:

a) If the Call Forwarding Over Private Facilities/Don't Answer Special Feature is not purchased (SFID 155 is not set), then screening option setting for DNSK or DNSL or DNSO must be DBYES.

b) If the Call Forwarding Over Private Facilities/Don't Answer Special Feature is purchased (SFID 155 is set), then screening option setting for DNSK must be DBNO and screening option setting for DNSL or DNSO must be DBYES.

3) If dnfltr.all_pass is DBNO (DN SCREENING is allowed) and cfpf_alwd is DBNO:

a) Screening option setting for DNSK and DNSL and DNSO must be DBNO.

4) If RLcf_opts.fwd_cndtn is CFN_DBUSY, CFN_DIDLE, CFN_DBSYIDL or CFN_ACDQIDL then cfpf_alwd must be DBNO.

**Attribute:**
annc_ri
**Fullname:**
CFPF announcement route index.
**Attribute Description:**
Indicates announcement route index for the CFPF call. The CFPF announcement is applied to the station from which the CFPF feature is activated.

Dependencies: value can only be non-zero if cfpf_alwd is DBYES, otherwise, value must be 0. A non-zero value implies the existence of a tuple in RLrt_routing keyed with this route index.

NOTE: The ability to use announcement has not been implemented yet. Therefore, the value of this attribute must be locked to 0.

**Attribute:**
acct_code
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

account code.

**Attribute Description:**

This attribute stores the default account code digits used by CFPF for the collocated invocation of CFPF.

if this attribute is not all zeros cfpf_alwd must be DBYES

**Attribute:**
acct_code.dig[*]
**Fullname:**
digit.
**Attribute Description:**
digit.

**Attribute:**
acct_code.dig[*]
**Fullname:**
digit 1.
**Attribute Description:**
digit.

**Attribute:**
acct_code.dig[*]
**Fullname:**
digit.
**Attribute Description:**
digit.

**Attribute:**
acct_code.dig[*]
**Fullname:**
digit.
**Attribute Description:**
Digit.

**Attribute:**
acct_code.digcnt
**Fullname:**
digit count.
**Attribute Description:**
Digit count.

**Attribute:**
auth_code
**Fullname:**
account code.
**Attribute Description:**

This attribute stores the default authorization code digits used by CFPF for the collocated invocation of CFPF.

if this attribute is not all zeros cfpf_alwd must be DBYES

**Attribute:**
auth_code.dig[*]
**Fullname:**
digit.
**Attribute Description:**
digit.

**Attribute:**
auth_code.dig[*]
**Fullname:**
digit 1.
**Attribute Description:**
digit.

**Attribute:**
auth_code.dig[*]
**Fullname:**
digit.
**Attribute Description:**
digit.

**Attribute:**
auth_code.dig[*]
**Fullname:**
digit.
**Attribute Description:**
Digit.

**Attribute:**
auth_code.digcnt
**Fullname:**
digit count.
**Attribute Description:**
Digit count.

**Attribute:**
fwd_dn
**Fullname:**
forward DN.
**Attribute Description:**
Stored dn to forward incoming calls to ( 32 digits max ).

**Copyright © 1999 Lucent Technologies** 

For the CFN_ACDQIDL forwarding condition, no forward DN is allowed.

**Attribute:**
fwd_dn.dcnt32
**Fullname:**
32 digits.
**Attribute Description:**
Count for up to 32 digits.

**Attribute:**
fwd_dn.edn32
**Fullname:**
extended digits.
**Attribute Description:**
Array of 32 of extended digits.

**Attribute:**
seq_act
**Fullname:**
Sequential calls.
**Attribute Description:**
Maximum number of sequential calls that can be forwarded.

Calls forwarded because of a CFN_ACDQIDL forwarding condition are not subject to the restriction specified by this attribute. Therefore, this attribute will be restricted to the value 1.

**Attribute:**
ia_sim_act
**Fullname:**
intra-office simultaneously active calls.
**Attribute Description:**
Maximum number of simultaneously active intra-office calls allowed between base station and forward to DN.

Call forwarding features with the CFN_ACDQIDL forwarding condition can have only 1 simultaneously active intra-office call, based on the Automatic Call Distribution algorithm. Therefore this attribute will be restricted to the value 1.

**Attribute:**
ir_sim_act
**Fullname:**
inter-office simultaneously active calls.
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

Maximum number of simultaneously active inter-office calls allowed between base station and forward to DN.

This attribute does not apply to calls forwarded because of a CFN_ACDQIDL forwarding condition. Therefore, this attribute will be restricted to the value 1.

**Attribute:**
dont_ans_t
**Fullname:**
do not answer time.
**Attribute Description:**
do not answer time (in seconds) before a call should be forwarded.

If fwd_cndtn is CFN_IDLE, CFN_PRCI, CFN_DIDLE, or CFN_PPIDLE, then valid values are from 4 to 60. If fwd_cndtn is CFN_IDLE or CFN_DIDLE and CFDA-Ring Control enhancement is active (SFID 335), then dont_ans_t valid values are 0 or from 4 to 60 seconds. default value should be 30.

If fwd_cndtn is CFN_ACDQIDL, valid don't answer time values are from 4 to 60 (default value should be 18 seconds).

If fwd_cndtn is CFN_BUSY, CFN_DBUSY, CFN_DBSYIDL, CFN_PPBUSY, CFN_PRCB, CFN_BSYIDL, or CFN_PRCV, then dont_ans_t should be zero.

**Attribute:**
mdnl_enhan
**Fullname:**
Master,Dependent or all enhanced.
**Attribute Description:**
this attribute indicates which package (basic or enhanced), if any, the customer has.

**Attribute:**
mdnl_opt
**Fullname:**
Master,Dependent or all enhanced options.
**Attribute Description:**
this attribute indicates which DN (Master,Dependent or all) will be forwarded.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

mdnl_rcf

**Fullname:**

Master,Dependent  or all remote activatiot.

**Attribute Description:**

this attribute indicates which DN (Master,Dependent or all) will be forwarded when forwarding is activated remotely.  This field is decided at subscription time.

**Attribute:**

mdnl_emsi

**Fullname:**

MDNL Enhanced Message Service Indication.

**Attribute Description:**

This attribute indicates which DN (Master or Called) will be sent when a call is forwarded. When set to DBYES the Master DN will be provided as the forwarding party. When set to DBNO the DN that was called will be provided as the forwarding party. The forwarding party DN is provided over the API link as well as in the ICLID data. NOTE: This attribute is NOT CORCable.

CHECKS: In order to provide more flexibility during CF Feature Administration there are no cross-checks restricting assignment of MDNL EMSI. However, the Call Processing code will provide the Called party for MLHG calls and ISDN calls, even if mdnl_emsi is set to DBYES. For call forwarding features with the CFN_ACDQIDL forwarding condition, MDNL Enhanced Message Service Indication must be DBNO.

**Attribute:**

cfda_cw

**Fullname:**

activate CFDA/CW special feature indicator.

**Attribute Description:**

The indicator provides the ability to override the office option and is used when the office option for CFDA/CW special feature (SFID062) is set to YES on RC/V Secured Feature Upgrade view.

If the feature is a CFDA feature (with fwd_cndtn equals CFN_IDLE), this bit will indicate whether CFDA after CW is active (YES) or not active (NO).

If SFID062 is not set (NO), the cfda_cw must contain the default value of DBYES for CFDA features, and must contain the default value of DBNO for non-CFDA features (with fwd_cndtn not equals CFN_IDLE).

For non-CFDA features, this bit should be always set to

**Copyright © 1999 Lucent Technologies** 

DBNO.

**Attribute:**
cfimb
**Fullname:**
Call Forwarding Busy Line Inhibit Make Busy
**Attribute Description:**
This attribute indicates whether call forwarding busy line is inhibited if a make busy key or make busy feature button is active

**Attribute:**
cfilb
**Fullname:**
Call Forwarding Busy Line Inhibit Line Busy
**Attribute Description:**
This attribute indicates whether call forwarding busy line is inhibited if a line is busy and the make busy key or make busy feature button is inactive

**Attribute:**
ovfcfi
**Fullname:**
Overflow Tone for Call Forwarding Busy Line Inhibit
**Attribute Description:**
This attribute indicates whether overflow tone should be given instead of busy tone when call forwarding busy line is inhibited

**Attribute:**
cs_alwd
**Fullname:**
Call Screening allowed
**Attribute Description:**
This attribute Indicates whether Call Screening is allowed

## 4. Population Rules for RLcfpf_ltm

**Relation Description** Call forwarding over private facilities (CFPF) line parameter relation. Contains CFPF Authorization and Account Code Information. This is a corcable relation.

**Attribute: ltm_type**

**Fullname:** CFPF Logical Termination Type

**Attribute Description** One of the Keys is the Logical Termination Type

**Attribute: lead_module**

**Fullname:** CFPF Lead Module

**Attribute Description** One of the Keys is the Lead Module

**Attribute: ltm_idx**

**Fullname:** CFPF Logical Termination Index

**Attribute Description** One of the Keys is the Logical Termination Index

**Attribute: feat_id**

**Fullname:** CFPF Feature Identifier

**Attribute Description** One of the Keys is the Feature Identifier

**Attribute: acct_code**

**Fullname:** CFPF Account Code Digits

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This Attribute is used to Store CFPF Account Code Digits for the Collocated invocation of CFPF. This is a corcable attribute.

**Attribute: acct_code.dig[*]**

**Fullname:** CFPF Account Code Digit.

**Attribute Description** See usage description for attribute acct_code.

**Attribute: acct_code.digcnt**

**Fullname:** Number of valid Account Code digits

**Attribute Description** This attribute is used to keep track of the number of valid account code digits in the digit field.

**Attribute: auth_code**

**Fullname:** CFPF Authorization Code Digits

**Attribute Description** This Attribute is used to Store CFPF Authorization Code Digits for the Collocated Invocation of CFPF. This is a corcable attribute.

**Attribute: auth_code.dig[*]**

**Fullname:** CFPF Authorization Code Digit.

**Attribute Description** See usage description for attribute auth_code.

**Attribute: auth_code.digcnt**

**Fullname:** Number of valid Authorization Code Digits.

**Attribute Description** This attribute is used to keep track of the number of valid authorization code digits in the digit field.

## 4. Population rules for RLcga_stat

### Relation Description

Carrier failure condition is to be reported, ignored, conditioned, also carrier type is specified
This relation resides on the switching module (SM) and contains information for each metallic scan unit (MSU) scan point, digital facility interface (DFI) facility, digital networking unit on SONET (DNU_S) facility, and integrated digital carrier unit (IDCU) facility (IFAC) that is alarmed. A tuple must be populated for each DFI facility and each IFAC that is alarmed. A tuple must be populated for each MSU scan point that is used to alarm an item or collection of equipment.
There is one tuple for each Digital Networking Unit-SONET (DNU_S) facility. The DNU-S facilities that are alarmed are:

- OC-3 SONET Termination Equipment (OC3STE) Facility,
- STSX-1 SONET Termination Equipment (EC1STE) Facility,
- Synchronous Transport Signal-1 (STS-1) Facility,
- Virtual Tributary 1.5 (VT1.5) Facility,
- Digital Signal Level 1 (DS1) Facility.

**Attribute:**
circuit
**Fullname:**
Circuit that has issued alarm
**Attribute Description:**
In the case of populating for an MSU scan point this attribute will be the port name of the scan point.
In the case of populating a DFI facility, this attribute will be the internal circuit name of the facility, which is also its key to the CKTDATA.
In the case of populating a remote integrated services line unit (RISLU) DFI facility, this attribute will be the internal circuit name of the RISLU DFI common board, which is also its key to the CKTDATA relation, and is formed as follows:
CKTDATA relation.
In the case of populating an IFAC, this attribute will be the internal circuit name of the IFAC, which is also its key in RLcktdata. The IFAC circuit name is formed as follows:
IFAC, which is also its key in RLcktdata.
For DNU-S facilities, this is the internal circuit name of the facility, which is also the key to the RLcktdata relation.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

spn

**Fullname:**

indicates if key is a scan point port

**Attribute Description:**

spn set to DBYES indicates that the 'circuit' is actually a scan point port name and is not a DFI circuit name. If spn is set to DBNO then 'circuit' is a DFI circuit name.

**Attribute:**

action

**Fullname:**

Indicates what to do when alarm occurs

**Attribute Description:**

Action specifies a particular action to be performed when the carrier reports an alarm.

TMCGIGNORE - if no action of any type is to be taken if the carrier fails.

TMREPORT - A message will be printed at the Master Control Center (MCC) when the carrier fails. No port conditioning is to be performed. This option is what is usually used for MSU carrier group alarm (CGA) scan points. This treatment would be most satisfactory for lines.

TMCONDITION - A message will be printed at the MCC when the carrier fails, and port conditioning is performed on the related ports. This is used for DFIs, IFACs, and ANCB, DTCB, MJOPEN, MNOPEN, MJCLOSED, and MNCLOSED MSU scan points. In the case of MSU scan points, a tuple in RLcgatrans must be populated to indicate which port(s) must be conditioned in association with this point. An action of TMCONDITION for MSU scan points is not allowed unless an RLcgatrans tuple exists for the MSU scan point.

**Attribute:**

type

**Fullname:**

Type of carrier facility

**Attribute Description:**

The type field describes the type of carrier system.

TM_ANCB - Analog carrier system (MSU scan pt)

TM_DTCB - Digital carrier system (MSU scan pt)

TM_PG - Non-integrated pair-gain/SLC(R) (MSU scan pt)

TM_SLC - Universal/integrated SLC(R). (MSU scan pt)

TM_MINGA - Minor group alerting circuit (MSU scan pt)

TM_MAJGA - Major group alerting circuit (MSU scan pt)

TM_DFI - DFI-1 trunk facility

TM_HDFI - DFI-1 host facility

**Copyright © 1999 Lucent Technologies** 

```
TM_RDFI         - DFI-1 remote facility
TM_CDFI         - DFI-1 communication facility
TM_SLCDFI       - SLC(R) DFI Facility
TM_RISLUDFI     - RISLU DFI Circuit board
TMDFI2TFAC      - DFI-2 Trunk Facility
TMDFI2HFAC      - DFI-2 Host Facility
TMDFI2RFAC      - DFI-2 Remote Facility
TMDFI2CFAC      - DFI-2 Communications Facility
TM_IFAC         - IDCU Facility
The following four types indicate the scan point is being
used by the service providers for a miscellaneous alarm.
TM_MJOPEN       - Major alarm, normal state open
TM_MJCLOS       - Major alarm, normal state closed
TM_MNOPEN       - Minor alarm, normal state open
TM_MNCLOS       - Minor alarm, normal state closed
The following types are for DNU-S facilities:
TM_OC3FAC  - OC-3 SONET Termination Equipment (OC3STE) Facility
TM_STEFAC  - STSX-1 SONET Termination Equipment (EC1STE) Facility
TM_STS1FAC - Synchronous Transport Signal-1 (STS-1) Facility
TM_VT1FAC  - Virtual Tributary 1.5 (VT1.5) Facility
TM_DS1SFAC - Digital Signal Level 1 (DS1) Facility
The following are for RAIU.
TM_TFACRAIU  - DFI-2 FAC that hosts an RAIU
TM_DNURAIU   - DNU DS1SFAC that hosts an RAIU
The Following are for RSM on DNU-S.
TM_DNUHSM - DNU DS1SFAC that hosts an RSM
```

**Attribute:**

verbose

**Fullname:**

Indicates verbose/non-verbose mode of conditioning for type = [DFI|ANCB|DTCB|IFAC] and action = TMCONDITION

**Attribute Description:**

This field indicates the CGA conditioning mode of an MSU scan point, DFI, or IFAC. Verbose mode conditioning means that for each port in a carrier group, when a port is removed or restored to service by CGA an individual user message will be printed. It is a boolean and should be populated with BNO for normal conditioning and DBYES for verbose conditioning. Verbose mode conditioning only makes sense for units associated with ports (type = ANCB, DTCB, DFI, or IFAC) that are to be conditioned (action = TMCONDITION). For all other situations verbose should be DBNO (default). Due to the large number of DNU-S facilities, verbose is always DBNO for DNU-S facilities.

```
DBYES   - verbose mode conditioning by CGA:
          action=TMCONDITION, type =[ANCB|DTCB|DFI|IFAC]
DBNO    - (default) normal action by CGA
```

**Attribute:**

name

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
The name associated with the alarm
**Attribute Description:**
This attribute is an optional field that can be assigned by the user. The field size is big enough for the common CLFI code or a name that fits within 25 characters.
The population rules for this field are:
anything you care to call the facility (25 chars).
RC must add a null (hex 00 or ) at the end of the string that is typed in for the name field if the field is less than 25 characters long.

**Attribute:**
afac_id
**Fullname:**
Advanced mobile phone service (AMPS) facility identifier
**Attribute Description:**
Unique AMPS facility identification number.

**Attribute:**
detail
**Fullname:**
should detailed CGA event reporting be allowed?
**Attribute Description:**
This flag indicates whether detailed CGA event reporting will occur.

**Attribute:**
cga_sp1
**Fullname:**
A spare bit for future use.
**Attribute Description:**
A spare bit for future use.

**Attribute:**
cga_sp2
**Fullname:**
A spare bit for future use.
**Attribute Description:**
A spare bit for future use.

**Attribute:**
cga_sp3
**Fullname:**
A spare bit for future use.
**Attribute Description:**
A spare bit for future use.

## 4. Population Rules for RLcga_trans

**Relation Description**

Translate Scan pionts.

Translate scan point alarm to ports affected by alarm

This relation is used only if port conditioning is desired for a change of state on a MSU scan point. (RLcga_stat's field 'action' is set to TMCONDITION for a particular scan point.)

**Attribute: scanpt**

**Fullname:** Scan pionts.

**Attribute Description** This attribute is divided into sub-attributes scanpt.member and

Copyright © 1999 Lucent Technologies

scanpt.module. Module refers the Interface module number 1-200. The member refers to the MSU scan point port name.

**Attribute: scanpt.member**

**Fullname:** Member.

**Attribute Description** Scan Point member.

**Attribute: scanpt.module**

**Fullname:** Module.

**Attribute Description** Scan piont Module.

**Attribute: member**

**Fullname:** Member number.

**Attribute Description** This attribute refers to a member of a logical port group.

**Attribute: port**

**Fullname:** Port.

**Attribute Description** This attribute is divided into sub-attributes port.member and port.module. Member is the port name of a line of trunk. Module refers to the interface module number.

The port cannot be a Digital Subscriber Line port (servclass=FC_ISDN).

**Attribute: port.member**

**Fullname:** Member.

**Attribute Description** Port member.

**Attribute: port.module**

**Fullname:** Module.

**Attribute Description** Port module.

# CGAREL

## 1. Description

This relation is used to store relationships between circuits for circuits which are CGA sources. It is currently used only for DNU facility circuits. Attributes which are not populated will be set to GLNULCKT. The src_map field in RLcgackt keys to tuples in this relation. There will be one tuple in this relation for every unique RLcgackt "src_map" value. These are currently only DNU VT and STE FACs.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1024 |
| expected number of tuples | 168 |
| access type | DBACC_HASH |

## 4. Population rules for RLcgarel

### Relation Description

```
        CGA relatives
        This relation resides on the switching module (SM) and contains
        information about the structure of hierarchical facilities, as
        needed for CGA processing.
        Examples of hierarchical facilities are the
        OC-3 SONET Termination Equipment Facility (OC3STE),
        STSX-1 SONET Termination Equipment Facility (EC1STE),
```

Copyright © 1999 Lucent Technologies

Synchronous Transport Signal-1 (STS-1) Facility,
Virtual Tributary 1.5 (VT1.5) Facility,
Digital Signal Level 1 (DS1) Facility.
One tuple must be populated for each family of facilities.
For a DNU-S Data Group using STSX-1 interface, there are 3 types of families:
(1) An EC1STE and its subtending STS, with no subtending operational VT1's.
(2) An EC1STE, its subtending STS, and its subtending VT1 and DS1S which are on the master VPIDB.
(3) A VT1 and its subtending DS1S which are not on the master VPIDB.
For a DNU-S Data Group using OC-3 interface, there are 5 types of families:
(1) Two OC3 STE with no subtending STS.
(2) Two OC3 STE with one, two, or three subtending STS. Each STS does not have any subtending operational VT1.
(3) Two OC3 STE with one, two, or three subtending STS. Some STS have a subtending operational VT1 that is the master VPIDB.
(4) Two OC3 STE with one, two, or three subtending STS. All STS have a subtending operational VT1 that is the master VPIDB.
(5) A VT1 and its subtending DS1S which are not on the master VPIDB.

**Attribute:**
ckt
**Fullname:**
Circuit id of a hierarchical facility
**Attribute Description:**
This attribute is the internal circuit name of a hierarchical facility. This will be the circuit name of a VT1 of the family if the VT1 is operational; otherwise, it will be the circuit name of the STS-1, EC1STE, or OC3STE (side 0). This circuit name is also the key to several other relations. These include RLcktdata, RLcga_stat, RLfac_prov, etc.

**Attribute:**
lvl1
**Fullname:**
Level-1 internal circuit identifier for a hierarchical facility.
**Attribute Description:**
Circuit id of the lowest level of the hierarchical facility associated with the tuple key. In the case of partial population of a hierarchical facility, "GLNULCKT" be entered in this field.
For DNU-S facilities:
If the key is an EC1STE, then "lvl1" will be GLNULCKT.
If the key is an OC3STE, then "lvl1" will be one of the following:
- GLNULCKT (if a subtending STS-1 facility #1 is not

**Copyright © 1999 Lucent Technologies** 

provisioned for the OC-3 interface).
- Subtending STS-1 facility #1 of that OC-3 interface if this STS-1 has no subtending operational VT1.5
- VT1FAC associated with the master VPIDB (if an operational VT1.5 facility is provisioned on STS-1 facility #1).

If the key is a STSFAC, then "lvl1" will be GLNULCKT.
If the key is a VT1FAC, and there is a DS1SFAC populated for the VT's hierarchical facility, then "lvl1" will be the internal circuit name of the DS1SFAC that is the child of the VT1FAC.
If the key is a VT1FAC, and there is no DS1SFAC populated for the VT's hierarchical facility, then "GLNULCKT" is entered for "lvl1".
This can not currently happen.

**Attribute:**
lvl2
**Fullname:**
Level-2 internal circuit identifier for a hierarchical facility.
**Attribute Description:**
Circuit id of the 2nd-lowest level of the hierarchical facility associated with the tuple key. In the case of partial population of a hierarchical facility, "GLNULCKT" may be entered in this field.
For DNU-S facilities:
If the key is an EC1STE, then "lvl2" will be GLNULCKT.
If the key is an OC3STE, then "lvl2" will be one of the following:
- GLNULCKT (if a subtending STS-1 facility #2 is not provisioned for the OC-3 interface).
- Subtending STS-1 facility #2 of that OC-3 interface if this STS-1 has no subtending operational VT1.5
- VT1FAC associated with the master VPIDB (if an operational VT1.5 facility is provisioned on STS-1 facility #2).

If the key is an STSFAC, then "lvl2" will be GLNULCKT.
If the key is a VT1FAC, then "lvl2" will be the same as the key to the tuple.

**Attribute:**
lvl3
**Fullname:**
Level-3 internal circuit identifier for a hierarchical facility.
**Attribute Description:**
Circuit id of the 3rd-lowest level of the hierarchical facility associated with the tuple key. In the case of partial population of a hierarchical facility, "GLNULCKT" may be entered in this field.

**Copyright © 1999 Lucent Technologies** 

For DNU-S facilities:
If the key is an EC1STE, and there is an STS (which does not have a master vpidb) is populated as a child of the key, then "lvl3" will be the internal circuit name of the STSFAC that is the child of the EC1STE.
If the key is an EC1STE and no child STS is populated for the EC1STE, then "GLNULCKT" is entered for "lvl3".
If the key is an OC3STE, then "lvl3" will be one of the following:
- GLNULCKT (if a subtending STS-1 facility #3 is not provisioned for the OC-3 interface).
- Subtending STS-1 facility #3 of that OC-3 interface if this STS-1 has no subtending operational VT1.5
- VT1FAC associated with the master VPIDB (if an operational VT1.5 facility is provisioned on STS-1 facility #3).

If the key is an STSFAC, then "lvl3" will be the same as the key to the tuple.
If the key is a VT1, and this VT1 is associated with the master_vpidb of the parent STS, then "lvl3" is the interal circuit name of the STS parent of the VT1.
If the key is a VT1, and this VT1 is not associated with the master_vpidb of the parent STS, then "lvl3" is "GLNULCKT".

**Attribute:**
lvl4
**Fullname:**
Level-4 internal circuit identifier for a hierarchical facility.
**Attribute Description:**
Circuit id of the 4th-lowest level of the hierarchical facility associated with the tuple key.
For DNU-S facilities:
If the key is an EC1STE, then "lvl4" is equal to the key.
If the key is an OC3STE, then "lvl4" is equal to the key.
If the key is an STSFAC for a STS-1 facility that is subtending to an OC-3 interface and the STS does NOT have a master vpidb, then "lvl4" will be the internal circuit name of the OC-3 facility (side 0).
If the key is a VT1FAC for a VT1.5 facility that is subtending to an OC-3 interface:
If this VT1FAC is associated with the master_vpidb of the parent STS-1, then "lvl4" is the internal circuit name of the parent EC1STE or the internal circuit name of the parent OC3STE (side 0).
If this VT1FAC is NOT associated with the master_vpidb of the parent STS-1, then "lvl4" is "GLNULCKT".

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
lvl5
**Fullname:**
Level-5 internal circuit identifier for a
hierarchical facility.
**Attribute Description:**
Circuit id of the 5th-lowest level of the hierarchical
facility associated with the tuple key.
For DNU-S facilities:
If the key is an EC1STE, then "lvl5" will be GLNULCKT.
If the key is an OC3STE, then "lvl5" will be the internal
circuit name of the OC-3 facility (side 1).
If the key is an STSFAC for a STS-1 facility that is
subtending to an OC-3 interface, then "lvl5" will be
the internal circuit name of the OC-3 facility (side 1).
If the key is a VT1FAC for a VT1.5 facility that is
subtending to an OC-3 interface:
If this VT1FAC is associated with the master_vpidb
of the parent STS-1, then "lvl5" is the internal
circuit name of the parent OC3STE (side 1).
If this VT1FAC is NOT associated with the master_vpidb
of the parent STS-1, then "lvl5" is "GLNULCKT".
If the key is a VT1FAC for a VT1.5 facility that is subtending
to an EC1STE, then "lvl5" is GLNULCKT.

## 4. Population Rules for RLcgatype

**Relation Description** Relation to determine carrier facility type. This relation is used only if port conditioning is desired for a change of state on a MSU scan point. (RLcga_stat's field action is set to TMCONDITION for a particular scan point.)

**Attribute: scanpt**

**Fullname:** circuit identification
**Attribute Description** This attribute is divided into sub-attributes scanpt.member and scanpt.module. Module refers the Interface module number 1-200. The member refers to the MSU scan point port name.

**Attribute: scanpt.member**

**Fullname:** MSU scan point port name
**Attribute Description** Indicates the MSU scan point port name.

**Attribute: scanpt.module**

**Fullname:** the interface module number
**Attribute Description** Indicates the interface module number.

Copyright © 1999 Lucent Technologies

**Attribute: type** **Fullname:** type of facilities
**Attribute Description** Indicates the type of facilities.

## 4. Population Rules for RLcgpn_ltm

**Relation Description** Calling party number to LTM index
Provides calling party number conversion to LTM index and module, to determine terminal location of a DN for DN's appearing on Basic *EKTS*® terminals. There is one tuple in this relation for every appearance of a DN on a Basic *EKTS*® terminal.

**Attribute: lport**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** logical port.

**Attribute Description** Logical port number of the terminal associated with the BRI port. Must have an entry in RLis_term with this lport.

**Attribute: cgpn**

**Fullname:** calling party number.

**Attribute Description** The DN on a terminal which originated the call. The DN may be a member of a MLHG.

**Attribute: cgpn.dig7cnt**

**Fullname:** Number of digits in the Directory Number

**Attribute Description** The Number of Digits in the Calling Party Number

**Attribute: cgpn.dn7**

**Fullname:** 7 digit Directory Number

**Attribute Description** 7 digit Directory Number of the Calling Party. The 7 digits may only contain digits 0 through 9.

**Attribute: ltm_idxi**

**Fullname:** Logical termination index.

**Attribute Description** Logical termination index.

**Attribute: lead_module**

**Fullname:** lead module.

**Attribute Description** Lead module for the ltm_idxi associated with this call appearance.

## 4. Population Rules for RLchgtbl

**Relation Description** Charge table to determine number of strokes. The charge table is used to peg message register counts (that is hotmot) that will be eventually pegged by a system process that actually increments the count to the port on the MSU.

This relation is used as a buffer for charge table counters. Whenever a message register (dist point) needs updating, this buffer will be read by the GLPGMSU system process and the appropriate ports on the MSU will be stroked (incremented)

**Attribute: chrgtabl_x**

**Fullname:** call type table

**Attribute Description** Call type table. Taken from CHRGIDXEXP relation attribute 'chrgtabl_x'. All MBI call types which use the Hotel/Motel message register feature, should have a number assigned in 'chrgtabl_x' attribute.

Copyright © 1999 Lucent Technologies 

**Attribute: table_name**

**Fullname:** identifies the charge table name

**Attribute Description** Set table name to name for hotmot call in feature data block located in the pcbla.

**Attribute: init_time**

**Fullname:** initial time period duration

**Attribute Description** Initial period of time for which a call is charged a fixed number of 'strokes'. Initial time period is given in minutes.

**Attribute: init_stroke**

**Fullname:** initial time period strokes

**Attribute Description** If 'init_stroke' is a zero value and 'ovr_stroke' is non-zero, the message register will not be accessed. However, a message register must be assigned.
If BOTH 'unit_stroke' and 'ovr_stroke' are populated as zero, the message register need not be assigned.

**Attribute: ovr_time**

**Fullname:** over time period duration

**Attribute Description** Incremental period of time for which a call is charged 'strokes' beyond the initial period of time. Over time period given in minutes.

**Attribute: ovr_stroke**

**Fullname:** over time period strokes

**Attribute Description** Over time period strokes. This is associated with the billing of over time units (strokes). If 'ovr_stroke' is a zero value and 'init_stroke' is non-zero, the message register will not be accessed. However, the message register must still be assigned. If BOTH 'init_stroke' and 'ovr_stroke' are populated as zero, the message register need not be assigned.

## 4. Population Rules for RLchklst

**Relation Description** Choke List. This relation contains a choke list that is read to determine what special office codes LASS Automatic Recall and LASS Automatic Callback invocation should not be allowed to camp on.

**Attribute: dummy_key**

**Fullname:** Dummy Key
**Attribute Description** This relation does not need a key, but one is required. A dummy key is used for this relation.

**Attribute: chkpad**

**Fullname:** Chokelist padding
**Attribute Description** This attribute is a dummy field used for alignment of chokelist entries.

**Attribute: ids_in_use**

**Fullname:** Number of chk_id structures in use.
**Attribute Description** This attribute specifies the current number of choke list entries populated. The choke list structures must be populated in a sequential order, chk_id1 first, then chk_id2 second, etc.

**Attribute: chk_id1**

**Fullname:** choke list entry id 1 thru 16
**Attribute Description** Choke List entry ID. This field specifies the choke list digits in ASCII. The choke list digits in each entry specify either an NPA, NPA-NXX, or NPA-NXX-XXXX. Special office codes for mass calling applications are in the choke list. These codes may be set aside by the service provider. LASS automatic recall and/or LASS automatic callback invocation should be denied to these codes on a call-by-call basis. The maximum number of entries on the list is 16. Each of which may be 3 or 6 or 10 digits in length. Special office codes which just consist of an NPA must be populated first in this list, combinations of NPA-NXX must be populated next. Combinations of NPA-NXX-XXXX populated last in the list.

**Attribute: chk_id1.chkid**

**Fullname:** choke list entry id (1 thru 16).
**Attribute Description** See usage description for attribute chk_id1.

**Attribute: chk_id1.chkcnt**

**Fullname:** choke list count (1 thru 16).
**Attribute Description** There are 16 of these counters that keep track of how many digits have been populated in a corresponding choke list entry. A choke list entry will contain at a minimum NPA.

**Attribute: chk_id[*]**

**Fullname:** See attribute chk_id1
**Attribute Description** See Attribute chk_id1.

**Attribute: chk_id[*].chkid**

**Fullname:** choke list entry id (1 thru 16).
**Attribute Description** See usage description for attribute chk_id1.

**Attribute: chk_id[*].chkcnt**

**Fullname:** choke list count (1 thru 16).

Copyright © 1999 Lucent Technologies 

**Attribute Description** There are 16 of these counters that keep track of how many digits have been populated in a corresponding choke list entry. A choke list entry will contain at a minimum NPA.

## 4. Population Rules for RLchperm

**Relation Description**

RLchperm

RLchperm is for the Carrier Handling Permissions data for the DIOR Sequence Call Enhancements feature.

**Attribute: countrycode**

**Fullname:** Country Code.

**Attribute Description** DIOR Country Code utilizing this feature.

**Attribute: carrier**

**Fullname:** Carrier.

Copyright © 1999 Lucent Technologies

**Attribute Description** Origination carrier of a call from this country code.

**Attribute: oaff1**

**Fullname:** tri-state boolean spare.

**Attribute Description** Unused.

**Attribute: autoinit**

**Fullname:** Automated Initial calls allowed.

**Attribute Description** Automated initial calling allowed on DIOR calls indicator.

**Attribute: autoseq**

**Fullname:** Automated Sequence calls allowed.

**Attribute Description** Automated sequence calling allowed on DIOR calls indicator.

**Attribute: diorotto**

**Fullname:** DIOR Otto allowed.

**Attribute Description** DIOR Offer Transfer To Operator indicator.

**Attribute: apq**

**Fullname:** Automated Position queue usage allowed.

**Attribute Description** Automated Position queue usage allowed on DIOR Automated Initial calls indicator.

**Attribute: prepdcard**

**Fullname:** Pre-paid card usage allowed.

**Attribute Description** Pre-paid card allowed on DIOR calls from this country code/carrier indicator.

**Attribute: indettrmt**

**Fullname:** Indeterminate reply treatment.

**Attribute Description** Treatment to be given when indeterminate reply received from card query.

**Attribute: annclang**

**Fullname:** Announcement language.

**Attribute Description** Language in which announcements are to be given if not in English. null field defaults to English announcements.

**Attribute: oaff3**

**Fullname:** tri-state boolean spare.

**Attribute Description** Unused.

**Attribute: oaff4**

**Fullname:** tri-state boolean spare.

**Attribute Description** Unused.

## 4. Population rules for RLchrgidxexp

### Relation Description

```
        Charge index expansion table

        This relation maps the charge index, determined by routing,
        into an automatic message accounting (AMA) call type.  Detailed
        charge treatments such as message billing index, wide area
```

Copyright © 1999 Lucent Technologies

telephone service (WATS) band, charge table, charging method and multimetering tariff are also determined from this relation. Special charge treatment for circuit switched data calls is also determined from this relation.

This relation expands a charge index into detailed treatment for charging a call.

**Attribute:**
charge_x
**Fullname:**
Charge index
**Attribute Description:**
Charge index (key). Determined from RT_SCRNING. For automatic route selection (ARS) it is normally determined from RT_MCRT (this is usually the case for trunk terminations). However, for ARS calls using uniform numbering plan (UNP) and terminating to an NXX in this office, the charge index comes from ARSCRN (this is usually the case for line terminations).

For integrated services digital network (ISDN) data calls it is determined from this relation:

The charge_x obtained from RT_SCRNING is used to access this relation and obtain the data_charge_x. The data_charge_x overlays the charge_x field in the RT_SCRNING buffer. This is done by remote terminal access (RTA) while in the RT_SCREEN state. For non-ISDN data calls, the charge_x used will be the regular charge index.

**Attribute:**
amacalltype
**Fullname:**
Type of AMA call
**Attribute Description:**
Defines the type of billing record that will be associated with the charge index. All call types listed here generate AMA records *except* those that are otherwise noted. The following enum values are allowed: See Local Switching Systems General Requirements (LSSGR) section 8.1 for specific uses.

AMDTLTMBI - AMA call code 001. Detailed message rate, timed, with message billing index (MBI).

AMMRTMBI - AMA call code 002. Message rate, timed, with MBI.

Copyright © 1999 Lucent Technologies 

AMDTLUMBI - AMA call code 003. Detailed message rate, untimed, with MBI.

AMMRUMBI - AMA call code 004. Message rate, untimed, with MBI.

AMDTLTNOMBI - AMA call code 005. Detailed message rate, timed, no MBI.

AMSTPAID - AMA call code 006. Station paid.

AMDA411 - AMA call code 009. 411 directory assistance.

AMDA555 - AMA call code 033. 555 directory assistance.

AMLOCALCOIN - AMA call code 041. Local coin.

AMFLATRATE - AMA call code 067. Flat rate (recorded only if under study).

AMBNWATS - AMA call code 068. WATS billing number.

AMFREE - AMA call code 074. Free call (recorded only if under study).

AMFGDOLATA - AMA call code 110 for feature group D (FGD) originating local access and transport area (LATA) calls.

AMFGDTLATA - AMA call code 119 for FGD terminating LATA calls.

AMFGDWATS - AMA call code 114 for FGD outward WATS (OUTWATS) originating LATA calls.

AMFGBOLATA - AMA call code 134 for feature group B (FGB) originating LATA calls.

AMFGBTLATA - AMA call code 135 for FGB terminating LATA calls.

AMSBWATS - AMA call code 7 for WATS, station billing number. Standard attribute values are: watsind - measured (MT).

AMFX - AMA call code 11 for foreign exchange (FX). Standard attribute values are: watsind - AMNOTUSED.

AMTANTTRK - AMA call code 32 for tandem tie trunk. Standard attribute values are: watsind - AMNOTUSED.

AMSBILWATS - AMA call code 111 for WATS, station

Copyright © 1999 Lucent Technologies 

billing inter-LATA. Standard attribute values are: watsind - measured (MT).

AMCFPFNOANS - AMA call code 32 for tandem tie trunk. (Same as AMTANTTRK except call processing does not generate simulated answer.) Standard attribute values are: watsind - AMNOTUSED

AMATTSTPD - AMA call code 060 for station paid calls. Standard attribute values are: watsind - AMNOTUSED

AMATTCMC - AMA call code 306 for cellular mobile carrier (CMC) calls. Standard attribute values are: watsind - AMNOTUSED

AMCCSASAMP - AMA call code 21 for common control switching arrangement (CCSA) sampling, records are for customer information only. (Used by the ARS II feature.)

AMETSMDR - AMA call code 85 for electronic tandem switching (ETS)-message detail recording (MDR) revenue accounting office (RAO), records are for customer information only. (Used by the ARS II feature.)

AMETSCCSA - AMA call code 99 for ETS-MDR RAO and CCSA route, records are for customer information only. (Used by the ARS II feature.)

AMISDNDATA - AMA call code 072 for ISDN data intra-LATA calls.

AMISDNOLATA - AMA call code 117 for ISDN data originating inter-LATA calls.

AMISDNTLATA - AMA call code 121 for ISDN data terminating inter-LATA calls.

AMOAICVPN - AMA call code 263 for originating access to interexchange carrier virtual private network (VPN) calls.

AMAPSVC - AMA call code 080 for ISDN packet switching virtual calls. * Note: No tuple will be generated for this call type in the relation RLamcall.G.

AMAPSIVC - AMA call code 378 for ISDN packet switching intra group virtual calls. * Note: No tuple will be generated for this call type in the

Copyright © 1999 Lucent Technologies 

relation RLamcall.G

AMSPAMEG - AMA call code 309 for MEGACOM(R) (special access) calls.

AMSDNCALL - AMA call code 129 for Software Defined Network calls.

* Note: The charge index is not used to determine these types of billing. Therefore, these values should never be populated in the charge index expansion relation.

* AMINWATS - AMA call code 008 for inward WATS (INWATS) calls. (Not used in charge index expansion.)

* AMCMCBOT - AMA call code 63 are used for calls terminating to a CMC using Type 2B access.

* AMCMCOT - AMA call code 64 are used for calls terminating to a CMC and originating from an access tandem using Type 2A access.

* AMCMCBTT - AMA call code 65 are used for calls originating from a CMC using Type 2B access.

* AMCMCTT - AMA call code 66 are used for calls originating from a CMC and terminating to an access tandem using Type 2A access.

* AMFGAOLATA - AMA call code 131 for feature group A originating LATA calls. (Not used in charge index expansion.)

* AMFGATLATA - AMA call code 132 for feature group A terminating LATA calls. (Not used in charge index expansion.)

* AMACCT - AMA call code 124 for account code dialed calls not normally recorded, records are for customer information only. (Not used in charge index expansion.)

* AMNSFAM - AMA call type for number services calls. This indicates that the call code has been stored in the call record. The call code was returned from the SCP database. (Not used in charge index expansion.)

* AMOSOINWATS - AMA call code 360 for INWATS calls at the originating screening office.

Copyright © 1999 Lucent Technologies 

(Not used in charge index expansion.)

* AMSPAWATS - AMA call code 318 for special access WATS calls. (Not used in charge index expansion.)

* AMDIDSTDY - AMA call code 381 for direct inward dialing (DID) study records associated with timeout while waiting for answer supervision from DID facilities.

* AMUTT - AMA call code 550 for Utility Telemetry calls. (Not used in charge index expansion.)

**Attribute:**
chrgmeth
**Fullname:**
Charge method
**Attribute Description:**
Charging method.
Not used by U.S. -- default to CHRGNON.

**Attribute:**
mm_tariff
**Fullname:**
Multimetering tariff identity
**Attribute Description:**
Multimetering tariff identity.
Not used by U.S. -- default to 0.

**Attribute:**
mbi_wats
**Fullname:**
MBI/WATS band
**Attribute Description:**
MBI/WATS band. Assign numbers 0-9 for WATS call types and 1-255 for MBI call types such that RLamcall.xmbi_wats is DBYES

**Attribute:**
chrgtabl_x
**Fullname:**
Charge table index
**Attribute Description:**
Non-zero numbers are allowed only with call types:

AMLOCALCOIN, AMDA411, AMDA555, AMFGDOLATA, and AMFGBOLATA. These numbers should correspond with

Copyright © 1999 Lucent Technologies 

the numbers assigned in relation FC_COINCHG.

AMDTLTMBI, AMMRTMBI, AMDTLUMBI, AMMRUMBI, AMDTLTNOMBI, and AMFLATRATE. These numbers should correspond with the numbers assigned in the CHGTBL relation used with the hotel/motel message register feature.

**Attribute:**
watsind
**Fullname:**
WATS indicator field
**Attribute Description:**
WATS indicator. WATS call type (AMBNWATS,AMFGDWATS, AMSBWATS, AMSBILWATS) must have AMMEASTM OR AMFULLBD. All other call types must have AMNOTUSED.

**Attribute:**
data_charge_x
**Fullname:**
Charge index for ISDN data call
**Attribute Description:**
Charge index for ISDN data call. For a regular voice call, the charge index is the charge_x attribute (key). The d ata_charge_x provides the operating company a means to charge a data call different from a voice call. If the data call is charged the same as a voice call, this data_charge_x should have the same value as the charge_x. If data_charge_x is other than charge_x, then there must be another tuple in RLchrgidxexp keyed by the value of data_charge_x.

**Attribute:**
alt_sfc
**Fullname:**
Alternate service feature code
**Attribute Description:**
This field allows operating companies flexibility in assigning service feature codes to be stored in the AMA record. Values reserved for assignment by the operating companies are 800-999. If this field is not set, the default is zero and the hard coded service feature code is used.

**Attribute:**
alt_cc
**Fullname:**
Alternate call code
**Attribute Description:**
This field allows operating companies flexibility in assigning call codes to be stored in the AMA record. Values reserved for assignment by the operating companies are 800-999. If t

**Copyright © 1999 Lucent Technologies** 

his field is not set, the default is zero and the hard coded call code is used.

**Attribute:**

maxwats

**Fullname:**

Maximal subscribed OUTWATS

**Attribute Description:**

This attribute is used to identify maximal subscribed OUTWATS for populating the network specific facility (NSF) information element (IE) of the private rate interface (PRI) SETUP message. This attribute may be DBYES if RLchrgidxexp.charge_x is a maximal subscribed OUTWATS charge index. This attribute can be DBYES only if RLchrgidxexp.amacalltype is AMBNWATS, AMSBWATS, AMFGDWATS, or AMSBILWATS. This attribute applies only to 5ESS(R)-2000 switches serving as private branch exchanges (PBXs), not central offices. In a central office this attribute should be set to DBNO.

## 4. Population Rules for RLciclkgrp

**Relation Description** Circuit Identification Code to Link group relation
This relation maps the Circuit Identification Code (CIC) to the Link group and member.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This attribute defines the Destination Point Code (DPC) for the link group.

**Attribute: opc**

**Fullname:** Originating Point Code

**Attribute Description** This attribute defines the originating point code.

Copyright © 1999 Lucent Technologies

**Attribute: cic**

**Fullname:** Circuit Identification Code

**Attribute Description** This attribute defines the Circuit Identification Code (CIC).

**Attribute: lnkgrp**

**Fullname:** Link Group

**Attribute Description** This attribute defines the Link group associated with the DPC, OPC and CIC.

**Attribute: member**

**Fullname:** Link group member

**Attribute Description** This attribute defines the Link group member.

# CICPHRAS

## 1. Description

For Carrier Specific Branding, this relation stores a carrier identification code (CIC) to Announcement Phrase ID mapping. This phrase ID is used to brand calls by carrier when the feature is active on the trunk group over which the call arrives at the OSPS.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10000 |
| expected number of tuples | 300 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```
CICPHRAS    relid = 2194  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population Rules for RLckt_port

**Relation Description** Circuit name and port index to port name.
Convert a circuit name and port index to its associated port name. Since there can be 1-to-many relationship between a circuit and ports, a port index is required. The port index uniquely identifies a port when multiple ports exist for a particular circuit or logical group of ports.

**Attribute: cktname**

**Fullname:** Circuit name

**Attribute Description** This is the circuit name that the port resides on. The port will be uniquely identified by the port index. If the circuit name is a holding circuit name then the port has no parent circuit, do not perform a crosscheck on RLcktdata.

**Attribute: port_indx**

**Fullname:** Port index for this port

**Attribute Description** The port index will uniquely identify a port within a circuit. If there is a 1-to-1 mapping between the port and its parent circuit then the port index is 0. See RLfc_porttyp.p for population rules.

Copyright © 1999 Lucent Technologies

**Attribute: port**

**Fullname:** Port name

**Attribute Description** The port uniquely identified by the circuit name and port index.

## 4. Population Rules for RLckt_rel

**Relation Description** Circuit Relationships
This relation contains static equipment information for circuits and units in the SMP. This relation also contains hardware hierarchy relationship information.

**Attribute: name**

**Fullname:** Circuit name

Copyright © 1999 Lucent Technologies

**Attribute Description** (key) name of the key circuit

**Attribute: type**

**Fullname:** Circuit type

**Attribute Description** The type of the key circuit

**Attribute: unit**

**Fullname:** Unit number

**Attribute Description** The unit number of the key circuit

**Attribute: utype**

**Fullname:** Unit type

**Attribute Description** The unit type of the key circuit.

**Attribute: ckt_indx**

**Fullname:** Circuit Index

**Attribute Description** The circuit index of the key circuit.

**Attribute: mate_id**

**Fullname:** Mate Circuit name

**Attribute Description** The name of the mate to the key circuit

**Attribute: spare_id**

**Fullname:** Spare Circuit name

**Attribute Description** The name of the circuit which can spare the key circuit. This name will be shared among more than one key circuit.

**Attribute: parent_id**

**Fullname:** Parent Circuit name

**Attribute Description** The name of the simple (single, dedicated) parent of this circuit, if it exists. This name may be shared among more than one key circuit.

**Attribute: parent_cmplx**

**Fullname:** Complex Parent Indicator

**Attribute Description** An indicator that the circuit's parent is not simple or dedicated. Typically this means there is one or more sets of variable (such as, duplex pair) parents. **Defines:**

## 4. Population Rules for RLckt2grp

**Relation Description**

```
Mapping of unit number, unit type, physical circuit number
(such as, physical rt#), and line Group Number to a logical group name
```

This relation represents the translation from a circuit name to the Group Summary Scan Data Block (GSDB) logical group name. This translation is used for scanning.

Relation RLckt2grp is accessed by the physical unit number, unit type, the Remote terminal number and the line group number. The transport unit number and RT number are obtained from relation RLcktdata. The line group number is derived by dividing the RT line number(0 - 2047) by eight (8).

Group Number = (RT_line_no / 8)

One tuple is needed for every eight (8) ports on a remote terminal. The GSDB group in each tuple is the key into the dynamic relation, RLgsdb, where processes can identify which of eight ports are reporting a state change.

Copyright © 1999 Lucent Technologies

**Attribute: unit**

**Fullname:** unit number

**Attribute Description** This is the unit number on the SM.

**Attribute: utype**

**Fullname:** unit type

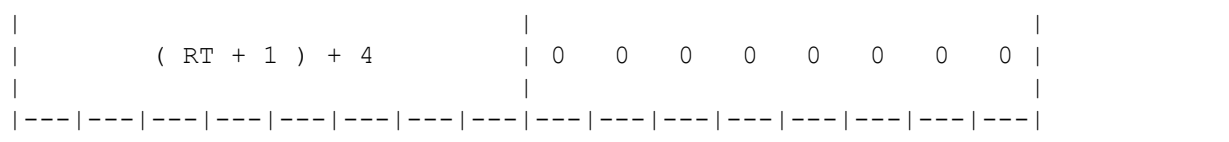
**Attribute Description** This is the unit type.

**Attribute: ckt_no**

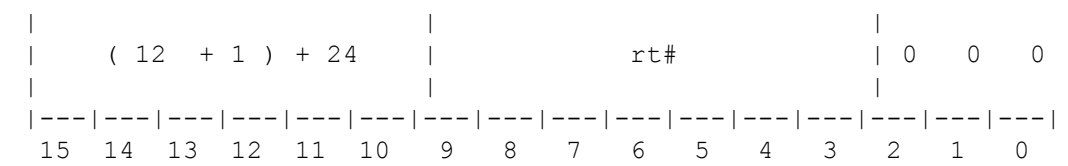
**Fullname:** Physical circuit number

**Attribute Description** The circuit number is contained in the circuit index as shown here. Valid RT numbers are 1 - 31 for IDCU and 1 - 99 for DNU-S.

IDCU



DNU-S

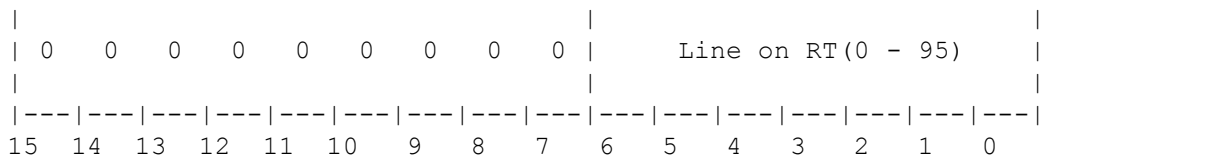


**Attribute: grp_num**

**Fullname:** Line Group Number

**Attribute Description** The line group number is derived by dividing the RT line number by eight (8). The RT line number can be obtained from the port index. If The RT line is a TR8 the line number is located in bits 0-6 of the port index. If the RT line is a TR303 then the line number is located in bits 2-13 of the port index as shown here.

TR8 RT(PCS96SHF,PCS96BNK):



TR303 RT(PCRDT303):

## 4. Population Rules for RLcktcddig

**Relation Description** Circuit code to digit translation. This relation is used to translate the 4 bit circuit code, received in the TNS parameter of an ISUP7 IAM message, to a digit value which represents the 0ZZ, or 1NX or 1N'X digit string used in equal access and international signaling.

This relation is only populated for Originating Access Tandem offices with incoming ISUP7 trunks and Originating Toll offices that handle international traffic on incoming ISUP7 trunks.

**Attribute: ckt_code**

**Fullname:** Circuit Code

**Attribute Description** This attribute, contained in the Network Identification field of the transit network selection (TNS) parameter, contains a 4 bit circuit code value.

A 4 bit value of 0000, in the circuit code bit subfield of the TNS parameter, is defined in the ISUP7 protocol specification to have a meaning of unspecified. Since all CCS7 parameter bit subfields have a default value of zero unless otherwise assigned, it is not recommended to translate a 4 bit 0000 code point as a meaningful value.

If ckt_code has a value of 0001 then dig must contain the corresponding 1NX (international call, no operator requested) standardized string.

If ckt_code has a value of 0010 then dig must contain the corresponding 1N'X (international call, operator requested) standardized string.

**Attribute: dig**

**Fullname:** Digits

**Attribute Description** This attribute contains a 3 digit string which represents the 0ZZ or 1NX or

## 4. Population rules for RLcktdata

### Relation Description

Circuit datag

Per circuit data.

DEVELOPER GUIDELINES FOR CLI ATTRIBUTE POPULATION RULES
See Usage section for attribute cli.

For circuits on dial through announcement (DTA) recorded announcement functions (RAFs): PC_ANN and PC_DTA circuit types can be mixed within one RAF.

This file is arranged based on utype and ckttype allows for a future ownership split based on ckttype owners (such as, SMIM, TM, & PC) 5E12.1 and 5E13.1 were un-commoned due to the delta file sizes approaching the 4MB extraction limit.

All changes will be strictly held to the following standards:

- Use Declarative code vs. Procedural (functions) to the greatest extent possible
- No linear searches
- No functions with error points
- For 5e10 and later, no new functions that read data
- All outer loops must be identical for loop jamming for example "for cktdata in RLcktdata"
- PRL must be located based on utype and ckttype.

**Attribute:**

name

**Fullname:**

Local circuit name

**Attribute Description:**

The circuit name is a logical 16-bit name. There is no physical information embedded in its name.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

type

**Fullname:**

Circuit type

**Attribute Description:**

This attribute indicates the circuit type.

**Attribute:**

baseadd

**Fullname:**

Base address of circuit

**Attribute Description:**

This value is used for switching module memory address. This attribute represents the base address for the circuit's registers and will address the first register. If the circuit does not have addressable registers, the base address will be 0. With addressable registers, the base address is typically populated with the PICB in the upper byte and 0 in the lower byte.

**Attribute:**

pidbtype

**Fullname:**

Peripheral interface data bus type

**Attribute Description:**

This attribute is to describe different types of peripheral interface data bus. Specific usage varies depending on the type assigned.

**Attribute:**

pidb

**Fullname:**

Peripheral interface data bus number

**Attribute Description:**

The valid range of data bus number used is unsigned char, ranging from 0 to 255.

**Attribute:**

dbind

**Fullname:**

Data Bus Channel Indicator

**Attribute Description:**

Indicates if a data bus channel is assigned to this circuit.

**Attribute:**

dbchan

**Fullname:**

Data bus channel number

**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute contains the PIDB time slot number (0 - 31).

**Attribute:**
chnasn
**Fullname:**
Channel assignment
**Attribute Description:**

This attribute is used to describe Channel assignment rules for circuits.

DEVELOPER GUIDELINES FOR COUNTING CHANNEL ASSIGNMENT FOR DI LOADING
---

The time slot interchanger (TSI) provides access for 512 peripheral interface data bus (PIDB) time slots which are mapped to 512 channels (also known as TSI time slots). Each PIDB time slot has access to eight channels. PIDB time slots terminating on DI 0 have access to one of eight even channels, and PIDB timeslots terminating on DI 1 have access to any one of eight odd channels. For example, PIDB timeslot 0 on PIDB 0 on DI 0 has access to any one of the channels 0, 2, 4, 6, 8, 10, 12, or 14.

NOTE: This paragraph is being added to explain why these guidelines of channel assignment were not written in population rule language (PRL). The information about time slot channel assignment is contained in RLcktdata for office data administration (ODA) reference. The switch will never allow a corrupted office-dependent data (ODD) (that is, an ODD with too many time slot channels allocated) to exist on the switch. Peripheral control (PC) initialization code checks this situation on every switching module (SM) initialization. RC prevents over growth of channels through either a PC interface (used by their mapping code) which is used by a few forms or by PC trigger functions failing when growing in more channels (PC trigger functions during growth check this situation). Another reason for this check not being put in PRL, is that with static ODD (SODD) audits based off of PRL. If this check was to be added as an audit, it would never find problems due to PC and RC code resident on the switch that already protects against this. (also, note that office database editor (ODBE) uses the PC trigger functions thus, not allowing over growth of channels). A final reason for not adding this check as an SODD audit, is that this will be a complicated check (due to the ability to move system tones around on different channels) and would use much central processing unit (CPU) time that could be used on a more productive audit. The audit would also use a lot of memory (it would keep a couple of large arrays used for time slots [for local calculations and counters] and the audit text portion of the audit would be fairly large [there will be a large amount of PRL code to implement this]).

The following describes in detail the mapping of time slots channels for each circuit type.

Copyright © 1999 Lucent Technologies 

There can only be eight channels assigned per PIDB time slot per data interface (DI). Their use is maintained in the unprotected channel allocation map PCchalloc[] as follows:

The following diagram shows the mapping.

```
DI 0    |               PIDB time slots (dbchan)
        |  31      30  ............. 4     3     2     1    0
-------------------------------------------------------------
P    0  |
I    1  |
D    2  |       EVEN CHANNELS IN THE RANGE SPECIFIED
B    .  |
     .  |496-510 480-494 ......... 64-78 48-62 32-46 16-30 0-14
N    6  |
O    7  |

DI 1    |               PIDB time slots (dbchan)
        |  31      30  ............. 4     3     2     1    0
-------------------------------------------------------------
P    0  |
I    1  |
D    2  |       ODD CHANNELS IN THE RANGE SPECIFIED
B    .  |
     .  |497-511 481-495 ......... 65-79 49-63 33-47 17-31 1-15
N    6  |
O    7  |
```

The following is the bit map diagram of a channel number. The dbchan field contains the PIDB time slot.

```
  8   7   6   5   4   3   2   1   0
_____________________________________
|   |   |   |   |   |   |   |   |   |
|                   |           |   |
|       DBCHAN      |  1 of 8   | DI |
|___________________|___________|____|
```

Certain rules apply towards how these channels are used up by different circuits, which are explained in the following. In addition, system tones must be considered as well.

SYSTEM TONES

There are two system tones (IDLE, AUDIBLE RING) to worry about unless this is an automatic voice network (AUTOVON) SM, then there are three (IDLE, AUDIBLE, and PRECEDENCE AUDIBLE RING). The global parameters, Glidlech, Glaudring, and Glpaudring specify the channel used by idle code, audible ring, and precedence ring respectively.

All system tones are movable at growth and initialization time,

Copyright © 1999 Lucent Technologies 

but they will always be there using up channels.

If all eight channels are used, then, if one or both of the system tones reside in this map column, an attempt is made to relocate the tone to a different channel. If there was no system tone clash, or if the relocation attempt fails, an illegal peripheral configuration exists. It is not necessary to over-assign the whole 512-channel pool to get in trouble -- any one column using over eight channels is bad.

For each timeslot, nine channels are allowed to be used if one is a tone and there are some allocatable channels.

There can never be more than 11 circuits using a given set of eight channels in the AUTOVON (three system tones ) case and never more than ten circuits in the non-AUTOVON (two system tones) case.

Other circuits use channels as described in the following diagram. Additional information regarding certain circuits is also included in the following diagram.

| TYPE | CHNASN | DBCHAN | COMMENTS |
|---|---|---|---|
| PCBTSR_CH | PCALLOCHAN | 0..31 | Not counted towards DI overload for channels used. |
| (ANALOG TUs) type = PCTCLOUT PCTCLIN,PCTCTST, PCTC2EM,PCTC4EM, PCTCTLO,PCTCTLI, PCTCT2E,PCTCT4E | PCINITCHAN | 32 channels | 32 channels/unit, max of 4 tuples per unit each unit has a unique value for 'pidb'. |
| PCCHAN | PCALLOCHAN | 64 channels (32/sg) | 64 tups/unit equipped. 1 tup per circuit. |
| PCCHAN | PCALLOCHAN | 64 channels (32/sg) | 1 tup/LU2/3 channel circuits equipped. |
| PCDCLCHN | PCALLOCHAN | 32 channels | 32 tup/SLC(R) 96 unit with 9:1 concentration. |
| | | 64 channels | with 4.5:1 concentration. |
| PCDCLCHAN | PCALLOCHAN | 32 channels | 1 tup/SLC(R) 96 PIDB channel with 9:1 concentratio n. |
| | | 64 channels | with 4.5:1 concentration. |

```
                                  (32 channels)   (there exists 1 tup/sg)

                  (PCDPIDB)                       Do not use channels.

                  (PCPSIUPIDB)                    Do not use channels.

PCPIDBIDCU        PCALLOCHAN                      32 channels/tuple pair
(5e8 and later)   (PCDUALPIDB)    0 .. 31
                                  (32 channels)
```

RSMs
---
RSM control time slots use channels as well.

For an HSM, the database relation RLrsmchan is read, where each tuple gives the channel number of a control time slot from an RSM in the chdb_num field.

```
DI number = !(chdb_num & 0x1)  (specifying even or odd)
TS number = (chdb_num & 0xf) + 1;
```

PCPIDBRISLUs
---
RISLU PIDBs may not use all 24 timeslots; some are reserved for signaling depending on the DFI mode, the stuffing phase being used by the DFI, and the number of control timeslots being used.

The common data (CD) configuration is stored in the relation rlISLUPIDB. The key to rlISLUPIDB is the common control (CC) PICB number (either CC will do). It is derived from the companion PICB field in the rlPICB tuple for this DFI.

To determine the DFI mode and type, we need to read the rlCKTDATA tuple for the DFI remoting this PIDB. The key, the DFI circuit name, is also in rlISLUPIDB. To access it we need the relative position on the CD of this PIDB (which is contained in the lower nibble of the PIDB circuit name).

The number of control time slots is contained in the relation rlRISLUDFI, but it is safe to assume that DFI-H1s use one CTS, and DFI-H2s use zero CTS (unless the DFI-H2 is being used for OSPS with facility sparing)

RISLU PIDBs are remoted over different types of primary rate carriers (PRC) facilities. Some timeslots are lost in the remoting process. The number and location of lost timeslots varies depending on the type of PRC, the number of control timeslots, the stuffing phase, and the type (H1 or H2) of DFI.

If the RISLU is being used for operator services position system (OSPS) with facility sparing, the map used will be the same for all DFIs/PIDBs. This is because the traffic from a given PIDB must fit on any other PIDB.

Copyright © 1999 Lucent Technologies 

This array maps control time slots to PIDB time slots for DFI-H1s Using various stuffing phases. It gives the TS number to be used for the control time slot. That should not be counted.

```
                0CTS  1CTS  2CTS  3CTS  4CTS
                ================================
/* stuffing phase 0 */  { 0x00, 0x04, 0x0c, 0x2c, 0x6c },
/* stuffing phase 1 */  { 0x00, 0x04, 0x0c, 0x1c, 0x5c },
/* stuffing phase 2 */  { 0x00, 0x02, 0x0a, 0x1a, 0x3a },
/* stuffing phase 3 */  { 0x00, 0x02, 0x06, 0x16, 0x36 }
```

Do not count stuffed timeslots if they are used for signaling based on the DFI mode.

SMT1FE, SMT1FE8Z - T1 format with no channel for signaling bits

SMDFRSM,SMDFB8ZS - T1 format with timeslot for signaling bits

- Don't count timeslot 30 if stuff phase 3
- Don't count timeslot 31 for other phases.

The dbchan field is the stuffing pattern (0-3) which is office engineered to distribute the 24 T1 channels across all 32 PIDB time-slots.
It tells which of the 0 ..31 timeslots on the PIDB will not be used for a channel. This way 4*24 = 96 channels would actually be spread across just three rows (3*32 = 96 channels). Stuffing patterns are the same as in DFI-H1/H2. The time slot not to be counted is the stuffing phase number and every fourth one thereafter. Therefore, 8 of 32 are not counted.

**Attribute:**
utype
**Fullname:**
Hardware unit type
**Attribute Description:**
This attribute is to indicate the hardware type that this circuit belongs to.

**Attribute:**
unit
**Fullname:**
Unit number
**Attribute Description:**
This attribute indicates the unit number that the circuit is located on within the SM.

**Attribute:**
ckt_indx
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

The circuit index is a unique representation of a circuit within its unit

**Attribute Description:**

Each circuit within a given unit number and unit type must have a unique circuit index. The format of the circuit index attribute is dependent on the type of circuit. Each circuit index will have embedded physical information about the circuit.

**Attribute:**

cktbrd

**Fullname:**

Physical circuit

**Attribute Description:**

This attribute indicates if this is a physical circuit. The value for this field is DBYES/DBNO.

**Attribute:**

eqstat

**Fullname:**

Equipage state

**Attribute Description:**

Generally, the range of this attribute is SMUNEQ (UNEQUIPED), SMGROW (GROWTH), and SMOPER (OPERATIONAL). The value of SMSGROW (SPECIAL GROWTH) is allowed only where specifically stated. This attribute indicates the current state of the circuit in the SM.

**Attribute:**

cli

**Fullname:**

Change level indicator (CLI)

**Attribute Description:**

This attribute indicates the current hardware release of a given circuit. As a circuit is upgraded, it is referenced with a new schematic drawing (J-Drawing) and changed level indication. The specific circuit version will have a CLI of 0x00. Upgraded version will have incremental CLI values.

DEVELOPER GUIDELINES FOR CLI ATTRIBUTE POPULATION RULES

- List the valid CLI values and describe the hardware equipage options associated with each value.

- Be specific and complete in describing each hardware option including feature provided and associated or distinguishing pack codes and J-drawing list numbers

- See the CLI population rules for the digital services unit or the modular MSU as examples of good rules.

**Copyright © 1999 Lucent Technologies** 

- Don't force the reader to go to J-drawings or the DMclidef.h file, the population rules should be complete enough to be the one reliable source for updates to the Translation Guide and recent change manuals.

**Attribute:**
dfimode
**Fullname:**
Digital facilities interface hardware mode
**Attribute Description:**
This attribute indicates the type of legal hardware transmission mode used for a particular DFI. This attribute only pertains to DFI-related circuits. All non-DFI circuits will be populated with SMDFNULL.

**Defines:**
"db/DMmodule.h",
"db/DMcircuit.h",
"db/DMclidef.h",
"db/DMportindx.h",
"db/DMcc_side.h"

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLclidat

**Relation Description** This relation contains certain specific information about each remotely located cluster of modules.

This relation is to be Group Partitioned. The grp_type (partitioning class) is GPDAMCL_COM, and the grp_id is the

**Copyright © 1999 Lucent Technologies** 

cluster id (clid). Since each RSM/ORM/TRM has a unique cluster id (clid), the CLIDAT relation will have exactly one tuple. A copy of this will also appear in the CLIDAT relation in the AM, as well as in each of the RMs in the cluster. The AM will have as many tuples as there are distinct clusters.
A tuple will exist in this relation only if there exists at least one equipped RSM, ORM, or TRM (that is, equipage state = SMOPER.) (During Growth, a new tuple may be added with no modules, but this should be only a transitional state.) Modules in unequipped states will not appear.

**Attribute: clid**

**Fullname:** remote cluster number

**Attribute Description** This is the identification number of the set of modules which comprise the cluster. The recommended convention in assigning cluster numbers is to number them consecutively beginning with 1. Note that this association of cluster number with associated module number is inverted in RLMODATT in the AM and in RLCL_MATES in the RMs. Even though the domain DMCLUSTER runs from 0 to 174, the number 0 is reserved to represent the case of not being a member of any cluster (that is, not a member of any remote cluster - RSM, ORM, or TRM) in the inverted relation module-->clid.

**Attribute: text**

**Fullname:** cluster title

**Attribute Description** This attribute holds a string of up to 15 characters. It is a text identification of the cluster and may contain any comment. However, it is expected to be used to title display pages and the like and was intended to carry a title for the cluster (such as Brokenburg, MCI POP, etc.) If there are less than 15 characters in the string, it should be padded with binary zeros.

**Attribute: rm_cnt**

**Fullname:** Number of modules in the cluster.

**Attribute Description** This attribute should contain the number of modules assigned to this cluster. This number must be less than or equal to Glmaxclsz for RSMs and must be equal to 1 for ORMs and TRMs.

**Attribute: rm_alm_in**

**Fullname:** The module number of module that has the remote alarm input option.

**Attribute Description** This attribute holds the module number (1-192) of the module that has the remote alarm input option. Only one module in a RSM cluster may have the remote alarm input option. Zero is used to indicate that no module in the cluster is equipped with the remote alarm input option. The default value is zero. The module number specified in rm_alm_in, rm_alm_out, rm_clk, and rm_mtb, if different from zero, must all be the same.

**Attribute: rm_alm_out**

**Fullname:** The module number of the module that has the remote alarm output option.

**Attribute Description** This attribute holds the module number (1-192) of the module that has the remote alarm output option. Only one module in a RSM cluster may have the remote alarm output option. Zero is used to indicate that no module in the cluster is equipped with the remote alarm output option. The default value is zero. The module number specified in rm_alm_in, rm_alm_out, rm_clk, and rm_mtb, if different from zero, must all be the same.

**Attribute: rm_clk**

**Fullname:** The module number of the module that has the remote clock unit.

**Attribute Description** This attribute holds the module number (1-192) of the module that has the

Copyright © 1999 Lucent Technologies 

Remote Clock Unit. Only one module in a RSM cluster may have the Remote Clock Unit. ORMs and TRMs are not equipped with a Remote Clock Unit, so this field will always be zero in those modules. Zero is used to indicate that no module in the cluster is equipped with the Remote Clock Unit. The default value is zero. The module number specified in rm_alm_in, rm_alm_out, rm_clk and rm_mtb, if different from zero, must all be the same.

**Attribute: rm_mtb**

**Fullname:** The module number of the module from which the metallic test bus connections are made to peripheral units in the other RSMs.

**Attribute Description** A multimodule RSM normally has only one MMSU. This situation may not be true if two or more 5A RSMs are combined to form a multimodule RSM. In the latter case multiple MMSUs could exist at the site. Metallic testing is limited to a single shelf of each MMSU on the MMRSM. The metallic test interconnect bus (MTIB) is only connected between service groups of the first shelf of each of these MMSUs and does not connect to other MMSUs. Metallic test bus (MTB) connections from peripheral units must connect to either the metallic access of the MMSU on the RSM with the peripheral units or to the metallic access of the MMSU on the RSM specified as having the global resource for metallic testing (master). Where two or more 5A RSMs, each of which has an MMSU, are combined into a single multimodule office, MTB connections from other MMSUs may be either left as is or moved to the metallic access of the MMSU on the master RSM. The attribute rm_mtb gives the module number (1-192) of the RSM having the MMSU on the master RSM. The default value is zero.

For ORMs and TRMs, the attribute rm_mtb is always set equal to the module number (1-192) if that module has a MMSU equipped. If the attributes rm_alm_in or rm_alm_out are set to a non-zero value, then rm_mtb should be set to the same value.

The module number specified in rm_alm_in, rm_alm_out, rm_clk and rm_mtb, if different from zero, must all be the same. The rm_mtb attribute should be changed to a non-zero value if and only if an MTB assignment is made from the MMSU of a RSM to a peripheral circuit in another RSM in the same MMRSM cluster. The rm_mtb attribute then should be set equal to the module number of the RSM where the connecting MMSU resides. That RSM is indicated by the module number part of the MTB number that is being assigned. If a peripheral circuit is grown whose MTB is connected to a MMSU existing in the same module, rm_mtb should not be changed. No MTB assignment should be allowed to any peripheral circuit on a module in one MMRSM cluster(site) from another site. Each tuple in this relation represents one site.

**Attribute: rm[*]**

**Fullname:** These remote member attributes hold the module numbers of the cluster.

**Attribute Description** These remote member attributes are populated with the module numbers assigned to this cluster. Attributes that are not assigned should be populated with zero. Modules may be listed in any order (no correlation with any physical property is implied).

Non-zero values are allowed for rm01 through rmNN for RSMs where NN is Glmaxclsz. For ORMs and TRMs, rm01 should be set to the module number for that module. Attributes rm02 through rmNN should be set to zero.

Whenever possible, RSM non-zero attributes should be consecutive starting with rm01. If holes develop through degrowth, they should be filled when growing the next RM. The remote member attribute rmXX defines a relative member number XX. Other relations that use the remote member number should be consistent with the assignment made in this relation. Examples are RLmodatt.r, RLmatatt.r, and GLcl_offset.

**Attribute: irm[*]**

Copyright © 1999 Lucent Technologies 

**Fullname:** ISDN remote module of the specified cluster ID.

**Attribute Description** These ISDN remote member attributes are populated with the ISDN module numbers assigned to this cluster.

## 4. Population Rules for RLclrkinfo

**Relation Description** Clerk information relation. This relation is populated only through recent change (RC) batch time release process. Each tuple contains the clerk identification number and clerk name (this is the actual name of the Batch file). Each tuple is created when the process starts, and is removed when the clerk file is released. Moreover, each tuple is associated to a RC batch process. Because RC Batch process is not allowed during a generic retrofit, ODA does not need to populate this relation.
One tuple for each clerk who does the release.

**Attribute: clrkid**

**Fullname:** Clerk Identification Number
**Attribute Description** Unique clerk identification number for the service provider clerk. The size of this field can't be changed.

**Attribute: clrknm**

**Fullname:** Clerk name.

Copyright © 1999 Lucent Technologies 

**Attribute Description** The actual file name of the Batch file as a string of 10 alphanumeric.

**Attribute: verbose**

**Fullname:** Verbose option.
**Attribute Description** Print out one line logging message after one RC transaction is completed if its value is DBYES. The default is DBNO.

## 4. Population Rules for RLcls_ls

**Relation Description** Combined Link Set to Link Sets mapping
This relation defines the components of the combined link set. The components must be two distinct link sets.

**Attribute: cls**

**Fullname:** Combined link set

**Attribute Description** This attribute defines the combined link set.

**Attribute: ls1**

**Fullname:** First component link set

**Attribute Description** This attribute defines the first component link set of the combined link set.

**Attribute: ls2**

**Fullname:** Second component link set

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute is the second component link set of the combined link set.

**Attribute: ls_sel**

**Fullname:** linkset selector

**Attribute Description** The ls_sel attribute indicates the bit chosen in SLS field to be used for selecting the linkset in the combined linkset.

The valid values are in the set {CCLS_D, CCLS_C, CCLS_B, CCLS_A}.

## 4. Population rules for RLclu_info

### Relation Description

Cluster Information Relation.

This relation stores routeset
information for equipped cluster routesets.

**Attribute:**
clix
**Fullname:**
Cluster Index
**Attribute Description:**
Cluster Index (key to dynamic RLclu_stat).

**Attribute:**
norm_rte
**Fullname:**
Normal Route
**Attribute Description:**
Normal Route, linkset (key to RLls_grp, RLls_clust) or combined linkset (key to RLcls_ls).

**Attribute:**
alt_rte1
**Fullname:**
Alternate Route 1
**Attribute Description:**
Alternate Route, linkset (key to RLls_grp, RLls_clust) or combined linkset
(key to RLcls_ls).

**Attribute:**
alt_rte2
**Fullname:**
Alternate Route 2

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Alternate Route, linkset (key to RLls_grp, RLls_clust) or combined linkset
(key to RLcls_ls).

**Attribute:**
xlist_alw
**Fullname:**
X-list allowed indicator
**Attribute Description:**
Indicates whether an X-list should be kept for this cluster routeset or not, to track the remote status of cluster members with a more restrictive status than the cluster as a whole.

**Attribute:**
cluster
**Fullname:**
Cluster Identifier
**Attribute Description:**
Cluster Identifier, top 16 bits of 24-bit point code for NAR; key to RLclu_clix.

**Defines:**
"db/DBls_stat.h",
"ccs/CCc7_param.h"

# CLUAPCI

## 1. Description

This relation will map the combination of a cluster and APCI to an unique index. The index will be used as a key to the new dynamic relation RLclapcrdb, which will own all routing data blocks for associated member routes (RLs7rdb tuples associated with DPCs in that cluster, representing routes through that APCI) and the cluster routes (RLclu_rdb tuples) through that APCI. This will make it easy to find all the affected routes when a TCx message regarding the cluster is received from the adjacent STP with that APCI.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum number of tuples | 38400 |
| expected number of tuples | 600 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| relation type | DBSTATIC |
| distribution | FP |
| trigger function | CCcluapci |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

through that APCI) and the cluster routes (RLclu_rdb tuples) through that APCI. Thiswill make it easy to find all the affected routes when a TCx message regarding the cluster is received from the adjacent STP with that APCI.

**Attribute:**
cluster
**Fullname:**
Cluster ID
**Attribute Description:**
Cluster (top 16 bits of 24-bit DPC).. Key to RLclu_clix.

**Attribute:**
apci
**Fullname:**
Adjacent Point Code Index
**Attribute Description:**
Index of the Adjacent Point Code. Key to RLapci_apc.

**Attribute:**
clapci
**Fullname:**
Cluster-APCI index
**Attribute Description:**
Cluster-APCI combination index, used for key to dynamic RLclapcrdb.

**Attribute:**
rdb_cnt
**Fullname:**
Count of the cluster-member routes
**Attribute Description:**
Count of the number of cluster + member routes that are associated with this cluster+apci combination. When rdb_cnt goes to zero, the RLcluapci tuple should be deleted.

**Defines:**
"ccs/CCc7_param.h"

Copyright © 1999 Lucent Technologies 

# CMAPDATA

## 1. Description

Relation that contains the site id of an Application Processor and uses this as key to determine the external data link bit map that for IOP data link, indexes into the ECD data base. For DSL data links, the bit position in link_map indicates the relative link number for an AP. The ISLU port number can be determined by referencing RLdslxn or RLxndsl.

## 2. Data Dictionary Values

| | |

## 4. Population Rules for RLcmapdata

**Relation Description** Bit Map Data
Relation that contains the site ID of an application processor (AP) and uses this as the key to determine the external data link bit map that for input/output processor (IOP) data link, indexes into the equipment configuration database (ECD). For digital subscriber line (DSL) data links, the bit position in link_map indicates the relative link number for an AP. The ISLU port number can be determined by referencing RLdslxn or RLxndsl.
In the 5E3(1) generic, client processes in the *5ESS*®-2000 switch that wish to send data to an AP used the AP communication package, and routed these messages through the IOP in the administrative module (AM). In 5E4(2), the messages could also be routed through an integrated services digital network (ISDN) switching module (SM). To handle the 5E3(1) generic, this relation provides a mapping from the office-dependent database (ODD) to the ECD. The link_map defines the index into a string array that identifies the remote user names that are allowed in the ECD for external data links to be used by the application processor communication package. The module attribute gives the processor that controls the data links to the AP. In 5E3(1) this processor was the AM; in 5E4(2) this processor could be an ISDN SM.
Beginning in 5E4(2), APs on ISDN SMs will use the bit position in the link_map attribute to indicate the relative link number for a given AP (APn-k). The relative link number can be converted to a corresponding port on an integrated services line unit (ISLU) by referencing either RLdslxn or RLxndsl as described here.
In the 5E7 generic, once the existing site_id becomes E911 site_id, no other AP feature can use this site_id. Recent change/verify (RC/V) cannot block making an existing site_id a new E911 site_id when the site_id is assigned to other features.
In the 5E9(1) generic, AP link diversification is adding the capability to link an AP to 2 ISDN SMs. This relation is being updated to add two fields, secapsiteid and is_alt, to store this secondary link information. This feature does not apply to E911.
Also in 5E9(1), dual ESA for E911 is adding the capability to allow a *5ESS*®-2000 switch to define two E911 application processor IDs (APIDs), one as a primary and one as a secondary. The fields used by AP link diversification will also be used for dual ESA for E911 (secapsiteid and is_alt).
In 5E9(2) the Dual ESA Enhancements Special Feature uses a boolean "esa" to indicate that an office is an ESA.
In 5E10 the International Direct Distance Dialing 15-Digit Expansion Feature (IDDD15) uses a boolean "use_iddd15" to indicate that the AP site requires existing format (default) or expanded format messages.

**Attribute: site_id**

**Fullname:** Site Identification

**Attribute Description** The site identification number can be any number from 1 to 255, and must uniquely identify the AP to the switch. This number is used by the AP capabilities to indicate where messages should be routed. The assignment of this number must be consistent with their usage.

**Attribute: apindex**

**Fullname:** AP Index for *5ESS*®-2000 Switch Use

**Attribute Description** The AP index is an integer between 1 and DBMAXAPS(99), and is used by the AP communication package to refer to the AP. This number must be unique to each site identifier.
This value will be generated internally by Recent Change or ODA in a sequential manner such that: APs hosted by AM IOP data links must have an apindex value between 1 and 3 and APs hosted by ISDN SMs will have an apindex value from 4 to DBMAXAPS (99).

**Attribute: module**

**Fullname:** Module Number

**Attribute Description** In 5E3(1) this attribute was set to 0 since only the AM controls data links to

Copyright © 1999 Lucent Technologies 

an application processor.
Starting in 5E4(2), APs hosted by ISDN SMs have module values consistent with SM number.
Each AP must be connected to one, and only one, ISDN SM with DSL data links.

**Attribute: alarm**

**Fullname:** Alarm

**Attribute Description** This field indicates whether the user desires alarms to be activated (DBYES) or not (DBNO) when the DSL data links from an ISDN SM to the AP are out of service. This bit is always set (DBYES) for AM IOP data links to APs.

**Attribute: use_isvm**

**Fullname:** Indicates the associated AP 'site_id' is used for ISVM feature.

**Attribute Description** The field, use_isvm, is set to DBYES if the associated AP 'site_id' is used for ISVM, otherwise, it is set to DBNO.

If the AP site_id is used for E911 feature, then verify that use_isvm must equal DBNO

**Attribute: use_iddd15**

**Fullname:** Use IDDD15 Format Messages

**Attribute Description** This field indicates that the associated AP has been modified to accept expanded format messages associated with IDDD15 feature and the IDDD15 secured feature (SFID223) is active if it is set to DBYES, otherwise, it is set to DBNO and existing formats are used.

**Attribute: use_spr1**

**Fullname:** Spare

**Attribute Description** Spare field.

**Attribute: use_spr2**

**Fullname:** Spare

**Attribute Description** Spare field.

**Attribute: use_spr3**

**Fullname:** Spare

**Attribute Description** Spare field.

**Attribute: link_map**

**Fullname:** Bit map of the data link.

**Attribute Description** The 32 bit link_map field will be populated differently for APs hosted via IOP data links in the AM and ISDN DSL data links in an SM. The bits are defined from right to left (low to high) such that bit 0 is the rightmost bit.

AM LINK_MAP RULES:

APs hosted via IOP data links in the AM are no longer supported.

SM LINK_MAP RULES:

For ISDN DSL data links, the bit position represents the relative link number for that AP. For

Copyright © 1999 Lucent Technologies 

example, bit 1 represents relative link 1 for that AP. Bits 1 - 16 (that is, 16 links) are allowed per AP when the AP is on a SM. Bits 1 - 30 (that is, 30 links) are allowed per AP when the AP is on a SM-2000.
Since the only valid apindex values for APs hosted by SMs are 4-99 (for example, AP4, AP5, ... AP99), the links will be referenced in the following format: APx-y, where 'x' is the apindex and 'y' is the relative link number. For example, AP 5, relative link 4 is represented as AP5-4.

To determine the corresponding DSL 'D' channel port number (dport), the relations RLdslxn.G or RLxndsl.G must be referenced.

| APINDEX | Bit Position Number | Relative Link # | External Name |
|---|---|---|---|
| 5 | 0 | - | Not Used |
| 5 | 1 | 1 | AP5-1 |
| 5 | 2 | 2 | AP5-2 |
| 5 | 3 | 3 | AP5-3 |
| . | . | . | . |
| . | . | . | . |
| . | . | . | . |
| 5 | 16 | 16 | AP5-16 (SM Limit) |
| . | . | . | . |
| . | . | . | . |
| . | . | . | . |
| 5 | 30 | 30 | AP5-30 (SM-2000 Limit) |

Bits 0 and 17 to 31 should not be used for ISDN SMs. Bits 0 and 31 should not be used for SM-2000s.

**Attribute: is_alt**

**Fullname:** Indicates the associated AP 'site_id' is used as a secondary AP site.

**Attribute Description** The field, is_alt, is set to DBYES, if the associated AP 'site_id' is used as a secondary 'site_id', otherwise, it is set to DBNO.
If 'site_id' is a non-E911 site and SFID103 is not set, then 'is_alt' must equal DBNO.
If 'site_id' is a E911 site and SFID108 is not set, then 'is_alt' must equal DBNO.

**Attribute: secapsiteid**

**Fullname:** Secondary AP 'site_id'

**Attribute Description** The secapsiteid attribute is used for AP link diversification and dual ESA for E911 special features to define a secondary AP 'site_id'. If this value is non-zero and 'is_alt' is DBNO, then 'secapsiteid' represents the secondary APID. If 'secapsiteid' is non-zero and 'is_alt' is DBYES, then 'secapsiteid' represents the primary APID.
If 'site_id' is a non-E911 site and SFID103 is not set, then 'secapsiteid' must equal zero.
If 'site_id' is a E911 site and SFID108 is not set, then 'secapsiteid' must equal zero.

**Attribute: esa**

**Fullname:** Indicates that processor is an ESA.

**Attribute Description** If esa is set to DBYES the processor is either the primary or the secondary ESA.

**Attribute: ffcf1**

**Fullname:** Boolean reserved for future field features use.

**Attribute Description** Not assigned yet.

**Copyright © 1999 Lucent Technologies** 

**Attribute: ffcf2**

**Fullname:** Unsigned 8 reserved for future field feature use.

**Attribute Description** Not assigned yet.

**Attribute: ffcf3**

**Fullname:** Unsigned int 16 reserved for future field feature use.

**Attribute Description** Not assigned yet.

**Attribute: alw_dup_nxx**

**Fullname:** Allow duplicate (non-unique) NXXs on the AP link.

**Attribute Description** This field indicates if the client process on the *5ESS*®-2000 switch can accept 7-digit DNs with non-unique NXXs transmitted over the AP link.
When this field is DBNO, the client process will accept 7-digit DNs that will map to the base NPA for that NXX. The attribute is set to DBYES if DNs with non-unique NXXs will be transmitted over the AP link. In this case, 7-digit DNs are no longer allowed since the client process is unable to determine the correct NXX.
From a Facility Management perspective, when the field is set to DBNO, 7-digit DNs are recognized for the ACSR feature and 8-character list names (of the format T + 7 digits or up to any 8 characters) for the TOD feature. When the field is set to DBYES, 10-digit DNs are recognized for the ACSR feature and 11-character list names (of the format T + 10 digits or up to any 11 characters) for the TOD feature.

## 4. Population Rules for RLcmp_crd

**Relation Description** Differentiation of card service charges. This relation contains the service provider administration (TCA) defined calling card comparison card for the differentiation of card service charges feature and a label which defines the issuer of the card. This comparison card can be used as a marketing technique to compare calling card prices between the calling customer's card and a TCA defined comparison card.

**Attribute: comp_crd**

**Fullname:** Comparison card number

**Attribute Description** This is the comparison card vendor/issuer ID number and will be used in rate quote queries. This field contains a two to seven digit calling card number.

**Attribute: comp_crd.dig7cnt**

**Fullname:** Comparison card digit count

Copyright © 1999 Lucent Technologies

**Attribute Description** The count of the comparison card vendor/issuer ID number.

**Attribute: comp_crd.dn7**

**Fullname:** Comparison card vendor/issuer ID number

**Attribute Description** This is the comparison card vendor/issuer ID number and will be used in rate quote queries. This field contains a two to seven digit calling card number.

**Attribute: crd_flag**

**Fullname:** 10+4 card indicator

**Attribute Description** This field will be used to set the 10+4 comparison card indicator field of the rate query. DBYES indicates that this card is a 10+4 card.

**Attribute: crd_label**

**Fullname:** Card character label

**Attribute Description** The card label attribute provides a meaningful label for the comparison card. This label will display the name of the card issuer on page two of the operator services position system (OSPS) video display terminal (VDT)/combined services terminal (CST) when a comparison card is used during processing of OSPS calling card rate quote queries. The crd_label field is a one to five character field.

### Relation Description

```
        CCS Message Transport Path

        This relation identifies the CCS (Common Channel
        Signaling) message paths that exist between
        switching modules (SM) in the office. The types
        of CCS message paths between SM's are:

        1. CCS Message Transport via a Direct Message Handler
           A Direct Message Handler is a Message Handler (MH)
           that physically resides on the SM-2000 and is used
           transport messages to/from QPH's on a Global SM
```

Copyright © 1999 Lucent Technologies

to the non-global SM-2000 SMP.

2. CCS Message Transport via a Transfer Message Handler
   A Transfer MH is an MH that physically resides on an SM-2000 and is used by an SM's to relay CCS messages from/to QPH's on a Global SM.

3. Intra-MD Message Delivery Link - A logical path within a GSM that is used by the Switching Module Processor (SMP) on a GSM to communicate with the PSU on the GSM.

This relation is being implemented as part of the 5e14(1) SS7 PSU Architectural Enhancements Feature. This feature will allow a PSU on a host global SM-2000 to support SS7 signaling to/from any SM in the office.

**Attribute:**
gsm
**Fullname:**
global switching module
**Attribute Description:**
The number that specifies a global SM which supports national SS7 signaling.

**Attribute:**
ngsm
**Fullname:**
non-global switching module
**Attribute Description:**
The number which specifies a non-global switching module (NGSM). An NGSM is an SM that is equipped with CCS trunks or TCAP applications that generate CCS messages that need to be transported to the PSU on the GSM so that the CCS messages can be sent or received over CCS signaling links.

**Attribute:**
appl_cnt
**Fullname:**
application count
**Attribute Description:**
This count equals the total number of TCAP applications plus the total number of trunk group members that use the CMT path. If this count is greater than zero, the RLcmtpath tuple cannot be deleted.

**Attribute:**
mh_sm
**Fullname:**

Copyright © 1999 Lucent Technologies 

message handler switching module

**Attribute Description:**

A switching module number. The message handler on the SM specified by mh_sm will be used by CCS Message Transport for communication between the non-global SM (ngsm) and global SM (gsm).

**Attribute:**

pathtype

**Fullname:**

type of CCS path

**Attribute Description:**

Pathtype identifies whether the path being defined between two SM's is a Direct MH path, a Transfer MH path, or an Intra-MD link path.

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLcnb_cas

### Relation Description

```
Customer Account Services Contract NPA Body Table
CAS contract body table - This relation indicates whether
a contract exists for a LEC call to be charged to a card
that uses CAS signaling. This based on NPA-NXX of the
calling number.
/*
 * This  relation is for domestic generics only
 */
```

**Attribute:**

npa

**Fullname:**

Numbering Plan Area

**Attribute Description:**

This is an NPA for which only some NXXs have contract as

indicated in the head table RLcnh_cas.

**Attribute:**
oamap00

  0 |            circuit            |   unitnum   |*****************|
    |---------------+---------------+---------------+---------------|
       ( 4 bytes )
```

## 4. Population Rules for RLcnf6_ckt

**Relation Description** 6 ports conference circuit names
See RLcnf6_ckt.circuit usage.

**Attribute: circuit**

**Fullname:** circuit name

**Attribute Description** For GDSU: Each TN1032 6-port conference circuit board generates 2 tuples for this relation. It also generates 12 CKTDATA tuples. Exactly one of the CKTDATA tuples must have CKTDATA.cktbrd = DBYES; this is the CKTDATA tuple corresponding to port 0 on the TN1032 board. The LEAD CIRCUIT NAME is the value of the CKTDATA.name attribute for that tuple. The 2 CNF6_CKT tuples for that board will then have the corresponding circuit indexes for attribute 'circuit' as:

```
ckt_indx = LEAD CIRCUIT NAME's ckt_indx
ckt_indx = LEAD CIRCUIT NAME's ckt_indx  + 6
```

For GDSF:
One (1) tuple for each 6-port conference leading circuit.

**Attribute: unitnum**

**Fullname:** unit number

**Attribute Description** Digit service unit number of the GDSU/GDSF containing the circuit.

    |                               |               |                |
  0 |            circuit            |   unitnum     |****************|
    |---------------+---------------+---------------+---------------|
       ( 4 bytes )
```

## 4. Population Rules for RLcnf10ckt

**Relation Description** Ten-way Conference Circuit
Each 10-port conference leading circuit generates a tuple for this relation.

**Attribute: circuit**

**Fullname:** Circuit Name

**Attribute Description** 1 tuple for each 10-port conference leading circuit.

**Attribute: unitnum**

**Fullname:** Unit Number

**Attribute Description** This is the digital services unit number of GDSF containing the circuit.

## 4. Population Rules for RLcnh_cas

**Relation Description** Customer account services contract NPA head table. CAS contract head table - This relation indicates whether a contract exists for a LEC call to be charged to an AT&T card. This is based on NPA or NPA-NXX of the calling number.

This relation is populated for domestic generics only.

**Attribute: casdummy**

**Fullname:** CAS dummy key

**Attribute Description** This is a dummy key set to 1.

**Attribute: oaff1**

**Fullname:** Spare field 1

**Attribute Description** Spare field for fast features.

**Attribute: oaff2**

**Fullname:** Spare field 2

**Attribute Description** Spare field for fast features.

**Attribute: oamap[*]**

**Fullname:** OA map word xx where xx can be 00 through 49

**Attribute Description** Each OA map word xx gives contract state for 16 NPAs The allowed values are:

```
OACASALW  = 00
OACASDENY = 01
OACASPALW = 10
```

## 4. Population Rules for RLcntylang

**Relation Description** Country code to initial language table
Relation is used to map a country code to a language code value.

This relation should be populated for domestic generics only.

Engineering Information:
```
Maximum # tuples: 10000
Average # Tuples: 500
```

**Attribute: cc**

**Fullname:** country code

**Attribute Description** This is the country code portion of the forward number converted to binary.

**Attribute: add_digits**

Copyright © 1999 Lucent Technologies

**Fullname:** additional digits

**Attribute Description** Additional digits is an additional refinement of the country code for screening purposes.

**Attribute: lang_code**

**Fullname:** language code

**Attribute Description** This is the language identifier code.

**Attribute: cust_entr**

**Fullname:** customer entry allowed

**Attribute Description** This field specifies whether the caller is allowed to change the language on the call.

**Attribute: hdr_id**

**Fullname:** header id

**Attribute Description** This field is the header id.

**Attribute: spare1**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

**Attribute: spare2**

**Fullname:** Spare Field

**Attribute Description** Spare field for fast features.

## 4. Population Rules for RLco_tmrs

**Relation Description** SCCP Connection Oriented Timers Relation
This relation defines the values of SCCP Connection Oriented Timers.

**Attribute: dummy_key**

**Fullname:** Dummy Key

**Attribute Description** It should always be 0.

**Attribute: c_est_timer**

**Fullname:** Wait For Connection Confirm Timer

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute defines the timer value for T(conn est) in seconds.

**Attribute: rel_timer**

**Fullname:** Wait For Release Complete Message Timer

**Attribute Description** This attribute defines the timer value for T(rel) in seconds.

**Attribute: int_timer**

**Fullname:** Wait For Reporting Abnormal Release Timer

**Attribute Description** This attribute defines the timer value for T(int) in seconds.

**Attribute: rep_r_timer**

**Fullname:** Wait For Release Complete Message After rel_timer Expires

**Attribute Description** This attribute defines the timer value for waiting for release complete message after rel_timer expires. It is defined in seconds.

**Attribute: ias_timer**

**Fullname:** Delay To Send Message On A Connection Section

**Attribute Description** This attribute defines the timer value for T(ias) in seconds.

**Attribute: iar_timer**

**Fullname:** Waiting For Receive Message On A Connection Section

**Attribute Description** This attribute defines the timer value for T(iar) in seconds.

**Attribute: guard_timer**

**Fullname:** Waiting to Resume Temporary Connection During Restart

**Attribute Description** This attribute defines the timer value for T(guard) in seconds.

**Attribute: freeze_timer**

**Fullname:** Duration of Local Reference Number Freeze Timer

**Attribute Description** This attribute defines the timer value for freezing local reference number. It is defined in seconds.

## 4. Population Rules for RLcocscrn

**Relation Description** RLcocscrn
RLcocscrn is a spare relation for OSPS Special Features.

**Attribute: service**

**Fullname:** Service type.

**Attribute Description** Type of service this call is using: non-DIOR, DIOR non-CPS, or DIOR CPS.

**Attribute: subsrvid**

**Fullname:** Sub-service ID.

Copyright © 1999 Lucent Technologies

**Attribute Description** Sub-service ID for DIOR CPS calls.

**Attribute: tgroup**

**Fullname:** Trunk group number.

**Attribute Description** Number identifying a specific trunk group or all trunk groups.

**Attribute: billgrp**

**Fullname:** Billing group number.

**Attribute Description** Number identifying a specific billing group or all billing groups.

**Attribute: treatment**

**Fullname:** Treatment.

**Attribute Description** Treatment to be given.

**Attribute: oaff1**

**Fullname:** uns4 spare.

**Attribute Description** Unused.

**Attribute: oaff2**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff3**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff4**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff5**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff6**

**Fullname:** ushort spare.

**Attribute Description** Unused.

## 4. Population Rules for RLcoi_gpid

**Relation Description** Community of interest group ID.

Copyright © 1999 Lucent Technologies

**Attribute: di**

**Fullname:** Destination Index.
**Attribute Description** Destination index value.

**Attribute: coi1**

**Fullname:** Community of Interest.
**Attribute Description** A sequence of booleans, one per COI group ID. If DBYES, this destination index is in the COI. If DBNO, it is not. The maximum number of destination indexes for any one COI is 150.

**Attribute: coi[*]**

**Fullname:** Community of Interest.
**Attribute Description** A sequence of booleans, one per COI group ID. If DBYES, this destination index is in the COI. If DBNO, it is not. The maximum number of destination indices for any one COI is 150.

**Attribute: dummy**

**Fullname:** Dummy
**Attribute Description** Placeholder value to ensure that a tuple which has all bits to '1' cannot occur.

Note: This is not a spare attribute! It cannot be re-used.

**Copyright © 1999 Lucent Technologies**

    |---------------+---------------+---------------+---------------|
       ( 8 bytes )
```

## 4. Population Rules for RLcont_tone

**Relation Description** Continuous TTF tone generation specification and network time slot allocation

**Attribute: tone_type**

**Fullname:** name of continuous tone

**Attribute Description** This attribute can be populated with any of the following DMTONE enumerated types:

```
TMMWATT - normally for domestic 1004 Hz milliwatt
TMMW_E  - normally for export 804 Hz milliwatt
TMTPT   - normally for domestic 2225 Hz test progress tone
```

No other DMTONE enumerated types will be allowed. There can be only one tuple for each of the previous types.

**Attribute: freq** **Fullname:** frequency of the desired tone

**Attribute Description** A 16 bit hexadecimal number which must correspond to the binary value of the input frequency left shifted 3 bits. Acceptable input frequencies are any integer frequency in a range from 0 to 4000 Hz. A warning message should be produced if the input frequency is not one of those listed here.

```
Normal Frequencies (that is - NO warning message)
```

Copyright © 1999 Lucent Technologies 

```
------------------------------------------------
                      804 Hz
                      900 Hz
                      1004 Hz
                      1020 Hz
                      2225 Hz
```

**Attribute: phase**

**Fullname:** phase of the desired tone

**Attribute Description** A 16 bit hexadecimal number which must correspond to the binary value of the input phase left shifted 3 bits. Acceptable input phases are any integer phase in a range from 0 to 360 degrees. A warning message should be produced if the input phase is not one of those listed here. Normal Phases (that is - NO warning message)

**Attribute: level**

**Fullname:** level of the desired tone

**Attribute Description** A 16 bit hexadecimal number which must correspond to the binary value of the following formula: 10 raised to the power of (((input level * .1) - 3.17) / 20) Acceptable input levels are the desired level times 10 in 1/10th level steps in a range from +3 dBm to -48 dBm. A warning message should be produced if the input level is not one of those listed here.

```
Normal Level (that is - NO warning message)
-------------------------------------------
     0  (Corresponds to 0 dBm)
  -100  (Corresponds to -10 dBm)
  -160  (Corresponds to -16 dBm)
```

Default Values: Default values for frequency, phase, and level may be used based on the 'tone_type' attribute. The default values are listed here.

| tone_type | freq | phase | level |
|---|---|---|---|
| TMMWATT | 1004 Hz | 0 | 0 dBm |
| TMMW_E | 804 Hz | 0 | -10 dBm |
| TMTPT | 2225 Hz | 0 | -10 dBm |

**Copyright © 1999 Lucent Technologies** 

# COS_CTGY

## 1. Description

This relation translates the class of service of a logical port, to the logical port category. The category of a logical port is used by the MFC signaling routines among other features. The supervision category is used to determine the charging/supervision responsibility of an exchange per call. It is used as key into the RLSUPERV relation.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLcot_cf

**Relation Description** Customer originated trace constructed feature (COT_CF).
This relation gives Customer Originated Trace constructed feature information used in the AM and SM. These constructed features can be assigned to analog and ISDN terminals.

**Attribute: feat_id**

**Fullname:** feature identification

**Attribute Description** A BRCS constructed feature id consists of a modular feature type and a

Copyright © 1999 Lucent Technologies 

unique identifier. For an COT constructed feature, the modular feature type is MFCOT which is an enumeration of type DMmftype. The feature id must have a class of FACBRCS and a subclass of SCL_FEAT. If the feature is offered on a generally available basis, the feature must also have a class of FACBRCS and a subclass of SCL_FEAT.

**Attribute: actvn**

**Fullname:** activation

**Attribute Description** Method of feature activation. This is an enumeration of type DMmc_actyp. This feature is not able to be activated (customer cannot activate via a dialed code or feature button) for 5E5 so that actvn always has the value ACTNONE. Future generics may allow this feature to be activated via dialed codes or feature buttons.

**Attribute: dctvn**

**Fullname:** deactivation

**Attribute Description** Method of feature deactivation. This is an enumeration of type DMmc_dctyp. This feature is not able to be deactivated (customer cannot deactivate via a dialed code or feature button) for 5E5 so that dctvn always has the value DCTNONE. Future generics may allow this feature to be deactivated via dialed codes or feature buttons.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description** Type of billing to be performed. This is an enumeration of type DMbool. This billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the service provider decides it will bill if the feature is universally available. If ama_rec is set to DBYES, the billing will be done on a usage sensitive basis, whereas if it is set to DBNO, the billing will be done on a flat rate basis.

## 4. Population Rules for RLcpc_ni

**Relation Description**

Calling Party Category and Network Identifier

Calling Party Category (CPC) and Network Identifier (NI) combinations that are to receive congestion treatment during Level 1 congestion of the Multiple Congestion Levels. This is used only by the BT7 signaling system.

**Attribute: cpc**

**Fullname:** Calling Party Category

**Attribute Description** The Calling Party Category provides information on the classification of the calling line (such as, residential, business, ISDN, etc.).

**Attribute: ni**

**Fullname:** Network Identifier

Copyright © 1999 Lucent Technologies

**Attribute Description** The Network Identifier identifies the network in which a call originates (such as, British Telecom, MCL, VPN, etc.).

## 4. Population Rules for RLcpm_unit

**Relation Description** Call Progress Monitoring Unit Relation
This relation defines the tone sets that a particular unit used in CPM supports. For valid CPM unit types see the checks section.

**Attribute: unittype**

**Fullname:** This attribute identifies the unit type.

**Attribute Description** This attribute is the first key to the relation RLcpm_unit.

**Attribute: unitno**

**Fullname:** This attribute defines the unit number.

**Attribute Description** This attribute is the second key to the relation RLcpm_unit.

**Attribute: tnset[*]**

**Fullname:** This attribute defines the [1-5] tone sets that the unit supports.

**Attribute Description** This attribute defines the key into the relation RLcpmtnset.

## 4. Population Rules for RLcpmfltr

**Relation Description** Call Progress Monitoring Filters
This relation specifies the filters used for Call Progress Monitoring and their coefficients. For valid CPM unit types see RLcpm_unit.R.

**Attribute: filterid**

**Fullname:** Call Progress Monitoring Filter Identification

**Attribute Description** This is the key to the relation. The value of this attribute is provided by the filter attributes in RLcpmtnid.

**Attribute: toneset**

**Fullname:** Tone Set

**Attribute Description** This key attribute associates a set of filters with a tone set.

**Attribute: filtcnt**

**Fullname:** Filter Count

**Attribute Description** This attribute defines the number of active filter coefficients.

**Attribute: padd**

**Fullname:** Padding

**Attribute Description** This attribute is used for padding.

**Attribute: filcoe[*]**

**Fullname:** Filter Coefficient

**Attribute Description** This attribute specifies the coefficients associated with the Call Progress Monitoring Filter where (*) range from 1-32.

## 4. Population Rules for RLcpmtnid

**Relation Description** Call Progress Monitoring Tone Id
This relation defines the filters and durations of CPM tones to be analyzed. For valid CPM unit types see RLcpm_unit.R.

**Attribute: tone_id**

**Fullname:** Tone Identification

**Attribute Description** This attribute is the key to the relation. It identifies the CPM tone to be analyzed.

**Attribute: ncycles**

**Fullname:** Number of Cycles

**Attribute Description** Number of cycles defines the number of times that all segments in a tone will be processed.

**Attribute: seg[*]**

**Fullname:** Segment [*] of RLcpmtnid where [*] for [1-10]

**Attribute Description** This segment defines the filters 1 and 2, minimum and maximum durations of CPM tones.

**Attribute: seg[*].fil1**

**Fullname:** Segment [1-10] filter 1

**Attribute Description** This attribute defines the first filter in Hz. It is used in the segment [1-10] of the tone.

**Attribute: seg[*].fil2**

**Fullname:** Segment [1-10] filter 2

**Attribute Description** This attribute defines the second filter in Hz. It is used in the segment [1-10] of the tone.

**Attribute: seg[*].mindur**

**Fullname:** Minimum duration for segment [1-10]

**Attribute Description** This attribute defines the minimum duration the segment [1-10] tone should be present so it can be analyzed. This field is in milliseconds.

**Attribute: seg[*].maxdur**

**Fullname:** Maximum duration of segment[1-10]

**Attribute Description** This attribute defines the maximum duration that the segment 1 tone can be present to be analyzed for CPM. This field is in milliseconds.

## 4. Population Rules for RLcpmtnset

**Relation Description** Call Progress Monitoring Tone Set Relation
This relation defines the set of tones required on a per country basis for CPM. A maximum of ten tones can be defined in a tone set. For valid CPM unit types see RLcpm_unit.R.

**Attribute: toneset**

**Fullname:** This attribute identifies the set of tones. A maximum of ten sets of tones can be defined.

**Attribute Description** This attribute is the key to the relation RLcpmtnset.

**Attribute: tone[*]**

**Fullname:** This attribute defines the [1-10] tone name in the set.

**Attribute Description** This attribute defines the key into the relation RLcpmtnid.

**Attribute: cont_dur**

**Fullname:** Continuation duration

**Attribute Description** Specifies the duration of a tone beyond which it is deemed continuous. This attribute is in milliseconds.

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLcpnbn_cf

**Relation Description** This relation defines the CPN/BN constructed and pre-constructed feature data. It includes feature ID, method of feature activation and deactivation, CPN/BN options, billing options and shared DN options. This feature is a terminating feature that allows the calling party number or billing number of the originator to be sent to an ISDN terminal. This feature can be assigned to directory numbers and to multi-line hunt group members. The class of service that this feature can be assigned to is FC_ISDN, FC_ISATND, and to FC_INDVDL. If the directory number of the FC_INDVDL class of service is not going to be shared with ISDN terminals, then this feature does not provide any service to the analog terminal. This is a new modular feature type, MFCPI. Only one MFCPI feature may be assigned to a directory number or to a multi-line hunt group member.

**Attribute: fid**

**Fullname:** CPN/BN Constructed Feature ID
**Attribute Description** Used to identify CPN/BN constructed and pre-constructed features. Consists of a modular feature type (MFCPI) (top 6 bits) and a unique identifier (1-1023) (bottom 10 bits).

**Attribute: act_type**

**Fullname:** Feature Activation Method
**Attribute Description** Used to identify how CPN/BN constructed and pre-constructed features are activated. These features can always be active or can be activated using dial code or feature button.

**Attribute: deact_type**

**Fullname:** CPN/BN Constructed Feature Deactivation Method
**Attribute Description** Used to identify method of deactivating CPN/BN constructed and pre-constructed features. These features can always be active (No way to deactivate them) or can be deactivated using dialed codes or feature buttons.

**Attribute: cpnbnopt**

**Fullname:** CPN/BN Options
**Attribute Description** Used to define the CPN/BN options. A user can have the following four options if they subscribe to this feature:

```
CPN_ONLY  - Receive only calling party number if available.
BN_ONLY   - Receive only billing number if available.
CPN_PREF  - Prefers to receive calling party number, but if not
            available will receive billing number.
BN_PREF   - Prefers to receive billing number, but if not
            available will receive calling party number.
```

**Attribute: bill_opt**

**Fullname:** CPN/BN Billing Options
**Attribute Description** Used to identify how a subscriber is going to be billed (usage-sensitive or flat-rate billing). If usage-sensitive billing is selected, a billing record will be generated every 24 hours with a count of the number of CPNs and BNs delivered to the user and a count of the number of CPNs and BNs that could not be delivered because they were not available or were private. If the feature is deactivated, the billing counts will not be made.

**Attribute: shdn_opt**

**Fullname:** CPN/BN Shared DN Options
**Attribute Description** Used to identify if all terminals on a shared DN receive the CPN/BN if

Copyright © 1999 Lucent Technologies 

CPN/BN has been subscribed to or if only the terminal where the DN is primary (lead port) receives the CPN/BN. When the CPN/BN feature is assigned to an analog DN this attribute must be set to ALL so that the ISDN terminals sharing the DN will get the CPN/BN data.

**Attribute: ffcf1**

**Fullname:** bit reserved for future special feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf2**

**Fullname:** bit reserved for future special feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf3**

**Fullname:** bit reserved for future special feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf4**

**Fullname:** bit reserved for future special feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf5**

**Fullname:** unsigned 8 reserved for future special feature use
**Attribute Description** Not assigned yet.

## 4. Population Rules for RLcqmask

**Relation Description** Call Queue Mask
This relation contains a bit mask of all 999 principle call queues and all 999 supporting call queues for a serving team. A principle call queue tuple or supporting call queue tuple will be inserted upon assigning the associated serving team to a call queue.

**Attribute: serv_tm**

**Fullname:** Serving Team Number

**Attribute Description** This key attribute is the serving team number.

**Attribute: st_role**

**Fullname:** Serving Team Role

**Attribute Description** This second key attribute defines the role of the serving team. If this attribute is CD_P, the call queue mask bits represent the call queues that use this serving team as its "principle" serving team. If this attribute is CD_S, the mask bits represent the call queues that use this serving team as a "supporting" serving team.

**Attribute: cq_count**

**Fullname:** Call queue mask bit count

**Attribute Description** This is a count of how many bits are set to 1 in cqmask1 through cqmask32. Essentially this is the count of principle/supporting call queues. This is an internally maintained count of bits set and does not appear in any ODA forms.

**Attribute: cqmask1**

**Fullname:** Call Queue Mask part 1

**Attribute Description** Mask for call queues 1-32. The low order bit (that is, least significant) represents call queue 1.

cqmask1 through cqmask32 form a 999 bit mask. A 1 indicates that this team (principle/supporting) serves the call queue, a 0 indicates that it does not. If the bit mask is all 0s, then the serv_tm should not appear in any RLcqparm tuple.

The first serving team in a call queue's list is called the principle serving team (attribute serv_tm in RLcqparm), all others are called supporting serving teams (attribute ifsstm[1-8].sup_tm in RLcqparm).

If this tuple represents a "principle" serving team: If a bit is set in a given mask, the same bit in the same mask for a different serv_tm must NOT be set. For each bit set in a mask for a serv_tm, there must exist a corresponding tuple in RLcqparm having the same call queue and serv_tm. If this tuple represents a "supporting" serving team: The attributes cqmask1 thru cqmask32 are used by Intraflow. It indicates supporting call queues for this serving team. A supporting call queue is a call queue that is handled by a supporting serving team. This bit field is used to indicate the supporting call queues this supporting serving team handles.

For example, assume a tuple in RLstparm has a key value of 3. If a tuple keyed by call queue 1 in RLcqparm has supporting team 1 equal to 3 (ifsstm1.sup_tm=3 in RLcqparm) and a tuple keyed by

Copyright © 1999 Lucent Technologies 

call queue 5 in RLcqparm has supporting team 1 equal to 3 (ifsstm1.sup_tm=3 in RLcqparm) bits 1 and 5 would be set in cqmask1 indicating the supporting call queues served by this supporting serving team.

```
(binary)cqmask1=00000000000000000000000000010001
(hex)   cqmask1=0x00000011
```

This bit field is maintained and updated internally and does not appear on any ODA form.

**Attribute: cqmask2**

**Fullname:** Call Queue Mask part 2

**Attribute Description** Mask for call queues 33-64. Low order bit represents call queue 33.

**Attribute: cqmask3**

**Fullname:** Call Queue Mask part 3

**Attribute Description** Mask for call queues 65-96. Low order bit represents call queue 65.

**Attribute: cqmask4**

**Fullname:** Call Queue Mask part 4

**Attribute Description** Mask for call queues 97-128. Low order bit represents call queue 97.

**Attribute: cqmask5**

**Fullname:** Call Queue Mask part 5

**Attribute Description** Mask for call queues 129-160. Low order bit represents call queue 129.

**Attribute: cqmask6**

**Fullname:** Call Queue Mask part 6

**Attribute Description** Mask for call queues 161-192. Low order bit represents call queue 161.

**Attribute: cqmask7**

**Fullname:** Call Queue Mask part 7

**Attribute Description** Mask for call queues 193-224. Low order bit represents call queue 193.

**Attribute: cqmask8**

**Fullname:** Call Queue Mask part 8

**Attribute Description** Mask for call queues 225-256. Low order bit represents call queue 225.

**Attribute: cqmask9**

**Fullname:** Call Queue Mask part 9

**Attribute Description** Mask for call queues 257-288. Low order bit represents call queue 257.

**Attribute: cqmask10**

**Fullname:** Call Queue Mask part 10

**Attribute Description** Mask for call queues 289-320. Low order bit represents call queue 289.

**Attribute: cqmask11**

**Fullname:** Call Queue Mask part 11

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Mask for call queues 321-352. Low order bit represents call queue 321.

**Attribute: cqmask12**
**Fullname:** Call Queue Mask part 12

**Attribute Description** Mask for call queues 353-384. Low order bit represents call queue 353.

**Attribute: cqmask13**
**Fullname:** Call Queue Mask part 13

**Attribute Description** Mask for call queues 385-416. Low order bit represents call queue 385.

**Attribute: cqmask14**
**Fullname:** Call Queue Mask part 14

**Attribute Description** Mask for call queues 417-448. Low order bit represents call queue 417.

**Attribute: cqmask15**
**Fullname:** Call Queue Mask part 15

**Attribute Description** Mask for call queues 449-480. Low order bit represents call queue 449.

**Attribute: cqmask16**
**Fullname:** Call Queue Mask part 16

**Attribute Description** Mask for call queues 481-512. Low order bit represents call queue 481.

**Attribute: cqmask17**
**Fullname:** Call Queue Mask part 17

**Attribute Description** Mask for call queues 513-544. Low order bit represents call queue 513.

**Attribute: cqmask18**
**Fullname:** Call Queue Mask part 18

**Attribute Description** Mask for call queues 545-576. Low order bit represents call queue 545.

**Attribute: cqmask19**
**Fullname:** Call Queue Mask part 19

**Attribute Description** Mask for call queues 577-608. Low order bit represents call queue 577.

**Attribute: cqmask20**
**Fullname:** Call Queue Mask part 20

**Attribute Description** Mask for call queues 609-640. Low order bit represents call queue 609.

**Attribute: cqmask21**
**Fullname:** Call Queue Mask part 21

**Attribute Description** Mask for call queues 641-672. Low order bit represents call queue 641.

**Attribute: cqmask22**
**Fullname:** Call Queue Mask part 22

**Attribute Description** Mask for call queues 673-704. Low order bit represents call queue 673.

Copyright © 1999 Lucent Technologies 

**Attribute: cqmask23**

**Fullname:** Call Queue Mask part 23

**Attribute Description** Mask for call queues 705-736. Low order bit represents call queue 705.

**Attribute: cqmask24**

**Fullname:** Call Queue Mask part 24

**Attribute Description** Mask for call queues 737-768. Low order bit represents call queue 737.

**Attribute: cqmask25**

**Fullname:** Call Queue Mask part 25

**Attribute Description** Mask for call queues 769-800. Low order bit represents call queue 769.

**Attribute: cqmask26**

**Fullname:** Call Queue Mask part 26

**Attribute Description** Mask for call queues 801-832. Low order bit represents call queue 801.

**Attribute: cqmask27**

**Fullname:** Call Queue Mask part 27

**Attribute Description** Mask for call queues 833-864. Low order bit represents call queue 833.

**Attribute: cqmask28**

**Fullname:** Call Queue Mask part 28

**Attribute Description** Mask for call queues 865-896. Low order bit represents call queue 865.

**Attribute: cqmask29**

**Fullname:** Call Queue Mask part 29

**Attribute Description** Mask for call queues 897-928. Low order bit represents call queue 897.

**Attribute: cqmask30**

**Fullname:** Call Queue Mask part 30

**Attribute Description** Mask for call queues 929-960. Low order bit represents call queue 929.

**Attribute: cqmask31**

**Fullname:** Call Queue Mask part 31

**Attribute Description** Mask for call queues 961-992. Low order bit represents call queue 961.

**Attribute: cqmask32**

**Fullname:** Call Queue Mask part 32

**Attribute Description** Mask for call queues 993-999. Low order bit represents call queue 993.
( bits for call queues 1000-1024 are not used )

## 4. Population Rules for RLcqparm

**Relation Description** Call queue parameter definition
Static relation containing call queue parameter definitions.

Intraflow background information: The supporting teams are searched in order until either the call's queue delay does not exceed a delay outflow threshold, the call checks all its supporting teams without success, or the call is assigned to a serving team.

For example:

---

Assume the following when a call arrives for call queue 1:

(1) Call queue one has principle team (serv_tm) two and supporting serving teams (ifsstm1.sup_tm and ifsstm2.sup_tm) 3 and 4, with delay outflow thresholds (ifsstm1.dotflw and ifsstm2.dotflw) 5 and 15, respectively,

```
that is,   ifsstm1.sup_tm = 3   ifsstm1.dotflw = 5
           ifsstm2.sup_tm = 4   ifsstm2.dotflw = 15
```

(2) Call queue one has two calls on queue and there are no available servers on principle team two (serv_tm),

(3) The call at the head of call queue one has waited 17 seconds,

Copyright © 1999 Lucent Technologies 

(4) 4. Serving team three's threshold is 50% (mxpcntsup = 50 from RLstparm. mxpcntsup has no population dependencies with sup_tm or dotflw), it has four agents logged in, two are busy with calls from supporting serving teams,

(5) Serving team four's team threshold is 75% (mxpcntsup = 75), it has ten agents logged in, one is busy with a call from a supporting queue. The new call is queued because other calls are already queued. The automatic call distributor (ACD) checks the call at the head of the queue and finds that it has waited longer than the delay outflow threshold (ifsstm1.dotflw) for the first supporting serving team (ifsstm1.sup_tm), team three. The call cannot be intraflowed to team three, however, because doing so would cause more than 50% of the agents on the serving team to be handling calls from supporting queues simultaneously. So, the ACD checks the next supporting team (ifsstm2.sup_tm). The call has also waited longer than the delay outflow threshold (ifsstm2.dotflw) for its second supporting team (ifsstm2.sup_tm), team four. The call will be intraflowed to team four because team four will still have only 20% of its agents handling calls from its supporting queues, much less than its team threshold of 75%.

**Attribute: call_que**

**Fullname:** Call queue

**Attribute Description** The number of the call queue.

**Attribute: cqname**

**Fullname:** The name of the call queue

**Attribute Description** The alphanumeric characters ([0-9],[A-Z],[a-z]) and blanks are used.

**Attribute: max_calls**

**Fullname:** Maximum number of calls allowed to queue on a call queue

**Attribute Description** The max_calls field may range from 0 to the number of tuples allowed in RLcllqdb.

**Attribute: cw_on**

**Fullname:** Call waiting display at position

**Attribute Description** This value represents the seconds of expected delay at which the call waiting display will be lit at positions serving this call queue.

**Attribute: cw_off Fullname:** Call waiting display darkened delay at positions

**Attribute Description** This value represents the seconds of expected delay at which the calls waiting display will be darkened at positions serving this call queue.

**Attribute: del1_thresh**

**Fullname:** First level of delay announcement threshold in seconds.

**Attribute Description** This attribute contains a threshold of the number of seconds of delay before the first announcement is played. Note: 0 is used to force the first announcement.

**Attribute: del2_thresh**

**Fullname:** Second level of delay announcement threshold in seconds

**Attribute Description** This attribute contains a threshold of the number of seconds of delay before the second announcement is played.

**Attribute: del3_thresh**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** Third level of delay announcement threshold in seconds

**Attribute Description** This attribute contains a threshold of the number of seconds of delay before the third announcement is played.

**Attribute: ann1_routex**

**Fullname:** Route index for first delay announcement

**Attribute Description** Must appear in RLrt_routing and must point to an announcement.

**Attribute: ann2_routex**

**Fullname:** Route index for second delay announcement

**Attribute Description** Must appear in RLrt_routing and must point to an announcement.

**Attribute: ann3_routex**

**Fullname:** Route index for third delay announcement

**Attribute Description** Must appear in RLrt_routing and may point to either an announcement or an outgoing trunk group.

**Attribute: serv_obj**

**Fullname:** Service delay objective for this call queue

**Attribute Description** This is the average delay in tenths of seconds that calls of this type should expect before reaching a server.

**Attribute: serv_tm**

**Fullname:** Number of the principle serving team serving this call queue

**Attribute Description** If serv_tm is non-zero, a tuple keyed by this value must appear in RLstparm. RLcqparm.serv_tm is the principle serving team. The first team in a queue's list is called the principle team, while all other teams are the supporting teams.

**Attribute: acdgrp**

**Fullname:** ACD/BRCS group number identifier

**Attribute Description** This attribute uniquely identifies a "sub-terminal group" group to allow customers (or end-users) to divide their call centers into smaller groups. This will allow different groups to exist within the same ACD customer with the same level of security that exists between different ACD customers.

When this attribute has a value of 1000, there are no restrictions on this call queue within its terminal group ID. RC and ODA does not currently support this "wild card" value.

This value is inherited from the principle serving team assigned to serve the call queue.

See also RLstparm.acdgrp.

**Attribute: cqavail1**

**Fullname:** Call Queue availability 1

**Attribute Description** This attribute indicates the availability of the call queue on day 1 of the week (Sunday).

It consists of a structure containing the time delimiters ( begintime and endtime ) and the condition

Copyright © 1999 Lucent Technologies 

of the call queue. The call queue condition can be either closed or open. The begintime and endtime delimiters define the times of the day (in minutes) when a queue is either closed or open.

**Attribute: cqavail2**

**Fullname:** Call Queue availability 2

**Attribute Description** This attribute indicates the availability of the call queue on day 2 of the week (Monday). See cqavail1.

**Attribute: cqavail3**

**Fullname:** Call Queue availability 3

**Attribute Description** This attribute indicates the availability of the call queue on day 3 of the week (Tuesday). See cqavail1.

**Attribute: cqavail4**

**Fullname:** Call Queue availability 4

**Attribute Description** This attribute indicates the availability of the call queue on day 4 of the week (Wednesday). See cqavail1.

**Attribute: cqavail5**

**Fullname:** Call Queue availability 5

**Attribute Description** This attribute indicates the availability of the call queue on day 5 of the week (Thursday). See cqavail1.

**Attribute: cqavail6**

**Fullname:** Call Queue availability 6

**Attribute Description** This attribute indicates the availability of the call queue on day 6 of the week (Friday). See cqavail1.

**Attribute: cqavail7**

**Fullname:** Call Queue availability 7

**Attribute Description** This attribute indicates the availability of the call queue on day 7 of the week (Saturday). See cqavail1.

**Attribute: cd_routex**

**Fullname:** Route index of closed down announcement

**Attribute Description** This route index may be a route index in RLrt_routing that points to an announcement or an outgoing trunk group. Calls of this call queue are routed to this announcement when cq_state == CD_CLOSED or when cq_state == CD_TOD and cqavail[1-7] indicates the queue is closed.

**Attribute: que_busy**

**Fullname:** Call queue busy

**Attribute Description** Indicates if busy tone should be given, instead of announcement/re-order, when a call is routed to the specified call queue and there are no queue slots available for that queue.

**Attribute: dly_busy**

**Fullname:** Delay thresholds busy

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates if busy tone should be given, instead of announcement/re-order, when the "del3_thresh" threshold for the specified call queue has been exceeded.

**Attribute: cq_state**

**Fullname:** Call Queue state

**Attribute Description** Availability of this call queue:

CD_OPEN - - call queue is available

CD_CLOSED - - call queue is not available

CD_TOD - - call queue availability depends upon the time of day. See cqavail[] attribute.

**Attribute: intra_alwd**

**Fullname:** Indicates whether intraflow is allowed

**Attribute Description** Indicates if intraflow is allowed for this call queue. For intra_alwd = DBYES, a call queue must have at least one supporting serving team (ifsstm[1-8].sup_tm) defined. Otherwise, if there are no supporting serving teams (ifsstm[1-8].sup_tm) RLcqparm.intra_alwd = DBNO.

See rc-oda-rules section for warning.

**Attribute: ifsstm1.sup_tm**

**Fullname:** Intraflow Supporting Serving Team one

**Attribute Description** Indicates supporting team one for intraflow. A call queue may have zero to eight supporting serving teams.

The supporting serving team(s) in ifsstm[1-8].sup_tm can be repeated for other call queues.

**Attribute: ifsstm1.dotflw**

**Fullname:** Delay outflow threshold for intraflow supporting serving team one

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team one (ifsstm1.sup_tm).

**Attribute: ifsstm2.sup_tm**

**Fullname:** Intraflow Supporting Serving Team two

**Attribute Description** Indicates supporting team two for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm2.dotflw Fullname:** Delay outflow threshold for intraflow supporting serving team two

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team two (ifsstm2.sup_tm).

**Attribute: ifsstm3.sup_tm**

**Fullname:** Intraflow Supporting Serving Team three

**Attribute Description** Indicates supporting team three for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm3.dotflw**

Copyright © 1999 Lucent Technologies 

**Fullname:** Delay outflow threshold for intraflow supporting serving team three

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team three (ifsstm3.sup_tm).

**Attribute: ifsstm4.sup_tm**

**Fullname:** Intraflow Supporting Serving Team four

**Attribute Description** Indicates supporting team four for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm4.dotflw**

**Fullname:** Delay outflow threshold for intraflow supporting serving team four

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team four (ifsstm4.sup_tm).

**Attribute: ifsstm5.sup_tm**

**Fullname:** Intraflow Supporting Serving Team five

**Attribute Description** Indicates supporting team five for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm5.dotflw**

**Fullname:** Delay outflow threshold for intraflow supporting serving team five

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team five (ifsstm5.sup_tm).

**Attribute: ifsstm6.sup_tm**

**Fullname:** Intraflow Supporting Serving Team six

**Attribute Description** Indicates supporting team six for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm6.dotflw**

**Fullname:** Delay outflow threshold for intraflow supporting serving team six

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team six (ifsstm6.sup_tm).

**Attribute: ifsstm7.sup_tm**

**Fullname:** Intraflow Supporting Serving Team seven

**Attribute Description** Indicates supporting team seven for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm7.dotflw**

**Fullname:** Delay outflow threshold for intraflow supporting serving team seven

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team seven (ifsstm7.sup_tm).

**Attribute: ifsstm8.sup_tm**

**Fullname:** Intraflow Supporting Serving Team eight

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates supporting team eight for intraflow. A call queue may have zero to eight supporting serving teams.

**Attribute: ifsstm8.dotflw**

**Fullname:** Delay outflow threshold for intraflow supporting serving team eight

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team eight (ifsstm8.sup_tm).

**Attribute: acd_dn**

**Fullname:** Automatic call distributor directory number

**Attribute Description** This attribute consists of a normalized office code (NOC) and four directory number digits. If RLcqparm.acd_dn is non-null (that is, RLcqparm.acd_dn.noc is not zero) then there must exist a corresponding tuple in RLacd_dn for an ACD DN, or RLdaa_dn for a direct agent access (DAA) DN, or RLdaa_dn for an ACD DN on Interflow.

This directory number is used for queue-dialed calls.

**Attribute: acd_dn.noc**

**Fullname:** Normalized office code

**Attribute Description** See acd_dn.

**Attribute: acd_dn.digits**

**Fullname:** Four directory number digits

**Attribute Description** See acd_dn.

**Attribute: tgid**

**Fullname:** Terminal group identifier

**Attribute Description** The attribute tgid is used to associate a call_que (that is, queue number) with an ACD/BRCS customer. See also RLstparm.tgid.

## 4. Population rules for RLcrd_attr

**Relation Description**

TCR (Telephone Credit Card) Card Attribute Table
This relation is used to group a set of card attributes together so that particular group of attributes can be associated with a particular card or cards that are identified via the Card Identification Tables.
This relation is populated for domestic generics only.
ENGINEERING INFORMATION:
Maximum number of tuples for this relation is 64.
Average number of tuples for this relation is 25.

**Attribute:**

crd_attr

**Fullname:**

Card Attribute Table key

**Attribute Description:**

This is the key into the RLcrd_attr relation. The crd_attr value is received from in the RLtcr_f[2 - 7]dv relations. It is used as an

Copyright © 1999 Lucent Technologies

index to determine information on a particular card.

**Attribute:**
tc_alw
**Fullname:**
Time and Charges Allow Flag
**Attribute Description:**
Time and Charges Allow Flag. This attribute determines whether a request for T&C will be honored for a call.

**Attribute:**
cc_type
**Fullname:**
Calling card type
**Attribute Description:**
Identifies the TCR calling card type.
The valid entries are:
CAS:Card that uses CAS(Customer Account Services) signaling,
TEL: Non-AT&T Telecommunication card,
CCC: Commercial Credit Card.

**Attribute:**
ind_alw
**Fullname:**
Indeterminate Allow Flag
**Attribute Description:**
Indeterminate Allow Flag. Indicates whether the calling card should be allowed or denied in the event an indeterminate query response occurs.

**Attribute:**
p891
**Fullname:**
Pre-Pend 891
**Attribute Description:**
Flag indicating whether to prepend 891 to the card number before the query is sent. Used for abbreviated card formats.

**Attribute:**
qsigtyp
**Fullname:**
Query Signaling Type
**Attribute Description:**
Query Signaling Type enumeration used to validate a calling card.

**Attribute:**
qtimeout
**Fullname:**
Query Timeout Parameter
**Attribute Description:**
Query Timeout Parameter. This value represents (in tenths of a second) how long call processing code will wait for a query reply from the network before

**Copyright © 1999 Lucent Technologies** 

timing out.

**Attribute:**
allow900
**Fullname:**
Allow 900
**Attribute Description:**
Flag indicating whether calls to OSPS 900 services are allowed for this card when the OSPS 900 feature is active.

**Attribute:**
oaff1
**Fullname:**
Spare field 1
**Attribute Description:**
Spare field for fast features. For ALL features, use the space from this field before increasing the tuple size of this relation.

## 4. Population rules for RLcrdprd

### Relation Description

RLcrdprd
RLcrdprd is for the card product type data for the PLBQ Business/Residence card feature

**Attribute:**
crdprdtype
**Fullname:**
Card product type.
**Attribute Description:**
Card product type by number 0 thru 255.

**Attribute:**
custannchdr
**Fullname:**
Custom announcement header ID.
**Attribute Description:**
Header ID where a customized announcement has been created.
Limited to header IDs 241 to 270 when populated.

**Attribute:**
oaff1
**Fullname:**
7-bit spare.
**Attribute Description:**
Unused.

**Attribute:**
oaff2
**Fullname:**
char spare.
**Attribute Description:**
Unused.

**Attribute:**
warnannchdr
**Fullname:**
Warning announcement header ID.
**Attribute Description:**
Header ID where a customized warning announcement has been created.
Limited to header IDs 271 to 300 when populated.

**Attribute:**
oaff3
**Fullname:**
7-bit spare.
**Attribute Description:**
Unused.

Copyright © 1999 Lucent Technologies

**Attribute:**
oaff4
**Fullname:**
char spare.
**Attribute Description:**
Unused.

**Attribute:**
anncmonbal
**Fullname:**
Announce monetary balance indicator.
**Attribute Description:**
Determines whether or not the monetary balance should be given.

**Attribute:**
annctimebal
**Fullname:**
Announce time balance indicator.
**Attribute Description:**
Determines whether or not the time balance should be given.

**Attribute:**
recbilling
**Fullname:**
Record billing indicator.
**Attribute Description:**
Determines whether billing should be recorded.

**Attribute:**
prepaid
**Fullname:**
Pre-paid card indicator.
**Attribute Description:**
Indicates whether cards of this card type are pre-paid.

**Attribute:**
crdrstr
**Fullname:**
Card restriction handling.
**Attribute Description:**
Indicates the restriction handling for cards in this product chart.

**Attribute:**
oaff5
**Fullname:**
boolean spare.
**Attribute Description:**
Unused.

**Attribute:**
oaff6
**Fullname:**

Copyright © 1999 Lucent Technologies

boolean spare.

**Attribute Description:**

Unused.

**Attribute:**

oaff7

**Fullname:**

boolean spare.

**Attribute Description:**

Unused.

**Attribute:**

oaff8

**Fullname:**

boolean spare.

**Attribute Description:**

Unused.

**Attribute:**

label

**Fullname:**

spare of chars.

**Attribute Description:**

created for future SU features.

**Attribute:**

oaff9

**Fullname:**

short spare.

**Attribute Description:**

Unused.

**Attribute:**

addoncardtrmt

**Fullname:**

Add-On card treatment eligibility indicator

**Attribute Description:**

This attribute specifies whether the card product type is eligible for add-on card treatment.

## 4. Population Rules for RLcri_crn

**Relation Description** Carrier identification to carrier name
Carrier identification (numerical) to carrier name (alphabetic) mapping.

**Attribute: carr_id**

**Fullname:** carrier identification

**Attribute Description** Carrier identification (numerical).

**Attribute: featgrp**

**Fullname:** Feature Group carrier type

**Attribute Description** Indicates which feature group this carrier belongs to.

**Attribute: carr_name**

**Fullname:** carrier name

Copyright © 1999 Lucent Technologies

**Attribute Description** Carrier name (AT&T, MCI, SPRINT, etc.). Characters must be ALPHA. The special characters '&' and ',' may is not the 1st character.

**Attribute: ospsff**

**Fullname:** OSPS fast feature

**Attribute Description** The item is to be used for future OSPS fast feature development.

## 4. Population Rules for RLcrn_cri

**Relation Description** Carrier name to carrier id
Carrier name to carrier id (numerical). This relation is populated whenever tuples in RLcri_crn are populated. RLcri_crn.carr_name becomes a key in this relation and RLcri_crn.carr_id becomes an attribute.

**Attribute: carr_name**

**Fullname:** carrier name

**Attribute Description** Carrier name (AT&T, MCI, SPRINT, etc.).

**Attribute: featgrp**

**Fullname:** Feature Group carrier type

**Attribute Description** Indicates which feature group this carrier belongs to.

**Attribute: carr_id**

**Fullname:** carrier id

Copyright © 1999 Lucent Technologies

**Attribute Description** Carrier identification (numerical). The rules for this attribute are governed by the rules for RLcri_crn.carr_id.

**Defines:** "db/DMcarr_val.h"

# CSR_ATTR

## 1. Description

This relation (carrier specific routing attribute) is used to provide information on international calls where the calling card issuer has carrier specific routing (CSR) agreement with the OSPS owner. The information provided is the card vendors country code as defined by the ITU-TS, administration id and CSR preference (preferred or mandatory).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 200 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |

       ( 4 bytes )
```

## 4. Population Rules for RLcsr_attr

**Relation Description** Carrier specific routing (CSR) attribute table.
This relation (carrier specific routing attribute table) is used to provide information about international credit cards. The information provided is the card vendors country code as defined by the international telegraph and union - telecommunication standardization sector (ITU-TS), international administration ID (carrier to be used for international call in the destination country) and CSR preference (preferred or mandatory).
The card vendor country code is used by the operator services position system (OSPS) office to determine whether a call is the CSR call. A call is the CSR call, if it is an international calling card call destined for the home country of the card issuer.
The international administration ID parameter and CSR preference indicator parameter are signaled by the OSPS office (via TOLL),to the GATEWAY office. The GATEWAY office depending on the condition of the network, and depending on the value of admin_id and the value of the csr_pref gives the CSR calls the following treatment:

- if admin_id's network (card issuer's network) is available, the CSR call is routed to that admin_id carrier's network in the destination country
- if admin_id's network (card issuer's network) is not available and if csr_pref is set to 'preferred', the CSR call is overflowed to another carrier's network in the destination country

Copyright © 1999 Lucent Technologies 

— if admin_id's network (card issuer's network) is not available and if csr_pref is set to 'mandatory', the CSR call is denied.

This relation is populated for USA generics only.

Engineering Information:
The maximum number of tuples for this relation is 200.
The average number of tuples for this relation is 64.

**Attribute: csr_attr_id**

**Fullname:** Carrier specific routing attribute ID
**Attribute Description** This attribute is the key into the RLcsr_attr relation. The csr_attr_id value is obtained from the RLtccid relation. It is used as an index to determine information for a particular card number when an international call is made.

**Attribute: card_vcc**

**Fullname:** Card vendor country code
**Attribute Description** This attribute provides the country code of the card issuer as defined by the ITU-TS.

**Attribute: admin_id**

**Fullname:** Administration identification
**Attribute Description** This attribute is used to store the administration ID. The administration ID represents an international carrier which should be used for routing a credit card call in the home country of the card issuer. This parameter is signaled by the OSPS office (via TOLL), to the GATEWAY office, and the GATEWAY office uses it to route the CSR call to an appropriate carrier's network in the destination country.

**Attribute: csr_pref**

**Fullname:** Carrier specific routing preference indicator
**Attribute Description** This attribute indicates whether the carrier to be used for the CSR international credit card, once the call reaches the home country of the card issuer, has to be the carrier identified in the admin_id (mandatory) or if the admin_id carrier is not available, the call may be overflowed to another carrier in that country (preferred).
This parameter is signaled by the OSPS office (via TOLL), to the GATEWAY office. The GATEWAY office uses it when routing the CSR call.

**Attribute: oaff1**

**Fullname:** Spare field 1
**Attribute Description** Spare field for fast features.

**Attribute: oaff2**

**Fullname:** Spare field 2
**Attribute Description** Spare field for fast features.

## 4. Population Rules for RLctdecckt

**Relation Description** Contains CAMA transfer call identity tone decoder circuit name.

**Attribute: circuit**

**Fullname:** circuit name

**Attribute Description** CAMA transfer call identity tone decoder circuit name. These circuits can only be provided with DSU2-LDSUF. A maximum of 30 tuples are for the CAMA transfer call identity tone decoders per LDSUF service group. The circuit names here correspond to those populated in RLcktdata for type = PCCT_DEC.

**Attribute: dummy**

**Fullname:** dummy

**Attribute Description** Dummy

# CTINFO

## 1. Description

static relation containing call type related information.

WARNING: This relation has an alternate structure which is used to define two arrays (sup_tm and dotflw). Caution must be used when adding new attributes to this relation and when modifying existing attributes positioned ahead of the arrays (sup_tm and dotflw) in the tuple structure so not to disturb the physical layout of these two arrays. These arrays must start on a word boundary so they can be accessed correctly. If you are adding new attributes, the new attributes must be added after the dotflw8 attribute and after the dotflw[numsuptm] attribute in the altval structure. Adding new attributes before this may upset the array alignment and cause intraflow not to work properly. If you are not sure how this works get help from your rdl engineer.

## 2. Data Dictionary Values

## 4. Population Rules for RLctinfo

**Relation Description** Call type information
Static relation containing call type related information.

This relation is not to be populated for export applications.

If the attribute serv_id is nonzero, then it cannot be changed (updated) if the call queue is active. Doing this will compromise any existing calls, or cause them to be dropped. This fact must be clearly documented for the customer.

Intraflow background information: The supporting teams are searched in order until either the call's queue delay does not exceed a delay outflow threshold, the call checks all its supporting teams without success, or the call is assigned to a serving team.

For example:
---
Assume the following when a call arrives for call type queue 1:

(1) Call type queue one has principle team (serv_tm) two and supporting serving teams (sup_tm1 and sup_tm2) 3 and 4, with delay outflow thresholds (dotflw1 and dotflw2) 5 and 15, respectively,

(2) Call type queue one has two calls on queue and there are no available servers on principle team two (serv_tm),

(3) The call at the head of call type queue one has waited 17 seconds,

(4) Serving team three's threshold is 50% (mxpcntsup = 50 from RLstinfo, mxpcntsup has no population dependencies with sup_tm or dotflw), it has four agents (operators) logged in, two are busy with calls from supporting serving teams,

(5) Serving team four's team threshold is 75% (mxpcntsup = 75), it has ten agents (operators) logged in, one is busy with a call from a supporting queue. The new call is queued because other calls are already queued. The automatic call distributor (ACD) checks the call at the head of the queue and finds that it has waited longer than the delay outflow threshold (dotflw1) for the first supporting serving team (sup_tm1), team three.

Copyright © 1999 Lucent Technologies 

The call cannot be intraflowed to team three, however, because doing so would cause more than 50% of the agents (operators) on the serving team to be handling calls from supporting queues simultaneously. So, the ACD checks the next supporting team (sup_tm2). The call has also waited longer than the delay outflow threshold (dotflw2) for its second supporting team (sup_tm2), team four. The call will be intraflowed to team four because team four will still have only 20% of its agents handling calls from its supporting queues, much less than its team threshold of 75%. The sup_tm and dotflw attributes are populated as follows:

```
sup_tm1 = 3     dotflw1 = 5
sup_tm2 = 4     dotflw2 = 15
```

**Attribute: call_type**

**Fullname:** Call type

**Attribute Description** The number of the call queue.

**Attribute: rcall_type**

**Fullname:** Operator Services Position System (OSPS) operator recall call type

**Attribute Description** OSPS operator call type to be used for recall. RC/ODA form file check: If rcall_type is unknown, set it equal to call_type.

**Attribute: ctname**

**Fullname:** The name of the call type

**Attribute Description** The alphanumeric characters ([0-9],[A-Z],[a-z]) and blanks are used. The character string in ctname should be left justified.

**Attribute: max_calls**

**Fullname:** Maximum number of calls allowed to queue on a call type queue

**Attribute Description** The max_calls field may range from 0 to the number of tuples allowed in RLcqdb.

**Attribute: cw_on**

**Fullname:** Call waiting display at position

**Attribute Description** This value represents the seconds of delay at which the call waiting display will be lit at positions serving this call type. The cw_on value must be greater than cw_off.

**Attribute: ospsff1**

**Fullname:** OSPS fast feature item 1

**Attribute Description** This item is to be used for future OSPS fast feature development

**Attribute: cw_off**

**Fullname:** Call waiting display darkened delay at positions

**Attribute Description** This value represents the seconds of delay at which the calls waiting display will be darkened at positions serving this call type. The cw_off value must be less than cw_on value.

**Attribute: ospsff2**

**Fullname:** OSPS fast feature item 2

**Attribute Description** The item is to be used for future OSPS fast feature development.

Copyright © 1999 Lucent Technologies 

**Attribute: del1_thresh**

**Fullname:** First level of delay announcement threshold in seconds.

**Attribute Description** Note: 'del1_thresh' < 'del2_thresh' < 'del3_thresh'. 'del1_thresh', 'del2_thresh', and 'del3_thresh' must never be equal.
Note 2: 0 is used for forced first announcement.

**Attribute: ospsff3**

**Fullname:** OSPS fast feature item 3

**Attribute Description** The item is to be used for future OSPS fast feature development.

**Attribute: del2_thresh**

**Fullname:** Second level of delay announcement threshold in seconds

**Attribute Description** Note: 'del1_thresh' < 'del2_thresh' < 'del3_thresh'. 'del1_thresh', 'del2_thresh', and 'del3_thresh' must never be equal.

**Attribute: del3_thresh**

**Fullname:** Third level of delay announcement threshold in seconds

**Attribute Description** Note: 'del1_thresh' < 'del2_thresh' < 'del3_thresh'. 'del1_thresh', 'del2_thresh', and 'del3_thresh' must never be equal.

**Attribute: ctinfsp1**

**Fullname:** ctinfo spare 1

**Attribute Description** Spare ctinfo attribute.

**Attribute: ctinfsp2**

**Fullname:** ctinfo spare 2

**Attribute Description** Spare ctinfo attribute.

**Attribute: ctinfsp3**

**Fullname:** ctinfo spare 3

**Attribute Description** Spare ctinfo attribute.

**Attribute: ctinfsp4**

**Fullname:** ctinfo spare 4

**Attribute Description** Spare ctinfo attribute.

**Attribute: annc_on_lvl1**

**Fullname:** Announcement on level 1

**Attribute Description** Specifies whether an announcement on level 1 should be given when the caller is placed in the call queue. This announcement is used for initial operator requests, or on transfer to a serving team.

**Attribute: ann1_routex**

**Fullname:** Route index for first delay announcement

**Attribute Description** Must appear in RLrt_routing and must point to an announcement.

Copyright © 1999 Lucent Technologies 

**Attribute: ann2_routex**

**Fullname:** Route index for second delay announcement

**Attribute Description** Must appear in RLrt_routing and must point to an announcement.

**Attribute: ann3_routex**

**Fullname:** Route index for third delay announcement

**Attribute Description** Must appear in RLrt_routing and must point to an announcement.

**Attribute: serv_obj**

**Fullname:** Service delay objective for this call type

**Attribute Description** This is the average delay in tenths of seconds that calls of this type should expect before reaching a server.

**Attribute: serv_id**

**Fullname:** Service identification

**Attribute Description** External Audible Response Unit (ARU) service ID. T&A call types with a zero serv_id are standard T&A call types. T&A call types with a nonzero serv_id are Listing Services (LS) call types. This field does not apply to directory assistance (DA) call types, and is zero for them. There are restrictions in the Recent Change (RC) - Office Data Administration (ODA) rules for when this field can change to/from zero. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: serv_tm**

**Fullname:** Number of the serving team serving this call type

**Attribute Description** A tuple keyed by this value must appear in RLstinfo and that RLstinfo tuple must point back to this RLctinfo tuple by the appropriate bit in the ctmask attributes. RLctinfo.serv_tm is the principal serving team. The first team in a queue's list is called the principal team, while all other teams are the supporting teams.

RESTRICTIONS/DEPENDENCIES: The tuple in RLstinfo which is keyed by serv_tm must have the same value for st_optype as the value of ct_optype in this tuple. There are some restrictions on when this value can be changed in the RC-ODA rules.

**Attribute: mech_type**

**Fullname:** mech type

**Attribute Description** Specifies the MECH queue for the call_type. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

RC/ODA form file check: If mech_type is unknown and required (see check section), set it equal to call_type.

**Attribute: cd_routex**

**Fullname:** Route index of closed down announcement

**Attribute Description** This route index must be a route index in RLrt_routing that points to an announcement. Calls of this call type are routed to this announcement when ctsign == DBNO.

**Attribute: que_busy**

**Fullname:** Call queue busy

Copyright © 1999 Lucent Technologies 

**Attribute Description** Indicates if busy tone should be given, instead of announcement/re-order, when a call is routed to the specified call type queue and there are no queue slots available for that queue.

**Attribute: dly_busy**

**Fullname:** Delay thresholds busy

**Attribute Description** Indicates if busy tone should be given, instead of announcement/re-order, when the delay thresholds for the specified call type queue have been exceeded.

**Attribute: tb_routex**

**Fullname:** Route index for the turnback announcement

**Attribute Description** This route index must be a route index in RLrt_routing that points to an announcement. This field must not be zero if the field ct_optype is set to OSPS_TA. If ct_optype is set to OSPS_DA, then this field should be zero. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: ct_optype**

**Fullname:** Call type operator

**Attribute Description** Type of operator that handles this call type. Only DA call types may be assigned to DA serving teams and T&A call types assigned to T&A serving teams.

**Attribute: ct_acdtype**

**Fullname:** Commercial ACD call type.

**Attribute Description** This call type is used for the OSPS commercial ACD feature.

**Attribute: ctsign**

**Fullname:** Open or closed for call queues.

**Attribute Description** Availability of this call type:

```
DBYES   - if available
DBNO    - if unavailable
```

**Attribute: intra_alwd**

**Fullname:** Indicates whether intraflow is allowed

**Attribute Description** Indicates if intraflow is allowed for this call queue. For intra_alwd = DBYES, a call type queue must have at least one supporting serving team (sup_tm(1-8)) defined. Otherwise, if there are no supporting serving teams (sup_tm(1-8)) RLctinfo.intra_alwd = DBNO.

If the intra_alwd attribute is DBYES, an ODA WARNING message should appear if intra_alwd in RLstinfo is set to DBNO keyed by sup_tm(1-8) or/and if the global parameter Glac_intra is set to DBNO. The warning message indicates which equipped sup_tm(s) have the intra_alwd attribute set to DBNO.

No warning message should appear if RLstinfo.intra_alwd is set to DBYES and Glac_intra is set to DBYES.

**Attribute: coin_recall**

**Fullname:** Coin recall call type

**Attribute Description** Call type queue for coin recall.
DEFAULT: The call_type associated with this tuple.

Copyright © 1999 Lucent Technologies 

**Attribute: notify**

**Fullname:** Coin notify

**Attribute Description** Indicates the specific flavor of notify coin recall. The default value: the call_type associated with this tuple.

**Attribute: sup_tm1**

**Fullname:** Supporting team one

**Attribute Description** Indicates supporting team one for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: sup_tm2**

**Fullname:** Supporting team two

**Attribute Description** Indicates supporting team two for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: sup_tm3**

**Fullname:** Supporting team three

**Attribute Description** Indicates supporting team three for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: sup_tm4**

**Fullname:** Supporting team four

**Attribute Description** Indicates supporting team four for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: sup_tm5**

**Fullname:** Supporting team five

**Attribute Description** Indicates supporting team five for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: sup_tm6**

**Fullname:** Supporting team six

**Attribute Description** Indicates supporting team six for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: sup_tm7**

**Fullname:** Supporting team seven

**Attribute Description** Indicates supporting team seven for intraflow. A call type queue may have zero to eight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

Copyright © 1999 Lucent Technologies 

**Attribute: sup_tm8**

**Fullname:** Supporting team eight

**Attribute Description** Indicates supporting team eight for intraflow. A call type queue may have zero to e
ight supporting serving teams. Zero is not allowed on the RC/ODA form. It is equivalent to unknown.

**Attribute: dotflw1**

**Fullname:** Delay outflow threshold for supporting team one

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team one (sup_tm1).

**Attribute: dotflw2**

**Fullname:** Delay outflow threshold for supporting team two

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team two (sup_tm2).

**Attribute: dotflw3**

**Fullname:** Delay outflow threshold for supporting team three

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team three (sup_tm3).

**Attribute: dotflw4**

**Fullname:** Delay outflow threshold for supporting team four

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team four (sup_tm4).

**Attribute: dotflw5**

**Fullname:** Delay outflow threshold for supporting team five

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team five (sup_tm5).

**Attribute: dotflw6**

**Fullname:** Delay outflow threshold for supporting team six

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team six (sup_tm6).

**Attribute: dotflw7**

**Fullname:** Delay outflow threshold for supporting team seven

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team seven (sup_tm7).

**Attribute: dotflw8**

**Fullname:** Delay outflow threshold for supporting team eight

**Attribute Description** Indicates the intraflow delay outflow threshold in seconds for supporting team eight (sup_tm8).

## 4. Population Rules for RLcttucb

Copyright © 1999 Lucent Technologies

**Relation Description** Callback information about the central trunk test unit. Relation containing the callback information about the central trunk test unit (CTTU).

**Attribute: user_numb**

**Fullname:** CTTU user number
**Attribute Description** This attribute is the CTTU user number. One tuple should exist for each CTTU that can access the switch and request class A, B, or C security access. The valid user numbers are 2-9 and 20-49. If the office has a CTTU, an entry for user number 2 is required and it must have class 'A' security access.

**Attribute: lvl_secure**

**Fullname:** security level of the CTTU
**Attribute Description** Specifies the security level of the CTTU. Populate one attribute for every valid user number in the 'user_numb' attribute.

```
Use CT_CLSA if the CTTU has class 'A' security.
Use CT_CLSB if the CTTU has class 'B' security.
Use CT_CLSC if the CTTU has class 'C' security.
```

**Attribute: security**

**Fullname:** DN for security callback
**Attribute Description** This is a directory number used to perform security callback. This attribute is required for all tuples.

**Attribute: security.digcnt**

**Fullname:** digit count
**Attribute Description** Digit count.

**Attribute: security.dn**

**Fullname:** directory number
**Attribute Description** Security callback DN.

**Attribute: talkmon**

**Fullname:** DN for talk and monitor
**Attribute Description** DN for talk and monitor.

**Attribute: talkmon.digcnt**

**Fullname:** digit count
**Attribute Description** Digit count.

**Attribute: talkmon.dn**

**Fullname:** directory number
**Attribute Description** Talk and monitor DN.

**Attribute: carrid**

**Fullname:** carrier ID for call backs
**Attribute Description** Indicates the carrier through which a call to a remote CTTU will be routed if the DN is outside the LATA. It must be a 4 digit character string where each of the characters can be '0' through '9'. The carrier ID value must be an existing one in the RLfc_carr relation. The default is '\0'.

**Attribute: cbakgport**

**Fullname:** logical test port used to originate a talk and monitor connection
**Attribute Description** This attribute is the global port corresponding to the LTP used to originate talk and monitor calls. There should one per tuple having a talk and monitor DN.

Copyright © 1999 Lucent Technologies 

**Attribute: cbakgport.member**
**Fullname:** member
**Attribute Description** Port member.

**Attribute: cbakgport.module**
**Fullname:** module
**Attribute Description** Port module.

**Relation Description**

SCCP Conversion Administration Group Mapping Relation

This relation provides for Signaling Connectionless Control Part's (SCCP) Conversion functionality a mapping from a Network Number and Destination Point Code to an administration group.

**Attribute: net_num**

**Fullname:** SCCP Network Number

**Attribute Description** This attribute provides a mapping from a SCCP Global SM to an index called network number.

**Attribute: dpc**

**Fullname:** Destination Point Code

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute represents a SS7 International, SS7 National, or CCSNA7 Destination Point Code.

**Attribute: pc_size**

**Fullname:** SCCP Conversion Point Code Size

**Attribute Description** This attribute specifies whether this point code is a full point code or cluster point code.

**Attribute: adm_grp**

**Fullname:** SCCP Conversion Administration Group

**Attribute Description** This attribute represents a group of Destination Point Codes which will be converted in the same manner.

**Attribute: full_ct**

**Fullname:** SCCP Conversion Count of Full DPC's in Group.

**Attribute Description** This attribute specifies the number of full destination point codes represented by this cluster point code. If this attribute is 0, then the tuple is a valid point code. Otherwise, the tuple is a mechanism to keep track of cluster point codes represented by a particular group.

## 4. Population rules for RLcv_dstdn

### Relation Description

Call vectoring destination number to directory number (DN) mapping table.
This relation defines where a call will be routed when a given destination number is specified in a call vectoring route steps. Depending on the value of the 'dirnmbr' attribute, the tuple will define a DN (for routing within the office) or a four-digit route index. In the case of routing over public networks, if more than ten digits are required or if billing is needed, the directory number defined in the tuple should correspond

Copyright © 1999 Lucent Technologies

to a line with remote call forwarding. Then that line would be forwarded to the desired destination.
When a DN is specified, it is important that no billing be required to reach this DN. This DN can be a remote call forwarded line if the access to a destination over public facilities that requires billing the call to the commercial-automatic call distributor (C-ACD) customer. Use of a route index should only be permitted when the route index corresponds to private facilities.

**Attribute:**
destnmbr
**Fullname:**
Destination number minus 1
**Attribute Description:**
Destination numbers are used in call vectoring route steps (RLcv_vectr) to send calls to other C-ACD sites. An entered destination number must be decremented by one in order to form the key for the corresponding tuple of the RLcv_dstdn relation.

**Attribute:**
dirnmbr
**Fullname:**
Directory number defined indicator
**Attribute Description:**
This attribute indicates whether the 'dnum0' through 'dnum9' attributes correspond to a directory/telephone number (TN) or a route index. If 'dirnmbr' is DBYES, a TN is stored in 'dnum0' through 'dnum9'. If the TN is less than ten digits, the remaining 'dnum[x]' fields are set to '15'. For example, 35217 would be stored with '3' in the 'dnum0' and '7' in 'dnum4' with 'dnum[5-9]' containing '15'. However, if 'dirnmbr' is DBNO, 'dnum0' through 'dnum4' contain digits corresponding to the desired route index. In the latter case, 'dnum5' through 'dnum9' are meaningless and are set to 15.

**Attribute:**
dnum0
**Fullname:**
Directory number 0
**Attribute Description:**
This is either the first digit of a directory number (if 'dirnmbr' is DBYES) or a route index (if 'dirnmbr' is DBNO).

**Attribute:**
dnum1
**Fullname:**
Directory number 1
**Attribute Description:**
If 'dirnmbr' is DBYES, this is the second digit of a directory number (if it exists) or 15 (if the TN is less than two digits); otherwise, this attribute is the second digit of a route index.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

dnum2

**Fullname:**

Directory number 2

**Attribute Description:**

If 'dirnmbr' is DBYES, this is the third digit of a directory number (if it exists) or 15 (if the TN is less than three digits); otherwise, this attribute is the third digit of a route index. This is either the third digit of a directory number (if 'dirnmbr' is DBYES) or a route index (if 'dirnmbr' is DBNO).

**Attribute:**

dnum3

**Fullname:**

Directory number 3

**Attribute Description:**

If 'dirnmbr' is DBYES, this is the fourth digit of a directory number (if it exists) or 15 (if the TN is less than four digits); otherwise, this attribute is the fourth digit of a route index.

**Attribute:**

dnum4

**Fullname:**

Directory number 4

**Attribute Description:**

If 'dirnmbr' is DBYES, this is the fifth digit of a directory number (if it exists) or 15 (if the TN is less than five digits); otherwise, this attribute is the fifth digit of a route index.

**Attribute:**

dnum5

**Fullname:**

Directory number 5

**Attribute Description:**

If 'dirnmbr' is DBYES, this is the sixth digit of a directory number (if it exists) or 15 (if the TN is less than six digits); otherwise, this attribute is meaningless.

**Attribute:**

dnum6

**Fullname:**

Directory number 6

**Attribute Description:**

If 'dirnmbr' is DBYES, this is the seventh digit of a directory number (if it exists) or 15 (if the TN is less than seven digits); otherwise, this attribute is meaningless.

**Attribute:**

dnum7

**Fullname:**

Directory number 7

**Attribute Description:**

If 'dirnmbr' is DBYES, this contains the eighth digit of a directory number (if it exists) or 15 (if the TN is less than eight digits);

**Copyright © 1999 Lucent Technologies** 

otherwise, this attribute is meaningless.

**Attribute:**
dnum8
**Fullname:**
Directory number 8
**Attribute Description:**
If 'dirnmbr' is DBYES, this contains the ninth digit of a directory number (if it exists) or 15 (if the TN is less than nine digits): otherwise, this attribute is meaningless.

**Attribute:**
dnum9
**Fullname:**
Directory number 9
**Attribute Description:**
If 'dirnmbr' is DBYES, this contains the tenth digit of a directory number (if it exists) or 15 (if the TN is less than ten digits); otherwise, this attribute is meaningless.

## 4. Population Rules for RLcv_vectr

**Relation Description**

`Call Vectoring Vector definitions`

Each tuple of this relation contains 15 steps defining how a call is to be treated while waiting for a C-ACD agent. As such it forms a sort of program defined in a 'language' specialized for call handling. This 'language' contains such functions as queuing a call, playing announcements, connection to a music source for a specified period and conditional or unconditional branching, to name just a few. Conditional and unconditional GOTOs branching between tuples of RLcv_vectr can be used to produce larger programs.

When a step's cmdcode subattribute is NOOP, there are no constraints on the other subattributes. This provides a way to temporarily disable a vector step without having to reenter the parameters when the step is later reenabled.

**Attribute: vectnmbr**

**Fullname:** vector number minus 1

**Attribute Description** A vector number can be referenced by conditional and unconditional GOTO steps within any of the 1024 vector tuples allowed. It can also be referenced by one or more tuples in RLac_tkct. Vectors are numbered from 1 to 1024. Thus the key value is actually the vector number minus 1.

**Attribute: vredirect**

**Fullname:** Vector to which calls are to be redirected

**Attribute Description** When the 'redirect' attribute is set to DBYES, the 'vredirect' attribute specifies the vector to which calls should be redirected (the value is the vector number minus 1).

Copyright © 1999 Lucent Technologies 

Note that this redirection is NOT recursive. The 'redirect' attribute in the vector to which calls are redirected are ignored. Moreover, the redirection attributes are NOT examined when vector processing branches to another vector using a conditional or unconditional GOTO step.

**Attribute: active**

**Fullname:** Vector Activated

**Attribute Description** This attributes allows a vector to be deactivated. While this attribute is DBNO, all calls arriving on a trunk group or with dialed digits assigned to this vector will instead receive standard treatment (call is placed into a queue according to call type determined, receives one or three announcements depending on the expected delay, and then hears audible ring until an agent answers). This allows the vector to be 'quarantined' while being edited.

**Attribute: redirect**

**Fullname:** Redirection of vector assignment enabling attribute

**Attribute Description** This attribute allows the redirection to another vector. If set to DBYES, new calls that ordinarily would have begun vector processing on this vector will instead be redirected to the vector specified in the 'vredirect' attribute.

**Attribute: step1**

**Fullname:** Step 1 of vector 'program'

**Attribute Description** This attribute defines the first step in this 15-step vector.

**Attribute: step1.cmdcode**

**Fullname:** command code of vector step

**Attribute Description** This subattribute defines the function to be performed by this vector step (such as GOTO, NOOP, RING, ...).

**Attribute: step1.arg2**

**Fullname:** vector step's second command argument

**Attribute Description** This subattribute records 1 of two arguments needed by the various vector step command codes (cmdcode). Its permissible range of values and its meaning is determined by the contents of the cmdcode subattribute.

**Attribute: step1.arg1**

**Fullname:** vector step's first command argument

**Attribute Description** This subattribute records 1 of two arguments needed by the various vector step command codes (cmdcode). Its permissible range of values and its meaning is determined by the contents of the cmdcode subattribute.

**Attribute: step1.errstp**

**Fullname:** Error Treatment Step number

**Attribute Description** Certain vector commands are subject to failure due to a number of reasons (For example, MUSIC can fail to route to a music source port because it is already connected to the maximum number of calls it can support). When such failures occur, vector processing can be diverted to an error treatment by specifying the first vector step of the error treatment in this subattribute.

**Attribute: step1.carg1**

**Fullname:** Conditional GOTO argument 1

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This subattribute records 1 of two arguments needed by the various conditional GOTO commands that can be placed in the cmdcode attribute. Its permissible range of values and its meaning is determined by which conditional GOTO command is in the cmdcode subattribute.

**Attribute: step1.carg2**

**Fullname:** Conditional GOTO argument 2

**Attribute Description** This subattribute records 1 of two arguments needed by the various conditional GOTO commands that can be placed in the cmdcode attribute. Its permissible range of values and its meaning is determined by which conditional GOTO command is in the cmdcode subattribute.

**Attribute: step1.cond**

**Fullname:** Conditional test

**Attribute Description** This subattribute is used to specify the condition of a conditional GOTO step. For example, if this subattribute contains a value of OACV_LE, the branch will occur if the parameter being tested (such as number of calls in a queue) is less than or equal to the threshold specified in carg1 and/or carg2.

**Attribute: step2**

**Fullname:** Step 2 of vector 'program'

**Attribute Description** This attribute defines the second vector step

**Attribute: step2.cmdcode**

**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step2.arg2**

**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step2.arg1**

**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step2.errstp**

**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step2.carg1**

**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step2.carg2**

**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

Copyright © 1999 Lucent Technologies 

**Attribute: step2.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step3**
**Fullname:** Step 3 of vector 'program'

**Attribute Description** This attribute defines the third vector step

**Attribute: step3.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step3.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step3.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step3.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step3.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step3.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step3.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step4**
**Fullname:** Step 4 of vector 'program'

**Attribute Description** This attribute defines the fourth vector step

**Attribute: step4.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step4.arg2**

Copyright © 1999 Lucent Technologies 

**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step4.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step4.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step4.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step4.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step4.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step5**
**Fullname:** Step 5 of vector 'program'

**Attribute Description** This attribute defines the fifth vector step

**Attribute: step5.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step5.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step5.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step5.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step5.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step5.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step5.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step6**
**Fullname:** Step 6 of vector 'program'

**Attribute Description** This attribute defines the sixth vector step

**Attribute: step6.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step6.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step6.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step6.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step6.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step6.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step6.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step7**
**Fullname:** Step 7 of vector 'program'

**Attribute Description** This attribute defines the seventh vector step

Copyright © 1999 Lucent Technologies

**Attribute: step7.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step7.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step7.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step7.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step7.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step7.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step7.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step8**
**Fullname:** Step 8 of vector 'program'

**Attribute Description** This attribute defines the eighth vector step

**Attribute: step8.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step8.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step8.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step8.errstp**

Copyright © 1999 Lucent Technologies

**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step8.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step8.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step8.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step9**
**Fullname:** Step 9 of vector 'program'

**Attribute Description** This attribute defines the ninth vector step

**Attribute: step9.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step9.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step9.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step9.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step9.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step9.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step9.cond**
**Fullname:** Conditional test

Copyright © 1999 Lucent Technologies

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step10**
**Fullname:** Step 10 of vector 'program'

**Attribute Description** This attribute defines the tenth vector step

**Attribute: step10.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step10.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

**Attribute: step10.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step10.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step10.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step10.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step10.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step11**
**Fullname:** Step 11 of vector 'program'

**Attribute Description** This attribute defines the eleventh vector step

**Attribute: step11.cmdcode**
**Fullname:** command code of vector step

**Attribute Description** Usage is same as for step1.cmdcode subattribute

**Attribute: step11.arg2**
**Fullname:** vector step's second command argument

**Attribute Description** Usage is same as for step1.arg2 subattribute

Copyright © 1999 Lucent Technologies

**Attribute: step11.arg1**
**Fullname:** vector step's first command argument

**Attribute Description** Usage is same as for step1.arg1 subattribute

**Attribute: step11.errstp**
**Fullname:** Error Treatment Step number

**Attribute Description** Usage is same as for step1.errstp subattribute

**Attribute: step11.carg1**
**Fullname:** Conditional GOTO argument 1

**Attribute Description** Usage is same as for step1.carg1 subattribute

**Attribute: step11.carg2**
**Fullname:** Conditional GOTO argument 2

**Attribute Description** Usage is same as for step1.carg2 subattribute

**Attribute: step11.cond**
**Fullname:** Conditional test

**Attribute Description** Usage is same as for step1.cond subattribute

**Attribute: step12**
**Fullname:** Step 12 of vector 'program'

**Attribute Description** This attribute defines the twelfth vector step

**Attribute: step12.cmdcode**
**Fullname:** command code of vector step

## 4. Population rules for RLcw_cf

### Relation Description

call waiting constructed feature
call waiting constructed feature information

**Attribute:**
feat_id
**Fullname:**
call waiting constructed feature id
**Attribute Description:**
Verify that RLfacname has a tuple such that feat_id = RLfacname.facid, and RLfacname.class = FACBRCS for that tuple.

**Attribute:**
filter
**Fullname:**
party filtering for called, calling party
**Attribute Description:**
party filting for called, calling party

**Attribute:**
filter.intratg
**Fullname:**
intratg
**Attribute Description:**
intratg

**Attribute:**
filter.intraoff
**Fullname:**
intraoff
**Attribute Description:**
intraoff

**Attribute:**
filter.interoff

Copyright © 1999 Lucent Technologies 

**Fullname:**
interoff
**Attribute Description:**
interoff

**Attribute:**
filter.pf
**Fullname:**
pf
**Attribute Description:**
pf

**Attribute:**
filter.attndnt
**Fullname:**
attndnt
**Attribute Description:**
attndnt

**Attribute:**
mw_cfid
**Fullname:**
constructed feature id of multiway feature to which this call waiting feature can bridge
**Attribute Description:**
If the mw_cfid > 0, the following must be true:
1) Verify its existence in the FAC relations.
2) RLmwcfdfl.feat_id = RLcw_cf.mw_cfid.
3) RLmwcfdfl.epfr_cw = DBYES
4) RLmwcfdfl.ah_tg_fl = RLcw_cf.filter.intratg
5) RLmwcfdfl.ah_intrafl = RLcw_cf.filter.intraoff
6) RLmwcfdfl.ah_interfl = RLcw_cf.filter.interoff
7) RLmwcfdfl.ah_pf_fl = RLcw_cf.filter.pf
8) RLmwcfdfl.ah_attfl = RLcw_cf.filter.attndnt
9) RLmwcfdfl.oh_tg_fl = DBYES
10) RLmwcfdfl.oh_intrafl = DBYES
11) RLmwcfdfl.oh_interfl = DBYES
12) RLmwcfdfl.oh_pf_fl = DBYES
13) RLmwcfdfl.oh_attfl = DBYES

**Attribute:**
fwd_cfid
**Fullname:**
constructed feature of call forwarding feature to which this call waiting feature can bridge
**Attribute Description:**
If set to > 0, verify existence of tuple in RLcf_opts for this key feat_id value.

**Attribute:**
bill_typ
**Fullname:**
billing type

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
If flat == DBYES, all other subattributes = DBNO.
If flat == DBNO, RLcw_cf.actvn = ACTCD.
If one or more subattributes other than flat
== DBYES, flat shall be = DBNO.

**Attribute:**
bill_typ.flat
**Fullname:**
flat
**Attribute Description:**
flat

**Attribute:**
bill_typ.usefreq1
**Fullname:**
usefreq1
**Attribute Description:**
usefreq1

**Attribute:**
bill_typ.usefreq2
**Fullname:**
userfreq2
**Attribute Description:**
usefreq2

**Attribute:**
bill_typ.usefreq3
**Fullname:**
usefreq3
**Attribute Description:**
usefreq3

**Attribute:**
bill_typ.usefreq4
**Fullname:**
usefreq4
**Attribute Description:**
usefreq4

**Attribute:**
bill_typ.actchrg
**Fullname:**
actchrg
**Attribute Description:**
actchrg

**Attribute:**
bill_typ.dactchrg
**Fullname:**
dactchrg
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

dactchrg

**Attribute:**
bill_typ.duration
**Fullname:**
duration
**Attribute Description:**
duration

**Attribute:**
bill_typ.change
**Fullname:**
change
**Attribute Description:**
change

**Attribute:**
typinv
**Fullname:**
type of invocation
**Attribute Description:**

| Attribute Value | Dependency |
|---|---|
| CWIN_IORG or CWIN_IDIAL | 1) RLcw_cf.filter.intratg = DBYES<br>2) RLcw_cf.filter.intraoff = DBNO<br>3) RLcw_cf.filter.interoff = DBNO<br>4) RLcw_cf.filter.pf = DBNO<br>5) Since 2 features with identical invocations and overlapping party filterings cannot be assigned to the same line, there can only be one of each CW feature with this particular invocation.<br>6) RLcw_cf.cdp_tn_intvl = 10<br>7) RLcw_cf.chg_tn_int = DBNO |
| CWIN_ITERM | This feature cannot be assigned if RLfc_porttyp.servclass = FC_ISDN or RLfc_porttyp.servclass = FC_ISATND. |

**Attribute:**
cgp_ind
**Fullname:**
calling party indicator
**Attribute Description:**
NOTE: for 5e4_2q the OSILENCE enumeration returns a 'beep' followed by 'silence' instead of 'busy' when selected as the value for the 'cgp_ind' feature option. For 5E7_1J, cgp_ind cannot be equal to OMUSIC for constructed features unless the Music On Hold Special Feature (SFID 064 is set) has been purchased for the office.

**Attribute:**
cdp_tone
**Fullname:**
calling party indicator tone

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
If tone is TNBEEP1,TNBEEP2 or TNBEEP3, tone repetition interval X must be specified in RLcw_port.cdp_tn_intvl

**Attribute:**
dep_tone
**Fullname:**
party departure indicator tone
**Attribute Description:**
TN_NONE is the only value allowed in 5e2_1

**Attribute:**
control
**Fullname:**
control action that can be taken by terminating party
**Attribute Description:**
If RLcw_cf.control == CW_CFLASH, then RLcw_cf.mw_cfid > 0.

**Attribute:**
cp_bill
**Fullname:**
CW feature calling party billing
**Attribute Description:**
call forwarding feature calling party billing

**Attribute:**
tout_actn
**Fullname:**
action to be taken on timeout
**Attribute Description:**
If set to TOT_FWD, RLcw_cf.fwd_cfid > 0.

**Attribute:**
actvn
**Fullname:**
feature activation type
**Attribute Description:**

| Enum. value | Dependency |
|---|---|
| ACTNONE | 1) RLcw_cf.dctvn = DCTNONE or DCTCD |
| | 2) RLcw_cf.bill_typ.flat = DBYES |
| ACTCD | 1) RLcw_cf.dctvn = DCTAUTO or DCTCD |
| | 2) Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTACT for |

**Attribute:**
dctvn
**Fullname:**
feature deactivation type
**Attribute Description:**

| Enum. value | Dependency |
|---|---|
| DCTNONE | 1) RLcw_cf.actvn = ACTNONE |
| DCTAUTO | 1) RLcw_cf.actvn = ACTCD |

Copyright © 1999 Lucent Technologies

```
          DCTCD       1) RLcw_cf.actvn = ACTCD or ACTNONE
                      2) Verify tuple exists in dial tree
                         RLdaprlfnl or RLidp_dtre with
                         'action' attribute = ACN_FTDCT for
```

**Attribute:**
chg_to
**Fullname:**
indicates if customer change of time-out is allowed
**Attribute Description:**
indicates if customer can change the time (in seconds) after which a waiting call is forwarded

**Attribute:**
chg_tn_int
**Fullname:**
indicates if customer change of called party tone interval is allowed
**Attribute Description:**
indicating if custom change of called party tone interval is allowed.

**Attribute:**
cwdeluxe
**Fullname:**
Call Waiting Deluxe
**Attribute Description:**
The cwdeluxe field is used by Call Waiting Deluxe (CWD) Phase I Special Feature in 5e10.1 SR. It will be used to indicate the CWD option for the Call Waiting Terminating feature. The default value is DBNO. In 5e9.1 and 5e9.2 Software Updates (SUs), a ffcf1 spare was used for this Feature. The default value is DBNO.
The CWD feature is allowed only on lines with service class of INDIV, or PBX.
The CWD feature is now allowed on LTSB lines if SFID 280 is turned on in 5E13 BMI and later releases.
It is not allowed on a ISDN, MLHG, 4WINDIV, ATTENDANT, Remote Call Forwarding, Coin, Denied Terminating, Denied Originating, Shared DNs, Two-party, and Multiparty lines. The cwdeluxe cannot be DBYES unless office has SFID145 set Y (that is, the CWD feature is purchased).

**Attribute:**
ffcf2

### Relation Description

Call Waiting options

Call Waiting feature definition's options and defaults.

**Attribute:**

feat_id

**Fullname:**

Feature ID

**Attribute Description:**

Call Waiting constructed feature ID.

**Attribute:**

filter

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Party filter
**Attribute Description:**
Party filtering for called, calling party. This is not a directory number filter.

**Attribute:**
filter.intratg
**Fullname:**
Intra-terminal group
**Attribute Description:**
Intra-terminal group.
A value of DBYES indicates PASS (no filtering).

**Attribute:**
filter.intraoff
**Fullname:**
Intra-office
**Attribute Description:**
Intra-office

**Attribute:**
filter.interoff
**Fullname:**
Inter-office
**Attribute Description:**
Inter-office

**Attribute:**
filter.pf
**Fullname:**
Private facility
**Attribute Description:**
Private facility

**Attribute:**
filter.attndnt
**Fullname:**
Attendant
**Attribute Description:**
Attendant

**Attribute:**
mw_cfid
**Fullname:**
Multiway constructed feature ID
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Constructed feature ID of a multiway feature to which this call waiting feature can bridge. The default value 0 indicates no bridging.

**Attribute:**
fwd_cfid
**Fullname:**
Call forwarding constructed feature ID
**Attribute Description:**
Constructed feature ID of a call forwarding feature to which this call waiting feature can bridge. The default value 0 indicates no bridging.

**Attribute:**
bill_typ
**Fullname:**
Billing type
**Attribute Description:**
Usage billing type. This is a boolean structure indicating the combination of several types of billing. In each case a DBYES indicates that type of billing is applicable and DBNO indicates that it is not.

**Attribute:**
bill_typ.flat
**Fullname:**
Flat rate
**Attribute Description:**
Flat rate - no usage sensitive charge.

**Attribute:**
bill_typ.usefreq1
**Fullname:**
Usage frequency 1
**Attribute Description:**
Usage frequency charge for use of `event' 1.

**Attribute:**
bill_typ.usefreq2
**Fullname:**
Usage frequency 2
**Attribute Description:**
Usage frequency charge for use of `event' 2.

**Attribute:**
bill_typ.usefreq3
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Usage frequency 3
**Attribute Description:**
Usage frequency charge for use of `event' 3.

**Attribute:**
bill_typ.usefreq4
**Fullname:**
Usage frequency 4
**Attribute Description:**
Usage frequency charge for use of `event' 4.

**Attribute:**
bill_typ.actchrg
**Fullname:**
Activation charge
**Attribute Description:**
Usage charge for activation.

**Attribute:**
bill_typ.dactchrg
**Fullname:**
Deactivation charge
**Attribute Description:**
Usage charge for deactivation.

**Attribute:**
bill_typ.duration
**Fullname:**
Duration
**Attribute Description:**
Usage charge for duration of use.

**Attribute:**
bill_typ.change
**Fullname:**
Change
**Attribute Description:**
Usage charge for change of parameter.

**Attribute:**
typinv
**Fullname:**
Type of invocation
**Attribute Description:**
Type of invocation. Since 2 features with identical invocations and overlapping party filterings cannot be assigned to the same line, there can only be one of each CW feature with this

Copyright © 1999 Lucent Technologies 

particular invocation. typinv cannot be set to CWIN_ITERM for servclass FC_ISDN or FC_ISATND.

**Attribute:**
cgp_ind
**Fullname:**
Calling party indicator
**Attribute Description:**
Calling party indicator - includes tones.
cpg_ind cannot be equal to OMUSIC for constructed features unless the Music On Hold Special Feature (SFID 064 is set) has been purchased for the office.

**Attribute:**
cdp_tone
**Fullname:**
Called party tone
**Attribute Description:**
Called party indicator tone.

**Attribute:**
dep_tone
**Fullname:**
Departure tone
**Attribute Description:**
Party departure indicator tone.

**Attribute:**
control
**Fullname:**
Control
**Attribute Description:**
Control action that can be taken by departing party.

**Attribute:**
cp_bill
**Fullname:**
Calling party billing
**Attribute Description:**
Call Waiting feature calling party billing.

**Attribute:**
tout_actn
**Fullname:**
Time out action
**Attribute Description:**
Action to be taken (treatment) after a set time during which

**Copyright © 1999 Lucent Technologies** 

a call has been waiting.

**Attribute:**
actvn
**Fullname:**
Activation
**Attribute Description:**
Indicates method of activating MFC features.

*** ODA ONLY WARNING ***
***(NOT SUPPORTED BY RC)***
Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTACT for the given dial code.

**Attribute:**
dctvn
**Fullname:**
Deactivation
**Attribute Description:**
Indicates method of deactivating MFC features.

*** ODA ONLY WARNING ***
***(NOT SUPPORTED BY RC)***
Verify tuple exists in dial tree RLdaprlfnl or RLidp_dtre with 'action' attribute = ACN_FTDCT for the given dial code.

**Attribute:**
chg_to
**Fullname:**
Change time out
**Attribute Description:**
Indicates if the customer is allowed to change the time after which a waiting call is forwarded.

**Attribute:**
chg_tn_int
**Fullname:**
Change tone interval
**Attribute Description:**
This attribute indicates if the customer can change the time of the called party tone interval.

**Attribute:**
cgp_tn_intvl
**Fullname:**
Calling party tone interval
**Attribute Description:**
The calling party tone repetition interval X in seconds.

**Copyright © 1999 Lucent Technologies** 

A value of 0 indicates no repetition.

**Attribute:**
cdp_tn_intvl
**Fullname:**
Called party tone interval
**Attribute Description:**
The called party tone repetition interval X in seconds.
A value of 0 indicates no repetition.

**Attribute:**
dep_tn_intvl
**Fullname:**
Departure tone interval
**Attribute Description:**
The party departure tone repetition interval X in seconds.
A value of 0 indicates no repetition.

**Attribute:**
bill_aft_x
**Fullname:**
Bill after X
**Attribute Description:**
The time after which to bill the calling party in (X) seconds

**Attribute:**
time_fwd
**Fullname:**
Time forwarded
**Attribute Description:**
The time in seconds after which the waiting call is forwarded.

**Attribute:**
cwdeluxe
**Fullname:**
Call Waiting Deluxe
**Attribute Description:**
The cwdeluxe field is used by Call Waiting Deluxe (CWD) Phase I Special Feature in 5e10.1 SR. It will be used to indicate the CWD option for the Call Waiting Terminating feature. The default value is DBNO. In 5e9.1 and 5e9.2 Software Updates (SUs), a ffcf1 spare was used for this Feature. The default value is DBNO.

The CWD feature is allowed only on lines with service class of INDIV, or PBX. It is not allowed on a ISDN, MLHG, 4WINDIV, ATTENDANT, Remote Call Forwarding, Coin, Denied Terminating, Denied Originating, Shared DNs, Two-party, and Multiparty lines. CWD is allowed on LTSB lines if SFID 280 is turned on for 5E13 BMI and later releases. The 'cwdeluxe' fiel

Copyright © 1999 Lucent Technologies 

d
cannot be DBYES unless office has SFID145 set Y (that is, the CWD feature is purchased).

**Attribute:**
alert_type
**Fullname:**
Alert type
**Attribute Description:**
The alert_type field is for use by the Call Waiting Deluxe (CWD) Special feature. If alert_type is set to OFC_ALERT, then the actual value which call processing uses is stored in the Glcwalert global office parameter.

**Attribute:**
cwd_dflt
**Fullname:**
Call waiting deluxe default option
**Attribute Description:**
The cwd_dflt field is for use by the Call Waiting Deluxe (CWD) Special feature. This field stores the default option (ringing, forward, announcement) taken when the CWD subscriber gets call waited and no action is taken by the subscriber. If cwd_dflt is set to OFC_DFLTOPT, then the actual value which call processing uses is stored in the Glcwdefopt global office parameter.

**Attribute:**
cwd_usgsens
**Fullname:**
Call waiting deluxe usage sensitive for conferencing
**Attribute Description:**
The cwd_usgsens field is for use by the Call Waiting Deluxe (CWD) Special feature. This field is set to DBYES when usage sensitive billing for conferencing after being call waited is required. If cwd_usgsens is set to OFC_CONF, then the actual value which call processing uses is stored in the Glcwconf global office parameter.

**Attribute:**
tcw
**Fullname:**
Talking Call Waiting
**Attribute Description:**
It will be used
to indicate that the customer not only has a terminating call waiting feature but a value of DBYES means that the customer has the talking call waiting feature which announces the name of the party trying to call.

**Copyright © 1999 Lucent Technologies** 

This attribute can not be changed from the default unless the special feature ID SFID331 is turned on.
not applicable

**Attribute:**
ffcf1
**Fullname:**
Future field
**Attribute Description:**
Boolean reserved for future field feature use.

**Attribute:**
ffcf2
**Fullname:**
Future field
**Attribute Description:**
Boolean reserved for future field feature use.

**Attribute:**

ffcf3
**Fullname:**
Future field
**Attribute Description:**
Boolean reserved for future field feature use.

**Attribute:**
ldst_cw
**Fullname:**
Long Distance Call Waiting
**Attribute Description:**
Tell if CW should give special consideration for long distance

calls. This attribute can not be changed from the default unless the special feature ID SFID091 is turned on.

## 4. Population rules for RLcw_port

### Relation Description

Call Waiting port

Call Waiting parameters assigned to a BRCS User (a User is defined to be an analog terminal, a trunk, or an ISDN User).

"BRCS FEATURE GROUPING (BFG), CAPABILITY G268, IS INTENDED TO IMPROVE RECENT CHANGE RESPONSE TIME AND PROVIDE FOR SM MEMORY REDUCTION. IT PERMITS THE CREATION OF GROUPS OF BRCS FEATURES AND PARAMETERS, AND THE UTILIZATION OF THESE GROUPS BY CALL PROCESSING. BFG GROUP PARAMETER RELATIONS WILL NOT BE CREATED, BUT WILL BE POPULATED IN EXISTING LPORT KEYED RELATIONS.

IDENTIFYING BFG GROUP PARAMETERS WILL BE ACCOMPLISHED VIA USE OF AN LPT_TYPE KEY FIELD SET TO LPT_BFG AND USE OF THE LPORT KEY FIELD TO CONTAIN THE BFG GROUP ID.
THIS CONCEPT IS USED TO AVOID CREATION OF NEW DATABASE RELATIONS.

DISTRIBUTION: GROUP PARTITIONED (IF LPT_TYPE=LPT_BFG) OR SM PARTITIONED

THIS RELATION NOW HAS TWO TYPES OF TUPLES.

1. THE FIRST TYPE is the existing tuples which are SM-PARTITIONED and remain unchanged. They are keyed by lpt_type != LPT_BFG and lport, and no change has been made to this key or data.

2. THE SECOND TYPE is the BFG GROUP PARTITIONED TUPLE associated with

Copyright © 1999 Lucent Technologies 

features in a BRCS Feature Group (BFG), having lpt_type=LPT_BFG, and the bfgid populated in the lport field.

For BFG purposes, RLcw_port is a Group type. Therefore, only BFG lport tuple is permitted for the lport assigned to a BFG. Individual lport tuples may not be created for BFG assigned lports (when the feature is in the BFG).

NOTE: There is a limit of 30 BRCS features for each bfgid. "

**Attribute:**
lport
**Fullname:**
Logical port
**Attribute Description:**
The logical port of the User being assigned the BRCS features.

**Attribute:**
lpt_type
**Fullname:**
Logical port type
**Attribute Description:**
The logical port type of the User being assigned the BRCS features.

**Attribute:**
feat_id
**Fullname:**
Feature ID
**Attribute Description:**
Call Waiting constructed feature ID.

**Attribute:**
cgp_tn_intvl
**Fullname:**
Calling party tone interval
**Attribute Description:**
The calling party tone repetition interval in seconds.
The default 0 indicates no repetition.

**Attribute:**
cdp_tn_intvl
**Fullname:**
Called party tone interval
**Attribute Description:**
The called party tone repetition interval in seconds.
A value of 0 indicates no repetition.

Copyright © 1999 Lucent Technologies 

**Attribute:**
dep_tn_intvl
**Fullname:**
Departure tone interval
**Attribute Description:**
The party departure tone repetition interval in seconds. A value of 0 indicates no repetition.

**Attribute:**
bill_aft_x
**Fullname:**
Bill after x
**Attribute Description:**
The time, in seconds (x), after which to bill the calling party.

**Attribute:**
time_fwd
**Fullname:**
Time forwarded
**Attribute Description:**
The time, in seconds, after which a waiting call is forwarded.

**Attribute:**
ldst_cw
**Fullname:**
Distinctive CW Tone for Long Distance Calls.
**Attribute Description:**
This attribute can not be changed from the default unless the special feature ID SFID091 is turned on.

**Attribute:**
alert_type
**Fullname:**
Alert type
**Attribute Description:**
The alert_type field is for use by the Call Waiting Deluxe ( CWD) Special feature (SFID 145). If alert_type is set to OFC_ALERT, then the actual value which call processing uses is stored in the Glcwalert global office parameter.

**Attribute:**
cwd_dflt
**Fullname:**
Call waiting deluxe default option
**Attribute Description:**
The cwd_dflt field is for use by the Call Waiting Deluxe (CWD) Special feature (SFID 145). This field stores the default

**Copyright © 1999 Lucent Technologies** 

option (ringing, forward, announcement) taken when the CWD subscriber gets call waited and no action is taken by the subscriber. If cwd_dflt is set to OFC_DFLTOPT, then the actual value which call processing uses is stored in the Glcwdefopt global office parameter.

**Attribute:**
cwd_usgsens
**Fullname:**
Call waiting deluxe usage sensitive for conferencing
**Attribute Description:**
The cwd_usgsens field is for use by the Call Waiting Deluxe (CWD) Special feature (SFID 145). This field is set to USGSEN_YES when usage sensitive billing for conferencing after being call waited is required. If cwd_usgsens is set to OFC_CONF, then the actual value which call processing uses is stored in the Glcwconf global office parameter.

**Attribute:**
tcw
**Fullname:**
talking call waiting
**Attribute Description:**

tcw contains a value that indicates that the customer not only has a terminating call waiting feature but a value of DBYES means that the customer has the talking call waiting feature which announces the name of the party trying to call.

This attribute can not be changed from the default unless the special feature ID SFID331 is turned on.

**Attribute:**
ffcf1
**Fullname:**
Future field 1
**Attribute Description:**
For future field feature use.

**Attribute:**
ffcf2
**Fullname:**

## 4. Population Rules for RLda_3digit

**Relation Description** Digit analysis of three digit code
This relation translates three digit codes (411, 911, etc.) into seven digit numbers

**Attribute: d_type**

**Fullname:** Destination type

**Attribute Description** Assign enough enumerations for 911,411,811, and numbers (relation DA_DIGSTRT) that require access to them.

**Attribute: t_index**

**Fullname:** Translation index

**Attribute Description** Use numbers assigned in 'digtree' attribute of relation DA_DIGSTRT.

**Attribute: dn**

**Fullname:** Directory number

**Attribute Description** A structure attribute consisting of digcnt and dn.

**Attribute: dn.digcnt**

**Fullname:** Digit count

**Attribute Description** Total number of digits used in attribute dn.dn.

**Attribute: dn.dn**

**Fullname:** Directory number

**Attribute Description** Directory number assigned to each 3 digit feature.

## 4. Population rules for RLda_ambig

### Relation Description

```
        Digit analysis ambiguous digits translation table
```

Copyright © 1999 Lucent Technologies

Relation da_ambig for ambiguous digits analysis for office dialing plan (ODP). The use of attributes depends upon the table number entering from the RLdaprldgt, RLdaprmdgt or RLda_conflct relation.

ODP digit analysis ambiguous digits translation table.

**Attribute:**
table
**Fullname:**
Table entry
**Attribute Description:**
Table number entered from RLdaprldgt.next, RLdaprmdgt.next or RLda_conflct.next.

**Attribute:**
next
**Fullname:**
Next entry
**Attribute Description:**
The use of this attribute depends upon the table number entering from RLdaprldgt, RLdaprmdgt or RLda_conflct relation:

next: 1. DA_AMBIG.table is pointed to by RLdaprldgt.next when RLdaprldgt.row is equal to FCAMBIG or FCRESAMBIG. DA_AMBIG.next points back to RLdaprldgt.previous in this case. The range of this value is 1 to 1048575, excluding NULL.

2. DA_AMBIG.table is pointed to by RLdaprmdgt.next when RLdaprmdgt.row is equal to FCSAC_CALL. When RLdaprmdgt.row is equal to FCSAC_CALL the range of this value is:

   0 to 9999 - For interchange carrier ID.
   1048575 - If the call will be handled by the service provider.

3. DA_AMBIG.table is pointed to by RLda_confclt.next when RLda_conflct.row is equal to FCSAC_CALL or FCCARRIER. When RLda_conflct.row is equal to FCSAC_CALL or FCCARRIER, the range of this value is:

   0 to 9999 - For interchange carrier ID.
   1048575 - If the call will be handled by the service provider.

**Attribute:**
final
**Fullname:**
Final entry

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

The use of this attribute depends upon the table number entering from RLdaprldgt, RLdaprmdgt or RLda_conflct relation:

final: 1. Table number for the final tuple to be accessed in the RLdaprlfnl relation if 'table' entered from RLdaprldgt. The range is from 1 to 1048575, excluding NULL.

2. Table number for the final tuple to be accessed in the RLdaprmfnl relation if 'table' entered from RLdaprmdgt. This value must be 0 or 1048575 when the 'desttype' is FCVACANT. The range is from 0 to 1048575, excluding NULL.

3. Table number for the final tuple to be accessed in the RLdaprmfnl relation if 'table' entered from RLda_conflct. This value must be 0 or 1048575 when the 'desttype' is FCVACANT. The range is from 0 to 1048575, excluding NULL.

## 4. Population rules for RLda_conflct

### Relation Description

Digit analysis table for conflict resolution

**Attribute:**
table
**Fullname:**
Table number
**Attribute Description:**
Table number from a RLdaprmdgt relation tuple. The valid range is from 1 to 1048575. There is no null value.

**Attribute:**
digits
**Fullname:**
Digit count
**Attribute Description:**
The count of digits dialed or inpulsed since the last digit analyzed in RLdaprmdgt. Valid values are from 0 to 15. There is no null value.

**Attribute:**
row
**Fullname:**
Row
**Attribute Description:**
Indicates the tuple type and is the principal determining factor for the valid values in all other attributes.

A. The following are valid values for LDIT:

FCAMBIG - Ambiguous state. Additional digits will be analyzed in da_conflct if received before time-out (as determined from the critical timing value in the da_timer relation tuple corresponding to the originators characteristics). If no digits are received before time-out, the 'next' attribute is used to

Copyright © 1999 Lucent Technologies 

determine the call treatment.

FCCONT - Continue digit analysis in da_conflct with the next digit received.

FCFINISH - Done with digit analysis. The 'next' attribute is used to determine the call treatment.

FCRAMBIG - Timeout has occurred before the longest possible conflict has been encountered. Use the 'next' attribute value to access RLda_ambig. Record the value of 'RLda_ambig.final' as the original dialing request, and use the value of 'RLda_ambig.next' to begin remaining translation.

FCTRANDONE - Longest possible conflict has been encountered. Use the 'next' attribute value to access RLda_ambig. Record the value of 'RLda_ambig.final' as the original dialing request, and use the value of 'RLda_ambig.next' to begin remaining translation.

B. The following are valid values for remaining digit interpretertable (RDIT):

FCCONT - The current digit sequence is not yet sufficient to interpret a selective dialing request. Use the 'next' attribute value to access a tuple in RLdaprmdgt to continue translation.

FCAMBIG - Ambiguity has been detected. Use the 'next' attribute value to access a tuple in RLda_ambig to resolve the ambiguity. Record the value of 'RLda_ambig.final' as the new final value which represents a selective dialing request. Use the value of 'RLda_ambig.next' to access RLdaprmdgt to continue translation since at least one more possible selective dialing request remains to be identified.

FCFINISH - The current digit sequence is sufficient to determine a selective dialing request. Record the 'next' attribute value as the final value which represents the selective dialing request.

Copyright © 1999 Lucent Technologies 

This field has no null value.

**Attribute:**
next
**Fullname:**
next table entry
**Attribute Description:**
The usage depends on the translator (LDIT/RDIT) and the value of the 'row' attribute.

Within the LDIT translator:

| Row | Usage |
|---|---|
| FCCONT | The 'next' attribute is unused. |
| FCSAC_CALL<br>FCRAMBIG<br>FCTRANDONE<br>FCCARRIER | Use the 'next' attribute value to access exactly one tuple in RLda_ambig with its 'table' value equal to 'next'. |
| FCFINISH<br>FCAMBIG | Use the 'next' attribute value to access exactly one tuple in RLdaprmfnl with its 'previous' value equal to 'next'. |

Within the RDIT translator:

| Row | Usage |
|---|---|
| FCCONT | Use the 'next' attribute value to access exactly one tuple in RLdaprmdgt with its 'previous' value equal to 'next' and its 'digit' value equal to the new digit. |
| FCAMBIG | Use the 'next' attribute value to access exactly one tuple in RLda_ambig with its 'table' value equal to 'next'. |
| FCFINISH | Use the 'next' attribute value to access exactly one tuple in RLdaprmfnl with its 'previous' value equal to 'next'. |

**Attribute:**
delete

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Delete
**Attribute Description:**
Number of leading digits to delete.
The valid range is from 0 to 15.
The null value is 0.

See rc/oda rules section for special "delete" rule.

**Attribute:**
psflag
**Fullname:**
Packet switching flag
**Attribute Description:**
Packet switching flag (DBYES/DBNO)
Must be DBNO for voice and circuit switched calls.
Must be DBYES for packet switched calls.
Default value is DBNO.

### Relation Description

Digit analysis starting table

Obtain starting table id for digit analysis.

**Attribute:**

digtree

**Fullname:**

Starting digit analysis table

**Attribute Description:**

Number associated with starting digit in digit analysis table, relation DAPRLDGT and DAPRMDGT. This number is used in the following relations; DA_3DIGIT, FC_LINE, FC_TRUNK, and RC_LCC.

**Attribute:**

Copyright © 1999 Lucent Technologies

preltable

**Fullname:**

Starting table for preliminary digit analysis

**Attribute Description:**

Starting table number for preliminary digit analysis, relation DAPRLDGT.

**Attribute:**

primtable

**Fullname:**

Starting table for primary digit analysis

**Attribute Description:**

Starting table number for primary digit analysis, relation DAPRMDGT. Most line ports will use starting table ids in both 'preltable' and 'primtable' attributes. Trunks will use starting table ids in 'preltable' attribute.

**Attribute:**

esco

**Fullname:**

Emergency Service Central Office number

**Attribute Description:**

The esco number identifies the originating office of an E911 caller. It is read from this relation upon line originations, and is used in call processing to retrieve an Emergency Service Number (ESN) which is used for call routing and call transfer. This ESCO number is used for lines and is also used for trunks when the ESCO for the trunk is unassigned.

## 4. Population Rules for RLda_enh

**Relation Description** RLda_enh is designated for the OSPS fast feature group.
RLda_enh has been allocated for OSPS fast feature development.

**Attribute: tgroup**

**Fullname:** Trunk group.

**Attribute Description** For every entry here, there must be a tuple in RLfc_oprtk with the same tgroup. Range is 1 - AVTRKGRPS().

**Attribute: aggr_id**

**Fullname:** Aggregator ID.

**Attribute Description** This attribute holds the 5 digit aggregator identification number of the traffic aggregator assigned to this trunk group.
Range is 1 - 99999.

Copyright © 1999 Lucent Technologies

**Attribute: aggr_index**

**Fullname:** Aggregator index.

**Attribute Description** This attribute contains the 5 bit aggregator index corresponding to the identification number of the traffic aggregator assigned to this trunk group.
Range is 0 - 31.

**Attribute: active**

**Fullname:** Activation indicator.

**Attribute Description** This attribute indicates whether the OSPS enhancements for DA and DACC special feature is active on this trunk group. When RLfc_oprtk.wlinedcis and RLfc_oprtk.wlessdcis are both DBNO, then this field will always be DBYES, because turning it off causes the tuple to be deleted.

When either RLfc_oprtk.wlinedcis or RLfc_oprtk.wlessdcis is equal to DBYES, then this field will always be DBNO.

**Attribute: cmc**

**Fullname:** Cellular Mobile Carrier.

**Attribute Description** This attribute indicates whether the traffic aggregator using this trunk is a Cellular Mobile Carrier (CMC).

**Attribute: npa**

**Fullname:** NPA.

**Attribute Description** When cmc is DBYES, then this attribute is used to hold the NPA for LATA and exception area determination.

**Attribute: nxx**

**Fullname:** NXX.

**Attribute Description** When cmc is DBYES, then this attribute is used to hold the NXX for LATA and exception area determination.

## 4. Population Rules for RLda_timer

**Relation Description** Digit analysis timing. When interdigital timing is done, one of two values is used for the time. These values are for partial dial timing and critical interdigital timing. The value chosen is determined by the state of

Copyright © 1999 Lucent Technologies 

the call. These values for both lines and trunks are found in the relation RLda_timer.

**Attribute: servclass**

**Fullname:** Class of service

**Attribute Description** This attribute contains type of terminal.

**Attribute: signal**

**Fullname:** Type of signaling

**Attribute Description** Type of signal. Taken from FC_TRUNK relation, either attribute in_startsig or out_startsig. Line enumerations (including serv- class FC_ISDN) will use a null value. (FCSSNULL)

**Attribute: sigtype**

**Fullname:** Digit signal type

**Attribute Description** This signal type taken from FC_TRUNK relation, either attribute in_sigtype or out_sigtype. From FC_LINE relation use enumeration from signal attribute.

NOTE: For 2 way or incoming common channel signaling (CCS) trunks with sigtype= DBTUP7, or DBCCIS6, this relation is not populated.

**Attribute: critical**

**Fullname:** Critical timing in milliseconds

**Attribute Description** This is used when interdigit timing is done.

**Attribute: partial**

**Fullname:** Partial dial timing in milliseconds

**Attribute Description** This is also used when interdigit timing is done. Use of this attribute critical is determined by the state of the call. A call processing program handles the determination of the state.

**Attribute: permsig**

**Fullname:** Permanent signal time

**Attribute Description** This attribute contains the permanent signal time.

**Attribute: ovldpart**

**Fullname:** Partial timing during overload

**Attribute Description** If the system is in an overload state then this attribute is used instead of partial attribute.

**Attribute: ovldperm**

**Fullname:** Permanent overload

**Attribute Description** This attribute contains the permanent signal timing during overload.

# DAA_DN

## 1. Description

This relation contains Direct Agent Access (DAA) DN information for Automatic Call Distributor (ACD) agents. It also contains ACD DN information for ACD DNs that are being interflowed.

This is a virtual update relation. The root storage relation is RLdaa_r.G. The child storage relation is RLdaa_g.G. The tree diagram Figure 1 depicts the stored structure of virtual relation DAA_DN.

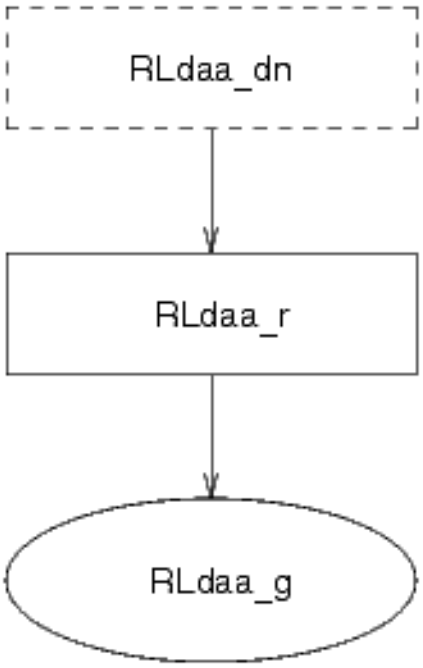

**Figure 1 Virtual Relation DAA_DN**

## 4. Population rules for RLdaa_dn

**Relation Description**

direct agent access directory number

This relation contains Direct Agent Access (DAA) DN information for ACD agents. It also contains ACD DN information for ACD DNs that are being interflowed.

**Attribute:**

dn

**Fullname:**

directory number

**Attribute Description:**

This attribute consists of a NOC (normalized office code) and four directory number digits. For DAA DNs and interflowed ACD DNs, there must be a tuple in RLRTDNMOD with noc+d4d3. Also, on the corresponding routing SM there must be a tuple in RLRT_DNTRAN with noc+d4d3d2d1. There must not be a tuple in RLACD_DN for this same DN. There must not be a tuple with a scmdn equal to a DAA DN or an interflowed ACD DN in RLdn_pscm.

**Attribute:**

dn.noc

Copyright © 1999 Lucent Technologies 

**Fullname:**
normalized office code
**Attribute Description:**
see dn

**Attribute:**
dn.digits
**Fullname:**
four directory number digits
**Attribute Description:**
see dn

**Attribute:**
call_que
**Fullname:**
call queue
**Attribute Description:**
This attribute identifies the default call queue that handles calls for a DAA DN or an interflowed ACD DN. Calls to DAA DNs are given queue treatment if the DAA agent is not logged in and a fwd_dn or vec_num is not assigned. If the call queue is not equal to zero, then there must be a tuple with a non zero tgid value in RLCQPARM for this call queue.

**Attribute:**
vec_asgnd
**Fullname:**
vector assigned
**Attribute Description:**
This attribute is DBYES only if a vector has been assigned to handle calls to this DAA DN or interflowed ACD DN. Calls to DAA DNs are given vector treatment if the DAA agent is not logged in and a fwd_dn is not assigned. For interflowed ACD DNs, vectoring is not used. When this attribute is DBYES, the vec_num attribute must contain a valid attribute vector number minus 1.

**Attribute:**
vec_num
**Fullname:**
vector number minus 1
**Attribute Description:**
This attribute identifies the RLQVVECTOR tuple that provides call handling while waiting for an ACD agent. When the vec_asgnd attribute is DBYES, vec_num must contain a valid vector number minus 1. There should be an existing tuple in RLQVVECTOR that defines the desired call treatment. When vec_asgnd is DBNO, vec_num should be 0.

Copyright © 1999 Lucent Technologies 

**Attribute:**
agent_id
**Fullname:**
agent identifier
**Attribute Description:**
This attribute identifies the agent associated with this Direct Agent Access (DAA) DN. The presence of a non zero agent_id distinguishes a DAA DN from an ACD DN. There must be a tuple in RLagentid if agent_id is non zero.

**Attribute:**
carrier
**Fullname:**
carrier
**Attribute Description:**
This attribute indicates the presubscribed carrier for a DAA DN or interflowed ACD DN. It is used for DAA call redirection or ACD call interflow. There must be a tuple in RLFC_CARR for this carrier.

**Attribute:**
pic2
**Fullname:**
presubscribed intra-LATA-toll carrier
**Attribute Description:**
This attribute indicates the presubscribed (preferred) intra-LATA-toll carrier for a DAA DN or interflowed ACD DN. It is used for intra-LATA-toll DAA call redirection or intra-LATA-toll ACD call interflow.

This attribute must be $NULL_BCARID (default) if the ICLATA SF (SFID 149) is not active. When pic2 is not equal to $NULL_BCARID, there must be a tuple in RLFC_CARR for this intra-LATA-toll carrier.

The value of this attribute is independent of the mass presubscribed intra-LATA-toll carrier, Glpic2.

**Attribute:**
plc
**Fullname:**
presubscribed intra-LATA local carrier ID
**Attribute Description:**
This attribute contains the presubscribed intra-LATA local carrier ID for an alternate LSP.

**Attribute:**
cnbrdisp

Copyright © 1999 Lucent Technologies 

**Fullname:**
calling number to agent's display
**Attribute Description:**
When this attribute is DBYES, calling numbers (if available) are displayed on the agent's terminal. When it is DBNO, calling numbers are not displayed on the agent's terminal.

**Attribute:**
cnbrmis
**Fullname:**
calling number to management information system
**Attribute Description:**
When this attribute is DBYES, calling numbers (if available) for calls to this DAA DN or interflowed ACD DN are sent to the MIS. When it is DBNO, calling numbers for calls to this DAA or interflowed ACD DN are not sent to the MIS.

**Attribute:**
fwd_dn
**Fullname:**
forward to directory number
**Attribute Description:**
This attribute is used as the forward-to-DN for calls terminating to DAA DNs when the corresponding agent is not logged in or as the ACD interflow destination DN.

For DAA not logged in forwarding, the forward-to-DN (if present) must be in the range of from 1 to 15 digits. For ACD interflow, the forward-to-DN is required and it must be in the range of from 1 to 15 digits.

**Attribute:**
fwd_dn.dn0
**Fullname:**
digit number 0
**Attribute Description:**
This is the 1st digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn1
**Fullname:**
digit number 1
**Attribute Description:**
This is the 2nd digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn2
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

digit number 2
**Attribute Description:**
This is the 3rd digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn3
**Fullname:**
digit number 3
**Attribute Description:**
This is the 4th digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn4
**Fullname:**
digit number 4
**Attribute Description:**
This is the 5th digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn5
**Fullname:**
digit number 5
**Attribute Description:**
This is the 6th digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn6
**Fullname:**
digit number 6
**Attribute Description:**
This is the 7th digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn7
**Fullname:**
digit number 7
**Attribute Description:**
This is the 8th digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn8
**Fullname:**
digit number 8
**Attribute Description:**
This is the 9th digit of the forward-to-DN.

Copyright © 1999 Lucent Technologies 

**Attribute:**
fwd_dn.dn9
**Fullname:**
digit number 9
**Attribute Description:**
This is the 10th digit of the forward-to-DN.

**Attribute:**
fwd_dn.dn10
**Fullname:**
digit number 10
**Attribute Description:**
This is the 11th digit of the digit structure.

**Attribute:**
fwd_dn.dn11
**Fullname:**
digit number 11
**Attribute Description:**
This is the 12th digit of the digit structure.

**Attribute:**
fwd_dn.dn12
**Fullname:**
digit number 12
**Attribute Description:**
This is the 13th digit of the digit structure.

**Attribute:**
fwd_dn.dn13
**Fullname:**
digit number 13
**Attribute Description:**
This is the 14th digit of the digit structure.

**Attribute:**
fwd_dn.dn14
**Fullname:**
digit number 14
**Attribute Description:**
This is the 15th digit of the digit structure.

**Attribute:**
fwd_dn.digcnt
**Fullname:**
digit number count
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This is the count of the number of digits in the forward-to-DN.

**Attribute:**
digtree
**Fullname:**
starting digit analysis tree
**Attribute Description:**
This attribute identifies the digit analysis table to start with when analyzing digits for DAA call redirection or ACD call interflow. There must be a tuple in RLDA_DIGSTRT for this digtree.

**Attribute:**
dispx
**Fullname:**
display index
**Attribute Description:**
This attribute identifies the display index for calls to this DAA DN. If this attribute is non-zero, there must be a tuple in RLACDDISP for this dispx.

**Attribute:**
freeterm
**Fullname:**
free termination
**Attribute Description:**
When this attribute is DBYES, calls to this DAA DN or interflowed ACD DN are not billed. When this attribute is DBNO, calls to this DAA DN or interflowed ACD DN get standard billing treatment (and therefore if chargeable, get billed).

**Attribute:**
line_screen
**Fullname:**
line screen
**Attribute Description:**
When this attribute is DBYES, this DAA DN or interflowed ACD DN is associated with toll/code restriction/diversion or WATS band screening. This attribute is used for DAA call redirection or ACD call interflow.

**Attribute:**
miscallcls
**Fullname:**
management information system call class
**Attribute Description:**
This attribute is used by the Management Information

**Copyright © 1999 Lucent Technologies** 

System (MIS) to track DAA or interflowed ACD calls.

**Attribute:**
screen_x
**Fullname:**
screening index
**Attribute Description:**
This attribute is used for routing and charging redirected DAA or interflowed ACD calls. There must be a tuple in RLrt_scrning for this screen_x.

**Attribute:**
psap
**Fullname:**
e911 public safety answering point
**Attribute Description:**
This attribute is used for the ACD E911 Public Safety Answering Point Special Feature to indicate if this DAA DN is an ACD E911 PSAP. The ACD E911 PSAP special feature is a secured feature (SFID 143). This attribute must not be set to DBYES unless the special feature has been purchased.

**Attribute:**
unbundled
**Fullname:**
Network/LEC indicator for calls to complete to an alternate LSP platform.
**Attribute Description:**
When unbundled = DBYES, (None/1)+ 7/10 digit intra-LATA local calls route using presubscribed local carrier (PLC) information. If PLC routing information is not populated, route via the LEC. When unbundled = DBNO, (None/1)+ 7/10 digit intra-LATA local calls always route via the LEC.

**Attribute:**
acdsp1
**Fullname:**
ACD/BRCS spare 1
**Attribute Description:**
Spare ACD/BRCS attribute.

**Attribute:**
acdsp2
**Fullname:**
ACD/BRCS spare 2
**Attribute Description:**
Spare ACD/BRCS attribute.

## 4. Population rules for RLdacc_trt

### Relation Description

DA Call Completion Treatment Table

RLdacc_trt defines the DACC Treatment Table for enhanced CICADA call completion.

**Attribute:**
dn
**Fullname:**
Directory Number + Digit Count
**Attribute Description:**
The 10, 7, or 3-digit destination number.

**Attribute:**
dn.dn0
**Fullname:**
Digit0 of DN
**Attribute Description:**
Digit0 of the 10, 7, or 3-digit destination number

**Attribute:**
dn.dn1
**Fullname:**
Digit1 of DN
**Attribute Description:**
Digit1 of the 10, 7, or 3-digit destination number

**Attribute:**
dn.dn2
**Fullname:**
Digit2 of DN

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
Digit2 of the 10, 7, or 3-digit destination number

**Attribute:**
dn.dn3
**Fullname:**
Digit3 of DN
**Attribute Description:**
Digit3 of the 10 or 7-digit destination number

**Attribute:**
dn.dn4
**Fullname:**
Digit4 of DN
**Attribute Description:**
Digit4 of the 10 or 7-digit destination number

**Attribute:**
dn.dn5
**Fullname:**
Digit5 of DN
**Attribute Description:**
Digit5 of the 10 or 7-digit destination number

**Attribute:**
dn.dn6
**Fullname:**
Digit6 of DN
**Attribute Description:**
Digit6 of the 10 or 7-digit destination number

**Attribute:**
dn.dn7
**Fullname:**
Digit7 of DN
**Attribute Description:**
Digit7 of the 10-digit destination number

**Attribute:**
dn.dn8
**Fullname:**
Digit8 of DN
**Attribute Description:**
Digit8 of the 10-digit destination number

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

dn.dn9
**Fullname:**
Digit9 of DN
**Attribute Description:**
Digit9 of the 10-digit destination number

**Attribute:**
dn.dn10
**Fullname:**
Digit10 of DN
**Attribute Description:**
Digit10 of dn. Not used.

**Attribute:**
dn.dn11
**Fullname:**
Digit11 of DN
**Attribute Description:**
Digit11 of dn. Not used.

**Attribute:**
dn.dn12
**Fullname:**
Digit12 of DN
**Attribute Description:**
Digit12 of dn. Not used.

**Attribute:**
dn.dn13
**Fullname:**
Digit13 of DN
**Attribute Description:**
Digit13 of dn. Not used.

**Attribute:**
dn.dn14
**Fullname:**
Digit14 of DN
**Attribute Description:**
Digit14 of dn. Not used.

**Attribute:**
dn.digcnt
**Fullname:**
Digit Counter
**Attribute Description:**
Defines the number of digits in the destination number. This

Copyright © 1999 Lucent Technologies 

attribute can only have the values of 10, 7, or 3.

**Attribute:**
da_type
**Fullname:**
Directory Assistance Type
**Attribute Description:**
This attribute defines the Directory Assistance (DA) Type.

**Attribute:**
dacc_alw
**Fullname:**
DA Call Completion Allowed
**Attribute Description:**
This attribute defines the Directory Assistance Call Completion (DACC) Allow value. When this attribute is DBNO, the DA Type must not be zero(0).

**Attribute:**
hdr_id
**Fullname:**
Header ID
**Attribute Description:**
This attribute defines the announcement header. When this attribute is non-zero, a tuple must exist in rlANNC_HDR equal to the value of this attribute.

**Attribute:**
dior_alw
**Fullname:**
DIOR Directory Assistance Call Completion (DACC) indicator.
**Attribute Description:**
This attribute determines the DA Call Completion eligibility for DIOR originated calls.

**Attribute:**
plcard_alw
**Fullname:**
Purchase Limit card indicator.
**Attribute Description:**
This attribute determines whether the DA Call Completion should be allowed for a valid Purchase Limits (PL) card.

**Attribute:**
intl_ind
**Fullname:**
Real Time Rating System (RTRS) international call indicator.

Copyright © 1999 Lucent Technologies 

**Attribute Description:**
This attribute determines how the Real Time Rating System should handle the rate quotation query.

**Attribute:**
ospsff1
**Fullname:**
Spare 1
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff2
**Fullname:**
Spare 2
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff3
**Fullname:**
Spare 3
**Attribute Description:**
This attribute defines the LSCC Redirect value. When this attribute is DBYES, the Service Provider is allowed to activate the LSCC feature treatment on a Directory Assistance destination number basis. This spare will be returned in 5e13.

**Attribute:**
ospsff4
**Fullname:**
Spare 4
**Attribute Description:**
This attribute (LIST LIMIT ENF) specifies whether or not to display the associated D1 error message to the OSPS-LS operator on calls to the associated DA destination number. This parameter is examined by the OSPS-LS only on a 4ESS(TM) originated call. This spare field will be returned in 5e13.

**Attribute:**
ospsff5
**Fullname:**
Spare 5
**Attribute Description:**
Spare field for fast feature development.

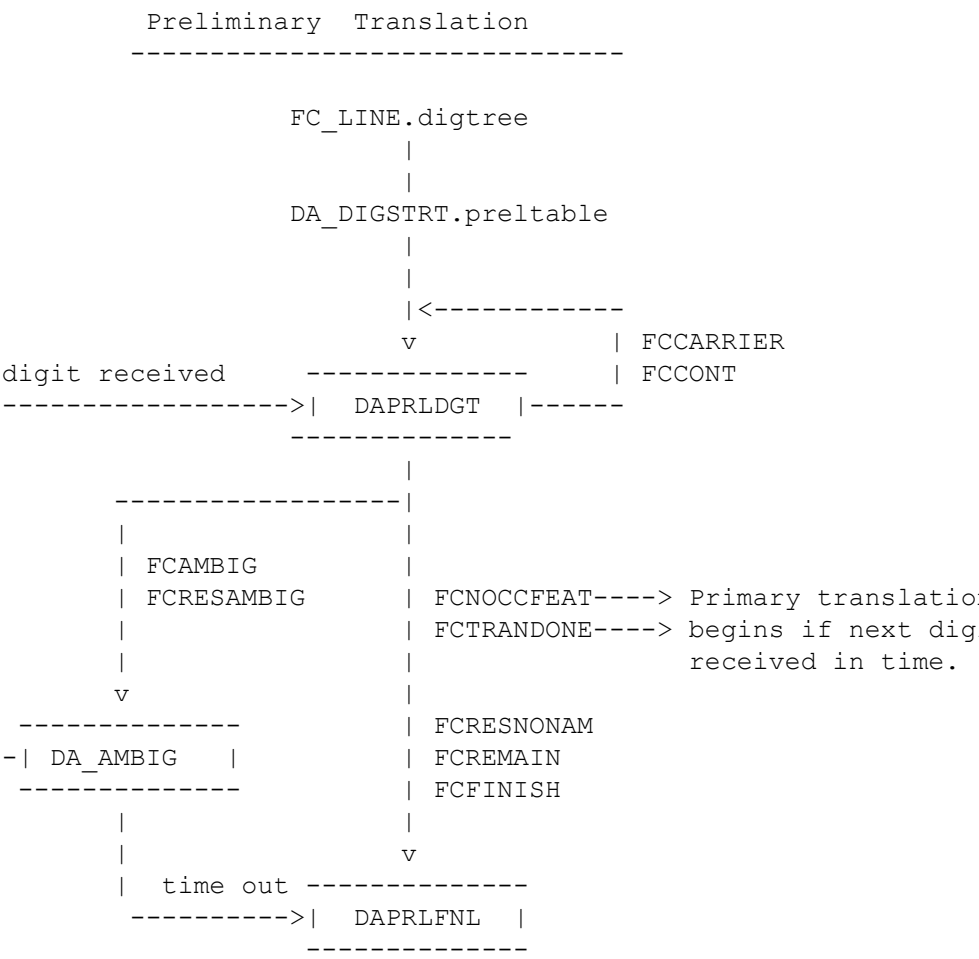
## 4. Population rules for RLdaprldgt

### Relation Description

ODP Digit Analysis Preliminary Translation Table

This relation implements a tree structure for parsing the dialed digits string. For each dialed digits string, this relation will be accessed first to do the preliminary translation which includes the feature access code, operator call, carrier interconnect call and incoming trunk call. All other dialing patterns will be re-translated in the primary translation (RLdaprmdgt).



**Copyright © 1999 Lucent Technologies** 

This diagram tells the next relation to access based on the
current dialing state ('row' attribute) and the incoming digit."

**Attribute:**
previous
**Fullname:**
Previous
**Attribute Description:**
This is the first key of the relation. It can be obtained from any
of the following attributes, depending on the previous tuple read:
DA_DIGSTRT.preltable,
DAPRLDGT.next,
DA_AMBIG.next

**Attribute:**
digit
**Fullname:**
The current digit for preliminary translation
**Attribute Description:**
The current dialed or impulsed digit.

**Attribute:**
row
**Fullname:**
The value of this attribute represent the current dialing state
**Attribute Description:**
Indicates the current dialing state and is the principal determining
factor for the valid values in all other attributes. The valid values
are the following subset of domain DMrow:

FCAMBIG
Indicates that the current digit string is a valid code
while more digits may be dialed. The digit translation
flow after this point can be described as:
DAPRLDGT.next -> DA_AMBIG.table
if next digit received in critical timing
DA_AMBIG.next -> DAPRLDGT.previous
else
DA_AMBIG.final -> DAPRLFNL.table

FCCARRIER
Indicates this is a carrier interconnect call. Collect the
carrier ID number without analysis then continue preliminary
digit analysis with the following digit.
FCCONT
Continue digit analysis in RLdaprldgt with the next digit
received. The next tuple to be accessed is
DAPRLDGT.next -> DAPRLDGT.previous.
FCNOCCFEAT

**Copyright © 1999 Lucent Technologies** 

No further digit analysis for customer calling features. A tuple in the RLdaprlfnl relation is the leaf node for customer dialing feature which is pointed to by the 'DAPRLDGT.next' attribute. If no further digits were dialed, desttype in the RLdaprlfnl relation specifies what kind of call it is. If the originating line does not have the indicated feature, the call times out based on the partial dial timing in the da_timer tuple corresponding to the originators characteristics. If more digits are dialed, preliminary digit analysis is done and primary digit analysis commences.

FCFINISH
Digit Analysis is completed. Currently used only for operator access, operator recall or cut-thru to IC calls. Used for packet switch also.

FCREMAIN
Used when digit analysis is complete but additional digits are to be collected without digit analysis. Used only for incoming trunk digit analysis.

FCRESAMBIG
Ambiguous restricted feature. Used for cases where the digits already dialed provide access to a custom calling feature. An entry of the RLda_ambig relation will be given in the next attribute. A tuple with this entry in RLda_ambig gives another two pointers, one points back to the next tuple in the RLdaprldgt relation, one points to the final routing data in the RLdaprlfnl relation. If digit received in critical timing (from da_timer) RLdaprldgt will be accessed and the preliminary digit analysis is continued. Otherwise RLdaprlfnl relation will be accessed to provide the customer dialed feature information.

FCRESNONAM
Unambiguous restricted feature. Used when the digits already received provide unambiguous access to a feature. No timing is done. The desttype in the RLdaprlfnl tuple which is pointed by 'DAPRLDGT.next' specifies what kind of call it is. If the originator does not have the specified feature then reorder treatment is returned.

FCTRANDONE
Indicates that preliminary digit analysis is done and primary digit analysis should begin.

FCRECONSTRCT
Indicates that the digit translation will need reconstruct.

**Attribute:**
next

**Fullname:**
Pointer to the next tuple to be accessed

**Attribute Description:**
The usage of this attribute depends upon the current value of

Copyright © 1999 Lucent Technologies 

**Attribute:**

```
1) If row is  FCCONT or FCCARRIER then
    DAPRLDGT.next -> DAPRLDGT.previous:
2) If row is FCAMBIG or FCRESAMBIG then
    DAPRLDGT.next -> DA_AMBIG.table:
3) If row is FCREMAIN, FCNOCCFEAT, FCRESNONAM or FCFINISH then
    DAPRLDGT.next -> DAPRLFNL.previous.
```

**Attribute:**

digits

**Fullname:**

The number of remaining digits to be collected

**Attribute Description:**

This attribute specifies the number of remaining digits to be collected for incoming trunk call.

**Attribute:**

delete

**Fullname:**

Number of leading digits to be deleted

**Attribute Description:**

This attribute specifies the number of leading digits that need to be deleted for the current dialing state.

**Attribute:**

prefix

**Fullname:**

The dialed prefix index

**Attribute Description:**

The dialed prefix index.

**Attribute:**

psflag

**Fullname:**

Packet switching indicator

**Attribute Description:**

For non-packet switching call, this attribute must be DBNO.

**Copyright © 1999 Lucent Technologies** 

# DAPRLFNL

## 1. Description

This is the OP VIEW relation for Preliminary Digit Analysis Final Translation.
This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation DAPRLFNL.

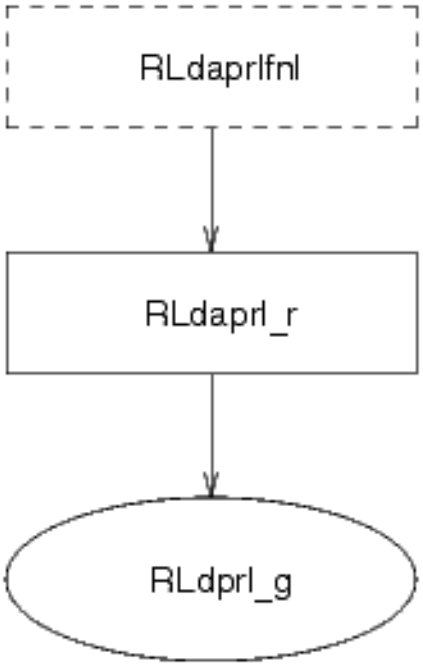


**Figure 1 Virtual Relation DAPRLFNL**

This is an OP VIEW relation for the Preliminary Digit Analysis Final Translation. This is a virtual update relation. The root storage relation is RLdaprl_r.G

## 4. Population rules for RLdaprlfnl

**Relation Description**

Office dialing plan (ODP) preliminary digit analysis final routing table

ODP preliminary digit analysis final routing table.

**Attribute:**

previous

**Fullname:**

Previous

**Attribute Description:**

Table number from either the RLdaprldgt relation or the RLda_ambig relation corresponding to the previous dialed or inpulsed digit.

**Attribute:**

dest

**Fullname:**

Destination index

**Attribute Description:**

Destination index is used in routing.

**Attribute:**

desttype

**Fullname:**

Destination type

**Attribute Description:**

A destination type used to indicate various actions to be taken

Copyright © 1999 Lucent Technologies 

on receipt of this digit. Valid values are the following subset of the DESTN domain:

For U.S.:

| | |
|---|---|
| FCDIALCODE | - Access to a Master Control Center (MCC) feature. |
| FCOPERATOR | - Operator access. |
| FCIDDDOPER | - International direct distance dialing (IDDD) operator access. |
| FCOPRECALL | - Operator recall. |
| FCNORMAL | - Plain old telephone service (POTS). |
| FC900 | - 900 call. |
| FC911 | - E911 call. |
| NULLDEST | - The null value. |

**Attribute:**
route_x
**Fullname:**
Route index
**Attribute Description:**
The introduction of the primary route concept brought in the route_x and route_type as new attributes three digit analysis relations. See the population rules for RLrt_scrning.G relation. According to it, only the following route_x and route type assignments are allowed in the digit analysis relations RLdaprlfnl, RLdaprmfnl, and RLda_conflct:

| ROUTE_TYPE | ROUTE INDEX |
|---|---|
| RTE_DNTRAN | A normalized office code (NOC) in the range 1-AVNOCMAX(). |
| RTE_HUNT | A route_x in the range 1-AVRIMAX(). |
| RTE_NULL | Zero. |
| RTE_POLYGRID | A pattern (key to RLrt_poly) in the range 1-AVRIMAX(). |

**Attribute:**
route_type
**Fullname:**
Route type
**Attribute Description:**
Route type.

**Attribute:**
desep
**Fullname:**
Destination separations class
**Attribute Description:**
Destination separations class for division of revenue purposes.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
action
**Fullname:**
Action
**Attribute Description:**
Indicates the MCC feature action to be taken as a result of the dialed code. The null value ACN_NONE indicates no action applies for the digits dialed. When an action is specified, the feature specified by feat_id must allow this action. This may be determined by looking in the RLFACFTDSC tuple keyed by this feature ID (FID). RLFACFTDSC.actions is an array containing all the dialed code actions allowed for the specified feature. This action must be contained in that array to be valid. An action other than ACN_NONE requires a feat_id other than zero.

Notice: Whenever a new valid enumerate value is added to the office dialing plan for the result of a dialed code of any MCC feature, the 'values' section should be updated to include the new value.

**Attribute:**
type_ci_call
**Fullname:**
Type of carrier interconnect call
**Attribute Description:**
Type of carrier interconnect call. Valid values are:

| | |
|---|---|
| FCAD1 | - Feature group D (FGD) carrier access code (CAC)+# call to cut through to the carrier's switch. |
| FCAVT | - 0ZZ call in the access tandem. |
| FCEM_REROUTE | - Emergency rerouted call through an extra equal access end office (EAEO). |
| FCINC | - 1NX call in the access tandem. |
| FCINTERLATA | - For voice or circuit switched calls, FCINTERLATA means call is inter-LATA but within the continental USA. For packet switched calls, FCINTERLATA means use preselected interexchange carrier (IECP) if one exists. |
| FCINTRALATA | - Call is within the local access and transport area (LATA). |
| FCNONCI | - For voice or circuit switched calls, this means a normal, tandem or feature activation call. For packet switched calls, FCNONCI means carrier interconnect does not apply. |
| FCINTERIM | - 950-XXXX INTERIM plan calls. |
| FCCI_NULL | - The null value. |
| FCICTOLL | - ICLATA-toll call. The FCICTOLL is not allowed if the ICLATA SF (SFID 149) is not activated. The FCICTOLL is only |

```
                    used with desttype of FCOPERATOR.
            FCICLOCAL     - ICLATA-local call.
            FCICCONLOCAL  - ICLATA-conflict-local call.
```

**Attribute:**
trignum
**Fullname:**
Trigger number
**Attribute Description:**
This field contains the network services trigger.
Trignum is the key to RLns_trig.

**Attribute:**
nature
**Fullname:**
Nature of Number
**Attribute Description:**
Used to tell the type of nature of number.

**Attribute:**
esccode
**Fullname:**
Escape code
**Attribute Description:**
Indicates digit sequences that are exempt from off-hook delay (OHD) treatment.

**Attribute:**
feat_id
**Fullname:**
Feature ID
**Attribute Description:**
Identifies the MCC constructed feature ID. The high order six bits is of domain MFTYPE (modular feature type), which is enumerated. The enumerated value MFMLHG, for multi-line hunt group, is not allowed, as it has no actions. The low order ten bits may contain any value, provided that there is a tuple in the facname relation with this feature identification number. The `/*' (null feature) can only be assigned to certain actions, such as ACN_AUCUSE. See RLbnfeat population rules for list of actions. The null value is zero. A non zero feat_id requires an action other than ACN_NONE.

**Attribute:**
dfltrt
**Fullname:**
Default Routing Treatment
**Attribute Description:**
Identifies the type of default routing treatment to be

**Copyright © 1999 Lucent Technologies** 

used for Special Feature ASP Default Routing for 3/6/10-Digit Triggers. SFID 153 must be on before dfltrt can be changed from the default value.

**Attribute:**
ffcf1
**Fullname:**
Future field feature
**Attribute Description:**
A bit reserved for future field feature use.

**Attribute:**
ffcf2
**Fullname:**
Future field feature
**Attribute Description:**
A bit reserved for future field feature use. It was used in 5e10 for attribute anibypass.

**Attribute:**
ffcf3
**Fullname:**
Future field feature
**Attribute Description:**
A bit reserved for future field feature use.

**Attribute:**
ffcf4
**Fullname:**
Future field feature
**Attribute Description:**
A short reserved for future field feature use.

**Attribute:**
carrid
**Fullname:**
Carrier identification number.
**Attribute Description:**
Carrier identification number. This attribute is not used at this time.

**Attribute:**
annc_code
**Fullname:**
Announcement code
**Attribute Description:**
Network announcement code for ASP Default Routing (Phase 2).

**Copyright © 1999 Lucent Technologies** 

This attribute is not used at this time.

**Attribute:**
spec_dn
**Fullname:**
Specific Directory Number
**Attribute Description:**
Specific directory number for ASP Default Routing (Phase 2).
This attribute is not used at this time.

**Attribute:**
iddd_ind
**Fullname:**
International Direct Distance Dialing Indicator
**Attribute Description:**
Indicates if the specific directory number (spec_dn) is an international number. This attribute is not used at this time.

**Attribute:**
bill_ind
**Fullname:**
Billing indicator
**Attribute Description:**
Indicates if the billing information should be generated when routing to a directory number for ASP 3/6/10 Default Routing (Phase 2). This attribute is not used at this time.

**Attribute:**
anibypass
**Fullname:**
anibypass indicator
**Attribute Description:**
This attribute will be used to indicate whether Toll Digital Exchange (TDX) ANI table processing should be by-passed. Default anibypass attribute is DBNO. When set to DBYES, no TDX ANI Table processing will be performed.
Note that the digtree, that is, digit analysis selector (DAS), from the ANI table is used for TDX trunks regardless of how the anibypass attribute is populated; by-pass does not apply to the digtree field of the ANI table. Use of the anibypass attribute will be allowed for all digit analysis destination types.
The trignum attribute has precedence over this attribute. If trignum is non-zero, then ANI table processing is not performed regardless of how the anibypass attribute is populated.

**Attribute:**
lnp_trignum
**Fullname:**

local number portability trigger number

**Attribute Description:**

This attribute is currently a spare to be used in the future.

**Attribute:**

geoport

**Fullname:**

geographic porting indicator

**Attribute Description:**

This attribute is currently a spare to be used in the future.

**Attribute:**

ported_in

**Fullname:**

Ported into this switch indicator

**Attribute Description:**

This attribute is currently a spare to be used in the future.

**Attribute:**

portdn_das

**Fullname:**

ported directory number digit analysis tree selector

**Attribute Description:**

This attribute is currently a spare to be used in the future.

**Attribute:**

home_lrn

**Fullname:**

home location routing number indicator

**Attribute Description:**

This attribute is currently a spare to be used in the future.

**Attribute:**

lrn_scrn

**Fullname:**

location routing number screening indicator

**Attribute Description:**

This attribute is currently a spare to be used in the future.

**Attribute:**

dny_xfer

**Fullname:**

Deny Transfer

**Attribute Description:**

This attribute indicates whether or not transfers are allowed on a line for this particular preliminary digit string. The transfer will be denied if this attribute is set to DBYES.

Copyright © 1999 Lucent Technologies 

Emergency calls must be allowed for all transfers.

**Attribute:**
o_bltrig_inh
**Fullname:**
Originating Busy Line Trigger Inhibit
**Attribute Description:**
This attribute is used to indicate whether or not to inhibit the office Originating Busy Line Trigger. Default for this attribute is DBNO. When set to DBYES, the trigger will not be invoked for these digit(s). This attribute is secured by SFID #212.

This functionality was provided by the attribute ffcf1 in 5e11.

**Attribute:**
o_natrig_inh
**Fullname:**
Originating No Answer Trigger Inhibit
**Attribute Description:**
This attribute is used to indicate whether or not to inhibit the office Originating No Answer Trigger. Default for this attribute is DBNO. When set to DBYES, the trigger will not be invoked for these digit(s). This attribute is secured by SFID #212.

This functionality was provided by the attribute ffcf3 in 5e11.

**Attribute:**
bld10dgts
**Fullname:**
build 10 digits
**Attribute Description:**
This attribute indicates whether to reconstruct to 10 digits or not. When set to DBYES, the corresponding tuples in RLdaprldgt must have the row attribute set to FCRECONSTRCT.

**Attribute:**
nodal_idx
**Fullname:**
EOLN service index
**Attribute Description:**
This attribute contains a numerical value denoting the particular EOLN service.
SFID218 must be active before this attribute is populated with a non-default value.

**Attribute:**
dn_prefd
**Fullname:**

DN PREFD indicator

**Attribute Description:**

This attribute indicates whether the ODN in the incoming SS7 GAP is to be sent to the terminating PBX as the called number. SFID218 must be active before this attribute is populated with a non-default value.

**Attribute:**

gets_hpc

**Fullname:**

GETS HPC indicator

**Attribute Description:**

This attribute allows assignment of GETS HPC to digit strings on RC View 9.5. The default value is DBNO.

The Government Emergency Telecommunications System, High Probability of Call Completion (GETS HPC) Feature is secured by SFID 279. The feature must be unlocked via RC View 8.22 before gets_hpc attribute is set to DBYES.

## 4. Population rules for RLdaprmdgt

### Relation Description

Office dialing plan (ODP) digit analysis digit translation table

This is the ODP primary digit translation table.

The distribution class for RLDAPRMDGT is group partitioned. The group type is GPD_DA and the group ID is the value of the local digit interpreter table (LDIT).

A group will exist for each of the different digit analysis selectors defined in the office (see relation RLRC_DAS). A switching module (SM) will subscribe to the groups that correspond to the primary digit trees that it needs to perform routing for the lines and trunks that terminate on that module (that is, an SM will contain those primary digit trees or LDITs that correspond to the digital analysis selectors (DASs) assigned to the lines and trunks on that SM). The administrative module (AM) never subscribes to any group.

A tuple in RLDAPRMDGT is always associated with a specific primary digit tree (LDIT), which can be associated with one or more DASs. The digit analysis selector corresponds to the group ID and will be used to determine the list of SMs that subscribe to this group (that is, contain this particular digit tree, or LDIT, corresponding to the DAS) for update purposes.

The association of LDITs, DASs, and SMs is shown in the following diagram:

```
          Primary      1:1              1:N         1:N
          Digit  <------------> LDIT <-----> DAS <-----> SMs
           Tree          |               |           |
             |           |               |           |
             v           v               v           v
```

**Copyright © 1999 Lucent Technologies** 

| RC/V View: | LDIT | LDIT | DAS | DAS-SM |
|---|---|---|---|---|
| Relations: | RLDAPRMDGT<br>RLDAPRMFNL<br>RLDA_CONFL | RLRC_LDIT | RLRC_DAS | RLDB_AMGPD |

RECENT CHANGE/VERIFY (RC/V) RULES

The definition, assignment, and population of LDITs and DASs is done according to the following view rules:

LDIT View

1. An LDIT (primary digit tree) cannot be defined unless:
   a. The LDIT has been assigned to at least one DAS (RLRC_DAS), and
   b. at least one SM subscribes to a DAS grp_id associated with the LDIT (RLDB_AMGPD).

NOTE: The order of these steps is irrelevant.

DAS-SM View

2. If an SM is added or deleted from the list of SMs that subscribe to a DAS (RLDB_AMGPD), the primary digit tree (LDIT) associated with the DAS is added to or deleted from that SM.

DAS-SM View

3. If an LDIT is associated with multiple DASs, an SM that is added or deleted from subscription to one DAS will automatically be added to or deleted from the list of SMs subscribing to all the DASs (all the grp_ids in RLDB_AMGPD) associated with the common LDIT. In addition, the LDIT associated with the DASs is added to or deleted from the SM. The following is an example:

| DAS | LDIT | PDIT | INDIT | SMs |
|---|---|---|---|---|
| 1 | 1 | 1 | 1 | 1, 5, 10 |
| 2 | 1 | 2 | 2 | 1, 5, 10 |
| 3 | 1 | 3 | 2 | 1, 5, 10 |

If SM 15 were added to DAS 1, it would also be automatically added to DAS 2 and 3. LDIT 1 would then be copied to SM 15. If SM 10 were deleted from DAS 1, it would also be deleted from DAS 2 and 3. LDIT 1 would then be removed from SM 10.

DAS-SM View

4. If the entire list of SMs associated with a DAS is deleted (RLDB_AMGPD), the primary digit tree (LDIT) is deleted from all the SMs in the list. In addition, RLRC_LDIT is updated to set RLrc_ldit.primtable to null.

**Copyright © 1999 Lucent Technologies** 

DAS-SM View

5. If the entire list of SMs is deleted from a DAS that shares a common LDIT with other DASs, only that DAS grp_id is removed from RLDB_AMGPD. The RLRC_LDIT and primary digit tree relations are not changed (that is, the LDIT continues to be associated with the other remaining DASs).

DAS View

6. If an existing LDIT (currently assigned to at least one DAS) is assigned to another new or existing DAS X (RLRC_DAS), the list of SMs subscribing to this DAS X must match the SMs subscribing to the other DASs associated with the existing LDIT (RLDB_AMGPD). If the previous LDIT associated with DAS X is an existed as a valid grp_id in RLDB_AMGPD) and this previous LDIT is no longer associated with any other DAS:

   a. The LDIT must be removed from the list of SMs that previously subscribed to DAS X.

   b. The RLRC_LDIT.primtable entry for the LDIT being removed must be set to null.

   Note that this LDIT removal must also be performed when a DAS is deleted, and the assigned LDIT is not associated with any other DAS.

ODA RULES

1. Office data administration (ODA) will subscribe SMs to DASs using a DAS-SM form that is similar to the RC/V DAS-SM view that performs DAS to SM assignment. This assignment is subject to the restrictions noted in RC/V rule #3 for multiple DASs associated with a single LDIT.

**Attribute:**
previous
**Fullname:**
current table entry from previous digit
**Attribute Description:**
Table number from one the following relations:

1. The RLda_digstrt relation.

2. The RLdaprmdgt tuple corresponding to the previous dialed inpulsed digit.

3. The RLda_ambig tuple corresponding to the previous dialed inpulsed digit.

If a new table number (previous) is added to this

**Copyright © 1999 Lucent Technologies** 

relation it must also be added to the RLrc_dgt, recent change relation.

If a new table number (previous) is added RLdaprmfnl, the number must be added to the corresponding recent change relation RLrc_fnl.

If a new table number is added to the relation RLda_confl the number must also be added to the recent change relation RLrc_con.

**Attribute:**
digit
**Fullname:**
Current dialed digit
**Attribute Description:**
Item from dialed string currently being analyzed--used as one of the keys to RLdaprmdgt.

**Attribute:**
row
**Fullname:**
current dialing state
**Attribute Description:**
Indicates the tuple type and is the principal determining factor for the valid values in all other attributes. The valid values are the following subset of domain DATYPE:

FCAMBIG - Indicates that the current digit string is a valid code while more digits may be dialed. An entry of the RLda_ambig relation will be given in the 'next' attribute. A tuple with this entry in the RLda_ambig gives another two pointers, one points back to the next tuple in the RLdaprmdgt relation, one points to the final routing data in the RLdaprmfnl relation. If digit received in critical timing RLdaprmdgt will be accessed otherwise RLdaprmfnl will be accessed.

FCCNFLCT - Indicates that multiple conflct codes exist. Attribute 'next' contains a conflict table number. If the conflict can be resolved by a prefix, attribute 'prefix' specifies the prefix-resolved code, and 'digits' is the number of digits expected for the prefix resolved code.

**Copyright © 1999 Lucent Technologies** 

```
        FCCONT    - Continue digit analysis in RLdaprmdgt
                    with the next digit received.
        FCFAT     - Indicates that a foreign numbering plan
                    area (NPA) LDIT is used.
        FCFAT     - Indicates that a foreign NPA LDIT is used.
        FCRANGE   - Indicates that a code conflict exists
                    among a contiguous range of quantities
                    of additional digits dialed.  Each of
                    the quantities in the range is analyzed
                    in the RLda_conflct relation.
                    Only used by international direct distance
                    dialing (IDDD) call at the moment.
                    NOTE:  For private branch exchange (PBX)
                    calls.
                    (RLfc_porttyp.servclass=FC_PBX or FC_PDID)
                    the RLda_conflct.desttype = FCIDDDSTST.
        FCREMAIN  - Used when digit analysis is complete
                    but additional digits are to be collected
                    without digit analysis. The remaining digits
                    are usually passed on to a directory number
                    translation or outpulsed over a trunk. This
                    is the most commonly used row type.
                    The 'next' attribute specifies the
                    entry point in the RLdaprmfnl relation
                    for accessing routing data.  A 'next'
                    value of zero is reserved for vacant
                    codes.
        FCSAC_CALL - Service access code call.  The 'next'
                    attribute will give a table entry
                    in the RLda_ambig relation which will
                    contain a pointer 'final' point to all
                    the routing data in the RLdaprmfnl.
                    The carrier ID will be specified
                    in the 'next' attribute in the
                    RLda_ambig tuple.
        FCTWOCONF - Indicates that a code conflict exists
                    which may be resolved by analyzing
                    exactly two quantities of additional
                    digits dialed (or inpulsed) in the
                    RLda_conflct relation.
        FCTRANDONE - Indicates primary translation is
                    complete but a selective dialing request
                    may exist.  Use the value specified
                    by the 'digits' attribute to determine
                    the number of digits to collect.  The
                    'next' attribute gives the RLda_ambig
                    table entry.  Use the RLda_ambig.final
                    value as the original dialing request.
                    The value of RLda_ambig.next should be
                    used to begin remaining digit translation.
```

**Attribute:**

next

Copyright © 1999 Lucent Technologies 

**Fullname:**
Next table entry
**Attribute Description:**
The usage depends upon the value of the row attribute.

1. If row is FCCONT or FCFAT, this attribute contains an RLdaprmdgt relation table number from 1 to 32767 and there must be at least one RLdaprmdgt tuple with its previous attribute equal to this value.

2. If row is FCCNFLCT, FCRANGE or FCTWOCONF, 'next' contains an RLda_conflct relation table number from 1 to 1048575 and there must be at least one tuple in RLda_conflct with its 'table' attribute equal to this value.

3. If row is FCAMBIG, FCTRANDONE or FCSAC_CALL, this attribute contains an RLda_ambig relation table number from 1 to 1048575 and there must be exactly one RLda_ambig tuple with its 'table' attribute equal to this value.

4. If row is FCREMAIN, 'next' contains RLdaprmfnl relation table number from 0 to 1048575 and there must be exactly one tuple in RLdaprmfnl with its 'previous' attribute equal to this value. Tuples with index 0 and 1048575 in the RLdaprmfnl are reserved for FCVACANT destination type. Upon deletion of a tuple in RLdaprmdgt when 'row' is FCREMAIN, the corresponding tuple in RLdaprmfnl should be left untouched because of the many-to-one mapping.

**Attribute:**
digits
**Fullname:**
Number of digits need to be specified
**Attribute Description:**
The usage depends upon the value of the row attribute.

1. If row is FCREMAIN or FCSAC_CALL, digits is the remaining number of digits to collect without analysis.

2. The following rules apply to a rowtype of FCCNFLCT:

   a. If the NBR OF DIGITS field on RCV 9.3 (ODA form 5300-3/5) is populated AND the PREFIX field is NULL

**Copyright © 1999 Lucent Technologies** 

AND there are just two entries on the
conflict page (9.3 page 2), then:

digits = NBR OF DIGITS from 9.3 - the
number of digits on the
INCOMING DIGIT field from 9.3

maxdigits = NBR DIG field on
the conflict entry page
(9.3 page 2) which
does NOT match NBR OF
DIGITS - number of
digits on INCOMING DIGIT field

The conflict will be resolved in the
following manner:

If a 1+ prefix is dialed,
the number digits remaining
to be collected = maxdigits attribute.
If no prefix is dialed, the
number of digits remaining to
be collected = digits attribute.

b. If the DIGITS field is populated
on 9.3, (ODA form 5300-3/5)
And the PREFIX field is something
other than NULL, then:

digits = NBR OF DIGITS from 9.3 - the
number of digits on the
INCOMING DIGIT field from 9.3

maxdigits = 0

The conflict is resolved in the following
manner:

If the prefix dialed matches
the value in the PREFIX field,
then the digits attribute
is the remaining number of digits
to collect for prefix resolved conflicts.

If the prefix dialed does not match
the value in the PREFIX field,
the conflict is resolved by
timing.

c. For the City Codes Routing on International
Calls feature (SFID 325), if
daprmfnl.type_ci_call is FCIDDD and
daprmfnl.desttype is FCIDDDSTS, then:

Copyright © 1999 Lucent Technologies 

digits = lowest NBR DIG field on the conflict entry page - number of digits on INCOMING DIGITS field from RC/V 9.3

maxdigits = highest NBR DIG field on the conflict entry page - number of digits on INCOMING DIGITS field from RC/V 9.3

These fields are modified through RC/V 9.3, not 9.6.

3. If row is FCRANGE, digits is the number of digits to collect before starting digit analysis in the RLda_conflct relation. The full range for customer dialed IDDD calls is 7-15 digits if the IDDD15 secured feature (SFID223) has been purchased and turned on; otherwise 7-12 digits is the allowed range--(includes country code [CC] and national number [NN]). This implies that this field have a value of at least four for the translation of three digit country codes, at least five for two digit CC's and at least six for one digit CC's.

   For Operator Services Position System (OSPS) IDDD, an operator may enter a range of 4-15 digits if the IDDD15 secured feature (SFID223) has been purchased and turned on; otherwise 4-12 digits is the allowed range (includes CC and NN). OSPS DASs can be recognized by incoming trunks with a service class of FC_ISPOPR, FC_OPR_DIOR, or FC_AISOA. The office must also be an OSPS office (Glospsta equal to DBYES). OSPS international dialing requires the country code and at least three national number digits. Since the CC can be one-three digits in length, the minimum range is four-six digits. This field should be populated as follows:

   If the operator enters a three digit CC, then the minimum number of digits allowed is six and this field is populated to three (six minus three).

   If two is entered and the minimum is five, then this field is three (five minus two).

   If a one digit CC is entered and a minimum of four is allowed, then this field is three (four minus one).

   Therefore this field should always have a value

Copyright © 1999 Lucent Technologies 

of three (for one, two, or three digit CC's) on OSPS switches.

4. If row is FCTWOCONF, digits is the smaller of the two valid remaining numbers of digits to analyze in the RLda_conflct relation. The valid range is 0 (the null value) to 15.

**Attribute:**
maxdigits
**Fullname:**
Maximal number of digits need to be specified
**Attribute Description:**
The usage depends upon the value of the row attribute.

1. If row is FCRANGE, maxdigits is the maximum number of digits to analyze in the RLda_conflct relation.

2. If row is FCTWOCONF, maxdigits is the larger of the two valid remaining numbers of digits to analyze in the RLda_conflct relation.

3. If the row is FCCNFLCT, the maxdigits and digits field may be populated. See the usage section of the digits attribute for a description of how maxdigits and the digits field are used.

The valid range is 0 (the null value) to 15.

**Attribute:**
prefix
**Fullname:**
Prefix index
**Attribute Description:**
Indexes dialed prefix. Used for conflict resolution.

**Attribute:**
psflag
**Fullname:**
Packet switch indicator
**Attribute Description:**
Must be DBNO for voice and circuit switched calls.
Must be DBYES for packet switched calls.
Default value is DBNO.
This field has no null value.

# DAPRMFNL

## 1. Description

This is an OP VIEW virtual relation for Primary Digit Analysis Final Translation. This is a virtual update relation. The root storage relation is RLdaprl_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation DAPRMFNL.

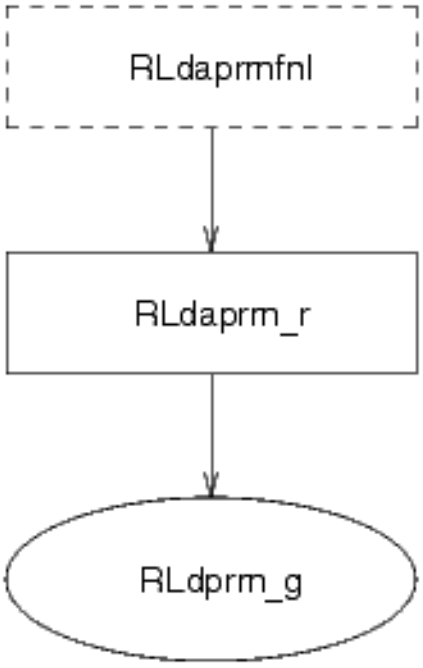

**Figure 1 Virtual Relation DAPRMFNL**

## 4. Population rules for RLdaprmfnl

### Relation Description

Office dialing plan (ODP) digit analysis primary translation final digit table

These are final digit analysis tables for ODP analysis.

The distribution class for RLDAPRMFNL is group partitioned. The group type is GPD_DA and the group ID is the value of the local digit interpreter table (LDIT).

A tuple in RLDAPRMFNL is always associated with a specific primary digit tree (LDIT), which can be associated with one or more digit analysis selectors (DASs). The LDIT corresponds to the group ID and will be used to determine the list of switching modules (SMs) that subscribe to this group for update purposes.

See the population rules for RLDAPRMDGT for the rules that describe how this relation is administered and populated.

Since 5E4(2), the initial data for this relation will not have redundant tuples, that is, duplicate values for non-key attributes, except when the 'desttype' attribute equals FCTLNACC. Therefore, other than the exception, tuples in RLdaprmdgt and RLda_ambig map in a many-to-one fashion to RLdaprmfnl. Because of this many-to-one relationship, tuples in RLdaprmfnl should never be deleted.

**Attribute:**

previous

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Table entry associated with the previous dialed digit

**Attribute Description:**

Table number from either the RLdaprmdgt or the RLda_ambig relation tuple. The valid range is from 0 to 1048575. Table numbers 0 and 1048575 are always populated by ODA for vacant code and this tuple should never be deleted or modyfied when a vacant code is being deleted or added to the LDIT (RC Views 9.3 and 9.15).

**Attribute:**

dest

**Fullname:**

Destination index

**Attribute Description:**

Destination index is used in routing.

**Attribute:**

desttype

**Fullname:**

Destination type

**Attribute Description:**

A destination type used to indicate various actions to be taken on receipt of this digit. Valid values are the following subset of the DESTN domain:

FC911 - Code conversion and 911 access;
FCASST411 - Code conversion to local information;
FCASST555 - Access to 555 information.

Note that if the desttype is FCASST555 and the type_ci_call is FCINTERLATA and the call is dialed without a numbering plan area (NPA), the call will be blocked. In order for an inter-LATA call which is dialed without an NPA to be routed, the desttype must be FCNORMAL.

FCAUTINW - Automated inward call. Calls with this desttype are originated by a distant operator and are routed to an automated query. This is a valid desttype only if the GLospsta parameter has the value DBYES, that is, only if the office receiving the call has an Operator Services Position System (OSPS).
FCBUS811 - Code conversion to business office.
FCHNPA - Reroutes call via RT_HNPA tuple in RLrt_fixedri.
FCINWATS - Inward wide area telecommunications service (INWATS) call.
FCIDDDSTST - Multistage international outbound call that is routed to a multi-frequency (MF) trunk, a Common Channel Signaling System Number 6 (CCIS6) trunk, or a Common Channel Signaling System Number 7 (CCS7) integrated services digital network (ISDN) user part (ISUP) trunk.

Copyright © 1999 Lucent Technologies 

```
Local office (Gloftyp = DBNO):  This is a valid desttype for the
digit sequence 011 + (7-12 digits).

Toll office (Gloftyp = DBYES):  This is a valid desttype for digit
sequences that SHOULD NOT receive the fully coded addressing treatment.
The possible digit sequences are:

1NX + YYY + CCC
011 + PCC
18X
where,
        N     - Digit range is two to nine
        X     - Digit range is zero to nine
        YYY   - International carrier (three digits)
        CCC   - Padded country code (three digits)
        PCC   - Paired country code (three digits)

FCIDDDFCA     - Address sequence of an international outbound call
                received by a toll office (Gloftyp = DBYES) and is
                translated with a digit analysis selector (DAS) of 81.
                This desttype can be assigned to the
                to the following digit sequences:

                CC + NN
                0/1X + CC + NN
                where,
                        X     - Digit range is zero to nine
                        CC    - One to three digit country code
                        NN    - National number
                        0/1X  - International switching center (ISC)
                                ID (two digits)
                        CC+NN - Must be 7 to 12 digits

                The international outbound call has been processed
                using fully coded addressing.  The normal case is
                to route this call on a CCIS6 or CCS7 ISUP outgoing
                trunk to a 4ESS(TM) toll office.  No RC or ODA cross
                checks should be added between DAS 81 and FCIDDDFCA
                dest type.

FCSTG1FCA     - The first stage of a multistage international
                outbound call entering a toll office
                that SHOULD receive the fully coded addressing
                treatment.  This call will leave the toll office in a
                CCIS6/CCS7 ISUP single stage.  This desttype can be
                assigned to the following digit sequences:

                1NX + YYY + CCC
                011 + PCC
                18X
                where,
                        N     - Digit range is two to nine
                        X     - Digit range is zero to nine
```

Copyright © 1999 Lucent Technologies 

```
                        YYY   - International carrier (three digits)
                        CCC   - Padded country code (three digits)
                        PCC   - Paired country code (three digits)

FCOSOIWTS     - Originating screening office (OSO) INWATS call.
                Requires querying an INWATS network control point (NCP)
                database to route the call; other attribute options
                with this desttype are:

                type_ci_call  - Must be in FCNONCI, FCINTRALATA,
                                or FCINTERLATA.

                route_x       - Optional
                route_type    - Optional
                dest          - Optional
                term_lata     - Zero

FCADDON       - Alliance(R) teleconferencing add-on call.  Requires
                querying a network call denial (NCD) database to screen
                the originator and an INWATS NCP query to route the
                call.  This is only a valid type if the Gl_oso and
                Glospson parameters are set to DBYES.
FCMEETME      - Alliance(R) teleconferencing meet-me call.
                Requires querying an NCD database to screen the
                originator.  This is only a valid type if the Gl_oso
                and Glospson parameters are set to DBYES.
FCNS800       - Service switching point (SSP) number services call.
                Will require a query to an external service control
                point (SCP) database to obtain routing information.
                This is only a valid type if the GLssp global parameter
                has a value of DBYES, indicating that the office is an
                SSP office.
FCNORMAL      - Plain old telephone service (POTS).
FC900         - 900 calls.
OADA2VDT      - Directory assistance (DA) calls routed to video
                display terminal (VDT).
OAOPNIT       - Non-initial signaling point (ISP) calls routed to a
                VDT.
FCOPINW       - Operator assisted inward call.  Calls with this
                desttype are originated by a distant operator and are
                routed to an OSPS operator position.  This is a valid
                desttype only if the GLospsta parameter has the value
                DBYES, that is, only if the office receiving the call has
                an OSPS.
FCREPR611     - Code conversion to repair service.
FCTLNACC      - Test line access which uses RLtmtsc.
FCSDNACCESS   - Software defined network access.
FCSDNEGRESS   - Software defined network egress.
FCVACANT      - Reroutes call via RT_VACANT tuple in RLrt_fixedri.
FCAPSDN       - Access to software defined
                network at an action point (ACP) switch.  This is a
                valid desttype only if the Glapsdn parameter has the
                value of DBYES.
FCLNACP       - Leased network at an action point.
```

Copyright © 1999 Lucent Technologies 

```
        FCSPAB800     - Address sequence of a special access basic 800 call
                        received by the toll office that will terminate to the
                        special access basic 800 customer.  This call will be
                        routed to a trunk group with a class of service (COS)
                        of FC_SPAB800.  In a non-terminating toll office this
                        call is routed as normal long distance call.
        FCSPAM800     - Address sequence of a special access MEGACOM(R) 800 call
                        received by the toll office that will terminate to the
                        special access MEGACOM(R) 800 customer.  This call will be
                        routed to a trunk group with a COS of FC_SPAM800.  In a
                        non-terminating toll office, this call is
                        routed as a normal long distance call.
        NULLDEST      - The null value.
        TMCSTL        - Coin station test line access.
        TMLTDCALL     - Access to local test desk.
        TMOCTL        - Access to open circuit test line.
        TMSRTT        - Access to station ringer/touch-tone test
                        circuit.
        TMBRITL       - Access to basic rate interface (BRI) dial up
                        test line.
        TMBBRITL      - Access to billed BRI dial up test line.
        WETESTCAL     - Test call associated with library programs.
        FCAPX         - Autoplex(R).
```

**Attribute:**

route_x

**Fullname:**

Route index

**Attribute Description:**

This attribute was introduced in 5E2(1) to enable the routing and terminal allocation (RTA) to read the route index and type when the digit analysis relations are read. Either the route index (range 0-AVRIMAX()), a normalized office code (range 1-AVNOCMAX()), or a poly grid route pattern (range 1-AVRIMAX()) are allowed. This depends on the value of the route type. This dependency follows the following rules:

| ROUTE_TYPE | ROUTE INDEX |
|---|---|
| RTE_DNTRAN | A normalized office code (NOC), range 1-AVNOCMAX(). |
| RTE_HUNT | A route index, range 1-AVRIMAX(). |
| RTE_NULL | Zero |
| RTE_POLYGRID | A pattern (key to RLrt_poly) in the range 1-AVRIMAX(). |

**Attribute:**

route_type

**Fullname:**

Route type

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

A route_type of RTE_POLYGRID is valid only in DSN offices (Gldsnopt = DBYES). If route_type = RTE_POLYGRID, then verify existence of a tuple in RLrt_poly with key pattern = ri and ri > 0. Also, the destination index (DI) should appear in RLrtppscrn if the route_type is RTE_POLYGRID, and in RLrt_scrning if the route_type is RTE_HUNT.

See poprules for RLrt_scrning, RLdaprldgt, RLda_conflct, and RLrtppscrn and following the 'conversion rules'.

**Attribute:**

desep

**Fullname:**

Destination separation class

**Attribute Description:**

Groups calls for statistical purposes--used for division of revenue study.

**Attribute:**

type_ci_call

**Fullname:**

Type of carrier interconnect call

**Attribute Description:**

Valid values are:

| | |
|---|---|
| FCCI_NULL | - The null value. |
| FCCOMPETE | - Call to an area in which the Bell Operating Companies (BOC) and carriers compete on an equal basis. |
| FCCONFLICT | - Seven digit call local access and transport area (LATA) conflict. |
| FCINTRALATA | - Call is within the LATA. |
| FCINTERLATA | - For voice or circuit switched calls, FCINTERLATA means call is inter-LATA but within the continental USA. For packet switched calls, FCINTERLATA means use preselected interexchange carrier (IECP) if one exists. |
| FCNONCI | - For voice or circuit switched calls, this means a normal, tandem or feature activation call. For packet switched calls, FCNONC means carrier interconnect does not apply. |
| FCPRIVELEGED | - Inter-LATA call handled by the BOC extended area service call which crosses a LATA boundary. |
| FCSAC | - Service access code call. |
| FCINTERIM | - 950-XXXX interim plan call. |
| FCICTOLL | - ICLATA-toll call. The FCICTOLL is not allowed if the ICLATA SF (SFID 149) is not activated. |
| FCICLOCAL | - ICLATA-local call. |
| FCICCONTOLL | - ICLATA-conflict-toll call. The FCICCONTOLL is not allowed if the ICLATA SF (SFID 149) is not activated. |
| FCICCONLOCAL | - ICLATA-conflict-local call. |
| FCWZ1 | - Call is to world zone one outside continental U.S. |

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
trignum
**Fullname:**
Trigger number
**Attribute Description:**
This field contains the network services trigger. Trignum is the key to RLns_trig.

**Attribute:**
nature
**Fullname:**
Nature of Number
**Attribute Description:**
This field contains an enumeration that aids transaction capabilities application part (TCAP) in formulating nature of number for use in query formulation.

**Attribute:**
esccode
**Fullname:**
Escape code
**Attribute Description:**
Indicates digit sequences that are exempt from off hook delay (OHD) treatment.

**Attribute:**
term_lata
**Fullname:**
Indicates terminating LATA identity
**Attribute Description:**
Takes on values from 0 to 31 to indicate the terminating LATA identity of the dialed digits for NCD and also OSPS LATA mapping.

Value 0 - Default value.
Value 1 - Indicates LATAs not subtending the toll office.
Values 2-31 - Indicates a subtending LATA of the toll office.

Additional population Rules required for an OSPS which does not have multiple digit trees--indicated by Gloftyp = YES
Glatmap = DBYES (LATA mapping turned on) and ci type = NONCI

Value 0 - Default value.
Value 1 - Indicates LATAs not subtending the toll office.
Value 2-31 - Indicates a subtending LATA of the toll office. It also indicates a subtending LATA of the OSPS for all NPA-NXX's contained in LATA's which this OSPS serves AND for which it has PARTIAL service for (shared LATA).

**Copyright © 1999 Lucent Technologies** 

Value of 1 for those LATA's not subtending this toll office.

**Attribute:**
dfltrt
**Fullname:**
Default Routing Treatment
**Attribute Description:**
Identifies the type of default routing treatment to be used for Special Feature ASP Default Routing for 3/6/10-Digit Triggers. SFID153 must be turned on before dfltrt can be changed from the default value.

This attribute may also be used for local number portability triggers.

**Attribute:**
ffcf1
**Fullname:**
Future Field Feature
**Attribute Description:**
A bit reserved for future field feature use.

**Attribute:**
ffcf2
**Fullname:**
Future Field Feature
**Attribute Description:**
A bit reserved for future field feature use.

**Attribute:**
ffcf3
**Fullname:**
Future Field Feature
**Attribute Description:**
This boolean attribute is reserved for future field feature use. It was used in 5e10 for TDX attribute anibypass.

**Attribute:**
ffcf4
**Fullname:**
Future Field Feature
**Attribute Description:**
A short reserved for future field feature use.

**Attribute:**
carrid
**Fullname:**

Copyright © 1999 Lucent Technologies 

Carrier identification number.

**Attribute Description:**

Carrier identification number. This attribute is not used at this time.

**Attribute:**

annc_code

**Fullname:**

Announcement code

**Attribute Description:**

Network announcement code for ASP Default Routing (Phase 2). This attribute is not used at this time.

**Attribute:**

spec_dn

**Fullname:**

Specific Directory Number

**Attribute Description:**

Specific directory number for ASP Default Routing (Phase 2). This attribute is not used at this time.

**Attribute:**

iddd_ind

**Fullname:**

International Direct Distance Dialing Indicator

**Attribute Description:**

Indicates if the specific directory number (spec_dn) is an international number. This attribute is not used at this time.

**Attribute:**

bill_ind

**Fullname:**

Billing indicator

**Attribute Description:**

Indicates if the billing information should be generated when routing to a directory number for ASP 3/6/10 Default Routing (Phase 2). This attribute is not used at this time.

**Attribute:**

anibypass

**Fullname:**

anibypass indicator

**Attribute Description:**

This attribute will be used to indicate whether Toll Digital Exchange (TDX) ANI table processing should be by-passed. Default for this attribute is DBNO. When set to DBYES, no TDX ANI Table processing will be performed.

**Copyright © 1999 Lucent Technologies** 

Note that the digtree, that is, digit analysis selector (DAS), from the ANI table is used for TDX trunks regardless of how the anibypass attribute is populated; by-pass does not apply to the digtree field of the ANI table. Use of the anibypass attribute will be allowed for all digit analysis destination types. The trignum attribute has precedence over this attribute. If trignum is non-zero, then ANI table processing is not performed regardless of how the anibypass attribute is populated.

**Attribute:**
lnp_trignum
**Fullname:**
local number portability trigger number
**Attribute Description:**
When the dialed or implied NPA-NXX is portable, this attribute contains the query trigger number to be used to determine the location routing number of the called number. SFID174 must be active before lnp_trignum may be populated with a non-default value.

**Attribute:**
geoport
**Fullname:**
geographic porting indicator
**Attribute Description:**
This attribute indicates whether geographic porting has occurred with respect to DNs associated with the designated LDIT, MLDIT, or RDIT entry.

**Attribute:**
ported_in
**Fullname:**
ported into this switch indicator
**Attribute Description:**
This attribute indicates whether one or more LDIT, MLDIT, or RDIT entry-associated terminations exist in this office that were ported in from another office. SFID174 must be active before ported_in may be set to DBYES.

**Attribute:**
portdn_das
**Fullname:**
ported directory number digit analysis tree selector
**Attribute Description:**
This attribute is currently a spare to be used in the future.

**Attribute:**
ignore_lnptn

Copyright © 1999 Lucent Technologies 

**Fullname:**
ignore the local number portability trigger number
**Attribute Description:**
This attribute is meaningful only when the tuple corresponds to an RDIT recent change view.

When set to DBYES and the lnp_trignum attribute is 0, then this lnp_trignum, ported_in, and geoport values will be ignored and the lnp_trignum, ported_in, and geoport from the associated LDIT or MLDIT will be used.

**Attribute:**
home_lrn
**Fullname:**
home location routing number indicator
**Attribute Description:**
This attribute is used for the analysis of location routing numbers (LRNs). When set to DBYES the LRN is owned by (or homes on) this switch.

**Attribute:**
lrn_scrn
**Fullname:**
location routing number screening indicator
**Attribute Description:**
This attribute is used for the analysis of location routing numbers (LRNs). When set to DBYES the screening information associated with the LRN is valid. This information consists of the code index (RLdaprmfnl.dest), type ci call (RLdaprmfnl.type_ci_call), and prefix (RLdaprmdgt.prefix).

**Attribute:**
dny_xfer
**Fullname:**
Deny Transfer
**Attribute Description:**
This attribute indicates whether or not transfers are allowed on a line for this particular primary digit string. The transfer will be denied if this attribute is set to DBYES. Emergency calls must be allowed for all transfers.

**Attribute:**
inh_dnt
**Fullname:**
inhibit the check for dialed number trigger
**Attribute Description:**
This attribute is used for the local number portability feature. When set to DBYES it indicates that a dialed number trigger should be not be checked for when a location routing number has been provided

Copyright © 1999 Lucent Technologies 

in the IAM message for an incoming ISUP call to a ported number.

**Attribute:**
o_bltrig_inh
**Fullname:**
Originating Busy Line Trigger Inhibit
**Attribute Description:**
This attribute is used to indicate whether or not to inhibit the office Originating Busy Line Trigger. Default for this attribute is DBNO. When set to DBYES, the trigger will not be invoked for these digit(s). This attribute is secured by SFID #212.

This functionality was provided by the attribute ffcf1 in 5e11.

**Attribute:**
o_natrig_inh
**Fullname:**
Originating No Answer Trigger Inhibit
**Attribute Description:**
This attribute is used to indicate whether or not to inhibit the office Originating No Answer Trigger. Default for this attribute is DBNO. When set to DBYES, the trigger will not be invoked for these digit(s). This attribute is secured by SFID #212.

This functionality was provided by the attribute ffcf2 in 5e11.

**Attribute:**
nodal_idx
**Fullname:**
EOLN service index
**Attribute Description:**
This attribute contains a numerical value denoting the particular EOLN service.
SFID218 must be active before this attribute is populated with a non-default value.

**Attribute:**
dn_prefd
**Fullname:**
DN PREFD indicator
**Attribute Description:**
This attribute indicates whether the ODN in the incoming SS7 GAP is to be sent to the terminating PBX as the called number.
SFID218 must be active before this attribute is populated with a non-default value.

**Attribute:**
gets_hpc

Copyright © 1999 Lucent Technologies 

**Fullname:**
GETS HPC indicator
**Attribute Description:**
This attribute allows assignment of GETS HPC to digit strings of RC Views 9.3, 9.9, and 9.15.

The Government Emergency Telecommunications System, High Probability of Completion (GETS HPC) Feature is secured by SFID 279. The feature must be unlocked via RC View 8.22 before gets_hpc attribute is set to DBYES.

**Attribute:**
rel_link
**Fullname:**
Release Link Indicator
**Attribute Description:**
This attribute indicates whether the dialed digits are eligible for Release Link processing.

**Defines:**

# DB_AMGPD

## 1. Description

DB AM Group Partitioned Data The purpose of this relation is to identify which processors a group resides on. Each tuple contains one bit per processor, where bit 0 represents the Logical Processor.

This is a virtual update relation. The root storage relation is RLamgpd_r.G. The tree diagram Figure 1 depicts the stored structure of virtual relation DB_AMGPD.

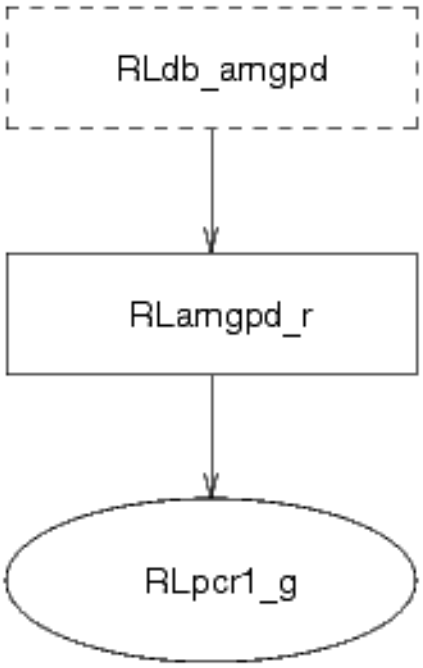

**Figure 1 Virtual Relation DB_AMGPD**

```
                RLdb_ampgd.pcr_map must reflect that
                distribution for the particular td_id.
RESTRICTION:    This relation is not populated with a grp_type of GPDMLHG
_CF.
GPD_QLPS,       This is a group partioning for QLPS. All tuples
                should appear in the AM. For this partioning, the
                tuple in the SM is populated if the unit type in
                the RLmodatt tuple is SMSM2000 or SMSM2005 and one of the
                networks, ql_ntwk0 or ql_ntwk1, exists on the SM.
GPDGDSF,        /* Group partitioning for GDSF. */
GPDCPM,         /* Group partitioning for CPM. */
GPDASPN,        /* Network Element Services Signaling group */
GPDVCDX,        /* Group partitioning for VCDX SM's */
GPDTDR,         /* Group partitioning for Time Dependent Routing */
```

**Attribute: grp_id**

**Fullname:** Group identification.

**Attribute Description** Identification (ID) for identifying the specific group within each group type. Valid values 1 - 65535. In addition, for grp_type=GPDCL_COM, GPDAMCL_COM, GPDAM_SM_PART, GPDSM_PART, GPDSA_PART, GPDISA_PART, and GPD_DA, grp_id=0 is valid.

```
for grp_type=GPDTDR, the valid grp_id value is 0
For grp_type=GPD_OSPS the only valid values are 1 thru 4.
```

The value of 4 can only be populated in OSPS offices.

```
For grp_type=GPD_OPRT the only valid values are 1, 2 and 3.
For grp_type=GPDISDN, the valid grp_id values are 0, 1.
For grp_type=GPDAM_SA_RED, currently the only valid grp_id is 0.
For grp_type=GPDATTMSK, the valid grp_id values are the same as
the domain defined by the DMGRPNUM domain (uhdr/db/DMgrpnum.G).
For grp_type=GPDTGMSK, the valid grp_id values are 1 thru AVTRKGRPS().
The domain is defined by the DMGRPNUM domain (uhdr/db/DMgrpnum.G).
A RLDB_AMGPD tuple must always be populated such that all the bits on
 pcr_map1, pcr_map2,..., pcr_map7 are set to zero.
When the Gl_ph parameter is updated to > 0
on any loaded SM, the following must be done:
```

(1) The RLDB_AMGPD tuples for grp_type = GPDISDN and grp_id = (0-1) must be updated to set the bit associated with that module in pcr_map1,.., pcr_map7 to 1. For grp_id = 1, a 1 should be placed in the low order bit of pcr_map1 to represent the AM's (and/or CMP's) subscription.

(2) Two RLDB_IMGPD tuples must be inserted on that module such that

```
RLDB_IMGPD.grp_type = GPDISDN
RLDB_IMGPD.grp_id = 0
RLDB_IMGPD.localflag = DBNO
RLDB_IMGPD.grp_type = GPDISDN
RLDB_IMGPD.grp_id = 1
RLDB_IMGPD.localflag = DBNO
```

(3) Two RLDB_GPDUS tuples must be inserted on the AM such that

```
RLDB_GPDUS.grp_type = GPDISDN
RLDB_GDPUS.grp_id = 0
RLDB_GDPUS.module = number of that module.
```

Copyright © 1999 Lucent Technologies 

```
     RLDB_GPDUS.grp_type = GPDISDN
     RLDB_GDPUS.grp_id = 1
     RLDB_GDPUS.module = number of that module.

For grp_type = GPDEDSL, valid values are 0-AVTRKGRPS().
For grp_type = GPDICR, valid values are 1-AVSFGRPS().
```

For grp_type = GPDTRKG, valid values are 1 - AVTRKGRPS() (a valid trunk group number). A tuple must be placed in this relation for every trunk group assigned the EPSCS 100 Second Scan (HSS) feature. Or, in other words, a tuple for EVERY trunk group found in RLmsaphss.

The bit maps pcr_map1 - pcr_map7 must be populated to reflect which processors contain members of the trunk group. The bit in pcr_map1 corresponding to the AM must always be set to 0 (DBNO).

For grp_type of GPD_DA, valid values are 0-999, 65000. These correspond to the valid values for the attribute 'ldit' in the relation RC_LDIT. A tuple is placed in this relation for every tuple in the relation RC_LDIT. The processor bit maps are set to reflect which processors contain the primary digit translator associated with the indicated LDIT.

For grp_type = GPDACSR, valid values are 1-1023.

For grp_type = GPDSA_PART, valid values are 0-192. Or, in other words, any valid processor number including the AM or CMP. Therefore, a tuple exists in this relation for each SM number and for the AM, CMP or both. The group ID is equal to the routing SM number. Each processor subscribes to its own group, except for the AM or CMP which subscribes to no groups. RSMs subscribe to all groups including their own. In addition, all non-RSMs with the stand alone call processing option subscribe to all groups including their own.

For grp_type = GPDISA_PART, valid values are 0-192. Or, in other words, any valid SM processor number plus 0. Therefore, a tuple exists in this relation for each Loaded SM number and a tuple always exists for 0. The group ID is equal to the packet routing SM number. Each valid processor number subscribes to its own group. Loaded RSMs subscribe to all groups including group 0. In addition, all Loaded non-RSMs with the stand alone call processing option subscribe to all groups including group 0.

For grp_type = GPDPM, GPDPMIFAC, or GPDPMDF2 valid values are limited to 0 to the value of Glpmmax. The following describes the tuple distribution for facility performance monitoring (PM) for the following relations: RLdb_amgpd, RLdb_imgpd, RLdb_gpdus, RLfacthrsh, RLpmfacgrp, and RLpmgrpfac.

For any facility PM group, there will be a single tuple in RLdb_amgpd (on the AM/CMP). Every PM group will also be represented by a tuple in RLfacthrsh on the AM/CMP, even if the PM group has no associated facilities. If the PM group has no associated facilities, all processor bits in RLdb_amgpd will be 0 except for the bit representing the AM/CMP. When a facility is added to a PM group, RLdb_amgpd must be checked for the appropriate processor bit being set. If the bit is not set, a

n RLdb_gpdus tuple must be created (on the AM/CMP) to represent this PM group and this SM (with use_count = 1), an RLdb_imgpd tuple must be created in this SM for this PM group, and the RLfacthrsh tuple for this PM group must be copied to the SM. Once these distribution tuples are created, tuples are created in RLpmgrpfac (on the AM/CMP) and RLpmfacgrp (on the SM) to associate the facility with a particular PM group.

If the bit corresponding to this SM is already set in RLdb_amgpd, the PM group is already

Copyright © 1999 Lucent Technologies 

referenced in the SM. In this case, the use_count in the RLdb_gpdus tuple is incremented, and the RLpmgrpfac and RLpmfacgrp tuples are created.

When a facility is removed from a PM group, the RLpmgrpfac and RLpmfacgrp tuples are deleted. The use_count in the RLdb_gpdus tuple is decremented, and if the use_count becomes 0, the RLdb_gpdus, and RLdb_imgpd tuples are deleted, and the appropriate processor bit in the RLdb_amgpd tuple for this PM group is cleared. The RLfacthrsh tuple on the SM is also deleted when the use_count becomes 0.

DSL performance monitoring works identically to facility performance monitoring, except that the relations RLpmthresh, RLpmgrpdsl, and RLpmdslgrp replace RLfacthrsh, RLpmgrpfac, and RLpmfacgrp, respectively.

The tuple distribution for DFI-2 PM facility PM is just like that of facility PM except that RLdf2thrsh is used rather than RLfacthrsh.
For grp_type = GPDPBX_ID, valid values are 1-4095. There must be at least one tuple in RLsc_range where RLdb_amgpd.grp_id = RLsc_range.pbx_id. RLsc_range is distributed to each SM that has a trunk group member where RLfc_trunk.pbx_id = RLsc_range.pbx_id and where screening is to be done on user-provided calling party numbers ( RLedsltrkg.grpnum = RLfc_trunk.tgroup and RLedsltrkg.cpn_scrn = DBYES.)

**Attribute: pcr_map1**

**Fullname:** First fullword bitmap field.

**Attribute Description** This field is a bit map which indicates if a group is present on each processor. Bit 0 is used for the AM or CMP or both, depending on the distribution of the GPD relation; bits 1 - 31 represent SMs 1 - 31, with 0 being the low-order bit. DBYES (1) indicates the group is present on the processor; DBNO (0) indicates the group is not present on the processor. Default value should be DBNO (0).

**Attribute: pcr_map2**

**Fullname:** Second fullword bitmap field

**Attribute Description** Bits 0 - 31 represent SMs 32 - 63.

**Attribute: pcr_map3**

**Fullname:** Third fullword bitmap field

**Attribute Description** Bits 0 - 31 represent SMs 64 - 95.

**Attribute: pcr_map4**

**Fullname:** Fourth fullword bitmap field

**Attribute Description** Bit 0 - 31 represent SMs 96 - 127.

**Attribute: pcr_map5**

**Fullname:** Fifth fullword bitmap field

**Attribute Description** Bit 0 - 31 represent SMs 128 - 159.

**Attribute: pcr_map6**

**Fullname:** Sixth fullword bitmap field

**Attribute Description** Bits 0 -31 represent SMs 160 - 191.

**Attribute: pcr_map7**

Copyright © 1999 Lucent Technologies 

**Fullname:** Seventh fullword bitmap field

**Attribute Description** Bit 0 represents SM 192.

## 4. Population Rules for RLdb_gpdus

**Relation Description** DB Group Partitioned Data Use (on processors).
The purpose of this relation is to store a count of the number of users a group has on a specific processor. Processor 0 represents AM, CMP or both.

**Attribute: grp_type**

**Fullname:** Type of GPD group.

**Attribute Description** This is an enumeration, valid values are defined in DMgpd_gps.G:

RESTRICTION: For grp_type interacting with BFG - These types of GPD are allowed to interact with BFG, when a BFG is constructed it may be associated with Group Name(s) for any of the grp_type as follows:

```
GPDDPLAN,    GPDAD1,    GPDAD2,    GPDTG,    GPDARS,    GPDASI,
GPDPFA,      GPDMDR,    GPDATH,    GPDACCT,  GPDRTTAB,  GPDEDS,
```

The following rules are appended and apply to the previous grp_type, to determine when and how they interact with BFG. This applies when BFG uses the previous grp_type and:

Copyright © 1999 Lucent Technologies 

(1) The BFG is not assigned on any SM, and resides on the AM

(2) The BFG is assigned on one or more SMs, and NOT on AM.

(1) In RLdb_gpdus, each previous grp_type may have one or more grp_id's associated with it. The following example is for grp_type GPDDPLAN, but applies to each previous grp_type: a. review RLbfgmatch until finding a tuple where RLbfgmatch.idp_gpid equals RLdb_gpdus.grp_id

(2) When idp_gpid is found in RLbfgmatch, check RLdb_amgpd, where RLdb_amgpd.grp_id equals RLbfgmatch.idp_gpid. Now if RLdb_amgpd.pcr_map1 is NOT equal to '1', then none of the GPD for idp_gpid should be populated in the AM.

If RLdb_amgpd.pcr_map1 is equal to '1', then all the GPD for that idp_gpid should be populated in the AM.

(3) When RLbfgmatch.idp_gpid equals RLdb_gpdus.grp_id, and where the corresponding RLdb_amgpd.pcr_map1 is equal to '1', this represents one usage of that idp_gpid in the AM, and RLdb_gpdus.use_count should be incremented in value by one.

Therefore, whenever one of these grp_type and grp_id is populated on one or more SMs, as indicated by RLdb_amgpd.pcr_mapx where x = 1 to 7, it must not be populated on the AM (bit 0 of RLdb_amgpd.pcr_map1 must equal 0). However, if the grp_type and grp_id is assigned to a BFG and BFG is unassigned, a RLdb_gpdus tuple must exist for module 0 and the use_count is incremented.

Exception: Unlike most GPD groups, terminal groups are not real 'groups'. We do not count their 'existence' on the CMP when they are not being used on an SM, like the other groups do.

**Attribute: grp_id**

**Fullname:** Group Identification to identify the specific group within each group type.

**Attribute Description** ID to identify the specific group within each group type. Valid values 1 - 65535. In addition, for grp_type=GPDCL_COM, GPDAMCL_COM, GPDAM_SM_PART, GPDSM_PART, and GPD_DA, grp_id=0 is valid.

For grp_type=GPDISDN, the valid grp_id values are 0, 1.

For grp_type=GPD_SPACB, all tuples should appear in the AM, CMP or both. A tuple should appear in the SM when the specified conditions in the RLspabilldn poprules are met. The valid values for grp_id are the same as the domain defined by the DMGRPNUM domain (uhdr/db/DMgrpnum.G).

For grp_type=GPD_SPABS, all tuples should appear in the AM, CMP or both. A tuple should appear in the SM when the specified conditions in the RLspabndscrn poprules are met. The valid values for grp_id include all valid NPA values for RLspabndscrn.npa1.

For grp_type=GPD_SPAENXX, all tuples should appear in the AM, CMP or both. A tuple should appear in the SM when the specified conditions in the RLspaenxx poprules are met. The only valid grp_id is 1.

```
For grp_type = GPDISDN, valid values are 0, 1.
For grp_type = GPDEDSL, valid values are 0-AVTRKGRPS().
For grp_type = GPDICR, valid values are 1-1023.
```

Copyright © 1999 Lucent Technologies 

```
For grp_type = GPD_DA, valid values are 0-999,
    and 65000 for RDIT.
For grp_type = GPDACSR, valid values are 1-1023.
For grp_type = GPDPM or GPDPMIFAC, the valid
    values are 0 to Glpmmax.
For grp_type = GPD_QLPS, the valid value is 0.
```

The following describes the tuple distribution for facility performance monitoring (PM) for the following relations: RLdb_amgpd, RLdb_imgpd, RLdb_gpdus, RLfacthrsh, RLpmfacgrp, and RLpmgrpfac.

For any facility PM group, there will be a single tuple in RLdb_amgpd (on the AM/CMP). Every PM group will also be represented by a tuple in RLfacthrsh on the AM/CMP, even if the PM group has no associated facilities. If the PM group has no associated facilities, all processor bits in RLdb_amgpd will be 0 except for the bit representing the AM/CMP. When a facility is added to a PM group, RLdb_amgpd must be checked for the appropriate processor bit being set. If the bit is not set, an RLdb_gpdus tuple must be created (on the AM/CMP) to represent this PM group and this SM (with use_count = 1), an RLdb_imgpd tuple must be created in this SM for this PM group, and the RLfacthrsh tuple for this PM group must be copied to the SM. Once these distribution tuples are created, tuples are created in RLpmgrpfac (on the AM/CMP) and RLpmfacgrp (on the SM) to associate the facility with a particular PM group.

If the bit corresponding to this SM is already set in RLdb_amgpd, the PM group is already refere

nced in the SM. In this case, the use_count in the RLdb_gpdus tuple is incremented, and the RLpmgrpfac and RLpmfacgrp tuples are created.

When a facility is removed from a PM group, the RLpmgrpfac and RLpmfacgrp tuples are deleted. The use_count in the RLdb_gpdus tuple is decremented, and if the use_count becomes 0, the RLdb_gpdus and RLdb_imgpd tuples are deleted, and the appropriate processor bit in the RLdb_amgpd tuple for this PM group is cleared. The RLfacthrsh tuple on the SM is also deleted when the use_count becomes 0.

DSL performance monitoring works identically to facility performance monitoring, except that the relations RLpmthresh, RLpmgrpdsl, and RLpmdslgrp replace RLfacthrsh, RLpmgrpfac, and RLpmfacgrp, respectively.

```
For grp_type = GPDPMDF2 the valid values
are 0 to Glpmmax.
DFI-2 performance monitoring works identically to facility
performance monitoring, except that RLdf2thrsh replaces RLfacthrsh.
For grp_type = GPDPBX_ID, valid values are 1-4095.
For grp_type = GPDBFG, valid values are 1-4095.
******************************************************
Begin             K18.0 - 5E6(2)
******************************************************
In 5E6(2), to avoid SM redundant relations needed by
OPSMOT, a new group id is being created for GPD_OSPS. These
relations can be partitioned instead of SM redundant. This
will save memory on BASIC SMs. In addition, the new GPD
relations previously added in 5E6 were not added to the
poprules for this relation.
******************************************************
End               K18.0 - 5E6(2)
******************************************************
```

Copyright © 1999 Lucent Technologies 

**Attribute: module**

**Fullname:** Processor number (AM, CMP or SM).

**Attribute Description** Processor 0 is for the AM, CMP or both. The bit corresponding to the processor number should be set in pcr_map of relation RLdb_amgpd.

RULE CLARIFICATION: when GPD tuples should/shouldn't be populated in the AM.

In reviewing tuples of RLdb_gpdus for a given grp_type and a given grp_id:

(1) If more than one tuple exists, this means GPD usage is on more than one processor. In this case, never populate any of it's GPD data in the AM.

(2) If only one tuple exists: if in that tuple RLdb_gpdus.module is NOT equal to zero, DON'T populate the GPD data in the AM. if in that tuple RLdb_gpdus.module is equal to zero, populate the GPD data in the AM.

Therefore when a given grp_type and grp_id are assigned to a BFG but the BFG is currently unassigned and the grp_type and grp_id is assigned on an SM, a tuple must exist in RLdb_gpdus with module = 0 and the RLdb_amgpd.pcr_map1, bit 0 must equal 0.

For grp_type = GPDISDN and grp_id = 0, no tuple should be populated on the AM, CMP or both.

**Attribute: use_count**

**Fullname:** The number of group lines (id, users) on this processor.

**Attribute Description** Valid values 0 - 65535. If use_count in all of the SMs is 0 and 1 in the AM, then GPD group is unassigned and exists in AM only. If use_count is greater than 0 in any SM, then GPD group is assigned to lines and does not exist in the AM (use_count in AM could be any value); if it is greater than 0 in AM, this GPD group is assigned to BFG which has not yet been assigned to a line. Therefore, this BFG resides in the AM. If use_count is zero in all of the SMs and is greater than 1 in AM, then GDP group is used by BFG and exists in the AM only.

The following layout shows how the IDP use count is impacted when the IDP is assigned to a BFG and the BFG assigned to lines. This same logic applies to other GPD group types if they are used in BFG.

| IDP action counts | BFG#1 counts | usage | | | | usage | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | AM | SM1 | SM2 | SM3 | AM | SM1 | SM2 | SM3 |
| 1. create IDP group | | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2. create BFG#1 which uses IDP group | | 2 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 3. assign on SM1, line with IDP | | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 |
| 4. assign on SM1, line with BFG#1 | | 0 | 2 | 0 | 0 | 0 | 1 | 0 | 0 |
| 5. assign on SM2, line with IDP | | 0 | 2 | 1 | 0 | 0 | 1 | 0 | 0 |
| 6. assign on SM3, line with BFG#1 | | 0 | 2 | 1 | 1 | 0 | 1 | 0 | 1 |
| 7. assign on SM3, line with BFG#1 | | 0 | 2 | 1 | 1 | 0 | 1 | 0 | 2 |
| 8. delete from SM1, line with IDP | | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 2 |
| 9. delete from SM1, line with BFG#1 | | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 2 |
| 10. delete from SM3, line with BFG#1 | | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| 11. delete from SM3, line with BFG#1 | | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 |
| 12. delete from SM2, line with IDP | | 2 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

Copyright © 1999 Lucent Technologies 

```
13. delete BFG#1                          1   0   0   0    0   0   0   0
14. create BFG#1 which uses IDP group     2   0   0   0    1   0   0   0
15. assign on SM1, line with BFG#1        0   1   0   0    0   1   0   0
    (IDP parameter inside BFG)
15a. assign on SM1, line with BFG#1       0   2   0   0    0   1   0   0
    (IDP parameter outside BFG)
```

These usage counts reflect the number of tuples in the DB relations.
For the case of BFG on the shared DNs and IDP, ARS, ACCT, ATH, etc is defined in the BFG. The following is only an example, this will apply to all of the GPD type defined in the BFG:

If a line is assigned with a BFG and is shared to another line on the same SM, then DB_GPDUS(sm,GPDB

FG,bfgid).use_count and DB_GPDUS(sm, GPDDPLAN,idpid).use_count would not change. Because the use_count in DB_GPDUS is kept on a per SM basis regardless of the number of shared instances a line might have on that SM.

If the a line is shared to another line on another SM, then DB_GPDUS(shared-to-sm,GPDBFG,bfgid).use_count and DB_GPDUS(shared-to-sm,GPDDPLAN,idpid).use_count will only be bumped up by one for the first instance of sharing and left along with each additional sharing case on the same SM with the same lead-line. When the last instance of the sharing is removed from this shared-to-sm, the use_count for DB_GPDUS(shared-to-sm,GPDBFG,bfgid) and DB_GPDUS(shared-to-sm,GPDDPLAN, idpid) will be decremented by one. Because the BGF is not longer using the IDP GPD data on the shared-to SM.

For the group type of GPDPM, GPDPMIFAC, or GPDPMDF2 the tuples with a 'module' of zero (that is, on the AM/CMP), the 'use_count' will be zero (0). For the tuples with a 'module' of 1 to 192 (really on an SM), the 'use_count' will be the number of circuits or DSLs assigned to that group in that particular SM. Exception to the previous rules: Unlike most GPD groups, terminal groups (GPDTG) are not real 'groups'. We do not count their 'existence' on the CMP when they are not being used on an SM, like the other groups do. SPECIFIC POPULATION RULES BY GROUP TYPE:

GPDTDR - The following relations have grp_type of GPDTDR: RLtdr, RLtdr_rti
This group partition type allows relations to be distributed to all SMs equipped in the office as well as the CMP. There will always be a tuple with the module equal to 0. There will also, always be a tuple for each SM equipped in RLmodatt. The grp_id is always 0 and the use_count is always 1.

GPDISDN - The following relations have grp_type of GPDISDN:
`RLpsdnicri, RLpsri_psn, RLpsmhgdnr, RLrateperd, RLacddisp, RLagentid, RLstparm, RLsrvcdesc.`
In ISDN group partioned data, there are only 2 valid group ids. Every ISDN SM should subscribe to groups 0 and 1.

grp_id = 0 for RLpsdnicri, RLpsri_psn, RLpsmhgdnr, RLrateperd, RLacddisp.
All the tuples of these relations must reside in all the ISDN modules.
grp_id = 1 for RLagentid, RLstparm, RLsrvcdesc,
All the tuples of these relations must reside in all the ISDN SMs and in the AM and/or CMP.
The AM, CMP or both should subscribe to group 1, but not group 0. The bit map, pcr_map1-7 should be marked in RLdb_amgpd with a 1 for each ISDN SM for both groups. For group 1, a 1 should be placed in the low order bit of pcr_map1 to represent the AM's (and/or CMP's) subscription.

**Copyright © 1999 Lucent Technologies** 

When the GI_ph parameter is updated to > 0 on any ISDN SM (either an SM or an SM-2000), the following must be done:

(1) The RLDB_AMGPD tuples for grp_type = GPDISDN and grp_id = (0-1) must be updated to set the bit associated with that module in pcr_map1,.., pcr_map7 to 1. For grp_id = 1, a 1 should be placed in the low order bit of pcr_map1 to represent the AM's (and/or CMP's) subscription.

(2) Two RLDB_IMGPD tuples must be inserted on that module such that
```
RLDB_IMGPD.grp_type = GPDISDN
RLDB_IMGPD.grp_id = 0
RLDB_IMGPD.localflag = DBNO
RLDB_IMGPD.grp_type = GPDISDN
RLDB_IMGPD.grp_id = 1
RLDB_IMGPD.localflag = DBNO
```

(3) Two RLDB_GPDUS tuples must be inserted on the AM such that
```
RLDB_GPDUS.grp_type = GPDISDN
RLDB_GDPUS.grp_id = 0
RLDB_GDPUS.module = number of that module.
RLDB_GPDUS.grp_type = GPDISDN
RLDB_GDPUS.grp_id = 1
RLDB_GDPUS.module = number of that module.
```

GPDAM_SA_RED In AM - Stand Alone SM redundant data, the only valid group ID is 0. A redundant copy of each relation associated with this group partitioned data type resides in the AM and in each switching module that has the stand alone call processing option installed (that is, office parameter Glsacp = DBYES in that modules ODD). In addition, each RSM should automatically subscribe to this group type.

Therefore, the bit map, pcr_map1-7 should be marked in RLdb_amgpd with a 1 for the AM, for each RSM, and for each non-RSM with the stand alone call processing option installed (Glsacp = DBYES).

This group type does not require any tuples in the relations RLdb_imgpd & RLdb_gpdus.

GPDSA_PART In stand alone group partitioned data, the valid group IDs are the values of the SM processor IDs plus 0. Therefore, one group should exist for each SM and for group 0. The group ID range is 0-192.

Each processor should subscribe to its own group in the processor bit map, pcr_map1-7, with the exception of the AM which does not subscribe to any group (that is, the processor map for each SM should have the bit corresponding to that SMs processor number set to a 1).

RSMs should subscribe to all groups including group ID 0.

In addition, each non-RSM with the stand alone call processing option (Glsacp = DBYES) should subscribe to all groups including group 0. Therefore, group 0 should be a group of the RSMs and non-RSMs with the stand alone call processing option.

This group partition type is used to distribute DN translation data associated with

Copyright © 1999 Lucent Technologies 

ports that have no physical termination. The group ID is the value of the routing SM processor number associated with the DN being distributed.

This group type does not require any tuples in the relations RLdb_imgpd & RLdb_gpdus.

GPDISA_PART In ISDN stand alone group partitioned data, the valid group IDs are the values of the ISDN SM processor IDs plus 0. Therefore, one group should exist for each ISDN SM and for group 0. The group ID range is 0-192.

Each SM processor should subscribe to its own group in the processor bit map, pcr_map1-7 (that is, the processor map for each ISDN SM should have the bit corresponding to that SMs processor number set to a 1).

ISDN RSMs should subscribe to all groups including group ID 0. In addition, each ISDN non-RSM with the stand alone call processing option (Glsacp = DBYES) should subscribe to all groups including group 0. Therefore, group 0 should be a group of (1) all the ISDN RSMs, plus (2) all the ISDN non-RSMs with the stand alone call processing option.

This group partition type is used to distribute ISDN packet DN translation data associated with ports that have no physical termination. The group ID is the value of the packet routing SM processor number associated with the packet DN being distributed.

This group type does not require any tuples in the relations RLdb_imgpd & RLdb_gpdus.

GPDLAST Usage Rule: This enumeration is only used as a check to determine if the group type sent to a DB function is within a valid range. The enumeration is never used to populate any relation.

GPDMDR Message Detail Recording groups may be assigned to both circuit and packet switched ISDN users. The group may have both circuit and packet types active or only one of the types active. If the group is defined in RLmdr_gp with the attribute pkt_mdr set to DBYES and all of the circuit MDR attributes (orig_priv, in_priv and public) are DBNO then this is a Packet only MDR group. When Packet only groups are assigned to packet services there will not be a tuple in RLmdr_port or in RLrt_sfg. There will be at least one RLpsx25ln tuple populated with the attribute pmdr_grp equal to this group. When MDR groups with both circuit and packet options active are assigned to circuit users and packet services the group will be populated in RLmdr_port and/or RLrt_sfg, and the RLpsx25ln.pmdr_grp attribute. The use counts for GPDMDR will reflect the sum of the tuples in RLmdr_port, RLrt_sfg and the tuples in RLpsx25ln where pmdr_grp is populated. RLmdr_port, or RLrt_sfg are only populated for circuit MDR ports.

Packet MDR groups assigned to different DSL packet services may be the same group or different for each packet service. The MDR activation status of each packet service may be either on or off independent of the other DSL packet services MDR activation.

GPDVCDX This group partition type allows relations to be distributed to VCDX SM's. There will always be a tuple with the module equal to 0. In VCDX offices, there will also be a tuple with the module equal to the VCDX SM. The grp_id is always 0 and the use_count is always 1.

Copyright © 1999 Lucent Technologies 

GPD_QLPS For this group partition type, the use count value must equal the number of MH pipes assigned to this SM-2000. Whenever an MH pipe is added to this SM-2000, the value of use count must be incremented. Similarly, whenever an MH pipe is deleted from this SM-2000, the value of use count must be decremented.

## 4. Population Rules for RLdb_imgpd

**Relation Description** IM Group Partitioned Data.
The purpose of this relation is to indicate if a particular group's data is local or global.

**Attribute: grp_type**

**Fullname:** group type.

**Attribute Description** Type of group partitioned data (GPD) group, valid values are defined in Mgpd_gps.

**Attribute: grp_id**

**Fullname:** group id.

**Attribute Description** Id used to identify the specific group within each group type. Valid values 1 - 65535. In addition, for grp_type=GPDCL_COM, GPDAMCL_COM, GPDAM_SM_PART, GPDSM_PART, and GPD_DA, grp_id=0 is valid. For grp_type=GPD_OSPS, the only valid values are 1, 2 and 3. For grp_type=GPD_OPRT, the only valid values are 1, 2 and 3.

For grp_type=GPDISDN, the valid values for grp_id are 0, 1.

For grp_type=GPD_SPACB, the valid values for grp_id is the same as the domain defined by the DMGRPNUM domain (uhdr/db/DMgrpnum.G).

Copyright © 1999 Lucent Technologies 

For grp_type=GPD_SPABS, the valid values for grp_id include all valid NPA values.

For grp_type=GPD_SPAENXX, the only valid grp_id is 1.

For grp_type=GPDATTMSK, the valid values for grp_id is the same as the domain defined by the DMGRPNUM domain (uhdr/db/DMgrpnum.G).

For grp_type=GPDTGMSK, the valid values for grp_id are 1 thru AVTRKGRPS(). The domain is defined by the DMGRPNUM domain (uhdr/db/DMgrpnum.G).

A RLDB_AMGPD tuple must always be populated such that all the bits on pcr_map1, pcr_map2,..., pcr_map7 are set to zero.

When the Gl_ph parameter is updated to > 0 on any loaded SM, the following must be done:

(1) The RLDB_AMGPD tuples for grp_type = GPDISDN and grp_id = (0-1) must be updated to set the bit associated with that module in pcr_map1,.., pcr_map7 to 1. For grp_id = 1, a 1 should be placed in the low order bit of pcr_map1 to represent the AM's (and/or CMP's) subscription.

(2) Two RLDB_IMGPD tuples must be inserted on that module such that

```
RLDB_IMGPD.grp_type = GPDISDN
RLDB_IMGPD.grp_id = 0
RLDB_IMGPD.localflag = DBNO
RLDB_IMGPD.grp_type = GPDISDN
RLDB_IMGPD.grp_id = 1
RLDB_IMGPD.localflag = DBNO
```

(3) Two RLDB_GPDUS tuples must be inserted on the AM such that

```
RLDB_GPDUS.grp_type = GPDISDN
RLDB_GDPUS.grp_id = 0
RLDB_GDPUS.module = number of that module.
RLDB_GPDUS.grp_type = GPDISDN
RLDB_GDPUS.grp_id = 1
RLDB_GDPUS.module = number of that module.
```

```
For grp_type = GPDEDSL, valid values are 0-AVTRKGRPS().
For grp_type = GPDICR, valid values are 1-AVSFGRPS().
For grp_type = GPD_DA, valid values are 0-999,65000.
For grp_type = GPD_ACSR, valid values are 1-1023.
```

For grp_type = GPDPM, GPDPMIFAC, or GPDPMDF2 valid values are from 0 to Glpmmax.

The following describes the tuple distribution for facility performance monitoring (PM) for the following relations: RLdb_amgpd, RLdb_imgpd, RLdb_gpdus, RLfacthrsh, RLpmfacgrp, and RLpmgrpfac.

For any facility PM group, there will be a single tuple in RLdb_amgpd (on the AM/CMP). Every PM group will also be represented by a tuple in RLfacthrsh on the AM/CMP, even if the PM group has no associated facilities. If the PM group has no associated facilities, all processor bits in RLdb_amgpd will be 0 except for the bit representing the AM/CMP. When a facility is added to a PM group, RLdb_amgpd must be checked for the appropriate processor bit being set. If the bit is not set, an RLdb_gpdus tuple must be created (on the AM/CMP) to represent this PM group and this SM (with use_count = 1), an RLdb_imgpd tuple must be created in this SM for this PM group, and the RLfacthrsh tuple for this PM group must be copied to the SM. Once these distribution

Copyright © 1999 Lucent Technologies 

tuples are created, tuples are created in RLpmgrpfac (on the AM/CMP) and RLpmfacgrp (on the SM) to associate the facility with a particular PM group.

If the bit corresponding to this SM is already set in RLdb_amgpd, the PM group is already referenced in the SM. In this case, the use_count in the RLdb_gpdus tuple is incremented, and the RLpmgrpfac and RLpmfacgrp tuples are created.

When a facility is removed from a PM group, the RLpmgrpfac and RLpmfacgrp tuples are deleted. The use_count in the RLdb_gpdus tuple is decremented, and if the use_count becomes 0, the RLdb_gpdus and RLdb_imgpd tuples are deleted, and the appropriate processor bit in the RLdb_amgpd tuple for this PM group is cleared. The RLfacthrsh tuple on the SM is also deleted when the use_count becomes 0.

DSL performance monitoring works identically to facility performance monitoring, except that the relations RLpmthresh, RLpmgrpdsl, and RLpmdslgrp replace RLfacthrsh, RLpmgrpfac, and RLpmfacgrp, respectively.

DFI-2 performance monitoring works identically to facilty performance monitoring, except that the RLdf2thrsh relation replaces RLfacthrsh.

For grp_type = GPDPBX_ID, valid values are 1 - 4095.

**Attribute: localflag Fullname:** local flag.

**Attribute Description** Identifies if this group data is local to the processor. DBYES - local: DBNO - global.
If a tuple with the same key exists on another processor, then localflag should be DBNO (on all processors) for this tuple.
See bit map in RLdb_amgpd. If localflag = DBYES, then only 1 bit associated with that module should be set in pcr_map1-7.

```
For grp_type = GPDISDN, localflag is always DBNO.
For grp_type = GPDMLHG_CF, local flag is always DBNO.
For grp_type = GPDPM, 'localflag' is always DBNO.
For grp_type = GPDPMIFAC, 'localflag' is always DBNO.
For grp_type = GPDPMDF2, 'localflag' is always DBNO.
FOR grp_type = GPD_QLPS, 'localflag' is always DBNO.
```

## 4. Population rules for RLdchnpri

### Relation Description

```
        D-channel to PRI

        This relation defines the PRI D-channels associated
        with a PRI group, which provide the signaling.
```

Copyright © 1999 Lucent Technologies

The relation also indicates whether the D-channel has a mate. If the D-channel has a mate, it means that the PRI group is provisioned with DCBU (D-Channel Backup) and one of the 2 D-channels must be marked as TMPRIMARY and the other as TMSECONDARY.

**Attribute:**
dport
**Fullname:**
D-channel global port
**Attribute Description:**
This is a global port of a PRI D-channel.

**Attribute:**
prigrp
**Fullname:**
PRI Group
**Attribute Description:**
This specifies the PRI group for which the D-channel provides signaling.

**Attribute:**
dchndesg
**Fullname:**
D-channel designation
**Attribute Description:**
This specifies the PRIMARY or SECONDARY designation of this D-channel. If the PRI Group has just 1 D-channel provisioned, then the value of this attribute may be either TMPRIMARY or TMSECONDARY. The attribute is meaningless when there is only 1 D-channel, so either value may be populated. When there are 2 D-channels provisioned, however, it means the PRI group has DCBU (D-Channel Backup) and this attribute must be TMPRIMARY for one of the D-channels in the PRI group and TMSECONDARY for the other.

**Attribute:**
interf_id
**Fullname:**
Interface ID
**Attribute Description:**
This specifies the interface ID of the facility where the D-channel resides.

**Attribute:**
mate_dport
**Fullname:**
Global port of mate D-channel
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This specifies the global port of the second D-channel when there are 2 D-channels provisioned for a PRI group (that is, the PRI group has D-Channel Backup).

## 4. Population Rules for RLdcpsss

**Relation Description** RLdcpsss

RLdcpsss is for the DIOR country pair screening special screening data for the CPS-R2 feature.

**Attribute: termcc**

**Fullname:** Terminating Country Code.

**Attribute Description** DIOR Terminating Country Code.

**Attribute: origcc**

**Fullname:** Originating Country Code.

**Attribute Description** DIOR Originating Country Code.

**Attribute: carrier**

**Fullname:** Originating Carrier.

Copyright © 1999 Lucent Technologies

**Attribute Description** DIOR Originating Carrier.

```
/* RULE about RLdcpsss.carrier */
for dcpsss in RLdcpsss
where (dcpsss.origcc == "ALL")
begin
      /*
      * When origcc == ALL, carrier must also be all carriers,
      * since cannot single out a specific carrier for all
      * originating countries.
      */
      dcpsss.carrier == 10;
end
```

**Attribute: screencard**

**Fullname:** Screen for AT&T card.

**Attribute Description** Always screen calls from/to this pair to require an AT&T card.

**Attribute: operator**

**Fullname:** Bailout to operator.

**Attribute Description** Always route calls from/to this pair to an operator.

**Attribute: oaff1**

**Fullname:** boolean spare spare.

**Attribute Description** Unused.

**Attribute: oaff2**

**Fullname:** boolean spare spare.

**Attribute Description** Unused.

**Attribute: oaff3**

**Fullname:** character spare.

**Attribute Description** Unused.

## 4. Population rules for RLddomrest

### Relation Description

OSPS DIOR Credit Card Restrictions for Domestic Terminations

RLddomrest is being used in for the OSPS DIOR Calling Card Restrictions to Domestic Terminations feature (98-5E-4925). This relation will support the OSPS DIOR Domestic Restrictions view (27.80), which provides the capability to define calling card restrictions on DIOR calls to domestic numbers. The relation will be used to specify those originating country, originating local access carrier, and domestic terminating NPA combinations for which card billing is restricted to an AT&T card.

The valid values for each of the key attributes is as follows:

Copyright © 1999 Lucent Technologies

```
origcc (originating country code) : 200 - 999
carrier (originating local access carrier) : 0 - 10
termnpa (terminating NPA) : 1 - 1000
```

The carrier and termnpa attributes may be set to 10 and 1000, respectively, to indicate that the entry globally applies to all originating local access carriers and/or terminating NPAs. When there are combinations of specific and global entries for a particular originating country code, precedence is applied by call processing in the following manner:

1. Originating country code with specific originating local access carrier and specific terminating NPA.
2. Originating country code with global (10) originating local access carrier and specific terminating NPA.
3. Originating country code with specific originating local access carrier and global (1000) terminating NPA.
4. Originating country code with global (10) originating local access carrier and global (1000) terminating NPA.
5. The absence of an entry in this relation for an originating country code is interpreted as being unrestricted (that is, card billing is not restricted to an AT&T card).

**Attribute:**
origcc
**Fullname:**
Originating DIOR country code
**Attribute Description:**
This attribute defines the originating DIOR country code. In Recent Change, the user may enter a country code in the range of 200 - 999. For 1- or 2-digit country codes, the user must pad the country code with zeros on the right. For example, the user should enter 600 for country code 6, 430 for country code 43, or 721 for country code 721.

**Attribute:**
carrier
**Fullname:**
Originating local access carrier
**Attribute Description:**
This attribute defines the originating local access carrier. In Recent Change, the user may enter a carrier number in the range of 0 - 9 or may leave the field blank. Recent Change mapping code will map a blank entry to the value 10 for storage in the database.

**Attribute:**
termnpa

**Copyright © 1999 Lucent Technologies** 

**Fullname:**

Terminating numbering plan area (NPA) code

**Attribute Description:**

This attribute defines the terminating numbering plan area (NPA) code. In Recent Change, the user may enter an NPA in the range of 1 - 999 or may leave the field blank. Recent Change mapping code will map a blank entry to the value 1000 for storage in the database.

**Attribute:**

restrictcard

**Fullname:**

Restrict card billing to an AT&T card?

**Attribute Description:**

This attribute defines whether card billing is restricted to an AT&T card for the associated originating country, originating local access carrier, and terminating NPA combination.

Copyright © 1999 Lucent Technologies

# DEHNP

## 1. Description

Relation containing the DIOR toll free 800 information to determine permissions or restrictions based upon the originating country code.

This relation is to have a distribution of fixed partition (FP), by officecode based on RLdehocsm.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 50000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |

## 4. Population Rules for RLdehnp

**Relation Description** RLdehnp

RLdehnp is for the DIOR Toll Free 800 data for the DIOR 800 feature.

**Attribute: inwnpa**

**Fullname:** INWATTS NPA.

**Attribute Description** NPA of the INWATTS/toll free number utilizing this feature.

**Attribute: officecode**

**Fullname:** Office Code.

**Attribute Description** Office Code of the INWATTS/toll free number utilizing this feature.

**Attribute: oaff1**

**Fullname:** 6-bit spare.

**Attribute Description** Unused.

**Attribute: linenumber**

**Fullname:** Line Number.

**Attribute Description** Line number of the INWATTS/toll free number utilizing this feature.

**Attribute: oaff2**

**Fullname:** tri-state boolean spare.

**Attribute Description** Unused.

**Attribute: range**

**Fullname:** range

**Attribute Description** Third key to allow multiple tuples for the same inwnpa, office code and line number.

Copyright © 1999 Lucent Technologies 

**Attribute: entries**

**Fullname:** Number of entries.

**Attribute Description** Number of entries in the caclists of all tuples having the same inwnpa, office code and line number.

```
/* RULE about RLdehnp.entries */
for dehnp in RLdehnp
where (dehnp.range != 0)
begin
        dehnp.entries == 0;
end
```

**Attribute: alltrmt**

**Fullname:** All treatment.

**Attribute Description** Default treatment to be given to a call made to this INWATTS number from a country access code that is not in the following caclst.

```
/* RULE about RLdehnp.alltrmt */
for dehnp in RLdehnp
begin
     if (dehnp.range == 0) then
     begin
        dehnp.alltrmt != EH_NULL;
        if (dehnp.entries == 0) then
               dehnp.alltrmt != EH_CALLER;
     end
     else
        dehnp.alltrmt == EH_NULL;
end
```

**Attribute: oaff3**

**Fullname:** 3 bit spare.

**Attribute Description** Unused.

**Attribute: oaff4**

**Fullname:** unsigned short spare.

**Attribute Description** Unused.

**Attribute: caclst[*]**

**Fullname:** Country Access Code list

**Attribute Description** List of country access codes and their treatments.

**Attribute: caclst[*].cac**

**Fullname:** Country access code.

**Attribute Description** Country access code having treatment different than alltrmt.

**Attribute: caclst[*].is809nxx**

**Fullname:** Is 809 NXX.

Copyright © 1999 Lucent Technologies 

**Attribute Description** Is the country access code an 809 NXX.

**Attribute: caclst[*].trmt**
**Fullname:** Treatment.

**Attribute Description** Treatment to be given to the corresponding country access code.

**Attribute: caclst[*].oaff1**
**Fullname:** spare 1

**Attribute Description** Tri-state boolean spare.

**Attribute: caclst[*].oaff2**
**Fullname:** spare 2

**Attribute Description** Unsigned 8 bit spare.

**Attribute: caclst[*].oaff3**
**Fullname:** spare 3

**Attribute Description** Unsigned 4 bit spare.

**Attribute: caclst[*].oaff4**
**Fullname:** spare 4

**Attribute Description** Tri-state boolean spare.

**Attribute: caclst[*].oaff5**
**Fullname:** spare 5

**Attribute Description** Tri-state boolean spare.

## 4. Population Rules for RLdehocsm

**Relation Description**

RLdehocsm

RLdehocsm is for mapping INWATTS number office code data to an SM for various DIOR features built around INWATTS numbers.

**Attribute: inwnpa**

**Fullname:** INWATTS NPA.

**Attribute Description** NPA of the INWATTS/toll free number utilizing this feature.

**Attribute: officecode**

**Fullname:** Office Code.

**Attribute Description** Office Code of an INWATTS number being used by a DIOR feature.

**Attribute: feature**

**Fullname:** DIOR feature.

**Attribute Description** DIOR feature requiring data about INWATTS numbers.

Copyright © 1999 Lucent Technologies

**Attribute: oaff1**

**Fullname:** 3-bit spare.

**Attribute Description** Unused.

**Attribute: sm**

**Fullname:** Switching Module.

**Attribute Description** Switching Module on which to store the INWATTS number data for this office code and DIOR feature.

**Attribute: oaff2**

**Fullname:** 8 bit spare.

**Attribute Description** Unused.

## 4. Population Rules for RLdf2thrsh

**Relation Description** Line and path performance monitoring thresholds for DFI-2 facilities.

This relation contains the line and path performance monitoring alert thresholds that are associated with DFI-2 facilities. Tuples are created, modified, or deleted when DFI-2 facility PM groups are modified via recent change or ODA.

A performance monitoring group defines the thresholds and inhibits that will be set for one or more facility on a DFI-2.

A line is a physical connection that may carry a portion or all of one or more paths. A path is a connection between two points, independent of the physical means of transporting the signal.

The following PM parameter thresholds are contained in this relation:

```
Bipolar Violation
Bursty Errored Second
Change of Frame Alignment
Cyclic Redundancy Code
Errored Second
Failed Second
Severely Errored Second
Slip Second
```

One tuple on the AM/CMP for each performance monitoring group (PMGRP). This tuple resides only in the logical processor until it is associated with an DFI-2 facility.

A PMGRP can be inserted at any time and must exist before being referenced by RLpmfacgrp or RLpmgrpfac.

This relation will always be populated with at least two tuples in the AM/CMP. These PMGRPs are named /DF2GDEF and DF2DEF.

The tuple corresponding to PMGRP /DF2GDEF is the generic office default tuple. This tuple can be verified but not changed and never has any DS1s assigned to it. The default attribute values for /DF2GDEF are as follows:

Copyright © 1999 Lucent Technologies 

```
inh15   DBNO
inh24   DBNO
bpv24   65535
bes24   600
cofa24  511
crc24   65535
es24    1706
fs24    90
ses24   90
slip24  255
bpv15   4095
bes15   100
cofa15  17
crc15   4095
es15    75
fs15    30
ses15   30
slip15  4
```

Although the /DF2GDEF tuple is not recent changeable (to protect generic defaults), the ability to change the defaults on an office basis is still required. Therefore, there is another tuple called DF2DEF that is initially populated with the values from /DF2GDEF. DF2DEF is recent changeable and changeable by ODA, but its name cannot be changed. When a DFI-2 FAC is configured, a PMGRP is required. If a PMGRP is not specified, the group will default to DF2DEF.

The /DF2GDEF tuple is populated only in the AM/CMP.

Other PMGRPs can be defined at any time. Each PMGRP may have from none up to all of the DFI-2 FACs in the office assigned to it. One tuple is populated in the logical processor for each PMGRP. A tuple is copied from the logical processor into a given SM when a DS1 in that SM is assigned to the tuple's PMGRP (in RLpmgrpfac and RLpmfacgrp).

An RLpmdf2thrsh tuple cannot be deleted on an SM until the group is no longer referenced on the SM in RLpmfacgrp. A RLpmdf2thrsh tuple cannot be deleted on the AM/CMP until the group is no longer referenced on any SM.

DS1s which currently use this relation are DFI-2 facilities. Others may be added in the future.

Default values for RLpmdf2thrsh tuple attributes are the values of those attribu

tes in the DF2DEF tuple. This can not be specified in PRL and therefore is not shown in the 'default' field associated with each of the following attribute.

**Attribute: pmgrp**

**Fullname:** Performance Monitoring Group

**Attribute Description** This is the performance monitoring group ID.

**Attribute: bes24**

**Fullname:** Bursty Errored Seconds Daily Alerting Threshold

**Attribute Description** This is the daily alerting threshold for bursty errored seconds.

**Attribute: bpv24**

**Fullname:** Bipolar Violation Daily Alerting Threshold

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This is the daily alerting threshold for bipolar violation events.

**Attribute: cofa24**

**Fullname:** Change of Frame Alignment Daily Alerting Threshold

**Attribute Description** This is the daily alerting threshold for change of frame alignment.

**Attribute: crc24**

**Fullname:** Cyclic Redundancy Code Daily Alerting Threshold

**Attribute Description** This is the daily alerting threshold for cyclic redundancy code.

**Attribute: es24**

**Fullname:** Errored Seconds Daily Alerting Threshold

**Attribute Description** This is the Daily alerting threshold for errored seconds.

**Attribute: fs24**

**Fullname:** Failed Seconds Daily Alerting Threshold

**Attribute Description** This is the daily alerting threshold for failed seconds.

**Attribute: ses24**

**Fullname:** Severly Errored Seconds Daily Alerting Threshold

**Attribute Description** This is the daily alerting threshold for severely errored seconds.

**Attribute: slip24**

**Fullname:** Slip Seconds Daily Alerting Threshold

**Attribute Description** This is the daily alerting threshold for slip seconds.

**Attribute: bes15**

**Fullname:** Bursty Errored Seconds 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for bursty errored seconds.

**Attribute: bpv15**

**Fullname:** Bipolar Violation 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for bipolar violation events.

**Attribute: cofa15**

**Fullname:** Change of Frame Alignment 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for change of frame alignment.

**Attribute: crc15**

**Fullname:** Cyclic Redundancy Code 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for cyclic redundancy code.

**Attribute: es15**

**Fullname:** Errored Seconds 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for errored seconds.

**Fullname:** Severly Errored Seconds 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for severely errored seconds.

**Attribute: slip15**

**Fullname:** Slip Seconds 15-Minute Alerting Threshold

**Attribute Description** This is the 15-minute alerting threshold for slip seconds.

**Attribute: inh24**

**Fullname:** Condition of Daily Alerts

**Attribute Description** This is the condition (inhibited or allowed) of daily alerts. DBYES indicates that daily alerts are inhibited. DBNO indicates that daily alerts are allowed.

**Attribute: inh15**

**Fullname:** Condition of 15 Minute Alerts

**Attribute Description** This is the condition (inhibited or allowed) of 15 minute alerts. DBYES indicated that 15 minute alerts are inhibited. DBNO indicates that 15 minute alerts are allowed.

### Relation Description

```
        Digital Facility Interface

        This relation maps the 5ESS(R)-2000 switch facility circuit name to
        an Autoplex(R) FACility (AFAC) number.  There is a unique AFAC number
        assigned to each facility used to carry AMPS traffic.

        This relation will map both DFI and DNU_S facilities.
```

**Attribute:**

```
        facname
```

**Fullname:**

```
        DFI1, DFI2, or DS1 Facility Name.
```

**Attribute Description:**

```
        Indicates the circuit name of the facility.
```

**Attribute:**

Copyright © 1999 Lucent Technologies

afac_id

**Fullname:**

AMPS Facility Identifier.

**Attribute Description:**

Unique AMPS facility identification number.

# DFTST

## 1. Description

This relation associates the external Main Distribution Frame (MDF) Test Trunk Circuit (TTC) with the internal switch dedicated connections : the specific Metallic Service Unit (MSU) Distributing Frame Test Access Circuit (DFTAC), the TN1040, and the global port name of the dedicated line wired to the DFTAC dedicated line appearance. In addition, the MSU, service group, and shelf number of the DFTAC circuit is contained here. For operational routing to this DFTAC circuit the global portname of the DFTAC logical port name is provided.

The external MDF TTC is identified via a MDF TTC frame number and a MDF TTC trunk number corresponding to the MDF TTC circuit pack in the MDF frame.

## 4. Population Rules for RLdftst

**Relation Description** Distribution Frame Test
This relation associates the external Main Distribution Frame (MDF) Test Trunk Circuit (TTC) with the internal switch dedicated connections:

- the specific Metallic Service Unit (MSU) Distributing Frame Test Access Circuit (DFTAC), the TN1040, and
- the global port name of the dedicated line wired to the DFTAC dedicated line appearance.

In addition, the MSU, service group, and shelf number of the DFTAC circuit is contained here. For operational routing to this DFTAC circuit the global portname of the DFTAC logical port name is provided.
The external MDF TTC is identified via a MDF TTC frame number and a MDF TTC trunk number corresponding to the MDF TTC circuit pack in the MDF frame.

```
KEY FORMAT: LOGICAL TEST PORT NAME

15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0
```

Logical port member 0-255.

**Attribute: mdf_frame**

**Fullname:** MDF TTC Frame Number Identifier

**Attribute Description** MDF TTC frame number identifier. This value can range from 1 to 255. A host office will only have one MDF TTC frame. There will be only one MDF TTC frame number at each RSM site, even considering cluster RSMs. There is no standard convention to name these MDF TTC frames. The mdf_frame number must be identical to the trunk group number of a trunk group of logical test ports with service class TMDFTACLTP. That trunk group connects the DFTAC (TN1040) to the MDF TTC. This is the MDF trunk number with which MLT-2 gains access to an MDF frame.

**Attribute: mdfttc_number**

**Fullname:** MDF TTC Trunk Number Identifier

**Attribute Description** MDF TTC trunk number identifier. This value can range from 1 to 999 or from 0 to 999. The mdfttc_number is the trunk group member number in this trunk group that connects the DFTAC to that MDF TTC.

**Attribute: dftac_id**

**Fullname:** DFTAC Circuit ID

**Attribute Description** This attribute is divided into sub-attribute dftac_id.circuit and

**Copyright © 1999 Lucent Technologies** 

dftac_id.module. Circuit the circuit name of the physical DFTAC circuit as should be assigned in relation RLcktdata.

```
circuit - 2 byte hex field
high order byte = PICB + 1
low order byte =
slot number in MMSU in hex (00-1f)
```

Module refers to the Interface Module in which this DFTAC circuit is located. Possibilities range from 1 to 192. The dftac_id must be unique for a given mdf_frame/mdfttc_number.

**Attribute: dftac_id.circuit**

**Fullname:** Circuit

**Attribute Description** Circuit name of DFTAC circuit in RLcktdata.

**Attribute: dftac_id.module**

**Fullname:** Module

**Attribute Description** Module to which the DFTAC circuit is connected.

**Attribute: dftac_ltp**

**Fullname:** Logical Test Port for DFTAC

**Attribute Description** This attribute is divided into sub-attribute dftac_ltp.member and dftac_ltp.module. Member is the port name of the logical test port that should be assigned as in relation RLfc_porttyp with servclass TMDFTACLTP and lp_type of PCDFTSTPORT. Module refers to the Interface Module in which this logical test port is located. Possibilities range from 1 to 192. This logical test port must be defined in the IM where the physical DFTAC circuit is located. See logical test port name here. The dftac_ltp must be unique for a given mdf_frame/mdfttc_number.

**Attribute: dftac_ltp.member**

**Fullname:** Member

**Attribute Description** Port name of the LTP used by the DFTAC circuit.

**Attribute: dftac_ltp.module**

**Fullname:** Module

**Attribute Description** The module on which the DFTAC LTP resides.

**Attribute: dedicated_line**

**Fullname:** gport for the dedicated line

**Attribute Description** This attribute is divided into sub-attribute dedicated_line.member and dedicated_line.module. Member is the port name of a line that should be assigned as in relation RLfc_line. Module refers to the Interface Module in which this line is located. The possibilities range from 1 to 192. See line unit port name here. The dedicated_line must be unique for a given mdf_frame/mdfttc_number.

**Attribute: dedicated_line.member**

**Fullname:** Member

**Attribute Description** Port of the dedicated line used by the DFTAC circuit.

**Attribute: dedicated_line.module**

**Fullname:** Module

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Module on which the port of the dedicated line resides.

**Attribute: msu**

**Fullname:** Metallic Service Unit Number

**Attribute Description** The metallic service unit number iused by the DFTAC.

**Attribute: sg**

**Fullname:** MSU Service Group Number

**Attribute Description** Is the MSU service group number used by the DFTAC.

**Attribute: shelf**

**Fullname:** MSU Service Group Shelf Number

**Attribute Description** The MSU service group shelf number.

## 4. Population Rules for RLdgrp_ri

**Relation Description** Remote integrated services line unit (RISLU)/Remote Access Interface unit (RAIU) D-channel piggy-back group
This relation contains information on the RISLU/RAIU D-channel piggy-back groups on a per packet switch unit (PSU) shelf basis. There are 32 piggy-back groups which are associated with the 32 PIDB time slots. There can be one to four PIDB pairs per PSU shelf. There is no direct relationship between the piggy-back groups and the PIDB time-slots (that is, the piggy-back groups are logical time-slots).

**Attribute: psushlf**

**Fullname:** PSU shelf circuit of type PCSHLFPSIU.

**Attribute Description** Populate with the circuit name of the PSU shelf associated with PSUCOM side0.

**Attribute: log_pidb**

**Fullname:** Logical PIDB number on a PSU shelf.

**Attribute Description** This is just a logical PIDB number ranging 0-3, on a PSU shelf.

**Attribute: pgbkgp[*]**

**Fullname:** Piggy-back groups 0-31

**Attribute Description** Structure containing information on the piggy-back group.

**Attribute: pgbkgp[*].dport[*]**

**Fullname:** RISLU/RAIU D-channel ports zero through three

**Attribute Description** The port names of the RISLU/RAIU D-channels occupying quarter positions zero through three in piggy-back groups 0 through 31.

**Attribute: pgbkgp[*].dsl_group**

**Fullname:** Digital subscriber line (DSL) group

**Attribute Description** The DSL group of the ports assigned to piggy-back group 0 through 31.

**Attribute: whlgpmask**

**Fullname:** Whole piggy-back group mask

Copyright © 1999 Lucent Technologies 

**Attribute Description** A bit mask giving status on whether the piggy-back group is used (1) or empty (0). Bit position 0 (rightmost) gives status on piggy-back group 0, bit position 1 gives status on piggy-back group 1, ..., bit position 31 gives status on piggy-back group 31.

**Attribute: partgpmask**

**Fullname:** Partial piggy-back group mask

**Attribute Description** A bit mask giving status on whether the piggy-back group has room (1) or is full (0). Bit position 0 (rightmost) gives status on piggy-back group 0, bit position 1 gives status on piggy-back group1, ..., bit position 31 gives status on piggy-back group 31.

**Defines:** "db/DMportindx.h"

## 4. Population rules for RLdi_comp

### Relation Description

```
        Destination index from digit analysis.

        This relation maps the destination index from digit analysis
        and the carrier id from either relation RLfc_carr or RLfc_fgbcarr
        into a new destination index (DI) and route index (RI)
        reflecting carrier information.

        This relation is used for both Feature Group B and
```

Copyright © 1999 Lucent Technologies

Feature Group D carriers. The carrier type is specified in the new attribute 'featgrp'.

The attribute 'carrid' in this relation, references DMcic4, which is used for both FGB and FGD carriers.

The 'carrid' entered must exist in either the RLfc_carr or RLfc_fgbcarr relation. These two relations contain all the valid carrier identifiers.

The RLfc_carr.carr_tp must NOT be TYPE_PSEUDO when SFID 188 IXE Tandem Calls via 2 Local Access Tandems has not been purchased.

**Attribute:**
dest_x
**Fullname:**
destination index
**Attribute Description:**

1. Consists of the 0ZZ/1NX destination indices. These indices are the destination indices assigned in Rldaprmfnl, RLda_conflct, and RLdaprlfnl when the attribute, 'type_ci_call', assumes the values: FCAVT or FCINC.
2. When the attribute dig_route in RLfc_carr is DBYES, any destination index assigned in RLdaprmfnl, RLdaprlfnl or RLda_conflct when the attribute 'type_ci_call' specifies a call that the IC accepts must be assigned for that carrid in RLdi_comp. Destination indices assigned when 'type_ci_call' is FCNONCI, FCCI_NULL or FCEM_REROUTE should not be assigned in RLdi_comp.

**Attribute:**
carrid
**Fullname:**
Feature Group carrier id
**Attribute Description:**
The carrier identification is a 4 digit character string, where each of the characters can be '0' thru '9'.

NOTE : If for example, carrier = 0288, only 288 needs to be entered.

The carrier identifier must be previously defined in the RLfc_carr relation if this is a Feature Group D carrier, or in RLfc_fgbcarr relation if this is a Feature Group B carrier.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
featgrp
**Fullname:**
Feature Group Carrier Type
**Attribute Description:**
Identifies carrier id as Feature Group B (FGB) or Feature Group D (FGD). Set the attribute to FGB_CARR if this is a FGB carrier. Set the attribute to FGD_CARR if this is a FGD carrier.

**Attribute:**
cdest_x
**Fullname:**
carrier destination index
**Attribute Description:**
carrier destination index.

**Attribute:**
croute_x
**Fullname:**
carrier route index
**Attribute Description:**
carrier route index.

**Attribute:**
ffcf1
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**
ffcf2
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

**Attribute:**
ffcf3
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
See fullname description

## 4. Population rules for RLdiorccc

### Relation Description

DIOR with Commercial Credit Card (CCC) Capability

RLdiorccc defines DIOR calls eligible for Commercial Credit Card (CCC) billing.

**Attribute:**
orig_cc
**Fullname:**
Originating DIOR country number
**Attribute Description:**
The originating DIOR country number.

**Attribute:**
carrier
**Fullname:**
Originating local access carrier
**Attribute Description:**
The originating local access carrier.

**Attribute:**
termpt_type
**Fullname:**
Terminating point type
**Attribute Description:**
The terminating point type, international or domestic.

**Attribute:**
termpt_code
**Fullname:**
The terminating point code
**Attribute Description:**
The terminating point code.
Terminating point code is one of the following:
- Country code,
- International NPA/NXX,
- Domestic NPA,
- All international terminations, or
- All domestic NPAs.

**Attribute:**
hdr_id

Copyright © 1999 Lucent Technologies 

**Fullname:**
Announcement header ID
**Attribute Description:**
The OSPS announcement header ID.

**Attribute:**
elig
**Fullname:**
CCC eligible
**Attribute Description:**
The DIOR calls eligible for CCC billing.

**Attribute:**
ospsff1
**Fullname:**
Spare1
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff2
**Fullname:**
Spare2
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff3
**Fullname:**
Spare3
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff4
**Fullname:**
Spare4
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff5
**Fullname:**
Spare5
**Attribute Description:**
Spare field for fast feature development.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ospsff6
**Fullname:**
Spare6
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff7
**Fullname:**
Spare7
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff8
**Fullname:**
Spare8
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff9
**Fullname:**
Spare9
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff10
**Fullname:**
Spare10
**Attribute Description:**
Spare field for fast feature development.

**Attribute:**
ospsff11
**Fullname:**
Spare11
**Attribute Description:**
Spare field for fast feature development.

# DIORCPS

## 1. Description

Relation containing the DIOR country pair screening (DIORCPS) information to determine permissions or restrictions based upon the originating country code and associated carrier.

This relation is to have a distribution of FG (fixed group), with a grp_type of GPD_OSPS, and a grp_id of 3.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLdiorcps

**Relation Description** DIOR Country Pair Screening.

Relation containing the DIOR country pair screening (DIORCPS) information to determine permissions or restrictions based upon the originating country code and associated carrier.

**Attribute: ctrycode**

**Fullname:** Country Code.

**Attribute Description** Identifies the country code of an originating DIOR carrier, or the terminating country code of a DIOR country to country call. Whether the country code is an originating or terminating country code will depend on the value in the field carrier.

**Attribute: carrier**

**Fullname:** Carrier.

**Attribute Description** Carrier associated with originating country code, which identifies the carrier from which the DIOR call originates. The originating carrier is a one-digit code in the range from 0 to 9. A terminating country code has no associated carrier. A value of 10 indicates that the country code identified in the ctrycode field is a terminating country code.

**Attribute: oaff1**

**Fullname:** OA fast feature spare 1

**Attribute Description** Spare.

**Attribute: tupnum**

**Fullname:** tuple number

**Attribute Description** Used to distinguish multiple tuples for the same country code and carrier pair.

**Attribute: entries**

**Fullname:** number of entries.

Copyright © 1999 Lucent Technologies 

**Attribute Description** number of entries in the namexx arrays (all tuples with ctrycode and carrier as the primary key)

**Attribute: comptype**

**Fullname:** completion type

**Attribute Description** Specifies the completion type, permitted or restricted, for this country code and carrier pair.

**Attribute: oaff2**

**Fullname:** OA fast feature spare 2

**Attribute Description** Spare.

**Attribute: name[*]**

**Fullname:** name

**Attribute Description** Array of permitted or restricted country codes and/or country names.

**Attribute: name[*].ccode**

**Fullname:** country code

**Attribute Description** Identifies the country code or country name associated with the originating country code and carrier.

**Attribute: name[*].spare**

**Fullname:** spare

**Attribute Description** Spare value used to align the data on word boundary. For terminating tuples (carrier == 10), bits 0-3 of this attribute are used to store the carrier corresponding to the country code in the ccode attribute.

# DIORSD

## 1. Description

DIOR speed dialing table. This relation associates a DIOR speed dialing code to a full directory number. Therefore, DIOR call processing may use the DIOR speed dialing code to determine a forward number, which is subsequently outpulsed.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 200 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FG |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 256 |

## 4. Population Rules for RLdiorsd

**Relation Description** RLdiorsd - DIOR Speed Dialing Table.

This relation associates a speed code with a forward number.

Call processing may use the speed code entered by the customer to determine the full forward number.

Tuples of this relation record information related to OSPS DIOR speed dialing.

**Attribute: speedcode**

**Fullname:** DIORSD - Speed dial code

**Attribute Description** Contains DIOR speed dial codes. Any value from 1-999.

**Attribute: dn**

**Fullname:** DIORSD - directory number

**Attribute Description** Contains the digit count and 15 digit forward number, in bcd.

**Attribute: dn.digcnt**

**Fullname:** Digit Count

**Attribute Description** Contains the number of digits in the forard number.

**Attribute: dn.dn**

**Fullname:** DIORSD - directory number

**Attribute Description** Contains the full 15 digit forward number.

**Copyright © 1999 Lucent Technologies** 

**Attribute: intl**

**Fullname:** DIORSD - International Indicator

**Attribute Description** Indicates the forward number is an international number.

**Attribute: spare1**

**Fullname:** first spare attribute

**Attribute Description** Unknown.

**Attribute: spare2**

**Fullname:** second spare attribute

**Attribute Description** Unknown.

**Attribute: spare3**

**Fullname:** third spare attribute

**Attribute Description** Unknown.

**Attribute: spare4**

**Fullname:** fourth spare field

**Attribute Description** Unknown.

**Attribute: spare5**

**Fullname:** fifth spare field

**Attribute Description** Unknown.

Copyright © 1999 Lucent Technologies

**Relation Description** RLdiorso is a spare relation for future OSPS DIOR features.

**Attribute: offer**

**Fullname:** Offer number.

**Attribute Description** Number identifying a specific DIOR special offer.

**Attribute: origcc**

**Fullname:** Originating Country Code.

**Attribute Description** DIOR Originating Country Code.

**Attribute: carrier**

**Fullname:** Originating Carrier.

**Attribute Description** DIOR Originating Carrier. A value of 10 means all carriers.

**Attribute: oaff1**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff2**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff3**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff4**

**Fullname:** boolean spare.

**Attribute Description** Unused.

**Attribute: oaff5**

**Fullname:** char spare.

**Attribute Description** Unused.

**Attribute: oaff6**

**Fullname:** ushort spare.

**Attribute Description** Unused.

**Attribute: begindate**

**Fullname:** Beginning date of the special offer.

**Attribute Description** Beginning date of the special offer stored as YYYYMMDD in characters.

Copyright © 1999 Lucent Technologies 

**Attribute: enddate**

**Fullname:** Ending date of the special offer.

**Attribute Description** Ending date of the special offer stored as YYYYMMDD in characters.

## 4. Population Rules for RLdisp_cf

**Relation Description** display constructed feature
ISDN Display Features constructed feature options - used in SM These constructed features can be to analog and ISDN terminals.

**Attribute: feat_id**

**Fullname:** feature id

**Attribute Description** A BRCS constructed feature id consisting of a modular feature type and a unique identifier. For a Display constructed feature, the modular feature type is MFDISP which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023. The feature id must have a class of FACBRCS and a subclass of SCL_FEAT.

```
Dependencies:
    RLfacname must have a tuple such that:
          RLfacname.facid = feat_id
          RLfacname.class = FACBRCS
          RLfacname.subclass = SCL_FEAT
```

Copyright © 1999 Lucent Technologies

**Attribute: actvn**

**Fullname:** activation method

**Attribute Description** Method of feature activation. This is an enumeration of type DMMC_ACTYP. These features are always active (customer cannot activate via a dialed code or feature button) for 5E4(2) so that actvn always has the value ACTNONE. Future generics may allow these features to be activated or deactivated

**Attribute: dctvn**

**Fullname:** deactivation method

**Attribute Description** Method of feature deactivation. This is an enumeration of type DMMC_DCTYP. These features are always active (customer cannot deactivate via a dialed code or feature button) for 5E4(2) so that dctvn always has the value DCTNONE. Future generics may allow these features to be activated or deactivated via

**Attribute: dn_priv**

**Fullname:** per-call DN privacy

**Attribute Description** Boolean value indicating whether the per-call privacy on a feature is allowed. Per-call privacy allows the calling party to control its privacy status for displaying the calling DN and calling name at the terminating party on a per-call basis.

The dial code actions are:

```
ACN_DNPUSE - toggle Per-Call DN privacy
ACN_CNPUSE - toggle Per-Call Name privacy
ACN_NNPRV  - Force name and number private
ACN_NNPUB  - Force name and number public
```

Per-call privacy is assigned on a per terminal basis for analog terminals (class of service = FC_INDVDL or FC_ATTENDANT or FC_4WIRE_INDV) or ISDN terminals (class of service = FC_ISDN or FC_ISATND).

For the Calling Number Delivery feature, all-call DN privacy is specified in RLfc_line for non-ISDN terminal, and in RLis_term for ISDN terminals. (RLfc_line.privacy = DBYES for analog terminals or RLis_term.privacy = DBYES for ISDN terminals with multiple call appearance - RLfc_line.mca = DBYES), The per-call privacy option can turn off DN privacy for the call by assigning the feature button or access code with an action of ACN_DNPUSE. If the terminal has no-call privacy (RLfc_line.privacy = DBNO or RLis_term.privacy = DBNO for MCA terminals, RLfc_line.mca = DBYES), then the per-call privacy option can turn on DN privacy for the call by assigning the feature button or access code with an action of ACN_DNPUSE. The DN privacy can be forced private by assigning the access code an action of ACN_NNPRV and can be forced public by assigning the access code an action of ACN_NNPUB.

For the Calling Name Delivery feature, there is no all-call Name privacy specified. The privacy status is stored in a Name Database external to the *5ESS*®-2000 switch. The per-call privacy option can toggle NAME privacy for the call by assigning the access code an action of ACN_CNPUSE. The NAME privacy can be forced private by assigning the access code with action ACN_NNPRV and can be forced public by assigning the access code with action ACN_NNPUB.

Dependencies:

If a dialed code is assigned to this display option, then for that dialed code:

```
Rldaprlfnl.action = {ACN_DNPUSE,ACN_CNPUSE,ACN_NNPRV,ACN_NNPUB}
Rlidp_dtre.action = {ACN_DNPUSE,ACN_CNPUSE,ACN_NNPRV,ACN_NNPUB}
Rlidp_cnfl.action = {ACN_DNPUSE,ACN_CNPUSE,ACN_NNPRV,ACN_NNPUB}
```

**Copyright © 1999 Lucent Technologies** 

**Attribute: inspect**

**Fullname:** inspect

**Attribute Description** Boolean value indicating that the inspect display is allowed. The inspect option allows the user to display the call information associated with a call appearance without answering the call. The data displayed consists of the call appearance identifier, the calling or called DN, the ISDN call identifier, and the originating permissions (if the terminal using the Inspect feature is an attendant console). This feature may be used as an off-hook or on-hook feature. The Inspect option is only allowed to be assigned to a terminal with a class of service of FC_ISDN (must be an MCA terminal, type A, B, C, or D) or FC_ISATND and allows all call appearances on the terminal to be inspected.

Dependencies: If a dialed code is assigned to this display option, then for that dialed code:

```
RLdaprlfnl.action = ACN_INSUSE
RLidp_dtre.action = ACN_INSUSE
RLidp_cnfl.action = ACN_INSUSE
```

**Attribute: time_date**

**Fullname:** time and date

**Attribute Description** Boolean value indicating that the time and date display is allowed. If this option is selected, the time and date will be displayed to the user when the time and date button is pressed. This option is only allowed to be assigned to terminals with a class of service of FC_ISDN (must be an MCA terminal, type A, B, C, or D) or FC_ISATND.

**Attribute: ama_rec**

**Fullname:** billing type

**Attribute Description** Type of billing to be performed. This is an enumeration of type DMBOOL. The billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed or how the Service Provider decides it will bill if the feature is universally available. If ama_rec is set to DBYES, then the type of billing to be performed will be usage sensitive whereas if it is set to DBNO, billing be done a flat rate basis.

**Attribute: insp_ama**

**Fullname:** billing type for Inspect

**Attribute Description** Type of billing to be performed for the Inspect feature. This is an enumeration of type DMBOOL. The billing can be done on a flat rate or usage sensitive basis according to how the subscribing user prefers to be billed. If insp_ama is set to DBYES, then the type of billing to be performed will be usage sensitive Inspect, whereas if it is set to DBNO, billing be done a flat rate basis. This usage sensitive Inspect billing is for National ISDN only.

## 4. Population rules for RLdldsl

### Relation Description

```
        Data Link ISDN Digital Subscriber Lines

        The dldsl Relation contains information about OSPS data link ISDN
        Digital Subscriber Lines (DSLs).  Switch personnel are informed
        of data link DSL status through MCC displays and alarmed
        output messages.  These features are available only for
        data link DSLs.
```

Copyright © 1999 Lucent Technologies

Each tuple in this relation represents a data link OSPS ISDN Digital Subscriber Line (DSL). Switch personnel are alerted to problems involving data link DSLs by means of MCC display pages and alarmed tty output messages.
Data link DSLs are defined as DSLs for Directory Assistance System Computer (DAS/C) links, RISLU site Remote Alarm Section (RAS) links,
Commercial ACD Management Information System (MIS) links,
External Database (XDB) links,
External Information System (EIS) links,
OSPS Administrative Processor (OAP) links,
Hotel Billing Information System (HOBIS) links, Hotel Billing Information Center (HOBIC) links, and Real-Time Rating System (RTRS) as data link DSLs.

The LP will have a RLDLDSL tuple for every data link DSL on the 5ESS(R)-2000 switch. Each SM will have only the RLDLDSL tuples for data link DSLs that it terminates.

| Service Class | External Id Keyword | xnamid | xnamrl | sm-rel-lnk |

Copyright © 1999 Lucent Technologies 

An inverse relation for RLDLDSL, named RLXNDLDSL, resides in the LP only. The tuples of RLXNDLDSL map one-to-one with tuples in the LP's version of RLDLDSL.

**Attribute:**
gdport
**Fullname:**
Global data link DSL PORT name
**Attribute Description:**
This is the global port name of the data link DSL.

**Attribute:**
gdport.member
**Fullname:**
port member for gdport
**Attribute Description:**
See gdport.

**Attribute:**
gdport.module
**Fullname:**
module for gdport
**Attribute Description:**
See gdport.

**Attribute:**
servclass
**Fullname:**
Service class
**Attribute Description:**
Service class of the data link DSL.

**Attribute:**
xnamid
**Fullname:**
data link eXternal NAMe ID
**Attribute Description:**
ID portion of the data link DSL external name.
The external name consists of two parts - an id (xnamid) and a relative link (xnamrl).

FC_HOTVT = (Voice Quote TTY)
FC_HOTRT = (Record TTY)

The xnamid for a RAS DSL (servclass HM_RAS) is the RISLU site number (domain DMRISITID). (see domain DMXNAMID).

Copyright © 1999 Lucent Technologies 

The xnamid value for RLDLDSL tuples with servclass OA_MIS_LNK must be set to the Management Information System ID that the link is used for.

The xnamid value for RLDLDSL tuples with servclass AS_OAP must be set to the Operator Service Center (OSC) or Force Management Center (FMC) number (ofc_num).

The xnamid value for RLDLDSL tuples with servclass FC_EIS_LNK must be set to the External Information System ID (eis_id) that the link is used for.

**Attribute:**
xnamrl
**Fullname:**
eXternal NAMe ReLative link
**Attribute Description:**
Relative link portion of the data link DSL.
(see domain DMXNAMRL).

**** SEE TABLE IN GENERAL SECTION ****

**Attribute:**
sm_rel_lnk
**Fullname:**
SM RELative LiNK
**Attribute Description:**
For servclass FC_EIS_LNK:
This is the link number of the EIS DSL relative to the SM. The global parameter Gleisdl will maintain the number of EIS links on the SM. The global parameter Gleiseq will maintain a list of available EIS links on an SM. Each bit in this global represents a link on the SM. If bit zero is one (1) then link zero is already in use. Bits which are zero indicate available links numbers on the SM.

**Defines:**
"db/DMportindx.h",
"db/DMport.h"

RLdn_esp (TR303 RTs on DNU-S)

DESCRIPTION:
Indicates the Essential Service Protection (ESP) status (that is, ON or OFF) for each TR303 RT line.

There are no restrictions as to the number of RT lines with ESP ON or their positions in the RT. All ESP lines are treated equally even if they are adjacent (that is, blocking will not occur due to the selection of RT ESP lines). grpname The key to RLdn_esp is grpname, (0x0001 - 0xFFFC) which is generated as follows:

```
-----------------------------------------------------------------
|                                                               |
|                        LOGICAL  GSDB                          |
|                                                               |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0
LOGICAL GSDB (bits 0-15) - number 0x0001 through 0xFFFC (Unique for
                           each DNU-S GSDB/SM) Zero (0) is illegal.
                           The grpname is located in RLgrp2ckt.gsdb_grp.
```

For each group of 8 ports on an RT terminated by DNU-S, no RLdn_esp tuple will exist if none of those ports have ESP. espmask If one or more of the ports in a group of 8 have ESP, a tuple will exist in RLdn_esp with one or more of the bits set in the espmask attribute. Each bit set represents a port with ESP. Each bit cleared represents a port without ESP.

The algorithm for setting a particular bit in the espmask attribute for a given port is:

new_espmask = old_espmask | (1 << (port_indx & 0x7))

**Attribute: grpname**

**Fullname:** Port group name

**Attribute Description** The key to this relation is 'grpname', which is generated in different ways depending on the type of unit the line resides on. The following sections tell how the key is generated. The RLdn_esp key is defined the same way as the RLgsdb key.

**Attribute: espmask**

**Fullname:** One byte per group ('on' means ESP is enabled for this port)

**Attribute Description** A tuple in the relation RLdn_esp only needs to exist if a line in the group has ESP. The espmask attribute indicates which lines have ESP. ESP lines receive priority originating treatment during severe peak traffic conditions if the user has enabled ESP.

Each line in a group will have a different bit for it in 'espmask'. Which bit a line uses is dependent on its relative position in the group and also the type of unit the line resides on.

Note: The attribute, espmask will logically be a projection of the RLrc_oeinfo 'esl' attribute for analog lines. ISDN lines with ESP do not have RLrc_oeinfo.esl set to DBYES.

**Defines:** "db/DMcircuit.h"

# DN_FEATS

## 1. Description

This relation contains alist of BRCS constructed features assigned to a ISDN BRCS DN/Member or BRCS Feature Group (BFG). This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation DN_FEATS.

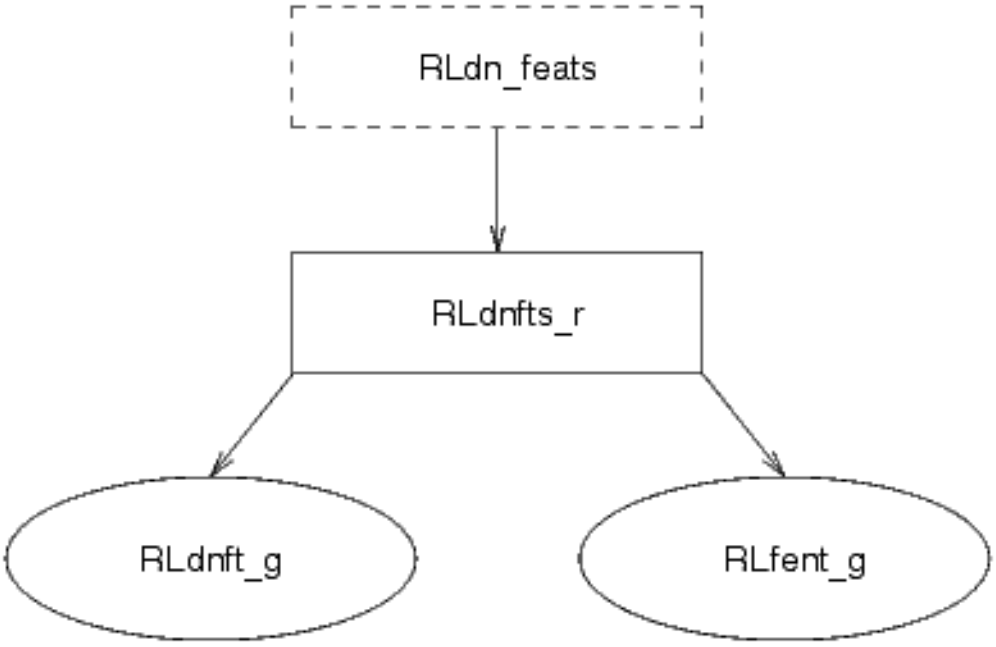

**Figure 1 Virtual Relation DN_FEATS**

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 0 |
| access type | DBACC_OPV |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| corcable relation | DBYES |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population rules for RLdn_feats

### Relation Description

Directory Number (DN) features.

list of BRCS constructed features assigned to a ISDN BRCS

Copyright © 1999 Lucent Technologies

DN/Member or BRCS Feature Group (BFG).

"Null feature entries contain the following values:

```
fid = 0
mastsw = DBNO
active = DBNO
rasalwd = DBNO
intratg = DBNO
intraoff = DBNO
interoff = DBNO
pf = DBNO
attndnt = DBNO
ath = DBNO
selcrit = SC_NULL
```

Non-null feature entries must precede null feature entries in the feature list. That is
Null feature entries cannot be interspersed among non-null feature entries.

If there is a tuple with range equal to x then for all tuples range less than x and the other keys the same, there are no null feature entries.
"

**Attribute:**
lead_module
**Fullname:**
lead module.
**Attribute Description:**
lead module.

**Attribute:**
ltm_type
**Fullname:**
logical termination index type.
**Attribute Description:**
logical termination index type.

**Attribute:**
ltm_idx
**Fullname:**
logical termination index.
**Attribute Description:**
logical termination index.

**Attribute:**
range

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
range.
**Attribute Description:**
Indicates which of six fid entries to be accessed.

**Attribute:**
feat_cnt
**Fullname:**
feature count.
**Attribute Description:**
Indicates the number of features assigned.

**Attribute:**
mlhg_ld
**Fullname:**
Multiline Hunt Group (MLHG) boolean.
**Attribute Description:**
Set to DBYES if this is member 1 of a MLHG, else set to DBNO.

If mlhg_ld = DBYES, then range must be zero.

**Attribute:**
ffcf[*]
**Fullname:**
future feature field.
**Attribute Description:**
This attribute is reserved for future use by field features.

**Attribute:**
tgid
**Fullname:**
terminal group members.
**Attribute Description:**

Indicates the terminal group identifier
assigned to this LT port. This is only specified
when a terminal group feature (mftype = MFTGR)
igned to the LTport. When tgid is non-zero
there must be a feature entry in this relation
for a terminal group modular feature. If no
terminal group id is assigned, the tgid is set to zero.
For each non-zero unique tgid in the RLdn_feats relation,
there must be a corresponding tuple in RLdb_amgpd
(GPDTG, tgid).

All MLHG members must belong to the same terminal
group. Specifically, for ISAT MLHGs, all subgroup
DNs specified in RLrt_dntran with RLrt_dntran.mctran
equal to DBYES, must have a tuple in RLrt_mctr

**Copyright © 1999 Lucent Technologies** 

such that RLrt_mctr.tgid = RLdn_feats.tgid.

All MLHG members must have the same terminating station restriction.

If tgid not equal zero, then range must be zero.

**Attribute:**
ftent1
**Fullname:**
feature entry.
**Attribute Description:**
feature entry.

**Attribute:**
ftent1.fid
**Fullname:**
feature id.
**Attribute Description:**
Indicates the constructed feature id. If non-zero there must be a tuple in RLfacname with a facid equal to this fid. The class associated with the facid in RLfacname must be equal to FACBRCS.
If fid is zero see the following null feature entry.
Furthermore, the only valid modular feature types are:

MFLID, MFBCL,
MFCFW, MFLID, MFEDS, MFDR,
MFMDS, MFPP, MFPUT, MFRND,
MFTGR.

The following fid's are blocked from being assigned to DNs on Standard BRIs or analog shared with Std BRI:
MFEDS (unless SFID225 is purchased),
MFPP.

The following fid's are can be assigned only to DNs on Standard BRIs or analog shared with Std BRI:
MFRND.

The following features have restricted options on Standard BRI or DNs of analog shared with Standard BRI:
CFW - block call forwarding over private facilities
MDS - block leave word calling
MDS - block message retrieval display
MDS - block print on demand
MDS - block auto call setup
CPI - allow only CPN_PREF or CPN_ONLY options

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
ftent1.mastsw
**Fullname:**
Master switch.
**Attribute Description:**
Indicates the status on master switch for this fid.

**Attribute:**
ftent1.active
**Fullname:**
Active.
**Attribute Description:**

Indicates the current run status of this fid.
DBNO indicates the fid is inactive: DBYES indicates
the fid is active.
If lead_module is 0 then
Features should be assigned as active.
Features with customer control options
of code will be assigned according to these rules:

1) All features with ACTNONE activation should
be assigned active.

2) All call forwarding features with activation
of ACTCD, ACTCD_DN, ACTCDDNC, OR ACTCDNCA should
be assigned inactive in the individual relations
RLfc_line and RLis_line. If this bfgid is assigned
to a non-ISDN terminal then the CFV_ON, CFDA_ON,
and CFBL_ON booleans in RLfc_line should be set
to DBNO. If the DN/Member is ISDN then the same
bits in RLis_line should be set to DBNO.
NOTE: There can be at most one of each of the
following Call Forwarding modular feature
types assigned in the BFG: CFV, CFDA
and CFBL
3) Features with an activation of ACTCD or ACTSCAN
and deactivation of DCTAUTO or DCTSCAN
are not allowed.

4) Display feature with ACTCD to
activate and DCTCD to deactivate will
be assigned active in the individual relations
RLfc_line and RLis_line. If this bfgid is
assigned to a non-ISDN terminal then the DISP_ON
boolean in RLfc_line should be set to DBNO.
If the DN/Member is ISDN then the DISP_ON bit
in RLis_line should be set to DBYES.
NOTE: There can be at most one Display
modular feature type assigned.

**Copyright © 1999 Lucent Technologies** 

5) Set this attribute to inactive (DBNO) for all LASS Selective Features (LSF) with the following modular feature types only when the screening list for that modular feature type does not exist.

   MFSCA for Selective Call Acceptance (SCA)/ Computer Access Restriction (CAR)
   MFSCF for Selective Call Forwarding (SCF)
   MFSCR for Selective Call Rejection (SCR)
   MFSDA for Selective Distinctive Alert (SDA)

   For retrofit, ODA will preserve the existing value of this attribute.

   RC does not update this attribute and always leaves it as is.

   LSF use the xxx_on (xxx represents sca, scf, scr, or sda) attribute in RLfc_line, RLis_line, and RLmhg_cf as a feature status indicator as follows:

| Attribute: | Usage: |
|---|---|
| RLfc_line.xxx_on | This attribute is applied to analog line for both individual line and member 1 of MLHG which has LTM_OTHER ltm_type. |
| RLis_line.xxx_on | This attribute is applied to ISDN and shared analog line for both individual line and member 1 of MLHG which has LTM_ISDN ltm_type. |
| RLmhg_cf.xxx_on | This attribute is applied to member 1 of MLHG for both analog and ISDN line. |

Otherwise,

Features should be assigned as active or inactive dependent on the status of their activation and constructed feature and or template base relation for the corresponding feature definition according to these rules.

1) If the actvn field in a feature's feature definition relation is ACTNONE, or there is no actvn field in that relation, active can be DBYES or DBNO. It will usually be DBYES, since the subscriber will not be able to CORC it on. If it is set to DBNO, Recent Change will have to be used to activate it.
   Active and Inactive with DBYES and DBNO respectively

**Copyright © 1999 Lucent Technologies** 

2) All call forwarding features with activation of ACTCD, ACTCD_DN, ACTCDDNC, OR ACTCDNCA should be assigned inactive.
Active and Inactive with DBYES and DBYNO respectively

3) All features with activation of ACTCD or ACTSCAN and deactivation of DCTAUTO or DCTSCAN should be assigned inactive.
Active and Inactive with DBYES and DBNO respectively

4) All features other than call forwarding with ACTCD to activate and ACTCD to deactivate can be assigned at the customer's discretion.
Active and Inactive with DBYES and DBNO respectively

5) Set this attribute to inactive (DBNO) for all LASS Selective Features (LSF) with the following modular feature types only when the screening list for that modular feature type does not exist.

| | | |
|---|---|---|
| MFSCA | for | Selective Call Acceptance (SCA)/ Computer Access Restriction (CAR) |
| MFSCF | for | Selective Call Forwarding (SCF) |
| MFSCR | for | Selective Call Rejection (SCR) |
| MFSDA | for | Selective Distinctive Alert (SDA) |

For retrofit, ODA will preserve the existing value of this attribute.

RC does not update this attribute and always leaves it as is.

LSF use the xxx_on (xxx represents sca, scf, scr, or sda) attribute in RLfc_line, RLis_line, and RLmhg_cf as a feature status indicator as follows:

| Attribute: | Usage: |
|---|---|
| RLfc_line.xxx_on | This attribute is applied to analog line for both individual line and member 1 of MLHG which has LTM_OTHER ltm_type. |
| RLis_line.xxx_on | This attribute is applied to ISDN and shared analog line for both individual line and member 1 of MLHG which has LTM_ISDN ltm_type. |
| RLmhg_cf.xxx_on | This attribute is applied to member 1 of MLHG for both analog and ISDN line. |

**Attribute Description:**
This bit determines if RAS is supported for this feature entry.

**Attribute:**
ftent4.intratg
**Fullname:**
Intra-terminal group.
**Attribute Description:**
This fid can be selected for calls between terminal group. This attribute must be identical to the intratg attribute for this fid in RLfacftdsc(fid).ptyfilt.

**Attribute:**
ftent4.intraoff
**Fullname:**
intra-office.
**Attribute Description:**
This fid can be selected for calls between terminal in the same office. This attribute must be identical to the intraoff attribute for this fid in RLfacftdsc(fid).ptyfilt.

**Attribute:**
ftent4.interoff
**Fullname:**
inter-office.
**Attribute Description:**
This fid can be selected for inter-office.

Copyright © 1999 Lucent Technologies 

This attribute must be identical to the interoff
attribute for this fid in RLfacftdsc(fid).ptyfilt.

**Attribute:**
ftent4.pf
**Fullname:**
Private facility.
**Attribute Description:**
This field can be selected for private facility
calls. This attribute must be identical to the pf
attribute for this fid in RLfacftdsc(fid).ptyfilt.

**Attribute:**
ftent4.attndnt
**Fullname:**
Attendant.
**Attribute Description:**
This fid can be selected for attendant calls.
This attribute must be identical to the attndnt
attribute for this fid in RLfacftdsc(fid).ptyfilt.

**Attribute:**
ftent4.ath
**Fullname:**
Authorization.
**Attribute Description:**
DBYES - this feature requiress an authorization
code for use.
DBNO - this feature does not require an authorization
code for use.

For the Modular Feature Types of MFMDS, MFMEDS, MFLID
and MFBCL RLdn_feats.ftent[n].ath will equal DBNO.

**Attribute:**
ftent4.selcrit
**Fullname:**
Select criteria.
**Attribute Description:**
This is the selection criteria for this fid.selcrit.
This field is an enumerated value that must be
identical to RLfacftdsc.P.
See population rules for the selcrit attribute in
RLfacftdsc for a complete description.

**Attribute:**
ftent5
**Fullname:**

Copyright © 1999 Lucent Technologies 

feature entry.

**Attribute Description:**

feature entry.

**Attribute:**

ftent5.fid

**Fullname:**

feature id.

**Attribute Description:**

Indicates the constructed feature id. If non-zero there must be a tuple in RLfacname with a facid equal to this fid. The class associated with the facid in RLfacname must be equal to FACBRCS.
If fid is zero see the following null feature entry.
Furthermore, the only valid modular feature types are:

MFLID, MFBCL,
MFCFW, MFLID, MFEDS, MFDR,
MFMDS, MFPP, MFPUT,
MFTGR.

**Attribute:**

ftent5.mastsw

**Fullname:**

Master switch.

**Attribute Description:**

Indicates the status on master switch for this fid.

**Attribute:**

ftent5.active

**Fullname:**

Active.

**Attribute Description:**

Indicates the current run status of this fid.
DBNO indicates the fid is inactive: DBYES indicates the fid is active.
If lead_module is 0 then
Features should be assigned as active.
Features with customer control options
of code will be assigned according to these rules:

1) All features with ACTNONE activation should be assigned active.

2) All call forwarding features with activation of ACTCD, ACTCD_DN, ACTCDDNC, OR ACTCDNCA should be assigned inactive in the individual relations RLfc_line and RLis_line. If this bfgid is assigned

Copyright © 1999 Lucent Technologies 

to a non-ISDN terminal then the CFV_ON, CFDA_ON, and CFBL_ON booleans in RLfc_line should be set to DBNO. If the DN/Member is ISDN then the same bits in RLis_line should be set to DBNO.
NOTE: There can be at most one of each of the following Call Forwarding modular feature types assigned in the BFG: CFV, CFDA and CFBL

3) Features with an activation of ACTCD or ACTSCAN and deactivation of DCTAUTO or DCTSCAN are not allowed.

4) Display feature with ACTCD to activate and DCTCD to deactivate will be assigned active in the individual relations RLfc_line and RLis_line. If this bfgid is assigned to a non-ISDN terminal then the DISP_ON boolean in RLfc_line should be set to DBNO. If the DN/Member is ISDN then the DISP_ON bit in RLis_line should be set to DBYES.
NOTE: There can be at most one Display modular feature type assigned.

5) Set this attribute to inactive (DBNO) for all LASS Selective Features (LSF) with the following modular feature types only when the screening list for that modular feature type does not exist.

| | | |
|---|---|---|
| MFSCA | for | Selective Call Acceptance (SCA)/ Computer Access Restriction (CAR) |
| MFSCF | for | Selective Call Forwarding (SCF) |
| MFSCR | for | Selective Call Rejection (SCR) |
| MFSDA | for | Selective Distinctive Alert (SDA) |

For retrofit, ODA will preserve the existing value of this attribute.

RC does not update this attribute and always leaves it as is.

LSF use the xxx_on (xxx represents sca, scf, scr, or sda) attribute in RLfc_line, RLis_line, and RLmhg_cf as a feature status indicator as follows:

| Attribute: | Usage: |
|---|---|
| RLfc_line.xxx_on | This attribute is applied to analog line for both individual line and member 1 of MLHG which has LTM_OTHER ltm_type. |
| RLis_line.xxx_on | This attribute is applied to ISDN and shared analog line for both individual |

Copyright © 1999 Lucent Technologies 

line and member 1 of MLHG which has LTM_ISDN ltm_type.

RLmhg_cf.xxx_on This attribute is applied to member 1 of MLHG for both analog and ISDN line.

Otherwise,

Features should be assigned as active or inactive dependent on the status of their activation and constructed feature and or template base relation for the corresponding feature definition according to these rules.

1) If the actvn field in a feature's feature definition relation is ACTNONE, or there is no actvn field in that relation, active can be DBYES or DBNO. It will usually be DBYES, since the subscriber will not be able to CORC it on. If it is set to DBNO, Recent Change will have to be used to activate it.
   Active and Inactive with DBYES and DBNO respectively

2) All call forwarding features with activation of ACTCD, ACTCD_DN, ACTCDDNC, OR ACTCDNCA should be assigned inactive.
   Active and Inactive with DBYES and DBYNO respectively

3) All features with activation of ACTCD or ACTSCAN and deactivation of DCTAUTO or DCTSCAN should be assigned inactive.
   Active and Inactive with DBYES and DBNO respectively

4) All features other than call forwarding with ACTCD to activate and ACTCD to deactivate can be assigned at the customer's discretion.
   Active and Inactive with DBYES and DBNO respectively

5) Set this attribute to inactive (DBNO) for all LASS Selective Features (LSF) with the following modular feature types only when the screening list for that modular feature type does not exist.

   | | | |
   |---|---|---|
   | MFSCA | for | Selective Call Acceptance (SCA)/ Computer Access Restriction (CAR) |
   | MFSCF | for | Selective Call Forwarding (SCF) |
   | MFSCR | for | Selective Call Rejection (SCR) |
   | MFSDA | for | Selective Distinctive Alert (SDA) |

   For retrofit, ODA will preserve the existing value of this attribute.

   RC does not update this attribute and always leaves it

Indicates the status on master switch for this fid.

**Attribute:**
ftent6.active
**Fullname:**
Active.
**Attribute Description:**

Indicates the current run status of this fid.
DBNO indicates the fid is inactive: DBYES indicates the fid is active.
If lead_module is 0 then
Features should be assigned as active.
Features with customer control options
of code will be assigned according to these rules:

Copyright © 1999 Lucent Technologies 

1) All features with ACTNONE activation should
be assigned active.

2) All call forwarding features with activation
of ACTCD, ACTCD_DN, ACTCDDNC, OR ACTCDNCA should
be assigned inactive in the individual relations
RLfc_line and RLis_line. If this bfgid is assigned
to a non-ISDN terminal then the CFV_ON, CFDA_ON,
and CFBL_ON booleans in RLfc_line should be set
to DBNO. If the DN/Member is ISDN then the same
bits in RLis_line should be set to DBNO.
NOTE: There can be at most one of each of the
following Call Forwarding modular feature types
assigned in the BFG: CFV, CFDA
and CFBL

3) Features with an activation of ACTCD or ACTSCAN
and deactivation of DCTAUTO or DCTSCAN
are not allowed.

4) Display feature with ACTCD to
activate and DCTCD to deactivate will
be assigned active in the individual relations
RLfc_line and RLis_line. If this bfgid is assigned
to a non-ISDN terminal then the DISP_ON
boolean in RLfc_line should be set to DBNO.
If the DN/Member is ISDN then the DISP_ON bit
in RLis_line should be set to DBYES.
NOTE: There can be at most one Display
modular feature type assigned.

5) Set this attribute to inactive (DBNO) for all
LASS Selective Features (LSF) with the following
modular feature types only when the screening list
for that modular feature type does not exist.

| | | |
|---|---|---|
| MFSCA | for | Selective Call Acceptance (SCA)/ Computer Access Restriction (CAR) |
| MFSCF | for | Selective Call Forwarding (SCF) |
| MFSCR | for | Selective Call Rejection (SCR) |
| MFSDA | for | Selective Distinctive Alert (SDA) |

For retrofit, ODA will preserve the existing value of
this attribute.

RC does not update this attribute and always leaves it
as is.

LSF use the xxx_on (xxx represents sca, scf, scr, or sda)
attribute in RLfc_line, RLis_line, and RLmhg_cf as a feature
status indicator as follows:

| Attribute: | Usage: |
|---|---|
| RLfc_line.xxx_on | This attribute is applied to analog |

Copyright © 1999 Lucent Technologies 

line for both individual line and member 1 of MLHG which has LTM_OTHER ltm_type.

RLis_line.xxx_on — This attribute is applied to ISDN and shared analog line for both individual line and member 1 of MLHG which has LTM_ISDN ltm_type.

RLmhg_cf.xxx_on — This attribute is applied to member 1 of MLHG for both analog and ISDN line.

Otherwise,

Features should be assigned as active or inactive dependent on the status of their activation and constructed feature and or template base relation for the corresponding feature definition according to these rules.

1) If the actvn field in a feature's feature definition relation is ACTNONE, or there is no actvn field in that relation, active can be DBYES or DBNO. It will usually be DBYES, since the subscriber will not be able to CORC it on. If it is set to DBNO, Recent Change will have to be used to activate it.
   Active and Inactive with DBYES and DBNO respectively

2) All call forwarding features with activation of ACTCD, ACTCD_DN, ACTCDDNC, OR ACTCDNCA should be assigned inactive.
   Active and Inactive with DBYES and DBYNO respectively

3) All features with activation of ACTCD or ACTSCAN and deactivation of DCTAUTO or DCTSCAN should be assigned inactive.
   Active and Inactive with DBYES and DBNO respectively

4) All features other than call forwarding with ACTCD to activate and ACTCD to deactivate can be assigned at the customer's discretion.
   Active and Inactive with DBYES and DBNO respectively

5) Set this attribute to inactive (DBNO) for all LASS Selective Features (LSF) with the following modular feature types only when the screening list for that modular feature type does not exist.

   MFSCA for Selective Call Acceptance (SCA)/ Computer Access Restriction (CAR)
   MFSCF for Selective Call Forwarding (SCF)

# DN_LOCDN

## 1. Description

This relation maps a 7-digit DN and port to a locdn.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 16382 |
| expected number of tuples | 232 |
| density | 80 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

```

## 4. Population Rules for RLdn_locdn

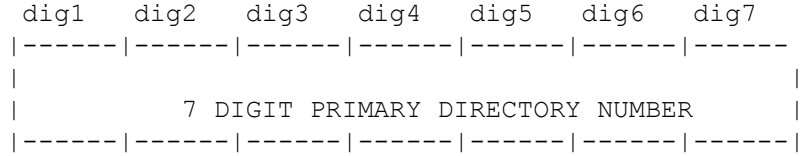
**Relation Description** 7 digit DN to Local DN
This relation is used to translate a 7 digit DN to a NOC and 4 digit DN format. Used by ISDN lines only.

**Copyright © 1999 Lucent Technologies** 

**Attribute: pdn**

**Fullname:** Primary Directory Number

**Attribute Description** PDN is the 7 digit DN used for a user's Service Profile IDentifier (SPID)



**Attribute: pdn.dig1**

**Fullname:** digit 1

**Attribute Description** refer to description of pdn

**Attribute: pdn.dig2**

**Fullname:** digit 2

**Attribute Description** refer to description of pdn

**Attribute: pdn.dig3**

**Fullname:** digit 3

**Attribute Description** refer to description of pdn

**Attribute: pdn.dig4**

**Fullname:** digit 4

**Attribute Description** refer to description of pdn

**Attribute: pdn.dig5**

**Fullname:** digit 5

**Attribute Description** refer to description of pdn

**Attribute: pdn.dig6**

**Fullname:** digit 6

**Attribute Description** refer to description of pdn

**Attribute: pdn.dig7**

**Fullname:** digit 7

**Attribute Description** refer to description of pdn

**Attribute: port**

**Fullname:** D-channel port

**Attribute Description** The port is a sequentially assigned number administered by Recent Change.

**Attribute: locdn**

**Fullname:** Local directory number

**Attribute Description** This attribute consists of the NOC (normalized office code) and four

**Copyright © 1999 Lucent Technologies** 

directory number digits.

**Attribute: locdn.noc**

**Fullname:** Normalized office code

**Attribute Description** Normalized office code

**Attribute: locdn.digits**

**Fullname:** Digits

**Attribute Description** The local dn minus the NOC.

## 4. Population Rules for RLdn_lpt

**Relation Description** Logical PORT (LPORT)
This relation is used to equate a DN and LPT_TYPE to its corresponding LPORT. The LPORT and LPT_TYPE are used as keys to other Service Order Profile (SOP) relations.

The following tuple semantics detail the allowed values for the possible combinations of Logical Port Type and Logical Port Sub-Type.

```
TUPLE SEMANTICS for Circuit Switched Logical Port Type
------------------------------------------------
locdn           Local Directory Number
lpt_type        LPT_ISDN - ISDN Circuit Switched lport
lpt_styp        LPT_SUB1
lport           Circuit Switched Logical Port

TUPLE SEMANTICS for Permanent Packet D-Channel Logical Port Type
------------------------------------------------
locdn           Local Directory Number
lpt_type        LPT_PKT - ISDN Packet Switched lport
lpt_styp        LPT_SUB1 - Permanent Packet D-Channel
lport           Packet Switched Logical Port
TUPLE SEMANTICS for On-Demand B-Channel Logical Port Type

------------------------------------------------
locdn           Local Directory Number
lpt_type        LPT_PKT - ISDN Packet Switched lport
lpt_styp        LPT_SUB2 - On-Demand B-Channel
lport           Packet Switched Logical Port"
```

**Attribute: locdn**

Copyright © 1999 Lucent Technologies 

**Fullname:** Local directory number

**Attribute Description** This attribute consists of the NOC (normalized office code) and four directory number digits.

**Attribute: locdn.noc**

**Fullname:** Normalized office code

**Attribute Description** Normalized office code

**Attribute: locdn.digits**

**Fullname:** Digits

**Attribute Description** The local dn minus the office code.

**Attribute: lpt_type**

**Fullname:** Logical PorT TYPE (LPT_TYPE)

**Attribute Description** The LPT_TYPE indicates the logical port type that corresponds to this lport.

**Attribute: lpt_styp**

**Fullname:** Logical Port Sub-Type

**Attribute Description** The usage of the Logical Port Sub-Type is as follows:

```
For the Packet Logical Port Type (lpt_type=LPT_PKT)

lpt_styp     Definition
--------     ---------------
LPT_SUB1     Permanent Packet D-Channel
LPT_SUB2     On-Demand Packet B-Channel

For all other Logical Port Type

lpt_styp     Definition
--------     ---------------
LPT_SUB1     All
LPT_SUB2     Unused
```

**Attribute: lport**

**Fullname:** Logical Port

**Attribute Description** The LPORT is a sequentially assigned number administered by recent change. For more information on the allocation of LPORTs, refer to the population rules for RLrc_lphol and RLrc_qidx.

## 4. Population Rules for RLdn_pscm

**Relation Description** Previous Series Completion Member for a Series Completion DN
This relation is used by Recent Change to track the reverse linkage for a series completion linked list. For a set of DNs A, B, and C where A and B both series complete to C, this relation will allow Recent Change code to start with C's DN and determine that A and B series complete to it. The linkage from A to C or from B to C is stored in relation RLscm_nscm. For a particular DN, there may be a maximum of 512 other DNs which series complete to it.

**Attribute: scmdn**

**Fullname:** Local Directory number of a Series Completion linked list member.

**Attribute Description** Local Directory Number of a member of a Series Completion Linked List.

**Attribute: scmdn.noc**

**Fullname:** Normalized office code(NOC).

**Attribute Description** The NOC of the Directory Number corresponding to the next member in the Series Completion linked list.

**Attribute: scmdn.digits**

Copyright © 1999 Lucent Technologies 

**Fullname:** Digits of the Directory Number

**Attribute Description** Last 4 digits of the DN corresponding to a Member of a Series Completion group. The Directory Number must be part of the Office Dialing Plan.

**Attribute: tupnum**

**Fullname:** Tuple Number

**Attribute Description** Tupnum is a sequence number to distinguish multiple tuples with the same scmdn. Tupnum is assigned and maintained as a consecutive series starting with 0 and ending with 511.

**Attribute: pltm_idx**

**Fullname:** Logical termination index of a previous member of a Series Completion linked list.

**Attribute Description** This logical termination index of a previous member, along with the attributes pltm_type and plead_module, uniquely identify a previous member of a Series Completion linked list. This previous member series completes to the Directory Number in the scmdn attribute.

**Attribute: pltm_type**

**Fullname:** Logical Termination Type of a previous Series Completion member

**Attribute Description** Indicates the logical termination type (ISDN or analog) of a previous series completion member.

**Attribute: plead_module**

**Fullname:** Lead Module of a previous series completion member

**Attribute Description** Indicates what module a previous series completion member resides on.

# DN_RDTA

## 1. Description

This static relation resides in the AM and it stores the output directory numbers for the remote protocol access (RPA) feature. The key for the relation is directory number associated with the output port.

## 2. Data Dictionary Values

| | |

## 4. Population Rules for RLdn_rdta

**Relation Description** Relation to store the output directory numbers for the remote digital test access (RDTA) 5e7(1) Capability.
This relation is used strictly by the 5e7(1) Remote Protocol Access Capability (j131). The relation is not used by call processing. The relation is to reside in the AM and is used to store the output directory number associated with the RDTA port. The relation will exist on both the access switch and the remote switch. Refer to the 'general' section for more details.

This relation is not used for call processing.

If the relation is populated for a Pseudo-BRI on a T, Phase 2 U or *ANSI*™ U ISDN Line card, tuples will be populated ONLY in RLfc_porttyp, RLfc_line, RLlpt_pt, RLrt_dntran, and RLdn_rdta. Tuples will NOT be populated in RLdslequip, RLequipdsl, RLdslgdata, RLpsx25ln, RLdpidbpts RLdgrp_ri or RLri_dgrp. Also see the following note for un-populated relations. Spare line cards may not be used for Pseudo-BRI ports.

RDTA output facilities are not supported on IDCU BRI ports. There should be no tuples in this relation for IDCU BRI ports.

If the relation is populated for a PRI on an EDSL Trunk Group tuples will be populated in RLfc_porttyp, RLrt_trkg, RLfc_trunk, RLrc_trk and RLrctgrprk as well as any other relation which normal EDSL trunk groups are populated. There must never be a route index assigned to this trunk group in RLrt_routing or RLrt_mcrt since the trunk group must be used entirely for RDTA members. The EDSL trunk group must have the call by call feature inactive. There will never be an lport value associated with an RDTA EDSL trunk group member. See the following note for un-populated relations.

The dn will always be populated with a ten digit number for the access switch (NPA-NXX-XXXX). Recent change and ODA will map the seven digit number entered on the view to a full 10 digit number. If the gport is > 0, dn.digcnt must equal 10. On the remote switch the dn may have from 7 to 15 digits defined depending on how the port is reached from the customer support center (CSC).

The gport will be populated with the BRI or PRI port if the switch is the access switch; however, if the switch is the remote switch the gport will be 0.

```
PLEASE NOTE:
------------

There will not be any tuples populated in RLrc_oeinfo for RPA
pseudo BRI or EDSL PRI ports!
There is no line class code associated with an RPA port!
(No RLrc_lcc tuples will be populated).
```

**Attribute: dn**

**Fullname:** Directory Number associated with the RPA output facility

**Attribute Description** The dn field may contain up to a 15 digit number for the output RPA facility port depending on where the port is located. Ports on the access switch must have exactly 10 digits defined and ports on the remote switch may have from 7 to 15 digits defined. The minimum seven digits are for NXX and 4 digits.

When a Pseudo BRI OE is provisioned all three dn's for the BRI must be entered (D Channel TN, B1 Channel TN and B2 Channel TN). This restriction does not apply to EDSL PRI dn's.

Copyright © 1999 Lucent Technologies 

NOTE: The DN is NOT populated in RLrc_oeinfo and has NO LCC!!!!

**Attribute: dn.digcnt**

**Fullname:** This field contains the number of digits populated

**Attribute Description** See the DN usage section.

**Attribute: dn.dn**

**Fullname:** dn.dn may contain up to 15 digits.

**Attribute Description** See Usage section for dn.

**Attribute: csc_id**

**Fullname:** Customer Service Center ID number.

**Attribute Description** Used to store the Customer Service Center ID number where the RPA test equipment is located.

**Attribute: gport**

**Fullname:** Global port name of the BRI/PRI output facility.

**Attribute Description** Used to store the Global Port name of the Pseudo BRI or EDSL PRI facility being used for the RPA session on the Access Switch. This attribute will be zero if the relation is on the Remote Switch (on the remote switch the relation is used strictly for comments only).

**Attribute: gport.member**

**Fullname:** The gport member for either the Pseudo BRI or EDSL PRI.

**Attribute Description** See gport usage section.

**Attribute: gport.module**

**Fullname:** The module where the Pseudo BRI or EDSL PRI port is located.

**Attribute Description** See gport usage section.

**Attribute: channel**

**Fullname:** Channel Number of the RPA output facility (0-23)

**Attribute Description** The attribute stores the Pseudo BRI or EDSL PRI Channel Number used by the RPA output facility. Valid range is 0-23. The value 0 is used for Pseudo BRI D Channel only and is not valid for PRI D Channel. The values 1 and 2 may either represent the B1 and B2 channels of a Pseudo BRI or channels 1 and 2 of a PRI. The values 3 - 23 may only represent PRI channels.

**Attribute: pair**

**Fullname:** Pseudo BRI or PRI output facility pair number.

**Attribute Description** Attribute defines the optional paired number for an RPA output facility. There may be from 1 to 24 pairs defined. Pair should be set to zero if the switch personnel wishes not to assign a particular output facility a paired number. Pairing allows the switch personnel to add separate pair numbers to sets of BRI or PRI pairs to allow for ease of identification when office records are printed.

In order to be compatible with some types of existing monitoring equipment (protocol analyzers) the monitor data will be transported from the access switch over pairs of ISDN facilities; either PRI or Pseudo BRI. One BRI of each pair will be used to transport Transmit data, the other BRI to

Copyright © 1999 Lucent Technologies 

transport Receive data. PRI facilities, if they are used, will be configured in the same manner; one facility from each pair will be used for Transmit data, the other for Receive data. In these cases a unique pair number would be given to both the transmit and receive facility. There is no data cross checking for this attribute so the switch personnel must document and enter the pair numbers consistently and sequentially. Monitoring equipment not requiring paired facilities will not use this attribute and will be populated with a default value.

In providing this mapping capability to be centralized at the Access Switch, the switch personnel from any remote location would be able to initiate a request to print, via office records, a list of the output facilities for that Access Switch showing the TN assigned to each channel, the CSC ID, the channel identification, and the 'pair' it is assigned to.

The capability will provide the customer with a means for identifying output facilities in pairs for documentation purposes. The use of this attribute is optional and will not affect the capability functionality.

**Defines:** "db/DMportindx.h"

# DNLPT

## 1. Description

This is the Extended Primary Directory Number (PDN) and logical port type to logical port mapping relation. The only logical port types currently supported are LPT_ISDN and LPT_PKT.

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation DNLPT.

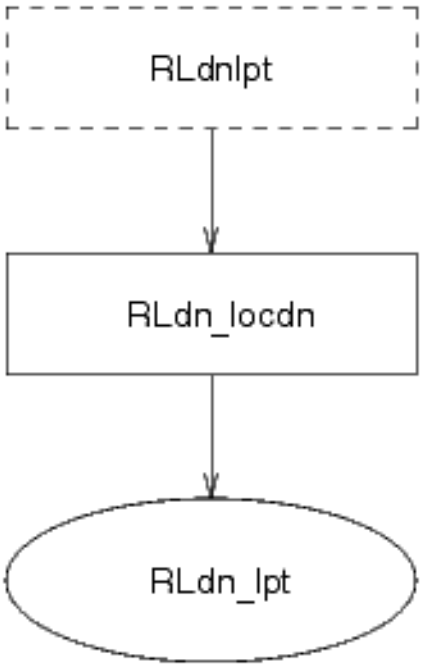

**Figure 1 Virtual Relation DNLPT**

## 4. Population Rules for RLdnntwk

**Relation Description** Directory Number Network
Static relation containing npa, carrier key, nxxs, and carrier id combination that is within the LEC intracompany network.

**Attribute: oanpa**

**Fullname:** operator action NPA

**Attribute Description** Valid NPAs (recent changeable) with a range of 3 digits.

**Attribute: oaindex**

**Fullname:** operator action index

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** An interexchange carrier that is supplying service to a LEC's private network. LEC may contract with as many as 3 different interexchange carriers for its private network. Value is recent changeable. There must be at least 1 index per NPA key. The 2 additional indices are not mandatory.

**Attribute: oacarr**

**Fullname:** operator action carrier id

**Attribute Description** Valid carrier value which corresponds and exists in the RLfc_carr relation.

**Attribute: oamap[*]**

**Fullname:** operator action map

**Attribute Description** Valid NXXs bit mapped (recent changeable). The range of the bit map is 000-799, which corresponds to valid NXXs within the 200-999 range. This bit map is comprised of 25 fields, OAMAP1 - OAMAP25. Each field contains information for 32 NXXs. Each bit of the NXX bit string represents a valid NXX (200-999 for all map fields). NXX 200 is represented by bit 000, NXX 201 is represented by bit 001, etc. Bit 001 is the low order bit. Each bit is independently set to either a 0 or 1. If a bit is set to a one in one of the RLdnntwk tuples, then the corresponding bit in the RLdnntwk tuple(s) of the same value of OANPA has to be 0. Map fields that cover NXXs are:

```
OAMAP1       NXXs  200-231
OAMAP2       NXXs  232-263
OAMAP3       NXXs  264-295
OAMAP4       NXXs  296-327
OAMPA5       NXXs  328-359
OAMAP6       NXXs  360-391
OAMPA7       NXXs  392-423
OAMAP8       NXXs  424-455
OAMAP9       NXXs  456-487
OAMAP10      NXXs  488-519
OAMAP11      NXXs  520-551
OAMAP12      NXXs  552-583
OAMAP13      NXXs  584-615
OAMAP14      NXXs  616-647
OAMAP15      NXXs  648-679
OAMAP16      NXXs  680-711
OAMAP17      NXXs  712-743
OAMAP18      NXXs  744-775
OAMAP19      NXXs  776-807
OAMAP20      NXXs  808-839
OAMAP21      NXXs  840-871
OAMAP22      NXXs  872-903
OAMAP23      NXXs  904-935
OAMAP24      NXXs  936-967
OAMAP25      NXXs  968-999
DEFAULT: None.
```

A range of NXXs within an NPA can be specified for a specific carrier.

defines: "db/DMcarr_val.h"

# DNRALST

## 1. Description

This relation contains the DIOR Network Remote Access exceptions to the default treatment of Allow or Deny based upon the originating country code.

This relation is to have a distribution of FP (fixed partition), by inwnpa, officecode and feature of 'NRA' based on RLdehocsm.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 50000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```

## 4. Population Rules for RLdnralst

**Relation Description** RLdnralst
RLdnralst is for the exception list data for the DIOR Network Remote Access (NRA) feature.

**Attribute: inwnpa**

**Fullname:** INWATS NPA.

**Attribute Description** NPA (area code) of the toll-free number subscribed to this feature.

**Attribute: oaff1**

**Fullname:** 6-bit spare.

**Attribute Description** Unused.

**Attribute: officecode**

**Fullname:** Office Code.

**Attribute Description** Office Code (NXX) of the toll-free number subscribed to this feature.

**Attribute: oaff2**

**Fullname:** 6-bit spare.

**Attribute Description** Unused.

**Attribute: linenumber**

**Fullname:** Line number.

**Attribute Description** Line Number of the toll-free number subscribed to this feature.

**Attribute: range**

**Fullname:** Tuple number.

**Attribute Description** unique value to allow multiple tuples for the same toll-free number.

**Attribute: oaff3**

**Fullname:** tri-state boolean spare.

**Attribute Description** Unused.

**Attribute: oaff4**

**Fullname:** unsigned short spare.

**Attribute Description** Unused.

**Attribute: excpt[*]**

Copyright © 1999 Lucent Technologies 

**Fullname:** Exception list.

**Attribute Description** List of country codes from which the treatment is the opposite of the default treatment in the RLdnrarte tuple.

**Attribute: excpt[*].occ**

**Fullname:** Originating country code

**Attribute Description** Country code from which calls are given the opposite of the default treatment.

**Attribute: excpt[*].oaff1**

**Fullname:** Spare 1

**Attribute Description** Unused tri-state boolean spare.

**Attribute: excpt[*].oaff2**

**Fullname:** Spare 2

**Attribute Description** Unused tri-state boolean spare.

**Attribute: excpt[*].oaff3**

**Fullname:** Spare 3

**Attribute Description** Unused tri-state boolean spare.

**Attribute: excpt[*].oaff4**

**Fullname:** Spare 4

**Attribute Description** Unused 8-bit spare.

**Attribute: excpt[*].oaff5**

**Fullname:** Spare 5

**Attribute Description** Unused 4-bit spare.

**Attribute: excpt[*].oaff6**

**Fullname:** Spare 6

**Attribute Description** Unused tri-state boolean spare.

**Attribute: excpt[*].oaff7**

**Fullname:** Spare 7

**Attribute Description** Unused tri-state boolean spare.

# DNRARTE

## 1. Description

This relation contains the DIOR Network Remote Access default treatment of Allow or Deny and the 7-digit routing number.

This relation is to have a distribution of FP (fixed partition), by inwnpa, officecode and feature of 'NRA' based on RLdehocsm.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 5000 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

```
DNRARTE     relid = 2575  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL
     inwnpa       DMONPA       (ushort: 10)      <--- key

# DNU2EEC

## 1. Description

DNU sts1 to Neptune sts translator. Neptune is external hardware that performs echo cancellation for DNU ports. Neptune control is via an *Ethernet*™ link. This relation should not exist in an SM-2000. Neptune will only be associated with DNU trunks which only appear on SM-2000.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 96 |
| expected tuples in relation | 24 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |

## 3. Field Layout

```
DNU2EEC     relid = 2935  DBSTATIC   DBACC_HASH  DBPRAM    FP      NULL

## 4. Population rules for RLdnu2eec

### Relation Description

DNU to Neptune External Echo Canceler Address

The keys are: dnu_s, dnu_sts1
Each tuple represents a DNU STS1(an STS1=28vts, a vt = a DS1) and identifies an Ethernet(R) address in order to access the associated Neptune echo canceler. The tuple also defines which Neptune packs are active - each active pack controlling 4 vts.

Copyright © 1999 Lucent Technologies

**Attribute:**
dnu_s
**Fullname:**
DNU frame identification, a number between 0 and 7.
**Attribute Description:**
Tuple Key.
Identifies a DNU frame that is connected to an external Neptune echo canceler which is potentially active on one or more of its associated vt(ds1) entities identified by attributes dnu_sts1 and vt00 through vt24.

**Attribute:**
dnu_sts1
**Fullname:**
STS1 identification, a number between 0 and 11.
**Attribute Description:**
Tuple Key.
Each DNU frame has 12 STS1 entities - any one can be connected to any Neptune frame with the exception that on EXM type modules, the DNU and associated Ethernet(R) access to Neptune must coexist on the same SM.

**Attribute:**
enet_sm
**Fullname:**
Ethernet(R) Switch Module
**Attribute Description:**
Identifies the hosting SM for access to a Neptune Echo canceler controller, a number between 1 and 192.

**Attribute:**
epipe
**Fullname:**
Ethernet(R) Pipe
**Attribute Description:**
Number of the Ethernet(R) pipe on which this Ethernet(R) link resides. This should be a value between 0 and (SMDBMEPIPES - 1), inclusive.

**Attribute:**
elnk
**Fullname:**
Ethernet(R) link.
**Attribute Description:**
Number of the Ethernet(R) link. This should be a value between 0 and (SMDBMELNKS - 1), inclusive.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
nept_sts
**Fullname:**
Neptune STS port.
**Attribute Description:**
Identifies the Neptune STS port, a number between 0 and 2.

**Attribute:**
vt00
**Fullname:**
vt00 also applies to vt04..vt24.
Virtual Tributary 00 thru 24.
**Attribute Description:**
Identifies which circuit packs are equipped and actively performing echo canceler functions. Each pack affects 4 consecutive VTs (DS1s). ie: vt00 affects DS1=00,01,02,03.
See "Cadenza II Shelf Plug-Ins Layout For Neptune" here.

**Relation Description**

Destination point code index mapping

This relation provides basic information about a destination point code with an index to the RLdpc_info relation which provides more information.

**Attribute:**
dpc
**Fullname:**
Destination point code
**Attribute Description:**
The destination point code is an arbitrary number which is assigned to an office in the signaling network.

**Attribute:**
lnk_set
**Fullname:**
Link set/Combined Link set
**Attribute Description:**
This attribute represents the link set or combined link set that is normally used for reaching this DPC.

**Attribute:**
dpcindx
**Fullname:**
Destination point code index
**Attribute Description:**
An index into RLdpc_info relation which lists all DPC's.

**Attribute:**
rtcase
**Fullname:**
routing case index
**Attribute Description:**
The routing case index attribute is used as index for RLrtcase relation. It is meaningful only when Gl_rmrte equals DBYES.

**Attribute:**
mtxindx
**Fullname:**
STP OPC Policing Matrix Index
**Attribute Description:**
The STP OPC policing matrix index is a sequential number which is assigned to the DPC when this DPC is being policed.

Copyright © 1999 Lucent Technologies

**Attribute:**
adjacent
**Fullname:**
Adjacent Point Code Flag
**Attribute Description:**
The adjacent attribute is a boolean bit used to indicate whether the DPC (key) is an APC. The bit is set to DBYES if the DPC is an APC and DBNO is the DPC is a Non-Adjacent Point Code.

**Attribute:**
lspcindx
**Fullname:**
Incoming Linkset/DPC Policing Index
**Attribute Description:**
The attribute, lspcindx, will be set to a non-zero value when the DPC associated with the tuple is being policed by the ILS/DPC Policing Feature

**Attribute:**
accpcindx
**Fullname:**
MTP Accounting Point Code Index
**Attribute Description:**
The attribute, accpcindx, will be used to indicate the Point Code (key) is being accounted for by the MTP Accounting Feature

**Attribute:**
gtpcindx
**Fullname:**
SCCP Accounting Point Code Index
**Attribute Description:**
The attribute, gtpcindx, will be used to indicate the Point Code (key) is being accounted for by the SCCP Accounting Feature

**Attribute:**
rmtinit_ssna
**Fullname:**
SCCP Remote Init SSN Allowed
**Attribute Description:**
After a remote init/restart, the states of the SSNs at this DPC are initialized as Allowed, if the value of this parameter is DBYES and lclinit_spec has the value DBYES. If the value is DBNO and lclinit_spec is DBYES then they are initialized as prohibited.

**Copyright © 1999 Lucent Technologies** 

```
        If lclinit_spec is DBNO then the values are calculated based
        upon sccp_type. See also attribute lclinit_spec of RLgsm_net.

Defines:
        "db/RLdpc_info.h",
        "ccs/CCc7_param.h"
```

## 4. Population Rules for RLdpc_info

**Relation Description** Destination point code information
This relation provides detailed information about a national and international SS7 destination point code.

**Attribute: dpcindx**

**Fullname:** Destination point code index.

**Attribute Description** The index for this particular DPC.

**Attribute: num_evencic**

**Fullname:** Even numbered circuit identification code.

**Attribute Description** The number of cics that are populated in the RLlab7_sm or RLlab7sm relation (depending on which is populated) for this given dpcindx that are even numbered.

**Attribute: num_oddcic**

**Fullname:** Odd numbered circuit identification code

**Attribute Description** The number of cics that are populated in the RLlab7_sm or RLlab7sm relation (depending on which is populated) for this given dpcindx that are odd numbered.

**Attribute: apcindx**

**Fullname:** Adjacent point code index.

**Attribute Description** An index into the listing of all APC's if the DPC being defined is adjacent. (that is, has signaling links directly connected to it.)

**Attribute: olo1_pc**

**Fullname:** Other licensed operator #1 point code

**Attribute Description** This attribute is a point code assigned by OLO1.

**Attribute: olo2_pc**

**Fullname:** Other licensed operator #2 point code.

**Attribute Description** This attribute is a point code assigned by OLO2.

**Attribute: olo3_pc**

**Fullname:** Other licensed operator #3 point code.

**Attribute Description** This attribute is a point code assigned by OLO3.

**Attribute: olo4_pc**

**Fullname:** Other licensed operator #4 point code

**Attribute Description** This attribute is a point code assigned by OLO4.

**Attribute: altls1**

**Fullname:** First alternate link set or combined link set

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute must contain the link set number or combined link set number which is to be considered the first alternate link set or first alternate combined link set used to carry signaling traffic to the destination.

**Attribute: altls2**

**Fullname:** Second alternate link set or combined link set.

**Attribute Description** This attribute must contain the link set number or combined link set number which is to be considered the second alternate link set or second alternate combined link set used to carry signaling traffic to the destination.

**Attribute: altls3**

**Fullname:** Third alternate link set or combined link set

**Attribute Description** This attribute must contain the link set number or combined link set number which is to be considered the third alternate link set or third alternate combined link set used to carry signaling traffic to the destination.

**Attribute: altls4**

**Fullname:** Fourth alternate link set

**Attribute Description** This attribute must contain the link set number which is to be considered the fourth alternate link set used to carry signaling traffic to the destination.

When Gl_rmrte equals DBYES then altls4 is not used to route messages and, this attribute is 0 for all tuples in RLdpc_info relation.

**Attribute: polindx**

**Fullname:** Policing index

**Attribute Description** If the DPC is being policed then populate with the next policing index value available from RLindx.

**Attribute: olo_id**

**Fullname:** Other licensed operator identifier.

**Attribute Description** This attribute is populated with the olo network number if the DPC is within an adjacent olo network.

Populate with the number ( 1-4 ) which is assigned to the Other Licensed Operator (OLO) which owns the DPC.

**Attribute: olomask**

**Fullname:** Other licensed operator mask

**Attribute Description** This attribute is used to administer which OLO's have point codes defined for the destination

**Attribute: stprte**

**Fullname:** Signal transfer point routing.

**Attribute Description** This attribute specifies if this office can act as an STP for the destination point code. It will have a value of DBYES if it can act as an STP, and a value of DBNO if it can not act as an STP. If this attribute is set to DBNO, TFP's and TFA's relating to this Destination Point Code will not be sent. The value for this attribute will come directly from RC.

## 4. Population Rules for RLdpc_ssn

**Relation Description** Destination Point Code, Network Number to Subsystem Numbers Mapping Relation. This relation specifies all the subystem numbers on a particular destination point code and network number.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This attribute specifies a SS7 International, SS7 National, or CCSNA7 Point Code.

**Attribute: net_num**

**Fullname:** SCCP Network Number

**Attribute Description** This attribute provides a mapping from a SCCP Global SM to index called network number.

**Attribute: ssn1**

**Fullname:** Subsystem Number (1)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

**Attribute: ssn2**

**Fullname:** Subsystem Number (2)

**Attribute Description** This attribute specifies a subsystem that is on this DPC and Network Number.

**Attribute: ssn3**

**Fullname:** Subsystem Number (3)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

**Attribute: ssn4**

**Fullname:** Subsystem Number (4)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

Copyright © 1999 Lucent Technologies 

**Attribute: ssn5**

**Fullname:** Subsystem Number (5)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

**Attribute: ssn6**

**Fullname:** Subsystem Number (6)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

**Attribute: ssn7**

**Fullname:** Subsystem Number (7)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

**Attribute: ssn8**

**Fullname:** Subsystem Number (8)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

**Attribute: ssn9**

**Fullname:** Subsystem Number (9)

**Attribute Description** This attribute specifies a subsystem number on this DPC and Network Number.

## 4. Population Rules for RLdpcind

**Relation Description** Destination Point Code, Subsystem Number, Network Number Mapping Relation. This relation provides a mapping from a Destination point code, subsystem number, and network number to a psn_index.

**Attribute: dpc**

**Fullname:** Destination Point Code

**Attribute Description** This attribute represents a SS7 International or SS7 National Destination Point Code.

**Attribute: ssn**

**Fullname:** Subsystem Number

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute specifies a subsystem number on a particular destination point code switch.

**Attribute: net_num**

**Fullname:** SCCP Network Number

**Attribute Description** This attribute provides a mapping from a SCCP Global SM to an index called network number.

**Attribute: psn_index**

**Fullname:** Point Code/Subsystem Number/Network Number Index

**Attribute Description** This attribute specifies an index that represents a Destination Point Code, Subsystem Number and Network Number tuple.

**Attribute: num_gtts**

**Fullname:** Number of Global Title Translations to this DPC, SSN, and NETWORK NUMBER

**Attribute Description** This attribute is used by RC/V to determine if the user is allowed to delete this point code.

**Attribute: prim_dest**

**Fullname:** Defined as a Primary Destination

**Attribute Description** The attribute specifies whether this dpc/ssn/network number has yet to be defined as a primary destination.

**Attribute: num_bck**

**Fullname:** Number of times defined as Backup DPC

**Attribute Description** The attribute specifies the number of dpc/ssn/network number combinations that this tuple has been defined as a backup.

## 4. Population Rules for RLdpidb_pt

**Relation Description** Directly connected peripheral interface data bus.
Relation describes the ports that are assigned particular nailed-up timeslots on DPIDBs connecting the PSIU and ISLU(2) AIU or IDCU.

**Attribute: dpidb**

**Fullname:** Circuit name of the directly connected PIDB.

**Attribute Description** A corresponding tuple is contained in RLCKTDATA. Regardless of the eqstat of the PIDB, if it is contained in RLcktdata and is of pidbtype PCDPIDB, it should be contained in RLdpidb_pt.

**Attribute: key_slot**

**Fullname:** The beginning timeslot of this half of the DPIDB.

**Attribute Description** The beginning timeslot of this half of the DPIDB. Valid entries are 0, and 16, such as the DPIDB is divided into halves: timeslots 0-15, and 16-31. The keys 0 and 16 indicate which half of the DPIDB is being accessed. For each DPIDB, two entries should be contained in this relation.

**Attribute: odb_min**

**Fullname:** Minimum number of time slots that must be left unassigned.

**Attribute Description** This attribute indicates the min. number of time slots that must be left unassigned. This is so that ODB will have at least that many time slots available for use when the feature is used. Note that if the value is set to 0, then all time slots can be assigned for other purposes. In that case, this DPIDB cannot be used for ODB (the DPIDB cannot be assigned to any ODB user).

The two tuples that have the same DPIDB key (one with key_slot = 0 and the other with key_slot = 16) should be redundantly populated with odb_min.

**Attribute: time[*]_slot**

**Fullname:** Nth time slot.

**Attribute Description** a structure that contains the four possible ports that could be contained in the 0th DPIDB timeslot for this half of the DPIDB. (DPIDB timeslot 0 or 16 )

If a nailed-up path uses a full timeslot, then fill in all four entries with the single port name.

D-channels all sharing the same DPIDB timeslot must be assigned to the same 'dsl_group' in RLDSLEQUIP.

D-channels all sharing the same DPIDB timeslot AND connected to a PH that has rate adapt chips (PH 16), must be assigned to HDLCs on the same rate adapt chip. The HDLC number a D-channel is assigned is given by the 'member' attribute in relation RLdslequip. Members (0 - 5), (6 - 11), (12 - 15) reside on rate adapt chips 0, 1 and 2 respectively on PH 16. Therefore, if D-channels share the same DPIDB timeslot and are connected to a PH 16, all those D-channels must be assigned member numbers in a single one of the three sets (0 - 5), (6 -11) or (12 -15).

**Copyright © 1999 Lucent Technologies** 

The PH128 does not have the previous restriction because there are no Rata Adapt chips in the PH128 hardware.

Note that ISLU D-channels sharing the same DPIDB timeslot must all connect to the same LGC for an ISLU, or the same LG for ISLU2. In other words, all the ports in a particular DPIDB timeslot structure (see the following) must be ports on the same LGC for ISLU, or the same LG for ISLU2.

Note also that different DPIDBs on the same ISLU cannot connect to the same LGC timeslot. In other words, if DPIDB 'X', timeslot 'Z', is connected to a port on LGC 'Y', then DPIDB 'Q' cannot also use timeslot 'Z' for any ports on DPIDB 'Q' connected to LGC 'Y'. Got it?

Note also that different DPIDBs on the same ISLU(2) cannot connect to the same LG timeslot. In other words, if DPIDB 'X', timeslot 'Z', is connected to a port on LG 'Y', then DPIDB 'Q' cannot also use timeslot 'Z' for any ports on DPIDB 'Q' connected to LGC 'Y'.

As a cross-check, one should read the population rules for the RLislulgc 'dpidb_mask' attribute and the population rules for the RLdslequip attributes 'dpidb', 'timeslot', 'qts', 'ds1' (IDCU only), and 'ds1_ts' (IDCU only).

Note that AIU D-channels sharing the same DPIDB timeslot must all connect to the same AP for an AIU. In other words, all the ports in a particular DPIDB timeslot structure must be ports on the same AP for AIU.

A nailed-up DSL B-channel for X.25 packet switching always uses a full time slot.

**Attribute: time[*]_slot.port0**

**Fullname:** Port0.

**Attribute Description** The name of the port using the first quarter of the timeslot consisting of PCM bits 0 and 1. The appropriate DPIDB, timeslot and quarter timeslot should also be contained in RLDSLEQUIP attributes dpidb, timeslot and qts for this port.

Also, for ISLU ports, this timeslot should be masked in relation RLISLULGC attribute dpidb_mask for the parent lgc of port0.

Also, for ISLU2 ports, this timeslot should be masked in relation RLISLU2LG attribute dpidb_mask for the parent lg of port0.

For AIU ports, this timeslot should be masked in relation RLAIU2AP attribute dpidb_mask for the parent ap of port0.

Default value is 0 for unassigned quarter timeslots.

**Attribute: time[*]_slot.port1**

**Fullname:** Port1.

**Attribute Description** The name of the port using the second quarter of the timeslot consisting of PCM bits 2 and 3. The appropriate DPIDB, timeslot and quarter timeslot should also be contained in RLDSLEQUIP attributes dpidb, timeslot and qts for this port.

Also, for ISLU ports, this timeslot should be masked in relation RLISLULGC attribute dpidb_mask for the parent lgc of port1.

Also, for ISLU2 ports, this timeslot should be masked in relation RLISLU2LG attribute dpidb_mask for the parent lg of port1.

Copyright © 1999 Lucent Technologies 

For AIU ports, this timeslot should be masked in relation RLAIU2AP attribute dpidb_mask for the parent ap of port1.

Default value is 0 for unassigned quarter timeslots.

**Attribute: time[*]_slot.port2**

**Fullname:** Port2.

**Attribute Description** The name of the port using the third quarter of the timeslot consisting of PCM bits 4 and 5. The appropriate DPIDB, timeslot and quarter timeslot should also be contained in RLDSLEQUIP attributes dpidb, timeslot and qts for this port.

Also, for ISLU ports, this timeslot should be masked in relation RLISLULGC attribute dpidb_mask for the parent lgc of port2.

Also, for ISLU2 ports, this timeslot should be masked in relation RLISLU2LG attribute dpidb_mask for the parent lg of port2.

For AIU ports, this timeslot should be masked in relation RLAIU2AP attribute dpidb_mask for the parent ap of port2.

Default value is 0 for unassigned quarter timeslots.

**Attribute: time[*]_slot.port3**

**Fullname:** Port3.

**Attribute Description** The name of the port using the first quarter of the timeslot consisting of PCM bits 6 and 7. The appropriate DPIDB, timeslot and quarter timeslot should also be contained in RLDSLEQUIP attributes dpidb, timeslot and qts for this port.

Also, for ISLU ports, this timeslot should be masked in relation RLISLULGC attribute dpidb_mask for the parent lgc of port3.

Also, for ISLU2 ports, this timeslot should be masked in relation RLISLU2LG attribute dpidb_mask for the parent lg of port3.

For AIU ports, this timeslot should be masked in relation RLAIU2AP attribute dpidb_mask for the parent ap of port3.

Default value is 0 for unassigned quarter timeslots.

**Attribute: dpidb_mask**

**Fullname:** The status of each time slot on a DPIDB.

**Attribute Description** This attribute indicates the status of each time slot on a DPIDB. It is non-redundantly populated in the two tuples that have the same value in the key attribute dpidb. (one with key_slot=0, and other one with key_slot=16).

Bit 0 of the dpidb_mask corresponds to time slot 0 (or 16) if the key_slot of the tuple is 0 (or 16).

Bit 0 of the mask is on the right side of the field. For example, time slot 1 would be represented 0x02.

If a time slot is assigned to a nailed up connection, then the corresponding bit of dpidb_mask of the tuple should be masked as 0, otherwise it is masked as 1. Even if a time slot is not fully used, as long as it is used for nailed-up connection, the corresponding bit of dpidb_mask of the tuple should

Copyright © 1999 Lucent Technologies 

be masked as 0.

## 4. Population Rules for RLdr_cf

**Relation Description** Distinctive ringing constructed feature.

The distinctive ringing (DR) modular feature provides distinctive ringing cycles to the subscriber line.

Distinctive ringing indicates the origin of calls terminating to the subscriber.

**Attribute: feat_id**

**Fullname:** feature id

**Attribute Description** Verify that RLfacname has a tuple such that feat_id = RLfacname.facid, and

Copyright © 1999 Lucent Technologies 

RLfacname.class = FACBRCS for that tuple.

**Attribute: actvn**

**Fullname:** activation type

**Attribute Description**

```
ACTNONE     1) RLdr_cf.dctvn = DCTNONE or DCTCD
            2) RLdr_cf.bill_typ.flat = DBYES
ACTCD       1) RLdr_cf.dctvn = DCTCD
            2) Verify tuple exists in dial tree
               RLdaprlfnl or RLidp_dtre with
               'action' attribute = ACN_FTACT
               for the given dial code.
```

**Attribute: dctvn**

**Fullname:** deactivation type

**Attribute Description**

```
DCTNONE     1) RLdr_cf.actvn = ACTNONE
DCTCD       1) RLdr_cf.actvn = ACTCD or ACTNONE
            2) Verify tuple exists in dial tree
               RLdaprlfnl or RLidp_dtre with
               'action' attribute = ACN_FTDCT for
               the given dial code.
```

**Attribute: filter**

**Fullname:** party filtering for called, calling party

**Attribute Description** Party filtering for called, calling party.

**Attribute: filter.intratg**

**Fullname:** intra-terminal group

**Attribute Description** This attribute specifies whether intra-terminal calls can have DR (does not include attendant calls).

**Attribute: filter.intraoff**

**Fullname:** intra-office

**Attribute Description** This attribute specifies whether intra-office calls can have DR (does not include attendant or intra-terminal group calls).

**Attribute: filter.interoff**

**Fullname:** inter-office

**Attribute Description** This attribute specifies whether inter-office calls can have DR (does not include private facility access calls).

**Attribute: filter.pf**

**Fullname:** private facility

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** This attribute specifies whether private facility access calls can have distinctive ringing.

**Attribute: filter.attndnt**

**Fullname:** attendant

**Attribute Description** This attribute specifies whether calls from an attendant can have DR.

**Attribute: featyp**

**Fullname:** calling party feature filtering

**Attribute Description** This attribute determines the type of feature using DR, only one of the following values may be used at any one time. The featyp values are as follows:

(1) DR_CFV This option allows for call forwarding variable (CFV) or call forwarding night service to apply distinctive ringing at the forward-to station. This feature is used primarily for night service, but is applicable to any call-forwarding feature that has the call forwarding modular feature attribute, FWDCOND set to BOTH.

(2) DR_CWO This option allows call waiting originating type calls from the attendant to apply distinctive ringing to the called party.

(3) DR_DCW This option allows dial call waiting type calls to apply distinctive ringing to the called party.

(4) DR_MWY This option allows for entry when an attendant sets up an added leg of a multiway call.

(5) DR_NONE This option indicates that distinctive ringing is not activated by any incoming feature but will automati- cally be active on all inter-office and intra-office calls but not on intra-terminal group calls.

**Attribute: chg_ring**

**Fullname:** ringing pattern

**Attribute Description** This attribute specifies whether the customer is allowed to change the ringing pattern.

NOTE- Following are per-line parameter for the DR feature that may be set during feature definition or during feature assignment.

Copyright © 1999 Lucent Technologies

## 4. Population Rules for RLdr_ltm

**Relation Description** Distinctive ringing feature per_line data.

Distinctive ringing may not be assigned to lines which are members of Multiposition hunt groups or members of an ISDN Attendant hunt group (ISAT). If RLport_grp keyed by RLltm_port.port (if non-ISDN) or RLis_line.lead_module and RLis_line.lead_lport (if ISDN) exists and RLrt_mhg.htype is RTH_MUPH, then this line is a member of a MUPH group.

The following is a list of valid service classes for ports assigned this feature:

```
LINES
-----
FC_INDVDL
FC_ATTENDANT
FC_4WIRE_INDV
FC_PBX
FC_ISDN
SPECIAL ENTRY FOR GROUP PARAMETER ASSOCIATED WITH BFG
```

Copyright © 1999 Lucent Technologies

---

BFG, capability G268, is intended to improve recent change (RC) response time and provide for SM memory reduction. It permits the creation of groups of BRCS features and parameters, and utilization of these groups by call processing. New group parameter relations will not be created, but will be populated in the existing relations. The group parameters will be identified by lead_module equal to zero. (see lead_module for details)

This relation has now two types of tuples distinguished primarily by LTM_TYPE.

1. The FIRST TYPE is the existing RLdr_ltm tuples which are group partitioned and remain unchanged (ltm_type = LTM_ISDN or LTM_OTHER).

2. The SECOND TYPE is the BFG GROUP PARAMETER tuple and is also group partitioned. This tuple is accessed by keys lead_module(equal to zero), ltm_index and ltm_type = LTM_ISDN(default for BFG) The BFG GROUP PARAMETER tuples were put in this relation to avoid creation of a new relation and minimize changes in the existing relation.

For BFG purposes, RLdr_ltm is a Group type. Therefore, only BFG Pseudo port tuple is permitted for the port assigned to a BFG. Individual port tuples may not be created for BFG assigned ports (when the feature is in the BFG). AT most one dr modular feature is allowed to be constructed inside a single BFG."

**Attribute: ltm_type**

**Fullname:** logical termination index type

**Attribute Description** IF RLdr_ltm.lead_module = zero RLdr_ltm.ltm_type is equal to LTM_ISDN then the tuple in the relation refers to BRCS feature grouping (BFG) group parameter tuples . See special entry for group parameter associated with BFG.

Dependency:
if LTM_ISDN, verify existence of tuple in RLis_line with this lead_module and ltm_idx. If RLdr_ltm.lead_module is equal to zero then a tuple must exist in RLis_line relation such that :

```
if RLfc_portyp.servclass = FC_ISDN,
RLdr_ltm.ltm_idx = RLis_line.bfgid
  RLdr_ltm.ltm_idx = RLfc_line.bfgid
```

**Attribute: lead_module**

**Fullname:** lead module

**Attribute Description** Dependency: Range value 0 allowed only for ltm_type = LTM_ISDN (these define the BFG case)

**Attribute: ltm_idx**

**Fullname:** logical termination index

**Attribute Description** Attribute ltm_idx has a domain range that starts with 0. The range in this relation starts with 1. As discussed in RLrc_smidx, the existence of an index implies the value 1 or greater. If no index is defined, RLrc_smidx would contain an ltm_idx value of 0 and no tuple would exist in this relation. Therefore, ltm_idx must be greater than 0 in this relation.

If lead_module is zero then ltm_idx range is 256-65535 for SM-2000 and 256-8191 for an SM.

**Attribute: feat_id**

**Fullname:** distinctive ringing constructed feature id

Copyright © 1999 Lucent Technologies 

**Attribute Description** Dependencies:

(1) Verify existence of tuple in RLdn_feats with same key (lead_module, ltm_type, ltm_idx). The RLdn_feats tuple must have an attribute, fid such that (mftype of MFDR + RLdr_ltm.feat_id) = RLdn_feats.ftent[n].fid. See the following NOTE.

(2) Verify existence of tuple in RLdr_cf with mftype of MFDR + RLdr_ltm.feat_id as key value. See the following NOTE.

NOTE: MFDR is defined in db/DMmftype.G. Adding mftype to feat_id before reading RLdn_feats or RLdr_cf is necessary because the feat_id in this relation is the unique 10 bits of the FID, it does not include the mftype. Whereas, RLdn_feats and RLdr_cf store the entire FID (mftype + 10 unique bits).

**Attribute: dring**

**Fullname:** distinctive ringing pattern

**Attribute Description** Identifies type of Distinctive Ringing pattern Dependencies: dring can have the values DR_E or DR_F if and only if RLfc_porttyp.servclass for this port = FC_4WIRE_INDV. Verify ltm_type == OTHER, read RLltm_port with this ltm_idx to obtain port. Next read FCporttyp and verify that servclass == FC_4WIRE_INDV.
SPECIAL CHECK FOR MLHG:
A MLHG line that is a MUPH line (RLrt_mhg.htype = RTH_MUPH) cannot have distinctive ringing.

```
If ltm_type == OTHER
       read RLltm_port with this ltm_idx to obtain port
       and party.
else
       read RLis_line with this lead_module and ltm_idx
       to obtain lead_lport. Next use lead_lport and
       lpt_type = LPT_ISDN to read RLlpt_pt to obtain the
       port and party.
Use port to read RLfc_porttyp.
If RLfc_porttyp.hunt == DBYES
       Use port and party to read RLport_grp to obtain grpnum.
       Use grpnum to read RLrt_mhg
       Verify that RLrt_mhg.htype != RTH_MUPH.
```

## 4. Population Rules for RLds_app

**Relation Description** Direct signaling application parameters relation
This relation translates a direct signaling application type into a translation type and a subsystem number (this relation is only used by a direct signaling application providing a service that uses the Common Channel Signaling System 7 protocol). This relation is mainly used by the ccs subsystem.

Copyright © 1999 Lucent Technologies

The ds_type enumeration, CCACND, is used by Analog Calling Name Delivery Special Feature (SFID40). The feature must be purchased and SFID40 must be set to populate a CCACND tuple.

WARNING!!
If any new ds_type enumerations are added, please contact the module owner of ct/CTdlndb. A change will be required to increase the maximum tuple size in the DLN.

**Attribute: ds_type**

**Fullname:** Direct signaling application type

**Attribute Description** The direct signaling application type that is providing a service that uses the CCS7 protocol. Valid values for ds_type are:

CCNS800 - - Number Services 800 (SSP)

CCLASS - - Local Area Signaling Services (LASS)

CCLIDB - - Line Interface Database (LIDB)

CCAT1 - - *ANSI*™ Type I Signaling to a Database (AT1)

CCLALT - - LIDB Alternate Destination (LALT)

CCAPSDN - - Software Defined Network (SDN)

CCDCIS - - Destination routed CCIS6 (DCIS)

CCPVN - - Private Virtual Network (PVN) service

CCLNACP - - Leased Network Action Point (LNACP).

CCCAS7 - - CCS7 Signaling to a CAS/NCP Database

CCICCV - - ICCV Signaling to a Foreign Database

CCISVM - - Inter-Switch Voice Messaging (ISVM)

CCACND - - Analog Calling Name Delivery (ACND).

CCAINR01 - - AIN Release 0.1B

CCNCD7 - - Network Call Denial (NCD)

CCONAI - - Network Access Interrupt for OSPS (ONAI)

CCTNAI - - Network Access Interrupt for Toll (TNAI)

CCAILS - - Automated Inward Line Screening (AILS)

CCOLNP - - OSPS Local Number Portability (OLNP)

5E8 ONLY:

The value "LALT" appears to the customer for the LIDB Alternate Destination although the value of ds_type is CCAT2. Through the RDL overlay process, this spare was used and RC/V displays "LALT". If accessed through odbe, the value "CCAT2" is used.

**Copyright © 1999 Lucent Technologies** 

**Attribute: trans_type**

**Fullname:** Translation type

**Attribute Description** The translation type to be used for the specific service the application is performing. It is included in the message to the CCS7 Network (external to the switch). It corresponds with the global title translation tables in the Signaling Transfer Point (STP) network for this service. If the ds_type is CCDCIS, the translation type field will be ignored. DCIS type direct signaling does not use a translation type.
If ds_type is CCCAS7 or CCICCV, then the value of trans_type in RLds_app is invalid. In this case, the value of trans_type in RLtcr_f[2-7]dv should be used instead. If ds_type is CCAT1, then the value of trans_type in RLds_app is invalid and the value of trans_type in RLtcr_f[2-7]dv should be used instead.

**Attribute: ssn**

**Fullname:** Subsystem number

**Attribute Description** The subsystem number assigned to this direct signaling application. For each ds_type, the subsystem number must be unique. It is included in the message to the CCS7 Network (external to the switch).

The valid range for attribute ssn is 0 - 22. The valid range of subsystem numbers is 232 - 254. After the database is read, it is up to the application to add the proper offset, 232, to the attribute ssn to get the valid subsystem range.

***NOTE:*** The reason the range of attribute ssn is 0 - 22 instead of 232 - 254 is that the range of ssn in the mirror relation, ds_ssn, is 0 - 22. In that relation ssn is the key and when the range is 0 - 22, it allows us to take advantage of indexed searching instead of linear searching. It also saves memory and search time. Also, we want to be consistent in the way the two relations are to be used.

## 4. Population Rules for RLds_ssn

**Relation Description** Direct signaling subsystem parameters relation
This relation translates a direct signaling subsystem number into a direct signaling application type. This relation is mainly used by the ccs subsystem.

The ds_type enumeration, CCACND, is used by Analog Calling Name Delivery Special Feature (SFID40). The feature must be purchased and SFID40 must be set to populate with ds_type = CCACND.

WARNING!!
If the valid range of subsystem numbers changes, please contact the module owner of ct/CTdlndb. A change will be required to modify database code in the DLN.

Copyright © 1999 Lucent Technologies 

This relation is only used by a direct signaling application providing a service that uses the Common Channel Signaling System 7 protocol.

**Attribute: ssn**

**Fullname:** Subsystem number

**Attribute Description** The subsystem number assigned to this direct signaling application. It is included in the message from the CCS7 Network (external to the switch).

The valid range of subsystem numbers is 232 - 254. The valid range for the attribute ssn is 0 - 22. Before the database is read, it is up to the application to subtract the proper offset, 232, from the attribute subsystem number to get the valid index.

***NOTE:*** The reason the range of attribute ssn is 0 - 22 instead of 232 - 254 is that when ssn is the key we can take advantage of indexed searching instead of linear searching. It also saves memory and search time. The mirror relation, ds_app, also has an attribute ssn (not the key) and it will also have a range of 0 - 22, so that there is consistency in the way the two relations are used.

**Attribute: ds_type**

**Fullname:** Direct signaling application type

**Attribute Description** The direct signaling application type that is providing a service that uses the CCS7 protocol. Valid values for ds_type are:

CCNS800 - - Number Services 800 (SSP)

CCLASS - - Local Area Signaling Services (LASS)

CCLIDB - - Line Interface Database (LIDB)

CCAT1 - - *ANSI*™ Type I Signaling to a Database (AT1)

CCLALT - - LIDB Alternate Destination (LALT)

CCAPSDN - - Software Defined Network (SDN)

CCDCIS - - Destination routed CCIS6 (DCIS)

CCPVN - - Private Virtual Network (PVN) service

CCLNACP - - Leased Network Action Point (LNACP).

CCCAS7 - - CCS7 Signaling to a CAS/NCP Database

CCICCV - - ICCV Signaling to a Foreign Database

CCISVM - - Inter-Switch Voice Messaging (ISVM)

CCACND - - Analog Calling Name Delivery (ACND).

CCAINR01 - - AIN Release 0.1B

CCNCD7 - - Network Call Denial (NCD)

CCONAI - - Network Access Interrupt for OSPS (ONAI)

**Copyright © 1999 Lucent Technologies** 

CCTNAI - - Network Access Interrupt for Toll (TNAI)

CCAILS - - Automated Inward Line Screening (AILS)

CCOLNP - - OSPS Local Number Portability (OLNP)

5E8 ONLY:

The value "LALT" appears to the customer for the LIDB Alternate Destination although the value of ds_type is CCAT2. Through the RDL overlay process, this spare was used and RC/V displays "LALT". If accessed through odbe, the value "CCAT2" is used.

## 4. Population Rules for RLds1_pt

**Relation Description** Facility to semi-permanent or permanent paths (associated with ports)
This relation describes the ports that are assigned permanent or semi-permanent paths on facilities that are associated with TR8 RTs, TR303 RTs, or PUB43801 facilities.

There are two tuples in DS1_PT for each facility which is a PUB43801 and is GROW or OPERATIONAL in RLcktdata, or for each facility which is not a protection line, and which goes to a remote terminal (RT) (TR008 or TR303) and the RT is GROW or OPERATIONAL in RLcktdata.

**Copyright © 1999 Lucent Technologies** 

This data is used by peripheral controller (PC) to determine which timeslots are available for call processing versus those which have already been allocated. The types of ports with path information stored in this relation are:

- On PUB43801 facilities, the ports which are nailed up or hair-pinned.
- On TR008 mode I RTs, the ports which are nailed up or hair-pinned.
- On TR008 mode II RTs, mode II specials (any assigned port which terminates on a SPOTS, COIN, DID, DIDDPT, SSV00, SSV10, FXS, or FXSL channel unit), and nailed up or hair-pinned ports.
- On TR303 RTs, the embedded operations channel (EOC) and timeslot management channel (TMC) ports, their associated (if any) guard timeslots, D-channels, permanent packet B-channels (PPB), and nailed up or hair-pinned ports.

***NOTE:*** On-demand B-channels and direct inward dialing (DID) trunks do not have path information in DS1_PT.

- On TR303 RTs, a special case is for the port name to have the value 0xFFFF, after Recent Change/Verify (RC/V) has deleted the relationship of port to digital signal level 1 (DS1). 0xFFFF will serve as a flag to Terminal Maintenance (TM) provisioning software to change the RLds1_pt portname from 0xFFFF to 0x0000, upon successful deletion of the cross connect in the TR303 RT for this DS1 full timeslot, or this DS1 quarter timeslot.

Each tuple represents one-half of a facility. The 12 attributes ds0_0 through ds0_11 represent the 12 timeslots in that half of the facility. Each of these attributes is a structure containing four fields, one for each quarter timeslot. A field will contain a portname if a port is using that 1/4 time slot. If a Semi-Permenent/Permenent (SP/P) path uses a full DS0, then all four fields will contain the same port name. A field will contain 0xFFFF only for TR303 RTs that need to be provisioned by TM software.

**Attribute: ds1name**

**Fullname:** Facility circuit name

**Attribute Description** This is the circuit name of a facility (DS1).

**Attribute: key_slot**

**Fullname:** Facility Half

**Attribute Description** This attribute indicates which half of the facility the tuple represents. The value of this attribute is the beginning timeslot (0 or 12) of this half of the facility.

**Attribute: ds0[*]**

**Fullname:** SP/P ports in Nth timeslot

**Attribute Description** This is a structure that represents which ports are assigned to each quarter of the Nth timeslot on this half of the facility.

**Attribute: ds0[*].port0**

**Fullname:** Port assigned to first 1/4 timeslot

**Attribute Description** This is the port name of the port that is assigned the First 1/4 of this timeslot. For TR008 RTs and PUB43801 facilities, if no port is using this 1/4 timeslot, then the value of this field is zero. For TR303 RTs, if no port is using this 1/4 timeslot, then the value of this field is 0xFFFF when provisioning to delete the TR303 RT cross connect is needed, otherwise the

Copyright © 1999 Lucent Technologies 

value of this field is zero.

**Attribute: ds0[*].port1**

**Fullname:** Port assigned to second 1/4 timeslot

**Attribute Description** This is the port name of the port that is assigned the second 1/4 of this timeslot. For TR008 RTs and PUB43801 facilities, if no port is using this 1/4 timeslot, then the value of this field is zero. For TR303 RTs, if no port is using this 1/4 timeslot, then the value of this field is 0xFFFF when provisioning to delete the TR303 RT cross connect is needed, otherwise the value of this field is zero.

**Attribute: ds0[*].port2**

**Fullname:** Port assigned to third 1/4 timeslot

**Attribute Description** This is the port name of the port that is assigned the third 1/4 of this timeslot. For TR008 RTs and PUB43801 facilities, if no port is using this 1/4 timeslot, then the value of this field is zero. For TR303 RTs, if no port is using this 1/4 timeslot, then the value of this field is 0xFFFF when provisioning to delete the TR303 RT cross connect is needed, otherwise the value of this field is zero.

**Attribute: ds0[*].port3**

**Fullname:** Port assigned to fourth 1/4 timeslot

**Attribute Description** This is the port name of the port that is assigned the fourth 1/4 of this timeslot. For TR008 RTs and PUB43801 facilities, if no port is using this 1/4 timeslot, then the value of this field is zero. For TR303 RTs, if no port is using this 1/4 timeslot, then the value of this field is 0xFFFF when provisioning to delete the TR303 RT cross connect is needed, otherwise the value of this field is zero.

**Attribute: ds0mask**

**Fullname:** Summary mask

**Attribute Description** This is a 12-bit mask that indicates which DS0s are not available for call processing. For each timeslot in this half of the facility that has one or more 1/4 timeslots assigned to an SP/P service, the corresponding bit in ds0mask is cleared. Also, for each timeslot in this half of the IDCU facility that has one or more 1/4 timeslots marked with the 0xFFFF port flag, the corresponding bit in ds0mask is cleared. All other bits are set.

**Defines:** "db/DMcircuit.h"

## 4. Population Rules for RLds1sid

**Relation Description** DS1 Name to Remote Terminal Site Identifier
This relation maps the external facility (DS1) name to the Remote Terminal (RT) Site Identifier (SID).

**Attribute: sm**

**Fullname:** Switching Module (SM) Number

**Attribute Description** This is the number of the SM.

**Attribute: unitno**

**Fullname:** Unit Number

**Attribute Description** This is the unit number on which the DS1 terminates.

**Attribute: utype**

**Fullname:** Unit Type

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the unit type on which the DS1 terminates.

**Attribute: ds1_num**

**Fullname:** Facility (DS1) Number

**Attribute Description** This is the DS1 number relative to the SM peripheral.

**Attribute: rdt_unit**

**Fullname:** TR-303 RDT unit number.

**Attribute Description** This is the internal RT unit number which is a sequential number assigned to each TR-303 RDT in an SM.

**Attribute: sid**

**Fullname:** RT Site Identifier

**Attribute Description** This is the RT site identifier, which uniquely identifies an RT within an office.

## 4. Population Rules for RLds12rt

**Relation Description** Mapping From Facility Circuit Name to Remote Terminal information.
This relation is used to determine which TR8 or TR303 remote terminal (RT) is associated with a specific facility (DS1) on the *5ESS*®-2000 switch peripheral. The data is used during call processing to determine the RT that is associated with an offhook indication on a facility.

**Attribute: ds1name**

**Fullname:** Facility Circuit Name

**Attribute Description** This is the circuit name of a facility (DS1) that connects a TR8 or TR303 RT to the *5ESS*®-2000 switch peripheral.

Copyright © 1999 Lucent Technologies

**Attribute: rtnum Fullname:** RT Number Relative To *5ESS*®-2000 switch peripheral

**Attribute Description** This attribute uniquely identifies the RT in relation to the *5ESS*®-2000 switch peripheral to which it is connected.

**Attribute: rtmode**

**Fullname:** Remote Terminal Mode

**Attribute Description** This is the mode (I, II, or TR303) of the RT, bank, or shelf.

**Attribute: shf_bnk**

**Fullname:** RT Shelf or Bank Number

**Attribute Description** This is the number of the shelf or bank on which the facility terminates. A value of 0 represents shelf A or bank AB, 1 represents shelf B, 2 represents shelf C or bank CD, and 3 represents shelf D. A value of 0 is used the protection DS1 on TR8 RTs. This attribute applies only to TR8 RTs. For TR303 RTs, the value of this attribute is 0.

**Attribute: is_prot**

**Fullname:** Protection Line

**Attribute Description** This is a boolean that indicates whether this facility is the protection line DS1.

**Attribute: is_backup**

**Fullname:** Backup Link for EOC/TMCs

**Attribute Description** This is a boolean that indicates whether this facility is the backup EOC/TMC link.

**Attribute: rt_ds1**

**Fullname:** Facility Number Relative to RT

**Attribute Description** This is the relative number of the facility on the RT side.

**Defines:** "db/DMcircuit.h"

## 4. Population Rules for RLdsc3pidb

**Relation Description** Digital Service Circuit Model 3 Peripheral Interface Data Bus.

Defines the pidbs associated with a picb connected to a DSC3.

**Attribute: picb**

**Fullname:** peripheral interface control bus

**Attribute Description** The peripheral interface control bus number that is connected to side 0 of the digital service circuit model 3 circuit pack.

**Attribute: unitno**

**Fullname:** unit number

**Attribute Description** The unit number assigned to this digital service circuit model 3 circuit pack. For a DSC3 used as an LDSF the value can be from 00 thru 05.

**Attribute: type**

**Fullname:** circuit type

**Attribute Description** Common board circuit type assigned to this digital service circuit model 3 circuit pack. This board can be used as an LDSF.

**Attribute: config**

**Fullname:** GDSF configuration

**Attribute Description** The GDSF configuration number. It will be 0 for LDSF.

**Attribute: pidb0**

**Fullname:** peripheral interface data bus 0 on the DSC3

**Attribute Description** The peripheral interface data bus 0 number assigned to the first internal PIDB on the Digital Service Circuit Model 3 circuit pack.

**Attribute: pidb1**

**Fullname:** peripheral interface data bus 1 on the DSC3

**Attribute Description** The peripheral interface data bus 0 number assigned to the second internal PIDB on the Digital Service Circuit Model 3 circuit pack.

**Attribute: pidb2**

**Fullname:** peripheral interface data bus 2 on the DSC3

**Attribute Description** The peripheral interface data bus 0 number assigned to the third internal PIDB on the Digital Service Circuit Model 3 circuit pack.

**Attribute: pidb3**

Copyright © 1999 Lucent Technologies 

**Fullname:** peripheral interface data bus 3 on the DSC3

**Attribute Description** The peripheral interface data bus 0 number assigned to the fourth internal PIDB on the Digital Service Circuit Model 3 circuit pack.

## 4. Population rules for RLdscports

**Relation Description**

Dedicated Switch Connection (DSC) number to nailed up controlling and controlled port numbers

This relation will be used to map the Dedicated Switch Connection number to the nailed up controlling port and switching module (SM) and controlled port and SM.

**Attribute:**

dscnum

Copyright © 1999 Lucent Technologies

**Fullname:**
Dedicated switch connection number
**Attribute Description:**
Number for the dedicated switch connection from the ECP to the cellsite through the nailup.

**Attribute:**
cntlg_sm
**Fullname:**
SM on which the controlling port is located.
**Attribute Description:**
SM on which the controlling port for the nailup connection is located.

**Attribute:**
cntlg_port
**Fullname:**
Controlling port of the nailup connection.
**Attribute Description:**

The controlling port for the nailup connection for the DSC.

**Attribute:**
cntld_sm
**Fullname:**
SM on which the controlled port is located.
**Attribute Description:**
SM on which the controlled port for the nailup connection is located.

**Attribute:**
cntld_port
**Fullname:**
Controlled port of the nailup connection.
**Attribute Description:**
The controlled port for the nailup connection for the DSC.

# DSLEQP_R

## 1. Description

This relation assigns a port to a DSL Group ( = logical Protocol Handler, or 'PH').

This is a root storage relation.

Examples of port types are:

- DSL D-channel
- Data Link Terminal (DLT) port (DLT ports include Message Delivery ports and Telecommunicaton Standarization Sector (ITU-TS) Signaling Terminal ports.)
- DSL nailedup B-channel for X.25 packet switching
- Interswitch Packet Trunks
- Inter-SM ports
- EDSL D port

## 2. Data Dictionary Values

| | |
|---|---|

# DSLEQUIP

## 1. Description

This relation assigns a port to a DSL Group ( or logical Protocol Handler, or 'PH').

This is a virtual update relation. The tree diagram Figure 1 depicts the stored structure of virtual relation DSLEQUIP.

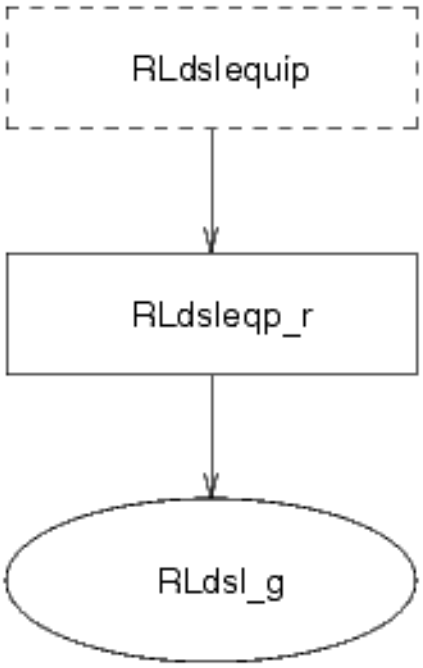

**Figure 1 Virtual Relation DSLEQUIP**

```
Examples of port types are:
   - DSL D-channel
   - Data Link Terminal (DLT) port (DLT ports include Message
     Delivery ports and   Telecommunication Standardization
     Sector (ITU-TS)   (formerly CCITT) Signaling Terminal ports.)
   - DSL nailedup B-channel for X.25 packet switching
   - Interswitch Packet Trunks
   - Inter-SM ports
   - EDSL D port
```

## 4. Population rules for RLdslequip

### Relation Description

Digital subscriber line (DSL) equipment assignment

This relation assigns ports to a DSL group. A DSL group is a representation of a logical protocol handler (PH).

The PRL in this file does not include any rules for international.

ISDN Poprules

CSD - Circuit switched data
CSV - Circuit switched voice
ODB - On-demand B-channel packet switching
PPB - Permanent B-channel packet switching
PPD - Permanent D-channel packet switching

1. DSL D-channel

| Description of port (servclass) | dserv | l2prof | dslrate | b1serv | b2serv |
|---|---|---|---|---|---|

Copyright © 1999 Lucent Technologies 

STANDARD APPLICATION DSL D-CHANNELS (FCPORTTYP.servclass = FC_ISDN)

Standard integrated services digital network (ISDN) DSL:
no permanent packet B-channel (PPB) service, number of
users is zero to eight:

```
ISDN DSL        PSSX    PSXISDN PSDSL16KB       RTDMD_SRV       RTDMD_SRV
B1:  unrestricted
B2:  unrestricted
```

Standard ISDN DSL: PPB1 service, number of users is zero to eight:

```
ISDN DSL w PPB1 PSSX    PSXISDN PSDSL16KB       RT_X25          RTDMD_SRV
B1:  X.25 provisioned packet
B2:  unrestricted
```

Standard ISDN DSL: PPB2 service, number of users is zero to eight:

```
ISDN DSL w PPB2 PSSX    PSXISDN PSDSL16KB       RTDMD_SRV       RT_X25

B1:  unrestricted
B2:     X.25 provisioned packet
```

Standard ISDN DSL: PPB1 and PPB2 service, number of users is zero to
eight:

Note: Users can have only permanent packet D-channel (PPD) service.

```
ISDN DSL PPB1/2 PSSX    PSXISDN PSDSL16KB       RT_X25          RT_X25

B1:  X.25 provisioned packet
B2:  X.25 provisioned packet
```

Standard ISDN DSL: PPB1 and/or PPB2 service, number of users is zero:
Note: Users may be created by service orders.

```
ISDN DSL PPB1/2 PSSX    PSXISDN PSDSL16KB       RT_X25          RT_X25
         PPB1   PSSX    PSXISDN PSDSL16KB       RT_X25          RTDMD_SRV
         PPB2   PSSX    PSXISDN PSDSL16KB       RTDMD_SRV       RT_X25
```

Standard ISDN DSL: PPB1 and/or PPB2 service, number of users is zero.
Note: No D-channel access allowed by the switch and no users can be
created by service orders.

```
ISDN DSL PPB1/2 PSADMIN PSISDN  PSDSL16KB       RT_X25          RT_X25
         PPB1   PSADMIN PSISDN  PSDSL16KB       RT_X25          RTNO_SRV
         PPB2   PSADMIN PSISDN  PSDSL16KB       RTNO_SRV        RT_X25
(DSLEQUIP.dflt_gpid equals zero)
```

Modem pool member:

```
DSL where       PSXMP       PSDX      PSDSL16KB     RTNO_SRV   RTNO_SRV
D-channel is
```

(PSX75_TK)

7. Operator services position system (OSPS)-EDSL D-channel (sending OSPS)

| | | | | | |
|---|---|---|---|---|---|
| OSPS-EDSL D-channel (OA_IFOPER) | PS_NA | PSIFPRI | PSDSL64KB or PSDSL64IK or PSDSL56KB | RTNO_SRV | RTNO_SRV |

8. OSPS-EDSL D-channel (receiving OSPS)

| | | | | | |
|---|---|---|---|---|---|
| OSPS-EDSL D-channel (OA_IFTERM) | PS_NA | PSIFPRI | PSDSL64KB or PSDSL64IK or PSDSL56KB | RTNO_SRV | RTNO_SRV |

Note: For populating the 'is_dte' attribute for ISDN ports, see the discussion on is_dte.

Note: For populating the 'q931proc' attribute for ISDN ports, see the discussion on q931proc.

RLdslequip (DSL D-port assignment to a DSL group)
(EDSL D-port assignment to a DSL group)
(OSPS-EDSL D-port assignment to a DSL group)

DESCRIPTION:

This relation provides the DSL group number, physical PH channel number, layer 2 protocol parameter set and the data rate assigned to an EDSLs D-port, or assigned to an OSPS-EDSLs D-port, or assigned to a DSL's D-port.

In these population rules, the terms Extended Digital Subscriber Line (EDSL) and Primary Rate Interface (PRI) are used interchangeable. Since PRI is preferred, all new rules should use PRI instead of EDSL.

KEY FORMAT:

See TUPLE SEMANTICS.

QUANTITY OF TUPLES:

One tuple for each equipped DSL or equipped EDSL or equipped OSPS-EDSL.

TUPLE SEMANTICS:

Copyright © 1999 Lucent Technologies 

All references to EDSL also apply to OSPS-EDSL, unless otherwise noted.

dsl (KEY1) - DSL 16-bit D-port name.
(Must be identified in RLfc_porttyp.)
Possible service class are: FC_ISDN and OA_DAOPER.

- OR -

EDSL 16-bit D-port name.
(Must be identified in RLfc_porttyp.)
Service class is FCEDSL.

- OR -

OSPS-EDSL 16-bit D-port name.
(Must be identified in RLfc_porttyp.)
Service class is OA_IFOPER or OA_IFTERM.
'dsl_group' is the DSL group number (0 to 95)
to which the D-port is assigned.

member - Physical PH channel (0 to 127 for PH128)
to which the D-port is assigned. For PRI and
OSPS D-channels, member must be a multiple of 4.
Each combination of dsl_group and member needs a
tuple in RLequipdsl.

l2prof - Value of type 'DMDSLPROF' based on user terminal
type (see attribute section).

dslrate - Value of type 'DMDSLRATE' based on port type
(see attribute section).

For EDSL D-channels, dslrate is based on dfimode
assigned to the circuit in RLcktdata.

For dfimodes SMT1D4, and SMT1FEB7 use
dslrate = PSDSL56KB.

For dfimodes SMT1FE8Z and SMT164K, use
dslrate = PSDSL64KB.

For dfimodes SMT1FE64K and SMT1D464K, use
dslrate = PSDSL64IK.

For OSPS-EDSL D-channels, dslrate is based on dfimode
assigned to the circuit in RLcktdata.

For dfimodes SMT1D4, and SMT1FEB7 use
dslrate = PSDSL56KB.

For dfimodes SMT1FE8Z and SMT164K, use
dslrate = PSDSL64KB.

For dfimodes SMT1FE64K and SMT1D464K, use
dslrate = PSDSL64IK.

Copyright © 1999 Lucent Technologies 

```
b1serv        - Service allowed on B1 channel.
                Populate according to rules in diagram titled
                'ISDN poprules'.

b2serv        - Same as for B1serv except it applies to channel B2.

dserv         - Value from domain DMdsrv (PS_NA not allowed).

dpktmax       - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

briclass      - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with 'BRI_PP'.

maxterm       - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '1'.

bind_lport    - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

bind_lptype   - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with 'LPT_ISDN'.

ptymlhg       - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

dflt_lport    - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

ppb1_pty      - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '8'.

ppb2_pty      - Same as ppb1_pty

dpkt_cnt      - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

ptyequip      - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

dflt_gpid     - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

acsr_gpid     - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

acsr_inh      - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with 'DBNO'.

cut_noc       - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.

cut_d4        - For DSL D-channels, populate per pop rules.
                For EDSL D-channels, not used; populate with '0'.
```

                For EDSL D-channels, not used; populate with '0'.

Notes  (integrity check)

This relation uses the same attributes as relation RLequipdsl.
Therefore, the following items must match in the two relations:
dsl           - 16-bit D-port name.
dsl_group     - DSL group to which the D-port is assigned.
member        - Physical PH channel number to which the
                D-port is assigned.

                RLdslequip (ISM port assignment to a DSL group)

DESCRIPTION:

This relation provides the DSL group number, physical PH channel
number, layer 2 protocol parameter set and the data rate
assigned to a inter-SM (ISM) port.

KEY FORMAT:
See TUPLE SEMANTICS.

QUANTITY OF TUPLES:
One tuple for each ISM port.

TUPLE SEMANTICS:
dsl (KEY1)    - 16-bit ISM port name.
                Must be identified in RLfc_porttyp with servclass
                PSPKT_ISM and lp_type PCISMPT.
                Every ISM port needs a tuple in RLismpath.
```

Copyright © 1999 Lucent Technologies 

```
dsl_group     - DSL group number (logical PH) to which the ISM port
                is assigned (0 to 95)

member        - Physical PH channel to which the ISM port is
                assigned (0 to 127).  Each combination of 'dsl_group'
                and 'member' needs a tuple in RLequipdsl.
                For PH2s, member values are limited to 0, 4, 8 and 12.
                For PH3s and PH4s, member values must be a multiple
                of 4 between 0 and 127.  Members do not need to be
                assigned sequentially.

l2prof        - Populate with the value of 'PSISMACK' if the
                mate SM (specified in RLismpath) or this SM has
                imtype of SMRSM in RLmodatt.  Otherwise, populate
                with the value 'PSISMUAK'.

dslrate       - Populate with the value of 'PSDSL64IK' if the
                mate SM (specified in RLismpath) or this SM has
                imtype of SMRSM in RLmodatt.  Otherwise, populate
                with the value 'PSDSL64KB'.

dpidb         - Not used; populate with '0'.

timeslot      - Not used; populate with '0'.

qts           - Not used; populate with '0'.

b1serv        - Not used; populate with 'RTNO_SRV'.

b2serv        - Not used; populate with 'RTNO_SRV'.

dserv         - Not used; populate with 'PS_NA'.

dpkt_cnt      - Not used; populate with '0'.

dpktmax       - Not used; populate with '0'.

briclass      - Not used; populate with 'BRI_PP'.

maxterm       - Not used; populate with '1'.

ppb1_pty      - Not used; populate with '8'.

ppb2_pty      - Not used; populate with '8'.

dpkt_cnt      - Not used; populate with '0'.

ptymlhg       - Not used; populate with '0'.

bind_lport    - Not used; populate with '0'.

bind_lptype   - Not used; populate with 'LPT_ISDN'.
```

Copyright © 1999 Lucent Technologies 

```
dflt_lport    - Not used; populate with '0'.

ptyequip      - Not used; populate with '0'.

dflt_gpid     - Not used; populate with '0'.

acsr_gpid     - Not used; populate with '0'.

acsr_inh      - Not used; populate with 'DBNO'.

cut_noc       - Not used; populate with '0'.

cut_d4        - Not used; populate with '0'.

is_dte        - Populate with 'DBYES' if master; otherwise 'DBNO'.

q931proc      - Not used; populate with 'NETWORK'.

Notes (integrity check)

This relation uses the same attributes as relation RLequipdsl
therefore, the following items must match in the two relations:

dsl           - 16-bit ISM port name.
dsl-group     - DSL group to which the ISM port is assigned.
member        - Physical PH channel number to which the ISM port
                is assigned

Every ISM tuple populated in this relation must have a
corresponding tuple with the same key populated in RLismpath.

An ISM tuple in this relation cannot have its attributes' values
modified by recent change.  The tuples must be deleted and added
to change the value of any of its attributes.

                RLdslequip

(Nailed-up B-channel with packet switching assignment to a DSL group)
(Internal protocol (IP) trunk assignment to a DSL group)
(X.75' trunk member)
(X.75  trunk member)
```

Copyright © 1999 Lucent Technologies 

```
TUPLE SEMANTICS:

dsl      (KEY1) - DSL 16-bit port name

                  (Must be identified in RLfc_porttyp)
                  The service class is:
                - FC_ISDN for nailed-up B-channels.
                - PSPKT_TRK for IP trunks.
                - PSX75P_TK for X.75' trunks.
                - PSX75_TK for X.75 trunks.

                  The logical port type is:
                - PCUXB_CHAN or PCTXB_CHAN for nailed-up
                  B-channels (depending on whether the
                  U-line card or T-line card is used).
                - PCISWIP for IP trunks.
                - PCX75PTK for X.75' trunks.
                - PCX75TK for X.75 trunks.

dsl_group       - DSL group number that the port is assigned (0 to 95).
                  Every port must appear in RLequipdsl

member          - Physical PH channel to which the port is assigned
                  (0 to 127).  Each combination of dsl_group and member
                  needs a tuple in RLequipdsl.

                  If PH128, then member can be 0, 4, 8,... (multiple of 4)

                  for X.75', X.75 and IP trunk member on PH2 must be 0

                  for X.75', X.75 and IP trunk members on PH3 and PH4,
                  members can be 0, 4, 8...20; however, it is recommended
                  only 4 X.75' or X.75 trunk members per PH3 or PH4
                  be populated.  All trunk members on a given PH3 or
                  PH4 must be equipped on the same SM and be of the
                  same type (that is, IP, X.75, X.75').

l2prof          - Populate with:
                - For nailed-up B-channels:  PSBXV.
                - For IP trunks:  PSISWV.
                - For X.75' trunks: PSX75_P.
                - For X.75 trunks: PSX75_T.

dslrate         - Populate with:
                - For nailed-up B-channels:  PSDSL64KB or PSDSL56KB.
                  (The data rate is dependent on the customer's choice
                  of terminating equipment.  The customer must be
                  queried for the data rate.)
                - For IP trunks with D3/D4 channel bank:  PSDSL56KB.
                - For IP trunks without D3/D4 channel bank:  PSDSL64KB.
                - For X.75' trunks:  PSDSL56KB.
                - For X.75 trunks:  PSDSL56KB.

dpidb           - For nailed-up B-channels:  see RLislulgc for (R)ISLU,
```

Copyright © 1999 Lucent Technologies 

```
                  RLislu2lg for ISLU2, or RLaiu2ap for AIU  population
                  rules general section, and dpidb_mask usage section for
                  more information on dpidb.

                - For IP trunks:  not used, populate with '0'.
                - For X.75' trunks:  not used, populate with '0'.
                - For X.75 trunks:  not used, populate with '0'.

timeslot        - For nailed-up B-channels:  see RLislulgc for (R)ISLU,
                  RLislu2lg for ISLU2, RLaiu2ap for AIU population rules
                  general section and dpidb_mask usage section for more
                  information on timeslot.

                - For IP trunks:  not used, populate with '0'.
                - For X.75' trunks:  not used, populate with '0'.
                - For X.75 trunks:  not used, populate with '0'.

qts             - Not used; populate with '0'.

b1serv          - Not used; populate with 'RTNO_SRV'.

b2serv          - Not used; populate with 'RTNO_SRV'.

dserv           - Not used; populate with 'PS_NA'.

dpkt_cnt        - Not used; populate with '0'.

dpktmax         - Not used; populate with '0'.

briclass        - Not used; populate with 'BRI_PP'.

ptyequip        - Not used; populate with '0'.

dflt_gpid       - Not used; populate with '0'.

acsr_gpid       - Not used; populate with '0'.

acsr_inh        - Not used; populate with 'DBNO'.

cut_noc         - Not used; populate with '0'.

cut_d4          - Not used; populate with '0'.

is_dte          - Not used; populate with 'DBNO'.

q931proc        - Not used; populate with 'NETWORK'.

odb_mhg         - Not used; populate with '0'.

pfixtei         - Not used; populate with 'DBNO'.

cddn_lport      - Not used; populate with '0'.

pddn_lport      - Not used; populate with '0'.
```

Copyright © 1999 Lucent Technologies 

pcr_n1 - Not used; populate with '0'.

pcr_n2 - Not used; populate with '0'.

Notes (integrity check)

1. This relation uses some of the same attributes as relation RLequipdsl therefore, the following items must match in the two relations:

   dsl - 16-bit port name.
   dsl-group - DSL group to which the port is assigned.
   member - Physical PH channel number to which. the port is assigned

2. A DSL with packet switching on B-channel will have two tuples in RLdslequip, if one of the B-channels have provisioned X.25 packet switching. If both channels have provisioned X.25 packet switching, then the DSL will have three tuples in RLdslequip (one for each B-channel and one for the DSL as a whole, that is, the D-channel tuple).

All lines with X.25 Packet features will only be supported by PH3's.

**Attribute:**
dsl
**Fullname:**
Digital subscriber line
**Attribute Description:**
Populate with PH port name. This port must be previously populated in relation RLfc_porttyp.

The dslequip tuple must always exist when the RLFC_PORTTYP D-channel servclass attribute is FC_ISDN.

A dslequip tuple will also exist when the RLfc_porttyp D-channel servclass attribute is FC_ISATND.

Note: If RLfc_porttyp.servclass is equal to FC_ISATND for this DSL, then this DSL does not support packet switched or circuit switched data. If the RLfc_porttyp D-channel servclass attribute is RC_PORTUNA, the DSL is on intercept (RLrt_dntran.termclass equals AGING), and the DSL is still associated with its port data (RLrt_dntran.portname.member <> 0 and RLrt_dntran.portname.module <> 0) then the tuple in RLdslequip will still exist.

For X.75 trunks, the DSL must have a corresponding entry in RLfc_porttyp with servclass equal to PSX75_TK and logical port type equal to PCX75TK.

**Copyright © 1999 Lucent Technologies** 

For X.75' trunks, the DSL must have a corresponding entry in RLfc_porttyp with servclass equal to PSX75P_TK and logical port type equal to PCX75PTK.

For IP trunks, the DSL must have a corresponding entry in RLfc_porttyp with servclass equal to PSPKT_TRK and logical port type equal to PCISWIP.

The PH port types are:
- DSL D-channel
- DSL nailed-up B-channel for X.25 packet switching
- Internal protocol trunks
- Inter-SM ports with packet switching
- EDSL D-port
- OSPS-EDSL D-port
- X.75' trunks
- X.75 trunks
- XAT trunks
- Modem pool
- TR303 remote terminal embedded operations channel (EOC) and timeslot management channel (TMC) data links

**Attribute:**

dpidb

**Fullname:**

Directly connected peripheral interface data bus (DPIDB) connection

**Attribute Description:**

The circuit name of the DPIDB on AIU/ISLU(2)/IDCU SG 0 of the DSL is assigned. Must be non-zero for DSLs on an AIU/ISLU(2)/IDCU. Must be zero for remote integrated services line unit (RAIU/RISLU) DSLs. Default to 0x0000. RC and ODA must allow this value to be optionally input.

If not input for an AIU/ISLU(2) DSL, RC and ODA must assign the DPIDB. See RLislulgc for (R)ISLU, RLislu2lg for ISLU2 assignment rules, or RLaiu2ap for AIU.

If not input for an IDCU DSL (which includes EOC and TMCs) then RC and ODA must find a timeslot from the PH to the RT. See the rc-oda rules section for rules on 'qts', 'pidb', 'timeslot', 'ds1', and 'ds1_ts' selection for IDCU DSLs.

The DPIDB assignment must be preserved across retrofits and any other off-line ODA processes. If populated, then relation RLdpidb_pt must be populated with this portname.

This attribute is not applicable for EDSL, populate with default for EDSL D-ports.

This attribute is not applicable for OSPS-EDSL, populate with default for OSPS-EDSL D-ports.

Copyright © 1999 Lucent Technologies 

This attribute is not used by X.75 or XAT port.

**Attribute:**
dsl_group
**Fullname:**
DSL group number to which the port is assigned
**Attribute Description:**
Populate with the DSL group number (0 to 95) to which the port has been assigned. The attribute assigned in RLdslgdata must be DBYES for this DSL group in order to insert this port.

The DSL group number that a XAT port is assigned is determined by protocol handler shelf and PH number entered via RCV/ODA.
All lines with X.25 packet features will only be supported by PH3's.

**Attribute:**
member
**Fullname:**
PH physical channel member number
**Attribute Description:**
Populate with the member number (0 to 127 for PH128) of the DSL group to which the port has been assigned. The member numbers can be assigned in any order.

Note: If the DSL group is assigned to one of the following ports on a PH2,
- Internal protocol trunk member
- X.75' trunk member
- X.75 trunk member

then one, and only one, member number shall be assigned; member 0 shall be assigned and no other members shall be allowed assignment in this DSL group.

Note: If the DSL group is assigned to one of the following ports on a PH3,
- Internal protocol trunk member
- X.75' trunk member
- X.75 trunk member

then the member number may be assigned in multiples of four (0, 4, 8...20); however, it is recommended only four X.75' or X.75 trunk members per PH3 be populated. All packet trunk members on a given PH3 must be of the same level 2 profile (that is, PSISWV, PSX75_T, PSX75_P) and all of the ports must be equipped on the same SM.

Hardware conversion note:
If the PH3 is to be converted to a PH2 only one member may be assigned to the PH3 and the 'member' attribute must equal zero otherwise the conversion will be blocked.

Copyright © 1999 Lucent Technologies 

If the DSL group (PH128) is assigned to one of the following ports:
- DSL B-channel with packet switch
- EDSL D channel
- OSPS interflow D-channel

Then only member numbers that are multiples of four (such as, member 0, 4, 8, 12, ..., 124) shall be allowed assignment in the DSL group.

If member X is chosen for a 56K/64K service (dslrate is PSDSL56KB, PSDSL64KB, or PSDSL64IK), then member X+1, X+2, and X+3 must not be assigned to any other user. Conversely, if member Y is chosen for a 16K service (dslrate is PSDSL16KB), then members Y-1, Y-2, and Y-3 must not be occupied by a 56K/64K user (dslrate is PSDSL56KB, PSDSL64KB, or PSDSL64IK).

OSPS & TCP_IP Population Rule for members
---

This section applies only to OSPS DSL ports having the following service classes (RLFC_PORTTYP.servclass) - AS_OAP, FC_DASC, FC_HOBIS, FC_HOTRT, FC_HOTVT, FC_RTRS, HM_RAS, OA_AQDSL, OA_DAOPER, OA_MIS_LNK (also used by ACD/BRCS), OA_TAOPER, TM_XDB, AS_TCPIP, FC_EIS_LNK.

PH members must be assigned to optimize the use of timeslots for D-channel paths. Each D-channel path requires a quarter timeslot. Timeslots are optimized by assigning DSLs to line group controllers (LGCs) and PH members so that four DSLs share one timeslot.

This paragraph describes the use of PH128s for OSPS DSLs equipped on RISLUs and ISLUs in the 5E9(2) Software Release. The DSL group member numbers may be any values in the PH128 member range 0-127, (that is, no restrictions).

Definition: A sub-line group (SLG) is a set of four RISLU/ISLU line cards (LCs) on a single line group controller (LGC), having LC numbers as follows:
(0, 2, 4, 6): (8, 10, 12, 14): (16, 18, 20, 22): (24, 26, 28, 30).

DSL D-channel ports equipped on a given SLG should all belong to the same DSL group (that is, logical PH 128). The maximum allowable number of D-channel or B-channel ports that can be assigned to a DSL group should be traffic engineered.

The DSL group member number that a XAT port is assigned is determined by PH channel number entered via RCV/ODA. If the port is an X.75 trunk then the member must be zero.

**Attribute:**
l2prof
**Fullname:**
Level 2 parameter profile for the port

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

Populate with the level 2 parameter profile type.

The only ports with LAPB are DSL B-channels with packet switching (dslequip.l2prof equals PSBXV), IP trunks with packet switching (dslequip.l2prof equals PSISWV) and X.75' trunks (dslequip.l2prof equals PSX75_P).

The profile chosen depends on the terminal type:

For North American offices, the following terminal types and service classes are valid:

| terminal type | service class(es) | l2prof selection |
|---|---|---|
| OSPS basic services terminal | OA_DAOPER<br>OA_DAOPER | PSBST<br>PSVDT |
| OSPS directory assistance system/computer terminal | FC_DASC | PSDASC |
| OSPS administrative terminal or alarm circuit | AS_OAP<br>HM_RAS | PSATA |
| Any circuit switching terminal (such as BRCS) | FC_ISDN | PSISDN |
| ISDN attendant DSL For 5E4: | FC_ISATND | PSISDN |
| application processor (AP) computer | PS_APDSL | PSAP |
| OSPS video display terminal | OA_TAOPER | PSVDT or PSBST |
| OSPS real time rating system | FC_RTRS | PSRTRS |
| OSPS hotel billing information system | FC_HOBIS | PSHOBIS |
| OSPS hotel billing information center | FC_HOTVT | PSHOTVT |
| OSPS hotel billing information center | FC_HOTRT | PSHOTRT |

Copyright © 1999 Lucent Technologies 

| | | |
|---|---|---|
| OSPS autoquote DSL | OA_AQDSL | PSATA |
| OSPS external database DSL (B-channel) | TM_XDB | PSBXV |
| OSPS DSL (D-channel) | TM_XDB | PSISDN |
| Used for TCP_IP database DSL (B-channel) | AS_TCPIP | PSBXV |
| Used for TCP_IP DSL (D-channel) | AS_TCPIP | PSISDN |
| Management Information System (MIS) data link | OA_MIS_LNK | PSDASC |
| EDSL primary rate terminal | FCEDSL | PSEDSL or PSSTDPRI |
| OSPS-EDSL primary rate terminal (sending OSPS) | OA_IFOPER | PSIFPRI |
| OSPS-EDSL primary rate terminal (receiving OSPS) | OA_IFTERM | PSIFPRI |
| OSPS external information system data link | FC_EIS_LNK | PSEIS_1 or PSEIS_2 |
| Message Delivery (MD) link | MSG_DELV | PSMDDLT |
| Signaling Data Link Terminal (ST-DLT) | CCS_STSS7 | PSBSTDLT |

For terminal type XAT and service class PSX25_T1, the level 2 profile selection is PSXAT. For X.75 trunks, l2prof equals PSX75_T. For X.75' trunks, l2prof equals PSX75_P. For IP trunks, l2prof equals PSISWV.

**Attribute:**
dslrate
**Fullname:**
Data rate and data inversion indicator
**Attribute Description:**
Populate with the port data rate.

**Copyright © 1999 Lucent Technologies** 

The 'dslrate' must be identical for all IP trunks within the same IP trunk group.

The profile chosen depends on the port type: For U.S. applications, the following port types are valid:

| port type | dslrate selection |
|---|---|
| DSL D port - 16 Kilobit, non-inverted | PSDSL16KB |
| DSL B-channel | PSDSL64KB<br>PSDSL56KB |
| IP trunk with D3/D4 chan bank | PSDSL56KB |
| IP trunk without D3/D4 chan | PSDSL64KB |
| X.75' trunk | PSDSL56KB |
| Inter-SM port | PSDSL64KB |
| restricted channel, inverted HDLC | PSDSL64IK |
| EDSL D port - 64 Kilobit clear channel, non-inverted HDLC | PSDSL64KB |
| EDSL D port - 64 Kilobit restricted channel, inverted HDLC | PSDSL64IK |
| EDSL D port - 56 Kilobit channel | PSDSL56KB |
| OSPS-EDSL D port - 64 Kilobit clear channel, non-inverted HDLC | PSDSL64KB |
| OSPS-EDSL D port - 64 Kilobit restricted channel, inverted HDLC | PSDSL64IK |
| OSPS-EDSL D port - 56 Kilobit channel | PSDSL56KB |
| TR303 EOC and TMCs | PSDSL64KB |
| Message Delivery (MD) port | PSDSL64KB |
| Signaling Data Link Terminal port (ST-DLT) | PSDSL56KB |

The data rates that can be assigned to a XAT port are PSDSL56KB (56 Kilobit), PSDSL64KB (64 Kilobit clear), and PSDSL64IK

Copyright © 1999 Lucent Technologies 

(64 Kilobit restricted, inverted HDLC). The data rate for X.75 trunks must be PSDSL56KB.

**Attribute:**

b1serv

**Fullname:**

Type of ISDN service allowed on channel B1

**Attribute Description:**

The full choice of values for this attribute only applies to tuples whose key refers to a DSL D-channel. For tuples associated with other port types (eg., B-channels, internal protocol trunks [IPT], ISM ports): populate with RTNO_SRV.

Default:
For servclass equal to FC_ISDN or FC_ISATND, set it to RTDMD_SRV
All other cases, set it to RTNO_SRV.

Populate with the type of service permitted on channel B1 for DSL D-channels with service class FC_ISDN or FC_ISATND. (For all other service classes and for all NON-DSL D-channel port types (even if they have service class equal to FC_ISDN) populate with RTNO_SRV). The allowable values for DSL D-channels with service class FC_ISDN (domain DMDSLSRV) are:

RTNO_SRV - Service is not allowed on this B-channel. (RLfc_porttyp tuple does not exist)

RTDMD_SRV - Any type of B-channel demand service is allowed:
- Circuit switched voice (CSV) (including default service)
- Circuit switched data (CSD)
- On demand B-channel packet (ODP)

These B-channel services are assigned at the user level (in RLlpt_pt).

RT_X25 - Provisioned X.25 packet switching service only on the DSL B-channel. [The sop capability is PPB].

This attribute not used by EDSL; populate with RTNO_SRV for EDSL D-ports.

This attribute not used by OSPS-EDSL; populate with RTNO_SRV for OSPS-EDSL D-ports.

DSL data links to application processors use only the D-channel and must have this attribute populated with RTNO_SRV.

For XAT ports, populate with RT_X25. This indicates that the XAT port is provisioned for B-channel X.25 packet switching service only. For X.75 trunks, b1serv is equal to RTNO_SRC.

**Copyright © 1999 Lucent Technologies** 

## 5. DSLEQUIP Population rules continued.

**Attribute:**
b2serv
**Fullname:**
Type of ISDN service allowed on channel B2
**Attribute Description:**
The rules are the same as for 'b1serv' except they apply channel B2.

This attribute not used by EDSL; populate with RTNO_SRV for EDSL D-ports.

This attribute not used by OSPS-EDSL; populate with RTNO_SRV for OSPS-EDSL D-ports.

This attribute is not used by XAT portp populate with RTNO_SRV for XAT ports. For X.75 trunks, b2serv is equal to RTNO_SRC.

**Attribute:**
timeslot
**Fullname:**
Timeslot on the DPIDB the DSL is assigned
**Attribute Description:**
The timeslot on the DPIDB the DSL is assigned. Only valid for DSLs on an AIU/ISLU(2). Must be zero for RISLU DSLs. Valid range is 0 - 31. Default to zero. RC and ODA must allow this value to be optionally input.

If not input for an AIU/ISLU(2) DSL, RC and ODA must assign the timeslots. See RLislulgc for (R)ISLU, RLislu2lg for ISLU2 assignment rules, or RLaiu2ap for AIU.
The timeslot assignment must be preserved across retrofit and any other off-line ODA process.

If not input for an IDCU DSL, ODA and RC should pick a timeslot. See the RC-ODA rules section for rules governing the choice.

This attribute is not applicable for EDSL; populate with default for EDSL D-ports.

This attribute is not applicable for OSPS-EDSL; populate with default for OSPS-EDSL D-ports.

This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**
ds1
**Fullname:**
Digital signal level 1 (DS1) internal circuit name

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

This attribute is used to denote the DS1 on an IDCU/DNU-S which carries the D-channels or B-channels for a given DSL. EOC and TMC data links for TR303 RTs are also treated as DSLs.

This attribute is zero for ports terminating on any peripheral other than an IDCU/DNU-S. For an IDCU, this must be a PCIFAC circuit terminating on the IDCU. For a DNU-S, this must be a PCRDTDS1 circuit terminating on a DNU-S.

**Attribute:**

ds1_ts

**Fullname:**

Timeslot number on a DS1

**Attribute Description:**

This attribute is the timeslot number (0 to 23) on a DS1 which carries the D-channels or B-channels for a given DSL. EOC and TMC data links for TR303 RTs are also treated as DSLs.

This attribute is zero for ports terminating on any peripheral other than an IDCU/DNU-S. For an IDCU/DNU-S, this can be any value between 0 and 23. This DSL must be documented in RLds1_pt (keyed by RLdslequip.ds1).

**Attribute:**

maxterm

**Fullname:**

Maximum number of terminals

**Attribute Description:**

The maximum number of terminals that can be active on this DSL. The summation of all the RLdslequip.maxterm attributes on the SM will give the value of Glmaxterm. This represents the maximum number of ISDN terminals that are allowed to be simultaneously active on the SM. For an RC update, Glmaxterm is less than or equal to (DBQNTEILA - DBSFTEILA). For more information refer to the Glmaxterm poprules.

If 'dserv' is PSADMIN, then set to zero, otherwise, if briclass is BRI_PP or BRI_STD, then 'maxterm' should default to one. Otherwise, set the attribute to two.

This attribute is not applicable for OSPS-EDSL; populate with default for OSPS-EDSL D-ports.

This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**

qts

**Fullname:**

Quarter time slot

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**

The quarter timeslot the DSL is assigned.

Only valid for DSLs on AIU/ISLU(2)/IDCU/DNU-S. Must be zero for RISLU DSLs. If the DSL uses more than one quarter timeslot, use the lowest quarter timeslot number available. All DSLs use D-channels of 1/4 timeslot bandwidth.

This attribute is not applicable for EDSL; populate with default for EDSL D-ports.

This attribute is not applicable for OSPS-EDSL; populate with default for OSPS-EDSL D-ports.

This attribute is not used by XAT port or by X.75 trunk ports.

Note: For DSLs on IDCU, the 'qts' attribute defines which quarter timeslot for both the DPIDB and the IDCU facility. (This is because the IDCU cannot switch quarter timeslots so therefore the D-channel must be in the same quarter timeslot from the RT to the PH.)

All four quarter timeslots within a given DPIDB timeslot and ISDN facility (IFAC) timeslot must terminate on the same RT and PH.

**Attribute:**

dserv

**Fullname:**

D-channel service

**Attribute Description:**

This attribute describes the service on a DSL D-channel.

For DSLEQUIP tuples that define ISDN DSL D-channel ports (FC_PORTTYP.servclass is equal to FC_ISDN, and FC_PORTTYP.lp_type is equal to PCD_CHAN/PCUD_CHAN), 'dserv' equals PSSX. The reason that both signaling and packet are always allowed at the D-channel-level is that D-channel services are assigned at the user level (in RLSPID).

One exception to this is an ISDN DSL D-channel that is a member of a modem pool MLHG. In that case, 'dserv' equals PSXMP. PSXMP is not allowed on standard BRI ('briclass' equal to BRI_STD).

For DSLEQUIP tuples that define ports other than DSL D-channels (eg., packet B-channels, internal protocol trunks, X.75' trunks, inter-SM packet links, EDSL, OSPS-EDSL, and ports for current export applications), 'dserv' is equal to PS_NA.

For non-ISDN special application DSLs where the D-channel is used:

| FC_PORTTYP.servclass | dserv |
|---|---|

**Copyright © 1999 Lucent Technologies** 

| | |
|---|---|
| OA_DAOPER | PSSONLY or PSSX |
| FC_DASC | PSSONLY |
| AS_OAP | PSSONLY |
| HM_RAS | PSSONLY |
| OA_TAOPER | PSSX or PSSONLY |
| FC_RTRS | PSSONLY |
| FC_HOBIS | PSSONLY |
| FC_HOTVT | PSSONLY |
| FC_HOTRT | PSSONLY |
| OA_AQDSL | PSSONLY |
| TM_XDB (D-channel) | PSADMIN |
| TM_XDB (B-channel) | PS_NA |
| AS_TCPIP (D-channel) | PSADMIN |
| AS_TCPIP (B-channel) | PSTCPSRV |
| OA_MIS_LNK | PSSONLY |
| PS_APDSL | PSSONLY |
| CCS_STSS7 | PS_NA |
| MSG_DELV | PS_NA |
| FC_EIS_LNK | PSSONLY |

For ISDN ports, see the detailed poprules in the diagram entitled, 'ISDN poprules'.

For applications processor (AP) DSLs, the DSLs are signal only (dserv equals PSSONLY) since they are used for SMP-to-AP X.25 level 3 signaling and not for PH-PH packet switching.

This attribute is not used by XAT port. Therefore it should be set to PS_NA. This attribute is not used by X.75 trunk ports.

**Attribute:**

briclass

**Fullname:**

Basic rate interface class

**Attribute Description:**

This attribute specifies the BRI class marking:

Point-to-point BRI - This BRI class supports a single terminal (ignores the SPID).

Multipoint BRI - This BRI class can support multiple terminals. Custom (Lucent Technologies Proprietary) protocol used.

Standard BRI - This BRI class can support multiple terminals. Standard (Telcordia Technologies compliant) protocol used.

BRI class is used for BRI D-Channels with servclass = FC_ISDN, FC_ISATND. For all other ports it is defaulted to Point-to-Point.

Copyright © 1999 Lucent Technologies 

Note: In order to allow Standard to be
the RC view default for ISDN BRI D-channels,
the zero value is assigned to Standard.
However, the relation default is Point-to-Point for all
ports except the BRI D-channels with a servclass of
FC_ISDN and FC_ISATND.

This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**
bind_lport
**Fullname:**
Binding logical port
**Attribute Description:**
The logical port value to be used for USOP binding for
a terminals on a point-to-point BRI or a single terminal
on a restricted multipoint BRI (see RC-ODA rules section).

This attribute is not used by XAT port or by X.75 trunk ports.
This attribute is not used by standard BRI.

**Attribute:**
bind_lptype
**Fullname:**
Binding logical type
**Attribute Description:**
The logical port type values to be used for USOP binding for a
terminal on a point-to-point BRI or a for a single terminal on
a restricted multipoint BRI (see RC-ODA rules).

This attribute is not used by XAT portp populate with LPT_PKT
for XAT ports. This attribute is not used by X.75 trunk ports.

For standard BRI (RLdslequip.briclass equals BRI_STD) bind_lptype
is not used, and must equal the default value, LPT_ISDN.

**Attribute:**
ppb1_pty
**Fullname:**
Party associated with PPB1
**Attribute Description:**
The party associated with PPB1. This is used by RC
for administration.

This attribute is not used by XAT portp populate with FCP_NULL for
XAT ports. This attribute is not used by X.75 trunk ports.

Note: OSPS implements a permanent packet B channel, but is not
associated with any user.

**Copyright © 1999 Lucent Technologies** 

Default is FCP_NULL.

**Attribute:**
ppb2_pty
**Fullname:**
Party associated with PPB2
**Attribute Description:**
The party associated with PPB2. This is used by RC for administration.

This attribute is not used by XAT port; populate with FCP_NULL for XAT ports. This attribute is not used by X.75 trunk ports.

Note: OSPS implements a permanent packet B channel, but is not associated with any user.

Default is FCP_NULL.

**Attribute:**
dpktmax
**Fullname:**
Maximum D-channel packet users allowed
**Attribute Description:**
This attribute contains the maximum number of ISDN DSL D-channel packet users allowed on this DSL.

This attribute is not used by XAT port; populate with zero for XAT ports. This attribute is not used by X.75 trunk ports.

**Attribute:**
dpkt_cnt
**Fullname:**
D-channel packet users count
**Attribute Description:**
This attribute indicates the number of ISDN DSL D-channel packet users defined on this DSL. This is used by RC/V for administration.

This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**
ptymlhg
**Fullname:**
Circuit MLHG party
**Attribute Description:**
The circuit MLHG party values that are in use on this BRI. Each bit within this eight-bit field identifies whether or not a particular party value is a member of circuit MLHG. This attribute must also be populated for secondary only circuit MLHG members such that the bit will be set for the party where the primary DN of the terminal key system resides.

**Copyright © 1999 Lucent Technologies** 

```
 ---------------------------------
 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  <---- party value
 ---------------------------------
 msb                           lsb

 0 = party is not a member of MLHG
 1 = party is a member of MLHG
```

This attribute is not used by XAT port; populate with zero for XAT ports. This attribute is not used by X.75 trunk ports.

**Attribute:**
ptyequip
**Fullname:**
Party that in use for this BRI
**Attribute Description:**
The party values that are subscribed to on this BRI. Each bit within this eight-bit field identifies whether a particular party value is subscribed to on this BRI. All 1's indicate that the BRI has the maximum eight USOPs. A party value exists for each USOP that is subscribed to on this BRI.

```
 ---------------------------------
 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  <--- party value
 ---------------------------------
 msb                           lsb

 0 = party value is not in use on this BRI
 1 = party value is in use on this BRI
```

Note: For OSPS DSLs, if the dserv attribute is set to PSSX, ptyequip should be set to one because there is a D packet user with a party value of zero. OSPS does not populate RLlpt_pt.

This attribute is not used by XAT port; populate with zero for XAT ports. This attribute is not used by X.75 trunk ports.

**Attribute:**
dflt_gpid
**Fullname:**
Default service group ID
**Attribute Description:**
The default service BFGID of the default group to which this BRI has subscribed. A zero value implies that this BRI does not have default service.

This attribute may be populated "automatically" by RC/ODA when a DSL is assigned. Automatically means populated without an entry for default service being made on the view/form.

**Copyright © 1999 Lucent Technologies** 

For automatic population to be done, the global parameter Gldfltsrv must be populated with the default service BFGID, and SFID 238 must be active. Also see dflt_lport.

This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**
dflt_lport
**Fullname:**
Default service lport associated with this BRI
**Attribute Description:**
The default service lport associated with this BRI This is used the key for dynamic data (TEDB VPORT). The lpt_type associated with this lport is LPT_BFG. Refer to pop rules in RLrc_qidx and RLrc_lphol for lport administration. A value of zero implies that this BRI does not have default service.

This attribute is populated when dflt_gpid is populated.

Users on a given DSL may not use both default service (dflt_lport) and circuit default DN service (cddn_lport). Provisioning does not prevent both of these services from being assigned on one DSL. If both are assigned, call processing only allows use of circuit default DN and blocks use of default service.

This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**
acsr_gpid
**Fullname:**
Automatic customer station rearrangement (ACSR) group ID
**Attribute Description:**
The ACSR group ID of the ACSR group associated with this BRI. A zero value implies that the BRI is not associated with an ACSR group.

Standard BRIs are not allowed to belong to an ACSR group. This attribute is not used by XAT port or by X.75 trunk ports.

**Attribute:**
acsr_inh
**Fullname:**
ACSR inhibited on this BRI
**Attribute Description:**
Indicates whether use of ACSR is inhibited on this BRI. RC/V users have the ability to allow/disallow ACSR on a per-BRI basis.

This attribute is not used by XAT port; populate with DBYES for XAT ports. Do not use default value. This attribute is not used

Copyright © 1999 Lucent Technologies 

by X.75 trunk ports.

DBYES - ACSR is not allowed.
DBNO - ACSR is allowed.

**Attribute:**
cut_noc
**Fullname:**
Normalized office code associated with the cutover
**Attribute Description:**
Specifies a valid NOC associated with the DSL during the time the cutover program is active. It is used with the 'thousands group' digit (cut_d4) to determine the line state of this DSL (whether inactive or active) during a cutover by thousands group (that is, tuples in the relation RLthcostat).

For the DSL port, the NOC is designated as the 'lead NOC' (cut_noc) of the port. It is used with the 'lead thousands group' digit (cut_d4) to determine the line state of this DSL and to allow management of the DSL port as a single entity. This 'lead NOC' can be the NOC of any equipped CPE associated with this DSL which is planned to be cutover, or a valid NOC selected specifically by the OTC for use in controlling cutover operation.

Note 1: A valid NOC is one that is defined in RLofficecode.noc and RLnoccode.noc.
Note 2: For information refer to Att 5D5-105-200 Precutover and Cutover Procedures.

**Attribute:**
cut_d4
**Fullname:**
The thousands digit associated with the cutover
**Attribute Description:**
Specifies the 'thousands group' digit associated with the DSL during the time the cutover program is active. It is used with the NOC to determine the line state of this DSL (whether inactive or active) during a cutover by thousands group (that is, tuples in the relation RLthcostat).

For the DSL port, the 'thousands group' digit is designated as the 'lead thousands group' digit of the port. It is used with the 'lead NOC' (cut_noc) to determine the line state of this DSL and to allow management of the DSL port as a single entity. This 'lead thousands group' digit can be the thousands group digit of the equipped CPE associated with the DSL which is planned to be cutover, or a valid thousand group digit selected specifically by the OTC for use in controlling cutover operation.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

is_dte

**Fullname:**

This is a data terminal equipment (DTE) connection

**Attribute Description:**

Indicates whether this is a DTE connection. This attribute is used to determine the Q.921/LAPD (layer 2) protocol procedures used by this application. This information is sent to Layer 2 when the application is brought into service to tell Layer 2 LAPD how the command/poll bits are sent and interpreted.

Currently. this field is only populated for PRI D-channels and ISM nailups. For unsupported applications, this attribute should be set to DBNO.

For PRI D-channel (RLfc_porttyp.servclass equals FCEDSL and RLfc_porttyp.lp_type equals PCTDCHAN), is_dte is also used to resolve SETUP glare for PRI CSV and CSD calls.

DBYES - Indicates user side procedures.
DBNO - Indicates network side procedures.

For the PRI, one end of the interface must be identified as user side and the other end as network side. There are no assignment rules about which end is user side and which end is network side, only this general guideline: a private network switch connected to a public network switch normally would be the user side, and the public network switch would be the network side. Similar to any trunk option, this assignment must be coordinated with the office at the other end of this PRI.

For PRI, the 'q931proc' attribute is dependent on this attribute. Please refer to the 'q931proc' description for an explanation of this dependency.

For ISM nailups (Rlfc_porttyp.servclass equals PSPKT_ISM,) this field must match the RLismpath.master field. ISM nailups do not use the 'q931proc' field.

**Attribute:**

q931proc

**Fullname:**

Q.931 procedures

**Attribute Description:**

Identifies the Q.931 (layer 3) procedures to be used for PRI CSV and CSD calls associated to this PRI D-channel (for PRI D-channels RLfc_porttyp.servclass equals FCEDSL and RLfc_porttyp.lp_type equals PCTDCHAN).

NETWORK - Indicates network procedures.
SYM_USER - Indicates symmetrical user procedures.

**Copyright © 1999 Lucent Technologies** 

For ports which are not a PRI D-channel this attribute should be set to NETWORK.

Note: The assignment of this field is dependent on the assignment of the 'is_dte' attribute. If the 'is_dte' attribute is set to DBYES (user side), then this attribute must be set to SYM_USER (symmetrical user). Other than this rule, there is only a general guideline which is suggested from the Lucent Technologies PRI Specification;

- If this PRI is connected in a PBX to PBX configuration, both ends if the interface should use symmetrical user procedures (q931proc equals SYM_USER).

In this configuration the assignment of the layer 2 procedures are arbitrary other than one end of the interface must be user side (is_dte equals DBYES) and the other end must be network side (is_dte equals DBNO).

Similar to the 'is_dte' option, this assignment must be coordinated with the office at the other end of this PRI.

Although q931proc is set to SYM_USER, this attribute is not used for inter-SM nailups.

**Attribute:**

odb_mhg

**Fullname:**

Packet on demand B-channel MLHG member

**Attribute Description:**

The packet ODB MLHG party values that are in use on this BRI. Each bit within this eight-bit field identifies whether or not a particular party value is a member of a packet MLHG.

```
---------------------------------
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  <---- party value
---------------------------------
 msb                         lsb
```

0 = party is not a member of MLHG
1 = party is a member of MLHG

For each packet ODB MLHG party with its bit set to one, then the corresponding 'ptyequip' bit must be also set to one.

A tuple must exist in RLodpsop for each assigned party. For the B-channels that appear in RLodpsop there must be a corresponding tuple in RLpsprt_grp.

Only ISDN D-channels can have a non zero value for 'odb_mhg'.

Copyright © 1999 Lucent Technologies 

**Attribute:**
agipty[*]
**Fullname:**
Associated group member
**Attribute Description:**
For each terminal that is a member of an associated group, the bit corresponding to that terminal will be set to one. This bitmap will be used by the one B-channel per user capability to know which terminals belong to an associated group. Either each terminal on a DSL with demand B-channel service will belong to one of two AGI groups, or none of the terminals on a DSL will belong to an AGI. A terminal can not belong to more than one AGI. One bitmap exists for every AGI that is allowed.

There are 2 AGIs that may exist.

```
 ---------------------------------
 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  <---- party value
 ---------------------------------
 msb                           lsb
```

0 = party is not a member of an associated group
1 = party is a member of an associated group

For example, if parties 0 and 3 are in AGI 1, and parties 1, 2, 4, and 5 are in AGI2, the AGI1 bitmap will be set as:

```
 ---------------------------------
 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
 ---------------------------------
 msb                           lsb
```

The value of AGI2 would be:

```
 ---------------------------------
 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 0 |
 ---------------------------------
 msb                           lsb
```

This attribute is only applicable to standard BRIs. If this is not a standard BRI, the bitmap must contain all zeros.

**Attribute:**
demand_bchan
**Fullname:**
Demand B-channel
**Attribute Description:**
This is a bitfield variable which represents whether or not demand B-channel service is provided for each party on this DSL.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
dsl_ffcf1
**Fullname:**
Boolean reserved for future field feature
**Attribute Description:**
Boolean reserved for future field feature.

**Attribute:**
pfixtei
**Fullname:**
Fixed Terminal Endpoint Identifier
**Attribute Description:**
This attribute is used to indicate if any fixed TEIs are assigned on the port. If the 'pfixtei' attribute is set to DBYES, then BRI class must equal BRI_STD and a tuple must exist in RLpfixtei where RLpfixtei.port must equal RLdslequip.dsl.

**Attribute:**
cddn_lport
**Fullname:**
Circuit Default Directory Number
**Attribute Description:**
This attribute is the Circuit lport of the circuit user assigned as default DN. This imples that the user lpt_type = LPT_ISDN. If the 'cddn_lport' attribute value is non zero it implies that BRI has a circuit default dn, the corresponding RLspid tuple must have ddn equal DBYES.

Users on a given DSL may not use both default service (dflt_lport) and circuit default DN service (cddn_lport). Provisioning does not prevent both of these services from being assigned on one DSL. If both are assigned, call processing only allows use of circuit default DN and blocks use of default service.

**Attribute:**
pddn_lport
**Fullname:**
Packet Default Directory Number
**Attribute Description:**
This attribute is the Packet lport of the packet user assigned as default DN. This imples that the user lpt_type = LPT_PKT. This could be On-Demand B packet or Permanent packet lports and if both assigned, On-Demand B packet lport takes precedence over Permanent packet D lport. Both cddn_lport & pddn_lport could belong to the same user or to different users. If the 'pddn_lport' attribute value is non zero it implies that BRI has a packet default dn, and the corresponding RLspid tuple must have ddn equal DBYES. If RLspid tuple has both the RLspid.ppd_lport and RLspid.odp_lport values equal to non zero, then RLpsx25ln.chan_sel must equal DBYES.

Copyright © 1999 Lucent Technologies 

**Attribute:**
pcr_n1
**Fullname:**
Preventive Cycle Retransmission N1 threshold of Message Signal Units (MSUs).
**Attribute Description:**
This is the threshold of the number of MSUs in the retransmission buffer of a Signaling Data Link (SdL, ST DLT), which if exceeded the Preventive Cyclic Retransmission (PCR) SdL protocol (this is assigned to a DLT by setting the l2prof attribute to PSCSTDLT) enters the forced retransmission state.

Forced retransmission means that PCR will continue to retransmit all the MSUs stored in the retransmission buffer in sequence ignoring all new MSUs, until enough MSUs have been acknowledged to reduce the number stored in the buffer to below the value of pcr_n1.

**Attribute:**
pcr_n2
**Fullname:**
Preventive Cycle Retransmission N2 threshold of octets.
**Attribute Description:**
This is the threshold of the number of Message Signal Unit (MSUs) octets in the retransmission buffer of an SDLs, which if exceeded PCR enters the forced retransmission state.

Forced retransmission means that PCR will continue to retransmit all the MSUs stored in the retransmission buffer in sequence ignoring all new MSUs, until enough MSUs have been acknowledged to reduce the number stored in the buffer to below the value of pcr_n2.

**Attribute:**
dsl_prex
**Fullname:**
Enable or disable REX testing on per DSL basis (per line circuit)
**Attribute Description:**
This is a boolean used to enable or disable REX testing of individual ISDN line circuit. This attribute is secured by sfid - 267 - Prohibit Routine Exercise (REX) on Basic Rate Interface (BRI) - (Individual line). DBYES implies that REX is prohibited on the line circuit of the dsl.

**Attribute:**
dsl_inv
**Fullname:**
DSL Inverted

Copyright © 1999 Lucent Technologies 

**Attribute Description:**

This is a boolean ued to indicate if this packet pipe uses inverted data, on a trunk group basis. This data is sent to the PH4 on initialization of packet pipes.

**Attribute:**

dsl_tscnt

**Fullname:**

DSL Time Slot Count

**Attribute Description:**

Indicate how many timeslots for this Packet Pipe trunk group member.

**Defines:**

"db/DMparty.h",
"db/DMport.h",
"db/DMportindx.h",
"db/DMcircuit.h"

# DSLGDATA

## 1. Description

This relation defines when at least 1 member (DSL) in a DSL_Group (that is, logical PH) has been assigned in relations RLEQUIPDSL and RLDSLEQUIP. This relation also defines the application type of the logical PH. This relation will always have 96 tuples. In addition this relation defines the PH hardware type on which each channel group must run.

For PHA channel groups, there won't be any tuple populated in RLdslequip or RLequipdsl as there is no port associated with a PHA channel group. RLpsulnk relation defines a PHA link, and will have the information on PHA channel groups, and it's mate PHA's channel groups. Hence, for PHA, the association between RLdslequip and RLdslgdata will be replaced by RLpsulnk and RLdslgdata.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum 96 tuples in relation | 96 |
| expected tuples in relation | 96 |
| density | 100 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | SMcg_to_hw |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |

## 3. Field Layout

## 4. Population rules for RLdslgdata

### Relation Description

This relation defines when at least 1 member (DSL) in a DSL_Group has been assigned in relations RLequipdsl and RLdslequip.

This relation defines when at least 1 member (DSL) in a DSL_Group has been assigned in relations RLequipdsl and RLdslequip or a PHA link is defined in RLpsulnk for PHA application. It also defines the type of application assigned to this DSL-Group and the PH hardware type. This relation will always have 96 tuples.

For IDCU, the EOC and TMC data links to TR303 remote terminals (RTs) use time slots to the protocol handler.

In this relation, EOCs and TMCs are defined and populated similar but not identical to DSLs. EOC and TMCs use a full timeslot similar to a DSL B channel.

"A. Special Population Rule
This relation is only to be populated when the ISDNBASE Feature Package is loaded. This relation need only be populated in those SMs in which the ISDNBASE feature is loaded.

B. RLdslgdata (Logical PH Data Summary Relation)
This relation provides summary information about a DSL-Group (that is, logical PH).
It is used to determine if any members in a DSL-Group have been assigned and it defines the Application Type that has been assigned to the DSL-Group.
It is also used to determine which PH hardware type this DSL-Group must run on.
If a DSL-Group contains only DSL (D or B-channel including EDSL or OSPS interflow, XAT, or EOC/TMC data links) member assignments, it will have a type of PS_DSLG.
If a DSL-Group contains only Inter-SM member assignments, it will have a type of PS_ISM.
If a DSL-Group contains only Inter-Switch trunk member assignments, it will have a type of PS_TRK.
If a DSL-Group contains only X.75' trunk member assignments, it will

Copyright © 1999 Lucent Technologies 

have a type of PS_X75P.
If a DSL-Group contains only X.75 trunk member assignments, it will have a type of PS_X75.
If a DSL-Group contains a mixture of 2 or more of the previous member assignments, it will have a type of PS_MIXED.

C. Notes (Integrity Check)

This relation is based on the tuples populated in RLEQUIPDSL. Therefore, if any DSL-Groups are populated in RLEQUIPDSL, then the corresponding DSL-Group assigned attribute must be populated to DBYES. Note that if no tuples exist in RLDSLEQUIP, then all assigned attributes are populated to DBNO. Also, this relation is not to be populated if the ISDNBASE Feature Package is not loaded.

D. Special Limits and Restrictions:

Due to hardware restrictions on the PH1 (alias PH16) the following rules will be put into effect. The hardware restrictions will change when new versions of the PH are available and this population rule should be changed according. This hardware type does not exist in 5E6 and later generics.

1) For 5E6, one and only one Inter-SM channel, IP, X.75' or X.75 Trunk may exist on a PH (see RLdslequip poprules for more information): therefore, ism_cnt and trk_cnt and x75_cnt and x75p_cnt should not exceed 1.
   For 5E7 and later, up to 6 IP, X.75' or X.75 members can exist on a DSL-Group with RLdslgdata.hw_type=SMPH3.

   For 5E10 and later, up to 6 IP, X.75' or X.75 members can exist on a DSL-Group with RLdslgdata.hw_type=SMPH4.
2) PH applications cannot be mixed: therefore, a dsltype of PS_MIXED is invalid and the following validity checks should be made.

   if ism_cnt >0 then dslg_cnt,trk_cnt,x75p_cnt,x75_cnt must=0.
   if dslg_cnt >0 then ism_cnt,trk_cnt,x75p_cnt,x75_cnt must=0.
   if trk_cnt >0 then dslg_cnt,ism_cnt,x75p_cnt,x75_cnt must=0.
   if x75p_cnt >0 then ism_cnt,dslg_cnt,trk_cnt,x75_cnt must=0.
   if x75_cnt >0 then ism_cnt,dslg_cnt,trk_cnt,x75_cnt must=0.

3) Due to hardware restrictions on the PH2 (alias PH128), the following rules will be put into effect.

   b) There can be maximum of 32 Inter-SM channels exist on a PH, therefore, ism_cnt should not exceed 32.

   a) Rule (2) of the previous restrictions: PH applications cannot be mixed, still applicable in PH128.

4) Whenever a new PH hardware type is added, SMIM local data SMhwty_image[][] and SMimage_hwty{} must be updated also.

Copyright © 1999 Lucent Technologies 

E. Notes for 5E9

X.25 Packet Switching will no longer be supported on the
PH2 Access Image, and will now only be supported on PH3's."

F. Notes for 5E10

X.25 Packet Switching will also be supported on PH4s.

**Attribute:**
dsl_group
**Fullname:**
DSL Group number.
**Attribute Description:**
DSL Group number to which DSL (D-Port) can be assigned. A dsl_group is also defined as a logical PH upon which B-channel, Inter-SM/Switch, EDSL or X.75' trunk ports can be assigned. For XAT ports this is the DSL group number to which an XAT port is being assigned. The DSL group number is determined by the Protocol Handler shelf and PH number entered via RCV/ODA.

When assigned field of the first RLdslgdata tuple is updated to DBYES on any loaded switching module, a RLdb_amgpd, RLdb_imgpd, and RLdb_gpdus tuple must be populated with grp_type = GPDISDN, grp_id = 0 such that

1. The RLdb_amgpd tuple must be updated such that
   RLdb_amgpd.grp_type = GPDISDN
   RLdb_amgpd.grp_id = 0
   and the bit associated with that module in pcr_map1,.., pcr_map7
   must set to 1.
2. A RLdb_imgpd tuple must be inserted on that module such that
   RLdb_imgpd.grp_type = GPDISDN
   RLdb_imgpd.grp_id = 0
   RLdb_imgpd.localflag = DBNO
3. A RLdb_gpdus tuple must be inserted on the AM such that
   RLdb_gdpus.grp_type = GPDISDN
   RLdb_gdpus.grp_id = 0
   RLdb_gdpus.module = number of that module.

X.25 Packet Switching will no longer be supported on the
PH2 Access Image, and will now only be supported on PH3's.

As of 5E10, X.25 Packet Switching will also be supported on
PH4s.

**Attribute:**
assigned
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

indicates if any ports have been assigned to the logical PH.

**Attribute Description:**

Populate with DBYES whenever there is a populated tuple in RLequipdsl for the corresponding DSL-Group (that is, logical PH) or a member from this DSLGRP is assigned to ODPSOP for B-Channel ODB Packet Switching. If there are no populated tuples in RLequipdsl or no channels assigned to ODP users for the corresponding DSL-Group, then populate with DBNO.

Note that when RLdslgdata.assigned = DBNO, then:
RLdslgdata.dsltype = PS_NULL, RLdslgdata.dslg_cnt = 0,
RLdslgdata.mlhg_cnt = 0, RLdslgdata.dpkt_cnt = 0,
RLdslgdata.usr_cnt = 0, RLdslgdata.ts_cnt = 0,
RLdslgdata.x75p_cnt = 0, RLdslgdata.ism_cnt = 0,
RLdslgdata.trk_cnt = 0 RLdslgdata.x75_cnt = 0,

If RLdslgdata.assigned = DBYES, RLdslgdata.hw_type must be populated with the PH hardware type.

This attribute can be changed from DBNO to DBYES only if the resulting number of non-empty DSL groups on the shelf does not cause the number of spare PHs to be less than the required minimum number of spare PHs, specified in RLpsiupidb (see rdl/poprules/RLpsiupidb.P for details).

This attribute can be changed from DBNO to DBYES only if the RLdslgdata.hw_type = {SMPH2,SMPH3,SMPH4,SMPH22}.

When this attribute is changed from DBNO to DBYES or from DBYES to DBNO, then the attribute 'num_grp' in RLpsiupidb must be updated accordingly for the appropriate hardware type.

**Attribute:**

dsltype

**Fullname:**

The application type that has been assigned to this DSL Group.

**Attribute Description:**

If RLdslgdata.assigned = DBNO then RLdslgdata.dsltype = PS_NULL
If RLdslgdata.assigned = DBYES then:

RLdslgdata.dsltype = PS_ISM (for all Inter-SM applications) and

            include XAT ports, EOC/TMC data links, EDSL
            and OSPS interflow)
            RLdslgdata.ism_cnt = 0,
            RLdslgdata.x75p_cnt = 0, RLdslgdata.x75_cnt = 0,
            RLdslgdata.trk_cnt = 0, and RLdslgdata.dslg_cnt > 0

        RLdslgdata.dsltype = PS_ST7 (for all SS7 DLT applications)
            RLdslgdata.mlhg_cnt = 0, RLdslgdata.dpkt_cnt = 0,
            RLdslgdata.usr_cnt  = 0, RLdslgdata.ts_cnt = 0,
            RLdslgdata.trk_cnt = 0,  RLdslgdata.ism_cnt = 0,
            RLdslgdata.x75_cnt = 0,  RLdslgdata.x75p_cnt = 0,
            RLdslgdata.dslg_cnt > 0 but <= 4

        RLdslgdata.dsltype = PS_MD (for all SS7 MD applications)
            RLdslgdata.mlhg_cnt = 0, RLdslgdata.dpkt_cnt = 0,
            RLdslgdata.usr_cnt  = 0, RLdslgdata.ts_cnt = 0,
            RLdslgdata.trk_cnt = 0,  RLdslgdata.ism_cnt = 1,
            RLdslgdata.x75_cnt = 0,  RLdslgdata.x75p_cnt = 0,
            RLdslgdata.dslg_cnt = 1

        RLdslgdata.dsltype = PS_MDST7 (for all SS7 DLT applications)
            RLdslgdata.mlhg_cnt = 0, RLdslgdata.dpkt_cnt = 0,
            RLdslgdata.usr_cnt  = 0, RLdslgdata.ts_cnt = 0,
            RLdslgdata.trk_cnt = 0,  RLdslgdata.ism_cnt = 1,
            RLdslgdata.x75_cnt = 0,  RLdslgdata.x75p_cnt = 0,
            RLdslgdata.dslg_cnt > 0 but <= 4
```

**Attribute:**

hw_type

**Fullname:**

PH hardware type.

**Attribute Description:**

The default value for this attribute is SMPH_NULL when RLdslgdata.assigned = DBNO. RLdslgdata.hw_type must

Copyright © 1999 Lucent Technologies 

```
change from SMPH_NULL to {SMPH2,SMPH3,SMPH4,SMPH22}
before RLdslgdata.assigned can be updated to DBYES (such as,
the hardware type must be known first before a logical PH
group is built).

For 80186-based PH with 128 channels, RLdslgdata.hw_type = SMPH2
        RLdslgdata.ism_cnt >= 1, or RLdslgdata.trk_cnt= 1, or
        RLdslgdata.x75p_cnt = 1, or RLdslgdata.x75_cnt = 1, or
        RLdslgdata.dslg_cnt >= 1.

For 68030-based PH with 128 channels, RLdslgdata.hw_type = SMPH3
    For 5E6
        RLdslgdata.ism_cnt >= 1, or RLdslgdata.trk_cnt = 1, or
        RLdslgdata.x75p_cnt = 1, or RLdslgdata.x75_cnt = 1, or
        RLdslgdata.dslg_cnt >= 1.
    For 5E7 and later
        RLdslgdata.ism_cnt >= 1, or
        RLdslgdata.trk_cnt > 0 but <= 6, or
        RLdslgdata.x75p_cnt > 0 but <= 6, or
        RLdslgdata.x75_cnt > 0 but <= 6, or
        RLdslgdata.dslg_cnt >= 1.

For 68030 and 68060-based PHs with 128 channels,
    RLdslgdata.hw_type is_in { SMPH4, SMPH22 }
    For 5E10 and later
        RLdslgdata.ism_cnt >= 1, or
        RLdslgdata.trk_cnt > 0 but <= 6, or
        RLdslgdata.x75p_cnt > 0 but <= 6, or
        RLdslgdata.x75_cnt > 0 but <= 6, or
        RLdslgdata.dslg_cnt >= 1.

If the RLdslgdata.hw_type is updated, then 'num_hw' in
RLpsiupidb should be updated accordingly for the particular
PH hardware type.

Populate with SMPH3 and SMPH4 for XAT ports.
```

**Attribute:**

dslg_cnt

**Fullname:**

Indicates the number of members on this logical PH which are assigned to D or B-channel or EOC/TMC applications or ODP users. D-channel applications include XAT, EDSL and OSPS interflow.

It is also used to indicate the number of MD and/or ST DLTs on the logical PH.

**Attribute Description:**

When RLdslgdata.assigned = DBNO, RLdslgdata.dslg_cnt must_equal 0.

Increment when a port is assigned to this logical PH in RLequipdsl and the port's service class in RLfc_porttyp is AS_OAP, FC_DASC,

**Copyright © 1999 Lucent Technologies** 

FCEDSL, FCEDSLHM, FC_EIS_LNK, FC_HOBIS, FC_HOTRT, FC_HOTVT, FC_ISATND, FC_ISDN, FC_RTRS, HM_RAS, OA_AQDSL, OA_DAOPER, OA_IFOPER, OA_IFTERM, OA_MIS_LNK, OA_TAOPER, PS_APDSL, PS_EOC, PS_TMC, PS_ST7, PS_MD, PS_MDST7 PSX25_T1, or TM_XDB.

Increment when a tuple of RLodpsop is added which has one PH channel assigned from this DSL GRP. Increment by two when a tuple of RLodpsop is added which has two PH channels assigned from this DSL GRP. Increment when a tuple of RLodpsop is updated from one PH channel to two PH channels from this DSL GRP.

Decrement when a tuple is removed from RLequipdsl for this logical PH and its port's service class is the same as previously seen.

Decrement when a tuple of RLodpsop is deleted which has one PH channel assigned from this DSL GRP. Decrement by two when a tuple of RLodpsop is deleted which has two PH channels assigned from this DSL GRP. Decrement when a tuple of RLodpsop is updated from two PH channels to one PH channel from this DSL GRP.

This count must be incremented for each XAT port or EDSL or OSPS interflow D-channel assigned to this DSL group. This count must also be decremented for each XAT port, or EDSL or OSPS interflow D-channel unassigned from this DSL group.

**Attribute:**

ism_cnt

**Fullname:**

Indicates the number of members on this logical PH which are assigned to Inter-SM applications.

**Attribute Description:**

When RLdslgdtat.assigned = DBNO, then RLdslgdata.ism_cnt must_equal 0.
If RLdslgdata.ism_cnt is 1 thru 32, a tuple must exist in RLtscount where:

RLtscount.module = the SM number in which this RLdslgdata tuple resides, and
RLtscount.ism_pidb[] and RLtscount.ism_tsiu must be incremented/decremented for every increment/decrement of ism_cnt.

Increment when a port is assigned to this logical PH in RLequipdsl and the port's service class in RLfc_porttyp is PSPKT_ISM.

Decrement when a tuple is removed from RLequipdsl for this logical PH and its port's service class is the same as previously seen.

This attribute is not used for EOC/TMC data link applications.

**Attribute:**

**Copyright © 1999 Lucent Technologies** 

trk_cnt

**Fullname:**

Indicates the number of members on this logical PH which are assigned to Inter-Switch trunk applications.

**Attribute Description:**

When RLdslgdata.assigned = DBNO, RLdslgdata.trk_cnt must_equal 0.
If RLdslgdata.trk_cnt >= 1, then one or more tuples must exist in RLtscount
where
RLtscount.module = the SM number in which this RLdslgdata tuple resides, and
RLtscount.ip_pidb[] must be incremented/decremented for every increment/decrement of trk_cnt, and
RLtscount.ip_tsiu must be incremented/decremented twice for every increment/decrement of trk_cnt.

Increment when a port is assigned to this logical PH in RLequipdsl and the port's service class in RLfc_porttyp is PSPKT_TRK.

Decrement when a tuple is removed from RLequipdsl for this logical PH and its port's service class is the same as previously seen.

If this attribute is > 0 then the following attributes must be equal to zero:

dpkt_cnt, usr_cnt, mlhg_cnt, ts_cnt,
dslg_cnt, x75p_cnt, x75_cnt, ism_cnt

If the PH assigned to an IP trunk member is of type PH2 then trk_cnt must be 1.

If the PH assigned to an IP trunk member is of type PH3 or PH4 then trk_cnt may be 1-6 as long as all members on a given PH3 or PH4 are of the same trunk group type (RLdslequip.l2prof = PSISWV) and all member ports are equipped on the same SM.

If the PH assigned to an IP trunk member is attempted to be converted from a PH3 or PH4 to a PH2, the conversion will fail unless only one member is assigned on the PH3 or PH4 and is also assigned to channel 0 of them.

This attribute is not used for EOC/TMC data link applications.

**Attribute:**

mlhg_cnt

**Fullname:**

a count of MLHG hunted lines that are NOT modem pool terminal adapters (MPTA) contained by this PH group.

**Attribute Description:**

RLdslgdata.mlhg_cnt should have as its value the number of tuples in RLpsx25ln whose ph_number is this dsl_group, mhgflg is DBYES, and doesn't belong to a modem pool MLHG.

**Copyright © 1999 Lucent Technologies** 

Increment when a port thats a member of a MLHG is assigned to this logical PH in RLequipdsl and the dserv attribute is not PSXMP.

Increment when a tuple of RLodpsop is added for a MLHG member which has one PH channel assigned from this DSL GRP. Increment by two when a tuple of RLodpsop is added for a MLHG member which has two PH channels assigned from this DSL GRP. Increment when a tuple of RLodpsop is updated for a MLHG member from one PH channel to two PH channels from this DSL GRP.

Decrement when a tuple is removed for a MLHG member from RLdslequip for this logical PH in RLequipdsl and the dserv attribute is not PSXMP.

Decrement when a tuple of RLodpsop is deleted for a MLHG member which has one PH channel assigned from this DSL GRP. Decrement by two when a tuple of RLodpsop is deleted for a MLHG member which has two PH channels assigned from this DSL GRP. Decrement when a tuple of RLodpsop is updated for a MLHG member from two PH channels to one PH channel from this DSL GRP.

XAT ports maybe members of Multi-Line Hunt Groups and therefore fall into these requirements. This count must be incremented whenever a XAT port thats a member of a MLHG is assigned to this DSL group and decremented whenever a XAT port that a member of a MLHG is unassigned from this DSL group.

This attribute is not used for EOC/TMC data link applications.

**Attribute:**

x75p_cnt

**Fullname:**

a count of the number of members on this logical PH which are assigned to X.75' trunk applications.

**Attribute Description:**

When RLdslgdtat.assigned = DBNO, RLdslgdata.X75p_cnt must_equal 0. If RLdslgdata.x75p_cnt = 1, then a tuple must exist in RLtscount where:

- RLtscount.module = the SM number in which this RLdslgdata tuple resides, and
- RLtscount.x75_pidb[] must be incremented/decremented for every increment/decrement of RLdslgdata.x75p_cnt, and
- RLtscount.x75_tsiu attribute must be incremented or decremented twice for every increment/decrement of RLdslgdata.x75p_cnt.

Increment when a port is assigned to this logical PH in RLequipdsl and the port's service class in RLfc_porttyp is PSX75P_TK.

Decrement when a tuple is removed from RLequipdsl for this logical PH and its port's service class is PSX75P_TK.

Copyright © 1999 Lucent Technologies 

This attribute is not used by X.25 access on a T1 (XAT) port.

This attribute is not used for EOC/TMC data link applications.

If this attribute is > 0 then the following attributes must be equal to zero:

dpkt_cnt, usr_cnt, mlhg_cnt, ts_cnt,
ism_cnt, dslg_cnt, x75_cnt, trk_cnt

If the PH assigned to an X.75' trunk member is of type PH2 then x75p_cnt must be 1.

If the PH assigned to an X.75' trunk member is of type PH3 or PH4 then x75p_cnt may be 1-6 as long as all members on a given PH3 or PH4 are of the same trunk group type (RLdslequip.l2prof = PSX75_P) and all member ports are equipped on the same SM.

If the PH assigned to an X.75' trunk member is attempted to be converted from a PH3 or PH4 to a PH2, the conversion will fail unless only one member is assigned on the PH3 or PH4 and is also assigned to channel 0 of them.

**Attribute:**

dpkt_cnt

**Fullname:**

This attribute is a count of the number of packet users assigned on this DSL group.

**Attribute Description:**

This count includes D-Channel packet users, Permanent Packet B-Channels, On-Demand B-Channels, and XAT channels.

Whenever an RLpsx25ln tuple is inserted on the channel group, the dpkt_cnt attribute should be INCREMENTED.

Conversely, whenever an RLpsx25ln tuple is deleted from the channel group, the dpkt_cnt attribute should be DECREMENTED.

The dpkt_cnt attribute is only allowed to be non-zero if the dsltype attribute is PS_DSLG.

For 5E9 and later, X.25 packet switching calls are not allowed on PH2s. Therefore, the dpkt_cnt attribute is allowed to be non-zero only if the hw_type attribute is SMPH3.

Also for 5E10 and later, the dpkt_cnt attribute is allowed to be non-zero if the hw_type attribute is SMPH4.

If the assigned attribute is DBNO or the dsltype attribute is not PS_DSLG, then the dpkt_cnt attribute must be 0.

Copyright © 1999 Lucent Technologies 

Every packet user (PPD, PPB, ODB, XAT) uses an ALCB (Access Line Control Block) and an LLCB (Logical Link Control Block).

RULES ABOUT ALCBs:
Since there are only 128 Access Line Control Blocks (ALCB) available on each PH, the dpkt_cnt attribute must be <= 128.
RULES ABOUT LLCBs:
The LLCBs are used by both packet (for SAPI 16) and signaling (for SAPI 0). Since engineering rules only allow 384 of the LLCBs to be used, the sum of the packet users (dpkt_cnt) and the circuit users (usr_cnt) must be less than 384.

**Attribute:**
usr_cnt
**Fullname:**
This attribute is the count of the number of ISDN signaling users assigned on the DSL group.
**Attribute Description:**
Whenever a RLdslequip tuple is inserted on the channel group, the usr_cnt attribute should be INCREMENTED according to the number of Layer 2 Control Blocks(LLCBs) used by the channel.

Conversely, whenever a RLdslequip tuple is deleted from the channel group, the usr_cnt attribute should be DECREMENTED according to the number of Layer 2 Control Blocks used by the channel.

NOTE: When updating a RLdslequip tuple for a port with a service class of FC_ISDN and Layer 2 profile of PSXISDN, the following rules apply to adding and deleting users. These rules only apply for updating RLdslequip, the rules for inserting and deleting are previously described.

| | |
|---|---|
| Adding the first user: | The usr_cnt attribute should not be incremented, because it was already increment when the RLdslequip tuple was inserted with no users. |
| Adding another user: | The usr_cnt attribute should be incremented by 1 for every user added after the first. |
| Deleting the last user: | The usr_cnt attribute should not be decremented, because it can only be decremented (for the last user) when the RLdslequip tuple is deleted. |
| Deleting a user(not last): | The usr_cnt attribute should be decremented by 1 for every user deleted that is not the last user. |

| otherwise | ANY | 1 |

The usr_cnt attribute is only allowed to be non-zero if the dsltype attribute is PS_DSLG.

If the assigned attribute is DBNO or the dsltype attribute is not PS_DSLG, then the usr_cnt attribute must be 0.

Copyright © 1999 Lucent Technologies

Every circuit users uses an LLCB (Logical Link Control Block) to store Layer 2 dynamic data in the PH.

RULES ABOUT LLCBs:
The LLCBs are used by both packet (for SAPI 16) and signaling (for SAPI 0). Since engineering rules only allow 384 of the LLCBs to be used, the sum of the packet users (dpkt_cnt) and the circuit users (usr_cnt) must be less than 384.

**Attribute:**
ts_cnt
**Fullname:**
Indicates the number of PDB time slots being used by BRI, XAT, EOC/TMC, and PRI applications for this DSL group
**Attribute Description:**
A count of the number of PDB time slots used by BRI and PRI applications on this logical PH

The default for this attribute is 0. This attribute is only allowed to be populated with a non-default value if the 'dsltype' = PS_DSLG. If 'assigned' = DBNO, this attribute must be 0.

**Attribute:**
x75_cnt
**Fullname:**
indicates the number of channels on this logical PH which are assigned to X.75 trunk application
**Attribute Description:**
This attribute specifies the number of X.75 trunk ports assigned to this dsl_group (logical PH). Increment/decrement when a port is added/deleted to/from this dsl_group in RLdslequip and the RLfc_porttyp.servclass for this port is PSX75_TK. Must be 0 when assigned is DBNO.

The corresponding RLtscount.x75_pidb[] array element must be incremented/decremented for every increment/decrement of x75_cnt and the RLtscount.x75_tsiu attribute must be incremented/decremented twice for every increment/decrement of x75_cnt.

This attribute is not used by X.25 access on a T1 (XAT) port.

This attribute is not used by EOC/TMC data link applications.

If this attribute is > 0 then the following attributes must be equal to zero:

dpkt_cnt, usr_cnt, mlhg_cnt, ts_cnt,

**Copyright © 1999 Lucent Technologies** 

dslg_cnt, trk_cnt, ism_cnt, x75p_cnt
If the PH assigned to an X.75 trunk member is of type PH2 then x75_cnt must be 1.

If the PH assigned to an X.75 trunk member is of type PH3 or PH4 then x75_cnt may be 1-6 as long as all members on a given PH3 or PH4 are of the same trunk group type (RLdslequip.l2prof = PSX75_T) and all member ports are equipped on the same SM.

If the PH assigned to an X.75 trunk member is attempted to be converted from a PH3 or PH4 to a PH2, the conversion will fail unless only one member is assigned on the PH3 or PH4 and is also assigned to channel 0 of them.

**Attribute:**
qphindx
**Fullname:**
QPH Index Number
**Attribute Description:**
QPH index number associated with this dsl_group.

**Attribute:**
cdma_cnt
**Fullname:**
indicates the number of defined members in a Packet Pipe (PP) or a Speech Handler (SH) channel group.
**Attribute Description:**
This attribute will be used to count the number of members in a SH or a PP channel group.

**Defines:**

## 4. Population Rules for RLdslxn

**Relation Description** "Data link" ISDN Digital Subscriber Link.

Relation contains information about 'data link' ISDN digital subscriber lines (DSL's). Craft is informed of data link DSL status through MCC displays and alarmed output messages. These features are available only for data link DSL's.

Each tuple in this relation represents a 'data link' ISDN DSL. Craft are alerted to problems involving data link DSLs by means of MCC display pages and alarmed tty output messages.

In Generic 5E4, data link DSLs requiring internal to external name conversion are DSLs to Application Processors (APs). The ISDN BRCS Application Processor (AP) Communication package uses this relation to define the relative DSL data link number for each AP on a specific SM.

The maximum number of data links per AP is sixteen (16) when the AP is on a SM. The maximum number of data links per AP is thirty (30) when the AP is on a SM-2000.

The xnamid will be APn (such as, AP5) while the xnamrl is the relative link (such as, AP5-3 is AP5 relative link 3).

Copyright © 1999 Lucent Technologies 

This relation is to be SM Partitioned. Each SM will have only the RLDSLXN tuples for data the link DSLs that it terminates.

The number of tuples in this relation will be from 1 to 16 in SMs and 1 to 30 in SM-2000s. The actual number depends upon the number of data links to an AP.

An inverse relation for RLDSLXN, named RLXNDSL, also exists.

**Attribute: dport**

**Fullname:** D-channel port name of the data link DSL as defined in RLequipdsl and RLdslequip.

**Attribute Description** A tuple must also exist in RLfc_porttyp with a value of dport and servclass of PS_APDSL.

The maximum number of tuples with servclass PS_APDSL is 16 per SM.
The maximum number of tuples with servclass PS_APDSL is 30 per SM-2000.

**Attribute: servclass**

**Fullname:** Service class of the data link DSL.

**Attribute Description** AP DSL data links will have a servclass of PS_APDSL.

An SM can have from 0 to 16 RLdslxn tuples with servclass PS_APDSL.

Dependencies (taken, as is, from RLdslxn.P)--RLfc_porttyp: Each port in RLdslxn must also be present in RLfc_porttyp of the SM hosting terminating the data link DSL. The DSL port must be a D-channel port with servclass set to PS_APDSL.

**Attribute: xnamid**

**Fullname:** ID portion of the data linkd DSL external name.

**Attribute Description** Data link DSL's are assigned external names in lieu of directory numbers. The external name consists of two parts - an AP number (xnamid) and a relative link (xnamrl) number. AP's hosted by ISDN SM's will have xnamid values between 4 and 99.

For every tuple with servclass PS_APDSL, a corresponding tuple must exist in RLcmapdata, where RLcmapdata.apindex equals xnamid.

**Attribute: xnamrl**

**Fullname:** Relative Link portion of the data link DSL.

**Attribute Description** For an AP with data links (servclass = PS_APDSL), xnamrl can have values between 1 and 16 for SMs and between 1 and 30 for SM-2000s.

The xnamrl attribute corresponds to a bit position in RLcmapdata.link_map. Thus, if RLcmapdata.apindex = xnamid = 5 and RLcmapdata.link_map has bits 2 and 4 set, this relation will have two tuples: one for AP5-2 and one for AP5-4 (that is, xnamid=5, xnamrl=2 and xnamid=5, xnamrl=4).

## 4. Population Rules for RLdsp_msg

**Relation Description** Display Messages.

This relation is used to store display messages for ISDN terminals with display capability. Currently display messages for SLE, AC, INSP, and COT are stored in this relation.

ISDN display messages are stored in this relation. Each message is stored as ASCII characters in the dsp[] array. When a DN or an EXTENSION needs to be inserted as a part of message, insert '~' (tilde) in the proper place and continue to fill the rest of message. (Note: Blanks are valid characters.) The '~' will serve as a place holder for a DN or an extension and will be replaced with the actual digits at run-time. Since the '~' occupies one character slot, it will be counted as one valid character.

```
msg_size = number of characters including
           white spaces  + number of '~'
           which is a place holder for a DN or extension.
```

Because of the DN expansion, the actual size of message can be greater than msg_size in a tuple.

The actual size of a message should be less than or equal to

**Copyright © 1999 Lucent Technologies** 

```
( number of characters )
        +  n * ( number of '~' )
where n is 1, 9, 11, or 17 depending on the dsp_type and dsp_id.
```
However, when a message is constructed, the msg_size should be equal to

(Expanded message to be displayed on the terminal)

- (n * (number of '~' in the message))

A null ( \0 ) is served as a string terminator if the number of characters in the string is less than 40. If the string is full, the delimiter (null: \0) will be skipped.

For SLE display messages, the dsp_id key is the same as the key used for the announcements that SLE uses during an SLE session. There is a one-to-one correspondence between the display messages and the announcements for SLE only.

**Attribute: dsp_type**

**Fullname:** Display Type

**Attribute Description** This field is used to define the type of an ISDN display message.

**Attribute: dsp_id**

**Fullname:** Display ID

**Attribute Description** This field is used to uniquely define an ISDN display message within a Display Type.

**Attribute: msg_size**

**Fullname:** message size

**Attribute Description** This field indicates the number of characters the display message has. Zero means the string is empty and 40 means the string is full.

**Attribute: dsp[*]**

**Fullname:** display characters 1 through 40

**Attribute Description** These fields are used to store the 40 character display message. The unoccupied character slots must be filled up with null characters.

## 4. Population Rules for RLdstid_rr

**Relation Description** Destination ID Number for Re-routing
Relation for mapping a four digit Destination ID number to an internal destination ID number from 1 to 16. This internal destination ID is the destination that a particular serving team's traffic will be routed to.

**Attribute: int_destid**

**Fullname:** Internal Destination ID Number

**Attribute Description** Indicates the internal destination ID number of the switch that the call is being rerouted.

**Attribute: dest_id**

**Fullname:** Destination ID

**Attribute Description** Destination ID of the switch that calls will be rerouted.

**Attribute: dest_name**

**Fullname:** Destination Name Switch
**Attribute Description** Indicates unique name of the switch that calls are being routed.

Copyright © 1999 Lucent Technologies

**Attribute: num_on**

**Fullname:** Number On

**Attribute Description** The number of serving teams that have been rerouted to a particular destination.

## 4. Population Rules for RLdtgstran

**Relation Description** Direct Trunk Group Selection (DTGS) translation.
Associates a PFA dialed code with a particular private facility.

**Attribute: config**

**Fullname:** configuration group.

**Attribute Description** ISDN configuration group. This number must be created and put in RLfacname.facid and RLfid2name.facid before being assigned to RLis_term.config. Unassigned configurations exist only in the AM.

**Attribute: dial_code**

**Fullname:** PFA dialed code.

Copyright © 1999 Lucent Technologies

**Attribute Description** Access code digits which represents a private facility. This dialed code may or may not be associated with a button. If it is associated with a button then the following must also exits. The RLbnfeat.str_param, which has the same config as this relation (RLdtgstran) and RLbnfeat.action = ACN_IDTGS, are the BCD digit version of this dial_code. The dial_code.dcnt5 can not be greater than four because only four digits can stored in RLbnfeat.str_param.
Range: An array 5 of extended digits

**Attribute: dial_code.dcnt5**

**Fullname:** Digit count.

**Attribute Description** digit count.

A length of 5 is not valid when the dial code is associated with a feature button. But if the dial code is not associated with a feature button, a length of 5 is valid.

**Attribute: dial_code.digits**

**Fullname:** digits.

**Attribute Description** digits.

**Attribute: pftype**

**Fullname:** private facility type.

**Attribute Description** Indicates if this facility is a simulated facility group (PFSFG) or a physical trunk group (PFPHYS).

**Attribute: grpnum**

**Fullname:** Group Number.

**Attribute Description** Indicates group number of the sfg or physical trunk group represented by this dialed code

```
   If pftype = PFSFG
           Verify existence of type in RLrt_sfg such that
           key rlRT_SFG.grpnum = rlDTGSTRAN.grpnum
   If pftype = PFPHYS
           Verify existence of type in RLrt_trkg such
           that key rlRT_TRKG.grpnum = rlDTGSTRAN.grpnum
If this tuple exists, then an RLtgtoatt tuple
   must also exists, whose keys are:
   rlTGTOATT.pftype = rlDTGSTRAN.pftype
   rlTGTOATT.grpnum = rlDTGSTRAN.grpnum,
   and the
   rlTGTOATT.isat_idx = rlISATGRP.isat_idx
   and one of the
   rlISATGRP.config[1-4] = rlDTGSTRAN.config.
```

**Attribute: tgidx**

**Fullname:** DTGS button index.

**Attribute Description** DTGS button index. If this dialed code is behind a button for this configuration then this attribute must be populated. This index is assigned in RLisatlmt in attribute tgbitmap. See RLisatlmt.P for information on how the index is generated.

The bit which corresponds to this index number in rlISATLMT.tgbitmap must be set to '1'.

```
        Verify the existence of a tuple in
```

## 4. Population Rules for RLdynacl

**Relation Description** Dynamic cluster update/delete identifiers.

This relation is populated only by recent change (RC) activities that update or delete the definition of BRCS feature clusters that are assigned to one or more logical terminals. This relation is normally empty, may contain at most one tuple, and is not initially populated by ODA. When populated, the tuple contains the cluster identifier(s) involved in the RC activity.

This relation, and sometimes the use of the reserved facname, DYNACLST, limit the cluster definition mapping function to a single dynamic update or delete at one time.

**Attribute: oldid**

**Fullname:** updated/deleted cluster name identifier

**Attribute Description** Contains the internal identifier corresponding to the name of the cluster which is being updated or deleted.

**Attribute: newid**

**Fullname:** identifier for cluster named DYNACLST (updates only)

Copyright © 1999 Lucent Technologies

**Attribute Description** For dynamic update operations, contains the internal identifier corresponding to the cluster named DYNACLST. For dynamic delete operations, contains 0.

**Attribute: chgcnt**

**Fullname:** not used

**Attribute Description** This attribute is not currently used.

## 4. Population Rules for RLe911_cnt

**Relation Description**

Enhanced 911 Counts.

This relation keeps track of the counts related to enhanced 911. The counts are used to update the number of tuples in the dynamic E911 relation RLe911db via a trigger function on a per SM basis. The counts are partly based on this relation and on RLe911_sfg.

This static relation is used for Enhanced 911 calls.

end relation;

**Attribute: sm**

Copyright © 1999 Lucent Technologies

**Fullname:** Switching Module

**Attribute Description** Indicates which SM this tuple is located.

**Attribute: psap_cnt**

**Fullname:** Public Safety Answering Point Count

**Attribute Description** Indicates the number of PSAP trunk group members on the given SM.

**Attribute: ipsap_cnt**

**Fullname:** ISDN Public Safety Answering Point Count

**Attribute Description** Indicates the number of ISDN PSAPs on an SM.

**Attribute: dedtrk_cnt**

**Fullname:** Dedicated Trunk Count

**Attribute Description** Indicates the number of E911 incoming dedicated trunk group members on an SM.

**Attribute: spr_chr1**

**Fullname:** Spare char 1

**Attribute Description** Spare char to be used at a later time.

**Attribute: spr_chr2**

**Fullname:** Spare char 2

**Attribute Description** Spare char to be used at a later time.

## 4. Population Rules for RLe911_sfg

**Relation Description** Enhanced 911 Simulated Facilities Group
This relation keeps the SFG related information related to the Enhanced 911 feature. It is used to determine how many RLe911db dynamic tuples should be populated on an SM via a trigger function. This is based off the SFG size in this relation and the counts in relation RLe911_cnt.

This static relation is used while routing Enhanced 911 calls.

**Attribute: sfg_type**

**Fullname:** SFG Type

**Attribute Description** This is the E911 SFG type for line and trunk originated calls.

**Attribute: sfg_size**

Copyright © 1999 Lucent Technologies

**Fullname:** SFG Size

**Attribute Description** Indicates the maximum number of simultaneous E911 line or trunk calls.

**Attribute: sfg_grp**

**Fullname:** SFG Group Number

**Attribute Description** Indicates E911 SFG group number.

**Attribute: spr_chr1**

**Fullname:** Spare char 1

**Attribute Description** This is a spare char to be used at a later time.

**Attribute: spr_chr2**

**Fullname:** Spare char 2

**Attribute Description** This is a spare char to be used at a later time.

## 4. Population Rules for RLe911psap

**Relation Description** Enhanced 911 Public Saftey Answering Point(PSAP)
This relation will be used to get reroute-dn if the specified public safety answering point (PSAP) trunk group is busy when a termination is attempted. It is also used to keep information specific to E911 PSAPs.

This is static relation used for Enhanced 911 call.

**Attribute: tgn** **Fullname:** Trunk Group Number

**Attribute Description** This is the trunk group number of the PSAP trunk group.

**Attribute: rerte_ind**
**Fullname:** Reroute Indicator

**Attribute Description** This attribute is used to indicate if reroute is allowed for busy PSAP. The valid values are DBYES, DBNO. If this attribute is DBYES, a reroute DN must be populated. The reroute DN will be used to reroute calls that have terminated to a busy PSAP.

**Attribute: rerte_dn**
**Fullname:** Reroute DN

**Attribute Description** This is a 7 or 10 digit DN that will be used to reroute calls that have terminated to a busy PSAP. This DN must be populated if rerte_ind is DBYES. This DN will be used before the next alternate PSAP DN specified in the ESN routing data is tried.

**Attribute: rerte_dn.dn0**
**Fullname:** Digit number 0

**Attribute Description** This is the 1st digit of the reroute DN

**Attribute: rerte_dn.dn1**
**Fullname:** Digit number 1

**Attribute Description** This is the 2nd digit of the reroute DN

**Attribute: rerte_dn.dn2**
**Fullname:** digit number 2

**Attribute Description** This is the 3rd digit of the reroute DN

**Attribute: rerte_dn.dn3**
**Fullname:** digit number 3

**Attribute Description** This is the 4th digit of the reroute DN

**Attribute: rerte_dn.dn4**
**Fullname:** digit number 4

**Attribute Description** This is the 5th digit of the reroute DN

**Attribute: rerte_dn.dn5**
**Fullname:** Digit number 5

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the 6th digit of the reroute DN

**Attribute: rerte_dn.dn6**
**Fullname:** Digit number 6

**Attribute Description** This is the 7th digit of the reroute DN

**Attribute: rerte_dn.dn7**
**Fullname:** Digit number 7

**Attribute Description** This is the 8th digit of the reroute DN

**Attribute: rerte_dn.dn8**
**Fullname:** Digit number 8

**Attribute Description** This is the 9th digit of the reroute DN

**Attribute: rerte_dn.dn9**
**Fullname:** Digit number 9

**Attribute Description** This is the 10th digit of the reroute DN

**Attribute: rerte_dn.dn10**
**Fullname:** Digit number 10

**Attribute Description** This is the 11th digit of the digit structure

**Attribute: rerte_dn.dn11**
**Fullname:** Digit number 11

**Attribute Description** This is the 12th digit of the digit structure

**Attribute: rerte_dn.dn12**
**Fullname:** Digit number 12

**Attribute Description** This is the 13th digit of the digit structure

**Attribute: rerte_dn.dn13**
**Fullname:** Digit number 13

**Attribute Description** This is the 14th digit of the digit structure

**Attribute: rerte_dn.dn14**
**Fullname:** Digit number 14

**Attribute Description** This is the 15th digit of the digit structure

**Attribute: rerte_dn.digcnt**
**Fullname:** Digit number count

**Attribute Description** This is the count of the number of digits in the reroute DN

**Attribute: wink_strt**
**Fullname:** Wink start

**Attribute Description** This is used to wait for start signal timer.

**Copyright © 1999 Lucent Technologies** 

**Attribute: abnd_timer**

**Fullname:** Abandon Timer

**Attribute Description** This is the timer that specifies how long to keep the PSAP ringing when the caller abandons the call. The value is entered as seconds.

**Attribute: spr_bit1**

**Fullname:** Spare bit 1

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit2**

**Fullname:** Spare bit 2

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_char**

**Fullname:** Spare character

**Attribute Description** This is a spare character to be used at a later time.

# E911SA

## 1. Description

Enhanced 911 Stand Alone

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 50 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| application | NULL |
| relation type | DBSTATIC |
| head table size | 256 |
| data page size | 1024 |
| page level | 0 |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLe911sa

**Relation Description** Enhanced 911 Stand Alone
This relation RLe911sa is an E911 stand alone/default relation. It is used in stand alone mode to route an E911 call, or when a query couldn't be sent, or received invalid data in a query response, or timed out waiting for a query response.

If the SM were in stand alone mode then this relation would be read (instead of reading RLesntran) to obtain the routing and selective call transfer telephone numbers.

If a message were sent to the GRSP/LRSP for the routing/selective information and no response was returned then this relation would also get read for that information. The routing numbers (pri_psap, alt1_psap, alt2_psap) are used in routing the call. If the first route failed then the other would be tried, etc. The selective transfer numbers are used by the PSAPs while doing selective call transfer.

This static relation is used in the routing of Enhanced 911 calls while in stand alone mode, or when a query couldn't be sent, or received invalid data in a query response, or timed out waiting for a query response.

**Attribute: sm**

**Fullname:** Switching Module

**Attribute Description** Indicated the SM number where this relation resides.

**Attribute: das**

**Fullname:** Digit Analysis Selector

**Attribute Description** Indicates the DAS to use to read this relation.

Copyright © 1999 Lucent Technologies 

***NOTE:*** This relation uses a DAS of 0 as a default tuple and that's why the value is full range (0 thru 99).

**Attribute: spr_bit1**
**Fullname:** Spare bit 1

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit2**
**Fullname:** Spare bit 2

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit3**
**Fullname:** Spare bit 3

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit4**
**Fullname:** Spare bit 4

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit5**
**Fullname:** Spare bit 5

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit6**
**Fullname:** Spare bit 6

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_char**
**Fullname:** Spare Char

**Attribute Description** This is a spare char to be used at a later time.

**Attribute: pri_psap**
**Fullname:** Primary Public Safety Answering Point Telephone Number

**Attribute Description** This Primary PSAP telephone number is first used to route the 911 call. It contains a psap telephone number and has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is mandatory and must be populated. It can only contain a 7 or 10 digit DN.

**Attribute: pri_psap.dn0**
**Fullname:** Digit Number 0

**Attribute Description** This is the 1st digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn1**
**Fullname:** Digit Number 1

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the 2nd digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn2**
**Fullname:** Digit Number 2

**Attribute Description** This is the 3rd digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn3**
**Fullname:** Digit Number 3

**Attribute Description** This is the 4th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn4**
**Fullname:** Digit Number 4

**Attribute Description** This is the 5th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn5**
**Fullname:** Digit Number 5

**Attribute Description** This is the 6th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn6**
**Fullname:** Digit Number 6

**Attribute Description** This is the 7th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn7**
**Fullname:** Digit Number 7

**Attribute Description** This is the 8th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn8**
**Fullname:** Digit Number 8

**Attribute Description** This is the 9th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn9**
**Fullname:** Digit Number 9

**Attribute Description** This is the 10th digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn10**
**Fullname:** Digit Number 10

**Attribute Description** This is the 11th digit of the digit structure.

**Attribute: pri_psap.dn11**
**Fullname:** Digit Number 11

**Attribute Description** This is the 12th digit of the digit structure.

**Attribute: pri_psap.dn12**
**Fullname:** Digit Number 12

**Attribute Description** This is the 13th digit of the digit structure.

**Attribute: pri_psap.dn13**
**Fullname:** Digit Number 13

**Attribute Description** This is the 14th digit of the digit structure.

**Attribute: pri_psap.dn14**
**Fullname:** Digit Number 14

**Attribute Description** This is the 15th digit of the digit structure.

**Attribute: pri_psap.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the PSAP telephone number.

**Attribute: alt1_psap**
**Fullname:** First Alternate PSAP Telephone Number

**Attribute Description** This First alternate telephone number is used to route the 911 call in the event that the primary PSAP TN routing failed. It contains a psap telephone number and has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is mandatory and must be populated. It can only contain a 7 or 10 digit DN.

**Attribute: alt1_psap.dn0**
**Fullname:** Digit Number 0

**Attribute Description** This is the 1st digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn1**
**Fullname:** Digit Number 1

**Attribute Description** This is the 2nd digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn2**
**Fullname:** Digit Number 2

**Attribute Description** This is the 3rd digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn3**
**Fullname:** Digit Number 3

**Attribute Description** This is the 4th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn4**
**Fullname:** Digit Number 4

**Attribute Description** This is the 5th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn5**
**Fullname:** Digit Number 5

**Attribute Description** This is the 6th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn6**
**Fullname:** Digit Number 6

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the 7th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn7**
**Fullname:** Digit Number 7

**Attribute Description** This is the 8th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn8**
**Fullname:** Digit Number 8

**Attribute Description** This is the 9th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn9**
**Fullname:** Digit Number 9

**Attribute Description** This is the 10th digit of the 1st alternate PSAP telephone number.

**Attribute: alt1_psap.dn10**
**Fullname:** Digit Number 10

**Attribute Description** This is the 11th digit of the digit structure.

**Attribute: alt1_psap.dn11**
**Fullname:** Digit Number 11

**Attribute Description** This is the 12th digit of the digit structure.

**Attribute Description** This is the 15th digit of the digit structure.

**Attribute: alt1_psap.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the PSAP telephone number.

**Attribute: alt2_psap**
**Fullname:** Second alternate PSAP telephone number

**Attribute Description** This Second alternate PSAP telephone number is used to route the 911 call in the event that the primary PSAP TN and the first alternate PSAP TN routing failed. It contains a psap telephone number and has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can only contain 0, 7, or 10 digits.

**Attribute Description** This is the 15th digit of the digit structure.

**Attribute: alt2_psap.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the PSAP telephone number.

**Attribute: selxfer1**
**Fullname:** Selective transfer number 1

**Attribute Description** This is the first selective transfer telephone number. It is used by the PSAPs to do a selective call transfer It contains a selective transfer telephone number but is not mandatory. It also has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can contain 0 to 15 digits.

**Attribute: selxfer1.dn0**
**Fullname:** Digit Number 0

**Attribute Description** This is the 1st digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn1**
**Fullname:** Digit Number 1

**Attribute Description** This is the 2nd digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn2**
**Fullname:** Digit Number 2

**Attribute Description** This is the 3rd digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn3**
**Fullname:** Digit Number 3

**Attribute Description** This is the 4th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn4**
**Fullname:** Digit Number 4

**Attribute Description** This is the 5th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn5**
**Fullname:** Digit Number 5

**Attribute Description** This is the 6th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn6**
**Fullname:** Digit Number 6

**Attribute Description** This is the 7th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn7**
**Fullname:** Digit Number 7

**Attribute Description** This is the 8th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn8**
**Fullname:** Digit Number 8

**Attribute Description** This is the 9th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn9**
**Fullname:** Digit Number 9

**Attribute Description** This is the 10th digit of the 1st selective transfer telephone number.

**Attribute: selxfer1.dn10**
**Fullname:** Digit Number 10

**Attribute Description** This is the 11th digit of the digit structure .

**Attribute: selxfer1.dn11**
**Fullname:** Digit Number 11

**Attribute Description** This is the 12th digit of the digit structure .

**Attribute: selxfer1.dn12**
**Fullname:** Digit Number 12

**Attribute Description** This is the 13th digit of the digit structure .

**Attribute: selxfer1.dn13**
**Fullname:** Digit Number 13

**Attribute Description** This is the 14th digit of the digit structure .

**Attribute: selxfer1.dn14**
**Fullname:** Digit Number 14

**Attribute Description** This is the 15th digit of the digit structure .

**Attribute: selxfer1.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the 1st selective call transfer

Copyright © 1999 Lucent Technologies 

telephone number.

**Attribute: selxfer2**

**Fullname:** Selective Transfer Number 2

**Attribute Description** This is the second selective transfer telephone number. It is used by the PSAPs to do a selective call transfer. It contains a selective transfer telephone number but is not mandatory. It also has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can contain 0 to 15 digits.

**Attribute: selxfer2.dn0**

**Fullname:** Digit Number 0

**Attribute Description** This is the 1st digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn1**

**Fullname:** Digit Number 1

**Attribute Description** This is the 2nd digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn2**

**Fullname:** Digit Number 2

**Attribute Description** This is the 3rd digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn3**

**Fullname:** Digit Number 3

**Attribute Description** This is the 4th digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn4**

**Fullname:** Digit Number 4

**Attribute Description** This is the 5th digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn5**

**Fullname:** Digit Number 5

**Attribute Description** This is the 6th digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn6**

**Fullname:** Digit Number 6

**Attribute Description** This is the 7th digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn7**

**Fullname:** Digit Number 7

**Attribute Description** This is the 8th digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn8**

**Fullname:** Digit Number 8

**Attribute Description** This is the 9th digit of the 2nd selective transfer telephone number.

Copyright © 1999 Lucent Technologies 

**Attribute: selxfer2.dn9**
**Fullname:** Digit Number 9

**Attribute Description** This is the 10th digit of the 2nd selective transfer telephone number.

**Attribute: selxfer2.dn10**
**Fullname:** Digit Number 10

**Attribute Description** This is the 11th digit of the digit structure.

**Attribute: selxfer2.dn11**
**Fullname:** Digit Number 11

**Attribute Description** This is the 12th digit of the digit structure.

**Attribute: selxfer2.dn12**
**Fullname:** Digit Number 12

**Attribute Description** This is the 13th digit of the digit structure.

**Attribute: selxfer2.dn13**
**Fullname:** Digit Number 13

**Attribute Description** This is the 14th digit of the digit structure.

**Attribute: selxfer2.dn14**
**Fullname:** Digit Number 14

**Attribute Description** This is the 15th digit of the digit structure.

**Attribute: selxfer2.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the 2nd selective transfer telephone number.

**Attribute: selxfer3**
**Fullname:** Selective Call Transfer Number 3

**Attribute Description** This is the third selective transfer telephone number. It is used by the PSAPs to do a selective call transfer. It contains a selective transfer telephone number but is not mandatory. It also has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can contain 0 to 15 digits.

**Attribute: selxfer3.dn0**
**Fullname:** Digit Number 0

**Attribute Description** This is the 1st digit of the 3rd selective transfer telephone number.

**Attribute: selxfer3.dn1**
**Fullname:** Digit Number 1

**Attribute Description** This is the 2nd digit of the 3rd selective transfer telephone number.

**Attribute: selxfer3.dn2**

**Attribute Description** This is the 14th digit of the digit structure.

**Attribute: selxfer3.dn14**

**Fullname:** Digit Number 14

**Attribute Description** This is the 15th digit of the digit structure.

**Attribute: selxfer3.digcnt**

**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the 3rd selective transfer telephone number.

**Attribute: selxfer4**

**Fullname:** Selective transfer number 4

**Attribute Description** This is the forth selective transfer telephone number. It is used by the PSAPs to do a selective call transfer. It contains a selective transfer telephone number but is not mandatory. It also has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can contain 0 to 15 digits.

**Attribute: selxfer4.dn0**

**Fullname:** Digit Number 0

**Attribute Description** This is the 1st digit of the 4th selective transfer telephone number.

**Attribute: selxfer4.dn1**

**Fullname:** Digit Number 1

**Attribute Description** This is the 2nd digit of the 4th selective transfer telephone number.

**Attribute: selxfer4.dn2**

**Fullname:** Digit Number 2

**Attribute Description** This is the 3rd digit of the 4th selective transfer telephone number.

**Attribute: selxfer4.dn3**

**Attribute Description** This is the 15th digit of the digit structure.

**Attribute: selxfer4.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the 4th selective call transfer telephone number.

**Attribute: selxfer5**
**Fullname:** Selective transfer number 5

**Attribute Description** This is the fifth selective transfer telephone number. It is used by the PSAPs to do a selective call transfer. It contains a selective transfer telephone number but is not mandatory. It also has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can contain 0 to 15 digits.

## 4. Population Rules for RLec5opts

**Relation Description** Echo Canceling boards (EC5) options.
This relation contains variables that set up the hardware of Echo Canceling boards(EC5s).

**Attribute: name**

**Fullname:** Circuit name

**Attribute Description** Contains the circuit name of an EC5. The relation should contain one tuple for each EC5 in a SM. This attribute is the key to the relation.

**Attribute: end_path**

**Fullname:** End path delay

**Attribute Description** This attribute indicates how much echo cancellation end path delay is needed for EC5.

**Attribute: tone_dis**

**Fullname:** Tone disabling

**Attribute Description** This attribute indicates the state of the tone disabling function for EC5.

**Attribute: alpha_val**

**Fullname:** Alpha value or gain

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** The alpha_val determines the alpha value or return loss used by EC5.

**Attribute: tn_match**

**Fullname:** Transient noise matching

**Attribute Description** The tn_match determines whether transient noise matching is turned on or off on EC5.

**Attribute: nb_engdt**

**Fullname:** Narrow band energy detection

**Attribute Description** The nb_engdt indicates the on/off state of narrow band energy detection of EC5.

**Attribute: ec_byp**

**Fullname:** Third generation echo canceller chipset bypass

**Attribute Description** Setting this to DBYES bypasses the echo canceller devices on the EC5. In order for the setting of this variable to take effect, the DFI which is paired with the EC5 'name' must be restored or a full or a selective initialization must take place.

**Attribute: trans_en**

**Fullname:** Transient echo control enable

**Attribute Description** Transient echo control enable/disable, open center clip switch on transient.

**Attribute: rsd_ectl**

**Fullname:** Residual echo control

**Attribute Description** Residual echo control or center clipping enable/disable.

**Attribute: vp_asran**

**Fullname:** Voice path assurance enable

**Attribute Description** Indicates whether voice path assurance tests are run continuously in the hardware: Hardware designers recommend DBNO, voice may simulate voice path assurance test if enabled. Also known as vpaen.

**Attribute: beta_val**

**Fullname:** Beta value

**Attribute Description** Determines the value of the center clip threshold.

**Attribute: leak_opt**

**Fullname:** Leak option value

**Attribute Description** When the echo canceller is driven by a narrow band signal, some of the impulse response coefficients might tend to diverge. This divergence can be eliminated by introducing 'leak' into the updating circuit.

**Attribute: nb_leak**

**Fullname:** Narrow band leak option value

**Attribute Description** The narrow band leak option has the same meaning as the leak option in the previous CCB register except that this value is used when narrow band energy is detected.

**Copyright © 1999 Lucent Technologies** 

**Attribute: cmp_line**

**Fullname:** Companding law used on line (DFI) side of EC5.

**Attribute Description** This is used to set the companding law, either A law or Mu law sent and expected on the FAR end PIDB. This attribute must be equal to Glcompnd.

**Attribute: cmp_drop**

**Fullname:** Companding law used on drop (TSI) side of EC5.

**Attribute Description** This is used to set the companding law, either A law or Mu law sent and expected on the NEAR end PIDB. This attribute must be equal to Glcompnd.

**Attribute: hpfenx**

**Fullname:** High pass filter enable (x)

**Attribute Description** High pass filter enable on x - facility end input

**Attribute: hpfeny**

**Fullname:** High pass filter enable (y)

**Attribute Description** High pass filter enable on y - drop end input.

**Attribute: hiclmp**

**Fullname:** High clamping

**Attribute Description** High clamping

**Attribute: pkf4t19**

**Fullname:** Peak factor

**Attribute Description** The value of this attribute is 7 for 32MS end path delay time, and 6 for 64MS end path delay time.

**Attribute: nbpft19**

**Fullname:** Narrow band peak factor

**Attribute Description** Narrow band peak factor

**Attribute: fstht27**

**Fullname:** Far end speech threshold

**Attribute Description** Far end speech threshold

**Attribute: glot26**

**Fullname:** Loop gain

**Attribute Description** Gain overflow reset. The valid range of this attribute is 28 thru 34.

**Attribute: govres**

**Fullname:** H overflow reset

**Attribute Description** H overflow reset

**Attribute: ufrmpas**

**Fullname:** I/O format conversion

Copyright © 1999 Lucent Technologies 

**Attribute Description** I/O format conversion

**Attribute: neshoc**

**Fullname:** Near end speech detection hang over count.

**Attribute Description** Near end speech detection hang over count.

**Attribute: reshoc**

**Fullname:** Residual echo control hang over count

**Attribute Description** The value of this attribute is 255 for 32MS end path delay and 196 for 64MS end path delay.

**Attribute: trehoc**

**Fullname:** Transient echo control hangover count.

**Attribute Description** The value of this attribute is 16 for 32MS end path delay and 8 for 64MS end path delay.

**Attribute: nesphoc**

**Fullname:** Near end speech detector hangover count.

**Attribute Description** Near end speech detector hangover count

**Attribute: eoves Fullname:** E output overflow reset.

**Attribute Description** E output overflow reset

**Attribute: eovclmp**

**Fullname:** Clamp e if e overflow

**Attribute Description** Clamp e if e overflow

**Attribute: ebig**

**Fullname:** E big

**Attribute Description** The value of this attribute is 4 for 32MS end path delay and 2 for 64MS end path delay.

**Attribute: yhi**

**Fullname:** Y high

**Attribute Description** Y high

**Attribute: ysmall**

**Fullname:** Y small

**Attribute Description** The value of this attribute is 2 for 32MS end path delay and 1 for 64MS end path delay.

**Attribute: gxmadj**

**Fullname:** Special Mu law adjustment at x

**Attribute Description** Required if echo cancellation and the high pass filter are both enabled.

**Attribute: gxaadj**

Copyright © 1999 Lucent Technologies 

**Fullname:** Special A law adjustment at x.

**Attribute Description** Required if echo cancellation and the high pass filter are both enabled.

**Attribute: gymadj**

**Fullname:** Special Mu law adjustment at y.

**Attribute Description** Required if echo cancellation and the high pass filter are both enabled.

**Attribute: gyaadj**

**Fullname:** Special A law adjustment at y.

**Attribute Description** Required if echo cancellation and the high pass filter are both enabled.

**Attribute: duble**

**Fullname:** Double precision

**Attribute Description** Double precision

**Attribute: cdly**

**Fullname:** C output delay

**Attribute Description** C output delay

**Attribute: addtac**

**Fullname:** Address of top of x in shift register.

**Attribute Description** Address of top of x in shift register.

**Attribute: fesen**

**Fullname:** Far end speech detector enable.

**Attribute Description** Far end speech detector enable.

**Attribute: nesen**

**Fullname:** Near end speech detector enable.

**Attribute Description** Near end speech detector enable.

**Attribute: dllow**

**Fullname:** Gain offset in convolution update chip.

**Attribute Description** Gain offset in convolution update chip

**Attribute: testub**

**Fullname:** Ec testing option

**Attribute Description** For use in testing the echo cancellation chipset.

**Copyright © 1999 Lucent Technologies**

## 4. Population Rules for RLeds_cf

**Relation Description** EDS constructed feature options and defaults - used in the switching module (SM).

**Attribute: feat_id**

**Fullname:** EDS constructed feature ID

**Attribute Description** A business and residential customer service (BRCS) constructed feature ID

Copyright © 1999 Lucent Technologies

consists of two parts when class equals FACBRCS and subclass equals SCL_FEAT: a modular feature type (top six bits, bits 10 - 15) and an unique identifier (bottom ten bits, bits 0 - 9). For an EDS constructed feature ID, the modular feature type must equal MFEDS, which is an enumeration of type DMMFTYPE. The unique identifier ranges from 1 to 1023 (0x1 to 0x3ff).
Dependencies:

```
Verify that RLfacname has a tuple such that:
RLfacname.facid    = RLeds_cf.feat_id
RLfacname.class    = FACBRCS
RLfacname.subclass = SCL_FEAT

Verify that RLfid2name has a tuple such that:
RLfid2name.facid    = RLeds_cf.feat_id
RLfid2name.class    = FACBRCS
RLfid2name.subclass = SCL_FEAT

Verify that RLeds_opts has a tuple such that:
RLeds_opts.feat_id = RLeds_cf.feat_id
```

**Attribute: dqd**

**Fullname:** Directory query display (DQD)
**Attribute Description** Boolean value indicating whether directory query display is allowed. The DQD option is assigned on a per primary directory number (DN) basis. Station users with this option assigned to their primary DN should be able to invoke DQD. The DQD option is not assignable on a secondary only DN or a secondary only multi-line hunt group (MLHG).
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND. Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO.
Dependencies:

```
Enumeration Value   Dependency
DBNO
DBYES
```

The checks for this attribute have been implemented in RLeds_port.

**Attribute: nd_prim**

**Fullname:** Calling name display (CND) primary DN

**Attribute Description** Boolean value indicating whether CND primary DN is allowed. If this option is DBYES for a DN, then it is assignable on a primary DN (lead port if there is no primary DN), secondary only DN, and a secondary only MLHG. These DNs will receive CND.
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND. Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO.
Range: DBYES, DBNO
Default: DBNO
Dependencies:

```
Enumeration Value  Dependency
DBNO               None
DBYES              If CND primary DN (nd_prim) is equal
                   to DBYES, then shared DN (nd_dn) must
                   be equal to DBNO.
                   If this DN has a line ID (LID)
                   constructed feature and the calling
                   name display option (RLeds_cf.nd_prim
                   equal to DBYES) is selected, then
```

**Copyright © 1999 Lucent Technologies** 

RLlid_cf.cnd_prim equals DBYES and
RLlid_cf.cnd_all equals DBNO (the
exception being if RLlid_cf.cnd_prim
equals DBNO, then RLlid_cf.cnd_all
must be equal to DBNO).

The checks for this attribute have been implemented in RLeds_port.

**Attribute: nd_dn**

**Fullname:** Calling name display (CND) shared DN

**Attribute Description** Boolean value indicating whether CND shared DN is allowed. If this option is DBYES for a DN, then CND is available for all terminals which share this DN. This option can be DBYES for a secondary only DN or a secondary only MLHG.
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND.
Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO.

Range: DBYES, DBNO

Default: DBNO

Dependencies: Enumeration Value Dependency DBNO None

DBYES If CND shared DN (nd_dn) is equal to DBYES, then primary DN (nd_prim) must be equal to DBNO.
If this DN has an LID constructed feature and the CND option (RLeds_cf.nd_dn equal to DBYES) is selected, then RLlid_cf.cnd_all equals DBYES and RLlid_cf.cnd_prim equals DBNO (the exception being if
RLlid_cf.cnd_all is equal to DBNO, then
RLlid_cf.cnd_prim must be equal to DBNO).
The checks for this attribute have been implemented in RLeds_port.

**Attribute: aucsu**

**Fullname:** Auto-call set up

**Attribute Description** Boolean value indicating whether auto-call set-up is allowed. Auto-call option is provided on a per primary DN basis. It can be activated from any call appearance on a terminal which has the auto-call option assigned to the primary DN. The auto-call option is not assignable on a secondary only DN or a secondary only MLHG.
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND.
Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN.
DN shared with analog line should be equal to DBNO.

Dependencies:

| Enumeration Value | Dependency |
|---|---|
| DBNO | none |
| DBYES | When assigned to an MLHG member that is not the first member, verify that RLis_line(lead_module, ltm_idx).noc does not equal zero and that RLeds_cf.dqd equals DBNO. |

The checks for this attribute have been implemented in RLeds_port.

## 4. Population Rules for RLeds_grp

Copyright © 1999 Lucent Technologies

**Relation Description** Electronic directory service (EDS) group ID.

**Attribute: eds_grpid**

**Fullname:** Electronic directory service (EDS) group ID
**Attribute Description** EDS group ID (10 bits: bits 0-9), is an identifier resulting from the conversion from an 8 character EDS group name using RLfacname. The eds_grpid is arranged sequentially starting at 1. When an eds_grpid is freed-up, that position will be re-claimed before adding one more to the end of the list. Refer to RLfacids poprules for reclaiming policy.
Dependencies: A tuple must exist in this relation for each non-zero EDS group ID in the RLeds_port relation

Verify that RLfacname has a tuple such that: RLfacname.facid = eds_grpid (compare RLfacname.facid low order bits (bits 0-9) against eds_grpid) RLfacname.class = FACEDS RLfacname.subclass = SCL_NULL

Verify that RLfid2name has a tuple such that: RLfid2name.facid = eds_grpid (compare RLfid2name.facid low order bits (bits 0-9) against eds_grpid) RLfid2name.class = FACEDS RLfid2name.subclass = SCL_NULL

**Attribute: gcsrid**

**Fullname:** Business customer ID
**Attribute Description** A non-zero gcsrid is required for an EDS group.
If a line is a member of an EDS group with a gcsrid greater than 0 and also a member of a message desk service (MDS) group with a gcsrid greater than 0, the gcsrid of the MDS group must be the same as the gcsrid of the EDS group to which the line is assigned.

**Attribute: ap_id**

**Fullname:** Application processor (AP) ID (APID)
**Attribute Description** Verify that EDS is not allowed on an AP hosted by the administrative module (AM) and RLcmapdata.module must not = 0.
For value of 1 to 255:
Verify that RLcmapdata has a tuple such that: RLcmapdata.site_id = ap_id.

**Attribute: psswrd**

**Fullname:** Password option
**Attribute Description** Boolean value to indicate whether the password option is assigned.

**Attribute: msrmnt**

**Fullname:** Measurement flag
**Attribute Description** If RLms_ap has a tuple such that RLms_ap(EDS,DBNO).edmsgp'n'= RLeds_grp.eds_grpid, (1<= n <= 25) then RLeds_grp.msrmnt = DBYES else RLeds_grp.msrmnt = DBNO.
When deleting a tuple from this relation and if the msrmnt flag is set to DBYES then, zero out the edmsgp'n' field and decrement the idscnt field by 1 in RLms_ap(EDS, DBNO) relation.

**Attribute: ffcf1**

**Fullname:** bit reserved for future field feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf2**

**Fullname:** bit reserved for future field feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf3**

**Fullname:** unsigned 4 reserved for future field feature use

Copyright © 1999 Lucent Technologies 

**Attribute Description** Not assigned yet.

```

**Attribute: edsgpname**

Copyright © 1999 Lucent Technologies 

**Fullname:** EDS group name
**Attribute Description** This attribute is the default parameter for EDS GROUP field in the recent change/verify (RC/V) line.

**Attribute: dqd**

**Fullname:** Directory query display (DQD)
**Attribute Description** Boolean value indicating whether DQD is allowed. The DQD option is assigned on a per primary DN basis. Station users with this option assigned to their primary DN should be able to invoke DQD.
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND. Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO. The DQD option is not assignable on a secondary only DN or a secondary only multi-line hunt group (MLHG).
The checks for this attribute have been implemented in RLeds_port.

**Attribute: nd_prim**

**Fullname:** Calling name display (CND) primary directory number (DN)
**Attribute Description** Boolean value indicating whether calling name display primary DN is allowed. If this option is DBYES for a DN, then it is allowed for a primary DN (lead port if there is no primary DN), secondary only DN, and a secondary only MLHG. These DNs will receive CND.
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND. Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO.

Dependencies:

| Enumeration Value | Dependency |
|---|---|
| DBNO | None |
| DBYES | If calling name display primary DN (nd_prim) is equal to DBYES, then shared DN (nd_dn) must be equal to DBNO. |

If this DN has a line ID (LID) constructed feature and the calling name display option (RLeds_opts.nd_prim equals DBYES) is selected, the RLlid_cf.cnd_prim equals DBYES and RLlid_cf.cnd_all equals DBNO. (The exception being, if RLlid_cf.cnd_prim equals DBNO, then RLlid_cf.cnd_all must be equal to DBNO.) The checks for this attribute have been implemented in RLeds_port.

**Attribute: nd_dn**

**Fullname:** Calling name display (CND) shared DN
**Attribute Description** Boolean value indicating whether CND shared DN is allowed. If this option is DBYES for a DN, then CND is available for all terminals which share this DN. This option is allowed to be DBYES for a secondary only DN and a secondary only MLHG.
Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND. Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO.

Dependencies:

| Enumeration Value | Dependency |
|---|---|
| DBNO | None |
| DBYES | If calling name display shared DN (nd_dn) is equal to DBYES, then primary DN (nd_prim) must be equal to DBNO. |

If this DN has an LID constructed feature and the calling name display option (RLeds_opts.nd_dn equal to DBYES) is selected, then RLlid_cf.cnd_all is equal to DBYES and RLlid_cf.cnd_prim is equal to DBNO. (The exception being, if RLlid_cf.cnd_all equals DBNO, then RLlid_cf.cnd_prim must be equal to DBNO). The checks for this attribute have been implemented in RLeds_port.

Copyright © 1999 Lucent Technologies 

**Attribute: aucsu**

**Fullname:** Auto-call setup

**Attribute Description** Boolean value indicating whether auto-call set-up is allowed. auto-call option is provided on a per primary DN basis. It can be activated from any call appearance on a terminal which has the auto-call option assigned to the primary DN. The auto-call option is not allowed for a secondary only DN or a secondary only MLHG.

Must be equal to DBNO unless 'servclass' equals FC_ISDN or FC_ISATND. Must be equal to DBNO unless 'ltm_type' equals LTM_ISDN. DN shared with analog line should be equal to DBNO.

Dependencies:

| Enumeration Value | Dependency |
|---|---|
| DBNO | none |
| DBYES | When assigned to an MLHG member that is not the first member, verify that RLis_line(ltm_idx,lead_module).noc does not equal zero and that RLeds_opts.dqd equals DBNO. |

The checks for this attribute have been implemented in RLeds_port.

## 4. Population Rules for RLeds_port

**Relation Description** Electronic directory service (EDS) line parameter.

Copyright © 1999 Lucent Technologies

For BFG purposes, this 'EDS' is an 'either' type. Therefore, BFG pseudo port tuple will be created for the SM where any BFG port members reside. Individual port tuples may or may not be created for BFG assigned ports.

BFG, capability G268, is intended to improve recent change response time and provide for SM memory reduction. It permits the creation of groups of BRCS features and parameters, and utilization of these groups by call processing. New group parameter relations will not be created, but will be populated in the existing relations. The group parameters will be identified by lead_module = zero and ltm_type = LTM_ISDN (see lead_module and ltm_type for details).
This relation has now two types of tuples distinguished primarily by ltm_type.
1. The first type is the existing RLeds_port tuples which are group partitioned and remain unchanged (ltm_type = LTM_ISDN or LTM_OTHER).

2. The second type is the BFG group parameter tuple and is also group partitioned. This tuple is accessed by keys lead_module(equal to zero), ltm_index and ltm_type = LTM_ISDN. The BFG group parameter tuples were put in this relation to avoid creation of a new relation and minimize changes in the existing relation.

**Attribute: lead_module**

**Fullname:** lead module
**Attribute Description** Range value 0 allowed only for ltm_type = LTM_ISDN.

**Attribute: ltm_type**

**Fullname:** logical termination index type
**Attribute Description** If RLeds_port.lead_module equal to zero and ltm_type is equal to LTM_ISDN, then the tuple in the relation refers to BRCS feature grouping (BFG) group parameter tuples. See special entry for group parameter associated with BFG.

**Attribute: ltm_idx**

**Fullname:** logical termination index
**Attribute Description** If lead_module is zero and ltm_type is LTM_ISDN the ltm_idx range starts with 256. Otherwise, the ltm_idx range starts with 1.

```
Dependencies:
If RLeds_port.ltm_type is equal to LTM_ISDN then a
tuple must exist in the RLis_line relation such that:
Rlis_line(lead_module, ltm_idx).lead_module =
RLeds_port.lead_module and
RLis_line(lead_module, ltm_idx).ltm_idx =
Rleds_port.ltm_idx.
If RLeds_port.lead_module is zero and RLeds_port.ltm_type
is equal to LTM_ISDN then:
a tuple must exist in RLis_line relation such
that:
       if RLrc_lcc.servclass = FC_ISDN (or FC_ISATND),
       RLeds_port.ltm_idx = RLis_line.bfgid
       if RLrc_lcc.servclass = FC_INDVDL, then
       RLeds_port.ltm_idx = RLfc_line.bfgid
```

**Attribute: eds_grpid**

**Fullname:** EDS group ID
**Attribute Description** EDS group ID ( 10 bits: bits 0-9), is an identifier resulting from the conversion from an 8 character EDS group name using RLfacname. The eds_grpid is arranged sequentially starting at 1. When an eds_grpid is freed-up, that position will be re-claimed before adding one more to the end of the list. Refer to RLfacids.P for reclaiming policy.

```
Dependencies:
Verify that there exists an RLeds_grp tuple such that
   RLeds_port.eds_grpid = RLeds_grp.eds_grpid
```

Copyright © 1999 Lucent Technologies 

```
Verify that RLfacname has a tuple such that:
   RLfacname.facid = RLeds_port.eds_grpid
   (compare RLfacname.facid low order bits (bits 0-9)
   against eds_grpid)
   RLfacname.class = FACEDS
   RLfacname.subclass = SCL_NULL
Verify that RLfid2name has a tuple such that:
   RLfid2name.facid = RLeds_port.eds_grpid
   (compare RLfid2name.facid low order bits (bits 0-9)
   against eds_grpid)
   RLfid2name.class = FACEDS
   RLfid2name.subclass = SCL_NULL
```

**Attribute: ffcf1**

**Fullname:** bit reserved for future field feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf2**

**Fullname:** bit reserved for future field feature use
**Attribute Description** Not assigned yet.

**Attribute: ffcf3**

**Fullname:** unsigned 8 reserved for future field feature use
**Attribute Description** Not assigned yet.

## 4. Population Rules for RLedsIdchn

**Relation Description** OSPS Extended Digital Subscriber Line D channels
This relation is populated with extended digital subscriber line (EDSL) D channels. It identifies the D channel number and all EDSL B channels controlled by the D channel. One tuple is populated for each assigned OSPS EDSL D channel only. or OSPS-EDSL D channel.

**Attribute: dport**

**Copyright © 1999 Lucent Technologies** 

**Fullname:** D channel port name

**Attribute Description** Populate with EDSL D channel port name. For OSPS-EDSL, D-channels are populated in RLfc_porttyp with servclass = OA_IFOPER or OA_IFTERM and lp_type = PCTDCHAN.

Note: A DLTU DFI terminates one T1 facility and a DLTU2 DFI terminates two T1 facilities. The Digital Channel field of the Digital Equipment Number (DEN) contains channel numbers from 1 to 48.

When mapping from channel DENs to port names, channels from 1 to 24 are mapped into the range 0 to 23. Channels from 25 to 48 are also mapped into the range 0 to 23.

The D-channel port is on channel 23.

**Attribute: dchan_no**

**Fullname:** Channel number of the D channel

**Attribute Description** This attribute is the channel number of the D channel. For domestic, the current value for the D channel is 23.

**Attribute: dp_addr1**

**Fullname:** B channels port names

**Attribute Description** This attribute will not be used after Port and Circuit Renaming takes effect. It is left in now to ease the transition.

**Attribute: bc_bmap1**

**Fullname:** B channels bit map

**Attribute Description** This attribute will not be used after Port and Circuit Renaming takes effect. It is left in now to ease the transition.

**Attribute: bport0**

**Fullname:** B channel port 0

**Attribute Description** This attribute is for B channel port 0. It is supervised by the D channel.

In the circuit indexing scheme for a DLTU terminating T1 trunks, bits 0-4 of the index represent the channel, bit 5 represents the DFI and bits 8-15 represent the DFI pack number. Bits 0-4 may contain a number between 0 and 23 with 0-22 being reserved for B channel ports and 23 reserved for the D channel port. Bit 5 is 0 if one T1 trunk is terminated (DLTU) and 1 if two T1 trunks are terminated (DLTU2).

This B port must be on the same DFI as its supervising D port. It must have a channel index that corresponds to its port number (such as 0 for B port 0). This holds true regardless of whether the DLTU is terminating 1 or 2 T1 trunks.

OSPS B channels are assigned in RLfc_porttyp with servclass = OA_IFOPER or OA_IFTERM and lp_type = PCTBCHAN. When a B channel is assigned in RLfc_porttyp, this attribute must be updated. OSPS-EDSL D channels must be assigned before their associated B-channels.

See the CHECK section for the rules relating to this attribute.

**Attribute: bport1**

**Fullname:** B channel port 1

## 4. Population rules for RLedslgprt

### Relation Description

```
        associates call by call information with trunk group.

        Associates an mcri with a trunk group and call by call
        service type.

       "This relation along with RLedsltrkg and RLnsfmap provide
        data for the EDSL call by call service selection feature
        (See population rules for RLedsltrkg and RLnsfmap).

        Also relation RLrcnsfmap is created for RC administration of
        RLnsfmap.eprtidx2 (See RLrcnsfmap population rules).

        RLedslgprt associates a Simulated Facilities Group (SFG)
        via an MCRI to a trunk group for each call by call service
        provided to the trunk group (Note that the same WATS band
```

Copyright © 1999 Lucent Technologies

service provided by 2 different carriers would be 2 services
as would OPOTS service provided by 2 different carriers).

A tuple must exist in this relation for each service that
will be used by the trunk group - that is, for each combination
of NSFTYPE, band, carrier ID (including null carrier). This
is potentially one for each carrier in the office for each
originating NSFTYPE assigned to the trunk group. A call
request from the trunk group without the associated service
assigned will result in a switch personnel assert on the
ROP and a failed call. Ideally, entries for all possible
carriers for an NSFTYPE assigned to a trunk group should
be made. However, in reality, this could consume many
unnecessary memory resources.

Two keys are provided for this relation. One is the eprtidx2
index provided from RLnsfmap representing the call by call
service. The other is the trunk group number. The data
associated with each call by call service for each trunk
group is an MCRI which through the RLrt_mcrt relation has a
n associated SFG. The SFG must be assinged in RLrt_sfg.

RLedslgprt is group-partitioned with group type = GPDEDSL."

**Attribute:**
eprtidx2
**Fullname:**
EDSL pre-routing index.
**Attribute Description:**
This attribute is the EDSL pre-routing
index for the call by call service.
The assignment of index eprtidx2 is in RLnsfmap
and is RC/ODA administered. RLrcnsfmap is
for RC administration of RLnsfmap and is a
'mirror' of RLnsfmap. The RLfacids
relation is used to keep track of assigned/
unassigned values. RLfacids.class = FACEDSL
for eprtidx2 (See RLfacids population rules).

A tuple must exist in RLrcnsfmap where
RLrcnsfmap.eprtidx2 = RLedslgprt.eprtidx2 and a
tuple must exist in RLrt_trkg where RLrt_trkg.grpnum =
RLedslgprt.grpnum. If RLrcnsfmap.nsftype = FC_OPOTS,
FC_HM, FC_SCOCS),
FC_OWBAND, FC_MAXOWATS, FC_OFX, or FC_OTIE
then RLrt_trkg.type = RTTWOWAY or RTINCOM.
If RLrcnsfmap.nsftype = FC_TPOTS, FC_TFX, FC_TTIE
then RLrt_trkg.type = RTTWOWAY or RTOUTGO.
If RLrcnsfmap.nsftype = FC_HM or FC_SCOCS,
RLrcnsfmap.bearcap
and RLrctgrprk.datarate must be compatible.

Copyright © 1999 Lucent Technologies 

**Attribute:**
grpnum
**Fullname:**
Group number.
**Attribute Description:**
This attribute is the trunk group number.
It is populated for each EDSL B channel trunk
group that has call by call service(s) assigned.
Each eprtidx2 value (2nd key) represents a call
by call service. A tuple exists for each grpnum,
eprtidx2 combination so that a given grpnum may have
more than one tuple. If the grpnum does not have
call by call services, no tuple exists for the grpnum.

A tuple must exist in RLedsltrkg such that
RLedslgprt.grpnum = RLedsltrkg.grpnum.

**Attribute:**
mcri
**Fullname:**
Route index with associated SFG.
**Attribute Description:**
This attribute is the MCRI assigned
for the trunk group and call by call
service. It is not required that an MCRI
be used in only one RLedslgprt tuple (such as,
two trunk groups requiring the same billing,
screening, and number of SFG members information
could use the same MCRI).

Verify existence of tuple in
RLrt_mcrt for RLrt_mcrt.mc_ri =
RLedslgprt.mcri with RLrt_mcrt.route_type=
RTE_SFG or RTE_REORDER.

Verify that RLrcnsfmap.carrid from the
RLrcnsfmap.eprtidx2 tuple =
RLrt_mcrt.carr_id if RLrt_mcrt.route_type
= RTE_SFG.
This is only required when the RLrcnsfmap.carrid
is not equal to NULL_BCARID.

Verify that RLrt_mcrt.grpnum = 0 for
RLrt_mcrt.mc_ri tuple where mc_ri =
RLedslgprt.mcri.

If RLrt_mcrt.route_type = RTE_SFG,
verify existence of tuple in RLrt_sfg
where RLrt_mcrt.sfg_grp = RLrt_sfg.grpnum.
Verify consistency of RLrt_sfg.sfg_type
and RLrcnsfmap.nsftype. For nsftype =
FC_OPOTS or FC_TPOTS, sfg_type = SFGEDSL.

**Copyright © 1999 Lucent Technologies** 

```
For nsftype = FC_OWBAND or FC_MAXOWATS,
sfg_type = SFGOUTWATS. For nsftype =
FC_SDN, sfg_type = SFGSDN. For nsftype =
FC_M800, sfg_type = SFGM800.
For nsftype = FC_HM, sfg_type = SFGHM.
For nsftype = FC_SCOCS, sfg_type = SFGSCOCS.
For nsftype = FC_OFX, sfg_type = SFGOUTFX or SFG2WFX.
For nsftype = FC_TFX, sfg_type = SFGINFX or SFG2WFX.
For nsftype = FC_OTIE, sfg_type = SFGOUTTIE or SFG2WTIE.
For nsftype = FC_TTIE, sfg_type = SFGINTIE or SFG2WTIE.
For nsftype = FC_MEGACOM, sfg_type = SFGMEGACOM.
For nsftype = FC_I800, sfg_type = SFGI800.
For nsftype = FC_MULTIQUEST, sfg_type = SFGMULTIQUEST.

Verify that RLrt_sfg.sfg_si != 0
in RLrt_sfg.grpnum tuple when
RLrcnsfmap.nsftype = FC_OPOTS,
SFGHM, SFGSCOCS,
FC_OWBAND, FC_MAXOWATS, FC_SDN, or FC_M800.

## 4. Population rules for RLedsltrkg

### Relation Description

Extended digital subscriber line (EDSL) trunk group.

Assigns EDSL features to trunk groups.

This relation RLedsltrkg is populated for EDSL B-channel trunk groups - trunk groups with members that have servclass = FCEDSL or FCEDSLHM and lp_type = PCTBCHAN in RLfc_porttyp (see RLfc_porttyp population rules for EDSL ports). EDSL trunk groups are also populated in RLrt_trkg.

RLedsltrkg is created along with relations RLedslgprt and RLnsfmap in order to provide EDSL features for trunk groups. Also, RLrcnsfmap is created to aid recent change (RC) administration of these relations (see population rules for RLedslgprt, RLnsfmap, RLrcnsfmap).

RLedsltrkg associates EDSL features with the trunk group. RLnsfmap associates an index (eprtidx2) with EDSL call by call services. RLedslgprt associates the call by call services with an EDSL trunk group. Note that if an EDSL trunk group does not have call by call services, a tuple exists for the group in RLedsltrkg but not in RLedslgprt.

RLrcnsfmap.nusers contains the number of users of an RLnsfmap.eprtidx2 value. The number of users is the number of trunk groups in the office associated with the eprtidx2 value. A trunk group is associated with an eprtidx2 value via the RLedslgprt relation (trunk group number and eprtidx2 are keys for RLedslgprt).

EDSL is an integrated services digital network (ISDN) capability which provides a private branch exchange (PBX) interface for customers using T1 carrier facilities (trunks) and Telecommunication Standardization Sector (ITU-TS) (formerly (CCITT) Q.931 message signaling. EDSL trunks can originate calls and receive 'line' screening and billing treatment. They can be terminated-to via a

Copyright © 1999 Lucent Technologies 

directory number (data-wise trunk group is linked to directory number [DN] via a route index in the DN translations), and the trunks are hunted via standard trunk hunting algorithms. They can also be terminated-to via digit analysis (data-wise trunk group is obtained from route index in the digit analysis tables) and hunted via standard trunk hunting algorithms. Note that if EDSL trunks are terminated-to via RLrtdnmod or digit analysis tables, no DN assigned features can be provided (such as, INWATS).

EDSL trunks may have an EDSL hotel/motel class of service to Traffic Services Position System (TSPS) (servclass = FCEDSLHM). Basic terminating service includes direct inward dialing (DID) functionality with the digits 'outpulsed' included in a Q.931 message. A presubscribed carrier ID and control interface (CI) dialing privileges are also provided.

Call by call service selection allows multiple services to be routed to an EDSL trunk group. On a per call basis, the service being used is indicated in the network specific facilities (NSF) element of a Q.931 message.

The following services are specified on a per call basis in a Q.931 message, but are not call by call services:

- Station ID (SID) to terminating end
- User to user information (UUI)
- Codeset 7
- Call by call service selection
- Data rates 56kb/s, 64kb/s restricted, 64kb/s clear.

Data service is assigned in RLfc_trunk.datarate.
(Datarate is provided on trunks by interswitch voice and data capability).

Outward wide area telephone service (OUTWATS) calls require wide area telephone service (WATS) screening and billing data different from plain old telephone service (POTS) calls. Trunk INWATS (TINWATS) calls require terminating billing data. Simulated facilities groups (SFGs) will be used to provide this screening and billing data. SFGs also provide a limiting function that controls the number of simultaneous calls allowed for each service (such as, it may be required that a given service be limited to a number of simultaneous calls that is less than the number of calls the trunk group can handle). See RLnsfmap and RLedslgprt population rules for additional call by call data assignments and RLrt_mctr for TINWATS modular communications route index (MCRI)/SFG assignments.

RLedsltrkg is group partitioned with group type = GPDEDSL."

**Attribute:**

grpnum

**Fullname:**

Group number

**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute is the trunk group number.
A tuple is populated for each assigned EDSL B
channel trunk group. A B-channel group has members
with RLfc_porttyp.servclass = FCEDSL or FCEDSLHM and
RLfc_porttyp.lp_type = PCTBCHAN. See RLrt_trkg
population rules for further D, B channel trunk
group definition.

Note that since this relation is not populated for
EDSL D-channel trunk groups, the attributes in this
relation are not valid for D-channel groups.

**Attribute:**
calbycal
**Fullname:**
Call by call
**Attribute Description:**
This attribute indicates whether or not this trunk group has
call by call capability. See the previous description of call
by call services.

RLedsltrkg.calbycal must = RLrt_trkg.calbycal. Note that calbycal
may be DBYES without having tuples in RLedslgprt for this grpnum
(This happens when trunk group is for TINWATS only or for both POTS
with no MCRI/SFG and TINWATS. A trunk group has TINWATS if a DN
routing to the trunk group has TINWATS - that is, for RLrt_dntran.dn,
RLrt_dntran.termclass = RTTC_TINWATS). Also note that RC cannot
guarantee consistency of the calbycal attribute with related data
(associated MCRI assignments in RLedslgprt and RLrt_mctr) since
the data is administered by different RC views and all data
necessary to guarantee consistency is not available on all views.

If an inconsistency exists (calbycal = DBYES without associated
MCRIs/SFGs, or MCRIs/SFGs with calbycal = DBNO), call processing
may issue a user assert or generate incorrect billing information
depending on the type of inconsistency.

This attribute also has dependency on RLfc_trunk.sdnded which
determines if this trunk is dedicated to software defined network
(SDN) service access. If RLfc_trunk.sdnded == DBYES, then calbycal
must be DBNO.

**Attribute:**
isdn_sid
**Fullname:**
SID treatment
**Attribute Description:**
This attribute indicates what SID treatment this group can have.
Valid treatments are FC_NOSID cannot receive SID. FC_TRANONLY
terminator will receive SID only if it was initially sent by the

**Copyright © 1999 Lucent Technologies** 

originator (that is, central office will transport SID if sent: it will not prompt originator or retrieve it from office data).

**Attribute:**
uui
**Fullname:**
User to user information
**Attribute Description:**
This attribute indicates if this group can send and receive UUI message elements.

**Attribute:**
codeset7
**Fullname:**
Code set 7 option
**Attribute Description:**
This attribute indicates what codeset7 option this group can have. Valid options are:

FC_NOCODE7 - codeset7 not allowed.
FC_CODE7 - allowed to send and receive codeset7, no interpretation by the central office.

**Attribute:**
carrid
**Fullname:**
Carrier ID
**Attribute Description:**
This attribute indicates the presubscribed carrier for this trunk group. It may be specified if RLrt_trkg.type = RTTWOWAY, RTINCOM, or RTOUTGO for this grpnum.

Allowable Range: 0-FGDMAXBCAR
A NULL carrier is defined as NULL_BCARID.
A non-existing or invalid carrier is defined as INVBCARID.

NOTE: A tuple must exist in RLfc_carr such that RLfc_carr.carrid = RLedsltrkg.carrid for all valid carrid values except NULL_BCARID.

Default: NULL_BCARID

**Attribute:**
ci_dial
**Fullname:**
Carrier dialing permission
**Attribute Description:**
This attribute specifies the carrier dialing permissions for this trunk group.

**Copyright © 1999 Lucent Technologies** 

```
CI_ALLOWED      - May dial feature group D carrier access
                  code (CAC).
CI_PROHIBITED   - Cannot dial feature group D CAC.
CI_REQUIRED     - Must dial feature group D CAC.
TEST_ALLOW      - May dial feature group D CAC to carrier
                  in thetest state.
TEST_PROHIB     - cannot dial feature group D CAC to carrier
                  in the test state.
TEST_REQ        - must dial feature group D CAC to carrier in
                  the test state.
```

**Attribute:**
opots_sfg
**Fullname:**
Orignating POTS SFG
**Attribute Description:**
This attribute indicates if an MCRI/SFG is to be used for originating call by call POTS calls.

If DBYES, a tuple exists in RLedslgprt keyed by this grpnum such that the nsftype is FC_OPOTS. That is, for the RLedslgprt.grpnum, RLedslgprt.eprtidx2 tuple, the tuple for RLrcnsfmap.eprtidx2 has RLrcnsfmap.nsftype = FC_OPOTS.

**Attribute:**
tpots_sfg
**Fullname:**
Terminating POTS SFG
**Attribute Description:**
This attribute indicates if an MCRI/SFG is to be used for terminating call by call POTS calls.

If DBYES, a tuple exists in RLedslgprt keyed by this grpnum such that the nsftype is FC_TPOTS. That is, for the RLedslgprt.grpnum, RLedslgprt.eprtidx2 tuple, the tuple for RLrcnsfmap.eprtidx2 has RLrcnsfmap.nsftype = FC_TPOTS.

**Attribute:**
m800_sfg
**Fullname:**
Megacom(R) 800 simulated facility group
**Attribute Description:**
Indicate if MCRI/SFG is used for incoming call by call Megacom(R) 800 calls. This attribute is set to DBYES when a tuple is inserted into RLnsfmap with nsftype = FC_M800 and when a tuple is inserted into RLedslgprt with RLnsfmap.eprtidx2 and RLedsltrkg.grpnum.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
nds0unans
**Fullname:**
N times DS0 unanswered call billing
**Attribute Description:**
Indicates whether to generate a billing record for wideband unanswered and unconnected calls on PRI.

**Attribute:**
sdn_sfg
**Fullname:**
Software defined network simulated facility group
**Attribute Description:**
Indicate if MCRI/SFG is used for incoming call by call SDN calls. This attribute is set to DBYES when a tuple is inserted into RLnsfmap with nsftype = FC_SDN and when a tuple is inserted into RLedslgprt with RLnsfmap.eprtidx2 and RLedsltrkg.grpnum.

**Attribute:**
bill_dn
**Fullname:**
Billing directory number
**Attribute Description:**
This attribute indicates the billing number for this trunk group. A billing number is required for EDSL B channel trunk groups with RLrt_trkg.type = RTINCOM or RTTWOWAY. If RLrt_trkg.type = RTOUTGO and the trunk group is to be used for TINWATS calls, a billing number is required. However, note that this outgoing case cannot be enforced by RC. Call processing will issue a user assert if it gets a TINWATS call to a group that does not have a billing number assigned. The billing number is a number of up to 10 digits (no. digits = (1 <= no. digits <= 10)). If the number of digits equals zero, then no billing number is present. The digits are stored in BCD, two per character (byte). The domain used for bill_dn has five characters for the ten digits plus one character for the number of digits (number of digits character is required by the I/O type). If the number of digits is less than ten, the null character (which becomes same as digit zero in BCD) is used to fill the remaining digits. The number of digits character always contains the number of digits. If no billing number is present for the trunk group, the digits will be set to null and the number of digits to zero. The digits are stored in the attribute starting with D1.

This attribute has a dependency on RLfc_trunk.sdnded which determines if this trunk is dedicated to SDN service access. If RLfc_trunk.sdnded == DBYES, then bill_dn.digcnt must be 10. Note: There is no dependency if RLedsltrkg.ded_serv is DED_SDN.

**Copyright © 1999 Lucent Technologies** 

Layout follows:

| byte 0 | byte 1 | byte 2 | byte 3 | byte 4 | byte 5 |
|---|---|---|---|---|---|
| D1 | D2 | D3 | D4 | D5 | D6 | D7 | D8 | D9 | D10 | no. dig. |

Also see RLfc_trunk.ln_type for Leased Network rules for bill_dn.

**Attribute:**

cpnbnopt

**Fullname:**

Calling party number (CPN)/billing number (BN) option.

**Attribute Description:**

CPN/BN options subscribed to by primary rate interfaces (PRIs) for outgoing calls. This option specifies whether CPN or BN should be delivered for circuit switched voice and circuit switched data calls. This option is assigned at the near switch and depends on the number (CPN or BN) that the far switch wishes to receive. The available options are CPNBN_NONE, CPN_ONLY, CPN_PREF, BN_ONLY, BN_PREF, and CPN_UP.

CPNBN_NONE - Neither CPN nor BN will be sent on out going calls. This is the default.

CPN_ONLY - Only CPN will be sent. If it is not available, no number will be sent.

CPN_PREF - CPN will be sent if available. If it is not available, the BN will be sent if it is available.

BN_ONLY - Only BN will be sent. If it is not available, no number will be sent.

BN_PREF - BN will be sent if available. If it is not available, the CPN will be sent if it is available.

CPN_UP - Only CPN will be sent if available, and the screening indicator in the calling party information element set to user provided, not screened. This option should be used on PRIs where the near office is a PBX and the far office is a public switch (central office or toll office).

The following diagram shows how the cpnbnopt should be set in the near office for different configurations interconnected via PRIs. It should be noted that these population rules cannot be enforced by

**Copyright © 1999 Lucent Technologies** 

RC. For customers in the far office to receive the expected number (CPN or BN) this attribute should be set in the near office as specified in the following diagram.

| near office | far office | cpnbnopt (select one) |
|---|---|---|
| public switch | public switch | CPNBN_NONE, CPN_ONLY, CPN_PREF BN_ONLY, BN_PREF |
| public switch | private switch | CPNBN_NONE, CPN_ONLY, CPN_PREF BN_ONLY, BN_PREF |
| private switch | public switch | CPNBN_NONE, CPN_UP |
| private switch | private switch | CPNBN_NONE, CPN_ONLY, CPN_PREF BN_ONLY, BN_PREF |

In a private network (PBX to PBX) the BN_ONLY option should not be assigned to PRIs connecting the private switches for customers that want to receive the calling party number from both callers within the private network and callers outside the private network.

**Attribute:**
priv_over
**Fullname:**
Privacy override
**Attribute Description:**
This attribute indicates whether private directory numbers may be sent over a PRI when the outgoing trunk has a CPN/BN option assigned to it (RLedsltrkg.cpnbnopt). Private directory numbers should not be sent from a public switch (central office or toll office) to a private network switch (PBX) except in special cases where the PBX has agreed not to sent the number to the terminator. To block private numbers from being sent over a PRI, set priv_over to DBNO. To allow private numbers to be sent over a PRI, set priv_over to DBYES. This option should only be assigned to outgoing or two-way trunk groups (RLrt_trkg.type must be RTOUTGO or RTTWOWAY).

**Attribute:**
main_dn
**Fullname:**
Main directory number
**Attribute Description:**
This attribute contains a default directory number that should be used when a user-provided CPN is discarded or when the user does not provide a CPN on circuit switched voice and circuit switched data calls. This attribute contains a 10-digit directory number of the form NPANXXXXXX. This number is stored in BCD and has a digit count indicating the number of digits stored. The digits are stored in order with the first digit (leftmost) of the number stored in digit 1 in the data structure. This attribute allows

Copyright © 1999 Lucent Technologies 

for 15 digits to be stored but only 10 are used currently. The unused digit positions must be populated with BCD `0's. If a directory number is not specified, then this attribute must be populated with all `0's and the digit count subattribute, RLedsltrkg.main_dn.digcnt, must be set to zero. The main_dn attribute should normally only be populated when the far office is a PBX and the near office is a public switch (central office or toll office). The directory number populated should be the main directory number of the PBX or some other number which can be called. This option should only be assigned to incoming or two-way trunk groups (RLrt_trkg.type must be RTINCOM or RTTWOWAY).

**Attribute:**
main_dn.dig[*]
**Fullname:**
Digit
**Attribute Description:**
Identifies digit 'nth' of main DN.

**Attribute:**
main_dn.digcnt
**Fullname:**
Digit count
**Attribute Description:**
Contains the count of digits in this DN.

**Attribute:**
npasrc
**Fullname:**
NPA source indicator
**Attribute Description:**
The NPA source indicator is used on PRI trunk originations when the Calling Party Number (CPN) is 7-digits and the NXX of the CPN is non-unique. The attribute indicates the source of the CPN NPA to the PRI trunk originating software. The available options are:

```
FC_NO_NPASRC    - no NPA source
FC_BASENPA      - use RLnoccode.npa, RLnoccode.basenpa must be DBYES,
FC_FENPA        - use RLrt_trkg.fenpa,
FC_CPN10DIGITS  - the CPN on the incoming PRI trunk must always
                  be 10-digits.
```

The default value of npasrc is FC_NO_NPASRC.

Dependencies: If npasrc is set to FC_FENPA, then RLrt_trkg.fenpa must be set to the NPA of the calling party switch.

**Attribute:**
cpn_disc
**Fullname:**

Copyright © 1999 Lucent Technologies 

Calling party number discard indicator

**Attribute Description:**

This attribute indicates if a user-provided CPN should be discarded and replaced with a network provided CPN on originations over the PRI for circuit switched voice and circuit switched data calls. This attribute is used when a user-provided CPN is screened and fails or when a user-provided CPN is not screened. If cpn_disc is set to DBNO, then the user-provided CPN is not discarded and is used as the CPN. If cpn_disc is set to DBYES, then a user-provided CPN will be discarded if it fails screening or if it is not screened. When the user-provided CPN is discarded, it should be replaced with a network provided number if available. The network provided number must be specified in the attribute main_dn.

User-provided CPNs on calls from private switches (PBX) to public switches may or may not be screened. The user-provided CPN should be discarded if it fails screening or is not screened. If the CPN is discarded, it will be replaced by a switch provided CPN if one is available.

User-provided CPNs on calls to private switches from a public switch or another private switch should not be screened and the CPN should not be discarded.

User-provided CPNs on calls to public switches from another public switch should not be screened and the CPN should not be discarded.

This option should only be assigned to incoming or two-way trunk groups (RLrt_trkg.type must be RTINCOM or RTTWOWAY).

The following diagram shows how the cpn_disc and cpn_scrn attributes should be set in the near office for different configurations interconnected via PRIs. In this diagram it is assumed that the call originates in the far office. It should be noted that these population rules cannot be enforced by RC.

| near office | far office | cpn_scrn | cpn_disc |
|---|---|---|---|
| public switch | private switch | DBYES | DBYES |
| public switch | private switch | DBNO | DBYES |
| private switch | public switch | DBNO | DBNO |
| private switch | private switch | DBNO | DBNO |
| public switch | public switch | DBNO | DBNO |

**Attribute:**

cpn_scrn

**Fullname:**

Calling party number screening

**Attribute Description:**

This attribute indicates whether a user-provided CPN should be screened against a range(s) of numbers associated with the PRI on originations over the PRI for circuit switched voice and circuit

**Copyright © 1999 Lucent Technologies** 

switched data calls. When a CPN is received in the SETUP message on originations over a PRI, this indicator specifies whether it should be screened or not. Screening is done to determine if a user-provided CPN is valid for the PRI over which it is received. CPNs received in a public switch (central office or toll office) from a private switch (PBX) may or may not be screened. If screening is done, the CPN received from a PBX would be screened against ranges of DNs that are to be screened for that PBX. These ranges of DNs are specified in relation RLsc_range. RLrt_trkg.pbx_id for each trunk group connected to the PBX must be set to a non-zero value. Each trunk group member must have RLfc_trunk.pbx_id set to the same value as RLrt_trkg.pbx_id. At least 1 tuple must exist in RLsc_range with RLsc_range.pbx_id = RLrt_trkg.pbx_id.

CPNs received in a private switch should not be screened since they may have already been screened by a public switch and since the received CPN could have come from any place in the public network. CPNs received in a public switch from another public switch should not be screened for the same reasons. This indicator should be set to DBYES to allow screening and to DBNO to prevent screening.

This option should only be assigned to incoming or two-way trunk groups (RLrt_trkg.type must be RTINCOM or RTTWOWAY).

See interaction with attribute cpn_disc.

**Attribute:**
cpnbilling
**Fullname:**
Calling party number (CPN) billing indicator.
**Attribute Description:**
The CPN BILLING attribute indicates whether the user-provided CPN sent over an incoming primary rate interface (PRI) should replace the PRI trunk billing DN. To allow CPN substitution of the trunk billing DN, set cpnbilling to DBYES. To prevent CPN substitution, set cpnbilling to DBNO. This option can only be assigned to incoming or two-way trunks that have a class of service or EDSL or EDSLHM.
In 5e9(1) and 5e9(2), the spare resource attribute ffcf1 provided this functionality.

**Attribute:**
dirconic
**Fullname:**
Direct Connect to an Inter Exchange Carrier.
**Attribute Description:**
The attribute indicates whether or not the EDSL or EDSLHM PRI is directly connected to an Inter Exchange Carrier. This attribute can only be set to DBYES when the secured feature ICLATA has been purchased (SFID 149 is active), or when the secured feature Alternate Local Service Provider

Copyright © 1999 Lucent Technologies 

has been purchased (SFID 269 is active).
In 5e9(1) and 5e9(2), the spare resource attribute ffcf2
provided this functionality.

**Attribute:**
d_cut_thru
**Fullname:**
Data cut through
**Attribute Description:**
Identifies the cut through procedure to used for circuit switched data (CSD) calls.

NORMAL_CUT - The path is cut in the backward direction upon receipt of an alerting or progress message. The path is cut in both directions upon receipt of the connect message.

EARLY_CUT - The path is cut in both directions upon receipt of a call proceeding, alerting or progress message.

DELAY_CUT - The path is not cut in either direction until receipt of a connect message.

NOTE: This attribute should be set to the default value ( NORMAL_CUT) if RLrctgrprk.datarate equals DBDATA_NULL.

**Attribute:**
v_cut_thru
**Fullname:**
Voice cut through
**Attribute Description:**
Identifies the cut through procedure to used for circuit switched voice (CSV) calls.

NORMAL_CUT - The path is cut in the backward direction upon receipt of an alerting or progress message. The path is cut in both directions upon receipt of the connect message.

EARLY_CUT - The path is cut in both directions upon receipt of a call proceeding, alerting or progress message.

NOTE: There is currently no delay cut through option for CSV calls.

**Attribute:**
ded_serv
**Fullname:**
Dedicated services
**Attribute Description:**
This attribute indicates the assigned dedicated service.

**Copyright © 1999 Lucent Technologies** 

Allowed values are:

```
DED_NULL   - Used if trunk group is not dedicated, or if
             dedicated and service enumeration is not defined
             (such as, POTS or long distance service).
DED_I800   - Dedicated to international 800 service.
DED_ILDS   - Dedicated to international long
             distance service.
DED_INWATS - Dedicated to INWATS.
DED_OUTWATS - Dedicated to OUTWATS.
DED_M800    - Dedicated to MEGACOM(R) 800.
DED_MEGACOM - Dedicated to MEGACOM(R).
DED_NOVA    - Dedicated to dial-it-nova.
DED_SDN     - Dedicated to software define network for non-ACP.
DED_SDS     - Dedicated to switched digital service.
```

If ded_serv is not DED_NULL, then the calbycal attribute must be DBNO. It is valid for this attribute to be DED_NULL and calbycal attribute equal to DBNO.

If this attribute (ded_serv) is not DED_NULL then RLrctgrprk.sdnded must be DBNO. RLfc_trunk.sdnded is populated from RLrctgrprk.sdnded.

Electronic tandem network (ETN) or SDN traffic can be routed over dedicated PRI facilities if the call originated from an ETS node. This is because ETS requires the Q.931 NSF IE to be transmitted for call-by-call or dedicated channels.

**Attribute:**

sdndas

**Fullname:**

Software defined network digit analysis selector

**Attribute Description:**

This attribute specifies the digit analysis selector (DAS) will be used for a SDN origination. The SDN DAS is used in call that processing to define the digit analysis tables that will be used to analyze the digits for an SDN dialing plan. This attribute is only populated if the trunk group is defined as call-by-call and is optional. Population of this attribute with non-zero is optional because if the SDN dialing plan cannot be included in the default DAS (such as, for example, RLfc_trunk.digtree) then this attribute, sdndas, will then be used as an alternate digit tree. This attribute is used for incoming SDN calls from a call-by-call PRI trunk group at a non-toll office (such as, 5ESS(R)-2000 switch PBX or end office) that provides access of SDN to a toll network. This attribute is not used to route SDN calls via automatic route selection (ARS).

SDN calls are routed with the code index and route index from standard digit analysis (such as local digital interpreter table

Copyright © 1999 Lucent Technologies 

[LDIT], rate and route [RAR], international direct distance dialing [IDDD]) and are not overwritten by the code index and route index obtained from the carrier (such as inter-LATA carrier form [ICF], carrier destination form [CDIM]). For example, the code index is obtained from RLDAPRMFNL.dest and the route index is obtained from RLDAPRMFNL.route_x or RLRT_SCRNING.route_x. The carrier is identified in the same manner as basic interexchange carrier calls, such as obtaining the carrier via the presubscribed interexchange carrier (PIC) parameter assigned to the PRI trunk group. When defining digits to interpret in LDIT, the call type (such as RLDAPRMFNL.desttype) must be FCNORMAL and cannot be FCSDNACCESS.

CDIM - Carrier destination mapping form
ICF - Inter-LATA carrier feature form
IDDD - International direct distance dialing form
LDIT - Local digit interpreter table form
RAR - Rate and route form, screening

Dependencies: If sdndas is not 0, then the RLedsltrkg.calbycal attribute must be DBYES and there must be a tuple in DA_DIGSTRT with the sdndas value.'

**Attribute:**
inhibit_tcm
**Fullname:**
Traveling class mark (TCM) inhibited indicator
**Attribute Description:**
inhibit_tcm is used to indicate whether the traveling class mark (TCM) information element (IE) in the SETUP message should be inhibited for an ARS routed call through a PRI trunk to an interexchange carrier. If and only if following conditions all held true then 'inhibit_tcm' can be set to DBYES.

1) PRI trunk, its class of service is FCEDSLHM or FCEDSL.
2) PRI trunk group which is connected to an Interexchange Carrier office.
3) Calls that are routed by ARS (Example: SDN, MEGACOM(R), or ETS) through a PRI trunk which meets conditions one and two.
4) Calls described in condition three are offnet calls (leaving private network). When this indicator is set to DBYES for a PRI trunk which will be used by a ARS routed call, the TCM information element (IE) in the SETUP message will not be sent to an Interexchange carrier.

If this indicator is set to DBNO, then the TCM IE in the SETUP message will be sent to an interexchange carrier, and treated as a Message associated user to user IE (MAUUI) which may be billed.'

**Attribute:**
e911_cpn
**Fullname:**

Enhanced 911 calling party number

**Attribute Description:**

This bool specifies if the CPN is used instead of the billing number for an E911 query.

**Attribute:**

std_rn_src

**Fullname:**

Standard Redirecting Number Source

**Attribute Description:**

Indicates the PRI B-channel trunk group provisioning field used by the Redirecting Number(RN) on PRI Special Feature. The RN on PRI special feature is a secured feature (SFID 161). This attribute must not be set to DBYES unless the special feature has been purchased and the uui attribute is DBYES.

**Attribute:**

pic2

**Fullname:**

Primary intra-LATA toll carrier ID

**Attribute Description:**

This attribute identifies the presubscribed intra-LATA toll carrier for this trunk group. It may be specified if RLrt_trkg.type == RTTWOWAY, RTINCOM, or RTOUTGO. The pic2 must be $NULL_BCARID if the ICLATA SF (SFID 149) is not activated.

**Attribute:**

plc

**Fullname:**

Presubscribed intra-LATA local carrier ID for an alternate LSP

**Attribute Description:**

This attribute contains the presubscribed intra-LATA local carrier ID for an alternate LSP.

**Attribute:**

pic4

**Fullname:**

Presubscribed international carrier ID

**Attribute Description:**

This attribute identifies the presubscribed international carrier ID.

**Attribute:**

hmtax

**Fullname:**

Hotel/Motel Tax

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

This attribute indicates if the Hotel/Motel with Tax service feature code or Hotel/Motel, No Tax service feature code are included in the AMA record. DBYES indicates Hotel/Motel with Tax.

**Attribute:**
cnam_alw
**Fullname:**
Calling Name Delivery Allowed
**Attribute Description:**
This attribute indicates if this PRI trunk group is subscribed to use Calling Name Delivery feature

**Attribute:**
cnam_ama
**Fullname:**
Calling Name AMA
**Attribute Description:**
This attribute indicates what type of billing is to be done for Calling Name Deliveries - usage-sensitive or flat rate.

**Attribute:**
pcn_alw
**Fullname:**
Privacy of Calling Name Allowed
**Attribute Description:**
This attribute indicates if the PRI trunk is subscribed to use Privacy of Calling Name.

**Attribute:**
pcn_ama
**Fullname:**
Privacy of Calling Name AMA
**Attribute Description:**
This attribute indicates what type of billing is to be done for Privacy of Calling Name - usage-sensitive or flat rate.

**Attribute:**

**Attribute:**

rn_scrn

**Fullname:**

Redirecting Number screen indicator.

**Attribute Description:**

This attribute indicates whether a Redirecting Number should be screened against a range(s) of numbers associated with the PRI on originations over the PRI for circuit switched voice and circuit switched data calls. When an RN is received in the SETUP message on originations over a PRI, this indicator specifies whether it should be screened or not. Screening for the RN is similar to that of a user-provided CPN. See description for cpn_scrn.

This attribute can be set to DBYES only when the secured feature Modified RN Origination on PRI has been purchased (SFID 244 is active).

Copyright © 1999 Lucent Technologies 

This option should only be assigned to incoming or two-way trunk groups (RLrt_trkg.type must be RTINCOM or RTTWOWAY).

**Attribute:**
rn_billing
**Fullname:**
Redirecting Number billing indicator.
**Attribute Description:**
This attribute indicates if the Redirecting Number should be used as billing DN. If rn_billing is set to DBYES, and the number in the PRI RN IE passes screening (or is not screened with a 7 or 10 digit RN), the call will be billed against the number in the RN IE. If rn_billing is set to DBYES, and the number does not pass screening, CPN billing feature will apply, if set. If not set, existing PRI billing applies. If rn_billing is set to DBNO, existing PRI billing applies. This attribute can be set to DBYES only when the secured feature Modified RN Origination on PRI has been purchased (SFID 244 is active).

This option should only be assigned to incoming or two-way trunk groups (RLrt_trkg.type must be RTINCOM or RTTWOWAY).

**Attribute:**
rn_disc
**Fullname:**
Redirecting Number discard indicator.
**Attribute Description:**
This attribute indicates if the Redirecting Number should be discarded. If rn_disc is set to DBYES only the number received in the PRI RN IE that is not screened or is screened and fails screening will be discarded. If rn_disc is DBNO, the number in the PRI RN IE will not be discarded. This attribute can be set to DBYES only when the secured feature Modified RN Origination on PRI has been purchased (SFID 244 is active).

This option should only be assigned to incoming or two-way trunk groups (RLrt_trkg.type must be RTINCOM or RTTWOWAY).

**Attribute:**
unbundled
**Fullname:**
Network/LEC indicator, for calls to complete to an alternate LSP platform.
**Attribute Description:**
When unbundled = DBYES, (None/1)+ 7/10 digit intra-LATA local calls route using presubscribed local carrier (PLC) information. If PLC routing information is not populated, route via the LEC. When unbundled = DBNO, (None/1)+ 7/10

**Copyright © 1999 Lucent Technologies** 

```
        digit intra-LATA local calls always route via the LEC.
```

**Defines:**

```
        "db/DMnpasrc.h",
         "db/DMcarrid.h",
         "db/DMcarr_val.h"
```

## 4. Population rules for RLeis_data

### Relation Description

External Information System Data
This relation is used to determine the operational parameters for a particular EIS. It will be accessed whenever a call is assigned to an EIS.

Trigger function OAteisdata is called during relation updates. This trigger function will block updates if certain fields are changed when there are links in service for this EIS. The fields which cannot be changed when links are in service are: eis_vendor, msg_set_id, eis_swid, eis_msg_dly.

Maximum number of tuples is 16. Expected average number is 10. To allow the addition of new vendors during the life of the generic without requiring rdl changes, the following local defines must be used by code on the switch for eis_vendor:

```
#define OANO_VEN        0
#define OACCI           1
#define OAIBM           2
#define OAVLTD          3
#define OAURIX          4
#define OALKHD          5
#define OACGI           6
#define OATMC           7
#define OANRP           8
```

**Attribute:**
eis_id
**Fullname:**
External Information System Identification Number
**Attribute Description:**
This attribute's value is the identification number assigned to the EIS.

**Attribute:**
locmethod
**Fullname:**
locality transfer method.
**Attribute Description:**
ADAS locality transfer method.

**Attribute:**
oaff1
**Fullname:**
Locality Method
**Attribute Description:**
This attribute will identify whether the Automated Directory Assistance System (ADAS) locality phrase is transmitted from an Automated Position to the Listing Services Database vendor via OSPS Operator Workstation (OWS) display or Call Processing Data Link (CPDL) message. Bits 0 and 1 of this attribute are being used for this purpose.

**Attribute:**
msg_set_id
**Fullname:**
message set identification
**Attribute Description:**
This attribute will contain the message sets supported by the EIS software interface.

**Attribute:**
oaff2
**Fullname:**
spare 2
**Attribute Description:**
Fast Feature Spare 2.

**Attribute:**
eis_msg_dly
**Fullname:**
message delay
**Attribute Description:**
Number of 50 millisecond intervals to wait for an expected message.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
eis_vendor
**Fullname:**
External Information System Vendor
**Attribute Description:**
Number assigned to vendor who supplies the EIS.

**Attribute:**
oaff3
**Fullname:**
spare 3
**Attribute Description:**
Fast Feature Spare 3

**Attribute:**
mx_call_lnk
**Fullname:**
maximum number of calls on link
**Attribute Description:**
This attribute's value will specify the maximum number of calls supported on an EIS link.

**Attribute:**
mx_lnk_cap
**Fullname:**
Maximum link capacity
**Attribute Description:**
This attribute's value will specify the maximum capacity of EIS link in messages per second.

**Attribute:**
eis_swid
**Fullname:**
Switch identification
**Attribute Description:**
Number assigned (by the EIS) to this switch and generic.

**Attribute:**
oaff4
**Fullname:**
spare 4
**Attribute Description:**

## 4. Population Rules for RLeis_rcl

**Relation Description** This relation allows the customer the ability to assign the recall call type based on the current service ID and EIS ID. The recall must be served by the same EIS because only it would have a record of the original call.
Maximum number of tuples is 320 (based on 32 call types and 10 EIS systems) with the expected average number of tuples to be 100.

**Attribute: eis_id**

**Fullname:** External Information System ID
**Attribute Description** Number assigned to the EIS.

**Attribute: serv_id**

**Fullname:** Service ID
**Attribute Description** Service ID for this particular listing service.

**Attribute: rcl_type**

**Fullname:** Recall call type
**Attribute Description** Recall call queue for this call. This cannot be changed (updated) if

Copyright © 1999 Lucent Technologies 

RLeis_rcl.serv_id equals RLctinfo.serv_id for any RLctinfo tuple.

**Attribute: oaff1 Fullname:** Spare 1
**Attribute Description** Fast feature spare.

**Attribute: oaff2 Fullname:** Spare 2
**Attribute Description** Fast feature spare.

**Attribute: oaff3 Fullname:** Spare 3
**Attribute Description** Fast feature spare.

**Attribute: oaff4 Fullname:** Spare 4
**Attribute Description** Fast feature spare.

    |---------------+---------------+---------------+---------------|
       ( 4 bytes )
```

## 4. Population Rules for RLeis_sm

**Relation Description** External information system (EIS) switching module (SM).
This relation specifies the minimum number of links needed to support the SM during the busy hour and the total number of call processing data links (CPDLs) assigned to the EIS on this SM.
Expected average number of tuples is one.

**Attribute: eis_id**

**Fullname:** External information system identification number
**Attribute Description** This attribute's value specifies the identification number assigned to the EIS.

**Attribute: magic_num**

**Fullname:** Minimum number of links assigned for busy hour service
**Attribute Description** This attribute's value specifies the minimum number of data links on the SM needed for support of busy hour service. It is checked when a link is removed from service. If the number of links remaining is less than 'magic_num', a major alarm is given. If the number of links remaining is equal to or greater than 'magic_num', a minor alarm is given.

**Attribute: lnks_on_sm**

**Fullname:** Number of CPDLs assigned to this EIS on the SM

Copyright © 1999 Lucent Technologies

**Attribute Description** This attribute's value designates the number of CPDLs assigned to this EIS on the SM.

**Attribute: lnks_asgnd**

**Fullname:** SM relative link numbers assigned

**Attribute Description** This attribute's bit map indicates the relative link number of the links for this EIS on the SM. It indicates the CPDLs assigned to this EIS on the particular SM. The bit position represents the value of the SM relative link number. For example, if this equals 0x9 (0000000000001001), then links zero and three are assigned to this SM.

## 4. Population rules for RLeisdsl

**Relation Description**

```
External information system (EIS) datalink data
This relation contains the data needed by measurements so
that they can peg measurement counts based on the relative
call processing data link (CPDL) number on the switching
```

Copyright © 1999 Lucent Technologies

module (SM), and yet obtain the 'x_name' and 'x_link' numbers for measurement printouts.

GROWTH/ENGINEERING RULES

The alternate link ID specified in the International Business Machine (IBM) DSSLNK utility must return to the same Operator Services Position System (OSPS) packet switching module (PSM). This is due to the fact that the call ID has been created from the PSM number prepended to the SM relative link number; changing PSMs in the middle of the call would require a change in the call ID (this condition is not advisable).

**Attribute:**
sm_rel_lnk
**Fullname:**
SM relative link
**Attribute Description:**
This is the number of the call processing data link relative to the SM.

**Attribute:**
x_name
**Fullname:**
External link name
**Attribute Description:**
This is the external name of the link. It is equal to the EIS number (ID) of the EIS using this link.

**Attribute:**
x_link
**Fullname:**
External link number
**Attribute Description:**
This is the external link number of the call processing data link. It can be the link number associated with the EIS.

**Attribute:**
dport
**Fullname:**
Port number on this SM
**Attribute Description:**
This is the member number of the link (port.member).

**Attribute:**
mx_lnk_cap
**Fullname:**
Maximum link capacity
**Attribute Description:**

**Copyright © 1999 Lucent Technologies**

## 4. Population rules for RLenetlink

### Relation Description

External Ethernet(R) link
This relation provides parameters for external Ethernet(R) links.

**Attribute:**

epipe

**Fullname:**

**Copyright © 1999 Lucent Technologies** 

External Ethernet(R) pipe number

**Attribute Description:**

Number of the Ethernet(R) pipe on which this Ethernet(R) link resides. This should be a value between 0 and (SMDBMEPIPES - 1), inclusive.
Key attribute.

**Attribute:**

elnk

**Fullname:**

External Ethernet(R) link number

**Attribute Description:**

Number of the Ethernet(R) link. This should be a value between 0 and (SMDBMELNKS - 1), inclusive.
Key attribute.

**Attribute:**

elnk_type

**Fullname:**

External Ethernet(R) link type

**Attribute Description:**

Type of external Ethernet(R) link described by this tuple.
Key attribute.

**Attribute:**

enet_serv

**Fullname:**

Ethernet(R) service type

**Attribute Description:**

Type of service provided by this Ethernet(R) link.

**Attribute:**

protocol

**Fullname:**

Ethernet(R) protocol

**Attribute Description:**

Ethernet(R) send/receive protocol supported by this Ethernet(R) link.

**Attribute:**

snd_port0

**Fullname:**

Starting (first) send port

**Attribute Description:**

Starting port from which data will be transmitted to the far end system. Other send ports are numbered consecutively from this starting port; the numports attribute gives the total number of send ports starting from snd_port0.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
rcv_port0
**Fullname:**
Starting (first) receive port
**Attribute Description:**
Starting port from which data will be received from the far end system. Other receive ports are numbered consecutively from this starting port; the numports attribute gives the total number of receive ports starting from rcv_port0.

**Attribute:**
numports
**Fullname:**
Number of ports
**Attribute Description:**
Number of consecutive send and receive ports (starting from snd_port0 and rcv_port0) supported on this Ethernet(R) link.

**Attribute:**
s0ip0ad
**Fullname:**
First internet protocol address on side 0.
**Attribute Description:**
First internet protocol address for side 0 of this Ethernet(R) link. This is one of the IP addresses the EIB transmits to and the far end receives on.

IP addresses are communicated to humans in dotted decimal notation (sometimes called "dotted quad notation" too). This notation represents the IP address as four decimal integers separated by decimal points, where each integer gives the value of one octet of the IP address, such as, 135.2.66.110. All the s[*]ip[*]ad attributes in this relation store the IP address as a 32 bit hexadecimal number. The hexadecimal version of the IP address is obtained from the dotted decimal version by converting each decimal octet to its 2 digit hexadecimal equivalent and then removing the decimal points. For example, the IP address 135.2.66.110 converts to 0x8702426e as follows:

135.2.66.110 = 0x87.0x02.0x42.0x6e = 0x8702426e

**Attribute:**
s0ip1ad
**Fullname:**
Second internet protocol address on side 0.
**Attribute Description:**
Second internet protocol address for side 0 of this Ethernet(R) link. If provisioned, this is one of the IP addresses the EIB transmits to and the far end receives on. This attribute allows support for duplex connections on a single Ethernet(R) link. See s0ip0ad attribute description above for an explanation of how this attribute stores an IP

**Copyright © 1999 Lucent Technologies** 

address.

**Attribute:**
s1ip0ad
**Fullname:**
First internet protocol address on side 1.
**Attribute Description:**
First internet protocol address for side 1 of this Ethernet(R) link. This is one of the IP addresses the EIB transmits to and the far end receives on. See s0ip0ad attribute description above for an explanation of how this attribute stores an IP address.

**Attribute:**
s1ip1ad
**Fullname:**
Second internet protocol address on side 1.
**Attribute Description:**
Second internet protocol address for side 1 of this Ethernet(R) link. If provisioned, this is one of the IP addresses the EIB transmits to and the far end receives on. This attribute allows support for duplex connections on a single Ethernet(R) link. See s0ip0ad attribute description above for an explanation of how this attribute stores an IP address.

**Attribute:**
s0hw0ad[*]
**Fullname:**
First Ethernet(R) hardware address on side 0.
**Attribute Description:**
First far end Ethernet(R) hardware address for side 0 of this Ethernet(R) link. This is a 6 byte (48 bit) hardware address where hardware address bits 47-40 are stored in s0hw0ad0, hardware address bits 39-32 are stored in s0hw0ad1, etc, on down to hardware address bits 7-0 stored in s0hw0ad5.

Ethernet(R) hardware addresses, also referred to as physical or MAC (media access control) addresses, are typically specified as 6 colon-separated hexadecimal octets. For example, an s0hw0ad[*] hardware address attribute value of { 0x08, 0x00, 0x20, 0x75, 0x8c, 0x0e } would be written as 08:00:20:75:8c:0e.

**Attribute:**
s0hw1ad[*]
**Fullname:**
Second Ethernet(R) hardware address on side 0.
**Attribute Description:**
Second far end Ethernet(R) hardware address for side 0 of this Ethernet(R) link. If provisioned, the hardware address is populated as described above for the s0hw0ad[*] attribute.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
s1hw0ad[*]
**Fullname:**
First Ethernet(R) hardware address on side 1.
**Attribute Description:**
First far end Ethernet(R) hardware address for side 1 of this Ethernet(R) link. The hardware address is populated as described above for the s0hw0ad[*] attribute.

**Attribute:**
s1hw1ad[*]
**Fullname:**
Second Ethernet(R) hardware address on side 1.
**Attribute Description:**
Second far end Ethernet(R) hardware address for side 1 of this Ethernet(R) link. If provisioned, the hardware address is populated as described above for the s0hw0ad[*] attribute.

# ENETPIPE

## 1. Description

This relation provides parameters for external *Ethernet*®Interface Boards (EIB)s and hubs, the two ends of a physical Ethernet connection that together define an Ethernet pipe.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1 |
| expected tuples in relation | 1 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FP |
| relation type | DBSTATIC |
| trigger function | SMt_enetpipe |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population rules for RLenetpipe

**Relation Description**

External Ethernet(R) pipe
This relation provides parameters for external Ethernet(R) interface boards (EIBs) and hubs, the two ends of a physical Ethernet(R) connection that together define an Ethernet(R) pipe.

**Attribute:**

epipe

**Fullname:**

External Ethernet(R) pipe number

**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Number of the Ethernet(R) pipe described by this tuple. This should be a value between 0 and (SMDBMEPIPES - 1), inclusive.
Key attribute.

**Attribute:**
eib_type
**Fullname:**
External Ethernet(R) interface type
**Attribute Description:**
Type of external Ethernet(R) EIB/hub described by this tuple.
Key attribute.

**Attribute:**
enet_serv
**Fullname:**
Ethernet(R)service type
**Attribute Description:**
Type of service provided by the Ethernet(R) links on this Ethernet(R) pipe.

**Attribute:**
s0e_cktnm
**Fullname:**
Side 0 EIB circuit name
**Attribute Description:**
Circuit name of the side 0 Ethernet(R) interface board. This circuit name must have a PCMELNK circuit type in RLcktdata.

**Attribute:**
s1e_cktnm
**Fullname:**
Side 1 EIB circuit name
**Attribute Description:**
Circuit name of the side 1 Ethernet(R) interface board. This circuit name must have a PCMELNK circuit type in RLcktdata.

**Attribute:**
s0eipad
**Fullname:**
EIB side 0 internet protocol address.
**Attribute Description:**
Internet protocol address of the side 0 Ethernet(R) interface board. This is the IP address the side 0 EIB receives on and the hub/far end transmit to.

IP addresses are communicated to humans in dotted decimal notation (sometimes called "dotted quad notation" too). This notation represents the IP address as four decimal integers separated by decimal points, where each integer gives the value of one octet of the IP address,

**Copyright © 1999 Lucent Technologies** 

such as, 135.2.66.110. The s[*]eipad and s[*]hipad attributes in this relation store the IP address as a 32 bit hexadecimal number. The hexadecimal version of the IP address is obtained from the dotted decimal version by converting each decimal octet to its 2 digit hexadecimal equivalent and then removing the decimal points. For example, the IP address 135.2.66.110 converts to 0x8702426e as follows:

135.2.66.110 = 0x87.0x02.0x42.0x6e = 0x8702426e

**Attribute:**
s1eipad
**Fullname:**
EIB side 1 internet protocol address.
**Attribute Description:**
Internet protocol address of the side 1 Ethernet(R) interface board. This is the IP address the side 1 EIB receives on and the hub/far end transmit to. See s0eipad attribute description above for an explanation of how this attribute stores an IP address.

**Attribute:**
s0hipad
**Fullname:**
Hub side 0 internet protocol address.
**Attribute Description:**
Internet protocol address of the hub connected to the side 0 EIB. If provisioned, this is the hub IP address the side 0 EIB transmits to and the hub receives on. A provisioned IP address (and corresponding HW address in the s0hhwad[*] attributes) indicates the hub is managed or "smart" and supports Internet Control Message Protocol (ICMP) loop back/echo request functionality (also known as, "ping"). See s0eipad attribute description above for an explanation of how this attribute stores an IP address.

**Attribute:**
s1hipad
**Fullname:**
Hub side 1 internet protocol address.
**Attribute Description:**
Internet protocol address of the hub connected to the side 1 EIB. If provisioned, this is the hub IP address the side 1 EIB transmits to and the hub receives on. A provisioned IP address (and corresponding HW address in the s1hhwad[*] attributes) indicates the hub is managed or "smart" and supports Internet Control Message Protocol (ICMP) loop back/echo request functionality (also known as, "ping"). See s0eipad attribute description above for an explanation of how this attribute stores an IP address.

**Attribute:**
s0ehwad[*]

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
EIB side 0 Ethernet(R) hardware address.
**Attribute Description:**
Ethernet(R) hardware address of the side 0 Ethernet(R) interface board. This is a 6 byte (48 bit) hardware address where hardware address bits 47-40 are stored in s0ehwad0, hardware address bits 39-32 are stored in s0ehwad1, etc, on down to hardware address bits 7-0 stored in s0ehwad5. Ethernet(R) hardware addresses, also referred to as physical or MAC (media access control) addresses, are typically specified as 6 colon-separated hexadecimal octets. For example, an s0ehwad[*] hardware address attribute value of { 0x08, 0x00, 0x20, 0x75, 0x8c, 0x0e } would be written as 08:00:20:75:8c:0e.

**Attribute:**
s1ehwad[*]
**Fullname:**
EIB side 1 Ethernet(R) hardware address.
**Attribute Description:**
Ethernet(R) hardware address of the side 1 Ethernet(R) interface board. The hardware address is populated as described above for the s0ehwad[*] attribute.

**Attribute:**
s0hhwad[*]
**Fullname:**
Hub side 0 Ethernet(R) hardware address.
**Attribute Description:**
Ethernet(R) hardware address of the hub connected to the side 0 EIB. If provisioned, the hardware address is populated as described above for the s0ehwad[*] attribute.

**Attribute:**
s1hhwad[*]
**Fullname:**
Hub side 1 Ethernet(R) hardware address.
**Attribute Description:**
Ethernet(R) hardware address of the hub connected to the side 1 EIB. If provisioned, the hardware address is populated as described above for the s0ehwad[*] attribute.

## 4. Population Rules for RLepo_pos

**Relation Description** Enhanced Professional Office positions
This relation contains Enhanced Professional Office (EPO) position number to port mapping information. It is used

Copyright © 1999 Lucent Technologies

by RC and ODA when administering EPO position numbers. Also, it is used by office records when reporting on EPO position number assignments.

**Attribute: eponum**

**Fullname:** enhanced professional office position number

**Attribute Description** This attribute uniquely identifies an EPO position.

**Attribute: module**

**Fullname:** switching module

**Attribute Description** This attribute identifies the switching module where this EPO position is located.

**Attribute: lport**

**Fullname:** logical port name

**Attribute Description** This attribute identifies the logical port to which this EPO position is assigned.

# EQUIPDSL

## 1. Description

This relation associates a logical protocol handler (PH) number and PH member number to a port name.

Examples of PH port types are:
- DSL D-channel
- Data link terminal (DLT) port
- DSL nailedup B-channel for X.25 packet switching
- Interswitch Packet Trunks
- Inter-SM ports
- EDSL D-channel
- Speech handler (SH) channel
- Packet pipe (PP) channel

RLequipdsl is the inverse of relation RLdslequip. This is a 2-byte tuple relation.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 10240 |
| expected number of tuples | 96 |
| density | 13 |
| access type | DBACC_CIND |

## 4. Population Rules for RLequipdsl

**Relation Description** Logical protocol handler (PH) member port assignment.

This relation provides the logical PH port name assigned to the physical PH member number. This relation provides the DSL D port or the OSPS-EDSL D port assigned to the physical PH member number. It is the inverse of the relation RLdslequip.

Additional information which appeared on the english text poprule file:

```
DSL group assigned to a DSL.
Logical PH assigned to a DLT.
Logical PH assigned to a nailed-up B-channel.
Logical PH assigned to an inter-SM port.
Logical PH assigned to an interswitch packet trunk.
Logical PH assigned to an X.75' trunk.
DSL Group assignment to an EDSL.
DSL Group assignment to an OSPS-EDSL.
```

Quantity for tuples: 1 tuple for each equipped port. or equipped EDSL or equipped OSPS-EDSL For TR303 remote terminals (RTs) on IDCU, this relation will include mappings from PSU channel numbers to EOC and TMC ports on the RTs.

As of 5E9, XAT ports or lines with X.25 Packet Switching features will be assigned to PH3's or PH4's. X.25 Packet Switching will no longer be supported on the PH2 Access Image.

**Attribute: dsl_group**

**Fullname:** DSL group number

**Attribute Description** Populate with the DSL Group (0 to 79). The DSl group number is determined by the PH shelf number and PH number entered on the RC/V T1 PACKET SWITCH CHANNEL ASSIGNMENT view.

As of 5E9, XAT ports or lines with X.25 Packet Switching features will be assigned to PH3's or PH4's. X.25 Packet Switching will no longer be supported on the PH2 Access Image.

**Attribute: member**

**Fullname:** Physical PH channel number

**Attribute Description** Member can be 0,4,8,...(multiple of 4) for PH128.

If the port is an X.75, X.75' or IP trunk then the member must be 0 if the PH is of type PH2.

If the port is an X.75, X.75' or IP trunk and the PH is of type PH3 or PH4, then member may be (0,4,8...20) in even multiples of four as long as all members on a given PH3 or PH4 are of the same trunk level 2 profile and all of the ports are equipped on the same SM. It is recommended that a maximum of 4 X.75' or X.75 trunk members be assigned to a given PH3/PH4.

Hardware Conversion Note:
If the PH3/PH4 is to be converted to a PH2 only 1 member may be assigned to the PH3/PH4 and the 'member' attribute must equal 0 otherwise the conversion will be blocked!

**Attribute: dsl**

**Fullname:** Port name

Copyright © 1999 Lucent Technologies 

**Attribute Description** Must be in RLfc_porttyp.

Copyright © 1999 Lucent Technologies 

# ESCO

## 1. Description

This relation contains the Emergency Service Central Office (ESCO) number.

## 2. Data Dictionary Values

| | |
|---|---|

## 4. Population Rules for RLesco

Copyright © 1999 Lucent Technologies

**Relation Description** Emergency Service Central Office number
RLesco stores the ESCO, default ESN, NPD, and selective routing indicator used in an Enhanced 911 call. This relation is read on call originations and is used to retrieve selective routing information and selective transfer information from either the E911 Service Adjunct (ESA) or the GRSP/LRSP.

This static relation is used while routing Enhanced 911 calls only.

**Attribute: esco**

**Fullname:** Emergency Service Central Office number

**Attribute Description** ESCO is the key of this relation. It is used to retrieve the NPD, default ESN and sel_rt_ind

**Attribute: esn**

**Fullname:** Emergency Service Number

**Attribute Description** The ESN is used as a default ESN to read the routing data from relation RLesntran in the cases where the sel_rt_ind is set to DBNO. This attribute is mandatory and must be populated.

**Attribute: npd**

**Fullname:** Numbering Plan Digit

**Attribute Description** NPD represents the NPA of the E911 call originator It is outpulsed to the PSAP on terminations. This attribute is mandatory and must be populated.

**Attribute: sel_rt_ind**

**Fullname:** Selective routing indicator

**Attribute Description** Sel_rt_ind is used to specify if a query is to be sent to ESA to retrieve an ESN or use the default ESN from this relation. This attribute is mandatory and must be populated

**Attribute: spr_bit1**

**Fullname:** Spare bit 1

**Attribute Description** This spare bit will be used at a later time.

**Attribute: spr_bit2**

**Fullname:** Spare bit 2

**Attribute Description** This spare bit will be used at a later time.

**Attribute: spr_bit3**

**Fullname:** Spare bit 3

**Attribute Description** This spare bit will be used at a later time.

**Attribute: spr_char**

**Fullname:** Spare char

**Attribute Description** Spare char to be used at a later time.

# ESN_MAP

## 1. Description

This reltion contains the Emergency Service Number Mapping (ESN_MAP).

Each bit is associated with an esn, eg. bit 0 in esnmap00 represents esn 0, bit 32 in esnmap01 represents esn 32, etc.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| ks key store | DBNO |
| trigger function | RTesn_trig |
| insert trigger | DBYES |
| update trigger | DBYES |
| delete trigger | DBYES |
| end of transaction trigger | DBYES |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLesn_map

**Relation Description** Emergency Service Number Mapping
This relation is used as a bitmap for the corresponding ESNs in RLesntran. Each bit position on the bitmap should reflect that the corresponding ESN is either valid or invalid.

The bit value of ESN0 is always set to 0 and ESN0 is invalid ESN.

For every tuple inserted in RLesntran a corresponding bit should be set to 1 in this relation.
For every tuple deleted in RLesntran a corresponding bit should be set to 0 in this relation.

This is static relation used for e911 call.

**Attribute: dummy_key**

**Fullname:** This is the key

**Attribute Description** Since there will always be only one tuple in this relation, a key is not necessary. However, DB access primitives require that there be a key anyway. Thus, this attribute exists.

The domain of this attribute is DMBOOL and this attribute can assume only a value of DBYES.

**Attribute: esnmap00**

**Fullname:** esn bitmap 0

**Attribute Description** This attribute is used as bit map for esn0 thru esn31 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap01**

**Fullname:** esn bitmap 1

**Attribute Description** This attribute is used as bit map for esn32 thru esn63 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap02**

**Fullname:** esn bitmap 2

**Attribute Description** This attribute is used as bit map for esn64 thru esn95 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap03**

**Fullname:** esn bitmap 3

**Attribute Description** This attribute is used as bit map for esn96 thru esn127 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

Copyright © 1999 Lucent Technologies 

**Attribute: esnmap04**

**Fullname:** esn bitmap 4

**Attribute Description** This attribute is used as bit map for esn128 thru esn159 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap05**

**Fullname:** esn bitmap 5

**Attribute Description** This attribute is used as bit map for esn160 thru esn191 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap06**

**Fullname:** esn bitmap 6

**Attribute Description** This attribute is used as bit map for esn192 thru esn223 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap07**

**Fullname:** esn bitmap 7

**Attribute Description** This attribute is used as bit map for esn224 thru esn255 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap08**

**Fullname:** esn bitmap 8

**Attribute Description** This attribute is used as bit map for esn256 thru esn287 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap09**

**Fullname:** esn bitmap 9

**Attribute Description** This attribute is used as bit map for esn288 thru esn319 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap10**

**Fullname:** esn bitmap 10

**Attribute Description** This attribute is used as bit map for esn320 thru esn351 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap11**

Copyright © 1999 Lucent Technologies 

**Fullname:** esn bitmap 11

**Attribute Description** This attribute is used as bit map for esn352 thru esn383 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap12**

**Fullname:** esn bitmap 12

**Attribute Description** This attribute is used as bit map for esn384 thru esn415 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap13**

**Fullname:** esn bitmap 13

**Attribute Description** This attribute is used as bit map for esn416 thru esn447 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap14**

**Fullname:** esn bitmap 14

**Attribute Description** This attribute is used as bit map for esn448 thru esn479 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap15**

**Fullname:** esn bitmap 15

**Attribute Description** This attribute is used as bit map for esn480 thru esn511 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap16**

**Fullname:** esn bitmap 16

**Attribute Description** This attribute is used as bit map for esn512 thru esn543 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap17**

**Fullname:** esn bitmap 17

**Attribute Description** This attribute is used as bit map for esn544 thru esn575 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap18**

**Fullname:** esn bitmap 18

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute is used as bit map for esn576 thru esn607 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap19**

**Fullname:** esn bitmap 19

**Attribute Description** This attribute is used as bit map for esn608 thru esn639 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap20**

**Fullname:** esn bitmap 20

**Attribute Description** This attribute is used as bit map for esn640 thru esn671 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap21**

**Fullname:** esn bitmap 21

**Attribute Description** This attribute is used as bit map for esn672 thru esn703 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap22**

**Fullname:** esn bitmap 22

**Attribute Description** This attribute is used as bit map for esn704 thru esn735 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap23**

**Fullname:** esn bitmap 23

**Attribute Description** This attribute is used as bit map for esn736 thru esn767 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap24**

**Fullname:** esn bitmap 24

**Attribute Description** This attribute is used as bit map for esn768 thru esn799 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap25**

**Fullname:** esn bitmap 25

Copyright © 1999 Lucent Technologies 

**Attribute Description** This attribute is used as bit map for esn800 thru esn831 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap26**

**Fullname:** esn bitmap 26

**Attribute Description** This attribute is used as bit map for esn832 thru esn863 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap27**

**Fullname:** esn bitmap 27

**Attribute Description** This attribute is used as bit map for esn864 thru esn895 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap28**

**Fullname:** esn bitmap 28

**Attribute Description** This attribute is used as bit map for esn896 thru esn927 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap29**

**Fullname:** esn bitmap 29

**Attribute Description** This attribute is used as bit map for esn928 thru esn959 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap30**

**Fullname:** esn bitmap 30

**Attribute Description** This attribute is used as bit map for esn960 thru esn991 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

**Attribute: esnmap31**

**Fullname:** esn bitmap 31

**Attribute Description** This attribute is used as bit map for esn992 thru esn1023 There is 1 bit for each of the 32 ESNs.

Bit value: 1 = valid, 0 = invalid.

# ESNTRAN

## 1. Description

This relation contains the Emergency Service Number Translation (ESNTRAN).

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 1023 |
| expected tuples in relation | 100 |
| access type | DBACC_CIND |
| memory type | DBPRAM |
| distribution | LPFG |
| application | RCMAP |
| relation type | DBSTATIC |
| permutation type | un_perm |

## 3. Field Layout

## 4. Population Rules for RLesntran

**Relation Description** Emergency Service Number Translation
The relation RLesntran is used to translate an ESN to the following: Primary PSAP number, 2 Alternate PSAP numbers, a flash indicator and 6 selective transfer numbers.

This static relation is used while routing an Enhanced 911 call.

**Attribute: esn**

**Fullname:** Emergency Service Number

**Attribute Description** The ESN is used as the key to this relation. This ESN is translated into a primary PSAP telephone number, 2 alternate PSAP telephone numbers, a flash indicator and 6 selective transfer telephone numbers.

**Attribute: flash_ind**

**Fullname:** Flash indicator

**Attribute Description** The flash_ind will be used to indicate if the NPD and caller's number (ANI) will be flashed at the PSAP terminal. This flashing will tell the PSAP that the call may require special attention/ handling.

**Attribute: spr_bit1**

**Fullname:** Spare bit 1

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit2**

**Fullname:** Spare bit 2

**Attribute Description** This is a spare bit to be used at a later time.

Copyright © 1999 Lucent Technologies 

**Attribute: spr_bit3**
**Fullname:** Spare bit 3

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit4**
**Fullname:** Spare bit 4

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_bit5**
**Fullname:** Spare bit 5

**Attribute Description** This is a spare bit to be used at a later time.

**Attribute: spr_short**
**Fullname:** Spare short

**Attribute Description** This is a spare short to be used at a later time.

**Attribute: pri_psap**
**Fullname:** Primary Public Safety Answering Point telephone number

**Attribute Description** This Primary PSAP telephone number is first used to route the 911 call. It contains a psap telephone number and has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is mandatory and must be populated. It can only contain a 7 or 10 digit DN.

**Attribute: pri_psap.dn0**
**Fullname:** Digit number 0

**Attribute Description** This is the first digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn1**
**Fullname:** Digit number 1

**Attribute Description** This is the second digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn2**
**Fullname:** Digit number 2

**Attribute Description** This is the third digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn3**
**Fullname:** Digit number 3

**Attribute Description** This is the forth digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn4**
**Fullname:** Digit number 4

**Attribute Description** This is the fifth digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn5**
**Fullname:** Digit number 5

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the sixth digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn6**
**Fullname:** Digit number 6

**Attribute Description** This is the seventh digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn7**
**Fullname:** Digit number 7

**Attribute Description** This is the eigth digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn8**
**Fullname:** Digit number 8

**Attribute Description** This is the ninth digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn9**
**Fullname:** Digit number 9

**Attribute Description** This is the tenth digit of the primary PSAP telephone number.

**Attribute: pri_psap.dn10**
**Fullname:** Digit number 10

**Attribute Description** This is the eleventh digit of the digit structure.

**Attribute: pri_psap.dn11**
**Fullname:** Digit number 11

**Attribute Description** This is the twelfth digit of the digit structure.

**Attribute: pri_psap.dn12**
**Fullname:** Digit number 12

**Attribute Description** This is the thirteenth digit of the digit structure.

**Attribute: pri_psap.dn13**
**Fullname:** Digit number 13

**Attribute Description** This is the fourteenth digit of the digit structure.

**Attribute: pri_psap.dn14**
**Fullname:** Digit number 14

**Attribute Description** This is the fifteenth digit of the digit structure.

**Attribute: pri_psap.digcnt**
**Fullname:** Digit count

**Attribute Description** This is the count of the number of digits in the PSAP telephone number.

**Attribute: alt1_psap**
**Fullname:** First alternate PSAP telephone number.

**Attribute Description** This First alternate telephone number is used to route the 911 call in the

Copyright © 1999 Lucent Technologies 

event that the primary PSAP TN routing failed. It contains a psap telephone number and has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is mandatory and must be populated. It can only contain a 7 or 10 digit DN.

**Attribute: alt1_psap.dn0**
**Fullname:** Digit number 0

**Attribute Description** This is the first digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn1**
**Fullname:** Digit number 1

**Attribute Description** This is the second digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn2**
**Fullname:** Digit number 2

**Attribute Description** This is the third digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn3**
**Fullname:** Digit number 3

**Attribute Description** This is the forth digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn4**
**Fullname:** Digit number 4

**Attribute Description** This is the fifth digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn5**
**Fullname:** Digit number 5

**Attribute Description** This is the sixth digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn6**
**Fullname:** Digit number 6

**Attribute Description** This is the seventh digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn7**
**Fullname:** Digit number 7

**Attribute Description** This is the eigth digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn8**
**Fullname:** Digit number 8

**Attribute Description** This is the ninth digit of the first alternate PSAP telephone number.

**Attribute: alt1_psap.dn9**
**Fullname:** Digit number 9

**Attribute Description** This is the tenth digit of the first alternate PSAP telephone number.

telephone number.

**Attribute: selxfer6**

**Fullname:** Selective transfer number 6

**Attribute Description** This is the sixth selective transfer telephone number. It is used by the PSAPs to do a selective call transfer. It contains a selective transfer telephone number but is not mandatory. It also has a digit count specifying the total number of digits. The digits are stored in order with the first digit (leftmost) stored in digit 0 of the structure, and the second digit in digit 1 of the structure, etc. This field is not mandatory. It can contain 0 to 15 digits.

**Attribute: selxfer6.dn0**

**Fullname:** Digit number 0

**Attribute Description** This is the first digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn1**

**Fullname:** Digit number 1

**Attribute Description** This is the second digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn2**

**Fullname:** Digit number 2

**Attribute Description** This is the third digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn3**

**Fullname:** Digit number 3

**Attribute Description** This is the forth digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn4**

**Fullname:** Digit number 4

**Attribute Description** This is the fifth digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn5**

**Fullname:** Digit number 5

**Attribute Description** This is the sixth digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn6**

**Fullname:** Digit number 6

**Attribute Description** This is the seventh digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn7**

**Fullname:** Digit number 7

**Attribute Description** This is the eigth digit of the sixth selective transfer telephone number.

**Attribute: selxfer6.dn8**

**Fullname:** Digit number 8

**Attribute Description** This is the ninth digit of the sixth selective transfer telephone number.

## 4. Population Rules for RLespinfo

**Relation Description** Enhanced Service Provider (ESP) Information
This relation contains the information about the Enhanced Service Provider external to the *5ESS*®-2000 switch.

**Attribute: code_access**

**Fullname:** Enhanced Service Provider Access Code

**Attribute Description** This is the Enhanced Service Provider (ESP) access code. This access code is used to complete the request to reach a Voice Messaging Service (VMS). A caller who encounters busy, or no answer, can transfer to an ESP's VMS to leave a message by entering a service code and an access code. The service code specifies a request for ESP service while the access code indicates a particular ESP's VMS. The access code consists of from one to three digits, with each digit having the full range 0-9.

**Attribute: tn_access**

**Fullname:** Enhanced Service Provider access telephone number

**Attribute Description** This is the actual ten (10) digit telephone number (TN) or Service Access Code (SAC) used to reach the VMS.

**Attribute: tn_access.digcnt**

**Fullname:** The count of the Access Telephone Number.

**Attribute Description** This is the count of the digits in the TN for the ESP access telephone number.

**Attribute: tn_access.dn**

**Fullname:** The telephone number (TN) or Service Access Code (SAC) used to reach the VMS.

**Attribute Description** This is the actual ten (10) digit telephone number (TN) or Service Access Code (SAC) used to reach the MVS.

Copyright © 1999 Lucent Technologies 

**Attribute: ccn_send**

**Fullname:** Send the calling card number to the ESP

**Attribute Description** The send card number field indicates whether or not to send the credit card number to the Enhanced Service Provider (ESP). This field indicates whether the ESP will accept commercial credit card numbers to bill the call to the ESP.

**Attribute: sabn_send**

**Fullname:** Send the subaccount billing number to the ESP

**Attribute Description** The send subaccount billing number field indicates whether or not to send the subaccount billing number to the Enhanced Service Provider (ESP). Subaccount billing is the ability to provide a telephone customer a detailed breakdown, per subaccount billing number, on their monthly statements.

**Attribute: bk_thrd_trn**

**Fullname:** Transfer the bill to a back third number.

**Attribute Description** The Back Third Transfer field indicates whether the Enhanced Service Provider (ESP) will permit the customer to transfer the bill to a back third number. That is, the ESP will bill the cost of forwarding the message from the calling party to a different back number other than the calling party.

**Attribute: ccs7sig**

**Fullname:** CCS7 signaling

**Attribute Description** The ccs7sig field will indicate whether CCS7 signaling is used for the information transfer to the ESP.

**Attribute: bncc_tod**

**Fullname:** billing number credit card type of digits

**Attribute Description** This field is the decimal form of the binary value to be placed into an Initial Address Message (IAM). This field will represent the billing number credit card type of digits used in the IAM.

**Attribute: bnpin_tod**

**Fullname:** billing number PIN type of digits used in an Initial Address Message (IAM)

**Attribute Description** This field is the decimal form of the binary value to be placed into an Initial Address Message (IAM). This field will represent the billing number PIN type of digits used in an IAM.

**Attribute: cac_tod**

**Fullname:** CCC Authorization Code type of digits used in Initial Address Message.

**Attribute Description** This field is the decimal form of the binary value to be placed into an Initial Address Message (IAM). This field will represent the Commercial Credit Card (CCC) authorization code type of digits used in an IAM.

**Attribute: sab_tod**

**Fullname:** subaccount billing number type of digits used in Initial Address Message.

**Attribute Description** This field is the decimal form of the binary value to be placed into an Initial Address Message (IAM). This field will represent the subaccount billing number type of digits used

Copyright © 1999 Lucent Technologies 

in an IAM.

**Attribute: thrd_type**

**Fullname:** third number type used in Initial Address Message.

**Attribute Description** This field is the decimal form of the binary value to be placed into an Initial Address Message message. This field will represent the third number type of digits used in an IAM.

**Attribute: esc_on**

**Fullname:** Expanded Call Screening On.

**Attribute Description** This field indicates whether the Expanded Call Screening feature is active for this ESP.

**Attribute: vmsdomblg**

**Fullname:** VMS domestic billing changes indicator

**Attribute Description** This field is the VMS DOM BLG field, which indicates whether to use the VMS Access Dialing Changes feature for billing purposes for forward numbers that are domestic.

**Attribute: vmsintlblg**

**Fullname:** VMS international billing changes indicator

**Attribute Description** This field is the VMS INTL BLG field, which indicates whether to use the VMS Access Dialing Changes feature for billing purposes for forward numbers that are international.

**Attribute: dny_treat**

**Fullname:** Deny Treatment.

**Attribute Description** This field indicates the type of deny treatment to be given a caller when card denial is indicated.

**Attribute: cardtyp1**

**Fullname:** Card Type 1.

**Attribute Description** This field is the first part of a bit map indicating which card types are accepted for billing by this ESP.

**Attribute: cardtyp2**

**Fullname:** Card Type 2.

**Attribute Description** This field is the second part of a bit map indicating which card types are accepted for billing by this ESP.

**Attribute: cardtyp3**

**Fullname:** Card Type 3.

**Attribute Description** This field is the third part of a bit map indicating which card types are accepted for billing by this ESP.

**Attribute: cardtyp4**

**Fullname:** Card Type 4.

**Attribute Description** This field is the fourth/last part of a bit map indicating which card types are

Copyright © 1999 Lucent Technologies 

accepted for billing by this ESP.

**Attribute: spare**

**Fullname:** Spare

**Attribute Description**

Copyright © 1999 Lucent Technologies

## 4. Population rules for RLexpacd

### Relation Description

OSPS Expanded (Flexible) Automatic Call Distribution (ACD) Call

Copyright © 1999 Lucent Technologies

Type Determination
RLexpacd defines an OSPS call type, display index, and automated position call type based on a call type determination pre-call ID and call processing call property.

**Attribute:**
ta_pcid
**Fullname:**
Pre-call ID
**Attribute Description:**
The pre-call ID value serves as a key to the flexible ACD call type determination process. The pre-call ID represents the link between this relation and the RLac_cqdet relation.

**Attribute:**
prop_type
**Fullname:**
Call property type
**Attribute Description:**
The call property type identifies a call processing characteristic used in flexible ACD call type determination. The following list provides the mnemonic representation of each of the valid call property types:

AN - Access Number (8XX or SSC-WXY-Z Number)
AO - Account Owner
CIC - Carrier Identification Code
DCIC - Direct International Originations (DIOR) Carrier
DEST - Destination Index
II - ANI II Digits
LC - Language Code
LRN - Originating Location Routing Number (LRN)
NPA - Originating NPA-NXX
OLS - Originating Line Screening (OLS) Code
TGRP - Incoming Trunk Group Number

**Attribute:**
cpval_char
**Fullname:**
Character call property value
**Attribute Description:**
This attribute stores call property values that, from the perspective of call processing, are of a character format. This attribute represents a call property value for the following call property types (also included are the valid values for each call property type):

Access Number - either a 10-digit number of the form 8XXNXXXXXX where N=2-9 and X=0-9 (8XX number) or a 7-digit number where each digit may be 0-9 (SSC-WXY-Z number)

**Copyright © 1999 Lucent Technologies** 

Account Owner - a 4-character alpha-numeric string
DIOR Carrier - a 4-digit number, where each digit may be 0-9
ANI II Digits - a number in the range 00-99
Originating LRN - a 6-digit number of the form NXXXXX
where N=1-9 and X=0-9
Originating NPA-NXX - a 6-digit number of the form NXXXXX
where N=1-9 and X=0-9
For all other call property types, this attribute is set to NULL.

**Attribute:**
cpval_int
**Fullname:**
Integer call property value
**Attribute Description:**
This attribute stores call property values that, from the perspective of call processing, are of an integer format. This attribute represents a call property value for the following call property types (also included are the valid values for each call property type):
Carrier Identification Code - a number in the range 0-9999 or 10001 for LEC.

Destination Index - a number in the range 1-4095
Language Code - a number in the range 0-1000
OLS Code - a number in the range 0-999
Trunk Group Number - a number in the range 1-4000
For all other call property types, this attribute is set to zero (0).

**Attribute:**
callq
**Fullname:**
OSPS call type or service ID
**Attribute Description:**
This attribute specifies an OSPS call type or service ID.

**Attribute:**
dispx
**Fullname:**
Display index
**Attribute Description:**
This attribute specifies an operator position display index.

**Attribute:**
ap_callq
**Fullname:**
Automated position call type
**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute specifies a call type used to direct calls to an automated position.

**Attribute:**

acdexp

**Fullname:**

Overriding flexible ACD call property expression

**Attribute Description:**

This attribute specifies the overriding call property expression to be used for flexible ACD call type determination. The expression is comprised of from 1 - 4 call property types. Each call property type must be separated by a logical operator (either OR (|) or AND (&)) when more than one call property type is defined. A call property type can appear only once in the expression. Call property type 'Q' is used to quit the call type determination process at this level. The expression may also be left blank (NULL), meaning that OSPS will continue the call type determination process with the current expression. The following list provides the mnemonic representation of each of the valid call property types:

NULL - Continue the call type determination process with the current expression
A - Account Owner
C - Carrier Identification Code
D - Destination Index
G - Language Code
I - ANI II Digits
L - Originating Location Routing Number (LRN)
N - Originating NPA-NXX
O - Originating Line Screening (OLS) Code
Q - Quit the call type determination process at this level
R - Direct International Originations (DIOR) carrier
S - Access Number (8XX or SSC-WXY-Z Number)
T - Incoming Trunk Group Number

## 4. Population Rules for RLf_vpidb

**Relation Description** Facility Number to Virtual PIDB
This relation associates a SONET STS-1 facility with a Virtual Peripheral Interface Data Bus (VPIDB). A VPIDB is a structure on a Peripheral Control and Timing (PCT) link. This relation is the reverse mapping of the RLvpidb_f relation. For each entry in RLf_vpidb there must be an associated entry in RLvpidb_f.

**Attribute: unittype**

**Fullname:** Peripheral Unit Type

**Attribute Description** The type of peripheral unit that terminates the facility.

**Attribute: unitnumber**

**Fullname:** unit number

**Attribute Description** The unit number that identifies the peripheral unit.

Copyright © 1999 Lucent Technologies

**Attribute: sts_num**

**Fullname:** STS-1 Path number

**Attribute Description** This attribute identifies the parent STS-1 path of the specified SONET facility number.

**Attribute: sfacno**

**Fullname:** SONET Facility Number

**Attribute Description** This attribute identifies the subtending SONET DS1 facility on a STS-1 path.

**Attribute: pct_link**

**Fullname:** peripheral control and timing link number

**Attribute Description** This attribute identifies the relative PCT link number for the peripheral. The range is 0 through 11 with links 0 through 5 being in data group 0 and links 6 through 11 in data group 1. There is only one tuple in this relation for every pair of peripheral links connected to the CDs.

**Attribute: vpidb**

**Fullname:** virtual PIDB number

**Attribute Description** This attribute identifies the structure on the associated PCT link.

**Attribute: appunit_asgnd**

**Fullname:** Application Unit Assigned Indicator

**Attribute Description** This attribute indicates whether a transport facility with the ability to host a remote application actually has a remote unit assigned, or if it is in the "limbo" state. Note that the "app_type" attribute may indicate the type of application to be assigned to this transport (in the near future), even if this attribute (appunit_asgnd) indicates it hasn't been assigned yet.

**Attribute: app_type**

**Fullname:** Application Type

**Attribute Description** Application type using the VPIDB on the PCT link.

**Attribute: fac_ckt**

**Fullname:** Facility circuit name

**Attribute Description** Circuit name of the facility (VT1.5 name for TR-303 on DNU-S application)

**Copyright © 1999 Lucent Technologies** 

# FAC_CAB

## 1. Description

Distance and type of cable used to connect facilities (DS1s) to the DSX frame.

## 4. Population Rules for RLfac_cab

**Relation Description** Integrated Digital Carrier Unit Cable Information
This relation contains the distance in feet between the integrated digital carrier unit (IDCU) and digital cross-connect (DSX) panel and the type of cable used to connect the backplane to the DSX.

**Attribute: cktname**

**Fullname:** Electrical Line Interface (ELI) circuit name

**Attribute Description** This is the ELI circuit name. There is one tuple in this relation for each ELI on every IDCU on the SM.

**Attribute: ckttype**

**Fullname:** Circuit Type

Copyright © 1999 Lucent Technologies 

**Attribute Description** This is the circuit type. For IDCU, this will always be the ELI.

**Attribute: distance**

**Fullname:** IDCU - DSX Distance

**Attribute Description** This is the distance in feet between the IDCU and the DSX panel.

**Attribute: cable_series**

**Fullname:** Cable Series

**Attribute Description** This is the cable series (series 609 or series 1249).

**Defines:** "db/DMcircuit.h"

## 4. Population rules for RLfac_prov

**Relation Description**

Facility provisioning data

Copyright © 1999 Lucent Technologies

This relation contains provisioning information for facilities that terminate on the Digital Networking Unit-SONET (DNU-S) This information is stored in the SM, but must be downloaded to the DNU-S via HW tasks. The facilities that are supported for the DNU-S peripheral are:

OC-3 SONET Termination Equipment (OC3STE),
STSX-1 SONET Termination Equipment (EC1STE),
Synchronous Transport Signal-1 (STS-1),
Virtual Tributary 1.5 (VT1.5), and
Digital Signal Level 1 (DS1).

**Attribute:**
cktname
**Fullname:**
circuit name
**Attribute Description:**
This attribute identifies the circuit name for the facility.

**Attribute:**
ckttype
**Fullname:**
circuit type
**Attribute Description:**
This attribute identifies the circuit type for the facility.

**Attribute:**
master_vpidb
**Fullname:**
Master Virtual Peripheral Interface Data Bus (VPIDB)
**Attribute Description:**
This attribute identifies the VPIDB number of the DS1 facility that is used by resident software in the DNU-S to report STE/STS Carrier Group Alarm (CGA) information.

**Attribute:**
ste_lbo
**Fullname:**
SONET Termination Equipment Line Build Out
**Attribute Description:**
Line Build Out is a signal attenuation function provided in the transmit path of the STSX-1 interface. Signal attenuation is needed to prevent excessive signal strength at the electrical cross connect panel when using short coax cable lengths. When the Line Build Out field is set to Y, attenuation is active. When the Line Build Out field is set to N, no attenuation is applied. The following diagram indicates cable length thresholds that require attenuation.

|------------|-------------------------|-------------------------|

**Copyright © 1999 Lucent Technologies** 

| Cable Type | Line Build Out = Y | Line Build Out = N |
|---|---|---|
| 735A | cable length <= 120 feet | cable length > 120 feet |
| 734A | cable length <= 225 feet | cable length > 225 feet |
| 728A | cable length <= 225 feet | cable length > 225 feet |

Note: If an electrical cross connect is located between the DNU-S and SONET transmission equipment, cable length refers to the distance between the DNU-S and the electrical cross connect. Otherwise, cable length refers to the total distance between the DNU-S and the SONET transmission equipment.

**Attribute:**
vt_mode
**Fullname:**
Signaling Mode of the Virtual Tributary
**Attribute Description:**
This attribute identifies the type of signaling supported by the VT.

**Attribute:**
vt_size
**Fullname:**
Virtual Tributary Group Size
**Attribute Description:**
This attribute identifies the VT group size.

**Attribute:**
vt_type
**Fullname:**
Virtual Tributary mode mapping type
**Attribute Description:**
This attribute identifies the VT mode mapping for the DS1s associated with the facility.

**Attribute:**
ds1_sig
**Fullname:**
DS1 Signaling Bit Insertion Mode
**Attribute Description:**
This attribute controls the per channel signaling insertion mode for the DS1. This attribute is no longer used.

**Attribute:**
ds1_frm

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
DS1 Frame Format
**Attribute Description:**
This attribute identifies the framing format for the DS1.

**Attribute:**
ds1_zcs
**Fullname:**
DS1 Zero Code Suppression
**Attribute Description:**
This attribute indicates whether zero code suppression
is provided for the DS1.

**Attribute:**
sf_thresh
**Fullname:**
Signal Fail Threshold
**Attribute Description:**
Indicates the automatic protection switching signal fail bit
error rate threshold.

**Attribute:**
sd_thresh
**Fullname:**
Signal Degrade Threshold
**Attribute Description:**
Indicates the automatic protection switching signal degraded bit
error rate threshold.

**Attribute:**
aps_inhibit
**Fullname:**
Automatic Protection Switch Inhibit
**Attribute Description:**
Indicates the inhibit/allow state of automatic protection switching.

**Defines:**
"db/DMvpidb.h"

## 4. Population Rules for RLfacaddsc

**Relation Description** Feature assignment and construction abbreviated dialing descriptor
This relation has a tuple for every shared 1 digit and 2 digit abbreviated dialing (speed calling) list, except for the following: if the adcount is 8 (for 1 digit) or 30 (for 2 digit), there is no tuple. The adcount tells how many entries there are in the list.

**Attribute: adid**

**Fullname:** Abbreviated dialing identification number

**Attribute Description** This is the internal identification number for the abbreviated dialing list.

**Attribute: class**

**Fullname:** Feature assignment and construction class

**Attribute Description** Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name as found in RLname2id.

Copyright © 1999 Lucent Technologies

This attribute allows 1 digit and 2 digit abbreviated dialing lists to have separate name and adid spaces.

**Attribute: subclass**

**Fullname:** Feature assignment and construction subclass

**Attribute Description** Each class of names (in this relation, FACAD1 and FACAD2) is divided into one or more subclasses. Both of these classes have subclasses SCL_SHR (shared) and SCL_UNSHR (unshared). However, this relation only has tuples for shared.

**Attribute: adcount**

**Fullname:** Abbreviated dialing count

**Attribute Description** This attribute tells how many entries there are in the abbreviated dialing list.

## 4. Population Rules for RLfacftdsc

**Relation Description** Feature assignment and construction feature descriptor.

There is a tuple in this relation for each business and residential customer service (BRCS) feature. In general, this relation is populated according to the options selected for the feature. The options vary for each modular feature type and a base relation exists for each modular feature. This base relation contains the options selected for each

**Copyright © 1999 Lucent Technologies** 

feature of that modular feature type.

**Attribute: fid**

**Fullname:** Feature identification (FID) number

**Attribute Description** This is the internal feature identifier. A FID is a special type of feature assignment and construction identification (FACID) consisting of two components: a modular feature type (top six bits, bits 15 to 10) and a unique identifier (bottom ten bits, bits nine to zero). The modular feature type is an enumerated data type. A unique identifier of one indicates a wild card (or magic) feature. Preconstructed features have a unique identifier less than 128, and other features have one greater than or equal to 128.

**Attribute: asncrit**

**Fullname:** Assignment criterion

**Attribute Description** This field is always ASNIM_ONLY, except for the null feature. The value of 'asncrit' in the null feature's tuple controls the autoform default value on the feature assignment views. ASNIM_ONLY means the view should autoform to feature parameter views if the 'P' field is blank; ASNNULL means it should not.

**Attribute: selcrit**

**Fullname:** Selection criterion

**Attribute Description** This is an enumerated date type used by feature execution to determine when a feature is to be selected for execution.

**Attribute: cfcount**

**Fullname:** Constructed feature count flag

**Attribute Description** This is a boolean flag set to DBYES when the feature is counted in the global parameter constructed feature count (CFC) against the constructed feature limit (CFL). MFID, MFSC, and MFPFA are not counted in the CFC, but all others are.

**Attribute: ffcf1**

**Fullname:** Future field 1

**Attribute Description** future field feature use.

**Attribute: ffcf2**

**Fullname:** Future field 2

**Attribute Description** future field feature use.

**Attribute: ffcf3**

**Fullname:** Future field 3

**Attribute Description** future field feature use.

**Attribute: ffcf4**

**Fullname:** Future field 4

**Attribute Description** future field feature use.

**Attribute: ffcf5**

**Fullname:** unsigned 6 reserved for future field feature use

Copyright © 1999 Lucent Technologies 

**Attribute Description** Not assigned yet

**Attribute: ffcf6**

**Fullname:** Unit 16 reserved for future field feature use

**Attribute Description** Not assigned yet

**Attribute: ptyfilt**

**Fullname:** Party filtering criteria

**Attribute Description** This is a structure of booleans containing party filtering criteria.

**Attribute: ptyfilt.intratg**

**Fullname:** Party filtering for intra-terminal group

**Attribute Description** This is a boolean used by feature execution to determine when a feature is to be selected for execution. DBYES indicates the feature can be selected for calls between terminals in the same terminal group. DBNO indicates the feature is not selected for calls between terminals in the same terminal group.

**Attribute: ptyfilt.intraoff**

**Fullname:** Party filtering for intra-office

**Attribute Description** This is a boolean used by feature execution to determine when a feature is to be selected for execution. DBYES indicates the feature can be selected for calls between terminals in the same office which are in different terminal groups (that is, all intra- office calls which are not intra-terminal group). DBNO indicates the feature will not be selected in this case.

**Attribute: ptyfilt.interoff**

**Fullname:** Party filtering for inter-office

**Attribute Description** This is a boolean used by feature execution to determine when a feature is to be selected for execution. DBYES indicates the feature can be selected for calls between terminals in different offices. DBNO indicates the feature is not selected for calls between terminals in different offices.

**Attribute: ptyfilt.pf**

**Fullname:** Party filtering for private facilities

**Attribute Description** This is a boolean used by feature execution to determine when a feature is to be selected for execution. DBYES indicates the feature can be selected for execution for private facility calls. DBNO indicates the feature is not selected for private facility calls.

**Attribute: ptyfilt.attndnt**

**Fullname:** Party filtering for attendant

**Attribute Description** This is a boolean used by feature execution to determine when a feature is to be selected for execution. DBYES indicates the feature can be selected for attendant calls. DBNO indicates the feature cannot be selected for attendant calls.

**Attribute: action[*]**

**Fullname:** Customer action for this FID

**Attribute Description** This gives a customer action allowed for this FID.

## 4. Population Rules for RLfacids

**Relation Description** Feature assignment and construction identification numbers.

This relation contains the data required for allocating unique facids. A tuple exists in this relation for each class, subclass, and modular feature type that has allocated facids. In addition, a tuple exists in this relation for each facid to be reclaimed for a given class, subclass, and modular feature type.

RLfacids consists of linked lists of tuples. The head cell of each linked list is called a master tuple. These can be class master, subclass master, or feature master tuples. Class master tuples can exist only for classes that allow no subclass but SCL_NULL. Subclass master tuples can exist for every valid class/subclass combination except for those using subclass SCL_NULL, with the following exceptions:

(1) For class FACBRCS, subclass SCL_FEAT, there is no subclass master tuple. Instead, there is (at most) one feature master tuple for each modular feature type other than MFNULL.

(2) For class FACBFG, there is no subclass master tuple for subclasses SCL_BFGR and SCL_DFLT. These subclasses share the same facid range as SCL_BFGID, and so they also use the subclass master tuple for

Copyright © 1999 Lucent Technologies 

SCL_BFGID.

Class master tuples have the given class with subclass SCL_NULL and facid 0. Subclass master tuples have the given subclass and its class and facid 0. Feature master tuples have class FACBRCS, subclass SCL_FEAT, and a facid containing the given modular feature type in the upper 6 bits with the other 10 bits being 0.

A master tuple is needed for one of two reasons:

(1) If any facids for this type have ever been defined, the master tuple's lastused attribute gives the largest facid of this type ever allocated.

(2) If any lower-numbered facids have been deallocated and have not yet been reallocated, there needs to be a linked list of tuples, with the reclaimid of each containing one of the holes. If the reclaimid of a tuple is nonzero, there will be another tuple in the linked list with its facid equal to this reclaimid.

If no facids have ever been defined for a given type, there will not be a master tuple for it.

For class=FACL1PM (layer 1 performance monitoring), subclass master tuples are required for subclasses SCL_DF2FAC, SCL_FAC, and SCL_DSL.

The subclass master tuple for DFI-2 DS1 facility performance monitoring has attribute values as follows:
```
facid = 0
class = FACL1PM
subclass = SCL_DF2FAC
```
The subclass master tuple for facility performance monitoring has attribute values as follows:
```
facid = 0
class = FACL1PM
subclass = SCL_FAC
```
The subclass master tuple for DSL performance monitoring has attribute values as follows:
```
facid = 0
class = FACL1PM
subclass = SCL_DSL
```
These subclass master tuples will always be present, because generic default and office default tuples exist for each of the subclasses SCL_FAC, SCL_DSL, and SCL_DF2FAC.

**Attribute: facid**

**Fullname:** Feature assignment and construction identification

**Attribute Description** This is the internal identifier associated with the external name. This is a short with a range from 0 to 65535. For most names, this is treated as a simple number. But if the name represents a BRCS feature (class is FACBRCS and subclass is SCL_FEAT), the number is divided into two fields: a modular feature type (mftype [top 6 bits: bits 15 - 10]), and a unique identifier (bottom 10 bits: bits 9 - 0). The mftype is a enumerated data type with one of the values found in domain DMmftype. For the null feature (a preconstructed feature) both fields are 0, giving a facid of 0. For any other feature, the mftype is nonzero, and so is the unique identifier. In this relation, a facid of 0 does not, however, represent the null feature: it tells that the tuple is a class or subclass master tuple (the head of a linked list). For a feature master tuple, facid has the modular feature type in the top 6 bits and zero in the other 10.

**Attribute: class**

**Fullname:** Feature assignment and construction class

**Copyright © 1999 Lucent Technologies** 

**Attribute Description** Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space and facid space.

**Attribute: subclass**

**Fullname:** Feature assignment and construction subclass

**Attribute Description** Each class of names is divided into one or more subclasses. The subclasses of a given class all share the same external name space, but they all have different facid number spaces: that is, names of different subclasses can have the same facid. The exception to this is that the BFG subclasses other than SCL_BFGB do share the same facid number space.

**Attribute: reclaimid**

**Fullname:** Reclaim identification

**Attribute Description** This attribute is used to keep a linked list of tuples representing the internal facids to be reclaimed for a given class, subclass, and modular feature type. If the value is zero this indicates the end of the linked list. If greater than 0 it indicates the existence of another tuple in this relation keyed by the class, subclass, and facid equal to the reclaimed id in this relation.

**Attribute: lastused**

**Fullname:** Last facid allocated

**Attribute Description** This attribute is always zero in non-master tuples. In a master tuple, it gives the largest facid that was ever allocated for the type facid shown by the keys to this tuple.

## 4. Population Rules for RLfaclust

**Relation Description** This relation lists the BRCS features which comprise the cluster, along with the values of activation, automatic forms presentation request, authorization code, and remote access service, to be used by feature assignment.

**Attribute: cid**

**Fullname:** cluster identifier

**Attribute Description** Contains the internal identifier corresponding to the name of the cluster which is described.

**Attribute: clent[*]**

**Fullname:** cluster entry

**Attribute Description** Contains information used by feature assignment when assigning the cluster.

**Attribute: clent[*].fid**

**Fullname:** feature identifier

**Attribute Description** Contains the internal identifier corresponding to the name of the feature which is a part of the cluster.

**Attribute: clent[*].initactv**

**Fullname:** initial value of activation

**Attribute Description** Contains the initial value for activation status of the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*].autoparm**

**Fullname:** automatic presentation of parameter forms

**Attribute Description** Contains the initial value of automatic forms presentation for the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*].ac**

**Fullname:** authorization code required

Copyright © 1999 Lucent Technologies 

**Attribute Description** Contains the initial value of authorization code for the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*].rasalwd**
**Fullname:** remote access service allowed

**Attribute Description** Contains the initial value of remote access service allowed for the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*]**
**Fullname:** cluster entry

**Attribute Description** Contains information used by feature assignment when assigning the cluster.

**Attribute: clent[*].fid**
**Fullname:** feature identifier

**Attribute Description** Contains the internal identifier corresponding to the name of the feature which is a part of the cluster.

**Attribute: clent[*].initactv**
**Fullname:** initial value of activation

**Attribute Description** Contains the initial value for activation status of the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*].autoparm**
**Fullname:** automatic presentation of parameter forms

**Attribute Description** Contains the initial value of automatic forms presentation for the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*].ac**
**Fullname:** authorization code required

**Attribute Description** Contains the initial value of authorization code for the feature. This attribute is used only during assignment of the cluster.

**Attribute: clent[*].rasalwd**
**Fullname:** remote access service allowed

**Attribute Description** Contains the initial value of remote access service allowed for the feature. This attribute is used only during assignment of the cluster.

## 4. Population Rules for RLfacname

**Relation Description** Feature assignment and construction name to ID translation
This relation translates an 8-character ASCII name (known to the switch personnel) to a 16-bit internal name. There is a separate name space for each class of names, which is the other key.

There is a tuple in this relation for every tuple in RLfid2name.

**Attribute: name**

**Fullname:** Eight-character ASCII name

Copyright © 1999 Lucent Technologies

**Attribute Description** This is the externally known ASCII name. It can be from 1 to 8 characters long. If it is less than 8 characters long, the field is padded with binary zeros ('\0'). Names must be unique within a given class. Names from different classes need not be unique.

**Attribute: class**

**Fullname:** Feature assignment and construction class

**Attribute Description** Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space.

**Attribute: subclass**

**Fullname:** Feature assignment and construction subclass

**Attribute Description** Each class of names is divided into one or more subclasses. The subclasses of a given class all share the same name space, since subclass is not a key to RLfacname.

**Attribute: facid**

**Fullname:** Feature assignment and construction identification

**Attribute Description** This is the internal identifier associated with the external name. This is a short with a range from 0 to 65535. For most names, this is treated as a simple number. But if the name represents a BRCS feature (class is FACBRCS and subclass is SCL_FEAT), the number is divided into two fields: a modular feature type (mftype [top 6 bits: bits 15 - 10]), and a unique identifier (bottom 10 bits: bits 9 - 0). The mftype is a enumerated data type with one of the values found in domain DMmftype. For the null feature (a preconstructed feature) both fields are 0, giving a facid of 0. For any other feature, the mftype is nonzero, and so is the unique identifier.

**Attribute: usecnt**

**Fullname:** Usage count

**Attribute Description** This is a count of the number of references of the facid in other base relations.

**Defines:** "db/DMmftype.h",
"db/DMfid.h"

## 4. Population Rules for RLfacrmks

**Relation Description** This relation contains remarks concerning an item in RLfacname (an external name). It is optional: external names do not need to have remarks.

**Attribute: facid**

**Fullname:** Feature assignment and construction identifier

**Attribute Description** This is the internal identifier associated with the external name. This is a short with a range from 0 to 65535. For most names, this is treated as a simple number. But if the name represents a BRCS feature (class is FACBRCS and subclass is SCL_FEAT), the number is divided into two fields: a modular feature type (mftype [top 6 bits: bits 15 - 10]), and a unique identifier (bottom 10 bits: bits 9 - 0). The mftype is a enumerated data type with one of the values

**Copyright © 1999 Lucent Technologies** 

found in domain DMmftype. For the null feature (a preconstructed feature) both fields are 0, giving a facid of 0. For any other feature, the mftype is nonzero, and so is the unique identifier.

**Attribute: class**

**Fullname:** Feature assignment and construction class

**Attribute Description** Externally known names are divided into a number of classes. This is an enumerated type identifying the class associated with the external name. This attribute allows each class to have its own unique name space.

**Attribute: subclass**

**Fullname:** Feature assignment and construction subclass

**Attribute Description** Each class of names is divided into one or more subclasses. The subclasses of a given class all share the same name space, since subclass is not a key to RLfacname.

**Attribute: remarks**

**Fullname:** Feature assignment and construction remarks

**Attribute Description** This attribute holds the remarks associated with these keys. Using these same keys, RLfid2name gives the corresponding external name. Names do not need to have remarks. If there are no remarks, there will be no tuple in RLfacrmks.

## 4. Population rules for RLfacthrsh

**Relation Description**

Line, Path, and Section Performance Monitoring Thresholds for Facilities
This relation contains the line and path performance monitoring alert thresholds that are associated with facilities. Tuples are created, modified, or deleted when performance monitoring groups are modified via recent change or ODA.
A performance monitoring group defines the thresholds and inhibits that will be set for one or more DS1s in both the integrated digital carrier unit (IDCU) and remote terminals (RTs).
A performance monitoring group can define the thresholds and inhibits that will be set for Digital Networking Unit-SONET (DNU-S) facilities also. Performance Monitoring of the following DNU-S facilities is supported:

- OC-3 SONET Termination Equipment (OC3STE)
- STSX-1 SONET Termination Equipment (EC1STE)
- Virtual Tributary 1.5 (VT1FAC)
- Digital Signal Level 1 (DS1SFAC)

A line is a physical connection that may carry a portion or all of one or more paths. A path is a connection between two points, independent of the physical means of transporting the signal.
The following parameters contains thresholds in this relation:
Errored Second - an errored second is an asynchronous one-second interval with one or more bipolar violations. A T1 bipolar violation

Copyright © 1999 Lucent Technologies 

occurs when two consecutive bits are received with the same polarity, excluding B8ZS coding.
Severely Errored Second - a severely errored second is an asynchronous second containing k or more bipolar violations, where k is the value of the global parameter Glfsesdef.
Frame Loss Second - a frame loss second is a second in which one or more out-of-frame events have occurred.
Unavailable Second - an unavailable second is an asynchronous second with a failed signal condition.
Slip Second - a slip second is an asynchronous second in which there are one or more uncontrolled slips. An uncontrolled slip occurs when the DS1's signal is not synchronized to the switch's timing source.

## 4. Population Rules for RLfactodsc

**Relation Description** This relation contains information about a time of day list needed during feature assignment.

There is a tuple in this relation for each time of day code list defined.

**Attribute: todid**

**Fullname:** Time of day list identifier

**Attribute Description** This attribute indicates the time of day list identifier.

**Attribute: dplanid**

**Fullname:** Dialing plan identifier

**Attribute Description** This attribute indicates the internal dialing plan identifier of the associated internal dialing plan.

**Attribute: das**

**Fullname:** Digit analysis selector

**Attribute Description** This attribute is the digit analysis selector, used to determine which table to start at.

**Attribute: lport_mod**

**Fullname:** Logical port module

**Attribute Description** This attribute identifies the switching module on which the owner's logical port is located.

**Attribute: lport**

**Fullname:** Logical port

**Attribute Description** This attribute identifies the logical port of the owner of the time of day list.

**Attribute: lpt_type**

**Fullname:** lport type

**Attribute Description** This attribute is the logical port type of the user owning the time of day list.

## 4. Population Rules for RLfc_4wire

**Relation Description** 4-wire subscriber lines
This relation contains parameters for 4-wire subscriber lines.

**Attribute: port**

**Fullname:** Logical port

**Attribute Description** This attribute is the key for this relation and is divided into sub-attributes port.member and port.module. The structure members are:

(1) member (DMport): Port name of a port

(2) module (DMmodule): The SM number that this port terminates on

**Attribute: port.member**

**Fullname:** Member

**Attribute Description** The port name of a port.

**Attribute: port.module**

**Fullname:** Module

**Attribute Description** The SM number that this port terminates on. NOTE: The lead_module cannot equal an SM number that has the SM Global Parameter, Glconfigname, set to D_BASIC.

**Attribute: routine_ring**

**Fullname:** Routine ringing

**Attribute Description** Indicates the type of routine ringing (routine PP calls and non-PP calls).

Copyright © 1999 Lucent Technologies 

**Attribute: priority_ring**

**Fullname:** Priority ringing

**Attribute Description** Indicates the type of priority ringing.

**Attribute: audible_ring**

**Fullname:** Audible ring

**Attribute Description** Indicates whether the 4-wire subscriber line equipment provides its own audible ring.

**Attribute: in_startsig**

**Fullname:** Incoming start signal

**Attribute Description** The incoming start signal type.

**Attribute: esp**

**Fullname:** Essential service protected

**Attribute Description** Indicates whether or not this 4-wire port is essential service protected.

**Attribute: conf_bridge**

**Fullname:** Conference bridge

**Attribute Description** Indicates whether a 4-wire port is a conference bridge connection or not.

**Defines:** "db/DMparty.h"

## 4. Population Rules for RLfc_911trnk

**Relation Description** 911 trunk
911 trunk information.

**Attribute: port**

**Fullname:** Port

**Attribute Description** Logical port with servclass of FC_911. This is a structure with subattributes port.member and port.module.

**Attribute: port.member**

**Fullname:** Member

**Attribute Description** Port name

**Attribute: port.module**

**Fullname:** Module

Copyright © 1999 Lucent Technologies

**Attribute Description** The SM number that this port terminates on.

**Attribute: ring_back**

**Fullname:** Ring back

**Attribute Description** Can ring back be requested?

DBYES means flash detection IS enabled and the 911 line has the capability of ringing back the originating line.

DBNO means flash detection is NOT enabled and the 911 line does not have the capability of ringing back the originating line.

**Attribute: statusmon**

**Fullname:** Status monitoring

**Attribute Description** Does service bureau have calling line status monitoring?

If statusmon and tondet are equal to DBYES, then 911 will supply its own status monitoring. If this bit is DBYES, then tondet must also be DBYES if no battery is to be given.

**Attribute: tondet**

**Fullname:** Low tone detector

**Attribute Description** Does service bureau have low tone detector?

DBYES means that the 911 bureau has a tone decoder hooked up and is capable of hearing lowtone, therefore lowtone should be sent by the *5ESS*®-2000 switch to the 911 bureau. If the 911 bureau is to perform its own status monitoring, the tonedet bit must also be set to DBYES.

DBNO means that the 911 bureau does NOT have a tone decoder hooked up and is therefore NOT capable of hearing lowtone if it is sent.

NOTE:

CALLING PARTY FC_911TRNK BITS SIGNAL SENT TO 911 BUREAU RECEIVING STATE

## 4. Population Rules for RLfc_anounce

**Relation Description** Announcement Data
This relation contains the information associated with announcements from a 13A or 13A-like announcement device.

There must be a tuple of this relation for each announcement or music source used in a ANNOUNC or MUSIC step used in the RLcv_vectr relation. Since Call Vectoring must allow for 512 different announcements and 128 different music sources, a minimum of 640 tuples are needed for C-ACD.

**Attribute: port**

Copyright © 1999 Lucent Technologies

**Fullname:** Announcement Port Definition

**Attribute Description** This attribute defines the trunk group member and interface module to which the announcement unit providing the desired announcement is connected.

**Attribute: port.member**

**Fullname:** Announcement Port Trunk Group Member Identifier

**Attribute Description** This is the port name of a trunks that should be assigned as an announcement trunk in relation RLfc_trunk.

**Attribute: port.module**

**Fullname:** Announcement Port Interface Module Identifier

**Attribute Description** This attribute refers to the Interface Module in which this trunk is located.

**Attribute: cycles**

**Fullname:** Number of Message Cycles

**Attribute Description** This is the number of times an announcement is repeated per call. For local coin overtime announcement, this attribute should be set to 1. Also, for a 15A Cascading Announcement trunk group, cycles must be set to 1. The attribute domain is 0 through 7. The larger numbers of cycles are used for Commercial Automatic Call Distribution features. The value of 0 (no cycle counting) permits bargein announcements to continue playing until the far end terminal process drops the path to the announcement terminal process (this is used for music sources).

**CAUTION:** If you use a value of 0 for bargein type announcements (bargein = DBYES). This combination might allow only a partial announcement cycle to complete.

**Attribute: bargein**

**Fullname:** Barge-in Announcement Type Identifier

**Attribute Description** If an enumeration of DBYES is used, this allows a call to barge in while the message is being played instead of at the beginning of the announcement cycle. This allows calls to be connected to the announcement faster but only if it is acceptable that the caller hear the announcement begin at an arbitrary point.

When bargein is set to DBYES, the attribute fcaudible should be set to DBNO. For music sources, cycles must be set to 0 to allow a call to be connected to music indefinitely. For a non-Cascading Announcement Trunk Group (non-15A), if bargein is set to DBNO, the message cycle length of a nonbarge-in message should not be greater than 18 seconds, and the attribute fcaudible should be set to DBYES. For Local Coin Overtime Announcement, this attribute should be set to DBNO.

For 15A Cascading Announcement trunk groups, barge-in is not allowed. That is, bargein must be DBNO. However, fcaudible may be either DBYES or DBNO.

**Attribute: fcaudible**

**Fullname:** Audible Ring for Delay

**Attribute Description** If an enumeration of DBYES is used, this provides audible ringing tone to the calling facility. If DBNO is used, no audible ringing tone will be provided. The default for nonbarge-in announcements is DBYES. For Local Coin Overtime Announcement, this attribute should be set to DBNO.

**Attribute: ra_type**

Copyright © 1999 Lucent Technologies 

**Fullname:** Recorder Announcement Type

**Attribute Description** Recorded announcement type. An enumeration of FCRA_NBARGE indicates a non-barge in announcement, meaning that a call must wait for the beginning of an announcement cycle. FCRA_BARGE allows a call barge in while the message is being played, instead of at the beginning of the announcement cycle. This allows many calls to be handled at the same time. In either case, FCRA_NBARGE or FCRA_BARGE, the maximum announcement repetition per call is controlled by the variable cycles. FCRA_TBARGE allows call barge in while the message is being played and the caller may listen to the announcement for a period of time determined by the variable ann_time. This attribute is not used by Domestic. Set to FCRA_NBARGE if bargein equals DBNO, FCRA_BARGE if bargein equals DBYES.

**Attribute: ann_time**

**Fullname:** Announcement Time

**Attribute Description** This is the maximum period of time the caller will be allowed to listen to the announcement. This should be long enough for the caller to hear at least one complete cycle from the beginning, even if the barge in occurs in the middle of a cycle. A value of 0 means that the announcement is untimed (That is, the calling party hears the announcement repeatedly until they hang up).

This attribute is only used for International.

**Attribute: maxcalls**

**Fullname:** Maximum Calls allowed to concurrently connect

**Attribute Description** This attribute defines the maximum number of calls that can be connected to this announcement/music port at the same time. Any attempt to attach additional calls will fail. A maxcalls value of 0 corresponds to a blank RC or ODA form field.

For 15A Cascading Announcement trunk groups, maxcalls must be 60.

**Attribute: retry**

**Fullname:** RETRY on route failure

**Attribute Description** This attribute indicates whether RTA should retry when it fails to connect to an announcement port (only useful when not a one member group).

# FC_CARR

## 1. Description

This relation contains the carrier data.

## 2. Data Dictionary Values

| | |
|---|---|
| maximum tuples in relation | 3000 |
| expected number of tuples | 500 |
| access type | DBACC_HASH |
| memory type | DBPRAM |
| distribution | FR |
| relation type | DBSTATIC |
| foldtype | DBGC31 |

## 3. Field Layout

```

## 4. Population rules for RLfc_carr

### Relation Description

Feature group D (FGD) Carrier data

This relation contains Feature Group D Carrier data Only.

**Attribute:**
carrid
**Fullname:**
Carrier id
**Attribute Description:**
Carrid indicates the carrier identifier.
It must be entered as a 4 digit character string, where each
of the characters can be '0' thru '9'.

**Attribute:**
intra_ind
**Fullname:**
Intraexchange indicator
**Attribute Description:**
Set to DBYES if the carrier accepts intra-LATA calls.

**Attribute:**
ad1_ind
**Fullname:**
AD1 indicator
**Attribute Description:**
Set to DBYES if the carrier allows abbreviated dialing
(FGD Carrier Access Code, CAC + #).

**Attribute:**
ovlap_ind
**Fullname:**
Overlap outpulse indicator
**Attribute Description:**

Copyright © 1999 Lucent Technologies 

Set to DBYES if overlap outpulsing should be attempted for 'non-service access code' calls.

**Attribute:**
sacovlap
**Fullname:**
Service Access Code overlap outpulse indicator
**Attribute Description:**
Set to DBYES if overlap outpulsing should be attempted for service access code (SAC) calls.

**Attribute:**
ci_acctp
**Fullname:**
Access type
**Attribute Description:**
Indicates the dialing access allowed by the carrier.

**Attribute:**
carr_tp
**Fullname:**
Carrier type
**Attribute Description:**
Indicates the type of carrier.

**Attribute:**
domes_di
**Fullname:**
Domestic destination index
**Attribute Description:**
The destination index for domestic U.S. calls

**Attribute:**
intl_di
**Fullname:**
International destination index
**Attribute Description:**
The destination index for international calls.

**Attribute:**
zerominus_di
**Fullname:**
Zero minus destination index
**Attribute Description:**
The destination index for calls dialed 0-.

Copyright © 1999 Lucent Technologies 

**Attribute:**
ad1_di
**Fullname:**
AD1 destination index
**Attribute Description:**
The destination index for calls dialed with Feature Group D Carrier Access Code (CAC) + #, that is, carrier cut-thru calls.

**Attribute:**
zplus_di
**Fullname:**
Zero plus destination index
**Attribute Description:**
The destination index for calls dialed 0+.

**Attribute:**
intlop_di
**Fullname:**
International zero plus destination index
**Attribute Description:**
The destination index for calls dialed 01+ (international 0+).

**Attribute:**
ns_di
**Fullname:**
Number service destination index
**Attribute Description:**
A destination index which results in routing to carrier trunks.

**Attribute:**
pvn_di
**Fullname:**
Private virtual network destination index
**Attribute Description:**
A destination index which results in routing to carrier trunks.

**Attribute:**
tfree_di
**Fullname:**
ASP Tollfree destination index
**Attribute Description:**
A destination index used for ASP Tollfree calls

**Attribute:**
long_rec

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
Long billing record
**Attribute Description:**
Set to DBYES indicates a terminating detailed (long) billing record should be generated.

**Attribute:**
dig_route
**Fullname:**
Route on dialed digits
**Attribute Description:**
Set to DBYES if calls to this carrier should be routed based on the dialed digits.
The Circuit Switch Tandem (CST) secured feature applies to carr_tp of TYPE_PSEUDO only. Dig_route must be DBYES if the secured feature, Circuit Switch Tandem (CST) (#SFID006), has been purchased and turned on, otherwise must be DBNO.

**Attribute:**
coin_easig
**Fullname:**
Coin_easig
**Attribute Description:**
This bit is used to indicate that overlap outpulsing should be used for a TAISP coin call. For this bit to be set to DBYES, the overlap_indi attribute must also be set to DBYES.

**Attribute:**
cac_screen
**Fullname:**
Charge-a-call screening
**Attribute Description:**
Set to DBYES if and only if this carrier wants normal charge-a-call screening, that is, set to DBYES if the carrier wants non-free calls from charge-a-call phones blocked in the same way they are currently blocked if they are BOC calls.
Set to DBNO if the carrier wants to receive all calls from charge-a-call lines.

**Attribute:**
domes_ri
**Fullname:**
Domestic route index
**Attribute Description:**
Route index for domestic U.S. calls.

**Attribute:**
intl_ri

**Copyright © 1999 Lucent Technologies** 

**Fullname:**
International route index
**Attribute Description:**
Route index for international calls.

**Attribute:**
zminus_ri
**Fullname:**
Zero minus route index
**Attribute Description:**
Route index for calls dialed 0-.

**Attribute:**
ad1_ri
**Fullname:**
AD1 route index
**Attribute Description:**
Route index for calls dialed with Feature Group D Carrier Access Code (CAC) + #, that is, carrier cut-thru calls.

**Attribute:**
zplus_ri
**Fullname:**
Zero plus route index
**Attribute Description:**
Route index for calls dialed 0+.

**Attribute:**
intlop_ri
**Fullname:**
International zero plus route index
**Attribute Description:**
Route index for calls dialed 01+ (international 0+).

**Attribute:**
ns_ri
**Fullname:**
Number services route index
**Attribute Description:**
Route index for number services calls.

**Attribute:**
pvn_ri
**Fullname:**
Private virtual network route index
**Attribute Description:**
A route index which results in routing to carrier trunks.

**Copyright © 1999 Lucent Technologies** 

**Attribute:**
tfree_ri
**Fullname:**
ASP Tollfree route index
**Attribute Description:**
A route index used for ASP Tollfree calls

**Attribute:**
osps_icos
**Fullname:**
Operator services indicator for Inter-LATA calls
**Attribute Description:**
An indicator as to whether or not the carrier wants LEC operator services for Inter-LATA calls. Indicator is set to DBYES when LEC operator services are wanted.

**Attribute:**
osps_iclata
**Fullname:**
Operator services indicator for ICLATA calls
**Attribute Description:**
An indicator as to whether or not the carrier wants LEC operator services for ICLATA-type (Intra-LATA-Toll) calls. Indicator is set to DBYES when LEC operator services are wanted.

**Attribute:**
scd_map_idx
**Fullname:**
Selective Carrier Denial (SCD) carrier map index
**Attribute Description:**
Set to bit position in RLscd_scrn.carr_map for this carrier. Each carrier which requires SCD screening must have its own unique nonzero value for scd_map_idx. Each carrier which does not require SCD screening should have a zero value for scd_map_idx.

**Attribute:**
scd_line_cnt
**Fullname:**
Selective Carrier Denial (SCD) carrier line count
**Attribute Description:**
Set to the number of lines screened for this carrier.

**Attribute:**
send_ani
**Fullname:**

**Copyright © 1999 Lucent Technologies** 

Send SCRIDX associated ANI II digits flag.

**Attribute Description:**

DBYES indicates that the carrier is allowed to send the screening index (SCRIDX) associated ANI II digits. send_ani can only be DBYES if the secured feature, Flexible ANI Enhancements (FANI-E, SFID142), has been purchased and turned on, otherwise must be DBNO.

**Attribute:**

iclatazp

**Fullname:**

Inter-LATA Carrier's Intra-LATA Capability (ICLATA) 0+ calls Option Indicator.

**Attribute Description:**

DBYES indicates that the LEC is handling the ICLATA 0+ calls instead of this carrier. DBNO indicates that this carrier is handling the ICLATA 0+ calls. The iclatazp can only be DBYES, if the secured feature, ICLATA (SFID 149), has been purchased and turned on, otherwise must be DBNO.

**Attribute:**

iclatazm

**Fullname:**

Inter-LATA Carrier's Intra-LATA Capability (ICLATA) 0- calls Option Indicator.

**Attribute Description:**

DBYES indicates that the LEC is handling the ICLATA 0- calls instead of this carrier. DBNO indicates that this carrier is handling the ICLATA 0- calls. The iclatazm can only be DBYES, if the secured feature, ICLATA (SFID 149), has been purchased and turned on, otherwise must be DBNO.

**Attribute:**

o_bltrig_inh

**Fullname:**

Originating Busy Line Trigger Inhibit

**Attribute Description:**

This attribute will be used to indicate whether or not to inhibit the office Originating Busy Line Trigger. Default for this attribute is DBNO. When set to DBYES, the busy line trigger will be inhibited for this carrier. This attribute is secured by SFID #212.
This functionality was provided by ffcf3 in 5e11.

**Attribute:**

o_natrig_inh

**Fullname:**

Originating No Answer Trigger Inhibit

**Attribute Description:**

**Copyright © 1999 Lucent Technologies** 

This attribute will be used to indicate whether or not to inhibit the office Originating No Answer Trigger. Default for this attribute is DBNO. When set to DBYES, the no answer trigger will be inhibited for this carrier. This attribute is secured by SFID #212.
This functionality was provided by ffcf4 in 5e11.

**Attribute:**
ac_iclata_ovr
**Fullname:**
Deny Automatic Callback on ICLATA per cic Over-ride.
**Attribute Description:**
Per CIC option indicator for Deny AC on ICLATA PIC calls(Phase-2).
For a non-LEC CIC:
DBYES indicates that the AC/AR should NOT be blocked for ICLATA PIC Calls to private DNs(Feature over-ride).
DBNO indicates that the AC/AR should be blocked for ICLATA PIC Calls to private DNs.

For a LEC CIC:
DBNO is the only valid setting, and the AC/AR should NOT be blocked for ICLATA PIC calls to private DNs.

The ac_iclata_ovr can only be set to DBYES, if the secured feature for Deny
AC on ICLATA PIC calls (SFID 201), has been purchased and turned on.

**Attribute:**
trignum
**Fullname:**
ASP Carrier Trigger Number.
**Attribute Description:**
ASP trigger number defined on the carrier

The trigger number can only be set, if the secured feature for ASP Carrier Routing (SFID 243) has been purchased and turned on.

**Attribute:**
altlsp
**Fullname:**
Alternate local service provider indicator.
**Attribute Description:**
This attribute indicates that the carrier is an alternate local service provider.

**Attribute:**
intraswitch
**Fullname:**
Indicator to route intra-switch calls.

**Copyright © 1999 Lucent Technologies** 

**Attribute Description:**
This attribute provides the option to route (None/1)+ 7/10 digit non-operator assisted intra-switch calls to the PLC instead of the LEC carrier.

**Attribute:**
tcut_call
**Fullname:**
Indicator for FGD Tandem Cut-thru calls
**Attribute Description:**
Indicates whether a FGD cutthru call is tandemed to another carrier

**Attribute:**
tcut_ri
**Fullname:**
Routing index for a FGD Tandem Cut-thru call
**Attribute Description:**
Routing index for a FGD Tandem Cut-thru call

**Attribute:**
tcut_di
**Fullname:**
Destination index for a FGD Tandem Cut-thru call
**Attribute Description:**
Destination index for a FGD Tandem Cut-thru call

**Attribute:**
tf_ii_subs
**Fullname:**
Toll Free ANI II subscription indicator.
**Attribute Description:**
